all made of clinker, either from the destructor or gasworks. There were also four small secondary beds, 18 in. deep. All this plant is still in use, one septic tank being worked at a time. Some sludge is usually drawn from the septic tank once a week, when the grit chambers are cleaned out, and the top scum is periodically removed, especially in warm weather, when the floating fat becomes offensive. The whole of the works already described had been laid out under either Mr. A. C. Bothams, ASSOC. M. INST. C. E., the author's predecessor, or his father, the late John C. Bothams, M. INST. C. E., and it is owing to the abilities and foresight of these two gentlemen, who between them held the office of city surveyor for fifty-five years, that the sanitary works of Salisbury owe their efficiency.

The system worked so satisfactorily that, when the works were extended under Sir Alexander Binnie & Sons, on the extension of the city, in 1907, the same method was adopted. The Worthington pumps are retained as the storm-water pumps, a pair of 20-horse power compound steam engines driving the air compressors which raise the dry-weather flow (now reduced by the exclusion of subsoil water to 630,000 gallons per day) by means of the air lift shown in Figs. 9 and 11 to the septic tanks, also providing compressed air for the two Shone's ejectors in the city. Compressed air is stored in a receiver, at the rear of the compressors, at a pressure of 16 lb. per square inch.

The primary filter area was extended by the erection

contract; the price at present received is £13 per annum, the contractor undertaking to keep the works clear. The quantity removed is about 1,000 loads each year. The effluent from the sludge lagoons returns to the main screening chamber for treatment.

The final effluent is remarkably bright and clear, and is perfectly free from smell. An analysis of samples taken by dippings over twenty-four hours in 1909 is as follows:—

Results expressed in parts per 100,000.

	Sewage.	Tank effluent.	Primary filter.	Final filter.
Saline ammonia	4.00	3.70	1.20	.50
Albuminoid ammonia	.67	.47	.28	.08
Nitrogen as nitrate and nitrite	—	—	1.58	2.06
Oxygen absorbed in 4 hours	2.60	1.7	.76	.46
Chlorine as chloride	6.60	6.0	5.80	5.80
Suspended solids organic	62.9	11.0	6.0	1.0
Suspended solids mineral	20.6	9.0	4.0	1.0

2 days	.794	.394

Between three and six times the dry-weather flow is dealt with on a storm-water bed, 3,900 sq. yds. in area of flints 3 ft. deep; all above six times being discharged over a separating weir direct into the stream.

The author, with the consent of the Local Govern-

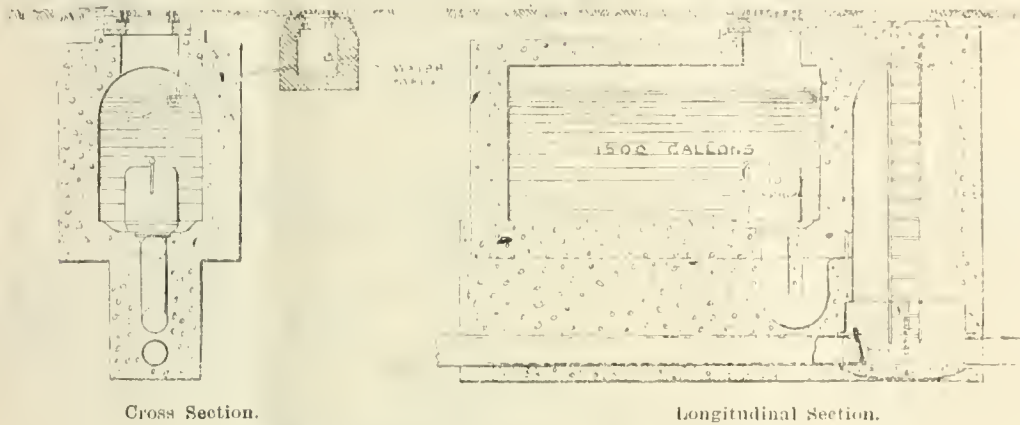

FIG. 5.—DETAIL OF SEWER FLUSHING CHAMBERS.

of five more filters of 500 sq. yds. area each, 6 ft. deep, with Adams' revolving sprinklers, marked F, G, H, I and J in Fig. 6. All the filters have open sides made of large clinker, stone, &c., and are filled in with smaller clinker, not graded, about 4-in. gauge. Fifteen secondary beds were constructed, with a total area of 4 acres. These are 18 in. deep, underdrained, and the clinker is not graded, except that the top 3 in. is fine to retain the particles of humus which come from the primary filters.

The first revolving sprinkler built (C in Fig. 6) is still in constant use after thirteen years' service. The primary filters do not show the slightest signs of clogging or disintegration, except in places where soft brick or stone was used for the containing walls. These have been repaired with clinker or old hard stone.

With reference to the secondary beds, under normal conditions they became choked when the depth of deposit was slight, and the labour of cleaning over the whole surface of the bed seemed out of proportion to the quantity of matter removed. The method now adopted is to allow the effluent to pond up the available depth of 6 in. to 12 in., the result being that the beds are worked much longer and the labour of removing the deposit is practically the same as for the thinner layer. Another advantage is that when a bed is choked it is not shut off from the carrier and the valve of the adjoining one opened, but a communicating pipe between the beds, at the opposite end to the carrier, feeds the new bed from the old one. The effluent, in travelling the length of the old bed, adds still further to the deposit there, and the greatest thickness being at the inlet, this, in the new bed, is where it can be most easily removed, which avoids wheeling across from the carrier end where it would normally deposit.

The sludge from the septic tanks and grit chambers is air dried in underdrained lagoons, and sold by

ment Board, four years ago carried out certain alterations to the grit chambers, and the "Waterloo" outfall, with a view to reducing the area of sewage exposed to the sun and air, and facilitating the cleaning of the grit chambers. The open channel between the outfall and the air lift was filled in, the sewage now being conveyed in pipes, and the area concreted over. In times of storm this is frequently submerged and, being the old chemical precipitation tanks, filled in with clinker, it was advisable to make it watertight.

It was found that the velocity of the sewage through the grit chambers was so much reduced that deposit of solids took place, which should be dealt with in the septic tanks. The channels were made narrower, giving an increased velocity, and a square drain constructed across the bottom, as shown in Figs. 7 and 8, controlled by penstocks; so that the storm-water sumps can be emptied into the small sumps next the septic tanks and pumped away by the centrifugal sludge pump, being either lifted into the septic tank or sent on to the sludge lagoons. The cross drains act as a check upon, and form pockets for, the grit, &c. The 18-in. by-pass was also laid at this time from the main outfall, for use while the grit chambers are being cleaned out, and the floors of the storm-water tanks were raised and concreted over, as shown in Fig. 8, the central channel sloping towards the grit chambers so as to facilitate cleaning and emptying after use. This section shows the shape of the original precipitation tanks.

It will be noted that the large tanks to the north of the grit chambers are not storm-water tanks, as so understood at the present time. They act as channels, conveying storm-water to the suction of the Worthington pumps. If a storm is of sufficient intensity to cause the sewage to flow over the weir, but it is not likely to continue, the water is allowed to remain there and is removed by the centrifugal

pump, thus avoiding starting the larger pumping plant unnecessarily.

The original centrifugal sludge pump was replaced in 1910, after about twenty-five years' service. One maker fixed two pumps which choked with the sludge; and another well-known firm, after quoting, declined to accept the responsibility of working with sludge. A Gwynne's "Invincible" was then fixed, and acts admirably. It is run by a 20-horse power Robey steam engine, which also supplies power for the lathe, drilling and other machines, all repairs being done on the premises. Electricity for lighting

haunches. The cost complete, including the removing of the old road crust, is about 2s. 6d. per square yard, made up as follows:—

	s.	d.
Scarifying and removing old surface	1	6
Granite, tar binder and chippings	11	5
Team labour	2	5
Manual labour and plant charges	1	5
Steam rolling	1	5
	2	6.6

The system was found to answer admirably, being quickly laid, and deluges of rain while the work was in progress having no effect upon the result. The

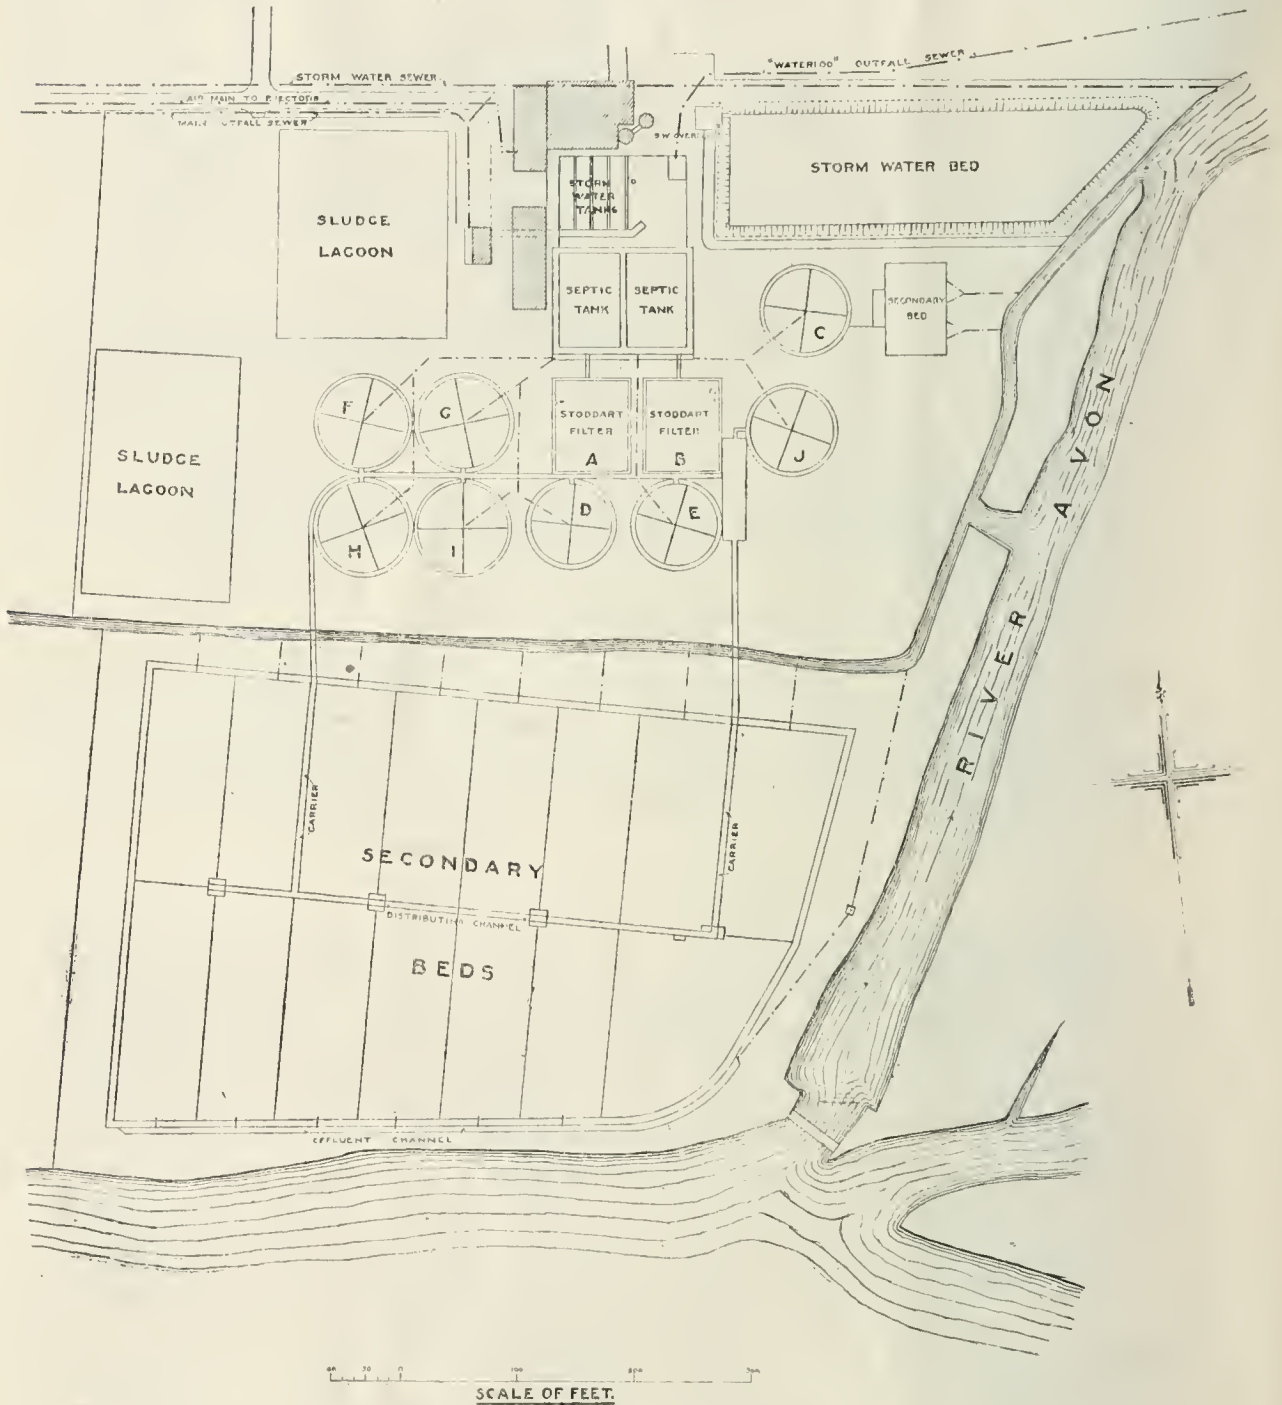

FIG. 6.—GENERAL PLAN OF SEWAGE DISPOSAL WORKS.

is generated at the works by a small steam engine of 5½-horse power.

ROAD CONSTRUCTION.

There are 7½ miles of main roads and 13 miles of district roads in the city. Flints are plentiful around Salisbury, and this accounts for the fact that when the author commenced duties, six years ago, there was not a square yard of granite in the city. Some of the heavily trafficked roads were therefore costly to maintain. In January, 1909, 300 tons of water-bound granite were laid on the main roads, and since then resurfacing has been carried out with granite, bound with "Targranix." The thickness averages 3 in., being two stones thick at the crown and one at the

first roads, laid four years ago, are still in excellent condition, although subject to heavy traffic. About a mile of main road has been resurfaced, and the allowance by the county council is now between 600 and 700 tons per annum. The amounts allowed by the county council for the past two years have been, maintenance and carriageways, £1,445; resurfacing with tar-macadam, £532; footpaths, £300; scavenging, £105; street watering, £110. Improvements to the value of about £300 a year are authorised, the cost being repaid by the county council in ten equal annual instalments. The council being anxious to improve the road surfaces as quickly as possible, spend rather more each year than is allowed. Several applications for assistance have

been sent to the Road Board, both direct and through the county council, but no grant has been made, which has caused great dissatisfaction.

Tar-spraying was commenced just prior to the author's appointment, but, crude tar being used, it was not a success.

Two years ago tar-spraying was again decided upon, Tarvia being used. All the tar-macadam surfaces are now tar-sprayed each year. Between £400 and £500 per annum is spent in tar-spraying the district roads. The machine purchased was Llewellens & James'. Various materials have been used for gritting, including beach grit, limestone and granite

PRIVATE STREET WORKS.

The making up of private streets used to be carried out on a very cheap specification, tar-concrete gutters were the rule. It was a coincidence that on the date upon which the author commenced duties the Private Street Works Act, 1892, came into operation in the city. In the first specification prepared after, stone channelling was introduced, set on concrete and with concrete behind the kerb to support it, as shown in Fig. 12. Frontagers objected to the small increased cost of 11d. per foot, and after the case was twice before the magistrates the specification was adopted. It is as follows: 12-in. by 4-in. Keinton

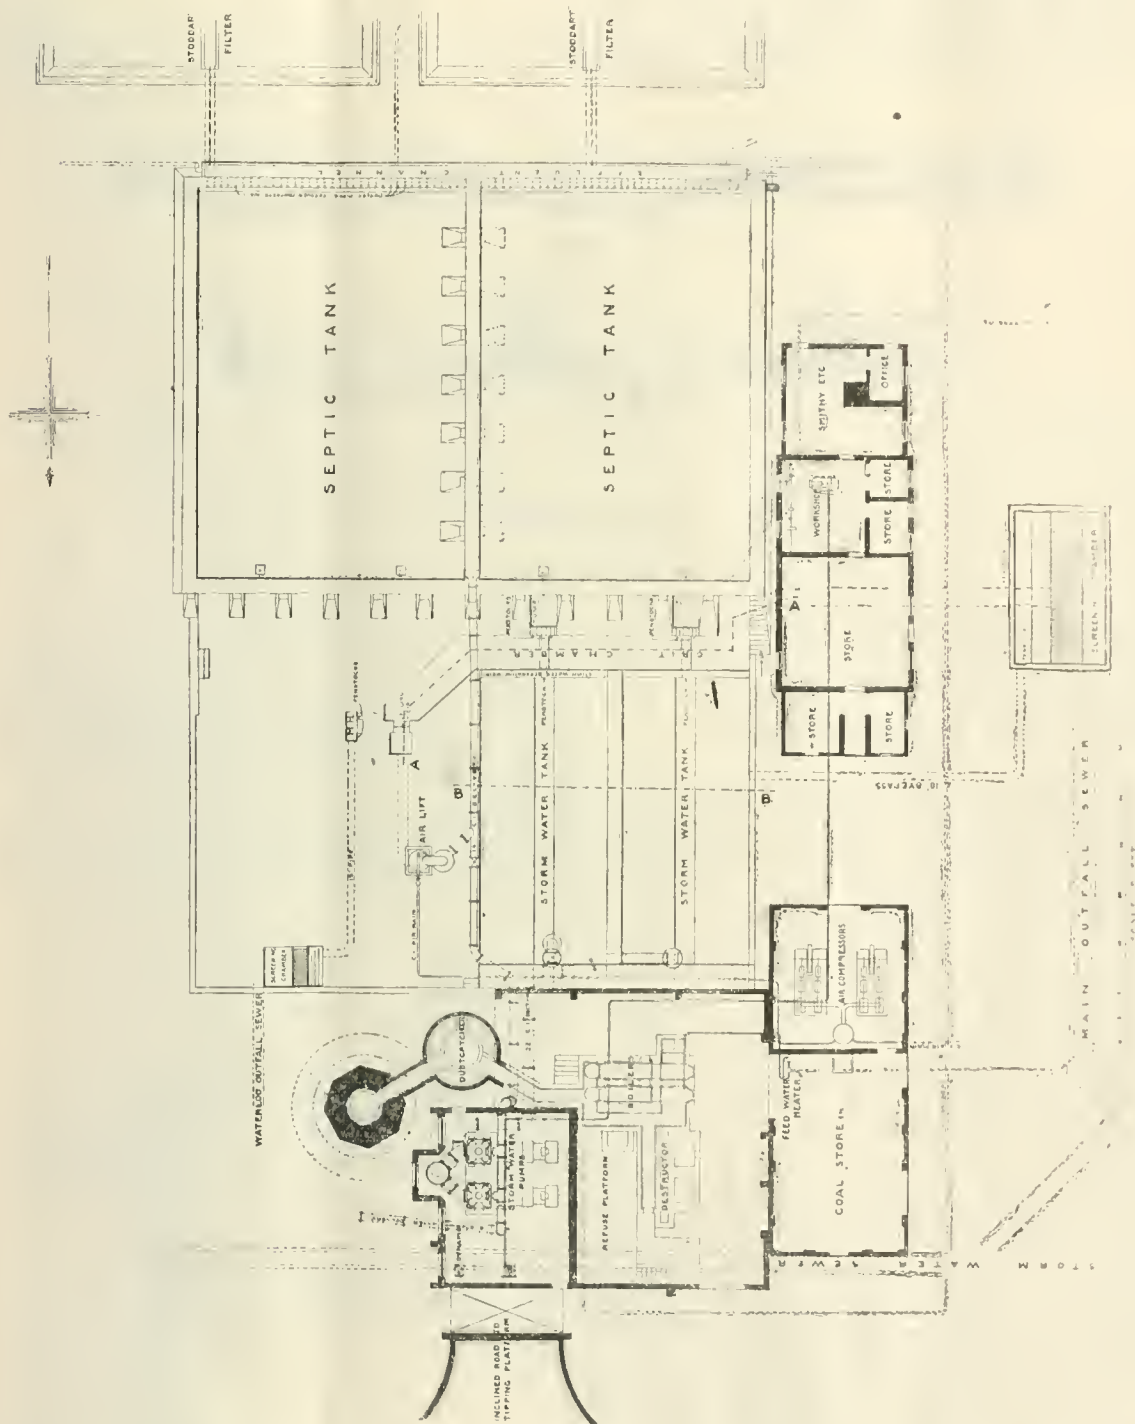

FIG. 7.—DETAIL PLAN OF SEWAGE DISPOSAL WORKS.

chippings, principally the latter. The tar "sets" better with it, and traffic is turned over it at once. The costs per square yard with Tarvia were as follows, for 1912:—

Tarvia, at 43d. per gallon, 4 1/2 yds. per gallon	d.	1.12
Granite chippings, at 12s. per ton, 150 yds. covered per ton	..	.97
Team labour	..	.10
Manual labour	..	.16
Total		2.35

Last year Tarco, being cheaper, was used, with very good results. It cost 4 1/2d. per gallon, and one gallon (being the second year of spraying) covered 5.3 square yards.

stone kerb, 12-in. by 4-in. Keinton stone channel, both on concrete, tar-concrete footpaths and gravel carriageways 8 in. thick. The cost, exclusive of sewers, is about 7s. per foot of frontage. The specification is the reverse of extravagant, but the author, knowing there would be opposition to stone channelling, decided to accept the remainder for streets with little traffic. As a consequence of the tar gutters previously laid down, which were soon useless, nearly £2,000 have been spent during the past five years in renewing some of them with stone.

STREET LIGHTING.

All the streets are lit by incandescent-gas lamps, with the exception of the Close, where electricity is the

illuminant, a special rate being levied by the waywardens on the residents there. In addition to a few high candle-power lamps in special positions, there are 297 100-candle-power lamps, for each of which £2 8s. 6d. is paid per annum, and 439 50-candle-power lamps, for which £1 15s. is paid per annum, the number of lighting hours per annum being 3,701. The council provide the pillars; the whole of the upkeep, including painting the pillars, is borne by the gas company. The price of gas in the city is 2s. 11d. per 1,000 cub. ft.

TREE PLANTING IN STREETS.

Although there are trees around the Market-square and the Green-croft, and a few of the streets were planted while they were still private, a commencement was not made by the council to plant trees in the roads until this year, when two roads were done, the trees selected being *prunus pissardi*, variegated

ing commenced on a cash basis, by which means all costs are accurately ascertained.

The combined depot is very convenient, having offices, workshops, stores, cart-sheds, house for the two road rollers, and ample yard space. A stable was also built to accommodate the contractor's horses during their midday meal. Every department under the author's control is connected to the telephone exchange.

MARKET.

The Market-square adjoining the council house is the property of the corporation, and brings in a net profit, including the annual pleasure fair, which is an old institution, of £250 per annum.

PARKS AND OPEN SPACES.

The Victoria Park, at the north end of the city, is about 16 acres in area. It was purchased in 1887 by

FIG. 8.—SECTION THROUGH GRIT CHAMBER AND STORM-WATER TANKS.

maple, laburnum, red and white may, white beam and almond. There was not room on the footpath for a tree-guard, and the trees are planted between 2-in. square stakes which protect as well as support them. The cost was 3s. each tree, planted complete.

HORSE HIRE.

The council own no horses, being able to hire a horse, cart and man at 5s. 9d. per day until two years ago. The cost had advanced to 6s. 3d., but from April 1st this year has been 7s., in consequence of a minimum wage of 18s. per week for drivers being made a condition of the new contract.

That cheap horse hire has not been inefficient is proved by the fact that the number of 400-gallon van loads of water distributed per day during the street-watering season, without any assistance, averages 27, and reached 28½ in 1910 when the season was unusually dry, and so less time was lost than usual in travelling back when rain came on. The council provide the watering-vans (nine four-wheeled and one two-wheeled), the house-refuse collection carts and iron tumbler carts, so the contractor is not called upon to provide many.

The author was instructed two years ago to report upon the purchase of a motor street-watering van, and it was decided not to buy one for the following reasons: (a) Salisbury being laid out in "chequers," there are cross-roads at frequent intervals, and such a heavy motor vehicle, run at an economical speed, would be a source of danger in the heart of the city; (b) horse hire is so cheap; (c) it was estimated that a motor van would displace three horse-drawn vans, in which case two districts would have to wait longer for the earlier watering of the roads than when three vans commenced together; (d) there is no suitable work for a motor lorry during the winter six months.

As an indication of the rapid changes which are taking place, and, incidentally, the increased wear on the roads, it is interesting to note that, while less than two years ago nothing heavier than a carrier's cart entered the square in front of the council house, there are now sixteen heavy motor buses using it, most of them being built at the Scout Motor Works, Salisbury, at a cost of about £1,000.

DEPOTS.

The present highways depot was built in 1907, the waterworks (distribution department) depot being erected adjoining in 1909 to the author's plans. At the same time a storekeeper's office and 10-ton weigh-bridge were provided, and strict stores account keep-

private subscription as a memorial of the Jubilee year of Queen Victoria, and is now under the control of the council. About 5 acres are laid out as gardens, and the remainder is a recreation ground with pavilion, grand-stand, cycle track, football ground, bowling green, tennis courts, &c. Concerts are given in the gardens during the summer, usually by military bands.

In the middle of the city is the Green Croft, an open space of about 4 acres, to be used for ever for "the practice of archery, beating of carpets, and other

FIG. 9.—DETAIL OF AIR LIFT.

recreations." It is still used for carpet beating (whether as a recreation ground or not is probably a matter of opinion among the beaters), but, needless to say, football has taken the place of archery.

There have recently been laid out at the south end of the city a children's playground of 1½ acres, equipped with swings, &c., and a riverside walk, along the bank of the Avon, nicely planted and furnished with seats and shelters.

ALLOTMENTS.

The council let allotment gardens of 10 rods each, in different parts of the city, to 371 holders at from 9d. to 1s. 3d. per rod per annum, including the free supply of water where required on the high ground. About 13½ acres are owned by the council, and a similar area held on lease.

HOSPITAL ACCOMMODATION.

Until about two years ago the council ran their own hospital upon very efficient and economical lines. This has been abandoned, Salisbury being now served by a joint isolation hospital recently erected just outside the city boundary, and used by several neighbouring authorities. The council also own a smallpox

of the corporation (robed) are accompanied by the three Sergeants-at-Mace with the maces, the procession ending with the city beadle, also in uniform and carrying their staves.

CONCLUSION.

The author thinks it will be agreed that, although old cathedral cities are usually considered to move slowly and be more or less behind the times, Salisbury is so much up to date in municipal matters that the councils, past and present, are to be congratulated upon their progressiveness, and it might well arouse the envy of many a county borough in some respect or other.

He wishes to express his thanks to Mr. W. J. E.

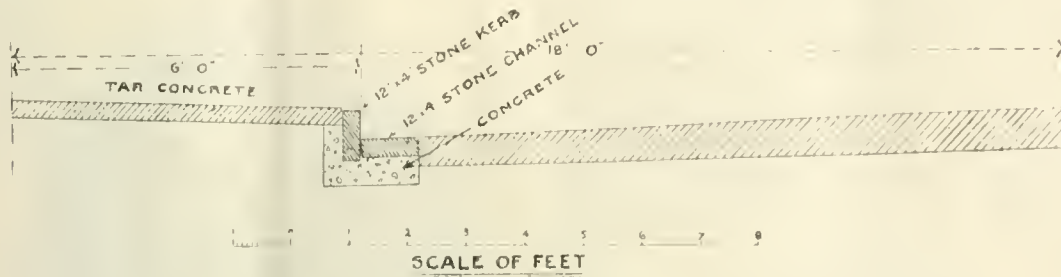

FIG. 12.—PRIVATE STREET WORKS: HALF-SECTION.

hospital, erected in 1900, but it has only been used once, some nine years ago.

MORTUARY.

A new mortuary was erected about five years ago, having glazed-brick dado and isolated viewing corridor.

PROTECTION AGAINST FIRE.

The fire brigade is a volunteer one, and the members are remarkably keen and efficient, call bells at their residences and places of business being rung from the fire station. There is a resident fireman at the fire station, which is a new and up-to-date building, equipped with the latest appliances, including a steamer, and a motor combination fire engine and escape of the Commer-Simonis type, with first-aid pump. The machine is 50-60-horse power, and was purchased by the council last year at a cost of £998. The two-stage turbine pump has a capacity of 350 gallons per minute, and the first-aid pump, for use while the turbine pump is being connected up, draws its supply from a 30-gallon tank, the jet being supplied through 150 ft. of 1-in. hose which is kept ready charged and is run quickly off a reel on the engine. The first-aid pump also creates the vacuum to start the turbine pump.

OTHER PROPERTIES.

The council own considerable remunerative property in the city.

The "Poultry Cross" is a beautiful piece of Gothic architecture, referred to as far back as 1335. The council house was erected in 1795, and is the gift of Jacob, the second Earl of Radnor, replacing the one which was burnt down. Some very interesting and valuable portraits are in the banqueting room and grand jury room; two of them by Hoppner, are valued at about £3,000 each. The municipal offices were enlarged by the author two years ago on the purchase of the adjoining property, and a new committee room was provided. A splendid public library was erected in 1905, and adjoining it is a new picture gallery, recently presented to the city. The whole of these buildings, including the police station and fire station, are within 200 yds. of the council house.

The council also rent an open-air swimming bath, let on a short lease, but they control the list of charges, which are nominal.

CITY PLATE AND INSIGNIA.

In addition to the pictures in the banqueting room, &c., already referred to, the corporation possess a quantity of valuable plate and insignia.

There are no fewer than three handsome silver-gilt maces made in the year 1750. The great mace is of very large size. Among 150 maces exhibited at the Mansion House in 1893 only one was larger. According to the amount paid for two maces recently at Christie's, the value of the Salisbury three is some thousands of pounds. The old-world customs are still retained. On all ceremonial occasions members

Binnie, M.INST.C.E., for permission to reproduce two detail drawings which were included in his paper on "Salisbury Drainage" to the Institution of Civil Engineers (*vide* "Minutes of Proceedings," vol. clxxxii.) also to his assistants, Mr. Charles Notley and Mr. Percy Williams, for their valuable aid in the preparation of the drawings, &c.; and his manager at the sewage disposal works, Mr. John Hamlin, for his revision of the history of the works of which he had had charge since their commencement, and to whose conscientious efforts the excellent result of the treatment is due.

THE DUNDEE TRACKLESS TROLLEY SYSTEM.

The engineer and manager of the Brighton tramways reported recently to the Tramways Committee of the corporation that, in consequence of statements which had been circulated concerning the alleged discontinuance of the trackless trolley service at Dundee, he had communicated with the general manager of the Dundee city tramways, from whom he had received the following reply:—

"The system has been in operation for one year and eight months, and so far as working is concerned it has been an unqualified success. It has been as reliable as an ordinary tramway service, and the working expenses have been very low. At busy times, such as week-ends, we have evidence that heavy rushes can be dealt with by this system. With two cars in service the receipts averaged for one day 25-31d. per mile run. The cause of trouble has been the roadway. To begin with, I understand it was the worst road in the city, with no bottoming beyond the natural subsoil. The roads department had, the year before it was proposed to instal the railless system, provided a sum in their annual estimates to put this road in a condition suitable for modern traffic, but the money was not spent. Some money has been spent on the roadway since the cars have been operating, but the road is not suitable; consequently the Tramways Committee have unanimously resolved to discontinue the service until the road is put in a reasonably suitable condition.

Swivel Nib Drawing Pen.—The outstanding advantage of this new pen, which Messrs. W. F. Stanley & Co., Limited, 286 High Holborn, London, W.C., have recently introduced, is that the nibs can be instantly opened out for cleaning and afterwards replaced without interfering in any way with the original adjustment of the thickness of line. In construction the lower nib is swivelled upon a central screw, and when the pen is in use this is securely held in position. To open for cleaning it is only necessary to slide back a ring and open out the nib, after which the nib and ring are replaced, which automatically readjusts the pen to its original setting.

SAND AND COARSE MATERIAL AND PROPORTIONING CONCRETE.*

By JOHN A. DAVENPORT, M.Sc.(VICT.), ASSOC. M. INST. C.E.,
A.M.I.MECH.E., and

PROF. S. W. PERROTT, M.A.(DUBL.), M. INST. C.E.,
Professor of Civil Engineering at Liverpool University.

In correctly made concrete the amount of sand should be just sufficient to fill the voids in the coarse material, and the amount of cement just sufficient to fill the voids in the mixture of sand and coarse material, and to coat all the particles with very thin jointing layers. It is a rational assumption that such concrete will give a maximum of strength with the minimum of cost, and if this assumption be justified by experimental results, it follows at once that the proportioning of concrete-forming materials is of the utmost importance. Greater strengths can be obtained by the use of excess of cement, as in the case of the ordinary mix of 1:2:4, but the increase in strength is less than the increase of cost of materials, and is, therefore, only justified in particular cases.

The strength of any concrete will depend not only upon the materials and their proportions, but also upon the method of using those materials. Any void in a mass of 3-in. coarse material may be filled in many ways. First, it may be filled with cement and sand and mortar, as in the 1:2:4 concrete; secondly, it may be filled with a piece of stone which practically fills the whole space; and, thirdly, it may be filled with a number of stones which vary in size with a minimum amount of cement-and-sand mortar. The first filling is composed almost wholly of joints, and on that account is weak; the second filling is strong, owing to the absence of joints, but it is impracticable; but the third is a compromise which is not only practicable, but also strong. It will be seen that the amount of the variations in size or the grading will depend upon the nature and quality of the work required. On the one hand there will be good but costly filling, and on the other a cheap but still good filling, and whether the gradation be large or small the filling will be better than one of cement-and-sand mortar only.

With a view to testing the

EFFECT OF PROPORTIONING

upon the strength and other properties, and also the cost of concrete, the authors drew up a series of experiments, the intention being to test compressive strength, modulus of rupture, specific gravity, water resistance and fire resistance. Various difficulties arose in the course of the work which not only prevented the paper being presented on the original date, but prevented also the inclusion of specific gravity, water resistance and fire resistance tests. The series involve 216 test pieces, to which must be added others prepared for water and fire resistance and specific gravity tests, but which could not be tested in the time available. The voids were measured in a patent apparatus designed by Mr. Davenport, which gives results to $\frac{1}{2}$ of 1 per cent. The preliminary data comprised tests on Portland cement, which was Martin, Earle & Co.'s brand "Rhinoceros," size of granite chips, volume of chips per batch, percentage volume of voids in chips, sizes of river sand used, volume of sand used per batch, percentage volume of voids in sand, and the volume of cement used per batch. Regarding the last-mentioned item, it must be noted that no allowance was made for the excess cement required for jointing, only the amount required to fill the voids being used. Had time permitted it, the correct allowance in each case would have been ascertained, and additional tests made therewith. The limited time made it impossible to test the cement before using it for the concreted test pieces, the brand only suggesting its probable good qualities.

The batches were hand mixed by engineering (senior honours) students, and as no special means of testing the thoroughness of the mix were adopted, the resulting concrete will probably compare favourably with machine mixed so far as uniformity of results go. Every care was exercised, however, in the mixing to get all the materials thoroughly intermixed and apparently uniform. This proved to be the case when the specimens were tested. The moulds were made of planed boards, bolted together with gangs, damped before using, and lined with paper on the under side to facilitate removal. In spite of this, several pieces

were damaged in removal, due more particularly to the relatively small sections used.

Immediately after mixing the moulds were filled and left in a tool shed till required for testing. They were wetted regularly every three or four days.

It was found that the ratio of compressive to tensile strength varied more in the one-month than the three-month tests, and is not sufficiently uniform to base any conclusions upon beyond the fact that such ratio is not constant. It is considered by the authors, however, that this ratio should be more or less constant as the failure, whether compressive or tensile, depends upon the adhesive strength of the cement.

The ratios strength at three months to strength at one month were more or less uniform, more particularly in the case of compressive strengths. In the case of 1:2:4 concrete the modulus of rupture appears to increase more rapidly than the compressive strength, while in the other series with cement accurately proportioned, the compressive strength increases more rapidly than the modulus of rupture, as out of six series only one runs the other way, probably due to rather dry mixing of those three-month test pieces.

Although the cement tests are unsatisfactory, it will be possible to compare the

STRENGTHS AND COSTS

of the concrete in the different series, as they will probably all be affected to the same extent. The most important point brought out by such comparison is the fact that for accurate proportions, the ratio $\frac{\text{cost of cement}}{\text{total cost}}$ is practically constant for all gradings taken in the tests, so that when the graded coarse material is used the total cost need only be further considered. Of course, the total cost is always the final criterion as regards economy, and it may be suggested that the ratio cost of cement to total cost need not be considered. But the relative values of total cost obtained may be altered when additional tests are made at other ages, and it is difficult to say whether they will be affected by the ratio; so that, if it can be shown conclusively that this ratio is constant, or nearly so, the total cost, age and proportions need only be dealt with.

The authors do not feel justified in attempting to generalise from the results given in the tables, as they consider such results do no more than open up the subject of proportioning and grading in relation to cost. They have no hesitation, however, in saying that the figures given by them show conclusively that the subject is well worth being made the object of special research, and while they cannot promise additional results for any special time, will continue the work, and hope to place their results before the institute at some future date.

Surveyors' Institution.—The annual general meeting of this institution, to receive the report of the council and the announcement of the result of the election of officers for the ensuing year, will be held in the Lecture Hall on Monday next at 5 o'clock. The prizes awarded to successful candidates in connection with the recent preliminary and professional examinations will be presented by the president.

Law of Private Street Works.—It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of house property (to say nothing of the occupiers of his houses) has to thread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them might be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices and he is not driven to consult a specialist. The work before us* deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1882, but not with the Metropolitan Management Acts: the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful hand-book. We find the recent decisions included, and the work seems to have been carefully prepared.—*The Builder*.

* Summary of paper read at a meeting of the Concrete Institute on the 14th inst.

* "Notes on the Law of Private Street Works under the Public Health Acts." By J. B. Reigier Conder, a Solicitor of the Supreme Court. 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

Institution of Municipal and County Engineers.

MEETING AT SALISBURY.

Gratifying success attended the meeting of the Institution of Municipal and County Engineers which took place at Salisbury on Saturday last. The weather conditions were all that could be desired. There was by no means a large gathering when the proceedings opened in the council chamber, but the papers prepared by Mr. W. J. Goodwin, the city engineer and

MR. W. J. GOODWIN, ASSOC. M. INST. C. E.,
City Engineer and Surveyor of Salisbury.

[Mr. Goodwin was educated at the Royal Grammar School, Newcastle-on-Tyne, and commenced his professional career as pupil under the late Hedley G. Himson, engineer to the urban district council of East Dereham, where extensive alterations to the water undertaking were being carried out. In 1901 he was appointed chief assistant under Mr. J. W. Wiles, surveyor to the Gorton Urban District Council, since absorbed in the city of Manchester. In 1903 he obtained an appointment under the city surveyor of Manchester, Mr. T. de Courcy Meade, M. INST. C. E., and quickly rose to a high position on the staff. In the spring of 1908 he came south to Salisbury, where important works have been carried out under him in connection with the waterworks, sewers, and sewage disposal works. The improvement of the road surfaces has engaged his special attention. He is an associate-member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers, having passed both examinations, also the practical sanitary science examination of the Sanitary Institute.]

surveyor, and Mr. John H. Blizard, Sir James Lemon's late partner, were productive of a discussion of considerable length, and, as will be seen from our report, of undoubted excellence. Those present at the meeting—which was preceded by a short district meeting—included Mr. J. W. Cockrill, president, in the chair, Sir James Lemon (Southampton), Messrs. J. Beynon (Frome), J. H. Blizard (Southampton), W. Butler (Fareham), W. J. Goodwin (Salisbury), W. H. Grieves (Sutton), C. C. Hancock (Warminster), T. W. A. Hayward (Battersea), R. H. Jenkins (Portsmouth), F. W. Jones (Frome), L. W. Jukes (Southampton), F. C. Keen (Bournemouth), A. J. King (Devizes), C. H. Lawton (Warminster), R. B. Lees (Bradford-on-Avon), L. S. McKenzie (Bristol), F. G. Nicholson Lailey (Trowbridge), F. R. Phipps (Basingstoke, district secretary), J. S. Pickering (Cheltenham), W. S. Raine (Hungerford), J. W. D. Robinson (Westminster), J. Wilson (Bristol), O. E. Winter (Hampstead) and R. C. Woodhall (Blandford).

The Mayor (Councillor J. Macklin, J.P.) said he was very pleased to welcome the institution to the ancient city of Salisbury. He had no doubt many of them knew Salisbury, because the town possessed considerable attractions for visitors. First of all, they had their ancient cathedral, and that alone was probably a sufficient inducement to anyone to pay them a visit. Public bodies owed a great deal to the municipal engineer, and he realised that the members of their profession were able to attain the positions they occupied only after long years of study and self-sacrifice. The duties they performed were of the greatest importance, for the very life of the

people depended on their energies; the proposals they put forward necessarily involved the expenditure of much of the ratepayers' money, but, however costly the results of their deliberations might be, it had to be realised that their work was essential to the public health generally. One thing they could lay claim to in Salisbury was that they had laid down a most efficient plant for the disposal of their sewage. It had been an expensive matter, but the outlay was one which he did not think ought to be grudged. Public bodies were frequently criticised for their seemingly lavish expenditure; that might be the case, but the necessity for this should not be overlooked. They had also a very efficient water supply, which involved a charge of only about 6d. in the £ on the rates of the city. His duty was to extend them a very hearty welcome, and he trusted that their deliberations, and the conclusions they ultimately arrived at might be of service to the com-

MR. JOHN H. BLIZARD, ASSOC. M. INST. C. E.

[Mr. Blizard, who was born in 1862, served his articles with the late Mr. William Jurd, F.S.L. of Southampton, after which he joined Mr., now Sir James, Lemon, M. INST. C. E., as a junior assistant, in due course attaining the position of chief assistant. In 1891 he was appointed surveyor to the School Board of Southampton, and held that position until the passing of the 1902 Education Act, when his office was abolished, the work now being carried out by Mr. J. Crowther, ASSOC. M. INST. C. E., the borough surveyor of Southampton, for the council education authority. During his service as surveyor, Mr. Blizard designed and carried out some of the largest schools in the South of England. Sir James Lemon's practice increasing so rapidly, he offered a partnership to Mr. Blizard. This he accepted, and entered into it in 1887. The connection terminated in 1908, when Sir James retired, and the practice is now carried on by Mr. Blizard under the old name. Mr. Blizard, in his career, has had an unique experience. He has been connected with the sewerage of many towns, among which are Winchester, Farnham (Surrey), Lyminster (Hants), Poole (Dorset), Eastleigh Park and Bishopstoke (Hants), Bournemouth—disposal, Dorking (Surrey)—disposal, special filter beds—Havant, Bemerton (Wilts), Wyke Regis, and Dorset. He has also had a very large experience in estate development, and as an arbitrator and expert witness. Last year, in the matter of a compulsory acquisition of property, he was appointed as an independent arbitrator by the Local Government Board, as provided by the Housing and Town Planning Act, 1909, and held a public inquiry at Liverpool. He is now engaged as joint engineer for the execution of the main sewerage and sewage disposal works of Sunningdale and Ascot, for the Windsor Rural District Council, and is preparing a scheme for an important district in North Wales. Mr. Blizard was elected an associate-member of the Institution of Civil Engineers in 1887; he is also a Fellow of the Royal Institute of Public Health, the Royal Institute of British Architects, and the Institute of Sanitary Engineers, and a member of the Association of Consulting Engineers, and the Royal Sanitary Institute.]

munity, and that their visit to the city would prove of a pleasant nature.

The PRESIDENT (Mr. J. W. Cockrill), in acknowledgment, remarked that wherever the institution went they generally received a cordial welcome from the authorities, and that day was no exception to the rule. He moved that the thanks of the members

be tendered to his Worship for the kind reception he had accorded them.

Mr. R. READ (Gloucester), in seconding, congratulated the city on its ancient history and modern progress.

The vote of thanks was carried, and the Mayor, in response, said he hoped that the members would take away from Salisbury some very pleasant recollections of their visit.

The discussion of papers—"Some Notes on the Municipal Works of Salisbury," by Mr. W. J. Goodwin, and "Bemerton and Wilton Sewage Disposal," by Mr. John H. Blizard, Southampton—was next proceeded with. The papers referred to are reproduced elsewhere in this issue.

DISCUSSION OF PAPERS.

The PRESIDENT (Mr. J. W. Cockrill) moved that the thanks of the institution be accorded to the authors of the two papers. With regard to sewage disposal, that was a problem which did not trouble him. They were able to get rid of their sewage in a very effectual way, and at a comparatively small cost. Salisbury's history was a most interesting one, and he hoped before leaving to see something of the city.

Sir JAMES LEMON (Southampton) seconded the vote of thanks. He congratulated Mr. Goodwin on preparing such an interesting paper. It was full of most interesting information, and he had read it with a great deal of pleasure. He also wished to congratulate Salisbury on the splendid position it occupied in the matter of its death rate, which was only 10·8 per 1,000. That was a good answer to those grumblers who found fault with every expenditure. The water supply was another feather in the cap of the city council. They got it from a deep well, and delivered it at the extraordinarily low price of 6d. on the rateable value. He did not know of any other town that was able to do that. Water was supplied to baths without charge. He knew some water companies who charged for that. He had to pay the water rates of the water company outside his borough, and they charged a pretty round sum for bath water; but a company who did that sort of thing could not have much regard for the health and cleanliness of the community. He thought every house, however small, ought to be provided with a bath; cleanliness was next to godliness. With reference to the open joints of the sewers, which were laid years ago, of course, they must not criticise too much what was done by their forefathers; but, considering what the results must have been to the city of Salisbury, the engineers of that time were not quite up to date in their methods of draining the subsoil water. In dealing with a city of about the same population, he dealt with it by draining the subsoil water into rubble drains laid under the sewers, but he had not to deal with such a large quantity of water as they had in Salisbury, where they had succeeded in reducing the daily flow in their sewers from 2,000,000 gallons to about 600,000 gallons. They had had some trouble from smells, but that might arise in some measure from the flat gradients, which were 1 in 1,760. Another thing he had noticed was that the main-water pipes were formerly connected direct to the sewers. That was not done nowadays, and he was glad to see that it had been remedied. He remembered when the sewage of Salisbury was treated in a very different way from what it was to-day. It was treated by lime precipitation, and they had constant complaints as to the condition of the river. In regard to the clogging of the secondary beds, he had not worked out the area of the filters, but it struck him that it was ample for dealing with a dry-weather flow of 600,000 gallons, and the only reason he could advance for the clogging was that the beds were not graded. The grading of the material was a necessity if they wanted to get a free filtering medium. He recommended Mr. Goodwin to try the experiment of taking out the material from one of these beds, putting in graded material, and watching results for a certain period. Nothing was said as to cost in the case of either the Salisbury or Bemerton works, and he should have liked to see a comparison of the system adopted for Salisbury with the direct application of sewage to land, as carried out by Mr. Blizard at the latter place. Of course, one must deal with these matters according to local circumstances. He remembered in his early days, in dealing with the sewage of a certain town, the mayor asked: "What is your system?" His reply was that

he had no system, and the mayor looked horrified; but he (Sir James) explained to him that he adapted the system to the particular conditions of each case. The Bemerton scheme, which was carried out by his late partner, was a good instance of the application of sewage direct to the land, and he had no doubt that an inspection of the works would afford them considerable information.

Mr. R. READ (Gloucester) said he had not the knowledge of Salisbury possessed by Sir James Lemon, but he should like to congratulate Mr. Goodwin and the citizens on having such a good water supply within their own boundaries. Being very cheap, they used it very freely—at the rate of 40 gallons per head per day. He took it that was the penalty of the separate system, and he should like to ask the author if he insisted upon the houses being drained separately—one drain for foul water and the other for rain water—and whether a limited amount of the rain water went into the foul water drains. Where, as in Gloucester, they had to bring the water 6 miles in one direction and 11 miles in another, they could not do it for less than 10d. per 1,000 gallons, and 10d. on the rateable value—these being convertible terms. Sixpence per 1,000 gallons was very low indeed. He saw that Mr. Goodwin charged other departments at the rate of 1½d. per 1,000 gallons, but he should think that that was a losing figure. They had a very large number of flushing chambers, necessitated by the separate system. That was a very good thing. It was not stated how much gas the Webb lamps used. His impression was that they used a large quantity—10 or 12 cub. ft.—per hour. Salisbury, however, only had two. As to the connection of the destructor chimney with the lower end of the sewer, he did not think one could get much effect more than 300 yds. from the sewer. With regard to the Bemerton paper, he congratulated Mr. Blizard that the Wilton people had allowed the sewage of the other district to go down into their area, for, as a rule, a village did not like to take the sewage of an adjoining place.

Mr. F. R. PHIPPS (Basingstoke) added his thanks to Mr. Goodwin and Mr. Blizard. Mention was made by Mr. Goodwin of an 82-ft. well with a borehole, 50 ft. in depth, lower down. He had never been able to understand why boreholes in chalk districts were put down at the bottom of dug wells. One could understand a borehole being put down where one had to go through impervious strata. The chalk area was about 600 ft., and if one did not go through the gault, or any impervious strata, he could not see the advantage. The dug well was sunk into the basin, and if galleries were driven laterally to increase the flow he could not see that a borehole was going to increase the amount of water. The small reservoir storage rather struck one. Apparently the pumping was about 800,000 gallons per day, and the storage capacity 362,000 gallons—less than half the day's supply. He supposed that Mr. Goodwin was sanguine that the pumps were not going to break down, but half a day's supply seemed small for a city like Salisbury. The charge for the railway supply—3d. per 1,000 gallons—was very small indeed. At Basingstoke they had an agreement by which a charge of 4½d. per 1,000 gallons was made for this service. The hardness of the water was also interesting. At Basingstoke the figure was 15·5 deg., and they got a few complaints and suggestions that they should soften the water. As regarded the sewerage and the point about the sewer joints being left open for the purpose of taking the subsoil water their own specification for the sewerage system laid in 1879 contained exactly the same provision. The consequence was that they used to pump to the sewage farm about 1,000,000 gallons per day; but he did the same as Sir James Lemon had done, with the result that they got the amount down to 300,000 gallons per day. He saw that Mr. Goodwin had carried out the ventilation of the sewers by connecting the end of the sewer to the outer cavity of the refuse destructor chimney. Another means he had adopted was to connect the outlet and the pump well up with the air blast of the destructor. The whole of the air for the destructor was brought from the pump well, and it proved an excellent means of getting rid of any smell there was formerly. On the question of house refuse disposal, had Salisbury considered the desirability of making the owners or occupiers provide sanitary dustbins? They had many complaints about the receptacles used in Basingstoke, but he thought the powers—even if they were obtained—were very difficult to put into force. He should be glad of

any information on the point. He also congratulated Mr. Goodwin on getting from the county council the whole of the expenditure incurred in watering the main roads. He himself could only get one-fourth or one-fifth of the cost. He saw that Mr. Goodwin obtained £110 a year for the watering. The contention of his own county council was that that amount of watering was not necessary on the main roads, and merely allowed what they considered was sufficient for the purpose. The use of granite chippings in connection with tar-painting resulted in the formation of a good road surface, but he thought the price of 97d. per square yard for the chippings was rather high. He preferred to use beach grit, obtainable at about 5s. per yard; it consolidated well, and formed a mosaic-like surface on the tar. Their own cost for spraying, using distilled tar, was 130d. The price for street lighting in Salisbury was very low, but he took it that that was due to the competition between the electric light and gas. Thirty-five shillings a year for a 50-c.p. lamp was very moderate. The cost of horse hire was also low. At Basingstoke it was 8s. 6d., but he saw that at Salisbury 7s. was considered high. The wages of drivers at 18s. was, however, very small, and he should have thought the local trades and labour council would have had something to say about it. The rent of allotments—9d. to 1s. 3d. per rod per annum—struck one as high; at Basingstoke the allotments were let at a round figure of 7d. per rod, but the price of land probably had some influence on the charge made. In the sewerage paper the point as to one being able to obtain sufficient land of good quality was very helpful. They had had to do something on the same lines in Basingstoke. Their sewage farm was on the chalk, and there was no effluent. It had been in operation for about thirty-five years, and the land was getting very tired of receiving so much sewage. He thought it was very much better, under the circumstances, to extend the sewage farm than to go into the question of tanks and filters, especially as they had no means of getting rid of the effluent. The whole of the water had to soak away into the chalk. It might seem a wrong thing to do, but analyses of the water from wells nearest the area showed that the water was quite good.

Mr. R. H. JENKINS (Portsmouth) said he would be interested to know what was being done in the matter of dustbins. His view was that every place should have a sanitary dustbin, but the question was, who should provide it—the corporation, the landlord or the tenant? He saw that the steam from the refuse destructor was being made use of, but was it not the case that they had a job sometimes to get the necessary head of steam? In their own case they hardly raised sufficient to run the electrically driven lifting plant. It seemed to him that they must occasionally be compelled to use coal. The air lift seemed to discharge into the open air, and he would like to know if that were necessary, as it must create a smell. Twenty-seven loads of water were distributed by each man daily. That seemed to indicate that the men were rather hard worked, and he would like to know how long they were engaged each day. The average number of loads at Portsmouth was twenty-two, and although the men's wages were 27s., they wanted more. Would Mr. Goodwin also explain why he made use of ordinary instead of centrifugal pumps.

Mr. J. H. BLIZARD (Southampton) remarked that he felt rather envious of the splendid paper by Mr. Goodwin, which gave them a lot of information. Mr. Goodwin told them that until 1849 there was no system of sewerage in the city, the drainage finding its way into the rivers direct or by means of channels which ran along the sides of many of the streets. During the next five years £27,000 was spent on laying sewers. Previously the water rose to the surface, and these sewers had the effect of lowering the level by 3 ft. 6 in., the sewer joints being left open for the purpose. He had been reading certain books, and it occurred to him that certain results followed the lowering of the water level. Dr. Creighton, in his history of epidemics in Britain, said that "in 1849 (which was the year mentioned by Mr. Goodwin) one thinks of Salisbury as standing among high downs, but it had a wet subsoil, bad sewerage, and bad water supply, and in 1849 it had 200 deaths from cholera among all classes in two months." With every respect for the opinion expressed by Sir James Lemon as to the mistake of laying the sewers with open joints, if that had the effect of lowering the level of the subsoil water by 3 ft. 6 in. it was a good thing for the health of the city of Salisbury. The

death-rate from phthisis was very high, and Salisbury was in the unenviable position of being about third from the top of the death-rate from that disease. Dr. Buchanan reported in 1865-7 that there had been a reduction in Salisbury of 49 per cent in the death-rate from phthisis, the drainage causing the drying of the soil and the lowering of the subsoil water. That made him think of what he saw in the Press some time ago that Salisbury was anxious even to-day about this particular complaint of tuberculosis. There was no doubt that in 1849, when they thought of lowering the level of the subsoil water, they should have gone to the root of the evil, which, in his opinion, they ought to do to-day, by lowering the general water level of the valley. In Salisbury they had got the water headed up in hatches, and the city was only 150 ft. above sea level. It was only a question of removing the hatches which held up water for the mills. Then people would say, "What about the cost?" What Salisbury would have to face was—what was the value of health? They would have to decide whether they would face the cost of removing the root of the evil by lowering the level of the water, and so get rid of the dampness which existed at the present moment. Wilton was much in the same position, the town being 178 ft. above sea level. A few years ago everybody was stricken with horror to think that the poor people in Wilton were flooded out by heavy storms. That was due to the dampness caused by heading up of the water. The proneness to tuberculosis was due to the high level of the subsoil water of the district. He noticed that when the borough extension took place some years ago an area of 1,100 acres was added to Salisbury, and he would like to ask Mr. Goodwin how much land in that area could be utilised for building purposes. Could it be easily acquired for the purpose of small dwellings for the working classes? He noticed also that at the Harnham reservoir the top water level was 355.11 ft. above ordnance datum. The members did not know how ambitious the people were in that district. Wilton had got a magnificent water supply, with a pumping station 200 ft. and a reservoir 300 ft. above ordnance datum, and by laying a main another 800 yds. they would get a top water level of 420 ft. above ordnance datum, and they might say they could supply Salisbury's highest level. He did not know whether the Wilton people had got designs on Salisbury and Bemerton. He noticed with pleasure that the Salisbury Corporation made no charge for water for baths; that was a very good practice, though not usually adopted by water companies, who generally taxed sanitation. Then Mr. Goodwin said that the sludge at the sewage works was air dried, and sold by contract for £13 per year, the contractor undertaking to keep the works clear. It might be the best method of getting rid of the sludge at the present time, but why could he not put in ejectors and pump it on to land near to the works and bury it? That would be better than making an arrangement with a contractor to pay £13 a year, cart it through the city of Salisbury, and make a dumping ground of Bemerton. The latter was an arrangement of which he had had to complain. The sewage works were very good, but that was the blot on the whole thing. In these days when they had ejectors and compressors, and could get land at a reasonable distance, there was no need for carting the sludge away. The question of private streets work had always been a trouble to municipalities. The way in which the work had been done formerly in Salisbury might have been advantageous to the owners of frontages, but he considered that if a man made a private street he should be responsible until it was taken over by the authority, and that the work should be done in the best possible manner so as not to be a burden on the rates when the street was taken over by the public authority. With regard to the riverside walk, he believed that was a pet scheme, and a very nice scheme of an ex-mayor of the city. He believed in open spaces; but there, again, was a very serious danger with regard to dampness. The level of the ground was only just above the river level. They had to raise it for the river walk, which was so much the better for the children. There was in the paper an analysis in which saline ammonia was referred to, and he was inclined to think when the wind was in the east they might get some seaside breezes from this saline ammonia. He would like to ask for the rating of Salisbury in detail, so that he might compare it with Bemerton and Wilton.

Mr. W. H. GRIEVES (Sutton, Surrey) said, with respect to the sewage works, he was looking forward to seeing the works, and did not propose to take up much time with them just then. Mr. Goodwin stated in his paper that the filters were 6 ft. deep. He knew there was a great difference of opinion as to the depth of filter required for the purification of the sewage, but he was one of those who did not believe in filters of very great depth. He had found from experience that filters 4 ft. deep gave as good or better purification than those 6 ft. deep. Then there was the saving in the cost of filters by not having the extra depth. Mr. Goodwin received £13 a year for the sludge taken from the sludge chamber. He thought he was very fortunate in getting that £13. A good many local authorities had very great difficulty in giving it away. It might affect Mr. Blizard, but he did not suppose that Mr. Goodwin troubled so much if he could get some money from it. With regard to the contribution from the county council for the watering of the main roads, that was something Mr. Goodwin ought to be proud of. He would suggest that Mr. Goodwin might probably increase the contribution received from the county council if he adopted the method of doing more tar-spraying in the district than he apparently did at the present time. He noticed that Mr. Goodwin spent between £400 and £500 a year, and the price was 235d. per yard. These figures gave them 55,000 yds. super. dealt with. If flints were very plentiful round Salisbury, there was nothing better for a flint road than tar-spraying. He did not know any road which looked better or which stood the summer better than a flint road tar-sprayed. He might then save something on horse hire. He was very fortunate in getting a horse, cart and man at 7s. 3d. per day; they could not hire under 9s. per day. The price of horse hire was said to have gone up in consequence of the council insisting upon a minimum wage of 18s. per week for drivers. He did not wonder at the council making a condition of that sort. They could not get men to work for 18s. a week in his district; they paid their men 24s. and 26s. a week. He considered the price of 235d. per yard too much to pay for tar-spraying. They were doing 14 or 15 miles of tar-spraying in his district. He was doing the work in two different ways—one was by contract, the contractor doing the work at 1½d. per yard; he was doing the other roads by direct labour at 1½d. per square yard. If they increased the tar-spraying they saved on watering and horse hire. He was able to knock off ten water carts in his district; that was a great saving in the cost of water. The corporation of Salisbury having their own water supply, it might not be a great item there.

Mr. T. W. A. HAYWARD (Battersea) said he would like to ask Mr. Grievés a question with respect to tar-painting. Mr. Goodwin had given them an account of the cost of materials, showing clearly how the cost of tar-painting was arrived at. He took it that if Mr. Goodwin could buy chippings at 2s. 6d. or 3s., the cost would be very materially reduced, and the price of tar-painting would be lower by ½d. or ¾d. per square yard.

Mr. GRIEVES explained that he had intended to mention that Mr. Goodwin's price provided for granite chippings at 12s. per ton. They used grit from flint quarries near, which they got at 6s. That made quite good enough surface for tar-spraying. He did not think it was worth paying the extra cost of granite chippings.

Mr. HAYWARD said he would like to add his grateful appreciation to Mr. Goodwin for the vast amount of work which he had put into his paper. It was full of information from beginning to end. He would congratulate Mr. Goodwin upon the very fine advertisement which he had been able to give to the city of Salisbury. It was most remarkable in a city like Salisbury that the average death-rate for the past five years was only 10·8. He could not imagine that the residents of Salisbury ever wanted to go away to recruit their health. It must be almost a health resort. As the mayor said, visitors came to Salisbury to see the cathedral, but if they knew what a healthy place it was to live in, they would stay in the city. In regard to tar-painting, he had a good deal of sympathy with Mr. Goodwin, who had to pay a very high price for his material. Tar via at 4½d. per gallon, costing 1½d. per yard, and granite chippings 37d., thus leaving very little team and manual labour. There were very few of them who could tar-paint their roads for ½d. per yard for labour. He had to pay from 8d. to 8½d. per hour for labour, and 12s. to 12s. 6d. per

day for horse, cart and man. That made all the difference. They were to be congratulated upon getting their work done at so very low a price. Then they obtained their water on very favourable terms. They got water for less than half the price he had to pay for it. In London the waterworks authority could not even supply them with water at 5 per cent on the rateable value, but had to make a further call upon the rates to run the show at all. He was glad to know that all the engineers who had spoken had been full of appreciation of the fine work which had been done by Mr. Goodwin in Salisbury. They looked upon him as a man of great ability, who would further make his mark in the profession of municipal engineering. He was very pleased that Mr. Goodwin had given them the opportunity of meeting in the beautiful old city of Salisbury.

Mr. J. S. PICKERING (Cheltenham) remarked that one had nothing but congratulations to offer to Mr. Goodwin upon reading such an excellent paper on the municipal works of the city. He had the honour to represent a residential town, but they certainly could not compete with Salisbury in the matter of the death-rate. It was exceedingly low, as pointed out by Mr. Hayward, and if the particulars given were reproduced in one of the leading London papers it would be a very happy advertisement for Salisbury. Then the unlimited quantity and exceptional purity of the water supply was a very noticeable feature, and one which the inhabitants should be proud of. They also should be satisfied with the low charges made for water. He did not know whether Mr. Goodwin knew of any other town where the water charges were so low as in Salisbury; certainly he did not know of anything like it. He thought the council were to be congratulated upon making no charge for baths. It was a practice which they would all like to follow if they could. He would like Mr. Goodwin to tell them whether the 1½d. per 1,000 gallons charged to the committees for water was the working cost, or whether it included also the repayment of principal and interest on loans; and also what profit was made on the water undertaking. He took it that some surplus profits would be retained for emergencies. Mr. Goodwin referred to sewer ventilation, but it seemed to him that his remarks on this subject were a little contradictory. He said that the sewers of the city were unusually well provided with 6-in. diameter wrought-iron vent shafts, 30 ft. high, which answered well and gave rise to no complaint; but in the following paragraph he spoke of complaints of bad smells, and said the ventilating shafts on one section had been cut off permanently. The method adopted in meeting the complaints made was very interesting, and showed the energy and interest which Mr. Goodwin had devoted to his work. It was rather interesting to hear that the connecting of the outer end of the sewer to the outer cavity of the refuse destructor chimney had an influence nearly half a mile away, particularly as the sewer was not a modern one and would have many open shafts. The experience of many of those who had tried the ventilating of sewers from a chimney shaft was that it had very little effect, and was only felt for a short distance. He was surprised to hear that the use of sanitary dustbins was not general. In his district they had special powers, and required a dustbin to be provided for every house. He paid a visit to Berlin a short time ago, and noticed in one of the suburbs there how the collection of house refuse was done. They had very suitable vans, the dustbins were hermetically sealed, and as the bins were emptied into the cart there was a mechanical arrangement which allowed not a particle of dust to escape into the atmosphere. He had never seen anything approaching it in this country. He thought the way dustbins were emptied in our country was not a credit to us. They took the dustbin, or an old box containing the refuse, and emptied it in a manner which allowed the dust and microbes to be scattered broadcast. He would like to say a few words on the sewage disposal works. He visited the works some nine years ago, and therefore was particularly interested in seeing them again, and noting the improvements which had been made. His recollection of the works at that time was the enormous amount of work the percolating filters were doing. As Mr. Goodwin had pointed out, the surface water was then entering the sewers, and the beds were dealing with 2,000,000 gallons a day, at the rate of 600 gallons per square yard per day. The results were not all that could be desired, but

they did show the enormous amount of work which could be got out of a percolating filter. With regard to the beds, the material was of very large gauge—about 4 in. in size. In the North of England, and particularly in Staffordshire, it was the custom to put in very small gauge material, grading it down to as low as $\frac{1}{4}$ in. There was a very wide margin between $\frac{1}{4}$ in. and 4 in. His own experience was that the method adopted in Salisbury of using the larger gauge material had the greater advantages. The only disadvantage was, as perhaps Mr. Goodwin would agree, that with the large material they got a very large quantity of humus. In getting the humus through the beds it had the effect of prolonging the life of the beds. In one particular case one of these beds had been working for sixteen years. He very much questioned whether the beds in the North of England with smaller material would work for anything like that time. He thought the principle of doing without humus tanks was one to avoid, but, as Sir James Lemon had said, they must deal with each case according to its own conditions. The results obtained were exceedingly good. There was one other matter as to road construction. Mr. Goodwin said he had no difficulty in making his roads with tar-macadam, even when the road was deluged with rain. He thought that was an experience which most of them had not had. They had generally found it was necessary to make a tarred road in fine weather. If there was a material in the market which would enable them to make a good road with bituminous material in wet weather they would all be glad to hear of it.

The PRESIDENT mentioned that the town clerk of Yarnmouth had found a clause in the Town Planning Act by which sanitary dustbins could be required to be provided for houses under a certain rateable value, and in his town, with regard to new buildings, no plans were passed unless the owner agreed to provide an iron dustbin. When he was a young engineer, the Local Government Board insisted that sewers should be laid with clay joints. His first job in sewer laying—fortunately, it was not a big job—was done with clay joints. Twelve months later the sewers—one of 12 in. and the other of 9 in.—were completely filled with the roots of trees, and not a rod could be passed through them. He soon rectified that mistake in future work.

Mr. GOODWIN, in reply, thanked the members for the kind way in which they had received the papers. With regard to Sir James Lemon's remarks as to the sewage disposal works, he admitted that the area of the secondary beds was too big, but that was the Local Government Board requirement, and they were obliged to put them down. Mr. Pickering had mentioned the question of getting rid of the humus, and that was one of the chief points of the secondary beds. A large amount of purification took place in the primary beds, but all the humus went through. When the sewage had passed through the primary beds, 10 parts per 100,000 of solids remained, but 8 of those 10 parts were caught in the secondary beds. It was very easily removed, and practically caused very little labour in doing it. With regard to tar-spraying, he knew that the price was high. There were several reasons to account for this. One was that the first experiments were made with crude tar, and were not a success. It was said that more tar was found on people's carpets than on the roads. The council dropped the tarring of the roads altogether for a year or two, and when it was restarted they had to proceed with caution as they could not afford to have another failure. Then there were the proceedings against Winchester for the pollution of the streams, and the killing of fish by the tar washed off the roads. Then they decided to use Tarvia. With regard to the cost of granite chippings, he knew that it was a big price, but it was a very good material for this purpose. If they could get grit at 4s., 5s., or 6s. per ton it might be different; but beach grit cost them 10s. per ton, so when it was a difference of only about 2s. per ton in the cost of granite, it was not worth the money to use an inferior material. In their main street they could go up one side of the street tarring the surface, and turn the traffic over on to the other half of the street, and after covering it with the granite chippings they could tar the other side of the street the same afternoon. If they could do that for a cost of 2s. per ton in the material, it was worth the money. As to the cost of working at the sewage works, he might say that the sewage works and refuse destructor were combined, and they could not separate them. The total cost of the combined undertakings was about

£2,000 per year, of which they got about £200 back in the sale of old tins and other things. Mr. Read had raised the question of the water supply. Of the total consumption of 41 gallons per head per day, 26 gallons were for domestic consumption, 9 gallons were sold for trade purposes, and the remainder was used for street watering, sewer flushing, and so forth. The charge of 1½d. per 1,000 gallons for sewer flushing more than covered the actual cost of pumping. As to separate drainage, they did insist upon it, especially in those parts of the city where they had ejectors. In the middle of the city where they had not ejectors they did not mind a little going in. The yard water went into the foul-water sewers. Difficulty had been experienced in lighting and extinguishing the Webb lamps, but now they were not extinguished, and no additional charge was made by the gas company. As to the reason for sinking the borehole below the dug well, he could not reply to that question. He found the borehole there when he came to Salisbury, and left it there. The reservoir storage was, he admitted, on the low side, but this was more than compensated for by the unusual extent of the pumping plant, which consisted of two sets of pumps, three engines and three boilers. The railway supply was sold at the ordinary scale for trade consumption. If they got more for it they would be glad. They did not reduce the hardness in the water, but took it as it was. Some doctors said that the hard water was good for them, others that it was not, so medical opinion on the point was divided. The provision of sanitary bins for domestic refuse was a very big question, but, fortunately, it did not come into his department. They were doing a little. They compelled owners to provide an ashbin for every new house which was built, and the old houses were being provided with ashbins gradually. The drivers' wages had been mentioned as being very low, but they must remember that Salisbury was in the midst of an agricultural district, and the wages in the district were very low. The wages in Battersea were very different from what were paid to agricultural labourers in Wiltshire. The prices charged for allotments might seem comparatively high, but they were just sufficient to pay expenses, and there was a large demand. Mr. Jenkins mentioned the question of the utilisation of the steam from the destructor. They had not sufficient steam all the year round; they paid about £200 a year for coal. When they were short of the refuse they had to use coal. There was no smell from the funnel of the air lift. The hours for street watering were from 7 to 5.30. Some comments had been made on the cheapness of the horse hire, but cheap horse hire was not necessarily inefficient if properly looked after. With reference to the suggested lowering of the water level of the district, a river like the Avon was a very tricky one. The only thing that could be done would be by removing the hatches. It was a very big question to go into. If ever Salisbury took in Wilton or Wilton took in Salisbury, then they might think about it. Mr. Blizzard had criticised their selling the sludge to a contractor, but he did not mind what happened to it so long as they got rid of it. Street refuse, largely grit, was covered over it when it was carted away, and they got no complaints whatever. Mr. Blizzard had also suggested lowering the level of the subsoil water, but that was entirely controlled by the levels of the water in the river, and to interfere with river rights was a big matter. As to the river walk, Mr. Councillor Pritchard devoted the whole of his salary as mayor to the laying out of that walk, and it was much appreciated. Mr. Pickering referred to the profit on the water undertaking. They made from £500 to £600 a year profit to the rates after paying all expenses. As to rates, the district rate was 3s. 3d., and the poor rate 4s. 3d.; in the added area the general district rate was 2s. 11½d. Mr. Pickering referred to the apparent contradiction in the paper about the ventilation shafts. He admitted that, but it was really quite correct. There were only about six shafts cut off. As to laying tar-macadam in wet weather, it was important in a town like Salisbury, with narrow streets, to get the work carried out as quickly as possible. With a town like Salisbury they had to run some risks to get the work done. What happened was that in the first case they had a shower; they went on with the work and it did no harm. Last year they had a deluge extending over two days, and the making of the road was continued, and they had absolutely no difficulty with the road afterwards.

Mr. BLIZZARD said with regard to the remark made by Mr. Read about the amalgamation of the districts, there was a difficulty to start with. Bemerton was

drained first, then Wilton was going to get a separate scheme. First it was said they would have to pump, but then he was able to show that they would not have to pump, but could gravitate in. With regard to Mr. Jenkins' remarks, he was a great believer in plunger pumps where sewage was concerned. He did not believe in centrifugal pumps, except for clear water. They installed plunger pumps at Havant, and had absolutely no trouble there. At Wilton they had centrifugal pumps, and were always in trouble.

LUNCHEON.

The members were then entertained to luncheon by the mayor (Councillor J. Macklin, J.P.), who presided.

The loyal toasts having been honoured,

Mr. F. HODDING, town clerk, said they felt very much honoured that the members of the institution had chosen Salisbury for their meeting, and he thought that when they had seen their public works they would feel they were not behindhand in regard to water supply and other municipal undertakings of a kindred nature.

The toast having been honoured,

The PRESIDENT said they were grateful to the

various corporations who received them in so genial and kindly a manner, and he thanked the mayor for the reception which he had accorded to the institution.

Sir JAS. LEMON, in proposing "the Health of the Mayor," said it had been his lot as the senior member of the institution to visit a great many towns in Great Britain, and some in Ireland, and they had never been more kindly and hospitably received than in Salisbury.

The MAYOR, in reply, expressed a hope that the visit of the institution would be a benefit to the city and to the members, and that they would go away with pleasant recollections.

Mr. J. S. PICKERING (Cheltenham) proposed the toast of "The Visitors," to which Alderman HILARY (Basingstoke) and Mr. G. M. WILSON, clerk to the Wilton Rural District Council, responded.

During the afternoon visits were paid to the Salisbury sewage disposal works and refuse destructor, and to the chief pumping station of Salisbury and the Bemerton pumping station. On their return to the city the members were entertained to tea by Alderman C. J. Woodrow, J.P., chairman of the Sanitary Committee.

EASTERN DISTRICT MEETING AT IPSWICH.

An Eastern District meeting of the Institution of Municipal and County Engineers was held on Saturday at the Town Hall, Ipswich, under the presidency of Mr. H. T. Wakelam, M.INST.C.E., district chairman. The members present included Messrs. A. E. Collins (Norwich), E. Buckham (consulting surveyor, Ipswich), E. A. Slater (Colchester), A. G. Wheeler (Colchester), John R. Mead (borough engineer, Ipswich), J. Rowland Hill (Ipswich), D. Steward (Aylsham), Thomas Jones (Ipswich), R. E. Wilson (Leiston), Harold Collins (Norwich), Gordon Harrison (Stowmarket Rural District Council), G. W. Lingwood (Stowmarket Urban District Council), H. Miller (East Suffolk), Stanley C. Lloyd (district surveyor, East Suffolk), J. W. Birch (East Ham), F. Harold French (Harwich), S. Douglas Meadows (Ipswich), F. Prentice (Ipswich), S. Ball (London), Raymond Wrinch (Ipswich), G. W. Spurring (Harwich), Pinkham (London), Dr. W. Benton (East Ham), Dr. Pringle (Ipswich), and the hon. district secretary, Mr. James Webb (Hendon).

Mr. J. A. WEBB, hon. district secretary, read, and the CHAIRMAN duly confirmed, the minutes of the Chelmsford meeting.

APPOINTMENT OF SUB-DISTRICT SECRETARY.

Mr. G. W. LINGWOOD then moved that Mr. John R. Mead, borough surveyor of Ipswich, should be sub-district secretary for the counties of Norfolk, Suffolk and Cambridge. This was seconded by Mr. A. E. COLLINS (Norwich), and carried unanimously.

Mr. MEAD said he was pleased to accept the office of assistant secretary. There was one thing he would like to mention in the presence of the members of the council of the institution, and that was that there was a great deal of dissatisfaction throughout the district that the secretaries of the various districts were not on the council. As he intended to bring the matter up some time or other, he simply mentioned it now to state that he was in sympathy with those who desired the change.

The CHAIRMAN said that that was a matter entirely for the annual meeting of the institution, because it would have to be made part and parcel of the regulations. It would be necessary for a resolution to be passed at the annual meeting before the necessary alterations could be made to carry the proposition into effect. He would advise Mr. Mead to give notice to the secretary of the institution that it was his intention to raise the question at the annual meeting. He might say that he was quite in sympathy with what Mr. Mead had stated, and he should be glad, and he was sure Mr. A. E. Collins would also be glad, to do anything he could to further the views to which that gentleman had given expression.

Mr. MEAD: I quite see your point.

Mr. A. E. COLLINS said he was quite in favour of what had been said. No members of the institution could be more in touch with the members generally than the assistant secretaries, and if it was possible to get them on the council he thought they would be quite fit and proper people to be there.

THE PROPOSED IPSWICH HEALTH OFFICES.

Mr. MEAD then proceeded to say that he was pleased

to know that the chairman, Mr. Wakelam, had found time to come to Ipswich, and he was glad to see present Mr. Collins and other members of the council. At the same time it seemed to him that some explanation was necessary with respect to that meeting. It

MR. JOHN R. MEAD,
Borough Engineer of Ipswich.

[Mr. Mead is only thirty-two years of age, but has had exceptional opportunities of gaining valuable experience in the many branches of the profession he has adopted. From 1898 to 1905 he was a pupil and salaried assistant of Mr. George T. Lynam, M.INST.C.E., F.S.I., borough engineer and surveyor of Burton-on-Trent, where, in addition to being engaged on bridge widenings, tramways, extensions to the sewage farm, and other works, he was for about two years resident engineer on the Stapenhill and Winshill sewerage scheme, which cost £50,000. In 1905 he was appointed general engineering assistant to Mr. Chas. Brownridge, M.INST.C.E., F.R.G.S., borough engineer of Birkenhead, under whom he carried out a large scheme for the demolition of property, and the erection of dwellings under the Housing of the Working Classes Acts, the construction of a boulevard 60 ft. wide, extensions to parks, design of a large main outfall sewer into the river, and for some two years was in charge of the repairs, renewals and extensions to the whole of the corporation's tramway tracks. Mr. Mead was in 1911 appointed deputy borough engineer and surveyor of St. Helens, Lancashire, under Mr. Arthur W. Bradley, M.INST.C.E., and in that town was engaged on extensions to the cemetery, culverting Windle Brook, erection of a Carnegie library, tuberculosis sanatorium, school clinic, and new schools, in addition to assisting in the supervision of about 300 workmen, and the usual work in connection with sewerage works, markets, parks, destructors, and cemeteries.]

was held in Ipswich simply because that town was the most convenient centre. He wrote to say he was in favour of small meetings of this description being held as often as possible throughout the district, and that members should be prepared to pay their own expenses.

Mr. Mead then proceeded to describe the proposed accommodation which is about to be provided for the Ipswich medical officer of health, including the school clinic and tuberculosis dispensary. The reason for the provision of the new accommodation, he should say, was that at present the offices were scattered. The new departure was probably only the forerunner of what would happen in many other towns. The work and responsibilities of the medical officer of health had been so increased that it would be necessary to have such accommodation as was being provided in Ipswich in the larger towns of the country. The site, he would first of all explain, was very convenient. It was close to the town hall, in a quiet street. The property was in a dilapidated condition, and the corporation were glad to remove it to make an improvement in the district. The estimated cost of the building was £5,700, and the land came to another £2,000. They would observe from the plans that they had endeavoured to keep the building symmetrical as far as possible. They hoped they had arranged the details without wasting space, and that the offices would be found convenient. It was possible to get to any part of the building without going outside. There were four separate departments—viz., the medical officer's administrative department—the sanitary inspector's department and laboratories; the tuberculosis department, which had an entirely separate entrance; and the infants' department. The last-mentioned was quite a novel feature, and it was not usually found in the particular form in which it was carried out here. Then there was the school clinic. The ground-

the whole of the school clinic. There was a waiting-room through which people passed into the consulting room, where there were two dressing-rooms and a dark-room. If necessary the patients passed into the operating-room in connection with which there was a recovery-room and a waiting-room.

THE MUNICIPAL TENEMENT DWELLINGS AND SANATORIUM.

A description was next given of the municipal tenement dwellings, which, Mr. Mead stated, were on rather a new principle. They were intended for persons who could not pay an economic rent—old-age pensioners, widows with one or two children, and people whose wages were such that they could not pay an economic rent. It was hoped that the council would be able to build for £200 per tenement. The extension of the sanatorium, at an estimated cost of £4,500, was also described. It was intended to provide accommodation for ninety patients. Generally, said Mr. Mead, sanatoria were one-story buildings, but this consisted of two stories. There were special features in connection with it. The work was commenced by private subscription before the passing of the Act, and the site was a gift to the council. With respect to St. Helens school, the plans of which were also on view, Mr. Mead said he did not think it was an expensive building.

ROAD MAKING AND MAINTENANCE.

Coming to the question of the roads, Mr. Meade remarked that he considered this the most important

Front Elevation.

IPSWICH PUBLIC HEALTH OFFICES

floor portion, the front rectangular portion, and the rectangular portion of the first floor were taken up by the administrative department and medical officer—the sanitary inspector's, the doctor's general offices, and the nurses' room. The nurses were not nurses for carrying on the work of the building, but were employed under the doctor in outside work; it was therefore necessary that they should have a room which they could look upon as their own. On the first floor was placed the medical officer's private room, his assistant's room with a spare office, and lavatory accommodation for himself and his assistant. On the right-hand side was the tuberculosis department. The only persons approaching on the right were persons who were going to the dispensary, and they went through the waiting-room and passed out into the consulting-room. There were two dressing-rooms, and adjoining these were the X-rays room, and from that they had the photographic room. Then there was a private entrance for the doctor or his assistant. Coming back to the administrative portion, there was a lavatory for ladies and tuberculous patients, but that would be revised. The dispensary was very conveniently situated for serving the whole of the different departments. On the left-hand side the children were on the ground floor. They entered a waiting-room, and were then taken to the nurses' room. The doctor found that he had as many as eighty people waiting, and the arrangements made in connection with the entrance portion were found to give very satisfactory results.

Describing the administrative, tuberculosis and entrance portion of the building, Mr. Mead stated that on the left-hand side there was a small building for disinfection purposes, and the treatment of verminous children, a bathroom, a dressing-room and a disinfectant. On the first floor, on the landing, they had

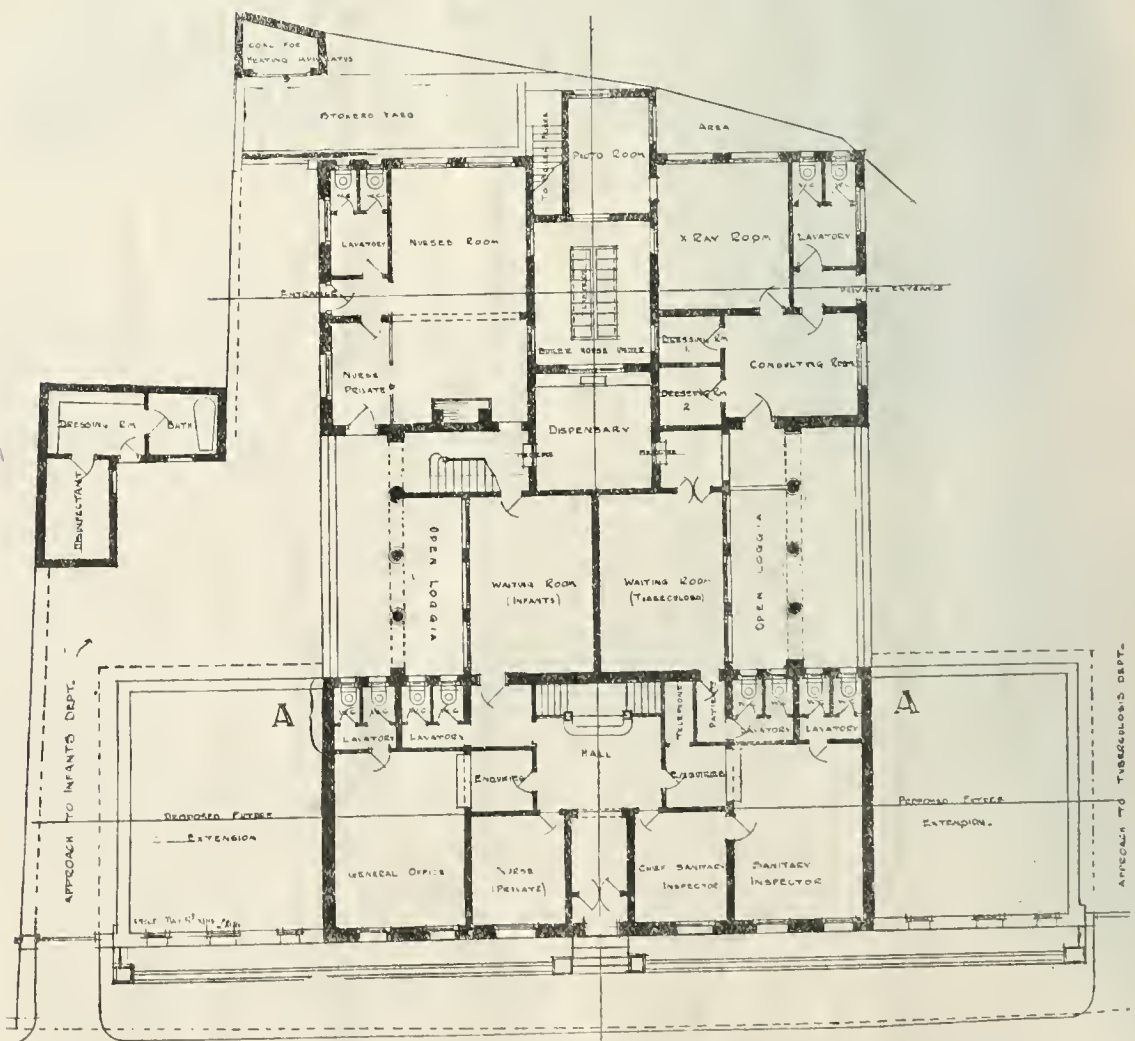

matter that a municipal surveyor had to deal with. A surveyor's duties were many, as they knew, but, owing to the change in the character of the traffic, they had become of a more responsible kind. The population of Ipswich was 75,000, and the area 8,432 acres. There were 1,750 houses, and the rates were 8s. in the £. There were 79½ miles of roads, consisting of water-bound macadam—granite 28½ miles, pit stones—29 miles, and flint 13½ miles. There were 6 miles of softwood paving, and ¼ mile of tar-macadam. They tar-sprayed about 18 miles, and the cost was, perhaps, a little high, being 12d. per yard. The work was done by hand with distilled tar. The standard road was 35 ft. wide, and it was made with 5 in. of core and 4 in. of local pit stone. The cost was £1 18s. 4d. per yard run, which he considered an exceedingly low price, and he thought they would agree that the streets were very good for such an outlay. The only expensive item was the gullies, which cost about £5 10s. each. He would like to say that he thought the corporation ought to congratulate themselves on the fact that they had the advice they did from their late surveyor, Mr. Buckham. That gentleman advised them to adopt creosoted wood blocks, and in the result it had been proved that this was the best advice that could be given. The cost was 10s. to 11s. per yard, and he (Mr. Mead) estimated that he could rely on the existing foundations at 9s. per yard. The price a short time ago for wood paving was 16s. per yard.

The CHAIRMAN: Soft?

MR. MEAD: No; hard wood. Then there was the question of grouting. Cement grouting had been used from the start, and he should consider long before he attempted to alter that system. The blocks were generally stored for a considerable time, and therefore there was not so much creosote to mix with the grouting. As to granite setts, he was glad

to say they had very little of such paving. What they had cost about 12s. per yard, put down on a concrete foundation. Water-bound macadam was a paving as to which they disagreed on account of the number of materials used. They used flints, gravel, pitstone, slag, and various kinds of granites. At Ipswich Guernsey and French granite were used chiefly. The standard road consisted of 5 in. of local pitstone and 5 in. of hard core, and the cost was 2s. 4d. per square yard. In some towns where they put down 17 in. the cost was about 5s. 9d. per yard, and in a particular town he knew it was 4s. In Ipswich he thought they got a very excellent road at very little cost. With regard to bituminous roads, including tar-macadam, he would say, without going into detail too much, that he personally preferred tar-macadam as against pitch grouting.

The CHAIRMAN: Do you mean tar slag or granite?

Mr. MEAD replied that his preference was for tar granite, as he had had an unfortunate experience with tar slag.

The CHAIRMAN inquired the price of the tar slag, and the tonnage of traffic.

Mr. MEAD replied that the cost was 3s. per square yard, and the traffic was of a purely suburban character. The 3s. did not include maintenance, as at the time it was laid down maintenance was not a common practice. As to tar-painting, they got distilled tar, and the results were really excellent. They used the local pitstones, which in the ordinary way might be termed gravel. Personally, he believed in tarring by hand, which, he thought, gave the best results.

DISCUSSION.

The CHAIRMAN moved a vote of thanks to Mr. Mead, and congratulated him upon the interesting address he had given. He might say he was quite with him in what he said about members paying their own expenses. They attended these meetings for business chiefly, and it was far better that the members should pay their own expenses than that somebody else should be asked to entertain them. The plans of the medical officer's quarters which Mr. Mead had described seemed to be well worthy of great consideration and thought. There were not many places where such buildings were put up for this purpose. In Middlesex, where they had seven medical officers, they had nothing like the accommodation which Mr. Mead had described. As an architect of some experience and practice, he agreed that the best thing to do was to frame one's building on some sort of centre line, for by this means more scope was obtained, and it was preferable to a haphazard scheme and planning the rooms as thought dictated. As to the tenement dwellings, he understood Mr. Mead to say that the rent would not meet

the payment of the principal and interest on the loan.

Mr. MEAD explained that the rent would possibly be half-a-crown per week.

The CHAIRMAN said he hoped the Ipswich rate-payers would be satisfied with that. As to tar-spraying, he would be very glad if they could do it at 1-2d. per yard in Middlesex; but their work was different. They always employed clean granite chippings. He could not say he was in love with sand. With respect to soft wood, they had laid probably 60 miles of wood in Middlesex, and they never had to pay anything like the price Mr. Mead had stated for soft wood blocks, *per se*. As to grouting, he could not say he agreed with Mr. Mead in his remarks, as in his experience pitch answered very much better than cement. He (Mr. Wakelam) had always had his painting done by hand, except where large areas were to be covered. But the cost in Middlesex did not come out at anything like the figure mentioned by Mr. Mead. The cost in the rural roads was 2½d. or 2¾d., but their conditions with respect to material were not so satisfactory as at Ipswich.

Mr. E. BUCKHAM (consulting surveyor to the Corporation of Ipswich) explained, with respect to the sanatorium, that the sewage had to be lifted by ejectors, whence it was conveyed to the Ipswich drainage system.

Mr. HAROLD COLLINS (Norwich) thought that at Ipswich they were well advised in separating their public health department from the town hall, for it was found at Norwich that the corridors of the municipal building became congested with people. The cost of tar-painting in Norwich was over 2d. per yard, for granite chippings or local gravel. At Norwich wood paving cost 8s. per yard, which provided for a small layer of cement about 2 in. in thickness; and with respect to tar-painting they made use of water-carts. Into these the gas company put tanks, and they obtained the tar hot for use.

Mr. E. A. SLATER (Colchester) said that in Colchester they had been paying 3d. a gallon for tar, but this year it had been reduced to 2¾d. Refined tar was out of the question with them, because they did not know where to go for it. Did they get refined tar in Ipswich?

Mr. MEAD: Yes.

Mr. SLATER, in continuation, suggested that the institution might usefully take action to deal with rings and combines in connection with the production of materials. He thought that there might have been some slight economy in the cost of the cottages, and explained that in Colchester they had obtained a revision of the building by-laws. He was pleased to see they were proposing to provide four rooms, for generally in that part of the country it was impossible to get less than six rooms.

Mr. A. E. COLLINS thought that rings had good points as well as bad, though, of course, he would agree that if unfair prices were charged the ring should be broken down. The question of the depth of road foundations depended upon the nature of the subsoil and the traffic, but more especially upon the weight of the vehicles.

Mr. BUCKHAM said that the subsoil of Ipswich, being sand and gravel, and generally dry, made all the difference in favour of good roads.

Mr. J. A. WEBB (Hendon Rural) inquired if the price, 2s. 4d., referred to the lineal yard.

Mr. MEAD: 2s. 4d. per square yard.

Mr. WEBB said that his experience of the price of tar-painting was very different to that at Ipswich.

Mr. MEAD said he ought to have explained that they had a company in Ipswich that distilled tar, and they took their carts to the yard for the tar.

Mr. BUCKHAM: The reason sand was used was because it was a local material. He agreed that fine granite chippings were better.

Mr. A. E. COLLINS said he now used ¾-in. gravel for tar-painting, and as far as he could see the results were as good as he previously got from granite chippings. He had not had a single complaint from motorists.

Mr. G. W. LINGWOOD (Stowmarket) stated that he used crude gas tar, and found that the granite dressing worked out at 1-6d. per square yard, and flint 1-7d. This year he had gone in for granite chippings, and had had a little trouble with the motorists.

After luncheon visits were paid to the sanatorium, the new vertical refort-house at the gasworks, and also to St. Helen's school, which has been erected at a cost of £13,000 to accommodate 1,000 children.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulæ involved. (T. W. P., *Bexhill-on-Sea*.)

397. Testing Cement.—Explain in detail, giving sketches where necessary, how a sample of cement would be tested in practice. (B. W., *Tadcaster*.)

398. Road Construction.—Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

399. Fireproof Construction.—What fireproof preparations can be used for protecting timber, and what independent coverings may be applied for the same purpose? (S.A., 1905.)

400. Structures.—What is meant by a redundant member in a truss, and why are such members introduced? Sketch two simple trusses, each having at least one redundant member. (I.C.E.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

395. Plumbing.—A lead pipe has to convey both hot and cold water in horizontal and vertical directions. Show by a sketch how it should be fixed, and give reasons. (B. W., *Tadcaster*.)

Lead pipes are not to be recommended for hot-water supply if the water to be used contains carbonate of lime—i.e., temporary hardness—because of the deposit, which is very difficult to get out without damaging the pipes. If the water is very soft, lead pipes must never be used, as water, when heated, is a more powerful solvent of lead than cold water.

However, where lead pipes are to be used for hot water (and particularly in this case, as the pipes are

to be used to convey both hot and cold water alternately, they must be properly fixed on wooden fillets, so as to allow for the expansion and contrac-

tion of the lead, and so prevent bulging. If the pipes are fixed firmly to the wall, they will soon become bulged and out of place, and this would prevent proper circulation of the water.

The sketch shows how the pipes should be fixed. (Sanitas.)

396. Strength of Materials.—A horizontal uniform bar 18 in. long, is laid over two supports, each 4 in. from its ends. Find two points at which the bending moments are zero.

In order to arrive at a formula applicable to all cases of beams similarly supported,

Let a denote the length of the overhanging ends,
 b the span between the supports,

R the reactions at the supports,

w the weight per inch run of the bar.

The bending moment at the supports is—

$$M = wa \times \frac{a}{2} = \frac{wa^2}{2}$$

Between the supports, at any distance x from a support, the bending moment is—

$$\begin{aligned} Mx &= w(a+x) \times \frac{a+x}{2} - Rx \\ &= \frac{w}{2}(a+x)^2 - wx(a+\frac{b}{2}) \text{ since } R = w(a+\frac{b}{2}) \\ &= \frac{w}{2}a^2 - \frac{w}{2}(bx-x^2) \end{aligned}$$

the first term of which is the bending moment at a support, and the second is the bending moment for a uniformly loaded span of length b . The two

terms are of opposite sign, and, provided b is sufficiently long the bending moment will be zero, and change sign at two points within the span—viz., when $M = 0$, or

$$\begin{aligned} \frac{w}{2}a^2 - \frac{w}{2}(bx-x^2) &= 0 \\ x^2 - bx + a^2 &= 0 \end{aligned}$$

$$\text{Solving the equation } x = \frac{b}{2} \pm \sqrt{\left(\frac{b}{2}\right)^2 - a^2}$$

that is, at two points which are situated

$$\sqrt{\left\{\left(\frac{b}{2}\right)^2 - a^2\right\}} \text{ inches}$$

on either side of the centre of span.

Substituting the values of the particular case in question, we have—

$$\begin{aligned} \sqrt{\left(\frac{b}{2}\right)^2 - a^2} &= \sqrt{\left(\frac{10}{2}\right)^2 - 4^2} \\ &= \sqrt{25 - 16} \\ &= 3 \end{aligned}$$

∴ the bending moments are zero at two points, each 3 in. from the middle of span.

NOTE.—The two points will be coincident at the centre of span if $b = 2a$, and they will not exist if b is less than $2a$, when the bending moment will not change sign. (H. G. L., *Crombie*.)

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

SEWAGE DISPOSAL: RIVER POLLUTION.—In *Port of London Authority v. Rochford Rural District Council* (King's Bench Division, April 22nd), the council appealed from an order of the magistrates convicting them of suffering the flow or passage of sewage from two sewage chambers at South Benfleet under their control into that part of the Thames known as Little Creek. Notice had been served upon the council by the Port Authority, under sec. 94 of the Thames Conservancy Act, 1894, to discontinue the flow within fourteen weeks, and this notice not having been complied with these proceedings were instituted. The council had not provided a system of sewage for South Benfleet, but there were two old brick sewers discharging into the Little Creek. These sewers had not been constructed by the council, and it was, in fact, not known who constructed them; but they had been in use for upwards of thirty years, and until the year 1909 they discharged crude sewage into Little Creek. In that year the council constructed a chamber or catchpit in each sewer to intercept solid matter, and prevent its discharge into the Little Creek, but they did not interfere with the sewers above or below these chambers, the effluent from which (containing some sewage) discharged into the creek. On behalf of the council it was contended that the mere fact of the construction of the two catchpits for the purpose of purifying the sewage before its discharge into the river was not "suffering" it to flow therein. The Court, however, held (affirming the decision of the magistrates) that, having constructed the chambers and exercised control over the sewage passing into and out of them, the council had "caused or suffered" sewage to flow into Little Creek within the meaning of the Act. The appeal was therefore dismissed.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

PRIVATE STREET WORKS: OCCUPATION ROAD AND PUBLIC FOOTPATH.—"H. G." writes: In a portion of my council's district there is an occupation road and public footpath combined (shown by thick black lines on accompanying plan), the total length of which is about 1½ miles. The whole of the thoroughfare is

in indifferent repair, but about ¼ mile (marked A to B) is in very bad repair. The whole of the road passes through agricultural land, with very few houses abutting thereon, but is extensively used both by vehicular and foot passenger traffic, and is not repairable by the inhabitants at large—at least there is no evidence of its having been repaired out of

public rates—and it is connected at four points with public roads which are repairable out of public funds. My council have written to the landowners whose lands abut on the ¼ mile of bad road above named, but they repudiate liability, and hint at indicting the urban district council for its bad repair. The council have no means of proving that any of the landowners are liable, *ratione tenura*, for its repair, and the only parties left to do the repairs are the parties using the road, and the work, as I have before remarked, is very indifferently done. My council would be glad of your opinion on the following points: (1) Is there any means of compelling the adjoining landowners to keep such a road in repair in face of the fact that it is used without restriction by the public generally? (2) Could my council proceed to schedule the road under the Private Street Works Act, 1892 (as the road varies in width from 11 ft. to over 40 ft. between the boundary fences), and charge the frontagers with either the whole cost or a portion thereof, as provided by sec. 15 of the Private Street Works Act, 1892? (3) Generally.

(1) Unless it can be shown that the adjoining landowners are liable to repair the road, *ratione tenura*, the only way in which they can be charged with the repairs is by proceeding under the Private Street Works Act, 1892 (which I assume is in force in the district), or (if not in force) under sec. 19 of the Public Health Acts Amendment Act, 1907. (2) Yes, unless the footpath is repairable by the inhabitants at large, in which case the frontagers might object. (3) Assuming that the road is an occupation road strictly—i.e., open as of right only to the occupiers of certain land and not to the public generally—it is not a public highway, and therefore cannot be repairable by the inhabitants at large. But if the public footpath was in use as such before the passing of the Highway Act, 1835, it would, *prima facie*, be repairable by the inhabitants at large.

THE PUBLIC HEALTH ACTS AMENDMENT ACT, 1907.—"Ynys" writes: I require to report to my council upon the question of adopting this Act, or certain sections thereof. Will you kindly say whether you have given any abstract or recommendations thereon in THE SURVEYOR that would assist me to discriminate the sections that would best serve for this urban area? If so, I shall be glad if you will kindly give me reference thereto, or some other source.

A full summary of this Act was given in THE SURVEYOR for January 31, 1908, pages 123-127.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain; Each man's opinion freely is his own Concerning anything, or anybody.

—MASSINGER: "The Fatal Dowry," Act. ii., 2

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—May I ask you once again for a little space to reply to "Engineer's" direct question, if I consider coal-tar pitch and all other pitches as bitumen? He refers to my letter published in your issue of 17th ult., he will find I advocated that neither bitumen nor bituminous could properly be applied to coal-tar products, and should therefore be dropped in that reference. In connection with coal-tar treatment, I suggested the use of "tarred road," "tar-macadam road," and "pitch-bound road." What was uppermost in my thoughts at the time was, while discarding the words bitumen or bituminous in all connection with coal tar, to annex the word pitch, and have it identified and used solely with reference to that material.

To this desire to detach the word pitch from all other substances except coal tar I attribute my too hastily formed opinion on the proposed classifying of petroleum pitch as bitumen, on which point "Engineer's" contention is undoubtedly sound.

I trust, however, with a view to avoiding confusion in the lay mind, that some other word than pitch may be found for the residue of petroleum distillation.—Yours, &c.,

JOHN HUTCHINSON.

May 19, 1914.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bradford T.C. (May 20th. Dr. F. J. H. Coultts).—£30,270 for the erection of a sanatorium at Grassington, near Skipton, for the treatment of tuberculosis cases.—Dr. Buchan, the medical officer of health, said he did not think the proposed sanatorium would be detrimental to the district. On the contrary, he thought it would be rather an ornament.

Flaxton R.D.C. (May 13th. Major C. E. Norton).—£2,200 in respect of sewerage works for Heworth Without and the township of Heworth, including works in the city of York; also for the consent of the Local Government Board to an agreement entered into between the York City Council and the Flaxton Rural Council for the communication of the sewers to be provided, with the sewers belonging to the Corporation of York.

Grantham T.C. (May 5th. Mr. F. H. Tulloch).—£467 10s. to purchase a piece of land adjoining the Grantham cemetery for extension purposes when the necessity arises.—There was no opposition.

Reigate T.C. (May 6th. Mr. M. K. North).—£3,300 for the improvement of London-road, Redhill, and £1,100 for the widening and improvement of Frenches-road, Redhill.—The town clerk, Mr. Alfred Smith, stated that the proposed improvements started at Gatton-corner and extended southward to the Lingfield-lane and Frenches-road cross roads, where they would terminate. The council asked for this loan for ten years, because the county council had entered into an arrangement with the town council with regard to the loan, and their (the county council's) payment extended for ten years. For that reason he took it that the Local Government Board would not grant part of the loan for ten years and the other part for a longer period. The road was the main road from London to Brighton, and carried an ever-increasing volume of traffic. The borough surveyor, Mr. F. T. Clayton, explained that there was a good margin inside the present tar-paved footpath. The surface water flowed from the lowest point into an open ditch and thence into a pond connecting with the Merstham Brook. With reference to the second application, Mr. Clayton stated that by the proposed improvements the width of the Frenches-road would be increased by 6 ft. or 7 ft.

APPLICATIONS FOR LOANS.

Ashbourne U.D.C.—£3,000 for improvements at the gasworks.

Basingstoke T.C.—£7,200 for the erection of workmen's dwellings.

Bodmin T.C.—£850 for footpath improvements.

Boston R.D.C.—£8,340 for the provision of forty cottages.

Bournemouth T.C.—£650 for sewer extension.

Cottingham U.D.C.—£2,900 for works of sewerage.

Darlington T.C.—£24,613 for road construction and improvement.

Hammersmith B.C.—£10,650 for wood paving.

Hastings T.C.—£530 for repaving works.

Hove T.C.—£3,500 for wood paving.

Llanfyllin R.D.C.—£1,585 for workmen's dwellings.

Mansfield T.C.—£5,000 for the extension of the Forest Hospital.

Nelson T.C.—£13,260 for the purposes of the gasworks.

Newport (Mon.) T.C.—£17,000 for additional police accommodation.

Normanton U.D.C.—£1,800 for a housing scheme.

North Riding C.C.—£600 for a school at Pickering Marshes.

Northwich R.D.C.—£1,352 for the provision of workmen's dwellings.

Redditch U.D.C.—£18,000 for the purposes of the electricity undertaking.

Ruislip-Northwood U.D.C.—£6,900 for sewage disposal works extension.

Rye T.C.—£300 for improvements at the town hall.

Sunderland T.C.—£50,000 for electricity extensions.

Thakeham R.D.C.—£5,172 for the Storrington water supply scheme.

Turton U.D.C.—£1,460 for electricity mains.

Wells U.D.C.—£1,300 for the purpose of the gasworks.

LOANS SANCTIONED.

Chippenham T.C.—£1,000 for street improvement, £2,320 for building twelve houses in Wood-lane in place of the workmen's dwellings, to be demolished, and £140 for the purchase of the land.

East Grinstead U.D.C.—£3,700 for a refuse destructor, £630 for allotments, and £475 for a public convenience.

Gravesend T.C.—£13,150 for the electricity undertaking.

Harrington U.D.C.—£1,000 for the extension of the gasworks.

Hemel Hempstead T.C.—£2,349 for private street improvement.

Leyburn R.D.C.—£220 for the purposes of water supply.

Mansfield T.C.—£2,000 for the purchase of gas stoves.

Paignton U.D.C.—£105 for purchasing a portion of the foreshore.

Radcliffe U.D.C.—£15,000 for a housing scheme.

Saltash T.C.—£750 for the extension of the recreation ground.

Tonbridge R.D.C.—£1,555 for a housing scheme.

Walsall T.C.—£1,945 for electricity purposes.

Wombwell U.D.C.—£925 for a fire station and fire engine.

Yarmouth T.C.—£7,563 for street improvement.

FORTHCOMING INQUIRIES.

MAY.

TOWN PLANNING.

JUNE.

9.—**Sidmouth.** (Mr. George L. Pepler)

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works particulars of which appear below: Buildings—Cardiff £20,500, Paddington £41,000; housing and town planning—Glasgow, Newport; roads and materials—Hove, Langholm; sewerage and sewage disposal—Darlington £26,000, Mexborough, Turton, water, gas and electricity—Cardiff £50,497, Carlisle £59,250.—Particulars of other works projected will be found in our "Local Government Board Inquiries" page.

BUILDINGS

Bacup T.C.—The borough surveyor, Mr. W. H. Elce, has received instructions to prepare a scheme and estimate for converting the Mechanics' Institute into municipal offices.

Bideford T.C.—It is proposed to build a bandstand in the park at a cost of £50.

Cardiff T.C.—It has been agreed to increase the grant for the erection of the new fire brigade station in Westgate-street from £17,500 to £20,500, this to include architects' fees and all contingencies.

Cornwall C.C.—Steps are being taken to provide a site for a sanatorium.

Edinburgh T.C.—The Cleansing and Lighting Committee recommend that alterations be carried out at the municipal workshops in King's Stables-road, at an estimated cost of £1,000.

Godalming T.C.—The council have approved a scheme for an open-air swimming bath, at an estimated cost of £1,500.

Hartlepool T.C.—An improvement scheme is to be proceeded with providing for the demolition of old property in Durham-street and Brougham-street and erection on the sites of modern dwellings, the estimated cost being £8,200.

Paddington B.C.—The council have adopted the plans prepared by Mr. Harold Burgess for new public baths. The estimated cost of the scheme is £41,000.

Paignton U.D.C.—With reference to an application for sanction to borrow £5,600 for laying out a part of the foreshore at Preston and the erection of shelters, the Local Government Board have written stating that they were advised that the proposals were generally satisfactory, but that sanction to a loan would be deferred until calculations had been submitted as to the strength of the reinforced concrete roof over the convenience. Sanction would be given on condition that the council undertook to employ a competent clerk of the works who had had experience of this form of construction, and would be on the spot when any concreting work was being done.

Saltcoats T.C.—The Public Health Committee have been authorised to go into the question of providing a pavilion with two wards at the hospital, at an estimated cost of £2,500.

Sunderland T.C.—It is proposed to erect a hostel at a cost of £4,330, and a principal's house, at a cost of £1,500, at the new training college.

Withernsea U.D.C.—The plan for the first section of the new sea wall at the South Cliff has been approved.

HOUSING AND TOWN PLANNING.

East Riding C.C.—It has been decided to provide houses for those of the council's employees who are not properly housed, and for those who occupy houses which would probably be occupied by other people if they were vacant. It has been further resolved that, for the purposes of giving effect to the resolution, application be made to the Local Government Board for an Order conferring on the council the powers of a local authority under Part III. of the Housing of the Working Classes Act, 1890, as to the provision of houses for the labouring classes.

Glasgow T.C.—The City Improvement Committee are considering a proposal to erect tenements in Moncur-street, Calton, for the poorest classes. The proposal is to erect two balcony tenements, the houses to be let either separately as forty-eight single apartments, or, if desired, as two-apartment dwellings. These houses are to be let out furnished at an average of 4s. 6d. per week. Two tenements are

also to be erected similar to those at Kennyhill, containing twelve two-apartment houses and six houses with living room and bedroom, and to be let unfurnished at £9 5s. and £6 10s. per annum.

Hamilton T.C.—The Local Government Board have been invited to send their architectural inspector to confer with the Housing Committee on the question of providing working-class dwellings at a moderate rental.

Kingstown (Co. Dublin) U.D.C.—The council are advertising for an architect to prepare all plans and specifications in relation to the proposed building scheme at Glasthule, Monkstown and Byrne's field at Sillynoggin, at a fee of 2½ per cent on the accepted contract, and for a quantity surveyor to prepare approximate estimates, &c., of the various dwellings at a fee of 20s. per cent.

Newport (Mon.) T.C.—The corporation are considering the question of providing municipal houses in various parts of the district. One of the proposals is to provide four different types of houses on the Somerton estate, near the Ladyhill golf links. The borough architect, Mr. C. F. Ward, A.R.I.B.A., and Mr. Norman T. J. Moses, controller of finance, have prepared reports on the subject. These deal with houses to cost £190, let at 6s. 9d. per week, with a ground rent of £2 5s.; houses to cost £220, rented at 7s. 6d. per week, with a £2 10s. ground rent; houses to cost £300, rented at 12s. per week, with a ground rent of £3 10s.; and houses to cost £420, let at 16s. 3d. per week, with a ground rent of £4; 5½ acres of land are allocated for allotments, and nearly 2 acres for playing fields and play centres.

Wells R.D.C.—Official sanction has been given to a scheme for the erection of seven workmen's dwellings in Meare.

Wick T.C.—The council are considering a proposal to build houses consisting of a room and scullery and sanitary conveniences downstairs, and two bedrooms upstairs, which could be put up for about £200, and rented at £11 or £12.

PARKS AND OPEN SPACES.

Exmouth T.C.—£1,050 is to be expended upon the purchase of property adjoining the undercliff walk for laying out new tennis courts.

ROADS AND MATERIALS.

Aberdeen T.C.—Beachgrove-terrace is to be widened at an estimated cost of £550.

Brighton T.C.—The Marine Palace Pier Company have consented to assist the corporation in carrying out a widening scheme at the Grand Junction-parade to the south up to the line of the present turnstiles of the pier. This will involve giving up to the public the approach to the pier between the existing footpath and the turnstiles.

Hastings T.C.—It has been decided to carry out works of repaving footways in parts of London, Bohemia, Laton, Mount, Old London, and Elphinstone roads, at an estimated cost of £530.

Hove T.C.—It has been agreed to wood pave New Church-road between the end of the present wood-paving at the Hove-Aldington parish boundary and the west side of Carlisle-road, and to borrow £3,500 for the purpose.

Langholm T.C.—A scheme has been adopted for paving High-street at a cost of between £2,000 and £3,000.

Penmaenmawr U.D.C.—The council on Wednesday passed a resolution urging the county council to widen the Penyclip-road (the main road to Bangor on the side of the Penmaenmawr headland) from 15 ft. to 20 ft., in view of the great increase in the traffic, and especially the motor and motor bus-traffic.

Shrewsbury T.C.—It has been agreed to carry out a number of street improvements, including street widening, to facilitate traffic to the Royal Agricultural Society's Show.

Sidmouth U.D.C.—The surveyor, Mr. R. Lake, has received instructions to prepare a scheme for street watering by means of a hose and standpipes.

Stepney B.C.—Consideration has been given to a communication from the Local Government Board with regard to the arterial roads of Greater London, and a report on the traffic using the roads to and from the docks in Stepney has been presented to the council by the borough engineer, Mr. W. Jameson, Assoc.M.Inst.C.E. The existing traffic on the six main roads of the borough is excessive and incessant, says the report, and it is well known that Whitechapel High-street is probably one of the most congested thoroughfares in the Metropolis. The heavy goods traffic to and from the various docks, wharves, and railways by which this borough is entirely surrounded contributes further to the already sufficiently harassed condition of vehicular traffic along the main roads of Stepney. The report adds: "It is evident that the existing arterial roads in this borough are by themselves quite inadequate to cope with the large volume of traffic passing through Stepney, and any increase in such traffic in the future must inevitably tend to make confusion worse confounded." The formation of a new road is suggested leading from Tower-hill, *via* Royal Mint-street, Cable-street, Brook-street, and White Horse-street, to the Commercial-road East. "The execution of this scheme," the report proceeds, "would at once afford an extremely valuable alternative main route from London Bridge, the Tower Bridge, and the City generally for the large amount of traffic proceeding from the London docks and wharves, while a further important improvement could be effected by the widening of Hanbury-street and Vallance-road, to facilitate the passing of traffic from Shoreditch to Whitechapel, and also provide an excellent means of approach to the Spitalfields Market."

Warwickshire C.C.—In recognition of the increased duties of the road inspectors, it has been agreed to make them an extra allowance of £30 per annum towards their travelling expenses as from April 1st last.

SEWERAGE AND SEWAGE DISPOSAL.

Clevedon U.D.C.—The tender of Messrs. J. Coles & Son, at £2,050, has been accepted for the construction of a new sewer.

Darlington T.C.—A scheme has been approved for the improvement of the sewage disposal works, at an estimated cost of £26,000.

East Grinstead R.D.C.—Sewer extensions are to be carried out at a cost of £363.

Mexborough U.D.C.—The tender of Mr. H. Cliffe, of Mexborough, at £1,712, has been accepted for the structural work in connection with the sewage disposal works extension scheme. The total estimated expenditure involved is between £7,000 and £8,000.

Turton U.D.C.—The Local Government Board have approved generally of the scheme prepared by Mr. Lomax for the extension and improvement of the Eagley sewage disposal works, but advise certain necessary alterations. These the council have agreed to carry out at an estimated cost of £371. The total estimated cost of the scheme is £8,736.

Whitehaven R.D.C.—The scheme for sewerage works at Beckermel, estimated to cost £2,200, has received the sanction of the Local Government Board.

WATER, GAS, AND ELECTRICITY.

Cardiff T.C.—The Waterworks Committee on Monday accepted the estimate of the waterworks engineer, Mr. C. H. Priestley, at £50,497, for new mains from the Llanishen reservoir and Heath filter-beds to the city. The engineer stated that the works were absolutely necessary. The scheme provides for taking the pipes through the side streets of the city so as to avoid disturbing the wood-paved thoroughfares more than necessary.

Carlisle T.C.—A scheme to supply water to several parishes, at an estimated cost of £59,250, is being considered by the Water Committee.

Dunfermline T.C.—A scheme is to be carried out for the extension of the gasworks, at an estimated cost of £41,000.

Hastings T.C.—New electricity mains are to be laid between the west end of York Buildings and the Cinema de Luxe, Marine-parade, at an estimated cost of £435.

Kidderminster U.D.C.—The council on Tuesday sealed an agreement with Bewdley Town Council for a supply of water in bulk at 4½d. per 1,000 gallons for

the parish of Wribbenhall, and it was decided to instruct Mr. Fiddian, engineer, to prepare plans for carrying out the scheme.

Portsmouth T.C.—The Electricity Supply Committee report that the past year's work has been very satisfactory. After all expenses have been paid, and a large sum set aside for interest and sinking fund, there is an available profit balance of £4,364. This the committee propose to allocate as follows: £3,000 to the relief of the rates, £1,000 to reserve, and £364 to the fire insurance fund.

Weymouth T.C.—The profit on the water undertaking last year was £996. This has been carried to the reserve, making this fund £9,800.

MISCELLANEOUS.

Bournemouth T.C.—Authority has been received for the borrowing of £4,000, repayable in five years, for the purchase of four motor omnibuses.

Edinburgh T.C.—The Plans and Works Committee recommend that the four steamers of the fire brigade be replaced by three motor fire engines.

London C.C.—For rendering the backs of fountains in their schools, the county council have used the powder Pudlo. They report that it has been very satisfactory, and that they expect to use more.

Warrington T.C.—The municipal tramways earned a nett profit of £3,239 last year.

PERSONAL.

Mr. E. E. Barlow, borough surveyor of Wisbech, has had his salary increased by £30 per annum.

Mr. J. H. Willis, borough surveyor of Eye, has been granted an increase of salary.

Mr. John Young, burgh surveyor of Ayr, has been voted an increased salary of £50 per annum.

Mr. W. R. Maxwell, burgh surveyor of Dunfermline, has had his salary increased by £15 per annum.

Mr. R. J. Angel, borough engineer of Bermondsey, has an etching entitled "Rochester" hung in this year's Academy.

Mr. F. W. Pearce, surveyor to the Twickenham Urban District Council, has received an increase of salary of £100 a year.

Mr. W. Wentworth Hyde, building surveyor to the East Preston (Sussex) Rural District Council, has resigned owing to ill-health.

Mr. M. F. Dunn, of Ballygawley, has been appointed assistant surveyor of Castlederg district under the Tyrone County Council.

Mr. C. Owen Baines, engineer and surveyor to the Paignton Urban District Council, has been elected a member of the Concrete Institute.

Mr. J. Bainbridge, surveyor and building inspector to the North Riding Education Committee, died recently, we regret to state, at the comparatively early age of forty.

Messrs. H. P. Hill, partner, Messrs. G. H. Hill & Sons, consulting water engineers, Manchester; S. B. Winsor, engineer to the Derwent Valley Water Board; and E. C. Young, consulting water engineer, Tientsin, China, have been elected members; and R. C. F. Busfield, resident engineer on waterworks extensions, Aberdeen; J. C. Cruickshank, assistant to consulting water engineers, Aberdeen; N. R. Kapur, assistant to corporation water engineer, Cardiff; S. Reason, assistant to water engineer, Antofagasta; and T. H. Tyson, assistant to corporation water engineer, Halifax, associate members of the Institution of Water Engineers.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ENGINEER, 24, B.A., B.Sc. Engineering (Lond.), with Diploma Civil and Municipal Engineering, Medallist and Prizeman, capable, energetic, and reliable, good mathematician, designer, and surveyor, over 1½ years' practical training, desires position, any capacity, United Kingdom or abroad. Excellent references. Moderate salary.—Box 1,426, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,637)

EAST SUSSEX COUNTY COUNCIL.

WANTED, A SURVEYOR AND DRAUGHTSMAN IN THE COUNTY SURVEYOR'S DEPARTMENT.

The person appointed must have a good knowledge of Surveying, Levelling, &c., and preference will be given to one who has had experience in the use of the theodolite.

Applications, stating age, qualifications, &c., and accompanied by not more than three recent testimonials, to be sent to the undersigned on or before Wednesday, the 3rd June, 1914.

Salary, £78 per annum.

F. J. WOOD, ASSOC. M. INST. C. E.,
County Surveyor.

County Hall,
Lewes.

May 20, 1914.

(1,635)

**EARBY URBAN DISTRICT COUNCIL.
SURVEYOR'S ASSISTANT.**

The above Council invite applications for the appointment of Surveyor's Assistant at a salary of £65 per annum.

Applicants must be neat and expeditious draughtsmen, and accurate surveyors and levellers, and preference will be given to candidates with experience in the carrying out of Private Street Works and duties under the Housing Acts.

Applications, in the candidate's own handwriting, stating age, qualifications, experience, accompanied by copies only of not more than three recent testimonials, to be sent in to me on or before Saturday, the 6th June, endorsed "Surveyor's Assistant."

Canvassing is strictly prohibited, and will be deemed a disqualification.

JAS. E. ALDERSLEY,
Engineer and Surveyor.

Council Offices,
Earby.

May 20, 1914.

(1,634)

**URBAN DISTRICT COUNCIL OF
BURNHAM, SOMERSET.
TEMPORARY ASSISTANT.**

A Temporary Assistant in the Surveyor's Department is required for a period of 6 to 9 months. Applicants must be neat and accurate draughtsmen, competent to take levels, prepare drawings, and have a good knowledge of sewerage work, building construction and sanitation. Preference given to one capable of making inspections of premises under the Housing and Town Planning Act. Salary, £2 10s. per week. Applications, with particulars as to qualifications and experience, together with copies of not more than three recent testimonials, must be sent to the undersigned on or before the 8th of June next.

WM. H. CHOWINS,
Engineer and Surveyor.

Public Offices,
Burnham,
Somerset.

May 21, 1914.

(1,638)

**CUDWORTH URBAN DISTRICT COUNCIL.
STEAM ROLLER DRIVER.**

The above Council require the services of an experienced Steam Roller Driver.

Wages, 30s. per week.

Applications, stating age, experience, with two copies of recent testimonials, to be sent to the undersigned on or before Wednesday, June 3rd, 1914.

W. T. LYNAM,
Surveyor.

Council Offices,
Cudworth.

(1,63U)

BARNET URBAN DISTRICT COUNCIL.

Tenders are invited for the Laying of about 140 yds. of 9-in. Pipe Sewer in New-road and Wrotham-road, Barnet.

Plans can be seen, and Bill of Quantities and Form of Tender obtained, from Mr. W. B. Chancellor, Engineer and Surveyor to the Council, at 40 High-street, Barnet.

Tenders, marked "Pipe Sewer," must reach the undersigned not later than 5 p.m. on Thursday, May 28th, 1914.

H. W. POOLE,
Clerk of the Council.

May 20, 1914.

(1,636)

CITY OF LIVERPOOL.

NORTHERN OUTFALL SEWER.

The Health Committee of the Council of the City of Liverpool are prepared to receive Tenders from responsible Contractors for the construction of a Main Sewer, known as the Northern Outfall Sewer, between Brasenose-road, Kirkdale, and the existing Walton Outfall Sewer on the Walton Hall Estate.

Plans may be seen, and copies of Specification, General Conditions, and Bill of Quantities may be obtained on application at the office of the City Engineer, Municipal Buildings, Dale-street, Liverpool, upon making a deposit of £10 (Ten Pounds) to the City Treasurer and Controller, which will be returned on receipt of a *bona-fide* Tender.

Sealed Tenders, endorsed "Tender for Northern Outfall Sewer," must be sent to the Town Clerk so as to be delivered at his office not later than 12 o'clock (noon) on Tuesday, the 16th June, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender, or to defray any expenses incurred in connection with tendering.

(By order)

EDWD. R. PICKMERE,

Town Clerk.

Town Clerk's Office,
Liverpool.

May 19, 1914.

(1,639)

**THE URBAN DISTRICT COUNCIL OF
ESHER AND THE DITTONS.
TO CONTRACTORS.**

The above Council is prepared to receive Tenders for the Laying of the undermentioned Sewers, and Constructing Manholes and other works connected therewith within their District—viz. :—

No. 1.—A 12-in. Cast-iron Sewer in Ember Court-road, Thames Ditton, about 730 ft. long, average depth about 13 ft. 4 in.

No. 2.—A 9-in. Stoneware Pipe Sewer in Alexandra-road, Thames Ditton, about 380 ft. long, average depth about 6 ft.

Plans and Specifications can be inspected, and any information obtained, at the Office of Mr. H. C. Fread, Engineer and Surveyor to the Council, on or after Tuesday, the 26th instant.

Tenders, on the prescribed Form, to be received by me, endorsed "Tender for Sewers," not later than 5 p.m. on Wednesday, the 3rd June.

JOHN T. METCALFE,

Clerk to the Council.

Council Offices,
Portsmouth-road,
Thames Ditton.

(1,632)

MANCHESTER CORPORATION.

The Rivers Committee invite Tenders for the Construction of Main Drainage Work No. 11 (2) (Gorton Intercepting Sewer).

Plans may be seen, and Specifications, Bills of Quantities, and Forms of Tender obtained, on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of the sum of £10 10s., which sum will, after the Corporation have come to a decision upon the Tenders received, but not before, be returned to the person submitting a *bona-fide* Tender.

All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester."

Tenders, enclosed in the official envelope and addressed to the Chairman of the Rivers Committee, are to be delivered at the City Surveyor's Office not later than 9.30 a.m. on Monday, June 15, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

THOMAS HUDSON,

Town Clerk.

Town Hall, Manchester.

May 19, 1914.

(1,633)

**SELBY URBAN DISTRICT COUNCIL.
STREETS AND SEWERS.**

The Council invite Tenders for the Making of a Street and Sewer on land at Fairfax-avenue, Selby. Plans and Specifications may be seen and all particulars obtained at my Office on and after Wednesday, May 27, 1914. Sealed Tenders, endorsed "Street," must be delivered to me not later than 12 noon on Tuesday, 8th June, 1914. The Council do not bind themselves to accept the lowest or any Tender.

BRUCE GRAY, C. E., F. R. S. (Edin.).

New-lane, Selby.

(1,630)

Bemerton and Wilton Sewage Disposal.*

PUMPING STATION AT BEMERTON.

By JOHN H. BLIZARD, ASSOC. M. INST. C. E.

Bemerton is a small suburb of Salisbury and Wilton in fact, it is situated between the two towns, in the rural district of Wilton, and lies in the valley of the river Nadder. Having regard to the growth of the district in 1903, the Wilton Rural District Council instructed my firm (Messrs. Lemon & Blizard) to prepare a scheme for the sewerage and sewage disposal of it.

The scheme was prepared, and in due course carried out and completed in October, 1906.

The main valley sewer was constructed at such a level that, in the event of the Wilton Corporation having to dispose of the sewage of Wilton, it could, by arrangement and agreement, flow into the Bemerton district by gravitation, and thus join the two districts for sewage disposal.

When the Bemerton scheme was in process of construction, the Wilton Corporation decided to have a scheme for sewage disposal, and called in an engineer to advise them on the question for Wilton. An agreement was entered into, and a pumping station was provided for pumping the sewage into the Bemerton system, as it was then thought the sewage could not gravitate into it. In 1903 I stated at the Local Government Board inquiry that the valley sewer I then proposed would be laid at such a level that, by a simple extension of the sewer, Wilton could come in by gravitation; however, it was not then done.

The main sewer was laid up through the valley, through the Wilton Park, to the Wilton Corporation boundary, where a receiving chamber was constructed, into which the Wilton sewage was pumped.

After a lapse of a few years it was thought that the statement I made in 1903 was correct, and the sewage could flow into the system by gravitation. Owing to the excessive leakage in the Wilton sewers, the pumps were unable to do the work required of them, and the sewage overflowed into the river and caused serious contamination. The late Lord Pembroke naturally objected to such a state of things, and I was called in by him to prove that Wilton could be drained by gravitation, and thus get rid of the pumping station, save the annual cost of pumping, and particularly stop the contamination of the river. I reported it was practicable, and the Wilton Corporation, at the suggestion of the late Lord Pembroke, retained me to carry out my scheme, which I did successfully, and the sewage is now gravitating to Bemerton as originally intended.

THE BEMERTON SEWERAGE WORKS

briefly are as follows: From the pumping station, for a distance of 220 ft., a 15-in. C.I. pipe is laid, and from thence to Wilton a 12-in. C.I. pipe, which is the main intercepting or valley sewer.

The branch sewers are of cast-iron and glazed stoneware socket pipes of 7 in., 8 in. and 9 in. diameter respectively, and of a total length of upwards of 4 miles. The usual manholes are constructed, and those at the heads of branches are arranged to act as flushing chambers.

The ventilation is by shafts, each 30 ft. high, placed at convenient points, the inlets being open manhole covers fixed in positions where they will not become a nuisance; in the streets they are closed, as it is well known that the open manhole cover is as often an outlet as an inlet, consequently there must be a nuisance at times; however, this has been guarded against as much as possible.

The gradients are all good and self-cleansing. The main valley sewer provides for the Wilton Union workhouse as well as Wilton town.

The present estimated population of Bemerton is 1,800, and Wilton 2,200, total 4,000; and, taking the water supply at 25 gallons per head per day—100,000 gallons dry-weather flow, or 70 gallons per minute average flow. This quantity is quite theoretical, as such a quantity as 25 gallons per head per day is never used in such districts as Wilton and Bemerton, with small houses and not many baths; but the quantity is a requirement of the Local Government Board, and is provided for. The unavoidable rainfall is

estimated at six times the dry-weather flow; this is quite theoretical, too. The sewers were well laid, as were also the house connections, and before Wilton came in by gravitation, six times the dry-weather flow was never reached; but since then it has exceeded owing to leakages in the Wilton sewers.

The whole of the sewage gravitates to the pumping station; it first runs through two iron screening tanks, then to two circular iron pump wells. From the pump wells it is pumped through a 12-in. cast-iron main to a sewage farm about 1½ miles in a south-south-west direction, with about 60 dead lift, and is delivered into two receiving tanks.

The pumping station is a brick building with slated roof, well lighted and ventilated; the floor is paved with white and black tiles, and a glazed-brick dado is built round the walls.

The accommodation is as follows: Engine and pump room, 40 ft. by 32 ft., there are now two engines and two sets of pumps, and a space is reserved for another engine and set of pumps to deal with the increasing population when necessary; space for bench; store; gas-plant house; fuel store and water closet. Over the bench room and store is a tower with two floors; the first is for the cooling tanks, and the second or upper floor the water tank, into which water is pumped from a well in the yard.

The gas engines and three-throw horizontal plunger pumps are in duplicate; each set will pump 500 gallons per minute, as against 420 gallons per minute now expected to be pumped; there is, therefore, ample pumping power for some considerable time yet. If the population of Bemerton should continue to rapidly increase—and I hope it will—it will be a simple matter to put in another engine and pump in a space provided for it, as before mentioned. The gas is made from anthracite from a suction-gas plant; it is made and used directly by the engines, and has been successfully and economically worked for the past eight years. The town gas is laid on as an auxiliary in case of breakdown or repairs to the plant, but very little is used beyond that required for the lighting of the building.

The adoption of this scheme has been proved to be very economical, and, compared with the town gas at 2s. 6d. per 1,000 cub. ft., there is an actual saving of at least 60 per cent. The engineer-in-charge keeps a daily record of the actual work done and fuel used, and can be inspected at any time.

The annual cost of the pumping station is as follows: Staff, two men and lad, £210; 45 tons of anthracite coal, £67 10s.; 45 gallons of oil, £3 15s.; waste, about 1½ cwts., £3 3s.; total, £284 8s.

The repairs and renewals spread over eight years have not been very considerable. The plungers have been turned, and glands rebushed. The engines now require an overhaul, which, doubtless, will be done in due course. The fact of the machinery having been worked for eight years with so small an amount of repairs reflects great credit on the engineer-in-charge, Mr. C. Castle, who has been here since the work started.

THE SEWAGE FARM.

The area of the land for the purification of the sewage is 30 acres. The sewage is lifted to the highest corner, and delivered into receiving tanks in duplicate, from which it flows along stoneware carriers or conduits, and distributed therefrom through branches or junctions over the land, as circumstances may direct, having regard to the nature of the crops growing. The land is let to a tenant under an agreement for the proper distribution of the sewage for purification.

The land is the best which can be obtained for the purification of sewage; it has a chalk subsoil, and there is no effluent from the land after distribution.

Bemerton has no further capital to spend for sewers; if more sewers are required the landowners must put them in and connect up to the general sewerage system. If any more land is required for purification, there is plenty adjoining the present area, and which can be obtained through the kind consideration and public spirit of the late Lord Pembroke; the price is fixed for the future, which is looking well ahead. By

* Paper read at the meeting of the Institution of Municipal and County Engineers at Salisbury last Saturday.

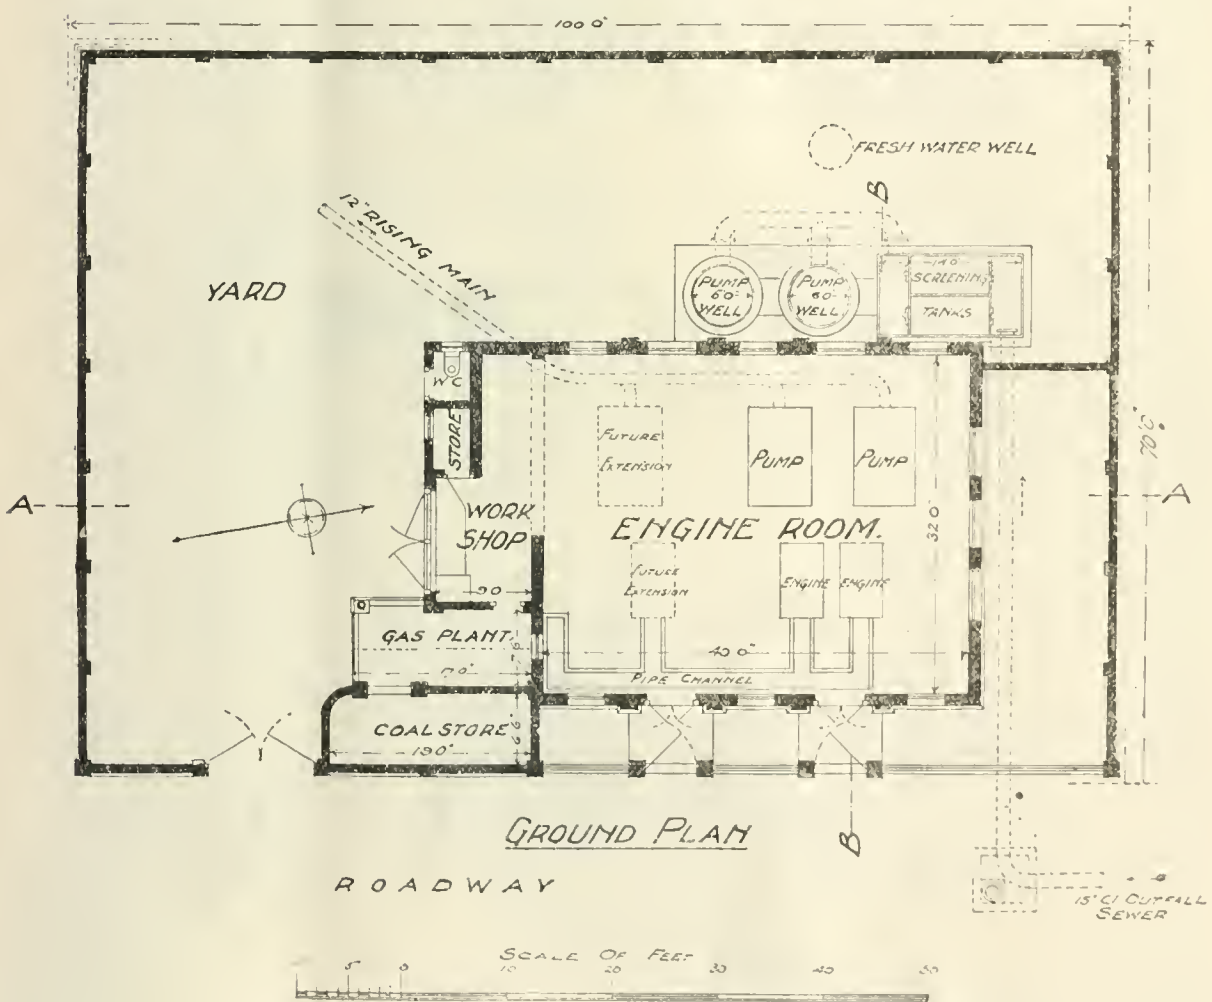

this arrangement not only does Bemerton benefit, but Wilton also, the two districts now being "married" for sewage disposal purposes.

It has been suggested that Bemerton ought not to have an old-fashioned sewage farm; my answer to that is, the old-fashioned sewage farm is good enough for Bemerton or any other place provided the land be suitable—that is the secret, suitability of soil for the purification of sewage, and plenty of it. Tanks and bacteria beds, as such, are quite good when they are

uninteresting, but trusts that the visit of inspection will compensate for it.

DESCRIPTION OF ENGINES AND PUMPS.

The engines and pumps are installed in duplicate. The rising main is of 12-in. cast-iron pipes, 2,100 yds. long, with a dead lift of 60 ft. above the pumping station. The sewage is raised by each out-stroke of the pumps through the suction pipes which are fitted with foot valves and strainers at the lower ends. The

BEMERTON MAIN SEWERAGE: PUMPING STATION.

required. I am now carrying out one scheme of bacteria beds, and preparing another scheme of the same character. Why? Because land is not available for sewage purification in either case. I have also been asked why we have no bacteria beds; my answer is, Bemerton has a very fine one now of 30 acres to start with, and a good one too. There is no expense for maintenance, as the crops will always pay for that. Attached hereto is a plan of the pumping station. The author is afraid that this paper may be somewhat

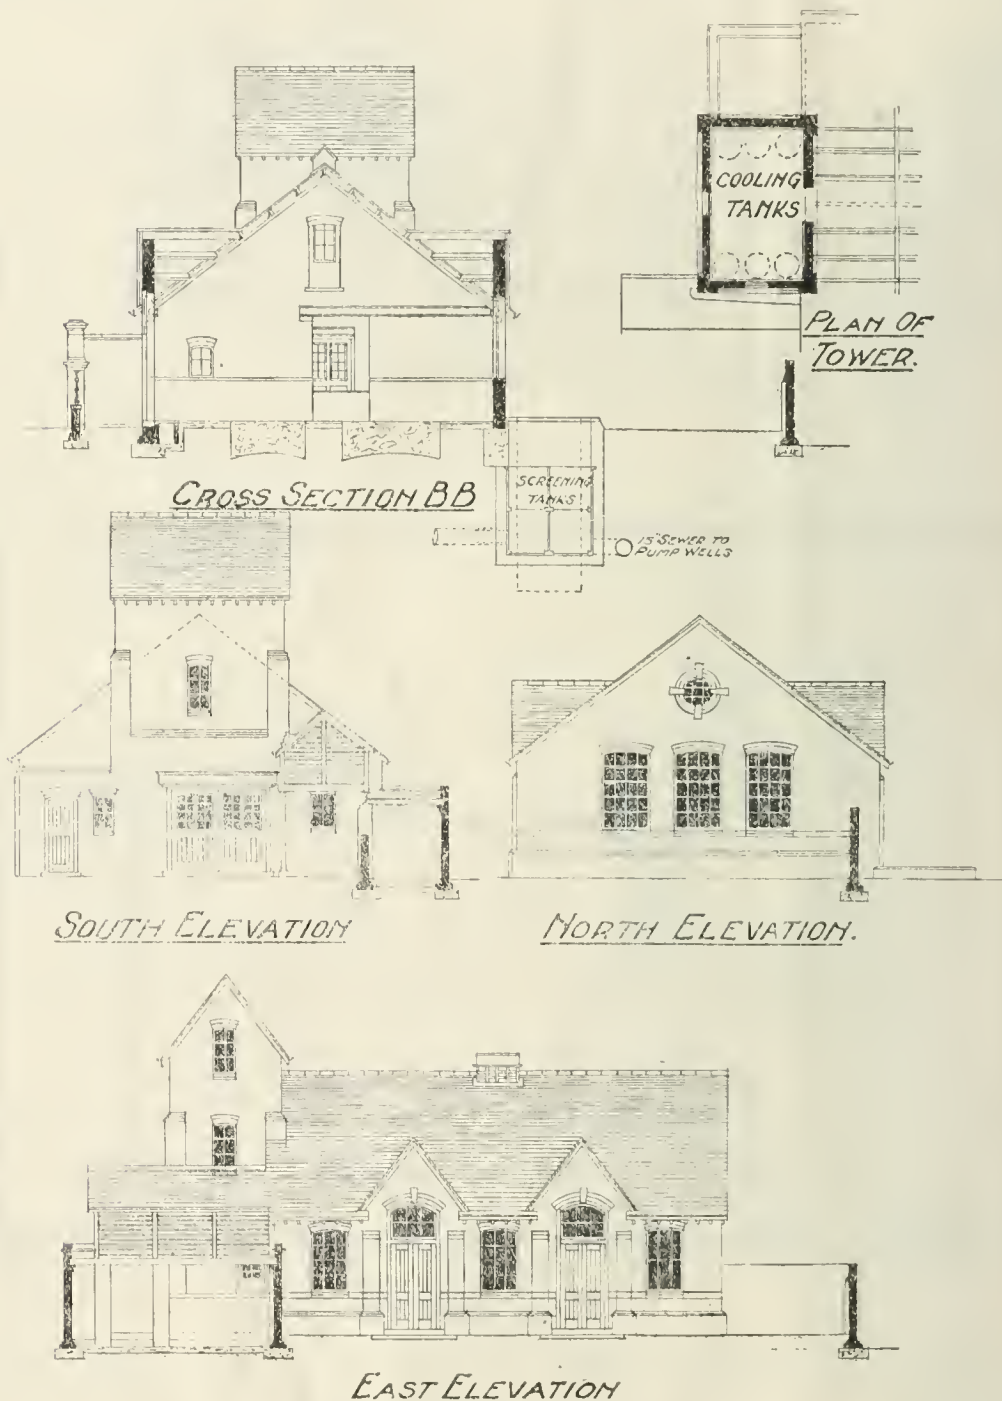

strainer arrests any floating insoluble matter which may have passed the screens. On the in-stroke the valves shut and the delivery valves open, thus allowing the sewage to be forced into the delivery main (upon which is fixed an air vessel), thence passing a retaining valve, and into the unobstructed rising main to the land. The air vessel is fitted above each set of delivery valves, and acts as a cushion to the pumps, and causes a continuous flow in the sewage through the mains without jerks. In case the air in the air vessel

should become exhausted, and in some way or other escape, an air cock is fitted for regulation. The relief valve fitted near the air vessel, above the delivery or top valve, acts as a safety valve, for without it, if a sluice valve on the delivery main was shut and the engines started, the sewage, having nowhere to go, would cause such a pressure that some part of the machinery would burst; but by having a relief valve the pumps will in no way be damaged, as the valve would open at a certain pressure and flood the floor of the engine-house, which would be such a reminder to the engineer-in-charge that he would never forget it again; this has actually happened once.

The sluice valve fitted to each set of pumps is for

the rising or delivery main, it is done as follows: At the rear of the building is a valve fitted in a pipe leading from the 12-in. main to the pump wells; when this is opened it discharges the sewage back into the wells and receiving tanks.

The pumps are arranged to be coupled together by means of a clutch, so that one engine can drive both pumps, or either engine either set of pumps. Each set of pumps has two gears or speeds, both of which can be thrown in and out separately. One speed is nine revolutions and the other thirty-six revolutions per minute. If the pumps are driven together on the slow speed it is equivalent to a speed of eighteen revolutions for one set of pumps. You have, there-

BEMERTON MAIN SEWERAGE: PUMPING STATION.

the purpose of shutting off the delivery main to examine the relief and retaining valves, or to admit air to the air vessel; it would also be used when the pumps required attention. The valve is fixed next beyond the retaining valve, and shuts off the sewage from every working part of each set of pumps. A retaining valve is fitted to each set of pumps, and is for the purpose of stopping the sewage from being forced back into the pumps after it has entered the delivery main, and also to take the pressure off the pump valves. It is fitted close to and below the sluice valve, and between that and the delivery valves.

If it should be found necessary at any time to empty

fore, three speeds—nine, eighteen and thirty-six revolutions per minute. The speeds were devised by us in conjunction with Messrs. Hayward, Tyler & Co., in order to properly deal with the varying flows of sewage. On the spur wheel shaft of each set of pumps a small single-cylinder pump is fitted for pumping fresh water from a well at the back of the station to the circulating tanks in the tower for cooling the gas engines when they are running. This fresh-water well means a great saving in the annual working expenses of the installation.

The pumps are of three-throw type, which makes the working much steadier, and, moreover, the strain

on the pumps is considerably lessened and more equalised. On each pump shaft two cog or pinion wheels are fixed, one larger than the other. Similarly, on each driving axle there are two sliding cog or spur wheels, both of which can be engaged or disengaged with the respective pinion wheels by means of levers. The larger spur wheel can be engaged with the smaller pinion wheel, thus giving a slow speed, and the smaller spur wheel can be engaged with the larger pinion wheel, thus giving a fast speed. Each of the pump axles has a counter fixed, which registers the number of revolutions made, so that the work done can always be ascertained by reference to it. Each driving axle is fitted with two wheels, one of which is a loose or free wheel, and the other the driving wheel for the belt. About half way between each pump and its engine is a standard, upon which is fixed the striking gear for the belts; when the pump is to be stopped the gear is pushed over, and the belt pushed with it on to the loose wheel; thus the pump is stopped, but not the gas engine, and to start the pump again the reverse is done.

The gas engines are in duplicate, by Messrs. Fielding & Platt, of Gloucester, and made to the order of Messrs. Hayward, Tyler & Co., of Luton and London, who supplied the whole of the installation. Each engine is of 17-b.h.p. with suction gas, and 20-b.h.p. with town gas. The fly-wheel is 5 ft. 6 in. in diameter, and makes 200 revolutions per minute. The ignition is by magneto, with an auxiliary tube ignition. The gas which is chiefly used is the producer or suction gas, but the town gas is laid on as an auxiliary to the producer plant in case of breakdown or sudden emergency, and for lighting the station. The engines, being internal combustion engines, must be cooled; as before stated, there is a small pump attached to the sewage pumps, which pumps water from a well; this is forced up to a tank at the top of the building.

On the floor beneath—that is, on the middle floor—are four other tanks, used as circulating tanks, supplied from the tank above. Each of the five tanks has a capacity for 200 gallons. From the circulating tanks the water flows to the engines, where it circulates in the water jackets of the cylinders, and back again to the tanks. This water quickly gets hot; hence the necessity for a good supply of cold water to the tanks, to keep the engines cool, which is an absolute necessity for their proper and efficient working. The gas, on leaving the producer plant, passes through a pipe into an expansion box, and from thence through another pipe into the engine. The expansion box is the reservoir for the gas from which the engines suck; they require more gas for each explosion than the pipes hold; hence the necessity for a reservoir. The town gas is taken from a 150-light meter to a gas bag, which is another form of expansion box or reservoir. A pipe connects the gas bag to the pipe taking the producer gas to the engine. Just below the junction of the town gas pipe and the producer gas pipe a tap is fitted, so that the producer gas may be shut off if the town gas is used. Similarly, a tap is fitted so that the town gas may be shut off when the producer gas is being used. The exhaust gases from the engines pass through a pipe to an exhaust box in the front of the building.

On the suction stroke of the engine, air as well as gas is sucked in, which causes the gas to explode in the cylinder. On the end of the air pipe, which is outside the building, an air box is fitted, which stops the noises caused by the sucking of the engines on its suction stroke. Close to one engine is a wrought-iron cylinder, connected to the engine by means of a small pipe; in this air is compressed by the engine when running (the pressure being registered by a gauge), and is used to start the engines again if stopped. When the engine is to be started a tap is turned on the compressed air chamber, as also is one on the engine; the air is forced into the cylinder of the engine, when the fly-wheel at once begins to revolve; the air is then shut off, and the gas admitted into the cylinder, it fires, and thus the engine is started. Without the compressed air the engine would have to be started by hand, which would be a very difficult and unsatisfactory way of working, especially in case of emergency; with the compressed air there is no difficulty whatever.

GAS PLANT.

The gas plant consists of a generator and a "scrubber." A fire is lighted at the bottom of the

generator, and anthracite (coal) "beans" or "nuts" put into the top; the anthracite is burnt and creates an intense heat, and gives off gas.

The generator is lined inside, up to a certain point, with firebricks; at the bottom is a revolving grate, which can be moved by means of a handle, to get rid of any clinker, which drops into an ash-space beneath and so keeps the fire free.

The fire is lighted in the ordinary way and a draught created by a fan (worked by hand) attached to the side of the generator; as soon as the fire is well under way a bucket full of anthracite beans is allowed to drop from the hopper. The fan is kept revolving, and within ten minutes of lighting up the gas engine can be started.

The gas leaves the generator at the top and enters the scrubber at the bottom; the pipe connecting these two is fixed vertically to a height of about 15 ft., and a valve is fitted just above the point of projection, also a small pipe and valve are fitted in gas pipe, at the top, where the gas leaves the generator. The gas passes through a pipe and enters the scrubber at the bottom, thence through $\frac{1}{2}$ in. of water, and ascends through coke, over which water is dripping, and is thus prepared for its work. After this process it is sucked through a pipe into the expansion box, and thence to the engine. When the engine stops the valve in the vertical pipe is opened, allowing the gas to pass up into the air. The pipe also causes a draught and keeps the fire from dying down quickly. The short pipe which is fitted is for ascertaining whether gas is being given off, which is tested by applying a lighted taper; when the engine is running the valve in this pipe is shut.

The plant is sufficient to run both engines at once, with the ordinary flow of sewage, or one engine when pumping six times the dry-weather flow. A complete record is kept of all the work done by the engines and pumps, the time they work, the quantity of town gas used, the quantity of anthracite coal used for the producer plant, the number of revolutions made by the pumps, and whether running at slow speed, pumps coupled together, or fast speed. There is also a rain gauge kept, and a record of the weather temperature inside and outside.

INSTITUTION OF MUNICIPAL ENGINEERS.

NORTH-WESTERN DISTRICT MEETING AT OLDHAM.

The members of this district met at Oldham on Saturday last, when among the members present were Messrs. A. R. Bleazard, chairman of the district, E. Walker (Stretford), J. W. Gleave (Heywood), R. E. Miles (St. Helens), A. Dempsey (Eccles), J. Liddell (Furness Vale), J. Jones (Gobowen, Salop), E. Green Davies (Gobowen, Salop), J. D. Hurst (Wardle), E. Ryder (Manchester), R. Aspinall (Manchester), J. H. Moore (Bucklow, Cheshire), and R. J. McKenn, the hon. district secretary. The party were received at the Oldham sewage works by Dr. Wilkinson, medical officer of health, Oldham, and Dr. Grossmann, patentee of the grease-extracting plant. Beginning at the precipitation tanks, Dr. Grossmann explained the method of raising the sludge by compressed air through ejectors to the higher settling tanks, where, by treatment with sulphuric acid, the sludge is concentrated and rises to the top, the liquid below being drawn off by valves and pipes placed at various levels. From these tanks the sludge is removed by means of a worm-conveyer into a channel, in which operate conveyers, which lift the sludge to the top retort-house. Here the sludge, after passing through the retort, has the moisture evaporated and is ready for passing to the de-greasing retort-house, which is situated below the former house. Passing through these retorts, the grease is extracted in a vapour, which is conveyed through pipes to a condensing plant, consisting of vertical pipes. The vapour rising in these pipes comes into contact with cold water entering at the top of the condensing pipes, and is condensed into a solidified grease, which discharges with the condensing water into collecting chambers, whence it is taken.

After inspecting the grease-extracting plant, the members were escorted round the works.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Greater New York's Water Supply Scheme.

DISCUSSION AT JOINT MEETING OF INSTITUTION OF MUNICIPAL ENGINEERS AND SOCIETY OF ENGINEERS.

In last week's issue we reproduced, together with the interesting illustrations that accompanied it, the paper by Mr. William T. Taylor, Fellow A.M.I.E.E., A.M.I.MECH.E., M.A.SOC.M.E., F.R.G.S., of New York, on the subject of "Greater New York's Water Supply Scheme," which was presented at a joint meeting of the Institution of Municipal Engineers and the Society of Engineers held in London on Monday of last week. The attendance at the meeting included Messrs. H. C. H. Shenton, president of the Society of Engineers—in the chair—H. Boot, president of the Institution of Municipal Engineers, H. C. Adams, Chas. V. Biggs, F. Ball, Charles T. Walrond, Percy Griffiths, members of council of the respective bodies; W. C. Easdale (Westminster), Harold J. F. Gourler (Westminster), Alex. H. Jameson (Golders Green), J. W. Cable (London), H. R. Askew (Streatham), L. Askew (Streatham), E. Sandeman (Westminster), E. A. P. Wood (Westminster), E. Malkinson (Westminster), G. Watson (Westminster), J. G. Sharp (Workington), Digby C. Wingfield (Streatham), Herbert Lapworth (Westminster), F. W. Poynter (Watford), J. D. Haworth (Westminster), J. R. Fayers (Watford), Edgar Graves (Westminster), D. C. Fidler (Hayes), A. S. Everett (Westminster), S. Rideal (Westminster), E. K. Rideal (Westminster), C. Buntin (Wandsworth), H. M. Jordan (Westminster), R. Harben (Finchley) and A. S. E. Ackermann, secretary of the Society of Engineers, and B. Wyand, secretary of the Institution of Municipal Engineers.

Mr. H. C. H. SHENTON, president of the Society of Engineers, said it was to be regretted that the author of the paper was not in England at the present time. The subject of the paper was of the very greatest importance, because it not only dealt with the largest waterworks in the world, but it was, he believed, the first paper on the subject that had been read before a representative engineering society in this country. That night it had been read before two representative English engineering societies, and it therefore became doubly important. Probably one of the first things which struck one in reading the paper was that the author did not state his authority for coming before them with that description of work which was not his own, and upon which he had apparently not been employed, and it seemed strange that at first there was no acknowledgment of the source from which the information was obtained, and the drawings—which were quite familiar—were taken. But it went without saying that a paper like that was not accepted without such matters being looked into as a preliminary, and he ought to say that Mr. Taylor had the best authority for his statements and the use of the illustrations, that of the chief engineer of the Board of Water Supply of the City of New York. He (Mr. Shenton) had before him the letter from Mr. Taylor, in which the latter told them that Mr. A. D. Flynn, the departmental engineer on the work, and the author of many well-known papers on the subject, had presented him with a complete set of reports dealing with the scheme and all other available data and drawings, and the matter was delivered to him at the Engineers' Club, New York, with the compliments of the chief engineer. He ought to mention also that not only had the New York Water Board empowered Mr. Taylor to write that paper to be read before a British Institution of Engineers, but they had at the same time sent copies of their reports to the Institution of Municipal Engineers, and these valuable publications were therefore available to the members of that body for reference. That showed, he thought, the very friendly feeling American engineers had towards them. The mention of the Engineers' Club made one sorry there was not some similar club in London. Mr. Taylor, he might tell them, was a mechanical and hydraulic engineer in private practice in New York, and a member of American and British Institutions of Civil and other engineering societies, and he had also had an eventful military career. That was, however, beside the subject of the paper, but as he had to propose a vote of thanks to Mr. Taylor, he thought they would like to know

something about him and his authority for writing the paper. The author had been able, from the sources stated, and from personal investigation, to gather special information with regard to his subject. The paper was, of course, general rather than particular, and to that degree he was rather disappointed, because there were so many points of detail in the scheme that well deserved discussion. There was mention in it, for instance, of concrete lined tunnels, but it was one thing to line a tunnel and another to make it watertight, and the methods employed in doing that were of interest. The lining of steel mains with cement was also very interesting, and there was a great deal to be said about that, and there were innumerable other matters of particular interest which ought at some future time to be discussed by the society and the institution. He did not propose to discuss the paper now, but he asked them to accord a vote of thanks to the author.

The vote of thanks was carried with acclamation.

Mr. E. SANDEMAN (Westminster) said it was difficult to avoid being very greatly impressed with the magnificence of these works, and with the efficient methods of the engineers. When one considered that the 500 million gallons of water which New York was going to take in was simply supplementary to their existing supply, and was sufficient to supply half of England, it gave some conception of the vastness of the scheme. Having been engaged for twenty years in the construction of impounding dams, it was natural for one to turn to the section of the Olive Bridge dam. As they had already heard explained, the whole length of the embankments and dams was about $5\frac{1}{2}$ miles, but the masonry part was only a very short length of that mileage. The dam he had referred to apparently had a thickness of 190 ft. at the base. Some 15 or 20 years ago New York built the new Croton dam, which was higher than the one under notice, and a much thinner one. When proposed, as it was going to be one of the biggest in the world, a special Board of Experts—that of the engineers of the Aqueduct Commission—was called together to consider the design. The board thickened the dam considerably, probably on account of the ice pressure which might affect the structure, but notwithstanding the decision of the Board of Experts, the design was again altered and the thinner section was adopted. It was interesting to compare what had been done in these two designs. At 50 ft. from the top the new Croton dam was 34 ft. thick, but this new dam would be 53 ft.; at 100 ft. from the surface the new Croton dam was 72 ft. thick, but the Olive Bridge dam would be 93 ft.; at 150 ft. from the top the new Croton dam was 156 ft. thick, whereas this new one would be 154 ft. So it was practically 20 ft. thicker the whole way down. There must be some strong reason for that increased thickness, as it now appeared that the engineers had reverted to the thicker design originally proposed by the Board of Experts. The effect of making the dam so thick was to give it increased strength, and whereas the Croton dam had a factor of safety of rather more than 2, this would have one of $4\frac{1}{2}$. There was another peculiarity about it. The resultant of the water pressure and the weight of the dam combined struck the exact middle of the dam, so that when the dam was full of water there was an exactly even pressure over the whole base. When the dam was empty the pressure on the up-stream side seemed to be about $11\frac{1}{2}$ tons, and on the downstream side apparently about half a ton. The weight per foot down to about 180 ft. was about 1,000 tons. In the dams which he had just been finishing in the Derwent Valley, down to about a similar level the cross-section would weigh about 880 tons, so that the Olive Bridge section was a much heavier one. He noticed that a great part of the embankment was formed in the American fashion with a concrete core, instead of puddle as used here. It seemed somewhat surprising that the Americans did not use puddle if it were available, because one could not help thinking that where large embankments were made with a central core the core must of necessity be bent to one side by the settle-

ment of the earth unless a reinforced core were adopted. It was difficult to make an embankment that would settle exactly evenly, and the pressure was almost bound to come on one side of the core. A noteworthy point was the rather high cost of the plant employed on these works. £500,000 invested in this way on two reservoirs seemed very large; but it was difficult to grasp what plant was required unless one had more details.

Dr. HERBERT LAPWORTH (Westminster) congratulated the members on having this interesting account of American engineering practice placed before them. He supposed many English engineers were rather inclined to think they had not much to learn from American engineering practice. That might have been true, possibly, fifty years ago, but he thought that at the present time they had a great deal to learn from them; certainly, as regards water supply, the Americans had the finest literature in the world. The Catskill scheme was of very great interest to water engineers in this country, and they could learn a great deal from it. It was without parallel in the history of waterworks engineering, not only by reason of its heroic dimensions, but also by reason of the extremely careful investigations from which the designs were prepared, and the painstaking attempts made to effect economies in location, and, lastly, by the extraordinary rapidity with which (in spite of these exhaustive preliminaries) the work had been carried out. In a paper like the one before him the subject was too vast to go into details, but there was one point of the utmost importance, namely, the question of the geological investigations. Throughout the whole of the scheme geology had played an essential part, and the location and designs were based largely on the results of geological investigations. The methods adopted in crossing wide and deep rivers afforded a good illustration of the care and yet boldness with which everything was done. When they considered the scheme in all its aspects, he thought it would be agreed that even the most experienced of them must greatly benefit by the study of its details.

Mr. HORACE BOOT (president of the Institution of Municipal Engineers) observed that the subject of the paper was of great interest to municipal engineers, especially in this country, where one was struck by the small, inadequate water schemes, which were so often carried out by our municipalities. If they traced the history of the water supply of our great towns, they found that the town councillors generally could not bring themselves to realise that their cities must grow and the requirements increase. In tackling a water supply, they should not be afraid of dealing with it on a large scale. He thought the thanks of the two societies were due to Mr. Taylor for sending over a paper of such great interest. It would have one effect, he thought; in the future, when they came to design a water scheme, they would be encouraged to put forward a sufficiently large one. One would have liked to see the analyses of the water for drinking purposes, also what Mr. Taylor expected would take place with regard to the expansion of the steel pipes. Mr. Taylor coated many of these pipes with concrete. In this country, if we were to treat water pipes in that manner, he was not altogether sure that it would be successful. To be able to judge a scheme like that of New York, one required to know something of the quantity and quality of the water, the capital cost of the work, and the selling price of the water before one could judge whether the scheme was going to be an engineering success. It was not difficult to design a scheme costing millions of money, provided that money did not matter. He did not for one instant suggest that in this particular scheme that point had not been borne in mind, but it was useless for engineers to put forward a gigantic scheme without regard for these important items. In one part of the paper the author spoke of the trouble arising from lead corrosion. If that were gone into a little closer, it would probably be found that it was set up by the presence of dissimilar metals causing electrolytic action rather than by corrosion. Mr. Taylor had included in his paper a rather elaborate diagram of the organisation of the engineering department, and there again it was quite possible that in this country their water schemes were not sufficiently organised. In one's travels abroad one could not but be surprised by the magnificent organisation that existed in such matters, and especially in water departments.

Mr. PERCY GRIFFITH (Westminster) said he thought it was right to say that they were proud (with their confreres the municipal engineers) to be the first of

the societies in this country to have a paper on this important subject read and discussed. He was bound to say that he considered the paper a very valuable and interesting forerunner of what would no doubt be available in greater detail later on. A great scheme had been undertaken, and an important section of it was nearing completion. In the paper they had a general summary of the dimensions, scope, cost, and other interesting features relative to the work. The figures presented to them did not tell them much more than that the scheme was a stupendous one, and one representing an epoch in the history of water engineering. That was enough to make the paper welcome and worthy of discussion. Their attention in these days was so often monopolised by small details that they were unable to take a broad and comprehensive view of any large scheme. It was for that reason that he thought it useless to raise certain questions that had occurred to him, questions in the nature of "asking for more." There was one matter, however, that he would refer to—namely, the relationship between the storage and the flow of the stream in each case. He was not sure whether or no information was published in book form and available to them at their leisure, and if so, he would not criticise the author for not giving details of that nature. The question of the relation between the dimensions of the scheme and the population to be supplied reduced itself to the quantity of water required per head per day.* He had not before him the proportion of the supply in New York required for trade and municipal purposes, but he knew that the so-called domestic consumption was in most American cities very large, while experience showed that health and sanitary conditions could be maintained on a much smaller quantity. It was a serious question whether it would not be worth while to attempt some reduction in the consumption of water rather than spend enormous sums on gigantic water schemes, such as the one described in the paper. A comparison between the expenditure necessary to reduce consumption and the expenditure necessary to increase the supply seemed worth consideration, and he would like to know something of the figures which could apply to this case. He did not hesitate to suggest that it would be more economical to check unnecessary consumption.

Mr. J. D. HAWORTH (Westminster) remarked that a consumption of 100 gallons per head per day appeared enormous. In Manchester, he believed, it was only from 40 to 42 gallons, in spite of the large consumption on account of the various trades carried on in that city. His own experience was that the supply to the ordinary consuming population should not exceed 20 gallons per head, and he had known it to be even as low as 15 gallons where means of preventing waste were adopted. Referring to the section of typical cut-and-cover construction in the paper, he thought there must have been some special reason for the Board of Experts constructing a concrete culvert on foundations of the nature shown in the section. For his own part, he would be very diffident in putting such a structure as the one illustrated on a foundation of filled-in earth, even when rolled. There was always the difficulty to be borne in mind of the filling material not consolidating sufficiently. If any settlement took place in the filling after the culvert was constructed, a fracture might occur in the concrete, which would not only be difficult to repair, but would cause serious inconvenience. It would be interesting to know what were the reasons which led the board to decide on the method of construction adopted in the dams.

Dr. S. RIDEAL (Westminster) remarked that he had had opportunities of studying on the spot the question that had been raised by Mr. Griffith and Mr. Haworth. He believed the population of New York was now approaching 6,000,000, and they certainly used more than 100 gallons per head per day. The Sewage Commissioners were counting on a population of 9,000,000 in 1940. He thought with Mr. Griffith that the consumption of water could be considerably reduced in the future, and many American towns were now being metered. It was a curious fact that, although New York had a larger water consumption than either London, Paris, or Berlin, the death-rate of the former was higher than that of any of the other three. It was noteworthy that in Mr. Taylor's paper there was not a word about purification, and they had to ask themselves what was going to take place in these large reservoirs. The large quantity of water was going to be very short

of oxygen in time, and would encourage all sorts of growths, so that before it arrived in New York he expected it to have a smell, a colour, and a taste. The experimental aerators were giving good results, but probably other methods of purification would be required.

Dr. ERIC RIDEAL (Westminster) followed with some remarks regarding the choice of steel in preference to wrought-iron pipes, and the protection of pipes by means of cement.

Prof. ALEX. H. JAMESON (Professor of Engineering, King's College, London University) said he recommended the members to read the book recently published, *The Catskill Water Supply*, by Lazarus White (Wiley & Co.), which was splendidly illustrated, and gave a very full account of the construction methods and plant used in the New York works. As to filtration, he called attention to the profile of the Catskill aqueduct in which, at 80 miles on the section, a "filter connection chamber" was marked. That was not, he thought, marked on the original drawings, but looked as if the idea now was to filter the water south of the Kensico reservoir. He thought it would be more advisable to filter the water at the head of the aqueduct so as to avoid organic growths therein, and he could point to the experience of Manchester on their Thirlmere aqueduct, where frequent cleaning of the cut-and-cover and tunnels was necessary to remove evil-smelling *Spongilla*, &c. That was a matter of considerable difficulty in lined tunnels, and he was therefore glad to see that the Catskill tunnels were lined with concrete. The cut-and-cover section was quite different to our British practice. The idea seemed to be to have shallow excavation, and no timbering of the trench, allowing the use of steam excavators and using the spoil for an embankment on top of the conduit, which got very little support from the sides of the trench, and was therefore of a horse-shoe section. The author referred to this aqueduct as "skirting many a steep hillside," but the many photographs in Mr White's book all showed the ground as nearly level across. For "steep hillsides" the type of section shown in the author's paper would not, he thought, be suitable on account of the risk of landslips and surface creep unless the trench were cut much deeper, and then a section deriving more support from the sides of the trench would be more economical. In bad cases, however, a lateral tunnel would be the best. His experience was that concrete became worn and pitted after a time by moving water, the velocity varying from 4 ft. per second in the Catskill cut-and-cover to 4.8 ft. per second in the grade tunnels, and 5.8 ft. per second in the pressure tunnels. He thought a vitrified-brick facing to the invert, at least where the wear was greatest, would have been found to have been advantageous. The pressure tunnels were certainly the most novel feature of the aqueduct, although there was a valuable precedent for them in the pressure tunnel, 7 miles long, under the Harlem River, on the New Croton aqueduct for New York City. They necessitated an immense amount of boring to locate in suitable watertight rock, but when constructed, were absolutely permanent; no maintenance was required, there was no danger of burst pipes, and no costly automatic arrangements to mitigate their effects. Under the Hudson River and Croton reservoir, undoubtedly, pressure tunnels were by far the best form of construction, as also under New York City, for security, and in order to avoid the enormous disturbance of the streets and cost of laying the equivalent thirty-two 48-in. pipes or the sixteen 66-in. pipes; but he questioned whether it was economical to construct them for the Rondout, Wallkill, Moodna and Yonkers syphons, which aggregated 16 miles, or nearly half of the total length of pressure tunnels (35 miles). The steel pipe syphons, of which only 6 miles were constructed, formed in reality a reinforced-concrete aqueduct of great strength and permanence, and had the advantage of far greater accessibility than a pressure tunnel, and would, he suggested, have cost far less for the above four syphons. Three of such steel-pipe syphons should not have cost more than twice as much per foot as the cut-and-cover, and allowing for the saving of interest on capital by laying each pipe only when demanded by the consumption, they would probably not have cost more than $\frac{1}{2}$ times the unit cost of cut-and-cover, whereas Mr. White stated that pressure tunnels cost 2 $\frac{1}{2}$ times the cost of cut-and-cover per unit length. Possibly the engineers had doubts as to the durability of the steel-pipe syphon construction, but there seemed every reason to expect that it would be a success and solve the difficulty of the in-

crustation of pipes with consequent greatly reduced delivery and necessity of renewal. He might point out that the pipes, after riveting together and caulking, were tested at working pressure, then concreted outside, while filled with water, to a thickness of from 6 in. to 18 in. in a horse-shoe section. The water was drawn off, and the 2-in. internal lining formed of 2 to 4 cement mortar by screening the invert and grouting the remainder behind flexible wooden moulds. Experiments of two years' duration made in Croton water with naked steel plates, plates bedded in cement, and plates separated from the cement by a $\frac{1}{2}$ -in. gap, showed, respectively, great corrosion, perfect condition and very slight incrustation of the steel plates, indicating that even when the cement did not perfectly adhere, it neutralised the acidity of the water, and prevented rusting. There were only 16 miles of ordinary pipe line, wholly in the delivery area.

[Since the meeting, Prof. Jameson has pointed out that the tunnel under New York is 15 miles and not 31 miles in length, and that the maximum available pressure there is 295 ft., not 590 ft. He proceeds to point out that the longest aqueduct in the world is Coolgardie, Western Australia, which has a length of 352 miles. In regard to the Kensico reservoir, the "elevation of water (full reservoir) above tide" is 355 ft., not 270 ft. He further points out that the downstream face of the Kensico reservoir is of granite masonry, and the upstream of concrete blocks. At Olive Bridge both faces are of concrete blocks. The seven pressure tunnels total 35 and not 17 miles, and Prof. Jameson adds, in regard to the thickness of the steel pipes being 7.68 in. to 0.75 in. wide, that the first is an absurd value.]

Mr. HENRY C. ADAMS (London) said that he thought it was recognised, to some extent, that the immense quantity of water delivered to New York was not actually consumed or used by the people, but that large volumes were wasted. Whatever the facts were, the problem of distributing the water supplied by this scheme was one of great importance. Calculating the water consumption on the usual per capita basis, a sufficiently accurate result would, no doubt, be obtained in the bulk, but when considered in detail, the size and character of both population and buildings varied to such an extent that the estimate was likely to be a long way out. The waste could be divided into two parts—that from the mains and that from the house services—the relative proportion of each depending on different circumstances. In general terms, it may be stated that the waste from the mains is proportional to their total length, while the waste from the house services is proportional to the population. The engineer in whose hands the distribution of the water had been placed had adopted the novel method of basing the consumption on the floor area. He assumed that the amount of water used in each building was proportionate to its cubic contents, or, more strictly, to the floor area in the building, which was arrived at by taking the ground area of the building from the maps and multiplying it by the number of floors, adopting 1,000 sq. ft. as the unit of area. In order to be satisfied that this basis was a satisfactory one, it was checked by observations made in two representative areas—one containing high-class property, and the other tenement property. It was found, after counting the inhabitants in the two blocks, that the consumption in the former area was 128 gallons per head per day, while in the tenement property it was 31 gallons. Basing the consumption in these two districts on the floor area, the consumption in the high-class dwellings was 151 gallons per 1,000 sq. ft., and in the other 149 gallons. It was therefore apparent that much greater accuracy would be obtained by designing the distribution system on the basis of the floor area. Of course, they must bear in mind that the figures quoted were United States gallons, and they ought, therefore, to take off 17 per cent to get British gallons; but there was no doubt that in America more water was used than was the case here, while in summer large quantities were used for cooling purposes. At the same time the waste was far greater than the use, and that was the reason why meters were being adopted so much on the services. Generally, a meter had the result of reducing the quantity of water lawfully used, and to that extent was undesirable; but it also prevented waste, and that had proved to be the case in many cities where the consumption had been reduced from about 100 gallons to 50 gallons per head per day. What took place was not a reduction in the ordinary domestic consumption; it meant that the waste had

been noted and stopped because the people had to pay for it. Chicago, with only 6 per cent of the services metered, used 237 gallons; Philadelphia and Denver, with 1 per cent metered, used 200 and 231 gallons respectively per head per day.

