Apologies for absence were announced from a number of members, including Mr. H. T. Chapman (Wells), now county surveyor of Kent, who, in the course of his letter, wrote: "May I take this opportunity of expressing how much I appreciate the honour of having held the office of district chairman for the last two years, and the pleasure I have derived from attending the meetings? I feel I have, through the instrumentality of the institution, made many good friends among the members, from whom I part with regret. I should like you to convey to the members my best wishes for their future, both in official and private life, and also my hope that the South-Western District will increase in strength and usefulness. I am sure you will have a pleasant and successful meeting at Torquay, which is equalled by few and excelled by no other watering-place in the country, and whose engineer and surveyor is one of the best."

SUPERANNUATION.

Mr. THOS. COLE, secretary of the institution, wrote that he was instructed by his council to forward a copy of the representation with regard to superannuation provisions for local government officers made by the National Association of Local Government Officers, and he asked that the members would do their utmost to secure the support of the Members of Parliament of the several divisions of their district.

The CHAIRMAN said he supported what the secretary had to say. Although some of them did not see eye

to eye with the majority on the council, they must be loyal and support them on that matter. The question of superannuation was one of the most important matters that had come before them for a long time, and it had been before them far too long. The National Association of Local Government Officers had been working away on the matter, but they had not made much progress. When the last General Election took place they circularised and interviewed candidates and got their views, and tried to get their promise for some kind of Bill for superannuating corporate officers. At Plymouth they waited upon the four candidates, and they expressed surprise at the anomalous position they were placed in compared with officers of other departments. As a matter of fact, they were all under the impression that they did enjoy some kind of superannuation scheme. They all promised to give their support, but, of course, they could not then go into details in the absence of a scheme. Since then some years had passed, and they did not seem very much nearer the point. He thought the secretary's suggestion was a good one. When there would be a General Election they did not know, but it was well to be prepared with something definite so that they could move in the matter should an election come along. He impressed upon members of the various districts the advisability of interviewing candidates and laying their case before them. He was quite sure that it only required a reasonable superannuation scheme on a fair contributory basis to meet with their approval. It was a matter of very deep interest, more particularly to the younger members of the profession. "We older men, getting towards the end of our tether, won't receive any benefit, or very little," added Mr. Paton, "but for the younger members it should be pressed forward." He thought it a great shame that officers should serve the public a good number of years with the possibility of being thrown aside like a sucked orange. He noticed that Mr. Samuel, President of the Local Government Board, expressed surprise that there was no superannuation scheme, and expressed approval of the principle of such a scheme. There was therefore some cause for hope. Mr. Burns, the former President of the board, had always been averse to a superannuation scheme, and more particularly to the security of tenure. Personally, he (Mr. Paton) would be prepared to drop that in order to secure superannuation. There were many good reasons why security of tenure should be dropped, because, in his opinion, if an officer was not in sympathy with his authority, good work could not be done. The mere interests of an officer should not be allowed to stand in the way of the public interests. There had been cases, as they knew, of harsh treatment, and it was possible to avoid it. But, taking municipal servants as a whole, he thought they were treated in a fair and generous way. Personally, he would strongly suggest the dropping of the security of tenure part of the scheme, and simply going for all they were worth for the superannuation scheme.

The CHAIRMAN asked Mr. Moulding what had been done in the council with regard to it.

Mr. T. MOULDING (Exeter) said they were moving as fast as they could, but it was a very difficult thing. A deputation waited upon the late President of the Local Government Board, but got no sympathy whatever. There was now a movement on foot with regard to security of tenure in an insurance form.

Mr. BAINES took it that the dropping of the question of security of tenure was more or less a matter of tactics.

Mr. PATON: I don't know that it is to be dropped. I said personally I should be prepared to vote for dropping it.

Mr. BAINES: So should I; but I do hope, if it is dropped, it will be only for a time. Security of tenure (he proceeded) was a very important thing, especially to those employed by small authorities. A surveyor who was employed by a large authority was out of the reach of anyone who wished to be vindictive, because the surveyor had carried out the instructions of his council. He certainly thought that the question of superannuation was far and away the most important matter.

Mr. H. GARRETT (Torquay) said one point was whether the officers of local authorities could see their

way to support the National Association of Local Government Officers. In that district they had got in touch with each other socially, but incidentally they desired to become associated with the association to help forward the work they were doing to get a superannuation Bill pushed through Parliament. He would strongly advise all officers of local authorities in small districts to join the association, because the larger the numbers the greater effect it would have on those promoting the National Association's Bill. The feeling was spreading throughout the country that such a Bill should be promoted.

Mr. D. EDWARDS (Taunton) said the Somerset Surveyors' Association—an association of fifty members—recently became affiliated with the National Association of Local Government Officers. He believed that was the only way to do it. They hoped for better results from the new President of the Local Government Board.

The CHAIRMAN said he thought it was a matter that might very well be referred to the Executive Committee to deal with. An election might be sprung upon them. If so, they ought to be in a position to move forward on some recognised lines. He proposed that the matter be referred to the Executive Committee of the Western District.

Mr. R. H. DUMOND (Exeter) asked if affiliation to the National Association of Local Government Officers would meet the case. Their Bill was already drafted. They had made representation to the different districts, and in each district where there was only a small society they had approached the members of Parliament they were in touch with. That had been done throughout the kingdom, and nearly all who had been approached had promised their support to the Bill.

The CHAIRMAN said they already had two members on the council of the institution. As an institution they were affiliated with the National Association. "This," he said, "is more to work up influence in support of the scheme when it comes before Parliament."

Mr. J. SIDDALLS (Tiverton) seconded, and remarked that they were all agreed that they would like superannuation to take the premier place in the matter. But as a matter of reasoned policy there was something to be said for getting security of tenure. Among the older officers it might have the effect of getting the man superannuated, whereas if there was security of tenure, and the man could claim to continue as an officer, unless there was extraordinary deficiency in his work—which would not be likely to develop after thirty years' service—it would put him in a stronger position. Without security of tenure it might have the effect of driving him from his position on the eve of his maximum pension. With security of tenure that would not come in. That was why the National Association was keeping security of tenure to the front. He thought it required very careful consideration before they requested them to drop it. If the two could be carried, well and good.

The resolution was agreed to.

ELECTION OF DISTRICT OFFICERS.

Mr. J. PATON was elected chairman for the district in succession to Mr. Chapman, Mr. T. Moulding, district representative on the council, and Mr. D. Edwards, hon secretary (re-elected), and Mr. Hutton a member of the Executive Committee.

LUNCHEON.

Following the business meeting the members inspected the Pavilion, where they were afterwards entertained to an excellent lunch, prepared by electricity, his Worship the Mayor presiding.

The MAYOR having proposed the loyal toasts, which were enthusiastically drunk.

Mr. J. PATON proposed the health of the Mayor of Torquay, and said they highly appreciated the honour he had conferred upon them by welcoming them and sitting through their formal business. They also highly appreciated his generosity and hospitality in inviting them to lunch in that beautiful building. That lunch had two objects in view. The mayor had had a secret opportunity of showing them the results of electric cooking. So far as he could see, the lunch had been entirely successful. The corporation were to be congratulated on their departure in municipal cookery, which would be to the benefit of the digestive organs of the ratepayers. (Laughter.) In conclusion, Mr. Paton said the fame of the Torquay Pavilion had travelled far and wide,

and all were unanimous in saying that the corporation had established a branch of municipal trading which tended to promote the health of the community and its good temper and general enjoyment.

The MAYOR, in responding, said that before the Pavilion café was opened there was not a place of the kind in the town.

Mr. T. MOULDING proposed the health of Mr. Garrett, who had made the arrangements for the day, and the latter, in reply, said he was delighted to see them in Torquay once more. When they were there in 1891 the spot on which they were that day assembled was nothing but sea. He never thought then that they would have such a place to meet in as the Pavilion. When he first propounded his scheme in 1892 it was only for a little plain shelter for those people who liked to patronise what was then the Princess Garden. Since then they had developed to such an extent that the Pavilion had been reared on the site. They hoped it would be a great attraction to the town, and a benefit to those who came to reside among them.

The members were afterward shown over the new town hall by Mr. Garrett.

TORQUAY PAVILION.

On re-assembling in the council chamber, Mr. Garrett made some supplementary remarks with regard to his paper (which he delivered prior to the luncheon interval) on the recently completed Torquay Pavilion.

In this interesting paper Mr. Garrett said that, although he had already given a general description of the building, and the members had visited it during its construction, he thought that as considerable additions and improvements were made during the progress of construction a further statement might now be of interest, and would assist in completing the history of an undertaking which had been the means in a great measure of placing Torquay in the forefront of health resorts.

The total area of ground covered by the building was 19,377 super. ft., and the area of the main or concert hall was 12,300 super. ft. The recess for the stage or platform was 36 ft. wide by 20 ft. deep, and projected beyond the main wall into the hall 10 ft. 6 in. It was widened out along the front to 37 ft. The building stood upon a portion of the Princess Gardens, which were formed by reclamation works, the material carrying the foundation of the building being dredged up from the harbour area, and averaged a depth of 20 ft., and retained in position by a massive sea-wall built in concrete. The framework of the building was of steel stanchions resting upon a reinforced-concrete roof covering the whole site. The roof was formed of elliptical and semi-circular lattice girder ribs. The whole of the framework was quite invisible, the space between the stanchions being of brickwork, externally faced with Doulton's Royal Lambeth Carrara ware, and internally covered with highly enriched fibrous plaster work, and oak panelling. The whole of the roof was covered with copper, 16 oz. to 1 ft., at an extra cost of £775, instead of No. 15 V.M. zinc, as originally proposed. The centre portion of the building, of an area of 60 ft. sq., was surmounted by a dome, the highest part being 45 ft. from the floor line. The two main aisles, branching north and south, were of 30-ft. width, and 34 ft. high, with transepts to each side of 18 ft. in width and 18 ft. high. The chief peculiarity about the building was the variety of heights of the interior. This variation was unavoidable owing to the restrictive covenants in the title deeds of the properties adjoining and overlooking the site of the building. Many "wise-heads" predicted that the acoustic properties of such a building would be a failure, but it was gratifying to record that, on the contrary, the properties had been a perfect success, and the softest passages of any music might be heard at the furthest corners of the building. There is seating accommodation in the building for 1,800 persons.

Referring to the restaurant attached to the building, Mr. Garrett said it had been claimed that it was the first of its kind to be operated entirely by electricity, and he believed that that was the first occasion upon which a municipal surveyor had been called upon to associate himself with such an extensive and so novel an undertaking as cooking by electricity. The Pavilion was constructed throughout from his (Mr. Garrett's) designs, and under his personal supervision. He pointed out that the whole of the electrical installation was laid out and equipped by the

borough electrical engineer (Mr. C. W. Salt), and added that it was intended to provide accommodation for the service of afternoon tea only in a "café" on the ground floor of an area of 60 ft. by 18 ft. As the building operations developed, the size of this café, with its service room, was commented upon. When the extent of the area of ground covered began to be realised, the subject of improvements and introducing a large up-to-date public restaurant engaged the serious attention of the council. It was subsequently determined practically to double the size of the space set apart for the café, and to enclose it by a handsome oak glazed screen, at an extra cost of £700, and to provide additional kitchen accommodation, equipped with suitable cooking plant for the full service of an up-to-date restaurant. The size of the café was thus increased to an area of 79 ft. by an average of 32 ft. The town council, being the owners of the borough electrical and power undertaking, were approached by that department, and strongly urged by them to instal complete electrical cooking apparatus instead of ordinary kitchen ranges or apparatus for cooking by gas. It could readily be understood that, as cooking by electricity was an entirely new undertaking, considerable opposition was raised by those who hitherto had pinned their faith to gas as being the only substitute for the older method of cooking by coal or coke fires. Owing to the situation of the building, it was undesirable to erect any unsightly chimney, which, at the best of times, would probably emit objectionable smoke and fumes, which might become an annoyance to the frequenters of the roof promenades. It therefore resolved itself into a question of gas versus electricity. There was, and probably always would be, a difference of opinion, but eventually the arguments in favour of electricity, and of utilising the town's electrical supply for the purpose, were so strong that consent was given to the borough electrical engineer to equip the whole buildings with apparatus for supplying not only afternoon teas, but sufficient for full-course luncheons, dinners and suppers.

The decision to embark upon such an ambitious scheme demanded extensive additions. Certain stores on the adjoining quay, the property of the council, were acquired, and the position of the building containing the heating installation was raised an additional story to provide a second kitchen on the level of the roof promenade. The kiosk, or shelter, on the south-east corner of the roof was enclosed, thus forming a second service room for use in the service of afternoon teas on the roof during the summer months. Additional accommodation for the increased staff, by way of lavatories and cloakrooms, was also provided by rebuilding a portion of the stores referred to, and thus arranging one of the most extensive and up-to-date restaurants to be found in any health resort; in fact, it was, on its completion, described by the electrical profession as the then "largest all-electrical restaurant" in the country. Subsequent events had proved that the decision to embark upon such an ambitious undertaking was the right one, for, with all these additions, it was found, within a year of the opening, during a certain part of the summer season, to be inadequate, and although further extensions had not yet been undertaken, serious consideration would probably be given to this point, especially in view of the disadvantages to which the staff were now working. The current was obtained from a special high-tension service of 2,000 volts alternating current, transformed to a secondary current of 200 volts for cooking operations. The current was supplied by meter, and paid for at the rate of less than 1d. per unit.

"It has no doubt occurred to many," added Mr. Garrett, "that this is a case of municipal trading, and how are the council able to carry on such an undertaking? The answer to this is a very simple one. By the Torquay Waterworks Act, 1903, sec. 45, the corporation were empowered 'to erect, maintain, furnish and equip pavilions, refreshment rooms, conveniences, &c., in any park or garden belonging to them.' This restaurant is therefore a 'refreshment room' within the meaning of this Act. The Local Government Board not only sanctioned the loan for the building, but for the electrical cooking installation also without question; hence the council are able to carry on the business of a public café and restaurant. It is true that some of the local tradesmen have raised objections to this restaurant, but it is nevertheless true that since the commencement of its operations local 'restauranters' have either reconstructed their premises or improved them to bring

them up to date, while at least two new cafés have been constructed, and two additional cafés, at no great distance from the Pavilion, are shortly to be constructed, thus amplifying the old axiom 'that the supply creates the demand.'"

Mr. Garrett mentioned that the first year's total income was £16,000. Although that amount did not cover the first year's expenditure, which included large non-recurring amounts, it was hoped that in the current year, with careful administration, the receipts would cover the full outlay.

The CHAIRMAN, in proposing a vote of thanks to Mr. Garrett for his excellent paper, said the full value of it was really in completing the record so far as their proceedings were concerned. It was three years ago, when the foundation works were in hand, that they had a description of the building. Now it was consummated, and they saw the building in its complete form, Mr. Garrett's paper was of great value. He thought it would add to the value of the paper if the cost of the building could be added. The excellence of design, of course, could not but strike one, while he had also been impressed with the enormous amount of detail involved. The corporation of Torquay were to be congratulated on the completion of such a scheme having regard to all the circumstances of the case. The site was not an ordinary one. As Mr. Garrett had explained, the land upon which the building had been erected had been reclaimed from the sea. The difficulties of building on a sandy foundation were very great. It was satisfactory that no cracks were to be seen in the building. The engineer had taken precautions that there should be no infiltration or outfiltration, and that it should not take away any of the subsoil. In that way it could not move at all. The wisdom of covering the roof with copper would be proved in years to come, not only from the point of view of the less cost of maintenance, but from an æsthetic point of view. The copper, in time, would become a beautiful colour, and at a distance add a charm to the building which ordinary observers, perhaps, did not notice. He had noticed it in other buildings where domes and roofs had been covered with copper. The Pavilion was also peculiar in another way, because he did not know another place in England where a corporation had power to run a restaurant and supply refreshments. The corporation of Torquay were fortunate in having powers under a municipal Bill empowering them to do the work. The success of such an institution showed that it was badly wanted in Torquay. They got a wealthy class of people in Torquay, and previous to the building of the Pavilion there was no place where they could hear first-class music. Added to that they had a place where they could get excellently cooked food at a reasonable rate. It was a departure even in these days, when so many things were carried on by the corporations. The progressive spirit of Torquay was also seen in the municipal buildings they had not inspected. The same spirit of thoroughness had actuated the council in putting up buildings not only convenient and commodious, but buildings which were excellently built, and were of the most substantial character. There was no question that the work of the borough could be carried on better and more economically than under the old arrangement, where the municipal offices were scattered. With regard to that branch of municipal trading which related to the restaurant business, it was a moot point how far that should be carried on. In most cases private enterprise was sufficient to meet the wants of the neighbourhood; but there were cases—and that was one of them—where there was a want, and the corporation had been well repaid for their progressive policy in supplying it. He understood that they were going in for medical baths in Torquay. That appeared to him to be absolutely necessary in such a town, and he was looking forward with a great amount of interest to the result. He had not the slightest doubt that the medical baths would pay handsomely. Swimming baths might pay, though they did not pay in many boroughs. As the bath in Torquay was to be in conjunction with medical baths, he had no doubt that it would be largely used by visitors and others, and that it would prove a good investment for the ratepayers.

Mr. J. SIDDALLS (Tiverton) seconded, and observed that Mr. Garrett was an ideal municipal officer in that whenever they got into any little difficulty, or wanted any advice, if Mr. Garrett was in possession of the information, he ungrudgingly gave it.

In answer to questions by Mr. Edwards and Mr. Siddalls as to the working cost of the Pavilion café,

MR. SALT, borough electrical engineer, stated that they could safely say that three meals were served at a cost of electricity of 1d. There was no concession granted to the Pavilion undertaking that was not granted to any other consumer of electricity in the town. The average cost of production of electricity in Torquay was 1.21d. per unit, but it did not follow from that that current was being supplied at a loss by reason of the flat rate of 1d. being charged for heating, cooking and domestic purposes, as some unit-cost considerably less than the average and others might cost a little more.

MR. GARRETT, replying to the chairman's question as to the cost of the Pavilion, said the actual cost was £19,000. The amount of the loan was £17,500, and of the £1,600 in excess the copper roof cost £775 and

the new café screen £700. The actual cost of the building came out at the amount they originally intended spending.

The vote of thanks was unanimously agreed to, and on the motion of the chairman, Mr. Salt was also thanked.

It was suggested that Exeter should be the next place of meeting.

The Corporation of Torquay were heartily thanked for placing the new town hall at the members' disposal, Mr. Paton again expressing appreciation of the mayor's presence.

His Worship said he hoped the members had enjoyed their short stay, and that they would one day come to Torquay again.

NORTH-EASTERN DISTRICT MEETING AT WAKEFIELD.

On Saturday last, the members of the North-Eastern District of the Institution of Municipal and County Engineers met at Wakefield, the attendance including Messrs. J. E. Acfield (Leeds), J. Andrews (Dewsbury), R. Archer (Brighouse), G. Atkinson (Leeds), A. Beaumont (Beverley), Edmund J. P. Bedford (Cleckheaton), H. L. Bottomley (Brighouse), S. E. Burgess (Middlesbrough), W. E. H. Burton (Wakefield), H. A. Butterfield (Batley), H. Dearden (Dewsbury), W. Dixon (Leeds), J. H. Drew (Wath-upon-Deerne), H. M. Driver (Tadcaster), H. P. Foster (Leeds), W. Fowlds (Keighley), T. H. Hailstone (Birstall), H. L. Hall (Batley), Geo. A. Hart (Leeds), S. S. Haywood (Brighouse), Frank Hewitt (Kiveton Park), A. C. Hodge (Sheffield), H. Holmes (Ossett), L. Ives (Wakefield), William T. Lancashire (Leeds), A. E. Loach (Wakefield), C. Lund (Cleckheaton), E. B. Martin (Rotherham), E. Picker (Beverley), W. H. Price (Leeds), Thos. H. Rawnsley (Ossett), C. E. Rivers (Harrogate), Leslie Roseveare (South Shields), A. Rothera (Liversedge), J. Saville (Heckmondwike), J. F. Smillie (Tynemouth), J. Southward (Rothwell), F. W. Spurr (York), W. J. Steele (Newcastle-on-Tyne), W. Sugars (Horbury), Fred. J. Thackray (Hoyland), G. Wharton Thompson (Hipperholme), D. C. Thwaites (Ossett), T. Waddingham (Hebden Bridge), J. P. Wakeford (Wakefield) and Charles F. Wike (Sheffield). The guests included Councillors T. C. Tattersall and P. Mountain, Mr. A. C. Allibone (town clerk), Dr. E. M. Chaplin (city analyst) and Mr. S. Atkinson (former chairman of committee having charge of sewage works).

After assembling at the town hall, the party proceeded to Calder Vale, where they inspected the recently remodelled sewage disposal works, Mr. J. P. Wakeford, M.INST.C.E., hon. district secretary, the city surveyor of Wakefield, taking charge of the party and explaining the principal features of the works. Later, by the kind invitation of his Worship the Mayor (Mr. J. W. Saville), the party partook of tea at the town hall.

MR. FRANK MASSIE, M.INST.C.E., district chairman, presided at the business meeting which followed.

THE CHAIRMAN announced that Mr. E. R. Matthews (Bridlington) had resigned his position as district representative on the council, upon his appointment to a professorship at the London University. While congratulating Mr. Matthews upon his success, the executive accepted his resignation with great regret. The executive suggested that Mr. E. B. Martin (Rotherham) should be nominated, and asked to continue in his position as one of the representatives on the executive. They had also done him (the chairman) the honour of suggesting his name to the meeting as the second representative for the North-Eastern District. He need hardly say that he thoroughly appreciated the honour they had done him. That was how the executive had dealt with the matter, but it was open to that meeting to suggest any other names.

The meeting adopted the recommendations.

MR. MASSIE proposed the election of Mr. W. J. Steele, city engineer of Newcastle, as his successor in the office of chairman. He was sure they would all agree that Mr. Steele would make an excellent chairman, and one who would uphold the dignity of the position, and succeed in promoting the usefulness of the institution. He also proposed the re-election of Mr. J. P. Wakeford as district secretary. Mr. Wakeford had done excellent work during the past two years, and he could assure them that the new chairman would find his labours very much lightened by the assistance he would receive from Mr. Wakeford.

In returning thanks, MR. STEELE said he would spare no effort to fill the position to the satisfaction of the

members. He was afraid he would fall very short of the dignity and ability which had been displayed by the present chairman. If Mr. Massie would have accepted the position for another year, there was no doubt he would have been elected unanimously.

MR. WAKEFORD said that, while he was extremely obliged to them for again electing him to the post of hon. secretary, he should have been quite willing to have handed the position over to someone else. However, during the two years he had held the position he had endeavoured in every possible way to further the interests of the institution, and that would be his aim in the future.

On the suggestion of the chairman, a collection was made on behalf of the Orphan Fund, a sum of £3 7s. 6d. being realised.

On the proposition of the chairman, a vote of thanks was accorded Mr. Matthews for his past services, and the members congratulated him upon the appointment he had received in the University of London.

The retiring chairman was also thanked, and it was remarked that he had performed his duties in an ideal manner.

MR. MASSIE said he had thoroughly enjoyed holding the position. It was in the best interests of the institution that the position should go round, and that was the reason why he had vacated the position. He thanked them for the kindly consideration that had always been extended towards him.

THE INSTITUTION "JOURNAL": MR. ROTHERA'S MOTION.

In accordance with notice given, MR. A. ROTHERA (Liversedge) moved:

"That the members of the North-Eastern District request the council to take a poll of members and associate-members as to whether they are in favour of the issue of the 'Journal' of the institution in parts as at present, or the retention of the annual bound issue formerly existing, and that a copy of this resolution be sent to the secretary of the institution and the hon. secretary of each of the various districts, asking for their co-operation by supporting a formal resolution to this effect."

MR. ROTHERA said that, in moving the resolution set down in his name, he did so with the very earnest desire to do what was best for the institution and for the bulk of its members. He desired to say, in order to disarm any criticism of his action, that it mattered not one iota whether the step taken by the council in publishing the "Journal" had in effect the swamping of any professional paper, because he had not, nor had he ever had, the slightest financial interest in any professional paper connected with their profession, and in denying that his word must be taken to applying to any American company, if such existed, so as to make it as wide-spreading and as definite as he possibly could. He particularly asked them not to leave that meeting until some definite vote had been taken on the resolution he had moved, because in all fairness to the bulk of our members it was very undesirable that a question of that importance should be delegated and settled by 100 or 150 members who might attend the annual meeting at Cheltenham. In his opinion the most desirable and fair way was to let everyone have an opportunity of voting by means of a poll. Their different branches were formed to serve in a great measure to help their council, and to indicate to them what was really needed for the good of the whole of its members. The postponement of the resolution passed at the Paignton meeting, when it was read at the Manchester meeting, evoked even from members in favour of the "Journal" many smothered complaints—another reason for some

decision to be come to at the present meeting. The backbone of their institution was composed of wise members, whom he knew, at some self-denial to themselves, willingly paid their subscriptions, and it was not right to put them to further expense in binding the volumes, when a year or two ago the subscription was advanced to meet the added cost of the institution in many ways. What was the matter with the "Proceedings"? They were well printed, well edited, and made a handsome-looking volume, and he could say they were the most treasured of his professional books. They came once a year, ready for reading and well bound. On the other hand, the new "baby" would never be the equal of its "good old daddy." It was much larger, and awkward to handle; it found a place on the desk and table of the busy professional man, and possibly eventually went into the waste-paper basket, or on to the shelf unbound. It was supposed to keep them up to date, yet that week he had received an issue containing the report of the Manchester meeting, which some of the professional papers had finished with nearly a month ago. Vital facts concerning the institution had to be learnt from sources other than their "Journal." One resolution had evidently been marked "not for publication." He referred to the retiring allowance of £250 a year to their esteemed secretary. The "Journal" had caused a new official to be created at a cost of no doubt not less than £150 a year, making a salary list of about £900 a year, with an income of £2,725, or possibly he might say, £3,000 per annum. Were their councillors as generous to them? They knew better! The old volume cost £40 a year in postage, while the new one would cost £320, making a total extra expenditure of nearly £500 a year, and he doubted whether the advertisements would reach that figure. There were three past-presidents against the change, two past-members of the council, two—and possibly more—members of the council, for a certainly one district chairman, nine county surveyors, four London borough surveyors, the assistant county surveyor of London, eight city surveyors, and about fifty borough surveyors, besides a host of the class he himself represents—the "young and obscure members"—so if he was erring he did so in good company. Let him again ask them to give a vote on the question of that important change in the procedure of their institution, and so give some lead to the council with regard to taking a poll, which was the surest way of enabling each member to have a say. It was not right to take such an unconstitutional step as had been done without first consulting those who paid the piper. Most of them never knew the decision had been come to until a few days before the last annual meeting, and it would not then have been allowed but for a statement made by the president to the effect that all arrangements had been made for printing, and that a great wastage of money would be caused if the meeting rejected the recommendation of the council. The professional journals had well represented them in the past, and he was pleased to say were still doing so, inasmuch as their meetings are fully reported before the "Journal" was issued. He hoped anything he had said would be received in the spirit in which he gave it. He had no axe to grind, and up to now his efforts to secure what his resolution aimed at had cost him both time and money, though for that he cared not one jot, so long as the council deal with the matter in a fair and popular way. Should the result be for the new order of publication, he would willingly bow to the majority, and go on still striving for what was best for the institution.

Mr. H. HOLMES (Ossett) seconded, and said that, after the very able speech of Mr. Rothera, few words on his part in support of the resolution were necessary. He took it that the minutes of their proceedings were intended for reference in after years. As far as he could see, the "Journal" was going to be after the nature of a trades journal. He thought every engineer had sufficient trade literature among his correspondence every morning without the "Journal" being added to it.

Mr. G. A. HART (Leeds) said it would be of material assistance to himself and other "dim and obscure" members if they could have an expression of opinion from one of the members of the council. They would like to hear the reasons which influenced the council in making this alteration.

Mr. W. T. LANCASHIRE (Leeds) said he was not a member of the Journal Committee, and at the beginning he felt opposed to the proposed change. How-

ever, since he had had some experience of the "Journal" in comparison with the annual volume, he must say that he was a convert to the new order of things. Their inability to provide anybody on this occasion who could put the case strongly on behalf of the "Journal" suggested to him that the best thing would be to wait until the annual meeting for a full discussion of this question. The Journal Committee would then have an opportunity of placing the facts before the members. Personally, he never used to read the old volume, and when it arrived he put it in his bookcase for reference when required. Now he took up the new "Journal" and at once read anything which took his fancy. The new volume gave them all that the old volume used to give, and a great deal more. He did not see why they could have any objection to the introduction of trade advertisements, because they need not read them unless they liked, and when the "Journal" was bound at the end of the year, all the trade advertisements could be cut out. The council were not taking an untried step, because the Royal Institute of British Architects, the Society of Architects, the Royal Sanitary Institute, and, he believed, a great many other societies which originally issued volumes like their old volume had found it desirable to change, and were now doing what the Municipal and County Engineers were doing. It was perfectly true that the parent institution, the Institution of Civil Engineers, and the Mechanical Engineers, and possibly others, were going on in the old way, but that was no reason why they should not vary if they could receive advantage by any new procedure. He thought they were differently constituted to these old institutions. They, as executive officers for municipalities, needed very constant intercommunication, and their information should at all times be fresh and new. In comparison with the old volume, there was no doubt that the new "Journal" gave them a greater advantage in that respect. Mr. Greatorex some little time ago thought it would be to the advantage of the members of that institution if they could be posted up in all the Bills and all the Acts that had been obtained with regard to trackless trolleys. That information had been given, and was proving extremely useful to those authorities who were projecting Bills in Parliament. The information was published in the "Journal" a short time ago, which was an instance of the advantage to be derived from the new order of things. The "Journal" was not yet perfect, but it seemed to him that, with satisfactory management, it could be made to meet a long-felt want. With the additional staff they would soon see considerable improvement in the editing of the "Journal." The speaker concluded by saying that it would be to the advantage of the institution to leave this matter unsettled until the next annual meeting.

The CHAIRMAN said this matter had been talked about for the last twelve months, and it was time it was definitely settled—in that district, at any rate. He wanted the members to express what was passing in their minds, and what action they wished the council to take.

Mr. E. B. MARTIN (Rotherham) said that, when he first went on the council, the scheme for the "Journal" had practically been settled. At that time he was bitterly opposed to it, and at several meetings of the council he was afraid he made himself rather a nuisance over it. But he had a large measure of support among older and more experienced men than himself who were members of the council, and although there was a majority in favour of the more modern system of distributing their literature, there was a very strong minority against it. Now, since the "Journal" had appeared, he had spoken to many of the men who formerly shared his views, and he must say that practically all of them were converts in favour of the new order of things. He admitted quite candidly that he had been converted. He welcomed the matter being brought up at this meeting, for he should like to tell the management in London what were the views of the members of the North-Eastern District. He was not a member of the Journal Committee, but from what he had heard, he believed the paper would pay its way. He did not object to the insertion of advertisements, because he gained a variety of information by reading them. He thought the matter they now got was fresher and more readable. He should oppose the resolution.

Mr. W. FOWLEDS (Keighley) opposed the motion, and said he could go on for half an hour answering the points raised by Mr. Rothera. All the same, he complimented that gentleman upon the reasonable way

in which he had introduced his subject. He contended that the "Journal" met all the points raised by Mr. Rothera. As to advertisements, they had them already in the technical papers, and they were mixed up more than in the "Journal." He now knew a great deal more about what was going on in the institution than ever he did before. He had a number of the annual volumes on his shelf. They looked very nice, but he never looked at them, as he had read all they contained in the technical papers. They were all partly conservative by nature, and did not like change. Before he even saw the "Journal" he was convinced that it would be a great improvement, but since it had been issued he did not think there could be a shadow of doubt about the matter. He was surprised that there had been so much opposition to the change. He thought it was a case of much ado about nothing. Mr. Rothera seemed almost to worship that old bound volume. At the beginning he was against the "Journal," but now he was fully persuaded it was a good thing. The question was too trivial for them to make such a fuss about it. It would be a different thing if it were a matter of life and death to the institution. He had been a full member for six or seven years, and it seemed to him that they had been altering by-laws and regulations from that day to this, and he sometimes wondered whether they were ever going to settle down.

Mr. T. H. HAILSTONE (Birstall) supported the resolution, and said there seemed to be a great deal of discontent about the whole thing. It had been said that they got information more quickly in the "Journal," but seeing they got that information from the technical press, it was really old when they got it in the "Journal," which was a strong point in favour of Mr. Rothera's resolution.

Mr. T. WADDINGHAM (Hebden Bridge) said he should support the proposal, for that would be the only means of giving the full membership an opportunity of saying which method of publication they supported.

Mr. F. HEWITT (Kiveton Park) said he agreed that the better way would be to leave the question over until the general meeting. He believed that the opposition was largely due to that which was inherent to all English people—a feeling of opposition to change. He was against it when it was first mooted, but he had been converted since, and was convinced that it was very much better than the old method. The old volume looked very pretty on the bookshelves, but surely they could take care of the parts and have them bound at the end of the year, getting the benefit of all information while it was quite fresh. He did not think Mr. Rothera was right in saying that the copies of the "Journal" would find their way to the waste-paper basket. Personally, he was in favour of a poll, but he hoped the new members would give the new system a trial and see how it worked.

Mr. F. J. THACKRAY (Hoyland) said that many of the speakers had admitted that they were not in favour of the "Journal" when it first came out. He was in favour of it, and since the eight parts had been issued he was more convinced than ever that the council were doing the members a good service by issuing it in parts instead of as before. He thought Mr. Rothera's attitude was rather like that of many gentlemen who, if they did not like a thing, would not have it at any price.

Mr. J. E. ACRIELD (Leeds) said the financial aspect of the question would have to be settled when more information had been placed at their disposal, but now was not the time to revert to the old system. They should wait and see what the new secretary could do to make the "Journal" a success. Until then he thought it would be very unwise to revert to the old system of things unless the financial situation demanded it. Certainly the "Journal" was capable of much improvement.

Mr. G. HART (Leeds) said he came to the meeting with a perfectly unbiassed mind on this question. He had listened very attentively to Mr. Rothera and every other speaker, and the conclusion he had come to was that it would be a very serious mistake indeed if they took the line of action which Mr. Rothera suggested. The whole question would be gone into again at the annual meeting, and that afternoon they were simply putting ammunition into a gun and firing it before they came to the fray. He felt strongly that if they took up a definite stand now they would be seriously hampering the discretion of the executive in London. The executive had not made the change without having given the matter

mature consideration, and he thought it would be very inopportune to take a line of action which would indicate that the executive had acted erratically and ill-advisedly.

Mr. ROTHERA, in replying on the debate, said he was very pleased indeed that his resolution had provoked so much discussion. As he said at the commencement he wished to be perfectly fair, and did not want to thrust his own opinions down the throats of others. They all had a right to their individual opinions and to vote as they thought best. He did not believe in his resolution being put on one side, and the matter being dealt with by delegates at the annual meeting. The "Journal" had now been tried for many months, and the members had ample opportunities for making up their minds whether they liked it or not. If a poll were taken the council would get the unbiased opinions of the members, and if they were in favour of the "Journal" he would bow to the decision of the majority. It cost £340 a year to send the "Journal" to the members. They were told at the beginning that an advertisement manager was going to be appointed, and he did not suppose that that gentleman would receive less than £150 a year, whereas the old volume only cost £40 a year for distributing. With regard to what Mr. Lancashire said about various other bodies publishing their journals monthly, he had spoken to several gentlemen, and several others had written him saying they wished they could go back to the old system, as they thought that was the most sensible way of publishing their "Proceedings." He did not understand why the members wanted in a way to disenfranchise themselves by taking this matter to the annual meeting. What were the District Committees for? They were to form definite opinions to air their grievances, and to discuss matters of interest to the institution. That was why he thought a definite vote should be taken that night on the question of a poll.

A vote was then taken, when eight hands were held up in favour of the resolution and twenty-two against.

The meeting closed with a vote of thanks to the chairman, and to Mr. Wakeford for the excellent arrangements he had made for the gathering.

The Utilisation of Solar Energy.—Mr. A. S. E. Ackermann, B.Sc. (Engineering), is to read a paper before the Society of Engineers on "The Utilisation of Solar Energy," embodying the results of his forty-eight trials of the engines for using the sun-produced steam. The plant tested has cost some £30,000, the investigations cover nearly four years, and though many experiments with sun power have been made during the last fifty years, this is the first paper of its kind. The meeting is to be held at the Institution of Electrical Engineers, on Monday, April 6th, at 7.30 p.m.

East Sussex Roads.—At the annual general meeting of the Sussex Branch of the Roads Improvement Association held at Lewes on the 11th inst., Mr. F. J. Wood, county surveyor for East Sussex, gave some interesting facts concerning his proposals for the improvement of his roads during the ensuing year. He said that the estimated cost of maintenance of main roads had increased to £90,000, and £12,000 would be spent on tar surface treatment of roads, and 150 miles would be treated. Of the latter sum the Road Board was contributing £5,000, and the other £7,000 would be raised by the county, and represented something like a rate of 1d. in the £. He went on to speak of the proposals to widen the road between Newhaven and Lewes, and treated upon the drainage and improvement of certain other roads.

Housing Schemes.—In the House of Commons on Monday, the President of the Local Government Board was asked the number of housing schemes submitted to the board by local authorities during each of the last three years. Mr. Herbert Samuel said he assumed that the hon. Member referred to applications for sanction to loans for the erection of houses under Part III. of the Housing of the Working Classes Act, 1890. He could not readily state the number of such applications received in the year 1911, but the number of schemes for which loans were sanctioned in that year was twenty-seven. The number of such applications received in the year 1912 was ninety-two, and the number of schemes for which loans were sanctioned was eighty. The number of applications received in the year 1913 was 163, and the number of schemes for which loans were sanctioned 132.

ASSOCIATION OF ENGINEERS-IN-CHARGE.

ANNUAL DINNER.

The nineteenth annual dinner of the Association of Engineers-in-Charge took place on Saturday evening last in the King's Hall of the Holborn Restaurant. The president, Dr. R. T. Glazebrook, C.B., F.R.S., occupied the chair, the company, which numbered over 300, including Surgeon-General Sir Alfred Keogh, K.C.B., F.R.S., Rector of the Imperial College of Science and Technology, Dr. H. S. Hele-Shaw, F.R.S., M.INST.C.E., immediate past-president, Sir Boverton Redwood (president of the Junior Institution of Engineers), Sir Thomas D. Pile, LL.D., J.P., Captain H. Riall Sankey, R.E.(RET.), M.INST.C.E., Messrs. W. H. Patchell, M.INST.C.E., M.I.MECH.E., Leslie S. Robertson, M.INST.C.E. (secretary, Engineering Standards Committee), W. Slings, M.I.E.E., B. A. Raworth, WH.SC., M.I.MECH.E., H. C. Guntton, M.I.E.E., H. Percy Boulois, M.INST.C.E., M.I.MECH.E., H. A. McFerren, M.I.MECH.E., Alex. Siemens, M.INST.C.E., M.I.MECH.E., H. C. H. Shenton (president of the Society of Engineers), Henry Adams, M.INST.C.E., M.I.MECH.E., F.S.I., J. S. Critchley, M.I.MECH.E., M.I.A.E. (president of the Institution of Automobile Engineers), Alex. Ritchie, J.P., S. A. Cooper, M.A., M.INST.C.E., W. Noble Twelvetrees, M.I.MECH.E., W. H. Booth, F.O.S., M.A.M.SOC.C.E., Frank Broadbent, M.I.MECH.E., M.I.E.E., H. D. Wilkinson, M.I.MECH.E., M.I.E.E., F. W. Bridges, H. E. Neale (chairman of association), J. R. Manning (vice-chairman), Hy. Swann (hon. treasurer), A. Davey, M.I.MECH.E., Hy. Capsey, W. H. Ball (hon. Social secretary), Wm. McLaren, J. E. Watkins, R. Thorp, A. J. Adams and W. A. Lester.

The toast of "Science, Practice and Technology" was proposed by Mr. B. ALFRED RAWORTH, who said that, as a former engineer-in-charge, he could lay claim to having undergone some of the trials and anxieties that fell to the lot of the man that had to take charge of machinery made by others who had not afterwards to work it under commercial conditions.

Sir ALFRED KEOGH, in replying, said he thought that in the various departments of the State they were exceedingly slow in taking advantage of discoveries, whether in the realms of science, political economy, or any other directions whatever. Those gentlemen engaged in such industries as were represented at that gathering held that our college institutions had not done so much for them as they might have done. He thought there was a great deal of truth in that, though, at the same time, he thought that much of the blame for the deficiency lay at the door of the industries themselves. The Imperial College of Science and Technology had been established to alter all that, and he thought they were proceeding on the right lines. They took the advice of the great leaders of industries in this country—the most celebrated men—and he believed the education given to young engineers in the City and Guilds Engineering College would commend itself to the profession.

Mr. LESLIE T. ROBERTSON and Sir THOMAS PILE responded to the toast of "Kindred Institutions and our Guests," proposed by Mr. Alfred E. PENN. Sir Thomas said he rejoiced at the success of the Association of Engineers-in-Charge, which he attributed to the boundless energy and organising skill of their admirable secretary.

Sir BOVERTON REDWOOD proposed "The Association." Their body, he said, was making steady and satisfactory progress, and was becoming of greater value year by year. The increase in numerical strength had perhaps not been conspicuously rapid, but that was clearly explainable by the circumstance that they very properly required from every candidate for admission to their ranks the production of proof of practical experience. At the same time it appeared that the conditions under which appointments were made were such as to lead to the introduction into their ranks of men who, in a great many instances, at any rate, possessed qualifications that were not comparable with those of their own members. The responsibility rested not with them, but with those who made the appointments, and he felt bound to say there was a lamentable lack of sense of proportion in weighing the merits of those who were to occupy positions of trust as engineers-in-charge. Mr. Penn had brought to his notice an object-lesson of that character which had fairly surprised him. He had shown him an advertisement recently inserted in the newspapers by the guardians of an important workhouse—an engineer and a cook being

required. The engineer was required to take charge of three steam boilers, and he was to be able to keep in repair and to renew or extend when necessary all steam, hot water, gas and sanitary fittings. It was therefore evident that the person wanted was a man not only of good education, but of some standing in his profession, a man of practical experience, in fact. There were no specified requirements in regard to the cook, though he did not suppose any great culinary skill was expected in his case. But he observed that the salaries and emoluments were the same in each case. What he wanted to know was how it was possible in these circumstances to get the men of experience that were required. Such things were managed better on the Continent, where it would be necessary for a man to produce a certificate of efficiency and practical experience before taking up a post, and his feeling was that something of the same kind was needed here. It was only in that way that the position of the engineer-in-charge could be defined, and by which a man would receive proper recognition on his merits. The engineer-in-charge himself could also help. He should not be tempted to do just as little work as was necessary to keep the place he was filling, but he should take every possible opportunity of showing how much more he was worth than the amount at which his services were improperly assessed. Looking to the time when their services would be properly appreciated, what they had to do was to see that there was an adequate supply of men of education and experience to fill positions when the great awakening took place. They knew, of course, that a good education—a scientific education—was necessary, but it was important to add to that practical experience. He found that all their functions, both recreative and educational, were highly successful. The papers read before the association were all excellent of their kind, and he especially commended their discussion evenings. It was quite impossible for the engineer-in-charge to keep himself up to date in regard to the multifarious matters which came under his purview unless he took advantage of the opportunities afforded by that association for intercourse and the exchange of views with his fellow members. The practice of some of leading isolated lives was a mistaken one. It had been the custom of the association to secure for the office of president some distinguished man directly or indirectly connected with some branch of the engineering profession, and he was quite sure that there was no one who better fulfilled the duties of the position than the present occupant of the chair. Dr. Glazebrook, who had had a distinguished scientific career, and who since he had been at the head of the National Physical Laboratory had demonstrated how much science could do for industry and matters of every-day life in which they were all largely interested. Dr. Glazebrook had brought his mind to bear on the solution of a vast number of important problems, and he (the speaker) did not hesitate to say that the work he had carried out in the department over which he presided had been of incomparable value to science and industry. With all the many and exacting claims on his time he had, nevertheless, been able to interest himself actively in the work of that association. He had followed it closely from day to day, and on no occasion had his sympathetic co-operation been lacking, and they were to be congratulated on having secured the services of so admirable a president.

Dr. GLAZEBROOK, in reply, said it had been a pleasure to him to help in some way the prosperity of the association. They of the Engineers-in-Charge had joined themselves together for good and useful purposes. The work they undertook was an arduous one, and their duties were of a responsible nature. Many of them occupied positions of trust, and the help and support they obtained by mutually combining in that institution, and the work done by their meetings, lectures and social evenings, all assisted them to carry out their arduous duties more efficiently. Speaking of the rapid growth of the association, Dr. Glazebrook said there were demands for branches in the Provinces and the Colonies, and the council had under careful consideration how better to make the usefulness and value of the association known.

Proposed Waterways Board.—Mr. John Burns, President of the Board of Trade, has consented to receive on Tuesday next a deputation from the Waterways Association, which will urge him to appoint a Waterways Board.

Comparative Economics of Tramways and Railless Electric Traction.

PAPER AT THE INSTITUTION OF CIVIL ENGINEERS.

At a meeting of the Institution of Civil Engineers on Tuesday Mr. Theodore Graham Gribble, M.INST.C.E., dealt in a paper with the comparative economics of tramways and railless electric traction.

Commencing by pointing out that in several large cities the system of transportation variously designated as "railless electric traction," the "trolley bus," or "the trackless trolley," already formed an extension to the tramways, and that numerous applications for the authorisation of similar lines were before Parliament, Mr. Gribble said his present purpose was to discuss the economic features of the system in general, as compared with tramways, with a view to definition of the sphere of usefulness open to the railless system.

There were still many who maintained that the tramway was more economical than the "trolley bus," although the latter was now being widely adopted in preference to tramway extensions. By others railless traction was regarded as a makeshift to save present capital expenditure with possibly no actual ultimate economy. He believed that such a view was not now held by those who had made installations, although it might have been held when they projected the lines.

It was worthy of notice that the initiation of the railless electric system had not been undertaken in England by private companies, but by municipal tramway committees, and in that respect it formed an exception to otherwise universal custom. From great railways down to taxi-cabs, the introduction of new forms of transportation had, with this exception, been left by the State or the municipalities to private enterprise. In the case of railless electric traction, however, special commissions were appointed by some of the municipalities to investigate what had been done on the Continent, with the result that, after considerable modifications had been made to suit British requirements, services upon this system were opened in Leeds and Bradford about two years ago, to be soon followed by others.

The numerous extensions and new lines projected pointed to satisfaction on the part of the respective public bodies with the results obtained so far, and to the possibility of the application of electric transportation by this method to public service on the highways.

The British tramway system, immense boon as it was to the general public, had involved colossal expenditure, mostly met by municipal borrowing. Many of the undertakings could not be described as remunerative. Moreover, the tramway, owing to its cost, had been limited in its service of suburban populations.

The object of the paper was to submit evidence that for urban and suburban transportation track laying had been carried far enough in this country, and in many cases too far. It was further contended that wherever overhead wires could be employed railless electric traction, on account of its greater economy and consequent wider sphere of application, was the most natural and efficient method of extending the tramways.

THE LIGHT RAILWAYS ACT.

The Light Railways Act, which was framed with the object of facilitating the extension of subsidiary communication, had not produced the results expected from it.

The utilisation of the highways for public mechanical transportation on a comprehensive scale was necessary, not only for progress, but as a relief. The railways—prime factor in the growth of national prosperity—had at the same time entailed great evils in the over-centralisation of the population, and the congestion of its life and movement. The problem now calling for solution was decentralisation and distribution, and as regarded suburban transportation, the application of electricity thereto, without the heavy burden of permanent way, was an accomplished fact. There was no reason, however, why the railless system should not be applicable also to intercommunication between railways to serve rural districts, and thus fulfil, in all respects, the objects

of the Light Railways Act, while at the same time bringing the various collateral advantages of electricity within the reach of sections of the population which at present lacked them.

Mr. Gribble went on to say that in his paper the economics of railless electric traction would be studied only in comparison with those of tramways; therefore the transportation of goods, which would be essential in the application of the system to communication between railways, was not touched upon. The final conclusions had, however, a direct bearing on that matter. Whether passengers or goods, or both, were carried, the line required to earn a certain sum per mile of route to cover working expenses, fixed charges, and a certain profit, in order to become remunerative. The author's object was to determine that sum.

It should be noticed, however, that, in contrast to the tramways, railless electric traction possesses the advantage that the carriage of goods in vehicles or trains specially adapted for the purpose, and running at a much lower speed than the passenger cars, need in no way impede the latter.

GENERAL FEATURES OF COMPARISON.

Railless electric traction differed from the tramway commercially in two main features: The capital expenditure on permanent way was saved, and the cost of maintenance of rubber tyres was added. The other expenses—of electrical energy, administration, traffic and maintenance of rolling stock—might, for practical purposes, be taken as equal in the two cases. If, therefore, the capital and working expenses of tramways could be stated in the form of normal figures for average circumstances, comparison would be simple.

The statistics of British tramways were ample, but the figures were extremely divergent. One tramway spent more than six times as much as another per electrical unit. One spent 125 times as much as another upon the maintenance of its track. In the first place, therefore, an attempt must be made to suggest a normal standard. The generalisation which was inevitable could not be expected to hold good for all circumstances; nevertheless, avoiding plainly abnormal figures, it might represent what would probably correspond, under average circumstances, with an engineer's estimates.

The three factors which governed the commercial efficiency of a transportation system were: (1) Capacity, (2) capital expenditure, and (3) working expenses. The comparison would therefore be made on these bases.

(1) *Capacity*.—The question of the relative carrying power of the tramway and the omnibus was not a simple one. The capacity of a vehicle, as expressed by the number of seats, was distinct from its carrying power. The terms would be synonymous if the people were always there to be carried. That, of course, was not the case, and it was the character of the traffic which mainly fixed the carrying power.

It would not be correct, when making a comparison of a tramway service with one by the "trolley bus" as regarded carrying power, to measure this by the relative seating capacity. For this purpose it was necessary and sufficient to consider whether the railless electric car, when compared as to receipts and expenses with the tramcar, could be regarded as capable of carrying the same average number of passengers per car-mile.

The railless electric cars put in service in this country up to the present time were of the single-decked type, and had seats for twenty-eight passengers.

A double-decked car with thirty-eight seats had been constructed and tested on the public roads with satisfactory results. Its general adoption was therefore quite probable.

The average number of passengers per car-mile on British tramways ranged from 5.39 to 12.92. If, therefore, nine passengers per car-mile were assumed as a traffic of average density, under all ordinary circumstances in this class of traffic it could be carried by even the single-decked railless car.

Before leaving this subject something should be said as to the respective merits of the top-seat car and the power-car with a trailer attached. In England trailers were only permitted to be attached to road tractors for goods traffic, the argument being, no doubt, that there was less risk to personal safety if they did not carry passengers. If, however, one of the goods trailers in the London streets were to collide with a motor omnibus, it would not be the goods alone that would suffer. If they were in themselves specially risky, trailers ought to be banished altogether. As to obstruction of the general traffic, it might be disputed whether a passenger omnibus and trailer, capable of deviating, would obstruct the general traffic as much as one of the long London County Council cars limited to a fixed track.

The covered top-seat tramcar was too large a vehicle for one conductor to control properly. The open top-seat car, whether on rails or not, was dependent on fine weather for the use of half its accommodation. In the omnibus, restricted as to size and weight, the winding stair to the top deck was a risky and undignified means of access. The most to be said for this type was economy in traffic expenses, and in quantity of rolling stock, also popularity of the top seats in very warm weather.

As regarded the effect upon working expenses, the use of trailers, which was general upon the Continent, could not be said to lessen materially the profit on the business. Should the use of an attached trailer be permitted in England, it would much enlarge the capacity of railless electric traction for handling special traffic. It would permit the weight of the power-car to be reduced—a matter of much importance in the maintenance of roads—and also facilitate better adaptation of the accommodation to the demand.

(2) *Capital Expenditure.*—An analysis of the capital expenditure on British tramways was embodied in the paper.

It had not been possible to collate every British tramway. Either from the absence of some essential data, or on account of inexplicable discrepancies, several cases had to be neglected. As to capital expenditure, forty-three cases had been available.

A further method of analysis had been to arrange the cases according to their traffic density, expressed in terms of the car-mileage per mile of route per day. Certain items varied, normally, in direct proportion to the traffic density, such as the power-station, rolling stock, and buildings. The cost of the permanent way and of the electrical equipment also increased to a considerable extent with the traffic density, although not in proportion. The permanent way ranged from single track with light rails and cheap paving to double track of the heaviest description and paved in the most substantial manner. The electrical equipment increased in cost on account of heavier copper sections, more feeders, and more expensive sub-stations.

The general result of the analysis had been to show a curve of total expenditure considerably lower than that which would result from a graphical averaging of the cases cited. The principal reason for this was the extremely high expenditure of the tramways on power stations and land and buildings, as compared with what would be estimated under ordinary circumstances.

The foregoing statement was not intended to reflect in any way upon the cost of construction of the tramways, the circumstances which had led to heavy expenditure in any particular case being unknown to the author.

With regard to rolling stock, in the cases cited the average number of car-miles per day per car in service was approximately 105, and per car in stock 70, so that the spare cars amounted to about one-third of the whole number in stock. The 105 car-miles were supposed to be performed in a traffic-day of fourteen hours, and at a scheduled speed of 7.5 miles per hour. The average time interval of service corresponding with a traffic-density expressed in car-miles per day per mile of route was given by the formula $I = 1680 \div D$, in which I denoted the time interval in minutes, and D the traffic-density.

Abnormalities of expenditure were least noticeable in the case of the rolling stock.

The general conclusion from the analysis of capital expenditure was one of surprise that the variations should be so great. If the analysis had been drawn from the statistics of private companies, in which promotion expenses figure, and the expenditure was by no means wholly on the construction, it would have

been easier to explain. In all the cases cited, however, the undertakings had been financed by municipal loans, effected at a low rate of brokerage. Why the cost of some items should be three times as much in one case as in another of equal traffic-density the author was without any clue to explain.

With regard to fixed charges, it had been assumed that the capital would be redeemed by a sinking fund placed at $3\frac{1}{2}$ per cent. compound interest, producing amortisation in thirty years. As a necessary profit, at which the undertaking could be described as remunerative, 5 per cent had been assumed. Although municipalities could borrow at a much lower rate of interest than 5 per cent, their loan had a par value on account of the collateral security of the rates, and not from the value of the property alone. As a private undertaking, a tramway would have to make 5 per cent profit in order to have its shares quoted at par.

(3) *Working Expenses.*—With regard to the working expenses of tramways, forty-seven cases had been available, and the results had been tabulated in detail by aggregating and averaging. Three digests of the tabulation were given in the paper. First, of all the forty-seven cases; secondly, of all the cases in which the total expenses exceeded 75d. per car-mile; thirdly, of all the cases in which they did not exceed 55d. per car-mile. Finally, a generalisation was attempted of a table of normal working expenses under ordinary circumstances.

As a rule, the results went to show that low working expenses were not the exclusive privilege of large undertakings. In many cases they were noticeable in small tramways, and appeared to be due to "cheeseparing," because the concern could not afford to spend more. Here, again, the general conclusion was one of surprise that the variations should be so great.

The most striking points of variation were the following:—

(1) *Cost of Electrical Energy.*—The effect of modern improvements had been not only to lower the cost of generation by all kinds of plant, but also to make it possible for small plants to produce current at a cost which only a few years ago was only possible in the largest stations. Further, in many cases the price debited by a municipality to the tramway departments for power supplied from a joint station appeared to be arbitrary, and thus to obscure the conclusions of the statistics.

(2) *Maintenance of Permanent Way.*—As a rule, the results appeared to warrant the conclusion that tramways which could afford to do so spent about 0.5d. per car-mile upon maintenance of track; in the cases cited this item ranged from 0.01d. to 1.25d. per car-mile. A tramway which began by keeping down track maintenance to 0.01d. would certainly end by having to spend 1.25d.

(3) *General Expenses.*—The general expenses of British tramways averaged more than six times as much as those of the Amsterdam Corporation tramways.

Renewals.—It would be impossible to find from the statistics a basis for generalisation in the matter of renewal funds. For the purpose of these estimates, the amounts which must be set aside for the replacement, at the proper time, of each kind of material had been dealt with as sinking funds, although in most cases renewals must be made by instalments. For instance, some portions of the permanent way lasted four times as long as others.

CORRESPONDING ESTIMATES FOR RAILLESS ELECTRIC TRACTION.

For reasons stated later, the cost of construction, in the case of railless electric traction, had been taken as being that of a tramway (including the power station) minus its track. The difference in the cost of the overhead equipment, due to two trolley wires instead of one, was negligible. The two positive wires were connected, and furnished available feeder section. The cost of the rolling stock was about the same in the two cases.

As regarded general and traffic expenses, maintenance of overhead wires, power station and buildings, the working expenses of the "trolley bus" were practically the same as for the tramway.

With regard to the consumption of energy, it was necessary to go further into detail.

Consumption of Energy by Railless Electric Traction.—In conjunction with Mr. Bertram D. Fox, Assoc.M. Inst.C.E., the author made some experiments in 1908 to determine the consumption of energy by an electric omnibus which then plied between Liverpool-

street and Victoria stations, London. Again, in February, 1912, the author, in conjunction with Mr. Fox, Mr. Lydall, of Messrs. Siemens Brothers, and a gentleman representing Mr. Christopher Spencer, the general manager of the Bradford Corporation tramways, made experiments upon a railless electric car in the service of that corporation.

The tests made in London might, as a whole, be taken as indicating the minimum consumption of energy for railless electric traction. The average consumption of four east-bound complete trips was 1441 watt-hours per ton-mile, and of four west-bound trips 1233 watt-hours per ton-mile, the difference being mainly due to the Ludgate-hill and Charing-cross ascents on the east-bound trips. The resistance on wood pavement was found to be perceptibly less than on asphalt.

The conditions under which the Bradford tests were made were very different. The road—a macadam one in a good state of maintenance—was covered with snow, which, at first fairly hard, thawed during the day into a thick slush. These tests might be taken to represent, although not the maximum possible resistance, still a resistance much above that of average conditions of road surface, and therefore calculations made from them indicated a conservative estimate of the current consumption on country roads.

The tests were taken at speeds ranging from a walking pace to 15 miles per hour, and on gradients ranging from the level to one of 6½ per cent.

The resistance of the vehicle, including gears, was found to increase after the speed of 8 miles per hour was reached.

Tests were also made at Bradford to determine the tractive resistance by finding upon what gradient the car would just run without accelerating or retarding, and with and without connecting the chain drive.

The car was driven by a Siemens equipment of two motors, having both series parallel and field control. The motors were wound for 550 volts, but could also be guaranteed for 600 volts. The line voltage was very variable, ranging from 450 to 495 volts, and in one isolated case jumping up to 520 volts. The normal starting current of the equipment was 33 amperes per motor. The car was loaded to a total weight of 5½ tons, that being then the average weight, including passengers, when in service. A table prepared by the author showed the capacity of this equipment as propelling the railless electric traction car now constructed, which weighs only four tons. With an average of ten passengers, and driver and conductor, the total average weight of the loaded car was taken as 5 tons.

Line losses were not allowed for, because this was purely a local question, chiefly dependent upon the positions and number of the sub-stations. The only possible way to state the consumption was in the form of input from the line to the motors. It was, in most cases, economical to keep down the line losses to within 12 per cent. Even when assuming such a drop, however, the results given in the table afforded no ground for the supposition that, even on a rough road surface, it required any more electrical energy—whether maximum demand or average consumption—to transport the same number of passengers by railless electric traction than it did upon a tramway.

Another table gave a further comparison of current consumption of a tramcar and a railless car under such conditions of road surface as were shown by the Bradford and London tests respectively, on the level and on a 5 per cent gradient.

In the case of single cars, in Case 1, with road surface A, the maximum demand of the tramcar on the line was 49 per cent more, and the consumption of energy per car-mile 1½ per cent less than that of the railless car. With road surface B, the maximum demand and consumption of energy of the tramcar were 76 per cent and 43 per cent respectively more than those of the railless car. In Case 2, with road surface A, the maximum demand and consumption were, respectively, 68 per cent and 48 per cent more; with road surface B, 86 per cent and 81 per cent more respectively.

When, however, a number of cars were in service, of which only a few are accelerating at the same time, the proportional maximum demand would approximate towards the relative demand when running at full speed.

The estimate of £500 per car in service for either tramway or railless electric traction was much less than would be represented by a graphic mean curve of the actual average expenditure on power stations

of the tramways cited, and could not, therefore, be taken as an unfair comparison towards the latter.

With regard to power in relation to working expenses, for purposes of generalisation the high results shown by many of the tramways had been neglected. The figure chosen was 0.765d. per car-mile, which was arrived at by assuming a price of 0.85d. per unit, and a consumption of 0.9 unit per car-mile.

With regard to railless electric traction, the traffic density and local conditions would affect the cost of power as much as they did in the case of tramways. The above generalisation might be taken as applicable, under average conditions, to a service at intervals of about ten minutes, or about 165 car-miles per mile of route per day. Under the most favourable conditions of railless traction, and with a price of 0.48d. per unit, the cost of power would be 0.3d. and 0.42d. per car-mile in the two cases cited. Under no conditions in England did there appear to be any necessity for it to exceed 1.25d. per car-mile for tramways.

MAINTENANCE OF RUBBER TYRES.

The figure chosen (1.5d. per car-mile) was dependent for its general application upon the very fluctuating price of rubber. It also depended greatly upon the condition of the road surface and on the weight and speed of the vehicle. Contracts had been made at as low a figure as 1d. per car-mile. The cost in the case of the petrol-driven motor omnibuses was generally estimated at 1.5d. per car-mile, but the character of the propulsion was not the same in the case of railless electric traction.

ROAD MAINTENANCE.

The subject of the wear and tear of highways caused by mechanically propelled vehicles, and the contribution by the owners of the latter towards maintenance, was one which called for special and comprehensive legislation. That everyone who uses a road should contribute towards its upkeep was obviously fair.

A tramway was usually bound to pave between and outside its track. It therefore relieved the road authority from expense as to a certain width of the road. An owner of mechanically propelled vehicles could not do this, but it was reasonable that he should make some contribution in proportion to his use of the road.

The parties who were thus liable were:—

- (1) The Government, which used the roads for military and postal purposes.
- (2) Public carriers, who carried on regular services for passengers and goods upon definite routes.
- (3) The general public, who used the roads for walking, riding and driving, both for private and for commercial purposes.

The Government had done its share by making the roads.

Public carriers' use of roads could be determined in car-miles in most cases.

The general public were by far the largest users, and the extent of their use could not be determined precisely. The private automobile and commercial tractor were, in most cases, more severe upon the roads than was the motor omnibus. The rapidly moving automobile destroyed the upper surface by attrition. The heavy commercial tractor produced settlements of the foundation. The two effects interacted. Unevenness increased the shock or dynamic effect of impact.

To apportion the responsibility was no easy task. The world was passing through a revolution in highway transportation, the converse of that which took place at the commencement of the nineteenth century. That generation gave railways to the neglect of the highways; this generation was confronted with the task of adapting the highways and maintaining them in a suitable condition for mechanical transportation.

The difficulty was increased by the decentralisation of government. The constructors of the roads were the supreme government, but they were no longer the custodians of them. Each local authority maintained such portions of them as were situated within the area of its jurisdiction by means of rates levied on the inhabitants of that area. That was a very practical arrangement as long as the traffic of a district corresponded approximately with its population. But what was expedient in the days of stage coach and gig might not be the most practical or fair arrangement in the days of the motor car. The users of the roads were to-day not even approximately the inhabitants of the respective districts. Consequently, one county had to maintain its road for the benefit of the inhabitants of a dozen other counties. For instance, the counties through which the road between London and Brighton passed maintained it princi-

pally for the benefit of the urban populations at its extremities.

There seemed to be a *prima-facie* case for united action on the part of the county and district councils to obtain comprehensive legislation by the Government.

The Bill promoted last Session for facilitating the authorisation of railless electric lines under the Light Railway Act was wrecked on the shoal of road maintenance. It was suggested by the Opposition that a contribution towards road maintenance should be made an essential condition of authorisation. Seeing, however, that motor omnibuses were not thus burdened, such a condition was regarded by the promoters of the Bill as unfair. There were no inherent expensive features of railless electric traction which would prevent it from contributing, but the contribution ought to be a fair one. At present it was handicapped severely as compared with the motor omnibus in the following ways:—

(1) Overhead wires for a new undertaking could as yet be authorised only by a special Act of Parliament. Apart from some uncertainty as to obtaining sanction of the petition, the expense involved was equal to that incurred for a tramway, and thus formed a much heavier item of expenditure, in proportion to the cost of construction, than in the case of a tramway.

(2) Popular sentiment was still strongly adverse to overhead wires. In any form except aviation, public transportation was not picturesque, but overhead wires disturbed the æsthetic sense more than rails.

In spite of these disabilities, railless electric traction was making rapid strides, and it was probable that the effort would be renewed to obtain authorisation under the Light Railways Act, and incidentally supply a field of usefulness for that torpid enactment.

Some of the recent authorisations included a provision that the railless electric service should be responsible for the extra cost of maintenance of the roads used, the amount not to exceed 3d. per car-mile; others fixed that amount. In either case, as the determination of "extras" was proverbially difficult, the "trolley bus" would probably expect them to come to 3d. precisely.

A service at intervals of thirty minutes would involve, on the above basis, a contribution of about £32 per annum per mile of road: a 2½-minute service nearly £400 per mile.

If all the route-mileage of British tramways were worked by the same amount of car-mileage using railless electric traction, the contribution, at the above rate, would amount to more than £250,000 annually, and to an average of about £215 per mile of road per annum.

The revolution in highway transportation was proceeding with more rapidity than anyone ever expected, and the subject of road maintenance and the equitable distribution of its cost did not admit of postponement.

FINAL COMPARISONS.

The general conclusions were:—

(1) That with a traffic-density represented by a 2½-minute service, equal to that of the largest British tramways, the cost of working was still in favour of railless electric traction, although only to the extent of about 7 per cent. The cost of construction was, however, about 44 per cent less.

(2) That the saving increases inversely with the traffic-density, so that with a time interval of thirty minutes the cost of operation was about 36 per cent less, and that of construction about 70 per cent less. The frequently expressed opinion that, owing to the supposed greater current consumption and the cost of tyre maintenance, the economy of the "trolley bus" ceased at a service frequency of about ten minutes, was, in the author's opinion, quite unfounded. A large number of British tramways now labouring under the burden of an annual deficit would, if their services had been worked by railless electric traction, be now showing a surplus.

There was, however, another and a wider point of view to which special attention should be drawn. The saving of money was important, but the serving of the public was much more so. The ratepayers could spend or save money as they pleased. If they preferred to incur the greater expense of a tramway because they regarded it as a greater convenience, no one had any right to interfere with them. The point of greatest importance was, however, that the tramway could not serve the public as comprehensively as the "trolley bus." In order to serve the city best, the aim should be to reach the farthest suburb, and to supply the greater frequency of service

in the centre of the city by means of overlapping services radiating to the suburbs, precisely as was done by the London General Omnibus Company. The cost of tramway construction set a limit to suburban extension which was not set by railless electric traction. In order to comply with the fundamental principle of providing the greatest benefit for the greatest number, the preferences of the wealthier occupants of the city should not be allowed to outweigh the claims of the less wealthy dwellers of the suburbs to obtain at least some adequate means of transportation.

MUNICIPAL INITIATIVE.

Concluding, Mr. Gribble said there was no intention whatever in his paper to criticise, still less to disparage, either the British tramway system as a whole or any unit of it. The organisation, especially in the municipal form, was admirable. The publicity given to the results by the free disclosure of statistics, and the frequent conferences of the responsible administrators under the auspices of the Tramway Association, all made for the excellence of the service to the public. Every new economy and every new invention was made use of within its powers. The individuals entrusted with leadership, both in technical and commercial matters, were men of exceptional ability. It was the municipal tramway which had fathered and fostered railless electric traction, and in a most enterprising manner. If the infant's future was one of greater promise than many yet anticipate, and if that future was speedily realised, it was to the initiative of municipal tramway managers and engineers that the honour would be due.

Hayward Brothers & Eckstein, Limited, 187-201 Union-street, Borough, S.E., ask us to state that they are not in any way connected with Haward Brothers, Limited, of Waltham Cross, against whom a winding-up order has recently been made.

Taxation of Motor Lorries.—The District Councils of Axminster, Barnstaple, Bideford, Crediton, Holsworthy, Honiton, Kingsbridge, Newton Abbot, Okehampton, Plympton, St. Thomas, Tiverton, and Totnes have invited the Devon County Council to call the attention of the Government to the urgent necessity which exists for the fair taxation of motor lorries, suggesting that the money so raised be spent in the localities in which the lorries are used, and that a definite weight be prescribed.

"Fluxphalte" and "Mexphalte."—A second edition of "Twentieth Century Roads," published by the Anglo-Mexican Petroleum Products Company, Limited, Finsbury-court, E.C., has been issued, and all concerned with road work will do well to obtain copies. We gather from this interesting little publication that "Fluxphalte" was used during 1913 on the roads of no fewer than twenty-seven different counties of England and Wales, in addition to a quantity laid in Scotland, and it would appear also that the efficacy of "Mexphalte" for grouting work is now very generally recognised, several excellent stretches of road on this system being constructed during the twelve months in question. This class of road construction is of great advantage where municipal engineers intend to lay down short sections of road employing their own workmen, and is a comparatively simple process with which apparently highly satisfactory results can be obtained.

Heating Apparatus in Cottage Flats.—On the occasion of the visit which the King and Queen paid to Kennington last Saturday in order to see for themselves the improvements which are being carried out on the Duchy of Cornwall estate in South London, her Majesty evinced special interest, during her inspection of the cottage flats in Cardigan-street, in the kitchen arrangements and the heating apparatus by which it is possible to obtain hot water for the ordinary taps, for the bath, and for the self-filling copper from the kitchen fire. The fittings in question, we understand, are the well-known housing specialities of Messrs. Cornes & Houghton, 240 High Holborn, W.C., and were supplied and installed by that firm. The new buildings are of two floors, being really two self-contained houses superimposed one on the other, each having an independent street door. In order that the King and Queen might see how the two floors are entirely distinct they visited a ground-floor flat and a first-floor flat, the latter consisting of a kitchen, a living-room, two bedrooms, and a combined scullery and bathroom, the rent being 11s. a week.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., *Plumstead*.)

386. Storm Overflow Weir.—A 9-in. diameter stone-ware pipe, laid on a gradient of 1 in 281, carries a mean dry-weather flow of 33,300 gallons per day. It is required to construct a storm overflow weir, in a manhole, to pass all above six times the dry-weather flow. At what height above the invert of the pipe should the lip of the weir be set? (H. V. O., *West Bromwich*.)

387. Boring.—Describe, with sketches, the appliances necessary in carrying out borings to a depth of 100 ft. for the purpose of ascertaining the character of the soil. (W. N. B., *Cambridge, N.Z.*)

388. Reactions on Beams.—Show how to find (graphically or otherwise) the pressures on the two supports of a horizontal beam which is loaded at any given point. If the distance between the supports be 20 ft., and if one of the loads be 12 cwt., find the changes in the pressures produced by shifting this load through a space of 5 ft. along the beam. (A.M.I.C.E.)

389. Design of Floors.—What loads should be allowed for in designing a floor (a) in a general warehouse, and (b) in a platform to which the public are to be admitted? What factor of safety would you adopt in each case?

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

381. Town Planning.—An area of 1,000 acres, chiefly undeveloped, in an urban district, is to be included in a town planning scheme. The approximate number of owners, occupiers and lessees is 250. Assuming that the referencing is to be done by the staff of the urban district council surveyor's office, state the information which should be sought, and the best method of ascertaining and recording it. Give an estimate of the cost of the work if done by professional referencers. Compare the advantages and disadvantages of the two methods, both in the above case and in the case of an area of 1,500 acres in the same district, which includes a considerable extent of partially developed building estates, and is to form the nucleus of a later scheme. (Togun.)

The task of compiling a reference of the various owners, lessees and occupiers of property contained in an area of 1,000 acres, mainly undeveloped, is a comparatively simple one, and one with which the surveyor's department might easily be able to cope without the aid of the professional referencer.

A good deal of preliminary information may be gleaned from the rate-book. The referencer should then interview the various occupiers, and obtain from them the names of the owners or agents. The next step will be to interview the owners or agents as a matter of confirmation of information already received. Should it be impossible or inconvenient to obtain an interview, an excellent plan to adopt is to send out notices. These notices should explain the reasons for which the information is desired, requesting a reply as early as possible, and attached to them should be questions as to ownership, if lessee or sub-lessee, if held in trust, if premises are underlet, &c. By this means a great deal of useful information can be obtained. If any of the land is

in the hands of builders or estate agents, these people would no doubt supply all the information required.

A professional referencer would charge £20 to £25 for an area of this description.

For entering up the information, an ordinary-sized notebook is desirable in the first place, with a larger book for making the fair copy afterwards. These should be printed, with headings and columns as follows:—

Reference number.	Description of property.	Ordnance numbers.	Owners or reputed owners.	Lessees or reputed lessees.	Occupiers	Remarks

The small 25-in. ordnance sheets, made to fold, are practically indispensable in ascertaining the various owners' boundaries, &c., each property being hatched in different colours, in addition to being numbered in conjunction with the reference book.

Regarding the second part of the question—viz., 1,500 acres of land in course of development, the main source of information would, no doubt, be derived from the various estate agents or builders.

Should it not be desirable to do the work from the surveyor's department, a course sometimes adopted is to invite quotations from various estate agents and others in the locality for doing the work.

In conclusion, it is, perhaps, as well to point out that referencing is purely a matter which concerns the clerk's department, and as such should be undertaken by his staff, although in a large number of cases this work is forced on to the surveyor's shoulders. (H. W. R., *Hendon*.)

382. Fire Hydrants.—Fire hydrants, 2½ in. in diameter, are taken from a 4-in. and a 12-in. main. What will be the ratio of discharge in the two cases, assuming that the initial pressure is the same in each main? (X. X., *Hounslow*.)

The pipes are assumed to be running full. The mode of procedure is to determine the ratio of the discharges from the 4-in. and the 12-in. mains, and then determine the discharge from the hydrant when connected to each main. The case is identical with a water main running full, and having branch pipes fitted to it, the branch pipe in this case being the standpipe to the fire hydrant.

The discharge from a water main, when running full, is obtained from the formula—

$$G = \sqrt{\frac{(3d)^5 h}{L}}$$

in which G = Discharge in gallons per minute

d = Diameter of pipe in inches

h = Head of water in feet

L = Length of pipe in yards

[NOTE.—In using this formula, great care must always be exercised as to the units employed, for it will be seen from the above that no symbol is expressed in the same unit as another.]

Now it is not given in the question what h and L are, but it is given that the initial pressure is the same in each case; hence, considering first the 4-in. main, we see that—

$$G_1 = \sqrt{\frac{(12)^5 h}{L}} = \text{discharge of the 4 main} \dots (1)$$

Again, if G₂ is the discharge of the 12-in. main, we get that—

$$G_2 = \sqrt{\frac{(36)^5 h}{L}} \dots (2)$$

Dividing (1) by (2) gives—

$$\frac{G_1}{G_2} = \sqrt{\frac{12^5}{36^5}}$$

The Surveyor

And Municipal and County Engineer.

$$\begin{aligned}
 \text{i.e. } \log \frac{G_1}{G_2} &= \frac{1}{2} (\log 12^5 - \log 36^5) \\
 &= \frac{1}{2} (5 \log 12 - 5 \log 36) \\
 &= \frac{1}{2} (5 \cdot 39590 - 7 \cdot 78150)
 \end{aligned}$$

$$\begin{aligned}
 \text{i.e. } \log \frac{G_1}{G_2} &= \bar{2} \cdot 80670 \\
 \therefore \frac{G_1}{G_2} &= 0.64076 \text{ or } \frac{1}{15.6}
 \end{aligned}$$

that is to say, the discharge from the 12-in. main is 15.6 times as much as that from the 4-in. main, both having the same initial pressure.

For the sake of argument, we will now assume that the 4-in. main discharges 100 gallons per minute. It is at once evident that the 12-in. main will therefore discharge 1,560 gallons per minute.

Now, since the lengths of the branch pipe is so short, the loss of velocity due to frictional resistances is small enough to be neglected (since the amount of work necessary to be done in overcoming friction is proportional to the length of the pipe), so that the discharge at each nozzle can be calculated from the ratio of the square of its diameter to the square of the diameter of the main from which it draws its supply.

Hence, discharge from 2½-in. branch from 4-in. main

$$\begin{aligned}
 &= \frac{100 \times (2\frac{1}{2})^2}{(4)^2} \\
 &= \frac{100 \times 25}{4 \times 16} \\
 &= 39 \text{ galls. per min.}
 \end{aligned}$$

Similarly, discharge from 2½-in. branch from 12-in. main

$$\begin{aligned}
 &= \frac{1560 \times (\frac{5}{2})^2}{(12)^2} \\
 &= \frac{1560 \times 25}{4 \times 144} \\
 &= 68 \text{ galls. per min.}
 \end{aligned}$$

Hence, the ratio of the discharge from the 4-in. main and the discharge from the 12-in. main is $\frac{39}{68}$

—that is to say, the discharge is about 1½ times as great from the 2½-in. branch if it draws from the 12-in. main as it would be if it drew its water from the 4-in. main. (T. W. P., *Bexhill-on-Sea*.)

ST. AUSTELL HOUSING SCHEME.

FIVE-ROOMED DWELLINGS.

Particulars are given in the annual report of Mr. E. D. Groves, the surveyor to the St. Austell Urban District Council, of the scheme of housing which he was recently instructed to prepare, following a decision of the local authority to close a number of defective dwellings.

A suitable site having been obtained, it was agreed to proceed with the erection of twenty-two five-roomed houses.

In laying out the site care was taken to avoid a cold and mechanical uniformity. For this reason the houses are not all placed fronting the adjoining roads, but some are arranged at angles to the others. The houses are arranged in five blocks—four of the blocks each having four houses and one having six houses.

In considering the actual accommodation to be provided in the houses themselves, the requirements of the probable tenants have been considered. In all houses no living-room will be entered directly by the front door, there being a small lobby giving access to the stairs before the living-room is entered.

The houses consist of a living-room 14 ft. by 13 ft., scullery 13 ft. by 8 ft., with coal-store, cupboard, larder and water-closet on ground floor.

On the first floor are three bedrooms measuring respectively 16 ft. 3 in. by 10 ft., 12 ft. by 8 ft. 9 in., and 8 ft. 9 in. by 7 ft. 3 in. The first two have fireplaces. All rooms are 8 ft. high.

The cost of the site is £325. It is proposed to take a portion of the site for widening the existing

highways. The cost of the land taken and charged to street works will be £18, therefore the nett cost of the site to the housing scheme is £307.

The whole scheme has received the sanction of the Local Government Board. The contract for the buildings, sewers, roads and fencing has been let to Mr. F. J. Stanbury, of Devonport, for the sum of £1,594 10s.

The loan will be obtained from the Public Works Loan Commissioners at 3½ per cent interest, and repaid as follows: Cost of land, mortgage, &c., eighty years; cost of buildings, roads and sewers, sixty years.

The estimated annual receipts and expenditure in connection with the scheme is shown in the accompanying table.

New Baths at Birmingham.—New public baths for women, forming an extension of the Kent-street establishment, Birmingham, have been completed. The buildings provide one large swimming bath, 75 ft. in length by 30 ft. wide. On each side of the main entrance nine first-class and nine second-class private baths have been constructed. The internal walls are lined throughout with glazed bricks, the scheme of colour being silver grey and white with green carrara for moulded work. The building was designed by Messrs. Cossins, Peacock & Bewlay, architects, Birmingham, and erected by Messrs. B. Whitehouse & Sons. The engineering work was carried out by the engineering staff of the baths department, under the direction of Mr. J. Cox.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY: DEDICATION.—The decision of the Court of Appeal in *Brockman v. Folkestone Corporation* (noted at p. 232 *ante*) has been reversed by the House of Lords (February 6th). The question in dispute was whether the Lower Sandgate-road, Folkestone, was or was not a highway repairable by the inhabitants at large. The road was made in 1827 by the then Earl of Radnor, and in order to determine the question it was necessary to decide whether it had become a public highway by informal dedication before March, 1836, when the Highway Act, 1835, came into operation. The matter came, in the first instance, before the Divisional Court upon appeal from the decision of the magistrates disallowing the objection of a frontager to a provisional apportionment under the Private Street Works Act, 1892, the objection being "that the road was a highway repairable by the inhabitants at large." That court thought that the case should be remitted to the magistrates to decide whether there had been a dedication of the road as a public footway prior to March, 1836. But the Court of Appeal (Lord Justice Fletcher Moulton dissenting) held that there had been dedication before that date, and consequently they allowed the frontager's objection. There was no evidence that the road was required for any other purpose than the use of the occupiers of houses which were erected on each side of it on building plots leased by the Earl. From the year 1831, however, it had, in fact, been used to a certain extent by other inhabitants of the neighbourhood. There was a gate across the road, with a toll-box annexed, and from before 1835 to the present time tolls had been levied for horses and vehicles, but spaces were left on either side for foot passengers. Notice boards were affixed with particulars of the tolls, and prohibiting the passage of motor cars, cattle and sheep, but not of foot passengers, and other boards described the road as a "private road." Before 1835 the road was left in a bad state of repair, but since that date it had been kept in repair by Lord Radnor or his lessees, and it had never been repaired by the local authority, nor had it ever been formally dedicated under sec. 23 of the Highway Act, 1835. The House of Lords having (as already stated) overruled the Court of Appeal, the frontager's objection is finally disposed of, and the provisional apportionment stands. This long-drawn-out litigation is another illustration (if one were needed) of the fact that it is impossible to give a general answer to the apparently simple question "When is a road repairable by the inhabitants at large?" The history of the road must be first known, and even then doctors may disagree.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

STREET SCAVENGING: HEAPS LEFT IN STREET: ACCIDENT: LIABILITY.—"Ford" writes: The highways in a borough are under the jurisdiction of the town council, and are kept in repair and scavenged by the said borough. It has been customary either to brush or scrape the mud off the roads, and to leave it in small heaps in the roadway close to the footpath for collection the same day or, where this is not possible, on the following day. An action is threatened against the borough for damages for negligence caused to a person falling over one of these heaps of mud at night-time and suffering damage. The heaps of mud were almost in a liquid state, and each covered quite a small area. Is there, in your opinion, any negligence on the part of the corporation, and can any claim be made against them for damages. I shall be pleased if you can give me any authority for or against any such claim.

I think it is highly probable that the corporation would be held to have been guilty of negligence in leaving the heaps unlighted and unguarded, and that damages could be recovered against them. In the Scotch case of *Nelson v. Lanarkshire County Council* (19 *Rettie*, 311), the council

were held liable for injuries sustained by a foot passenger tripping over a heap of road scrapings left by the council's workmen on a dark night. And there are several English cases in which local authorities have been held liable where accidents have occurred through heaps of stones, &c., being left on the road. See, for example, *Foreman v. Canterbury Corporation* (L.R., 6 Q.B., 214); *Gould v. Birkenhead Corporation* (74 J.P., 105).

PRIVATE STREET WORKS: PUBLIC FOOTPATH.—"Oughty" writes: My council are about to make up a new road under the Private Street Works Act, 1892. The path on one side of the road is a public one, and extends the whole length of the road. When the road is made up the urban district council have agreed to pay for the cost of repairing the footpath, but not for the kerbing and channelling which will be neces-

sary. I shall be glad if you will kindly inform me how this will affect the apportionment with regard to the following matter: (1) Are the council bound to pay for the kerbing and channelling which it will be necessary to put along the edge of the public path when making up the road? (2) Can the council, after deducting their contribution towards the cost of repairing the public path, apportion the cost of making up the road equally among the frontagers on both sides of the road? (3) Some of the owners of property on the south side of the road contend that they do not front, adjoin or abut on to the road, and are therefore not liable to be apportioned for any of the cost of making up the road. I shall be glad of your valued opinion on the above matters.

(1) Assuming that the footpath is repairable by the inhabitants at large, the frontagers cannot be charged with any work thereon, but only with what is done to the rest of the street. The kerbing would presumably be placed on the footpath itself, and the channelling on the adjoining roadway, in which case the channelling could be charged to the frontagers, but not the kerbing. (2 and 3) The cost of making up the street, exclusive of the public footpath, is apportionable among the frontagers on the north side only. The contention of the frontagers on the south side is correct.

LAYING OUT A NEW STREET.—"W. L. F." writes: About three years ago the owner of a piece of land built four houses thereon, the only approach to the houses from the public road being along a private road, about 14 ft. wide, belonging to the owner of the houses. The plans for the houses only were approved by the council. The owner of the road has given a right of user of the road to a local builder, who has a large piece of land abutting to the road, one house thereon has been built, and the remainder of the land offered in plots. Please advise: (1) Does the road come within the meaning of sec. 4, Public Health Act, 1875? (2) Can the owner be made to widen it to 36 ft. in accordance with the by-laws?

(1) The road is undoubtedly within the definition of a "street" contained in that section. (2) This depends upon whether he is laying out the road as a "new street." The cases as to what constitutes the laying out of an old road as a new street are not easy to reconcile with one another, and it is difficult, if not impossible, to deduce from them any general rule applicable to every possible combination of circumstances. But having regard to some of the more recent decisions, it would appear that the mere erection of a few houses fronting on an old road will not in itself amount to the laying out of that road as a new street. See *Gozzett v. Maldon Urban Sanitary Authority* (1891, 1 Q.B., 327); *Bushell v. Creer* (64 J.P., 600); *Deronshire Corporation v. Tozer* (1903, 1 Ch., 759).

PRIVATE STREET WORKS: APPORTIONMENT.—"Troy" writes: In the case of works carried out by a local authority under the powers of sec. 150 of the Public Health Act, 1875, should the cost of replacing defective kerbing, channelling and paving to footpaths

(laid down at the time the houses fronting the street were built) be charged to the owners of those houses only in front of which such replacement is found necessary (the work in front of the other houses being satisfactory and not requiring to be replaced)? Or should such cost be added to that of the carriageway, sewers, &c., and divided up between all of the owners in proportion to frontage?

Under this Act the expenses of executing the works referred to in the notices is recoverable from the owners in default according to the frontage of their respective premises, and there is no power (as there is under the Private Street Works Act, 1892) to have regard in making the apportionment to the amount or value of any work already done by the owners or occupiers of any premises. The entire cost of the works should therefore be lumped together, and apportioned according to frontage.

AUTOMOBILES AND IMPROVED ROADS.

[From an article by L. W. Page, Director of the United States Office of Public Roads, in the *Scientific American*.]

The total number of motor vehicles upon the roads of the United States last year was about 1,000,000, and during the year the sum of \$5,638,878 was paid in registration and licence fees. The mileage of improved roads amounts to about 222,000, including a large mileage of graded and shaped natural soil roads. There is therefore an average of about $\frac{1}{2}$ motor vehicles for each mile of such highways, and with a daily run of 25 miles, each mile of road would be traversed by 113 motor vehicles. The improved macadam roads are not able to withstand the action of the motor vehicle, and although there are many places where such roads may be made with economy and with confidence as to their service, this is not the case in densely peopled areas. The construction of bituminous-bound roads, and of concrete and brick roads, which has taken place since 1906 is almost entirely due to the effects of motor vehicles on the old water-bound macadam road. The improved roads are sustaining an amount of traffic several times as great as that of ten years ago, and the cost of maintenance per unit of traffic has probably not increased. The substitution of bituminous-bound crusts for water-bound macadam has increased the first cost from 20 to 40 cents per square yard, and has apparently increased the cost of maintenance from \$500 to \$600 or more per mile, including all charges.

THE NATURAL SOIL ROAD.

The natural soil road well drained and crowned is a most comfortable road during a large part of the year. Such roads have not been scientifically cared for in the past, but might now be given a thorough trial. "It is now known that, with persistent dragging, natural soil roads may be kept in splendid condition except in the very worst weather. It has not yet been demonstrated that an earth road built with the same care for grading, alignment and drainage structures that would be given to a bituminous macadam road, or a brick road, may not, after all, be a very economical type of road if properly maintained. If traffic on such a road develops in future there will be an excellent foundation for a superior surface. One reason that natural soil roads have not been considered by modern highway engineers is because such roads have never been maintained with sufficient continuity and care to demonstrate what they can do. There is no doubt that a well-built, sand-clay road, where the materials are carefully selected, is a most excellent highway. It will stand up under considerable traffic, and is very comfortable for automobiling. Of course, such a road must be maintained by skilled labour continuously."

Business Announcement.—The Barnstone Blue Lias Lime Company, Limited, Barnstone, near Nottingham, have appointed Mr. J. T. Hockley, of Grantham, as sole agent for "Vianex" in England, Ireland and Wales. The firm's Scottish agents are Messrs. Eben, More & Co., of Glasgow.

A District Council Without a Rate.—At their last meeting Louth Rural District Council accepted a recommendation of the Finance Committee that there should be no rate levied for the ensuing half-year. The chairman of the committee (the Rev. T. Longley) said that apparently they had raised nearly £3,000 too much. They had received from the county council £540 more than they expected. In road material alone they had spent £1,800 less than they expected, and, with the difference in labour, there was a total of £2,200 less than estimated for the roads.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bideford R.D.C. (March 23rd. Mr. H. A. Chapman).—£2,700 for the purchase of land and the erection of ten cottages, two in Buckland Brewer, four in Hartland (on two sites), two in Parkham, and two in Woolsery. It was stated that the plans prepared by Mr. W. H. Heal provided a large living-room, scullery, three bedrooms, sanitary accommodation, and pig shed and toolhouse. The council had been assured that every site would produce an adequate water supply. The council applied for an eighty years' loan for the land, and sixty years for the buildings. It was estimated that the rental would not exceed 3s. per week inclusive.

Blackpool T.C. (March 10th. Mr. F. H. Talloch).—£2,700 for the enlargement and improvement of the Cocker-street baths.—The borough surveyor, Mr. J. S. Brodie, said that under the Act of 1910 the corporation had power to borrow £10,000 for the acquisition and improvement of the baths. One of the main reasons for obtaining the power was that the old proprietors of the baths had a sea-water main down under the foreshore for the purpose of pumping sea water into the baths, and with the promenade extension scheme it was very desirable that that should be done away with. The excess expenditure for which the loan was required was partly due to the unsoundness of the walls below the ground level, which necessitated a good deal of underpinning, and the walls enclosing the large swimming bath were found to be defective and in a very leaky condition.

Bucklow R.D.C. (March 19th. Mr. W. M. Cross).—£1,624 for works of sewerage for the township of Baguley.—It was stated that the proposed scheme would do away with the existing works at Baguley sanatorium. The proposal was to connect a sewer to an existing culvert which ran through Baguley, Sale, and Ashton-on-Mersey and discharged near the river Mersey. This, it was argued, was the most economical method of dealing with the situation. The Manchester Ship Canal Company opposed the scheme on the principle that the company objected to any scheme which would add sewage to the silt which had to be removed from their waters. The Mersey and Irwell Joint Board also submitted that the Local Government Board should not sanction a scheme by which untreated sewage would be discharged into the Mersey.

Burnham-on-Crouch U.D.C. (March 13th. Mr. M. K. North).—£550 for building public conveniences and shelters, and for adapting an existing shed for the storage of the fire engine.—The plans were explained by the surveyor, Mr. J. Cook, and evidence in favour of the scheme was given by Mr. Edward Read (chairman) and Mr. C. T. Steward.

Dewsbury T.C. (March 4th. Major C. E. Norton).—£2,650 for the purchase of 17 acres of land in close proximity to Mitchell Laithe's sewage farm, for sewage disposal purposes.—The borough surveyor, Mr. H. Dearden, explained the scheme in detail, and there was no opposition; March 12th. Mr. P. M. Croftwaite).—£350 for the purchase of land in Wakefield-road, Earlsheaton, for the purposes of a refuse tip.—The town clerk, Mr. H. Ellis, said the site consisted of 16,020 sq. yds. of freehold land, and it was very suitable for the purpose to which it was to be devoted. It was not proposed to tip night soil, but only trade rubbish and street sweepings. He asked for sanction to repay the money in sixty years.

Hebden Bridge U.D.C. (March 11th. Mr. A. W. Brightmore).—£2,900 for the extension of the sewage outfall works at Mytholmroyd.—The clerk, Mr. S. Ogden, stated that the council had had to meet considerable opposition in their efforts to satisfy the demands of the Rivers Board. They had done that so well that no complaint had ever been received from the board. After the council had arranged to take in and treat part of the sewage of the Todmorden rural district early in 1912 the Rivers Board called attention to the need for extension. Mr. Newton, engineer, who has prepared the scheme, said that if the pumps were kept working longer hours it would do away with the objection that when the receiving

tank overflowed the sewage percolated into the land and thence into the river without treatment.

Leicester T.C. (March 11th. Mr. R. H. Bicknell).—£377 for the purchase of land for the widening of Bonner's-lane, and £1,006 for works of sewerage in and the widening of, Evington-road.—From the statement of the town clerk, Mr. H. A. Pritchard (with whom was the borough surveyor, Mr. E. G. Mawbey), it appeared that it is proposed to widen Bonner's-lane to 25 ft. With respect to the Evington-road proposal, Mr. Pritchard said that they had to pay very expensively for the lack of foresight of their predecessors, and the corporation felt that it was desirable in regard to the development of the outskirts of the town to make arrangements for the requirements of the future. This was eminently a case of that character, although it more approximates to meet the requirements of the present. There was a large development on that side of the town for residential purposes, and it was likely to continue.

Manchester T.C. (March 17th. Mr. W. M. Cross).—£50,000 for the purpose of the municipal hydraulic undertaking.—It was stated by the deputy town clerk, Mr. P. M. Heath, that the money was required for the provision of additional plant, the alteration and extension of buildings, and the extension of trunk and distributing mains. The corporation had established three power stations, one at Whitworth-street West, another at Pott-street, and the third at Water-street, and in those stations the most up-to-date plant for dealing with hydraulic pressure had been installed, and in addition over 26 miles of hydraulic mains had been laid. In 1895, the first year of the undertaking, 423 machines were connected with the hydraulic mains. To-day the number was 2,310, and the income derived from the undertaking was £35,431.

APPLICATIONS FOR LOANS.

Brierfield U.D.C.—£500 for electricity works extension, and £3,128 for private street works.

Cambridge T.C.—£450 for laying out the recreation ground.

Dagenham P.C.—£2,656 for street works.

Hayes U.D.C.—£4,500 for the purchase of land for workmen's dwellings, and £300 for the purchase of land for road improvement.

Rochdale T.C.—£700 for road widening.

Rowley Regis U.D.C.—£10,000 for the paving of footpaths.

Ryde T.C.—£5,025, supplemental loan for works of water supply.

Southend T.C.—£1,847 for sewer extensions.

Spalding R.D.C.—£300, supplemental loan for a water main.

Stanley (Yorks) U.D.C.—£14,000 for sewerage works.

Teddington U.D.C.—£700 for making up a street.

Walsall T.C.—£2,092 for electricity purposes.

Wilts C.C.—£270 for school extension at Wootton Bassett.

LOANS SANCTIONED.

Barnes U.D.C.—£1,250 for street and sewerage works, and fencing in connection with the Malthouse area improvement.

Blean R.D.C.—£580 for drainage extension.

Chester-le-Street R.D.C.—£3,833 for private street works.

Foots Cray U.D.C.—£2,050 for new municipal offices.

Hastings T.C.—£11,778 for the purchase of land for pleasure grounds.

Holywell U.D.C.—£12,500 for water supply and drainage schemes.

Hoylake and West Kirby U.D.C.—£7,200 for a cemetery, allotments, and a recreation ground, and £515 for the purchase of land for a refuse tip.

Kingsbridge U.D.C.—£250 for the purchase of land for a cattle market.

Lindsey (Lincs) C.C.—£1,655 for the purchase of a site for a new school.

Mansfield T.C.—£5,000 for the electricity undertaking.

Oakworth (Yorks) U.D.C.—£280 for road improvement.

Rochdale T.C.—£65,000 for the extension of the electricity works.

St. Austell R.D.C.—£4,325 for the Penwith water-works.

West Riding Asylums Board. £20,000 for asylum extension and other purposes.

FORTHCOMING INQUIRIES.

MARCH.		£
31.—	Bognor. For the provision of dwellings and a public convenience (Mr. H. S. Stewart)	1,128

Loans to Local Authorities.—The President of the Local Government Board stated in the House of Commons on Tuesday, in reply to a question, that the number of loans to local authorities sanctioned in each of the last three years is as follows: In 1911, 5,363; in 1912, 6,210; and in 1913, 6,382.

Town Planning Schemes.—Asked in the House of Commons last week as to the number of town planning schemes submitted to the Local Government Board for each of the last three years, Mr. Herbert Samuel stated that in the year 1911 authority was given for the preparation of ten schemes. In the year 1912 authority was given for the preparation or adoption of fourteen additional schemes, and three schemes were formally submitted for approval. In the year 1913 authority was given for the preparation of twenty-eight additional schemes, and two schemes were formally submitted for approval.

Concrete Institute: Junior Meetings.—It has been decided to hold informal meetings once a month during the session for the benefit of junior members of the Concrete Institute. The first meeting will take place on Friday, April 3rd, at 7.30 p.m., in the Council Room on the first floor at Demison House, 296 Vauxhall Bridge-road, Westminster, S.W. (close to Victoria Station), when Mr. E. Piander Etchells, F.PHYS.SOC., M.MATH.A., A.M.I.MECH.E., member of council of Concrete Institute, will take the chair. The business before the meeting will be the inauguration of the series of meetings and a discussion on problems proposed by the junior members attending.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Edinburgh £5,500, Esher and the Dittons £5,100, Glasgow £17,500, Southend; housing and town planning—Hendon; roads and materials—Camberwell, Edinburgh £12,743; sewerage and sewage disposal—Aldershot, Grimsby £19,107, Hull; water, gas and electricity—Greenock £50,000, Sleaford.—Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Birmingham T.C.—The Northfield public library, which was destroyed by fire, is to be rebuilt.

Bodmin T.C.—The borough surveyor, Mr. R. T. Buscombe, has prepared a detailed plan and estimate of the proposed new fire station which is to be erected on a site adjacent to the free library, at an estimated cost of £350.

Cambridgeshire C.C.—The Public Health and Housing Committees are about to consider the desirability of erecting cottages for the housing of the council's employees in those districts in which there is a shortage of suitable accommodation.

Dorset C.C.—The council have approved the proposal of the County Works Committee to extend the retaining wall along Preston beach a further 100 yds. towards Weymouth, at an estimated cost of £300, and to increase the length of the groynes not done last year at a cost of £300. It was stated that the groynes lengthened last year had helped to keep the shingle in position and from being washed away.

Edinburgh T.C.—It has been decided to build public washhouses in McLeod-street, at an estimated cost of £5,500.

Esher and the Dittons U.D.C.—A special meeting is to be held to discuss the proposals of a committee recommending the acquisition of a site for the centralisation of offices and depot, at an estimated cost of £5,100. The surveyor, Mr. H. C. Fread, estimates that in addition to other economies there would be a considerable saving of labour through having the depot in a central position.

Glasgow T.C.—The council have agreed to reconstruct the Couper Institute, Cathcart, at an estimated cost of £17,500.

Hastings T.C.—It is proposed to construct a public convenience at White Rock.

Northampton T.C.—The tender of Messrs. Souster & Son, at £1,699, has been accepted for the extension of the tramway car sheds.

Southend T.C.—The borough surveyor, Mr. E. J. Elford, has been instructed to obtain tenders for a corrugated iron building for tramcars, and to build at the depot a temporary shed for six buses.

Troon T.C.—The Duke of Portland has asked the corporation to accept a gift of £2,000 for the erection of a town hall.

HOUSING AND TOWN PLANNING.

Hendon U.D.C.—Subject to the sanction of the Local Government Board, the council have accepted a tender of £9,960 for the erection of fifty cottages at Child's-hill.

Kingstown U.D.C.—A housing scheme is to be carried out at an estimated cost of over £40,000.

Newcastle-on-Tyne T.C.—The council on Tuesday last affirmed the principle of providing municipal dwellings on a site adjoining Walker-road recent on ground, and in City-road.

Risca U.D.C.—A scheme has been adopted for the erection of 200 workmen's dwellings.

Stratford-on-Avon T.C.—The borough surveyor, Mr. R. Dixon, has submitted a site plan of the proposed new cottages, and the council have decided that all necessary plans for thirty-six cottages should be sent in draft to the Local Government Board for their suggestions before definitely settling them.

PARKS AND OPEN SPACES.

Bacup T.C.—The tender of Messrs. Cheal & Sons, Crawley, at £1,250, has been accepted for laying out the new public park.

Edinburgh T.C.—A bowling green is to be constructed at Morningside, at an estimated cost of £340.

REFUSE COLLECTION AND DISPOSAL.

Colchester T.C.—The council have adopted a scheme prepared by the acting borough surveyor, Mr. E. A. Slater, for the construction at the Hythe Quay depot of a raised tram-road on which to run the tipping wagons into the depot, so that they may discharge their loads of road material on to specially constructed concrete surfaces, from which the material can then be carted direct to the required locality without the expense of trimming the material, which would be necessary if it were carried and tipped on the level.

ROADS AND MATERIALS.

Ayrshire C.C.—The Northern District Committee are considering the question of improving the roadway at Routenburn Bridge, Largs, by widening the bridge from 10 ft. to 18 ft., straightening the east parapet, and raising the roadway in order to cope with the increased traffic. The cost is estimated at £250.

Barnes U.D.C.—The surveyor, Mr. G. Bruce Tomes, has prepared plans for the widening of Upper Richmond-road.

Barnoldswick U.D.C.—The council have approved a scheme for the construction of a new road, 36 ft. wide, commencing from Park-road to join the highway at Helbrook, and the Road Board and the West Riding County Council are to be approached with a view to obtaining a grant towards the cost of the work.

Camberwell B.C.—In the course of a discussion upon the annual estimates it was reported that the borough engineer, Mr. W. Oxtoby, M.INST.C.E., proposed an expenditure of £34,000 upon the roads, but the Works Committee cut down the amount to £15,000.

Cardiff T.C.—The Public Works Committee have decided to ask the Finance Committee to obtain a loan for the cost, estimated at £1,500, of treating with asphalt-macadam Park-place from Queen-street to the road contiguous to the Welsh National Museum site. It has also been agreed to lay down similar material in Kingsway, at an estimated cost of £864.

Garmarthenshire C.C.—A committee has been appointed to consider the desirability of constructing a new road through the valley between Ammanford and Pontardulais.

Devon C.C.—When it was proposed at the council meeting last week to appoint a surveyor of the northern district, the chairman stated that the Road Board had offered to "lend" the council one of their engineers as a friendly arrangement for the next two or three months. They had tried to get the board to give the county more than one-half of the cost of their improvement scheme, but the deputation were given to understand that the board would not increase their contribution unless the scheme was well thought out, including efficient superintendence of the work. In the circumstances the council decided to postpone filling up the vacancy in the northern district.

East Grinstead R.D.C.—The surveyor, Mr. C. Turton, has prepared plans and estimates for private street works which it is proposed to carry out at Three Bridges.

East Ham T.C.—It has been decided to carry out repairs in High-street, at an estimated cost of £4,000.

Edinburgh T.C.—Street works in hard wood, compressed asphalt, mastic asphalt and granite setts, involving an estimated expenditure of £12,743, have been approved by the council.

Exeter T.C.—The borough surveyor, Mr. T. Moulding, has prepared an estimate, at £2,995, for paving a portion of Sidwell-street.

Langholm T.C.—It is proposed to pave High-street with whinstone setts, at an estimated cost of £2,400, and the Road Board is to be asked to make a grant in aid of the work.

Mid-Lothian C.C.—It was reported recently to the council that the road surveyor had made suggestions for removing the cause of the complaint with respect

to the slipperiness of tarred roads. These suggestions would be put into operation in future treatment of the roads, and the surveyor had been instructed to inquire how the difficulty was being dealt with in other parts of the country.

Rhyl U.D.C.—It has been decided to support the scheme of the county surveyor, Mr. S. Evans, for the construction of a new road from Gronant to Rhyl, a distance of 5 or 6 miles. The estimated cost of the scheme is from £18,000 to £20,000.

Rochester T.C.—The tender of Messrs. Griffith & Co., at £500, has been accepted for repaving a portion of the Maidstone-road.

St. Columb R.D.C.—The question whether the council should retain the two surveyors, Messrs. T. T. Strongman and S. Gilbert, having regard to the fact that the county council will take over the main roads after March 31st, has been decided in the affirmative, it being considered that the district roads require the attention of the surveyors more than previously. The surveyors are to be paid the same salaries as before.

Taunton R.D.C.—It has been agreed to divide the district into two divisions for road purposes—one to be called the Eastern and the other the Western. At the same time it has also been decided that the salary of Mr. T. G. Crump, senior surveyor, be increased by £20 a year to assist him to provide a motor cycle, and that the salary of Mr. S. S. Orchard, the other surveyor, be increased by £40 on account of increased work, and also to meet the cost of a motor cycle.

Warrington T.C.—For the purpose of experiment, and in view of a silent pavement being desirable around the Oakwood-avenue school, it has been decided to pave several streets with granited asphalt.

SEWERAGE AND SEWAGE DISPOSAL.

Aldershot U.D.C.—A resolution has been passed to sub-divide the works connected with the sewerage scheme into three contracts—viz., contract No. 1 to embrace the reconstruction of the main sewer in Ash-road; contract No. 2 to comprise the works of subsidiary sewerage; contract No. 3 that connected with enlarging the pumping station and refuse destructor buildings; provision of extra boiler pump and pump well extension.

Chertsey R.D.C.—Plans for a surface-water drainage scheme, estimated to cost £1,643, have been forwarded to the Local Government Board.

Chesterfield T.C.—The medical officer of health has received instructions to report upon the sanitary condition of the town so far as closet accommodation is concerned, and also upon the water service in houses. It was stated by a councillor that in some instances one privy was used by the occupants of four houses, and that the sanitary conditions were "a disgrace to a civilised society."

Grimsby R.D.C.—The council have agreed upon a sewerage scheme for Immingham, at an estimated cost of £19,107.

Hull T.C.—The Health Committee have adopted a scheme for the conversion of privies into water-closets, using the powers under the Public Health Acts Amendment Act of 1907, which came into force in Hull in August, 1911. About 2,500 conversions are suggested as a first instalment, and this will need a sum of £20,000. When this has been expended a report on the work done will be submitted, and an application for a further loan will be considered.

Mid-Lothian C.C.—The council have acceded to the application of the Gala Water District Committee to borrow £1,150 for sewage purification works within the Gorebridge special drainage district.

Skipton U.D.C.—The construction of additional filters is receiving the attention of the Sewage Disposal Committee.

WATER, GAS, AND ELECTRICITY.

Barnoldswick U.D.C.—The council have engaged the services of Mr. E. J. Silcock, M.INST.C.E., of Westminster and Leeds, to report upon the water-works of the town with a view to increasing the supply which, owing to the rapid growth of the population, is at present insufficient.

Bodmin R.D.C.—The medical officer, Dr. A. G. Salmon, in his annual report, emphasises the need for water supplies in the scattered villages of the district, and for Port Isaac in particular.

Colchester T.C.—From a report by the acting borough surveyor, Mr. E. A. Slater, it appeared that

the cost of the 766 gas lamps for the past year averaged £2 13s. 8d. each, against £2 13s. 3d. the previous year, the 294 100-candle-power electric lamps £3 17s. 5d., against £3 18s. 7d., and the 65 50-candle-power electric lamps £2 4s. 11d. against £2 5s. 3d.

Fraserburgh T.C.—The council have approved the construction of a new water main from D. L. Lydford-road to Shore-street, for conveying the old water supply for distribution in the Shore-street and new harbour area.

Greenock T.C.—It has been decided to carry out extensions at the gas-works, at an estimated cost of £50,000.

Holywood U.D.C.—In addition to the £1,560 already authorised for water-works, a further sum of £500 is to be expended in raising the height of the embankment, flushing the filter-beds and other works.

Mid-Lothian C.C.—The council have acceded to the application by the Lasswade District Committee to borrow £460 for works of water supply within the Inveresk special water district.

Penrith U.D.C.—Improvements are to be carried out at the gasworks, at an estimated cost of £9,600.

Rye T.C.—The waterworks extensions at Cadboro have been completed, and both the new main and the reservoir have been subjected to satisfactory tests. The cost of the scheme is estimated at £4,300, and it has therefore been found necessary to apply for a supplemental loan of £400. The council have passed a vote of thanks to the water superintendent, Mr. W. J. Burnham, for the efficient manner in which he has supervised the work.

Sleaford R.D.C.—The question of water supplies for various parishes is under consideration, and meanwhile the Local Government Board have advised the council to resort to compulsory powers for the purchase of bores.

Tanderagee U.D.C.—As a result of the recent inquiry into the alleged defective water supply, the Local Government Board have given directions for the preparation of an order, under seal, directing the council to set about the provision of a proper water supply within a period of six months.

Wednesbury T.C.—The tender of the South Staffordshire Waterworks Company has been accepted for laying 760 yds. of main for the purpose of supplying the Delves with a supply of water.

MISCELLANEOUS.

Brighouse T.C.—After applying unsuccessfully to the West Riding chief constable for police old clothing, the council have purchased a quantity of policemen's overcoats from a dealer. They are to be served out to the street sweepers, whom the corporation recently promised to provide with overcoats.

Deptford B.C.—The council have resolved to support the view of the Wandsworth Borough Council that district surveyors' fees should be revised so that those payable in respect of additions and alterations to buildings should bear some relation to the value of the work executed instead of, as at present, being calculated upon the area of the buildings.

Richmond (Surrey) T.C.—The following revised scale of wages has been adopted: Drivers from 28s. to 29s. per week; refuse collectors and general labourers from 26s. to 27s. per week; scavengers from 25s. to 26s. per week, if and when they shall have completed five years' service with the corporation, subject in every case to the employee being able-bodied and to the borough surveyor reporting that his work is satisfactory; non-able-bodied scavengers from 22s. 6d. to 23s. per week, subject to all the above conditions being fulfilled, except that relating to able-bodied condition.

Todmorden T.C.—The council on Wednesday decided to adapt Centre Vale mansion for the purposes of a public museum. It was also resolved to establish municipal bowling greens. A special committee was empowered to purchase a motor fire engine for £1,150.

Brighton and Hove Railless Traction Differences.—While Brighton Council have decided in favour of the under-running system of railless trolley traction, owing to the necessity of crossing tramway tracks, the Hove Council appear to prefer the over-running system. Brighton Council therefore suggests that the matter should be referred to the arbitration of the Board of Trade.

PERSONAL.

Mr. W. F. Loveday, borough engineer of Stoke Newington, has been granted an increase of salary.

Mr. T. Bowes, assistant surveyor to the Brompton Rural District Council, has been voted an increase of salary.

Mr. Francis Bergin, Kildare, has been appointed temporary county surveyor for Kildare for a period of six months.

Mr. John H. Clarke, surveyor to the Haverhill Urban District Council, has been voted an increase of his salary of £20 per annum.

Mr. J. Hammond, surveyor to the Bedale Rural District Council, has been appointed a district surveyor under the North Riding County Council.

Mr. Hugh Owen, who has been surveyor to the Flint Corporation during the past forty years, has tendered his resignation on account of ill-health.

Mr. H. E. Basden, assistant superintendent of highways and works at Southend, has been appointed road inspector to the Islington Borough Council.

Mr. H. N. Woodard, assistant in the Paignton surveyor's office, has been appointed assistant to the surveyor to the Stourbridge Urban District Council.

Mr. C. G. Else, a member of the Ilkeston borough surveyor's staff, has been appointed assistant surveyor to the Sutton-in-Ashfield Urban District Council.

Mr. Robert McElroy, assistant surveyor to the Tyrone County Council, met with a serious accident recently while driving, and has been under medical treatment ever since.

Mr. John Murphy, who has been temporarily engaged on county council business, has been appointed assistant surveyor in the Timoleague district, under the Cork County Council.

Mr. W. Fawcett Wilkins, engineer and surveyor to the Barnet Urban District Council, has been appointed surveyor and inspector to the Dunstable Town Council at a salary of £225 per annum.

Mr. G. E. Ashforth, chief assistant surveyor and engineer to the Durham County Council, has been appointed assistant county surveyor and bridge-master to the Cheshire County Council.

Mr. T. H. Bell, surveyor to the Ramsbottom Urban District Council, has been voted £25 for his services in connection with the new destructor works, the tramway shed and the tramway undertaking generally.

Mr. H. Leonard Hinnell, M.INST.C.E., Manchester, has been engaged by the Ulverston Urban District Council to report upon the sewerage and sewage schemes designed by their surveyor, Mr. C. T. Hague, for the relief of the present sewers of the district and the treatment of the sewage.

Mr. E. G. Mawbey, M.INST.C.E., borough engineer and surveyor of Leicester, has asked the Electricity and Tramways Committee of that corporation to recognise in a tangible way the services he has rendered in the design and construction of the tramway track. He has all along contended that this work was outside his duties as borough surveyor, and it has been stated that the corporation were saved about £20,000 by his scheme of track construction.

Mr. C. C. Hutchinson, K.C., who recently passed away in the prime of life, was well known to municipal engineers and surveyors, as his practice was mainly at the Parliamentary Bar and in connection with arbitrations involving engineering evidence. In these matters Mr. Hutchinson had the advantage of having been trained as an engineer, and to the engineering profession he always evidenced a warm side. At one period of his early life he was engaged with the firm of Johnson & Co., of Stratford, E., the well-known makers of sludge presses.

With reference to the appointment of Mr. H. Hamer as chief assistant to the borough surveyor of Stockport, we are now informed that prior to his appointment at Stockport Mr. Hamer acted as deputy to Mr. W. J. Newton, borough engineer of Accrington, with whom he served his articles. Mr. Hamer is an associate member of the Institution of Civil Engineers, and a member of the Institution of Municipal and County Engineers, and while at Accrington

had charge of main roads, highways, sewerage and sewage works, public and private street improvements, tramways, and allotments. Mr. W. J. Heard was appointed deputy on the 2nd inst.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

SEWAGE DISPOSAL BY DILUTION.

To the Editor of THE SURVEYOR.

SIR,—After Mr. Kershaw's acknowledgment that he is in complete agreement with Colonel T. W. Harding's statement as to conditions of dilution, I agree that the matter should now rest, as I feel that the correctness of the contention contained in my letters—viz., that quality as well as quantity of diluting water must be taken into account—has been fully confirmed by Colonel Harding's statement with which Mr. Kershaw agrees.

I desire to tender my thanks for the opportunity you have so generously provided in your columns for the discussion of this important point.—Yours, &c.,

HUGH STOWELL, M.INST.C.E.

44 Mosley-street,
Manchester.

March 20, 1914.

HUMUS IN SLATE BEDS.

To the Editor of THE SURVEYOR.

SIR,—Mr. Dibdin calls my attention to an inadvertent error in my paper on sewage disposal, a portion of which you published last week.

I there stated that the residuum in the Dibdin slate bed has to be washed out from time to time. I had in mind the flushing out in situ through specially provided flushing holes, which I had seen in some of the earlier installations. Such an operation is not a very serious one in any event, but Mr. Dibdin now tells me that even this is no longer necessary, as, owing to the sharp fall now provided in the bed bottom, the humus passes away with the effluent, as in the case of an ordinary percolating filter.—Yours, &c.,

GILBERT J. FOWLER.

Manchester.

March 23, 1914.

Manchester Tramways and Street Improvement.

The general manager of the Manchester tramway undertaking, Mr. McElroy, has prepared a report which contains many proposals for the betterment of street traffic. He suggests, among other things, that underground tramways might relieve the traffic in the middle of the city, and that the corporation might create several new streets branching from Albert-square and from Piccadilly to shorten and expedite the journeys of the tramcars.

Slag Wool.—Messrs. F. McNeill & Co., Limited, Lamb Buildings, Bunhill-row, E.C., have issued a new catalogue of their patent "Lion Brand" slag wool. This publication contains a great deal of valuable information to architects and builders as to the best methods of applying this material in buildings for the purposes of fireproofing and sound deadening, and has the additional utility of bearing against each method of application the approximate cost, so that an architect may see at a glance what any particular application of the material as a fireproofing or sound-deadening medium will cost. Messrs. McNeill will be pleased to send to any of our readers a copy of the catalogue, post free, on application.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ENGINEERING ASSISTANT.

The Battersea Borough Council require, temporarily, the services of an experienced Engineering Assistant. Must be an expert surveyor and leveller, a good draughtsman, and have had practical experience of sewer reconstruction. Salary at the rate of £150 per annum. Application must be made (on a form to be obtained from the undersigned) by 9 a.m. on Monday, 6th April.

W. MARCUS WILKINS,

Town Clerk.

PONTEFRACT CORPORATION WATER- WORKS.

ROALL PUMPING STATION.

The Corporation of Pontefract invite Tenders from firms of experienced Well Sinkers for the execution of the works comprised in Deepening the Existing Pump Well at Roall from 124 ft. to 200 ft. below the Engine-house floor, and driving Headings from the sides of the Well, and other incidental works for increasing the yield of water and maintaining the supply to the District.

Drawings and Specifications may be seen at the Pumping Station, or at the Office of the Engineers, Messrs. G. & F. W. Hodson, M.INST.C.E., Bank Chambers, Loughborough, and copy of Schedule of Quantities and Form of Tender may be obtained from them on deposit of cheque for £10 10s., which will be refunded to all persons making a *bonâ-fide* Tender, and on the return of the documents to the Engineers.

Tenders are to be made out on the Form supplied, and sent to the undersigned not later than the 27th April, 1914.

In the event of a Tender being withdrawn the deposit will be forfeited.

The Corporation do not bind themselves to accept the lowest or any Tender.

Dated this 25th March, 1914.

WILLIAM HADDOCK,

Town Clerk.

(1,489)

EAST SUSSEX COUNTY COUNCIL. TO ROAD CONTRACTORS.

Tenders are invited for the widening, improvement and reconstruction of the Lewes-Newhaven road from the boundary of the Borough of Lewes to the boundary of the Urban District of Newhaven, being in length 5½ miles, or thereabouts.

Plans may be seen on application at the County Surveyor's Office, and a copy of the Specification, Conditions of Contract and Bills of Quantities may be obtained from the undersigned upon payment of a deposit of five guineas, which will be returned upon receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Tender for Lewes-Newhaven Road Improvement," and addressed to the Chairman of the Newhaven Road Committee, must be delivered at the County Hall, Lewes, not later than Monday, the 27th of April, 1914.

The County Council does not bind itself to accept the lowest or any Tender, and will not pay any expenses incurred in connection with the preparation thereof.

F. J. WOOD, ASSOC. M. INST. C. E.,
County Surveyor.

County Hall, Lewes.

March 25, 1914.

(1,479)

CUMBERLAND COUNTY COUNCIL. HIGHWAYS AND BRIDGE DEPARTMENT.

REBUILDING "METAL BRIDGE."

The above Council invite Tenders from Contractors licensed to execute Ferro-Concrete Construction on the Hennebique System for the Reconstruction in Ferro-Concrete of "Metal Bridge" across the River Esk, in the Parish of Kirkandrews-on-Esk, about 6½ miles from Carlisle, on the Glasgow main road.

Plans and Specifications, &c., can be inspected, and Forms of Tender obtained at the Office of the undersigned, on payment of £2 (which sum will be returned on receipt of a *bonâ-fide* Tender), on and after the 23rd of March, between the hours of 9.30 a.m. and 4 o'clock p.m.

Sealed Tenders, endorsed "Tenders for Metal Bridge," must be delivered to the undersigned before twelve o'clock noon on the 25th of April, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

WILLIAM FINCH,
County Surveyor and Bridge Master.

The Courts,

Carlisle.

FOR SALE.—"Proceedings" of the Association of Municipal Engineers. Twenty volumes, 1887-88 to 1906-07. Offers invited.—J. H., 18 Ashfield-road, King's Heath, Birmingham. (1,481)

ROAD BOARD GRANTS TO IRELAND.

OFFICIAL FIGURES.

A statement was given in the House of Commons on Tuesday showing the amounts paid under grants and loans by the Road Board to county councils in Ireland in the financial years ended March 31, 1912, March 31, 1913, and the eleven months ended February 28th last.

The figures for the first-mentioned period were as follow: Grants £18,073, loans nil; for the second—grants £25,040, loans £3,721; and for the third—grants £23,909, loans £6,199. Amounts outstanding and not yet requisitioned were: Grants £190,961, loans £39,003.

In reply to a question the Secretary to the Treasury stated that no sums by way of grant or advance had been paid by the board to local authorities in Ireland during the three years for purposes other than road improvement.

THE ADVISORY STAFF.

Questioned as to what officials or staff were employed under the board in Ireland for advisory or inspection purposes, and whether, if any of these officials are in the employment of Irish departments or local authorities, he would state on what terms and conditions the board had obtained their assistance, Mr. Montagu said that at the present time two engineering inspectors on the staff of the Road Board—namely, Messrs. J. P. J. Butler and R. W. Butler—were employed. In addition, Mr. P. C. Cowan, chief engineering inspector of the Local Government Board for Ireland, was a member of the Advisory Engineering Committee of the Road Board, the constitution and duties of which were set forth in the board's first annual report. Mr. Cowan received no payment for his services as a member of that committee. He was the only member of the Local Government Board staff employed on the Road Board staff in Ireland. An Advisory Engineering Committee was appointed last year, and Mr. Cowan was a member of it. Asked who decided as to the grants, Mr. Montagu replied: "I do not know that they actually advise."

Road Improvement Fund.—Asked in the House of Commons on Wednesday as to the method of calculating the shares of England, Scotland and Ireland of the Road Improvement Fund, the Secretary to the Treasury stated that the grants were not allocated in rigid proportions to highway authorities in any prescribed area, but those indicated up to February 28th last worked out in the following proportions: England and Wales, £3,133,271 (84 per cent of total); Scotland, £340,424 (9 per cent); Ireland, £257,986 (7 per cent).

Bayard Cars.—For the motorist of unlimited means the choice of a motor car presents no difficulty, but the man to whom price is a consideration is confronted with a very real problem—to decide which of the many more cars of lesser cost represents his soundest investment. The new twenty-four-page catalogue just issued by Bayard Cars, Limited, presents their 1914 range of six models, from 8-h.p. to 30-h.p., at prices which represent excellent value, bearing in mind the exemplary reputation these cars have earned. This new catalogue synchronises with the company's move to more commodious premises at 155-7 Great Portland-street, W., which is in itself a happy augury for the continued success of the Bayard car.

Lifting Machinery.—We have received from Messrs. Herbert Morris, Limited, Empress Works, Loughborough, copies of their latest catalogues, Nos. 55 and 92, and a pamphlet dealing with their standard electric overhead travelling cranes. Catalogue No. 55 illustrates and describes the firm's latest types of their hoist blocks, electric trolley hoists, and runways for electric operation, also their standard types of cupola hoists, freight elevators, and self-landing and delivering hoists for power operation. These gears are fully priced. All the gears described in the book are built on interchangeable lines, and of the same first-class material and workmanship as Messrs. Morris's electric cranes, which are so well known and widely appreciated. Catalogue 92 deals specially with the company's 90 per cent efficiency spur-gear pulley-block, and further gives some particulars of overhead runways and cranes. The pamphlet illustrates and describes Morris standard electric overhead cranes.

The Calder Vale, Wakefield, Sewage Disposal Works.*

By J. P. WAKEFORD, M.INST.C.E., City Surveyor.

During the past three years these works have undergone considerable extension and remodelling at a cost of £28,000.

They are now practically complete, with the excep-

I anticipate that in two months' time the full quantity will be treated.

The following comparative analyses will indicate the results obtained:—

RESULTS EXPRESSED IN PARTS PER 100,000.

Sample.	Oxygen absorbed in 1 hrs. from $\frac{N}{80}$ KMnO ₄ at laboratory temp.	Chlorides (as Cl)	Ammonia (as N)		Nitrates as N	Nitrites as N	Dissolved oxygen taken up in 5 days at 65° Fahr.	Suspended Solids.		
			Free and saline	Albuminoid				Total	Loss on ignition	Ash
Crude ...	10.80	15.8	2.670	1.250	—	—	—	42.0	25.20	16.80
Tank effluent ...	5.20	16.0	2.470	.780	—	—	—	8.40	3.50	4.90
Final effluent ...	1.70	15.8	1.230	.260	.90	.08	1.85	2.40	1.05	1.35

tion of the coupling up of the sewage from the Sandal area, which is at present treated at a separate disposal works which are shortly to be abandoned and the sewage brought to Calder Vale for treatment.

The original works, put down in 1898, were found to be inadequate owing to the nature of the soil, which, being largely clayey marl, was altogether unsuitable for filtration purposes. This scheme was chemical precipitation, continuous settlement, and filtration on land. The sludge was dried in lagoons, and a small sum given to farmers to get rid of it.

The principal features of the new scheme include:

- (1) Alteration to existing detritus tanks.
- (2) Provision of two electrically driven pumps—capacities 2,000 and 4,000 gallons per minute.
- (3) Lime-mixing house, provided with two mixers (Gabbett's patent) and the necessary electric power and pumping installation for same.
- (4) Ferric-sulphate house, with leaden vats, &c.
- (5) Meter house (2) with Lea recorders.
- (6) An increase in the tank capacity to 18½ hours dry-weather flow, and the provision of baffle and scum boards.
- (7) Percolating filters—3¼ acres, average depth 6 ft., with the necessary conduits, channels, syphons, &c.
- (8) Humus tanks (three), total capacity equal to about three hours' dry-weather flow.
- (9) Storm areas (two).

The works have been designed to deal with a maximum volume during times of storm of 10,000,000 gallons per day. The dry-weather flow has been estimated at 2,000,000 gallons per day. This estimate, however, includes the sewage from the Sandal area, and the sewage from the outlying district of Crigglestone.

In considering the scheme from the outset it was quite apparent that some description of precipitant was necessary. Experiments were undertaken, and the results have been the subject-matter of two papers which I gave before the Royal Sanitary Institute, the first at the annual congress in Belfast in 1911, and the second last year at the congress at Exeter. I must therefore refer you to those papers for full information regarding precipitants.

In actual practice it is found that lime alone, if added in proper proportions, gives excellent results, and therefore for the present, at any rate, the use of ferric sulphate has been abandoned, and an annual saving of £400 thereby effected. The amount of lime necessary is an average of 13.5 grains per gallon of the dry-weather flow, and used in this proportion the alkalinity of the tank liquor is, approximately, equal to 2.8 parts (CaO) per 100,000, experience proving that this alkalinity is reduced in passing through the first foot of the media to 0.8 CaO, and samples taken 2 ft. below the surface give no reaction to phenolphthalein.

The whole of the filter has now been in use four months, and the quantity treated has been gradually increased up to 60 per cent of the dry-weather flow.

* Paper presented at the North-Eastern District meeting of the Institution of Municipal and County Engineers held at Wakefield on Saturday last.

GENERAL DESCRIPTION.

At the termination of the 6-ft. barrel sewer, the sewage enters the detritus tanks through ½-in. screens, which have been completely overhauled with new rakes and an automatic cleansing device. These screens can be operated either by hand or by a motor drive. The amount of screenings per week is about 36 cwt. The detritus tanks are in duplicate, each with a settlement capacity of 32,700 gallons, and a storage capacity of 26,300 gallons, making a total capacity in the two tanks of 118,000 gallons. The sewage passes from the detritus tanks to the pump wells, and is lifted a height of 19 ft. to the inlet channel, along which it passes to the precipitation tanks. The pumping capacity on completion will be:

No. 1	Electrically driven	4,000	galls. per min.
2	" "	2,000	" "
3	Steam	1,600	" "
4	" "	4,000	" "

the object being to instal sufficient pumping power to enable any three pumps to deal with 5 volumes of sewage (6,950 gallons per minute) in case of a breakdown of any one pump.

The Local Government Board requirements as to the quantity of sewage to be dealt with is 6 volumes of the dry-weather flow, but in the present instance representations were made to the board that, as half the flow at Calder Vale is trades waste (which does not increase in wet weather), that the discharge is into a main stream, and that it is proposed to deal fully with more than the quantity ordinarily stipulated by the board in places where a considerable portion of the flow is trades waste, the corporation suggested that anything over 5 volumes should be permitted to go direct to the river, and after some correspondence the board assented to this proposal.

In its passage along the inlet channel the precipitants are added to the sewage, baffle stones being provided for the more effective mixing of the lime, &c., before entering the precipitation tanks.

The lime mixers, which are in duplicate, are known as Gabbett's patent, supplied by Messrs. Young & Co., Nine Elms Ironworks, London. They are electrically driven, and are quite satisfactory in their working. A portion of the filtered effluent from the humus tanks is conveyed to a well in the liming house, whence it is pumped up to a steel tank in the roof of the building, and used for lime-mixing purposes.

At the end of the inlet channel a weir is placed adjacent to its junction with the carriers supplying the precipitation tanks, and is set to discharge at 3 volumes so as to permit the flow up to this amount to pass through the tanks. The flow between 3 and 5 volumes passes forward through the culvert between the tanks into the newly constructed storm-water carrier to two of the disused land filtration areas. Portions of these areas are walled off to arrest solids, and adjustable weirs opening downwards are inserted to permit of the effluent being drawn off to the filtration areas to a depth of 18 in. The effluent, after being so drawn off, is discharged into the existing underdrains through outlet chambers fitted with adjustable weirs.

The maximum flow to be treated on the filter is

6,000,000 gallons per day, and the capacity of the filter is 15,617 sq. yds. = 3.227 acres (average depth, 6 ft.).

The rate of treatment is as follows:—

	Galls. per day per sq. yd.	Galls. per day per cube yd.	Galls. per day per acre.
Average (D.W.F.)	128	63.9	619,000
3 volumes	384	191.7	1,857,000
or average	1 gall. per sq. yd. every 11 mins.		
Maximum	1 " " " 3 1/2 mins.		

The area required to treat this flow (2,000,000 dry-weather flow) at 65 gallons per cube yard (Local Government Board requirement) is 15,385 sq. yds.

Therefore the area laid out is 232 sq. yds. in excess of present requirements, or would deal with an additional flow of 30,150 gallons, representing a population of 737 persons.

The three volumes passed through the precipitation tanks (capacity eighteen hours' dry-weather flow) passed to the tank effluent channel, and thence through the lead culvert to the supply channel by means of four adjustable telescopic feed pipes. This method allows the supply channel to be used in eight separate sections, so that portions of the filter might be thrown out of use as required. In this channel thirty-two syphons have been fixed. These discharge automatically into chambers from which the sewage passes through delivery pipes laid upon the floor of the filters, and communicating by means of vertical pipes with 15-in. half-pipe distributors, cement-jointed, laid upon the surface of the filters. From the half-pipe distributors 3-in. diameter butt-jointed earthenware pipes are laid at intervals of 3 ft., and on the syphons coming into action the liquid escapes from every joint of the pipes, the distribution over the surface of the bed being effected by a top layer of moderately fine material, grading down to larger sizes beneath.

When an efficient state of affairs has been set up this upper fine layer retains the liquid to an extent necessary to provide an equable flow throughout the body of the filter. This method of distribution, which has been adopted owing to the limited fall and the size of the filtering media, and on account of subsidence due to colliery workings, is virtually a compromise between the two methods, type 3 and type 4, referred to on page 92 of the Fifth Report of the Royal Commission. The corporation have been exceptionally fortunate as regards the filtering media, both in respect of its excellent quality and the price paid for it. The gravel has been dredged from the river at Horbury, about 3 miles up the river, and the clinker obtained from the destructor on site. The gravel has been washed, graded and placed in position in the bed for 4s. 6d. per cube yard, while the clinker has cost 2s. 6d. after being crushed and dealt with similarly to the gravel. The sizes of the media, for three-quarters the area of the filter are:—

	Depth.	Grade.	
Bottom layer	1 ft. 0 in.	4 in. to 3 in.	Gravel
	2 ft. 8 in.	3 in. to 1 1/2 in.	Gravel
	1 ft. 0 in.	1 1/2 in. to 1/2 in.	Gravel
Top distributing layer	10 in.	1/2 in. to 1/4 in.	Clinker
	6 in.	1/4 in. to 1/8 in.	Clinker
	6 ft. 0 in.		(free from dust)

The remainder has been graded as follows:—

	Depth.	Grade.	
Bottom layer	1 ft. 0 in.	4 in. to 3 in.	Gravel
	1 ft. 8 in.	3 in. to 1 1/2 in.	Gravel
	1 ft. 0 in.	2 in. to 1 1/2 in.	Clinker
	1 ft. 0 in.	1 1/2 in. to 1/2 in.	Clinker
	10 in.	1/2 in. to 1/4 in.	Clinker
	6 in.	1/4 in. to 1/8 in.	Clinker
	6 ft. 0 in.		

A 6-in. concrete floor, covered with Naylor's tiles, has been laid underneath the gravel media, the floor having a fall towards the filter effluent culvert.

The filtered effluent passes from the bottom of the filter to this culvert, which is situated beneath the supply channel and the feed culvert, and thence to the humus tanks, which are provided with sump boards, and have a capacity of about three hours' dry-weather flow, after which it passes over a weir into the effluent channel, and is conveyed by a 27-in. pipe and a short length of 30-in. brick culvert to the old outlet into the river Calder.

SLUDGE DISPOSAL.

The old method of drying in lagoons was very unsatisfactory. It was expensive, costing about £100 per annum, and was a source of nuisance,

stinking abominably at times. Now a Tangyes' horizontal double-acting sludge pump has been installed in each of the sludge tanks, and each pump is capable of lifting a week's supply of sludge in twelve hours. This sludge is forced through a 6-in. cast-iron main on to portions of the land to be trenched in and finally disposed of. It is estimated that the 21 acres reserved for this purpose will be raised at the rate of 1.87 in. per annum. The cost in this way has been reduced to about £170 per annum, while the nuisance from smell has been reduced to a minimum, no complaints having been raised during the past three years, during which time the sludge trenching has been in vogue.

The top water from the sludge in the sludge tanks is drawn off into the detritus tank by means of a floating arm; in this way the moisture is reduced from 94.5 to 92.7 per cent (approximately). The sludge produced from the precipitation tanks is equal to 60 tons per day, containing 90 per cent water, and from the humus tanks 2.63 tons per 1,000,000 gallons.

RURAL HOUSING.

GOVERNMENT COTTAGE BUILDING.

We understand that the Local Government Board for Scotland have informed a correspondent that, subject to any modifications necessitated by differences in Scottish law practice, the undertaking as expressed in the letter addressed on December 4th last by the President of the English Local Government Board to Mr. Henry Hobbhouse, is intended to apply to Scottish as well as to English rural districts. That letter appeared in the Press on December 5th, but the following extract is sufficient to show the terms of the undertaking:—

"I am in a position to announce, on behalf of the Government, that, in any case in which a rural district council now gets the sanction of the Local Government Board and starts to build cottages in its district under the Housing Acts, the State, when the necessary powers to enable it to provide cottages in rural areas have been obtained, will be willing to take over the council's cottages with the liabilities then properly outstanding in respect of them. This will be subject to the Local Government Board giving a certificate, in each case, that the houses were built to satisfy a real demand, that they are satisfactory in construction, and are reasonable in cost."

School Heating.—The Park Schools new observation block, Hanwell, are being supplied with Shorland's warm air ventilating patent Manchester stoves and grates by Messrs. E. H. Shorland & Brother, Limited, of Failsworth, Manchester.

Metropolitan Asylum Extension.—At the Saturday's meeting, the Metropolitan Asylums Board approved, subject to the sanction of the Local Government Board, of a scheme for the extension of the Tooting Bee Asylum, at an estimated cost of from £151,500 to £165,854.

Institution of Civil Engineers.—The examiners' report on the February examinations for admission to associate-membership of the Institution of Civil Engineers contains notifications that Mr. Geoffrey Alden Stevens, building surveyor to the city engineer, Norwich, has passed in Section A, including scientific knowledge, and that Mr. Frederick Charles Riley, assistant in the electricity department, has passed in the whole of the subjects. Both these gentlemen were articled pupils of the city engineer of Norwich, Mr. A. E. Collins, M.A.S.T.C.E.

Royal Masonic Institution for Boys: April, 1914, Election.—The support of municipal officers is earnestly solicited on behalf of Frederick Charles Lloyd, the eleven-years-old son of the late Bro. Frederick Charles Lloyd, town clerk of Croydon, who died on July 18th last, leaving a widow and six children, five of whom are under twelve years old and dependent upon her. Before going to Croydon Bro. Lloyd was town clerk of Huddersfield, and prior to that deputy town clerk of Cardiff. He was initiated in the Bute Lodge, No. 960, Cardiff, in 1891. The candidate will be twelve years of age in July next, and will not be eligible to contest another election; this is therefore a "last-chance case." Proxies will be thankfully received by W. Bro. T. W. Wood Roberts, F.M. 1556 and 3363, L.R., 59 Park-lane, Croydon (hon. secretary).

RECENT DEVELOPMENTS IN COMMERCIAL MOTOR-VEHICLES.

By THOMAS CLARKSON, M.INST.C.E.

[Abstract of paper read at a meeting of the Institution of Civil Engineers on Tuesday evening.]

The period reviewed in this paper has witnessed the evolution of the motor omnibus as it exists to-day. Greater facilities for the transport of passengers in cities are constantly in demand. Electric rail motors, both on the surface and underground, have met this demand to some extent, but the motor bus has already demonstrated its superiority over the rail car or tram. Complete flexibility is obviously impossible in motors dependent upon an extraneous power station; the vehicles must be self-contained, and the power generated from within. The author regards flexibility as the key to the successful solution of the street-traffic problem in cities.

By reason of the extent of the subject, it is scarcely possible, within the limits of a paper, to do more than select for examination some typical examples of the commercial motors of the present day, and consider the suitability of various types of motor to the diverse conditions of industrial transport. There are at present three methods of generating power for commercial transport—namely, by internal-combustion engines, by steam engines, and by electric motors. Each of these methods has found a fairly clearly defined field of utility. The internal combustion motor far outnumbers the other types of motor for nett loads up to 3 tons. For heavier duty than this, the steam motor continues to hold the field. The rise in the price of petrol has directed attention to other liquid fuels for the internal-combustion motor, and the steam motor using solid fuel is being adapted for loads less than 3 tons, with the object of checking the ever-growing demand for motor-spirit.

The electric vehicle supplied with energy by a storage battery has made remarkably little progress in England.

FUEL.

The petrol motor is confined to the employment of a volatile liquid fuel; the steam motor may use either liquid or solid fuels.

The relative cost of the two systems for fuel per mile is, of course, governed by the ratio between the cost per pound of fuel and the mileage per pound. The fuel cost for a 3-ton petrol commercial vehicle, with petrol at 1s. 4d. per gallon, and at 8 miles per gallon, works out at 2d. per car-mile. The London petrol bus, which may be taken as equivalent to the 3-ton commercial vehicle, costs about 1d. per car-mile for fuel. This lower fuel cost, it should be explained, is not due to superior engine efficiency, but is the result of an exceptionally favourable contract for the purchase of petrol in very large quantities. The present cost of fuel for London petrol buses is, therefore, abnormal from the point of view of the ordinary user of petrol commercial vehicles.

The steam omnibus at present costs, for liquid fuel, 1-875d. per mile, which is a little less than the cost of the ordinary petrol 3-ton vehicle. The steam omnibus, or 3-ton lorry, using coke, costs for fuel 0-4d. per mile with coke at 13s. per ton.

The significance of this economy, and the real value of an apparently small reduction in cost per mile, is indicated by the fact that 4d. per mile represents, approximately, £200,000 per annum on the cost of running London omnibuses.

With regard to the relative reliability of petrol and steam cars, it has been demonstrated conclusively that with either type of motor the mileage lost from mechanical causes is extremely small, even when performing a commercial duty involving an annual mileage of 30,000 miles and more per vehicle.

As regards the cost of mechanical upkeep, there does not appear to be any reason for a material difference between the two systems under this heading when they are run under similar conditions of management. The light steam 3-ton vehicle using coke as fuel may be regarded as combining the speed and handiness of the petrol motor, with a fuel cost equivalent to petrol at 4d. per gallon.

The paper gives details of the construction of present types of both steam and petrol omnibuses, and deals particularly with modern methods of omnibus illumination. The important question of the construction of road wheels most suitable for commercial motors of from 30 cwt. to 3 tons capacity is dealt with. The present position of the electric commercial

vehicle is considered in relation to other types of motor, particularly with reference to the investigations of working costs which have been recently conducted by the Massachusetts Institute of Technology.

The paper concludes with a reference to modern steam motor wagons and tractors.

"Warwick" Sprinklers for Lambeth.—The Lambeth Borough Council have, we understand, decided, after trials, to place an order with Messrs. Glover & Sons, of Warwick, for the supply of forty-eight of their "Warwick" sprinklers to be fitted to existing water vans in place of various other distributors.

Fortrose Water Supply.—A new water supply for the burgh of Fortrose, including the older burgh of Rosemarkie, was formally turned on last week. Up to twenty-one years ago the burgh was supplied by wells in the neighbourhood, which had been in the old days considered ample. The head springs are about 3½ miles from the town.

Excursions in the Eastern Counties.—The Great Eastern Railway Company are drawing attention to the very low rates which they offer for the conveyance of pleasure parties from London and their suburban stations to the seaside, Epping Forest, and Rye House. An illustrated pamphlet, giving full particulars, can be obtained on application to the superintendent of the line, Liverpool-street Station.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

SOUTH-EASTERN DISTRICT.

A South-Eastern District meeting is to be held at the Town Hall, Tunbridge Wells, to-morrow (Saturday).

PROGRAMME

11.30 a.m. Members will assemble at the town hall. Welcome by his Worship the Mayor (Mr. Councillor C. W. Emson, J.P.).

District business.

1 p.m. Members will partake of luncheon at the Royal Mount Ephraim Hotel (tickets 3s. per head).

2 p.m. Members will proceed by motor conveyances (fare 2s. each) to Mount Ephraim, Major Yorke's-road to Forest-road, along Forest-road and thence to Pembury—

(1) To inspect the Tunbridge Wells Corporation waterworks;

(2) To proceed to and inspect the Tunbridge Wells Corporation electricity works.

Tea will be kindly provided by the Mayor.

Other works of interest to surveyors and engineers in Royal Tunbridge Wells: High-street bridge, indoor baths, technical institute, cemetery and sanatorium. Arrangements can be made for any members who desire to do so to inspect any of the above works.

H. W. BOWEN, A.M.I.C.E., A. DRYLAND, M.I.C.E.,
Hon. District Secretary. *District Chairman.*
County Surveyor's Office, County Surveyor,
Horsham. Surrey.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on June 13th.

THE ANNUAL MEETING.

The date for the annual meeting of the Institution of Municipal and County Engineers at Cheltenham has been fixed definitely for June 24th, 25th, 26th and 27th next. It has been decided to make a special feature of town planning and of roads, and, if possible, to arrange for an exhibition of town plans.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

COUNCIL MEETING.

At a meeting of the council held at Leeds last Saturday the following applicants were recommended for admission:—

To Membership.—Messrs. F. W. Ellis, chief assistant, Colne; and C. B. Barnes, assistant surveyor, Gloucester Rural District Council.

To Associate-Membership.—Mr. F. J. Dean, surveyor's office, Plympton Rural District Council.

Transfer to Membership.—Mr. S. E. Axon, assistant city engineer and surveyor, Adelaide.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

Architects' Registration Bill.—The council, after consideration of the report of the General Purposes Committee, decided that the Bill be opposed unless provision be made either for the registration of all municipal engineers under the Act or for their exemption from its operation.

Town Planning Institute.—It was decided that application be made to the institute asking them to recognise membership of the institution as sufficient qualification for admittance to their body.

Sectional Conferences on Arterial Road Communication in Greater London.—The secretary submitted certain correspondence in this matter, and the council strongly endorsed his action in claiming the right of the institution to be represented at the conferences.

Members are requested to note the following correction: A meeting will be held at Darlington on April 18th, and at Hexham on May 2nd.

The next meeting of the council will be held in London on Wednesday, April 29th.

B. WYAND,
39 Victoria-street, S.W. Secretary.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

TEMPORARY ENGINEERING DRAUGHTSMAN.—March 30th.—Godstone Rural District Council.—Mr. Geo. E. Crowter, engineer and surveyor.

SUPERINTENDENT OF CLEANSING.—March 31st.—Corporation of Glasgow. £550—£700 per annum.—Mr. J. Lindsay, town clerk.

HYDRAULIC ENGINEER.—March 31st.—Nenagh Urban District Council.—Mr. Frank R. Maloney, town clerk.

JUNIOR ASSISTANT.—April 1st.—Wanstead Urban District Council. £70—£100 per annum.—Mr. Bruce Blewitt, clerk.

ENGINEER AND SURVEYOR.—April 2nd.—Barnet Urban District Council. £250 per annum.—Mr. H. W. Poole, clerk.

ASSISTANT SANITARY INSPECTOR.—April 3rd.—Corporation of Middlesbrough. £105—£140 per annum.—Mr. P. Kitchen, town clerk.

ROAD SURVEYOR.—April 4th.—Norfolk County Council. £140—£180.—Mr. T. H. B. Heslop, county surveyor, Shirehouse, Norwich.

TEMPORARY ENGINEERING ASSISTANT.—April 4th.—Finchley Urban District Council. 2½ guineas per week.—Engineer and Surveyor.

ASSISTANT TO COUNTY ROAD SURVEYOR.—April 5th.—Breconshire County Council. £80 per annum.—Mr. W. Lewis Harpur, county roads surveyor, County Hall, Brecon.

TEMPORARY ASSISTANT.—April 6th.—Hiracombe Urban District Council.—Mr. O. M. Prouse, engineer and surveyor.

WATERWORKS MANAGER.—April 6th.—Neath Rural District Council. £300 per annum.—Messrs. Cuthbertson & Powell, clerks.

SURVEYOR'S OFFICE ASSISTANT.—April 6th.—Urnston Urban District Council. £1 per week.—Mr. T. J. Rowland, clerk.

SURVEYING ASSISTANTS.—April 21st.—Shanghai Municipal Council. £335 per annum.—Messrs. John Pook & Co., agents for the Shanghai Municipal Council, 68 Fenchurch-street, London, E.C.

CLERKS OF WORKS.—Rivers Committee of the Manchester Corporation. £3 3s. per week.—Chairman of the Rivers Committee.

ASSISTANT SURVEYOR OF ROADS.—Public Works Department, Gold Coast Government. £300—£350, with £7 10s. per month allowance.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAY WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAY to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

LONDON.—May 4th.—Designs from British architects for the architectural treatment of the new St. Paul's Bridge, for the City Corporation. Premiums, £300, £200, and £100.—Town Clerk, Guildhall, E.C.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

CORNWALL.—March 30th.—For the supply of twenty-four portable shelters, for the Tuberculosis Committee.—Mr. C. L. Cowland, clerk, Bodmin.

BOURNEMOUTH.—March 30th.—For the erection of new schools and alterations to existing schools, for the Education Committee.—Borough Engineer.

OSWESTRY.—March 30th.—For the erection of a lodge in Cae Glas Park, for the corporation.—Mr. G. William Lacey, borough engineer and surveyor.

GLAMORGAN.—March 31st.—For the erection of two cottages, for the county council.—County Hall, Cardiff.

SWANSEA.—March 31st.—For the construction of masonry and concrete approaches and piers, for a steel girder bridge of 111-ft. span, also for the supply of steelwork for the said bridge, for the corporation.—Mr. H. Howard Humphreys, 28 Victoria-street, Westminster.

WATERLOO - WITH - SEAFORTH.—March 31st.—For additions and alterations to fire station, for the urban district council.—Mr. F. Spencer Yates, surveyor.

HUNTS.—March 31st.—For the erection of offices and alterations to a school, for the Education Committee.—The Surveyor, Market-place, Huntingdon.

ABERDEEN.—March 31st.—For the construction of an underground concrete pump chamber and valve-house, for the Electricity Committee.—Mr. J. Alex. Bell, city electrical engineer, Millburn-street.

SHIPLEY.—March 31st.—For the extension of a boiler-house, for the urban district council.—Mr. W. Illingworth, architect and surveyor, 15 Sunbridge-road, Bradford.

FAREHAM.—March 31st.—For the erection of public conveniences, for the rural district council.—Mr. C. W. Hunt, inspector.

ISLE OF WIGHT.—April 1st.—For the extension of a water main, for the rural district council.—Mr. H. B. Cullin, inspector, Brooklands, Wootton, I.W.

BUCKS.—April 2nd.—For partially pulling down and rebuilding a bridge, for the county council.—Mr. R. J. Thomas, county surveyor, County Hall, Aylesbury.

BUCKS.—April 2nd.—For school extension, for the Education Committee.—Mr. C. G. Watkins, secretary, Aylesbury.

LINTHWAIT.—April 3rd.—For the erection of sixteen dwellings, for the urban district council.—Mr. Joe Ainley, architect, Chapel-street, Slinthwaite.

KENT.—April 3rd.—For the erection of new offices, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

BURNLEY.—April 4th.—For the completion of the construction of an impounding reservoir, with catchwaters, aqueducts, and meter-houses, for the corporation.—Messrs. James Diggle & Son, engineers, Hind Hide-street, Heywood, Lanes.

BLACKPOOL.—April 4th.—For work in connection with the laying of cast-iron pipes, sluice valves and hydrants, for the corporation.—Mr. John S. Brodie, borough engineer.

HUDDERSFIELD.—April 4th.—For the construction of a filter-house and reinforced-concrete tanks, for the corporation.—Mr. J. Henry Field, town clerk.

RUTLAND.—April 4th.—For the construction of a culvert over the brook at the foot of Wordley Hill, for the county council.—Mr. James Richardson, county surveyor, 13 Barn-hill, Stamford.

NORTHUMBERLAND.—April 4th.—For the reconstruction or widening of certain bridges, for the county council.—Mr. J. A. Bean, county surveyor, The Moot-hall, Newcastle-on-Tyne.

HUDDERSFIELD.—April 4th.—For the erection of a filter-house, for the corporation.—Waterworks Engineer.

LIVERSEDGE.—April 6th.—For the rubble fencing walling to be constructed around the new circular sewage filters, for the urban district council.—Mr. A. Rothera, engineer and surveyor.

WEST HAM.—April 6th—20th.—For alterations and additions to a school, for the Education Committee.—Mr. W. Jacques, architect, 2 Fen-court, Fenchurch-street, E.C.

BUCKFASTLEIGH.—April 6th.—For sewer and water main extensions, for the urban district council.—Mr. W. J. Goode, surveyor.

STRANORLAR.—April 6th.—For the erection of twenty-nine cottages, for the rural district council.—Mr. G. McLaughlin, clerk.

WITNEY.—April 6th.—For the construction of a concrete lining to a dug well 82 ft. deep, laying about 1,800 yds. of 3-in. service mains, with necessary fittings, and the supply and fixing of a vertical oil engine, three-throw pump, two air compressors, air-lift plant, and necessary piping to connect existing main, for the rural district council.—Mr. H. Howard Humphreys, engineer, 28 Victoria-street, Westminster, S.W.

MONAGHAN.—April 7th.—For the conversion of military barracks into eleven cottages, and the erection of sixteen new cottages, for the urban district council.—Mr. J. J. Inglis, 36 Dawson-street, Dublin.

DEPTFORD.—April 7th.—For repairs and redecoration to mortuary and coroner's court, for the borough council.—Borough Engineer.

BARNES.—April 7th.—For building a sports pavilion, for the urban district council.—Mr. G. Bruce Tomes, surveyor.

NORMANTON.—April 9th.—For the erection of seventy-six workmen's dwellings, for the urban district council.—Mr. A. Hartley, architect and surveyor.

CLONMEL.—April 11th.—For the erection of a re-tort-house and coal store in concrete or, alternatively, in stone, at the gasworks, for the corporation.—Mr. Henry O'Connor, 1 Drummond-place, Edinburgh.

KEIGHLEY.—April 11th.—For the construction of a storage reservoir, filter-beds, clear-water basin, and other appurtenances, for the corporation.—Mr. Ratcliffe Barnett, engineer.

EDMONTON.—April 14th.—For the erection of a public convenience, for the urban district council.—Mr. C. Brown, engineer and surveyor.

HASTINGS.—April 14th.—For the erection of two cottages, for the corporation.—Mr. P. H. Palmer, borough engineer.

HEREFORD.—April 14th.—For the erection of sixty-two cottages, for the corporation.—Mr. J. Parker, city surveyor.

CHESHIRE.—April 18th.—For the erection of certain new buildings and alterations, for the county council.—Mr. W. H. Lancaster, 49 Northgate-street, Chester.

BURNLEY.—April 18th.—For the construction of an impounding reservoir, catchwaters, aqueducts and meter-houses, for the corporation.—Messrs. James Diggle & Son, engineers, Hindhill-street, Heywood, Lanes.

CHELMSFORD.—April 20th.—For sinking a 14-in. borehole, for the corporation.—Borough Surveyor.

MARGATE.—April 20th.—For the erection of a pumping engine house, for the corporation.—Mr. A. E. Borg, borough engineer.

WALLASEY.—April 21st.—For the erection of a town hall, for the corporation.—Messrs. Briggs, Wolstenholme & Thorneley, Royal Liver Buildings, Liverpool.

WEST RIDING.—April 24th.—For alterations at a school, for the Education Committee.—The Clerk, County Hall, Wakefield.

WARWICKSHIRE.—April 24th.—For the enlargement of the police station and the erection of a pair of cottages and works incidental thereto, for the county council.—Mr. John Wilmot, county surveyor, 6 Waterloo-street, Birmingham.

Iron and Steel.

RUISLIP-NORTHWOOD.—March 30th.—For the supply of sixty-seven cast-iron lamp columns, for the urban district council.—The Surveyor.

SHREWSBURY.—March 30th.—For the supply of cast-iron pipes and specials, for the corporation.—Mr. W. Arnold Hewitt, waterworks manager.

BELFAST.—March 31st.—For the supply of 7½ tons of cast-iron specials, for the corporation.—City Surveyor.

TOTNES.—April 2nd.—For the supply of iron pipes, for the rural district council.—Mr. F. K. Windeatt, clerk.

BLACKPOOL.—April 4th.—For the supply of 3,000 lin. yds. of 4-in. cast-iron spigot and socket pipes, sluice valves, hydrants, and surface boxes, for the corporation.—Mr. John S. Brodie, borough engineer.

BRIDGWATER.—April 13th.—For the supply of 124 tons of 3-in. cast-iron pipes and other castings, for the rural district council.—Mr. W. A. Collins, engineer.

TAUNTON.—April 14th.—For the supply of sluice valves, air valves, hydrants, surface boxes, cast-iron mains, carting and laying cast-iron water mains, including fixing valves and hydrants, for the rural district council.—Mr. Sidney S. Orchard, engineer and surveyor.

Roads.

LAUNCESTON.—March 25th.—For main road improvements, for the corporation.—Mr. Arthur W. Grace, borough surveyor.

PENGE.—March 25th.—For resurfacing certain roads with either tarred slag or tarred granite macadam, for the urban district council.—The Surveyor, Town Hall, Anerley, S.E.

WIGTON.—March 25th.—For the maintenance of certain roads, for the rural district council.—Mr. Thomas B. Simmons, surveyor.

HORNSEA.—March 30th.—For making up certain roads, for the urban district council.—Mr. W. E. Warburton, surveyor.

Minutes of Proceedings.

Extraordinary Traffic and Recognised Industries.

A defence not infrequently raised to a claim for "extraordinary traffic" expenses is that the traffic complained of took place in connection with a "recognised industry" of the district. One of the earliest cases in which this defence was successful was *Wallington v. Hoskins* (6 Q.B.D., 206), the traffic consisting of the carriage of stone in a district where quarrying was a recognised business. The magistrates found that the traffic was not extraordinary having regard to the industry of the place and to the mode in which that industry was carried on. Nevertheless, they held that, though the traffic was not extraordinary, the weight was excessive, and on the latter ground they allowed the claim. An appeal to the High Court was allowed for reasons thus stated by Lord Coleridge: "It seems to me that the moment the justices have found this an ordinary and recognised industry of the place, and that it is carried on in the ordinary and recognised mode in which such industry is carried on, the weights are no longer excessive." This decision was followed in *Raglan Highway Board v. Monmouth Steam Company* (46 J.P., 598), which was a case of timber haulage in a district where the woods were periodically cut for sale. The magistrates found that the traffic was connected with a long-established industry, and that the weights of the individual loads were not excessive. They therefore disallowed the claim, and their decision was upheld by the High Court. These decisions, however, were not uniformly followed. Without wearying the reader with references, it will suffice to state that in two cases of stone haulage and in one case of the cartage of agricultural produce, the traffic was held to be extraordinary notwithstanding its connection with a recognised industry. The want of a settled principle was shown by yet another case, in which the carting of peat moss was held not to be extraordinary, although the facts were practically identical with those in one of the stone-hauling cases.

All these decisions were prior in date to the leading case of *Hill v. Thomas* (1893, 2 Q.B., 333), which came before the Court of Appeal, where all the previous cases were reviewed, and a definition of "extraordinary traffic" was given by the Court. That definition is too lengthy for citation here, but it will suffice in this connection to say that its effect was decidedly to weaken the "recognised-industry" doctrine by establishing as the standard of comparison the ordinary traffic on the particular road in question, and not that on other roads in the district. This principle has been applied in

several subsequent cases in which traffic connected with a recognised industry has been held to be extraordinary either by reason of its being conducted on roads not previously used for similar traffic, or by reason of a new method of haulage having been adopted. One of the most recent of these was *Geirionydd Rural District Council v. Green* (72 J.P., 321; THE SURVEYOR, Vol. xxxv., p. 361), which was a case of timber haulage in a district where timber growing was a staple industry. This case is specially striking because timber had been hauled on the particular road some forty years previously. On that occasion, however, the road was not damaged, and this fact was accepted by the Court as evidence that the present traffic must have been extraordinary. This decision was followed in another case of timber haulage—*Llangollen Urban District Council v. Coward & Co.* (noted at p. 484 *ante*)—in which the "recognised industry" defence was set up, but failed for similar reasons.

The Relative Efficiency of Bituminous Road Crusts.

In a short and very practical paper read at the Tunbridge Wells meeting of the Institution of Municipal and County Engineers last Saturday Mr. W. H. Maxwell, the borough engineer of that town, discussed some of the most important of the facts concerning methods of road crust construction with bituminous binders, and indicated what, in his view, is the position held to-day by such crusts in relation to those of other kinds. Mr. Maxwell does not see so wide a gulf between water-bound and bituminous-bound crusts as that which exists in the view of some engineers, and attention may specially be directed to the paragraph in which he sums up certain important features of the former class, and to the remarks made on this point by Mr. A. Dryland and Mr. P. H. Palmer, who spoke in the discussion. Mr. Maxwell's experience is that tar-painting by hand reduces the annual expenditure on road metalling, but his appreciation of the value of tar-painting includes, of course, the consideration that it leads to various indirect economies and advantages beyond those which are apparent in costs accounts. As regards the behaviour of tar-macadam crusts in hot weather, as described in the paper, and with reference also to the efficiency of tar-painting, it may be remarked that the maximum temperature which a road crust attains is very much reduced by suitable shade, which, if the trees are tall enough, or when they have grown tall enough, may, in many cases, be so regulated that it is summer shade only, and

leaves the road exposed to sunshine for six months of the year. Mr. Maxwell's remarks regarding the liability of tar-macadam to creep in summer and to soften under a hot sun, strongly suggest the importance of shade on roads provided with crusts of this kind.

As regards the comparison which Mr. Maxwell has made in his paper between tar-macadam proper and pitch-grouted macadam, it may be suggested that those defects of pitch-grouted macadam to which he refers are traceable to errors in the method of making the crusts. Corrugations may be formed as the result of a too solid construction, lacking the voids which Mr. Francis Wood, in his recently published book, has referred to as playing an important part in providing the necessary resiliency in a road crust or street pavement. It is impossible to indicate in a single sentence the nature of the means which should be taken to avoid the evils referred to, but one important item, perhaps, is the choice of an aggregate with stones which vary considerably, but not too gradually, in size and shape. This, to some extent at least, resists the rocking effect of wheels of small diameter carrying heavy loads. If the corrugation effect is accompanied by the appearance of black, slippery mud during wet weather, this is an indication that the crust has been filled too full of bituminous binder, and one of the precautions against this may be to run in the first portion of the binder at a relatively low temperature, up to, say, 2 in. of the top, in order that the voids in the lower part of the crust may not be quite filled with bituminous binder, though they should be packed tightly with a sufficient proportion of small mineral binder. The crust, as a whole, will then be more resilient, and excess binder in the topmost layer may be to some extent squeezed downwards, or, at least, will not be added to by oozeings from below.

* * *

Other Points in Crust Construction.

Some interesting points were brought forward in the discussion. As regards the strengthening of the edges of the crust, the method described by Mr. H. W. Bowen seems to be a very good one, following, as it does, the principle that the edges should be part and parcel of the crust itself. By the use of large flints, either a flush margin or a raised margin of turf may, if desired, be maintained over this metalling, and so keep the normal incidence of wheel loads well away from the real edge of the crust, so that the spread of the wheel load is within the limits of the strength crust—not beyond it, as in the case of trenched edges. The "abutment" edge, such as that of creosoted deal, described by Mr. W. H. Grieves, may be of value during construction, and may be permanently useful in particular places; but one cannot regard it as typical of practice in crust construction generally. Mr. Dryland supported Mr. Maxwell in his opinion regarding pitch-grouted crusts, as well as in his attitude towards the "panacea" idea, which is one of the most mischievous of the fallacies which road engineers have to combat in carrying out the work of making road crusts suitable for the traffic which they have to carry. Mr. F. Harris's support of Kentish rag deserves attention, and it seems that, in the area in which it can be obtained at a moderate cost, this material provides a really important road metal.

Mr. Grieves' reference to a 1-in. carpet on a water-bound crust is especially interesting. A 1-in. carpet is a carpet proper, and may have important advantages compared with the, at present, much-favoured wearing course of about 3 in. or 3½ in. in thickness. It may be suggested that the bituminous carpet on a crust which is in itself of ample thickness and strength has not yet had a fair trial, and we hope that Mr. Grieves will go further in this direction and give the results of his experience in the matter at some future meeting of the institution. It may be pointed out that

when Mr. Walker Smith, in a paper read before the Institution of Civil Engineers a few years ago, advocated thicknesses such as 4 in. for bituminous road crusts, Mr. Reginald Ryves, speaking in the discussion, pointed out that such a layer, expected to carry some of the load, would not be a carpet proper, and suggested that it would be better to make thicker layers which could be regarded as crusts, or thinner layers which would be carpets proper. As regards asphaltic surfaces for country roads, this advice, and urban precedent, have been followed; but nearly all tar-macadam crusts have been made of just about the thickness which Mr. Ryves said was wrong. As to the use of slag in bituminous crusts, Mr. Maxwell's paper and the discussion, taken together, convey the impression that the decay of slag may be of advantage in the case of tar-bound crusts, attrition and decay proceeding simultaneously having a less disintegrating effect than either would have by itself; this accounting, on the one hand, for the greater difference between tar-bound slag and water-bound slag than that which might otherwise be expected, and, on the other hand, among other reasons, for the superiority of tar-slag to such materials as tarred basalt.

The Basement House.

It is a commonplace observation that there is no accounting for the passing fancies of popular taste, but when any public dislike reveals any sign of permanence it is usually based upon some solid foundation of good sense. An example of this is to be found in the modern revolt against the basement house, primarily caused, in all probability, by considerations relating to domestic labour and administration. That many other factors are involved, some of them, no doubt, but dimly perceived by those most immediately concerned, was clearly shown by Mrs. Cloudesley Brereton in a paper which she read before the Institute of Sanitary Engineers on Wednesday evening. Her immediate subject was "Problems of Domestic Lighting, Heating and Cooking from the Woman's Point of View." At the outset, however, she narrowed the scope of her paper to these matters as they specially affect the basement house. The problem is fourfold. In the first place, the interests and convenience of the householder must be considered, and this is a most important matter, although it does not very directly affect the sanitary engineer. Then there is an aspect of the question which does directly concern the sanitarian, for modern sanitary science and legislation alike condemn the basement as a place for sleeping or even living. In this connection we would point out that it is by no means only in the case of small property that basement rooms are used as sleeping places. In many of the most fashionable quarters servants in expensive houses of the basement type are relegated to underground "rooms" which, as regards the access of light and air, are little better than cupboards. By the Housing, Town Planning, &c., Act, 1909, such rooms, when used for sleeping purposes, are liable to be closed as being unfit for human habitation unless they are 7 ft. high and comply with regulations made by the local authority, or, in default, by the Local Government Board—a most salutary provision. The third point from which the problem of the basement house may be viewed is that of the property owner. There can be no doubt that at the present time property owners on every hand are suffering much loss by the continued unpopularity of this type of house. As a remedy for this depression, Mrs. Cloudesley Brereton suggests that the remodeling of the basement house either for service purposes, as in the case of more expensive town houses, or as cellars, and so forth, as in the smaller houses, is a sanitary work worthy of the consideration of the progressive landlord as a strictly business and paying proposition, and a large part of her very interesting paper is devoted to an elaboration of this

them. Finally, the question must be looked at from the point of view of the legislator, whose business it is to examine with a view to more effective prohibition the case of houses which are rapidly becoming unwholesome tenement dwellings. There can be no doubt that the paper draws attention to one of the less appreciated living problems of modern sanitation.

Weight and Speed Regulations for Heavy Motor Vehicles. Regulations restricting the weights and speeds of heavy motor vehicles are in force in Massachusetts, New Jersey, and Philadelphia, as the result of laws passed in the spring of 1913; and a set of regulations based on the Massachusetts law was recently issued by the Commissioner of Highways for New York State. During the winter sessions of the legislatures efforts were to be made to introduce similar legislation in Maryland, and probably in New York and several other States, the regulations at present in force in New York State being, presumably, applicable only on State roads. A plea for uniformity is put forward by the *Scientific American*, and it is pointed out that eleven Eastern States are attempting to harmonise the different laws relating to motor vehicles. Our contemporary remarks that the manufacturers of heavy motor vehicles object to discriminating legislation in this matter, and point out that highway commissioners themselves admit that heavy team haulage is one of the most injurious forms of highway traffic. The speed limits of 15 miles an hour for vehicles of a gross weight of more than 4 tons, and 6 miles an hour for hard-tyred, and 12 miles an hour for soft-tyred vehicles of over 6 tons gross weight, are not objected to by leading manufacturers, and it is remarked that out of 80,000 commercial vehicles now registered in the United States, fewer than 400 weigh as much as 14 tons with full load. Those exceeding 5 tons rated capacity do not number much more than 1,200. It is interesting to note, in this connection, that the association of automobile manufacturers known as the Automobile Chamber of Commerce has adopted standard speed ratings slightly below those fixed by the State regulations, and the standard form of warranty issued with each truck provides that overspeeding and overloading will render the warranty void. Leading tyre manufacturers recommend loads considerably less than 800 lb. per inch of width, and seek to discourage loadings in excess of those specified.

It seems, then, that the regulations are regarded as reasonable; and since different regulations are needed for the smaller loads carried by horsed vehicles, the only just cause of complaint seems to be that suitable regulations are not framed for the latter class. Since these vehicles, when the tyres are narrower than they ought to be, inflict much damage on roads in the United Kingdom, and doubtless in the United States also, it is not unreasonable that persons who are taxed to provide funds for the upkeep of roads should desire that other classes should be made to provide tyres of width suitable for the loads carried. When this is done the taxes on vehicles may be regarded mainly as general taxes, and not be considered to entitle those who pay them to a voice in the management of roads and traffic.

New York Sewerage Commission and Chlorine Treatment.

Four further reports of the Metropolitan Sewerage Commission of New York have been issued, and one of these, which is concerned with a report of Dr. Samuel Rideal on oxidation processes applicable to New York conditions, is reproduced in part elsewhere in this issue. Briefly, it is Dr. Rideal's opinion that all the sewage produced now and in the next genera-

tion in the metropolitan district of New York and New Jersey could be sufficiently purified on properly selected sites near where it is produced to permit of its discharge locally into the waters of the inner harbour without violating any of the provisions of the commission's standard of cleanliness. The purification works, he thinks, should be able to remove the unsightly and offensive floating suspended matters of the sewage, and ensure that the effluent becomes invisible and inodorous when mixed with the harbour waters. So far as oxidation is concerned, Dr. Rideal considers that sufficient oxidising treatment should, and could, be given to the sewage to keep the effluent from absorbing more than one-half of the oxygen in the harbour water. In order completely to oxidise the 1,500 million gallons per day of sewage included in the estimates, Dr. Rideal finds that 1,280 tons of available chlorine would be required daily. The chlorine could be added, in Dr. Rideal's opinion, in the form of chlorine gas, bleaching powder, or as sodium hypochlorite produced from an electrolysed solution of sodium chloride. A considerable part of Dr. Rideal's report is devoted to the question of forced aeration as a method of sewage disposal and the results of various calculations are given to show that it would be impracticable to oxidise New York sewage by this means. At the conclusion, the report recommends that chlorine treatment should be given serious consideration along certain lines. As will be seen, however, the commission do not regard the proposition as affording a practical solution of the problem before them on the ground that the amount of chlorine which it would be necessary to apply to settled sewage in order to produce a material reduction in the dissolved oxygen would be so great, its sterilising effects so powerful, and its odour so penetrating, as to make it probable that the entire harbour would become sterilised, and smell disagreeably of the disinfectant.

Engineers-in-Charge.

In our last issue there appeared a report of the proceedings at the nineteenth annual dinner of the Association of Engineers-in-Charge, but considerations of space precluded us from offering any observations on the speeches which were delivered on that occasion. In the first place, it should be mentioned that in proposing the toast of "The Association," Sir Boverton Redwood was able to record another year of steady and satisfactory progress. In reply, Dr. Glazebrook, the distinguished president of the association, threw out a hint that there was a real demand for its extension by forming branches in the provinces and in the Colonies. There can be no doubt that the vitality of an organisation of this character depends to a large extent upon the provision of facilities for local meetings of its widely scattered members. It is satisfactory to observe, therefore, that the development of the association on these lines is receiving the most earnest consideration of the council. One other point is worthy of special note. In replying to the toast of "Science, Practice, and Technology," Sir Alfred Keogh spoke of the relationship between engineering colleges and industry. It has been alleged—with what degree of truth we express no opinion—that hitherto the colleges have been lacking in their recognition of the practical requirements of modern industries. But, as Sir Alfred Keogh pointed out, the Imperial College of Science and Technology has been established to alter this, and in taking the advice of the great leaders of industry, there can be no doubt that those responsible for the education of the students at that college are proceeding on sound lines. The association, which fulfils a very useful function, is to be congratulated upon its present healthy condition.

Chemical Oxidation as a Process of Sewage Treatment.

NEW YORK COMMISSION AND DR. RIDEAL'S PROPOSALS.

Among the latest reports of the Metropolitan Sewage Commission of New York is one which deals with the proposals of Dr. Samuel Rideal for the adoption of chemical oxidation as a method of treatment of the sewage of that city. The commissioners point out that the object of oxidising New York's sewage, partly or completely, by chemicals would be to remove the excessive demand which the sewage makes on the dissolved oxygen in the harbour water, and so permit the sewage to be discharged into the inner harbour with little or no other treatment.

AERATION AND CHEMICAL OXIDATION COMPARED.

Forced aëration has been suggested for this purpose by various investigators, as it has previously been proposed for other situations, and as it has subsequently been recommended in connection with various biological processes; but aëration (the commissioners observe) is not a process in itself. Its function is not to oxidise sewage, but to supply the oxygen with which the ordinary purifying forces of Nature can carry the oxidising processes forward. Its benefits are slow, for they depend not only upon the rate at which sewage will absorb oxygen, but upon the rate at which the natural purifying agencies will appropriate it.

Aëration is especially useful where the oxygen supply is deficient, for then the rate at which the water will absorb it is relatively high. Water and sewage absorb oxygen at the same rate and to the same extent, and, as has been shown elsewhere, when there is a considerable amount of dissolved oxygen present, it is difficult to add more by aëration or by any other means. Where large quantities of oxygen have to be supplied by aëration, it is necessary to continue the process over a long period of time, or to repeat it at frequent intervals. Either of these alternatives is likely to prove expensive, for the reason that they make it necessary to provide means for keeping the sewage on hand for a considerable period.

Chemical oxidation seeks to eliminate the slowness and inconvenience of the aëration process, and, by aiming directly at the desired re-aëration, to effect a material gain. Unlike aëration, chemical oxidation is a radical form of treatment which involves abrupt interruption in the natural course of self-purification which sewage ordinarily undergoes from the moment it is produced until its harmful properties are rendered inert, and in which living organisms play an important part. Chemical oxidation, by whatever method it is carried on, means a sudden arresting of the natural purifying agencies, a rapid and intense chemical re-aëration between the oxidising agent and the oxidisable ingredients of the sewage and the final discharge of the effluent in a state which is not inimical to the fauna and flora of the natural body of water into which it is emptied. Incidentally, the oxidation produces disinfection, and the disinfecting properties of the oxidising matter in some cases prove to be advantageous. Under other and more usual circumstances, it may prove embarrassing, as, for example, where a large amount of sewage effluent possessing antiseptic properties is discharged into water which is inhabited by fishes.

The use of chemicals to purify sewage is by no means a new idea, although there are apparently no existing large sewage works where chemical oxidation is practiced to serve as an example of the size and arrangement of apparatus needed, and the cost, efficiency and reliability of the process. Nevertheless, considerable help in forming an opinion on the leading difficulties to be overcome can be obtained from the experience gained with certain standard processes of water and sewage treatment, notably the application of basic sulphate of alumina, lime and iron, copper sulphate and hypochlorite.

INTENDED SCOPE OF DR. RIDEAL'S REPORT.

Experiments on the purification of New York's sewage through the electrolytic decomposition of sea water by the application of bleach and by chlorine led the commission, in 1912, to seek the opinion of an eminent expert on chemical questions relating to the purification of sewage and disinfection, and Dr.

Samuel Rideal, of London, was requested to make a report on the possibilities of direct chemical oxidation. . . .

In preparation for his report, Dr. Rideal made a personal inspection of the conditions of sewage disposal in New York Harbour, and visited the commission's office to become familiar through conferences and study with the results of the commission's work. His report is a discussion of the questions assigned to him from a chemical and theoretical standpoint, and makes no claim either to finality or practicability, which he rightly says would not be warranted in "so short a report nor without a prolonged study of the main details, chiefly of an engineering character."

In a letter dated October 3, 1912, the commission requested Dr. Rideal to report on "other ways of oxidising sewage than by biological means—that is, through the use of chemicals. Absence of odour, restricted areas of land, and freedom in the effluent from substances poisonous to fishes should be features of such procedures. It should be remembered also that the process must be applicable to large volumes of sewage—not less than 25,000,000 or 30,000,000 gallons per twenty-four hours, for example. The cost of the treatment, including the purchase of materials, should not be excessive, nor should the process involve expense for pumping. Inasmuch as processes for the chemical oxidation of sewage are not in general use, it will be desirable to give such assurance as is possible that any process suggested can actually be carried out."

In addition to his opinion on chemical oxidation, Dr. Rideal was asked if, in his view, the commission was right in placing importance on the presence of sludge on the harbour bottom as an element making for the exhaustion of oxygen from the water, whether he considered it possible to purify the sewage sufficiently near its points of origin to permit the effluent to be discharged into the inner harbour, and to give his impression of the condition of the harbour as he saw it on his trip from the Battery to Hell Gate on October 2, 1912.

SYNOPSIS OF THE REPORT.

It is Dr. Rideal's opinion that all the sewage produced now and in the next generation in the metropolitan district of New York and New Jersey can be sufficiently purified on properly selected sites near where it is produced to permit of its discharge locally into the waters of the inner harbour without violating any of the provisions of the commission's standard of cleanness. The purification works, he thinks, should be able to remove the unsightly and offensive floating suspended matters of the sewage, and insure that the effluent becomes invisible and inodorous when mixed with the harbour waters. So far as oxidation is concerned, Dr. Rideal thinks that sufficient oxidising treatment should, and can, be given to the sewage to keep the effluent from absorbing more than one-half of the oxygen in the harbour water.

The reagents which are considered available for the oxidation of the sewage are few in number. They include manganates and permanganates, and oxidised compounds of chlorine. The first two would be prohibitively costly. Even the cost of hypochlorite, the cheapest oxidising agent, would be too expensive for use with crude sewage, according to Dr. Rideal's report. It would be necessary to use it as a finisher to the mechanical or bacterial process, which would remove much of the floating suspended matters. Sedimentation basins having from four to twenty hours' flow are suggested to accomplish the removal of the solids, the basins to operate on the principle of septic tanks or sludge-digesting tanks.

In addition to their main function of retaining and digesting the solids so as to reduce the cost of the chemicals, the basins would prevent sludge from forming on the harbour bottom. In Dr. Rideal's opinion, the advantage to be gained in this respect would be of small value, for he does not think that the sludge deposits in New York harbour are as responsible as the liquid part of the sewage in exhausting the dissolved oxygen from the water.

If it was not possible to secure space for septic or

sludge-digesting tanks on land, Dr. Rideal thinks the tanks could be erected in the water along Manhattan Island and elsewhere with the necessary chemical equipments by their side. He suggests that the basins be covered to prevent nuisance. The sludge having attained its main decomposition without oxygen could, in Dr. Rideal's opinion, be discharged into the harbour with no fear of absorbing much oxygen afterward. The effluent should be treated at the outlet by a small quantity of the oxidiser. By the use of such tanks as he proposes, Dr. Rideal thinks that hardly any pumping would be required.

The report contains calculations on the amount of chlorine necessary; and in these due account is taken of the oxygen required by the sewage, the quantity of oxygen which is brought by tidal action into the harbour from the ocean, that which is contributed by the land water from the rivers, and that which is absorbed from the atmosphere. The object of the chemical process would be to supply only enough oxidation to supplement the natural process which proceeds in the harbour.

To completely oxidise the 1,500 million gallons per day of sewage included in the estimates, Dr. Rideal finds that 1,280 tons of chlorine would be required per day. Basing his opinion on experiments made with Philadelphia sewage, the report indicates that New York harbour sewage could be disinfected with a good quality of chloride of lime in the proportion of 27.9 tons for screened sewage and 19.5 tons for screened and settled sewage. In another way, it is calculated that 6 parts per 1,000,000 is the proper dose which is likely to prove effectual.

The chlorine could be added, in Dr. Rideal's opinion, in the form of chlorine gas, bleaching powder, or as sodium hypochlorite produced from an electrolysed solution of sodium chloride. The supply of sodium chloride could be obtained from the harbour water or from a solution of rock salt. Sea water might not be strong enough for practical purposes, its weakness possibly requiring works of too large size. Electric bleach works usually operate with 5 to 15 per cent sodium chloride solutions.

A considerable part of Dr. Rideal's report is devoted to the question of forced aeration as a method of sewage disposal, and the results of various calculations are given to show that it would be impracticable to oxidise New York sewage by this means. At the conclusion, the report recommends that chlorine treatment be given serious consideration along the two following lines: (1) Preliminary screening and sedimentation to produce a non-fermenting sludge which can be discharged into the harbour waters separately without robbing them of any dissolved oxygen, and (2) a chlorine treatment of the clarified effluent to such an extent as will insure the proposed minimum standard of 3 c.c. of dissolved oxygen per litre being maintained throughout the whole of the harbour waters.

THE COMMISSION'S OPINION.

The commission has given careful consideration to Dr. Rideal's recommendation, and as a result does not regard his proposition as affording a practical solution of New York's sewage problem.

Experiments have shown that the amount of chlorine which it would be necessary to apply to settled sewage in order to produce a material reduction in the dissolved oxygen required would be so great, its sterilising effects so powerful, and its odour so penetrating, as to make it probable that the entire harbour would become sterilised, and smell disagreeably of the disinfectant.

Theoretically a powerful oxidising agent, chlorine appears to be capable of producing an appreciable oxidising effect upon sewage only in concentrations which it is impracticable to employ. In moderate concentration it is a poisonous gas easily soluble in water, from which it can be completely driven only with difficulty.

Hitherto chlorine and hypochlorite have been used in water and sewage treatment only as disinfectants, minute doses being usually sufficient to accomplish the desired end. In the arts, chlorine compounds are used extensively for bleaching purposes. There are no works for the chemical oxidation of sewage now operating upon this principle, and it appears impossible to give reasonable assurance that the process suggested can actually be carried out. Used as a disinfectant, the commission is of opinion that chlorine, perhaps, prepared from electrolysed sea water may be found to be of considerable service in dealing with certain parts of New York's sewage.

The cost of oxidising the sewage by means of

chlorine would be excessive, especially in view of the ample provision which would have to be made for the preliminary septic tanks or basins capable of producing a non-fermenting sludge. It is not clear why the fermentation of sludge appears to the author of the report to be a necessary step in the process. If thorough sedimentation could be provided for all the sewage entering the harbour, it would seem, from the commission's researches, to be permissible to dispense with the oxidising process.

The idea of discharging fermented sludge into the harbour is, apparently, contrary to the federal laws which have been enacted for the protection of the navigable channels against shoaling.

CHEAPER HOUSES.

URBAN SURVEYOR'S SUGGESTIONS.

In a paper which he read at a recent meeting of the South-Western Centre of the Sanitary Inspectors' Association at Radstock, Somerset, Mr. G. H. Gibson, surveyor to the urban district council of that town, put forward the following suggestions for the cheapening of houses:—

(1) I think the speculative builder must go for good, so far as working-class property is concerned. He cannot get his money so cheaply by a considerable amount as the local authorities. He cannot afford to leave his money in the property to earn as small a percentage as the local authority, and therefore cannot afford to accept as low a rent.

(2) Local authorities should build their houses by direct labour. Smart managers of large commercial undertakings, such as factories and collieries, keep their own staff of workmen to put up their buildings, and it goes without saying that they have found out that it pays to do so. No builder can possibly live and pay his way without a profit of from 10 to 15 per cent, and nobody can deny that this is anything but a reasonable and legitimate sum. If rents, however, are to be kept down to what the workman can pay, these profits cannot be allowed.

(3) If properly built, eighty years is not too long a period for a housing loan to be extended to. This would ameliorate the unfairness of the man who is living in the house not only having to pay his rent, but also having to pay for the house, a single brick of which will never belong to him.

(4) The rate of interest charged should be lowered. For this purpose the money deposited in the National Savings Bank should be used. In 1912 the total amount in the Savings Bank was £181,699,122, belonging to nearly 9,000,000 people, and averaged about £20 per head. I am not a national financier enough to know just exactly where this money is, but, wherever it may be, I can well believe it is wanted. Well, leave it there, but every year this fund increases. In 1912 it increased by nearly £1,500,000. Why not, in future, until there is a sufficiency of houses, allow this annual surplus to be lent to local authorities for the erection of working-class houses for the people who have mainly deposited the money? This would allow for 7,500 houses to be erected annually at a cost of £200 each. I do not know what it costs to administer the Savings Bank, but I should think not more than 5s. per cent. Make the rate of interest, therefore, £2 15s. per cent.

(5) Exempt local authorities from paying income-tax upon working-class dwellings. Co-operative societies pay no tax, because, I think, it cannot be proved that their members, as a whole, have an income that exceeds £160 each year. It could, I think, easily be established in the case of the ratepayers, as a whole, to whom the houses built by all local authorities belong, that their income is much short of £160.

(6) Make the rating easier. In 1869 the Poor-rate Assessment and Collection Act was passed, allowing the owner of a dwelling-house situate in the provinces to obtain a 30 per cent reduction on rates upon a house not exceeding £8 in rateable value, where let to a *bona-fide* tenant. Within my own recollection and experience, many houses in country towns which were formerly let at £8 a year will now command £10 and £12, and it would only be fair, having regard to the increased cost of building, that the minimum for compounding should now be raised to cover a rateable value of £12.

Royal Sanitary Institute.—The Housing and Town Planning Act and its application to Southampton will be discussed at a meeting of this body to-day at Southampton.

New Public Offices, Harrow-on-the-Hill.

The building illustrated herewith, the architect of which is Mr. Henry Prince, A.R.I.B.A., 19 Old-square, Lincoln's-inn, W.C., is an extension of the old public offices, and is built on a strip of ground next to the latter, necessitating the pulling down of some cottages standing on the site. The old building, which has been retained, includes the fire station on the ground

round the window opening, and the plinth, cornice, &c., in Portland stone. A feature of the front elevation is the cast-lead rain-water pipes and heads.

The roofs are covered with red tiles, the roof to the front elevation being surmounted by a small fleche of oak with copper dome. A yard for fire drill has been formed off Byron Hill-road.

HARROW-ON-THE-HILL PUBLIC OFFICES: BACK ELEVATION.

floor. The rooms on the first floor and in the basement have been altered to suit the needs of the new scheme.

The main front faces the High-street, while the back and side elevations face Byron-hill. The walls are built with purple bricks, with lighter-coloured bricks

riched plaster ceiling. Other rooms on the first floor are the clerk's private and general offices. The rooms on this floor in the old building have been reconstructed, and now form the surveyor's private, general and drawing offices. The building cost £5,400 to erect.

BASEMENT FLOOR.

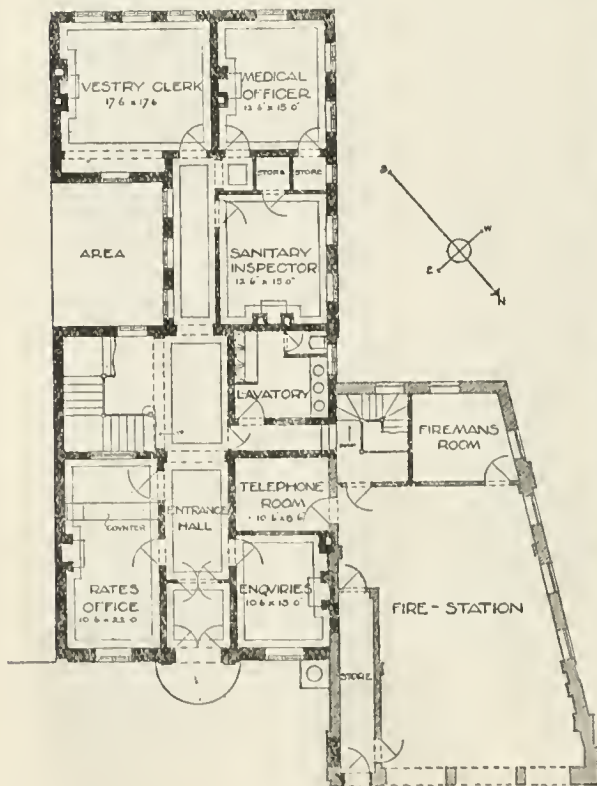

On the basement floor are the caretaker's rooms and two strong-rooms. The basement to the old building has been reconstructed, and includes a new pay-room, heating chamber and bicycle store. A new staircase has been formed in the old building, giving access to the basement from the fire station and the new offices.

GROUND FLOOR.

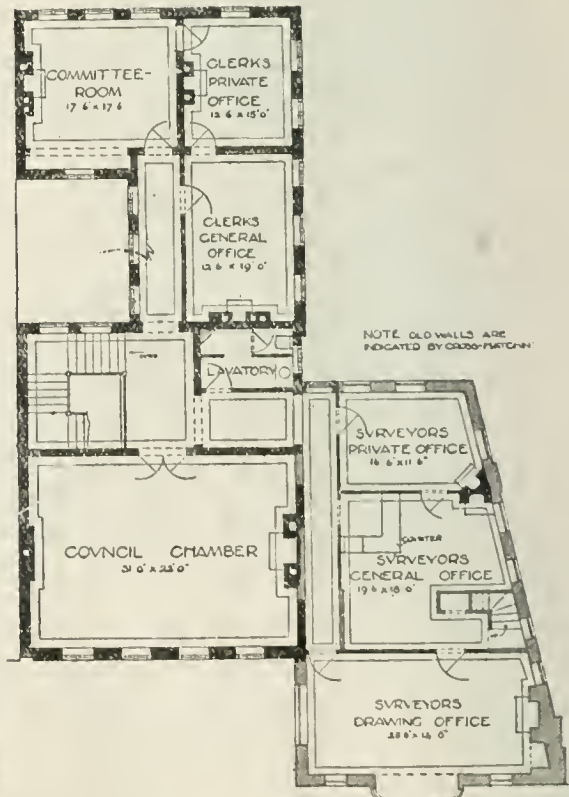

The main entrance to the new offices is from the High-street. On the ground floor are situated offices for the rate-collector, vestry clerk, medical officer and sanitary inspector, also a room next the entrance for inquiries, and a new telephone room for the use of the fire brigade. The main staircase, leading to the first floor, is placed in the centre of the building.

FIRST FLOOR.

The whole of the front of the building is occupied by the council chamber. The windows of the room overlook the High-street. It is panelled in Austrian oak, and has a coved ceiling enriched with ornamental plaster work. This room, which measures 31 ft. by 22 ft., is ventilated by means of an electric fan fixed above the circular grille in the ceiling. The committee room is panelled in American white wood, and has an enriched plaster ceiling.

CANALS DEVELOPMENT.

PROPOSED WATERWAYS BOARD.

On Tuesday, at the Board of Trade offices, Mr. J. M. Robertson received a deputation from the Waterways Association to urge the Government to give effect to the recommendations of the Royal Commission by appointing a Waterways Board to consider the question of the acquisition by the State of the canals on what is known as the "cross" route.

Mr. Neville Chamberlain, the chairman of the association, stated that their proposals comprised three distinct and separate stages, but it would be a mistake to suppose that, having got through the first stage, it was absolutely necessary to go on to the second or third stage. Each stage was independent of the others, and it would be possible to stop at the first or the second without necessarily completing the scheme in all its stages. The first stage was the appointment of a Waterways Board; the second the acquisition of the canal system of the country by the State through the medium of the board; and the third was the improvement of the

Government intervention it would justify action. The State was the only body that could unify the existing ownerships. The proposed Waterways Board would not consist of more than five members, but they should be men who had special knowledge of the subject, and who could act as a board of technical advisers to those by whom the canals could be controlled. The board might be responsible to the Development Commissioners and to the Board of Trade, but that was a point on which they did not presume to offer an opinion. The acquisition would be a simple matter, and might be carried through in somewhat the same sort of manner as the Port of London Authority was constituted. He did not see why there should be any difficulty in getting the various companies to agree to the purchase, but if an agreement could not be arrived at, then there would be

COMPULSORY ARBITRATION

As to the price, he took it that that would be fixed in a certain number of years' purchase of the nett earnings of each company. He thought it would be safe to assume that the capital that would have to be invested by the State would not exceed £6,000,000. Waterways stock could be issued to the existing holders, whose stock would be cancelled, and the interest in the new waterways stock could be guaranteed by the State. The earnings through tolls would go to pay the interest. They did not desire to see the third stage commenced until the first two had been carried out. They had received sufficient information to say that there was likely to be very generous support on the part of local authorities to any demand for assistance. Traders in this country suffered very considerably from Continental competition. Their competition had specially benefited by the money spent by their respective Governments on the improvement of waterways; but in this country the canals were left just as they were 100 years ago, and traders had been handed over to the tender mercies of the railway companies, who were totally unable to deal with the mass of traffic, who had continually tightened up their restrictions and raised their rates. They thought the time had come when the Government should do something to assist the waterways in taking their proper place in the transport system.

Mr. Robertson having promised to lay before the President of the Board of Trade, Mr. John Burns, the views which had been expressed, the deputation withdrew.

HARROW-ON-THE-HILL PUBLIC OFFICES: FRONT ELEVATION.

system so acquired to a reasonable standard of efficiency. Seventeen and a-half millions was the capital sum which it was estimated would be required for the improvement of the waterways to what was known as the 100-ton standard—they did not suggest that so large a sum should be spent before suitable experience had been acquired. What they were asking for was only that a Waterways Board should be appointed, and that from that point they should proceed step by step, and not that the whole scheme should be carried out at once. He pointed out the difference in the carrying capacity of the canals in the North of the country as compared with those in the South, and said that in the report of the Royal Commission there was a large amount of evidence as to the difficulty of obtaining through tolls. That was to a considerable extent due to the fact that so many canals or portions of canals were owned or controlled by railway companies. The

MULTIPLICATION OF AUTHORITIES,

and especially the ownership by railways of certain sections of canals, was one of the principal causes why our canals had remained in their present stagnant and ineffective condition. Unification was so important that if that alone were the result of

houses, with scullery and bathroom; ten two-room and kitchen houses, with scullery and bathroom; and the remainder of a larger class of house. The estimated cost is £13,000.

Adjustment of Public Works.—Answering a question in the House of Commons on Tuesday, Mr. Herbert Lewis stated that, although the Local Government Board had in times of exceptional distress from want of employment issued circulars to local authorities to urge the putting in hand of public works, and had on various occasions emphasised the desirability of regularising employment as far as possible, they had not taken direct and formal action so to adjust such works as to regularise the demand for labour in recurring periods of good and bad trade. The practicability of doing this would, however, be examined by the committee which the Government were appointing.

EASTER HOLIDAYS.

Owing to the necessity of going to press earlier than usual, news and advertisement matter intended for insertion in next week's issue of "The Surveyor" must reach us not later than Wednesday morning, April 8th.

Institution of Municipal and County Engineers.

SOUTH-EASTERN DISTRICT MEETING AT TUNBRIDGE WELLS.

A successful meeting of the South-Eastern District of the Institution of Municipal and County Engineers took place at Tunbridge Wells on Saturday last, those present including Messrs. W. Banks (Rochester), H. W. Bowen (West Sussex), hon. district secretary, J. H. Brierley (Richmond, Surrey), T. A. Busbridge (Maidstone), E. R. Capon (Epsom), R. Chart, junr. (Croydon), A. Dryland (Surrey), W. H. Grieves (Sutton, Surrey), P. Harris (Tunbridge Wells), P. E. Harvey (Worthing), W. Hosken (West Sussex), W. H. Maxwell (Tunbridge Wells), B. A. Miller (Seaford), P. H. Palmer (Hastings), T. A. P. Phillips (West Sussex), J. L. Redfern (Gillingham), F. W. Ruck (Maidstone), H. H. Scott (Hove), G. M. Seels (New Malden), H. S. Wood (Brighton), and W. E. Woollam (East Grinstead).

Assembling at the town hall shortly before mid-day, the members were received by the Mayor (Councillor C. W. Emson, J.P.), who, in an allusion to the duties and responsibilities of municipal engineers, said they thoroughly justified their existence by the work which they undertook. Mr. Maxwell, the borough surveyor of that town, was a man whom they all very highly appreciated, and the short statement as to the engineering features of the district which he (Mr. Maxwell) had prepared for their information would, he thought, be of interest to them. His Worship added that he did not think there was another town in the kingdom that had a purer water supply than Tunbridge Wells, while in the matter of drainage they had arrived as near perfection as possible.

Mr. A. DRYLAND, district chairman, moved the accordancy of a vote of thanks to his Worship for his kindly welcome and the appreciative remarks he had made with regard to their profession. It was a profession which they thought did great work for the public, and they were always delighted when they found their activities were appreciated by those who presided over public bodies. They were very glad to have an opportunity of visiting such an interesting town as Tunbridge Wells, and they were greatly obliged to Mr. Maxwell for the trouble he had taken in arranging the gathering and enabling them to inspect the works he had carried out and had in hand.

The vote of thanks was passed with acclamation.

THE DOVER MEETING.

Reference was made to the arrangements for the meeting of the institution which, as announced elsewhere in this issue, is to be held at Dover on Saturday, May 9th, and the hope was expressed by the chairman that the gathering would be well attended by members, not only of the South-Eastern, but other districts. It was intimated by the hon. district secretary that Mr. A. T. Walmisley, of the Dover Harbour Board, Mr. W. C. Hawke, the borough engineer, and Mr. P. C. Tempest, of the South-Eastern Railway, were doing all that was possible to make the meeting a success.

The chairman next stated that, in addition to preparing a statement regarding the various municipal works of the borough, Mr. Maxwell had consented to read the following short paper on the question of roads.

HAVE BITUMINOUS METHODS OF CONSTRUCTION SOLVED THE MODERN ROAD PROBLEM?

By W. H. MAXWELL, ASSOC. M. INST. C. E.,
Borough Engineer of Tunbridge Wells.

For a decade past the doctrine of bituminous methods of construction has been both preached and practised almost universally throughout the country, and applied, antidotally, against certain well known evils alleged to have arisen owing to the use of high-speed mechanically propelled traffic on highways. It can therefore scarcely be said to be in any way premature to expect that some general and yet fairly definite conclusions should now be formulated with reference to the advantages or otherwise of these methods of road making and maintenance.

In the great majority of cases, where the traffic is insufficient to justify the expense of granite, wood, or asphalt paving laid on a concrete foundation,

apart from special proprietary and more or less improved processes, little choice remains except as between a granite macadam surface and one formed of one or other of the various bituminous methods in which the presence of coal-tar and pitch is the distinguishing feature.

The bituminous methods include tar-macadam as used in some parts of the country for probably half a century or more, pitch-grouting of recent experimental notoriety, tar-binders, and various other forms, all having for their main object the exclusion of water from the crust of the road. Tar-painting, although not a process of construction, is an important factor in the matter of maintenance, and may be looked upon as a useful step towards the waterproofing of road surfaces. Its adoption has introduced what is practically a new department in the administration of the work of highway maintenance.

Tar-macadam has long proved to be a very serviceable material when laid in suitable situations and under favourable conditions, but its successful application requires careful discrimination. Its cost is generally fairly high, owing largely to the difficulty of obtaining a cheap and suitable aggregate from which it can be prepared. Almost every class of stone has been experimented with in this connection, but among the most largely used materials are slag, Kent ragstone, and Quenast stone, all broken to the required gauge. If the aggregate selected is too soft much wear and dust is naturally formed. If too hard the tar does not satisfactorily combine with the stone to produce a good, well-bound surface when laid.

Slag varies considerably, and much care is needed in the selection of suitable material, but the point is one of some difficulty, as large demands upon the available supplies have been made of recent years. Tar-macadam made from unsuitable slag is very liable to disintegrate, and thus involve frequent resurfacing.

Kent rag tar-macadam may be employed as a bottom layer supporting a wearing coat of slag tar-macadam, or an armouring of asphalt.

The writer has also experienced good results from Quenast stone, but very few of the harder classes of stone are suitable for the purpose.

In all cases, and especially in the case of slag, it is advisable, where facilities exist, to buy the aggregate unmixed in order that its quality can be more readily detected, and subsequently to carry out the drying and mixing process at the local public works depot.

Some disadvantages commonly experienced in the use of tar-macadam are:—

(1) That it cannot be satisfactorily laid and repaired during wet and cold weather.

(2) It will not withstand heavy traction engine traffic for a considerable period after it has been laid.

(3) At all times it is liable to soften slightly under hot sun to an extent sufficient to admit of damage by heavy traffic.

(4) It is liable to creep during a hot summer towards the sides of the roadways, especially on country roads, where the lateral support of a kerb and footpath is not available. Some provision to meet this tendency must usually be made.

(5) Its cost is, as a rule, considerably beyond that of a granite macadam tar-painted surface, and its useful life cannot always be so accurately predicted.

But notwithstanding all the difficulties which may be enumerated, much successful work of this description has been carried out, and every case must be carefully considered on its merits, with special reference to local traffic situation and conditions of the site.

The official figures of cost given in the Road Board interim report (January, 1913) for different classes of tar-macadam and for pitch-grouted macadam are as follows:—

Kent rag tar-macadam, $3\frac{1}{2}$ in. finished thickness, 2s. 8d. per square yard.

Selected blast-furnace slag tar-macadam, 3 in. thick, 3s. 3d. per square yard.

Selected blast-furnace slag tar-macadam, 4 in. thick, 3s. 8½d. to 4s. per square yard.

Blue Guernsey stone tar-macadam, 4 in. thick, 4s. 1d. per square yard.

Single pitch-grouted macadam, 3 in. thick, 4s. 1d. per square yard.

Double pitch-grouted macadam, 4½ in. thick, 5s. 7½d. per square yard.

So far as the writer's observations have gone, pitch-grouting has not yet manifested any superiority over good-class tar-macadam, well laid, and it has been frequently noted that its serviceable life is not great, also that deep corrugations quickly appear in the newly formed surface, making motoring, even at the most moderate speeds, an unpleasant experience. The surface, too, during wet weather, often carries much slippery black mud.

The work involves the use of a considerable amount of rather cumbersome and highly depreciative plant, which not infrequently causes inconvenient obstruction on narrow highways.

An absolutely sound and uniform foundation is indispensable for all well-made roadways, and this is particularly true in the case of bituminous road crusts, which are necessarily of a yielding and more or less plastic nature.

Where the old macadam road surface is used as a foundation for the bituminous coating, the surface should be first lightly scarified all over and consolidated by rolling to a uniform face before the tar-macadam or other material is laid. If this precaution is neglected, the old inequalities and potholes in the road crust will soon reappear on the surface of the new bituminous coat.

Amidst the present popularity of bituminous methods, as the writer has often previously pointed out, the fact should not be lost sight of that a thoroughly well-made first-class granite macadam road surface subsequently coated with refined tar and granite chippings is free from many of the drawbacks appertaining to most of the bituminous methods. When laid on a good foundation, and tar-painted annually, a good, rigid contour is usually maintained free from the fatal defects of deep, wavy corrugations, so characteristic of some bituminous processes. Tar-painting by hand is more satisfactory, from many points of view, than machine work, and, in the writer's experience, this treatment reduces the annual expenditure on road metalling, and certainly minimises the amount of road dust.

Although bituminous methods have contributed more largely towards the waterproofing of road crusts than almost any other process, and form very serviceable surfaces in many situations, it cannot be claimed, in the writer's opinion, that this mode of construction solves the road problem, as has been so often advocated. On the contrary, it is eminently unlikely there can ever be any universal solution to such a problem, inasmuch as local conditions and requirements, character and extent of traffic, local facilities of obtaining suitable materials, considerations of cost and the like, must always constitute deciding factors in arriving at the most satisfactory mode of treatment in each particular case.

Fast travelling motor omnibus and char-à-banc traffic, motor vehicles and tractors for the delivery of goods have unquestionably a very destructive action on road surfaces, and, in view of the rapid growth of this class of traffic, the problem of maintaining public roadway surfaces within reasonable limits of expenditure, is one of ever-increasing difficulty to highway authorities.

DISCUSSION OF MR. MAXWELL'S PAPER.

The CHAIRMAN (Mr. A. Dryland), in moving a vote of thanks to Mr. Maxwell, said the subject dealt with in the paper was one in which they were all interested in a greater or less degree. A great deal had been said and written upon it for a long time past, but he thought they would agree with the assertion of the author that there was no absolute panacea for all the evils with which they were confronted; as had been said, each particular problem had to be dealt with by itself. There was no special system suitable for all situations and all kinds of traffic. He thought Mr. Maxwell's experience with pitch-grouting was very much the same as that of most of them. While undoubtedly it did make a crust of considerable strength, it had some disadvantages, greater in some respects than was the case with other methods—one being corrugation. That might not matter much on roads with slow traffic, but it did on roads with fast traffic, for, besides

restricting the speed of vehicles passing over it, it tended to its own destruction. So it could not be an economical proposition. There was no doubt that to-day in certain situations and under certain conditions a good water-bound macadam road, tar-painted, was the most satisfactory method. He had roads of that character on the open downs—almost perfect roads of their kind—but now that he had motor buses running over them he "had doubts," for after traffic exceeded a certain limit there came a time when a method ceased to be economical. In the summer-time there was no difficulty, but continuous heavy traffic passing over a road during a long spell of wet weather resulted in the surface beginning to chum up. One did not get out of the road quite the results one wanted, and it became necessary to coat the tarred macadam, and adopt even more expensive forms of reconstruction than that. After all, the great secret of success with all roads carrying fast traffic was waterproofing, and unless one could get a surface that would exclude the water, even in the winter time, it was not possible to get a perfect road. That was one of the advantages of slag as compared with ordinary tar-macadam—it did preserve a waterproof surface during the winter. He had had a very favourable experience of slag tar-macadam. He was sorry, for many reasons, that they had not had more success with granite tar-macadam, but his experience with it had been very limited. A few years ago he laid a number of lengths of it between lengths of slag tar-macadam, and the latter was very much better to-day than the other, largely perhaps owing to the fact that the slag kept so much more waterproof.

Mr. H. W. BOWEN (West Sussex), seconding the vote of thanks, pointed out that while Road Board returns gave them the cost of different forms of construction, they said nothing as to where the particulars were obtained. He thought it was somewhat misleading that the localities should not be specified. For instance, in the Midlands, where one was close to the quarries, and works from which the slag was obtained, the cost of materials must be very much lower than in the Southern counties. On one occasion when his chairman heard a county surveyor speak of having constructed roads at so much per mile, he wanted to know how it was they were so extravagant in West Sussex. But in the county in which the work in question was done, stone was delivered direct on to the roads at from 7s. to 11s. per ton, as against from 16s. to 17s. per ton in his own county. The chairman had observed that a water-bound road, tar-painted, was one of the best roads that one could put down under some conditions. The conditions had, of course, changed in recent years. On nearly every road in his county they had a large amount of motor traffic, and their greatest difficulty was to keep the roads together before they were tar-painted. Another trouble was the lack of abutments on country roads, and the method he had adopted to overcome that was to excavate the roads on each side and put in boulder flints, which acted as part and parcel of the roads, and did duty as a sort of kerb. When engaged in carrying out road works and having no possible means of diverting the traffic they had found with these abutments that there was not so much trouble with lateral movement.

Mr. P. H. PALMER (Hastings) stated that he had obtained from macadam roads twice tar-painted far more satisfactory results than with tar-macadam roads.

Mr. W. H. GRIEVES (Sutton, Surrey) said there was no doubt that everything depended on the position and the traffic the roads had to carry. He had tried several of these special kinds of road construction, and he, too, had yet to obtain any very satisfactory results from granite tar-macadam. The best material he had so far found was Rocmac. That could be laid in almost any weather, even frosty weather, though it was not wise to put it down during very wet periods. He had laid it on the main road from London to Brighton, and he knew of no material that gave a better result on a hill. It was not absolutely free from dust. One got dust from it in a dry time, more in the second than in the first year, but it was absolutely free from mud, when on the ordinary water-bound roads they had the sweepers and scrapers at work. Another material from which he had obtained good results was Mexphalte, a half mile of which he had laid some fourteen or fifteen months ago on the main road of which he had spoken. That was made on the site, and put down at a temperature of over 200 degrees, and up to the present time it had stood most excellently. On that section

of road they had put in abutments of creosoted deal 3 by 2, and he had found that these answered very well. Still another method which he had tried in his district was putting on a carpet of Roadant, 1 in. in thickness, on an ordinary water-bound road. The effect of that was wonderful, for several business-people with premises on the road on which the work was carried out had told him that whereas vibration from traffic had previously been very bad it had now entirely ceased.

Mr. T. A. BUSBRIDGE (Maidstone) said he assumed from the suggestion of Mr. Maxwell as to the employment of Kent rag bottoming with a topping of slag, that the slag was superior in wearing qualities to the Kent rag. He had, however, had considerable experience of both materials in an untarred condition, and he had found that the Kent rag was by no means inferior to the other. He would like to know whether it was Mr. Maxwell's personal experience that slag was better.

Mr. F. HARRIS (Tunbridge Wells Rural) said he could recommend everyone to experiment with ragstone, for they would find it satisfactory. He was quite certain it was good enough to carry any traffic.

Mr. E. R. CAPON (Epsom) said he had a good deal of experience with both slag and limestone tar-macadam in his district. The cost was practically the same, but he much preferred the slag. He thought they were inclined to make a mistake when they spoke about a stone absorbing tar. When it did that to any considerable extent it was proof that it was too soft. It would seem that slag had an affinity for tar that other materials did not possess, and his belief was that it was the finest material for roads they had.

The vote of thanks was carried.

Mr. MAXWELL, in the course of his reply, said his view was that Kent ragstone was a very suitable material under many conditions. He had used it under different conditions, but so far as roads bearing very much traffic were concerned, he had to admit that he was not very much impressed with it. For a side road with light traffic it made a good wearing surface, but it had been his experience that slag made a very much more durable road. If one broke up a slag tar-macadam surface one would notice that the slag and tar seemed to have consolidated in one crust, but he did not think quite the same thing would be observable in a Kent rag tar road.

Before the close of the proceedings Mr. J. H. BRIERLEY (Richmond, Surrey) pointed out that the discussion had shown how everything depended on the nature of the traffic, and so forth. When they had presented to them various details as to cost they did not convey much, and he desired therefore to know whether it would not be possible to make arrangements for a collection of statistics which might be mutually helpful to all engaged in the construction of bituminous roads.

The CHAIRMAN said he agreed that the tabulation of such information would serve a useful purpose, for it was important if any comparisons of cost were to be made that all the circumstances should be known if they wished to avoid falling into error. He suggested that Mr. Brierley should bring up the question at the next meeting of the executive in order that steps might be taken to obtain figures.

THE MUNICIPAL WORKS OF TUNBRIDGE WELLS.

In his description of the various municipal works of Tunbridge Wells, Mr. Maxwell, after mentioning that the area of the borough was 3,991 acres, the population 36,000, or including the "water area," about 40,000, the rateable value £309,928, and the rates, including district, borough, education and poor rates, 6s. 1d. in the £, went on to refer to the

WATER SUPPLY.

The area of supply consists of a circle of 6 miles in diameter. The sources of water consist of twelve springs, and deep borings into the Ashdown sand rock, which is overlaid by about 185 ft. of Wadhurst clay. The daily supply varies from about 1,000,000 to 1,500,000 gallons per day according to the season. The character of the water is soft, and of the highest purity.

Filtration consists of open sand beds and Candy oxidising mechanical pressure filters, the latter, it was pointed out, being specially adapted for the removal of iron from the deep well supplies.

There is an open storage reservoir of 42,000,000 gallons capacity, and a clear-water reservoir of 200,000

gallons at the waterworks; also a high service reservoir of 900,000 gallons at Blackhurst, near the eastern boundary of the borough.

From one bore well water is raised by an air lift capable of discharging from 25,000 to 30,000 gallons per hour from a depth of about 90 ft. to 120 ft. The pumping machinery consists of steam-driven deep-well pumps, centrifugal pumps to filter-beds, compressor engines for the air lift, an 80-h.p. oil engine for deep well pumping, two compound rotative beam engines jet condensing, and two triple-cylinder compound inverted direct-acting rotative surface-condensing engines for pumping to the high-service reservoir.

There are four Lancashire boilers, 30 ft. by 7 ft. 6 in., with Sugden superheater.

Electric light has been installed throughout the works.

Bore wells recently sunk are 336 ft. deep by 3 ft. 6 in. overall diameter at the top, lined with cast-iron tubes in 12-ft. lengths, through 185 ft. Wadhurst clay and 151 ft. Ashdown sand.

SEWERAGE AND SEWAGE DISPOSAL.

The borough is divided into three watersheds, or drainage areas, two being drained by gravitation outfall sewers of 5 ft. and 5 ft. 6 in. diameter respectively, and one to a sewage pumping station. The depths of the sewers vary up to a maximum of about 66 ft., the district being of a hilly character.

Sewage disposal is by means of broad irrigation on two sewage farms of 386 acres in area, with the assistance of percolating bacteria beds at one farm. About thirty-five horses are kept at one farm for town work.

The sewage pumping station is provided with four gas engines, and sets of three-throw plunger pumps capable of raising 60,000 gallons per hour through 135-ft. lift. The rising mains are 9 in. and 12 in. diameter.

ROADWAYS.

The total mileage of roads is about 50, of which 8½ miles are main roads. The gradients, in some cases, reach a maximum of about 1 in 10. Tar-painting has been carried out for many years past, and a length of slag tar-macadam was laid in the St. John's-road seven years ago, when a considerable widening of this thoroughfare took place at a cost of about £7,000.

The public works depot adjoins the S.E. & C.R. goods station, and is accommodated with sidings for delivery of materials. Here also are stabling for about twenty horses, stores offices, three weighbridges, stone-breaking machinery, tar-macadam mixing plant, storage for steam rollers, fitters', blacksmiths', carpenters' and painters' workshops, waterworks fitting and testing shop, and other municipal services.

ELECTRICITY WORKS.

These adjoin the public works depot, and were opened in 1895. The system adopted is high-tension, single-phase, alternating current, periodicity 67.5, with transformer sub-stations and distributing low-tension mains. The voltage is 220. The charge for lighting is 4½d. per unit, and for heating, power and cooking 1d. per unit.

GENERAL.

A quarry at Sevenoaks is worked by the corporation for the purpose of providing stone for roadways of medium and light traffic, and gravel for paths, and so forth.

There are three recreation grounds having a total area of 18 acres.

Both open-air and indoor baths are provided by the corporation. The indoor baths have one large swimming bath, 90 ft. by 35 ft., fifty dressing boxes, and sixteen slipper baths.

A technical institute in Monson-road, which was erected by the corporation, was opened in 1902. The cost, including equipment, was about £19,944.

A sanatorium, accommodating about sixty-five patients, is situated on high ground at Frant Forest, 1½ miles from the town, and is surrounded by about 7 acres of land.

The Grosvenor Bridge, crossing the S.E. & C.R. goods sidings and main line, was built by the corporation, and opened in 1883. It is a steel-girder bridge, with a wood-paved carriageway. The High-street bridge, over the S.E. & C.R. main line and passenger platforms, was rebuilt in 1906-7 jointly by the corporation and the S.E. & C.R. Company at a total cost of £15,000. A substantial street improvement and widening was at the same time secured. Owing to the very limited headroom available, considerable difficulty was experienced in suitably arranging the levels of the various approach roadways, and with relation

to the floor levels of adjoining properties. The carriageway is paved with "Acme" Jarrah blocks on concrete.

The borough cemetery consists of 28 acres, and is situated at Frant Forest, $1\frac{1}{2}$ miles from the town. A new portion is now about to be laid out, drained, and a new waiting-room, offices, &c., provided.

The Calverley-parade property was acquired by the corporation in 1895, at a cost of £20,600, for the purpose of new municipal buildings, and for the widening of Mount Pleasant-road, this latter work having been completed in 1901.

The public health offices are situated at the Calverley-parade, and a well-equipped municipal laboratory is also provided.

The Tunbridge Wells and Rusthall Commons are under the management of a body of conservators, and comprise an open space of great natural beauty of 249 acres in area.

Mr. P. H. PALMER asked, with reference to the statement that the daily supply of water varied from about 1,000,000 to 1,500,000 gallons per day, whether that was the daily supply from the various springs and boreholes or the consumption. [Mr. MAXWELL: The consumption.] Was that due to the fact that they could not get more? He was in a similar district, and he knew that the summer yield was very much less than that of the spring and autumn.

Mr. MAXWELL said they had no difficulties in that connection. There was no fluctuation in consumption. So far as the underground sources of supply were concerned, there was a fluctuation of water within a range of 50 ft. of depth, but they always obtained as much as they required, with a very large margin over. From one borehole, 15 in. in diameter, they were able to draw at a rate of 40,000 gallons per hour.

The CHAIRMAN (Mr. Dryland) said he saw that Mr. Maxwell had a tar-macadam plant, and some figures regarding the cost of working that would be of interest to the members.

Mr. MAXWELL said he had not the figures available at the moment.

Mr. W. H. GRIEVES (Sutton, Surrey) asked what was the consumption of water per head per day. He supposed that in a place like Tunbridge Wells it was rather high.

Mr. MAXWELL said the figure was 21 gallons. That could not be regarded as a high figure, considering that a large quantity was used for gardens and so forth, and included all municipal purposes. A close lookout, however, was kept on leakages in mains and elsewhere. Answering other questions, Mr. Maxwell said the upkeep of the baths involved something between a 1d. and $1\frac{1}{2}$ d. rate. The sanatorium was built about eighteen years ago, but he could not supply off-hand any figures as to cost. A 1d. rate produced about £1,150.

During the afternoon the members made an inspection of the corporation waterworks, electricity works and depot, being subsequently entertained to tea by the mayor.

Public Authorities and Tarco.—Tenders for the supply of Tarco for surface spraying, and Bi-Tarco for the construction of improved tar-macadam, have been accepted by the corporations of Ossett, Bexhill, Birkenhead, and Tenterden, and the Kendal Urban District Council.

Road Tarring in St. Austell.—During last year a large proportion of the roads in the St. Austell Urban District were sprayed with tar, and generally speaking, says the surveyor to the council, Mr. E. D. Groves, in his annual report, the treatment was very effectual in keeping down the dust and preventing the road surface from breaking up during the dry season. Where, however, the traffic was especially heavy, the face of the tar was soon broken, causing an objectionable mud to form on the surface. Mr. Groves adds that where tar-spraying has been done on slight gradients it has been found to be slippery for horse traffic at certain periods. Referring to ordinary tar-macadam, the surveyor says: "I am very doubtful of its success under heavy traffic. Tar is sensitive to weather conditions, and, having a low melting point, flows in hot weather, or becomes very soft, and the traffic moves the metalling. When the road surface is fractured and broken by the traffic the tar loses its nature, and becomes hard and brittle in cold weather; and the wet gets into the road and causes it to break and churn up."

ELECTRIC LIGHTING FOR COTTAGES.

THE WEDNESBURY EXPERIMENT.

The scheme of the Wednesbury Corporation for the supply of electricity to small houses and cottages was the subject of an address given last week by Mr. W. Fennell, engineer and manager of the Wednesbury electricity department, to the Birmingham members of the Institution of Electrical Engineers at the Birmingham University.

Mr. Fennell said electricity had for so many years been looked upon by the public—and even by electrical engineers themselves—as a very convenient but rather expensive form of lighting, that it required considerable imagination, even to-day, to contemplate the installation of electric light in hundreds of cottages inhabited by the poorest people, and rented at, say, 3s. to 4s. a week. It might be said that while electric lighting would confer great benefits upon the tenants of cottages by supplying a healthy light which would not vitiate the air in already overcrowded rooms, it was not reasonable to suppose this could be done profitably at a cost within the means of the consumer, and that any such proposal was doomed to failure, if only on the ground that such tenants were unreliable as well as careless, and would not properly use or appreciate the supply.

It might be well to set out the reasons that led to the consideration of the question. Wednesbury, like many Midland towns, was not an attractive residential area. The richer people, for the most part, lived outside, and the workers formed nine-tenths of the population. In developing the demand for electricity on the usual lines most of the larger houses and shops were soon connected. Reduced rates for licensed premises brought almost all those houses on the mains, and the smaller shops followed when a free wiring scheme was introduced. But not even free wiring coupled with the rateable value system of charge, or slot meters, induced the £8 to £18 householder generally to take a supply of electricity. With those small consumers, the convenience of gas for cooking and the cheapness of the apparatus was greatly in its favour. That class of consumer would not, as a rule, use both electricity and gas, and had no money to spare for the purchase of expensive cooking stoves. It was therefore useless to expect to make much headway until cheap electric cooking apparatus could be offered. It appeared that the limit of the lighting demand was being reached.

ENGINEERS AND COMPETITIONS.

IRISH INSTITUTION'S ACTION.

The following letter from the Institution of Civil Engineers (Ireland) was read at the meeting of the Belfast Rural District Council held recently:—

"The council of the above engineering society have had their attention drawn for some time past to a practice which exists among local authorities of inviting by advertisement engineers to submit in competition with others their terms of preparing plans and proposals of certain engineering schemes, accompanied, then or perhaps at a later stage, by estimates of the cost of the works proposed. In the opinion of the council such a proceeding is very undesirable in the best interests of the public authorities themselves, and is derogatory to the engineering profession. The council desire to express emphatically the repugnance with which they regard the practice in question. They have every confidence that the members of the institution will support them by declining to respond in any way to such advertisements as those. The council have informed the Local Government Board of their action in making this communication."

Cost of Leeds Strike.—At the Leeds City Council on Wednesday it was reported that the recent municipal strike had cost the city £112,000.

Housing and Town Planning Conference.—A conference of local authorities of Greater London was held at the Westminster Palace Hotel on Wednesday under the auspices of the National Housing and Town Planning Council, to consider practical town planning administration. Forty councils were represented, and of these about thirty already have town planning schemes under contemplation or in various stages of progress.

The Road Board General Directions and Specifications Relating to the Tar Treatment of Roads.

THEIR BEARING ON ROAD CONSTRUCTION AND MAINTENANCE.

By JOHN HUTCHINSON.

It will doubtless be quite satisfactory to the Advisory Engineering Committee who prepared for the Road Board the specifications three years ago, to know that the president of the Southern District Association of Gas Engineers and Managers, in his inaugural address at the meeting on March 12th (*The Surveyor*, March 20th), declared that the specifications had "been of some assistance." To appreciate fully the weight to be now attached to such an expression of opinion, coming as it did from one of the leading men in the gas and tar world (Mr. Thomas Glover, Norwich), we must go back to the time when those same specifications were regarded with a not too friendly eye. The editor of *The Journal of Gas Lighting*, issue of February 27, 1912, wrote as follows: "These specifications have been the subject of a good deal of criticism on the part of gas managers and tar distillers; but the criticism has been to some extent mutually destructive, because gas managers and tar distillers seldom hold identical views on such matters."

Gas managers and tar distillers had hitherto worked with a free hand, and it is not to be wondered at that they felt at first disposed to resent any restraint or control being imposed upon the products of their works.

I gather from that part of the president's address which dealt with tar and the treatment of roads that at the time the address was prepared Mr. Glover had not seen the second (and revised) edition of the specification, otherwise he would hardly have suggested that "Adherence to the Road Board Specifications would appear to mean the exclusion of many such tars, so reducing the source of supplies, with a consequent rise in prices." Whatever limitations were imposed (as a fact they were only suggested) in the first edition, it would now appear that the revised edition, as regards tars Nos. 1 and 2 and pitch, has been prepared with a view to be as broad and liberal as possible. One instance of this may be given, the amount of free carbon formerly with maximums of 16 and 18 per cent in tars Nos. 1 and 2 are now given a range of 12 to 21 and 12 to 22 per cent.

To refer once more to that portion of Mr. Glover's remarks which has reference to the title of this paper, it must be noted that the president gives evidence of "research" in his investigation of the properties which he deemed essential in tar-binders. His views on the necessity for a "standard of viscosity and adhering to that standard," which coincided with those of the engineering department of the Road Board, will be endorsed by all concerned with bituminous road making, who will also gladly acknowledge that gas engineers and tar distillers can be of much assistance to road authorities, and will agree with Mr. Glover that the best results will follow co-operation of the supplier and user of road tar. Both parties are interested, the one in preparing a material which will fairly meet the specified requirements of the engineer, the other in seeing that the material supplied is that which he has ordered, and that it is of that quality, as regards certain properties which he has specified as essential.

It is here that the Road Board Specifications will act as a valuable guide to the tar producer as well as the road maker. Coal-tar in its adaptation to road making is only in its infancy. It is only within quite recent years that the properties which render it so valuable for road treatment have become the subject of laboratory research and service experiment. Many of the secrets, and certainly most of the records, of the success, or, on the other hand, the failure, of tars in their application to roads are in the possession of the Road Board. It is that invaluable knowledge which gives weight and authority to the suggestions and directions which have been prepared by the engineering department.

The first edition of the Road Board Specifications, having been superseded by the second (revised) edition, I will make no further reference to it beyond saying that its publication had unquestionably the result of calling the attention of local authorities,

including works committees and their surveyors and engineers, to the fact that the time had come when road construction and maintenance would have to be conducted on scientific lines in the interests of all concerned, while at the same time it woke up gas managers and tar distillers to the necessity for more attention to be given to the preparation of tar for roads.

It is perhaps to be regretted that this new edition did not bear on its title page an announcement that the specifications had been revised and brought up to date. The result of this omission will probably be that those who have in their possession the first edition will regard the second as merely a reprint and will think it hardly necessary to buy it. The second edition is, however, far from being a reprint of the first. The careful reader will observe that the directions for surface tarring refers only to the water-bound road. He will perhaps find in practice that "boiling," par. 9, will not be reached at the temperatures given for tar No. 1 (220-240 Fahr.). If the tar froths and wallops to any considerable extent within those ranges of temperature it is evidence that it does not comply with the specification for tar No. 1.

The engineer will now use his own discretion as to the amount of gritting material to be spread on the tarred surface, and he will doubtless be careful to direct that such material must be free from dust. Should he keep samples of the tar he has used on any particular piece of work, which he will be sure to do, as a guide for future operations, he will direct that the vessels containing the samples—which might be half gallons in preference to quarts—are well stoppered so as to exclude air.

Though the surveyor will not now be invited to send his records of bituminous work to London, he will no doubt have them kept as carefully as before.

The *Value of Specification No. 2* (directions for surfacing with tar-macadam) cannot be over-estimated. There are a few road makers in England who regard themselves as wanting in knowledge of either how to prepare tar-macadam or in what manner to lay it, yet either of these operations can only be successful if carried out on scientific and approved lines.

Paragraph 6 defines the grading of the stone. It is of first importance to note that the grading is now based on the standard gauge, and that the term "gauge" is used to describe the standard group of sizes into which broken stone is divided. Were it not for this proviso the amount of air spaces in the aggregate would be so great as to make it impossible to produce an impermeable surface.

It is assumed that all those engaged in the preparation of tar-macadam have provided themselves with a copy of the "British Standard Specification for Sizes of Broken Stones and Chippings,"* which was published last August. If not, I might mention here that it would be found invaluable to engineers and quarry owners.

When thoroughly drying the stone (par. 7), which all makers of tar-macadam agree is essential, it will be remembered there is always present the risk of overheating. If the stone is too hot the film or coating of tar will be "burnt" and rendered useless as a binding medium.

In *Specification No. 3* the directions for surfacing with pitch-grouted macadam will be found of great value. The importance of waiting for fine weather until the stone is dry before carrying out the operation (par. 8) will be observed by those who have witnessed the result of pouring pitch on wet stone. Coal tar has no affinity for moisture is a well-known saying, and is applicable to the tar treatment of roads in greater force than probably to any other work in which tar may be used.

The rules for mixing the heated sand with the pitch, the proportions of both to be used, the method of pouring and the necessity for keeping the matrix well stirred throughout the operation of mixing and pouring are essential, and it is only by careful adherence

* Crosby Lockwood & Son. Price 3s. nett.

to these rules that this important method of road construction will have a fair trial. The instructions for melting the pitch (par. 18) and adding the oils, with the observations made as to how temperatures can be raised or lowered, cannot fail to prove a valuable guide to those directing this part of the work.

Specification 4, Tar No. 1. Suppliers as well as users of road tars will examine this specification carefully to learn what, if any, alterations have been made since 1911. They will find a strong recommendation to use heaters specially designed to prevent "frothing, which will otherwise inevitably occur if the tar contains even a small percentage of water." This is very sound advice, and should be taken note of, especially by those who from various circumstances are compelled to use crude or raw tars.

It is noticeable that the discrimination between "tar from gasworks" and tar from distilleries is not now made.

A very proper and, indeed, requisite addition to the specification is now made in defining the method which should be adopted in determining freedom from water and ammonia. The method of testing for crude tar acids (phenols) is also given.

The distillates at given temperatures are now usefully described as "light," "middle" and "heavy" oils. The wide range now given for free carbon—12 to 21 per cent—should satisfy those distillers who were disposed to criticise the limitation of that constituent to 16 per cent.

Specification 5 for Tar No. 2 will also be closely looked into, and it may come as a surprise to some that carburetted water-gas tar may now be admitted to an amount not exceeding 25 per cent of the volume of the tar. (In tar No. 1 it is limited to 10 per cent.) This liberal extension of the former limit in carburetted water-gas tar may be attributed to the desire of the Road Board to avoid the exclusion of any source of supply, so long as the tar complies with the specification in other respects.

Free carbon is given a range of from 12 to 22 per cent—that is 1 per cent more than is admissible in No. 1 tar.

In direct connection with these important specifications for road tar are the directions for their being tested. The necessity for such directions is obvious.

Specifications, no matter how well drawn up, would effect nothing unless the material supplied was to be examined for compliance or otherwise. It is now plainly stated that "compliance of a sample of tar with the Road Board Specifications" can be ascertained only in a chemical laboratory. This, of course, implies that the necessary analysis is to be made by a properly qualified chemist.

Immediately following the above directions comes a suggestion as to how it can be promptly and simply ascertained whether or no the consignments "differ fundamentally from an approved sample."

Herein lies one of the greatest risks for which the surveyor has to bear the responsibility under present conditions. He may have ordered, on the strength of an approved sample, tar No. 2, with which he intends to prepare tar-macadam. The consignment arrives; it is tar No. 1, and the work proceeds. It is only when the final tribunal of actual experience on the road—to use Mr. Glover's words—has given its decision that the mistake will have come to light.

The specifications provide against the occurrence of such a disaster.

A chemical test, it goes without saying, could not conveniently be carried out either at the municipal depot or on the roadside. Fortunately, however, what is known as a physical test can. Now, the quickest and simplest physical test is that for specific gravity. Be it noted that one of the most valuable features in the specific gravity test is that it provides very reliable means for identification; in a word, by having this test applied to a consignment the foreman can report whether it is what was ordered for the job or not. The specification describes—pp. 23 and 21—the kind of instrument to be used and the method of using it, the time occupied being some two or three minutes.

Immediately following the above test for checking consignments, it is laid down that "the specific gravity of a tar is not by itself a sufficient indication of the utility of the tar." That brief statement of a scientific fact should be carefully noted by every supplier and user of tar.

The gas engineer and the tar distiller with their staffs may be, as Mr. Glover declares, better equipped for experimental work and standardising than the

road surveyor; but, nevertheless, the only guide they have hitherto used for determining the suitability of tar for road treatment of various kinds has been that of specific gravity. There are some few exceptions to the above, among which may be mentioned Mr. Glover.

Specific gravity not being a sufficient indication of utility, the specification proposes a test for viscosity, and sets forth in a concise and simple form the conditions under which such a test should be made. The surveyor's attention to the directions under head of viscosity will be well repaid.

A simple and, so far as I know, an original test for the presence of water and naphthalene completes these new directions for the testing of tar.

Specification for Pitch, No. 6.—Here we are told how a "straight-run" pitch suitable for pitch-grouting is obtained, also how a harder pitch may be softened or cut "back." A test by a standard penetrometer using a weighted needle, with the sample at a fixed temperature, is proposed, and an excellent test it is for ascertaining the comparative hardness or softness of the sample.

The proportions of distillates at given temperatures of prepared pitch and commercial soft pitch, and the permissible range of free carbon as set forth in the specifications, give evidence of much chemical research supplemented by the experience of the chemical engineer in both experimental and service work.

The directions for tar oil to be used in softening the pitch will, no doubt, be accepted as a guide to what has been found by careful experiment to give the best results.

The bearing that the Road Board Specifications, especially the new and revised edition, will have on road construction and maintenance cannot be made manifest to the lay mind at once. The professional mind will not be slow to grasp the fact that powerful influences are at work, suggesting now—later on, perhaps, insisting—that work must be conducted on scientific and approved principles.

In the road-making world of to-day everything points to the desire of the British surveyors and engineers to keep abreast with their colleagues in other countries. That they will succeed is certain, and to such an end the Road Board Specifications will have contributed much.

The note at foot of specifications Nos. 1, 2 and 3, that the directions are not intended to displace or discourage the use of proprietary articles should be noted, also that the engineering department find themselves able to endorse the opinion of the Advisory Committee as to those articles being of proved value.

QUERIES AND REPLIES.

We cannot undertake to reply to any queries which are not accompanied by the writer's name and address. These are required as a guarantee of good faith, and not for publication. Sketches accompanying queries should be made separate, on white paper, in plain black ink lines. Lettering or figures should be bold and plain.

904. Water Supply.—Mr. H. Fox Hill, surveyor to the Ware Urban District Council, writes: I shall be glad if any of your readers can give me any information as to where loaded equilibrium valves are used for the purpose of keeping a head on the pumping main for pumping to high districts.

Roads Improvement Association.—The Hon. Arthur Stanley, M.V.O., M.P. (president of the branch), occupied the chair at the annual general meeting of the Lancashire and Cheshire Branch of the Roads Improvement Association held at Manchester on the 24th ult. The president was supported by a full attendance of the committee, a large number of local subscribers and general road users being also present. In his opening remarks the president emphasised the representative nature of the Roads Improvement Association, and its wide field of usefulness. He congratulated the branch upon their very busy year, and the large measure of success that had attended their activities. The annual report was adopted on the motion of Mr. A. Lyle Rathbone, J.V., C.C. (Liverpool), seconded by Mr. E. J. Chambers (Manchester), and general discussion ensued upon road topics, and especially in relation to the provision of roads in town planning proposals, and the need for a central highway department with more power than the Road Board. In the evening the committee dined together at the Midland Hotel, Manchester.

Passenger Transportation Problems in Large Cities.

MANCHESTER TRAMWAY MANAGER'S REPORT.

In November, 1911, the Manchester Tramways Committee decided upon an investigation of the problem of street congestion within that city, and a sub-committee was appointed to consider and report upon—(1) The probable increase of tramway traffic during the next twenty years, (2) The provision necessary to diminish the increasing congestion in the central streets, and for facilitating tram traffic, by the following or other means: (a) Widening of existing streets or the construction of new streets; (b) the acquisition of an arterial centre for the marshalling of tram traffic; (c) The construction of subways for tram traffic. (3) The extent to which the financial resources of the tramway undertaking can be applied to this purpose. In the following January the sub-committee presented an interim report showing the magnitude and importance of the problem, and recommending that the general manager and the permanent way engineer be instructed to visit certain cities in the United Kingdom and abroad, carefully study the passenger transportation facilities of those cities, and present a full report upon the subject. This recommendation was approved by the committee, and subsequently by the city council, and Mr. McElroy, the general manager, and Mr. Mattinson, the permanent way engineer, proceeded to visit in turn, New York, Philadelphia, Boston, Chicago, Pittsburg, Newark, Montreal, Toronto, Paris, Berlin, Vienna, Hamburg, London and Glasgow.

The general manager's report has now been issued, and, as mentioned in our last issue, contains many proposals for the betterment of street traffic in the city of Manchester. It includes numerous illustrations in the shape of photographs, maps and diagrams, and the information generally which it furnishes is of an extremely valuable character.

GENERAL OBSERVATIONS.

Mr. McElroy points out that in all the larger cities in various parts of the world the municipalities have found that the provision of adequate facilities for local passenger transportation has been one of the most complex problems they have had to deal with. "As cities have grown, due to the gradual increase in population, and as the riding habits of the people have developed, especially in the last few decades, it has become more and more difficult," he observes, "to make the channels of passenger transport equal to the ever-growing demands. In every city the main factors affecting the problem are much the same. There is a constant migration of the population from the inner to the outer zones, and this is greatly accelerated by every extension and improvement in the means of transit. Suburban districts rapidly become urban, and new suburban districts in the outlying areas are always in progress of formation. Smaller towns and districts on the outskirts are being drawn into closer touch with the cities, and a greater community of interests is being established over a gradually widening area.

"Every extension of the means of transit into the outer zones adds to the difficulties of handling the traffic in the central zone, and in time the congestion becomes so acute that the city authorities realise they are face to face with the inevitable traffic problem. This condition of things arises sooner or later in all large cities, but some cities have been confronted with the problem at an earlier date than others owing to the narrowness and bad lay-out of the streets in the older parts of the city, to the absence of suitable arterial roads, and to the presence in the central zones of a large amount of ordinary vehicular traffic, which, if it is slow-moving, tends to retard the general flow of the traffic."

NEW YORK.

Some interesting features presented by the transit facilities now in operation, and those which are under construction in New York, are noted in the report. Greater New York, with a population of about 5,000,000, and an area of 324 square miles, embraces Manhattan Island and the boroughs of Brooklyn, Queen's, Richmond, and Bronx. Manhattan Island, the original city prior to the inclusion of the adjoining boroughs within the city area, is the most densely populated piece of territory in the world, and the crowding of huge buildings for business purposes

into its limited area has created a transportation problem of the most complex kind.

Comparing the Manhattan subways with the deep level "tubes" of London, Mr. McElroy says:—

"The most interesting feature of the existing transportation facilities is the underground railway—the subway as they call it—in Manhattan. This subway is owned by the city authorities, and is leased to the Interborough Company. It is constructed under the streets of the city, and as near the surface as possible. The usual depth of the station platforms from the street levels is about 25 ft., and the approaches are by short flights of steps. The nearness of this subway to the street surface, and its easy accessibility as compared with the deep-level "tubes" in London, with their lifts and long subterranean passages, at once illustrates the advantages from the passengers' point of view of shallow underground railways as against deep-level "tubes." The subway has four tracks—two for express services and two for local services. It was originally built to carry 400,000 passengers per day, but it is now carrying over 1,000,000 per day, and the traffic is still increasing."

The problem as to the best method of meeting the present demands and making provision for the future occupied the attention of the Public Service Commissioners for several years. Ultimately they prepared a scheme which, as regards breadth of conception and thoroughness in all its details, is unsurpassed. The entire scheme, when completed, will add 333 miles of rapid-transit lines to the existing 296 miles, making a total of 629 track miles. The total cost of the new scheme when completed will be about £68,000,000—a figure about equal to the amount invested in the existing rapid-transit lines in New York. Thus the total investment on these undertakings, as outlined, will reach £137,000,000.