THE CLASSIFICATION OF ROADS.

LOCAL GOVERNMENT BOARD PRESIDENT'S EXPLANATION OF A CIRCULAR.

On Monday evening, in accordance with leave granted earlier, Mr. Rupert Gwynne moved the adjournment of the House of Commons in order to call attention to the recent circular issued by the Road Board requesting local authorities to classify the roads of the country, the object of this classification being to enable it to be used as a basis for the new grants promised by the Chancellor of the Exchequer towards the maintenance of roads. He contended that there was no legal authority for requiring the local authorities to make this classification, which would entail great expense upon the local councils. He suggested that it had been done in a hole-and-corner way to prevent Parliament having an opportunity of discussing the matter.

Mr. Hayes Fisher seconded the motion, condemning as extraordinary and unwarranted what he termed the grossly irregular procedure of the Road Board and of the Local Government Board. The date of the circular was April 30, and the Budget was not introduced until May 4th, yet the House was always being told that the Government had no control over the Road Board.

Mr. Herbert Samuel, President of the Local Government Board, said that for a long period it had been pressed on the Government that additional grants should be given to local authorities to assist them in bearing the cost of main roads, and the Government were now prepared to ask Parliament to vote an additional million and a quarter for local authorities. It was admitted that classification of the roads was essential, and the Government thought it should be done by the Road Board, because the board was independent of any Government department and could be trusted to determine fairly the basis on which grants should be distributed by Government departments. As soon as the Government decided this year to make proposals to Parliament for increasing the grants to local authorities it devolved upon him to take measures to secure that that policy should be carried into effect, and he consulted with the chairman of the Road Board as to the steps that were desirable and practicable. That was before the Budget—as soon as the Government had decided on their policy.

Mr. Hewins: Before Parliament knew anything about it?

Mr. Samuel: Yes, of course. It was an administrative matter. The Road Board had already in the course of their duties obtained particulars from time to time on the lines now suggested. With respect to a very considerable number of roads for which they were requested to make grants for some time past, the Road Board had decided that it was necessary for their own purposes to have a general survey and classification, but they held back issuing a circular knowing that the day was not far distant when classification of the roads would become necessary, not only for their own purposes, but for the purpose of future grants. They came to the conclusion that no statutory authority was necessary for the issue of the circular, and no local authority need supply the particulars if they did not wish to do so—but he rather thought they would need no compulsion. It was estimated that the total expense would be between £6,000 or £7,000 divided among sixty-four county authorities. The whole amount was quite trivial compared with the immensely increased grants, and it must be remembered that this was only one expense, whereas the grant of a million and a quarter would be made annually unless Parliament otherwise determined. The Government desired to distribute increased grants this year, but the grants would not be distributed until a provisional classification was made. If they postponed the classification they postponed the grant, and it was impossible to say how much any local authority would receive until there had been such classification. He was informed by the Road Board that no local authority had refused to give this information, or had ever complained with respect to it. On the

contrary, the board had received a vast quantity of material from the various local authorities.

The motion to adjourn was defeated by 229 to 110.

THE PROPOSED GRANTS.

Replying to questions in the House of Commons on Monday, Mr. Herbert Samuel, President of the Local Government Board, stated that until the provisional classification of roads had been made it was impossible to calculate, otherwise than roughly, the estimated receipts of local authorities under the new scheme of grants proposed in the Budget. Detailed estimates published at the present time would necessarily be misleading, and it was desirable that any return should be deferred until the materials necessary for the calculations were complete.

Mr. Rupert Gwynne asked what was the estimated cost of the classification of roads under the proposals of the Budget; and by whom the cost is to be borne.

Mr. Samuel said the Road Board would pay out of the Road Improvement Fund their expenses in connection with the classification of roads, estimated at about £8,000, and highway authorities would bear any expenses they might incur in submitting proposals to the Board.

Mr. Gwynne asked whether, under the Budget proposals, it was intended that the roads at present under the control of various local highway authorities should, after classification, still remain under the same authorities, or whether it was proposed to transfer all roads coming within Class I. to the county authorities.

Mr. Samuel said that was a matter for separate consideration. The legislation at present proposed would not deal with this point.

Mr. Gwynne asked whether, under the proposals of the Budget, highway authorities were being asked themselves to prepare and send in the classification of the various roads in their areas; whether it was intended to accept this classification as a basis for grants from the National Exchequer; and what expectation he had under this system of obtaining a classification on a uniform basis when it was left to the discretion of the respective county, rural, and urban councils throughout the country to decide hurriedly the basis on which the classification of their particular roads should be made.

Mr. Samuel, in reply, stated that the highway authorities had been asked by the Road Board to send in their proposals for classification, but the classification itself would be settled by the Road Board after consideration of those proposals.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham to-morrow (Saturday), the 23rd inst.

PROGRAMME.

Assemble at Victoria-square entrance to the Council House.

- 2.15 p.m.—Leave Council House.
- 2.30 p.m.—Arrive Aston Church-road Bridge (two-span girder bridge, with trough flooring, spanning river Rea and canal).
- 2.40 p.m.—Leave Aston Church-road, travel *via* Alm Rock-road (60-ft. road laid out with grass margins and trees).
- 3.10 p.m.—Arrive Kings-road Bridge (single-span brick arch bridge over canal, with retaining walls to street).
- 3.20 p.m.—Leave Kings-road.
- 3.35 p.m.—Arrive Stratford-road Bridge (two-span brick arch over river Cole, with stone superstructure; note raising of levels of Stratford-road and new double line of tramway).
- 3.50 p.m.—Leave Stratford-road.
- 3.55 p.m.—Arrive Foremans-road Bridge (two-span brick arch over river Cole, with made-up approaches).
- 4.10 p.m.—Leave Foremans-road.
- 4.30 p.m.—Arrive Council House, where members will be entertained to tea by Mr. H. E. Stilgoe, city engineer.

District Business:—

Elect district chairman for the year 1914-15.

5 p.m.—Discussion on paper entitled, "Recent Highway Bridges in Birmingham," by Mr. A. S. Parsons, ASSOC.M.INST.C.E. (Birmingham).

F. C. COOK, A. T. DAVIS, M.INST.C.E.,
Hon. District Secretary, District Chairman,
Nuneaton. Shrewsbury.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.

The following papers will be read—viz.:—

"A Town Planning Scheme: Its Effects on Housing and Architecture," by Mr. Raymond Unwin.

"Edinburgh and Its Early Examples of Town Planning," by Mr. A. Horsburgh Campbell.

"Town Planning from a Lawyer's Point of View," by Mr. John L. Jack.

"The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

The programme of the meeting of the institution to be held at Southend-on-Sea on Saturday, June 6th, was issued yesterday, and is as follows:—

11 a.m.—Members will assemble at the Palace Hotel. Reception by his Worship the Mayor (Alderman Joseph Francis, J.P.).

11.35 a.m.—Leave hotel to inspect the following works in course of construction: (a) Pier extensions (electric cars to pier head, kindly provided by the Pier Committee); (b) Esplanade improvement and sea wall; (c) large swimming bath.

1.30 p.m.—Lunch at the Palace Hotel by kind invitation of the Mayor.

2.15 p.m.—Discussion on paper by Mr. E. J. Elford, M.INST.C.E., on "The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea."

2.45 p.m.—Leave hotel to inspect the following works: (d) Reinforced-concrete loading pier; (e) tramway boulevard; (f) sewage disposal works.

4.45 p.m.—Tea on the site of the sewage works at the invitation of Mr. E. J. Elford, followed, if desired, by further discussion on paper.

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

PROGRAMME.

11 a.m.—District executive meeting.

11.30 a.m.—District meeting.

Reception in the council chamber by the chairman of the council, Mr. Councillor J. Pearson, J.P.

District business.

Paper by Mr. Arthur J. Price, engineer and surveyor, on "The Municipal Works at Lytham," which will be taken as read.

Discussion.

1 p.m.—Lunch at Clifton Hotel.

2.15 p.m.—By the kindness of the Blackpool, St. Anne's, and Lytham Tramway Company, cars will be provided to enable the members to visit the West End outfall sewage works (in course of construction), the East End sewage and destructor works and slaughter-houses.

4.30 p.m.—Afternoon tea will be provided for the members at De Grey's Café.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in

the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future. Provisional arrangements are also in hand for a meeting (probably an Institution meeting) to be held at Cleethorpes (C. H. Waithman, ASSOC.M.INST.C.E.) during September.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—MR. HORACE BOOT, M.I.E.E., M.I.MECH.E.

COUNCIL MEETING.

The next meeting of the council will be held in London on Wednesday, May 27th.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

NORTH-WESTERN DISTRICT.

A meeting of this district, followed by a social evening, will be held at the Mitre Hotel, Manchester, on Friday, July 3rd.

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

INSTITUTION OF WATER ENGINEERS.**SUMMER GENERAL MEETING.**

The nineteenth summer general meeting will be held at Stockport on Thursday, Friday and Saturday, the 11th, 12th and 13th of June next, under the presidency of Mr Thomas Molyneux, ASSOC.M.INST.C.E., corporation waterworks engineer.

By kind permission of the mayor and corporation, the meetings will be held in the Town Hall, Stockport, and at the opening of the proceedings on Thursday the institution will be welcomed to Stockport by his Worship the Mayor (Councillor Thomas Worthington Potts, J.P.).

Ladies will be cordially welcomed at the meetings and visits, and all official functions except the annual dinner.

The programme will include the presentation of premiums awarded by the council for papers presented during the year 1913.

PAPERS AND COMMUNICATIONS.

The following papers have been promised for reading and discussion at this meeting, and advance copies

will be sent out as soon as printed to members who signify their intention of attending the meeting, also, so far as the stock will allow, to those who, being unable to attend the meeting, are anxious to assist in the discussion by correspondence:—

- (1) "The Character of Mechanically Filtered Water," by Prof. Sheridan Delépine, of the University of Manchester.
- (2) "The Aération and Filtration of Water for Swimming Baths," by L. Holme Lewis, M.I.M.E.C.U.E. (member).
- (3) "Notes on Scraping a 15-in. Water Main," by J. S. Barrowclough (member).

A lecture, entitled "The Geological Structure of the Stockport District," will be delivered by Prof. George Hickling, D.Sc., of the University of Manchester.

The president-elect (Mr. Thomas Molyneux) will deliver his presidential address on Thursday, June 11th, and will also supply a description of the Stockport waterworks, with map of the district of supply, which will be circulated among those present at the meeting.

VISITS TO WORKS.

On Thursday afternoon, June 11th, starting from the Town Hall, Stockport, visits will be made to the Wilmslow pumping station and softening works, and to the Alderley balancing reservoir (reinforced concrete, under construction), where afternoon tea will be provided by the president and Mrs. Molyneux.

On Friday, June 12th, starting from the Midland Hotel, Manchester, at 10 a.m., visits will be made to the recently completed Kinder reservoir and filtration plant, where lunch will be provided by the corporation of Stockport, and to the Lyme Park reservoirs; also to the works of Messrs. Mierles, Bickerton & Day, Limited, Hazel Grove (Diesel oil engines under construction), where afternoon tea will be provided.

On Saturday afternoon, June 13th, members will be free to visit the Colliery Exhibition or the Victoria Park Baths (at the latter will be seen an installation for filtering the water used in the swimming baths).

SOCIAL FUNCTIONS.

The annual dinner will be held at the Midland Hotel, Manchester, on Thursday evening, June 11th, when the Mayor of Stockport, the Lord Mayor of Manchester, and other distinguished guests will be entertained by the institution.

In addition to the luncheon provided on Friday at the Kinder works, the corporation of Stockport will entertain the members at luncheon on Thursday, June 11, at the Town Hall Stockport.

The committee of the Manchester Engineers Club have kindly offered to elect the members attending the meeting as hon. members of the club during the three days of the meeting. Admission on presentation of programme card.)

PERCY GRIFFITH,
Secretary.

20 Victoria-street, S.W.

CONCRETE INSTITUTE.

The fifth annual general meeting of the institute will take place on Thursday, May 28th, at 4.30 p.m., and the fourth annual dinner will take place on the evening of the same day at 8 p.m., at the Connaught Rooms, Great Queen-street, W.C., Prof. Henry Adams presiding.

H. KEMPTON DYSON,
Secretary.

WEST RIDING OF YORKSHIRE HIGHWAY SURVEYORS' ASSOCIATION.

A general meeting will be held in the Grand Jury Room, Town Hall, Leeds, on Tuesday, May 26, 1914, at 3 p.m., to formulate the policy of the association and elect officers for the year.

If time permits, discussion will be invited on the Road Board's proposals *re* the "Classification of Roads."

All surveyors who are interested are cordially invited to attend.

A. GORDON KILNER,
Hon. Secretary.

Council Offices,
Wetherby.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

METROPOLITAN DISTRICT.

A visit will be paid to the Surbiton Urban District Council's new sewage disposal and refuse destructor works, Lower Marsh-lane, Surbiton, to-morrow (Saturday).

PROGRAMME.

- 2 p.m.—Meet at the works, when a description will be given by the engineer and surveyor, Mr. H. T. Mather, who, afterwards, with the works manager, Mr. C. A. Snook (member), will conduct the party over the works.
- 3.15 p.m.—Demonstration of the dissolved oxygen test by Dr. Rideal (past-president).
- 5 p.m.—Tea at the Red Lion Hotel, Tolworth, by kind invitation of the chairman of the council, Councillor Stephen Kavanagh, A.P.

J. FIELDHOUSE,
Hon. District Secretary.

BASFORD.—May 25th.—For providing and laying stoneware pipe sewers with Hassall's joints and manholes, for the rural district council.—Mr. S. Maylan, engineer and surveyor.

ST. HELENS.—May 25th.—For conversions to the water-carriage system, for the corporation.—Chief Inspector of Nuisances.

GREAT CROSBY.—May 26th.—For laying 600 yds. of pipe sewer, for the urban district council.—Mr. Joseph A. Wright, surveyor.

BLYTH AND CUCKNEY.—May 26th.—For scavenging work, for the rural district council.—Mr. A. E. Hewitt, inspector.

KIVETON PARK.—May 26th.—For the construction of sewers, for the rural district council.—Mr. F. Hewitt, engineer and surveyor.

FARNBOROUGH.—May 26th.—For the construction of sewers and storm-water drains, and making good a road, for the urban district council.—Mr. John E. Hargreaves, surveyor.

CHEPPING WYCOMBE.—May 28th.—For the supply and erection of steam engines, air compressors, air lifts, ejectors, and all necessary appurtenances in the extension of the sewage outfall works at Wycombe Marsh, for the corporation.—Mr. T. J. Rushbrooke, borough engineer and surveyor.

CANNOCK.—May 29th.—For works of sewerage extension, for the urban district council.—Mr. R. Blanchard, surveyor.

DEWSBURY.—May 30th.—For the construction of sewage disposal works, for the corporation.—Mr. Henry Dearden, borough engineer.

WARWICK.—June 1st.—For the construction of manholes, chambers, sedimentation and storm-water tanks, and other works, for the corporation.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

HUNSLET.—June 2nd.—For the extension and alteration of sewerage works, for the rural district council.—Messrs. C. H. Marriott, Son & Shaw, engineers, Church-street Chambers, Dewsbury.

HAYES.—June 13th.—For the construction of sewerage at Yeading, for the urban district council.—Mr. D. C. Fidler, engineer and surveyor.

MATLOCK.—June 22nd.—For the completion of the main sewerage, consisting of main outfall and subsidiary sewers of earthenware, steel and cast-iron pipes, with manholes, ventilation and flushing tanks, for the urban district council.—Messrs. J. Diggle & Son, engineers, 14 Victoria-street, Westminster, S.W.

Stores.

FRIERN BARNET.—May 28th.—For the supply of steam coal, engine slack, coke, hardcore, hoggin, gravel, broken Leicester granite, cartage, and general horse hire, for the urban district council.—Mr. E. J. Reynolds, engineer and surveyor.

LUTON.—May 30th.—For the supply of broken granite for the year ending June 30, 1915, for the corporation.—Borough Engineer.

CHURCH.—June 1st.—For the supply of road materials, sanitary pipes, gullies, manhole covers, lamphole covers, street grids, manhole step-irons, disinfecting powder, disinfecting fluid, brooms, pitch and creosote oil, for the urban district council.—Mr. J. B. Fallowfield, surveyor.

PAIGNTON.—June 5th.—For the supply of coal, coke, granite, lamp columns, gully gratings, oil, firewood, and other articles, for the urban district council.—The Surveyor.

Miscellaneous.

TYLDESLEY-WITH-SHAKERLEY.—May 25th.—For the supply of gas fuel, cast-iron pipes and special (gas and water) lead pipes, wrought-iron tubes and fittings, and gas meter, for the urban district council.—Mr. Hedley Hoy, gas engineer.

WARWICK.—June 1st.—For the supply of electric motors, centrifugal pumps, switchgear, automatic control apparatus, pipes, and valves, at the Longbridge pumping station, for the corporation.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

MADRAS.—June 1st.—For the supply of two petrol-driven motor fire engines, for the corporation.—Mr. James R. Coats, engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

GRAVESEND.—For the supply of English hasalt, English basalt chippings, granite setts, scoria setts, and ragstone chippings, for the corporation.—Mr. F. T. Grant, borough surveyor:—

British Macadams, Limited, London.—Penmaenmawr, 12s. 11d. per ton; Penmaenmawr chippings, 12s. 11d. per ton.

Chittenden & Simmons, Maidstone.—Ragstone chippings, 11s. 1d. per ton; 4 in. by 4 in. setts.

Road Maintenance Company, London.—Clee Hill, 33s. 11d. per ton.

BEDWAS.—For the erection of new council offices and stores, for the urban district council.—Mr. A. S. V. Taylor, surveyor:—

R. W. Moon, Newport	£3,021
R. Jones, Caerphilly	2,975
W. Pugh, Bedwas	2,682
Hamilton & Millard, Caerphilly	2,548
W. H. Evans, Cardiff	2,529

Clements, Knowling & Co., Brentford	397
H. Morecroft, Acton	393
A. & B. Hanson, Southall*	386
Engineer's estimate, £363.	

WANDSWORTH.—For the construction of drainage works at Streatham cemetery, for the borough council.—Mr. P. Dodd, borough engineer:—

J. Ford, £285.†

SWANSEA.—For the execution of private street works, for the corporation.—Mr. George Bell, borough surveyor, Swansea:—

Hill Brothers, Swansea	£554
F. Hayes, Liverpool	438
W. H. Owen, Seaforth and Swansea	423
E. E. L. Tucker, Swansea	405
R. Lacey, Swansea	395
Bennett Brothers, Swansea*	385

WAKEFIELD.—For building a boundary wall, for the corporation.—Mr. J. P. Wakeford, city surveyor:—

Wilson Brothers, Wakefield.

WARE.—For laying foul and surface-water sewers, and constructing manholes, for the urban district council.—

Mr. H. Fox Hill, surveyor:—	
W. Jackson & Co., Forest Gate	£231
H. & C. Hampton, Palmer's Green	195
F. Hitch & Co., Ware	186
Pilgrim & Sons, Whetstone*	173

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MAY.

- 23.—Association of Managers of Sewage Disposal Works: Visit to Surbiton Sewage Works.
- 23.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham; Mr. A. S. Parsons on "Bridge Construction."
- 24.—Institution of Civil Engineers (Students' Meeting): Mr. A. A. Hudson, k.c., on "Engineering Contracts," 8 p.m.
- 25.—Association of Consulting Engineers: Annual General Meeting, Caxton Hall, Westminster, 4.30 p.m.
- 26.—West Riding of Yorkshire Highway Surveyors' Association: Meeting at Leeds.
- 27.—Institution of Sanitary Engineers: Visit to Eton Rural District Council's sewage outfall works at Gerrard's Cross. Train from Marylebone, 2 p.m.
- 28.—Concrete Institute: Annual General Meeting, 4.30 p.m.; Annual Dinner, Connaught Rooms, 8 p.m.

JUNE.

- 5-6.—Institution of Municipal and County Engineers: Meeting in Dunfermline.
- 6.—Institution of Municipal and County Engineers: Meeting at Southend.
- 11-13.—Institution of Water Engineers: Summer Meeting at Stockport.
- 13.—Institution of Municipal Engineers: Western District Meeting at Tisbury. Mr. E. Plummer Davies on "Wiltshire Roads, Past and Present."
- 17.—Royal Institute of British Architects: Annual Dinner, Hotel Cecil.
- 24.—Institution of Sanitary Engineers: Visit to Luton sewage farm. Train from St. Pancras, 2.50 p.m.

Minutes of Proceedings.

Refuse Removal. The provision of means of access to premises, by which dustbins may be removed by the local authority's scavengers, is one of the most important elements of town planning. The system of collection from the street has the single advantage that a part of the cost of collection is represented by the exertions of individual householders, the loss of time being so small in each case that it is hardly felt. Against this solitary advantage we have to set some very serious objections to the system. In the first place it is not every household in which there is a person, or two persons together, capable of carrying out the dustbin without undue exertion and risk of physical injury. The chances of injury resulting from strain are very small indeed when each bin is lifted and carried by a muscular man who is constantly doing it, but they are considerable when each bin has to be carried out by whoever happens to be available—often women and children who are not fit for the job. A sick dustman can take a day off, but the widow who happens to be ill on dustbin days must drag it out somehow, or get a neighbour to do it. This brings us to the next point, that if the bins are taken out by a neighbour, or by someone who is not in the house at the proper time, they may have to remain longer than is desirable upon the public highway. This is also the case when the collection cannot be done at the same time on every occasion—and it is not easy to be very punctual in this work. Bins standing in the street are liable to be upset by foraging dogs, or the refuse may be pulled about by needy persons routing for more or less useful odds and ends. Stuff which the dustmen are not authorised to remove may be left to be scattered about until it mysteriously disappears, and, on windy days, loose papers are blown about the road.

One of the difficulties in the way of the system of fetching out the dustbins, or a matter of expense where that is done, is that the bins are so heavy that the men cannot remove them except very slowly and with frequent short rests. This difficulty is reduced by more frequent collection, or, better, by the system which we recently recommended—namely, the separate storage and collection of three or four classes of refuse, the weight of the garbage alone being relatively small and the bin of reduced size. At a recent meeting of the Lichfield City Council several councillors recommended that the fetching out system should be adopted instead of the putting out system, but this was not accepted by the council. The chairman of the Streets Committee said that some occupiers regarded it as a trespass for the scavengers to go on to their premises; but in such cases, it may be suggested, it would be quite feasible to allow these persons

to put out their bins, those of the other occupiers being taken out by the dustmen. We believe, then, that removal of the dustbins by the scavengers should be arranged for as far as possible; that, as regards areas now being built upon, suitable means to make this method easy and cheap should be adopted, and that the collection and disposal of house refuse could be made cheaper, more seemly, and more sanitary by arranging for the separate storage of distinct materials, this being done, if not generally, at least in those streets where the occupiers are willing.

An Important Leicestershire Case.

An action in the Leicester County Court, in which a farmer recovered £25 for the loss of a horse, has a not unimportant bearing upon a phase of the question of road repair. The defendants were the Leicestershire County Council, and it was charged against them that in the process of tar-grouting part of the highway from Hinckley to Burbage they had raised the surface of the road 3 in. above the level of a manhole cover belonging to the Hinckley Rural District Council, with the result that plaintiff's horse fell, and died from the injuries it sustained. Judge Moore Cann, who tried the action, delivered recently a considered judgment in which he held that the county council were guilty of negligence, and that this negligence was of the type known as misfeasance rather than non-feasance, for the reason that the local authority had done something to the road. The existence of the manhole, with its iron cover below the surface of the road, was admitted by the council's witnesses to be a danger, but they said that endeavours were made to minimise this danger, and that the surface of the road was sloped down to the manhole cover at a gradient of 1 in 12. It was contended that this slope was safe, and that it would be impossible to avoid the depression of which the manhole became the centre, because the road could not be repaired except by raising its surface, and that the manhole cover could not be raised without the concurrence of the Hinckley Rural District Council, which was not obtained, and which, as a matter of fact, was "stated to be non-obtainable." As to this latter ground of defence, the judge appears to have been somewhat incredulous—it certainly does seem to be strange that permission to raise the manhole cover should be "non-obtainable"—for he finds that the county council allowed the traffic to be resumed "without having used all reasonable endeavours to procure the Hinckley Rural District Council to raise the cover of the manhole to the new surface of the road, and the defendants were negligent in this respect." Briefly, he found that the county council were responsible for the

accident, because they raised the surface of the road to the extent they did above the level of the manhole cover, and allowed traffic on the roadway while the manhole remained as they left it. The lesson which the judgment carries would appear to be that mere measures of expediency in dealing with a manhole cover situated in a road undergoing repair have a particular danger of their own, and that where it is the question of a second authority being concerned it is imperative to obtain its consent to the works necessary before permitting the resumption of traffic upon the road. It is clearly a case where certain protective safeguards which ought to have been taken were, unfortunately, overlooked.

Summer Meetings.

Noteworthy among the meetings of the Institution of Municipal and County Engineers which are to be held after Whitsun are those at Dunfermline and Southend-on-Sea, in both of which towns there is likely to be a considerable gathering of members. Town planning bulks largely in the programme of the Scottish meeting, but the paper on the advantages of steam tractor haulage over team labour for road metal, which Mr. W. L. Gibson, the county road surveyor of the Western District of Perthshire, is to contribute to the proceedings, may be expected to elicit a discussion of some interest. That Mr. Gibson speaks with some authority on the subject with which he is to deal will be evident when it is stated that he is reputed to be the first county road surveyor in Scotland to adopt tractor haulage, and the account of his experience with this method of transportation, particularly as it will be accompanied by detailed statements of actual cost and comparative analyses, should be of the greatest value to his professional brethren.

It will not be the first visit of the institution to Southend, but the interval which has elapsed since the occasion on which the members last assembled there has been one of somewhat remarkable progress and development—to which the activities of the borough engineer, Mr. E. J. Elford, may be said to have contributed in no small degree—and many new and important works, several of which are in course of construction, will be thrown open to inspection. A week after Southend there will be a district meeting at Lytham, and on the same day the Wiltshire town of Tisbury will be visited by the Institution of Municipal Engineers. At Stockport the Institution of Water Engineers will hold its annual summer meeting from June 11th to 13th, and June 24th will witness the opening of the annual meeting and town planning, housing and road conference of the Institution of Municipal and County Engineers at Cheltenham, the full programme of which has already been given in our pages. In July the most important fixture is the annual congress and exhibition of the Royal Sanitary Institute, which takes place this year at Blackpool.

Highway Bridges in Birmingham.

The paper descriptive of recent highway bridges in Birmingham which was read by Mr. A. S. Parsons, ASSOC. M. INST. C. E., at the meeting of the West Midland District of the Institution of Municipal and County Engineers last Saturday, was a plain and unassuming record of important works successfully accomplished in the face of considerable difficulties. The total number of highway bridges within the city area is no fewer than 107, and of these 238 are maintainable by the corporation. It can easily be imagined, therefore, that extensive repairs and reconstructions are matters of constant occurrence. Thus, during the past year four highway bridges have been constructed, and Mr. Parsons' paper not only contains an interesting description of these works, but also an account of the general methods of design and construction adopted in the city engineer's office. The construc-

tion of the Aston Church-road bridge involved the demolition of the existing canal walls, the building of new waterway walls, and the paving of the invert with blue bricks in cement laid on concrete. This work had to be done within the space of eighty-six hours, which was the maximum time during which the company would allow the canal to remain empty. When the necessity of waiting for concrete and mortar to set and the restricted working area are taken into account, it will be seen that the most careful organisation and minute supervision were necessary to ensure success. In the case of the King's-road bridge, which was next dealt with by Mr. Parsons, a similar difficulty had to be met. Further, an agreement with the canal company necessitated an increased headroom, with a consequent steepening of the approaches. The other bridges described by Mr. Parsons were those in Forman's-road and Stratford-road. In the case of the latter, which carries the main road from Birmingham to Stratford-on-Avon over the river Cole, the opportunity was taken of straightening the river by constructing the new bridge midway between two old ones, and then turning the river under it. The paper concluded with some general notes giving particulars of the materials used in the bridge work supervised by the city engineer's department, and some account of the method of design employed for bridges of moderate span. It was received with great attention, and produced a very useful discussion. A full report of the meeting will be found in another column.

The discussion on Mr. Parsons' paper centred in the main around two points—namely, the absence of reinforced concrete in the bridges which had been described and inspected and the desirability from a public point of view of artistic and ornamental design. The first of these matters was raised by Mr. A. T. Davis, who presided in the absence of Mr. Stilgoe. He pointed out that by using this material bridges which were divided into two might have been constructed in a single span. With this view Professor Lee, of Birmingham University, agreed, and pointed out that by the adoption of ferro-concrete in one or two cases some headroom might have been saved and the necessity for excessively steep gradients avoided. Some other members expressed surprise that reinforced concrete had not been used, but the matter was ultimately explained by Mr. Gray, who stated that this construction had been tried on one bridge, but that traffic difficulties, coupled with the delay caused by allowing the time necessary for the work to settle before opening the bridge for traffic, had caused such an outlay that it had been decided to abandon the use of ferro-concrete for bridge work in the central portions of the city. The question of artistic treatment was raised by Professor Lee, who praised the finer sense of beauty displayed by the old-time bridge builders. In his reply Mr. Parsons agreed that bridges ought to be made as ornamental as possible—with the funds at disposal. It is only too true that architects and engineers, even when acting for a public authority, cannot give full expression to their own ideas and ideals because of considerations of economy which are forced upon them.

A Veteran Road Nuisance.

For some years past a traction engine domiciled near a town in one of the Home Counties has been a serious nuisance to the inhabitants of the district partly on account of the vibration caused by its passage along the roads and streets, but even more on account of the loud noise, amounting to a roar, which it makes whenever it is moving. The local council have been informed that the county council have no power to prevent heavy locomotives being used on the highways provided they do not exceed the legal weight, and on the off-chance that this notorious vehicle does contravene the regula-

tions in this respect it is to be weighed before the licence is renewed. One would have supposed that, apart from the question of nuisance, the engine might be considered as a vehicle which is always driven "to the common danger," since the noise which it makes is so great that a person who is near it cannot hear the approach of other vehicles. The combination of this deafening noise and of the effect which the engine has upon a lively horse certainly tends to accidents. It has been stated, though for the truth of this we do not vouch, that cyclists riding past the engine sometimes find that their lamps and pumps have been shaken off on to the road. As to the effects of this engine upon the roads, it will be realised that a vehicle of this description is necessarily more damaging to tarred surfaces and to the crusts of by-roads than are traction engines which are more firmly held together. It is a pity that in a case like this the various local authorities concerned do not act in concert and put an end to the activities of vehicles which, in common sense, ought not to be allowed on the roads: but, in justice to the road authorities immediately concerned, it must be pointed out that the local magistrates, as we understand, refused some time ago to countenance the suppression of the nuisance on the ground that it helped to provide a living for a number of workpeople. It is difficult to believe, however, that the industry in which this traction engine is used could not get along perfectly well, if not better, without it.

* * *

Sewer or Drain? The Committee stage of the Walsall Corporation Bill was made the occasion of the official opposition of the Local Government Board to Clause 69, which had been inserted to amend the definitions of "sewer" and "drain" as contained in section 4 of the Public Health Act, 1875. Our readers are sufficiently familiar with the difficulties—both practical and legal—which have arisen out of these definitions, and even more out of the provisions of section 19 of the amending Act of 1890 as to nuisances occurring in a "single private drain." Expert opinion is practically unanimous that some amendment of the law is urgently required, but unfortunately up to the present Parliament has not found time to deal with the matter, although more than one Bill has been presented to the House of Commons to clear up the question and to lay down a general principle. The opposition of the Local Government Board was not based upon the merits of the suggested clause, but upon the ground that the subject was not appropriate for legislation applicable only to particular districts, and especially where sewers and drains had already been constructed under the general law. We are bound to say that in our view there is much to be said for this contention, and it is a little unfortunate that the practice of Local Legislation Committees has not been uniform, inasmuch as clauses have been allowed in some Bills and disallowed in others. Once the principle of local legislation with regard to the matter has been admitted, it is difficult to see why a clause should be refused in any particular case. We are therefore able to congratulate the Walsall Corporation on obtaining their clause, but at the same time we hope that the granting of such clauses may not delay a much-needed and long-delayed amendment of the Public Health Acts.

* * *

Highways in Devonshire. The annual report of Mr. Frank J. Harris, the surveyor to the Holsworthy Rural District Council, is a courageous document which very frankly sets forth the administrative difficulties of the position which he occupies. In the first place, it must be remembered that the area of the district

is 84,820 acres, and that it contains 281 miles of roads, of which 44 miles are county main roads and the remainder district roads. Further, Mr. Harris's task is rendered all the more difficult by reason of the fact that the subsoil is generally of clay. Prior to 1907 it appears that the main roads were starved, and at the present time both these roads and the district roads are feeling the effect of modern traffic. For the entire superintendence of these roads Mr. Harris, who is allowed no travelling expenses, no assistant, neither clerical assistance nor office accommodation, and not even a foreman, is paid the beggarly annual salary of £140. Little wonder that he feels bound to draw the earnest attention of the council to the work of his department, and particularly to the probability of the county council themselves undertaking the maintenance of the main roads in the near future. It is not often that an annual report of this kind, which shows a good year's work accomplished under very discouraging circumstances, concludes by the writer asking his council for a testimonial to enable him to apply for a more lucrative and certain appointment: but there can be little doubt as to Mr. Harris's justification in taking such a course. We draw attention to the case of Holsworthy because we believe that it is only typical of what is going on in many other districts. If the local authorities cannot afford the due maintenance of the highways in their districts, it is high time that further Exchequer relief should be forthcoming.

* * *

What is a Chain? A correspondent who speaks with great authority on the subject has called our attention to a common error committed by surveyors and even the writers of textbooks in using the word "chain" to denote indiscriminately either a length of 66 ft. or one of 100 ft. He points out that the standard gauge in Trafalgar-square speaks of a 66-ft. *chain*, but of a 100-ft. *measure*. The confusion probably arises from the fact that a measuring *instrument* of either length (or, indeed, of any other length) may be correctly described as a chain, if it is actually made in that form. Gunter's chain, of length 66 ft., which is in general use among land surveyors, must be held responsible for giving the name "chain" to a measure of length, and the name link to the smaller unit—i.e., one-hundredth part of 66 ft. The convenience of measuring land in chains and links lies in the fact that the chain is an aliquot part of a mile, and that 10 square chains make up 1 acre. It should be carefully borne in mind, however, that when the term "chain" is used to denote a measure of length, it can only be so used with accuracy if the 66-ft. length is meant.

* * *

Middlesex and Motor Omnibuses. Among the opponents to clause 25 of the Middlesex County Council (Western Road and Improvements and Finance) Bill, under which the county council seek powers to levy a local charge of 3d. per vehicle per mile upon owners of motor omnibuses using the new Western Road, are the Roads Improvement Association. The council of that body have decided to carry their opposition, if necessary, to the House of Lords. The association are opposing the principle only; they make it clear that they are not concerned with the question whether motor omnibuses or any other form of traffic are sufficiently taxed, having regard to the benefits they derive from the public services. The association feel that the re-enactment of local tolls or local taxation in any form upon traffic for the use of particular highways would be an unjust and retrograde movement, and would prove a great inconvenience to and hardship upon the community at large. The association's view is that all taxation imposed on vehicles should be imposed direct by the State, and afterwards disbursed by the State, as at present.

Institution of Municipal and County Engineers.

WEST MIDLAND DISTRICT MEETING AT BIRMINGHAM.

The members of the West Midland District of the Institution of Municipal and County Engineers met at Birmingham on Saturday last. Starting at the Council House, they first proceeded on an inspection of a number of the City's highway bridges, and later assembled to discuss a paper prepared by Mr. A. S. Parsons, Assoc.M.INST.C.E., a member of the staff of the City Engineer, Mr. H. E. Stilgoe, M.INST.C.E., those present including Messrs. A. T. Davis (Shropshire), district chairman, presiding, A. D. Greatorex (West Bromwich) and J. Lobley (Hanley), past-presidents; W. E. Ballard (Birmingham), R. Blanchard (Cannock), W. A. H. Clarry (Sutton Coldfield), H. J. Coleby (Atherstone), F. C. Cook (Nuneaton), hon. district secretary, A. J. Dickinson (Redditch), S. Douglas (Kenilworth), J. Gammage (Dudley), J. S. King (Birmingham), Measham Lea (Karachi), G. W. Lacey (Oswestry), J. Moncur (Staffordshire), R. C. Moon (Nuneaton), A. S. Parsons (Birmingham), W. Plant (Stafford), members; R. Fletcher (Worcestershire), E. J. Goodacre (Shrewsbury), A. R. Gray (Birmingham), B. C. Hammond (Worcestershire), A. P. Howell, J. Perkins, W. C. Rubie, E. W. Turner, W. N. Thomas, N. G. Tomey (Birmingham), E. Willan (Bilston), associate-members; and T. S. Griffin (Wolverhampton), student.

A vote of thanks to Mr. Stilgoe for entertaining the members to tea was proposed by Mr. A. T. Davis, the district chairman, who expressed regret that, owing to indisposition, their host was unable to be with them that day. In his absence they wished to say how grateful they were to him for giving them facilities for meeting in that building for the business of the district and arranging for visits to the works of the City. As most of them were aware, Mr. Stilgoe had unfortunately been laid aside, they hoped temporarily, by illness, and was unable to be present with them. They wished him a speedy return to health.

The vote of thanks having been heartily accorded,

Mr. A. R. GRAY (Birmingham) promised to convey their very kind wishes to Mr. Stilgoe with their hopes for his speedy recovery. Mr. Stilgoe had wished, if possible, to attend the tea, if not the later meeting, but unfortunately he had not been able to be present.

At the ensuing business meeting Mr. A. T. Davis (Shrewsbury) was in the chair.

Mr. F. C. COOK (Nuneaton), honorary district secretary, said their first business was to elect a chairman of the district for the ensuing year. He would like to read a letter which he had received from Mr. Stilgoe regretting his inability to be with them:—

"I regret that I am prevented by a severe cold from attending the meeting of the Institution of Municipal and County Engineers to-day. I had looked forward to the meeting, but hope that the members will obtain all the information they require with regard to the bridges from my assistants, Mr. Gray and Mr. Parsons, who will be present."

RE-ELECTION OF DISTRICT CHAIRMAN.

Mr. A. D. GREATOREX (West Bromwich) proposed that Mr. A. T. Davis, county surveyor of Shropshire, be re-elected chairman of the district. At the last meeting of the Executive Committee it was agreed that Mr. Davis should be again nominated for the position of chairman of the West Midland District, and when that proposal was brought before a general meeting it was accepted. He had great pleasure in proposing that Mr. Davis be elected chairman of the district, and in doing so he would like to thank him for the very excellent way in which he had conducted the business of the district during the past year.

Mr. J. MONCUR (county surveyor of Staffordshire) seconded the re-election of Mr. Davis. He felt they could not choose a better chairman; certainly they could not have one who took a greater interest in the work of the district.

Mr. F. C. COOK (Nuneaton) said he wished to be allowed to express his appreciation of all Mr. Davis had done during the time he had been chairman of the district. On every occasion he had had to speak or to write to Mr. Davis upon the work of the district he had taken the fullest interest in the work, and he hoped Mr. Davis would allow himself to be re-elected.

The resolution was unanimously carried.

Mr. A. T. DAVIS, in acknowledgment, thanked the

members for their vote of continued confidence. He would, owing to his other engagements, have been glad to be relieved of the position. It was none of his seeking in the first place. When the system of district committees came into force they did him the honour of inviting him to be chairman of the West Midland District, which was part of the old Midland district of which he was honorary secretary for ten years. He had a great love for the institution, and anything he could do for it would be a pleasure to him.

The following paper was submitted to the meeting

RECENT HIGHWAY BRIDGES IN BIRMINGHAM.

By A. S. PARSONS, ASSOC.M.INST.C.E.,
Engineering Assistant to the City Engineer and Surveyor
of Birmingham.

[Mr. Parsons was born in Birmingham in 1884, and educated at King Edward VI. school. He has been successively pupil and assistant to the borough surveyor of Aston Manor (Mr. G. H. Jack), assistant to Mr. H. J. Hamp, borough surveyor of Swindon, deputy surveyor of Aston Manor, and engineering assistant to the city surveyor, Birmingham. During his fourteen years in the profession he has been engaged on tramway construction to the value of £250,000, the building of eleven bridges, a twenty-four-bed isolation hospital, an 8,000-kilowatt electric station, a highways depot, costing £8,000, a refuse destructor, main road reconstruction works, costing upwards of £30,000, and extensive sewerage and sewage disposal works. He is an associate-member of the Institution of Civil Engineers, a professional associate of the Surveyors' Institution, and a member of the Institution of Municipal and County Engineers.]

The city of Birmingham has an area of 43,601 acres, a population of 840,372, and for administrative purposes is entirely within the county of Warwickshire. It is served by four railway companies, owning within the city 55 miles of track (excluding sidings); five canal companies, owning 35 miles of canal; and it has also within its boundaries 62 miles of rivers and streams.

There are 101 highway bridges over canals, 105 over railways, and 201 over rivers and streams, and of the total of 407, 238 are maintained by the city of Birmingham. Owing to the early date of their construction, the bridges over canals are constantly needing attention, and during the past twelve years eighteen of these have been re-built or strengthened. Under the exigencies of increasing traffic and population, the provision of new, or the alteration of existing, bridges over rivers is called for, and within the same period sixteen cases have been dealt with.

During the past year there have been four highway bridges constructed, and the object of this paper is to give some account of each, and to indicate briefly the general methods of design and construction adopted in the city engineer's office. The four bridges referred to are: (1) Aston Church-road, (2) King's-road, (3) Forman's-road, (4) Stratford-road. There is one other bridge well in hand.

ASTON CHURCH-ROAD BRIDGE.

This bridge replaces the structure erected in 1842 by the Birmingham and Warwick Junction Canal

Company to carry the path leading from Washwood Heath to the parish church at Aston over their new canal. The canal was constructed on the east bank of the river Rea, the old bridge spanning both canal and river. There were three brick arches, two of 28-ft. span and one of 32-ft., and the width of roadway was 15 ft. between parapets. This width, although possibly quite adequate at the time, very quickly became insufficient, and the bridge was for many years considered to be one of the most inadequate in the city.

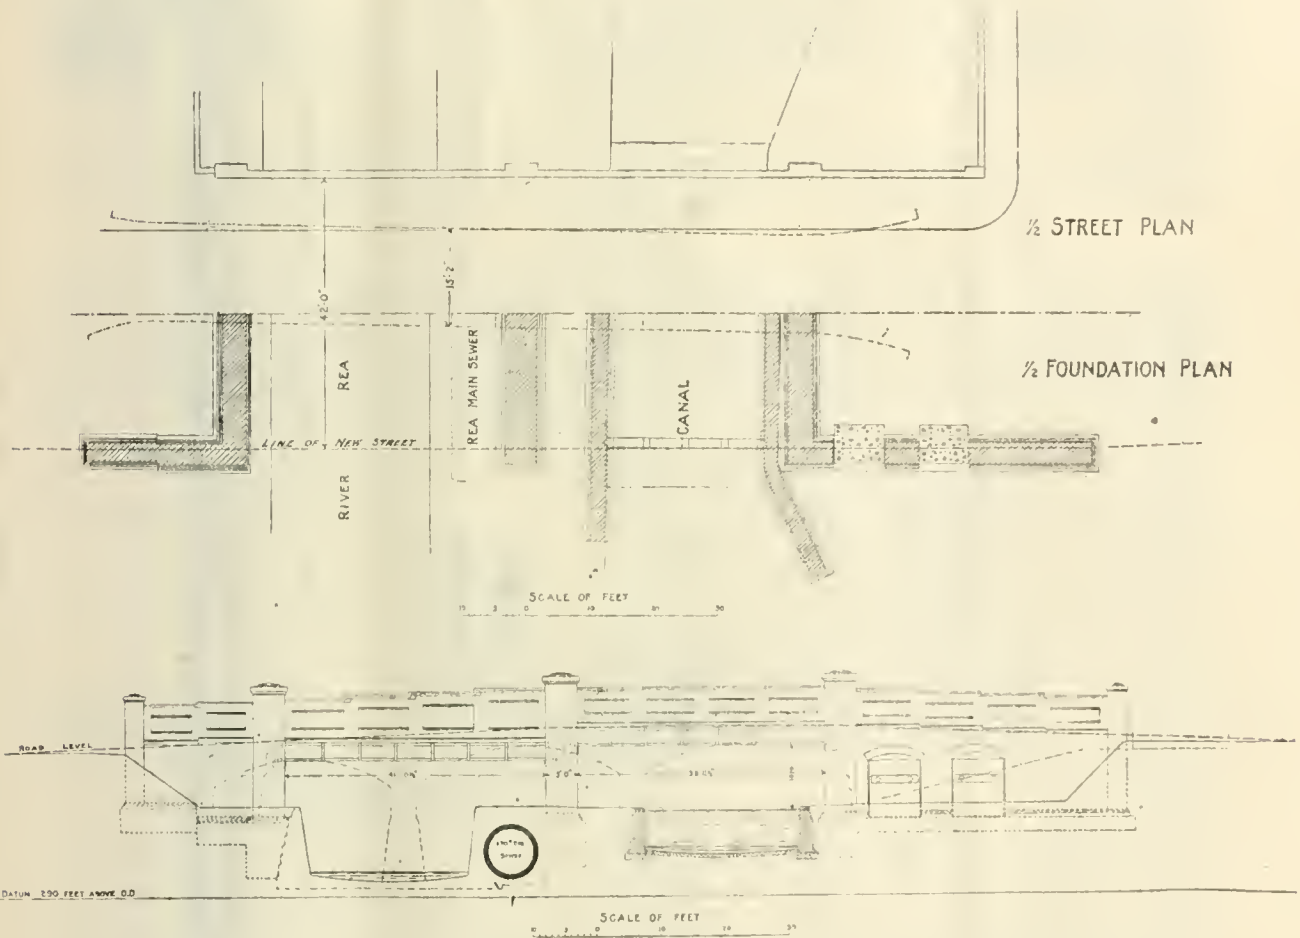

The reconstruction of this bridge was under consideration, and as the gas and electricity departments asked for accommodation on the bridge for a 36-in. main and a large number of cable ducts, a scheme was prepared for rebuilding.

The requirements for gas main and cables necessarily limited the design to some extent, as it was impossible to provide the accommodation asked for except by utilising the space under the footpaths; but it was further affected by the demands of the canal company, and also by the presence of the 7-ft. dia-

vantages. The plates from which it is made are a stock product and can be obtained at short notice, whereas delay sometimes occurs in the production of a rolled section owing to the particular number being out of stock, and the unwillingness of the manufacturer to put in rolls for a small order. Again the riveting is in a more accessible position, making the field work more speedy.

Cover plates can, of course, be used with either form, but to be economical must be properly riveted to the troughing and calculated to take their proportion of the stresses. The saving in total weight of flooring (neglecting asphalt and road formation) due to the elimination of concrete filling is about 68 per cent, which, by reducing the stress in the main girders, effects a saving in their weight also. In this particular case the weight of steelwork (girders and troughing) comes out at 56 lb. per foot super., a moderately low figure in relation to the spans and loading.

The obvious objection to the use of cover plates is the impossibility of painting the internal surfaces.

ASTON CHURCH-ROAD BRIDGE.

(Plate I., Figs. 1 and 2.)

meter Rea main sewer between the canal and river. The design adopted was the one shown in Plate 1. This provided a width of 42 ft. between parapets, and complied with all the conditions laid down by the parties affected.

The spans are, west 41 ft., east 39 ft., and they are composed each of two parapet and two main girders carrying trough flooring. On each span the parapet girders are level for the sake of external appearance, but the main girders on the west span are inclined at a slope of 1 in 25, that being the gradient of the roadway over them. This arrangement secures a nearly constant depth between road surface and steelwork, and, together with the special type of road troughing adopted, gives a minimum depth of concrete under the road formation, thus saving a large amount of dead weight. The additional height given by the kerb was utilised to obtain a deeper main girder, while the footpath troughing was kept hard down on the bottom angles to secure the maximum cross-sectional area for pipe and conduit laying.

Pressed troughing was used throughout for the flooring, that under the carriageway being fitted with cover plates. This type of trough, though theoretically less efficient than rolled troughing, has its practical ad-

This difficulty can be met, to a great extent, by coating with a non-rusting compound before assembly.

Val de Travers asphalt, $\frac{3}{4}$ in. thick, was laid on concrete floating over the whole of the steelwork, and the footpath trenches are drained to catchpits in the piers. Concrete was then brought up to the necessary camber and falls, and paved with 4-in. Enderby cubes jointed with $2\frac{1}{2}$ to 1 cement grout. All brickwork is built of Hamblett's brindled bricks in 2 to 1 cement mortar, and coped and capped with Pennant stone.

As the new east pier encroached to a small extent on the canal waterway, the canal company asked for the length of canal under the bridge to be reconstructed. This involved the demolition of the existing canal walls, the building of new waterway walls $3\frac{1}{2}$ bricks thick, and the paving of the invert with blue bricks in cement on 6-in. concrete. The time during which the company would allow the canal to remain empty of water was restricted to eighty-six hours, during which time the following work was done:—

- 72 cub. yds. of brickwork demolished.
- 300 cub. yds. of excavation taken out (mostly slurry).
- 22 cub. yds. of concrete placed.
- 45 cub. yds. of brickwork built.

145 super. yds. of concrete and blue brick invert laid.
 32 lin. yds. of 21-in. by 10-in. stone coping and cast-iron guards fixed.
 49 lin. ft. of 18-in. by 7-in. sill constructed, and two pairs stop-plank grooves built in.

When the necessity of waiting for concrete and mortar to set and the restricted working area are taken into account, it will be understood that careful organisation and minute supervision are essential to the successful completion of the work within the time limit. It is an advantage if a supply of quicker setting cement can be at hand for this class of work, but considerable care has to be exercised in this connection to ensure that rapidity of setting is not attained at the expense of soundness.

The order to commence work was given on July 1, 1913, and the bridge opened for traffic on February 18, 1914, the contractors being—

Steelwork: Messrs. Braithwaite & Kirk, West Bromwich.

Building Work: Messrs. John Wilson & Sons, Handsworth.

The estimated cost was £5,000, and the actual detailed costs were:—

Steel decking, girder and concrete screeding, 9s. 2d. per super. ft.

Asphalt, 6d. per super. ft.

Concrete, 7½ in. thick, and setts, 11s. 6d. per super. yd.

Foundations to ground level (total cost for bridge only), excluding wing walls, £315.

Canal work (total cost), £565.

KING'S-ROAD BRIDGE.

King's-road, Hay Mills, is a thoroughfare leading from Coventry-road to Tyseley Station, and was carried over the Warwick and Birmingham Canal by a single span brick arch bridge erected in 1792, giving a canal waterway of 14 ft., a headway above water level of 8 ft. 6 in., and a width between parapets of 13 ft. 6 in.

The reconstruction of Tyseley Station, its growing importance as the junction of the new North Warwickshire line with the old Great Western main line, and the rapid development of the adjoining district, forced on the late Yardley Rural District Council the necessity for rebuilding the bridge. The negotiations with the Canal Company were nearly completed when Yardley was absorbed by Birmingham.

An agreement subsequently entered into with the company in respect of the new bridge provided for a canal waterway of 19 ft. wide, a towing path 8 ft. wide, a width of 28 ft. between abutments, a depth of water of 5 ft. 6 in., and a headway above water level of 10 ft. This increased headroom is typical of most cases of canal bridge reconstruction, and is frequently the sole reason for the perpetuation of steep approaches.

Unfortunately the existing gradient leading up to the old bridge on the north side was already 1 in 15 average, with 1 in 11 maximum, and after allowing for the increased headway it was found impossible to obtain any better gradient than 1 in 17 average, with 1 in 12½ maximum. The new bridge is a single span brick arch, five rings thick, 28 ft. span, 5 ft. rise, 22 ft. 3 in. radius, with its axis at an angle of 84 deg. 15 min. to the centre line of roadway; the abutments are 5 ft. 3 in. and 6 ft. 3 in. thick at the base, and 5 ft. 3 in. at the springing level.

The lowest level of excavation was 9 ft. 6 in. below water level, and as the time during which the canal could be empty was limited to the usual eighty-six hours, an attempt was made to construct the south-west abutment behind a cofferdam. This dam was of the usual type—two rows of 9-in. by 3-in. sheeting packed with clay puddle—and answered sufficiently well for all the excavation to be done behind it, but just as the ground was bottomed up for concrete an empty boat collided with the dam, and all attempts to make it watertight again failed. Subsequent investigations revealed the fact that the sheeting had not been driven to a sufficient depth, and pointed to the conclusion that a much better job would have been obtained by using 7-in. by 2-in. sheeting, which can be driven by hand much more easily, its displacement being roughly 50 per cent only of the larger size.

Under the agreement with the Canal Company the water should have been out of the canal early on Easter Monday morning, but owing to the failure of the Canal Company's stop planks, &c., a start could not be made on the work till 2 p.m. on Tuesday. During the next eighty-six hours the following work was done:—

96 cub. yds. brickwork demolished.
 240 cub. yds. excavation taken out.
 80 cub. yds. concrete placed.
 176 cub. yds. brickwork built.
 160 sup. yds. brick invert and concrete laid.

The waterway walling was 2 ft. 3 in. thick at the base, and stood on concrete 12 in. thick. A large portion of its length is curved in plan, and this was

ASTON CHURCH-ROAD BRIDGE: CROSS-SECTION.
 (Plate I, Fig. 3.)

built to the templates from which the iron guards to be fixed on the top had been cast. This method answered quite well, though some difficulty was experienced in fitting the guards on the walls, owing to warping and contraction in the castings. This

force to be left for short intervals, to set—still further reducing the time available for its completion. It was ultimately built up to the required level within the time, but at the expense of the face work, which became slightly out of plumb in small patches.

ASTON CHURCH-ROAD BRIDGE: DETAIL OF ROAD TROUGHING AND CONNECTIONS.

(Plate I., Fig. 4.)

would have been obviated had the templates been adjusted to the actual castings when delivered, but lack of time and space prevented this being done.

In building the south-west abutment the most troublesome feature was the slowness of setting of the mortar. Such a large mass of brickwork (46 ft.

When the canal had again been filled, the north-east abutment was constructed behind the shelter of the new waterway wall, which proved to be quite watertight, and the whole of the brickwork was then raised to springing level. Owing to delays at the quarry, the stone springers for the oblique arch were

KING'S-ROAD BRIDGE: PLAN.

(Plate II., Fig. 1.)

long, 6 ft. 3 in. thick, 8 ft. high) would, in the ordinary way, be taken up very slowly, but in this case it had to be built in forty-eight hours. Although every care was taken to keep the work as dry as possible, it rapidly became unstable and had per-

not delivered in time for use, and the arch sprung from cut blue brick skewbacks.

As it was imperative that traffic along the canal should not be interrupted during the turning of the new arch, the usual type of timber centering could

not be used; 7-in. by 4-in. rolled steel joists, 5 ft. apart, bent to radius and fitted with shoes, were employed, and covered with 3-in. laggings. It was anticipated that, owing to the lack of ties, there would be a tendency for the feet of these ribs to spread and bind against the brickwork, and to obviate this folding wedges were used at the back of the shoes to allow of their easy liberation. This the wedges did admirably.

Concrete haunching was placed on the arch, the crown waterproofed, and the road surface paved with 1-in. Enderby cubes on 6 in. of concrete.

All the blue pillar caps, copings, and bricks were supplied by Messrs. Hambletts.

The work was commenced on February 26, 1913, and the bridge opened for traffic in November, 1913. A great deal of delay was caused by strikes and delays in delivery of materials.

The estimated cost was £3,250, and actual detailed costs were:—

Arch and concrete haunching, 3s. 10d. per super. ft.

Concrete 6 in. thick, and setts, 11s. per super. yd.

Foundations (bridge only) to ground level, including wing walls, total £923.

Canal work, total £511.

The contractors were Messrs. Curall, Lewis & Martin, Limited, of Birmingham.

FORMAN'S-ROAD BRIDGE.

Forman's-road is an old highway leading from Sparkhill to Tyseley, and carries a good deal of east

3-in. sheeting driven into the gravel and packed with puddle. By closing the spaces between the ends of this dam and the river banks, first on one side and then on the other, the excavation and concreting were executed in two portions. Owing to the flooding previously mentioned, the dam was overflowed on several occasions and the work submerged.

The lowering of the river bed exposed the footings of the house on the south-west side of the river, and a low breast wall was built to support them. This was successfully carried out in short lengths without damage to the property. On the north-east bank a heavy retaining wall was erected to support the house and garden on that side.

Enderby setts, 4 in. by 4 in. by 1 in. on 6-in. concrete, are used as carriageway paving over the bridge.

All the facing bricks are Hambletts', the common bricks being from the Aldridge Brick Company. The stone caps, copings and skewbacks are Fishponds Pennant, and the contractors for the work were Messrs. J. Wilson & Sons.

The construction of the bridge was commenced in February, 1913, and it was opened for traffic in November, 1913, the estimated cost being £3,000, and detailed actual costs—

Arch (including concrete), 2s. 10d. per super. foot.

Setts and concrete, 10s. per super. yard.

Foundations (bridge only), total cost £319.

The necessary making up of the 350 lin. yds. of approach roadway to the standard 42-ft. cross-section involved about 6,000 cub. yds. of filling and 350

KING'S-ROAD BRIDGE: SECTION.

(Plate 11, Fig. 2.)

and west traffic. The river Cole was crossed by a ford, which frequently was impassable for days together owing to the flooding to which the river is subject. This trouble is certain to be accentuated in the future, as the upper part of the valley of the Cole offers one of the most pleasant and eligible building areas within the city boundary, and it was therefore decided that a cross-sectional area of 260 sq. ft. of waterway was desirable. On taking into consideration the floor levels of the houses which existed on either side of the river it was found that two spans were necessary to give the required area.

The two arches are each of 20 ft. span, 13 ft. 6 in. radius, 4 ft. 6 in. rise, and four rings thick, their axis being at an angle of 79 deg. to the centre line of the roadway. The abutments are 3 ft. 9 in. thick, with counterforts, the centre pier 4 ft. 6 in. thick, and the width between parapets 42 ft.; the arches spring from Pennant stone springers, are backed up with concrete, waterproofed, and the centre spandrels drained by a 4-in. pipe discharging into the river.

In conformity with the general scheme of improvement for the river Cole, the bed of the river was lowered by about 2 ft. in the vicinity of the bridge, and is inverted with blast-furnace slag 8 in. thick, grouted with cement and slag chippings, and laid on concrete 6 in. thick. A temporary weir marks the termination of the deepening of the bed on the upstream side, its function being to prevent the washing down of the gravel from the upper to the lower levels.

For the purpose of carrying out that portion of the work which was below water level, a longitudinal cofferdam was put in, constructed of two rows of

lin. yds. of new sewers, with connections, the estimated cost being £3,250. The contractors were Messrs. Curall, Lewis & Martin, Limited.

STRATFORD-ROAD BRIDGE.

This bridge has replaced two old bridges carrying the main road from Birmingham to Stratford-on-Avon, over the river Cole; the old bridges were of brick, 31 ft. between parapets, and their arches gave a total effective waterway of 78 sq. ft. The more easterly of the two bridges spanned the original course of the river, and was a county bridge up to the time of the absorption of Yardley by Birmingham. It had been silted up for some years. The western bridge was over the overflow stream from a sword mill erected very many years ago and since demolished, and was constructed and maintained by the owner. Under increasing traffic this liability for maintenance became a serious one, and in 1912 the owner, in consideration of its assumption by the city corporation, surrendered a considerable amount of land in the vicinity for street improvement purposes. Owing to the silting up of the county bridge, this private bridge was compelled to take the whole of the river flow, and its insufficiency of aperture, together with the devious course of the river which led to it, gave rise to such severe flooding in times of storm as to seriously depreciate the value of the adjacent low-lying land.

The Birmingham Corporation Act of 1912 authorised the construction of tramways along this portion of Stratford-road, with the necessary street widenings, and the opportunity was embraced of straightening the river by constructing a new bridge midway between the old ones, and then turning the river under it.

This method enabled the whole of the new work to be done in comparatively dry ground.

The new bridge is 60 ft. between parapets, and has two brick arches, each 25-ft. span, 19-ft. 7-in. radius, five rings thick, which give a waterway area of 260 sq. ft. As Stratford-road is the main entrance to the city from a large and growing residential quarter, some attempt was made to give a definite architectural character to the new structure. To this end the brick sub-structure is surmounted by a Portland-stone balustrade, with three pillars on either side, the corner pillars carrying ornamental wrought-iron lamps. The concrete foundations are 4 ft. deep, the brick abutments 5 ft. 3 in. thick, with counterforts; the arches spring from grey Forest of Dean skewbacks, are backed

Portland stone balustrade and cornice, £3 0s. 3d. per foot-run.

Main pillars from underside cornice, £50 each.
Main pillars, 8s. 9d. per cub. ft.

River invert on concrete, 6s. 9d. per sq. yd.

Slag walling, 15s. per cub. yd.

Completed channel, including excavation, 4s. 6d. per cub. yd.

Complete channel, standard section, £7 10s. per lin. yd.

The contractor for the work was Mr. A. Hopkins, of Birmingham. All the bricks were obtained from Messrs. Hadleys, of Brierley Hill; the grey Forest of Dean stone from the Bixhead No. 3 quarry of the United Stone Firms, Limited, and the Portland stone

FORMAN'S-ROAD BRIDGE: PLAN.

(Plate III., Fig. 1.)

up with concrete, and the crowns waterproofed and drained to catchpits. Creosoted deal paving on 9-in. concrete is used for the roadway paving, and a double line of tramway crosses the bridge.

On Plate 5 is shown a typical section through the river bed. The invert is constructed of blast furnace slag, 8 in. thick, jointed with cement grout and slag chippings, laid on 6-in. concrete, and has a dishing of 15 in. in 28 ft. The retaining walls are also of slag in cement mortar, and are built with a batter of 1 in 6.

The estimated costs were—

Bridge, £3,750.

River work, £2,700.

Detailed costs are—

Arch and concrete backing, 2s. 9d. per super. ft.
Concrete and wood paving, 15s. 3d. per super. yd.

is Whitbed, from the Easton quarries of Messrs. Barnes, Isle of Portland.

The work was commenced in July, 1913, and traffic first crossed the new bridge in March, 1914.

GENERAL NOTES.

In the following notes the author proposes to give particulars of material in general use in the bridge work supervised by the city engineer's department, followed by an indication of the method of design employed in bridges of moderate spans. He recognises that anything approaching an exhaustive treatment would expand the paper to an unlimited length, but hopes that the points mentioned may be interesting.

MATERIALS.

The concrete used is composed, by measure, of three parts of local sand (new red sandstone, Bunter

beds), four parts 2-in. cold-blast slag, and one part British standard (medium setting) Portland cement.

Each consignment of cement is tested before being used, and any sample not passing the specified tests is rejected. The department has a properly fitted test room for carrying out the necessary physical tests, and, what is equally important, an assistant who has been specially trained in this delicate work. There are not many rejections, the principal troubles in the samples thrown out being in regard to setting time. Rotary kiln cement is erratic in setting, though possibly its vagaries are due in a large degree to the insufficient time allowed for cooling in the storage bins during a busy season.

Where concrete is used next steelwork the slag is replaced by Harts Hill chippings, to obviate any risk of corrosion by the sulphur compounds.

The common bricks used are all Black Country brindles, carefully selected for soundness and thoroughness of burning. The blast-furnace slag used is specified to be cold-blast slag, free from cinders and porous lumps, and to be of a dark colour where used for facing. It is a difficult material, from the clerk of work's point of view, because of its infinite variations in quality; at its best it closely resembles Rowley ragstone, at its worst furnace clinker, and the price paid at the slag mound will not permit of much grading.

Cement mortar is exclusively used for brickwork,

effect of the live load, the margin being 15 per cent over the usual stress of 7½ tons for dead loads.

Bending moments and shearing forces on girders are obtained graphically from diagrams drawn with the load in several positions, the curve enveloping the various diagrams being that of an equivalent distributed load. To this curve is added the parabola due to the weight of the girder and the dead loads, and the maximum bending moment thus obtained, divided by the working stress, gives the required section modulus for the girder under consideration. From this modulus the maximum section of the girder is worked out in the usual way, having regard to the condition of flange width, total depth, &c., which the particular girder has to satisfy. The flange plates are then curtailed by means of the bending moment diagram. Machined bearing plates are provided under the principal girders, which are set on 10-lb sheet lead on stone pads.

The trial thickness of brick arches is determined by the formula—

$$T = \frac{3}{8} \sqrt{S}$$

where T = thickness at centre in feet,
S = span in feet.

A stress diagram is then drawn by Fuller's method, which gives the curve of equilibrium for the whole arch under any given loading at the first trial. This line should be enclosed by the middle third of the

FORMAN'S-ROAD BRIDGE.

(Plate III., Fig. 2.)

in the proportion of 1 part of cement to 2 parts sand. The extra cost of cement over lime is quite justified by the additional strength of the work.

METHOD OF DESIGN.

The maximum live load for bridges in Birmingham is now taken to be a traction engine drawing a boiler wagon, with the following axle loads:—

- Engine, front axle, 7½ tons.
- Engine, rear axle, 15 tons.
- Boiler wagon, front axle, 20 tons.
- Boiler wagon, rear axle, 20 tons.
- Wheel bases, 11 ft. 6 in.; track, 6 ft. 6 in.
- Front wheel of wagon to back wheel of engine, 14 ft. 6 in.

For trough decking each wheel load is taken as concentrated on two sections of troughing, and for arch work as distributed through a cone of 90 deg. apex angle. One cwt. per super. foot is taken as the maximum likely to occur from a crowd load, and is an ample provision.

In calculating the dimensions of the different parts of the structures, the following are taken as the maximum working stresses:—

- Mild steel:—
- 28-32 tons ultimate tensile strength, elongation 20 per cent in 8 in. { tension 6½ tons per sq. in.
- compression 6½ tons per sq. in.
- shear (webs) 3 tons per sq. in.
- shear (rivets) 5 tons per sq. in.
- bearing 8½ tons per sq. in.
- Concrete:—Compression 5 tons per sq. ft.
- Tension nil.
- Brindle bricks (2 to 1 cement mortar) Compression 10 tons per sq. ft.
- Pennant stone 40 tons per sq. ft.

Six and a-half tons per square inch is considered to be a sufficiently low working stress to allow for the

arch, but this condition cannot always be obtained under the conventional methods of load treatment.

The usual way of considering the wheel loads in the same track as being borne by a single parallel section of arch is not, in the author's opinion, a fair one. It is generally assumed that a concentrated load on a road surface is transmitted through the earth filling to the arch as a cone of pressure of 90 deg. apex angle, and it is only logical to think that the pressure is then distributed through the arch brickwork in the form of a truncated triangle with its base on the abutment. The width of the base of this triangle depends, of course, on the angle of distribution of stress in the brickwork, about which there is not, in the author's knowledge, a large amount of information available. That some such action does occur cannot be doubted, and for this reason a certain amount of latitude is allowable in the position of the thrust line, both within an arch and in an abutment.

It will be obvious that, as the distance of the load from the springing of the arch increases both vertically and horizontally, more abutment weight comes into play as a resisting force, until a point is reached where one may safely take the whole length of abutment as resisting overturning; but for arches of small span with little cover the angle of distribution of the stress is a vital factor in economical design.

The author has made this digression in hope that it will elicit the experience of members on the point.

Having found the magnitude and direction of the thrust of the loaded arch, the minimum section of abutment is ascertained by plotting the opposing forces and considering the position of the resultant on the base. Counterforts are considered to act as part of the abutment itself, their specific gravity being taken at a reduced figure in proportion to their size and spacing.

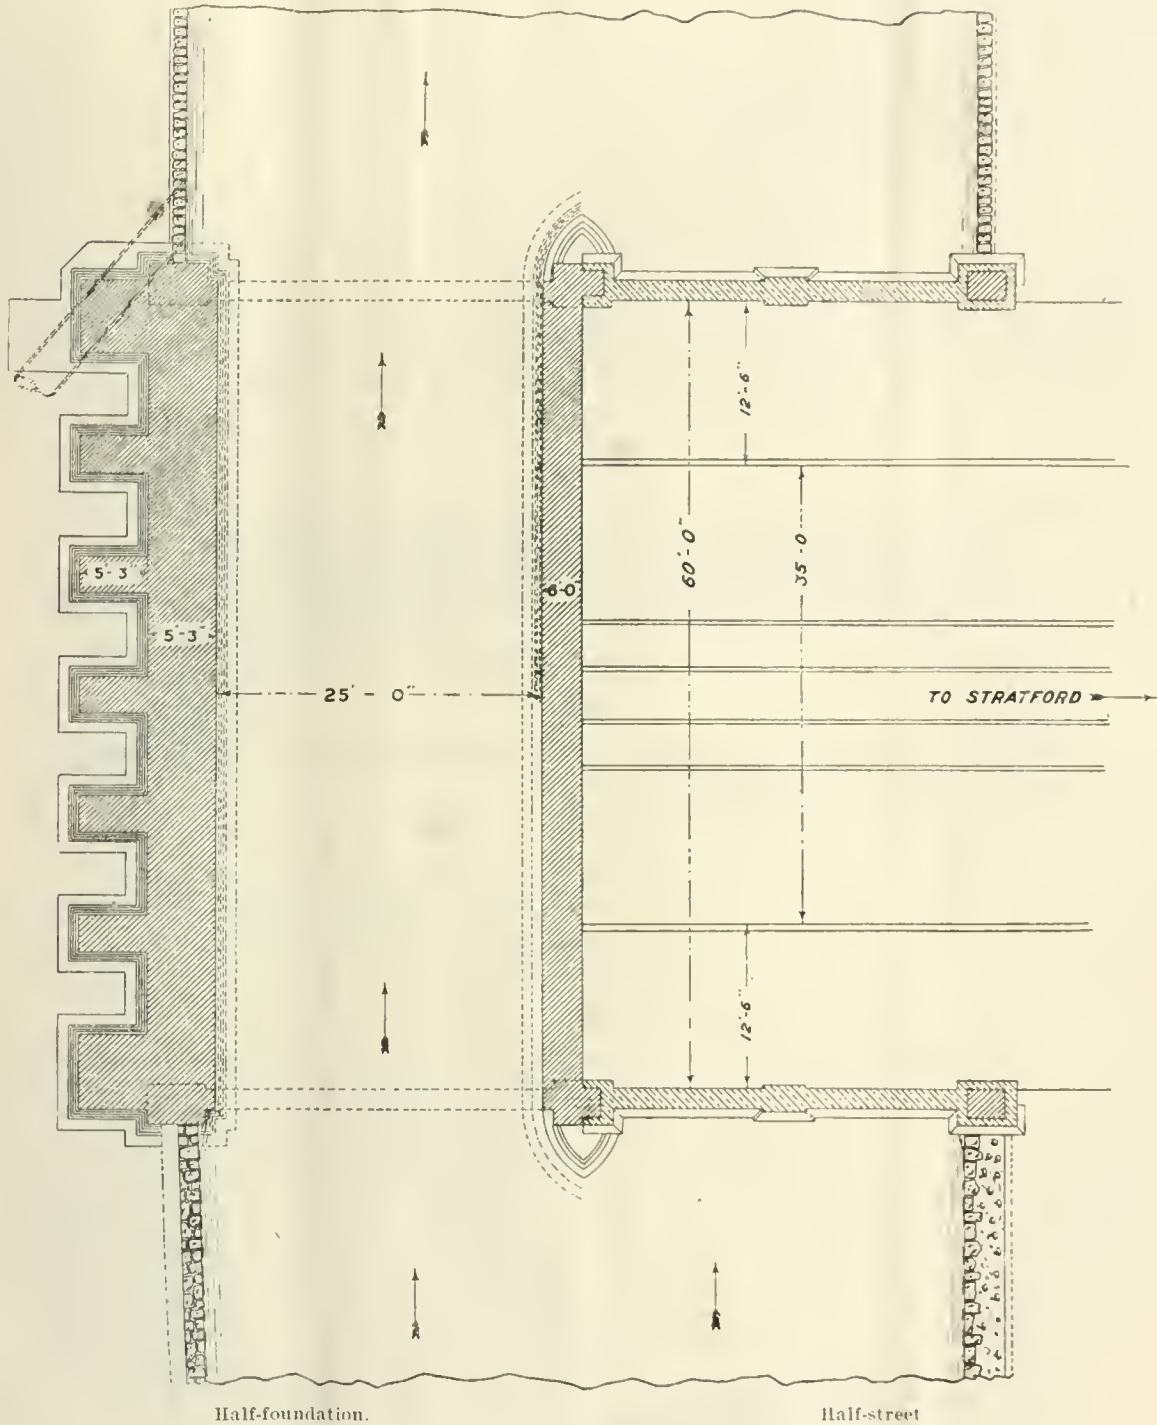

An average foundation pressure, without live load, in the bridges recently erected, is $1\frac{1}{2}$ tons per square foot, the soil being either compact river gravel or brick earth. As a general rule, for bridges of small spans on moderately good ground, the governing factors for thickness of abutments preclude high foundation pressures.

Retaining walls are assumed as having a maximum thickness of one-third their height, and are checked by Rebhahn's method, which, by taking into account

primary 8-in. footpath. Projecting footings and concrete are frequently omitted at the back of retaining walls, and an appreciable amount of excavation thus saved.

Weep holes are provided at the rate of one 2-in. pipe to about 4 sq. yds. of brickwork in ordinary ground.

While on the subject of retaining walls, the author would draw attention to the necessity of designing the spandril walls of bridge arches to resist the very heavy

— SCALE —
0 5 10 15 20 25 30 FT
STRATFORD-ROAD BRIDGE: PLAN.

(Plate IV., Fig. 1.)

the friction of the wedge of earth on the back of the wall, allows the use of a thinner section than Rankine's construction, and one much more in keeping with the apparent necessities of earth retention.

Where retaining walls support footpaths they are treated as surcharged, the crowd load being reduced to an equivalent weight of earth. It is found that if a retaining wall be surmounted by a brick parapet wall 6 ft. high, the additional weight is usually sufficient to counteract the effect of the crowd on an ordi-

horizontal thrust that comes on them in many cases. It is a simple point, but in the course of his periodic inspections of existing bridges he has been surprised to see the large proportion of cases in which the spandril walls are being slowly forced out in a lateral direction. The accompanying photograph illustrates a particularly bad case of this kind. At some date the parapet wall has been rebuilt, and the arch slightly widened. As the joint between the parapet and the arch is a fairly good one, the horizontal thrust has

had the effect of splitting off the added portion of the arch, and developing a crack some 4 in. wide.

SETTING OUT.

As the accuracy of design and setting out is entirely dependent on the original survey, this is always made with theodolite and steel tape, particular attention being paid to cross measurements between important points. Off-sets are quite useless for this class of work, and every point, except minor details, should have at least three measurements to it.

In setting out work centre and parapet lines are laid down with the theodolite, the points being marked on a nail head in a peg embedded in concrete. Such subsidiary lines as are necessary can then be obtained at any time, and checked from the permanent lines.

Levels are taken from the same bench mark as was used in the original sections, and a temporary bench mark set up in a convenient position out of reach of any possible influence from the new work. This mark is checked by an independent assistant, and all levels are given from it if possible. If it is fixed at an even foot there is less risk of error in hurried calculations.

Before the top level of foundation concrete is decided, the contractor has to deliver on the site a truck or boat load of the bricks to be used. A brickwork gauge is then worked out, allowing $\frac{1}{2}$ -in. joints, and the finished concrete level adjusted so as to avoid

and substituting a very weak concrete—a 20 to 1 concrete. Of course, it would take a very large amount of concrete, and he wanted to reduce the cost as much as possible, consistent with the obtaining of the desired relief. No doubt the bridges able to carry the traffic of past days were not sufficient to carry modern traffic with ponderous traction engines weighing 16 or 17 tons, and drawing heavy loads. No doubt, as Mr. Parsons had said, there were numerous cases of bridges giving way from the heavy horizontal thrust that came on the spandril walls of the arches. In the case of the bridge he had mentioned, he did not want to put tie rods in, or anything of that sort. He thought he should secure a good result in the way he proposed. It would be very interesting if Mr. Parsons would say how he dealt with this fracture. He had been very much interested in visiting these bridges, although they had visited them under unpropitious circumstances. There was one matter which struck him in connection with some of these bridges. They were divided into two spans, when some of them would have dealt with them in one span. He would have done it with ferro-concrete. Of course, they were not all in favour of ferro-concrete, but he thought ferro-concrete had come to stay. He had obtained some very good results with ferro-concrete bridges in Shropshire. He had found it a most excellent material. He had had bridges with a similar arch to this, and he had

Half-elevation.

Half-section.

STRATFORD-ROAD BRIDGE.

(Plate IV., Fig. 2.)

split courses under springers, padstones, &c. Brickwork is levelled every few courses with the instrument to ensure the different parts of the structure rising equally.

The course lines for arches are carefully marked on the laggings, points being obtained through which to draw the lines by means of a flexible lath marked off to gauge and laid at right angles to the courses. This method is the most practicable one for oblique arches, as it is impossible to use a string line for the purpose owing to the curvature of the drum.

In conclusion, the author would thank Mr. H. E. Stilgoe, the city engineer, for his permission to write this paper and to use the drawings.

DISCUSSION OF MR. PARSONS' PAPER.

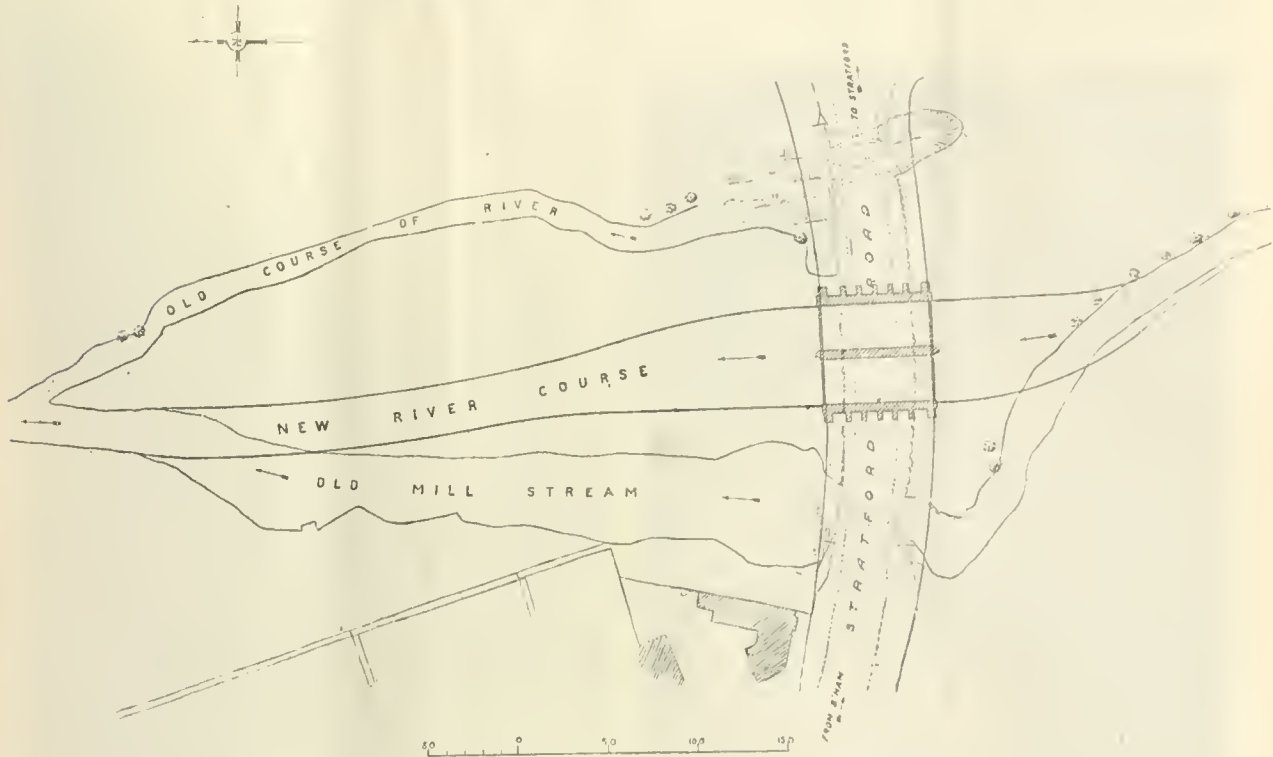

The CHAIRMAN (Mr. A. T. Davis) proposed a vote of thanks to Mr. Parsons for preparing such an admirable paper. He would especially commend it because the author had given prices. They all knew how valuable that practice was. If they were putting up a simple balustrade—it might not be in connection with a bridge at all—they could turn to this paper and find the cost at so much per lineal foot. He would like to ask Mr. Parsons how he dealt with the fracture illustrated by a photograph in the paper. He believed he understood Mr. Parsons to say that the bridge had been repaired. He asked the question because he had got a bridge spanning the river Severn, with a series of arches which were fractured in a very similar manner. It might really be a photograph of the particular arch of the Severn Bridge; therefore they could understand his interest in that matter. He had not yet made up his mind as to the method by which he should repair that bridge. He had thought of taking out the filling,

strengthened those bridges with a ring of ferro-concrete. If the width between the parapet was sufficient to carry the traffic, and the sectional area of the archway was sufficient to carry the water—and in many instances the archway was 50 per cent more than was necessary—they could curtail the capacity of the bridge by adding a ring of ferro-concrete inside the structure, and have the work done while the bridge continued to carry the traffic of the district. The ring of ferro-concrete acted as a tie, and held it together in the same way as tie rods would hold it. He would ask them to pass a very hearty vote of thanks to Mr. Parsons for his very valuable paper.

Prof. LEE (Birmingham University) said he must thank the institution for giving him the privilege of attending the meeting and hearing this very valuable paper. He did not know that there was much one could say about it, because so many details were given, and all the difficulties which one might have suggested seemed to have been overcome by the details given in the paper. He did think that perhaps a little more courage might have been shown in one or two cases, and a little headroom saved, and some of those terrible slopes of 1 in 12 obviated by using ferro-concrete construction. A rather theoretical question was raised by Mr. Parsons when he suggested that, in dealing with the loading of arches, the loads might be supposed to be distributed over a larger area than was very frequently done. He was inclined to agree with Mr. Parsons in that respect. It was true if they examined a good many arches the stress appeared to be very great, if they limited the loads to a foot width of the arch. Therefore there was something to be said for Mr. Parsons' suggestion. It became an important point as to how this question could be expressed quantitatively. He

was aware of some experiments made in America a few years ago, the results of which were given in the "Proceedings" of the American Society of Civil Engineers, but he was not sure that they had any data which allowed them to say that those results were correct. Nevertheless, he thought these suggestions were on the right lines. It was necessary and desirable that a considerable number of experiments should be made in future to find some definite data, so that they might find the actual stress and strains on

with Prof. Lee as to the artistic beauty of bridges. At the present time he was carrying out the widening of a mediæval bridge, one-half of which was in his own county and the other in Derbyshire. His friend, the county surveyor of Derby, got out a scheme for executing the work in ferro-concrete, at an estimated cost of £2,000. He (the speaker) felt sure, however, that his committee would not agree to embark on a structure of that kind, and he succeeded in persuading them to abandon the idea of using ferro-concrete, and to retain the present

STRATFORD-ROAD BRIDGE: GENERAL PLAN.

(Plate IV., Fig. 3.)

arches. At the University they were attempting something in that direction. They were making experimental arches. Mr. Crowther had been carrying out some researches in that direction, and they would be published in the near future. It was important in the designing of arches to know what was a sufficient limit. They did want data upon this matter, and if any of the members who were interested could give them information in this respect it would be useful to engineers the world over. Concluding his observations, Prof. Lee said that bridges were things which came before the notice of people day after day and year after year, and he would suggest that so

character of the bridge, although the expenditure amounted to £5,000 instead of £2,000. He was glad he was able to do that, for it would have been a mistake to adopt ferro-concrete. To a large extent Mr. Horton's object was to avoid risk of difficulty with foundations, by adopting the cantilever principle in effecting the improvement, but he was sure that when the work was completed Mr. Horton would recognise that the right thing had been done.

Mr. W. PLANT (Stafford) said that, as a firm believer in ferro-concrete, he would like to ask why the Birmingham Corporation had given that system such a wide berth. He had certainly heard of failures, but

INVERTING OF RIVER: TYPICAL CROSS-SECTION.

(Plate V.)

far as possible they should always be made things of beauty. The bridges they had seen that afternoon would doubtless fulfil their functions properly, but in the case of the King's-road structure it might have been an improvement from an artistic point of view if the parapet had been somewhat more ornamental. It was important, he thought, that they should persuade their local authorities to be a little more lavish in such matters. The old-time bridge builders had a finer sense of beauty than we had to-day, and he should be glad to see more attention paid to their teachings than was the case at present.

Mr. J. MONCOUR (Staffordshire) said he was at one

of these, he believed, were due to faulty workmanship or design. He thought the system might have been used with advantage in some of the bridges they had seen that day. Slag, he noticed, entered into the composition of the concrete which had been used. Good concrete could, of course, be made with slag, but there was an element of risk. He would like to know whether, in addition to the traction engine and boiler wagon which were regarded as the maximum live load for bridges in Birmingham, any allowance was made for the load of people. In the case of a bridge which he had before the Local Government Board some time ago, that authority insisted upon an allowance of that

kind. It struck him as being somewhat harsh. The cone of pressure of 90 deg. seemed to him to be rather a large angle. It was common, he thought, to take an angle of 70 deg., but he supposed it depended to some extent on the nature of the finished material.

Mr. MEASHAM LEA (Karachi, India) said the attempt which had been made to beautify the Stratford-road bridge had been very successful, and he congratulated the designers of the structure on the effect. The difficulties in connection with the Aston Church-road bridge had also been met most successfully; but, looking at the cross-section, it seemed to him that the main girder was rather heavy. He had been par-

EFFECT OF HORIZONTAL THRUST.

ticularly interested in the setting out of brick arches as described in the paper, and it reminded him of the difficulties he had experienced in India in connection with the erection of a skew bridge, for he had not a man on his staff who had ever seen a skew arch, or believed, when the method of construction was explained to him, that it would stand when built. He even went to the length of preparing a model showing the courses, but that was not sufficient to convince them, though eventually the work was carried out in a most successful manner.

Mr. J. LOBLEY (Hanley) said he could not help being struck with the courage of Mr. Stülgoe and his colleagues in building brick arch bridges at the present day. A great deal depended on the locality, but if anyone attempted to build a brick-arch bridge in his district it was unlikely that he would live to build another. In his part of the country, where the undermining was such a serious matter, they were continually having to raise the bridges. One had been raised as many as fifteen times. Six other bridges had been raised four or five times, and one, in which he put in a new superstructure only four or five years ago, would shortly require to be dealt with.

At this point of the proceedings Mr. A. T. Davis announced that he was obliged to leave, and Mr. A. D. Greatorex took the chair in his place.

Mr. D. G. BEVAN (Birmingham) said he thought the question of the distribution of load was going to be a vital factor, especially in ferro-concrete. In a district where he was previously engaged good bricks were very scarce, and all the abutments were built in solid mass concrete, and the concrete so bonded together in its length with old steel rails that the whole abutment was available to resist the thrust. That resulted in a great saving in the cost of the abutments, the figure being 16s. per cub. yd. as against 30s. to 35s. for brickwork. Mr. Parsons gave the working stresses at 6½ tons in steel for compression and tension. Of course, that was practically fixed by the

Local Government Board; but it was rather a hard and arbitrary rule, and he did not see why they should be bound to it when they could go up to 7½ tons. The permissible figure depended on the difference between the live and dead load. Again, the Board did not say anything about joints; one could do practically what one liked with a joint. The troughing at Aston Church-road Bridge was new to him, and he could not say that he liked it. It seemed to him that it would get damaged in the pressing. Personally, he preferred the rolled troughing that one could fill in with concrete, and cover in every space open to the atmosphere.

Mr. H. J. COLEBY (Atherstone) said he had also noticed that slag had been made use of for concrete, and that where concrete was used next to steelwork the slag was replaced by Hartshill chippings to obviate any risk of corrosion by the sulphur compounds. So there was a risk of sulphur compounds even although cold-blast slag was specified, and it was surely also risky to use it for the concrete. He would like to know whether any tests were made of the slag before it was used. Were any crushing tests carried out and did they wash the slag before mixing it into the concrete? He remembered a large building—a technical institute—in which the floors of the basement were laid with concrete composed of clinker—not cold-blast furnace slag—and the expansion of the material forced out the walls of the building. Therefore, he thought the use of slag in connection with such important work as bridge building was rather risky. Mr. Parsons' experience with a cofferdam which had been employed in connection with the construction of a bridge abutment was similar to one of his own. The dam he was concerned with also turned out a failure, and for the same reason as given in the paper—a boat collided with it, and so damaged the puddle that it was impossible to repair it.

Mr. W. E. BALLARD (Birmingham) expressed surprise that neither Mr. Parsons nor the corporation had gone in for reinforced concrete, especially in the King's-road bridge. The depth of the girders of the Aston Church-road bridge struck one as being rather small. He would like to know whether any deflection had been worked out on those, or whether they had tested the deflection since the erection, and they might, perhaps, have had a little more information as to the practice of putting the arch in lime mortar.

Mr. A. R. GRAY (Birmingham), referring to the remarks of Mr. Davis as to the point of using only one reinforced arch instead of two brick arches on the Stratford-road bridge, stated that they had tried reinforced concrete on one bridge. They did one half first, maintaining the traffic on the other half during the operations, but then they had to wait for several months to allow the work to settle before they could make a start with the other section, the result being that it was a solid year before they got the bridge right. The bridge was on the main line of traffic, and the town was up in arms at the delay, and they had accordingly abandoned the use of reinforced concrete for bridge work in the central portions of the city. As to the shifting of the spandril walls, he did not think due regard was paid to that point. In many bridges they had taken down, they had found only a 9-in. or 14-in. wall, and no allowance for outward thrust consequent upon the heavy traffic of the present day. In one bridge built about ten years ago—a skew arch bridge—he tried to prevent that movement by building brick toothings to project 4½ in. above the line of the arch, and building the spandril walls into them. He had since been watching that bridge, and what they had done seemed to prevent that outward thrust.

Mr. MONCUR asked what proportion of the cost of these bridges was borne by the canal companies.

Mr. PARSONS, in reply, said the preparation of the paper had given him a great deal of pleasure, and he had been amply repaid for his efforts by the fact that so many had thought it worth while to attend the meeting and take part in the discussion. Mr. Davis had asked how they had repaired the fracture in the bridge which had failed. They first of all put under the bridge some ordinary wooden ribs; they then stripped all the fittings off the arch, and carefully washed out, with water under pressure, all the cracks and cut out all the brickwork that was useless. About a square yard of brickwork was absolutely perished. Then on the centre ribs they put grooved and tongued boarding, which they wedged up tightly to the brickwork. Cement grouting was applied, and tie rods having been fixed, the centering was stripped off, quite a solid job being made of the repair. As the road was to be, or might be, widened, they did not consider it

necessary to take down any part of the arch, but he believed the repair was quite satisfactory. A concrete wall was built up on the inside of the parapet walls, converting them into retaining walls to make them the proper thickness. The opinion had been expressed that they might have had one arch instead of two in some cases, but they were bound down in nearly every instance by step levels. They had raised the road as far as they could. Prof. Lee's remarks on the distribution of stress were particularly welcome, and he was glad to know that this matter was being threshed out, and would await the results with interest. He agreed with him that they ought to make these bridges as ornamental as possible, but they had been instructed not to spend more money than they could help on the work. One reason why the parapets were not panelled on the inside was that would-be suicides had found them convenient for their purpose, while small boys also found it easy to climb up by means of them. As to slag, that was a very difficult material to work with, but they had a clerk of works on the ground the whole of the time, and he had to approve every load of slag before it was unloaded—and their clerks knew good slag when they saw it. They had a good deal of trouble, but they insisted on really good, dense, heavy slag, and although possibly a little sulphur or free lime might sometimes be present in it, briquettes made of the slag had shown no signs of blowing or expansion. As to the distribution of load and live load, the Local Government Board asked them, in the case of the Aston Church-road Bridge, to provide for a live load on the footpath as well as a distributed load, and although they had done that it seemed a question whether there was a real necessity for it. The canal company made no contribution to the cost of the bridges; on the other hand, they compelled them to spend a great deal more on them than they would otherwise do. Mr. Loble had admired their courage in building brick arches. It was not a question of courage, however; they thought it the safest thing to do. In a mining district, of course, brick bridges were unsuitable. He quite agreed with Mr. Bevan that they ought, as a profession, to be allowed to design their bridges without being restricted to a figure of 6½ tons. It certainly could not be applied to every case, and if they could prove the accuracy of their calculations they should be allowed to design their structures accordingly. He did not think the troughing was strained in the pressing, that operation being done while the material was hot. The question of painting and corrosion was an important one. They had painted the troughs inside with a special mixture of tar, tallow and quicklime. That seemed very suitable, for it set into a hard cake, and he was hopeful that it would prevent any corrosion. In the matter of the failure of the dam, that was not due to the disturbance of the puddle, but to the fact that the toe was knocked right in. If the puddle only had been damaged it could have been made watertight again. With regard to Mr. Gray's remarks, his own view was that the parapet walls should be designed as retaining walls, and of adequate thickness to resist any thrust.

Mr. A. D. GREATORIX (West Bromwich) was elected vice-chairman of the district, and the meeting then closed.

Clacton's New Pavilion.—A new pier approach pavilion at Clacton was formally opened on Wednesday. The completion of the scheme is a tribute to the surveyor, Mr. D. J. Bowe. The lowest price submitted by any contractor was £15,000. Mr. Bowe undertook to do the work for £11,500, and when it is finished he will be well within his estimate. The total cost of the improvements, including cliff bath pavilions, designed to accommodate eighty people, as yet uncompleted, will be about £20,000.

Housing Reformer's Death.—Alderman William Thompson, the well-known housing reformer, died suddenly on the 20th inst., we regret to state. Chairman of the National Housing Reform Council and, since 1900, a member of the Executive Committee of the International Housing Congress—of which he was president one year—Alderman Thompson established for himself a world-wide reputation as an authority on the subject which he practically made his life's work. He was vice-president of the Co-partnership Tenants' Housing Council, and a member of the council of the Garden Cities Association, and it is asserted that much of the Town Planning Act was due to his advice.

INSTITUTION OF MUNICIPAL ENGINEERS.

VISIT TO GENERAL ELECTRIC COMPANY'S WORKS.

A visit was paid on Thursday of last week to the works of the General Electric Company at Witton, Birmingham. Among those who attended were Messrs. H. Boot, president of the institution, H. C. Adams, vice-president of the institution, Frank Richards (Bridgnorth), Ernest Trevor (Bridgnorth), J. R. Evans (Swadlincote), C. W. Denny (Redditch), H. E. Gilkes (Birmingham), W. J. Powell (Birmingham), T. W. Ellett (Smethwick) and B. Wyand, secretary of the institution. The party arrived at the Witton works at 2 o'clock, and were taken round by Messrs. A. F. Morgan and E. P. Hollis, who explained clearly and interestingly the works being carried out in the various departments. These comprised the engineering works, small motor, switchboard and switchgear departments, foundry, test-house and conduit works, and it is not too much to say that the works are among the best-equipped in the country, and that the employees (who number some 3,000) work under the best of conditions.

At the tea which followed the visit, Dr. Railing, a director of the company, who is in sole charge of the Witton works, took the chair, and in welcoming the members gave a brief but interesting sketch of the progress of his company from its inception. The president, in response, dwelt upon his many years of pleasant association with Dr. Railing, and requested him to convey to his co-directors the thanks of the institution for the kindness shown to its members. A vote of thanks to the gentlemen who had made such able "guides" closed the day's proceedings.

Surbiton's Motor Fire Engine.—A motor fire engine, supplied to the Surbiton, Surrey, Fire Brigade by Messrs. Dennis Bros., was officially tested last week by the chief engineer to the Metropolitan Water Board, Mr. J. W. Restler. The results were most successful, the engine proving to be fully up to, and even beyond, the guarantee of the makers.

Windsor Bridge to be Rebuilt.—The Albert Bridge at Windsor is to be rebuilt by the Berkshire and Buckinghamshire County Councils, certain defects having developed in it. The new structure will be a two-span bridge in place of the existing single span. The Thames Conservators have asked that a clear width of waterway of not less than 80 ft. should be provided under each arch.

East Ham Fire Station and Firemen's Dwellings.—These buildings, an illustrated description of which was given in THE SURVEYOR of March 14, 1913, were formally opened yesterday afternoon by the mayor, Alderman O. R. Anstead, J.P. Since the scheme was initiated motor engines have come into use in East Ham, and the accommodation for stables, harness-room, and corn store provided for in the plans of the borough engineer, Mr. J. Birch, has been utilised as engineers' repairs shops and store-rooms. Apart from this the work has been carried out as originally designed.

Local Authorities and Housing.—The President of the Local Government Board was asked in the House of Commons on Monday whether he had lately called upon local authorities to supply him with detailed information concerning housing in their respective areas; whether he was aware that in many districts medical officers of health, sanitary inspectors, clerks, and other officials were already working at high pressure endeavouring to carry out the requirements of the Housing, Town Planning, &c., Act, and other recent enactments, and whether, in the event of local authorities employing additional assistance to obtain this further information without undue delay, he would see that the cost was not placed on the rates. In reply Mr. Herbert Samuel said that sec. 17 of the Housing, Town Planning, &c., Act, 1901, contemplated that the necessary expenditure should be borne by the authority. Much of the remaining information now required to be transmitted to the Local Government Board was either readily available or would usually be obtained in ordinary course in the exercise of their duties under the Housing Acts and Public Health Act, if those duties were properly performed. In the circumstances, as at present advised, he saw no reason for asking the Treasury to sanction a special grant for this purpose.

GASWORKS TAR AND ROAD-BINDING MATERIAL.

The competition between natural asphaltic and bituminous materials and those road binders which can be produced from gasworks tar seems likely to result in considerable advances being made in the preparation of materials of the latter class. By the use of mixtures of refined coal-tar and coal-tar pitch it is possible, of course, to produce materials of varying consistencies, in the useful part of the range between pitch used alone and tar used alone, the Road Board specifications for No. 1 and No. 2 tars being a case in point; but it does not follow that the resulting mixture, obtained by the usual means, will have to the full the useful qualities of a similar material prepared beforehand, and having, in the bulk, the same consistency throughout.

The two questions that await answers are: First, can tar and pitch, or heavier and lighter tar preparations, be so mingled that they will possess qualities approximating to those of natural bitumens; and, secondly, if such mixtures, made on the spot, cannot

works tar, and its properties as regards ductility and tenacity may be judged from the accompanying illustrations and the notes thereunder. At a temperature of 77 deg. Fahr. the tenacity between two plates was 18.1 lb. per square inch, or well over the full atmospheric pressure; and at 70 deg. Fahr. the tenacity, measured in a similar way was over 40 lb. per square inch. The ductility tests are sufficiently explained by the illustrations, which are reproduced from photographs.

In the course of remarks made as "an extempore interpolation" in his presidential address, Mr. Glover showed a piece of road crust which had been grouted with his material, and he said that it had taken a man some hours to cut out the sample with a good chisel and hammer, owing to the tenacity of the binding material. The binder was just soft enough to work to the top, so that no stones appeared on the surface. The tenacity test, as described above, is not one which has been generally applied to bituminous materials, and the results of ordinary viscosity and penetration tests of "Macgrout," which will no doubt be made, will enable surveyors to classify the material as a road binder.

Test for Ductility.—
Test piece 14 in. square

have those properties, is it possible to prepare from gasworks tar a material which will have those qualities? Chemists may have something to say on this point, and in the meantime one must be ready to consider the significance of any fact bearing upon the matter.

The value of special methods for producing from coal-tar a tenacious and ductile material having as nearly as possible the average of the range of qualities desired in a road binder depends partly, but not wholly, upon the nearness of the resemblance between that material and the best natural bituminous binders; not wholly, for so long as the special material is better than a mixture made on the spot, it is desirable that it should be produced. Further, there may be an advantage, practically, in producing a material of nearly the average of useful consistencies and softening points, instead of leaving a relatively large gap between the desired consistency and that of any of the component parts of the mixed material. A sufficient range of materials can in any case be produced, so that the highway engineer may prepare a binder of exactly the desired properties for a particular case.

THE ROAD BINDER OF THE BRITISH GASLIGHT COMPANY, NORWICH.

At the annual meeting of the Southern District Association of Gas Engineers and Managers, the new president, Mr. Thomas Glover, who is manager of the British Gaslight Company, Norwich, described the road binder produced at his gasworks, and intended to compete with natural bituminous materials as a binder for road crusts. This material, which is called "Macgrout," is prepared from gas-

It may, however, be pointed out that the tenacity exhibited in the tests of "Macgrout" is very high, if we compare it with those found in the case of certain materials tested by Major W. W. Crosby (see THE SURVEYOR, November 17, 1911, p. 588). At a temperature of 77 deg. Fahr., the highest recorded tenacity was about 31 oz. per square inch, between circular glass plates of about 5 sq. in. area, about 5 grammes of material being used in each case; and the next highest was about 24 oz. per square inch. The plates used to test "Macgrout" were of cast-iron faced for the 70 deg. Fahr. test, and marble blocks for the 77 deg. Fahr. test. The conditions were not therefore the same, except as regards temperature; but, apart from comparisons of this kind, it is obvious that the tenacity of the Norwich material is very high.

London Guildhall Improvements. In 1911 the City of London Corporation passed an important scheme submitted by the City surveyor, Mr. Sydney Perks, for the rebuilding of large portions of the Guildhall, at a total estimated expenditure of £130,000. For financial reasons the matter was adjourned, but certain portions of the proposed works have now become so urgent that the City Lands Committee has brought up a report recommending that section "C" of the scheme be at once put into operation, with a view to providing adequate accommodation for the transaction of the business of the corporation, and improving the unsatisfactory conditions associated with the stores and workshops at present housed in various parts of the basement. The new works will involve an expenditure of £30,000.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21, Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

397. Testing Cement. Explain in detail, giving sketches where necessary, how a sample of cement would be tested in practice. (B. W., *Tadcaster*.)

398. Road Construction. Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

399. Fireproof Construction. What fireproof preparations can be used for protecting timber, and what independent coverings may be applied for the same purpose? (S.A., 1905.)

400. Structures.—What is meant by a redundant member in a truss, and why are such members introduced? Sketch two simple trusses, each having at least one redundant member. (L.C.E.)

401. Specific Gravity.—A bullet of lead, whose specific gravity is 11.4, weighs 1.09 oz. in air and 1 oz. in olive oil. Find the specific gravity of the olive oil.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulæ involved. (T. W. P., *Bexhill-on-Sea*.)

The angles of the triangle we are investigating are $A B C$, C being the centre of the tower. (Fig. 1.) We have set up our instrument at A and B , and read the angles $C A B$, $C B A$, and require the angle

FIG. 1.

$A C B$. As we are unable to use the point C , we have to find another point C' at which we can set up the instrument and read $\angle A C' B$. Having done this we proceed to find the value of $\angle A C B$.

We now by the methods described below obtain the following:—

Length $C C'$ (by calculation)
 \angle 's $A C' C$, $B C' C$ (by instrument)
 \angle 's $C' A C$, $C' B C$ (by calculation)

To find $\angle A C B$.

Produce $C C'$ to D .

$\angle A C D = \angle A C C' + \angle C' A C$. (Ext. ang. Int. & opp.)
 $\angle B C D = \angle B C' C + \angle C' B C$. (do.)

$\therefore \angle A C D - \angle B C D = (\angle A C C' + \angle C' A C) - (\angle B C' C + \angle C' B C)$

$\therefore \angle A C B = \angle A C C' + \angle C' A C - \angle B C' C - \angle C' B C$
 $= \angle A C' B + \angle C' A C - \angle C' B C$

We read $\angle A C' B$, and calculated \angle 's $C' A C$, $C' B C$ and so we get the value of $\angle A C B$.

FIG. 2.

To find $C' C$.

Take another point C'' where we can set up the instrument and see points C and C' and also accurately measure $C' C''$. Read $\angle C C' C''$, measure distance $C' C''$, and read $\angle C' C'' C$.

FIG. 3.

We now have in the triangle $C' C C''$ one side and the two base angles so we can calculate the length $C C'$.

$$C = 180 - C' - C''$$

We want c .

$$c = \frac{C' C'' \sin C''}{\sin C} \quad (\text{for proof})$$

$$= \frac{C' C'' \sin C''}{\sin C} \quad (\text{see below})$$

$$\log c = \log C' C'' + \log \sin C'' - \log \sin C$$

We measured c and C'' and calculated the value of C , so we get c' which is the length $C C'$.

To find \angle 's $C' A C$, $C' B C$. (Fig. 1).

In the triangle $C' A C$ we know one side $C C'$ and $\angle A C' C$, we must calculate $C A$.

In the triangle $A B C$ we have the side $A B$ and the base angles $A B C$, $B A C$.

∴ log b = log c + log sin C - log sin A.
 log a = log c + log sin C' - log sin A.
 we therefore have the lengths a and b which are A C, B C.
 Proceeding to find ∠'s C A C', C' B C
 In the triangle A C C' we know C' C, A C and ∠ A C' C,
 we want C' A C.

$$\frac{\sin A}{\sin C'} = \frac{a}{c'}$$

$$\therefore \log \sin A = \log a + \log \sin C' - \log c'$$

Similarly

$$\log \sin B = \log b + \log \sin C' - \log c'$$

Thus we have the angles A & B or ∠'s C' A C, C' B C.

To prove that the sides of a triangle are proportional to the sines of the opposite angles. (See Fig. 3.)

$$\begin{aligned} AD &= AB \sin B. \\ AD &= AC \sin C. \\ AB \sin B &= AC \sin C. \\ c \sin B &= b \sin C. \end{aligned}$$

$$\frac{c}{b} = \frac{\sin C}{\sin B}$$

$$\text{Similarly } \frac{a}{b} = \frac{\sin A}{\sin B} \text{ \& } \frac{a}{c} = \frac{\sin A}{\sin C}$$

$$\text{or } \frac{a}{\sin A} = \frac{b}{\sin B} = \frac{c}{\sin C} \quad (\text{J. U. S.})$$

NOTES.

With reference to question (394) as to the examination of building plans, a correspondent sends us the following form, in use in his office:—

SURVEYOR'S NOTES ON DEPOSITED PLANS.

By-Laws.	Nature of Requirements.	Remarks.
B.I.S.A. 1888.	Is the building line in compliance with the Act . . .	
11	Is the site covered with concrete . . .	
12	Has site been previously excavated . . .	
17	Are the footings satisfactory	
18	Is concrete provided to footings . . .	
19	Are damp courses horizontal and vertical provided . . .	
21	Are thickness of external and cross walls sufficient	
21	Do any storeys exceed 16 or 14 times thickness of walls	
24	Does any cross wall support a superincumbent external wall . . .	
25	Are openings in storey of external wall greater than one-half and if so are there sufficient piers . . .	
26	Are any windows within 6 ft. of windows of adjacent building . . .	
27	Are parapets provided to external wall over 30 ft. high and within 15 ft. of another building . . .	
28	Are parapets provided to party walls over 30 ft. and are they corbelled out at eaves . . .	
30	Are there any openings in party walls . . .	
31	Are there any recesses with backs less than 9 in. thick or within 13½ in. of a return wall . . .	
42	Are kitchen chimney backs in party walls less than 9 in. thick for 9 ft. high . . .	
44	Do chimney shafts extend 3 ft. above roof . . .	
45	Do chimoe shafts exceed in height six times least thickness . . .	
53	Are roofs covered with incombustible material . . .	
54	Is there sufficiency of air space in front of building	
55	Is there sufficiency of air space at rear of building . . .	
58	Are windows in rooms one-tenth of floor area . . .	
59	Are rafters, purlins and roof battens of sufficient size . . .	
60	Are joists, trimmers and trimming joists, floor beams and floor boards of sufficient size . . .	
62	If a public building, are floors of lobbies, corridors, passages, landings and stairs fire resisting . . .	
64	Are rooms of sufficient height for habitation . . .	
66	Is part of open space paved	
69	Is lowest storey capable of drainage . . .	
71 to 75	Are bye-laws as to drains complied with	
..	Is there separate R.W. drainage . . .	
76	Are W.Cs. against external walls . . .	
77	Are W.Cs. provided with windows and ventilators . . .	

Other remarks.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain;
 Each man's opinion freely is his own
 Concerning anything, or anybody.

—MASSINGER: "The Fatal Dowry," Act. ii., 2

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR, While with "Engineer" to the extent that it would be better, were it possible, to classify materials according to their origin, I fail to see any reason for alarm if materials are all classed "bitumen" when they are certainly very similar in appearance and behaviour.

I should like to inform "Engineer" that certain petroleum residuums have been known in the road-making world as "bitumen" for many, many years—often referred to as "fat" on account of their fluxing value. When he says that asphalt and bituminous macadam is correctly described as "bitumen-grouted macadam" he is quite original, and apparently desires to assist the Standardisation Committee rather than to criticise them. He mentions in his letter of May 1st "a road grouted with natural bitumen." Does he know of any areas? I know of none throughout the United Kingdom. Perhaps he means "grouted with an asphalt mixture, or matrix, made from a natural bitumen"? In the same letter he says: "The natural material itself should never be mixed or laid in connection with any coal-tar product, as the latter destroys the good properties of the bitumen." Perhaps he means more than proportionately lessens the good properties; otherwise it would place the natural article in a false light, as it would seem paradoxical that articles that have "failed terribly" should overpower and utterly destroy a material that has proved to be tough, weather-resisting and imperishable. He refers to Mr. Sutherland as an authority on "bitumen." He may be so; but I have never heard of his having been consulted on road-making matters.

Is the damage "Engineer" fears to "manufacturers and others who for many years have sold only the genuine natural product" prospective or retrospective? Have they sold only the "genuine natural product," and have they sold it for road making? "Engineer" forgets that the heading under which he writes is "Road Terminology." Probably his informers are more conversant with bitumen for other uses, which are many. Anyhow, my hat is off to "Engineer" for his faith in the accuracy of his information, and I hope it has not led him to criticise those who may possess intimate and impartial knowledge equal to that of his informers.

Although I am entitled to query "Engineer's" statements on account of my years of intimacy with bitumen and asphalt for footway and carriageway purposes, I hold no brief for the vendors of petroleum by-products; they are quite capable of supporting the claims of the materials they wish to exploit.

I prefer not to disclose my identity; otherwise I also may be accused of having an "axe to grind." Perhaps I have.—Yours, &c.,

NOT SO DUSTY.

May 21, 1914.

THE LATE ALDERMAN THOMPSON AND HOUSING REFORM.

To the Editor of THE SURVEYOR.

SIR,—All Housing Reformers are mourning the loss of Alderman Thompson, whose tragically sudden death has come as a great shock to his many friends and co-workers. Only last week he attended a meeting of the Executive Committee of the National Land and Home League at the House of Commons, and in a forcible and eloquent speech moved the following resolution:—

"That this league earnestly requests the Government to consider the possibility of including in their proposals for land and housing reform the giving of a grant in aid of those housing schemes carried out by local authorities to meet the needs of certain classes, men and women, who cannot under any probable scheme of increased wages pay an economic rent, especially in rural districts, and in connection with the rehousing of those dispossessed by closing orders and clearance schemes; and the league suggests that efforts should be made to give effect to such proposed grant in connection with the consideration of the Unionist Housing Bill, which has three times passed its second reading in the House of Commons, and might be modified in such a way as to secure common agreement."

A couple of hours before the news reached me of

The Surveyor

And Municipal and County Engineer.

Alderman Thompson's death, I received a long letter from him asking me to help him to get together a committee of Members of Parliament, who, though belonging to different political parties, would work together in order to forward the housing policy embodied in the above resolution. Alderman Thompson asked me to send copies of the resolution to the editors of the principal daily papers and the weekly Press, and this I now do, hoping that you may be able to find space in your columns for it.

It behoves those of us who had the privilege of being associated with Alderman Thompson to see that the work to which he devoted his life is carried on with unflinching determination.—Yours, &c.,

MARJORY PEASE,
Hon. Secretary,
National Land and Home League.

Queen Anne's Chambers, S.W.
May 21, 1914.

Housing Schemes in Ireland.—On Monday, in the House of Commons, the Chief Secretary was asked if he was aware that petitions had been presented to Parliament from municipal bodies all over Ireland asking for legislation to provide financial aid to assist municipal authorities in carrying out housing schemes for the working classes in cities and towns in Ireland, and whether it was the intention of the Government to introduce such legislation at an early date. Mr. Birrell, in reply, said he was aware that petitions of the nature indicated in the question had been presented to Parliament by various municipal bodies in Ireland, but he could make no statement as to intended legislation on the subject.

Cottage Building in Rural Areas.—The President of the Local Government Board was asked in the House of Commons last week if it was still the intention of the Government to meet the deficiency of cottages in rural areas by undertaking the building of them by a Government Department on a large scale; if so, when they propose to start, and in what localities; and how they proposed to find the money for the scheme. Mr. Herbert Samuel, in replying, pointed out that legislation would be necessary to enable the building of cottages in rural areas to be undertaken by the State, and he was not at present in a position to say when such legislation would be introduced.

MIDLAND ASSOCIATION OF LOCAL GOVERNMENT OFFICERS.

VISIT TO CLEE HILL GRANITE QUARRIES.

On Saturday, the 16th inst., the members of the Midland Association of Local Government Officers had a very interesting visit when they journeyed to the Clee Hill Granite Company, Limited, Clee Hill, near Ludlow, Salop, to see the working of these large quarries.

The party took train from Birmingham to Kidderminster, being met there by Mr. R. Lee Roberts, J.P., the chairman and managing director of the Clee Hill Quarries, and were conveyed by motors to the Cather-ton Quarries, where an inspection was made, the members being shown the great crushing plant, the various blasting operations, the breaking of the stone to different sizes, and the aerial ropeway which carries the granite to the railway station, some 2½ miles away.

The granite from these quarries is of a very high standard, and is widely known for its hard-wearing qualities and resistance to atmospheric conditions. At Doddington, after lunch, the president, Mr. Henry E. Stilgoe, M.INST.C.E., city engineer and surveyor, Birmingham, proposed the toast of the Clee Hill Granite Company, Limited, and in doing so thanked Mr. R. Lee Roberts for his kindness and welcome to the members.

Mr. R. Lee Roberts, in proposing the toast of the M.A.L.G.O. (coupled with the name of the secretary, Mr. Frank E. Bennett, Council House, Birmingham), stated it gave him great pleasure to have the Midland Association visit their works.

Mr. Bennett, in responding, stated that the National Association, to which the M.A.L.G.O. was affiliated, had a membership of nearly 40,000; it was one of the aims of each association to visit works of interest, and he was sure that the visit to the Clee Hill quarries had more than fulfilled this condition.

The party, on the conclusion of lunch, motored on to Ludlow, where they inspected the old castle and ruins and the church. They were afterwards entertained to tea in the council chamber at Ludlow.

A vote of thanks was accorded to the staff of the Clee Hill Granite Company, Limited, for the trouble they had taken to make the day so instructive and enjoyable. Mr. R. Lee Roberts, Mr. T. Roberts and Mr. S. Sharpe briefly replied.

CONCRETE PIPES.

PROPOSED STANDARD SPECIFICATION.

In the House of Commons on Monday Mr. Grant asked the President of the Local Government Board if, in the public interest, he would consider the desirability of the publication of a standard specification for concrete pipes for strength, porosity and density, so that local authorities, when asking for tenders, might be able to state clearly the quality of pipes they require, and that all manufacturers of concrete pipes might have a fair opportunity of tendering.

Mr. Herbert Samuel said he did not think it would be advisable for the Local Government Board to issue a standard form of specification, but he would bring the hon. Member's question to the notice of the Engineering Standards Committee, who were a body supported by the leading technical institutions, and were engaged in drawing up standard specifications of all kinds of materials used in the execution of public works.

Mr. Grant asked the President of the Local Government Board if, in most cases, concrete pipes of the manufacture of Messrs. John Ellis & Co. were specified in public contracts by most of the borough and municipal engineers and surveyors, whereas no special make of iron, steel or earthenware pipes was specified when calling for tenders; whether any of the Local Government Board inspectors suggest to borough and council engineers and surveyors the use of concrete pipes of the manufacture of John Ellis & Co., of Leicester, and, if so, for what reason.

Mr. Samuel said the terms of the contracts of local authorities scarcely ever came before the Local Government Board, and the board had no information as to whether the practice referred to in the first part of the question was a common one. With regard to the last sentence, the engineering inspectors not only did not make any such suggestions, but in any cases where it did come to their notice that a special manufacturer was mentioned they objected to it.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HOUSING OF THE WORKING CLASSES: PREMISES OUT OF REPAIR: INJURY TO TENANT'S DAUGHTER: LANDLORD'S LIABILITY.—An interesting point under the Housing and Town Planning Act, 1909, was decided in *Ryall v. Kidwell & Son* (Court of Appeal, April 28th). This was an action by the infant daughter of the tenant of a house to which secs. 14 and 15 of the Act applied, who had been injured owing to the premises not being reasonably fit for human habitation. Sec. 14 of the Act, it will be remembered, provides that in any contract made for letting for habitation a house to which the Act applies, there shall be implied a condition that the house is at the commencement of the holding in all respects reasonably fit for human habitation. By sec. 15, subsec. 1, sec. 14 shall, where applicable, take effect as if the condition applied in that section included an undertaking that the house shall, during the holding, be kept by the landlord in all respects reasonably fit for human habitation. By subsecs. 3, 4 and 5, if it appears to the local authority that the implied undertaking is not complied with, they may require the landlord to execute such works as they shall specify as necessary. The landlord may thereupon close the house for human habitation, otherwise the authority may do the necessary work, and recover the expense from the landlord as therein provided. By subsec. 6 the landlord may appeal to the Local Government Board; by subsec. 9 any remedy given by the section for non-compliance with the undertaking implied by virtue of the section shall be in addition to, and not in derogation of, any other remedy available to the tenant against the landlord either at common law or otherwise. It was held by the Court of Appeal (affirming the Divisional Court) that the action was not maintainable, the effect of the sections being to import into the contract for the tenancy an implied undertaking to the tenant only that the house should, during the tenancy, be in all respects fit for human habitation. The plaintiff being a stranger to the contract had no right of action.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as nouns de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

OPEN SPACE: RECREATION GROUND.— "Roy" writes: There is an open space in the centre of this village, about half an acre in extent, and known as "The Square." The lord of the manor has up to date taken up the tolls from standings, &c. The surface of the square had become very rough and uneven; being on an incline it washes badly. The parish council took the matter in hand and appealed to his lordship to put it in repair; he, however, declined, but offered to relinquish his manorial right. They next appealed to the rural district council to take it over; the rural district council replied that it must first be put in order and maintained for twelve months (this has now been done by voluntary subscriptions), after which they would take it over. The parish council, however, are not sure of their position, as wheeled vehicles have a right to pass across where and when they like. Will you kindly give me a reply to the following query: The lord of the manor having offered to relinquish his right, can the parish council accept the same and make a rate for its maintenance? The site is rectangular in shape, bounded on the north by the churchyard, on the east and west by cottages, and on the south by a highway, from which vehicles can travel to houses, and land on the north-west corner. If they are able the parish council would like to convert it into a recreation ground.

It would appear that the land is subject to public rights of way, and if such is the case it would be necessary to get these rights extinguished under secs. 84 to 92 of the Highway Act, 1835. This having been done, an order of the county council must be obtained investing the parish council with the powers of the Open Spaces Act, 1906. They would then be in a position to accept a conveyance of the

land for the purpose of an open space from the lord of the manor (or other persons having power to sell same). By sec. 17 (e) the expenses of the parish council incurred in the execution of this Act may be defrayed according to the Local Government Act, 1894.

PUBLIC HEALTH ACTS AMENDMENT ACT, 1907, SEC. 39: (CLOSED ACCOMMODATION. "R. O." writes: A block of twenty-three houses are now served by twelve privies. My council want water-closets to be adopted. The privies are not dilapidated, but owing to their distance from the houses and existing drains it would be better, and probably no more expensive, to build new water-closets in preference to converting them. We have offered the owner a contribution of 20 per cent of the cost of building twenty-three new water-closets. (1) Is such an arrangement legal? If it is not accepted what would be our legal position in regard to expenditure if we were to serve a notice on him to (2) provide twenty-three water-closets in place of the privies, (3) provide twelve water-closets in place of the privies, (4) provide eleven water-closets in addition to the privies? The owner is in agreement with us on all points except the provision of a water-closet to each house, which he considers unreasonable. (5) Are there any decisions on this?

The effect of subsections (3) and (4) of this section (so far as material to this case) appears to be as follows: (a) Where there are a sufficient water supply and sewer, an owner may be required (apart from any question as to the sufficiency of the existing accommodation) to convert a privy into a water-closet, half the cost to be borne by the owner, and half by the local authority; (b) where the accommodation is insufficient, and cannot be made sufficient by alteration, and there are a sufficient water supply and sewer, an owner can be required to provide such number of water-closets as the circumstances of the case may render necessary, at his own expense. Assuming that this section is in force in the district, and that there are a sufficient water supply and sewer, the following courses appear to be open to the council: (1) The conversion of the twelve privies into water-closets, at the cost of the council and the owner in equal shares; or (2) if the council are satisfied that the existing accommodation is not sufficient, and that it cannot be made sufficient by altering the privies into water-closets, the provision, at the owner's expense, of such number of water-closets as the circumstances of the case render necessary. I think the question of the sufficiency of the existing accommodation, and also the question of the number of closets necessary, would be for the council to determine, subject to an appeal to the Local Government Board. See *Boyle v. Sherborne Local Board* (46 J.P., 675). If the existing accommodation is not sufficient, and twenty-three water-closets are necessary, I do not think the council would be justified in contributing to the cost thereof.

RURAL DISTRICT: SPECIAL EXPENSES. "Jackson" writes: Please advise whether it is legal for a rural district council to employ a man who is casually employed by them for disinfecting to take water-meter readings, and water pressures in water mains under their control, and charge the cost for doing that work as special expenses on the contributory places within which the work is done?

Under sec. 229 of the Public Health Act, 1875, expenses of disinfection are general expenses, and expenses of maintaining necessary works for the purpose of water supply, if and so far as they are not defrayed out of water rates or rents, are special expenses, chargeable on the contributory places. "Workmen employed at waterworks may properly be paid out of the special expenses rate" (Lumley's "Public Health Acts," 7th edition, page 521); and I presume the same would apply to a man employed to take meter readings and water pressures. I do not think the fact of the same man being casually employed for disinfection would prevent the council from charging as special expenses the amounts paid him for work in connection with the water supply.

PRIVATE STREET WORKS: SEWERING. "W. L. E." writes: A portion of an estate has been laid out for building purposes, and several plots have been sold to various owners, who now desire the urban district council to construct a sewer in one of the roads. It is thought that the land is not sufficiently developed at present to make up the road under the Private Street Works Act, 1892. Will you kindly advise me if the council can construct the sewer as desired by the several owners under the Private Street Works Act, 1892, and leave the making up of the road until the land is further built upon?

Yes. Sec. 6 (1) provides that the urban authority may resolve to do any one or more of the works therein specified, of which sewerage is one.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Brighton T.C. (May 20th. Mr. Edgar Dudley).—£1,600 for the purchase of land in Dyke-road for the purpose of a recreation ground, and £1,925 for the purchase of Castle-street Yard depot.—It was stated that it was proposed to pay £900 per acre for the land intended for a recreation ground. The period asked for was fifty years in respect of both loans. With regard to the depot, the town clerk, Mr. Hugo Talbot, said the yard was now in the occupation of the council on a lease, determinable on six months' notice, and containing a clause with the option of purchase, at a rent of £50 per annum. The inspector stated that two applications must be made—one for the land and the other for the purchase—as they would not get longer than fifteen years for the buildings at the yard.

Coventry T.C. (May 15th. Major J. Stewart).—£3,700 for the purpose of a park at Poleshill; £1,200 for the widening of Park-side (a highway connecting London-road with Birmingham-road); and £15,400 for extension of the public baths, Priory-street.—It was stated that the population was increasing at a high rate, and was now 120,000. The local debt was nearly £2,000,000, which the inspector remarked was rather high, seeing that the rateable value was under £500,000. The city treasurer (Mr. H. Lord): But we have the gas, water, electric light and trams. The inspector: What will you do when some of these properties are scrapped? I am told there will not be a tramway in the country in ten years' time.

Darlaston U.D.C. (May 14th. Major J. Stewart).—£525 for the purchase of land at Rough Hay for a recreation ground.—It was stated that the purchase price was £500, or about £50 per acre. It was feared that the council might be shut off from making improvements if there was any delay.

Hornsea U.D.C. (May 21st. Mr. M. K. North).—£1,700 for street improvements.—The surveyor, Mr. W. E. Warburton, explained that part of the money had been already expended. The condition of the streets, he added, was bad in places.

Leeds T.C. (May 20th. Mr. T. C. Ekin).—£212,000, of which amount £200,000 would be spent in extensions of the existing generating station in Whitehall-road, including land, buildings, and plant. The remaining £12,000 was for the purchase of land in South Accommodation-road, which the corporation proposed to use for the purposes of a coal store.—It was explained that it was proposed to demolish the buildings forming the older portion of the generating station purchased in 1898, and the corporation proposed to discontinue the 640 kilo sets at present standing in the building. The total cost of new plant was estimated at £108,950, with an additional £9,000 for contingencies.

Manchester T.C. (May 21st. Mr. W. O. E. Meade-King).—£13,100 for the erection of baths at Barlow-road, Levenshulme, and for £3,770 for the provision of public wash-houses adjoining the Leaf-street baths, Hulme.—Mr. J. Holden, chairman of the Baths Committee, said that he was so satisfied with the way in which Manchester people patronised the baths and wash-houses that he was prepared to extend the facilities as much as possible.

Margate T.C. (May 12th. Mr. M. K. North).—£1,800 for the purchase of land known as Rolfe's Yard, for the purposes of a town yard. The borough surveyor, Mr. E. A. Berg, stated that the new depot would be midway between two existing depots, and would provide storage for several thousands of yards of stone. On an average they used 4,000 yds. of stone in a year. The means of access to this proposed depot were ideal, the site was central, it was on the same level as the harbour, and only about ½ mile from the sea front.

Nottingham T.C. (May 13th. Major J. Stewart).—£1,600 for the improvement of Bulwell-street.—It was stated that the original scheme consisted of the widening of the east side of Main-street also. The total cost of the complete scheme was estimated at £3,500, but having regard to so large a sum being involved it had been decided that the work should be carried out gradually. The Improvement Committee proposed to prescribe an improved street line on the east side of Main-street.

Plymouth T.C. (May 20th. Mr. F. O. Stanford).—£700 for works of sewerage at the rear of Julian-

street and Oakfield-terrace-road.—The town clerk (Mr. J. H. Ellis) said the period of repayment asked for was seven years. The owners being responsible in the ordinary way they would have put the expenditure upon them and treated it as a revenue matter. But the owners had appealed to them to spread payment over that term of years. The borough surveyor (Mr. J. Paton) said there were about eighty-eight houses over the area, and they were owned chiefly by working-class people who resided there.

Romford U.D.C. (May 14th. Mr. F. H. Tulloch).—£1,974 for the improvement of Hornchurch-road, Old Church-road, and Balgores-lane.—The acting surveyor, Mr. H. T. Ridge, explained the plans of the proposed improvements.

Torquay T.C. (May 21st. Mr. F. O. Stanford).—£665 for the widening of Walnut-road railway bridge.

The borough surveyor, Mr. H. A. Garrett, stated that the ward of Chelston was cut off from the whole borough of Torquay by the Great Western Railway, and the existing roadway between parapet walls was only 20 ft. wide, out of which there was a small, narrow footpath about 3 ft. wide, leaving the carriage road 17 ft. only. It was proposed to widen the road to 30 ft., and provide a footpath of 5 ft.

APPLICATIONS FOR LOANS.

Biddulph U.D.C.—£100 for the Station-road improvement.

Birmingham T.C.—£150,000 for electricity mains.

Chailey R.D.C.—£1,300 for drainage works.

Church U.D.C.—£1,630 for the reconstruction of Dill Hall-lane.

Cleethorpes U.D.C.—£10,000 for the enlargement of the electricity undertaking.

Crompton U.D.C.—£350 for sewerage work.

Kent C.C.—£600 for the technical institute and special subjects' classroom at Ashford, £325 for the enlargement of St. Peter's school, Broadstairs, and £2,600 for the enlargement of the special subjects school at Foot's Cray.

Mansfield T.C.—£2,850 in respect of street improvements.

Newquay U.D.C.—£2,200 for a drainage scheme.

Todmorden T.C.—£460 for a hockey field and tennis courts.

LOANS SANCTIONED.

Barnstaple T.C.—£400 for the purchase of a steam fire engine.

Bedwas and Machen U.D.C.—£1,900 for municipal offices, £186 for a caretaker's house and stores, and £80 for a fire station.

Bognor U.D.C.—£60 for underground lavatories.

Dover T.C.—£300 for the provision of tennis courts.

Exeter T.C.—Purchase of land in Claremont-road, £325 (eighty years); erection of workmen's dwellings in Princess-gardens and Claremont-road, £7,765 (sixty years); street works, sewerage, water supply, and fencing in Bartholomew-street, Blackboy-road, Princess-gardens, and Claremont-road, £2,157 (twenty years).

Hackney B.C.—£15,750 for electricity plant.

Hemsworth R.D.C.—£1,218 for sewage works extension.

Huddersfield T.C.—£21,500 for the electricity undertaking.

Ilford U.D.C.—£27,500 for main road improvement.

Lewisham B.C.—£21,023 for wood paving works.

Luton T.C.—£7,500 for the extension of the sewage disposal works.

Margate T.C.—£16,000 for a new road and promenade extensions.

Rowley U.D.C.—£750 for the improvement of Powke-lane, Blackheath.

Whitefield U.D.C.—£13,131 for a housing scheme, and £1,116 for street, sewerage, and water supply works.

Yarmouth T.C.—£5,391 for repaving works, and £1,173 for repairing Caister-road.

FORTHCOMING INQUIRIES.

	JUNE.	£
2.—Bournemouth.	For the provision of public conveniences (Mr. W. O. E. Meade-King)	1,911
2.—Ramsbottom.	For street and depot purposes (Mr. R. H. Bicknell)	1,710

2.— Yarmouth. For river protection works (Mr. A. G. Drury)	£ 1,300
3.— Birkenhead. For road improvement (Mr. M. K. North)	1,350
3.— Clitheroe. For road widening and the provision of a recreation ground (Mr. R. H. Bicknell)	1,000
3.— Croydon. For works of road widening (Mr. Edgar Dudley)	14,354
3.— Lowestoft. For the purposes of a recreation ground and town hall extension (Mr. F. H. Tulloch)	4,750
3.— Winchester. For paving works (Mr. W. O. E. Meade-King)	1,516
1.— Erpingham. For private street works (Mr. F. H. Tulloch)	275

ROAD MAINTENANCE IN STAFFORDSHIRE.*

By JAMES MONCUR, ASSOC. M. INST. C.E.,
County Surveyor.

It is not only the increase in ordinary pleasure cars that is becoming so serious a matter from a traffic and road maintenance point of view, but in a manufacturing county such as this it is the increase of heavy motors and light locomotives conveying merchandise that is really seriously deteriorating the road surface, and in places taking the very heart out of some of the roads. I have reiterated time after time that it is the foundations that carry the traffic, and it is obvious that foundations put in fifteen or twenty years ago, although capable of carrying the traffic then, are unfit in many instances for the changed traffic of the present day. If this traffic continues to increase in volume and weight of load carried, it would be economical to hold our hands for a time to see to what extent it is likely to increase and thereby arrive at the maximum traffic that is likely to use those roads, and build them accordingly. Such a policy of standing entirely still is, of course, practically impossible, and it is therefore obvious that to strengthen the roads and at the same time keep the traffic going will entail a certain amount of wasteful expenditure. It will be well in future to keep this fact in view, and when opportunity occurs increase the strength of the foundations, even although it is only on comparatively short lengths. A good deal of thought and judgment will require to be exercised so as to avoid wasteful expenditure by putting in stronger foundations than the future traffic might warrant. In such a county as this the normal vagaries of traffic are very considerable, due for example to the opening of new mines or the closing down of worked-out ones, and there is the risk in the latter case of having roads left stronger than is required after the mine traffic is gone; but this cannot well be avoided.

Apart altogether from the question of strengthening the roads, I am strongly of opinion that everything possible should be done to improve the standard and character of all roads. This would undoubtedly have the tendency of inducing the traffic to adopt a greater variety of routes, and the cost of future maintenance will, I am certain, be largely governed and kept within reasonable bounds in proportion to the extent that traffic is diverted from a few through or trunk roads and induced to use more or less all roads. In the case of touring cars a few extra miles in a day's

* Extracts from annual report for year ended March 31st last.

journey would never be considered, provided the road was good.

WIDENING CARRIAGEWAYS.

Modern traffic has made it imperatively necessary to increase the widths of the metal beds on many of the main roads, not only because of the larger and faster traffic they have to carry, but also to enable horse-drawn vehicles to pass the fast-moving traffic with greater safety. The total amount expended in this way during the year has been £1,315 13s. 2d., towards which the Road Board have contributed £937. In the majority of roads the sides, as a rule, are much weaker than the centre, which is inimical to best construction, and increased cost of maintenance is the result. The haunches or sides act as abutments to the road, and it is therefore all-important that the margin of strength should rather be over than under. This work has, therefore, the further advantage of contributing indirectly to maintenance, but, nevertheless, there is an increased area to maintain.

Mr. Moncur makes a reference in his report to the reconstruction of part of the Lichfield and Sudbury road, near Sudbury Station, a work which was in hand for two years. The upper metal crust was stripped off and a hand-set foundation of 9-in. slag put in, the upper crust being formed with the old macadam with the addition of new, so as to form a wearing surface of 6 in. after consolidation. In order to fill up the voids the large material in the foundation was well packed and keyed up with smaller material, and consolidated with a 12½-ton steam roller before the surface metal was applied, and similarly consolidated. Notwithstanding this, however, slight depressions have formed. These, Mr. Moncur thinks, can only be accounted for by the fact that, no matter how well the road may be built and the rolling done, a certain amount of unequal settlement takes place under ordinary traffic until the foundation has got its proper bearing and the surface coating has formed into a solid and homogeneous mass. "It also," he adds, "confirms the opinion I expressed in my first annual report that, no matter how well the steam roller may do its work, it is the ordinary traffic that puts the finishing touches to the surface, but, unfortunately, in the present instance, the traffic has done something more, and found out the unequal bearing strength of the foundations. The moral seems to me to suggest that in the reconstruction of roads, and especially heavy trafficked ones, it would be advisable to defer the application of the top finishing coat of granite until the expiry of several months after the road has been built. If my contention is right regarding the movement of the foundation and upper crust of an ordinary macadam road, it appears to me that where tar-macadam or bituminous binding is used on a new foundation it is doubly necessary to defer the application of the finishing coat for a time, for if movement does take place in such cases the damage done is much more serious. If the bituminous joints are once broken the whole surface will go to ruin."

Coast Sand Dunes, Sand Spits and Sand Wastes.

By Gerald O. Case. 5s. nett. London: St. Bride's Press, 24 Bride-lane, E.C.—This work is a treatise on the advantages of the proper utilisation of inblown sand, so as to turn it into a protection against coast erosion, instead of being, as too often at present, an active agent in such erosion and in the laying waste of fertile land. The author draws many of his examples from Scotland. He points out the work that has been done on the Continent in turning sand wastes into pine forests. The book gives an able and systematic treatment of its subject.—*Scotsman*.

The Surveyors' Institution and Road Engineering.

In the forty-sixth annual report of the council, presented at the annual general meeting of the Surveyors' Institution on Monday evening, it is stated that the council have for some time recognised the importance of greater scientific study being given to the construction of arterial and other roads. The change in the traffic passing along roads, and its ever-increasing weight and speed, clearly indicate that road engineers and surveyors of the future will have to be far more fully and scientifically equipped than was necessary in the past. Apart from pupilage in a practising surveyor's office, little or no provision is made for the more advanced training now required, and the council have therefore thought it desirable to bring this need to the notice of the universities, who have done so much to advance the scientific side of professional knowledge in other directions.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Brighton £14,000, Kent £30,000, Swansea £6,000, Wilts; housing and town planning—Bentley £23,800, St. Helens £15,000; refuse collection and disposal—Cleethorpes; roads and materials—Heris, Hull, Lewisham, Portsmouth £200,100; sewerage and sewage disposal—Nantwich £16,750, Truro £24,300; water, gas and electricity—Carlisle £59,250.—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS

Aberdeen T.C.—The tender of Mr. Alexander Hall, at £170, has been accepted for building the new shelter at the Beach.

Arbroath T.C.—The building of the proposed public baths, towards which Mr. Andrew Carnegie has given £7,000, is to be proceeded with. The total estimated cost is £7,600.

Brierfield (Lancs) U.D.C.—It is proposed to build a new school for 342 scholars, at an estimated cost of £5,292.

Brighton T.C.—It has been agreed to erect an elementary school for 700 scholars at Patcham, at a cost of about £14,000.

Cambridge T.C.—A scheme has been approved for the extension of the municipal buildings, at an estimated cost of £4,500.

Cheshire C.C.—Arrangements have been entered into between the county council and the county boroughs of Chester, Birkenhead, Wallasey, Stockport and Stoke-on-Trent for the provision of a joint sanatorium containing 150 beds, but with the administrative block so constructed as to allow of possible expansion to a total of 240, the number originally estimated as likely to be required in the future.

Deptford B.C.—A scheme for slipper baths, estimated to cost £1,500, has been adopted.

Kent C.C.—It is intended to proceed with the scheme for the erection of new headquarters for the county police at Maidstone, at an estimated cost of £30,000.

Morecambe T.C.—The borough surveyor, Mr. F. W. Hipwood, has received instructions to prepare a plan and estimate for a tramway shed.

Richmond (Surrey) T.C.—Plans are to be prepared for a bathing shed on the river bank with a view to their being considered by the council, and meanwhile a temporary structure is to be erected in order to judge its effect on the amenities of the district.

Swansea T.C.—A scheme is under consideration for the extension of the police buildings at an estimated cost of £6,000.

Wilts C.C.—Subject to the approval of the Local Government Board, it has been decided to purchase land at Trowbridge and Salisbury for the erection of hospitals for the treatment of advanced cases of tuberculosis, and to erect on such sites suitable hospital blocks, each containing twelve beds, at an estimated cost of £1,500 each.

HOUSING AND TOWN PLANNING.

Bentley (Yorks) U.D.C.—The surveyor, Mr. R. G. Whitley, has prepared the plans of a housing scheme which is estimated to cost £23,800.

Branston R.D.C.—The council have referred to the Housing Committee a letter that has been received from the Kesteven County Council, advising the district council to proceed at once to remedy the insanitary conditions of the old houses at Waddington, and to present a scheme to the council for providing a sufficient number of new houses for the working classes in that district. If the district council failed to do so, the county council would be compelled to exercise its powers under the Housing of the Working Classes Act.

Hendon U.D.C.—Official sanction has been given to the council's proposed housing scheme at Child's Hill.

Inverness T.C.—The council have under consideration a scheme for the erection of municipal dwellings. At a meeting of the Housing Committee last week it was decided to make a start in the matter,

and the sanitary inspector was instructed to draw up a draft report of a scheme to embrace the whole of the slum property known as Davis-square.

Selby U.D.C.—A sum of £9,100 is to be borrowed for the erection of thirty-nine workmen's dwellings in Fairfax-avenue.

St. Helens T.C.—It is proposed to proceed with a series of housing schemes at an estimated cost of £15,000.

Tandragee R.D.C.—A tender has been accepted for building eight labourers' cottages, at £165 per cottage. This exceeds the sum allowed by the Local Government Board, and their sanction will have to be obtained to the increase.

PARKS AND OPEN SPACES.

St. Annes-on-Sea U.D.C.—A London firm are providing gardening designs for the laying out of 12 acres forming Ashton Park, recently presented to the town. It is proposed to make it an attractive outdoor sports centre. The new ornamental gardens and waterfalls on the promenade are now completed.

Tamworth T.C.—The scheme of the borough surveyor, Mr. F. E. G. Bradshaw, for developing the pleasure grounds has been adopted, and the Local Government Board is to be asked to sanction a loan for the work.

Walton-on-Thames U.D.C.—It has been decided to purchase for £1,170 a site for a recreation ground.

REFUSE COLLECTION AND DISPOSAL.

Chard T.C.—By eight votes to five the council have rejected a motion to advertise for tenders for scavenging and watering, and determined to continue to do these works by direct labour.

Cleethorpes U.D.C.—It has been decided to proceed with the scheme for the erection of a refuse destructor, at an estimated cost of £3,000.

ROADS AND MATERIALS.

Bath R.D.C.—Application has been made to the county council for a grant of £250 towards the cost of asphaltting the footpaths of London-road, £40 for the new Warminster-road, and £25, the cost of tar-spraying the road on Claverton Down.

Buckie T.C.—An improvement of the Cunningholes road, including sewerage, is to be carried out at an estimated cost of £1,684.

Gannock U.D.C.—It is announced that the county council have consented to make a contribution of £250 towards the scheme for widening the Stafford main road in the council's district.

Gavan C.C.—The county surveyor, Mr. O'Reilly, has made a number of recommendations, which have been referred to the Roads Committee. They include the appointment of a mechanic to take charge of the road machinery; the gaol yard at Gavan to be used as a machinery repair and store yard, and the gaol itself as a workshop for the repair of road machinery; the purchase of three steam rollers, three scarifiers, two watering-carts, and stores to keep machinery in repair; wages of engine-drivers to be progressive by 1s. per week per annum to 30s. maximum; and various improvements in the matter of road maintenance.

East Riding C.C.—It was decided at the recent council meeting to grant £1,200 for the purchase of a steam tractor, a petrol motor lorry, a pitch-grout mixer, and a sand dryer in the direct maintenance of main roads. The Road Board's offer of a £1,300 loan free of interest, repayable in three years, was accepted. A further sum of £710 was granted for the purchase of a site at Leeming Bar, and the erection of buildings as a depot for the storage of motor vehicles used in connection with the direct maintenance of the main roads.

Edinburgh T.C.—A conference is to be held between representatives of this council and the Leith Town Council on the subject of the proposed widening of Eastern-road and the paving of Lochend-road.

Exeter T.C.—The borough surveyor, Mr. T. Moulding, has been authorised to spend £800 on tar-spraying.—A tender at £3,293 has been accepted for the wood paving of Sidwell-street.

Herts C.C.—An expenditure of £1,475 is to be incurred in bringing the secondary roads in the rural districts to a higher standard of efficiency.

Holworthy U.D.C.—The council have adopted the estimates of the surveyor, Mr. F. Vanstone, for the execution of several improvements to the approaches of the town.

Hull T.C.—Two schemes for widening the thoroughfare between the Paragon Station-square and Prospect-street are engaging the attention of the council. One scheme, which is estimated to cost over £100,000, provides a street, 70 ft. wide, from the south end of Brook-street to the junction of Beverley-road and Spring Bank; the other scheme provides a street running from Mill-street, in Brook-street, to Beverley-road, at a cost of about £90,000. The estimate for widening Brook-street is £72,000.

Kingston (Surrey) T.C.—Particulars of dangerous corners in the borough have been prepared by Mr. R. H. Clucas, the surveyor, and are to be forwarded to the Surrey County Council with the comment that the suggested basis of the Road Board and county contributions towards any improvements of such corners are considered to be quite inadequate to effect the objects in view.

Lewisham B.C.—New road works estimated to cost £3,317 have been approved by the council.

Loftus U.D.C.—A preliminary scheme is being prepared for a proposed new road between West Loftus and Carlin How.

Marylebone B.C.—The tender of the Trinidad Lake Asphalt Paving Company, Limited, has been accepted for bituminous paving in Abbey-road and St. John's Wood-road, at 11s. 2d. per yard super., to include free maintenance for a period of eight years, the contractors to maintain the paving for a further two years following this period at the price of 9d. per square yard per annum. It has also been agreed to accept the tender of the Highways Construction, Limited, for Grove End-road at 6s. 6d. per yard super., to include free maintenance for a period of five years from the date of completion, subject to the road being left by the contractors at the end of that period to the satisfaction of the borough surveyor.

Portsmouth T.C.—An intimation has been received from the county council of their willingness to approach the Road Board with respect to the proposed new road out of Portsmouth, but that they (the county council) cannot pledge themselves to make a contribution towards the cost. The estimated cost of the scheme is £200,100.

Richmond (Surrey) T.C.—The views of the council with respect to the proposed arterial road have been duly submitted to the Local Government Board. They are summarised in a statement made at the council meeting by Alderman Simpson, who said that at the conference one of the things that most of them wanted to know was who was to pay for the arterial roads, and what assistance might be expected from the Government, or whether they were going to do all the work themselves. They did not get any satisfactory answer from any member of the Local Government Board or anyone connected with the Road Board; all that they could say was that it was not necessary to consider the question of cost at the present time. With regard to the proposed road through Richmond, the council were of opinion that it was an entirely wrong line. It would cross the river near the sewage works, then cross the railway, cut through Kew-road near the Wesleyan church, and then run across the Old Deer Park. The council were of opinion that a road was not required in that position.

Selby U.D.C.—Property is to be purchased for over £3,000 in order to construct a road leading from Gowthorpe-street to Flaxley-road.

Wandsworth B.C.—At a cost of £6,000, High-street, Putney, is to be improved by the widening of the bridge which carries the roadway over the London and South-Western Railway.

SEWERAGE AND SEWAGE DISPOSAL.

Bacup T.C.—The borough surveyor, Mr. W. H. Elee, has prepared a sewerage scheme.

Basingstoke T.C.—A grant of £235 has been made by the county council towards the cost of a new surface-water drain in Brook-street.

Cottingham U.D.C.—The Hull-road sewer is to be repaired for a distance of 1,130 yds., at an estimated cost of £2,900.

Darlington T.C.—The Local Government Board having intimated that they were prepared to issue a Provisional Order granting an extension of the borough and constituting Darlington a county borough, subject to certain requirements being carried out, the council have resolved to convert all privies into water-closets. It was stated that something like 1,500 closets had been dealt with, and that 1,267 remained to be dealt with. When these were cleared out of the way the council proposed to act with respect to the remainder of the conveniences under the Public Health Amendment Act, 1907, which meant that the public authority would have to pay half the cost.

Epsom U.D.C.—A scheme has been adopted for the extension of the sewage disposal works, at an estimated cost of £8,197.

Leicester T.C.—It was announced at the council meeting on Tuesday that the Local Government Board had refused to sanction the storm-water scheme as at present proposed. The Local Government Board had made suggestions, one being that the council should consider the advisability of formulating a scheme for the construction of further purification works on the Soar Valley side. The Sewage Works Committee recommended the council to authorise them to take measures for the preparation by the borough engineer and surveyor, Mr. E. George Mawbey, M.INST.C.E., of plans and estimates of an amended scheme to meet the Local Government Board suggestions, and this was agreed to by the council.

Nantwich U.D.C.—Approval has been given to the amended plans for the extension of the sewage works, at an estimated cost of £16,790.

Truro T.C.—It has been agreed to carry out a sewage disposal scheme, at an estimated cost of £24,300.

WATER, GAS, AND ELECTRICITY.

Audley U.D.C.—Consideration is being given to a scheme for the extension of the gasworks, at an estimated cost of £3,000.

Bexhill T.C.—A nett profit of £1,817 was earned by the electric light undertaking last year.

Brynmawr U.D.C.—The surveyor, Mr. J. J. Quirk, reported last week that the trial hole at Rhos Meredith had not yet been sunk to its proper depth; at present it was about 15 ft. deep. Progress had been slow, owing to the quantity of water to be dealt with and to the hole having to be sunk in the solid rock. The yield of water was approximately 5,700 gallons per twenty-four hours. He had also measured the water discharging into the dingle a little further on and found that the yield was 4,800 gallons per twenty-four hours. The council therefore were sure of 10,500 gallons of water per day. It was found that the water increased as they went lower with the trial hole.

Burton T.C.—The basin of the reservoir at Kilmundy has been concreted and improved to facilitate the delivery of filtered water to the inhabitants. To protect the water from contamination, a 6-ft. wall has been built round the area, and other measures have been taken to safeguard it. The reservoir has capacity for over 300,000 gallons, or fully a day's supply, and is situated a mile north-east of the town, 200 ft. above the sea level.

Carlisle R.D.C.—The engineer, Mr. J. Graham, has prepared a scheme for supplying the whole of the district with water, at an estimated cost of £59,250, and it has been submitted to the various parishes for their consideration.

Falkirk T.C.—A scheme has been approved for the purchase of new electricity plant at a cost of £5,750.

Fulham B.C.—The Electricity and Lighting Committee report that there are about 100 public street lamps at the present time which are on the lines of the council's mains, and which can be converted from gas to electric lighting without involving extension of cable. The cost of the conversion is estimated as follows: To laying services to 100 posts, £191; 100 conversion sets, consisting of switches, frogs altering, and wiring lanterns, and proportion of saving charges, £80; total, £271.

Isle of Wight R.D.C.—A conference is to be held with the Arreton Parochial Committee on the subject of a proposed water supply scheme for that district, prepared by Messrs. Collins & Merwood, which is estimated to cost £1,900.

Kilmarnock T.C.—The council have voted an honorarium of £100 to the electricity manager in recog-

dition of services in connection with the promotion of the Electric Extension Order, and at the same time increased his salary by £100 per annum.

Redditch U.D.C.—It has been decided to adopt the scheme recommended by Messrs. Handcock & Dykes, London, for the extension of the electricity undertaking, and to apply to the Local Government Board for sanction for a loan of £18,000 for the purpose.

Shrewsbury T.C.—For the protection of the water supply it has been decided to purchase, for £1,120, a field adjoining the conduit head.

Southwell R.D.C.—The council have decided to give consideration to a representation from the Local Government Board with respect to the insufficiency of the water supply in the villages of Oxtou, Epperstone, Lowdham, and Gunthorpe.

Thakeham R.D.C.—Pumping operations having proved satisfactory, the council have instructed Messrs. Tulloch & Haworth, engineers, to prepare plans of the proposed water supply scheme for Storrington. The estimated cost is £5,172.

Thetford T.C.—An agreement has been signed with the gas company for public lighting on the following terms—viz.: All-night incandescent lamps £1 12s., incandescent lamps £2 11s. 6d., ordinary gas lamps £2 11s. 6d.

MISCELLANEOUS.

Dundee T.C.—The Police Committee recommend the acceptance of the tender of Leyland Motors, Limited, at £965, for the supply of a new motor fire engine.

Exeter T.C.—A surplus of £1,724 from the working of the tramway undertaking last year, after paying sinking fund and interest, has been carried to the reserve and renewals account, which will then stand at £7,835.

Kingston (Surrey) T.C.—Mr. R. H. Lucas, the surveyor, was on Tuesday asked to report at the next meeting as to the provision of an open-air swimming bath.

PERSONAL.

Mr. J. Parry Humphreys has been appointed borough surveyor of Flint.

Mr. A. Lupton, surveyor to the Knaresborough Rural District Council, has been granted an increase of salary.

Mr. H. A. Butterfield, engineering assistant at Batley, has been appointed chief assistant to the borough engineer of Keighley.

Mr. A. W. Smith, assistant surveyor of Abertillery, has been appointed district surveyor to the Monmouthshire County Council.

Mr. J. C. Matthew, of the Exmouth surveyor's department, has been appointed surveyor to the Sidmouth Urban District Council.

Mr. P. H. McCarthy has been appointed surveyor to the Bray Urban District Council at a salary of £150 and 2½ per cent on all schemes.

Mr. D. P. Boath, of Glasgow, assistant surveyor in the Eastern District of Dumbartonshire, has been appointed burgh surveyor of Denny.

Mr. Sydney Perks, surveyor of the City of London, has in the Royal Academy a water-colour drawing of a building on the Tower Bridge approach.

Mr. Urban A. Smith, county surveyor of Hertfordshire, resigned, has been appointed consulting engineer and surveyor to the county council, at a salary of £500 per annum.

Mr. Reginald Brown, M.I.N.S.T.C.E., of Old Queenstreet, Westminster, has been called in by the Cudworth Urban District Council to inspect the district and report upon the scheme of sewage disposal prepared by the surveyor, Mr. W. T. Lynam.

Mr. Wallace E. Riche, secretary to the Roads Improvement Association, has been appointed to represent that body at the town planning and road conference of the Institution of Municipal and County Engineers at Cheltenham next month.

Mr. E. G. Owen, assistant in the office of Mr. Harry Riding, engineer and surveyor to the Burley-in-Wharfedale Urban District Council, has received a similar appointment under the Ilkworth Urban

District Council. Mr. Owen served his articles under Mr. Riding.

Mr. George E. Bond, J.R., of Rochester, immediate past-president of the Society of Architects, died, we regret to state, on the 20th inst. Mr. Bond commenced practice in the city of Rochester upwards of thirty years ago, and some of the principal buildings in the district, including the town hall and municipal buildings, technical institute, and free library, were erected from his designs. He was architect to a number of public bodies, and had an extensive and varied practice in the county of Kent. He joined the Society of Architects in 1888, and for many years served on the council, and was president for four years in succession. The funeral took place on Saturday last at St. Margaret's Cemetery, Rochester.

Mr. E. George Mawbey, borough engineer and surveyor of Leicester, was on Tuesday voted an honorarium of £500 by the town council in respect of special services in connection with the construction of the tramways. It will be recalled that about twelve years ago Mr. Mawbey was paid £500 for designing the tramway scheme and preparing the Parliamentary work. Alderman Flint, who moved that Mr. Mawbey receive an honorarium of £500, stated that the track construction had involved a tremendous amount of extra work. The permanent way was made for £17,000 less than the Parliamentary estimate for the contract price. The capital expenditure for the tramways work, carried out under the direction of Mr. Mawbey, was something like £550,000. The borough engineer had ungrudgingly given his services to the Tramways Committee whenever they were required. Mr. Mawbey, it may be added, holds the office of chief engineer to the electrical departments as well as for the designing and carrying out the permanent way. His salary for some years has been £1,250.

Mr. Joshua Cartwright, M.I.N.S.T.C.E., one of the original members and a past-president of the Institution of Municipal and County Engineers, entered upon the eightieth year of his age on Saturday last, the 23rd inst., and his numerous friends in the profession will be glad to know that he is still in harness and actively

MR. JOSHUA CARTWRIGHT, M.I.N.S.T.C.E.

engaged in consulting work. Born at Stalybridge in 1835, Mr. Cartwright was one of the early band of students that attended the old Quay-street School, Manchester, the pioneer of Owens College, now Victoria University, Manchester. He entered the service of the Dukinfield Local Board as an assistant in the surveyor's department in 1862, and two years later was appointed surveyor to the board. During the fourteen years he occupied the latter post he carried out extensive main drainage and street works, and upon the waterworks becoming the property of the board was appointed engineer for the undertaking. He went to Bury in 1877 as first engineer and surveyor

after the incorporation of the borough, and held that office until 1900, when he resigned in order to take up private practice, being retained by the corporation as consulting engineer for a term of years. At this juncture the waterworks undertaking of the Bury Corporation was transferred to the Bury and District Joint Water Board, and he became engineer to that authority. For the Bury Corporation Mr. Cartwright designed and constructed Clough Bottom reservoir, and for the Joint Board Ogdon reservoir, and Scout Moor high-level reservoirs. Mr. Cartwright will have the sympathy of all to whom he is known in the bereavement which he has suffered this week, his younger son, Mr. Philip Cartwright, passing away on Monday at the early age of forty. Mr. Philip Cartwright had assisted his father for some years in his professional undertakings, and had personally a wide grasp of engineering knowledge. He was held in high esteem by all who had business associations with him, and his death is generally regretted.

Highway Maintenance in the West Riding.—It was reported at a recent meeting of the West Riding County Council that the average outlay for the maintenance of main roads (including the nett cost to the county council of tar-spraying and tar-binding) last year as compared with the previous year was £303 17s. per mile for "claimed" roads, against £313 19s. 2d. per mile in the previous year, and £317 for unclaimed urban roads and £132 for unclaimed rural roads, against £319 and £124 respectively. As compared with last year's estimates there were savings effected on the highways account of £13,551, and on the bridges account of £5,024.

FOR OTHER ADVERTISEMENTS

See End of Paper.

RURAL DISTRICT COUNCIL OF YSTRADGYNLAIS.

APPOINTMENT OF CLERK OF THE WORKS.

Applications are invited for the position of Clerk of the Works in connection with the construction of the New Sewerage and Sewage Disposal Scheme for the Parish of Ystradgynlais.

The salary offered is £3 3s. a week, and the works will take about 18 months to complete.

Applications, stating age, full particulars of experience, accompanied by not more than three recent testimonials, must be sent to the undersigned on or before Saturday, the 6th June, endorsed "Clerk of the Works."

Canvassing, directly or indirectly, will be a disqualification.

A. JESTYN JEFFREYS,

Solicitor and Clerk to the Council.

Queen Chambers,

Neath.

(1,654)

WYCOMBE RURAL DISTRICT COUNCIL. PRINCES RISBOROUGH SEWAGE DISPOSAL.

The above Council are prepared to receive Tenders from responsible Contractors for the construction of sewage disposal and purification works at Princes Risborough.

Plans and Specification may be inspected, and Bill of Quantities obtained, at the office of the undersigned on payment of a deposit of two guineas, which will be returned on receipt of a *bona-fide* Tender.

The Council's Engineer or his representative will be in attendance at the Sewage Outfall Works, Princes Risborough, between the hours of 3 p.m. and 5 p.m. on Wednesday, 3rd prox., to explain the scheme to intending Contractors.

Sealed Tenders, endorsed "Princes Risborough Sewerage," to be delivered at my offices not later than 12 noon on Saturday, the 13th day of June, 1914.

The Council does not bind itself to accept the lowest or any Tender.

B. L. REYNOLDS,

Clerk to the Council.

12 Easton-street,

High Wycombe.

May 27, 1914.

(1,655)

FOR SALE OR HIRE—4 Capital Second-hand Tank Wagons for use on road. Spring mounted on 4 wheels; cylindrical tanks 400 gallons capacity. Photo. sent.—Bateman, Engineer, Woking.

(1,653)

MANCHESTER CORPORATION SEWAGE WORKS, WITHINGTON.

INSTALLATION OF EMSCHER TANKS.

There has just been completed at the Withington works of the Manchester Corporation an installation of Emscher sewage disposal tanks, the first plant of the kind in this country. The works, which have been carried out by Mr. O. J. Wilkinson, A.S.O.C.M.I.N.S.T.C.E.E., consulting engineer, of Manchester, for the Manchester Corporation Rivers Committee, comprise grit chambers, Venturi meter, Emscher tanks, and sludge-drying beds. The plant has been specially designed, on strictly scientific lines, with a view to dealing with a daily flow of sewage equal to 750,000 gallons.

The installation is self-contained, and has been planned in such a manner that careful records and observations can be taken from time to time as to the capability and efficiency of the plant. The grit chambers are intended to eliminate the mineral solids in suspension which cannot be digested in the tanks, and the rate of flow passing through the tank will be recorded by the Venturi meter erected between the grit chambers and the inlet to the tanks.

The Emscher tank comprises two sludge digestion chambers, each 27 ft. diameter and 17 ft. 4 in. deep, underlying a sedimentation chamber of two hours' capacity. The sludge chambers have capacity for six months sludge, and the arrangement is such that when the sludge has remained in the tanks for a sufficient length of time to ensure complete digestion it can be drawn off by means of the water pressure in the tanks through a cast-iron pipe while the pipe is in operation. Provision has also been made for breaking up the sludge in the tank by means of compressed air in the event of clogging taking place. A feature of the design is the arrangement for collecting gases given off by the decomposition of the sludge. These gases will be analysed from time to time, the volume given off measured, &c.

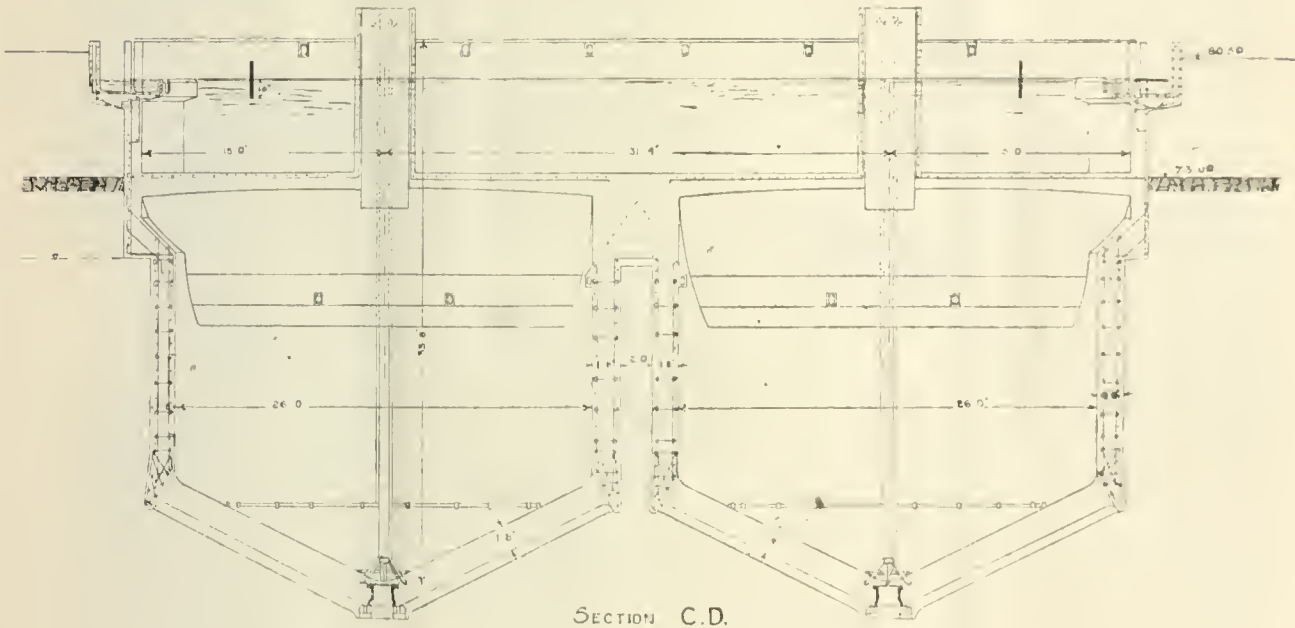

The sludge, when in a suitably "rotted-out" condition, will be passed into drying beds, where the water will be rapidly drained off through clinker beds and treated in the existing contact beds. Experience shows that sludge cake resulting from the Imhoff tanks rapidly drains and hardens, and is absolutely innocuous. Wagon ways are provided in the drying beds for the removal of the cake from time to time as required.

The estimated cost of the complete plant, which has been carried out in reinforced concrete throughout, and in water-bearing strata, was about £4,000. This figure has not been exceeded in actual cost: in fact, a slight saving has been effected.

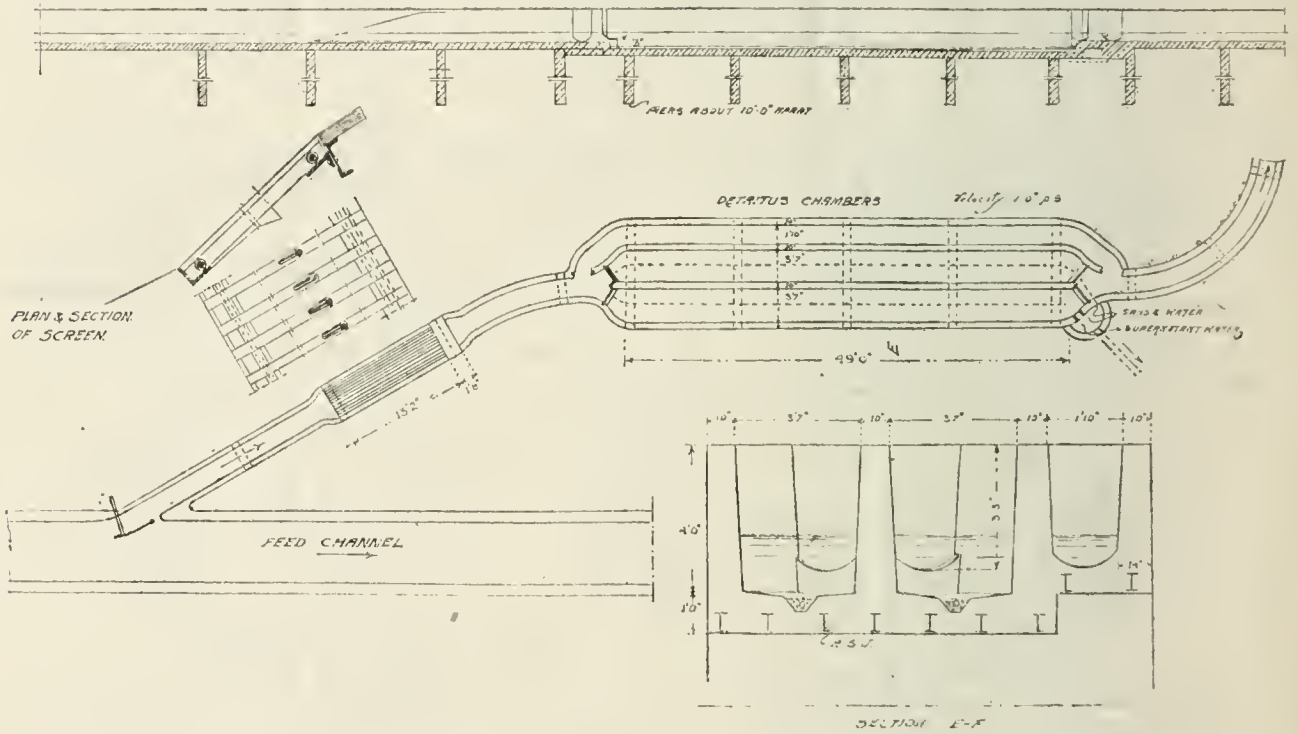

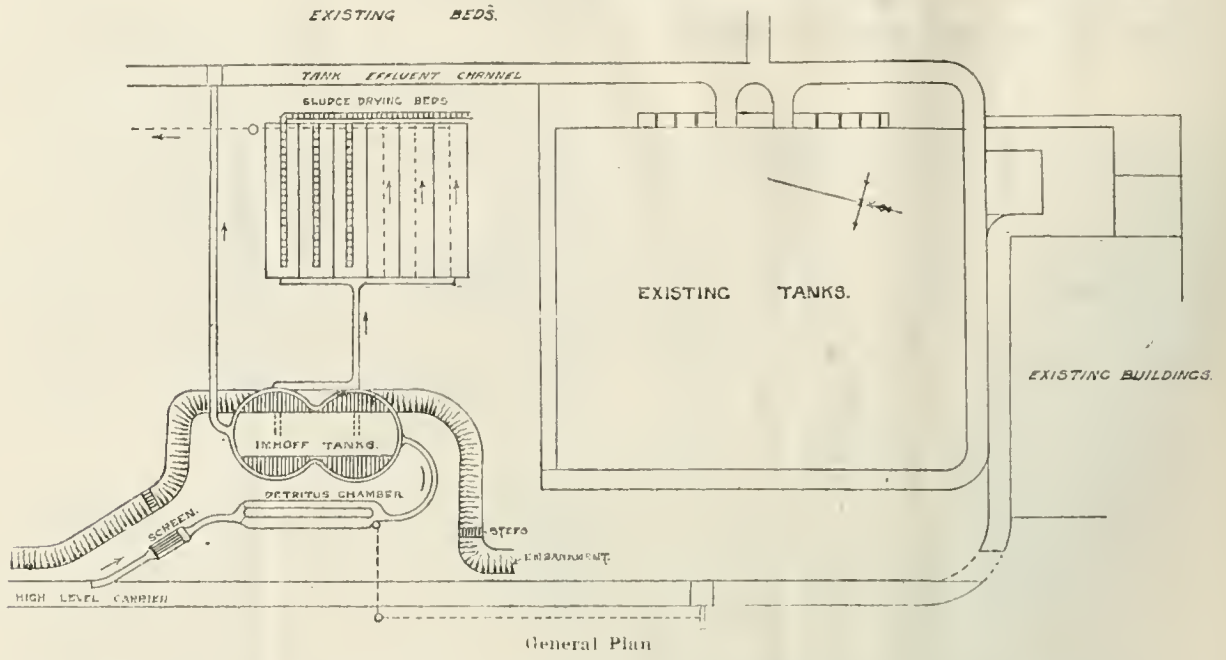

Claridge's Asphalte.—This material is being used on the roofs of the Imperial Tobacco Company's premises, Millbank, and H.M. Stationery Offices, Stamford-street.

Association of Managers of Sewage Disposal Works.—To-morrow (Saturday) the members of this body will pay a visit to the sewage works of the Tipton Urban District Council, which have just been reconstructed. Meeting at three o'clock at Dudley Port Railway Station, the party will arrive at the works half an hour later, where they will be met by Mr. W. W. Doughty, J.R., chairman of the Sewerage Committee and other members of the council. A short paper will be presented by Mr. W. H. Jukes, the surveyor.

The Scottish Road Trials.—The road surveyor of Renfrewshire, Mr. Robert Drummond, has reported to the Road Committee of Upper Renfrewshire that Road Board experiments in that district will be made on the south end of the Crookston-road. The sections will be treated as follows: (1) Ordinary macadam; (2) ordinary macadam, surface tarred; (3) macadam, grouted with pitch and sand; (4) macadam, grouted with pitch and oil; (5) macadam, grouted with pitch and oil and surface sealed with Trinidad bituminous mixture; (6) tar-macadam, surface sealed with distilled tar; (7) tar-macadam, surface sealed with Trinidad bituminous mixture; and (8) tar-macadam, surface sealed with Mexican bituminous mixture. The total estimated cost, including purchase of instruments, making observations, measurements, supervision, &c., is £807, of which £628 will be paid by the Road Board, leaving £179 to be borne by the county authorities. The work will be begun immediately.

EMSCHER TANKS INSTALLATION AT WITHINGTON SEWAGE WORKS, MANCHESTER.

EMSCHER TANKS INSTALLATION AT WITHINGTON SEWAGE WORKS, MANCHESTER

THE PROBLEM OF ROAD TRAFFIC.

Captain H. H. P. Deasy, late 16th [Queen's] Lancers, a member of the council of the Roads Improvement Association, has written a pamphlet with the above title, in which he attempts to solve this troublesome and complex problem.

He begins by stating that the problem is one that should introduce such an improved and popular system that the public and all "authorities concerned" shall regard it as efficient and just, and ensure the confidence of the public, that it should increase the traffic bearing capacity of the existing highways, and "effect a substantial reduction in the number of accidents of all kinds."

His solution of the problem is shortly as follows:

(1) A single Government Department entrusted with adequate powers, and suggests the title of the Highways Board.

(2) There should be only one law relating to traffic for the whole of Great Britain, as those at present in force are voluminous, scattered, incomplete, antiquated, and overlapping.

(3) There should be very few local by-laws or regulations which do not apply to the whole country.

(4) He says that the Highways Board "should consist of a small number of specially qualified persons selected solely on the ground of their competence," that there should be two departments of this board, one called the highways branch, the other the traffic branch, and he defines their respective duties.

(5) That this board should be advised on legal and technical matters by independent and well-paid experts.

(6) He suggests that the terms of reference should be—

(a) Consider all matters relating to highways and the traffic thereon, and advise Parliament upon these subjects.

(b) Formulate a standard code of by-laws for the proper control of the road traffic, all existing laws and by-laws being repealed.

(c) Make, modify, approve or cancel by-laws relating to general traffic on the highways applicable throughout the country, or only in particular localities, the Highways Board to be the only authority enforced by Parliament to do this.

(7) The board should prescribe routes for public service vehicles, and deal with their time tables so far as public safety is concerned.

(8) He suggests that a public inquiry should be held in most cases where any alteration is proposed in existing routes for public services.

(9) The board should hold an inquiry at an early date as to the present system of contribution by owners of public service and other vehicles towards the cost of upkeep, &c., of the highways, and report result to Parliament.

(10) That all highways should be classified.

(11) That the board should have power to limit or prohibit the use on a highway of any vehicle likely to cause undue damage on a road, or is dangerous or objectionable to the public.

(12) Fix special controls as to limits of speed after holding a public inquiry.

(13) Captain Deasy is of opinion that fixing a speed limit does not afford sufficient protection to the public, and that sec. 1 of the Motor Car Act, 1903, should be emphasised, which, if enforced, would place a much greater responsibility on the driver of a car under varying conditions which at present are met.

(14) The question of direction posts and signal posts should be standardised and more rigorously enforced.

Captain Deasy then advocates the allocation of State grants in aid of costs of existing highways, and the manner in which the Highway Board should proceed before making any grant or loan; also that the Highway Board should be empowered to consider all applications for permission to lay rails in the streets; that the board should be authorised to spend money on experiments connected with improvements on highways or road traffic, and give remuneration to originators of improved methods of highway construction or maintenance and matters relating thereto; further, that they should "devise, and, if possible, establish, a proper system of technical

education on all matters relating to the construction and maintenance of highways."

There are other matters contained in this valuable little pamphlet [published by E. J. Larby, 1 Paternoster-avenue, E.C., price 6d.] which can be read with profit by all those who are interested in the traffic problem. We have given a very full description of the principal matters contained in the pamphlet because we think they are well worth consideration, and in some cases no doubt one criticism.

SEWER OR DRAIN?

DECISION OF A HOUSE OF COMMONS COMMITTEE.

In the proceedings before the House of Commons Committee recently on the Walsall Corporation Bill, seeking modifications and extensions of by-laws, an important decision was announced with respect to the clause dealing with sewerage. This was Clause 69, dealing with sewers to be drained, and for the Local Government Board it was pointed out that the clause would alter the provisions of the general law. It was submitted that the subject-matter of the clause was not appropriate for legislation applicable only to particular districts in case where sewers and drains in the district had been constructed under the general law. A similar clause had been disallowed in another Bill by a Local Legislation Committee on the ground that the matter should be dealt with by general legislation. A similar clause had, however, been given to the Southgate Urban Council.

Mr. Beveridge (for the Walsall Council) said this clause was debated at great length with the West Bromwich Bill of last year, and a Bill was presented to the House of Commons backed by several gentlemen of influence, including Sir Charles Nicholson, Sir Luke White, and Mr. Middlebrook, to clear up the matter and lay down a general principle. The object of that Bill was to amend the definitions of "sewer" and "drain" in the Public Health Act. Under those definitions at present any drain for the drainage of more than one house became technically a sewer, and was therefore repairable by the local authority. Numerous decisions in the law courts illustrated the practical difficulties which arose from the present uncertain state of the law on the subject. He had looked into the law, and was bound to say he could not understand it. The law, as it stood, involved frequent interference by local authorities with private property. The cost of repairing drains which in all respects were private and of no use to the general public was thrown upon the whole body of rate-payers, and militated against the adoption of the best methods of draining houses and streets. This section of the Public Health Act had probably caused more controversy in law than any other. The clause now submitted was drafted upon the Bill that had been before Parliament. He contended that Walsall Corporation ought to have this clause given to them. Mr. J. Samuel: Suppose a street has been paved, flagged, and sewered, and is practically taken over by the corporation, why do you then call upon the owners to pay for any repairs to the sewer?

Mr. Beveridge: The corporation only step in when private owners do not do what the corporation think they ought to do.

Mr. Samuel: The owner might think that it was a sewer repairable by you, and you might say it was a drain. Therefore you might call upon them to do the work twice over.

Mr. Beveridge: It is all subject to the definition in the sub-section as to what is a public sewer which we are responsible to maintain and repair and what is a drain which the private owner must maintain and repair. There has been case after case to decide what is a sewer and what is a drain, and this clause will make the matter clear so far as Walsall is concerned.

The Committee granted the clause, but Mr. Samuel pointed out that it was more important in the interests of public health that Walsall should have back streets than they should have a clause of this kind.

Buxton's Thermal Water. Mr. Chamberlain, the Buxton water engineer, during excavations in the Crescent, discovered that a supply of thermal water had been going to waste. This new supply, which approximates in volume to 43,000 gallons a day, and possesses all the radio-active property of the Buxton natural water, has been diverted for use in the hot baths.

BROTHERHOOD OF THE CHEERFUL SPARROWS.

INAUGURAL DINNER OF WESTMINSTER BRANCH.

The Westminster branch of the Brotherhood of the Cheerful Sparrows held their inaugural dinner on Friday, May 22nd, at the Victoria Mansions Restaurant, Westminster. The Brotherhood was established in 1899 by a small party of fellow railway travellers, who, realising the uselessness of indiscriminate charity, came to the conclusion that by banding themselves together, and organising a society on business lines, it would be possible to give much more practical and effective help in cases of severe distress. Its objects are twofold: (a) To promote fraternity and general good fellowship among its members; (b) to assist in every manner possible persons in distress, either directly or through other institutions, irrespective of creed or politics.

A month or six weeks back it was discovered that among those engaged in the various branches of engineering work in Westminster, and frequently in contact with each other on business matters, there were thirty-three members of the Brotherhood. A suggestion that a Westminster branch should be established was adopted, and last Friday evening's function was arranged to mark its inauguration.

Fifty members of the Brotherhood were present at the dinner. Mr. H. D. Blake (chairman of the Westminster Committee), supported by Mr. J. N. Kingwill (president of the Brotherhood), and several members of the Executive Council and of the Westminster Branch Committee, presided. The toast list was very short, and the speakers were all of opinion that "Brevity is the soul of wit," and acted up to it.

Mr. J. N. Kingwill, who proposed "The Westminster Committee," reviewed the activities of the Brotherhood and the facilities and benefits it afforded to those needing help and assistance. He specially drew attention to the fact that any cases submitted as suitable for relief by any members had always been dealt with, and any relief that might be decided upon afforded within twenty-four hours. They thoroughly believed that he who gives quickly gives twofold.

Mr. H. D. Blake, in responding, pointed out that his committee were really very keen, and that already the membership in the district had increased from 33 to 80. He was sure that they would uphold the reputation of the Central Council for promptness and usefulness.

Mr. Wallace E. Riche, of 15 Dartmouth-street, Westminster, is acting as hon. secretary to the Westminster branch of the Brotherhood.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A., Borough Surveyor, Great Yarmouth.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.

The following papers will be read—viz.:—

"A Town Planning Scheme: Its Effects on Housing and Architecture," by Mr. Raymond Unwin.

"Edinburgh and Its Early Examples of Town Planning," by Mr. A. Horsburgh Campbell.

"Town Planning from a Lawyer's Point of View," by Mr. John L. Jack.

"The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

The programme of the meeting of the institution to be held at Southend-on-Sea on Saturday, June 6th, is as follows:—

11 a.m.—Members will assemble at the Palace Hotel. Reception by his Worship the Mayor (Alderman Joseph Francis, J.P.).

11.35 a.m.—Leave hotel to inspect the following works in course of construction: (a) Pier extensions (electric cars to pier head, kindly provided

by the Pier Committee); (b) Esplanade improvement and sea wall; (c) large swimming bath.

1.30 p.m.—Lunch at the Palace Hotel by kind invitation of the Mayor.

2.15 p.m.—Discussion on paper by Mr. E. J. Elford, M.INST.C.E., on "The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea."

2.45 p.m.—Leave hotel to inspect the following works: (d) Reinforced-concrete loading pier; (e) tramway boulevard; (f) sewage disposal works.

4.45 p.m.—Tea on the site of the sewage works at the invitation of Mr. E. J. Elford, followed, if desired, by further discussion on paper.

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

PROGRAMME.

11 a.m.—District executive meeting.

11.30 a.m.—District meeting.

Reception in the council chamber by the chairman of the council, Mr. Councillor J. Pearson, J.P.

District business.

Paper by Mr. Arthur J. Price, engineer and surveyor, on "The Municipal Works at Lytham," which will be taken as read.

Discussion.

1 p.m.—Lunch at Clifton Hotel.

2.15 p.m.—By the kindness of the Blackpool, St. Anne's, and Lytham Tramway Company, cars will be provided to enable the members to visit the West End outfall sewage works (in course of construction), the East End sewage and destructor works and slaughter-houses.

4.30 p.m.—Afternoon tea will be provided for the members at De Grey's Café.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

IRISH DISTRICT.

Mr. M. Sellars, hon. district secretary of the Irish District, is endeavouring to arrange for a two-days' District meeting in Cork towards the end of July, and the council appeal to English members to give this meeting strong support. Two dates are suggested—viz., July 17th and 18th, or July 24th and 25th, and it would be a convenience if English members would say which date would be preferable.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future. Provisional arrangements are also in hand for a meeting (probably an Institution meeting) to be held at Cleethorpes (C. H. Waithman, Assoc.M.INST.C.E.) during September.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Ahwiek on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

SOUTH-WESTERN DISTRICT.

A South-Western District meeting will be held at Tisbury, Wilts, on Saturday, June 13th.

PROGRAMME.

12.15 p.m.—Meet at the Victoria Hall. Short business meeting, at which will be presented a paper, "Wiltshire Roads: Past and Present," by E. Plummer Davies, engineer and surveyor, Tisbury Rural District Council (member).

1.15 p.m.—Luncheon.

2.40 p.m.—Proceed by motor cars and motor buses to the waterworks at Lawn.

To Fonthill Arch (by Inigo Jones).

To eight new cottages on Fonthill Hill.

To Little Ridge. Inspect extensive additions to the residence of Mr. Hugh Morrison, J.P., county alderman.

To Old Tithe Barn, Place Farm, Tisbury, one of the largest barns in England.

4.45 p.m.—Tea.

C. OWEN BAINES,
Hon. District Secretary

Paignton.

NORTH-WESTERN DISTRICT.

A meeting of this district, followed by a social evening, will be held at the Mitre Hotel, Manchester, on Friday, July 3rd.

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

INSTITUTION OF WATER ENGINEERS.

SUMMER GENERAL MEETING.

The nineteenth summer general meeting will be held at Stockport on Thursday, Friday and Saturday, the 11th, 12th and 13th of June next, under the presidency of Mr. Thomas Molyneux, Assoc.M.Inst.C.E., corporation waterworks engineer.

By kind permission of the mayor and corporation, the meetings will be held in the Town Hall, Stockport, and at the opening of the proceedings on Thursday the institution will be welcomed to Stockport by his Worship the Mayor (Councillor Thomas Worthington Potts, J.P.).

Ladies will be cordially welcomed at the meetings and visits, and all official functions except the annual dinner.

The programme will include the presentation of premiums awarded by the council for papers presented during the year 1913.

PAPERS AND COMMUNICATIONS.

The following papers have been promised for reading and discussion at this meeting, and advance copies will be sent out as soon as printed to members who signify their intention of attending the meeting, also, so far as the stock will allow, to those who, being unable to attend the meeting, are anxious to assist in the discussion by correspondence:—

- (1) "The Character of Mechanically Filtered Water," by Prof. Sheridan Delépine, of the University of Manchester.
- (2) "The Aëration and Filtration of Water for Swimming Baths," by L. Holme Lewis, M.I.MECH.E. (member).
- (3) "Notes on Scraping a 15-in. Water Main," by J. S. Barrowclough (member).

A lecture, entitled "The Geological Structure of the Stockport District," will be delivered by Prof. George Hickling, D.Sc., of the University of Manchester.

The president-elect (Mr. Thomas Molyneux) will deliver his presidential address on Thursday, June

11th, and will also supply a description of the Stockport waterworks, with map of the district of supply, which will be circulated among those present at the meeting.

VISITS TO WORKS.

On Thursday afternoon, June 11th, starting from the Town Hall, Stockport, visits will be made to the Wilmslow pumping station and softening works, and to the Alderley balancing reservoir (reinforced concrete, under construction), where afternoon tea will be provided by the president and Mrs. Molyneux.

On Friday, June 12th, starting from the Midland Hotel, Manchester, at 10 a.m., visits will be made to the recently completed Kinder reservoir and filtration plant, where lunch will be provided by the corporation of Stockport, and to the Lyme Park reservoirs; also to the works of Messrs. Mirrlees, Bickerton & Day, Limited, Hazel Grove (Diesel oil engines under construction), where afternoon tea will be provided.

On Saturday afternoon, June 13th, members will be free to visit the Colliery Exhibition or the Victoria Park Baths (at the latter will be seen an installation for filtering the water used in the swimming baths).

SOCIAL FUNCTIONS.

The annual dinner will be held at the Midland Hotel, Manchester, on Thursday evening, June 11th, when the Mayor of Stockport, the Lord Mayor of Manchester, and other distinguished guests will be entertained by the institution.

In addition to the luncheon provided on Friday at the Kinder works, the corporation of Stockport will entertain the members at luncheon on Thursday, June 11, at the Town Hall Stockport.

The committee of the Manchester Engineers Club have kindly offered to elect the members attending the meeting as hon. members of the club during the three days of the meeting. Admission on presentation of programme card.)

PERCY GRIFFITH,
Secretary.

20 Victoria-street, S.W.

Dermatine Hose at Sandwich.—The Dermatine Company, Limited, Neate-street, Camberwell, S.E., have received from Mr. W. Ryder Richardson, secretary of the Royal St. George's Golf Club, Sandwich, Kent, where the Amateur Golf Championship was decided last week, the following communication: "After various trials, I have not found any hose that stands such hard wear as the Dermatine hose. . . . We shall be using the hose day and night, especially just now, prior to the Amateur Championship, when we want the greens in extra good order."

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M.  Allowance for old stone, 1s. 7d. per yard.

FOOTS CRAY.—For the erection of council offices, for the urban district council.—Mr. W. A. Farnham, surveyor:—
 BUILDING, HEATING SCHEME "B," AND AMERICAN WHITEWOOD.

C. E. Skinner & Son, Chatham	£2,570
J. W. Ellingham, Dartford	2,416
A. Morris Fenn, Woolwich, S.E.	2,356
H. T. Vaughan, Plumstead, S.E.	2,333
W. F. Blay, Limited, Dartford	2,300
Friday & Ling, Erith	2,278
Thomas & Edge, Woolwich, S.E.	2,257
H. Somerfeld & Son, Clapham, S.W.	2,251
F. Webster & Son, East Dulwich, S.E.	2,133
T. M. Brightling, Sidcup	2,073

HOLMFIRTH.—For the construction of sewers and man-holes, for the urban district council.—Messrs. J. Barrow-clough & Son, engineers:—
 S. & S. Sykes, Golcar £2,190
 A. Graham, Huddersfield 1,975
 R. Turner, Holmfirth 1,859
 W. Waring & Sons, Huddersfield 1,659
 Wagstaff & Turner, Holmfirth 1,649
 E. Gill, Holmfirth 1,490

HERTS.—For the erection of a school at Fleetville, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield:—

Peppiatt & Cooper, London	£2,273
Blow & Peters, St. Albans	2,120
C. B. King, Limited, Hampstead	2,109
T. Bow, Nottingham	1,894
Miskin & Son, St. Albans	1,863
Hacksley Brothers, Wellingborough	1,862
Ekins & Co., Hertford	1,790
Brown & Son, Wellingborough	1,788
Henson & Son, Wellingborough	1,728

HOLYWOOD (Ireland).—For the supply of road metal and screenings, for the urban district council:—

J. Boyd, Holywood, Co. Down. 1s. 6d. per ton for 2½ in., and 4s. 3d. for other and screenings; roller, 28s. 6d. per day.	
M. Gill, Newtonards, Co. Down. 4s. 10d. per ton for all, and 23s. 6d. per day for roller.	

HORNCastle.—Accepted for the supply of materials, for the urban district council.—Mr. F. Weeber, surveyor, Horncastle:—

Ellis & Everard, Leicester.—280 tons of Bardon Hill granite, 13s. 3d. per ton.
 Groby Granite Company, Leicester.—60 tons of Groby granite, 12s. 9d. per ton, and 220 tons of Groby granite, 12s. 7d. per ton.
 Contract and Works Supply Company, Scunthorpe.—115 tons of slag, 6s. 6d. per ton.
 E. P. Davis, Bonnerley.—90 tons of slag chippings, 7s. 4d. per ton.

NEWPORT (Mon).—For the construction of stoneware pipe and cast-iron pipe sewer, for the corporation.—Mr. H. Tremelling, borough engineer:—

W. E. Evans, Skinner-street, £598.

PAIGNTON.—For laying cast-iron water mains, with connections, for the urban district council. The Water Engineer, Town Hall:—

G. Pollard & Co., Taunton, £138.

RAWTENSTALL.—Accepted for paving and sewerage certain streets, for the corporation.—Mr. J. Johnson, borough surveyor:—

J. R. Crisp, Stalybridge.

SAMFORD.—For constructing a water supply, for the rural district council.—Mr. H. J. Wright, architect, Ipswich:—

Sheldrake & Son, Hornsea	£215
W. T. Wheeler, East Berylholt	215
A. Dunningham, Raydon, West Hadleigh	208
Engineer's estimate.	£215.

SHREWSBURY.—Accepted for providing and laying 130 lin. yds. of 9-in. cast-iron pipes, with manholes, for the corporation.—Mr. A. W. Ward, borough surveyor:—

H. Price, Shrewsbury, £256.

Minutes of Proceedings.

Working-class Accommodation in Greater London.

A return designed to show the amount of housing for persons of the working class that was provided during the year 1912 in London and the districts in the neighbourhood within the area of Greater London has been issued by the London County Council. Similar returns have been prepared since 1902, but in previous years these did not relate to the whole of Greater London. From 1902 to 1905 only thirty extra metropolitan districts were included, and this number was increased in 1906 to forty-three. The present return comprises the twenty-eight metropolitan boroughs, the City of London, and in Extra London two county boroughs, seven municipal boroughs, sixty-two urban districts, and fifty-six parishes in rural districts. For the first time on record, there has been a net reduction in the number of working-class rooms provided in the county at large, the 4,167 rooms provided in new houses being more than counterbalanced by 6,790 rooms in houses demolished, the net loss of accommodation being 2,623. Compared with this loss of 2,623, the average number of rooms provided during the first five years for which information is available—namely, 1902 to 1906—was 17,372. In 1912 some addition was made to working-class accommodation in nine metropolitan boroughs, but the only metropolitan boroughs where any material amount of additional housing was provided during the year are Wandsworth, Fulham, Woolwich, Lewisham, and Hammersmith, and in each case the numbers are far less than those for the period 1902-6. It appears that the additional housing provided in Fulham in 1912 was almost entirely due to the erection of dwellings by the Peabody Trustees, and that in Hammersmith, to a considerable extent, to the erection of cottages by the London County Council on its Old Oak estate. In Wandsworth, Woolwich, and Lewisham the houses were provided by ordinary commercial operations. No houses of the working class were provided during the year in the City of London and nine metropolitan boroughs—namely, Battersea, Bethnal Green, Chelsea, Finsbury, Hampstead, Holborn, Islington, Paddington, and Stoke Newington. In eleven other metropolitan boroughs, although some new working-class houses were provided, the demolitions exceeded these, so that the amount of accommodation was reduced. A table in the report shows that the net accommodation provided in Extra London has fallen, with great regularity, from 38,473 rooms in 1906 to 10,961 rooms in 1912, and that the fall has extended to every section of the area. It is interesting to note that in central London the accommodation provided in 1912 consisted mainly of two-roomed and three-roomed tenements, in the rest of London of three, four, and five-roomed tenements and cottages, and in

Extra London of four and five-roomed cottages. The average rent per room of the new accommodation provided during the year was: Central area, 3s. 5½d.; rest of London, 2s. 7d.; Extra London, 2s. 3¾d. The high average in the central area is produced by the rents of tenements in certain block dwellings in St. Marylebone and South St. Pancras, and is to some extent due to the fact that each of the tenements in the latter contains a kitchen-scullery which is not counted as a room. Assuming the average in Central London to be represented by 100, the middle zone and the outer zone would be represented by seventy-three and sixty-six respectively. In the outer zone itself there is considerable variation in rents, the governing circumstance being mainly the distance or accessibility from London. In the case of Barking, however, as in past years, rents are exceptionally low—1s. 6½d. per room. That the average rents of four-roomed tenements is slightly higher than the average for five-roomed tenements in Extra London appears to be mainly due to the fact that a considerable number of four-roomed tenements are provided in districts where the rents generally are on a higher level than in other districts, such as Ealing, Willesden, Hendon, and Croydon; that some of the four-roomed tenements are of a particularly good class; and that a considerable number contain a box-room or bath-room or both.

* * *

The announcement of a meeting at Southend, with a paper by Mr. E. J. Elford, M.INST.C.E., the borough engineer, would in itself have been sufficient to insure an interesting meeting and a large attendance to-morrow; and the paper having been already published in the *Journal* of the Institution, there can be little doubt that its perusal will make members all the more anxious to discuss and view the works which the author so clearly and excellently describes. The greater part of the paper is occupied by a description of the main sewerage and sewage disposal works, the necessity for which arose owing to the extraordinary development of the town and increase in the population which occurred after the 1898 installation, which was designed by the late Mr. James Mansergh, M.INST.C.E. The actual population at that time was only 23,000, and it was estimated that this might increase to 40,000 in thirty years. As a matter of fact this number was reached in only six years, and its attainment was followed by the issue of a writ against the corporation by the owner of some oyster layings over 3 miles up the river. The story of this litigation will probably be well remembered by our readers. The Court of first instance not only awarded the plaintiff £1,500 damages, but, what was perhaps more serious,

granted an injunction restraining the corporation from discharging sewage from the outfall complained of. It is true that the injunction was dissolved by the Court of Appeal, but the corporation were heavily mulcted in damages and costs, and being threatened with further proceedings they were compelled to agree with their adversary on somewhat onerous terms, and to undertake the construction of new works. The first scheme proposed was prepared by the late Mr. R. Strachan, M.A.S.T.C.E., but met with violent opposition, and the Bill in which it was embodied was ultimately rejected by the House of Lords' Committee on the ground that it did not include any means for the effective purification of the sewage before discharge. Mr. Elford was then asked to report upon the matter, and he naturally expressed the opinion that the discharge of the crude sewage during the first four hours of the ebb tide into the estuary of the Thames constituted a method of disposal which was at once effective, economical, and free from objection. In support of this view he was able to cite no less an authority than the Fourth Report of the Royal Commission on sewage disposal. Having regard, however, to the experiences of the corporation in the law courts and in Parliament, he felt compelled to advise the adoption of some means of purifying the sewage before discharging it into the estuary. Mr. Elford's report was adopted, and he was instructed to prepare a scheme. After holding a local inquiry, the Local Government Board suggested to the corporation that their proposals, both as regards the construction and the subsequent operation of the works, should be embodied in a special statute, in order to avoid any risk of further litigation. This course was followed, and an Act was obtained which fixed a definite standard of purity for the effluent, and also prescribed the method of taking samples and of examination.

Such is the history of one of the greatest legal struggles with regard to sewage disposal, and the circumstances are of a kind to lend a very special interest to the very clear and complete description of the works embodied in Mr. Elford's paper. Any observations which we may have to make in regard to that part of the paper must, of course, be held over until next week. We may, however, state here that Mr. Elford also deals with other works of interest, including the refuse destructor, esplanade works, swimming bath, loading pier, improvement of the Southend pier, and tramway boulevard. It will be seen therefore that attendance at the meeting at Southend to-morrow should prove both pleasant and profitable to those members who are able to make the journey.

* * *

The Control of Ashpits. Among the smaller matters of sanitary administration which come within the ken of the municipal engineer not the least important is that of the construction and control of ashpits. In another column will be found the first portion of an article in which Dr. R. H. Quine sets forth the powers given to local authorities under the Public Health Acts, and discusses the measure of efficiency with which those powers are being exercised. The provisions of the Public Health Act, 1875, are good enough as far as they go. A careful examination of the Act will enable the reader to discover in various places a series of provisions, not only with regard to the construction, but also as to the repair and maintenance of ashpits, and the prevention of nuisances from dust, ashes, and refuse. As Dr. Quine points out, the intention of the Act is the *prevention* of nuisances from these causes, rather than their abatement. The operation of the Act soon dis-

closed three defects. In the first place it left untouched all those houses which were in existence when it was passed. Again, doubts arose as to the meaning of the word "ashpit," and particularly as to whether it included the light, movable receptacle which is now in general use. Lastly, there was no sufficient control of the occupier so as to compel him to facilitate the work of removal. These defects were dealt with by the Public Health Acts (Amendment) Act, 1890, which provided (a) that by-laws governing the construction and keeping of ashpits could be made to apply to houses erected before 1875; (b) that the term "ashpit" should include every form of receptacle for ashes; and (c) that a local authority might make by-laws imposing duties on occupiers so as to facilitate the collection of house refuse. In considering these amendments—very useful as they no doubt are—it must be constantly borne in mind that the Act of 1890 is an adoptive Act, and is therefore not of general application. Some misapprehension appears to have arisen in certain quarters in regard to the effect of the extended definition of the term "ashpit" just referred to. The exact words of the statute are: "The expression ashpit in the Public Health Acts and in this Act shall, for the purposes of the execution of those Acts and of this Act, include any ashtub or other receptacle for the deposit of ashes, faecal matter, or refuse." It will thus be seen that in those districts to which this definition applies all the provisions of the Public Health Act, 1875, with regard to ashpits are extended to every form of receptacle for ashes, including the movable bin; and the enlarged definition does not merely mean that other receptacles may be used instead of the old ashpit, and free from the control by by-law and otherwise to which the old ashpit was subjected.

There can be no doubt that in the past many sanitary authorities have been not a little remiss in the exercise of their powers in regard to this matter. Now that it is generally known that the place of refuse deposit forms the finest possible breeding ground for flies, and that these insects are expert in the dissemination of the germs of several diseases, the whole question of the storage, collection and destruction of house refuse has assumed a new importance. In the past many authorities have omitted to make by-laws altogether, or have displayed some laxness in their enforcement. Others have not seen fit to adopt the appropriate sections of the Act of 1890, and are in consequence limited as to their power of control by the Act of 1875, the defects in which have been emphasised above. Dr. Quine therefore, in our opinion, does well to call attention to the matter at the present juncture. The precise nature of the functions of the several departments concerned is evidently fair matter for discussion, and no doubt some of our readers will disagree with the opinions which Dr. Quine expresses as to this matter. Nevertheless, all will agree that stricter control is required, by whatever means it may be accomplished.

* * *

Thames Floods. It is now little more than a year ago that Lord Desborough, in a statement made to the Thames Conservancy, indicated that a sectional survey of the river was in progress, and that upon its completion it would be possible to give some details of a scheme by which the water that falls upon the area drained by the Thames could be got to the sea much more quickly than is possible at the present time, with a consequent reduction of flooding. Prior to that time owners of riverside lands which were subject to floods had repeatedly requested that their trouble should receive the earnest consideration of the con-

servators. This consideration has resulted in the issue of a report by Mr. C. J. Griffiths, the engineer to the board, which has aroused the keenest interest of those immediately concerned and of the thousands who use the river for the purposes of pleasure. Briefly, the effect of the report is that, in order to obviate the flooding of 30,000 acres of private land, a sum of over £3,000,000 sterling would have to be expended. The river would require widening to a maximum width of 275 ft. at Teddington, and to a minimum width of 180 ft. at Oxford, while the depths likewise would have to be increased to 12 ft. and 8 ft. at these places respectively. The majority of the islands would have to be removed. The by-pass channels would vary in section from 150 ft. wide by 8 ft. deep to 100 ft. wide by 8 ft. deep, according to gradient and volume. There would be seventeen of these channels between Teddington and Oxford. Nearly all the masonry and arch bridges across the Thames would require rebuilding as well as all the towpath and numerous small bridges along the 95 miles of river. The scheme . . . would necessitate the purchase of upwards of 1,200 acres of land, the excavation of some 12,000,000 cub. yds. of material, and its disposal in bank formation and spoil grounds. . . . The question of mill rights would have to be dealt with.

The report may perhaps best be regarded as a reply to complaints, rather than as embodying a scheme which is put forward as a practical proposal. It is perfectly clear that the execution of the works outlined above would completely destroy the amenities of the river, which form such a large factor in the maintenance of the prosperity of many of the towns on its banks. It is unfortunate that the prevention of the floods is such an expensive matter and would involve wholesale vandalism. On the whole we think that public opinion will incline to the view that it is preferable to have the river as at present including the floods!

* * *

**Staffordshire
By-ways:
Footpaths and
Bridle Roads.**

The excellent work performed by the North Staffordshire Field Club in the interpretation of the topographical history of the county, and in maintaining public interest in its natural features and its antiquities, is, no doubt, well known to the surveyors to local authorities in that part of the North Midlands. Always alive to the importance to the public of the preservation of the minor highways and by-ways of Staffordshire, the Field Club has recently taken the step of inviting surveyors to show on their ordnance maps the public footpaths and bridle roads in their districts, and the district council of Stone has already authorised the marking of these rights of way on their ordnance sheets. It is, of course, one of the ordinary duties of a surveyor to prepare for his council reports as to the facts in connection with public rights of way, and the particular merit of the present proposal is, clearly, that it would provide for comprehensive schedules of such paths and roads being made, once for all, in each district. The expression "once for all" applies, of course, only to existing rights of way, and it must be recognised that paths and roads may become rights of way in the future in the same way as in the past. The scheme is supported by the influential local paper the *Staffordshire Advertiser*, though that journal believes that to act on the advice of the Field Club may result in a crop of litigation—a view expressed by Mr. C. J. Blagg, a solicitor well known in the county. Such litigation as is necessary to secure public rights may, however, be faced with courage, and with the conviction that the law is meant to be used for rightful purposes, and is not, as a Devonshire man would say, useful

only in "hookem-snivey" dealings. The law may be a "hass," but if so it is, in this respect, the daps of a good many individuals.

* * *

**Tests for
Coal-tar Creosote.**

The practical value of materials of certain classes often depends upon the presence, and in other cases the absence, of small proportions of particular substances, and it is therefore important that we shall be provided with the means of making tests by which the proportion of the favourable or unfavourable ingredient may be readily and truly determined before we make use of a consignment of such a material. Creosote is a material of this character, and it is essential to have reliable tests of its composition, and desirable that such tests shall be simple, and easily made. A paper on "Paraffin Bodies in Coal-tar Creosote, and their Bearing on Specifications" was read before the American Association for the Advancement of Science last January by Mr. S. R. Church and Mr. J. M. Weiss, research chemists to the Barrett Manufacturing Company, and we are able, through the courtesy of Prof. Arthur Blanchard, to reproduce the paper in to-day's issue. The considerations put forward in this paper seem to be of a very practical kind, and, as regards the comparison between the dimethyl sulphate method and the sulphonation method, the objections to the use of the former material are of practical importance, especially to those who make tests from time to time with simple and inexpensive apparatus and without the advantages of a well equipped laboratory. The authors' view as to the limitations of the sulphonation test with respect to the presence of oils of petroleum origin may perhaps be unacceptable to some chemists, but it seems to be based on the results of a considerable number of tests.

* * *

**The Melting Points
and Viscosities
of Refined Tars.**

In a short paper, which is reproduced on another page, some interesting data are presented, showing the relations between viscosities, melting points, and free carbon contents of refined tars. This paper, by Mr. P. P. Sharples, chief chemist of the Barrett Manufacturing Company, of New York, was read at a meeting of the American Association for the Advancement of Science, and was intended to bring out practical points relating to the drawing up of specifications. The figures are valuable, not only as throwing light upon the text of the paper, but also as a part of the data of the subject, and we are glad to avail ourselves of the opportunity of placing them before our readers. Any authentic information as to the properties of refined tars is welcome at the present time, and there is no property of tar more important than its viscosity, assuming that the material is stable under traffic and weather conditions.

* * *

**Motor Omnibuses
and
Special Road Tolls.**

Owing to the importance of the principle involved, the fate of clause 25 of the Bill promoted by the Middlesex County Council for the making of the new western approach road to London is being awaited with much interest. The opinions which we ventured to put forward on this matter have been quoted by a considerable number of journals. With a full sense of responsibility for the arguments which we adduced, and for the conclusions which we drew from them, we find, on going through our article, that we have nothing to add and nothing to take away from our presentment of the case, and those of our readers who are interested in the matter may, therefore, be referred to our issue of May 15th, page 793.

Wood Bridge, Guildford.

REINFORCED CONCRETE REPLACES MASONRY.

Interesting particulars of a reinforced concrete bridge which the Surrey County Council, acting upon the advice of the county engineer, Mr. A. Dryland, ASSOC. M. INST. C. E., have erected in place of a masonry structure spanning the river at Guildford, appear in the May issue of "Kahncrete Engineering," a bi-monthly, which, as its name implies, is concerned with reinforced concrete work on the well-known Kahn system.

The clear span between the abutments of the new bridge is 70 ft., and the width between the parapets is 40 ft., made up of two 6-ft. 6-in. footpaths and a 27-ft. roadway. Arch ribs spaced at 5 ft. centres support the decking slab, one rib being under each parapet and two ribs being placed close together at the centre of the structure. This arrangement allows one-half of the bridge to be constructed without having to divert the traffic.

The bridge had to be designed to carry a test load consisting of three 20-ton traction engines in a train travelling over the bridge, in addition to the dead load of the structure. The train was placed in a

taken—(a) with the dead load on one-half the span, and dead and live load on the other half, to arrive at the maximum bending moment (which now occurs at the abutment), and (b) the live and dead load over the whole span to ascertain the maximum thrust of the rib. These diagrams are also shown.

The arched ribs, which are 20 in. by 12 in. at the crown and 60 in. by 12 in. at the abutments, are reinforced with Kahn trussed bars and Kahn rib bars of sufficient sectional area to resist the maximum bending moments given by the two diagrams; thus, the area of steel at the quarter points of the arch is determined from the bending moment derived from the three-hinged diagram, and the area of steel at the abutment is determined from the bending moment given by the fixed end diagram. The general arrangement and details of the reinforcement are clearly shown in the diagrams.

Considerable difficulty was experienced in providing satisfactory foundations to the abutments. The ground under the abutments was of poor pressure-bearing quality, and 12-in. by 12-in. "Kahn"

WOOD BRIDGE, GUILDFORD.

position which caused a maximum bending moment on the span, and a uniformly distributed load was calculated which would produce an equal bending moment. This uniform load worked out at 200 lb. per square foot, which is the load per square foot for main road bridges recommended by various authorities on arched bridge design.

In the preliminary stages the arched ribs were treated as being of the three-hinged type, assuming a hinge at each abutment and another hinge at the crown. The span was divided into equal panels, and the load on each panel point calculated on the assumption that the live load extended over one-half the span, this being the loading which would produce the maximum bending moments in the rib. This diagram is shown herewith, together with the diagrams of stresses produced at various sections of the rib.

The design was checked on the assumption that the ribs were fixed at the ends to the abutment buttresses—that is, on the elastic theory without any hinges. A diagram was drawn for this type of arch based upon Prof. Landsberg's "Method of the Reaction Locus." The centre line of the rib is divided into panels in such a way that the length of the panels divided by the average amount of inertia in that panel is constant. For all practical purposes the moment of inertia is taken on the section of the concrete neglecting the reinforcement. Since the rib reduces the depth from the abutment to the crown the length of the panels, and therefore the load on the panels decreases from the abutment to the centre of the span. Two systems of loading were

piles, 22 ft. long, six to each rib buttress, were driven to assist in taking the pressures. Several of the piles could not be driven in their true positions owing to the presence of the foundations of the old bridge. Finally, a very thick, heavily reinforced slab was put in between the rib buttresses over the existing foundations. This treatment has proved to be entirely satisfactory. The fronts of the buttresses are connected by a reinforced concrete wall, 5 in. thick at the top, to 7 in. thick at the bottom, reinforced with $\frac{1}{2}$ -in. Kahn rib bars 12 in. to 6 in., centres to form a retaining wall for the earth-filling over the abutments.

The centering of the ribs was of special design, as a clearway 16 ft. wide and 7 ft. 6 in. high above summer water-level had to be provided in order that the river traffic should not be stopped for any period of the work. The concreting of the arched ribs was commenced simultaneously at each end of the rib in order not to put undue tendency to deformation on the centering and the rib, and the decking slab was cast in one operation for one-third its length from each abutment for one day's work. The work was stopped on a plane approximately normal to the centre line of the rib, and the joint at the commencement of the next day's work was carefully cleaned and coated with cement grout to key the new work with that already cast. The arch ribs are stiffened laterally by seven 12-in. by 10-in. braces reinforced with four $\frac{1}{2}$ -in. Kahn rib bars, bound together with $\frac{3}{8}$ -in. diameter ties at 9-in. centres. The decking slab is designed to carry the 7½-ton back wheel load of a 20-ton road engine.

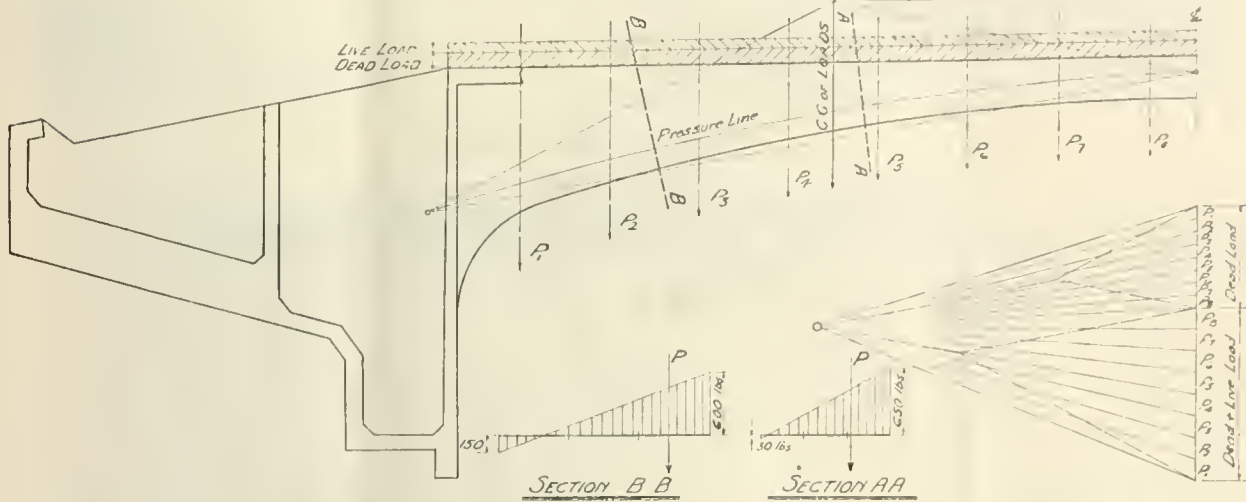

This is assumed to rest on a strip of wheel tyre 24 in. wide and 6 in. long. The load is then spread at an angle of 45 deg. in all directions through the 6 in. thick wood block and foundation material so that the area covered by the load is 3 ft. by 1 ft. 6 in. The bending moment due to the weight of the roadway material and the weight of the concrete slab is added, and the whole moment is resisted by a 9-in. thick slab reinforced with $\frac{1}{2}$ -in. Kahn trussed bars spaced 7 $\frac{1}{2}$ -in. centres, allowance being made for the continuous action of the slab, for which $\frac{1}{2}$ -in. Kahn trussed bars spaced at 12 in. apart are provided.

Three-eighths-in. Kahn rib bars, one to each bay of slab, are provided to act as temperature and dis-

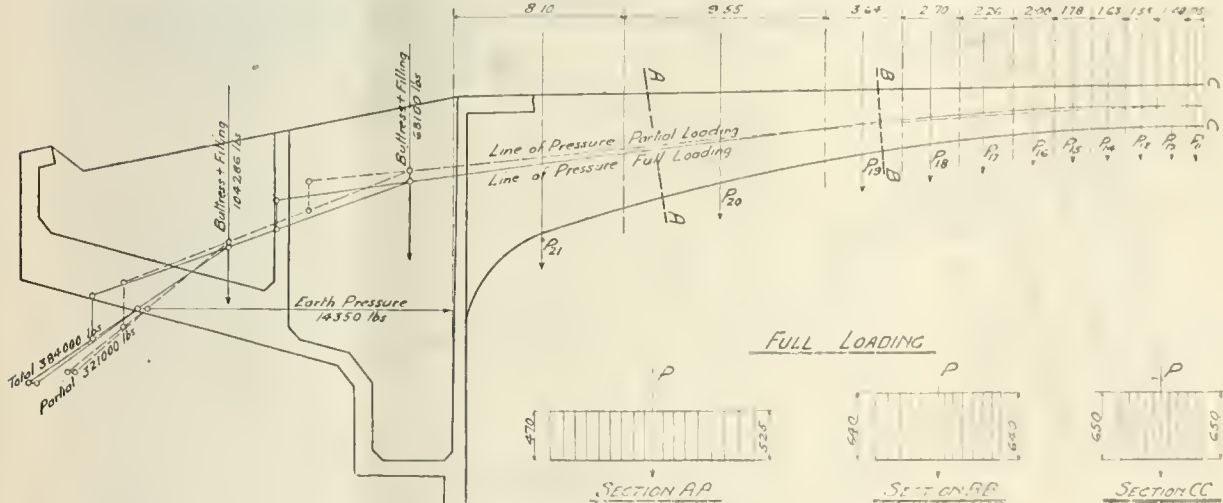

The outside ribs of the bridge are carried to a level of about 12 in. above the footpath, and have a moulded string course on the outside to give relief to the elevation. The abutment piers are relieved by panels and have moulded caps. The parapet is formed of cast concrete balusters, in each of which was cast a Kahn rib bar projecting at each end to form a secure connection with the weathered moulded coping, which was cast in position, having expansion joints about 30 ft. apart. The proportions of the balusters were taken from balusters on another bridge under the county engineer's contract by means of a plaster cast.

The bridge was opened for traffic by Mr. A. C.

STRESS DIAGRAM FOR THREE-HINGED ARCH

STRESS DIAGRAMS FOR WOOD BRIDGE, GUILDFORD.

tribution bars. The decking slab was cast at the same time as the arch rib, and was stopped at the end of each day's work against a straight vertical screed board which was placed at the centre of the span between the ribs, this being the most satisfactory position for the joint from the point of view of shear resistance and bending moment.

The whole of the concrete for the reinforced work is composed of 9 cub. ft. of clean gravel to pass a $\frac{3}{4}$ -in. screen, but to be retained on $\frac{1}{2}$ -in. screen; 4 $\frac{1}{2}$ cub. ft. of clean, sharp sand, and one bag (224 lb.) of English Portland cement to comply with the British Standard specification for medium setting cement. The reinforcing steel was Kahn trussed bars and Kahn rib bars, supplied by the Trussed Concrete Steel Company, Limited, complying with the standard specification for structural steel.

The road foundation was of mass concrete, laid with a finishing coat to take the 4-in. wood-block paving. The cross-fall of this paving was $\frac{3}{8}$ in. The footpath is paved with 2 in. thick artificial stone paving, with a granite kerb adjoining the roadway.

Pain, the chairman of the Highways and Bridges-Committee, on September 1, 1913, and was tested on November 8, 1913. Deflectometers were placed under the crown of the two ribs on each side of the centre ribs on a temporary scaffolding erected from the river bed. The train of road engines, before described, was then run across the ribs under test in both directions, and also stopped over the crown of the arch and at various other points as directed by the county engineer and the engineer of the Trussed Concrete Steel Company.

The deflection at any position of the loading was practically unmeasurable, amounting to $\frac{1}{8}$ in., which is $\frac{1}{175,000}$ part of the span. The specification stipulated that the deflection under the test load was not to exceed $\frac{1}{1,000}$ part of the span, with a permanent set not exceeding $\frac{1}{2}$ in. at the centre. The allowable deflection was therefore 1 $\frac{1}{4}$ in.

The accompanying photograph shows the bold and artistic outlines of the bridge. Timber guard piles, which were driven on the up and down stream sides of the bridge, although they do not enhance the

appearance, serve the useful purpose of protecting the arch ribs from damage by the collision of barges plying the river.

The whole of the design for the bridge was executed on the Kahn system of reinforced concrete by the Trussed Concrete Steel Company, Limited, Caxton House, Westminster, acting as consulting engineers to the Surrey County Council, and was checked by an independent engineer appointed by the county council, Mr. B. L. Hurst, M. INST. C.E.

ROYAL SANITARY INSTITUTE CONGRESS.

THE MUNICIPAL AND COUNTY ENGINEERS' CONFERENCE.

The conference of engineers and surveyors to county and other sanitary authorities to be held in connection with the forthcoming annual congress of the Royal Sanitary Institute at Blackpool will be

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

THE MEMBERSHIP ROLL.

At the last meeting of the council of the Institution of Municipal and County Engineers the following applications were approved for election to membership:—

Members.—Messrs. H. C. Phillips, district surveyor to the Hursley Rural District Council; A. S. F. Mody, municipal engineer, Cochin State; W. H. Murphy, municipal engineer, Bangalore; and G. C. Bedington, assistant engineer, Public Works Department, Federated Malay States.

Associate Members.—Messrs. W. Jaggat, engineering assistant to borough engineer, Huddersfield; J. K. Hunter, engineering assistant to borough engineer, Leigh; H. S. Ganderton, engineering assistant

DESIGN OF WOOD BRIDGE, GUILDFORD.

presided over by Mr. John S. Brodie, M. INST. C.E., the borough engineer and surveyor of that town, the following being vice-presidents—viz.: Messrs. J. A. Brodie, city engineer, Liverpool; J. Cook, engineer, Fylde Water Board; T. Cookson, borough surveyor, Preston; C. Cross, surveyor, Kirkham Urban District Council; H. Fenton, surveyor, Thornton-le-Fylde Urban District Council; Gilbert J. Fowler; T. Harrop, surveyor, Bispham Urban District Council; J. W. Hipwood, borough surveyor, Morecambe; T. H. Maxwell, surveyor, Fylde Rural District Council; T. de Courcy Meade, city surveyor, Manchester; E. L. Morgan, borough surveyor, Bolton; S. S. Platt, borough engineer, Rochdale; W. H. Schofield, county surveyor, Lancashire; W. Stubbs, borough surveyor, Blackburn. Messrs. E. Frobisher, surveyor to the Fleetwood Urban District Council, and A. J. Price, engineer and surveyor to the Lytham Urban District Council, are acting as local secretaries, and Mr. J. E. Worth, London County Council, as recording secretary to the conference, which is open to all municipal and county engineers.

to borough surveyor, Torquay; W. S. Jones, chief assistant, sewerage draughting department, Metropolitan Water and Sewerage Board, Brisbane; H. R. Sayer, resident engineer on Hartley Wintney sewerage and sewage disposal contract; B. V. Bradforth, engineering assistant to borough engineer, Croydon; O. Hilton, engineering assistant to the urban district council, Watford; R. K. Wortley, engineering assistant to borough engineer, Southend.

Students.—Messrs. F. Cleaver, county surveyor's office, Northampton; W. Manger, assistant to county surveyor, Northampton; D. G. Wild, borough surveyor's office, Blackpool; W. B. Mather, borough surveyor's office, Blackpool.

Transfers from Associate Members to Members.—Messrs. F. Pritty, burgh surveyor and water engineer, Prestwich; B. D. Tracy, engineering assistant to city engineer, London; and A. Bromly, borough surveyor, Godalming.

Transfer from Student to Associate Member.—Mr. F. M. McRae, engineering assistant to borough engineer, Hampstead.

THE RELATION BETWEEN THE MELTING POINT AND THE VISCOSITY OF REFINED TAR.*

By PHILIP P. SHARPLES.

The rough dependence of the viscosity of refined tars, as determined by any of the standard instruments and their melting point has been long recognised. Many discrepancies have, however, been noted, and apparently little thought has been given to the relation between the two in making specifications.

Table I. shows a series of samples taken from refined tars made on a manufacturing scale from the same raw tars. The methods used in analysis are those described by S. R. Church in the *Journal of Industrial and Engineering Chemistry*, Vol. iii., No. 4, April, 1911, and Vol. v., No. 3, March, 1913.

The melting point is the $\frac{1}{2}$ -in.-cube method in water, starting, however, at 40 deg. Fahr. instead of 60 deg. Fahr.

The Schutte penetrometer is, strictly speaking, not a penetrometer, but a modified melting point [? tester]. An arbitrary melting point is assigned, and the time

changes than oils or asphalts, and not enough attention has been paid to viscosity changes with temperature.

The work in Table II. was undertaken to show that, although a specification was rather closely drawn for the Engler reading at 60 deg. Cent., it yet failed in its object in that it admitted all mixtures of tar H and tar D from 40 per cent H to 80 per cent H. Testing the same mixtures at 50 deg. Cent. shows that the same limit in the upper part of the table would confine the mixture to within 20 per cent, while at 40 deg. Cent. the same limit would confine it to within 15 per cent.

The table also illustrates, again, the rapid increase in the time interval as the temperature of the determination of the viscosity approaches the melting point. Thus, under 60 deg. Cent., the space interval is 46 for the 50 per cent H mixture, but this is increased to 256 for the 80 per cent H mixture at 40 deg. Cent.

The examples that have been cited have been in series of tars of nearly uniform composition. An illustration of the effect of free carbon on the relation between the melting point and the viscosity is given in Table III. The effect of the free carbon is very

TABLE I.
A SERIES OF SAMPLES OF REFINED TAR MADE FROM SAME RAW TAR.

Sample No.	Free carbon.	Distillation total to 315 C.	Melting point.	Schutte Penetrometer.	Viscosity Engler 100 c.c. at 100° C.	Float test at 50 C.
5	12.1	21.8	—	29 sec. at 40° F.	94 sec.	34 sec.
7	12.0	19.2	—	108 " 40° F.	127 "	35 "
8	14.0	10.4	—	114 " 50° F.	159 "	68 "
9	14.4	14.9	50.9	85 " 60° F.	208 "	75 "
10	17.2	12.7	99.7	90 " 70° F.	335 "	110 "
11	18.2	19.4	108.7	88 " 80° F.	431 "	170 "

taken at the assumed melting point to force out under constant pressure a plug of the material cooled to 10 deg. Fahr. is noted. The arbitrary melting point is so chosen on a 10 deg. Fahr. scale that the number of seconds is, as near as possible, 100 deg.

The float test is the New York Testing Laboratory test. The plug was cooled to 41 deg. Fahr. before floating. The Engler test is made under standard conditions with the exception that 100 c.c. were run off instead of 200 c.c. The reduction of the number of cubic centimetres with viscous materials allows more concordant results to be obtained, and gives lower figures.

A comparison of the three melting points and the Schutte penetrometer figures show that they advance quite regularly together. Other experiments have shown this same relation to hold true, provided the

TABLE II.
COMPARISON OF MIXTURES OF TAR H AND TAR D, ON ENGLER VISCOSIMETER 100 C.C. AT THREE TEMPERATURES

Mixture.	Free carbon est.	40° C	50° C	60° C
40% H } 60% D }	4.4	75.7 sec.	54.0 sec.	41.0 sec.
50% H } 50% D }	5.0	88.1 sec.	57.6 sec.	45.6 sec.
40% H } 40% D }	5.6	97.3 sec.	62.5 sec.	47.0 sec.
70% H } 30% D }	6.2	110.5 sec.	66.3 sec.	49.7 sec.
80% H } 20% D }	6.8	136.1 sec.	83.3 sec.	56.0 sec.

free carbon content is very nearly the same. Samples 7 and 8 may then be included in our further examination of the results without introducing undue error.

An examination of the float test shows an increasing interval between samples as we ascend in the series. Between 7 and 8 the interval is 20 seconds, while between 10 and 11 the interval is 60 seconds.

The results with the Engler viscosimeter show the same tendency much more accentuated. The interval between the samples 7 and 8 is 32 seconds, while between samples 10 and 11 it is 96 seconds. It is interesting to note that the ratio is the same as in the float test.

A more careful consideration of temperature in testing tar materials with viscosimeters would seem to be indicated. The tars are more sensitive to temperature

marked. In the Schutte and float test the times are markedly increased. With the Engler the results are more irregular, but show a marked increase with the high carbon tar. From a physical standpoint the increase of free carbon might be expected to have this effect. It impedes the flow of the material with increase of temperature, and in that way up to the point at which the free carbon tends to weaken the binding and lasting qualities of the tar would seem to be a desirable addition. The inclusion of both the melting point and the viscosity in a physical examination of refined

TABLE III.
REFINED TAR: RELATION OF VISCOSITY TO CARBON CONTENT.

Sample.	Free carbon.	Melting point.	Schutte Penetrometer at 50° F.	Engler 100 c.c. at 21.2° F.	Float test at 21.2° F.
1	1.4	110° F.	42.2 sec.	302 sec.	153 sec.
2	14.6	109° F.	80.1 sec.	298 sec.	192 sec.
3	30.6	112° F.	144.9 sec.	739 sec.	337 sec.

tars to be used as binders would seem to be warranted. The viscosity at 100 deg. Cent. compared with the melting point would give an indication of the behaviour of the tar with uniform distributors, and also an indication of its resistance to temperature changes when used on the road. In conclusion, first, the viscosity of tars of the same composition varies with the melting point, but not in direct ratio; second, the viscosity of tars of the same melting point, but of different carbon content, increased with the carbon content.

Motor Cycles for Road Officials.—Mr. John H. Middleton, Assoc. M. I. N. S. T. C. E., surveyor to the Pembroke, Co. Dublin, Urban District Council, writes: "I have recently recommended my council to purchase a motor cycle for the use of the road foreman, as at present he has to ride about 40 miles a day on an ordinary push bicycle. I shall be much obliged if you will give me any assistance, through the medium of your valuable paper, in finding out for me what other urban districts have provided motor cycles for similar officials." We have frequently noted in our columns the purchase by local authorities of motor cycles for the use of officials engaged on the roads, but in the absence of a record such as is necessary to enable us to furnish the information desired by our correspondent, we insert his letter in the hope that surveyors of urban districts in which machines have been provided will communicate with him.

* Paper read at a meeting of the American Association for the Advancement of Science.

BRISBANE'S SEWERAGE SCHEME.

CITY ENGINEER'S CRITICISM.

The city engineer and surveyor of Brisbane, Mr. J. Kemp, recently submitted to his council a report regarding the sewerage of that city, in connection with which a deputation recently waited on the Minister for Works. Mr. Kemp says:—

"It was stated by the Minister that the proposed outfall sewer would suffice for twenty-five or thirty years. Now, in engineering practice it is almost an axiom in designing works of this class that those portions of a scheme which do not admit of easy and economical enlargement or extension in the future should be designed sufficient for the ultimate population. The main outfall sewer, which is practically all in tunnel, is essentially a part of this scheme which does not admit of either easy or economical enlargement in the future, and at the rate the population is increasing this may be necessary within twenty years, as the population provided for is only 278,000. The life of the sewer may be anything from 50 to 100 years or over, but it is not usual to grant a loan for a work for a longer period than fifty years. I will show, actually, that it is more economical to build the sewer in the first instance of sufficient capacity for the estimated ultimate population, and also that a more sanitary sewer is so obtained.

"I assume that the loan will be for a period of fifty years, and that the amount, with interest at the rate of 4 per cent per annum, will be repayable in equal average annual instalments of principal and interest. Judging by the amount of the tenders already received for a portion of the sewer, the total cost, including the tunnels, will approximate £1,000,000. A sewer of double the capacity could now be built for one-third more, or about £1,333,000. It could probably be built for much less, because the cost of shafts, plant, establishment charges, and engineering and supervision is already included in the tenders received. The annual charges on £1,000,000 borrowed and repayable on the above basis would be £46,000. At the end of twenty-five years it would be necessary to duplicate this sewer, which would bring the annual charges up to £92,000 for the second half of the term. The total amount to be repaid in fifty years would be £3,450,000. On the other hand, if the sewer is built double the capacity, it would, in all human probability, suffice for fifty years, and the annual payments on the above basis would amount to £61,333, or a total for the whole period of £3,066,650, showing a saving of £384,000, or an average of £7,667 annually. Financially, if the sewer is designed of sufficient capacity for twenty-five years only, the loan should not exceed that period, in which case the annual payments would amount to £64,000, so that in either case it is anything but economical to build the sewer too small for the probable ultimate population, or, at any rate, for the full period of fifty years.

"Looking at the question from a sanitary point of view, the proposed sewer gives a velocity of only about 2½ ft. per second, whereas a sewer double the capacity, or a little over, would give a velocity of 3 ft. per second, thus increasing the self-cleansing power of the sewer, coupled with the more rapid transmission of the sewage to its destination—an important consideration in a climate like this. The annual charge for keeping one sewer clean instead of two would be considerably less, and likewise the production of foul gases.

"It is estimated that the proposed sewer will suffice for a population of 278,000. This figure is obtained on the assumption that a considerable portion of the sewage on the south side will be stored during the day, and discharged into the main trunk sewer under the river during the hours of least flow—presumably at night—so as to equalise the flow. This is an excellent and economical view, but I have grave doubts about its effects from a sanitary point of view. The sewage will probably be ponded up for twelve hours, and then discharged during the night in a more or less putrefactive condition into the main trunk sewer, the foul gases from which will permeate the area reticulated through vent shafts. Night time is the worst possible time for discharging sewage in this condition into the main sewers, because the foul vapours will be condensed by the cool night atmosphere and fall, in the form of dew, to the ground, to be evaporated by the sun's rays in the morning.

"All sewage should be transmitted as soon as possible after it is formed to the outfall works. In fact,

in general drainage by-laws it is usual to prohibit the discharge of sewage from a cesspool or septic tank direct to the sewer. If it were not for this arrangement the sewer would not be sufficient for more than 220,000 people. Query: Is not the gain from an engineering point more than counterbalanced by the defects from a sanitary point of view? The position of the disposal works in relation to what must inevitably become the seaside resort and lungs of the metropolitan area requires the gravest consideration. I refer to the beach between Sandgate and the Brisbane River. The possibility of reaching this beach for a 3d. tram fare will force this matter through without doubt. In this case, too, the condensation and vaporising of the foul gases generated in the process of purification and sludge disposal would take place for the reasons already given, and adversely affect a considerable area all round the outfall works."

CHICAGO'S SEWAGE DISPOSAL PROBLEM.

EXPERTS' PRELIMINARY REPORT.

Filtration of the water is the only way by which protection and improvement of the supply for the city of Chicago can be obtained. Furthermore, diversion of the sewage into the drainage canal and extension or alteration of the location of the intake would not result in drinking water of suitable quality. These conclusions are presented in the preliminary report of Dr. George A. Soper, New York, John D. Watson, M.INST.C.E., Birmingham, and Arthur J. Martin, M.INST.C.E., Westminster, the board of experts to the Harbour and River Improvement Committee of the Chicago Real Estate Board, following a study of the sewage disposal problem on the ground for two weeks.

Some of the eighteen principles and lines of action set forth are, states the *Engineering Record*, as follows:—

The principle of diverting the sewage from the lake should be adhered to, in spite of any degree of sewage purification or water purification which may be employed.

Full advantage should be taken of as large a volume of diluting water as may be obtainable from the lake.

It is desirable to concentrate as much of the sewage as practicable at a point beyond the built-up sections of the city and in the vicinity of the drainage channel.

To avoid excessive cost, and in order to relieve the drainage channel as far as practicable, it will be desirable to treat the sewage of some parts of the city in the areas in which the sewage is produced.

Practically no sewage should be discharged into the Chicago River, nor the drainage channel, without some form of treatment, except in times of storm.

The minimum requirement in the treatment of the sewage at the main station should be the removal of the suspended solids by screens and settling basins.

Arms of the Chicago River which have no present or future value for navigation, and which are now in a foul and stagnant condition, should be filled in.

All considerable flows of especially foul liquids, such as those from the stockyards, should receive special treatment before they are discharged into the Chicago River or the drainage channel.

London Municipal Electricity Undertakings.—An official return of the London County Council shows that, with the exception of Woolwich, the fifteen borough councils having municipal electricity undertakings are now making profits. Last year rates were reduced by 1d. in Battersea, 1½d. in Hackney, 1d. in Hammersmith, ¾d. in Hampstead, and 1½d. in St. Pancras.

West Hartlepool's Sea-water Bath.—A salt-water swimming bath, presented to the town of West Hartlepool by Mr. W. Cresswell Gray, was formally opened last week. The building is of reinforced concrete, and the swimming bath measures 100 ft. by 40 ft., the depth of water at the ends being 3 ft. 3 in. and 6 ft. 9 in. respectively, with a maximum depth at one point of 7 ft. 3 in. There are thirty-three dressing boxes, a lounge for bathers, and adequate accommodation for spectators on gala occasions. The water is pumped from the sea, and the temperature raised by a system of steam blowers.

Paraffin Bodies in Coal-Tar Creosote, and their Bearing on Specifications.*

By S. R. CHURCH and JOHN MORRIS WEISS.

In specifications for coal-tar creosote there is usually a paragraph stating that the oil shall be a pure product of coal tar, and free from adulteration with any oil or products from any other tar. The purpose of this clause is usually to provide against admixture with petroleum products, such as water-gas tar or oil-tar derivatives. In the present paper the writers wish to consider one requirement which is sometimes introduced with the object of enforcing this provision.

Coal tar is made up mainly of aromatic compounds, and the presence of bodies belonging to the saturated paraffin series has been regarded by some as direct and unmistakable evidence of contamination of coal-tar creosote by distillates from other tars.

Dean and Bateman proposed a sulphonation test for creosote oils, based on the principle that aromatic hydrocarbons dissolve in concentrated sulphuric acid to sulphonic acids, while bodies of the paraffin series remain unattacked. They applied this test to numerous creosote oils, and concluded that any oil yielding a sulphonation residue was contaminated with products of other source than coal tar.

A modification of this test, devised by J. M. Weiss, was proposed in an article by S. R. Church, which did not in any way change the results of the test, but merely made it easier of operation, so far as the detection of traces was concerned. Later, Bateman made further modifications in the test, which made it a still more convenient laboratory operation. This modification was endorsed by Church after trial, as more convenient and practical than the earlier proposals.

Chapin proposed the substitution of a dimethyl sulphate test to be used to determine paraffin hydrocarbons in creosote oil, as well as in creosote-oil dips. Reeve and Lewis have used this test, and have given a number of results obtained by it.

A brief description of the tests in question may be useful in this connection.

SULPHONATION TEST.

"Ten cubic centimetres of the fraction of creosote to be tested are measured into a Babcock milk bottle. To this is added 40 cubic centimetres of 37 times normal sulphuric acid, 10 cubic centimetres at a time. The bottle with its contents is shaken for two minutes after each addition of 10 cubic centimetres of acid. After all the acid has been added, the bottle is kept at a constant temperature of from 98 deg. to 100 deg. Cent. for one hour, during which time it is shaken vigorously every ten minutes. At the end of an hour the bottle is removed, cooled and filled to the top of the graduation with ordinary sulphuric acid, and then whirled for five minutes in a Babcock separator. The

in the form of a clear, almost colourless, supernatant liquid layer."

We will first briefly discuss the relative merits and demerits of the sulphonation test and the dimethyl sulphate test, and then consider in what manner the results of such a test should be interpreted, particularly as regards creosote oil specifications.

We have made some experiments using the dimethyl sulphate test, as recommended by Chapin, and the modified sulphonation test with fuming sulphuric acid and the Babcock bottle, as proposed by Bateman. Average samples of coal-tar oil and water-gas tar oil were distilled, and fractions taken from 240 deg. to 270 deg. Cent., and from 270 deg. to 300 deg. Cent. These fractions were then subjected to the dimethyl sulphate test and the sulphonation test, with the following results:—

	Sulphonation test residue.	Dimethyl sulphate test residue.
Coal tar distillate 240-270°C.	1.2%	0
" " " " 270-300°C.	2.0	0
Water gas tar distillate 240-270°C.	1.0	0
" " " " 270-300°C.	6.8	0

Further tests on other oils were also made, with the following results:—

	Sulphonation test residue.	Dimethyl sulphate test residue.
Water gas tar distillate 240-270°C.	2.4%	0.0
" " " " 270-300°C.	1.2	0.0
Mixed tar distillate 240-270°C.	2.6	0.0
" " " " 270-300°C.	3.0	0.0
Blast furnace tar distillate 240-270°C.	17.6	23.0
" " " " 270-300°C.	23.2	38.0
Oil tar distillate 240-270°C.	11.1	22.0
" " " " 270-300°C.	18.8	28.0

It can be seen from these results that the dimethyl sulphate method showed no residue in many oils that gave measurable residues by the sulphonation method, and we feel that the former test is of no value so far as the detection of small amounts of saturated hydrocarbons in the presence of aromatic hydrocarbons is concerned. Undoubtedly, if there were considerable amounts of petroleum or blast-furnace tar distillates present, where there might be a sulphonation residue of from 10 to 20 per cent, the dimethyl sulphate test would detect it; but where there is only a question of comparatively small admixtures of material, it eli

Lignite tar	7.0	7.0	9.8	11.6	13.4	11.8	17.0	20.4	20.4	19.6	19.0	12.0

unsulphonated residue is then read off from the graduations."

DIMETHYL SULPHATE TEST.

"Five cubic centimetres of the fraction is pipetted into a narrow 25-cubic centimetre burette, and shaken with 8 cubic centimetres of dimethyl sulphate after closing the burette with a smooth, close-fitting cork. Separation of the residual oil occurs in a short time

low in sulphonation residue, this test would not seem to be of any value.

We have experienced great difficulty in obtaining dimethyl sulphate; moreover, we find that it rapidly changes on standing, so that fresh supplies must frequently be had. Another objection to this reagent is the danger attendant upon handling it.

In a great deal of our laboratory work on oils distilled from various kinds of tar the results have been clouded by uncertainty as to the authenticity of the sample. Some time ago, therefore, we procured

* Presented before Section D of the American Association for the Advancement of Science at the Atlantic meeting, January, 1914.

samples of tars from typical coke ovens and gas plants under such conditions as to make accidental contamination or admixture practically impossible. These tars were distilled to pitch, and the distillate oils recovered. The oils were subjected to a number of tests, partially along the lines of Dean and Bateman's work (loc. cit.). It is not our intention to give the details of this work at present, except in so far as they affect the question of the sulphonation test.

Coal tars may be divided into two classes:

(1) Coke-oven tars, which may be further sub-divided according to the type of oven in which the coal is carbonised.

(2) Gasworks tars, which may be divided similarly into horizontal, inclined and vertical gasworks tars.

In this investigation, we had one or more samples from each of the different types of installation, both coke-oven and gasworks, and have, we believe, examined a sufficient number of samples to draw correct conclusions.

The examination of the oils, which is of interest in this connection, was a Hempel distillation (made in accordance with the Forest Service method for analysis of creosote oil), taking fractions at the following points: 210 deg., 210-225 deg., 225-235 deg., 235-245 deg., 245-255 deg., 255-265 deg., 265-275 deg., 275-285 deg., 285-295 deg., 295-305 deg., 305-320 deg., and 320-330 deg. Cent. These fractions were then subjected to the sulphonation test, using Bateman's modified method, as described above. In the appended table are given the results of these tests of the various oils examined, representative tests of each type of installation being selected. Where there were any great variations between oils of the same origin, the tests of the two most widely divergent materials examined are given.

A consideration of the creosote oil specifications in active use indicates a tendency toward the use of the sulphonation test. The requirements of the test vary widely; in one case the sulphonation residue is limited to 10 per cent, in others to 1 per cent, while still others specify that, in the fraction 300 deg. to 360 deg. Cent., it shall not exceed 0.25 c.c.

In a Forest Service circular, C. P. Winslow gives the requirement for Class 1 and Class 2 coal-tar creosotes, which are the only ones considered by him as pure coal-tar creosotes, that there shall be no sulphonation residue. In "mixed coal-tar creosotes" he allows, in Class 1, 10 per cent of the 305-320 deg. Cent. fraction as a sulphonation residue, and in Class 2, 20 per cent of the fraction 305-320 deg. Cent., expressing it in the form that "the volume of the sulphonation residue in cubic centimetres should not be greater than one-tenth or one-fifth, respectively, of the weight of the fraction in grammes."

In the opinion of the writers, the requirement of no sulphonation residue is unfair as a basis of classification of pure coal-tar creosotes, and a very high limit for mixed creosotes, such as 10 to 20 per cent, is useless, as it makes it unnecessary, *per se*, to have any coal-tar creosote at all present, in view of the fact that a great majority of the water-gas tar distillates have considerably less than this amount of sulphonation residue in any fraction. If a requirement for no sulphonation residue should be enforced, only straight coke-oven tars could be used to produce such creosote oils, and this is certainly a commercial impossibility for the most part. If a limit of 1 per cent is set, the coke-oven tars and some of the horizontal gasworks-tar oils would meet the requirement, but some of the latter would require the admixture of coke-oven tar oils to bring the percentage below this limit; also, if a tar distiller should be handling considerable quantities of inclined or vertical gasworks tars, oils containing as low as 15 to 20 per cent derived from these tars might fall outside of the 1 per cent sulphonation residue limit.

The writers feel that a fairer limit for such specifications would be about 2 per cent, as this would not bar any normal coal-tar creosote oils, and would, at the same time, prevent the admixture of petroleum products (other than those from water-gas tar), blast-furnace oils, &c. The admixture of water-gas tar distillates will, of necessity, have to be taken care of in some other way than by the sulphonation test, as it is very plain that certain mixtures of coke-oven tar oil and water-gas tar oil of a low sulphonation residue would show a lesser sulphonation residue than most oils obtained wholly from gasworks coal tars.

We believe, moreover, that we have demonstrated the sulphonation test of itself to be of comparatively little value in detecting the admixture of oils of petroleum origin, particularly those derived from water-gas tar, with creosote oil.

In a later paper we intend to publish additional data from our analyses of authentic tars, indicating the value of certain other tests, as means of determining the origin of oils used for creosoting.

INTERNATIONAL ENGINEERING CONGRESS, 1915.

Among the general subjects to be treated before next year's International Engineering Congress at San Francisco, probably the one having the broadest interest is that of Materials of Engineering Construction, which enters into all phases of engineering activity.

The list of topics which will be treated in this section is as follows:—

- (1) Timber.
- (2) Preservative Treatment of Timber.
- (3) Substitutes for Timber in Engineering Construction.
- (4) Brick in Engineering Structures.
- (5) Clay Products in Engineering Structures.
- (6) Probable and Presumptive Life of Concrete Structures made from Modern Cements.
- (7) Aggregates for Concrete.
- (8) Slag Cement.
- (9) Waterproof Concrete.
- (10) Cements containing Additions of Finely-ground Foreign Material.
- (11) Economics of the World's Supply of Iron.
- (12) The Life of Iron and Steel Structures.
- (13) The Employment of Special Steel in Engineering Construction.
- (14) The Place of Copper in the Present Engineering Field, and the Economics of the World's Supply thereof.
- (15) Alloys and their Use in Engineering Construction.
- (16) Aluminum in Engineering Construction.
- (17) The Influence of the Testing of Materials upon Advances in the Designing of Engineering Structures and Machines.
- (18) Cement Testing.
- (19) Testing of Metals.
- (20) Testing Full-sized Members.
- (21) Proof Testing of Structures.

The papers to be presented from the United States have already been arranged for from the recognised leading authorities on the various topics. Arrangements for the papers from foreign authors are being rapidly concluded, and the aggregation of papers which will be presented will constitute a broad review of the field and be of the highest value. Marked interest in the congress from foreign countries continues, and there is every evidence that the attendance from abroad will be large.

Full information concerning the congress, the price of subscription, and the arrangement for purchase of volumes of the proceedings, may be obtained by addressing the Committee of Management, as follows: International Engineering Congress, 1915, Foxcroft Building, San Francisco.

Preservation of Ancient Monuments.—In the report of the Inspector of Ancient Monuments recently issued by the British Government, instructions are given to the foremen in charge of the various works of preservation. It is interesting to note that the powder Pudlo is suggested as a medium for waterproofing the ancient buildings under the care of the Government.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why is it that in a recent issue of "Royal Automobile Club Journal" it is stated that "the Denbighshire roads are generally bad, and will not be up to the level of neighbouring counties till the county council recognises the changed conditions of modern traffic," and if this statement is a fact whether the county council have risen to the occasion and are improving their roads on modern lines?

What was the reason that the Kenilworth Urban District Council had allowed their water supply to remain liable to serious risk of pollution from an adjoining brook for so many years, and that it required the services of a medical inspector of the Local Government Board to discover this danger of pollution, and what steps are the urban district council taking to remedy this state of affairs?

What is the apparent difficulty with regard to the much-needed relief road at Croydon? Is it a fact that the Local Government Board are not satisfied with the contribution of land and money promised by the Ecclesiastical Commissioners, or is it that the opposition to the scheme has been able to bring further arguments before that board, after the inquiry which was held last year? Does it not seem rather a pity that such an important and useful scheme should be now "hung up" at the eleventh hour?

How many surveyors are aware that the "National Health Week" is to be held in this country from November 15th to the 21st of this year, and what steps are they taking to assist in this useful movement, which it is hoped will popularise the subject of sanitation?

Why cannot the example of the Hampshire Automobile Club be followed by other clubs throughout the country in issuing the following letter to their members and others who own or use motor cars: "Dear Sir (or Madam).—The county surveyor asks for the assistance of members of the club as follows—namely, that cars passing men at work on the roads, repairing or tarring same, should be driven quite slowly. The surveyor asks this on account of a recent occurrence when a workman was knocked down and dragged by a car some yards and narrowly escaped with his life. The surveyor points out that in repair work, if there is a steam roller working at the same time, the men cannot easily hear the approach of traffic.—Yours faithfully, Chas. E. Godwin, hon. secretary."

Is it a fact that there are several large contractors for road construction and maintenance in this country who are prepared to reconstruct roads "at a price," and to keep them in repair afterwards at a fixed charge of 7d. per square yard "for all time," or is this statement mere hearsay?

What are these terrifying diseases "Aukylostomiasis" and "Bilharziasis," which, according to Viscount Kitchener's report, appear to be prevalent in some parts of Egypt, and what are their English names, if they have any? Why should the ova of this germ be found in mummies of the twentieth dynasty still alert, and all alive for mischief, after nearly 3,000 years of quiescence? Should not the medical officer of health and the surveyor of England be glad that he has not to tackle this problem? Are not the fearsome names of these diseases sufficient to kill the fellahin of the Delta even if they only know they are in their neighbourhood, and what steps are being taken to eradicate these diseases?

What will be the result if the Middlesex County Council succeed in obtaining their Act of Parliament under which they will be empowered to make a charge on all motor omnibuses using the proposed new Great West Road out of London of 3d. per vehicle-mile, and is it a fact that under a conservative estimate this tax will bring in about £100 per annum per mile of road? Will not this restriction of traffic be the means of bolstering up the tramways owned by the county council, and does not this

"preferential proposal" savour of a disguised Tariff Reform movement? Will not the "people" have to pay this tax in the form of increased fares, and does the proposal seem fair in these democratic days?

Whether the surveyors in this country are satisfied with the requirements contained in the Road Board's revised specifications and general directions relating to the tar treatment of roads, and whether they have been able to adopt these specifications, or whether local conditions make it difficult for them to do so?

Is it a fact that the Permanent Committee of the International Road Congresses, whose headquarters are at Paris, have decided to increase the subscriptions of the members attending the next International Road Congress at Munich, and, if so, to what extent? Would not such an increase diminish the number of attendances and tend to reduce the usefulness of these congresses?

When will the Engineering Standards Committee issue their report on the definitions of "Bitumen" and "Asphalte," and decide for us the vexed question as to whether either or both are to be regarded as natural materials, and under what circumstances should they be regarded as artificial substances? Is the committee waiting to confer with the American engineers on the subject, and, if not, why should there be this delay?

When will the "traffic question" be seriously considered in this country, and who is to do it? Why is it that the "rule of the road" is for vehicles to keep to the left and pedestrians to keep to the right, and does not this rule cause the pedestrian to be always in danger because if he steps off the footpath he is liable to be run over by a vehicle coming from behind him, whereas if he, too, "kept to the left" he would be facing the traffic. "What department of the Government is really responsible for traffic regulations"? is the question which now exercises the mind of the "man in the street."

Sheffield Society of Architects and Surveyors.—At the recent annual meeting of this body the retiring officers were re-elected as follows: Messrs. A. F. Watson (president), C. B. Flockton (vice-president), R. W. Fowler (treasurer), J. R. Wigfull (hon. secretary), W. G. Buck, F. E. P. Edwards, J. R. Hall, C. F. Innocent, H. L. Paterson, H. I. Potter, C. S. Sandford, E. Winder, F. H. Wrench.

Housing at Chester-le-Street.—Official sanction has been given to a scheme of the Chester-le-Street Urban District Council for the erection of 168 workmen's dwellings. The council proposed to build 116 houses with only two bedrooms, and the rest with three bedrooms, but the Local Government Board have suggested that the number of two-bedroom houses should be reduced, and 150 houses built with three bedrooms.

New Baths at Pontefract.—New swimming and slipper baths erected by the Pontefract Corporation on the Headlands estate were formally opened last week. The baths, which have cost about £8,000, exclusive of land and equipment, include a large pond of regulation size—75 ft. by 25 ft.—and a children's bath 25 ft. by 15 ft., six slipper baths, and one vapour bath for each sex, with steam laundry, the heat being supplied from the adjacent refuse destructor.

Blackburn's New Motor Fire Engine.—Blackburn has just placed its second motor fire engine in commission. Like the first motor, which has been in service about twelve months, the new machine is of the Merryweather "Hatfield" type, with pump to deliver 450 gallons per minute. Arrangements are also made for throwing a "first-aid" jet for dealing with small fires, and a 55-ft. escape is carried. At the official trial at Blackburn the pump was thoroughly tested with one, two, three, and four jets and with nozzles of various bores, and a single jet of water was sent to a height of 190 ft. Afterwards the motor was taken to the bridge which spans the canal at Highfield-road, in order to carry out a deep-lift test. With the pump drawing from a vertical depth of 21 ft., water was sent through the nozzle in 13 seconds, and 170 lb. pressure was obtained, a fine jet being thrown to a great height.

Control of Ashpits, Ashbins, and House Refuse by By-Laws.

EFFECTS OF THE PUBLIC HEALTH ACT, 1875, AND THE PUBLIC HEALTH ACTS AMENDMENT ACT, 1890.

By R. H. QUINE, D.P.H. (VICT.).

The storage of house refuse on private premises and its collection are matters of the greatest importance to all local authorities, as affecting the health and the pocket of the community. The critical observer visiting the different parts of the kingdom must be profoundly impressed by the entirely unsatisfactory manner in which house refuse is generally treated. One frequently sees extremely untidy and insanitary conditions about the house from this cause, and it is evident that enormous sums of the ratepayers' money must be wasted every year in antiquated methods in emptying badly designed and constructed or inconveniently situated receptacles. Slack methods and low standards of backyard cleanliness, with bad or doubtful conditions, are the rule rather than the exception.

While there are elaborate by-laws regulating the relatively unimportant subjects of thickness of walls, strength of floors and roof timbers, &c., there is an absence of anything like complete and efficient by-laws to regulate house refuse, and no intelligent and uniform general policy seems to be adopted by local authorities. This is due partly to divided responsibility, partly to puzzlement and lack of knowledge as to how to handle an apparently simple, but really very difficult question, partly also to the almost entire absence on the part of cleansing departments of statistics, or information as to the relative speed, labour, cost of collection, or relative weight, volume, and quality of refuse produced by the various appliances which they have been using for years. There is a lack of knowledge of the efficiency of their tools which would ruin any merely commercial undertaking. There does not appear to be any intelligent guiding power ruling the installation of the whole town plant for handling and working refuse. There is often, indeed, conflicting policy and cross purposes between departments within the authority. Three departments may be concerned in this matter.

All these things point to something being very seriously wrong on this subject, and create the impression that of all the duties imposed by law on the local authority, those dealing with house refuse are probably the least efficiently carried out.

An inquiry into the reason of all this and the remedy is desirable.

Let us first of all be quite clear on the legal position. In estimating the meaning and intention of any Act, it is well to have in our minds a very clear idea of the Act itself, and of the purpose behind it.

The danger and nuisance of dirt and untidiness around the dwelling was clearly recognised in 1875, as well as the importance of properly storing and removing house refuse, and the Public Health Act of 1875 was intended to ensure tidiness and cleanliness, and to prevent possible danger. It is well to remember that at the passing of the 1875 Act microbes, as a common cause of disease in man and decay in food, transferable by flies, cats, wind, &c., were not known or thought of in connection with house refuse. Had the microbial dangers been then known as now, the Act would no doubt have been more stringent. Even with the limited knowledge of that date the Public Health Act, 1875, enacts (in sec. 35) that every person who builds a house must provide an ashpit "with proper cover and with proper doors"—the intention of the cover and the door being obviously to keep out that which ought to be kept out, and to keep in that which ought to be kept in, and to give access for depositing and removing refuse, and for inspection.

In order that the above duty imposed on the builder of the house should be carried out, sec. 40 of the Act compelled the local authority to do two things:

(1) To see to it that the ashpit is provided and is properly constructed.

(2) To see to it that the ashpit is not only provided and constructed, but is kept so as not to be dangerous to health.

These two duties are different. They are not

optional, but compulsory, and so important are they both regarded that the most ample powers are given to the local authority in regard to them. To that end sec. 36 enacts that if there be no ashpit provided, the local authority may itself provide one and recover the cost from the owner. The Act even goes further, and in sec. 41 it enacts that if there be an ashpit which is in any way defective, the local authority may itself alter, or amend, or repair it, and recover the cost from the owner.

In order that the local authority itself should have no excuse for not enforcing duties on builder and owner, and even occupier, it is empowered to make by-laws. Sec. 157 of the Act empowers the local authority to make by-laws regulating the construction of the ashpit, and (in order that it may be kept and used properly) sec. 44 of the Act enables the local authority to make by-laws for the prevention of nuisance from dust, ashes and refuse. Note that this is not for abatement of nuisance, but for its prevention. It is thus seen that the whole spirit as well as the letter of the 1875 Act is quite clear in insisting on the provision by the builder of receptacles for refuse and ashes, properly constructed and covered with proper means of access, and that afterwards the same shall be properly used and kept by the parties responsible for using and keeping them.

The owner is made responsible for the cost of erection, alteration, amendment, repair and renewal, and the local authority is made responsible for providing that the work be promptly and properly done. This clear policy of constructing things right at the start, and providing that they should be kept right, and nuisance and danger prevented, is the real policy and meaning of the Public Health Act, 1875. It is a policy of active foresight, in devising means and precautions to prevent evil. It is in no sense a slack and lazy policy of allowing nuisances to occur, and then abating them when they obtrude themselves, or the mischief is done.

After being in force for a quarter of a century, it was made clear that at least three serious defects existed in the 1875 Act in relation to house refuse:

(1) The Act provides such properly constructed and kept ashpits only for those houses erected after the date of the passing of the Act, and does not deal with those houses erected before the Act.

(2) By the use of the word "ashpit" it might be thought to limit the receptacles and the making of by-laws controlling them to the old form of ashpit—the type of large, solid, fixed, permanent structure, in which first construction was the important point, and to make no provision for the use or control of the smaller, movable, fragile type of receptacle which came later, and the keeping of which is of equal importance with the construction, and which so urgently required controlling.

(3) The occupier was not sufficiently controlled.

In order to remedy these and other defects in the 1875 and other Acts the Public Health Acts Amendment Act was passed in 1890, and it enacted with regard to ashpits:—

(1) In sec. 23, that any by-laws governing the construction and keeping of ashpits made under the 1875 Act could be made to refer to houses built before the 1875 Act, thus bringing all houses (whenever built) under a common standard of sanitation and control in this matter.

(2) In sec. 11 it enacted that the term "ashpit" should not merely mean and refer to the old form of ashpit, but should mean and include any ashtubs, boxes, or any other receptacle whatsoever, thus giving to such things the legal status of the ashpit of the old form, and at the same time bringing every kind of receptacle used for the reception of ashes and refuse under the control of the local authority, and subject to any by-laws made by them. The local authority being already compelled to regulate how the old "ashpits" should be constructed and kept, and how nuisance from dust, ashes and refuse may

be prevented, is now further compelled to regulate how all receptacles, of whatever nature, should be constructed and kept so as to conform to decent sanitary principles and conditions, and cause neither nuisance nor danger.

(3) In sec. 26 it empowered the local authority to make by-laws imposing duties on the occupier, so as to facilitate collection.

Let us see how these two Acts worked out in practice.

The effect of the 1875 Act was that every local authority was made responsible for four classes of work in connection with house refuse:

(1) To see that refuse receptacles properly constructed were provided for new dwellings by the builder.

(2) To compel the owner to provide, renew, alter, amend, and repair refuse receptacles, or itself to do the work if necessary.

(3) To see that refuse receptacles were used and kept properly by occupiers, so that collection might be facilitated and nuisance from dust, ashes and refuse prevented.

(4) To see that refuse receptacles were emptied promptly by the local authority.

To carry out these duties the local authority divided up the work between its various departments.

On the surveyor's department lay:—

(a) The burden of making building by-laws, governing the construction of new erections of all kinds, including ashpits.

(b) The burden of seeing that such by-laws were carried out, whether it was a new ashpit for a new building or a new ashpit in connection with an old dwelling.

If there was any new structure, the surveyor's department had to see to it.

On the sanitary department lay the burden of:—

(a) Making by-laws as to how all receptacles should be kept, so as not to be dangerous to health; also making by-laws which would prevent nuisance from dust, ashes and refuse.

(b) Of seeing that the by-laws so made were adhered to.

On the cleansing department (whether as a separate department or a sub-department under the surveyor's or the sanitary department) was laid the burden of removing from the premises all refuse in the most sanitary manner, and (naturally in the interests of the ratepayer) with the greatest economy of time, labour and cost.

The manner in which the various departments carried out these duties is interesting. It may be said that some of the duties were well done, some very badly done, and others altogether neglected.

THE SURVEYOR'S DEPARTMENT.

By-laws regulating the construction of ashpits became general, and the supervision of the construction was of very fair efficiency. There are two reasons for this:—

(1) By-laws regulating the construction of all sorts of buildings were being prepared, and it was easy and convenient to include with them by-laws regulating the construction of ashpits. Architecture and surveying being already developed sciences, it was easily possible to get the construction part of the work properly drawn out.

(2) It was also easy and convenient, after the construction by-laws were made, to keep a very firm and complete control on the execution of the work. In the first place, plans had to be submitted showing details of the proposed structure, and conforming to the by-laws; faults could thus be checked or amended. Then the building surveyor constantly inspected the work during construction, and finally, before a house could be occupied, a certificate of habitation had to be obtained from the local authority, which could refuse it if the building by-laws were not adhered to. This control by plans, by inspection, and by certificate—is very important, and its significance will appear later.

It will thus be seen that the work entrusted to the surveyor's department was, on the whole, well done, and carried out the intention of the 1875 Act. Where it was weak was in the design of the ashpit from a sanitary point of view. The reason of this was that the science of modern sanitation hardly existed. It was difficult then, as it is to-day, to find men who could accurately define how an ashpit should be constructed and kept so as not to be dangerous to health.

It was even more difficult to find men who could frame by-laws to effect these objects.

THE SANITARY DEPARTMENT.

Long after the passing of the 1875 Act medical officers of health and inspectors of nuisances had little or no training in sanitation, nor did means of efficient training exist. Modern sanitary science and the existence of the microbe were practically unknown. The medical officer frequently had his private practice, and left things pretty much to the inspector, who often had other duties. The whole aspect and outlook of the department seemed to be influenced by the inspectors of nuisances title, and to involve merely the abating of obtrusive nuisances that refused any longer to be hidden. Public health seemed to mean abatement and not prevention.

Such sanitary departments were made responsible for carrying out the preventive work of the 1875 Act in relation to ashpits, not only to declare to the surveyor's department the principles and conditions to be observed in construction and installing, but to make by-laws providing how they should be kept so as not to be dangerous, and how nuisance from dust ashes and refuse should be prevented. The result was obvious; they left the whole thing to the surveyor and the construction by-laws made by him, and made no preventive by-laws, but waited for nuisances, which, if not very obtrusive, were often not seen.

With the development of sanitary science a new race of medical officers and sanitary inspectors has sprung up, with different training and outlook. The more enterprising of these new men at once started to condemn the old form of large ashpit with its long accumulations and polluted walls. They urged the adoption of small tubs or ashbins and frequent emptyings, but, in the hurry of abating great evils, forgot that they might be introducing others almost as bad, and forgot also to make the preventive by-laws demanded by the 1875 Act, which should extend to and regulate and control the construction and keeping of the new receptacles as well as the old ashpit, and prevent nuisance and danger from their use. They caused the old strictly governed receptacle to be discredited, while a crowd of new and cheap ones entirely without control were not only permitted, but encouraged.

The speculative builder and property jobber readily fell in with the new policy, not because of a love of sanitation, but because it saved the bother of preparing plans for the ashpit, which was not now enforced. It took the whole thing away from the eye of the surveyor and the critical building inspector, and, above all, it saved about 50s. in cost, which could be pocketed. According to the new idea, any sort of bin or tub would do. It could be bought for a few shillings and dumped down anywhere, and what happened afterwards was not their business. The matter appealed to the property owner much in the same way as it did to the builder.

To get rid of the old ashpit was a good work, but certain results followed.

The surveyor being already furnished with a set of by-laws which regulated the construction of the old ashpit, but which did not apply to the new tub or bin, found himself left high and dry by the tide which ebbed from his department and flowed towards the sanitary department. He was left with the by-laws and no ashpits to which to apply them, while the sanitary department had the new receptacles but no by-laws to govern them. The surveyor lost control, but the sanitary department did not gain it. Neither of the departments seemed quite to realise that any and every receptacle was really in essence an ashpit, and had to be governed and controlled by the local authority, and that it was subject, not only to construction, but also to such repair, alteration and amendment as would bring it within any by-laws which might be made to regulate it.

Gradually surveyors began to realise this, and new by-laws were made; but, unfortunately, they referred to construction only and not to keeping, and to new houses only and not to sanitary alterations of old houses, which were left to be dealt with by the sanitary department, whose officials, having no by-laws or any power of compulsion behind their recommendations, soon found themselves compelled to submit to all sorts of inferior and bad arrangements, and were even reduced to bargaining to get these.

Thus the two departments in many towns came to have different standards and different practice. Where that occurred, the department which had the care of the public health, strange to say, almost invariably

had the lower standard, and often, in the sanitary alteration of old houses, which, on account of bad surroundings, needed the best sanitation, things were permitted which would not be tolerated in the new houses being erected at the same time under the surveyor. This weakness was freely exploited by the unscrupulous, greedy, or poor owner, and by the property-owning interests on the local councils. Sanitary departments now realise that they ought either to have themselves obtained and kept the full powers of control over the new receptacles which they introduced, or have arranged with the surveyor to do so, and supplied him with the necessary information. They are finding out that when there is no co-operation in the making of by-laws, and no united action in enforcing them, and when two departments of a corporation are permitting different standards, there cannot be efficient control. The higher standard is maintained with extreme difficulty, tending to fall to the lower level, and incidentally local government is brought into contempt. The jerry-builder and property "scamper" always buy the cheapest thing allowed, and will put into their own pockets any extra profit permitted by slack rule. Slack rule compels the occupier and his family to live through the years under conditions which are not as good as they might be. It also allows the ratepayer to be saddled with a "cheap and nasty" installation very costly to work—all to save the temporary owner a few shillings.

(To be concluded.)

ENGINEERING JOTTINGS.

V.—UNUSED NATURAL MEDICINAL WATERS.

By HERBERT G. COALES, ASSOC.M.INST.C.E., F.S.I.

This heading is suggestive of fresh industries—or municipal undertakings—hinging on the finding and tapping of medicinal water for the unfortunate rheumatic, gouty or dyspeptic subject to drink and pay for. And that is the suggestion.

On the one hand, there is the continuous exodus of people to take the waters and experience the cure at foreign watering places, and, on the other, the possibility of the existence of equally curative waters at home, unused and ignored. Many of the British medicinal springs, which were once quite unappreciated, are now the centres of large and growing towns. Why should not the same thing occur again in respect to other undiscovered or unused springs? It cannot be said that there are not any of the latter, for most counties contain one or more of such. Some are known to contain healing virtues, while some only bear the reputation; yet who can doubt that other springs lie within reach to be tapped and utilised?

Just as herbs of various medicinal qualities have been used to cure the ills of man, so any other natural product should, when discovered, be commandeered in the same service. A little trouble should be taken to find waters with healing qualities. Money is often worse spent.

It would be very interesting if an Ordnance Survey special map were prepared, in the first instance, showing every known medicinal spring in the British Isles. That would form the nucleus of a very important record, to which could be added, from time to time, further information as it was collected. The comparison of such a map with the geological survey would, in all probability, suggest where other medicinal springs were likely to be found. The attendant expenses of an investigation would at least be no more onerous or wasteful than many another Government or local expenditure.

Analyses are available of all the medicinal waters at the chief health resorts; but other known and unused springs should be tested and tabled, and, in conjunction with the aforesaid map, studied too. Why should all our water analyses be confined to inquiries after hardness or contamination?

It is more than likely that buried in the earth are many ready-mixed medicines awaiting discovery and use. How do things now stand? There are the known and utilised springs, the known and unused springs, and the (as yet) undiscovered underground waters.

The doctor and chemist, working in conjunction with the engineer, are the people to tackle this question. It is known that hard water with bone-making attributes is good for children to drink, but bad for gouty adults. In the same way the medicinal waters should be studied and understood. It is a gross folly not

to take advantage of the available beneficent provisions of Nature.

Springs at a distance from existing towns could be collected and brought by pipes to any desired point. Galvanised-iron tubes could be used for one class of water, glass-lined for another. The supply could be regulated and controlled by the attendant at the town end, and duly paid for by the patients as usual.

It does not seem absolutely necessary that people should reside for a month or a fortnight in the vicinity of such springs. The water could be bottled, and distributed in the way of business like any other commodity. A curative spring, bubbling up in an out-of-the-way spot, far removed from any town, now affords a disagreeable drink, maybe, to a casual passer-by, or to the more determined man who comes to carry away a few jars full of the reputed wonderful water. But to experience a cure a course of it must be taken. Here, then, is the opportunity for enterprise; the water in the absence of dwellings on the spot must be consumed at one's home, and bottling must be carried on as is now done with some foreign waters.

The doctor and the chemist ought to agree what classes of impregnated waters would be beneficial for sufferers from various ailments. Then it should be the duty of the engineer and the geologist to make the necessary inquiries, and to investigate the various strata. It would appear quite possible that there may be many kinds of medicinal underground water which do not show themselves in the form of springs, but are in subterranean pockets or basins, and which, to be available, would have to be pumped.

The recent scare in reference to the Derwent water supplied to the city of Nottingham makes one realise that there are waters *and* waters, and should lead one to compile as many results of analyses as possible. Though unappreciated by science at present, a water hitherto unused may be a cure for many a disease or complaint.

It is said on good authority that some of the foreign water drunk by the confiding Britisher abroad is a manufactured article. Indeed, the impregnating salts required for converting ordinary water into medicinal are often bought in England. Would the man intending to make a journey abroad to drink the waters still go if he saw the salts put on board his own ship? Rather would he prefer to turn back, and go and drink the natural chalybeate, sulphuric or saline springs of his own country, and, possibly, take an interest in the finding of others.

St. Helens Engineer and Mechanical Traction. The borough engineer of St. Helens, Mr. Arthur W. Bradley, is considering the substitution of mechanical traction for horse power in relation to cleansing and highway work.

His One Request.—“Personally, all I ask from the users of the roads which I have the privilege and honour of supervising is the same consideration as was shown to the organist in the American mining camp, and contained in the notice conspicuously in front of him: ‘Don't shoot the organist; he is doing his best.’ And while doing my best, I am sometimes prompted to join with Robert Louis Stevenson, and say

Let the lave go by me;

All I want; the Heaven above

And the road before me.”

—Mr. W. L. Gibson, county road surveyor, Dunblane, in a recent paper.

Town Planning in Saskatoon.—Mr. C. J. Yorath, ASSOC.M.INST.C.E., commissioner and consulting engineer to the city of Saskatoon, in the province of Saskatchewan, Canada, has recently completed a town plan of Greater Saskatoon. The plan provides for through river drives and boulevards along both banks of the Saskatchewan River, which runs through the centre of the city; inner and outer encircling boulevards connected up with diagonal avenues leading from the centre of the city to the principal outlying towns and villages; a civic centre on the river front, and a complete system of tramways, sewers and water mains, so arranged that it can be built up in units as required. Mr. Yorath attended, as the city's representative, the town planning conference held by the Commission of Conservation in Toronto last week, and submitted a paper on “Town Planning and Civic Aesthetics.” The plans to which reference has been made were among the exhibits.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for May is awarded to

Mr. E. LOVATT,
Oak Tree House,
Talke, Stoke-on-Trent,

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

Mr. F. NICHOLSON, to whom the premium for April was awarded, selected a 15-in. Brass Rolling Parallel Rule (made by Messrs. J. Halden & Co., Limited), which has been duly sent to him.

QUESTIONS.

This week answers are invited to the following questions:—

398. Road Construction. Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

399. Fireproof Construction.—What fireproof preparations can be used for protecting timber, and what independent coverings may be applied for the same purpose? (S.A., 1905.)

400. Structures.—What is meant by a redundant member in a truss, and why are such members introduced? Sketch two simple trusses, each having at least one redundant member. (I.C.E.)

401. Specific Cravity.—A bullet of lead, whose specific gravity is 11.4, weighs 1.09 oz. in air and 1 oz. in olive oil. Find the specific gravity of the olive oil.

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

396. Strength of Materials.—A horizontal uniform bar 18 in. long, is laid over two supports, each 4 in. from its ends. Find two points at which the bending moments are zero.

The following additional reply to this question has been received:

A bar of uniform section supported in the manner shown in Fig. 1 would have a shear diagram, due

FIG. 1.

FIG. 2.

to its own weight, as in Fig. 2, where the dimension *ac* is equal to half the weight of the central span,

and *ab* is equal to the weight of the overhanging portion.

Considering the overhanging portion alone, the maximum bending moment will be equal to—

$$\frac{w x^2}{2} \dots \dots \dots (1).$$

and will occur at the supports, and would be uniform over the central span—as indicated by the dotted line in Fig. 3—but for the opposing moment due to the weight of the bar over the central span. The intensity of this moment at any point distant *y* from a support is given by the formula—

$$\frac{w (l y - y^2)}{2} \dots \dots \dots (2).$$

and where the diagram of this equation crosses the diagram of expression (1) will be the point at which no bending moment occurs. To find this position mathematically, it is only necessary to combine expressions (1) and (2) in an equation so that their difference shall be zero. Then, using the known values, calculate the corresponding value of *y* (Fig. 3).

FIG. 3.

$$\frac{w}{2} x^2 - \frac{w}{2} (l y - y^2) = 0.$$

Hence—

We may discard the factor $\frac{w}{2}$ leaving—

$$x^2 - l y + y^2 = 0$$

$$\therefore y^2 - l y = -x^2$$

Inserting the arithmetical values, we get—

$$y^2 - 10 y = -(4)^2$$

By adding the square of half the coefficient of *y* to both sides of the equation, we get—

$$y^2 - 10 y + (5)^2 = 25 - 16$$

$$= 9$$

Finally, extracting the square root, we get—

$$y \pm 5 = 3$$

$$\therefore y = 2$$

So that, in this instance, the neutral point is exactly 2 in. inside each support, as shown in Fig. 3. (E. E. W.)

397. Testing Cement.—Explain in detail, giving sketches where necessary, how a sample of cement would be tested in practice. (B. W., *Tadcaster.*)

Tensile Tests.—Cement is seldom subjected to tension in practice, and is not usually employed "neat," yet the tensile test of neat cement is the general test for strength employed, as under carefully arranged conditions it gives a good index as to quality. Neat and properly cooled cement is mixed with 20 per cent of its weight of water, and filled into moulds under thumb pressure only to form briquettes. The form of the briquette and the holding clips of the testing machine have considerable influence on the distribution of stress over the breaking section of the briquettes, and they have therefore been standardised. The form of briquette adopted by the Engineering Standards Committee is shown in Fig. 1, the minimum section being 1 in. square. A very high tensile resistance is not necessarily an advantage, because it may be due to the

cement being "hot" or to the presence of an excess of lime; but if the cement will pass the tests for fineness of grinding and for proper cooling, it is a valuable quality. The "Standard" specification of ultimate tensile strength for the square-inch section of a briquette, which, after filling into the

FIG. 1.

mould has been kept for twenty-four hours in a damp cloth in the atmosphere, and then placed in fresh water until tested, gives the following figures:

7 days from mixing 400 lb. per sq. in. of section.
28 " " " 500 lb. " " "

the results to be determined by the average of six briquettes for each period. The tensile breaking load of a briquette is considerably affected by the rate at which the load is applied; the rate has therefore been standardised, and the Standards Committee specify a rate of 100 lb. in 12 seconds—i.e., 500 lb. per minute.

Compression Tests.—Compression tests are seldom made, as the tension test is more satisfactory and simple. The chief drawback to compression tests is the difficulty in securing a satisfactory bedding for the material. If they are to be made, however, 3-in. or 4-in. cubes can be tested in an ordinary testing machine, and these should give an ultimate strength of from eight to eleven times the tensile strength.

Fineness Tests.—Coarse particles in the cement have a damaging effect as they have little strength or cementing value, and would be tantamount to the addition of sand or other inert matter. Fineness of grinding is therefore essential, and to test this quality the cement is sieved. The Standards Committee specification requires that the residue on a sieve with 5776 meshes per square inch and wires 0.0044 in. diameter shall not exceed 3 per cent, and that on a sieve of 32,400 meshes per square inch and with wires 0.002 in. diameter shall not exceed 2 1/2 per cent.

Specific Gravity.—This is a valuable test, as it detects an underburnt cement, and also a cement which has been exposed to the air, and which has absorbed a good deal of moisture and carbonic acid, and thereby lost its capability of combining with water. In both the conditions mentioned, the cement has a low specific gravity. The specific gravity test requires to be carefully done, but it is at least reliable, which is more than can be claimed for the test of a certain weight per given volume. In good practice, the specific gravity is specified to be 3.10 after delivery, and is determined by the displacement of level of turpentine in a glass vessel having a long, narrow, graduated neck. A quantity of cement, which has been carefully weighed, is dropped into the bottle, when the weight of the cement in grammes divided by the volume of turpentine displaced in cubic centimetres gives the specific gravity. Another method is to fill a narrow-necked bottle with water up to a marked level and weigh it; pour some water away, and drop in a weighed quantity of cement; then fill up with water to the original level, and weigh bottle and contents again.

The weight of water of equal volume to the cement used is then equal to the weight of cement minus the difference between the first and second weights of the bottle and contents, and the specific gravity of the cement is equal to the weight of cement divided by the weight of an equal volume of water as found above, or

Specific gravity =
$$\frac{\text{weight of cement}}{\text{1st wt. of vessel + weight of cement} - \text{2nd wt. of vessel.}}$$

Soundness Test.—This test is usually carried out by what is known as the Le Chatelier process, which consists of the apparatus shown in Fig. 2. It is a

FIG. 2.

small split cylinder of brass, 30 mm. long, 30 mm. diameter, and of 0.5-mm. metal. Two long pointers, aa, are fixed one on either side of the split, of 165 mm. length from the tips to the centre of the

FIG. 3.

cylinder. The split edges of the cylinder are held closely together, while it is placed on a piece of glass and filled with the usual cement paste. A glass plate and a small weight are then placed on the mould, and it is put into water at about 60 deg.

Fahr. for twenty-four hours. The cement will then be set, and the distance between the tips of the pointers measured on a millimetre scale. The apparatus is then placed in cold water, which is raised to boiling-point and kept boiling for six hours. When cool, the distance between the pointers is again measured. Under this test a bad cement will turn into soup, while an unsound one, owing to the presence of an excess of free lime or unslaked particles, will crack and expand, and this will be indicated by the movement apart of the pointers. The "Standard" specification allows an expansion of not more than 6 mm. in cement that before mixing had been exposed to the air for seven days.

Time of Setting Test. By varying the constituents cement can be made to set slowly or quickly according to the purpose for which it is required. Slow-setting cements allow greater latitude in mixing, while in tidal work rapid setting is essential. A briquette or pat of cement is made up in the usual way, and is tested by the indentation of a weighted "needle" of the form shown in Fig. 3. It has a flat end $\frac{1}{8}$ in. square, and weighs 2½ lb. The cement is considered to be "set" when the "needle," after being lifted by means of the loose hollow washer A, and gently applied to the surface of the cement, fails to make an impression. (Reader.)

Motorists and Roadmen.—A letter has been addressed to members of the Hampshire Automobile Club enclosing a request from the county surveyor, Mr. W. J. Taylor, that motor cars should be driven very slowly when passing men at work on the roads.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By Gerald O. Case. London: St. Bride's Press, Limited, 24 Bride-lane, E.C. 5s. nett.) While a good deal of attention has been directed in recent years to the question of coast erosion, but little has been said of the changes made by the wind on sandy shores. . . . The subject is certainly of sufficient importance to deserve more attention than it has hitherto received, and in discussing the nature of the groynes, embankments, &c., as well as of the vegetation best suited to arrest the movements of sand, Mr. Case has made distinct progress towards the solution of a difficult problem.—*Journal of the Society of Arts.*

NORTHANTS AND EAST MIDLANDS SURVEYORS' ASSOCIATION.

MEETING AT KETTERING.

A meeting of the recently-formed Northants and East Midlands Surveyors' Association took place at Kettering on the 23rd ult.

Assembling at the Free Library, the members were cordially welcomed to the town in the museum at the Free Library by the chairman of the urban district council (Mr. J. Loake, J.P.), who was supported by the vice-chairman of the council (Mr. E. C. Gravestock), and the clerk (Mr. J. Bond).

Mr. Alfred Fidler (borough surveyor at Northampton) proposed a hearty vote of thanks to Mr. Loake and to the Kettering Urban Council.

Mr. T. Reader Smith then took the chair.

Mr. Walton Maughan, of Northampton, who has taken an active share in the inauguration of the association, said the idea of the institution was to enable the members to get to know each other personally, so that they could work well together for mutual education and for the advantage of the public authorities employing them.

Mr. Alfred Fidler was unanimously elected president, Messrs. Williams (Daventry) and T. Reader Smith (Kettering) were unanimously appointed vice-presidents, and the committee were elected as follows: Messrs. Madin (Rushden), W. W. Band (Newnham), J. E. Wilkes (Northampton), T. Lloyd (Thrapston), and E. Y. Harrison (Wellingborough); while Mr. W. Maughan (Northampton) was, amidst applause, appointed hon. secretary.

Those members present at the meeting included Messrs. Alfred Fidler, M.INST.C.E. (Northampton), W. B. Madin (Rushden Urban Council), T. Yorke (Raunds Urban Council), G. F. Bearn (Wellingborough Rural Council and Finedon Urban District Council), W. W. Band (Daventry Rural Council), T. Northen (Rutland County Council), G. Dolphin (Uppingham and Gretton Rural Councils), F. W. Smart (Shire Hall, Bedford), J. W. Lloyd (Rushden Urban Council), G. E. Marlow (Desborough Urban Council), A. Harris (Rothwell Urban Council), T. F. Parker (Kettering), T. Lloyd (Thrapston Rural Council), C. H. Dorman (Northampton), G. Belson Chilvers (Oundle Urban Council), C. W. N. Jack (Northampton), C. G. Atkinson (Wellingborough), J. B. Williams (Daventry Borough Council), T. W. Millner (Blisworth), H. B. E. Brown (borough surveyor's office, Northampton), H. L. Harrison (Bedford County Council), L. J. Rogers (Wellingborough Urban Council), A. C. Wallingford (surveyor to the Soke of Peterborough), T. R. Smith (Kettering Urban Council), W. Manger, W. Maughan (Northants County Council), H. George, J. W. Whiteman (Bedford County Council), G. F. Hartigan, W. K. Leslie (borough surveyor's office, Northampton), E. Y. Harrison (Wellingborough Council), and others.

After the meeting the party proceeded in motors and brakes to the large blast furnace works of the Kettering Iron and Coal Company, Limited, at the northern portion of the town, being taken round in parties under the guidance of Mr. H. J. Preston (the managing director), Mr. F. H. Preston, Mr. G. Barratt (secretary of the company), and Mr. A. E. Linnell (works manager). The members then adjourned to the company's offices, where they were entertained at tea by Mr. Preston. At the conclusion, Mr. Alfred Fidler proposed a hearty vote of thanks to Mr. Preston. Mr. H. J. Preston suitably replied.

The party, under the guidance of Mr. T. Reader Smith, next proceeded to the electric light station and refuse destructor works, which were explained by Mr. W. A. Walker, and then on to the new baths in course of erection.

Aberdeenshire Road Schemes. Sir George Gibb, chairman of the Road Board, accompanied by Mr. H. P. Maybury, chief engineer of the board, arrived in Aberdeen last week (the *Glasgow Herald* states) for the purpose of inspecting roads in the northern counties. Accompanied by several county councillors and the road surveyor of Kincardineshire, Sir George Gibb and Mr. Maybury visited the Laureneekirk district, where improvements are in contemplation. They will also examine the proposed scheme for the improvement of the North road from Aberdeen to Keith, which affects the Aberdeen, Garioch, and Huntly districts of Aberdeenshire.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act ii., 2.

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR, Will you kindly allow me to repeat, for the benefit of "Not so Dusty," the statement made in my letter of May last—viz., that "natural bitumen should never be mixed or laid in connection with any coal-tar product, as the latter destroys the good properties of the bitumen"?

If "Not so Dusty" recommends, or has recommended, the mixing of natural bitumen with coal-tar products, and oil for road work or any other purposes, then I say distinctly he cannot be aware of the action which certain bodies contained in coal-tar products have on bitumen.

I have, as "Not so Dusty" says, every faith in the accuracy of my statements, and it may perhaps interest him to learn that my information has been gained first hand and as the result of over thirty years' personal experience in the refining and manufacture of bitumens, asphalts and pitches of all kinds for road paving and a variety of other purposes.

I can also assure "Not so Dusty" there is no need for him to disclose his identity, and it is not surprising that certain well-known facts may at present "seem paradoxical" to him, but the leading authorities and those who have made a study of the subject would, I think, be able to satisfy "Not so Dusty" that to have full knowledge of the behaviour and life of bitumens and asphalts is only to be acquired after, practically speaking, a lifetime's work.

His sneer at Mr. D. A. Sutherland, F.I.C., F.C.S., and several other of his remarks are not, in my opinion, in the best of taste, and I cannot see that anything would be gained by replying to any further such letters from your correspondent.—Yours, &c.,

ENGINEER.

June 3, 1914.

SOME RECENT PUBLICATIONS.*

SANITARY ENGINEERING. A practical manual of town drainage and sewage and refuse disposal. By Francis Wood, M.I.N.S.T.C.E., F.G.S. Price 8s. 6d. nett. London: Charles Griffin & Co., Limited.

This is the third edition of Mr. Wood's well-known book, and he has taken the opportunity to bring it up-to-date by dealing with a number of improvements and alterations which have been made in the design and construction of sewers, particularly in the application of concrete, also in destructors and the ventilation of sewers or oxygenation of sewage, together with a study of rain storms, and the volume and rate of discharge into sewers of rain water. As stated in connection with the first edition, this book is primarily intended for engineering students, but many engineers no doubt will find something of value in the matter included in this volume.

The various subjects treated, including hydraulics, house drainage, land drainage, the various systems of sewerage, sewer construction, ventilation, refuse disposal, and so forth, are dealt with in a very clear and simple manner, and this book should prove useful to many engineers who wish to have a handy means of reference to a work by an author who has had personal experience in the matters with which he deals.

The only criticism we have is that the subject of sewage disposal is not brought up-to-date. Several methods of treatment described in the book are now almost, if not entirely, obsolete. The Local Government Board's requirements, as set forth, are those which were in use prior to the publication of the Fifth Report of the Royal Commission on Sewage Disposal, and no mention whatever is made of the many developments, both in the preliminary treatment and filtration of sewage and in methods of sludge disposal, which have been brought out during the past few years.

The publishers of "Sell's Directory of Registered Telegraphic Addresses," that well-known and almost

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

indispensable reference book, have obtained official authority to publish the list of firms in Australia using registered cable addresses, and arrangements have been made for the names, together with the postal and cable addresses and other particulars, to appear in the next volume of the directory.

REFLECTING SIGNALS FOR TRAFFIC PURPOSES.

MR. WALTON MAUGHAN'S INVENTIONS.

After making a large number of experiments with the object of obtaining efficient reflecting signals, suitable for various purposes, Mr. Walton Maughan, whose name is known to our readers in connection with studies of road traffic, has embodied the results of his work in a number of devices for reflecting rays of artificial or natural light so as to locate and define stationary and moving objects. These devices are intended for use on roads and railways, and for docks and shipping, and, generally, wherever safety may be increased by defining the position or shape of a building or other object, or by erecting a signal which will convey definite information in a simple manner.

As regards the form of the device, it may be a tube (plain or lens fronted), a lens, bar, disc, or other shape; and the material of which it is made may be glass or polished or plated metal. These devices will be so made that, in the words of Mr. Maughan's patent specification, "the position and nature of any object, form, signal, or lettering can be ascertained in darkness or in defective daylight, by means of artificial light, or enhanced by sunshine or natural light, directed or deflected thereon, striking such forms of construction . . ."

The reflecting device may be solid or hollow, forming a transparent or translucent body or substance, which can be coated either inside or outside, and backed or filled with solid or liquid reflecting agents, either open to the air or sealed in vacuum. The object of the sealing in vacuum is to protect the reflecting agents from the destructive agents met with on roads and railways, and in marine work. Such reflectors may render safer any dark or dangerous places on a road, and reveal hidden dangers, acting either as signals or by outlining an object. The scope of these inventions is wider than that of ordinary direct reflection, and in suitable forms they are intended to be applied to the edges of wharves and station platforms, and the kerbing of roads at dangerous bends and corners. They may also be applied to staircases, doorways and gangways, so as to make the fullest use of defective daylight or artificial light.

In their application to road signs these devices may conveniently be in the form of straight or curved tubing, preferably lens-fronted, or small shapes of silvered glass, and can be adapted to the shapes of letters and numbers, for warning purposes, the numbering of houses, and so on. The inventor specially draws attention to the low cost of maintenance, which is "practically negligible," and to the permanence of the glass tubing with the silvering in a vacuum, and therefore protected from the atmosphere.

Bournemouth's New Drive.—Bournemouth's new undercliff drive and promenade were formally opened on Wednesday by the Earl and Countess of Malmesbury. The drive extends from Bournemouth Pier to Boscombe Pier, and cost £60,000.

Finchley Housing Scheme.—The Finchley Urban District Council have received a letter from the Local Government Board approving generally of their housing scheme. It is proposed to borrow £93,443 for the purchase of land on the Woodhouse Estate, North Finchley, and the erection of 300 dwellings, of which 240 are to be let at 8s. 6d. a week and 60 at 7s. 6d. The estate is to be laid out on town planning lines, and 5 acres are to be kept as an open space.

Liverpool Water Engineership.—Under the new age limit relating to the retirement of Liverpool Corporation officials on superannuation, Mr. Joseph Parry's occupancy of the position of city water engineer terminated at the end of May. He was succeeded on June 1st by Mr. J. R. Davidson, who for the past sixteen years has held the position of principal assistant engineer. Mr. Parry's connection with the corporation will not, however, be completely severed, as he is retained in a consultative capacity.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bristol T.C. (May 26th. Major J. Stewart).—£2,114 for purposes of street improvement; also for the approval of the transfer of certain consolidated stock, and the appropriation of the proceeds towards defraying the cost of the acquisition of a part of the Drill Hall, Queen's-road, for the extension of the Municipal Art Gallery.—It was explained by Mr. Williams, of the borough surveyor's department, that the proposed street improvements related to widenings in Bourneville-road, Whitehall, Old Market-street, Redcross-street, and other thoroughfares.

Crompton U.D.C. (May 21st. Mr. F. H. Tulloch).—£1,500 for completing the laying out of Dun Wood Park, including the construction of an approach road from Milnrow-road and of a bridge over the river Beal, and of £4,012 for the provision of a refuse destructor and steam disinfecter in Limey-lane, including the execution of certain works of sewerage.—The proposed loan for Dun Wood Park, it was explained by the surveyor, Mr. F. F. Gartside, was on account of excess expenditure for necessary works. The dust destructor, he stated, would consist of a two-cell plant, with room for a third cell to be installed when requisite.

Newton Abbot R.D.C. (May 27th. Mr. H. A. Chapman).—£3,000 for a housing scheme at Cludleigh, where it is proposed to erect two blocks of six cottages each.—The architect, Mr. S. Segar, stated that the ground floor would consist of large living-room and scullery, with three bedrooms upstairs.

Norton R.D.C. (May 26th. Mr. W. M. Cross).—£1,432 for the purpose of providing a water supply for Westow township.—Mr. G. S. Cattle, clerk, said the present water supply was mainly from wells, and was in many cases unsuitable, and the water was often polluted. The council had considered various schemes for supplying this Wold village. A gravitation scheme had now been formulated, an adequate supply of water having been secured from springs at Mount Farrant. A lease of ninety-nine years had been granted at a rent of £15 per annum, which included $\frac{1}{4}$ acre of land on which to erect a reservoir. The springs had been tested to supply 3,888 gallons in twenty-four hours. It was proposed to spread the cost of the scheme over thirty years, and a rate of 2s. in the £ on houses and 6d. in the £ on land would be necessary.

Plympton R.D.C. (May 19th. Mr. F. O. Stanford).—£2,510 for sewerage and sewage disposal for the parish of Plymstock.—It was stated that at present a portion of the village of Plymstock was drained into a cesspit. The old sewers were to be connected up with the proposed scheme. The discharge into the cesspit at present had no outfall, and was unsatisfactory. Their new scheme would tap the whole of the houses in the village.

St. Helens T.C. (May 28th. Major C. E. Norton).—£42,191 for the gas undertaking.—The town clerk, Mr. W. H. Andrew, stated that the proposal of the Gas Committee was to put up sixty-four of the Glover-West vertical retorts in place of the 168 old horizontal retorts, which would bring the capacity of the works to 3,500,000 cub. ft. per day. The new system would enable the corporation to increase the make of gas per ton of coal, and increase the economical working of the undertaking. The demand for gas was increasing, being 392,000,000 cub. ft. in 1904, and 555,000,000 cub. ft. last year. Mr. S. Glover, gas manager, and inventor of the new style of retorts, produced plans, and offered the necessary explanations.

Scarborough T.C. (May 26th. Mr. Edgar Dudley).—£368 for the purchase of certain land forming part of Columbus Ravine, and £1,125 for the purchase of property in Low Conduit-street, Coverley's-court, and St. Mary's-street, for the widening and improving of Low Conduit-street.—The first-named sum, the town clerk, Mr. Sidney Jones, explained, is needed to complete the Columbus Ravine improvement, which connects the North-west Ward with the north side, and the other improvement will give better access to Princess-street in the East Ward, and remove an insanitary area.

Sleaford R.D.C. (May 29th. Mr. W. M. Cross).—For the purposes of a water supply scheme—viz., Evedon, £346; Ewerby, £1,100; Haverholme Priory,

£467; and Kirkby Laythorpe, £246.—The parish of Kirkby objected to inclusion in the scheme, and to the apportionment of the cost of the works. The clerk, Mr. C. E. Clements, stated that the council had made terms with Lord Winchelsea for a supply of water from his bore at Evedon, and the cost had been fairly apportioned over the four parishes.

Todmorden T.C. (May 20th. Mr. F. H. Tulloch).—£1,650 for the purchase of a motor fire engine and motor ambulance.—The town clerk, Mr. H. Garrett, stated that the proposed new fire engine was to be of 75-horse power, and would cost £1,150. It would be much more powerful than the present horse-drawn engine. The horse-drawn ambulance, the town clerk added, had been found to be too slow a method for conveying patients to accident hospitals at Halifax, Manchester, and other surrounding towns.

Wigton U.D.C. (May 19th. Mr. R. H. Bicknell).—£550 for works of street improvement in Longthwaite-road, George-street, Union-street, and Station-hill, and £310 for the extension of the water mains to Brookfield, and along Cemetery-road.—With respect to the proposed paving, the inspector stated that the Local Government Board did not sanction a loan for this kind of work for so long a period as twenty years. It would probably be for five years. He asked if it would not be worth their while to consider the question of using concrete slabs from either Shap or Threlkeld. He did not think they would cost more than 3s. 2d. a yard. Slabs were easily lifted if they wanted to get at a gas pipe, whereas concrete was not satisfactory after it had been once broken. It occurred to him that it was hardly worth while borrowing for a period of five years, but that was the time they would get for the £225 if they wished to continue it. With regard to the kerbing and channelling, they would get a longer period. He did not like concrete channels himself. The surveyor, Mr. J. J. Davison said they found that concrete was better than Lazonby kerb. In reply to the inspector, Mr. Davison said that along crossings they intended to put whinstone cube setts for the wheels of carts, &c. Between gratings and doorsteps they proposed to put cobbles. The inspector said that the Local Government Board had not got a period for cobble paving. It was forgotten about 300 years ago. With reference to the water mains, the surveyor said they would be laid with a 3-ft. cover.

APPLICATIONS FOR LOANS.

Beaconsfield U.D.C.—£9,600 for the erection of forty houses.

Isle of Wight R.D.C.—£1,620 for a recreation ground.

Lincoln T.C.—£9,680, excess expenditure in respect of the construction of the Bracebridge Heath reservoir.

Llandudno U.D.C.—£750, contribution to the Colwyn Bay through road scheme.

Maidenhead T.C.—£3,000 for a depot and stables.

Malvern U.D.C.—£1,600 for the electricity undertaking.

Padstow U.D.C.—£2,000 for the erection of eight cottages.

Rowley Regis U.D.C.—£1,130 for the purchase of a school site.

Southampton T.C.—£5,000 for water supply works.

Southgate U.D.C.—£40,000 for the provision of 160 workmen's houses; £1,800 for an underground convenience.

Staines U.D.C.—£310 for sewerage works.

Sunderland T.C.—£8,000 for building a training college.

Swanage U.D.C.—£7,500 for the purchase of a site for a recreation ground.

Uxbridge U.D.C.—£7,000 for the provision of twenty-eight workmen's dwellings.

Wolstanton U.D.C.—£1,000 for the purchase of a site for municipal offices.

LOANS SANCTIONED.

Axminster R.D.C.—£11,000 for works of sewerage and sewage disposal.

Bandon R.D.C.—£1,500 for the provision of dwellings.

Bromley (Kent) R.D.C.—£2,046 for a housing scheme.

Castleford U.D.C.—£1,463 for road widening.

Cheadle R.D.C.—£1,900 for water supply works.
Chiswick U.D.C.—£1,140 for road widening.
Finchley U.D.C.—£1,197 for the purchase of land for open spaces.
Middlesbrough T.C.—£10,240 for laying out a recreation ground.
Stirling T.C.—£14,000 for the St. Mary's-Wynd improvement.

TOWN PLANNING.	
16.— Edmonton. (Mr. Thomas Adams) ...	—

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council of the Institution of Municipal Engineers held in London on May 27th, the following applicants were recommended for admission:—

To Membership: Messrs. Thomas A. Prince, consulting highway surveyor, Leeds; W. Murdoch, city engineer, St. Johns, N.B.; L. E. Allen, engineer, County of Hastings, Ontario; E. C. A. Hanson, city electrical engineer, Saskatoon; Geo. D. Weaver, city engineer, Melfort, Saskatoon; A. W. E. Fawkes, waterworks engineer, city of Calgary, Alberta; and G. N. Hatfield, road engineer, City of St. John, N.B.

Transfer to Membership: Mr. H. W. Lovelock, assistant surveyor, Godstone Rural District Council.

Transfer to Associate Membership: Messrs. J. A. S. Menezes, assistant engineer, Public Works Department, Deccan Irrigation; H. P. Cocks, assistant surveyor, Horbury Urban District Council; D. Barton, assistant surveyor, Cheadle and Gatley Urban District Council; and W. J. Powell, surveying assistant, Birmingham Corporation electricity supply.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

To Studentship: Mr. Hassan Foad, University College, London.

New Members, &c.—From the applicants recommended for admission at the last meeting two members were elected, and one associate member was transferred to membership.

Nominations for Council.—Nominations for ordinary members of council must now be deposited with the secretary by June 20th in each year. Nomination forms may be obtained on application.

Badge for Members.—Estimates for the supply of members' badges were considered, and the secretary was instructed to write to the district secretaries with a view to obtaining some idea as to the number of badges that should be ordered, for supply to members at a cost not exceeding 1s. each.

Defence Fund.—The question of appointing trustees for the administration of this fund was considered, and it was decided to defer the matter pending the result of certain inquiries which the secretary was instructed to institute. The opinion of the solicitors of the institution on the cases mentioned in the report of the April council meeting was before the meeting, and the secretary was instructed to convey such opinion to the members interested.

The next meeting of the council will be held at Manchester, on Saturday July 4th.

The Holsworthy Surveyor's Report.—The report of Mr. Frank J. Harris, surveyor to the Holsworthy, Devon, Rural District Council, to which attention was directed in our "Minutes of Proceedings" of last week, has been duly presented to the members of that body. It will be recalled that in the document in question Mr. Harris set forth in very plain fashion the administrative difficulties of the position he occupies, and concluded his observations by asking the council for a testimonial to enable him to apply for a more lucrative and certain appointment. At present, for the superintendence of the very considerable mileage of roads in his charge, although he is allowed no travelling expenses, no assistant, neither clerical assistance nor office accommodation, and not even a foreman, he is paid an annual salary of only £140. Mr. Harris' courageous attitude is, however, we are glad to learn, likely to result in an improvement of the conditions under which he is working, for the district council have decided that a committee shall consider the various points raised in his report. One member said he thought Mr. Harris deserved their sincere thanks for his statement, adding that they ought to do the best they could to help him, and that if he were not sufficiently paid his salary ought to be increased. The chairman, Mr. M. Yeo, was equally complimentary, remarking that there was no doubt Mr. Harris was "one of the best surveyors they had had."

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Birkenhead £13,000, Hull £91,000, Wilts; housing and town planning—Salford; roads and materials—Cheshire, Haddington, Winchester; sewerage and sewage disposal—Birmingham £33,000, Burton-on-Trent £30,000; water, gas and electricity—Newton Abbot.—Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Birkenhead T.C.—It has been agreed to carry out an extension of the Holt technical school, at an estimated cost of £13,000.

Gillingham T.C.—A scheme has been approved for the erection of public swimming baths, at an estimated cost of £3,500.

Glossop T.C.—A committee has received authority to prepare a scheme for the provision of public conveniences.

Howden R.D.C. A new isolation hospital is to be built at a cost of £3,500.

Hull T.C.—The council have approved a scheme prepared by the borough engineer, Mr. A. E. White, for the widening of the North Bridge and its immediate approaches, at an estimated cost of £91,000.

Maidenhead T.C.—The council have approved the plans of the borough surveyor, Mr. P. Johns, for new stables and a depot upon land adjoining the electric light works, at an estimated cost of £5,000.

Motherwell T.C.—A new pavilion affording accommodation for twenty-seven additional beds is to be added to the council's hospital, at an estimated cost of £4,500.

Padiham U.D.C.—The surveyor, Mr. John Gregson, has received instructions to prepare an estimate for a public mortuary.

Penzance T.C.—The tender of Messrs. N. Holman & Sons, Limited, at £363, has been accepted for the ironwork, and the tender of Mr. I. W. Legg, at £405, for decking, in connection with the scheme for repairing the Ross swing bridge on the quay.

Stoke Newington B.C.—The Town Hall Committee have submitted plans of a proposed scheme for the provision of private offices for the town clerk and the surveyor, an improved drawing office, storage accommodation, and a committee-room.

Tynemouth T.C.—The council last week adopted a report from the Town Improvement Committee in reference to the restoration of the seabanks at Tynemouth which were destroyed by a landslip eighteen months ago. The report embraced a scheme for the restoration of the highway near Percy-garden, and the improvement of the section of the seabanks adjoining, the work to be done upon the Hembique ferro-concrete system. It was decided, subject to certain conditions and stipulations arranged and provisionally agreed to, to accept the tender of Mr. R. Fisher, at £6,600, for section I, and the tender of Mr. W. T. Weir, at £2,729, for the other work. It was further agreed that the borough surveyor, Mr. J. F. Smillie, should be instructed to prepare working drawings and estimates, and obtain tenders for that portion of the whole scheme for protecting and improving the seabank from the works already proposed to the north of Sharpness Point.

Wilts C.C.—The tender of Messrs. Mussellwhite & Son, Basingstoke, at £27,172, has been accepted for the building of the new blocks at the county asylum.

HOUSING AND TOWN PLANNING.

East Cowes U.D.C.—A proposal is to be discussed for the erection of thirty cottages, at a cost of £225 each.

Hoyland U.D.C.—A scheme is under consideration for the erection of fifty workmen's dwellings.

Kendal T.C.—The council at their last meeting accepted an offer by Lord Henry Bentinck of 2 acres of land known as Two Stiles Field for the municipal housing scheme. It was explained that the price of the land was £170, this being the agricultural value

merely. Lord Henry placed the condition upon the sale of the land that the houses to be built by the corporation should be let at rents not exceeding 8s. per week, inclusive of rates. The borough surveyor, Mr. F. W. Oxberry, stated that the houses would pay for themselves.

Liskeard R.D.C. The Local Government Board is to be asked for sanction to borrow the necessary money for the erection of workmen's cottages at Morval and Bosconoc.

North Dublin R.D.C.—Official sanction has been received to a scheme for the erection of 107 workmen's cottages.

Salford T.C.—The Building and Bridges Committee have issued a report on a proposed application to the Local Government Board in respect of a town planning scheme for the town. A survey and inspection of the borough made in 1910 disclosed that more than 2,000 acres of land were then available for building purposes, and in 1913 the Building Committee decided upon the areas suitable for inclusion in a town planning scheme. The owners of the largest areas have expressed their willingness to co-operate. At a meeting of the committee on May 22nd last a resolution was passed that the council be recommended to ask for authority to prepare the scheme, and thus empower them to give the statutory notices to the adjoining local authorities and all persons owning land within the scheme.

Wallasey T.C.—The Local Government Board have decided to grant the application of the council to prepare a town planning scheme in Penkett-road. The Works Committee recommend the council to issue the necessary notices of their intention to apply for a town planning scheme in connection with the remaining undeveloped areas in the borough.

ROADS AND MATERIALS.

Axminster R.D.C.—The surveyor, Mr. G. A. Millard, has received instructions to prepare plans and specifications, and invite tenders for road improvement works at Axmouth.

Cambs C.C.—The question of providing motor cycles for the three road foremen has been referred for consideration to the Roads and Bridges Committee.

Chelmsford T.C.—Various road improvement schemes have been agreed to, including the wood-paving of part of Duke-street, at an estimated cost of £2,300, subject to a grant being received from the county council and the Road Board.

Cheshire C.C.—The Road Board have sanctioned a grant of £12,000 towards the cost of surfacing various roads with granite coated with Tarvia. The total estimated cost of the work is £42,364. A grant of £6,000 has also been made by the Road Board towards tar-dressing work, estimated to cost £15,065.

Croydon T.C.—Improvements are to be carried out in Shirley-road, at an estimated cost of £275.

Dorset C.C.—The county surveyor, Mr. W. T. Fletcher, has submitted to the council a report on the organisation of road labour in the Southern district, showing an economy for the year ending March 31st compared with the cost of the year before. After certain deductions, the cost of manual labour came to £646, as against £703 for the same services for 1912-13. Yarding flint also showed a saving of £39. Compared with the other districts at per mile, the South district manual labour works out at the lowest rate: North district, cost per mile, £10 13s.; South £8 18s.; East, £10 6s.; and West, £9 10s. Besides the question of cost, the South district now has twenty-three men who have worked together for a year, and have carried out their various works under methods which are practically the same all over the district, and in consequence the standard of work has considerably improved. All material is more evenly and economically spread than elsewhere in the county.

East Ham T.C.—It has been decided to carry out widening and improvement schemes, at an estimated cost of £2,492.

Haddington C.C.—The Western District Committee have agreed to purchase road-making plant at an estimated cost of £2,947, for the improvement chiefly of the Great Post road.

Helston R.D.C.—A proposal for the repair of the Helston to St. Keverne road, for a distance of 8 miles, at an estimated cost of nearly £1,000, has been referred to committee.

Kent C.C.—The council recently gave authority for the purchase of six 600-gallon tar boilers at £70 each, and six sand dryers at £57 10s. each, for pitch-grouting work; also two 80-gallon tar boilers at £16 10s. each.

Maidenhead T.C.—Braywick-road is to be repaired at an estimated cost of £2,500, a loan for this sum having been granted by the Road Board.

Mansfield T.C.—The council have adopted provisionally a scheme for the construction of a road from Pelham-street to Toothill-lane. The Duke of Portland has promised to give the necessary land, and it is proposed to build a bridge over the Maun and make the road. A considerable hollow will have to be filled up, and this will for the time being form a tip in a central position for the corporation.

Paddington B.C.—A sum of £2,750 is to be spent in improving the gradients of the bridge over the Grand Junction Canal at Great Western-road.

Wilkesden U.D.C.—A scheme has been approved for the widening of High-street, Harlesden, and Station-road, at an estimated cost of £6,250, the cost to be borne by the urban district and the Middlesex County Council.

Winchester R.D.C.—The county council have approved a scheme of the rural district council to lay wood paving on the Winchester and Southampton main road at St. Cross. It is proposed to lay sectional Jarrah blocks on 6-in. beds of concrete from Stanmore-lane in a southerly direction for a distance of 388 yds., and the estimated cost is £3,000.

SEWERAGE AND SEWAGE DISPOSAL.

Birmingham T.C.—It has been found necessary to provide a main valley sewer to meet the needs of the Erdington district, and the Public Works Committee recommend that this be done at an estimated cost of £33,000.

Burton-on-Trent T.C.—A scheme has been adopted for duplicating the rising main at the sewage farm, at an estimated cost of £30,000.

Hoyland U.D.C.—Extensions are to be effected at the sewage disposal works, at an estimated cost of £1,344.

Liskeard R.D.C.—New sewers are to be constructed at Pelynt, at an estimated cost of £966.

Nuneaton R.D.C.—The Local Government Board have sanctioned a sewerage scheme for Arley, at a cost of nearly £3,000. The area of the outfall site is 3 acres, and effluent will pass over the land before finding its way into the stream.

Ulverston U.D.C.—Consideration is being given to a proposed sewerage scheme for Sontergate, which is estimated to cost £700.

WATER, GAS, AND ELECTRICITY.

Ashton T.C.—The Baths Committee are considering the question of installing a system of filtration in connection with the water used in the public baths.

Audley U.D.C.—The question of making considerable alterations and extensions at the gasworks has been referred to the Gas Committee.

Bolton T.C.—The Waterworks Committee have instructed the waterworks engineer to prepare plans, specifications and bills of quantities for the construction of reservoirs at Eagley and Hordern. It is the intention of the committee to proceed with the construction of two reservoirs as quickly as possible, and they are to be completed by 1923.

Chester T.C.—It was decided last week to take steps to purchase the local waterworks undertaking from a private company.

Haverfordwest T.C.—The surveyor, Mr. W. Bevan, has been instructed to prepare an estimate of the cost of an extension of the water main to Merlin's Bridge.

Hereford T.C.—It is stated that the prospects of the electricity undertaking are now assured. Last year there was a surplus of £106, as against a deficit in the year before. A scheme is proposed for extending the machinery at a cost of £530, building a new chimney at £500, and constructing new mains at a cost of £240.

Lincoln T.C.—The nett profit earned by the electricity undertaking last year was £2,715.

Newton Abbot R.D.C.—The council have referred to the parish council a report on the experimental operations recently carried out for the improvement of the Bovey Tracey water supply. The works were carried out in the vicinity of Yarrer, and the results showed that, making liberal deduction for the usual dry season, and allowing only 12,500 gallons per day as the available yield of the existing source, there would be an average of 68,000 gallons per day available over a period of five months, which left 7,000 gallons per day to be drawn from the storage, to make up 75,000 gallons per day required. The amount drawn from storage would be 850,000 gallons, leaving a balance of 2,000,000 gallons for contingencies. The water from the adits was of unquestionable purity, and the analysis was satisfactory. The only point about which there might be some question before the Local Government Board was any action which the water might have upon metals. The estimate of the cost was £2,679.

Ulverston U.D.C.—It has been decided to proceed with a water supply scheme at Head Craggs, at an estimated cost of £665.

Ware U.D.C.—Messrs. Blake & Scott, of 5 Victoria-street, Westminster, have received instructions to enquire into and report upon the water supply of the town.

Wigan T.C.—The profits on the gas undertaking last year were £9,708, including the cost of street lighting, which amounted to £5,600.

MISCELLANEOUS.

West Bromwich T.C.—After charging interest on loans and sinking fund instalment, the nett profit of the working of the tramway undertaking last year amounted to £261.

PERSONAL.

Mr. W. Moore, assistant to the city surveyor of Hereford, has received an increase of salary.

Mr. George Faulds, assistant surveyor to the Earby Urban District Council, has received an increase of salary.

Mr. Leonard Tait, of Morpeth, has been appointed surveyor and sanitary inspector to the Norton (Yorks) Urban District Council.

Mr. W. H. Jukes, surveyor to the Tipton Urban District Council, has received an increased salary of £30, making £250 per annum.

Mr. A. T. Williams, a member of the surveyor's staff, has been appointed assistant surveyor to the Bridgewater Rural District Council.

Mr. T. Waddington, surveyor to the Hebden Bridge Urban District Council, has resigned with a view to commencing practice at Grimsby.

Mr. W. Fawcett Wilkins, borough surveyor of Dunstable, has been installed Master of the Cordwainer Ward Lodge of Freemasons, No. 2,241.

Mr. H. Leadbetter, of the Rotherham borough surveyor's office, has been appointed senior draughtsman to the Wood Green Urban District Council.

Mr. W. A. Harrison, assistant surveyor to the Long Eaton Urban District, has resigned his position to take up a Government appointment in Ceylon.

Mr. C. G. Bradley, surveyor to the Goole Urban District Council, has been appointed borough surveyor of Bridlington, at a salary of £275, rising by annual increments of £25 to £350 per annum.

Mr. A. Dunning, surveyor to the Wigmore Rural District Council, has had his salary raised from £170 to £200 a year, the council at the same time complimenting him on the excellent condition of the roads in his district.

Mr. J. Haller, surveyor to the Carlton Urban District Council, who has been appointed chief engineering assistant to the Notts county surveyor, was on Saturday presented with a framed photograph of the members of the fire brigade, and a handbag from the general workmen of the Carlton Council, a necklet for his little daughter, from the fire brigade, a gold sovereign purse from "a few old friends at Carlton," and a ten years' service medal from the National Fire Brigades' Union.

Mr. Prevost Hubbard, ASSOC. AM. SOC. C. E., in charge Division of Roads and Pavements, the Institute of Industrial Research, Washington, and Lecturer in Highway Engineering Chemistry at Columbia University, and Mr. Arthur H. Blanchard, M. AM. SOC. C. E., consulting highway engineer, and Professor in Charge of the Graduate Course in Highway Engineering at Columbia University, have been elected by the council of the International Association for Testing Materials the American members of Commission No. 58 on Standardisation of Methods of Testing and Nomenclature of Road and Paving Materials.

DEATH OF MR. A. M. FOWLER.

PAST-PRESIDENT OF THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

We regret to announce the death, which occurred on Tuesday at his residence at Ascot, of Mr. Alfred M. Fowler, M. INST. C. E., who was president of the Institution of Municipal and County Engineers from 1894-5, his membership of that body dating back to its formation in 1873.

Mr. Fowler was eighty years of age, but until a fortnight ago was in attendance at his office in St. Peter's-square. A very energetic man, Mr. Fowler got through a tremendous amount of work and frequently travelled in one day between his offices in London and Manchester and on to Colwyn Bay. He carried on many important engineering undertakings in various parts of Great Britain, and at the time of his death he had in hand big contracts in Windsor and Staffordshire.

Mr. Fowler was appointed borough engineer of Salford in October, 1872. Previously he had occupied a similar post at Leeds. In 1877 he became borough engineer at Newcastle-on-Tyne. For many years he had been in private practice.

Metropolitan Water Board's New Offices.—The Metropolitan Water Board have adopted the design of Mr. H. Austin Hall, of Messrs. Warwick & Hall, architects, of South-square, Gray's Inn-road, for the erection of the new central offices of the board. The assessor to the board reported that the buildings could be erected for £90,000.

Assistant County Surveyorship of Cheshire.—The Main Roads Committee of the Cheshire County Council have appointed Mr. G. E. Ashforth, ASSOC. M. INST. C. E., chief assistant surveyor and engineer to the Durham County Council, to the office of assistant county surveyor and bridgmaster of Cheshire, at a commencing salary of £350 with travelling expenses.

A Roadmender's Letter.—Roadmenders in the employ of Guildford Rural District Council sent a petition to the council for higher wages and shorter hours. A roadman, Mr. T. R. Daly, who did not sign the petition, sent a letter which came before the council yesterday. He wrote: "Our troubles are primarily due to a colourless compulsory education and certain Acts of Parliament which promise the worker a 'new heaven and a new earth,' with 'rare and refreshing fruit' which would act as the balm of Gilead to soothe his parched lips, and that there would be 'no more complaining in our streets.' But, alas! the workman has found those promises illusory—'sounding brass and a tinkling cymbal'—and that he is taxed indirectly to pay for their administration."

FOR OTHER ADVERTISEMENTS

See End of Paper.

ROAD FOREMAN seeks re-engagement to Council or Contractor. Thoroughly experienced in road construction, tar-painting, tar-grouting, and laying tarmac; capable of taking jobs through; 10 years' references, five years as foreman; total abstainer, age 36.—Box 1,429, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,678)

WANTED, immediately, few Engineers for pipe laying and street work, chiefly in towns, and preferably with experience of contractors' work. Apply, with copies of testimonials, and state salary required, to British Insulated and Helsby Cables, Limited, Prescot, Lanes. (1,677)

WATFORD URBAN DISTRICT COUNCIL.

WATERWORKS.

CONTRACT NO. 10, PUMPING STATION.

The Watford Urban District Council is prepared to receive Tenders for the Erection of a Pumping Station, including Engine-house, Basement, Machine Shop, Boiler-house, Coal Store, Filter-house, Lime Store and Softening Tank.

Persons desirous of Contracting for the work may see the Plans, Specification, and Conditions of Contract upon application to the Engineer, Mr. D. Waterhouse, Council Offices, High-street, Watford.

The Schedule of Quantities, Specification and Form of Tender may be obtained from the Engineer upon the payment of a deposit cheque of £10, payable to the Watford Urban District Council, which will only be returned upon the receipt of a *bona-fide* Tender and the Specification supplied to him.

Sealed Tenders and Schedule, addressed to the undersigned Clerk to the Council, endorsed "Waterworks Contract, No. 10," must be delivered under cover to me at Watford not later than noon on Monday, July 6th, 1914.

The Council does not bind itself to accept the lowest or any Tender.

W. HUDSON,
Clerk and Solicitor.

Council Offices,
14 High-street,
Watford.

URBAN DISTRICT OF FINCHLEY.

SEWAGE FILTERS.

The Council of the above-named District invites Tenders for the Construction of Four Clinker Sewage Filters, &c., at the Sewage Farm, Summers-lane, Finchley.

Plans may be seen, and Specification, Schedules, and Form of Tender obtained, on application to the Council's Engineer, Mr. C. J. Jenkin, M. INST. C. E., M. I. M. E., on payment of the sum of £2 2s., which will be returned on receipt of a *bona-fide* Tender for the whole of the Works, together with the fully-priced Schedule and the return of all papers supplied.

Sealed Tenders, endorsed "Tender for Filters," to be forwarded to the undersigned not later than 4 p.m. on Monday, the 22nd day of June, 1914.

The Council does not bind itself to accept the lowest or any Tender.

E. H. LISTER,
Clerk of the Council.

Council Offices,
Finchley, N.

June 3, 1914. (1,682)

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

Tenders are invited from Contractors for the execution of Foundation Works to certain roads within the County, consisting of excavation and supplying and laying hardcore at various depths.

Specification, Schedule of Prices, and Form of Tender can be obtained from the undersigned.

Tenders are to be delivered to the County Surveyor's Office at Chelmsford not later than Monday, June 15, 1914.

PERCY J. SHELDON, M. INST. C. E.,
County Surveyor.

County Surveyor's Office,
Chelmsford.

June 3, 1914. (1,679)

THE SEWAGE COMMITTEE of the CORPORATION of BURY are prepared to receive Tenders for the supply and erection of three Revolving Sprinklers at their Sewage Disposal Works, Bury.

Full particulars, Specifications, and Form of Tender can be had by intending contractors from Mr. Joshua Bolton, Sewage Works Manager, Bury, on and after June 10th, 1914.

Tenders, endorsed "Tender for Sprinklers," must be delivered at my office on or before Wednesday, June 17th, 1914.

JOHN HASLAM,
Town Clerk.

Corporation Offices,
Bury.

(1,681)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

SOUTHEAST MEETING.

The programme of the meeting of the institution to be held at Southend-on-Sea to-morrow, Saturday, June 6th, is as follows:—

- 11 a.m.—Members will assemble at the Palace Hotel. Reception by his Worship the Mayor (Alderman Joseph Francis, J.P.).
- 11.35 a.m.—Leave hotel to inspect the following works in course of construction: (a) Pier extensions (electric cars to pier head, kindly provided by the Pier Committee); (b) Esplanade improvement and sea wall; (c) large swimming bath.
- 1.30 p.m.—Lunch at the Palace Hotel by kind invitation of the Mayor.
- 2.15 p.m.—Discussion on paper by Mr. E. J. Elford, M.INST.C.E., on "The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea."
- 2.45 p.m.—Leave hotel to inspect the following works: (d) Reinforced-concrete loading pier; (e) tramway boulevard; (f) sewage disposal works.
- 4.45 p.m.—Tea on the site of the sewage works at the invitation of Mr. E. J. Elford, followed, if desired, by further discussion on paper.

J. A. WEBB,
Hon. District Secretary.

Great Stanmore.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

PROGRAMME.

- 11 a.m.—District executive meeting.
- 11.30 a.m.—District meeting.
Reception in the council chamber by the chairman of the council, Mr. Councillor J. Pearson, J.P.
District business.
Paper by Mr. Arthur J. Price, engineer and surveyor, on "The Municipal Works at Lytham," which will be taken as read.
Discussion.
- 1 p.m.—Lunch at Clifton Hotel.
- 2.15 p.m.—By the kindness of the Blackpool, St. Anne's, and Lytham Tramway Company, cars will be provided to enable the members to visit the West End outfall sewage works (in course of construction), the East End sewage and destructor works and slaughter-houses.
- 4.30 p.m.—Afternoon tea will be provided for the members at De Grey's Café.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

IRISH DISTRICT.

Mr. M. Sellars, hon. district secretary of the Irish District, is endeavouring to arrange for a two-days' District meeting in Cork towards the end of July, and the council appeal to English members to give this meeting strong support. Two dates are suggested—viz., July 17th and 18th, or July 24th and

25th, and it would be a convenience if English members would say which date would be preferable.

EASTERN DISTRICT.

An Eastern District meeting will be held at Bedford on June 20th, and one at Tilbury on July 25th.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

SOUTH-WESTERN DISTRICT.

A South-Western District meeting will be held at Tisbury, Wilts, on Saturday, June 13th.

PROGRAMME.

- 12.15 p.m.—Meet at the Victoria Hall. Short business meeting, at which will be presented a paper, "Wiltshire Roads: Past and Present," by E. Plummer Davies, engineer and surveyor, Tisbury Rural District Council (member).
- 1.15 p.m.—Luncheon.
- 2.40 p.m.—Proceed by motor cars and motor buses to the waterworks at Lawn.
To Fonthill Arch (by Inigo Jones).
To eight new cottages on Fonthill Hill.
To Little Ridge. Inspect extensive additions to the residence of Mr. Hugh Morrison, J.P., county alderman.
To Old Tithe Barn, Place Farm, Tisbury, one of the largest barns in England.
- 4.45 p.m.—Tea.

C. OWEN BAINES,
Hon. District Secretary

Paignton.

NORTH-WESTERN DISTRICT.

A meeting of this district, followed by a social evening, will be held at the Mitre Hotel, Manchester, on Friday, July 3rd. On the following day a visit will be paid to the waterworks of the corporation of Ashton-under-Lyne. Full programme will be issued later.

EASTERN AND NORTH-EASTERN DISTRICTS.

A visit will be paid by these districts of the institution, on Saturday, June 27th, to the quarries of the Enderby and Stoney Stanton Granite Company, Scarborough. Full programme will be issued later.

A meeting will be held at Newmarket in September, when visits will be paid to the municipal works of the town. Full programme will be issued later.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

WEST RIDING OF YORKSHIRE HIGHWAY SURVEYORS' ASSOCIATION.

A meeting will be held at Wetherby on Thursday, June 11th, when an inspection will be made of Mephafte grouting in progress on the Great North Road. Tea will be provided by the Anglo-Mexican Petroleum Products Company.

Meet at council offices, Wetherby, 3 p.m.

Will members please notify the hon. secretary of their intention to be present, so that the proper arrangements may be made for tea?

A. GORDON KILNER,
Hon. Secretary.

Council Offices,
Wetherby.

INSTITUTION OF WATER ENGINEERS.

SUMMER GENERAL MEETING.

The nineteenth summer general meeting will be held at Stockport on Thursday, Friday and Saturday, the 11th, 12th and 13th of June next, under the presidency of Mr Thomas Molyneux, Assoc.M.Inst.C.E., corporation waterworks engineer.

By kind permission of the mayor and corporation, the meetings will be held in the Town Hall, Stockport, and at the opening of the proceedings on Thursday the institution will be welcomed to Stockport by his Worship the Mayor (Councillor Thomas Worthington Potts, J.P.).

Ladies will be cordially welcomed at the meetings and visits, and all official functions except the annual dinner.

The programme will include the presentation of premiums awarded by the council for papers presented during the year 1913.

PAPERS AND COMMUNICATIONS.

The following papers have been promised for reading and discussion at this meeting, and advance copies will be sent out as soon as printed to members who signify their intention of attending the meeting, also, so far as the stock will allow, to those who, being unable to attend the meeting, are anxious to assist in the discussion by correspondence:—

- (1) "The Character of Mechanically Filtered Water," by Prof. Sheridan Delépine, of the University of Manchester.
- (2) "The Aëration and Filtration of Water for Swimming Baths," by L. Holme Lewis, M.I.MECH.E. (member).
- (3) "Notes on Scraping a 15-in. Water Main," by J. S. Barrowclough (member).

A lecture, entitled "The Geological Structure of the Stockport District," will be delivered by Prof. George Hickling, D.Sc., of the University of Manchester.

The president-elect (Mr. Thomas Molyneux) will deliver his presidential address on Thursday, June 11th, and will also supply a description of the Stockport waterworks, with map of the district of supply, which will be circulated among those present at the meeting.

VISITS TO WORKS.

On Thursday afternoon, June 11th, starting from the Town Hall, Stockport, visits will be made to the Wilmslow pumping station and softening works, and to the Alderley balancing reservoir (reinforced concrete, under construction), where afternoon tea will be provided by the president and Mrs. Molyneux.

On Friday, June 12th, starting from the Midland Hotel, Manchester, at 10 a.m., visits will be made to the recently completed Kinder reservoir and filtration plant, where lunch will be provided by the corporation of Stockport, and to the Lyme Park reservoirs; also to the works of Messrs. Mirrlees, Bickerton & Day, Limited, Hazel Grove (Diesel oil engines under construction), where afternoon tea will be provided.

On Saturday afternoon, June 13th, members will be free to visit the Colliery Exhibition or the Victoria Park Baths (at the latter will be seen an installation for filtering the water used in the swimming baths).

SOCIAL FUNCTIONS.

The annual dinner will be held at the Midland Hotel, Manchester, on Thursday evening, June 11th, when the Mayor of Stockport, the Lord Mayor of Manchester, and other distinguished guests will be entertained by the institution.

In addition to the luncheon provided on Friday at the Kinder works, the corporation of Stockport will entertain the members at luncheon on Thursday, June 11, at the Town Hall Stockport.

The committee of the Manchester Engineers Club have kindly offered to elect the members attending the meeting as hon. members of the club during the three days of the meeting. Admission on presentation of programme card.)

PERCY GRIFFITH,
Secretary.

20 Victoria-street, S.W.

APPOINTMENTS WANTED.

PREPAID Advertisements under this heading are inserted at the rate of ONE PENNY per word, with a minimum charge of 2s. THREE consecutive insertions given for the price of TWO.

ASSISTANT desires appointment in Urban or Rural Surveyor's Office. Good experience in building, surveying, levelling, and road making. Moderate salary.—Box 1,428, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,675)

(Continued on p. xxvi.)

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

ENGINEERING ASSISTANT TO THE COUNTY SURVEYOR.

Applications are invited for the appointment of an outdoor Engineering Assistant on the staff of the County Surveyor. Candidates must be specially qualified to superintend the mixing and laying of bituminous macadam, either in asphalt or tar, whether by contract or direct labour; to be fully conversant with all the latest and most approved systems of wood and

stone paving, and to be responsible to the County Surveyor for the organisation and control of a large outdoor staff of workmen of every description connected with the modern construction of highways.

Salary, £400 per annum, payable quarterly, with travelling allowance of £100 per annum.

Age not to exceed 40.

The appointment will be subject to three months' notice given or received. No superannuation or pension is attached to the appointment.

A medical examination will be a condition precedent to any appointment.

Only those persons should apply who have had practical experience in the manufacture of bituminous macadam on a fairly large scale, and if not now so engaged must satisfy the Council that during the past twelve months they have been so engaged.

The name of the candidate selected will be submitted to the Road Board for their approval.

Applications, with copies of not more than three recent testimonials, both as to ability and character, to be received at the office of the County Surveyor, Chelmsford, not later than Friday, the 12th inst.

PERCY J. SHELDON, M.INST.C.E.

County Surveyor.

Chelmsford.

June 2, 1914.

(1,676)

SURVEYOR'S CLERK.

The Axminster Rural District Council require the services of a Clerk in the Surveyor's Office. Applicants must have had previous experience in a Surveyor's office, be quick and accurate at accounts, able to make neat tracings, and be willing and able to assist outdoors if required. Salary £52 to £65 per annum, according to ability.

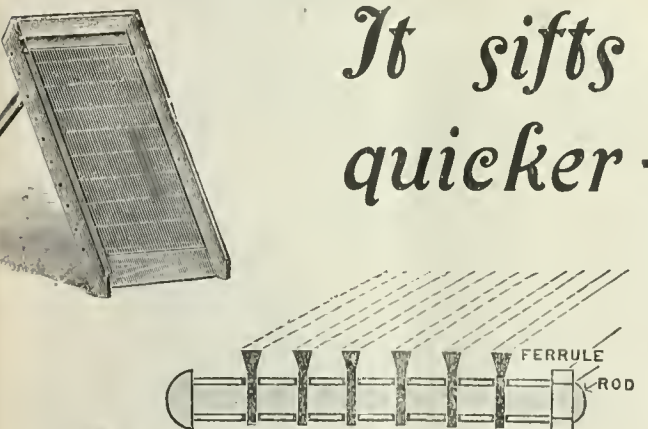

Applications, stating age and experience, accompanied by copies of not more than three testimonials, to be sent to the undersigned not later than June 13th, 1914.

GEO. A. MILLARD,

District Surveyor.

Axminster.

(1,673)

It sifts quicker

Because the steel blades cut and do not become clogged like the wires of the ordinary screen. As the sand or other material slides down, the sharp edges of the blades cut up the lumps. Once past the cutting edge, there is a clear drop. Actual tests have proved that

The Excelsior Patent Screen

will do as much work in 6 hours as an ordinary wire screen can do in 10. Used by Government and other leading contractors. It lasts longer and soon saves its cost.

Minutes of Proceedings.

Sewage Disposal at Southend-on-Sea.

The possibilities of purifying sewage by dilution in large bodies of water have been investigated with great care, both in this country and abroad, during recent years, and the results of these investigations, particularly those recorded in the Eighth Report, with Appendix, of the Royal Commission on Sewage Disposal, demonstrate that, where the diluting water is of sufficient volume and contains sufficient dissolved oxygen, and the sewage is treated in such a manner as to remove the greater portion of the suspended solids, it can be satisfactorily purified without creating a nuisance. An excellent example of this method of sewage disposal exists in the case of the discharge into the Thames of the London sewage, all evidence of which has disappeared in the river at Southend-on-Sea, and it would certainly seem that disposal by dilution in the case of the latter much smaller town would have fulfilled all possible requirements, bearing in mind the enormous volume of diluting water available. This was the opinion of the borough engineer of Southend-on-Sea, Mr. E. J. Elford, M.A.S.T.C.E., as set forth in the extremely interesting and valuable paper which he read at the meeting of the Institution of Municipal and County Engineers held in his town last Saturday, and which we print in a special supplement to this issue. In spite of this, however, the town has been compelled to construct works of such elaborate and expensive character that they would suffice for any inland town having only a small stream to receive the final effluent, and, as stated by Mr. J. D. Watson in the course of the discussion upon the paper, the town of Southend might claim that no other seaside place purified its sewage to such a degree before it was discharged into the sea.

It will be seen from a perusal of Mr. Elford's admirable paper that a number of unusual engineering difficulties were encountered and successfully overcome, and several new devices and methods of construction were adopted. The details of the scheme are thus very interesting, and are worthy of careful study. On the other hand, it would be very unfortunate if other seaside towns should be compelled to follow the example set by Southend, and have to incur such enormous expenditure, much of which, in the light of present-day knowledge, is altogether unnecessary. The remarks made upon this point, and upon the question of a fixed standard for effluents, by Mr. Watson, in the course of the discussion upon the paper, were interesting and very much to the point, and we believe the views he expressed will receive the

support of all municipal engineers. We shall be glad to see the report of the Committee of the Association of Municipal Corporations, referred to by Mr. Watson, and to learn the reasons which they put forward to show the impossibility and inadvisability of making a statutory standard for sewage effluents. These reasons will undoubtedly confirm the recommendations of the Royal Commission with regard to the question of standards, and the need for a central authority with powers to decide upon the degree of purity required in effluents. We have on many occasions urged the importance of giving early effect to the recommendations of the Royal Commission by a new Act of Parliament, and we would suggest that the Association of Municipal Corporations might usefully devote its energies and influence to persuading the Government to bring in without fail in the next Session of Parliament a Bill to deal with this matter.

With regard to the details of Mr. Elford's scheme, we are specially interested in the straining and roughing filters arranged between the silt tanks and the percolating filters. Bearing in mind the area and depth of the percolating filters, the size of the filtering medium, and the capacity of the humus tanks, we should have thought that the roughing filters would not be needed, and we shall be much interested to learn in due course the results obtained with and without the roughing filters. On the other hand, the method adopted for the cleansing of these filters includes an arrangement for blowing air through the gravel of which the filters are composed, and we would suggest that this might be used not only for cleansing purposes, but for aerating the tank liquor on the lines of the latest developments which have been under investigation in America and at Winchester. We hope this opportunity for making a series of experiments on a practical working scale to ascertain the effects of aerating a settled sewage, and particularly the cost of the process, will be utilised, as a record of the results obtained would be of great value for comparison with the results which are being obtained elsewhere.

Water Engineers' New President.

Mr. Thomas Molyneux, the corporation water engineer of Stockport, who has just assumed office as president of the Institution of Water Engineers, has been a member of the institution—and its predecessor the old association—since the first year of its existence. His election to the presidency is therefore peculiarly appropriate, and

it was also fitting that he should devote the first part of his presidential address yesterday to a review of the progress of the institution since that time. In regard to the matters which are to the fore at present, Mr. Molyneux mentioned that a special committee of the council is still engaged on the standardisation of conditions of contract, and that, although the subject is one that requires very careful consideration and involves much labour, it is hoped that the report will be available at an early date. A committee has also under consideration the incidence of income tax as affecting waterworks undertakings, a subject which, as Mr. Molyneux observed, is perhaps more particularly interesting to those who are engineers of water companies, but which may also prove worthy of study by municipal water engineers. A third committee has been appointed to take into consideration the question of charges for domestic and trade supplies in the light of recent decisions in the law courts. The last of these questions is one of considerable importance both to water authorities and the public. The principle laid down by the Courts appears to be broadly that, in deciding whether any given supply is domestic, regard must be had to the nature of the purpose for which it is used, and if that purpose is domestic in character, even though it be connected with the carrying on of a lucrative trade, such as that of a restaurant, then the water authority are only entitled to charge as for a domestic supply. The result is that the proprietors of many businesses obtain a supply of water at the same nominal rate which applies in the case of the ordinary householder.

The latter part of the address was concerned with matters connected with the new president's own experience as a water engineer, and comprised some interesting observations regarding the watershed of the river Mersey, and the mechanical filtration of upland waters. In dealing with the use of reinforced concrete in the construction of covered reservoirs, he pointed out that the extra cost per cubic yard is not only due to the steel reinforcement, but to the extra care which has to be exercised in the selection of the material to be used and the placing of it in position, as watertightness depends not on several feet thickness, but on inches only. The aggregate must be of exceptional quality and of carefully selected size and shape, and the timbering must be carried out by skilled carpenters, the ordinary timberman not being sufficiently trained. No doubt in course of time, as the use of the material increases, the timberman will become educated to the work and highly skilled carpenters will not be required. It is also to be anticipated that, as the reliability of reinforced concrete is proved by repeated examples, the period allowed by the Local Government Board for the repayment of loans will be extended. Another matter of interest with which Mr. Molyneux dealt was the effect of the improvement of road surfaces on the cost of distribution. The more costly methods of road construction render it more than ever desirable that subways for the accommodation of mains should be constructed whenever practicable, and that when this cannot be done footways should be made wider so as to accommodate the several pipes and cables, and some definite plan should be agreed upon between the parties concerned for adjusting the relative positions of their mains.

The Imhoff Tank.

On several occasions during the past two or three years, when describing the number of cases in which this tank has been adopted, and the results of its operation, particularly in America, we pointed out that, so far as we were aware, it had not been put into operation in this country, and therefore anyone proposing to use it

would have to rely upon experience gained in other countries. As will have been noticed from our issue of the 29th ult., this lack of experience will shortly cease to exist, as a set of two Imhoff tanks has recently been constructed at the Withington sewage works of the Manchester Corporation. This is an event of considerable importance to engineers engaged in sewage disposal works, as, whatever opinions may be held by individual engineers with regard to the value of this tank compared with other types, it is very desirable to have exact data of the results obtained in this country. That the working of the tank at Withington will be carefully observed and the results accurately noted may be anticipated from the past record of the Rivers Committee of the Manchester Corporation, whose annual reports are so extremely well prepared and a source of valuable information in connection with the art of sewage disposal. In the absence of any properly equipped State institution for carrying out experimental and research work, it is a matter for congratulation that the first installation of these tanks is in the hands of such a capable and progressive local authority, who will not only carry out the necessary investigations on strictly scientific lines, but place the results of their observations on record for the benefit of the whole community.

In the details we published recently it will be noticed that the tanks are described as "Emscher" tanks after the district in Germany in which they were first constructed. We have preferred to use the term "Imhoff," which is the name of the patentee—one of the engineers of the Emscher District Drainage Board. In America, where this type of tank has been adopted in a number of cases in recent years, they are known as "Imhoff" tanks, and as "Two-story" tanks, to distinguish them from "One-story" tanks, such as ordinary septic or settling tanks. We have thought it desirable to refer to this matter of terminology, as we believe that this new type of tank is already confused with other types, and it would be well to have a definite and understood name for it. In conclusion it should be noted that the chief features which distinguish it from other tanks are the claims that (a) the sewage is not fouled in its passage through the tank, so that, in cases where the sewage arrives at the works in a fresh state, it passes out of the tank in the same state to the filters; (b) that a very high percentage of suspended solids is arrested and retained in the tank; (c) that the decomposition of the organic matters which takes place in the tank does not create any evil-smelling gases, and thus the risk of nuisance from smell is avoided; and (d) that the sludge when removed is easily dried and rendered spadeable by simple sludge-draining beds, and its disposal by use as manure, or for filling up low-lying areas, can be effected without creating a nuisance from smell. These are advantages which are well worthy of consideration, and we now await with much interest the publication in due course of the results to be obtained from the tanks at Withington.

Haulage of Road Material.

The principal feature of the annual Scottish meeting of the Institution of Municipal and County Engineers, which took place on Friday and Saturday last at Dunfermline, under the presidency of Mr. J. Bryce, of Glasgow, was a paper by Mr. W. L. Gibson, the county road surveyor for the Western District of the Perthshire County Council. Mr. Gibson took as his subject "The Advantages of Steam Tractor Haulage over Team Labour for Road Material." The matter is one upon which we have had something to say upon former occasions, but we have peculiar pleasure

in reproducing Mr. Gibson's paper in this issue, inasmuch as he was the first county road surveyor in Scotland to adopt tractor haulage. He has now had some ten years' experience of this method of transportation, and consequently his paper, and particularly the detailed statements of actual cost and comparative analyses of tractor haulage as compared with team labour which it contained, are of special value. The question is one which must be looked at from many points of view. The epigram that the bigger the load the cheaper the cost per ton-mile contains just as much truth as most epigrams, and no more. The inevitable damage to roads by tractor haulage is a factor which must be considered, and the ideal to be aimed at is to secure at one and the same time cheapness of transport and minimum damage to roads. In the opinion of Mr. Gibson, to which, as we have already said, great weight must be attached, these two aims are irreconcilable, so long as heavy traction haulage is employed. His verdict in favour of light tractor haulage can also be supported on other grounds. For example, convenience of working is an important consideration, and in this respect the light tractor is at a great advantage. In concluding his paper, Mr. Gibson suggested five points for the consideration of these road engineers and surveyors who might be contemplating the adoption of mechanical haulage. First, they must consider whether the roads are capable of carrying the maximum axle weight of the type of vehicle it is proposed to use. Then, in regard to the quantity of materials to be transported, the question of hire *versus* purchase arises. If, as is said to be the case in some fortunate districts, the present prices of cartage are so cheap that it would be no economy to adopt mechanical traction, the matter need not be viewed from any other aspect in such districts. Other matters which ought to be taken into account are the possibility of using a convertible tractor and roller, and the use of the engine for driving a small stone-breaker, or for some other suitable purpose. The whole of Mr. Gibson's paper will be found in another column, and we cordially recommend those of our readers who may be interested in the subject carefully to peruse its contents.

* * *

Town Planning. The fact that the town planning sections of the Housing, Town Planning, &c., Act, 1909, have, so far, not given rise to very much litigation is due to the delays which are inevitable in enforcing those schemes which have up to the present been sanctioned. It appears from the paper on "Town Planning from a Lawyer's Point of View," which Mr. John L. Jack, the town clerk of Dunfermline, read at last week's meeting of the Institution of Municipal and County Engineers in that town, that, in his view, the Act will in time open up a wide field for litigation. The powers which are given by the Act to the Local Government Board and to the local authorities are certainly very great. It is commonly agreed that the right to enforce a town planning scheme is a most valuable one to any community. On the other hand, it must not be forgotten that that right necessarily imposes great restrictions upon landowners in dealing with their properties. It has been made clear by the Local Government Board that, in order to work the Act, the views of the landowners should, as far as possible, be ascertained and complied with. At the inquiry which was held into the Dunfermline scheme some very interesting questions arose, and particularly as to what land proposed to be included in the scheme was likely to be used for building purposes, or was so situated with respect to land likely to be so used that it ought to be included. Objection was taken to the inclusion of certain lands on the ground that in all likelihood they would not be built upon for

at least twenty years to come. The answer, on behalf of the local authority, was that the words "likely to be used for building purposes" did not necessarily mean that it was likely to be so used within the next year or two; and further that the very lands under discussion had only a few months previously been included by Parliament within the city boundary, thus showing that Parliament had considered them to be urban in character. The Local Government Board adopted the view put forward by the corporation and included the lands. As Mr. Jack points out, this decision is eminently reasonable, and does not confer any hardship on the landowner. If his lands are not likely to be built upon in the near future, the mere fact that they are included in the scheme does not necessarily entail upon him any disadvantage. Considerations of space preclude us from reproducing Mr. Jack's paper this week, but we hope to do so in our next issue.

A Surrey Beauty Spot Threatened.

At a recent meeting of the Dorking Urban District Council it was stated by the chairman that the council were taking full steps to see what could be done with regard to the danger threatening the Nower, an open space of great natural beauty to which the public have for a long time had access with the consent of the owners. The danger is that a considerable portion of the estate of which the Nower forms a part is soon to be offered for sale, and, in view of the fact that the Glory Woods adjoin land which has already been built upon, and where further building is in progress, it is felt locally that an effort should be made to secure for the town the only other open space of considerable size, access to which is at present enjoyed by the public. The Nower is a park-like area, including a high ridge from which fine views of the surrounding country can be obtained, and a long sweeping slope down to the lower ground; and it is beautifully timbered. It is situated close to the town, and the ground is often dry enough for walking when the paths across Holmwood Common, where the soil is clay, are almost impassable. Holmwood Common is, moreover, at a distance of about three-quarters of a mile from the town, the high-lying portion much further; and Ranmore Common, in the other direction, lies about a mile and a-half away, at the top of a very steep ascent. The deduction of general interest to be drawn from this particular case is that even those towns which are situated in the heart of a country abounding in open spaces and woods to which the public have access find it desirable to have open spaces of their own at a short distance from their main streets.

Helston Councillors Cry "No!"

The nerves of the rural councillors of Helston, in Cornwall, received quite a rude shock recently, when, it having been announced that Mr. C. E. Boaden, surveyor of the southern district, had resigned, a member had the temerity to propose that they should advertise for a successor at a salary of £100 instead of £70, which the officer had been receiving. There was a stentorian chorus of "Noes!" from all parts of the council chamber when the awful suggestion was made, and one can imagine that certain full-blooded protectors of the rural purse came nigh to a fatal attack of apoplexy at the mere idea of making an advance upon a salary of £70 a year. It is no surprise that the proposition found no seconder, and that rustic Helston remains free from the suspicion or danger of the outer influences of progress. All the same we are thankful for small mercies, for it seems that in the district there is one courageous Abdiel among the faithless ones. In all sincerity we are constrained to say more power to him!

Institution of Municipal and County Engineers.

THE SOUTHEND-ON-SEA MEETING.

Vice-presidents, past-presidents and members of council formed quite a substantial proportion of those who were present to support the president at last Saturday's meeting of the Institution of Municipal and County Engineers at Southend-on-Sea. In all there was an attendance of nearly 150, but the arrangements for handling the gathering were such that everything passed off with the greatest smoothness. If not ideal, the weather at any rate remained fine throughout the day, and the visits to works, which were a

MR. E. J. ELFORD, M.INST.C.E., M.I.MECH.E.,
Borough Engineer of Southend-on-Sea.