In his reference to the Manhattan tramways, Mr. McElroy states that experiments are being made for the first time with a double-deck car, which has several special features. Tramways are not regarded as means of rapid transit, however, for we read that "the conditions of traffic and the strong desire of the inhabitants for rapid transit lead one to think that a great deal of attention is not given to tramway development—although the Public Service Commissioners have in recent years caused many improvements to be effected in the tramway equipment and the service generally—but everywhere we became impressed with the idea that the authorities do not regard tramways as an important factor in any schemes for meeting the future transportation requirements in New York."

The motor omnibus has not, so far, made much headway in New York. There are a few running in one or two of the main avenues in Manhattan—avenues in which tramways have not been permitted.

Mr. McElroy quotes from a report recently made to the municipality, following an inquiry in London and Paris, as to the motor bus question. In this report the effect of the competition of these vehicles with the tramways in London is dealt with. It is admitted that, to a certain extent, the increase in facilities will result in increased riding, but it is added: "Motor buses operated by more than one company should not be permitted on the same route. The experience of London shows that if it is allowed the number of accidents will be increased by the racing of rival buses. Further, if more companies than one were to receive a franchise to operate buses in New York, it would only be a short time before one company would control the entire operation. Motor buses should not be operated in the same street with street surface railways (tramways), except for short distances where such duplication of route is necessary, because there are no other existing highways available for that portion of the omnibus route. This is undesirable, not only on account of competition, but because of such deliberate interference as has occurred in London, where in some cases buses run so close to surface cars that people cannot use the latter in safety. Motor buses should be excluded from streets having macadam pavements, and permitted only on pavements having a heavy foundation; the weight of the vehicle should not

exceed that permitted by police regulation of London."

PHILADELPHIA.

When Mr. McElroy and his colleague visited Philadelphia there was no evidence of traffic congestion such as they are familiar with in Manchester, nor as great as what they saw in other cities in America. The most striking traffic feature in this city, they remark, is the small mileage of rapid-transit lines as compared with what exists in other large cities in the United States. "The rapid-transit lines run between the business district on the east side of the city and the suburban district on the west, and they cater only for the flow of traffic in these directions. The lines in the business area are of the shallow subway type. In the outer area they are elevated. A special feature of the underground facilities is that, at the sides of the tracks laid for the rapid-transit trains, tracks are laid for tramcars, which enter the subway at certain convenient places and handle the local traffic. The system is designed so that the tramways shall act as tributaries to the rapid-transit lines."

BOSTON.

The chief feature which characterises the methods employed in Boston to meet the passenger transportation requirements is the excellent way the various means of transit have been devised to supplement one another. "The authorities," the report says, "have endeavoured to eliminate waste of facilities by not creating the unnecessary competition which accompanies the paralleling of different means of transit. The tramway lines, both on the surface and underground, and the rapid-transit lines are all operated by one company—the Boston Elevated Railway Company. This method of having only one operating authority for all the means of transit in a city has much to commend it. Under proper conditions and safeguards it leads to the best results."

CHICAGO.

In this, the second largest city in the United States, the population is widely spread, and every endeavour has been made to insure that the transit facilities should keep pace with the public demands. Developments are now being proposed in the direction of further rapid-transit lines to relieve the congestion of the surface lines which, in certain streets in the heart of the city, is becoming very acute.

PITTSBURG.

As regards the question of the provision of rapid transit in this city, this, it is observed in the report, will have to remain in abeyance for some years until the tramways have been modernised and brought nearer to their maximum efficiency for dealing with the passenger transportation requirements of the city. Ultimately, rapid-transit lines will have to be provided.

NEWARK, TORONTO, AND MONTREAL.

In each of these cities there were many points connected with the construction and management of the tramways systems which were interesting and instructive, but there was nothing of importance from which lessons might be drawn in relation to the special investigation Mr. McElroy and his colleague were making. In each of the cities there are troubles with a certain amount of traffic congestion, and suggestions have been made in the Canadian cities that relief might be provided by the introduction of rapid-transit facilities, but the subject has not yet taken any practical shape.

PARIS.

The City of Paris is the only place where practically the whole of the surface transit facilities—tramways and motor omnibuses—are operated by one authority on a large scale, and it was thought, therefore, that an unbiased opinion might be obtained as to the merits and demerits of the two systems from the point of view of the management. On this question being put to the officials there was a strong pronouncement in favour of the tramways, mainly on the ground of less cost in operation.

BERLIN.

In addition to rapid transit lines, there are the State railways within the city of Berlin. One line runs through the city, and the other is a circular line—the ringbahn.

The large network of tramways in Greater Berlin is operated by a company—the Grosse Berliner Strassenbahn. There are a number of important streets in the heart of the city from which tramways

are excluded, and surface transit in these streets is provided for by motor omnibuses.

VIENNA.

Vienna is the only large city on the Continent where the tramway system is owned and operated by the municipality, and this, added to the fact that the city has just had a thorough investigation made with the object of introducing a number of new rapid-transit lines to meet the city's growing transportation needs, makes the Vienna problem very interesting.

At the present time there is a rapid-transit line—the Stadtbahn or State Railway, partly elevated and partly underground—which was originally constructed for State purposes, and is therefore not well laid out for dealing with local passenger transportation. It is a steam-driven line, but is just about to be electrified. It forms a connection between a number of main line railway stations.

The proposed new rapid-transit lines closely follow the line of the flow of traffic, and it is intended to construct them on the shallow subway plan. With a view of obtaining the fullest information on the subject of rapid-transit lines, exhaustive inquiries have been made on behalf of the city into the methods of construction and operation of the American rapid-transit lines.

The motor bus services have not, so far, made much headway. The municipality, however, is gradually introducing them, and "we may," Mr. McElroy observes, "expect considerable development." Experiments are now being conducted with a view to the adoption of covered tops for the upper decks of the buses.

A proposal has been made to the city that shallow subways for tramways should be constructed in order that the tramcars now excluded from the central area might be brought underground within that area, and thus provide the through services which are much needed. This proposal, however, has not found favour with the city authorities, they being of opinion that if subways are to be constructed they must be operated as rapid-transit lines by high-speed trains, otherwise the cost of their construction is prohibitive.

HAMBURG.

The city of Hamburg has a large network of tramways, and, in common with other cities, the traffic congestion along certain arterial lines became so acute that in recent years steps had to be taken to meet the difficulties. The tramways company suggested the construction of tramway subways, but after a full investigation the city authorities negatived this proposal, and determined to construct lines for high-speed trains—rapid-transit lines; these are partly in shallow subways and partly elevated. The lines form a circular route, but the flow of traffic along the northern portion of the route is comparatively small, and scarcely justifies its existence.

The city provided the necessary capital for the construction of the lines, and the operating company provided the capital for their equipment. The company have to pay to the city a certain percentage of the gross receipts, but otherwise is not responsible for meeting the fixed charges on the construction costs.

LONDON.

The defect of London's rapid-transit system, Mr. McElroy remarks, is that it has not been laid out in accordance with a comprehensive plan so as to meet the requirements of London as a whole. "It has been laid out piecemeal in accordance with the plans of different private companies, and there has been no permanent authority which has exercised control over the planning and development of the system. This method of handling one of the most difficult problems a city is faced with can only end in failure to secure the most satisfactory results.

"Individual companies and authorities promoting and operating the various means of transit, without the controlling and regulating influence of a central authority acting in the public interests, is a condition of things which everyone who has studied the question should not have permitted to grow up, because it produces anything but the best results."

It is shown in the report that the full development of the London tramways system has been much retarded owing to local causes and influences; "hence the county council tramway system can only be said to supply imperfectly the surface transit facilities within the administrative county generally, and there are practically no tramway facilities at all in the heart of London.

From the passengers' point of view, the main ad-

advantages of the motor bus over the tramcar in London are:

(a) That its mobility enables it to run practically anywhere. Narrow and congested streets are not shut against it, and it gives the through service, which the tramcar is unable to do.

(b) It can maintain a slightly higher average speed than the tramcar, and this appeals to the increasing desire on the part of the public for more rapid transit.

(c) It can set down and pick up passengers at the footpaths, thus avoiding the danger which is experienced in boarding and alighting from tramcars.

When the financial aspect of the two means of transit is compared, the following points, says Mr. McElroy, should be borne in mind:

"In the first place, the tramways are weighted with a very heavy expenditure on their track construction; secondly, the tramway authorities have to repair and maintain the tramway portion of the roadway; and, thirdly, they have to pay large sums in local rates in respect of the rails laid in the streets.

"These two latter obligations the motor bus is entirely free from. It is true, however, that the bus has to pay the petrol tax, but this is small in comparison with the cost of the obligations placed upon the tramways.

"The irony of the situation is that the tramway owners are called upon to repair and maintain the tramway portion of the roadway which their competitors—the motor-bus companies—are helping to wear out rapidly.

"There is little doubt, however, that these anomalies will in time be removed. In the meantime, the facts should not be lost sight of when drawing inferences from operating results of the rival systems of transit."

Mr. McElroy adds: "There is no other city in any part of the world so favourably circumstanced for the working of motor buses as London. It has the best paved streets in the world. It has an immense population, which is growing at an estimated rate of 100,000 per annum. The riding habits of the people are increasing rapidly. They are still a long way below those of New York, so there is ample scope for increased traffic—new traffic—and not traffic necessarily drawn from other channels. And, as has already been pointed out, motor buses supply what the tramways are not permitted to do—they give through services to all parts of the Metropolis. The rapid-transit facilities of London are not all that could be desired from the passengers' point of view. This, again, is favourable to motor-bus operation. The motor bus competes fairly well with the rapid transit of the "tubes." The time occupied from point to point at the street level is not much less by "tube" than by motor bus, except for long-distance traffic."

At the same time, the report points to the fact that tramways cause not nearly so many fatal accidents as the motor buses, while they also offer cheaper travelling facilities.

GLASGOW.

Mr. McElroy remarks that in Glasgow the corporation are faced with a traffic problem very similar to that they are attempting to solve in Manchester, and, like them, they sent a deputation to America last year to study the traffic conditions over there.

LESSONS FOR THE FUTURE.

Some of the more important lessons drawn from the wide investigations made by Mr. McElroy and Mr. Mattinson are summarised in the report as follows:—

(1) That in all cities and towns there is an immense potentiality in the riding habits of the people. Everywhere there is a continual growth in the number of journeys per head of population, and the provision of new or improved transit facilities accelerates this growth in a very marked degree.

(2) That in planning city transit facilities a wide outlook is all important; any schemes carried out on narrow or confined lines ultimately result in serious losses to the community from every point of view.

(3) It is essential that every city should have a permanent authority directing the initiation and carrying out of all schemes for new transit facilities, in order that there may be continuity of policy, and that future needs of the city and the surrounding districts over a wide area are properly looked after. It is also desirable that all the means of passenger transportation—both surface and rapid-transit—should be centralised under one management. If the management is not that of the city itself, then it should be subject to control and regulation by a permanent authority appointed by the city.

(4) That, in planning underground lines for rapid transit, the aim should be to supplement the surface-transit facilities; that the rapid transit lines should be laid so as to follow as closely as possible the direction of the flow of the greatest volumes of traffic, and the surface lines should be adapted so as to act as feeders to the rapid-transit lines at all convenient points.

(5) That, on account of the great initial cost, the construction of underground rapid-transit lines cannot be justified unless there is a very large volume of traffic to be dealt with; that, speaking generally, underground subways for tramcars are an unjustifiable expense owing to the comparatively small number of passengers it is possible to pass through them by single or double deck cars. Underground lines, if they are to be placed upon a paying basis, must be worked by the high-speed trains operated at a very close headway. This demands a great density of traffic.

(6) The motor buses have proved themselves to be an exceedingly valuable means of surface transit, especially under conditions such as exist in London and Paris; but the question of their general adaptability for conditions which exist in other cities, and the part they will play in the future, either in supplanting or supplementing the existing tramway facilities, calls for a careful analysis of their advantages and disadvantages from the local point of view.

Among the few special points which Mr. McElroy recommends should guide future tramway development are the following:—

Tramcar design requires further study; improvements should be directed (a) to more rapid loading and unloading, and (b) to the prevention of boarding and alighting accidents.

The number of stopping-places should be reduced so as to increase the average speed of the cars.

Island refuges for the safety of tramcar passengers should be constructed wherever possible; also shelters should be provided at all suitable places.

No doubt is felt by the author of the report that the time is rapidly drawing near when Manchester will have to be provided with rapid-transit facilities, with the lines so laid out that they can be worked in conjunction with the surface lines by providing suitable transfer points from surface to rapid transit, and *vice-versa*. The surface lines must gather the local traffic, and "feed" the rapid-transit lines, which, in order to pay their way, must be provided with an immense volume of traffic. A general all-round figure of, say, £500,000 to £700,000 per mile of double track is suggested as roughly representing the cost, which will, of course, largely depend upon the engineering difficulties to be encountered.

With regard to motor buses, Mr. McElroy says that in Manchester and the surrounding districts these will in future form an important part of the surface-transit facilities; they will supplement the tramway services in many directions, and particularly in the outlying and thinly populated districts.

While lacking the great elasticity as to routes which the motor bus provides, there are circumstances, he adds, which may warrant the introduction of trackless trolley cars in outlying areas, especially if the operating costs continue to be lower than those of the bus, "which seems likely to be the case."

The statement was frequently made that in ten years hence the tramways would be "scrapped," and motor buses substituted. From the facts before us at the present time, it was almost unnecessary to deal with this suggestion, but in these days of rapid developments of mechanical traction it was unwise to make dogmatic predictions as to the future one way or the other. "One fact, however, must be borne in mind: Ten years hence—even if we do not in the meantime borrow any further capital for our tramway system—we shall still owe nearly a million of money, and it would surely not be good business to throw away assets representing a large part of that sum unless we were assured that the newer form of traction would so cheapen the expenses of operation as to leave sufficient net revenue to meet the fixed charges on the new capital as well as on that of the discarded plant. This does not seem likely to occur."

Institution of Civil Engineers' Examinations.—At the examinations of February, 1914, Mr. Knowles' pupils were conspicuously successful, there being but one failure, and one pupil obtained the highest marks in the associate-membership examination, being awarded the Bayliss prize.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—I would like to be allowed a little more of your space to remind Mr. L. J. Small that, while it may be advisable to scrutinise carefully the experience of any person applying for membership, it would, in my opinion, be quite inadvisable to reject his application solely for the reason that he has not passed the institution's examination. If Mr. Small will look through the roll of membership he will find the names of a large number of our best engineers who have not passed, but who, he will have to admit, are more fitted to be members than some of those who have passed.

I think it would be more to our benefit if we endeavoured to concentrate our powers as a professional body by, as I stated before, influencing public authorities to give preference to our members—a most vital point to us all.—Yours, &c.,

ROAD SURVEYOR.

March 27, 1914.

Swinton's New Waterworks.—The new waterworks constructed by the Swinton Urban District Council were opened on Tuesday. The works represent the completion of a thirty years' search for an abundant water supply, and the cost to the township has been about £30,000. The parish is now in the position of being able to command two watersheds within its boundaries, and, although the population is less than 15,000, there are now two good supplies.

Smoke Abatement: A Departmental Committee. The President of the Local Government Board was asked last week whether he proposed to appoint a departmental committee to inquire into the question of smoke abatement, and, if so, whether he would state the names of its members and the terms of the reference to them. Mr. Samuel said the reply to the first part of the question was in the affirmative. He was not yet in a position to state the terms of reference and the names of the members, but he hoped to be able to do so very shortly.

STATE AID TO LOCAL AUTHORITIES.

THE QUESTIONS OF ROADS AND PUBLIC HEALTH.

Considerable changes, involving an augmentation of grants to local authorities in respect of semi-national services, are proposed in the recently issued report of the Departmental Committee, of which Sir John Kempe was chairman. They recommend, in the first place, the abolition of the assigned revenue-system, and the substitution of direct payments to local authorities from the Exchequer.

These grants, they suggest, should be made only in respect of local services of a national character, of which the more important are education, poor relief, police, main roads, public health, criminal prosecutions, and mental deficiency.

Changes are proposed in the financing of these services which will entail a nett estimated increase in Government subventions of £4,700,000 per annum, £2,385,000 being in respect of elementary education and £2,315,000 on account of other services.

As to highways, they recommend that these should be classified by the Road Board into main roads, county roads, and district roads, and half the maintenance of main roads and a quarter of that of county roads be met by the Exchequer grants; that the balance of the cost of main roads and a quarter of that of county roads should be borne on county funds, the remaining half of the cost of the latter roads being charged to the highway district responsible for them, and that the necessary Parliamentary authority should be obtained as soon as possible to enable the Road Board to commence a provisional classification of highways.

The total grant for main roads is estimated at £1,800,000, and that for county roads at £600,000.

Under the head of public health, it is proposed that the present grant for the salaries of sanitary officers should be withdrawn, and that a subvention should be given in aid of public health administration generally at the rate of 9d. per head of population in rural, and 6d. per head in urban districts. Here the total grant is estimated at £1,000,000.

SOME RECENT PUBLICATIONS.

We have received a copy of this year's edition of Messrs. Waterlow Bros. & Layton's Diary, and find it as excellent as ever. There is one matter for regret, however, and that is the omission of the names and addresses of the members of the various professional societies. We think we are voicing the views of many subscribers to this useful publication in drawing attention to the absence of this useful feature of the book.

"Laxton's Price-book" is again with us, and although it is the oldest price-book it is as vigorous as ever; its bulk seems to expand yearly, and its usefulness certainly increases. What would a modern surveyor's office be without its copy of Laxton's?

Local Government Board and Rural Council.—The Local Government Board have informed the Beverley Rural District Council that, unless within two months a satisfactory reply is received with regard to the order of the board for the council to undertake the drainage of Elloughton and Brantingham, the board will apply in June for a mandamus to enforce the order. The cost of the drainage scheme referred to is estimated at £10,000, and the parishes concerned have opposed it. The rural council on Saturday resolved simply to acknowledge the receipt of the letter.

The Supply of Building Materials.—The Prime Minister was asked in the House of Commons on Tuesday if, in view of the fact that builders and housing reformers complained that the supply of building materials was controlled by a trust which raised prices last year by 20 per cent, which was equal to the price of the land on which houses were built, he would make provision in the Government's Housing Bill enabling public authorities to manufacture building materials and to supply them to private builders. It was stated in reply that consideration would be given to the matter, but that so far no request to be furnished with such powers had been received from any public authority.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for March is awarded to

Mr. H. BONE,
Municipal Offices,
Palmouth.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., *Plumstead*.)

387. Boring.—Describe, with sketches, the appliances necessary in carrying out borings to a depth of 100 ft. for the purpose of ascertaining the character of the soil. (W. N. B., *Cambridge, N.Z.*)

388. Reactions on Beams.—Show how to find (graphically or otherwise) the pressures on the two supports of a horizontal beam which is loaded at any given point. If the distance between the supports be 20 ft., and if one of the loads be 12 cwt., find the changes in the pressures produced by shifting this load through a space of 5 ft. along the beam. (A.M.I.C.E.)

389. Design of Floors.—What loads should be allowed for in designing a floor (a) in a general warehouse, and (b) in a platform to which the public are to be admitted? What factor of safety would you adopt in each case?

390. Removal of House Refuse.—A new urban district has just been formed in the neighbourhood of London of which the following are particulars: Area, 3,500 acres; population, 9,000, increasing at rate of 700 per annum; number of houses, about 2,300; length of district, north to south 3 miles, east to west 1½ miles; mileage of roads, 17; character of district, flat in northern part, hills up to 1 in 16 in southern part; distribution of population, 2,000 at north end in £40 villas, shops, &c., 500 in north-east in large houses with long approach drives, 1,000 in south and south-west in small villas and workmen's cottages. The refuse for the present will be utilised at brickfields on the southern boundary of the district. It is desired to organise the removal of house refuse on the most up-to-date methods compatible with economy. Describe fully the methods of collection and transit, the organisation of the staff, the plant required, and give an estimate of the capital and annual charges for this work. Trade refuse is negligible, and no plant has been taken over from the rural authority who formerly had control of the area. (Togun.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

386. Storm Overflow Weir.—A 9-in. diameter stone-ware pipe, laid on a gradient of 1 in 281, carries a mean dry-weather flow of 33,300 gallons per day. It is required to construct a storm overflow weir, in a manhole, to pass all above six times the dry-weather flow. At what height above the invert of the pipe should the lip of the weir be set? (H. V. O., *West Bromwich*.)

The mean dry-weather flow is 33,300 gallons per day. It must not be assumed from this that the mean flow per hour is $\frac{1}{24}$ of this value, for it is obvious that the flow in the middle of the day is very different from the flow at night. It is usual

to assume that one-half of the mean dry-weather flow passes off in six hours, and we must design the overflow on this assumption.

Hence $\frac{33300}{2}$, i.e., 16,650 galls. flow in 6 hrs.

∴ Flow per hour = $\frac{16650}{6}$ galls.

And the discharge of the sewer $\frac{16650}{6 \times 60}$ galls. per min.

Now the overflow is to be set so that it passes all above six times this flow—i.e., it must be set above the invert at such a height that if the flow exceeds $\frac{16650}{6 \times 60} \times 6$ gallons per minute, the excess will pass over the lip of the overflow.

It is given that the gradient of the 9-in. sewer is to be 1 in 281. It is therefore correct to assume a velocity of flow of 3 ft. per second, as such velocity will render the sewer self-cleansing.

The discharge of a sewer is obtained from the formula—

$$Q = A V$$

wherein Q = Discharge of sewer in cub. ft. per min.

$$= \frac{16650}{60} \div 6\frac{1}{4} = \frac{16650 \times 4}{60 \times 25} \text{ cub. ft. per min.}$$

A = Area of cross section of flow in sq. ft.

and V = Velocity of flow in feet per min.

$$= 3 \times 60 = 180 \text{ ft. per min.}$$

Substituting known values in this equation gives

$$\frac{16650 \times 4}{60 \times 25} = 180 A$$

$$\therefore A = \frac{1665 \times 4}{180 \times 6 \times 25} \text{ sq. ft.}$$

$$= \frac{6660 \times 144}{180 \times 150} \text{ sq. in.}$$

∴ Area of flow = 35.5 sq. in.

Now, the cross-sectional area of the pipe is $\frac{\pi}{4} \times d^2$, wherein d = internal diameter of pipe.

Hence area of cross-section = $\frac{81\pi}{4} = 63.5$ sq. in.

It is thus clear that the pipe is running just a little more than half full, for, if it were flowing half full, the area of flow would be $\frac{63.5}{2} = 31.8$ sq. in.

The depth of water in the pipe would then be 4½ in.

Let us suppose that the depth of water is 5 in. If this were so, we should be adding nearly (½ × 9) square inches to the cross-sectional area of the flow, thus bringing the total area of flow up to (31.8 + 4.5) square inches = 36.3 sq. in.

But, as the added area is not exactly 4½ in. (it is not a true rectangle), it will be advisable to allow another ½ in. in depth to be added to the total depth of flow.

Thus the depth of flow, and hence the height at which the storm overflow weir should be set above the invert of the sewer, is (4½ + ½ + ½) inches = 5½ in.

The construction of the sill requires most careful attention. It must be set dead level throughout its length, and should be constructed of dressed granite worked to a rounded or bull-nosed face, or it may be made of bull-nosed Staffordshire blue bricks carefully pointed in cement. The overflow should be of a suitable slope to allow the water to fall gradually, and thus prevent undue splashing and the wearing away of the slope. Care must also be exercised in making the weir of sufficient length to prevent the water rising too high in the sewer. (T. W. P., *Berkhilton-Sca.*)

Blotter.—We have received from Messrs. Kerner-Greenwood & Co. a handsome blotter, which contains useful information regarding Pudlo, "the powder which makes cement waterproof." Messrs. Kerner-Greenwood & Co. will be pleased to send one to any architect who has not received a copy.

INSTITUTION OF MUNICIPAL ENGINEERS.

MEETING OF NORTHERN AND NORTH-WESTERN DISTRICTS.

A joint meeting of the Northern and North-Western Districts of the Institution of Municipal Engineers was held at Leeds on the 21st ult. Among the members present were Messrs. Horace Boot, president of the institution, Wm. Finch, chairman Northern District, A. R. Bleazard, chairman North-Western District, J. H. Halstead (Harrogate), H. G. Firth (Leeds), John Davison (Morpeeth), B. Hinchliffe (Gomersal), P. Morris (Doncaster), R. Laycock (Farsley), G. L. Bowron (Darlington), J. W. Plewes (Ripon), Geo. Symon (Blaydon-on-Tyne), A. G. Kilner (Wetherby), G. H. Hopkinson (Chorley), W. Wilby (Gildersome), H. P. Coeks (Horbury), John Robinson, hon. secretary Northern District, R. J. McKenn, hon. secretary North-Western District, and B. Wyand, secretary of the institution. There was a number of visitors, including Messrs. J. Battye (Guisley), T. A. Prince (Leeds), W. M. Stephenson (Darlington), D. Wood (Leeds), W. Whitaker (Donholme), J. Slater (Horbury), F. Horsepool (Leeds), J. C. B. Smith (Leeds), H. J. Ward (Doncaster), J. H. Hardacre (Leeds), W. Miller (Leeds), H. Richardson (Horsforth), and E. C. Tomkins (Darlington).

The members met on the North-Eastern Station, Leeds, and were received by Mr. David Wood, representative of Messrs. J. Fowler & Sons, Limited, Hunslet. A visit was then paid to Messrs. Fowler's works, and under the guidance of the managing director and Mr. Wood an inspection of the various and extensive departments was made. Afterwards the party were entertained to lunch at the Griffin Hotel as Messrs. Fowler's guests.

Mr. Horace Boot, the president of the institution, in proposing the success and prosperity of the firm, and thanking them for their kind hospitality, said that all the members were struck by the various classes of machinery seen, especially the oil or petrol driven tractors and huge engines built for foreign work where coal and other fuel was difficult and costly to obtain. Messrs. Fowler & Sons were well up to date in all their departments, and the works were under excellent management. The president, in thanking the two local secretaries, Mr. McKenn, North-Western District, and Mr. John Robinson, Northern District, alluded to the enthusiasm for the institution shown in the North, and referred to the great success of the annual meeting of the Northern Division held in Newcastle.

Both local secretaries replied, thanking the president for his kind remarks, and stated that it was their intention to further the interests of the institution in the Northern and North-Western Districts so far as lay in their power.

Mr. A. R. Bleazard, chairman of the North-Western District, endorsed all that the president had said, and said he felt sure that everyone present had had a most enjoyable and instructive visit.

Mr. W. Finch, chairman of the Northern District, on behalf of his members expressed his thanks to Messrs. J. Fowler & Sons and to Mr. Wood for their kindness for making arrangements for the visit.

Mr. David Wood, on behalf of his firm, said it had been a pleasure to entertain the members, adding that they would be very pleased to do so again at any time.

Mr. Bleazard, in proposing a vote of thanks to Mr. Boot for attending the meeting, said that the prosperity of the institution depended greatly upon the president, and he felt sure that Mr. Boot had the interests of the institution thoroughly at heart.

Mr. Boot, in reply, said he hoped that the Institution of Municipal Engineers would eventually become one of the strongest institutions in this country, and he was prepared to give all members every assistance in his power, and should be only too pleased to give his advice in any case of difficulty on receipt of a personal letter.

SUGGESTED FUND FOR NORTHERN DISTRICT.

It was decided that Mr. John Davison's motion be left over until the next meeting of the Northern District.

PROPOSED BADGE.

It was suggested that some small badge should be obtained, so that when attending meetings members who were strangers would be able to approach each other, and on the motion of Mr. Finch, seconded by Mr. Symon, it was resolved: "That the council of

the institution be asked to take into consideration the question of providing a small suitable button badge for members to wear at the District and other meetings of the institution."

PAST-PRESIDENT'S MARRIAGE.

The secretary was asked to write to Mr. J. T. Pegge, the first president of the institution, and convey to him the congratulations of the institution, and the hope that he and Mrs. Pegge would have a long, prosperous, and happy life.

LEEDS MEETING.

The secretary was asked to write thanking Mr. G. A. Hart, Mr. F. Horsepool, and Mr. J. B. Hamilton for their kindness in assisting in the day's entertainment.

VISIT TO SEWAGE DISPOSAL WORKS AT RODLEY.

After lunch the members visited the Leeds Corporation sewage disposal works at Rodley, where the system adopted was fully explained by Mr. F. Horsepool, who also handed to each member a pamphlet giving a full description of the undertaking.

ROAD BOARD APPOINTMENTS.

FURTHER QUESTIONS IN THE HOUSE.

In the House of Commons on Tuesday Mr. Lardner asked the Secretary to the Treasury whether any county surveyor in Ireland, at the request of the Road Board or the Advisory Committee, or any of the inspectors of the board, inspected or reported on any road improvement work in Ireland in any county other than that of which he is surveyor; and, if so, in how many cases.

The Financial Secretary to the Treasury (Mr. Montagu) said the answer was in the negative, except in so far as county surveyors were members of the Advisory Engineering Committee.

Mr. Lardner asked when Messrs. J. P. J. Butler and R. W. Butler were appointed as inspectors by the Road Board; what the terms of their appointment and salaries are; and at what they were engaged prior to their appointment by the Road Board.

Mr. Montagu stated that Mr. J. P. J. Butler was appointed engineering inspector to the Road Board on December 12, 1911, at a salary of £6 a week and travelling expenses. Prior to his appointment by the Road Board he was engaged as an engineering assistant upon the staff of a consulting engineer. Mr. R. W. Butler was appointed engineering inspector of the Road Board on April 28, 1913, at an initial salary of £250 per annum and travelling expenses. Prior to his appointment he was the chief assistant to the engineer and surveyor of the county borough of Newport.

Mr. Lardner asked the names of the persons comprising the Advisory Engineering Committee appointed by the Road Board last year, showing the representation for England, Ireland, and Scotland; and for how long the committee was appointed.

Mr. Montagu said the Road Board appointed in February, 1913, a temporary Advisory Engineering Committee for the purpose of inspecting a considerable mileage of roads in Ireland. The committee, which was dissolved in February, 1914, consisted of Mr. P. C. Cowan, chief engineering inspector, Local Government Board for Ireland; Mr. W. Cohen, county surveyor of county Dublin; Mr. W. E. Duffin, county surveyor of county Waterford; and Mr. R. H. Dorman, county surveyor of county Armagh. This temporary committee was distinct from the Advisory Engineering Committee constituted by the Road Board in August, 1910, in accordance with the scheme printed in Appendix No. 10 of the first annual report of the Road Board.

Mr. Lardner asked on whose advice, recommendation, or report were the grants and loans made by the Road Board in Ireland; whether all work in process or actually completed was inspected by an officer of the Road Board; and, if so, who these inspection officers were.

Mr. Montagu said the details of each application for grants or loans were examined and reported upon by the engineering staff of the Road Board. The answer to the second part of the question was in the affirmative, and as regarded the third part, he would refer the hon. Member to the reply which he gave him on March 24th. [THE SURVEYOR, March 27th, p. 562.]

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

HIGHWAY: ACCIDENT: DANGEROUS BUILDING LIABILITY.—The decision of Mr. Justice Scrutton in *Hurlstone v. London Electric Railway Company and Another* (noted at p. 232 *ante*) has been reversed by the Court of Appeal (March 13th). By an agreement between the company and one other defendant (a builder), the latter agreed to erect a super-structure over the company's tube station at Cranbourn-street and to take a ninety-nine years' lease thereof. The necessary scaffolding and hoardings were to be erected in such a way as should be reasonably approved by the company, and a gantry for raising building materials was to be erected in a particular manner specified in the agreement. During the progress of the work the plaintiff (a lady), while walking on the pavement adjoining the building, was injured by a piece of wood falling on her head. The jury found that there had been negligence on the part of the builder, and awarded the plaintiff £75 damages, and Mr. Justice Scrutton gave judgment against both defendants. He held that there was a duty on the company to safeguard the public during building operations on their property adjoining the street, and that they did not fulfil that duty by delegating it to an independent contractor. In the Court of Appeal the Lord Chief Justice said that the Court were of opinion that the appeal must be allowed. The circumstances revealed the fact that the railway company were merely the reversioners of the building, having given the builder the sole occupation by virtue of a lease, and no authority had been cited in which a reversioner had been held liable for the negligence of a lessee. It was argued that, as the railway company "caused" the dangerous work to be done, they could not shelve their responsibility merely because the work had been delegated to an independent contractor. It was also argued that the company had a duty imposed upon them to protect the public. The Court, however, saw no ground for these contentions, having regard to the position of the company. In fact, they could not see that the company could not free themselves from all responsibility in connection with the erection of the building. Lord Justice Swinfen Eady, who concurred, said that this was not a case of principal and agent or employer and employed, but of lessor and lessee. Lord Justice Phillimore also concurred, and the appeal was allowed.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words as *noms de plume*. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

BUILDING BY-LAWS: FOOTINGS.—"Quest" writes: A builder in this district is erecting a small villa. His attention has been called to by-law No. 18 of this council's by-laws (a copy of which I enclose), which requires the wall to rest upon proper footings, &c. The builder contends that he has provided a depth of 3 ft. 9 in. of concrete for foundations, and has then provided 9 in. of concrete for footings, which 9 in. has been continued over the whole site, and that he has caused the diminution of the footings to be in one offset at the top of the footings. I should be glad of your opinion as to whether the builder has reasonably complied with the by-law, or whether the council would have reasonable grounds for taking proceedings for an infringement of the by-law. The following is a copy of the by-law referred to:

18. Every person who shall erect a new building shall construct every wall of such building so as to rest upon proper footings, or upon a sufficient bressummer. He shall cause the projection at the widest part of the footings (if any) of every wall, on each side of such wall, to be at least equal to one-half of the thickness of such wall at its base, unless an adjoining wall interferes, in which case the projection may be omitted where that wall adjoins. He shall also cause the diminution of the footings to be in regular offsets, or in one offset at the top of the footings, and he shall cause the height from the bottom of the footings to the base of the wall to be at least equal to two-thirds of the thickness of the wall at its base.

19. Every person who shall erect a new building shall

cause the footings (if any) of every wall of such building to rest on the solid ground, or where necessary upon a sufficient thickness of good concrete, or upon some solid and sufficient sub-structure, as a foundation.

A footing is defined in Lloyd's Encyclopaedic Dictionary as "the base, foundation, or first courses of brick or stone in a wall, broad at the bottom and gradually narrowing to the width of the wall above ground." This appears to imply that a footing is an integral part of the wall, and constructed of similar material. In this sense the wall shown on the sketch has no footings. It may be, however, that in practice the term has a wider interpretation, and that such an arrangement as shown constitutes a footing. I think really it is a question for an architect to decide.

COMBINED DRAINAGE: CESSPOOL.—"H. R." writes: I shall be glad if you will kindly inform me for which portions of the drain and cesspool (the cesspool was

connected to the sewer some time after the former was constructed) shown on the accompanying plan the owners (A and B) and the council are respectively responsible.

Each of the three drains connected with the cesspool is a "sewer" from the point at which it receives the drainage of more than one house, and (assuming that Part III. of the Public Health Acts Amendment Act, 1890, has not been adopted in the district) is repairable by the council from that point. So much of each drain as drains one house only is repairable by the owner. If the cesspool is a mere catchpit it is part of the "sewer," and repairable by the council. See *Pakenham v. Ticehurst Rural District Council* (67 J.P. 448). Otherwise, in the event of its being a nuisance or injurious to health, it can be repaired at the cost of the owner or occupier, under sec. 41 of the Public Health Act, 1875; or if the contents overflow or soak therefrom the council can abate the nuisance at the expense of the occupier under sec. 47 of that Act. See *Meador v. West Cowes Local Board* (1892, 3 Ch., 18).

EXTRAORDINARY TRAFFIC: STEAM TRACTOR ON HIGHWAYS.—"Dony" writes: A steam wagon with a truck is being used in this district to convey bricks, &c., from a brickyard to a new colliery village, and is damaging the roads. The roads are good and strong, and well adapted to the ordinary traffic. Can I successfully claim for damage?

If the surveyor gives a certificate that having regard to the average expense of repairing the highways in the neighbourhood extraordinary expenses have been incurred in repairing the highways in question by reason of the damage caused by excessive weight or extraordinary traffic, the authority can recover from the person by or in consequence of whose order the traffic was conducted, the amount of such expenses as may be proved to the satisfaction of the Court to have been incurred by reason of the damage. The question of whether the weight was excessive, or the traffic extraordinary, would be determined by reference to the ordinary traffic on the roads and to their character, and the authority would have to prove that the user of the roads by the defendant was out of the common orders of traffic, either in itself or in the way in which it was conducted, and substantially increased the burden imposed by the ordinary traffic.

We have to draw the attention of querists to the directions laid down for their guidance in regard to the preparation of diagrams. Rough sketches obviously cannot be made use of, and we should be obliged if correspondents would therefore send only carefully-prepared drawings, preferably about 6 in. in width, and without colouring or wash of any description. Failure to observe these rules will involve the risk of queries remaining unanswered.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Durham C.C. (March 31st. Mr. Edgar Dudley).—£1,800 for the purchase of land in Newgate, as a site for a public elementary school.—Mr. A. J. Dawson, representing the Education Committee of the county council, said the site was the only one which had in all respects commended itself to the county education authority. It had been approved by the Board of Education.

Hoyland U.D.C. (March 20th. Mr. A. W. Brightmore).—£1,344 for enlarging and improving the sewage disposal works at Elsecar. The surveyor, Mr. F. Thackray, stated that it was proposed to add additional septic tanks and sludge lagoons to the existing works. This work was, he said, proposed to meet the requirements of the West Riding Rivers Board, from whom repeated complaints, though Dr. Maclean Wilson, their chief inspector, had been received with respect to the final effluent, which found its way into the South Yorkshire Canal at Elsecar. The last analysis of the effluent which had been submitted to Dr. Wilson showed the solids in suspension to be about an average of 10 parts per 100,000 gallons, and that, he submitted, left no room for doubt as to the necessity for the improvement scheme.

Paignton U.D.C. (March 25th. Mr. P. M. Crosthwaite).—£105 for the purchase of foreshore in Goodrington Bay, and £5,600 for laying out land between Preston Sands and Redcliffe-road, including the provision of public shelters and a convenience.—The clerk, Mr. J. R. Mill, stated that the council asked for a thirty years' repayment for Goodrington and sixty years for Preston. The surveyor, Mr. E. O. Baines, said the proposed works embraced the filling up of the low-lying portions of Preston land, the construction of a promenade at the back of the sea wall, laying drains for the conveyance of spring and subsoil waters, and the erection of conveniences, shelters, seats, rockeries, and sloping embankments. The whole had to be completed within two years from the date of completing the purchase in July, 1913. The promenade was to be 25 ft. wide by 1,000 ft. long, with approaches from Manor-road and Redcliffe-road. The western edge of the promenade would be formed with rough dry walling in limestone, set as a rockery. At the back of this wall embankments would be formed right along the west of the promenade. Four shelters, similar in design to those on the Paignton front, would be erected.

Preston R.D.C. (March 18th. Mr. W. M. Cross).—£12,075 for purposes of sewerage and sewage disposal for the townships of Little Hoole and Longton.—The borough engineer of Blackburn, Mr. W. Stubbs, said he had carefully inspected the districts, and had considered the proposed schemes. The population of both districts was so scattered and the land so flat that a satisfactory scheme of sewerage by gravitation methods was almost impossible, and to employ pumping in any form would add not only to the capital outlay, but would enormously increase the yearly upkeep. Mr. H. Heaton's scheme of gravitation, assisted by flushing chambers, should be quite satisfactory. He calculated that the 9-in. sewer would deliver 413,000 gallons per day, and the 12-in. 890,000 gallons. He considered the detritus and settling tanks, as designed, to be capable of dealing with the sewage, but it was a question whether it would not be advisable for the overflow from the tanks to be carried by means of an 18-in. outfall sewer into the river below the floodgate. That would entail an extra expenditure of £1,000.

Rhyl U.D.C. (March 31st. Mr. P. M. Crosthwaite).—A further sum of £4,259 for dredging.—The council, it was explained, had undertaken dredging to drain the river in connection with the sewerage scheme. A dredging fleet had been purchased, and the sum already borrowed had been swallowed up in the plant and dredging. It was now necessary to cut off a bend in the river and to carry out other works. Mr. Baldwin Latham said he could not say what the total cost of the dredging would be, as delays meant silting up.

Wakefield T.C. (March 26th. Mr. M. K. North).—£17,813 for sewerage extension works.—Mr. A. C.

Allibone, town clerk, stated that the loan is required for the provision of sewers for the undrained part of Sandal, and, by arrangement, for dealing with the sewage of Crigglestone within the area of the Wakefield Rural District Council.

APPLICATIONS FOR LOANS.

Aberdare U.D.C.—£15,350 for the purposes of water supply.

Bowland R.D.C.—£2,180 for sewerage works.

Brighouse T.C.—£563 for sewerage works.

Bromley T.C.—£13,234 for wood paving.

Cheimsford T.C.—£1,000 for the erection of an engine-house and the provision of pumping machinery.

Harrogate T.C.—£7,300 for a water supply scheme.

Haslingden T.C.—£220 for surface-water drainage.

Listowel R.D.C.—£2,600 for the purposes of the waterworks, and £430 for sewerage works.

Llandudno U.D.C.—£4,855 for workmen's dwellings.

Newton Abbot R.D.C.—£600 for the purchase of land for the erection of twelve houses at Chudleigh and £2,400 for the erection of the houses.

Romford R.D.C.—£2,095 for making up certain streets, and £470 for surface water drainage.

Skiffelagh R.D.C.—£1,155 for the erection of cottages.

Stoke-on-Trent T.C.—£5,875 for conversions to the water-carriage system.

Sunderland R.D.C.—£4,360 for sewerage works.

Sutton (Surrey) U.D.C.—£1,600 for main road improvement.

Walthamstow U.D.C.—£674 for road widening.

LOANS SANCTIONED.

Barking U.D.C.—£930 for road widening.

Belper R.D.C.—£655 for a water supply for Kilburn and district.

Cheshunt U.D.C.—£255 for street improvement.

Essex C.C.—£1,728 for a school at Messing, and £506 for the provision of an engineering school at Colchester.

Gloucester T.C.—£5,250 for water supply extensions.

Haverfordwest T.C.—£5,000 for the gasworks.

Hfracombe U.D.C.—£1,050 for the purchase of property for a public improvement.

Newbury T.C.—£2,545 in respect of sewerage works.

Southend T.C.—£4,250 for the provision of a public pleasure ground.

Stoke-on-Trent T.C.—£2,500 for a new police station at Fenton.

Wellingborough U.D.C.—£360 for road widening.

FORTHCOMING INQUIRIES.

	APRIL.	£
6.— Wilton-upon-Thames. For works of sewerage (Mr. R. H. Bicknell) ...		1,600
7.— Altrincham. For street works and the provision of a public convenience (Mr. F. H. Tulloch) ...		1,265
7.— Gravesend. For electricity extension (Mr. P. M. Crosthwaite) ...		13,600
7.— Great Harwood. For works of sewage disposal (Mr. F. O. Stanford) ...		15,000
7.— Lincoln. For burial ground purposes (Mr. M. K. North) ...		1,100
8.— Dartford. For tar-paving works and public park extension (Mr. Edgar Dudley) ...		1,991
8.— Disley. For sewage disposal works (Mr. F. O. Stanford) ...		2,239
8.— Eccles. For the erection of offices (Mr. F. H. Tulloch) ...		1,110
8.— Sheffield. For the purposes of telephonic fire alarms and street works (Mr. M. K. North) ...		12,059
9.— Loigh. For gas supply purposes and street improvement (Mr. F. O. Stanford) ...		17,672
9.— Mansfield. For sewerage and street works (Mr. M. K. North) ...		6,350
9.— Stockport. For the purposes of street improvement and public pleasure grounds (Mr. F. H. Tulloch) ...		11,987

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Cambridge £4,500, Derby £6,000, Redruth; housing and town planning—Coventry, Leicester; roads and materials—Penistone, Romsey, Scarborough £25,000; sewerage and sewage disposal—Branston £21,600, Folkestone £29,000, Redruth £25,000; water, gas and electricity—Atherstone £15,000, Coventry, Withernsea.—Particulars of other works projected will be found on our "Local Government Board Inquiries" page.

BUILDINGS.

Bourne R.D.C.—An isolation hospital is to be built at an estimated cost of £1,000.

Brighton T.C.—Plans have been approved for the construction of a new bandstand and concert hall on the West Pier.

Cambridge T.C.—The Guildhall buildings are to be enlarged, at an estimated cost of £4,500, and premises are to be purchased for conversion into lodging-houses and baths for women.

Derby T.C.—A proposal has been made for the enlargement of the public library and art gallery, at an estimated cost of £6,000.

Inverness T.C.—It has been agreed to purchase, at a cost of £3,000, a house and grounds for the purposes of an infectious diseases hospital and sanatorium.

Lowestoft T.C.—The tender of Mr. James Wales, Lowestoft, at £1,632, has been accepted for additions to the hospital.

Redruth U.D.C.—The Sanitary Committee has been asked to consider the question of constructing an underground public convenience.

St. Helens T.C.—The Watch Committee has decided to build branch police stations to serve the outlying districts of Clock Face and Derbyshire Hill.

Sunderland T.C.—The borough engineer, Mr. J. W. Moncur, has received instructions to proceed with the alterations at the Diamond Hall school, the cost of which is estimated at £387.

Torquay T.C.—The tender of the Stanton Iron Company, Nottingham, at £3,353, has been accepted for the cast-iron pipes for the first section of the new water main, and the tender of Mr. Duke, Plymouth, at £1,079, for laying the main.

HOUSING AND TOWN PLANNING.

Bungay U.D.C.—It has been decided to purchase land for the erection of twenty houses.

Coventry T.C.—The council have adopted a recommendation from the Housing Committee that a housing scheme be prepared in connection with Leicester-street improvements, and that 101 houses already sanctioned be allocated for the purpose of the scheme.

Leicester T.C.—It was announced at the council meeting on Tuesday that the borough surveyor, Mr. E. G. Mawbey, had for the past three years been at work upon a town plan, which would in a short time come before the council for discussion.

Midhurst R.D.C.—The council have adopted the scheme of the surveyor, Mr. A. G. Gibbs, for the erection of two pairs of cottages at Milland, at an estimated cost of £775.

Pembroke (Co. Dublin) U.D.C.—The council last week affixed the seal to the necessary deeds for borrowing £81,418 for the provision of working-class dwellings.

Petworth R.D.C.—A start is to be made with the housing scheme by the erection of four cottages at Fittleworth.

PARKS AND OPEN SPACES.

Salford T.C.—The council have accepted, with thanks, the offer of Sir Arthur Percival Heywood to convey to them a portion of the Light Oaks estate, Pendleton, for the purposes of a park. The area is some 11½ acres, and the gift includes a mansion.

West Ham T.C.—At a cost of £10,000 the council have decided to purchase the freehold of the sports ground and a portion of the Memorial estate at

Manor-road, West Ham, for the purpose of a public recreation ground.

REFUSE COLLECTION AND DISPOSAL.

Glasgow T.C.—The tender of the Patent Lightning Crusher Company, Limited, 14A Rosebery-avenue, Gray's Inn-road, E.C., has been accepted for the supply of two patent lightning dust manipulators, to be erected at the Partick destructor works.

ROADS AND MATERIALS.

Arbroath T.C.—Consideration is being given to an improvement scheme from Rosemount-road to Dundee-road, the estimated cost of which is £900.

Dulverton R.D.C.—At a meeting of the council last week Mr. D. J. Tapp (Dulverton's representative on Somerset County Council) attended and gave the council particulars regarding the County Works Committee's opinion as to the Exmoor road improvement and widening scheme. The scheme was started five or six years ago, when a tender was accepted at about £3,317. The firm was allowed to relinquish the work some time ago, and it transpired that the scheme had already cost £5,774, which with £1,736 estimated expenditure for the year amounted to a total of £7,510. A short time ago the county surveyor, in company with Mr. Berryman (chairman of the County Works Committee), motored over the Brendon road. The day was wet, and the road in a bad condition owing to incessant rain. Consequently the county surveyor's report on the road to the County Works Committee was very unfavourable. The grant of £500 promised by the county council on condition that the Brendon road work was completed by Lady-day to the county surveyor's satisfaction would not now be forthcoming. After some discussion the council resolved to complete the work as soon as possible.

Langholm T.C.—The road surveyor, Mr. R. Milligan, has prepared a report on the improvement of the High-street, which forms part of the trunk road from Carlisle to Edinburgh, and it is expected that the street, which is an old macadam roadway, will soon be put into a good condition. The Road Board are expected to spend a large sum in improving the trunk road, and it is anticipated they will help in putting High-street into a satisfactory state.

Middlesex C.C.—Messrs. W. Griffiths & Co., contractors, Bishopsgate-street, E.C., have secured the contract for laying 56,248 super. yds. of paving on some of the county main roads, with 38,387 ft. run of 12 in. by 8 in. granite kerbing.

Penistone R.D.C.—The council have referred to the county authority the scheme for repairing a portion of the Sheffield Wadsley, and Manchester turnpike road, from Flouch to Fiddler's Green, about 3 miles in length. The surveyor, Mr. W. Howard, estimates the cost of the work at £4,669.

Rickmansworth U.D.C.—A widening scheme is to be carried out in High-street, at an estimated cost of £3,000.

Rotherham T.C.—The council on Wednesday passed a series of resolutions which will result in the corporation purchasing the West Riding Court House and St. George's Hall for the widening of College-square and Eflingham-street. The scheme involves the removal of the cattle market to the new site in Millgate.

Romsey R.D.C.—The surveyor, Mr. C. Dyson, having submitted a report on the subject, the Roads and Finance Committee have been instructed to consider the purchase of a steam roller.

St. Ives (Cornwall) T.C.—The council have adopted the scheme of the borough surveyor, Mr. S. Palmer, for making good Wharf-road and erecting a sea wall from the Custom House to the public latrine, at an estimated cost of £950.

Scarborough T.C.—Approval has been given to a scheme for the construction of a new road from the centre of the town through the east ward, at an estimated cost of £25,000. The Road Board will be asked to make a grant in aid of the project.

Swansea T.C.—A scheme for a larger widening having fallen through, an alternative proposal for

setting back the corner of Temple-street and Castle-street is to be carried out.

Tavistock R.D.C.—The clerk, Mr. A. K. Johnstone, reported recently that the auditor held that the council ought to pay for the new steam roller outright, and that by paying by instalments they were incurring a loan without permission. If they paid outright they would have to make provision for £360. The council resolved to ask for the sanction of the Local Government Board to pay for the roller by instalments.

Westminster B.C.—The council have decided to repave a number of streets, and have issued a memorandum containing the dates fixed for the work in each thoroughfare concerned.

SEWERAGE AND SEWAGE DISPOSAL.

Brampton R.D.C.—The Local Government Board have returned the scheme of sewerage and sewage disposal for Castle Carrock for amendment in certain details. The estimate of cost is £1,240, but the council are advised to submit a revised estimate if the suggested alterations involve an increase in the amount of the proposed loan.

Branston R.D.C.—It has been agreed to ask the Local Government Board for sanction to a scheme prepared by the sanitary surveyor, Mr. T. R. Howitt, for sewage disposal in Boultham, part of the parish of Skellingthorpe, and the parish of North Hykeham. The estimated cost is £21,600.

Chester-le-Street R.D.C.—The surveyor, Mr. J. H. Mole, has been authorised to prepare a scheme of sewage disposal for Black House.

East Westmorland R.D.C.—The Pollution of Rivers Committee of the county council inquired what progress was being made with the abatement of the river pollution. They thought the time had now arrived when the district council should be in a position to submit to them a scheme for dealing with the sewage. It was stated by a councillor that "the thing had been going on for years," and eventually a committee was appointed to go into the matter.

Folkestone T.C.—The scheme for the construction of relief sewers is estimated to cost £29,000, and Messrs. James Mansergh & Sons, Victoria-street, London, have been appointed engineers.

Redruth R.D.C.—A drainage scheme for the Hlogan-Portreath district is engaging attention, and Major Tulloch has prepared a report on the subject. The estimated cost is approximately £25,000.

Romford R.D.C.—The tender of Messrs. Petters, at £66, has been accepted for a 3-in. pump and 5-b.h.p. oil engine, for lifting the sewage from the low level sewer.

Wallington U.D.C.—The cost of the sewage disposal scheme, for which a loan of £4,700 has been sanctioned, will now be supplemented by a further charge of £8,200 for 56 acres of land at £135 per acre, the construction of a culvert on the land, and the erection and maintenance of fences.

WATER, GAS, AND ELECTRICITY.

Atherstone R.D.C.—A scheme for supplying the Atherstone district with water from the new borehole is now being prepared for the Local Government Board. Dr. H. Lapworth, M.INST.C.E., who recommended the boring, and has acted as consulting engineer during its sinking, will continue to act as joint engineer with Mr. H. J. Coleby, engineer and surveyor to the council, in preparing and carrying out the new scheme, which is estimated to cost about £15,000.

Battle U.D.C.—With the object of purifying the water and increasing the supply, it has been decided to proceed with the work of deepening the new well at the waterworks and connecting it with the borehole.

Coventry T.C.—The Waterworks and Fire Brigade Committee recommend the council to adopt a scheme for the treatment of water from the Whitley Well so as to safeguard it for drinking purposes. The cost of the scheme will be £3,500.

Dunoon T.C.—The tender of Mr. Ewan Cameron, Dunoon, at £5,819, has been accepted for the construction of a new reservoir to give an additional 17,000,000 gallons.

Hackney B.C.—The council have decided upon a further extension of electricity generating plant at an estimated cost of £15,750. The proposed plant includes a 5,000-kw. turbo alternator, with condensing plant and accessories, and an extension of the switch gear.

Hammersmith B.C.—The nett surplus on the accounts of the electricity undertaking for the current year is estimated at £6,328.

Hampstead B.C.—The council have adopted a recommendation of the Lighting Committee to reorganise the staff of the electric supply department, and, in order to give the officials and permanent workmen some distinct personal interest in the success of the undertaking, have decided to allow them in future to participate in a proportion of the profits. The staff and workmen total 139.

Llanelly R.D.C.—An agreement has been signed with the Swansea Rural District Council for the supply of water to Hendy at 1s. per 1,000 gallons.

Llangollen R.D.C.—It has been agreed to obtain a supply of water for Garth from the Cefn Water Company.

Manchester T.C.—The Electricity Committee have completed arrangements for an improvement in the lighting of the central parts of the city. It is intended to proceed with a further installation of metallic filament lamps in Oxford-road from Whitworth-street to All Saints'. In Oxford-road the lamps will be suspended from the arms of the existing tramway poles. From Whitworth-street to Deansgate the thoroughfare will be lighted by arc lamps suspended in the centre.

Marylebone B.C.—It has been agreed to ask for sanction to a loan of £5,521 for a third rotary converter, and a duplication of the canal condensing equipment.

Newmill U.D.C.—The question of the construction of a reservoir, as advised by Messrs. Marriott, Son & Shaw, engineers, has been referred to a committee for consideration.

Salford T.C.—Authority has been given to the Gas Committee to borrow £70,000 for various purposes, including cooking stoves, fires, and meters.—The tender has been accepted of West's Gas Improvement Committee, Limited, Manchester, for the supply and erection at the Regent-road gasworks of an installation of Glover-West vertical retorts, with all necessary machinery and apparatus, for the sum of £25,720.

Saxmundham U.D.C.—The Local Government Board have sanctioned a scheme of water supply for the urban district.

Withernsea U.D.C.—Proposals with respect to a new water supply scheme are to be submitted to the Local Government Board.

PERSONAL.

Mr. Joseph Hackett, an assistant surveyor of Tyrone, has resigned.

Mr. A. A. Peccaver, surveyor to the Long Sutton Urban District Council, has been granted an increase of salary.

Mr. W. W. H. Musselwhite, surveyor to the Wilton Town Council, has resigned after twenty-five years' service.

Mr. W. Dengate, surveyor to the Horsham Rural District Council, has been voted an increase of salary of £25 per annum.

Mr. John Bennett, L.R.I.B.A., Bolton, has been appointed architect to the Exeter City Council, out of 209 applications.

Mr. F. P. Cook, surveyor and water engineer to the Mansfield Woodhouse Urban District Council, has received an increase of salary.

Mr. Charles Newell, Dungannon, has been appointed assistant surveyor under the Tyrone County Council in the place of Mr. J. H. Mitchell, resigned.

Mr. James Smellie, Airdrie, has been appointed water engineer to the Dumfries and Maxwelltown Water Commission, in place of Mr. Nigel B. Wilson, resigned.

Mr. John A. McLeod, burgh surveyor and inspector of Girvan, has resigned, and the town council are advertising for a successor at a commencing salary of £120 per annum.

Mr. H. T. Chapman, who was recently appointed to succeed Mr. H. P. Maybury as county surveyor of Kent, terminated his connection with the Somerset County Council on Tuesday.

Mr. H. Richardson, electrical engineer of Dundee, who was recommended by the Electricity Committee for appointment as electrical engineer of Salford, having withdrawn his candidature, the town

council on Wednesday appointed Mr. J. A. Robertson to the post at a salary of £1,000 a year.

Mr. H. C. Marks, city surveyor of Carlisle, has been felicitated upon the fact of the city having become a county borough. Mr. Marks is now one of the principal officers of a city of 52,000 inhabitants, a place which at the beginning of the eighteenth century was described as "a dirty little town of mud, and daub and thatched roofs, with deep gutters for filth running through all the streets, whose only trade lay in a weekly market."

Mr. E. J. Elford, borough engineer and surveyor of Southend, is to be congratulated upon the advance of his official status consequent upon the town having been made a county borough. A mayoral banquet was held on Wednesday to celebrate the event, and in the course of the proceedings striking figures were quoted showing the borough's growth and development. In twenty-one years, it was stated, £276,650 had been spent upon sewerage works. The death-rate was 10.3, whereas the average of the ninety-five towns was 14.7. It was added that the completion of the sea front would provide a promenade nearly 5 miles in length.

FOR OTHER ADVERTISEMENTS

See End of Paper.

COUNTY COUNCIL OF EAST SUSSEX. SEA DEFENCES.

Tenders are invited for the carrying out of certain Sea Defence Works between the Ventilating Shaft at Roedean and Rottingdean, and also at Saltdean, in the Parish of Rottingdean.

Plans may be seen, and copies of the Specification, Conditions of Contract, and Bills of Quantities may be obtained, at the County Surveyor's Office, or at the Office of Dr. J. S. Owens, 47 Victoria-street, London, S.W., upon payment of a deposit of Three Guineas, which will be returned upon the receipt of a *bonâ-fide* Tender.

Sealed Tenders, endorsed "Tender for Sea Defence Works," and addressed to the Chairman of the Roads and Bridges Committee, must be delivered at the County Hall, Lewes, not later than Saturday, the 25th April, 1914.

F. J. WOOD, ASSOC. M. INST. C. E.,
County Surveyor.

County Hall, Lewes.

April 1, 1914.

(1,500)

MANCHESTER CORPORATION.

The Rivers Committee invite Tenders for the Construction of Main Drainage Work No. 2c. (New Outfall Sewer, Chester-road to the Cheshire Lines Railway).

Plans may be seen, and Specifications, Bills of Quantities, and Forms of Tender obtained, on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of the sum of £10 10s., which sum will, after the Corporation have come to a decision upon the Tenders received, but not before, be returned to the person submitting a *bonâ-fide* Tender.

All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester."

Tenders, enclosed in the official envelope, and addressed to the Chairman of the Rivers Committee, are to be delivered at the City Surveyor's Office not later than 9.30 a.m. on Monday, April 20, 1914.

The Corporation do not bind themselves to accept the lowest or any Tender.

THOMAS HUDSON,

Town Clerk.

Town Hall, Manchester.

April 2, 1914.

(1,501)

CORPORATION OF THE CITY OF CAPE TOWN.

APPOINTMENT OF ROAD ENGINEERING ASSISTANT.

The undersigned are authorised to receive applications for the position of Road Engineering Assistant, at a commencing salary of £500 per annum, rising by increments to a maximum salary of £600 per annum.

Candidates must have had considerable experience

in the construction and maintenance of modern roads, and be capable of preparing plans and estimates for new works, of supervising all road works within the limits of the Municipality, setting out new works, and seeing that the various works foremen are keeping their districts in good order and securing the best results from the votes provided for road maintenance.

The Corporation will supply the officer appointed with a first-class passage from England to Capetown.

Applications, accompanied by copies of not more than six testimonials of recent date, must be forwarded to the undersigned not later than Monday, 20th April, 1914.

DAVIS & SOPER,

Agents of the Corporation of the City
of Capetown.

54 St. Mary-axe,

London, E.C.

March 31, 1914.

(1,497)

LEWISHAM.—For the enlargement of the Kilmorie-road school, for the London County Council:—

W. Downs, Walworth	£11,382
W. Akers & Co., Limited, South Norwood	10,993
Triggs & Co., Clapham	10,841
F. & T. Thorne, Isle of Dogs	10,644
G. E. Wallis & Sons, Limited, Haymarket	10,560
C. Wall, Limited, Chelsea	10,518
G. Godson & Sons, Kilburn-lane	10,466
T. D. Leng, Deptford	10,270
J. Smith & Sons, Limited, South Norwood	10,209
W. Smith & Son, Harleyford-road	10,165
W. Moss & Sons, Limited, Loughborough	10,020
F. & H. F. Higgs, Herne Hill	9,993
J. & C. Bowyer, Limited, Upper Norwood	9,889
H. L. Holloway, Deptford †	9,876

Architect's estimate, £9,786.

ST. PANCRAS.—For the remodelling of Burghley-road school, for the London County Council:—

Thomas & Edge, Woolwich	£19,198
W. King & Son, Vauxhall Bridge-road	19,030
Rowley Brothers, Wood Green	18,967
McCormick & Sons, Limited, Essex-road	18,733
G. E. Wallis & Sons, Limited, Haymarket	18,656
J. Smith & Sons, Limited, South Norwood	18,548
J. Chessum & Sons, South-place	18,388
W. Lawrence & Son, Finsbury-circus	17,872
C. P. Roberts & Co., Dalston	17,844
L. H. & R. Roberts, Lower Clapton-road	17,654
Brand, Pettit & Co., Tottenham	17,368
J. Willmott & Sons, Hornsey	17,289
J. & C. Bowyer, Limited, Upper Norwood †	17,167

Architect's estimate, 17,985.

WAKEFIELD.—For repaving work, for the corporation.—Mr. J. P. Wakeford, city surveyor:—

Wilson Brothers, Wakefield.

WHITECHAPEL.—For the erection of Vallance-road school, for the London County Council:—

Comyn, Ching & Co., Limited, Long-acre	£1,920
J. C. Christie, Aldgate	1,830
Wilson & Smith, Limited, Strand	1,780
Brightside Foundry and Engineering Company, Limited, Victoria-street	1,725
E. Deane & Beal, Limited, Monument-street	1,607
H. J. Cash & Co., Limited, Westminster	1,568
Cannon & Heford, Peckham	1,563
J. Cormack & Sons, Limited, Westminster	1,553
W. G. Cannon & Sons, Limited, London-road	1,550
R. H. & J. Pearson, Limited, Notting Hill-gate	1,549
Arding & Dyne, Southwark Bridge-road	1,529
Palowkar & Sons, Queen-street	1,493
G. & E. Bradley, Lever-street †	1,469

Architect's estimate, £1,600.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted † Recommended for acceptance.
‡ Provisionally accepted.

ASHINGTON.—Accepted for work of sewerage, for the urban district council.—Mr. G. Beatty, surveyor:—
R. Baxter, Blyth, Northumberland, £1,980.

CASTLEFORD.—For works of road improvement, for the urban district council.—Mr. W. Green, surveyor:—
E. A. Greaves, Castleford £379
Jonas, Rodgers & Son, Castleford † 377

CHESHAM.—For the reconstruction with cast-iron pipes of about 712 lin. yds. of 12-in., 977 yds. of 9-in., and 935 yds. of 6-in. existing stoneware pipe sewers and house connections with manholes and flushing chambers, for the urban district council.—Mr. Percy C. Dormer, engineer and surveyor:—

A. Mead & Son, Chesham	£3,658
E. Free & Sons, Maidenhead	3,635
W. Wright, Chesham	3,539
F. W. Southson, Leicester	3,380
W. H. Shaddock, Plymouth †	3,162

Engineer's estimate, £3,363.

CHESHAM.—For the erection of twenty workmen's dwellings, for the urban district council.—Mr. Percy C. Dormer, engineer and surveyor:—

Honour & Son, Fring	£5,400
Hanson Brothers, Southall	4,279
H. & R. Abbott, Chesham	4,275
T. Bow, Nottingham	4,220
Organ & Son, Oxford	4,200
W. W. Freeman, Chesham	3,775
Clarke Brothers, Watford	3,700
Mead & Son, Chesham	3,650
Rust & Ratcliffe, Chesham	3,580
— Clark, Melton Mowbray	3,567
Grimsdell & Haddock, Chesham †	3,525

Engineer's estimate, 3,537.

GRIMSBY.—For the erection of a public convenience at Welholme-road level crossing.—Mr. H. Gilbert Whyatt, borough engineer and surveyor:—

J. H. Thompson & Sons, Limited	£466
G. Dixon	401
Borrill & Cheesman	349
Edwards & Raynor	329
Hewins & Goodband	320
W. Kirton	313
W. Gilbert	307
Swaby & Walsham	300
Taylor & Richardson	296
D. Seamer †	294

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

APRIL.

- 3.—Royal Sanitary Institute: Meeting at Southampton. Discussion on "The Housing, Town Planning, &c., Act, and its Application to the County Borough of Southampton." 7 p.m.
- 6.—Society of Engineers: Mr. A. S. E. Ackermann on "The Utilisation of Solar Energy." Institution of Electrical Engineers. 7.30 p.m.
- 7.—Institution of Civil Engineers: Mr. F. W. Cowie, M.I.N.S.T.C.E., on "The Transportation Problem in Canada and Montreal Harbour." 8 p.m.
- 20.—Institute of Sanitary Engineers: Mr. E. A. Lees, A.I.N.S.T.C.E., on "The Birmingham Waterworks." Caxton Hall, Westminster. 8 p.m.

MAY.

- 9.—Institution of Municipal and County Engineers: Meeting at Dover.
- 13.—Royal Sanitary Institute: Annual Dinner, Langham Hotel.
- 23.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham; Mr. A. S. Parsons on "Bridge Construction."

JUNE.

- 6.—Institution of Municipal and County Engineers: Meeting at Southend.
- 13.—Institution of Municipal Engineers: Western District Meeting at Tisbury. Mr. E. Plummer Davies on "Wiltshire Roads, Past and Present."
- 17.—Royal Institute of British Architects: Annual Dinner, Hotel Cecil.
- 24-27.—Institution of Municipal and County Engineers: Annual Meeting and Town Planning, Housing and Road Conference at Cheltenham.

100 PER CENT BETTER TERMS.

THE REASONS WHY.

(By a SPECIAL CONTRIBUTOR.)

"While giving thirty years for Cast-iron Tubes, we give only twenty years for Steel Tubes when not tapped, and fifteen years when tapped."

This, under any circumstances, would be a very notable announcement, whatever be the Business matter to which it related. For it means in the first instance 50 per cent, and in the second instance 100 per cent better terms.

It becomes outstanding—indeed, in more senses than one commanding—when we learn that the statement describes the conditions under which the Government sanctions loans for certain Public Health, Sanitation, and Illuminating Purposes.

The works were used in an explanation offered to the Representative of a leading South Wales Journal who had sought information at the Offices of the Local Government Board as to the reasons for a communication addressed by the Board to the Tredegar Urban District Council.

What *can* be the reasons for Terms so contemptuous of Steel Tubes?

"It is," continues the report in the *South Wales Daily News*, "because the Board are advised by their Engineering Experts that Steel Tubes have a shorter 'life' than Cast-iron Pipes."

A very sensible, sound, business-like reason, most people will agree—a reason to be taken to heart by municipal administrators everywhere.

This attitude upon the part of the Local Government Board, however, is scarcely justified—if we have regard, that is to say, to some recent instances of the "unservicability" of Steel Tubes for Water Mains—witness, among many others, the following:—

1. At Atlantic City, U.S.A., some seven miles of 48-in. pipe are being installed, at a cost of about £60,000 to £70,000, to replace steel piping only 12 years in use, this having already been found beyond repair.
2. At Troy, U.S.A., about seven miles of 30-in. steel pipe, which has gradually been going out of service since it was installed some thirteen years ago, is being replaced by Cast-iron Pipes, at a cost of about £45,000.

Are not the terms laid down by the Local Government Board, enormously favourable as they are to Cast-iron Pipes, altogether too generous to Steel Tubes?

One Hundred per Cent Better Terms! There must be very exceptional qualities in Cast-iron Pipes when they are so countenanced by a responsible Government Department. In addition to the initial economy, the community obtains reliable, and, in fact, almost everlasting work.

Surely the prudent men who man our municipal bodies will not permit themselves to be misled by the seeming cheapness of the first cost of a material capable of giving results like the above, so disastrous to the interests of the Commonwealth?—Adv't.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BOROUGH OF CHORLEY.

The Chorley Corporation invite applications for the appointment of a Temporary Assistant, with experience in Town Planning.

Applications, in candidate's own handwriting, stating age, experience, present employment, and salary required, and accompanied by copies of not more than three recent testimonials, to be sent to the undersigned, endorsed "Town Planning Assistant," not later than Friday, the 17th of April, 1914.

JNO. MILLS,
Town Clerk.

Town Hall, Chorley.
March 27, 1914.

(1,486)

SHANGHAI MUNICIPAL COUNCIL.

PUBLIC WORKS DEPARTMENT.

FOUR SURVEYING ASSISTANTS.

Four thoroughly qualified Surveying Assistants, with experience in town surveys and cadastral work, are required in the Public Works Department.

Candidates should be about 25 years of age and unmarried.

Salary, taels 250 per mensem, without allowances, under a three years' agreement, with first-class passage from home, half pay on voyage, and medical attendance. There is an excellent superannuation scheme.

The value of the tael at the present rate of exchange is about 2s. 7d., but it is liable to fluctuation. Taels 250 per mensem taken at Exchange 2s. 7d. is equivalent to about £385 per annum. Particulars of the appointment may be obtained of the Council's Agents, and applications, in Candidate's own handwriting, stating qualifications, experience, &c., accompanied by copies of not more than three recent testimonials, and endorsed "Surveying Assistants," should be forwarded, on or before April 21st, to Messrs. John Pook & Co., Agents for the Shanghai Municipal Council, 68 Fenchurch-street, London, E.C.

March, 1914. (1,412)

BOROUGH OF LEIGH.

The Corporation invite applications for the appointment of General Assistant in the Borough Engineer's Office. Salary £97 10s., rising to £104 in March, 1915.

Candidates must have been trained in a Borough Engineer's Office, and must have passed in at least some of the subjects for the Testamur of the Institute of Municipal and County Engineers.

Forms of application may be obtained from Mr. Tom Hunter, Borough Engineer, Town Hall, Leigh, Lancashire.

Applications, on prescribed Forms, together with copies of three testimonials, are to be delivered to the undersigned on or before 13th April, 1914.

W. H. COWBURN,
Town Clerk.

Town Hall,
Leigh, Lancashire.
March 26, 1914.

(1,484)

SEVERAL first-class DRAUGHTSMEN wanted at once in London, with experience of sewage disposal plant and drainage, and, in one case, of dust destructor work. Two juniors for similar work also required, and one first-class mechanical draughtsman with good knowledge of hydro-extractor design. Apply, with full particulars of experience, age and salary required, to Box 1,407, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,485)

DISS URBAN DISTRICT COUNCIL.
WATERWORKS ENGINEER.

The above Council invite early applications from persons capable of taking entire charge of the Machinery and Plant in connection with the Waterworks at Diss, and also of making connections for House Services from the Mains to the Stopcocks.

The Plant consists of duplicate 6-h.p. Suction Gas Engines, Producers, Pumps, and Water Softener. There are about 5 miles of Water Mains.

Applications, in candidate's own handwriting, stating age, previous experience, and salary required (a house is provided by the Council), together with copies of two recent testimonials, to be sent to the undersigned not later than Saturday, 18th April.

The person appointed will be required to take up the duties as soon as possible.

ALFRED COOPER,
Waterworks Superintendent.

The Terrace, Diss.
March 31, 1914.

(1,492)

SURVEYOR'S ACCOUNTS CLERK.

Required, during extensive road reconstruction work, a competent and experienced Clerk, accustomed to keep accounts, prepare pay sheets, attend to correspondence.

Salary 2 guineas per week.

Details of past experience, age, and copies of three recent testimonials to Box 1,409, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, London, E.C. (1,495)

CLERKS OF WORKS.—Required, two Clerks of Works, thoroughly experienced in the reconstruction of country roads, the preparation and laying of tar-macadam, and the control and direction of labour, cartage, rolling, plant, &c.

Salary 3 guineas per week.

Full particulars of past experience (and age), with three recent testimonials (copies), to Box 1,408, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,494)

ENGINEER AND SURVEYOR to Urban District short distance from London has vacancy for Pupil. Large sewerage scheme in hand.—Apply Box 1,393, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,423)

TO LOCAL AUTHORITIES.

EXPERIENCED SURVEYOR,
USED TO MUNICIPAL WORK,

is prepared to make accurate surveys, plans, &c., for town planning or other public purposes.

References to many Municipal Engineers.

Address—

Box 1,403, office of THE SURVEYOR,
(1,452) 24 Bride-lane, Fleet-street, E.C.

TENDERS WANTED.

PONTEFRACT CORPORATION WATER- WORKS.

ROALL PUMPING STATION.

The Corporation of Pontefract invite Tenders from firms of experienced Well Sinkers for the execution of the works comprised in Deepening the Existing Pump Well at Roall from 124 ft. to 200 ft. below the Engine-house floor, and driving Headings from the sides of the Well, and other incidental works for in-

creasing the yield of water and maintaining the supply to the District.

Drawings and Specifications may be seen at the Pumping Station, or at the Office of the Engineers, Messrs. G. & F. W. Hodson, M.INST.C.E., Bank Chambers, Loughborough, and copy of Schedule of Quantities and Form of Tender may be obtained from them on deposit of cheque for £10 10s., which will be refunded to all persons making a *bonâ-fide* Tender, and on the return of the documents to the Engineers.

Tenders are to be made out on the Form supplied, and sent to the undersigned not later than the 27th April, 1914.

In the event of a Tender being withdrawn the deposit will be forfeited.

The Corporation do not bind themselves to accept the lowest or any Tender.

Dated this 25th March, 1914.

WILLIAM HADDOCK,

(1,480)

Town Clerk.

MERTON AND MORDEN URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

The above Council invite Tenders for Surfacing about 22,000 sq. yds. of the Carriageway in Kingston-road, Merton, with Bituminous Material.

Specification can be seen and further particulars obtained on application to Mr. G. Jerram, Engineer and Surveyor, Council Offices, Kingston-road, Merton, on and after the 3rd April.

Scaled Tenders, to be endorsed "Tender for Surfacing Work," must be delivered to the undersigned not later than 4 o'clock p.m. on the 17th April, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

C. J. MOUNTFIELD,

Clerk to the Council.

District Council Offices,
Kingston-road, Merton, Surrey.
March 30, 1914.

SURVEYORS' INSTITUTION EXAMINATIONS.

COMPLETE COURSES OF PREPARATION in all Divisions and Sub-Divisions of these EXAMINATIONS are given, either in Class, by Correspondence, or in Office, by

Messrs. PARRY, BLAKE & PARRY and B. W. ADKIN.

The TWELVE MONTHS' and TWO YEARS' COURSES for the next Two Examinations are just commencing.

These Courses have been taken by the great majority of the successful candidates in these Examinations for very many years past, including the winners of **NINETY-SEVEN** out of the **ONE HUNDRED AND FORTY-FIVE** prizes awarded during the last nineteen years. The Beadel Prize for Agricultural Knowledge, awarded in the Land Agency Section of the Examination, has been obtained every year since its institution by Candidates prepared by **MESSRS. PARRY, BLAKE AND PARRY.**

For particulars of the Courses of Work or for any advice with respect to the Examinations, apply to—

Messrs. PARRY, BLAKE & PARRY, 82 VICTORIA ST., WESTMINSTER

Telephone No. : GERRARD 5680.

These Courses were established twenty-two years ago, and since that time no stone has been left unturned to raise them to, and maintain them at, the highest standard of efficiency.

COUNTY BOROUGH OF BURNLEY TO CONTRACTORS.

The Burnley Corporation invite Tenders for the Completion of the Construction of an Impounding Reservoir, with Catchwater, Aqueducts, Meter-houses, &c., at Hurstwood, near Burnley.

Plans may be seen, and Specification, Schedule of Prices, Form of Tender, and all other particulars obtained, on application to Messrs. James Diggle & Son, Engineers, Hind Hill-street, Heywood, Lancashire, on and after Monday, the 23rd February, 1914, on payment of a deposit of £5, which will be returned on receipt of a *bona-fide* Tender, accompanied by the Schedule of Prices, fully priced out, but not otherwise.

Scaled Tenders, endorsed "Tender for Completion of Reservoir," must reach me not later than Saturday, the 18th day of April, 1914.

Intending Tenderers are requested to notice that the time for sending in Tenders for the above works has been extended from April 10th to April 18th, 1914.

PEREGRINE THOMAS,
Town Clerk.

Town Hall, Burnley.
February 11, 1914. (1474)

COUNTY BOROUGH OF BURTON-UPON-TRENT. REFUSE DESTRUCTOR.

The Town Council invite Tenders for the extension of their Refuse Destructor at Bond End.

Particulars of capacity, site, &c., may be obtained from the undersigned, to whom Tenders must be delivered before 10 a.m. on Wednesday, the 29th April, 1914.

No Tender will be accepted from any party who pays his employees, whether artisans or labourers, less than the standard rate of wages paid in this Borough, or who does not conform to the hours and conditions of labour generally recognised in each branch of industry affected.

The Corporation do not bind themselves to accept the lowest or any Tender, and persons tendering must do so at their own expense.

GEORGE T. LYNAM,
Borough Engineer and Surveyor.

Town Hall.
March 31, 1914. (1491)

THE URBAN DISTRICT COUNCIL OF SUTTON (SURREY). TENDERS FOR MATERIALS.

The District Council invite Tenders for the Supply of the following Materials, &c., for the period ending 31st March, 1915—viz.:

- Form A Road Materials, &c.
- B Ironmongery, Oils, Paints, &c.
- C Coal and Coke.
- D Horse Forage.
- F Team Labour.

Forms of Tender may be obtained on application to the undersigned. Applications through the post

must be accompanied by a stamped addressed foolscap envelope.

Further particulars, if any, may be obtained from the Surveyor to the Council (Mr. Wm. Hedley Grieves), at the address below.

Scaled Tenders, endorsed "Tender for ——" must reach the undersigned not later than Wednesday, the 22nd April, 1914.

The Council do not bind themselves to accept the lowest or any Tender, and reserve the right of accepting any Tender, either for the whole or any of the items comprised therein.

H. BOLTON,
Clerk to the Council

No. 1,160.

Minutes of Proceedings.

Skidding and Road Camber.

In its issue of March 26th, our contemporary the *Commercial Motor* returns to the subject of recent articles in its leading column and in our own "Minutes" pages, in which references were made to a particular accident and to certain aspects of vehicle design and of road crust construction. What first attracted our attention to the matter was a conclusion jumped at by the writer of a leading article in a daily paper—namely, that an accident having occurred as the result of the skidding of a motor omnibus, this accident was probably due to excessive camber of the street surface. We desired to defend municipal engineers, and, in this case, more especially the borough engineers of London, from the imputation that when a case of skidding occurs it is likely to be due to the defective design of the street pavement. The places where the camber of a street surface is too steep will, in most cases, be found to be dominated by the levels of footways, entrances to houses, and drainage outlets, and by the money value of the unused life of an existing and costly concrete foundation and pavement. It will be seen that the desired alteration to the road camber cannot be made except at a considerable expense and, sometimes, not without the concurrence of authorities or departments not advised by the borough surveyor. The cost of the change may not be in itself a sufficient reason for indefinitely postponing the carrying out of the work necessary to reduce the camber, but it may be a sufficient reason why all these works cannot be carried out immediately—especially in view of the fact that rapid developments in the design of vehicles render it impossible to say exactly what camber will be suitable. Mr. Shrapnell Smith, the able editor of the *Commercial Motor*, will realise the difficulty which he would have in making a general change in the design of the motor vehicles of an existing service, even if the design were unsatisfactory in certain respects. The desired improvement might be incorporated in new vehicles, or whenever a vehicle was undergoing a general overhauling; but, as a matter of practical economics he would not condemn the whole fleet of vehicles. As regards the data quoted in the *Commercial Motor* of February 19th, we cannot accept the figures as conclusive, but agree that they have a value as evidence, and may be held to be of some significance. It must be remarked, however, that if data of this

kind point to the need for adopting a camber which is, for other reasons, too flat, it may be necessary to seek another solution, or to introduce another factor, and to aim at obtaining a better coefficient of friction between the tyre and the road. We have not suggested that the solid rubber tyre should be condemned, but in view of the possibility that it is not the last word in tyre construction, we consider that surveyors would not be justified in allowing the coefficient of friction of rubber tyres on certain kinds of pavement to dominate the situation.

As regards the effect of the diameter of the wheel upon the tendency to skidding, there are certain considerations which cannot be set forth except by a careful presentment of the mathematics and dynamics of the subject. There are, however, four more simple reasons why there is less tendency to skid with wheels of larger diameter. The larger the diameter of the wheel the greater is the area of road surface covered, for the same width of tyre, or, at least, the length of this area is greater, and the probability that a patch of sufficient roughness to resist side-slip occurs in the portion of road covered is correspondingly increased. In the case of a wood pavement this would practically mean that the probability of covering an effective piece of imbedded flint is increased. This particular advantage is not very great for rubber tyres, but it counts. More important is the fact that a wheel of larger diameter holds the road better, and is less liable therefore to that momentary slackening of grip which often initiates skidding. Thirdly, there can be with the larger wheel a brake-drum of greater diameter. It can, while allowing for the necessary clearances, be larger in proportion to the diameter of the wheel, which is an advantage, reducing the tendency to locking of the wheels. But even if the radius of the drum be no greater in proportion to the diameter of the wheel, the combined lengths of the two levers, brake-drum diameter and wheel diameter, will be greater; and therefore for the same actual retarding effect the actual strain due to putting on the brake will be greater, measured circumferentially. This means that the force exerted in the production of the necessary degree of circumferential strain at the tread of the wheel will be smaller. Therefore, the loads being the same, a smaller coefficient of friction suffices, and the wheel has less tendency to skid when the brake is put on. The same reasoning

applies to those changes in the force at the tread which occurs as the braked wheel rolls on.

These changes of force are due to important changes in the amount of the load, as the vehicle sways, or as the wheel passes over humps and hollows, corresponding to changes in the degree of compression of the spring. The wheel and brake with the longer strain, measured as an angle or circumferentially, will absorb less extra coefficient of friction when the load becomes less, because the distance through which the force acts, while that condition attains, is a greater distance. Force multiplied by distance is equal to the work done. Putting it another way, we can say that the elastic reluctance of the wheel and brake drum, and therefore their efficiency as an intermediary between the force on the brake and the force on the road is a measure of one of the factors of efficient braking. The same considerations, it may be remarked in passing, apply to propulsion, and the wheel of larger diameter is therefore less severe upon the road. Lastly, the wheel of larger diameter and the same strength will be subject to an angular strain, sideways, of greater dimensions for the same force exerted centripetally at bends, or when the vehicle is being steered to one side, or when, having begun to side-slip, its wheel comes to a rougher or less slippery part of the surface. This reduces the chances of side-slip, because the amount of the coefficient of friction needed to prevent or check the side-slip is smaller than it would be with a wheel of less diameter. To show that the combined effect of a number of factors, such as the advantages stated above, can be very considerable, assume that the advantage in the first case is so small that it is expressed by the factor $\frac{10}{100}$, the second by $\frac{2}{3}$, the third by $\frac{1}{2}$, and the fourth by $\frac{1}{3}$; the resultant advantage is expressed by the quantity $\frac{1}{2}$, an advantage of over 70 per cent, numerically, but really much greater, because in these matters the difference between just enough and not quite enough is very great, and may be all-important. The above reasoning, we fully realise, cannot be followed except by those who are competent to make calculations in applied mechanics, and are, at the same time, trained and experienced engineers, but there is no other way of explaining our point.

* * *

**Road Maintenance
Costs:
Recommendations
of the
Departmental
Committee.**

The recommendations of the Departmental Committee on Imperial and Local Taxation, with respect to the distribution of the burden of road maintenance, have been made, one may assume, on the understanding that although they might suggest the expediency of changes in the administrative system, they could not include an outline of such changes, but must be confined to proposals which could be carried out without altering the present system. The recommendations themselves are of such a character that those who wish strongly for radical changes, such as those involved in the recommendations made by the British Committee reporting to the Third Road Congress on the subject of "Qualifications of Engineers and Surveyors," will find in them the suggestion that some such changes are desirable. On the other hand, the more conservative reformers who wish to reform financial arrangements without affecting, to any important extent, the administrative arrangements, will probably refuse to admit that the recommendations of the committee can be regarded as pointing to the need for interference with the duties of the present road authorities. If the committee had recommended grants, the total of which would reach some £3,500,000, say, instead of £2,400,000, this might have been held to point to State control; or, if they had recom-

mended grants of three-quarters of the cost of maintenance of the first class of roads, this might have suggested an extension of the Road Board's powers to include the direct management of that class. Again, had they recommended a smaller grant for main roads, and larger grants for county roads, and more especially if they had proposed that there should be four classes, a third of which, important district roads, would receive a small *direct* grant from the Exchequer, this also might have been considered to foreshadow, not direct control of main roads, but supervision, in some degree, of all highways. Looking at the matter from the other point of view, the proposed grant of one-half of the cost of maintenance of roads of the first class is too high to negative the suggestion that some measure of control by a central authority may be contemplated. The recommendations preserve the principle of the joint responsibility of county and district authorities for certain classes of roads. As regards county boroughs, the committee evidently recognise that a distinction must be made between those boroughs, usually the smaller ones, in which a main road may preserve its character right through the borough, and, on the other hand, those in which main roads are absorbed in a general network of important thoroughfares, or, as a matter of traffic, lose the character of a main route.

The actual effect of the new arrangements would depend very much upon the decisions of the classifying authority. We cannot congratulate the committee on their suggestions as to the principles to be taken into consideration in deciding which roads are to be main roads. The expression "the recognised main roads" is meaningless unless it is stated whether this recognition is that involved in the use of the word "main," as applying to a road under the control of the county, or whether it is to mean that the road is a main road in common sense. If the former, a large mileage of relatively unimportant roads would be included. The common-sense interpretation is also very difficult of application, everyone agreeing as to a large mileage, but opinions differing widely as to the further mileages which should be included. As, however, in the case of urban areas, the Road Board would, it is recommended, decide where main roads cease to have the characteristics of such roads, it seems to be taken for granted that the board will adopt some method of deciding when a road is a main road, the logical result of this procedure being that the mileage of main roads will have to be just what it turns out to be, unless the whole of the work were to be done over again on a different basis. The suggestion that a thoroughfare to a railway station is necessarily a main road seems very unpractical, and another suggestion, that the old turnpike roads may all be included, is one which, though it would be reasonable in most cases, might not be so in all. The present powers of the Road Board are no doubt sufficient for the purpose of carrying out a classification of roads, but it would perhaps be better that further powers should officially be given to the board in order that they might feel justified in carrying out the work on the scale that is desirable, having regard to its great importance. This classification could be used as an instrument for adjusting the burden of the cost of road maintenance, in the light of the effects of topography, soil, climate, local industries, the nature of the local and through traffic, and the distribution of population; and this not only for each county, but also for each district, while the capacity of the local population to bear the cost of maintaining roads in good condition might also be considered, as regards the mileage to which, in each case, the Exchequer and the county contributions

would apply. It may be pointed out that a district which is traversed by many main roads is in one respect much better off than a district in which there are few main roads. In the former case the local traffic uses the main roads to a considerable extent, while in the latter case the corresponding traffic wears out roads which are maintained by the local ratepayers. The same principle applies to assisted roads.

Liability for Contractor's Negligence.

When an independent contractor is employed to execute works, questions not infrequently arise as to whether the employer is liable for the negligence of the contractor or his servants. As a general rule, it would appear that the employer is not liable, unless he has the power of controlling the contractor's servants, and of regulating the manner in which they do their work. Thus, where a contractor agreed with a local authority to supply a horse and man to draw one of their water carts, the man being selected and paid by the contractor, and the authority having no control over him except to tell him what streets to water, it was held that they were not liable for an accident caused by the driver's negligence (*Jones v. Liverpool Corporation*, 49 J.P. 311). But to this rule there are certain exceptions—viz., (1) where the act which a contractor is employed to do is one which, if done by the employer, would, though lawful, be done at his peril; (2) where a contractor is employed to do works which the employer is under a statutory obligation to execute; (3) where the work is, on the face of it, unlawful; (4) where the contractor is employed to do work in a place where the public are in the habit of passing, which work will, unless precautions are taken, cause danger to the public. In cases falling within either of the above categories the employer is liable for injury sustained by third parties by the negligence of the contractor's workmen, whatever may be the terms of the agreement as between the contractor and the employer.

From a practical point of view, and more especially as affecting local authorities, the second and fourth exceptions are, perhaps, the most important. In illustration of the second, there is, among others, the leading case of *Hardaker v. Idle District Council* (60 J.P., 196), in which a contractor employed by the council to construct a sewer had to remove soil from beneath a gas main. In replacing the soil the workmen neglected to repack it securely under the main, which broke and let gas into the plaintiff's house, and the council had to pay for the damage done. As an instance of the fourth, reference may be made to the recent case of *Hurlstone v. London Electric Railway and Another* (29 T.L.R., 514), in which the facts were rather special. A building agreement was entered into between the railway company and a firm of contractors, under which the latter were to build a superstructure over a station, and were to take a ninety-nine years' lease of it when finished. The necessary scaffolding and hoardings were to be erected by the contractors in such a way as should be reasonably approved by the company, and a gantry (necessary for raising materials to the top of the existing building) was to be erected in the manner specified in the agreement. The plaintiff, while walking in the street, was injured by timber which fell from the building during the carrying out of the works. It was held that the railway company were liable on the ground that they had a duty to safeguard the public during the building operations, and could not delegate that duty to an independent contractor. It appears, however, that it is quite competent to the employer, in such cases as these, to take an indemnity from the contractor in respect of liabilities of this kind, and that such an indemnity is not against public policy. Such, at any rate, was the decision of Mr. Justice Darling in *Newcombe v. Yeven and Croydon Rural District Council* (THE SURVEYOR, Vol. xliii., pp. 370, 388).

The Utilisation of Solar Energy.

The practical utilisation of the vast resources of energy which reach the earth in the form of solar rays is a problem which has attracted the attention and fascinated the imagination of mankind from very early times. Simple applications of the sun's heat—as, for instance, for cooking purposes—have long been practised by means of some device for concentrating the rays, but the conversion of this heat into other forms of practically useful energy on a commercial scale has hitherto been regarded rather as an inventor's dream. The history of the past hundred years ought to be sufficient to convince the most sceptical that there is practically no limit to the frontier of scientific research, but it is difficult for most people to realise matters which are beyond their own experience. A most exhaustive paper on "The Utilisation of Solar Energy" was read at the last meeting of the Society of Engineers. The author, Mr. A. S. E. Ackermann, confessed that he himself felt very doubtful as to the possibility of much achievement in this direction until he witnessed experiments in which water was made to boil by the unconcentrated rays of the sun. Since that time Mr. Ackermann has spared no pains to make himself a thorough master of the whole subject, in which he has done a good deal of pioneer work. The Society of Engineers were thus peculiarly fortunate in hearing a paper from one so eminently well qualified to deal with the matter. Beginning with an historical introduction, Mr. Ackermann proceeded to describe the several types of the Shuman sun-heat absorber, tracing the improvements which have been effected since the installation of the first plant in 1907, and discussing the conclusions to be drawn from the several trials of the various absorbers. The subject is essentially one of the future, and, as we believe, of a very great future, and in setting forth for the first time the results of reliable and official trials of sun power plants, the author of this extremely able and interesting paper has earned the thanks of all engineers who are interested in this vast question.

Attacks on Public Officials.

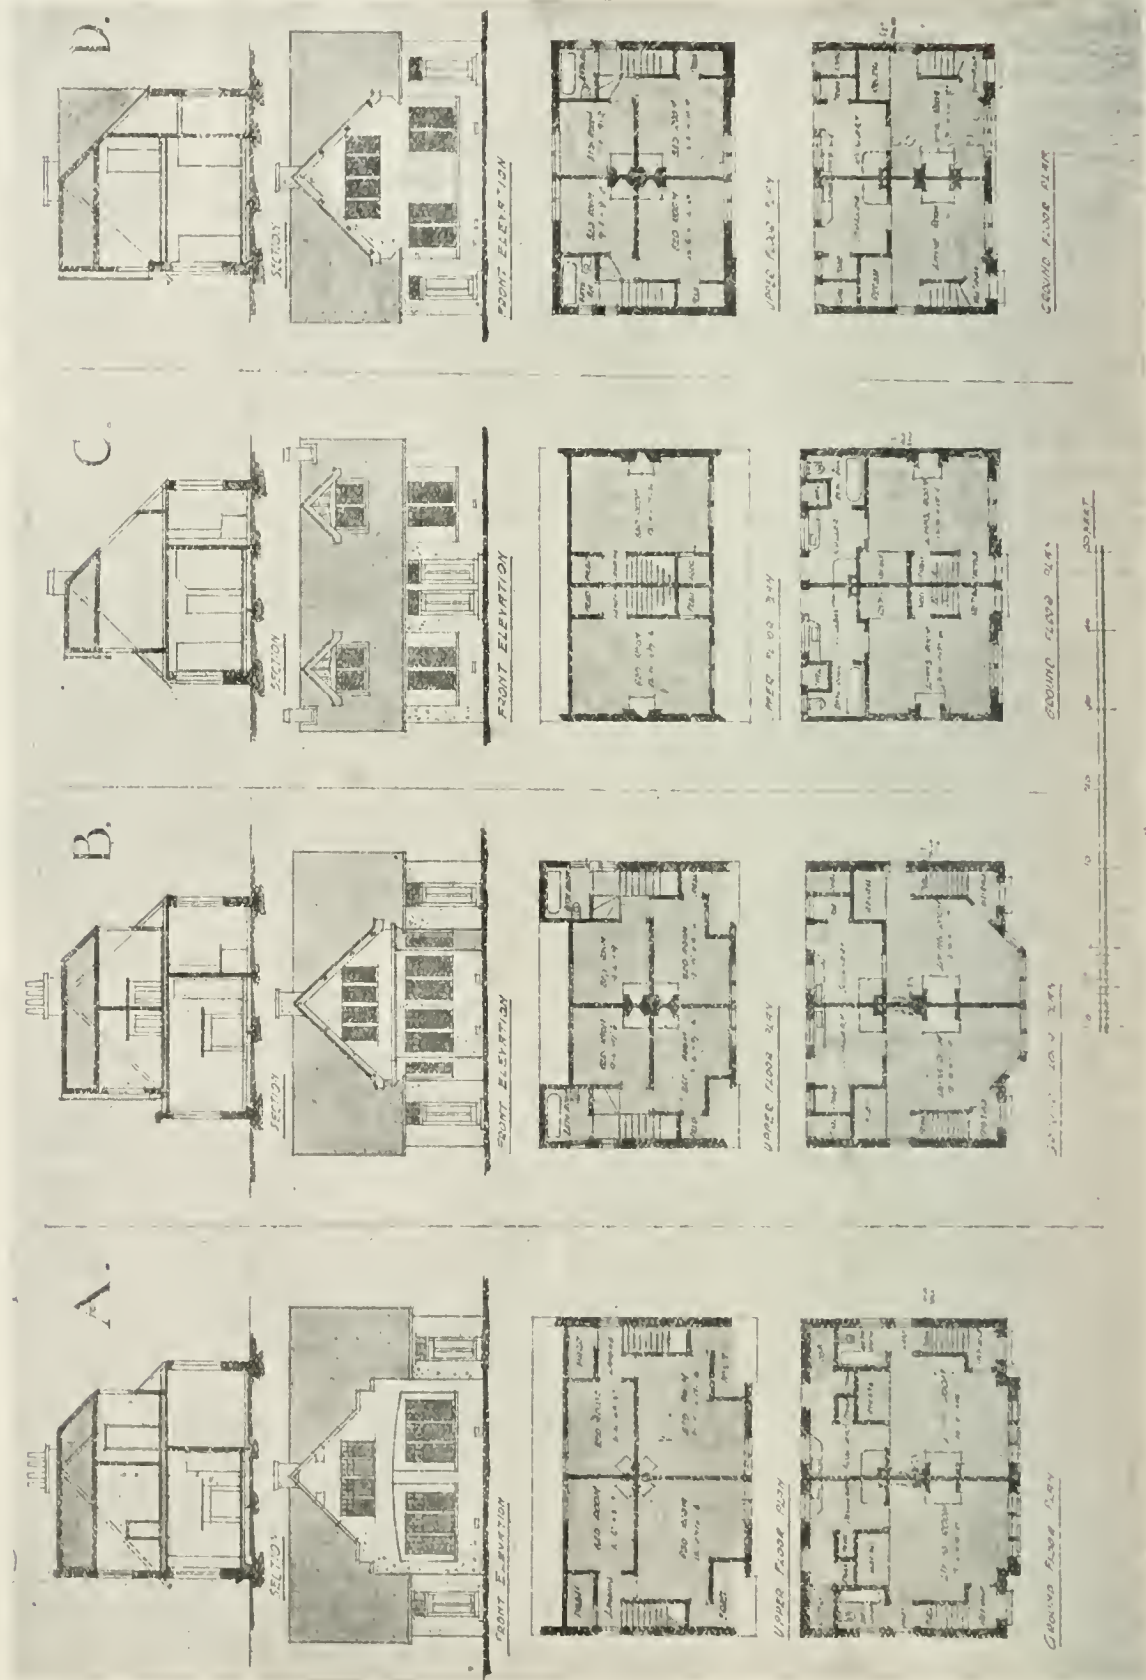

Public officials, who are so frequently the target of uninformed criticism, will be interested to know that in Bradford not criticism only is indulged in by newspaper correspondents, but libel of a particularly odious and wholesale type. Recently there appeared in the *Bradford Daily Telegraph* an anonymous letter in which the eleven road foremen of the city were pilloried most unmercifully. It was insinuated that their work involved no responsibility, though they are responsible for maintaining in repair over 120 miles of macadamised roads, not to mention other duties. Then it was suggested that they were incompetent and unfaithful to their employers, and by inference it was, of course, imputed that the city surveyor, Mr. W. H. S. Dawson, was lax in his superintendence of the foremen. On behalf of the latter a firm of solicitors has written a letter of protest to our contemporary, to which the editor appends the following footnote: "We regret that we have unwittingly been the means of reflecting upon the persons named in the above letter. At the same time we may also say that we disclaim any sympathy whatever with the views expressed in the letter to which exception is taken by Messrs. Sutcliffe & Trenholme on behalf of their clients, and accept their assurance that the allegations of our anonymous correspondent are unfounded." Some such withdrawal and correction was certainly called for, as it is obvious that a serious error of judgment had been committed in giving publicity to the letter. The incident serves to show how public servants are made inconsiderately the objects of promiscuous attack for no other reason, apparently, than because they are public servants.

Motherwell Housing Scheme.

THREE TYPES OF DWELLINGS ADOPTED.

As reported in our issue of last week, Mr. John Wilson, of the Local Government Board for Scotland, recently made his award in the competition for

type E, as illustrated in the accompanying plans. The cost, we now learn, will be rather over £14,000, including streets and sewers.

MOTHERWELL MUNICIPAL HOUSING SCHEME.
(Mr. A. Victor Wilson, B.Sc., L.R.I.B.A., Architect.)

a municipal housing scheme for the burgh of Motherwell. The successful architect is Mr. A. Victor Wilson, B.Sc., L.R.I.B.A., Motherwell. The council propose to erect thirty houses of type C, ten houses of type A, and eight houses of

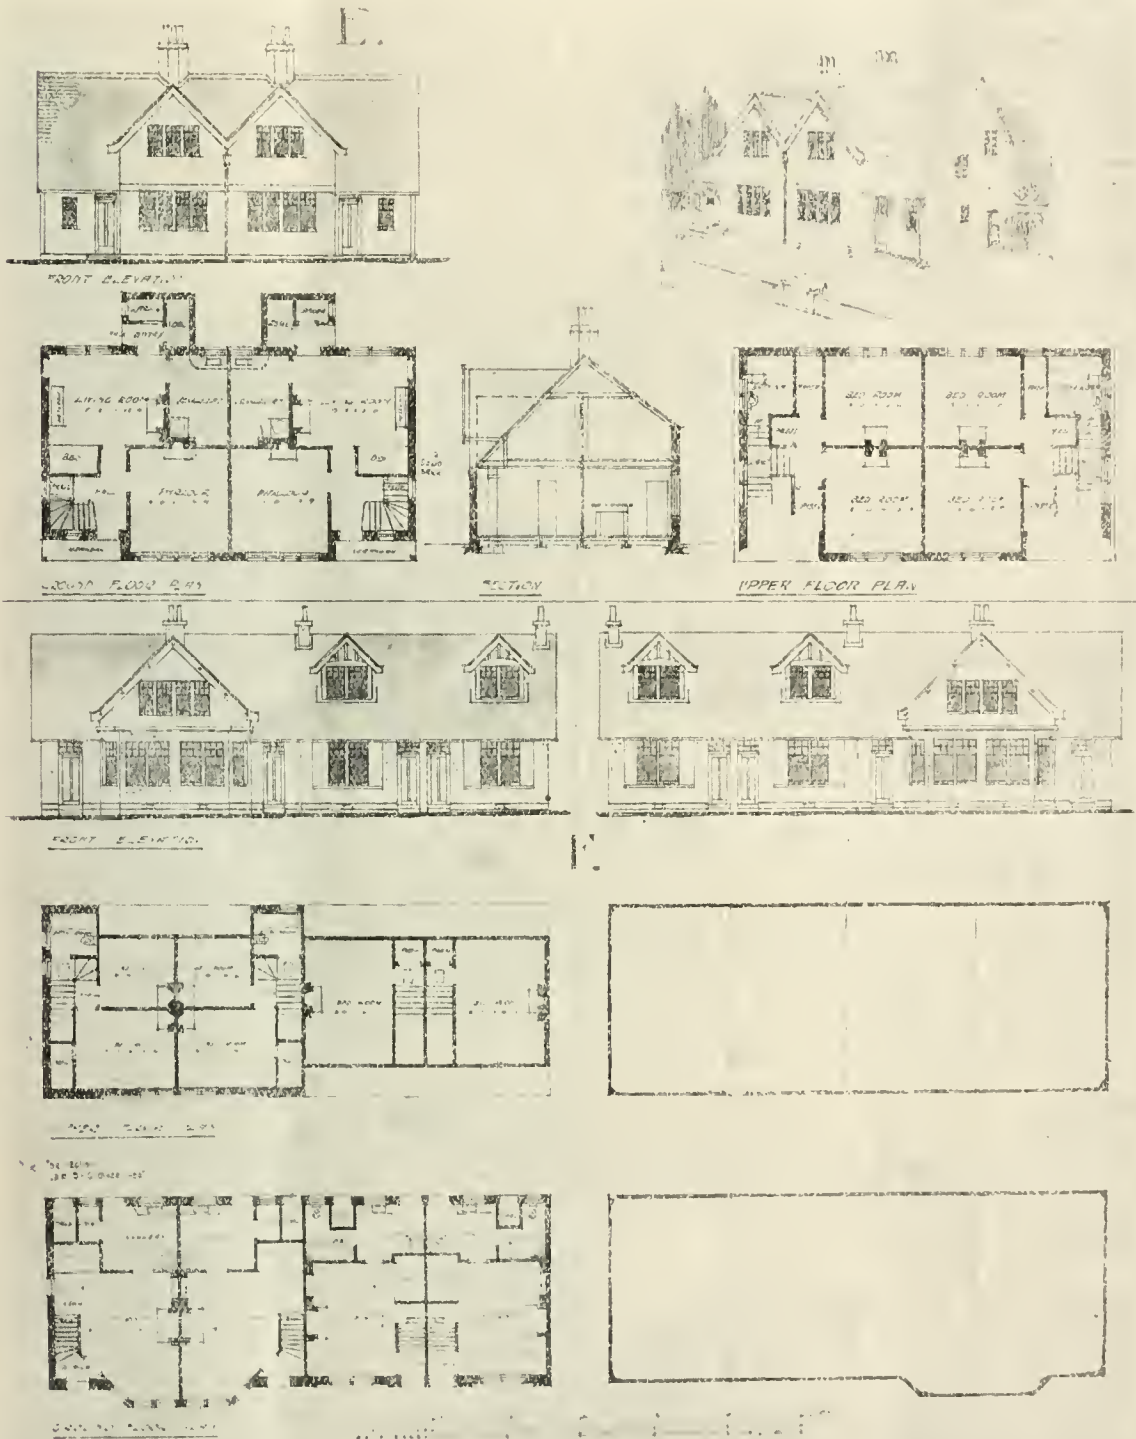

The area of land has been obtained from Lord Hamilton of Dalzell at £10 per acre, on condition that the council make all the streets and lay the sewers, and agree to reserve as a playground a triangular area facing the dwellings.

The houses are to be let at an economic rent—i.e., sufficient to clear all burdens—and so make the building not burdensome on the rates. There has been a great dearth of house-building in Motherwell, and the council have been compelled to take action in the matter.

The houses will be built of brick and roughcast with cement, and have slated roofs. The finishings

IS THE STREET TRAMWAY DOOMED ?

This is the somewhat startling heading given to an article which "A Well-known Municipal Engineer" contributes to last week's issue of the *Commercial Motor*. The increasing use of motor 'buses by the public is noted by the author, and after comparing the flexi-

MOTHERWELL MUNICIPAL HOUSING SCHEME.
(Mr. A. Victor Wilson, B.Sc., L.R.I.B.A., Architect.)

will be kept as plain as possible to give the best accommodation at the cheapest possible rent.

The Northwich Water Scheme.—Northwich Urban District Council have arrived at an agreement with the Middlewich Urban District Council by which Middlewich withdraw their opposition to the Northwich Parliamentary Water Bill on the Northwich Council undertaking, on the payment of pumping costs only, to make up any diminution in the Middlewich supply occasioned by the new undertaking, which is to cost £20,000.

bility of this means of conveyance with that provided by the tramcar, he asks whether the latter vehicle should be continued. "Is it right that any portion of a highway should be devoted to one class of traffic which is of such a rigid and inflexible nature that it cannot give way $\frac{1}{2}$ in. in order to accommodate the general traffic? The tramcar has no flexibility; it can only move in two directions—forwards and backwards—and consequently is, at times, the inevitable cause of serious obstruction. If a tramcar breaks down, or the line of tramway is obstructed in any way, the whole service of tramcars on that route is dislocated, with very serious results to the whole of the

traffic on that particular road. The speed also of a tramcar is governed by that of the traffic immediately in front of it; there is no possibility of escape either to right or left, and consequently everything has to get out of its way in order that it may proceed."

The writer of the article proceeds to point out that the enormous size of the modern tramcar makes it a serious source of danger to the ordinary traffic. "It is impossible for anyone driving behind a tramcar to see what is coming in an opposite direction, and the great length involves considerable time when trying to pass it when travelling in the same direction. A further danger arises from the fact that, owing to the position of the tram lines, the 'rule of the road' cannot be always followed in passing a tramcar, and consequently it has frequently to be passed on the wrong side. . . . It is even more dangerous when passengers are leaving a tramcar in order to reach the footpath. . . ."

"There is also the fact that, owing to the tram lines being constructed generally in the centres of carriageways, and that they are paved within their statutory limits, where the margins are unpaved tends to attract all the slow-moving vehicles to follow the lines of tramway instead of keeping to their proper near side, an obviously dangerous and most inconvenient practice, and quite contrary to the now generally agreed upon necessity that all slow-going traffic should keep as near the kerb on the near side as possible.

"There is another serious objection to the position of the tram lines in the centres of the carriageways where the margins between the statutory limits and the kerb are macadamised. It is universally agreed that the crossfall or camber of a carriageway can be greatly reduced where an impervious surface is adopted; but when tram lines were originally constructed, the margins were almost universally left macadamised, and now that this practice is being abandoned the camber cannot be altered except at the enormous cost of relaying the whole of the tram lines and paving, or by raising the kerb and footpath, which is often impracticable owing to the frontagers naturally objecting to being 'buried.'

"There is another point worth consideration, and that is with regard to the repair of the tramway lines. This obviously takes time, with the consequent dislocation of traffic, both of tramcars and the ordinary vehicles using the road or street."

The repair of the tramway lines is another point which the writer of the article suggests is deserving of consideration. "This obviously takes time," he remarks, "with the consequent dislocation of traffic both of the tramcars and the ordinary vehicles using the road or street." He admits that before the introduction of the internal combustion quick-running engine the tramcar was the democratic transporter of the "masses," but it was not, and never could be, a "door-to-door" or "kerb-to-kerb" conveyance like the motor omnibus.

"On the contrary, the passengers by tramcar have to walk to a stopping-place, and then have generally to cross half the carriageway, sometimes at the risk of their lives, to reach their vehicle. The same performance has to be repeated at the end of their journey, whereas with a motor omnibus all this is rendered unnecessary. Then again, for rapidity of transit the tramcar cannot compete with the motor omnibus for reasons already given, and also from the fact that high rates of speed with a tramcar may mean its leaving the rails with serious consequences. A breakdown of the tramway service means walking the rest of the journey, whereas if a motor 'bus breaks down the conductor will always transfer the passengers, free of cost, to another omnibus if of the same company. For 'cross' routes also it is evident that no tramcar can afford the facilities which are now given by any well-organised motor-omnibus service."

The article suggests, in conclusion, that the street tramway has become old fashioned and out of date, and must give way to the more popular, lively and mobile motor omnibus. "We have," the author observes, "put up with the improper use of our streets and roads for many years, but has not the time now arrived when this obstructive form of traffic should disappear, and our highways revert to the independent circulation of traffic for which they were originally intended?"

[It would be interesting to know whether the general body of municipal engineers are in agreement with the views expressed in the article above quoted, and we should be glad if readers would favour us with their opinions on the subject.—Ed. SURVEYOR.]

EXPERIMENTS ON THE OXIDATION OF SEWAGE WITHOUT THE AID OF FILTERS.*

By EDWARD ARDEN, M.Sc., and WILLIAM T. LOCKETT, M.Sc.

Under the above title is described an investigation which has been carried out at the Manchester Corporation sewage works at Davyhulme during the past twelve months.

The line of enquiry was suggested by Dr. Fowler, in the light of allied researches by the Massachusetts State Board of Health and others.

The essential point in the method now described is the production from sewage of a residuum, which has been termed "activated sludge." This is obtained as an accumulated deposit when successive quantities of sewage are completely oxidised by prolonged aeration.

This "activated sludge," once obtained in sufficient quantity, brings about the rapid purification of sewage when intimately mixed with it in the presence of a sufficient supply of air.

It is possible therefore by its means completely to purify sewage in a tank without the use of filters.

The experiments show that Manchester sewage can be purified by simple aeration in contact with this "activated sludge" in a period of from six to nine hours. By this means there is obtained an effluent showing at least as high a percentage purification as that resulting from the treatment of sewage by any system of bacterial filters.

The activated sludge differs very considerably in character from ordinary sewage sludge. It is in a well-oxidised state, and consequently entirely innocuous, and possesses an abnormally high nitrogen content as compared with the usual tank sludge.

During the course of the investigations, endeavours have been made to determine the conditions controlling the activity of the sludge and consequent purification of sewage.

The scope of the enquiry has been up to the present largely confined to experiments under laboratory conditions, and while the results have shown conclusively that the purification process can be readily maintained, a large amount of further research is required in order to obtain a thorough knowledge of its character and mechanism.

The method is, however, of so simple a nature that there would not appear to be any insuperable difficulties in translating the experiments described on to a working scale.

In view of the obviously great reduction in the area of works required and capital expenditure involved, the available data in regard to the probable cost of aeration are such as to lend encouragement to the idea that the adoption of aeration methods on the lines of these experiments would result in a considerable reduction in the total cost of sewage purification. In this connection it may be stated that the enhanced value of the resultant sludge should at least cover all costs incidental to its disposal.

The Langholm Water Scheme.—A report received from Messrs. Taylor & Wallin, Newcastle, the engineers of the scheme for augmenting the Langholm water supply, shows that the scheme has cost £7,177, which is £1,349 in excess of the estimate. The greater part of this was due to unforeseen circumstances.

Mold's Need of a Municipal Slaughterhouse.—The medical officer of health of Mold (Dr. Edward Williams) says in his yearly report that the slaughterhouses in that town are a serious nuisance and injury to health owing to their situation, want of supervision, and close proximity to dwellings. An abattoir should be seriously considered.

Kent and Road Board Grants.—The Kent County Council are making application to the Road Board for grants towards the improvement of a number of roads in the county, the improvement schemes embracing the following: Orpington, widening road and constructing new footpath, £325; Crayford, purchase of property, widening road, £870; Stone, constructing new footpath and widening portion of road, £925; Gravesend to Strood, extension of surface-water drains, constructing new footpaths, widening portion of road, £6,060; West Wickham, widening road, £3,225; and Bromley Rural, improving corner and widening Motttingham-lane, £638.

* Abstract of paper read before the Manchester Section of the Society of Chemical Industry on Friday last.

New York Sewage Problem.

METROPOLITAN COMMISSION AND EMSCHER TANKS.

Sedimentation is a standard form of sewage treatment which the Metropolitan Sewerage Commission of New York has recommended strongly in connection with some of its projects for the preparation of New York's sewage before discharge into the tidal waters, and its application as a general procedure for the sewage of Manhattan and Brooklyn, preparatory to discharging the effluent into the inner harbour, is a subject which has received much study. Such experiments as the commission has been able to make with New York's sewage, and such experience as has been gained elsewhere with sewage of similar composition, indicates that the optimum period of time to provide for the sedimentation of New York's sewage would be two hours, this allowance to be based on the average rate of dry-weather flow. Under these circumstances, settling basins should be able to remove about 60 per cent of the suspended solids, of which one-half would be organic matter and capable of putrefaction. By the addition of chemicals, the efficiency could be increased so as to remove 85 per cent of suspended matter and 50 per cent of organic matter. As compared with screens, such as experience indicates could be employed in New York without undue refinement and difficulty with operating details, sedimentation would be about four times as effective as screening.

The commission has given serious consideration to the use of Emscher tanks as a means of preparing the sewage of New York for local discharge and for discharge from centrally located points, such as Ward's Island and the ocean island. Desiring to obtain an authoritative opinion upon their use, and believing that the arguments which might be put forward in their favour by an advocate would contain the most favourable statements which could be made in comparison with other forms of sedimentation, the commission, in 1912, requested Dr. Imhoff to make a report upon his invention as applicable to New York.

As a basis for his report, a series of questions was placed before Dr. Imhoff. He was requested to express an opinion as to whether Emscher tank treatment was sufficient to bring about the standard of cleanness for the harbour which the commission proposed in its report of August, 1912; how and where Emscher tanks could be installed in the New York territory, and, if Emscher (or Imhoff) tanks were not sufficient to accomplish the desired results, what other process should be combined with them.

REPORT BY DR. IMHOFF.

Dr. Imhoff's report states that the suggestions made as to the practicability of constructing Emscher tanks in the built-up parts of New York, and the use of chemicals are based upon assumptions, and might have to be materially modified by local conditions. He says the question whether it would be feasible to build such works on the shores of the inner harbour depends upon the possibility of acquiring proper sites and upon the cost of land. He disclaims sufficient familiarity with conditions in the metropolitan district to warrant him in giving technical details. He has therefore only given capacity figures, intending that they should be used as a basis for calculation by the commission.

Dr. Imhoff considers the most difficult provisions of the commission's standard of cleanness to comply with are those which relate to deposits and to oxygen. He thinks it unavoidable that deposits somewhat resembling sewage sludge should occur through the death and decomposition of plankton, which he says cannot thrive in the mixture of ocean and upland water which exists. Owing to the fact that sea water has a precipitating action upon all suspended matter, and because of the unfavourable conditions for the plankton, the harbour is not regarded by Dr. Imhoff as affording favourable conditions for the assimilation of sewage. He agrees with Dr. Adeney that it is the sewage sludge which produces the intense nuisance which exists in places, and not the liquid part of the sewage. The average figures for dissolved oxygen are not, in Dr. Imhoff's opinion, capable of indicating the presence of offensive conditions due to the fermenting sludge.

As to efficiency, Dr. Imhoff does not consider that Emscher tanks are capable of satisfying the commis-

sion's standard either with respect to dissolved oxygen or to the deposit of sewage matters in the vicinity of sewer outfalls, but all the other requirements of the standard can easily be complied with. It is impossible for him to say how much sludge can be held back by tank treatment; he is inclined to consider the probable amount about one-half. He thinks that which would be retained would be more objectionable than that which escaped into the harbour.

If Emscher tanks were not sufficient, their efficiency might be augmented by the addition of chemicals. The effect would be to remove practically all the suspended matter and much of the colloid matter. More sludge would be produced, and this, Dr. Imhoff says, would require that the sludge chamber in the tanks be increased about 70 per cent above the size required for plain sedimentation. The report states that Emscher tanks are capable of reducing the volume of sludge, even when chemicals are used.

Dr. Imhoff is of the opinion that if chemicals were used, that part of the commission's standard which refers to deposits could be practically satisfied, but it is doubtful whether the reference to oxygen could be complied with.

In the outlying districts of the city, Emscher tanks could, in Dr. Imhoff's opinion, be advantageously combined with percolating filters. In the city limits, filters of this type would not be admissible because of the large areas required and the nuisance from odours and flies which would be practically certain to arise from them. Chemical treatment combined with Emscher tanks is recommended by Dr. Imhoff as an alternative to sedimentation combined with percolating filters for such situations as are suitable for them. The plants which he proposes would consist of Emscher tanks with the application of precipitating chemicals, aeration and rapid filtration. This process, Dr. Imhoff states, would be cheaper and require less area than percolating filters. In winter, when the best treatment procurable was not needed, it would not be necessary to employ the chemicals, thereby saving a considerable amount of money over percolating filters, which would represent a considerable investment.

In Dr. Imhoff's opinion, Emscher tanks can be installed in the built-up parts of the city. For local use, he says they should be placed at the mouths of the sewer outfalls, suitably grouped by means of intercepting sewers so as to produce a minimum total cost for Emscher tank treatment. The tanks could be built, in his opinion, beneath the streets, or in other open spaces, and covered like the subways so as not to interfere with traffic overhead. Sludge pipes would carry the sewage by pumping to steamers at the water front, which, after receiving the sludge, would carry it to the ocean for final disposal. Tanks built beneath the streets would not give rise to nuisance, the report says, because little odour would be produced, and the gases could be taken care of by ventilation.

Assuming 700,000,000 gallons per day as the quantity of sewage to be dealt with, and that one-eighteenth of the daily flow would run off in one hour, the cubic space which should be provided for settling basins on the Imhoff tank principle would be about 10,000,000 cub. ft. if it was intended to provide for one hour's period for sedimentation without chemicals. The amount of sludge produced would be about 1,330 cub. yds. per day. If chemicals were to be added to facilitate deposition, the sludge digesting chambers would have to be larger than for plain sedimentation. Instead of allowing 4,200,000 cub. ft. as Dr. Imhoff advises that 7,000,000 cub. ft. be provided.

THE COMMISSION'S COMMENTS

It will be observed, state the commission in a recently issued report, that the sedimentation period provided for by Dr. Imhoff in his estimates is one hour instead of two, which most authorities regard as the optimum. The commission considers that 50 per cent is a rather large removal of suspended matter to expect for settling basins operating with a one-hour period. "In this connection, it must be remembered that the supply of sewage is not uniform, and that there are times when the flow is so much greater than

the average that the settling period in basins intended to provide for one hour would be much reduced. Exceptionally large amounts of suspended matter would be likely to be brought down by the sewage when the flow was greatest, in consequence of which it is possible that considerably more deposit-forming material would be carried through the settling basins into the harbour than might be expected."

The commission is in favour of chemical precipitation for certain situations where the purification effected by plain sedimentation may in time not prove sufficient, and where sufficient protection to the harbour can be effected by settling the sewage more thoroughly.

The assumption that the sewage deposits in the harbour do not make a material effect upon the dissolved oxygen is not in accordance with the commission's opinion, nor with that of most other investigators of the New York problem. "It is true," they say, "that the amount of dissolved oxygen present in any large section of the harbour does not afford an infallible indication of the local nuisance which may occur from fermenting sludge; but the evolution of gas carries particles of the putrefying sludge into the overlying water, and these particles possess a strong avidity for oxygen which makes itself felt not only where the bubbling occurs, but elsewhere by diffusion."

The water of New York Harbour is not unfavourable to plankton, so far as the commission's knowledge of the facts extends.

After giving careful consideration to Dr. Imhoff's report, and making various studies for such works in various locations, the commission is compelled to state that, in its opinion, the suggestion that Emscher settling basins could be located in the built-up parts of the city would not be satisfactory. They would not be satisfactory because of their cost, probability of nuisance, and the practical certainty of public opposition. The relatively small efficiency which could be accomplished by them would not be commensurate with the cost of construction and maintenance. These statements, the commission point out, apply to Emscher tanks and all other settling basins operating on the principle of plain sedimentation, and they have equal reference to tanks operated on the principle of chemical precipitation.

It appears that tentative plans for the construction of Emscher tanks beneath the city streets had been prepared by the commission before Dr. Imhoff's report was made, and his report states that he examined these plans and regarded them favourably. The plans provided for a plant of eight Emscher tanks having a capacity of 12,000,000 gallons per twenty-four hours, with a settling period of one hour. It was proposed that they should be located beneath a marginal street bordering the Hudson River or Lower East River. The principle was sedimentation without the use of chemicals. The tanks were circular in plan, 35 ft. outside diameter, and arranged closely together in a single row, which took up a large part of the space available between the sidewalk kerbing on the one side and the bulkhead of the marginal street on the other. A pumping plant operated by direct-connected electric motors carried the sewage away from the works for discharge by means of submerged outlets or otherwise. The settling basins were protected by means of a coarse screen, simple grit chamber and automatic gate to prevent flooding. Blowers and air ducts were to be used in order to carry away the gases and water-saturated air from above the tanks; inlets were arranged for the supply of fresh air. The tanks were to be 35 ft. deep from the surface of the sewage to the extreme bottom. There was to be a space of 12 ft. between the sewage and the top of the street paving overhead, the total depth of construction beneath the street pavement thus amounting to 47 ft. The total length of the plant was 343 ft.

The sewage would be supplied through interceptors, which would run along the water front to collect the sewage from the common sewers, which otherwise would discharge into the harbour. Provision would be made for sending storm water in excess of the capacity of the plant direct to the harbour and tide gates would be provided to keep the harbour waters from backing up past this overflow. The sewage would enter at one end of the plant, pass through the coarse screen and grit chamber, and thence to the tanks by means of a channel running along one side of the row of eight tanks. After passing through the settling tanks, the effluent would be collected in a channel lying alongside of the tanks parallel to the channel supplying the raw sewage, and would flow

to the pumps. The sludge would be retained until it was thoroughly decomposed by fermentative action. It would then be removed by the hydrostatic pressure of the overlying sewage to a sump well, whence it would be forced to a tank ship lying at a neighbouring pier. The screenings would be removed in the same vessel.

In their comments on these proposals the commission say: "It is possible that in some cases an Emscher tank plant could be constructed without pumps, thereby effecting a considerable saving both in first cost and in maintenance charges. Where, however, the effect of the tide would be felt in sewers at the site of the plant, it would be necessary either to exclude the harbour water by tide gates and pump the sewage, or so construct the works as to act without reference to the tidal levels. Since a large part of the water front of Manhattan is at so low an elevation that the sewers lying but a few feet beneath the surface are tide-locked for 500 ft. or more inland, there is poor opportunity for building Emscher tanks without excluding the tide water. Provision of head room, amounting preferably to about 12 ft. above the sewage, would be impossible in most cases if the tanks were to be located upon the marginal streets. It is not clear whether Emscher tanks, unprotected from tidal influence, would operate satisfactorily even if the structural difficulties, due to want of head room, height of ground water and crowded space, could be overcome. The average period of sedimentation would be short and irregular, due to the alternate backing up and outflow of the sewage under the action of the tidal head.

"The tanks might be built at a sufficient distance back from the water front to be free from interference by the tides, but this would require the reconstruction of the common sewerage system throughout that part of the city which lay between the tanks and the water front. Another difficulty to be overcome, and a more serious one, would be found in the fact that the streets beneath the surface are already occupied with water and steam pipes and conduits for electric light, telegraph, telephone and power purposes. The Emscher tanks would have to be arranged in single file, and, for a plant of moderate size, the length of street appropriated would be more than one block long. A plant to deal with 20,000,000 gallons would be about 570 ft. long if the period for sedimentation was to be one hour, and about 1,100 ft. long, or more than one-fifth of a mile, if the sedimentation period provided was two hours. To deal with all the sewage which will be produced by Manhattan Island in 1940 an aggregate of about 3½ miles of tanks would be required if the sedimentation period was one hour, and about 7 miles if this period was two hours."

Serious question might be raised, in the commission's opinion, as to the probability of trouble from the gas given off in the fermentation of sludge in Emscher tanks when placed in crowded positions beneath the city's streets. The odours might not be offensive, although this was not certain, but large volumes of inflammable gas would be produced, and that, when mixed with air in the confined space beneath the street pavements, might lead to explosions. Private property might be acquired, either by purchase or by condemnation, to serve as sites for Emscher tank installations, and, if this were done, some of the difficulties, especially those which related to crowding, want of ventilation and inconveniently long collections of tanks, could, in large measure, be overcome. Settling basins so located would not, however, reduce the chance of nuisance nor the public protest which might reasonably be expected against them; nor would they add to the ability of the works to purify the sewage, and the cost of the land would add to the expense.

There was no precedent, so far as the commission was aware, for such extensive underground sewage treatment works. No city seemed to have placed settling tanks of large capacity, operating with or without sludge fermenting chambers, beneath the street pavements. No plant of Emscher settling tanks had thus far been constructed to operate with such tidal interference as would be met with (unless avoided by tide gates and pumping) in the most congested sections of the city. As to the removal of the sludge, Emscher tanks, in the commission's views, undoubtedly afforded one of the best means of overcoming the difficulties of cost of sludge disposal in inland cities; but New York was particularly favoured in being close to the sea, and so able to ship its sludge to the open ocean at less cost than any other method of disposal, and whether it would be feasible to trans-

port fermented sludge, charged as it was with gas, unless special provision for the escape of the gas was made on the ships, appeared doubtful. The comparative value of Emscher tanks and other deep tanks in which sludge was not digested lay in the opportunities which were afforded by Emscher tanks for the fermentation of the sludge and the consequent reduction in its volume. This advantage was gained at the cost of providing a large storage place for the sludge at the bottom of the compartment in which the suspended matter deposited and fermented. In New York the construction of the deep sludge chamber would be very costly. So far as the commission had been able to cover the point in its studies and estimates, it would appear that the peculiar advantages which the Emscher type of tank afforded over the Dortmund were not warranted by the greater cost of the Emscher tanks.

NOVEL TYPE OF FOUNDATIONS.

AN INCENIOUS APPLICATION OF FERRO-CONCRETE.

Every civil engineer worthy of the name must be able to recall numerous instances of invention begotten by sheer necessity. A case in point is furnished by the recent extension of the quays in the French port of Saint-Nazaire.

After the port authorities had made an unsuccessful attempt to construct foundations for the extension in the soft mud of the harbour, the problem was submitted to M. Hennebique, of Paris. Owing to the extremely low bearing power of the soil, the foundations were formed of ferro-concrete piles having an extended footing a short distance above the point so as to distribute the load.

As shown by the drawing, the footings rest upon platforms constructed of rock and rough concrete. The footings were first adjusted in position by divers,

FERRO-CONCRETE QUAY, SAINT-NAZAIRE FRANCE.

and the ferro-concrete piles were then driven through a square hole moulded at the centre of each footing. The piles take a secure bearing upon the footings, and effectually prevent any transverse movement of the latter. The piles were grouted into the footings after having been driven, thereby rendering the whole perfectly monolithic.

In order to render the structure additionally secure, the front rows of footings were connected by horizontal beams, and the front rows of piles by horizontal and diagonal bracing, as shown by the drawing. The works were completed several months ago, and have given every satisfaction to the port authorities.

The quay extension is 1,272 ft. long, and the entire structure was carefully tested after completion under the uniformly distributed superload of 4 metric tons per square metre.—*Ferro-Concrete* for April.

Roads Improvement Association.—The annual general meeting of the Roads Improvement Association will be held in the Council Chamber of the Institution of Civil Engineers, Great George-street, Westminster, S.W., on Thursday, April 23rd, at 4.30 p.m.

R.I.B.A. and Registration.—In pursuance of a resolution passed at a special general meeting on January 3th last, the council of the Royal Institute of British Architects have considered in detail proposals for obtaining a new charter and by-laws to enable the institute to constitute and maintain a register of qualified architects, and a draft has been submitted for the consideration of the general body. If the proposals receive the approval of members, the institute solicitors will be instructed to prepare the necessary petition for submission to the Privy Council.

THE UTILISATION OF SOLAR ENERGY.

By A. S. E. ACKERMANN, B.SC.(ENG.), ASSOC.M.INST.C.E.

A paper on the above subject was read before the Society of Engineers on Monday evening last by Mr. A. S. E. Ackermann, B.SC.(ENG.), who has been associated with the work (as joint consulting engineer with Mr. C. T. Walrond, to the Sun Power Company and the Shuman Engine Syndicate) for nearly four years. The paper is the first of its kind, and deals with the whole of the experiments which have been made during the four years, and which have cost about £30,000.

After naming the principal workers in this field, the author gives determinations of the solar constant and deals fully with the varying percentages of this quantity that are available throughout the day for power purposes. He then describes four types of Shuman sun-heat absorbers, and gives in great detail the results of his forty-eight trials of these absorbers, the latest pattern (that erected near Cairo, Egypt) of which gave a maximum thermal efficiency of no less than 40.7 per cent, and a maximum output of steam of 1,442 lb. per hour, at a pressure of 15.8 lb. per square inch abs. The results of these types of absorbers are compared by means of tables and curves, and from these the author has constructed a formula by means of which it is easy to calculate for a given type and size of absorber the total amount of steam per hour if three things are known—(1) the time of day, (2) the humidity, and (3) the steam pressure. It has been known that humidity adversely affects the quantity of solar radiation arriving at the Earth's solid surface, but this is the first time that its effect on solar steam production has been quantitatively determined.

The difference between the thermal efficiency of the solar boiler and the commercial value of the steam produced is ingeniously brought out, the author making it clear that in the case of such low-pressure boilers a high thermal efficiency is not necessarily the same thing as the most economical conditions of working, and he shows that, up to a certain limit, the higher the steam pressure the more economical the working, though the thermal efficiency is then lower. Two of the types of absorber did not move with the sun, and one did. The greater constancy of output of steam in the case of the latter is very marked.

In order to utilise the low-pressure steam economically,

Mr. Frank Shuman designed a special engine, which has also gone through several stages. This engine is fully described with drawings, and the author gives the results of his fourteen trials of the several engines, and compares their results with those of exhaust steam turbines and the low-pressure cylinders of compound and triple expansion engines, showing that the Shuman engine is the more economical. The steam consumption of one of these engines was only 22.1 lb. per b.h.p. hour, when the output was 94.5 b.h.p., and the steam pressure only 16.2 lb. per square inch abs. The thermal efficiency of the engine compared with an engine working on the Rankine cycle was 54.75 per cent. In the case of a Shuman high-pressure non-condensing engine with an output of 29 b.h.p., the steam consumption was 23.8 lb. per b.h.p. hour, and the relative thermal efficiency 71.7 per cent.

Finally, the author gives the results of his trials of the complete sun power irrigation plant at Cairo, and describes his design of a special form of weir tank for measuring greatly differing quantities of water. The bibliography of the subject, which is a very short one, is given as an appendix.

The Surveyors' Institution.—The Special Diploma Examination in Sanitary Science will be held on June 9th, 10th and 11th. The Special Diploma Examinations in Forestry and Surveying will not be held this year, the entries having been insufficient.—The sixth meeting of members, students and examinees under the age of thirty, authorised (subject to certain conditions) by the council to be held during the present session, will take place on Monday, April 27, 1914, when a paper on "Jerry-building" will be read by Mr. H. Thorne. The chair will be taken at 7 o'clock.

State Assistance Towards the Cost of Roads.

RECOMMENDATIONS OF DEPARTMENTAL COMMITTEE ON LOCAL TAXATION.

In last week's issue we set out briefly the important recommendations contained in the recently issued final report of the Departmental Committee on Local Taxation. As to highways, it will be recollected, they recommend that these should be classified by the Road Board into main roads, county roads, and district roads, and half the maintenance of main roads and a quarter of that of county roads be met by the Exchequer grants; that the balance of the cost of main roads and a quarter of that of county roads should be borne on county funds, the remaining half of the cost of the latter roads being charged to the highway district responsible for them, and that the necessary Parliamentary authority should be obtained as soon as possible to enable the Road Board to commence a provisional classification of highways.

The total grants for main roads is estimated at £1,800,000, and that for county roads at £600,000.

Sir George Gibb, chairman of the Road Board, suggested that the roads in administrative counties should be divided into four classes, and that Exchequer grants should be given towards the first two classes, a higher proportionate grant being given for the first class, which would comprise the most important roads of the country, than for the second. He was of opinion that the greater number of classes would facilitate classification, and make it possible to give assistance towards the maintenance of a greater mileage. His suggestion that there should be two classes of roads subsidised by the State was supported by representatives of local authorities, but they generally contemplated only a threefold classification. Some witnesses proposed that the entire responsibility for the maintenance of "trunk" roads should be assumed by the State.

The evidence given on behalf of London and the county boroughs was generally in favour of the simpler classification into main roads and other roads, grants being given in respect of the former class only.

"After careful consideration," the committee state, "we agree that such a classification would be sufficient in these areas, but in the case of the administrative counties the proposed threefold classification seems to us the most suitable. In arriving at this conclusion, we have been greatly influenced by three considerations. The first is that in rural districts during quite recent years large additions have been necessary in the highway rates in consequence of the growth of motor and other traffic not required by the locality, and this additional burden is more acutely felt in these districts in consequence of the comparatively low level of their ability to bear rate burdens. The second is that the cost of maintenance of rural roads is charged on the rate to the relief of which the grants under the Agricultural Rates Act and the Tithe Rentcharge (Rates) Act are applied, and on the withdrawal of those grants, which we recommend, it seems necessary to substitute some better form of Exchequer aid. The third is that the constitution of an intermediate class of roads, of which the county authority will bear part of the cost, will furnish means for equalising rates."

The committee recommend, therefore, that roads in administrative counties outside London should be classified by the Road Board into (a) main roads, (b) county roads, (c) district roads, and that Exchequer grants should be given in respect of the first two classes; and that in London and the county boroughs the classification should be into (a) main roads, (b) streets, grants being given only in respect of main roads.

MAIN ROADS.

The committee are of opinion that it is impracticable to lay down any rules for determining main roads which can equitably be applied to all areas, their view being that the variations as regards the nature of the traffic and the conditions of maintenance are too great.

"As regards the administrative counties—other than London—we recommend that, in determining whether a road shall be classed as a main road, the Road Board should have regard to one or more of the following considerations:—

"(a) That it was originally constructed as a turnpike road or is now a main road,

"(b) That it is a medium of communication between towns, or a thoroughfare to a railway station.

"(c) That a substantial portion of traffic upon it is not of a purely local character.

"Before any determination is arrived at with regard to a road, all local authorities concerned should be afforded an opportunity of making representations; also every local authority responsible for the maintenance of highways should be authorised to apply to the Road Board with regard to any road within its area.

"In many cases substantial improvements will be necessary before a road can properly be classed as a main road. The expenditure on such improvements would appear to be a suitable object for grants from the Road Improvement Fund.

"A grant of one-half of the cost of maintenance, and minor works of improvement of all main roads so determined, should be made to the local authority financially responsible, such cost to include payments to sinking fund and interest on all moneys borrowed for those purposes, and all items now paid for by county councils under sec. 11 (2) and (3) of the Local Government Act, 1888.

"As regards London and the county boroughs, and other boroughs where the Road Board so decide, the mileage of roads to be recognised as main roads for the purposes of the maintenance grant should, we think, be determined by ascertaining the length of the continuation of all the recognised main roads impinging on the boundary of the borough to some central point or points at which, in the opinion of the Road Board, they cease to have the characteristics of main roads. The councils of these towns should have the same privileges and powers as other authorities of being consulted by, or of making representations to, the Road Board with respect to their roads.

"A grant should be paid on the mileage of main roads so determined at the average cost per mile of main roads in the urban areas of the adjacent administrative county or counties. In the case of London, this will be the average cost for the four counties Essex, Middlesex, Surrey and Kent. In Lancashire, where main roads are a charge upon the 'hundred,' the average should be taken over the urban areas of the adjacent hundred or hundreds.

"In all cases the grant should be conditional on the efficient and economical maintenance of the roads, and where this condition is not fulfilled the Road Board should have power to reduce or withhold it. The amount of the grant should be based upon the expenditure of the local authority for the last financial year.

"The total amount of the grant for main roads will, of course, depend upon the standard adopted in the classification. Doubtless, many of the present district roads will in future be classed as main roads, and many main roads will be removed from that category; but on the whole we see no reason why the total mileage of main roads in administrative counties should be appreciably different from the present figure. This would involve a grant on the expenditure for 1911-12 of about £1,600,000, to which we may add £200,000 for roads in London and the county boroughs, giving a total of £1,800,000. If our suggestion that the standard of the class should be adjusted to give the desired mileage proves to be impracticable, an adjustment might be made in the percentage of expenditure met from grants in order to give a total grant, calculated on the basis of the figures for 1911-12, approximately equal to the above amount. The adjusted percentage should, of course, be the same over the country, and should remain constant.

COUNTY ROADS.

"The class of county roads should include all roads in administrative counties which, though less important than main roads, may yet be regarded as serving more than merely local purposes. As already indicated, our proposals with regard to grants for this class of road are closely bound up with our recommendation for the withdrawal of the grants under the Agricultural Rates Act and the Tithe Rentcharge (Rates) Act. We may, however, so far anticipate our conclusions as to state that they involve an Exchequer grant of one-quarter of the cost of maintenance of

such roads, our estimate for the total grant being £600,000.

INTERIM ARRANGEMENTS.

"A complete classification of roads on the lines suggested above, with the necessary collection of statistics, consideration of objections, &c., will probably take some time to carry out. Meanwhile grants might be based upon a provisional classification, or, alternatively, they might take the form of a percentage of the total expenditure on roads of all kinds within each area. The former course appears to us the more satisfactory, as the provisional classification would gradually merge in the complete classification without any large and sudden alteration in the amount of the grant to any authority. But even a provisional classification cannot be produced at once. Inasmuch as our recommendations, if adopted, will involve the abolition of the Assigned Revenues System, and the consequent withdrawal of all subventions at present available for the maintenance of main roads, it is most important that steps should be taken well in advance to secure that the new classification will be ready when the whole question of State subventions to local authorities comes under review. We accordingly recommend that the necessary Parliamentary authority should be obtained to enable the Road Board to commence the work of classification at once."

In a concluding paragraph on this question the committee mention that they have experienced exceptional difficulty in dealing with the various problems involved on account of the lack of information as to the present position in regard to this service, and the great uncertainty prevailing as to its future. Most of their recommendations under this head should therefore be regarded as of a somewhat tentative character, and subject to modification in the light of further experience.

LOWER THAMES VALLEY DISTRICT SURVEYORS' ASSOCIATION.

MEETING AT TWICKENHAM.

The above-named association held its last meeting of the present session at the Town Hall, Twickenham, on Saturday last, when there was a full attendance of members.

A considerable amount of business was transacted. Nominations were received for the election of president, vice-president, hon. secretary and treasurer, and hon. auditors for session 1914-1915. The question of the annual dinner was discussed, and it was decided that this year it should take the form of a dinner and social evening to which ladies should be invited, the date fixed being May 9th.

Mr. G. W. Manning, engineer and surveyor to the Staines Rural District Council, then read a most instructive paper entitled

NOTES ON RECENT ROAD MAINTENANCE EXPERIENCES.

Mr. Manning recommended that all roads should be classified into various heads, and stated that in his district such classification consisted of (1) main through roads, (2) important connecting links, (3) merely residential streets or lanes. Proceeding, Mr. Manning stated that since 1903 upwards of 30 miles of tar-constructed roads had been formed, the water-bound system gradually being converted into tarmac roads. The cost of water-bound roads in 1901 to 1904 was £205 per mile per annum for repairs and renewals, or about 4d. per super. yard. The cost of reconstruction and resurfacing amounted to practically 2s. 6d. per super. yard, with a maintenance of about 3½d. per yard super. per annum for a clean road as against 4d. for a dirty, dusty surface. Mr. Manning next outlined his experience with grouting methods, and showed that some very good results had been obtained, the cost per super. yard averaging about 2s. 9d. Tarrivated Leicestershire granite, graded from 1½-in. to ½-in., was tried, the cost of this working out at about 1s. 8½d. per super. yard. Mr. Manning next gave some comparative costs of different materials laid at Sidcup during June and July, 1911.

A full discussion ensued on Mr. Manning's paper, and a hearty vote of thanks was accorded to him for the trouble he had taken in bringing this subject before the association.

Other matters discussed were the allocation by the county council of Road Board grants for road construction and maintenance, and the propulsion of motor rollers by means of paraffin.

MARTEN'S ADJUSTABLE SCAFFOLD BRACKETS.

These brackets, which are made of steel throughout, are largely used in place of the ordinary scaffolding, built up from the pavement and swing cradles hung from the roof.

They are extremely light, yet very strong, and can be fitted by unskilled labour in two or three minutes. They can be used for any number of jobs, and when not in use can be stored easily, as each single bracket is only 4 in. wide.

They are fixed, at any window opening, from the inside of building, by means of square threaded

MARTEN'S ADJUSTABLE SCAFFOLD BRACKET.

steel screw and handle, the wood blocks which clamp against the wall being padded with thick felt.

Double brackets, about 2 ft. 6 in. wide, are made with fixed wood platform and handrail complete, and are suitable for working at a fixed position.

Single brackets may be fixed at each window of a building, and scaffold boards laid from one to the other, thus providing a continuous platform along the front of same.

Messrs. E. A. Reed & Co., Limited, 14 Victoria-street, S.W., are the sole manufacturers, and will be pleased to send full particulars and prices upon application.

Tarco.—The Corporation of Liverpool, for the sixth year in succession, have sealed an order for the supply of 80,000 gallons of Tarco, and the Staines Rural District Council have accepted a tender for the supply of Pitchmac for grouting purposes.

Electrical Plant at Norwich Sewage Works.—Specially prepared, electrically driven, air-compressing plant is now being erected in the city of Norwich, under the supervision of Mr. Arthur E. Collins, M.I.N.S.T.C.E., the city engineer, in connection with an extensive scheme for the purpose of raising the sewage from one level to another, and for conveying it to the irrigation sewage farms at Newmill. This air-compressing plant, costing about £1,000, has been made in Aberdeen, and operates ejectors of the latest automatic type. A special feature about the plant is that the electric motor is directly coupled to the air-compressor, and no gearing or belts are used for the transmission of the power. The motor develops 65-horse power, and the output of the compressor is about 800 cub. ft. of free air per minute, amply sufficient for its purpose. It is expected the plant will be in full operation in about one month.

The Design of Sewage Works.

CANADIAN PUBLIC HEALTH DEPARTMENT'S SUGGESTIONS.

The following suggestions with reference to the design of sewage treatment works are formulated upon principles of sewage treatment which are in accordance with present-day practice, and are being issued by the Bureau of Public Health of the Province of Saskatchewan to serve as a guide to those preparing schemes for municipalities in the province.

SCREENING.

(a) That where sewage is to be pumped, provision be made for screening, cleaning the screens at regular intervals, and for removing and disposing of screenings.

(b) That where works are of a character producing a large quantity of screenings, mechanical means must be provided for their removal.

GRIT CHAMBERS.

(a) The function of grit chambers (or detritus tanks) being to arrest the heavier mineral particles carried in suspension, the construction of such tanks is, generally speaking, unnecessary in this province, where the majority of sewerage systems are designed on the "separate" principle.

(b) That in special cases where sand or other mineral particles cannot be kept out of the sewerage system, it is advisable to introduce grit chambers.

(c) That these be constructed in multiple compartments to take care of the varying volume of flow.

(d) That a lineal velocity of 1 ft. per second be aimed at, calculated to retain the heavy mineral, but not the organic matters.

PUMPING.

(a) That where it is necessary to raise the sewage at the works, it is advisable that all machinery be in duplicate with alternative forms of power in case of failure.

(b) That appliances for raising sewage be specified with reference to efficiency in dealing with solids.

SEDIMENTATION.

(a) That there be at least two sedimentation tanks.

(b) That such tanks be so constructed that the precipitated solids are automatically and continuously removed from that portion of the tank in which precipitation takes place, and that a tank or chamber combined with, or separate from, the sedimentation tank, be provided, into which the precipitated solids may pass by gravitation immediately following settlement.

(c) That consequent upon the modern requirement of the continuous removal of sludge, as above stated, all base slopes of sedimentation tanks be made as near to the perpendicular as is practicable, relative to general construction.

(d) That the tank capacity be equal to one-fifth of the dry-weather flow in twenty-four hours, or equal to three hours' flow calculated upon the twenty-four hours' dry-weather flow taking place in fifteen hours.

(e) That the cross-sectional area of the tanks provide a velocity of flow of not more than .05 ft. per second, while lower velocities are preferable. Flows may be either vertical or horizontal.

(f) That consideration be given to the design of the inlets and outlets with a view to ensuring uniformity of flow throughout the breadth of the tank, and the absence of stagnant sections; and that all channels and parts of the tanks apart from the sludge storage area, be so constructed that no solids are retained.

SLUDGE STORAGE.

(a) That the overall depth of the sludge storage chamber from the surface of sewage in sedimentation tank be generally not less than 15 ft. Greater depths may be adopted, producing a more concentrated form of sludge.

(b) That in deep tanks, wherever possible, provision be made for breaking up the sludge at the inlet to the sludge removal pipe.

(c) That the capacity of the sludge storage chamber be equal to at least four months' precipitation of sludge, containing 85 per cent of water. Greater storage capacity is preferable as septic action is delayed in winter months. The cubic capacity of the sludge storage chamber shall be taken as only that space which is below the level of the deepest point of the sedimentation tank. In general, the average

accumulation of sludge may be taken as $3\frac{1}{2}$ cub. yds. per 1,000,000 gallons of sewage on the above basis of dilution.

(d) That ample provision be made for the escape of gases from the surface of the sludge storage chamber.

(e) That pipes for the conveyance of sludge be of an internal diameter of not less than 8 in., and that the inclination of such pipes, where the sludge is discharged by gravity, be at least 3 per cent, and preferably 5 per cent.

BIOLOGICAL FILTRATION.

(a) Where a dosing or syphon chamber is constructed to regulate the flow of the sewage over the surface of filter-beds, that the capacity of such chamber does not exceed a ratio of two gallons of sewage to each square yard of filter surface. For instance, if the area of the filtering surface be 200 sq. yds. the capacity of the dosing chamber should not exceed 400 gallons, representing a dose of $\frac{1}{2}$ in. depth of sewage over the whole surface of the filter.

(b) That the depth of the filter media be not less than 4 ft., and preferably 7 ft.

(c) That the filter media for effluents from the above form of tank be composed of hard broken stone or other suitable material, broken from 1-in. to 2-in. cubes.

(d) That the surface area of filtering media for domestic sewage be in proportion to the population using the sewers—i.e., in proportion to the amount of oxidisable matter present in the sewage.

Where a high degree of oxidation is required, the ratio of population to surface area of filter media should be approximately 17,500 persons to the acre (or 275 sq. yds. per 1,000 population).

This corresponds to a rate of filtration of 1,750,000 imperial gallons per acre per day, or 155 imperial gallons per cubic yard per day (assuming depth of filter media to be 7 ft.), at a per capita flow of 100 imperial gallons per day.

The efficiency of filters will not be materially affected by increasing the rate of filtration during periods of storm, to, say, three times the above stated rate, provided that the increase in volume is due to clear water.

In cases where the volume of dilution at the point of final discharge exceeds twenty times the volume of the sewage effluent higher rates of filtration may be adopted.

(e) That the method or apparatus adopted for the distribution of liquid over the filter-bed shall ensure a uniform distribution over the whole surface.

(f) That all filter-beds be drained at the base by tile pipes, or preferably by means of a false floor over the entire base of the filter.

(g) That sufficient provision be made for ventilation to allow of oxygen being present at all times and in all parts of the filter-bed.

HUMUS SETTLING TANKS.

(a) That it is generally advisable to provide settling tanks for the removal of the humus which is unloaded by the filter-beds from time to time.

(b) That such tanks be constructed in every case where disinfection of the final effluent is adopted.

(c) That humus tanks have a capacity equal to one forty-fifth of the dry-weather flow in twenty-four hours, or equal to twenty minutes' flow calculated upon the twenty-four hours' dry weather flow taking place in fifteen hours.

(d) That it is desirable that such tanks have separate storage compartments, as in the sedimentation tanks above described.

DISINFECTION.

(a) That where chloride of lime is used for the disinfection of the final effluent, provision be made for weighing, measuring and storing the disinfectant in a dry covered building.

(b) That the period of contact between the disinfectant and the sewage be not less than fifteen minutes. An open pond or lagoon will serve this purpose.

EFFLUENT PIPE.

That the effluent from the works be discharged into the watercourse or lake in such a manner as will ensure a maximum amount of dispersion.

HOUSING OF TANKS AND BEDS.

(a) That all parts of the works containing sewage under treatment be housed to conserve the latent heat of the sewage during low temperatures and to prevent fly nuisance in summer.

(b) That such covers be designed to enclose the minimum amount of space, at the same time giving room for accessibility and inspection.

(c) That with properly designed covers the introduction of artificial heat is unnecessary in sedimentation tanks, and may be obviated in filter-beds.

(d) That provision be made in all covers for the access of light and for efficient ventilation.

LABORATORY.

That wherever the size of a municipality or other circumstance warrants its construction, a small laboratory be provided and equipped in which simple tests may be made of the sewage and effluents.

LAYING OUT THE SURROUNDING GROUNDS.

That provision be made in the specifications and estimates for laying out, grading and improving the appearance of the surrounding grounds by terracing and seeding the slopes.

LONDON BEFORE THE FIRE.

AS REFERRED TO IN SIXTEENTH AND SEVENTEENTH CENTURY LITERATURE.

A paper on the above subject was read at the ordinary general meeting of the Surveyors' Institution last week by Mr. W. Wilberforce Jenkinson (Fellow).

The period of English literature chosen for reference was more exactly defined by the author in his opening sentence as "the latter half of the sixteenth and the first half of the seventeenth century; or, with a little elasticity, the years lying between the Dissolution of the Monasteries and the Great Fire; perhaps the most vigorous as it is the most intellectually expansive era in the range of our national literature." The limits of the period are, indeed, marked by two destructive events, of which the first at least was not accidental, but within those limits it was an era of great creative vigour and expansive energy, not only in our national literature, but in our national life.

Mr. Jenkinson's second sentence may also be quoted almost in its entirety: "Should it be objected that the subject treated in this way savours more of the literary or the antiquarian than of the technical, I would reply, first, that I assume that the study of English literature and history is neither at variance with the tastes nor opposed to the professional pursuits of the members of this institution; and, secondly, that the references I have been able to collect . . . include many facts and details directly in touch with the practical work of the surveyor." Not only is there no necessary antagonism between surveying and literature, but their connection has sometimes been very close indeed. To say nothing of Dante and Goethe among foreign literary surveyors, the "father of English poetry," Geoffrey Chaucer, was himself a surveyor, and at the close of the period now under discussion, as Mr. Jenkinson reminds us, the surveyor-general for the rebuilding of St. Paul's Cathedral was Sir John Denham, better known "as a poet and dramatic writer of no mean powers." Many of our readers will recall with pleasure the delightful and scholarly paper which the late secretary, Mr. Julian C. Rogers, read on "An Evening in the Surveyors' Institution Library," the leading points of which were reproduced in THE SURVEYOR of February 2, 1912, when we welcomed the contribution as a stimulating plea for the widest culture on the part of "surveyors" in all the branches which that comprehensive term covers. This high standard is worthily maintained by Mr. W. Wilberforce Jenkinson, and it would be difficult to find any one more competent to address a meeting of surveyors on "London Before the Fire." He is not only a Fellow of the Surveyors' Institution of long standing, and a London citizen still actively engaged in business in the City, but he knows London well, both past and present, and is remarkably well read in the literature of the period chosen and of his special subject. He is, moreover, an active member of the Elizabethan Literary Society, a society whose catholic interests embrace all that concerns the life, as well as the literature, of the period.

The practical value of such a paper to the modern surveyor is probably to be sought in the fact that while the period described had, of course, its own special problems, many of its problems are still present with us, and their treatment in the past may afford some encouragement or warning even to this more scientific age. Such very live questions as water supply and water rate, sanitation, overcrowding, leaseholds, ground rents, building regulations, contract prices and extras, as well as such comparatively minor questions as "ancient lights," found mention in Mr. Jenkinson's paper. The City had long been supplied with "sweet water conveyed by pipes of lead from Tiborne," or "from Paddington." Moreover, "there were wells and pumps. The pump at Aldgate still stands, and there are traces of the one (though out of use) attached to the holy well of St. Bridget (shortened to Bride), which gave a name to the palace of Bridewell adjacent. . . . The water of the Thames could hardly have been pure, considering that the river received such streams as the Fleet, which was used as a common sewer." This being the case, it is startling to find that "water was taken from the river," and in 1582 it was conveyed "into divers men's houses in Thamis Streete, new fish streete, &c., and up unto the north-west corner of Leadenhall . . . being since at the charges of the Cittie brought up into a standard . . . serving to the use of the inhabitants neere adjoining that will fetch it." It is not stated either in this quotation from Stow's "Annals," or by Mr. Jenkinson himself, that the Thames water was actually used for drinking purposes, and for other purposes we know that a public service of non-potable water still exists, especially on the Continent, where one sometimes comes across a warning legend to the effect that the water is not drinkable. A little over 300 years ago the New River was designed and carried out by Sir Hugh Middleton, and in view of its present value and utility it is sad to note that "it did not in the first instance meet with adequate appreciation, or afford much, if any, profit to the adventurer, as Middleton was termed."

The expansion of London was not assisted by the building regulations under Queen Elizabeth and her successors, who "endeavoured by legislation or royal enactment to arrest all increase of houses," not only in London itself, but "likewise in the suburbs." But, as Mrs. Partington could not keep back the Atlantic with her mop, nor King Canute the waves at Southampton by his command, so neither Tudor nor Stuart monarchs could stop the growth of London.

South Shields Tramways Extensions.—The South Shields Town Council recently decided to extend the tramway system within the borough boundary, at a cost of £8,000. The eighth year of the undertaking, just completed, shows a profit of £4,000 over the previous year.

The Concrete Institute.—With reference to the proposed alteration of the Memorandum of Association of the Concrete Institute, some members have taken up an attitude of opposition, preferring that the institute should be one solely concerned with concrete and reinforced concrete.

Swinton Waterworks.—The new waterworks at Swinton, provided at a cost of £30,000, were formally opened last week. The urban district is now in the position of being able to command two watersheds within its boundaries, and, although the population is less than 15,000, there are two good supplies.

The Derwent Valley Water.—The Nottingham Town Council on Monday confirmed the action of the Water Committee in discontinuing entirely the supply from the Derwent Valley reservoirs, and the city is thrown back on its old resources of pumping from wells in sandstone. Nottingham, Sheffield, Derby, and Leicester, Nottinghamshire and Derbyshire, are all concerned in the Derwent Valley scheme, which up to the present has cost nearly £7,000,000 sterling, and is little more than half completed. Nottingham's contribution, which, if the present situation is permanent, will be entirely wasted, is £25,000 per annum. The Water Committee stated that owing to widespread complaints they made exhaustive investigations, and found that the continued use of Derwent water would in a short time choke all wrought-iron pipes, cylinders, and boilers in the city. In the course of a few months the pipes were found to be corroded and choked with metal.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., Plumstead.)

388. Reactions on Beams.—Show how to find (graphically or otherwise) the pressures on the two supports of a horizontal beam which is loaded at any given point. If the distance between the supports be 20 ft., and if one of the loads be 12 cwt., find the

changes in the pressures produced by shifting this load through a space of 5 ft. along the beam. (A.M.I.C.E.)

389. Design of Floors.—What loads should be allowed for in designing a floor (a) in a general warehouse, and (b) in a platform to which the public are to be admitted? What factor of safety would you adopt in each case?

390. Removal of House Refuse.—A new urban district has just been formed in the neighbourhood of London of which the following are particulars: Area, 3,500 acres; population, 9,000, increasing at rate of 700 per annum; number of houses, about 2,300; length of district, north to south 3 miles, east to west 1½ miles; mileage of roads, 17; character of district, flat in northern part, hills up to 1 in 16 in southern part; distribution of population, 2,000 at north end in 240 villas, shops, &c., 500 in north-east in large houses with long approach drives, 1,000 in south and south-west in small villas and workmen's cottages. The refuse for the present will be utilised at brickfields on the southern boundary of the district. It is desired to organise the removal of house refuse on the most up-to-date methods compatible with economy. Describe fully the methods of collection and transport, the organisation of the staff, the plant required, and give an estimate of the capital and annual charges for this work. Trade refuse is negligible, and no plant has been taken over from the rural authority who formerly had control of the area. (Togun.)

391. Concrete Floor.—A concrete floor is to be constructed as shown in the sketch, with 4-in. by 3-in.

Fig. 1.—Boring Sheerlegs with Geared Windlass.

R.S. joists, and woven mesh steel wire with a 3-in. lap. The R.S. joists have a 4½-in. wall hold, and

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

387. Boring.—Describe, with sketches, the appliances necessary in carrying out borings to a depth of 100 ft. for the purpose of ascertaining the character of the soil. (W. N. B., Cambridge, N.Z.)

The following is a brief description of the primary essential tools and appliances necessary for a trial borehole: First, a light set of geared sheerlegs (Fig. 1) is erected over the site selected, a small pit about 3 ft. square and 3 ft. deep is dug, and a lining tube (Fig. 2)—say 6 in. diameter—is inserted and driven tightly into the ground with a monkey (Fig. 3) weighing about 400 lb. The material inside this tube is then removed with an auger tool (Fig. 4), to which is screwed a boring rod (Fig. 5), which is rotated by means of rod tillers (Fig. 6) by two or more men. More rods are screwed on as the tool descends, and soil, bit by bit, is brought to the surface by pulling out the rods from time to time and removing the soil from the auger. Should the ground be somewhat hard, then a chisel (Fig. 7) is used first in place of the auger; this loosens or breaks up the ground, which can then be removed either with the auger or with a shell (Fig. 8), this latter being essentially a tube fitted with a clack-valve near the bottom end. Hard grounds may be more expeditiously cut through by means of a circular chisel (Fig. 9), which, in its simplest form, consists of a tube with a steel cutter screwed on to the end. As this progresses downward, the soil passes up inside in the form of a core, which is brought to the surface. To raise or lower the rods a lifting dog (Fig. 10) is attached to the top length of rod, the dog being hooked to a rope which passes over the pulley at the apex of the sheerlegs, and down to the windlass. The rods are unscrewed by means of a hand dog (Fig. 11). Should the sides of the hole show a tendency to cave in while boring, then further lining tubes of small diameter (usually of 10-ft. lengths) must be inserted. (J. P. Le Grand.)

Royal Sanitary Institute.—The annual congress and exhibition will be held at Blackpool from July 4th to 11th.

THE ROAD BOARD.

GRANTS TO HIGHWAY AUTHORITIES: FOURTEENTH LIST.

During the months of January, February, and March, 1914, the Road Board indicated additional advances to highway authorities amounting in the aggregate to £684,940, of which £445,005 was by way of grant and £236,935 by way of loan.

The total advances made and indicated up to March 31, 1914, amount to £5,213,812—£3,829,105 by way of grant and £1,384,707 by way of loan.

The formal advances by way of grant made, with the approval of the Treasury, during the last quarter, amounting to £500,499, were applied as follows:—

To road crust improvements	£461,520
To road widenings and improvement of curves and corners	20,173
To road diversions	12,620
To reconstruction and improvement of bridges	6,186

During the same period advances by way of loan, amounting to the sum of £101,160, have been arranged.

Included in the foregoing totals are advances (£56,321 by way of grant and £31,450 by way of loan) to a scheme submitted by the Oxfordshire County Council for improving 63 miles of main roads in the county, at an estimated cost of £95,465. The work will take three years to complete.

TAR MACADAM ROADS.

EXPERIENCE WITH QUENAST STONE AND SLAG AT TUNBRIDGE WELLS.

Mr. W. H. Maxwell, Assoc. M. Inst. C. E., the borough engineer of Tunbridge Wells, whose paper, "Have Bituminous Methods of Construction Solved the Modern Road Problem," presented at the recent South-Eastern District meeting of the Institution of Municipal and County Engineers held in that town, was reproduced in our issue of last week, has favoured us with some additional particulars respecting the tar-macadam work referred to in his contribution.

It will be recollected that in his paper Mr. Maxwell mentioned that he had experienced good results from Quenast stone. The Quenast used cost 13s. 3d. per ton delivered into depot, and the cost of converting the material into tarred-macadam ready for use was 7s. 1d. per ton, or a total of 20s. 4d. The tar-macadam plant is capable of properly heating the stone and tar, and of mixing it in a rotary cylinder driven by motive power. The plant has an output of 30 tons per day. The work is carried on and the material stored under cover. This tarred macadam when laid an average of about 3 in. thick over an existing macadam road surface cost slightly under 2s. per square yard. The work has been completed nearly three years, and is giving every satisfaction.

Slag tar-macadam was laid by Mr. Maxwell in 1907 on a main road, which was at the same time sewered and widened from about 20 ft. to 60 ft. The traffic on this thoroughfare is considerable, there being an average of 5,373 vehicles per day, equivalent, on the Road Board basis of calculation, to 2,892 tons per day, which represents a total traffic-weight of about 310 tons per yard width of carriage-way per day. These statistics were taken in the month of September, 1913, during wet and unsettled weather, and do not include the night traffic between 10 p.m. and 6 a.m.

This road, for about two-thirds of its width, had to be constructed on made-up ground over an adjoining ditch and field, and a wide and deep trench with two sewers side by side, ran through the whole length of the road. Notwithstanding these unfavourable conditions, the slag tar-macadam, which was laid on a strong foundation of 12-in. to 18-in. hardcore, has stood the test extremely well, and after seven years of wear under a traffic as above described, the surface is still in a good, sound serviceable condition.

"QUARRITE" AT SUTTON.

In our report last week of the discussion of Mr. Maxwell's paper we omitted to record certain passages in the speech of Mr. W. H. Grieves, engineer and surveyor to the Sutton, Surrey, Urban Council, having reference to the use of "Quarrite" in that district. Mr. Grieves, it will be recalled, mentioned that he had yet to obtain any very satisfactory results from granite tar-macadam, and he then went on to say that the nearest approach to solving the difficulty in that connection was to be found in the three sections of "Quarrite" which had been put down two years ago on the main road from Sutton to Epsom, and which had stood very well. The material in question consists of Leicester granite mixed with special bitumen, and is laid in two coats of a total thickness of 3 in.

Road Board Policy.—In the House of Commons on Tuesday, Mr. Bridgeman asked the President of the Board of Trade whether it was the policy of the Road Board and Development Fund Board, in spending the accumulations of their funds at a time when employment was scarce, only to make grants to local authorities when those authorities were willing to raise money from the rates for the same purpose. Mr. Montagu, who replied, stated that since the establishment of the Development Commission and the Road Board employment had been generally good, and it was impossible at present to make any general statement as to the policy to be pursued in different circumstances. Mr. Bridgeman inquired whether the hon. gentleman could point out to the Road Board that the effect of carrying out such a policy would be to help rich districts and to leave poor districts alone. Mr. Montagu said he would convey the suggestion to the Road Board, but added that he had no control over that body.

SOME RECENT PUBLICATIONS.*

ARCHITECTURAL DRAFTING. By A. Benton Greenberg, B.A., and Charles B. Howe, M.E. Price 6s. 6d. nett. London: Chapman & Hall, Limited.

This volume forms one of the Wiley Technical Series for Vocational and Industrial Schools. The object of the authors has been not only to lay a practical foundation for those whose vocation demands a knowledge of the subject, but also to instil an appreciation of good architecture in the minds of readers of the work. The authors have departed from the plan of presenting a series of plates to be copied by the student, holding that mere copying leads to superficial knowledge and mechanical skill, instead of promoting originality. The book is divided into six sections, respectively dealing with drafting implements, theory and practice of drafting, materials of construction, building construction and design; while specifications and estimating are dealt with in appendices. The book is not a text-book of either building construction or drawing in the ordinary sense, but for the particular purpose for which it is written it will be found very useful. Its title indicates that the work is an American one.

SCREW PROPELLERS AND ESTIMATION OF POWER FOR PROPULSION OF SHIPS. By Captain Charles W. Dyson, United States Navy. Price 31s. 6d. nett (two volumes). London: Chapman & Hall, Limited.

This work, which consists of a volume of text and an atlas of charts, is based upon several papers which have from time to time been contributed by the author to the journal of the American Society of Naval Engineers. In an interesting introductory chapter the history of the development of screw propeller propulsion is shortly traced, while subsequent chapters deal with the conditions governing the design of propellers and their propulsive coefficients, including the geometry and drawing of the screw propeller. The subject, if technical, is undoubtedly of the highest importance, and a carefully arranged work like that under notice will prove of great value to those practically interested.

Proposed Dublin Housing Scheme.—If the recommendations of the recent Departmental Committee of the Local Government Board are adopted and carried out (writes a correspondent of the *Manchester Guardian*), 14,000 urban cottages will be provided in Dublin, the fast-rotting tenements and dilapidated small houses in which over 100,000 people exist in an environment of hopeless degradation will be gradually swept away. It is estimated that the 14,000 cottages would cost £250 each, and the committee suggest a State loan of £3,500,000 at 3½ per cent, with a 16 per cent free grant. Fixing the rentals at 3s. 7d. a week per cottage, it is assumed that a burden of about 6d. in the £ would be left to be borne by the rate-payers. The first tangible result of the inquiry is that the Irish Local Government Board has appointed one of its inspectors, Mr. J. F. MacCabe, who was a member of the committee, to carry out a survey of the city. This is the first official survey to be undertaken in the United Kingdom.

Preliminary Studies in Bridge Design.—This little book,† a reprint of articles which appeared in *THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER*, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

* Any of the publications reviewed or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

† By Reginald Ryves, Assoc. M. Inst. C. E. London: St. Bride's Press, Limited, 24 Bride-lane, E.C. Price 2s. nett.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Coventry T.C. (March 27th. Mr. F. H. Tulloch).—£6,110 for paving footpaths, and sums amounting to £565 for the widening of Narrow-lane, Beechwood-avenue and Stoke-row.—The town clerk, Mr. G. Sutton, stated that the council had had two previous paving schemes—in 1906 and 1910 the total amount of the cost being £23,690. The corporation now proposed to spend £10,785, but the balance between £6,110 and £10,785 it was intended to provide out of revenue—i.e., slabs made at the refuse destructor works would be used. This was a class of paving which local inhabitants liked. It was further stated that much of the new paving was for the Red-lane and Narrow-lane districts, which of late years had passed from the character of semi-rural neighbourhoods to well-inhabited ones. With respect to the proposed street widenings, there were land purchases to be made, and building developments were going on in each district. The price to be paid for land in Narrow-lane was closely scrutinised by the inspector, and the city engineer, Mr. J. E. Swindlehurst, expressed the view that a reasonable figure had been arrived at. In Beechwood-avenue and Stoke-row the price was 5s. a yard.

Hebburn U.D.C. (April 1st. Mr. R. H. Bicknell).—£215 for sewerage works, and £135 for the provision of public urinals.—Mr. H. Paterson, surveyor, gave evidence bearing upon the proposed works. In reply to the inspector, the clerk, Mr. T. Stewart, said that the schemes were governed by consideration of cost. The rates were appallingly high, and would probably go up 3d. this year.

Mitchelstown R.D.C. (March 24th. Mr. A. D. Price).—£1,598 and £2,890, respectively, for the purpose of sinking wells and erecting pumps in the Mitchelstown No. 1 and Kildorrery dispensary districts.—The engineer to the council, Mr. Patrick Coughlan, outlined the scheme. He said that he had had much success in finding water by the divining rod. With reference to the proposed pump at Farahy school house, there was an underground stream. He selected that site from his observation with the rod.

Westbourne R.D.C. (April 1st. Mr. A. W. Brightmore).—£7,810 for the purposes of a water supply.—The clerk, Mr. Loader Cooper, asked for sanction to borrow over the longest possible period. The water from the bore, he stated, was adequate for the requirements of the district, and absolutely pure.

Wharfedale R.D.C. (March 25th. Mr. M. K. North).—£2,741 for purposes of sewerage and sewage disposal in the Middleton township. The district council in 1908 received sanction to borrow £2,650 for the purpose of carrying out a sewerage scheme for Middleton, and the whole of the sum now required, with the exception of £170 bank interest, has also been absorbed in the undertaking. Mr. Edgar Newstead (clerk to the Wharfedale Council) explained that additional cost had been incurred through delay occasioned in respect to a land restriction, also through leakages, and the necessity of substituting iron for earthenware pipes, and by a claim by the contractor.

APPLICATIONS FOR LOANS.

- Barnoldswick U.D.C.**—£2,000 for paving works.
- Bexhill T.C.**—£6,420 for an isolation hospital.
- Darwen T.C.**—£5,000 for conversions to the water-carriage system.
- Devonport T.C.**—£4,900 for Swilley-road widening.
- Doncaster R.D.C.**—£4,000 for sewage works extension.
- Epsom U.D.C.**—£2,000 for water main extensions.
- Halifax T.C.**—£2,800 for electricity plant.
- Hoyland U.D.C.**—£1,300 for sewage works improvement.
- Leeds T.C.**—£200,000 for a new electricity station.
- Maidstone T.C.**—£550 for electricity offices extension.
- Mansfield T.C.**—£3,750 for street works.
- Midhurst R.D.C.**—£780 for the erection of four cottages.
- St. Asaph R.D.C.**—£1,855 for a housing scheme, and £2,000 for a water supply.
- St. Helens T.C.**—£42,191 for gasworks extensions.

Salford T.C.—£70,000 for gas mains, services, and meters.

Tilbury U.D.C.—£2,695 for surface-water and soil sewers, £63,500 for the erection of 231 dwellings, £840 for channelling, and £651 for the purchase of a depot.

Wrexham T.C.—£1,207 for surface water drainage and sewerage.

LOANS SANCTIONED.

Bradwell Joint Hospital Committee.—£7,448 for hospital extensions.

Brighton T.C.—£2,490 for the purchase of property for a street improvement (period forty years).

Felixstowe U.D.C.—£460 for the erection of public baths.

Hereford T.C.—£11,752 for the provision of workmen's dwellings.

Silsden U.D.C.—£485 for rotary washers for the gasworks.

FORTHCOMING INQUIRIES.

	APRIL.	£
11.— Newquay. For a housing scheme (Mr. H. A. Chapman)		1,000
11.— Orsett. For a housing scheme (Mr. H. S. Stewart)		5,592
11.— Walton-on-the-Naze. For the purposes of public walks and a depot (Mr. Edgar Dudley)		515
11.— Winchelsea. For a water supply (Major J. Stewart)		250
15.— Buckfastleigh. For a housing scheme (Mr. Courtenay Clifton)		3,151

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times.*

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Dudley £40,000, Margate £12,000, Oxford £21,500, Wrexham; housing and town planning—Chester, Llanelly, Southgate; roads and materials—Dundee, Hartlepool, Strood £6,060, Wigtownshire, Woolwich £20,681; sewerage and sewage disposal—Banbury £37,900, Dewsbury £17,000, Hull, Kidderminster £38,000; water, gas and electricity—Hove £20,000.—Particulars of other works projected will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Birmingham T.C.—Extensions to two council schools are recommended by the Education Committee, at a cost respectively of £6,000 and £5,185.

Dudley T.C.—The Public Works Committee recommend that a large municipal building scheme, involving an expenditure of £40,000, should be proceeded with at once. The scheme includes a town hall, municipal offices, police accommodation, an art gallery, and a museum, and has been rendered necessary owing to the refusal of the Home Office to pay the police grant until modern premises are provided.

Margate T.C.—It has been decided to build a new school at Garlinge, at an estimated cost of £12,000.

Middlesbrough T.C.—The Streets Committee are giving consideration to a report by the borough surveyor, Mr. S. E. Burgess, with respect to a proposed bridge over the railway from Grove Hill to North Ormesby. A 7-ft. bridge, he estimates, would cost £500, but if the council wanted a road bridge suitable for the requirements of modern traffic, one 60 ft. wide could be erected at Saltwell's-road for £55,000, or one 50 ft. wide for £50,000. If such a bridge were built from Longlands to Millfield-road the cost would be £35,000.

Nottingham T.C.—Alterations estimated to cost £1,000 are to be carried out at the Meadow baths.

Oxford T.C.—A scheme has been approved by the Education Committee for building a technical school, at an estimated cost of £21,500.

Padiham U.D.C.—The surveyor, Mr. John Gregson, has received instructions to prepare plans for a public mortuary in the town's yard.

Reading T.C.—It is proposed to erect at the cattle market a building for the disposal of condemned food, at an estimated cost of £985.

Swansea T.C.—The training college in Nelson-terrace is to be converted into an elementary school, at an estimated cost of £6,044.

Worthing T.C.—The borough surveyor, Mr. F. Roberts, has submitted to the General Purposes Committee schemes and plans for extending the Parade bandstand enclosure at an estimated cost of £5,800, and for the erection of an additional shelter on the Parade, opposite Steyne-gardens, at an estimated cost of £900. The borough surveyor has also submitted an alternative sketch plan of a shelter which could be erected at the south end of the Steyne-gardens. The committee have deferred further consideration of the matter.

Wrexham T.C.—The question of providing new municipal buildings is to be reported on by a committee.

HOUSING AND TOWN PLANNING.

Chester T.C.—The Local Government Board have sanctioned the proposed housing scheme, by which it is proposed to build 130 houses as a garden suburb.

Hemel Hempstead R.D.C.—The surveyor, Mr. T. H. Lightbody, is preparing a housing scheme for King's Langley.

Llanelly U.D.C.—The council are recommended by the Housing Committee to build sixty cottages at Capel Ueka, at an estimated cost of £15,805.

Sevenoaks U.D.C.—For the accommodation of the council's workmen, it has been agreed to build four-teen cottages, at an estimated cost of £4,550.

Southgate U.D.C.—The council have resolved upon a scheme for the provision of 160 dwellings, of which 115 will contain three bedrooms, and thirty-one two

bedrooms, while fourteen will consist of tenements.

Scarborough T.C.—The borough engineer, Mr. H. W. Smith, has prepared plans defining the areas of the proposed housing schemes in the east and central districts, and these have been duly forwarded to the Local Government Board.

Winchester T.C.—The Sanitary Committee have been authorised to prepare a scheme for the erection of fifty houses.

York T.C.—It is proposed to purchase a site near Tang Hall-lane for the purpose of a housing scheme.

PARKS AND OPEN SPACES.

Folkestone T.C.—The Parks Committee have adopted a scheme for the provision of a covered promenade and shelter on the Leas, at an estimated cost of £500.

REFUSE COLLECTION AND DISPOSAL.

Worthing T.C.—The Sanitary Committee recommend the adoption of a scheme for the removal of trade or garden refuse—as distinct from ordinary house refuse, at a charge of 2d. a bushel, or 2s. 6d. a cart load of 20 bushels. The regulations lay down that in no circumstances will the corporation in future remove garden refuse without payment, and householders must not therefore place it in the bin used for household refuse.

ROADS AND MATERIALS.

Bath T.C.—Acting upon a report prepared by the borough surveyor, Mr. C. R. Fortune, it has been decided to proceed at once with further repairs of the Grand Parade, at an estimated cost of £1,500. The cost of the work in hand at present is £900.

Blean R.D.C.—The surveyor, Mr. F. A. Ward, reports the completion of the Herne Bay and Whitstable road, at a cost within his estimate (£235). A grant in aid of the scheme was sanctioned by the Road Board.

Cheadle R.D.C.—It has been agreed to make a contribution of £150 towards the Black Horse corner improvement, and it is hoped that the county council will make up the balance—£600.

Devonport T.C.—The council have approved the plans and estimates of the borough surveyor, Mr. J. F. Burns, for the widening of Swilley-road as follows: Purchase of Rose Cottage and land, £1,021; constructing sewer and widening and completing road, £3,888; total, £4,909.

Derby T.C.—The Road Board have signified their willingness to grant £5,300 towards the cost of tarmacadamising and tar-spraying of roads in the borough, £500 each towards the widening of London-road and Uttoxeter-road, and £700 towards the widening of Mansfield-road. For the improvements in the two last-mentioned thoroughfares a grant of £3,700 is asked from the council.

Dundee T.C.—The Works Committee have resolved to carry out repairs to Clepington-road, at an immediate cost of about £6,000. In regard to the controversy as to whether the trackless trolley trams were responsible for the state of the road, it was argued that the traction engine and other heavy traffic was equally responsible. The ultimate cost of the work along the whole of the trackless tramway route will be about £14,000.

Droitwich T.C.—The borough surveyor, Mr. H. Hulse, has prepared a scheme for raising the level of the High-street to prevent floodings, and the matter is under the consideration of a committee, the borough surveyor meanwhile to have a conference with the engineer to the Salt Union.

Hartlepool T.C.—An improvement scheme is to be carried out from Sheraton-lane to the borough boundary, at an estimated cost of £16,000.

Helensburgh T.C.—The council have accepted the offer of the Road Board of a loan of £1,800, free of interest for four years, and a grant of £150 for road improvements.

Killarney R.D.C.—The council have agreed to make a contribution of 10 per cent towards the cost of

works on the road from Rathmore to Killarney, estimated at between £7,000 and £8,000. The scheme will be under the direction of the Road Board, which has sanctioned the necessary outlay.

Malton R.D.C.—The surveyor, Mr. J. T. Wiseman, has received instructions for asphaltting various footways, at an estimated cost of £210.

Oldham T.C.—It appears from a return by the sanitary superintendent that the flagmaking department earned during last year a profit of £303. It was hoped next year to make a profit of £350 so that the deficiency might be wiped out and a sum of £203 given in aid of the rates. The quantity of flags sold to private traders during the year amounted to 6,563 sq. yds., or an increase on last year's sale of 800 sq. yds. The total sales of flags had been 19,794 sq. yds., representing £2,812.

Perthshire C.C.—The road surveyor, Mr. W. L. Gibson, has submitted to the Western District Committee a report on the proposed reconstruction of 25 miles of roads in the Killin district, at an estimated cost of £11,558. The Road Board propose to give a grant of three-fourths of the cost and a loan for the remainder free of interest. The roads to be treated are those from Lix Toll to Tyndrum, from Tyndrum to the county march on the Fort-William-road, and from Crianlarich to Invernan through Glenfalloch. The roads will be widened, levels raised where necessary, and narrow, old-fashioned bridges will be widened and improved.

Shipley U.D.C.—The tramway track is to be partially reconstructed at an estimated cost of £8,365.

Strood R.D.C.—The Gravesend-road from Denton to Strood, is to be improved, at an estimated cost of £6,060.

Stockport T.C.—Grants of £2,500 and £1,500 have been made by the Road Board for reconstruction works in Edgeley-road and Bramhall-lane.

Uckfield U.D.C.—It has been agreed to adopt the scheme of the surveyor, Mr. E. Johnson, for repairs to the roads at Grub-road and Limney, including the driving of pitch-pine piles, and drainage, at a cost of £243.

Wigtownshire C.C.—The Mackers District Committee have approved the report of the road surveyor with reference to the proposed improvements in aid of which the Road Board had promised a grant of £2,500 and a loan for six years of £2,900. The scheme includes the reconstruction of the Barhill road for 6 miles, also reconstruction work on the Clachan-easy and Glenling roads, and the widening and improvement of others.—The Rhins District Committee propose to reconstruct and surface with tar 50 miles of main roads in the district within the next three years at an estimated cost of £25,000, the Road Board having given a grant of £8,500 and a loan of £16,500, free of interest, repayable in eight years.

Woolwich B.C.—Subject to a loan of £20,681 being obtained, it has been agreed to resurface portions of the motor-bus routes as detailed in the report of the borough engineer, Mr. J. Rush Dixon.

Worcester T.C.—The Streets Committee recommend the council to accept an offer from the Road Board of £627 for the application of tarmac to various roads. They also recommend that the foundations of the Bath road should be strengthened, at an estimated cost of £2,344.

SEWERAGE AND SEWAGE DISPOSAL.

Banbury T.C.—The Local Government Board have sanctioned a loan for £37,000 for carrying out the scheme of sewerage and sewage disposal for the borough which has been prepared by Messrs. Willecox & Raikes, of Westminster and Birmingham, and tenders are at once to be obtained for the first portion of the work, including the erection of a refuse destructor and pumping plant, the construction of pump well, sedimentation and storm tanks, and bacteria beds, together with the sewerage of the district of Grimsbury.

Bath R.D.C.—The tender of Mr. Hill, Kidderminster, at £17,403, has been accepted for laying a sewer from Monckton Combe along the Claverton Valley, *via* Batheaston, to connect with the Bath city sewerage system.

Bowland R.D.C.—The council recently approved the scheme prepared by Mr. Johnson of the proposed

sewage disposal works at Grindleton. The estimated cost of the scheme is £2,180.

Dewsbury T.C.—It is proposed to carry out alterations at the sewage disposal works at Mill Bank, at an estimated cost of £15,000.

Gateshead T.C.—A letter has been received from the Local Government Board on the subject of domestic sanitary conveniences in the borough. It is pointed out that the borough compares unfavourably with the majority of the ninety-five great towns of England and Wales in the proportion of dry-closets and in the matter of the conversion of these to water-closets. In view of the many disadvantages of the dry system, the board urge the council to reconsider the question of undertaking the systematic and general conversion of these closets wherever a sufficient sewer and water supply are available, and of prohibiting in similar circumstances the erection of closets other than fresh water-closets in new buildings. The council have sent a reply to the effect that having further considered the question, they did not see their way to alter their previous decision.

Halifax T.C.—A letter has been received from the Local Government Board Committee urging the council to formulate a scheme for the systematic and general conversion, where adequate sewers and water supply are available, of all existing conservancy closets in the borough.

Hull T.C.—It has been agreed to borrow £20,000 as an instalment towards the cost of a scheme for conversions to the water-carriage system.

Isle of Thanet R.D.C.—The Local Government Board have called the attention of the council to the need for a drainage scheme in order to safeguard the water supply of Birchington.

Kidderminster T.C.—The corporation have instructed Messrs. Willecox & Raikes, of Westminster and Birmingham, to at once prepare and submit to the Local Government Board a scheme for the sewerage of the areas recently added to the borough, the provision of new pumping plant at the sewage disposal works, the construction of storm-water tanks, as well as the works necessary for the extension of the sewage farm, and including sedimentation tanks for dealing with the whole of the sewage of the borough. The estimated cost of the scheme, together with the land, is £38,000.

Kids Grove U.D.C.—The surveyor, Mr. F. C. Crimes, has been instructed to prepare a scheme of sewage disposal.

Nuneaton T.C.—A scheme of surface-water drainage and sewage disposal is to be carried out, at an estimated cost of £1,750.

Truro T.C.—The city surveyor, Mr. F. A. Barnes, has submitted to the Sanitary Committee alternative schemes of sewage disposal, and it is understood that the committee regard favourably the one which provides for the filtration of the effluent. It is proposed to carry the sewage from Truro by a tunnel under the river to Calenick, where the effluent will be treated on a portion of the foreshore before going into the river. In addition, it is proposed to take the drainage of Trennick Row up Malpas-road and across the river by means of a siphon to the corporation yard.

Witham U.D.C.—A proposal is under consideration for a sewage disposal scheme, which is estimated to cost £8,000.

Worthing T.C.—The council have referred to the borough surveyor, Mr. F. Roberts, for report, a proposal by the Steyning West Rural District Council for draining a portion of Lancing into the Worthing outfall. The rural council also ask upon what terms the corporation will undertake the disposal of the council's sewage.—The Highways Committee recommend the acceptance of the tender of Mr. A. G. Osenton, of Horsham, at £3,193 3s. for the laying of two sewage and surface-water additional outfalls.

WATER, GAS, AND ELECTRICITY.

Banffshire C.C.—A water supply scheme for the special Findochty district has been agreed upon by the Banff District Committee, the estimated cost being £2,555, exclusive of compensation to tenants.

Bath T.C.—A difficulty having arisen with the gas company as to street lighting, the Street Lighting Committee considered the question of obtaining a supply of gas from the company and lighting and maintaining the lamps either by their own men or by contract. The present payment to the gas company,

which covers the supply of gas at the current price of 1s. 10d. per 1,000 cub. ft., and the lighting and maintenance of the lamps, is £2 10s. per lamp per annum. The committee ascertained that the company would supply gas for public lighting at the price from time to time charged to ordinary consumers. This price, upon an assumed consumption of 17,000 cub. ft. of gas per annum for 3,650 hours of lighting, will amount to £1 11s. 2d. per lamp per annum. The council have agreed to enter into an agreement with the gas company for a supply of gas, and have also accepted the tender of Messrs. Horstmann Brothers & Edgar for fitting automatic controllers and lighting, cleaning and maintaining the lamps at 19s. 4d. per lamp, thus making the total cost £2 10s. 6d. per lamp, which is practically the same as the amount now paid for the lighting and painting of the columns.

Blackrock (Co. Dublin) U.D.C.—The council have approved a report by Mr. Tierney for a scheme for the erection of a power station for the production of electricity, and Mr. Tierney, assisted by the surveyor, has been authorised to prepare a scheme of electric lighting.

Bognor U.D.C.—The surveyor, Mr. O. A. Bridges, has been authorised to purchase ten automatic controllers at 30s. each, to be fixed to the all-night lamps.

Camelford R.D.C.—The Camelford water supply has been extended by the council to Valley Tuckle, a village $\frac{3}{4}$ mile from the town on the Bodmin road. The inaugural ceremony took place on Saturday last.

Darwen T.C.—Mr. H. Howard Humphreys, the arbitrator appointed by the Local Government Board to go into the matter, has directed the corporation to pay to the Bolton Town Council 7½d. per 1,000 gallons for a supply of water.

Eastbourne T.C.—The Electric Lighting Committee are advocating alterations to the electricity mains, at an estimated cost of £4,656.

Fraserburgh T.C.—The alterations and extensions at the Broad-street site of the gasworks has been approved. The tender of Messrs. Henry Balfour & Co., Limited, Durie Foundry, Leven, has been accepted for the ironwork, and that of Messrs R. & G. Hyslop, Paisley, for the new chimney and retorts.

Hove T.C.—The purchase being completed, the Hove electric lighting undertaking was last week formally handed over to the corporation. The property includes two generating stations, 10 miles of feeder and distributing mains valued at £70,000, machinery representing about £68,000, and meters £12,000. The purchase price was £180,000. Most of the plant is in good condition, the cables particularly so, but the engineers contemplate an expenditure of £20,000 in modernising the machinery.

Kingsbridge R.D.C.—It was stated in council that Dr. J. R. Hinchinson, Local Government Board medical inspector, had been directed to make an inquiry into the water supplies of Modbury and Kingston, and he requested that the sanitary surveyor, Mr. W. H. Whitaker, should meet him.

Lincoln T.C.—It has been agreed to pay £5,500 from the profits of the gas undertaking, and £1,500 from the electricity and tramways profits in relief of the rates.

Newcastle (Ireland) U.D.C.—An agreement has been signed with the Irish Towns Electric Light and Power Company, Limited, Belfast, to provide for nine months in the year, from half an hour after sunset till 11 p.m., 100 50-c.p. lamps and 30 25-c.p. lamps, and for the three summer months three lamps of 300-c.p. each in the main promenade, for the sum of £185 per annum.

Norton R.D.C.—The tender of Messrs. H. C. Puller, at £674, has been accepted for the Leavening water supply scheme.

St. Germans R.D.C.—The council have approved a scheme prepared by the surveyor, Mr. P. B. Govett, for a water supply for St. Germans, showing that it would be necessary to drive an adit in a field near Lanjore and to construct intake chambers. In addition, a reservoir to contain about 15,000 gallons would have to be made at Pennadown and piped to the village for distribution. The total length of pipe would be about 3,700 yds. Mr. Govett suggested that application should be made to the Local Government Board for a loan of £1,500, repayable in thirty years.

Scarborough T.C.—The Corporate Property Committee have instructed the town clerk to ascertain upon what terms the Scarborough Electric Supply Company are willing to sell their undertaking.

Sleaford R.D.C.—It has been agreed to proceed with the water supply scheme for Evedon, Ewerby, Haverholme and Kirby Laythorpe, at an estimated cost of £2,300.

Swanage U.D.C.—The business of the Swanage Water Company has been bought by the council on behalf of the ratepayers for £22,550.

MISCELLANEOUS.

Bootle T.C.—The council last week accepted the tender of Messrs. Merryweather & Sons, London, at £1,257, for the supply of a petrol motor fire engine with Hatfield (reciprocating) pump.

Conway T.C.—It has been agreed to purchase a site at Deganwy for the purposes of a cemetery, and the borough surveyor, Mr. F. Delamotte, has received instructions to make trial borings on the land to ascertain the nature of the subsoil.

Derby T.C.—The Tramways Committee report that they are considering the question of substituting motor traction for all the horse traction used in connection with the tramways, and that they have arranged for the purchase for £800 of 1,779 sq. yds. of land at Alvaston for a waiting-room and depot, and for street improvement.

Devonport T.C.—It has been agreed to accept a tender, at £1,150, for the supply of a motor fire engine, subject to the loan being sanctioned.

Kent C.C.—The council have accepted the tender of Messrs. J. & E. Hall, 10 St. Swithin's-lane, E.C., for a repeat order of six of their 5-ton "Hallford" tip-wagons. The council have had in use for some time past four vehicles of this firm's manufacture.

Loftus U.D.C.—An illuminating discussion took place recently at the council upon a proposal that the surveyor, Mr. B. J. Wormleighton, should be authorised to take an articulated pupil, the council to pay such pupil 5s. per week. Several councillors were indignant that the ratepayers should be asked to pay this money. It would actually go on for three years! The chairman said the surveyor had asked for a pupil on account of the increased office work. That work had been much increased by the requirements of the Local Government Board during the past few years. The surveyor would then be able to devote more time to his outside duties. A councillor said it had been admitted that the surveyor spent many nights at the office till 10 o'clock—the surveyor added: "And at home till midnight"—whereupon another member retorted that he did not get to the office till 9.30 a.m. In the end the proposition was agreed to.

Stowmarket U.D.C.—The council are seeking to obtain prices for the supply of a motor or steam fire engine.

Town Planning Scheme for Wallsend.—The borough surveyor of Wallsend, Mr. G. Hollings, has received instructions to prepare the necessary information in order that formal application may be made to the Local Government Board in connection with a town planning scheme.

Institution of Civil Engineers: Students' Meeting.—At a students' meeting held at the Institution of Civil Engineers on the 3rd inst. at 8 p.m., Mr. Edward Sandeman, M.A., M.Sc., E., in the chair, a paper on "The East Stirlingshire Waterworks and a Note on Earthen Embankments" was read by Oswald Irving Bell, STU.A.M.S.T.C.E. The first part of the paper consisted of a description of the methods employed in the construction of the waterworks supplying the eastern district of the County of Stirling. It was accompanied by a number of very interesting slides, which were explained by the author in the course of his reading. The second part of the paper dealt with the design and construction of earthen embankments employed for impounding water, and was illustrated by diagrams. The discussion was opened by Mr. W. C. Mitchell, and was continued by Messrs. D. A. Stephens, F. R. Freeman, W. H. Cooper, P. V. Hoare, P. J. Bowie, and H. E. Denny. The author, in his reply, dealt at length with the various points raised in the discussion, and the chairman made some remarks on the design and construction of the puddle wall in earthen embankments. The meeting concluded with a vote of thanks to the chairman, proposed by Mr. W. C. Mitchell. After the meeting nominations were received for the London Students' Committee for the year 1914-15.

PERSONAL.

Mr. P. T. Harrison, borough surveyor of Chelmsford, has been voted an increase of his salary to £360 per annum, rising to a maximum of £400.

Mr. Charles Durie, highways surveyor of the eastern district of the Williton Rural District Council, has been voted an increase of salary of £60 per annum, to commence from the 1st inst.

Mr. J. H. Walters, borough surveyor of Congleton, has been appointed architect to the Education Authority, and has been instructed to report on available sites for the erection of the proposed new schools.

Mr. Thomas Tadwell Thomas, Conway, has been appointed surveyor and inspector to the Holywell Urban District Council, at a commencing salary of £105 per annum, in succession to the late Mr. R. A. Thomas.

Mr. Measham Lea, ASSOC. M. INST. C. E., chief engineer, Karachi Municipality, will arrive in England during May for a six months' stay. Communications will find him if addressed c/o Dr. F. C. Lea, Professor of Civil Engineering, Birmingham University.

Mr. G. W. Mitchell, sanitary surveyor to the Pocklington Rural District Council, has been voted £30 for his services in connection with the Shipton sewage disposal scheme, at the same time being complimented on the excellent way he had superintended the work.

Mr. W. McK. Brown, water engineer to the Lincoln City Council, was on Monday voted £1,000 for his services in connection with the new waterworks. It was stated that he had carried through the scheme—the total cost of which was £227,000—at a saving to the rates of £10,000.

Mr. J. H. Sagar and Mr. W. H. Hall, B.S.C., surveying assistants to Mr. Arthur Harrison, M. INST. C. E., borough engineer of Southwark, have been elected associate-members of the Institution of Civil Engineers. Mr. Sagar, who was resident engineer for the passenger subways at the Elephant and Castle, completed in 1911, at a cost of £15,000, holds the testamur of the Institution of Municipal and County Engineers. Mr. Hall is a Professional Associate of the Surveyors' Institution, and has passed the examination of the Royal Sanitary Institute in Sanitary Science.

Mr. James P. Wilkinson, M. INST. C. E., of Cathedral-street, Manchester, and Ardlin, Ley Hey Park, Marple, one of the oldest members of the Institution of Municipal and County Engineers, died last week, we regret to state, at the age of sixty-two. Mr. Wilkinson had been engineer to the Rivers Committee of the Manchester Corporation until recently, and designed and helped to carry out the great sewage disposal works at Davyhulme. The designing and planning of this famous undertaking had occupied practically the whole of his time and energy since his appointment as engineer to the Rivers Committee in 1900, and they will stand as a lasting monument to his engineering skill. Mr. Wilkinson, who had carried out work for the Admiralty at Harwich, was consulting engineer to the Stalybridge and Dukinfield Joint Sewerage Board and a number of local authorities. He leaves two daughters and a son, Mr. Oswald J. Wilkinson, ASSOC. M. INST. C. E., who succeeds his father as engineer to the Davyhulme works extension scheme, which is estimated to cost £200,000.

The London Highways Committee have recommended that an agreement should be entered into with Messrs. Kennedy & Donkin for Sir Alexander Kennedy to become consulting engineer to the county council tramways at a retaining fee of £500 a year.

Wexford's Garden Suburb.—Wexford, says the *Freeman's Journal*, is to have the largest "garden city" in Ireland. The Local Government Board order empowering the Gorey District Council to raise a loan for the erection of seventy cottages on a site purchased two years ago has been received. The land was obtained from Sir George Errington for £2,000, and the whole cost of the scheme, including the erection of cottages and the laying out of plots, will, it is estimated, be about £12,000. A garden of $\frac{1}{2}$ acre will be attached to each cottage, and the roads and open spaces throughout the "city" will be planted with trees.

WATERPROOFING MASONRY.

AMERICAN COMMITTEE'S RECOMMENDATIONS.

A comprehensive report of forty-eight pages on waterproofing masonry, the results of five years of investigation, was submitted at the last annual meeting of the American Railway Engineering Association by the committee on masonry. The committee discusses coatings, membranes, integrals, and watertight concrete construction, and includes five pages of diagrams showing methods of waterproofing bridge floors of various types, arches, subways, expansion joints, &c. The following conclusions are recommended for adoption:—

(1) Watertight concrete may be obtained by proper design, reinforcing the concrete against cracks due to expansion and contraction, using the proper proportions of cement and graded aggregates to secure the filling of voids and employing proper workmanship and close supervision.

(2) Membrane waterproofing, of either asphalt or pure coal-tar pitch in connection with felts and burlaps, with proper number of layers, good materials and workmanship, and good working conditions, is recommended as good practice for waterproofing masonry, concrete and bridge floors.

(3) Permanent and direct drainage of bridge floors is essential to secure good results in waterproofing.

(4) Integral methods of waterproofing concrete have given some good results. Special care is required to proportion the concrete properly, mix thoroughly and deposit properly so as to have the void-filling compounds do the required duty; if this is neglected, the value of the compounds is lost and their waterproofing effect destroyed. Careful tests should be made to ascertain the proper proportions and effectiveness of such compounds. Integral compounds should be used with caution, their chemical action on the concrete being ascertained as well as their effect on its strength. As a general rule, integral compounds are not recommended, since the same results as to watertightness can be obtained by adding a small percentage of cement and properly grading the aggregate.

(5) Surface coatings, such as cement mortar, asphalt or bituminous mastic, if properly applied to masonry reinforced against cracks produced by settlement, expansion and contraction, may be successfully used for waterproofing arches, abutments, retaining walls, reservoirs, and similar structures; for important work under high pressure of water these cannot be recommended for all conditions.

(6) Surface brush coatings, such as oil paints and varnishes, are not considered reliable or lasting for waterproofing of masonry.

FOR OTHER ADVERTISEMENTS

See End of Paper.

CITY OF WESTMINSTER.
DRAUGHTSMAN.

The Westminster City Council invite applications for the position of Engineering Draughtsman in the Works Department at a commencing salary of £120 per annum, rising by annual increments of £10 to £150 per annum.

Applicants must be associated with the Institute of Civil Engineers, and hold the rank of Student at least.

Application for the position must be made on a printed form to be obtained from and delivered to the undersigned not later than Saturday, the 25th April, 1914. Envelopes should be endorsed on the outside "Draughtsman."

Personal canvassing of members of the Council is strictly prohibited, and is held to be a disqualification.

JOHN HUNT,
Town Clerk.

Westminster City Hall,
Charing Cross-road, W.C.

April 8, 1914.

(1,512)

ENGINEERING ASSISTANTS with experience of Sewerage, Sewage Disposal and Waterworks, wanted immediately by Messrs. Willeox & Raikes, Civil Engineers, 63 Temple-row, Birmingham. Applicants must state age and salary required, with particulars of qualifications and experience. (1,509)

RHONDDA URBAN DISTRICT COUNCIL. TO CONTRACTORS.

The above Council invite Tenders for the Extension of Treorchy Cemetery, Treorchy, comprising the Clearing and Levelling of about 15 acres, the building of a Masonry Boundary Wall, the drainage by Deep Stoneware Drains, the forming of Carriage and Foot Ways, &c.

Plans and Specifications may be seen and Forms of Tender obtained at the Council Offices, Pentre, upon the production of a receipt from the accountant for the required deposit of one guinea (to be returned on receipt of a *bonâ-fide* Tender). The Contractors will be required to pay their workmen not less than the standard rate of wages paid in the district for each class of work respectively.

Sealed Tenders, endorsed "Treorchy Cemetery Extension," must be delivered by 10 o'clock on Friday morning, April 17, 1914, addressed to the Chairman of the Council, Council Offices, Pentre.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

E. TAYLOR,

Acting Engineer and Surveyor.

Council Offices,

Pentre, Rhondda.

April 7, 1914.

(L510)

WOLSTANTON UNITED URBAN DISTRICT COUNCIL.

Tenders are invited for the Supply of Materials, delivered as mentioned below:—

2-in. and 2½-in. Machine-broken Clew Hill Basalt, Leicester Granite, or Welsh Granite.

815 tons to Brampton Siding, Newcastle, N.S.R.

365 tons to Silverdale Station, N.S.R.

330 tons to Chesterton Station, N.S.R.

400 tons 1½-in. and 2-in. Tarred Granite to Brampton Siding.

Refined Tar.—Give alternate prices for Tar to be applied hot and applied cold.

9,720 gallons to Brampton Siding, Newcastle, N.S.R.

1,200 gallons to Chesterton Station, N.S.R.

2,800 gallons to Silverdale Station, N.S.R.

80 tons 1-in. to 1½-in. Tarred Limestone for Footpaths to Brampton Siding.

30 tons ¾-in. to 1-in. Tarred Limestone to Brampton Siding.

The Tenders to be endorsed, and to be in the hands of the Clerk, E. Hollinshead, Esq., Town Hall Chambers, Tunstall, not later than Tuesday, April 14th, 1914.

The Council does not bind itself to accept either the lowest or any Tender, and reserves to itself the right to increase or reduce any of the above quantities.

W. F. SLATER,

Engineer and Surveyor.

Burslem, Staffs.

April, 1914.

(L508)

BOROUGH OF HAMMERSMITH.

The Borough Council invite Tenders for the Provision, Erection and Painting, complete, of approximately 1,270 ft. run of Iron Railing, 4 ft. high, to enclose the St. Peter's-square open space, within the Borough, and also for the execution of certain Repair Works to the Dwarf Boundary Wall, in accordance with Specification, which, with Form of Tender, may be obtained on application to Mr. H. Mair, M.INST.C.E., Borough Surveyor, at whose office Plan thereof may be inspected.

Sealed Tenders, endorsed "Tender for Iron Railing," must be delivered to me not later than 10 a.m. on Wednesday, the 22nd April instant.

The Council does not bind itself to accept the lowest or any Tender.

LESLIE GORDON,

Town Clerk.

Town Hall, Hammersmith, W.

April 7, 1914.

(L511)

TO ASPHALT CONTRACTORS.

The Battersea Borough Council invite Tenders for the Supply of Materials and Works for Resurfacing Roadways with Asphalt Macadam. Specification and Form of Tender may be obtained from the undersigned. Tenders, endorsed "Asphalt," must be delivered by 9 a.m. on Saturday, April 18th, 1914.

W. MARCUS WILKINS,

Town Hall,

Battersea.

April, 1914.

Town Clerk.

(L507)

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKEILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford on April 18th.

PROGRAMME.

11 a.m.—Meet at the Chelmsford Railway Station, and proceed either (a) to the Marconi wireless telegraphy works, by kind permission of the directors. Inspection will be made of the whole of these works, which are quite new and up-to-date, and the manufacture, testing, and assembling of the apparatus used in connection with wireless telegraph installations may be seen; or (b) to the engineering works of Messrs. The Hoffmann Manufacturing Company, Limited, by kind permission of the directors. Inspection of the manufacture of steel balls, rollers and bearings of all sizes, including the cutting off and converting of the raw material, turning, hardening, grinding and assembling of the parts. The plant inspection includes centrifugal oil separating installation and engines totalling over 2,000-horse power, including a 1,000-horse power Diesel engine just completed.

12.30 p.m.—Inspect corporation open-air swimming bath.

1 p.m.—Lunch at the Shire Hall, by kind invitation of the Worshipful the Mayor, Alderman G. W. Taylor, J.P.

2.15 p.m.—District business.

Paper by Mr. Percival T. Harrison, Assoc.M.INST.C.E., borough engineer, entitled "Description of Municipal Works in Chelmsford." Discussion.

3.30 p.m.—Inspection of houses in course of erection under the Housing of the Working Classes Act.

4.15 p.m.—Inspection of new suction gas plant at Mildmay Yard waterworks.

4.30 p.m.—Inspection of new stables and depot.

5 p.m.—Tea at the Shire Hall, by kind invitation of Mr. P. T. Harrison.

J. A. WEBB,

Hon. District Secretary.

Surveyor's Office,
Hendon, Great Stanmore.

H. T. WAKELAM,

District Chairman.

County Engineer,
Middlesex

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District is to be held at Sheffield on May 2nd.

DOVER MEETING.

A meeting of the institution is to be held in the South-Eastern District at Dover on May 9th.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury on May 16th.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

ANNUAL MEETING.

A town planning, housing and road conference and the forty-first annual general meeting is to be held at Cheltenham from June 24th-27th.

THOMAS COLE,

92 Victoria-street, S.W.

Secretary.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

INSTITUTION OF MUNICIPAL ENGINEERS.

President Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held at Darlington on Saturday, April 18th, Hexham on Saturday, May 2nd, Cumberland in June, Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

GENERAL MEETINGS.

A general meeting will be held at the Institution of Electrical Engineers, Victoria-embankment, W.C. on May 11th, for the discussion of a paper—"The Water Supply of New York," by W. T. Taylor, Fellow A.M.I.E.E., M.A.M.SOC.M.E.E., F.R.E.G.S. (member).

A general meeting will be held at Birmingham in May, when a visit will be paid to the works of the General Electric Company.

COUNCIL MEETING.

A council meeting will be held in London on Wednesday, April 29th.

EASTERN AND NORTH-EASTERN DISTRICT.

A joint Eastern and North-Eastern District meeting will be held at Finedon and Kettering on Thursday, May 7th, when a visit will be paid to the works of the Excelsior Stone Company at Finedon, and certain municipal works inspected at Kettering.

PROGRAMME.

12.20 a.m.—Meet at the works of the Excelsior Stone Company at Finedon, and inspect the manufacture of patent stone slabs, kerbs, channels, architectural dressings, &c.

Proceed thence by motor bus to Kettering for lunch at the Royal Hotel, at the kind invitation of the Excelsior Patent Stone Company, when a short paper will be read by Mr. W. B. Mortimer, managing director of the firm.

An inspection will afterwards be made of works in Excelsior stone at Kingsley-avenue, the new Co-operative Clothing factory, and the county police station.

G. BELSON CHILVERS,
Hon. District Secretary.

Council Offices,
Oundle.

A joint Eastern and North-Eastern District meeting will be held at Ilunstanton in July.

NORTHERN DISTRICT, WITH YORKSHIRE.

A Northern District meeting, in combination with Yorkshire, will be held at Hull on Saturday, May 16th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

39 Victoria-street, S.W.
B. WYAND,
Secretary.

INSTITUTION OF MECHANICAL ENGINEERS.**PARIS MEETING: PROVISIONAL OUTLINE PROGRAMME.**

The Summer meeting of the Institution of Mechanical Engineers will be held in Paris, and will begin on Monday, July 6th. The following outline programme (which is subject to revision) has been drawn up:—

Monday, July 6th.—Arrival in Paris.

Tuesday, July 7th (Morning).—Reading and discussion of papers in the theatre of the Société des Ingénieurs Civils. Luncheon.

Afternoon.—Visits to engineering works and places of interest in Paris.

Evening.—Institution dinner.

Wednesday, July 8th (Morning).—Reading and discussion of papers in the theatre of the Société des Ingénieurs Civils. Luncheon.

Afternoon.—Visits to engineering works and places of interest in and around Paris.

Evening.—Conversation, by kind permission of the Société des Ingénieurs Civils.

Thursday, July 9th.—Visits in or from Paris.

Evening.—Proceed to Lille.

Friday, July 10th.—Visit locomotive, steel and textile works in Lille, Roubaix, Valenciennes, &c., returning to Paris in the evening, if desired. It is intended to arrange for visits to works in Le Havre, and a visit might be made after the meeting to the International Exhibition at Lyon.

EDGAR WORTHINGTON,
Secretary.

CONCRETE INSTITUTE.

A meeting of the Concrete Institute will be held at Denison House, 296 Vauxhall Bridge-road, Westminster (close to Victoria Station), on Thursday, April 16th, at 7.30 p.m., when Mr. Oscar Faber, M.Sc. A.C.E.T., ASSOC. M.A.N.S.T.C.E., &c., will read a paper entitled "The Design of Steel and Reinforced Concrete Pillars, with special reference to Secondary and Accidental Stresses," of which the following is a synopsis:—

The eccentricity on a pillar of a beam reaction with various forms of brackets and caps in the case of jointed construction—such as structural steel—and of monolithic construction—such as reinforced concrete construction.

The effect on the eccentricity of stiffening the joints of a jointed construction.

The design of brackets and cleats in structural steelwork.

The stresses in pillars due to poor workmanship frequently met in practice.

The bracing of pillars and the lesson of the Quebec Bridge failure.

The effect of continuity of pillar on eccentricity.

Worked out examples of design to compare the results of common methods of calculation frequently met, especially in competitive work, with accurate calculations.

JUNIOR MEETINGS.

The second informal meeting of junior members will be held on Friday, May 1st.

H. KEMPTON DYSON,
Secretary.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

INSPECTOR OF NUISANCES.—April 14th. Mitford and Launditch Rural District Council. £150 per annum.—Mr. W. J. Barton, clerk, Guildhall, East Dereham.

CLERK OF WORKS.—April 15th.—Corporation of Leigh. £2 10s. per week.—Mr. Tom Hunter, borough engineer.

SECOND ASSISTANT.—April 15th.—Corporation of Nuneaton. £100—£120 per annum.—Mr. F. C. Cook, borough surveyor.

INSPECTOR OF NUISANCES.—April 16th.—Coseley Urban District Council. £125—£145 per annum.—Mr. W. Lees, clerk.

TEMPORARY ASSISTANT.—April 17th. Chorley Town Council.—Mr. J. Mills, town clerk.

WATERWORKS ENGINEER.—April 18th. Diss Urban District Council.—Mr. Alfred Cooper, waterworks superintendent.

GENERAL ASSISTANT.—April 20th.—Corporation of Leigh. £97 10s. £104. Mr. Tom Hunter, borough engineer.

SANITARY INSPECTOR.—April 20th. West Riding County Council. £170 a year.—Mr. F. A. Darwin, clerk, County Hall, Wakefield.

ROAD ENGINEERING ASSISTANT.—April 20th. Corporation of Capetown.—Messrs. Davis & Soper, agents, 54 St. Mary-axe, London, E.C.

DISTRICT SUPERINTENDENT OF HIGHWAYS. — April 20th.—Corporation of Huddersfield. £120 per annum.—Mr. K. F. Campbell, borough engineer and surveyor.

SURVEYING ASSISTANTS. — April 21st.—Shanghai Municipal Council. £385 per annum.—Messrs. John Pook & Co., agents for the Shanghai Municipal Council, 63 Fenchurch-street, London, E.C.

ASSISTANT ENGINEERS AND DRAUGHTSMEN. — Public Works Department of the Sierra Leone Government. Engineers, £300—£400; draughtsmen, £300—£350, with furnished quarters or allowance.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

COLWYN BAY.—April 18th.—For the supply of drain pipes, kerbs, channels, ironmongery (manhole covers), disinfectants, creosote oil, granite macadam and chippings, and limestone chippings, for the urban district council.—Mr. William Jones, engineer and surveyor.

ROTHERHAM.—April 18th.—For the supply of broken granite, broken slag, tarred slag, tarred limestone, concrete flags, Portland cement, timber, pitch and creosote oil, grit-stone setts and kerbs, and granite

SURVEYORS' INSTITUTION EXAMINATIONS.

COMPLETE COURSES OF PREPARATION in all Divisions and Sub-Divisions of these EXAMINATIONS are given, either in Class, by Correspondence, or in Office, by

Messrs. PARRY, BLAKE & PARRY and B. W. ADKIN.

The TWELVE MONTHS' and TWO YEARS' COURSES for the next Two Examinations are just commencing.

These Courses have been taken by the great majority of the successful candidates in these Examinations for very many years past, including the winners of **NINETY-SEVEN** out of the **ONE HUNDRED AND FORTY-FIVE** prizes awarded during the last nineteen years.

The Beadel Prize for Agricultural Knowledge, awarded in the Land Agency Section of the Examination, has been obtained every year since its institution by Candidates prepared by **MESSRS. PARRY, BLAKE AND PARRY.**

For particulars of the Courses of Work or for any advice with respect to the Examinations, apply to—

Messrs. PARRY, BLAKE & PARRY, 82 VICTORIA ST., WESTMINSTER

Telephone No.: **GERRARD 5680.**

These Courses were established twenty-two years ago, and since that time no stone has been left unturned to raise them to, and maintain them at, the highest standard of efficiency.

Bayard

"The First-Grade Car without the First-Grade Price"

Bayard Cars appeal to that ever widening circle of buyers who insist upon a car of absolute efficiency, yet are shrewd enough to place a definite limit on the price they will pay. Quality is not sacrificed to Economy, but on the contrary coupled with it to a degree that makes the Bayard Car the most profitable of motoring investments.

sells, for the corporation.—Mr. Ernest B. Martin, borough engineer.

SUTTON (Surrey).—April 22nd.—For the supply of road materials, ironmongery, oils, paints, coal, coke, horse forage, and team labour, for the urban district council.—Mr. W. Hedley Grieves, surveyor.

INVERNESS.—April 20th.—For supplies for the Gas Commissioners.—Manager to the Gasworks.

TEES VALLEY.—For the supply of road and valve boxes, brass castings, taps, ferrules, and general stores, for the Water Board.—Mr. Hugh Wilson, clerk.

Miscellaneous.

BRIGHTON.—April 21st.—For the supply of Portland cement, for the corporation.—Borough Surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted † Recommended for acceptance.
‡ Provisionally accepted.

BINGHAM.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. C. W. Kendrick, sanitary surveyor:—

E. Tomlinson, Keyworth, Notts	£373
J. & J. Warner, Derby	340
E. Somerfeld, Nottingham	330
W. Burnett, Hickling, Notts	329
W. Wilson, Bingham, Notts	280

DARTFORD.—Accepted for laying stoneware and iron pipes, with manholes, for the rural district council.—Mr. J. E. Goreham, engineer, Dartford:—
Streeter Brothers, Croydon, £650.

EASTLEIGH.—For making up certain streets, for the urban district council.—Mr. W. Wallace Gandy, engineer and surveyor:—

Weston-road.—Douglas, Southampton, £251; Grounds & Newton, Bournemouth, £267; Osman, Southampton, £268; Free, Maidenhead, £301; Nichol, Southampton, £317; Bicknell, Yeovil, £411; surveyor's estimate, £267.
Northlands-road.—£252,* £269, £268, £300, £312, £427, £252.
Bellevue-road.—£252,* £268, £268, £299, £346, £431, £251.
The Crescent.—£370, £353,* £268, £443, £455, £695, £385.
Barton-road.—£593, £590,* £689, £703, £730, £986, £662.
Desborough-road.—£544, £454,* £623, £630, £651, £948, £585.
High-street.—£348,* £385, £417, £424, £430, £682, £438.

EGREMONT.—For the supply of cast-iron spigot and socket pipes, specials and valves, for the urban district council.—Mr. J. Cowan, engineer:—

J. & R. Ritchie, Middlesbrough.	
Cochrane & Co., Middlesbrough.	
Cochrane & Co., Dudley.	
Birtley Iron Company, Durham.	
J. Oates & Co., London.	
Stanton Iron Company, Nottingham.	
Holwell Iron Company, Melton Mowbray.	
Sheepbridge Iron Company, Chesterfield.	
Staveley Iron Company, Chesterfield.	
CUTTING PIPE TRENCHES.	
J. Dawson, Whitehaven.	
H. J. Dohughan, Cleator Moor.	
Brebner & Co., Glasgow.	
Waring & Sons, Huddersfield.	

FAREHAM.—For the erection of public conveniences, for the rural district council.—Mr. C. W. Hunt, sanitary surveyor:—

J. Chance, Fareham	£435
T. Draper, Fareham	295
A. Sothcott, Lee-on-the-Solent	273
C. Wright, Lee-on-the-Solent	268

LEYLAND.—For the supply of broken granite, slag, tar-macadam, limestone dust, rocmac, kerbs, and setts, for the urban district council.—Mr. M. H. Wilkinson, surveyor:—

2-in. Hand-broken Granite.—Penmaenmawr Granite Company, Limited, Penmaenmawr, 9s. 4d. per ton.
12-in. Machine-broken Granite.—Penmaenmawr Granite Company, Limited, Penmaenmawr, 8s. 9d. per ton.
2-in. Machine-broken Granite.—Shap Granite Company, Limited, Shap, Westmorland, 9s. 2d. per ton; Threlkeld Granite Company, Keswick, Cumberland, 9s. 11d. per ton.
3-in. Hand-broken Copper Slag.—W. & J. Turner, Preston, Lanes, 4s. per ton.
Tar-macadam.—Pwhelli Granite Company, Runsorn, 17s. per ton; Threlkeld Granite Company, Keswick, Cumberland, 16s. 6d. per ton; Wigan Coal and Iron Company, Fishergate, Preston (branch), 12s. 9d. per ton.
Screened Limestone Chippings.—R. Briggs & Co., Limited, Clitheroe, 6s. 10d. per ton.
Roemac.—Roemac, Limited, London (in 700-gallons lots), 9d. per gallon.
6-in. Setts.—J. & D. Crook, Chorley, 11s. 6d. per ton.
4-in. Cubes.—H. Heyes & Co., Manchester, 24s. 6d. per ton.
12 in. by 6 in. Flat Kerbs.—J. Southworth, Abbey Village, Withnell, straight, 3s. per yard; circular, 4s. 2d. per yard.
Concrete Flags.—Shap Granite Company, Shap, Westmorland, 3s. 5d. per square yard.
Earthenware Pipes and Irregulars.—J. Crankshaw & Co., Bolton.
Earthenware Gullies.—J. Plaice & Sons, Limited, Darwen, Lanes, 27 in. by 12 in. by 15 in., 10s. 3½d. each; 21 in. by 12 in. by 15 in., 8s. 3d. each.
Tar-spraying.—H. V. Smith & Co., Limited, London, spraying with Clare's Gold Medal Tarco, and spreading chippings, 2d. per super yard.

And Municipal and County Engineer.

Vol. XLV.

APRIL 17, 1914.

No. 1,161.

Minutes of Proceedings.

The Work of the Compiler. Every technical work must, to some extent, be "a compilation." We quote the expression, as it is one which is used far too frequently as a term of reproach, when discussing a technical book. Complete originality—or even anything approaching complete originality—is not to be looked for in any work. A man can write only what is in him, and by study and observation alone can he lay by the store on which he is to draw when he sits down pen in hand, with a blank sheet of paper on the desk before him. The veriest slush that is vended on the bookstalls, crammed as it may be with impossible heroes and heroines, and bespattered with the goriest of adventures, is no more entitled to be termed original than is a first-class work on mathematics or engineering. A little of what is actually "in" the author is to be found in the pages of both; but precious little. They are, for the greater part, compilations—fragments culled from reading and experience, strung together and woven finally into a more or less harmonious whole. "A dictionary," says Emerson, "is not a bad book to read. There is no cant in it, no excess of explanation, and it is full of suggestions—the raw material of possible poems and histories. Nothing is wanting but a little shuffling, sorting, ligature, and cartilage." And it is in the manner of this shuffling and sorting, this provision of ligature and cartilage, that the genius or folly of an author is made manifest.

One often reads in the review columns of a paper that a work shows startling originality. Any such work of a technical nature must at once be open to suspicion, for none but the quack and the charlatan can aspire to such a height. Medicine offers a case in point, and we take at random from our shelves a book which ranks as a classic on matters physiological. "Hence," we read, in the preface to the seventh edition, "though a record of all important and well-founded recent observations has been inserted in various sections, the chief difference in the present when compared with the previous editions will be found to consist mainly of additions and rearrangements of old facts, and, it is hoped, a plainer exposition of them." We open, again at random, the pages of a work on "Zoism," which was published some years ago in Chicago, and we read: "The body of the Zoist is spiritualised matter, formed of particles refined in process of manufacture by the fire of his thought. . . . Eventually he reaches the state in which the physical body, truly refined from all grossness, truly spiritualised in its molecules, is capable of existing eternally without other food than that which is drawn from the air." The stern, sober facts of the physiologist (in the

preface from which we have quoted) lack sadly the originality betrayed in this representation of the physiology of Zoism. The one work is what is known among the ignorant as "a mere compilation." The other has been described as "a soundly reasoned exposition of a great truth," and, again, as "a work of singular beauty, unique in conception, and of an originality truly refreshing in these workaday times."

The engineer, of all men, has reason to be grateful for the work of the compiler. The greater number of the best books may—we hope without offence—be termed compilations. Originality betrays itself more in newspaper articles and in papers read before societies. In these a man may let himself go, so to speak. He opens himself out for attack, inviting full discussion, and adverse rather than friendly criticism. But what he may say in the Press or on the platform he would be loth to commit to the comparatively imperishable pages of a book. The words of the prophet loom large in his mind, and when he does favour his adversary so far as to write a book he is going to see that every statement in it is backed by some indisputable authority; or, in other words, that it shall partake largely of the nature of a compilation. Theories more or less startling, and bearing every stamp of originality, are necessarily enunciated from time to time, but they are taken for what they are, and those that do not suffer premature decease are slowly but surely stripped of their plumage and end as the sorriest of birds. The burden of this unpleasant duty falls largely to the lot of the compiler. He is the matrix which binds together the loose material, and this material needs selecting with care and judgment, rejecting the inferior, the badly formed, the underburned, and retaining only what is clean, sharp, wholesome and lasting. Life itself is, after all, but a compilation, an adding together and building up of forces and experience. Engineers owe a debt to the compiler which is ill-discharged by aspersions cast upon his work. Is not the engineer himself—regard him in ever so favourable a light—a compiler, working upon a broad basis of facts, leavened by derived experience?

Pure Water a Manufactured Product.

Two cases of remarkable interest to the water engineer are before us at the present time. On the one hand we hear of the Coventry City Council adopting proposals for reclaiming the Whitley waterworks, which have been out of use for the last five years, owing to the water being polluted. It is now proposed to sterilise this polluted water by means of hypochlorite in the form of chloros, and it is estimated that an annual saving of £3,285 will thus be

effected. On the other hand we have the case of Nottingham, where a very serious state of affairs has arisen in connection with the Derwent Valley water supply undertaking, inaugurated only a few months ago. Almost at once there were complaints as to the colour and taste of the water, and it now appears from the report of the Water Committee of the city of Nottingham that if the supply from the Derwent Valley works is to be continued the whole of the wrought-iron pipes, cylinders and boilers at present in use for hot-water domestic supplies will have to be replaced by lead and copper piping and fittings. Thus, as an immediate safeguard, the supply of the Derwent water has been discontinued. It seems that this water in its present condition, though absolutely pure and safe from the point of view of the public health and consumption, is of such a quality that if it is used at Nottingham every wrought-iron pipe in the city will have to be replaced by pipes of some material which will not be acted upon; at least such appears to be the opinion of the Water Committee. It seems that Sheffield had the same trouble thirty years ago, and discontinued the use of iron service pipes altogether, substituting lead. Leicester and Derby have used galvanised iron pipes in anticipation of the Derwent supply, but the opinion is expressed that this will only postpone for a short time the action of the water on the iron.

It is evident from the foregoing that we are every day coming nearer to the knowledge of the fact that water which is used for domestic purposes must be regarded as a manufactured product. If the water is polluted, as in the case of Coventry, it can be purified to any required standard, and water which has been rendered absolutely pure and sterile by proper treatment is a far safer source of supply than water absolutely pure at the source, but liable to accidental contamination. Such specific accidental contamination, we have learned, is far more deadly than general known pollution for which proper safeguards have been taken, and we see in the case of Coventry how a large saving of annual expense may be avoided by sterilisation. In the case of Nottingham it is once again shown that the pure water from upland gathering grounds may need treatment quite as urgently as the water from a polluted stream. There are special troubles which may be encountered, and which can be overcome by proper treatment. But what is abundantly clear is that treatment is required, and that if waters derived from pure sources need chemical treatment, the advantage of going far afield vanishes. It seems therefore that water ought to be treated, in most cases, if the best results are to be obtained, and if this is so, the use of the supply nearest home is to be recommended.

* * *

Competitive Schemes for Engineering Works.

The council of the Institution of Civil Engineers has taken a very important step with respect to the practice of inviting engineers, by advertisement, to submit in competition with others their terms for preparing plans and proposals for engineering schemes. In a circular letter addressed to corporate members of the institution the council express the opinion that such a proceeding is very undesirable in the best interests of the public authorities themselves, and is derogatory to the engineering profession, and they state that they desire to express emphatically the repugnance with which they regard the practice in question. Further, they express their confidence that the members of the institution will support them by declining to respond in any way to such advertisements as those alluded to. The council have not left the matter here, for they have informed the Local Government Board of their action in

making this communication to the institution. It is quite possible that all the other engineering societies will support the parent institution in this matter, and as to the attitude of the Association of Consulting Engineers there can be no doubt whatever. The practice referred to is, on the lowest grounds, undesirable, since it involves much waste of time and money, and it is derogatory not only to the consulting engineer, but also to the engineering officers of the local authorities concerned, who, as professional men, are quite able to decide what assistance they require, and fully competent to suggest the names of reliable consultants whose assistance could be obtained. It would also be to the advantage of contractors that those who are able and willing to work to plans and specifications prepared by responsible officials or consultants should not be ousted by others who, answering the advertisements, attempt to combine the functions of an independent professional engineer with those of the contractor tendering for the work. When it is necessary to compare the costs of carrying out a specific work in different ways, the necessary estimates should be prepared either by the technical officers to the local authority or by independent engineers, paid for doing whatever work is necessary in preparing alternative plans and estimates. In the long run the ratepayers are likely to pay dearly for the attempt to get something for nothing. They often do. The action taken by the council of the Institution of Civil Engineers is an important step towards a better state of public opinion with regard to the status of the whole of the engineering profession. As will be seen from a paragraph in our issue of the 3rd inst., the Institution of Civil Engineers of Ireland is taking the same course.

* * *

The Development of London.

At the last meeting of the Royal Institute of British Architects, Mr. W. R. Davidge, the district surveyor of Lewisham, made a most interesting excursion into the past in a paper in which he traced the origin and development of metropolitan building legislation. The earliest regulation was in all probability that imposed by the Roman building laws, and from that time onwards apprehension of danger from fire and disease has led to the enactment of many laws and the adoption of several and diverse devices for the control of building operations. One of the earliest matters to which attention was given was the erection of party walls, for we find that in 1189 FitzAlwyne's Assize contained provisions to facilitate their erection, and "especially for appeasing contentions which sometimes arise among neighbours." Many things have changed since that day, and among them the law relating to the erection and rebuilding of party walls; but contentions still arise among neighbours, as those who have much to do with building in London are so well aware, and the provisions of the London Building Acts regarding this matter may be regarded as in direct lineal descent from the legislation of 1189. A curious episode is provided by the attempts which were made in the time of Elizabeth, and again under the Commonwealth to restrict building in the Metropolis. These attempts were due to the overcrowded and insanitary conditions of the City, but they were foredoomed to failure. It is difficult to imagine what would be the astonishment of the framers of these Acts were they able to visit the mammoth Greater London of to-day. A new chapter was begun by the Act for rebuilding the City of London after the Great Fire of 1666. This was the first attempt to make anything like a complete code of building regulations, and was a broad and statesmanlike attempt to deal with a desperate situation. Surveyors were appointed to secure its due observance. The growth of London is undoubtedly one of the

great wonders of the world, and although the administrative county is now nearly built over, the outer ring is developing at an enormous rate, and the fact that it is to all intents and purposes an integral part of the Metropolis is shown by the Greater London Bill, which is even now in embryo. The immediate problems of building in London are of great magnitude and importance, and the historical light which is thrown upon them by Mr. Davidge's paper must be of great value to those who are practically concerned in their solution.

* * *

The Engineer as Arbitrator.

In a paper which he read last night before the Society of Architects, Mr. W. Valentine Ball dealt with the position of the municipal or county engineer who is called upon pursuant to the terms of a contract to act as arbitrator between his authority and a contractor who has been executing works under his supervision or control. The fundamental thing to remember in such cases is that the appointment of such an arbitrator—whose independence is obviously open to question—is the result of free contract between the parties, and that the contractor cannot therefore object to his acting merely upon the ground that he is open to suspicion of bias. On the other hand, of course, the arbitrator is bound to act with judicial impartiality and fairness. In the words of Lord Justice Bowen in *Jackson v. Barry Railway Company*, in appointing the engineer as arbitrator the parties "rely on his professional honour, his practice, and his intelligence; and the contractor certainly has a right to demand that, whatever views the engineer may have formed, he will be ready to listen to argument, and at the last moment to determine as fairly as he can, after all has been said and heard." In certain cases, however, the Courts have held that the contractor is entitled to be relieved from the arbitration clause. For example, if the engineer himself is a necessary witness at the inquiry, or if the question in dispute involves a consideration of the engineer's own conduct, it is manifestly unfair that he should act as arbitrator. Other similar instances were given by Mr. Ball, whose paper is well worthy of perusal as a logical and orderly statement of an important branch of the law peculiarly affecting engineers.

* * *

The Roads Improvement Association.

The report of the past year's work of the Roads Improvement Association is an optimistic document, and records considerable progress in the modern movement for improved roads. There can be no doubt that the Third International Road Congress which was recently held in London served to focus public attention in this country on the problems of highway engineering arising out of the new traffic conditions. This in itself was a result of the greatest possible value, inasmuch as the formation of an intelligent public opinion is a condition precedent to the attainment of any real progress. The next thing to impress upon the public mind is that highway matters will claim great attention for many years to come. We are at present in the throes of the greatest transition in the means of locomotion that has ever been known—with the one possible exception of the advent of the railway—and the road engineer of the future must be a man of practical attainment, engineering ability, and economic foresight. It is evident that, as has been pointed out in our columns by Mr. H. Percy Boulnois, some special training is necessary to equip such a man; and the scheme which has been outlined for the establishment of a Chair of Highway Engineering at a suitable university is one which merits the most careful consideration. We observe with pleasure, there-

fore, that the president of the Institution of Municipal and County Engineers has invited Mr. Boulnois to read a paper on the subject at the forthcoming annual meeting at Cheltenham. It would be difficult to imagine a more suitable opportunity for the discussion of such an important question.

* * *

Purification of Swimming Baths.

If we have been rather insistent in pointing out the danger to health which is caused by the deposit and germination of disease-bearing bacteria in the water of a swimming bath which is used by a promiscuous number of bathers without renewal or purification, it is because we believe the danger to be both real and preventable. The comparative merits of the process of aeration and filtration, and the use of electrolytic fluid have been discussed in these columns from time to time, and we now recur to the subject for the purpose of directing the attention of our readers to an invention which has just been patented by Mr. Arthur Pollard, a member of the Baths Committee of the Nottingham City Council. Briefly stated, the scheme ensures a continual flow of water from rivers or other watercourses through swimming baths without loss or waste of water, in combination with a mode of filtering and heating the water. While the scheme is devised primarily for baths already existing, or to be built, in proximity to a watercourse, the principle is adaptable to premises not so favourably situated. Swimming baths by the riverside are not by any means uncommon, but, as Councillor Pollard points out, no attempt is made to filter or heat the water used by them. They are often objectionable, and even unsafe, owing to the muddy river bed, while people too weak or delicate to use cold water baths are necessarily compelled to forego the pleasure of a swim, except in warm weather. Councillor Pollard hopes to induce the Nottingham Corporation to adopt his invention. If they do so the result will be watched with interest.

* * *

The Institution of Municipal and County Engineers.

As will be seen from the report which appears on another page, the March council meeting of the Institution of Municipal and County Engineers was called upon to discuss several matters of importance. The Constitution Committee, in their report, recommended that the articles and by-laws should be amended so as to provide for the election into the Institution of engineers holding appointments under authorities such as the Road Board. This recommendation was adopted, and it is to be hoped that it may be possible to carry it into effect with little delay, for it is indeed anomalous that engineers whose work is so closely akin to that of the municipal engineer should be excluded from the ranks of the Institution. As regards the future, attention must be concentrated on the town planning, housing and road conference, and the forty-first annual general meeting, which are to be held at Cheltenham from June 24th to 27th. The preliminary list of papers, which will be found in another column, the visits to works, and the other arrangements which are being made for the comfort, instruction, and entertainment of the members should secure a large and representative attendance. Moreover, an important exhibition of plans, maps and models of town planning and housing schemes will be held during the four days of the meeting. A large number of local authorities, engineers, architects, and others interested in the town planning and housing movement, both in this country and abroad, have undertaken to forward exhibits, and the collection will be one of great educational and practical value.

Bygone Building Acts and the Development of London.*

By W. R. DAVIDGE, ASSOC. INST. C.E., A.R.I.B.A., F.S.I., District Surveyor, Lewisham.

Sometimes one hears suggestions as to the inconsistency of various sections and regulations. It may be so. Is it any wonder, when we consider that perhaps one section, in its essence at least, has stood the test of seven hundred years of argument between the building owner and his neighbour, another perhaps is reminiscent of the days when the only fire protection was the parish "squirt," and yet another comes white-hot from the neo-modern theories of the structural engineer?

ROMAN AND MEDIÆVAL LONDON.

The site of the first Roman city and the lines of its general lay-out have undoubtedly greatly influenced the development of London through the ages. Of the many things we may know with certainty, one is undoubtedly that the Roman building laws were enforced in Londinium Augusta as elsewhere in the empire, and some of these too may even have had their influence in shaping or modifying later ideals. The streets within the comparatively restricted area of the first settlement were apparently laid out in the regular rectangular fashion, and there is no reason to doubt that the regular rectangular arrangement of the walls and streets was extended considerably during the 400 years of the Roman occupation.

Prof. Haverfield thinks that in London no street to-day follows the course of any Roman street.

EARLY ATTEMPTS AT FIRE PREVENTION.

For seven centuries London building was at a standstill, but with the election of her first Lord Mayor, in 1189, the second chapter of London's building history begins. Like many another authority since, FitzAlwyne, the new Mayor, saw the need for regulating the buildings. The London Assize of 1189, the first year of Richard I., although it dates back before the formation of our Parliamentary system, had all the force of a modern Act of Parliament, and in its details it affords a most valuable insight into the conditions of the times. Stow tells us that it remained in force for upwards of 200 years.

FitzAlwyne's Assize of 1189, although aimed against the spread of fire, was not intended to be compulsory, but rather permissive in character, and to facilitate the erection of stone party walls to separate premises belonging to different owners, and "especially for appeasing contentions which sometimes arise among neighbours." Up to this date the greater part of the city had been built of wood, roofed with straw, reeds, and similar materials, and the great fire in the first year of King Stephen (1136), which destroyed practically the whole city, was still in painful remembrance. It appears from the opening statements that after this widespread fire the more wealthy citizens rebuilt their houses with stone party walls and covered the roofs with thick tiles, but that wood and thatch were still in general use.

When two neighbours agreed to build between themselves a stone party wall, each had to give 1½ ft. of land, and a wall 3 ft. thick and 16 ft. high was built at their joint cost, and provision was also made for a party gutter. It is somewhat remarkable that this height of 16 ft. occurs in the present-day Building Acts in connection with requirements as to open space, and is also a limit frequently imposed on projecting shops.

It is evident that "ancient lights" did not worry architects seriously in those days. The height of buildings seems to have been a matter of sentiment.

Modern methods of procedure and those of mediæval times do not greatly differ, for in the very next reign we find an Amendment Act or Further Ordinance to regulate London building (Ordinance of King John, 1212). This second series of regulations was to some extent "panic legislation," brought about in consequence of the serious fire of July 11, 1212. All alehouses, except by special licence, were forbidden unless of stone. Bakehouses and brew-houses were not to use reeds or straws, but wood fuel. Cookshops, bakehouses, and other trade pre-

misces were to be whitewashed and plastered inside and out as a preventive from fire, and all superfluous woodwork removed. Even nowadays lime-whiting of timber is a common enough requirement.

A general admonition was given to whoever wished to build "to take care as he loveth himself and his goods, that he roof not with reed nor rush, but with tile only or shingle or boards or lead." All thatched houses were to be plastered over within eight days, under pain of being demolished. All wooden houses in Cheapside were to be pulled down or amended to the satisfaction of the Mayor and Sheriffs.

REGULATIONS AS TO PROJECTIONS.

Still further regulations were made dealing with projections from buildings. All penthouses and "jetties" (a general name for projections) of houses were required to be at least 9 ft. high, so that folk on horseback might ride beneath them. Irregular structures of this description were required to be removed or altered within forty days under a penalty of 40s. The amount of the penalty has not altered during the last 700 years! No stall was to project from the house to which it belonged more than 2½ ft., a dimension which to the present day is retained to limit projecting cornices.

ATTEMPTS TO RESTRICT BUILDING.

The famous Act of Queen Elizabeth in 1592 (35 Eliz., cap. 6), forbidding any new building within 3 miles of the City of London is, of course, well known. Its opening words give a striking description of the overcrowded and insanitary state of London at a time when its outward appearance, as shown in Wyngaerde's map, was so attractive and picturesque. The effect was considerably spoilt, however, by limiting the Act to seven years, and by allowing an exemption for larger houses assessed at anything above £5 per annum.

The modern idea of the healthfulness of an open belt of country was evidently beginning to make itself felt, for we find a strong prohibition against any further enclosure or encroachment on the numerous commons and open land within 3 miles of the City, such open spaces, having been for many years "heretofore used for training and mustering of soldiers, and for recreation, comfort, and health of the people."