[Mr. Elford served his articles with his father, Mr. J. Elford, then borough engineer of Poole, and was afterwards engaged as an assistant under him for two years in connection with the Poole main drainage scheme, which was carried out at a cost of £82,000, and with other large and important works. From 1890 to 1892 he was assistant to Mr. T. de Courcy Meade, M.INST.C.E., now city engineer of Manchester, but at that time borough engineer of Hornsey, and during this period he was engaged on drawings for, and the supervision of, extensive drainage works at Highgate, a large storm-water sewer, sanitary depot, alteration to refuse destructor works, the provision and correction of an ordnance survey map of Hornsey and Highgate, as well as on important street and other works. Between 1892 and 1895 he was engineering assistant to the late J. Buchan, city engineer of Norwich, and afterwards to Mr. Buchan's successor, Mr. A. E. Collins, whom he assisted largely with the drawings, estimates and supervision of the new drainage works, as well as in the preparation of designs for public baths. In May, 1895, he was appointed engineer and surveyor to the urban district council of Portland, where he designed and superintended the construction of new water supply works costing nearly £45,000, and a main drainage scheme costing about £25,000. In 1902 he was appointed to Southend, and since that date he has been engaged in designing and carrying out many important works. Mr. Elford is a member of the Institution of Civil Engineers, a member of the Institution of Mechanical Engineers, and a member of the Institution of Municipal and County Engineers.]

prominent feature of the programme, were participated in with the keenest enjoyment. Those who at eleven o'clock assembled at the Palace Hotel for the mayoral reception included Sir James Lemon (Southampton), Messrs. J. Anstee (Guildford), H. L. Baker (East Ham), E. M. Bate (Frinton-on-Sea), J. Birch (East Ham), W. N. Blair (St. Pancras), J. H. Blizard (Southampton), H. Percy Boulnois (Westminster), W. L. Bradley (Tonbridge), A. T. Bridgwater (East Ham), T. F. Bunting (Maidstone), J. H. Brierley (Richmond), E. R. Capon (Epsom), J. R. Cartledge (Barnes), H. T. Chapman (Kent County Council), C. J. Cloke (Chiswick), R. Collins (Enfield), W. A. Collins (Bridgwater), W. R. Collins (Enfield), J. W. Cockrill (Great Yarmouth,

president), L. A. Cooper (Chiswick), H. B. Crossley (Acton), C. F. Dawson (Barking), J. Dewhurst (Chelmsford), W. J. Dresden (Battersea), R. H. Dyer (Southend-on-Sea), E. J. Elford (Southend-on-Sea), W. Fairley (Westminster), B. A. Farley (Malling), T. J. M. Flower (Bristol), C. A. Gill (Peterborough), W. Gornall (Hendon), E. Y. Harrison (Wellingborough), P. T. Harrison (Chelmsford), B. Haylor (Willesden), T. W. A. Hayward (Battersea), O. Hellowell (Withington), J. R. Hill (Ipswich), S. A. Hill-Willis (Tilbury), R. L. Honey (Chatham), L. R. Impey (Ipswich), A. C. James (Grays), R. H. Jeffes (New Malden), C. J. Jenkin (Finchley), R. J. Jenkins (Portsmouth), C. C. Kidd (Southend-on-Sea), T. Kidd (Swadlincote), P. G. Killeck (Finsbury), R. J. W. Layland (Billericay), M. Lea (Karachi), H. W. Line (London County Council), H. J. Marten (Streatham), S. Mathew (Chelmsford), J. R. Mead (Ipswich), A. J. Meeson (Brentwood), E. J. Messent (Kensington), A. E. Nichols (Folkestone), W. H. Prescott (Tottenham), A. E. Prescott (Eastbourne), F. W. Pearce (Twickenham), H. W. Rackham (Hendon), J. L. Redfern (Gillingham), J. W. D. Robinson (Westminster, secretary), E. E. Ryder (Bushey), F. Sadler (Acton), N. Scorgie (Hackney), E. C. Seabrook (Hendon), J. E. Sharpe (Cheshunt), G. G. Shepherd (Hford), R. H. Shaw (Hford), E. J. Silcock (Westminster), S. S. Small (Southend-on-Sea), C. Chambers Smith (Westminster), J. H. Smyth (Willesden), E. F. Spurrell (Holborn), T. R. Swales (Maldon), E. W. Swinstead (St. Pancras), J. Sutcliffe (Dertford), H. Taylor (Newcastle), P. G. Thorby (Southend-on-Sea), H. L. Torr (Southend-on-Sea), B. D. Tracey (London), H. T. Wakelam (Middlesex County Council), J. D. Watson (Birmingham), J. A. Webb (Hendon), H. C. Whitehead (Southend-on-Sea), E. Willis (Chiswick), H. F. Wilkinson (Tottenham), O. E. Winter (Hampstead), R. K. Wortley (Southend-on-Sea), members; H. M. Alderton (Chelmsford), G. F. Andrassy (Chelmsford), G. T. Allan (Southend-on-Sea), S. W. Ball (Willesden), C. S. Bilham (Southend-on-Sea), J. Bowen (Reading), F. Britain (Southend-on-Sea), J. H. Chapman (Southend-on-Sea), F. J. Crabb (Southend-on-Sea), A. S. Culham (Southend-on-Sea), H. A. Dowsett (Southend-on-Sea), E. F. Edwards (Southend-on-Sea), Alderman Francis (Mayor of Southend-on-Sea), A. J. Frankland (Southend-on-Sea), T. S. W. Harrison (Leigh-on-Sea), W. H. Hill (Kensington), W. E. Long (Southend-on-Sea), W. H. Makepeace (Stoke-on-Trent), Alderman A. Martin (Southend-on-Sea), S. W. Mott (Wickford), R. H. Nerney (Southend-on-Sea), C. G. Pugh (medical officer of health, Southend-on-Sea), S. M. Reed (Middlesex County Council), S. N. Richards (Southend-on-Sea), W. S. Roper (Southend-on-Sea), G. W. Shreeve (Chelmsford), P. G. Smales (Southend-on-Sea), T. W. Smith (Southend-on-Sea), A. Snodgrass (Teddington), J. R. Smith (Southend-on-Sea), J. W. Turner (Southend-on-Sea), C. E. Tweedale (Southend-on-Sea), J. G. Ward (Southend-on-Sea), A. F. Wicken-den (Southend-on-Sea) and H. J. Worwood (town clerk, Southend-on-Sea), visitors.

The Mayor (Alderman Joseph Francis, J.P.) said it was with real pleasure that he extended to them a very hearty welcome to the borough of Southend. It was one of the privileges of a mayor to welcome visitors to his town, and he could assure them no visitor was received more heartily than the one who was engaged in keeping the municipal machine going, and devoting his time and energies and abilities to improving that machine. In 1901 he had the privilege of entertaining some of the gentlemen present. Since that time many and great changes had taken place. They had added no fewer than 50,000 to their population, and they had spent more than £500,000 in public works and improvements of various kinds. He hoped, therefore, they would find something at least to interest them, and that when they left they would not say their day had been wasted; but, on the other hand, that they had had an interesting day—such an interesting day, in fact, that before very long they would be induced to come again.

The next hour was occupied by the members in making inspections of the pier-head extensions, the esplanade improvement and sea wall, and the huge swimming bath which is being erected on the front at Westcliff. The journey of something over a mile to the end of the pier was made on electric cars. From

Westcliff motor vehicles conveyed the whole party round the western outskirts of the town back to the Palace Hotel, where the mayor entertained the members to lunch.

HIS WORSHIP said it was his privilege for the second time to submit the toast of "The Institution of Municipal and County Engineers." On the former occasion, as some of them would no doubt remember, they had their luncheon in what was then a new building, and was known as the Kursaal, and he believed their president on that occasion was Mr. Mawbey, of Leicester. When he told them that at that time the Palace Hotel was not in existence, it would go to show they had made progress, and he thought what they had already seen of Southend was further proof of his statement, and he hoped there would be no possible doubt of it when they had made further visits that afternoon. There were those who did not speak favourably of institutions such as this—they did not see what was to be gained by members of the same profession meeting together and exchanging ideas; but he ventured to suggest that much good could come from an institution such as this, particularly when they visited towns of progress, and saw what was being done by their professional brethren in the particular district. The man who never went outside his own particular district was likely to have narrow ideas. He suggested that, in his individual interest, as well as the interest of the corporation, it was his duty to serve; it was to the advantage of everybody concerned that he should go and see what his neighbours were doing. In some cases they might profit by their mistakes, because he supposed they would admit that they all made mistakes, but it was not everybody who would admit that a mistake had been made. He should like to take that opportunity of paying his tribute to municipal officials. He had had the privilege of knowing all the officers of that borough since it was incorporated, and they had one—their borough accountant—who had been in office during the whole of that period. The other officers, with the exception of Mr. Elford, who of course, was well known to them, had been with them some years, and, it was hoped, would remain with them for many years to come. It was only fair to their officials to say that, although those who were members of the corporation, and were the spokesmen to the public, received credit for many works which were carried out, it was only fair to say that without the assistance of capable and loyal officials those works could not be carried out satisfactorily. Although he had said very little, he could assure them he was most sincere in wishing that this institution should go on and be a great success, and, as they said in the City of London, should flourish root and branch for ever.

The PRESIDENT, in his reply, thanked the mayor for the very kind and hospitable manner in which the institution had been received. He came from a rival watering-place; he was out to learn something, and Mr. Elford's paper, and what he had seen that day had taught him something which would be of use in the town he came from. He was glad to hear the remarks which the mayor had made respecting the institution, and the advantage of professional men meeting together to interchange ideas. Five years ago their institution was regarded by some as moribund, but since then it had increased its roll by 500 members. That day they were holding a meeting in Dunfermline, and he believed it would be as successful as that meeting in Southend. A fortnight ago they held meetings in Salisbury and in Ipswich, and in both towns they were received in the same generous manner as they had been received in Southend.

Sir JAMES LEMON said the mayor, with his well-known modesty, had not put a toast on the menu with reference to himself, but he was going to supply the deficiency and ask them to pass a hearty vote of thanks to his worship for his kind and generous hospitality. It was said that they did not expect these luncheons, but all he could say was they always got them. (Laughter.) He hoped the day would never come when they would be omitted.

The toast was drunk with musical honours.

The MAYOR, in response, said it was a real pleasure to a mayor to entertain visitors, and having had the privilege and pleasure of entertaining some of them years ago, he thought it would be nice to see them again this year, and with the assistance of their engineer, Mr. Elford, who, with his secretary, had done all the work, they managed to get them to revisit the town. He could not promise to be mayor in twelve years' time and provide the expected

luncheon, but he trusted that whoever was mayor would see that the luncheon and something else was provided.

The discussion of Mr. Elford's paper, "The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea," was then proceeded with, Mr. J. W. Cockrill, the president, occupying the chair.

DISCUSSION OF MR. ELFORD'S PAPER.

The PRESIDENT, in proposing a vote of thanks to Mr. Elford for his paper, observed that he was out to learn something, and there was much he had seen in Southend from which there was something to learn.

Mr. J. D. WATSON, Birmingham, Tame and Rea District Drainage Board, in seconding the vote of thanks, said the paper was one of the best of its kind he had ever read, and he felt it was—and ought to be—a model for papers presented to that institution. It contained an excellent description of the works; the description was clear and accurate, and well illustrated with informing drawings. The whole paper was an illuminating contribution, calculated to convey much knowledge of a very interesting kind. He thought that much praise was due to the designer of the works, and he was sure they would accord very heartily their thanks to him. Southend was in a very unique position with regard to this question of sewerage and sewage disposal. Usually the sewage of a town, especially when built on a hillside as it was there, was conveyed to the water front. In this instance it had to be conveyed to the hills. The front was so very valuable that it obviously would not have been to the advantage of Southend to have had sewage disposal works there, because, after all, however good the works might be, however free of nuisance they might be, they were still sewage works, and had that character which people did not wish to be associated with when they went to the seaside. There were two questions which came up very prominently with regard to sewage purification. One question was as regarded the amount of purification which ought to take place before sewage could be discharged into a river or the sea. He had always thought, and he thought now, that Southend had been very hardly dealt with. He felt that for the powers to be to have called upon Southend to effect the purification which they would see later on was somewhat unfair, especially when one remembered that the greatest town in the country, and in the world, did comparatively little to purify the sewage which was sent into the River Thames, and that Southend was on the estuary. He did not say that nothing should be done—far from it. He had only just come back from investigating a case where sewage was taken into a very great stream without purification of any kind, and he was able to trace evidence of that pollution for 100 miles. It was, in his view, necessary that something should be done. In every case the solids should always be removed before the sewage was allowed to enter even the biggest river, but neither Parliament nor the courts were satisfied with the proposition that Southend should remove all solid matter from the sewage before it was sent direct into the sea. They required as much to be done as was done in any town he knew of. The works themselves were excellently designed, and he thought they would find they had been as well executed, and that with the effluent which was being discharged no fault could be found. One thing which would have a good effect was that Southend would be able to say that there was no other watering place in England or abroad, so far as he knew, which purified its sewage to the same extent before it was discharged into the sea. If there was any detriment from sewage going into a great wide estuary like that it had been reduced to a minimum. The question which Mr. Elford alluded to, and which he (Mr. Watson) thought was a very important one, and one which affected every municipality in the country, was the question of standard. Mr. Elford stated clearly in his paper the standard of purification which ought to be effected, and which he must effect before the effluent was discharged. He (Mr. Watson) thought all stereotyped standards were objectionable. The law as it stood was even more strict than the standard which had been put upon Southend by their private Act. But two blacks did not make a white, and when they thought of it, it was impossible to have a standard which was applicable to all cases. The Royal Commission of Sewage Disposal had recognised that, and in all their recommendations they had suggested that a central authority should be established, and that to that authority powers should

be given to say whether the effluent was fit to be discharged into the river or not. Another suggestion had been made that the standard should be statutory. He would oppose that, and would advise all municipalities to oppose it. He might tell them that the Association of Municipal Corporations appointed a committee to consider that question about a year ago. He was one of the committee, and they made a report which had not yet seen the light of day—for what reason he could not tell—but he could assure them it would appear, even if he should have to take the responsibility, as chairman of the committee, of furnishing it himself. The committee advised the Association of Municipal Corporations to oppose any proposition to make the standard statutory, and they gave several reasons why it was quite impossible, as well as inadvisable, that such a course should be taken by Parliament. Those of them who had experience of sewage works knew quite well that they depended very largely upon conditions of climate to produce certain results. Their works were made for this climate, and not for tropical climates; nor, as a matter of fact, did they make sewage works to give good effluents during long periods of frost. The best sewage works, and the best sewage farm they had ever seen gave out variable effluents, and to keep a town to one particular standard, which must be observed day in and day out, year after year, was to ask for the impossible. Nature did not work for such a condition as that. Nature invariably, or almost invariably, gave to them a much greater volume of water in our rivers during the winter than they had during the summer, and the effluent was better during the summer than it was during the winter; but if an engineer were to be required to construct works which would always give an effluent of a purity which was equivalent to any particular standard, it would become necessary for him to spend a larger amount of money, to increase the area, and capacity of works, in order to be ready for all contingencies. Now he thought they were asking the communities to spend more money than was necessary when they asked them to do that. The money was required for other purposes. He thought they ought to say that there were other purposes for which the money was more needed than the purification of sewage if that purification was to be an exceptionally good purification. He was glad of that opportunity of being with the members of the institution to view the works. They were quite up-to-date works. They were as good works as they would expect to find in any inland town. They were such good works that they would find in juxtaposition the Humphrey internal combustion pump and the Stereophagus pump. Mr. Elford had adopted the newest possible methods, and when they had seen the works that day they would agree with him that they were works of a very excellent character.

Mr. T. W. A. HAYWARD (Battersea), in supporting the vote of thanks, said some of them had seen and heard a good deal of Mr. Elford of recent years. As he came down in the train he read the paper, and he could not help wondering how Mr. Elford had given the time to their institution in the midst of the heavy professional claims which Southend had made upon his time, energies and ability. One could not read the paper without feeling that Mr. Elford's work in Southend had been very arduous; yet, during the past six years, there was no man who had given more time to the council of the institution. Mr. Elford's labours in the matter of standardisation would be helpful to all of them, and he was glad of the opportunity to bear testimony to the very valuable work which he had done, and which would be helpful to the whole profession in days to come.

The president at this point being obliged to leave, Mr. Wakelam, district chairman, took the chair.

Mr. E. WILLIS (Chiswick) remarked, as regards the sewer and outfall conduit, that Mr. Elford had arranged for the two sewers to be in the same trench, and the effluent was discharged under a hydrostatic head. He would like Mr. Elford to tell them how much the hydrostatic head was, and the friction in the outfall sewer. Then, in connection with the grouting machine, there appeared to be a hand air pump. He could hardly think that could be the method of grouting. When he had carried out the grouting of a sewer the air was generated from an engine on the surface and conveyed through ordinary flexible tubing. There was one serious difficulty which Mr. Elford had managed to overcome, but which would not have occurred if the works had been done by administration in the earlier stages, as they were at the completion.

He referred to the serious loss caused by the falling in of the large excavation. He would like to have Mr. Elford's experience of the bitumen joints on the lead pipes. He had not used these at all, and it would be advantageous to have Mr. Elford's experience on that particular method of connecting. Mr. Elford called attention to the big savings which were effected by the works being carried out by administration. He thought there were many works where municipal engineers could do better for the local authority by carrying out the work by direct labour instead of by contract. He did not think that applied to all work, particularly to building work, where costly plant was necessary; but in sewer work very considerable savings might be effected by direct labour. He would like to know whether there were any other instances of the Humphrey pump being used for a high lift. Probably most of them had seen the Humphrey pumps at the Chingford reservoir, but there they were only lifting water 25 ft., whereas there they had to lift screened sewage against a head of 65 ft. At present only one pump had been erected, but he was convinced that there was a great future for the Humphrey pump if the high lift could be arranged.

Mr. E. J. SILCOCK (Westminster and Leeds) said he had the privilege of being called upon to support the sewerage scheme in connection with the Parliamentary proceedings. Some reference had been made by Mr. Watson to the requirements of purification at Southend, and Mr. Watson had said that, so far as he knew, Southend did more than any other town of a similar character. That was not strictly accurate, because at Southport they had very efficient purification works, also at Skegness, and although he quite agreed with the views expressed by Mr. Elford that in this case, the sewage being discharged into the estuary, purification had no connection whatever with oyster beds, he ventured to think that, as an investment, the town of Southend was perfectly justified in going to this great expense of purifying its sewage. As a health resort, and one where sea bathing was carried on, there could be no doubt they must remove the slightest suspicion that the water in which the public bathed was liable to pollution, and he thought that many other towns situate on the sea coast would in future find it to their advantage to purify their sewage rather than allow it to be discharged into the sea without any previous treatment. These works of sewage purification in Southend were, undoubtedly, of the latest construction and thoroughly up to date, and he regretted that the time at their disposal at the works would be so very short. He hoped they would be given an opportunity of coming down again, and having a further inspection of the works when they were in full operation. Reference had been made to the Humphrey pump. He thought that was the first application of it to sewage pumping. It was proposed to use it at the Leeds sewage works, but just before the corporation finally decided upon the type of pump they came to the conclusion that it would be better to utilise their electric power for pumping rather than launch out into a new system of which they had no experience, and the Electric Committee offered such favourable terms that they finally adopted electricity. He believed this system of pumping was one well adapted to sewage, and in future there would be many applications of the system to this class of work. Reference had also been made to the Stereophagus pump. That was a new type of pump. At their meetings they hesitated to give any sort of testimonial, but he would like to say he had had two pumps of this type pumping unscreened sewage for a year, and they had had no difficulty with it. He thought that type of pump was very applicable to the pumping of sewage, and could be used at isolated stations without using an air lift from power generated at a central station. That type of pump was quite new, and so far his experience of it had been very satisfactory.

Mr. T. J. MOSS-FLOWER (Westminster) said it was rarely they saw a town grow at the rate Southend had grown. Since 1881, including the added districts, the town had grown from 7,979 to 84,000. They must congratulate Mr. Elford upon having the opportunity of exercising his engineering skill in such a progressive town, and, on the other hand, they must congratulate Southend on having a man with the energy and capacity to grapple with the difficulties presented by such rapid growth. He would content himself with referring to just one or two points in the evidence that was brought before the Courts in opposition in the action of *Hobart v. The Southend Corporation*. The outfall was allowed to discharge for a period of four

hours after the ebb tide. Mr. Elford said he believed this evidence was given quite honestly, and that most of the pollution which took place was from the tailings of sewage after the penstock had been closed down. That was an important matter for anyone who had to deal with a sewage outfall into a river or into the sea. If they had a long outfall, and the tide rapidly falling at the time of the ebb, they had a large amount of sewage discharged on to the foreshore. It was important that no sewage should be discharged on to the foreshore. Then there were the difficulties Mr. Elford experienced in connection with contractors. One knew that half the troubles of engineers arose from contractors. It was a very easy matter for a contractor with knowledge to do that part of the work which could be done cheaply, and on which a large amount of money could be made, and to leave to the last the difficult part of the work on which there was little or no profit. They should see to it that the contractor did the latter work as well as that which could be done easily. Although the Act of Parliament insisted upon a high standard of purification, Southend was to be congratulated upon that fact. They had in these seaside towns to make clear that there was no suspicion of sewage being returned at any state of the tide to where people might be bathing. The least they could do was to screen the sewage so as to take the solids out, so that no flocculent matter could be seen floating about in the sea. Southend had an up-to-date method of sewage treatment, and though they might consider they had to purify their sewage to an unreasonable standard, it was well to be on top; they were meeting all the requirements, and they were not likely to be shot at by the powers that be.

Mr. J. E. SHARPE (Cheshunt) asked, with regard to the Mexphalte, the cost per yard and the term of free maintenance.

The CHAIRMAN (Mr. H. T. Wakelam) said he should like to say how much he was in favour of the vote of thanks. Mr. Elford deserved everything that had been said of him.

Leaving the Palace Hotel, the members proceeded in the motor vehicles to the sewage works, the journey being made by way of the new tramway boulevard. The inspection of the works, which proved full of interest, occupied the greater part of an hour, and was followed by tea, kindly provided by Mr. Elford.

Mr. HAYWARD, in proposing a vote of thanks to the borough surveyor, said he thought that would be regarded by all present as one of the red-letter days in the annals of the institution. Mr. Elford had provided for them food both for the mind and body. He was sure all of them had been highly gratified at what they had seen and heard, and that he was voicing the general feeling in expressing their indebtedness to Mr. Elford, and wishing him all prosperity in his future career.

The vote of thanks was carried with enthusiasm.

Mr. ELFORD, in acknowledgment, said the day had been a pleasurable one to him, and if their visit had been in any way a profitable one to them he was more than repaid.

It was found impracticable to continue the discussion on Mr. Elford's paper. Mr. HAYWARD put a question as to why, at the destructor, the material, after being put on the floor, was shovelled into the hopper and subsequently taken out of that and put on a lower floor before being shovelled into the furnace.

Mr. ELFORD said he thought that, owing to the difficulty of making oneself heard, it would be more desirable if he replied in writing.

The proceedings accordingly terminated.

SCOTTISH DISTRICT MEETING AT DUNFERMLINE.

The annual Scottish meeting of the Institution of Municipal and County Engineers took place at Dunfermline on Friday and Saturday last under the presi-

Mr. W. L. GIBSON,
County Engineer, Western Division, Perthshire.

[Mr. Gibson is a native of Glamis, Forfarshire, and received his early education at the public school there, after which he completed a two years' course of technical studies at the Harris Academy, Dundee. After leaving school he received a commercial training with the late Messrs. J. D. Cox & Co., Panmure-street, Dundee. Subsequently he received an engineer's training under the Glasgow Corporation in the engineer's office of the cleansing department, and later he spent three years in the county road surveyor's office (Perth district) as principal assistant. At the age of twenty-three Mr. Gibson was appointed surveyor and engineer to the Morpeth District Council, Northumberland. After nearly five years the Western District Committee of Perthshire County Council appointed him to his present position, which he has held since 1902, since when he has carried out many important works. Mr. Gibson is a member of the Institution of Municipal and County Engineers, and a member of its Road Committee for the Scottish district. He is also a member of the Executive Committee of the Scottish Road Surveyors' Association.]

denry of Mr. J. Bryce, Glasgow, vice-president. The members assembled on Friday morning in the Court

Room at the City Chambers, those present being Messrs. A. W. Allison (Crieff), R. Blackwood (Kilmarnock), T. Callen (Haddington), A. H. Campbell (Edinburgh), T. Cole (London), consulting secretary, G. Cunnison (Blairgowrie), J. W. Dickinson (Berwick-on-Tweed), R. A. Donald (Grangemouth), Geo. Donaldson (Fife County), R. Drummond (Renfrew County), W. H. Ellacott (Midlothian), J. R. Findlay (Leith), Wm. Forbes (Edinburgh), A. Forbes (Fife County), W. L. Gibson (Perth County), T. Goodwillie (Fife County), H. Goudie (Stirling), T. Gourlay (Kirkcaldy), A. D. Greatorex (West Bromwich), F. G. Holmes (Glasgow), H. Inglis (Airdrie), G. Landale (Musselburgh), J. Lee (Paisley), J. L. Lumsden (Kirkcaldy), Wm. A. Macartney (Johnstone), D. Mackenzie (Fife County), J. Murray McGregor (Ayr County), T. McLaren (Perth), H. McKillop (Perth), R. S. Macmillan (Clydebank), D. Maxwell (Carnoustie), J. C. Mitchell (Edinburgh), R. Moir (Midlothian), J. B. Peterson (Dundee), F. Pritty (Prestwick), J. Pritty (Selkirk), T. T. Ramsey (Linlithgow County), D. Ronald (Edinburgh), Geo. Ross (Clydebank), J. Scott (Perth County), T. H. Scott (Inverness), D. H. Shaw (Fife County), Peter Sinclair (Buckhaven), F. C. Smith (Arbroath), J. Walker Smith (Edinburgh), R. Spittal (Hamilton), A. Stevenson (Ayr County), J. Storrar (Midlothian), J. Thomson (Dundee), A. A. Turiff (Elgin), J. A. Waddell (Burntisland), Wm. Watson (St. Andrews), J. Watson (Lanark County), J. Weekes (Newport, Fife), C. F. Wilkes (Nottingham), G. Wyllie (Perth County), and J. Young (Ayr), members; McAllister (Airdrie), D. Beveridge (Kirkcaldy), W. Burt (Fife County), G. Somervail Carirac (Edinburgh), J. F. Combe (Grangemouth), Deas (Kirkcaldy), J. McHutchen Dobbie (Midlothian), Dunean (Arbroath), Fraser (Edinburgh), Frew (Airdrie), Wm. Gardner (Lanark County), Grieve (Perth), H. Hasterton (Fife County), C. P. Hogg (Glasgow), J. O. Jack (Dunfermline), J. Meikle (Ayr), Motherwell (Airdrie), M. Nicol (Kirkcaldy), Sir Wm. Robertson (Dunfermline), J. Spence (Coatbridge), Spence (Dundee), J. Spence (St. Andrews), W. Sym (Lanark County), Tainsh (Crieff), Raymond Unwin (Hamstead, London), H. W. Wallace (Kirkcaldy), Wilson (Arbroath), and W. Ross Young (Lanark County), visitors.

The CHAIRMAN expressed his pleasure at welcoming so many members. He was sorry to say that since their last meeting they had lost by death one of their members, Mr. W. Bell, county surveyor in Perthshire for the Aberfeldy District.

Mr. A. STEVENSON (Ayr County) proposed a vote of

condolence with the family of the late Mr. Bell. Mr. Bell was a man who in his own district had the respect of everyone who knew him, and in every transaction he always left the impression that he was thorough and well grounded in every department. He would be very much missed on account of his professional work in Aberfeldy District, and because of his work in connection with that institution and the sister body, the Road Surveyors' Association, as he had taken a very deep interest in all such work, and had done good service on committees in other ways.

The resolution was passed in silence.

NEW DISTRICT OFFICERS.

The CHAIRMAN said that certain changes had been made in the officers for the ensuing year—namely, vice-president, Mr. Allan Stevenson, county road surveyor, Ayr; district chairman, Mr. John Young, burgh engineer, Ayr; district representative, Mr. Thomas Nisbet, master of works, Glasgow; and hon. district secretary, Mr. D. A. Donald, Grangemouth. He was sure they would give them a hearty welcome to those positions. He would also like to refer to the promotion of Mr. Ronald, who had been hon. district secretary, and who had been given an eminent position in connection with the body which they so often maligned, the Local Government Board. It was pleasant to have friends at Court, and they were pleased to see Mr. Ronald in that position. In the name of the Scottish District he offered to Mr. Ronald their best thanks and their hearty congratulations on his promotion.

Mr. RONALD, in acknowledgment, said it had been a great pleasure to him to act as secretary of the Scottish District of the institution. The foundations of the new system were laid by Mr. Bryce, and, moreover, he had received every help from the district officers.

BY-LAWS FOR WATER SUPPLY.

The CHAIRMAN introduced the question of appointing a special committee to draft by-laws for water supply. They had already drafted building and sanitary by-laws, and he thought they might with advantage take up the question of water supply, and try to standardise the regulations on the subject.

Mr. J. LEE (Paisley) pointed out that a set of model by-laws had been drawn up by the Waterworks Engineers Association at Glasgow.

Mr. F. G. HOLMES (Govan) said he thought they should hesitate before appointing such a committee. There were so many different sets of people interested that it would be impossible to get imposed conditions which were desirable. One of the difficulties they had to deal with was the use of antiquated apparatus, particularly for water-closets. If they could not get power to order the removal of such apparatus after a number of defects had been reported within a given period they might as well save their time. No one knew better than the water engineers what was practicable and what was impracticable in these matters, and the best thing they could do was to get into communication with the Waterworks Engineers Association, and see what could be done. It was of no earthly use trying to do anything as long as these antiquated contrivances could not be removed.

Mr. A. H. GOUDIE (Stirling) said he was in favour of appointing the proposed committee. They could get a copy of the waterworks engineers' model by-laws, and if these proved satisfactory as applied to Scotland, they could recommend the institution to adopt them.

Mr. LEE thought the Waterworks Engineers' model by-laws would apply to most of the towns and small burghs, though there were some things which were not applicable to them. He did not think they contained power to order the removal of antiquated fittings, and he did not think it likely such a power would be obtained.

The CHAIRMAN said he had a good deal of sympathy with what Mr. Holmes had suggested, but much as they might desire radical changes they could only make by-laws consistent with the Act of Parliament.

The meeting decided to appoint a special committee, and the following were chosen to serve on it: Messrs. J. Young (Ayr), A. H. Goudie (Stirling), W. Watson (St. Andrews), P. C. Smith (Arbroath), R. Blackwood (Kilmarnock), D. A. Donald (Grangemouth) and C. Massie (Falkirk). Mr. Donald was made chairman of the committee.

SCOTTISH CLAIMS TO THE PRESIDENCY.

The CHAIRMAN said as he was the retiring vice-president he would like to say that he thought they should move with a view to having, if possible, a

president of the institution nearer to Scotland than had been the practice in the past. The president was almost always chosen from the South, and it was a long time since they had had a meeting of the whole institution in Scotland. At present the vice-president for Scotland or for Ireland was not eligible for the higher position, and he thought the constitution ought to be altered so that that should no longer be the case, and a Scottish or Irish vice-president should be eligible for the chair of the Institution.

Mr. A. D. GREATOREX (West Bromwich) agreed that the institution should have now and then a president from Scotland and from Ireland. At the last council meeting but one a resolution was passed that the president and vice-presidents should be elected by ballot, so as to give the Northern counties a chance of having a president in the near future. It had been felt that the English engineers in the North had not had a proper chance of getting a president, and that an opportunity should be given of having a Scottish or Irish president.

The CHAIRMAN expressed his pleasure that the opinion he had expressed had met with so much sympathy in England. They would bear in mind what Mr. Greatorrex had said, and take action when the time came.

The CHAIRMAN mentioned that there had been difficulty with the head office as to the cost of printing the by-laws, but the account had been cleared up with the assistance of some of the burghs in Scotland. He considered they ought to be treated more liberally with regard to finance. Scotland was not like a district in England; it was a nation, and the national feeling was strong. The membership in Scotland was contributing a considerable revenue to the institution, and he knew that their honorary secretaries in the past had been out of pocket rather than ask headquarters to pay for things.

Mr. RONALD said he considered that a grant should be made as a payment on account of working expenses, and the account cleared up once in six months.

Mr. T. COLE, consulting secretary, suggested that the Scottish district should put the matter in the most convenient form, and let their district representative bring it before the council.

The CHAIRMAN said they would leave it with the district representative. In Mr. Nesbit they had a gentleman who would not stand any nonsense.

It was also suggested that the council meetings should be held at times in places other than London.

Mr. GREATOREX (West Bromwich) mentioned that this question had been before the council on many occasions, but on account of the many committee meetings that were held before and after the council meeting, it would be necessary to carry to each town a cartload of papers. It was recognised that the present arrangement was a hardship to many of the members, especially those who paid their own expenses, and it had been suggested that the expenses should be pooled, everybody paying into a general fund. If the Scottish representatives could show the council a clear way out of the difficulty they would consider it.

Mr. COLE said the decision of the districts on the question of movable council meetings was somewhat confusing. The greater part of the districts thought the matter should be left to the council to consider whether it would be possible to hold meetings outside London.

The CHAIRMAN considered the matter might be left to the district representatives.

SUPERANNUATION.

Mr. GREATOREX, speaking with reference to superannuation, said the executive of the National Association of Local Government Officers had prepared a Bill, the financial portion of which had been revised in consultation with an actuary. The draft Bill had been finally approved by the Executive Council and was ready to be submitted to Parliament at a favourable opportunity. It included every public officer of all local authorities, and of every grade. The Executive Council wanted the assistance of all who were interested to secure the support of Members of Parliament and prospective candidates, and of all local authorities. Unfortunately, the late President of the Local Government Board did not support the Bill, or did not seem inclined to do so, and pressure should be brought to bear by local government officers and local authorities to get the support of the Local Government Boards of England and Scotland. He would suggest that members of

the Scottish District should get copies of the Draft Bill from Mr. Hill, the secretary of the National Association of Local Government Officers, who would give them every information they desired. The Bill, if it should become law, would be a very good thing indeed for all officers of local authorities, and more so for those in lower positions, because the higher the position of an officer the more he would have to contribute to the cost of the scheme.

Mr. W. A. MACARTNEY (Johnstone) observed that if they were affiliated to the National Association of Local Government Officers that was quite sufficient to enable them to claim an interest in the Bill.

Mr. GREATORIX replied that they were affiliated, and Mr. Blair, one of their past presidents, was vice-chairman, while Mr. Scorgie and himself were members of the committee.

DUNFERMLINE'S WELCOME.

Provost HUSBAND then welcomed the members to Dunfermline. He considered it a great honour to the town that such an important institution had chosen Dunfermline for their meeting. They had not much to show the members, but if they would visit Dunfermline again in 1919 they would then probably see a large scheme of town planning carried out. No doubt they knew that the corporation had had a good deal of difficulty with regard to that scheme, but they were hopeful that the difficulties were at an end. Only that morning he received the completed plans of the scheme, and he supposed Dunfermline was the first place in Scotland to get a scheme approved. They had a complaint to make against the Government of having delayed the work for twelve months, but the Government had promised they would thoroughly make amends for the delay they had caused.

Mr. J. BRYCE thanked the Provost for the welcome which he had given to the members of the institution.

LUNCHEON.

The members attending the meeting were then entertained to luncheon in St. Margaret's Hall by the provost, magistrates and councillors of the Royal Burgh of Dunfermline. Provost Husband presided.

Provost HUSBAND, in proposing the toast of "The Institution of Municipal and County Engineers," said they had all sorts of societies holding conferences, town clerks, borough officials, chief constables, and so on; but he could not imagine that any class of men would benefit more from such meetings than those who were engaged in the public service as engineers.

The toast was heartily received.

Mr. J. BRYCE, in responding, remarked that one reason for their visit was the knowledge that Dunfermline had some wonderful town plans to show them. He had seen some of those plans, and could say they were worth looking at, especially as they were the first of their kind in Scotland. Dunfermline had taken the lead in town planning, which they were all agreed was to be the great thing of the future. There was not a town in Scotland that was not suffering for the want of town planning in the past, and engineers were the persons who were practically interested in that work. Of course they must have the lawyers, but very grievous blunders might be committed if they had not competent engineers. He proposed the toast of "The City of Dunfermline."

The toast having been suitably honoured, the Provost briefly replied.

The meeting was resumed later in St. Margaret's Hall, under the presidency of Mr. Bryce, and consideration was given to, among others, a paper entitled "The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson, county engineer of the Western Division of Perthshire. Mr. Gibson's paper is reproduced elsewhere in this issue.

DISCUSSION OF MR. GIBSON'S PAPER.

Mr. A. STEVENSON (Ayr County), in proposing a vote of thanks to Mr. Gibson, said probably no other surveyor in Scotland could have dealt with the question in such a thorough way. He had used steam tractors, and he knew that in specific instances the saving by the use of steam traction was about 60 per cent. The saving was particularly evident when the haulage was over long distances. The general results given in the paper were very satisfactory.

Mr. T. Y. RAMSAY (Linlithgow County) said there was not only economy in the actual haulage to be considered in adopting steam traction, but also the advantage of getting a more regular supply of mate-

rial. They might get 20 or 30 tons a day, or even double, and by having a proper supply of material they were able to do better work on the roads.

Mr. G. DONALDSON (Fife County) remarked that if Mr. Gibson could get a ton of metal hauled a mile for 6½d., he must be getting his labour very cheap in one sense and very dear in another.

The CHAIRMAN remarked that nothing was put down in the paper for damage to roads by motor haulage. Probably it was considered that there was no damage done; but if there were any it should be put in as part of the cost.

Mr. GIBSON, in reply, remarked that the difference in mileage and the absence of difference in cost was explained by weather conditions and the gradients of the roads traversed. The latter formed a very important factor in the cost per mile. In one case they might be hauling over a road with several steep gradients, while another quarry 2 or 3 miles distant might be practically on a level road. That accounted for the difference per mile in the cost of the materials. As to allowing for damage to roads the damage had to be considered both in tractor haulage and in team haulage, and he had not allowed for it in either case, as he considered it to be about the same with both forms of haulage.

The vote of thanks was heartily accorded.

Following the business meeting, visits were made to the main outfall sewer, tunnel works, and to the Pittencrieff Glen and museum.

In the evening the annual dinner of the Scottish District was held in the City Hotel, Dunfermline, Mr. J. Bryce, vice-president, in the chair.

On Saturday a visit of inspection was made to the naval base at Rosyth by permission of the Admiralty and Messrs. Easton, Gibb & Co. The visit was of much interest. The members returned to Dunfermline for lunch, and the afternoon was devoted to visits to the baths, gymnasium, and women's institute. The members were entertained to tea in Pittencrieff Glen by the Carnegie Dunfermline trustees.

(To be concluded.)

Owing to the small number of acceptances, the proposed Whitsuntide visit of the Institution of Municipal and County Engineers to Hamburg did not take place. We are also informed that the two days' meeting of the Irish District which it had been hoped to hold in Cork towards the end of July has been postponed, the time having proved inconvenient for most of the members of the district.

Institution of Civil Engineers.—The president, Mr. Anthony G. Lyster, and the council of the Institution of Civil Engineers will hold a conversazione at the institution on Thursday, July 2nd, from 8.30 to 11.30 o'clock.

Surrey Bridge Widening.—Surrey County Council on Tuesday decided to widen Windows Bridge at Long Ditton, one of the most dangerous places for motorists on the Portsmouth road. The cost is estimated at £2,500.

Coast Sand Dunes, Sand Spits, and Sand Wastes. (By Gerald O. Case. London: St. Bride's Press, Limited, 24 Bride-lane, E.C. 5s. nett.)—While a good deal of attention has been directed in recent years to the question of coast erosion, but little has been said of the changes made by the wind on sandy shores. . . . The subject is certainly of sufficient importance to deserve more attention than it has hitherto received, and in discussing the nature of the groynes, embankments, &c., as well as of the vegetation best suited to arrest the movements of sand, Mr. Case has made distinct progress towards the solution of a difficult problem.—*Journal of the Society of Arts.*

British Fire Prevention Committee.—Arrangements have been made for an extensive series of fire tests to be undertaken by the British Fire Prevention Committee in July; they will include tests with non-inflammable wood, with a fibrous partitioning material, with fire-resisting glazing, and with some petrol extinguishers. The committee will be issuing shortly some further reports in respect to tests and other work completed during the past few months. During the current month the British Fire Prevention Committee has made elaborate arrangements for showing some of the leading authorities of the Continent and the United States who are visiting England the progress made in this country in matters relating to fire research work and fire prevention generally.

Institution of Water Engineers.

SUMMER MEETING AT STOCKPORT: MR. THOMAS MOLYNEUX'S PRESIDENTIAL ADDRESS.

The nineteenth summer general meeting of the Institution of Water Engineers opened at Stockport yesterday, when Mr. Thomas Molyneux, Assoc.M. INST.C.E., corporation water engineer of that town, was formally installed as president of the institution in succession to Mr. C. Clemesha Smith, M. INST.C.E., water engineer to the corporation of Wakefield.

On taking the chair Mr. MOLYNEUX said he accepted the highest honour which they, as an institution, could confer upon him, with great diffidence, knowing, as he did, the responsibilities which devolved on the occupant of the presidential chair. While thanking them for the trust reposed in him, he felt sure that he would have the assistance of all the members during his term of office in keeping up the high standard it had attained in the hands of his predecessors.

Mr. Molyneux proceeded to state that he joined the old association in the first year of its existence, and, on looking back, he was struck with the great developments which had taken place both in its usefulness and its membership, and notably the *camaraderie* of its members, which had always been a feature of their meetings. The records of their work, as published in the "Transactions," were as practical as those of any kindred institution, and members had no doubt often received expressions to that effect from engineers who were not members. He would like to emphasise, particularly to the younger members and associate-members, that the council would welcome from them details of experience met with in the execution of their multifarious duties. Among the special subjects requiring further explanation and consideration was the use of steel pipes for waterworks purposes, and he was sure some of their members had had experience in this practice which would be of value to the institution, particularly in the light of present-day controversy.

As evidence of the steady progress of the institution the president mentioned that since 1904 the membership had grown from 300 to 422, last year's increase being 21. That, he observed, was all the more satisfactory in face of the increase of subscription, which a few of them thought might have an adverse effect, but which, on the contrary, appeared to have stimulated the growth of the institution, and, further, the council were using the powers which the members had given to them of electing candidates for membership with a full sense of their responsibility, and they might rest assured that any candidate accepted was well worthy of election in whatever class of membership he was placed. The increase of subscription had so far improved the financial position of the institution that a further sum had been invested, and there was still left a good working balance which would enable the council to give increased facilities and benefits to the members generally. The library had been thoroughly overhauled, and, by the weeding out of that which was useless, room had been made for standard works which were being purchased from time to time, as well as for a file of all the Acts of Parliament passed each year dealing with waterworks matters. The council hoped that members would take full advantage of the facilities offered for borrowing the books, pamphlets and Acts of Parliament in the library. With that in view, the catalogue had been thoroughly revised, extended and simplified, so that no difficulty would be experienced in selecting the books or pamphlets containing the information required.

A special committee of the council (the president continued) is still engaged on the standardisation of conditions of contract, and although the subject is one that requires very careful consideration and involves much labour, it is hoped that the report will be available at an early date. A committee has also under consideration the incidence of income tax as affecting waterworks undertakings, a subject which is, perhaps, more particularly interesting to those who are engineers of water companies, but which may also prove worthy of study by municipal water engineers. A third committee has been appointed to take into consideration the question of charges for domestic and trade supplies in the light of recent decisions in the Law Courts.

The members will be interested to know that the council have recently decided to publish the abstracts

of legal cases separately from the "Transactions" in future. Thus, in the new volume (XVIII.) just issued this item has been omitted, and members will shortly receive a reprint of all the abstracts already published together with more recent decisions, arranged in a convenient form for filing, and fully indexed to date. Arrangements will also be made by which members may purchase suitable lettered cases at cost price as soon as the bulk is sufficient to make a book of convenient size.

The institution has suffered the loss, by death, of five members during the year 1913. Among these special reference must be made to Mr. Simmelkjaer, who for some years occupied the position of hon. auditor, and to Mr. Easton Devonshire, than whom, I am sure, no one had the institution more at heart. Those who worked with him on the council will remember the whole-hearted manner in which he devoted himself to making the institution one of which any water engineer may be proud to belong. Those of you who joined our visits to Belgium and France will remember that it was entirely due to him that those visits were made possible and successful. I am therefore sure you will agree that in his untimely death the institution has lost a member whose services and personality will long be remembered with grateful appreciation and respect.

The position of hon. secretary, rendered vacant by the death of Mr. Devonshire, has, as you know, been filled by the appointment of Mr. Ashton Hill, a selection which cannot fail to give satisfaction to all, as it will secure the continued work and interest of a highly esteemed past-president.

I regret also to have to record the death of one of your past-presidents, which took place in March of this year. I refer to Mr. Griffith, of Leicester. In Mr. Griffith we have lost one who, until failing health prevented him, took a deep and lively interest in the institution and those who knew him personally will ever remember him with kindness and good feeling.

Having dealt with the more intimate matters concerning the institution, I propose now to occupy a short time in the relation of a few items of my personal experience as a water engineer.

THE WATERSHED OF THE RIVER MERSEY.

This corporation is, I believe, the latest, and may probably be the last, authority to utilise a fresh tributary of the river Mersey for water supply purposes. There are to-day no less than twenty-two water authorities dependent entirely or in part (as in the case of Manchester) on the head waters of this river. These authorities serve a population of 2,500,000, and have expended about £11,000,000 in storage reservoirs (combined capacity 12,465 million gallons), and in other works supplying upwards of 55,000,000 gallons of water daily for domestic and trade purposes, and in addition between 30,000,000 and 40,000,000 gallons per day as compensation water to the various streams, the waters of which are impounded. The total area of gathering grounds is something approaching 100 square miles, and there are also some 15 square miles utilised for the supply of canal reservoirs. Of the remaining gathering grounds some are occupied by towns or villages, and on others suitable sites for reservoirs are not available.

The watershed, which is on the westerly side of the Pennine Chain, and faces south-west, has a mean annual rainfall of about 45 in., and as the rock formations are for the most part impervious, the yields, as compared with the rainfall, are high, in some cases as much as 90 per cent of the rainfall flowing off individual gathering grounds, and 70 to 80 per cent being quite common.

I append, in the form of a diagram, the rainfall and percentage of yield on a large portion of this watershed as shown by actual rain and stream gauging. A period of ten consecutive-years has been plotted, each year commencing October and ending September, so as to allow of each year being divided into wet and dry seasons. The variation in the rainfall between the two seasons is surprisingly small, averaging only 1.4 in., but that of the proportionate yield varies from an average of 94 to 54 per cent.

This diagram illustrates the impermeability of the strata by the large yield in the winter months and

the apparent lack of effect of the heavy winter yields on those of the following summers, which vary almost solely according to the rainfall of the individual seasons, although the wet summers of the fourth, seventh and ninth years appear to have affected the yield of the following winters. The low yield of the summer months I attribute to evaporation and growing vegetation.

The reservoirs in the watershed are, in many cases, inadequate to provide for this variation, and were made intentionally so, as it was not considered advisable to store all the flood water, chiefly on account of the difficulty in rendering it fit for domestic use. It is a remarkable fact that in the early part of the year 1911, the last dry year in this part of the country, during the summer of which many of the water authorities had a difficulty in supplying the demands of their consumers, no less than 5,000 million gallons of water passed to waste owing to the reservoirs being full—that is to say, a quantity sufficient to have supplied the whole population with a further 13,000,000 gallons per day for a full year, or nearly 500,000 new consumers with 30 gallons per head per day for the same period.

These upland surface waters have, until comparatively recent times, been considered suitable for domestic use after sedimentation, without filtration, and the bulk of the water obtained from this water-

can be found, or existing reservoirs enlarged, it is not possible to greatly extend the available resources of our present watersheds, and so postpone that expensive alternative, the amalgamation of the constituent authorities, and the promotion of a scheme for bringing water from some distant source.

The equalisation of the flow from the river Mersey watershed has also a further special interest, as the Manchester Ship Canal is entirely dependent upon it. The problem of finding water for the increasing traffic in dry seasons would be minimised if more of the flood water were impounded.

MECHANICAL FILTRATION OF UPLAND WATERS.

As this subject was so ably and exhaustively dealt with by Mr. Dixon at the last winter meeting, and as I have described fully our installation at Kinder in my paper on the Stockport works, I propose only to refer to a few details which have not, I think, been dealt with previously.

Before mechanical filtration is taken up on a much larger scale, the design of the plant will, I suggest, have to receive further consideration. The unit commonly in use is 8 ft. in diameter, and capable of dealing with about 150,000 gallons of water per day, but there does not appear to be any reason, except mechanical difficulties which can undoubtedly be overcome, why the unit should not be much larger.

DIAGRAM SHOWING THE RELATION BETWEEN THE RAINFALL AND RUN-OFF IN THE MERSEY WATERSHED.

shed has been delivered to the consumer unfiltered. To-day, however, the consumer is not satisfied with unfiltered water, and many authorities have been compelled by force of public opinion, backed up by that of the analyst and of the medical profession, to undertake the filtration of their supplies. Indeed, I have little doubt that in the near future the whole of the water supplies drawn from this source will be filtered.

We, as water engineers, cannot but be grateful that the mechanical filter has made this possible, as the older method of sand filtration would not only have entailed very large capital expenditure, but it is doubtful whether the large area of land required could have been obtained; and, again, the result of sand filtration, although bacteriologically good, is not comparable either chemically or physically with that of mechanical filtration.

The results obtained by mechanical filtration with water considerably discoloured and carrying large quantities of suspended matter are such that it is well worth consideration whether the flood water which now has to be passed to waste, even in dry years, cannot be successfully treated and so rendered available for ordinary domestic use, and seeing that, where gravitation works have been designed to take only a portion of the flood water, the watersheds are not fully reservoired, I think it is worth while considering whether, with the aid of mechanical filtration, and assuming that satisfactory reservoir sites

There is already a plant in course of construction with units 9 ft. in diameter, and experience will show how far this can be extended on the present designs. The cleansing of the filtering material, and the period for which it has to be dormant after washing, are probably the two most important factors which will need consideration, but the reduction in the number of units will tend to both economy in construction and reduced expense in working.

In my opinion also mechanically filtered water would be further improved if, before being delivered to the consumer, it were passed into a service reservoir to allow a secondary deposition of matter in suspension, which no ordinary laboratory analysis shows, but which I think is undoubtedly present. The addition of the aluminiferous and lime to the raw water, the chemical action thereby involved, and the bacteriological and chemical changes produced by filtration, all take place so rapidly that I venture to suggest that the time allowed is insufficient for the completion of the various processes.

The analyses I have tabulated in my description of the Stockport works were obtained from samples of the water taken immediately it left the filters, yet deposition took place in the service reservoir into which the water flows, taking the form of a film on the bottom and on the lower portion of the walls. This reservoir had been in use eighteen months, and during that time 400 million gallons had been delivered through 6 miles of cast-iron pipes from the

filters, and the water had stood, on an average, twenty-four hours in the reservoir.

I regard the action as in some respects analogous to the deposition which takes place after softening and filtering, an action which carbonating has frequently been introduced to counteract. An alternative cause of the deposit may be the action of the treated water on the cast-iron pipes, which in some districts has had the effect of loosening the corrosion and causing serious disturbance of the water as delivered to the consumer for varying periods after the installation of mechanical filters. I am pleased to say that Prof. Delépine, of the Public Health Laboratory, Manchester, has undertaken to give us the results of his research in this connection.

The cost of mechanical filtration varies with the quality of the water, which determines the quantity of chemicals needed. In the case of the Kinder water, the cost during the last twelve months has averaged one-tenth of a penny per 1,000 gallons, including wages of attendants and cost of chemicals. The amount of water used in washing the filter works out at 1 per cent, but I consider that a certain proportion of this may be set off against that which would otherwise have been used to cleanse the mains.

It will also be interesting to observe the effect of mechanical filtration of water on the community at large. We all remember the controversy which at one time prevailed between advocates of hard and soft matter, and we also know the detrimental effects which the medical profession attribute to the lack of mineral matter in moorland waters, to the action of such water on lead, and to the discoloration due to peat, all of which disadvantages are removed by this process. It must therefore be shown, particularly in districts formerly supplied with unfiltered water, to what extent mechanical filtration, with its chemical treatment, acts as a physiological or pathological factor in the health of the community.

REINFORCED CONCRETE.

The use of reinforced concrete in the construction of covered reservoirs is an advantage, especially in regard to cost of construction. Although I have found that the cost of the concrete with reinforcement, when laid, is approximately the same as that of the bulk-concrete, brickwork or other similar material which would have been necessary, a great saving is effected in the reduced amount of excavation relative to a given capacity of the reservoir. Thus, in a reservoir 20 ft. deep, to hold 4,000,000 gallons, which I have constructed, the cubical contents of the structure, including water space, when reinforced concrete is used, is 28,000 cub. yds., as compared with 35,000 cub. yds. if constructed of brickwork or bulk-concrete, while the area covered by the reinforced concrete reservoir is from 15 to 20 per cent less than that covered by reservoirs of bulk concrete or other material.

The extra cost of reinforced work per cubic yard is not only due to the steel reinforcement, but to the extra care which has to be exercised in the selection of the material to be used and the placing of it in position, as watertightness depends not on several feet thickness, but on inches only. The aggregate must be of exceptional quality and of carefully selected size and shape (it must not be of larger size than $\frac{3}{4}$ in., and as near cubical as possible), the cement should not be less than one-seventh of the whole in bulk (not weight), and the timbering must be carried out by skilled carpenters, the ordinary timberman not being sufficiently trained. No doubt, in course of time, as the use of the material increases, the timberman will become educated to the work, and highly skilled carpenters will not be required. It is also to be anticipated that, as the reliability of reinforced concrete is proved by repeated examples, the period allowed by the Local Government Board for the repayment of loans will be extended. As so much depends on the quality of the work, I consider it advisable that it should be carried out by administration.

DISTRIBUTION.

The difficulties connected with the distribution of water are well illustrated in the Stockport area, where the levels vary from 120 ordnance datum to 600 ordnance datum, and the water has to be passed through the low-lying districts to the higher parts. A high and low level distribution would, therefore, be most complicated and costly. The service reservoirs from which the supplies are given are situated at 770 ordnance datum, 580 ordnance datum, 450 ordnance datum and 475 ordnance datum respectively. That at 475 ordnance datum belongs to the Manchester Corpora-

tion, and it is possible to confine it to the supply of one district; but the remaining four-fifths of the supply has to be, to some extent, interchangeable as regards its area of distribution. The trunk main between the two higher reservoirs is therefore charged with water at a pressure which would be excessive in the districts supplied by the lower reservoirs, but to enable the supply from the higher reservoirs to be utilised as required in the lower districts, the junctions of the two systems of mains are fitted with reducing valves, so that the pressure in the lower areas is maintained equal to the static head of the lower reservoir, and the losses by friction are thus counteracted.

In some high districts, on the low pressure supply, special provision for fire extinguishing is made by means of underground tanks. These are watertight brick structures placed under the footways in the proximity of large "risks" fed by direct connections with the water mains, particular care being taken that the mains used are low pressure, and therefore not connected with sprinkler installations.

The cost of distribution is constantly increasing, due, in a large measure, to improvements of road surfaces, such materials as tarred macadam, rock asphalt, granite setts grouted with cement, concrete beds, and even reinforced-concrete beds, involving excessive cost in opening and making good. In some cases I have found that the reinstatement of the road surfaces has cost as much as, and even more than, the providing and laying of the main. Another difficulty is the ever-increasing number of conduits in addition to water pipes—such as gas, electric light and power, telephones, telegraphs and hydraulic power and the fixing of standards for electric lighting and traction. The footways are thus becoming so crowded that when the road surface is of such a nature as to be practically inaccessible for laying pipes, &c., special provision will have to be made in future town planning schemes for much wider footways to accommodate the various pipes, cables, &c. At the same time the authorities, having power to lay such conduits, will have to agree upon some definite system for adjusting their positions relative to each other. This has already been done in the borough of Stockport as regards municipal supplies of water, gas and electricity, each being laid at certain fixed distances from the building line.

CHARGES FOR WATER SUPPLY.

Water is the cheapest commodity with which the public is provided. In the case of cottage property the amount paid is, approximately, only $\frac{3}{4}$ d. per inhabitant per week. In the case of a house rented at, say, £30 per annum, fitted with bath and water-closet, with the usual average of five inmates, the maximum amount paid per inhabitant is between 2d. and 3d. per week. In a house rented at £50, between 3d. and 4d. per week, and even in the highest-rented houses of, say, £200, only 6d. per week. Not only is the amount of water consumed per head increasing every year, but by the wider meaning given by the Courts of Law to the term "domestic supply," the income of the water authorities throughout the country is being gradually but materially reduced. The difficulty arises chiefly from the fact that the Acts of Parliament under which we work do not define what a "domestic supply" is, but almost invariably what it is not, so that any new demand which arises cannot, from force of circumstances, be in the exception, and is therefore liable to be ruled a "domestic supply." In regard to some recent decisions I cannot refrain from remarking that, when a consumer uses a "domestic supply" for the purposes of a profitable trade, he should surely be liable for something over and above the normal charge for a domestic supply.

It must not be forgotten that both municipal and company undertakings must charge sufficient for the water supplied to meet the actual cost of providing, purifying and distributing it. Therefore, any serious reduction in the income from one class of consumers (as, for example, the trade consumer) must be met by increased charges on the other class of consumers (in this case, the domestic consumer), and therefore adjustment of the charges should be based upon some equitable principle, and not be subject to the various decisions obtained in the Courts of Law.

CONSUMPTION OF WATER AND PREVENTION OF WASTE.

Experience in this district shows that the domestic consumption of water is between 20 and 21 gallons per head, and, as the whole of the district is sewered on the water-carriage system, this may be considered satisfactory.

Actual measurement shows that, in cottage property fitted with water closets, the consumption is from 8 to 9 gallons per head per day, and, with baths in addition, 13 to 14 gallons; in the highest-class property, where water is used for garden, horses and carriages, or motor cars and such-like purposes, 40 gallons per head is consumed, and in large institutions, such as industrial schools, the consumption is 30 gallons per head per day.

With the increasing cost of new works, owing to the gradual exhaustion of what may be termed local watersheds, the increasing cost of distribution and the gradual elimination of special charges, it becomes more necessary, year by year, to use constant vigilance in the matter of waste, and British engineers may well congratulate themselves that from 30 to 40 gallons per head per day is sufficient for all needs as compared with the quantities our *confrères* on the Continent and in America have to provide—viz., from 100 to 150 gallons per head per day. In this connection Stockport may claim some credit for having introduced the first device for tapping water mains without first emptying them of water, a device now in very general use.

The new Model Code of By-laws recently issued by the Local Government Board, in the framing of which your council (acting both in conjunction with the Joint Committee on Water Regulations and independently) took a prominent part, has improved our position in the restrictions which we can justifiably impose on the consumer in regard to waste and misuse of water, and I have hopes that, in the future, further headway may be made in this direction. Our members figure so largely on the Joint Committee on Water Regulations that I can confidently ask you to support the work of this organisation to the utmost.

WATER DIVINING.

The water engineer has always had a deep distrust of those who claim to accomplish by intuition that which he can only do with some degree of certainty after years of study and experience, and I think that the results of the experiments which took place in April of last year under the supervision of a scientific committee (which included two of our members) is worth recording. The committee say "that whatever sensitiveness to underground water may exist in certain persons, of which some evidence has been given, it is not sufficiently definite and trustworthy to be of much practical value."

This is a result which will surprise none of us, and should be convincing evidence that the engineer is the only one to be trusted in locating and securing a public water supply.

There are matters of extreme importance which I have refrained from referring to, such as the codification of existing Acts of Parliament, and the necessity for new legislation relating to water supplies; the appointment of a central authority to deal with the allocation and protection of sources of supply; the investigation of available sources of both upland and underground water, and many others; but they have already been ably put before you by my predecessors, and I have therefore advisedly restricted my remarks to my personal experience and opinions in the hope that they may be of some value.

In conclusion I trust that during my year of office the institution will continue to progress in the good work which it is undoubtedly carrying on, not only for our own benefit, but for that of the authorities we serve.

WATER ENGINEER'S NEW PRESIDENT.

Mr. Thomas Molyneux, ASSOC. M. INST. C. E., the author of the foregoing address, was from 1881 to 1893 an assistant in the waterworks engineer's office of the Manchester Corporation, under the late Mr. Jas. C. Eastham. In 1893 he was appointed assistant water engineer to the Stockport District Waterworks Company, and later engineer. In 1899 he was actively engaged in the sale of the undertaking to the Stockport Corporation, and on the completion of the purchase his services were engaged by the Stockport Corporation as engineer. The works Mr. Molyneux has carried out include the sinking of boreholes to provide a supply of 1,000,000 gallons of water per day, and the installation of a softening plant to deal with this water. In 1901 he took part in the promotion of the Act of Parliament by which Stockport was empowered to take water from the river Kinder, and has since carried out the works in connection with the distribution of the water provided by this scheme, which includes the construction of two reinforced reservoirs. A portrait of Mr. Molyneux accompanies this issue in the form of an inset.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act ii., 2.

THE MUNICIPAL AND COUNTY ENGINEERS' MEETINGS.

To the Editor of THE SURVEYOR.

SIR,—The "Municipal and Counties" seems to be quite rejuvenated, and perhaps it was never before doing such useful work as it is at present. The membership is, I understand, going up in leaps and bounds. Not the least incentive to membership is, no doubt, the opportunity afforded of increasing one's knowledge by the visits. These visits, like many sermons, have three points—the printed description of the engineer-in-charge, the inspection of the works, and, lastly, and most particularly, the discussion, which includes requests for elucidation of difficulties.

The printed description by the engineer-in-charge is generally above reproach, and often is far more useful than a text-book. The inspection of the works is generally excellently well done, and at the same time gives the opportunity of some hurried further explanation on the various sites. Would it not, however, be wise to cut out some of the unproductive sight-seeing which strikes one as being more for the purpose of showing what a nice town so-and-so is than for engineering help?

The discussion, indeed, has room for much improvement. There is never a dearth of speakers; often half those present would like to make a few comments and ask a few questions, but the whole thing is generally much rushed. There is no doubt that for real usefulness a lot of short speeches is productive of far more good than a few long-drawn-out speeches. Unfortunately, however, added to the briefness of the time allowed for discussion is the drawback of lengthy speech making. It is more than useful to hear the terse opinions of some engineers who put their knowledge freely at the disposal of the members present. The time has, however, come undoubtedly for a limit to be put on all speeches at these meetings, and this might with advantage be fixed at five minutes. If this were done there would be an opportunity of hearing twenty-four members in a couple of hours. It being understood that oratory was not desired, encouragement would be given to many members who, although of a retiring disposition, have interesting things to say, to get up and say a few straight words without feeling that they ought to be silent because they were either unknown men or lacked the gift of words. Perhaps my remarks may receive consideration by those having the welfare of the institution at heart. In conclusion I should like to say that, having a fairly good carrying voice, and a certain amount of decision, I can generally manage to find a way of saying what I want to at a meeting, so my suggestion is not a case of two for myself and one for someone else.—Yours, &c.,

DETritus.

June 8, 1914.

ROAD TARS.

To the Editor of THE SURVEYOR.

SIR,—Be assured that those readers of your journal who are engaged in highway engineering, as well as the manufacturers of road material, recognise the assistance you have given them by publishing such selected papers as have reference to the art of the road maker. Many students of this great subject, with a keen desire for information, have not the opportunity to seek out for themselves the invaluable information which you from time to time place at their disposal.

Especially will those concerned with the preparation of tar for roads appreciate your aid in having given them in the current issue of *THE SURVEYOR* Mr. Sharple's fine paper on "The Relation between the Melting-point and the Viscosity of Refined Tars." The author's visit to England when he came to Europe to attend the Road Congress at Paris left pleasant memories with those who had the pleasure of meeting him, and it is needless to say that anything from his pen on the subject of which he is such a master will be highly valued.

Your views, as expressed in the editorial notice of Mr. Sharple's paper of the important property of viscosity in tar cannot be too widely known. In his presidential address to the Southern District Association of Gas Engineers and Managers in March last, Mr. Glover remarked on the necessity for a

"standard of viscosity and adhering to that standard." The Road Board, in the new edition of "General Directions and Specifications," recognise the importance of viscosity, and explain in a concise and simple form the conditions under which a service test for that property should be made.

The efficiency of road tars depends upon the amount of binding power present in that degree which is requisite for the particular nature of the work in hand; to this broad statement I would add the words which come at the end of your editorial notice—"assuming that the material is stable under traffic and weather conditions."

In the "Market Report of Gas Products," *Journal of Gas Lighting, &c.*, June 2, 1914, appears the following, dated London, May 30th: "The supply of tar and pitch for road purposes continues to absorb the attention of manufacturers."

Those few words are full of meaning to those who remember the time when tar distillers and gas engineers were not disposed to regard the preparation of road tars as a prominent factor in their sales products.—Yours, &c.,

JOHN HUTCHINSON.

11 Tothill-street,
Westminster.
June 9, 1914.

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

Sir,—Please let me use your columns again to point out to "Engineer" that, as he has carefully avoided answering any of my questions contained in my letter of the 29th ult., I take it that they are unanswerable.

He repeats, but in no way substantiates, his remark that coal-tar products destroy the good properties of natural bitumen. He surely knows that thousands of tons of natural bitumen are used annually in conjunction with tar products for road making and maintenance!

I refuse to answer him when he asks if I have recommended or do recommend it—"Half a loaf is better than no bread."

He says he has "thirty years' personal experience in refining bitumen for road paving." I challenge him to prove it. I further challenge him to prove that he or any of his "authorities" have anything else but a very limited knowledge of the manipulation of natural bitumen for road work outside the laboratory. . . .

The fact that "Engineer" considers my questions "not in the best of taste" will explain fully the reason why he omits answering them. I think he has shown bad taste also by continually attacking the Standardisation Committee and members of the Road Board, who might find less difficulty in justifying their *bona fides* than would "Engineer."

When "Engineer" gives you the same right, you have my permission to publish my full name, address and credentials.—Yours, &c.,

NOT SO DUSTY.

June 9, 1914.

Town Planning in Salford.—Salford Corporation decided on Wednesday to make application to the Local Government Board for authority to prepare a town planning scheme over an area of about 2,000 acres, principally in the north and west of the borough.

The Cheapest Gas.—The Widnes Corporation Gas-works produce what is claimed to be the cheapest gas in the world, and at a meeting of the town council on Tuesday further reductions in price were announced. The rate for motive power is now as low as 8d. per 1,000.

Surveyors' Institution.—The president (Mr. Howard Chatfield Clarke) and the council of the Surveyors' Institution will hold a reception, by arrangement with the council of the Zoological Society, in the Gardens of the Society, on Friday, June 26, from 4 p.m. to 7 p.m.

Sewer Cleansing.—Brighouse Corporation Highways Committee have decided to purchase, after a very successful trial, a sewer plough and cleanser at a cost of £12 12s. The inventor, Mr. Jas. Caine, sewers inspector to the Eccles Corporation, recently sold the first pair to his corporation after a successful demonstration on a congested pipe main under the tramway track.

SOME RECENT PUBLICATIONS.*

TECHNICAL MECHANICS. By Edward R. Mamer. Price 10s. 6d. nett. London: Chapman & Hall, Limited.

The author of this work is Professor of Mechanics in the University of Wisconsin, and this the third edition embodies many changes made in the light of ten years' use of the book as a text in the author's classes. The scope of the work is rather unusual, being neither the ordinary theoretical mechanics on the one hand nor, on the other hand, covering the same ground as a text-book on applied mechanics. It is really a work on theoretical mechanics specially adapted to meet the requirements of students of engineering. For example, the first chapters on forces are followed by a chapter in which the principles enunciated are applied to simple structures and their graphical analysis. Subsequent chapters are devoted to a consideration of the laws of friction, centre of gravity, suspended cables, motion and work. Many solved numerical examples have been included to elucidate principles—a feature which will doubtless be appreciated by the student. There is also a good collection of problems to be solved by the reader.

THE DOCK AND HARBOUR ENGINEER'S REFERENCE BOOK. By Brysson Cunningham, B.E. Price 7s. 6d. nett. London: Charles Griffin & Co., Limited.

In this handbook the author has endeavoured to compile and arrange, in a convenient manner, notes primarily made for his own use, which will, however, be found of general utility. A useful feature of the volume is that sources are indicated whence fuller information on any given subject may be derived if the reader so desires. The scope of the work may best be indicated by the following list of sections into which it is divided: (i.) General administrative, nautical and physical data; (ii.) cost of dock and harbour systems; (iii.) harbour construction; (iv.) dock construction; (v.) quay and dock walls and wharves, and their equipment; (vi.) locks, graving docks and floating docks, and their equipment; (vii.) dredging and subaqueous rock removal; (viii.) maritime canals, channel rectification, channel demarcation, and coast defence. Each section is written in a practical way, and the many illustrations render the text very clear. A copious index facilitates reference.

STEAM TURBINES. By J. A. Moyer. Second Edition. Price 15s. nett. London: Chapman & Hall, Limited.

This book is intended as a manual of the theory and practice of the design, operation and manufacture of steam turbines, the author's object being to give within the compass of a single volume of reasonable size all the information which the student or practical engineer is likely to require. Starting with the elementary theory of heat, the author next deals with the more simple problems of nozzle design, steam turbine types, and blade design. Several commercial types are considered, and among the later chapters are those which deal with tests of turbines, steam turbine economics, gas turbines, and electric generators for turbines. Most of the additions in this new edition are concerned with new applications of existing commercial types. New chapters on bleeder or extraction turbines and mixed pressure turbines are included. Much of the other matter has been rewritten, and many new examples have been added, so as to render the book more serviceable than before as a text-book for students of the subject and practitioners.

PRACTICAL ILLUMINATION. By Justus Eck, M.A., M.I.E.E. Price 1s. nett. London: S. Rentell & Co., Limited.

The object of the author of this pocket-book, intended for engineers, contractors, and all interested in efficient illumination by electricity, has been to encourage the reader to study the subject more extensively by placing the elements of the matter before him in a simple and practical way. In addition to sections dealing with direct incandescent and arc lighting and indirect lighting, the work contains much other information regarding the installation and maintenance of lighting systems and many kindred matters. The book should prove useful both to the consumer and installer of electric light, particularly by helping them to solve the problems which confront them on a scientific basis.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Why is it that the Leicester County Council decline to tar-paint the surface of their roads? Is it because the hunting interest is so strong, and there is a fear that this treatment of the road surfaces will cause them to be unduly slippery, or is it on account of the expense? Can nothing be done to these roads to keep down the dust which at the present season is excessive, and makes these roads almost impassable? What do the pedestrians say to it, and is not this excessive dust a menace to health?

Why cannot the Metropolitan omnibus companies manage their traffic a little better in the interests of the travelling public? Why should one often have to wait five or six minutes for an omnibus and then a whole flock of them arrive together? Why should they then appear to be in such a desperate hurry all to start together that they can hardly wait for their passengers to mount the vehicle? Would it not be much better in the interests of all concerned if they could be somewhat divided out into units?

What has become of the Barford and Perkins' three-axle road roller which was exhibited at the Exhibition last year in connection with the Third International Road Congress? Was it not claimed for this roller that it would diminish "the harmonic recurring waves or depressions" in the surface of a roadway treated by this roller? Has this roller, or one of similar type, been used anywhere, and, if so, with what results?

Is it a fact, as stated in the columns of THE SURVEYOR a short time ago by a correspondent, that street repairs in the larger provincial towns are better and more expeditiously effected than in the "Mighty Metropolis"? And if this is not a fact, why is it that no one has yet taken up the cudgels on behalf of the Metropolis to controvert this statement?

What has been the experience of concrete road beds, or strength crusts, reinforced with steel wire netting? Has sufficient time elapsed to state definitely whether the steel will rust and perish in such an exposed position, and what has been the experience with regard to cutting trenches in a roadway constructed in this manner? Subject to the replies to these questions proving satisfactory, must it not appear that this form of construction is on right scientific lines, and should meet some of the difficulties now encountered with road foundations?

Has not the time arrived for the serious consideration of the desirability of the formation of a Highway Engineers' Association, or some society of a similar nature, by which questions of road construction and maintenance only could be discussed? Or is it felt that there are already too many professional associations or institutions existing at the present time?

Is it a fact that the Permanent Committee of the International Road Congresses has recently passed a resolution to the effect that the papers submitted to the forthcoming congress at Munich must not be printed in any newspaper until a period of at least three months has elapsed after the congress? Will not this resolution stultify the object of these International Congresses—viz., the desire to give publicity to road questions—and prevent all newspapers reporting their proceedings? Is it too late to take steps to prevent this resolution being carried into effect? And what about the copyright laws of different nations?

Why is it that the Local Government Board allow the expenses of surveyors or members of councils attending, as delegates, the town planning conferences or meetings as a proper charge on the rates, whereas they refuse to allow such expenses for surveyors or delegates attending equally, if not more, useful conferences? Is it because the Local Government Board are anxious to boom the Town Planning Act more than any other sanitary Acts?

Why are there read at the Institution of Civil Engineers so few papers of interest to the municipal engineer, seeing that so large a number of members

of that institution are engineers or surveyors to local authorities?

When is the surface of a carriageway worn out, or at what stage of the wear is it necessary completely to repair or renew the surface? Who is the judge of this necessity? Is it the surveyor, his council, or the user of the road? Is not this question very largely one of opinion and description and amount of traffic? Is it not difficult, nay, almost impossible, to say at what exact date the road needs repairs?

Is it a fact, as is sometimes stated, that the dust from a road with an impervious surface is more detrimental to health than one that is of the ordinary water-bound construction? If this is so, does it arise from the fact that the organic moisture cannot be absorbed, or is it due to the "acid" dust which may generate on a road surface treated with some bituminous compound?

Can it not now be assumed that most of the objections to the monthly "Journal" of the Institution of Municipal and County Engineers have died down, and that the objectors, like the proverbial eels, have got used to it?

Has not sufficient time now elapsed since the introduction of the motor bus on our streets to be able to tell with some exactitude how far the indictment against this description of traffic is justified, and what is the exact measure of extra wear on the roads which has been caused in the Metropolis since this form of traffic was introduced? For instance, can it be shown that the wood pavements have been worn out much quicker since their use by motor buses, and, if so, what is the exact measure of wear?

How does the question of "security of tenure" now stand with regard to the municipal surveyor? Is it not possible that the present President of the Local Government Board may be more in sympathy with this movement than his predecessor in office? And could there not be some further efforts in this direction made by the Institution of Municipal and County Engineers?

When will the palatial new offices of the London County Council be finished? At the present rate of progression it looks as if these buildings will be ready for occupation by the grandchildren of the present members of the council, and then only if there are not too many strikes in the meantime.

What is the reason that, although in the United States of America they have a profound technical and theoretical knowledge of road construction and maintenance, we hear so many complaints of bad roads and streets in some of their larger centres? Is it because, as we sometimes hear, a considerable amount of the money voted for roads and streets is often diverted from its legitimate channels?

Is not the programme of the annual meeting of the Institution of Municipal and County Engineers at Cheltenham of a rather "severe" character? Are there not too many papers to be read and discussed, and too few excursions? How does the programme compare with former meetings of this institution at which some excellent and instructive excursions were arranged and carried out?

How long will it take the Massachusetts Highway Commission to convert their 7,200 miles of "dirt" roads into macadam roads, and how long did it take them to "treat with bitumen" the 1,200 miles of road surfaces out of the 20,000 miles which exist in the State? Is it surprising to hear that these "dirt" roads "are broken up by the frost for a few weeks in the Spring as they have not adequate foundations"? And what about the repair and maintenance of the remaining 12,800 miles of road? May we not consider ourselves fortunate that we have no county surveyors who have to grapple with such a problem, and that we have no "dirt" roads in this country?

May it not be taken as rather a "sign of the times" that the name of the candidate selected for the proposed appointment of engineering assistant to the county surveyor of Essex is to be submitted to the Road Board for their approval? Does not this rather point to the possibility of "State control" over our roads in the near future?

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

398. Road Construction.—Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

399. Fireproof Construction.—What fireproof preparations can be used for protecting timber, and what independent coverings may be applied for the same purpose? (S.A., 1905.)

402. Column Design.—A hollow cast-iron column is 9 in. in external diameter, its length is 12 ft., and its two ends are firmly built in. The compressive load it supports is 60 tons. What thickness must the metal be in order to have a factor of safety of 10? (T. R.)

403. Rain Gauge.—Describe, with sketches, a reliable form of rain gauge.

404. Collapsing Strength of Pipes.—What is the collapsing pressure in lbs. per square inch of a 3-in. cast-iron pipe, 12 ft. long, and of 1/4-in. thickness? Pressure on outside of pipe only. (H. V. A.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

400. Structures.—What is meant by a redundant member in a truss, and why are such members introduced? Sketch two simple trusses, each having at least one redundant member. (I.C.E.)

A frame, or truss, may, for the purposes of statics, be either incomplete, complete, or redundant. In the first case the truss is not properly formed into triangles, as in an ordinary queen-post truss, which, except for the rigidity of the joints at the ends of the queen-post, would obviously fail

FIG. 1.

under an oblique thrust. A redundant frame, on the other hand, is one in which there are too many triangles, the truss being completely triangulated apart from the redundant members. Fig. 1 shows a cross-braced queen-post truss, the braces being of round iron, and therefore capable of supporting tensile stresses only. It will be found on drawing the stress diagram that it is impossible to take into account both the stresses AB and CD. If either is omitted the diagram works out quite naturally. It is obvious that if AB is in tension, CD is in compression, and vice versa, and the member in compression is the redundant one. It will be seen on referring to the stress diagram that under the thrusts shown AB is the redundant

member; but it is also clear that when the wind pressure is acting on the other slope of the roof.

FIG. 1A.

the stresses in AB and CD are reversed, and CD becomes the superfluous member. It is this re-

Cincinnati Southern Railway Bridge
Central Span (510')

FIG. 2.

versal of the stresses due to the moving load that has to be provided against by introducing cross-

FIG. 3.

bracing; thus the central portions of the Cincinnati Southern Railway Bridge over the Ohio, for in-

FIG. 3A.

stance, are cross-braced; while the ends of the spans are constructed as Whipple-Murphy girders

(Fig. 2). The trains in passing over the bridge cause a reversal of the stresses in the members near the centre of the span. Fig. 3 shows a girder supporting both a distributed and a concentrated load on the bottom flange. On referring to the stress diagram it is seen that the members 2-16, 7-8, and 13-21 are not stressed at all, as is obvious also from first principles, for three forces acting at a point cannot be in equilibrium if two of them are in a straight line. (F. W. P.)

401. Specific Gravity.—A bullet of lead, whose specific gravity is 11.4, weighs 1.09 oz. in air and 1 oz. in olive oil. Find the specific gravity of the olive oil.

Since the weight of bullet in air is 1.09 ozs.
and specific gravity of lead is... 11.4

∴ the weight of an equal volume of water is $\frac{1.09}{11.4} = .0956$ ozs.

Again the weight of bullet in air is 1.09 ozs.
and the weight of bullet in olive oil is 1.00 "
then the weight of an equal volume of olive oil is .09 "

∴ the specific gravity of the sample of olive oil is $\frac{.09}{.0956} = .941$

(H. G. L.)

The specific gravity of a substance is a number merely, being the ratio

$$\frac{\text{Mass of a given volume of the substance.}}{\text{Mass of an equal volume of water.}}$$

In the case of the olive oil, call this ratio S.

Weight of bullet in air is 1.09 oz., and its specific gravity referred to water is 11.4.

Hence weight of an equal volume of water is $\frac{1.09}{11.4}$ oz., and weight of an equal volume of oil is $\frac{1.09 \times S}{11.4}$ oz.

When the bullet is lowered into the oil (Fig. 1), the forces acting on the bullet are:—

- (1) Its weight acting downwards (W).
- (2) The tension in the string from the balance

FIG. 1.

(T) acting upwards and measuring the apparent weight—1 oz.

(3) The buoyancy (F) acting upwards, being equal to the weight of oil displaced.

(4) The thrusts of the liquid on the surface of the bullet, these thrusts counteract one another, their algebraic sum being zero.

Equating the first three forces we have—

$$T + F = W$$

$$\text{i.e., } 1 + \frac{1.09 \times S}{11.4} = 1.09$$

$$\frac{S}{11.4} = \frac{1.09 - 1}{1.09} = .941$$

If the oil had been quite pure, and the observations more exact, our answer would have been about .915. There are two or three corrections to apply to the result on account of the buoyancy of the air, &c., but these would only affect the third decimal place, and that very slightly. (F. W. P.)

CONCRETE INSTITUTE.

ANNUAL MEETING AND DINNER.

The fifth annual general meeting of the Concrete Institute was held on Thursday, May 28th, when Prof. Henry Adams, M.INST.C.E., M.I.MECH.E., F.S.I., F.R.SAN.I., was installed as president for the ensuing two years of office.

The fourth annual dinner of the institute was held in the Crown Room, Connaught Rooms, in the evening, the president occupying the chair, among others present being Mr Horace L. P. Boot, M.I.MECH.E., M.I.E.E., president of the Institution of Municipal Engineers; Mr. C. McArthur Butler, F.C.I.S., secretary of the Society of Architects; Mr. Thomas J. Carless, M.C.I., president of the Quantity Surveyors' Association; the Hon. Sir John Cockburn, K.C.M.G., M.D., late Premier of South Australia; Mr. H. Kempton Dyson, secretary of the Concrete Institute; Mr. J. Ernest Franck, A.R.I.B.A., M.C.I., member of council and hon. secretary of the Parliamentary Standing Committee of the Concrete Institute, Mr. W. Curtis Green, F.R.I.B.A., president of the Architectural Association; Mr. George Hubbard, F.S.A., vice-president of the Royal Institute of British Architects; Mr. Ellis Marsland, M.S.A., district surveyor for Camberwell, president of the District Surveyors' Association; Mr. John Murray, F.R.I.B.A., Crown surveyor; Mr. F. W. Rice, president of the Institute of Builders; Mr. Leslie S. Robertson, M.INST.C.E., secretary of the Engineering Standards Committee; Mr Alexander Ross, past-vice-president of the Concrete Institute, vice-president of the Institution of Civil Engineers; Mr. H. D. Searles-Wood, F.R.I.B.A., vice-president of the Concrete Institute; Sir Henry Tanner, C.B., I.S.O., F.R.I.B.A., F.S.I., past-president of the Concrete Institute.

Mr. ELLIS MARSLAND, M.S.A., district surveyor for Camberwell, president of the District Surveyors' Association, in proposing the toast of "The Concrete Institute," offered his congratulations on the fact that the institute had, in the short space of six years, attained a membership exceeding 1,000. The institute had evolved order out of chaos, had standardised and regulated the whole system of concrete construction, so as to make it practical and workable.

The PRESIDENT, in replying, said the Concrete Institute had come in on a flood tide, and its immediate success was almost phenomenal. The meetings were crowded, and the copies of the papers were eagerly sought after; then, unfortunately, there was an ebb—the attendance fell off because it was found that in concrete alone there was not sufficient scope. The council, in considering the matter, came to the conclusion that some development was wanted, and he thought they wisely decided to admit papers on structural steelwork where no concrete was employed, or only employed in a secondary manner. The result was that the interest in the meetings was revived, and the attendance went up again with a bound. The council then fully considered the whole position, and came to the conclusion that some amplification of the title was desirable, and added a sub-title—"An Institute for Structural Engineers, Architects, &c." Structural engineering was the one term that best expressed the variety of work of which the institute took cognisance. But that did not mean structural steelwork alone; it included all kinds of buildings, and all materials where stability was the chief aim. It excluded architecture, town planning, railway and tramway work, sewerage work, waterworks, and mechanical engineering of all kinds. For some time past the council had been preparing a scheme of examinations. The intention was that the graduates and associate-members should be able to obtain certificates testifying to their knowledge of the various branches that came under the domain of the structural engineer and architect. At present the examination would be entirely voluntary; but there was no doubt that the time might come when the question of making them compulsory would be considered. The policy of holding examinations had been questioned in some quarters, but an examination certificate was the best form of testimonial, and with so large a proportion of young men among their members the opportunity of obtaining a certificate should be of great assistance.

Mr. H. D. SEARLES-WOOD, F.R.I.B.A., proposed the toast of "The Visitors," and Sir JOHN COCKBURN responded.

Mr. E. FINDER ETHELLES, F.PHYS.SOC., A.M.I.MECH.E., HON. A.R.I.B.A., M.C.I., proposed the health of the chairman, the PRESIDENT briefly responding.

Royal Institute of British Architects.—Mr. Ernest Newton, A.R.A., has been elected president of this body.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

EXTRAORDINARY TRAFFIC.—In *Worsborough Urban District Council v. Barnsley British Co-operative Society, Limited* (Court of Appeal, May 20th and 21st) the society appealed from the decision of Mr. Justice Rowlatt. For some time prior to the year 1904 the society had sent out to their various branches in the neighbourhood of Barnsley traction engines laden with goods along a main road which was suitable to bear such traffic. In that year, however, tramways were laid down in the main road, and the society then began to use a country lane, the only alternative route available. The council having remonstrated with them for so doing, they returned to the main road, and continued to use it till 1909. In that year the main road was paved with granite, which, as the society alleged, rendered it dangerous for their purposes. They accordingly from that time used the lane, which, being unsuitable for traction traffic, was thereby damaged. On behalf of the society it was contended that, in deciding whether there had been extraordinary traffic, it was material to consider (a) the motive of the persons conducting the traffic, (b) whether there is or is not an alternative route, (c) whether a road previously used has been rendered impossible to use by the action of the highway authority. Mr. Justice Rowlatt, however, held that these considerations were not material, but that the Court had simply to look at the phenomena as they occurred on the road in question, to see the nature of the road, and to decide whether the traffic was extraordinary; and he gave judgment in favour of the council. The Court of Appeal affirmed this decision. The Lord Chief Justice, without deciding whether the fact that a road is not adapted to particular traffic is conclusive that the traffic is extraordinary, held that the traffic was extraordinary, and that the road in question was not adapted to the traffic. Lord Justice Phillimore held that traffic remained extraordinary until the road was made fit to bear it. Mr. Justice Lush held that, the alleged fact that the society had been forced off the main road was immaterial, the question being whether the traffic in fact was extraordinary. The appeal was accordingly dismissed.

PRIVATE STREET WORKS: CHARGE ON PREMISES.—An important point as to the statutory charge upon premises for expenses of private street works was decided in *Croydon Rural District Council v. Betts* (Chancery Division, Mr. Justice Warrington, March 18th). The defendant was the owner of several houses and plots of building land abutting on two roads within the Croydon Rural District which had been made up by the council under sec. 150 of the Public Health Act, 1875. The expenses were apportioned in the usual way, and demand was made for payment. Default having been made in payment, the council applied to the Court for a declaration that under sec. 257 of the Act they were entitled to a general charge upon all the defendant's properties in both roads for the aggregate amount of the expenses apportioned in respect thereof. On behalf of the defendant, it was contended that the council were entitled only to a separate charge on each individual house or plot separately in respect of the sum apportioned thereon. Mr. Justice Warrington accepted this view. He said that the charge given by sec. 257 was a charge, not on the interest of the owner, but on the property itself. Hence it was only rational to hold that the Legislature intended that there should be a separate charge in respect of each separate plot; otherwise the charge could not be worked. It would be extremely unfair to the mortgagee of a small piece of land to have his security charged with a large sum in respect of other property of the mortgager. Sec. 257 confirmed that view. The charge was to be a charge on the premises in respect of which the expenses were incurred. The provisions for apportioning the expenses showed that the Legislature regarded the premises in respect of which the expenses were incurred as separate premises, and treated the expenses incurred as incurred in respect of these separate

premises. Hence the expenses were to be apportioned in respect of each separate piece of land fronting on the road, and the charge should be in respect of each separate piece of land.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HIGHWAY: BOUNDARY.—"Boundary" writes: Kindly advise me on the following points: (1) Is the centre of the growth of a hedge adjoining a highway the limit to which an owner may build a wall, always providing the public have an uninterrupted right over the whole of the road up to the toe of the bank? (2) or can the owner build a wall out to the toe of the bank? My council have had no difficulty in enforcing the former; now an owner claims a right to erect a wall 2 ft. or 3 ft. outside the growth of the hedge.

"The presumption of law where a highway is separated from adjoining land by a bank is that the whole of the bank is upon the adjoining land, and that the highway extends only to the foot of the bank" (Copnall's "Law Relating to Highways," 2nd edition, page 52). No authority is cited for this statement, however, and it appears to be intended to refer only to cases in which the bank is the only boundary, and therefore not to apply to the present case, where there is a hedge on the top of the bank. The ordinary presumption of law is that where there is a highway between fences the highway extends up to the fences on both sides. But this presumption may be rebutted by the nature of the ground or other circumstances (Pratt and Mackenzie's "Law of Highways," 15th edition, page 41). Assuming that there is nothing to rebut the presumption in the present case, the highway would, in my opinion, extend to the centre of the hedge, and the landowner could not build beyond that point.

SUBSCRIPTIONS TO INSTITUTION.—"F. H." writes: What is the position of a member of an institution who has discontinued paying his subscriptions for several years, during which period he has attended no meetings or otherwise acted as a member, being under the impression that his membership lapsed at the expiration of the year for which he last paid a subscription? Is he legally liable to pay subsequent subscriptions?

With respect to institutions to which the Literary and Scientific Institutions Act, 1854, applies, sec. 25 of that Act provides that any member who is in arrear with his subscriptions according to the rules of the institution may be sued. The Act applies to every institution "for the time being established for the promotion of science, literature, or the fine arts, for adult instruction, the diffusion of useful knowledge, the foundation or maintenance of libraries or reading-rooms for general use among the members or open to the public, or public museums and galleries of paintings and other works of art, collections of natural history, mechanical and philosophical inventions, instruments, or designs." By sec. 24, the governing body of such an institution is empowered to make by-laws. These by-laws usually contain provisions as to (*inter alia*) the method of election of members, the amount of the annual subscription, the notice to be given by members wishing to resign, the expulsion of members, &c. In my opinion, a member of such an institution who has not given the prescribed notice of resignation continues liable to pay his annual subscriptions until he gives such notice or is expelled. In some institutions every candidate for election has to sign a written agreement to be bound by the by-laws, but I think such an agreement would be implied even if not put into writing. The position is for all practical purposes the same with respect to institutions which are not within the Act, the rules of the institution representing the terms of the contract entered into between the members.

BUILDING BY-LAWS: EXEMPTION.—"J. D. K." writes: Any building in His Majesty's possession, or employed or intended to be employed for His Majesty's use or service, is exempt from the operation of by-laws relating to new buildings. Our by-laws require a duplicate system of drainage for buildings, one set of drains for sewage only, and one for surface water only, to be provided. Seeing that our town sewers were designed on the separate system, taking advantage of the exemption would place us in an awkward position. Is not the Crown impliedly bound by the by-laws?

It is a general rule that the Crown is not bound by an Act of Parliament except so far as the Crown is mentioned

The Surveyor

And Municipal and County Engineer.

therein (Glen's "Law of Public Health," 13th edition, page 943). The by-laws being made in exercise of powers conferred by sec. 157 of the Public Health Act, 1875, which does not mention the Crown, they would not, in my opinion, bind the Crown. And even if they did, the exemption clause would prevent them from being applicable to buildings in possession of his Majesty or employed for his use or service.

CROSSING OVER FOOTWAY IN NEW STREET.—"C. G. L." writes: Will you be good enough to state whether sec. 18 of the Public Health Acts Amendment Act, 1907, applies to any person laying out a new street involving passage for building and other materials across a kerbed footway?

As pointed out in "Lumley's Public Health Acts" (7th edition), page 1175, the meaning of this section is not clear. The owner of premises abutting on a highway has a common law right of access to that highway, and apparently, if he owns half the width of the roadway he can open a cartway across the footpath, so long as there is no unreasonable interference with the public rights. Whatever may be the effect of the section, however, it only applies to a street which has become repairable by the inhabitants at large, and which has a kerbed or paved footway. It would not apply to a new street until that street became repairable by the inhabitants at large.

Business Announcement.—Mr. W. E. Horsman, 127 Pendle-road, Streatham, London, S.W., informs us that, after having been for over thirty years with Messrs. George Waller & Son, he has now commenced business on his own account, and will in future trade under the style of W. E. Horsman & Son.

Housing at Warrington.—It has been decided by the Warrington Town Council to send a deputation to London to consult the Local Government Board on the Housing and Town Planning Act. It has also been decided to give notice that persons erecting houses in excess of twenty to the acre, pending the adoption of a scheme, would do so at their own risk.

A Chair of Town Planning.—The Senate of London University are instituting a part-time Chair of Town Planning, tenable at University College, at a salary of £400 a year. The professor will act in co-operation with the Professor of Architecture and the Chadwick Professor of Municipal Engineering, who deals with the engineering aspects of town planning.

Manchester and Electricity Production.—The Manchester City Corporation on Wednesday agreed to a recommendation of the Electricity Committee that its chairman, deputy chairman, and engineer should be authorised to visit Paris, Berlin, New York, Schenectady, Philadelphia, Pittsburg, Chicago, and Montreal, to inquire into (a) the most modern practice in regard to the design and equipment of large generating stations for economical production, and (b) the lay-out of modern extra high-voltage transmission systems.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Birkenhead T.C. (June 3rd. Mr. M. K. North).—£1,350 for the widening of Borough-road.—It is proposed to increase the width of the road at the part dealt with in the application from 18 ft. to 60 ft., and for this purpose it is necessary to purchase a strip of land. The proposed loan would cover the cost of the land and the necessary works.

Brackley T.C. (May 22nd. Mr. H. S. Stewart).—£2,200 for a scheme under Part III. of the Working Classes Act, 1890, for the provision of twelve houses.—The borough surveyor, Mr. A. A. Green, stated that there were no cases of overcrowding at present, but there were ten or twelve houses that should be closed. It was proposed to let the cottages at 4s. 8d. per week.

Evesham T.C. (June 9th. Mr. H. S. Bidwell).—£1,800 for the purchase of land as a site for working-class dwellings to be erected under Part III. of the Housing of the Working Classes Act, 1890.—The surveyor and sanitary inspector, Mr. H. S. Harvey, stated that there was considerable overcrowding in eighty-four dwellings. No dwellings under £13 per annum rent had been erected during the past five years. People were living under conditions detrimental to health and morals, and nothing could be done, for if they were turned out there was no place for them to go to. There was overcrowding all over the borough. The site, when fully developed, would accommodate 150 cottages.

Norwich T.C. (June 3rd. Mr. A. G. Drury).—£12,800 for the extension of the municipal offices on the site of the old fish market.—A statement in support of the scheme was made by the town clerk, Mr. A. H. Miller, and the city engineer, Mr. A. E. Collins, submitted the plans and explained them in detail. It was not disputed by the opposition that the existing municipal buildings were inadequate.

Penrith U.D.C. (June 4th. Mr. R. H. Bicknell).—£7,000 for gasworks improvements and extensions.—Part of the scheme is for the installation of mechanical stokers, which it was claimed would increase the make of gas by 500 ft. per ton of coal, and save £400 a year in labour.

Ramsbottom U.D.C. (June 2nd. Mr. R. H. Bicknell).—£1,450 for the widening and improvement of Bolton-street.—It was stated that the widening of the road would mean the removing of a bend, and would facilitate and protect the traffic along the road.

Hastings T.C. (June 9th. Mr. P. M. Crosthwaite).—£362 for the enlargement of a public convenience at White Rock; £3,755 for works of sea defence; and £640 for works of sewerage in Silverhall Park.—The town clerk stated that the corporation were constructing a sea wall at a point eastward of the town. The work had already been commenced, because during the gales in March last a large hole was made in the present wall by the waves. They had received many complaints from residents in the vicinity regarding the flooding of their premises, and the corporation were constructing a new wall in such a manner as would permit of the minimum of sea to wash over in the future. In addition to the new wall a great improvement would be effected to the roadway, which was probably narrower there than at any other portion of the parade. There would be a widening of nearly 12 ft., and general approval had been expressed in regard to the scheme. Statements were also made with respect to the other proposed works.

Salford T.C. (June 10th. Mr. T. C. Ekin).—£13,500 for the purpose of the electricity undertaking, and £70,000 for the gas undertaking.—The deputy town clerk, Mr. S. Carnt, stated, with respect to the first application, that it became necessary owing to an agreement arrived at between the Salford Corporation and the Manchester Ship Canal Company, by which the corporation agreed to supply electrical energy for the No. 9 Dock, which was within the borough's area of supply. In regard to the second application, Mr. Carnt stated that £7,100 was required for the erection of boundary walls in connection with the Liverpool-street gasworks. The board had previously sanctioned the expenditure of £2,000 for this purpose, and the corporation now asked for

that sanction to be cancelled, as since it was applied for they had bought additional land and would require a larger sum. For general prospective requirements the board had given their sanction to borrow £27,000, so that their application now was virtually only for £43,000. Of this it was intended that £42,000 should be spent in gas cookers, for which there was a large demand in the borough at present, meters, and the laying and maintenance of mains.

Southgate U.D.C. (May 26th. Mr. F. H. Tulloch).—£1,150 for the provision of an open space. The surveyor, Mr. C. G. Lawson, informed the inspector that the land to be acquired was about 2½ acres in extent.

Winchcombe R.D.C. (June 9th. Mr. H. S. Bidwell).—£1,150 for a housing scheme for the village of Alderton. It was explained that the council proposed to build six cottages and to purchase an acre of land for £100. It was intended to charge a maximum rent of 4s. a week, and if possible the rent would be less.

Yarmouth T.C. (June 2nd. Mr. A. G. Drury).—£1,300 for the construction of quay heading in the river Bure for the protection of the North River-road. The borough surveyor, Mr. J. W. Cockrill, said the work was necessary to keep in place and maintain the road. By the proposed work the road would be increased in width slightly. He believed Jarrah was the best wood to use, and well worth the extra cost. He had used Jarrah for river works about eighteen years, and there were no signs of decay.

APPLICATIONS FOR LOANS.

Arundel T.C.—£2,200 for the erection of ten five-roomed cottages, including street works and fencing.

Barnet U.D.C.—£8,000 for a housing scheme.

Carlisle R.D.C.—£60,000 for a water supply scheme.

Chester T.C.—£2,910 for street widening.

Chester-le-Street U.D.C.—£2,600 for the purchase of land for housing purposes.

Chesterton R.D.C.—£650 for the erection of four cottages.

Chorley T.C.—£3,963 for street improvement.

Cleckheaton U.D.C.—£1,700 for the purposes of the destructor.

Darlington T.C.—£41,000 for sewage disposal works and sewerage.

Dewsbury T.C.—£400 for road widening.

Docking R.D.C.—£1,000 for the erection of workmen's dwellings.

East Dereham U.D.C.—£312 for works of water supply.

Epsom R.D.C.—£850 for street works.

Hereford T.C.—£530 for an increased water supply at the electricity works.

Newcastle-upon-Tyne T.C.—£2,075 for work at the Ouseburn culvert.

Seaford U.D.C.—£1,000 for the purchase of land for a pleasure ground.

Sevenoaks R.D.C.—£2,000 for workmen's cottages.

Staines R.D.C.—£29,046 for a sewage disposal scheme.

Stroud U.D.C.—£1,650 for stables and the extension of the baths.

Swindon T.C.—£7,075 for school buildings, and £7,000 for electricity plant.

Tralee U.D.C.—£8,185 for the erection of thirty-nine cottages.

Wallasey T.C.—£11,912 for a housing scheme.

Walton-upon-Thames U.D.C.—£1,450 for the purchase of land for a recreation ground.

Westhamnett R.D.C.—£12,500 for a sewerage scheme for Selsey.

Wigan T.C.—£6,000 for new gas mains and services.

Worcester T.C.—£5,250 to cover expenditure during the next three years on electricity mains and transformers.

Yarmouth T.C.—£11,550 for a school at Newtown.

LOANS SANCTIONED.

Bath T.C.—£600 for an improvement scheme.

Bridlington T.C.—£1,300 for a widening scheme.

Camborne U.D.C.—£25,000 for a sewerage scheme.

Darwen T.C.—£5,000 for the installation of the water-carriage system.

Hove T.C.—£10,000 for the widening and improvement of Hove-street, repayable as follows: £6,120

repayable in sixty years; £3,022 repayable in twenty years; £858 repayable in thirty years.

Linthwaite U.D.C.—£1,200 for streets and sewers.

Merton and Morden U.D.C.—£3,130 for a recreation ground.

Norton U.D.C.—£119 for the Leavening water supply works.

Rathdrum U.D.C.—£2,700 for the housing scheme.

Sefton R.D.C.—£2,200 for sewage disposal and sewerage.

Shoreham U.D.C.—£200 for the extension of the town hall.

Walton-upon-Thames U.D.C.—£1,600 for sewer extension.

FORTHCOMING INQUIRIES.

23. Epsom. For works of water supply (Mr. A. G. Drury)		12,260

TOWN PLANNING.

30.—**Southend.** (Mr. George L. Pepler)

An Important Canadian Contract.—The authorities of the city of Toronto have accepted the joint tender of the John verMehr Engineering Company, Limited, as engineers, and Wm. Cowlin & Son (Canada), Limited, as contractors, for the new mechanical filtration plant at Toronto Island. The Ransome-verMehr Machinery Company, Limited, London, is the head office of the John verMehr Engineering Company, Limited, Toronto, and Wm. Cowlin & Son (Canada), Limited, is a branch office of Wm. Cowlin & Son, of Bristol. The work to be done, in addition to the pressure filtration plant (embodying Ransome continuous filters), includes the erection of filter-house building, pumping station building, suction well building, chemical storage and mixing house, coal storage building, wash-water tank, chimney and wharf. It is believed to be the largest single order ever placed for an installation of this description, the filters themselves being required to treat 60,000,000 imperial gallons of water per day of twenty-four hours, the total contract price being, approximately, £220,000.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Middlesex £58,000, Somerset; housing and town planning—Finchley £93,443; roads and materials—Limerick £34,251, Wanstead £50,000; sewerage and sewage disposal—Fleet £36,400, Larne £12,750, Westhampnett £12,500; water, gas and electricity—Carlisle £60,000. Particulars of other projected works will be found in our "Local Government Board Inquiries" pages.

ADMINISTRATION.

Chichester T.C.—Acting upon a report by the Highways Committee, it has been decided to separate the offices of surveyor and inspector of nuisances, that Mr. E. J. Lobley continue to be paid £250 a year for acting as surveyor alone, that Mr. Nash be appointed inspector of nuisances (to include the work of housing inspector) for one year, and so on, to devote the whole of his time to the work, and be paid a salary of £130 per annum, and that the surveyor's temporary assistant be dispensed with.

BUILDINGS.

Bideford R.D.C.—For the erection of ten workmen's cottages, a series of tenders amounting to a total of £2,025 have been accepted.

Brixham U.D.C.—The surveyor, Mr. J. Silley, has been instructed to prepare alternative plans and estimates for the erection of a pavilion or shelter on Furzeham recreation ground.

Burnham (Somerset) U.D.C.—It has been agreed to fit up part of the old fire station as a mortuary.

Middlesex C.C.—It has been decided to erect at Eastwood, in compliance with the provisions of the National Insurance Act, a sanatorium at a cost of £58,000, to accommodate 280 consumptive patients.

Somerset C.C.—The Local Government Board have intimated their approval of the council's scheme for a county sanatorium upon a site at King's Castle, near Wells.

Southmolton R.D.C.—Plans of a proposed new bridge at Drayford have been passed by the council, and forwarded to the county council, the latter authority having sanctioned a contribution of £1,000 towards the cost of the structure.

Uckfield U.D.C.—The Sanitary Committee have been authorised to obtain the necessary particulars as to the cost of a proposed municipal slaughterhouse.

Wallasey T.C.—The council on Tuesday accepted the contracts of Messrs. Hughes & Stirling, Liverpool, at £11,437 for the new electricity buildings; of Messrs. Ferranti, Limited, London, at £1,304, for the transformers; and of M. Louis Prat, London, at £1,084, for three steel chimneys.

Whitby U.D.C.—Plans are being invited for a shelter at the Spa, at a cost not exceeding £1,000.

HOUSING AND TOWN PLANNING.

Alnwick U.D.C.—The surveyor, Mr. Geoffrey Wilson, has received instructions to prepare plans for cottages with two bedrooms in No. 2 area.

Arundel T.C.—The tender of Mr. Sydney Payne, of Southwick, at £1,914, has been accepted for the erection of ten five-roomed cottages. The Works Committee, in submitting the recommendation, stated that they would much have preferred to have six-roomed cottages, but they were unable to decide upon that owing to the high price of building materials.

Aylsham R.D.C.—It has been decided to build six workmen's cottages.

Bridgnorth T.C.—The council on Tuesday decided to submit to the Local Government Board for their approval plans prepared by the borough surveyor, Mr. E. Trevor, for dwellings on two sites provisionally selected. The approximate estimate for the erection of the dwellings, in pairs, on the Bacon's Croft site in Mill-street was £203 each, and on the Cliff-road site, in four, £185 each. These amounts did not include cost of site, roads, fences, nor extension of gas, water and sewage mains. Having regard to the total

cost it was further estimated that on a rental of 3s. 6d. a week, free of rates, there would be an annual loss of over £2 each. If let at 4s. a week, the tenant also paying poor-rate and water-rate, there would be a loss of about 9s., or at 4s. 6d. a week, in addition to poor-rate and water-rate, a profit of about 15s. each per annum.

Docking R.D.C.—A scheme has been adopted for the erection of six cottages at Brancaster, at a cost of £150 each.

Feckenham R.D.C.—A draft scheme for the erection of ten workmen's dwellings at Astwood Bank has been submitted to the Local Government Board. The items include the purchase of 1 acre of land, £242; estimated cost of building, £1,575; sewerage and water supply, £50; fencing, £25; architect fees and legal expenses, £45; a total of £1,937. Based on a calculation that the houses were let at 4s. a week, the tenants paying rates, a surplus of £4 a year would be realised by the council. Including rent and rates the cost to the tenants would be from 5s. 6d. to 5s. 9d. a week.

Finchley U.D.C.—A scheme for the erection of 300 houses at an estimated cost of £93,443 has been approved generally by the Local Government Board.

Guildford T.C. A proposal to accept a tender for the erection of twenty cottages in Old Farm-road has been referred back to the Housing Committee in consequence of the receipt of a letter from the tenderer stating that a clerical error had been made in filling up the form of tender. A councillor stated that the lowest tender was £1,000 more than the tenders accepted in 1912 for building a similar number of cottages.

Nottingham T.C.—The council on Monday approved the Housing Committee's proposal for laying out an unhealthy area under the Nottingham (Carter-gate and Mauvers-street) Improvement Scheme, 1912.

PARKS AND OPEN SPACES.

Briton Ferry U.D.C. A bowling green is to be constructed at an estimated cost of £150.

Dundee T.C.—The Town Planning Committee recommend the corporation to purchase the freehold of 25 acres round the Law at a cost of £1,700, for the purpose ultimately of a park.

Exmouth U.D.C.—Land is to be purchased at a cost of £1,050 for the purpose of public tennis courts.

Swanage U.D.C.—It has been decided to apply to the Local Government Board for powers to borrow £7,500 with a view to purchasing the recreation ground near the sea-front, which is at present held on lease. The owner has met the council in the most favourable manner with regard to the purchase, and the council have unanimously accorded him a vote of thanks for his public-spirited action.

REFUSE COLLECTION AND DISPOSAL.

Dromore U.D.C.—Being pressed by the Local Government Board, the council have resolved to give consideration to the system of refuse removal. At present there is no systematic collection of rubbish, and a serious nuisance is threatened from accumulations.

Portadown U.D.C.—Consequent upon a report by a special committee, the council have agreed to adopt a scheme of domestic scavenging by their own workmen, and to make a charge upon the occupiers for the removal of refuse.

ROADS AND MATERIALS.

Axminster R.D.C. The surveyor, Mr. G. A. Millard, at the recent council meeting, stated that during the last month he had kept a very accurate record of the time he had spent in the office and the time he had spent out, and he found that altogether he spent ninety-one hours at the office. That, he thought, represented about ten days, and in addition to that he had six days in the month on which he paid wages, and two days to prepare for the annual meeting. That was eighteen days, and left him working six days to do the work of the council. Mr. J. Richards proposed that a clerk be appointed. Mr. Bates seconded, and stated that, from the facts the

surveyor had told them, they must come to the conclusion that something must be done. Six days on the road was not sufficient for an expenditure of £6,000. The proposition was agreed to.

Blaenavon U.D.C.—The question of refuse disposal is to be considered at a special meeting of the council. The surveyor, Mr. E. W. Edwards, stated that the present cost is about £617 per annum, equivalent to a rate of 5½d. in the £. He estimates the cost of a refuse destructor, including purchase of land, at £2,750, equivalent to a rate of 7½d. in the £.

Gamberwell B.C.—A section of Rye-lane from Hanover-street to Hanover-park is being laid with lithofalt by the Limmer Asphalt Paving Company, Limited.

Chingford U.D.C.—The council have accepted an offer by the Road Board of a loan of £600 for the improvement of Hall-lane.

Durham T.C.—The city surveyor, Mr. J. T. Pegge, has received instructions to carry out tar-grouting in North-road, at a cost of about £700.

Edinburgh T.C.—The Streets Committee recommend that the roads to be traversed by the corporation motor buses should be tar-sprayed.

Elgin C.C.—A letter has been received from the Road Board stating that the board would be prepared to give grants in connection with the proposed improvements on the Palmercross and Pittendreich road, and the Dulnain Bridge and Grantown road. The estimated cost of the work was £2,934, and the board had proposed to give a grant of £2,299, and £700 on loan, free of interest. The County Road Board have agreed to accept the offer for the Palmercross and Pittendreich road, and to ask for a five-sixth grant for the other road, which was stated to be essentially a motor road.

Farnham U.D.C.—The surveyor, Mr. R. W. Cass, has received instructions to prepare a scheme for the widening of part of Longdown-road, an intimation having been received that the council would probably obtain substantial contributions towards the cost from the county council and the Road Board.

Fermanagh C.C.—The Road Board have offered a grant of any amount up to £2,500, in addition to past grants, for work that may be executed up to the end of 1915, with the proviso that the district councils should provide £1 for £1. The grants are to be spent on strengthening the surfaces of roads and improving bad corners.

Hampstead B.C.—The council having agreed to undertake the necessary paving, an intimation has been received from the London County Council that it is their intention to proceed with the acquisition of the property required for the widening of High-road, near Messina-avenue.

Hove T.C.—The Works Committee recommend that the tender of Messrs. J. Parsons & Sons, 176 Church-road, Hove, at £295, for carrying out the proposed new street works in Ferndale-road be accepted. The committee also recommend the acceptance of the tender of the Improved Wood Pavement Company, Limited, 46 Queen Victoria-street, London, at £941, for providing and laying wood paving and taking up and relaying existing wood paving adjoining Palmeira Lawn.

Hursley R.D.C.—An application has been made to the Road Board for a grant to improve the road between Highbridge and Allbrook, and the Winchester and Eastleigh councils are to be asked to join in an application to the county council to take the road over as a main road.

Limerick T.C.—The Improvement Committee recommend the council to adopt an extensive paving scheme, estimated to cost £34,251.

Morayshire C.C.—The Laurencekirk District Committee have in contemplation an extensive scheme of road improvement. Recently the chief engineer of the Road Board (Mr. H. P. Maybury) visited the district and inspected the roads, and the committee met and considered a scheme. Among other things the scheme provides for the development of the Knock Hill quarry, and for the purchase of quarrying plant costing about £800.

Nottingham T.C.—The council on Monday approved a scheme for widening Hkoston-road by the purchase of the necessary land.

Rotherham T.C.—The Road Board have sanctioned a grant of £1,000 towards the cost of the improvement of College-square.

Surbiton U.D.C.—On Monday the council agreed to certain replies—prepared by the clerk, Mr. F. W. Wood, and the surveyor, Mr. H. T. Mather—to questions put by the Local Government Board as to arterial roads in Greater London. The following query and reply are given as being of general interest: Have you any opinion to offer as to the width of roads for various purposes and requirements—*i.e.*, as to whether roads of short length for estate or domestic purposes should be narrower, and main traffic routes wider than are required by the by-laws in force in your district?—Answer: Certainly main traffic routes should be wider than the width prescribed for roads by the local by-laws (36 ft.). The carriageways should not be less than 40 ft., and if likely to be used by tramways should be at least 50 ft. On the other hand, roads which are of short length and which are likely to be used by domestic traffic only might be narrower than 36 ft., and a by-law to this effect is now under the consideration of the council. For general estate or domestic purposes, as long as the distance between fronts of buildings is under control, it is only necessary to have the road wide enough for the particular class of traffic it is likely to serve. This depends on length, character of property and any other considerations.

Walton-upon-Thames U.D.C.—The council have decided to proceed with the scheme of the surveyor, Mr. R. Wilds, for the widening of Esher-road.—It has been agreed to make up Crutchfield-lane for a distance of 249 yds., at an estimated cost of £592.

Wanstead U.D.C.—The surveyor, Mr. C. H. Bressey, reports that the Road Board have agreed to finance a scheme of wood paving for practically all the main roads, and other works, at an estimated cost of £50,000. The work will extend over three years.

Warrington T.C.—The council have accepted a tender by the Limmer Asphalt Paving Company, Limited, for laying lithofalt blocks over 1,000 yds. of roads.

Westmorland C.C.—The Road Board, it was announced at the council meeting last week, had voted a further grant of £1,361 towards road improvements which were being made. At the present time, the chairman of the Main Roads Committee stated, they received 32 per cent of the whole money spent on the roads of the county, but he hoped the committee who had the thing to settle in the future would see that it would be unfair only to allow relief on that basis, as the roads cost 8s. 4d. per head to keep in order, whereas those in Lancashire cost only 4s. 6d. per head. Lancashire expected to get 4d. in the £ relief from the rates, whereas in Westmorland no further benefit was expected.

Whitley and Monkseaton U.D.C.—The new lower promenade and public shelter constructed by the council out of revenue were formally opened on Saturday. In the course of the proceedings appreciative reference was made to the interest taken in the scheme by the surveyor, Mr. A. J. Rousell.

SEWERAGE AND SEWAGE DISPOSAL.

Cuckfield R.D.C.—A report by Messrs. Strachan & Weekes on a drainage scheme for Handcross has been referred to the parish councils concerned.

Fleet (Hants) U.D.C.—At the last meeting of the council the clerk reported that the Local Government Board had approved, without requiring any modification, the scheme of sewerage and sewage disposal for the drainage of Fleet, prepared by the council's consulting engineer, Mr. T. J. Moss-Flower, Westminster and Bristol, and had sanctioned the borrowing of the amount required to carry out the work—*viz.*, £36,400. Instructions were given to the solicitor to complete the purchase of the land for the air-compressing station, and to complete the lease in connection with the land required for the sewage disposal works. Tenders for cast-iron pipes were received, and referred to the engineer for report. The scheme involves some 16 miles of gravitating sewers. The sewage will concentrate at several points, from which it will be ejected to the sewage disposal works, which are a long way from the residential part of the town. The ejectors will be worked by means of compressed air from a central air-compressing station. The sewage disposal plant consists of screening chambers, balancing, detritus, sedimentation, upward-flow, storm and dosing tanks, primary and secondary percolating filters, humus channels, works for the disposal of the sludge, and for dealing with storm-water and other incidental works. Tenders are to be at once invited for the work.

Larne U.D.C.—A scheme of sewerage, which it was stated had occupied the attention of the council for thirteen or fourteen years, was finally adopted last week, when the council instructed Mr. G. M. Taylor to prepare the necessary plans, specification and estimates for the sea outfall, storage tank, and gravitation sewer to Lahorna Hotel, the whole of the sewers shown in his original report, and the pumping station, at an estimated cost of £12,750.

Newcastle (Ireland) U.D.C.—A contract has been sealed for the work in connection with a scheme of sewerage.

Peterborough R.D.C.—The surveyor, Mr. G. A. Penwill, has received instructions to carry out the Eye drainage scheme by direct labour.

Westhampnett R.D.C.—The council have adopted a sewerage scheme for Selsey prepared by Mr. Howard Humphreys, which is estimated to cost £12,500. Mr. Humphreys reports that float tests showed quite clearly that a reasonably satisfactory point of outfall could be obtained in Bracklesham Bay if the sewage was discharged upon the falling tide, and providing the sewage was partially treated prior to discharge. It was to be regretted that no satisfactory point of discharge for crude sewage could be found either to the east or west of Selsey; the currents were so peculiar, however, that, unless the council were prepared to incur a very heavy expense for a long outfall sewer, it would be needful partially to treat the sewage before discharging the same into the bay. It was scarcely needful, perhaps, to state that Selsey was a most difficult place to drain economically. Roughly speaking, there was a square mile of land to be dealt with, and very little fall in any direction; to make matters worse there was subsoil water a few feet below the surface, together with a large amount of running sand. Unless the scheme was to cost an enormous amount, it was evident that the sewers must be kept at as shallow a depth as possible; at the best the work would be difficult. Moreover the population was very scattered. After much consideration, it seems that the best course to pursue would be to gravitate the greater part of the sewage to tanks, and to raise the sewage of the lower areas by means of automatic air lifts discharging into the gravitation sewers. It was clear that no purely gravitation scheme was possible, even if they could safely discharge crude sewage at the Bill, for they could not get self-cleansing gradients for the pipes and the average depth of the sewers would be at least 12 ft. Air lifts could be placed anywhere they were required, and so, when the eastern side of Selsey developed fully, all that would be needful would be the provision of one extra lift near the Beach station.

Wolstanton U.D.C.—The tender of Mr. S. Heath, at £980, has been accepted for the construction of the new sewage outfall works at Apedale-road.

WATER, GAS, AND ELECTRICITY.

Carlisle R.D.C.—A scheme for the supply of water to the whole of the council's area, at an estimated cost of £60,000, was adopted on Monday last. The source of supply is Roughton Gill mine on Coldbeck Fells.

Derby T.C.—The council are recommended by the Highways Committee to provide an installation of 500 patent automatic gas controllers and pilots, at a cost of £653.

Loughborough R.D.C.—The question of the Hathern water supply has been referred to a special committee of the council, with the clerk, medical officer, and engineer, Mr. F. W. Hodson.

Loughborough T.C.—The profit earned by the gas undertaking last year was £7,884.

Nottingham T.C.—The council on Monday adopted an instruction to the Lighting Committee to confer with the electrical engineer, with a view of arranging for experiments to be carried out in certain streets by suspending metal filament electric lamps from cables or attached to the tramway standards.

Southampton T.C.—The waterworks engineer has submitted a report stating, with respect to the Otterbourne water supply, that the chalk had been reached at a depth of 14 ft. from the surface in the trial shaft at the southern boundary of the land recently purchased, and there was no doubt that the proposed scheme to connect adits in that land with the present adits, although at a lower level, was perfectly feasible, and he was strongly of opinion that a permanent shaft should be sunk and adits driven so as to increase

the supply without delay. The council have decided to refer this report to Mr. Rolfe, engineer, and Mr. W. Whitaker, previous to asking for a loan of £5,000 for the proposed works.

Swansea T.C.—Twenty-two new fire hydrants are to be purchased, at an estimated cost of £162.

Tendring R.D.C.—The council have instructed Messrs. Taylor & Wallin, of Newcastle-on-Tyne and London, to prepare a scheme for and report upon the water supply of the parish of Great Bentley, Essex.

Tetbury U.D.C.—A water supply scheme estimated to cost £3,255 has been submitted to the Local Government Board.

Truro T.C.—An amended scheme for electric lighting has been adopted, the cost being estimated at £9,700.

MISCELLANEOUS.

Brighton T.C.—The tramway undertaking last year earned a nett profit of £842.

Hull T.C.—The tender of the Brush Electrical Engineering Company (Limited) has been accepted for twenty tramway car bodies at £181 each; the tender of the M. and G. Trunk and Engineering Company (Limited) for twenty trucks at £49 17s. 6d. each; and the tender of Siemens Brothers' Dynamo Works (Limited) for twenty pairs of motors for ordinary series parallel at £181 per pair, and twenty pairs of controllers of their latest pattern at £3 per pair.

Plymouth T.C.—The nett profit of the tramway undertaking last year was £4,037.

Winchester T.C.—It has been agreed to purchase a motor fire engine, at an estimated cost of £1,000.

Wolverhampton T.C.—The nett profit of the tramway undertaking last year was £5,553, equal to a rate of 3½d. in the £.

York T.C.—The Tramways Committee's report for the year ended March 31st, which marks the completion of four years since the tramways were taken over by the corporation, shows that the receipts yielded a nett surplus, after interest, sinking fund, and all charges have been met, of £2,523.

FOR OTHER ADVERTISEMENTS

See End of Paper.

GOOLE URBAN DISTRICT COUNCIL.
APPOINTMENT OF TOWN SURVEYOR.

The above Council invite applications for the above appointment.

The salary will be £200 per annum, payable monthly, and the person appointed will be required to reside in the Urban District and devote his whole time to the duties of his office.

He must have a thorough knowledge of the Construction and Maintenance of Roads, and be capable of preparing Plans and Estimates for new works.

Applications, on pre-scribed Forms to be obtained on receipt of stamped addressed envelope, stating age, qualifications and experience, together with copies of three recent testimonials, to be sent to the under-mentioned not later than Saturday, 27th June, 1914, endorsed "Town Surveyor."

Canvassing, directly or indirectly, will be a disqualification.

(By order)

ROBERT TYSON,

Clerk to the Council.

Council Offices,

Goole.

(1,697)

ESSEX COUNTY COUNCIL.

CLERK OF WORKS

Wanted, at once, a Clerk of the Works for six months, competent to supervise the Construction of a Ferro-concrete Bridge (Hennebique System) at Ongar, Essex.

Only applications from those having previous experience in Ferro-concrete will be considered.

Salary £3 3s. per week.

Applications, with two recent testimonials (copies only), to be sent not later than 17th June, 1914.

PERCY J. SHELDON, M.INST.C.E.

County Surveyor.

County Surveyor's Offices,

Chelmsford.

June 11, 1914

(1,700)

ASSISTANT desires appointment in Surveyor's Office. Good experience in building, surveying, levelling, and road making. Good draughtsman. Moderate salary.—Box 1,432, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.
(1,695)

ASSISTANT desires appointment in Surveyor's Office. Expert shorthand-typist; experience in surveying and levelling; good mathematician. Five years' experience Road and Sewer Contractor's Office. Moderate salary.—Box 1,433, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.
(1,699)

WHITSTABLE URBAN DISTRICT COUNCIL.

SEWERAGE AND SEWAGE DISPOSAL WORKS.

CONTRACT No. 2.

SLUDGE PUMP AND OIL ENGINE.

The above Council are prepared to receive Tenders from competent persons for the supply and erection upon the Council's Sewage Disposal Works at Swalecliffe of a Sludge Pump to deliver 4,000 gallons of sewage sludge per hour, and an oil engine to drive the same, together with accessories.

Full particulars of the proposed plant, together with Specifications and Forms of Tender, may be obtained on application to Messrs. Strachan & Weekes, Civil Engineers, 9 Victoria-street, Westminster, on and after Monday, June 15, 1914, on payment of a deposit of One Guinea by cheque, which will be returned on receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Tender for Sludge Pump," are to be delivered at my office at Whitstable at or before 12 noon on Monday, June 29, 1914.

The lowest or any Tender will not necessarily be accepted.

(By order)

J. F. WHICHCORD,

(1,696)

Clerk.

TUNBRIDGE RURAL DISTRICT COUNCIL.

RURAL HOUSING.

TO BUILDERS AND CONTRACTORS.

The above Council invite Tenders for the erection of 25 Pairs Cottages in connection with above scheme, in various parts of their district as follows:—

A.—Brenchley (Petteridge site)	...	3	pairs.
B.—" (Pixot Hill site)	...	2	"
C.—Paddock Wood (Warrington site)	...	3	"
D.—" (Catts Place site)	...	2	"
E.—Hadlow	...	5	"
F.—Hildenborough	...	2	"
G.—Horsmonden	...	4	"
H.—Pembury	...	4	"

Plans and Specification and Form of Contract may be inspected at the office of the Surveyor, Mr. Frank Harris, the Broadway, Southborough, Tunbridge Wells, between the hours of 9.30 a.m. and 5 p.m., Saturdays excepted, until the time appointed for the delivery of the Tenders.

Any person desiring to tender and to receive a copy of the Bills of Quantities must send in his name and address, accompanied by a deposit of £2 2s., so as to reach the undersigned not later than the 22nd June. The deposit will be returned provided the tenderer shall have sent in and not withdrawn a *bonâ-fide* Tender.

Copies of the Bills of Quantities will be posted to applicants on or about the 25th June. Tenders, on forms which will be supplied with the Bill of Quantities, must be enclosed in a sealed envelope endorsed "Tender for Rural Housing," and sent or delivered to the undersigned not later than 10 a.m. on Tuesday, the 7th day of July, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

NEVILLE R. STONE,

Clerk to the Council.

23 Church-road,
Tunbridge Wells.
June, 1914.

(1,698)

PERSONAL.

Mr. J. W. Cockrill, borough surveyor of Yarmouth, has been supplied by his council with a Belsize motor car.

Mr. P. A. Benn, deputy borough surveyor of Loughborough, has been appointed city surveyor of Lichfield, at a salary of £200 a year.

Mr. W. Smith Wilson, of Kenilworth, and Mr. L. Walker, of Cudworth, have been appointed junior assistants to the borough surveyor of Chesterfield.

Mr. A. S. Butterworth, city engineer of Port Elizabeth, will, it is reported, pay a business-cum-pleasure visit to England about the end of the year.

Mr. Austin H. Elliott, ASSOC.M.INST.C.E., P.A.S.T.I., who was chief assistant to Mr. J. R. Elliott (Messrs. Elliott & Brown), civil engineer, Nottingham, assistant in the borough surveyor and water engineer's office, Lancaster, and eleven years engineering assistant to the city engineer, Nottingham, has been appointed engineer and surveyor to the Carlton Urban District Council, Notts, and commences his new duties on July 1st.

Mr. William Lewis Harpur, county road surveyor for Breconshire, son of Mr. William Harpur, city engineer of Cardiff, was married on Monday at the parish church of Llangorse (Breconshire) to Miss Mabel Powell, second daughter of Alderman David Powell, J.P., and Mrs. Powell, Caedryssu, Brecon. Afterwards a reception was held at Lake House, Llangorse, and subsequently Mr. and Mrs. Harpur left for Aberystwyth.

Major Henry Macaulay, who for thirty years was borough surveyor of Kingston (Surrey), and for another five years consulting surveyor to the corporation, celebrated his eighty-fourth birthday last week. He is in excellent health, and recently was present, as a member of the National Reserve, at the inspection by Lord Roberts. He is at present preparing plans for the extension of the Victoria Hospital, of which he is the honorary architect.

Mr. T. Waddingham, surveyor to the Hebden Bridge Urban District Council, who, as announced last week, has retired with the object of commencing business at Grimsby on his own account, is the subject of a highly appreciative article in the *Hebden Bridge Times*, the writer of which says: "Many important and permanent improvements have been made during his surveyorship, and considerable economies effected by his enterprise, backed up by a progressive council. Inquiring for details of these, we find an extensive list which makes interesting reading, and which will be informative to the Hebden Bridge ratepayer in showing how his interests are being served by the council and its officials."

Mr. D. M. Jenkins, ASSOC.M.INST.C.E., borough engineer of Neath, was the chief figure of an interesting function recently, when his past and present engineering pupils gave expression to their appreciation of their former chief by presenting him and Mrs. Jenkins on the occasion of their silver wedding, with a silver tea set and tray. The front of the tray was engraved with the initials "D. M. & S. A. J., 1889-1914," and the back bore the following inscription: "Presented to D. M. Jenkins, Esq., ASSOC.M.INST.C.E., and Mrs. Jenkins, on the occasion of their silver wedding, by his past and present engineering pupils, as a slight token of their appreciation and best wishes." The following are the names of Mr. Jenkins' past and present pupils who took part in the presentation: Messrs. T. Thomas, chief engineering assistant, Hull; A. H. Quick, London County Council engineer's department; E. C. Pole, deputy county surveyor, Glamorgan; D. Edwards, borough surveyor, Taunton; W. L. Jenkins, county surveyor, West Suffolk; R. Dudley, 80 North-gate, Regent's Park (late city engineer, Lucknow); D. P. Howells, town engineer, Benoni, Transvaal; F. G. Price, Great Western Railway engineer's department, Paddington; D. S. Thomas, Neath; N. H. Moore, Great Western Railway divisional engineer's office, Neath; F. Hatcher, assistant borough surveyor, Neath; F. C. Payne, Neath; N. J. Sair, surveyor's department, ironworks, Ebbw Vale; and Messrs. E. Rees, G. C. Jones, N. Kimble and A. G. Evans, of the borough engineer's office, Neath. The committee having charge of the matter were Messrs. Thomas, Pole, Dudley, Hatcher and Edwards, the last-named acting as hon. secretary.

The Advantages of Steam Tractor Haulage Over Team Labour for Road Material.*

By W. L. GIBSON, County Road Surveyor, Western District, Perthshire County Council.

No small debt is due to the efforts of the makers of road plant in having contributed to the great advance made in modern times in the methods of road making and maintenance, and not least in the manufacture and transportation of all kinds of material necessary for road work. The ratepayers, no less than road surveyors, owe them a debt for carrying out the great work at the minimum of cost.

Within the last thirty years the methods of road construction and maintenance have been revolutionised. For generations, we may say, no advance was made on the methods taught by the Romans. Insufficient attention was paid to the importance of good roads, and up to a generation ago the work was carried out by rule-of-thumb methods by the local blacksmith, who supplied the plant, consisting chiefly of tools, and the farmer and the local carting contractor who did the haulage.

Under this primitive system of haulage most of the material had to be distributed into depots along the roadside, entailing extra expenditure in relifting while road surfacing, and often there was difficulty in securing the necessary amount of team labour when required in isolated districts. But now road making has been elevated from the position of mere empiric practice to the dignity of a science. The local blacksmith, the farmer, and the local carting contractor are being replaced by engineering experts who undertake the supply of all kinds of plant necessary for the most improved methods of road making and maintenance and haulage of material.

In no department is the advance more notable than in the substitution of mechanically propelled vehicles for team labour. It is the purpose of this paper which I have the honour of submitting to you to consider some of the advantages possessed by tractor haulage as compared with team labour, and my observations may be useful to road engineers and surveyors who contemplate the adoption of the more modern method. I may be permitted to speak with some authority on the subject, as I understand I was the first county road surveyor in Scotland to adopt tractor haulage, and having now had ten years' experience of this method of transportation I am in a position to submit to you some observations on the subject, accompanied by detailed statements of actual cost and comparative analyses of tractor haulage as compared with team labour.

It has been said that, to put it succinctly, "the bigger the load the cheaper the cost per ton-mile." If this be true, haulage by heavy traction engines is still the

CHEAPEST KNOWN METHOD OF ROAD TRANSPORT.

so far as cost per ton-mile is concerned. Nevertheless, road surveyors must consider the question of damage to road by such haulage, and it is therefore necessary for them to keep the axle weights within reasonable limits. If heavy plant is used surveyors must make and maintain their roads to meet this class of traffic, which means that a large initial expenditure as well as a large annual cost would be required to meet the expense of road maintenance for their own traffic. If, on the other hand, light tractor haulage be employed there is a marked saving in the wear and tear to the road surface as contrasted with the heavier plant. We must, therefore, qualify our axiom that "the bigger the load the cheaper the cost per ton-mile" by this rider, "The heavier the axle weight the greater the damage to roads," with its corollary of increased cost for maintenance.

To secure at one and the same time cheapness of transport and minimum damage to roads must be the aim and ideal of the skilful road engineer, and it is my opinion that the two aims are irreconcilable so long as heavy traction haulage is employed. On other grounds the use of heavy traction haulage is to be deprecated.

The question of easy working—*i.e.*, turning and shunting on narrow roads, and in quarries and loading banks of railway sidings—is an important

consideration, for it must be remembered that in haulage of road material the primary object is to ply between the quarry or the railway siding and the scene of steam road rolling operations without the intervention of roadside storing depots, and the inevitable and unnecessary cost of depositing and relifting the material.

Let us consider briefly team labour as regards cheapness of transport and

DAMAGE TO ROADS.

As far as the first is concerned, team labour cannot compete with tractor haulage. But the difference in wear and tear between light tractor haulage and team labour is a more problematical question, though my own experience goes to confirm me in the view that in some cases if not in most there is a difference here also in favour of the former. Indeed, I would go further and affirm that in some cases where the effect of the use of team labour was to cut through the surface and cause deep ruts, the substitution of tractors resulted merely in a depression, which was more easily remedied by making up with metal, and that continued use of the tractor and wagon over the metal in the course of haulage actually producing a much stronger road than before. It is naturally to the advantage of the carting contractor, when hauling under contract, to load to the full, but the greater the profit the greater the damage to the road. I am thus led to conclude that here again, though of course in a much less degree, the two aims of the road surveyor cannot be fully secured by the employment of team labour.

In considering as to the adoption of mechanical haulage for West Perthshire, I recognised that many of my roads were lightly constructed and narrow, and the quarries restricted in area and not easy of access. I considered that to adopt heavy traction engines would be almost impracticable for the work contemplated. Under the heavy motor-car regulations the use of self-contained vehicles such as steam and petrol wagons is permitted; but from the author's point of view they have the disadvantage of the great axle weight on the hind wheels, which are as a rule, in the case of the steam wagon, only about 3 ft. 6 in. diameter by 10 in. wide, carrying a legal weight—often, unfortunately, exceeded—of 8 tons.

This is quite an extravagant load for an ordinary country road. An illustration of the damage by vehicles of this class is the great difficulty my friends in Renfrewshire and Ayrshire have in maintaining the main Glasgow and Kilmarnock road. This type of vehicle has also another disadvantage to road authorities, in that the whole plant must remain idle while being loaded, whereas the tractor, using two tipping wagons, can be hauling the one while the other is loading. The output of this plant, therefore, is greater than that of a steam or petrol wagon, and the produce of the breaker, or tar-macadam mixer, or material from the railway siding, is delivered on the road in a more regular manner. While the higher speed—legal maximum of 12 miles per hour—of motor wagons on rubber tyres may be considered an advantage for this type, in the present state of development of mechanical haulage it appears to me that the cost of rubber tyres alone, which could be calculated at not less than 2d. per vehicle mile, and the cost of petrol where motor engines are used, make it impossible for this type to be compared with tractor haulage for the conveyance of road material irrespective of the disadvantages already mentioned of the self-contained unit.

Notwithstanding rubber tyres, the axle weight of this self-contained vehicle has proved to be very damaging to road surfaces where regular services of motor buses, heavy vans and charrs-à-banc are in operation. It must, of course, be understood that where the roads are strong and smooth, and where facilities are provided for quick and cheap loading, the use of the fast-running motor wagon—either steam or petrol—may be seriously considered; but the author has yet to learn of instances in any way similar to his own work where this type of vehicle has been used at a cost which can be compared with his own experience.

* Paper read at meeting of the Institution of Municipal and County Engineers held at Dunfermline, on Friday and Saturday last.

The following points may be suggested for the consideration of road engineers and surveyors who may be contemplating the adoption of mechanical haulage:

- (1) Strength of Roads. Whether capable of carrying the maximum axle weight of the type of vehicle it is proposed to use.
- (2) Quantity of Material to be Transported.—If the

still so cheap that purchase of plant may not at present be justified.

(4) Whether the work of the district suits the use of convertible tractor and roller. (The author finds the convertible tractor the most useful plant he has.)

(5) Whether the engine can be utilised for driving small stonebreaker for tar-macadam mixer, supplying

SUMMARY:—

Saving in favour of steam tractor haulage ... £ 1,330 18 10½
 Deduct initial cost of tractor wagons and rolling gear ... 750 7 6
 Add present value of tractor wagons and rolling gear ... 380 11 4½
 375 0 0
 Total estimated saving ... £ 935 11 4½

NOTE.—This engine has also been employed at rolling operations for 683 days during the past 6 years at an average cost of 18s. 5d. per day. The value of this work is not included in the estimated saving.

Details of the actual work and cost of operation of the two first tractor plants purchased by my council are annexed. The third engine replacing 3-ton tractor "Pioneer" sold last year, has been in

for the whole of the years during which the tractors have been at work.

A comparison between the costs of team labour and tractor haulage is shown in each statement.

Control of Ashpits, Ashbins, and House Refuse by By-Laws.

EFFECTS OF THE PUBLIC HEALTH ACT, 1875, AND THE PUBLIC HEALTH ACTS AMENDMENT ACT, 1890.

By R. H. QUINE, D.P.H. (VIC.).

(Conclusion.)

Respectable builders and contractors would prefer to instal the best form of sanitary appliance generally, but by the absence of any decent standard or rules set by the local authority they are compelled, in tendering for work, to compete with unscrupulous rivals, and to quote for and introduce cheap and flimsy rubbish, which turns out to be more costly in the long run. Where there is no standard low price becomes the sole and absolute master, and the most skilful "scamper" or producer of cheap or sweated goods gets by way of reward whatever business goes, but which, like the dodges of the adulterator, benefits no one but himself, only injuring the others. Those who refuse to make or sell rubbishy goods, and those who produce high-efficiency appliances, but at even slightly higher initial cost, are squeezed out. On the other hand, where there is a decent standard with a high minimum level of conditions, it benefits all and is equal for all, injuring none. It encourages the invention of still higher standards. Moreover, to insist on decent minimum conditions is the very reason for the existence of local authorities.

It is thus seen that the sanitary department, working with no doubt the best intention, has not realised its high duty of guiding the council in making preventive by-laws, and has failed seriously in this particular direction.

In all this the cleansing department has taken a very subsidiary place, and has merely contented itself with emptying whatever receptacles it found. Although one of the greatest spending departments of corporate work, it was not in the past considered necessary to put it under the control of men with scientific education. An intelligent and forceful foreman, and protégés (more or less able-bodied) of the local councillors were formerly considered good enough for the work. The result has been that the cleansing department has contributed little or nothing to the settlement of this question. Not one such department in 100 can even now furnish statistics as to the relative speed, labour, and cost of working, and the quantity or quality, or weight of refuse, produced by the various receptacles placed in various positions for dealing with house refuse which they handle. When ideas are present, they mostly run to the vague belief that one uniform size and shape of receptacle for all situations is the thing to be desired and enforced: round pegs to fit square, triangular, and all sorts and sizes of holes. In some misguided places they even go so far as to make these appliances, and not only compete against dealers, but try to exclude all improvement in methods and appliances.

This important problem is not to be solved by any one bin, but by right conditions for all bins. Cleansing departments, as a rule, are not sufficiently educated in sanitary law or the principles of sanitation or engineering to act as leaders of reform in this subject, which is much more difficult and complicated than might be supposed from its apparent simplicity.

Let us now glance at the reasons for this great absence of standards and divergence of practice in local authorities. We will find that it is largely due to perverted reading and misunderstanding of the Public Health Acts Amendment Act, 1890. This Act was almost revolutionary in the matter of house refuse. Its intention was to bring the older houses, the occupiers of houses, and the newer form of receptacles all under control.

The quite obvious intention of sec. 11 of the 1890 Act was to provide that all those various small unauthorised new receptacles which were of different construction from the old ashpits, kept in a different way, worked in a different way, and liable to infinitely greater possibilities of misuse and abuse, and which were beginning to replace the old ashpits, should be brought under control to prevent nuisance and danger, and to facilitate collection. The simplest way to do this seemed to be to enact that they should all be deemed to be ashpits, and therefore subject to the law

of ashpits. This they are, in fact, at the present time. Every ashbin, bucket, tub, box—whether soap box or kipper box or cardboard—is now, in the eyes of the law, an ashpit if used for house refuse, and is liable to the law of ashpits and to control by by-laws. This law of 1890 has not in any way shifted from the local authority the burden of providing, in accordance with the 1875 Act, that ashpits (including the newer form) shall be properly constructed and properly kept, and that they be supplied if not present, and be repaired, mended or altered if not in accordance with the by-laws. What it has done is to order the local authorities to extend such control to these new appliances.

If any new kind of receptacle is provided, it shall be considered an ashpit and subject to the same conditions as any other form of ashpit, and shall be in accordance with the by-laws for the time being, and if the by-laws are not sufficient they shall be extended so that nothing shall be introduced without sanction and approval of the council.

The reason of the 1890 Act causing so much confusion and mischief lies in the fact that, instead of being read as meaning that every receptacle is now legally an ashpit and subject to ashpit law and control, it has been taken to mean that any of these receptacles can now be used instead of an ashpit, and that because they are not in the same form as the old ashpit, nor controlled by the same by-laws as to construction, they therefore are not subject to ashpit law and control, and because no by-laws worth speaking of have been made to control how they are to be constructed and kept, that they are free to be of any construction, kept in any place, and used anyhow. Sanitary departments are very seriously to blame for tolerating, if not actually encouraging, this loose and improper view, and for not laying down strict rules for governing these appliances. Failing the making of by-laws themselves, they ought to have furnished the surveyor's department with the conditions required by them, so that the surveyor might have attended to the matter. No false pride or petty dignity of office ought to be allowed to interfere with asking for or tendering advice in this matter; the law and the public interest demand it.

Recently some attempts have been made to frame more complete by-laws to govern how all forms of ashpit should be constructed and kept, and how nuisance from dust ashes and refuse should be prevented; also what duties should be imposed on the occupier. As a rule, however, by-laws referring to the new receptacles are of the most elemental description. In London, for instance, at the present day they take the form of "a metal receptacle with one handle or more, a cover, and under 2 cub. ft. capacity," conditions quite filled by an old saucepan, kettle, tin pail or milk can. There are no by-laws as to how all these receptacles should be constructed, kept or used; the result is the use of the flimsiest and cheapest ashbins that can be made, and filthy and untidy backyard conditions. Improved methods are impossible.

In South Wales and other places this neglect of the local authority to make by-laws as to the new form of ashpits, and the prevention of nuisances and danger is carried to the extreme limit. The ashpit disappears altogether, and neither the builder of the houses nor the owner provides any receptacles whatsoever—neither the old ashpit nor its newer equivalent. The 50s. on the ashpit and the few shillings on bin or tub are both saved, and go into the builder's pocket. The occupier may provide something if he thinks fit when he comes into the house, but the local authority, having ignored its duty as to by-laws, is powerless, so that when the occupier does provide anything it is far below the standard set by the 1875 Act. In the streets may be seen lard buckets, pails, soap boxes, kipper boxes, old tins, cardboard, and even paper, all uncovered and exposed to wind, weather, flies, and animals. This result in the open street is more than paralleled by extremely bad con-

ditions behind the houses, and often inside them. For want of safely covered and constructed receptacles, the local authority is compelled to collect daily, and this daily collection, involving the co-operation of thousands of more or less careless housewives, sometimes approaches the farcical in that it is a daily perambulation of the cart rather than an actual collection from every house. South Wales and London do not stand alone in this matter.

Elsewhere the newer ashpit in the form of ashbins and boxes is frequently found without cover, or uncovered. They are therefore exposed to flies, cats, and other animals, wind and weather. They may be exposed in the streets, locked up in back yards, hidden from inspection, and involving extra travelling time and labour in collection. They usually stand on the ground, and are responsible for the dirtiest corner of the yard, surrounded by spill and dirt, which cannot be swept up without moving the bin. They are exposed to the corrosive effect of rain-splash and capillary attraction of ground-wet. They may stand under a window or close to a door, in the lobby or kitchen, in cellar or pantry, under the stairs, or even in sleeping rooms. They have been used as baths and wash tubs, and cradles, and for carrying coal or manure through the house to gardens, and even for baking. The children play with them. All sorts of improper things have been put in and taken out of them, and what ought to have been put in them has often been thrown on the ground.

Some of these refuse receptacles can be emptied six or eight times as quickly as others, and with less than a quarter of the labour. Some last four or five times as long as others. Some have a short sanitary life and others a long one.

From the above it will be seen that the manner of keeping the newer form of ashpit is at least as important as the manner of construction, and that preventive by-laws regulating the keeping are as important as those regulating construction, and that nuisances from dust, ashes and refuse may very readily arise if the bin is not put and kept where it ought to be kept, with by-laws made to enforce its right use.

If all this disorder and waste exists, and is due to want of proper control by the local authority, how may such control be recovered and order restored? How is a town to secure the best conditions for every type of house and situation, the best varieties of receptacles for each situation to secure those conditions, and the best methods of working such receptacles?

The carrying out of the law as to ashpits and house refuse in order to meet portable ashpit conditions involves the preparation by the council of a new kind of regulation in by-law form; new in kind because the new receptacles are in construction, keeping and use, and in every other way entirely different from the old ashpits.

It is absolutely necessary to define the manner in which these new forms of ashpits (and, in fact, all forms) should be constructed, how and where they should be kept, how not kept, how used and not used, and what conditions should be made for the prevention of nuisance from dust, ashes and refuse, to secure clean and tidy premises so that the builder, the owner, and the occupier should each know how to act.

It is obvious that mere construction regulations in building by-laws can no longer be made to cover all this; something more is necessary. It becomes a question as to the desirability of the whole matter of house refuse treatment being dealt with in a special and separate set of by-laws made *ad hoc*. This would mean some one department alone taking up the work of preparing and enforcing them, as far as installation of the receptacles in all houses, both new and old.

For various reasons the surveyor's department seems to be the most suitable for the purpose. If the surveyor took up the duty, he should ask the health department to lay down the conditions it desired to be imposed on all receptacles, of whatever kind, to prevent danger to health, covering—

- (1) The nature of the material of construction.
- (2) The nature of the "proper covers," and if an attached and self-closing cover is desirable.
- (3) The size most desirable in view of the frequency of emptying.
- (4) The place and manner in which the receptacle should or should not be kept, so as to facilitate in-

spection and emptying, and prolong their sanitary life, and promote tidiness.

(5) To say what should or should not be put into them.

(6) What facilities for collection should be imposed.

(7) And what precautions the occupier should observe for preventing nuisance and danger to health.

The cleansing department ought to be asked to express an opinion as to the size preferred for easy and quick handling, and what facilities in certain classes of houses should be imposed, so as to ensure the quickest, cheapest, and easiest collection.

The surveyor's department having the lists of these conditions should add their own conditions as to construction, workmanship, strength, and as to being "as approved." They should then draw up the by-laws. The officials of this department should alone control the inspection and passing, if not the actual installation of all forms of receptacles, whether for new or old houses, and should see that the construction of all appliances, however varying in form, submitted to the council for sanction should fulfil the conditions laid down in the by-laws, and that all such appliances of approved construction, size, and form, of sound material and good workmanship, should be sanctioned for use in a formal and open manner, and samples kept in view. Thus inspectors might know what to pass and what not to pass, and builders, owners and contractors might know exactly what appliances were sanctioned, and thus be able to choose out of those sanctioned the most suitable for the kind of house or situation being dealt with.

It is only by control of the installation being thus orderly, and centering in one department, that the treatment of house refuse can be put on a satisfactory footing, and the local authority again perform its clearly defined and much neglected duty.

SUMMER SCHOOL OF TOWN PLANNING.

The first course of lectures in Town Planning to be given in the University of London will take place in August, when a summer school will be held from the 3rd to the 15th. The lectures will be given in the new School of Architecture at University College. This building is the largest and most complete of its kind in the United Kingdom, and it is intended to use some of the rooms at an early date for a Department of Town Planning.

A similar summer school has been held for the last two years at Hampstead Garden Suburb, and this year several demonstrations will be given at the suburb, where the large area of land being developed on town planning lines serves as an excellent ground for study.

Mr. Raymond Unwin, F.R.I.B.A., architect of the Hampstead Garden Suburb and special lecturer in town planning in the University of Birmingham, will lecture on the practice of town planning; Prof. Ad-head, of Liverpool University, the first professor of town planning in this country, and Mr. L. P. Abercrombie, lecturer in civic design at Liverpool University, will deal with the foreign and historical aspects of the subject. Mr. E. R. Abbott, who, as clerk to the Ruslip-Northwood District Council, has been in charge of the legal side of the town planning measure here, lectures on the Act and the legal problems connected with it. The engineering side is being taken by two lecturers, both of whom are in charge of town planning schemes. Mr. G. L. Pepler, F.S.I., and Mr. Chas. J. Jenkins, M.A.S.T.C.E., M.I.M.E.C.E. Dr. Brinckmann, professor at Karlsruhe, will outline the development of town planning in Germany, and it is hoped that Mr. John Nolan will be in England in time to lecture on town planning in America. A lecture by Mr. H. V. Lanchester, F.R.I.B.A., with the interesting title, "Tradition and Civic Development," is also announced.

A programme of excursions and visits has been arranged to a number of centres of housing and town planning interest. On the first day of the session the president of the summer school, Mr. Herbert Samuel, President of the Local Government Board, will give an address at a reception of students to be held at University College.

The syllabus of the course can be had on application to Mr. J. S. Rathbone, joint hon. secretary, Fitzalan House, Finchley, N.

THE NORTON PATENT SURFACE BOX.

We illustrate herewith some examples of the various types of surface boxes made by the Norton Patent Surface Box Company, of 25 Bucklersbury, London, E.C.

The special feature of these surface boxes is that their construction permits of broken, smooth, or dangerous covers being removed and new ones re-fixed in a few minutes without disturbance to the frame or roadway, or interference with traffic—an arrangement which, as engineers will be quick to

NORTON'S ROAD GULLEY, WITH DOUBLE-LINK COVER AND TRAP OUTLET.

realise, makes for very considerable savings in cost of repairs.

The boxes are arranged with a specially designed cover with a loose hinge fitted into recesses, in which are white metal blocks forming a non-corrodible bearing for the hinge, thus preventing rusting up. There are no bolts or nuts of any description, and the blocks are interchangeable—in fact, simplicity of construction is the keynote of the design throughout. The firm's recently designed covers for man-

HYDRANT OR VALVE CASE, WITH DOUBLE-LINK COVER.

holes, gullies, hydrants, meters, and so forth, while combining all the advantages of an interchangeable lid, are fitted with a double hinge which enables them, when open, to lie flat on the roadway; and it may also be pointed out that where traffic is extraordinarily heavy, steel or malleable iron covers can be fixed to the frames.

The company have already secured the patent rights in Great Britain, South Africa, Canada, New Zealand, and various foreign countries; but we understand that, so far as Great Britain is concerned, they are prepared to allow any manufacturing firm to make under their licence, in order that public authorities may place contracts in the hands of local firms. Already 5,000 of the firm's surface boxes are in use.

In reference to the enormous saving in cost by the use of the Norton patent surface boxes, it may be

mentioned that one water company in England spent, between 1902 and 1914, £8,470 for between 9-10,000 cases, a large proportion of this being made up in the cost of paving, labour, and removal of old cases. In the new system of Norton's patent the whole total cost during these twelve years to this particular water company would have been only £847, which is exactly 10 per cent of the money actually spent during the twelve years.

A "RING" IN ENGLISH WATER PIPES ?

WINCANTON RURAL COUNCIL AND A PROPOSED FRENCH SUPPLY.

With regard to the scheme for providing a water supply for Charlton Musgrove, for which work the tender of Messrs. Wright & Son, of Glastonbury, has been accepted, Mr. Phelps, of Shepton Mallet, the engineer engaged for the undertaking, attended the meeting recently of the Wincanton Rural District Council, and (the *Western Gazette* reports) made a statement to the effect that Messrs. Wright now found that the best terms they can get for the pipes—a 3-in. main—were from a firm in London for pipes made in France. The contractor had spoken to him (Mr. Phelps) asking if these French pipes could be used, and he had replied that if they came up to the specification, with the approval of the council, he would have no objection. Mr. Phelps added that these pipes were now being used very much in this country, which was probably due to the fact that a "ring" had been formed in England among English pipe makers as regards the price, with the result that French-made pipes were now coming into this country very freely.

In answer to Colonel Ridley, Mr. Phelps said that the fact remained that French firms could deliver these pipes in this country much cheaper than English makers.

Colonel Ridley remarked that he had never known anyone make a fortune either out of pipe making or brick making.

Mr. Osmond (representative of Charlton Musgrove) said it would be a pity to spoil the ship for a half-pennyworth of tar, and they wanted to have the best kind of pipes for the work.

Mr. Phelps pointed out that certain constituents in soils affected pipes, but if the French make were used he would take every precaution against that.

The chairman (Mr. W. E. Stacey) raised a point as to whether they would be doing justice to the other contractors who tendered for the work to have French pipes.

Mr. Scammell thought the council should not be prejudiced against the foreigner if the pipes were as good and cheaper than English made.

Mr. Phelps remarked that he would like to frustrate the object of the "ring" that had been formed, which brought a reply from Mr. Osmond that he hoped it would not be done at the expense of Charlton Musgrove.

Mr. Cornish: We should certainly support our own industries, but I must say I don't like this "ring."

Mr. Wright, the contractor, was also called into the meeting, and on the question of a reduction in the price of his tender in consequence of the price of pipes having since gone down, he was prepared to make a reduction of £67, and a further reduction now of £20. Asked as to the French pipes, he expressed the belief that they would last as long as English make, and said that he had already laid 20 miles of them.

Mr. Phelps said it was right that the council should know that some of those pipes had been eaten through.

Mr. Wright remarked that it had been proved on analysis that it was nothing to do with the pipes. However, he was quite prepared to make the reduction he had mentioned, although he would be out of pocket if he could not use French pipes, which had been used for the Bridgewater gasworks.

After further discussion it was agreed that English-made pipes only should be used.

BRUSHES FOR ENGINEERING PURPOSES.

The saying that "new brooms sweep clean" is based on a knowledge of the fact that, for several reasons, the efficiency of a broom or brush rapidly becomes less when the instrument is in regular use. In engineering work—notably in the cleaning of engines and machinery and in road sweeping and

METHOD OF MANUFACTURING "FEARLESS" BRUSH.

tarring—it is especially desirable to be able to use brushes which will not leave some of their fibres behind them in the working parts of the engine or on the road, and when we reflect

ENGINE-CLEANING BRUSHES.

that the rate at which a brush can be used is in direct proportion to its efficiency, we must realise that any device or method of construction which prolongs the life of a brush reduces the cost of labour in the operations in which it is employed.

TRAMWAY OR RAILWAY POINT BRUSH AND SCRAPER.

One must not, however, overdo the expenditure on new brushes, and it is, therefore, of importance that the most lasting implements should be bought.

In this connection, attention may be directed to the

range of brushes made by the "Fearless" Brush Company, Limited, of No. 26 Hart-street, London, E.C., which are of considerable technical interest. These brushes are made without the use of any cementing material, and the fibres cannot, therefore, be loosened by solvent liquids or by variation in temperature. The fibres are held by a hook which is clamped, and this hook, with its loop of fibres, bristles or hairs, is then lapped with wire, and the wire soldered. Among the advantages of this method of construction that have attracted the attention of those who use brushes for engineering and other purposes, the following may be noticed: The brushes may be disinfected by immersion in a suitable liquid, and can even be boiled without loosening the fibres; they resist the effects of tar, oils, acids and other liquids; the fibres do not become detached, and get left behind in the valves or other working parts of machinery, and cannot be loosened by rough treatment.

From the point of view of the municipal engineer, all these considerations are important, and it may be further noted that the use of detachable knots is very convenient in the cases of road sweeping and

STIFF BASS BRUSH WITH INTERCHANGEABLE KNOTS.

tarring, and the cleaning out of tramway grooves and points. If the knots of which the brush is made up become worn they can be reversed or replaced with new ones. For road tarring, the advantage of being able to clean the brush by dipping it in a tar-solvent liquid is an important one, and for engine-cleaning work the resemblance which, in principle, the brush bears to a rag looped round a piece of wire is significant of its value for this purpose.

The "Fearless" Brush Company, Limited, have issued an illustrated catalogue showing many classes of brushes to which their patent principle is applied, and this should be in the hands of all municipal engineers and surveyors.

Burton Sewage Problem.—The Burton Corporation have a perplexing problem in hand in respect of the rising main of their sewage farm. At a special and private meeting of the town council it was decided to duplicate the main, at a cost of something like £30,000. Difficulty has been experienced for some time past, and only recently ½ mile of the rising main, between the pumping station and the sewage farm, was duplicated, at a cost of £4,000. Now it has been decided similarly to safeguard the remaining 4½ miles of main. This important step is believed to have been precipitated by a threatened action on the part of a neighbouring parish council, on the ground of alleged pollution of the Trent, and consequent annoyance to residents down the river, as the result of Burton sewage being turned into it. On one or two occasions last year the rising main burst, and sewage ran into the river. The sewage which has to be dealt with amounts to 40,000,000 gallons a week, and it is reported that something like four-fifths of this emanates from the breweries of the town. The decision to undertake the work, the *Birmingham Daily Mail* states, was arrived at unanimously, but it is believed one member was strongly of the opinion that the brewers should be asked to contribute more largely to the cost of disposal.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham to-morrow (Saturday).

PROGRAMME.

11 a.m.—District executive meeting.

11.30 a.m.—District meeting.

Reception in the council chamber by the chairman of the council, Mr. Councillor J. Pearson, J.P.

District business.

Paper by Mr. Arthur J. Price, engineer and surveyor, on "The Municipal Works at Lytham," which will be taken as read.

Discussion.

1 p.m.—Lunch at Clifton Hotel.

2.15 p.m.—By the kindness of the Blackpool, St. Anne's, and Lytham Tramway Company, cars will be provided to enable the members to visit the West End outfall sewage works (in course of construction), the East End sewage and destructor works and slaughter-houses.

4.30 p.m.—Afternoon tea will be provided for the members at De Grey's Café.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

EASTERN DISTRICT.

An Eastern District meeting will be held at Bedford on June 20th, and one at Tilbury on July 25th.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland this month, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

SOUTH-WESTERN DISTRICT.

A South-Western District meeting will be held at Tisbury, Wilts, to-morrow (Saturday).

PROGRAMME.

12.15 p.m.—Meet at the Victoria Hall. Short business meeting, at which will be presented a paper,

"Wiltshire Roads: Past and Present," by E. Plummer Davies, engineer and surveyor, Tisbury Rural District Council (member).

1.15 p.m.—Luncheon.

2.40 p.m.—Proceed by motor cars and motor buses to the waterworks at Lawn.

To Fonthill Arch (by Inigo Jones).

To eight new cottages on Fonthill Hill.

To Little Ridge. Inspect extensive additions to the residence of Mr. Hugh Morrison, J.P., county alderman.

To Old Tith Barn, Place Farm, Tisbury, one of the largest barns in England.

4.45 p.m.—Tea.

C. OWEN BAINES,

Hon. District Secretary

Paignton.

NORTH-WESTERN DISTRICT.

A meeting of this district, followed by a social evening, will be held at the Mitre Hotel, Manchester, on Friday, July 3rd. On the following day a visit will be paid to the waterworks of the corporation of Ashton-under-Lyne. Full programme will be issued later.

EASTERN AND NORTH-EASTERN DISTRICTS.

A visit will be paid by these districts of the institution, on Saturday, June 27th, to the quarries of the Enderby and Stoney Stanton Granite Company, Narborough.

PROGRAMME.

12.45 p.m.—Assemble at Leicester (Midland) Railway Station, and proceed by conveyances (kindly placed at our disposal) on a visit of inspection to the Enderby and Stoney Stanton Granite quarries. Arrangements will be made for blasting operations to be seen. Refreshments will be kindly provided by Mr. H. J. Grace, managing director of the company.

6.45 p.m.—Arrive back at Leicester Station.

Members of the Western District are specially invited.

Members are specially requested to note the following: August 15th and 16th, week-end visit to Hunstanton (ladies and friends especially invited), September 26th, Newmarket.

G. BELSON CHILVERS,

Hon. District Secretary.

Council Offices,
Oundle.

B. WYAND,

Secretary.

39 Victoria-street, S.W.

- Takeley Station—
90 tons 1½-in. gauge.

Tenders (on Forms to be obtained of me), with samples, should reach me not later than the 25th inst.

A. E. FLOYD,
Clerk.

Dunmow, Essex.
June 9, 1914. (1,694)

(Continued on p. xx.)

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

CLERK OF WORKS (experienced) for Water-works wanted by the Kirbymoorside Rural District Council. Apply, in candidate's handwriting, stating age, experience, references, and salary required, not later than noon, Tuesday, June 16th, to R. Jennings, Clerk Rural District Council, Kirbymoorside, Yorks. (1,684)

URBAN DISTRICT COUNCIL OF DENTON.

APPOINTMENT OF SURVEYOR'S CLERK.

The above Council invite applications for the position of Clerk in the Surveyor's Department.

The person to be appointed must have had experience in the keeping of time and wages books, stores accounts, day books, &c., and be an efficient shorthand typist.

Candidates with experience in the office of a Surveyor of a Local Authority preferred.

The salary will be 30s. per week.

Applications, in Candidate's own handwriting, stating age, qualifications and previous experience, accompanied by copies of not more than three recent testimonials, and endorsed "Surveyor's Clerk," to be sent in so as to be received by the undersigned not later than Monday, the 22nd day of June, 1914.

WM. RICHARDS,

Clerk to the Council.

Town Hall,
Denton,
Near Manchester.
May 30, 1914. (1,666)

BOROUGH OF TIVERTON.

Wanted, an experienced Man as Foreman in the Streets and Highways Department. Salary, £100 per year. Application, in own handwriting, giving full particulars of age, experience, &c., and with copies of three recent testimonials, and endorsed "Foreman," to be sent to the undersigned, from whom further particulars may be obtained, not later than Saturday, June 20th.

Canvassing will disqualify.

J. SIDDALLS,

Borough Surveyor.

Town Hall, Tiverton.
June 6, 1914. (1,683)

TAR MACADAM PAVING

Telephone: No. 232 North.

Telephone: No. 49 Matlock.

Minutes of Proceedings.

Salford Highways: Charges of Neglect.

Sweeping charges made by a Special Committee of the Salford Corporation with respect to the methods and policy of the Highways Committee of that corporation, to which publicity was given locally some time ago, naturally created a great deal of feeling in the town, but the wisdom of suspending judgment would appear to be justified by the report which the accused committee have prepared in their defence. It was in many respects a serious and in all respects a deplorable indictment that was levelled against the Highways Committee. They were charged with gross mismanagement of their trust, and it was alleged that, by reason of improper supervision, wages in Salford greatly exceeded the cost of materials, while a suggestion of suspicion, whether intentional or otherwise we need not stop to inquire, was raised by the statement that one firm year after year secured the order for stone setts and other material without due regard being paid to the prices quoted in other tenders. In the belief that the charges were of a nature to cause a loss of confidence in the Highways Committee, the Special Committee advised the town council not to pass the former committee's supplementary estimate for the sum over-expended until steps were taken to have the department efficiently managed, and as a result the Finance Committee withheld their sanction to the increase of the highway rate above the hitherto recognised rate of 6d. in the £, although it was admitted that this was insufficient for the due maintenance of the streets.

That such an unsatisfactory state of things as is here suggested should have been allowed to exist and to continue for a considerable period of time in such a town as Salford was, to say the least, surprising. Manifestly a responsibility rested upon the Highways Committee to meet the charges, or for ever hold their peace and hide their heads in ignominy as a body that had shamefully betrayed a public trust. The members accepted the challenge thrown out, and from a summary of their report which has been published we gather that they traverse and repudiate the report of the Special Committee in almost every particular. They state that the general complaints with regard to the working of the highway department appear to be based upon information with regard to one district only, though the methods pursued differed in many

respects. Reliable figures as to income and expenditure, they allege, had been ignored, and the committee proceed to point out that while in twenty years establishment charges have increased by 58 per cent, the works expenditure has only been advanced 5 per cent. Streets have been neglected, they maintain, owing to lack of funds, and this would appear to receive support from a comparison of the cost of upkeep in other cities, which is £283 per mile in Manchester, £368 in Sheffield, and £103 in Salford. It is denied that contracts were given year after year to the same firm regardless of circumstances, and it is explained that where the lowest tender was not accepted the material was considered to be of inferior quality. In other respects it is claimed that the committee's system was correct and proper, and as to the charge that the percentage of wages exceeded that of materials, it is alleged that the report of the Special Committee is misleading. Whether this defence will tend to exonerate the Highways Committee remains, of course, to be seen. From the statements made by the committee there appears to be no question that the borough surveyor and his staff have been for a long time seriously handicapped by the voting of sums inadequate for the proper execution of their various works. The Highways Committee have probably been lacking more in backbone than anything else, but in any case the publicity given to the subject will have served a useful purpose if it brings conviction home to the Salford Corporation that in the matter of street upkeep it is much better to face obvious facts than to seek to make a virtue of false prudence and futile economy.

* * *

The Physics and Dynamics of Road Traffic Problems.

In the first instalment of an article which appears in another part of this issue an engineer who writes under the pen name of "Contributor" discusses some of the elements of a very important subject—the effects of fast traffic upon roads. His points are made so clearly and his arguments are so definitely expressed that the reader cannot possibly be in any doubt as to the practical application of the reasoning to the immediately pressing problems of road and vehicle design. Whatever opinions may be held as to the principles and data upon which the reasoning in a scientific article is based, it will be admitted by all that the

most important desideratum is that the article shall be logical. Engineers can then express their opinions on it by direct references to the premises, and their acceptance or rejection of these will at once define their position in relation to the conclusions. In regard, for instance, to the relation between speed and dynamic effects, the writer of the article has correctly interpreted natural laws as regards the effects of braking a vehicle and the effects of the reaction between the vehicle and the road crust at bends and turnings. The dynamic effect is in those cases theoretically proportionate to the square of the speed. As regards thumping effects, however, the blows which the vehicle inflicts upon humps, for instance, the dynamic effect is directly proportionate to the speed—not the square of the speed. Again, as regards the relations between the nature of the tyres and the vehicle's repair bill, if we provisionally accept the estimate referred to in the article, it follows, logically, that a similar relation must obtain as regards thumping effects upon the road.

We do not, however, accept the whole of the conclusion come to in the article, because we know, both practically and by calculation, that the higher speeds result in relatively greater attrition effects, not only on account of what happens during acceleration and deceleration, but also because the power required to drive the vehicle is much greater than in simple proportion to the speed. There is also to be considered the fact that on many kinds of road crust the rubber tyre has a nearly constant tendency to loosen the surface when under the same conditions a steel or iron tyre has no such tendency; the zero line of the curves of comparison is not the same. As regards the comparison between "elastic" and "rigid" crusts, the writer of the article puts the matter in such a way that the practical application of his terms and of his arguments is perfectly clear. It is to be observed, however, that he uses the term "elastic" in a special sense—the property of being elastic through a relatively large contraction or expansion. The rigid road crust to which he refers is really elastic, particularly the telford type, but what "Contributor" wants to obtain is a material with a lower modulus of elasticity. He might, in fact, say that he wants a greater range of resiliency.

We have so often advocated increased thicknesses for road crusts that we feel bound to point out that greater thickness does not involve any sacrifice of elasticity. To suggest that it does implies a reliance upon the elasticity of the natural foundation—a very dangerous doctrine, unless, which seems quite needless, we were to make road crusts capable of standing really severe cross-breaking stresses. The foundation under a road is a continuous one, and by making thick crusts this natural foundation can be made to serve our purpose. Some degree of resiliency, that is a reasonably low modulus of elasticity, and a reasonably high actual elasticity are desirable in the whole of this crust. The top course may be made with materials having a lower modulus of elasticity, which, seemingly, is what "Contributor" desires. We believe, however, that a more important advantage of the carpeting system is that the materials of the carpet may be so chosen that plastic deformation may be followed by plastic restoration of form, and that the carpet may be readily replaced when it is worn without involving the expense of making up the strength crust. To understand what are the most satisfactory combinations or compromises as between elasticity, plasticity and rigidity is to be a master of the art of road-crust construction. We strongly commend "Contributor's" article to the notice of our readers, and shall be glad to give publicity to their views on the important

matters of principle and practice with which he deals.

A Local Government Board Report.

The Local Government Board have recently published Dr. Reginald Farrar's report to them on sanitary administration in the Wigton Rural, Wigton Urban, and Holme Cultram Urban Districts—a document which not only makes very interesting reading, but also demonstrates the value of that department of the board's activities which is concerned with the holding of inquiries similar to that undertaken by Dr. Farrar. The inquiry was held in consequence of certain information which had come to the knowledge of the board in 1912 to the effect that in the Wigton Urban District the housing conditions were bad, and that in the Wigton Rural and Holme Cultram Urban Districts the water supplies were deficient and the methods of excrement and refuse disposal unsatisfactory in certain villages. Dealing first with the Wigton Rural District, and especially with the water supply in that area, Dr. Farrar points out that for several years past the medical officer of health in his annual reports has drawn the attention of his council to the inadequacy and unsatisfactory character of the supplies of water in many parts of the district, particularly in its northern portion. In 1911, analyses of the water of 101 wells showed that no fewer than seventy-eight were polluted! In consequence of the continued representations of the medical officer of health, the district council ultimately directed their surveyor to prepare a scheme for a gravitation supply for those portions of the district which were in the greatest need. Having regard to the exceedingly unsatisfactory conditions, it comes as rather a shock to read that the scheme met with considerable opposition from the parish councils, chiefly, it would appear, on the ground of its cost. Dr. Farrar, in our view, sums up the position with extreme moderation when he says that, having regard to the urgent need of water in the area, an expenditure of the order indicated in the surveyor's estimates can hardly be called prohibitive or out of proportion to the benefit which the district is likely to receive.

We turn now to that part of the report which deals with housing conditions in the Wigton Urban District. The present position may be gauged from the following extract:—

The prevalence of casual labour and the deficiency of well-paid regular occupation for men have discouraged building, and fostered the demand for houses of low rental; the deplorable tendency to buy up old house property at low prices for speculative profit has created a vested interest in slums; while the inertia of the district council has perpetuated conditions which seem by no means creditable to that body. In few towns of England, within my experience, are the housing conditions so wretched as in the central parts of Wigton.

No wonder that Dr. Farrar deems it necessary to recommend that the district council should pay prompt attention to the unsatisfactory housing conditions that prevail in their district. In the Holme Cultram Urban District, too, the report recommends increased and systematic action under the Housing (Inspection of District) Regulations, in addition the provision of a system of public scavenging for Abbey Town and other matters. It is to be hoped that in each of these districts it will be recognised that it is unwise to restrict expenditure at the cost of efficiency when the interests of public health are at stake.

* * *

Mechanical Filters in America.

The mechanical filter is being used in America for the treatment of the very largest water supplies. At St. Louis a plant capable of treating 160,000,000 gallons a day is now in course of con-

struction, at Baltimore there is an installation with a capacity of 128,000,000 gallons a day, while by comparison a third installation at Trenton, New Jersey, which can deal with 30,000,000 gallons a day seems quite small. The adoption of mechanical filters on this large scale is entirely due to the good results produced at smaller installations. With the mechanical filter plus chemical treatment, it is felt that the purification of the water can be effected to any required degree, and, no matter how turbid or impure the raw water may be, the engineer and the chemist have means ever ready to hand to give the water the special treatment it may require. By a very simple provision of settling tanks and mixing channels, such preliminary treatment as may be required can be given, or if the water is sufficiently pure no chemicals need be used at all; and the American engineer appears to have grasped the important fact which we in England seem slow to understand, that as the raw water drawn from a river or storage reservoir varies in quality from time to time, so must its treatment vary. It is also notable that at all the new works we hear of provision being made for the application of a sterilising agent to the water whenever this may be required. Great care is given also to the way in which coagulant chemicals are added to the water. At St. Louis it is estimated that a saving of 30 per cent in the chemicals will be effected merely by allowing a long period for the softening action of the lime before sulphate of iron is added, thus avoiding the loss due to incomplete chemical reactions.

The completeness of detail is shown by the fact that even the wash water at Baltimore is clarified before it is discharged. The economy in power effected at Trenton by the use of a tank made like a gas holder for the storage of air and wash water is also noteworthy, an estimated saving of nine-tenths of the power required for the pumps and blower being effected by its means. Covered concrete tanks, 50 ft. by 28 ft., filled with a 30 in. depth of sand, resting on 12 in. of gravel, do not appear at first glance to differ greatly from ordinary slow sand filters as used at smaller works in this country. The real difference, however, lies in the facilities for regular and perfect mechanical cleaning, the working under a greater pressure with sand of finer grade, and the careful preliminary and after treatment of the water.