Elizabeth's attempt to stop the growth of London was as futile as Canute's to stop the rolling waves, but she and her successor, James I., persevered in the idea of stopping all building except on old foundations.

Under the Commonwealth Parliament, in 1656, still another Act was passed with the express intention of preventing "the multiplicity of buildings in and about the suburbs of London and within 10 miles thereof." The method of stopping unnecessary buildings was to impose a fine of one year's rent for every new dwelling-house, out-house, or other building upon a new foundation unless it had at least 4 acres of ground.

THE ACT FOR REBUILDING THE CITY.

The Act for rebuilding the City of London after the Great Fire of 1666 (18 and 19 Charles II., cap. 8) provided the first complete code of building regulations. Although, no doubt, in its inception, it had some of the vices of panic legislation, the great City being described as "now lying buried in its own ruins," it is remarkable for its statesmanlike grasp of the situation. The Act early states that "building with brick is not only more comely and durable, but also more safe against future perils of fire," and the outside walls of all buildings in and about the City were henceforth to be of brick or stone.

For the better regulation, uniformity, and gracefulness of all new buildings, they were to be divided into four classes, working upwards in quality:—

First and least sort: Fronting by-lanes.

Second sort: Fronting streets and lanes of note.

Third sort: Fronting high and principal streets.

The roofs of all these classes were required to be uniform, and this restriction seems to have applied

* From a paper read at the last meeting of the Royal Institute of British Architects.

to all buildings, except the halls of the various companies and similar buildings.

Fourth and largest sort: Mansion houses for citizens or other persons of extraordinary quality not fronting either of the three former ways.

The object of the first three classes was to provide for varying thicknesses of wall and heights of story.

In the fourth class, which consisted of mansion-houses "of the greatest bigness," the number and height of stories were left to the discretion of the builder, but not in any case to exceed four stories (in addition to cellar and garret).

The Lord Mayor, Aldermen, and Common Council were empowered to appoint "one or more discreet and intelligent person or persons in the art of building to be surveyors to see the said rules and scantlings well and truly observed," and the surveyors or supervisors were "to take oath upon the Holy Evangelists for the true and impartial execution of their office" within their several precincts or districts.

The setting out of the party walls equally on each owner's land appears to have been one of the first duties of the newly appointed surveyors.

The raising of prices of building materials by means of "rings" or combinations was evidently not unknown, for we find a provision enabling two Judges of the King's Bench to fix the prices of brick, tiles, and lime. A similar method was to be adopted in case of combinations or exactions by workmen.

The streets as a general rule were to be 24 ft. wide, and the Act of 1670 states that many builders advanced their foundations further than formerly to secure regularity for the new streets. Payment was to be made for land taken, the price to be assessed by a jury. A "betterment" clause also existed giving power to charge the owners of houses improved by the opening out of streets.

QUEEN ANNE, 1707-1708.

Fires still continued frequent, and further attempts at fire prevention were felt to be useless without proper appliances. In the reign of Queen Anne two Acts (6 Anne, cap. 58 [1707] and 7 Anne, cap. 17 [1708]) were passed, making it compulsory on each parish to provide two fire engines—viz., one large engine and also a hand engine, and the prompt attendance of the fire engines was secured by offering rewards of 30s., 20s., and 10s., for the first, second, and third parish engines to reach the scene of a fire, "provided they arrived complete and in good order."

Party walls were required by the Act of 1708 to be of the following thickness, somewhat simplifying the code previously in force: Two bricks thick in cellar (half on each man's ground); one and a half bricks thick up to garret floor; one brick thick in gable ends (under penalty of £50).

Parapets to gable ends to be 18 in. above the roof. Front and rear parapets to be 2 ft. 6 in. above the garret floor and coped with stone or brick (1707 Act). This is the first introduction of the idea of carrying the party wall above the roof, which has been one of the bugbears of architects ever since.

For the first time a right was given to the building owner to pull down and rebuild a party wall, charging the adjoining owner at the rate of £5 per rod.

Dangerous trades, such as turpentine distilling, were to be at least 50 ft. away from any other building. The distance laid down in the present-day Act has therefore lasted over 200 years. An important point, too, is the setting back of all door frames and window frames in all houses, which were now for the first time to be set in reveals 4 in. deep—not for a protection from fire, but as a shelter from the weather.

GEORGIAN PERIOD.

Discontent and dissatisfaction seem to have been felt by many with the previous Act of Queen Anne's reign, and an attempt was made to set things right. In 1724 a new Building Act (11 Geo. I., cap. 28) came in, which introduced the necessity for three months' notice to be given to the adjoining owner where it was desired to rebuild a party wall in connection with any new building. Brickwork was to be paid for at £5 per rod. No timber was to be allowed in party walls. Party wall openings uniting buildings were only allowed so long as the premises were used as one house only, and provision was made for party pipes to take off water from roofs.

The Act goes on to show us what was wrong with the Act of Queen Anne. "A very great increase of buildings" had taken place, and many of the houses so built were admittedly not in accordance with the

Act. The owners and head builders were accordingly liable to the heavy statutory penalty of £50, but there was no means of making them put the work right.

WINDOW TAX.

Windows were first taxed in this country by 6 and 7 William III., cap. 18 (1695).

Typical examples of the tax at different dates are given below:—

In 1762.—Eight windows, 11s.; eleven windows, 14s.; twelve windows, £1 1s.; sixteen windows, £1 7s.; eighteen windows, £1 10s.; nineteen windows, £1 11s. 6d.; twenty windows and upwards the same as before—viz., 1s. 6d. per window and 3s. the house.

In 1833.—Eight windows, 16s. 6d.; eleven windows, £1 16s. 3d.; twelve windows, £2 4s. 9d.; sixteen windows, £3 18s. 6d.; eighteen windows, £4 15s. 3d.; nineteen windows, £5 3s. 9d.

TAX ON BRICKS.

Bricks were first taxed in 1784, at the rate of 2s. 6d. per 1,000. This duty was several times increased, until by 1839 it was fixed at 5s. 10d. per 1,000 for ordinary-sized bricks, and 10s. for the larger size. It was repealed in 1850.

LAWS AS TO BRICKS AND TILE MAKING AND SIZE OF BRICKS.

In the time of Edward IV. directions were given for the proper making of plain tiles, roof tiles and gutter tiles.

The Tilers and Bricklayers Company, incorporated in the reign of Queen Elizabeth, had been given power to supervise brick and tile making within fifteen miles of London, but it was found necessary in 1725 to again legislate on the subject.

In 1730 it was found necessary to forbid combinations of manufacturers to advance the price of these materials, and in 1769 the statutory size of bricks within 15 miles of London was reduced to 8½ in. by 4 in. by 2½ in., another clue to the date in buildings of this period.

Concluding his remarks, Mr. Davidge observed that the growth of London had through all the centuries been a source of wonderment and pride to successive generations, and it bid fair to continue at an even accelerated pace. True, statisticians averred that the actual county of London showed an actual decline in the last ten years, but London itself knew nothing of county borders or administrative areas. The state of London's narrow streets, the lecturer continued, was steadily growing from bad to worse, and with the erection of newer and higher buildings in place of the old, the future could not be regarded with equanimity. A right to re-erect old buildings to the old height might be reasonable, but any increased height should be under regulation. Power was also needed, in the interest of wise town extension, to fix building lines both for new and old streets, and to regulate the height of the buildings in relation to the width of the streets on which they abutted. He predicted that in less than 50 years the population would be double what it is to-day, and pointed out that the present generation must prepare not only to improve modern London, but to build an immense city as large again, encircling it north, south, east and west. They must prepare, and prepare at once, for so gigantic a task. They could see ahead but a little way, but that little way was lighted by the illumination which came to them from the past.

Waterproofing of Cement.—The Australian States have combined to build a mutual bank at Sydney. British made materials are naturally being specified where possible, and we understand that 2 tons of Pudlo are being used to cement waterproof the basements, &c., the shippers' agents being Messrs. A. G. Kidston & Co., of Fenchurch-street.

Crystal Palace Engineering Society.—The "Wilson Premium" for the best paper read before the society (affiliated to the Society of Engineers) during the present session has been awarded by the council to Mr. A. E. B. Graham, for his paper on "The Construction of the Uganda Railway." Other papers read during the session were: "Pioneer Engineering," by Mr. R. H. Steed, and "Engineering Progress in Egypt," by Mr. E. H. Sharteni. The premium was presented to Mr. Graham by Mr. Cyril S. Cobb, M.V.O., chairman of the London County Council, on the occasion of the 124th distribution of certificates of the above school on Wednesday of last week.

NEWBURN COUNCIL OFFICES.

This work was won in open competition, and has been carried out by Mr. Edward Cratney, M.S.A., Station-road, Wallsend.

The general contractor was Mr. Thos. Clements, Newcastle-on-Tyne.

The heating, wrought-iron work and electric light

PUBLIC OFFICIALS AS ARBITRATORS.*

By W. VALENTINE BALL, M.A.,
Barrister-at-Law.

In contracts with local authorities it not infrequently happens that disputes are all referred to the county or borough surveyor, and the builder or contractor may very well take exception to his acting

Sons, Gateshead-on-Tyne; electric installation by Messrs. Robson & Coleman, Newcastle-on-Tyne; and sandstock bricks by Messrs. Wray & Sons, York. The ornamental plaster work to the hall, staircase and council chamber was carried out to the architect's design by Messrs. John Ferguson & Co., Newcastle-on-Tyne.

when the time comes. I need hardly point out that he cannot be objected to merely because he is in the employment of and is paid by one party.

It has long been settled law that this does not disqualify him; but the cases go further. They show that even where a man may possibly be biased, or has expressly declared himself on a matter he is not necessarily disqualified. In *Jackson v. Barry Railway Company* (1893, 1 Ch., 238) objection was taken to an engineer of a railway company acting in the capacity of arbitrator, because in a preliminary correspondence he had expressed a view adverse to the interests of the contractor. This fact did not induce the Court of Appeal to say that he was unfit to act. Lord Justice Bowen said: "To an adjudication in such a peculiar reference the engineer cannot be expected nor was it intended that he should come with a mind free from the human weakness of a preconceived opinion. The perfectly open judgment, the absence of all previously formed or pronounced views—which in an ordinary arbitrator are natural and to be looked for—neither party to the contract proposed to exact from the arbitrator of their choice. They knew well that he possibly or probably must be committed to the prior view of his own, and that he might not be impartial in the ordinary sense of the word. What they relied on was his professional honour, his practice, his intelligence, and the contractor certainly had a right to demand that whatever views the engineer might have formed, he would be ready to listen to argument, and at the last moment to determine as fairly as he could, after all had been said and heard."

The doctrine above enunciated has been considerably modified by certain recent decisions. Thus, it has been held by various judges that a reference to the surveyor or architect of one party will not be

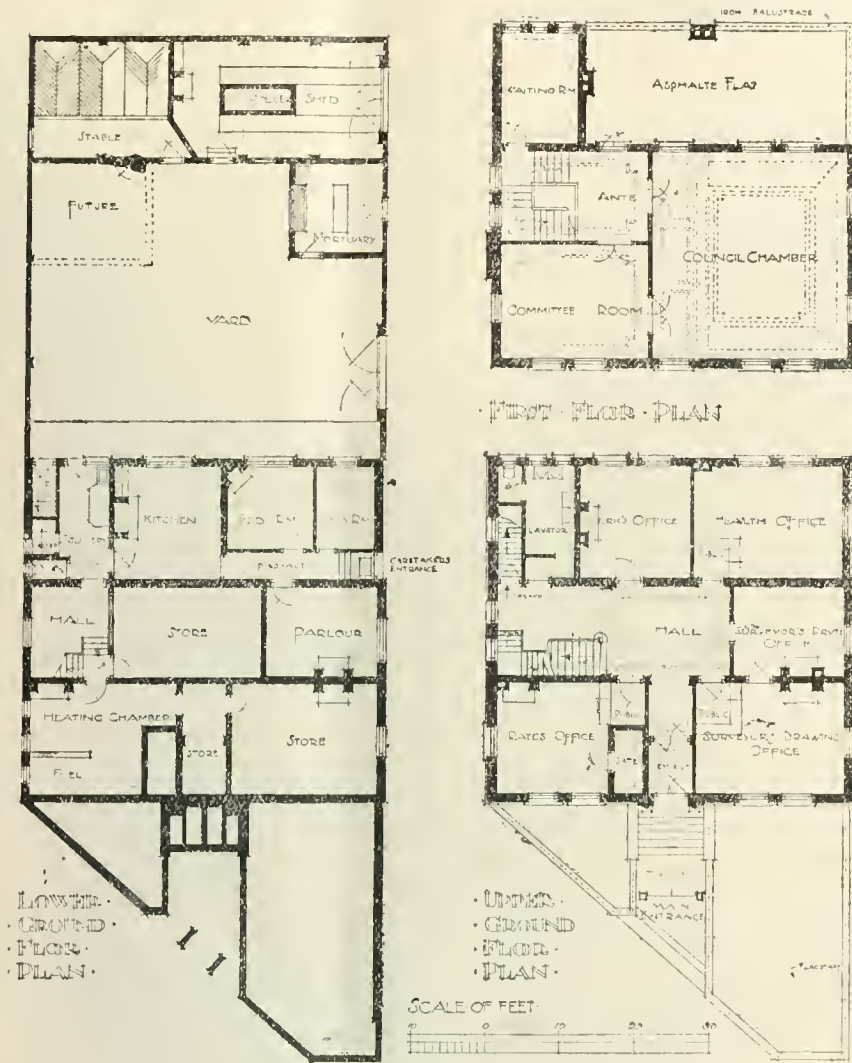

* Extract from paper read last night before the Society of Architects.

enforced (c) if the question to be decided is one which cannot be properly determined without the cross-examination of the surveyor (*Freeman v. Chester Rural District Council*, 1911, 1 K.B., 783); (b) if the dispute

Corporation, 1909, 75 J.P., 129); (d) if, although acting honestly, the surveyor has lost his independence by conferring with and accepting advice from one party to the contract (*Roberts v. Hickman*, 2 H.B.C., 3rd Supplement, p. 10); (e) the contractor will not be compelled to submit if the matter in issue is an unseemly personal dispute raising a vindictive feeling between the engineer and the contractor, and the engineer has so strongly expressed his view that it amounts to a prejudgment (*Nuttall v. Manchester Corporation*, 1893, 8 T.L.R., 513).

I think it may be said that in the above cases the Courts have gone as far as they are likely to go in the direction of relieving contractors from the arbitration clause. I heard of the following attempt to extend the doctrine: A dispute was on foot between a contractor for the erection of a county hospital and the local authority. The contractor had made a large claim for extras, and the architect had quoted the county surveyor, who was named as arbitrator in the contract as having said that in allowing for extras he had already taken the contractor's claim into account. In these circumstances the contractor sought to have the reference to the surveyor set aside on the ground that the surveyor had already committed himself to a view of the matter. He failed in his attempt.

It may seem odd that a reference should in any case be ordered to proceed when one party takes serious objection to the arbitrator, but when considering this class of case it is well to remember that the parties have voluntarily bound themselves to submit disputes to a certain person. In the stress of competition your builder or contractor makes a tender, and rushes blindly in without considering

NEWBURN-ON-TYNE COUNCIL OFFICES.

be as to the existence and terms of an agreement made between the surveyor (acting for the building owner) and the contractor (*Gird v. Bristol Corporation*, 1912, 28 T.L.R., 278); (c) if the question is whether

they have voluntarily bound themselves to submit disputes to a certain person. In the stress of competition your builder or contractor makes a tender, and rushes blindly in without considering

the surveyor did or did not act unreasonably—e.g., by making alterations and amendments in drawings, by delaying the delivery of drawings and materials, and by rejecting suitable material (*Blackwell v. Derby*

the arbitration or any other clause. He has only himself to blame if, when disputes arise, the judge who is to consider them is not altogether to his liking.

Relation between the Disposal of Sewage and the Death-rate.

This forms the subject of one of the recently issued reports of the Metropolitan Sewerage Commission of New York, in which the benefits that are likely to accrue from the system of main drainage proposed by that body are presented.

The commission observe at the outset that the most important benefit would be to health. The argument upon this head, although circumstantial and incapable of mathematical demonstration, was nevertheless conclusive. It rested upon the known relations which now existed between the polluted condition of the harbour and the public health, as, for example, bathing, shellfish, driftwood, flies and odours, and the possibility of materially reducing the death-rate through a systematic treatment of the sewage.

On comparing the death-rates of New York with those of London, Paris and Berlin for the last year for which the statistics of all four of these cities are available, it appears that New York's rate was exceeded only by that of Paris. For the ten years ending in 1909, New York stood at the bottom of the list. London and Berlin were well in the lead. These facts referred both to the crude and corrected death-rates.

"For the purpose of studying the relative healthfulness of cities," the commission state, "corrected death-rates are indispensable, since they have for their object the elimination of differences in the population which considerably affect the results. When the corrected death-rates of the four cities here mentioned are compared, it is seen that the death-rate of New York is higher than the crude rate indicates, whereas the corrected rate for London is lower than the crude rate for that city. Consequently, the difference in healthfulness between London and New York is seen to be greater than the crude death-rates indicate. London's crude rate of 14 is 12½ per cent less than New York's crude rate of 16, and London's corrected rate of 13.7 is over 2½ per cent less than New York's corrected rate of 17.5. Comparing New York with the other cities in the group . . . Berlin's corrected rate of 16.4 is 6.3 per cent lower than the corrected rate for New York. New York's corrected rate is exceeded by that of Paris by 2.8 per cent."

The commission can see no reason why New York should not have as low a death-rate as London or Berlin; on the contrary, it could, apparently, have the lowest rate of any city of its class, and the attainment of this result, it is suggested, should be the aim.

"New York is a good example of a city of the largest class wherein the highest requirements of sanitation are demanded, and are, at the same time, capable of being satisfied. Occupying an unrivalled situation, a favourable climate, good and abundant water supply and an efficient health administration, it should be the aim of every citizen to make New York's death-rate the lowest to be found among the municipalities of the class to which this city belongs. New York should be the cleanest city in the world if for no other reason than to afford a barrier against the danger which results from the immense influx of immigrants from all parts of the world who, not infrequently, bring epidemic diseases to this port, a danger which is intensified by the highly congested conditions under which most of the population lives and works.

"Owing to the congestion of population, practically all the conditions necessary to maintain life in a wholesome way must be secured through a careful and skilful observance of sanitary rules and principles. This relates not only to the food, clothing and habitations of the people, but, in a peculiar degree, to the care of their wastes. Upon the prompt and complete disposal of these wastes largely depends the comfort, convenience and healthfulness of the city."

UNSATISFACTORY CONDITIONS OF SEWAGE DISPOSAL.

The commission remark that the most important sanitary provisions which a modern city can possess are the public water supply and sewerage system. "The relation between these two public services is very close. Aside from a small proportion of the water which is used for drinking purposes and for the extinguishment of fires, nearly the whole of the public

water supply is used for cleansing that is, for the removal of bodily, household and street wastes.

"The sanitary function of water is to act as a vehicle in removing the waste materials from their source. To be satisfactory, this removal should be prompt, complete, and unattended by injury to health or offence to the senses. Removal to a certain distance from its points of origin usually can be accomplished satisfactorily up to a certain point by modern sewerage systems, but the disposal of the sewage at the outlets of these systems often presents a problem of great difficulty.

"Until recently there has been no question as to the efficiency of the custom of sewage disposal pursued by New York and its neighbouring municipalities. House sewage and street washings have been discharged without regulation or purification of any kind into the nearest tide waters. Investigation has shown that it is unwise longer to count blindly upon the purifying action of dangerous and offensive wastes which are discharged every day into the arms of the harbour which intersect the city in every direction. Only a part of the sewage is flushed out to sea; some is turned into gas; some is liquefied by the bacteria in the water, and some is stored in pockets and sludge banks. All of these processes are attended with more or less nuisance. Gradually the harbour as a whole is becoming over-polluted."

POSSIBILITY OF REDUCING THE DEATH-RATE.

"That a material reduction can be made in the death-rate seems assured by the reduction which has been made in it during recent years, from the fact that this city does not now possess a large death-rate as compared with London or Berlin, and from the fact that such a reduction always follows the introduction of a great sanitary improvement.

"New York stands third among the four great cities in regard to its death-rate, the crude or uncorrected rates for which are commonly but erroneously assumed to give a correct basis for comparing the relative health of the populations. The crude death-rate, which is obtained by multiplying the number of deaths per year by 1,000 and dividing by the population, gives an imperfect knowledge of the healthfulness of a city, since it fails to take account of well-recognized differences in susceptibility to disease which exist among different elements in the population. Females have lower death-rates than males, in consequence of which a city which has an unusually large proportion of males is healthier than it appears to be. Young children and old persons have a higher death-rate than the average, from which it follows that a city in which there is an unusually large proportion of persons in middle age is less healthy than it seems.

"Among the most important causes of these differences in susceptibility in the greatest cities are those which are due to sex and age. A proper comparison of the healthfulness of cities cannot be made until their crude death-rates have been corrected.

"In 1913 the commission requested Prof. Walter F. Willcox, the eminent statistical expert of Cornell University, to report on the corrected death-rate of New York City, comparing the age and sex distribution of New York, London, Paris and Berlin with each other through some standard population. Prof. Willcox found that in London, Paris, Berlin and New York the females outnumber the males. The difference is least in New York—4 in 10,000—and greatest in Paris—638 in 10,000. The effect of the correction to be made on this account is to raise the rate for New York. New York has a larger proportion of persons in the healthy ages than any of the other cities with which it can be compared. Among every 10,000 persons in New York, there are 249 more than there are in London who belong to the healthy ages. The effect of the correction to be made on this account is to lower the rate for New York. The corrections for sex and age to some extent counterbalance each other. If corrected for sex, New York would have a lower death-rate than any of the other three cities; if for age, the rate would be higher. The combined effect is to make the crude death-rate lower than it should be. This influence is stronger in New York than in any of the other cities."

Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

IS THE STREET TRAMWAY DOOMED?

To the Editor of THE SURVEYOR.

SIR,—There are several observations which, with your permission, I should like to make on the subjects brought forward and those suggested by the article in the *Commercial Motor* to which you refer in your issue of April 10th. The writer of the article is, possibly, the first municipal engineer to put forward the opinions indicated by your extracts, and it is to be hoped that he will satisfy our not unnatural curiosity by disclosing his name.

His article, I may point out, appeared shortly after a discussion which took place at the Institution of Civil Engineers on the papers by Mr. Gribble and Mr. Clarkson, abstracts of which appeared in your issue of March 27th. These papers provided recent and authoritative data for a discussion of the merits of the three systems of transport—tramways, wire 'buses and motor 'buses. At this meeting I stated that, in my opinion, the tramways should be scrapped, and that the motor vehicle provided the means of transport to replace them as well as the means of transport for the thousands of miles of road now awaiting traffic developments. I did not, of course, indicate any particular type of omnibus as *the* type for general use; it is a matter of comparing one kind of transport system with another.

As regards country roads, my own and other opinions—adverse to tramways or light railways—were expressed in my article in your issue of February 27, 1907, and I have not seen any reason to alter that opinion. It is, indeed, probable that the resistance which those interested in motor vehicles offered to the laying of tramways and light railways on country roads was made effective by the further opposition which some of us who wrote from the highway point of view were enabled to make through the medium of the then, as now, influential SURVEYOR. I think that few, if any, county and district surveyors are now at variance with our opinion. As regard towns and suburbs, matters were on a different footing, and I have possibly shared with some municipal engineers a reluctance to condemn urban and suburban tramways, which, by the body of the profession, seem to be regarded as a valuable means of transport. Closer acquaintance with the traffic conditions of to-day in the London area, and special study of important tramway and motor-omnibus routes, have, however, led me to form an opinion so definite that I felt justified in expressing it publicly before the parent institution. Whether this encouraged "A Well-known Municipal Engineer" to write his *Commercial Motor* article, or whether he had already prepared that article, I do not know. Anyhow, I got my blow in first. The opinions I expressed at the Civils' meeting on March 18th were that the thousands of miles of road awaiting transport systems would be served by motor vehicles, that even in the urban and suburban areas now served by tramways these tramways would be scrapped, and that the wire 'bus is only the last gasp of a dying tramway system.

In your issue of January 27, 1905, one of your "retrospective" articles ended with a passage (p. 92) showing a grasp of the significance of the presence in the London streets of a few dozen, or few score, motor omnibuses, and THE SURVEYOR was thus, I believe, the first engineering paper to read aright the signs of the times, though journals devoted to motor matters were naturally more sanguine as to possible developments. Possibly the invitation which you have held out to municipal engineers to express opinions as to the doom of the tramway system may lead to your adopting an official view in accordance with the opinion which I have ventured to place conspicuously before the profession at large.

A belief that the tramway is doomed involves no adverse criticism of the work of tramway engineers. The tramway system is a fine example of engineering skill; the trouble is that it is in the wrong place on public roads and streets, and prevents the application of methods of construction and maintenance proper to such highways. The authorisation of trailers on certain lines only hastens the end, being at once a challenge and an admission that the tramway is a railway. While they have been occupying the public

roads, the natural sphere of the tramways has been to some extent filled by branches and loops of steam railways intended for local traffic, and possibly less suitable for that traffic than would have been tramways of the ordinary type occupying roads of their own. The railways strangled the first-born of the motor-vehicle family and put a changeling in its cradle, and the proper place of that changeling is now occupied by the legitimate offspring of the railways, while the younger and more vigorous children of the motor vehicle family are struggling for their birthright.

Lastly, a word of caution as to the permissible development of motor transport on the public roads. In the article already referred to (February 27, 1907) I pointed out that there was a danger that main roads might be so exploited by owners of motor vehicles that a specialisation might be brought about, such as would lessen the value of the roads to the public generally, including users of ordinary motor vehicles. This attitude I have maintained, and I believe that the public owes much to THE SURVEYOR, which has defended the roads from being exploited in this manner. The motor associations have had, no doubt, the best intentions in this matter; but their view was a narrow one.

I still hold the opinion I expressed in 1907—namely, that such developments of motor traffic as cannot take place without ill-effects upon the truly highway character of public roads should be rendered possible by the making of trunk motor roads, provided with bridges over ordinary roads. I do not believe that many such need be made; but a few would be useful, especially between manufacturing districts in the North and the North Midlands. As regards local passenger transport in urban areas, a relatively slow-moving vehicle of large capacity would take the place of the present tramways, while lighter vehicles would deal with traffic to outlying areas.—Yours, &c.,

REGINALD RYVES.

April 14, 1914.

To the Editor of THE SURVEYOR.

SIR,—I read with considerable interest your article on the above subject quoted from the *Commercial Motor*. There can be no doubt, I think, that the motor 'bus has come to stay, and is the democratic vehicle of the future. There may be cases where tramways are required in order to bring people in from the suburbs of a town, but even in such cases it is doubtful if they can compete, either in speed or convenience, with a good service of motor 'buses. But if this description of traffic is to increase on our ordinary roads, how is the question of their maintenance to be met? There is no blinking the fact that the road of the future will have to carry more and more traffic, for there is no finality to mechanical traction when once it has commenced, and the road maker and mender of the future will be faced with difficult problems.

It may eventually become necessary to tax all kinds of self-propelled vehicles in such a way that the whole of the proceeds of this taxation shall be devoted to the maintenance of roads in some proportion to the amount of traffic they are called upon to bear. It is idle to think that legislation may step in and prevent certain classes of locomotion on certain roads; such restrictions could only be temporary, as the needs of commerce would very soon make itself heard.

The problem has got to be faced; money will have to be spent on our roads, and the sooner this fact is seriously grasped the better for this country.—Yours, &c.,

H. P. B.

April 13, 1914.

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR.—No British highway engineer of to-day needs to be told that tar and bitumen are not synonymous terms. Laymen, however, not being so well informed on the subject, are liable to confuse one material with the other, and it may not be amiss to state briefly how that confusion in the lay mind may possibly have arisen from the loose manner in which engineering nomenclature has been used in the past.

The term "bituminous" as applied to a certain quality of coal is familiar, and doubtless understood by most of us. Scientists put such coal in the class of pyro-bitumens, and on this ground it might appear to be reasonable to describe an educt of such a material as bitumen. It would, however, be necessary to qualify that term by prefixing the word "artificial."

and no road maker would care to have such a word applied to anything he was using.

It will be argued that tar is recognised as a bituminous product of gasworks, and that therefore a road which has been treated with tar may be fitly described as a bituminous road. Here it is that not only the lay but the professional mind will have to seek further information, and a third term, "asphalt," with its admitted ambiguity, is sure to come up.

Can we not at once get rid of all confusion and possible misunderstanding by dropping the word "bituminous" altogether in any relation to tar in its employment on roads? Let us speak of a road which has been surface treated with tar as a "tarred road"—there is nothing new or original in this—then we have the tar-macadam road, and last, but by no means least, the "pitch-bound road." We will then have no use for the term "bituminous" in any of these three references.

The above remarks may seem to be of an academic rather than a practical character. They are not submitted with any intention to interfere with or replace any terms or definitions which may have come from a representative or authoritative source, and should be regarded merely as suggestions made with a view to clear the ground before bitumen is approached.

Those readers of THE SURVEYOR who followed the

exception could be taken to the application of the term "bituminous" to the finished road.

It is to be hoped that the approaching publication of the Bouhois Glossary will lead to greater precision and uniformity in the use of road terminology.—
Yours, &c.,

JOHN HUTCHINSON.

MUNICIPAL ENGINEERING IN CHINA.

NEW PUBLIC OFFICES FOR SHANGHAI.

The accompanying illustration is a perspective of two sides of the new municipal buildings which it is intended to erect in Shanghai. The general design is by Mr. R. C. Turner, chief architectural assistant to Mr. Chas. H. Godfrey, M.A.S.T.C.E., chief engineer to the municipality, and the perspective view is by Mr. C. W. English, of London. The two sides shown and part of another will be commenced at once. The estimated cost of this portion is £110,000, exclusive of land, the assessed value of which is £180,000.

We reproduce also a photograph of the indoor

PROPOSED NEW MUNICIPAL BUILDINGS FOR SHANGHAI.

correspondence on the subject of what is and what is not bitumen (August, 1912—August, 1913) will have observed the intimate knowledge of the subject displayed by many of the writers in expressing their views. Is it too much to hope that the contributors to that discussion will be given an opportunity of stating their views personally as "witnesses" before the Standardisation Committee who have the nomenclature and accompanying definition of bitumens in hand? The subject being, as it were, *sub judice*, it would not be proper to offer any remarks at this stage beyond saying that the responsibility which rests with the committee is considerable, not only as regards the claims of science, but those of commerce.

With the knowledge that highway engineers have acquired by practical experiments of the comparative properties of coal-tar products and bitumens, no great difficulty will be found in selecting the material which is best adapted to the requirements of the work to be carried out. No doubt some authorities will be found to agree with de Smedt* as to the properties of adhesiveness, tensile strength, and impermeability being present to a greater degree in tar than in bitumen, while others will take the view that bitumen is less liable to be affected by atmospheric influences, and will consequently give better results under severe traffic conditions.

It may be that both binders will find a place together in the making of British roads, the more powerful (according to de Smedt) being used in the form of tar or pitch-grouted macadam as a sub-crust, and the other as a wearing surface. This would be a happy combination of the home product with the imported material, and in such a case it is probable that no

staff of Mr. Godfrey, among the group being nine who have been trained in, and recruited from, municipal offices at Home, as shown below:—

There are thirty other members of the Public Works Department, forming an outdoor staff of clerks of works, inspectors, and so forth.

Swansea's Costly Improvement.—At the Swansea Town Council meeting on Wednesday it was stated that the price of the corporation's recent purchase of Temple-street corner for street widening purposes worked out at £58,400 per acre.

Cost of Leicestershire Roads.—In a return showing the increased cost in connection with the main roads and the necessity for the increased rates, comparing 1896 and the present time, the Highway Committee of the Leicestershire County Council inform the Loughborough Rural District Council that the increased expenditure is £12,500, due to the fact that 14,000 tons more granite are required, and owing to the extra cost of stone and labour.

* British Patent de Smedt and Twining, 1881.

ROADS IMPROVEMENT ASSOCIATION.

REPORT FOR 1913.

The report of the above association for 1913 states that the movement for improved roads and better facilities for all forms of traffic has made great progress. "The Third International Road Congress," the report proceeds, "being held in London greatly assisted in increasing the interest of the general public in road topics. Many of the association's trunk road improvement schemes have made substantial advances. There is need now for much more collaboration between the road user and the road maintainer, and the association is taking steps to organise this. If road transport is to be handled efficiently and economically it is essential that representatives of both sections of the problem—the traffic and the road—should confer freely and frequently. The road user places traffic of various types, speeds and weights upon the road, and the road maker is confronted by varying conditions in regard to supply of material.

Roads Improvement Association, and negotiations have been opened with the local authorities concerned to develop the scheme."

(5) Birmingham and Wolverhampton Road.—"The campaign for the improvement of the surface of this important Midland thoroughfare has been continued."

£100 FOR AN IMPROVED HORSESHOE.

In this competition over 850 shoes were submitted by entrants from the United States of America, Canada, South Africa, Australia, China, Germany, France, Holland, Sweden, and all parts of the United Kingdom. The judges selected shoes entered by seven competitors for special tests. These competitors have supplied five sets of shoes, which have been fitted upon representative horses in London, Leeds, Birmingham and Sheffield, and are now undergoing practical tests.

TRAINING FOR ROAD ENGINEERS.

Following the letter to THE SURVEYOR, in which Mr. H. Percy Boulnois pointed out that there appeared to be an abiding future for the road or highway engi-

SHANGHAI MUNICIPAL ENGINEER'S STAFF.

(In the front row, reading from left to right: Mr. C. Luthy, constructional engineer; Mr. R. C. Turner, chief architectural assistant; Mr. C. Harpur, son of the city engineer of Cardiff, deputy engineer, recently married and now at home on leave; Mr. C. H. Godfrey, M.I.C.E., municipal engineer, son of the late Mr. R. Godfrey, for many years engineer to the Kings Norton District Council, and a member of the council of the Institution of Municipal and County Engineers; Mr. J. E. Needham, chief assistant engineer; Mr. W. E. Sauer, chief surveying assistant; Mr. F. G. Helsby, first assistant engineer.)

financial resources, &c. It is only by close co-operation and a generous exercise of give-and-take upon both sides that the best results can be obtained for the benefit of all classes of road users."

The trunk road improvement schemes mentioned in the report are as follows:—

(1) Great West Road.—"The general outlines of a scheme have now been agreed upon by the Middlesex County Council and the Road Board. A new road, 100 ft. wide, is to be constructed from High-road, Chiswick (near Gunnersbury-lane), to the Bath road at a point about 600 yds. west of Hounslow Barracks Station, with suitable connections to existing thoroughfares. The gross cost is estimated at £560,000, of which the Road Board will contribute 75 per cent."

(2) London-Brighton road (road to by-pass High-street, Croydon).

(3) London-Portsmouth road (road to by-pass King-ton-hill).

(4) Manchester and District and Southport.—"Better road communication between these localities is badly needed; the existing route is far from satisfactory, and passes through the worst colliery districts. A suggested new line of route has been evolved by the

neer, and asked in what manner a member of this new profession should be trained, the Roads Improvement Association approached the various engineering institutions and societies, inviting their support and co-operation in the formation of a scheme for the establishment of a Chair of Highway Engineering at a suitable university. The Institutions of Mechanical Engineers, Municipal Engineers, and Automobile Engineers have already notified their support, and nominated representatives to join a small sub-committee which the association suggested should be established. The president of the Institution of Municipal and County Engineers has invited Mr. Boulnois to read a paper on the subject before the institution at its meeting at Cheltenham in July next, at which, it is understood, Sir George Gibb will be present to open the proceedings.

The president H.R.H. Prince Arthur of Connaught, K.G., G.C.V.O., has intimated that he hopes to occupy the chair at the annual general meeting of the Roads Improvement Association, which will be held in the Council Chamber of the Institution of Civil Engineers, Great George-street, Westminster, on Thursday next, the 23rd inst., at 4.30 p.m.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

COUNCIL MEETING.

At the last council meeting of the institution the following were elected as Members: Messrs. J. N. Stirling, burgh surveyor, Helensburgh; G. Cumison, burgh surveyor, Blairgowrie; A. Dunn, chief assistant engineer, Bombay Municipality; and J. Weekes, burgh surveyor, Newport, Fife. Associate Members: Messrs. R. H. Shaw, engineering assistant, Hford Urban District Council; F. A. Hilborn, deputy engineer, Lucknow, India; and R. W. N. Winstanley, chief draughtsman of the Melbourne City Council. Students: Messrs. G. I. G. Smith, articled pupil to surveyor, Hebden Bridge Urban District Council; S. A. Holman, articled pupil to surveyor, Southwick Urban District Council; R. C. Lewonski, assistant surveyor, Southwick Urban District Council; H. E. Denham, articled pupil to surveyor, Tilbury Urban District Council; H. G. McDowell, articled pupil to surveyor, Hendon Rural District Council; E. C. Seabrook, junior assistant to the Hendon Rural District Council; W. Pickstone, articled pupil to borough engineer and surveyor, Bury; G. H. Pratley, articled pupil to borough surveyor, Cheltenham; and J. D. M. Morton, articled pupil to surveyor, Lytham Urban District Council. Transferred Associate Member to Member: Mr. W. H. Johnson, assistant city engineer and surveyor, Chester. Transferred Student to Associate Member: Mr. W. H. Price, engineering assistant to sewerage engineer, Leeds.

ELECTION OF COUNCIL, 1914-15.

Upon the report of the scrutineers of the ballot lists the following were found to be elected as the council for 1914-15:—

President: Mr. J. S. Pickering.

Vice-presidents: Messrs. T. W. A. Hayward, H. T. Wakelam, and P. H. Palmer.

Ordinary Members of the Council: Messrs. J. Patten Barber, W. N. Blair, J. A. Brodie, J. S. Brodie, G. F. Carter, A. E. Collins, W. Harpur, W. T. Lancashire, H. E. Stilgoe, and C. F. Wike.

Honorary Treasurer: Sir James Lemon.

ARTICLES AND BY-LAWS.

The Constitution Committee reported that they had considered various suggestions received from members of council as to alterations to the articles and by-laws. The committee did not see their way to recommend that the examination of the institution should be made compulsory for applicants for election to associate membership, or that application for membership should be compulsory for successful candidates for the examination of the institution.

The committee, having considered the present arrangements as to the admission of visitors to meetings, recommended that the same remain in force as at present.

The committee were of opinion that the articles and by-laws as at present constituted enabled the council to take a ballot of the members (by post-card or otherwise) upon any matter concerning the institution, should occasion at any time arise.

The committee recommended that the articles and by-laws be amended upon the advice of the solicitor to provide as far as possible for the election into the institution of engineers holding appointments under authorities such as the Road Board.

The committee recommended that the articles and by-laws be amended to provide for the election of twelve ordinary members of council instead of ten as at present, and that two of the twelve gentlemen elected should be associate members of the institution.

The committee did not see their way at present to recommend the formation of a new class of associates.

The committee considered a letter received from Mr. Bryce suggesting that as the duties of the Scottish vice-president and the district chairman for Scotland were usually carried out by the vice-president, the election of a district chairman was not actually required. After careful consideration the committee recommended the council that no action was necessary in this direction at present.

The report was adopted, with an instruction to the committee to further consider the amendment of the articles and by-laws to provide for the admission to membership of members directly engaged upon the staff of municipal and county engineers and surveyors not being engineering assistants.

SUPERANNUATION.

Mr. Bramall, solicitor to the institution, advised the council that under the present Articles of Association it would not be competent for the institution to establish a superannuation fund for its members.

SPECIAL EXAMINATIONS.

Mr. Bramall advised that if the proposed special examinations came within the scope of the provisions of the clause in the Memorandum relating to examinations there was no necessity to amend the articles and by-laws in this respect.

CHARLES JONES MEMORIAL.

The secretary reported receipt of subscriptions to date amounting to £41.

EXAMINATIONS: SUGGESTED NEW SUBJECT.

A suggestion that a new subject dealing with "Gas Engineering" should be added to the syllabus was referred to the board of examiners for consideration and report.

NOMINATION OF VICE-PRESIDENTS.

Mr. W. H. Prescott gave notice that he would move the following resolution at the next meeting of the council:—

"That this council is of opinion it is not in the best interests of the institution to follow the practice of nominating the president or vice-presidents according to seniority of service, and it is hereby agreed that the practice be not observed in all future elections."

EASTERN DISTRICT MEETING.

A meeting of the Eastern District took place at the offices of the institution on the 21st ult., Mr. H. T. Wakelam presiding.

The hon. district secretary (Mr. J. A. Webb) reported that meetings at Chelmsford and Tilbury had been fixed and the arrangements were left in his hands.

A letter was read from Mr. Cole, enclosing copy of resolution passed by the North-Eastern District Committee.

It was unanimously resolved on the motion of Mr. E. Willis: "That the meeting of the Eastern District of the Municipal and County Engineers, having considered the resolution passed at the North-Eastern District meeting, is of opinion that the ordinary meetings of the council should be held in London at the offices of the institution, or at such other place as may prove most convenient to its members."

Nominations for chairman, secretary and district representative for the ensuing year were made as follows: Mr. H. T. Wakelam, chairman; Mr. W. H. Prescott and Mr. E. J. Elford, representatives on the council; Mr. J. A. Webb as hon. secretary.

The question of appointment of two assistant district secretaries, one for the district of Norfolk, Suffolk and Cambridge, and the other for the counties of Northants, Beds and Bucks, was discussed. Mr. Harrison, of Wellingborough, reported that an association of surveyors was being formed in Northampton. It was left to Mr. Harrison and the hon. secretary to call a meeting of the members at a convenient centre and arrange to appoint an assistant secretary for Northants, Beds and Bucks at that meeting.

It was left to the hon. secretary to see Mr. Julian and to call a meeting of the members at Cambridge, and appoint an assistant secretary for Norfolk, Suffolk and Cambridge that day.

The question of the "Journal" was discussed, and the following resolution, proposed by Mr. Willis, and seconded by Mr. Jenkins, was carried unanimously: "That this meeting of the Eastern District regrets the opposition to the institution's 'Journal,' and gives the council its whole-hearted support in the publication of the 'Journal,' and hopes to see it permanently continued."

IRISH DISTRICT MEETING.

At a meeting of the Irish District of the Institution of Municipal and County Engineers held at Armagh on the 21st ult., Mr. R. H. Dorman in the chair, the hon. district secretary (Mr. M. Sellars) reported that the district had increased its membership by twelve since the last meeting, and that sixteen county surveyors, in addition, had become affiliated members. Mr. Leebody proposed and Mr. Shillington seconded the following as officers for the ensuing year: Mr. W. E. L. Duffin (vice-president), Mr. R. H. Dorman (representative), Mr. J. F. Delany (chairman), Mr. M. Sellars (hon. district secretary).

A resolution was passed similar to that of the South-Western District calling for a post-card poll of the members, associate members, and students, asking definitely whether they are in favour of retaining the old volume or not.

A resolution was adopted approving of the council meetings being held in the provinces periodically instead of always in London.

The chairman referred to the idea of holding a District meeting in the South of Ireland in the summer, preferably in Cork at the end of July, and said he desired to see a provincial road congress held at the same time and place. It was agreed to take immediate action in this matter, and a committee was appointed with power to add to their number, and with full power to make whatever arrangements were considered desirable.

A discussion followed on "The best crust for Irish roads in the immediate future." Mr. Dorman afterwards entertained the members to lunch at Tullymore Park.

THE CHELMSFORD MEETING.

At to-morrow's Eastern District meeting at Chelmsford, we are asked to state, the members will be taken round on a tour of inspection in motor 'buses kindly provided by the National Steam Car Company, whose works are situated in the town.

STREET MAINTENANCE IN CAPE TOWN.

By W. J. JEFFRIES,
City Engineer.*

The cost of maintenance of the streets and footways, including the salary of the superintendent of roads, and a proportion of the votes for travelling expenses, water and establishment charges, has been £20,604, an increase of £1,800 over the previous year. Out of this sum an additional 7½ miles of streets have been made up and tar-sprayed, so that there is now a total of about 24 miles of streets with a tar-sprayed surface.

Of the 24 miles of tarred streets, about 11½ miles had been treated throughout the whole length more than one year ago, and they have therefore had a clear year's maintenance. These show a slight saving as compared with the untreated macadam road, but they do not compare anything like so favourably as they did last year. Still, there is a saving, and there is the improved surface, and the increased comfort brought about by the minimising of the dust and mud nuisance.

The paved streets, which showed up very favourably indeed in last year's comparison of cost, appear in a still more favourable light this year, the cost of maintenance having come down from £88 to £71 per mile. When this is compared with the £319 per mile for macadam streets, it will be seen that the paved streets are contributing handsomely towards their interest and sinking fund.

At the present time the 83 miles of streets in the city are classified as follows: Paved with setts, wood or asphalt, 22 miles; tarred, 24 miles; macadam, untreated, 37 miles.

The following return shows as nearly as possible the cost of maintenance in each class of street. The figures are affected to some extent by the fact that many of the streets are subject to different treatment in different sections. Some are partly tarred and

Description of streets.	Mileage.	Total cost.	Cost per mile.
Total mileage of streets (all classes)	83	£ 20,604	£ 248
Streets under macadam including 19½ miles of streets tarred or partly tarred	48½	14,765	319
Macadam streets dressed with tar throughout whole length more than one year ago	11½	3,226	287
Streets paved throughout	19½	1,372	71
Streets part paved (about 2½ miles paved)	6	1,240	207

partly paved, some partly tarred and part under untreated macadam, and some part macadam and part paved. In the case of the streets which have an uniform surface throughout it has been possible to record the cost separately. The streets which are partly paved and partly macadamised have also been

kept separate, but this has not been possible in the streets partly tarred and partly water-bound macadam, because the process of bringing new areas under tar has been in continuous operation. The streets shown as under macadam therefore compare a little less favourably than they probably would under ordinary circumstances.

SCAVENGING.

Every endeavour has been made to carry out the cleansing of the city in an effective and economical manner. The work had to be done under somewhat adverse circumstances, owing to the long spell of exceptionally dry weather which necessitated the restriction, and later on the total prohibition, of the use of fresh water. This involved the complete re-organisation of such works as the cleansing of the asphalt and other paved streets, the flushing of catchpits, and the watering of the streets.

In spite of the extension of the area of paved or tarred streets, there is again a large increase in the number of loads of sweepings removed from the streets, and there has been an increase of about 8,000 in the number of loads of house refuse removed.

During a long period of drought salt water was used for street watering, and on the macadam streets this proved more effective as a dust layer than fresh water. Among the drawbacks to its use are the extra haulage entailed through the salt water hydrants being situated at greater distances from each other than is the case with the fresh water hydrants, and the occasional delays caused by the failure of the salt water pumping system. The total consumption of water for these services was 8,500,000 gallons of fresh and 2,500,000 gallons of salt. Street watering cost £1,721, and flushing catchpits £897. There is a saving of about £800 under the heading of street watering, probably due partly to the use of salt water and partly to the extension of the area of paved or tarred streets.

DUBLIN TOWN PLANNING COMPETITION.

The Executive of the Civic Exhibition, Ireland, 1914, are inviting designs for the improvement and extension of Dublin, and the Lord Lieutenant has offered a premium of £500 to be awarded to the author or authors of the design which may be placed first in order of merit. The conditions have been very carefully compiled by the Technical and Advisory Committee of the Housing and Town Planning Association of Ireland, with the expert advice of Prof. Patrick Geddes, of Edinburgh, and Mr. John Nolen, M.A., Sc.D., of Cambridge, Mass. These two gentlemen will also, by request of the Lord Lieutenant of Ireland, act as adjudicators, and they will have as a colleague Mr. Charles McCarthy, Fellow of the Royal Institute of the Architects of Ireland, city architect of Dublin.

The committee do not feel that they are as yet in a position to foresee the requirements and future development of Dublin with sufficient definiteness to justify them in promising to recommend for execution any of the town plans which may be submitted in the competition. The object is rather to elicit plans and reports of a preliminary and suggestive character, and thus to obtain contributions and alternatives which may be of value towards the guidance of the future development of the city in its various directions.

The adjudicators will give credit in their report for suggestions of interest as well as for solutions of value.

All correspondence with regard to the competition should be addressed to Mr. E. Kaye-Parry, Civic Exhibition, Dublin.

Cremation in Great Britain.—Sir Charles Cameron presided at the annual meeting of the Cremation Society, held in London last week, and, in moving the adoption of the report, said that in 1913 there were 1,188 cremations carried out in Great Britain—an increase of fifty-four on the previous year. When this society started, over thirty years ago, it received very little support, but as time progressed the movement took practical shape throughout the country, and there are now thirteen crematoria in active operation, and many others in course of construction. The total number of cremations which had taken place in England and Scotland, he went on, up to the end of 1913 was 12,306, of which more than 25 per cent had occurred within the last three years, and the number still increased, although at a slower rate than in other countries.

* Extract from annual report for year ended June 30th last.

The Administration of Municipal Public Works, especially Relating to Highways.*

By NELSON P. LEWIS, Chief Assistant, Board of Estimate and Apportionment, New York City

Most American cities have a department of public works. The organization of such a department and the precise field covered by it vary in almost every city. Generally, such a department has control over the preparation of city maps; street surface improvements, including grading, paving, sidewalks, maintenance, repairs and renewals; street signs and house numbers; sewers and sewage treatment; water supply and distribution, including the care of watershed, filtration, &c.; street cleaning, including the collection and disposal of wastes; street lighting; public buildings; the construction and reconstruction of surface railway tracks in streets; and the elimination of railroad grade crossings.

In cities of moderate size—say 300,000 or less—this work is usually under the more or less complete control of the city engineer, although there are conspicuous exceptions. In very large cities the organization is more complex, sometimes jurisdiction over but one or several of these activities being under a single administrative head; again, a larger group or all are under one head, but under a number of different administrative units, each with limited geographical jurisdiction. An example of the first class is the organization provided by the first Greater New York Charter, under which commissions of water supply, sewers, street cleaning, bridges, public buildings, lighting and supplies, each had jurisdiction over the entire city, and together they formed the board of public improvements, the president of which, a separate officer appointed like the others, by the mayor, had control over all topographical work. This was the charter which took effect immediately after the Consolidation Act, which created the Greater City.

An example of the second class is that of Greater London, where there are thirty separate administrative units, which are practically independent cities, each administering its own local affairs, and raising the money which they feel they can afford to spend on the street and other services. The City of London comprises 673 acres, and has less than 20,000 population. Even here, however, the London County Council has jurisdiction over certain municipal functions which are essentially metropolitan—such as the water supply, the main drainage system, the surface railway lines traversing two or more boroughs, and certain street improvements which extend beyond the limits of a single borough, and which are of great importance to the entire metropolitan district.

In the present City of New York is found a combination of these two general plans. The head of each of the five boroughs has entire control of the mapping of its territory, the improvement of its streets, including the maintenance and renewal of pavements, the design, construction and maintenance of sewers, including sewage treatment plants, and of all public buildings and offices, and in two of the boroughs of street cleaning and the disposal of wastes. Other functions which necessarily relate to the entire city, and where local jurisdiction would be unsatisfactory, are under the control of department heads appointed by the mayor, and they have jurisdiction over the entire city. The chief borough officers, together with the mayor, the comptroller and the president of the legislative body, form the Board of Estimate and Apportionment, which body has a pretty general control over all city activities, so that the City of New York comes nearer having a commission form of government than is generally realised.

New York is not alone in working through special commissions. Chicago's park system is managed through a separate commission for each park, and the results appear to have been most satisfactory. The city of Baltimore has lately established a Paving Commission, entirely distinct from the Department of Public Works or the city engineer's office.

Then, there are the various forms of commission government, the commission in each city which has adopted this system having much latitude, and the

details consequently varying greatly. Perhaps the best and

MOST EFFICIENT FORM OF ADMINISTRATION

is that to be found in cities of moderate size, where one administrative head and the city engineer have virtually entire control. There is one serious defect which is the more pronounced in the smaller cities, and that is the practice, if not the right, of citizens to dictate to a certain degree what kind of improvements are to be made and their character. The town meeting method will answer very well for the village or the very small city, but as the city grows, as its organization becomes more complex, there is more and more need for technical skill in the planning and execution of its public works, and as the city grows the general interests of the community and the particular interest of the property owner are likely to grow more and more apart. In the small town the individual and the property he represents form a much greater relative part of the population and of the physical city than is the case in the larger city.

There is no field of municipal work where the engineer has the opportunity to develop greater versatility than in the moderate-sized city, corresponding, say, with cities of the second class in New York State. Here the city engineer, appointed by the mayor, is a voting member both of the Board of Estimate and Apportionment and of the Board of Contract and Supply. He is called upon to exercise control over almost every kind of public work incidental to the modern city. The work may not be of the magnitude to be found in the greater cities, but its variety is far greater than that which comes to the engineer of cities of the first class, where jurisdiction and responsibility are sub-divided. Having less of a certain kind of work to do, he takes it very seriously, and it is often exceptionally well done.

The practice of electing a city engineer by the council or other legislative body, or, as is done in some cases, by popular vote, cannot be too strongly condemned. Past experience has given good ground for the general statement that no man should be

SELECTED BY ELECTION

to do professional or highly technical work, whether that election be by the general public or by a legislative body. Those who are called upon to vote for candidates for such an office have no means of knowing their peculiar qualifications or lack of qualifications, and better results will almost invariably be obtained if responsibility for the appointment of a man to do such work is vested in the chief executive of the city.

One of the most fertile sources of inefficient administration and of unsatisfactory results is a divided responsibility. In the city of New York the president of each borough is responsible for the care and condition of the public streets, and yet the department of water supply, the fire department, or the State-created Public Service Commission has the right to open the pavement for the purpose of installing the underground structures without the consent, and often without the knowledge, of the officer who is held responsible for the condition of the streets. The surface railway companies must secure permission from the borough president to open streets, but gas companies, electric light companies, and telephone companies must also get permits from the department of water supply, gas and electricity. In all these cases we have a dual responsibility which is inimical to proper control.

An amusing instance of the lack of knowledge in one city department of what exists in city streets under the control of another department was afforded the speaker several years ago in the City of London. Application was made to the authorities of the city of Westminster for the right to examine pipe galleries in Charing Cross-road and Shaftesbury-avenue. There was apparently no knowledge of the existence of such pipe subways, and after extended inquiry the speaker was told that there was no subway large enough for a man to enter. Upon application next day to the chief engineer of the London County

* Abstract of lecture delivered on March 9th before the Graduate Students in Highway Engineering at Columbia University.

Council, a member of the engineer's staff was immediately delegated to conduct the speaker through capacious pipe galleries in these two streets, while the Westminster authorities did not seem to be aware of their existence.

The following requisites are necessary in order to secure satisfactory results in highway administration:

(1) Centralisation of authority over, and responsibility for, all work relating to highways within the administrative district.

(2) Such flexibility of organisation as will permit a concentration of force on any work of pressing importance.

(3) Administrative units sufficiently large to permit the utilisation of an entire force and equipment all of the time, reducing overhead charges to a minimum consistent with efficiency and thoroughness.

(4) Get rid of the prevalent horror of a bureaucracy. If such bureaucracy works well, it is a good thing. If it works badly, it is not because it is a bureaucracy, but because it is not well organised.

(5) Direct and undivided responsibility for every part of the work, each head of a bureau or subdivision to be made to realise, however, that his own particular work should be so done as to help and not to hinder that of other bureaus or divisions.

(6) Promotion to the headship of bureaus and departments to be made from within the organisation when possible, not necessarily according to seniority, but by reason of peculiar fitness. When it is necessary to go outside of the organisation to fill such a place, the appointee should be one who has already made good in similar work in some other place.

(7) Permanent tenure of office for those in responsible charge, so that continuity of purpose and policy may be assured.

LONDON ELECTRICITY SUPPLY.

IMPORTANT PROPOSALS.

A report of Messrs. Merz and McLellan, who in August last were commissioned by the London County Council to investigate the question of the electricity supply of the Metropolis was issued on Wednesday night.

The report points out that in the Greater London area there are at present no fewer than seventy companies and generating stations, and forty-nine systems of generation. The desirability of the unification of control is insisted on, and the engineers, after setting out the advantages and disadvantages of private and municipal ownership, put forward a scheme for municipal control combined with private operation.

If this method were adopted, the county council would own and control the system, and supply the bulk of the capital necessary to construct the new works, while the operating body—the amalgamated companies—would guarantee the interest on the capital, and work the undertaking on behalf of the controlling authority. This would bring London into line with Paris, Berlin, and Chicago and other United States cities.

It is further proposed that nearly all the seventy existing generating stations should be closed down, and all the necessary electrical energy produced in stations outside the central area, down the river. The economic advantages of this concentration of production would be very considerable.

If the council should adopt the scheme of their advisers, a private Bill would be needed to secure the necessary powers. A sum of £30,000,000 is involved in the scheme.

Motor Buses on Country Roads.—The President of the Local Government Board was asked in the House of Commons last week whether he was considering the question of the damage done to the macadamised country roads by the user of these roads by services of motor omnibuses, and if he would cause an inquiry to be made into the cost of repair and upkeep of these roads before and after such user. Mr. Herbert Samuel said the circumstances varied so greatly in different cases that he did not think it would be possible to draw any useful conclusion from such an inquiry. Asked whether a specimen road could not be taken, and the cost of repair previously to the user of the motor omnibuses, and an estimate of the present cost of repair be made, Mr. Samuel pointed out that, in the first place, it would be exceedingly difficult to distinguish between the amount of user of the road by omnibuses and other vehicles, and, in the second place, no generalisation could be drawn from a single instance, or even from half a dozen instances.

SOME RECENT PUBLICATIONS.*

A DIGEST OF THE LAW AND PRACTICE RELATING TO LOCAL GOVERNMENT IN ENGLAND AND WALES (INCLUDING LONDON). By Arthur D. Dean and F. J. Rimmer. Price 5s. nett. London: Butterworth & Co.

We may say at once that this book is like no other work on local government with which we have any acquaintance, and that, in our opinion, it supplies a real need. The aim of the authors has been to explain in outline the meaning of local government, its growth, the constitution of local government authorities and their various powers and duties. The result of their work is a "digest" in fact as well as in name, and the arrangement is such that the reader who desires a succinct account of any topic can easily find it by reference to the table of contents or index. The work has five main divisions—namely, (1) introduction, (2) local authorities, their constitution and functions, (3) Government departments having jurisdiction in local government affairs, (4) the powers and duties of local authorities, and (5) the Metropolis. The fourth of these divisions naturally occupies the greater part of the work, and under this heading the authors deal in turn with administration, procedure, public health, education and insurance, matters under local control, municipal works and undertakings, and finance. It will be seen at once that in a work of this character each matter must be dealt with very shortly, but the authors have succeeded in presenting the gist of each subject with lucidity and, so far as we have been able to test, with accuracy. If this book were in the hands of every councillor the work of local government administration would be carried on with greater intelligence than is now often the case.

CLEAN WATER AND HOW TO GET IT. By Allen Hazen. (Second Edition; Revised and Enlarged.) Price \$1.50. New York: John Wiley & Sons.

This is the second edition of a book that has become well known in America. It treats of the general subject of water in supplies from the standpoint of the city executive and the layman. Probably no other book can be found in which so many important engineering facts are set forth in such a way that the ordinary man can comprehend them. Several new chapters have been added to the book. One of these describes what are termed "Red Water Troubles." Mention is also made of the method of obviating the trouble by renewing the carbonic acid from water either chemically or by aeration. Another new chapter is that on disinfection. This takes up the general use of calcium hypochlorite, liquid chlorine, ozone, and the ultra-violet rays. The new matter covers about twenty additional pages. The various tables in the book have been brought up to date.

LOCAL LEGISLATION, 1913. By Frank Noel Keen, LL.B. Price 10s. nett. London: Walter Southwood & Co.

This book sets out in compendious form numerous provisions of general interest contained in Private Acts of Parliament dealing with such matters as sanitation, building regulations, infectious disease, water supply, lighting, tramways, railless traction superannuation, rating and local government finance. It deals with all the Acts—sixteen in number—obtained by provincial corporations and urban district councils in England and Wales in the Session of 1913 which were considered by the Local Legislation Committee of the House of Commons. About 1,400 sections from these Acts are classified under convenient headings for the purpose of easy reference, and so as to show the differences in the form of legislation applied to different districts. The work is wellnigh indispensable to officials and others advising local authorities who contemplate applying to Parliament for special legislation.

Barking Tramway Undertaking.—Owing to heavy loss on the local tramways the Barking Urban District Council are trying to lease them to neighbouring authorities, failing which the tramways will, according to the *Standard*, cease running after Midsummer Day.

*Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

390. Removal of House Refuse.—A new urban district has just been formed in the neighbourhood of London of which the following are particulars: Area, 3,500 acres; population, 9,000, increasing at rate of 700 per annum; number of houses, about 2,300; length of district, north to south 3 miles, east to west 1½ miles; mileage of roads, 17; character of district, flat in northern part, hills up to 1 in 16 in southern part; distribution of population, 2,000 at north end in £40 villas, shops, &c., 500 in north-east in large houses with long approach drives, 1,000 in south and south-west in small villas and workmen's cottages. The refuse for the present will be utilised at brickfields on the southern boundary of the district. It is desired to organise the removal of house refuse on the most up-to-date methods compatible with economy. Describe fully the methods of collection and transit, the organisation of the staff, the plant required, and give an estimate of the capital and annual charges for this work. Trade refuse is negligible, and no plant has been taken over from the rural authority who formerly had control of the area. (Togun.)

391. Concrete Floor.—A concrete floor is to be constructed as shown in the sketch, with 4-in. by 3-in.

R.S. joists, and woven mesh steel wire with a 3-in. lap. The R.S. joists have a 4½-in. wall hold, and the floor a 2-in. wall hold. The size of the room is 16 ft. by 13 ft. Calculate the safe distributed load per super. foot, also the breaking load. (Assistant.)

392. Sewage Purification.—The sewage of a college is to be treated as follows: The liquid is first admitted to a septic tank, then to a vertical upward filter filled with agricultural pipes; thence it flows through a clinker filter to the sewer of the city. The population of the college is about 300 people. (1) Give dimensions of each of the tanks, in order that the liquid effluent may be good. (2) Does the vertical upward filter act as an oxidising filter or merely as a second settling tank? (3) How often will the vertical upward filter have to be cleaned in order to keep the effluent good? (Deleatur.)

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulae involved. (P. W. P., *Bexhill-on-Sea*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

385. Chimney Design.—Design a brick chimney shaft 130 ft. in height from ground level, the internal diameter at the base being 10 ft. (F. S., *Plumstead*.)

The regulations of the London County Council re chimneys are a good guide for the construction of chimney stacks outside their area. They provide that if the stack be square it shall have a width at base equal to one-tenth the total height,

and if circular one-twelfth total height, which gives in this case $130 \text{ ft.} \div \frac{1}{12} = 19.8333 \text{ ft.}$ at base; but in the drawing I have taken 10 ft. as question. The batter should be 2½ in. in every 10 ft., or an inclination of 1—48. Brickwork to be at least 8½ in. at top, and to increase 4½ in. for every 20 ft. height, measured from top downwards. Firebrick linings to be in addition to ordinary brickwork, in thickness.

I have not adhered strictly to the regulations. In practice the weight of the brickwork, &c., would be taken, and then, having assumed a certain area of concrete, we would see whether the weight per superficial foot was more than could be allowed.

and increase the area of concrete if necessary to the required area. The question does not give the nature of the ground the stack is to be erected upon.

Clay would stand 1 ton per superficial foot.

Of course, the thickness of concrete would also depend upon the weight of building above it, and width from bottom footing to edge of concrete.

I have shown in drawing 7 ft. concrete, which is ample for chimney if fairly good ground. ("Sanitas.")

389. Design of Floors.—What loads should be allowed for in designing a floor (a) in a general warehouse, and (b) in a platform to which the public are to be admitted? What factor of safety would you adopt in each case?

Warehouse floors should be strong enough to support a load of 2½ to 4 cwt. per super. foot, and for a platform or hall where large numbers of people are moving a load of 1½ cwt. should be allowed for.

A factor of safety of one-fifth is usually allowed for dead loads, but for live loads, as in the latter case, a factor of safety of ten should be taken.

The size of joists in each case can be found by the empirical formula:—

$$W = \frac{2K \times b \times d^2}{l} \text{ for distributed loads.}$$

Where l = length in feet

b = breadth in inches

d = depth in inches

w = breaking weight in cwt.

K = constant for different woods; being the breaking weight in cwt. of a wood beam 1 ft. long.

The Surveyor

And Municipal and County Engineer.

1 in. broad, 1 in. deep, supported at ends and loaded at centre.

Material.	VALUE OF K.	Central breaking weight in cwts.
Spruce fir		3.5
Northern pine		4.0
English oak		4.5
Canadian oak		5.0
Pitch pine		5.0

By transposing the above formula we get:—

$$b \times d^2 = \frac{W \times l \times f}{2K} \text{ or } d = \sqrt{\frac{W \times l \times f}{2K \times b}}$$

By assuming a dimension for *b*, *d* may be found. If the joists be placed at 12-in. centres, *w* will equal the load in cwts. per super. foot times the span in feet. (H. V. A., Clapton.)

WEST RIDING OF YORKSHIRE HIGHWAY SURVEYORS' ASSOCIATION.

It has been decided to form an association to be known as the West Riding of Yorkshire Highway Surveyors' Association.

Mr. A. G. Kilner, surveyor to the Wetherby Rural District Council, has been appointed hon. secretary of the new body.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

HOUSING IN SCOTLAND.

LOANS FOR BUILDING.

In the House of Commons last week inquiry was made as to what public funds were at present available to local authorities or individual applicants by way of advances for building purposes in Scotland, and under what conditions and at what rate of interest.

Mr. McKinnon Wood stated that under the Housing Acts the funds controlled by the Public Works Loan Commissioners might be lent for purposes connected with the housing of the working classes (1) to local authorities on the security of the rates and upon the recommendation of the Local Government Board for Scotland; the present rate of interest was 3½ per cent, irrespective of the period of repayment; the maximum periods of repayment recommended by the Local Government Board were sixty years for houses and eighty years for land; (2) to companies, societies and individuals, as specified in sec. 67 of the Housing of the Working Classes Act, 1890, with a maximum period of repayment of forty years, the rates of interest being 3½ per cent and 3¼ per cent respectively, according as the period of repayment does or does not exceed thirty years.* Under the Small Landholders (Scotland) Act, 1911, assistance for building purposes might be provided by way of loan to "landholders" and cottars from the Agriculture (Scotland) Fund.

THE LATE MR. JAMES P. WILKINSON.

Mr. James P. Wilkinson, M.INST.C.E., whose death was recorded in our last issue, was one of the oldest members of the Institution of Municipal and County Engineers, and as engineer to the Rivers Committee

of the Manchester Corporation designed and helped to carry out the great sewage disposal works at Davyhulme. His son, Mr. Oswald J. Wilkinson, ASSOC.M. INST.C.E., succeeds him as engineer to the extension scheme, which is estimated to cost £200,000.

Leigh and Municipal Motor 'Buses.—A proposal that the Leigh (Lancs) Corporation should take steps to promote a Bill in Parliament to secure powers to run motor 'buses within the borough was discussed by the town council on Wednesday. Twelve voted for and twelve against the proposal. The mayor said he would vote for the resolution, so that the matter might be again discussed. The opponents of the proposal said it would mean 3d. to 4d. on the rates. A discussion also took place on the question of erecting a public abattoir, but it was decided that the time was not opportune, and that the question "ought to be dealt with nationally."

* Provided the borrowers enter into covenants restricting the rents or otherwise limiting the profits to be derived from buildings to 5 per cent per annum on the capital outlay. Where such covenants are not entered into, the rates are 4 per cent for thirty years, and 4½ per cent for forty years.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

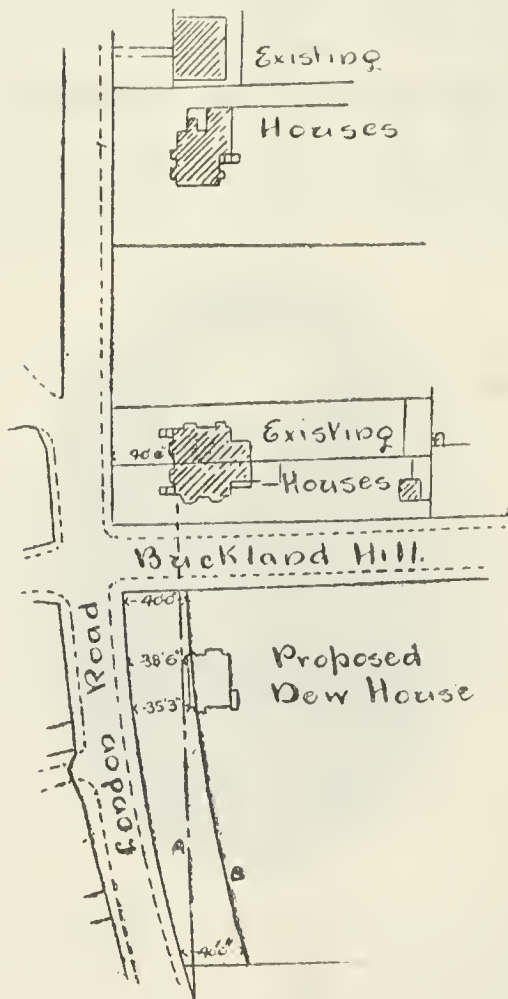

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK INK only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion querists are requested to use distinctive words, as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

PUBLIC HEALTH (BUILDINGS IN STREETS) ACT, 1888.

"T. B." writes: A builder has commenced the erection of a house in this town, and a question has arisen as to the building line adjoining the main road. The nearest houses on the north side at the opposite corner are built 40 ft. back from the road. The proposed house will not be in front of the line of the front main wall of these houses, but it will be within 35 ft. of the road. The builder contends that he is not infringing the Buildings in Streets Act, as

he is not in front of the line on either side. If he is correct in his contention, then he could build anywhere up to the dotted line marked "A" on the accompanying sketch, and could place the last house on the line close to the road. The 40-ft. building line is marked "B" on the sketch. The corporation contend that the existing houses set out a 40-ft. building line parallel with the main road, and that this should be observed in the present case. If the builders are correct, then it seems that the Buildings in Streets Act is absolutely useless, excepting in the case of a street which is laid out in a perfectly straight line.

So far as I am aware this is a point under the Public Health (Buildings in Streets) Act, 1888, which has not been decided. In my opinion, however, if the proposed new house is erected in the position shown on the plan, part of it will be "beyond the front main wall" of the existing houses, within the meaning of the Act, and it will consequently be a contravention of the Act. Having regard to the obvious purpose of the Act, I think the term "beyond"

must be understood as used in relation to the line of the street, and as meaning, in fact, "nearer the street than." The builder's interpretation would (as my correspondent points out) defeat the intention of the Act, except in straight streets.

SCHOOL BUILDINGS AND BY-LAWS.—"Ynys" writes: An Education Committee are carrying out certain alterations and additions in connection with their higher standard schools in this town, and have declined to deposit plans thereof for the approval of this urban council, and they say it is not incumbent upon the Education Committee to do so. The alterations comprise the conversion of existing stables and outbuildings into a manual instruction room, the addition of a new porch at the rear of the schoolmaster's house, including new bedroom, bath-room, and water-closet, partly over the said porch and partly over the existing scullery, as per sketch. It is also proposed to alter and extend the existing drain situated in a public footpath repairable by the inhabitants at large, and to provide a gully thereon to receive the wastes from the bath, lavatory and sink. My council declined to allow the trapped gully referred to to be fixed in the public footpath, and the Education Committee now propose to fix it in a recess to be made in the side wall of the house, enclosed by an iron door. Will you kindly advise—(a) Whether the schoolmaster's house is exempted by sec. 3 of the Education (Administrative Provisions) Act, 1911? (b) Whether the additions and alterations amount to the erection of a new building? I submit that it is not sanitary to provide gullies in recesses made in the walls of houses, as proposed, otherwise the by-laws would not provide for their being situated 18 in. therefrom.

(a) The Act of 1911 contains no definition of "school premises." But "premises" is a very comprehensive term, and if the schoolmaster's house was erected according to plans which are under any regulations relating to the payment of grants required to be, and have been, approved by the Board of Education, I think the house would probably be held to be "school premises" within the meaning of the Act. (b) In my opinion they do. See *James v. Wyeell* (48 J.P., 725).

IMPROVEMENT OF MAIN ROADS. "Pounds" writes: I should be much obliged if you would refer me to any decisions upon, or, failing any decisions, if you would express an opinion upon, the wording of sec. 11, subsec. (2), of the Local Government Act, 1888: "... and the council shall make to such authority an annual payment towards the costs of the maintenance and repair and reasonable improvement connected with the maintenance and repair of such road." My understanding of the words italicised is that they only refer to those cases of improvement such as are covered by, say, the substitution of granite for gravel surfaces, or again, say, by wood block paving or granite setts for macadam—i.e., making a more permanent surface—and that they would not cover such improvements as widening a narrow road, improving dangerous corners, buying land for widening and other analogous works, which, although improvements in the broad meaning of the word, hardly appear to come under the heading of "improvements connected with the maintenance and repair of such road." In your opinion, is an urban authority empowered by this section to carry out such works without first obtaining the consent of the county council? The point is that, if an urban authority is empowered to carry out widenings and purchase the necessary land for such purpose without any control being exercised over their expenditure by the county council, it appears that the latter might find their credit pledged to an inconvenient extent.

I do not know of any case dealing with this precise point. In *Warminster Local Board v. Hills County Council* (25 Q.B.D., 450) it was held that if the urban authority alter the paving or flagging of the footways, as, for instance, by substituting flagging, pavement wood, or asphalt for gravel or other substance, the county council are bound to make an annual payment in respect of such alteration, in so far as it is a reasonable improvement connected with maintenance and repair, the question whether it is reasonable in any particular case being, in case of dispute, settled by arbitration under subsec. (3).

In my opinion the words "improvement connected with the maintenance and repair" would not cover widening or cutting off corners, or the purchase of land for such a purpose. But there appears to be nothing in the section prohibiting an urban authority who retain a main road from carrying out such works without the consent of the county council. The subsection says that they shall have the same powers as if the road were an ordinary road vested in them.

PURCHASE OF HOUSE AND LAND FOR OFFICES AND RECREATION GROUND: SALE OF SURPLUS LAND.—"Bogie" writes: My council have under consideration the purchase of a house with grounds and fields, comprising about 7 acres, with the intention of utilising the residence as council offices, and laying out the grounds and fields as recreation grounds, &c. As three sides of the estate abut on highways, it is contended that, in the event of a purchase being effected, the land fronting these highways should be sold off for building plots. Is it probable that the Local Government Board would sanction the purchase under such conditions? and, if so, would the council be permitted to dispose of individual plots? The council have no local Acts, nor have they adopted the Public Health Amendment Act of 1907.

The power to purchase lands for the purposes of the Public Health Act, 1875, is given by sec. 175 of that Act, which makes it compulsory to sell any lands acquired and not required for the purpose for which they were acquired, unless the Local Government Board otherwise direct. The consent of the board to the purchase is not necessary unless the council wish to purchase compulsorily. Where lands are purchased by means of borrowed money, the board practically bring pressure to bear upon the local authority to dispose speedily of the surplus lands by requiring the estimated cost to be divided, and assigning a short term (usually five years) for the repayment of so much of the loan as represents the estimated value of the surplus property (Lumley's "Public Health Acts," 7th edition, page 417). I cannot express any opinion as to the probability of the board sanctioning a compulsory purchase or loan in the present case, as so much must necessarily depend upon the local circumstances.

OVERCROWDING: "FREE-HOUSE SYSTEM."—"Midget" writes: This is a mining district, and the houses are provided by the colliery owners on what is known as the "free-house system," a reduction being made from the wages for house, coal and water. The miners have no choice of house, but must take the house offered them. Many of the houses are overcrowded. Who is responsible, and upon whom should notice be served to abate the nuisance?

Under sec. 94 of the Public Health Act, 1875, notice of a nuisance is to be served on the person by whose act default or sufferance the nuisance arises or continues, or if such person cannot be found, on the owner or occupier of the premises on which the nuisance arises. In Lumley's "Public Health Acts," 7th edition, page 177, the opinion is expressed that in general the occupier and not the owner is the person by whose act default or sufferance a nuisance consisting of overcrowding arises; and it is stated to have been so decided in a Scotch case (*Horne v. Kelso Local Authority*, 3 Cou., 239). The circumstances of the present case, however, are exceptional, inasmuch as the occupiers have no option as to the house which they are to occupy, and I think proceedings against the owners would have a very good chance of being successful.

WATER SUPPLY: "FIXED" BATH.—"Q." writes: A section in the Local Act relating to the charge for water-closets and baths shortly reads as follows: "A charge may be made for every water-closet beyond the first at a rate not exceeding 10s. per annum, and for every fixed bath capable of containing not more than 50 gallons a sum not exceeding 10s. per annum." The only point I wish to raise is with regard to the word "fixed," and I should be glad to have your opinion as to whether it means—(1) Attached to the building by means of a waste pipe, or (2) attached to the fittings, through which the water passes into the bath?

Prima facie, I should think that the term "fixed bath" means a bath which is fixed in a permanent position in any way whatever, as distinguished from a movable or portable bath which can be used anywhere.

GATES ACROSS ROAD.—"Rikkatikka" writes: A road leading to the village church and rectory, some $\frac{1}{2}$ mile from the village, runs through three fields, and consequently has three gates across it. My council would like to have the gates removed. Have they any power to do so?

The question of the legality of gates across a highway depends upon whether the highway was dedicated subject to the right to maintain the gates. If the gates have existed as far back as living memory goes, there is a presumption that the dedication was made subject to the right to maintain them, and the council cannot compel their removal, except in the cases provided for by sec. 81 of the Highway Act, 1835. That section provides that if any gate across a public cartway is less than 10 ft. wide, or any gate across a public horseway less than 5 ft. wide, notice may be given to the owner to enlarge it. If he neglects to remove or enlarge it for twenty-one days after the notice, he is liable to penalties.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bolton T.C. (March 31st. Major J. Stewart).—£5,100 for the purchase of Haacken Hall Farm for the purposes of sewage disposal.—The borough surveyor, Mr. E. L. Morgan, stated that the total area it was proposed to purchase was 44 acres. For a number of years they would leave it as an ordinary farm. They might not use it for the purposes required for twenty years, but that was an extreme view. The inspector said he presumed that it was cheap now, and they would want it one day, and they might as well take it now. The council, Mr. Morgan stated, had had the present scheme before them for some time, and it would be started at the earliest possible date, probably in the spring of 1917. The total cost of the scheme, Mr. Morgan added, was approximately £79,000.

Chorley T.C. (April 1st. Mr. A. G. Drury).—£29,783 for the purposes of the gas undertaking, and £3,100 for the purchase of property for the improvement of Market-street.—With respect to the loan for the gasworks, the gas manager, Mr. J. W. Allin, stated that the proposed vertical plant was of a nominal producing power of 1,200,000 in twenty-four hours. It was intended to dismantle five settings of the horizontal retorts in the existing retort-house. The space recovered from this would be used for covered coal storage, which would thus be increased by at least 100 per cent. The new installation, together with three horizontal settings left standing, and the water-gas plant would give an estimated total daily productive power of 1,755,000 cub. ft. In the matter of the proposed purchase of property it was explained that it was the intention to widen Market-street and Chapel-street.

Colwyn Bay U.D.C. (April 2nd. Major J. Stewart).—£7,172 for the widening and improvement of Abergele-road, Old Colwyn.—The proposed works are expected to cost £11,572, towards which contributions are expected from the county council, the Road Board and the light railway.

Devizes R.D.C. (April 9th. Mr. E. Leonard).—£1,329 for the purpose of building six houses at Potterne.—It was stated that the scheme had been prepared on the assumption that it would be necessary to charge an economic rent of 5s. 3d. per week. The surveyor had based his calculations on the payment of 5d. per cubic foot, which the inspector said was too much. The county medical officer said tenders had already been accepted in the county for building larger houses than these at £30 or £40 per house less, though the difficulties were greater, and the price of labour was 1d. or 1½d. an hour higher than in this district. It was the general opinion that the houses could be built and let at about 4s., or even less, but it was said this was more than labourers would pay at the present rate of wages.

Leigh T.C. (April 9th. Mr. F. O. Stanford).—£11,420 for the purpose of the gas undertaking, and £6,252 for improvements in Firs-lane and Plank-lane.—Mr. Gibson, gas manager, explained that the consumption of gas had largely increased of late years, and that the sum required was chiefly for vertical retorts.

Lincoln T.C. (April 7th. Mr. M. K. North).—£1,100 for the purchase of land for extending the Newport burial ground.—Mr. W. Bagshaw, town clerk, said the land was in the market, and the corporation had secured a provisional contract at what was considered a reasonable price. At present there was only a right of way into the burial ground, there being no chapel or accommodation for mourners. The land would enable a road to be provided and a cemetery chapel to be erected.

Lurgan U.D.C. (April 1st. Mr. G. B. Deane).—£12,000 for an electric lighting scheme. Mr. Walter Pleasance, Assoc. M. INST. C. E., engineer of the scheme, said he believed the sum asked for would be sufficient to provide for a plant to supply not only the compulsory area, but the rest of the urban district. His original scheme provided for the substitution of eighty gas lamps by electricity, and his second report for the substitution of 140. As to revenue, he anticipated that they would derive from public lighting £255, that the light would be better than at present, and that the

lamps could remain longer lighted. He estimated the revenue from lighting the council offices, &c., which at present costs £86, at £60, and believed that £1,260 would be obtainable from private consumers, charging at the rate of 6d. per unit, and £525 from power at 1½d. per unit.

Rochdale T.C. (April 7th. Dr. Miles B. Arnold).—£12,500 for the purchase of the Springfield estate for the purposes of a sanatorium "and other purposes as the corporation may determine."—A representative of the Rochdale Property Owners' Association read a letter which had been forwarded to the Local Government Board suggesting that the loan should be earmarked for the purposes of the sanatorium only, as they did not consider it advisable to set apart a portion of the land for playing fields, a park, or for the erection of working-class houses.

Stockport T.C. (April 9th. Mr. F. H. Tulloch).—£7,380 for the widening of Bramhall-lane; £1,087 for street improvements in Buckingham-road, Park-road and Peel Moat-road, Heaton Moor; and £3,520 for the purpose of public walks and pleasure grounds at South Reddish.—It was explained that it is proposed to widen Bramhall-lane, in the borough of Stockport, from 37 ft. to 75 ft., near Kennerley-road, and to widen the road to 50 ft. at the south side of Barnfield-road. The land for this purpose has been given by the owners, and the town council have only to bear the cost of erecting a boundary wall. The inspector asked if Bramhall-lane was to be widened on the southern side, as it was desirable that the road should be widened all the way from Stockport to Bramhall. The town clerk Mr. Robert Hyde, replied that that portion was in the Hazel Grove and Bramhall Council's district, and they were town planning their own area. An arrangement would have to be come to between that authority and the Midland Railway Company, who owned most of the land at the point of the road referred to.

APPLICATIONS FOR LOANS.

- Bournemouth T.C.**—£600 for public conveniences.
Brierfield U.D.C.—£320 for street improvement.
Buxton T.C.—£1,750 for improvements at Spring Gardens.
Cleckheaton U.D.C.—£1,307 for works of sewerage.
Clones U.D.C.—£2,400 for a sewerage scheme.
Dartford U.D.C.—£364 for fire alarms.
Erpingham R.D.C.—£720 for four cottages.
Grimshy T.C.—£1,130 for the purchase of a school site.
Hereford T.C.—£1,500 for prospective expenditure on electricity mains.
Hexham U.D.C.—£250 for road widening.
Hornsea U.D.C.—£1,450 for the erection of eight cottages.
Lowestoft T.C.—£3,800 for the purchase of a park.
Nelson T.C.—£6,344 for street improvement.
Nottingham T.C.—£1,000, additional loan for public baths.
Orsett Joint Hospital Board.—£950 for hospital extension.
Peterborough T.C.—£400 for new road construction.
Romford R.D.C.—£350 for street improvement.
Tilbury U.D.C.—£3,890 for the provision of a recreation ground.
Turton U.D.C.—£500 for the erection of a store shed.
Wantage R.D.C.—£1,500 for drainage works.
West Sussex C.C.—£1,920 for a new school at North-chapel.

LOANS SANCTIONED.

- Bexhill T.C.**—£3,710 for a recreation ground.
Chester T.C.—£1,310 for road improvement.
Darton U.D.C.—£300 for sewer extension.
Exmouth U.D.C.—£1,050 for the purchase of ground and laying out tennis courts.
Grimshy T.C.—£355 for asylum extension.
Hackney B.C.—£1,600 for street improvement.
Hendon U.D.C.—£563 for street improvement.
Hinckley U.D.C.—£2,800 for the erection of sixteen working-class houses.
Littlehampton U.D.C.—£1,000 for laying out a recreation ground.

Lowestoft T.C.—£517 for the extension of a public convenience; £950 for electricity meters.

Newport (Mon.) T.C.—£3,132 for extensions at the central fire station.

Poole T.C.—£256 for sewerage and surface-water drainage.

Scarborough T.C.—£4,350 for the provision of a shelter, public conveniences, tennis courts, and other works.

Stepney B.C.—£2,500 for street improvement (payable in ten years).

Woolwich B.C.—£15,000 for the electricity undertaking.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier.*

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Dundee, Essex £4,620, Ipswich £11,700, Scarborough £8,200; housing and town planning—Irlam £36,780, Ryton £6,000, Selby; roads and materials—Bournemouth £5,600, Islington £30,597; sewerage and sewage disposal—Watford £11,000; water, gas and electricity—Burton-on-Trent. Particulars of other works projected will be found on our "Local Government Board Inquiries" pages.

BUILDINGS.

Ashington U.D.C.—The surveyor, Mr. G. Beaty, has completed plans for a proposed new hospital.

Blyth U.D.C.—The council have agreed to submit to the county council and the Road Board a scheme for a bridge over the river Blyth.

Bury (Lancs) T.C.—It has been decided to apply to the Local Government Board for power to repeal a section of the Bury Corporation Act, 1909, which provides that no street shall be laid out for building purposes exceeding 100 yds. in length without at least one intersecting street in every 100 yds. of the total length of the street. It is understood that the purpose of the resolution is to reduce the cost of putting up house property, and so to contribute in some degree to the relief of the housing difficulty.

Clacton U.D.C.—It has been decided to provide a bathing pavilion on the East Cliff to accommodate eighty bathers at a time. The cost is estimated at £850.

Derbyshire C.C.—A tender of £5,114, together with an additional £450 for extra work, has been accepted for the widening of Dove bridge, an undertaking which is to be carried out in conjunction with the Staffordshire County Council, and to which the Road Board are making a grant.

Dundee T.C.—At a meeting of the council last week Lord Provost Urquhart announced a gift of £100,000 from Sir James K. Caird, a Dundee manufacturer. The money is to be spent in providing a new city hall, council chambers, and offices for various corporation departments, the foundation-stone of which will be laid by the King, on the occasion of his visit to Dundee with the Queen, on July 10th. The building, which has to be completed within three years, will open up a large area in the centre of the city, and about £40,000 will be required to purchase the property at present occupying the site. The hall will have accommodation for 3,500.

Essex C.C.—The council have agreed to extensions and alterations at the Colchester Asylum, at an estimated cost of £4,620.

Harrogate T.C.—The borough surveyor, Mr. C. E. Rivers, has received instructions to proceed with the rebuilding of the market hall, which was recently damaged by fire.

Ipswich T.C.—It has been agreed to carry out extensions at the isolation hospital, at an estimated cost of £6,000, and new offices for the health department are to be built, at an estimated cost of £5,700.

Littlehampton U.D.C.—The council have approved of plans for a new fire station.

Newport (Mon.) T.C.—The council have adopted a scheme of extensions to the Stowhill baths, the estimated cost being £2,680.

Sandwich T.C.—The borough surveyor, Mr. J. E. Turner, has completed plans of a new fire station.

Scarborough T.C.—The Parks Committee propose to erect refreshment rooms, pavilions, and public conveniences in the South Cliff Gardens, at an estimated cost of £8,200.

Sutton-in-Ashfield U.D.C.—The tender of Mr. H. Shaw, Sutton, at £289, has been accepted for the erection of the new fire station in Church-street.

HOUSING AND TOWN PLANNING.

Arundel T.C.—The borough surveyor, Mr. E. F. Farrington, has received instructions to prepare plans for ten working-class dwellings.

Ayr T.C.—The council have approved a recommendation by the Housing Committee that the committee visit towns in Scotland where houses have been erected for the working classes by the municipality, and that the committee hold a public inquiry in Ayr into the necessity of providing houses for the working classes, and whether private enterprise had failed to provide such houses.

Dunmow R.D.C.—The council are asking for sanction to the purchase of a site at Felstead for the erection of four cottages.

Feckenham R.D.C.—It has been agreed to make a start with rehousing by building six houses at Cook-hill.

Haltwhistle R.D.C.—The medical officer, Dr. Glasse, reports that extra housing accommodation for workmen is needed in the town.

Irlam U.D.C.—The surveyor, Mr. R. H. Winterbottom, has prepared plans, quantities and specifications for 154 workmen's houses to be erected in Irlam, and the Local Government Board have sanctioned the borrowing of £36,780 for the purpose.

Lichfield T.C.—The borough surveyor, Mr. W. B. Chancellor, has been instructed to prepare a scheme for the provision of twenty cottages.

Ruislip-Northwood U.D.C.—It was announced last week that the town planning scheme, which is the pioneer town planning scheme in the United Kingdom, had emerged from the Local Government Board in its final stage. The council decided to make application to the Local Government Board for sanction to prepare another scheme which will include all the land in Northwood and Ruislip left out of the original scheme, and portions of the districts of the Uxbridge Rural District Council and Watford Rural District Council.

Ryton U.D.C.—A scheme is on foot for the provision of twenty-five workmen's houses, at an estimated cost of £6,000.

Selby U.D.C.—The housing scheme adopted by the council will provide for 104 dwellings.

Stalybridge T.C.—Commenting in his annual report upon the treatment of tuberculosis, the medical officer of health, Dr. Hancock, writes: "Never before was the borough so sanitary, so well sewered, so well paved, and so well supplied with an abundance of pure water as it is to-day. Much has been done during recent years, and more remains to be done, and must be done in the near future. I am convinced that if the money which the State is now providing towards the establishment of sanatoria was devoted to the abolition of slums and overcrowded dwellings and their replacement by modern dwellings in open situations, much more permanent good would result within the next ten years than will accrue from all the treatment in sanatoria, from which the patients, too often of necessity, return to their former unhealthy surroundings."

Yarmouth T.C.—The borough surveyor, Mr. J. W. Cockrill, on Tuesday last submitted a plan showing an area in Southtown and Gorleston, comprising practically all the land now unbuilt upon, which he suggested should be included in a town planning scheme. This would enable the corporation to have some control over the manner in which such land might be developed in the future, more particularly with regard to the overcrowding of houses on certain areas. He estimated the expenses at £200. The owners of land within the area would be consulted. The council resolved to apply to the Local Government Board for authority to prepare the scheme.

PARKS AND OPEN SPACES.

Newmarket U.D.C.—Tenders are to be obtained for laying out the Memorial Hall grounds, plans for which have been prepared by the surveyor, Mr. W. H. Fley.

St. Annes-on-Sea U.D.C.—Lord Ashton, of Lancaster, has supplemented his recent gift of over £21,000 to St. Annes-on-Sea for the purchase of St. George's Gardens as a public recreation ground, by a further donation of £4,500 for additional land which it was considered advisable to add to the gardens.

REFUSE COLLECTION AND DISPOSAL.

Littlehampton U.D.C.—The tender of the Bristol Wagon Company, at £40, has been accepted for the supply of a refuse van, with tipping gear.

Sutton Coldfield T.C.—The council have accepted the tender of Messrs. Hughes & Stirling, at £5,050, for the construction and equipment of a refuse destructor.

ROADS AND MATERIALS.

Ashby-de-la-Zouch U.D.C.—The Highway Committee have recommended that, owing to repeated complaints as to the slipperiness of the streets, no tarring should be done during the summer. Consideration of the matter has been adjourned with a view to obtaining the opinion of the town-people.

Belfast R.D.C.—A scheme has been sanctioned for the improvement of Shore-road, at an estimated cost of £5,250, a moiety of the cost to be borne by the county council.

Bournemouth T.C.—It is proposed to carry out road improvements at an estimated cost of £5,600.

Buxton T.C.—Tarred slag and tarred basalt are to be used for the resurfacing of St. John's-road, the estimated cost of the work being £800.

Chelmsford T.C.—A contribution of £700 is to be made by the county council for road widenings, the total cost of which is estimated at £1,620.

Derbyshire C.C.—Expenditure aggregating over £2,000 upon road improvements has been sanctioned. The purchase of four additional steam rollers, with the necessary vans, at an estimated cost of £2,100, has been approved, it being pointed out that during the past year the amount paid for hire of rollers was £1,961. Having been informed that the Road Board intended to reduce by a half the grant of 1d. per square yard for the surface-tarring of main roads, the Roads Committee have forwarded a strongly worded protest.

Devonport T.C.—A scheme has been submitted to the council for the improvement of Swilley-road, which is estimated to cost about £5,000.

Edinburgh T.C.—The question of paving Cambridge-street with wood has been referred to the Streets and Buildings Committee for report.

Fareham R.D.C.—For main road improvement the Road Board have sanctioned a grant of £505, together with a loan of £3,000 free of interest.

Felixstowe U.D.C.—The council have agreed in principle to the construction by Mr. E. G. Pretyman of a new road between Walton and Falkenham, including a ferro-concrete bridge to span King's Fleet. The road would measure about 1,565 yds. in length, and would lead from the road near Hill House and Gulpher Farm to the road adjoining Deben Lodge premises, Falkenham. The width of the road would be 17 ft., except across the bridge, where it would be 16 ft. wide. Before agreeing to be responsible for the future maintenance of the road, the council are urging that the proposed width should be increased.

Greenock T.C.—The Road Board have given their approval to a revised scheme for works in Clyde-street and Sinclair-street, which are estimated to cost £2,500.

Isle of Wight R.D.C.—It has been agreed to accept the tenders of Messrs. Somerfeld & Lang, Limited, for 5,000 tons of basalt, and that of the Road Maintenance and Stone Supply Company, Limited, for 5,000 tons of quartzite, provided grants are obtained from the Road Board towards the cost.

Islington B.C.—Towards a scheme of road construction, estimated to cost £30,597, the Road Board have promised a grant of £10,000.

Kendal T.C.—An estimate of £2,783 for works of street improvement has been approved.

Langholm T.C.—It has been agreed to purchase the necessary property for the widening of High-street.

Newport (Mon.) T.C.—It is proposed to repair certain sections of wood paving, at an estimated cost of £1,800.

Preston R.D.C.—The council have accepted the tender of Messrs. R. S. Clare & Co. for a supply of Tareo for surface-dressing the roads.

Runcorn U.D.C.—The scheme for the completion of Sandy-lane is to be carried out, at an estimated cost of £800.

Swansea T.C.—The Highways Sub-Committee have agreed to take over Eversley-road, and make it up with tar-macadam, at the expense of the owners.

Wallsend T.C.—The borough surveyor, Mr. G. Hollings, has prepared the plan of a new road from King's-road to the Rising Sun Colliery, the estimated cost of which is £1,709.

Westhampnett R.D.C.—In reply to a councillor who asked a question with respect to the cost of road tarring, the clerk stated that two years ago the council had a considerable stretch of road tarred by contract at 2d. per square yard. The district surveyors, in accordance with the request of the Highways Committee, had submitted statements of tarring done by the council's own labour, and the cost worked out at practically 2d. per square yard.

SEWERAGE AND SEWAGE DISPOSAL.

Airdrie T.C.—Messrs. Wylie & Son, Glasgow, who were awarded first premium in the competition for the sewage disposal scheme, have been appointed engineers to carry out the work.

Irlam U.D.C.—The council have instructed the surveyor, Mr. R. H. Winterbottom, to prepare a scheme for more efficient sewage disposal.

Llandyssul R.D.C.—The sanitary surveyor, Mr. C. L. Evans, has received instructions to prepare a plan and estimate of the cost of a sewerage scheme.

Watford R.D.C.—A scheme has been approved for sewage disposal works at Radlett, the estimated cost of which is £11,000.

WATER, GAS, AND ELECTRICITY.

Burnley T.C.—Coke-breaking and screening machinery is to be installed at the gasworks, at an estimated cost of £600.

Burton-on-Trent T.C.—Extensions of the electric lighting system are to be carried out at an estimated cost of £7,000.

Cheltenham T.C.—The Water Committee propose to carry out a water main extension to Hester's Way.

Crediton R.D.C.—The Local Government Board have sanctioned the purchase by the council of Zeal Monachorum water supply.

Dover T.C.—It is proposed to instal 239 electric lamps in the place of gas lamps, at an estimated cost of £1,600.

Dumbarton C.C.—A water supply scheme which has been prepared for Clynder has been submitted to a sub-committee already appointed in connection with the matter.

Langholm T.C.—The council last week resolved to borrow an additional £1,000 (making a total of £7,000) to meet the cost of increased water supply. It was referred to the Lighting Committee to bring up a report on the question of improving the lighting of the burgh by extending public lamps to the burgh boundary south of Land's End, and as to extending the hour of lighting to 11 p.m. The question of establishing electricity works has been referred to a committee for consideration and report.

Londonderry T.C.—A letter has been received from the Local Government Board stating that they had received the report of their chief engineering inspector, Mr. P. C. Cowan, on the inquiry into the petition of the corporation for a Provisional Order to enable them to put in force the powers of the Land Clauses Act for the purpose of taking, otherwise than by agreement, certain lands at Burn Gibbagh, required for the purpose of an auxiliary water supply for the city. The board were satisfied that the evidence given at the inquiry did not show that the scheme proposed by the corporation was of a proper kind. It was clear that an urgent need existed for obtaining a pure and adequate supply of water which would meet the city's requirements at all seasons, and the anticipated increase in population must also be taken into account. The board, therefore, did not consider that it was in the interests of the ratepayers to sanction a makeshift scheme such as that contemplated, and they were not prepared to grant a Provisional Order in accordance with the prayer of the corporation. They trusted that the corporation would now press forward a comprehensive scheme for the permanent improvement of the water supply.

Longtown R.D.C.—Messrs. Taylor & Wallin recently presented a scheme for supplying portions of the parishes of Hethersgill and Stapleton with

water, the estimate being about £3,500. The council have now instructed Messrs. Taylor & Wallin to extend the scheme, and report fully upon supplying the north-eastern, eastern, and south-eastern portions of the rural district. By this extended scheme eleven parishes are under consideration, the scheme necessitating probably something like 30 or 40 miles of water mains.

Malvern U.D.C.—A proposal to put down additional plant at the electricity works, at an estimated cost of £1,500, has been agreed to.

Motherwell T.C.—The price of the Motherwell Gas Company, which the council propose to purchase, has been fixed by the arbitrator at £135,987, which is equivalent to about £2 8s. per share.

Ruthin T.C.—The Board of Trade have granted a Provisional Order for an installation of electric light in the borough.

Stafford T.C.—The necessary authority has been given for gasworks extensions, and land for the purpose is to be purchased at a cost of £1,050.

Tendring R.D.C.—Works of water supply for St. Osyth are to be carried out, at an estimated cost of £1,500.

Tiverton T.C.—A proposal has been submitted by the Streets Committee for water supply works which are estimated to cost £155.

Torquay T.C.—The council have adopted the scheme of the borough electrical engineer, Mr. C. W. Salt, for the extension of the boiler-house at the electricity works, at a cost of £1,440, the erection of a new engine room, at a cost of £9,517, and the erection of a new switch-control chamber, at a cost of £1,765, making a total cost of £15,722.

MISCELLANEOUS.

Ayr T.C.—The council have adopted a proposition that the minimum wage for men in the cleansing department be 25s. per week, with 2s. additional for Sunday labour.

Hove T.C.—A resolution has been adopted allowing the borough surveyor, Mr. H. H. Scott, an increase of £10 a month for office assistance. The Works Committee, from whom the recommendation emanated, reported that they had no difficulty in arriving at the decision because they knew a great deal of work had been piled on the borough surveyor's office during the last ten years.

Surbiton U.D.C.—Sanction has been received for laying out a cemetery near the sewage disposal works, at an estimated cost of £1,583.

PERSONAL.

Mr. David Hill, of Ruddersfield, has been appointed surveyor to the Golear Urban District Council.

Mr. E. Prest, of Norton, Malton, has been appointed surveyor to the Knaresborough Urban District Council.

Mr. H. E. Tresidder, Falmouth, has been appointed borough engineer of Falmouth, at a salary of £150 rising to £200.

Mr. W. A. Burton has resigned his position as engineer to the Diss municipal waterworks, having obtained an appointment in West Africa.

Mr. Percival T. Harrison, borough surveyor of Chelmsford, has received an advance of salary to £380 (not £360 as previously stated), rising to £400 a year.

Mr. Wheatley, building surveyor to the Southport Corporation, has had his salary raised from £200 to a maximum of £225, by two annual increments of £10 and one of £5.

Mr. Wm. B. Bryan, chief engineer to the Metropolitan Water Board, will take the chair on Monday evening next at the meeting of the Institute of Sanitary Engineers, at which Mr. E. A. Lees, A.I.N.S.T.C.E., will read a paper on the subject of the Birmingham waterworks.

Mr. C. H. Godfrey, municipal engineer, Shanghai, has been transferred from the class of associate-member to that of member of the Institution of Civil Engineers. Messrs. A. D. Anderson, engineer's department, Water Office, Belfast; R. H. Couzens, city engineer's office, York; S. Hall, water engineer's

office, Aberdeen; and J. B. Thomson, public offices, Southall, have been elected associate-members of the same body.

Mr. William Bell, Highland District road surveyor for Perth County Council, died on Tuesday at Aberfeldy, we regret to learn. Mr. Bell, who was in his fifty-seventh year, went to Aberfeldy in 1879, being the first surveyor appointed in the Highland district under the Roads and Bridges Act of 1879. For the past thirty-five years Mr. Bell had discharged his duties with an ability which was readily recognised and admitted. Ever since Aberfeldy became a burgh Mr. Bell had acted as its burgh surveyor.

FOR OTHER ADVERTISEMENTS

See End of Paper.

BARNET URBAN DISTRICT COUNCIL.

TO CONTRACTORS.

PRIVATE STREET WORKS ACT, 1892.

The Council invite Tenders for the Making up, under the above Act, of the Private Streets within their District known as Byng-road and Wentworth-road.

Plans and Specification can be seen, and all information, with Form of Tender, obtained, on application to the Surveyor to the Council, at his office, No. 40 High-street, Barnet, on any day during office hours.

Tenders, on official forms only, sealed and endorsed "Tender for Roads," must be addressed to me, and delivered at the Council Offices, No. 40 High-street, Barnet, not later than noon on Tuesday, May 5th, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

H. W. POOLE,

Clerk of the Council.

April 14, 1914.

(1,529)

TO CONTRACTORS.

The Wandsworth Borough Council is prepared to receive Tenders for the construction of drainage works at Streatham Cemetery, Carratlane, Tooting, S.W.

Form of Contract, Specification and Drawings, may be seen, and Form of Tender obtained, at the office of the Borough Engineer, Mr. P. Dodd, A.I.N.S.T.C.E., 215 Balham High-road, S.W., between the hours of 10 and 4 (Saturdays 10 till 1).

Contractors will be required, in the case of all workmen employed by them in and about the execution of the Contract, to pay wages at not less, and observe hours of labour not greater than, the rates and hours recognised by the Associations of Employers and Employees, and in practice obtained in the district where the work is to be executed, and to pay to all workmen a wage of not less than 4s. 6d. per day.

Tenders, sealed and endorsed "Drainage Works, Streatham Cemetery," must be delivered at the Council House, East-hill, Wandsworth, S.W., and may be placed by the person tendering in a box provided for the purpose, not later than 12 o'clock noon on Thursday, 30th April.

The Council does not bind itself to accept the lowest or any Tender.

D. A. NICHOLL,

Town Clerk.

Council House,
Wandsworth, S.W.

April 15, 1914.

(1,530)

WELTON RURAL DISTRICT COUNCIL.

HIRE OF STEAM ROLLER.

The above Council invite Tenders for the Hire of a 12½-ton Steam Roller with Scarifier fitted. The approximate number of days' rolling required is 250 per annum, and the Tenders should include quotations for either one or two years.

The Tenders to include wages of driver, fuel, oil, &c., and also the use of a water cart.

Tenders to be sent to me on or before the 30th day of April instant.

W. B. DANBY,

Clerk.

2 Bank-street, Lincoln.
April 15, 1914.

(1,524)

CORPORATION OF MADRAS.

SPECIAL WORKS DEPARTMENT.

CONTRACT M & M No. 22.

The Corporation of Madras is prepared to receive tenders from competent persons willing to enter into a contract for the supply and delivery of Cast iron Pipes, Special Castings, Sluice Valves, Hydrants, &c. The total weight of the pipes and special castings is about 11,500 tons, the sizes varying from 2½ in. to 12 in. (2,300 tons being 4 in.).

The Specification, Bills of Quantities and Form of Tender, prepared by J. W. Madeley, Esq., M.A., M.INST.C.E., M.A.M.SOC.C.E.E., Special Engineer to the Corporation of Madras, may be obtained from the undersigned, Agents to the Corporation, on payment of 10 (Ten) shillings, which will not be returned.

Tenders, accompanied by a deposit in currency notes or a draft on a Madras Bank of Rs.500, should be sent direct to the President, Corporation of Madras, so as to reach him at or before 12 noon on the 17th day of June, 1914.

The Corporation does not bind itself to accept the lowest or any Tender.

Early application for particulars is desirable, as only a limited number will be given out.

JAMES MANSERGH & SONS,
Agents to the Corporation.

5 Victoria-street,
Westminster.
April 15, 1914. (1,525)

BOROUGH OF KENDAL.

EXTENSIONS TO SEWAGE DISPOSAL WORKS.

CONTRACT No. 3.

The Corporation invite Tenders, in whole or part, for the undermentioned Ironwork in connection with the above:—

100-ft. diameter Sprinklers, Floating Arms, Decanting and Sludge Valves, Penstocks, Sluices, Cast-iron Pipes, Specials, &c.

Plans may be seen and particulars obtained on application at the office of the undersigned on and after Monday, the 20th instant.

Tenders to be delivered on or before Friday, the 8th May, 1914, endorsed "Tender for Ironwork, Sewage Disposal Works."

The Corporation do not bind themselves to accept the lowest or any Tender.

(By order)
F. W. OXBERRY,
Borough Surveyor.

Town Hall, Kendal.
April 15, 1914. (1,526)

ALDERSHOT COUNCIL.

TO GRANITE MERCHANTS, &c.

Tenders are invited by the above-named Council for supplying, i.o.r. Aldershot Town Station, the undermentioned materials:—

700 tons (more or less) 2½-in. Basalt.
200 tons " " Slag Tar-macadam.
130 tons " " 3-in. and 1½-in. Limestone
Tar-paving.
1,750 yds. " " 2½-in. Hungry Hill Flints.

Forms of Tender may be obtained on application at the office of Mr. Fred. C. Uren, the Surveyor to the Council.

Tenders, endorsed "Basalt," "Tar-macadam," &c., as the case may be, to be sent to the undersigned not later than 5 p.m. on Tuesday, the 5th May proximo.

The Council do not bind themselves to accept the lowest or any Tender.

(By order of the Council)
W. E. FOSTER,
Clerk.

Municipal Buildings,
Aldershot.
April 15, 1914. (1,527)

SURVEYOR'S ASSISTANT (21). 3 years Articles, desires appointment in Municipal Office, or Contractor executing Municipal Contracts. Experience levelling, surveying, draughtsmanship, building construction, architectural drawing, street works, waterworks. Excellent testimonials. Moderate salary. Free immediately.—Box 1,412, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,528)

NEATH'S NEW WATER SUPPLY.

DETAILS OF WORKS.

The extensive new waterworks which the Neath Rural District Council have constructed at Ystradfellte, Breconshire, and which have taken seven years to complete, were opened recently. The works, the *South Wales Daily News* states, are situated among the Breconshire mountains, 3 miles above the village of Ystradfellte and 8 miles from Hirwain. The district is 2,000 ft. above the level of the sea. The council, in 1902, secured Parliamentary powers to borrow £150,000 to carry out the works, and the site at Ystradfellte was secured. The contract for the construction of the reservoir was let to Messrs. Morrison & Mason, Glasgow, and the works were commenced in the summer of 1907. Before proceeding with the work the contractors were compelled to construct a concrete tunnel under a portion of the Dringarth Mountain, so as to divert the river. Later the council were compelled to seek further Parliamentary powers, on two occasions, to carry out the work, and the total cost of the works now amounts to £275,000.

A dam, 1,056 ft. long, has been constructed from mountain to mountain. The reservoir, which has admirable gathering ground and a watershed of 20,000 acres, has a storage capacity of 700,000,000 gallons of water. It will supply the whole of the Neath District Council's area, which includes the Neath district, Skewen, Aberdulais, Baglan, the Dulais and Neath Valleys, Cwmavon, Aberavon, and Briton Ferry. It is estimated that the Neath District Council will derive a revenue of £6,500 a year from the scheme, and this amount will more than provide for the repayment of capital and interest, while it is stated that within ten years the works will secure a handsome sum to the relief of the rates of the district.

The work was carried out under the direction of Mr. D. M. Davies, the engineer to the district council, while the work at the reservoir was under the supervision of Mr. E. H. Hill, London, with Mr. W. S. Beecher as resident engineer.

The Cost of Motor-car Hire.—The borough surveyor of Great Yarmouth, Mr. J. W. Cockrill, has reported that hiring a car worked out at 8d. to 9d. per mile, while the total cost of running his car during the past six months had been between 3d. and 4d. a mile. A new car is, therefore, to be purchased.

ASSOCIATION OF SOMERSET SURVEYORS.

President—Mr. W. ALEX. COLLINS, Surveyor to the Bridgwater Rural District Council.

A meeting of the above association will be held in the vestry-room at Street, on the 25th inst. Previous to the meeting the members are to lunch at the Bear Hotel, by the kind invitation of the chairman and members of the Street Urban District Council. Mr. A. W. Stacey, J.P., will preside.

PROGRAMME.

- 1.15 p.m.—Lunch at the Bear Hotel.
- 2.15 p.m.—Inspection of the new houses recently erected by the council under the Housing and Town Planning Act.
- 3.15 p.m.—Meeting at the vestry-room and discussion on a paper on the "Financial and other Aspects of Housing," by Mr. W. H. Consins, F.A.S.I., surveyor to the Street Urban District Council.
- 4 p.m.—Tea at the Bear Hotel, by the kind invitation of the president (Mr. W. Alex. Collins).

A motor char-à-banc may be hired from Bridgwater to Street, providing an interesting drive over the Polden Hills, for £2 5s. If only fifteen members would join in this means of travelling the price per head would be 3s. return, and the return journey made at a time to suit the convenience of all the members.

D. EDWARDS, ASSOC. M.INST.C.E.,
Hon. Secretary.

Taunton.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKERILL, M.INST.C.E., & R.I.B.A.,
Borough Surveyor, Great Yarmouth.

EASTERN DISTRICT.

A meeting of the Eastern District is to be held at Chelmsford to-morrow (Saturday).

PROGRAMME.

- 11 a.m. Meet at the Chelmsford Railway Station, and proceed either (a) to the Marconi wireless telegraphy works, by kind permission of the directors. Inspection will be made of the whole of these works, which are quite new and up-to-date, and the manufacture, testing, and assembling of the apparatus used in connection with wireless telegraph installations may be seen; or (b) to the engineering works of Messrs. The Hoffmann Manufacturing Company, Limited, by kind permission of the directors. Inspection of the manufacture of steel balls, rollers and bearings of all sizes, including the cutting off and converting of the raw material, turning, hardening, grinding and assembling of the parts. The plant inspection includes centrifugal oil separating installation and engines totalling over 2,000-horse power, including a 1,000-horse power Diesel engine just completed.
- 12.30 p.m.—Inspect corporation open-air swimming bath.
- 1 p.m.—Lunch at the Shire Hall, by kind invitation of the Worshipful the Mayor, Alderman G. W. Taylor, J.P.
- 2.15 p.m.—District business.
Paper by Mr. Percival T. Harrison, ASSOC.M.INST.C.E., borough engineer, entitled "Description of Municipal Works in Chelmsford." Discussion.
- 3.30 p.m.—Inspection of houses in course of erection under the Housing of the Working Classes Act.
- 4.15 p.m.—Inspection of new suction gas plant at Midday Yard waterworks.
- 4.50 p.m.—Inspection of new stables and depot.
- 5 p.m.—Tea at the Shire Hall, by kind invitation of Mr. P. T. Harrison.

J. A. WEBB, H. T. WAKELAM,
Hon. District Secretary. *District Chairman,*
Surveyor's Office, County Engineer,
Hendon, Great Stanmore. Middlesex.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District is to be held at Sheffield on May 2nd.

DOVER MEETING.

A meeting of the institution is to be held in the South-Eastern District at Dover on May 9th.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury on May 16th.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Edinburgh on Saturday, June 13th.

COUNCIL MEETING.

Council meetings have been arranged for the following dates: April 25th, May 23rd, June 24th.

ANNUAL MEETING.

A town planning, housing and road conference and the forty-first annual general meeting are to be held at Cheltenham from June 24th-27th.

The following is a preliminary list of the papers to be read and discussed at the conference:—

- (1) "Town Planning Large Areas," by Mr. W. A. Clarry, borough surveyor, and Mr. R. A. Reay-Nadin, town clerk, Sutton Coldfield.

- (2) "The Housing, Town Planning, &c., Act, 1909 (Part 2) as Applied to Commercial and Industrial Districts," by Mr. J. C. Midgley, deputy city surveyor, Newcastle-upon-Tyne.
- (3) "Town Planning and Architectural Issues," by Prof. S. D. Ashhead, Liverpool University.
- (4) "The Abnormal Development of Coventry and some of its Town Planning and Housing Problems," by Mr. J. E. Swindlehurst, city engineer, Coventry.
- (5) "Town Planning Amended Procedure Regulations," by Mr. H. E. Stilgoe, city engineer, Birmingham.
- (6) "Town Planning Procedure," by Mr. Fred. W. Pearce, engineer to the Twickenham Urban District Council.
- (7) "Town Planning Practice in America," by Mr. C. M. Robinson, Rochester, N.Y.
- (8) "Some Notes on Highway Law as Affecting the Municipal Engineer," by Mr. S. G. Turner, Barrister-at-Law, London.
- (9) "The Training of the Highway Engineer of the Future," by Mr. H. Percy Boulnois, London.
- (10) "The Control, Management and Maintenance of Roads," by Mr. J. Fred. Hawkins, county surveyor, Berkshire.
- (11) "The Prevention of Sub-Crust Movement in Roads," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.
- (12) "The Economics of Modern Methods of Road Construction," by Mr. Francis Wood, borough engineer, Fulham.
- (13) "Some Notes on Grouting and Penetrating Methods of Road Surfaces," by Mr. Geo. Green, borough engineer, Wolverhampton.
- (14) "The Organisation of a Municipal Engineer's Department," by Mr. E. Willis, surveyor to the Chiswick Urban District Council.
- (15) "The City of Worcester Sewage Disposal Works," by Mr. T. Cank, city engineer, Worcester.
- (16) "Notes on the Protection of the Foundations of Chepstow Bridge over the river Wye in Ferro-Concrete," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.

The conference will be opened on Wednesday afternoon June 24th (when the delegates will be welcomed by the Mayor and Corporation of Cheltenham), and continued during the two following days. Visits will be made on Thursday afternoon, June 25th, and Saturday morning, June 27th, to the corporation new sewage purification works, waterworks, destructor, concrete slab factory, &c.

An important exhibition of plans, maps and models of town planning and housing schemes, &c., will be held during the four days of the meeting. A large number of local authorities, engineers, architects, and others interested in the town planning and housing movement, both in this country and abroad, have kindly undertaken to forward exhibits, and it is believed that the collection will be one of great educational and practical value.

PROGRAMME.

- Wednesday, June 24th (Morning).—General business of the institution.
Presidential address and presentation of premiums.
Afternoon. Conference—Town planning and housing; conference—Roads, &c.
Evening.—Exhibition of town planning and housing schemes, &c.
- Thursday, June 25th (Morning). Conference—Town planning and housing; conference—Roads, &c.
Luncheon given by mayor to members of the institution and delegates.
Afternoon. Drive to inspect planned areas of town. Visit to refuse destructor, concrete slab factory and new sewage purification works.
Evening.—Annual dinner.
- Friday, June 26th (Morning).—Conference—Town planning and housing; conference—Roads, &c.
Afternoon.—Conference—Town planning and housing; conference—Roads, &c.
Evening.—Open-air concert—Montpellier Gardens.
- Saturday, June 27th (Morning). Visit to corporation waterworks at Tewkesbury, &c.

THOMAS COLE,
Secretary.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held at Darlington to-morrow (Saturday), Hexham on Saturday, May 2nd, Cumberland in June, Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Hull on Saturday, May 16th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

The programme of the Northern District meeting to be held at Darlington to-morrow is as follows:—

11 a.m.—Meet at Bank Top Station.

11.20 a.m.—Special tramcar leaves Parkgate Station entrance for the Forge and Darlington Corporation gasworks.

Light refreshments provided by the Slag and Tar-macadam Company, Limited.

2 p.m.—Visit to view the North-Eastern Railway Company's new offices, Brinkburn-road, and their new boiler shops.

4 p.m.—Short business meeting at the hon. secretary's office, Crown-street.

5 p.m.—Dinner at Boot and Shoe Hotel (2s. 6d. per head).

JOHN ROBINSON,
Hon. District Secretary

Darlington.

GENERAL MEETINGS.

A meeting in conjunction with the Society of Engineers will be held at the Institution of Electrical Engineers, Victoria-embankment, W.C., on Monday, May 11th, at 7.30, for the purpose of discussing a paper—"The Greater New York Water Supply Scheme," by Wm. T. Taylor, Fellow A.M.I.E.E., M.A.M.S.O.C.M.E.E., F.R.G.S., and a member of the Institution of Municipal Engineers. Full programme will be issued later.

A general meeting will be held at Birmingham in May, when a visit will be paid to the works of the General Electric Company.

COUNCIL MEETING.

A council meeting will be held in London on Wednesday, April 29th.

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Finedon and Kettering on Thursday, May 7th, when a visit will be paid to the works of the Excelsior Stone Company at Finedon, and certain municipal works inspected at Kettering.

PROGRAMME.

12.20 a.m.—Meet at the works of the Excelsior Stone Company at Finedon, and inspect the manufacture of patent stone slabs, kerbs, channels, architectural dressings, &c.

Proceed thence by motor bus to Kettering for lunch at the Royal Hotel, at the kind invitation of the Excelsior Patent Stone Company, when a short paper will be read by Mr. W. B. Mortimer, managing director of the firm.

An inspection will afterwards be made of works in Excelsior stone at Kingsley-avenue, the new Co-operative Clothing factory, and the county police station.

G. BELSON CULVERS,
Hon. District Secretary.

Council Offices,
Oundle.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

B. WYAND,
Secretary.
39 Victoria-street, S.W.

INSTITUTION OF MECHANICAL ENGINEERS.

PARIS MEETING: PROVISIONAL OUTLINE PROGRAMME.

The Summer meeting of the Institution of Mechanical Engineers will be held in Paris, and will begin on Monday, July 6th. The following outline programme (which is subject to revision) has been drawn up:—

Monday, July 6th.—Arrival in Paris.

Tuesday, July 7th (Morning).—Reading and discussion of papers in the theatre of the Société des Ingénieurs Civils. Luncheon.

Afternoon.—Visits to engineering works and places of interest in Paris.

Evening.—Institution dinner.

Wednesday, July 8th (Morning).—Reading and discussion of papers in the theatre of the Société des Ingénieurs Civils. Luncheon.

Afternoon.—Visits to engineering works and places of interest in and around Paris.

Evening.—Conversation, by kind permission of the Société des Ingénieurs Civils.

Thursday, July 9th.—Visits in or from Paris.

Evening proceed to Lille.

Friday, July 10th.—Visit locomotive, steel and textile works in Lille, Roubaix, Valenciennes, &c., returning to Paris in the evening, if desired. It is intended to arrange for visits to works in Le Havre, and a visit might be made after the meeting to the International Exhibition at Lyon.

EDGAR WORTHINGTON,
Secretary.

SEA-COAST EROSION.—For a very complete and expensive library on the cause, prevention and repair of coast erosion the following three works are recommended: "Coast Erosion and Foreshore Protection," by John S. Owens, M.D., Assoc.M.Inst.C.E., F.R.C.S., and Gerald O. Case (price 7s. 6d., post free 7s. 10d.), with numerous illustrations and diagrams; "Sea-Coast Erosion and Remedial Works," by R. C. Allanson-Winn, M.Inst.C.E.I. (price 1s., post free 1s. 1d.); and "Erosion of the Coast and its Prevention," by F. W. S. Stanton, Assoc.M.Inst.C.E., F.S.I. (price 3s., post free 3s. 2d.), with numerous maps and other illustrations. The publishers are the St. Bride's Press, Limited, 24 Bride-lane, Fleet-street, London, E.C.

APPOINTMENTS VACANT.

Roads.

HALFAX.—April 18th.—For the execution of street works, for the corporation.—Mr. J. Lord, borough engineer.

BEDWELLY.—April 18th.—For the construction of an access road, for the urban district council.—Mr. D. H. Price, surveyor, Aberbargoed.

BATTERSEA.—April 18th.—For the supply of materials and works for resurfacing roadways with asphalt macadam, for the borough council.—Mr. W. Marcus Wilkins, town clerk.

RUSKINGTON. April 18th.—For the supply of granite, slag, and ironstone, for the urban district council.—Mr. E. H. Godson, clerk.

ROTHERHAM. April 18th.—For the supply of broken granite, broken slag, Portland cement, tarred slag, tarred limestone, concrete flags, gritstone setts and kerbs, for the corporation.—Mr. E. B. Martin, borough engineer.

GLASGOW. April 20th.—For paving works in certain streets, for the corporation.—Office of Public Works, 64 Cochrane-street.

HADLEIGH.—April 20th.—For the supply of Guernsey or Quenast granite, for the urban district council.—Mr. H. W. F. Grimwade, clerk.

WADEBRIDGE.—April 20th.—For widening main road and other works, for the urban district council.—Mr. R. W. Burr, surveyor.

EAST PRESTON.—April 20th.—For the supply of granite and flints, for the rural district council.—Mr. A. Shelley, clerk, Littlehampton.

WILLESDEN.—April 21st.—For road making and paving, for the urban district council.—Mr. O. C. Robson, engineer.

RAWMARSH.—April 21st.—For making up a certain street, for the urban district council.—Mr. J. A. Tonge, engineer and surveyor.

SALFORD.—April 21st.—For paving, flagging and sewerage, for the corporation.—Borough Engineer.

LONDON.—April 21st.—For paving works in certain streets, for the City Corporation.—Engineer to the Corporation, Guildhall, E.C.

MERE.—April 22nd.—For the supply of Mendip stone, for the rural district council.—Mr. J. McKenzie, district surveyor.

WOODHALL SPA.—April 22nd.—For the supply of granite, granite chippings and slag chippings, for the urban district council.—Mr. E. E. T. Bolton, surveyor.

NEWPORT (Mon.).—April 22nd.—For the execution of private street works, for the corporation.—Borough Engineer.

HERTS.—April 22nd.—For laying about 1,000 yds. of kerbing, for the county council.—Mr. Urban A. Smith, county surveyor, Hatfield.

DURHAM. April 23rd.—For tar-grouted whinstone surfacing work, for the county council.—Mr. J. T. Pegge, city surveyor, Durham.

NELSON. April 23rd.—For the execution of private street works, for the corporation.—Mr. W. Shackleton, borough engineer and surveyor.

LUTON.—April 23rd.—For private street works, for the corporation.—Borough Engineer.

GLOUCESTER.—April 23rd.—For the supply of stone and hauling, for the rural district council.—Mr. F. E. Weaver, district surveyor.

MIDDLEWICH.—April 24th.—For the supply of road materials, paving, steam rolling, and team labour, for the urban district council.—The Surveyor.

AIRDRIE.—April 24th.—For the supply of road metal, kerb and channel work, granolithic paving, and curbing, for the corporation.—Mr. H. Inglis, burgh surveyor.

ALTON.—April 25th.—For the supply of broken granite and steam rolling, for the rural district council.—Mr. C. W. Maudsley, surveyor.

FAIRSWORTH.—April 25th.—For laying asphalt at cemetery, for the urban district council.—Mr. W. M. Shummin, engineer and surveyor.

YORK.—April 27th.—For excavating existing material of roadway, and laying concrete foundation and tar-macadam surface on about 1½ miles of main road, for the corporation.—Mr. F. W. Spurr, city engineer.

BLAENAVON.—April 27th.—For the supply of 850 tons of broken limestone and 150 tons of limestone gravel, for the urban district council.—Mr. E. W. Edwards, surveyor.

FARNBOROUGH.—April 27th.—For the supply of broken granite, slag, or granite tar-macadam, for the urban district council.—Mr. J. E. Hargreaves, surveyor.

FINSBURY.—April 27th.—For paving work with creosoted deal on Portland cement concrete, for the borough council.—Borough Surveyor.

EAST SUSSEX.—April 27th.—For the widening, improvement, and reconstruction of the Lewes-Newhaven road, for the county council.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

BELFAST. April 29th.—For the supply of 280 tons of setts, for the Harbour Commissioners.—Mr. W. R. Kelly, harbour engineer.

ARGYLE.—April 30th.—For road maintenance, for the county council.—Mr. J. Thomson, surveyor, Strontian.

WHITWORTH (Lanes).—May 4th.—For paving various lengths of main road, for the urban district council.—District Surveyor.

MADRAS.—May 4th.—For the supply of 400 40-gallon casks of tar, for the corporation. A copy of specification and conditions may be obtained at the office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C.

ENFIELD.—May 6th.—For the supply of 780 yds. of granite kerbing, 780 yds. of granite channelling, and 4,100 yds. of artificial stone paving, for the urban district council.—Mr. Richard Collins, surveyor.

ST. MELONS.—May 12th.—For widening and improving part of Lighthouse-road, for the rural district council.—Mr. Gomer S. Morgan, engineer, Pontypridd.

Sanitary.

RADCLIFFE. April 18th.—For the construction of bacteria beds and other works, for the urban district council.—Mr. W. L. Rothwell, engineer.

GOOLE.—April 20th.—For the construction of branch sewers and connections, consisting of about 6 miles of stoneware pipe sewers, with manholes and other appurtenances, for the urban district council.—Mr. Robert Tyson, clerk.

STONE.—April 20th.—For the construction of sewers, manholes, pumping station, and rising main, for the rural district council.—Mr. H. W. Makepeace, engineer, Leek-road, Stoke-on-Trent.

WESTPORT.—April 20th.—For the construction of an outfall sewer, for the urban district council.—Mr. T. H. McCarthy, engineer, 39 Westmoreland-street, Dublin.

KEIGHLEY.—April 20th.—For the construction of a pot pipe drain, for the rural district council.—Mr. T. Burton, engineer and inspector.

BRADFIELD.—April 20th.—For the collection and disposal of house refuse, for the rural district council.—Mr. C. West, junr., clerk, Pangbourne, Berks.

MANCHESTER.—April 20th.—For main drainage work, for the corporation.—The Town Clerk.

BRIGHTON.—April 21st.—For the supply of glazed drain pipes, for the corporation.—Borough Surveyor.

AXMINSTER.—April 21st.—For relaying a sewer, for the rural district council.—Mr. Cecil Forward, clerk.

BEESTON.—April 21st.—For closet conversion, for the urban district council.—The Surveyor.

COSELEY.—April 21st.—For the construction of earthenware pipe sewers, for the urban district council.—The Surveyor.

STOCKPORT.—April 23rd.—For excavating and sewerage, for the corporation.—Mr. J. Atkinson, borough surveyor.

DARLINGTON.—April 24th.—For the erection of a foul main at the gasworks, for the corporation.—Mr. F. T. Tarratt, gasworks engineer.

WIGAN.—April 25th.—For the supply of 1,000 galvanised sanitary pans, for the corporation.—Mr. W. H. Tyrer, town clerk.

CHERTSEY.—April 27th.—For the extension of the Byfleet sewerage works, comprising 643 yds. of 9-in. and 7-in. Hassall's stoneware pipes, with manholes and appurtenances, also ejector chamber, and laying 1,420 yds. of 2½-in. cast-iron compressed-air main, and 194 yds. of 5-in. cast-iron pumping main, for the rural district council.—Messrs. Elliott & Brown, engineers, Burton Buildings, Parliament-street, Nottingham.

CHERITON.—April 27th.—For the collection and removal of house refuse, for the urban district council.—Mr. A. Atkinson, clerk.

HINDLEY.—April 27th.—For the construction of eight circular percolating filters, for the urban district council.—Mr. O. P. Abbott, surveyor.

CHEPPING WYCOMBE.—April 28th.—For the supply and erection of steam engines, air compressors, air lifts, ejectors, and all necessary appurtenances in the extension of the sewage outfall works at Wycombe Marsh, for the corporation.—Mr. T. J. Rushbrooke, borough engineer and surveyor.

LISKEARD.—April 30th.—For the construction of a drainage scheme, for the rural district council.—Mr. B. C. Andrew, engineer, St. Austell.

KENT.—May 1st.—For the construction of a septic tank and incidental drainage work, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

GOOLE.—May 4th.—For the construction of drainage works, for the Joint Hospital Board.—Messrs. Chambers & Son, Belgravia, Goole.

FEATHERSTONE.—May 5th.—For the construction of sewerage and other works.—Mr. S. Chesney, engineer.

Stores.

SUTTON (Surrey).—April 22nd.—For the supply of road materials, ironmongery, oils, paints, coal, coke, horse forage, and team labour, for the urban district council.—Mr. W. Hedley Grieves, surveyor.

INVERNESS.—April 20th.—For supplies for the Gas Commissioners.—Manager to the Gasworks.

TEES VALLEY.—For the supply of road and valve boxes, brass castings, taps, ferrules, and general stores, for the Water Board.—Mr. Hugh Wilson, clerk.

Miscellaneous.

BRIGHTON.—April 21st.—For the supply of Portland cement, for the corporation.—Borough Surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance. ‡ Provisionally accepted.

BLEAN.—The following tenders have been accepted by the rural district council:—

Road Materials.—Blean, Finn & Co., gravel, fine gravel, fine chalk, Chislet East, A. A. Baldoek, fine chalk, Chislet West, Finn & Co., gravel; Larkin, fine gravel, Herne East, A. A. Baldoek, fine chalk; Finn & Co., chalk flints. Herne West, A. A. Baldoek, gravel; L. Baldoek, fine gravel; A. A. Baldoek, fine chalk; Finn & Co., chalk flints. Hoath, A. A. Baldoek, fine chalk. Reculver, A. A. Baldoek, fine chalk. St. Stephens, Finn & Co., gravel, fine gravel, chalk flints; L. Baldoek, fine chalk. St. Dunstan's Without, Finn & Co., gravel and fine gravel. Sturry, L. T. Ashenden, gravel and fine gravel; L. Baldoek, fine chalk. Swalecliffe, Finn & Co., dug flints and fine gravel. Westbere, Homersham Brothers, gravel; L. T. Ashenden, fine gravel; L. Baldoek, fine chalk. Whitstable-cum-Seasalter, E. Colthup, dug flints and fine chalk; Finn & Co., fine gravel.

Team Labour.—Section 1, H. Goodsell; section 2, Terry Brothers; section 3, G. Taylor; section 4, A. Price.

Steam Rolling.—Sections 1 and 2, A. A. Baldoek; sections 3 and 4, Finn & Co.

EAST STEYNING.—For the execution of street works, for the rural district council.—Mr. G. W. Warr, surveyor:—
G. Burstow, Brighton £965
H. Farrow, Brixton 943
Parsons & Sons, Hove 918
A. Pearce, Forest Hill 914
McKellar, Westernman, Hove 875

HAYFIELD.—Accepted for works of sewerage, for the rural district council.—Messrs. John Newton, Son & Bayley, engineers, Manchester:—
T. Winter, Hayfield, £924.

NORTH BRONGROVE.—For the supply and erection of three sets of gas engines, and three throw pumps, capable of lifting in the aggregate 20,000 gallons per hour, for the urban district council.—Mr. R. Green, Birmingham:—
G. R. Mather & Son, Wellingtonborough £2,196
Crossley Brothers, Manchester 1,455
Davey, Paxman & Co., Colchester 1,410
G. Waller & Son, Stroud, Glos. 1,259
Campbell Gas Engine Company, Halifax (including sludge pump) 1,164

OSWESTEY.—For the erection of a lodge in Cae Glas Park, for the corporation.—Mr. G. William Lacey, borough engineer and surveyor:—
Jabey Higgins, Oswestry £341
W. H. Thomas & Sons, Limited, Oswestry 319
Jones & Evans, Oswestry 318

SWANSEA.—For the construction of about 2,350 yds. of roads, sewers, surface-water drains, manholes, inspection chambers, gullies, and other works, for the corporation.—Mr. G. Bell, borough surveyor, Somerset-place:—
Bennett Brothers, Swansea £14,389
T. Walker, Clydach 10,983
Hill Brothers, Swansea 10,862
F. Hayes, Liverpool 10,309

WANDSWORTH.—For constructing a sewer, for the borough council.—Mr. P. Dodd, borough surveyor:—
S. Lane, £268, and 15 per cent above schedule prices for stoneware pipes, and schedule prices for the remainder of the items in the schedule, for extras or omissions.

WANDSWORTH.—For making up Hambleton-road, Southfield, for the borough council.—Mr. P. Dodd, borough surveyor:—
E. Parry & Co., £991, and 10 per cent above schedule prices for extras or omissions.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

APRIL.

- 20.—Institute of Sanitary Engineers: Mr. E. A. Lees, A.I.S.T.C.E., on "The Birmingham Waterworks." Caxton Hall, Westminster. 8 p.m.
- 20.—Junior Institution of Engineers: Mr. James Richardson, B.S.C., ASSOC.M.I.S.T.C.E., on "Lines of Future Development in High Power Diesel Oil Engines." Institution of Electrical Engineers. 8 p.m.
- 20.—Royal Institute of British Architects: Mr. Max Clarke on "Professional Practice." 8 p.m.
- 23.—Institution of Mechanical Engineers: Anniversary Dinner, Connaught Rooms.
- 23.—Roads Improvement Association: Annual General Meeting, Institution of Civil Engineers. 4.30 p.m.
- 25.—Association of Somerset Surveyors: Meeting at Street.

MAY.

- 1.—Junior Institution of Engineers: Mr. S. T. Robson on "The Control and Organisation of the Engineering Profession." 39 Victoria-street, S.W. 8 p.m.
- 9.—Institution of Municipal and County Engineers: Meeting at Dover.

 21.—Institute of Sanitary Engineers: Visit to Luton sewage farm. Train from St. Pancras, 2.50 p.m.
 24-27.—Institution of Municipal and County Engineers: Annual Meeting and Town Planning, Housing and Road Conference at Cheltenham.

JULY.

- 4-11. Royal Sanitary Institute: Annual Congress and Exhibition at Blackpool.
 6-10.—Institution of Mechanical Engineers: Summer Meeting in Paris.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

SHANGHAI MUNICIPAL COUNCIL.

PUBLIC WORKS DEPARTMENT.

FOUR SURVEYING ASSISTANTS.

Four thoroughly qualified Surveying Assistants, with experience in town surveys and cadastral work, are required in the Public Works Department.

Candidates should be about 25 years of age and unmarried.

Salary, taels 250 per mensem, without allowances, under a three years' agreement, with first-class passage from home, half pay on voyage, and medical attendance. There is an excellent superannuation scheme.

The value of the tael at the present rate of exchange is about 2s. 7d., but it is liable to fluctuation. Taels 250 per mensem taken at Exchange 2s. 7d. is equivalent to about £385 per annum. Particulars of the appointment may be obtained of the Council's Agents, and applications, in Candidate's own handwriting, stating qualifications, experience, &c., accompanied by copies of not more than three recent testimonials, and endorsed "Surveying Assistants," should be forwarded, on or before April 21st, to Messrs. John Pook & Co., Agents for the Shanghai Municipal Council, 68 Fenchurch-street, London, E.C.

March, 1914.

(1,412)

COUNTY BOROUGH OF HUDDERSFIELD.

The Corporation require the services of an experienced District Superintendent of Highways to take charge of a District under the Borough Engineer.

Applicants must have had practical experience in sewerage, paving and macadamising of roads, and be competent to set out and measure up work, and keep daily accounts of all labour and materials used.

The person appointed must have had previous practical experience in a similar situation, and be prepared to reside within his district.

For statement of duties apply to the Borough Engineer.

Salary £120 per annum.

Applications, in the handwriting of candidates, giving full particulars of present and previous occupation, age, &c., accompanied by copies of not more than three testimonials of recent date, endorsed "District Superintendent of Highways," must be addressed to me not later than 10 a.m. on Monday, the 20th April, 1914.

Canvassing will disqualify.

K. F. CAMPBELL, M.INST.C.E.,
Borough Engineer and Surveyor.

1 Peel-street,
Huddersfield.

April 3, 1914.

(1,506)

BOROUGH OF HOVE.

Applications are invited for the post of General Assistant in the Borough Surveyor's Office. Salary, £104 per annum.

Candidates must have had experience in the work of a Borough Surveyor's Office. Applications, stating age, experience and qualifications, with copies of three testimonials, to be sent to the undersigned not later than the 25th inst.

H. H. SCOTT,
Borough Surveyor.

April 14, 1914.

(1,521)

ILFORD URBAN DISTRICT COUNCIL.
JUNIOR ASSISTANT, SURVEYOR'S DEPARTMENT.

The Ilford Urban District Council invite applications for the position of Junior Assistant in the Engineer and Surveyor's Department.

Salary, £90 per annum, rising by £10 increments annually to £100. Applicants must have served articles to a municipal engineer or surveyor. Particulars of duties and forms of application may be obtained on application to Mr. H. Shaw, M.INST.C.E., Engineer and Surveyor, Town Hall, Ilford. Applications, accompanied by copies of two recent testimonials (which will not be returned), endorsed "Junior Assistant," must be received at the office of Mr. Adam Partington, Clerk, Town Hall, Ilford, by 12 noon on Tuesday, the 28th day of April, 1914. Canvassing will disqualify.

Clerk-Solicitor's Department,
Town Hall, Ilford.

April 7, 1914.

(1,513)

ENGINEERING ASSISTANTS with experience of Sewerage, Sewage Disposal and Waterworks, wanted immediately by Messrs. Willcox & Raikes, Civil Engineers, 63 Temple-row, Birmingham. Applicants must state age and salary required, with particulars of qualifications and experience. (1,509)

ENGINEER AND SURVEYOR to Urban District short distance from London has vacancy for Pupil. Large sewerage scheme in hand.—Apply Box 1,393, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,423)

TENDERS WANTED.

URBAN DISTRICT COUNCIL OF ENFIELD.
TO MANUFACTURERS OF IRON FENCING.

The Council invite Tenders for supplying free, and in good condition, at Ponders End Railway Station, G.E.Ry.—

350 lin. yds. (more or less) of Wrought-iron Unclimbable Fencing, 5 ft. high, and one pair of gates to match.

Drawings, Forms of Tender, and all information can be obtained on application to Mr. Richard Collins, the Council's Surveyor, at these offices, any day except Saturday, between the hours of 9 a.m. and 5 p.m.

Tenders (on the forms supplied only) to be sent in to me not later than noon on Wednesday, the 6th day of May next, endorsed "Tender for Fencing."

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

T. W. SCOTT,
Clerk.

Public Offices,
Enfield, Middlesex.

April 16, 1914.

(1,522)

URBAN DISTRICT COUNCIL OF ENFIELD.
PUBLIC STREET IMPROVEMENT WORKS.

The Council invite Tenders for providing and laying about

780 yds. run of Granite Kerbing,
780 yds. run of Granite Channelling,
4,100 yds. super. of Artificial Stone Paving,

in various Public Streets within the District of Enfield.

Specifications can be seen, Forms of Tender and all information obtained, on application to Mr. Richard Collins, the Council's Surveyor, any day, except Saturday, between the hours of 9 a.m. and 5 p.m.

The Contractor will be required to observe trade union hours of labour, and to pay wages according to the published scale of the London County Council for the time being in force.

Sealed Tenders, endorsed "Tender for Street Works," to be sent to me not later than noon on Wednesday, the 6th day of May next.

The Council do not bind themselves to accept the lowest or any Tender.

(By order)

T. W. SCOTT,
Clerk.

Public Offices,
Enfield, Middlesex.

April 16, 1914.

WOOD PAVING.

The Finsbury Borough Council invite Tenders for paving with Creosoted Deal on Portland Cement Concrete the carriageways of Cowcross-street (part) and Turnmill-street.

Specifications can be seen, and Forms of Tender obtained, at the Borough Surveyor's Office any day, except Saturday, between 10 a.m. and 4 p.m., on deposit of One Guinea, which will be returned on receipt of a *bonâ-fide* Tender.

Tenders must be delivered to me not later than 1 p.m. on Monday, 27th inst. Only those made upon the official form and properly filled in will be entertained.

GEORGE WHITEHEAD PRESTON,
Town Clerk.

Finsbury Town Hall, E.C.
April 14, 1914.

(1,518)

£ s. d. from Waste Paper.

The Sutton (Surrey) Urban District Council have, according to the *Sutton Advertiser*, through their Surveyor, discovered another source of income which promises to turn the wilderness on Balaam's plain into a little goldmine. By means of a contrivance technically known as "The 'All-Metal' Waste Paper Bin and Baler," manufactured and sold by the Patentees, The Canadian American Machinery Company, Limited, 8 Bouverie-street, Fleet-street, London, E.C., waste paper which has hitherto been dumped at the shoot with house refuse, and has been blown about by contrary winds of heaven, is now rescued, sized, baled, and found to have an appreciable market value. In an experimental stage lasting thirteen days the quantity of paper dealt with has amounted to 4 tons 17 cwt. 11 lb., with a market value estimated at £7 5s. 8d.

At the rate mentioned, the *Advertiser* goes on to state, it means that in a twelvemonth the waste paper would amount to 126 tons 1 cwt. 2 qr. 6 lb., with a face value of £189 6s. 10d., equal to the amount of a rate of 3 of a penny in the £, always presuming that 30s. a ton can be got for it!—[Advt.]

CITY OF WESTMINSTER.**ALTERATIONS AND SANITARY WORK.**

The Westminster City Council invite Tenders for certain alterations and sanitary work at the Buckingham Palace-road Public Baths.

Conditions of Contract, Specification and Form of Tender may be obtained on application on and after Monday, the 20th April, to the City Engineer, Westminster City Hall, Charing Cross-road, W.C., between the hours of 10 a.m. and 4 p.m.

The Contractor will be bound by the Contract in the case of all workmen employed by him to pay wages at rates not less, and observe hours of labour not greater, than the rates and hours recognised by the associations of employers and employees, and in practice obtained in the district where the work is to be executed.

Tenderers are prohibited from directly or indirectly canvassing Members or Officials of the Council in reference to any Tender, and the Tender of any person who does so canvass will be rejected. The Contract Deeds will be prepared at the expense of the Council, and the Contractor will be required, together with two sureties, to enter into a bond for the due fulfilment of his Contract, or, in the alternative, to agree to the retention by the Council, during the period mentioned in the Form of Tender, of certain monies.

Each Tender, on the official form supplied, is to be enclosed in a sealed cover, addressed to the Town Clerk, Westminster City Hall, Charing Cross-road, W.C., and marked "Tender for Alterations, &c., Buckingham Palace-road Baths." Tenders may be placed by, or on behalf of, Tenderers in a locked box at the City Hall, provided for the purpose.

No Tender will be received after 12 noon on Wednesday, the 29th April, 1914.

The Council do not bind themselves to accept the lowest or any Tender.

JOHN HUNT,

Town Clerk.

Westminster City Hall,
Charing Cross-road, W.C.

April 14, 1914.

SURVEYORS' INSTITUTION EXAMINATIONS.

COMPLETE COURSES OF PREPARATION in all Divisions and Sub-Divisions of these EXAMINATIONS are given, either in Class, by Correspondence, or in Office, by

Messrs. PARRY, BLAKE & PARRY and B. W. ADKIN.

The TWELVE MONTHS' and TWO YEARS' COURSES for the next Two Examinations are just commencing.

These Courses have been taken by the great majority of the successful candidates in these Examinations for very many years past, including the winners of NINETY-SEVEN out of the ONE HUNDRED AND FORTY-FIVE prizes awarded during the last nineteen years.

The Beadel Prize for Agricultural Knowledge, awarded in the Land Agency Section of the Examination, has been obtained every year since its institution by Candidates prepared by MESSRS. PARRY, BLAKE AND PARRY.

For particulars of the Courses of Work or for any advice with respect to the Examinations, apply to—

Messrs. PARRY, BLAKE & PARRY, 82 VICTORIA ST., WESTMINSTER

Telephone No.: GERRARD 5680.

These Courses were established twenty-two years ago, and since that time no stone has been left unturned to raise them to, and maintain them at, the highest standard of efficiency.

The Surveyor

And Municipal and County Engineer.

APRIL 24, 1914.

No. 1,162.

Minutes of Proceedings.

London Electricity Supply.

The issue last week of a comprehensive report on the future supply of electricity to London, prepared for the London County Council by Messrs. Merz and McLellan, has aroused general interest in this question, which is of great and growing importance. The approach of the date at which the existing companies which supply the bulk of London's electrical needs will become subject to compulsory purchase by the county council has drawn attention to the imperative necessity for the future conduct of the supply to be clearly defined and provided for long before the year 1931—the period in question—for if this were not done, the companies would be unable to raise fresh capital and the undertakings would be starved, as happened to some extent in the case of the telephones. The uses of electricity are now so manifold and universal that it has become a necessity to the community, and its applications are constantly increasing in variety and scope, so that any restriction upon its employment—such as would result from the maintenance of an unduly high price—can only be regarded as an evil that must not on any account be suffered to occur. It is unfortunately the case that electrical energy in London costs much more than in most large cities, or even in many of the smaller ones: for example, even on the borders of the Metropolis, the Croydon Corporation charges only 3½d. per unit, and West Ham Corporation 3d. per unit for lighting purposes, while in large areas of London itself the price is 5d. Favourable exception should be made of some of the metropolitan borough councils which have established their own supply undertakings, and charge prices as low as these. It is the companies that are to blame for the high prices. The trouble is really traceable directly, as the engineers point out in their report, to the action of Parliament in parcelling out the metropolitan area between a great many authorities—there are to-day no fewer than thirty-nine authorities supplying the central area, and seventy in Greater London—whereas, in point of fact, the essence of economy in the supply of electricity is summed up in the words “concentration” and “unification,” which form the keynotes of the report. The average size of the generating sets in the existing stations is between 600 and 800 kw., but in a modern power station nothing under 5,000 kw. should be installed, and, indeed, sets of no less than 50,000 kw. each are foreshadowed, though none of more than 25,000 kw. are actually at work. The increase in size of the generating units has brought about not only a great improvement in economy of fuel and labour, but also an immense reduction in the capital cost of plant and buildings, a factor which bulks very largely in the economics of electricity supply. The diversity of ownership has led also to the adoption of something like forty-nine different systems of supply in Greater London—an astonishing fact in itself, suggesting that the designers of many of these undertakings must have thought it a virtue to be different from everybody else, but reflecting no credit upon their intelligence.

We cannot and need not follow Messrs. Merz and

McLellan through their lengthy report upon this great problem; suffice it to say that, after showing that the metropolitan area ought to be, perhaps, the finest field in the world for electricity supply, and that the enormous development of the use of electricity for cooking and heating which will take place when it is supplied at a low price will go far towards banishing combustion and smoke from the city—thus indirectly effecting a saving estimated at £5 per annum per inhabitant—the authors proceed to lay down the lines upon which the necessary reorganisation should be carried out. Technically, the scheme involves the scrapping of all the existing generating stations, and the erection of a few very large ones down the river, together with the unification of the distributing systems with a view to arriving ultimately at a uniform three-phase 50-cycle supply. The more difficult question, however, is that of control, and after reviewing alternative methods of effecting this, the authors recommend the formation of a new undertaking “to concentrate production, standardise distribution, and bring about the amalgamation of all the various undertakings”—under such safeguards as will ensure the maximum efficiency and economy, to the advantage of the general public. A similar policy has been followed with marked success by several of the greatest cities in the world, and Parliamentary opinion in the past has shown itself favourably disposed towards it in connection with this question. There is reason to hope, therefore, that steps will be taken to bring order out of the existing chaos, and to remove from our Metropolis the reproach of “dear electricity.”

The Village Dust Heap.

A local paper reports as follows a discussion which took place at a parish meeting in an English county:—

Mr. A referred to the dust heap, and said that the refuse was allowed to remain so long that the whole district around was overrun with rats. Mr. B (the contractor for refuse removal) said that the refuse was burned as quickly as possible, a man always being at work there for that purpose. There were really not many rats there, as when he had a man there he had never caught more than a dozen in a day. Mr. C said that what he objected to was allowing children to run over the dust heap, as they were very likely to pick up disease. Mr. B said that he did his best to keep the children away, but he thought he would have to prosecute in order to put a stop to it. Mr. D said people would grumble, but if Mr. B gave up the contract, the parish would be put to the expense of a dust destructor. He was sure Mr. B tried to please the people, and took away a great deal of rubbish he was not compelled to take. He should be surprised if he could please the people of “Dustham,” as he (the speaker) could not (laughter). Mr. B said that the more he tried to please them the more he got behind (laughter). Mr. E said his complaint was that the system was inadequate. One man could not possibly visit every house in the parish in a week. There should be more men and more carts. (A voice: “And more money.”)

The situation is eminently one of those which lends itself to ironical comment. We resist the temptation, however, preferring to state a few

plain facts. This village is by no means the only place in the neighbourhood where refuse is dumped in the fields and a miserable attempt made to burn it. If, however, the refuse were dumped under a roof, a Dutch barn would suffice, and if it were raked over in order to separate the more readily burnable portions, these could be burned in a small refuse destructor, the kind supplied to hospitals and similar institutions, and such burning as did take place would be a cleanly operation, and would not give rise to the stinking smoke that is sometimes produced by the present method. Refuse in heaps does not really burn, it smoulders. Failing the funds needed for a refuse destructor maker's apparatus, a simple stove with a tall steel chimney could be put up, and this would burn a considerable quantity of refuse per week. The one man could then deal with far more in two days than he could in a week by the present method, and the saving in labour would pay for the stove. It is not really, however, a question of expense so much as a matter of taking a little trouble. Householders should be educated up to the point at which they could be induced to deposit two or three classes of refuse in two or three separate bins—hard stuff and ashes in one, and paper and stuff that decays in another, at least, but preferably with a third bin for old tins. Kept separate, the materials of house refuse have their value, or, at the least, qualities which reduce the cost of their disposal. The village is the unit with which trials of such methods should be made, and the system of division would still effect economies if proper distinction were installed. Why should money be spent on separating things which need never be mixed? High rates are not so much due to lack of zeal, or of moderation, on the part of local government officers as to lack of system in the households of the ratepayers. On windy days the wages of the scavengers in certain boroughs are largely spent in hunting loose papers about the streets; and rats and children play upon the village dust heaps of the countryside.

**Programme of
the Fourth
International
Road Congress.**

We have reproduced in another part of this issue the programme of "Questions" to be discussed at the Fourth International Road Congress, which is to be held next year at Munich. We are glad to find that the number of these subjects—why they are called "Questions"—we have never been able to understand—is to be seven only, assuming that no additional series under the head of "Communications" is to be added. The first subject—the repair of macadamised roads for minor damage and, as seems to be intended, the ordinary current repairs for wear—is one of so great importance that its inclusion in the programme will be generally welcomed. In view of recent developments, the next two subjects—*asphalt roads and sett and brick paved roads*—may also be considered of first importance from the congress point of view, but the former subject should be extended so as to take into consideration the asphalt carpet as applied to main roads in rural districts. The fourth and last subject, under the head "Construction and Maintenance," is one of very live interest at the present time, and we may, perhaps, expect that by next year discussion of the effects of tramways on roads will be even more energetic and controversial than it is at the present day. It will be interesting to learn whether tramway engineers will be able to make any important proposal intended to lead to a reduction of the rolling noise of tramcars, or of the noise made by the machinery when the trams are being accelerated. In these directions there seem to be possibilities of improvement, and, generally, for profitable competition with motor vehicles.

Under the general heading "Traffic and Administration," three subjects are to be discussed. The particular effects caused by different kinds of traffic are very important, and much is still to be learned

concerning them, and we may expect that some very interesting and important papers on this subject will be sent in. The traffic census is also deserving of full discussion, and may be usefully studied from different points of view. The seventh question does not seem to be of sufficient importance, as stated, to be included in a list of seven. It may, however, be suggested that, if the effects of different kinds of vegetation upon the road were taken into consideration, a great deal of useful information could be put before the profession. It is clear that the framers of the programme consider that certain subjects of great importance have been sufficiently discussed, for the time being, at previous congresses, while, as regards certain kinds of roads—wood-paved roads, for instance—the information in the possession of the profession is precise and complete. So far, however, there has been no adequate discussion of the significance of climatic and topographical conditions upon highway systems or upon road crusts, though a knowledge of these effects is necessary to an appreciation of comparisons between practice in different countries or different parts of a country. Another subject that might have been included is that of the specialisation of roads, including consideration of the extent to which the public highway is capable of providing for the economic development of motor vehicles. But the most important element of success in discussing highway affairs at a congress is the restriction of the number of subjects and the scope of each within reasonable limits, and this element, it seems, is fully recognised in the programme.

* * *

**Enteric at
Kenilworth.**

The promptitude with which the Local Government Board undertook the investigation of the causes of the recent outbreak of enteric fever in the urban district of Kenilworth affords another illustration of the useful work accomplished by the board as the central public health authority. The outbreak in question was an "explosive" one—that is to say, one in which the bulk of the cases occurred within a short period. This in itself afforded a strong indication that the disease had not spread by infection from person to person, but that it was probably caused by the contamination of some food or drink consumed by a large section of the population. It appears from the report of Dr. Manby, the medical inspector sent by the board to inquire into the matter, that local circumstances which were brought to his notice soon placed the water supply under suspicion. This supply is afforded by a company, and part of it is derived from an adit which runs roughly parallel to a brook, and at a distance from the latter varying from 5 ft. to 30 ft. This brook was found to be liable to pollution from several sources, and in particular it formed the outlet for the storm-water overflows from three sewers. The effect of the geological evidence was that the adit was liable to receive water from the polluted stream by percolation through the sandstone, and that the distance between them was too small to admit of efficient filtration. It was further shown that the outbreak synchronised with the blocking of a sewer during a period of rain, which caused the sewage to flow freely into the brook. It is evident, however, that although a specific cause may be assigned to the explosive outbreak under investigation, the danger of pollution of the adit water supply has been an ever present one. Hitherto considerable laxity has been displayed in the matter of periodical chemical and bacteriological analyses, but the recent trouble will no doubt result in an improvement in this respect. Dr. Manby, while refraining from entering at length into the causes which have led to the danger of contamination having for so many years been ignored, expresses the view that the principal reason is that the adit had so long been in existence that it was accepted by all concerned as an established source of supply not specially open to suspicion. The experience of Kenilworth should serve

as a warning to other places where similar risks are being run. * * *

Wolverhampton and Canal Development.

The resuscitation of the national canal system upon the lines of extended utility is a subject that must appeal with powerful interest to municipal engineers, and it is obviously one that is beset with not a few difficulties. This supplies a reason why the matter should be handled with discrimination, for nothing is easier, the circumstances being such as they are, than to criticise the reform movement as being impracticable or even hopeless. The Royal Commission that inquired into the position and condition of the canal system advocated the appointment of a Waterways Board. This is a first step that may be taken with the complete assurance that it is the right and proper thing to do, for such an authority would be able, as an essential preliminary, to ascertain the facts upon which subsequent action could be based, and would be fitted by its knowledge to place the subject in such perspective that we may know just where we stand, and in what precise direction alteration and development, if desirable, are to be anticipated. This is a reason why it would appear to be inadvisable, at the present stage, to copy the example of the General Purposes Committee of the Wolverhampton Town Council in proceeding to discuss the details of a project which is as yet in a state of imperfect development, and upon such unreliable data advising the corporation that it would be unreasonable to contribute to the proposed scheme of the Waterways Association. The *Birmingham Post*, in a leading article, points out that the Wolverhampton General Purposes Committee have fallen into the error of treating as definite and settled something that is tentative and provisional, and further explains that for the moment all the Waterways Association ask is that the local authorities governing areas served by canals which are capable of development should recognise that they stand to gain by the modernisation of those canals in the interests of local industries, and should therefore give practical encouragement to the policy of modernisation by signifying their readiness to contribute something towards the cost. We cordially agree that this is a subject upon which an open or affirmative attitude is highly desirable. To bang and bolt the door at the present juncture would be unreasonable and stultifying.

* * *

The Chelmsford Meeting.

The Eastern District meeting of the Institution of Municipal and County Engineers held at Chelmsford last Saturday must be accounted a success in every way. Favoured as regards the weather, the large number of members who were present were the recipients of civic hospitality, were able to participate in an exceptionally interesting round of visits, and were privileged to hear an excellent paper on "Recent Public Works at Chelmsford," by Mr. Percival T. Harrison, assoc. M. INST. C.E., the borough engineer. This paper was chiefly concerned with the questions of water supply and housing, but the variety of other topics dealt with afforded some indication of the very large number of works undertaken by Mr. Harrison since his appointment. During the past few years the town of Chelmsford has shown remarkable development, the increase of population approaching 1,000 persons per annum being largely due to the advent of several manufacturing firms who have erected works within the borough boundaries. This increase has been responsible in the first place for a great strain upon the waterworks undertaking, necessitating the sinking of a further borehole to augment the supply—a work in the course of which exceptional difficulties had to be surmounted—and, in the second place, the demand for working-class dwelling accommodation became so acute that a housing scheme has been undertaken at the instance of the Local Government Board. In regard to the latter scheme, Mr. Harrison is to be congratulated

on being able to say that the cottages are estimated to be self-supporting, after allowing for repayment of loans (principal and interest), rates, repairs, empties and management. In the course of the discussion Mr. Harrison's work was the subject of very favourable comment, as will be noted from our report, one member pointing out the benefit which a local authority secured by appointing an engineer who makes it his business to keep his knowledge thoroughly up to date.

* * *

The Design of Pillars.

In the opening sentences of the paper on "The Design of Steel and Reinforced-concrete Pillars," which he read at the last meeting of the Concrete Institute, Mr. Oscar Faber pointed to the desire which has existed for some time for more information on such matters as the correct eccentricity on columns as justification for dealing with a subject which is necessarily one of detail. In so far, however, as it is possible to infuse life into a paper of such a nature, Mr. Faber succeeded in doing so, but his excellent contribution to the proceedings of the institute will be more appreciated by those who take the trouble to study it thoroughly for themselves. Mr. Faber dealt separately with jointed construction (such as structural steel) and monolithic construction (such as reinforced concrete). In concluding he made a special appeal to architects and others who are responsible for the conditions under which constructional work is designed, and criticised the system of competitive designs and lump-sum prices as penalising good designing, and securing work for those firms who are prepared to take the greatest risks. The only correct system is for the architect to entrust the design to an engineer in whom he has complete confidence, and to invite tenders on the design so prepared. The architect and building owner will obtain in this way—and only in this way—sound and safe design and construction, and if they exercise a good discretion in the choice of the engineer whom they employ the work will not cost more than the minimum consistent with safety. The question of competitive designs and lump-sum prices is one upon which our opinion is well known by this time, and we need say no more upon the present occasion than that we heartily endorse what Mr. Faber had to say on the subject.

* * *

Co-operation.

The recognition by Parliament of the desirability of co-operation between neighbouring authorities in regard to certain matters of local administration naturally leads to the consideration of the question whether such joint action could not advantageously be taken upon a much more extensive scale than is the case at present. Mr. Herbert G. Coales—who writes upon this subject in another column in the first of his "Engineering Jottings" which we hope to publish from time to time—recognises that a line must be drawn between those services which must be supplied by the individual authority and those in which joint action is possible. The difficulty is to know exactly where to draw this line. If it were possible to commence afresh the development of our complex system of local government, and at the same time to have the experience of the past as a guide, there is little doubt that there would be much more co-operation and co-ordination than exists at present. Keeping in view the two ends to be pursued—namely, efficiency in service and economy in cost—it will be seen that, wherever a joint undertaking would mean economy in first cost and maintenance, or a better service for the public, the principle of co-operation should be applied. Such is the short conclusion at which Mr. Coales arrives. In subsequent "Jottings" he will deal with other subjects of general interest to municipal engineers, such as "Looping or Lowering of Roads over Hills," "Subsoil Water," "Prevention of Waste by Standardisation," and "Untapped Medicinal Waters."

Design of Steel and Reinforced-Concrete Pillars.

By OSCAR FABER, B.S.C., ASSOC. INST. C.E., A.M.I.E.E., A.C.G.I., M.C.I.

"The Design of Steel and Reinforced-concrete Pillars, with Special Reference to Secondary and Accidental Stresses," was the title of a paper read by Mr. Oscar Faber at the last meeting of the Concrete Institute.

Mr. Faber divided his paper into two sections; he first dealt with jointed construction, such as structural steel, and secondly with monolithic construction, such as reinforced concrete. Taking the case of a girder resting on the end of a steel stanchion, he stated that in several drawing offices he knew as a fact that the construction in such a case would be treated as centrally loaded. He proceeded to argue that such was not the case, because when a load was applied to the beam it would deflect, and the end originally horizontal would assume a certain slope, and therefore one of two things would happen—namely, (a) the end of the girder would lift, in which case the whole load would be carried on one flange, so causing eccentric loading, or (b) the column must be constrained to adapt itself to the slope of the girder, in which case a bending moment would be introduced into the stanchion by such constraint.

In this way he showed that increases in strains of 140 and 480 per cent respectively were obtainable.

Mr. Faber then took for consideration the case of a girder resting on an angle bracket. He argued that if an ordinary bracket were used, the action would not be very far from the face of the leg of the angle since the horizontal leg of the angle would not be strong enough to resist the bending moment which would be produced in it. It followed, therefore, that, although the horizontal leg of the angle served a useful purpose in connecting the girder to the stanchion, it must not be thought capable of supporting it. In effect the construction became dangerous if the clearance between the face of the stanchion and the edge of the girder exceeded the thickness of the angle.

The author of the paper supposed there were few engineers present who would assert that this limiting clearance was never exceeded in practice, and an engineer had carefully to consider whether it was desirable to employ this type of bracket except for quite small reactions.

He next considered a stiffened bracket. Confining his attention to cases where the workmanship was good, he assumed that the stiffening angles had been machined or forged to fit the angle bracket perfectly, and that the bracket was initially horizontal. It followed that when the girder deflected there was a tendency for it to rest on the outer edge of the bracket, and for very small loads there was no doubt that this actually happened. As the load increased, the outer edge of the stiffeners yielded appreciably, and a greater area supported the load, the reaction gradually approaching the face of the column. The author's practice was to make the web of the stiffeners sufficient in area to carry the reaction under a uniform stress of $7\frac{1}{2}$ tons/in.²

In calculating the resistance he ignored a large area of steel in the flange of the stiffeners, and in the vertical leg of the angle bracket, because (a) the clearance between the face of the stanchion and the end of the girder might be sufficient to prevent bearing on this steel; (b) even if it was not, this material could not be stressed appreciably until the stiffener webs are greatly overstressed.

In any case, the difference in cost between good and bad brackets was an extremely small percentage of the cost of the steelwork, and a smaller one of the cost of the building, and he declined to endanger the "ship" for what in this case might be fairly described as a "ha-porth of tar."

It has long been recognised in good practice that the machining of the ends of stanchions was of the first importance. Yet there were at least two constructional works in London which, with a view to economy, omitted this item of workmanship, and were erecting considerable tonnages of stanchions with the ends left so that the upper tier had contact with the lower tier over the width of one plate only, the remainder of the section having varying clearances often amounting to $\frac{1}{4}$ in. The stress was still gaily calculated as uniformly distributed, and it had been explained to the author that "steel is a ductile material which would yield and flow," and perform other

convenient antics, "until the stress was uniformly distributed." The effect of loading such a stanchion was to cause the plates to slide past one another, and partly to shear through the rivets. Even where stanchions were machined a careful engineer must satisfy himself that they were machined truly square. Architects should bear in mind also that, apart from the danger involved in these practices, the yielding of stanchions and brackets before they obtained their bearing involved unknown and unintended stresses on the stonework, and to the author's knowledge many a beautiful and costly façade and interior decorative work had been badly cracked by bad steelwork details and workmanship.

From the consideration of case 1. it would appear to follow that it was desirable to make those joints somewhat flexible, and occasionally this was so. If buildings were braced with diagonal braces, he should say without question that stiffness of connections should be avoided. Unfortunately, such bracing had obvious objections, and the whole stiffness of practical buildings against wind lay in the stiffness between beams and stanchions. There was therefore no alternative but to make the joints stiff, and to make the necessary allowance for those secondary stresses in the design of stanchions. This might be onerous, both in requiring extra labour and an increase in material, but a conscientious engineer would grudge neither the one nor the other.

Mr. Faber then dealt with the design on cleats. A common method of calculating the safe reaction of a cleat was to take it as the sum of the resistance of the rivets, the effect being to neglect the very appreciable stresses due to bending.

Dealing with the bracing of pillars, Mr. Faber said that it was well known that pillars failed by buckling, and that their stress was to be determined with reference to their l/g . This phenomenon was fairly well understood, and there were sufficient experimental data available to make the design of pillars, with reference to what he might call primary buckling, a comparatively simple matter. The phenomenon to which he referred was that of secondary buckling, in which the pillar, instead of buckling as a whole, failed by the individual buckling of its component members. On this subject there appeared to be practically no experimental data, and practically no formulæ or rules for the guidance of a designer. The importance of this problem might be gathered from the fact that bad design in the matter of bracing in pillars was certainly responsible for the two greatest failures in recent years—the Quebec Bridge of 1907 and the gasholder in Hamburg.

Mr. Faber then proceeded to the second portion of his paper treating of monolithic construction and the eccentricity of beam reactions on pillars therein. Whereas in steel construction the eccentricity was very definite and easily calculated with most common types of brackets, with reinforced concrete the eccentricity could only be calculated from considerations of elastic flexure, and the problem was a much more difficult one. There was, however, no longer any excuse for claiming ambiguity since the problem had been analysed very completely in "Reinforced Concrete Design," and numerical examples fully worked out. The author took as an example the case of the outside column of the building, working it out in detail, showing very great increases in stress over the values as ordinarily calculated. If thoughts of eccentricity were banished, either from ignorance or under stress of competition, the actual maximum stress would have been 1,300 lb.-in.².

It was interesting to note that the outside pillar in good design did not suffer much reduction in size up through the last three tiers. This was in accordance with the best practice in steel-frame buildings.

In conclusion, Mr. Faber said that without suggesting for a moment that the engineering staffs of several constructional firms were not fully as efficient as many consulting engineers, he did feel that the system of competitive designs and lump sum prices penalised good designing by such firms, and secured the work to those responsible for the most risky design. The only correct system, in his opinion,

was for the architect to entrust the design to an engineer who had his confidence, and to invite tenders on the design which he prepared. The architect and building owner were then likely to obtain a sound construction, and if they used their discretion in the choice of the engineer the work would not cost more than the minimum consistent with safety.

The best constructional firm would be protected by being protected from competition with weak design and bad workmanship, and he might state that in considering tenders he considered that an engineer should give preference to those firms whose detailing and workmanship he knew he could rely upon. He urged this in the interest of the building owner, knowing as he did the importance of good details and good workmanship. The only man to suffer was the man who would take great risks and do shoddy work in order to secure a contract, and he could not say that he had much sympathy with him.

ENGINEERING JOTTINGS.

1.—CO-OPERATION BETWEEN AUTHORITIES IN THE PROVISION OF PUBLIC WORKS.

By HERBERT G. COALES, ASSOC. M. INST. C. E., F. S. I.

If Great Britain were an uninhabited land about to be discovered and colonised by a civilised race one imagines that under an "Island Planning Act" things would be arranged somewhat differently to the present lay-out.

The head of the department would assuredly be an engineer, who, from some lofty seat—possibly an anchored airship—would map out the country for colonisation. The rich land would be assigned for agriculture, and the poor barren parts for manufactories. The watersheds would be duly utilised, and made to serve sequences of towns with water by means of a joint conduit, instead of (as at present) each locality having its own little installation. Central electric power-houses, too, would be the rule instead of the exception.

But such a hypothetical situation not being within the range of practical politics, it is more to the point to consider what can be done under present circumstances for a co-operation between authorities in the provision of public works. The village pump should not be allowed to obstruct our outlook in various directions; neither should petty antagonisms nor silly pride prevent co-operation between towns where it would be advantageous to the long-suffering rate-payers.

In considering the provision of a joint scheme for public works, three questions at once present themselves:—

- (1) Would there be economy in first cost?
- (2) Would there be economy in working?
- (3) Would the service be better?

The answers entirely depend upon circumstances. It is for the engineer to go into the facts of each case, and to demonstrate the advantages or the reverse. It is evident there are certain public services—as, for instance, public baths, public abattoirs or public conveniences—which could not be used jointly with mutual advantage owing to accessibility being essential. On the other hand, there are joint installations which admirably meet the needs of separate communities—for example, lunatic asylums, secondary schools and isolation hospitals. Without this co-operation the cost of these services generally would be prohibitive. A single community would find the provision of a lunatic asylum with all its requirements out of the question. So, too, with the working expenses of an infectious diseases hospital or a secondary school. Three matrons and three headmasters, with proportionately swollen staff, would demonstrate the folly of isolated action in respect to these places. Here, at all events, union is economy.

The public works which more especially lend themselves to a co-operation between local authorities are water supply, sewage disposal, electric power and light, and so forth.

Sometimes, but not often, the question of co-operation is brought forward, and considered as a practical proposition. Unfortunately, there is often a considerable amount of jealousy or suspicion between neighbouring towns, which does not tend to mutual accommodation and help. There is also a distinct question of the civic pride of possessing public works belonging solely to one's own community.

This is a pity, for at least the question of co-ope-

ration should always be taken into account. A broad outlook is good business at all times.

Three towns, with equal populations and equal wants, may be without a public water supply. Three sources of water are available, any one of these being sufficient for the present and prospective combined wants of all. How wasteful to buy three parcels of land, pay for three sets of water rights, build three dams, three pumping stations, and three reservoirs, when one scheme would be efficient and economical in first cost! The chances, too, are that the upkeep and outgoings—certainly the interest and repayments of loan—would show a saving and economy in working.

One wonders sometimes if it would be feasible to collect, by means of a large culvert, the crude sewage of a dozen towns, and to purify it at one selected spot where suitable land could be obtained. One hears of such dreadfully unsuitable land for sewage-filtration purposes that artificial filters have to be constructed at vast expense; yet, on the other hand, excellent natural filtration areas are not unknown—so good that no effluent ever appears at the underdrain outfalls! Surely it would be worth while to locate these sites for model sewage farms, and to compare the cost of bringing the sewage along from a bunch of towns with the cost of artificial filtration for each?

Most towns have their recreation grounds and pleasure parks on a moderate scale, but a more ambitious scheme might be carried out by co-operation between two or three authorities. A few miles out it would generally be quite possible to purchase 20 acres of land for the price of 1 acre adjacent to the urban parts. An estate of considerable area might therefore be purchased for the joint use of several towns, embracing woods and water, and everything that the heart of a town dweller longs for on half-holidays and Sundays. Here the boy scout could have his camp, the piscator could fish, the golfer could golf, the oarsman could row, and everyone would have plenty of elbow room in his "own" park.

Co-operation might advantageously be practised in the provision of "kit," such as fire brigade appliances, tar-spraying machines, and steam rollers. If one steam roller or one tar-sprayer is sufficient for the needs of three districts, why buy three of each? Of course, there are some appliances which manifestly could not be used jointly—the snow-plough or the horse-brush, for instance.

If the day ever comes when each watershed is controlled by one authority, then no doubt there will be joint waterworks for groups of towns. Certainly the question of co-operation in the provision of public works might be more often considered than it is at present.

Society of Engineers.—A Bohemian concert will be held in the Council Chamber, Caxton Hall, Westminster, on Saturday, May 2nd, at 8 p.m.

Road-making Tools and Appliances.—A new catalogue of tar, road and paving tools and appliances has been issued by Messrs. John Yates & Co., Limited, Edge Tool Works, Aston Manor, Birmingham. A thumb index renders the catalogue, which is most comprehensive in its character, and contains many new lines not previously shown in the firm's lists, very convenient for use. It should be pointed out that the catalogue is not intended to supersede Messrs. Yates' general catalogue of contractors' tools and plant, but is a section devoted, as we have indicated, simply to road-making tools and plant, made up in a handy form for the use of road surveyors and contractors. As manufacturers of tools the company have behind them a record of 110 years, and their more recent innovations are in every case the result of considerable experiment and trial. They have recently extended their works, and are now in a position to cope with any ordinary demand. Their long experience, their modern and up-to-date machinery, and the situation of their works alongside a canal, by which they can receive their raw material bearing a minimum of carriage, and the fact that Birmingham is served by three of the greatest British railways, render them peculiarly fortunate as regards cost of production, which is further enhanced by the very large quantities of their specialities which they are enabled to make at a time. Uniform with the list referred to the firm issue a general catalogue of public authority and contractors' tools, a catalogue of tools and appliances for gasworks, and a catalogue of tools and appliances for tramways and railways, as well as separate illustrated catalogues of special tools to suit local requirements for all the markets of the world.

Institution of Municipal and County Engineers.

EASTERN DISTRICT MEETING AT CHELMSFORD.

A well-attended meeting of the Eastern District of the Institution of Municipal and County Engineers took place at Chelmsford on Saturday last. Mr. H. T. Wakelam (Middlesex), the district chairman, presided, and there were present the president (Mr. J. W. Cockrill, Great Yarmouth), Messrs. W. Ashbee (Hawwell), W. H. Budcott (Wood Green), J. Birch (East Ham), C. D. Bright (Colchester), S. H. Chambers (Hampton), A. E. Collins (Norwich), H. Collins (Norwich), J. Dewhurst (Chelmsford), H. E. Denham (Tilbury), L. F. Dunbar (Hemel Hempstead), W. Gornall (Great Stanmore), J. E. Hattersley (Saxmundham), S. A. Hill-Willis (Tilbury), J. Rowland Hill (Ipswich), R. E. Holding (Wood Green), L. R. Impey (Sudbury), T. Jones (Ipswich), P. G. Killick (Finsbury), J. W. Liversedge (Leigh-on-Sea), G. W. Linwood (Stowmarket), J. R. Mead (Ipswich), A. J. Meeson (Brentwood), S. Matthew (Chelmsford), R. H. Matthews (Wood Green), H. G. McDowell (Stanmore), W. Rackham (Great Stanmore), S. S. Small (Southend), Steer (Southend), L. J. Small (Woodford Green), C. Vawser (Hatfield), E. A. Slater (Colchester), E. Willis (Chiswick), T. N. W. Watts (Marlow), H. F. Wilkinson (Tottenham), S. A. Loft (Chelmsford), G. W. Shreeve (Chelmsford), W. J. Tait (Sudbury) and W. L. Jenkins (West Suffolk).

The proceedings commenced with a visit to the Marconi works, an extensive block of buildings adjoining Chelmsford Station. No fewer than 600 hands are employed here in the manufacture, assembling and testing of the complicated apparatus by which wireless telegraphy is rendered possible, and the extent of the company's operations came as a revelation to the majority of the visitors. Installations of various types, for naval, military and commercial purposes, are now being sent by the firm to all parts of the world, and the members were particularly interested in a large number of field sets which are being supplied to the order of various European Governments for army use. From the shops the visitors were conducted to the chambers in which messages are received and transmitted, and those who wished were enabled to listen to "conversations" in Morse code being carried on between ships at sea. The wonders of wireless telephony were also demonstrated, a test of this latest development of the system being, as it happened, in progress at the time of the visit.

An inspection of the corporation open-air swimming bath followed, after which the members were entertained to lunch at the Shire Hall by the Mayor. Alderman G. W. Taylor, J.P., the hospitality of his Worship being warmly acknowledged by Mr. H. T. Wakelam, the district chairman, in a short speech. The Mayor, in response, remarked that he had always felt a very great regard for the borough officials. There had been a considerable amount of work done in Chelmsford since Mr. Harrison took up the duties of borough surveyor, and he hoped that what the members would see that day would prove of interest to them.

A collection on behalf of the Orphan Fund of the institution was made, and realised £3.

At the subsequent business meeting, the following paper was submitted for discussion:-

RECENT PUBLIC WORK AT CHELMSFORD.

By PERCIVAL T. HARRISON, ASSOC. M. INST. C. E.,
Borough Engineer.

It has been said at meetings of the institution that the papers presented were so complete in themselves that little scope was afforded for discussion; whatever faults may be urged against the paper before you to-day, it is hardly possible that a similar charge can be preferred in this case.

The development of Chelmsford during the last few years has necessitated extensions and additions to practically all its municipal undertakings, and though some of the new work may not have been of that magnitude found necessary in larger towns, yet the variety of the schemes taken in hand, together with the necessity of foresight in their execution, has put a great amount of work upon the responsible departments. To minutely describe every work recently undertaken by the borough council might prove wearisome, and the author has considered it

advisable to deal somewhat fully with two or three of the more important schemes, and to be content with a brief description of the others, hoping that this decision will meet with the general approval of the members.

Chelmsford is the county town of Essex, and is situated on the river Chelmer, within 30 miles of London. The earliest mention of Chelmsford found in the old records refers to the year 1100, and 100 years later a licence for a market and a fair was granted to the town. There is, however, plenty of evidence of Roman occupation, so that Chelmsford has undoubtedly some claim to antiquity. For centuries Chelmsford could be described as a small market town, situated in an agricultural district, possessing the usual features and industries, and not showing any signs of great development. During the last few years, however, Chelmsford has assumed a new character, that of a thriving commercial town, several manufacturing firms having erected works within the borough boundaries, and thus attracted a continually increasing industrial population. The principal firms are Messrs. Crompton & Co., electrical engineers; Messrs. Hoffmann & Co., engineering works; Messrs. Marconi, Limited, wireless telegraphy works; and the works of the National Steam Car Company. Another event of some moment is the formation of the See of Essex, with Chelmsford as the cathedral town and the residence of the newly appointed Bishop.

The population of Chelmsford has increased from 12,580 in 1901 to an estimated population of 20,000 to-day, part of this being attributable to an extension of the borough boundary in 1907. An important feature is the development of the districts just outside the present boundaries, and the overcrowding which sometimes occurs there owing to lack of accommodation in Chelmsford for those whose daily occupation lies in the town. This increase, which at the present time is approaching to nearly 1,000 persons per annum, has had two effects of considerable importance to the administration of the borough—in the first place, it has caused a great strain upon the waterworks undertaking; and, secondly, it has resulted in a dearth of houses to such a degree that the Local Government Board has practically compelled the council to take action. The author will therefore deal with these two matters first, and then refer more briefly to other works carried out.

WATER SUPPLY.

The water supply belongs to the town, and the borough surveyor is the water engineer. Water is obtained from surface gravel springs and from boreholes driven through London clay into the Thanet sands.

The provision of an adequate water supply to Chelmsford has for many years been a problem of considerable difficulty at times, and would appear to be a kind of legacy of anxiety handed down from one borough engineer to another. One reason is, of course, the increasing population, and another the increased consumption per head, owing to activity in public health administration and modern requirements. The supplies are as follows:—

	Average daily quantity supplied, July, 1913.
Mildmay Yard. Borehole	125,000
Burgess Well. Gravel spring	58,000
Admirals Park. Gravel spring	87,000
Springfield. Surface springs and borehole belonging to the rural district council	71,000

The water from Burgess Well gravitates to Mildmay Yard and joins the Mildmay Yard borehole water in a service reservoir holding 145,000 gallons, and from thence is pumped up to Long Stomps reservoir, which, since its enlargement under the author's predecessor, now holds 818,000 gallons. The water from Admirals Park is pumped up to a water tower, which adjoins the springs, and has a capacity of 80,000 gallons. The Springfield water supply is obtained from the rural district council waterworks at Baddow under an agreement entered into in 1907, when the borough boundary was extended to include the portion of the rural district council area known as Springfield.

Immediately prior to the author's appointment the council had bought a piece of land at Galleywood,

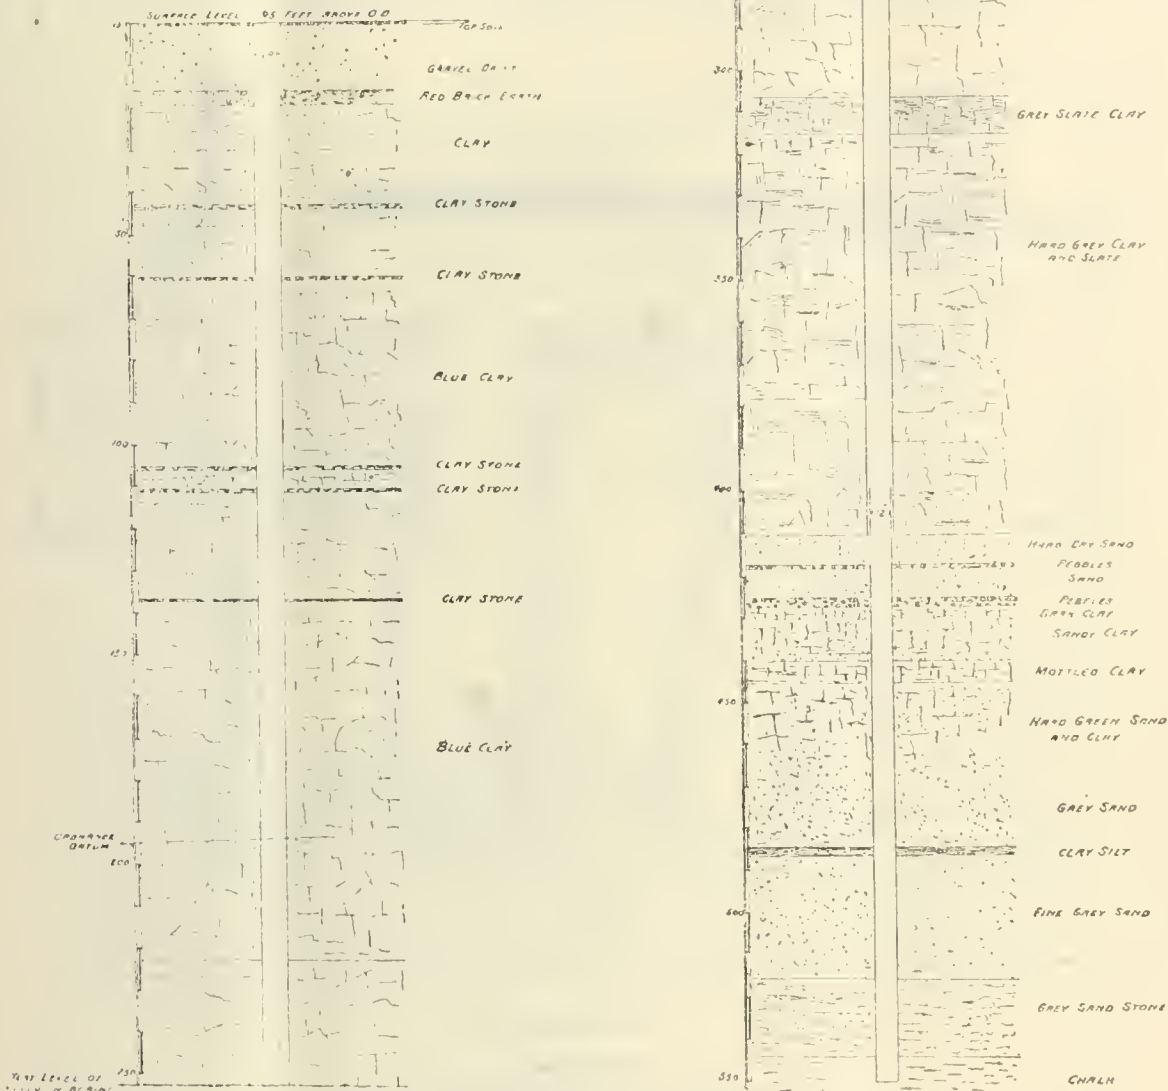

acting under the advice of Mr. Cuthbert Brown, ASSOC.M.INST.C.E., the then borough engineer, for the purpose of sinking a borehole to augment the water supply, and the author's first work upon taking up office was to push forward this scheme.

A trial borehole of 9 in. diameter was completed in May, 1912, after considerable delay, owing partly to the fact that the London clay was found to be about 200 ft. thicker than anticipated. The test pumping showed a yield of between 5,000 and 6,000 gallons an hour. This quantity is generally considered a satisfactory result from a borehole in the Thanet sands, and it was decided to sink a further borehole of larger diameter at a point 10 ft. from the trial borehole.

The second borehole is lined with steel tubes 14 in. inside diameter for 400 ft., and 12 in. diameter per-

owing to the urgent need of this additional water supply. A scheme has been prepared for a pumping station, with engineer's cottage, to cost £4,000. The application is now before the Local Government Board. Tenders have been invited, and the work will be pushed on with as soon as sanction for the loan is obtained.

The plant will be in duplicate, each unit consisting of a suction gas installation, a gas engine about 25 b.h.p., a deep well borehole pump, with Ashley patent bucket fixed at a depth of about 350 ft. below

CHELMSFORD WATER SUPPLY GALLEYWOOD BOREHOLE.

forated tubes for a further 134 ft. The strata pierced was as follows:—

	Thickness of each stratum.	Total depth from surface.
	ft. in.	ft. in.
Top soil	1 0	1 0
Gravel drift	15 0	16 0
Red brick earth	3 0	19 0
London clay: Blue, with thin beds of rock	204 0	223 0
Brownish	83 0	306 0
Grey clay slate	9 0	315 0
Hard grey clay and slate	95 0	410 0
Reading Beds and Thanets:		
Hard dry sand	7 0	417 0
Sand & water with pebbles	11 0	428 0
Dark clay	2 0	430 0
Dry sand, clay and shingle	10 6	440 6
Greenish mottled clay	4 6	445 0
Hard green sand and clay with water	39 0	484 0
Dark clayey silt	2 0	486 0
Fine grey sand & sandstone	48 0	534 0
Flints	0 6	534 6
Chalk	5 6	540 0

The second borehole was completed in May, 1913, and temporary steam pumping plant was installed

surface level, and a three-throw surface pump. The plant is so designed and arranged that either engine can be supplied with gas from either suction gas producer set, while by means of clutches either or any pump can be run by either gas engine. The water will be brought up to the surface by means of the deep well pump, and will be passed outside the building through a settling tank, which will catch any sand brought up, and thence over a weir into a suction sump, from which it will be forced up to the reservoir at Long Stomps by means of the three-throw surface pumps. The deep well pumps will be designed to pump on an average 5,000 gallons per hour, and the surface pump will be capable of pumping slightly in excess of this quantity. Everything necessary will be provided for dealing with a breakdown as expeditiously as possible, and for the lifting of the pumps and rising mains as occasion requires.

The waterworks at Mildmay Yard have had a varied history, and have been the scene of more than one disappointment. The author found the following plant in operation: Old steam boilers raising steam for a modern engine and borehole pump, and also for a new Worthington steam pump, the first pump

raising the water from the borehole to the surface reservoir, and the second forcing it up to Long Stomps reservoir. The boiler-house belonged to an earlier scheme, and was situated a good distance from the engine-house.

The average daily delivery of water raised to Long Stomps reservoir never exceeded 190,000 gallons, the total lift never exceeded 372 ft. for two-thirds of the water and 142 ft. for one-third of the water. The annual coal bill was, however, between £700 and £800.

In January, 1912, the author presented a report on the matter accompanied by comparative estimates of initial cost of new plant and running costs for pumping by electricity, steam, or suction gas, and recommended the latter. The report was adopted and the work was completed last year. The

tional supply from the borehole will be available. Tenders have been invited, and the work will be put in hand at once. The estimated cost of borehole, buildings and plant is £4,000. The new engine-house will adjoin the existing engine-house, which occupies the basement of the water tower.

HOUSING.

The town council have for many years been giving the question of scarcity of houses for the working classes their consideration, and many schemes have been prepared, but for some reason or other abandoned.

Owing to the continued rapid development of industries, the Local Government Board began putting pressure upon the council in 1910-11, and shortly after the author's appointment the council were

Block Plan.
CHELMSFORD WORKMEN'S DWELLINGS.

guarantee of the contractors as regards coal consumption is being realised, and the plant has been running long enough now to prove that the cost of fuel consumption will be reduced from nearly £800 to under £200 per annum.

The council decided to erect a permanent engine-house in place of the temporary corrugated iron structure which had done duty for some years, the new house to cover not only the new plant, but the existing borehole pump and steam plant, the latter being retained as a standby. Some idea of the difficulties which had to be overcome in the carrying out of the work may be formed from the fact that the old building had to be pulled down and the new building erected, and new plant fixed while the existing plant had to be kept running night and day, week in and week out, to maintain the water supply to the town. The cost of the new building was about £1,000, and the machinery £750.

With regard to Admirals Park water supply, the council recently decided to purchase the adjoining land with the primary object of protecting the supply, but were unable to get sanction to the loan unless they undertook to sink a borehole. This they have now decided to do, so that not only will the surface springs be to a certain extent protected, but an addi-

fortunate in obtaining a most suitable site of 3½ acres.

In September, 1911, the author prepared a scheme for the development of the whole of this area, but recommended the carrying out of a portion only at first, to ascertain what class of house was most likely to meet the requirements of the district. This suggestion was adopted, and thirty-eight houses were built in 1911-12. Particulars of these are given in the tables below.

Class.	Description.	Accommodation.	Average cu. per cottage.	Cost per ft. cu.	Average cost per cottage.	Rent.	Remarks.
A	1 block of 7	Parlour, living-room, scullery, 3 bedrooms	8,147	d. 5'52	£ s. d. 188 0	s. d. 6 3 and 6 6	Baths to Class A
B	2 blocks, 7 and 8	Living-room and scullery, 3 bedrooms	6,440	5'42	145 2	5 3 and 5 6	Wood block flooring throughout on ground floor
C	2 blocks, 8 each	Living-room and scullery, 2 bedrooms	5,867	4'94	121 0	4 3 and 4 6	

Each house was provided with coals place, larder, paved yard, fencing, and about 3 rods of garden.
It should be pointed out that the first portion of the scheme had to bear the cost of the purchase of

There was such a demand for these cottages, especially Class A (those possessing parlours), that the council decided, in April, 1913, to proceed with the remainder of the scheme, and eventually adopted a

the whole of the 6½ acres of land, otherwise the rents would have been 3d. per week less than that shown in the table.

modified arrangement of that originally proposed. The number of cottages in the second portion of the scheme is 106, making a total of 144. It was de-

vided to build no more cottages without parlours. Particulars of the second portion of the scheme are given below.

Class.	Description.	Accommodation.	Average cost per cottage.	Cost per ft. cu.	Average cost per cottage.	Rent.	Remarks.
D	Blocks of 5 to 7 cottages each	Parlour, living room, scullery, 2 bedrooms	9,274	5 6 39	£ s. d. 217 18 0	s. d. 6 6 and 6 9	Baths to Class D.
E	Blocks of 5 and 6 cottages each	Do. slightly smaller	8,401	5 6 39	197 8 9	5 9 and 6 0	

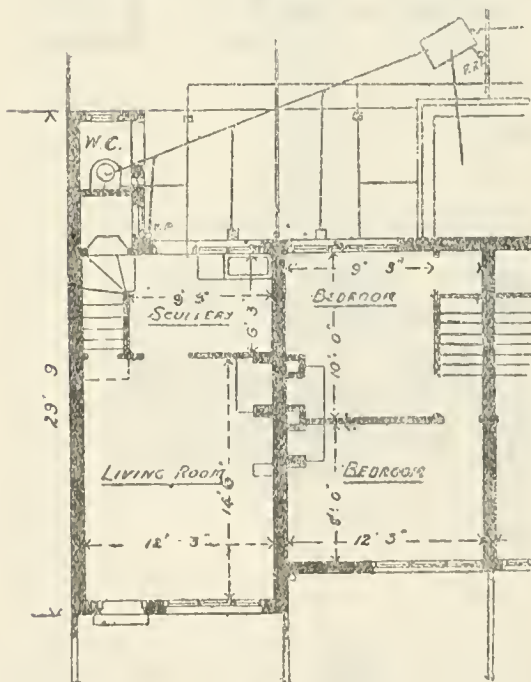

The cottages are estimated to be self-supporting, after allowing for repayment of loans (principal and interest), rates, allowances for repairs, for empties, and for management.

latter being carried out by the borough engineer's department.

The cottages are built in blocks, generally six or seven cottages to the block. Each cottage has a front and back garden and a front and back entrance, the latter being on back roads, which are arranged for the collection of house refuse, delivery of coals, &c. The cottages are brick built and slated. Red brick facings are used alternately with stucco, which treatment is continued on all elevations. The joinery is deal, twice stained, so that the painting bill is reduced almost to a minimum. The casements of the second portion of the scheme are metal. Inside walls are treated with Duresco. Tip-up baths in cabinet cupboards are provided in classes A and D. Wood block floors were laid down on ground floor in the first scheme, but not in the second. Scullery floors are cement rendered. Deal fencing, creosoted under pressure, is provided throughout, except division fencing between back gardens, which is round-bar wrought-iron fencing. The scheme involves the laying out

Front Elevation.

Plan.

Type C.

Section C D.

CHELMSFORD WORKMEN'S DWELLINGS.

The loans are obtained from the Public Works Loan Commissioners at 3½ per cent, the terms of years for repayment being sixty for the buildings and twenty for street works.

The rates are estimated at 8s. 6d. in the C, though for the last five years they have not exceeded 8s. 3d.

Thirty shillings per cottage per annum is allowed for repairs, and as very little will probably be required for the first three or four years, a good sum will have accumulated by the time any heavy expenditure is required. Two weeks per annum per cottage is allowed for as "empties"—i.e., loss of rent. There has, however, not been a single day's rent lost on the first thirty-eight cottages during the fifteen months they have been erected.

A sum of £30 is allowed for expenses attaching to the collection of rents and supervision. The former work is done by one of the town clerk's staff, the

and making up of three new roads, all of which have been included and allowed for in the scheme.

FIRE BRIGADE.

The borough engineer for the time being is also the chief officer of the fire brigade, but a whole-time superintendent is appointed, upon whom the upkeep of the station and the training of the men devolves. He is provided with a house adjacent to the station. The station, which has been doubled in size during the author's time, is equipped with two horse steamers, fire escape, hose cart, &c. The remainder of the brigade is volunteer, and consists of first and second officers, two engineers, and eleven firemen.

Each fireman's house is connected with the station by an electric alarm bell. The committee are considering the installing of fire alarm posts. A horse contractor is paid a retaining fee of £40 per annum,

and guarantees to keep a couple of horses always in readiness, and to bring them ready harnessed to the station within ten minutes of the alarm.

No charge is made for the services of the brigade within the borough boundaries, but the brigade attends fire calls within a 6-mile radius of the station, when charges are made according to a printed schedule which has to be signed by a responsible person before the brigade turns out.

MARKET.

The market is generally considered a good one, and is continually being brought up to date and improved, altogether a sum of £20,000 having been spent upon constructional work.

There are four sale rings, and the market provides accommodation for 400 pigs, 2,000 sheep, 1,500 cattle, 100 horses and 120 calves.

In 1909 the council erected a covered cowshed at a

old buildings in Mildmay Yard. The council have, however, just built a new depot on some land they possessed off the Manor-road, and have erected there stabling accommodation for fourteen horses, cart-sheds, mess-room, foreman's office and store, and a horsekeeper's cottage, and have just decided to build a foreman's house on a piece of land adjoining.

The plans show that the stable block consists of two wings one story high, each comprised of six stalls and one loose box, with a harness-room and corn-store in the centre with loft over. The shedding for vehicles is open, with a brick wall at the back and a corrugated-iron roof supported by columns in front.

It is proposed to utilise some old shedding existing on the site as cover for a tar-macadam plant.

The horsekeeper's cottage contains parlour, large kitchen, scullery, three bedrooms, and usual offices.

The total cost of the scheme, exclusive of land, but

Front Elevation.

Plan.

Type D.

Cross-section A B.

CHELMSFORD WORKMEN'S DWELLINGS.

cost of £1,568, from designs prepared by Mr. Cuthbert Brown, ASSOC.M.INST.C.E., with accommodation for eighty-four cows. The market is almost entirely a cattle market, the tolls and rents amounting to about £800 per annum.

LIGHTING.

Both the electric light and gas are in the hands of private companies. Chelmsford was the first town in England to have its streets lit by arc lamps, owing, no doubt, to the enterprise of Messrs. Crompton's, Limited, whose works are in the town. The corporation pay the following sums for street lamps to cover all maintenance: Arc lamps (2,750 nom. c.p.), £25 per annum; incandescent electric (100 Heffner c.p.), £3 3s. per annum; incandescent gas (not less than 75-c.p.), £3 per annum. The street lighting costs the town nearly £2,000 per year.

STABLES.

The council keep eleven horses and a cob, which used to be housed in the market stables and some

including fencing and gates, drainage, &c., will be about £2,000.

ROADS.

There are 7½ miles of main roads, and about 14 miles of other roads, maintained by the town council.

The roads of Chelmsford, like those of many other old towns, are for the most part narrow, and the considerable building activity, combined with the heavy increase of traffic, including motor-bus and motor-traction, has caused the problem of road maintenance to assume great importance. The council are, however, alive to their responsibility in this direction, and have spent and are spending large sums of money on works of widening and surface improvement. During the author's three years of office eighteen widenings have been effected at a cost of nearly £10,000, while £9,000 have been spent on wood-block and granite-sett paving for the roads in the centre of the town within the last eighteen months.

The subsoil of Chelmsford is clay, and many of the

roads have not a foundation that will successfully withstand the heavy weights they are called upon to bear. The old system of water-bound macadam is obviously unsuitable for modern traffic requirements, and tar-macadam is being laid in increasingly large areas every year. Tar-painting is carried out fairly extensively, principally with local tar.

BATH.

The open-air swimming bath constructed from designs prepared by the late surveyor, Mr. C. Brown, was opened in May, 1903. The bath is 150 ft. long by 100 ft. wide, with a depth of water from 3 ft. to 6 ft., and contains 400,000 gallons of water. The water is obtained by gravity from the river, first being passed through sand filters. The bath is provided with over seventy dressing-boxes, and also a long dressing-shed.

into the overflow pipes situated in the corners of the bath.

SCAVENGING AND REFUSE DISPOSAL.

This work is carried out by the council by their own staff, with the exception of the collection of house refuse from a small area, which work is let out to contract.

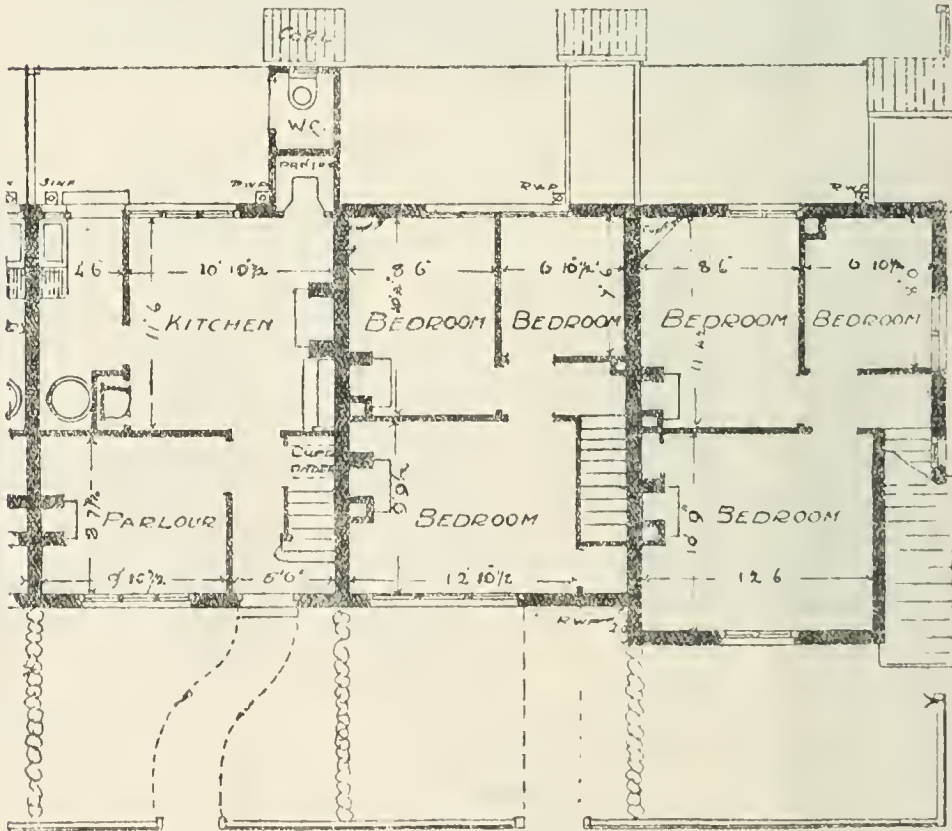

The house refuse is at the present time either taken to tips outside the borough or disposed of to brick-makers. The erection of a destructor is under consideration.

SEWERAGE.

The partially separate system of sewerage is in vogue in the borough, and increased efforts are being made to keep as much as possible of the surface water from entering the sewers. Owing to the continued rapid

Front Elevation.

Plan.

Type E.

CHELMSFORD WORKMEN'S DWELLINGS.

The initial cost of construction was £900, but certain work has been done since, including a new filter put down last year at a cost of £126, and paid for out of revenue.

The walls are of brick rendered in cement, the floor and paving around being formed of concrete slabs. The dressing-boxes are of wood with corrugated-iron roof, and a diving platform is provided at the deep end. An electric motor, with centrifugal pump, is brought into operation during the emptying of the bath, when the level of the water in the bath falls below the level of the river. By an arrangement with a mill owner a constant supply of water is allowed to enter the bath, which, while "freshening" the water, also carries away any scum which may form

development of the town, the preparation of a comprehensive scheme of re-sewerage for the whole of the borough is becoming very urgent, and the preliminary work is already in hand. The sewage is delivered to a sewage farm of 108 acres, where, after passing through settling tanks, the sewage is dealt with by broad irrigation on underdrained land. The sewage farm is under the control of a Joint Sewerage Committee composed of members of the town council and rural district council, a portion of the area of the latter council being in the joint drainage district.

The officers of the town council are the officers of the Joint Sewerage Committee. The committee have decided to purchase a further 40 acres for the purpose of constructing beds to deal with the storm water.

The effluent is discharged into the Chelmer at a point on the river about 3 miles below the centre of the town. A considerable portion of the farm is cropped, and the sale of the produce of the farm, which includes willow trees, for which Essex is famous, enables the farm to be managed without making a call upon the rates.

PUBLIC CONVENIENCES.

There are several public conveniences in the town, including a substantial well-appointed one for both sexes constructed in the High-street by the previous surveyor, costing, exclusive of site, about £770, and the one erected by the author in Duke-street, costing about £260, which consists of a red brick and tile structure, with oak half timber framing, and finished inside with white and coloured glazed brickwork, pitchpine woodwork and terrazzo floor. The accommodation consists of lobby, two water-closets, six stalls, and cleaner's store.

DISCUSSION OF MR. HARRISON'S PAPER.

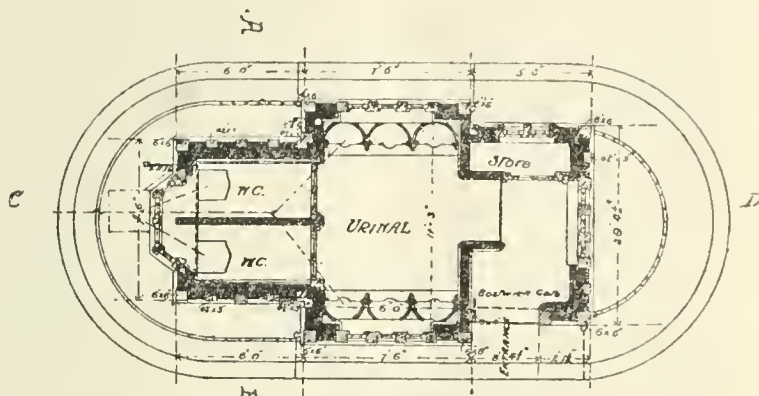

The CHAIRMAN (Mr. H. T. WAKELAM), in proposing a vote of thanks to Mr. Harrison for his paper, said he had been particularly struck with the geological section of the formation which had been passed

figures quoted being between £210 and £220. The results obtained at Chelmsford were exceedingly good. As to garden space, his own experience was that it was not desirable to provide that, for it was generally turned into chicken runs, and so on. It was therefore best to utilise the ground available for gardens as children's playgrounds in the fronts of the houses.

Mr. H. COLLINS (Norwich) congratulated Mr. Harrison on the efficiency of the control exercised over the water supply, which, including the new Galleywood supply, worked out at 18 gallons per head per day. That was a very low consumption, though, of course, the large manufactories had their own water supplies. He might say that at Norwich they had made some running tests in connection with their new sewage pumping station. The dry-weather flow of sewage was 3,000,000 gallons. The total head, the static and friction head, was 95 ft. They had a suction gas plant driving a Roturbo plant and one set of electric motors. They ran the suction gas plant from 6 in the morning until 10 at night, and the electric plant from 10 at night until 6 in the morning, and it also did Sunday work. The cost of pumping on this combined system worked out at £1 16s. 7d. per 1,000,000 gallons pumped.

Elevation to Duke-street.

Long Section C.D.

PUBLIC CONVENIENCE, CHELMSFORD.

through in putting down the borehole; he did not think he had ever seen more strata in such a comparatively small depth as 540 ft., and many difficulties must have been encountered in the carrying out of the work. The plans for the cottages were most creditable to Mr. Harrison; they were well thought out, and were cheap in their execution. The cottages costing £187 showed that great ingenuity had been exercised in the preparation of the scheme. He noticed that the roads of Chelmsford were referred to as being on a clayey formation, but he had observed on entering the borough that morning that the roads were well formed and particularly well cleansed—which was always a great consideration and a great pleasure to members of that institution who interested themselves in such matters in the different districts they visited. He had also been much impressed with the planning of the sanitary convenience which had been described to them. Altogether, Mr. Harrison's experience in a town like Chelmsford must be very valuable, for he was a veritable Pooh Bah in the number of works which he had to carry out.

The PRESIDENT (Mr. J. W. Cockerill) said he was afraid he could not erect cottages as cheaply as Mr. Harrison had done, his nearest approach to the

If they had done the whole of the pumping with suction gas it would have worked out at £1 11s., and if with electricity at £2 4s. 1d., while if the old steam beam engines had been employed the cost would have been £2 10s. 8½d. That bore out the efficiency of suction gas. With regard to the cottages, did the average cost per cottage include the land? He presumed not. [Mr. Harrison: No.] He was surprised that it was not proposed to install baths in all the cottages, because those engaged in dirty trades needed them most. He also thought too many houses had been built on the estate. No provision had been made for children's playgrounds, which in Norwich had been found to be an advantage, as they kept the children off the streets.

Mr. E. WILLIS (Chiswick) complimented Mr. Harrison on the saving, in round figures, of £600 per year, due to modern machinery and boilers. He thought that was one of the benefits councils got by appointing men who tried to keep up to date in all these matters. With regard to the housing scheme did Mr. Harrison find that the baths were used, and was there hot water from the copper immediately in the rear? Arrangements were now made by which hot water from the copper gravitated to the bath. His own experience was that the ordinary baths were

not used except for the storage of sundry chattels and coal. He would like Mr. Harrison's opinion as to the metal casements—were they successful for cottages? Then as to wood block floors, those were used on the earlier schemes, but not on the later ones. He did not understand that, for they seemed very suitable for that class of building. With regard to the fire brigade, was Mr. Harrison, as chief officer, supposed to attend fires and take charge, or leave matters to the superintendent? He agreed with the principle that the chief officer of the council should be chief officer of the brigade. With reference to lighting, he noticed that that cost £2,000 a year. That was somewhat high, considering the comparatively small length of roads, but he attributed it to the arc lamps, and partly to the incandescent lamps. It might, however, be due to the peculiar position Chelmsford held in relation to electric lighting. Did the price of the stables include the foreman's house which was just being built on the land adjoining? In connection with the open-air bath, which had many admirable points about it, the initial cost of construction as quoted was £900, and Mr. Harrison mentioned a new filter put down at a cost of £126. Did the total sum cover the cost of the whole work as they had seen it that day? If so, it was a cheap piece of work, but the cost of maintenance was likely to be heavy in the future owing to the use that had been made of corrugated iron. He complimented Mr. Harrison on the sewage works, there were very few districts able to run their sewage works without a call upon the rates. The borough was to be complimented on their fortunate position. He had been very pleased with the design of the convenience; it seemed most suitable and exceedingly artistic, while the price of £260 appeared to be a very low one. But he would like to ask whether the rate of wages for ordinary artisans and labourers in that neighbourhood accounted for the somewhat low figure.

Mr. C. VAWSER (Herts) asked the cost of the well, which had been sunk 540 ft. With regard to the suction gas plant, which showed a saving of £600 a year. Mr. Harrison did not say what was the horse power, or the cost per horse power for running that machinery, or even the cost of pumping the water per unit of 1,000 gallons. As regarded the roads, Mr. Harrison stated that during his three years of office he had effected eighteen street widenings, at a cost of nearly £10,000, while £9,000 had been spent on wood block and granite sett paving within the last eighteen months. He would like to know the cost per yard of paving in Chelmsford. Tar painting was said to be carried out pretty extensively in Chelmsford. He would like to ask whether the tar was in any way refined or used in its crude state.

Mr. A. E. COLLINS (Norwich) said his experience supported that of Mr. Harrison with reference to wood block floors. He found that where they used wood floors of any sort on the ground they had them ruined in many cases by people covering them with linoleum. He had had endless trouble from people laying linoleum and causing dry rot to set in. It was stated that Chelmsford was the first place for its streets to be lighted by electricity. It was before his time in the Eastern Counties, but he was told that Norwich was the first town. The streets there were lighted with electricity before the Paris Exhibition, which was looked upon as the first large installation of electric lighting. With regard to the use of crude or refined tar on the roads, he had had crude tar from some gasworks which was better than refined tar from others. It was the quality of the coal and the method of carbonisation which governed what the tar would be. Of course, the tar from some gasworks would be better for refining. If they got tar from Somersetshire coal, carbonised in the old way, they got tar like varnish; but if they got tar from some other coal it was as thin as water.

Mr. S. H. CHAMBERS (Hampton) asked what period the loan was obtained for the bath, and also whether the bath was a charge upon the rates.

Mr. S. A. HILL-WILLIS (Tilbury) asked with regard to the housing scheme whether the borough engineer supplied bills of quantities to the contractors. In Tilbury they could not get within a penny of 5-32d. per cube foot. They had cement within a mile, brickworks in the district, and floated the timber, and yet they were just under 7d. per cube foot.

Mr. E. A. SLATER (Colchester) said he saw that Mr. Harrison had economised in several ways in the housing scheme, particularly by utilising the roof as much as possible, and by building in long rows.

There was a great tendency to go in for semi-detached cottages. As regarded the means of secondary access—provided, was it intended to pave these back lanes? The material which he (the speaker) advocated for that purpose was cement concrete, which could easily be made strong enough to stand horse traffic, and was more sanitary than any other method. Mr. Harrison had abandoned wood block flooring, but he (Mr. Slater) rather advocated a system which was a compromise between wood blocks and the other method. He first put down a thin layer of concrete, floated on a covering of neat cement, and then breeze concrete to take the boards. He had worked on those lines for some years, and had had no case of dry rot. He should like to have seen tile roofs to the houses; he thought that would be found to be not only an improvement, but an economy. As to cement, he considered it was rather a curious thing that in the neighbourhood of the Thames, the home of cement, contracts had been running at about 35s. per ton, whereas he had had tenders as low as 28s. from the Thames district, and 31s. from Ipswich. With regard to the tarmixing apparatus, he should like to know what type of machine it was proposed to adopt.

Mr. J. W. LIVERSEDGE (Leigh-on-Sea) said he knew the difficulties which Mr. Harrison had met with regarding the water supply. They had not been ordinary difficulties, because Chelmsford was peculiarly situated in regard to its strata. He would like to ask how far apart these various boreholes were proposed to be placed, and whether Mr. Harrison anticipated any influence of one borehole upon another. He had had some little experience of water supply in Essex, and knew something of the influences in that direction. There was no mention of the capacity of the borehole, unless 1,900,000 gallons a day was the figure.

Mr. HARRISON: That is so.

Mr. LIVERSEDGE added that he had previously seen the works, and he congratulated Mr. Harrison upon his pumping plant. He was quite sure that the corporation would be quite pleased with the arrangement when finished.

Mr. J. R. MEAD (Ipswich) said the paper proved that the municipal engineer was a jack-of-all-trades, and that Mr. Harrison was the master of them all. He thought the design of the cottages was very artistic. He was interested at the moment in the question of how to obtain power for raising sewage. Mr. Harrison stated that he had reduced the cost of pumping by the use of suction gas from £800 to £200 per annum. This was really a wonderful reduction. It was only 25 per cent of the original cost. He had worked out Mr. Collins' cost as 66 per cent only of the higher figure. He thought Mr. Harrison had adopted the best method when he adopted suction gas, but those figures did appear extraordinary.

Mr. H. COLLINS explained that his figures were not for fuel only, but covered labour and everything complete for the running of the station. The saving on fuel would be much greater than on the running cost.

Mr. J. A. WEBB (Great Stanmore) asked for statistics of the various methods of tar-surfacing in Chelmsford.

Mr. HARRISON, in replying to the discussion, said the president of the institution had raised a question as to the provision of playgrounds for the children. The Housing Committee—to whom must be given the credit of the housing scheme—desired to place the largest number of cottages possible upon the site, and although modern thought was tending towards town planning, they were not able to reduce the number of cottages to less than twenty-two to the acre. He agreed that more could have been done with the site but for that decision. With regard to Mr. Harold Collins' reference to the waterworks and the consumption of water, all the manufacturing works of any size had their own water supply. The low water consumption per head was accounted for by the fact that only the large houses had baths, and some of the smaller houses had a standpipe water supply. With regard to baths in cottages, he had reason to believe that the baths were appreciated. They had the foresight to adopt folding baths which could not be used as coal bunkers. With reference to Mr. Willis's question, the baths were filled with a tap by which a hot-water supply could be obtained from the copper. With regard to the metal casements to the windows, the cost per super. foot came considerably less than joiner's work, and as it was anticipated that the maintenance cost would be reduced, they felt justified in using them. With regard to the wood-block floors, his first idea was to have boards nailed on the con-

crete, but they had a clay subsoil, and some of the practical members felt that it would not be suitable, and it was decided to have wood blocks. With regard to his being chief officer of the fire brigade, the chief officer attended fires when his conscience would not allow him to stay away. They had a superintendent who did take control pending the arrival of the chief officer. They paid £3 3s. per lamp per annum for electric lighting other than the arc lamps, and £3 for gas. The foreman's house was not included in the figure for the depot, but the horsekeeper's cottage was. He agreed that the cost of the open-air bath was low. The painting bill would, however, be high, and quite an appreciable cost in the future. The pumping plant was 35-h.p. He was not able to give the working cost other than for fuel alone. It was an exceedingly nice thing for an engineer to come across in taking up his duties. He did not take all the credit of such an enormous saving. The engine was designed to run at high pressure, and the old boilers, which were extremely old, at low pressure, so that they would see that the saving was bound to be considerable whatever improvement was made at the waterworks. With regard to the tar-painting of the roads, whatever tar was put on the roads in the summer was destroyed during the winter. The mud formed in winter forced itself up, and the tar surface was destroyed. Until they could go in for tar-macadam he had come to the conclusion that the best thing they could do was to tar-paint the roads at the lowest cost. He used crude tar, which he boiled to get rid of the light oils and water. He did not think it worth paying another 150 per cent more for refined tar. With regard to bills of quantities, he might say that no bills of quantities were prepared as the practical men on the council were inclined to think that a bill of quantities would increase the cost. Mr. Slater referred to the pavings of the backways of the cottages. At the present time hardcore and gravel were used. He quite admitted that a concrete paving would be better, but the question of cost came in again. He was also sorry that he was not able to put tile roofs instead of slate roofs, but the question of cost, in more ways than one, came in. They had to save somewhere, otherwise they would not have got the figure they had.

In the afternoon inspections were made of the working-class dwellings described in the paper, the new suction-gas plant at Mildmay Yard waterworks, and the new stables and depot. On the termination of the visits the members returned to the Shire Hall, where they were entertained to tea by Mr. Harrison.

GOLDSMITHS' COLLEGE ENGINEERING DEPARTMENT.

SUMMER COURSES.

Summer courses of special character are being held in the engineering department of Goldsmiths' College (University of London), New Cross, S.E., during May and June, as shown in another column, and the lectures on reinforced concrete, engineering costs and works management, and wireless telegraphy should prove very attractive. All these will be treated practically, and the college installation will be used for "wireless" practice. In addition, there are to be special demonstrations in the mechanical and hydraulic laboratories, classes in drawing-office and workshop practice, and land surveying for both elementary and advanced surveyors, with plenty of actual work.

"Trinidite" and "Bitite."—We have received from the Dussek Bitumen Company, Canal Bank, Deptford, S.E., copies of two pamphlets giving particulars regarding "Trinidite," which they specially manufacture for grouting macadam, and "Bitite" for granite setts and laying wood-block paving, and surfacing all kinds of macadam roads. We are informed that these materials are giving every satisfaction in every case where laid, and, owing to the success which has attended their use, and the considerable amount of work which the firm have in hand for the present season—one item alone being 600 to 800 tons. for Mr. H. T. Wakelam, county engineer of Middlesex—they have been obliged to take new premises, and are at the present time erecting further works at Poplar. The company will be pleased to forward to any SURVEYOR readers who may not have already received one, a copy of their pamphlet describing "Trinidite."

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain,
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2.

PURIFICATION OF SWIMMING BATHS WATER.

To the Editor of THE SURVEYOR.

SIR,—Many thanks for your note of last week on my swimming bath system. I do not wish to weary you, but perhaps you would be interested to know that the cost of water supplied to the Radford baths (main water) for 1913-1914 was £265, the Victoria baths £466 10s., and the Northern baths £151. These baths are emptied twice a week.

The Radford baths, from April 1, 1913, to March 31, 1914, were used by 40,057 persons (swimmers), made up as follows: Males, 34,472; females, 5,585—an average weekly attendance for the fifty-two weeks of 770. The actual bathing season is from April to September, so I assume for that period the average attendance would be something like 900 persons. Some 450 persons are thus compelled to pass through a pond of water which stands three days before it is changed!

I am of the opinion that the structure of our town or inland baths is greatly at fault, inasmuch as the light and air appear generally to be from the roof only. Why not rearrange the thick walls, and let quite half the height be windowed, and so made to be opened for the admission of fresh air and sunlight, as in school buildings? If a boundary wall or other partition were built, the whole of the sides could be made to open.—Yours, &c.,

ARTHUR POLLARD.

Nottingham.

April 18, 1914.

To the Editor of THE SURVEYOR.

SIR,—We again see reference made by you to the question of sterilisation of water in swimming baths, but you refer only to the use of electrolytic fluid. One of the special features in our system is the use of lime water as a sterilising agent, its action in this respect having recently been proved conclusively. The enormous advantage in the use of lime water is that it has no detrimental effect whatever on the water, having neither smell nor taste.

We were the first to adopt the process of continuous chemical treatment in connection with the purification of water in swimming baths, and in particular the use of lime water, which we have now been using for the past 4½ years with excellent results.

We recently sent a copy of analysis to an eminent authority on sewage purification, and he wrote back saying that the results were astonishingly good.—Yours, &c.,

"TURN-OVER" FILTER COMPANY.

39 Chichester-street,
Belfast.

April 20, 1914.

[The "Turn-over" Filter Company forward with the above letter a copy of one of their latest pamphlets, which we recommend to the notice of all interested in the question referred to in our "Minute" of last week.—Ed. SURVEYOR.]

THE INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

To the Editor of THE SURVEYOR.

SIR,—With reference to the letter of "Another Member," in your issue of February 27th, I consider the suggestions put forward in the first portion of his letter worthy of serious consideration, and I feel sure that the present progressive and liberal-minded council of the institution would give them favourable consideration if approached in the right spirit. What I have seen and know of the present council has convinced me that they are anxious and willing to listen to and encourage the views of the younger members, and desirous that they should take an increasing interest in the affairs of the institution.

I, however, wholly disagree with the idea of amalgamation with the Institution of Municipal Engineers, entirely failing to see what there is to be gained by it since the junior institution can hardly be considered either a rival or representative body. I am sure the proposition, if put to the vote of members of the Institution of Municipal and County Engineers, would

receive scanty support and the short shift that it deserves.—Yours, &c.,

A. G. WHITEFIELD.

Public Works Department,
Taiping,
Federated Malay States.
March 29, 1914.

[It may be recalled that in the letter referred to by Mr. Whitefield the suggestion was made that the example of the Surveyors' Institution might well be followed, and about four young members elected to the council of the institution. These members, who, it was pointed out, would know and feel the hardships existing, should, it was further proposed, be not over thirty-five years of age, hold the testamur of the institution, should not occupy a chief appointment or be engaged in the same office as another member of the council, and their travelling expenses should be paid for from the institution funds. The desirability of amalgamation with the Institution of Municipal Engineers was also touched upon.—Ed. SURVEYOR.]

ROAD BOARD GRANTS.

A WILTSHIRE GRIEVANCE.

In the House of Commons, on Monday, Mr. C. Bathurst asked whether the Road Board, after making

EALING COUNTY SCHOOL.

REINFORCED-CONCRETE CONSTRUCTION.

By the courtesy of the proprietors of the *Indented Bar Bulletin* we are enabled to reproduce three views of the above-named school—the exterior, the assembly hall and the art room. This is another of the buildings which have been carried out for the Middlesex Education Committee on the system of the Indented Bar and Concrete Engineering Company, Limited.

In this case, the columns, beams and floors are all of reinforced concrete, as well as some of the staircases. The beams and columns for the hall are carried on strip footings, and the former are interesting owing to their large span—viz., 20 ft. 3 in. clear, having a section of 18 in. by 18 in. They are also a good illustration of how the main reinforced-concrete structural members can be made to harmonise with the architect's scheme of internal decoration.

Immediately over the assembly hall are a series of three class-rooms and a corridor, the beams over which are a trifle longer than those already mentioned—namely, 31 ft.—and shallower in section—viz., 24 in. by 12 ft.

From the view of the art room it will be seen that the roof trusses are carried on reinforced-concrete beams, which are T-shaped, with a slab approximately 3 ft. wide forming the top of the T.

The building consists of a basement, ground floor,

EALING COUNTY SCHOOL.

a grant to the Wiltshire County Council of 50 per cent of the cost of tar-spraying the main roads of the county where they pass through the more populous villages, had recently intimated that no further grant would be made for this purpose, with the result that the whole cost of the process would be thrown upon the county ratepayers; and, if so, whether, seeing that at least two-thirds of the dust nuisance from which the villages suffered was in that county occasioned by pleasure-seeking motorists living outside the county, the Government will undertake that an adequate proportion of the total cost of abating such nuisance should continue to be defrayed out of the Motor Licence and the Petrol Duties which constituted the Road Board Fund?

Mr. Montagu said a conference between the board and representatives of the Wiltshire County Council had been fixed to be held on the 21st instant. Perhaps the hon. Member would therefore postpone his question.

CIVIL SERVICE COMMISSION'S RECOMMENDATIONS.

Mr. Bridgeman asked the Prime Minister whether he proposed to take any steps to carry out the recommendations of the Civil Service Commission that the Road Board should be brought under Ministerial and Parliamentary control, and its staff brought under Civil Service rules?

In reply, the Prime Minister said: The recommendation would be carefully considered, along with the other recommendations of the Royal Commission.

first and second floors. The architect was Mr. H. G. Crothall, F.R.I.B.A., architect to the Middlesex Education Committee. The contractors were Messrs. Allan Fairhead & Son, Enfield.

Electrically-Driven Refuse Vehicles.—The Birmingham electricity department have undertaken to supply the Refuse Disposal Committee with two electric battery vehicles for the removal of street refuse. These vehicles will cost about £550 each, but it is considered they will do the work better and more economically than horse-drawn vehicles. Should the experiment prove successful it is probable that more vehicles of a similar type will be provided.

Gloucestershire Roads.—Mr. F. W. B. Cripps (chairman of the Highways Committee) at the Gloucestershire County Council meeting on Monday stated that the estimate put forward by that committee was the largest ever brought before the council. The cause and the justification of the figures were simply that they were due to the traffic which the roads of the county had to bear. From June, 1912, to 1914 the increase in the tonnage had gone up 71 per cent. For the period now to be faced the committee's expenditure would be up a matter of £29,000, and this would enable them to put 27,000 tons of increased material upon the roads. The estimate totalled £136,331, and with this the county surveyor would put upon the roads a total of 145,000 tons of material.

MUNICIPAL WORK IN AUSTRALIA.

PRAHRAN CITY SURVEYOR'S REPORT.

In his report on the works carried out under his direction during the year ended September 30th last, Mr. E. F. Gilchrist, city surveyor of Prahran, reports a slight increase of the length of roadways and pavements, there being now 65 miles of streets

not watering excessively, is a strong argument in its favour. This motor is now converted and provided with a tipping body worked mechanically from the engine, so that when not in use for street watering it can be used for general carting.

The other motor lorry has worked almost continuously since commencing, and covered during the eight months 4,407 miles for a consumption of 814 gallons of petrol, which is equal to 5.41 miles per gallon. It transported 6,087 tons of material, the average mileage per day being 21.8. The cost per ton cartage worked out at 1s. 13d.

ASSEMBLY HALL, EALING COUNTY SCHOOL.

and 18 miles of lanes. The area of the city is 2,357 acres.

During the twelve months under review over 4 miles of streets were metalled, while repairs and top dressing were carried out on a large number of foot-paths.

The tar-painting of macadam streets was carried on during the summer months, the area so treated being 114,540 sq. yds.

Mr. Gilchrist mentions that the whole of the house refuse (8,770 tons) and trade and market refuse (884 tons), making a total of 9,654 tons, were destroyed at the destructor.

The number of electrical units generated and sold was 423,770, and the power used for council's own lighting and other works was 37,648 units. The quantity of electricity generated per ton of refuse burned was 43.89 units, and the water evaporation per lb. of refuse .95 lb. The revenue received from electricity was £725, as against £678 in the previous year. The revenue for burning private refuse was £165, as against £167. The value of clinker sold to builders and others amounted to £128, and that used on the council's own works to nearly £100.

MOTOR TRACTION.

The report states that two Halford petrol motor lorries were at work for eight months up to the end of September, and had done excellent work. One of these, a 3-ton vehicle, used for street watering, covered 2,284 miles for a consumption of 418 gallons of petrol, or 5½ miles to the gallon. The advantages of this system of street watering have been found to be very great; for, although the cost works out at about the same as for horse traction, the convenience in getting over the ground so much more quickly, in being no hindrance to the travelling public, and in

collection, scavenging and street watering. Reply "Snowdon," office of this paper.

Concrete Institute: Junior Members' Meeting.—The second informal meeting of junior members of the Concrete Institute will be held on Friday, May 1st, at 7 p.m., at Denison House, 296 Vauxhall Bridge-road, Westminster, S.W. (close to Victoria Station), when

Mr. Balfour—Civil Engineer.—The interesting announcement was made yesterday that the Right Hon. Arthur James Balfour, P.C., F.R.S., D.L., M.P., 4 Carlton-gardens, S.W., has been elected an honorary member of the Institution of Civil Engineers.

Refuse Collection, &c.—

A surveyor to an urban district of about 5,000 inhabitants would be very much obliged for any information from surveyors who have had experience of contract v. direct labour as applied to house refuse

ART ROOM, EALING COUNTY SCHOOL.

Mr. E. Fiander Etchells, F.PHYS.SOC., M.MATH.A., A.M.I.MECH.E., member of council of Concrete Institute, will take the chair. The business before the meeting will be a continuation of the discussion on the paper "The Design of Steel and Reinforced-concrete Pillars, with Special Reference to Secondary and Accidental Stresses," read at the ordinary general meeting on April 16th by Mr. Oscar Faber, B.S.C., A.C.G.I., ASSOC.M. INST.C.E.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. INST. C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

Mr. H. BONE, of Falmouth, has selected the following books in respect of the March premium, and they have been duly sent to him:

- "Public Health Act, 1875, and other Statutes, &c.," by Herbert Davey (Knight);
- "Arbitrations and Awards," by J. P. H. Soper (*Estates Gazette*, Limited);
- "A Short Specification of Materials, &c.," by James Cubitt (Lockwood); and
- "Municipal Engineering: Model Answers to Questions" (St. Bride's Press, Limited).

QUESTIONS.

This week answers are invited to the following questions:—

390. Removal of House Refuse. A new urban district has just been formed in the neighbourhood of London of which the following are particulars: Area, 3,500 acres; population, 9,000, increasing at rate of 700 per annum; number of houses, about 2,300; length of district, north to south 3 miles, east to west $1\frac{1}{4}$ miles; mileage of roads, 17; character of district, flat in northern part, hills up to 1 in 16 in southern part; distribution of population, 2,000 at north end in 240 villas, shops, &c., 500 in north-east in large houses with long approach drives, 1,000 in south and south-west in small villas and workmen's cottages. The refuse for the present will be utilised at brickfields on the southern boundary of the district. It is desired to organise the removal of house refuse on the most up-to-date methods compatible with economy. Describe fully the methods of collection and transit, the organisation of the staff, the plant required, and give an estimate of the capital and annual charges for this work. Trade refuse is negligible, and no plant has been taken over from the rural authority who formerly had control of the area. (Togun.)

391. Concrete Floor.—A concrete floor is to be constructed as shown in the sketch, with 4-in. by 3-in.

R.S. joists, and woven mesh steel wire with a 3-in. lap. The R.S. joists have a $4\frac{1}{2}$ -in. wall hold, and the floor a 2-in. wall hold. The size of the room is 16 ft. by 13 ft. Calculate the safe distributed load per super. foot, also the breaking load. (Assistant.)

392. Sewage Purification.—The sewage of a college is to be treated as follows: The liquid is first admitted to a septic tank, then to a vertical upward filter filled with agricultural pipes; thence it flows through a clarifier to the sewer of the city. The population of the college is about 300 people. (1) Give dimensions of each of the tanks, in order that the liquid effluent may be good. (2) Does the vertical upward filter act as an oxidising filter or merely as a second settling tank? (3) How often will the vertical upward filter have to be cleaned in order to keep the effluent good? (Deleatur.)

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulæ involved. (T. W. P., *Bexhill-on-Sea*.)

REPLIES TO QUESTIONS.

388. Reactions on Beams.—Show how to find (graphically or otherwise) the pressures on the two supports of a horizontal beam which is loaded at any given point. If the distance between the supports

be 20 ft., and if one of the loads be 12 cwt., find the changes in the pressures produced by shifting this load through a space of 5 ft. along the beam. (A.M.I.C.E.)

When a beam is loaded with given weights placed at certain points, and rests in a horizontal position on two supports, it is often necessary to determine the forces of pressure on the supports, or, what amounts to the same thing (since action and reaction are equal and opposite), the reactions of the supports on the beam, which are, of course, equal and opposite to them.

FIG. 1.

These two reactions, together with the weights on the beam, and the weight of the beam itself, if it be heavy, form a system of forces in equilibrium, and hence the following statements hold:—

- (1) The sum of the forces is zero.
- (2) The sum of their moments about any point is zero.

FIG. 2.

If we want to find the reactions one at a time, we therefore proceed as follows:—

(a) Take moments about one of the supports. The reaction of that support has no moment, and therefore the equation of moments at once gives the reaction of the other support.

FIG. 3.

(b) Equate to zero the algebraic sum of the forces (including the two reactions). The equation gives the sum of the reactions, and hence the other required reaction.

An example will perhaps make the method quite clear:—

Let a beam, whose weight is W , acting at its centre of gravity G , be supported at X and

Y, and let any weights w_1, w_2, w_3 be attached at points A_1, A_2, A_3 .

Then if P and Q denote the unknown reactions at X and Y (see Fig. 1), the equation of moments about Y gives:

$$P \cdot XY = w_1 \cdot YA_1 + w_2 \cdot YA_2 + w_3 \cdot YA_3 + W \cdot YG \dots (1)$$

Again, the equation of moments about X gives:—

$$Q \cdot YX = w_1 \cdot XA_1 + w_2 \cdot XA_2 + w_3 \cdot XA_3 + W \cdot XG \dots (2)$$

Adding equations (1) and (2) gives:—

$$(P+Q)XY = w_1(XA_1 + YA_1) + w_2(XA_2 + YA_2) + w_3(XA_3 + YA_3) + W(XG + YG)$$

$$\text{or } (P+Q)XY = w_1 \cdot XY + w_2 \cdot XY + w_3 \cdot XY + W \cdot XY$$

i.e., P + Q = $w_1 + w_2 + w_3 + W$.

This is the equation we should have obtained by resolving perpendicular to the rod or equating the algebraic sum of the forces to zero, showing that the values of P and Q found by resolving and taking moments about the supports are consistent.

If it should be found that the thrust on one of the supports should come out negative, it is to be inferred that the rod presses upwards on its support, and that the latter has to hold it down.

Now, referring to Fig. 2, suppose that the load is originally placed at a distance of 8 ft. from the left-hand support, and let the weight of the beam be W cwt.

As above; taking moments about the left-hand support, we get:—

$$12 \times 8 + W \times 10 = Q \times 20$$

i.e., 96 + 10W = 20Q

$$\therefore Q = \frac{96 + 10W}{20}$$

$$= \frac{48 + 5W}{10}$$

Referring to Fig. 3, the load is now supposed to be moved 5 ft. nearer the left-hand support—*i.e.,* it is 3 ft. away.

And we have again:

$$12 \times 3 + W \times 10 = Q_1 \times 20$$

i.e., 36 + 10W = 20Q₁

$$\therefore Q_1 = \frac{36 + 10W}{20}$$

$$= \frac{18 + 5W}{10}$$

Hence the change in pressure at the support Q is:—

$$Q - Q_1 = \frac{48 + 5W}{10} - \frac{18 + 5W}{10}$$

$$= \frac{48 + 5W - 18 - 5W}{10}$$

$$= \frac{30}{10}$$

\therefore Change in pressure = 3 cwts.

Similarly, by taking moments about the right-hand support, it would be found in the same way the pressure altered by 3 cwt. as the load was moved, but the alteration would be a decrease, whereas the other was an increase; or symbolically—

$$Q - Q_1 = 3 \text{ cwts.} = P_1 - P$$

(T. W. P., *Bechill-on-Sea*.)

The following problem and its solution are sufficiently wide in character to answer the question submitted:—

Fig. 1 shows a system of balanced parallel forces. Determine graphically (1) the reactions of the two supports AB and GA; (2) the bending moment about B' of all the forces to the left of this point; (3) the bending moment about C' of all the forces to the left of this point.

Assume the 12-cwt. load to be any of those shown in Fig. 1, say the load DE of 1,000 lb.

(1) Construct the force polygon *bcdefg* (Fig. 3), by representing to scale (any convenient scale) the parallel forces BC, CD, DE, EF, and FG. Since all these forces act downwards they are scaled downwards; and since their direction of action is parallel, the force polygon reduces to a straight line *bg*.

Since the position of the polar point *p* in the force diagram is arbitrary, it is convenient so to

select it that the normal ray, *ph*, will be a convenient number to multiply by. To accomplish this it is sufficient to choose any point *h* in the force polygon (this applies to parallel forces only), which will be normal to the vectors of the polygon, making it represent, to the same scale as the polygon, a force, say, 100, 1,000, or 10,000 lb. In Fig. 3 it is scaled to represent 20,000 lb., and the point *h* is chosen anywhere about midway on the force polygon.

The vectors *pb, pc, pd, pe, pf,* and *pg* are now drawn and the force diagram completed.

The funicular (Fig. 2) is now constructed, having each of its strings parallel, respectively, to the vectors of the force diagram.

The intersection of the funicular strings being at the points of intersection of the strings with the vertical lines of action of the corresponding forces, these latter lines are projected in Fig. 1 for convenience.

The convenience of the lettering will now be apparent; *p* being normal to all the forces, it is used in the middle of the funicular, and is only written once to save confusion.

Then PB is drawn parallel to *pb*, PC parallel to *pc*, &c., and PG parallel to *pg*, their points of intersection being on the vertical lines of actions of the corresponding forces. These, from *b* to *g*, representing all the known forces.

Close the funicular by the line PA. From the fact that the system was stated to be a balanced system of forces, by the principles of graphic statics its funicular must close—that is, the last string of the funicular (in this case PA) must coincide with the first.