There can be no doubt that where such a system is applied the source from which the water is obtained becomes more a matter of quantity than of quality, for with the modern appliances and with our present knowledge we may treat the water so as to make it conform with the highest standard of purity. If the principle applied to these great American works were applied to small town or village installations in this country, there are few places which could not be supplied at comparatively small expense. The practice of always seeking a supply absolutely free from all possible contamination, even though this involves enormous expense, is unreasonable, and we adopt it in spite of the fact that the purest supply is always liable to accidental specific contamination of the worst kind.

Bituminous Road Carpets for a Surrey Urban District.

The example set by Mr. A. Dryland, M.I.N.S.T.C.E., county surveyor of Surrey, in adopting the carpeting principle for important main roads, has been followed by Mr. W. H. Grieves, engineer and surveyor to the urban district council of Sutton, in that county. Since the kind of bituminous carpet which Mr. Grieves proposes to use is similar to that adopted by Mr. Dryland, and since the way in which the carpet will be put down is also similar, we need not repeat here the observations which we made with reference to Mr. Dryland's scheme. The considerations which

have led up to the adoption of this method of reforming the road crusts of the Sutton Urban District are ably set forth in Mr. Grieves' very interesting report, the purport of which is given in our summary in another part of this issue.

This trial of a sand-bitumen carpet, with a small proportion of a stone filler, is bound to provide valuable data, and the cost per square yard is so low that even if the carpeting fails to last as long as is expected it may prove a useful and economical means of making up road crusts for heavy traffic. Mr. Grieves is alive to the importance of effecting the strengthening of the edges of the road crusts when they are provided with these bituminous carpets, and we venture to suggest to him that it will be worth while to adopt a more expensive and efficient method than that mentioned in his report, in view of the long life which is expected of the new carpeting and the relatively large number of chances of injury to the edges of the crusts before they are made up again. The most important element affecting the durability of a good tough road carpet, such as asphalt, is the behaviour of the strength crust as regards distortion, and the efficiency of the water-bound broken-stone crust as a strength crust supporting a waterproof carpet has yet to be determined practically under service conditions. The results of Mr. Grieves' practical trials of this method will be awaited with much interest.

As regards the durability of the carpet we may have to wait for some years for definite indications of its value, but in the meantime much may be learned as to its behaviour under wear, and the probable limits of its applicability to gradients. We wish Mr. Grieves every success in his new departure, and feel sure that his skill and energy will be directed to making the most economical use of the machinery and materials employed. Our own contribution to the subject is a definite recommendation that the desirability of bringing up the road crusts to ample thicknesses may be considered in a liberal spirit, since the cheapness of the carpet layer fully justifies a fairly large expenditure in this direction.

The Surrey County Council and their Surveyor.

The salary of 50 guineas per annum which is paid by the Road Board to the members of their Advisory Committee provided the Surrey County Council with a subject for a considerable discussion at their last meeting. Our readers will be aware that one of the members of the committee is Mr. A. Dryland, the county surveyor of Surrey, and the debate arose on the question of whether he, being a whole-time officer of the council, could with propriety be permitted to retain his salary from the Road Board, or whether he ought to pay the amount into the county fund. It must at once be said that the discussion proceeded entirely upon the question of principle involved, and that no disparaging word was said either as to Mr. Dryland's professional worth or as to his serving the Road Board, with the consent of the county council. On the contrary, many kindly references were made to the great services which he has rendered to the county since his appointment. In the result, the recommendation of the Highways Committee that he should be allowed to retain the amount, was referred back, with a broad hint that the time has come when his salary should be increased. Thus the principle will be maintained, and at the same time Mr. Dryland's many friends will see that he is not to be allowed to lose over the matter. It would be well if similar discussions in other councils were always conducted in the same spirit.

Fast Traffic, its Effect on Roads, and the Remedy.

By "CONTRIBUTOR."

Our roads now carry traffic differing widely from that of the past, not only in the total number of vehicles and in the great increase of axle weight of many of them, but chiefly in the great increase in average speed. The first two matters have been much discussed in your columns and elsewhere, but the effect of modern high speed has not been so much discussed, nor has it received the consideration which in the writer's opinion it deserves to receive, for it seems probable that the high and increasing speed at which motor traffic of all classes is now traversing our highways is likely to form the most difficult problem which the road engineer has to face.

We may assume that in the past, on most country roads, so large a proportion of the traffic was haulage of agricultural produce, and that passenger vehicles were then comparatively few in number, so that the average speed then approached very closely to the horses' walking pace. Therefore we may safely say that it is unlikely that it exceeded 5 miles per hour, whereas on a modern road, where the bulk of the traffic now consists of motor vehicles, heavy, medium, and light, and where the horse-drawn vehicle is comparatively infrequent, it is probable that the average speed of the vehicles will now be found to work out at over 16 miles per hour.

No one will question the well-known engineering formula—*i.e.*, that the dynamic effects of a moving body are proportionate to its mass, multiplied by its velocity squared—applies to vehicles moving on road surfaces, and if we apply this formula we shall see that for equal weights of vehicles the increase of speed from 5 to 16 miles an hour would increase the effect on the road as 1 is to 11, and this quite independent of increase of weight. Fortunately, even in the old days, it was observed that the vibration and hammering of vehicles moving at any pace higher than that of the walking pace of a horse must be cushioned by springs between the load and the road, and this cushioning action has been greatly increased by adding to the springs placed between the axles and the vehicles a highly effective cushion in the form of rubber tyres and pneumatic tyres interposed between the wheels themselves and the road surface. If it had not been for modern springing and the use of cushioning tyres, modern road traffic at modern speeds would have been impossible, if it were only on account of the immense damage to the road which would have followed on its adoption.

Modern motor traffic may be roughly divided into three classes. First there are the heavy vehicles which have axle weights often exceeding 8 tons, and which are generally provided with rigid steel wheels. The speed of these by law should not exceed 5 miles an hour, but in practice they usually attain an average of 7 miles. Then comes the medium motor-van traffic usually carried on wheels having solid rubber tyres. The average speed of these vans on country roads is apparently about 16 miles an hour. Then there is the light vehicle usually carried on pneumatic tyres, of which the speeds in many cases exceed 40 miles an hour, and of which a very conservative estimate of the average may be put at 20 miles.

If we assume that the statements made by the rubber tyre makers are approximately correct—that the cushioning action of the rubber saves the vehicle and thereby reduces the repair bill somewhat in the proportion of halving the cost when solid rubber is used in place of steel, or quartering the cost if pneumatic tyres are used, and that the damage done to road surfaces is mitigated in about the same proportions—we can readily calculate that a heavy steam lorry loaded up to 8 tons on the back axle, running at 12 miles an hour, damages the road as much as a 2-ton vehicle driven at nearly 50 miles an hour on pneumatic tyres, and that equal damaging effect is probably caused by medium 5-ton solid rubber-tyred tradesmen's vans running at about 20 miles an hour.

The damage which is done to road surfaces by traffic, and which is chiefly due to speed effects, is not confined to mere abrasion of the surface, but causes rapid formation of potholes, or cross corrugations, even when the road surfaces are surface tarred and the road material is excellent in quality.

As the undoubted convenience to the general public

of the motor omnibus depends largely on the speed at which passengers can be carried from point to point, and as this applies equally to the popularity and convenience of the modern motor delivery vans, it is extremely unlikely that any attempt will be made to reduce the speeds at present observed; in fact, it is much more probable that the future will see still greater speeds safely attained, and the writer has therefore thought the present moment fitting to discuss the views of the two schools of engineers and surveyors who are attempting to deal with the problem.

First, we must take what we may call the rigid school. This comprises all the men who, from the days of Telford, have thought that the stability and endurance of the road can be best effected by mass in the foundations, rigidity in the road crust itself, and in the wearing surface. On all sides we hear proposals to increase the thickness of the concrete supporting our wood pavements, of reverting to nicely squared and jointed granite-sett pavement for carriageways in our towns, and a similar extension of the use of rigid foundations, in the shape of concrete sub-crusts, for country roads. In America the roads themselves, even to the wearing surfaces, have been made with hydraulic concrete.

On the other hand, a school of engineers, of which the writer is one, are trying to impart some degree of elasticity to the road, and to endeavour to find out how such elasticity is to be obtained at reasonable cost, so as to supplement by elasticity or resiliency of the road the cushioning effect of the springs of the vehicles and of their rubber tyres. Writers in the daily Press, who have evidently never gone into cost questions, now talk glibly of the necessity for rubber roads, forgetting that, apart from high cost, the rolling resistance would be increased out of all proportion to the advantages gained.

Practical road surveyors have, from time to time, noted the very excellent results that have been obtained from modern elastic bituminous carpets, and are now extending the treatment to providing not only these elastic wearing surfaces, but elastic supporting crusts, and finally elastic foundations. If this school are right, here we have a field for inquiry and experiment of the highest importance, for, if their theories are carried to their logical conclusion, large sums of money which are now being spent, or proposed to be spent, on rigid foundations and rigid crusts are being wasted, and the effects of increased rigidity on both road and vehicle will be marked; the cost of upkeep of both will be increased, whereas enthusiasts on the side of elastic treatment see prospects of a reduction of wear and tear both of road and of vehicle; and last, but not least, a reduction of the vibration now communicated to the houses and properties of the frontagers to our public thoroughfares.

(To be continued.)

Tar-macadam Plant: Notice to Manufacturers.—The Somerset County Council contemplate purchasing a portable tar-macadam-making plant, and Mr. Edward Stead, the county surveyor, Wells, is desirous of obtaining various manufacturers' catalogues, &c.

Change of Address.—Messrs. A. & F. Manuelle, granite quarry owners and marble and stone merchants, advise us that they have removed to more convenient offices at Bishopsgate House, 80 Bishopsgate, E.C. Their telegraphic address will remain as at present—*viz.*, "Feldspar." London, but their telephone number will in future be London Wall, 8836 (two lines).

A New "Journal."—The Institution of Mechanical Engineers are the latest professional body to embark on the publication of a "Journal." The new production, a copy of the first issue of which reached us during the week, will be circulated to the members about eight times a year—namely, once a month during the period of session. So far as the present year is concerned it is intended that the "Journal" shall be supplementary to the "Proceedings" hitherto published, but subsequently it is proposed that it shall replace the latter. Advertisements, needless to say, do not find a place in its pages.

Institution of Water Engineers.

SUMMER GENERAL MEETING AT STOCKPORT.

The nineteenth summer general meeting of the Institution of Water Engineers was held on Thursday, Friday, and Saturday, June 11th, 12th, and 13th, at Stockport, Mr. Thomas Molyneux, ASSOC. M. INST. C. E., the corporation water engineer of that town, being, as we announced last week, formally installed as president in succession to Mr. C. Clemesha Smith, M. INST. C. E., water engineer to the Corporation of Wakefield. Those present were Messrs. A. Andrew (Oldham), H. J. Atkinson (Manchester), F. J. Bancroft (New Barnet), J. C. Barrowclough (Batley), J. F. Bedford (Colne), A. B. E. Blockburn (Sunderland), R. A. Blakeborough (Brighouse), C. Boldry (Chesterfield), H. Braddock (Stockport), F. H. Brunt (Rochdale), W. T. Burgess (London), R. Chamberlain (Buxton), C. H. Chapman (Salford), S. C. Chapman (Torquay), J. Chisholm (Airdrie), H. Cottam (Blackpool), G. Christie (Kilwinning), W. Clemence (Walton-on-Thames), J. H. Crowther (Wallasey), F. W. Davis (Nottingham), J. Dewhurst (Chefinsford), E. W. Dixon (Leeds), F. J. Dixon (Ashton-under-Lyne), G. T. Edwards (Leicester), J. Gray (Warrington), G. Greenslade (Southampton), P. Griffith (Westminster), R. J. Hartley (Halifax), H. C. Head (Winchester), H. Ashton Hill (Birmingham), F. W. Hodson (Loughborough), F. E. Howard (London), A. H. Jameson (London), A. J. Jenkins (Jersey), Dawson Kitchingman (Southampton), G. O. H. Klopp (London), J. Lackland (St. Helens), H. Lapworth (Westminster), J. Lees (Tonbridge), L. Holme Lewis (Manchester), F. W. Lillierap (Devonport), F. W. McCullough (Belfast), W. Matthews (Westminster), W. Millhouse (Scarborough), H. Molyneux (Westminster), T. Molyneux (Stockport), C. B. Newton (Hull), C. E. Newton (Manchester), H. Nicholson (Manchester), C. W. S. Oldham (Ipswich), W. Paterson (London), A. C. Potter (London), H. Preston (Grantham), C. H. Priestley (Cardiff), R. B. Rigby (Bury), H. Robinson (Consett), Edward Sandeman (Westminster), E. J. Silcock (Westminster), C. Clemesha Smith (Wakefield), J. H. W. Stocks (Manchester), E. Wainwright (Heaton Chapel), A. H. Walker (Loughborough), W. Watts (Wilmslow), W. Watts, junr. (Wilmslow), W. Whitaker (Croydon), J. W. Wilkinson (Manchester), F. L. Williams (London), O. Williams (Aberdare), G. Winter (Darlington), H. W. Woodall (Bournemouth) and R. H. Wyrill (Swansea), members; Councillor Atkey (Nottingham), G. F. Atkinson (Blackpool), Councillor H. Bell (Stockport), Councillor C. H. Bird, J.P. (Cardiff), Alderman E. Blackall (Devonport), H. G. Blakemore (London), F. P. Candy (London), Councillor J. Cartwright (Loughborough), Councillor J. Crocker (Torquay), M. Crossley (Halifax), Prof. S. Delépine (Manchester), J. Derbyshire (Manchester), A. E. Drown (Westminster), J. E. Edmondson (Manchester), Alderman J. Evans (Warrington), Alderman Greaves (Oldham), Councillor J. Gourley (Wallasey), J. E. Hardman (Manchester), Prof. G. Hickling (Manchester), Alderman A. Johnson (Stockport), J. Johnstone (Stockport), D. Kirk (Coatbridge), Councillor R. W. Oddy (Rochdale), Councillor Ogden (Bradford), C. W. Matthews (Manchester), Councillor T. W. Potts (Stockport) and C. W. Smith (Bury), visitors.

The proceedings opened in the Town Hall, Stockport, on Thursday morning, when the mayor, Councillor THOMAS WORTHINGTON POTTS, J.P., welcomed the institution to Stockport. He said he could assure them that Stockport was very pleased to think that the institution had selected that town for their annual meeting. In selecting such a busy manufacturing centre, it was evident that it had not been chosen because it was a health or pleasure resort. (Laughter.) It was far from that. Some 150 or 200 years ago, when the river Mersey was a beautiful and pellucid stream, Stockport might have been considered a pleasure resort, but those things had had to give way to the progress of manufacture, and to-day the town was a very busy industrial centre. Still, there were some things that Stockport might justly claim to be proud of. One, of course, was its magnificent town hall, and another, of which they might be even more proud, was their splendid waterworks undertaking at Kinder. The members would have an opportunity of visiting not only the Kinder undertaking but the Alderley reservoir and the pumping station at Wilmslow. They would be able to form their own opinion on those works, and he hoped they might be benefited

by what they would see. He could assure them that they in Stockport felt proud that the institution should have selected their water engineer as president for the ensuing year. They felt very proud that they had conferred such an honour upon Mr. Molyneux, thereby in some degree giving a little reflected glory to Stockport itself. In conclusion, he said he hoped the members would have a most enjoyable and successful gathering.

Mr. C. CLEMESHA SMITH, the retiring president, then took the chair, and in a short speech thanked the Mayor of Stockport for his welcome. The institution, he said, had for one of its main objects the widening of the experience and the increasing of the knowledge of its members with a view to making them more useful to the public whom they served. With that object they had endeavoured to create a common meeting ground, not only for engineers, but for scientists and others interested in water undertakings, and they would fail in that object if they were not assured of the sympathy and support of public authorities concerned. In the past they had had many evidences of that sympathy, and they had had renewed evidence that morning that the Corporation of Stockport was in entire sympathy with their aims and objects. They had to thank the mayor for his kind welcome, and the corporation for placing that magnificent town hall at their disposal for the meetings, and for giving them the opportunity of seeing their recently completed works at Kinder.

The mayor then left the meeting amid the applause of the members.

PRESENTATION OF PREMIUMS.

The SECRETARY having read the minutes of the last meeting, which were duly signed as correct,

The CHAIRMAN presented the following premiums awarded for papers read during the year 1913:—

(1) President's Premium, value £10, awarded to W. J. E. Binnie and Dr. Herbert Lapworth for their paper, entitled "Reservoir Storage in Relation to Stream Flow."

(2) Institution Premium, value £5, awarded to W. T. Burgess for his paper, entitled "The Solubility of Carbonate of Lime."

(3) Institution Premium, value £5, awarded to Alfred J. Jenkins for his paper, entitled "The Water Supply of Jersey."

(4) Institution Premium, value £5, awarded to R. Stevenson Henshaw for his paper, entitled "The Portland Urban District Council Waterworks."

NEW MEMBERS.

The SECRETARY announced the names of members elected by the council since the last general meeting as follows:—

As Members: Messrs. H. P. Hill, partner, Messrs. G. H. Hill & Sons, consulting water engineers, Manchester; S. B. Winsor, engineer to the Derwent Valley Water Board; E. C. Young, consulting water engineer, Tientsin, China; Henry C. Adams, partner, Messrs. Henry Adams & Sons, consulting water engineers, London, W.C.; A. W. E. Fawkes, city waterworks engineer, Calgary, Alberta, Canada; R. E. Tickell, consulting water engineer, London, W.

As Associate Members: Messrs. R. C. F. Busfield, resident engineer on waterworks extensions, Aberdeen; J. C. Cruickshank, assistant to consulting water engineers, Aberdeen; N. R. Kapur, assistant to corporation water engineer, Cardiff; S. Reason, assistant to water engineer, Antofagasta; T. H. Tyson, assistant to corporation water engineer, Halifax; G. F. Anderson, assistant to engineer of the Fylde Water Board; C. Hall, assistant to chief water engineer, F.C.A.B., Antofagasta, Chile; G. H. Ivory, resident engineer on waterworks for consulting engineer; J. H. Murphy, assistant to corporation waterworks engineer, Manchester; E. J. Wainwright, assistant to corporation water engineer, Stockport.

As Associate: Mr. G. Smith, engineer and surveyor to Eton Urban District Council.

For Transfer to Class of Members: Mr. T. Waddingham, recently water engineer, Hebden Bridge Urban District Council, now consulting engineer, Grimsby.

INSTALLATION OF PRESIDENT.

The CHAIRMAN, having offered a hearty welcome to the new members present, said his next duty was one

which gave him the greatest pleasure—it was that of introducing to them the president for the ensuing twelve months. This introduction was, he thought, quite unnecessary. Mr. Molyneux was known to them all; he had been a member of the institution for a long time. He was one of the original band who founded the institution, or, as it was then, the association, in the year 1897. Mr. Molyneux had been a member of the council for many years past, and by the regularity of his attendance, by his strong common sense, and by the fearlessness with which he had supported his opinion, once convinced that he was right, he had made a place for himself in the minds and hearts of his colleagues. He had no hesitation in saying that Mr. Molyneux would make an excellent president, and that his year of office would be one of pleasure to himself and of benefit to the institution, and that they would all mutually profit by his holding that office. He asked Mr. Molyneux to accept the document certifying the fact of his election as president, and he trusted that he would have good health for the coming year, and that he would live long to retain happy memories of his year of office. This year, though it would be heavy with responsibility, would have many pleasures, and the president would, he hoped and believed, look back upon his tenure of office with pleasurable feelings. He had very great pleasure in asking Mr. Molyneux to fill the chair for the ensuing year.

Mr. CLEMESHA SMITH then vacated the chair, which was taken by Mr. Molyneux amid applause.

The PRESIDENT said he was exceedingly delighted with the manner in which Mr. Clemesha Smith's words had been received. He was afraid they had had described to them a different man to what he was, but he would endeavour to live up to the standard that had been fixed for him. He could assure them that he would use his best endeavours to forward the interests of the institution, and that that should be his sole object in occupying the presidential chair.

THANKS TO RETIRING PRESIDENT.

Mr. Molyneux said his next duty was to ask their support to the following resolution: "That the best thanks of the members of the Institution of Water Engineers be given to Mr. Clemesha Smith on his relinquishing the position of president." Mr. Clemesha Smith was a gentleman whose urbanity had appealed to them all, and who had borne the office of president with dignity and honour. As a water engineer he had a record of which he might be proud, and which they could fully appreciate. He went to Wakefield in 1897, when there was a rate in aid of the waterworks undertaking of no less than 1s. 5d. in the £, and had to deal with a domestic consumption of 26 gallons per head. To-day he had succeeded in wiping out the rate, and reducing the consumption to 18 gallons per head. He had charge of the construction of the works he now looked after, and had dealt with a typical moorland water, so that Wakefield now had a water of excellent quality used economically, and without a burden on the rates. He took up the presidency of this institution last June, and had held the office with satisfaction to them all. He had presided over their meetings with courtesy and tact, and it had been a pleasure to sit with him. He submitted, therefore, to them that their heartiest thanks were due to him, and asked them to accord them by vote, trusting that, although retiring from the presidential chair, he would be long spared to give the institution his valuable services in other directions.

The resolution was carried by acclamation.

Mr. CLEMESHA SMITH said he had to thank them for the very hearty way in which they had received the words spoken by Mr. Molyneux in moving the vote of thanks for the services which he had been able to render during the past year. He feared that Mr. Molyneux had spoken of him in terms which were far too flattering, for the services which he had rendered had only been slight. At the outset he asked for the support not only of the council, but of the whole of the members of the institution, and any progress that may have been made was due entirely to the heartiness with which that support had been given him, and he thanked the council and the members of the institution for their attitude towards him during the past year. He would like to take that opportunity also of thanking their secretary, Mr. Griffith, for his share in the work of the institution. His work was far heavier than was apparent, and he performed it faithfully and zealously, and he had the true interests of the institution at heart. He thanked them for the vote which they had accorded him.

The PRESIDENT then delivered his address—fully reported in our last issue.

Mr. ASHTON HILL (Birmingham) in proposing a vote of thanks to the president, said he was sure they would all agree that Mr. Molyneux had given them a thoroughly useful and practical address, and one that would bear thinking over and reading at their leisure. They had been told that Mr. Molyneux had been a member of the institution from its commencement. He (Mr. Ashton Hill) had also been a member from the start, and he was sure they would agree with him when he said that it was clear Mr. Molyneux had served a very good apprenticeship, and that the experiences he had gained during all those years fully entitled him to the position he had now attained. He had known their president not only in connection with that institution, but he had come across him in other directions, and he had always regarded him as a very level-headed Lancashire man, and although they had not always seen eye to eye with one another, they had agreed to respect each others' opinions. All that Mr. Molyneux would require to make his year of office a success was the support of the members, and he (Mr. Ashton Hill) had no hesitation in assuring him that he would receive the undivided and earnest support of them all in the duties he had undertaken.

Mr. W. MATTHEWS (Westminster) seconded the resolution. He said he thought Mr. Molyneux was to be congratulated on the innovation he had made in his address by incorporating in it a *résumé* of the work that had been carried on by sectional committees of the council during the year. It was information that had hitherto not been brought before the members in general. The precedent set by Mr. Molyneux was a very good one, and would, he hoped, be followed by those who would succeed him in the presidential chair.

The resolution was carried with enthusiasm.

The PRESIDENT said he had to thank them for their kind vote of thanks. He must admit that as he was their nineteenth president it was somewhat difficult to write an address with anything new in it. He was afraid the twentieth president would find it even more difficult.

THE ANNUAL DINNER.

On Thursday, the 11th inst., the annual dinner was held at the Midland Hotel, Manchester. The president (Mr. T. Molyneux) was in the chair, and was supported by the Lord Mayor of Manchester (Alderman McCabe), the Mayor of Stockport (Councillor T. W. Potts), Aldermen A. Johnson and T. Allcock, Councillors Hy. Bell, D.L., C. Royce, J. Winter, A. Derwent, R. Foley, J. Burgon Padmore, the town clerk of Stockport (Mr. R. Hyde), the borough treasurer of Stockport (Mr. H. Grundy), Mr. C. Day, and Prof. Hickling, among others.

Following the usual loyal toasts,

Mr. F. W. McCULLOUGH proposed "The Mayor and Corporation of Stockport." The corporation, he said, possessed their own gas, electric lighting, tramways and water undertakings. They purchased the water undertaking in 1899 at a cost of three-quarters of a million. The new Kinder waterworks cost another three-quarters of a million. The difficulties they had in carrying through that scheme were almost insurmountable, and very great credit was due not only to the corporation, but to the members of the sub-committee of the Waterworks Committee.

The MAYOR OF STOCKPORT, in reply, dealt with the progress of municipal matters in Stockport and Manchester. One proposition which had been put forward, and which originated in Leeds, was that municipalities should be managed by a kind of general manager, who would be in the position of a sort of dictator, or like the mayor of a Continental town, who had things all in his own hands. He did not know what favour that proposition would meet with, but it was brought about by the great difficulties which confronted every municipal authority. Stockport had great difficulties to face, and one of them concerned the supply of water. When the water engineers came to see the Kinder works he thought they would agree that the corporation had overcome those difficulties in a most admirable manner.

Alderman E. JOHNSON, in giving the toast of "The Institution of Water Engineers," said it afforded him great pleasure to propose that toast, in the first place because they were holding their annual meeting in the ancient town of Stockport, and secondly because in their wisdom they had unanimously elected their water engineer, Mr. Molyneux, to the distinguished position of president of their institution for the ensuing year. He was sure that he could safely

predict that their new president would well and worthily fill the office to which they had elected him, and would hand the office down unsullied to his successor. Their institution was a most valuable one, for it was very essential that engineers who had to deal with all those grave and complex questions which surrounded the supply and distribution of water should meet together and associate with each other in an endeavour to arrive at a wise solution of the problems. In conclusion he expressed the sincere hope and belief that the institution would continue to grow in membership and strength because he was convinced of its usefulness not only to the water engineer, but to the community in general.

The PRESIDENT, in reply, said that those who were members of that institution were glad to hear that they were well thought of by those whom they served. The institution was a very progressive one. They had now a large membership—members belonging to it all over the world. They had members in Australia, India and America—in fact, there was hardly an English-speaking country in which they had not a representative. They had been in existence nineteen years, so that in a very short time they would be celebrating their twenty-first birthday, and he hoped they would then be able to do something which would bring the institution prominently before their fellow engineers.

Mr. C. CLEMESHA SMITH proposed "The Visitors."

The LORD MAYOR OF MANCHESTER, in responding to the toast, said that he was very pleased to be there because their president was a Manchester man, and received his early training in the town hall of that city.

Alderman CHARLES H. BIRD, J.P., and Councillor HENRY BELL, D.L. (Stockport), also responded.

(To be continued.)

THE INCORPORATED MUNICIPAL ELECTRICAL ASSOCIATION.

ANNUAL CONVENTION AT BIRMINGHAM.

This week the Incorporated Municipal Electrical Association are holding their annual convention at Birmingham; an attractive programme of papers, visits to works, receptions, and entertainments has been organised, and there is every reason to believe that the meeting will prove at least as successful as its many predecessors. The papers deal with the development of electricity supply, modern boiler-house plant, and the inexhaustible subject of tariffs.

A presidential address of exceptional interest was delivered on Tuesday by Mr. R. A. Chattock, the city electrical engineer, who deplored the fact that, owing to the rejection of the council's recommendations last year, the negotiations which were in progress with the British Electrical and Allied Manufacturers' Association for the adoption of a standard set of conditions of contract had fallen through. In the meantime, the Institution of Electrical Engineers has issued a set of model general conditions of contract, which, while not altogether acceptable to the Incorporated Municipal Electrical Association, has come into use, backed by the authority of the institution, and seems likely to hold the field. Referring to the Electric Lighting Bill which the association has promoted, Mr. Chattock stated that some members of the Electrical Contractors' Association were willing to accept it, but that the extreme opponents of municipal wiring had gained the day, and that the Bill would be opposed. The contractors, in his opinion, had nothing to fear from the municipal engineers, who only desired to ensure that good work should be done, especially in the case of the smaller installations, which were apt to fall into the hands of jerry wiremen. He thought that friendly agreement between the two associations ought not to be prevented by the idiosyncrasies of a few individuals on either side. In view of the recent dissolution of the Industrial Committee of the Institution of Electrical Engineers, Mr. Chattock suggested that a central body should be formed by all the associations connected with the electrical industry, to which should be referred all disputes arising between the component bodies, and which should afford influential support to political and industrial proposals for the benefit of the industry. Commenting on a recent speech of Mr. Newbigging, chief engineer to the gas department of the Corporation of Manchester, who advo-

ated the combined control of municipal gas and electricity supply undertakings, he declared that this would be fatal to progress, as competition was essential to the interests of the consumer; the gas supply authorities were feeling the competition of electricity because the price of the former had only been reduced (in Birmingham) 19.4 per cent in thirteen years, while the price of electricity had come down 73.6 per cent in the same period. Cheap power was a by-product of electricity supply, and the prices had not been unjustifiably cut down; in his opinion there was room for both commodities. Mr. Chattock strongly favoured the view that the supply of electricity should be centralised as far as possible, so that electrical energy could be obtained in every part of the country at bed-rock prices. He pointed out that cheap power was necessary to the commercial prosperity of the country, in view of the competition of foreign countries, which were already developing the policy of centralisation. It remains for Parliament to deal with the question of nationalisation of the supply industry, by forming a Government department, a public board of management like the Port of London Authority, or a private company under public control as to prices and dividends. They would have to give a supply at much lower prices than those which ruled at present, and there would be a deficit during the first few years, but this would be fully reimbursed when the undertaking matured. Small generating stations would be converted into sub-stations, but the engineers at present in charge of them need not fear the loss of their employment, for their aid was indispensable to success. The commercial side of electricity supply was dependent upon the technical side, and there must be an engineer at the head. To secure the full economy of overhead transmission, compulsory powers to obtain wayleaves were necessary. The supply of electricity to London, which was engaging the attention of the London County Council, would form part of the great national scheme. The leading municipalities, which had led the way in electricity supply, should meet and discuss proposals to be laid before Parliament. The results of such a policy would be general benefit to the community, abolition of the smoke nuisance and its attendant evils, conservation of our coal resources, and the maintenance of our commercial supremacy.

It will be seen that Mr. Chattock's views are in agreement with those propounded by Dr. Ferranti a few years ago, when he became president of the Institution of Electrical Engineers, and in his classical address foretold the time when electrical energy, generated and distributed under the most economical conditions, would be supplied everywhere at 3d. per unit. There is no doubt that public opinion is moving in the direction indicated by both these presidents, but material progress is painfully slow.

Coast Sand Dunes, Sand Spits and Sand Wastes.

By Gerald O. Case. 5s. nett. London: St. Bride's Press, 24 Bride-lane, E.C.—This work is a treatise on the advantages of the proper utilisation of inblown sand, so as to turn it into a protection against coast erosion, instead of being, as too often at present, an active agent in such erosion and in the laying waste of fertile land. The author draws many of his examples from Scotland. He points out the work that has been done on the Continent in turning sand wastes into pine forests. The book gives an able and systematic treatment of its subject.—*Scotsman*.

Road Grants.—In the House of Commons on Monday the Chancellor of the Exchequer was asked whether under the new financial proposals rural districts containing few or no first or second class roads would lose the amount they now received for the maintenance of the other roads in their area. Mr. Herbert Samuel, who replied, said that no Exchequer grants were payable at present to rural district councils in aid of the maintenance of roads. The Finance Bill did not affect the provisions of the Local Government Act, 1888, under which county councils might, if they thought fit, contribute towards the cost of the maintenance of any highway which was not a main road. Later, answering a question as to whether local municipal authorities would receive the grant in aid of the upkeep of main and second-class roads, as proposed in the Finance Bill, 1914, for roads passing through county boroughs, Mr. Samuel stated that councils of county boroughs would receive grants in aid of roads on a basis to be proposed by the Road Board.

Institution of Municipal and County Engineers.

NORTH-WESTERN DISTRICT MEETING AT LYTHAM.

A most successful meeting of the North-Western District of the Institution of Municipal and County Engineers took place on Saturday last at Lytham, the charming Lancashire coast resort some half-dozen miles distant from Blackpool. At the business meeting, which was presided over by Mr. John S. Brodie, the district chairman, a paper on the municipal works of the town was read by Mr. A. J. Price, the engineer and surveyor, and produced a good discussion, and in the afternoon visits were paid to the West End outfall sewage works which are in course of construction, the East End sewage and destructor works, and the slaughter-houses. Those attending the meeting were Messrs. A. W. Bradley (St. Helens), district chairman, John S. Brodie (Blackpool), Chas. Brownridge (Birkenhead), T. Burrows (Burscough), Randle Burslam (Congleton), Thos. A. Clare (Leigh), William Clough (Audenshaw), H. W. Corrie (Lower Bebington), D. J. Diver (Marple), William H. Elce (Bacup), Henry Entwistle (Swinton), Chas. Hall (Droylsden), T. H. Hartley (Colne), Charles E. Hines (Windermere), J. W. Hipwood (Morecambe), F. H. Holden (Accrington), J. D. Hurst (Wardle, near Rochdale), I. Johnson (Rawtenstall), L. Kenyon (Tottington), John S. Loble (Stoke-on-Trent), T. W. Maxwell (Preston), J. Mitchell (Birkdale), T. S. Picton (Eccles), Arthur J. Price (Lytham), A. Rothera (Liversedge), J. Rowbottom (Ashton-under-Lyne), J. A. Settle (Bury), W. Shackleton (Nelson), William Stubbs (Blackburn), E. D. Thompson (Preston), W. H. Travers (Wallasey), Wm. Welburn (Middleton, Manchester), Geo. H. Wild (Littleborough), B. J. Wolfenden (Bootle), Ernest Worrall (Old Trafford), H. Yarwood (Rochdale), members; Wm. Bentley (Bolton), Frank J. Boydell (Leigh), A. V. Cole (Nelson), J. Cunliffe (West Didsbury, Manchester), Wm. Debney (Birkenhead), S. Brasse Edwards (Liverpool), E. Pilling (Lytham), Alfred J. Price (Eccles), W. H. Price (Leeds), B. Milnes (Birkenhead), Wm. Moss (West Didsbury, Manchester), F. W. Mozley (Nelson), G. Whittaker (Fylde Water Board), associate members; H. Ashcroft (Preston), A. Entwistle (Preston), Arthur A. Harrison (Preston), J. D. M. Morton (Lytham), Thos. W. Noblett (Preston), student members; F. E. J. Bradshaw (Tamworth), C. T. Hague (Ulverston), Percy Leigh (Swinton and Pendlebury), Stanley A. Royle (Lytham), Stanley Walker (Birkenhead), and Councillors J. Pearson (chairman of the council), E. R. Lightwood (chairman of the Highways and Sewerage Committee), W. F. Holden (chairman of the Finance Committee), J. Ainscough, H. N. Whittle, J. Chadwick, T. V. Barker, and J. J. Beesley.

The members were cordially welcomed by Councillor J. Pearson, J.P., chairman of the urban district council, who said he felt it was a privilege to welcome a number of gentlemen representing such a highly technical branch of public work. He had had only a short experience of council affairs, but it had shown him the value of the work they carried out. He did not think the community at large or the man in the street quite realised their indebtedness to municipal engineers for many of the comforts they enjoyed in their daily life, but took them as a matter of course. They were very proud of their own town, which they thought in its way was almost unique. The two miles of greensward, which was a feature of the front, was a great asset to them, and the trees from which they took the name of "Leafy Lytham" contributed greatly to the beauty of the town. He hoped the meeting of the institution would prove both pleasant and profitable.

Mr. E. R. LIGHTWOOD, chairman of the highways department, said it was also a great pleasure to him to see the members there that day, because he was quite convinced from his knowledge of Mr. Price that they were all very busy men. Their duties were onerous from more than one point of view. The greatest asset a community could have was a surveyor who was absolutely independent—a very difficult position to take up. They all knew how committees were constituted in many townships, and it was both a trying and dangerous position that a surveyor occupied when he had to deal with men who had a certain amount of authority over him and to consider at the same time the conflicting interests of the rate-payers. Very little reflection enabled them to recognise that not only the health of the people, but many

other things, depended to a very large extent on the work they did. Meetings of the kind were essential for the good of the community. They enjoyed the possession in Lytham of a surveyor who was able on his own account to carry out very important work, and he hoped that one result of their visit would be that they would be able to learn something that might be of advantage to them.

Mr. J. S. BRODIE said he heartily appreciated the very kind welcome which had been extended to them. It was particularly gratifying to hear one of their members so highly spoken of. Meetings in the smaller communities were of quite as much as, and frequently of greater interest than, meetings in larger towns, for in the smaller towns the surveyor was able to give a personal attention to details that was impossible in the larger places. He proposed that the thanks of the North-Western District be accorded to the council for the cordial welcome which had been extended to them.

Mr. W. STUBBS (Blackburn), in seconding, said he agreed with Mr. Brodie that it was not in the largest towns that they gained the most information.

The vote of thanks was carried, and the chairman of the council acknowledged the compliment.

Mr. Brodie then took the chair.

SUPERANNUATION.

Mention was made of the scheme which is being considered by the National Association of Local Government Officers as a basis of a Superannuation Bill on national lines, and the chairman, in alluding to this, mentioned that some important steps in connection with the question had been taken as recently as the previous Thursday, when a deputation of medical officers and sanitary inspectors waited on three Cabinet Ministers, who received with every sympathy the views of that deputation, not only in regard to superannuation, but also security of tenure. Judging by the remarks of Mr. Lloyd George and Mr. Herbert Samuel, he really thought an advance had been made with regard to the attitude of the Government on this subject far ahead of anything attained before. He thought municipal engineers ought to do their best not to be left out in the cold, for the Chancellor of the Exchequer told the deputation that it was not a case of dealing piecemeal with the question, but with all the municipal officers in the country. Unless they asserted themselves, however, in all probability, and deservedly so, they would be left out of the arrangement.

Mr. C. BROWNIDGE (Birkenhead) said he considered that, in addition to passing resolutions on the subject, every member should endeavour to assist by bringing pressure to bear on their Parliamentary representatives.

Consideration was afterwards given to the following paper:—

MUNICIPAL WORKS AT LYTHAM.

By ARTHUR J. PRICE,

Engineer and Surveyor to the Lytham Urban District Council.

The surveyor's work in a small town makes up in variety what it lacks in importance, for, while in many large towns the engineering, surveying, and architectural departments are separate, the house drainage work controlled by the health department, the collection and disposal of refuse under the charge of a cleansing superintendent, and the sewage works under the separate control of a manager, the surveyor in the small district is generally responsible for all these works, and is, in addition, frequently his own chief draughtsman, clerk of works, and building and drainage inspector; in short, he holds as many offices as the illustrious "Pooh Bah."

Again, the work of the engineer in a large town is mainly of an administrative character dealing with the control and organisation of a large staff of expert assistants; but the surveyor to the small authority must not only possess a power of organisation sufficient for dealing with the workmen and staff he controls and directs, but, owing to the scarcity of skilled assistants, his work is largely executive, and of a more intimate and personal character than that of the engineer of a large town.

As will be seen from the plans hung in the council room, the author's work in Lytham during the time

he has acted as surveyor to the Lytham Council has been sufficiently varied to satisfy any craving for change, and there has been no ground for complaint of monotony, or fear of rust or sleepiness.

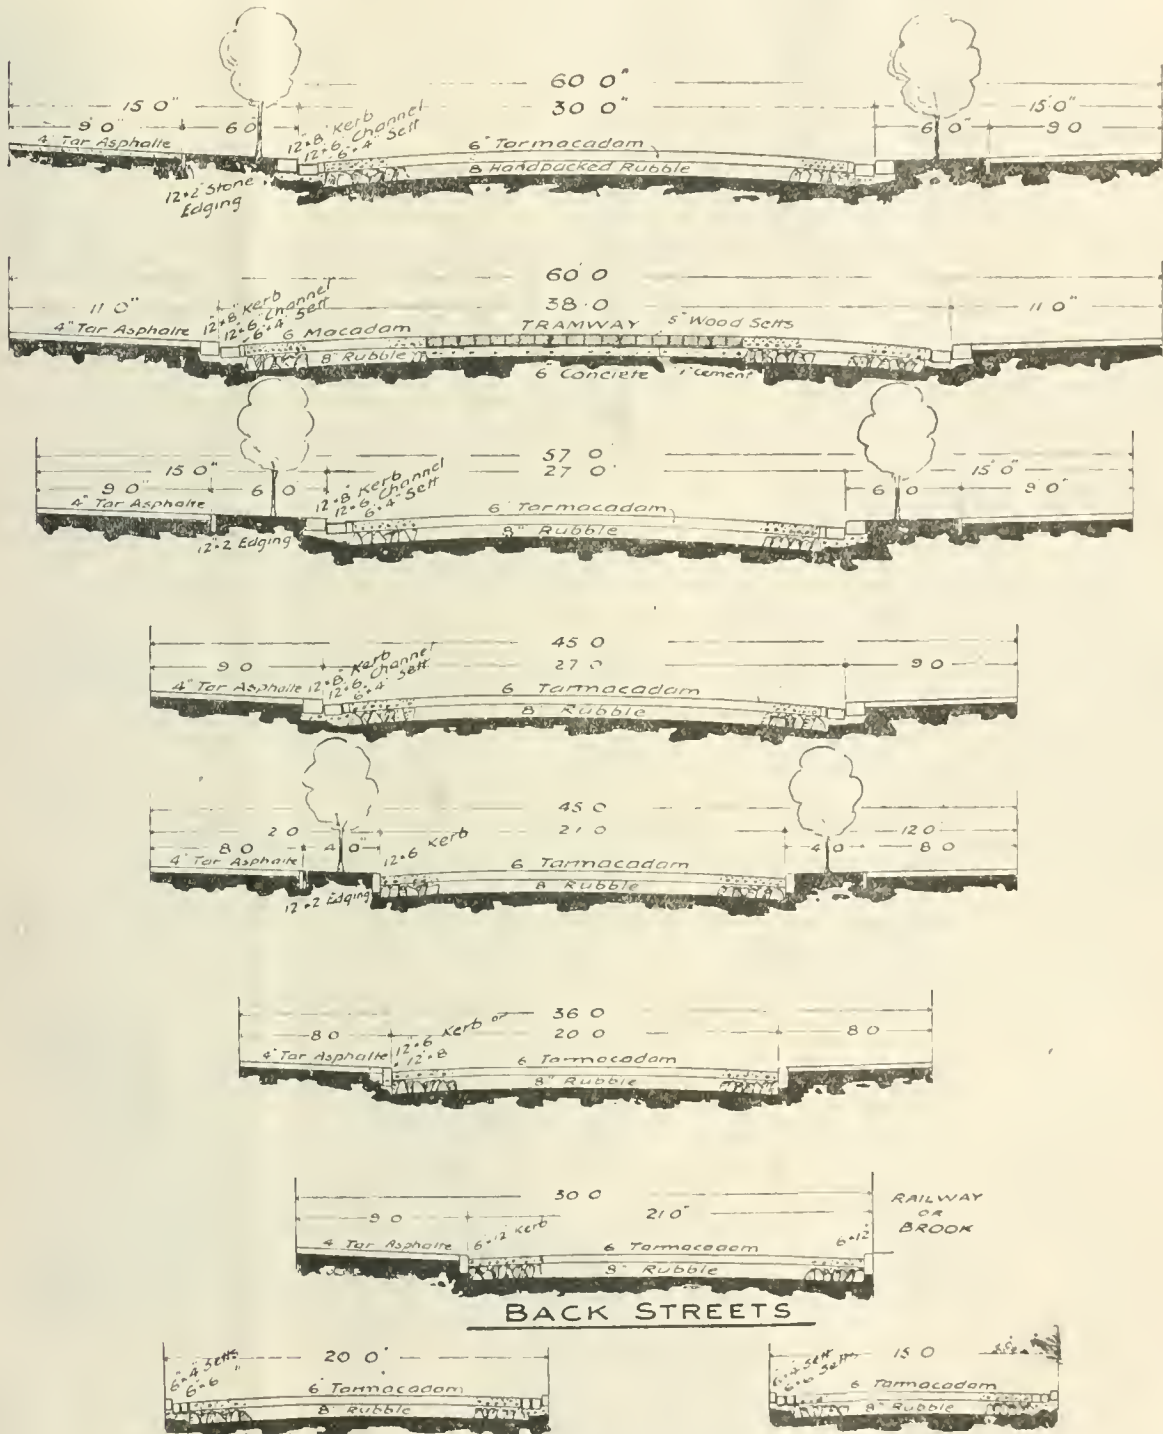

Lytham is an old town whose name is found in Domesday Book as "Lidun," and a Benedictine priory was founded here in 1188, in the reign of Richard I., though, like many other religious houses, it was dissolved by Henry VIII., and only a few remains of the buildings are now to be found in the Lytham Hall Park.

Though much has been done to modernise the town

The council spare no efforts to preserve the sylvan aspect of the town by planting trees in many of the new streets, and protecting those which now line the chief shopping and residential streets.

Twenty years ago the population was under 5,000, with a rateable value of £31,832; to-day the population exceeds 10,000, and the rateable value is £77,975. The district rate is 3s. 2d., and the area is 3,539 acres.

When the author came here the town was just beginning to go forward, consequent, very largely, upon an alteration in the land tenure, by which the leases were extended from 99 to 999 years.

LYTHAM PRIVATE STREET SECTIONS.
(Plate 1.)

during the past twenty years, it still retains much of that old-world charm and natural beauty which appeal so strongly to the cultured English man or woman.

While we willingly admit that we owe much of our growing popularity to the proximity of our go-ahead neighbour Blackpool, we make no effort to emulate them on the lines which have placed them in the forefront of pleasure resorts.

Lytham is essentially a quiet and select watering place relying more on its wealth of foliage, pleasant surroundings and residential qualifications than upon the amusements which form the main attractions for the majority of holiday seekers.

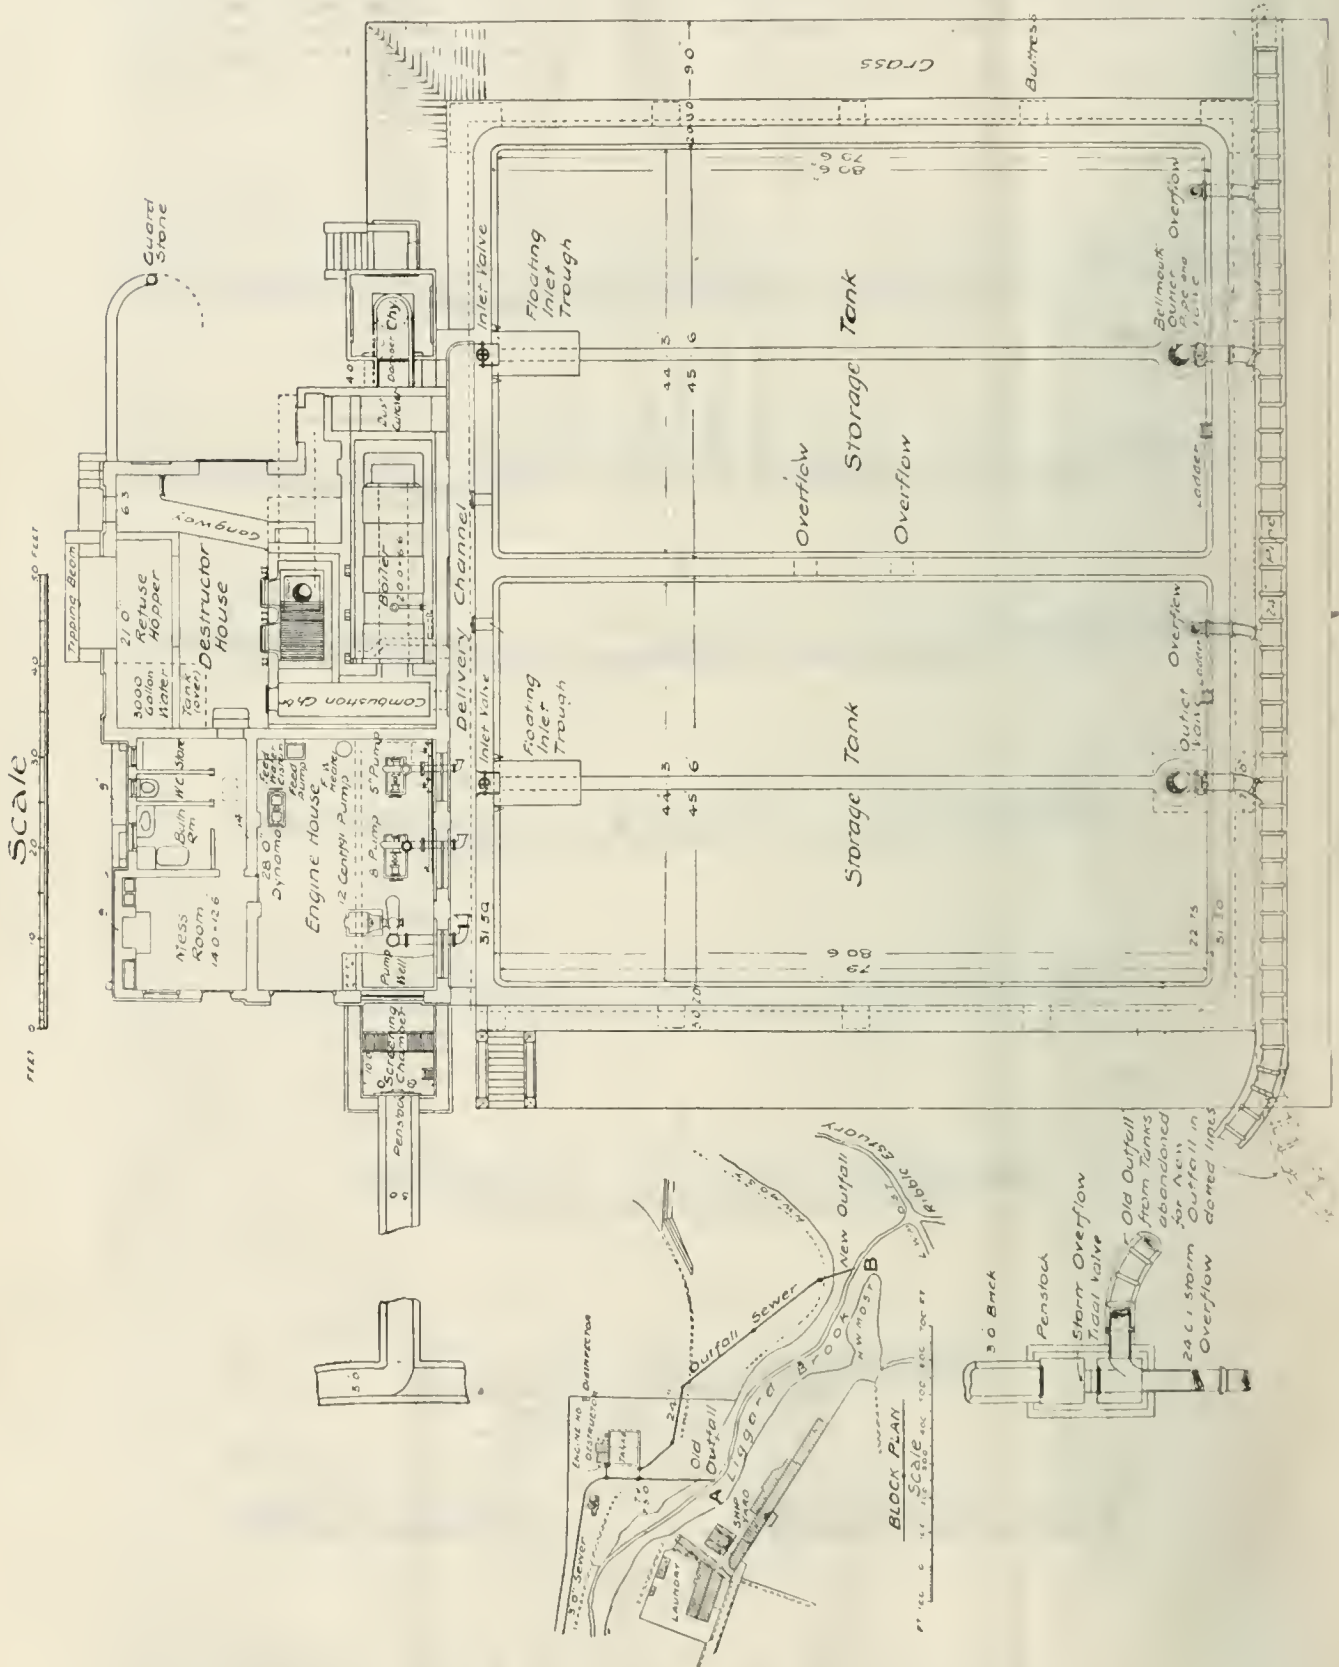

Practically the whole of the land in Lytham and our neighbour St. Anne's is leasehold, and belongs to Mr. J. Talbot Clifton, of Lytham Hall, and it is due to Mr. Clifton, and the skill and experience of his agents, Messrs. Thomas Fair & Son, that Lytham is laid out on such satisfactory lines, and so largely in accordance with the views of present-day town planners.

The lay-out of the town has provided a sea front with 3 miles of promenade, with a stretch of green-sward adjoining the promenade varying in width from 50 yds. to 120 yds., nearly 2 miles long, and 45 acres in area. This stretch of green is a feature almost

unique to Lytham, and forms an ideal promenade. Another length of promenade, about 1 mile long, at the extreme west end of the green, skirts the Fairhaven Lake. This lake, which has an area of 15 acres, is largely used for boating and open-air bathing, and a large number of tennis courts and a bowling green adjoin the lake and provide for the recreation

Gardens and the Lytham Hall Park, and a recreation ground of 6½ acres is leased to the Ratepayers' Association on easy terms.

Several smaller plots of land have recently been presented by Mr. Clifton, and laid out by the council as public gardens, and as a municipal bowling green at the east end of the town, and the Green Drive, which

LYTHAM REFUSE DESTROYER AND PUMPING STATION. (Plate 2.)

of the inhabitants and visitors at the west end of the district.

The Lowther Gardens—a park of 13 acres, laid out at a cost of £12,000, and presented to the town by Mr. Clifton—is a very fine example of small park designing. A bandstand, shelter and public conveniences have been erected in the gardens during the past few years, and tennis and croquet lawns are largely used by both visitors and residents.

A cricket ground of 10 acres lies between the Lowther

forms a beautiful and shady avenue of trees nearly 2 mile long, adjoining the recently opened golf links, is a favourite walk with all visitors to Lytham.

Golf has done much to popularise Lytham, and the well-known Lytham and St. Anne's Golf Club, together with the Fairhaven Golf Club, are partly in the Lytham district and partly in St. Anne's, while a new 18-hole course within five minutes' walk of Lytham Station was opened last year, and a private links is formed in the Lytham Hall Park.

The chief shopping street is parallel to the sea front, lying between the sea and railway, and the principal residences face the sea looking south, or follow the prevailing fashion and go west. The industrial portion of the population is housed at the east end of the town, where a shipyard, employing at times over 400 hands, and the other main industries of the town are to be found.

ROADS.

To come to matters of more immediate professional interest to municipal engineers, the length of the roads when the author came here at the beginning of 1899 was 14½ miles; to-day it is 24½ miles.

In the country they were mostly formed with gravel or broken gravel, and many were moss-grown; but the chief roads in the town were made with granite macadam. Tar-macadam had been used on two streets at the east end, but these were so unsatisfactory, and the council had so much trouble with the contractor—the roads having to be broken up and relaid as ordinary macadam—that a strong prejudice against tar-macadam—and for several years none was used by the council. One or two very good roads in tar-macadam had been made, one of which, running to the pier, may be of interest to the members, as it has been laid, as far as can be ascertained, something like twenty-four years, during which time it has never been repaired beyond making good a trench, has not had a coat of tar, and, though somewhat rough, is still a good road likely to last for many years.

For many years now we have used tar-macadam with very satisfactory results, and at the present time 8 miles of streets are laid with tar-macadam, and 4½ miles are tar-painted. With the exception of one short trial length of roadway, which was carried out for the council by a well-known firm of contractors, who had afterwards to take a portion of it up and relay it, the whole of the tar-macadam streets in the centre of the town have been laid by the council's own workmen with material mixed in the council's store yard, and with tar from the council's gasworks.

On the principal roads the tar-macadam is made with Penmaenmawr granite, as being more durable and less dusty and slippery than limestone. In the purely residential streets limestone is used, this material being very suitable for light traffic, as it wears very smoothly, and from the hygienic and economic point of view is almost an ideal road material when properly mixed and laid.

Much of the success of our tar-macadam work is due to the excellent quality of the tar supplied from the council's gasworks.

The tar occasionally varies considerably, according to the quality of coal used and the amount of light oils extracted, and it is necessary for the road foreman and man in charge of the boiling to exercise great care in the boiling so as to obtain tar of the proper consistency, and suitable for the situation in which it is to be laid.

The position of the street with regard to the sun and wind, the extent and nature of the traffic, the difference of temperature in winter and summer, all make it difficult to adopt a universal standard for tar. The personal factor cannot altogether be eliminated, for the man in charge of the tar boiling will have to make the tar harder—i.e., with more pitch in its composition—for a road where it is exposed all day to the sun and is subjected to a heavy traffic. In a back street, where neither sun nor much traffic finds its way, less of the lighter oils should be distilled or evaporated, for more "life" is required in the tar in such a position, to avoid the brittleness and subsequent disintegration of the road, which is the chief danger in such a position.

Also with tar-painting, a tar with a larger proportion of the lighter oils left in it than for tar-macadam work is necessary.

We have not had half-a-dozen bad consignments of tar during the past twelve years, and when these have happened it has been due to the inferior quality of the coal being used, or to too great a demand for tar having led to the tar tank getting too low, and water being supplied instead of tar. It was the latter cause chiefly that in 1912 led to a failure of one short length of road which had been tar-painted, though a spell of very wet weather was also, to some extent, responsible.

We have a small drying hearth which is used for drying stone in wet weather, but if possible the stone is dried naturally, as this is not only more economical, but avoids any danger of the stone being overheated and converting the tar into pitch.

Tar-painting has been carried out in Lytham for

the past nine years, this town being probably the first in the North of England to adopt it. Some 300 yds. of the road along the sea front, which was an ordinary macadam road, was tried experimentally, half with limestone and half with granite chippings.

The portion laid with limestone was for a time almost as dusty as ordinary macadam, but the granite, being a harder material than the limestone, was practically dustless when put on, and nothing but granite has since been used for tar-painted roads.

When tar-painting a new road we use an ordinary 160-gallon tar-boiler, which is convertible into a sprinkler with gas piping perforated to form a spray; but for repairs we chiefly use a small 80-gallon boiler fitted with a pump and movable spray.

In 1903 the principal street was paved with 4-in. Jarrah blocks on a 6-in. concrete foundation. The blocks were laid with a close joint directly on the concrete foundation, after being dipped into a mixture of pitch and tar, and were grouted with tar. Practically this street has needed no repairs during the past ten years, and the blocks are in so good a condition that they will probably last another ten years.

The footpaths in the main street are laid with concrete flagging, and portions of the other main streets with natural stone flagging. The residential streets are chiefly in tar-asphalt, and country roads have footpaths of gravel or fine clinker. Some very interesting cobble-paved footpaths are to be seen in the streets leading from the beach; those in Bath-street, in which are the date at which they were laid—1831—with designs of a ship, compass, anchor, rose, &c., picked out in white pebbles, are in a very fine state of preservation, and are well worth inspection.

PRIVATE STREET WORKS.

During the past fifteen years plans and apportionments for over 100 new streets have been prepared, and, with the exception of some half-a-dozen awaiting construction, have been carried out. They were until a few years ago mainly carried out by the council's staff, but, owing to the objection then first raised by the Local Government Board to the council's regular workmen being employed on work carried out by a loan, the work has since been carried out by contract, and not always with equal success.

The width and lay-out of the streets is shown in the sections submitted in Plate No. 1, varying from 60 ft. to 30 ft. for front streets, with 20-ft. and 15-ft. back streets.

They are now nearly always carried out in tar-macadam, and the footpaths have almost invariably been of tar-asphalt.

It will be noted that where the streets are 45 ft. or greater width the footpaths have a 4-ft. or 5-ft. wide plot set apart for the plantation of trees. These trees have grown well in most situations, and are much appreciated by the residents in the avenues where they are planted.

SEWERAGE, SEWAGE DISPOSAL AND DESTRUCTOR WORKS.

When the author came to Lytham main outfall sewers were just about to be laid at the east and west ends of the district, the schemes being carried out by two well-known firms of Manchester engineers.

The east end and central portions of the town were sewered by a 24-in. main outfall, which discharged by gravitation into a tidal creek near to the Preston-road. This position was not, on sanitary grounds, very desirable, and so a scheme for providing a new outfall, storage tanks and a pumping station at the east end of the district was designed.

The outfall sewer was partly carried out, but when the author (who, on his appointment as surveyor, had been requested to act as resident engineer on the work) came to fix the sight rails for the outfall, he found that a serious mistake had been made in the levels, and that it was impracticable to carry out the scheme as designed by the engineer. On Major Tulloch, M.E., C.B., late chief engineering inspector to the Local Government Board, being consulted on the matter, he advised that a new scheme should be adopted.

The council instructed the author to prepare a new scheme for dealing with this portion of the district, and this scheme, which included a pumping station, refuse destructor, and storage tanks, was carried out as now described and illustrated on Plates Nos. 2, 3 and 4.

About two-thirds of the sewage of the district flows to the sewage and destructor works, where it is screened and pumped into storage tanks, and then discharged, on the ebb tide, into the sea.

The dry-weather flow is about 250,000 gallons per

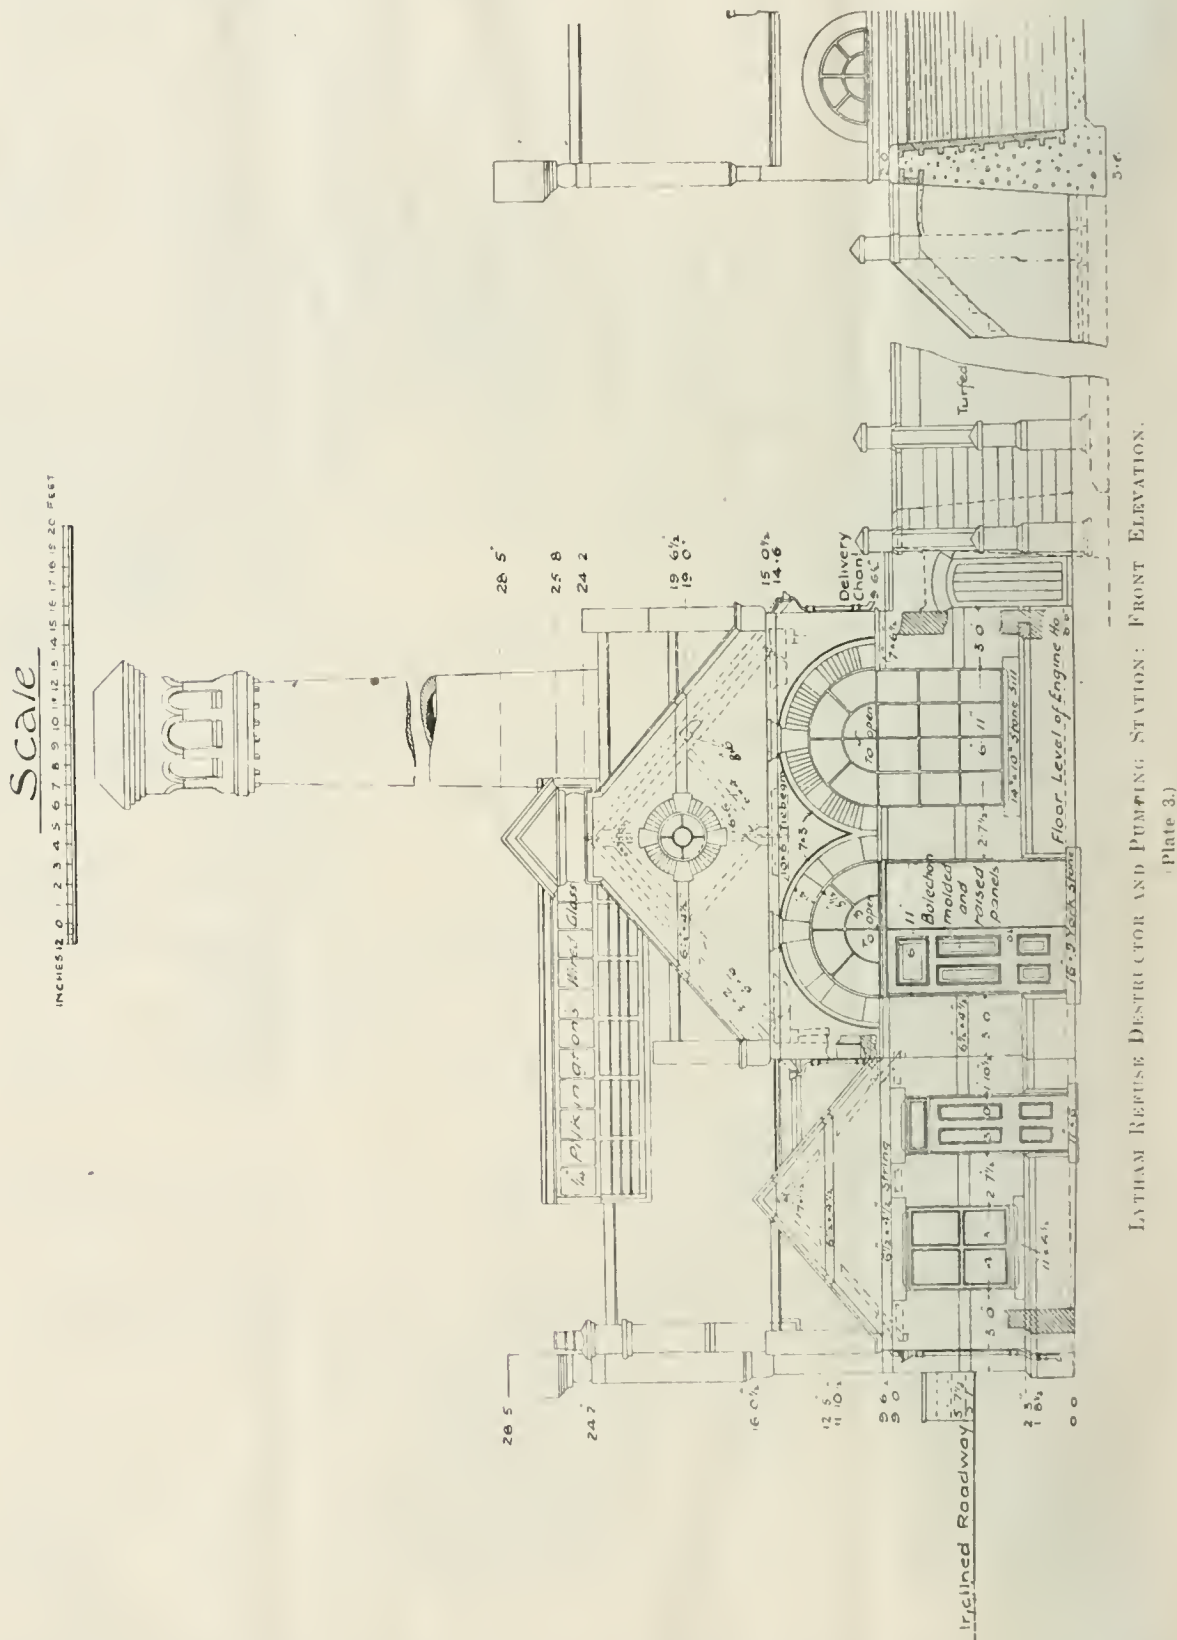

day, and a 5-in. and an 8-in. centrifugal pump, capable of lifting eight times this quantity, were put down when the works were opened.

While a margin of eight times the dry-weather flow is more than sufficient to meet the Local Government Board's requirements, it is, however, hardly necessary to point out to a meeting of municipal engineers that, with the growth of population and an increased paved area, a much greater quantity of sewage and storm

centrifugal pump. This is capable of lifting 2,500,000 gallons per day, making the total pumping capacity 4,500,000 gallons per day.

The 5-in. pumping engine has a single cylinder, the 8-in. pump has a tandem compound engine, and the 12-in. pump has a twin-cylinder engine, all the pumps being direct driven, and made by Messrs. Gwynnes, Limited.

The sewage is pumped into a delivery channel, from

water has now to be dealt with at the works during a heavy storm. This difficulty would not be so great if the storm overflows could always come into operation; but as the heaviest storms frequently occur near high tide, the main overflow near the works is then practically useless, and the other smaller overflows are frequently not of great use for some time. To meet this difficulty and prevent backing up in the sewers, the council have just put down another 12-in.

which it flows into the tanks. There are two tanks, each holding 200,000 gallons, and, as they can be discharged twice a day, they have a total capacity of 800,000 gallons per day, or just over three times the dry-weather flow required by the Local Government Board. The plan of the tanks is given in Plate No. 2, and a section of the tanks, pump well and engine-house is given in the paper on "Seaside Sewage Disposal," read by the author at the Plymouth annual

meeting, and published in Vol. xxxvii. of the institution "Proceedings."

The power for pumping is obtained from the destruction of the refuse in a two-cell destructor adjoining the pump-house.

by Messrs. Dawson & Manfield, of Manchester, who reconstructed the furnaces.

Instead of the air for the blowers being heated by passing over the regenerator tubes, the air is now drawn over the top of the combustion chamber and

Scale 3 in. to 3 ft.

 (Plate 5.)

Originally it was a Meldrum two-cell destructor with regenerator, but after ten years' constant use it was found necessary to rebuild the furnaces, and as the regenerator tubes gave considerable trouble, these were dispensed with in favour of the system designed

furnaces, by which means not only is the air heated, but the foul air is drawn out of the destructor-house, and the ventilation greatly improved. The cells are front and hand fed, and the total quantity burnt averages about 12 tons per day.

While the reconstruction was being carried out, the opportunity was taken to put in an offal door in the top of the furnace, with a gangway from the inclined

tains the feed-water pump, feed-water heater, dynamo, and crane.

The dynamo, provided by the Lancashire Dynamo Company, has a capacity of 50 amperes, is driven by a 7-h.p. Robey engine, and lights the engine and destructor houses, manager's cottage, disinfecting station, and the outside of the works.

When the site for the east end outfall was chosen, the council was compelled by the engineer to the Ribble Commissioners to place the outlet in the creek opposite the shipyard, at the point A shown on block plan on Plate No. 2; but as a large number of men were frequently working almost over the outlet, it was not surprising that complaints were made of the position of the outfall. The council recognised that these were justified, and have removed the outlet some 800 ft. nearer to the sea, as shown at B on the block plan on Plate No. 2.

A large portion of the old 24-in. main on the south side of the Liggard Brook was laid in very bad ground, and was found to be in such a bad condition that it was considered advisable to abandon it. A new 24-in. main sewer was laid in its place on the north side of the brook, and this also served the purpose of opening out the land on that side for building purposes.

As the brook had to be crossed twice, the scheme involved either syphoning the sewer under the brook or deepening the brook, so as to allow the water to pass under the sewer with an equal water area to what it would have had if the sewer had not interfered with the flow.

This was done as shown on Plate No. 5, the bottom of the brook being deepened and concreted, and the sewers—12-in. and 18-in. cast-iron pipes—were carried straight across the brook.

A somewhat similar case is dealt with in the manhole on Plate No. 6, where a small brook crosses the line of sewer. This brook may form the centre of a roadway in the near future, and will be culverted. It was necessary that the flow of the brook should not be interfered with, as it drains a prospective building area, so the water in the culvert is syphoned under and passed over the sewer in the manhole provided for inspection and clearing of the culvert when necessary. The ordinary manhole for the sewer adjoins the manhole for the culvert.

These have been found in practice to require very little attention, while they are much more accessible for cleaning and freer from nuisance than the sewers would have been if laid with inverted syphons.

The storm overflows, shown in Plate No. 7, are of the usual sill type, and the sills come into operation when the sewers are running three-fourths full.

Owing to the nature of the ground in the district, which is largely alluvial with running sand and peat in parts, and the increased loads now being carried on the roads, trouble has been experienced with the older sewers. The absence of concrete foundations and concrete protection has led to serious breakdowns in several of the main sewers, and in the case of the west end outfall necessitated putting down temporarily an 8-in. pulsometer pump, fed by two vertical boilers, by which the sewage was pumped some 200 yds. for six weeks, while the damage to the sewer was being made good.

Since that time, on the author's recommendation, the council have allowed no sewers to be laid unless they are laid on and encased in concrete. Sewers less than 10 ft. deep are laid on 6 in. of concrete and covered with 4 in. of concrete, and sewers over 10 ft. deep have to be laid on a 9-in. concrete foundation and be surrounded with 6 in. concrete.

All drains in the roadway, either for house drainage or street gullies, have to be incased in 4 in. of concrete, and are only allowed to be laid under strict supervision by the council's officers.

The west end sea outfall sewer, at Fairhaven, is a 15-in. cast-iron pipe carried for 100 yds. through a 4-ft. cast-iron surface water pipe, and was originally carried some 80 yds. beyond the end of the 4-ft. pipe. The low water channel of what is known as the North Hollow is constantly changing, and this change makes it difficult to maintain a constant position for the outlet.

Owing to the difficulty of obtaining any storm overflows on the west end main sewer, it has for some years past been incapable of carrying off the sewage and storm water in time of heavy storms, especially if the storm occurred at high water. The consequence has been that basements in a number of buildings draining into this sewer have been flooded,

and it is to remedy this nuisance that the works illustrated on Plates Nos. 8 and 9 have been designed.

The trouble in the past has been the want of storage, and as this part of the district has developed rapidly it was likely to be a growing want.

The works now being carried out consist of a 30-in. cast-iron sea outfall carried on timber piles for a portion of its length, and where buried under the sand on concrete. These cast-iron pipes end at the tidal valve chamber fixed under the promenade. From this chamber to the screening chamber the pipes are 30-in. concrete pipes, which are laid on a 9-in. concrete foundation and covered with 6 in. of concrete. The ground was found to be running sand, and it has been necessary to lay a timber decking to support the concrete and leave the bottom frame of timber in for the protection of the pipes.

The screening chamber, in which a screen and raking apparatus are to be fixed, and the storage culvert, are to be placed under the roadway of the promenade.

The storage culvert, of which details are given in vol. xxxvii., will hold 400,000 gallons, which is equal to the capacity of the tanks at the east end. As it can be discharged twice per day, the total daily capacity is 800,000 gallons, and this it is hoped will prove sufficient to remove any danger from flooding.

SLAUGHTER-HOUSES.

The council have owned the slaughter-houses in Lytham for the past fifty years. Until seven years ago, however, they were not public slaughter-houses, but eight small private slaughter-houses in a somewhat dilapidated condition. These stood on land which the railway company wished to acquire for the purpose of widening the railway, and the council obtained from the railway company £800, the materials in the old buildings, and 1,132 sq. yds. of land in exchange for the 800 yds. given up to the railway company.

After considering some half-a-dozen different schemes for public and private slaughter-houses, the council finally adopted the scheme the plans of which are given on Plates Nos. 10 and 11.

The site is not an ideal site to plan, and it is not quite the scheme the author would have adopted had he had a free hand with regard to land and expenditure. The scheme has, however, the merit of having made the best use of the site, is economical, and it meets all reasonable requirements in a sanitary and convenient manner.

The slaughter-houses consist of a public slaughter-hall, 40 ft. by 30 ft., fitted up with hoisting and overhead gear, and is well lighted and ventilated. Cattle lairs are placed conveniently at each end of the slaughter-houses. The hanging room is a building, 40 ft. by 30 ft., detached from the slaughter-house, being cut off by a covered but open passage. This will probably be large enough for many years to come, and will serve for a future slaughter-hall on the east side when required.

The pig slaughter-house is fitted with overhead fittings, hoist and scalding tub. A boiler-house containing a vertical boiler and a tripe boiler, attendant's office, piggery, skin and hide stores, and outside cattle and sheep lairs, are also provided.

SANITARY CONVENIENCES.

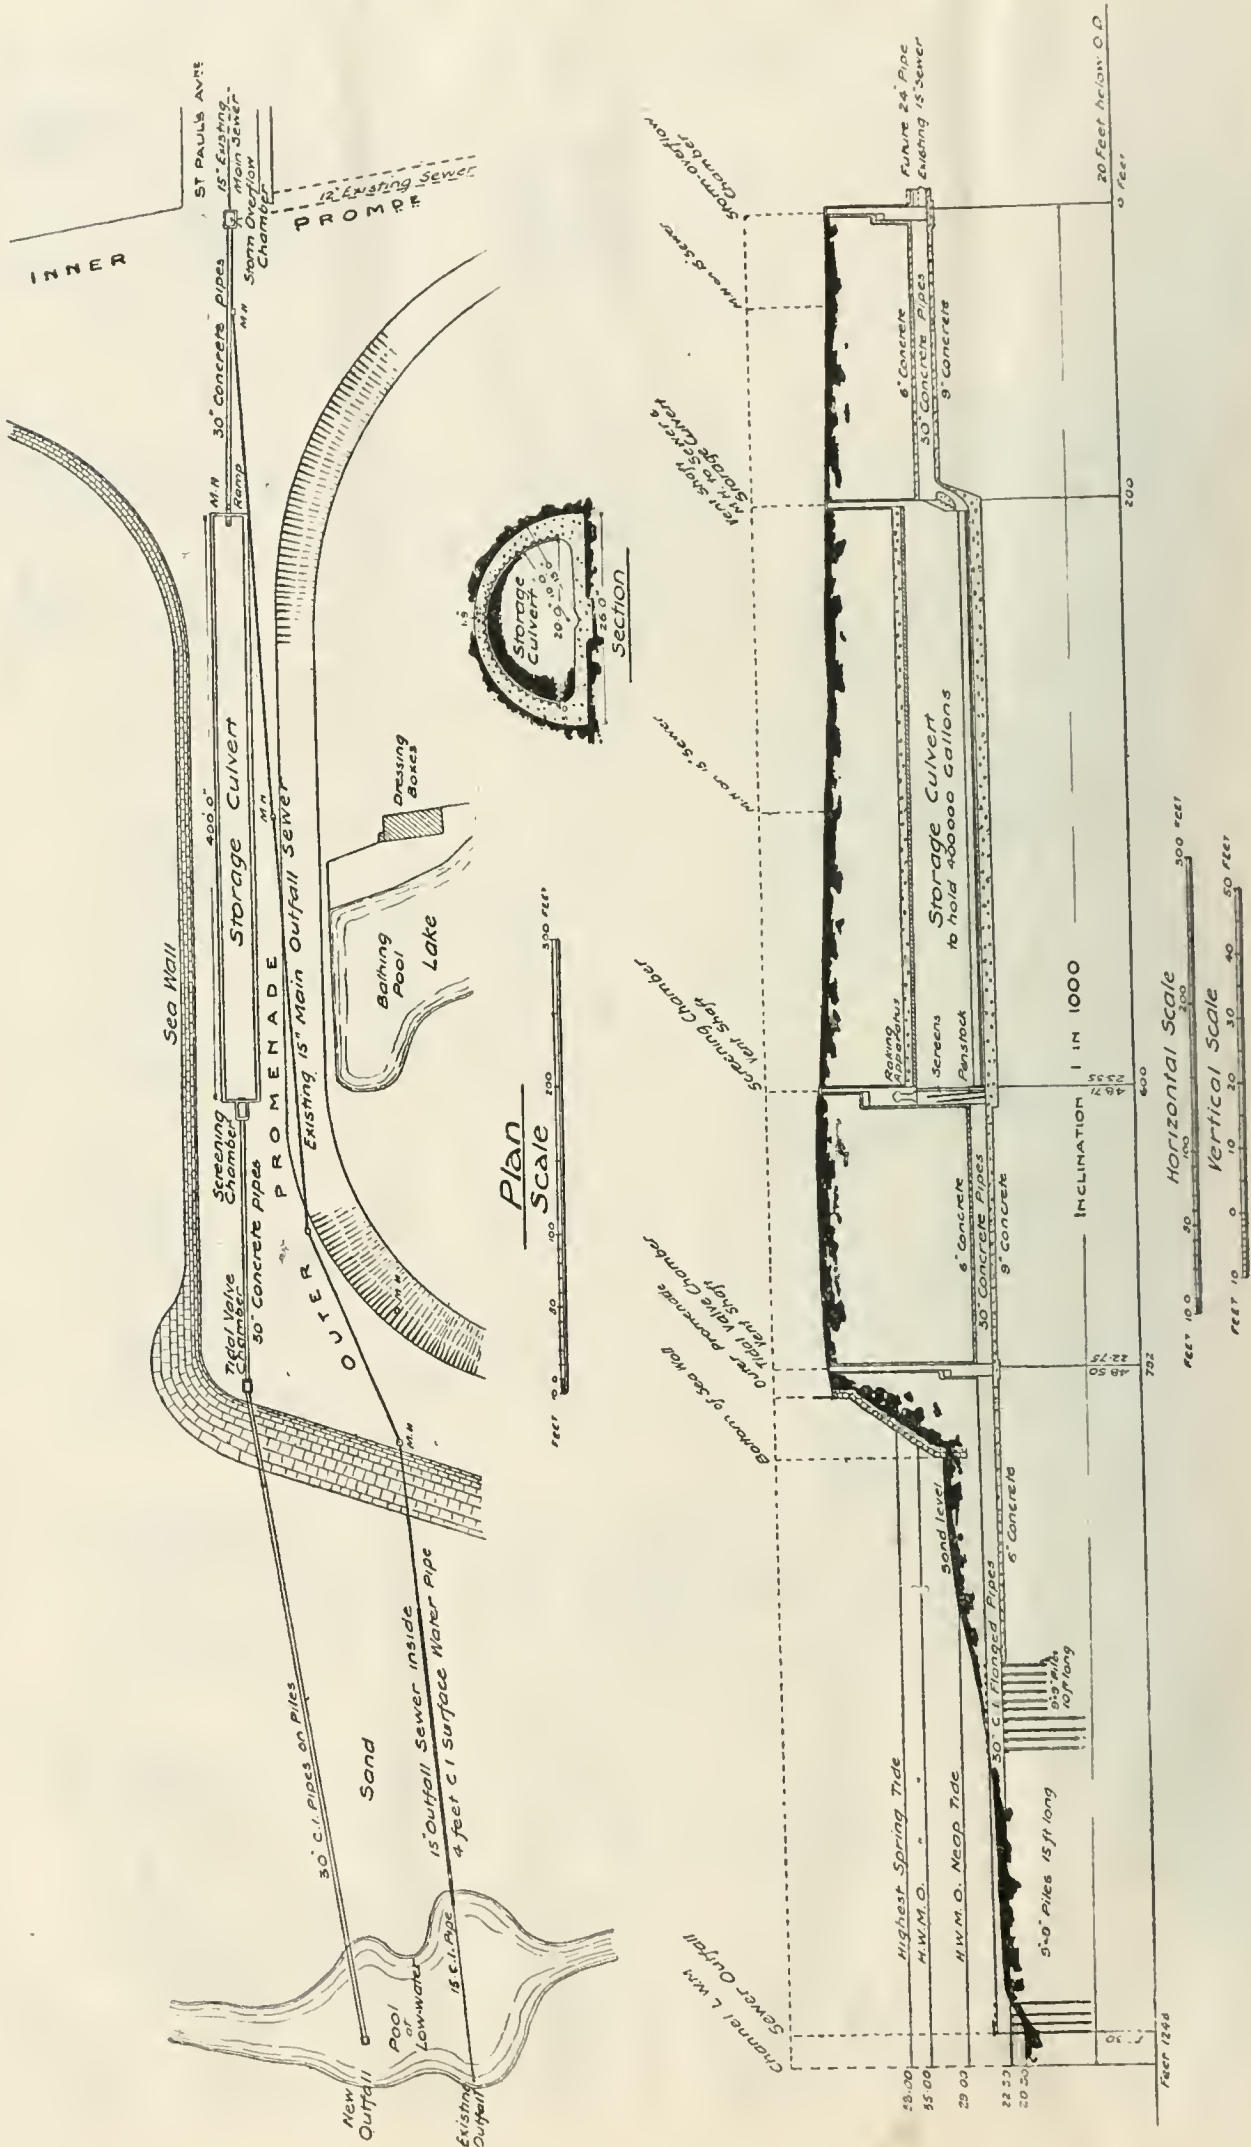

The selection of suitable sites for public conveniences is always a matter of some difficulty, and especially so in seaside resorts of the character of Lytham. Continental nations rather poke fun at what they consider our extreme sensibility in such matters, but, while it is very important that these conveniences should be put in positions where the public can easily find them, it is at the same time desirable that they should be screened and made as little obtrusive as possible.

The underground conveniences in Clifton-square, which is the most central spot in the town, have been planted round with flowers and shrubs in such a way that the square is, in most people's eyes, improved by the placing of the conveniences there, while there is no difference of opinion as to their value and necessity.

On the East Beach, near the old Windmill, one of Lytham's oldest landmarks, conveniences are constructed half in and half out of the ground, these, again, being well screened by a shrubbery, as are also the conveniences erected at the Lowther Gardens.

Other public conveniences have been erected at the Market Hall, and others are projected for the west end of the district.

The council have erected stabling, which adjoins a

LATHAM SEWERAGE: SEA OUTFALL AND STORAGE CULVERT, FAIRHAVEN. (Plate 8.)

fire station well equipped with steam engine and other fire appliances, have a good store yard, shedding and other accommodation, and generally are well equipped for carrying out the sanitary and highways work in an efficient manner.

Lytham has had a most successful gasworks for the past sixty-four years, supplying gas at 2s. per 1,000 ft. nett, which is the lowest in the Fylde district, and lower than any gasworks in the country of the same size. An installation of vertical retorts is just nearing completion, and it is confidently expected will lead to much cheaper gas in the near future.

The success of the gasworks has in the past militated against the introduction of electricity; but this is shortly to be introduced. The council have recently obtained an order from the Board of Trade to provide electricity, and are awaiting the result of the Local Government Board inquiry into their application for £23,700 to carry out the scheme prepared by their electrical engineer, Mr. J. H. Tonge, M.I.E.E., ASSOC.M. INST.C.E., of Preston.

The water supply of Lytham is provided by the Fylde Water Board, which is composed of members of the Blackpool, Fleetwood, Lytham and St. Anne's Councils. The gathering grounds are at Grisedale, near Garstang, where a new reservoir is now being constructed under the engineer to the board, Mr. J. Cook, ASSOC.M. INST.C.E., an old and valued member of our institution. Powers have recently been obtained from Parliament for acquiring extensive gathering grounds on the upper reaches of the Hodder in Yorkshire, and to carry out works estimated to cost over £1,000,000, so as to provide for future requirements.

The district is well served by the Blackpool, St. Anne's and Lytham Tramway Company, whose cars run right through from Blackpool Central Station to the Cottage Hospital at the east end of Lytham. The cars have materially assisted the development of the district, and are very largely used by visitors during the summer season.

In conclusion, the author wishes to acknowledge the valuable assistance he has received in preparing the plans accompanying the paper from his chief assistant, Mr. E. Pilling, and from Mr. J. D. M. Morton.

DISCUSSION OF MR. PRICE'S PAPER.

The CHAIRMAN (Mr. J. S. Brodie) moved a formal vote of thanks to Mr. Price for his paper.

Mr. E. WORRALL (Stretford), in seconding the vote of thanks, said there were many features in the paper which commended themselves to those engaged in municipal work, but he ventured to join issue with Mr. Price when he spoke of a surveyor's work in a small town as lacking in "importance." If he had substituted the word "magnitude" he would have agreed with him. Municipal works in Lytham were just as important to the inhabitants of that town as were those of Manchester, Liverpool, and other large cities. The comprehensive detail shown in the diagrams accompanying the paper would be of great use both to the older and the younger members of the institution. In the matter of town planning, Lytham was situated very much as they in Stretford were, as they also had practically only one landowner of an energetic and pioneering frame of mind, the result having been that they had been able to formulate a town planning scheme without any of the usual formalities, although, in order to secure for it an official status, they might go to the Local Government Board later on. It was interesting to know that Lytham had gone one better than their big neighbour—Blackpool—and provided a public park. That was one thing Blackpool had not done. [Mr. Brodie: The sea front is our park.] A park was one of the necessities for those in search of quiet retirement. [Mr. Brodie: They don't want quiet at Blackpool.] (Laughter.) After inquiring as to the powers under which a 60-ft. roadway had been provided in Lytham, Mr. Worrall went on to say that it would be interesting to have a little more information, if it could be given with due propriety, as to the reasons which led to the submerged outfall to which reference had been made. Some of the tar-paved roads in Lytham appeared to have a very remarkable life—twenty-four years being the maximum given. The occurrence of storms at times of high water was interesting, and he would like to know whether this was peculiar to the district, and, if so, whether there were any recorded facts available. He took it that the pumping capacity of the centrifugal pumps referred to a twenty-four hours' day. [Mr. Price: Yes.] The practice of laying pipes in concrete was, as a rule, a good one, but not one

that was always infallible—that was to say, one could not always rely on it in all circumstances. He would like some explanation as to Mr. Price's statement that, although the council had owned the slaughterhouses in Lytham for the past fifty years, they were not public slaughterhouses. The diagram of these buildings, which accompanied the paper, was, however, very useful material for members who contemplated the provision of such structures. The progressiveness of Lytham was, he thought, shown very clearly by the statement towards the end of the paper that a modern installation of vertical retorts was being installed at the gasworks, with a view, presumably, of further reducing the low price of gas.

Mr. S. PICTON (Eccles) said he thought there were several excellent ideas in the paper, especially for the younger members of the institution. One was in the remark of the author as to the work he had been able to do since his appointment to Lytham. They all knew the old adage about a rolling stone gathering no moss, and what Mr. Price had accomplished seemed to prove that to go about from place to place was not the best thing to do. He would like to know the price per yard of the tar-painting; also, in regard to the private street works, whether the council provided their own materials or allowed the contractors to purchase them. He was rather sorry to see the work was not done under direct labour, which was more beneficial. Did the owners pay for the provision of the streets under the statutory regulations? He was informed they could not legally charge the owners.

Mr. J. LOBLEY (Hanley), who said he had watched the progress of Lytham for nearly forty years, expressed a hope that the council would not spoil the broad stretch of greensward in front of the town by converting it into gardens.

Mr. W. STUBBS (Blackburn) inquired what would happen in the event of a breakdown of the single boiler that was available for the pumping of sewage.

Mr. H. YARWOOD (Rochdale) asked whether the entire cost of the 60-ft. road mentioned was borne by the abutting owners, or did the local authority or freeholders contribute something to the extra width?

Mr. T. BURROWS (Lathom and Burscough) asked whether it was the practice in Lytham to season the tar-macadam, and what size of stone was used for the aggregate. Was the tar tested for viscosity by an apparatus such as Hutehinson's viscosimeter? Was anything in the nature of resin or pitch put into the tar? He saw it was strengthened by pitch, but in what way? [Mr. Price: That is only in regard to wood paving, I think.] Was the tar distilled? Also, was the surface of the old macadam road scarified before the tar-macadam was laid?

Mr. J. HIRWOOD (Morecambe) remarked that the 45 acres of greensward on the front at Lytham was unique, but he considered it could be improved, and made a place of unrivalled attraction. Mr. Price was to be congratulated on being in a position to obtain such reliable tar that he was able to use it successfully at all times. He would like to know whether the tar was refined before delivery or whether Mr. Price dealt with it himself; also, were any viscosimeter tests applied? Were the concrete flags used for footpaths 2-in. or 2½-in.? [Mr. Price: 2½-in.] As regarded cross-overs on the footpaths, what paving was allowed for means of private access?

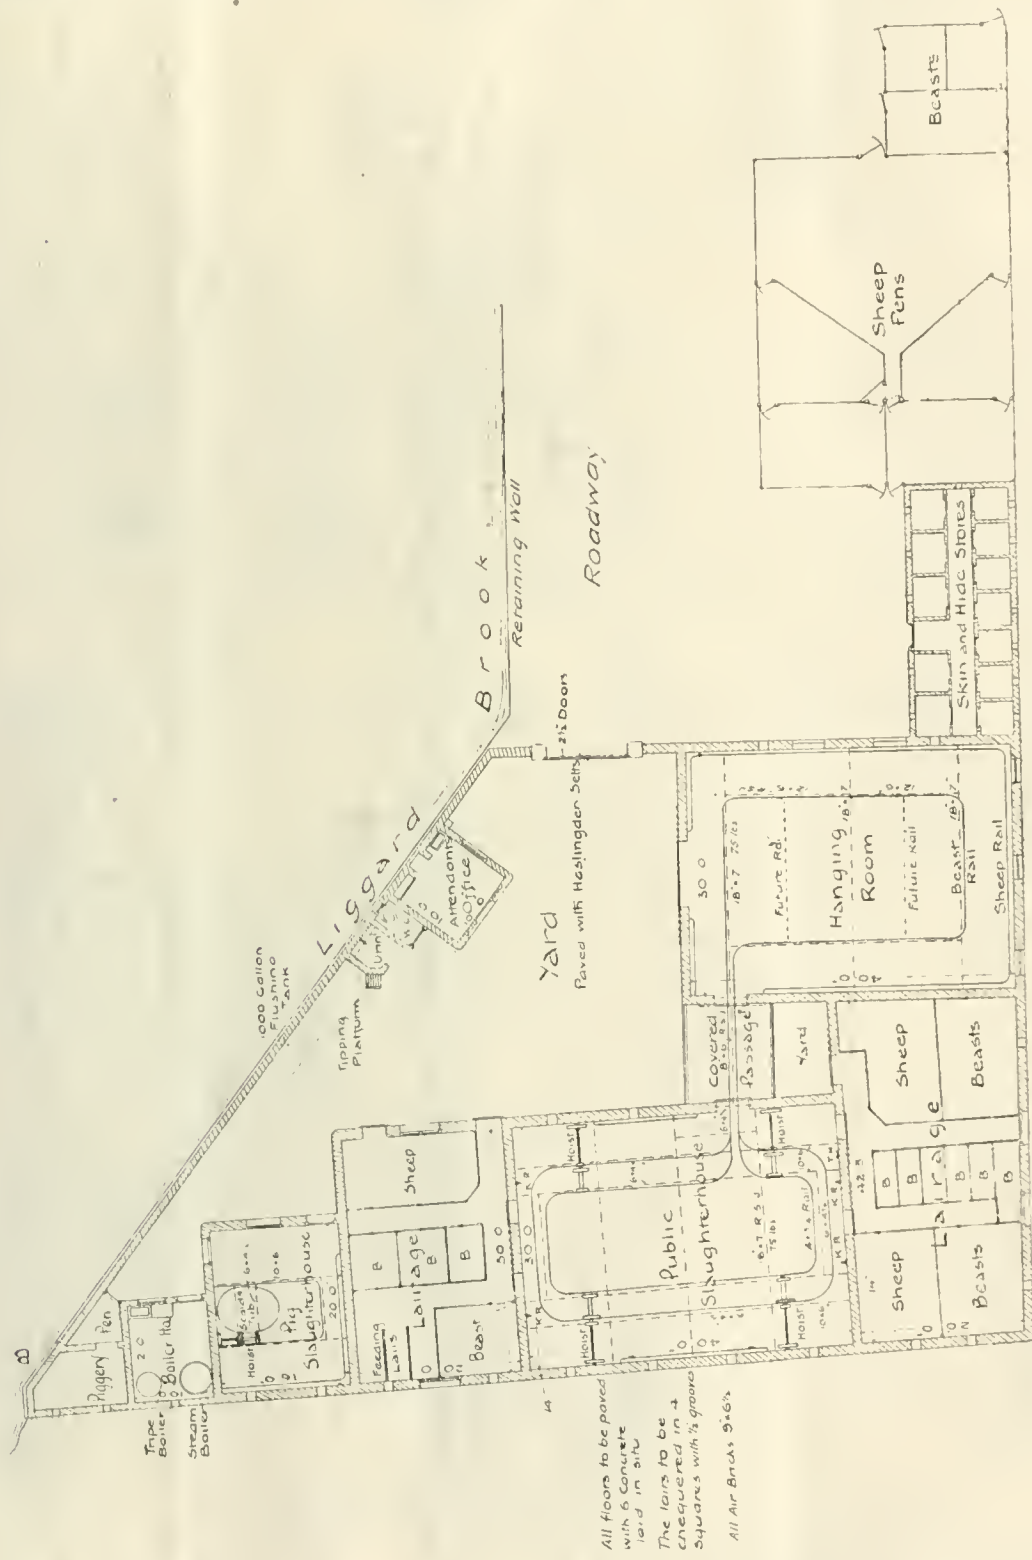

Mr. W. H. TRAVERS (Wallasey), following some remarks appreciative of the paper, said he was interested in the question of town planning as applied to Lytham because he was blessed in his town with a multitude of owners. He thought Lytham was to be congratulated on having a ground landlord who had taken a broad view of his responsibilities, and assisted the authorities to develop the district on such satisfactory lines. He should like to know whether the requirement of a 60-ft. road emanated from the estate office or the ground landlord, or whether it was a by-law requirement. If a by-law requirement it showed that the district had been very far-seeing, and anticipated problems like few other places.

Mr. C. BROWNRIDGE (Birkenhead) suggested that the addition of some particulars as to costs would add to the value of the paper. He would like to have some information as to the procedure adopted in regard to the mixing of the tar-macadam—whether Mr. Price mixed the stone only with the tar or put in a small proportion of chippings and mixed the larger with the smaller stone; because he thought many failures were caused by expecting stone to become cemented together simply by putting a liquid on the outside of it. Three different kinds of pumps had been alluded to by Mr. Price, and he would be glad to know the

efficiency of these; at the same time, in regard to the destructor, would he state what was the calorific value of the refuse?

The vote of thanks was carried.
 Mr. PRICE, in replying, thanked those present for the kind manner in which they had referred to his paper. He had had very great pleasure in preparing the contribution and in seeing them at Lytham. He had said at the outset of his paper that the surveyor's work in a small town made up in variety what it lacked in importance, but he agreed with

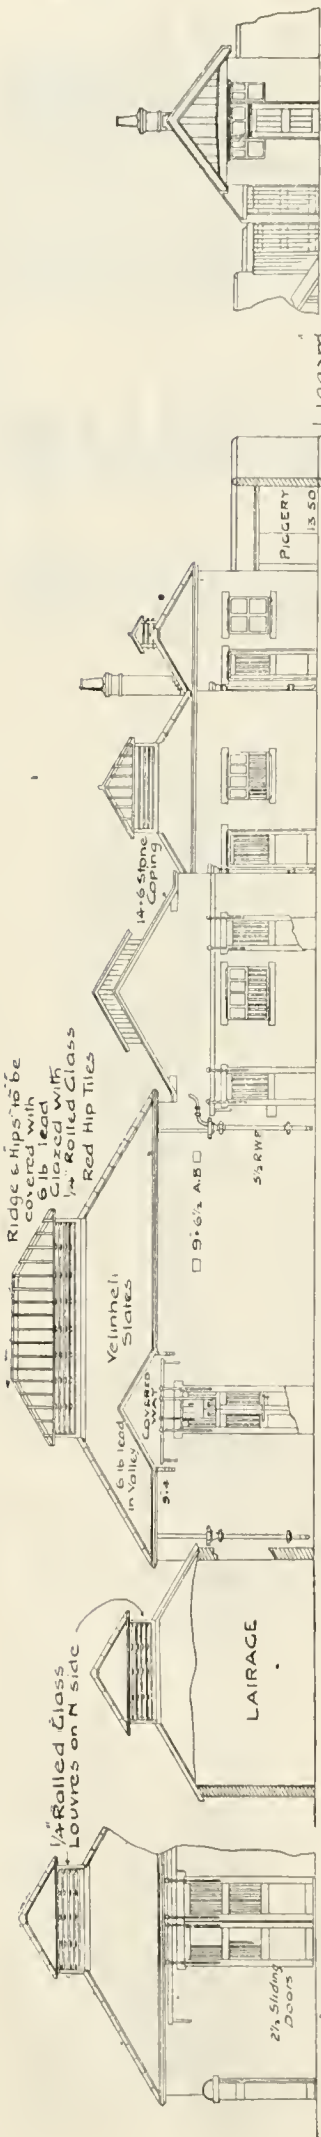

of tar got too low and some water got in, and he was afraid there had been occasions when they had been supplied with water instead of tar—which, as a rule, however, was excellent. One could not get a standard tar, or a tar that could be used in every situation. In the back street on which there was little traffic and sun it was desirable to retain the lighter oils in the tar, but on the front streets where there was a good deal of traffic and more sun, the effect of the traffic was to bring the tar to the surface. Therefore they could not eliminate the personal factor alto-

Scale 24 ft. to 1 in.
 LYTHAM PUBLIC SLAUGHTER-HOUSES.
 (Plate 10.)

Mr. Worrall that "magnitude" would have been a more correct word than "importance." At the same time, he thought they understood what he had meant to convey. The only reason for the submerged outfall given by the engineer was that he could not take the levels because the tide was up. It was a rather singular explanation to give, but the fact of the matter was it was due to a mistake the engineer had never anticipated, and was compelled finally to admit. With regard to tar-painting, he might say that they never used any pitch at all, so long as the tar was in its usual condition. Sometimes the store

together. The mixing of his tar-macadam was done by hand. When he first went to Lytham he found a yard full of chippings, and in order to make use of these he mixed them with larger stone for the tar-macadam. From that time on they had done that, and one of the largest contracting firms in the country whom he told of the step he had taken immediately patented the process and put it on the market—(laughter)—in spite of the fact that he had been putting down the material in Lytham years before. They put a barrow load of chippings into a yard of stone. He had often thought of getting Hutchinson's appa-

(Plate 11.)

ratus for testing the viscosity of tars, but he had been doing so well that he was rather afraid to adopt more scientific methods. He did not know what the new system of vertical retorts at the gasworks might do, but it might alter the character of the tar. The 60-ft. road to which reference had been made was laid out for them by the estate. With regard to the syphon, all he could say now from his experience was that he would not attempt to syphon a sewer under a brook. As it was, cleansing operations were easy; the bottom of the brook had been concreted, and there was sufficient velocity of water to clean it out. In regard to the provision of trees, they were met very well by the ground landlord, who presented them with all the trees they wanted for new streets. With only two cells at the refuse destructor, and a single boiler, he agreed that they required a stand-by plant. In a statement prepared since the meeting Mr. Price deals as follows with other questions raised in the course of the discussion: "I should like also to point out that on Plate 8 an error has been made in the tracing, as the level 23.35 on the section should be at 200 ft., not at 600 ft., which is 22.95. The cost of the private street making, asked for by Mr. Brownridge, is, less sewerage and lighting, about as follows: 60 ft. wide, 28s. per foot-run for total width; 45 ft. wide, 24s. per foot-run for total width; 36 ft. wide, 18s. per foot-run for total width; 20 ft. wide, 12s. per foot-run for total width. The prices for sewers vary considerably, according to the depth and nature of the ground, but a 9-in. sewer 6 ft. deep costs about 8s. per yard, 8 ft. deep 10s. The slaughter-houses, as shown on the plans, when completed cost £3,000. The destructor and engine-houses with furnaces and pumping plant cost, including pump well, roughly £4,500, and the tanks £1,500. These prices would, however, hardly rule to-day, and I should estimate that the cost of materials and labour have gone up quite 40 per cent since this work was carried out."

Before the meeting terminated Mr. Brodie made a sympathetic reference to the late Mr. Alfred M. Fowler, whose death was recorded in *THE SURVEYOR* of the 5th inst. A vote of condolence with the relatives was passed, the members upstanding.

SCOTTISH DISTRICT MEETING AT DUNFERMLINE—(2).

Elsewhere in this issue we reproduce one of the three town planning papers submitted at this meeting—that of Mr. Raymond Unwin, entitled "A Town Planning Scheme: Its Effect on Housing and Architecture"—and we hope to be able to print next week the contributions of Mr. A. Horsburgh Campbell, the burgh engineer of Edinburgh, and Mr. John L. Jack, town clerk of Dunfermline, together with a report of the discussion which followed their presentation.

BEDFORD MEETING PROGRAMME.

To-morrow's Eastern District meeting of the Institution of Municipal and County Engineers at Bedford will open at the town hall at 2 p.m. There will be a short business meeting, at which a sub-district secretary for Bedfordshire, Buckinghamshire, and Northamptonshire will be elected. Afterwards an inspection will be made of the tar-macadam mixing plant of the county council and the Bedford Corporation, and this will be followed by a visit to tar-macadam roadworks in progress.

If time permits the members will proceed later to inspect the new sewage disposal works in course of construction.

Cardiff Housing Scheme.—The Housing Committee of the Cardiff Corporation have decided to appoint a sub-committee to act with the city engineer, Mr. W. Harpur, in preparing a housing scheme. The Lord Mayor stated that 1,400 or 1,500 houses were wanted in the city—300 immediately.

Maldens and Coombe Council's Employees.—On Saturday the officers and workmen, to the number of twenty-four, on the invitation of Councillor G. C. Hodgson, chairman of the Highways Committee, were taken to Box Hill in motor chars-à-banc. After luncheon Mrs. Hodgson was presented with a bouquet given by the wives of workmen, and Councillor Hodgson with a silver-mounted ebony walking-stick, given by the employees. After sports in the evening, a vote of thanks was cordially accorded to Mr. and Mrs. Hodgson, on the proposal of Mr. H. A. Jeffes, the surveyor.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act ii. 2.

THE CONTROL OF ASHPITS.

To the Editor of *THE SURVEYOR*.

SIR,—I have read the very interesting article on "The Control of Ashpits" in your issues of the 5th and 12th inst.

My council have for many years maintained all wooden ash tubs at the cost of the town, the owner paying for the tub in the first instance. New by-laws have recently been adopted which call for a galvanised iron tub, and the council are considering whether these shall be maintained free of cost to the owner or occupier as tending to better sanitary conditions.

Can you refer me to any town where the authorities do this work free of charge?

Can the council legally incur this expense?—Yours, &c.,

INQUIRER.

June 13, 1914.

[We cannot find any statutory provision expressly authorising a local authority to repair ashpits free of charge. The Public Health Act, 1875 (sec. 35), prohibits the erection of a house without an ashpit, and (sec. 36) empowers the authority on the owner's default to provide one and recover the cost from the owner, or as private improvement expenses. Sec. 42 empowers the authority to undertake the cleansing of ashpits, but says nothing about their repair. We think it is, to say the least, very doubtful whether the council can legally incur this expense. Perhaps some of our readers may be able to refer "Inquirer" to towns in which the work is done free of charge.—Ed. *SURVEYOR*.]

LARGE HUMPHREY PUMPS FOR EGYPT.

An installation of Humphrey pumps has been ordered by the Ministry of Public Works of the Egyptian Government for the drainage of Lake Marcotis at Mex, near Alexandria. When completed this plant will be one of the largest pumping installations in the world, and will consist of eighteen pumps, each capable of delivering 100,000,000 gallons per day through a lift of 20 ft. The present order includes the first ten of these pumps together with the necessary gas-producer plant, Venturi water meters, travelling cranes, locomotive weighbridge, regulating gates and screens, and a complete gas-driven electric light and power installation.

The great size of the pumps may be judged from the fact that each unit is to be capable of delivering between two and three times that delivered by each large Humphrey pump unit installed at the Metropolitan Water Board's pumping station at Chingford. It will be recalled that the large pumps at Chingford have an output of 40,000,000 gallons per day each. The pumps comprised in the present contract have been designed with the aid of the valuable experience obtained with the Chingford station, and include many notable improvements although operating on the same cycle which has proved so successful at Chingford. The whole of the work will be carried out under the supervision of Messrs. Harper Brothers & Co., who are the consulting engineers to the Egyptian Government. They have prepared the specification and plans, and have designed the handsome buildings which will become a landmark in the neighbourhood of Alexandria.

Grants to Local Authorities.—In reply to a question in the House of Commons on Wednesday as to whether public health officers were included in the list of authorities to receive grants under the Finance Bill, 1914, Second Schedule, Part 1, England and Wales, line 25, *et seq.*, Mr. Herbert Lewis, Parliamentary Secretary to the Local Government Board, said the intention was to pay to local authorities one-half of the salaries of medical officers of health and their assistants, medical officers of hospitals, sanitary inspectors and their assistants, inspectors of foods, including milk, health visitors, veterinary officers, and any other health officers. It was not intended to make a grant in respect of the salaries of surveyors and analysts.

Road Carpeting in Surrey.

BITUMINOUS CARPETS FOR SUTTON URBAN DISTRICT.

At a recent meeting the Urban District Council of Sutton (Surrey) unanimously adopted a special report prepared by their engineer and surveyor, Mr. W. H. Grieves, relating to roads and traffic, and embodying specific proposals for the adoption of the bituminous carpet for the resurfacing of important roads. The report begins with a reference to traffic conditions, and to the classification of roads which is being undertaken by the Road Board for the purpose of deciding which roads are to be subsidised by annual grants of, respectively, 50 per cent and 25 per cent. The Sutton roads to be recommended for inclusion in the first class include portions of the London and Brighton main road, the Cheam road, the London road, the Carshalton road, and three other roads. Five roads are to be recommended for inclusion in the second class, including West-street and Banstead-road. At present the contribution of the county council towards the cost of main roads is £1,900 per annum, and £280 per annum on account of wood block paving; but this does not cover the whole cost of maintaining the present main roads. The Government grant will not directly advantage the urban council with respect to these roads, but the county, to whom the rates are paid, will have less money to find than at present, and this is partly how the local rates will be relieved.

In respect to the second class roads, the county council now pay half the cost of materials and haulage for "assisted" roads, the Carshalton road being at present the only road of this class in the urban district. Under the new scheme half the cost of second-class roads will be paid, partly by the county council and partly by the Government.

HEAVY TRAFFIC ON SECONDARY ROADS.

Heavy traffic is not confined to the main roads, for many motor vehicles of the large London stores, and other vehicles of a similar kind, traverse the secondary and other district roads, and were it not for the annual tar-spraying these roads would be ruined and the cost of repairs would become unbearable. The county surveyor, Mr. A. Dryland, showed in a recent report that in the last four years the number of heavy motor cars registered in the county of Surrey had increased by 132 per cent, and in the county of London by 201 per cent, and Surrey, being within easy range of London, was subjected to the increased traffic. During the past twelve months motor omnibus services have been extended into the Sutton urban district, on the London and Epsom road, the London and Brighton road (three services), and Sutton Common road (Putney Bridge to Kingswood service). The last named road is not even an assisted road. It has a flint crust, which has for the last two or three years been dressed with tar, and it is often breaking under ordinary conditions of traffic. Experience with water-bound, tar-dressed roads shows that an even surface cannot be maintained under present traffic conditions, and the expenditure on continual repairs is considerable. Sutton is reaping the benefit of the foresight and enterprise of its council in the matter of road maintenance, but further progress is necessary.

PRESENT METHODS.

In order to maintain the roads as provided by the agreement with the county council, the following surfacings have been provided. Five thousand square yards of creosoted deal blocks have been laid, on 7 in. of concrete crust, at a cost of 10s. 6d. per square yard. An area of 2,165 sq. yds. of Roadmant, 1 in. thick, has been laid on water-bound macadam, at a cost of 4s. 8d. per square yard. Over 6,000 sq. yds. of Roemac, with Penlee stone or Guernsey granite, have been put down at a cost of 3s. 9d. per square yard; 2,500 sq. yds. of tarred slag, in two coats, at 3s. per square yard; and 5,500 sq. yds. of Mexphalte, 3 in. thick, at 4s. per square yard. An area of about 2,000 sq. yds. of Quarrite has cost 3s. 4d. per square yard. The wood paving is considered too costly, although a more satisfactory and substantial pavement it is perhaps impossible to find."

THE CARPETING METHOD RECOMMENDED.

"My opinion is that, given a satisfactory foundation, even though it be an existing tar-macadam or water-bound macadam road, a carpet of bituminous

material such as this can be produced at much less cost than would be possible by a contractor carrying out the work, if the council would provide the machinery to dry and mix the necessary ingredients. It would be laid similar to the Mexphalte carpet on Brighton-road and the Roadmant at the bottom of High-street.

"The advantages of an asphaltic surface such as that produced by the Mexphalte and Roadmant carpeting would be many, as, for instance, the necessity of purchasing granite macadam could be largely done away with, as the sand, which is the chief ingredient, could be obtained within the county itself; roughly speaking, it (the sand) would comprise about 78 per cent of the whole, with about 12 per cent of bitumen and 10 per cent filler, or taking a less percentage of sand and adding granite chippings if thought desirable. Further advantages of this class of road is that the scavenging would be very much less, no watering at all would be required, and the saving each year in the tar dressing of the surface would be very considerable, in addition to which the wear and tear and repairs would be considerably less than on many other classes of roads. The remarkable feature of this class of surface is that slipperiness for horses is reduced to a minimum."

Mr. Grieves then quotes from the report of the county surveyor, to the effect that, with a suitable base, the life of an adequate thickness of a bituminous carpet might be taken at a minimum of seven years, with a maximum, according to traffic, ranging up to double that life, or even more; and continues:

"Up to the present I have simply referred to the surfacing of existing roads. It is, of course, quite necessary that good foundations are required for a road of this description, and where not already in existence some support for the sides of the road will also be necessary; but this does not need to be costly, as the same method that I introduced on Brighton-road for the Mexphalte itself—namely, a creosoted deal kerbing fixed with iron dogs, and stakes driven into the ground, and finished off level with the surface of the material—would be all that would be required, or Mr. Dryland's method of laying a 9-in. by 4-in. reinforced-concrete kerb left flush with the carpet, which would cost about 1s. 6d. per yard run."

THE PLANT REQUIRED.

The following is a short specification of the plant for preparing the bituminous carpeting material:—

One Coleman's patent stone and sand drier, consisting of one 5 to 6 h.p. petrol engine, with water tank and fittings complete; one dryer and furnace capable of drying and heating to a temperature of at least 400 deg. Fahr.; stone, slag, sand, chippings, or any other similar material for bituminous road making, and including all pulleys and fittings and elevator. The whole mounted on a steel frame, lock, steel wheels and axles of sufficient strength to carry the required load. The machine to be fitted with brake and draw-bar.

The total output of bituminous compound of the above machine is guaranteed to be approximately 40 to 60 tons per day, according to weather conditions.

One Coleman's mixer, mounted on steel frame, fore-carriage and lock with steel wheels and axles, the mixer elevated to a sufficient height to allow the material to empty into a cart.

One enclosed elevator for lifting the material into measuring bin, with the necessary raised platform for men to work upon.

One 10-h.p. petrol engine, with water tank and fittings.

One small hand winch and wire rope for elevating bitumen.

One measuring bin of 10 to 15 cwt. capacity.

Brake fitted, and mixer supplied complete with draw-bar. The above machine is capable of thoroughly mixing the material with the bitumen at the rate of about 15 cwt. in three to four minutes.

The total cost of the machinery would probably be about £900.

The main idea is that the sand should not only be absolutely dry, but it must be heated to a temperature not exceeding 180 deg. Cent.

The Road Board are prepared to grant a loan, free

The Surveyor

And Municipal and County Engineer.

of interest, for the cost of the plant, and this could be paid off in five years. Assuming that the machine could be worked 150 days in the year at 40 tons per day, it would turn out 6,000 tons per annum. Allowing for one fore-man, two men feeding the machine, two mixing, one man at the bitumen tank, an engine driver, two men wheeling, three men laying the material, the cost of sand, bitumen and filler, and adding charges for maintenance, haulage, depreciation, depot rents and steam rolling, the cost per ton would be at least 50 per cent less than the price at which the work would be done by contractors, "and at a figure somewhat less than the cost of laying an ordinary tar-macadam road." Assuming that the machinery would do all that is claimed for it, then the cost will be equal to about 2s. to 2s. 6d. per square yard.

The cost of the main roads already repaired at the prices mentioned in the report amounted to over £6,000. There still remains to be repaired, on the main roads, an area of 24,870 sq. yds., which, at 5s. per square yard, would cost £6,217 10s. Putting the cost of the new method at the higher figure of 2s. 6d. per square yard, this would amount to £3,103 15s., effecting a saving of over £3,000, or more than enough to pay the cost of the machinery three times over. The machinery could also be used for mixing tar or asphalt macadam, and for this purpose stone taken up from other roads could be used in addition to new stone.

TEST OF THE MACHINERY.

The following test of the machinery was made at the manufacturers' works at Derby in the presence of a sub-committee appointed by the council for the purpose:—

Wet sand was put into a measure 3ft. 6in. square by 9 in. deep, and then put into the drier, and immediately came out of the drier at a temperature of 360 deg. Fahr. Within 5½ minutes 7½ cwts. were put through the machine, and came out at a temperature of 600 deg. Fahr.

A second lot was put in, to which 4 gallons of water was added to the already wet sand, and within 1½ minutes this was turned out of the machine at a temperature of 500 deg. Fahr. The temperature of the wet sand before it was put in was 70 deg. Fahr. One man fed the mixer with 7½ cwts. in seven minutes. Ordinary sand on a dry day was then put in, and the 7½ cwts. was passed through the machine in 3½ minutes at a rising temperature of over 400 deg. Fahr. In the combined stone and sand drier 2 tons of wet limestone macadam were put through the machine, and after

remaining in the same for ten minutes, came out at 470 deg. Fahr.; 21 to 22 cwts. of sand were passed through this machine in 8½ minutes, and came out at a temperature of 465 deg. Fahr.

This mixer will deal with 10 to 15 cwts. in three minutes.

Stone revolves in this machine at a rate of 14 miles per hour, and sand at the rate of 25 miles per hour.

RACE MEETING TRAFFIC.

Included in the report are the following figures—a traffic census taken for the four days of the Epsom Summer Meeting, from 11 a.m. to 10 p.m., at a point on the Brighton road just north of its junction with Banstead road:—

Nature of traffic.	No.	Weight, Tons.
Cycles	12,117	1,990.5
Motor Vehicles		
Motor cars	7,028	11,244.8
Motor cycles	1,696	220.18
Motor vans	267	517.5
Motor omnibuses	1,007	6,042
Motor lorries (rubber tyred)	47	282
Trailers to same	4	20
Motor lorries (steel tyred)	5	50
Motor lorries, trailers	2	10
Traction engine and trailer	1	20
Horse Drawn Vehicles		
Light, one-horse vehicles	3,693	1,257.2
Light, two-horse vehicles	444	260.4
Heavy, one-horse vehicles	322	402.5
Heavy, two or more horses, vehicles	118	295
Omnibuses (three or more horses)	178	534
Total all vehicles	26,970	23,222.38
Horses, &c.	5,551	1,847.9
Total weight of traffic on road		25,070.28

INFILTRATION OF SUBSOIL WATER INTO SEWERS.

[Extract from paper read by Mr. J. N. Ambler before the American Association for the Advancement of Science.]

Feeling the necessity of having some criterion upon which to base the engineer's acceptance of the work, so far as ground water is concerned, the writer read up all available data on ground waterflows, and came to the conclusion that it is a subject about which too little is known, and that what is known is conflicting.

There should, however, be some criterion to apply to work done by contract, and it seemed that nothing better could be done than to determine how much water the sewer might be allowed to carry without materially injuring its usefulness. The criterion should not be so severe as greatly to affect contractors' bids.

Such a criterion, it would seem, should be based upon the number and circumference of the joints.

The following clause appears in one of the writer's specifications, and is offered for what it is worth, until something better can be substituted. It at least has had the effect of securing some very careful work, and contractors were not disposed to regard it as severe when thoroughly explained to them:—

"It is the intent of these specifications that no more leakage of ground water into the sewer be allowed than is admissible with a first-class piece of work, in which care has been exercised to get as near as possible to a watertight result.

"To determine the admissible amount of leakage, the length of a joint will be considered as the outside circumference of the spigot end of a pipe.

"Leakage not in excess of 2 gallons per day of twenty-four hours for each foot of circumference of every joint will be considered admissible, the amount of flow to be determined by the engineer's gauging in each section, by means of a notch board.

"The contractor agrees that for each 10,000 gallons per day of twenty-four hours by which the total flow of the sewer exceeds what the total flow should be, when figured on the basis already given, a deduction of £20 from the contract price will be made.

"This will not apply further than to a total flow resulting from 3 gallons per day of twenty-four hours, from each foot of joint length, beyond which figure the sewer will be regarded as not in compliance with this contract."

The writer's opinion is that the above requirement is a very mild one, as he once laid a mile of large sewer through exceedingly swampy land, passing under several streams, with a result that not more than a stream ¼ in. deep was flowing in the bottom of the pipe at the lower end on completion.

However mild the criterion may be, it has had a powerful deterrent effect against bad work.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

398. Road Construction.—Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

402. Column Design. A hollow cast-iron column is 9 in. in external diameter, its length is 12 ft., and its two ends are firmly built in. The compressive load it supports is 60 tons. What thickness must the metal be in order to have a factor of safety of 10? (T. R.)

403. Rain Gauge.—Describe, with sketches, a reliable form of rain gauge.

404. Collapsing Strength of Pipes.—What is the collapsing pressure in lbs. per square inch of a 3-in. cast-iron pipe, 12 ft. long, and of 3/4-in. thickness? Pressure on outside of pipe only. (H. V. A.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

400. Structures.—What is meant by a redundant member in a truss, and why are such members introduced? Sketch two simple trusses, each having at least one redundant member. (I.C.E.)

The following further reply to this question has been received:—

A redundant frame is one in which the stresses are statically indeterminate owing to there being more bars than are required to make the structure a complete triangulated frame, and may be generally

FIG. 1.

considered as two frames superimposed. They are most frequently used to avoid a reversal of strain

FIG. 1(a).

on certain bars in structures designed to carry a moving load. They are sometimes introduced to

FIG. 1(b).

increase the rigidity of a frame. They are further employed when it is desired to split up the load into a greater number of parts than would be possible with a single frame, and by so doing enable lighter sections to be used for their resistance. Two

of the most widely used trusses of this class are the lattice truss (Fig. 1) and the Whipple-Murphy

FIG. 2.

truss (Fig. 2). It will be seen that each of these examples may be split up into two independent

FIG. 2(a).

frames (a) and (b), each complete in itself. If one of these frames should act alone in the truss as a

FIG. 2(b).

whole, then the bars of the other frame, not common to both, are redundant. (E. E. W.)

399. Fireproof Construction.—What fireproof preparations can be used for protecting timber, and what independent coverings may be applied for the same purpose? (S.A., 1905.)

Timber can be rendered fire-resisting with more or less satisfactory results by impregnating it with one or other of the following preparations: A dilute solution of silicate of soda and limewash applied in alternate coats, and then another and stronger coat of the silicate; "Burnetising," which consists of steeping the timber in a solution of 1 lb. of chloride of zinc to 4 gallons of water; "Payne's" system, which is an injection of sulphate of iron into the pores of the wood, and then a further injection of sulphate of zinc. Asbestos paint has given good results, and so also has tungstate of soda when applied as a paint. Wood treated in either of the above ways will not grow incandescent and burst into flame when exposed to the action of fire, but will merely become charred. This is subject to a reasonable time limit, however, for no material will withstand the action of fire indefinitely. Independent coverings to protect wood from fire may be porous terra cotta in specially shaped blocks according to the situation; 2 in. of concrete; or by plaster and expanded metal. (H. G. L.)

Bristol and Tramway Purchase.—The ratepayers of Bristol on Saturday were polled on the question of the purchase of the local tramway undertaking, with the following result: In favour of purchase, 18,057; against, 14,894; majority in favour, 3,163. The total on the register is 71,902, and the actual number who voted was 33,017, there being sixty-six spoilt papers.

Cause of Street Collapses in Paris.—Following the disastrous street subsidences in Paris during the great storm of Monday night, the Minister of Public Works announces that he has ordered an inquiry into the method of construction of the underground railways of the city. The *communiqué* says that the wash-outs followed the rupture of sewers and the flooding of the underground railway construction works.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Derby T.C. (June 11th. Mr. Edgar Dudley).—£4,050 for three schemes of main road widening.—In anticipation of an automatic increase of traffic, land already belonging to the corporation on the Mansfield and Uttoxeter roads, in each instance near the borough boundary, is to be thrown into the roadways, thus making them 50 ft. wide. The actual expenditure upon the Mansfield-road improvement will be £2,800, and on that in Uttoxeter-road £3,403, and the Road Board is making grants of £1,040 and £1,463 respectively. The third proposal affects the Wardwick, in continuation of the widening of which to 47 ft. is estimated to cost £350.

Newark T.C. (June 9th. Mr. Edgar Dudley).—£2,105 for the purchase of property in Middlegate to enlarge the town hall and provide a new police station. It was asked that the repayment should be spread over a term of sixty years.

Riccall R.D.C. (June 11th. Mr. F. O. Stanford).—£3,810 for a water supply scheme for Barby.—It was explained that it is proposed to take the supply from the Selby waterworks at a cost of 9d. per 1,000 gallons, and carry it by means of two 6-in. pipes across the bed of the River Ouse to the Barby side.

South Mimms R.D.C. (May 26th. Mr. Edward Leonard).—£2,750 for the erection of twelve cottages upon land forming part of the sewage farm.—The surveyor, Mr. G. Simcox, stated that his plan showed twelve cottages, each with large kitchen, scullery, and offices; and three bedrooms measuring 15 ft. 2 in. by 11 ft. 6 in., 11 ft. by 7 ft. 7 in., and 8 ft. 4 in. by 7 ft. 2 in. He estimated the cost at £185 per cottage on the basis of 8,000 cub. ft. at 5½d. The inspector: Why not less than 5½d.? Mr. Simcox: That seems to be about the current rate. Cartage is heavy. The inspector: Do the plans comply with the by-laws? Mr. Simcox: Except as to drainage. The clerk, Mr. C. D. Byfield, explained that when the architect to the Local Government Board saw the plan he suggested that the cost might be reduced by having "combined drainage." The plan was altered accordingly, and the council asked the Local Government Board to approve a by-law giving them a discretionary power to vary the by-laws in cases where it was considered desirable, but the board refused to allow a permissive by-law. Mr. Simcox, replying to the inspector, said if combined drainage was not allowed he must add to his estimate £3 or £4 per cottage. It was hoped that the rent would not exceed 5s. or 5s. 6d. at the outside.

Wigan T.C. (June 12th. Mr. W. M. Cross).—£50,638 for a new scheme of sewerage, together with £5,518 for supplementary expenditure on the old scheme.—The town clerk, Mr. W. H. Tyrer, stated that the town council concluded that it was useless spending more money on the old works. With regard to the over-expenditure, the town clerk said the corporation very much regretted it, but the old committee which had the matter in hand were not aware that the expenditure was going on in such a manner. Mr. W. Bolton, formerly borough engineer, admitted that there had been over expenditure, and said it ought not to have been incurred without the sanction of the Local Government Board, but the emergencies demanded action. The town clerk stated that Mr. Bolton had satisfied the Investigation Committee that all the unauthorised expenditure was legitimately spent and accounted for.

APPLICATIONS FOR LOANS.

- Ashington U.D.C.**—£5,000 for water mains.
- Bromyard (Herefordshire) U.D.C.**—£1,200 for a sewerage scheme.
- Ealing T.C.**—£5,500 for the erection of twenty-two workmen's dwellings.
- Feckenham R.D.C.**—£1,940 for the erection of ten workmen's houses.
- Gosport U.D.C.**—£2,000 for road construction.
- Grimby R.D.C.**—£3,376 for road improvement.
- Heath Town (Staffs) U.D.C.**—£1,000 for the provision of municipal offices.
- Newcastle-on-Tyne T.C.**—£2,075 for the Ouseburn culvert.
- Rhyl U.D.C.**—£650 for the enlargement of the isolation hospital.

Sunderland T.C.—£20,000 for electrical machinery, and a training college.

West Sussex C.C.—£550 for the purchase of a site at Bognor for a school.

Wortley R.D.C.—£4,400 for an infectious diseases hospital.

LOANS SANCTIONED.

- Baldock U.D.C.**—£420 for the Klondike water supply.
- Birmingham T.C.**—£65,428 for the enlargement of the council house.
- Bucklow R.D.C.**—£2,542 for the Northenden sewage disposal works.
- Carshalton U.D.C.**—£750 for a motor fire engine.
- Chorley R.D.C.**—£200 for water mains.
- Clacton U.D.C.**—£816 for a bathing pavilion.
- Darlaston U.D.C.**—£15,660 for works of sewerage.
- Frinton U.D.C.**—£600 for the extension of the sewer outfall.
- Hitchin U.D.C.**—£9,640 for an isolation hospital.
- Liverpool T.C.**—£3,500 for the Chorley reservoir, and £1,500 for water mains.
- Newton Abbot R.D.C.**—£4,350 for Hsington water supply.
- Normanton U.D.C.**—£1,800 for the erection of workmen's dwellings.
- Radcliffe U.D.C.**—£1,180 for street improvement.
- Reigate T.C.**—£765 for a first-aid motor tender.
- Wakefield T.C.**—£17,200 for workmen's dwellings.

10.—	Merton and Morden. (Mr. Thomas Adams)	—

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bognor, Huddersfield £5,000, Southport, Sunderland; housing and town planning—Salfron Walden; roads and materials—Haddingtonshire, Isle of Wight £50,000; sewerage and sewage disposal—Grimsby £20,261, St. Austell, Skelmersdale; water, gas and electricity—Hitchin, Manchester.—Particulars of other projected works will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Bognor U.D.C.—The provision of a public slaughter-house is to be considered by the council.

Clydebank T.C.—With respect to division walls and fences in back courts, the master of works has been instructed to prepare an amendment to the by-laws, prohibiting the erection of spiked railings, which were declared to be dangerous, and asking power to insist on a bar of iron along the top of fences.

Hamilton T.C.—It has been agreed to erect premises for the fire brigade, at an estimated cost of £1,451. New stables are also to be provided for the cleansing department, at an estimated cost of, including site, £3,400.

Huddersfield T.C.—It has been decided to enlarge the girls' high school, at an estimated cost of £5,000.

Radcliffe U.D.C.—The surveyor, Mr. W. L. Rothwell, has received instructions to prepare the plan of a tramway shelter.

Redditch U.D.C.—The surveyor, Mr. A. J. Dickinson, has prepared a scheme for the erection of a ferro-concrete bridge over the River Arrow at Beoley brook, and the construction of a new road, at an estimated cost of £1,458. A contribution of £200 has been promised by the Bromsgrove Rural District Council, and £150 by the Worcestershire County Council, and the former council, on being appealed to, have declined to increase their grant. In the circumstances, Mr. Dickinson has advised his council to carry out the scheme by degrees, as opportunity and means permit.

Romford U.D.C.—The surveyor, Mr. H. T. Ridge, has been instructed to prepare a plan and estimates for a public convenience for both sexes upon a site in Laurie-square.

Southport T.C.—A site at the corner of Eastbank-street has been acquired for the purpose of municipal offices.

South Shields T.C.—Arrangements have been completed for the purchase of the Olympia skating rink for the purpose of a public shelter, at a cost of £250.

Sowerby Bridge U.D.C.—The surveyor, Mr. J. Eastwood, has been instructed to prepare plans and estimates for the enlargement and alteration of the swimming baths as a preliminary to adopting a filtration scheme.

Sunderland T.C.—Plans and estimates are to be prepared of a proposed scheme for the extension of the town hall.

Sunderland T.C.—Preliminary steps have been taken with a view to the preparation of a scheme for the enlargement of the town hall.

HOUSING AND TOWN PLANNING.

Bognor U.D.C.—The surveyor, Mr. O. A. Bridges, has received instructions to prepare plans for the erection of houses in accordance with suggestions received from the Local Government Board. The board wrote with respect to a scheme proposed by the council that they did not consider it advisable that two houses should be placed on such a restricted site, but were advised that it would be quite possible for the council to prepare a scheme for the erection on the site of one house of a better type than the two proposed and let it at the proposed rent of 6s. 6d. without incurring any charges upon the rates.

Bray U.D.C.—A proposal is being considered for a housing scheme estimated to cost £7,000.

Crewkerne U.D.C.—The surveyor, Mr. B. Slade, has received instructions to prepare the plans of a housing scheme to consist of twenty houses.

Dewsbury T.C.—The council have approved a block plan submitted by the borough surveyor, Mr. H. Dearden, and the medical officer, for laying out the Old Borough Park and the erection of houses thereon, and the surveyor has been instructed to submit further plans showing the arrangements of the interiors of the houses.

Dore (Hereford) R.D.C.—A letter has been received from the Local Government Board stating that the board had had under consideration the report made by their inspector, Mr. W. H. Collin, after the inquiry held by him during a recent visit for the purpose of investigating housing conditions in the rural district. The board gathered from the report that the housing conditions in the district were very unsatisfactory. The inspector reported that a large number of the houses were in a defective and insanitary condition; that some appeared to him quite unfit for habitation, and probably not worth the cost of repair. The board requested the council to give these extremely unsatisfactory conditions their immediate and serious attention, and the council decided to consult the parish councils on their housing requirements.

Dumfries T.C.—Plans are to be prepared for forty-eight additional workmen's houses.

Newquay U.D.C.—The council are inviting tenders for twenty workmen's cottages.

Pebworth R.D.C.—The sanction of the Local Government Board is being asked for a loan for the erection of ten workmen's cottages.

Saffron Walden R.D.C.—The council have adopted a housing scheme the cost of which is estimated at £6,000. The proposed dwellings will be distributed over various parishes.

Thetford T.C.—It was reported last week that there had been a saving upon the contract for the erection of fifty houses of nearly £37, and that with extras the contract was only exceeded by £14. The council considered this quite satisfactory, and accorded Mr. Waring, the architect, a vote of thanks for his services.

Wigston U.D.C.—Subject to the necessary loan being obtained, arrangements have been completed for the erection of twenty-four workmen's dwellings.

PARKS AND OPEN SPACES.

Bognor U.D.C.—The council have purchased for £6,150 certain freehold properties overlooking the Marine-parade, with a view to converting the site into a pleasure garden.

ROADS AND MATERIALS.

Aldershot U.D.C.—A mild protest by the surveyor, Mr. F. C. Uren, on the subject of his professional discretion, had the desired effect at a recent meeting, when Mr. Smith, referring to the remaking of a footpath in Station-road, alleged that the old path had been good enough to last for ten or fifteen years more, and suggested that the chairman of the Highways Committee should go round and ascertain what paths required repairing. Mr. Calvert spoke in similar terms. The surveyor: If the chairman of the Highways Committee is going round to inspect the whole of the paths which are mapped out for execution in the six months, he had better take over my job. Isn't there anything left to my discretion? I say emphatically this path did require repairs. It was full of water during rain, and there wasn't sufficient fall to it. In my discretion, and in accordance with the programme arranged by the Highways Committee, I had the work executed. Mr. Calvert said he was pleased to hear it, and he was sorry if anything he said reflected on the surveyor. It was very satisfactory to be able to explain it. He could not before, but he could now. Mr. Ainger: So could Mr. Smith.

Axminster R.D.C.—It has been agreed to proceed with the improvement of the tidal road between Axmouth and Seaton, and the widening of Stedcombe-lane, at an estimated cost of £560.

Barnsley T.C.—Estimates of £371 have been adopted for works of street improvement.

Bognor U.D.C.—An 8-ton steam roller with awning and scarifier is to be purchased from Messrs. Wallis & Stevens, at a cost of £467.

Bournemouth T.C.—The borough engineer, Mr. F. W. Lacey, has received instructions to construct a temporary approach to the beach at Southbourne. Mr. Lacey has also been asked to prepare a more permanent scheme for the consideration of the Beach Committee.

Cannock U.D.C.—Contributions of £590 have been promised from the county council and the Road Board towards the proposed widening of Stafford-road, which is estimated to cost £1,018.

Gromer U.D.C.—The council have approved the plan of the surveyor, Mr. R. Croome, for the widening of Overstrand-road, at an estimated cost of £944.

Haddingtonshire C.C.—The Eastern District Committee have adopted a five years' scheme for the main post and coast roads. The cost amounts to £12,493, towards which the Road Board have agreed to make a grant estimated at £3,436, in addition giving a loan estimated at £7,616, free of interest and repayable in five years. The cost of the plant will be £2,434. In connection with the experimental road construction scheme, a station is to be established in the vicinity of the Knowes, where observations are to be taken daily.

Hemel Hempstead T.C.—It is proposed to carry out a highway improvement scheme at an estimated cost of £3,510.

Isle of Wight R.D.C.—Plans have been adopted for strengthening and resurfacing with granite and tar about 40 miles of main roads radiating from Newport to the coast towns. Towards the estimated outlay of £50,000 the Road Board will give a grant of £10,000, and will further lend £30,000 free of interest.

Romford U.D.C.—The council have approved the specification of the surveyor, Mr. Herbert Thomas Ridge, for works of widening and street improvement in Hornchurch-road, from the south end of the Great Eastern Railway Company's goods yard to the Territorial Force Association's premises, also from opposite Brentwood-road to the north end of the South Essex Waterworks cottages.

Stonehaven T.C.—Sections of Dannottar-avenue are to be treated experimentally with tarmac, tar-grouting, and tar-macadam.

Wath U.D.C.—The engineer and surveyor, Mr. J. H. Drew, has received instructions to prepare a report on the wear and tear of local highways by motor-bus traffic.

Wolverhampton T.C.—The Streets Committee have accepted a tender of the Improved Wood Paving Company, Limited, for repaving part of Lichfield-street, and a portion of Snow-hill.

Wood Green U.D.C.—The council have adopted a scheme for a 40-ft. road from White Hart-lane to Glendale-avenue, through the town hall grounds, the cost being estimated at £3,083.

SEWERAGE AND SEWAGE DISPOSAL.

Abercarn U.D.C.—Sewer extensions are to be carried out at a cost of £630.

Ashington U.D.C.—A new sewer is to be constructed at Hirst Park, at an estimated cost of £2,000.

Audley U.D.C.—The scheme of sewerage recommended by Mr. Whitehead, engineer, has been approved, and will be submitted to the Local Government Board for confirmation.

Grimsby R.D.C.—Sanction is being sought for a scheme of sewerage at Immingham which is estimated to cost £20,264.

Haltwhistle R.D.C.—A sewerage scheme is to be carried out at Townfoot, at an estimated cost of £3,500.

St. Austell R.D.C.—Consequent upon an outbreak of scarlet fever, the question of a sewerage scheme for St. Denis, which the medical officer declares is much needed, has been referred to the Sanitary Committee.

Skelmersdale U.D.C.—For some time the council have had under consideration the question of improving their system of main drainage and sewage purification works, and last year Messrs. Taylor & Wallin, of Newcastle-on-Tyne, were authorised to report fully upon the matter. A scheme was duly submitted and approved by the council, and in due course application

was made to the Local Government Board to borrow the sum of £12,200 for the execution of the works. There will be several miles of new sewers, and the disposal works are of the most modern type. Dr. Brightmore, one of the Local Government Board inspectors, has just held the inquiry, at which there was practically no opposition.

Spalding U.D.C.—With respect to the proposed sewerage scheme, which is estimated to cost £30,000, a letter has been received from the Local Government Board insisting upon the appointment of an expert engineer to assist the surveyor, Mr. J. Bailey, in the revision of the sewerage scheme (the plans for which he had prepared), and declining to sanction the scheme unless revised by an engineer. The council resolved that an engineer be appointed, at a fee not to exceed £250, to confer with the surveyor on the subject, on the understanding that the surveyor should be reasonably remunerated for the plans prepared by him.

Whitstable U.D.C.—Land has been purchased at Swalecliffe for the purpose of purification works.

Whiston R.D.C.—Subject to official sanction it has been decided to carry out a sewerage scheme.

Worsborough U.D.C.—The council are giving consideration to the advisability of supplanting the horses in the sanitary department by motor vehicles.—The Local Government Board have written pointing out that during the last ten years only forty-eight privies had been converted, and that there were still 1,073 in the township. The clerk was instructed to reply that the council were alive to the importance of the matter, and were pushing ahead as quickly as they could. As an inducement to property owners to make conversions the annual charge for water for water-closets was reduced to 2s. 6d.

WATER, GAS, AND ELECTRICITY.

Chard T.C.—The council on Monday decided to accept the following tenders in connection with the water scheme: Contract No. 5 (cast-iron pipes, bends, junctions, and castings), the Sheepbridge Coal and Iron Company, Chesterfield, £3,120; contract No. 6 (sluice valves, fire hydrants, surface boxes, &c.), Messrs. Stone & Co., London, £278; contract No. 7 (construction of reservoir, tunnel, &c.), Mr. E. Ireland, Bath, £8,606.—It was agreed that the borough surveyor, Mr. E. W. Hearn, be resident engineer, at a salary of £2 per week, and that an assistant be engaged temporarily, at 30s. per week.

Chirk R.D.C.—Messrs. Bevington have been instructed to prepare a survey for a water supply scheme for Nantyr, including a service reservoir.

Colwyn Bay U.D.C.—Acting upon a report by Mr. E. M. Lacey, Westminster, the council have adopted a scheme for the erection of electric lighting and destructor works at Bronyant. It was further resolved that Mr. Lacey's services be retained to carry out the scheme at a fee of 1,200 guineas, to include the preliminary fee of 50 guineas. In the event of the capital expenditure being less than £25,000, the fee to be at the rate of 5 per cent on the cost of the combined scheme.

Cwmaman U.D.C.—A contract has been sealed with the local gas company to supply gas for public lighting at 3s. per 1,000 ft., with meter rents at 2s. 6d.

Devizes T.C.—The formal opening took place last week at the Shepherd's Store pumping station of a new set of pumps and engine, driven by a newly-installed gas plant, which has been put in at an expenditure of over £3,000. The pump has been fixed into the new well which was sunk some few years ago, and it is capable of raising about 25,000 gallons per hour. The suction gas plant has been installed with a view to economy in the working, both as regards fuel and the haulage of the same. The contractors were Messrs. F. Rendell & Sons.

East Grinstead U.D.C.—Mr. J. B. Morgan, electrical engineer to the Horsham Urban District Council, is to be asked to confer with this council's surveyor, Mr. W. E. Woollam, as to the advisability of an electric lighting scheme.

Faversham R.D.C.—It has been decided to supplement the water supply scheme by a distributory main, in addition to the rising main, along a part of the route, at an estimated cost of £270.

Hitchin R.D.C.—The council have adopted the amended scheme for providing an adequate water supply for the parishes of Codicote, Kimpton, King's

Walden, and St. Paul's Walden. This matter has been a source of trouble to the council for over twenty years, and is now being overcome through the generosity of Viscount Hampden and the Earl of Strathmore, the former not only giving the site for the well and pumping station, but contributing £3,400 towards the cost, and the latter £380. The estimated cost of the scheme is £10,700.

Keith T.C.—It has been agreed to borrow £800 for the construction of a reservoir at Cuthil.

Llandudno U.D.C.—A committee recommended the council to instal the Fiddes Aldridge machine at the gasworks, and the gas manager, in conjunction with the deputy engineer, have received instructions to prepare an estimate, with specification, of the proposed work with a view to an application to the Local Government Board for a loan.

Lynn T.C.—The accounts of the electricity undertaking for last year show a profit of £1,776.

Manchester T.C.—It is intended to carry out improvements at the Longden Valley waterworks, at an estimated cost of £160,000. Messrs. G. H. Hills & Sons, Manchester, have been appointed engineers.

Market Harborough R.D.C.—Mr. Herbert G. Coales, ASSOC.M.INST.C.E., has been instructed to report upon a water supply scheme for Fleckney.

Northampton T.C.—The Water Committee recommend the acceptance of the tender of Messrs. Moss & Sons, Limited, Bedford, at £16,131, for the construction of the tunnel from Hollowell to Ravenshorpe in connection with the waterworks extension.

Slough U.D.C.—It has been ascertained that the total cost of the purchase of the waterworks system is £108,981. The council acquired the works by Act of Parliament upon arbitration terms. The award of the arbitrator was £90,623, and the cost of arbitration £5,612. Compensation to directors and officials of the late company came to £1,430, and the Parliamentary expenses accounted for the remainder of the total.

Winchester T.C.—The nett profit for the year earned by the electricity undertaking was £101, which has been placed to the reserve fund.

Worcester T.C.—In a letter to the town council the Local Government Board state, as regards the water supply of the city, they are strongly of opinion that the council would be well advised to provide for storage of the water prior to filtration. They also urge the council to make such arrangements as will enable the water from each filter to be obtained separately for bacteriological examination in order to test the efficiency of the filters respectively. These examinations should be made at frequent intervals. The council should also be prepared to carry out such works as may be found necessary to render the water supply perfectly safe.—The accounts of the electricity department for the past year show a deficit of £504. It was explained that the income was £500 more than the previous year, but that the council had been compelled by the Board of Trade to spend that sum on a transforming chamber.

MISCELLANEOUS.

Clacton U.D.C.—It has been decided to purchase a motor lorry of about 35 h.p., capable of carrying 3 tons, for haulage purposes. It is estimated that the change will result in an economy of about £81 a year.

Port Elizabeth T.C.—It is not many years since the flotation of a "million" scheme for sewerage, electric light, and additional water supply took place, but it has now been resolved to proceed with further works to the extent of an additional £500,000, consisting of electricity undertaking (£100,000), town attractions (£30,000), Baakens River improvement (£55,000), enabling ordinance (£100,000), abattoirs (£25,000), relaying steel water main in cast iron (£175,000), and expenses (£15,000). Mr. A. S. Butterworth, the city engineer, will thus be sufficiently occupied for some time to come.

Southampton T.C.—The Fire Brigade Committee propose to convert the horse-drawn steam engine into a motor vehicle, at a cost of £700.

Sowerby Bridge U.D.C.—It is proposed to purchase a combined motor-propelled tender and fire escape, at an estimated cost of £750.

PERSONAL.

Mr. John Barker, burgh surveyor and sanitary inspector, has received an increased salary of £25, making it £330.

Mr. Herbert Thomas Ridge, assistant surveyor, has been appointed surveyor to the Romford Urban District Council, in succession to the late Mr. Jonas Tovey, at a salary of £250.

Mr. O. Parry, of Tycroes, has been appointed by the Cwmaman Urban District Council engineer for the local scheme of sewerage, which is estimated to cost from £10,000 to £14,000.

Mr. H. Clegg, surveyor to the Felixstowe and Walton Urban District Council, has received an increase of salary from £275 to £300 a year.

Mr. Wentworth Jones, borough surveyor and inspector to the Thetford Town Council, has received an increase of salary, and has also been voted £30 for extra services.

Mr. R. G. Coles, surveyor to the Wells (Norfolk) Urban District Council, has been appointed borough surveyor and sanitary inspector to the Wilton Corporation, at a salary of £135.

Mr. E. H. Colgrove, of Nottingham, has been appointed as junior assistant in the office of the Ilford Urban District Council surveyor (Mr. Herbert Shaw) at a salary of £80, rising to £100.

Mr. William Frank Gardner, assistant in the borough engineer and surveyor's office, Morecambe, has been appointed to a similar position under the Earby (Yorks) Urban District Council.

Mr. Albert Garratt, surveyor and assistant inspector to the Drayton Rural District Council, was on Tuesday appointed highway surveyor and sanitary inspector to the newly-formed Market Drayton Urban District Council.

Mr. Edward Bindon Martin, who carried out many important engineering works in the Midlands, and who was the pioneer of the Staffordshire main drainage scheme, died, we regret to state, on the 8th inst. He was in his 83rd year.

Mr. E. H. Barber, ASSOC.M.INST.C.E., assistant surveyor and engineer to the Sheffield Corporation, has been appointed engineer and surveyor to the Rhondda Urban District Council. The commencing salary is £500 per annum rising to £750.

Mr. E. Southall Moule, assistant in the department of Mr. J. W. Tomlinson, ASSOC.M.INST.C.E., borough engineer, Luton, has been appointed first assistant to the Cannock Urban District Council, under Mr. Robert Blanchard. He served his articles and remained for some years assistant to Mr. A. J. Dickinson, engineer and surveyor to the Redditch Urban District Council.

Sir Maurice Fitzmaurice, C.M.G., M.INST.C.E., Messrs. Henry C. Adams, M.INST.C.E., M.I.MECH.E. A.M.I.E.E., Westminster, F. E. P. Edwards, F.R.I.B.A., Town Hall, Sheffield, and J. Parry, M.INST.C.E., water engineer, Liverpool, have been elected fellows, and Messrs S. E. Axon, assistant city engineer and surveyor, Adelaide, South Australia, N. C. Staveley, ASSOC.M.INST.C.E., borough engineer, Wanganui, New Zealand, J. B. Thomson, ASSOC.M.INST.C.E., Town Hall, Southall, Middlesex, and R. W. Watson, ASSOC.M.INST.C.E., borough engineer's office, Durban, South Africa, members of the Royal Sanitary Institute.

Mr. A. E. Brookes, county surveyor of Cornwall, has been unanimously recommended for the post of county surveyor of Durham by the Main Roads Committee of the county council. The salary is £800, rising to £1,000. He will take up his new appointment in September. Mr. Brookes has had an experience of county administration of nearly a quarter of a century, having been previously engaged under the Worcestershire and Hertfordshire County Councils. In Cornwall he became surveyor of the Western district in the first instance, and since the retirement of Mr. Jenkin, the surveyor of the Eastern district, he has assumed control of the whole county. His removal to a more lucrative appointment will not come as a surprise to members of the Cornwall County Council, for it was only recently that the chairman of the Highways Committee (Mr. A. Carleek) warned his colleagues that if they desired to retain his services they must be prepared to treat him with more generosity.

FOR OTHER ADVERTISEMENTS

See End of Paper.

DISTRICT ENGINEER required for Public Works Department by British Guiana Government. Engagement for three years, with prospect of permanency. Salary, £300—£20—£400 per annum. Travelling allowance, £100. Free passage. Age, 25-40. Should have served articles with Corporate Member of Institute of Civil Engineers, or possess diploma from a recognised Engineers' College, or have been engaged since completion of articles on Public Works for at least ten years. Capable of designing and carrying out buildings, bridges and other structures, of taking out priced bills of quantities, and preparing detailed estimates. Knowledge of book-keeping and accounting essential. Candidates should be competent to execute surveys, take sections, and lay out and construct roads, and be familiar with use of surveying instruments, including theodolite, dumpy level, prismatic compass and box sextant. Apply at once, by letter, to the Crown Agents for the Colonies, Whitehall-gardens, London. (1,726)

CITY OF WESTMINSTER.

PAINTING, &c., WORKS.

The Westminster City Council invite Tenders for Internal and External Painting Works and Repairs at the Marshall-street Public Baths.

Conditions of Contract, Specification, and Form of Tender may be obtained on application on and after Thursday, the 18th June, to the City Engineer, Westminster City Hall, Charing Cross-road, W.C., between the hours of 10 a.m. and 4 p.m.

The Contractor will be bound by the Contract in the case of all workmen employed by him to pay wages at rates not less, and observe hours of labour not greater, than the rates and hours recognised by the Associations of employers and employed, and in practice obtained in the district where the work is to be executed.

Tenderers are prohibited from directly or indirectly canvassing Members or Officials of the Council in reference to any Tender, and the Tender of any person who does so canvass will be rejected. The Contract Deeds will be prepared at the expense of the Council, and the Contractor will, if necessary, be required, together with two sureties, to enter into a bond for the due fulfilment of his contract, or, in the alternative, to agree to the retention by the Council during the period mentioned in the Form of Tender of certain monies.

Each Tender, on the official Form supplied, is to be enclosed in a sealed cover, addressed to the Town Clerk, Westminster City Hall, Charing Cross-road, W.C., and marked "Tender for Painting, &c., Works, Marshall-street Baths." Tenders may be placed by or on behalf of tenderers in a locked box at the City Hall provided for the purpose.

No Tender will be received after 12 o'clock noon on Wednesday, the 8th July, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

JOHN HUNT,
Town Clerk.

Westminster City Hall, W.C.
June 16, 1914. (1,723)

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

PRIVATE STREET WORKS.

The above Council invite Tenders for the making up of the Private Street known as Hilliard-road, Northwood (about 600 yds. in length).

Plans may be seen at, and Specification, Form of Tender and all other particulars obtained from, the Office of the Surveyor to the Council, Council Offices, Northwood, upon the deposit of £1, which will be returned upon the receipt of a *bona-fide* Tender.

Tenders, sealed and endorsed "Street Works," must be delivered to the undersigned not later than Twelve noon on Saturday, 4th July next.

The Council do not bind themselves to accept the lowest or any Tender.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Northwood, Middlesex.
June 16, 1914. (1,720)

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

RECONSTRUCTION OF SEWER.

The above Council invite alternative Tenders for the reconstruction, with iron or earthenware pipes, of 362 yds. of 9-in. Sewer at Eastcote.

Plans may be seen at, and Specifications, Form of Tender and all other particulars obtained from, the Office of the Surveyor to the Council, Council Offices, Northwood, upon the deposit of £1, which will be returned upon the receipt of a *bona-fide* Tender.

Tenders, sealed and endorsed "Street Works," must be delivered to the undersigned not later than Twelve noon on Saturday, 4th July next.

The Council do not bind themselves to accept the lowest or any Tender.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Northwood, Middlesex.
June 15, 1914. (1,721)

RUISLIP-NORTHWOOD URBAN DISTRICT COUNCIL.

PRIVATE STREET WORKS.

The above Council invite Tenders for the making up of a part of the Private Street known as Dene-road, Northwood (about 260 yds. in length).

Plans may be seen at, and Specifications, Form of Tender and all other particulars obtained from, the Office of the Surveyor to the Council, Council Offices, Northwood, upon the deposit of £1, which will be returned upon the receipt of a *bona-fide* Tender.

Tenders, sealed and endorsed "Street Works," must be delivered to the undersigned not later than Twelve noon on Saturday, 4th July next.

The Council do not bind themselves to accept the lowest or any Tender.

EDMUND R. ABBOTT,
Clerk to the Council.

Council Offices,
Northwood, Middlesex.
June 16, 1914. (1,722)

TOTTENHAM URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The Council invite Tenders for laying creosoted deal wood block paving and other works in the portion of Turnpike-lane within their District.

The Plans can be seen, and General Conditions, Specification, Bill of Quantities and Form of Tender can be obtained, on application to Mr. W. H. Prescott, M.INST.C.E., Engineer to the Council, at the Town Hall, The Green, Tottenham.

The sum of £5 will be charged for the Quantities, which sum will be forfeited by the person whose Tender is accepted if the Contract be not executed within seven days from the date he is informed it is ready for signature; otherwise it will be repaid.

The Contractor will be required to pay all workmen on the Council's Work the recognised Trade Union Rate of Wages. A Schedule of such wages will be inserted in the Contract, and a copy of the Schedule must be exhibited on the Pay Office at the Works.

Canvassing members of the Council is strictly prohibited, and if any Members, Agents or Representatives of Firms tendering for this work interview or canvass members of this Council, Tenders sent in from such Firms will be immediately disqualified.

Sealed Tenders, on the Form supplied, endorsed "Tender for Wood Paving Turnpike-lane," to be delivered to me by Twelve o'clock noon on Tuesday, the 30th June, 1914.

No other Form of Tender will be received.

Security will be required for the due performance of the Contract.

The Council will not be bound to accept the lowest or any Tender, and reserve the right to accept a part only of any Tender received.

(By order)
E. CROWNE,
Clerk of the Council.

Tottenham.
June 19, 1914. (1,725)

RESIDENT ENGINEER and Building Surveyor, disengaged, well trained and experienced; five years with County Council, four years with Borough on Public Works and Buildings.—Box 1,435, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,724)

KOEHRING PORTABLE HOT MIXER FOR TAR-MACADAM AND BITUMINOUS ROADS.

Some very interesting and important road work has recently been carried out with a machine known as the Koehring hot mixer. Although the machine has been very well known and very largely used on the American Continent for over three years, it is only during the last eighteen months that it has been employed in England. The first machine here was bought by a well-known firm of bituminous road contractors, and has been used in their works for eighteen months with excellent results on their special material.

The Kent County Council had one of these machines last August after making exhaustive trials, and they have since then done a very fine stretch of bituminous work on the London-Sevenoaks road between Bromley Common and Green-street Green, this including the well-known Farnborough Hill. This is a very good specimen of modern road work, and we understand the costs are remarkably low, owing to the economies rendered possible by the Koehring hot mixer.

The Essex County Council have adopted these machines, and are using a No. 20 size for the bituminous road work they are carrying out on the main Cambridge road at Epping. They are also producing with this machine, in spare time and during wet weather, tar-macadam and tar-pitch-macadam, and we understand all the work is most satisfactory, and produced at exceptionally low cost.

We find a large number of English and Scottish

KOEHRING MIXER: SIDE LOADING AND DISCHARGE TYPE.

county and borough surveyors and their committees have viewed these machines running, and have decided to use them for their own particular work, and we certainly think all interested in tar-macadam and bituminous roadwork should investigate the merits of the apparatus. We have ascertained that the machines have proved themselves to be very reliable, as up to the present time there has not been a single breakdown with those in use here.

It may be of interest if we explain some of the principal features of this machine. It is a combined heating and mixing plant, suitable for the various types of road paving materials now on the market, and is usually supplied complete with its own power unit on the same frame as the heating and mixing arrangements, the whole being mounted on suitable axles and road wheels for easy movement. The batch of stone and sand is shot into a loading bucket which lies on the ground. This elevates through suitable mechanism and discharges the batch quickly into a constantly revolving drum having a special form of blading which causes the materials to shower continuously through the centre of the drum while a hot blast from an oil furnace passes through the separated particles. The oil furnace is fixed above the drum, and a lined conduit is carried over to one side of it, finishing with a nozzle which projects into one side of the drum. Fuel oil feeds automatically into the burners of the furnace, and the pressure is main-

tained by a powerful blower fixed on the machine. When the materials have reached the desired heat, which is known by timing, tar or bitumen flows from a measuring tank through a pipe, which conveys it to the inside of the drum, the blast not coming into direct contact with this. The mixing of the binder with the stone and sand then takes place in about one minute, and on raising a lever the finished material discharges from the drum. This mixing appears to be perfect, as every stone has an equal coating of binder and sand.

What most interested us and others who have seen the machine is the extremely efficient and rapid way in which the moisture is driven from the stone and sand, this being brought about by the peculiar manner in which the materials are made to scatter

KOEHRING MIXER: END LOADING AND DISCHARGE TYPE, WITH TRACTION.

and separate while the intensely hot air is driven through them, each particle in turn passing again and again through the hot blast, the moisture being very rapidly driven off through the orifices on the discharge side of the drum.

A distinct advantage is that the same machine can be used for cement-concrete by disconnecting the oil furnace and connecting up to the water measuring tank, thereby making it possible to lay a concrete base and do a variety of other work.

The machines are made in several sizes and types to suit various working conditions, and can be supplied without power and arranged for belt-driving, and in some cases are being furnished with a match hopper instead of elevating loader, this being done to suit certain conditions in some quarries where they will shortly be used. In some cases, also, a special elevating hoist is being supplied to elevate and tip the finished material into wagons, this, of course, saving hand labour.

Rural Housing.—At the annual conference of rural district councils, held at the Guildhall, London, on Wednesday, a resolution was adopted requesting the Government to include in their proposals for rural housing legislation the giving of an annual grant in aid of housing schemes carried out by local authorities to meet the needs of certain classes who could not, under any probable schemes of increased wages, pay an economic rent.

Town Planning Schemes.—In the House of Commons on Wednesday it was stated that the Local Government Board now have information as to 232 town planning schemes. Of these, two have been finally approved by the board, four have been submitted for approval, sixty-two have been authorised by the board to be prepared, and in twenty-two other cases application has been made to the board for authority to prepare the scheme.

New Oxford-street Paving.—The Works Committee of Holborn Borough Council have recommended that, as New Oxford-street has, approximately, the same traffic throughout its length—motor buses and other heavy vehicles bulking largely—the conditions afford a good opportunity to test the comparative methods of different road materials, including creosoted deal blocks, Acme sectional Jarrab blocks, and fine-dressed Grey Royal granite blocks. The borough council have approved this recommendation.

Institution of Municipal Engineers.

SOUTH-WESTERN DISTRICT MEETING AT TISBURY.

A South-Western District meeting of the institution was held at Tisbury, Wilts, on Saturday last. Those present included Messrs. Henry C. Adams, vice-president of the institution, E. Plummer Davies (Tisbury), W. J. Potter (Andover), W. E. Groves (Dulverton), A. Carter (Droxford), H. B. Rogers (Wells), W. W. Earwaker (Cerne), V. C. Munckton (Wimborne), S. W. Crittall (Lymington), A. J. Redfern (Honiton), E. H. Knapman (Wincanton), D. T. G. Brown (Sherborne), members; A. S. Northover (Tisbury), T. A. Sims (Tisbury), C. N. Butler (Tisbury), R. D. D. Massy (chairman, Lymington Rural District Council), G. W. Child (Droxford), A. T. Squire (Dorset), E. E. Hibberd (chairman, Tisbury Water Committee), S. J. James (Sherborne), R. A. Skeeton (Wilton), Sidney F. Ford (Camelford), E. J. Padfield (Wincanton), G. F. Fowles (Salisbury), G. H. Gibson (Radstock), and Dr. C. A. Ensor (medical officer of health, Tisbury), visitors; and B. Wyand, secretary of the institution.

The VICE-PRESIDENT, in opening the business meeting, held at the Victoria Hall, apologised for the absence of the president, Mr. Horace L. P. Boot.

amount of stress had been put on the roads. He might say that there were 40 miles of main roads in the Tisbury district and 160 miles of district roads. The cost of the main roads per mile ten years ago was £43, as compared with £53 per mile to-day. He thought the members would agree, having regard to the amount of motoring, that the increase had been very moderate and reasonable. He claimed that they gave good value for the money expended. No one ought to call himself an engineer unless he could make that claim. He did not think it would be easy to give a better account for money expended than the Tisbury Council was showing under its contract for the maintenance of the main roads with the Wilts County Council. The tendency to-day was to take the main roads from the local councils. He did not dispute for a moment that the county councils produced improved roads under direct management, but only because more money was spent upon them. Anybody could improve the roads by spending more money on them, and the local councils could do it. Calling attention to the day's programme, Mr. Plummer Davies alluded to a bridge which he had constructed

INSTITUTION OF MUNICIPAL ENGINEERS AT TISBURY, WILTS.

He (the vice-president) had also to express regret that Mr. Owen Baines, of Paignton, the secretary for the district, was unable to attend. Mr. Baines was only just recovering from an attack of influenza, and he had a domestic affliction in the illness of his wife. He (Mr. Adams) suggested that a letter should be sent to Mr. Baines expressing sympathy with him in his trouble.

The vice-president then called upon Mr. E. Plummer Davies, engineer and surveyor to the Tisbury Rural District Council, to present his paper.

Mr. PLUMMER DAVIES, in introducing his paper, said he had received a most encouraging letter from the chairman of the district (Mr. Frank Latham), who was unable to attend, and messages from the chairman and vice-chairman and other members of the Tisbury Council. Turning to his subject, Mr. Plummer Davies said the members would understand that it was difficult to go very far into details of the past because the records of road management had not been kept as they ought to have been, the roads had grown from lanes into roads without the public being really aware of the change. He thought there were a few points of interest in the paper, and possibly points that would never have been recorded at all but for the meeting that day, and the necessity for the preparation of a paper on the subject of the roads. He ought to have mentioned in the paper that one cause of the great increase in the cost of the maintenance of Wiltshire roads had been the introduction of the military camps into the county near Amesbury and Tidworth. Little towns had sprung up like mushrooms near the camps, and an immense

by direct labour, remarking that several eminent engineers had valued it at double the actual cost.

The paper was then presented to the meeting.

WILTSHIRE ROADS, PAST AND PRESENT.

By E. PLUMMER DAVIES,

Engineer and Surveyor to the Tisbury Rural District Council.

The author in preparing a paper on the above subject finds his information somewhat limited to probe in detail into the past, but believes that sufficient incidents will be quoted to enable the members of the Institution of Municipal Engineers to appreciate the varied conditions that have existed, and the improvements that have taken place, especially during the last thirty years, in the condition of, and the method of maintaining and managing, the King's highways in a county almost entirely agricultural.

In order to give you a glimpse into the past, I am indebted to Mr. J. M. Bennett Stanford, Pyt House estate, for his kindness in showing me a deed, executed January 7, 1789, by seven trustees of the Old Turnpike Trust to Thomas Bennett, Esq., of Pyt House, Tisbury, for the sum of £100 advanced for amending, widening and keeping in repair a section of road passing through this district, and known as the Salisbury and Shaftesbury Turnpike, being a section of the trunk road between London, Salisbury, Exeter, and Penzance. The said Mr. Bennett was to receive such proportion of the tolls arising as the said sum did bear to the whole sum advanced until paid off, with 4½ per cent interest thereon.

However, the secretary of the Turnpike Trust

wrote to the exors. of the late Mr. Benett, June 14, 1859, seventy years afterwards:—

"Dear Sir,—White Sheet Turnpike. The trustees have made no order for the payment of any interest accrued due since June 7, 1844, and there is no probability that any further interest ever can be paid. For some years past the tolls have not produced sufficient to keep the roads in repair, and they will be still further diminished by the opening of the Salisbury and Yeovil Railway. Under these circumstances it will be impossible, I think, to find a purchaser to your client's bond."

We may reasonably infer from the said letter what was the position of the Turnpike Trust and the condition of their roads from 1844 to 1859, resulting from the change in the method of travelling, &c., consequent on the advent of railways. The great trunk roads of the country were very little used from the time the coaching days ceased until the advent of the motor cars; long stretches of turnpike roads had, and needed, but little attention, and this was true as recently as fifteen years ago, except for short sections that might happen to come in the radius used to get from the

MR. E. PLUMMER DAVIES.

village to the nearest railway station. This change of conditions resulted in the county council considering the question as to what turnpike roads should be scheduled as main roads, and what roads or sections of turnpike roads should be classified as district roads. About 7 miles of turnpike roads passing through this district between Salisbury and Shaftesbury were then classed as district roads, and have remained so till this day, notwithstanding that quite 300 motor cars per day pass over some of these sections at certain periods of the year, and the same applies to other districts, and if the tolls of the coaching days had been revived, they would yield a substantial revenue. I should also add that when this adjustment took place local roads and lanes leading from villages to railway stations were taken over by the county council and classed as main roads, and have been so maintained ever since. That fact accounts for so many of the main roads in Wiltshire that are not trunk roads being so narrow, and in many instances having high banks on each side, as the following extract from the county surveyor's report a few years ago, under the heading of Tisbury, indicates:—

"This district is one of the most satisfactory in the county for general excellence of surface. The roads are maintained with suitable cross-sections, care having been taken to strengthen the sides where necessary, so as to give as much available surface as possible for traffic. Many lengths are narrow and lie considerably below the level of the adjoining land, but the ill-effects of situation have been minimised by the attention given to the hedges and trees to enable sun and wind to exercise their drying effects as freely as possible."

A Mr. Henry Weaver was county surveyor of Wilts for some years prior to January 7, 1887, when Mr. C. S. Adye was appointed to succeed Mr. Weaver on his retirement. The late Mr. Adye told me that Mr.

Weaver stated in his last report to the county council that he had got rid of the ruts that were general following the coaching days, except in the case of two of the roads in the county which he named; and Mr. Adye stated these were "the legacies Mr. Weaver left for me when I took on." From that period till 1906, when Mr. Adye's health failed, Mr. Adye threw himself whole-heartedly into the work of improving the general condition of the main roads, and during that period, especially during the latter years, a great change had become general in the method of management and the manner in which repairs to highways were performed.

Mr. Adye was fortunate during the period of transition that there lived in Southwick by Trowbridge a man carrying on the business of mineral water manufacturer, by the name of Thomas Barnes. Mr. Barnes told me how strongly convinced he was at that period that steam rollers were to play an important part in the road making and road repairing of the future, and that consequently he decided to purchase a steam roller. Mr. Barnes was of a naturally engineering turn of mind, and one day in the year 1888 Mr. Barnes left home for Rochester. He travelled *via* London, taking with him sufficient money in hard cash to purchase a steam roller, and when the purchase price was agreed Mr. Barnes took the cash out of his pocket and paid Mr. Aveling, who, after counting the cash, looked at Mr. Barnes in amazement, remarking, "How in the world did you come through London with such a sum of money on you without being robbed?" Mr. Barnes replied by asking another question, "Look at me, and tell me honestly if you would have thought by looking at me that I was likely to be in possession of such a sum?" Mr. Aveling answered, "Well, honestly, I must say I would not," and Mr. Barnes retorted, "And I knew that the London pickpockets would be of that opinion too."

Mr. Barnes brought the steam roller back with him to Southwick, and it was soon at work for the first time in Back-street, Trowbridge, for the Trowbridge Urban District Council. Being in close proximity to Trowbridge, where the county council offices are, increasing demands for steam rollers kept pouring in to Mr. Barnes, so that he purchased one roller after another, and by the year 1906—the year in which he died (and now this splendid business is successfully carried on by his sons)—he was the owner of over forty steam rollers, besides traction and other engines, with modernly equipped engineering works. During that period not only did steam rolling and scarifying of main roads become general in Wiltshire, but by to-day there are only a few unimportant district roads that are not being repaired with the use of steam rollers. The coincidence referred to no doubt will, to a great extent, explain why steam rolling in the county of Wilts became general somewhat earlier than in the other counties of the West, and this proved a great boon to the public and a source of assistance and encouragement to traders.

A successful merchant in the county gave it as his opinion fifteen years ago that their firm benefited in the save of wear and tear and in horse labour to the extent of £200 per annum (because the steam rolling of Wiltshire roads had then become general) as against their experience prior to that.

In January, 1907, Mr. A. Dryland, now the popular county surveyor of Surrey, was appointed county surveyor of Wilts in succession to the late Mr. Adye. The experience and energy controlled by the trained mind that Mr. Dryland brought to bear on the work of the department, and the courtesy and kindness he extended to the district surveyors, soon won their confidence, and ensured their best endeavours in the discharge of increased duties which have gradually developed into a much higher technical character.

In December, 1908, Mr. J. George Powell, the present county surveyor, was appointed to succeed Mr. Dryland, and his keen and practical adaptation continued the beneficent work outlined by his predecessor, and the success soon became evident in the general condition of the roads, notwithstanding the effect of greatly and continued increased traction and motor traffic. The marked improvement in the general condition, in the uniformity of width, contour and straightness in the Wiltshire roads will remain a successful and lasting monument to the resourcefulness and ability of Mr. Powell. Most of the districts in Wiltshire are deficient in suitable stone for successful road making, especially for modern traffic, flint, with few exceptions, being the only material that can be successfully used, with a suitable proportion of

Mendip limestone to ensure a good wearing and tenacious surface. Flints cannot be successfully consolidated without suitable binding material, and when that has not been ensured the newly metalled portions of the road readily break up and become very unsuitable, and particularly annoying to motorists.

Such being the case, a large quantity of road material has to be imported into the county, consisting of limestone, basalt, quartzite, granite, &c., and this of necessity has increased annually. Mendip limestone mixed with local flints in suitable proportions constitutes a splendid wearing surface for roads of medium traffic. Where the amount of traffic necessitates the use of quartzite or granite, flint is unsuitable. For low-lying and shaded roads, and especially on weak subsoils, I find that basalt stone has been eminently satisfactory, forming a good successful crust and ensuring a uniform, even surface.

Mr. Powell has devoted considerable attention to tar-spraying, and, fortunately, has introduced it largely into the county with most satisfactory results, thereby improving the surface and increasing the life and utility of the sections of roads so treated, and reducing the necessity for patching motor squats at least 90 per cent on sections so treated.

The Wilts County Council are recognised as a body keeping abreast of the times, and with endeavouring to provide the public with roads that successfully meet requirements, and, acting on the advice of the county surveyor, the county council has secured a grant and a loan from the Road Board of £70,000 towards reconstructing over 34 miles of road, being the portion through Wiltshire of the London and Bath great trunk road, and this work is now being performed. The reconstruction involves straightening of verges, making up low quarters, and increasing the width of road surface where necessary, and the conversion of same from ordinary or water-bound systems to bituminous-bound macadam.

Several other trunk and the more important roads are being widened and strengthened, so that the general condition of the main roads in Wiltshire has wonderfully improved during the last six years.

The mileage of main roads in 1899-1900 was 745 miles 1 furlong 247 yds., and the cost of maintenance £51,743. The mileage in 1914-15 will be 760 miles 7 furlongs 153 yds., and the estimated cost £86,648, exclusive of the London and Bath trunk road improvement scheme.

Having regard to the increase that has taken place during that period in the cost of labour, material and haulage, and to the increased mileage, the improved efficiency insisted upon and the immense increased traffic to be contended with, the additional amount of £35,000 in expenditure is absolutely necessary in order to make the roads better for the users, and to reduce the causes productive of accidents. All who are keeping themselves well informed in such matters are satisfied that the increase is very moderate, and, having regard to developments, eminently satisfactory, and the money was never better expended.

The methods adopted, if faithfully followed as persistently in the future as they have been in the past, will maintain the good name of Wiltshire in the honoured position it has hitherto held among its friendly rivals.

(To be concluded.)

Business Announcements.—Messrs. A. Grimwood & Co., 47 Victoria-street, Westminster, S.W., inform us that they have transferred their business as asphalt merchants to Messrs. Grimwood & De Geus, Limited.—Mr. W. E. Horsman having, as already stated in our columns, severed his connection as London representative of Messrs. George Waller & Son, gas, hydraulic and general engineers, the firm ask that orders and inquiries should be addressed direct to them at the Phoenix Ironworks, Stroud, Glos.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Whether the members of the Institution of Municipal and County Engineers will relish carrying about with them at Cheltenham next week the formidable supplement to the "Journal" which has just been issued, and if they would not prefer to have the papers in separate form as hitherto, so as to be able to discard them at the close of the discussions? Was this innovation decided upon merely on the score of economy?

* * * * *

Why do not more municipal authorities throughout the country follow the example of Southend-on-Sea and other towns by purchasing a fleet of motor omnibuses, and running them as a municipal undertaking? Would not such a step tend to minimise the friction now existing between the road authority and the owners of the commercial motor omnibus? And would it not be better for the municipality thus to secure complete control of the design, weight and speed of these vehicles?

* * * * *

What is the opinion formed by municipal engineers as to the future possibilities of the Bachelet Levitated Railway? Have any of them invested their money in the company which has recently been formed to exploit this "flying" railway?

* * * * *

What is all this outcry now being made by some medical men about dirty money and the necessity for having it thoroughly washed and disinfected before it is issued from the banks? Are not most of us quite willing to accept money whether dirty or not so long as we receive it with "clean" hands?

* * * * *

Why is it that Committees of the House of Commons often blow hot and cold with the same breath? Is it not rather curious that, whereas only a few weeks ago a committee granted the Middlesex County Council powers to levy a tax of 3d. per vehicle-mile on the new West road, a committee has now refused the Walsall Corporation permission to include in their Bill a clause to the same effect? What is the difference between a trolley omnibus and a self-propelled ordinary motor omnibus which caused this committee to allow a tax on the former vehicle and not on the latter? Why should there be any difference in the flavour of the sauce for the goose and that of the gander?

* * * * *

When will the Government find time to pass an Act of Parliament under which the advertisements which now disfigure the country on every line out of London shall be heavily taxed? Are they not aware that the Government of France have passed such a law, which comes into force next year? And why should we be behind in endeavouring to secure a revenue out of these methods for disfiguring the land, instead of taxing improvements?

* * * * *

What is a nuisance? May the following definition of what constitutes a legal nuisance be taken as approximating to a correct definition? "A nuisance may be considered as a condition or set of conditions working harm to one or more persons through an assault or offence to the sense of decency, propriety or comfort. The effect is positive, not slight or partial. An odour or a sight which seriously disturbs the peace of mind which is necessary to the ordinary vocations of life may constitute a nuisance."*

* * * * *

Why is it that aluminium galvanising paint is not more generally used for painting public lamp-posts and tramway standards, and so forth, than is now the case? Is it not apparent to everyone that the appearance given by this paint is brighter and more cheerful than some of the colours selected for this work, and would not a uniform colour be an advantage over the various colours now selected?

* * * * *

Who is the highway engineer who advises H.M. Office of Works on the construction and maintenance of the roads coming under their jurisdiction, and does he read THE SURVEYOR? or what steps does he take to keep himself informed as to the developments now taking place in road construction reforms?

* Extract from the report of the Board of Experts on the Future Sanitary Policy of the City of Chicago.

A Town Planning Scheme: Its Effect on Housing and Architecture.*

By RAYMOND UNWIN.

A town planning scheme consists of two parts. There is first a plan, and second the text of the scheme, which includes a series of regulations of the nature of by-laws covering a very wide range of subjects, which may be independent of the plan, or may consist of interpretations of the plan, or regulations which take effect in particular areas defined by the plan. The effect of the scheme therefore depends on the constructive meaning of the two parts read together, and it will only to a limited extent be possible to deal with the parts separately. So far as it is possible, however, it may be well to take the plan first.

There are certain considerations in connection with it which appeal strongly to the architect, whether he is considering the effect in architecture as a whole, or the effect on the domestic branch which we have summed up under the word "housing." The architect's special point of view may perhaps be stated by saying that he looks upon the scheme as a design; as something thought out as a whole, aiming to produce some definite total effect which will depend on the relation and proportion between the different parts. A design must not, however, be taken to mean merely a pretty picture on the paper. Many natural features of the site, many existing conditions, such as the position of railways, waterways, roads, or buildings, will determine the planning, and will very often prevent that symmetry and balance over large areas of ground which would produce the pretty paper pattern. The town plan is not made primarily to be beautiful, but to provide for the convenient and efficient arrangement of all the different component parts which go to make up the modern city. When the architect is asked to design some decorative feature he is right in concentrating his attention almost exclusively on the creation of a beautiful object; but when he is asked to design a building he must first consider the purposes for which the building is required, its efficiency for these purposes, and its convenience for those who are to occupy it. These considerations will determine the main disposition of the parts, their relation to one another, and the size and detail accommodation required in each; but it is the function of the architect to find a solution of these dispositions, relations, and sizes that will not only give the utmost convenience and efficiency, but in addition will create a beautiful building by the proper adjustment of the different relations, and by the harmonious proportioning of the parts. It is quite possible to create an efficient and convenient building which will be devoid alike of interest and beauty; such a building is not architecture. It is also possible to design a building of considerable superficial beauty of proportion and interest of design which may, nevertheless, be most inefficient for its purpose and inconvenient for its occupants; such a building is equally not architecture in its true sense. It is when the utilitarian objects are efficiently satisfied by a building of beautiful proportions and interesting detail that we have genuine architecture produced.

Exactly the same is true of town planning. In the disposition of the areas, the arrangement and alignment of the roads, the position allotted to the main buildings, the sizes of the different open spaces, and the widths of the highways, the plan may be such as to provide efficiently for the needs of the town, and yet may not contain the elements of design, may lead to no beautiful grouping of the buildings, no distinction resulting from their placing, and no interest arising from the relative position and proportion of the different parts.

It is only when all the utilitarian considerations are fused into some consistent design by the exercise of an imagination specially trained to find beautiful forms by means of which to satisfy useful purposes that a really fine town plan is produced. This is the contribution which the architect, as architect, has to make. A few individual architects may know

enough of engineering and surveying to handle the whole problem, just as some engineers and surveyors may have enough architectural feeling to confer that crowning quality of beautiful design on their schemes; but the knowledge required by these different professions, and the cumulative effect of their practice is so different, that usually it will be necessary for a successful result that representatives of the different professions should work together, so that the total contribution of skill may be higher than can ordinarily be expected from an individual who knows a little of each branch. But if this co-operation is to be effective, each party must have sufficient knowledge and appreciation of the importance of the other departments to give due weight to their representations. The engineer must not sacrifice main architectural matters for quite minor considerations of gradient or convenience; nor must the architect sacrifice the utility of roadways by piling them up on embankments in order to maintain some preconceived effect not suitable to the particular problem in hand. In the main it will be found that while the aims and purposes of the architect, the engineer, and the surveyor are different, they are not conflicting; and that a simple, definite scheme with wide, handsome roads and well-designed crossings and road junctions will be the best form in which to provide easy and convenient thoroughfares.

In considering the scheme of

ROADS

it is important to remember the two main purposes for which they are required—to accommodate traffic and to afford frontages for buildings. Roads generally serve both these purposes, but their treatment depends largely on the relative importance of the two functions; those that are required to serve as main roadways for traffic should be planned primarily for the convenience of traffic, and their junctions should be considered from this point of view first. On the other hand, those roads, the traffic on which is mainly concerned with the buildings fronting upon them, should be considered primarily from the point of view of affording economical, serviceable, and therefore valuable building frontages. As far as possible such roads should either follow approximately the lines of the contours or should travel at right angles to those lines, so that the plane of the land, in whichever direction it may slope, may be nearly square with the building. Both the satisfactory placing of the building on the ground and the convenient treatment of the garden depend considerably upon this. Not only is the importance of traffic secondary in these roads, but it is even desirable that they should not be planned so as to afford short cuts for main lines of traffic. The only way in which it is possible, without great total cost, to secure adequate width for main arterial roads is to design the minor roads so that they cannot become trafficways: the actual width of the carriageways and footways in these may then safely be reduced to a minimum, and the saving in land and cost thus effected can be set off against the extra width and cost of the main traffic highways. This does not mean, of course, that the width between the building lines on minor roads should be reduced, nor even that the width dedicated to the roadway should always be reduced. There will be cases in which it may be desirable either to provide space for the decoration of the roadways with grass margins, shrubberies, or trees, or to provide space for possible future widening of footways or carriageways, where, owing to the planning of the roads, an increase of traffic seems possible.

It is hardly necessary to emphasise the degree to which the health and attractiveness of dwelling-houses depend on the planning of the roads. The spacing of the roads influences the frontage given to the houses, and the area of open ground available to provide air, light, and outlook for the windows. Their adjustment to the nature of the slopes of the ground will have a marked effect on the cost of roadway per house; careful planning will preserve the residential roads from through traffic, thus reducing

* Paper read at the meeting of the Institution of Municipal and County Engineers, held at Dunfermline on June 5th and 6th.

both noise, dust, and danger, and will, moreover, keep open many attractive views of open spaces and distant objects of interest or beauty. The orderly arrangement of the houses themselves and the decoration of the streets with trees and shrubs will add enormously to the pleasantness of the dwellings; and at the same time a good system of main trafficways, by adding to the facility for getting from place to place, will increase the efficiency of the people as industrial workers, and add to their opportunities of enjoying social life and culture.

Some sacrifice of the building convenience may wisely be made on arterial roads; in order to increase their directness, or improve their gradients, we shall be justified in carrying out an extent of cutting and filling that would be unpardonable on a building road. Where there is a choice between cutting and filling, it may be taken as a general rule that filling is most objectionable in roads where dwelling-houses are to be erected, and cutting in roads for business premises. Dwelling-houses are much better built above the road than below it. On the other hand, business premises must be entered on a level with the road, and can usually employ a basement story profitably; this means that when the road is in a cutting, heavy expense must be incurred in excavating the site, and sometimes also in sinking cellars still further below the level. The main consideration on the arterial roads, however, must be the traffic; and it is important to consider this in planning the scheme of minor roads. In order that their traffic should interrupt that on the main roads as little as possible, it should be collected by secondary roads, and delivered by them at not too frequent intervals into the main arteries. It should not be forgotten when planning that every needless junction or crossing on a main artery reduces its efficiency as a traffic carrier. Moreover, when arterial roads are broken into by too many minor roads, the façades of the buildings are apt to become ragged, to lack sufficient breadth and dignity; here as often we find the architectural considerations in harmony with the traffic convenience. On the other hand, in the minor residential roads, the variations which will give further adjustment of the roads to the site, and the limited vistas which will be produced by so planning the roads that, while they divide up the land conveniently, they do not form tempting short cuts, will help the architectural effect with the type of domestic building for which they are intended. The importance of so planning the roads and road junctions as to give at least a favourable opportunity for the beautiful grouping of the buildings must not be overlooked. A straight approach on an axial line to an important building, and the development of the whole of any civic or other centre composed of a group of public buildings on such an axial line, will be found to give a sense of order and dignity. Certain types of building are usually characterised by more handsome architectural treatment; it is desirable that the most should be made of these opportunities, and that these buildings should, as far as possible, be placed where they will confer distinction upon several street pictures, and serve as central features for architectural groupings from several points of view.

In most localities there are features connected with the history of the city's development in commerce, civilisation, or culture, around which there cling the most cherished associations of the people, or which keep alive the memory of heroic citizens of the past. Underlying and infusing all the planning which we have been considering from utilitarian and aesthetic points of view, there must be a sympathetic appreciation of these higher elements of the individuality of the city, and an imaginative enthusiasm for their expression in the outward form of the town, if the result is to be a work of art of the higher order.

We must pass now from the town plan to

THE TEXT OF THE SCHEME.

Here the architect's point of view is somewhat peculiar. He usually sympathises with the aims of by-laws and building regulations, but is intensely irritated by their methods; and if town planning schemes are to work smoothly, the municipal authorities must try to understand this point of view.

The architect is delighted that adequate space about his buildings should be secured, but he is annoyed when that space is required to be exactly in one position, and of an exact dimension throughout the width. He would willingly support the municipal authorities if they would ask for two or three times as much average space about the build-

ings, if only he could be allowed some liberty to dispose this space as may best suit the circumstances of each individual case. He is in full sympathy with the local authorities when they require a certain minimum cubic space to be provided in a living room; but when he is required to reduce the size of a room by cutting off the angles to provide a minimum height to the springing of the ceiling, either wasting the space or providing cupboards that are not wanted, then he is tempted to put in dummy cupboards and remove them after the building is completed.

He is in agreement with the local authority which has sought to prevent the erection of stuffy and congested closes; but when he finds that he cannot erect a quadrangle of buildings without leaving gaps in each angle, or carrying the road right through to avoid a *cul-de-sac*, then by-laws are apt to become his bugbear, and the defeating of them one of his chief delights!

The town planning scheme is largely an extension of the field which may be covered by building regulations, but it is freed from many of the technical difficulties under which by-laws have been made by the local authorities in the past.

Strictly speaking, there are only comparatively few matters on which, previous to the Town Planning Act, by-laws could legally be made, and much ingenuity has been expended by the local authorities and the Local Government Board to make by-laws produce indirectly effects which they deemed desirable, but which they were not legally empowered to secure directly. One result has been that large sums of money have been wasted in making wide roads, because a by-law could not fix a minimum distance between the houses. There is only one way in which building regulations can be made to work satisfactorily, and that is for them to provide sufficiently generously for the requirements to enable a considerable amount of freedom to be left as to the particular method in which they are satisfied. If you secure a sufficiently ample provision of open space about buildings, you can disregard the exact position in relation to the individual building, and the exact distance at any point across a particular bit of open space. This is a very important consideration when framing regulations under the scheme for limiting the number of houses to the acre. It is in every way wise and practicable to reduce the average number of houses to the acre over a reasonable area to such an extent as will secure not only ample light and air space for the houses, but a sufficient proportion of garden ground in relation to the population to provide quite a considerable addition to the economic basis of the family, and sufficient recreation areas for both children and adults; but if this result is to be attained considerable elasticity must be secured. I find that with an average disposition of ten houses to the acre for a rectangular building plot measuring 10 acres there may be usually sixteen or seventeen houses on 1 acre in the corner. If the space is not rectangular, and should be bounded by roads meeting at an angle of 60 deg., there may be twenty houses to the acre on the corner; or, if the road should meet at a still more acute angle—say, 15 deg.—the number of houses to the acre may go up to twenty-four or twenty-five if the full use is made of the road frontage, and all the houses are of the smallest type. While, therefore, over the whole unit of 10 acres it is desirable to reduce the number to ten, twelve or fifteen to the acre, very great care must be taken not to cause a needless waste of road frontage at junctions by insisting on too low a maximum of houses on the individual acre, or on too arbitrary a method of measuring it. It will be seen that, if the acre at the corners were measured to include more of the back land instead of being made square, the lower maximum number of houses on the individual acre would be practicable without causing waste of road frontage. For this reason I think it is a good rule that the general limitation should be sufficiently drastic to secure plenty of open space, but that the particular limitation applying to the individual acre should be sufficiently generous not to cause unnecessary waste of road frontage. Further, if open space is secured generally by the limitation of the number of houses to the acre, any requirement as to the area of open space at the back of the building, or as to the proportion of an individual plot which may be covered by buildings, should leave the greatest possible elasticity in the laying out of buildings around corners.

It is not generally realised how difficult it is to stereotype the minor development of a plan for a large area without causing very serious waste. For example,

if a town planner were to lay out the detail roads on 20 acres of land on a basis of ten houses to the acre, under the expectation that the average frontage per house would be 30 ft., he would have to secure a certain depth of plot and distance between his roads and provide 2,000 yds. of road frontage; but should the type of house eventually built be a narrow house having an actual building frontage of only 15 ft. or 16 ft., probably the average frontage of road required would not much exceed 20 ft.; but he would have laid out 666 yds. of frontage, or 333 yds. of roadway on these 20 acres more than was required, and the unfortunate person who had to develop the land would have wasted £1,333 if the roadway cost £4 per lineal yard. Now it is not possible to foresee exactly what type of house will be built in different places, and therefore elasticity in the number of minor roads, their arrangement and placing on a plan must be permitted if waste is to be avoided. On this account I am inclined to think that the best arrangement for limiting the

NUMBER OF HOUSES TO THE ACRE

is to fix units of reasonable size, taking, as far as possible, areas that are defined on the town plan by main roads, railways, streams, or other definite features not likely to be changed. There should, then, in connection with each unit, be fixed a maximum average density for the whole of the unit, and a maximum density for any one acre within the unit.

But there is still one point to consider: Houses vary very much in size. If it is permissible to have a certain maximum number of large houses on an acre of land, is it not permissible to have a greater number if the houses are each only of one-half or two-thirds the size? In deciding this matter, we must consider the reasons for limiting the number of houses to the acre. These are mainly two: First, limitation aims at providing a sufficiency of open space about dwelling houses to secure an ample supply of the freshest of fresh air and full access for sunlight, both of which are necessary for health. So far, then, as this reason goes, it would seem to be important to take into account the size of the building in fixing the number to the acre, otherwise the larger the building the less would be the open space. There is, however, a second reason for limiting the number of houses—viz., to secure, on the average, to each family the use of a certain amount of ground for recreation, for the growth of garden produce (a matter of great economic importance), and for the preservation of the pleasantness, or, as it is called in the Act, "the amenity," of the area. For this purpose the amount of land required is rather a fixed quantity per family, and does not necessarily depend on the size of the house. The family living in the small house really needs as much land as the family living in the larger house; but it can hardly be contended that it needs more. So even here there is reason for making some difference, because with a given number of houses to the acre a small house, owing to the less area which it covers, will be left with a larger area for garden than the large house, and the utmost that can be said under this heading is that as much land is needed.

There is, however, another pressing reason for doing something to adjust the area of land to the size of the house, and this is the increasing ratio which the cost of the site bears to the cost of the house as that cost decreases. In a house costing £1,500, the cost of the site, including the cost of road making, will usually be no more than one-sixth of the value of the house; in the case of the £150 cottage, the value of the site will not uncommonly be found to represent one-quarter or even one-third of the value of the house. This means that, relatively, the smaller the house the greater is the expense of providing it with a site. If, then, we fix a given limit to the number of houses without reference to their size, we shall add still more to the relatively higher cost of site for smaller dwellings. This is not desirable, for already there is a strong inducement to the builder to build on each plot as big a house as possible, because the bigger house will carry a little more ground rent or site value than a small one, even for the same actual area of ground.

For all these reasons, therefore, it seems to me of importance that the number of houses to the acre should be limited by means of a schedule, which should fix the number in relation to the size of the house, and for the purpose of determining the size of the house one needs to take the effective size, and to eliminate accidental matters, such as the difference between a high-pitched roof or a low-pitched roof, or

the difference between a house that has a large cubic space occupied by foundations and one that has a minimum of foundations. On the whole, therefore, I think the best plan is to fix the number according to the cubic contents of the building, measured to the outside of external walls, to the centre of party walls, and excluding from the measurements all unused space above the level of the highest ceilings and below the level of the ground floor of the building. The schedule would then be somewhat as follows, the actual numbers being adapted to suit the individual circumstances:—

Houses containing not more cubic feet than.	Maximum average to the acre	Maximum on any one acre.
5,000	15	20
6,300	14	19
8,000	13	18
10,000	12	16
12,000	10	14
14,000 and over	8	12

The question of

THE BUILDING LINE

in town planning schemes has considerable bearing upon the building of houses and the architectural effect of the streets, and it is not easy to frame regulations that will work satisfactorily in all cases. There are existing roads on which it may be desirable to fix a building line for the purpose of securing the possibility of road widening at some future date should the traffic on the road develop sufficiently to require it. A line that is fixed for this purpose must, if it is to be effective, apply to all buildings, and must not be subject to exceptions on corner sites, or for the purpose of giving a sense of enclosure to the street view at certain points. On the majority of roads that are mainly used for building purposes, and have only to accommodate local traffic, and on new roads laid out of ample width, the question of street widening beyond the limits of the street boundaries hardly arises. Here the building line is fixed for the purpose of providing adequate width between the rows of houses to secure light and air, and the amenity of the streets; for this last purpose it is desirable that there shall be some opportunity for varying the building line. In some schemes the minimum amount of set-back which could be accepted for any building is all that has been secured, leaving anything further entirely to the option of the builder; in other schemes an attempt has been made to secure a more generous depth of forecourt over the general frontage of the street, but at the same time to give opportunities both to bring forward certain limited lengths of frontage here and there, and also to bring forward, to some extent, the houses at the corner of two streets, so that the amount of road making which must be wasted at street corners may not be unduly increased. While it is certainly desirable in town planning schemes that there should be an opportunity for a settled building line more interesting than the simple continuous street line, it is obviously not desirable that houses should be dotted down along the road irregularly, just where each individual builder may think fit. For this reason, perhaps, the best solution of the building line difficulty is to require a minimum length of building frontage to be submitted as a definite scheme where the ordinary building line is to be departed from. Clauses to this effect are provided for in the Ruislip scheme.

Where the land slopes steeply it is not at all desirable that the buildings on each side should have to be an equal distance from the centre of the road; generally speaking, and where land in several ownerships has to be dealt with, the building lines may need to be set out equidistant from the centre of the road; but provision should be made in the scheme for cases where it is desirable that houses should be set much nearer the road on one side, generally where the ground is falling from the road. This may be compensated for by setting back the houses on the higher side of the road, the distance between the two building lines remaining the same.

Having secured ample space about buildings, perhaps the next most important point is to secure that adequate

FRONTAGE

shall be provided for each house, and that long projecting wings shall not be permitted in such a way as to block proper access of light and air to the windows. There is in the Ruislip scheme a somewhat complicated clause dealing with this matter which secures an angle of light of 45 deg., but it does not prevent the window to a living room being placed at the end of a narrow space between two wings. A

simple regulation requiring that all the living room windows should have a certain angle of light vertically and horizontally would, I think, be more effective, and more readily secure the desired result; such angles should not be less than 60 deg. This would allow of reasonable projections to buildings, but would prevent their undue extension in length, or their undue proximity to each other in the manner that is so objectionable in a very large number of buildings erected under the ordinary by-laws.

Where an attempt is made in a town planning scheme to fix the height of buildings, or to limit the number of stories, care must be taken that this is not effected in such a rigid manner as to require on a sloping road the stepping down of every building. Provision should be made that a level roof may be carried over a group of four or six buildings, and the extra height of the lower buildings utilised for an additional story.

In a similar way, one might go through many other individual regulations which aim at something which is desirable, and might point out how easily, if these regulations are looked at apart from the point of view of those who have to build under them, they may prevent many things which are quite harmless from being done, and may even entail the doing of much that is undesirable. For this reason it is most important in framing town planning schemes that the local authorities should enlist the co-operation and assistance of architects and builders. It is perhaps natural that the busy official of a local authority who is trying to put through a town planning scheme in the short spaces of time he can snatch from his other work should be somewhat impatient of criticism and suggestions; but he should remember that he looks at a regulation purely from one point of view, and that no regulation is good which only satisfies the point of view of the official. The Town Planning Act is so framed that any new regulation that is included in the scheme can be carefully adjusted to meet the

NEEDS OF EXCEPTIONAL CASES.

and to suit the varying circumstances of different districts, and even different areas within the same district. The framing of such regulations is by no means easy, because it is not only the effect of the particular regulation that has to be considered, but the constructive effect of two or three regulations taken together. For example, in the draft of one scheme it was provided that on certain roads houses should be set back 35 ft. from the boundary of the road, and it was also provided in another part of the scheme that no house in a certain area should be more than two stories in height. Where land was sloping steeply, the result of setting back the houses 35 ft. would be that one story would be below the road, and would be in effect a cellar; so that these two regulations, taken together, would mean that on certain sites houses could only be built having cellars and bedrooms, with no proper ground floor rooms at all. What we need is so to frame our regulations that they will effectively prevent anything that is detrimental to health or injurious to the amenities of the district, but will leave the utmost possible freedom for every builder to do anything that he may desire to do that is in itself harmless and unobjectionable.

So far we have been considering the regulations of a town planning scheme as affecting the placing of buildings and the distribution of space about them; but the town planning scheme affords an

OPPORTUNITY FOR MODIFYING BY-LAWS

in England, or regulations made under the Burgh Police Acts in Scotland; and these are much needed. In England the by-laws were framed especially to prevent the evils springing from an overcrowded development of small houses packed together in long rows, without proper access, air space, or sanitary conditions. Such packing together of small houses produced certain dangers which had to be met by a fairly complex system of building regulations, aiming to secure protection from fire risks, sanitary conditions, and a certain standard of stability; but if once the overcrowding of these dwellings is prevented by a definite limitation of the number of buildings which may be placed upon an acre of ground, the whole character of development is changed; the relative importance of many matters must necessarily change also. For example, with endless rows of dwellings packed together closely, the risk of fire spreading from house to house over a large area may be sufficient to justify the by-law re-

quiring parapet walls to be carried up through the roof between each pair of houses; but with the development which follows from the limitation of houses to the acre, such risk is greatly reduced, and the requirement ceases to be one on which it is desirable that the local authorities should insist, for not only can the cost of complying with it be spent to much greater advantage in other ways on the building, but it is in itself an ugly and inconvenient expedient, only justified by a very serious danger.

In Scotland the Burgh Police Acts have been largely framed with a view to meeting the difficulties arising from the prevalence of many-storied tenement dwellings. With a limitation of the number of dwellings on the acre, there can be no doubt that this system of housing families one above the other will give place to that of housing them each in their own house, standing on its own plot. It is necessary, therefore, that all the regulations embodied in the Burgh Police Act, or enforced by Dean of Guild Courts, should be reviewed in the light of the new conditions set up by the Town Planning Act. For example, where population on the acre is as dense as it usually is with many-storied tenement house development, certain expedients have been adopted to try to secure a modicum of fresh air for each person. Among these, the heights of rooms have been fixed much greater than is commonly adopted where cottage dwellings are built. It may, or may not be some slight advantage for comparatively small cottage rooms to be 9 ft. or 10 ft. high; opinions widely differ as to whether any height above 8 ft. is really of advantage in such rooms; but it is hardly open to doubt that it would be a much greater advantage to secure an extra foot in the size of the room, and, further, that additional height over 8 ft. when all the rooms have windows looking out upon ample open space is, to put it at the highest, such a very small advantage that the local authority is not justified in compelling it. The cost had much better be spent in making the rooms a little larger, and under the town planning scheme, which allows rooms to be 8 ft. high, a provision requiring a minimum floor space or a minimum cubic space, or both, can be inserted. The two-story cottage also does not need such a heavy form of construction. Questions of climate must, of course, be considered, but there is no reason to suppose that an 11-in. hollow wall would not be as weather-proof in Scotland as it is found to be in all parts of England; and it is doubtful whether in walls having one air cavity there is any necessity to strap the inside of the wall under the plaster to form a second cavity. Exactly what modifications in detail should be made, and how far differences of climate would affect these, as compared with the modifications found desirable in England, can only be determined after careful consideration of the new conditions by those having a knowledge of both systems of development. I wish only to emphasise the point that a local authority should not attempt to secure in connection with the dwelling the utmost in every direction that the particular surveyor may think desirable, but that they should secure the main conditions necessary for health, and should then leave to the individual builder some freedom to develop in one direction or another as may seem desirable for different classes of tenants.

Above all, let it not be supposed that housing reformers are asking for by-laws to be relaxed; nothing could be further from the truth. In asking for a limitation of the number of families which should be allowed on the average to occupy an acre of ground, housing reformers are calling for a far more drastic regulation than anything which has ever been proposed, one which so alters the character of development that it renders many old regulations no longer necessary, and what they seek is that certain minor requirements chiefly applicable to the older types of development, which are found to hamper the newer and better system, should be removed or adapted to the new conditions.

Certain other regulations should be considered also in reference to the introduction of

NEW BUILDING MATERIALS.

notably in regard to concrete and reinforced concrete, for both of which there is undoubtedly a future as building materials for dwellings in those districts where suitable aggregates are plentiful, and where the more ordinary building materials, brick and stone, are not so easily obtained.

The Town Planning Act gives power to control the character of buildings, and this would seem to carry

with it the right to exercise some supervision over the general character of their designs and the materials of which they are composed, with a view to preserving or securing the amenities of the scheme. Such power has been exercised in the past by enlightened ground landlords in developing their estates, but has not been given to local authorities. It is admittedly a matter of some difficulty, because design or character cannot be defined in precise terms of a number or measurement, and, moreover, is subject to a certain variation of individual taste and opinion; but, none the less, I believe that some such control is desirable, and that the difficulties are less than appear. It is true that if you asked a dozen architects to design a building to fit a certain position, you would receive probably a dozen different designs; but, on the other hand, if you submitted any design for a building to a dozen architects, you would probably get an almost unanimous opinion as to whether that design was such as could reasonably be allowed to be erected in the particular place. There would be a general consensus of opinion which would rule out all designs below a certain quality, although of the designs above that quality there might be some difference as to which should be placed first. Now, in the regulation of design by a local authority, what is aimed at is not to secure absolutely the best among the many good designs, but to maintain a certain average standard, to preserve streets from being spoilt by the erection of buildings which are monstrosities of ugliness or bad taste. This I believe to be both practicable and desirable; but it is work that should not be attempted by a committee of laymen. The layman will very often know what he likes, and what he does not like, and his taste may be good, but he cannot tell what it is that causes him to like a building, and does not understand how a design fails or how it can be amended. Only the trained architect is qualified to exercise this function, and where the local authority desires to criticise the general character or design of buildings, it is at least due to those submitting plans that the criticism should be only entrusted to a well qualified architect, of such standing and independent position that he is not likely to be influenced by petty considerations.

What the municipal authority can do for architecture by means of a town planning scheme, and by the control of buildings, is not to secure fine architecture, but to grant an opportunity for its development, to prepare an adequate stage for its display, and to protect such fine architecture as may arise, and as I believe will arise, out of these better conditions from being spoiled by incongruous surroundings and the ugly freaks of eccentric fancy.

If by means of co-operation between the architectural profession and the municipal engineer a mutual understanding of this position can be secured, a very great step will have been taken towards the building up of more beautiful cities in this century than those which have resulted from the activities of the last.

Claridge's Asphalt has been specified for the damp-courses and the roofing at the new London and County and Westminster Bank premises, Pulborough.

The Civic Engineer's Who's Who, compiled by the editor of *THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER*, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

The Three-Axle Roller.—Messrs. Barford & Perkins, Limited, Queen-street Ironworks, Peterborough, write: "In reply to the query on page 955 of your issue of the 12th inst. as to what has become of the Barford & Perkins' three-axle road roller, we desire to say that the experimental roller which was shown at the exhibition last year in an incomplete state was used last year, and did some rolling at West Hill, Wandsworth, which was considered by Mr. Dodd, the borough surveyor, to compare very favourably with the ordinary rolling by steam roller. During the winter we have had it back in the works to alter it to run on paraffin, and to make an additional adjustment so that the driver could vary the weight on the rollers without moving from his seat. It has just been sent up to London, and has been used by the Trinidad Company at Cross Deep, Twickenham, and we are informed with highly satisfactory results. A second roller has been sent out to Calcutta, and others are now being constructed.

GLASGOW'S WATER SUPPLY.

OPENING OF LOCH ARKLET WORKS.

On the occasion of the annual inspection by the Glasgow Corporation on Friday last of the source of the city's water supply, opportunity was taken to open formally the new Loch Arklet works, which were begun in 1909. The following description of the works has been prepared by the chief of the city water department, Mr. John R. Sutherland:—

The natural flow from Loch Arklet is by the stream which discharges itself from the west end of the loch into Loch Lomond at Inversnaid. The direction of the main discharge from the loch is now reversed by means of a tunnel 12 ft. wide, 11 ft. high, and about $\frac{1}{2}$ mile long leading eastward to Loch Katrine. The difference in height between the raised level of Loch Arklet and Loch Katrine is 103 ft. The tunnel, which starts from an inlet basin at the east end of Loch Arklet, does not run all the way to the edge of Loch Katrine, but terminates in a measuring basin on the hillside on the west side of Loch Katrine. The measuring basin is about 200 yds. from the shore of the loch, and the water flows from the basin to the loch down a natural watercourse, which has been widened and improved with this object in view. Compensation water to the amount of 2 $\frac{1}{2}$ millions of gallons per day, discharged westward by suitable pipes and valves through the dam, will preserve a good flow in the original direction down the stream and over the falls at Inversnaid. The dam, which holds up the water of the loch to its new level, is constructed of concrete faced with masonry. The length is 1,050 ft., its greatest height above the original surface of the ground about 35 ft., and its width at top 11 ft. The greatest width at bottom was intended to have been about 34 ft., on foundations excavated a moderate distance into solid rock.

About half-way along the dam a bad fault crossed the foundation in a diagonal direction, terminating near the down-stream side of the dam in a large pocket of very soft material, quite unsuitable for giving support to the dam. This bad material had all to be cut out, with the result that for a length of about 50 ft. the bottom of the foundation is fully 100 ft. below the top of the dam, or 65 ft. below the original surface of the ground. The width of the structure at this part is proportionately increased, attaining for a short distance an extreme width of 80 ft. These difficulties gave rise to considerable anxiety in the winter of 1910-11, but they have been quite overcome. The inner face of the dam is built of artificial stone made in a blockyard near the site of the works, and the outer face is of red freestone brought from Annan. The imported material—chiefly Portland cement, freestone, and granite—was brought to the railway terminus at Balloch, Loch Lomond; thence it was conveyed in barges to a specially constructed landing-stage near Inversnaid, from which point it was taken up to the site of the works on a wire ropeway, about 1 $\frac{1}{4}$ miles in length. The landing-stage and ropeway were provided for in the specification of the works.

The area of Loch Arklet in its natural state is 207 acres. At its new top-water level—22 ft. higher than the present level—the area will be 551 acres. The loch originally measured about 1 mile long and rather less than $\frac{1}{2}$ mile wide. It is now fully 2 miles long, and of about the same average width as formerly.

The contract was let early in 1909 to Messrs. Charles Brand & Son, of Glasgow, who have carried on the work with great energy. In addition to providing the wire ropeway and other necessary plant, the contractors devised a scheme for using the water power, available from the stream discharging into Loch Lomond, for obtaining electric power by turbines and suitable generators situated close to the special landing-stage. The water was led to the turbines in a steel pipe, mostly 21 in. in diameter, and had a working head of 300 ft. This power provided the means for driving the ropeway, cranes, stone crushers, and other mechanical appliances on the contract, including air compressors for actuating the pneumatic rock drills. The current was taken to the points at which it was required by overhead copper wires. The contract sum was a little over £100,000, and the amount paid to date has been about £168,000. The additional work at the foundations for the dam was the chief cause of the increase on the total cost of the undertaking.

The contract for the gun-metal sluices of the dam and inlet basin, and for the ironwork required, amounting to £4,400, has been carried out by Messrs. Glenfield & Kennedy, Limited, of Kilmarnock.

A BOROUGH ENGINEER'S TRAVELS.

SUGGESTIVE DISCUSSION AT SCARBOROUGH TOWN COUNCIL.

At the meeting recently of the Scarborough Town Council there was a discussion as to the advisability of the borough engineer, Mr. H. Smith, paying professional visits to other towns for the purpose of information. Alderman Hastings Fowler having moved the adoption of the minutes of the Public Parks and Entertainments Committee,

Councillor Stephenson moved as an amendment that the minutes should be approved except that giving power to the borough engineer to visit other towns. He thought the borough engineer already knew sufficient, and that it was quite unnecessary for him to go and see other places. He hoped no one would think him niggardly in moving that amendment, but he would like first to see the slumdom of Scarborough done away with, and good houses provided for the people in general.

Councillor Hebden seconded the motion that that part of the minutes referring to the borough engineer's visits to other towns should be deleted.

Alderman Whittaker strongly opposed the amendment. He considered it would be very well spent money. They got the idea of the bather's bungalows which had been so great a success—from Bourne-mouth, and they got the idea of the floral hall—another big success—from Margate. Never had the borough engineer gone on a visit without bringing back something of interest. The future for Scarborough was full of promise, and they were on the eve of greater development. Every penny spent would be returned to them in pounds. They were doing much for the workers by their reproductive work.

The amendment was defeated, and the minutes, as printed, were adopted.

N.A.L.G.O. and Superannuation.—On Thursday morning next Mr. Herbert Samuel, President of the Local Government Board, will receive at the offices of that authority a deputation from the National Association of Local Government Officers on the subject of superannuation.

Law of Private Street Works.—It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of house property (to say nothing of the occupiers of his houses) has to thread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them might be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices and he is not driven to consult a specialist. The work before us* deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1882, but not with the Metropolitan Management Acts; the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful hand-book. We find the recent decisions included, and the work seems to have been carefully prepared.—*The Builder.*

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A., Borough Surveyor, Great Yarmouth.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday of next week. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom, and repre-

* "Notes on the Law of Private Street Works under the Public Health Acts." By J. B. Reignier Conder, a Solicitor of the Supreme Court. 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

sentatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. The programme of the meetings and conferences is as follows:—

Wednesday, June 24th.

9.30 a.m.—Meeting of subscribers to the Orphan Fund.
9.30 a.m.—Finance Committee meeting.

10 a.m.—Council meeting.

10.30 a.m.—Assemble in supper-room.

Members will be welcomed by the Mayor of Cheltenham, Mr. Alderman W. Nash Skillicorne, J.P., C.C.

ANNUAL GENERAL MEETING.

Chairman, the Outgoing President, Mr. J. W. Cockrill, M.INST.C.E., A.R.I.B.A.

Minutes of last annual general meeting.

Annual general meeting adjourned.

Annual report of the council (to be taken as read).

Annual general meeting, to be adjourned.

Special meeting Alterations in Articles of Association.

Annual general meeting resumed.

Alterations in by-laws.

Presentation of premiums.

Presidential address.

1 p.m.—Adjournment.

CONFERENCES.

TOWN PLANNING AND HOUSING.

(In Supper Room.)

Chairman: The President.

2.30. Opening Address by Mr. Thos. Adams (representative of the Local Government Board).

Mr. Adams will reply to questions arising from his remarks.

Discussion on Paper No. 1.

4 p.m.—Exhibition of town planning and housing schemes in Large Hall. Afternoon tea.

7 for 7.30 p.m.—Annual dinner in the Town Hall (delegates and visitors are invited to attend).

ROADS.

(In Drawing Room.)

Chairman:

Mr. H. T. Wakelam, M.INST.C.E. (vice-president).

2.30. Opening Address by the Chairman.

Discussion on papers Nos. 9 and 10.

Thursday, June 25th.

CONFERENCES.

TOWN PLANNING AND HOUSING.

(In Supper Room.)

Chairman: The President.

10.0. Discussion on Papers Nos. 2, 3 and 4.

ROADS.

(In Drawing Room.)

Chairman:

Mr. H. T. Wakelam, M.INST.C.E. (vice-president).

Discussion on Papers Nos. 13, 14 and 15.

1 p.m.—Luncheon in Large Hall given by the mayor to members, delegates and visitors.

2.30 p.m.—Visit to destructor, concrete slab factory and electricity works, and new sewage purification works.
Tea at sewage works by invitation of mayor.

8 p.m.—Exhibition of town planning and housing schemes in Large Hall.

Friday, June 26th.

CONFERENCES.

TOWN PLANNING AND HOUSING

(In Supper Room).

Chairman: The President.

10.0 to 1.0. Discussion on Papers Nos. 5 and 6.

2.30. Discussion on Papers Nos. 8, 9 and 10.

ROADS AND GENERAL SUBJECTS

(In Drawing Room).

Chairmen:

Mr. H. T. Wakelam, M.INST.C.E. (vice-president).

Mr. T. W. A. Hayward (vice-president).

Discussion on Papers Nos. 16, 17 and 18.

Discussion on Papers Nos. 19, 20 and 21.

4.30 p.m.—Votes of thanks to mayor and corporation,

authors of papers and exhibitors (in Supper-room).
8 p.m.—Open-air entertainment, Montpellier Gardens.

Saturday, June 27th.

10 a.m.—Assemble at the Town Hall. Visit to Cheltenham Corporation waterworks at Tewkesbury and Tewkesbury Abbey, returning to Cheltenham by 1 p.m.

EASTERN DISTRICT.

An Eastern District meeting will be held at Bedford to-morrow (Saturday), and one at Tilbury on July 25th.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

EAST MIDLAND DISTRICT.

It is hoped that a District meeting will be held in South Leicestershire in the near future.

J. W. DUDLEY ROBINSON, B.S.C.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

SOUTHERN DISTRICT MEETING.

A district meeting will be held at the offices of the institution on Wednesday, the 24th inst., at 7 o'clock p.m. prompt, for the discussion of Mr. Barralet's paper entitled "Temporary Buildings in Relation to By-laws."

It is hoped that a good number will be present, since the paper (which appears in the November, 1913, "Journal") is worthy of the fullest interest.

An additional copy of the paper may be had on application to the secretary, 39 Victoria-street, Westminster, S.W.

ARTHUR PALMER,
Hon. District Secretary.

Greenwich, S.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland this month, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

NORTH-WESTERN DISTRICT MEETING.

(July 3 and 4, 1914.)

PROGRAMME.

Friday, July 3rd.

General council meeting, tea and social to be held at the Mitre Hotel, Manchester.

6 p.m.—Tea. (Tickets, 2s. per head.)

7 p.m.—Council meeting.

8 p.m.—Smoking Concert, for which a capital programme has been arranged.

Saturday, July 4th.

Visit to the Ashton-under-Lyne, Stalybridge and Dukinfield waterworks.

1.55 p.m.—Leave Manchester Exchange Station.

2.10 p.m.—Arrive at Stalybridge Station, whence conveyances depart for Brushes.

2.30 p.m.—Arrive at Brushes filters, where an inspection will be made of the general plant.

3 p.m.—Leave Brushes for Ashway Gap filters.

4 p.m.—Arrive at Ashway Gap, and inspect filters and waterworks.

4.45 p.m.—Tea at the Old Dining Hall, Ashway.

5.45 p.m.—Leave Ashway Gap for Greenfield Station.

6.21 p.m.—Leave Greenfield Station for Manchester.

6.52 p.m.—Arrive at Manchester Exchange Station.

Mr. F. J. Dixon, F.G.S., M.INST.C.E., has courteously placed his services at our disposal, and will conduct members over the waterworks. At Ashway Gap Mr. Dixon will entertain members to tea.

The cost of conveyance from Stalybridge to Greenfield will be 2s. per head.

R. J. MCKENN,
Hon. District Secretary.

Heywood.

EASTERN AND NORTH-EASTERN DISTRICTS.

A visit will be paid by these districts of the institution, on Saturday, June 27th, to the quarries of the Enderby and Stoney Stanton Granite Company, Narborough.

PROGRAMME.

12.45 p.m.—Assemble at Leicester (Midland) Railway Station, and proceed by conveyances (kindly placed at our disposal) on a visit of inspection to the Enderby and Stoney Stanton Granite quarries. Arrangements will be made for blasting operations to be seen. Refreshments will be kindly provided by Mr. H. J. Grace, managing director of the company.

6.45 p.m.—Arrive back at Leicester Station.

Members of the Western District are specially invited.

Members are specially requested to note the following: August 15th and 16th, week-end visit to Hunstanton (ladies and friends especially invited). September 26th, Newmarket.

G. BELSON CHILVERS,
Hon. District Secretary.

Council Offices,
Oundle.

B. WYAND,
Secretary.

39 Victoria-street, S.W.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.

MEETING AT MANSFIELD SEWAGE DISPOSAL WORKS.

By kind permission of the Mansfield Town Council and the borough engineer, Mr. Thos. P. Collinge, Assoc.M. INST.C.E., a visit will be paid to the sewage disposal works on Saturday, June 20th. Objects of interest: Grit and screening chambers in duplicate, sedimentation tanks, percolating filters, storm-water tanks, storm-water filters, ram pump and sludge lagoons.

PROGRAMME.

2.30 p.m.—Meet at the town hall, when the visitors will be received by the Mayor, Mr. Alderman Taylor, and members of the Highways Committee.

2.50 p.m.—Proceed to the sewage disposal works, when the visitors will be conducted over the works by Mr. Collinge, the engineer, who has kindly promised to give a description of the works.

5 p.m.—The visitors will be entertained to tea by kind invitation of the town council.

ROBERT TYSON,
Hon. District Secretary.

VISIT TO BRENTWOOD, ESSEX.

By kind permission of the chairman and members of the Brentwood Urban and Billericay Rural Joint Sewage Disposal Works Committee, a visit will be paid to their works on Saturday, June 27th. Objects of interest: Modern sewage purification plant on gravitating systems, comprising silt and detritus chambers, continuous liquefying sedimentation tanks, tank effluent tanks on Dortmund principle with primary and secondary percolating filters followed by humus tank; also sludge treatment on prepared lagoons.

PROGRAMME.

1.33 p.m.—Train leaves Liverpool-street, G.E.R. (East side); arrives Brentwood 2.39 p.m.

2.45 p.m.—Conveyances leave railway station.

3.15 p.m.—Arrive at works, Nag's Head-lane, Brook-street, where a descriptive paper of past and present works will be read by Mr. A. James Meeson, surveyor, who afterwards, with the works manager, Mr. G. J. Quick (member), will conduct the party over the works.

5 p.m.—Tea at the town hall by the kind invitation of the chairman of the Joint Committee, Mr. J. J. Crowe, J.P.

J. FIELDHOUSE,
Hon. District Secretary.

ANNUAL SUMMER MEETING AT NORWICH.
(Saturday, July 4th.)

PROGRAMME.

- 10 a.m. Meeting of council (Committee Room).
 11.15 a.m.—Assemble in Council Chamber at Guildhall.
 11.20 p.m.—Lord Mayor, Mr. James A. Porter, welcomes the association.
 Read minutes, &c.
 Short paper by Mr. Arthur E. Collins, M.INST.C.E., city engineer, Norwich, on "The Sewage Pumping Plant, Travis Tanks, and Sludge Treatment Works of Norwich."
 12.30 p.m.—Luncheon at Criterion Restaurant, White Lion-street.
 1.50 p.m.—Embark at Foundry Bridge Wharf, near Thorpe Station, on board the "Doris," and proceed to the city's refuse tip at Whittingham Farm Marshes.
 2 p.m. Arrive at tip, where association will be welcomed by Mr. O. J. Horner, chairman of the Sewage Committee.
 Walk to sludge treatment works of Norwich.
 2.15 p.m.—Natural Manure Company.
 2.45 p.m.—Walk to Travis tanks.
 3.45 p.m.—Tea, at invitation of the city engineer, Mr. Arthur E. Collins, M.INST.C.E.
 4.15 p.m.—Embark on "Doris."
 4.35 p.m.—Reach Trowse sewage pumping station. Inspect old beam pumping engines, Tangye suction-gas plant (450-b.h.p.), roturbo pumps, automatic electric roturbo pump, special screening gear to suit awkward conditions, coal discharging and storage plant.
 5 or 6 p.m.—Leave Trowse and take electric tramcar to city.

CHARLES H. BALL,
Hon. Secretary.

WHEATLEY.—June 23rd.—For the execution of private street works, for the urban district council.—Mr. J. Simmonds, surveyor.

ROMFORD.—June 23rd.—For fencing and road improvement, for the urban district council.—Mr. H. T. Ridge, surveyor.

ENFIELD.—June 24th.—For the supply of Hertfordshire or other approved gravel, for the urban district council.—The Surveyor.

WOOD GREEN.—June 24th.—For private street works, for the urban district council.—The Surveyor.

ROCHDALE.—June 24th.—For making up certain roads, for the corporation.—Borough Surveyor.

CASTLEFORD. June 24th.—For repaving tramway margins with granite setts, for the urban district council.—Mr. W. Green, surveyor.

ASHFORD.—June 24th.—For the supply of broken granite and granite chippings, for the urban district council.—Mr. W. Terrill, surveyor.

DUNMOW.—June 25th.—For the supply of broken granite, for the rural district council.—Mr. A. E. Floyd, clerk.

LLANTRISANT.—June 25th.—For road widening and surface-water drainage, for the rural district council.—Mr. T. Saunders, surveyor, School-street, Pontyclun, Glam.

LARNE.—June 25th.—For the construction of a new street, for the urban district council.—Mr. W. G. Younge, clerk.

MERTON.—June 26th. For the construction of concrete flag paving, for the urban district council.—Mr. G. Jerram, engineer and surveyor.

EAST SUSSEX.—June 26th.—For the hiring of steam rollers and scarifiers, for the county council.—Mr. Fred. J. Wood, county surveyor, County Hall, Lewes.

LYMINGTON.—June 27th.—For the supply of 600 tons of granite or basalt, for the corporation.—Mr. J. Barnes, borough surveyor.

HERTFORDSHIRE.—June 27th.—For the construction of kerbing, for the county council.—Mr. U. A. Smith, county surveyor, Hatfield.

SOUTHGATE.—June 27th.—For private street works, for the urban district council.—Mr. C. G. Lawson, surveyor.

BURNLEY.—June 29th.—For making up certain streets, for the rural district council.—Mr. H. Pritchard, surveyor.

ALTOFTS.—June 29th.—For the construction of new footpaths, for the urban district council.—The Surveyor.

RHYL.—June 29th.—For the construction of tarmacadam paving, for the urban district council.—Mr. A. A. Goodall, surveyor.

WOODFORD.—June 30th. For road construction with creosoted deal blocks, for the urban district council.—Mr. W. Farrington, surveyor.

BROMLEY (Kent).—June 30th.—For paving the carriage-way in the main London road, a portion of High-street, East-street and Market-square with creosoted wood blocks, including the necessary excavation and concrete foundation, approximately 21,100 yds. super., for the corporation.—Mr. Fred H. Norman, town clerk.

HUNSLET.—June 30th.—For making up private streets, for the rural district council.—Mr. W. B. Pindar, clerk.

BASINGSTOKE.—July 1st.—For steam rolling work, for the rural district council.—Mr. R. Forrester, surveyor.

HASLEMERE.—July 2nd.—For the supply of 600 tons of 1½-in. and 2-in. broken granite, for the urban district council.—Mr. Howard V. Snook, surveyor.

HARROW.—July 4th.—For the supply of broken granite, granite chippings, tarré granite, and tarré granite chippings, for the urban district council.—The Surveyor.

SUNBURY.—July 6th.—For the supply of Guernsey granite, for the urban district council.—Mr. H. F. Coales, surveyor, Sunbury-on-Thames.

SEAFORD.—July 6th.—For the supply of 1,000 tons of granite, for the urban district council.—The Surveyor.

BROMLEY (Kent).—July 6th.—For works of private street improvement in Somerset-road, Wiltshire-road

and St. John's-road, for the rural district council.—The Surveyor, Maulden House, Sidecup-hill, Sidecup.

LOUGHTON.—July 6th.—For the supply of granite and gravel, and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

LEWISHAM.—July 7th.—For supplying and laying wood paving, for the borough council.—The Borough Surveyor.

GODSTONE.—July 4th.—For the supply of tarmacadam and bituminous materials, kerbing, channeling, tools, oils and iron goods, and hire of steam rollers, for the rural district council.—Mr. Geo. Crowter, engineer and surveyor.

Sanitary.

ELGIN.—June 20th. For relaying a sewer, for the corporation.—Borough Surveyor.

MATLOCK.—June 22nd.—For the completion of the main sewerage, consisting of main outfall and subsidiary sewers of earthenware, steel and cast-iron pipes, with manholes, ventilation and flushing tanks, for the urban district council.—Messrs. J. Diggle & Son, engineers, 14 Victoria-street, Westminster, S.W.

BASFORD.—June 22nd.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. S. Maylan, engineer and surveyor.

ROWLEY REGIS.—June 22nd.—For the construction of a sewer, for the urban district council.—Mr. D. Wright, clerk, Council House, Old Hill.

ASHTON - IN - MAKERFIELD.—June 22nd.—For work of sewer construction, for the urban district council.—Mr. T. Burgess, surveyor.

BEDWELLTY.—June 22nd.—For the construction of 750 yds. of 9-in. sewer with manholes, for the urban district council.—Mr. Dan H. Price, surveyor.

FINCHLEY.—June 22nd.—For the construction of four clinker sewage filters at the sewage farm, for the urban district council.—Mr. C. J. Jenkin, engineer.

ROCHDALE.—June 24th.—For sewerage work, for the corporation.—Borough Surveyor.

HUDDERSFIELD.—June 24th.—For the conversion of tub-closets to water-closets, for the corporation.—Town Clerk.

WESTBURY.—June 24th.—For the construction of stoneware pipe sewers, manholes, and flush chambers, for the urban district council.—Mr. W. H. Radford, engineer, Albion Chambers, Nottingham.

SLAITHWAITE.—June 26th.—For the construction of a main sewer, for the urban district council.—The Surveyor.

LYMM.—June 27th.—For the construction of stoneware pipe sewers and manholes, for the urban district council.—Mr. W. M. Beckett, 33 Brazennose-street, Manchester.

WHITSTABLE.—June 29th.—For the supply and erection upon the sewage disposal works at Swalecliffe of a sludge pump to deliver 1,000 gallons of sewage sludge per hour, and an oil engine to drive the same, together with accessories, for the urban district council. Messrs. Strachan & Weekes, 9 Victoria-street, Westminster, S.W.

NEWPORT (Mon.).—June 29th.—For the construction of a stoneware pipe sewer, for the corporation.—Borough Engineer.

ELY.—June 29th.—For sewerage works, for the urban district council.—The Surveyor.

MANCHESTER.—June 30th.—For work of re-draining, for the corporation. Mr. W. Moss, inspector, Town Hall, West Didsbury.

READING.—June 30th.—For sewer construction, for the corporation.—Mr. J. Bowen, engineer and surveyor.

WALMER.—July 1st.—For the construction of sewers and manholes, for the urban district council.—Mr. H. W. Barker, engineer and surveyor.

BIRMINGHAM.—July 1st.—For the construction of about 1,550 yds. of brick sewers, and 2 miles of stoneware pipe sewer, together with railway and canal crossing and cast-iron and stoneware pipe drains, for the corporation.—Mr. Henry E. Stilgøe, city engineer and surveyor.

LICHFIELD.—July 9th.—For the construction of sewage purification works, filters, and manholes, also for laying approximately 1,820 yds. of 15-in., 4,860 yds. of 9-in., and 2,000 yds. of 6-in. stoneware socket pipes, and erecting ventilating columns, for the rural district council.—Mr. C. O. Rawstron, engineer.

ASHFORD.—July 9th.—For the construction of an ejection station with pneumatic ejectors and air-compressing plant, 240 yds. of 6-in. rising main, and a set of sewage purification works, for the West London District School Managers.—Mr. Arthur Martin, 7 Victoria-street, Westminster, S.W.

BARROWFORD.—July 11th.—For the construction of sewage disposal works, for the urban district council.—Mr. F. Sutcliffe, surveyor.

BRADFORD.—July 20th.—For the construction of a circular outfall sewer in tunnel, for the corporation.—Mr. J. Watson, Town Hall.

RINGWOOD.—For the construction of sewage purification works, for the rural district council.—The Surveyor.

Stores.

LEEDS.—June 22nd.—For the supply of articles, for the Gas Committee.—Mr. W. B. Leach, general manager, Gas Offices, Market Hall, Leeds.

BIRMINGHAM.—June 23rd—30th.—For the supply of general and engineering stores, for the corporation.—Mr. R. A. Chattock, city electrical engineer, 14 Dale End.

ROTHERHAM.—July 8th.—For the supply of requisites, for the Electric Light and Tramways Committee.—Engineer and Manager.

Miscellaneous.

WALTHAMSTOW.—June 24th.—For the supply of four motor tractors and motor sweeper, for the urban district council.—Mr. E. Morley, surveyor.

RHONDDA.—June 26th.—For the construction of river bridge, masonry abutments, and road making, widening of Station-street, Treherbert, masonry abutments, river wall, about 15 tons steelwork in plate and lattice girders and troughing, about 46 tons of the same, and 200 suits of workmen's oilskins, for the urban district council.—Mr. E. Taylor, acting engineer and surveyor, Pentre, Rhondda.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of Surveyor readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance. ‡ Provisionally accepted.

ALDERSHOT.—The following tenders have been accepted by the urban district council:—
Granite.—Johnston Brothers, 43s. per ton.
Tar-paving.—Read & Son, 1½ in., 17s. 8d. ½ in., 18s. 8d. and grit, 9s. 4d. per ton.
Horse Hire.—W. North, 8s. per day.
Cement.—Wiggins & Co., 33s. 7d. per ton.
Gravel.—W. Norris, 4s. 11½d. per yard, town roads; and T. Lamport & Sons, 5s. 2d. per yard main roads.
Tarmac.—Divided between Tarmac, Limited, and J. Smart & Sons, 17s. 7d. per ton.
Workmen's Tools.—Stephens & Johnson, Limited, pick handles, 8s. 6d. per dozen; scavengers' brooms, 29s. 6d.; broom handles, 1s. 3d.; gully scoops, 30s. F. Bird & Co., navy shovels, 27s. 6d.; steel shovels, 15s. 6d.; picks, 23s. 6d. per cwt.; stone hammers, 4d. lb.; salvage buckets, 17s. 6d. per dozen; trenching forks, 25s.; mud scoops, 20s. 6d.

BASFORD.—For providing and laying stoneware pipe sewers with Hassall's joints and manholes, for the rural district council.—Mr. S. Maylan, engineer and surveyor:—
Moss & Sons, Loughborough .. £1,140
T. Smart, Nottingham .. 1,093
E. Somerfield, West Bridgford, Notts .. 1,053
A. & C. Rayner, West Bridgford, Notts .. 1,041
G. Belshaw, Nottingham .. 981

MR. J. S. PICKERING, M.INST.C.E.,

Borough Surveyor and Water Engineer, Cheltenham,

President of the Institution of Municipal and County Engineers, 1914-15.

The Surveyor

And Municipal and County Engineer.

Vol. XLV.

JUNE 26, 1914.

No. 1,171.

Minutes of Proceedings.

The Cheltenham Meeting.

By the time this issue is in the hands of our readers the forty-first annual meeting of the Institution of Municipal and County Engineers will have made good progress. The programme is an ambitious one, and it has been found necessary to extend the time of the meeting in order to provide an adequate opportunity for the discussion of the papers which are to be read. It is, of course, impossible for us to comment this week upon the individual papers, but we may offer some observations upon the annual report of the council. In the first place an increase of 126 is recorded in the membership, which now stands at the satisfactory figure of 1,709. Suggestions are made in the report for further alterations in the articles and by-laws in order to secure that a certain number of past-presidents and two associate-members shall become members of the council. These proposed alterations are not so controversial as those which have occupied the attention of the institution in the past, and their principle will probably be agreed upon. Another matter mentioned in the report is an informal interview with the President of the Local Government Board, at which the views of the institution were put forward in regard to the protection of municipal and county engineers in the execution of their duty. At the request of the board information as to cases of hardship to individual members has been forwarded from time to time, and it is to be hoped that some remedy may now be found for a long-standing grievance. The report contains references to several other matters, which show that the council have been watchful of the interests of the members in a variety of ways. Altogether the institution and the retiring president may be congratulated upon a year's very satisfactory work.

The meeting of subscribers to the Orphan Fund has been a feature of the annual meetings of the institution for many years past. On Wednesday the committee were able to report an increased revenue, and a corresponding increase in the benefits awarded to the several grantees. The addition of forty-two annual subscribers is so far satisfactory. If, however, the fund is to be

really worthy of the institution and of the profession, its income ought to be of a much more representative character. It is not so much large subscriptions that are required, although of course these are always welcome. A large number of small subscriptions, showing that the fund has a place in the affections of the general body of members, would be specially welcome to those who are responsible for its administration. The grants made by the committee during the year have benefited in varying degrees twenty-two children, while one child remains at the British Orphan Asylum until the year 1916 by reason of the purchase of a presentation in 1909. The annual expenditure is not a very large one, but the committee believe that the payments made have in all cases proved of timely assistance.

The address delivered by Mr. Pickering on assuming the office of president of the institution consisted in the main of an able *résumé* of the principal matters which ordinarily come within the scope of the duties of a municipal engineer. Some observations in regard to drainage and sewage disposal were followed by a reference to questions connected with water engineering. Dealing with the subject of the allocation of available sources of supply, Mr. Pickering pointed out the urgent need for the creation of a central authority empowered to deal with matters affecting the conservation and disposal of water supplies generally. The question is one upon which we have already expressed our opinion, and we have now only to say that we are in cordial agreement with Mr. Pickering's remarks. The new president had something to say in regard to the technical training of the highway engineer, and pointed to the difficulty of raising the standard of roads in districts where the authorities fail to recognise the necessity of this. A reference to the work of the institution and to the important subject of superannuation concluded an address which may fairly be described as a model of its kind. Mr. Pickering's many friends will cordially wish that his year of office may not only be a conspicuous success, but that it may also witness a continued development in the useful activities of the institution.

Electricity Supply.

The convention of the Incorporated Municipal Electrical Association held at Birmingham last week attained the high-water mark of success in every respect, and was fully worthy of the very energetic association by which it was organised, as well of the great city which gave it hospitality. We briefly summarised the presidential address in our last issue; three papers were also read, which afforded abundant scope for discussion. The first was written by Mr. W. A. Vignoles, chief electrical engineer, Grimsby, who dealt with the "Commercial Development of Electricity Supply in Moderated Towns" in an exceptionally thorough and inspiring manner. In addition to effective advertising the author advocated co-operation with contractors, and explained the system of hiring-out apparatus in force at Grimsby, where the electricity department maintains friendly relations with the contractors, and does no wiring work. He also emphasises the importance of a progressive policy in laying mains to reach new consumers without waiting till a remunerative demand is certain. Referring to the temporary set-back experienced by some undertakings when the highly-efficient metallic-filament lamp was introduced, he pointed out that the present prosperous condition of electric lighting undertakings was entirely founded on the tungsten lamp, thus justifying the view which we repeatedly expressed at the time, that the new lamp should be welcomed and not feared. Moreover, he said, the tungsten lamp had made it possible for electricity to compete with gas for street lighting on favourable terms. For dealing with small consumers Mr. Vignoles found the slot meter advantageous. At 1d. a unit a considerable revenue was derived from heating and cooking in Grimsby, and with the new tariff—15 per cent on the rateable value, and $\frac{1}{2}$ d. per unit—it was expected that a very large development would take place in this branch. In the second part of his paper Mr. Vignoles dealt very fully with the financial management of the undertaking, into which we have not space to follow him, but we note with approval that he strongly condemned the pernicious policy of bleeding the undertaking by annexing the profits for the relief of the rates, instead of placing the business in a sound financial position. Still another section was devoted to the cost of supply, and the whole paper was full of information useful to the manager of such an undertaking.

Mr. S. E. Fedden, chief electrical engineer and manager to the Corporation of Sheffield, discussed the subject of boiler-house plant from a technical standpoint, and described the arrangement of his new station at Neepsend, which possesses many unusual features. The third paper was by Mr. J. H. Bowden, chief electrical engineer to the Corporation of Poplar, and related to the standardisation of tariffs. The author lamented the chaotic state of opinion regarding contributions to the rates, the proper period of loans, and so forth, which resulted in the present diversity of systems of charging for electrical energy. Equal justice to every class of consumer was his ideal, and he held that future practice would tend towards the assessment of a fixed annual charge, irrespective of the purpose for which the supply was used, plus a small charge per unit for energy consumed. Eventually, he thought, by the recovery of by-products, it might become possible to dispense with the secondary charge altogether. The "Norwich" system of basing the fixed charge on the rateable value of a house he describes as most pernicious, bearing unequally upon consumers and not at all in proportion to their consumption; he preferred to take into account "the conditions of each class of supply

in each individual area upon its own merits," as affording a basis for the assessment, and discussed the question in detail. Like Mr. Vignoles, he foresaw an immense development in the demand for electric heating and cooking in the near future which must be provided for by supply managers.

Requirements for Mechanical Filters.

Mechanical filtration is a process which includes the full treatment of water as distinguished from merely passing it through a layer of sand. It includes various processes which may or may not be used according to the requirements of the case. The water consumer has but to state his requirements and obtain a water of any degree of purity, and possessing, in addition, whatever special qualities may be necessary. Waters differ not only in quality at different places, but they also differ in quality from time to time at the same place, and thus need different degrees of treatment. The requirements of one case are not necessarily those of another; for instance, absolute bacterial purity, softness, hardness, plumbo-solvency, acidity, and so forth, are matters which have special bearing upon special cases. Thus there is far more difficulty in making out a list of essential requirements in connection with a filtration plant than is generally supposed, and to prepare a list applicable generally is still more difficult.

That the effects of treatment by means of coagulants and mechanical filters have not been fully understood in the past is demonstrated by Professor Sheridan Delépine in his paper on "The Characters of Mechanically Filtered Water," read before the Institution of Water Engineers and reproduced elsewhere in these pages. In discussing the conditions of guarantee which are sometimes suggested by manufacturers of filters, or which are sometimes imposed on them, it is shown that there are certain requirements which are generally not fulfilled, which are valueless from a hygienic point of view or which cannot be realised. The author's remarks as to the differences in the deposit on the surfaces of mains caused by untreated moorland water and by treated water show that the requirement as to the removal of suspended matters is one which offers certain difficulties; for the suspended matter in the treated water is of an entirely different character to that in the raw water. Again, the percentage reduction requirement for bacteria is such that it is possible for a very pure water to be condemned, for, though an impure water will show a great percentage reduction, a very pure water may actually show an increase after treatment, such increase being quite immaterial. It is also shown that when dealing with hard water it may be convenient to indicate in terms of percentage how much the hardness shall be reduced, but in the case of a soft water, when increase of hardness has for its object the prevention of action on lead, it is clearly useless to demand a percentage increase, because such increase may yet leave the water plumbo-solvent if the water is very soft to start with. The author gives a list of essential conditions for treated water, but he certainly leaves one with the strong impression that the engineer must in the future work with the chemist in water purification and treatment more than has been the case in the past if the best and most economical results are to be obtained. It is clearly impossible to say exactly what treatment is required by any water till its character in the raw state is known and the exact purposes for which it is to be used and the conditions under which it is to be delivered are known. When these are known the chemist and the engineer may co-operate in deciding upon the exact requirements applicable to the case.

**A Dorchester
Outbreak.**

Owing to the number of cases of diphtheria which had been notified in the Borough of Dorchester during the months of September and October, 1913, the Local Government Board, after consideration of a report on the subject by the medical officer of health, and a request from certain residents that an inquiry should be made, instructed Dr. M. B. Arnold, one of their medical inspectors, to make a local investigation of the circumstances of the outbreak. The result of his inquiry, as indicated in the report on the matter which has just been issued by the board, is to show that the outbreak cannot be attributed to any glaring sanitary defect. The recommendations are therefore entirely of an administrative character, and some very pertinent remarks are made as to the possibility of a medical officer, holding other public appointments, and carrying on a large general practice, being able to devote sufficient time to the duties of his office. A proposal to join with the Rural District Council of Dorchester in the appointment of a whole-time medical officer of health was recently debated by the council and rejected. As Dr. Arnold points out, however, there can be no doubt that some association of districts in the appointment of a whole-time medical officer of health will in time be found to present the best prospect of maintaining administrative efficiency. Meanwhile, however, the debate may be taken as evidence that the council desire to continue the services of the medical officer of health as a part-time officer, and it must be admitted, first, that the duties are not such as for the town alone would require the whole time of one medical officer, and, secondly, that Dr. Day's knowledge and experience should enable him to carry out the work satisfactorily if he were in a position to give sufficient time to it. The question is one which is constantly cropping up in different places, and in our view all-round efficiency is only to be gained on the lines indicated in the report.

* * *

**Security
of Tenure.**

A scheme which has been put forward by "Official Security, Limited," for insuring officials against loss of office otherwise than for misconduct, and for providing indemnity for loss by litigation, will doubtless arouse considerable interest among municipal engineers. The council of the institution are recommending the scheme to their members, and, having regard to the peculiar liability of the conscientious engineer or surveyor coming into conflict with the private interests of individual members of his authority, there can be no doubt that the matter is worthy of the most careful consideration. It will be remembered that not long ago a proposal was on foot for forming a voluntary mutual defence fund, but the measure of support that it received was not such as to justify the promoters in proceeding with the matter. The scheme of "Official Security, Limited," is on commercial lines, and is already on a fairly broad basis, having been approved by the Tax Collectors' Associations of London, Liverpool, and Manchester, and by the Rate Collectors' and Sanitary Inspectors' Associations. The company has been formed specially by officials, and, having no share capital, all the profits will be available either for the extension of benefits or the reduction of premiums. A further attractive feature of the scheme is the intention of the management to devote any surplus profits to benevolent purposes. In the circular issued by the institution it is stated that the trustees appear to be taking every precaution to keep down the working expenses, and that, as there were no costs of promotion beyond the

actual charges for printing and registration, the company may rightly claim the hearty support of municipal officers.

* * *

**Lymington
Town Council
and
Street Watering.**

The vagaries of municipal mis-handling, in all probability having their origin in the spurious form of economy which is so dear to many councillors, would appear to have reached a climax in connection with the street watering of Lymington. The work has been let to a contractor, and, judged by the chorus of criticism at a recent meeting of the town council, the system pursued is about as primitive as it is possible to be. One councillor who undertook the office of amateur investigator found that while certain streets were flooded the main thoroughfare got no water; and in reply to a question the borough surveyor, Mr. J. Barnes, said there was no reason why only one standpipe should be made use of while a second was available. There was, no doubt, Mr. Barnes stated, that both the street watering and the scavenging were "most unsatisfactory." The why and wherefore of this were probably explained by the fact that the work of street watering was entrusted to two boys! The mayor, Alderman Shrubbs, was constrained to bear testimony to the "serious state of things that had been disclosed," and added that the "town clerk could not be too emphatic" in the letter of complaint which he was instructed to write to the contractor. In the circumstances it was not surprising to find the mayor and councillors in agreement with the suggestion that the council should take into consideration the question of doing the scavenging and street watering with their own staff. The pity of it is that the town council did not in the first instance give due consideration to this form of management and control of what should be essentially their own affair.

**A Scottish
Appointment.**

Few would be found to quarrel with the principle that long and efficient service in the office of a local authority should be rewarded by promotion when suitable opportunities occur. When, however, it is intended to adopt this course in making an appointment it is evidently to the advantage of everybody concerned that all the circumstances should be such as will obviate the least suspicion of impropriety or favouritism. Moreover, if the man on the spot is good enough, we have always held the view that he should be appointed outright and without placing him in competition with other candidates. The latter course is irritating in the extreme to those who have been put to the trouble and expense of replying to an advertisement, and inevitably leads to a suspicion that the rules of fair play and impartiality have not been followed. We are led to repeat these observations, which in substance we have often made before, because of a complaint which has reached us in regard to the appointment of road surveyor to the Highland District Committee of Perthshire. In reply to an advertisement, 101 applications for this appointment were received, and the choice of the committee ultimately fell upon a gentleman who had been acting as principal road assistant to the previous holder of the office for a period of eight years. We are not complaining of the propriety of the appointment, as we have no reason to believe that the new surveyor is not perfectly qualified to fill the post. We do say, however, that in adopting the procedure they did the committee have at least acted thoughtlessly towards the other 100 applicants.

New Workmen's Cottages for Southwold.

Some ten years ago the Southwold, Suffolk, Town Council erected sixteen cottages for the accommodation of working-class people, and last year, shortly after his appointment, Mr. James S. Hurst, the borough surveyor, was instructed to prepare a scheme for the provision of a further twelve dwellings.

The new cottages, which are built in sets of four, have just been completed, and they were formally opened on the 8th inst.

Each cottage has a small garden in front 10 ft. deep, and at the rear there is an average length of

130 ft. The cottages are faced with Peterborough stock bricks. The gardens will be enclosed with ornamental chestnut fencing.

The contractor for the cottages was Mr. H. Thompson, brother of the late Alderman Thompson, the well-known housing reformer. His tender for the work was £2,155 10s., which, apart from the land, works out at an average of £179 12s. 6d. per cottage.

The cottages will be let at a rental of 4s. 6d. per week, which it is estimated will easily clear all liabilities. The cottages erected ten years ago are rented at 1s. a week, and during the time they have

Front Elevation.

Plan.

SOUTHWOLD WORKMEN'S COTTAGES.

(Mr. James S. Hurst, Borough Surveyor, Architect.)

garden of 130 ft. On the ground floor there is a parlour 12 ft. square, fitted with a tiled register stove with tiled hearth, and a kitchen 12 ft. by 10 ft., fitted with a cooking range, open and closed fire and side boiler, with a copper and sink. A commodious cupboard is arranged under the stairs, and there is also a large pantry, a coal-house, and water-closet, the out-offices all being approached under cover. The staircase leads up directly from the front door, and upstairs there are three bedrooms, 12 ft. square, 10 ft. by 9 ft. (these being fitted with fireplaces), and 13 ft. by an average of 7 ft. 6 in. The cottages are faced with local red bricks at the front to the first story, and rough-cast above, with raised brick quoins, while the roofs—slated—overhang 9 in., both at the back and the front. The backs of the houses are

been occupied they have shown a working surplus of £200. There are the usual restrictions placed on the tenants.

Fast Traffic, its Effect on Roads, and the Remedy.—

A further instalment of "Contributor's" article will appear next week.

Glasgow Municipal Buildings Extension Scheme.—

The estimated cost of this scheme is £168,228, being £137,728 for the new buildings and £30,500 for altering the existing buildings. The architects are Messrs. Watson & Salmond, F.F.R.I.B.A., 242 West George-street. The scheme was adopted by the corporation in September last, and operations are in progress for beginning the new buildings in John-street, the foundation stone of which will be laid by the King on July 7th.

Town Planning from a Lawyer's Point of View.*

By JOHN L. JACK, Town Clerk of the City and Royal Burgh of Dunfermline.

It is a trite saying that no Act of Parliament has ever yet been passed which did not contain loopholes big enough to allow of a horse and cart being driven through it by astute lawyers whose clients desired to avoid its restrictive or other provisions. Doubtless the Housing, Town Planning, &c., Act, 1909, will prove no exception to the rule, but until some town planning scheme is approved and being enforced there will be little, if any, opportunities of testing in the law courts the points of difference which must inevitably arise between responsible authorities and parties interested as to the effect of the town planning provisions of the Act. Already some of us who are engaged in preparing town planning schemes are daily having points raised, some of which might almost be termed fantastic in conception, others, however, being points of real difficulty, calling for serious attention and sometimes prolonged consideration.

The Act of 1909 is remarkable in many respects, but specially so, I think, from a lawyer's point of view, in respect of the provision therein authorising the Local Government Board to prescribe general provisions for carrying out the general objects of town planning schemes with reference to a great many matters, including the modification and adaptation of statutory enactments, and, most important of all, for supplementing the provisions of the Act of 1909 for enforcing schemes. The great latitude of that provision seems to my mind to open up a field for litigation which might well prove costly to responsible authorities, if lucrative to the lawyers; but of that more anon.

Meantime, however, let me put before you in some kind of logical sequence the points which I propose to submit for your consideration.

To begin with, therefore, let us first consider to what extent the town planning part of the Act of 1909 extended or amended the existing law. First, and most important of all, it conferred upon local authorities the right to town plan lands not only in their own area, but also in the area of other local authorities, provided always, of course, that these lands were likely to be used for building purposes.

THE RIGHT TO TOWN PLAN.

The right to town plan is one of the most valuable powers which have yet been entrusted to local authorities, and, conversely, it is one of the greatest restrictions which have been imposed upon landowners in dealing with their properties. Consequently, in the administration of the Act, its provisions must be subject to the very strictest interpretation, and any deviation therefrom, however small, in dealing with a town planning scheme might prove disastrous. I might make my meaning clearer by suggesting this to you, that if, for any reason after a town planning scheme has been completed it were to be found as the result of an appeal to the courts, that the provisions of the Act had been neglected or exceeded in any way, the whole scheme might be declared to be ineffectual. The time involved in the rectification, by the promotion of another scheme, or otherwise, during which a large area of land might be sterilised for building purposes, might entail a considerable financial loss on the local authority and landowners interested. In addition, such a situation would undoubtedly give rise to the question of whether landowners are entitled to compensation for such a delay. I incline to the view that they would be entitled to compensation where the delay is occasioned by the fault or neglect of the local authority.

One other point with regard to the right to town plan that should be borne in mind is that that right is not quite an absolute one in respect that local authorities promoting schemes are directed to endeavour by means of conferences, or otherwise, to secure the co-operation of owners, parties interested, and local authorities in the lands affected by any scheme. That obviously means that where a landowner has views with regard to the laying out of his own lands, a local authority is bound to give these every consideration.

It is my opinion that if in a town planning

* Paper read at the meeting of the Institution of Municipal and County Engineers, held at Dunfermline on June 5th and 6th.

scheme a landowner has already initiated a scheme of development, and partly carried out same, local authorities would be well advised to accept that development, if the objects of the scheme were not interfered with thereby, in preference to entering upon a lengthy controversy with the view of forcing the scheme of development differing from that proposed by the landowner in unimportant engineering details.

LANDS OUTWITH THE AREA OF LOCAL AUTHORITY PROMOTING SCHEME.

With regard to the right of a local authority to town plan lands which are outwith their own jurisdiction, it may interest you to know that in connection with the Dunfermline town planning scheme the corporation have included in that scheme an area of land immediately adjoining the city, which lies within the jurisdiction of the Dunfermline District Committee of the County Council of Fife. One peculiarity about the inclusion of this land is that in the year 1911 the Corporation of Dunfermline promoted in Parliament a Bill for the extension of the city boundary, which, *inter alia*, included this area, now included in their town planning scheme. The Bill was passed without alteration by the House of Commons, but the House of Lords' Committee struck out from the area proposed to be annexed to the city the area to which I am now referring. It is an area presently unbuilt upon, and the buildings in the city are built close up to the boundary thereof. The corporation felt that the development of this area must be made to harmonise with the lay-out of the existing city immediately adjoining, and accordingly, in promoting their town planning scheme, they asked the Local Government Board to include it therein. The proposal was opposed by the County Council of Fife, who appeared before the Local Government Board Commissioners, and stated that while they agreed that the area in question, if it were developed, should be planned in conformity with the city development, they were of opinion that it was rural in character. The Local Government Board, however, took the view of the corporation that it was land likely to be used for building purposes, and allowed its inclusion in the city scheme. Perhaps their decision was influenced to some extent by the corporation stating at the inquiry they had no objection to constituting the county authority the responsible authority for the administration of the scheme, so far as within their jurisdiction, after it had been completed. Be that as it may, I am convinced that the case I have put to you is just such a one as the Legislature had in contemplation when they gave local authorities power to include in a town planning scheme lands in the area of another authority.

Before a local authority can successfully include in a town planning scheme land in the area of another authority they must be in a position to show that it is necessary in the interests of the amenity and convenience of a scheme being prepared by them, or of their existing town, that they should have control of the development therein.

I have heard the view expressed by members of some burghal authorities that it would be well for a burgh, in anticipation of a future extension of boundaries, to ask for authority to town plan county areas in the immediate neighbourhood of the burgh. I am of opinion that any application for a town planning scheme of that nature would be foredoomed to failure. I feel sure that the Local Government Board would be inclined to resent rather than encourage anything which might look like putting them in the position of supporting one local authority against another. At the same time I do not believe that the fact that a county authority has initiated and carried through a town planning scheme for land in the immediate neighbourhood of a burgh will prevent any burghal authority from obtaining an extension of boundaries, although it may entail payment of a larger amount of compensation. The preparation of a town planning scheme does not in the slightest impair the powers of burghal authorities to apply for extension by any of the recognised methods.

I ought to say, in passing, that the County Council of Lanark are promoting a scheme for an area of land

which includes an area within the burgh of Motherwell.

LAND LIKELY TO BE USED FOR BUILDING PURPOSES.

I now come to another point which was discussed at the Local Government Board inquiry into the Dunfermline scheme *viz.*, that land proposed to be included in a scheme is likely to be used for building purposes, or is so situated with respect to land likely to be used for building purposes that it ought to be included in a scheme.

At the Dunfermline inquiry an agent for one of the landowners appeared and objected to the inclusion of certain lands within the city on the extreme eastern boundary thereof. It was urged on behalf of the landowner that this was land which would not in all likelihood be built upon for the next twenty or thirty years, or perhaps fifty years. The answer on behalf of the local authority was that the words "likely to be used for building purposes" did not necessarily mean that it was likely to be so used within the next year or two, and, further, that these very lands had only a few months previously been included by Parliament within the city, thus showing that Parliament had considered the land to be burghal in character; that if lands were burghal in character, it must necessarily follow that they were liable at any moment to be feued or leased for building purposes; and that while it might be quite true that no feuing or leasing for building purposes might take place for even fifty years, the local authority could not very well run the risk of leaving these lands out, because they would undoubtedly form a danger zone to any town planning scheme for the remainder of the city area, in respect that they would be absolutely free of all the restrictions of the town planning scheme designed for the preservation of the amenity and health of the district, and would become an attraction for the speculative builder. In this case, also, the Local Government Board took the view of the corporation, and included the lands objected to. That decision is eminently reasonable, and does not confer any hardship on the landowner. If his lands are not likely to be built upon in the near future, the mere fact of their being planned does not necessarily entail upon him any disadvantage.

Suppose that lands are presently in use for agricultural or any other purpose, there is nothing, in my view, to prevent the Local Government Board making provision in a town planning scheme that additional buildings necessary for the proper working of the farm, and which will be occupied by persons employed in connection therewith, shall be put up, even if these do not harmonise with the proposals of the scheme. Such a condition is eminently reasonable. In fact it is only fair to landowners that until actual development takes place they should be in a position to continue to erect such buildings as are necessary for the proper working of their estates. I think that if, as the result of a town planning scheme, landowners were prevented from erecting such necessary buildings as I have referred to they would undoubtedly have a good claim for compensation in respect of any loss incurred by them thereby. If, however, the landowner desires to erect new buildings for purposes other than those to which his lands are put at the time a town planning scheme is initiated, that goes to show that his lands are likely to be used for building purposes, and he is no worse off than his neighbours who are nearer the heart of the city in being compelled to have these buildings erected in conformity with the town planning scheme.

The conclusion to be drawn from what I have just said is that local authorities are not compelled to take too narrow a view of what is land likely to be used for building purposes, but are entitled to take a broad view thereof, even to the extent of including lands which may not be built upon for generations, so long as the interests of the landowner and his tenants are properly safeguarded. It is not sufficient for a landowner to show that to the best of his knowledge it is unlikely that his land shall be built upon in the near future. If, owing to its proximity to a populous centre, it is doubtful when any particular area of land might be built upon, I think local authorities should have no hesitation in including such an area in a town planning scheme.

MINERAL DEVELOPMENT.

Since the preparation of the Dunfermline town plan intimation has been made, on behalf of one of the landowners in the town planning area, that a trial lease has been granted for the working of certain

minerals which will involve the sinking of shafts within the town planning area at a place which has been laid out for housing purposes. The question has been asked, first, whether a town planning scheme would effectually prevent the working of minerals if that is desired by a proprietor after the scheme is in course of preparation or is actually in operation; and, second, what provision, if any, could be made to meet such a case as I have indicated, where it is problematical whether there are or are not minerals workable to profit within the town planning area. I am distinctly of opinion that it was never intended that the Town Planning Act should interfere with the development and recovery of valuable minerals in any estate, and if, after a town planning scheme has been in operation, minerals should be recovered in any part of the area affected by the scheme, I should say that such a discovery would be a very good and sufficient reason for the revocation of any scheme as regards the area affected, and the substitution of new provisions which, while safeguarding the amenity of existing buildings, would allow of the minerals being developed and recovered. It might be that that could only be done by sinking shafts in the immediate vicinity of houses already erected under the town planning scheme, in which case it would necessarily follow that the party desiring to work the minerals should relieve the responsible authority of any compensation which might be payable to the owners of property injuriously affected by such working.

Coming next to the case which confronts us at Dunfermline, where it is doubtful whether there are minerals workable to profit in a portion of the town planning area, and, if not, where it is desired to utilise the area affected for housing purposes, the question which has been put to me is, what can be done to meet such a situation? I have very carefully considered the matter, and have come to the conclusion that there is nothing in the Act to prevent the town planning scheme making provision to meet such a case. One way, of course, would be to delimit an area within which minerals could be wrought in the original scheme, and if, after a time, it was found that there were no minerals, or that they were not workable to profit, an application could be made for a variation of the scheme, and new provisions could be inserted for the area affected, which would enable it to be planned out for housing purposes. I am of opinion that that would be a costly and cumbersome method of dealing with the situation looking to the procedure that would require to be gone through, and the delay that would be required to be involved thereby. A better method of dealing with the situation would, in my view, be that the proprietor affected should mark off the area within which he desired to work minerals; that the town planning scheme should contain alternative provisions for the area affected, which should come into effect according as mineral development took place or not, and which should permit of houses being erected in the area affected, if no mineral development took place, or after all risk of subsidence had ceased, and the ground been restored, if mineral development did take place. I can find nothing in the Act to prohibit such a course being followed, and I think that the wide powers conferred on the Local Government Board would enable them to insert such alternative provisions in a scheme.

VARIATION OF A SCHEME.

By sec. 54, subsec. 6, of the Act, provision is made for the variation or revocation of a scheme by a subsequent scheme prepared and approved in the same way as the original scheme. Such a provision must inevitably act as a great deterrent on town planners in regard to detail planning, for I think you will agree that the intention is that, whatever appears on the town plan will be in the scheme, and will only be revocable as provided for in the Act. At the commencement of this paper I called attention to the great latitude of the powers of the Local Government Board in the way of suspending existing statutes and supplementing the provision of the Act of 1909 itself, and the point I desire to raise here is whether these powers confer on the board the right of varying the express provisions of the Town Planning Act itself. The nearest analogy is that of a Statute which authorises local authorities to prepare by-laws. It is well-settled law that such by-laws must not exceed or conflict with the powers of the Statute itself. That would lead us to the conclusion that the regulations of the Local Government Board must not conflict with the provisions of the Act of 1909, and that, consequently, no regulation which they may

make can provide for the variation of a scheme by any other method than that provided in the Act.

In the preparation of a large scheme such as the Dunfermline scheme, where development will come in a rush, and where no one can say precisely where that development will commence, detail planning over a wide area becomes absolutely necessary in order to save time and to show to intending builders the lines on which the development is intended to proceed. With development on such a large scale going on, there must arise circumstances in which it will become necessary to make alterations on the lay-out of roads shown on the plan. So far as these alterations are confined to such minor matters as the deviation laterally, to a small extent, of any road shown on the plan, I think there is no difficulty; but the trouble begins when it is desired to eliminate altogether certain of the roads shown on the town plan, and the question comes to be, can this be provided for without following out the provisions of sec. 51, subsec. (6), of the Act? The desirability, if not the actual necessity, of being able to do so must be patent to all, and while certain main features of each scheme must be unalterably fixed except by the means provided in the Act, I think it is permissible to show in a distinctive manner on the town plan detail development which may be altered or abandoned without having recourse to a subsequent scheme so long as the original scheme contained provision for safeguarding the interests of parties concerned. It may be felt that I am drawing a very fine distinction, but the provision for variation as suggested by me would become part of the scheme itself, and not a variation thereof, and everyone would have notice from the beginning that the detail planning referred to would be subject to alteration. Whether the Local Government Board will take the same view remains to be seen.

DELEGATION OF POWERS OF RESPONSIBLE AUTHORITY TO A COMMITTEE.

In framing the Dunfermline scheme I have inserted a provision authorising the responsible authority to delegate all or any of their powers to a committee with power of revocation of such delegation at any time. There is nothing in the Act permitting or forbidding such delegation, but the desirability thereof cannot be questioned. Close scrutiny will require to be taken of all plans for building in a town planning area, and it seems absurd to have to call a whole town council together every time a plan has to be passed. I am of opinion that it is quite within the powers of the Local Government Board to allow delegation to a committee.

COMPENSATION.

I should now like to deal with another point which arose in connection with the Dunfermline scheme. Under sec. 58 (2) of the Act of 1909, it is provided that no compensation shall be payable on account of any building erected on, or contract made, or other thing done, with respect to land included in a town planning scheme after the time at which the application for authority to prepare the scheme is made, or after such other time as the Local Government Board may fix for the purpose.

Some time before the Dunfermline Corporation resolved to make application for permission to prepare a town planning scheme, a building syndicate acquired an area of ground in the vicinity of Rosyth Naval Base, practically in the heart of the area proposed to be included in the town planning scheme. They lodged plans in the Dean of Guild Court for the erection of a number of three-story tenements on that area, having a density of about sixty houses per acre. This was considered by the corporation to be objectionable, but, owing to the period of two months which requires to elapse between the date of notice of intention to make an application and the actual making of the application, there was abundance of time to enable the syndicate to complete their contracts for the erection of the houses, and, in fact, to have the actual erection begun to some extent before the time at which the application for authority to prepare the scheme could be made. I advised the corporation that, according to my reading of the Act, although they had not actually made their application to the Local Government Board, there was nothing to prevent the board from fixing a date anterior to the date of making application. They accordingly authorised me to make application to the Local Government Board to fix the date of their first advertisement of intention to apply for authority to prepare a scheme as the date after which no compensation should be payable on account of any

building erected on or contract made or other thing done with respect to the land proposed to be included in the corporation's town planning scheme. I was heard by the board in support of the application. From what passed I gathered that the board were in some dubiety as to whether they were justified in fixing a date anterior to an application being made to them, and I was asked what guarantee the board had that there should be any town planning scheme put forward at all. My answer was that as a guarantee of the corporation's good faith they had already advertised their intention to apply, and that if they failed to apply within a reasonable time the board had ample power, under sec. 61 of the Act of 1909, to compel the corporation to proceed with their scheme. It was suggested that perhaps the proper course was to wait until such time as the application had been actually made to the board, who might then issue an order making the date after which no compensation would be payable retrospective as far back as the date of the first advertisement. Against that view I contended that such a course would be a distinct hardship, and was one which would be unlikely to be upheld in a court of law, in respect that any person erecting buildings within the town planning area up till the date of the application to the board were quite within their legal rights even if the buildings being erected did not harmonise with the proposed scheme, and that I held the view that the board had not the power to make an order retrospective in such circumstances, the effect of which might ultimately be to confiscate the property which was quite legally brought into existence. As a result of the application and discussion, the board issued an Order fixing the date of publication of the first notice of the corporation's intention to apply for authority to prepare a scheme as the date after which a person should not be entitled to compensation, under sec. 58, on account of any building erected on or contract made or other thing done with respect to land included in the corporation's town planning scheme conditionally upon the corporation making application to the board within a period of two months and three days after the date of publication of the notice referred to. This all goes to show that, once a local authority have resolved to proceed with a town planning scheme, they are in a position to effectually protect the amenity of the area proposed to be included therein pending the decision of the Local Government Board on their application.

It is true that there is no direct prohibition against the erection of buildings in the prescribed area, and anyone who cares to take the risk can build in that area if they choose; but I fancy there are few who are willing to take the risk if the local authority indicate that there is a likelihood of the building being disconform to the proposals of the town planning scheme then in preparation.

In Dunfermline houses have been erected within the town planning area since the town council made application to the Local Government Board, but in granting warrant for their erection the Dean of Guild Court have invariably inserted therein a notice to the effect that the proposed buildings are within the town planning area, and at the hearing in court applicants have invariably been informed of the risk which they incur if the buildings referred to should eventually turn out to be disconform to the town planning scheme.

BETTERMENT.

There is, perhaps, no provision in the Act which will give rise to greater difficulties than that which entitles the local authority to claim betterment from landowners. In Dunfermline the corporation have pursued a policy of "give and take" in this matter. There can be little doubt that where a town planning scheme makes provision for the construction of some special feature, such as a park or a main thoroughfare of some considerable width, it must naturally follow that the ground abutting thereon will become specially valuable for building purposes. Consequently, the landowner can obtain a very much greater rent or feu-duty than he would have done if this special feature were not constructed on his estate. If the local authority were themselves to undertake the construction or provision of this special feature, as has been done in some of the large cities in England, obviously they would be entitled to lodge a claim for betterment against the landowner. Against that, however, the landowner would be entitled to set off his claim for land taken for the construction of the roadway, if not to the whole extent, at least to the extent to which the roadway exceeds the width of road which must be provided under existing by-laws or statutes. In Dun-

fermine the corporation have been successful in arranging with landowners through whose estates specially wide thoroughfares are to be constructed, that, in consideration of the landowners giving off the land necessary for the construction of the roadways and contributing towards the cost thereof the expense of the construction of an ordinary statutory road, they should not lodge a claim for betterment, and that the landowner should not lodge any claim for compensation. That is a policy which will doubtless be pursued successfully in connection with most town planning schemes. But it is conceivable that cases may arise where local authorities will be compelled to make claims for betterment, and the point which I wish to make with regard thereto is one which was recently put to me—viz., that, as a result of the Finance Act of 1909, the Government valuers are in course of making valuations of all estates; that, with respect to land in the immediate vicinity of large centres, these are treated as lands which are immediately available for building purposes, and the valuations are consequently fixed at a very full price, the result of which will be that there is very little room, if any, for any claim for betterment. I, personally, know of lands at present included in a town planning scheme which are let for agricultural purposes at a rate of from £2 to £3 per acre. These very lands have been quite recently valued by the Government valuers at £20 and upwards per acre.

It will therefore be seen that, if a local authority were to construct any special feature through lands of this description, the betterment which they could recover would be bound to be of small amount, and the onus of proving it would be entirely on them. On the other hand, you have the landowner in a strong position, he being armed with no less authority than that of the Government as to the present value of his land. I mention this point in order to put before you the necessity of making inquiry as to the valuations which have recently been put upon lands, so that if any of you are anticipating substantial claims for betterment in connection with town planning schemes you may be led to inquire more carefully into them before incurring expenditure which you would hesitate to incur were it not for the expectation of being recouped to some extent by means of a claim for betterment.

WIDTH OF ROADS.

There is one other small matter which I must mention before closing this paper, and that is as to the powers of local authorities with regard to roads. It is undoubted, I think, that a local authority may plan roads of a much greater width than those which are authorised by Statute, but the cost of doing so, in so far as the road exceeds the present statutory requirements, must be borne by the local authority. Under the General Police Acts in Scotland local authorities cannot demand a road of greater width than 60 ft. between building lines, 40 ft. of which is devoted to carriageways and footpaths. This makes it necessary that buildings must at least be 10 ft. back from the inner line of the footways. If, however, a local authority desire that the buildings shall be further apart than the width prescribed by the General Acts, I am of opinion that they can secure this under the Act of 1909 without incurring any claim for compensation. In this way, under the Act of 1909, sec. 59, no compensation will be payable on account of any provisions in a town planning scheme which prescribe the space about buildings or limit the number of buildings to be erected. My view of that provision is that local authorities can, in Scotland at least, insist on a much wider space than 10 ft. being left between the inner line of the footway of an ordinary statutory road and the building line, and by this means they can secure wider streets without compensation so long as they do not demand a carriageway and footpaths of greater width than 40 ft.

In what I have written above I have endeavoured to confine myself to a few points which are likely to crop up in most town planning schemes, and I hope that the views expressed by me will give rise to some discussion, as I think everyone will agree that the valuable part of any conference is the discussion which usually follows the various papers submitted.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

THINGS ONE WOULD LIKE TO KNOW.

(Contributed.)

Has the Humphrey pump yet been installed in any pumping station near a dwelling-house or houses, and what has been the effect caused by noise or vibration? Have any figures yet been produced as to the efficiency and economy of this pump as compared with pumps of ordinary type?

Why is it that people will keep dogs in towns? Is it not an unnatural life for the dog, and is it not thoughtless selfishness that imposes such a dreary life on a pet animal? Is it not a fact that dogs are responsible for the filthy condition of some of our footpaths? And would it not have been a good plan to impose a tax of ten guineas a year on people who own dogs in any town of more than 20,000 inhabitants?

Why is it that so many private motor cars in London are allowed to belch forth black and obnoxious fumes from their exhausts? Why do not the police interfere and summon the drivers for creating this terrible nuisance? And why is it that this defect seems to be almost non-existent with commercial motors and omnibuses?

Why is it that tar-grouting succeeds in some cases and is a dismal failure in others? Is it because the materials are wrong, or too little filling is used, or the metal is not sufficiently dry? Is it not a fact that some very successful and economical roads have been constructed in this manner?

Why does it seem impossible for some inventive genius to design a simple machine for breaking up the concrete foundation in our streets? Does it not seem to be a rather crude operation to drive wedges into the material with so much expenditure of labour and with so little result comparable with the labour involved?

What is the reason that at the present time so many Eurasians and natives of India are entering for the examination of "Sanitary Science" held by the Royal Sanitary Institute in this country? Is it a fact that the Government of India are sending these men to England on the understanding that if they pass the examination the Government will pay all their expenses? Or is this a mere rumour without any foundation?

Why is it that municipal engineering is so attractive a profession? Is it because the emoluments are so large and the work so light, or is it because the "weekly wage" is secure, however small, and that men prefer to bear the ills they have rather than to fly to others that they know not of? What is the average per 1,000 of population of a surveyor's salary throughout the country?

What is the reason that so little progress has been made in the scientific and sanitary collection and temporary storage of house refuse, whereas such great strides have been made in its ultimate disposal? Is it because the question is beneath the attention of those capable of dealing with it, or is it that habit and custom have made us callous?

Has anyone in this country tried the following Belgian method of road making? A concrete is made of 10 parts, by measure, of pulverised slag, 2 parts of slaked lime, 1 part of slow-setting cement, mixed with the right proportion of water to make it "pasty." The road is excavated to the required depth and contour, and a layer of broken stone 2½ in. gauge laid thereon and rolled to a moderate amount of consolidation. The concrete is then laid on this to a depth of about 1 in., and the final coat of 1½ in. macadam laid thereon and well rolled. The concrete is thus forced both downwards and upwards into the "metal," and is said to form a good and cheap road.

What do surveyors and road experts think of Mr. Boulnois' recently published "Glossary of Road Terms," and will not a number of people entirely disagree with a number of his definitions? Is it not evident from a perusal of this glossary that in our language there are often too many terms employed to designate the same thing?

Institution of Municipal Engineers.

SOUTH-WESTERN DISTRICT MEETING AT TISBURY.

(Conclusion.)

At the recent meeting of the Institution of Municipal Engineers held at Tisbury, a paper entitled "Wiltshire Roads, Past and Present" was submitted by Mr. E. Plummer Davies, the engineer and surveyor to the Tisbury Rural District Council. The paper was reproduced in our issue of last week, with the first instalment of this report.

The CHAIRMAN, Mr. Henry C. Adams (vice-president), in moving a formal vote of thanks to Mr. Plummer Davies, said he had been wondering where all the information came from. Mr. Plummer Davies had told them there were no records kept. He (Mr. Adams) thought the records were kept in minute-books and report-books, but the trouble was that these old books were not indexed and tabulated, and they were of no practical use to anybody, because one could not find information when it was wanted. One of the rules every engineer ought to adhere to was to index and tabulate all his information, so that at a moment's notice he could find anything he wanted. The construction and maintenance of roads was becoming one of the most important branches of engineering. In the old days anything was good enough as long as it was possible to drive over a road, but now roads were wanted in a high state of perfection, and, unfortunately, money was wanted to construct them. As engineers they were always coming into contact with different classes of the public, and it was interesting to note the different ideas they had. He had a conversation with a casual acquaintance in the train, who said councils made mistakes when they advertised for a man used to making roads, and added that what they wanted was an engineer, because an engineer was capable of doing anything. He (Mr. Adams) would not like to contradict that, because engineers could do most things; but, after all, this was an age of speculation. He could make a road, but he would be sorry to set himself up as an expert in road construction. If a good road was wanted they should get a man who was a road engineer. At the present time there was enough to learn in road making to occupy an engineer the best part of a lifetime, and it was the same in every other branch of the profession. From roads they passed on to bridges. Mr. Plummer Davies was a very bold man to have erected a reinforced concrete bridge with local labour. An engineer was running a very great risk in constructing a reinforced concrete bridge with anything but labour of the highest skill. [Mr. Plummer Davies: Concrete and steel—not reinforced construction.] It was not desirable perhaps to go direct to the manufacturers and accept the lowest tender, because there was a natural tendency to cut it as fine as they could. They wanted an engineer to prepare the design, but the construction should be left in the hands of a specialising firm, so that they could rely upon a good result.

Mr. E. H. KNAPMAN (Wincanton) seconded the vote of thanks, and said they all appreciated the paper, and also Mr. Plummer Davies' remarks.

Mr. G. H. GIBSON (Radstock) said he had pleasure in supporting the motion. He had had the pleasure of meeting Mr. Plummer Davies in connection with the Sanitary Inspectors' Association, and knew that he had done excellent work for that organisation. Mr. Davies was always ready to promote the best interests of the profession. His paper on roads was of historical interest, and in adjacent counties they would be able to profit by it.

Mr. R. D. D. MASSY (Lymington), speaking as chairman of a Hampshire district council, said he appreciated an opportunity of taking part in the discussion, not being a member of the institution, although incidentally he happened to be a member of their profession. For the last forty years highways had been of great interest to him. He remembered cycling very close to the Tisbury district when travelling from Salisbury to Warminster on an old-fashioned machine many years ago, and he had been cycling more or less ever since. An old cyclist could speak with some authority about the old roads. They remembered the roads when there were no signposts and no road maps, but they found their way about for a very long time. In recent times he (Mr.

Massy) had been connected with highway work for twenty years. Of course, they could all see that a tremendous strain had lately been thrown upon the ratepayers. What was to be the final outcome of it was very hard to predict, but it might be that the time would come when the Government would have to take over the roads, especially as they were now getting an enormous amount of commercial traffic that used to be borne on railways constructed and maintained by proprietary companies. The road expenditure under the direction of the rural district council of which he was chairman, and to which Mr. Crittall was a most able surveyor, had increased during the past eleven years from something like £900 a year to over £4,000, and the latter figure was about £1,000 too little. They had done a great deal during the period named. When they took hold of the thing they had very narrow roads, a good many of them only 12 ft. wide. The first thing they did was to make an 18-ft. standard, and by gradually pushing and widening they now had all the main roads with an 18-ft. minimum surface. Another question was that of bridges. When he took hold of that, about two years after Mr. Crittall's appointment, they had thirteen streams which required bridging. To-day there were only three. They had adopted a standard of an 18-ton traction engine for these bridges, and they were built of ferro-concrete. The question whether one ought to go to an expert or not was purely one whether the person who had to make the calculations was competent to do so, and whether the council felt, as they did at Lymington, that they had an engineer able to carry out the thing in an efficient manner. He thought many districts had made mistakes in accepting the cheapest tenders for ferro-concrete bridges, because there was a tendency to cut prices. He thought it was a far better plan to make a design and ask for tenders for building a bridge to the specification, and then accept the lowest or not, according to experience.

Mr. E. H. KNAPMAN (Wincanton) asked whether the Tisbury roads were repaired under contract or under the direct maintenance system.

Mr. A. CARTER (Droxford) inquired whether separate gangs were kept for the main roads, or whether the same gangs worked on district as well as main roads. He also asked as to the mileage each man was expected to look after. He presumed that the figures given in the paper only applied to the main roads.

Mr. PLUMMER DAVIES said that, working one road with another, the district roads cost £12 10s. per mile.

Mr. A. J. REDFERN (Honiton) said he found very great difficulty in making any criticism of the paper. He was inclined to think that some of the 160 miles of district roads did not get done very often if Mr. Plummer Davies managed to spend only £12 10s. per mile. There was no doubt that Mr. Davies had brought out one very strong point, which was not sufficiently prominent in these days when people were grumbling so much about the increased cost of the roads—viz., that there had been considerable saving to owners of vehicles and horses in the way of less wear and tear due to the improvements in the roads. It was generally thought that the improvements were solely for the benefit of motorists, but, as a matter of fact, the improved roads were a benefit to all users of the highways, even down to the pedestrian, who saved his shoe leather. He agreed with Mr. Plummer Davies' remarks with reference to the use of flints. They had a lot of crying out for the use of local material, but, as Mr. Plummer Davies had stated, it was not always sound economy to use it.

The CHAIRMAN having put the vote to the meeting, when it was adopted unanimously, said he would like to know whether Mr. Davies had any trouble from unequal wear by using Mendip limestone with local flints.

Mr. PLUMMER DAVIES, in replying, said he could best answer the chairman's query by asking him to go over the roads where they were mixing flints and Mendip limestone. In this matter, as in the case of the main roads, it was an instance of the advantages of local control. The man on the spot knew the needs of the road, and the wear and tear upon it, and

knew how to differentiate between one road and another. In a district like that at Tisbury, where they had the most magnificent flocks of sheep the country possessed travelling over the roads, the roads needed a great deal of attention in order to keep the surface firm. He always made it a point to execute the repairs early in the autumn, so that the roads would settle down before the spring came. If a man was worth twopence in his business he tried to give a good account for money expended. That was the effort they made in Tisbury, and that was why they were able to get such good roads for £12 10s. a mile. There were not 10 miles out of the 160 that were not steam rolled. He could not give particulars of the material used per mile, because they gave each road the quantity it was crying for. They had been steadily improving the roads and bringing them up to a certain pitch, and if he lived there another ten years he hoped to strengthen the roads with material that had up to now been used for widening and improving their shape. As an old cyclist he was very glad that that section of the travelling community were now enjoying a far larger portion of the road surface than was formerly the case. With regard to bridge building, the chairman had referred to bridges of reinforced concrete. The bridge he (Mr. Davies) referred to was of concrete and steel, and the labour employed was skilled local labour. The council gave him a free hand, knowing that that was the only way to get good material. The bridge would bear a 30-ton strain without any difficulty. Mr. Davies went on to condemn the contract system for road making, remarking that unless the surveyor had direct control he became a nonentity. In the Tisbury district the men worked the main and district roads together under eleven road foremen. He had had as many as five steam rollers working at the same time. There had been no trouble with the workmen. The council had very readily increased their day wages 1s. per week recently, and the average roadman earned from 18s. to 22s. per week, according to the character and age of the man.

The members and visitors were hospitably entertained at lunch. Dr. Ensor, presiding, gave the toast of "The Institution of Municipal Engineers," to which Mr. Adams, Mr. W. J. Potter and Mr. B. Wyand responded, the last-named remarking that their thanks were heartily due to Mr. Plummer Davies, who had made the local arrangements for a successful meeting. The toast of "Tisbury Rural District Council" was also honoured, and Mr. E. E. Hibberd, Dr. Ensor and Mr. Plummer Davies responded.

Motor cars afterwards conveyed the party to the Tisbury waterworks reservoir and pumping station, and subsequently they were shown over Fonthill House and inspected the mansion at Little Ridge, to which additions are being made by Mr. Hugh Morrison at a cost of £60,000. The great tithe barn at Place Farm was an object of interest on the homeward journey across the charming Wiltshire Downs, and Mrs. Plummer Davies had tea in readiness prior to a hasty scramble for trains.

A Surveyor's Will.—The late Mr. John Bainbridge, surveyor and building inspector to the North Riding of Yorkshire County Education Committee, left property of a value of £4,013.

Coast Sand Dunes, Sand Spits and Sand Wastes. By Gerald O. Case. 5s. nett. London: St. Bride's Press, 24 Bride-lane, E.C.—This work is a treatise on the advantages of the proper utilisation of inblown sand, so as to turn it into a protection against coast erosion, instead of being, as too often at present, an active agent in such erosion and in the laying waste of fertile land. The author draws many of his examples from Scotland. He points out the work that has been done on the Continent in turning sand wastes into pine forests. The book gives an able and systematic treatment of its subject. *Scotsman.*

Seventeenth Century Municipal Engineers.—Mr. Roger Thornton has contributed to the *Newcastle Municipal Officer* an article entitled "The Town Surveyors of Newcastle." The first to fill the position referred to was Henry Moore, appointed in the year 1666 at a salary of £200, with a gratuity of £50. Ten years later, John Pig took up the work, acting also as county surveyor. John Pig, Mr. Thornton states, was a very eccentric person, and would never ride when going a long distance, walking being his great hobby. When tired of outside life he would live in a prison cell. He died in a pigstye a very peculiar coincidence, remarks the writer of the article.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MANSINGER: "The Fatal Dowry," Act ii., 2.

WATER ENGINEERS AT STOCKPORT.

To the Editor of THE SURVEYOR.

SIR,—In your report of the meeting at Stockport I regret to find that the list of members elected and transferred since the last meeting contained two errors, which I must ask you to correct. The name "George F. Anderson," of the Fylde Water Board, should have been "George F. Atkinson," and the transfer of Mr. Waddington, of Grimsby, to the class of members should not have appeared. It is only fair to state that these errors were due to a secretarial oversight, and not to any failure on the part of your journal. Will you therefore kindly publish my apology to the gentlemen concerned, as well as to any of your readers who may have been misled.—Yours, &c.,

PERCY GRIFFITH.

20 Victoria-street, S.W.

June 20, 1914.

ROYAL SANITARY INSTITUTE CONGRESS AT BLACKPOOL.

Delegates to the congress of the Royal Sanitary Institute, which opens at Blackpool on Monday, July 6th, under the presidency of the Earl of Derby, have been appointed by over 200 authorities, and as the institute's membership numbers over 4,500, a large and influential meeting is expected.

A reception of the members and delegates by the Mayor of Blackpool will take place in the Hotel Metropole, and following a public luncheon the inaugural meeting of the congress will be held in the Grand Theatre.

The usual conference of engineers and surveyors, which will be presided over by Mr. John S. Brodie, the borough engineer and surveyor, is fixed for Tuesday, July 7th, while the engineering and architecture section will meet on Thursday and Friday, July 9th and 10th.

On the last-mentioned date the congress dinner will take place at the Hotel Metropole.

The Health Exhibition arranged in connection with the congress will be opened on the Saturday preceding the actual congress week.

Sheffield Street Improvements.—The Local Legislation Committee of the House of Commons, over which Mr. Middlebrook presides, on Tuesday further considered the Sheffield Corporation Bill. The committee proceeded to deal with the unopposed clauses of the Bill relating to street improvements. Mr. C. F. Wike, the city engineer and surveyor, said the proposed works would cost £163,248. The corporation expected to recoup themselves to the extent of £90,000 by the resale of land. The committee approved the street improvement clauses, but amended the clause specifying the period in which the work must be completed by reducing the time allowed for improvement. No. 1 (the widening of Waingate, Exchange-street, Furnival-road, and Blonk-street) was reduced from seven years to five years, and seven years were allowed for the other works.

The Museum of Practical Geology.—A second edition of the "Short Guide to the Museum of Practical Geology, Jermyn-street, London, S.W.," has been issued, and is obtainable at the price of 1d. The first edition of this guide was issued in 1909. In it the various departments of the museum were described by the officers directly responsible for their maintenance, but the arrangement and editing of the book were carried out by Mr. Howe, the curator. The new edition, also edited by Mr. Howe, differs from the first only in such alterations as have been necessitated by the rearrangement of some of the old exhibits and by the addition of new exhibits. Among the latter may be mentioned geological models of Ingleborough and district, and of the Thames Valley near Goring and Reading, examples of photographs taken by the Geological Survey, a collection of micas lent by Messrs. Wiggins & Sons, and some rock specimens from Cornwall.

Institution of Municipal and County Engineers.

ANNUAL MEETING AND HOUSING AND TOWN PLANNING AND ROADS CONFERENCES AT CHELTENHAM.

Mr. J. S. Pickering, who on Wednesday succeeded Mr. J. W. Cockrill, the borough engineer of Great Yarmouth, as president of the Institution of Municipal and County Engineers, is not without experience of the responsible and arduous duties attaching to such an office. It is only two years ago since his installation as president of the Institution of Water Engineers took place in the beautiful Gloucestershire town in which he is engaged as borough surveyor and water engineer, and it is no exaggeration to say that he proved himself an ideal occupant of the position. One of its keenest supporters during the long period with which he has been connected with it, and probably one of its best known and most popular members, it may be anticipated with every confidence that his year as president of the "Municipal and Counties" will be attended with unqualified success, and that the institution will continue to prosper under his able guidance. A pupil of the late Mr. J. T. Eayrs, one of his predecessors in the chair, Mr. Pickering commenced his career as assistant to the late Mr. John Anstie, of Westminster, under whom he was engaged in the general practice of a civil engineer. Subsequently he took up the position of engineer and manager of the East Warwickshire Waterworks Company, afterwards going to Nuneaton as engineer and surveyor to the local authority. He was appointed to Cheltenham eleven years ago, and has since carried out several important engineering works, including new sewage disposal works, the re-sewering of a large portion of the borough, and extensions of the water undertaking.

As is customary, meetings of the council and of subscribers to the Orphan Fund took place before the commencement of the annual meeting, which opened with a cordial welcome to the members from the Mayor of Cheltenham. The reading of the presidential address and the discussion of certain suggested alterations in the articles of association, the presentation of premiums, and other matters occupied the attention of the gathering very fully up to the adjournment for lunch. Conferences on housing and town planning and roads opened simultaneously in the afternoon under the chairmanship of the president and Mr. H. T. Wakelam, county engineer of Middlesex, respectively, and in the evening the annual dinner of the institution was held in the town hall. The conferences were resumed yesterday morning, and on adjourning the members and delegates were entertained to luncheon by the mayor, visits to a number of the municipal works of the town following in the afternoon. Appended is the list of acceptances for the meeting—some 400 in all: Sir James Lemon (Southampton), Messrs. A. E. Abbot (Stratford and Wolverton), G. Alves (Glastonbury), J. A. Angell (Beckenham), S. C. Baggott (Macclesfield), W. E. Ballard (Birmingham), W. Banks (Rochester), A. Barlow (Ripon), E. M. Bate (Frinton-on-Sea), J. E. W. Birch (East Ham), L. C. Blackburn (Bristol), W. N. Blair (St. Pancras), R. Blanchard (Cannock), H. Bottomley (Bingley), H. Percy Boulnois (Westminster), T. Bowes (Hatfield), A. G. Bradshaw (Lancaster), J. A. Brodie (Liverpool), J. S. Brodie (Blackpool), A. Bromly (Croydon), J. Bryce (Glasgow), W. Burn (Sutton-in-Ashfield), T. Burrows (Lathom), A. Burton (Stoke-on-Trent), T. Caink (Worcester), A. W. Callaway (Nails-worth), A. H. Campbell (Edinburgh), E. R. Capon (Epsom), W. L. Carr (Ruislip-Northwood), E. W. A. Carter (Gloucester), H. T. Chapman (Kent), W. A. Chapman (Lanarkshire), W. H. Clarry (Sutton Coldfield), A. H. Claypoole (Bristol), H. Clegg (Felixstowe), W. A. Clegg (Dorking), C. A. Clews (Derby), H. Cliffe (Mexborough), H. G. Coales (Market Harborough), J. W. Cockrill (Great Yarmouth), F. C. Cook (Nuneaton), H. J. Coleby (Atherstone), T. P. Collinge (Mansfield), R. Collins (Enfield), A. E. Collins (Norwich), T. Cole (consulting secretary, Westminster), A. P. I. Cotterell (Westminster), G. Cowan (Portsmouth), J. S. Crawshaw (Weybridge), R. Croome (Cromer), J. W. Croxford (Brentford), E. H. Crump (Hinckley), A. E. Currall (Solihull), H. Clegg (Felixstowe), C. F. Dawson (Barking), H. Dearden (Dewsbury), J. F. Delany (Cork), A. J. Dickinson (Redditch), R. Dixon (Stratford-on-Avon), J. R. Dixon (Woolwich), J. H. Drew (Wath-upon-Deane), W. Dryack (Aberdeen),

Sholto Douglas (Kenilworth), N. F. Dennis (West Hartlepool), G. Eaton-Shore (Crewe), J. Edey (St. Neots), D. Edwards (Taunton), W. H. Elce (Bacup), E. J. Elford (Southend-on-Sea), J. England (Wrexham), T. E. Fellows (Willenhall), J. R. Findlay (Leith), M. E. W. FitzGerald (Warmley), R. Fletcher (Broms-grove), W. Fowlds (Keighley), T. P. Frank (Newark-on-Trent), J. Gammage (Dudley), C. F. Gettings (Worcester), H. A. Giles (assistant secretary, Westminster), C. A. Gill (Peterborough), W. J. Goodwin (Salisbury), A. T. Gooseman (Wigan), F. T. Grant (Gravesend), A. D. Greatorex (West Bromwich), G. Green (Wolver-hampton), J. S. Green (Haslingden), W. Gregory (Royston), W. H. Grieves (Sutton, Surrey), H. F. Gullan (Belfast), R. G. Gurney (Ledbury), W. J. Had-field (Sheffield), C. Hall (Droylsden), H. L. Hall (Bat-ley), C. L. Hamby (Beccles), H. Hamer (Accrington), C. C. Hancock (Warminster), H. W. Harding (Bristol), J. E. Hargreaves (Farnborough), J. L. Harpur (Brierley Hill), W. Harpur (Cardiff), F. Harris (Tunbridge Wells), P. T. Harrison (Chelmsford), E. Y. Harrison (Wellingborough), G. A. Hart (Leeds), G. B. Hartree (Alton), H. S. Harvey (Evesham), T. W. A. Hayward (Battersea), S. S. Haywood (Brighouse), J. A. Heap (Todmorden), F. Hewitt (Kiveton Park), E. Holloway (Evesham), H. Holmes (Ossett), R. L. Honey (Chatham), E. P. Hooley (Notts), A. Hosken (Smeth-wick), W. Howard-Smith (Westminster), H. H. Howell (Bristol), J. C. Hunt (Bristol), S. Hutton (Exmouth), R. H. Jeffes (Malden), D. M. Jenkins (Neath), R. J. Jenkins (Portsmouth), J. Johnson (Rawtenstall), F. E. Jones (Tyldesley), F. W. Jones (Frome), W. Jones, J. Julian (Cambridge), A. M. Ker (Warrington), W. H. G. Kieser (Bristol), P. G. Killick (Finsbury), F. O. Kirby (Doncaster), G. W. Lacey (Oswestry), F. W. Lacey (Bournemouth), W. T. Lancashire (Leeds), C. H. Lawton (Warminster), M. Lea (Karachi, India), H. W. Longdin (Penge), G. T. Lynam (Burton-on-Trent), C. Lund (Cleckheaton), G. W. Manning (Staines), C. W. Marks (Wokingham), E. B. Martin (Rotherham), F. Massie (Wakefield), E. G. Mawbey (Leicester), W. H. Maxwell (Tunbridge Wells), L. S. McKenzie (Bristol), J. C. Midgley (Newcastle-on-Tyne), J. Moncur (Stafford), J. H. Montgomery (Llanely), S. H. Morgan (Prestwich), P. Morris (Doncaster), A. Murray-Smith (Cheltenham), T. Nisbet (Glasgow), J. B. Nuttall (Heywood), R. Oakden (Newark), P. H. Palmer (Hastings), F. Parr (Bridgwater), J. Paton (Plymouth), F. W. Pearce (Twickenham), G. A. Phillips (Cardiff), F. R. Phipps (Basingstoke), T. S. Picton (Eccles), W. Plant (Stafford), S. S. Platt (Rochdale), D. H. Price (Bedwelty), W. H. Price (Leeds), A. J. Price (Lytham), W. B. Purser (Grantham), J. J. Quirk (Bryn-mawr), A. Race (Barrow-in-Furness), W. S. Raine (Hunger-ford), W. Ransom, (Worcester), R. Read (Gloucester), J. L. Redfern (Gillingham), W. Ridler (Tewkesbury), C. E. Rivers (Harrogate), J. W. D. Robinson (secretary, Westminster), O. C. Robson (Willesden), L. Rose-veare (South Shields), A. Rothera (Liversedge), T. J. Rushbrooke (High Wycombe), F. R. Ryman (Stam-ford), Norman Scorgie (Hackney), J. A. Settle (Bury), H. Shaw (Ilford), G. J. Shepherd (Kidder-minster), T. H. Shipton (Oldbury), Edward S. Sinnott (Gloucester), J. F. Smillie (Tynemouth), J. Walker Smith (Edinburgh), J. P. Spencer (North Shields), W. J. Steele (Newcastle-on-Tyne), A. Steven-son (Ayr), E. A. Stickland (Windsor), H. E. Stilgoe (Birmingham), W. Strickland (Ramsbury), J. Sutcliffe (Deptford), D. S. Sutherland (Southgate), M. H. Sykes (Coventry), E. J. Silcock (Westminster), R. J. Thomas (Bucks), W. Thompson (Burton-on-Trent), G. W. Thompson (Hipperholme), J. Thomson (Dundee), H. Tillstone (Brighton), W. H. Travers (Wallasey), H. Tremelling (Newport, Mon.), S. G. Turner (London), E. W. Turner (Sheffield), F. C. Uren (Aldershot), C. Vawser (Hatfield), T. Waddingham (Hebden Bridge), J. P. Wakeford (Wakefield), H. T. Wakelam (West-minster), A. H. Walker (Loughborough), A. W. Ward (Stockport), J. Ward (Derby), G. W. Warr (Southwick), P. A. Watford (Newark-on-Trent), J. D. Watson (Birm-ingham), E. T. Watts (Bishops Cleeve), T. N. W. Watts (Marlow), H. G. Whyatt (Great Grimby), J. A. Webb (Great Stanmore), F. Weeber (Horncastle), W. Welburn (Middleton), C. F. Wike (Sheffield), F. Wil-kinson (Prestatyn), J. E. Willcox (Birmingham), E.

Willis (Chiswick), H. B. Williams (Workington), O. E. Winter (Hampstead), R. H. Winterbottom (Irlam), F. Wilson (Bristol), B. J. Wolfenden (Bootle), W. S. Woodcock (Oakham), F. Woodward (Stourbridge), E. Worrall (Old Trafford), J. A. Wright (Bristol), T. H. Yabbicom (Bristol), F. S. Yates (Waterloo) and J. Young (Ayr), members, associate-members and students; T. Adams (Local Government Board), Prof. Adshad, H. R. Aldridge, Councillor W. Allon, H. N. Alves, L. P. Appleton, Councillor Ashworth, Alderman Bainbridge, J. H. Barlow, E. J. Beddington, H. C. Bell, C. J. A. Benyon, F. H. Berryman, E. Betham, Dr. Bibby, Councillor J. Booth, J. Bowen, Dr. J. Buchanan, Buish, Councillor Berry, Alderman J. Bester, Conke, Alderman W. Caldicutt, Councillor Cartwright, F. Child, J. Cole, W. E. Collier, Councillor H. W. Cooper, H. Craske, F. H. Crawford, E. T. Culpin, H. M. Ll. Davies, R. Davison, G. S. Doncaster, Councillor H. A. Dowsett, E. Eays, Councillor Eaton, Councillor W. L. Edwards, Councillor A. Frith, Councillor Fielding, A. J. Gainsforth, Councillor J. W. Garland, W. Garner, G. F. Garter, J. Gourlay, D. Graham, W. H. Grant, Alderman T. Greenwood, T. S. Griffin, A. F. Haines, C. W. Hall, Alderman Hardy, G. Harris, Councillor T. Harrison, G. Henson, A. R. V. Hickley, L. M. Hill, J. V. Hodgson, Councillor Hudson, G. Hughes, R. R. Humphrey, Councillor W. Hutchinson, Alderman G. Jackson, J. W. Jackson, Councillor L. M. Jacobs, Alderman Jenkinson, F. A. Jenkins, P. Johns, E. W. Jones, T. J. Jones, F. W. Kellway, O. J. Kirby, Councillor W. Latham, D. Lamb, Councillor C. Lawley, J. Leigh (Chiswick), E. R. Lightwood, S. Liley, Alderman Lloyd, T. A. Lloyd, Councillor J. Longmore, G. Madge, J. M. Martin, Councillor J. Malton, Councillor Martin, G. F. B. Maxengarb, G. Melvin, H. M. Miller, E. H. Morgan, Alderman Mullins, Alderman Marlor, Mawson, R. A. Reay Nadin, B. Nation, H. F. Nichols, Alderman Northfield, J. S. Nowill, T. Overbury, W. Pardon-Howse, A. A. Pattison, H. D. Pearsall, Councillor E. Pennington, T. Picken, Alderman Pinkham, Alderman C. P. Plant, F. E. H. Powell, J. G. Powell, Pratley, J. J. Quaid, A. J. Redfern, W. E. Riche, Alderman W. Roberts, T. F. Ryan, Councillor G. Smith, E. J. Stead, Stewart, J. E. Swindlehurst, T. Lee Syms, D. J. P. Thomson, Alderman W. Tougher, Councillor Turner, T. Turnbull, W. Vincent, P. H. Wakefield, J. Ward, H. M. Webb, S. Williams, Alderman R. Wilson, J. R. Wilson, F. Wood, Councillor J. Wood, T. Woodcock, Woodward, E. Wooldridge, and Councillor A. P. Young, visitors. The following ladies were also present: Mrs. Alves, Mrs. Bate, Mrs. Cockrill, Mrs. Cole, Miss Cole, Mrs. F. C. Cook, Mrs. Child, Mrs. Gettings, Mrs. Hall, Mrs. Hayward, Mrs. Montgomery, Miss Mountford, Mrs. Picton, Mrs. Ridler, Miss Ridler, Mrs. Tillstone, Miss Tillstone, Mrs. Tremelling and Mrs. Walker.

At the opening proceedings Mr. J. W. Cockrill, the retiring president, occupied the chair, supported by Mr. J. S. Pickering, the president-elect.

The MAYOR (Alderman W. Nash Skillicorne), in his speech of welcome, observed that Cheltenham was noted as the garden town of England, and he thought they would say the place had not been misnamed. They were there on important business. The times moved very rapidly, and it was the duty of engineers to keep up with the times. At the present moment there were many improvements of great importance requiring attention. For instance, there was road making, which required all the brains of engineers to keep the roads up to the high standard required by fast motor traffic. Then they had the great question of town planning. He thought that Cheltenham could claim that the town had been laid out on modern lines. He did not say that those who had laid out the town had made much out of it, because even in those times when labour was cheap it was very difficult to make estates pay. They ought to be grateful to the people who had laid out Cheltenham, and at the present time they were reaping the benefit. As they walked round the town they would see how it had been kept up to date in every way, thanks to the engineers of the present and the past. Referring to Mr. Pickering, he was glad that they were honouring him that day by making him president of the institution. It was felt in Cheltenham that he deserved it, for Mr. Pickering was one of the best engineers they had had, and whatever he did he did well. He would also like to bear testimony to the work of Mr. Sinnott, the county surveyor of Gloucestershire, who was a man of great ability. He had great pleasure in welcoming the institution.

The PRESIDENT thanked the mayor for the very hearty reception which he had given to the members of the institution. Cheltenham had been a great draw, for they had the largest and best town planning exhibition which had ever been held. They had also the largest meeting in the history of the institution, upwards of 400 members and delegates having signified their intention of being present.

Mr. T. COLE read the minutes of the annual meeting at Great Yarmouth, which, on the motion of the president, seconded by Mr. J. S. Brodie (Blackpool), were adopted.

THE RETIREMENT OF MR. COLE: APPRECIATION OF HIS SERVICES.

The PRESIDENT said he could not allow the occasion to pass without calling attention to the fact that Mr. Cole, their secretary for so many years, had retired. He had to move "that the members do place on record their high and grateful appreciation of the useful and striking services rendered by Mr. Cole during his term of office as secretary of the institution, covering the period of thirty-two years; and while regretting his retirement from office it is earnestly hoped that the future may have in store for him every happiness and prosperity." He had known Mr. Cole practically during the whole period of his secretaryship, and he had always found him what a secretary of an institution such as this should be. (Cheers.) He had great pleasure in moving the resolution.

Sir JAMES LEMON (Southampton) said he had much pleasure in seconding the resolution. He with others was responsible for the appointment of their friend Mr. Cole. He did not remember whether he proposed him or not, but what he did know was that he had looked upon his career with pleasure. No institution ever had a better secretary than Mr. Cole. The least they could do was to pass the resolution of appreciation of his long and eminent services.

Mr. H. PERCY BOULNOIS (Westminster) said he had the greatest pleasure in adding his testimony to the worth of Mr. Cole. It seemed to him a very short thirty-two years he had been in office, but time passed quickly. He could remember when he was president—he was fortunate enough to hold the position for two years—Mr. Cole was invaluable to him. What he should have done without him he could not say. Mr. Cole's popularity was wonderful. Whence arose this popularity? In Mr. Cole's case it had been his urbanity, his courtesy, his love of his work, and his love of the institution. It was no use painting the lily or adorning the rose. He had been an ideal secretary, and he felt he was parting with a link with the past in the retirement of Mr. Cole.

Mr. E. G. MAWNEY (Leicester) said they all appreciated Mr. Cole's real good-heartedness and his geniality. These qualities had a good deal to do with Mr. Cole's popularity, and the success of the institution. They did know this, that the institution had grown and prospered as probably no other institution had done. He, like Mr. Boulnois, when president experienced the splendid help and guidance which Mr. Cole had extended to all the presidents.

Mr. G. W. LACEY (Oswestry) as a representative of the rank and file of the institution, said every word which had been spoken by past-presidents could be substantiated by those he claimed to represent. He had known Mr. Cole for 22 years, and one could not help but be struck by his courtesy and kindness to every member of the institution. One always venerated his memory because he had become venerable in his long service to the institution.

Mr. W. HARPUR (Cardiff) said he would like to add his meed of praise of Mr. Cole. He would not like the occasion to pass without saying how much he appreciated Mr. Cole's services to the institution. He had been the backbone to the institution, and his services had been invaluable as he hoped they would continue to be invaluable for many years to come. The fact that the institution had reached its present status was largely owing to Mr. Cole. Without a secretary such as Mr. Cole they would not have attained to the position they had.

Mr. J. A. BRODIE (Liverpool) said he had not known Mr. Cole as long as the older members of the institution, but he had conceived a very great liking for him. He had looked upon him as a friend, a wise counsellor, and one to whom the younger members of the institution could go at any time for wise advice and help. He thought possibly he was young himself once. Young men were all very anxious to push on full speed ahead. He thought if they looked back on the work which Mr. Cole had done in push-

ing along the institution from very small beginnings to its present position, even the young fellows must admit that he had done his duty on splendid lines. He thought he had been an exceedingly wise secretary to the institution, and his knowledge of Government ways and departments had been of very great advantage to them. He would like while on his feet to welcome the new secretary. He could assure him there was plenty of need for hard work. From what he had seen of him he was likely to do well for the institution, and if he did as well relatively for the institution as Mr. Cole had done, then at the end of his period of service he would be worthy of a very hearty vote of thanks, and possibly a good deal more.

Mr. T. W. A. HAYWARD (Battersea) said he would like to add his word of appreciation. They had all come to love their secretary, and that was saying a good deal. They had looked upon him as a friend, and had never been treated as a servant of the institution. They were not losing him; Mr. Cole was remaining with them as their consulting secretary. He would always be at their meetings, giving them the advice he had given in the past; but they did feel that as years were passing he deserved to have a little more rest and be relieved of responsibility. He was glad to say that the new secretary and the old secretary were working amicably together, like father and son. Personally he would like to thank Mr. Cole for his kindness to him.

The vote of thanks having been passed by acclamation.

Mr. T. COLE, in reply, said: Mr. President and gentlemen, please forgive me, because I feel I can hardly get words out; but I should like to express my thanks, my very grateful thanks, for all that has been said to-day, and for as much of it as I am entitled to I thank you from the bottom of my heart. I have seen this institution grow from small things. In 1881, when I was appointed, there were 180 members; now there are 1,720. In that time I have seen no fewer than thirty-four presidents. Those presidents were some of the finest men that had ever lived in this country. Many of them have gone from us, and it is difficult to mention names. Angell, Morant, Laws and Till have enriched and ennobled the traditions of this institution. (Hear, hear.) For that alone I am very proud of my connection with the institution. I am not going to detain you now. There are lots of things that crowd into my mind with regard to many of the occurrences that have passed in my history; but I can only say that I have given my best life's work to the institution, and on the other hand, I gratefully acknowledge that the institution has done all it possibly could for me. I am therefore very grateful that the institution I have so much loved has in its goodness elected me as consulting secretary, and therefore I shall be with you as long as I live. Gentlemen, I thank you very much. It has been such a pleasure to me to listen to the words of past presidents—men with whom I have served—and it is music to me to hear that my work has been appreciated.

ALTERATIONS IN ARTICLES OF ASSOCIATION.

The business was then suspended for the holding of a special general meeting for the purpose of considering and, if approved of, adopting alterations in the articles of association.

Mr. H. GILBERT WHYATT (Grimsby) pointed out that Article 27 stated that the council shall consist of members only, and Article 14 was to be altered so that the council shall consist of twelve names, of which two shall be those of associate-members. He should like to know which the council intended; one or the other must be wrong.

The PRESIDENT replied that the technical meaning of the word member included members, associate-members, and students also.

Mr. WHYATT presumed that he would have to take the president's definition of the meaning.

The PRESIDENT: At the council meetings it has been generally assumed to be so.

Mr. WHYATT was willing to accept the president's ruling, but when they provided for nominations they had differentiated between the two classes. He was not going to fight the question, though he maintained that it was contradictory. The only other point was the pulling in of the ex-presidents ex-officio as members of the council. The first meeting he attended was at Leicester, in 1901, and it had been the custom up to then for the ex-presidents to be members of the council. That was rescinded from 1901. It seemed that the members who came on the council then were the men who wanted to have the ex-presidents on

again. He was not going to oppose it, but called attention to it to show that the pendulum swung both ways, and in another thirteen years they would be wanting the ex-presidents off again.

Mr. E. WILLIS (Chiswick) pointed out that by not altering the rule they would be preventing the younger men going forward.

The articles as proposed were agreed to by 60 votes to 3.

The proceedings of the annual general meeting were then resumed.

The annual report of the council was presented.

ANNUAL REPORT OF COUNCIL.

The council have pleasure in presenting the forty-first annual report recording the work of the year 1913-1914.

THE NEW COUNCIL.

The scrutineers, having examined the ballot lists, report the following members elected as the council for the year 1914-1915:—

President—J. S. Pickering.

Vice-Presidents—T. W. A. Hayward, H. T. Wakelam, P. H. Palmer.

Ordinary Members of Council—J. Patten Barber, W. Nisbet Blair, John A. Brodie, J. S. Brodie, G. F. Carter, A. E. Collins, W. Harpur, W. T. Lancashire, H. E. Stilgoe and C. F. Wike.

Past-Presidents (ex-officio Members of Council)—A. D. Greatorex, R. J. Thomas and J. W. Cockrill.

General Hon. Secretary—Vacant.

Hon. Treasurer—Sir James Lemon.

Serving upon the council, in addition to the above, are the district vice-presidents and the district representatives reported by the scrutineers as having been elected for the year 1914-1915:—

DISTRICT OFFICERS.

Vice-President for Scotland—A. Stevenson.

Vice-President for Ireland—W. E. L. Duffin.

DISTRICT REPRESENTATIVES.

Scottish District—T. Nisbet.

Irish District—R. H. Dorman.

North-Eastern District—E. B. Martin and F. Massie.

North-Western District—C. Brownridge and W. Stubbs.

Eastern District—E. J. Elford and W. H. Prescott.

Metropolitan District—N. Scorgie and O. E. Winter.

South-Western District—T. Moulding.

West-Midland District—F. C. Cook.

Southern District—L. S. McKenzie.

East-Midland District—E. P. Hooley.

South-Eastern District—Frank Harris.

North Wales District—W. Jones.

South Wales District—G. A. Phillips.

ABBREVIATION OF TITLE.

The council draw attention to By-law 22: "The following, and no other, abbreviations may be used to denote connection with the institution: Hon. Mem. Inst. M. & Cy. E., M. Inst. M. & Cy. E., A. M. Inst. M. & Cy. E., Stud. Inst. M. & Cy. E." As this by-law forms an agreement entered into by the council on behalf of the institution, the council trust that members will assist them by using the exact form of abbreviation as shown.

[A record is here given of the various institution and district meetings—eight of the former and twenty-two of the latter—held during the year.]

THE ROLL OF THE INSTITUTION.

During the financial year ending April 30th last, 169 new members, consisting of sixty-six ordinary members, fifty-three associate-members, forty-eight students and two affiliated members, have been elected. Twelve members, one associate-member and one student have resigned. Ten members, five associate-members, and four affiliated members have been written off. Four members and one associate-member have rejoined.

The council record with regret the deaths of R. S. Anderson, T. T. Bains, H. F. Bull, W. F. Curry, C. T. Garratt, A. Hale, R. Hara, G. W. Hewes, C. Jones, W. J. Jones, E. Rushton, J. P. Wilkinson and P. R. A. Willoughby (members), and R. Kerr (associate-member).

The roll now stands: Hon. members, 13; members, 1,197; associate-members, 332; students, 112; affiliated members, 55; total, 1,709 [a nett increase of 126 for the year].

Four students have been transferred to the class of associate-member, and ten associate-members to the class of member.

THE FINANCES.

The accounts which accompany this report for the financial year ending April 30, 1914, have been duly audited by the official auditors, Messrs. Wood, Drew & Co. It will be seen from the figures that the institution is in a satisfactory financial position. The only item showing a substantial increase on the year ending April, 1913, is printing, lithography and stationery, which is due to the inclusion of the cost of the conference volume, and extra expenses incurred owing to the increased activity of the district committees. It is satisfactory to note that, in spite of the increased membership and the increased activity in various directions, the figure is practically the same as the year ending April, 1912.

In addition to the cost of printing the "Proceedings" during the year, the cost of printing the *Journal* which replaces them has had to be met, which may be regarded as printing a double set of "Proceedings" in one year. This introduces the abnormal item of £500 for the cost of the *Journal*, and it is very satisfactory to see that this item has been to a large extent met by the amount of £326 6s. 7d., which would have remained as a surplus if only one set of printing had been paid for. It should also be stated that the sum of £500 represents the approximate cost of the *Journal* up to April 30th. As the *Journal* year finishes with the last number of Vol. 40, the accounts will be made up so as to include the whole of Vol. 40, and will then be audited and presented to the members. The auditors report that the total cost for Vol. 40, including the premiums (£93 9s.), will, in all probability, be within £700.

The appeal issued by the council last year for prompt payment of members' subscriptions has met with a ready response, as is shown by the large decrease in the amount of arrears reported. It is hoped that members will continue to assist in producing this satisfactory result.

THE "JOURNAL."

Fifteen numbers of the *Journal* will have been issued before the members assemble for the annual meeting, comprising 850 to 900 pages, or 34,000 sq. in. of matter, as against 16,000 sq. in. in Vol. xxxix. In addition, the increase in the membership roll has caused a corresponding increase in the number of copies printed and in the cost of postage.

The council are therefore glad to be able to report that, in spite of the large increase in gross cost, it appears from the figures available for Nos. 1-9 that the nett cost of the *Journal*—Vol. xl., Nos. 1-15 may be estimated as follows:—

Cost of printing, binding cases, postage, &c.	£1,110		
Less revenue	600		
Nett cost of printing, &c.	£510	0	0
Premiums	93	9	0
Contingencies	96	11	0
Total nett cost	£700	0	0

It is therefore evident that, although the amount of matter published has been doubled, and despite the normal additional cost due to the increase in membership, the publication of the "Proceedings" in *Journal* form will for the first year cost practically the same amount as Vol. xxxix., while in the future it is anticipated that it will be less.

Out of the sum of £700, £93 9s. will be returned as premiums to members. This fact should not be lost sight of.

It is also evident from a scrutiny of the accounts that a deficit of £173 13s. 5d. has arisen during the year owing to the publication of two volumes (xxxix. and xl.) of the "Proceedings" during the year instead of one. In this connection it must not be forgotten that there have also been (1) the publication of the special conference volume, (2) the publication of the index relating to "Proceedings," vols. xxxi. to xxxvii., and (3) the increased printing connected with district meetings.

The council, in submitting the above report, desire to add that they have the greatest confidence in stating that, in their opinion, a substantial balance will appear in the annual statements of accounts of future years in favour of the institution owing to the publication of the *Journal*.

ALTERATIONS IN ARTICLES AND BY-LAWS.

The council have from time to time given careful attention to the situation arising by reason of past-presidents being returned as ordinary members of

council to the exclusion of other members of the institution, and have resolved to place before the members suggestions for the alteration of the articles and by-laws to provide for past-presidents becoming ex-officio members of the council.

The council have given attention to the desirability of alterations in the articles and by-laws in respect of the provision for the election of two associate members as ordinary members of council, and proposals for the amendment of the articles and by-laws accordingly have been drafted.

The provisions of the articles and by-laws have been amended to provide that the institution *Journal* shall not be sent to members whose subscriptions shall remain unpaid six months after the same becoming due.

Owing to the inconvenience arising from the nomination for election of members who are unwilling to take office, the by-laws are being altered to provide that the consent of members should be required to accompany such nominations.

Attention has also been given to a suggestion for the division of Africa into two districts, and the secretary has been instructed to make further inquiries and to report.

The council are giving attention to a proposal for the formation of a Canadian District of the Institution.

TESTAMUR.

It is satisfactory to note that of those who have gained the testamur, the greater majority have joined the institution.

The application form to be filled by candidates for permission to sit for examination has been amended by a clause requiring the candidate to state his intention of joining the institution if successful.

The council have received further suggestions as to the recognition of the testamur and have taken steps to secure full recognition thereof.

COLONIAL SERVICE PENSIONS.

Attention has been given to a suggestion that the Colonial Office should be approached with a view to obtaining the same favourable consideration on retirement to pension for members of this institution engaged in Colonial service, as is granted to members of the institution of civil engineers.

AMENDMENT TO TOWN PLANNING ACT, 1909.

The council have also given attention to the Bill proposed to be introduced in Parliament amending the Town Planning Act, 1909.

Suggestions for the amendment of the Procedure Regulations under the Town Planning Act were laid before the Local Government Board and secured a sympathetic reception.

UNFAIR TREATMENT OF MEMBERS.

An informal interview with the President of the Local Government Board was sought and obtained, and the views of the institution as to the desirability of inserting a clause in the said Bill affording protection to municipal and county engineers in the execution of their duty were placed before him. At the request of the Local Government Board, information as to cases of hardship to members has been forwarded. It is reported with satisfaction that intervention by the institution on behalf of certain members receiving unfair treatment at the hands of their councils has been exercised with favourable results.

COUNCIL MEETINGS IN PROVINCES.

Representations received as to the holding of council meetings in the provinces have been considered, and the secretary has been instructed to obtain further information from the district secretaries who have not yet conveyed the views of their districts upon this subject.

REGISTRATION OF ARCHITECTS.

The council have given consideration to the Bill promoted by the Society of Architects in reference to registration, and have endeavoured to obtain the insertion of a clause protecting the interests of municipal and county engineers.

EXPENSES OF MEMBERS ATTENDING CONFERENCES.

The council have requested Mr. J. Patten Barber to represent the institution at a conference of kindred societies to be summoned under the auspices of the Royal Sanitary Institute, in reference to the amendment of the Conference Act, with a view to providing for the payment of the expenses of engineers and surveyors in attending conferences.

MUTUAL DEFENCE AND SECURITY OF TENURE.

The council regret that no great measure of support has been received to the proposals of the council in reference to the Mutual Defence Fund, and the attention of members has therefore been directed to additional means of securing protection.

The support of the institution has been given to the Superannuation Bill promoted by the National Association of Local Government Officers.

AWARD OF PREMIUMS.

The council have awarded the prizes offered in the Premium Scheme for 1913-14 as follows:—

STUDENTS' PRIZES.

Section (a)—For measured drawings of existing buildings.

The council awarded a prize of £3 3s. to S. J. Hellier, student, engineer's office, Church End, Finchley.

Section (b)—For a design for a steel bridge.

A prize of £3 3s. was awarded to H. Cliffe, student, surveyor's assistant, Mexborough Urban District Council.

MEMBERS' AND ASSOCIATE-MEMBERS' PRIZES.

Section (c)—For an essay.

The first prize of £8 8s. was awarded to S. S. Davson, member, engineer to the Tazini Department, Ministry of Public Works, Cairo, for his paper on "The Dry-weather Flow of Sewage, and its Relation to the Design of Sewers and Arrangements for Pumping."

Section (d)—For a design for a park and recreation ground.

The first prize of £12 12s. was awarded to Messrs. W. H. Price, associate-member, resident engineer's office, Knostrop sewage works, Leeds, and A. J. Price, associate-member, borough engineer's office, Eccles, both holding the testamur of the institution.

The second prize of £6 6s. was awarded to G. Cowan, member, chief assistant to borough engineer, Portsmouth; holds the institution testamur.

A third prize of £3 3s. was awarded to W. Thompson, member, deputy borough engineer, Burton-on-Trent; holds the institution's testamur.

PRIZES FOR PAPERS OR ESSAYS APPEARING IN THE "JOURNAL."

Section (e)—Illustrative papers.

The first prize of £8 8s. was awarded to W. J. Hadfield, member, surveyor of highways, Sheffield, for his paper on "Road Construction."

The second prize of £4 4s. was awarded to P. T. Harrison, member—holds the institution testamur—borough surveyor, Chelmsford, for his paper on "Recent Public Work at Chelmsford."

Section (f)—Essays on special subjects.

The first prize of £8 8s. was awarded to L. Leeper, associate-member, assistant engineer to borough surveyor, Great Yarmouth, for his papers on "Moment in Mechanics" and "Elastic Theorem."

The second prize of £4 4s. was awarded to Reg. Brown, member—holds the institution's testamur—surveyor to the Southall-Norwood Urban District Council, for his papers, "Students' Section."

Section (g)—Essays by students.

The first prize of £4 4s. was awarded to S. J. Hellier, student, engineer's office, Urban District Council, Church End, Finchley.

Section (h)—Designs for artizan's dwellings.

The first prize of £15 15s. was awarded to M. B. Bennett, associate-member—holds institution's testamur—Town hall, Hove.

The second prize of £7 7s. was awarded to P. Morris, associate-member, town planning assistant to the Doncaster Rural District Council.

A third prize of £4 4s. was awarded to A. H. Elliott, associate-member—holds the institution testamur—engineering assistant to city engineer, Nottingham.

REVISION OF SYLLABUS AND REGULATIONS FOR EXAMINATIONS.

The Board of Examiners have given careful attention to the revision both of the procedure of the examinations and the syllabus, and have appointed a sub-committee to consider the matter fully. Subject (4)—Sanitary Science—of the examination has been added to by a new section dealing with the improvement of insanitary areas.

SPECIAL EXAMINATIONS.

It has also been decided to institute special examinations in (a) county and highway engineering and surveying, and (b) town planning. A communication has been addressed to the Road Board informing them of the intention of this institution to hold a special examination in county highway engineering and surveying. Careful attention is being given to the preparation of the syllabus in these examinations, and it is hoped to hold the first special examinations in conjunction with the ordinary examination in October next. The board have also given attention to a suggestion received for the addition of gas engineering to the syllabus of the examination, but considered that at present this subject was not of importance to so many municipal engineers as to warrant its inclusion as a special subject.

TRAMWAY RAILS.

The Tramways Committee report that there have been no meetings of the Rails Standardisation Committee since May, 1913. At the last meeting of that committee it was agreed to recommend the retention of Secs. Nos. 2, 3, 4 and 5 of Tramway Rails (with the exception of the reduction of the flanges from 7 in. to 6½ in.). To suit the views of the different members it was agreed to have a meeting to consider other suggested modifications. A Panel Committee has been appointed by the Sectional Committee to give effect to the recommendations and suggestions; Mr. Elford has been appointed on the Panel Committee to watch the interests of the institution. Data to form the basis of a draft specification for points and crossings is being prepared by a sub-committee, and this matter will probably be dealt with by the Sectional Committee during the coming year.

RAIL CORRUGATION.

The Tramways Committee have, during the year, been carefully watching several important questions relating to tramway practice. Among them was that of "Rail Corrugation," upon which two interesting papers have been recently read at a meeting of the Institution of Civil Engineers. Members of our institution interested in the subject will be well advised to read carefully the papers when they are officially published. The committee were represented at the meeting by Mr. Wakelam, who took part in the discussion.

SALT-GLAZED SEWER AND DRAIN PIPES.

The Standardisation Committee have had under consideration from time to time during the year the proposed specification for salt-glazed sewer and drain pipes. Instructions have been given to the institution's representatives on the Sectional Standardisation Committee upon various important points relating to the specification. This specification has now been practically completed and will be published shortly. This committee have under consideration other matters requiring standardisation, and hope to issue further specifications during the ensuing year.

SPECIFICATION FOR CONCRETE FLAGS.

The sale of the second edition of the Institution's Standard Specification for Concrete Flags is proceeding steadily.

SPECIFICATION FOR BROKEN STONES AND CHIPPINGS.

The Roads Committee have drawn attention to the British standard specification for broken stones and have recommended the members to adopt same, subject to a modification in the maximum length of stones.

ARTERIAL ROADS IN GREATER LONDON.

At the suggestion of the Northern Section of the Conference on Arterial Roads in Greater London, and with the approval of the Local Government Board, the council have decided to convene meetings of the engineers to the various authorities concerned. Both the Local Government Board and the Board of Trade have consented to send representatives to such conferences. A Central Committee will be formed to receive the reports and to prepare the final report for submission to the authorities concerned.

WEIGHTS UPON AXLES OF HEAVY MOTORS.

The question of weights upon axles of heavy motors and of their excessive speed has received the careful attention of the committee, and representations have been made to the Local Government Board on the subject.

TAXES ON MECHANICALLY PROPELLED VEHICLES.

Attention has been given to representations made by a member in reference to the taxation of surveyor's means of locomotion, and the views of the institution have been laid before the Chancellor of the Exchequer.

THE DEATH OF THE HON. SECRETARY.

The council have to record with great regret the irreparable loss sustained in the death of Mr. Charles Jones, and have placed on record their deepest sympathy with the surviving relatives in their great sorrow, and also their high appreciation of his distinguished public talents, and of the useful and ungrudging service he rendered to the Municipal Engineering Profession during his forty years' membership of the institution. The council resolved

Mr. J. Patten Barber was appointed delegate to the Sanitary Inspectors Examination Board.

Mr. J. S. Pickering has been appointed delegate to the Victoria League.

Mr. T. W. A. Hayward was appointed delegate to the Summer School of Town Planning.

Mr. W. H. Prescott has been appointed delegate to the Garden Cities and Town Planning Association.

TOWN PLANNING.

The council referred to the Town Planning Committee the suggestions sent up by last year's conference at Great Yarmouth in reference to the various matters concerning Town Planning, and the Public Works Loan Commissioners have been requested by the council to advance loans for Housing Schemes at the lowest possible rate of interest. The

to raise a fund to perpetuate the memory of Mr. Charles Jones, and have issued an appeal to members.

DEATH OF MR. A. M. FOWLER.

The council also record with great regret the death on the 2nd of June of Mr. A. M. Fowler, who was president during the year 1894-5, and a member of the institution from its foundation.

APPOINTMENT OF DELEGATES.

Mr E. J. Eloff has been nominated as a delegate to the Engineering Standards Committee (Panel Committee) on Tramway Rails.

Messrs. T. W. A. Hayward, W. H. Prescott, and H. T. Wakelam were appointed delegates to the Arterial Roads Conferences convened by the Local Government Board.

Messrs. J. S. Brodie, J. S. Pickering, and A. E. Collins were appointed delegates to the Royal Sanitary Institute Congress at Blackpool.

committee were unable to recommend the taking of any action in reference to the resolution referring to the assistance to be granted to local authorities in the erection of workmen's dwellings.

Representations have been addressed to the Council of the Town Planning institute in reference to the admission of members of this institution with satisfactory results.

The council are considering suggestions for the formation of a Town Planning loan library.

TRACKLESS TROLLEY SYSTEMS.

The Parliamentary Committee have given careful consideration to Bills presented to both Houses of Parliament. Particular attention has been paid to the clauses in the Bills dealing with Trackless Trolley Systems in relation to maintenance and widenings, and the chairman of the committee, together with the secretary were requested to tabulate such clauses. The tabulation has been published

in the *Journal* of the institution for the general use of members.

BUILDING BY-LAWS.

The council have appointed a committee to prepare and give evidence before the Departmental Committee of the Local Government Board appointed to inquire into the working of the Building By-laws, and also to consider the Public Health (Building By-laws) Amendment Bill.

JOINT COMMITTEE ON REINFORCED CONCRETE.

Report from Mr. A. E. Collins: "During the past year the Joint Committee has had before it the proposed by-laws of the London County Council, under the London County Council General Powers Act, 1909, the Act requiring that copies of the regulations be submitted to the Royal Institute of British Architects, who referred them to the Joint Committee. This Joint Committee had previously considered them in 1913. Reconsideration was necessary by reason of alterations proposed by other institutions to whom they had to be referred. We were able to arrive at a working agreement with these other institutions, and with the London County Council. With respect to the Engineering Standards Committee on Tramway Tyres and Axles, to which I was appointed a delegate by the council of the Institution of Municipal and County Engineers, we have had several meetings, the last of which was on the 22nd ult. I think we have now arrived at an agreement as to what form the standard specification for tramway tyres and axles shall take, and I hope to report the conclusion of the work of this committee in time for the annual report of 1915."

The PRESIDENT moved the adoption of the report.

Mr. E. WILLIS (Chiswick), who seconded, congratulated the members of the council on the report which they had placed before them.

Mr. H. GILBERT WHYATT (Grimsby) raised a question as to the contributions of the Road Board to county boroughs. He suggested at Yarmouth that the council should take some action to induce the Road Board to deal more liberally with county boroughs than they had done. They dealt very liberally with counties and small rural authorities. The only two authorities which could have any influence were the Association of Municipal Corporations and their institution, and something ought to be done to influence the Road Board in this matter.

The report was adopted.

The PRESIDENT then presented certificates to the prize-winners whose names appear in the report.

The auditors and scrutineers were re-elected.

INSTALLATION OF PRESIDENT.

The incoming president, Mr. J. S. Pickering, was then installed in office, and invested with the presidential chain by the retiring president.

THANKS TO THE RETIRING PRESIDENT.

Mr. J. S. BRODIE (Blackpool) moved that the best thanks of this meeting be given to the retiring president for his conduct of the affairs of the institution during the past year. Mr. Cockrill, he said, had had a most strenuous year. He had inaugurated the prize system, and got it carried through the council off his own bat. He wished to associate Mrs. Cockrill in the resolution.

Mr. E. WILLIS (Chiswick) seconded. He said they had had a most successful year. He should like to add his thanks to Mrs. Cockrill for the help she had given to the president during his year of office.

The vote of thanks was accorded by acclamation.

Mr. COCKRILL said he was extremely obliged to them for the vote of thanks. He wished to acknowledge the help which his wife had given to him.

Mr. PICKERING then rose and delivered the following

PRESIDENTIAL ADDRESS.

A history of the progress of civilisation and all that has made for the welfare of humanity could not be written without reference to the enormous advantages that have accrued from the accomplishments of the engineer, and it is with a feeling of justifiable pride that the municipal engineer—I use the term in its broadest sense—claims to have taken no small share in promoting the health, happiness and convenience of mankind.

With the demand, by a more educated and enlightened community, for a higher standard of sanitation and a greater degree of comfort, the responsibilities of engineers and surveyors to local authorities

have increased. The provision of a suitable system of sewers and drains is now a recognised necessity for the smallest village as well as for the largest city; the prevention of the pollution of rivers and streams has brought about a desire for efficient schemes of sewage purification; the demand for a wholesome and adequate public supply of water has become general; the collection and sanitary disposal of house and trade refuse are matters that have assumed the greatest importance; in the construction, maintenance and administration of public roads there has been nothing short of a revolution; the passing of the horse and steam tram has necessitated the construction and equipment of suitable permanent ways for electric and cable trams; most towns of importance have provided public baths, abattoirs, markets, fire stations, infectious diseases hospitals, and other public buildings; housing schemes of considerable magnitude have been promoted and carried out, and during the last few years a new departure has been made in the preparation of schemes for the systematic planning of towns. These are all matters for which the municipal engineer is mainly responsible, but they only embrace a portion of his duties. Apart from his technical knowledge he is required to have a sound commercial training, to understand the value of labour and materials, and to possess a keen power of organisation; while by no means the least of his qualifications lies in his aptitude to accommodate his energies in the interests of the community to the trying and difficult position he occupies as a public official.

DRAINAGE.

Dealing with the subject of drainage, much progress has been made of late years in the scientific design and construction of both public sewers and house drains. Where the best construction is not always met with is in the case of sewers laid by private individuals for the drainage of speculative building estates, efficiency generally being looked upon as secondary to financial considerations. Even with the most careful supervision it is obvious that the same standard of work cannot be obtained as in the case of sewers over which the engineer has direct control, and a local authority has frequently to take over and afterwards maintain sewers which, although not sufficiently defective to condemn, do not meet all the requirements of first-class construction. It seems to me quite a reasonable suggestion that sewers which are to become public property should be laid only by the local authority, the property owner being charged the actual cost.

After somewhat fruitless discussions extending over a period of something like half a century, the question of sewer ventilation and the use of the intercepting trap has now been dealt with in a valuable report prepared by a Departmental Committee of the Local Government Board. The questions involved are of so complex a character that it was scarcely to be expected that the committee would arrive at their conclusions without making many qualifying safeguards; but there is no mistaking their opinion that it is desirable, except in very special cases, to dispense with the use of the intercepting trap, and to ventilate the public sewers through private house drains. These conclusions, although confirming the opinions frequently expressed by a large section of municipal engineers and other sanitarians, are opposed to the practice still in operation under the "Model" Code of By-laws issued by the Local Government Board in 1877, and it is therefore unlikely that there will be a ready acquiescence in adopting the findings of the committee. But the scientific evidence and the practical observations on which the report is based cannot be lightly set aside on the mere assumption that the practice which has hitherto prevailed is the correct one, and, unless rebutting evidence of an equally weighty description is forthcoming, exception can only be taken to the report on the ground that the inquiries and investigations of the committee have not been sufficiently exhaustive to justify the conclusions arrived at. A careful reading of the report will, however, convince any unprejudiced mind of the care and thoroughness with which it has been compiled, and the information it contains cannot but be useful in arriving at a solution of the difficult problems involved.

SEWAGE TREATMENT.

The remarkable progress of late years in many of the branches of sanitary science has been brought about mainly through the co-operation of the bacteriologist, the chemist, the medical officer and the engineer. Up to a comparatively recent time there had

been little or no combination in the research work which had been carried out, and progress had necessarily been slow; but in proportion as each profession has realised the futility of working independently of the other, so has sanitary science advanced. Not only have the combined efforts of scientists brought about a better knowledge of subjects connected with sewers and drains, but they have gone a long way towards a solution of the equally vexed questions relating to the disposal of sewage.

While, however, it is now possible to produce an effluent of any reasonable standard of purity for preventing the pollution of streams, the means adopted for doing so have in many cases created a new difficulty in the pollution of the atmosphere surrounding the works of sewage purification. Where sewage is allowed to become septic, and is distributed over the modern filter-bed, either in the form of sprays or otherwise, there must be an objectionable odour produced, the intensity of which will depend chiefly upon the quantity and character of the sewage. To obviate this it is now becoming the practice to abandon the septic tank as a means of partially dissolving the sludge, and to distribute the sewage on the filter-bed in as fresh a condition as possible, and this appears to be a desirable course. The next advance should, it appears to me, be in the direction of dispensing with the usual form of precipitation tank altogether and substituting a combined tank and disintegrating filter in order to retain only mineral solids, and thus allow the organic matter to be discharged in a suitable condition for treatment through the aerating filter. This course has been adopted at the new sewage works for Worcester, and there is every probability of the system proving a success.

Another feature of sewage treatment, in which greater economy and improved results may be looked forward to, is in the aëration of the sewage before its application to the filter. It has already been proved that the rate at which sewage may be filtered is considerably increased when an additional quantity of oxygen is added to the tank effluent, and there appears to be no reason why this should not be applied in a practical and economical manner. Opinion is still somewhat divided upon the size of the media for percolation filters. Broadly speaking, it may be said that the finer the media the better the filtrate, but the more the tendency of the filter to become choked. Local conditions will, of course, affect each particular case; but as a rule it appears to me desirable to use a fairly coarse material (say from $\frac{1}{2}$ -in. to 1-in. gauge), and to deal with the humus escaping from the filter either by means of deep tanks, secondary filters, or land treatment. Coarse filtering media and subsequent treatment of the effluent will, I think, become more general as the necessity for dispensing with the usual objectionable form of precipitation tank becomes more recognised.

WATER SUPPLY.

Probably no branch of the municipal service in which members of the institution are actively engaged has attained so high a standard of proficiency as that of water engineering, and it may safely be stated that comparatively few centres of population in the kingdom are still unprovided with a supply of wholesome water. From an engineering standpoint there is no difficulty in satisfying the increasing demands made by the growth of population, though it is a matter of some concern with many authorities that they are compelled to resort to sources of supply far removed from their own districts, and to incur an expenditure which can only be met by an excessive charge to the consumer, or by a special rate in aid of the undertaking. But for the sound practice which prevails for the prevention of waste, the disadvantages alluded to would be yet greater.

Year by year the difficulty of obtaining an ample supply within reasonable distance of rapidly growing towns must increase, but under existing conditions a still greater difficulty presents itself in the acquisition of a supply where several authorities have decided upon the same source. The unsatisfactory conditions which prevail are exemplified in the Parliamentary struggle a few years ago between the corporations of Derby, Leicester, Nottingham and Sheffield, and other local authorities for securing the upper waters of the Derbyshire Derwent. Separate Bills were promoted by three of these corporations, and separate engineers were engaged to design different works for the same source of supply, and this complicated and costly procedure, after the waste of much valuable time, ended in the division of the

supply between the several authorities interested. There is urgent need for the creation of a new organisation to deal with matters affecting the conservation and disposal of water supplies generally. Suggested details for carrying this into effect have been clearly set out by the Institution of Water Engineers, and legislation in the direction indicated is very necessary in order to efficiently and economically deal with the future needs of the country.

ROADS.

The skill and energy of the engineer have of late been put to the test by the necessity that has arisen for the adaptation of the highways of the country to meet the new and destructive types of vehicular traffic, and it may be said without hesitation that he has not been wanting in ability to deal with the emergency to the best advantage, having regard to the means at his disposal. In the short space of half-a-dozen years or so enormous improvements have taken place in highway engineering, long-established types of construction having been superseded by improved methods based upon a more scientific knowledge and a full realisation of the requirements due to altered circumstances. The road question has been recognised as of national importance by the creation of the Road Board and by the raising and distribution of funds to meet the more pressing needs of the reconstruction and improvement of arterial roads. But as the grants made have generally been conditional upon the authorities receiving them providing a large proportion of the cost, the work undertaken has added appreciably to the burden of local rates without conferring a compensating advantage on those who have been called upon to contribute, and this has had the effect of curtailing necessary expenditure in other directions to the disadvantage of the towns and districts affected. Increased rates for education and other national purposes have also had the same result. Happily, provision has now been made for some relief to be given to local rates by new grants from the Exchequer towards matters which are of a national rather than a local character, and it is to be hoped that the assistance ultimately to be given will be sufficient to enable local authorities to deal with the many pressing matters affecting the health and convenience of the public which are now deferred or ineffectually performed for lack of the requisite funds.

Together with financial considerations the demand for a better type of road has raised the general question of administration. There are too many authorities having the control of highways, and it cannot be denied that many of them, either from want of funds or indifference to modern requirements, are doing little or nothing to bring the roads under their charge into a condition suitable for the traffic they have to carry. A glance at the list of salaries paid by the greater number of minor road authorities to officials having a considerable mileage of the roads of the country under their supervision should in itself be sufficient to prove the case for change in administration. It is not likely that the standard of roads will be raised in districts where the authorities fail to recognise the technical training required in the official responsible for their construction, and it will be to the advantage of the road engineer, as well as to the benefit of the road user and the ratepayer, when all officials having the supervision of roads are required to possess such qualifications as may be approved by a central road authority.

In a report to the Departmental Committee on Local Taxation, the chairman of the Road Board points out the necessity of securing men of good education and technical knowledge as county surveyors; and in order to minimise the risk of waste in any attempt to reduce the salaries and number of their staff below what is essential to secure efficient administration and supervision, it is suggested that one-half the salaries of county surveyors and one-fourth the salaries of their staff should be paid by the State, subject to a central authority being satisfied as to their qualifications, duties and tenure of office. Although these recommendations are apparently not endorsed by the Departmental Committee, it is something to be grateful for that a Government Department intimately acquainted with the work of highway engineering thus recognises that efficient and economical results are more likely to be obtained where the responsible officials are adequately remunerated for their services. The observations of the chairman of the Road Board can be applied with equal force to the work of every engineer and surveyor occupying a public appointment.

HOUSING AND TOWN PLANNING.

Among the more important questions of the day affecting the welfare of the community as a whole a foremost place must be given to the subjects of education and the housing of the poorer classes, and systematic town planning may be added as being inseparable from the housing question and entirely dependent for its success on education and culture. If this country is to maintain the power and prestige which its glorious achievements of the past have won for it, every possible provision must be made for its citizens to attain the educational standard and the physical fitness and stamina requisite to enable them successfully to cope with the growing competition of other nations. However brilliant and enviable the past history of a nation may have been, its influence must wane and finally decay unless it realises to the full the progressive spirit of civilisation in all that tends to elevate the mind and promote the well-being of the human race. The continued prosperity of our country depends in a great measure upon the healthy housing of the labouring classes, and upon the amplitude of facilities afforded for the play of ennobling aspiration. The growth of our cities and towns, particularly in industrial centres, has brought with it a responsibility involving problems of so complex a character that a solution can only be found in the strong and determined resolution of the nation.

What would be said of the man who proceeded to build his house without a plan or design, and without any preconceived idea of his requirements, or of a company, say, that built a theatre without any thought as to the means of ingress and egress, and regardless of the convenience and accommodation of the public? If such acts on the part of the individual or a company would be looked upon as a wasteful folly, what is to be said of the lack of design and arrangement of our cities and towns, and of the overcrowded and insanitary areas characteristic of nearly all large centres of population in the country? The comparatively few towns that have resolved themselves into desirable places of residence owe their present position mainly to the foresight and enterprise of the private individual. The landowner in these cases has, on his own initiative, laid out his estate, not within the narrow limits of the local by-laws, which would have produced nothing but a network of monotonous and narrow streets and overcrowded dwellings, but on the broad and comprehensive principle of what is now understood as systematic town planning.

Notwithstanding these exceptional cases, however, I think it will be agreed that the lay-out of a town should not depend upon the will of the individual, whose chief interest, after all, is generally to secure a pecuniary advantage for himself. The powers of local authorities to govern the extension and development of their towns under the general Acts are so inadequate that it is impossible to prevent the formation of thoroughfares unsuited to the needs of the district and the building of houses which come under the category of the opprobrious term of slums. The large majority of authorities are limited to the provision of the Public Health Act, 1875, under which by-laws may be made governing the "level, width and construction" of new streets. There is no authority to require a new street to follow any particular direction or to communicate with an existing street, and in most towns the by-laws only provide for one standard width, usually 36 ft.

The development of building areas under these conditions, particularly in industrial towns, has resulted in the formation of a perfect maze of narrow streets following a direction to suit the varying shapes of the land and crowded with houses as closely as they can be built to comply with the letter of the by-laws. The Public Health Acts Amendment Act, 1907 (an adoptive Act), among other useful provisions, contains a section giving power to local authorities to lay down the direction of any new street by paying compensation to any owner of land prejudicially affected. This is a step in advance of the provisions of the 1875 Act, but the additional powers are obviously insufficient to check the improper development of building areas.

It is somewhat startling to the uninitiated to learn that there is no general Act giving local authorities power to require a minimum height for habitable rooms. The Public Health Acts Amendment Act, 1890, provides for this, but as the Act contains other provisions not always acceptable to local authorities, it has not been generally adopted. It is also not generally known that local authorities have no power to require a minimum floor space for a bedroom in con-

nection with a new building. Few local authorities have any control over the height and elevations of new buildings, and fewer still can deal with buildings as affecting the amenities of the district.

One or two of the larger municipalities have anticipated many of the provisions of the new Town Planning Act, and have either obtained Parliamentary powers to carry these into effect or have adopted extensive schemes in co-operation with landowners and others interested in the development of building areas. In 1908 the Liverpool Corporation obtained powers to require the submission and approval of general building estate plans before the commencement of any work, the provision of roads up to a width of 80 ft., the limitation of the length of a street without cross-roads to 150 yds., the adjustment and alteration of irregular boundaries, and to accept reduced street works in the case of open spaces given up beyond by-law requirements. Most of the provisions that Liverpool, after years of costly experience to the city, has found it so necessary to acquire under a private Act, and many other important powers which at the time the corporation was unable to secure, may now be embodied by any local authority in a town planning scheme under the new Act.

As an instance of what may take place in any town extension under the limited powers of the general Acts, a typical case may be mentioned of plans being deposited with the city of Liverpool for the housing of a population of about 10,000 on an estate of 53 acres with no street wider than the minimum by-law requirement of 36 ft. In this particular case the operation of a private Act, and the good sense of the owner, resulted in an amendment to the scheme whereby a street 60 ft wide and 600 yds long was made, and the buildings were set back 36 ft. from the centre of the road. In the vast majority of towns, however, there would have been, with an obstinate landowner, no power to reject so undesirable a scheme.

To give an example of the economy of laying out and constructing the main thoroughfares in advance of the development of a town, Liverpool may again be quoted. The fine avenues which have been made during the last few years, and which vary in width from 80 to 114 ft., have cost the corporation an average of about £7,000 per mile, whereas street widenings near the city boundary to a width of only 60 ft. have cost at the rate of £70,000 per mile, and approaching within a mile or so of the centre of the city the cost of widening to 66 ft. has averaged over £350,000 per mile.

There is probably not a town of importance in the country in which costly improvements might have been avoided had a suitable town planning scheme been in operation during the period of development. And what is true in this respect of past experience applies with equal force to existing conditions. No one knows better than the municipal engineer that developments which are taking place at the present time in compliance with so-called "model" by-laws will sooner or later require to be amended and improved at the expense of the public in order to meet the most ordinary conditions of traffic and to comply with the most elementary principles of hygiene.

A study of the history and of the sociological aspect of town planning is as engrossing as it is essential for formulating the true principles on which the towns of the future should be designed. As a nation we have an inherent dislike to copying the examples of other countries, and while this characteristic of temperament may be generally commendable, it has in some respects recoiled upon us to our disadvantage. We have much to learn from other countries on the subject of town planning, and there is no reason why we should not profit by their experience, and, as far as possible, avoid the errors and failures which have naturally followed the attempts made to deal with so complicated and difficult a problem. The task is an international one, and every nation has something to learn as well as something to teach.