Now draw *pa* parallel to PA, and it is seen that it cuts the force polygon into two portions (forces), *ab* and *ga* (not *ag*, as this would indicate the force acting from *a* to *g*—downward, which cannot be the case of the support if the system of forces is to be kept in equilibrium), which, according to the lettering used, represent the forces exerted by the supports AB, GA.

Scaling *ab* and *ga*, they are found to be 7,200 and 11,800 lb. respectively.

(2) and (3) The bending moments about the points B' and C' (in fact, about any point on the beam) can now be determined graphically from the funicular and force diagrams. This, in terms of the intercepts and the normal ray, may be stated, in words: The moment of a force about a point is equal to the product of the normal ray, and the intercept of the force (or any other point of the beam) with the funicular both referred to the same polar point.

B' and C' are the points on the beam in question about which the moments are required. Draw lines through the points B' and C', parallel to the forces, then KL and K₁L₁ are the intercepts for these points, and by the scale of distances (1"=4' here used) are found to be 1.96 ft and 2.32 ft, respectively. The normal ray was made to represent 20,000 lb.

Therefore—

$$\text{B.M. at point B}' = 1.96 \times 20,000 \text{ lb.} = 39,200 \text{ ft. lb.}$$

$$\text{B.M. at point C}' = 2.32 \times 20,000 \text{ lb.} = 46,400 \text{ ft. lb.}$$

For practice, the 1,000 lb. load can be moved 5 ft. to the right of its present position, and the graphic method, here explained, repeated.

Analytic Method. As stated, the system of forces is in equilibrium, and therefore their resultant must equal zero; its moment about any point must also be zero; and as the moment of the resultant of a system of forces is equal to the sum of the moments of the components of the same system of forces we have, stated in equation:—

$$M_1 + M_2 + M_3 \dots \text{e.c.} = 0$$

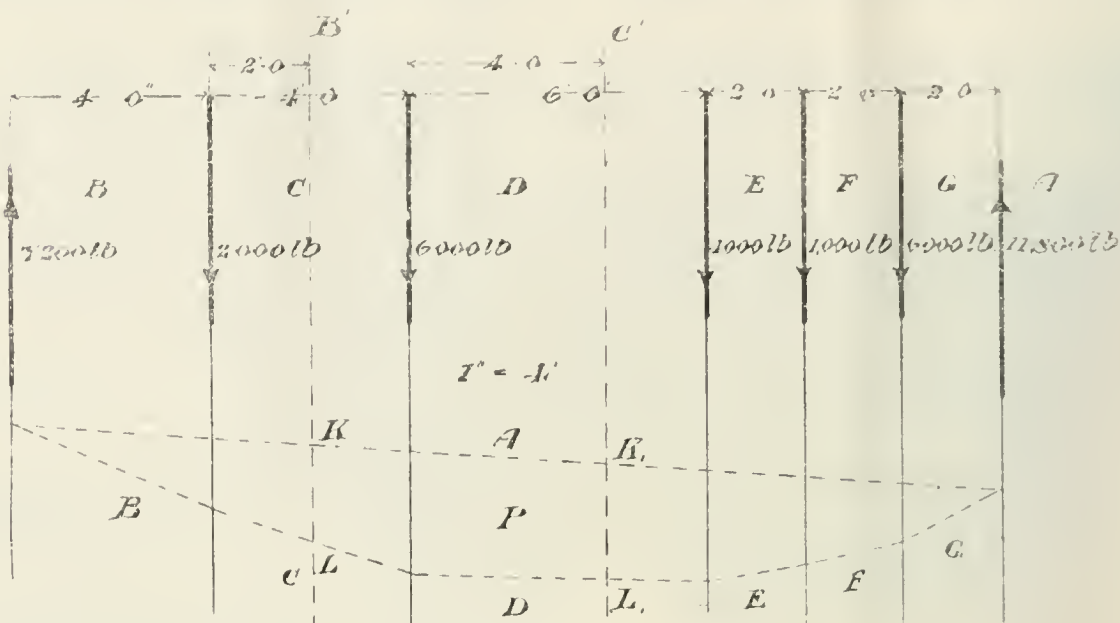

Where M_1 , &c., are the moments of the components about any point in their plane. The use of the word "sum" must be understood to be the algebraic sum, plus or minus, as the action of the moment may be about that point. For instance, the moment of the load BC about the point B' is minus—*i.e.,* it tends to move about the point B' in a contra-clockwise direction. Again, the load CD would have a plus moment about the point B', as its direction would be clockwise.

On the beam in question there are seven forces acting; two of them, the reactions of the supports, are unknown. By taking moments about the support GA, one of the unknown forces will be cau-

celled—i.e., the reaction at the support GA can have no moment about the point GA, since its lever arm is zero. There remains, then, only one unknown quantity (force) in the above equation to be determined.

Let R represent the unknown force (reaction at AB). Then, taking moments about GA, and giving

Now, moving the 4,000 lb. load 5 ft. to the right of its present position, the above equation becomes—
 $+ R \times 20 - 2000 \times 16 - 6000 \times 12 - 4000 \times 11 - 1000 \times 4 - 6000 \times 2 = 0$
 $R = \frac{164000}{20} = 8,200 \text{ lb.}$
 and $R_1 = 19000 - 8200 = 10,800 \text{ lb.}$

FIGS. 1 AND 2.

The term "lever arm" was made use of; this is merely the distance that the force is to the right or left of the point about which moments are taken.

It should be noted, too, that the equation $M_c +$

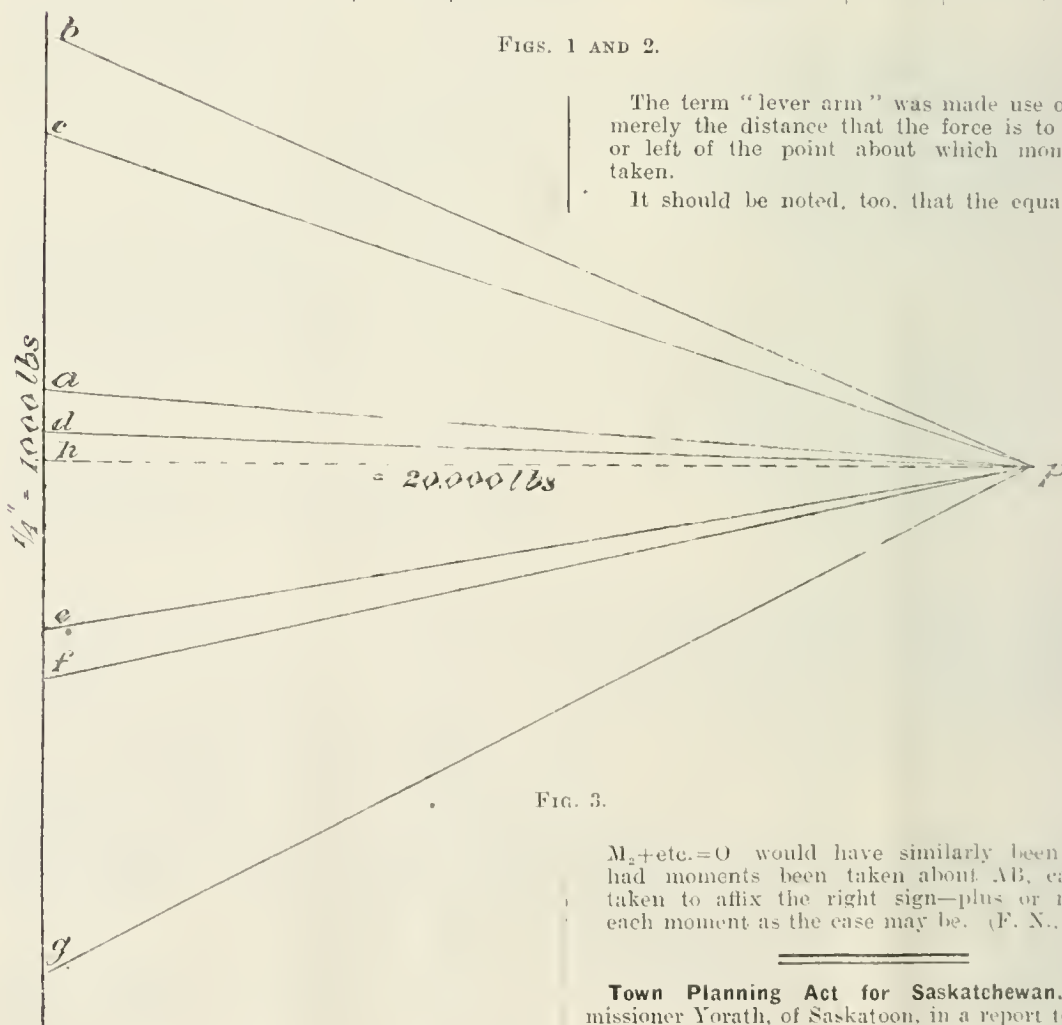

FIG. 3.

$M_2 + \text{etc.} = 0$ would have similarly been satisfied had moments been taken about AB, care being taken to affix the right sign—plus or minus—to each moment as the case may be. (F. N., Dornoch.)

each force a + or a - sign, according to the rule previously stated, we have:—

$$+ R \times 20 - 2000 \times 16 - 6000 \times 12 - 4000 \times 11 - 1000 \times 4 - 6000 \times 2 = 0$$

$$R = \frac{164000}{20} = 8,200 \text{ lb.}$$

Then R_1 (reaction at GA) = $2000 + 6000 + 4000 + 1000 + 6000 - 7200 = 11,800 \text{ lb.}$

Thus $R + R_1 = 7200 + 11800 = 19000 = \text{total load on beam.}$

Town Planning Act for Saskatchewan. — Commissioner Yorath, of Saskatoon, in a report to the city council recently, proposes to take the initiative in urging upon the Provincial Government the necessity for passing a Town Planning Act. In the opinion of Mr. Yorath, the Town Planning Act should provide: (a) The design of a proper system of main sewers, water mains and tramways; (b) the types of main, secondary and residential roads; (c) the provision of open spaces, parks and recreation grounds; (d) the space about buildings, their limitations, height and character; (e) the restriction of stores, factories and works to special areas; (f) amenity; (g) compensation and betterment.

The Surveyor

And Municipal and County Engineer.

SOME RECENT PUBLICATIONS.*

THE MUNICIPAL YEAR BOOK, 1914. Price 15s. nett.
London: The Municipal Journal, Limited.

Although the general arrangement of this well-known and exceedingly useful annual remains the same as in former years, the new issue has been amplified in many respects, one of the most important additions being a section devoted to the subject of Motors in Municipal Service. The sections relating to Libraries and Baths and Washhouses have been recast, the former in order that municipal museums and art galleries might be enumerated, and the latter in order to differentiate between various types of baths. Evidence that the work is thoroughly up-to-date is afforded by the inclusion of the new Procedure Regulations under the Housing, Town Planning, &c., Act, 1909, issued in February this year. The general contents may be briefly reviewed under three headings—namely (1) Particulars and statistics of municipal and local government authorities (sections 1 to 8); (2) Particulars and statistics of municipal services and undertakings (sections 9 to 23); and (3) Miscellaneous matters (sections 24 to 29). As regards the first of these main divisions, some account is given of the constitution and functions of the Local Government Board, the Road Board, and the Development Commission. Then, each corporation, urban district council and rural district council is dealt with individually, the information (except as to the rural authorities) comprising statistics, names of members and officers, and an account of the chief undertakings. Special sections are devoted to similar information in regard to Scottish and Irish authorities. Under the second main division there appear general statistics and analyses of accounts of water supply, gas supply, electricity supply, and tramway undertakings, together with information regarding motors in municipal service, education, housing and town planning, markets and slaughterhouses, baths, libraries, cemeteries, sewage and refuse disposal, fire protection, small holdings and allotments, and old-age pensions. The section on town planning is deserving of special notice, and constitutes practically a short treatise on the practical execution of Part II. of the Act of 1909. The third and last main division of the work comprises a digest of legal decisions and statutes, and sections devoted to municipal trading, local taxation, wages, distress committees, and

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

municipal societies. Enough has been said to show the exhaustive character of the work, which is practically indispensable to the local government official.

ROAD CLASSIFICATION AND MAINTENANCE.

SIR GEORGE GIBB'S PROPOSALS.

Proposals for the classification of roads and a reform of the provision for their maintenance were made by Sir George Gibb, chairman of the Road Board, before the Departmental Committee on Imperial and Local Taxation. Sir George's statement is published in the appendix to the committee's final report.

The question was discussed by Sir George Gibb from three principal points:—

(1) Complaints on behalf of ratepayers in regard to the burden of road maintenance cost and the inadequacy of Exchequer contributions thereto.

(2) Complaints in regard to the distribution among highway authorities of the Exchequer contributions.

(3) Complaints of road users in regard to the standard of road maintenance in some districts.

Sir George Gibb suggested that all public roads be classified into the following groups: Urban.—

(1) Subsidised main roads; (2) subsidised county roads; (3) county local roads; (4) district roads.

Rural.—(1) Subsidised main roads; (2) subsidised county roads; (3) county local roads; (4) district roads.

The classification should be made by some central authority after conference with highway authorities and with power on its own initiative or on the application of a highway authority to determine the classification of each and every part of any road, and to alter the classification from time to time. There would be no objection to sections of a continuous length of road being in different classes.

All provisions contained in any existing Act of Parliament relating to main roads should remain applicable to roads classed as main subsidised roads, county subsidised roads, and county local roads, except that sections 15 and 16 of the Highways and Locomotives (Amendment) Act, 1878, should cease to apply to main subsidised roads. This would involve county councils taking over any district roads which may be classified as main roads in their existing condition. (See section 11 [7] of the Local Government Act, 1888.)

The central authority would decide as to whether expenditure was chargeable to maintenance or improvement. Annual estimates should be presented to the central authority. The latter would certify to the Treasury the amounts under each heading in respect of subsidised roads.

The central authority would pay out of the road maintenance fund to each county council, non-county borough council, and urban district council in respect of roads maintainable by them:—

(1) Fifty per cent of the certified estimated cost of maintaining subsidised main roads.

(2) Thirty per cent of the certified estimated cost of maintaining subsidised county roads.

(3) Special grants towards the maintenance of any main roads, and such percentage as the central authority might determine, not exceeding 25 per cent of authorised contributions by county councils to the cost of maintaining district assisted roads, but the total amount to be allowed under this head should not exceed a prescribed sum in any one year.

Grants-in-aid might be withheld or reduced if the roads had not been properly kept up.

Roads in county boroughs would be dealt with in one or other of the three following alternatives:—

(1) Roads to be selected and classified by a central authority as subsidised main roads in county borough areas, and to receive subsidies calculated as nearly as possible at the same rate per square yard on the selected roads as the average grant to subsidised main roads in the adjoining county or counties.

(2) Grant a small annual percentage—say, 5 to 10 per cent of the total cost of maintaining all roads in county boroughs.

(3) In lieu of grants to maintenance grant a fixed annual sum based on population to each county borough to be spent either on the widening of roads or the construction of new roads to relieve traffic congestion.

Roads in London should be dealt with in the same way as in county boroughs.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in black ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

SEWAGE DISPOSAL: MANUFACTURING EFFLUENTS: RIVERS POLLUTION PREVENTION ACTS, 1876 AND 1893.

An important question under the Rivers Pollution Prevention Acts 1876 and 1893 was decided in *West Riding Rivers Board v. Linthwaite Urban District Council* (King's Bench Division, January 30th). Briefly, the point at issue was whether, where an offence is committed under sec. 4 of the Act of 1876, the manufacturer or the local authority is liable. That section makes it an offence to cause to fall or flow, or to knowingly permit to fall or flow, or to be carried, into any stream any poisonous, noxious or polluting liquid proceeding from any factory or manufacturing process. But sec. 6 prohibits proceedings being taken against the offender save by a sanitary authority or without the consent of the Local Government Board, with the proviso that, if the authority, on the application of any person interested, refuses to take proceedings or to apply for the necessary consent, the board may compel the authority to proceed. The board are not to consent to proceedings by the authority of a district which is the seat of any manufacturing industry unless satisfied that means for rendering the effluents harmless are reasonably practicable and available, and that no material injury will be inflicted on the industry. By the joint effect of sec. 14 of the Local Government Act, 1888, and a Provisional Order of the Local Government Board made in 1891, the plaintiffs have the powers of a sanitary authority under the Act of 1876. They took proceedings against the council in the county court, alleging that the council had committed an offence under sec. 4 by permitting to be carried into a stream polluting liquid from a factory or manufacturing process. The county court Judge decided in favour of the plaintiffs, and the council appealed. In support of the appeal it was contended that the only persons or body against whom proceedings could be taken under sec. 4 were the persons whose factory or manufacturing process was producing the liquid. The Court accepted this view, and allowed the appeal. Mr. Justice Bankes, in the course of his judgment, said that there was nothing more in the language of sec. 4 to restrict the kind of person against whom proceedings should be taken than there was in sec. 3 (which relates to sewage pollutions). But sec. 6 clearly dealt with restrictions on proceedings under Part III. of the Act, which began with sec. 4. It was plain that secs. 4 and 6 must be read together. Looking at sec. 6 it became clear that two classes of persons were dealt with—the persons by whom proceedings were to be taken, and the persons against whom proceedings were to be taken. These could not be the same identical people. That was not, perhaps, conclusive of the matter, because it might be that one sanitary authority might be permitting manufacturing pollution to flow into a stream in another district; but when one looked further into the section to ascertain the persons against whom proceedings might be taken, it seemed to him clear that such persons were those whose factory or manufacturing process was producing the polluting liquids. The reference to the practicability of rendering the liquids harmless must refer to action by the persons creating the liquids. In his opinion, the last paragraph of the section pointed to the same conclusion, for it provided that a person against whom proceedings were to be taken might object, and was to have an opportunity of being heard against such proceedings being taken "so far as the same relate to his works or manufacturing processes."

QUERIES AND REPLIES.

In order to avoid confusion queries are requested to use distinctive words as nouns de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

EXTRAORDINARY TRAFFIC.—"L. C." writes: A gentleman buys an old stone building, has it pulled down, and requests the builder employed to haul the stone over district roads to his residence, as he wishes

to extend his outbuildings. The builder informs him that the cost of hauling by horses and wagons would come to a high figure, and suggests obtaining prices for hauling the stone by steam tractor. This is done, and the owner of the buildings accepts a tender, and instructs the builder to get the stone hauled by tractor. Some 200 tons of material were delivered, and, in consequence, the roads have been damaged. The bill for hauling was paid by the purchaser of the old building direct to the owner of the tractor, the builder having nothing to do with the transaction. The district council have repaired the damage after the hauling has been finished, and claim £50 for extraordinary traffic off the purchaser of the building, but he repudiates liability, and refers the council to the owner of the tractor. The traffic of the district is purely agricultural, there being no traction traffic whatever. The tractor owner was told verbally by the district surveyor, previous to the hauling being done, that the roads would not stand tractor traffic, but nothing in writing passed. (1) Do you think the council have a strong case, seeing that the traffic was from one definite point to another, and that tractor traffic is not the ordinary traffic of the district? (2) Is the owner of the building or the tractor owner liable?

(1) I should certainly think the council have a strong case. (2) In my opinion both are liable—the owner as the person "in consequence of whose order," and the tractor owner as the person "by whose order" the traffic was conducted.

HIGHWAY: DEDICATION.—"Highway" writes: (1) A street was formed by sewerage, kerbing, channelling and cindering. It is a *cul-de-sac*, and has one house only built upon it, and has been opened for about eighteen months. Can this road be closed by placing stumps across the entrance? (2) A street has been formed by sewerage, kerbing, channelling and cindering, and is a *cul-de-sac*. This road has been opened for about five years, and has a number of houses built upon it. Can it be closed by placing stumps across the entrance?

(1) This depends upon whether there has been a presumed dedication of the street as a public highway. The street being a *cul-de-sac*, mere acts of user alone would not be sufficient evidence of dedication. (*Whitehouse v. Hugh*, 1906, 2 Ch., 283; *London County Council v. Hughes*, 75 J.P., 239.) There would have to be evidence that the street has been used by the public generally, and not merely by residents in the house and their visitors, &c., or other persons having business there. And even if the general public have used the street, the period of user is so short that in my opinion dedication would not be presumed. See *Kirby v. Paignton Urban District Council* (noted in Vol. xliii. of THE SURVEYOR, at page 438), where after six years' user a *cul-de-sac* was held not to have been dedicated, and an adjoining owner was allowed to enclose part of it with a wall. Unless there has been dedication in the present case the road can be closed, subject to any express or implied private rights of way to which the owner of the house or other persons may be entitled. (2) The same principles apply with respect to this street. It is true that the period of user is longer, but it falls short of that in the Paignton case, and in that case no steps had been taken to exclude the public.

REMOVAL OF HOUSE REFUSE.—"W. S." writes: In our district where we undertake the removal of domestic refuse, &c., there are a number of ashpits inaccessible with a cart, and the contents have to be wheeled down narrow garden paths and passages, tipped up on the front street, and afterwards re-loaded into the carts. Can the council make any rules or by-laws insisting that ashbins should be provided in lieu of ashpits, so that the contents may be carried out and emptied into the cart direct?

If Part III. of the Public Health Acts Amendment Act, 1890, has been adopted, the council can make by-laws imposing on the occupier of any premises duties in connection with the removal of house refuse so as to facilitate the work which the council undertake or contract for. See sec. 26, subsec. (2), of that Act.

BUILDING BY-LAWS: REAR AIR SPACE.—"A. A." writes: Are buildings of the warehouse class exempt from the provision of the by-law with respect to air space at rear? I have an idea they are. Do you know of a case?

The provisions as to air space (both front and rear) contained in the Model By-laws apply only to new domestic buildings, and not to buildings of the warehouse class.

The Fertilising Value of Sewage and Sewage Sludge.

By H. W. CLARK, Chemist to the Massachusetts State Board of Health.

From time to time attention is called by various people, scientific and otherwise, to the great value of the fertilising materials in sewage, and the waste of these materials by all modern methods of sanitation and sewage disposal. This waste occurs more especially among such communities as have modern systems of water supply, sewerage and household plumbing, and at the present time the most civilised nations are those in which the greatest waste of this manurial product of human life takes place. The increased health, comfort and cleanliness in our modern life, due to our public water supply and sewerage systems, have, however, become such an integral part of our civilisation that these systems will undoubtedly continue to prevail, and the fertilising materials of sewage continue to be wasted, until some economical method of reclaiming them is devised. In other words, the prevention of this waste concerns essentially the value of these materials in a given volume of sewage when compared with the cost of extraction. Enough material of a fertilising or other value must be extracted by any process to more than pay for the cost of the process if it is to be employed. This problem will be solved eventually, but the difficulties are great, and only slight progress has thus far been made in its solution.

Average American sewage contains not much, if any, more than 2,400 lb. of suspended matter in each 1,000,000 gallons of water, and of these 2,400 lb. only about 350 lb. have fertilising or other value. European sewage is more concentrated owing to the smaller per capita water consumption, and hence the matter in suspension is greater per unit volume of sewage. Dunbar* gives the pounds of suspended matter in sewage from ten representative German and English cities—namely, Hamburg, Hanover, Cologne, Essen, Freiburg, Breslau, London, Manchester, Leeds and Birmingham—and his figures show that these matters vary from 2,800 lb. to 7,500 lb. per 1,000,000 gallons, with an average for the sewage of the cities given of about 3,450 lb. per 1,000,000 gallons. In this sludge the fertilising constituents are found in connection with a large mass of inert organic and mineral matter, and also with much fatty matter, the presence of which lessens the manurial value of the sludge.

For many years past it has been widely acknowledged in England that the utilisation of sewage upon land, or sewage farming, can show a profit only under the most favourable conditions. England has in operation hundreds of these farms at the present day, but English cities and towns are, one after the other, relinquishing this method of disposal and purification in favour of more modern methods of filtration—that is, it has been found, in most cases, that no profit can be expected from such farming, and that the cost of sewage utilisation in this way is greater under many conditions than when the sewage is treated from the view-point simply of purification rather than utilisation.

The largest and probably the best-managed sewage farms in the world are those of Paris and Berlin. The Paris farms cover more than 15,000 acres, and those of Berlin in 1907 were 39,000 acres in area. At portions of the Paris farms the farmers use the sewage without any financial return to the city, and at others the rent of the land is much increased by irrigation. According to Calmette,† however, the profits are small, and the process as a whole a costly one. The total operating cost of the Berlin farms in 1906 was \$700,000, and the receipts for that year \$750,000, showing a profit when these two items are taken into consideration. The capital sum expended on the farms up to 1907, however, aggregated \$12,000,000. The cost of operation in that year amounted to \$16.40 per 1,000,000 gallons of sewage treated, the receipts to \$17.60 per 1,000,000 gallons of sewage, while the interest on the invested capital at 3½ per cent was \$9.80 per 1,000,000 gallons treated, showing, instead of a profit, an actual cost of \$8.60 per 1,000,000 gallons of sewage treated. In fact, the only regions where sewage farming can at present probably always be carried on at a profit are arid regions such as found in India and the western parts of the United States, and in such regions the profit is due really to the value that the sewage has

as a liquid rather than to its value as a fertiliser—that is, in these regions irrigation is a necessary adjunct to crop raising.

At the Lawrence Experiment Station an investigation has been made in regard to the increased amount of fats and nitrogen obtainable by acidification of the Lawrence sewage. Summarising ten experiments of this kind, it was proved that by sedimentation of Lawrence sewage for four hours, 1,486 lb. of dry sludge, containing 49 lb. of nitrogen and 357 lb. of fatty matters, could be obtained from each 1,000,000 gallons of this sewage. When duplicate volumes of sewage were acidified with sulphuric acid, 60 deg. B., at the rate of 2.685 lb. of acid per 1,000,000 gallons of sewage, the total dry solids obtained by four hours' sedimentation were 2,171 lb. per 1,000,000 gallons, containing 87.8 lb. of nitrogen and 467 lb. of fatty matters. This showed an increase of 38.5 lb. of nitrogen and 110 lb. of fat over the amounts obtained by sedimentation without acidification; in other words, we obtained, by the use of acid to the value of \$25 additional, nitrogen and fats worth about \$7.25.

While these figures represent actual values of fatty and nitrogenous materials in the sludge, it must be borne in mind that the fatty matters must be separated from the remainder of the sludge if either portion is to be of material value, and that this separation can only be accomplished by a great additional expense.

As showing general views from widely differing sources in regard to the fertilising value of sludge, the following statements are taken from the book on "Sewage Sludge," by Elsner, Spillner and Allen:—

Page 82.—The hope of securing a revenue from sludge utilisation equal to the cost of operation, or making it a profitable undertaking, has long been destroyed, at least with city sewage. This is easily understood when one considers that in a city with an output of 2,000,000 gallons of sewage per day only, perhaps 5½ cub. yds. of sludge, with 90 per cent moisture, or 59 cub. yds. of dried material, are recovered, of which possibly 26 to 31 cub. yds. are of organic origin.

Page 84.—The fertilising material in sludge cannot be wholly utilised as is the case with sewage irrigation, for the proportion available as a plant food yields an excess of nitrogen. With grain this results in an abundance of straw, but few shrivelled grains. If, then, nitrogen is to be entirely utilised, either one must not apply too much sludge, unless vegetables only or leafy plants are to be raised, or else the lime and potash which are lacking must be brought to the field independently. For these reasons the actual value is much less than the theoretical. Moreover, artificial fertilisers are now much cheaper than formerly, and are preferred because more easily handled.

Page 91.—At Frankfort-on-the-Main sludge dried in the air was transported as far as 5 miles; in Neustadt even 6.85 miles by wagon, and in the latter case 62 cents per cubic yard was paid when no lime had been added, or 44 cents with lime. Conditions are seldom so favourable, however. In most cases a very small price is paid for dried sludge which is quite out of proportion to the cost of drying. In Leipzig, in 1908, the gross revenue (from the sale of sludge) was \$318,688, while the cost in wages for removing the dried sludge from the pits was about \$6,854.

Page 108.—Extracting grease from sewage sludge under normal conditions can never be profitable. The situation is different in towns where much grease is discharged into the sewage from factories, as, for example, in various English cities from wool-washing works.

CONCLUSIONS.

In conclusion, it is evident (1) that the total amount of fertilising and fatty matters in each 1,000 gallons of representative American sewage is not worth above 6 or 8 cents. Of this about half is represented by the ammonia in solution, and there is no method by which this material can be utilised except by application of the sewage to land. All experience, covering many years with hundreds of well-operated sewage farms ranging in size from a few acres to the vast 39,000-acre farm at Berlin, Germany, has shown that only under the most favourable conditions can the return from these farms be made to pay operating expenses, and an instance is yet to be cited where these returns pay

* Director, Hygienic Institute, Hamburg.
† Director, Pasteur Institut at Lille.

both the cost of operation and interest on the capital invested. The exceptions, perhaps, to this are certain tracts or farms in regions of low rainfall, and where the sewage is valuable as a liquid—that is, for real irrigating purposes. The Wolverhampton farm is undoubtedly a representative English farm as regards management and cost of operation, and at this farm the actual total cost of sewage treatment is \$49 per 1,000,000 gallons. (2) Much of the valuable fertilising and fatty constituents in sewage is found in the matters in suspension. Average American sewage contains, perhaps, about 2,400 lb. of sedimentable matter in 1,000,000 gallons, and the nitrogen, fatty matters, &c., in this 2,400 lb. of sludge are worth, approximately, \$15 or \$18. In order, however, to reclaim this valuable material, the sludge must be dried, pressed and also subjected to a process for the separation of grease from the fertilising constituents in the remaining body of the sludge. Only by this separation can the grease become an article of commerce, and the sludge of real agricultural value. This fact is well established by long experience and many investigations. When the fatty matters are separated by any known process, this procedure is costly. Only in a few places as yet is such separation attempted as a commercial enterprise, and the profitableness of the works at these places is as yet doubtful. When the sludge is freed, or practically freed, from fatty matters, it consists of a large weight of inert mineral and organic matter mixed with a comparatively small weight of fertilising matter; hence the cost of carriage is great even when it is well dried. It has also been well proved that the nitrogen, phosphoric acid, &c., present are generally in a less assimilable form than the same bodies in ordinary commercial fertilisers. The sludge has value, however, and as the processes of drying, pressing and fat separation are improved, and also as nitrogen advances in price, as seems inevitable, sewage sludge will become of greater agricultural value than it is at present, especially as the basis of a fertiliser enriched by the addition of potash, phosphates, &c.

HOUSING IN URBAN DISTRICTS.

COUNCILS' FAILURE TO BUILD.

In the House of Commons on Wednesday the President of the Local Government Board was asked whether he would give the names of the urban districts in which, as the result of formal complaints under sec. 10 of the Housing, Town Planning, &c., Act, 1909, or of inspections by the board's officers, the councils had, prior to January 1st last, been urged by the board to build houses under Part III. of the Housing of the Working Classes Act, 1890, and had not yet agreed to do so; and whether, as regarded cases of formal complaints, a mandamus had been applied for in any instance; and, if so, with what result.

Mr. Herbert Lewis said the names of the urban districts were: Northam, Pwllheli, Bridgnorth, Margam, Stowmarket, East Cowes, Barnoldswick, and Tenby. The last named was the only one in which there had been a formal complaint under sec. 10 of the Housing, Town Planning, &c., Act, 1909, and in which action or a promise of action had not been secured. It had not yet been thought necessary to make application for a writ of mandamus in that case. In the case of Northam, it was right that he should add that the council had stated that they were looking for a site for houses, but he was afraid that they had been a long time finding it. The Margam Council had made some provision, but not as much as the Local Government Board thought necessary, and, as regarded Stowmarket, it must be admitted that the circumstances had changed somewhat since the board recommended the council to build.

Rand Water Supply.—A Bill has been introduced into the House of Assembly, Cape Town, making provision for the construction of an impounding reservoir and a barrage across the Vaal River in the Potchefstroom district. The barrage will consist of thirty-six gates, each 23 ft. deep and 30 ft. wide, and will impound 11,560 million gallons of water, calculated to give a supply of 20,000,000 gallons a day for the benefit of the large area served by the Rand Water Board. The Rand Water Board is authorised to borrow up to £1,250,000 for this purpose, and to recover contributions from the railway department, the mines, and the corporations in the area supplied.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Axminster R.D.C. (April 16th. Mr. Courtenay Clifton).—£1,815 for the purpose of purchasing land, and erecting twelve cottages at Colyton, under the Housing of the Working Classes Act.—The clerk, Mr. Cecil Forward, stated that the council had provisionally agreed to purchase a piece of land at Ridgeway, Colyton, at £100 per acre. It is proposed to erect ten houses, to be let at 4s. 2d. per week. The council had asked the board to allow the cost of the scheme to be a special charge on the parish of Colyton. The inspector said it was a question whether Colyton wanted to pay for it. Mr. Forward replied that they would not if they could get out of it.

Bandon R.D.C. (April 3rd. Mr. A. D. Price).—£1,722 for the extension of the water supply.—Mr. Richard Evans, engineer, explained that he proposed to take a stream at Farnalough which would yield 25,000 gallons a day, and erect a filter. The scheme was essential owing to the lack of a sufficient supply in dry weather.

Birmingham T.C. (April 17th. Mr. R. H. Bicknell).—£41,260 for works of sewerage and surface-water drainage, £7,550 for the cost of construction of certain parts of a new road between Salford Bridge and Bromford-lane, and £5,150 for the purchase of land for the extension of King's Heath Park.—The deputy town clerk, Mr. H. J. McIlveen, stated that a sum of £24,400 was required for the sewerage scheme for Hall Green and Yardley Wood districts, and another sum of £16,860 for works at Griffin's Brook, near Bournville. The Local Government Board in November, 1912, sanctioned the borrowing of £19,000 for the carrying out of the sewerage scheme at Hall Green, in order to provide for the building development taking place in that district. The work comprised in the scheme was well on the way to completion, and the scheme now submitted dealt with a larger portion of the area, at the extreme south of the area. With respect to the other item, the city council recently had before them plans of the proposed development of an estate between Bristol-road and Lodge-hill cemetery by the erection of about 1,000 houses. The Bournville Village trust had also intimated to the council their intention of developing an estate between Oak Tree-lane and Bristol-road. A difficulty was experienced in dealing with the existing sewage of houses in the district, and the expense was thrown on the corporation of emptying the cesspools. It was considered advisable by the council that a sewerage scheme should be carried out in the immediate future. Concerning the £5,150 required for the extension of King's Heath Park, it seemed that the ground, which comprised about 15 acres, was purchased by the King's Norton District Council for the sum of £11,000 in 1908. Owing to the greatly increased housing accommodation in the district, it was deemed advisable to purchase an additional 14 acres, which could be obtained for £5,150. It was proposed largely to devote the new portion to playing fields.

Blaydon U.D.C. (April 16th. Mr. R. H. Bicknell).—£1,620 for the purpose of diverting the Derwent and Shotley main road at the Slide, near Lockhaugh Lodge.—Mr. Henry Dalton, the clerk, stated that the county council had agreed to pay the cost in the end, but meantime the Blaydon Council required a loan of the amount named. The period asked for the loan was five years.

Colwyn Bay U.D.C. (April 16th. Mr. H. S. Stewart).—This was an inquiry with reference to the council's scheme for the provision of workmen's dwellings.—Sir G. Everard Cayley, Bart., whose estate is being developed, has agreed to sell to the local authority a little over 6 acres of land at a nominal price, and it is largely due to this action that the council are able to initiate a self-supporting garden village scheme, which includes twenty-eight houses at a weekly rental of 4s. 6d., forty-four at 5s. 6d., and sixteen at 6s. 6d., the total of eighty-eight costing £18,700. In none of the houses, however, is provision made for a bath. This is due partly to the necessity for the strictest economy, and partly to the engineer's experience that in housing schemes in other parts of the kingdom the baths are misused. There is to be a spacious recreation ground; the cottages will have

gardens back and front, and the roads will be lined with trees.

Listowel R.D.C. (April 5th. Mr. A. D. Price).—£1,800 for a supply of water to Ballybunion, £800 for Doon and Rahavanig water supply, £1,400 for Ballyduff water supply, £430 for Ballybunion main sewers, and £230 for Newtownsandies main sewer.—The medical officer, Dr. J. Costelloe, said he had drawn attention on several occasions during the past year to the fact that there was no water supply to the houses in Ballybunion, or an inadequate supply, at any rate, and that there was imminent danger of an epidemic, or at least a very serious inconvenience, to the large concourse of people who visit Ballybunion as a popular seaside resort during three or four months.

Lymington R.D.C. (April 3rd. Mr. A. W. Brightmore).—£14,772 for sewerage and sewage disposal works at Brockenhurst.—Mr. H. C. H. Shenton, the engineer, described the scheme, and said he had adopted the method of making the sewage gravitate to one place, whence it was pumped to the disposal works. The present population of Brockenhurst was a little over 2,000, of which 400 were not included in the present scheme.

Prestwich U.D.C. (April 21st. Mr. W. O. E. Meade-King).—£1,151 for the widening of Bury Old-road.—The scheme, it was stated, had become necessary by the increase of heavy motor traffic from Manchester to Bury. Ninety per cent of the total cost of the improvement will be borne by the county council. A special staff of men will be engaged for the work, the services of the unemployed having, it was said, always proved very expensive.

Sheffield T.C. (April 8th. Mr. M. K. North).—£3,894 for private street works.—Originally the corporation had asked for sanction to borrow £5,559 for works of private street improvement, but this figure was reduced to £3,894.—It was stated that most of the streets are to be paved with gritstone setts and concrete flags. The exceptions are Shearwood-road, which will have a gritstone road and an asphalt foot-path, and Stumperlowe-avenue, where the roadway will be tar-macadam and the footway asphalt.

Walton-upon-Thames U.D.C. (April 6th. Mr. R. H. Bicknell).—£1,600 for sewer extension.—The surveyor, Mr. R. Wild, stated that the necessity for the extension of the sewerage system was brought about by the establishment of the Whiteley Homes. These were now in course of erection, and were to take the form of a model village of some 220 acres in extent, with scattered cottages for aged couples. It was anticipated that the homes would eventually contain a population of 800 to 1,000 persons. In addition to providing drainage for this estate, the new sewer would accommodate available building land on each side of the Burwood-road, the development of which had undoubtedly been retarded by the lack of drainage facilities.

Whitley and Monkseaton U.D.C. (April 15th. Mr. R. H. Bicknell).—£2,300 for the improvement of Hill Heads-road.—The surveyor, Mr. A. J. Rousell, said it was proposed to make a 40-ft. road. There was heavy traffic on the road at the present time, and it was likely to become heavier as the district expanded.

APPLICATIONS FOR LOANS.

Ayr T.C. — £25,000 for electrical generating machinery and buildings.

Carlisle T.C.—£1,500 for a drainage scheme.

Chorley R.D.C.—£200 for sewage disposal works.

Penzance T.C.—£1,100 for the provision of lavatory accommodation and offices.

Slough U.D.C.—£380 for sewerage works.

Torrington T.C.—£1,100 for the erection of five cottages.

Tynemouth T.C.—£2,000 for sanitary conversions.

Whitby R.D.C.—£600 for the purchase of the Hawsker water supply.

Yarmouth T.C.—£3,000 for high and low tension mains.

LOANS SANCTIONED.

Ouckfield U.D.C.—£1,128 for a housing scheme.

Foots Cray U.D.C.—£2,050 for municipal offices.

Hackney B.C.—£1,600 for street extension.

Harrogate T.C.—£7,000 for surface-water drainage.

Radcliffe U.D.C.—£3,000 for electricity mains.

Rathdown No. 1 R.D.C.—£3,000 for the completion of the improvement scheme.

Taunton T.C.—£4,765 for the electricity undertaking.

Warminster U.D.C.—£145 for a sewerage scheme.

FORTHCOMING INQUIRIES.

	£
27.— Croydon. For the installation of a telephonic fire alarm (Mr. F. H. Tulloch)	3,600
27.— Liverpool. For a housing scheme (Mr. Courtenay Clifton)	34,500
28.— Bingham. For a housing scheme (Mr. Courtenay Clifton)	1,008
28.— Brecon. For the provision of a public convenience (Major J. Stewart) ...	180
28.— Littlehampton. For the provision of a public convenience (Mr. P. M. Crosthwaite)	710
29.— Aberdare. For works of water supply (Major J. Stewart)	15,536
29.— Ashford. For the purposes of sewage disposal (Mr. W. M. Cross)	15,000
29.— Epsom. For works of sewerage and storm-water drainage (Major C. E. Norton)	6,050
29.— Gosport. For the repair of "The Hard" (Mr. P. M. Crosthwaite) ...	2,750
29.— Keighley. For the provision of a cemetery (Mr. M. K. North)	2,250
29.— Lichfield. For the improvement of the Guildball (Mr. R. H. Bicknell) ...	3,760
29.— Rotherham. For the electricity undertaking (Mr. T. C. Ekin)	19,956
30.— Gelligaer. For street improvement purposes (Major J. Stewart)	2,010
30.— Nuneaton. For the electricity undertaking and park extension (Mr. T. C. Ekin)	7,820
30.— Rochford. For works of sewage disposal (Mr. W. M. Cross)	9,100
30.— Walthamstow. For works of sewage disposal (Major C. E. Norton)	4,889

MAY.

1.— Aylesbury. For the purposes of electric lighting (Mr. T. C. Ekin)	21,323
1.— Cardiff. For the provision of a weights and measures office (Major J. Stewart) ...	2,000
1.— Southend. For the provision of conveniences and an electric crane (Major C. E. Norton)	2,950

St. Helens Housing.—The St. Helens Health Committee on Wednesday discussed a resolution which had been passed by the town council that tenement dwellings should be erected at a cost of £15,200. The committee passed a resolution to the effect that the erection of tenements ought not to be proceeded with.

Manchester Water Undertaking.—In the annual report of the Manchester Waterworks Committee it is stated that the total income for the year ended March 31st last was £441,878. After deducting the expenditure there was a surplus of £6,616, but included in this amount there is an item of £5,576 discount on 3 per cent consolidated stock repurchased.

Glasgow's Proposed New Water Supply.—The Bill of the Glasgow Corporation for an extension of the scope of the Highland water supply will come before the House of Commons next month, says the *Glasgow Herald*. The promoters claim that for many years they have looked to this valley, containing Lochs Voil and Doine, as the natural source from which an additional supply should be obtained. They put the limit of the supply which can be provided by the present Loch Katrine system at 1920, and therefore an additional volume of water should be ready for use by that date. Loch Voil, which is 3½ miles west of Balquhidder Station, on the Callander and Oban railway, extends westward for 3½ miles from Balquhidder Church to Monachyle Glen, at the foot of which a short and narrow strait connects Loch Voil with Loch Doine, which is about 1 mile in length. The estimated cost of the scheme is £1,250,000.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Derby, Edinburgh £15,000, Knutsford; housing and town planning—Southgate; roads and materials—Southwark, Stockton; sewerage and sewage disposal—Aberystwyth £30,000; water, gas and electricity—Fifehire, Lindithgow, Riccall. Particulars of other projected works will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Bexhill T.C.—It has been agreed to contribute £150 towards a private scheme for the construction of a subway under the railway in Terminus-road, and to accept the liability of maintenance and lighting.

Birkenhead T.C.—The Baths Committee have been requested to report on the cost of constructing an open-air swimming bath.

Bourne R.D.C.—Plans have been completed for an isolation hospital.

Clacton U.D.C.—The surveyor, Mr. D. J. Bowe, stated at a recent council meeting that he hoped to complete the band pavilion in May, and that his estimate of £11,500 for the work would not be exceeded.

Derby T.C.—It has been agreed to carry out an extension of the administrative block of the infectious diseases hospital, at an estimated cost of £1,356. —A scheme has been prepared for an extensive improvement at the Spot, including the construction of a public convenience at an estimated cost of £3,000.

Edinburgh T.C.—It has been agreed to purchase a site at Westbank, Portobello, for the erection of a new electric light station, which is to cost £15,000.

Essex C.C.—The council have accepted a tender, at £998, for the rebuilding of Langford bridge, Ongar.

Goole U.D.C.—A letter has been received from the Local Government Board declining to sanction a loan of £8,000 for the proposed erection of new municipal offices on a site fronting the market hall.

Johnstone T.C.—Plans have been submitted for the extension of the town hall, at an estimated cost of £600.

Knutsford U.D.C.—A scheme is under consideration for new council offices and a fire station.

Warmley R.D.C.—The sanitary surveyor, Mr. H. M. Bennett, submitted on Tuesday the plan of a proposed tuberculosis sanatorium for which about 3 acres of land belonging to the council have been set apart at Mangotsfield. The building is to provide twelve beds for cases in an advanced stage, and also those in the early stage of the disease. There is to be a dining-hall in the centre, with female wards on one side and male wards on the other, with bathroom and lavatory accommodation. The offices are to be situated behind the main building, and to contain nurses' and servants' quarters, cooking department and heating arrangements. The front of the building is to face due south, and contain a verandah extending the length of the building, and 7 ft. 6 in. wide. Each ward is to open to the verandah. Mr. Bennett was instructed to complete the plan, and forward it to the Local Government Board.

Witham (Essex) U.D.C.—The tender of Messrs. McLaughlin & Harvey, Brecknock-road, London, at £370, has been accepted for the construction of a new bridge.

HOUSING AND TOWN PLANNING.

Blackburn T.C.—Under the Housing and Town Planning Act, 1909, the Highways Committee on Monday approved a scheme of streets and roadways for some 900 acres of land situate westward of Revidge, and extending from Preston New-road to Brown-hill, Wilpshire. It is not the intention to build houses or develop the estate on "garden city" lines. The chief object is to create a residential quarter on definite and ordered lines. Several new roads and streets are suggested and these are to be formed and completed as the corporation shall from time to time direct.

Boston R.D.C.—The following tenders have been accepted for the erection of twenty pairs of cottages. Wrangle, two pairs, Mr. M. H. Allen and Mr. J. W. Allen, Wrangle, one pair each at £334; Freiston, one pair, Messrs. J. Leafe & Son, Boston, £319; Frampton, two pairs, Messrs. J. Leafe & Son, £330 per pair; Kirton, Messrs. Belton & Co., Gypsy Bridge, five pairs at £324 per pair, and Messrs. J. Leafe & Son two pairs at £325 per pair; Algarkirk, three pairs, Messrs. Belton & Co., at £335; Sutterton, three pairs, Mr. Barnsdale, of Donington, at £320; Wigtoft, two pairs, Mr. Barnsdale, at £320; Palham's Lands, one pair, Messrs. Belton & Co., £327.

Bungay U.D.C.—Application is to be made to the town reeve for the purchase of sufficient land to permit of the building of twenty houses.

Clydebank T.C.—The council are seeking for sanction to prepare a housing scheme.

Killarney U.D.C.—Tenders have been received for the erection of eighteen two-story cottages.

Merthyr Tydfil T.C.—The borough architect has received instructions to prepare plans for a housing scheme on 6½ acres of land which the council propose to purchase.

Somerset C.C.—It has been agreed to build six cottages for roadmen and a depot on land attached to the Long Ashton police station. The cost of the cottages is not to exceed £220 each.

Southgate U.D.C.—The surveyor, Mr. C. G. Lawson, has received instructions to prepare plans and estimates for 160 workmen's cottages, to be erected on land belonging to the council.

PARKS AND OPEN SPACES.

Bexhill T.C.—The borough surveyor, Mr. G. Ball, has prepared a plan and estimate for laying out two new football grounds on the portion of the Down immediately to the east of West Down-road. The estimated cost is £3,126. It is intended to ask the sanction of the Local Government Board to a loan for the scheme.

Glasgow T.C.—Lord Glenconner has offered to give 13 acres of land to the corporation to provide a public park and recreation ground in the St. Rollox district.

Liverpool T.C.—Three additional open spaces were dedicated to the public on Wednesday—viz., Pownall-square recreation ground, Donaldson-street recreation ground, and the Grant Gardens.

Rochdale T.C.—The borough surveyor, Mr. S. S. Platt, has been instructed to prepare plans and estimates for fencing, draining and levelling the proposed recreation ground at Spotland preparatory to application being made to the Local Government Board for a loan.

REFUSE COLLECTION AND DISPOSAL.

Haltwhistle R.D.C.—The tender of Mr. Wilson, of Haydon Bridge, at £280 a year, has been accepted for the scavenging of the town of Haltwhistle.

ROADS AND MATERIALS.

Bideford T.C.—The council by resolution have directed the attention of the county council to the condition of the road between Bideford and Hartland, which was described as dangerous and impassable.

Bristol T.C.—It has been agreed to pay £4,750 for the purchase of property for the improvement of Rupert-street.

Cardiff T.C.—The Finance Committee recommend the council to purchase 153 yds. of land for £1,000 at the East Canal Wharf for street widening. The city engineer, Mr. W. Harpur, estimates that it will cost £100 to effect the widening.

Essex C.C.—The council have agreed to the following highway improvements: Widening of Queen's-road corner, Brentwood, approximate cost £750; widening of main road at Springfield, near Chelmsford borough boundary, £150; kerbing and paving works, Chingford, £200; improvements of corners, consisting in most cases of taking away quick hedges and substituting open railings, at Littlebury, Patching Hall,

Roxwell-road, Froyz Hall, Sible Hedingham (two), Foxearth Hall, and Theydon Bois, £310; widening main road at Bell Inn corner, Great Baddow, £241; contribution of £200 to Halsted Urban District Council towards acquiring and demolishing buildings at corners of High-street and North-street, Halsted, and the carrying out of certain road works at the spot; widening Pier-avenue, Clacton, opposite Royal Hotel, £95; and widening main road at West Thurreck, adjoining the Old Ship Inn, £190.

Guildford T.C.—The county council having agreed to contribute a sum not exceeding £206, a third of the cost of the proposed improvement in Farnham-road opposite the new secondary school, it has been decided to make provision for the improvement in the next estimates.

Hendon U.D.C.—It is proposed to lay down tar-paving in Love-lane, at an estimated cost of £1,761.—The estimates of the surveyor, Mr. S. S. Grimley, have been approved for making up four roads.

Lowestoft T.C.—The clerk to the East Suffolk County Council has written to the town council a letter on the practice to be pursued in the proposed maining of roads. He says: "The county council have recently had under consideration the question of dealing with applications from local authorities to declare certain highways to be main roads, and in connection with other matters the question has been discussed with the Road Board. The county council are advised that they should be the governing body to control the expenditure on main roads in borough and urban districts. With regard to bringing the proposed main road into a proper standard of efficiency, the Road Board would probably be prepared to assist the various local authorities through the county council by way of loan, free of interest, towards the cost of the work, provided the county council are to directly carry out the work and maintain the main roads when finally accepted."—The borough surveyor, Mr. G. H. Hamby, has received instructions to prepare estimates of the cost of channeling several streets.

Middlesbrough T.C.—The tender of Messrs. R. Lander & Co., West Hartlepool, has been accepted for 250,000 creosoted soft wood paving blocks, at £6 1s. 6d. per 1,000, for the paving of Marton-road, and the continuation of Park-road South.

Poole T.C.—High-street is to be paved with wood blocks, and the tender of Messrs. W. Griffiths & Co. has been accepted for the work.

Reigate T.C.—The Highways Committee have been requested to consider the question of making up Woods-road East, under the Private Street Works Act.

Rochdale T.C.—The borough surveyor, Mr. S. S. Platt, has been authorised to proceed with the remainder of the work of widening Heights-lane on the easterly side between Howard-street and Quarry Hill.

Southwark B.C.—Southwark-street is to be repaved with wood blocks, at an estimated cost of £3,387. The question of repaving portions of Walworth-road, New Kent-road, and Camberwell-road is under the consideration of the Works Committee.—The council have accepted the tenders of Messrs. Thos. Gabriel & Sons, and Messrs. Burton, of Lambeth, for a supply of creosoted blocks, at £7 5s. per 1,000.

Stockton T.C.—A special committee has been appointed to consider the provision of new roads, or the extension of existing roads, at the west side of the town.

SEWERAGE AND SEWAGE DISPOSAL.

Aberystwyth T.C.—The council on Tuesday adopted the sewerage scheme prepared by Messrs. James Diggle & Son, and it was decided to apply to the Local Government Board for sanction to borrow £30,000, repayable in fifty years.

Burnham (Essex) U.D.C.—The surveyor, Mr. J. Cook, has been authorised to make inquiry into the merits of the Fieldhouse tank, to visit Guildford and other places where this tank is in use, and report to the council.

Leyburn R.D.C.—The Local Government Board, acting upon a report by their inspector, recommend the council to make six specific alterations at the sewage works, and the council have forwarded the communication to their consulting engineer.

Witham (Essex) U.D.C.—A letter has been received from the county council drawing attention to certain

defects in the sewage disposal system, and the council have replied that the matter is receiving attention.

Womhwell U.D.C.—The surveyor, Mr. W. Quest, has received instructions to raise the carriers at the sewage disposal works, and, in conjunction with the medical officer, he has been asked to consider and report upon a comprehensive scheme for effectively dealing with the sewage now being carried and likely to be carried to the works in the near future.

WATER, GAS, AND ELECTRICITY.

Berwick T.C.—The Special Water Committee have reported that the amount of water from the borehole was not sufficient for the purposes of the joint scheme. There was sufficient to supply Tweedmouth, but not both Spittal and Tweedmouth. In the circumstances the council have asked Messrs. Leslie & Reid, Edinburgh, to prepare a report as to an auxiliary supply.

Cork T.C.—As a result of a new and improved method of inspection, the city engineer reports a considerable improvement in the water supply. "There have been more genuine defects brought to light in six months' work," the city engineer states, "than was possible in ten years under the old system."

Fifeshire C.C.—The Dunfermline District Committee have accepted the tender of Mr. W. Tawse, Aberdeen, at £28,435, for contract No. 1, in connection with the construction of new waterworks at Glendevon.

Flint T.C.—The council on Tuesday agreed to a scheme for the electric lighting of the borough, which is estimated to cost £6,000.

Hammersmith B.C.—The engineer has reported that considerable improvement in the main street lighting could be effected by installing a number of small 10kw. transformers in switch pillars, which would considerably reduce the loss of electrical energy in the mains and improve the lighting effect to the individual lamps. The council have agreed to obtain quotations from firms for the supply of six transformers as required.

Linlithgow C.C.—The Linlithgow District Committee have accepted the tender of Messrs. H. M. Murray & Co., Glasgow, at £18,331, for constructing the new reservoir at Beeceairs. It is estimated that the total cost of the water supply scheme will be £30,000.

Margam U.D.C.—The seal of the council was on Monday affixed to contracts with Messrs. Gibbon Brothers, Limited, and Messrs. Cockey & Sons, Limited, for the erection of the new gasworks at Port Talbot.

Riccall R.D.C.—A special water committee has been appointed to consider a scheme, estimated to cost £3,000, for carrying water from Selby across the bed of the Ouse to the Balbyside.

Shepshed U.D.C.—The Gas Committee recommend the council to obtain a loan for the extension of the gasworks.

Thrapston R.D.C.—The engineers, Messrs. Everard, Son & Pick, have received instructions to prepare a report in connection with the proposed water supply for the town, and the services of the council's surveyor, Mr. T. Lloyd, have been placed at the disposal of the Parochial Committee in carrying out the scheme.

MISCELLANEOUS.

Reigate T.C.—The tender of Messrs. Dennis Brothers, of Guildford, at £765, has been accepted for a first aid motor tender.

Publishers' Announcement.—The Homeland Association, Limited, announces that new and revised editions of the handbooks for Minehead, Newquay, St. Ives, Lynton, Torquay, Isles of Scilly, and many other places are ready for the 1914 season. A completely revised edition of "Where Shall We Live," describing the residential districts around London, will be published in May, and new books on Harpenden (Herts), Falmouth and Truro, and Bexhill-on-Sea, are in the press. A new book, "Our Homeland Cathedrals and How to Study Them," will be published towards the end of the summer, and some new volumes on footpath rambles in the neighbourhood of London will be issued.

PERSONAL.

Mr. J. Stones, sanitary surveyor to the Sedgefield Rural District Council, has received an increase of salary.

Mr. Michael Conway, of Easkey, co. Sligo, has been appointed deputy county surveyor to the Sligo County Council.

Mr. G. M. Khan, city engineer's office, Edinburgh, has been admitted as a student of the Institution of Civil Engineers.

Mr. C. A. Howard, surveyor to the Brigg Rural District Council, is to be provided with a motor cycle by the council, at a cost of £60.

Mr. H. E. Cackett, surveyor of highways to the Redruth Rural District Council, has been voted an increase of salary of £15 a year.

Mr. R. H. Jenkins, engineer and surveyor to the Skegness Urban District Council, has been voted an increase of salary of £30 per annum.

Mr. W. R. Maxwell, burgh surveyor of Dunfermline, has been voted £50 for his services in connection with the town council's water supply scheme.

Mr. G. W. Knowles, surveyor to the Clevedon Urban District Council, has been voted £50 for his services in connection with the pier landing-stage.

Mr. J. S. Pickering, borough surveyor of Cheltenham, is to be provided with a motor car to replace the hired car he has hitherto made use of.

Mr. W. F. Wilkins, surveyor to the Barnet Urban District Council, has been voted 50 guineas for "his valuable services in connection with the council's housing scheme."

Mr. E. S. Simmott, county surveyor of Gloucestershire, has received an immediate increase of salary of £100, with two annual increments of £50 until the maximum of £800 is reached.

Mr. J. S. Walton, borough surveyor of Falmouth, has been presented with a silver hot-water jug by the borough officials upon leaving to take up his new appointment at Barrow-in-Furness.

Mr. Robert Heslop, surveyor to the Tanfield Urban District Council, has received the thanks of the council "for his very exhaustive and splendid annual report, which did him much credit."

Mr. Henry C. Adams, junior partner in the firm of Henry Adams & Son, consulting engineers, is included in the recent list of transfers to full membership of the Institution of Civil Engineers.

Alderman J. P. Spencer, ASSOC. M. INST. C. E., one of the oldest members of the Institution of Municipal and County Engineers, was on Tuesday presented with the honorary freedom of the county borough of Tynemouth.

Mr. T. Clement Jones, engineer and surveyor to the Frimley Urban District Council, Surrey, has been voted an increase of salary of £55 per annum. The council also expressed their appreciation of the work done by the surveyor.

Mr. F. Sadler, engineer and surveyor to the Acton Urban District Council, has been voted £100 and an increased salary of £100 a year to meet the cost of the upkeep of his official motor car, which will be garaged by the council.

Mr. William Greig, assistant superintendent, has been appointed superintendent of cleansing under the Glasgow Corporation, in succession to Mr. D. M'Coll, retired. There were 149 applicants for the position, the salary attached to which is £550, rising to £700 per annum.

Mr. W. B. Chancellor, borough engineer and surveyor of Lichfield, has been appointed engineer and surveyor to the Barnet Urban District Council. Mr. Chancellor has held office at Lichfield for seven years, and he was previously surveyor to the Brownhills Urban District Council.

Mr. W. W. Price, inspector of main roads, Central Division, Oxfordshire, has been appointed main road inspector of District 1 under the Essex County Council; Mr. G. G. Grace, assistant in the city surveyor's department, Birmingham, inspector of District 2; and Mr. W. A. Rogerson, district surveyor to the Norfolk County Council, inspector of District 4.

The Rosyth Drainage Contract.—Mr. Andrew Blair, Glasgow and North Queensferry, who is completing the laying of the first section of the new main outfall sewer for Rosyth, has obtained the contract to lay the third section of the work from Pitreavie to the southern boundary of old Dunfermline. The distance is nearly 2 miles, and the most of it will require to be tunnelled. The amount of the tender was nearly £28,000.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WEST SUFFOLK COUNTY COUNCIL.

COUNTY SURVEYOR'S DEPARTMENT.

APPOINTMENT OF CLERK OF WORKS.

Applications are invited for the post of Clerk of Works during the Reconstruction of certain Main Roads in the County.

Applicants should possess a thorough knowledge of road construction, and be prepared to keep the same hours as the workmen.

Salary £2 15s. per week, in addition to locomotion expenses.

Applications, endorsed "Clerk of Works," to be made, in candidate's own handwriting, upon Forms to be obtained from the undersigned (together with particulars of the duties), accompanied by copies of three testimonials, to be received not later than 4th May, 1914.

W. LIONEL JENKINS, ASSOC. M. INST. C. E.,
County Surveyor.

Shire Hall,
Bury St. Edmunds.
April 22, 1914.

(1,547)

RUGELEY URBAN DISTRICT COUNCIL.

APPOINTMENT OF INSPECTOR OF
NUISANCES.

The above Council invite applications for the appointment of an Inspector of Nuisances, who will also act as Officer for the purposes of the Housing (Inspector of District) Regulations, 1910, and as Inspector for certain purposes under the Factory and Workshops Acts, at an inclusive salary of £90 per annum.

Candidates must possess the Certificate of Inspector of Nuisances of the Royal Sanitary Institute, or its equivalent.

Applications, stating age, experience and qualifications, and endorsed "Inspector of Nuisances," to be delivered to the undersigned, with copies of not more than three recent testimonials, not later than Monday, the 4th May, 1914.

Canvassing, directly or indirectly, will be deemed a disqualification.

(By order)

W. L. ORGILL,
Clerk to the Council.

Rugeley.
April 22, 1914.

(1,546)

ASSISTANT required in Civil Engineer's Office, Westminster. Sewerage and Water Supply. State references, wages, &c., to Box 1,416, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,549)

UNIVERSITY OF LONDON.

Goldsmiths' College, New Cross, S.E.

ENGINEERING AND BUILDING DEPARTMENTS

SUMMER SESSION, MAY AND JUNE.

Land Surveying Classes are held during May and June; elementary lectures, with practical work, on Chain Surveying and Levelling, and advanced lectures, with practical work, on the Theodolite and all other angular instruments. Fee, 10s. elementary, 10s. advanced.

Also special summer courses in Wireless Telegraphy, Reinforced Concrete, Drawing Office and Engineering Workshop Practice, Engineering Costs and Management, Mechanical and Hydraulic Laboratory Demonstrations.

For details apply to the Warden. (1,548)

Birmingham Water Supply.

MR. ANTONY LEES AT THE INSTITUTE OF SANITARY ENGINEERS.

A paper descriptive of the Birmingham Corporation waterworks was read on Monday evening by Mr. E. A. Lees, A. INST. C. E., secretary and manager of the Birmingham water department, at a meeting of the Institute of Sanitary Engineers presided over by Mr. W. B. Bryan, M. INST. C. E., chief engineer to the Metropolitan Water Board.

At the outset Mr. Lees alluded to the situation of the works in the Elan Valley, and the construction and capacity of the reservoirs. The gathering ground, he mentioned, contains a total area of 45,562 acres—that is over 70 square miles—and has an extreme length of about 15 miles and an extreme breadth of 8 miles. Of this area 20,515 acres drain into the Elan and 25,047 acres into the Claerwen. The minimum elevation of the gathering ground is 822 ft. ordnance datum, that being top water level of the lowest reservoir at the site of the lowest dam. Some of the hills round the rim of the watershed rise to elevations of over 2,000 ft.

The geological formation is silurian, and consists of shales and flagstones, with some very massive layers of conglomerate. None of the land is cultivated, the whole being occupied as hill pasture restricted to sheep-farming. The corporation have secured the full control over the whole gathering ground of the Elan, and most of that of the Claerwen by the acquisition of the freeholds and manorial and common rights. The population of the gathering ground is very sparse, there being only thirty-one houses, occupied by the sheep farmers, who hold their farms under strict regulations for preventing contamination of the streams and reservoirs.

RAINFALL.

As regards rainfall, for the purpose of circulating the storage capacity, a minimum rainfall of 60 in. per annum was assumed, and allowing for deductions for successive years of exceptional drought, evaporation, percolation, and loss in floods, the yield of the gathering ground was calculated on the basis of 36 in. per annum, and on this basis there is an available yield of 99,000,000 gallons per day. Of this quantity 27,000,000 gallons per diem are appropriated as compensation to the river Wye, leaving 72,000,000 gallons for supply.

The completed scheme provides a total storage capacity of 17,960 million gallons, of which 11,320 million gallons are provided by the works already executed.

The rainfall is measured by twenty-five gauges located on the gathering ground under the direction of Dr. Hugh Robert Mill, of the British Rainfall Organisation. Up to six years ago the average rainfall over the whole of the watershed was calculated by taking the arithmetical average of the records of the rain gauges. For the year 1908, and in subsequent years, the average yield has been calculated by means of the Isoyhetal areas. "It is evident," Mr. Lees observed, "that the arithmetical method assumes that the area represented by all of the gauges shall be equal. This manifestly is not the case in fact, and the Isoyhetal method aims at determining the area to which the record of each rain gauge applies." The difference between the two methods of calculation was shown by a table in the paper.

Mr. Lees recalled that the construction of the impounding dams and all of the other work on the gathering ground was carried out by the corporation by administration, this course being taken in view of the tremendous responsibility entailed by these works. The aqueduct and all the distribution works at the Birmingham end were carried out by contract.

The inlet to the aqueduct is situate at Careg-ddu, a point $1\frac{1}{2}$ miles above the Caban Cŏch dam. The inlet to the aqueduct is controlled at the Foel Valve Tower. Proceeding up the valley the next reservoir reached is Pen-y-gareg, and the third is Craig Gŏch. The reservoirs in the Claer Valley have not been constructed, the only work carried out there being the foundations of the first dam at Dol-y-mynach, which were put in owing to the fact that the site of the dam was submerged by the filling of the Caban Cŏch reservoir. Below the Caban Cŏch dam the

Elan village has been constructed for the accommodation of the permanent staff.

FILTRATION.

An important part of the works consists of the Foel filter-beds, by means of which the water is strained through copper gauze of forty threads to the inch, and rough filtered. The Foel filters did not form part of the original scheme. The decision to provide them was arrived at in the year 1901, in view of the experience of Liverpool, which showed that the discharging capacity of lines of iron pipes conveying water from a similar gathering ground was liable to serious diminution in consequence of a growth on the interior of their pipes. As it was proved at Liverpool that this growth was prevented by filtration through coarse sand, it was decided to provide filter-beds at the head of the aqueduct, and the construction of the filters at the Foel was undertaken. The filters are thirty in number. Their dimensions, with slight individual variations, are 80 ft by 50 ft, the total filtering area being 120,000 sq. ft. The construction of these filters has been fully justified, as there has not been in the pipes any of the growth peculiar to moorland waters. The filtering material is formed of layers of shingle graded up to rough sand.

The method of cleansing and renewing the filters is as follows: The washing stages are situate at the west end of the beds, and the sand is conveyed to and from the filters by means of conveyors running on an overhead railway operated by electric energy generated in the turbine. Mr. Lees mentioned incidentally that all of the power required on the works is derived from the compensation water, which is utilised to generate electricity by means of turbines and dynamos situate in the turbine houses at the foot of the Caban dam. What has been termed the "reservation system" of renewing the filter sand has been adopted, the method being the following: When a bed becomes blocked, a layer of 1 in. or more, as may be required, is skimmed off and removed to the washing stage; the filter is then restarted without re-sanding, successive layers of dirty sand being taken away until the stratum of sand remaining in the filter is reduced to the minimum consistent with efficient working. The remainder of the sand is then removed to one side and the filter entirely remade with clean sand at the bottom and the removed sand at the top. Sand which has been washed and is awaiting replacement on the filters is stored in two filter basins at the inlet end, which have been temporarily converted into sand stores.

The washers employed are those known as "Greenway's patent," and are of a capacity to deal with 8 or 9 cub. yds. per hour. The washers are driven by hydraulic engines. The water used for sand washing and also for cleansing the copper gauze strainers, is obtained from a tank having a capacity of 100,000 gallons, situated on the hill at the back of the filters. Water is pumped into this tank from the aqueduct by means of an electrically driven rotary pump situated in the gauge chamber.

The water from the sand washers, containing the peaty material removed from the sand, flows into a settling tank, from which the deposit is removed periodically by means of a rotary pump driven electrically.

TREATMENT OF SOFT WATER.

In view of the danger of the action of the water on lead, in consequence of its softness, the medical officer of health of the city considered it prudent to introduce a small quantity of hardening matter. The medium adopted is finely powdered chalk, and the quantity used varies from 1 to 1.75 grains per gallon, the amount being varied as required from time to time.

The method of introducing the chalk into the water is as follows: A vessel is provided into which is put the quantity of chalk required for adding the fixed proportion for the time being to the water to be discharged into the aqueduct during the following twelve hours. The chalk is then mixed with water. The vessel is provided with a stirrer operated by means of a water engine. The same engine operates an endless band on which are small cups, each of

which picks up a small quantity of the mixture and discharges it into a launder, where it mixes with the tail water from the water engine. This further dilutes it, and it is then discharged into the aqueduct.

The apparatus is situated in a building at the head of the aqueduct, and the passage of the water through the 73 miles suffices for the complete solution of the chalk. The whole apparatus is very simple and works admirably.

CONSUMPTION OF WATER.

Statistics relating to the consumption of water were submitted by Mr. Lees. These showed that with a "population in supply" of 84,820 (the estimated average during the half-year to September 30, 1913), the maximum daily consumption was 28,325 million gallons. The minimums were 15,970 million gallons (all days) and 16,328 million gallons (excluding Sundays and holiday weeks), while the average quantity per diem was 22,404 million gallons. The average consumption per head per diem by meter for trade and public sanitary purposes was 6.68 gallons, and for domestic purposes and unmeasured trade supplies, including water supplied for fire and waste, was 19.62 gallons, a total of 26.30 gallons.

TAR-MACADAM ROADS IN CALCUTTA.

A COMPARISON OF METHODS.

The issue of *Indian Engineering* for March 28th contains an article on the new tar-macadam roads that are being constructed in Calcutta, from which we gather that the work is being somewhat freely criticised. The writer of the article, with the intent of informing the mind of the public, alludes to the discussion two and a-half years ago of two papers on roads which were read at the Institution of Civil Engineers. The Road Board Specification, No. 2, with respect to surfacing with tar-macadam, is quoted, as are also the remarks of Mr. Jansen, an engineer from the Netherlands, who took part in the discussion, to the effect that the tar-macadam road when "fresh" required time, traffic, and warmth (for the evaporation of volatile compounds of the bitumen) before the tractive effort would become lower than on the common macadam road. "These are only some of the salient points in connection with tar-macadam roads," the article continues, "that have a bearing on those being now laid down in this city, and we quote them to show that the roads here seem to be receiving somewhat hasty condemnation. It is known to everyone that before the old macadam roads are surfaced with tar-macadam their cross-section is being reduced, and thus the recognised and legitimate precaution is being taken against slipperiness; it is also known that, according to the best of their judgment, municipal authorities have used pitch of a viscosity somewhat firmer than used at home on account of the high temperature prevailing in Calcutta, a measure quite in accordance with one clause of the Road Board Specification, which says: 'For making pitch-grouted macadam the pitch used should comply with the Road Board Specification for pitch, its viscosity being altered to suit climatic and local conditions by varying the quantity of the tar oils as specified therein.' Lastly, the thickness of the surfacing does not differ materially from what the Road Board lays down. We may then fairly conclude that the results here are the same as at home, making some allowance for difference of climate.

But what are the complaints made here? First, that the road surface is sticky and gives rise to increased tractive effort; second, that the road surface is slippery. The objection to its stickiness is answered by the remark of Mr. Jansen quoted above, which plainly tells us that when first laid they are sticky elsewhere, too, and that this defect lessens with time, as is clear to any observer in Calcutta, too. As regards slipperiness, the little said about it in the two papers, the discussion and the correspondence we are here considering, is significant. It suggests to our mind that this defect is just as little absent at home, is accepted as inevitable, and weighs little in the balance against the vast advantages of these roads over the water-bound macadam roads. That stickiness and slipperiness have been complained of at home most bitterly is common knowledge, and that both are still defects of the bituminous-bound macadam is also indisputable, so that Calcutta has

not a monopoly of these defects, and, judging by precedent, will also one day cease to lament them. It is freely admitted at the same time that much remains to be studied for the improvement of present methods, and, as a matter of fact, the problems are being carefully studied, and must result in time in still better roads.

The directions in which further detailed knowledge needs to be sought are mainly the following: (1) The investigation and standardisation of bituminous binders; (2) the investigation and standardisation of road metal; (3) the investigation and standardisation of methods of preparing materials and constructing roads with known or standard constituents; (4) the compilation of statistics of traffic, of wear, and of initial and maintenance cost; (5) the recording of all local and other influences, such as extent and condition of foundations, gradient, crossfall, presence or absence of overhanging trees, direction of road with regard to prevailing wind, meteorological observations, both during construction and in subsequent service.

The method of construction pursued in Calcutta is somewhat analogous to what is known as the 'penetration' method at home, with this essential difference, that at home the stone is placed first and the grouting poured on it, while here the grouting is laid first in a stiff layer, the stone laid on it and rolled in, forcing the grouting to come up between the pieces of stone, and also cover the top. Personally, we cannot help thinking that the Calcutta method of carefully arranging the stone piece by piece on the surface of the grouting ensures a better distribution of the grout around each piece. In both the home and Calcutta method the surface is finally sprinkled with dry chippings of the stone, so that it is difficult to understand why one surface should be more slippery than the other, if it is so.

It seems almost superfluous to dwell at this date on the advantages of bituminous-bound roads. It is universally conceded that, compared to water-bound roads, they are more lasting, freer from dust, more easily cleaned, smoother to run on, and, in the long run, more economical. The chief complaint against Calcutta roads so far has been on the score of their dustiness; and people still complain that the tar-macadam roads are not materially less dusty. It must not be forgotten, however, that most of the dust on these roads is nothing more than mud imported by the traffic from the water-bound roads, and that as the latter are eliminated one by one so will the tar-macadam roads become less dusty. As regards economy, even with the statistics now available it has been shown that the cost of maintenance would be only half that of maintaining water-bound roads when the cost of strengthening was repaid. Nor should the question of economy be looked at from the point of view of the road only. There is an appreciable saving in the wear of vehicles and horses due to the reduced tractive effort on the smoother roads, which the public are apt to lose sight of in balancing the cost of the two classes of roads."

The Sanitary Inspector. Sir James Orichton Browne stated that the sanitary inspector has to be a bit of a lawyer, a bit of a doctor, and a great deal of a diplomat. Mr. J. H. Brocklehurst, at the Sanitary Inspectors' Conference at Hoyle, suggested that "rat-catcher" and "rag-washer" should be added to those qualifications.

Chartered Surveyors' Golfing Society: Spring Meeting. By kind permission of the Bramshot Golf Club, a one-day competition will be held on that club's course on Wednesday, May 6th. The station is Fleet (L. & S.W.Rly.), where cabs may be obtained, about 3/4 mile from the course. There is also a halt at the club-house, and the train leaving Waterloo at 9.25 will stop there. In the morning a Bogey Competition will be played under handicap. A prize, kindly presented by Mr. Samuel Martin (captain), will be given for the best nett return. In the afternoon a Stroke Competition under handicap. A prize will be given for the best nett return. There will be no entrance fees. Members of the society will be made members of the course for the day. In order to facilitate the necessary arrangements, members who intend to be present for either the whole day or any part of the day are requested to notify Mr. Sydney A. Smith, 22 Chancery-lane, W.C., who, if application is made in time, will be able to provide railway vouchers to enable members to travel at reduced fares.

THE UNITED STATES OFFICE OF PUBLIC ROADS.

ANNUAL REPORT OF THE DIRECTOR.

The report of Mr. L. W. Page, director of the United States Office of Public Roads, for the fiscal year ended June 30, 1913, is a brief record of useful work of a comprehensive character. The educative, technical, and administrative activities of the department are closely related, and the conditions in the United States are such that the central office is able to do very useful work in areas where the means for intelligent planning and construction of roads would not otherwise be available. It is much to the advantage of the United States that a large amount of the information presented to the public on the subjects of road problems and road finance is from a well-informed source, and is of an authoritative character. In the year under review 558 lectures and addresses were delivered in various parts of the States by twenty-nine representatives of the office. The number was less than in the previous year, and the total attendance less than half, and this form of primary education in road matters is probably not expected to be, on any considerable scale, a feature of the permanent work of the office. Close attention is given, however, to the matter of imparting direct instruction in highway engineering, and during the year eight graduates in civil engineering were appointed to the position of civil engineering student, and put through a post-graduate course in highway engineering, including work in the field and in the laboratories of the office. Some of these students are appointed to the position of junior highway engineer at the end of the first year, and at the end of the second year to that of highway engineer.

COUNTY ROAD SYSTEMS.

The work of the office in the matter of planning county road systems is specially interesting. In one case an engineer and an assistant were stationed in a county for the purpose of devising a county system; making the surveys for relocation, investigating materials, designing road structures, and advising the county officials in matters of construction, administration, and maintenance for a system of about 120 miles of road. In this case the general plan of the roads was already fixed, but in another county, in Texas, the study involved a consideration of the farm area, the productive crops, the distribution of population, and other elements affecting the selection of roads for improvement. In another county of the same State a short study of 120 miles of road was undertaken, and included an investigation of the road-making materials throughout the county, and, after the materials had been tested at headquarters, it was recommended that in view of the small resources of the county the roads should be made of graded earth and sand-clay. In twenty-three States consultations were held with engineers from the central office, and an engineer was deputed to begin a study of the roads and trails in the national forests.

A number of "object-lesson" and experimental road lengths were put down during the year, and a table in the report shows the area in square yards of each kind of crust. Out of a total area of just over 500,000 sq. yds., nearly 163,000 sq. yds. were earthen, 123,000 sand-clay, 63,000 gravel, 57,000 macadam, 44,000 shell, and 16,000 bituminous macadam. To the class of sand-clay roads must be added about 5,300 sq. yds. of "sand-gumbo." Taking into account only the "object-lesson" roads proper, it may be noted that, since 1905, brick and concrete appear in one year only, and several other types very seldom; but it must not be overlooked that this work is carried out mainly in the less thickly peopled and less developed States.

MAINTENANCE EXPERIMENTS.

Maintenance experiments were conducted during the year on eleven types of bituminous macadam road, built in 1911-1912, and on 8 miles of road in Virginia, and the manner in which the time of the patrolman was divided is shown in tables in the report. On the bituminous road the patrolman's length was 3.2 miles, and he worked eight hours a day, and was provided with a horse and cart.

In the case of the earth and gravel road in Virginia, the length allotted to each patrolman is not stated, but the days given to each kind of work are shown, month by month, for a year. The chief features are as follows: Repairing, cleaning, and improving ditches and underdrains, 80 days, of which

17 were in August, 14 in July, 13½ in November, 12 in October, and none in February, March, or May (one in June). Miscellaneous, including the clearing away of leaves, filling holes, repairing the shoulders, and shaping the road bed, 47 days, of which 10 were in June, 8 in October, and 4 to 7 apiece in March, April, September, November, and December. Loading, hauling, and spreading gravel, 46 days, of which 11 were in February, 5 in March, 7 in April, 8 in May, and 7 in June. Cutting brush, &c., 36 days, of which 9 were in May, 8 in March, 7 in February, and 4 in June. Dragging, 36 days, of which 8 were in January, 5 in December, with 2 to 4 days in other months, except June and November, one day each, and February none. Inspection during storms 25 days, none in July, August, or October, one each in November and June, 2 in September, and 3 or 4 in each of the remaining months. Picking off stones, 18 days, of which 5 were in July, 4½ in August, 2 each in September, October, and January, one each in June and November, and half a day in April (none in December, February, March, or May). The remaining three days were given to a traffic census.

LABORATORY WORK.

Eight hundred and thirty-nine samples of road building materials were received for investigation in the chemical and physical laboratories. In the petrographic laboratory 95 samples of rock were analysed qualitatively, 33 quantitatively, and 373 were examined for the purpose of identification. Two colleges sent each a member of its faculty to take a full course of instruction, with a view to introducing similar work in their curricula. During the year 124 specifications for bituminous materials and methods of using them were issued from the laboratory. Special attention was given to some specimens of Texas natural rock asphalt, and to the means of using bitumen with the Florida coralline rocks. Reports were made as to the road building properties of 118 samples of dolomite, 96 of limestone, 70 of gravel, 41 of sandstone, 19 of granite, and 40 of trap rock, besides 118 other samples, including gneiss and schist.

THE IMPROVEMENT OF POST ROADS.

The Office of Public Roads undertakes preliminary inspection of post roads designated for improvement, makes economic studies in relation to these roads, and superintends the construction of projects approved by the Postmaster-General. The inspections made covered 1,143 miles of road, and construction work has been begun on two projects. Under the head of "Economic Investigations," arrangements are made for censuses to be taken by the collaborators of the office, in the case of the post roads for one week before improvement, and afterwards at other times each year for a period of one week. The number of tons hauled over each mile of road in the year is estimated as nearly as possible, and photographs are taken at distances not less than ½ mile apart. The studies tend to show that a very small reduction per ton-mile in the cost of hauling will pay all interest and maintenance charges, and meet sinking fund requirements "on the road investment proposed." A wagon equipped with a traction meter is run over each post road before improvement, and the pull in pounds for a standard load on standard tyre widths is automatically registered throughout the length of the road.

Change of Address.—Messrs. Wailes, Dove & Co., Limited, announce that, owing to the rebuilding of their present premises, they have taken larger offices, and their address will in future be Channel Chambers, James-street, Cardiff (corner of South William-street). These new offices are on the first floor, and very convenient owing to their central situation. The company's representative, Mr. T. I. Forward, and his assistant, Mr. T. J. O'Leary, will continue to look after the firm's interests.

Waterproofing of Lime. We have recently received a booklet dealing with this subject. The need of such a material for use with lime in setting and pointing ancient and modern stone and brick work, for rough-cast walls rendered with lime, and for obtaining a white joint for modern brickwork, is recognised. The booklet deals with the substance called Lime Pudlo, which is a by-product of the well-known Cement Pudlo. Lime Pudlo, we are given to understand, has been found by tests to prevent disintegration of lime mortar by frost.

DUBLIN HOUSING CONDITIONS.

(From a Correspondent.)

The Lord Lieutenant of Ireland and Lady Aberdeen are taking an active interest in the Dublin housing problem, and with the object of directing public attention to the subject the Lord Lieutenant, as already announced in your columns, has offered a prize for the best plan for laying-out and rebuilding the slum areas of Dublin.

The coming Civic Exhibition in Dublin is to have a special display of town planning, which is being organised under the direction of Lady Aberdeen, who is president of the Executive Committee of the exhibition. Her ladyship hopes to make the town planning section the most important in the exhibition, and by its means to educate the citizens in the principles of town planning.

It is understood that Lord Aberdeen favours the recommendations of the Departmental Committee's report as to the housing conditions of Dublin, and that his lordship is not a believer in dealing with the problem piecemeal. He recognises that any scheme of such magnitude must of necessity be a State-aided scheme.

Since the Fire of London in 1666 no city rebuilding of this magnitude has been under consideration in Great Britain.

Turning to the report of the Departmental Committee appointed by the Irish Local Government Board to inquire into the housing conditions of the working classes in the city of Dublin, it is generally interesting, when considering documents of this kind, to look at the position of those composing the committee. We here find the following four gentlemen appointed by the Irish Local Government Board to serve on this committee—viz.:—

Mr. Charles H. O'Connor is a son of The O'Connor Don. Mr. Charles H. O'Connor is one of the lay inspectors of the Local Government Board, and has occupied that position for some ten years. He is thirty-five years of age.

Mr. S. Watt is a first-class clerk in the Irish Local Government Board, and is thirty-three years of age.

Mr. J. F. McCabe, a son of Sir Francis McCabe, is a Bachelor of Arts, Trinity College, Dublin. He is thirty-four years of age, and an inspector of the Local Government Board, Ireland.

Mr. Alfred Delaney, who is thirty-four years of age, is a reporter on the staff of the *Irish Times*.

The report of the Departmental Committee goes into the subject very fully, and expresses many good ideas and many new ideas. The good ideas are not, however, in all cases new, neither are the new ones uniformly good. It seems a matter of regret that none of the leading municipal engineers of this country were added to the committee, nor the evidence of any such experts taken. The four gentlemen who composed the committee were not wanting in diligence, and they appear to have performed their task in a highly creditable manner, but the report they produced, although doubtless a correct record of facts, lacks the weight which the recommendations contained in it would otherwise have had.

The wretched state of things that at present exists in Dublin are set out in much detail, and illustrated by numerous photographs.

From the slum point of view, Dublin may certainly be considered the first city in the Empire. No other community of its extent can show such an area of slum-land.

The report is signed by all four gentlemen named, but appended is a memorandum by Mr. McCabe, which seeks to give a clean bill of health to the Dublin Corporation. In his opinion, what the Dublin Corporation left undone was beyond their power to effect in practice. With this view one cannot agree. We have only to look at the enormous improvements effected under similar conditions in Liverpool, Manchester, Birmingham, Glasgow, and other large cities in Great Britain to see that much might have been done by the Dublin authorities, had they been so minded.

The Dublin Corporation had given to them compulsory powers which were not enforced as they should have been. This is clearly set out in the body of the report, which is signed (under reservation) by Mr. McCabe. It is therefore difficult to see how he could consistently absolve the Dublin Corporation if the facts stated in the report are accurate.

The committee recommend the rebuilding of the slum areas of the city, and the erection of 14,000 houses, at an estimated cost of £3,500,000.

They make it clear that they favour a State-aided scheme.

It is to be hoped that if the matter is to be pressed forward to a practical issue the advice of engineers skilled in work of this character will be taken, and that a comprehensive scheme will be produced and agreed upon before any piecemeal rebuilding is undertaken. One also hopes that the Dublin authorities will be more fortunate in dealing with private landowners than the City of London Corporation were in the seventeenth century when endeavouring to carry out the bold scheme of Sir Christopher Wren. The property owners in those days were apparently too strong for the City Corporation and for the Government of the day who legislated upon the subject. The London owners objected to parting with their properties in exchange for similar areas on the lines of the intended new and more commodious thoroughfares, and their influence secured their success. The result was that Wren's scheme was, for the most part, abandoned. The Corporation of the City of London, aided by contributions from other portions of the Metropolis, have spent many millions during the past century in trying to undo to a small extent the unfortunate muddle due to the obstinacy and shortsightedness of the landowners of those days.

It appears from the Dublin local press that the Lord Mayor has charged the Local Government Board with giving specific and deliberate opposition to well-matured and well-considered efforts made by the corporation to prevent rural labourers from coming into Dublin. One can scarcely see how the Local Government Board could draw a barrier round Dublin to prevent the influx of rural labour—which is taking place in all large towns. The solution would probably have been found had the jobbers in slum property less influence in the City council.

The commissioners in their report have been rather severe on the sanitary department of the Dublin Corporation, but before attaching blame to any official in that department it is well to consider their remarks with respect to the constitution of the council and the position of small property owners thereon.

So long as it is legal for interested councillors to protect individual interests to the detriment of the public interest such difficulties will always arise. The evils arising from local interests represented and worked by unscrupulous members of municipal councils are generally recognised. It is to the personal interest of such persons to become members of public bodies, and they spare neither time nor trouble to secure and retain such positions.

The Municipal Corporations Act makes an attempt to preclude such persons from voting on matters in which they are interested, but it does not prevent them from being present at committee and council meetings, or canvassing their friends and colleagues on the council. Where many interests of this kind are involved it is often a case of "you scratch my back and I'll scratch yours," and in this way parties most interested often influence other members of the committee, whose interests they have served on previous occasions.

One can only hope that the prominent part which the Lord Lieutenant and Lady Aberdeen are taking in the promotion of the Civic Exhibition, and their interest in the housing question in Dublin, will lead to good results and remove from Dublin that unenviable notoriety which attaches to it as one of the largest slum communities in the United Kingdom.

London District Surveyors' Fees.—A letter has been received from the London County Council acknowledging the receipt of a communication from Kensington Borough Council in support of the views expressed by the Wandsworth Borough Council, that a revision of the scale of fees of district surveyors in respect of additions or alterations to existing buildings should be sought, and intimating that, in the absence of specific instances of alleged excessive fees, it is not proposed to take any action in the matter; also pointing out that under the London Building Act, 1894, the county council are required to pay compensation to a district surveyor in respect of any diminution of his income caused by the reduction by the county council of the amount of the fees specified in the third schedule to the Act.

FOURTH INTERNATIONAL ROAD CONGRESS.**PROGRAMME OF QUESTIONS.**

Appended is the programme of questions drawn up by the Permanent International Commission for the Fourth International Road Congress, which is to be held at Munich next year.

1ST SECTION: CONSTRUCTION AND MAINTENANCE.

1st Question.—Methods of repair of macadamised roads of all kinds for minor damage (unevenness, pot-holes, &c.).

- Repair by patching or by resurfacing.
- Nature, quality and size of materials employed and crushing of the materials employed.
- Plant; methods of carrying out work.
- Prime cost; comparisons.

2nd Question.—Asphalt roads (urban roads carpeted with asphalt, or laid with hard asphalt, compressed asphalt, asphalt slabs, and pavings and similar methods).

- Conditions governing the selection of type of the surfacing; constitution of the mastic; specification and inspection.
- Methods of construction and maintenance; prime cost; life.
- Advantages and disadvantages of the various methods.

3rd Question.—Small setts, including brick roads.

In what circumstances is the use of setts to be recommended (a) for urban roads, (b) for roads in open country?

Gauge and kind of materials to be used; methods of construction, substructure and maintenance; prime cost; life.

Advantages and disadvantages.

4th Question.—Laying tram rails on various kinds of road surface (macadam, ordinary setts and small setts, wood paving, asphalt, &c.).

To what extent does the section rail, type of rolling stock, ballast and infiltration of water affect the destruction of the road (surfacing and foundation)?

How should the foundations and surfacing of the road be constituted according to the various methods of construction? Experiments carried out with this object.

Methods of fixing the rails in various surfacings; advantages and disadvantages of these various expedients.

Steps to be taken to deaden the noise and vibration caused by heavy tramcars.

2ND SECTION: TRAFFIC AND ADMINISTRATION.

5th Question.—Special deterioration of roads caused by various kinds of traffic.

Effect of weight, speed traction or propulsion; various kinds of tyres; construction and shape of vehicles (chassis, coach work and wheels); fittings of carriages and harnessing.

6th Question.—Traffic census.

Methods used or recommended; classification and counting of vehicles and animals; calculation of tonnage.

Conclusions to be drawn from the point of view of construction and maintenance

7th Question.—Road Products.

Cut grass; trees and shrubs, and especially fruit trees; sale of old material, &c.

INSTITUTION OF WATER ENGINEERS.**SUMMER MEETING AT STOCKPORT.**

The annual summer meeting of the Institution of Water Engineers will be held this year on June 11th, 12th and 13th at Stockport (headquarters at Midland Hotel, Manchester). Candidates for election at the council meeting to be held on June 11th should see that their proposal forms (duly filled in and signed) are received by the secretary, Mr. Percy Griffith, 20 Victoria-street, Westminster, S.W., not later than June 1st.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A R.I.B.A.,
Borough Surveyor, Great Yarmouth.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District is to be held at Sheffield on May 2nd.

PROGRAMME.

2 p.m.—Meet at the town hall to inspect the plans of the town planning scheme.

2.30 p.m.—Leave town hall for Wincobank to inspect the sewage disposal works.

4.30 p.m.—Leave sewage disposal works to view the High Wincobank Corporation model dwellings.

5.30 p.m.—Return to town hall, where tea will be provided by the kind invitation of the Right Hon. the Lord Mayor (Colonel G. E. Branson, J.P.).

6.30 p.m.—District business.

In order that the necessary arrangements may be made, members must give notice of their intention to be present not later than Tuesday, April 28th.

J. P. WAKEFORD, M.I.C.E., F. MASSIE, M.I.C.E.,
Hon. District Secretary. *District Chairman.*
Wakefield. Wakefield.

DOVER MEETING.

A meeting of the institution is to be held in the South-Eastern District at Dover on May 9th.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury on May 16th.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.—not at Edinburgh, as previously announced.

The following papers will be read—viz.:—

“A Town Planning Scheme: Its Effects on Housing and Architecture,” by Mr. Raymond Unwin.

“Edinburgh and Its Early Examples of Town Planning,” by Mr. A. Horsburgh Campbell.

“Town Planning from a Lawyer’s Point of View,” by Mr. John L. Jack.

“The Advantages of Steam Tractor Haulage over Team Labour for Road Material,” by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

ANNUAL MEETING.

A town planning, housing and road conference and the forty-first annual general meeting are to be held at Cheltenham from June 24th-27th.

The following is a preliminary list of the papers to be read and discussed at the conference:—

- (1) “Town Planning Large Areas,” by Mr. W. A. Clarry, borough surveyor, and Mr. R. A. Reay-Nadin, town clerk, Sutton Coldfield.
- (2) “The Housing, Town Planning, &c., Act, 1909 (Part 2) as Applied to Commercial and Industrial Districts,” by Mr. J. C. Midgley, deputy city surveyor, Newcastle-upon-Tyne.
- (3) “Town Planning and Architectural Issues,” by Prof. S. D. Ashead, Liverpool University.
- (4) “The Abnormal Development of Coventry and some of its Town Planning and Housing Problems,” by Mr. J. E. Swindlehurst, city engineer, Coventry.
- (5) “Town Planning Amended Procedure Regulations,” by Mr. H. E. Stilgoe, city engineer, Birmingham.
- (6) “Town Planning Procedure,” by Mr. Fred. W.

Pearce, engineer to the Twickenham Urban District Council.

- (7) "Town Planning Practice in America," by Mr. C. M. Robinson, Rochester, N.Y.
- (8) "Some Notes on Highway Law as Affecting the Municipal Engineer," by Mr. S. G. Turner, Barrister-at-Law, London.
- (9) "The Training of the Highway Engineer of the Future," by Mr. H. Percy Boulnois, London.
- (10) "The Control, Management and Maintenance of Roads," by Mr. J. Fred. Hawkins, county surveyor, Berkshire.
- (11) "The Prevention of Sub-Crust Movement in Roads," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.
- (12) "The Economics of Modern Methods of Road Construction," by Mr. Francis Wood, borough engineer, Fulham.
- (13) "Some Notes on Grouting and Penetrating Methods of Road Surfaces," by Mr. Geo. Green, borough engineer, Wolverhampton.
- (14) "The Organisation of a Municipal Engineer's Department," by Mr. E. Willis, surveyor to the Chiswick Urban District Council.
- (15) "The City of Worcester Sewage Disposal Works," by Mr. T. Caink, city engineer, Worcester.
- (16) "Notes on the Protection of the Foundations of Chepstow Bridge over the river Wye in Ferro-Concrete," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.

The conference will be opened on Wednesday afternoon June 24th (when the delegates will be welcomed by the Mayor and Corporation of Cheltenham), and continued during the two following days. Visits will be made on Thursday afternoon, June 25th, and Saturday morning, June 27th, to the corporation new sewage purification works, waterworks, destructor, concrete slab factory, &c.

PROGRAMME.

- Wednesday, June 24th (Morning).—General business of the institution.
 Presidential address and presentation of premiums.
 Afternoon.—Conference—Town planning and housing; conference—Roads, &c.
 Evening.—Exhibition of town planning and housing schemes, &c.
- Thursday, June 25th (Morning).—Conference—Town planning and housing; conference—Roads, &c.
 Luncheon given by mayor to members of the institution and delegates.
 Afternoon.—Drive to inspect planned areas of town. Visit to refuse destructor, concrete slab factory and new sewage purification works.
 Evening.—Annual dinner.
- Friday, June 26th (Morning).—Conference—Town planning and housing; conference—Roads, &c.
 Afternoon.—Conference—Town planning and housing; conference—Roads, &c.
 Evening.—Open-air concert—Montpellier Gardens.
- Saturday, June 27th (Morning).—Visit to corporation waterworks at Tewkesbury, &c.

THOMAS COLE,
Secretary.

92 Victoria-street, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held at Hexham on Saturday, May 2nd, Cumberland in June, Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Hull on Saturday, May 16th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

GENERAL MEETINGS.

A meeting will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C. (corner

of Savoy-street, Strand), on Monday, May 11, at 7.30 p.m., for the discussion of a paper.

GREATER NEW YORK'S WATER SUPPLY SCHEME, which has been presented for that purpose by Mr. William T. Taylor, Fellow A.M.I.E.E., M.I.E.E., M.A.M. SOC.M.E., A.M.I.MECH.E., F.R.G.S. (Member).

The meeting is being held jointly with the Society of Engineers. The paper will be printed in the forthcoming issue of the "Journal."

A general meeting will be held at Birmingham in May, when a visit will be paid to the works of the General Electric Company.

COUNCIL MEETING.

A council meeting will be held in London on Wednesday, April 29th.

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Finedon and Kettering on Thursday, May 7th, when a visit will be paid to the works of the Excelsior Stone Company at Finedon, and certain municipal works inspected at Kettering.

PROGRAMME.

12.20 a.m.—Meet at the works of the Excelsior Stone Company at Finedon, and inspect the manufacture of patent stone slabs, kerbs, channels, architectural dressings, &c.

Proceed thence by motor bus to Kettering for lunch at the Royal Hotel, at the kind invitation of the Excelsior Patent Stone Company, when a short paper will be read by Mr. W. B. Mortimer, managing director of the firm.

An inspection will afterwards be made of works in Excelsior stone at Kingsley-avenue, the new Co-operative Clothing factory, and the county police station.

G. BELSON CHILVERS,
Hon. District Secretary.

Council Offices,
 Oundle.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

B. WYAND,
Secretary.
 39 Victoria-street, S.W.

ASSOCIATION OF SOMERSET SURVEYORS.

President—Mr. W. ALEX. COLLINS, Surveyor to the Bridgwater Rural District Council.

A meeting of the above association will be held in the vestry-room at Street, to-morrow (Saturday). Previous to the meeting the members are to lunch at the Bear Hotel, by the kind invitation of the chairman and members of the Street Urban District Council. Mr. A. W. Stacey, J.R., will preside.

PROGRAMME.

- 1.15 p.m.—Lunch at the Bear Hotel.
- 2.15 p.m.—Inspection of the new houses recently erected by the council under the Housing and Town Planning Act.
- 3.15 p.m.—Meeting at the vestry-room and discussion on a paper on the "Financial and other Aspects of Housing," by Mr. W. H. Cousins, F.A.S.L., surveyor to the Street Urban District Council.
- 4 p.m.—Tea at the Bear Hotel, by the kind invitation of the president (Mr. W. Alex. Collins).

A motor char-à-banc may be hired from Bridgwater to Street, providing an interesting drive over the Polden Hills, for £2 5s. If only fifteen members would join in this means of travelling the price per head would be 3s. return, and the return journey made at a time to suit the convenience of all the members.

D. EDWARDS, ASSOC.M.INST.C.E.,
Hon. Secretary.

Taunton.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

CLERK OF WORKS.—April 28th.—Pontardawe Rural District Council. £4 per week.—Mr. Wyndham Lewis, clerk.

JUNIOR ASSISTANT.—April 28th.—Ilford Urban District Council. £80—£100 per annum.—Mr. H. Shaw, engineer and surveyor.

TEMPORARY ASSISTANT.—April 29th.—Maidenhead Town Council. £2 10s. per week.—Mr. Percy Johns, borough surveyor.

SURVEYOR'S GENERAL ASSISTANT.—May 1st.—Ulverston Urban District Council. £1 15s. per week.—Mr. C. Telford Hague, surveyor.

ASSISTANT SURVEYOR OF MAIN ROADS.—May 1st.—Staffs County Council. £175—£250 per annum.—Mr. James Moncur, county surveyor.

GASWORKS MANAGER.—May 2nd.—Bollington Urban District Council. £110 per annum.—Mr. Samuel Knight, clerk.

CLERK OF WORKS.—May 2nd.—Corporation of Swansea. £2 10s. per week.—Mr. H. L. Coath, town clerk.

INSPECTOR OF NUISANCES.—May 4th.—Corporation of Birkenhead. 35s. per week.—Mr. J. Fearnley, town clerk.

BOROUGH ARCHITECT'S ASSISTANT.—May 6th.—Corporation of Swansea. £150 per annum.—Mr. H. L. Coath, town clerk.

CLERK OF WORKS.—May 9th.—Guildford Rural District Council. £3 10s. per week.—Mr. John Anstee, engineer, Commercial-road, Guildford.

SURVEYOR.—June 15th.—Board of Trustees for the Improvement of Calcutta. 600—800 rupees per month (rupee valued at 1s. 4d.). Chairman, Calcutta Improvement Trust.

ASSISTANT ENGINEERS.—Public Works Department of the Government of Nigeria. £300—£400, with free quarters.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

CHIEF DRAUGHTSMAN.—Federated Malay States. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

DRAUGHTSMAN.—Nigerian Government Railway. £300—£350.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

MANCHESTER.—May 23rd.—Plans, specifications, and estimates for semi-detached cottages, for the Manchester Sanitary Committee.—Sanitary Department, Civic Buildings, Mount-street.

HYTHE.—May 30th.—Designs for a concert hall and public shelter, for the Hythe Corporation. Premiums, 50, 25 and 10 guineas.—Mr. B. C. Drake, town clerk.

SUNDERLAND.—June 23rd.—Designs for a secondary school for 600 scholars, for the Corporation of Sunderland. Premiums, £100, £50, and £25.—Mr. J. W. Moncur, borough engineer and surveyor, Town Hall.

BELPER.—Designs and estimates for the erection of a bridge over the River Derwent, for the Belper Rural District Council.—Mr. Robert C. Cordon, surveyor, Duffield, near Derby.

CHESTER.—Designs for working-class dwellings, for the Corporation of Chester. Premiums, £50, £25, and £10. Mr. Patrick Abercrombie, M.A., Liverpool University School of Civic Design, has been appointed assessor.—Mr. J. H. Dickson, town clerk.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

BURY (Laucs).—April 27th.—For the construction of concrete foundations to generator, for the corporation.—Borough Engineer.

EAST COWES.—April 27th.—For driving ferro-concrete piles and strengthening the sea wall, for the urban district council.—Mr. Albert Barton, surveyor.

ABERDEEN.—April 27th.—For the erection of a car shed, for the corporation.—Mr. W. Dyack, burgh surveyor.

EASTBOURNE.—April 27th.—For the erection of public conveniences, for the corporation.—Borough Surveyor.

HARROGATE.—April 27th.—For the rebuilding of the market hall, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

MEXBOROUGH.—April 27th.—For the erection of public baths, for the urban district council.—Mr. H. Burgess, architect, Queen Anne's Chambers, Westminster, W.C.

PONTEFRAC.—April 27th.—For deepening a well and other incidental works, for the corporation.—Messrs. G. & F. W. Hodson, engineers, Bank Chambers, Loughborough.

HETTON.—April 27th.—For the erection of a public convenience, for the urban district council.—Mr. J. Harding, surveyor.

ARBROATH.—April 28th.—For the erection of public baths, for the corporation.—Mr. H. Gavin, architect, 42 Hill-street.

TRURO.—April 28th.—For the erection of a stone bridge, for the rural district council.—Mr. C. Hancock, clerk.

WANDSWORTH.—April 28th.—For deepening the artesian well and supplying and fixing an air-compressor engine and water and air tubes, for the borough council.—Mr. P. Dodd, borough engineer.

ILFORD.—April 28th.—For the erection of electricity station and lodge, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

EAST RIDING.—April 28th.—For the erection of clerk and steward's house, six cottages, bailiff's house and dairy, for the Asylum Visiting Committee.—Mr. C. W. Hobson, clerk, 26 and 28 Lairgate, Beverley.

WESTMINSTER. April 29th.—For the execution of certain alterations and sanitary work at the Buckingham Palace-road public baths, for the city council.—City Engineer.

KENT.—April 29th—May 18th.—For the extension of a school, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

HULL.—April 29th.—For building workshops, and alterations to car shed, for the corporation.—Mr. A. E. White, city engineer.

HULL.—April 29th.—For the building of a market, for the corporation.—Mr. A. E. White, city engineer.

BURTON-UPON-TRENT.—April 29th.—For the extension of the refuse destructor, Bond End, for the corporation.—Mr. George T. Lynam, borough engineer and surveyor.

CARDIFF.—April 30th.—For the erection of a fire station, for the corporation.—Messrs. E. V. Harris & T. A. Moodie, architects, 8 New-square, Lincoln's Inn, London, W.C.

ASHFORD.—April 30th.—For the erection of baths and attendant's room, for the urban district council.—Mr. W. Terrill, surveyor.

BIRMINGHAM.—April 30th—May 25th.—For the construction of piling in foundations, basement floors, cooling ponds, canal basin, and canal widening, for the corporation.—Secretary, Electric Supply Department, 11 Dale-end.

LANCASHIRE.—May 1st.—For the erection of a school, for the Education Committee.—Mr. H. Littler, county architect, 16 Ribblesdale-place, Preston.

BROMLEY.—May 1st.—For work of hospital extension, for the Joint Hospital Board.—Mr. F. H. Gedney, clerk, Park House, Bromley.

BURTON-ON-TRENT.—May 1st.—For the extension of a retort house, for the corporation.—Manager, Gasworks.

CHESHIRE.—May 1st.—For widening a bridge, for the county council.—Mr. W. Holland, The Castle, Chester.

BLACKPOOL.—May 2nd.—For additions to Waterloo-road school, for the corporation.—Mr. John S. Brodie, borough engineer.

COVENTRY.—May 4th.—For additions to certain premises, for the corporation.—Mr. J. E. Swindlehurst, city engineer and surveyor.

FEATHERSTONE.—May 5th.—For the erection of 149 working-class dwellings and laying sewers, for the urban district council.—Mr. S. Chesney, engineer.

FOOTS CRAY.—May 5th.—For the erection of council offices, for the urban district council.—Mr. W. A. Farnham, surveyor.

HERTS.—May 7th.—For the erection of a school, for the county council.—County Surveyor, Hatfield.

GUILDFORD.—May 11th.—For the erection of twenty cottages, for the corporation.—Mr. C. G. Mason, borough engineer.

ILKLEY.—May 11th.—For the erection of an electricity generating station, for the urban district council.—Mr. George Wilkinson, consulting engineer, Beech Mount, Harrogate.

DURHAM.—May 19th.—For the erection of a school, for the county council.—Mr. A. J. Dawson, clerk to the Education Committee, Shire Hall, Durham.

KIDSGROVE.—For the erection of a urinal, for the urban district council.—Mr. F. C. Crimes, engineer and surveyor.

Iron and Steel.

DUNDEE.—April 27th.—For the erection of a corrugated-iron shed, for the Water Commissioners.—Mr. G. Baxter, 93 Commercial-street.

CHELMSFORD.—April 30th.—For the provision and erection of a pumping installation, including suction-gas plant, for the corporation.—Mr. Percival T. Harrison, borough engineer.

BURNLEY.—May 2nd.—For the supply of 4-in. weldless steel spigot and faucet tubes, for the rural district council.—Mr. H. Pritchard, engineer.

ENFIELD.—May 6th.—For the supply of 350 lin. yds. (more or less) of wrought-iron unclimbable fencing, 5 ft. high, and one pair of gates, for the urban district council.—Mr. Richard Collins, surveyor.

MADRAS.—June 17th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer, and Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster, S.W.

Roads.

ANTRIM.—April 25th.—For resurfacing certain roads, for the county council.—County Surveyor, County Courthouse, Belfast.

SOUTHWICK.—April 27th.—For laying concrete slab paving in certain streets, for the urban district council.—Mr. G. W. Warr, surveyor.

YORK.—April 27th.—For excavating existing material of roadway, and laying concrete foundation and tar-macadam surface on about 1½ miles of main road, for the corporation.—Mr. F. W. Spurr, city engineer.

BLAENAVON.—April 27th.—For the supply of 850 tons of broken limestone and 150 tons of limestone gravel, for the urban district council.—Mr. E. W. Edwards, surveyor.

ASHFORD WEST.—April 27th.—For the supply of basalt and quartzite, for the rural district council.—Mr. A. Sims, surveyor.

YORK.—April 27th.—For making up with concrete and tar-macadam, for the corporation.—Mr. F. W. Spurr, city engineer.

FARNBOROUGH.—April 27th.—For the supply of broken granite, slag, or granite tar-macadam, for the urban district council.—Mr. J. E. Hargreaves, surveyor.

EAST SUSSEX.—April 27th.—For the widening, improvement, and reconstruction of the Lewes-Newhaven road, for the county council.—Mr. F. J. Wood, county surveyor, County Hall, Lewes.

FINSBURY. April 27th.—For paving work with creosoted deal on Portland cement concrete, for the borough council.—Borough Surveyor.

RUNCORN.—April 27th.—For the supply of broken stone, and granite tar-macadam, for the urban district council.—Mr. J. Wilding, surveyor.

LLANDAFF.—April 28th.—For flagging footpaths, for the rural district council.—Mr. J. Holden, surveyor, 20 Park-place, Cardiff.

GOSFORTH.—April 28th.—For making up a back street, for the urban district council.—Mr. G. Nelson, surveyor.

WOODFORD.—April 28th.—For making up certain streets, for the urban district council.—Mr. W. Farrington, surveyor.

BERWICK.—April 28th.—For the supply of machine-broken whinstone, for the corporation.—Borough Surveyor.

WATERLOO.—April 28th.—For making up a road, for the urban district council.—Mr. F. S. Yates, surveyor.

BELFAST.—April 29th.—For the supply of 280 tons of setts, for the Harbour Commissioners.—Mr. W. R. Kelly, harbour engineer.

LYDD.—April 29th.—For the supply of tarred Kent ragstone and basalt, for the corporation.—Mr. T. Kettle, borough surveyor.

BOLLINGTON.—April 29th.—For the supply of 300 tons of granite macadam, for the urban district council.—Mr. S. Knight, clerk, Council Offices, Bollington, near Macclesfield.

CHESTER-LE-STREET.—April 30th.—For making up certain streets, for the urban district council.—Mr. W. Ridley, surveyor.

WELTON.—April 30th.—For the hire of a 12½-ton steam roller with scarifier fitted, for the rural district council.—Mr. W. B. Danby, clerk, 2 Bank-street, Lincoln.

ASHFORD.—April 30th.—For the supply of unbroken Kentish ragstone and broken pit flints or coarse gravel, for the urban district council.—Mr. W. Terrill, surveyor.

ARGYLL.—April 30th.—For work of road maintenance, for the county council.—Mr. J. Thomson, surveyor, Strontian.

RICHMOND (Surrey).—May 1st.—For constructing granite sett paving, for the corporation.—Mr. J. Brierley, borough surveyor.

LANCASTER.—May 2nd.—For highway construction, for the rural district council.—Mr. W. Dixon, surveyor.

WHITWORTH.—May 4th.—For paving sections of the main road, for the urban district council.—Mr. J. C. Owen, clerk, Council Offices, Facit, near Rochdale.

WIMBLEDON.—May 4th.—For work of surfacing with asphalt or other bituminous material, for the corporation.—Borough Surveyor.

MADRAS.—May 4th.—For the supply of 400 40-gallon casks of tar, for the corporation. A copy of specification and conditions may be obtained at the office of The Surveyor, 24 Bride-lane, Fleet-street, E.C.

LONDON.—May 5th.—For paving work in Blackwall and Rotherhithe tunnels, for the county council.—Mr. G. W. Humphreys, chief engineer, Spring-gardens, S.W.

BARNET.—May 5th.—For private street works in Byng-road and Wentworth-road, for the urban district council.—The Surveyor.

ALDERSHOT.—May 5th.—For the supply of 100 tons of 2½-in. basalt, 200 tons of slag tar-macadam, 130 tons of ¾-in. and 1½-in. limestone tar-paving, and 1,750 yds. of 2½-in. Hungry Hill flints, for the urban district council.—Mr. F. C. Uren, surveyor.

EALING.—May 5th.—For making up Curzon-road (portion), Hope-road, Gumleigh-road, Ellis-road (portion), and Ealing Park-gardens (portion), for the corporation.—Mr. W. R. Hicks, borough engineer.

WREXHAM.—May 5th.—For making up certain streets, for the corporation.—Mr. J. England, borough engineer.

KINGSTON-UPON-THAMES.—May 6th.—For the supply of 2,000 tons of Guernsey, Quenast, or other granite, the whole to be broken so as to pass through rings having 1½ in. or 2 in. internal diameter, accord-

ing to percentages specified, for the corporation.—Mr. R. Hampton Clucas, borough surveyor.

ENFIELD.—May 6th.—For the supply of 780 yds. of granite kerbing, 780 yds. of granite channelling, and 4,100 yds. of artificial stone paving, for the urban district council.—Mr. Richard Collins, surveyor.

HAMMERSMITH.—May 6th.—For paving the carriageways of portions of Latimer-road, Bridge-avenue, and North Pole-road with creosoted deal blocks, for the borough council. Mr. H. Mair, borough surveyor.

STRETFORD.—May 9th.—For making up certain streets, for the urban district council.—Mr. Ernest Worrall, surveyor.

SOUTHAMPTON.—May 11th.—For laying tarpaving, for the corporation.—Borough Engineer.

COLCHESTER.—May 12th.—For making up tarpaved roads, paths, and surface-water drainage, for the Committee of Visitors of the Asylums.—Mr. H. H. Gepp, clerk, 57 New-street, Chelmsford.

ST. MELLONS.—May 12th.—For widening and improving part of Lighthouse-road, for the rural district council.—Mr. Gomer S. Morgan, engineer, Pontypridd.

WOOLWICH.—May 12th.—For resurfacing roads in Woolwich, Plumstead, and Eltham with asphalt, asphalt macadam, and wood and other material, for the borough council.—Mr. J. Rush Dixon, borough engineer.

LITTLEHAMPTON.—May 13th.—For scarifying and surfacing work, for the urban district council.—Mr. H. Howard, surveyor.

TANGIER.—June 8th.—For the construction of about 10 miles of road, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

CLARE.—For resurfacing and steam rolling, for the county council.—County Surveyor, Court House, Ennis.

Sanitary.

CHERTSEY.—April 27th.—For the extension of the Byfleet sewerage works, comprising 643 yds. of 9-in. and 7-in. Hassall's stoneware pipes, with manholes and appurtenances, also ejector chamber, and laying 1,420 yds. of 2½-in. cast-iron compressed-air main, and 194 yds. of 5-in. cast-iron pumping main, for the rural district council.—Messrs. Elliott & Brown, engineers, Burton Buildings, Parliament-street, Nottingham.

CHERTON.—April 27th.—For the collection and removal of house refuse, for the urban district council.—Mr. A. Atkinson, clerk.

HINDLEY.—April 27th.—For the construction of eight circular percolating filters, for the urban district council.—Mr. O. P. Abbott, surveyor.

ILFORD.—April 28th.—For the construction of a concrete tube sewer, for the urban district council.—Mr. H. Shaw, engineer and surveyor.

SMALLTHORNE.—April 29th.—For drainage and paving works, for the urban district council.—Mr. J. W. Deane, surveyor.

OAKWORTH.—April 29th.—For scavenging certain districts, for the urban district council.—Mr. J. Spencer, inspector, Cooke-street, Keighley.

BRADFORD.—April 29th.—For the supply of 20,000 filter press cloths, for the corporation.—Engineer, Esholt Hall.

HARROGATE.—April 29th.—For the construction of a surface-water drain, for the corporation.—Mr. C. E. Rivers, borough engineer and surveyor.

WANDSWORTH.—April 30th.—For the construction of drainage works at Streatham cemetery, for the borough council.—Mr. P. Dodd, borough engineer.

LISKEARD.—April 30th.—For the construction of a drainage scheme, for the rural district council.—Mr. B. C. Andrew, engineer, St. Austell.

GRAVESEND.—May 1st.—For the construction of a cesspool, for the corporation.—Borough Surveyor.

KENT.—May 1st.—For the construction of a septic tank and incidental drainage work, for the Education Committee.—Mr. W. H. Robinson, architect, Sessions House, Maidstone.

BISHOP AUCKLAND.—May 4th.—For the supply of disinfectants, for the rural district council.—Dr. Macdonald, medical officer of health.

GOOLE.—May 4th.—For the construction of drainage works, for the Joint Hospital Board. Messrs. Chambers & Son, Belgravia, Goole.

STANLEY.—May 4th.—For scavenging work, for the urban district council.—Mr. J. Harris, sanitary inspector.

FEATHERSTONE.—May 5th.—For the construction of sewerage and other works.—Mr. S. Chesney, engineer.

HOOLE.—May 5th.—For the reconstruction of sewers, for the urban district council.—Mr. F. Davies, surveyor, 11 Newgate-street, Chester.

HOLMFIRTH.—May 6th.—For the construction of sewers and manholes, for the urban district council.—Messrs. J. Barrowclough & Son, engineers.

KENDAL.—May 8th.—For the supply of 100 ft. diameter sprinklers, floating arms, decanting and sludge valves, penstocks, sluices, cast-iron pipes, and specials, for the corporation.—Mr. F. W. Oxberry, borough surveyor.

WOOLWICH.—May 12th.—For the construction of main and subsidiary sewers, for the borough council.—Mr. J. Rush Dixon, borough engineer.

RICHMOND.—May 12th.—For the supply of Welsh steam coal, house coal, lime for precipitation, lime for sludge pressing, sulphate of ammonia, green copperas, and filter press cloth, for the Main Sewerage Board.—Mr. William Fairley, engineer, West Hall-road, Kew Gardens.

RHYMNEY.—May 18th.—For the construction of outfall sewer, storage tank, discharge pipe, and storm overflow pipe, for the Sewerage Board.—Mr. J. S. Alford, 9 Victoria-street, Westminster, S.W.; Messrs. Willcox & Raikes, 63 Temple-row, Birmingham; and Mr. T. J. Thomas, 36 High-street, Bargoed.

CHEPPING WYCOMBE.—May 28th.—For the supply and erection of steam engines, air compressors, air lifts, ejectors, and all necessary appurtenances in the extension of the sewage outfall works at Wycombe Marsh, for the corporation.—Mr. T. J. Rushbrooke, borough engineer and surveyor.

DEWSBURY.—May 30th.—For the construction of sewage disposal works, for the corporation.—Mr. Henry Dearden, borough engineer.

Stores.

SUTTON (Surrey).—April 22nd.—For the supply of road materials, ironmongery, oils, paints, coal, coke, horse forage, and team labour, for the urban district council.—Mr. W. Hedley Grieves, surveyor.

INVERNESS.—April 20th.—For supplies for the Gas Commissioners.—Manager to the Gasworks.

TEES VALLEY.—For the supply of road and valve boxes, brass castings, taps, ferrules, and general stores, for the Water Board.—Mr. Hugh Wilson, clerk.

Miscellaneous.

BRIGHTON.—April 21st.—For the supply of Portland cement, for the corporation.—Borough Surveyor.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted † Recommended for acceptance.

- Royal Institute of British Architects: Annual Dinner, Hotel Cecil.
- Institute of Sanitary Engineers: Visit to Luton sewage farm. Train from St. Pancras, 2.50 p.m.
- Institution of Municipal and County Engineers: Annual Meeting and Town Planning, Housing and Road Conference at Cheltenham.

JULY.

- Royal Sanitary Institute: Annual Congress and Exhibition at Blackpool.
- Institution of Mechanical Engineers: Summer Meeting in Paris.

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

PONTARDAWE RURAL DISTRICT COUNCIL.

CLERK OF WORKS.