Town planning and housing must necessarily proceed simultaneously, and what must be guarded against and overcome at any cost is the retrograde system which has prevailed in some countries of beautifying the towns without regard to the convenient and healthy accommodation of the working-class population. The high and overcrowded "tenement barrack" buildings which prevail in most Continental cities are, happily, not likely to find favour in this country. Yet it is by no means an easy matter to secure for a town a full complement of broad and convenient streets, an adequate number of open spaces, and an ample area of pleasure grounds, and

at the same time to provide a sufficiency of convenient and healthy dwellings of the cottage or small tenement type. These are, however, essential principles which should govern any town planning scheme, notwithstanding what at present appear to be the insuperable difficulties of carrying them into effect.

Circumstances have arisen which make the building of the workman's dwelling as a source of profit an impossibility in many parts of the country, and it is not unreasonable to ask whether this difficulty is likely to be increased or diminished by the application of a systematic plan of town extension. If a convincing reply could be given that town planning would be a direct solution of the housing problem, few authorities would hesitate to take advantage of the Town Planning Act. But, while it is obvious that in many districts the remedy lies beyond the application of town planning, it may safely be stated that there are numerous instances where a properly-devised scheme would materially assist in the housing problem, and there are few, if any, cases where town planning would actually increase the present difficulties. Private enterprise frequently succeeds where a public authority would fail, but in the erection of workmen's dwellings the builder whose aim has been to obtain a profit on his work, or to secure a reasonable return on his capital, has succumbed to the many adverse conditions which have been entirely beyond his control, and, as a consequence, the ever-increasing demand for houses has not been adequately supplied.

In planning the extension of a town under the new Act local authorities are able to deal with the undeveloped areas as a whole, and in a great measure to allocate the building sites to the purposes for which they are the most suitable in the interests of the community. They are able to modify the building and street by-laws, to arrange for sewerage, water, and lighting, to provide means of transit, and to carry out many other matters advantageous to the development of land which would be difficult, if not impossible, for the individual wholly to accomplish. In thus providing, under a town extension scheme, better facilities for building operations, private enterprise will be greatly assisted, and the desirability of municipal housing schemes lessened. There is, however, an immediate demand for houses which cannot be met by private enterprise, and which local authorities cannot supply, in most cases, except at a charge on the rates which they are not prepared to incur.

In a recent report of the Land Inquiry Committee, dealing more particularly with urban districts, it is recommended that it should be the statutory duty of all local authorities to see that adequate and sanitary accommodation is available for the working-class population employed, or reasonably likely to be permanently resident within their area. Where there is a deficiency of such houses, and sites suitable for their erection are not available at reasonable prices, local authorities, it is recommended, should be required to promote transit schemes to render accessible a sufficient area of suitable building land, and each authority should make a complete survey of housing conditions in its area, and prepare within a stipulated period a scheme of proposed action under the Housing Acts.

If these delightfully simple recommendations could be brought into effect, they would go a long way to solve the housing difficulty. Unfortunately, however, financial considerations have been entirely overlooked, and no such measures are likely to be carried out where the loss incurred would entail an additional heavy charge on local rates. Municipalities being unwilling, and individual enterprise unable, to meet the difficulty, there is no alternative but to look to the Legislature for a remedy, and all who are acquainted with the present deplorable housing conditions will anxiously await the "great housing legislation" promised by the Government, in the hope that some measure may be forthcoming to relieve the present deadlock.

THE INSTITUTION'S WORK.

Referring briefly to the work of our institution, the past year has been one of activity, and the report of the council shows that substantial progress has been made in the promotion of objects affecting the welfare of members and the interests of the profession to which they belong. A new departure has been made during the year in recording the transactions of the institution in the form of a monthly and bi-monthly

journal in lieu of an annual volume, and although this change has not been received with unanimous approval, I have no hesitation in expressing the opinion that it will prove to be one of the most beneficial steps taken in the annals of the institution. Much as each member must have valued the old form of "Proceedings," there can be no doubt as to the greater advantage to a large majority of the members in receiving official copies of papers, and a report of the discussions within a few weeks of the different meetings held, and it must not be overlooked by those members who prefer the old form that they may adorn their libraries with a handsome and much more serviceable annual volume by the simple process of binding the sectional parts in the specially designed cover to be supplied year after year. One of the main features of the journal is the simple and convenient means it affords for keeping each individual member in touch with the work of the institution. The regular publication of a summary of the council meetings, reports of district and executive committee meetings, announcements of future meetings, and of the numerous matters of professional and personal interest which arise from time to time must be far more appreciated when contained in an official journal rather than having to be sifted from the columns of the public Press. Then, again, the pages of the journal are at the disposal of members for correspondence and suggestions, and for contributions on subjects of professional interest, and no doubt these facilities will be taken advantage of by many who would hesitate to discuss the affairs of the institution, and to express their opinions except through an official organ. The introduction of the journal is by no means due to any dissatisfaction at the manner in which the affairs of the institution have been dealt with in the technical Press. On the other hand, there is a general feeling of appreciation and gratitude for the services which have always been rendered in this direction, and which cannot be overestimated. The new journal is the natural outcome of the growth and increasing influence of the institution, and it is bound to extend its usefulness and power.

The council recognise the growing importance of town planning and highway engineering, and have decided to hold separate examinations for candidates in each of these subjects. The municipal engineer must necessarily take a leading part in matters connected with town planning, and it is particularly desired that the younger members should make a special study of the subject in order to qualify by examination for important positions likely to be created under the new Town Planning Act. The examination in highway engineering is intended chiefly for candidates who may wish to qualify for engineering positions under county and other road authorities; but it will be open to others, and many who have received the testamur under the present examination will find it to their advantage to submit themselves to a further test of their knowledge on the special subject of highway engineering.

It is only a few years ago that membership was limited to engineers and surveyors occupying chief appointments; but there can be no doubt that the institution has been greatly strengthened by extending its privileges to those who are entering upon their professional career, and it is a gratifying feature in connection with the increased membership that the number comprises so large a proportion of students and assistants. It is the wish of the council to give every possible encouragement to junior members, and it is earnestly to be hoped that full advantage will be taken of the facilities afforded for their advancement.

Though the subject of superannuation makes but slow progress, there is some hope that when the present political strife is sufficiently abated to allow of a calm deliberation on the Bill that has been prepared, the Legislature will recognise the just claim of the local government official to a scheme of superannuation towards which he is willing to make generous contribution. Members of the institution can best forward this object by giving their whole-hearted support to the National Association of Local Government Officers, which has been entrusted with the drafting of the Bill.

The institution has done a great deal to raise the status of officials who are engaged in public work as engineers and surveyors. No opportunity has been lost in impressing upon both the central and local authorities the importance of their work as affecting the health and convenience of the community, and in pointing out the desirability, in the public interest, of

engaging men properly trained by education and experience for their work. Notwithstanding all that has been accomplished by the institution, much remains to be done to bring about a full recognition and appreciation of the services of its members, and this can only be attained by a determination on the part of each individual member to discharge the duties which devolve upon him with integrity and zeal, and with a conviction that, in proportion to the devotion and energy he displays in his own particular work, will

he assist in promoting the welfare of the profession to which he belongs.

Mr. A. D. GREATOREX (West Bromwich) moved a vote of thanks to Mr. Pickering for his address, and paid a high tribute to his work for the institution.

Mr. T. W. A. HAYWARD (Battersea) seconded, and it was carried by acclamation.

The meeting then adjourned for luncheon.

THE ROADS CONFERENCE: CHAIRMAN'S OPENING SPEECH.

The Roads Conference opened on Wednesday afternoon, Mr. H. T. Wakelam, M.INSTR.C.E., county engineer of Middlesex, presiding. In an address to the conference Mr. Wakelam said:—

The primary object of this gathering is to discuss papers prepared by members of the institution on the important question of road construction, maintenance and management. The question is not only of absorbing interest to those belonging to the institution, but also to the ratepayers of the United Kingdom. The ratepayers' interest, in fact, is of very substantial import, and if we can at this meeting, by an interchange of our experiences and views, produce something tangible in the way of assisting to lighten the financial burden attaching to road upkeep, we shall have attained a much-to-be-desired resultant benefit.

Thanks primarily to the work and efforts of the County Councils' Association, suggestions as to new methods and schemes of road classification have recently been published by the Road Board, with the principle of which methods and schemes I am sure we all agree. We have also lately read accounts of what the Chancellor of the Exchequer is proposing to do in the way of relief of local rates, with the principle of which, I again say, we all agree, provided relief can be given without taking money out of one pocket of the ratepayer to put it in the other, and the relief is given without increased Imperial taxation.

With regard to the proposed scheme of road classification, it would be well for us not to lose sight of the fact that in another room of this building, at the present moment, the important question of town planning is being discussed. Town planning is much interwoven with the question of roads, and especially so in correlation with arterial roads. I am bound to say that, to my mind, if we are not careful, "the cart will be going before the horse" in regard to the two questions which, as I have said, are so much interwoven. Far from it that I should decry town planning; personally I think it is one of the best things ever done in this country in relation to local government; but I do think "we should make haste slowly" in connection with town planning schemes. It would, to my mind, be infinitely better for the routes of any proposed arterial roads to be first laid down, thoroughly discussed by sectional or central committees, and decided upon, before most of the town planning schemes are finally settled. In this way they could be superimposed, so to say, on the arterial routes, and so avoid isolations. This, to me, appears to be the best mode of procedure; but as county councils—under one of which I have the privilege and pleasure to serve—have no powers under the Act, I feel somewhat diffident in commenting upon the matter.

HIGHWAY CASES.

This gathering, as I have said, is to discuss the question of roads, but it may not be misplaced if I at the outset refer for a moment to a legal judgment given on an appeal case at the beginning of this year by Lord Justice Vaughan Williams, Lord Justice Kennedy, and Lord Justice Swinfen Eady, in regard to the repair and support of bridges in the city of Worcester. The Birmingham Canal Company in the year 1812 made a canal, and, among others, there were nine bridges built in Worcester. The company were asked some time ago by the corporation to keep the bridges in a state of repair sufficient to carry the ordinary traffic which might reasonably be expected to pass over them. To this the company demurred, with the result that the corporation took the case to the Courts. After a hearing before Mr. Justice Phillimore, judgment was given by him in favour of the company. The defence was that the company were not bound to keep the bridges in a state of repair sufficient to carry the traffic which might be reasonably expected to pass along the roads and over the structures at the present time, and that the company were only bound to carry such traffic as was ordinary

when the bridges were originally built. Upon appeal the decision of Mr. Justice Phillimore was reversed by Lord Justice Vaughan Williams, Lord Justice Swinfen Eady and Lord Justice Kennedy, and the result of their lordships' judgment is of the greatest importance to all highway authorities.

After another recent hearing in the Chancery Division, Mr Justice Warrington gave judgment in a case in which a mandatory injunction was claimed to compel the Great Northern Railway Company to put in a proper state of repair a bridge which carried the public highway over the railway line. It was alleged that the present bridge was not strong enough to bear the modern heavy traffic that passed over it, but the defendants contended that the structure was not unsafe. Giving judgment, his lordship said he was of the opinion that the Locomotives and Highways Acts and the Motor Car Act did not relieve the defendants of the obligation to maintain the bridge; consequently there must be a declaration that the defendants were liable to put the bridge into such a condition as to bear the traffic that might be expected upon it.

I have referred briefly to these cases as they appear to me to have a great bearing on the question as to upon whom rests the liability and responsibility to keep in proper repair for modern traffic bridges of the kind covered by the two cases.

With regard to the particular business we are here to discuss, I should like to say that the papers presented to the meeting appear to contain many points and features of interest, indicative of careful preparation. The writers are of some considerable reputation in their profession, and when the discussion is opened you will all have opportunities of expressing your views upon the contents of each paper.

A RETROSPECT.

The subject of road evolution in this country is, or should be, of deep interest to all road engineers, and before the discussion commences on the papers I would like to make a few remarks in regard to the progress of road maintenance and management generally since the Roman period. I will be as brief as I can.

History tells us that before that period the ancient Britons were absolutely without roads, and that tracks were the only means of communication for the inhabitants of this country to follow. The Romans, on their arrival, set to work and constructed several great lines of roads which were practically straight in character, and which are so easily traceable on the map to-day. Those great lines of communication were evidently much used during the Roman period; but in regard to the connecting and branch roads nothing much is known. The principle of construction adopted by the Romans has been so often described that I will not dwell upon it.

About the twelfth century it began to be recognised that the community had common rights to, and were allowed to pass over, certain confined limits of land, which rights became well established, and the limits of highways, to which we are ourselves confined to-day, may possibly be in some cases those to which rights were obtained about that period.

From the twelfth to the eighteenth century nothing of great importance was attempted in the way of systematised maintenance, local dues being extracted by men appointed locally to succeed each other in carrying on the primitive road work of that time.

Nor, as a matter of fact, was much progress made until the days of Brindley, Macadam and Telford. In 1835 the first Highways and Locomotives Act was passed, and really may be considered to be the commencement of any organised system of road maintenance in this country. About that time, among other works, Telford was commissioned by the Government to reconstruct portions of the main Holyhead road at a cost, I believe, of something like £35,000, which

then appeared to have been considered a very large amount. Compared with the sums which are daily being expended in all directions in connection with road construction and maintenance at the present time, the amount does not seem a large one.

MODERN REQUIREMENTS.

The practice of construction and maintenance to-day is of a much more scientific nature than at any other period in the history of Great Britain. The stress of the modern mechanically propelled traffic, especially in and about largely populated areas, requires very careful consideration, and it is left to the members of this institution to devise ways and means best to deal with it. Great success has already been attained in this connection by the more seasoned and experienced among us. To insure a continuity of the good work special examinations will, in future, be held on road subjects by the Examination Board of the council of the institution for the benefit of those who are on the threshold of their road-making careers, and the council are looking forward to good results from the examinations.

It is now admitted by many engineers who visit this country from abroad that the main thoroughfares of England taken as a whole, are to-day the best in the world. A very few years ago members of this institution were twitted about their shortcomings in this connection, and it was a common thing to hear remarks made to the effect that English road engineers should visit continental areas to learn how to

make roads. This state of things, I am glad to say, has, within a comparatively short space of time, undergone a great change, and now, instead of English engineers being asked to go abroad, engineers from foreign countries are constantly visiting England seeking advice on the important problem of road construction.

WORK OF THE ROAD BOARD.

It is gratifying to think that the Road Board, under the able guidance of Sir George G. Bb., is giving valuable financial support in connection with the changes, which are to be seen on all sides of the country, in connection with new surfacings and improvements. That Sir George is taking an active, personal part in the movement is proved by the fact that he has been good enough to prepare a short paper for consideration at this meeting. There are other papers of a practical nature for consideration, and the knowledge of the "Road Question" possessed by the writers of the communication, and also by some of those I see around me to-day, augurs well for an interesting discussion, from which I hope much good will result. Sectional discussions, such as the one we had at Yarmouth last year, and the one we are looking forward to to-day, will, I hope, become a fixed part of our annual proceedings. I now have pleasure in declaring the discussion on the papers open, with the hope that as many as possible will give the meeting the benefit of their knowledge and experience.

(To be continued.)

ORPHAN FUND MEETING.

The annual meeting of subscribers to the Orphan Fund was held in the Town Hall, Cheltenham, on Wednesday morning, Mr. J. W. Cockrill in the chair.

Mr. T. COLE read a letter from Mr. O. Claude Robson, hon. secretary and hon. treasurer to the fund, regretting that, owing to an important council meeting, it would be impossible for him to reach Cheltenham in time to take part in the gathering that morning.

Mr. Cole afterwards read the annual report of the committee, as follows:—

ANNUAL REPORT.

To the Subscribers to the Orphan Fund of the Institution of Municipal and County Engineers.

GENTLEMEN, Your committee have pleasure in reporting that the revenue of the Orphan Fund during the year ended December 31, 1913, has been somewhat larger than that of the preceding year, while the benefits derived therefrom by the grantees has also been in excess of that for the year 1912.

The comparative results of income and expenditure for the two years of 1912 and 1913 may be summarised as follows—viz.:—

	1912		1913	
	£	s. d.	£	s. d.
Revenue:				
Balance from previous year	120	1 1	180	10 3
Donations	4	18 6	15	1 10
Subscriptions	128	11 0	139	18 6
Collections at meetings	23	16 3	28	14 3
Interest on investments	33	18 0	36	10 6
Total	£311	4 10	£400	15 4
Expenditure:				
Grants to orphans	120	0 0	170	0 0
Printing, stationery, postages, &c.	10	14 7	9	17 3
Purchase of London County 3 per cent stock			100	0 0
Transfer of stocks to new trustees			3	15 6
Balance carried forward	180	10 3	117	2 7
Total	£311	4 10	£400	15 4

An additional sum of £100 has been invested during the year in London County Council 3 per cent stock, the total amount of the investments now amounting to £1,051 19s., according to the market value at January, 1914, the income derived from which has been £36 10s. 6d. during the year. Owing to the depreciation in securities generally, your committee regret to report a reduction of £47 5s. 8d. in the capital value of the investments as compared to the valuation of 1912.

The accounts of the fund for the year 1913 have been duly audited by the accountants of the institution, Messrs. Wood, Drew & Co., and a balance-sheet duly approved by them is herewith appended, giving details of revenue and expenditure as follows—viz.:

CASH ACCOUNT FOR THE YEAR ENDED DECEMBER 31st, 1913.

Examined and approved,

WOOD, DREW & CO.,

London: 139 Cannon-street, E.C. 4.
29th May, 1914.
Chartered Accountants.

It is gratifying to be able to record an addition of forty-two annual subscribers to the fund during the year 1913, the total that year having been 227, as against 185 in 1912. The donations principally relate to collections made at the various district meetings, and are doubtless the outcome of a circular letter sent by the honorary secretary to the various district secretaries in February, 1913. While fully recognising the addition to the revenue thus generously contributed, your committee cannot but wish that endeavours should also be made to increase the number of annual subscribers, the proportion of the subscribers to the muster roll of the institution being at the present time 13 per cent only.

The amount of subscriptions and donations received for the year 1913 may be summarised among the various districts as follows—viz.:—

Name of District.	Donations.	Subscriptions.	Total.						
	£	s.	d.	£	s.	d.	£	s.	d.
East Midland	5	0		20	9	6	20	14	6
Eastern	1	8	10	25	0	6	26	9	4
West Midland	—	—	—	15	15	6	15	15	6
Metropolitan	2	10	6	17	0	6	19	11	0
North Eastern	7	15	6	15	17	0	23	12	0
North Western	10	10	6	9	19	0	20	9	6
Southern	—	—	—	11	0	0	11	0	0
South Eastern	—	—	—	5	4	6	5	4	6
South Western	2	16	6	2	14	6	5	11	0
Welsh (North)	—	—	—	10	6		10	6	
Welsh (South)	—	—	—	5	3	6	5	14	0
Scottish	—	—	—	1	1	0	1	1	0
Irish	—	—	—	10	6		10	6	
India and the Colonies	—	—	—	2	2	0	2	2	0
Miscellaneous	16	2	3	1	1	0	17	3	3
Non-members	1	6	0	10	10	0	11	16	0

The grants made by the committee during the year have benefited in varying degrees twenty-two children, while one child remains at the British Orphan Asylum until the year 1916 by medium of purchase of a presentation in 1909. The annual expenditure made in the direction of grants is not a vast one, but your committee venture to hope that the modest payments on behalf of the children of our deceased brethren have in all cases proved of timely assistance to those in need.

Your committee, as indeed all members of the institution, much regret the loss of their old and greatly esteemed friend Mr. Charles Jones, of Ealing, who has been a member of the committee and subscriber to the fund from its inception. The vacancy upon the committee thus caused by his death has been filled by the election of Mr. E. J. Eiford, of Southend-on-Sea.

The ordinary vacancies occurring upon the committee were duly filled by the retiring members, Messrs. Blair, Cooper, Richardson and Thomas.

The position of honorary secretary and honorary treasurer has again been filled by Mr. O. Claude Robson, who was unanimously elected to the dual office at your last annual meeting.

The CHAIRMAN moved the adoption of the report, and proposed that the thanks of the meeting be accorded to Mr. Robson for his services as hon. treasurer and hon. secretary.

Mr. E. WILLIS (Chiswick) seconded. He had been connected with Mr. Robson for many years as his assistant, and later in connection with the Orphan Fund. No one could take a greater interest in the fund than Mr. Robson had done.

Mr. H. GILBERT WHYATT (Great Grimsby) said he would like to support the motion chiefly for the purpose of suiting Mr. Robson's convenience at future meetings. If in future years it was possible to have the meeting on the Thursday or Friday morning it ought to be done. He considered that the meeting ought not to be fixed without asking Mr. Robson if he could be present. He was sorry, and yet pleased, that other districts had beaten the East Midland in the amount subscribed, but they had not beaten them in the number of subscribers.

Mr. H. PERCY BOULNOIS (Westminster) commented on the fact that the Eastern District appeared to do so much better than the Western. With regard to the Metropolitan District he thought the position was most disappointing. There were sixteen subscribers, eight of whom, being in private practice, did not benefit one atom from the scheme. He supported the suggestion as to Mr. Robson; but for him the thing would have died out. He had used his energies in a marvellous way.

The CHAIRMAN remarked that the rise in the amount from the Eastern District was due to the annual meeting being held at Yarmouth and the collection of £16 or £17 taken there.

Mr. WHYATT: No, sir; your collection is given separately at the end of the report.

The PRESIDENT: I am glad it is so, and will try to maintain it if possible.

Mr. G. WILLIS (Chiswick) proposed the re-election of Mr. Claude Robson as hon. secretary and treasurer.

They all knew the interest Mr. Robson had taken in the fund. There was one point in the report—the increase in the grants from £120 to £170. That, for a small fund, was exceedingly good.

Mr. G. W. LACEY (Oswestry) seconded, and remarked that he could bear out all that had been said as to the interest Mr. Robson took in this fund. If anything could be done so that they could have his presence at the meeting, it would meet with the unanimous support of the subscribers. He would like Mr. Robson to take another opportunity of asking for the appointment of a charity steward in each district. Subscriptions of a guinea or half-guinea were not expected from the members generally, but they would be glad to receive amounts of 5s. or 2s. 6d.

Mr. F. MASSIE (Wakefield) said he was pleased this question of the appointment of a charity steward for each district had been raised. He had acted as chairman of the North-Eastern District for two years, and the secretary of the district was with him, and they were not aware of any request ever having been made to appoint a charity steward. The only way they could get the members to subscribe to this fund was by a personal canvass. About eighteen months ago he sent a circular to 150 members, and he got only three replies. He agreed that each district should be asked to appoint a charity steward, and thought that if this were done the subscriptions to the fund would be increased.

Mr. A. J. WEBB (Hendon) expressed the thanks of the members to the chairman for the great interest taken by him in this fund. At every meeting he had attended he had made a special point of asking the members present to subscribe.

Mr. E. WILLIS (Chiswick) supported the proposal to thank the chairman. He added that the wives of some of their members had expressed a wish to be allowed to subscribe, and if this were permitted he thought it would be advantageous to the fund.

Mr. E. PURNELL HOOLEY (Nottinghamshire) supported the idea of obtaining the help of the ladies. He had found that ladies were far better cadgers than men. If they got a ladies' committee to help them they might strengthen their resources very greatly. He had hoped to see one lady who had taken a great interest in the fund, and intended to ask her to take up the position of secretary. Might he hope that Miss Cole would come to their rescue, and that her father would back her up and guide her as he had done so well in the past?

Mr. E. WILLIS then proposed that a Ladies' Committee be formed, consisting of Mrs. Cockrill, Mrs. Thomas, Mrs. Hooley and Mrs. Hayward, with Miss Cole as secretary.

Mr. HOOLEY seconded, and it was carried.

THE ANNUAL DINNER.

The annual dinner of the institution was held on Wednesday evening in the town hall, the president, Mr. J. S. Pickering, in the chair.

Sir JAMES LEMON proposed "The Mayor and Corporation of Cheltenham." He remarked that when they tried to do good for themselves they also did good for the town which they served. They had been exceedingly well treated in the town of Cheltenham, and they congratulated themselves they were visiting that beautiful town. It had many advantages, but the authorities had utilised those advantages to the best of their power. The town had a reputation for its educational facilities, and Cheltenham College was one of the best schools in the country.

The MAYOR OF CHELTENHAM (Alderman Skillicorne), in responding, said they felt very proud of Cheltenham and its character as a garden town. He had had twenty-six years as a member of the corporation, and since he had been an alderman, or in the House of Lords, so to speak, he had taken a different view of things. He had the greatest sympathy with the officials. He often thought the official of a corporation was not quite so happy as the official of a private firm. He thought the time had arrived when pensions should be given to their officials when they retired from their arduous duties.

Mr. AGE GARDNER, M.P., proposed "The Institution of Municipal and County Engineers." He remarked upon the great problems of sanitation, housing and town planning, which confronted them, and said they were greatly indebted to the institution for having assisted local government in the way it had done. They were greatly indebted to Mr. Pickering in Cheltenham. He had been with them for eleven years. They could not offer too warm a

tribute to his zeal and the energy and ability with which he had discharged the duties of his high office.

The toast having been honoured,

Mr. J. S. PICKERING, in responding, said he had to thank Mr. Agg Gardner for the kind and graceful manner in which the toast had been proposed, and the hearty and generous response that it had secured. It was particularly gratifying on the visit of the members to Cheltenham that the success of the institution should be proposed by Cheltenham's most distinguished townsman. Mr. Agg Gardner having spent a most successful career in the service of his country and the town, it enabled him to speak with experience of the public benefit that was derived from institutions such as their own, and one looked upon it as a very great thing to have as their guest one who was held in such high esteem by his fellow townsmen and all who had the honour of his acquaintance. It was probably not generally known that this was the third occasion on which a meeting of the institution had been held in Cheltenham. The first meeting was in its early days, and so long ago that it had almost sunk into oblivion. Although it was thirty-nine years since the meeting was held, it was worth recording for several reasons, as the proposer of the toast then represented Cheltenham in Parliament, and had continued to do so, with only a slight interruption, ever since. That was a record of which the town might be proud. There was another reason why the meeting in 1875 was of interest. The town surveyor, Mr. Humphreys, read a paper in which it was considered the town had a low death-rate—17.2 per 1,000. Cheltenham had made remarkable progress since then, and had reduced its death-rate by something like 6 per 1,000. The mayor had told them the people in Cheltenham lived to 100 years, but if this rate of progress continued in the same ratio the death-rate would be nil. The institution had made very great progress during the forty-one years of its existence. The Cheltenham meeting of thirty-two years ago was attended by thirty-nine members, and to-day it was attended by over 400. The membership at that time was a little over 100; to-day it was over 1,700. It was not merely in numbers they had increased; the institution had grown in strength and influence, and it was now realised as essential to the well-being of the municipal engineering profession,

and also the development of measures brought about with the object of securing the health and convenience of humanity. For some years they had invited delegates to their annual conferences, and he felt sure it was to the mutual advantage of the members of the institution and the delegates who attended. Members of councils and their officials had one common object in view—that was the good of the town they had to serve. If the administration was to be carried out with the very best results it was essential that they should have complete confidence one in the other. Local government in this country compared favourably with any other country in the world, and he thought it was a matter for congratulation that our civic life was free from the dishonesty and corruption which was not uncommon in many parts of the world. One of the objects in the formation of their institution was to secure for their members some form of protection. There had been times when such a protective measure would have been a great advantage, but happily the local authorities had recognised not only the responsibility of their own position and that of the officials, but that these protective measures had become less and less necessary, though it did seem in the smaller towns that protection was necessary. He had now been connected with the institution for twenty-seven years, first as a graduate, and for the past seventeen years he had had the honour of a seat on the council. Apart from the professional advantage he had gained he valued even more the lasting friendship he had formed among the members. There was a freemasonry among their membership of which others knew nothing, but which, among those who participated, was highly prized. He appreciated to the fullest extent the honour they had conferred upon him in electing him president of the institution. He hoped that meeting would be the beginning of another era of very great prosperity for their institution. (Cheers.)

Mr. J. S. BRONIE (Blackpool) proposed the health of the ex-president and Mrs Cockrill, to which Mr. Cockrill responded.

Mr. H. E. STILGOE (Birmingham) proposed "The Visitors," for whom Alderman Wagborne, deputy mayor, Mr. H. R. Aldridge, and Mr. T. Adams, Local Government Board, responded.

Mr. NORMAN SCORGIE (Hackney) proposed "The Ladies," and Mr. F. C. Cook (Nuneaton) responded.

SCOTTISH DISTRICT MEETING AT DUNFERMLINE—(Conclusion).

Three papers on subjects connected with town planning came before the recent annual Scottish District meeting of the Institution of Municipal and County Engineers at Dunfermline. One of these—"A Town Planning Scheme: Its Effect on Housing and Architecture," by Mr. Raymond Unwin—was reproduced in last week's SURVEYOR, and we give the other two—"Early Examples of Town Planning in the City of Edinburgh," by Mr. A. H. Campbell, M.I.N.S.T.C.E., engineer to the corporation, and "Town Planning from a Lawyer's Point of View," by Mr. John L. Jack, town clerk of Dunfermline—in the present issue.

DISCUSSION OF MESSRS. CAMPBELL'S, JACK'S AND UNWIN'S PAPERS.

The CHAIRMAN (Mr. J. Bryce) congratulated the authors upon having given a vigorous, concise, lucid and helpful explanation of their papers.

Baillie FRASER (Edinburgh) said he was impressed with what Mr. Jack had said as to the legal aspect of this question, because as a rule it was legal matters which upset the apple-cart. Mr. Campbell's paper was very interesting to him, although it dealt with matters which were quite familiar to him. They had giants at town planning in the days referred to in Mr. Campbell's paper, but Edinburgh had afterwards sadly fallen off in that matter. They started splendidly, but it should be remembered that Edinburgh in those days was owned entirely by the corporation and one or two trusts, so that the land to be dealt with was then entirely under public control. Competitive designs were asked for planning out the land, and the competitors were given full instructions as to what was required. Now they had so many different owners that it was almost impossible to do anything of the kind; it was a matter of compromise, and they could not lay down any hard-and-fast general rules. They had to try to do something which would not injure the owners of the land, and would at the same time be for the advantage of the public, and often it was very difficult to reconcile the two interests. The town planning carried out in Edinburgh up to forty years

ago was fairly good, but then the land began to be sold to speculative builders, and streets were made of insufficient width, and laid out without any regard to what was best for the city as a whole, and houses were densely packed together. With their present town planning powers he hoped they would not again allow such things to happen. They would certainly see that the roads were of sufficient width, that the density of population was kept down to a reasonable figure, and that every dwelling had plenty of fresh air and light round it. They had five areas under consideration; three had been sanctioned by the Local Government Board, and one had been advertised. A fifth was in progress for 1,500 acres.

Mr. ROSS YOUNG (Lanarkshire) remarked that in town planning the difficulties only arose when they were actually getting to work. Mr. Jack had raised a very important question as to their powers in prescribing a width for county roads. In burghs they could bargain with landowners on the basis of prescribed widths of roads, but where the road was in a county they had a difficulty in bargaining with landowners, because the landowners could say: "I can make my road any width I like, and this road you have planned is far too wide for my purposes." If they could prescribe that the county roads should be the same width as in the burghs, then they had got a good way in advance. Mr. Unwin's paper was one of the best contributions they had to the subject. He would have liked Mr. Unwin to explain to what extent it was desirable to go into details in a town planning scheme. Some recommended showing only the arterial roads, others recommended showing the arterial and subsidiary roads, leaving out only the minor roads. He found great difficulty in laying out the roads before one had a complete plan and negotiated with the landowner, who always wanted to know how the scheme was going to suit his building plots. If they were going to secure open spaces in proper positions they must have a proper scheme; they required a full detailed plan in order to save those open spaces. In all the schemes which had been prepared, the land

unit question had been dealt with in different ways. He believed that the Birmingham, Ruislip and the German schemes all differed in regard to that matter. As to applying the land unit, they wanted to know whether physical boundaries settled the matter. There was much to be said for that method. Then Mr. Unwin raised the question as to the power an authority might exercise with regard to the design of a building. He was not sure that the Act provided for that. He did not think they could say to the person building that his design was not very pretty, and they would not allow it. An important question raised by Mr. Jack was as to the extent to which building could go on while the scheme was being got through. In one case they had 200 or 300 houses built while they were getting authority for a scheme; but these had been only under a feasible scheme put forward under the Building Act. On the other hand, if they had such things as lodging-houses in unsuitable positions they said to those concerned: "If you go on you go on at your own risk." They had not restricted building by having a town planning scheme, but it was important to fix their main lines so as to obtain immediate control over the area. There was a great variety of opinion as to the amount of contouring requiring, and as to its value. For a small burgh the contouring of 800 or 1,000 acres was a very big job; 50 or 60 acres a day was a fair day's work.

Baillie NORVAL (Dunfermline) said they contoured the whole of their 8,000 acres in six months to 5-ft. contours. They did it in the summer time, and of course they had to delay a good deal while the crops were on, and so they did not get it finished until the autumn. Their town planning scheme was now practically finished. They had had very great difficulties with the Admiralty in the first instance, but these had now been got over. They felt that Dunfermline had done some very effective spade work so far as Scotland was concerned in adapting the provisions of the Town Planning Act to Scottish requirements and Scottish necessities. It had been suggested that a ceiling height of 8 ft. or 8 ft. 6 in. was much too low. He did not know how it would be received in Scotland, but they had incorporated those figures in their scheme—8 ft. 6 in. for the ground floor, and 8 ft. for the top floor of cottages. They considered that by giving ample cubic air space they compensated entirely for the lowness of the ceiling. If any of them had ever lived in a house with an 8-ft. 6-in. ceiling height they would realise, provided they had sufficient floor space, that it was not such a very low ceiling after all, and that the room was quite comfortable. They had put that into the scheme in deference to the Admiralty, whose opinion was that houses of the English type should be provided for the large population from England that was expected to settle in Dunfermline for the working of the naval base. Those would be the first houses to be built in the new area, and they would serve as an object lesson for the rest of the area after the scheme had got under way. The main feature of the scheme was actually the provision of two large main arteries leading direct from the naval base to Dunfermline, and an endeavour to preserve to the utmost the individuality and character of the old town. They had planned these two main boulevards to make them attractive arteries, to induce the population to gravitate north towards the old centre.

Mr. J. THOMSON (Dundee) said they had started with 25 acres of land to make open spaces. They were threatened with building operations, and they did not know how to deal with the party who proposed to build within their area, particularly with regard to the boundaries of his feu. Their task was to deal with things as they were, and not with things as they would like them to be. As to betterment, they had difficulties with parties who said their property was being deteriorated, and with other parties immediately adjoining whose properties they assumed would be bettered.

Councillor DEAS (Edinburgh) asked as to the possibility of having competitive schemes for different areas. Reference had been made to the new town of Edinburgh having been the result of competitive schemes, and he would like to know whether the principle was feasible under present-day conditions.

Mr. J. YOUNG (Ayr) proposed a vote of thanks to the authors of the papers. He thought that of Mr. Unwin was like his book—suggestive and inspiring. Mr. Unwin had gone into the principles of town planning schemes very thoroughly, and had raised a very high ideal in their minds as to what to attempt in planning out different areas. Then Mr. Jack, with his practical and thoroughly Scottish mind and legal

acumen, had set forth all the difficulties authorities had to encounter in getting up a town planning scheme, and putting into the scheme those regulations which were so important to its success. An outstanding feature of all town planning schemes was the size of the land unit for the different classes of properties that were likely to be erected in the areas dealt with in different schemes. He would like an expression of opinion as to what should be the size of the land unit—whether 3 acres, 5 acres or 10 acres—and whether the unit should be marked off irrespective of any natural boundaries, proprietary boundaries, or main or secondary boundaries; also whether any compensation would have to be paid to proprietors for leaving land marked off as land units. Again, whether compensation should be paid for the different classes of land, the different manner in which the land was to be developed, whether for small cottage property or for expensive villas, or for factories, or for works of a public character, open spaces, or other things.

Mr. W. A. MACARTNEY (Johnstone), who seconded the vote of thanks, said each paper had a distinct individuality, and each was of great value to the public. It was sometimes laid to the charge of engineers that their designs were not very pretty; but, generally engineers' designs were workable, and that was the main thing to be considered. Mr. Jack's paper gave them some very necessary information as to dealing with the grievances of persons affected by schemes. They were bound to have laws to keep themselves and other people in order, and they must have regulations made in compliance with those laws. If the authorities did all the building that was carried out, they would not require schemes; but there were men who were out simply to make money, and it was desirable to have limitations to place upon these gentlemen and their shrewdness and foresight. In laying out a new area such as Hampstead, they could ensure model conditions, and regulate the building; but in an old town they had to make the best they could of an unsatisfactory state of things. As to the height of rooms, that was a question of the kind of construction. If they were putting up tenements, as, unfortunately, had been done, and was likely to be done, in Scotland for many years to come, they must insist upon a certain cubic space, and, owing to the price of land, it was easier to get it upwards than horizontally. As long as they had the tenement style of construction it would be necessary to insist upon a good height of ceiling; but where there were commodious ground-floor houses, then the type of construction agreed to in the case of Dunfermline was feasible and would be satisfactory.

The CHAIRMAN said he hoped that in the Dunfermline scheme they would be able to abolish the tenement system throughout the area. He did not see why they should not be able to do this, because he understood that the land was to be got from £10 an acre per annum. In Glasgow and its suburbs they had to pay six to ten times the price, so that there they were up against the tenement system, and had been so at all the conferences that had taken place during the past year. It was impossible to get cottages where they wanted them in Glasgow, but he did not see anything impossible in regard to getting them in the Dunfermline area. He was sure that Dunfermline had the sympathy of the whole of that meeting in the hope that tenements would not be planted in that area. He was inclined to think that the Town Planning Act gave them some control over the character of the buildings, and he thought that every locality who went in for a town planning scheme should have an advisory architect. It would probably not be possible for a small authority to have an architect permanently employed, but they could retain a man of some standing to whom plans could be referred when necessary. In a city it was not difficult to keep an architect for that work; but every authority should be in a position to prevent the monotonous, repulsive style of building that had been going on for so many years in their Scottish towns.

The vote of thanks was carried.

Mr. CAMPBELL, in reply, said Mr. Unwin had dealt with the character of buildings, and referred to the control which the Act gave in that respect. Mr. Unwin thought that this would be held to embrace some control over the style of the elevations of the buildings. That was a matter which had engaged their attention in Edinburgh very much. Some of them thought that in such a city, and, indeed, in most cities, they ought to be able to exercise some sort of local oversight and some judicial authority in requiring any alteration or modification of the design or elevation; but up to the

Town Planning from a Lawyer's Point of View	1029

present moment he was bound to say that they had failed to get that. They had no precise specific power in that respect, saving as to the material to be used in the elevation. In the Dean of Guild Court in 1883 they were held to have a complete dominant with respect to the material to be used in the elevation, but with regard to the style of elevation they had not that power. Mr. Unwin asked whether they should not have that power. The latest example they had was in the Ruislip scheme, where the Local Government Board granted that some form of control might be exercised, though he thought it was not very effective. The clause in the draft order read: "In regard to the design of the buildings to be erected, if the council are of opinion that the character of the buildings, whether on account of the design or the undue repetition of the design, or the materials to be used or proposed to be erected, would be injurious to the amenity of the neighbourhood, the council may, subject to an appeal to the Local Government Board, require reasonable alterations to be made." He understood that in Dunfermline they had gone one better, and Mr. Jack would no doubt explain in his reply how in Dunfermline they were superior in this respect. But even that, he thought, was not very effective. Control was already granted to many authorities in English cities, particularly the power to control elevation upon land which, on account of new areas carried out by the council, became frontage land. The council were then supreme in the matter of elevation without further trouble—in fact, without appeal. The landowner, or person proposing to build, could not proceed without the consent of the council. He thought that, as in an ordinary case of back land becoming front land, Parliament had sanctioned the granting of that power, the Local Government Board, both in England and Scotland, should grant some greater measure of authority and control in dealing with elevations. For the want of such a power they had to put up with such elevations, to take a notorious case, as that which in Edinburgh had quite ruined the Canongate. There they had something which was nothing short of a monstrosity. In order to preserve the amenities of architecture, the local authorities ought to be granted much greater powers than they now possessed.

Mr. RAYMOND UNWIN, replying to the criticism as to the height of ceilings, said if they were going to lodge a number of families in one room the limit of the number of families was the limit of floor space,

and they must have high ceilings. But he hoped they were going to change that in Scotland, and were going to use the Town Planning Act to control the land in such a way that they would not be forced to pile families one upon another as in times past. The builder should be persuaded that he would be wise in building over as wide an area as possible so as to get as many acres as possible covered. That was the whole secret of town planning. They would not find in countries where town planning had been put into practice those dreadful tenements. Every family ought to have a cottage of five or six rooms, and they would find it better to have the space outwards than to have it upwards. With regard to the character of buildings, he could only say that he thought that what their chairman said was well worthy of consideration. Architects thought that there ought to be architectural control over the elevations of buildings so as to get a harmonious effect, and this could not be achieved if people were allowed to put up whatever they liked. The Local Government Board were advised that in England this control could be exercised under the Town Planning Act. He heard only the other day of a deputation from the Royal Institution of British Architects to Mr. Samuel, who, in all probability, would propose to substitute an appeal to an architect appointed by the R.I.B.A. for the appeal to the Local Government Board. Personally, he did not say that that was the best course, but it was evident that they had the sympathy of the Local Government Board. The suggestion by Mr. Bryce of a consulting architect for a local authority was one that deserved consideration; but it would not meet every case. Where the elevation was in question the surveyor was not the man to decide: just as they would not expect an architect, as a rule, to have studied road problems. He thought there should be an appeal to some impartial person appointed, probably, by the Local Government Board, who should decide whether or not what the architect required was of sufficient importance to put the expense of it upon the man who was to build. He thought it was best to have a practising architect of some standing to whom the plans could be submitted; the cost would be trifling, and the improvement in the town would be vastly greater than in any other way. As to the details of a scheme being shown on the plan, he believed that the right way in town planning, and the way in which they would very shortly be expected to proceed, was to have two stages, and that on the first they should have a somewhat definite skeleton plan. Then they should proceed to get agreements between the landowners and the local authority so as to avoid running any risks of having difficulties afterwards; that was a point not provided for by the Act. Then they would be in a position to superimpose details. The whole area of a town ought to be protected at once, and the chief roads should be indicated, and other points, which were of very great importance as putting limitations on the use of the land, should be sent out as soon as possible. Then they could go on and prepare their detailed scheme, and that was where time ought to be taken. The first stage ought to be quick, and the second very slow; whereas it was too often the case that the first stage had to hurry over the second stage because they had difficulties which had not been provided against in the first stage. He quite agreed with the gentleman who said that they must at once state their outline to a large extent, so that they might get their main lines rightly placed and the details filled in. But it was dangerous to put too much detail into the plan unless they could find some way, as had been done in Dunfermline, to provide a certain series of detailed roads which were specially indicated on the plans, though, of course, subject to some possible modifications. As to contouring, it was far and away the most economical thing to contour their land before laying out a road.

Mr. JACK, in reply, said that in the Act of 1899 there was a provision that a town planning scheme could only be followed by a subsequent scheme prepared in the same manner. It was a very serious question whether, if once roads were laid down, they were not bound to be made according to the provision of the Act. He was rather inclined to the view that the roads as laid down in the plan could not be departed from except by means of another scheme. With regard to the character of buildings, he was inclined to the view that they had control over the design, and could regulate the height and character of the buildings with a view to the amenity of the neighbourhood. In the Dunfermline scheme they had a clause that, if the council were advised that certain

designs would be detrimental to amenity they might demand such alterations as they might be advised were reasonable, subject always to an appeal to the Local Government Board, with a further appeal, on points of law, to the Court of Quarter Sessions. In Dunfermline they had been very successful so far in making agreements with landowners with respect to matters connected with the plan, the arrangement generally being that the council made no claim for betterment, and the landowner no claim for compensation. With regard to building in an area after a town planning scheme had been projected, one gentleman had told them that the Act of 1909 was prepared with a view to dealing with conditions in England. Parliament was asked to have that Act held over in order that provisions might be inserted dealing with Scottish conditions, but the only concession they could get through was one with regard to the notices necessary before a scheme could be entered into. In England it was usual to issue certain notices to all the landowners, occupiers and tenants in the district. That, in fact, was the original regulation, but he understood that under the new regulation the English authorities would be put into the same position as the Scottish. In Scotland all they had to do was to put notices in the newspapers in the first instance; but when they applied for the approval of a scheme they had to give these individual notices to owner, occupier and tenant. He considered that was all nonsense, because the notice in the papers was quite sufficient. With regard to the control of the land while the scheme was being got through, it was complained that, from the moment a scheme was applied for the land for building purposes was sterilised. That was a point which they could have dealt with if they had been framing the measure to meet Scottish conditions. If they had had the framing of this Act for Scotland, no doubt they would have made provision that no building should be allowed within the area except with the consent of the responsible authority. In that case no landowner or feuer would have suffered greater detriment than at the present moment. He believed people in Dunfermline were taking risks in the building of houses which, if they had been clients, he would have advised them not to take. One such case came before the court only that week. A man wanted to put houses on the area of a proposed road; but a man who took that risk under their scheme or any other scheme must know that when the road came to be made under the town planning scheme his house must come down. With regard to the height of ceilings, he thought there was an impression that in the Dunfermline scheme they were proposing to allow 8 ft. 6 in. in all houses. What they were doing was to allow these low ceilings only in houses that were not built for tenements.

Mr. CAMPBELL said it had been made evident that the great problem of town planning was the monopoly of no particular individual or profession. It was the business of the architect, the lawyer, the landscape gardener, and, above all, the guiding and restraining and providing hand of their committees, were all necessary. With the power of organisation the Act gave them, they might hope to see something better arising in the areas under their control than the haphazard, confused mess which, during the last forty or fifty years, and grown up to the disgrace of our cities and towns.

Bath Sewage Disposal Scheme.—The Bath sewage disposal works, which have involved an outlay of £224,682, were formally opened last week.

Rural Council's Conference.—At the resumed conference of rural councils, held at the Guildhall, London, referred to in last week's issue, a resolution was agreed to that, in order to minimise the unavoidable delay imposed on rural councils desiring to adopt the Private Street Works Act, 1892, the Local Government Board be urged to invest rural councils with the powers of that Act generally, without requiring them to obtain a separate Order for every street or block of streets to be made up. On the proposition of Mr. H. S. Tebbitt, surveyor to the Tutbury Rural District Council, the Executive Committee were instructed to consider the granting of powers to local authorities to enforce the cutting of hedges and the lopping of trees where they obstructed the view of traffic, and to empower the authorities to refuse plans for new buildings, the erection of which would cause danger or risk to users of motors or other vehicles, or to the general public.

HEAVY MOTOR VEHICLES AND TRACTION ENGINES ON ROADS.

DEPUTATION TO MR. HERBERT SAMUEL.

On Wednesday a deputation from the County Councils Association of England and Wales and of Scotland, and of the Urban and Rural District Councils Association, waited on the President of the Local Government Board to urge an amendment of the law and the administrative regulations with respect to heavy motor-cars and traction engines. The deputation suggested that heavy motor-cars and traction engines should pay an adequate licence fee, the proceeds of which should be distributed among road authorities, and that trackless trolley services and motor omnibuses should contribute towards the maintenance of roads, while road authorities should have power to regulate the running of such vehicles.

Mr. Herbert Samuel, in reply, said he proposed that a technical committee should review the regulations relating to weight and other technical questions. He fully recognised there was a general sense of injustice that these vehicles which did so much damage did not contribute more towards the cost of roads, and the deputation had made out a strong case for calling on them to pay a larger sum and for the proceeds to be distributed to the local authorities. Whatever was done, let them not return to the system of the toll bar. That matter, however, was one for the Chancellor of the Exchequer, and while it could hardly be added to this year's Budget, he hoped the time was not far distant when the wishes of the deputation would be to some degree met. He also announced that a Joint Committee of both Houses of Parliament would be proposed to consider what provisions should be inserted in local bills dealing with motor omnibuses and trackless trolley services, and whether general legislation dealing with those services was required.

HERTFORD COUNTY SURVEYORSHIP.

SELECTION COMMITTEE'S RECOMMENDATION.

The committee having in hand the selection of a successor to Mr. Urban A. Smith, M.INST.C.E., county surveyor of Hertford—now consulting engineer and surveyor to the council—have recommended the appointment of Mr. J. S. Killick, ASSOC.M.INST.C.E., assistant engineer to the Road Board.

Prior to securing his present position, Mr. Killick was for nearly eight years surveyor of highways to the Croydon Rural District Council. He served his articles with the present county surveyor of Oxfordshire, and in 1897 became an assistant in the office of the surveyor to the Hoyland Nether, Yorks, Urban District Council, being appointed a year later an assistant surveyor under the Wombwell Urban District Council, in the same county. From 1899 to 1904 he held the position of surveyor to the Maidstone Rural District Council.

The Hertfordshire appointment, which comes up for confirmation at a meeting of the county council on July 20th, carries with it a commencing salary of £800 per annum.

Profits on London Housing Schemes.—According to a report submitted to the London County Council on Tuesday on the housing of the working classes, the financial results of the year ended March 31st last show a net surplus on all dwellings and estates in course of development of £15,977, compared with £7,298 in 1912-13. This is stated to be the most favourable result attained by the council.

County Councils Association.—At a meeting of the council of this body in London on Wednesday a number of resolutions relating to the Finance Bill were adopted, and approval given to the general principle of substituting Exchequer grants for assigned revenues. Among the resolutions was the following: "Roads.—(a) That the paragraphs with regard to roads in the second column of Part I. of the second schedule will be extremely uncertain and unequal in application unless at the same time the law relating to main roads is amended; (b) that, for the purposes of these grants, 'roads' should include bridges and bridge roads."

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

404. Collapsing Strength of Pipes.—What is the collapsing pressure in lbs. per square inch of a 3-in. cast-iron pipe, 12 ft. long, and of $\frac{1}{4}$ -in. thickness? Pressure on outside of pipe only. (H. V. A.)

405. Disinfection.—Sketch and describe a form of steam disinfecter suitable for use in a town of 30,000 inhabitants.

406. Building Construction.—Sketch a mansard roof, showing timbers; also a dormer window in an ordinary roof. (Junior.)

407. Surveying.—Describe a method of setting out circular curves by means of offsets. (M.C.E.)

408. Pumping.—How many gallons of water per minute will a 7-in. double-acting pump deliver? Stroke 30-in., revolutions 27. Give formula and say how much should be allowed for slip. (A. B.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

402. Column Design.—A hollow cast-iron column is 9 in. in external diameter, its length is 12 ft., and its two ends are firmly built in. The compressive load it supports is 60 tons. What thickness must the metal be in order to have a factor of safety of 10? (T. R.)

For the purpose of this problem it will be most convenient to use Gordon's formula for ascertaining the stress per square inch which would correspond to a factor of safety of 10, and if f_p = the safe stress in ton/in.² on the section, f_c = the safe compressive stress of a short specimen of cast iron, a = a constant depending upon how the ends are fixed, and is = $\frac{1}{750}$ when, as in the present case, both ends are rigidly built in, l = the overall length of the column in inches, and d = its external diameter in inches, then

$$f_p = \frac{f_c}{1 + a \left(\frac{l}{d}\right)^2}$$

The ultimate compressive resistance of cast iron as generally used in columns is 40 ton/in.²; so that, with a factor of safety of 10, the value of f_c will be 4 ton/in.²

Now, inserting these figures in the formula, we get:—

$$f_p = \frac{4}{1 + \frac{1}{750} \left(\frac{144}{9}\right)^2} = 3 \text{ ton in.}^2$$

The load is 60 tons, so that the area of metal required will be:—

$$60 \div 3 = 20 \text{ in.}^2$$

The area of a circle 9-in. diameter is 63.6 in.²; therefore the area of the hollow core will be:—

$$63.6 - 20 = 43.6 \text{ in.}^2$$

The radius of a circle of this area will be:—

$$= \sqrt{43.6 \div \pi} = 3.72 \text{ inches.}$$

Therefore the thickness of metal will be:—

$$4.5 - 3.72 = 0.78 \text{ in.}$$

which is, for practical purposes, $\frac{3}{4}$ in. (E. E. W.)

403. Rain Gauge.—Describe, with sketches, a reliable form of rain gauge.

The most common form of rain gauge is that known as the "Snowdon" (Fig. 1), which is best

made of copper, and should have a circular funnel of 5-in. or 8-in. diameter; the Meteorological Office require it to be 8 in., but 5 in. is quite suitable, and is sanctioned by the British Rainfall Organisation.

FIG. 1.—"SNOWDON" GAUGE.

FIG. 2.—CAMDEN MEASURE.

There is a can and bottle inside to collect the water, and a 6-in. cylinder on top of the funnel, with a sharp brass rim. The top of the rim should be 1 ft. above the ground.

The water is measured with a glass measure (Fig. 2), graduated in inches, and with the lower part shaped as a cone, which enables a fall of .005 to be easily read (the definition of a "rain" day).

Since the Meteorological Office began publishing their readings in millimetres last month, the makers have been supplying metric measures; but the neces-

FIG. 3.—FERNLEY SELF-RECORDING RAIN GAUGE.

sary calculation can be readily made, and many observers prefer to continue to record in inches.

1 millimetre = .03937 in., or, approximately, .04 in.

The best form of self-recording gauge is the "Fernley" pattern, patented by Mr. J. Bazendale, of the Fernley Observatory, Southport (Figs. 3 and 4). The principle of this is a float rising in a chamber into which rain falls.

The rain from the funnel passes into the float chamber, and causes the float to rise to the top of the chart, this representing $\frac{1}{4}$ in. of rainfall. At this juncture the water is syphoned away, the float descends to zero in six seconds, and is ready to commence a fresh upward trace.

In the plan (Fig. 4) the main syphon tube (D) is of very wide bore, and at the end of it is a trap (E)

to prevent air being sucked up into the syphon. A branch pipe (F) of smaller bore than the main syphon is attached to this tube (D), and leading into (F) is another pipe (G). The tilting bucket (H) is connected by a rod (J) with the tripping gear, actuated by the cam (K), when the float reaches its highest position.

When the float reaches its highest position, and the cam (K) has turned the weight over, the bucket (H) is upturned, and the water therefrom pours into (G), creating a vacuum in the wide bore syphon (D) to fully prime it, and thus empty the reservoir (A). In the course of syphoning some water is carried

FIG. 4.

through a pipe (M) into the tilting bucket, which is then ready for discharging on the next occasion.

The pen carrier consists of two anti-friction wheels, which do not press continuously upon the guide rods. The guides are braced with a third rod in triangular form.

When the cam turns the weighted arm past its centre of gravity, it falls suddenly, the elbow striking the knob of the rod attached to the tilting bucket. The "detent" (N) keeps the weight from being accidentally overturned, and only releases it when the pen is close to the top of the chart.

As the pen carrier descends to zero, a pin on the descending float rod automatically returns the weighted arm into its previous position.

The small lever (O) helps to raise the bucket into its preliminary horizontal position.

The case is of two parts. The lower metal well of iron, completely galvanised, containing the copper float chamber and syphon arrangement, is sunk into the earth up to the rim. The cover, made of copper, surmounted by an 11-in. accurately turned brass ring, is provided with lugs to permit of easy removal, ventilation holes for the heating in winter, a glass window for the observation of the chart, and a slot for fitting into the correct position on the rim of the well. (G. C. W., *Norbury*.)

Rubber Roads Again.—At a Press view of the fourth International Rubber and Allied Industries Congress and Exhibition—which opened at the Royal Agricultural Hall, Islington, on Wednesday—Sir Henry Blake, president, stated that the day was coming when the streets of London would be paved with rubber. Fifty British and foreign Governments are taking official part in the exhibition, and delegates will come from all parts of the world. Among the novelties to be seen is a rubber lawn tennis court, the first ever built. It has been laid by a British firm with British-grown plantation rubber. There will also be shown plaster casts of rubber and stone steps, from the same flight of stairs, which have been in use an equal time. The stone steps have worn down 2½ in., whereas at no part is the rubber worn more than ¼ in. in the twenty-four years the steps have been in use.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Barnsley T.C. (June 17th. Major J. Stewart).—£1,065 for the purchase of a motor wagon and tar-sprayer.—It was explained that the motor vehicle was required to deal more expeditiously with the removal of refuse. In regard to the work of spraying the roads with tar, the council considered that it would be more satisfactory to possess a machine instead of having to hire one as in the past.

East Sussex C.C. (June 11th. Mr. P. M. Cross-thwaite).—£2,262 for sea defence works. The county council accountant, Mr. I. T. Mellvee, asked that the repayment should be for over a period of thirty years. The engineer of the works, Mr. J. S. Owens, stated that the proposed expenditure was necessitated by the fall of a cliff.

Gateshead T.C. (June 16th. Mr. A. W. Brightmore).—£23,000 for the provision of a refuse staith between High Level-road and the Tyne to the east of the High Level Bridge. The town clerk (Mr. W. Swinburne) said the council had had the question of the disposal of the town's refuse under consideration for a considerable time. About 1901 they erected staiths at Redhugh, and that scheme had proved so successful that the council had decided to repeat it. They considered the site most suitable, having regard to the needs of the borough. The method of conveying the refuse to a staith and then out to sea was the most efficient and economical. They would be enabled to dispose of the town refuse at a cost much lower than that involved by the use of a destructor.

Gwyrfaï R.D.C. (June 17th. Mr. E. Leonard).—£6,760 for the purchase of land and the erection of thirty-six workmen's dwellings in the quarry villages of Clwtybont and Ebenezer. The surveyor, Mr. Watkin Thomas, submitted the plans, and described the houses to be erected. Ten would contain a parlour, a living-room and scullery, and four bedrooms, and would let at 4s. 9d. a week, and twenty-six would have a living-room, a scullery, and three bedrooms, and would let at 3s. 9d. a week. The houses would be built on four sites, the purchase price of the land being £80 per acre. The inspector said he thought the figures given by the surveyor were too high, and that the tenders that would be received would be much lower.

Heckmondwike U.D.C. (June 18th. Dr. L. Seymour).—£450 for the provision of a disinfecting station.—It was explained that the one belonging to the Dewsbury Joint Hospital Board, in which Heckmondwike are partners, was too far away to be of use to the latter place, the distance being 4½ miles.

Iford U.D.C. (June 12th. Major C. E. Norton).—£21,100 for the erection of public baths.—It was stated that the existing baths were erected in 1894, when the population was only 12,000, and they were now totally inadequate. The council intended seriously to consider the utilisation of the present baths for the purposes of teaching school children swimming.

Kirkby-in-Ashfield U.D.C. (June 10th. Mr. Edgar Dudley).—£1,190 for the purchase of land for a recreation ground.—The area, it was stated, was over 7 acres, and the price £150 per acre.

Neath R.D.C. (June 8th. Major J. Stewart).—£3,250 for works of water supply at Dylais Higher (Seven Sisters and Onllwyn). Mr. Edward Powell, representing the council, said that under the Ystradfellte Water Bill, 1902, the whole of the area under the jurisdiction of the public authority was to be supplied, and the present application was in relation to the provision of distribution mains to connect with the main pipe line. In a few years the population of Dylais Higher had quadrupled, and the present population of 5,500 would probably be increased to 30,000 in thirty years.

Romford R.D.C. (June 11th. Mr. M. K. North).—£470 for works of sewerage for the parish of Dagenham, and £2,095 for works of private street improvement. The surveyor, Mr. W. J. Grant, explained with respect to the proposed paving works that the roads were not all built upon, and in some instances sections only would be made up.

St. Mellons R.D.C. (June 9th. Major J. Stewart).—£600 for private street improvements in Tredegar-

street, Rhiwderin. Mr. Gomer Morgan, sanitary surveyor, stated that the total length of the road it was proposed to make up was 630 ft. 9 in. The road had previously been roughly formed, and a little kerbing had been put by the owners here and there, but there had been no combined effort.

Sheffield T.C. (June 11th. Mr. F. H. Tulloch).—£5,650 for the widening of Campo-lane, Whitham, Sandygate, Worktop, and Cricket Inn roads; £1,000 for the widening of Bramall-lane and for laying out St. Mary's churchyard as an open space; and £1,000 for the provision of bowling green pavilions in the Crookesmoor recreation ground, Whiteley Woods, and Hillsborough park.—It was explained that property was to be purchased for the widening of Campo-lane, and that with respect to Whitham-street the land to be utilised formed part of the city water undertaking. The other improvements had become necessary owing to the increase of traffic. With regard to the proposed pavilions, it was stated that the game of bowls was very popular in Sheffield, and that the corporation had now sixteen bowling greens. Evidence as to the proposals was given by Mr. Partington, of the city engineer's department.

Worcester T.C. (June 17th. Mr. T. C. Ekin).—£650 for the purchase of land for the extension of the sewage disposal works.—The area of the land was stated to be over 5 acres. The borough surveyor, Mr. T. Caink, stated that complaints had arisen with respect to the sewage works owing to the surface of the land becoming clogged. He was now experimenting on a totally different arrangement by upward instead of downward filtration. If the experimental filters were successful, he would convert the whole of them to upward filtration. The inspector said that it was a disquieting feature that the works were—he would not say constantly breaking down—but had failed four or five times since last September, giving rise to those complaints. Mr. Caink stated that in the process of time all the defects would be eliminated.

Worktop U.D.C. (June 12th. Mr. F. O. Stanford).—£550 for the erection of a public lavatory in Victoria Square.—The surveyor, Mr. G. Rawson, stated that the estimated cost of the road work was £505, and that the remaining £45 was for improvements to the footpath.

APPLICATIONS FOR LOANS.

Burton-on-Trent T.C.—£5,000, supplemental loan for the extension of the retort house.

Cambridge T.C.—£2,400 for the erection of twelve workmen's dwellings.

Falkirk T.C.—£8,000 for the extension of the electricity works.

Hastings T.C.—£2,300 for the provision of a fire station, and £682 for water main extension.

Honiton T.C.—£4,700 for a sewerage and sewage disposal scheme.

Kingstown (Co. Dublin) U.D.C.—£7,900 for a housing scheme.

Nelson T.C.—£21,500 for a tip and culverting works.

Salford T.C.—£520 for the purchase of land for playing fields.

Southend T.C.—£5,328 for making up certain streets.

West Lancashire R.D.C.—£823 for the electricity undertaking.

Wortley R.D.C.—£4,000 for the erection of a small-pox hospital.

LOANS SANCTIONED.

Bath R.D.C.—£3,231 for works of sewerage.

Brighton T.C.—£4,550 for street improvement, and £1,025 for the purchase of a depot.

East Barnet Valley U.D.C.—£3,283 for the purchase of land for a recreation ground.

Eppingham R.D.C.—£730 for the erection of cottages.

Hailsham R.D.C.—£6,757 for the Polegate sewerage scheme.

Heckmondwike U.D.C.—£600 for the purposes of the market.

Keighley R.D.C.—£2,250 for a new cemetery.

Newport Pagnell R.D.C.—£1,585 for the Loughton housing scheme.

Romford R.D.C.—£350 for works of private street improvement.

Tetbury U.D.C.—£730 for works of water supply.

Wirral R.D.C.—£2,200 for street improvement.

St. Paul's Bridge Designs.—Mr. G. Washington Broyne, R.S.A., of 24 Charlotte-square, Edinburgh, has been awarded the first prize of £300 by the Bridge House Estates Committee of the City of London Corporation in the competition for designs for the architectural treatment of the new St. Paul's Bridge, which is estimated to cost £1,646,000. The second prize of £200 was won by Mr. Charles E. Barry, Parliament-mansions, Victoria-street, Westminster, and the third of £100 by Mr. E. R. D. Selway, A.R.I.B.A., 9A Fouknay-road, Bedford-hill, S.W.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Brighton £25,000, Devon £15,040, Edinburgh £100,000; housing and town planning—Ogmore and Garw; roads and materials—Southend £24,800; sewerage and sewage disposal—Barton-on-Trent £30,000, Hailsham £7,190; water, gas and electricity—Southampton £22,000. Particulars of other projected works will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Ashburton U.D.C.—The surveyor, Mr. A. Wilson, has received instructions to prepare an estimate of the cost of erecting a public convenience.

Bishop Stortford U.D.C.—The council are considering the advisability of purchasing the Wharf House property on the Causeway for council offices and depot. It is proposed to sell the present office in North-street and the depot in South-street. The estate is on the riverside, and there is a dock which could be converted into public baths.

Bourne R.D.C.—The tender of Messrs. Thornhill, Lincoln, at £1,060, has been accepted for the erection of an isolation hospital.

Bradford T.C.—A proposal to construct an open-air bath in Lister Park has been agreed to.

Brighton T.C.—A special committee recommend extensive alterations at the Aquarium, at an estimated cost of £25,000.

Broadstairs U.D.C.—The council have adopted the amended plans of the surveyor, Mr. H. Hurd, for alterations to the slipway, including steps from the slipway to the sands, the whole of the work to be constructed in Jarrah wood at an estimated cost of £180.

Cannock U.D.C.—The tender of Mr. C. Linford, of Cannock, at £110, has been accepted for the construction of a public convenience at Cannock, and the surveyor, Mr. R. Blanchard, has received instructions to prepare plans for a convenience for both sexes at Hednesford.

Cardiff T.C.—It has been agreed to strengthen the bridge between Bridge-street and Guildford-street, and reduce the sharpness of the road approaches, at an estimated cost of £1,725.

Dawlish U.D.C.—The surveyor, Mr. S. F. C. Churchward, has prepared plans for a new harbour or landing stage, which it is proposed to discuss at the next meeting of the council.

Devon C.C.—The Public Health and Housing Committee are proposing to carry out extensions at the Hawkmoor sanatorium, at an estimated cost of £15,040.

Edinburgh T.C.—Investigation is being made into a proposed scheme for a new fruit and vegetable market on the site of the old gasworks the cost of which is, approximately, £100,000.

Hull T.C.—The Health Committee are, subject to official sanction, inviting tenders for a sanatorium at Cottingham, the plans of which have been prepared by the city architect.

Salteoats T.C.—The council are considering a proposal for the enlargement of the joint hospital, at an estimated cost of £1,700.

Sedgley U.D.C.—The surveyor, Mr. F. W. Turton, and the medical officer have received instructions to confer on plans prepared for a public mortuary.

HOUSING AND TOWN PLANNING.

Bradford T.C.—A decision has been reached to promote schemes under Part II. of the Housing and Town Planning Act, 1909, to deal with lands undeveloped or partially developed within and in the neighbourhood of the city.

Evesham R.D.C.—A site has been obtained at Brefforton for a housing scheme at £80 per acre, and plans have been approved for the erection of twenty cottages, at an estimated cost of £3,370.—The council have accepted a tender, at £1,000, for the Littleton housing scheme.

Hungerford R.D.C.—The surveyor, Mr. W. S. Raine, has received instructions to prepare an estimate for the erection of four cottages.

Ogmore and Garw U.D.C.—It has been decided to carry out a housing scheme, at an estimated cost of £14,100.

Sedbergh R.D.C.—The Local Government Board having pressed the council to build cottages for the working classes, owing to there being a scarcity in the neighbourhood, the council have secured suitable land in Station-road, and are in negotiation for other land at Millthrop. Mr. John Stalker, architect, of Kendal, has been instructed to prepare plans. Twelve cottages will be built upon 1 acre of ground, and each cottage will have an average of 240 sq. yds. of garden ground.

Wortley R.D.C.—The council have, in reply to a letter from the Local Government Board, stated that 300 more houses were required in the district, representing 5 per cent of the houses under a rental of £16 per annum.

Ystradgynlais U.D.C.—The council have approved a scheme for the erection of sixty workmen's houses.

PARKS AND OPEN SPACES.

Abercarn U.D.C.—The council have referred to the West Ward members a plan prepared by the surveyor, Mr. John Williams, for laying out the Distillery ground. The estimated cost is £1,370, and if an open-air swimming bath is included, there will be an addition of £500.

Birkenhead T.C.—A new recreation ground adjoining Birkenhead Park was formally opened on Tuesday last. The cost of the site was £2,200, and the land was laid out at an expenditure of £1,100.

Newmarket U.D.C.—The surveyor, Mr. W. H. Eley, has received instructions to lay out the memorial hall grounds, at an estimated cost of £175.

Southend T.C.—A decision has been reached to purchase the Bellairs estate, Leigh, comprising 270 acres, for £16,500, subject to the sanction of the Local Government Board.

ROADS AND MATERIALS.

Aberdeenshire C.C.—It has been agreed by the Garioch District Committee to replace forty-five direction posts on the main road, and provide fourteen additional posts and sign-posts, at a cost of £3 16s. per post. The chairman, Mr. H. D. McCombie, referring to the recent visit of the chief engineer of the Road Board to Aberdeenshire, said two points struck him in the conversations he had had during the visit of the chief engineer. With regard to dangerous corners, the Road Board did not seem to be in favour of large expenditure in cutting off such corners. They did not seem to be in favour of making roads better in order to facilitate motor searching. Evidently they were not willing to give money for that purpose. They were willing to cut down hedges and so forth to give a better view of the road. That, in the public interest, was a very sound view.

Bideford T.C.—It has been agreed to purchase a steam roller from Messrs. Isaac & Son, at a cost of £600.

Cottingham U.D.C.—The county council having declined to support this council in an application to the Road Board for a grant towards the Hull-road improvement, the council have resolved to depart from the usual custom and make application themselves.

Devizes T.C.—The roads in the town have been treated with Westrumite, at a cost of £38. This is generally spoken of as having proved to be very satisfactory.

Farnborough U.D.C.—The surveyor, Mr. J. E. Hargreaves, has received instructions to carry out private street improvement works in Cambridge-road and Closeworth road by means of direct labour.

Hampstead B.C.—Repairs are to be carried out in England's-lane (with lithofalt blocks), Avenue-road, and Hillgrove-road, at an estimated cost of £1,536.

Keswick U.D.C.—The surveyor, Mr. W. Hodgson, has completed the scheme of flagging, for which the

sum of £820 was borrowed, and has received the congratulations of the Streets Committee on doing the work so economically. These congratulations were endorsed by the whole council at a meeting recently.

Liskeard R.D.C.—It has been decided to ask the Road Board to lend £1,000, free of interest, in order further to improve the road from St. Cleen to Cheese-wring.

Lowestoft T.C.—Statutory notices have been served for making up a number of streets under section 150 of the Public Health Act, 1875.

Monmouthshire C.C.—The council are promoting a scheme for a new road from Bedwas to Caerphilly, including the construction of a new bridge, which avoids the rise, and cuts out the circuitous bend in the present highway.

Neath R.D.C.—A committee has been appointed to interview the owner of the land in Dylais Valley, through which it is proposed to construct a new road. The surveyor, Mr. D. M. Davies, has submitted a report with reference to the proposed scheme, and suggests that as the road would improve the property of the owner he should give the land free of cost, as others have done in similar instances.

Selby U.D.C.—The Highways Committee recommend that the Local Government Board be asked to sanction the purchase of property in Gowthorpe-street, to enable the council to make a new road into Flaxley-road, at an estimated cost of £3,600.

Southend T.C.—The Road Board have sanctioned a grant of £5,000, and a loan of £16,000, in aid of the cost of improving the main road to Bourne Green. The estimated cost of the work is £21,800.

Weston-super-Mare U.D.C.—The surveyor, Mr. H. A. Brown, in his annual report states that during the past year forty-six roads and streets have been reconstructed or resurfaced, and that 5,319 super. yds. of artificial stone paving have been laid. About sixty roads and streets have recently been tar-sprayed (including main roads) at a cost of £507.

Woking U.D.C.—Approval has been given to the plans of the surveyor, Mr. G. J. Wooldridge, for widening Triggs-lane, at an estimated cost of £124, and a scheme for widening Old Woking road near Broadmead bridge, at an estimated cost of £1,840, has been submitted to the county council for their consideration.

SEWERAGE AND SEWAGE DISPOSAL.

Burnham (Somerset) U.D.C.—The surveyor, Mr. W. H. Chowins, has been engaged as engineer to carry out a drainage scheme in the proposed new area at a remuneration of 100 guineas, and an assistant surveyor will be engaged by the council for nine months at a salary of £2 10s. per week.

Burton-on-Trent T.C.—A decision has been reached to duplicate the sewage rising main from the pumping station to the farm, a distance of $1\frac{1}{2}$ miles, at an estimated cost of £30,000.

Dalton (Lancs) U.D.C.—Two new sprinklers are to be constructed at the sewage disposal works, at an estimated cost of £330.

Esher and the Dittons U.D.C.—The tender of Messrs. Sireeter Brothers, of Croydon, at £630, has been accepted for the laying of a sewer in Ember Court-road, and with respect to the proposed sewer in Alexandra-road the council agreed that, as there was so much difference between the surveyor's estimate of the cost of the work (£110) and the lowest tender (£196), the surveyor should carry out the work by the council's workmen.

Hailsham R.D.C.—The Local Government Board have formally sanctioned the sewerage and sewage disposal scheme for Polegate, at an estimated cost of £7,190.

Honiton R.D.C.—It has been agreed that the storm water pipes at Fenton be separated from the sewer, and that a separate new sewerage system with proper disposal works be constructed for the village.

Honiton T.C.—It has been agreed to comply with certain amendments proposed by the Local Government Board in the sewerage and sewage disposal scheme. The borough surveyor, Mr. A. Tilloison, estimates the cost of the extra works at £200. The estimated total cost of the scheme is £1,700.

Sedgley U.D.C.—A report has been submitted to the effect that a joint committee of Sedgley and Coseley district councils, in conjunction with the County Committee, had agreed to instruct Messrs. Willcox & Raikes, as sanitary engineers, and Messrs. W. F. Clarke, W. H. Hughes, and A. P. Taft, as mining engineers, to report upon the two urban districts with a view to ascertaining the best practicable method of sewerage of the districts, either in parts or as a whole, or individually, and to confer with the county medical officer on the feasibility and sufficiency of their recommendations.

WATER, GAS, AND ELECTRICITY.

Belfast T.C.—Tenders are to be obtained for new electricity plant.

Bury St. Edmunds T.C.—The council have adopted a recommendation from the Electricity Supply Committee to adopt a system of free wiring through a contractor, for the supply of electricity to houses in the borough, as suggested by the electrical engineer; that by way of an experiment the system should be applied to not more than twelve houses of a rental of not less than £14 a year each; and that the electrical engineer be authorised to arrange terms with a contractor for carrying out the necessary wiring, at the expense of the corporation.

Exeter T.C.—There was a profit of £1,446 on last year's working of the tramways. It is proposed to deal with the surplus by giving a discount of 15 per cent to the Lighting Committee, dating back to April, 1913, by reducing the charge for current to the tramways from 1½d. per unit to 1¼d. per unit, and that the balance should be devoted to the installation of the high-pressure turbo-alternator at the power station.

Gourock T.C.—The first sod of the new works at Daff Valley in connection with a water supply scheme was cut last week. The new reservoir will have a capacity of 162,000,000 gallons, being 180 days' storage, a supply equal to 50 gallons per head per day for an estimated population of 12,000. The works will occupy ground to the extent of about 65 acres, and are expected to cost something like £22,000. Mr. A. Lettich, of Glasgow, is the engineer-in-charge.

Lurgan U.D.C.—A resolution has been passed agreeing to purchase the local gas and chemical undertaking for a sum of £10,000.

Saxmundham U.D.C.—The tender of Mr. Charles Ball, of Letchworth, Herts., at £4,903, has been provisionally accepted for the proposed water supply works.

Southampton T.C.—The Water Committee recommend the town council to construct an additional reservoir at Bassett, at an estimated cost of £22,000.

MISCELLANEOUS.

Cork T.C.—After the usual tests by the city engineer, the council have accepted the tender of the Ship Canal Portland Cement Manufacturers, Ellesmere Port, for the supply of cement at £2 0s. 1d. per ton.

Kingston (Surrey) T.C.—For the year to June, 1915, the tender of Messrs. Doulton & Co. has been accepted for drain pipes, &c., and that of Mr. J. Jonas for scavengers' brooms. Messrs. Ide & Son's tender of £300 has been accepted for the erection of a new urinal near the Kingston Hotel.—The surveyor, Mr. R. H. Clucas, was on Tuesday authorised to engage the services of three suitable men to take the census of road traffic, at a salary of £2 2s. per week each.

FOR OTHER ADVERTISEMENTS

See End of Paper.

BOROUGH OF HORNSEY.

The Town Council invite applications for the position of Second Assistant Engineer and Surveyor. Salary £200 per annum, rising by annual increments of £10 to £250. Applications, stating age, qualifications and experience, accompanied by copies of not more than three testimonials, should be forwarded to the undersigned not later than Saturday, the 4th of July.

E. J. LOVEGROVE,
Borough Engineer and Surveyor.

Municipal Offices,
Highgate, N.

June 25, 1914.

(1746)

BOROUGH OF WARWICK.**SEWAGE DISPOSAL WORKS.****RESIDENT ENGINEER.**

The candidate must have had previous experience on similar works, be able to set out the works, test materials, use the various surveying instruments, and measure up work done.

The person appointed will be required to act under the directions of Messrs. Dodd & Dodd, M.A.I.N.S.T.C.E., the Engineers to the Council.

The salary will be Three Guineas per week.

Applications, endorsed "Resident Engineer," stating age and qualifications, accompanied by copies of three recent testimonials, to be sent to the undersigned not later than 12 o'clock noon on Tuesday, the 14th day of July, 1914.

Applicants who canvass any member of the Council, either directly or indirectly, will be disqualified.

(By order)

BRABAZON CAMPBELL,

(1,743)

Town Clerk.

TO PAVING CONTRACTORS AND OTHERS.

The Wandsworth Borough Council is prepared to receive Tenders for the Execution of Wood Paving and other works in Streatham High-road, and Streatham-hill.

Form of Contract, Specification and Drawings may be seen, and Form of Tender obtained, at the office of the Borough Engineer, Mr. P. Dodd, M.A.I.N.S.T.C.E., 215 Balham High-road, S.W., between the hours of 10 and 4 (Saturdays 10 till 1).

Contractors will be required, in the case of all workmen employed by them in and about the execution of the Contract, to pay wages at not less and observe hours of labour not greater than the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed, and to pay to all carmen a wage of not less than four shillings and sixpence per day.

Tenders (enclosed in a sealed envelope, endorsed "Tender for Wood Paving Works") must be delivered at the Council House, East-hill, Wandsworth, S.W., and may be placed by the persons tendering in the Tender-box provided for the purpose, not later than Ten o'clock in the forenoon of Tuesday, 7th July next. No Tender will be received unless it is made upon one of the printed forms issued for the purpose. The Council does not bind itself to accept the lowest or any Tender.

D. A. NICHOLL,

Town Clerk.

Council House,
Wandsworth, S.W.
June, 1914.

(1,745)

DARLINGTON RURAL DISTRICT COUNCIL.**TENDERS FOR HAULAGE PLANT.**

The above Council, having adopted rubber-tyred petrol wagons for haulage purposes, wish to dispose of the following plant, for which Tenders are invited:

8-h.p. McLaren Compound Traction Engine, with roller wheels for converting into road roller.

2 Speeds. Cylinders and rings as new. New tubes. 21-in. diameter. Boiler insured at 140-lb. pressure.

Travelling wheels 6-ft. diameter, and recently straked.

7-h.p. Aveling & Porter Compound Traction Engine, convertible into road roller fitted with roller wheels only. Two speeds. Tubes 21-in. diameter. Boiler insured at 150-lb. pressure. Fitted with Morison Patent Scarifier.

Four 8-ton Traction Wagons, with side doors. Wheels 9 in. wide, recently rebushed.

The whole of this plant can be inspected on application to Mr. A. Potter, Council's Slag Works, Middle-ton St. George (Dinsdale Station).

Tenders, to be endorsed "Tender for Haulage Plant," to be sent to the undersigned not later than the 15th July.

JOHN ROBINSON,

Highway Surveyor.

Surveyor's Office,
Crown-street,
Darlington.

(1,744)

PERSONAL.

Mr. Bernard Glossop, surveyor and clerk to the Heage (Derbyshire) Urban District Council, has resigned.

Mr. H. L. Bottomley, of Brighouse, has been appointed surveyor to the Healden Bridge Urban District Council.

Mr. W. Stoddart, for nearly forty years chief surveyor in the city engineer's department of the Nottingham Corporation, died, we regret to state, last week.

Mr. C. P. Stubbs, of Aintree, has been appointed temporary general assistant in the surveyor's department of the Hindley Urban District Council at a salary of £78.

Mr. F. B. Drake, ASSOC. M.A.I.N.S.T.C.E., town engineer of Oudtshoorn, Cape Province, has been appointed, from 127 candidates, road engineer to the (recently unified) city corporation of Cape Town.

Mr. J. Johnson, highway surveyor to the Keynsham Rural District Council, has received an increase of salary of £15 this year, with £10 a year for the next four years, rising to a maximum of £230.

Mr. T. N. Young, son of the late waterworks manager, has been appointed engineering manager to the water undertaking to the Epsom Urban District Council, at a salary of £200 per annum, rising to £250, with house, fuel and light free, and £27 motor car allowance.

Mr. C. H. Croxford, surveyor, and Mr. W. P. Harding, clerk to the Wood Green Urban District Council, are the donors of a silver challenge cup for rowing at the annual sports of the town hall staff, and at the reunion at Pangbourne on the 15th inst. the trophy was won by Messrs. King, Longland, and Burr (cox), of the surveyor's department, after a keen contest. The surveyor's and the clerk's department have each held the cup five times.

Mr. James S. Cree, Aberfeldy, has been appointed road surveyor to the Highland District Committee of the Perthshire County Council, at a salary of £350. Mr. Cree is thirty-two years of age, and was educated at Murthly Public School and Perth Academy. He entered the office of the late Mr. William Bell, whom he succeeds, fifteen years ago, and has for the past eight years been principal road assistant. He was inspector-in-charge of the construction of the Aberfeldy waterworks, which cost about £4,000.

Mr. H. W. Smith, to whom reference was made in the last issue of THE SURVEYOR, under the heading "A Borough Surveyor's Travels," has his services to Scarborough dealt with by a well-informed and discriminating critic of the *Scarborough Post*, who uses the *nom de plume* of "Observer." Mr. Smith, the writer states, was appointed borough engineer and surveyor in December, 1896, and at that time the only pleasure grounds in the town were the Holbeck Gardens, the Clarence Gardens, the Valley Park, and the Weaponness estate. "The go-ahead policy of the corporation," he proceeds to say, "synchronises with the advent of the borough engineer. The average ratepayer has little idea of what we owe to this painstaking, capable, courteous, conscientious, and brilliant official. Not only is he in the first rank as an engineer and surveyor, but he is also an eminent architect, and as a landscape gardener has few equals. He designed the present town hall, he built the sanatorium, he has erected all the public conveniences in the borough; the various pavilions and shelters and the entrancingly beautiful bungalows on the North and South Cliffs are the outcome of his creative genius. He is now engaged in constructing a bathing pool on the South Sands, and in the South Cliff Gardens (the late Belvedere Gardens) he is rearing a structure which will surpass in beauty anything he has yet attempted. For some years he has had charge of the Marine Drive, and his experience of sea-defence works is unique. He has saved the corporation hundreds of pounds in architects' fees alone, and since he took over the duties of Marine Drive engineer has saved that body the annual salary paid to that official."

The Government's Housing Bill.—Replying to a question in the House of Commons on Wednesday, the Prime Minister said he hoped the Housing Bill, which would take the place of the housing provisions now excluded from the Revenue Bill, would be introduced next week.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY: RAILWAY BRIDGE: STANDARD OF REPAIR.—In *Attorney-General v. Great Northern Railway Company* (Chancery Division; Mr. Justice Warrington) an important question was decided as to the extent of the liability of the company for the repair of a bridge erected in 1867, carrying a highway over their railway at Crouch End. The bridge was insufficient to carry heavy motor traffic, and the point in dispute was whether the company were bound to render it sufficient for that purpose, or whether they could only be compelled to maintain it in a state sufficient for such traffic as it was capable of sustaining at the time of its erection, and as was ordinary on the highway at that date. A further point was whether the company could limit their obligations by affixing the usual statutory notice to the bridge under the Locomotives and Motor Car Acts. Mr. Justice Warrington held that the company were bound to maintain the bridge in a condition of safety for the passage of such traffic as might be expected to use the highway, of which it formed part at the present time, and that they were not relieved of this liability by the provisions of the Locomotives and Motor Car Acts giving power to exclude heavy traffic. A similar decision was arrived at, it may be remembered, by the Court of Appeal in the case of a canal bridge in *Attorney-General v. Sharpness New Docks, &c., Company* (noted at p. 520 ante). In the course of his judgment in the present case, Mr. Justice Warrington said that there were certain principles established by authority—viz.: (1) Where persons, acting under statutory powers, for their own purposes, interrupted a highway, they were under a *prima facie* obligation to construct and maintain such works as might be necessary to restore the use of the highway to the public; (2) the body responsible for the maintenance of the highway was bound to maintain it in a condition sufficient for such traffic as might be reasonably expected to pass over it—i.e., to keep it "up to date"; (3) there was no distinction in this respect between the solid part of a highway and a bridge; (4) in order to rebut the presumption mentioned in (1) the persons in question must show that the statute under which they were acting expressly exempted them from the implied obligation. It was not enough that the statute was silent on the point. Applying these principles, his lordship said he could find no provision in the Railways Clauses Consolidation Act, 1845, which defined, expressly or by implication, the obligation to maintain the bridge imposed by sec. 46. The measure of that obligation must therefore be sought in the above general principles. The standard according to which the bridge was to be maintained was to be determined by the nature and extent of the traffic to be expected upon the highway of which the bridge formed part.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as nouns de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

OFFICER OF LOCAL AUTHORITY: REMUNERATION FOR EXTRA SERVICES.—"Civic" writes: My council has appointed me engineer in connection with an important scheme, and has agreed to pay me a fee by means of an increase of salary for the next two years. I am a full-time officer. I have asked for an agreement under seal which will provide that, in the event of my leaving the service of the council before the expiry of the above period, the balance of fee due shall be paid to me, but the clerk says that this cannot be done. His view is that the only way in which I can be paid is by an increase of salary, and that immediately I leave my salary will cease. But in that event could not the balance be paid to me either (1) as an increase of salary for the month which would have to expire after my giving notice to leave, or (2) as an allowance for extra services? (See *Edwards v. Salmon* (1889, 23 Q.B.D., 531; 54 J.P.

180; 58 L.J.Q.B., 571; 30 W.R., 166, as to allowances). Please refer to the case of the Penmaenmawr Urban District Council and their surveyor in the High Court. I have not the date, but it is during the last two or three years, and was reported in THE SURVEYOR.

The case of *Edwards v. Salmon* (*supra*) is not quite on all fours with the present case, but it does, I think, show that it is not necessarily illegal to pay an officer a lump sum for extra services which he has rendered beyond the scope of his employment. If therefore "Civic" should leave the service of the council before the expiration of the two years, the council could, in my opinion, pay him for such extra services as he has actually rendered. In order to avoid any question, however, it would be well to apply to the Local Government Board for their approval of the payment being made, and if they sanction it the district auditor could not disallow the payment. I have not been able to trace the Penmaenmawr case.

PRIVATE STREET WORKS: SURFACE-WATER SEWER: QUARRY.—"W. R. D. C." writes: (1) The Local Government Board have by Order put into force in the contributory place of W. within this rural district the provisions of the Private Street Works Act, 1892, except as to sewerage, for certain specified streets. The contributory place is sewered on the separate system, and a foul-water sewer is provided for the streets in question. The question now arises as to whether the expense of a surface-water drain to carry the water off the surface of the streets themselves can be included in the apportionment on the owners. This surface-water drain is absolutely essential for the street, and would be equally necessary (though slightly cheaper) if the combined system were in operation, on account of the position of the foul-water sewer. How must this be charged? (2) A second question with respect to the same streets is as to the liability for the filling up of a quarry. This quarry is of varying depths of from 6 ft. to 20 ft., and is not now worked. Is the owner of the quarry solely responsible, or must it be included in the total estimate and apportioned among all the owners in the street? The street cannot be made up without filling this up.

(1) In my opinion the expense of a surface-water sewer cannot be included in the apportionment in the absence of an Order applying the provisions of the Act as to sewerage. (2) I do not see how the filling up of the quarry can be included in the works, inasmuch as it forms no part of the street.

UNDERGROUND WATER.—"W. R." writes: I am anxious to obtain information on the right of property owners to underground water, and on arbitration for the acquisition of land for waterworks where the owner claimed special valuation because there happened to be springs, wells, &c., which, until the water authority had constructed, or proposed constructing, work, had no particular value. Can you help me with data as to names of cases, results, &c., on this point? I know there are a number of cases on record, but living, as I do, out of England, I cannot trace them.

An owner of land has, as such, the right of drawing all water he can which flows underground in no defined channel, or in a channel which, though capable of being defined and ascertained, is not in fact known. But he cannot exercise this right if the direct result of so doing is to divert water from a stream, having a defined course above ground, to the prejudice of the riparian owners on such stream. See *Chasemore v. Richards* (7 H.L.C., 349); *Acton v. Blundell* (13 L.J., Ex., 289); *Ewart v. Belfast Guardians* (9 L.R., Ir., 173); *Bradford Corporation v. Ferrand* (1902, 2 Ch., 655); *Grand Junction Canal Company v. Shugar* (L.R., 6 Ch., 433); *English v. Metropolitan Water Board* (1907, 1 K.B., 588).

DISTRICT COUNCILLOR.—"Ratepayer" writes: Can one person be elected as district councillor for two separate townships in the same rural area?

By sec. 24, subsec. (4), of the Local Government Act, 1894, the qualification of a rural district councillor is the same as that of a guardian, and any person qualified to be a guardian for a union comprising the district is qualified to be a district councillor for the district. By sec. 20, subsec. (2), a person is not qualified to be a guardian for a poor law union unless he is a parochial elector within the union or has for twelve months before the election resided in the union. By sec. 24, subsec. (1), the councillors are elected by the parishes or other areas for the election of guardians in the district. The election of a councillor by one parish or area does not apparently prevent him from being also elected by another parish or area, assuming that he possesses the necessary qualifications in both parishes or areas.

Institution of Water Engineers.

SUMMER GENERAL MEETING AT STOCKPORT—(2).

Among the papers read at the recent meeting of the Institution of Water Engineers at Stockport was one by Prof. Sheridan Delépine, of the University of Manchester.

In introducing Prof. Delépine the President (Mr. Thomas Molyneux) said that the Professor was no stranger to them. Those of the members who went to Bolton in 1903 would remember that Prof. Delépine gave them a paper there, and on that occasion many of them did not see eye to eye with what he said. Subsequent events had, he thought, shown that the Professor was in advance of them, and what he had to tell them that day would, he had no doubt, be of benefit to them individually and to the institution.

Prof. Delépine then read his paper, and at the close he threw a series of pictures on the screen in explanation of his address.

CHARACTERS OF MECHANICALLY-FILTERED WATER.

By Prof. SHERIDAN DELÉPINE, M.B., C.M., M.Sc.,
of the University of Manchester.

The effects of the treatment of water by means of coagulants and pressure mechanical filters do not appear to have been fully understood in the past. Since 1901, when the author had for the first time the opportunity of observing on a large scale the action of pressure filters, he has had several opportunities of testing the action of important installations, and has more than once noticed that although the results obtained were highly satisfactory, the conditions of guarantee suggested by or imposed upon the contractors had not been fulfilled, because the effects of filtration had been different from what had been expected. From a hygienic point of view many of the requirements were valueless, and a consideration of what could be expected to take place in a mechanical filter would have been sufficient to show that some of the conditions could not be realised, and that among those capable of realisation there were several which were not of material importance.

To make this clear the author will briefly discuss the conditions of guarantee included in a contract which came under his notice about four years ago. The water to be treated was a very soft water. The only conditions to which reference need be made for the present were included in 12 clauses which, in the form finally agreed to by both sides, read as follows:—

"The contractors to guarantee purification to the following extent:

"(1) The removal of 95 per cent. of the discoloration present in the raw water.

"(2) The removal of 95 per cent. of the suspended matter and 45 per cent. of the organic matter in solution in the raw water.

"(3) The filtered water not to take up more than .035 grain of lead in solution per gallon (0.05 per 100,000) after being in contact continuously with new lead during a period of 24 hours.

"(4) The filtered water to have no odour when heated to 100 deg. Fahr.

"(5) The filtered water in appearance on examination in a 2ft. tube to be clear and bright.

"(6) The filtered water not to contain any alumina in excess of that present in the raw water previous to treatment and filtration.

"(7) The filtered water not to contain:—

"(a) any *bacillus coli communis* in quantities not exceeding 10 c.c. of water.

"(b) more than 100 bacteria growing at 20 deg. Cent. on peptone gelatine (plus 10) in 3 days in 1 c.c. of water.

"(8) The free ammonia present in the raw water to be reduced by at least 25 per cent. after treatment and filtration.

"(9) The albuminoid ammonia in the filtered water not to exceed .003 grain per gallon (0.0042 per 100,000).

"(10) The oxygen absorbed from permanganate in four hours not to exceed .035 grain per gallon (0.05 per 100,000).

"(11) The permanent hardness of the filtered water

to be increased not less than 10 per cent. above the raw water.

"(12) The filtered water to have no deleterious action whatever on wrought-iron, steel or cast-iron pipes."

In another contract which came under the author's notice at about the same time some of the conditions were stated differently. Only five of these need be mentioned—viz.:

"(1) The colour of the filtered water shall not exceed 10 deg. of the platinum cobalt scale, when 1 deg. corresponds to 1 part of platinum per 1,000,000.

"(3) The filtered water shall be tested for its action on lead in the following manner: A length of new lead pipe, 3-in. internal diameter and 3 ft. long, bent into the form of a U tube, shall be filled with water from the sample to be tested. The ends of the tube shall be sealed, and the whole left standing for twenty-four hours. At the end of this period the tube shall be emptied, rinsed with the filtered water, and then refilled from the sample. The whole shall be sealed and again left for twenty-four hours, and the water then run off and tested for dissolved lead.

"The lead found in solution shall not exceed 0.05 parts per 100,000.

"(5) The filtered water shall be free from turbidity as measured by the immersion of a platinum wire, 1 mm. in diameter, which shall be visible at a depth of 50 in.

"(7) Bacteria.—When the unfiltered water contains less than 500 per cubic centimetre, the bacteria present in the filtered water shall not exceed 20.

"When the unfiltered water contains more than 500 and less than 1,000 per cubic centimetre, the bacteria removed shall, on the average, be not less than 97 per cent of the whole, within a minimum for each sample of 96 per cent.

"When the unfiltered water contains more than 1,000 per cubic centimetre, the bacteria removed shall not be less than 98 per cent.

"Acidity.—The filtered water shall in no case be acid, and the alkalinity shall not exceed 1½ deg.

"The test for acidity shall be made by evaporating 500 c.c. to a small bulk, and filtrating with N/10 caustic soda solution.

"The test for alkalinity shall be made by adding an excess of N/10 sulphuric acid solution, boiling to expel the carbon-dioxide, and determining the excess of acid. The indicator used shall be phenolphthalein, and each degree of acidity or alkalinity respectively shall be equal to 1 c.c. of the corresponding N/10 solution used to neutralise 500 c.c. of the water."

The conditions enumerated above indicate fairly completely the characteristics which successfully treated water was expected to have. It will be noticed that some of these are indicated in absolute terms, while others are stated in terms relative to the characteristics of the raw water. The object in view in imposing conditions on a contractor is that the water should, after treatment, be free from any objectionable property—that is, so far as its essential properties are concerned.

A properly treated water intended for ordinary drinking and domestic purposes should be free from—

(1) Discoloration.

(2) Appreciable turbidity.

(3) Any product capable of imparting to it an unpleasant taste or smell.

(4) Any excess of bacteria, and more specially of bacteria indicating dangerous, or possibly dangerous, pollution.

(5) Any material power to act on metals, and more specially on lead.

(6) Any product imparting to the water an unusual physiological action.

(7) An excess of mineral matter capable of imparting to the water excessive hardness.

It is quite possible to state in absolute terms the characteristics of a water satisfying these desiderata, and there are methods by which one can accurately ascertain whether a treated water meets these necessary requirements. It is therefore unnecessary to rely upon the percentage improvement which has taken place as a result of treatment—a test which may lead to gross errors, seeing that the fulfilment of such conditions would not be proof that the water was fit for domestic purposes, and *vice versa*. For example,

a water so polluted that it contained before treatment 10,000,000 bacteria and associated products of decomposition would not be rendered satisfactory by treatment, even if the number of bacteria removed amounted to 98 per cent, for this would still leave 200,000 bacteria in the treated water. Similarly a reduction in the free ammonia by at least 25 per cent would not in such a case be proof that other soluble objectionable products of decomposition were not present in the water.

On the other hand, no constant material reduction in number of bacteria could be expected from the treatment of a water usually containing less than 10 bacteria per cubic centimetre, and a 50 per cent increase in number would not be an indication that the water was unsuitable for domestic purposes; neither is the absence of any reduction in the amount of free ammonia material when the quantity is originally very low. As a matter of fact, the quantities of free or saline ammonia usually present in drinking water are quite immaterial from a hygienic point of view even when the water is distinctly polluted. The ammonia figure is only of use as an indicator of pollution when other more direct methods are not available for the purpose of ascertaining whether pathogenic or faecal bacteria are possibly present.

The author now proposes to discuss some actual results obtained in connection with two installations of pressure mechanical filters of different types (erected by two of the leading firms in this country) which may be designated by the letters A and B.

Both installations yielded excellent results, and for the purpose of this discussion we will suppose that the conditions enumerated at the beginning of this paper had to be met in each case. In both cases the waters to be treated were derived from peaty moorlands, were therefore liable to discoloration, soft, had

in the twelve cases in which the colour of the treated water was greenish-blue. It is obvious that when the water appeared to be of a pure blue colour no trace of original discoloration could be detected.

In the case of installation B, the water of a reservoir was examined six times, and found to be:—

	Before Treatment.	After Treatment.
Dull brown	4 times	0 times
Yellowish brown or dull brown	2 "	0 "
Greenish blue	0 "	4 "
Pale blue	0 "	2 "

These remarks indicate that, as far as the colour is concerned, the treatment can be considered as satisfactory when the colour of the treated water is either pale blue or greenish blue, and a statement to that effect is far more likely to be correct and to be clearly understood than a figure indicating the percentage of discoloration removed, as may be done by the platinum or other colorimetric method.

Condition 2.—Removal of 95 per cent of the suspended matter and 45 per cent of the organic matter in solution in the raw water.

The second part of this clause is, in the author's opinion, entirely unnecessary. The figures relating to oxygen absorbed, and various nitrogenous products, would, if information were needed regarding organic products, give most of the information required. The estimation of volatile and organic matter as usually conducted does not give results capable of simple interpretation.

The first part of the clause, which relates to suspended matter, is one which offers certain difficulties of interpretation. The coarse suspended matter which was present in most of the samples of raw water was invariably removed by treatment, and in ordinary light the treated water appeared to be quite clear; a

No.	Weight moist.	General composition of deposit.				Mineral matter.

a marked action on lead, and required the same kind of chemical and mechanical treatment.

Filter A had to deal with the water of four reservoirs. The water from each of these reservoirs was examined both bacteriologically and chemically before and after treatment at short intervals during a period of over 1½ years, but it will suffice to deal with only one set of observations in each case. Some of the observations relate, in the case of A, to the initial period, when the working of the filters had not been fully adjusted. The author will deal seriatim with the conditions of guarantee in the light of the analytical results obtained in the laboratory. Tables giving the results of two short series of tests carried out lately in connection with both installations are given in an appendix.

Condition 1.—Removal of 95 per cent of the discoloration present in the raw water.

The water of the four reservoirs was examined thirty-two times, and found to be, when examined in good daylight in a 2-ft tube:—

	Before Treatment.	After Treatment.
Dark or dull brown	14 times	0 times
Brown	5 "	0 "
Yellow or brownish yellow	8 "	0 "
Yellowish green	5 "	0 "
Greenish blue	0 "	12 "
Pale blue	0 "	20 "

On attempting to estimate colorimetrically the amount of yellow or brown discoloration which had been removed by treatment, it was found that more than 95 per cent of the discoloration had been removed

platinum wire, 1 mm. thick, could invariably be seen through 50 in. of water, but when the water was strongly illuminated, and examined against a dark ground, a slight turbidity or opalescence was usually recognisable. This turbidity was not due to the suspended matter originally present in the raw water, but to the presence of extremely fine particles. This slight turbidity was generally more marked when the quantities of chemicals had not been completely adjusted. Before this was done it was possible by gravimetric method to show that there was slightly more insoluble suspended matter in the treated than in the untreated water; after adjustment the reverse was true; but in both cases it was clear that the suspended matter which caused turbidity in the raw water had been replaced in the treated water by another kind of suspended matter. This suspended matter was composed almost entirely of minute particles, many of which were almost ultramicroscopic. It had, therefore, nothing in common with the coarse particles which caused the turbidity of the untreated water.

When the treated water was made to pass through a sedimentation tank, a dark gelatinous layer was, in the course of several months, deposited on the sides and bottom of the tank. This deposit was due to the separation of the fine particles contained in the water. Through Mr. Molyneux's kindness the author has had an opportunity of investigating the nature of this deposit. By a process of elutriation, it was possible to separate from it five types of constituents:—

(1) Fine, heavy, reddish, greyish and white sandy particles, which separated easily from water in about one minute (that is, after they had been freed from

the surrounding gelatinous mass). These particles had to the naked eye the characters of fine sand grains and silicious debris. This part of the sediment was very scanty.

(2) Much finer, heavy particles of a dark-grey colour, which separated from the water almost as rapidly as the coarser particles.

(3) Extremely fine, dark-brown particles held by semi-gelatinous flakes, which separated from the water in about half-an-hour in the form of a semi-gelatinous mass. This contracted in the course of twenty-four hours to about half of its original bulk.

(4) A greyish-white sediment difficult to separate from the previous parts, and composed of very light flakes. In the course of several hours these formed a very light flocculent sediment, which continued to contract for several days.

(5) After separation of these various deposits the water still retained a slight whitish opalescent appearance, due to the presence of extremely minute particles, which, in the course of a month, formed an extremely thin, whitish film on the bottom of the vessel to which it adhered. This layer could be separated from the vessel as a very soft whitish pellicle.

Mr. Heap, at the author's request, has kindly analysed these various constituents with the results given in the foregoing table.

The composition of this sediment indicates that it is partly composed of fine particles derived from—

- (1) The filtering material.
- (2) The walls and other parts of the filter, which are composed of iron.

(3) Precipitates resulting from the addition of lime salts, and from the rearrangement of the constituents of the water during treatment. It will be noticed that this alteration in the composition of the water is one of the desired effects of treatment, and that, when a soft water is dealt with, it is reasonable to expect an increase in the amount of soluble mineral constituents.

The finer particles of iron and silica are probably produced by attrition during the washing of the filters, when the grains of sand, or broken quartz, are thrown into a state of active motion.

The suspended matter just described may, by deposition in the mains, form very slowly a thin coating, which for a long time would be incapable of reducing materially the carrying capacity of the mains, and would probably have a protecting action. Such a coating should be easily removed by simple mechanical means if it ever became too thick.

Very different effects are observed when untreated moorland waters are conveyed by iron pipes; in such cases the inner surface of the pipes is rapidly incrustated with organic matter mixed with mineral deposits. This incrustation is associated with more or less rapid erosion, more specially when the deposit scales off or is removed. The author has seen pipes lined in this way with rough nodulated deposits more than ½ in. in thickness, firmly adherent and very hard, which diminished considerably the carrying capacity of the mains.

The nature of the suspended matter which is found in treated water is interesting chiefly from this point of view, for, as previously explained, this matter does not affect either the appearance or the hygienic value of the water.

Condition 3.—The treated water not to take more than 0.35 grain of lead in solution per gallon—i.e., 0.05 part per 100,000.

The results obtained at installations A and B showed that this important condition was easily met, even in the case of water having considerable action on lead before treatment.

The author has in another place* explained that in order to obtain comparable results it is necessary to use pure bright lead under very definite conditions for the purpose of testing the action of water on that metal. The method described in the second set of conditions enumerated at the beginning of this paper does not appear satisfactory, for the author has found that the action of the same water on several new lead pipes obtained from the same source varied considerably. Some pipes yield much more lead than others. Lead pipes which have been exposed to air containing traces of sulphuretted hydrogen yield much less lead, even after several washings, than pipes which have always been kept in air free from that gas. The action of water is modified by many other factors which cannot be controlled when lead pipes are used for the purpose of this test.

Conditions 4 and 5 need not be discussed. It is sufficient to say that the treated water was always found free from odour. The question of clearness has already been discussed under clause 2.

Condition 6.—The filtered water not to contain any alumina in excess of that in the raw water previous to treatment and filtration.

The accurate estimation of the amount of alumina in the raw and in the treated water was found to involve an expenditure of time which the results did not justify. Both before and after treatment the amount found was very small, and, with very few exceptions, no excess of alumina was discovered in the treated water. The slight turbidity and the increase in the amount of solids previously alluded to cannot therefore be attributed to an increase of that product during the passage of the water through the filter.

The results of 40 analyses made in the author's laboratory by Mr. Heap may be tabulated as follows:—

INSTALLATION A.—ALUMINA IN WATER.

Reservoir 1.		Reservoir 2.		Reservoir 3.		Reservoir 4.	
Before treatment.	After treatment.	Before treatment.	After treatment.	Before treatment.	After treatment.	Before treatment.	After treatment.
0.05	0.05	0.20	0.10	0.20	0.20	0.40	0.20
0.17	0.05	0.42	0.02	0.14	0.05	0.29	0.24
0.08	0.05	0.33	0.23	0.33	Traces	0.27	Traces
0.02	0.02	0.01	0.03	0.65	0.10	0.75	0.80
0.60	0.95	0.50	0.80	0.35	0.10	0.30	0.20

Condition 7.—The filtered water not to contain:—

- (a) Any *bacillus coli communis* in quantities not exceeding 10 c.c. of water.
- (b) More than 100 bacteria growing at 20 deg. Cent. on peptone gelatine in three days in 1 c.c. of water.

With regard to installation A, quantities of raw water exceeding 10 c.c. were tested sixty-two times, and the *bacillus coli communis* was found to be present on seven different occasions. The treated water was tested the same number of times and never found to contain this bacillus in 10 c.c. Over 100 c.c. of each sample was used in each test. Installation B yielded equally good results.

With regard to the total number of bacteria, some details will be found in the table at the end of this paper. In the case of installation A, the number of bacteria found in the treated water rose above 10 on 7 occasions out of 32, and above 20 only once out of the same number of observations, when the total reached 47. The results were, therefore, eminently satisfactory, yet on four occasions on which there were only 1, 2 and 5 bacteria in the untreated water, there was an increase after treatment, but this increase was quite immaterial. If the condition as regards the number of bacteria had been stated in the form of a percentage improvement, as in the second set of conditions (No. 7), the treated water would have been condemned on those four occasions, and yet on each of them the treated water would have been of great bacterial purity. The number of bacteria in the raw water before treatment was generally low, but it reached 1,400 once, 385 once, and was about 50 or more on nine occasions.

Installation B also yielded excellent results as regards the reduction in the number of bacteria.

Condition 8.—The free ammonia present in the raw water to be reduced by at least 25 per cent. after treatment and filtration.

The author has already stated that this condition is of no importance and should never be insisted upon. As a matter of fact, it does not appear to be capable of realisation.

In the case of installation A, the results obtained in connection with each of the 4 reservoirs were as follows:—

FREE AMMONIA IN TREATED WATER AS COMPARED WITH RAW WATER.

	Increased.	Unchanged.	Reduced.
Reservoir 1	1 occasion	2 occasions	5 occasions
" 2	1 "	5 "	2 "
" 3	2 occasions	1 occasion	5 "
" 4	1 occasion	3 occasions	4 "
Totals	5 occasions	11 occasions	16 occasions

* Journal of the Royal Sanitary Institute, xxxv., p. 117, 1914.

With regard to installation B, the free ammonia was increased twice, unchanged once, and reduced once.

Condition 9.—The albuminoid ammonia in the filtered water not to exceed 0.033 grain per gallon (0.042 part per 100,000).

Installation A gave very good results. The albuminoid ammonia was reduced, sometimes considerably, on thirty-two occasions out of thirty-two. Once only was the reduction so slight as to be doubtful. The amount found in the treated water was well below the limit indicated, except on three occasions, when the amounts found in the treated water were, respectively, 0.0048, 0.0044, 0.0044—i.e., 0.0006, 0.0002, 0.0002 above the amount allowed—which are insignificant quantities well within the limits of experimental error.

Installation B yielded similar results.

Condition 10.—The oxygen absorbed from permanganate in four hours not to exceed 0.035 grain per gallon (0.05 part per 100,000).

This condition was amply fulfilled by filters A and B on thirty-four out of thirty-six occasions, and the two failures were due to exceptional and accidental circumstances. The amount of oxygen absorbed by permanganate of potash indicates the amount of oxidisable matter which is chiefly organic matter. The removal of this oxidisable matter is of importance, and this was very thoroughly effected by the filters.

Condition 11.—The permanent hardness of the water to be increased not less than 10 per cent above that of the raw water.

When dealing with hard water it might be convenient to indicate in terms of percentage how much the hardness should be reduced, but in the case of a soft water, when increase of the hardness has for object the removal of the action which the water has on lead, it is useless to demand a percentage increase. What is wanted is that the water should not act on lead, and this can be tested directly. It is also obvious that when a water is exceedingly soft, a 10 per cent increase may be quite insufficient to render the water inactive as regards lead. This is actually what happened in one instance. The hardness had been increased by treatment to the extent of 30 per cent, and yet the water had still a marked action on lead.

The reaction of the water is a better indicator of its probable action on lead, but even the reaction cannot always be depended upon, and it appears to the author safer to rely on a direct estimation of the actual action of water upon pure lead than to trust to the indications given by hardness or reaction. The reaction is, however, a valuable indicator in the practical working of filters. When one knows the average composition of water, and the extent of its action on lead, the reaction may be generally used with advantage for the purpose of determining the quantity of chemicals to be used.

The tests for reaction given in the second set of conditions quoted at the beginning of this paper do not, however, seem to the author so suitable in current work as the combined use of three indicators. Mr. Heap, who has charge of chemical water analyses in the author's laboratory, has paid special attention to this point, and has supplied the following short statement of the way in which he estimates the reaction in ordinary routine work.

Indicators—

Methyl Orange.—2 grammes dissolved in 1 litre of water.

Laemoid.—2 grammes dissolved in 1 litre of 75 per cent alcohol and water.

Phenolphthalein.—2 grammes dissolved in 1 litre of 75 per cent alcohol.

Titration.—In the case of waters showing an alkaline reaction with an indicator, they are titrated with centinormal sulphuric acid, and in the case of an acid reaction the titration is made with centinormal caustic soda. The quantities taken are 100 c.c. of the water and 1 c.c. of indicator.

The results are expressed in cubic centimetres of normal acid or alkali in 100,000 cubic centimetres of the water.

Methyl Orange.—This gives the bicarbonates of calcium and magnesium.

Phenolphthalein. Laemoid.—When no colour is given in the cold with phenolphthalein and the water is alkaline to laemoid, it means that no normal carbonates are present and that the alkalinity is due entirely to acid carbonates.

GENERAL CONCLUSIONS.

The facts recorded in this communication show that the results of treatment by coagulants and

mechanical filtration of soft moorland water are eminently satisfactory when reliable plants are used. The author has also had the opportunity of observing the effects of treatment of hard waters by the same method, and these have also been satisfactory. The seven essential conditions indicated at the beginning of this paper can easily be met when the best types of pressure mechanical filters are properly worked. As to the conditions to which the author attaches little or no importance, some have been satisfied, while others have remained unsatisfied. He would therefore suggest the following conditions as meeting the requirements of the case.—

Essential conditions—

(1) The water viewed in a 2-ft. tube shall be of a pale blue colour, or retain not more of any original yellow or brown discoloration than an amount capable of giving to the water a bluish green colour.

(2) The water viewed in a 2-ft. tube shall be clear.

(3) The water when heated to 30 deg. Cent. and to 100 deg. Cent. shall be free from any appreciable smell.

(4) One cubic centimetre of filtered water shall never contain more than 100 bacteria, capable of growing in three days on peptone bouillon gelatine (+10) incubated at 20 deg. Cent.

(5) Any quantity less than 10 c.c. of the filtered water shall not contain the *bacillus coli communis*.

(6) The filtered water shall have no material action on bright pure lead after being in contact continuously for twenty-four hours at a temperature of 20 deg. Cent. (By material action is meant an action causing the taking up by the water of more than 1 part of lead in 2,000,000 parts of water. When the lead is completely immersed, the ratio between the surface of lead and the volume of water is as 1 to 4).

(7) The hardness of the filtered water as tested by Clarke's method shall not, except in special cases, exceed 10 per 100,000.

(8) The amount of alumina in the filtered water shall not exceed the amount of alumina in the raw water.

(9) The filtered water shall contain no copper, lead, zinc, or more than traces of iron.

Conditions regarding which the scientific referee may exercise his discretion:—

(10) 100,000 parts of filtered water should not take more than 0.05 part of oxygen from permanganate of potash in acid solution in four hours at 27 deg. Cent.

(11) Free ammonia in the filtered water should not exceed 0.02 part in 100,000.

(12) The albuminoid ammonia in the filtered water should not exceed 0.005 part per 100,000.

The author cannot conclude this paper without expressing grateful thanks to Mr. T. Molyneux and to Mr. F. J. Dixon for the trouble they have taken to make certain observations, and in forwarding to the author some special samples needed to complete the work. He also desires to thank the representative of Messrs. Mather & Platt, and of Messrs. Bell Brothers, for the very ready manner in which they have replied to inquiries. The waters treated had different characters; useful comparison could be made only if the same water had been treated by both methods. The small number of examples selected for the purpose of this paper (out of a considerable number of observations) are sufficient to show that both installations have worked very satisfactorily. Finally the author wishes to acknowledge the very great help received from Dr. E. J. Sidebotham and Mr. H. Heap, who respectively have charge of the bacteriological and of the chemical analysis of water in the author's laboratory.

DISCUSSION OF PROF. DELEPINE'S PAPER.

Mr. F. J. Dixon (Ashon-under-Lyne), in opening the discussion, said he could not speak from a scientific point of view—he could only speak from actual experience which he had gained from association with Prof. Delépine—association which he could assure them had been very instructive to both of them. The paper was a very interesting one, especially when it covered two installations on a different type, and treated practically with similar classes of water. He noticed in the paper that Prof. Delépine somewhat condemned the conditions of guarantee included in installation "A." He (Mr. Dixon) happened to be the unfortunate gentleman who formulated the conditions for installation "A." That was some four years ago, and he was ready to plead that some of the conditions were severe, but if anything, they erred on the right side from the

engineer's point of view. His only regret was that when he framed his specification and conditions of guarantee he had not more knowledge of chemistry, which would have assisted him in excluding those conditions which Prof. Delépine had criticised. Another thing he regretted was that he did not call in the advice of eminent scientists, such as Prof. Delépine or Prof. Franklin, but the conditions in his case were somewhat different. He had to work at a very low cost, and his committee always raised objections to calling in outside experts. He did the very best he could under the circumstances to safeguard his committee, and he felt, especially after hearing the paper, that he had attained that object. They would, he thought, notice in the concluding remarks of Prof. Delépine that the results came out fairly satisfactorily from the basis of the original conditions which he (Mr. Dixon) included. The conditions for installation "B" were he believed laid down by a very eminent man, Prof. Franklin, and he noticed in clause 7 the Professor paid great attention to the reduction of the percentage of bacteria. He must admit that that was not a very satisfactory clause, and in his clause 7 he did not include that percentage, but he stated distinctly that there should be a certain amount of bacteria in so many cubic centimetres of water, which he thought had been fully justified by the results. The colour of the water which Prof. Delépine showed undoubtedly must be very satisfactory to them all, for it showed that of 32 samples which he examined the water was practically colourless; 95 per cent of the discoloration was removed, showing that the results from a colour point of view were very satisfactory. The references to suspended matter were undoubtedly very interesting. In his original samples which he sent to the Professor about eighteen months or two years ago, when he received the results of his examinations, he was at a loss to understand why there was such a large increase of suspended matter. He could not understand it at all. He thought the contractors would not be able to comply with those conditions, and he was very pleased to find that the increased suspended matter in the treated water was accounted for by the fine particles of the filtering medium which had evidently passed through the filter and gone into the water. He thought it was only fair to the contractors who put down his plant to say that at the commencement when they put the medium in there was a certain amount of dust caused by the granulating of the quartz or sand and that by constant washing those particles undoubtedly had increased, especially in the installation which he had under his control. They were all familiar with the medium when washing, and if anything the attrition was greater in the installation which he controlled than in the one which they visited the previous day at Kinder. In the process of watching the results of the washing of the filter medium he found after opening some of the filters that the whole of the medium was not thoroughly washed. He drew the attention of the contractors to this, and suggested that the reason was that the high velocity with which they had to drive the propellers in order to bring the medium through the central tube was too great, and did not allow sufficient time thoroughly to wash each particle of sand. The sand was pushed rapidly by, instead of being slowly pushed through the tube—at the time the speed of the propeller was something like 650 revolutions per minute. That of course was a very high speed; and he found that the life of the propeller section of the jets would be very short. He suggested to the contractors that they should reduce the speed, and they did reduce it to something like 350 revolutions, with very excellent results. The Professor was acquainted with those conditions and he could not understand why the suspended matter was not increased in the filtrate, as it had hitherto been. He (Mr. Dixon) told him in conversation what had been done to reduce the dust. He also found that the washing of filters was greatly improved by the slow speed of propellers. Referring to the sediment which Prof. Delépine found in the clear water while at Kinder, he (the speaker) was wondering how long after treatment the Professor discovered any sediment. In the sample which the Professor had passed round, and which he had had for three weeks, he (Mr. Dixon) could not detect any sediment with the naked eye. He had also had samples which had been kept for three and six months, and had never seen any sediment, and he was of opinion that there was very little sediment in

the new mains which were on the filtered side of the installation. They had an inspection cover on one of the 24-in. mains which he had inspected. There was a certain amount of small green slime, but he had never found any deposit such as was found in the clear water-well at Kinder. He was wondering whether the fine suspended matter might be due to the velocity with which the water passed through the pipes. They were greatly indebted to the Professor for giving them the constituent parts of the sediment which was found, as it proved that it was undoubtedly due to the medium and to the pipes. They would notice that the iron was very pronounced, which would be due to the interior of the filters coming away. He (the speaker) observed that in his specification he specified that the filters should have three coats of paint on the interior. In the case of the filters at Kinder those coats might remain intact, but in his case they did not, because of the scouring action of the medium driven through the pipes. The result was that the iron was exposed, and no doubt the contact of the water with the exposed iron caused those small particles of iron that were passing in the filter which the Professor discovered. He would like to know whether the Professor had since found the same quantity of iron in the water as he did when he first took the samples. Passing to another point, he thought they would all agree in thinking that the Professor had adopted a very excellent way in arriving at the action of the water on lead. They were methods which were adopted by a good many scientists, including scientific men in America and Germany. He thought that they would agree that the results obtained by the Professor were excellent, and that his test was a very severe one—far more severe than the methods hitherto adopted. He thought they had to congratulate Prof. Delépine on bringing forward those results in such an excellent way. He (Mr. Dixon) only regretted that the members were not present at the Manchester University when Prof. Delépine gave a lecture on the action of water on lead, in connection with the Royal Sanitary Institute. They could hardly realise the difference between the lead foil before and after contact. The test was undoubtedly the most severe which could be applied, and if water came out satisfactory under it he thought it was water as to which they might be well satisfied. With regard to bacteria at the works which were under his (the speaker's) control, it was very curious that after water had been passed through the filter the bacteria increased. The number of bacteria in the original water was so small that it did not affect the results, but, as he had said, it was very strange that the number in the filtrate should be increased, and he would like to hear from Prof. Delépine what was the cause of that. The indicators which the Professor enumerated in his paper were very useful to the man in charge. As he (Mr. Dixon) explained in a paper which he read in London, it would be beneficial if there was a simple method for the man in charge readily to ascertain the condition of his water for the purpose of knowing the quantity of chemicals required to deal with it. The Professor had been good enough to prepare those indicators, and they were very helpful with the exception of one case. In the case of a supply which he had at Greenfield Valley, obtained from an impounded reservoir and from springs, during a drought they used more of the spring water than of the impounded reservoir water. The reason was that unfortunately there was no waste water channel round the reservoir, which held 200,000,000 gallons, and consequently they had to put the whole of the water as it came down direct into the reservoirs. In the case of a storm a lot of suspended matter was brought down and made the reservoir very turbid. If he used a lot of the water it necessitated the flushing out of the filters perhaps every twelve hours. He had been in the habit of using a good deal of the spring water, which was hard, but he had never had those waters separately analysed. When a man used that water after drought, he must have used an excess quantity of tunnel water, which was very hard water. He had known when the hardness was equal to 16 Clarke's scale. When the man tested that water to know what the reaction would be by his indicator, which was a laemoid one, he found that it showed a neutral action, and when he sent a sample to Prof. Delépine he got a very bad report. The plumbo-solvent action in the unfiltered water showed .36, and in the filtered water it showed .26. He could not under-

stand such a result being shown, and upon investigation by Prof. Delépine, he found it was due to the excessive alkalinity which was present in the water. In the last table in the paper—table "B"—if they compared it with the two waters, he thought the results were extremely satisfactory for installation "A." They would notice that the action on lead before filtration was what he would call very excessive, in every case .36 being the minimum. In one case in July it was as high as 2, and in every case after filtration, and treatment with the very small use of chemicals—not more than .3 grain per 1,000 gallons—it was neutral. If they compared the two waters he thought the results were far more satisfactory than installation "B," because the unfiltered water was very easy water. In no case was the action on lead before filtration above .12, so it was evident that the work which installation "B" had been doing was nowhere near as severe as installation "A."

Mr. W. T. BURGESS (London) said that Prof. Delépine had given them some very valuable information concerning mechanical filters, and the reasonable conditions that might be formulated for makers. He quite supported Prof. Delépine in his criticisms as to some conditions which were unreasonable. For instance, when the water had too few microbes in it, it was absolutely unreasonable to insist that they should take a definite percentage out. In fact, as the Professor had told them, it was quite possible that water that had but few bacteria in it should come out of the filters with a larger number. With reference to the action on lead, he noticed that in one of the installations it was specified that the water should not be capable of taking up lead to a greater extent than 0.05 per 100,000. He had come across conditions in which even that proportion of lead was not desirable. He certainly thought the Professor had not erred on the side of unreasonableness in insisting, at any rate, that the water should give not more than .05 per 100,000 after treatment. For himself, he had tried all sorts of methods for testing waters for their action on lead. He had tried the method adopted by Mr. Houston in connection with his researches for the Local Government Board—using pure sheets of lead—but he still pinned his faith to trials in lead pipes, and he believed he would continue to do so. Whenever he was testing water on lead pipes, knowing the difficulty that there was in always getting the same sort of pipe, it was his habit to have control water which he knew something about, and if he was making a series of experiments he always had his pipes cut from the same new coil of lead. It was important to see that the interiors of the pipe were nice and clean, and that could only be done by rubbing—it was unsafe to use chemicals. He was quite satisfied that he would stick to lead pipes for his testing. Condition 7, referring to the hardness of filtered water, was very important, and there was a lot to be said about the question of the hardness of filtered water. He did not see that that condition was one that could be insisted upon. Hardness of the filtered water as tested by Clarke's method was not to exceed 10 per 100,000, but anybody who had anything to do with mechanical filtration and the treatment of water with chemicals knew that it was going to increase the hardness of the water. The increase in the hardness was perfectly definite, and depended upon the quantity of the chemicals used. If too much chemicals were used the cost would be so excessive as to condemn the process. He would like to see any reference to the hardness of the water omitted altogether from the conditions.

Mr. F. W. HOBSON (Loughborough) said he thought it would be interesting if Prof. Delépine would explain the nature of the figures in his paper relating to the sludge taken out of the tank at Kinder. It would also be interesting if they could be told if the deposit was obtained when the filters were first started, or whether the tank had been cleared out in the meantime.

The PRESIDENT said he had pleasure in proposing a vote of thanks to Prof. Delépine for his interesting and instructive paper. Mechanical filtration, they must remember, was the development of a process to provide drinking water which had long been used for manufacturing purposes. Mechanical filters had been in use for fifty or sixty years for clearing river water for manufacturing purposes, and it was owing to the thought and ability which gentlemen like Prof. Delépine had brought to bear upon the subject that the mechanical filter had been so perfected that the

water which was turned out by mechanical filters now was practically equal to any distilled water.

Mr. E. J. SILCOCK (Westminster) seconded the vote, which was carried unanimously.

Mr. WILLIAM PATERSON, being unable to attend personally, sent the following remarks on Professor Delépine's paper: Professor Delépine is to be heartily congratulated upon his timely paper, as the facts he brings out will undoubtedly receive careful consideration by the members of council, who, our esteemed president advises, are engaged upon the framing of satisfactory contract guarantee clauses. The title of the paper might perhaps more precisely indicate its contents were it to read "Characters of Pressure-filtered Moorland Waters," because it refers exclusively to experience of pressure filters, and the special nature of the filtrate, to which the author calls our particular attention, may, as we see, be exclusively characteristic of pressure, and not gravity filtration; further, they particularly apply to the mechanical filtration of soft, artificially hardened moorland waters and not turbid and calcareous supplies. The author remarks that, "although the results obtained were highly satisfactory, the condition of guarantee had not been fulfilled, because the effects of filtration have not turned out what might have been expected," and later says that "a consideration of what could be expected would have been sufficient to say that some of the conditions could not be realised." Consider the position of two contractors "X" and "Y" tendering to a specification containing such a guarantee clause. Let us suppose contractor "X" takes the specification seriously, and, after elaborate and costly analytical tests on the crude water before and after treatment with various reagents, proves conclusively that the guarantee required is impossible of attainment. Contractor "Y," on the other hand, swallows the guarantee clause whole and trusts to luck. Most probably he will receive the contract on the ground that he alone is prepared to guarantee fulfilment of all the clauses in the guarantee form. Obviously those responsible for the framing of the specification unwittingly inflict a grave injustice on contractor "X," who has at much expense proved by tests that the conditions required were impossible of attainment. For this reason it must be obvious that it is urgently necessary for an independent authoritative body like the Institution of Water Engineers to establish some form of guarantee which, if fulfilled, will comply with all the essential conditions of a pure potable water without calling for conditions to be complied with which no responsible contractor could conscientiously undertake. I am in entire agreement with all that Professor Delépine has to say in criticism of the guarantee clauses. There is no precision in the term "removal of 95 per cent of the discoloration," and the requirement that .45 per cent of the organic matter in solution must be removed might lead to serious misunderstanding unless it is agreed as to how this must be estimated. In one case that came under my experience the reduction of organic matter when estimated by the albuminoid ammonia test was 63 per cent, while the oxygen absorb test showed only 31 per cent reduction. Again, the free ammonia in a treated water may quite as frequently be increased as diminished, as the treatment more or less shows traces of ammonia in commercial alumina. The condition No. 10, "The oxygen absorbed from permanganate in four hours not to exceed 0.035 grains per gallon," is in some cases practically impossible of attainment. In one simple case that came under my notice lately the oxygen absorbed by the crude water was no less than .8, while this was reduced to 0.15, or 81 per cent, an excellent case, but far from complying with the figure called for by the specification. This proves the necessity, as far as possible, for making tests of samples of water obtained before giving a binding guarantee as to the official figures to be obtained. The author draws attention to the fact that, whilst under normal working conditions the water was apparently cleared, when viewed in a strong light there was a slight turbidity or opalescence due to suspended matter, composed almost entirely of minute particles which were practically ultra-microscopic, and goes on to say that when the treated water was made to pass through a sedimentation tank a dark gelatinous layer was deposited on the sides and bottom of the tank. The deposit was due to the separation of the fine par-

ticles contained in the water. From the interesting analysis given he concludes that this is composed of (1) filtering material, (2) iron from the filter walls, (3) precipitation resulting from the lime salts, and says it is reasonable to expect an increase in the soluble mineral constituents; but I venture to suggest that, while the analysis shows that results are exceedingly good, they would have been better had this insoluble precipitate been removed by the filtration process, and see no reason why this should not be effected by allowing time for the chemical reaction to complete before filtration. It is claimed that on the addition of a coagulant the reaction is instantaneous. My experience is that, while its effect in clearing the water from discoloration would lend one to imagine that this was so, time is essential for the completion of the reaction, and the slight, exceedingly minute precipitate described by the author is due to the completion of the reaction if the water has been freed from discoloration and gross suspended matter. The remedy, in my opinion, is the provision of a storage tank to allow a completion of the chemical reaction before the water passes on to the filter. The excellent summary of the essential conditions which the author has given appear to be very fair, and should be acceptable to any responsible contractor. The only suggestion that I should make is that Clause 3 might read: "The filtered water and vapour therefrom shall be free from odour at all temperatures up to 100 deg. Cent." Clause 7 seems hardly essential, as with a soft moorland water a licence to increase the hardness to 10 parts per 100,000 is too sweeping. The requirements desired could be obtained by specifying that the hardness is not to be increased more than 2 or 3 parts per 100,000. My experience is that it is generally desirable to insert a clause guaranteeing the weight and cost of the reagents required per 100,000 gallons purified. Professor Delépine is to be congratulated upon his excellent paper, which doubtless will lead to the framing of satisfactory standard guarantee clauses.

Prof. DELÉPINE said he had to thank the members for the very kind reception they had accorded his paper. He would like to remove a misconception which was in Mr. Dixon's mind. He (the Professor) did not say that Mr. Dixon was responsible for the conditions which he had criticised. Mr. Dixon was only responsible for putting them forward on the advice of experts who at the time thought them to be necessary. It was those gentlemen who made the conditions, and immediately he (Prof. Delépine) saw them he told Mr. Dixon that he thought some of them would never be fulfilled, and that if he acted shylock he would be able to break through any contract. He would reply in writing to the other questions which had been asked.

(To be continued.)

Surveyors' Institution Special Diploma Examinations.—The following members have been successful in obtaining the Special Diploma in Sanitary Science—namely, Messrs. Edgar O. Brown, Dover; George Harold Gudgeon, Bayswater, W.; Maurice K. Matthews, Tottenham Court-road, W.

Law of Private Street Works.—It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of house property (to say nothing of the occupiers of his houses) has to thread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them might be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices and he is not driven to consult a specialist. The work before us* deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1882, but not with the Metropolitan Management Acts; the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful hand-book. We find the recent decisions included, and the work seems to have been carefully prepared.—*The Builder*.

* "Notes on the Law of Private Street Works under the Public Health Acts." By J. B. Reiguer Conder, a Solicitor of the Supreme Court. 3s. 6d. nett. London: St. Bride's Press, Limited, 24 Bride-lane, E.C.

SCUNTHORPE AND CROSBY JOINT SEWERAGE BOARD.

NEW DISPOSAL WORKS.

The inauguration of new sewage disposal works provided by the Scunthorpe and Crosby Joint Sewerage Board took place on the 19th inst. The population draining to the works is about 20,000, and the dry-weather flow of sewage is about 500,000 gallons per twenty-four hours.

As the population of the two parishes is increasing rapidly, the sewers have been designed of a capacity to deal with the sewage of a population of 30,000. The disposal works are so arranged that the necessary extensions may be readily carried out in order to be able to deal with the higher figure. The whole volume of the sewage gravitates to the works at such a level as to permit of treatment through the tanks and filters without recourse to pumping.

The treatment of the sewage is as follows: On arrival at the works it is passed through screening and detritus tanks. These tanks are in duplicate to facilitate emptying and cleaning, &c. They are each 34 ft. by 6 ft. by 6 ft. deep, and have a total capacity of 15,500 gallons.

The septic tanks are 92 ft. by 22 ft. 9 in. by 6 ft. deep, and their total capacity 313,000 gallons. The filter-beds are sixteen in number, and are of the circular type with revolving sprinklers. They have a total capacity of 10,368 cub. yds. They are each 73 ft. diameter, and their average depth is 4 ft. The filtering medium is clean, hard, blast-furnace slag, and varies in size 2½-in. to ¼-in. There are two storm-water tanks, each 68 ft. 6 in. by 29 ft. 2 in. and 5 ft. deep, having a capacity of 125,000 gallons.

The total cost of the works amounts to about £31,000.

The work was divided into four contracts. The main sewer through the town was constructed by Mr. H. E. Buckley, of Bradford; the cast-iron outfall sewer and timber trestles were by Messrs. Sangwin & Co., of Hull; the disposal works by Messrs. Lane Brothers, of Manfield; and the cast-iron pipes for the outfall sewer were supplied by the Stanton Iron Company, near Nottingham; the oil engine and pump were supplied by the Campbell Gas Engine Company; the revolving distributors by Messrs. Adams-Hydraulics, Limited; the slag and floor tiles for filter-beds by Messrs. C. L. Stiff & Co., and the valves and other ironwork fittings by Messrs. W. E. Farrer, Limited. The engineers received valuable assistance throughout from Mr. J. E. Laybourn, the resident clerk of the works.

The engineers for the scheme were Messrs. Herbert Walker & Son, Nottingham.

SOME RECENT PUBLICATIONS.*

POWER AND POWER TRANSMISSION. By E. W. Kerr, M.E. Third Edition. Price 8s. 6d. nett. London: Chapman & Hall, Limited.

In preparing this the third edition of his work, the author has thoroughly revised the whole, while much has been entirely rewritten. The first of the three parts into which the book is divided deals with machinery and mechanics. The elementary principles are explained in an introductory chapter, and in subsequent chapters the several mechanical devices for power transmission are dealt with. The second part is devoted to steam power, while the final division deals with such matters as pumping machinery, internal combustion engines, water power, compressed air, and hot-air engines. The work is clearly written, and the illustrations are excellent. At the conclusion of each chapter there are several problems to be worked by the student. The new edition should be even more successful than its predecessors.

Claridge's Asphalte is being used on the roofs of King Edward's Memorial Church and Lloyds Bank Limited new premises, Hull.

"Pudlo" in Sewerage Work.—For the large sewerage works at Adare, on Lord Dunraven's estate, Pudlo has been specified to waterproof all the cement work.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

Early Examples of Town Planning in the City of Edinburgh.*

By A. H. CAMPBELL, M.INST.C.E., Engineer to the Corporation.

In this period of what may be called the renaissance of local government it is refreshing to turn to early examples of town planning furnished by the Corporation of Edinburgh and other public trusts in the laying-out of the new town.

THE OLD TOWN OF EDINBURGH.

In most striking contrast to the closely piled and many-storied blocks of the old town is the straight, rectangular plan distinctive of the new town, with its wide thoroughfares, its lavish allotment of land for gardens, and the stately edifices flanking its principal thoroughfares. It is, as it were, the swing of the pendulum from the congestion resulting from close aggregation of people who inhabited the pent-up

[Mr. Campbell is a native of Edinburgh, and received his technical education at the Heriot-Watt College and Edinburgh University as a student under the late Prof. Fleeming Jenkin. He was for six years assistant engineer in the Edinburgh burgh engineer's department, to which he returned as chief in October, 1919, after an absence of twenty-one years, during which interval he held in succession the positions of borough surveyor of Stratford-on-Avon, city surveyor of Canterbury, and borough engineer and surveyor of East Ham. He is a member of the Institution of Civil Engineers, and of the Institution of Municipal and County Engineers; also a Fellow of the Royal Sanitary Institute.]

closes of the ancient Royal Mile—known as High-street and Cannongate—to that of distribution of the people which resulted from the planning and development of the new town. But this change in the domestic and social conditions of the people was not attained without much physical change in the city's natural features. Thus, between the old town (represented at its two extremities, by the Royal Palace of Holyrood on the east, and the Fortress or Castle, crowning the rocky summit on the west) and the new town, then undeveloped, a "gulf was fixed" in the presence of the Nor' Loch Valley, a deep hollow situate at the base of the Castle Rock and thence sloping eastwards towards Calton and Canongate. The ridge of this slope has been not inaptly called "the spinal cord" of the city.

The draining of this Nor' Loch about 1763 was the first work towards the reclamation of this marsh, and the preliminary step towards its present-day service as a public park and pleasure ground, known as Princes-street Gardens. But it was essential to the development of the new town that this valley should be spanned, and thus unite the old town upon the south with the contemplated new town upon the north. Hence came the first "North Bridge," commenced in the year 1763, and opened for traffic, after

a chequered constructional experience, in 1772. The north side of the city being thus linked up to its ancient civic centre in the High-street, the territory upon the north became ripe for the founding of a new city, or rather for the expansion of an ancient city upon new lines. In 1767 an Act was obtained for extending the ancient royalty of the city over the fields to the north. Thanks to civic foresight and the natural prosperity of the city as the Scottish capital, right well has this new town developed to its present-day importance. The land was held principally by the City Corporation and the George Heriot's Trust. This ownership of the land by public bodies facilitated the steps which resulted in the adoption of a plan upon which this new town should be laid out, commencing with the plateau of Princes-street, and thence along the northern slopes of the city, with Queen-street as the boundary of this first effort at town planning.

CRAIG'S PLAN OF PRINCES-STREET, ETC. (1767)

The plan of James Craig (a local architect) was selected in competition (1767). This plan was deservedly regarded at the time as a work of genius, and when compared with the streets of the ancient city must have impressed the popular mind as nothing short of a revolution in the laying-out of a town, showing, as it did, spacious rectangular building blocks intersected by wide streets and finely conceived terminal squares, known as St. Andrew-square and Charlotte-square, on east and west respectively. Curiously, although George-street is now regarded as secondary to Princes-street, the intention of the designer was that George-street should be the principal shopping street and dominant feature of the plan, with Princes-street subsidiary or secondary thereto, and as a residential road, which indeed it was. Time has, however, effected in this respect a complete conversion and almost entire reconstruction of Princes-street into the great shopping street of the city. Writing upon this plan of Craig's, Mr. Peter Macnaughton, s.s.c., clerk to the Heriot Governors, says:—

"The enterprise of a municipality, which deliberately set out to build a new town on a new site, evoked great interest throughout the country, and King George III. took a lively personal interest in the scheme. The names of the streets testify to the enthusiastic loyalty for the Hanoverian dynasty which animated the citizens of Edinburgh through the events of the Rebellion of 1745 must have been still fresh in the memories of the people. The plan is dedicated by the author 'To His Sacred Majesty George III., the Munificent Patron of every polite and liberal art, this plan of the new streets and squares intended for ancient Capital of North Britain, one of the happy consequences of the peace, security, and liberty his people enjoy under his mild and auspicious Government, is with the utmost humility inscribed by His Majesty's most devoted servant and subject James Craig.' The street names are themselves a tribute of loyalty, the principal street, in Craig's view, being called after His Majesty himself—George-street. The squares were named St. Andrew's-square and St. George's-square, after the patron saints of Scotland and England, but St. George's-square gave way to Charlotte-square, it having evidently been regarded as somewhat invidious to omit the name of the Royal Consort. It is said that Princes-street was originally named St. Giles's-street, after the patron saint of the city but that the King, on the plan being submitted to him, expressed his disapproval, and promptly named it Princes-street, after the heir to the throne. Then we have Rose-street and Thistle-street, the respective emblems of the two countries. In his 'Memorials of Edinburgh in the Olden Times,' published in 1848, Mr. Daniel Wilson, secretary of the Society of Antiquaries, says: 'The regular array of parallelograms thus sketched out for the future city was received by the denizens of the old town with raptures of applause. Pent up in narrow and crooked wynds, its broad, straight avenues seemed the beau-ideal of perfection, and the more sanguine of them panted to see the

* Paper read at the meeting of the Institution of Municipal and County Engineers, held at Dunfermline on June 5th and 6th.

magnificent design realised. Some echo of their enthusiastic admiration still lingers with us.”

PRINCES-STREET GARDENS (1763-1816).

The great valley of the Nor' Loch, at that date just

somewhat of the latent value of the land for such profitable purpose as its conversion into building sites. Building operations were actually begun, but the public sense prevailed, so that, after much pro-

EDINBURGH TOWN PLANNING: PLAYFAIR'S CALTON HILL PLAN. 1819.

reclaimed by drainage and bounded by the broad boulevard—now Princes-street—formed a most tempting site for building developments, especially so to proprietors, it may be, needy and eager to realise

tracted litigation, an Act of Parliament was obtained in 1816 enacting, *inter alia*, "That it should not be lawful, nor in the power of the Lord Provost, magistrates and council, or their successors in office to

erect or sanction the erection of any building whatever to be erected in any part of the ground belonging to the community of the said city on the south side of Princes-street."

From this Act, confirmed and re-enacted by subsequent Acts, dates the preservation of this uniquely beautiful valley in the centre of the city as a perpetual pleasure ground for the people—probably unsurpassable in its combination and variety of natural features unspoilt by the builder's and the gardener's art, which have their part, nevertheless, in this beautiful city landscape.

The realisation of Craig's building plan proceeded rapidly, and culminated in the building of Charlotte-square (1800) as a terminal feature upon the west. This square is probably the most dignified and stately of all our city squares, the architecture being noted as one of the finest works of Adams. With the then approaching completion of Craig's plan, and the continued demand created by the flow of fashion migrating from the High-street and Cannongate to this new town, the need arose for the development of further building lands, lying still northwards, and declining towards the valley of the Forth.

LEITH WALK (1774).

Mention must here be made of the formation of Leith Walk in 1774, a great highway extending from Princes-street, Edinburgh, to the heart of Leith—a distance of $1\frac{1}{2}$ miles, and having a width of from 68 ft. to 163 ft.

REID AND SIBBALD'S PLAN FOR NORTH SIDE (1804-6).

Again resort was had to a town plan, and in turn that piece of land bounded by Heriot-row upon the south to Fettes-row upon the north, and from Bellevue on the east to the old-time village of Stockbridge on the west, was made the subject of a town plan. This land again was vested, principally in Public Trusts, and so enabled this large tract to be treated and planned out as one subject. This development plan, prepared about 1806, adheres to the bold conception—although albeit severe formality—of Craig's scheme for Princes-street, George-street and Queen-street areas.

The joint authors of this plan were Messrs. Robert Reid and William Sibbald—the former being the architect to His Majesty in Scotland, while the latter held the position of city superintendent of works. . . . The leading ideas are streets and buildings ranged in rectangular order, straight, but impressive by their great width, fronted by palatial buildings, chiefly of a residential kind, and having that continuous stretch of woodland and greenery as garden ground, extending practically the entire length of the plan from east to west, between Queen-street on the south and Heriot-row upon the north, with the gardens of Drummond-place and Royal-circus balancing the northern fringe of this area.

GARDEN SPACES THE LUNGS OF A CITY.

It is the free introduction of the garden idea into those early plans, both of Craig and again of Reid and Sibbald, that give to them such outward attractiveness, and add to their worth from a public health and amenity point of view. The inclusion of such "lungs" as essential adjuncts of city development is evidence of the foresight of the planners, and of the appreciation, by landowners and citizens alike, of those things that really matter, and which stamp a city as composed of something more than mere stone and lime, or an accumulation of bricks and mortar. This recognition of recreation or airing spaces as vitally essential to the growth of a town has set the pace, which, happily, has been well maintained in other areas which followed on, north and south of the ancient city boundary, such as Moray-place, Ainslie-place, and in more recent times the squares and gardens of the west end; while the gardens of George-square, Nicolson-square, St. Patrick-square, Gayfield-square and St. James'-square, &c., all pay tribute to the same idea of a central garden space as indispensable to the successful hygienic grouping of buildings and the growth of communities.

It is regrettable that this custom of those early planners has not been followed in the more utilitarian plans of later days, and thus have preserved for the city in those areas of a crowded kind spaces and airing grounds for the inhabitants. The passion for extracting from the land its utmost yield in building, and therefore in money, applied not indeed so much in Edinburgh as in other cities, and seems to have obsessed the owners to the exclusion of those finer points of estate planning, indicative of regard for

amenity and for health. It is well, therefore, that a new era has set in, and the public sense reawakened to the need for the garden and the playing-field as indispensable parts of the planning of building estates, and the initial contribution of the landowner towards the necessities of his future subjects resident upon the land. We . . . see in the succeeding plans how this provision of air space was still further developed—or neglected—in the plans for the Calton Hill and the district lying away to the north thereof, and partly within the burgh of Leith. This was a very large part of the city, at its north-east boundary, and bordering the neighbouring burgh. The land was owned principally by the corporation as trustees of the Trinity Hospital, and by George Heriot's Trust, together with other interests of a minor kind.

CALTON HILL AND LANDS TO THE NORTH THEREOF: PLAYFAIR'S AND OTHER PLANS (1819).

Again, the results of voluntary combination by the landowners are to be witnessed in the singularly impressive series of competitive plans . . . prepared about the year 1819.

[In submitting photo copies of these plans to the members, Mr. Campbell observed that they provided material not only of present-day interest in the doings of our city rulers a century ago, but were real object lessons and examples worthy, in their main features, of reproduction in the plans of the present. They were instructive too as works of art, and in that respect might encourage the youthful town planner of to-day in the clear and graphic expression of his ideas by drawings that indicated care and displayed skill in design, culture of hand, as well as quality of head, combining at once the conception of the artist and the common sense and practical experience of the man of affairs. It was those qualities that were, he said, needed in the town planner of to-day, and if those century-old town plans were studied as examples of the art and science of town planning, much good would have been done. Space and time forbade a critical exposition of each plan which, with possibly one exception, were in their leading lines and their general treatment remarkably good. Like the plans which preceded them of earlier areas, they were deficient in points and matters now deemed essential. It was sad to relate that the adopted plan of Playfair's had suffered much mutilation in execution owing primarily to the incursion of railways in the Leith-walk locality, so that it was only the noble terraces that girdled the Calton-hill and the fringe of the hillside upon the north that had been realised.]

EFFECT OF RAILWAYS UPON TOWN PLANS.

Truly the havoc of the railway age and the commercialism of the latter part of the nineteenth century seem to have paid scant respect to the better vision and the finer conception of an earlier generation. Although too late to redeem that particular area from the hands of the spoiler, the lessons taught by that period of decadence remain with us as a warning against the intrusion of a railway into the realm of a town plan, except under adequate safeguards, securing the area against the wrecking of unconsidered railway plans. Railway expansion may go hand-in-hand with town planning, and this is the business of the town planner, that he may ensure the land against ill-considered proposals whether of a railway or other enterprise. Intelligent co-operation and timely representation can generally secure the desires of both without injury to the plan of development.

The next area to be taken in hand was that tract of land, the property of the Earl of Moray, overlooking the water of Leith and Dean Valley, and embracing Moray-place, Ainslie-place, Randolph-crescent and Cliff. For this area plans were prepared by Gillespie Graham about the year 1823, and this plan probably approximates nearest to the ideas of the town planner of to-day in the freedom and informality as compared with the earlier plans referred to in this paper.

MORAY-PLACE, ETC.: GRAHAM'S PLAN (1823).

The site of this was exceptionally fine, including, as it did, the wooded and grandly picturesque slopes of the water of Leith Valley. The plan of development is made to dovetail into the western termination of Craig's plan of Princes-street and Queen-street, and of Reid and Sibbald's plan of the territory to the north thereof. Internally this plan of Graham's is attractive and novel in its departures from the straight lines of the earlier plans. In lieu thereof we have the curved lines of Moray-place, Ainslie-place and Randolph-crescent encircling a series of gardens along the

axial line of the plan and flanked by palatial town mansions of exceptionally dignified architectural treatment. This is noticeably so in Moray-place. Criticism is sometimes directed against Graham's plan that it disposes the "backs" of the houses towards the Dean Bridge and the deep valley of the Water of Leith spanned by that bridge. In explanation of this seemingly reasonable objection it should be remembered that this plan was prepared at least nine or ten years before the Dean Bridge was erected, or probably even projected. There was therefore no justification from a public point of view why at that date buildings should front instead of back upon the valley; nor can it be seriously maintained that any loss of amenity has been suffered by reason of the disposition adopted. The many-storied mansions of Moray-place, crowning the wooded slopes of the valley, and the terraced treatment of the gardens of those mansions, present from the bridge a combination at once pleasing to the eye, effective as a picture, and void of offence against the æsthetics of this beautiful valley.

WEST-END DEVELOPMENTS: MELVILLE-STREET, ETC.

Concurrently with the development of the Earl of Moray's estate came the western outgrowth of the city in those streets called Melville-street, Coates-crescent, Atholl-crescent, &c. The planning of this area is in no wise inferior to the excellence of the earlier examples that have been described. Modelled upon similar lines, the area worthily sustains the traditions of the New Town, both as regards the width of its streets and the quiet dignity of its architecture. The later additions to or extensions of this plan in the buildings of St. Mary's Episcopal Cathedral at the extreme west end of Melville-street and directly in line thereof form a noble terminal feature to the west, with St. George's Established Church and its domed crown close in the view towards the eastern end.

IMPORTANCE OF SUITABLE VISTAS IN TOWN PLANNING.

Those terminal features serve to show the importance in town planning of securing good and suitable vistas as the natural and proper termini to leading thoroughfares, and that not only in the formal type of town planning, but likewise in the freer treatment of the informal style adopted in the planning of suburban parts. It will be conceded that the various designers of the New Town of Edinburgh recognised the part which may be played in giving to leading streets suitable terminal features. To mention a few, consider Princes-street with the Calton-hill, and its many monuments closing in the eastern vista, while St. George's Campanile Tower and the stately spire of St. Mary's Cathedral terminate the western view; or, again, George-street, with its Melville Monument on the east and St. George's parish church and dome on the west; Howe-street, with the appropriately disposed St. Stephen's Church at its northern terminus; or Hanover-street, with the classic Royal Academy in the immediate foreground, backed by the turreted terminals of the Assembly Halls, and crowned by that triumph of Gothic architecture in the lofty spire by Pugin; or see the Scott Monument from St. Giles'-square; while the Castle is the dominating feature, visible from all points of the city's compass. All these and many others that attract the eye at nearly every turn in our New Town bear witness to the foresight of those early planners, to whom we must pay grateful tribute, and to the passion that then prevailed of adorning, by worthy architectural dispositions, the city so favoured initially by Nature, and yet also presenting, by reason of Nature, those very barriers that have made the planning of the city and the linking up of its several parts so physically difficult and so constructionally expensive. Upon this aspect of the subject the following notes are submitted.

The author has mentioned the North Bridge as the first link in the chain of important connecting works undertaken by the corporation for the bridging of the valleys by which Nature had seemed to bar the city's growth. The influence of the first North Bridge in opening up the north side has been apparent. A like problem awaited solution in preparing the way for another new town waiting to grow up on the southern slopes of the old city. This was to be accomplished through the building of the South Bridge.

SOUTH BRIDGE (1735-1738)

is a viaduct about 300 yds. long, spanning the Cowgate Valley, and immediately to the south of High-street. The roadway is carried upon a series of nineteen arches built up in flatted sections with a longitudinal partition wall under the centre of the street, and divid-

ing the business premises that now line this highway. Those arches serve as vaults and stores attached to the shops, and as cellarage to the premises on the lower levels of the street. Constructionally this work must have involved heavy cost, and presents much interest to the student of design, revealing evidence of ingenuity in suiting the supports of the bridge to the future service of the street and its frontages. South Bridge is now one of the principal shopping centres; it has a width of 60 ft., and crosses the Cowgate at a height of 37 ft. Its cost, including the purchase of the old Merlyn's Wynd and buildings, is stated to have been £65,000. The new building sites fronting this new road realised upwards of £80,000; truly "there is that scattereth and yet increaseth." The formation of this new highway prepared the way for the development of the city upon its south side, commencing with the laying out of the suburb of Newington about 1806.

THE MOUND (1781-1830).

Another valley crossed, to unite the old with the new town upon the north, was the site of the old Nor' Loch, at a distance of about 600 yds. west from the North Bridge, and called "The Mound." It is so named because the crossing is effected by a great mound of earth, designated at one time "The Mud-Brig." Commenced about the year 1781, it served as a "toom" for the deposits of earth and rubbish (obtained, doubtless, from the building up of the New Town). It is computed to contain about 2,000,000 cartloads of earth. Although opened for traffic in 1787, it continued to be widened and improved until, in 1830, it was completed substantially as it now appears. The Mound is now pierced by two tunnels carrying the main lines of the North British Railway through the Princes-street valley. Flanked upon both sides by grassy slopes, and winding steeply up the hill, the Royal Scottish Academy at the base and the Bank of Scotland at the summit are worthy subjects of architectural study, and give to this highway its own distinctive charm. It is about 400 yds. in length, and has a road width of 50 ft.

REGENT BRIDGE, WATERLOO-PLACE AND REGENT-ROAD (1815-1819).

Spanning a deep ravine known as the Lower Calton, and thence skirting the southern slope of the Calton-hill, this work was really in the nature of a viaduct for about 160 yds. of its length. It opened out the enclosure which till then, by a block of mean buildings, terminated the eastern end of Princes-street, and concealed the fine prospect of the Calton-hill and its monuments as the natural and fitting terminal feature of Princes-street, of which it now forms the eastern prolongation, and the leading highway out of the city to Dunbar, Berwick and London. This work was first projected in 1784, soon after the completion of the North Bridge and the commencement of Princes-street developments; but it was not until 1817 that it took active shape, being opened in 1819 by Prince Leopold, afterwards King of Belgium. It was fitting, following upon the triumph of Waterloo, that the Sovereign-designate of that country should be associated with the work perpetuating in name that memorable victory. The roadway of Waterloo-place is carried from the low level by a series of arches which are now enclosed, and used in conjunction with the business premises which front the highway. Owing to the depth of the ravine and its precipitous nature, the work must have been of a difficult and costly kind. The clear width of the road is 70 ft.; the height of viaduct is 50 ft.; the total length of this highway, including Regent-road as the essential part of the scheme, is 1,300 yds.

KING'S BRIDGE AND JOHNSON-TERRACE (1827).

Constructed about 1827, this highway forms an easy decline from the Lawnmarket to Castle-terrace, immediately skirting the south base of the precipitous Castle Rock, rising at its side to a height of about 260 ft. This work must have involved the clearance of many ancient buildings, which stood upon the site of what is now the Tolbooth Parish Church, and forms the eastern termination of the new road, where it debouches from the old Castle Hill. It must also have involved the cutting through of much rock to form the fine terrace which it now presents. The length of this road is about 600 yds., and its width 65 ft.

GEORGE IV. BRIDGE (1827-1836)

is a viaduct running parallel to the South Bridge, and a work of precisely similar nature, spanning the

same valley at a distance of about 400 yds. westward therefrom. It is really the sequel to "The Mound," of which it forms the continuation southwards, and thus operates to the relief of traffic from the South Bridge. It is raised upon a series of arches, fully 300 yds. in length, some two or three stories in height, the top story showing an exceptionally fine piece of finished masonry, well worthy of inspection and study as an exhibition of grained vaulting. The cost of this work alone is stated to have been very great; considered side by side with the South Bridge, which is a work of even greater magnitude, and the limited resources of those days, this must have demanded on the part of the city rulers much courage and enterprise, especially when we remember those earlier works of heavy cost, for the repayment of which the city's finances were chargeable.

Those various undertakings of bridge and highway construction, however, had opened the way for the rapid developments which followed upon the south side of the city, in the Newington, Grange, Blackford, and Warrender Park districts. It is difficult to conceive how such developments would have been possible without those two arterial lines of communication in the South Bridge and George IV. Bridge. Without them, the only accesses would have been St. Mary-street and Pleasance upon the east, with the West Bow and Candlemaker-row upon the west. The very thought of such unsuitable accesses stirs a sense of gratitude to the city fathers of those days who, foreseeing the needs of the morrow, were not afraid to venture, even at such great cost, to prepare the way for those developments, upon which the growth and progress of the city depended.

THE DEAN BRIDGE (1832).

The provision of suitable means of communication was essential to the development of the lands of Dean Park, lying to the north and west of the Dean Valley.

By the co-operation of town council and landowner—although principally at the cost of the latter (Lord Provost Learmouth)—the now famous Dean Bridge was erected about 1832 from the design of Thomas Telford. This bridge, by virtue of the eminence of its engineer, its strikingly impressive design, and its picturesque setting, has acquired a deserved acknowledged reputation as one of the sights of the city. It is probably the finest example of a stone arch bridge to be found. It consists of four arches, each 96 ft. span, and 106 ft. high to road level. Its total length is about 450 ft., with a 39-ft. width between parapets. Although when built its immediate purpose was local estate development, it is now the leading highway to that greater engineering achievement the Forth Bridge, and *via* Queensferry it is the direct highway to the North of Scotland.

But these works, numerous and costly though they were, do not complete the chain of city improvements falling within the title of this paper. The formation of Cockburn-street and the old Waverley Bridge, carried out by private enterprise about 1859; also Chambers-street, Jeffrey-street, St. Mary-street, and Marshall-street, &c., included within that programme of city improvements during the *regime* of Lord Provost Chambers (1870), and works of a subsequent date (1895) which embraced the reconstruction of the North Bridge at a cost of about £217,000, testify to the fact that each generation has now for fully 150 years busied itself with thinking out and putting into execution schemes for the betterment of the city, and making it worthy of the reputation it has earned as "The City Beautiful."

There is still scope left, although it may be upon a scale less grand and formal, yet nevertheless essentially beneficial, and needing the exercise of the same qualities as influenced our predecessors in their day, so that the present generation may make its contribution and add its link to the continuing chain.

Abstract of the New Town Planning as shown on Map on view at the meeting.

CITY OF EDINBURGH.

PLANNING OF NEW TOWN A.D. 1767-1912.

Area embraced	796 acres.
Building area	322 acres
Roads	160 "
Public parks and open spaces	314 "
Total	796 acres
Number of houses within area equals	8,351
Equals a density of 10.5 houses per gross acre.				

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. S. PICKERING, M.INST C.E., Borough Surveyor and Water Engineer, Cheltenham.

EASTERN DISTRICT.

An Eastern District meeting will be held at Tilbury on July 25th.

CLEETHORPES MEETING.

A meeting of the institution will be held at Cleethorpes on September 19th.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.S.C.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland this month, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

NORTH-WESTERN DISTRICT MEETING.

(July 3 and 4, 1914.)

PROGRAMME.

Friday, July 3rd.

General council meeting, tea and social to be held at the Mitre Hotel, Manchester.

6 p.m.—Tea. (Tickets, 2s. per head.)

7 p.m.—Council meeting.

8 p.m.—Smoking Concert, for which a capital programme has been arranged.

Saturday, July 4th.

Visit to the Ashton-under-Lyne, Stalybridge and Dukinfield waterworks.

EASTERN AND NORTH-EASTERN DISTRICTS.

A visit will be paid by these districts of the institution to-morrow (Saturday) to the quarries of the Enderby and Stoney Stanton Granite Company, Nareborough.

B. WYAND,
39 Victoria-street, S.W. *Secretary.*

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

SURVEYOR'S ASSISTANT.—June 29th.—Abertillery Urban District Council. £80 per annum.—Mr. William Gait, clerk.

SURVEYOR'S ASSISTANT. June 29th.—Corporation of Luton. £80 per annum.—Borough Surveyor.

JUNIOR ASSISTANT. — June 29th. — Somerset County Council. £80 per annum.—Mr. Edward Stead, county surveyor, Wells.

TEMPORARY SEWAGE WORKS ASSISTANT.—June 29th.—Corporation of Dewsbury. £2 2s. per week.—Mr. Henry Dearden, borough surveyor.

SURVEYOR'S ASSISTANT.—June 29th.—Slough Urban District Council. £90—£120 per annum.—Mr. W. W. Cooper, surveyor.

BOROUGH SURVEYOR'S ASSISTANT.—June 30th.—Corporation of Middleton. £90 per annum.—Mr. F. Entwistle, town clerk.

ARCHITECTURAL ASSISTANT.—July 1st.—Dewsbury Town Council. £90.—Mr. H. Ellis, town clerk.

TEMPORARY SURVEYING ASSISTANT.—July 2nd.—Royton Urban District Council. £2 2s. per week.—Mr. Ellis Harrison, clerk.

TEMPORARY ASSISTANT SURVEYOR.—July 4th.—Failsworth Urban District Council. £2 per week.—Mr. H. C. Broome, clerk.

SANITARY INSPECTOR.—July 4th.—Lewisham Borough Council. £150—£200.—Mr. E. W. Wright, town clerk, Town Hall, Catford, S.E.

TEMPORARY ASSISTANT.—July 4th.—Corporation of Chard. £78 per annum.—Mr. E. W. Hearn, borough engineer and surveyor.

ASSISTANT SURVEYOR.—July 4th.—Antrim County Council. £120.—Mr. A. Millar, deputy secretary, County Courthouse, Belfast.

SURVEYOR'S ASSISTANT.—July 4th.—Kidderminster Rural District Council. £1 10s. per week.—Mr. G. J. Shepherd, surveyor, 85 Chester-road, Kidderminster.

BOROUGH SURVEYOR'S ASSISTANT.—July 6th.—Corporation of Loughborough. £120 per annum.—Mr. Henry Perkins, town clerk.

SECOND ASSISTANT.—July 6th.—Devon County Council. £2 2s. per week.—Mr. R. M. Stone, county surveyor (northern division), The Square, Barnstaple.

CLERK OF WORKS.—July 6th.—Devon County Council. £3 per week.—Mr. W. P. Robinson, county surveyor (No. 2 division), 22 Queen-street, Exeter.

CLERK OF WORKS.—July 6th.—Ruislip-Northwood Urban District Council. £3 3s. per week.—Mr. Edmund R. Abbott, clerk, Northwood, Middlesex.

BUILDINGS SURVEYOR.—July 7th.—Hentley-on-Thames Rural District Council.—Mr. A. R. Lloyds, clerk.

CLERK OF WORKS.—July 7th.—Minehead Urban District Council.—Mr. L. C. Webber-Inledon, clerk.

ASSISTANT COUNTY SURVEYOR.—July 8th.—Somerset County Council. £200 per annum.—Mr. Edward Stead, county surveyor, Wells.

ASSISTANT SANITARY INSPECTOR.—July 15th.—Highland District Committee of the Perth County Council. £100.—Mr. R. McNicoll, County Buildings, Perth.

CITY SURVEYOR.—August 4th.—Municipal Council of Sydney, New South Wales. £1,000—£1,300 per annum.—Mr. Thomas H. Nesbitt, town clerk, Town Hall, Sydney.

DISTRICT ENGINEER.—Public Works Department of the British Guiana Government. £300—£400 per annum.—Crown Agents for the Colonies, Whitehall-gardens, London.

YOUTH.—Surrey County Council.—Mr. A. Dryland, county surveyor, County Hall, Kingston.

WESTMINSTER.—July 8th.—For internal and external painting works and repairs at the Marshall-street public baths, for the city council.—City Engineer, City Hall, Charing Cross-road, W.C.

CARLISLE. July 9th.—For the extension of electric lighting station, for the corporation.—Mr. H. C. Marks, city engineer and surveyor.

OSWALDTWISTLE.—July 9th.—For the erection of a public library, for the urban district council.—Mr. F. Q. Farmer, architect, 14 Little Park-street, Coventry.

LAUNCESTON.—July 9th.—For the erection of twenty-four cottages, for the corporation.—Town Clerk.

CROYDON.—July 10th.—For the erection of a school, for the Education Committee.—Education Office, Katherine-street, Croydon.

SUNDERLAND.—July 11th.—For the erection of a training college and hostels, for the corporation.—Borough Surveyor.

HITCHIN.—July 13th.—For the erection of an isolation hospital, for the rural district council.—Mr. A. E. Passingham, clerk.

CROYDON.—July 14th.—For the erection of a covered steel shed, for the corporation.—Borough Engineer.

KESTEVEN.—July 15th.—For additions and alterations to schools, for the Education Committee.—Mr. H. Donaldson, County Education Office, Grantham.

GRANTHAM.—For the erection of two cottages, for the corporation.—Borough Surveyor, Guildhall.

Iron and Steel.

STOCKHOLM.—July 3rd.—For the supply of 15,800 metres of wrought-iron piping, for the Stockholm waterworks.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, London, E.C.

TIPTON.—July 4th.—For the supply of a Lancashire boiler, for the urban district council.—Mr. S. O. Stephenson, engineer and surveyor.

GOOLE.—July 6th.—For the erection of a 4-ton travelling crane, for the urban district council.—The Clerk.

BELPER.—July 9th.—For laying cast-iron mains, for the rural district council.—Mr. G. Pym, clerk.

ST. PANCRAS.—July 13th.—For supplying and fixing a Cornish boiler at public baths, for the borough council.—Mr. C. H. F. Barrett, town clerk.

CHELMSFORD.—July 13th.—For the supply of cast-iron pipes for water mains, for the corporation.—Mr. G. Melvin, town clerk.

Roads.

COTTINGHAM. June 29th.—For the supply of broken whinstone, granite, and screened chippings, for the urban district council.—Mr. J. H. Hanson, surveyor.

HARROGATE.—June 29th.—For private street improvement works, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

BURNLEY.—June 29th.—For making up certain streets, for the rural district council.—Mr. H. Pritchard, surveyor.

ALTOFTS.—June 29th.—For the construction of new footpaths, for the urban district council.—The Surveyor.

RHYL.—June 29th.—For the construction of tarmacadam paving, for the urban district council.—Mr. A. A. Goodall, surveyor.

TOTTENHAM.—June 30th.—For laying creosoted deal paving, and other works, in portion of Turpikelane, for the urban district council.—Mr. W. H. Prescott, engineer, Town Hall, The Green, Tottenham.

WOODFORD.—June 30th.—For road construction with creosoted deal blocks, for the urban district council.—Mr. W. Farrington, surveyor.

BROMLEY (Kent).—June 30th.—For paving the carriageway in the main London road, a portion of High-street, East-street and Market-square with creosoted wood blocks, including the necessary excavation and concrete foundation, approximately 21,100 yds. super., for the corporation.—Mr. Fred H. Norman, town clerk.

HUNSLET.—June 30th.—For making up private streets, for the rural district council.—Mr. W. B. Pindar, clerk.

HOVE.—July 1st.—For paving and other works, for the corporation.—Mr. H. H. Scott, borough surveyor.

BASINGSTOKE.—July 1st.—For steam rolling work, for the rural district council.—Mr. R. Forrester, surveyor.

HASLEMERE.—July 2nd.—For the supply of 600 tons of 1½-in. and 2-in. broken granite, for the urban district council.—Mr. Howard V. Snook, surveyor.

GODSTONE.—July 4th.—For the supply of tarmacadam and bituminous materials, kerbing, channeling, tools, oils and iron goods, and hire of steam rollers, for the rural district council.—Mr. Geo. Crowter, engineer and surveyor.

ILFORD.—July 4th.—For repairing tar-pavings, for the Education Committee.—Mr. H. Shaw, engineer and surveyor.

SAFFRON WALDEN.—July 4th.—For making up a road, for the corporation.—Mr. A. H. Forbes, borough surveyor.

RUISLIP-NORTHWOOD.—July 4th.—For making up Hilliard-street, Northwood (about 600 yds.), for the urban district council.—The Surveyor, Council Offices, Northwood.

RUISLIP-NORTHWOOD.—July 4th.—For making up part of Dene-road, Northwood (about 260 yds.), for the urban district council.—The Surveyor, Council Offices, Northwood.

HARROW.—July 4th.—For the supply of broken granite, granite chippings, tarred granite, and tarred granite chippings, for the urban district council.—The Surveyor.

KEYNSHAM.—July 6th.—For making up a road, for the rural district council.—Mr. H. M. Bennett, surveyor, 36 Corn-street, Bristol.

SEAFORD.—July 6th.—For the supply of 1,000 tons of granite, for the urban district council.—The Surveyor.

BROMLEY (Kent).—July 6th.—For works of private street improvement in Somerset-road, Wiltshire-road and St. John's-road, for the rural district council.—The Surveyor, Maulden House, Sidecup-hill, Sidecup.

LOUGHTON.—July 6th.—For the supply of granite and gravel, and hire of steam roller, for the urban district council.—Mr. H. White, surveyor.

LEWISHAM.—July 7th.—For supplying and laying wood paving, for the borough council.—The Borough Surveyor.

MAESTEG.—July 7th.—For private street improvement works, for the urban district council.—Mr. S. J. Harpur, engineer.

HAMMERSMITH.—July 8th.—For paving the carriageways and footways of Letchford-mews and Willow-vale, for the borough council.—Mr. H. Mair, borough surveyor.

HORNSEY.—July 8th.—For paving works with creosoted deal blocks, for the corporation.—Mr. E. J. Lovegrove, borough engineer and surveyor.

ST. HELENS.—July 13th.—For granite paving work, for the corporation.—Mr. A. W. Bradley, borough engineer.

BROADSTAIRS.—July 13th.—For the supply of a 10-ton steam roller with scarifier, for the urban district council.—Mr. H. Hurd, surveyor.

CHELMSFORD.—July 15th.—For paving Duke-street with creosoted deal blocks, for the corporation.—Mr. P. T. Harrison, borough engineer.

PERTSHIRE.—July 31st.—For the reconstruction of 25 miles of road through Glen Dochart, Glen Falloch and Strath Fillan, in the parish of Killin, for the Western District Committee.—Mr. W. L. Gibson, engineer and surveyor, Post Office Buildings, Dunblane, Perthshire.

Sanitary.

WHITSTABLE.—June 29th.—For the supply and erection upon the sewage disposal works at Swalecliffe of a sludge pump to deliver 4,000 gallons of sewage sludge per hour, and an oil engine to drive the same, together with accessories, for the urban district council.—Messrs. Strachan & Weekes, 9 Victoria-street, Westminster, S.W.

NEWPORT (Mon.).—June 29th.—For the construction of a stoneware pipe sewer, for the corporation.—Borough Engineer.

ELY.—June 29th.—For sewerage works, for the urban district council.—The Surveyor.

MANCHESTER.—June 30th.—For work of re-draining, for the corporation.—Mr. W. Moss, inspector, Town Hall, West Didsbury.

READING.—June 30th.—For sewer construction, for the corporation.—Mr. J. Bowen, engineer and surveyor.

KIRKCALDY.—July 1st.—For the construction of sewers, for the corporation.—Borough Surveyor.

LLANDAFF.—July 1st.—For works of sewerage, for the rural district council.—Mr. J. Holden, engineer, Park House, 20 Park-place, Cardiff.

WALMER.—July 1st.—For the construction of sewers and manholes, for the urban district council.—Mr. H. W. Barker, engineer and surveyor.

BIRMINGHAM.—July 1st.—For the construction of about 1,550 yds. of brick sewers, and 2 miles of stoneware pipe sewer, together with railway and canal crossing and cast-iron and stoneware pipe drains, for the corporation.—Mr. Henry E. Stilgoe, city engineer and surveyor.

SWANSEA.—July 2nd.—For works of sewage, for the corporation.—Borough Engineer.

RUISLIP-NORTHWOOD.—July 4th.—For the construction with iron or earthenware pipes of 362 yds. of 9-in. sewer at Eastcote, for the urban district council.—The Surveyor, Council Offices, Northwood.

PRESTON.—July 7th.—For alterations at sewage disposal works, for the rural district council.—Messrs. Myers, Yeevens & Myers, 15 Chapel-street, Preston.

WREXHAM.—July 9th.—For work of sewer construction, for the corporation.—Mr. J. England, borough engineer.

BELPER.—July 9th.—For the construction of sewage disposal works, for the rural district council.—Mr. R. C. Cordon, surveyor, Duffield, near Derby.

LICHFIELD.—July 9th.—For the construction of sewage purification works, filters, and manholes, also for laying approximately 1,820 yds. of 15-in., 4,860 yds. of 9-in., and 2,000 yds. of 6-in. stoneware socket pipes, and erecting ventilating columns, for the rural district council.—Mr. C. O. Rawstron, engineer.

ASHFORD.—July 9th.—For the construction of an ejection station with pneumatic ejectors and air-compressing plant, 240 yds. of 6-in. rising main, and a set of sewage purification works, for the West London District School Managers.—Mr. Arthur Martin, 7 Victoria-street, Westminster, S.W.

BARROWFORD.—July 11th.—For the construction of sewage disposal works, for the urban district council.—Mr. F. Sutcliffe, surveyor.

SCARBOROUGH.—July 15th.—For a sewage purification installation, for the rural district council.—Mr. J. A. Iveson, surveyor.

BRADFORD.—July 20th.—For the construction of a circular outfall sewer in tunnel, for the corporation.—Mr. J. Watson, Town Hall.

Stores.

ROTHERHAM.—July 8th.—For the supply of requisites, for the Electric Light and Tramways Committee.—Engineer and Manager.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance. ‡ Provisionally accepted.

CHARD.—Accepted for the construction of covered reservoir, well, tunnel, and the laying of 7-in., 5-in., 4-in., 3-in. and 2½-in. cast-iron water mains, valves, hydrants, and other castings, for the corporation.—Messrs. Dodd & Dodd, Birmingham:—

APPOINTMENTS WANTED.

PREPAID Advertisements under this heading are inserted at the rate of ONE PENNY per word, with a minimum charge of 2s. THREE consecutive insertions given for the price of Two.

ASSISTANT desires appointment in Surveyor's Office. Good knowledge of building and road making; neat draughtsman; moderate salary. Free immediately.—Box 1,437, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,742)

TENDERS WANTED.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

**BOROUGH OF HAMMERSMITH.
TO PAVING CONTRACTORS.**

The Borough Council invites Tenders for paving the carriageways and footways of Letchford-mews (part) and Willow-vale (northern portion), total length, approximately, 650 ft.

Plans may be seen, and Specifications and Forms of Tender obtained, on application to Mr. H. Mair, Borough Surveyor, after Monday, 29th June instant.

Sealed Tenders, endorsed "Tender for Paving Works," must be delivered to me not later than 4 p.m. on Wednesday, 8th July, 1914.

The Council does not bind itself to accept the lowest or any Tender.

LESLIE GORDON,
Town Clerk.

Town Hall, Hammersmith, W.
June 23, 1914. (1,737)

**COUNTY COUNCIL OF PERTSHIRE.
WESTERN DISTRICT.**

Tenders are invited for the reconstruction of 25 miles of road through Glen Dochart, Glen Falloch, and Strath Fillan, in the Parish of Killin.

The construction includes the widening of five Bridges and the erection of a new one; raising levels of roadway and the building of Retaining Walls; also Metalling, Steam Road Rolling and Surface Tarring.

Conditions and Specifications, with Form of Tender and Bill of Quantities, may be obtained on application from the undersigned, at whose office the drawings may be seen, on deposit of a *bonâ-fide* Tender, which will be returned upon receipt of a *bonâ-fide* Tender and the return of all documents issued.

Sealed Tenders, endorsed "Tender for Improve-

ment Work," must be received by Mr. Will Alexander, Clerk to the District Committee, Dunblane, not later than 4 p.m. on Friday, the 31st July, 1914.

The Committee do not bind themselves to accept the lowest or any Tender.

W. L. GIBSON,
Engineer and Surveyor.

Post Office Buildings,
Dunblane, Perthshire.
June, 1914. (1,741)

(Continued on p. xxiv.)

APPOINTMENTS OPEN.**BOROUGH OF LOUGHBOROUGH.****BOROUGH SURVEYOR AND WATERWORKS
ENGINEER'S DEPARTMENT.****APPOINTMENT OF ASSISTANT.**

The above Council invite applications for the appointment of an Assistant in the above Department, at a salary of £120 per annum.

Applicants must have had previous experience in a Municipal Office, be expeditious and neat draughtsmen, and possess a thorough knowledge of Surveying and Levelling, and general routine of office work. Some knowledge of architecture will be an advantage.

Applications, in candidate's own handwriting, stating age, present employment and past experience and qualifications, accompanied by copies of not more than three testimonials of recent date, endorsed "Surveyor's Assistant," to be sent to me not later than Monday, the 6th day of July, 1914.

Canvassing, directly or indirectly, will be a disqualification.

HARRY PERKINS,
Town Clerk.

Town Hall,
Loughborough.

A FEW NOTES ON TWENTY YEARS' WORK IN A GREAT CITY.

By T. DE COURCY MEADE, City Surveyor of Manchester.

[In this paper Mr. De Courcy Meade describes some of the Municipal Works of the City of Manchester, the new main drainage works at present in course of construction being dealt with at considerable length. The meeting of the Institution of Municipal and County Engineers at which it was read last Friday is reported elsewhere in this issue.]

It would not be possible within the limits of this paper to refer to all the projects considered and works carried out by the author since he commenced his official duties in the city of Manchester in 1894. He has therefore selected for consideration only a few

further particulars on any item referred to will with pleasure be given to members if they so desire.

It is customary on occasions of this kind to enlarge upon successes, and to touch lightly or to pass over works that have not proved satisfactory, although from such cases the most useful lessons may often be learnt. The author will therefore depart from the beaten track and make reference to some works that fall within the latter category.

MAIN DRAINAGE AND FLOOD PREVENTION.

As this is one of the chief items in to-day's programme, it is presented first. Manchester has suffered from the effects of floods for a long period, and works for flood prevention have been under consideration by the city council for many years. In 1874 Mr. J. G. Lynde, M.INST.C.E. (past-president), then city surveyor, submitted a report and plan dealing with the subject. These proposals were followed by a subsequent report from the same engineer in conjunction with Mr. J. F. Bateman, M.INST.C.E., but their recommendations were not given effect to by the city council.

In 1885 Mr. John Allison, M.INST.C.E., the author's immediate predecessor, prepared for the drainage of the city a scheme which was eventually approved. The area of Manchester at that time was only 5,934 acres.

A description of Mr. Allison's scheme of main drainage will be found in Vol. 19 of the "Proceedings." These works were in progress when the author entered upon his duties here twenty years ago. The city had in the meantime been extended by the inclusion of certain out-townships, and its area was then (1894) 15,369 acres, or nearly three times

DIAGRAM A.

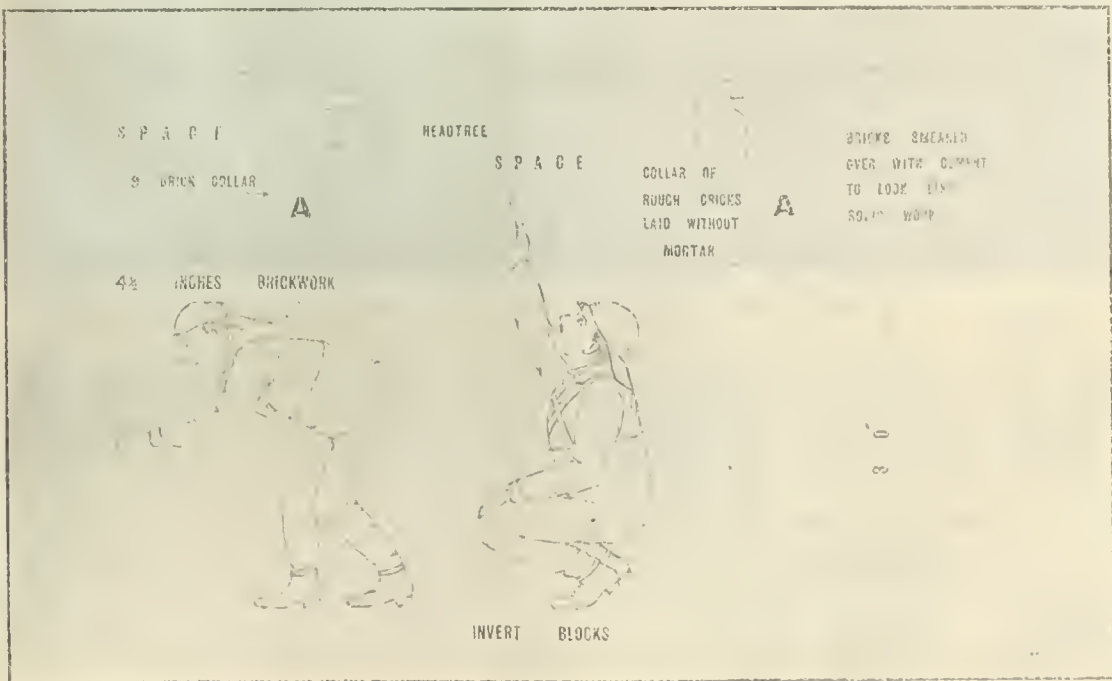

DIAGRAM B.

NOTE.—The rings of dry work (A) occurred about every 3 ft. or 4 ft. Sometimes they were omitted, and boards (B) were placed against the 4½-in. ring of brickwork forming the sewer to support it until the mortar had set.

subjects that are likely to be of general interest to members of the institution. The descriptive matter is necessarily condensed as far as practicable, but

the area that Mr. Allison's sewerage scheme was designed to accommodate. His plans had been submitted to Mr. J. Bailey Denton, M.INST.C.E., for con-

sideration and report, and the latter engineer calculated that the sewers proposed by Mr. Allison would be sufficient to serve a population of 868,522. Before the sewage from 500,000 persons had been coupled up the sewers proved wholly insufficient, and frequent floodings of property resulted. A temporary remedy was therefore found by freely overflowing the storm waters into the rivers and streams, and by this means the existing intercepting sewers have been made partially to fulfil their intended purpose.

It became the author's duty to complete the works which had been designed and largely carried out by his predecessor. All the work was done by contract. Unfortunately, Mr. Allison's health broke down about eighteen months prior to the author's appointment, and during that interval the services of the city engineer were withdrawn from the important works then in progress. Supervision became lax, and as a consequence much of the work was improperly executed or omitted altogether. Wherever timber was left in it was paid for as an extra item under the provisions of the contract. It was therefore to the advantage of the contractors to leave as much timber as possible in the ground, and in every case the amount claimed for extra work of various kinds was

securing competent, thorough, and effective supervision of all work of this nature, much of which is hidden from view during progress, and all is ultimately buried beneath the surface.

With such examples before them the present Rivers Committee, who are charged with the care of the main drainage, have spared no pains to prevent a repetition of the deplorable state of things referred to, and the system they have adopted for supervising the present works and for keeping full control of the payments and liabilities for extra work will be explained later.

The chairman, Alderman Frowde, and the deputy chairman, Councillor West, are, fortunately, engineers, and their committee insist upon the best materials and workmanship.

The existing sewers having been found inadequate, several schemes for flood relief were prepared by the author. In 1895 he commenced a series of gaugings of sewage, rainfall flow in sewers, and observations of the effect of storms upon the rivers and the low-lying and other areas of the city subject to flooding. This work has been continued up to the present time, and all data necessary to ensure a complete scheme of drainage for Manchester has thus been obtained. In July, 1909, the author was instructed to consider and report upon the whole subject of main drainage

VIEW OF INTERIOR OF DEFECTIVE SEWER (FIG. C).

considerable. The greed of one contractor in claiming a large extra sum for concrete packing where it was subsequently found that none had been used, and that only 50 per cent of the proper thickness of brick-work had been supplied, led to a general opening up and examination of the work, and to the disclosure of the fraud.

The typical illustrations (A and B) on the previous page, made from actual measurements at the time, will exemplify the conditions discovered by the author.

In other instances, where contractors had been paid and their liability had ceased, the work gradually failed, and it became necessary, in order to prevent a total collapse, either to renew it or to support it in the manner shown by the above illustration (C).

In this view the portion of the sewer nearest to the observer has been rebuilt, and that more distant has been supported by steel tram rails.

Proceedings were instituted against some contractors, and others who had made default endeavoured to remedy their deficient work. The result, however, was not satisfactory, and shows the importance of

and flood relief works, and the scheme he prepared, which will be described later, was submitted to Sir Alexander Binnie, past-president of the Institution of Civil Engineers, and approved by him. Several volumes of diagrams and other records relating to main drainage and rainfall, which have not hitherto been made public, are, by permission of the Rivers Committee, open to-day for the inspection of members of the institution who may be interested in the subject.

The following diagram (D) is from a much-reduced photograph of a chart that has been constructed from automatic rain-gauge records, and shows the rainfall intensities for the past fourteen years. The curve indicates the provision made in the new main drainage scheme for the reception and removal of storm waters.

The study of rainfall and the resulting floods is usually one of interest to the municipal engineer. The following remarks are intended for the students' section of the institution, but it is hoped that they may induce some of the younger members also to take an active interest in this subject. It is however, unfortunate that so few authentic records of rainfall intensities in this country are available for refer-

ence. The author believes that he established the first modern automatic recording rain gauge in England. It was made by Messrs. Richards, of Paris, and was ordered in 1886 by Mr. G. J. Symons, F.R.S., for his own use at Camden Town. The makers

Replying to an inquiry on the subject by the author, Mr. Carle Salter, assistant director of the British Rainfall Organisation, writes:—

“ In the absence of Dr. H. R. Mill, I have received your letter of February 2nd. So far as I have been

DIAGRAM SHOWING DURATION AND INTENSITY OF STORMS IN SOUTH LANCASHIRE (D).

having forwarded a gauge which gave a weekly instead of a daily record. Mr. Symons was about to return the instrument when the author purchased it, and this automatic gauge was fixed in the following year (1887) near Muswell Hill, in the North of London.

able to ascertain, the earliest recording gauge established in this country was that designed by a Mr. B. Bevan, of Leighton Buzzard, and constructed in 1817. Another recording rain gauge was established at Dublin in 1820, and Osler's rain gauge in 1837.

This latter is still in use at Greenwich Observatory, though I do not think it is the original instrument. The standard Casella recorder which we have in use at Camden-square was set up by Mr. Symons in 1880, and has been under observation continuously from that time. I believe that the gauge to which you refer was the first designed with so low a price as £10, and its maker might therefore possibly be regarded as the pioneer of the modern popular recording rain gauge."

When recording rain gauges are more generally used, and have been studied for a lengthened period, say, of thirty years and upwards, the municipal engineer of the future may be able to determine with some degree of assurance what amount of rainfall should properly come within the doubtful category of "damnum fatale," a line of defence so often pleaded by local authorities, but so difficult to prove. In the author's opinion, an automatic recording rain gauge should, in the public interest, be established in every urban district. The first cost of an efficient instrument is not large—about £15. The records would be of great value to the municipal engineer, and to the public generally, if furnished to the British Rainfall Organisation, or otherwise made available for reference. The selection of the position in which a gauge is to be placed is most important, and should be chosen with regard to the immediate surroundings and surface elevation, so as to obtain, as far as practicable, a fair average record of the rainfall in the locality.

Mr. G. J. Symons considered that 3 in. to 4 in. of rain might fall in one hour in any part of the area covered by his recorded observations of rainfall, and Dr. Mill, the present director of the British Rainfall Organisation, states that a fall of at least 3.50 in. of rain may occur in one hour in any part of the British Isles. Coming from such authorities, the opinion is worthy of careful consideration, as no town in this country has a system of sewerage capable of receiving and removing such a fall of rain if widespread. The author's observations have led him to the conclusion that rainfalls of great intensity affect much more limited areas than is generally supposed; consequently the results are seldom so disastrous as would otherwise be the case. He has many times noticed that intense rainfalls are not stationary; the centre of the

tion of the surface of the ground immediately preceding the fall have also an important bearing on the result. A storm lasting five minutes might not produce a damaging flood, while serious results might follow a rainfall of the same intensity if of fifteen minutes' duration, other conditions being equal. In districts of a semi-urban character, when surface saturation point is reached the available sewer and other conduits are usually heavily taxed, and therefore in the most unfavourable condition for the reception of storm waters. If the run-off from an intense rainfall that followed a period of dry weather be compared with the run-off from a similar rainfall that took place when the ground had reached saturation point (the whole area affected being then practically impervious) it will be found that the resulting floods in the latter case greatly exceeded those in the former. In the first case no flooding of property may have occurred, while in the second considerable damage may have resulted. For example, on January 15, 1910, .570 in. of rain was registered, the greatest intensity being at the rate of .10 in. per hour for forty minutes; the ground was saturated, the seven previous days being wet, and much damage was done by flooding. On the 23rd and 24th of the same month, .989 in. of rain fell in forty-eight hours; the greatest intensity equalled .165 in. per hour for forty minutes. No rain fell on the two previous days, and only .006 in. on the 20th; no damage was occasioned by flooding.

In some instances the conditions that produced floods were reversed, and a storm succeeding a period of dry weather resulted in flooding. This seeming anomaly may be accounted for if the centre of the storm did not pass over the recording gauges, and from indications observed at the time it is believed that this was the case; therefore the quantity registered was less than the actual fall over much of the area affected.

In order to determine the relation between impervious surface and population under the varying conditions to be found in Manchester, ten fully developed areas of 50 acres each, and of similar lengths and breadths, were selected for special survey and comparison. Each area represents a different type of development.

STATEMENT SHOWING THE RATIO OF IMPERVIOUS SURFACE TO POPULATION AND THE APPARENT RELATIONSHIP BETWEEN DENSITY OF POPULATION AND DEATH RATE.

Note.—Each of the ten localities lettered A to K has an area of 50 acres. The population has been ascertained by multiplying the average number of houses per acre by 17, obtained from the Returns compiled by the Registrar-General in the Census of 1911. Where rentals are marked thus * the rates are compounded.

cloudburst generally moves around or across the area affected. August, 1912, was a month of unusual rainfall both in the British Isles and Western Europe, and the author had an opportunity of observing at high altitudes the conditions under which rain fell in Switzerland during that month. Cloudbursts there were frequent, and were in many instances so local in character that the area affected could at times be distinctly traced by the eye and fairly estimated—phenomena seldom visible in England, where the geographical and local conditions are so different, and therefore, to a certain extent, not comparable. The facts, however, remain, and are here stated as matters of interest. They confirm, in a remarkable manner, the author's deductions from observations in this country.

When determining the provision to be made for storm waters in intended works for flood relief, the intensity of rainfall, impermeability of surface, and retardation of flow are important factors; but it should be remembered that storm duration and condi-

tion of the surface of the ground immediately preceding the fall have also an important bearing on the result. A storm lasting five minutes might not produce a damaging flood, while serious results might follow a rainfall of the same intensity if of fifteen minutes' duration, other conditions being equal. In districts of a semi-urban character, when surface saturation point is reached the available sewer and other conduits are usually heavily taxed, and therefore in the most unfavourable condition for the reception of storm waters. If the run-off from an intense rainfall that followed a period of dry weather be compared with the run-off from a similar rainfall that took place when the ground had reached saturation point (the whole area affected being then practically impervious) it will be found that the resulting floods in the latter case greatly exceeded those in the former. In the first case no flooding of property may have occurred, while in the second considerable damage may have resulted. For example, on January 15, 1910, .570 in. of rain was registered, the greatest intensity being at the rate of .10 in. per hour for forty minutes; the ground was saturated, the seven previous days being wet, and much damage was done by flooding. On the 23rd and 24th of the same month, .989 in. of rain fell in forty-eight hours; the greatest intensity equalled .165 in. per hour for forty minutes. No rain fell on the two previous days, and only .006 in. on the 20th; no damage was occasioned by flooding.

A view of each area referred to will be placed on the screen for the information of visitors. The original intention was to ascertain the relationship

between population and impervious surface, but other particulars were added at the request of a committee.

With the object of estimating the probable time taken by rainwater to reach the sewers, many typical areas throughout the city were placed under observation. In those covered with the best class of property the time of entry was found to vary from 1½ minutes to 4½ minutes, according to the average distance of the houses from the roads. In areas covered with second-class property the time of entry varied from 1 minute to 5 minutes.

In cottage property areas under favourable conditions, where houses abut on streets in line of the main sewer, the time of entry was as low as half a minute, and where opposite conditions prevailed as high as 7½ minutes.

From a number of like observations it was found that the time rain water took to reach the main sewers varied from a minimum of half a minute to a maximum of ten minutes, to which must be added the additional time occupied in reaching the intercepting sewer or other point of concentration.

No rule can therefore be laid down for general application, as the results are dependent on so many circumstances which vary in almost every locality. Each local drainage area within the town or district under consideration should therefore be segregated for this purpose, and the time of run-off determined by observation on the spot.

As soon as the rain ceases, or the intensity of fall materially lessens, the quantity of run-off begins to decrease in volume, but the diminution is gradual, and this "tailing out" of the run-off is one of the troubles at sewage works, and increases the normal dry-weather flow for many hours after the rain has stopped.

The drainage from buildings and streets in the city of Manchester was originally discharged into the rivers by means of numerous local sewers. There was no attempt at sewage treatment previous to the

During the past twenty years 82,269 water-closets have been substituted for dry-closets.

The dry-weather flow of sewage was ascertained by gauging, to average 53·4 gallons per head per day. A considerable volume of spring water passes into the existing sewerage system from ancient watercourses which were covered over in former times and converted into sewers. The old local sewers of the city were constructed with open joints, with the object of lowering the level of the ground water. These also add largely to the volume of water mingled with the sewage. Generally speaking, the sewers are under a head of subsoil water which percolates into the old

DIAGRAM F, SHOWING THE FLOW OF SEWAGE AFTER A PERIOD OF DRY WEATHER.

NOTE. The portion hatched represents the gauged flow of sewage for the 24 hours. The portion cross-hatched represents the continuous flow of water from streams, watercourses, and subsoil water admitted through open joints of sewers.

DIAGRAM E.

opening of the Ship Canal in 1894. At that date a small percentage only of the houses were provided with water-closets.

The above diagram shows the progress that has been made during the past twenty years by the Sanitary Committee in converting the dry system into the water-carriage system.

sewers in considerable quantities. There is, however, one advantage in this in addition to the lowering of the ground water—namely, the reduction of the temperature of the sewage, which is at times unduly raised by the admission of condensing water. The flow of sewage in the Manchester main outfall sewer has been continuously gauged for many years. The gaugings and analysis of the sewage show that during long periods of dry weather there is a large and very dilute flow between midnight and 6 a.m. This is indicated by the diagram which fairly represents the dry-weather flow from part of the drainage area.

The Manchester Corporation Act, 1911 (an Act which sanctioned the main drainage works), provides that the Manchester water supply shall be the basis for determining the dry-weather flow of sewage for the purpose of storm overflow. The present water supply is 30 gallons per head per day, and upon this basis the sewers would provide for the dry-weather flow of sewage to the outfall works at Davyhulme from a population of 2,498,408. A margin, however, must be allowed for an increase in the water supply, as the quantity now being supplied is 50 per cent more than that given in 1886.

Diagram G indicates very approximately the relative positions of the outfall sewers, the intercepting sewers, the proposed new sewers, and the rivers Mersey, Irwell, Irk and Medlock. The proposed new sewers are shown thereon by broken lines, and the existing outfall and intercepting sewers are indicated by thick black lines.

Within the city the existing intercepting sewers branch off in various directions. One passes in a northerly direction along the valley of the Irk; another follows the valley of the Medlock in a north-easterly direction; another passes in an easterly direction to Openshaw, and one diverges towards the south with a short branch sewer to the south-east.

Although the existing sewers are relieved by storm overflows, they work under a head of water in times of storm. Many local and tributary sewers also become surcharged during periods of heavy rain, chiefly owing to the insufficiency of the main sewers into which they discharge.

In Manchester there are upwards of 200 storm overflows, and no two of these are exactly similar in construction. As the main drainage work proceeded and the old sewers were exposed, an accurate survey was made and detail drawings prepared to meet the conditions found in each case.

It was necessary to ascertain the character of the diluted sewage passing over the sill of each overflow

at the beginning of a storm. In a town where there are a number of overflows it is obviously impossible to take the samples by hand. A simple and cheap arrangement for securing these samples was therefore devised and successfully used for several years in Manchester.

The figures H and I show a plan and section of a typical storm overflow chamber for small sewers,

overflows in this city, arranged in order of grains of chlorine per gallon, this being considered an index of the putrescibility. The percentage of organic matter in the total suspended matter is also indicated on the diagram. It will be observed that only a comparatively small percentage of the samples taken have high chlorine figures or a high percentage of organic matter.

DIAGRAM G.

with the automatic sampler in position. The arrangement consists of—

An overflow cill (A), an upright wooden post (B), a leaden gutter or channel (C), leading the storm water to the sampling apparatus, which consists of a re-

ceiver (D), fitted with a heavily-weighted lid; from the back of the latter a wire projects to which is attached a cork; the whole apparatus is placed in a strong wooden box or cistern (E).

For the purpose of obtaining accurate particulars of flood levels in sewers, the arrangement shown by Fig. K, has been successfully employed in Manchester. The device consists of a board (A) placed vertically in the manhole shaft to support a number of small

— PLAN —

ceiver (D), fitted with a heavily-weighted lid; from the back of the latter a wire projects to which is attached a cork; the whole apparatus is placed in a strong wooden box or cistern (E).

The receiver (D) is closely covered with an airtight joint when the lid falls. The cost of this sampling appliance, fixed complete, is under a sovereign.

The following diagram (Fig. J) shows the putrescibility of the samples taken at the cill level of the storm

tins (B) placed at regular intervals. These vessels fill as the water rises and record the height to which the sewers have been surcharged. The tins are protected from roof drippings by the hood (C).

As many of the largest sewers in the city have of necessity to be laid with very flat gradients, experiments were carried out in an existing brick culvert of similar construction to ascertain the transporting power of water flowing at different velocities on the

materials most likely to find their way into the sewerage system. The results of these experiments were as follows:—

Material.	Depth of flow.	Minimum velocity to move.
Cinders about 3½-in. gauge	3 in.	0.73 ft. per sec.
Sandstone screenings ¼-in. gauge	2 in.	1.46 " "
Pebbles ½-in. gauge	3 in.	1.64 " "
Flat broken sandstone 1½-in. gauge	4 in.	1.79 " "
Pebbles 1½-in. gauge	3 in.	1.86 " "
Broken granite 1½-in. gauge	1½ to 2½ in.	1.93 " "
Powdered cinders	2½ in.	1.93 " "
Sandstone chippings	4 in.	2.19 " "

By the kind permission of Prof. Petavel, F.R.S., further experiments were conducted at the Whitworth Laboratory of the Manchester University. A lining of brick-

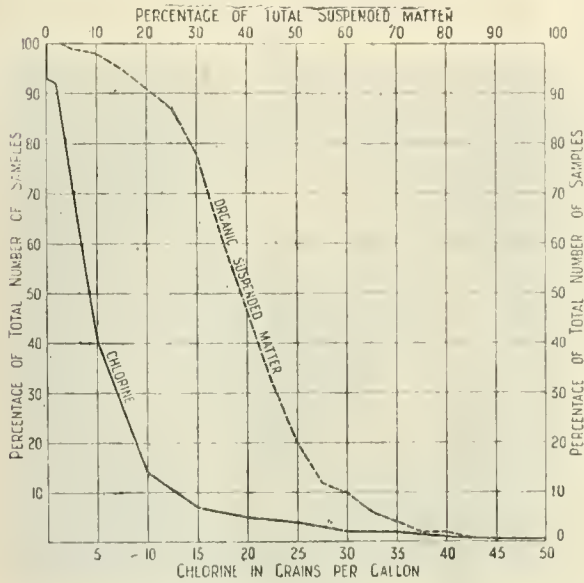

FIG. J.

work similar to that used in the sewers was placed within the flume, and a series of tests were made with the materials named in the following table:—

Material.	Minimum transporting velocity.
Fine cinders	1.42 ft. per sec.
Grit screenings	1.57 " "
Large cinders	1.60 " "
½-in. pebbles	1.67 " "
1½-in. pebbles	1.74 " "
¾-in. gritstone	1.90 " "
1½-in. " "	2.5 " "
1½-in. granite	2.55 " "

The results of the latter experiments are believed to be more accurate than those of the former series, as a greater depth of water could be obtained in the laboratory tests, as shown by diagram 1.

FIG. L.

PITOT TUBE.

A modified arrangement of the Pitot tube has been used for ascertaining the velocity of the flow in sewers. Considerable difficulty was at first found in the use

FIG. K.

of this instrument, owing to the large amount of fibrous and soapy matter in the sewage, which clogged the orifice of the instrument immediately it was submerged. The difficulty has, however, been overcome to a large extent by the modified type of instrument

which will be submitted for the members' inspection. A funnel-shaped mouth was provided at the top of the manometer, but it was found better to fill the tubes by suction with clean water, there being no practical difference between its specific gravity and that of ordinary sewage. The instrument was calibrated by timing it against floats in smooth, straight channels of uniform section. The "calibration constant" was found to be nearly unity for the particular type of instrument referred to.

The nozzle is made of copper, which appears to stand the Manchester sewage best; it is the easiest metal to work to the required shape. The tubes con-

meter tubes, and so allows the instrument to reset itself automatically.

EXISTING MAIN SEWERS.

The existing scheme of drainage (described in vol. xix. of the "Proceedings") consists of an outfall sewer from the city, which passes through the townships of Stretford and Davyhulme, and terminates at the Manchester sewage works in the latter township, about 5 miles from the city. This sewer, from the city boundary to "Waters-meeting," in Trafford Park, is elliptical, 11 ft. wide and 10 ft. 6 in. high. The workmanship is good, but wire-cut bricks inferior to those now in use were employed, and the crown has become

FIG. M.

necting the nozzles to the manometer gauge are made of vulcanised rubber, with an internal layer of cotton cloth similar to that used for steam gauges. Pure rubber tubes were at first tried, but they perished almost immediately. It was found necessary to have rubber connections, as the nozzles had to be inserted in positions which did not admit of the instrument. The twin tap is believed to be a novel arrangement. By turning this tap when the reading is taken the record is fixed, and the instrument may be removed and read in a better light outside the sewer. The second tap connects and disconnects the two man-

depressed in places. The new outfall sewer, now in progress, which is circular, is being placed as far away from the elliptical sewer as practicable, and where parallel streets are available they have been utilised as the route for the new outfall.

The existing sewer from "Waters-meeting" to Davyhulme is circular, 10 ft. in diameter, and the excess of storm water is run off by a storm overflow which passes from "Waters-meeting," in a northerly direction, into the Ship Canal below Mode Wheel Locks.

At the last meeting of the institution in this city, in May, 1893, reference was made by Mr. Santo Crimp

and by Mr. Allison to the discharging capacity of this outfall sewer. Fig. M is therefore interesting.

It was found by experiment that the correct coefficient of roughness to be used with the formula of Kutter was .012 for pipe sewers in good condition, and .015 for brick sewers of average construction and in good condition. It will be seen that these results are fully borne out by the tank measurements at Davyhulme, which agree closely with the results obtained by the formula of Kutter with the coefficient .015.

The formula of Santo Crimp does not give a variable coefficient for friction, which, under some conditions of surface, so largely affects the discharge.

NEW DRAINAGE SCHEME.

The main drainage scheme prepared by the author was approved by Parliament in 1911. It provides for the drainage of the whole city and certain adjoining districts. The new sewers will be of sufficient capacity to meet the estimated requirements of Manchester and

NEW SEWER IN COURSE OF CONSTRUCTION (FIG. N).

neighbourhood for fifty years. The total area included in the scheme is 39,100 acres.

The sewers are circular, and vary in size from 2 ft. 3 in. diameter to 15 ft. 3 in. diameter. They gravitate to the sewage works at Davyhulme.

The number of rings of brickwork range from two

In bad ground the sewers are strengthened by the addition of concrete. The diagram shows the standard sections that have been used.

The specification provides that compressed air, with or without a shield, shall be employed where the nature of the ground warrants this method of construction, and in some cases it has been found necessary to use compressed air in order success-

MEN WORKING IN A NEW SEWER (FIG. P).

fully to accomplish the work. Cast-iron segments of the usual type, as shown by the view, were used in two places in lieu of brickwork in cement.

Extreme care is taken in setting out the work.

Records, progress plans of the work and geological sections of the strata met with on each contract are kept, and these documents are brought up to date weekly.

SUPERVISION.

To ensure proper supervision an assistant engineer is employed on each section of the work, and he is allowed as many competent clerks of works as are necessary for complete supervision both night and day. Each clerk of works enters in a book daily the particular length of sewer built under his immediate supervision during that day or night, as the case may be. The progress-drawings and record

STANDARD SECTIONS (FIG. O).

to four. The inner ring is composed of red engineering bricks, in the remainder of the work hard shale-bricks are used. All brickwork is set in Portland cement mortar.

identify each length of work completed with the official who supervised it.

After the work is finished, or (if required) during its progress, the contractors are bound to cut into it

at any points indicated to them by the city surveyor for the purpose of examination. If the exposed work is found to be satisfactory, the corporation pay the cost of cutting and restoring the work.

CAST-IRON SEGMENTS BEFORE LINING (FIG. Q).

A complete series of photographs are taken of the works during their progress.

The whole of the work is under the general supervision of the resident engineer, Mr. C. O. Bullough, who reports daily to the city surveyor. A final and searching inspection is made before the expiration

of the period of maintenance, which is two years from the date of completion.

the referee, unless such work shall have been done under an order in writing on the form provided for the purpose signed by the city surveyor, and furnished to the contractor before such extra work has been commenced, and the contractor is required to furnish a return of extra work done every week, giving the details and the number and date of the order authorising the work. If no weekly return is sent in, it is to be deemed an admission that no extra work was done during that week.

The contractor's prices include the cost of any timber left in, and of strengthening foundations as may be required.

These provisions have been found to work well, and have reduced the extras to a minimum, in fact, those contractors who cut their tenders fine, and rely upon extras for their profits, now give Manchester a wide berth.

PENSTOCKS.

Provision has been made, by means of penstocks, for regulating or transferring the flow from the old sewers to the new, or *vice versa*, as occasion may require. This arrangement has many advantages, and it enables the workmen to enter the large sewers with safety during the day for the purpose of repairs, &c.

Messrs. Glenfield & Kennedy, Kilmarnock, and Messrs. Blakeborough, Brighouse, are sub-contractors for the large penstock work.

The penstocks on the sections of the main drainage scheme under construction vary in size from 6 ft. 9 in. diameter to 14 ft. by 10 ft. 6 in. They are of cast iron, fitted with gunmetal faces scraped watertight. The lifting spindles are made of mild steel, and are protected from the action of the sewage by wrought-iron tubes. These tubes are filled with lubricant in which, under normal conditions, the screws are submerged.

The dead weight of the penstock gates varies from 3 to 8 tons; they are counterbalanced by cast-iron weights. Worm gearing is fitted to each penstock,

VIEW OF PENSTOCK IN COURSE OF ERECTION (FIG. R).

of the period of maintenance, which is two years from the date of completion.

EXTRA WORK.

The contract provides that no charges whatever for extra work shall be claimed by the contractor or allowed by the corporation, or by the city surveyor or

with a velocity ratio of 5.654 to 1, so that a force of a few pounds applied at the handle will operate the penstock. With this mechanical advantage the largest of these penstocks could be operated by hand in four hours if the motor should fail or break down. Electric motors, fitted with limit switches, and capable of running at 1,000 revolutions per minute, will be installed.

The penstocks can then be opened or closed in about eight minutes.

The motors will be of the submergible type, with gaslight starters, so arranged that in the off-positions the field coils on the motor are on half current. The wiring will be of sheathed cable run on porcelain insulators. Hydraulic power is not available in the locality, otherwise it would be used in preference to electricity, owing to the moist atmosphere in the chambers.

DESCRIPTION OF SOME OF THE WORKS PROPOSED TO BE INSPECTED.

Manchester is a city which is intersected by numerous canals, rivers and railways. The crossing of these has been a matter of no little anxiety to those concerned.

Many miles of work are now in progress, and the value of contracts let, including the work which is being carried out by the corporation staff, amounts to upwards of £500,000.

Work known as No. 8¹ (Messrs. E. Nuttall & Co., Contractors) comprises about 1,960 yds. of circular brick sewer of 9 ft. 3 in. internal diameter; this sewer is now practically finished, but it is not yet brought into use.

The work was carried out in "cut-and-cover," and the space between the tram rails and the building line was very little in excess of the actual width of excavation. The use of ordinary jib cranes was found to be impracticable. The contractors therefore employed four transporters of their own design and of the type shown (Fig. S), by means of which they performed the work expeditiously and with the minimum amount of traffic obstruction, vibration, and cost.

The transporter works longitudinally over the trench, and discharges or receives the material at either end. Each machine consists of a steel framework on travelling wheels and supporting a steel girder which carries an electric crab controlled from the ground level. The girder is 50 ft. long, with an effective travel of 43 ft.; the height is 16 ft. 9 in., total width of frame 11 ft., and the length of supporting framework 28 ft.

The only moving part consists of the crab, which with its full load represents only about 25 per cent of the travelling load of a jib-crane of equivalent capacity. Much of the vibration which would have

Each crab is capable of raising a load of 25 cwt. at a speed of 48 ft. per minute, and of travelling with this load at a speed of 150 ft. per minute.

END VIEW OF TRANSPORTER (FIG. S).

Electrical energy was supplied by the corporation through a twin cable 250 yds. long wrapped on a drum, the extreme end of the cable being passed

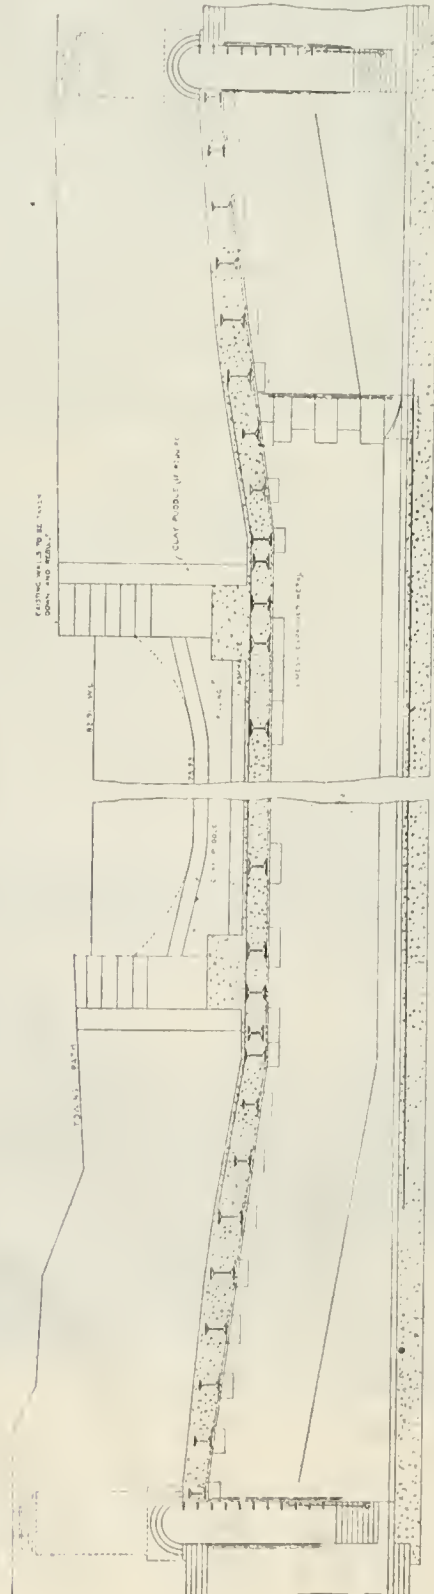

BRIDGEWATER CANAL CROSSING (FIG. T).

been caused by the latter was therefore obviated: this was important, as the excavation was close to buildings. The girder carrying the crab has a lateral movement so that pipes or other obstructions in the trench may be avoided and the skip adjusted to miss them.

through the side of the drum and attached to a plug-box, from which a flexible cable was carried to the crane. The contractors state that this special plant effected a large economy in working expenses, and enabled them to execute the work with the least amount of inconvenience to persons on the line of

SECTION A-A
CROSS SECTION AT CENTRE OF CANAL

MANCHESTER MAIN DRAINAGE: CROSSING UNDER BRIDGEWATER CANAL (BARTON BRANCH). (FIG. U.)

route, especially in front of shop property where room was limited.

Work No. 8² (Messrs. Kinnear, Moodie & Co., Contractors).—This main intercepting sewer, 8 ft. 3 in. in diameter, is a continuation of work No. 8¹. It is mainly constructed in tunnel at an average depth of about 28 ft.

The total length is 2,510 lin. yds.

Work No. 8³ (Messrs. Griffiths & Co., Limited, Contractors).—This sewer is a continuation of work No. 8². The total length of the work is 2,863 lin. yds., and it varies in size from 8 ft. 3 in. diameter to 5 ft. 9 in. diameter, with an average depth of about 36 ft. It is being constructed in tunnel, and work under compressed air is in progress.

A few visitors only can be admitted at a time to this work, as the space within the air locks is limited.

Work Nos. 3b and 4¹ (Messrs. Kinnear, Moodie & Co., Contractors).—In these works there are some large penstocks which are now being fixed in position, and preparations are being made for working under air pressure owing to the nature of the substrata.

Contracts Nos. 1 and 2a (Messrs. E. Nuttall & Co., Contractors).—These works comprise about 3,181 yds. of 13 ft. circular brick sewer. The contractors have laid a line of railway across the Bridgewater Canal from the dock system on the Trafford Park estate to the westerly end of the works. By this means they are enabled to run trucks from the railway company's system direct to the job.

The temporary crossing of the Bridgewater Canal (Fig. T) has been effected by a lift-bridge, operated by electricity, which enables the canal traffic to be continued without interruption. The construction of the outfall sewer under the canal is now in progress. Half the width of the canal is enclosed by a cofferdam (Fig. U) constructed with Ransome (type D) interlocking steel piles, 26 ft. long, and weighing about 28 lb. per square foot. The cost delivered is about 2s. 4d. per square foot. They have been driven without difficulty through sand and clay into marl, and the joints are watertight. The sewer is to be carried under the canal by a twin culvert roofed with steel joists and concrete.

Some of the works now in progress are within the township of Stretford, and the author desires to record his indebtedness to Mr. Ernest Worrall, the engineer and surveyor of Stretford, who, while carefully guarding the interests of Stretford, has given all reasonable facilities for, and assistance in, carrying on the work.

The following table may be found useful for reference:—

NUMBER OF BRICKS PER LIN. YARD OF SEWER.

Diameter of sewer.	1st ring, engineering bricks.	2nd ring, common bricks.	3rd ring, common bricks.	4th ring, common bricks.
ft. in.				
4 6	*237	*253	—	—
5 0	*254	*271	*310	—
6 3	277	316	340	—
7 0	316	366	391	—
7 3	332	371	411	—
7 6	340	379	419	—

8 0	371	407	442	—
8 9	403	480	567	—
12 0	511	573	612	651
13 6	624	656	687	719

* Radiated bricks.

These figures were obtained by counting the bricks built in the sewers in many places, and taking the averages.

Contract No. 16 (Messrs. Moffatt, Contractors).—This work comprises about 1,716 yds. run of inverting the river-bed, and the erection of new retaining walls and the underpinning and repair of the existing walls. Maximum gradient of the invert is 1 in 219, and the minimum gradient is 1 in 500. The invert is constructed with red engineering bricks laid on edge, resting on a foundation of 6 to 1 concrete 12 in. in thickness. The centre portion is dished and of segmental section, 12 ft. by 2 ft. 9 in. The parts between the dishing and the river walls are laid to an inclination of 1 in 12.

RIVER CLEANSING.

The subject of river cleansing is an important one in cities like Manchester, where some of the rivers and streams are of small volume during periods of

dry weather, and the quantity of refuse which finds its way into them is considerable.

VIEW OF RIVER IMPROVEMENT (FIG. V).

The system of inverting the river beds has been largely carried out in Manchester, and while it does

VIEW OF RIVER BEFORE IMPROVEMENT (FIG. W).

not aim at the source of the nuisance, it enables the corporation to maintain the rivers in a much better

VIEW OF RIVER AFTER IMPROVEMENT (FIG. X).

sanitary condition during hot weather than would otherwise be the case; it also facilitates the cleansing

of the river beds and prevents the accumulation of offensive matter therein.

The foregoing views show a portion of the river before and after the improvement respectively.

SETTLING POND.

The section for the protection of the Manchester Ship Canal Company in the Manchester Corporation Act, 1911, provides that a settling pond is to be constructed in the Clayton Valley to prevent *débris* being washed down the river Medlock into the Ship Canal. The following view shows this pond, which has an area of $\frac{1}{2}$ acre.

Since it came into use it has intercepted a much larger quantity of material than was anticipated. Much of the *débris* brought down consists of gravel, sand and ballast, which can be utilised by the paving department; therefore the cost of keeping the pond clear from obstruction is reduced. A valve is provided in the weir, and when the pond is being cleaned the water is lowered for the purpose. The bottom is paved with 6-in. setts on a foundation of cement-concrete 8 in. thick.

SEWAGE DISPOSAL.

In 1896 the author recommended the construction of an outfall sewer to convey the sewage to the tidal

Canal, and sludge sent mainly to sea. Small proportion sold.

Gorton. Sewage precipitation tanks. Total capacity about 1,200,000 gallons. Contact filters, 3 ft. deep. Total capacity 958,320 gallons. Effluent discharged into Gore Brook. Sludge pressed and mainly tipped.

Withington. Two sewage sedimentation tanks, total capacity 781,000 gallons. Twenty-four contact filters, total capacity 2,356,000 gallons. No stand-by storm-water tanks. Effluent discharged into Ouzel Brook and river Mersey. Sludge trenched into land.

Moss Side.—Four sewage precipitation tanks, total capacity 630,000 gallons. Capacity of irrigation area (20 acres), 800,000 gallons. Portion of storm water allowed to settle in lagoons. Sludge pressed and cake sold. The sewage of these works has just been intercepted by one of the new sewers, and it is now conveyed to Davyhulme. The Moss Side works will be retained for the treatment of excess storm waters.

SEWER VENTILATION.

This subject has engaged the attention of a Special Committee of the Manchester City Council for many years. In April, 1901, the city surveyor presented a report on the matter, and recommended the substitution of upcast shafts for surface ventilation.

In the following year the city council appointed a

VIEW OF SETTLING POND (FIG. Y).

waters. His scheme was twice approved by the city council, and twice rejected by a statutory meeting of ratepayers. Since that time he has not been associated with the sewage treatment, which is under the direction and supervision of Dr. Gilbert Fowler. The following statement, showing the quantities dealt with at the different works, may be of interest:

	Total present d.w.f., including subsoil water.	Maximum quantity reaching works (6 times d.w.f.).	Quantity treated as sewage (3 times d.w.f.).
	Gallons.	Gallons.	Gallons.
Davyhulme	30,100,000	109,000,000	64,500,000
Gorton	1,900,000	6,760,000	2,880,000
Withington	3,000,000	14,076,000	7,038,000
Moss Side	1,000,000	1,806,000	2,103,000
Total	35,000,000	133,642,000	66,821,000

SEWAGE TREATMENT.

Davyhulme.—Twelve open septic tanks of total capacity 16,000,000 gallons; 110 acres of contact filters, 2 ft. 6 in. to 4 ft. deep, and total capacity 18,360,000 gallons. Four stand-by storm-water tanks, total capacity 4,500,000 gallons. Effluent discharged into Ship

Special Committee to consider the subject. Prof. Delepine was appointed to undertake the bacterial work, Dr. Fowler the chemical work, and the author the supervision of the experimental installations and the investigation of air currents, &c.

Experiments were conducted on an extensive scale for many years. The investigations show that the air of sewers situated at a depth exceeding 10 ft. does not contain more carbonic acid than the worst street air, and that the proportion of carbonic acid in sewers increases as the depth of the sewer increases, and becomes considerable when the sewers are unventilated. Ventilation by upcast shafts fixed in suitable positions has been adopted with good results; tramway standards are used for this purpose in many cases.

Experiments were made on four proprietary systems designed for the purpose, but the results were not such as to induce the corporation to adopt any of those systems. On private lands near to one of the public sewers a station was provided, where bacteriological and chemical work was conducted on an extensive scale for a considerable period; this showed that the passage of sewage bacteria into the sewer air did not, in itself, prove that sewer air was necessarily a source of material danger, and that in the air of an efficient sewer carrying ordinary domestic sewage the number of sewage bacteria is very small.

Animals exposed to large amounts of that air for lengthened periods did not appear to suffer from the exposure. It was also observed that the discharge of a considerable amount of sewer air passing through ventilating shafts had not caused any special outbreak of disease in the houses surrounding the ventilators.

TRADE EFFLUENTS.

There are many chemical and other works in Manchester whose trade wastes were formerly admitted into the sewers. Several explosions occurred; some with fatal results to men working in the sewers. In 1892 Parliament gave the corporation special powers under which the city council may by order absolutely prohibit any such matters being permitted to flow or be washed into any sewer, either directly or indirectly. The corporation also obtained power in their discretion of constructing within any manufacturing premises, at the cost of the corporation, and without any liability on their part for compensation in respect thereof, an inspection chamber or chambers accessible to corporation officials at all times for the purpose of ascertaining the nature of the discharge from such premises into the sewers. These powers have been put into force, and explosions in the sewers have since ceased.

Since the introduction of motor cars, a new element of danger has been occasioned by waste petrol finding its way into the sewers. In July, 1912, the corporation issued a special order declaring that the intro-

duction of manufacturing or trade refuse containing petrol or allied spirits into a sewer, whether alone or in combination with other matter or liquid, and whether directly or through any drain or channel communicating therewith, involved danger to the health of persons entering the sewers, and prohibited any such matters being caused or permitted to fall, flow, or enter, or to be carried or washed into any sewer either directly or indirectly.

recorded, and a value assigned. In ascertaining the value the original cost has been taken wherever known, and in other cases where the sewers were constructed by private individuals an estimate of the value was made.

The whole of the Manchester sewers are now brought into assessment by the various rating authorities through whose districts they pass.

TREATMENT OF OLD RETAINING WALL.

The accompanying view of this wall (Fig. Z) shows the method adopted for strengthening it. The face of the wall had been pointed and defective bricks cut out before the photograph was taken.

The wall was built in 1886, and is constructed of local bricks, with a face batter of 1 in 12. Its length is about 226 yds., and it supports the street, which is about 18 ft. above the level of the adjoining ground.

In 1902 it was found that an overturning movement was taking place, and observations from time to time showed that this movement was increasing.

In 1911 cracks were visible, and the parapet wall was leaning over to a dangerous extent. Trial openings were made, and a careful examination revealed that—

- (1) The wall was deficient in thickness.
- (2) The bricks were of inferior quality, and the mortar and concrete were perished.
- (3) The footings for the greater part rested on ash-bin rubbish.

VIEW OF OLD RETAINING WALL DURING REPAIRS, &c. (FIG. Z).

duction of manufacturing or trade refuse containing petrol or allied spirits into a sewer, whether alone or in combination with other matter or liquid, and whether directly or through any drain or channel communicating therewith, involved danger to the health of persons entering the sewers, and prohibited any such matters being caused or permitted to fall, flow, or enter, or to be carried or washed into any sewer either directly or indirectly.

ASSESSMENT AND RATING OF SEWERS.

In consequence of the decision in the House of Lords that sewers where overground or underground are rateable wherever the occupation of them is "valuable," for the purpose of deciding whether the occupancy is "valuable" or not, the Manchester Corporation are advised that the public authority sought to be rated may be regarded as possible hypothetical tenants of the sewers from year to year.

This decision practically abolishes the exemptions which under case law the sewers have enjoyed, and places them in the same position as water mains, gas mains, and similar underground works.

The valuation of the whole of the sewers in the city of Manchester has recently been completed by the author. It was an undertaking of great magnitude, as will be seen by an inspection of the record. This volume shows the system adopted. The particulars of each individual sewer had to be ascertained and

The following remedial measures were adopted—viz.:—

Concrete backing was placed behind the wall, the parapet was taken down and rebuilt, the perished bricks were cut out of the face, and the wall was pointed in cement: 579 holes were drilled at distances of about 6 ft. apart, and cement grouting was forced in under pressure to fill the interstices in the brickwork; 42 tons of cement were thus used.

The soft concrete under the footings, and dust-bin rubbish, were removed in short lengths, and the wall was underpinned down to the solid.

The total cost of strengthening and repairing the wall amounted to £2,931. Much of this money might have been saved had the work not been scamped in the first instance, as the original cost of the deficient wall was £3,794, at a period when labour and materials were much cheaper than at present.

RIVER COVERING.

A section of the covering of the river Medlock is an example of partial failure in a case where there is an ample margin of strength in design combined with good workmanship and materials. The structure is close to coal mining operations, and a large quantity of water is abstracted from the subsoil by pumping. Shortly after completion, and before the embankment which it was to carry was finished, several transverse cracks which passed right round the structure, and

through the invert appeared at intervals of about 50 ft. (Fig. AA). Sir Benjamin Baker was consulted, and recommended that a strong lining of brickwork and concrete, strengthened by the insertion of old tram rails, should be carried out. At the same time he reported that he had to deal with a work under somewhat similar con-

FIG. AA.

ditions within 10 miles of London, and from past experience there and elsewhere he came to the conclusion that, if his surmise as to the cause of the cracks was correct, the lining suggested by him, and which under ordinary conditions was in itself more than sufficient for the purpose, would in time also crack

acting upon the structure, and was causing the arch and abutments (which, with the lining, are more than three times the theoretical thickness required in such structures) to crack in this way. The new cracks were watched for many years, and as they did not increase or extend they have been repaired and grouted under pressure.

The only building near to the site is a chapel in the corporation cemetery, which is 153 yds. away. The tower of this building has gone over as much as 19 in. to the south, showing that the settlement and drawing of the subsoil was regular and was continued over a considerable area. The movement also is manifest in a bridge about 150 yds. from the culvert.

RETAINING WALL AT A BRIDGE APPROACH.

This is an example of first-class material and scamped workmanship. The wall is constructed of 6 to 1 Portland cement concrete, faced with brickwork built to a batter of 1 in 12.

It is about 120 yds. long, and retains a street approach to a bridge. It varies in height from 21 ft. to 10 ft. above the adjoining land.

Owing to the treacherous nature of the sub-stratum and charged with water—the wall was reinforced by three tiers of old tram rails overlapped 4 ft. at the ends, built in longitudinally with transverse rails 3 ft. apart under the lowest tier (Fig. BB).

Some months after the completion of the work, and during the period of maintenance, several irregular cracks appeared in the face of the wall. The contractor failed to cut into it for examination or to remedy the defects. The corporation therefore took the work out of his hands and executed the repairs.

Subsequently the contractor brought an action against the corporation to recover the full amount of retention money, but on the trial it was held that the corporation were entitled to deduct the amount that they had expended in repairing the wall, and they also recovered upwards of £400 in costs from the contractor.

The case is interesting, as the work was completed and certified prior to the appearance of the cracks or to the discovery of the improper workmanship. The cause of the failure was due to the want of packing around the steel reinforcement, which therefore formed an element of weakness, instead of strength

RETAINING WALL (FIG. BB).

in each place where the original fracture had appeared, but without affecting the stability of the structure. Time has proved the correctness of Sir Benjamin Baker's opinion, as at each of the old cracks a new crack appeared subsequently in the new lining, showing that an enormous force was

as was intended. A clerk of works was wholly engaged in the supervision of this work and of an adjoining bridge; both works were in progress at the same time by the same contractor. The foundations of the bridge were also on bad ground. The clerk of works appears to have given almost his whole atten-

tion to the latter, thus neglecting to supervise the work in the wall, and this the contractor's men evidently took advantage of.

In restoring the work, the wall was cut through at each crack. It was then found that a 2-ft. rule could be passed easily along the web and lower flange of the rails in most places, owing to the concrete not being properly packed around the steelwork.

Seventy-eight 2-in. holes were drilled into the wall immediately under each tier of rails, and at distances of about 10 ft. apart. These holes extended from the face of the wall to the inner line of tram rails; 22 tons of cement in the form of grout were forced into the interstices in the wall, and the want of packing was thus, to a large extent, remedied (see Fig. CC).

The Effects of Certain Oils on Cement.—Table A (which will be exhibited at the meeting) and the following diagrams 1 and 2 show the results of 630 tests of nine kinds of oil, mixed with neat Portland cement in the proportion by weight of 10 per cent and 5 per cent respectively, compared with briquettes of similar cement mixed with water in the usual manner.

The tests were made with two specific objects—namely, to determine the value of a proposal for—
(a) A dustless concrete pavement, and
(b) A non-absorptive pavement.

The figures show that mineral oils in small quantities have the least injurious effect on cement, while vegetable oils, such as linseed and colza, are the most harmful. Briquettes gauged with boiled linseed oil

VIEW OF WALL AND GROUTING PLANT (FIG. CC).

The sections of the wall cut into were then carefully rebuilt.

It is probable that in course of time the cracks will reappear, but will not affect the stability of the structure.

MATERIALS.

The following is a synopsis of the specification which has been in use in Manchester for many years—viz.:

Portland Cement.—Cement is tested for tensile strength, fineness, soundness, specific gravity, time of setting.

Tensile Strength.—Minimum 420 lb. per square inch after seven days in water. No ramming allowed in filling moulds. Two types of machine are used (Bailey's and Adie's). The second is of the steelyard type, and the load is applied by a jockey weight.

Fineness.—On a 76 by 76 mesh sieve, the residue not to exceed 3 per cent.

Soundness.—Pats, 1/2 in. thick, submitted when first made to a temperature of 90 deg. to 100 deg. Fahr. After setting, placed in a hot bath, 110 deg. to 120 deg. Fahr., for forty-eight hours. Chatelier's expansion test is also used.

Specific Gravity.—Not less than 3.15 or 3.10 if cement has been ground for not less than four weeks.

Time of Setting.—A 300-gramme needle, with a point of 1 sq. mm., lowered into pat 4 c.m. thick by automatic regulator of the "dashpot" type. "Initial" set estimated to begin when needle fails to completely penetrate, and "ultimate" set when needle makes no impression.

The specification admits of the substitution of the "standard" specification should the contractor so desire. The testing-rooms are in the basement of the Manchester Town Hall, and may be viewed by members, and specimens may be examined.

break quite easily in the fingers, even three months after they are made. The results are what might have been expected, as, of course, all vegetable and animal oils react chemically with the constituents of the cement, and produce a secretion of soap.

DIAGRAM 1 PORTLAND CEMENT BRIQUETTES MIXED WITH 10 PER CENT OF OIL.

Under favourable conditions the process of saponification is rapid. Under no circumstances, however, could a combination of such substances as vegetable or animal oil with Portland cement be of any practical value to the municipal engineer, but the results may be of some interest to him. The admixture of a small percentage of some mineral oils with Portland cement mortar or concrete may produce a mortar or concrete suitable for use under special conditions, but their durability and permeability have yet to be determined.

Concrete made with Furnace Cinders.—Experiments

with clinker concrete have extended over a considerable period, as the Manchester Corporation have a large and annually accumulating accumulation of this residual. The clinker is, however, too fine, and not sufficiently sharp for the purpose of a good aggregate

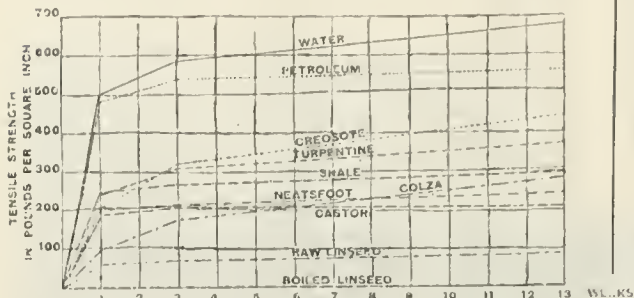

DIAGRAM 2. PORTLAND CEMENT BRIQUETTES MIXED WITH 5 PER CENT OF OIL.

for concrete, and its capacity to resist crushing is therefore proportionately lower than that made in the ordinary way with broken stone or brick. A specimen may be seen during the visit.

DIAGRAM 3. CRUSHING STRENGTH OF 5-IN. CUBES GAUGED 1 TO 1.

Cement and Lime Crushing Tests.—The following experiments to determine the comparative strengths of cement concrete and lime concrete were made for the information of a committee.

DIAGRAM 4. CRUSHING STRENGTH OF 5-IN. CUBES GAUGED 2 TO 1.

Table B, which will be shown by a slide, gives the crushing strength of 135 5-in. cubes composed of—

- (1) Portland cement,
- (2) Hydraulic lime,
- (3) Non-hydraulic lime,

gauged with standard sand in the proportions of 1 to 1, 2 to 1, and 3 to 1 respectively.

DIAGRAM 5. CRUSHING STRENGTH OF 5-IN. CUBES GAUGED 3 TO 1.

It was found necessary to spread and thoroughly to aerate the lime for at least seven days before admixture. After this treatment the cubes set well in water.

These tests indicate, approximately, the crushing resistance of each material. Had it been practicable to make a larger number of experiments better results might have been obtained.

BRICKS.

The usual tests are applied to bricks for use in main drainage work—namely, the crushing, absorption, and specific gravity tests.

The specification provides:—

(a) Engineering bricks when immersed in water for twenty-four hours shall not weigh more than 3 per cent in excess of their weight when taken from the kiln.

(b) Common bricks shall not absorb more than 10 per cent of their weight of water after being completely dried and then immersed for twenty-four hours.

(c) Blue bricks when immersed in water for twenty-four hours shall not weigh more than 3 per cent in excess of their weight when taken from the kiln.

SAND.

Every new parcel of sand is sampled and tested (both washed and unwashed) by admixture with Portland cement. In some cases the results do not justify the opinion that might be formed from the feel and appearance of the specimen.

The specification provides:—

(a) Briquettes made with sand and cement in the proportion of 1 part of cement and 2 parts of sand, shall, after being exposed to the air for twenty-four hours in a humid atmosphere at a temperature of 60 deg. Fahr., and subsequently immersed in water for six days, bear a tensile strain of not less than 70 per centum of the tensile strain of briquettes made with standard sand and cement from the same bag or specimen, and mixed and tested in the same manner and under similar conditions.

(b) Specimen bags of sand for testing, filled and sealed on the works by the city surveyor's representative, containing 10 lb. weight of sand per bag, at the least, shall be delivered at the town hall by the contractor.

In many cases sands containing a small proportion of loam gave satisfactory results, while others, apparently good, clean samples, did not give such good results, showing that a small percentage of loam is not necessarily harmful.

UNDERGROUND TELEPHONES.

In order to obviate the danger and unsightly appearance of overhead telephone wires crossing the streets, the corporation entered into an agreement with the National Telephone Company which provided for pipes being placed in the public streets for the conveyance of cables. The company paid a rent to the city council for the wayleave and repaid the cost of laying the underground pipes.

TYPICAL MANHOLE (FIG. DD).

Fifteen contracts were let for this work at different times by the corporation.

The main thoroughfares were avoided as far as possible, in order to minimise inconvenience to the general public and disturbance of business. The pipes are of cast-iron, 3 in. in diameter, with socketed lead joints. The cables contain from 50 to 350 pairs of wires.

From the typical manhole (Fig. DD) it will be seen that in some cases a large number of pipes are laid in the same trench, and to these additions have been made, as shown.

Each nest of pipes is supported by bands of Portland cement concrete at intervals. The intermediate spaces are filled in with fine dry packing, and there has been no trouble from settlement, breakage of pipes from the heavy traffic, or otherwise.

The total length of pipes laid is about 141 miles, and the length of the route traversed about 76½ miles.

STUART-STREET ELECTRICITY WORKS.

Coal Railway.—The generating station at Stuart-street is situated on the north-easterly side of the

VIEW OF ELEVATED RAILWAY (FIG. EE).

city, and is bounded on one side by the Manchester and Ashton-under-Lyne Canal.

A railway designed by the author, 980 yds. in

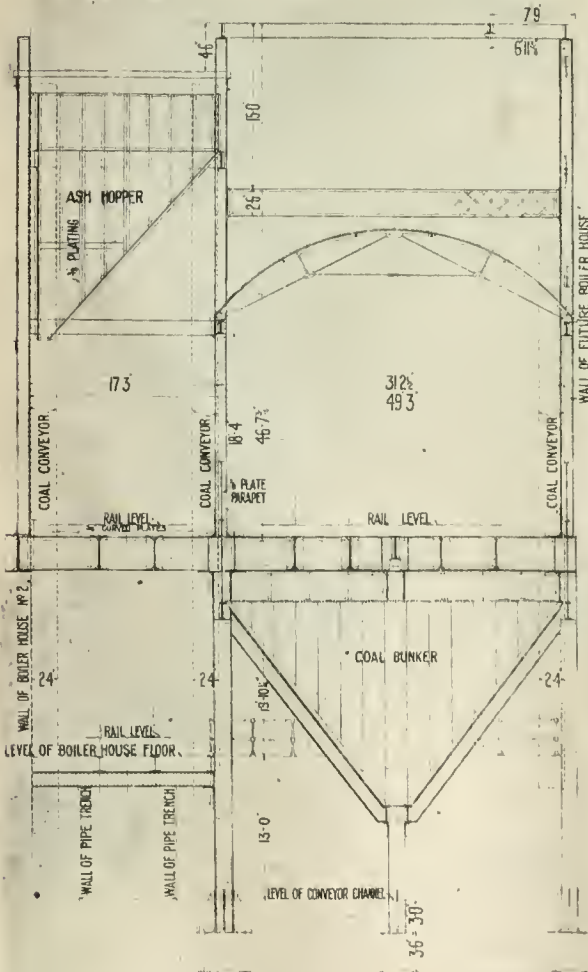

generating works, and consists of a brick viaduct, two high embankments, and a steel bridge and viaduct (Fig. EE). It is used for conveying coal and heavy machinery. The coal is tipped from the trucks on the high-level railway into hoppers, and thence it is carried by electrically-driven conveyers to the 5,000-ton bunkers over the boilers. The ashes are re-

STUART-STREET CABLE SUBWAY (FIG. GG).

moved by the same conveyers and loaded into the empty coal trucks, or as an alternative the ashes can be removed by barges.

There are four hoppers, each having a capacity of 275 tons. The trucks are run over the hoppers. Either bottom or side-tipping wagons can be used. The slope of the sides of the hoppers is 1 in 14. The fuel falls to the bottom as it is drawn off by the conveyer, and the hoppers automatically clear themselves. Fig. FF is a view through one of the hoppers.

STUART-STREET GENERATING STATION: CROSS-SECTION OF ASH HOPPER AND COAL BUNKER (FIG. FF).

length, has been constructed across Clayton Valley. It connects the L. and Y. Ry. with the Stuart-street

QUEEN-STREET SUBWAY, SHOWING CABLES (FIG. HII).

The portion of the coal railway within the generating works consists of a steel viaduct 365 yds. long, of which 260 yds. is double track and the remainder triple-track. The rail level is 21 ft. above the floor of the station. The decking consists of Hobson's curved flooring, 2 ft. 6 in. wide by 1 ft. 3 in. deep and 3 in. thick. The coal bunkers are below and the ash hoppers above the rail level. The coal when discharged into the bunkers is weighed automatically.

By reversing the conveyers, ashes are brought back and discharged into the high-level hoppers which feed wagons on the railway.

The total capacity of the low-level coal hoppers is 1,050 tons, and of the ash hoppers 150 tons.

The space beneath the elevated railway is utilised for storage and other purposes.

Cable Subway.—The cable subway from Stuart-street is upwards of 800 yds. in length: it passes under the Manchester and Ashton Canal. The internal dimensions are 9 ft. 8 in. high by 4 ft. 4 in. wide. The subway is of brickwork in cement mortar, with an asphalt collar joint. The cables are carried on malleable-iron brackets fixed to 4-in. by 3-in. steel joists bent to the section of the subway, and resting on pad stones (Figs. GG, HH, and II). The brackets can be readily attached to or removed from the supporting joists. They carry the high and low tension cables. The side walls are vertical, covered by a semi-circular brick arch three rings thick, the extrados of which is about 3 ft. below the surface of the street; the foundation of the subway consists of 18 in. of cement concrete.

ANOTHER VIEW OF CABLE SUBWAY (FIG. II).

The street sewer is divided into two sections, one of which is placed on each side of the subway. It is composed of cast-iron pipes supported on concrete, with manholes built close to the sides of the subway. The depth of the existing sewer and its outlet did not admit of the new sewer being placed under the floor of the subway.

Sub-stations.—Fifteen sub-station buildings were designed by the author in connection with the extensions of the electricity undertaking.

The buildings are somewhat similar in character.

In most cases they are arranged for both lighting and traction purposes.

HOUSING.

The corporation of Manchester, under the provisions of sec. 41 of the Manchester Waterworks and Improvement Act, 1867, have for many years dealt with insanitary property. From 1885 to 1913 24,775 houses have been ordered to be closed as unfit for human habitation. Of this number 14,823 have been reopened after satisfactory alterations and repairs; proceedings were suspended in 2,175 cases, the owners having undertaken to carry out satisfactory alterations, and the remaining 7,777 houses were discontinued as dwellings or demolished to form yard space for adjoining houses or for other improvements.

Plans of typical examples of insanitary houses before and after alteration, and the approved schemes for their alteration will be exhibited. In each approved scheme there is a separate yard and water-closet and an internal water supply for each house. A large number of buildings have been

erected by the Manchester Corporation for housing the working classes, and several sites have been acquired for future extension of working-class dwellings.

GENERAL STATISTICS.

Area of city, 21,645 acres (census return). Of this 8,612 acres are unbuild upon, and 2,483 acres (parks, railways, &c.) cannot be built upon.

Number of houses within the city, 158,060, of which 151,254 are inhabited; 55 per cent of voids are working-class houses. Number of back-to-back houses, 259. Average number of new houses built per annum (last ten years), 2,070.

Number of new streets in last ten years, 1,079. Total length, 64½ miles. Number of houses not connected to sewers, 175. All houses have piped water supply.

Sanitary conveniences, 160,787 water-closets (cistern flushed), 788 privies, 4,671 pail closets, 50 cesspools, no earth-closets. Average conversion of privies 2,111 pail closets 9,420, in the last three years.

Ashpits 1,078 dry, 273 combined.

Refuse disposal, 310,200 tons collected per annum. Tips at Harpurhey and Clayton. Six destructors, total cost (land, &c.) £575,460. Nightsoil from privy ashpits, cesspools and half pail closets sent to Chat Moss and Carrington estates; remainder of refuse from pail closets made into concentrated manure and sold.

TOWN PLANNING.

The Town Planning Special Committee of the City Council have given much thought and consideration to this subject. The city has been divided for the purpose into three areas—the Northern, Central, and Southern. Cartoons can be seen in No. 3 committee-room in this town hall.

The Northern area includes about 2,695 acres within the city and about 557 in the adjoining district of Chadderton. Most of this area is hilly (see topographical plan), and the planning of roads with suitable gradients is therefore a matter of some difficulty.

The Central area includes the commercial centre of the city, and is covered with warehouses, shops, mills, works, congested areas and very old buildings occupied by the poorer classes; it therefore cannot be dealt with as a whole under the provisions of the Town Planning Act, but a costly process of street improvement, demolition of unhealthy areas and remodelling has been in progress for a long period. The city council have spent a sum (approaching £4,000,000) on works of this character.

The Southern area comprises about 5,157 acres. Preliminary plans and particulars have been prepared, and conferences have been held with the owners, lessees and occupiers.

Several main roads converging on the centre of the city are in contemplation. Manchester occupies a unique position with respect to street traffic. The city is surrounded by a large urban area. The following figures show how Manchester stands with relation to other large towns in this respect:—

STATEMENT OF POPULATION WITHIN 15 MILES RADIUS OF THE CENTRE OF THE FOLLOWING CITIES (CENSUS 1911).

City	Centre.	Population.
London	Charing Cross	7,251,169
Manchester	Royal Exchange	2,618,759
Birmingham	Municipal Buildings	1,800,764
Glasgow	Town Hall	1,685,934
Liverpool	St. George's Hall	1,476,502

STREET TRAFFIC AND WIDTHS OF STREETS.

A census of the traffic entering the centre of the city—i.e., the area included within a radius of two-thirds of a mile from the Royal Exchange—was taken on April 4, 1911, and shows that a total of 1,072,667 persons and 99,747 vehicles entered and left that area of 1 square mile within the day of twenty-four hours. Of this total 351,183 persons entered and left by trams, 187,745 by railways, 70,503 by taxi-cabs and other vehicles, and 463,236 on foot.

There are no records to show that any statistics of the quantity and character of traffic in the streets were available when their widths were originally determined by the city council and their predecessors, nor can any estimate be found of its probable future growth. To this may be attributed in some measure the insufficiency of former street improvements, which has led to so large an expenditure in recent times.

Cross-street, which has been widened three times, is

perhaps one of the best examples of this kind. Since the street was first widened the property there has increased in value by upwards of 1,300 per cent. This enhanced value is, in a large measure, due to public

Measurements have been taken of a number of heavy vehicles in use in this city, and it is found that the width varies from about 6 ft. 6 in. to 7 ft. 6 in. This would make a maximum width of load, allowing

TRANSVERSE SECTION OF STREET (FIG. JJ).

improvements in that street and in the streets leading thereto.

The Advisory Board of Engineers in their report to the Royal Commission on London traffic state that

for the hubs, of about 8 ft. 9 in., but such widths are exceptional, and 8 ft. only has been allowed as the width for each line of ordinary traffic, including clearance space, and 15 ft. for a double line of traffic.

PLAN OF PLATT FIELDS PARK (FIG. KK).

“in second-class streets there should be space for two lines of standing vehicles and two lines of moving vehicles, and a double line of tramway.” Those, with footways 16 ft. wide, would give a total width of 80 ft.

Fig. JJ shows the minimum* statutory width
 * The Manchester General Improvement Act, 1851, sec. 6, provides that all streets shall be made with a footway on each side of not less than one-sixth the entire width of the street.

of footways in Manchester, with double lines of side traffic and two tramway tracks in the centre.

Street improvements should be designed to serve the probable requirements of the increasing traffic for a period at least equal to that allowed for the repayment of moneys borrowed for the purpose of purchasing the properties needed for the improvement.

PARKS AND RECREATION GROUNDS.

In the year 1894 the city council owned twenty-three parks and open spaces, with a total area of 222 acres. During the past twenty years eighteen parks and recreation grounds have been acquired, making a total of forty-one, with an area of 1,054 acres. Boating lakes have been constructed at the three principal parks—viz., Platt Fields, Heaton Park, and Boggart Hole Clough.

Platt Fields. In the autumn of 1903 the city council were urged to start public works in order to find employment and relieve the acute distress which then

is 6½ acres; the depth of water is 3 ft., diminishing to 15 in. at the sides. The 19,000 tons of water required to fill it were supplied from the town mains and by land drainage.

The best clay found on the site was used for puddle to form the watertight layer at the bottom and sides of the lake. The bottom of the lake was covered with old bricks laid flat and pressed into the puddle to protect it from damage and to enable the lake to be periodically cleansed and freed from deposit. Quite recently the lake was emptied for this purpose.

The lake is used for boating, which in the summer is a very popular form of recreation, indulged in by large numbers.

Boggart Hole Clough. Boggart Hole Clough lies on the north side of the city, and covers an area of about 90 acres. The construction of a boating lake in that park was decided upon by the city council with a view of finding work for the unemployed, as in the case of Platt Fields. The lake at Boggart Hole Clough

SITE OF LAKE: RELIEF WORKS (FIG. LL).

existed in the city. The Local Government Board sanctioned works of inverting a brook, the construction of public walks and bridges, land drainage, levelling and returfing, and the construction of a lake. These works found employment during the winter of 1903-9 for 720 men, who were engaged from the corporation employment registry, preference being given to married men and those with a large number of dependents. Most of the men were unused to this class of work and had to be closely supervised.

The distress works were closed in April, 1903, and Platt Fields were left in such a condition that they could not with safety be used by the public, and therefore on May 14th following the Parks Committee gave instructions for tenders to be obtained for completing the works by contract.

Platt Brook Improvement.—This work consists of 705 yds. run of paved invert, with new retaining walls on each side of the stream. The maximum gradient is 1 in 222.14, and the minimum gradient is 1 in 350. The invert is constructed with red engineering bricks laid on edge on a foundation of 6 to 1 concrete 12 in. in thickness. The section is segmental, 11 ft. 3 in. by 1 ft. 9 in., with vertical sides 2 ft. in height.

The area of Platt Fields lake, including the island,

covers an area of 5½ acres, and the method of construction was similar to that at Platt Fields.

Heaton Park.—Heaton Park, formerly the residence of the Earl of Wilton, was purchased by the Manchester Corporation in 1902, the area being about 691 acres, of which 39 acres are reserved for building purposes and 41 acres have been acquired by the Waterworks Committee for the construction of a reservoir, leaving 608 acres of park. It is used by large numbers of people during the summer months, and as there is no natural boating water in the north of Manchester the city council decided to construct an ornamental boating lake within Heaton Park, having a total area of 12½ acres, which includes three small islands. The net water area is 11½ acres, and the depth 3 ft. 6 in.

The lake was opened in March of last year; there are eighty-four boats, including a motor launch and a dinghy launch. Since the opening of the lake up to January 13th of this year, £1,886 has been received for the hire of the boats, &c., which were provided by the corporation at a cost of £1,465; the wisdom of the city council in providing such a form of recreation is thus clearly manifested.

The dinghy referred to is worked by a 1½-h.p. Evin-

rude detachable motor, and has been found a great attraction.

BRIDGES.

During the past twenty years forty-nine bridges have been built, renewed, strengthened or widened, the largest of which is Prince's Bridge over the river Irwell.

Princes Bridge and approaches were originally constructed in 1863 under the provisions of the Manchester Improvement Act, 1855, which enabled the corporation to make a new street from Manchester across the river Irwell into the adjoining borough of Salford.

In 1900 an examination of the old bridge was made, and the ironwork was found to be much corroded and the bridge of insufficient strength for the traffic then using it.

The present steel girder bridge, which was erected in 1905, has a clear span of 156 ft., and a nett width between the parapets of 54 ft.

It is composed of two Linville-truss girders, each 18 ft. deep and 167 ft. 3 in. long, with flanges 3 ft. 4 in. wide. Each of these main girders weighs about 140 tons, and rests upon the old stone abutments; the Manchester ends of the girders are fixed, and the Salford ends rest on roller bearings.

each capable of holding fifty cattle. Each pair of compartments is fitted with brick divisions and sliding doors for the purpose of isolating the cattle in lots of 100. An auction-room with seating capacity for 140 buyers is provided at the end of the lairs. The pens are near the slaughter-houses, and admit of the cattle being driven direct from any lair to any pen. Two pens are provided for each slaughter-house. A chilling-room is placed opposite the slaughter-houses and connected with them by a covered roadway. The room is capable of holding 500 "sides." Chill-rooms were erected on the east side of the cooling-room; each room is capable of chilling 174 "sides" at a time. The cooling-tank and fans are placed over the chill-rooms.

The engine and boiler houses are opposite the chill-rooms, and form a rectangular block of buildings 150 ft. by 62 ft. The engine-house contains engine, compressor, and circulating pump for the refrigerating machinery; two 50-horse power pumping engines for lifting the whole of the sewage of the wharf to a height of 17 ft. and discharging it into the corporation outfall sewer—which is situated at a distance of nearly a mile—and two 50-horse power engines and two dynamos for generating electricity for lighting the premises. These premises have been leased

VIEW OF PLATT FIELDS LAKE (FIG. MM).

Provision was made to allow of all exposed metal-work being accessible for painting.

The bridge is capable of carrying loads of 30 tons on four wheels, and 60 tons on eight wheels, and the total weight of the steelwork in the structure is about 560 tons.

The work was carried out by Manchester under the supervision of the author, a moiety of the cost being contributed by the borough of Salford.

Many of the corporation bridges span canals where the headroom is limited, and in such cases it has been found that the most convenient and cheapest type of construction consists of steel girders and jack arches with pipe bays under the footways.

There are 377 bridges of various kinds in the city under the supervision of the city surveyor.

Particulars of each bridge will be found in the Bridge Records, which are open for inspection.

FOREIGN ANIMALS' WHARF.

In 1896 the corporation provided lairages for the reception of foreign cattle at Manchester. Up to that time foreign cattle had been slaughtered at Birkenhead, and it was anticipated that with the provision of city lairages a cheaper supply of meat would be available and better facilities provided for distribution in the outlying districts.

A wharf was constructed on the side of the Manchester Ship Canal at Mode Wheel. There is a frontage of 265 yds., with a landing stage and three jetties, where most approved arrangements for landing cattle have been provided. Buildings to accommodate 1,000 head of cattle were at that time erected, and space left for future extensions. Lairages of substantial buildings of brick were constructed close to the canal, these being divided into compartments,

to the Ship Canal Company, and have been considerably extended to meet the increasing traffic.

COLD STORAGE.

At the Manchester Meat Market, Elm-street, cold storage has been provided. The works were nearly completed when the author commenced his duties here in 1894. Subsequently, cold storage was provided under the Smithfield Markets, existing vaults being utilised for the purpose.

The system adopted in both places is the ammonia compression system of the Linde British Refrigerator Company.

Should any members be sufficiently interested in this subject, arrangements might be made for them to visit the Smithfield Market early on Saturday morning.

ARCHITECTURAL WORK.

The architectural work was carried out by the city surveyor for many years. In consequence of the large increase in the business of his office, he was relieved of that portion of his work in 1902, when the present city architect, Mr. Henry Price, was appointed.

REMOVAL OF HUMAN REMAINS.

An unpleasant part of the business which comes under the supervision of the city surveyor is the exhumation and removal of human remains from disused burial grounds in the centre of the city and their reinterment in one of the city cemeteries.

In one case upwards of 6,200 bodies were removed, the average cost per body, including reinterment, amounted to 4s. 5d.

Many of the sites of the old burial grounds were quite unsuited for the purpose of interment, the substrata being of clay or other retentive soil.

The conditions found were such as cannot be

publicly described. They point to the advantages of cremation as a mode of disposing of the dead in the future. Detail drawings of the Manchester crematorium, especially the construction of the furnaces, which have been obtained through the courtesy of the secretary of that institution, Mr. A. E. Piggott, will be on view during the meeting.

CORPORATION ESTATES.

The corporation properties (exclusive of the Waterworks Committee's properties) amount to an aggregate value of upwards of 12½ millions sterling, and extend to a total area of about 6,800 acres, an area approaching one-third of the whole area of the city, which is 21,645 acres.

He hopes that a useful discussion may follow, as the exchange of views by those engaged in like pursuits makes for progress.

The author has pleasure in recording the fact that he is assisted by a loyal, able and hard-working staff. The moral to be drawn from the experiences referred to in these notes is that good work and value for the money expended can only be assured by obtaining and retaining the services of a capable and thoroughly reliable staff. It would be invidious to here refer to any members of his staff individually, when all have proved themselves so willing. He cannot, however, omit to mention the special assistance he has received

VIEW OF PRINCES BRIDGE (FIG. NN).

These properties lie largely outside the city, although the most valuable portions are in Manchester.

The Estate Books, which will be open for the inspection of visitors, show the history of each property from the date of its purchase, and all easements and other matters affecting it. The system of estate record was designed by the author; it has proved most useful.

ORDNANCE SURVEY.

The ordnance department having decided not to reproduce any further plans on the 1/500 scale, the city council obtained permission from the Board of Agriculture and Fisheries to resurvey and publish the maps, and also to sell copies at a fixed charge; 142 sheets have already been resurveyed and published, and it is interesting to note that a Government department are purchasers of copies.

In conclusion, the author feels that an apology is due to members of the institution for these disjointed notes, and for the delay in issuing them, which, however, was unavoidable. They have been dictated at intervals snatched from strenuous work, and he regrets that he has not had sufficient time to properly revise them. Many small matters have been referred to in detail, while larger and more important works have been omitted, his object being to select those which contained matter most likely to be of general interest.

from his secretary, Mr. A. E. Bradburn, and others who devoted several evenings to transcribing, reading and checking these pages.

Road Board Grants to Ireland.—In the House of Commons on Monday the Secretary to the Treasury stated that since May last the Road Board had definitely indicated to county councils in Ireland grants amounting in the aggregate to £114,862.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Main Roads Expenditure.—The President of the Local Government Board, replying to a question in the House of Commons on Thursday of last week, stated that the expenditure of county councils in England and Wales on the maintenance, repair, improvement, and enlargement of main roads (exclusive of expenditure out of loans) had risen, year by year, from £2,487,000 in 1904-5, to £3,356,000 in 1911-12. Complete figures could not yet be given for the year 1912-13.

The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea.*

BY E. J. ELFORD, M.INST.C.E., M.I.MECH.E.,
BOROUGH ENGINEER.

In preparing this paper the author has endeavoured, as far as possible, to eliminate matters of local interest only, and to give prominence to those likely to be of some interest to members of the institution.

It is desirable, however, in the first instance, to give some local statistics which have had an important bearing upon the schemes referred to hereafter. As will be seen from the following table, the exceptionally rapid growth of the population has been one of the

retention of the sewage in the tanks during the flood tide, and its discharge during the first four hours of the ebb tide only, no provision being made for screening or other treatment. Each tank was provided with two overflow weirs, so arranged as to cause the first overflow of storm water to discharge into the main outfall, and any excess into storm-water outfalls across the foreshore. The population at this time was 23,000, and the system was designed to deal with the sewage from a population of 40,000, which it was estimated would be reached in about thirty years.

It was soon found, however, that this estimate was quite unreliable; but, as will be seen by reference to the table, the subsequent growth of the population was very much greater than the engineers could have reasonably anticipated; in fact, the provision they made was considered by many to be excessive. Within six years the population had reached the maximum number for which the scheme was intended, and just about this time the corporation were served with a writ, at the instance of the owner of certain oyster layings some 3½ miles up the river, under which damages were claimed for alleged pollution by sewage from the corporation outfall. The litigation which followed resulted in a verdict for plaintiff, who was

MARINE PARADE, SOUTHEND-ON-SEA.

most important factors in some of the problems which have had to be faced by the corporation:—

Year.	Population.	Increase per cent.	Rateable value.
1881	7,979	—	—
1891	12,333	54.56	£68,000
1901	28,793	133.46	£196,000
1911	62,723	117.84	£431,746
1914 (est.)	84,000*	—	£548,587

* Including population of added area of Leigh-on-Sea, 10,000.

Year.	Occupied houses.	Unoccupied	
		Number.	Per cent.
1901	5,596	417	7.45
1911	12,488	229	1.83
1914 (est.)	16,181	273	1.68

MAIN SEWERAGE AND SEWAGE DISPOSAL WORKS.

Before describing the new works it is desirable to state briefly the circumstances which necessitated their construction.

The first comprehensive and effective drainage system was designed by the late Mr. James Mansergh, M.INST.C.E., and was inaugurated in 1898. The scheme comprised main sewers, two small pumping stations and two storage tanks in the eastern and western parts of the town respectively, which were connected to a common outfall, discharging into the estuary at a point about 600 yds. east of the pier and a short distance below low-water mark. The eastern storage tanks had a capacity of 540,000 gallons, and the western tank 225,000 gallons. The scheme provided for the

SOUTHEND'S NEW OPEN-AIR SWIMMING BATH.
(Water area 300 ft. by 70 ft.)

awarded £1,500 damages, and an injunction restraining the corporation from discharging sewage from this outfall. In the Court of Appeal the injunction was dissolved, but the corporation had to pay the damages and costs, which amounted, in the aggregate, to about £8,000.

It was, of course, impossible to provide other means for dealing with the sewage without considerable delay, and as the plaintiff at once threatened another action for further pollution, the corporation had no alternative but to endeavour to come to an agreement with him. Ultimately they were able to do this, on undertaking to pay him the sum of £500 per annum until they were able to complete new works.

This paper is not the place in which to discuss the merits of the case, but the author might, perhaps,

* Paper read at the Meeting of the Institution of Municipal and County Engineers at Southend-on-Sea, on Saturday last.

be allowed to say that, having, probably, as full a knowledge of the facts as anyone, he still holds the opinion, which has been confirmed by subsequent experience, and which was shared by many others, that it was impossible for the oyster beds in question to have been affected by Southend sewage.

There is no doubt the corporation was prejudiced by the fact that the existing sewerage system had reached the limit of its capacity, and by evidence for the plaintiff that discharge from the outfall was not discontinued at the proper times—viz., one hour before low water. This evidence undoubtedly carried much weight with the Court, and appeared to be honestly given, although the corporation records, which were made with the greatest care and under close supervision, showed that the outlet valves from the tanks

boundary of the borough, and apparatus for screening the sewage before discharge, and for preventing the discharge of "tailings" at improper times, would meet all reasonable requirements. For dealing with the "tailings" he proposed to provide upon the foreshore, in connection with and near the head of each outfall, a tank to be filled with sea water, so that by closing the outlet valves of the sewage tanks half an hour earlier, and discharging through the outfall a large quantity of sea water, it might be cleared of the sewage "tailings."

The complete scheme was to be capable of serving a residential population of 60,000, with allowance for visitors, and the estimated cost was £115,000. The corporation adopted the scheme, which was embodied in a Bill promoted in Parliament in the Session 1907.

MAP SHOWING POSITIONS OF SEWAGE DISPOSAL WORKS, MAIN SEWERS, PUMPING STATIONS AND OUTFALLS, SOUTHEND-ON-SEA.

(Plate No. 1)

had been opened and closed well within the stipulated times. The explanation was ultimately found to lie in the fact that, under certain tidal conditions, the sewage remaining in the outfall after the valves were closed continued to discharge during the last hour of the ebb tide, at an apparently rapid rate, owing to the quick drop of the sea from the level of the top to the level of the invert of the long length of flat pipe across the foreshore.

The extension of the sewerage system had now become very urgent, and the corporation instructed the late Mr. R. Strachan, M.INST.C.E., who had been a partner with Mr. Mansergh when the existing system was carried out, to report fully upon the subject. He reported that, in his opinion, an extension upon the lines of the present system, by providing a third storage tank with a separate outfall near the eastern

The corporation's proposals met with strenuous opposition before the House of Lord's Committee from the Kent and Essex Sea Fisheries Committee, the Essex County Council, and other bodies, and the Bill was rejected on the grounds that the scheme did not include any means for the effective purification of the sewage before discharge.

Following this, the author received instructions to prepare a report upon the subject. This report was presented to the corporation in July, 1907. After reviewing the whole of the circumstances, he summarised his conclusions in the following words:—

"My own view, after hearing the subject discussed in the Law Courts before the Parliamentary Committee and elsewhere, is that the discharge of Southend's crude sewage during the first four hours of the ebb tide into the enormous volume of water contained in

the Thames Estuary constitutes one of the most effective and least objectionable methods of disposal, and is certainly the most economical. The water of the estuary, teeming with life of various kinds, and satu-

ing power of sea water is that furnished in connection with the disposal of London sewage.

"During the year 1904 the average daily flow of sewage contributed by a population of nearly 6,000,000

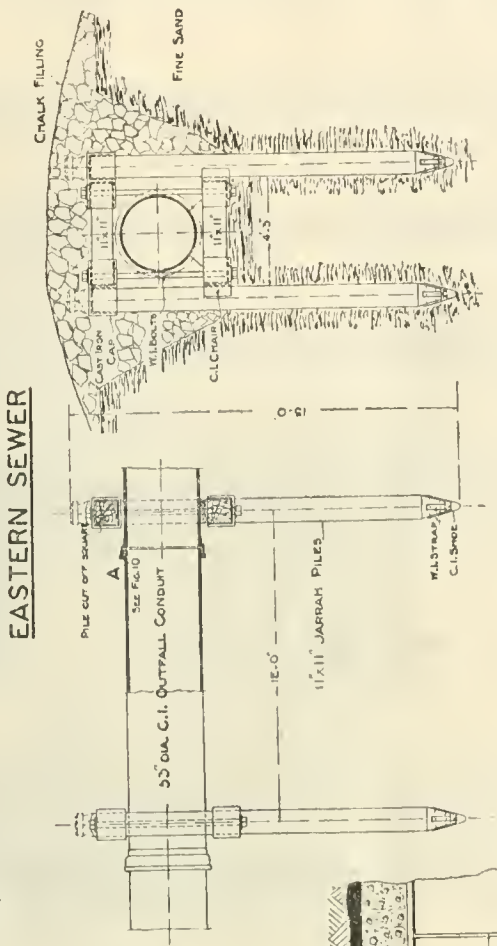

FIG. 8. WESTERN SEWER

FIG. 9. PILING TO OUTFALL CONDUIT

FIG. 10. TURNED & BORED JOINT AT A

SOUTHEND-ON-SEA MAIN SEWERAGE WORKS: SEWER AND OUTFALL CROSS-SECTIONS AND DETAILS. (Plate No. 2.)

rated with oxygen, quickly changes the form of the waste organic matter discharged by the sewers, and reduces it to harmless and inoffensive compounds.

"Perhaps the most striking evidence of the purify- was 232,000,000 gallons. It is true that the sewage is, before discharge, subjected to a meagre system of treatment by chemical precipitation, but this results only in about one-sixth of the total suspended and

dissolved matters being removed, leaving the effluent almost as foul as the crude sewage. The effluent is at times equal in dry weather to about one-sixth part of the total volume of the river at the point of discharge, and contains 100,000 B. coli per cubic centi-

all evidence of its presence has practically disappeared."

One of the conclusions of the Royal Commission, given in their fourth report, is expressed in the following words—viz., "That the waters of a tidal river

FIG. 3

FIG. 2

FIG. 1

SOUTHEND-ON-SEA MAIN SEWERAGE WORKS: SECTIONS OF TYPICAL MANHOLES. (Plate No. 3.)

metre; but, notwithstanding the vast volume of this pollution, discharged day by day and year by year, the purifying power of Nature is so effective that by the time it has travelled some 25 miles down the river

grossly polluted in its lower estuarial reaches may, after a flow of some 25 miles, become so far purified by sedimentation, dilution, and the operation, presumably, of bactericidal agencies, as to become seem-

ingly as little objectionable, or, in some respects, less objectionable, bacteriologically, than certain of our water supplies."

"When referring to the disposal of sewage sludge in the Barrow Deep, amounting to some 50,000 tons per week, or 2,600,000 tons per year, the commissioners say: 'The ultimate fate of this vast horde of microbes

sewage into such waters does not, according to present knowledge, cause any harm, and to require purification in all cases would lead to the waste of large sums of money.'

"'And even where shellfish have to be considered such an alteration of the law would not always meet the necessities of the case.'

"'After considering the whole of the evidence, together with the results of our own investigations and local inquiries, we are strongly of opinion that the only way in which this evil can be effectively dealt with is by placing tidal waters under the jurisdiction of some competent authority, and conferring on that authority power to prevent the taking of shellfish for human consumption from any position in which they are liable to risk of dangerous contamination, and to enforce restrictions as regards pollution, and as regards waters, foreshores, pits, ponds, beds and layings in which shellfish are fattened or stored, as and when required.'

"'In view, however, of the judgment of the Courts in *Hobart v. Southend-on-Sea Corporation*, of the opposition to the corporation's sewage Bill and its subsequent fate in the House of Lords, and having regard to the provisions of the by-laws of the Kent and Essex Sea Fisheries Committee, I feel that I have no alter-

SECTION OF RUBBER RING AND STEEL BAND BEFORE COMPRESSION

Typical Cross-section of Heading.

SOUTHEND-ON-SEA MAIN SEWERAGE WORKS: TUBE JOINTING APPARATUS.

(Plate No. 4.)

is a matter for conjecture, but the actual result is, beyond question, most satisfactory.'

"The Royal Commission deal directly with the subject of 'The Pollution of Tidal Waters,' with special reference to 'Contamination of Shellfish,' in their fourth report, dated December, 1903. The following extract from this report indicates the views of the commissioners on the subject:—

"'It has been suggested that the evils would be removed if the law were altered so as to require that all sewage should be purified before its discharge into the tidal waters. We do not consider that any such sweeping alteration of the law would be justified. There are, undoubtedly, many cases where shellfish are not concerned, in which the discharge of crude

native but to advise the corporation to adopt some means to purify the sewage before discharging it into the estuary.

"The proposals I am about to lay before you will therefore include the construction of treatment works. Those of us, however, who hold the views to which I have given expression may, perhaps, find some consolation in the hope that the expenditure, which, in our judgment, appears to be unnecessary, may find some justification in an enhanced reputation of the borough as a health resort, and that this, by increasing the town's prosperity, may have the effect of relieving the present ratepayers of much of their additional burden."

He then dealt with a number of alternative pro-

posals, and outlined the scheme which, with slight modifications, has now been carried out.

After prolonged consideration, and after obtaining a favourable report upon the proposals from Mr. J. D. Watson, M.INST.C.E., the corporation decided to apply to the Local Government Board for sanction to the raising of a loan to cover the cost of the scheme, and the author was instructed to prepare the drawings, estimates, &c., to accompany the application.

After holding a local inquiry, the board suggested to the corporation that they should obtain special statutory authority for the execution and subsequent operation of the works, so that they might avoid any risk of further litigation. The corporation adopted this suggestion, and a Bill was promoted in the Session 1908-9. The proceedings before the Parliamentary Committees were strikingly different from those on the previous occasion. Those who had then attended to curse the corporation proposals were now there to bless, and the Bill received sanction of Parliament without amendment. The effect of the Act is to give the corporation full security so long as they comply

TEMPORARY SUSPENSION BRIDGE ERECTED IN TWO DAYS AFTER A HULK HAD DRIFTED THROUGH SOUTHEND PIER.

with its provisions. The Act fixes a definite standard of purity for the effluent, the requirements of which are briefly as follows:—

Solid Matter.—Each gallon shall not contain more than 4 grains of solid matter in suspension.

Odour.—The effluent shall have no offensive odour, and when kept for three days at a temperature of 98 deg. Fahr., in a full stoppered bottle, shall not develop a putrefactive odour.

Impurity Figure.—To ascertain the impurity figure the albuminoid ammonia in grains yielded by 1 gallon of the effluent shall be multiplied by fifty, and the amount of oxygen in grains absorbed from permanganate of potash in three hours by 1 gallon of the effluent shall be multiplied by five, and the sum of the two figures so obtained shall be the "impurity figure." This shall not exceed 16.

The Act also prescribed the method of taking samples and of examination.

Such a provision in a local Act appears to be without precedent, and, in the author's opinion, the standard was more stringent than is necessary, having regard to the conditions under which the effluent is discharged. This view has been confirmed by the recommendations as to standards contained in the Eighth Report of the Royal Commission on Sewage Disposal, published in 1912. Notwithstanding this, however, it must be of advantage to the corporation to know exactly what they have to do, instead of being left to the tender mercies of some authority, which might change its requirements from time to time.

General Description.—In preparing the new scheme the author had in mind the following main considerations:—

(a) The production of an effluent of such a character, and its discharge in such a position, as to prevent any risk of suggested pollution.

(b) The securing of a suitable site of ample area and at a low price for the construction of the necessary purification works, in such a position as to be as unobjectionable as possible to any residential property, and at the same time as near to the outfall as practicable.

(c) The utilisation, as far as possible, of the works comprising the existing system.

(d) Provision for storm-water settlement and discharge.

(e) A scheme which would involve the pumping of the sewage at one central pumping station only, preferably at the site of the treatment works, and the avoidance of twice pumping, except in respect of the small existing pumping areas.

(f) The utilisation, if practicable, of steam from the proposed refuse destructor for sewage pumping.

The scheme provided for the purchase of a site of about 40 acres at the rear (north) of the town (Plate No. 1), and for the construction of two main sewers to intercept the bulk of the sewage immediately before it entered the eastern and western storage tanks respectively, and convey it to the pumping station and works to be constructed on the site, pumping plant sufficient to deal with at least three times the dry-weather flow, sedimentation tanks to retain as large a proportion as practicable of the suspended matter, roughing filters, bacteria beds, humus tanks, facilities for sludge disposal, and a main outfall conduit to discharge the effluent at a point in the Thames Estuary far removed from the land and shell fisheries.

In addition the scheme provided for the allocation of a portion of the site for the construction of a refuse destructor adjoining the proposed pumping station.

Arrangements were made for the utilisation of the existing tanks as settlement tanks for storm-water overflow, to be discharged through the existing outfalls, and for the useful retention of all the existing works, except a short length of outfall sewer.

The sewers and outfall were designed for a maximum residential population of 150,000, with allowance for visitors, and the treatment works for a population of 100,000.

The estimated cost of the scheme was £160,000.

Following this brief general description the author proposes to deal with each part of the scheme in greater detail, and particularly to refer to any points which may be of some special interest to the members of the institution.

Site of Disposal Works (Plate No. 1).—The selection of a site for sewage treatment works is generally a subject of some difficulty, especially in connection with a seaside town or health resort. The only land in any way suitable, and near the sea, into which, under any circumstances, the effluent must discharge was a low-lying area situated in the east of the town. At that time very little had been done in regard to the development of this area, and the site was strongly

SOUTHEND DESTRUCTOR AND SEWAGE PUMPING STATION.

advocated by some on account of its proximity to the point of discharge of the effluent. The author, however, felt that the selection of such a position for works of this character would be detrimental to the best interests of the town, and after careful examination of every possible area he recommended the acquisition of the site already mentioned. This is near the northern boundary of the borough, and is bounded on the west by a railway, on the north by agricultural land, on the east by a cemetery, and on the south by agricultural land.

Before presenting his report he secured an option upon 20 acres, at the price of £200 per acre. After the adoption of the scheme the corporation acquired an additional area of about 19 acres.

The ground has a fairly regular slope from south to north, the subsoil being of sand and gravel, varying in thickness from 40 ft. to 20 ft., and overlying the London clay. The surface level at the highest

point (south-east) is 75 ft., and at the lowest point (north-west) 47 ft. above ordnance datum.

On obtaining possession of the land, the author had trial holes sunk in various positions, from which it was found that a valuable bed of sand and gravel covered the southern part of the land, but that there was a considerable quantity of water in the sand immediately overlying the clay, particularly in the north-west corner, where it was proposed to construct the pumping station.

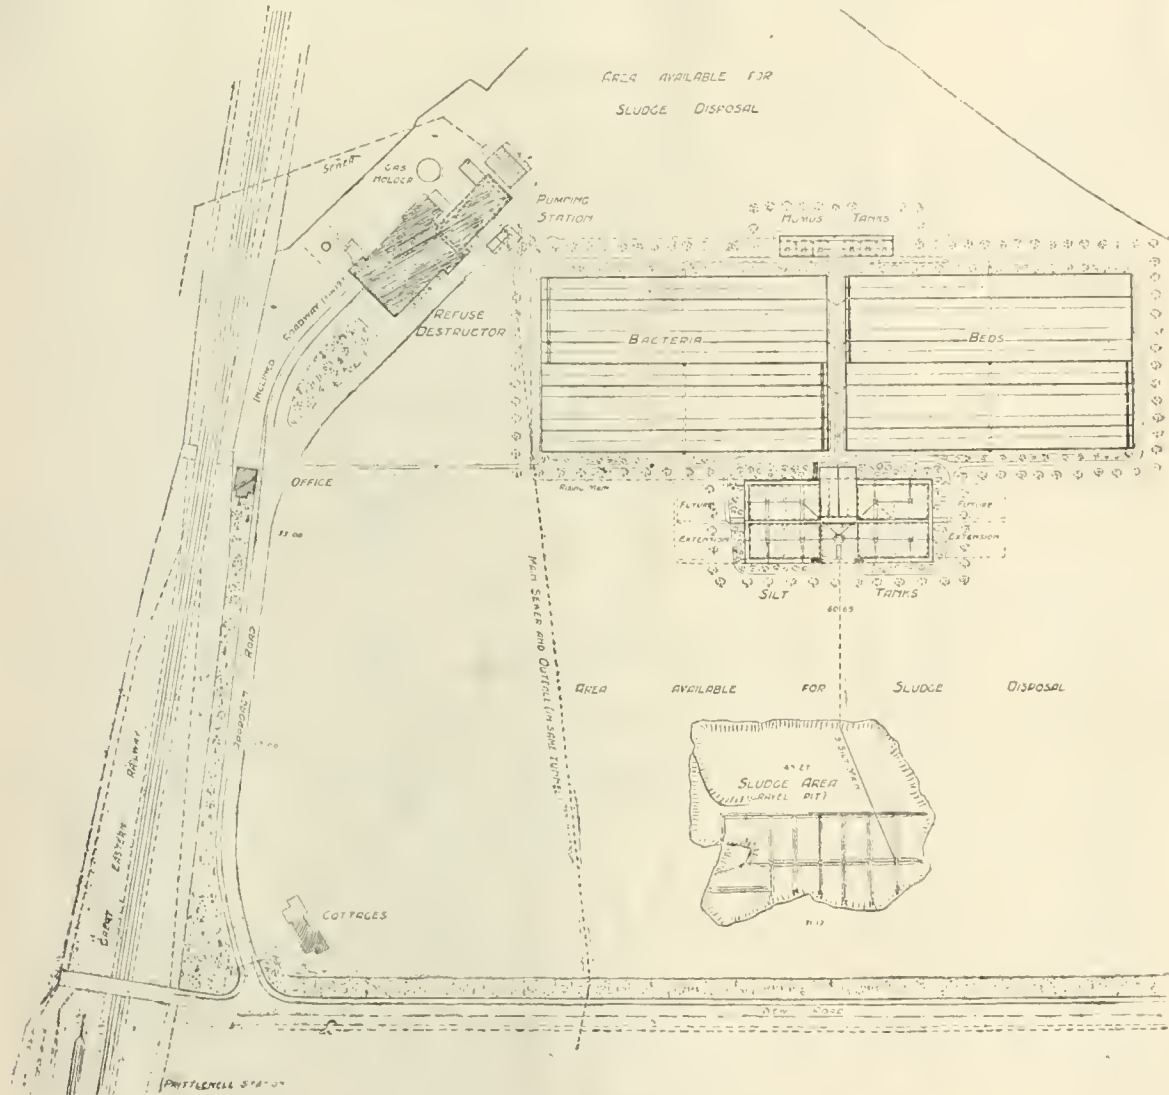

During the progress of the works about 50,000 cub. yds. of sand and gravel have been excavated, of which about 22,800 yds. have been used for concrete in the sewer tunnels, pump well walls, sedimentation and humus tanks, bacteria bed floors and walls and other parts of the works, resulting in a saving of over £2,500.

On the other hand, a considerable sum has been expended in pumping water from the excavations,

the surface by a steam winch and run by gravitation to a platform above the washers. After being tipped the trucks were hauled back by the steam winch. The cost of the washed gravel was 3s. 3d. per cub. yd., divided as follows: Excavating and loading into trucks, 1s.; winding up full trucks and returning empty trucks, 9d.; washing, 1s.; and 6d. royalty debited to the works.

A well was constructed of concrete tubes outside the wall of the pump well, and it is now proposed to pump and convey the water to the corporation electricity works for use in the boilers, and thereby effect a saving of over £400 per annum, a sum which is more than sufficient to cover the annual loan charges in respect of the land forming the site of the works, after allowing for the value of the sand and gravel already obtained from the site.

Sewers and Outfall Conduit.—The two intercepting sewers are laid in tunnels in London clay at depths

SOUTHEND-ON-SEA SEWAGE DISPOSAL WORKS: GENERAL PLAN.

(Plate No. 5.)

the pumping, during the construction of the pump well, first by the contractor, and afterwards by the corporation, having been carried on continuously for over two years. Part of the cost of the pumping was recovered by using the water for washing gravel and sand for the reinforced concrete, cement rendering, &c., and generally for the construction of the works, in lieu of water costing 1s. 6d. per 1,000 gallons. The gravel washers used were of simple design, and constructed on the works. They were rectangular in form, 14 ft. by 6 ft. by 5 ft. deep, and made of timber, with a perforated false bottom, through which water was forced from below. The gravel was tipped into the washer upon the false bottom, and the water passing upward carried with it the clay and loam, thoroughly washing the gravel and overflowing into a channel surrounding the upper edge of the washer. Each batch contained 3 cub. yds., and after washing was removed through doors at the front of the washer. The gravel was loaded into trucks in the pit, which were hauled to

varying from 40 ft. to 100 ft. At this depth the water-bearing sand overlying the clay escaped except at the shafts, where it was easily dealt with. The eastern sewer and outfall conduit are laid one above the other in the same tunnel for a distance of about 3,000 yds., the former gravitating to the works and the latter discharging under hydrostatic head. The sewers are constructed of concrete tubes, those for the outfall being laid below, and having flat tops to carry the gravitating sewer, which was constructed with a flat base and bedded on cement mortar. The conduit is 33 in. diameter throughout, and the gravitating sewer from 39 in. to 27 in., and laid at gradients varying from 1 in 1,400 to 1 in 1,100. (Plates Nos. 2 and 3.)

The specification for concrete tubes included the following conditions:—

Manufacture.—The concrete to be of three parts washed granite chippings up to 3-in. gauge (equal to sample to be submitted with tender), and one part slow-setting Portland cement complying with the

British Standard Specification. The concrete to be filled into moulds immediately after mixing and consolidated by ramming or vibration. The tubes on being removed from the moulds to be immersed in a solution of silicate of soda having a specific gravity of 1.10, and allowed to remain therein for at least seven days.

Testing.—Transverse Stress.—The tube shall be placed on a hard flat surface, and a steel joist of sufficient strength to resist bending, and not more than 4 in. in width, shall be placed on the top of the tube parallel with the axis, and extending the whole length of the tube. Wooden wedges, ½ in. in depth, may be used to keep the tube in position. The load hereafter given for each size of tube shall then be gradually applied through the steel joist by means of a lever, and no sign of fracture shall appear in any tube when the maximum load is reached.

Size of tube.	Test load.
39 in. diameter...	28 cwts.
36 in. " " " " " " " " " " " "	25 "
33 in. " " " " " " " " " " " "	27 "
30 in. " " " " " " " " " " " "	30 "
27 in. " " " " " " " " " " " "	21 "
2 ft. 8 in. by 4 ft., egg-shaped ...	55 "
2 ft. 4 in. by 3 ft. 6 in., " " " " " " " " " " " "	46 "
2 ft. 2 in. by 3 ft. 6 in., oval ...	41 "
1 ft. 8 in. by 2 ft. 6 in., egg-shaped ...	36 "

These test loads were designed to obtain a safe tensional stress in the concrete of 3 cwt. per square inch.

Appearance.—On being fractured the interior of the concrete shall present a clean, homogeneous appearance, free from all air holes or other defects.

Absorption.—Sample pieces of the tubes supplied, weighing about 20 lb., shall, after being dried to constant weight, be submerged in water for a period of forty-eight hours. They shall then be wiped with a cloth and again weighed. The increase in weight by absorption shall not exceed 1 per cent of the dry weight.

Marking.—Each tube shall have legibly marked upon its internal and external surfaces the date of its manufacture, the internal dimensions, and the name of the maker.

It is obvious that it was of vital importance that each pipe should be perfectly watertight, as any leakage from one to the other would be fatal to the efficiency of the scheme. In addition it was important that the space in the headings surrounding the pipes should be well and solidly filled with concrete. Those who have been responsible for work of this kind know how difficult it is to ensure effective supervision, and these questions gave the author much anxious thought. The method finally adopted to secure these results was as follows:—

The spigot and socket of the concrete tubes were so designed as to provide when placed together an annular space within the joint of about ¼ in., and the specification required the contractor to lay the tubes with dry, clean joints, fill in solidly with concrete on the outside, and afterwards to make the joints by first sealing the interior with an expanding steel and rubber ring (Plate No. 4), and then forcing liquid cement into the annular space through a hole in the ring at the side or invert. A second hole was to be provided at the top of the ring as an air vent, and this was to be left open until the cement began to flow out, after which it was to be plugged and the cement forced in until the joint was solid.

The contract for this work and the construction of the pump well was let to a limited company, and at first the works progressed fairly satisfactorily, but difficulties subsequently arose, apparently due largely to financial trouble.

The contractors excavated a considerable length of heading, for which they had good prices, and after some pressure proceeded slowly with the laying of the concrete tubes, for which their prices were not so profitable, but delayed for a long time the jointing. They were warned of the extra cost and difficulty of executing this part of the work if it was not carried on simultaneously with the tube laying, owing to the trouble of conveying the necessary materials and plant for long distances through the confined space afforded by the tubes, and after much pressure they obtained a few rings and bogeering apparatus and made a start. The packing of the concrete had been watched as carefully as practicable by the inspectors, but the author had been afraid that when the jointing was commenced some imperfections would be found. He expected, however, the

contractor would early realise that perfect consolidation of the concrete would prevent waste of cement when bogeering, and therefore be to his advantage. If properly put together and sealed inside with a ring and outside with concrete, each joint in the 33-in. tubes should have taken less than half a gallon of liquid cement, but the first few joints attempted were found to take as much as two bags of cement each. Thereupon the contractors alleged that the specified method was impracticable and declined to proceed with the work. Ultimately, in the hope of ending the dispute, the author offered to lay a short length of sewer and demonstrate the practicability of complying with the terms of the specification. The contractors accepted this offer, and the experiment was carried out with quite satisfactory results, the joints being easily and perfectly made without waste of cement. Notwithstanding this, they continued delaying the work, and ultimately the author was compelled to serve them with a notice of discharge from the contract. Litigation ensued, but while the hearing was proceeding the contractors suggested a settlement, which was agreed upon terms very favourable to the corporation.

In the meantime the works had been standing for some months, and were in a deplorable condition. Tenders were obtained from other contractors for clearing up the mess and completing the contract, but as the acceptance of the lowest price would have involved serious loss to the corporation, they instructed the author to carry out the work by administration. This has been done at a cost to the corporation less than the original contract sum.

The concrete filling was composed of 8 parts natural gravel to 1 part Portland cement. As the work proceeded portions of the joints were cut out for examination at frequent intervals, and in every case were found to be satisfactory; some of these sections will be on view when the works are visited.

Both the sewer and outfall conduit are quite sound and watertight throughout.

The manholes are of cast iron of somewhat unusual design, and were adopted as being more quickly and easily constructed, cheaper and more likely to be watertight than brick shafts. It will be seen (Plate 3, Fig. 3) that they are built upon a heavy cast-iron base forming part of the sewer, and consist of 12-ft. lengths of 30-in. pipes having turned and bored (parallel) joints, a ring of soft lead ¾-in. pipe being placed in the bottom of the socket to form a cushion for the spigot, and the socket outside run with bitumen. Each landing is constructed of three castings, the centre oval in form, and the cap and base of one pattern. The manholes are provided with galvanised-iron ladders, and each landing with a galvanised-iron grating, half of which is hinged. They were found simple and economical to construct, and quite watertight and satisfactory.

After leaving the heading the outfall is continued in cast-iron pipes across the foreshore to the point of discharge, about 2,000 yds. beyond high-water mark and 1,000 yds. east of the pier head. The pipes have turned and bored socket and spigot joints.

At the sea end a length of about 100 yds. is carried on Jarrah wood piles. The design for this part of the works was prepared with a view to simplifying as much as possible the construction and adjustment of the underwater structure (Plate 2, Fig. 9).

The western intercepting sewer (Plates Nos. 2 and 3, Figs. 8 and 2) is egg-shaped, 30 in. by 24 in., has a total length of 3,600 yds., and is constructed on the McAlpine system of concrete segments in tunnel. This system can only be adopted where the ground is comparatively free from water and fairly stable in character. Its advantages are that no timbering is required, as the tunnel is lined with segments as excavated, and the quantity of excavation is very much reduced. The excavation is slightly larger than the external diameter of the sewer, and the top segments are provided with holes through which the annular outside space is completely filled with cement grout, forced in under a pressure of about 10 lb. per square inch. This part of the work was carried out under contract by Messrs. Robert McAlpine & Sons, at a price much below the cost of ordinary tunnel construction.

Pumping Station Buildings (Plates Nos. 6, 7 and 8).—The main building is 103 ft. by 35 ft., and, except at the southern end, the walls are carried upon the concrete walls of the pump well. At the rear of this building is the workshop and stores, the gas-generator house, coal store, mess-room, &c. The pumping station and refuse destructor adjoin, and form one building,

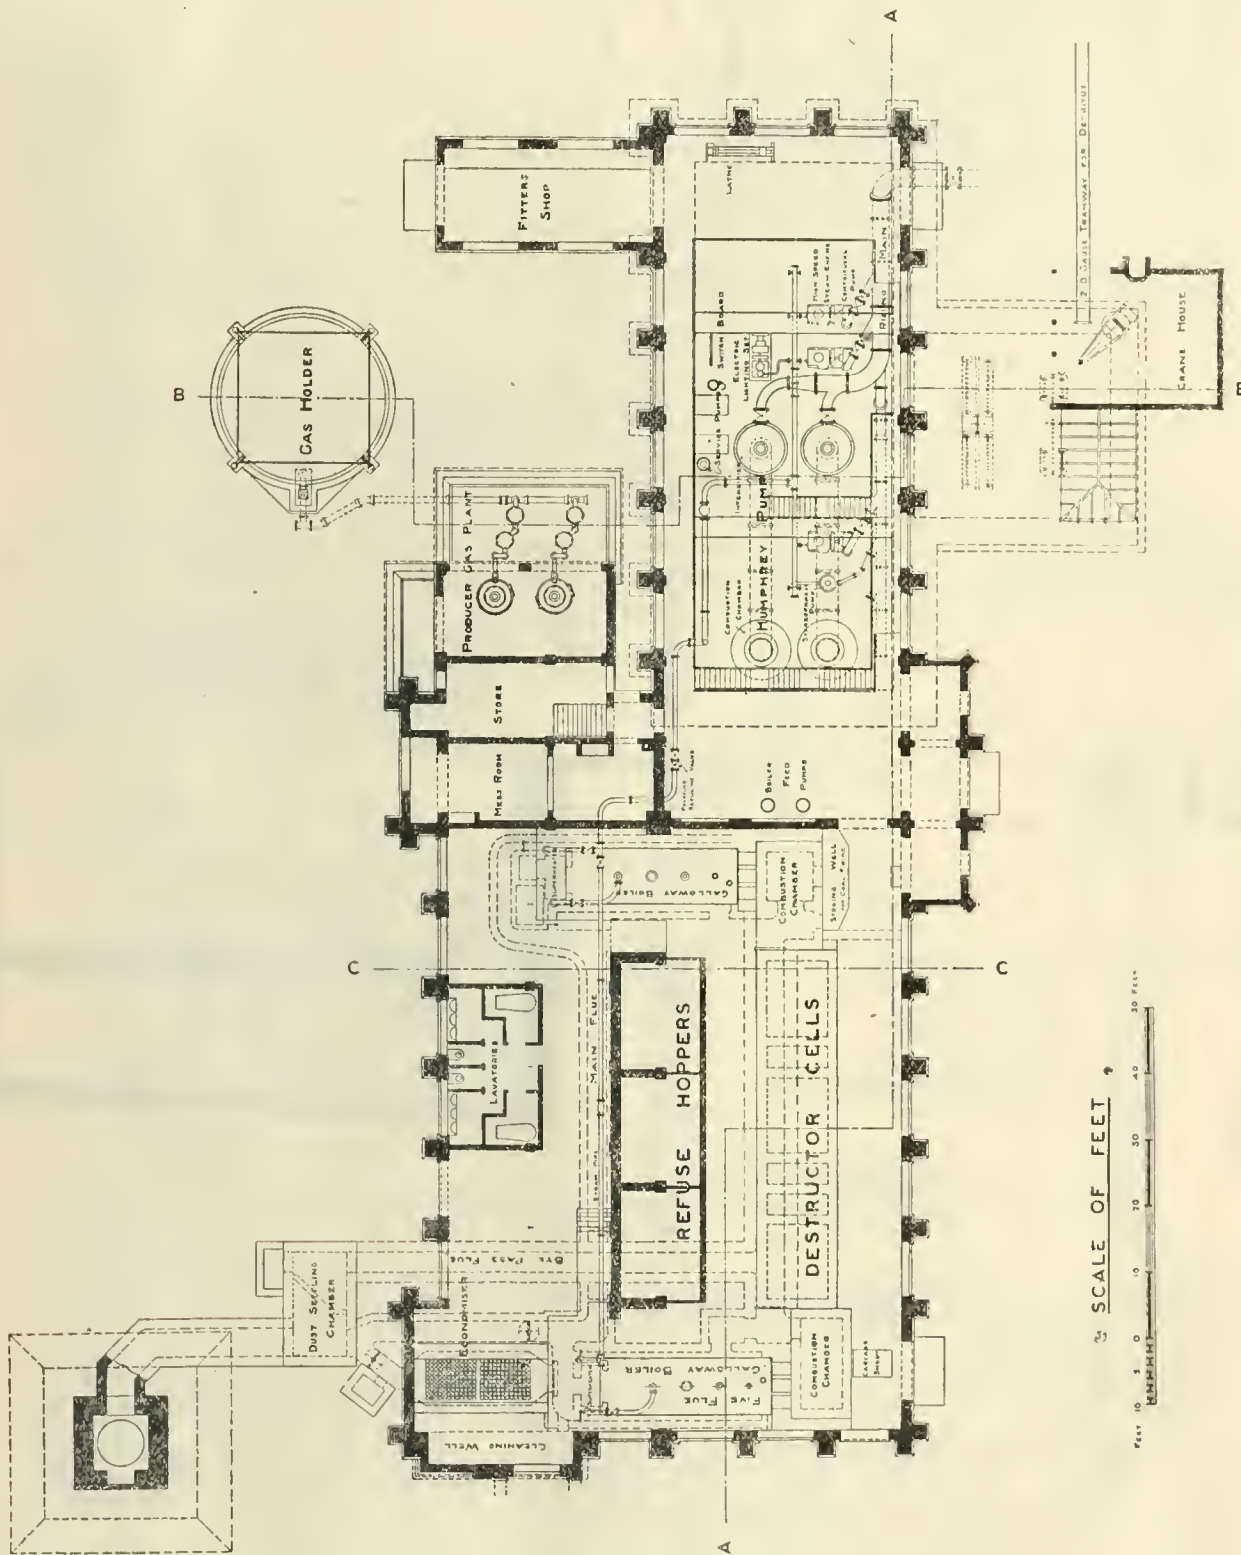

having a total length of 200 ft. The walls have a red-brick plinth, and above this are of Fletton bricks, covered externally with rough-cast. Internally the walls are faced with glazed bricks from ground level upwards. The pump floor is 30 ft. below ground level, and has a surface of mosaic. This material is also used for the upper floors. Large windows are provided on each side. The roof is of match boarding carried on iron principals and covered with tiles.

Pumping Station.—The invert level of the gravitating sewer at its outlet is 2.45 ft. above ordnance datum,

the screens twice in each complete revolution, and to make one revolution per minute.

The rakes and elevators are operated by electric motors, and both the detritus and screenings are delivered into trucks at pump-floor level and lifted to ground level by an electric crane.

The pump well is 80 ft. by 30 ft. by 50 ft. deep, a floor being provided at 30 ft. below ground level, upon which is carried the pumping and other machinery. The pump well proper has a maximum capacity of 170,000 gallons, and is also divided into two parts, each served

SOUTHEND-ON-SEA REFUSE DESTROYER AND PUMPING STATION: GENERAL PLAN.
(Plate No. 6.)

and of the pump well 1 ft. below ordnance datum. Before entering the latter, the sewage passes through a detritus and screening chamber, which is divided into two parts, each containing a detritus pit, elevator and screens. The combined capacity of these pits is 9,300 gallons during normal flow (1 dry-weather flow) and 12,700 gallons during maximum flow, and will reduce the velocity of flow to 4 ft. per minute during dry weather and 7.5 ft. per minute at times of maximum storm-water flow. The silt is removed by bucket elevators. The screens are of the fixed type, cleared by rakes attached to endless chains, these being so arranged as to clear

by one part of the detritus and screening chamber, and so arranged that the whole can be worked together or each part separately. The walls are of concrete, 5 ft. 6 in. to 6 ft. 6 in. thick, partly reinforced to resist external pressure. Before the work was commenced trial holes were sunk, and from the information obtained it appeared that the clay would be found about 22 ft. above the bottom of the excavations. It was found, however, when the work was carried out, that in some parts of the site the clay surface was much deeper, and that there was an average depth of 17 ft. of running sand in place of 11 ft. found in the trial

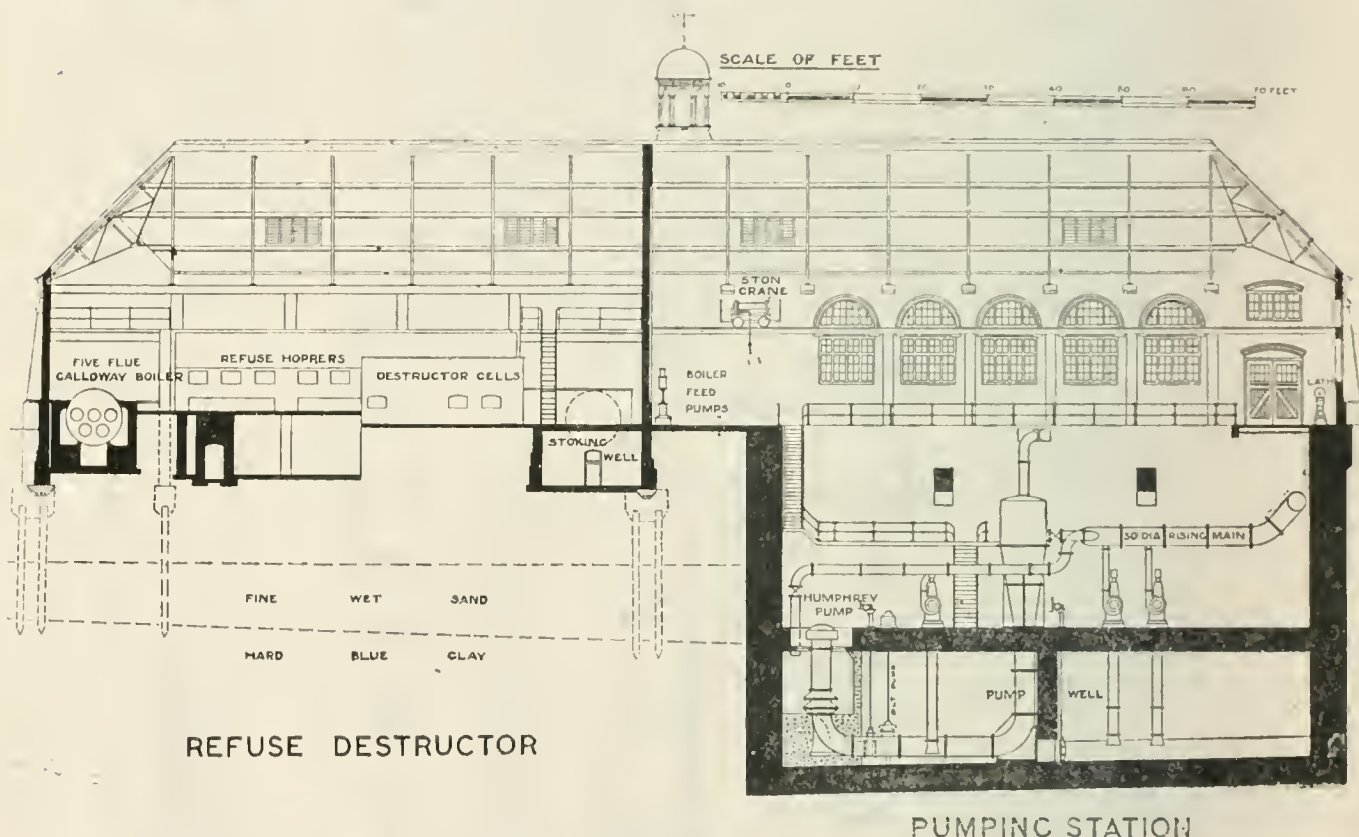

hole. This added greatly to the difficulty of executing the work. The excavation for the external walls was carried out in trench, and just before the full depth was reached an exceptionally heavy rainfall of three days' duration raised the water level in the water-bearing strata to such an extent that a bad leak was started at the north-eastern end of the excavations. Before the damage could be remedied the water reached the dry sand in the "dumping," causing a settlement, and the general collapse of the heavy timbering and the disturbance of the surrounding ground over a considerable area. Fortunately, no loss of life or personal injury resulted, but the progress of the work was considerably delayed. The contractors adopted the only course which appeared open to them, and proceeded to excavate the fallen material and to form the sides of the excavation to a batter, as they could not re-timber. This involved the removal of a large quantity of additional soil, and refilling on the outside of the walls as they were brought up. A considerable amount of work remained unexecuted when the author took over the completion of the works.

Mechanical Equipment.—The pumping plant consists of three centrifugal pumps driven by high-speed

pressure of 120 lb. and vacuum of 26in., and under these conditions at full load are guaranteed not to require more than 21 lb. of steam per brake-horse power per hour. The price of this plant, delivered and fixed, is £1,071.

The engines exhaust through a feed-water heater into a submerged surface condenser, which is placed in a concrete chamber over the screening floor. This chamber is placed on a by-pass from the effluent pipe, and the whole of the effluent water can be passed through for cooling purposes.

The condenser and air pump are designed to deal with 5,000 lb. of exhaust steam per hour, and to produce a vacuum of 26 in. The condenser has a total cooling surface of 500 sq. ft., and is divided into four sections with U-shaped tubes of solid drawn brass 1½ in. external diameter by 16 W.G. The chamber is fitted with Jarrah wood baffle plates to deflect the cooling water round and through the condenser before leaving the chamber. The cost of condenser, air and lift pump, fixed complete, is £370. The feed-water heater is capable of heating 8,000 gallons per hour from 60 to 90 deg. Fahr. The oil separator is guaranteed to remove all grease in excess of ¼ grain per gallon from 5,000 lb. of steam at 2 lb. absolute pres-

REFUSE DESTROYER

PUMPING STATION

SOUTHEND-ON-SEA REFUSE DESTROYER AND PUMPING STATION: LONGITUDINAL SECTION.

(Plate No. 7.)

compound two-crank condensing engines, each equal to 1,600 gallons of screened sewage per minute, and two Humphrey internal combustion pumps, each equal to 3,300 gallons per minute; in each case against a maximum head, including friction, of 65 ft.

The total combined capacity is therefore 11,400 gallons per minute, equal to approximately seven times the average dry-weather flow from a residential population of 100,000, with due allowance for visitors. It is estimated that sufficient steam will be supplied from the refuse destructor to pump the dry-weather flow for five and a-half to six days in each week, and that the Humphrey pumps will be required to deal with one day's flow in each week and storm-water.

In addition to the above pumping plant a small Stereophagus pump is provided for clearing the pump well of deposit.

The centrifugal pumps were supplied by the Worthington Pump Company, and are direct-coupled to Sisson high-speed steam engines of 50-h.p., working at a speed of 550 revolutions per minute. The pumps have 10-in. delivery and suction openings, and the guaranteed efficiency is 72 per cent. Steam ejectors are provided for charging purposes. The engines have forced lubrication, and are designed for a steam

sure per hour, with a maximum drop in pressure between inlet and outlet of ¼ in. of mercury. The cost of feed-water heater and oil separator, fixed complete, is £82 10s.

The condenser, &c., above mentioned were supplied by Messrs. Isaac Storey & Sons, Limited.

Humphrey Pumps.—It was originally intended to provide oil or gas engines coupled to centrifugal pumps for raising the surplus sewage during storm time and other sewage which could not be dealt with by the steam pumps, but early in 1910, before any tenders for this plant had been accepted, the author had the opportunity to peruse a paper read before the Institution of Mechanical Engineers by Mr. Herbert A. Humphrey, in which he described his recently invented internal combustion pump.

The author was much impressed with the possibilities of this invention for dealing with large volumes of water sewage, and at interviews subsequently with Mr. Humphrey discussed the practicability of providing pumps of this type for the Southend sewage works. After inspecting the experimental pumps erected by Mr. Humphrey at Dudley Port, and prolonged negotiations with the licensees, Messrs. Siemens Brothers, Limited, he obtained from the latter a tender for the supply of

two large pumps at a price which compared favourably with that of the plant originally proposed. One important condition attached to the tender was that one pump should be first constructed and thoroughly tested under ordinary working conditions, and that, should this be found deficient in capacity, but satisfactory to the engineer in other respects, the second pump should be made so much larger as to yield with the first pump the total capacity required, but that should either or both pumps fail to yield, under

ing the "play-pipe," but the Southend pumps are provided with what is described as an "intensifier," through which the sewage passes into the rising main, and between which and the combustion chamber a short "play-pipe" is provided, these pumps being therefore less simple in construction.

At the time of writing one pump has been installed, and has been run for short periods with clean water and a number of adjustments made. It is probable that before the date of the meeting it will be pumping sewage under ordinary working conditions. The author is, of course, unable to express any opinion until after the completion of the official trials, but he thinks it may reasonably be expected that the results of the tests will be quite satisfactory.

The pump is 3 ft. internal diameter, the length of play-pipe being 48 ft. 6 in., and the height of the intensifier is 20 ft. above floor level. The specified capacity of each pump is 198,000 gallons per hour, with a consumption of not more than 170 cub. ft. of producer gas of 130 British thermal units calorific value per pump horse power per hour.

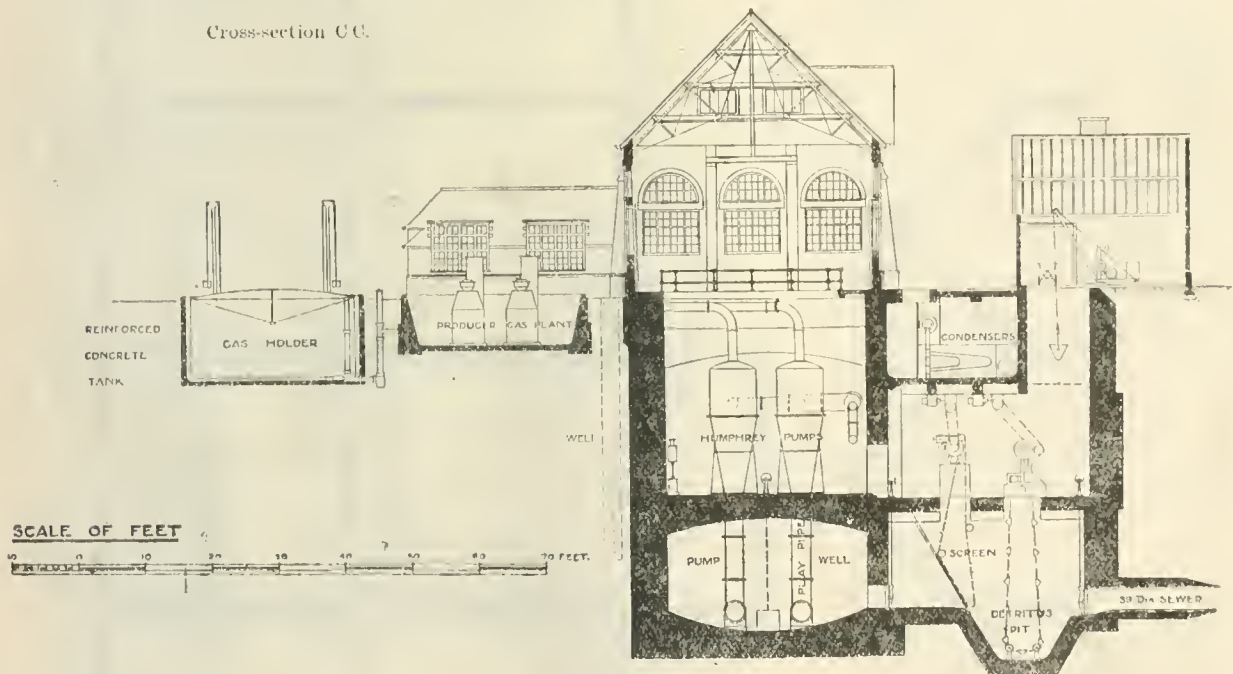

The sewage valves are made of "Duralumin" plates faced and hinged with "Dermatine."

The valves are arranged in two rings, one above the other, carried on steel castings, to both the suction and intensifier. The suction chamber was originally intended to be a sheet steel, but, having regard to the liability of this material to rapid corrosion, the author arranged to omit this from the contract and himself construct the chamber in reinforced concrete. The irregular shape of the chamber and the fact that it must be airtight rendered its construction somewhat difficult, but it was completed quite satisfactorily.

The producer-gas plant (Dowson & Mason) is supplied with the pumps, and comprises two sets of producers, designed to use either anthracite coal or coke, and each having a capacity of 5,535 cub. ft. of gas per

Cross-section C.C.

Cross-section B.B.

test, results satisfactory to the engineer, the corporation were to be entitled to call upon the contractors to remove them at their own expense and without any charge. At this time the only pumps that had been made were comparatively small experimental sets, but the author felt no hesitation in advising the corporation to accept Messrs. Siemens Brothers' tender, and a contract was entered into.

Since then the large Humphrey pumps for the Chingford reservoir have been installed, and have given results of a highly satisfactory character.

These, however, are of the low-lift type, pumping clean water against a total head of from 25 ft. to 30 ft., whereas the Southend pumps are of the high-lift type, pumping screened sewage against a head of 65 ft. The main difference in the design is that the Chingford pumps are so constructed that the rising main and pump are one, the former constitut-

hour. A gasholder of a capacity of 5,535 cub. ft. is also supplied.

Stercophagus Pump.—This pump has inlet and outlet of 5-in. diameter, with a vertical spindle, through which it is driven by a 15-h.p. motor. The normal speed is 1,860 revolutions per minute, at which it is guaranteed to pump 18,000 gallons of sewage per hour against a total head of 65 ft. The pump is submerged in the pump well, and is provided for the purpose of removing accumulations of deposit from the invert. The suction terminates in a sump at the lowest point in the pump-well floor. This type of pump was designed by the Hon. R. C. Parsons for raising liquids containing large quantities of solids. It is provided with a cutter which, it is claimed, breaks up solid matters, such as wood, coal, coke, rags, &c., which may find their way into the pump, and so enables it to deal with sewage sludge and other substances of

similar character without risk of blockage. The efficiency is slightly less than that of an ordinary centrifugal pump of similar capacity, but under some conditions the small amount of additional power required is more than compensated for by greater reliability and more regular working. This pump was supplied by the Pulsometer Engineering Company, Limited.

Electrical Plant.—The generating plant comprises one steam-driven generator, consisting of a vertical tandem compound high-speed "Sisson" engine, coupled to a 15 - k.w. continuous - current dynamo, and as a stand-by a similar dynamo, driven by a horizontal oil engine, previously used for driving a sewage pump. This plant is required to supply current for lighting the works and cottages, and for driving a 1-h.p. motor for air compressor, a 3-h.p. motor for the screens and silt elevator, a 2-h.p. motor for economiser in refuse destructor, and motors for silt tanks, humus tanks, &c., aggregating 7-h.p.

The switchboard is on the pump floor, and the current is conveyed to the different parts of the works by bare copper overhead wire on creosoted poles.

Overhead Crane.— This is arranged to travel the whole length of the pumping station, and has a span of 35 ft. and a capacity of 5 tons. Cost, £105.

Lathes, &c.— The station is equipped with one large and one small gap bed lathe, a radial drill, and other tools; all are electrically driven.

Rising Main.—The pumps are connected to a cast-iron rising main, 30 in. in diameter, carried on brackets above the pump floor. Additional branches are provided in this main for further pumps as required.

Silt Tanks (Plate No. 9).—These are of the upward-flow type, eight in number, and have a combined capacity of 1,150,000 gallons, or half the ordinary daily dry-weather flow. The tanks are 40 ft. by 40 ft. on plan, with a depth of 23 ft. from water level to invert. The lower part is in the form of a hollow inverted pyramid from which rise vertical walls.

The tanks are arranged in two groups of four, with the roughing filter and sludge well between. A conduit runs through the centre of each group, into which the tank effluent overflows through a number of rectangular openings. The tanks are constructed of concrete (6 to 1), and covered with light arched reinforced-concrete roofs, and rendered to above water level. It was at first intended to provide galvanised-iron scum plates, but after making a few experimental reinforced-concrete slabs the author decided to substitute these. The slabs are 5 ft. by 3 ft. by 1½ in. thick, reinforced with Hy-rib metal lathing, and carried in cast-iron brackets. They have been found to be good and cheap, and are practically everlasting. The cost is about 1s. 6d. per super. foot unfixed. The sewage enters the tanks, which work in parallel, through a cast-iron bell-mouthed bend turned downwards in the

centre of each tank, and at a point about 18 ft. below water level. The normal average rate of upward flow is 1.2 ft. per hour, and the maximum rate 3.6 ft. per hour, the latter being on the basis of three times the dry-weather flow. An alternative arrangement, consisting of a Jarrah wood box outlet, is being tried in one of the tanks. This is expected to increase the deposit of suspended matter by effecting greater diffu-

An ejector chamber is provided alongside the silt well, so that the silt, when found necessary in the future, may be delivered to the higher land and to a greater distance than is required at present.

Straining and Roughing Filters (Plate No. 9).—These filters are in two parts, have a total area of 230 super. yds., and a depth of medium of 3 ft. They are intended to act as screens between the silt tanks and

(Plate No. 11.)

sion of the entering sewage. A mushroom valve, 18 in. diameter, is provided in the invert of each tank, through which the silt is forced by the hydrostatic head in the tank, the latter therefore being self-cleansing.

A storage silt well is provided into which the silt is discharged from the different tanks, and from which it can be delivered to the drying beds.

bacteria beds, their duty being to arrest any colloidal matter in suspension in the tank effluent.

To maintain their efficiency frequent cleansing is necessary, and this is effected by reversing the flow of water through the filters and at the same time blowing a quantity of air through the medium. The washings resulting from these operations are delivered into the silt well. Compressed air for the second

SOUTH-END-ON-SEA PIER IMPROVEMENT: EXTENSION OF OUTER HEAD PLAN OF MAIN DECK. (Plate No. 12.)

operation is provided by a positive pressure blower worked from an oil engine of 12½-h.p. in the small pump chamber adjacent to the filters.

The medium is composed of washed gravel ¼-in. to ½-in. gauge.

By-pass pipes enable sections of the filters to be isolated and the tank effluent conveyed direct to the bacteria beds.

Reinforced concrete has been used in the construction of the division walls, channels, &c.

This type of filter was introduced by the late Mr. Joseph Corbett, borough engineer, Salford, who kindly gave the author full particulars of the construction and method and results of working his roughing filters, which have been of much assistance.

Bacteria Beds (Plate No. 10).—These are rectangular, and have a total area of about 3 acres, divided into four sections, each about 105 ft. by 350 ft.

The walls and floor are of concrete (6 to 1), the latter 5 in. thick. The medium is of washed clinker varying in size from 3 in. to 1 in., and is 6 ft. in depth, carried on a false bottom of salt glazed tiles. The effluent drains to channels running through the centre of the beds.

The distribution is by sixteen travelling and reciprocating sewage-wheel distributors, of the mono-

PERCOLATING BEDS, SOUTHEND SEWAGE WORKS.

rail type, running on 55 lb. steel rail track carried by light cast-iron columns, and taking the tank effluent from 13 in. by 13 in. galvanised steel troughs. The distributors are capable of sprinkling the tank effluent at varying rates of flow up to 450 gallons per super. yard per day, travelling at the rate of from 40 ft. to 80 ft. per minute, and giving average rest intervals of five minutes and upwards. They were supplied and erected by Messrs. Jones & Attwood at a total cost of £3,754.

Humus Tanks.—These are designed on the same principle and worked in the same way as the silt tanks. There are two tanks, each 58 ft. 3 in. by 22 ft. 9 in., the bottom of each being divided into three inverted pyramids, with three inlet pipes discharging at a depth of 8 ft. below top-water level. The normal rate of upward flow is 7 ft. per hour, which increases to 21 ft. per hour at three times the dry-weather flow. The humus is pumped from the invert of the tanks by a small centrifugal pump, electrically driven.

Gauge Basin.—A gauge basin is provided on the effluent pipe near the humus tanks. This contains a rectangular weir 7 ft. wide, the flow over which is recorded by a Lea recorder.

Sludge Disposal.—It was at first intended to dispose of the sludge on the low-lying ground on the north of the site of the pumping station, but when it was found that the quantity of gravel required would involve the excavation of a very large pit, the author decided to under-drain the bottom of the pit and utilise it for dealing with the sludge. About half the area has been under-drained back into the gravitation sewer to the pump well, and divided into sludge lagoons by means of earth embankments.

The sludge gravitates to these lagoons, and is distributed by means of timber troughs.

The soil overlying the bed of gravel is light in character, varying in thickness from 3 ft. to 5 ft., and this together with quantities of foamy sand found in some parts of the pit will be used for covering over and mixing with the sludge. The author is hopeful that after a time this mixture may be

found of value to farmers in the neighbourhood, particularly those cultivating heavy land.

It is proposed to continue excavating gravel and sand, for which there is a constant demand both for corporation works and by builders and contractors, so that the pit will probably be capable of accommodating the sludge for many years, even if none is removed, and there will be available a constant supply of surplus soil. This method of dealing with the sludge has several advantages, including the avoidance of pumping, less risk of nuisance, low cost, and the hiding from view of the sludge lagoons.

Storm Water.—About half the borough is provided with a system of storm-water sewers, which take the storm water from the roads and fronts of the houses. The corporation Act requires the treatment of three times the dry-weather flow, beyond which the storm water may overflow into the two existing tanks. After these become full it overflows from them and discharges through the existing outfalls, the tanks then acting as continuous settlement tanks. They may be emptied only between the times of high and low water. It has been found by actual measurement that the ordinary daily dry-weather flow is about 23 gallons per head of the permanent population during the winter and 23½ gallons during the month of August, when the greatest number of visitors and trippers are in the town, and on this basis it is anticipated that overflow from the tanks between the times of low and high water will take place at rare intervals, and only when the overflowing storm water is practically innocuous.

In addition to the completion of the pump well and deep-level sewers, the whole of the bacteria beds, silt tanks, humus tanks, and other important parts of the works have been carried out by administration. The pumping station and refuse destructor buildings were erected by Messrs. E. & B. H. Davey, Southend-on-

SOUTHCHURCH AND THORPE BAY BOULEVARD.

Sea. The concrete tubes were supplied by Messrs. Ellis & Sons, Leicester, and the British Improved Construction Company, London, and the electrical plant by Messrs. Crompton & Co., Chelmsford. Mr. E. J. Messent, Assoc. M. Inst. C.E., acted as resident engineer, and Mr. A. Snodgrass as works manager, to both of whom the author is indebted for whole-hearted thoroughly efficient service.

This paper having already reached a greater length than the author intended, he will confine his further remarks to a condensed description of the refuse destructor, pier extensions, loading pier, tramway boulevard and open-air bath.

REFUSE DESTRUCTOR.

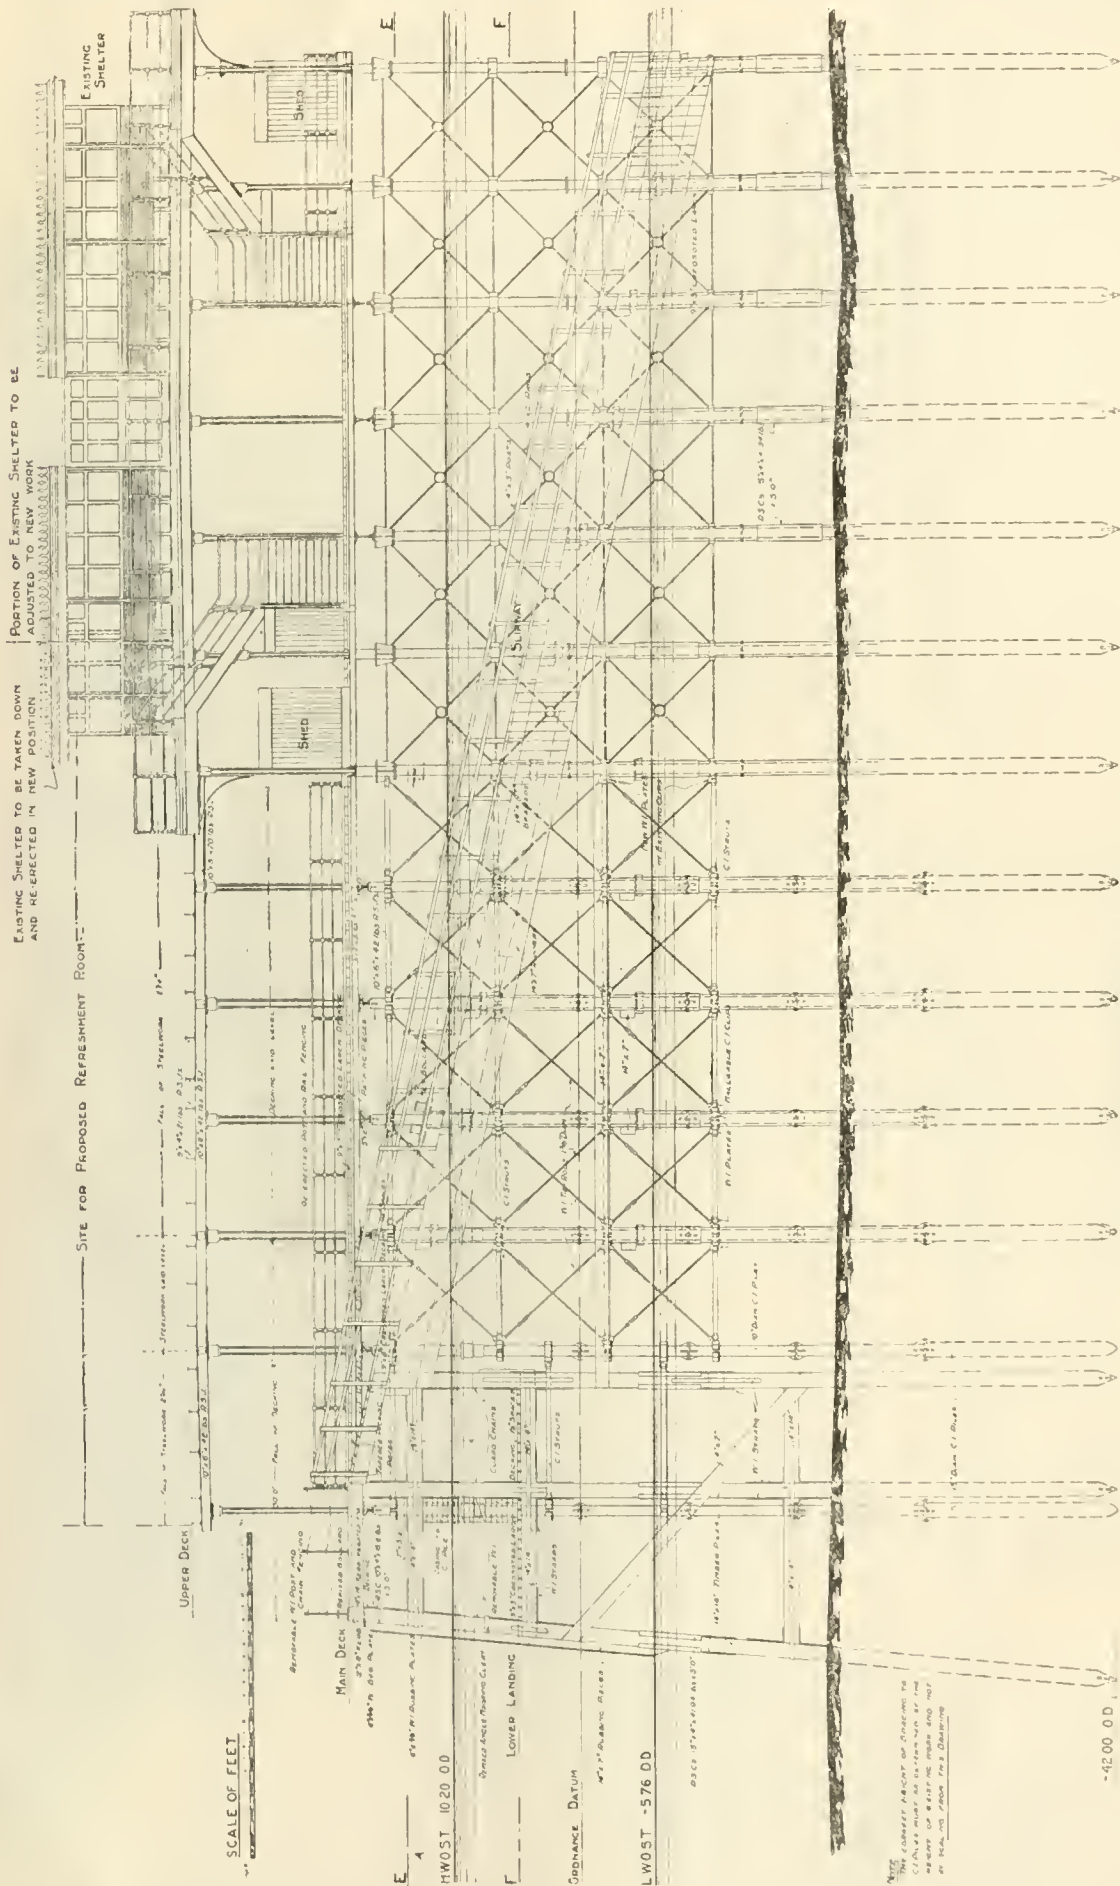

(Plates Nos. 5, 6 and 7.)

The main building is 91 ft. by 68 ft., with a tipping floor at the rear 91 ft. by 25 ft. The refuse is delivered into three reinforced-concrete hoppers, of a total capacity of 150 cub. yds., equal at the present time to about one-fourth the weekly supply. The cells are back feed, six in number, arranged in pairs, each pair having a continuous grate of 50 super. ft. The feeding is by hand, but the author is experimenting with a tipping truck, the principal object of which is to reduce labour and facilitate the conveyance of refuse from either hopper to either cell. Forced draught is provided by steam blast, the air being drawn from a space between the top of the main fire arch and the reinforced slabs covering the cells.

The two boilers are five-flue Galloways, one being

arranged for coal firing when required. They are 8½ ft. diameter by 26 ft. long, have ample steam capacity, and are constructed for a working pressure of 200 lb. per square inch, this pressure being reduced to 120 lb.

The chimney shaft is 125 ft. high, 7 ft. diameter at the base and 6 ft. at the top, lined its whole height with firebricks. It was erected by the Alphons Custodis Company, Limited, at a cost, excluding concrete

SOUTHEND-ON-SEA PIER IMPROVEMENT: ELEVATION C.C.
(Plate No. 13.)

before reaching the engines. Each boiler is provided with a superheater having a heating surface of 235 sq. ft. A 240-tube Green's economiser is provided on the main flue.

foundation, of £660. A dust catcher is provided beyond the economiser, and ample provision is made for obtaining access to every part of the plant and flues for the removal of dust.

The cells were constructed by Messrs. Dawson & Manfield, Manchester, at a total cost of £1,850. The boilers cost £1,370, the superheaters £150, and the economiser £490. The flues, boiler settings, and dust catcher were constructed by Messrs. Poulton & Timmis, Reading, at a cost of £1,250.

Lavatory accommodation and baths are provided for the use of the staff.

ESPLANADE WORKS.

These works comprise the final section of the Esplanade improvement works, which were commenced by the author about eleven years ago, the total cost of which will be about £160,000. Originally the Esplanade consisted of a footpath only, of an average width of about 15 ft., and this has been extended to a total width varying from 60 ft. to 100 ft. A footpath 12 ft. wide on the north side, a promenade 20 ft. wide on the southern side, in some parts one and in others two carriageways, and generally throughout the whole length plantations and ornamental gardens have now been provided. The greater portion of the sea wall is formed to a slope of 4 to 1, and constructed of concrete faced with Kentish ragstone. At the western end the wall is vertical and faced with basalt, and on the Marine-parade section is sloping, with moulded granite concrete rock-faced blocks on concrete bed. These blocks are somewhat too expensive for large areas, but are of exceptionally good appearance and very satisfactory. Immediately west of the pier the widening is extended so as to include an area of about 3 acres which it is proposed to lay out as a sunk garden.

About 270,000 cub. yds. of earth filling and about 30,000 cub. yds. of concrete have been used in carrying out the esplanade works. When these are completed they will provide a marine drive of 4½ miles. Messrs. W. Muirhead & Co., Limited, are the contractors for the works now in hand.

SWIMMING BATH.

For some years there has been a demand for a bathing pool or other bathing facilities on the foreshore, and several schemes have been proposed, but have met with considerable opposition, principally because the adoption of either would have involved the erection of buildings which would have obstructed the view from the promenade.

When, however, the completion of the last section of the esplanade improvement works was under consideration, it was suggested that the objections might be removed by constructing an open-air bath as part of these works, below the promenade level, and this proposal is now being carried out.

The bath pond is 300 ft. by 70 ft., surrounded by gangways and dressing boxes, &c., over which the promenade is carried on cast-iron columns. The main walls are of concrete, those at each end and on the sea side being faced with Kentish ragstone. The pond walls and floor are also of concrete, and will be lined with white glazed vitreous tiles. The bath will be approached by a staircase from the promenade, and will be provided with 130 dressing boxes, diving boards at various heights, shower baths, &c. The depth of water will vary from 2 ft. 6 in. to 6 ft., with a diving pool 8 ft. 6 in. deep across one end. The water will be admitted into the bath through sluice valves in the sea wall, and will pass through a series of coarse and fine screens. It will be discharged at low water, a small portion having to be pumped. The cost of the bath, beyond the cost of the esplanade works, is £8,200. The main walls were constructed under contract by Messrs. Muirhead & Co., Limited, the tiling is being executed by Messrs. Carter & Co., Poole, and the remainder of the work by Messrs. Davey & Armitage, Southend-on-Sea.

LOADING PIER.

Some thirty years ago the old timber promenade pier was replaced by the present iron structure, and some of the timber removed was utilised for the erection of a small jetty for unloading barges. The use of this jetty has increased to such an extent during recent years that, although it is equipped with three electric cranes, the accommodation has for some time been quite inadequate, and in consequence the corporation obtained powers under a Provisional Order to erect a new loading pier near the gasworks. This pier is 580 ft. in length, and provides eight berths, accommodation for storage of goods, weighbridge office, &c. Tenders were invited for alternative forms of construction—viz.:—

(a) Cast-iron piles with framed steel and concrete superstructure, and

(b) Reinforced concrete.

The lowest tender for (b) was found to be about 20 per cent lower than the lowest tender for (a), and the corporation decided to accept the former.

The drawings, specification, and bill of quantities for the reinforced concrete structure containing general particulars of work and materials and conditions to be complied with were issued to contractors with the forms of tender. The specification required that the stresses in the structure should not exceed the following:—

Concrete in compression in beams and slabs subjected to bending (extreme fibre stress) 600 lb. per square inch.

Concrete in piles and columns under simple compression, 500 lb. per square inch.

Concrete in shear in beams, 60 lb. per square inch.

Adhesion of concrete to metal, 400 lb. per square inch.

Steel in tension, 16,000 lb. per square inch.

Steel in compression, 15 x (stress in surrounding concrete).

Steel in shear, 12,000 lb. per square inch.

The loads to be carried by the different parts of the structure were shown upon the plan, and the specification stipulated that the engineer should be entitled to load to one and a-half times the specified loads any parts of the works, after the same had been completed at least eight weeks. The space at the author's disposal will not permit him to describe the work in further detail, but he will be pleased to give any further information to any member to whom it may be of interest.

The tender of Mr. T. W. Pedrette, of Enfield, which provided for reinforcement on the Piketty system, was accepted. The total cost is about £11,000.

PIER IMPROVEMENT.

(Plates Nos. 12, 13 and 14.)

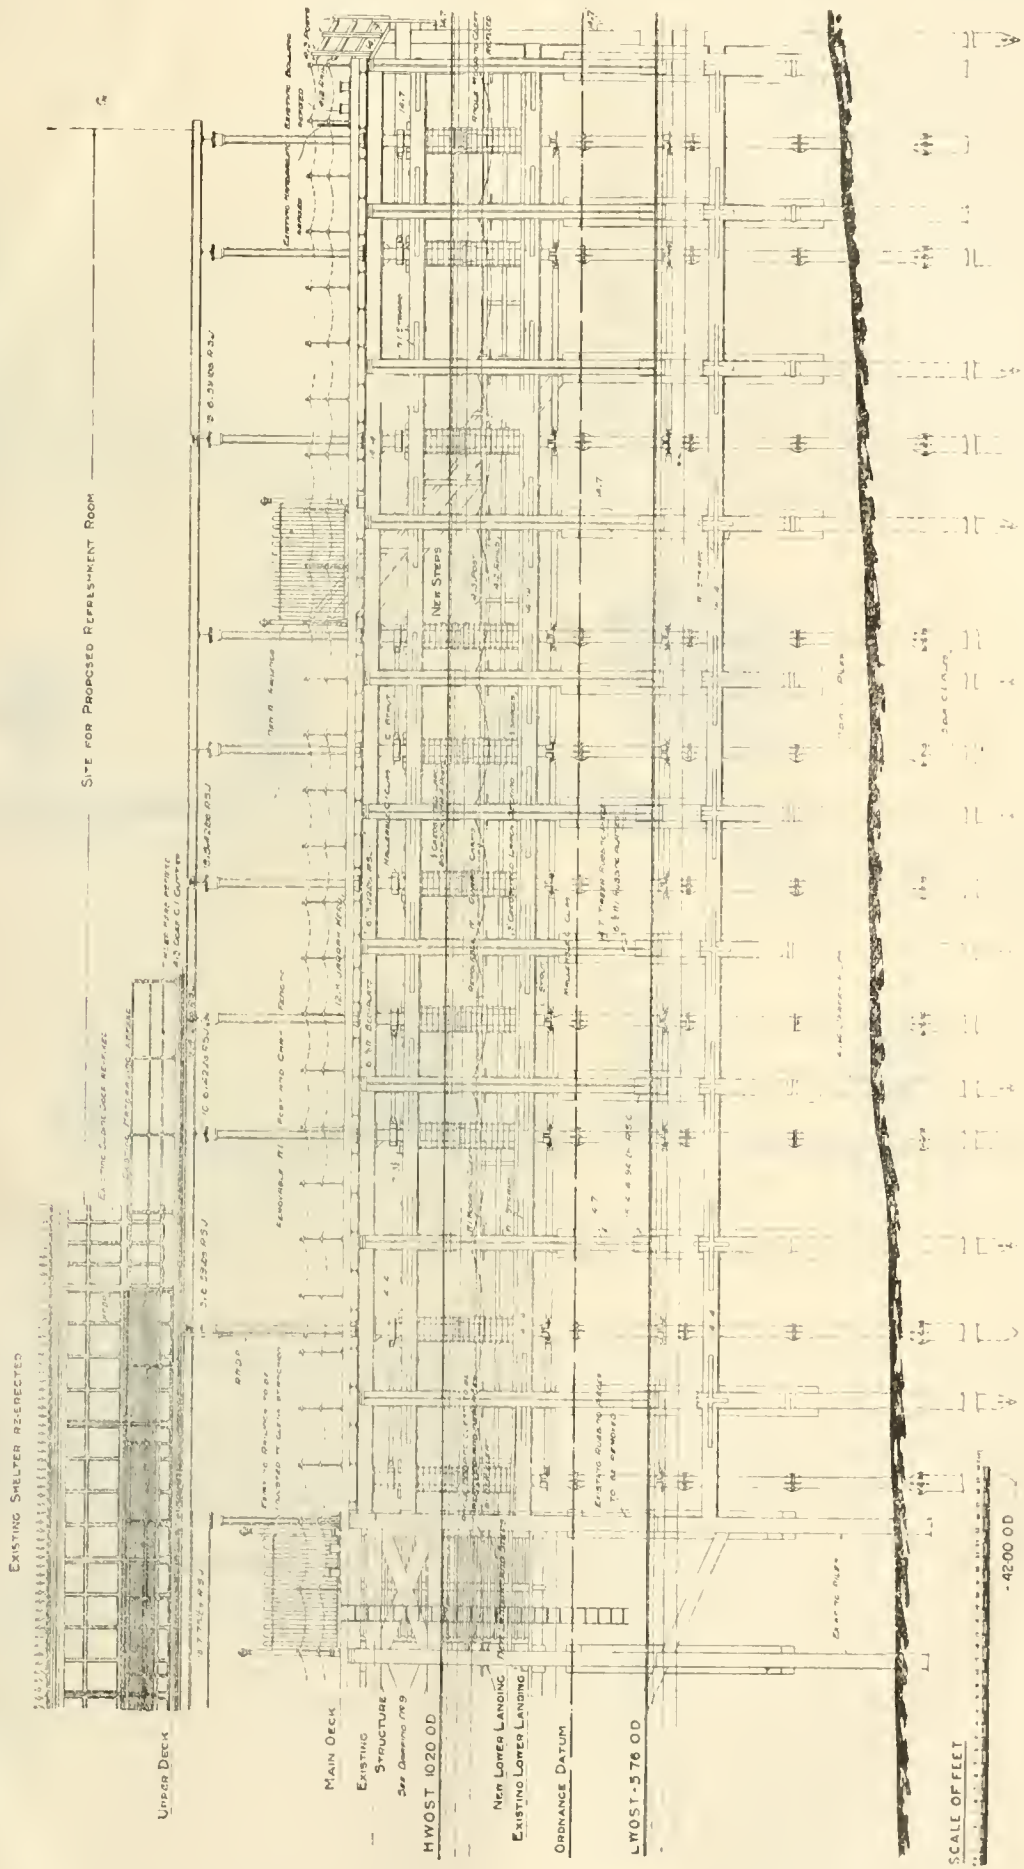

The Southend-on-Sea Pier is about 1½ miles in length, and is equipped with an electric tramway for conveying passengers from end to end. About eight years ago the author carried out extensions to the pier head, which included the provision of an upper deck with shelters and bandstand. This has been very popular, and further works are now being executed which will increase the area of the main deck and upper deck by 1,800 sq. yds. A large café is to be constructed on the upper deck, the roof of which will provide a promenade at a still higher level. The original structure is carried on cast-iron screw piles, but the author has adopted pointed iron piles. These are built up of 10-in. diameter flanged castings 8 ft. 6 in. long, upon a bottom pointed casting 15 in. diameter, 15 ft. long. The thickness of metal is 1 in., and all flanges are heavily bracketed.

The maximum calculated dead load to be carried by any of the piles is 65 tons, and the specification requires that they be driven until the set does not exceed 2 in. in ten blows from a 50-cwt. tup falling 4 ft. The piles driven up to the time of writing have not complied with this requirement until they have reached an average depth of 45 ft. below ground level, which will result in some of the piles having a total length when completed of 83 ft. Jarrah wood piles 14 in. square and 60 ft. long are used for forming the landing stage for steamboats outside the metal structure. These are heavily braced and strutted, as the stage is disconnected from the other portion of the pier and intended to withstand the full shock from boats alongside. The cast-iron piles are provided with wrought-iron stays and cast-iron struts. In the previous alterations the original design of the pier was followed, but it was found that the connections of the various members, especially where under water, was so difficult and expensive that in the present scheme the design has been entirely altered with the object of simplifying and expediting as much as possible this part of the work. The result has been quite satisfactory.

The main and lower decking is of creosoted larch, 3 in. in thickness, and the floor of the upper deck is constructed of 3-in. pitch pine in 5-in. widths, the edges being bevelled and the joints caulked similar to a ship's deck. The shelters are arranged to form an enclosure for the bandstand and to accommodate an audience of about 1,300, and have seats outside which are so arranged as to provide shelter whatever the direction of the wind. The café will have accommodation for seating 170. The kitchen will be in a large dome forming part of the roof; the remainder of the roof will be available as a promenade 50 ft. above sea level. Cloak rooms and ample lavatory

accommodation are included in the scheme, and a lift between the decks. The estimated cost of the work is £20,000. The contractors are Messrs. Wall, Limited, of Grays.

the same character constructed ten or more years ago, especially in connection with the permanent way, most of which has been relaid since it was constructed in 1900.

SOUTHEND-ON-SEA PIER IMPROVEMENT: PART ELEVATION DD.
(Plate No. 14.)

TRAMWAY BOULEVARD: TYPICAL CROSS SECTIONS.
(Plate No. 15.)

The Southend tramways—or, more correctly, light railways—have experienced difficulties similar to those associated with most other undertakings of

The principal difficulties have been rail movements—which have resulted in movements of the paving—hammering and loosening of the joints, and corrugation. In relaid and new track the rail movements have been practically eliminated by forming a shallow

depression in the concrete bed below the rail flange, and lightly packing the rail with granite clippings, and running the depression with Plac-com. The effect of this process is to form an elastic bed to the rail, a water-tight joint between the flange and the concrete, and to effectually hold the rail in position. The joint hammering has been overcome by the provision of Thermit welded joints which, although expensive, give excellent results. Notwithstanding these improvements, corrugation and other difficulties appear to be more or less unavoidable in connection with ordinary street tramway construction, and, in the author's opinion, the primary cause is the rigid, unyielding form of construction necessary to provide, at the same time, for the requirements of electric traction and ordinary vehicular traffic.

When, therefore, the author was instructed in 1910 to prepare a scheme for an extension of the tramway system in the eastern part of the borough, he endeavoured to make arrangements which would avoid the necessity of laying the track in the public highways. After prolonged negotiation, the co-operation of the landowners on the proposed route was secured, and they ultimately agreed to convey to the corporation sufficient land to enable a separate track, with shrubberies on either side, to be provided for the tramways, and for a road on each side of same. The corporation were to lay the track, plant and maintain

tion in cost. The total length of new double track is about 2 miles, of which $\frac{1}{2}$ mile has been in use since July, 1913, and the remainder is now nearing completion.

The rails are laid on sleepers throughout, except where they cross existing highways. The foundation is of screened gravel, the ground level below which is sloped from each side to a rubble drain in the centre of the track. The ballast is brought to the top of the sleepers, and it is intended to cover this with soil, level with the top of the rails, and sow the surface with grass, after the track has taken its bearings.

Having regard to the fact that the track will be soiled over, the author was inclined at first to adopt reinforced-concrete sleepers, but ultimately decided to use Jarrah as being less expensive, more resilient, more easily packed, and likely to be less noisy, although possibly having a somewhat shorter life. A short length of track is laid with reinforced-concrete sleepers for trial, and may be inspected by those interested. The first section of the track was laid with 90-lb. grooved rails removed when relaying and doubling a portion of the original tramways, but which were not badly worn, and should, under the more favourable conditions now provided, give useful service for some years. The remainder of the new track is laid with 70-lb. flat-bottom railway rails. The formation work

SOUTHEND-ON-SEA LIGHT RAILWAYS EXTENSION—THORPE HALL BOULEVARD: TYPICAL CROSS-SECTIONS. (Plate No. 15.)

the shrubberies, lay out as "estate" roads, and thereafter maintain, one of the proposed roads referred to for a portion of the length, and construct a new railway bridge of 100-ft. span over the boulevard in place of an existing bridge of 20 ft. They were, in one case, to pay an agreed sum as compensation to tenants, and in respect of land taken from the golf course were to acquire and convey to the golf club an equivalent area, and pay the cost of the necessary alterations. Other landowners agreed to contribute a sum exceeding £5,000 on condition that the corporation made up completely and took over the roads on each side of the track where it passed through their estate. The total area of land required for the proposed track and roads was, approximately, 15 acres. The terms having been provisionally agreed, application was made to the Light Railway Commissioners for powers to carry out the scheme, and a local inquiry was held. The commissioners appeared at first to hesitate to approve the proposals because of their novelty, but ultimately they were satisfied that the scheme was likely to yield satisfactory results, and the chairman, in stating their decision to make the Order, expressed the hope that the interesting proposals of the corporation might be found of great advantage to the town.

Some difficulty was experienced in obtaining the confirmation of the Order by the Board of Trade, who withheld it until they were convinced that the carrying out of the works as proposed would effect a reduc-

tion in cost. The total length of new double track is about 2 miles, of which $\frac{1}{2}$ mile has been in use since July, 1913, and the remainder is now nearing completion.

In conclusion the author would like to acknowledge his indebtedness to the members of his staff, for whose loyalty, zeal and efficiency he is deeply grateful, and to specially mention his deputy, Mr. R. H. Dyer, and chief engineering assistant, Mr. H. C. Whitehead. ASSOC. M. INST. C. E.

Wrexham's Bowling Greens.—Two municipal bowling greens, which have been provided in the new park at Wrexham, were opened on Saturday by the mayor, Mr. S. G. Jarman.

Worcester Sewage Works.—In their letter intimating that a Provisional Order had been granted for the extension of Worcester, the Local Government Board refer to the question of the sewage disposal arrangements of the city, and state that, on the evidence before them and in view of the short time the completed works have been in operation, they do not feel they are yet in a position to regard this matter as satisfactorily settled. The board understand that the works have been stopped on two occasions since the beginning of the year, and from this it would appear that they are hardly yet in a reliable condition.