The Council invite applications for the Appointment of a temporary Clerk of Works in connection with the Construction of a Ferro-Concrete Bridge under the Hennebique system. It is anticipated that the work will take about three months. Applicants must be good practical men, between 30 and 45 years of age, and must have had good experience in this particular class of work. The salary will be at the rate of £4 per week. Applications, endorsed "Clerk of Works," stating age, qualifications, and experience, and accompanied by copies of not more than three recent testimonials, to be sent to Mr. Wyndham Lewis, Clerk to the Council, Pontardawe, Glam., by April 28th. Duties to be commenced at once.

(1,532)

ULVERSTON URBAN DISTRICT COUNCIL.

Wanted, in the Surveyor's Office, a General Assistant at a salary of £1 10s. per week.

Candidates must be competent Surveyors, Levellers, neat Draughtsmen, and have a practical knowledge of Sewerage, Street Works, and Road Improvement Works, and be under 30 years of age.

Applications, in the handwriting of candidates, giving full particulars of present and previous appointments, age, &c., accompanied by copies of not more than three testimonials of recent date, with envelope endorsed "General Assistant," must reach me by the first post on Friday, May 1st, 1914. Canvassing will disqualify.

C. TELFORD HAGUE,

Surveyor.

Town Hall,
Ulverston.

April 21, 1914.

BOROUGH OF HOVE.

Applications are invited for the post of General Assistant in the Borough Surveyor's Office. Salary, £104 per annum.

Candidates must have had experience in the work of a Borough Surveyor's Office. Applications, stating age, experience and qualifications, with copies of three testimonials, to be sent to the undersigned not later than the 25th inst.

H. H. SCOTT,
Borough Surveyor.
(1,521)

April 14, 1914.

COUNTY OF STAFFORD.

The Staffordshire County Council invite applications for the post of Assistant Surveyor of Main Roads. The person appointed will be required to devote the whole of his time to the discharge of his duties, and to enter upon same on an early date.

The salary will commence at £175 per annum, rising to a maximum of £250 per annum, as follows: After 1½ years' service £200 per annum, after a further 5½ years' service £225 per annum, with a further annual increment of £5 after each succeeding year's service, until a maximum of £250 per annum is reached.

Candidates must have good practical knowledge in the maintenance of roads, and be accustomed to the management and organisation of labour.

Applications, endorsed "Assistant Surveyor," stating age (not over 45), present occupation and past experience, accompanied by testimonials (not more than three), to be sent to me on or before the 1st day of May, 1914.

Further particulars of duties and terms of engagement can be obtained on application to the undersigned.

JAMES MONGUR, ASSOC.M.INST.C.E.,
County Surveyor.

County Buildings,
Stafford.
April 16, 1914. (1,531)

GUILDFORD RURAL DISTRICT COUNCIL.

The Guildford Rural District Council invite applications from qualified persons as Clerk of the Works in connection with the Construction of Four Bridges, one being Ferro-Concrete on the Hennebique system and the others Steel and Brick.

The person appointed must be experienced in Ferro-Concrete and Bridge Construction generally, and will be required to take up the appointment about the middle of May, the salary being at the rate of £3 10s. per week.

Particulars and Forms of Application can be obtained from, and must be sent, accompanied by copies of three recent testimonials, to me the undersigned, not later than Saturday, the 9th day of May.

JOHN ANSTEE,
Engineer to the Council.

Commercial-road,
Guildford.
April 21, 1914. (1,540)

BOROUGH OF MAIDENHEAD.**TEMPORARY ASSISTANT.**

A Temporary Assistant with sound Architectural experience and some knowledge of Quantities is required immediately in the office of the undersigned.

Six weeks' engagement certain, at a salary of £2 10s. per week.

Applications, with one recent testimonial, to be delivered on or before Wednesday, 29th April, 1914.

PERCY JOHNS, ASSOC.M.INST.C.E.,
Borough Surveyor.

Minutes of Proceedings.

Exchequer Grants in Aid of Roads: Sir George Gibb's Memorandum.

We have pleasure in reproducing, with Sir George Gibb's permission, the valuable memorandum on Exchequer Grants in Aid of Roads, which is printed as an appendix to the final report (England and Wales) of the Departmental Committee on Local Taxation. The greater part of the memorandum appears in our present issue, and the remainder will appear next week. The memorandum begins with a brief outline of the present position as regards the classes and mileages of roads maintained by the various highway authorities, and the sources from which, in each case, the funds for the maintenance of these roads are derived. The way in which local ratepayers have become liable for the costs of maintaining roads is then explained by means of a lucid historical summary. "It is very important," we read, "to remember, in connection with any discussion of the claim of local ratepayers to State assistance, that before turnpikes existed there was no settled policy that all roads should be made and maintained at the cost of ratepayers." The fact that at common law parishioners were liable to maintain all public roads led to the responsibility for the maintenance of turnpike roads being thrown upon the local ratepayers when these roads were disturnpiked. In 1882 the burden was partly shifted on to the State, but as regards the share of the cost borne by the Imperial Exchequer, Sir George Gibb shows, further on in the memorandum, that it is only some portion, not easily to be determined, of a sum of less than £1,500,000, and is probably about £1,280,000, the estimated figure for 1908. The value of the contribution is, moreover, heavily discounted by the inequalities in its distribution. It may here be pointed out that the number of turnpike trusts in the year 1864 was 1,100, not 11,000 as printed in the report, the error being, of course, too obvious to mislead any one who knows anything of the subject. The memorandum proceeds with a summary of the main provisions of the Act of 1888, and Sir George Gibb expresses the opinion that the conclusions to be drawn from the history of main roads are that the claim of local authorities for substantial contributions to the cost of maintaining disturnpiked roads is indisputable, and that the existing classification of main and other roads is practically useless as a basis for the distribution of Exchequer contributions. With both these conclusions we fully agree; and as regards disturnpiked roads, we may remind our readers that in our Special Coming-of-Age issue, January 17, 1913, our "Highways" article contained a sketch of the conditions as regards turnpike roads in the 'thirties, with special reference to certain counties repre-

sentative of important areas. The total mileage of disturnpiked roads which became main roads is given in the memorandum—12,553 miles in rural areas, and 1,567 in urban sanitary districts; so that about half the rural main road mileage is of turnpike origin, and more than a third in urban districts.

Sir George explains very clearly the financial position as regards State contributions towards the cost of maintenance of disturnpiked and of declared main roads, and shows, with striking examples, how great are the inequalities between different counties as regards the burdens borne by the local ratepayers. The inequalities between counties are shown in the table accompanying the memorandum, and reference is also made to inequalities between rural districts, and between county boroughs and adjacent counties. As regards some of the natural and inevitable differences which exist between different areas, we do not quite follow Sir George to his conclusion that such differences cannot be taken into account in distributing Exchequer grants for road maintenance. We have, in fact, expressed the definite opinion that a considerable number of factors affecting costs, factors such as the nature of the soil, the pursuits of the inhabitants, and the cost of road materials, might properly, in their combined effect, be taken into account as one basis of such distribution of grants. There are inequalities in the relation of local traffic to the rateable value of the persons causing the traffic. For instance, in several rural districts South of London there are many persons owning motor vehicles whose direct and indirect contributions to the rateable value of the district are relatively very small, though they contribute largely to Imperial taxation and to the Road Board funds. We do not therefore agree with the conclusion that "in order to adapt State assistance as far as possible to the varying cost of the main roads in each county, grants in relief of road maintenance should take the shape of definite proportions of actual expenditure, and that some provision should be made for making grants in special cases"—that is, we do not consider this adequate without a corresponding provision for roads other than main roads, nor adequate unless, in addition to the provision for special cases, there is to be a logical general provision for a distribution of regular grants, based upon a number of factors affecting the financial position. With the conclusion that the substitution of unallocated assigned revenues was a most unfortunate step as regards the road system we agree, and we are glad to find that Sir George Gibb brings to the notice of the Government Committee the fact that the present system may lead to roads being imperfectly or wastefully maintained.

Classification of Roads.

The next part of the memorandum deals with the important subject of road classification, and a number of extracts from the report of the Departmental Committee on Local Taxation, of 1901, and the separate reports of members of the committee are followed by an excellent presentation of the position to-day as regards traffic and the costs of maintenance. Next comes the recommendation that roads should be divided into four classes: Subsidised main roads (50 per cent Exchequer grants), subsidised county roads (30 per cent Exchequer grants), county local roads, and district roads. It is also recommended that a loan fund should be created, to be administered by a central authority, from which local authorities might borrow without interest "for the purpose of enabling them to strengthen and improve road crusts." The sum of £5,000,000 is mentioned, and it is suggested that at an average cost of £500 a mile, 10,000 miles of road could be improved in the manner indicated. We trust that if such a fund be created it will not be used mainly for the purpose mentioned, which suggests the influence of the advice of motorists rather than that of highway engineers. We have often urged in these columns the importance of recognising the fact that in most places where crust reconstruction, or substantial improvement, is desirable, works of a different kind are even more desirable, or, at any rate, should be done first. In some cases these other works are the more important, first and last. It would seem to be far better to use such a fund as this for primary improvement, and for such improvements as cannot conveniently be made from year to year, with the help of Road Board grants, from their fund of about £1,250,000 per annum. We also wish to put in a plea for the roads which would fall into the third and fourth of Sir George Gibb's four classes. The improvements which are desirable on these roads would usually cost but little per mile, but the improvement of considerable mileages should be undertaken as single works. Crust improvements, on the other hand, can usually be carried out a mile, or a furlong, at a time, without prejudice to the quality of the work. We are, however, fully in accord with the principle that if fairly heavy expenditure is to be met by loans these should be for short terms—the shorter the better—and free of interest. To pay for the privilege of spending one's own money is a logical absurdity, except when the gambling element justifies it—financially.

The traffic relations between large urban areas, cities and county boroughs, and neighbouring administrative counties are excellently described in the memorandum, with convincing examples, and the conclusions to which Sir George Gibb arrives with respect to financial requirements seem to be quite sound. As regards the passages relating to county surveyors and their staffs, the recommendations are in harmony with what has been the consistent policy of this journal for many years, and we are glad to find the phrase "subject to a central authority being satisfied as to the qualifications, duties, and tenure of office of the county surveyor." It must be realised that, in this connection, Sir George Gibb was able to refer only to such points as could properly be included in a memorandum forming a part of a report on local taxation; but, in view of his reference to the fact that half the salary of a sanitary inspector is paid by the State, we should have been glad to find a further recommendation that surveyors to district councils should, in their capacity as road surveyors, be in a similar position to that of the county surveyor as regards pay and tenure of office. We know, of course, that Sir George Gibb would not countenance a policy tending to the neglect of roads of the humbler classes, or to the thrusting aside of district surveyors from participation in a scheme of administrative reorganisa-

tion, and we do not for a moment suggest that the omission referred to ought to bear the interpretation which some might be willing to place upon it. As regards the proposed classification, we regret that the Departmental Committee did not see fit to accept the recommendation. Whatever be the system of road administration, the facts as regards the nature of the roads and of the chief classes of traffic point to the desirableness of recognising a class comprising a relatively small mileage of the most important trunk roads, without doing away with the class comprising the ordinary important main roads of the counties. Obviously, if this be accepted, the rest of the roads cannot be regarded as falling into one class. If we start at the other end of the scale, the roads now regarded as by-roads, many of them narrow lanes or moorland roads with very little traffic, cannot be included with roads regarded as ordinary district roads of some importance, or the less important secondary roads. We need, in fact, two classes before we come to main roads of ordinary importance, or even to those of definitely less than average importance, of which there is a large mileage; and above this class there must be at least one more. Most competent authorities recommend four classes. For instance, the British Committee reporting to the Third International Road Congress on the subject of statistics and cost of construction and maintenance, recommended that there should be four classes: Second Class District, First Class District, County Main Roads, and a class which they called "National Roads," the major share of the cost of which should be borne by the State, the maintenance of these roads remaining in the hands of the county councils. The ordinary county main roads cannot, in fact, be regarded as in the same class as *those parts* of certain trunk roads on which the traffic is especially heavy. Sir George Gibb's memorandum concludes with a very useful summary of his recommendations and of the procedure suggested for giving effect to them, and this summary, as well as the whole of the memorandum and the accompanying tables, should be very carefully studied by all road surveyors and members of local authorities.

Sanitary Administration of Dartmouth.

The report which Dr. Mivart has just presented to the Local Government Board on the sanitary circumstances and administration of Dartmouth is a most interesting document, and illustrates both how things ought *not* to be done and how appointments ought *not* to be made. In introducing his conclusions, Dr. Mivart points out that a number of weighty questions, gravely affecting the good government and health of the borough, are awaiting consideration by the town council, whose supineness for many years past has permitted the gradual growth of a large number of insanitary conditions, many of them now difficult of abatement. A perusal of the report shows that these severe words are amply justified. The council have lamentably failed in their duty as regards ordinary administration and in the discharge of their obligation systematically to inspect their district under the Housing, Town Planning, &c., Act, 1909. Further counts in the indictment are absence of public water supply to many houses of the poorer class, the discharge of the sewage without treatment into the River Dart, the absence of by-laws as to the drainage of existing houses, and insanitary means of refuse disposal.

In some ways the most interesting part of the report is that which deals with administration. It is pointed out that the inspector of nuisances, Mr. Frederick John Voisey, formerly for some years in business as a builder, possesses no sanitary certificate, and has had no previous experience as to his present duties.

Some years ago he was a town councillor, but gave up office and remained "off" the council. In October, 1912, however, he was again elected a town councillor, resigning office three months later in order to become candidate for "the combined office of surveyor, water engineer, and sanitary inspector," applications for which were invited by advertisement dated January 24, 1913. The advertisement stated that "Canvassing of members of the corporation either directly or indirectly will disqualify an applicant. Applicants must state salary required." Mr. Voisey was appointed in preference to some 108 other applicants, many of whom are stated to have had experience of the duties or to have possessed certificates of sanitary knowledge obtained, after examination, from the Royal Sanitary Institute or other similar bodies. At the time this appointment was made it seems to have been understood that Mr. Voisey himself would study sanitary work with a view to obtaining such certificate, but he does not seem to have taken, or to be about to take, any active steps in this direction, and the report states that he appears to have little knowledge of the duties of his office. In this connection it is interesting to refer to our observations at the time he was appointed. In a "Minute" which appeared in our issue of February 21, 1913, we criticised the appointment of Mr. Voisey, and every word that we then wrote has apparently been justified. The matter having now come directly and officially before the Local Government Board, it is to be hoped that some drastic action may be possible.

The Improvement of Calcutta.

An exceedingly interesting and comprehensive report on the condition, improvement and town planning of the City of Calcutta and the contiguous areas has been prepared, at the request of the Calcutta Improvement Trust, by Mr. E. P. Richards, the chief engineer to that body. The compilation of the report, some extracts of which appear elsewhere in this issue, has occupied the author for over a year, and the amount of labour involved in its preparation must have been enormous. The main problems with which the report deals are three in number—namely, the city main roads, slums and rehousing, and suburban planning and development. In the case of Calcutta, the first of these problems presents unusual difficulties, inasmuch as there is at present no general or proper connection between the city and its suburbs. In the case of most cities suburban main road planning depends on an already existing and well-developed city street system, but the peculiar conditions of Calcutta have necessitated the design of a new system of main roads for the city itself. For this purpose no fewer than nine separate schemes have been prepared—in itself an evidence of the thoroughness with which Mr. Richards has done his work. The basis of the scheme ultimately selected for adoption is an "ideal" design, showing complete access to and from the city and suburbs, and internally to and from a series of focal centres, which are themselves completely joined up. It embodies the best plan for the city which in any circumstances could be regarded as reasonably practicable, but it is, nevertheless, beyond the means at present at the disposal of the Trust. This ideal scheme, with a general reduction of road widths and the elimination of all absolutely non-vital roads, but with certain added improvements, constitutes the scheme which is recommended as being the best possible under all the limiting conditions. If this scheme were carried out, the total estimated expenditure on internal city main roads would be no less than £3,750,000. Dealing with the present extent and condition of slum and

insanitary property, the report points out that the inevitable evils are aggravated by reason both of the excessive height of the buildings and the narrowness of the streets, with the consequent reduction in the amount of available open space. The result of these appalling conditions appears in an infant mortality rate which is about three times that of European slums, and the highest recorded mortality from tuberculosis. This terrible state of affairs has been produced by the lack of by-law control in the past, coupled with a great deficiency in main roads for rapid transit to outlying districts. Mr. Richards points out that the areas to be dealt with are so vast that the expense of acquisition and demolition, except in the very worst districts, would be prohibitive. He is therefore constrained to recommend the undertaking of the repair of insanitary property on a wholesale scale. Finally, the report deals with the town planning of the outlying districts with a view to future development, and points out that an ordered, carefully designed street plan, divided into segments by the great main roads to be constructed in the future, must be designed for the whole of Calcutta, and carried into execution as and when required by natural expansion. The report is a bold one, inasmuch as Mr. Richards has not hesitated to insist upon the inadequacy of the funds at the disposal of the Trust, and the need for further legislation if Calcutta is to be transformed into a city of beauty and health. While this new legislation is being obtained, the work of rehousing should be pressed forward, thus preparing the way for the creation of the internal main roads and the inception of a scheme of slum repair.

The Architect as Structural Engineer.

It is not often that a paper read before a professional society is written in direct criticism of opinions expressed at a former meeting, although in our view such a proceeding is entirely commendable as being calculated to act as a tonic and stimulant to the meetings of such bodies and to those who contribute to their deliberations. The paper on "The Architect and Structural Engineering," which Mr. William E. Brown, A.R.I.B.A., read at the last meeting of the Concrete Institute, was the outcome of certain observations which had been made in the course of the discussion on Mr. Cocking's paper a few weeks ago [THE SURVEYOR, March 13th], and constituted a defence of the ability of the architect to deal with the structural portions of a building. Although the term "structural engineering" in its wider sense includes many other matters, Mr. Brown dealt particularly with steelwork, and with a statement made by Mr. Cocking as to the relative positions of the engineer and architect as regards the design and construction of a steel frame building. The question is one of importance, not only to architects and engineers, but also to building owners, and it was dealt with by Mr. Brown in the proper spirit. Without attempting in any way to belittle the status of the structural or consulting engineer, he emphasised that it is the duty of the architect to determine at least the positions of all the girders and supports in the building he designs. He should also be able to make the necessary calculations for the steelwork of ordinary buildings, even though lack of time or the magnitude or special nature of the work might sometimes lead to the employment of a specialist for this purpose. In such a case the relationship should be something like that of practitioner and consultant—a relationship which is well known, in every great profession, and one which can be worked to the benefit of every party concerned. A summary of Mr. Brown's paper, which also dealt with many matters of practical interest, will be found in another column.

Calcutta : Its Evils and Required Improvements.

By E. P. RICHARDS, M.INST.C.E., F.G.S., M.R.SAN.I., Chief Engineer to the Calcutta Improvement Trust.

[The subjoined matter is extracted from a report which Mr. Richards has prepared at the request of the Calcutta Improvement Trust, whose chief engineer he became in 1912 after a short service as City Engineer of Madras. The exhaustive character of Mr. Richards' report will be realised when it is stated that it covers nearly 400 foolscap pages, and is accompanied by numerous maps and plans explanatory of the matters with which it deals. So comprehensive is it that it is quite impossible in the space at our disposal to do anything like justice to the contents, but the "Minute" on another page will, we trust, furnish some slight idea of the manner in which Mr. Richards proposes that the difficulties with which the Improvement Trust are confronted can best be overcome.]

Calcutta has been built mostly on the left bank of the Hugli river, is situated in the giant delta of the Ganges, and occupies a south-central position in the interminably flat, marshy plain of Bengal. South-east from Calcutta the swampy and low-lying flat land extends 80 miles without a break to the sea; west, north and east for 80, 150 and 180 miles the same flat, low-lying land extends from Calcutta without scarcely a single hillock appearing. This vast plain is composed mostly of the finest silt—an intimate mixture of fine sand and clay particles—underlaid deeply by saturated gravels.

The railways have been brought to Calcutta on hundreds of miles of embankments, almost every one raised from the dug-out ponds and tanks that now border them on each side for mile after mile. Countless bridges convey the railways over the channels that intersect the delta. In old days the Calcutta site was wellnigh inaccessible by road, and the river Hugli was then, as it is still to-day, the greatest highway of trade.

The river at Calcutta varies from about 500 to 1,300 yds. wide, and from about 25 to 70 ft. deep, according to tide and position—for the river is tidal, and has a maximum range from this cause only of some 20 ft. between high and low water, although the sea is 80 miles distant. So flat and low-lying is the site of Calcutta, that a really big marine wave, caused by an earthquake, would almost certainly reach and might wellnigh wipe out Calcutta. It has even been argued ironically that such would give town planning an excellent chance. Exceptional high tides, especially when combined with river-flood, or with a strong southerly gale, cause flooding in Strand-road and other localities.

The city on the east is bounded closely by actual swamp and salt lakes, and less closely by swamp lands on the south-east and south-west. Land along the river banks is higher in general than land half a mile away, and is very definitely higher than land one mile away. This is due to frequent ancient overflows of the river. The flood-borne silt was caught and deposited in the grass and vegetation extending from each side of the river, and these tracts were thus raised above the general swamp-plain. The same phenomenon occurs, and has occurred on a big scale, in nearly all great deltas.

This site condition of extreme flatness and low-level is a very grave disadvantage to any modern city.

CLIMATIC CONDITIONS.

The climate is so moist, and the silty ground so wet and low, that good grass, most grateful to the eye, covers the great Maidan almost the whole year round, thinning and browning only in May and early June. Vegetation flourishes exceedingly, and after the rains the great delta plain round Calcutta becomes a sea of level, brilliantly green rice fields, broken only by dark palms and the tall, reed-like jute crops. The climate of Calcutta, plus the crowded condition of the city, is trying both to Europeans and Indians, but especially to the former. Death rates are very high.

THE CITY MASS CHARACTERISTICS.

Dalhousie-square is about the centre of gravity of the city, and is the main focus of business and administration of traffic and tramways. It touches on the oldest fort-site, the first and original chief focus of growth. From Dalhousie-square the dense built-up city extends northwards for almost 3 miles to Cossipore-Chitpore; eastwards to Sealdah for 1½ miles; southwards, with decreasing density, the city curves round outside the east and south boundaries of the Maidan, through Ballygunge to Kidderpore; the south-east limit of the building area being about 3 miles, and the south-west limit about 4 miles from Dalhousie-square.

One of the next most salient features on the Calcutta map is Circular-road, girdling on north, east and south, the internal oldest and most densely built-up portion of the city, and forming with the Hugli and Tollys Nullah the ancient line of the Mahratta Ditch. Circular-road now forms perhaps the sole long, broad, nearly perfect example of a big city road in Calcutta. Unfortunately, it is in a very secondary position, and much of its comparatively small traffic is due to the absolute want of normal roads and routes for such traffic.

A straight line drawn from Howrah Bridge to the east end of Park-street divides the mass of the city into two bodies of very different character. All that lies north and east of the line is of intense density, is almost streetless, and is served by an abnormally sparse set of right-angle, narrow main roads, which bound some nineteen huge blocks of property. These latter contain about 2,500 acres of streetless property, arranged anyhow. This slum-like city mass, north and east of the Howrah Bridge to Park-street line, houses the bulk of the population of Calcutta, and contains both the best and worst of the Indian residential quarters. In this section lie also the chief Indian markets, shops, bazaars, and places of business. Along the river north of the bridge are the most important of the sacred bathing ghats, and there, too, is the greatest activity in light river traffic and shipping.

In the past this main section of Calcutta was shut in from free expansion by the Mahratta Ditch, and later by the Circular Canal forming an outer parallel; still later by the railway embankment; and always by the nearness of swamp conditions. It is now one of the densest city areas in the world, and contains on an average not more than 12 per cent of open total space in squares, streets and passages. Portions contain only 5 per cent in open space of all kinds, both public and private.

Owing to the natural physical conditions already described, the chief district road traffic enters Calcutta from the north and north-east, and that from the north-west, west, and a portion of the south-west, enters Calcutta by Howrah Bridge—i.e., it enters on the west centre pivot of densely built-up Calcutta. This concentration of road traffic on the north, north-east and north-west has assisted in some degree to produce the great density of the north half of Calcutta.

South-west of the same line, drawn from Howrah Bridge to the east end of Park-street, we have in general quite different conditions. All around Dalhousie-square, and arranged in a moderately good street system, are built the chief British business houses, the banks, the exchange, the seats of Government, and the public offices. Following along the line, we find just south-west of it the leading hotels and more European business premises, bringing us *via* Old Court House-street and Esplanade East to Chowringhee—the combined Oxford-street, Piccadilly and Park-lane of Calcutta; this development along the Maidan edge continues southwards in a thin band along Chowringhee front, and brings one to the Park-street area, the only section of all Calcutta that has a really decent street system. It is almost purely residential, chiefly European, with a sprinkling of Indian.

South-east of Park-street area is the huge, undeveloped, thinly peopled suburb of Ballygunge, more and more waterlogged and crammed with tanks as one penetrates south, yet a very promising area.

Bhowanipore, owing its existence and much denser population almost solely to the Chowringhee tramway service, occupies a position south of Park-street area and the Maidan, and is an increasingly popular Indian residential district.

Due south of the racecourse, and extending to the Tollys Nullah Canal, is Alipore, an English-Indian residential suburb likely to be shut in, injured and

encroached on by the future railway and dock extensions of Kidderpore, and the working-class dwellings they will bring in their train. Alipore is hardly in a sound position for development as a high-class suburb.

Lastly, on the left bank of the Hugli, we have Kidderpore, a straggling and vitally important industrial railway and shipping area, growing up fast, badly, anyhow, criminally undisciplined, and like every other suburb and section of Calcutta, choking and diseasing itself for want of order, plan and direction.

Howrah remains to be outlined. It owes its original growth chiefly to the East Indian and Bengal-Nagpur Railway passenger and goods termini at Howrah Bridge and Shalimar. Howrah has now become in reality the most important manufacturing district of Calcutta; it is also an increasing residential suburb.

THE ROAD AND STREET SYSTEM.

In the existing road and street system of Calcutta we notice the following striking defects:—

(1) The maximum density of building and population concurs, unfortunately, with the least provision of roads and streets.

(2) The city exhibits in general a rectangular system

and east there are far too few outlets, and these are each troubled by the same inadequate type of bridge bottle-neck.

The obstacles to free main road extension are chiefly the canals and railways on the north, north-east and east. On the south-west Kidderpore docks and railway yards, and their future extensions, offer an impediment that must be met fully, and be overcome. On the west is the Hugli, the present sole route across this great natural barrier being the Howrah Bridge. A new and very wide bridge is required to replace the existing 60-ft. structure, and a very real want is a second big bridge at Aheeritolla.

The above items relate only to main roads. A casual glance at the Calcutta plans shows instantly that the city, as a whole, actually possesses no streets. There are but two small areas in Calcutta having the normal street system which is found throughout the whole area of almost every city in the world.

This enormous lack of streets throughout the mass of Calcutta is a giant defect, and of extreme gravity. It is hardly necessary to remind ourselves that normal cities are composed of streets, forming the unbroken small, close mesh between many big main roads. The plan of Calcutta is composed of a dozen main roads,

TYPICAL VIEW IN THE BUILT-UP MASS OF CALCUTTA.

Mud and bamboo bungalow in foreground, enclosed by streetless better-class property.

of main roads, the meshes being many times larger than those of any other city—i.e., the roads are far more widely separated than is normal.

(3) The roads forming the rectangular system are of very unequal width and traffic capacity, and there is no ordinary relation between width and position. Some of the best roads are so placed that they carry but a small traffic.

(4) There is a very great lack of diagonals.

(5) There is scarcely a single true radial direct route out of or into the main focus of the city.

(6) The north and south main road parallels—which normally should increase in width, traffic capacity, and nearness to each other, as they become closer to the riverside—positively decrease in reverse ratio. This is a grave defect in a riverside port.

(7) The normal and vital riverside road of Calcutta Strand-road is comparatively very narrow indeed, and lies out suddenly in the middle of what should be its northern half.

(8) Detached fragments of main road lie about the map haphazard.

(9) The city main road inlets and outlets on the north are fairly well placed, but are constricted by hopelessly out-of-date bridges and approaches. On the north-east

thrown down criss-cross and far apart, as it might be done by a child from a handful of sticks; between these distant, narrow, over-burdened main roads lie immense compressed streetless jumbles.

Quite apart from main roads, it would cost, to provide Calcutta with a fairly normal street system, such as is possessed by every western city, or such as is possessed even by Madras, not less than £15,000,000, apart from the cost of impossible rehousing problems that would arise. Remedial gradual measures during the next century will have to be the reform policy for this grievous state of things. The first want in the existing road and street system of Calcutta is seen to be that of more main roads, and secondly the logical working into a main road system, and the sensible inter-connection and improvement of every useful piece of main road we already possess.

SLUM AREAS IN THE CITY.

Lack of a street system indicates its concomitant—i.e., built-up Calcutta contains slum areas of an extent and a density undreamt of in European cities. The subject is dealt with in six chapters of this report, and it is sufficient at this point to mention that there are 2,500 acres of streetless property in built-up Cal-

cutta. The various slum blocks are found from Cossipore almost to Park-street, and from Sealdah to the Strand, and are separated from each other, in most cases, only by the main roads and the better buildings that line them. Judged even by a very low sanitary and housing standard, at least 800 acres of the above 2,500 acres must be classed as rank slum.

PARKS AND OPEN SPACES.

The Maidan, forming a great park of 800 acres, occupies a south-west-west central position in relation to the city whole. It is a little larger than Hyde Park, London, and is, perhaps, the finest possession of Calcutta, and is so placed as to be fairly close and accessible to about one-quarter of the inhabitants of the city. It is, unhappily, too far south to be of any daily use to the dense population of north Calcutta; nevertheless, it is a most valuable large city reservoir of open space and decently fresh air, and without the Maidan and the zone of modern buildings that bound it on the north and east, Calcutta would be something of a hell.

With the exception of the Maidan, Calcutta is very badly off for parks and open spaces. In the mass of built-up Calcutta there are but six open spaces worthy of much notice. The largest is Dalhousie-square, which measures between the building lines about 1,000 ft. by 1,000 ft., but the actual square is only about 800 ft. by 800 ft., and out of this the best and most central part is occupied by a very plain tank, almost certainly breeding mosquitos and serving no very definite purpose, but confining the public

most attractive and useful park in Calcutta. They are closely accessible by tram.

Three miles west of the Zoological are the Botanical Gardens, situated far away in the southern extremity of Howrah, and almost inaccessible from Calcutta, except by occasional ferry. These grounds are park-like, admirably cared for, and have been ably designed. They are full of solemn beauty, quiet and dignity. Usually, the grounds are almost quite deserted, and they are at present of little or no value to the Calcutta populace, who are cut off from them by the lack of tramways over Howrah Bridge, and by the lack of any tramway going nearer than 2 miles to the gardens. Then, also, the road from Howrah Bridge is an almost continuous 4 miles of dusty, congested and hideous street and lane. We must therefore reluctantly dismiss these noble glades as not being available for the people of Calcutta.

The only other park-like enclosure is that belonging to the Body Guard Lines, whose large exercise ground lies out to the south-east in Ballygunge; it is not, of course, open for public use.

TRAMWAYS.

The tramways of Calcutta do not belong to the city, but to a limited liability company.

The city (apart from Howrah) is served by about 31 miles-run of 4-ft. 8½-in. gauge tramway route—mostly of double track, the cars being of the usual electric-driven, overhead trolley-pole type. The main city focus of tramways is Dalhousie-square. The tracks and rolling stock are good, and there are

MID-DAY TRAFFIC IN CANNING-STREET, CALCUTTA.

to the narrow strips that lie between the tank and the traffic-filled roads. This square can be immensely improved, beautified, and made far more valuable both to the public and to traffic, at a trifling cost—as will be shown later on.

Four of the other noticeable city squares all lie at intervals along the east side of the long single north and south road known by so many parts and names: Cornwallis-street, College-street, Wellington-street, Wellesley-street, and Wood-street. The dimensions of these four squares vary between about 500 ft. to 700 ft., by 300 ft. to 500 ft. Three of them are very much occupied by plain, colourless and useless tanks. No real skill or thought has been expended on their lay-out. Chitpore-road possesses a square at Beadon-street, and this has been rather nicely laid out: it measures about 500 ft. square. Several little open spaces, like Jorapuker-square, lie hidden in the dense built-up city mass.

The north half of Calcutta is very badly in want of a good sprinkling of green, small open spaces to be used as playgrounds for children and sitting-out places for adults. The big Maidan—one, two or more miles away, or the usual "town-planning park" clapped down far away out in the suburbs, and containing on most days about half a child per acre—these would be of no service to the 600,000 people crammed into built-up northern Calcutta.

In southern Calcutta, and almost touching the Maidan, are the Zoological Gardens, about 800 yds. by 400 yds. in extent. They have been laid out with very great taste and skill, and are maintained in excellent order. After the Maidan, they form the

plenty of cars, but the abnormal narrowness and scarcity of Calcutta roads is a great hindrance to the tram service, and the mileage works out to be only one quarter of that found in cities of the same size as Calcutta.

On the north and east all the tram routes stop abruptly on the edge of the closely built-up city. The great south-east would-be suburban areas are absolutely devoid of any tram service, or of any main road able to take such a service; and it is only in a south direction that Calcutta tram routes run out into suburban areas in a manner resembling the normal of all other cities.

No tram route crosses the river by the Howrah Bridge. During the past twenty years this lack of tramway tracks and bridges into Howrah has much helped in the shocking and increasing building congestion of North Calcutta.

The length of roads and streets traversed by tramway track in Calcutta, as stated above, is only some 31 miles, and in Howrah we find but a little over 4 miles. These exceedingly low figures are in keeping with the abnormal lack of roads, the quite neglected condition of all suburbs, and the dense central congestion. No city to-day can hope to expand properly unless it is served by numerous fast radial tram routes. The normal tram-mileage found necessary and kept busy in all modern cities that are similar in position to Calcutta is rarely less than 60 miles, and often is very considerably more.

WATER SUPPLY AND DRAINAGE.

Calcutta possesses a good water supply, which has been obtained only by overcoming great difficulties,

chiefly because of the unbroken flatness of country for so very great a distance all round the city. The largest water tower in the world has been a necessary

pipe sewerage. Very little or no work has, however, been done in the undeveloped suburbs. Owing to extreme flatness, but very much more on account of

AN EXAMPLE OF INADEQUATE BY-LAWS, CALCUTTA.

A large new building is to be crammed into the open space, and has been commenced. A narrow passage will be the only source of light and air to about 100 existing dwelling-rooms, mostly one family, one room.

consequence. Calcutta can be proud of her water supply.

TRAFFIC IN THE CALCUTTA LANES.

Within Circular-road, and for some distance outside, especially to the south, Calcutta enjoys modern

the sloppy and saturated subsoil, sewerage operations in Calcutta are very costly, difficult, and slow. On the north-east no sewerage extends beyond the Circular Canal. Manicktola possesses neither sewerage nor land drainage. South of Sealdah Station and east of Circular-road, a fair amount of drainage has been done in Entally, and again to south-east and south, several lines of sewerage extend a considerable distance into Ballygunge. Alipore has been seweraged to a fair extent. West Kidderpore is in need of sewerage. Howrah is but very partially seweraged.

Manicktola, and the south portion of Ballygunge, of Alipore, and of Kidderpore, need land surface drainage in addition to sewerage. This need not be very costly; the linking up and improvement of existing earth channels, and the provision of tidal exit sluices being all that is required to make large areas more habitable.

HOUSING AND RESIDENTIAL CONDITIONS OF CALCUTTA.

These are scandalously bad; an acute house famine prevails, and increases. It has prevailed during the last thirty years, and nothing has been done to remedy it. Europeans, Indians, and all castes are affected. Rents are tremendous, and the accommodation given is all too small, and far too crowded.

Comfortable, wholesome family life is being pushed right out of existence in Calcutta. It has already vanished to the extent of 45 per cent. The number of women in the city continually decreases in proportion to the population of men—always an indication of thoroughly bad housing conditions. Infant mortality and tuberculosis stand at world records. The monstrous chawl, the flat and the hotel are becoming the only places of residence for immense numbers of people. The poor are herded and forced into abominably packed slums. The barrack chawl is the home of the next stratum. But all classes suffer. Nearly every European bungalow,* built for single families, and only of moderate size, has too many occupants. The original drawing-rooms and reception-rooms on ground floors are now the hot and close ground-floor bedrooms of a flat, and the original bedrooms upstairs now compose another uncomfortable and inconvenient flat. The rent will seldom be less than £25 a month

* Two or three story villa.

for each half of the converted bungalow, which costs about £700 when built.

Nine hundred thousand people live in 45,000 houses—i.e., the average number of people per house is twenty. The average Indian house contains about twice as many rooms as an English house, so that, for genuine comparison, the Calcutta housing squeeze is equal to about ten people per house in Great Britain. The actual number of people per house in Great Britain is a shade over five, and the size of each family is a shade under five. If the present housing accommodation of England were untouched, but the population were doubled, then we would produce an

open spaces. Northern Calcutta especially is badly in need of a dozen good squares and playgrounds. A riverside promenade road would be as good as a park in North Calcutta, and would be of very great use for traffic, and the increasing river shipping, and is perfectly feasible of execution. Radial parks—coming into Calcutta from south, east and north, plus plenty of small squares, would, perhaps, be the best system for Calcutta—given plenty of money and powers. Nearly all existing squares can be much improved at trifling cost.

(j) Private and public-company housing enterprise needs every possible encouragement at Calcutta, not

ARMENIAN STREET, TYPICAL OF THE BETTER STREETS IN CENTRAL CONGESTED CALCUTTA.

overcrowding and house famine about equal to that which now exists in Calcutta.

NECESSARY IMPROVEMENTS.

The improvements required to bring Calcutta up to a moderate standard of city amenity may be summarised as follows:—

(a) Urban built-up Calcutta requires about 21 miles of new wide main roads, and 8 miles of widenings. These would bring the city fairly into line with a western city as regards main road provision and traffic facilities.

(b) Urban built-up Calcutta has no street system: 2,500 acres are provided only with highly irregular lanes and passages. It would require the creation of about 110 miles of ordinary 30-ft. to 40-ft. streets to bring Calcutta into line even with the old built-up sections of European cities.

(c) Of the 2,500 acres, not less than 800 acres are slums of a much worse type than anything in Europe, and they require removal or remedy.

(d) 6,000 acres of suburbs inside the city boundary are growing up anyhow, and require replanning, roads, tramways, and development.

(e) 2,000 acres of land in Manicktola (outside the city boundary) need planning, sewerage, tramways, and development.

(f) 2,000 acres in Cossipore Chitpore will one day become part of Calcutta. This area likewise requires replanning at once.

(g) Bridge communication with Howrah needs radical improvement and augmentation. A second bridge is wanted; it should be at Aheeritola.

(h) Sixteen defective out-of-date existing road bridges over railways and canals need reconstruction and widening, or replacement by new bridges of two or three times the existing widths. Approaches and gradients also need improvement. New bridges are needed at several points, such as at Halsi Bagan.

(i) The dense built-up city is remarkably short of

only by suburban and tramway development, but by the British and European loan systems.

(k) Calcutta and Howrah are short by 60 miles of the normal allowance of tramway routes. There are no roads for them, either in the city or suburbs.

Norwich Shirehall Improvement.—The work of restoring the front of the Norwich Shirehall, which has been proceeding for several months past, has now been completed. The old front was of stucco, and owing to the serious settlement in the foundations it was seriously out of perpendicular. The new work was undertaken first for the purpose of improving the appearance generally, and, second, to restore the front to the perpendicular. The design generally followed exactly the design of the old building. The bricks, which were specially made, are small and thin. They are 1½ in. in thickness. They were specially selected for colour, too, as many of the grey bricks as possible being introduced to tone down the somewhat garish effect of the ordinary red brick facing. The joints in the brickwork are thicker than usual, and considerably enhance the appearance. The work was carried out in conjunction with the general restoration of the interior, as owing to the settlement in the front, the walls and floors throughout the building and the general interior of the old premises were in a somewhat serious condition, with the possibility of a collapse had not the foundations been underpinned and made sound. Now the whole of the interior is being satisfactorily repaired. The roof and the gutters have also been repaired, a very large amount of unseen work having to be done. On account of the decayed nature of the woodwork the whole of the roof had been made good in the front with new timbering throughout where required. The *Eastern Daily Press* states that the improvement has been carried out entirely, and with the utmost satisfaction, by the county surveyor, Mr. T. H. B. Heslop.

Some Financial Aspects of Housing, with Details of the Street Housing Scheme.*

By W. H. COUSINS, P.A.S.I., Surveyor to the Street Urban District Council.

The housing question, I should think, holds the field as the most prominent question before local authorities. The housing of the working classes had, of course, received mixed and varied attention for many years previous to the 1909 Act, but the additional powers given local authorities by that Act, with also the additional obligations, have brought the question to the front, and a local authority or municipality can hardly be considered in the fashion, as it were, unless it has either launched out a scheme or is definitely considering one.

There are few authorities, whether it be rural or urban, who could not, with advantage as regards sanitation, and generally better housing conditions, as well as the provision of additional houses, undertake a housing scheme; but the question of building at an economic rental is the serious drawback. . . .

It is not my intention to deal in detail with the financial aspect of housing in general, but more particularly to present a few details of the financial part of the Street Urban District Council housing scheme.

It is common knowledge that the cost of building has enormously increased during the past twenty or thirty years, owing to various causes, principally increased cost of materials and labour. No one can deny the increased cost in the production of certain manufactured goods used in the building trade, but one cannot get away from the fact that competition is one of the chief means of cheapening any goods in whatever market. In the face of this, what can be said of the combines in the building trades? In this trade there is a cement combine, an iron combine, a lead combine, a timber combine, and combines in many other branches.

It is not my purpose to criticise the business methods of merchants or manufacturers, but when builders, local authorities, and others interested are up against these combines, it cannot but affect the cost of building, to the disadvantage of the tenant in cases where the scheme has taken practical shape, another result being the possible postponement of quite necessary schemes in other cases.

What should be, and no doubt is, the principal detail for consideration in a scheme generally is the class of tenant to be provided for, for this, to some extent, governs the amount of rent which can reasonably be expected.

It would, of course, be folly to build houses which could not be economically let at less than about 6s. per week for persons of the labouring class and others with wages of, say, 12s. or 16s. per week; yet these people, as a rule requiring more accommodation than those above the income-tax limit, are entitled to be decently housed. Many and varied are the suggested methods of solving that problem, yet the problem has not been, and under the existing state of things cannot be, solved in a practical sense.

THE STREET HOUSING SCHEME.

With regard to the Street housing scheme, it was clear, I think, that the class to be catered for was the artisan class, the large majority of the population being engaged in the boot and shoe industry. The council were faced with the shortage of houses in the urban district, and in 1910 the medical officer of health and the surveyor reported on the matter. The council, realising their responsibilities, at once decided to take advantage of the Housing Act of 1909, and land was purchased.

The scheme resolves itself into two parts—one named "Merriman-road" and the other "Brooks." The site of Merriman-road was originally an orchard, close to High-street, containing nearly 4 acres, and could no doubt be considered as ideal for the purpose of development. Several years ago the then owner of the orchard cut a new road, and divided the site into building plots which, however, were not developed, and the road was not opened to the public. In a sewerage extension for Silver-road, carried out by the council later, it was found that the best direction to carry the sewer was through this new road, and connect into the existing sewer in Vestry-road. Here was

a site with road cut and partly made and sewer laid, and this was purchased for the sum of £743 15s., at the rate of £200 per acre. Directly the land was bought, plans were prepared for thirty-six houses in semi-detached pairs. The Local Government Board, after holding an inquiry, sanctioned the purchase of the land, but would not approve of the type of house.

After some correspondence and interviews at the Local Government Board offices, the present scheme was sanctioned, building was commenced in October, 1911, and the first block of four houses was occupied in May, 1912.

Only one side of the road has been built upon, the other side being let as an orchard at a rent of £7 per annum. This space will, of course, be built upon if required. Twenty-one houses have been erected in the following order: Four houses in one block, one single house, two semi-detached houses, six in one block, another semi-detached pair, and another block of six. Fifteen of the houses are let at 6s. per week each inclusive, four at 7s. 3d., one at 7s., and one at 8s.

With regard to the Brooks part of the scheme, the council had in view the requirements of the part-time small holder, and a field of 5 acres, about a $\frac{1}{2}$ mile from the centre of the village, and containing a good quarry, was bought for £450, or £90 per acre, including the quarry.

Twelve houses have been erected on this site in six semi-detached pairs, and to each house is allotted about one-third of an acre of land. Six of these houses are let at 6s. per week, inclusive, and six at 5s. 6d. per week, while a plot of spare land alongside the quarry has been let at 30s. per year.

The original estimates were made on the basis of 4d. per cubic foot, and the scheme has been carried out under that figure.

The total amount of loans is £8,560, of which £993 15s. was for land, £90 15s. 3d. for Local Government Board transfer and other expenses, £230 for management and clerk of works, the remainder, £7,245 9s. 9d., being for buildings, footpaths, road, drains, boundary walls, fences and building plant, there being about £30 worth of the last-named in hand.

Taking the total number of houses in the scheme—that is, 33—the average cost per house, including paths, drains, fences, &c., but excluding land and management, works out at about £230 (the lowest houses are £173 each).

The whole of the work has been carried out by direct labour. The materials were bought from the open market on the best possible terms, and it should be stated that the wages of all the classes of workmen employed on the buildings were put on a higher scale than had ever before been the custom in this district.

The council were fortunate in being able to retain the services of my predecessor, Mr. James Jursey, he being a man of wide experience in building, and keenly interested in the matter for many years. He was appointed by the council, upon his retirement from the surveyorship, as clerk of works over the whole scheme, the success of which is to a very great extent undoubtedly owing to his energy and capable management.

DIRECT LABOUR.

A good deal can be said in favour of direct labour for carrying out schemes of this kind, but it is quite possible and easy to overestimate its advantages as compared with work done by contract—that is, from a financial point of view. The argument used, and with which I agree, provisionally, is that by doing such work by direct labour, builders' profits are saved; but, on the other hand, such assumed profits can very soon be lost by careless supervision of the labour and inexperienced buying of materials and goods. When the person responsible gets unquestionably the very best value for money, no matter whether in labour or materials, then it is beyond question the most economical and the very best method.

I hardly think it is advisable to lay down hard-and-fast rules; the question is one which should be settled by circumstances and conditions, and, as with

* Paper read at a meeting of the Association of Somerset Surveyors, held at Street on Saturday last.

housing schemes generally, each district can almost be said to be a law unto itself.

The houses erected by the Street Council were eagerly sought after, and were occupied directly they were finished.

The balance-sheet for the working of the scheme is as follows:—

Receipts.		Per annum.	Expenditure.		Per annum.
		£ s. d.			£ s. d.
15 houses at 6s. per week	Merriman-road.	234 0 0	Interest and sinking fund on £8,560 at 4 per cent		342 8 0
4 houses at 7s. 3d. per week		75 8 0	Rates, Merriman-road		77 11 11
1 house at 8s. per week		20 16 0	Rates, Brooks		39 9 3
1 house at 7s. per week		18 4 0	Property tax, Merriman-road		11 19 8
Unmade part of orchard		7 0 0	Property tax, Brooks		6 3 0
Brooks.			Land tax		1 5 6
6 houses at 6s. per week		93 12 0	Collection of rents at 33 per cent		20 1 0
6 houses at 5s. 6d. per week		85 16 0	Fire insurance		5 0 0
Spare land by quarry		1 10 0			
		£536 6 0	Annual balance for repairs, voids, &c.		32 7 8
					£536 6 0

The sum of nearly £20 for taxes appears quite an unfair charge, seeing that on the scheme there will be no actual profit or income. It would be interesting to hear what is being done in other districts where this charge is made in respect to housing schemes. We cannot claim to have solved the housing problem, but I think the council can claim to have overcome the difficulties which had obtained at Street previous to the carrying out of the scheme.

There is just one point which I might have mentioned earlier in this paper, and that is with regard to the period of the loan. As is known, the length of the periods for houses, lands, fences, roads, &c., vary considerably, but in our case the Local Government Board agreed to a flat rate of 4 per cent for a period of fifty-eight years on the whole scheme.

ENGINEERING JOTTINGS.

2.—LOOPING OR LOWERING OF ROADS OVER HILLS.

By HERBERT G. COALES, ASSOC. M. INST. C. E., F. S. I.

Most people feel the romance of the old coaching days, with their highwaymen and the posting inns. Possibly the passengers did not experience much romance themselves at the time, when the roads were ill-kept and dangerous, and the hills heart-breaking. We know that the old roads, as a rule, had to be used, badly as they served the countryside, until in sheer exasperation people cried out for something better. In many cases, to ease the gradients, cuttings were made through the worst of the hills, and the excavated material was used to flatten out the hill approaches. This no doubt was a decided improvement, and was then looked upon as a considerable engineering work—as indeed it was. At least, we can give the authorities of the past due praise for having realised an objectionable fact, and for having the pluck and enterprise to alter it. How many hills have been lowered in our time? None of us can say we have not noticed objectionable hills round about us. But beyond grumbling at the exertion of mounting them, no action, broadly speaking, has been taken to remedy the state of things. We watch an ant, laden with food, going to its home. It hurries straight along, and if it finds a stone in its path it goes over the top of it instead of making a detour. We, with our superior knowledge, condemn it as a fool, although we do the same thing ourselves every day; we make no detour, but climb right over the hills. Horses—poor things—realise the punishment in front of them, and strive to mitigate it by zig-zagging backwards and forwards across the road—reducing the gradient as far as the width of the road will allow.

A steep hill not only curtails the weight of the load which can be drawn, but slows up the traffic, and wears out the horse or other motive power.

Let us examine a concrete case. Here is a village, a couple of miles from a town, where the connecting road passes over a long hill, with a gradient of, say, 1 in 15. Every farmer in the village knows that, whereas his horses could each comfortably draw 30 cwt. of corn to the railway station, he must only load up with a ton because of the hill. For the same reason, the town merchant can deliver only two-thirds of an average load of coal to the village.

Supposing the daily traffic to and from the village over the hill is only ten loads, there is a loss in cost of haulage of 5 tons per day, or, say, 1,500 tons per annum, which at 3s. a ton totals up to £225—a nice little tax on the village. If then one village suffers to this extent, what of the other traffic—the through traffic?

It cannot, therefore, be economical to tolerate steep hills. What is the remedy?

There are two remedies:—

(1) If the hill is short the gradient may be reduced by cutting down the summit and making up the approaches by a give-and-take process.

(2) If the hill is long the difficulty may be overcome by making a loop road round it.

Imagine a short hill which for countless generations has imposed its objectionable self between two towns. It is 100 yds. to the top, and a like distance down the other side. The gradient is 1 in 15, which means that the total rise is only about 20 ft. Twenty feet! Why the whole of the hill covered by the road might be levelled by moving 14,000 cub. yds. of earth! But the shifting of only 3,000 yds. would reduce the gradient from 1 in 15 to 1 in 50 at the worst, where it was possible to tip the excavated material on the hill approaches. If, however, the level of the road at the bottom of the hill could not be raised, then the shifting of 4,000 cub. yds. would reduce the gradient of the hill from 1 in 15 to 1 in 30. In either case, the expense incurred would probably be recouped within a year by the saving in haulage expenditure alone.

There is little doubt that the crust and foundation of an existing road, when disturbed for the new gradient, would be utterly insufficient for making the new road. Therefore the purchase of new pitching and macadam would have to be faced. In the case of a long, steep hill, probably the cost of the lowering and tipping would approximate to the cost of the new road building.

One serious difficulty in carrying out a cutting would be the hindrance to traffic involved; the road would have to be temporarily closed, and, unless the traffic could be sent round another way, the inconvenience would be considerable.

If, however, it were decided to make a new loop road, the interference to traffic would not arise. The construction of a loop road would be based upon engineering and economical principles. The hill would have to be carefully contoured, and the road plotted in such a position as to furnish an easy, workable gradient for the traffic around instead of over the hill. Or, in the case of people having (from the geography of a district) to climb to the summit of a hill, then the reduction in the gradient would be effected by, say, making the loop double the length of the old direct route. Presumably, owing to the acquired rights of the public, as well as of the owners of the abutting land, the new loop road would have to be in addition to, and not in substitution of, the old direct road. A general Act of Parliament might, of course, on terms, overcome the difficulty.

Here and there the local authority might purchase all the land between the loop and the old road for a garden suburb, allotments, or small holdings, or recreation ground or other public purpose. In some cases the new road would be an asset to the adjoining land, and in others nothing but a nuisance. The terms for the acquisition of the soil of the new road would consequently vary in every case. Whereas in one place it might be negotiated free of a monetary payment, in consideration of the value of the frontage, in another substantial compensation would have to be paid for severance and depreciation of property.

Where the frontage to a new road was of no value to anybody, the land occupied by the road might be considered waste economically, for it would be permanently lost to agriculture. But as against this fact there is the overwhelmingly more important consideration of the saving in the cost of haulage year in and year out.

Has a remedy for the stiff, heartbreaking, hilly roads all over the country had proper consideration? No doubt the draught horses think a lot if they do not speak!

Surveyors' Institution: Country Meeting.—The council have accepted the invitation to hold the next country meeting at York on May 22nd and 23rd.

The Architect and Structural Engineering.

By WILLIAM E. A. BROWN, A.R.I.B.A., M.C.I.

At a meeting of the Concrete Institute, held on Thursday of last week at Denison House, Westminster, Mr. William E. A. Brown, A.R.I.B.A., M.C.I., submitted a paper entitled "The Architect and Structural Engineering."

The author said that an architect was necessarily a structural engineer, with the addition of the artistic sense and skill to clothe the structural forms with beauty of line and contour, and so to arrange mass and void into one harmonious whole, studying the great lessons of the past, and carrying on the architectural traditions of ancient Greece and Rome, down through the Middle Ages, and on through the Renaissance. He thought all would agree that the architects of such buildings as the Church of Santa Sophia at Constantinople; St. Peter's at Rome; the Pantheon, Rome; the Duomo, of Florence; and, to come down to more recent time, Sir Christopher Wren's masterpiece in London, and Bentley's last great work of Westminster Cathedral, were structural engineers.

Were not all our cathedrals, which were the delight of artists and lovers of the beautiful, wonderful examples of architect's engineering skill?—majestic buildings, with vaulted roofs poised on slender pillars, and held in position by flying buttresses, each thrust met by a counter-thrust, all combined so as to keep the whole structure in a stable condition.

Structural engineering included not only steelwork used in buildings, but also all forms of construction, whether in brick, stone, timber or concrete, and in designing buildings and other structures the architect was called upon not only to exercise his artistic ability, but also so to plan and arrange the various materials to carry safely, in addition to their own weight, all superimposed loads and external forces, so that the whole might remain perfectly stable.

No doubt the council of the Concrete Institute had this in mind when it was decided to enlarge the scope of the institute by adding structural engineering, and not to confine itself to one branch only—i.e., concrete and reinforced concrete. The wisdom of this, he thought, was manifest by the large increase in the membership as well as by the greater attendance at the meetings.

It was the architect, and the architect alone, who should determine the position of all main girders, stanchions and supports. In many buildings it was impossible to proceed with the design until these positions were determined. In some cases it was the roof which was the determining factor in planning a building, whether the spans should run from north to south or east to west. In others it would be such a feature as a dome. For example, how could Wren have planned St. Paul's unless he knew beforehand how he was going to support that great and glorious crowning feature of his design? That building could not have been erected had Wren simply made a drawing, and handed over the structural work to someone else to deal with. Had that course been adopted, the resulting design would have been different to that made by the architect.

There was no doubt that many people did not realise the importance of having a properly qualified professional man to advise them. They were led to believe, and fondly imagined, that they were saving a large sum in fees, until they found by experience that their folly had cost them more. It was not his intention nor wish to belittle in any way the status of the consulting engineer, who occupied a very important position in the building world; but what he did wish to emphasise was that it was the architect's duty to determine the position of all girders and supports in the buildings he designed. He should also be able to make the necessary calculations for the steelwork in, at any rate, the smaller buildings under his control. Architects often did employ consulting engineers to do the calculations for the steelwork—first, owing to lack of time to do so themselves, and often because in some modern buildings the steelwork was of so complicated a character that it was advisable and necessary to do so; but that did not alter the question of the position of the architect in the matter.

NECESSARY INFORMATION.

A good deal of stress has been laid upon the question of whether the steelwork should be designed, and quantities taken out by the consulting engineer before

being sent to the constructional firms for estimates, or whether these firms should be allowed to do the calculations themselves. For contracts involving a large amount of steelwork of a complicated character, the author agreed that a consulting engineer should be appointed by the architect; but there were many smaller works where this was not necessary, nor would the outlay on the building work warrant the expense incurred. It was quite satisfactory, given certain conditions, laid down, for the architect to send the drawings to several firms of engineers, and let them make their own calculations and quantities; but to enable the various contractors to estimate on the same basis, the following information must be given to each:—

(1) Plans of all floors showing the lines of all main girders, and the positions of stanchions and columns; also a section or sections and outline elevations must be given.

(2) The loads that each floor had to carry, and whether live or total loads.

(3) Whether British or foreign steel was to be used, and whether the London County Council Regulations under the General Powers Act, 1909, were to be complied with. If not, the stresses should be specified that were to be worked to.

(4) Whether price was to include for hoisting and fixing, or only for steelwork delivered to site.

(5) If it was to be delivered unpainted, painted or oiled, and, if painted, with what materials, and that all scale and rust must first be removed.

(6) Workmanship; whether connections were to be riveted or bolted, and, if the latter, whether ordinary bolts would be allowed.

(7) Whether the price was to include 10 per cent profit for the builders, or only 2½ per cent cash discount. The author's practice was to state the latter.

FLOOR LOADS AND LOADING.

There was a diversity of opinion as to whether dead loads and superloads on a floor should be kept separate in making the calculations, or whether a load to include the dead weight of the floor itself should be taken. The author's practice was to work to the latter, as the calculations were much simpler and the liability of error was materially reduced.

One must, of course, take into consideration the point loads which often occurred from partitions, &c. This was often neglected by competing firms of engineers, but some of the concrete partition blocks on the market weighed a considerable amount, and one was often surprised when the weight was calculated out.

Another matter that he sometimes had to argue with the steel contractors was the central loading on girders carrying walls with openings and narrow piers between. Some assumed that the loads were evenly distributed over the span through the brickwork below the window sills. If the sills are very high up, that might be so; but in many cases the sills were only 12 in. or 18 in. above the girder, and, in his opinion, the loading in such a case should be considered as a point load, or as a distributed load over a length of the girder equal to the width of the pier.

In calculating the loads on stanchions, &c., he did not take advantage of the reductions allowed by the 1909 Act. He did not think it advisable, as buildings were often loaded to a greater extent than was allowed for. How often was an architect told that the floors would never have to carry more than a certain weight, and on going over the premises when occupied he was surprised to find these loads greatly exceeded.

CHECKING ESTIMATES AND DESIGNS.

When the various estimates and plans showing the steelwork were received the architect should carefully go through each set, and compare the sections of the girders, &c., and make rough calculations to check the sizes, and ascertain if the allowable stresses had been adhered to. It was also necessary to check the depths of the joists in relation to the span, otherwise undue deflection might occur.

After the plans had been gone through the architect was in a position to determine which estimate he would accept, and when giving the general contractor instructions to accept the estimate it was important to state that all dimensions were to be taken from the site, and that the whole of the work

was to be carried out to the architect's satisfaction, detail drawings of all parts to be submitted to him for approval. The steel contractor must take his own dimensions from the site, arranging, of course, with the general foreman which portions of the steelwork were to be delivered first, and the order of delivery of the remaining consignments. When the cleared site had been measured with steel tapes and all angles carefully triangulated, it should be possible for engineers to set out and scale off the lengths of the various parts.

CONNECTIONS, WORKMANSHIP, AND SUPERVISION.

The connections and workmanship were, in the author's opinion, very important matters to be considered, and as far as his experience went they did not always receive the attention that should be given them. Of what use was it to have a strong joist or stanchion if the cleats under the joist, or the joists under the stanchion, were not properly designed; or, if the design was correct, the connections themselves were badly made? It was a regular practice to use ordinary bolts to take shear, such as the ordinary $\frac{3}{4}$ -in. bolt in a $\frac{1}{2}$ -in. hole, the shank being threaded to within $\frac{3}{8}$ in. of the head. He had examined connections made in this way, and often out of five bolts in the connection four could be taken out with the fingers when the nut was removed. What amount of bearing area did one get on the threaded end of the bolt, supposing that the bolt was bearing on the plates? The bearing surface consists only of a series of knife edges. If bolts must be used in shear then the holes must be carefully drilled concentric through all the plates without the usual amount of clearance, and bolts with plain shanks long enough to pass right through all of the plates should be driven in. In order to make sure of having no portion of the threaded end bearing on the outer plate a $\frac{3}{4}$ -in. washer should be placed under the nut. He was aware that the 1909 Act said that rivets should be used in all cases where reasonably practicable, but there were a very large number of buildings to which this Act did not apply. He thought that all steelwork should be designed in accordance with the provisions of the 1909 Act, but that the conditions for bolted work should be amplified in the Act, the only requirement now being that the bolt should extend through the nut, and the latter secured so as to avoid risk of becoming loose. Another important point, and one that was not always attended to, was that all holes through two or more thicknesses of metal should exactly coincide. If they did not coincide, how could the rivets or bolts take a proper bearing and transmit the loads from one to the other?

Filler joists in concrete floors should be bolted or cleated at least every third joist to the main beams. He had seen cases in which this was not done, but the fillers simply rested on short cleats in beams connected to stanchions running through three floors, next the street, and with no other tie than that afforded by two $\frac{3}{4}$ -in. bolts at each floor level; the end stanchion, built on the face of the party wall with only $\frac{4}{8}$ -in. brick casing round it, was not tied in at all. He believed it was becoming a common practice to place the small filler joists on a concrete haunching resting on the bottom flange of the main girder, and not tied in any way to the girder. In his opinion this method of construction should be condemned. The area of the stanchion bases should be checked to see if the concrete was not loaded more than 12 tons to the square foot. Large gusset plates should not be allowed unless properly stiffened to prevent buckling. It was a good practice to encase the whole of the stanchion base right up to the floor line with concrete. This prevented rusting, and also held the floor of the stanchion firmly in position. He did not advocate the putting of stone templates under stanchions. There was a difficulty in bedding both the template and stanchion, and, if the latter had to be grouted in, the stone might as well be absent. Girders supporting walls, as well as main floor girders, if they were formed of two or more plain I-beams, side by side, should have plates riveted on top and bottom. Simply to bolt them together was, in his opinion, not sufficient, as the load from the main floor girders was not transferred to the outer joist, though some engineers thought it was.

Caution must be observed in casting girders and stanchions with patent plasters, especially those that were stated to adhere without the intervention of any lathing. He had in mind one that corroded the steel to an alarming extent in a short time.

Stanchions and girders were best encased with fine Portland cement concrete, the steelwork having $\frac{1}{8}$ -in.

wire wound round and spaced about 12 in. apart. This held the concrete firmly in position, and it was not easily damaged, even by motors.

When he told them that he had seen specialist firms' own men sawing up timber for centering, and the sawdust and shavings and small pieces of wood all left and mixed up with the concrete, he thought one's faith in trusting to such people was rudely shaken. One required a good clerk of works, well up in reinforced concrete construction, with several smart assistants under him to look after the work.

In calculating the sizes for steel joists embedded in concrete, the author's practice was to let the steel carry the load as an independent beam, but taking the depth of the beam anything up to one thirtieth of the span, limiting the stress to $7\frac{1}{2}$ tons per square inch. This was quite enough, as he often found that these small joists, such as 3-in. by $1\frac{1}{2}$ -in., and $4\frac{1}{2}$ -in. by $1\frac{1}{2}$ -in. were of foreign make. He had also a preference for joists with 3-in. flanges over those with $1\frac{1}{2}$ -in. and $1\frac{3}{4}$ -in. flanges, for the reason that the concrete had a much better bearing on the joist.

The author uttered a warning against using breeze for floors. There was a great danger of expansion, and he knew of several cases where this had occurred and pushed walls several inches out of upright, and even when the wall was rebuilt it happened again. There was also a corrosive action between the concrete and steel, which in time might endanger the stability of the floor. The modern architect had to be a man of many parts, a jack-of-all-trades—a bricklayer, mason, carpenter, joiner, plumber, and painter, always an artist, often a lawyer, and last, but not least, a structural engineer.

ROAD BOARD GRANTS.

TAR-SPRAYING IN WILTSHIRE.

The Secretary of the Treasury was asked in the House of Commons on Monday whether the Road Board, after making a grant to the Wiltshire County Council of 50 per cent of the cost of tar-spraying the main roads of the county where they passed through the more populous villages, had recently intimated that no further grant would be made for this purpose, with the result that the whole cost of the process would be thrown upon the county ratepayers; and, if so, whether, seeing that at least two-thirds of the dust nuisance from which the villages suffered was in that county occasioned by pleasure-seeking motorists living outside the county, the Government would undertake that an adequate proportion of the total cost of abating such nuisance should continue to be defrayed out of the Motor Licence and the Petrol Duties which constituted the Road Board Fund?

Mr. Montagu said the Road Board had not intimated that no further grant would be made for tar-spraying. In January last, having regard to the sums then in course of distribution and to the grants already made and indicated to Wiltshire, amounting in all to £48,000, the board informed the county council that they were not prepared to give any further assistance to the county for some time. But at a conference between the board and representatives of the county council, the board, having in the meantime decided to make a further general distribution, intimated that certain further applications would be considered with due regard to the funds now available.

THE BOARD'S ANNUAL REPORT.

Mr. Lloyd George stated in the House of Commons on Monday that he hoped the annual report of the Road Board would be published towards the end of June.

Institution of Civil Engineers: Awards for Papers.—

The council of the Institution of Civil Engineers have made the following awards for papers read and discussed during the session 1913-14: A Telford Gold Medal to Mr. F. W. Cowie (Montreal), a George Stephenson Gold Medal to Mr. F. E. Wentworth-Shields (Southampton), Watt Gold Medals to Mr. Thos. Clarkson (Chelmsford) and Mr. Henry Fowler (Derby); and Telford Premiums to Prof. E. G. Coker (London), Mr. W. A. Seoble (London), Mr. Wm. Willox (London), and Mr. S. P. W. D'Alte Sellon (London). The awards for papers published in the "Proceedings" without discussion and for students' papers will be announced later.

Exchequer Grants in Aid of Roads.

MEMORANDUM BY SIR GEORGE GIBB, CHAIRMAN OF THE ROAD BOARD.

Being Appendix XVI. of the Final Report of the Departmental Committee on Local Taxation.

The object of this memorandum is to submit some considerations on the financial arrangements relating to the maintenance of roads and bridges in England and Wales, and to examine complaints made against the existing operation and outcome of these arrangements.

The complaints may, for the purpose of examination, be grouped under three heads:—

(1) Complaints on behalf of ratepayers in regard to the burden of road maintenance cost, and the inadequacy of Exchequer contributions thereto.

(2) Complaints in regard to the distribution among highway authorities of the Exchequer contributions.

(3) Complaints of road users in regard to the standard of road maintenance in some districts.

The mileage of roads in England and Wales in the year 1909 is shown in the following table:—

TABLE SHOWING THE MILEAGE OF ROADS IN ENGLAND AND WALES IN THE YEAR ENDING 31st MARCH, 1909 (COMPILED FROM LOCAL TAXATION RETURNS, SUMMARY, PART VIII.).

	Main.	Other than Main.	Total.
	Miles.	Miles.	Miles.
IN URBAN AREAS:—			
City of London...	—	48	—
Metropolitan Boroughs ...	—	2,125	—
Total in London ...	—	—	2,173
COUNTY BOROUGHS ...	—	—	3,106
NON-COUNTY BOROUGHS:—			
Main roads ...	1,362	—	6,038
Other roads ...	—	4,776	—
URBAN DISTRICTS:—			
Main roads ...	2,391	—	14,063
Other roads ...	—	11,692	—
Main roads maintained directly by County Councils in Urban Areas. (Mileage cannot be divided between Non-County Boroughs and Urban Districts.)	600	—	600
Total main roads in Urban Areas ...	4,253	—	—
Total Urban outside London ...	—	—	29,827
Total Urban including London ...	—	—	32,000
IN RURAL AREAS:—			
Main roads ...	23,549	—	118,692
District roads ...	—	95,143	—
Total main roads ...	27,802	—	—
GRAND TOTAL ...	—	—	150,692

The total expenditure in connection with roads and bridges in the year ending March 31, 1909 (excluding capital expenditure out of loans, but including loan charges in respect of street improvements), amounted to £14,722,295, and Table 1. in the Appendix hereto gives the component parts of that total divided so as to show the various spending authorities and the different heads of expenditure.

It will be seen from the table that outside county boroughs and London the total cost of maintaining urban roads, both main and other, was £2,312,659, and rural roads, both main and other, £3,925,590; also that the expenditure on the maintenance of 27,802 mile of main roads amounted to £2,643,044.

The existing distinction between main roads and other roads is a singularly misleading and haphazard distinction, but it has a very important bearing on the question of State assistance to road maintenance, because it was on the basis of that distinction that the first grants-in-aid were made. It will, however, be convenient to postpone the discussion of it until the history of main roads has been traced in some detail. It is difficult even to ascertain the amount of the Exchequer contributions to road maintenance, in the now existing shape of assigned revenues, without reference to that history, and that branch of the subject will therefore in like manner be postponed to a later part of this memorandum.

The distribution, as now existing, of the duties and money burdens of maintenance among the very nume-

rous maintaining authorities is the result of changes connected with the development of local government rather than the outcome of any scheme of organisation adopted after special consideration of the conditions and needs of the roads themselves. It is only recently, since new conditions have arisen owing to the introduction of motor traffic, that the defects have become so serious as to create a need for some material alterations. Under existing circumstances, those who use roads are dissatisfied with their condition, not in all, but in some districts; those who maintain roads are dissatisfied probably in all districts with the heavy and increasing burden of the cost of maintenance, while there is some ground for thinking that much, or at least some, of the dissatisfaction is due, not so much to the inadequacy of the total amount of Exchequer contributions to road maintenance, as to the defective methods of application and apportionment of these contributions.

There are 1,900 separate authorities who maintain roads, consisting in London of the Corporation of the City of London, the London County Council (Thames Embankment) and 28 borough councils, and outside London of 74 county borough councils, 61 county councils, 253 non-county borough councils, 815 urban district councils, and 667 rural district councils.

MAIN ROADS.

Outside London and outside county boroughs the expenditure on the maintenance of roads other than main roads is borne wholly by the ratepayers in the areas, either urban or rural, in which the roads are situated, and no contributions (except in the case of some district roads to which some county councils make contributions out of county rates) are made to the relief of this expenditure from any source extraneous to the local rates.

The expenditure on the maintenance of main roads, which is borne directly or indirectly by county councils (less the Exchequer contributions thereto), is paid for out of county rates, which are assessed and levied in urban districts and non-county boroughs as well as in rural districts.

In considering the real burden of the cost of road maintenance outside London and county boroughs, it is therefore necessary to take into account in each administrative county not only the nett cost of main roads payable out of the county rates, but also the cost of other or district roads payable out of the district rates, because each ratepayer pays both a district (either urban or rural) and a county rate, and comparisons between counties based on main roads only are vitiated by differences of policy in "maining" roads.

Before discussing in detail and in relation to the circumstances of the present time whether the existing Exchequer contributions are adequate, and whether they are applied and distributed in the right way, it will be useful to refer to the history of main roads and of the Exchequer contributions thereto.

It is important to remember that the distinction between main roads and other roads had not, in its origin, any reference to a division between the National Exchequer and local ratepayers of the cost of maintaining roads, nor were the first grants in aid of road maintenance based on any definite allegation or admission that road maintenance was in any proper sense of the phrase, or in relation to any class of road, a national service locally administered. The original differentiation of main roads from other roads was mainly, if not exclusively, concerned with grievances of ratepayers in individual parishes arising from the fact that the whole burden of road maintenance fell upon them without any means of apportioning some part of the burden on larger district or county areas. It was the unfair and unequal incidence of the burdens as between parishes and the larger areas of districts and counties that was then in question, and not any claim that the National Exchequer should bear any part of the costs of the roads subsequently classed as main roads. That claim was raised by a more modern ingenuity, and has, since it was raised, no doubt gained greater force and effectiveness from the changes which have taken place during quite recent years in the use of roads by motor traffic.

The liability to repair roads has from the earliest times been an exclusively local obligation. Prior to the passing of the Highway Act, 1862, the liability rested on each parish, or, in the case of roads in certain urban areas, on the council of each urban sanitary authority.

The obvious objections to the control of highway maintenance being vested in such a small unit as a parish led to successive extensions of the areas of highway administration. In 1862, under the Highway Act of that year, provision was made for the constitution of highway boards having jurisdiction over highway districts formed within county areas. The common expenses of such highway boards were to be paid for out of the district fund, such fund being chargeable on the constituent parishes; but the expenses of the highway boards in repairing the highways in each parish remained separately chargeable on each parish. In 1878 (Highways and Locomotives Amendment Act, 1878) all expenses of road repairs in each constituent parish incurred by a highway board became chargeable on the district fund. Up to that time the county had no liability for road maintenance, nor were any

new roads after they had been made. The source from which the funds for making and maintaining turnpike roads were drawn was not local rates, but payments in the shape of tolls by road users.

It appears probable that if the turnpike and toll system had not been developed it would have been impossible to compel or induce local ratepayers out of local rates to undertake the construction and maintenance of the new roads, which were, in fact, made as turnpike roads; but the necessity for the construction of these new roads to afford communication between important places was so imperative that it may fairly be assumed that if private enterprise had not undertaken the task in consideration of the right to take tolls from road users, the State would have been compelled to assume the duty. Subsequent events have tended to obscure the original position as between the State and local ratepayers. Private enterprise having stepped in to relieve the State of the duty which it would otherwise have inevitably been compelled to undertake, and ruin having fallen upon the turnpike trusts following the construction of railways, the State was then able to throw upon local ratepayers

roads specially distinguished from others as main roads.

Concurrently with the enlargement of the area of highway administration from the parish to the highway district, another series of changes was in progress which ultimately led to a still further enlargement of the administrative areas, and to the transfer of part of the burden of maintenance from the parish or district ratepayer to the county ratepayer, and the movement was accelerated by the breakdown of the system of turnpike roads which followed the growth of railway construction.

THE FINAL RESULT OF THE TURNPIKE SYSTEM.

It is very important to remember, in connection with any discussion of the claim of local ratepayers to State assistance, that before turnpikes existed there was no settled policy that all roads should be made and maintained at the cost of ratepayers. The parochial system provided for the repair of such roads or tracks as did exist, so far as it can be said that any systematic provision was made, but no obligation rested either upon ratepayers or on anybody else to make roads. It was the absence of any other means whereby the making, or, in many cases, the remaking, of necessary roads could be secured that led to the introduction of turnpikes, and the introduction of the turnpike system, covering the duty of maintenance as well as construction, was a practical admission of the impossibility of getting ratepayers either to provide new roads or to maintain, at their sole cost, such

a burden which could probably not have been cast upon them—at least, to such a great extent—if in the first instance the turnpike system had not been developed.

At common law parishioners were liable to maintain all public roads. The making of a turnpike road, therefore, although the turnpike trustees undertook and intended to maintain it, created a sort of contingent liability on parishioners to maintain in the event of the turnpike trustees failing to do so. It was this contingent liability which afterwards fixed upon parishioners the burden of maintaining all roads which had been made as turnpikes, although at the time these roads were made there was probably no intention or expectation that their maintenance would ultimately fall on the parishes. The financial failure of turnpikes created a situation in which the burden of maintenance had to fall either on the State or the parishioners, and, as the conception of State aid had not been developed in those days, the result was that the burden of maintaining disturnpiked roads fell on the parishioners until, from 1882 and onwards, local authorities managed to shift that burden, to some extent, on to the State.

The steps by which the liability to maintain turnpike or disturnpiked roads was fixed by statute on local authorities may be noted. Prior to 1841 the liability rested on common law, and was not clearly defined. But in 1841 a General Turnpike Act was passed which enabled justices in case of deficiency and default of turnpike trusts to order the parish

surveyor to pay actual and necessary repairs on a turnpike road in a parish out of the highway rate.

In 1864, when there still existed 1,100 turnpike trusts and 8,000 toll bars, a Select Committee of the House of Commons recommended the abolition of all turnpike trusts. No immediate legislation followed, but by the Annual Turnpike Act of 1870 it was enacted that the cost of maintaining any highway which within seven years previous to 1870 has ceased, or which might thereafter cease, to be a turnpike road should be a charge on the common fund of the highway district in which the highway was situated. Finally, and this is the first creation of the class of "main roads," under the Highways and Locomotives (Amendment) Act, 1878, it was provided that any roads which had ceased to be turnpikes between 1870 and 1878, and any turnpike roads thereafter ceasing to be such, should be deemed to be "main roads," and that one-half of the cost of maintenance should be paid by the county authority if the roads were maintained to the satisfaction of the county surveyor.

COUNTY POWERS UNDER THE ACTS OF 1878 AND 1888.

Under the same Act powers were given to the county authority to enforce the performance by highway authorities of the duty of maintaining and repairing all the highways within their jurisdiction.

County authorities were also empowered on the

dealing with" any main roads, at the cost of county councils. (Sec. II, subsec. 4.)

(4) That a county council might contribute towards the cost of the maintenance, repair, enlargement, and improvement of any highway in the county, though not a main road. (Sec. II, subsec. 10.)

The roads classified as main roads, which are now repairable by or at the cost of county councils, are therefore—

(1) Roads which were previously turnpike roads.

(2) Roads which have been declared under the powers of the Highways and Locomotives Amendment Act, 1878, to be main roads, and this declaration, it should be noted, requires the concurrence of both the county council and the highway authority, urban or rural, as the case may be, of the district. If a district authority is unwilling to give up the control of the maintenance of any road the county council cannot "main" that road, however much it may possess the characteristics of a main road, or may need to be maintained on a higher standard than a district either can or will adopt. If, on the other hand, the county council and district highway authorities in any county agree to treat any roads as main roads, either for the purpose of placing their maintenance under the direct charge of the county surveyor or for the purpose of throwing the cost of their maintenance on the county rate instead

TABLE II.—COMPARING BURDEN OF EXPENDITURE ON MAINTENANCE OF ALL ROADS IN COUNTY BOROUGHS, METROPOLITAN BOROUGHS, AND ADMINISTRATIVE COUNTIES (INCLUDING RURAL AND URBAN AREAS).

Compiled from Local Taxation Returns, year 1909.

11. Expenditure per head of population	27.3d.	25.7d.	27.1d.	65.6d.	72.4d.
12. Net expenditure on maintenance after deducting £1,321,522. Exchequer contributions assumed at 50 per cent of expenditure of main roads	—	—	—	—	£4,916,727
13. Net expenditure per £ of assessable value	—	—	—	—	11.2d.
14. Net expenditure per head of population	—	—	—	—	57.0d.

application of a highway authority (which expression includes urban authorities, highway boards, and parish surveyors) to declare any road to be a main road if it appeared to the highway authority that it ought to have become a main road by means of its being "a medium of communication between great towns or a thoroughfare to a railway station or otherwise."

This power was afterwards (Local Government Act, 1888, sec. 11) qualified by a provision that the declaration of a road as a main road "should not take effect until the road had been placed in proper repair and condition to the satisfaction of the County Council." Then, under the Local Government Act, 1888, it was provided:—

(1) That every then existing main road should be wholly maintained and repaired by the county council of the county in which the road is situate. (Sec. II, subsec. 1.)

(2) That, within prescribed limits of time, any urban authority might claim to maintain any main road within its district, and that the county council should make to such authority "an annual payment towards the cost of the maintenance and repair and reasonable improvement connected with the maintenance and repair of such road," the amount of such payment being determined, in the absence of agreement, by arbitration of the Local Government Board. (Sec. II, subsecs. 2 and 3.)

(3) That district councils should, if required by county councils, undertake "the maintenance, repair, improvement, and enlargement of and other

of on the district rate, such roads become main roads, however little they may possess importance for through traffic or other features which ought to distinguish main roads.

The conclusions to be drawn from the history of the growth of main roads are (1) that the claim of highway authorities for substantial contributions to the cost of maintaining disturnpiked roads is indisputable, and (2) that the existing classification of roads into main roads and other than main roads is practically worthless as a basis for the distribution of Exchequer contributions.

The mileage of disturnpiked roads which became main roads in England and North Wales is stated in 2 Main Roads (Mileage), Returns of, 1881 (White Papers 226 and 402), as follows:—

	Disturnpiked.	Declared.	Total main roads.
Roads in rural areas	Miles. 12,553	Miles. 2,572	Miles. 15,125
Roads in urban sanitary districts	1,567	263	1,830
Totals	14,120	2,835	16,955

It will now be convenient to trace the history of the Exchequer grants in aid of road maintenance. The first grant was described as a grant in aid of disturnpiked and main roads, and the following

passage relating to it is extracted from Mr. Fowler's Report on Local Taxation, 1893, p. 83:—

PARLIAMENTARY GRANTS IN AID OF LOCAL TAXATION.

Disturnpiked and Main Roads.

This grant in aid was first made in 1882. At the beginning of the Session of that year notice was given in the House of Commons of a resolution that, "In the opinion of this House, immediate relief should in some form be afforded to ratepayers from the present unjust incidence of rates appropriated for the maintenance of main roads in England," and Mr. Gladstone engaged to propose something in conformity with the spirit of the resolution. The result was the voting of Parliament of the sum of £250,000 in respect of the cost of the maintenance of disturnpiked and main roads in England, Wales and Scotland. The expenditure out of the vote was £187,652, of which £20,487 was paid to Scotch authorities. In 1883 the sum voted for England and Wales was £200,000, and the expenditure £195,649. There was a separate vote for Scotland. The grant was paid to the several highway authorities in England and North Wales, to whom repayment of a moiety of the cost of maintenance of disturnpiked and main roads had been made by the county authority under the Highways and Locomotives (Amendment) Act, 1878, and on the basis of one-fourth of the cost of such maintenance allowed by the county authority for the preceding year. In the Metropolis and in South Wales the grant was distributed on a basis which it was estimated would allow of an equivalent payment to the road authorities there.

In the year 1887-8 the sum of £245,500 was voted by Parliament for the purpose of this grant, and in connection with Mr. Goschen's Budget of that year an additional sum of £256,000 was granted in further aid of the cost of the maintenance of disturnpiked and main roads. This additional sum was distributed to the county authorities on the basis of one-half of the sum paid by them to the local highway authorities in respect to the cost of the maintenance of disturnpiked and main roads for the previous year.

In this year, therefore, one-half of the cost of the maintenance of these roads was borne by Imperial funds, one-fourth of such cost being repaid to the county authorities and one-fourth to the local highway authorities. The amounts paid in the Metropolis and in South Wales were proportionately increased.

This grant ceased to be voted by Parliament on the passing of the Local Government Act, 1888. Provision was made by sec. 121 (2) (i.) of that Act for payments to the highway authorities during the year 1888-89 on the same basis as in the previous year, and by Section H. of the Act it was provided that, from April 1, 1889, all main and disturnpiked roads should, with certain exceptions indicated in the section, be maintained by the county councils.

The same report contains the following table showing the successive increases in the grants:—

GRANTS IN AID OF DISTURNPIKED AND MAIN ROADS,
ENGLAND AND WALES.

Year ending 31st March,	£
1883	167,165
" " 1884	195,649
" " 1885	205,965
" " 1886	229,490
" " 1887	237,123
" " 1888	498,797
" " 1889	538,679

The grant of £538,679 for the year 1889 purported to be a grant equivalent to one-half the cost of maintenance of main roads, and no distinction appears to have been drawn between the 14,120 miles of main roads which had previously been turnpike roads and the mileage (the exact figure of which, including urban mileage, cannot be given) which had been declared as main roads between 1878 and 1888. It may be inferred, therefore, that the declaration of a road as a main road was held to be sufficient to justify its sharing in the grant; but, although this may be an accurate assumption in regard to the roads declared from 1878 to 1888, it cannot with equal accuracy be applied to the 6,400 miles, or thereabouts, declared from 1888 to 1909, because in that period some counties adopted the policy of declaring as main roads most of the roads in the county, without regard to their characteristics.

THE CONTRIBUTION FROM IMPERIAL REVENUE.

Turning now to the question of what, in fact, is the amount now contributed from Imperial revenues towards the cost of maintaining main roads, it is clear, at all events, that the contribution comes from the

balance of assigned revenues, which, after 1888, took the place of Parliamentary grants, after payment thereof of the priority charges payable under the provisions of the Local Government Act, 1888. That balance, in the case of the administrative counties in England and Wales (excluding London and county boroughs), amounted to £1,438,916 in 1909. It is difficult, however, to determine what portion of that balance can be definitely assigned to the heading of main road maintenance expenditure.

Under the financial settlement of 1888 the balance of the assigned revenues, after payment of the priority charges, was available to meet any expenditure for general county purposes, including expenditure on main roads; but it was not specially provided that any part of the balance was to be earmarked or appropriated for the payment of any specified proportion of that expenditure.

It would, however, probably be a sound assumption that it was intended that the growing produce of the assigned revenues should bear (1) one-half of the increasing cost of the roads which were main roads in 1888, and also one-half of (2) the cost of maintaining such roads as might, after 1888, be declared by county councils to be main roads, provided that the roads so declared did possess the legitimate characteristics of main roads.

In the "Review of the Financial Relations between the Imperial Exchequer and the Local Authorities of England and Wales (1889-1910)," by Mr. H. E. Howard, controller of the London County Council, published in 1911 under the direction of the council of the Institute of Municipal Treasurers and Accountants (Incorporated), the above-mentioned assumption is made (though without the qualification in [2]), and in Table X11. appended to that Review, p. 15, the amount assumed to be borne by Exchequer contributions in respect of expenditure by county councils, other than London, on main roads in the year 1908 is stated as £1,282,934.

In the same table the expenditure is stated as £2,614,025, so that the contributions appear to be less than one-half of the expenditure by the sum of £24,078; but this figure appears to require some correction. The figure given by Mr. Howard is the total expenditure of county councils outside London in respect of main roads (excluding £142,120 for loan charges) in the year 1908, as stated in the Local Taxation Returns for 1908.

That figure, however, includes £63,577 for main roads in urban areas, and £10,447 for main roads in rural areas, making together £74,024 in respect of improvements and other items not classified as maintenance, the bulk of which was probably spent on widenings of urban streets for local purposes.

Moreover, the balance of £2,540,001 entered in the accounts of county councils as expenditure on maintenance may contain many items which on scrutiny would not be admitted as expenditure properly chargeable to maintenance account. Prior to the institution of the system of assigned revenues, the Parliamentary grants of one moiety of maintenance expenditure were paid after the Local Government Board had certified the expenditure on maintenance; but since 1889 it has been comparatively immaterial whether items of expenditure by county councils were entered under the heading of "maintenance" or under the headings of "improvements" or other headings, and there can therefore be no assurance that the expenditure described as for maintenance does not include items which on scrutiny would not be admitted to be expenditure properly chargeable to maintenance.

ROADS MAINTAINED SINCE 1888.

In addition to this, 6,400 miles, or thereabouts, have been declared by county councils as main roads since 1888, and it is impossible to determine from any materials now available what proportion of that extra mileage should be treated as consisting of roads in respect of which Imperial subventions could be sought on the basis of a proper classification. It is practically certain that in some counties roads are classified as main roads which would not be admitted to be roads in respect of which State assistance could be fairly claimed. This consideration might not substantially affect the net total, because the deduction to be made on this account from the additional mileage of main roads since 1888 might be balanced or even more than balanced by the mileage of roads still treated as district roads in some counties which, if their characteristics and conditions were properly considered, would be classified as roads fairly entitled to share in Imperial subsidies.

The only conclusion that can be arrived at in regard

to this matter on the materials available is, therefore, that if it be assumed that the sum of £1,282,934, as stated by Mr. Haward, is the amount of Exchequer contributions which should be regarded as attributable

more than sufficient, to cover one moiety of the maintenance expenditure of the county councils in that year. It is probable, however, having regard to the increase which has taken place in the cost of main-

TABLE III.—TABLE SHOWING FOR EACH COUNTY (OUTSIDE LONDON) THE EXPENDITURE IN THE YEAR 1911 ON ROADS AND BRIDGES BY (1) THE COUNTY AND (2) THE DISTRICT AUTHORITIES, AND (3) THE TOTAL FOR BOTH AUTHORITIES; THE AMOUNT OF THE EXCHEQUER CONTRIBUTION AVAILABLE FOR ROADS IN EACH COUNTY, AND THE PERCENTAGE THAT SUCH CONTRIBUTION IS OF THE TOTAL EXPENDITURE.

(Prepared from returns obtained from each county and district council. In a few cases in which district councils have failed to send in returns the figures for the year 1908-9—as given in the Local Taxation Accounts—have been interpolated.)

Note.—Col. 2, Expenditure by county council; figures in italics refer to year 1910.

to expenditure on the maintenance of main roads in the year 1903, and if it be further assumed that the greater part of the main road mileage added since 1883 should be treated as falling within the category of roads which should be subsidised, the Imperial contributions in 1903 were sufficient, and probably

tenance, that the available balance may now be insufficient to cover half the cost.

ACTUAL COSTS OF MAINTENANCE.

Turning now to the question of what is the present burden on local rates of maintaining roads, it is pro-

ably better in the first instance to look at the figures of maintenance cost not for main roads only, but for all roads. This burden can best be measured by the expenditure per £ of assessable value.

In the year 1909—the latest year for which local taxation returns are available—the expenditure on road maintenance per £ of assessable value was 3.24d. in metropolitan boroughs, 5.58d. in county boroughs, and 14.2d. in administrative counties; but if £1,321,522, being the assumed portion of the Exchequer contributions available to cover 50 per cent of the main road expenditure, is deducted from the gross expenditure, then the figure for administrative counties is reduced to 11.2d. (See Table 2 in Appendix hereto.)

The first point to notice on these general figures is that the actual burden in county boroughs is only about one-half of what it is in administrative counties.

The next point is that the burden, when measured in the aggregate and on the average, is not so excessive as to create any grievance. It is really in connection with the division or distribution of the burden that legitimate grievances and complaints arise.

County ratepayers, as a whole, have only to pay 3d. per £ on the aggregate county assessable value for the maintenance of all main roads (after allowing for Exchequer contributions), and this sum, added to the expenditure in the various constituent areas of administrative counties, makes up in respect of all roads, main or other, a total of 8.53d. per £ for the non-county borough ratepayers, 8.79d. per £ for the urban districts, and 14.5d. for the rural districts.

But, although the average burden is as stated above, the actual burden varies widely in different areas. In rural districts, for example, the rates vary from under 2d. to over 3s. per £, and in those districts, taken as a whole, the expenditure on the maintenance of roads other than main roads is 69 per cent of the total receipts from public rates.

The inequalities between the different counties can be followed in detail from Table 3 in the Appendix hereto. That table has been prepared from information applicable to the year 1911, which the highway authorities have been good enough to supply to the Road Board. But it must be noted that the expenditure shown does not distinguish between maintenance and improvement, and the figures must be taken with that qualification.

INSTANCES OF INEQUALITIES.

One or two concrete instances may be given in illustration of the inequalities as between districts taken from the above table and from the Local Taxation Returns for 1909.

Farnham Urban and Farnham Rural are adjoining highway districts, both forming part of the administrative county of Surrey. In Farnham Urban the expenditure on the district roads represents about 4d. per £ of the assessable value. In Farnham Rural the expenditure is equivalent to about 20d. per £ of the assessable value. Both districts have to pay for the county main roads, and the expenditure on these roads is about 4d. per £ of the assessable value. Thus, the total burden on the ratepayers in Farnham Urban for roads, both main and district, is equivalent to an expenditure of 8½d. per £ of the assessable value, and in the Farnham Rural to 24d. per £ of the assessable value. Thus, in two adjoining districts the total burden of the highways is three times as great, although it cannot be said that the value to Farnham Rural residents of the roads in their district is any greater than the relative value to Farnham Urban of their roads.

The practical effect of this difference is that in heavily-rated districts the ratepayers and their representatives, the district councils, consider that they are taxed up to the hilt for highway expenditure, and they are unwilling or unable to face the additional burden which the maintenance of their roads to meet the additional requirements of traffic imposes upon them, and thus the roads are not maintained up to the standard that modern traffic requires.

The above is an example of the differences that prevail in the burden of highways in the same administrative county.

A further category of inequalities is to be found in the difference that exists between the burden in a county borough and the adjoining county. An example may be furnished from the county of Southampton (Hampshire). The total expenditure on highways in the administrative county on main and district roads is equivalent to an average of 1s. 4½d. per £ of assessable value. In the county boroughs of Portsmouth and Southampton the expenditure on

the roads, including loan charges, works out at 11d. and 10d. respectively per £ of assessable value. Thus, the total burden in the county is about 50 per cent greater than in the county boroughs which have been formed out of the ancient county.

If particular districts are taken for purposes of comparison instead of the general county average, it will be found that even greater variations than that indicated above exist. In the Havant rural district, which adjoins Portsmouth, the expenditure on main and district roads together works out at 1s. 5d. in the £, and in the neighbouring rural district of Petersfield the expenditure represents no less than 2s. 8½d. in the £, or three times greater than in the county boroughs of Portsmouth and Southampton, and the ratepayers in these districts are able to point out that many of their roads are used to a greater extent by the inhabitants of the county boroughs than by the resident ratepayers themselves.

There is a third class of inequalities—viz., those which exist between counties in different parts of the country. In Table 4 the average expenditure on roads and bridges in the year 1911 is worked out at 16d. per £ of assessable value. In the following counties the expenditure per £ of assessable value on all roads and bridges in the county is above 2s. in the £—viz.:—

	d.
(6) Gloucestershire	24.2
(4) Herefordshire	24.7
(1) Isle of Ely	32.4
(2) Lincolnshire (Holland) ..	28.3
(5) Lincolnshire (Kesteven) ..	24.4
(3) Oxfordshire	24.7

In the following counties the expenditure per £ of assessable value is less than 1s.:—

	d.
(3) Durham	5.7
(1) Lancashire	11.5
(2) Middlesex	11.0

If the expenditure per head of population is taken as the measure of the burden it will be found that the average expenditure per head of population is 6s. 2d. In the following counties the expenditure is above 12s. per head—viz.:—

	s.	d.
(4) Herefordshire	12	3
(3) Isle of Ely	12	9
(1) Lincolnshire (Holland) ..	14	2
(2) Sussex (East)	13	1

and in the following counties it is below 6s.:—

	s.	d.
(1) Cumberland	5	9
(12) Durham	4	4
(2) Isle of Wight	5	9
(11) Lancashire	4	6
(6) Middlesex	5	6
(3) Monmouth	5	8
(4) Nottingham	5	8
(8) Staffordshire	4	10
(10) Worcestershire	4	9
(9) Anglesey	4	9
(7) Carnarvon	5	6
(5) Glamorgan	5	8

Several causes contribute to the conversion of a moderate average burden in all administrative counties into an almost intolerable burden in some counties and many districts. For example, the policy of limiting the mileage of main roads in some counties may throw a heavy burden on particular districts in those counties; the mileage of roads in some counties or districts may be abnormally large; the climate or the subsoil, or other physical conditions in some areas may cause abnormally high cost in maintenance; the price of suitable stone for road making may vary from 3s. to 15s. per ton, or even over a wider range, owing to differences in distance from stone supplies, or the cost may be affected by differences in the efficiency of the local organisation and administration in connection with road maintenance. But unless the principle of equalisation of burdens in rating areas were adopted most of the differences which exist are inevitable, and their economic effects are adjusted in the rents and values of land and buildings in the different areas. Such differences therefore cannot be directly taken into account in distributing Exchequer contributions to road maintenance, but a most practical difficulty does arise from the inequality of the burdens, because in the heavily-rated districts there is naturally great reluctance to spend the amounts needed to maintain the roads in the condition of efficiency that modern traffic requires.

The constant demand of road users in recent years has been that a higher standard of efficiency shall be secured in the maintenance of the roads. The standard has been gradually rising. With the abolition of the stage coach and the introduction of the railways the main roads of the country fell very

largely into disuse and were often neglected. The introduction first of the bicycle and later of the motor car has brought about "the return of the road," and with it a demand for smooth and dustless tracks for vehicular traffic.

THROUGH TRAFFIC AND THE RATEPAYER.

The latest development in road traction (the heavy motor vehicle, the motor tractor, and the motor de-

time, leaving it to the traffic to work it in, and it may be expected, if financial arrangements in respect of roads remain as at present, that it will be many years before a large number of the rural authorities will, on their own initiative, carry out the strengthening and improving of the roads which the user insistently demands. It is indeed difficult to see how they could do so without increasing rates to quite impossible figures.

TABLE IV.—TABLE SHOWING THE COST OF MAINTAINING ROADS AND BRIDGES IN EACH COUNTY (OUTSIDE LONDON) IN 1910-11, MEASURED BY THE (1) EXPENDITURE PER HEAD OF THE POPULATION, AND (2) PER £ OF ASSESSABLE VALUE.

* Including Eastbourne (made a county borough April 1st, 1911).
NOTE.—Col. 3. Assessable value; figures in italics refer to 1910.

livery van) has created a demand for stronger roads and stronger bridges.

The demand has been met to some extent, but, speaking generally, the demand of the user is always in advance of the willingness of the local authorities to satisfy it. There are still rural districts in England which obstinately refuse to steam roll their roads, and repair them as they were repaired a century ago by throwing down metal from time to

The user says: "The condition of the road should not be entirely dependent upon local standards; that there should be some central authority to secure a certain minimum standard of maintenance on all roads used by through traffic, even if it is necessary for that central authority to adjust by financial grants the additional burdens which its standards may impose."

The user argues that it would be just as reason-

able to leave to the graziers on the Westmorland Fells the responsibility of determining the standard of the railway line from London to Carlisle over Shap, or to the Devonshire farmers the responsibility of determining the standard of the railway line through Devonshire, as to leave to the selfsame graziers and farmers the responsibility of determining whether the main road from London to Scotland and the road from London to the West should be maintained in a condition sufficient for their requirements as graziers and farmers, or should be made suitable for the needs of through traffic.

The attitude of the user is natural and inevitable. He wishes to take his vehicle with the maximum of comfort and the minimum of wear and tear over any road upon which he wishes to travel.

The attitude of many local authorities is equally natural, and is both logical and strong. They say: "Our roads are quite good enough for us; they carry the agricultural and local traffic of the district, and we will not raise the standard of maintenance to meet the demands of 'alien' traffic at the expense of our local ratepayers. We have no objection to raising the standard if it is at their expense and not at ours, but we point blank refuse to spend more money out of our own pockets." To this position, when taken up and maintained, the law supplies no answer, and the existing system of administration no remedy.

THE RELATION OF GRANTS TO EXPENDITURE.

These considerations indicate that, in order to adapt State assistance as far as practicable to the varying cost of the main roads in each county, grants in relief of road maintenance should take the shape of definite proportions of actual expenditure, and also that some provision should be made for making special grants in special cases.

As regards the proportion of expenditure which should be paid, it would probably be generally admitted that if grants are made to roads to be classed as subsidised county roads as well as to subsidised main roads in the proportions and manner indicated in a later part of this memorandum, and if these grants are properly distributed, grants covering half of the cost of subsidised main roads would be adequate. But under the present system of distribution of Exchequer contributions the actual share of each maintaining authority has no proper relation to their expenditure in maintaining those roads towards which they can fairly claim national assistance. The amount of the expenditure on such roads in any county cannot be ascertained with any approach to accuracy until there has been a reclassification of roads, but dealing only with the expenditure on the maintenance of main roads as now classified, it will be seen from Table 3 in the Appendix that some counties receive considerably more than half the cost of their main road expenditure, including improvements, while other counties receive only a small percentage of that expenditure.

In Table 3 the assumed Exchequer contributions are shown in the shape of a percentage of the total expenditure of all highway authorities in each county on all roads, because, although the Exchequer contributions are paid to the county councils, and applied directly in relief of county rates, the total burden for road maintenance borne by the county and district ratepayers includes the expenditure on other roads as well as main roads. It will be observed that the range of the percentages varies from *nil* in the county of Middlesex and 4 per cent in the county of Essex up to 31 per cent in Norfolk and 32 per cent in Westmorland, and it is obvious from the table that many counties have a legitimate grievance in regard to the share of the Exchequer contribution which they receive.

It seems therefore to be essential in order to remedy the grievance of the local authorities in regard to the distribution of the Exchequer contributions that there should be a return to the system of earmarked grants.

It is now generally admitted that the substitution of unallocated assigned revenue for earmarked grants was a most unfortunate step as regards the road system.

The receipt of any county in respect of main roads is not in any way affected by, nor does it influence, the actual expenditure on maintenance. This is unfair to the counties, because the expenditure on main roads has increased, and is increasing, in greater ratio than the revenue.

It is unfair to district highway authorities, because, however good a case they may have for some share

of the grants to assist the maintenance of any road used to a material extent by non-local traffic, no assistance can be obtained unless the county council is willing to "main" the road. It is true that county councils have power to contribute to roads other than main roads, but this power has only been exercised to a limited extent. The total amount so contributed in the year 1911 was £122,631.

It is unfair to road users, because, although the counties receive money from Imperial sources for the purpose of enabling them to keep the more important roads in good condition, no precautions are taken that the money is in fact spent on the important roads and not on roads which are "district" in character though "main" in name, or that the important main roads are efficiently maintained. Neglect of maintenance is not followed by either the withdrawal or diminution of the grants made.

The expenditure to be incurred in any year on the maintenance of a road must necessarily be determined by expert opinion. Sufficient material must be laid down to strengthen the road crust if it is too weak for the traffic it has to bear and to replace the wear due to traffic and weather, and sufficient money must be spent on the renewal of surface coatings to keep the road in good condition. But under the present system the recommendations of expert surveyors in charge of roads may be set aside, and the expenditure recommended by them may be cut down, not because their judgment as to the expenditure necessary for efficient maintenance is impugned as inaccurate, but simply for financial reasons due to considerations quite apart from road maintenance. When this is done the result is that the roads deteriorate, and road users have to put up with roads in bad condition, but the ratepayers are also placed at disadvantage because the deterioration allowed to occur has to be made good by still larger expenditure in some future period.

CLASSIFICATION A NECESSITY.

If grants for main roads were earmarked instead of being open, as they now are, to diversion to any other head of expenditure to which for the moment it may be financially convenient to divert them, there would be less danger of roads being imperfectly or wastefully maintained, and whatever may be the amount of future grants it is strongly recommended that they should be grants of definite proportions of expenditure on roads selected as possessing more than local importance.

But before the Exchequer contributions can be made as earmarked grants it is evident that there must be a reclassification of roads in order to determine what roads can fairly be classified as roads of which the maintenance can be regarded as to some extent a national service locally administered.

The Majority Report of the Royal Commission on Local Taxation, 1901, contained the following references to this matter:—

Page 12. "The maintenance of main roads we also consider, on the whole, to be to some extent a national service, and likely to become more so, owing to the increasing mobility of the population and the development of new means of locomotion."

Page 29. "Since 1888 the cost of maintenance of main roads has greatly increased, and they have become from year to year increasingly a national service owing to the increase of population and the development of new means of locomotion. We fully recognise the fact that the changes in locomotion which have taken place during the last quarter of a century, and the different policies which have prevailed in different counties as to the making and dismaying of roads, and the technical definition of 'main roads,' which excludes main roads in county boroughs and roads disturnpiked prior to December 31, 1870, unless the latter have since been made main roads, have rendered it eminently desirable that some authoritative and impartial body should revise the distribution of the main road grant and decide what roads should be main roads alike in counties and county and quarter sessions boroughs. This is a task involving minute local investigation and the taking of detailed evidence on the part of those locally interested, which it has not been possible for us to undertake; but we trust it may hereafter be undertaken by some duly authorised tribunal."

Lord Balfour of Burleigh, in his "Separate Recommendations," said:—

Page 72.—"It will be seen, in the scheme of allocation for the grants towards national services which I put forward in the following section, I have sug-

gested a contribution from central funds towards the maintenance of main roads. It is less easy to forecast the effect of the scheme in this respect than in others. For under the existing statutes the policy of all the counties in regard to their roads has not been of a uniform character.

"The main roads which are now maintained at the expense of county funds were never selected upon any well-defined principles, the only condition originally imposed being that they should have been disturnpiked since 1870, and as the raising of highways to the status of main roads in any county rests entirely with the county council, the additions which have been made to the number of main roads in recent years have not been determined with uniformity.

"Accordingly, for the purposes of the distribution of the grant proposed for main roads, we have recommended that the determination of the roads to be deemed main roads shall rest with an independent authority to be specially appointed."

And again at p. 81:—

"It is probable that the determination of the roads to be deemed main roads would entail special inquiry by a small expert commission."

The separate report by Sir Edward Hamilton and Sir George Murray, in referring to the claims that the assistance from national funds should be given towards the cost of roads now classified as district roads, stated:—

Page 118.—"There is, however, one particular feature in which the indiscriminate relief to agricultural ratepayers appears to us to be specially open to objection. We find that the relief given under the Agricultural Rates Act is not confined to national services in any possible definition of that term. Under that Act, for instance, the Exchequer defrays a large part of the cost of maintaining highways in rural districts—i.e., those district roads which are not of sufficient importance to be considered main or county roads."

Again, in assigning main roads and county bridges to the category of national services, the assignment is made with the following qualification:—

Page 124.—"Main roads and county bridges (which, though they may have lost some of their former national character, are likely to regain it by the development of new means of locomotion)."

And, in referring to the application of the scheme for grants in aid recommended by the separate report, it is said that, so far as the suggested grant for main roads is concerned, the scheme "could hardly be worked out without local inquiry in each case."

The members of the Royal Commission, therefore, unanimously concurred in the view that no new scheme for grants in respect of main roads could be adopted and applied until the roads for which grants should be made had been selected and classified by some central authority, but they gave no indication as to the principles on which the selection should be made.

The Departmental Committee on Highways reported in 1903 that the maintenance of trunk roads was a matter for "national rather than local or county provision," and that the selection of the roads which should be regarded as forming part of such trunk roads should be left to some tribunal. It is, perhaps, better to avoid the use of expressions such as national road, trunk road, or arterial road, as these embody conceptions which are too vague to be of any practical use.

It is suggested, therefore, that the roads and the portions of road in respect of which State subsidies should be paid should first of all be selected, described, scheduled and delineated on an official plan, and this should be done by some expert and central authority on applications from county councils as regards roads in administrative counties outside London and outside county boroughs.

Power should be given to any highway authorities within the area of a county to request the county council to make application in respect of any road or part of a road maintained by such highway authority, and in the event of refusal of the county council to do so power of appeal to the central authority should be given.

Provision should be made in the classification for main roads of first importance, and also for main roads or county roads which, although not of first importance, are of more than county importance and carry a sufficient volume of through traffic to justify a claim for some assistance from State revenues.

The proposal that Exchequer contributions, based on percentages of actual expenditure, should be given needs some justification in detail. This question of

State contribution has been materially affected by the introduction of motor traffic. Before motor traffic arose, the case for State assistance to any considerable mileage of roads, other than disturnpiked roads, was very weak, but now the case is very strong.

The claim for maintenance grants is based on the following among other considerations:—

(1) That the maintenance of certain roads is a national service locally administered for which the present payments are inadequate.

(2) That the cost of maintaining roads has largely increased.

(3) That the growth of motor traffic has introduced a new factor, which causes (a) destruction and wear of road surfaces, (b) the need for increased expenditure not only on ordinary annual maintenance, but also on reconstruction and strengthening of roads, and in securing a higher standard of maintenance than was previously required.

(4) That it is unfair to throw on local rates the burden of providing roads of the standard required for motor traffic.

As regards the first of these considerations, it is generally admitted that the maintenance of certain roads is a service towards which the State should contribute, and that, at least in certain counties, there is a considerable road mileage in respect of which increased State aid should be given. What that mileage is cannot be determined until a reclassification has been made.

It does not follow from this that the aggregate of the existing State contributions need be largely increased. Reapportionment of grants is required as much as reclassification of roads.

THE BASIS OF CLAIMS FOR SUBSIDIES.

It cannot be, nor is it alleged, that State subsidies should be given to any roads other than those which are used to a material extent for traffic extending beyond the locality in which the road is situated. The claim cannot be based wholly on volume of traffic; indeed, the greater the volume the weaker the claim may be for national aid, as high density of traffic generally indicates that the traffic is mainly local. The local ratepayer has no grievance calling for remedy unless he is bearing some burden of maintenance not required for his local needs, and not balanced by the burden which his traffic throws upon roads in adjoining districts. In other words, he must show that the burden from which he seeks partial relief is to some material extent a national service. The difficulty lies in selecting the test for determining whether the maintenance of any road is to a greater or less extent a national service. Probably the test is to be found in data drawn from several sources. The location and function of the road must be taken into consideration. If it connects places which ought, in the national interest, to have superior road communication with each other, then it must be maintained at a high standard throughout, and although it is required and is used for local traffic on its several parts, its utility as a means of through communication between distant places is a legitimate ground for claiming that some part of the cost of maintenance should be borne from non-local sources, provided that the standard of maintenance required for the through traffic is higher than the standard which may be sufficient for local traffic. For example, no one would deny that one or more roads connecting London and Brighton should be regarded as main roads, entitled to State subsidies on the maximum scale, and that at least one road passing between Perth and Inverness should be similarly regarded. The test must largely depend on the character and sources of the traffic. The volume of traffic on Piccadilly is much greater than that on the Maidstone-Tonbridge road, and the parts of London served by Piccadilly are more populous and of greater importance than the sources of the through traffic which uses the Maidstone-Tonbridge road; but probably no one would contend that the Maidstone-Tonbridge road should be excluded from, or that Piccadilly should be included in, a schedule of subsidised roads. The percentage of local traffic to the total traffic on Piccadilly is so great as to render the addition of a small percentage of through traffic wholly negligible, while the through traffic on the Maidstone-Tonbridge road probably forms a large percentage of the total, and materially affects the cost of maintaining the road.

The traffic on any road may be divided into the following classes:—

(1) Local—i.e., traffic between termini, of which one or both are situated within the boundaries of the district in question.

TABLE V.—EXPENDITURE ON MAINTENANCE OF ROADS OUTSIDE LONDON AND OUTSIDE COUNTY BOROUGH, 1890—1902—1909.
(Compiled from Local Taxation Returns.)

Year.	Main roads						Other than main.						Main and other.					
	Rural.	Standard- ised.	Urban.	Standard- ised.	Total main.	Standard- ised.	Rural.	Standard- ised.	Urban.	Standard- ised.	Total other than main.	Standard- ised.	Total rural.	Standard- ised.	Total urban.	Standard- ised.	Grand total rural and urban.	Standard- ised.
1890	£ 781,430	100	£ 165,743	100	£ 947,182	100	£ 1,290,322	100	£ 720,475	100	£ 3,019,797	100	£ 2,050,751	100	£ 886,218	100	£ 2,906,970	100

(2) Regional—i.e., traffic between termini, of which both are situated outside the boundaries of the district in question, but in which the district has some direct and proximate interest.

(3) Through traffic—i.e., traffic originating and terminating at places beyond the range of any direct or proximate interest of the locality, and which merely uses the road as a means of through communication.

All roads doubtless carry some through traffic. The question must always be one of degree. If the local and regional traffic on any road is so great that the road must in any case be maintained on such a high standard of strength and efficiency as to render practically inappreciable the effect of the percentage of through traffic upon it, then the case for State assistance to the maintenance of such a road seems to be very weak. No additional burden which appreciably affects the cost of maintenance is thrown upon the road by a small percentage of through traffic, and the local interest in maintaining the road is a sufficient guarantee that it will be kept in good condition.

As regards the increase which has taken place in the cost of maintaining roads and the effect of motor traffic, there is a general impression that the increase has been due to motor traffic; but, although motor traffic undoubtedly will cause a very large increase in the cost of maintenance, it is doubtful whether the increase due to this cause has yet affected the figures to as large an extent as it will do in the future.

The increase in the maintenance expenditure on all roads during a period of nineteen years—from 1890 to 1909—is shown on Table 5 in the Appendix hereto. The figures are divided between two periods—twelve years, from 1890 to 1902, and seven years, from 1902 to 1909—because in the former period practically no motor traffic existed, and in the latter period the motor traffic was a constantly growing factor.

The figures shown by Table 5 are very remarkable. The total maintenance expenditure on all roads, rural and urban, outside London and outside county boroughs, increased 108 per cent, but of that increase 85 per cent accrued in the first twelve years, or at the average rate of 7 per cent per annum, while in the second period the further increase was only 23 per cent on the original figure, or at the rate of 3.28 per cent per annum.

The expenditure on main roads (rural and urban) increased 179 per cent in the nineteen years, the increase in the mileage being 29 per cent, and the increase in the cost per mile 116 per cent, of which 87 per cent, or at the rate of 7.25 per cent per annum, accrued in the first period, and 29 per cent, or at the rate of 4.14 per cent per annum, in the second period.

But, as has already been pointed out, the figures for all roads are the best measure of the actual burden on ratepayers. If attention is confined to main roads paid for out of county rates the burden borne by the district ratepayer, who is also the county ratepayer, in maintaining district roads is left out of account, and the transfer of roads from the class of district roads to main roads obscures the significance of the figures. The total burden may be badly distributed among ratepayers, but that distribution is within the control of the authorities themselves, and it is therefore the nett increase of the total burden which must be dealt with. An increase in main road expenditure due to transfer of mileage involves a decrease in district road expenditure.

The abnormal increase in urban main roads which occurred almost wholly in the first period must be noticed. The cost of these roads per mile rose 270 per cent, or 22.5 per cent per annum, in the first period, and only a further 50 per cent, or 7.14 per cent per annum, in the second period. This was probably due to the great increase in urban traffic, which is mainly local traffic, in regard to which the question of State assistance does not arise, and to the consequent necessity of reconstructing the roads, so that the figures express the cost of reconstruction rather than the recurring cost of ordinary renewals of surface coatings.

The comparative figures for rural main roads show an increase of 50 per cent, or 4.1 per cent per annum, in the first period, and a further 23 per cent, or 3.28 per cent per annum, in the second period.

The increase in the expenditure on rural main roads per mile since 1902 has not, therefore, been so large as might have been expected. It is, however, almost certain that a very large additional expenditure has yet to be faced in order to bring important roads up to the standard of strength and efficiency required for motor traffic.

(To be concluded.)

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC.M.INST.C.E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

THE MONTHLY PREMIUM.

The premium for April is awarded to—

Mr. F. NICHOLSON,

Golspie,

Sutherlandshire.

whose contributions have, in the opinion of the adjudicators, been the best received during the month.

QUESTIONS.

This week answers are invited to the following questions:—

391. Concrete Floor.—A concrete floor is to be constructed as shown in the sketch, with 4-in. by 3-in.

R.S. joists, and woven mesh steel wire with a 3-in. lap. The R.S. joists have a $\frac{1}{2}$ -in. wall hold, and the floor a 2-in. wall hold. The size of the room is 16 ft. by 13 ft. Calculate the safe distributed load per super. foot, also the breaking load. (Assistant.)

392. Sewage Purification.—The sewage of a college is to be treated as follows: The liquid is first admitted to a septic tank, then to a vertical upward filter filled with agricultural pipes; thence it flows through a clinker filter to the sewer of the city. The population of the college is about 300 people. (1) Give dimensions of each of the tanks, in order that the liquid effluent may be good. (2) Does the vertical upward filter act as an oxidising filter or merely as a second settling tank? (3) How often will the vertical upward filter have to be cleaned in order to keep the effluent good? (Deleatur.)

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulæ involved. (T. W. P., *Bechill-on-Sea*.)

394. Building Inspection.—In carrying out the duties of a building inspector, state what are the common errors to be looked for when inspecting a deposited plan, and also the chief faults that are met with on the actual building. (T. W. P., *Bechill-on-Sea*.)

395. Plumbing.—A lead pipe has to convey both hot and cold water in horizontal and vertical directions. Show by a sketch how it should be fixed, and give reasons. (B. W., *Tadcaster*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

390. Removal of House Refuse.—A new urban district has just been formed in the neighbourhood of London of which the following are particulars: Area, 3,500 acres; population, 9,000, increasing at rate of 700 per annum; number of houses, about 2,300; length of district, north to south 3 miles, east to west $1\frac{1}{2}$ miles; mileage of roads, 17; character of district, flat in northern part, hills up to 1 in 16 in southern part;

distribution of population, 2,000 at north end in £40 villas, shops, &c., 500 in north-east in large houses with long approach drives, 1,000 in south and south-west in small villas and workmen's cottages. The refuse for the present will be utilised at brickfields on the southern boundary of the district. It is desired to organise the removal of house refuse on the most up-to-date methods compatible with economy. Describe fully the methods of collection and transit, the organisation of the staff, the plant required, and give an estimate of the capital and annual charges for this work. Trade refuse is negligible, and no plant has been taken over from the rural authority who formerly had control of the area. (Togun.)

Owners should be compelled to provide galvanised iron dustbins for the storage of house refuse pending the visit of the scavengers; this can be enforced under sec. 36 of the Public Health Act, 1875.

The bins should be fitted with ventilated lids and handles, and should rest upon a bed of concrete to prevent rusting. The collection can be best carried out by the local authority themselves, the work being better done than by employing contractors. The district should be divided into sub-districts, and the refuse collected systematically once a week, so that all the people know the day of collection in their respective districts, and the workmen do not have to travel over the same ground twice. By this method one set of workmen will be able to carry out the work in this district. The bins should be carried out to the cart, which should be a properly constructed cart (the old "tip cart" with high sides is not suitable). This method prevents paper, &c., being blown about the streets.

When the refuse has been collected, the ultimate disposal must be considered. The method, of course, depends upon the district. If it is a sea port, it is better to take it out to sea; but for inland towns no method is so safe as the destruction by furnace.

Many firms instal refuse destructors, but it is necessary to obtain the best type to ensure effectual disposal without nuisance, and minimise the cost of maintenance. The cost of destruction by fire varies in most towns, but the average may be taken as 1s. per ton. Of course, it greatly depends upon the wages paid to workmen. This sum does not include interest and sinking fund. The destruction by fire, however, can be carried out at little extra cost to carting to tips, as there will be a revenue from clinker, which can be sold for mortar, or used for the foundation of footpaths, country roads, &c., and also from the sale of tins, &c.

However, the little cost will be well spent. The destructor need only be worked for, say, fourteen hours per day; but care should be taken to provide for the addition of extra cells as required.

There is usually no charge for maintenance for the first two years, as the contractors usually carry out the necessary repairs during that time. (Sanitas.)

NOTES.

Mr. H. Conyers Kirby, town engineer of Potchefstroom, Transvaal, writes:

In the "Assistants' Section" of your issue of March 13th, 1914, there appears a reply to a question (No. 379) *re* testing pipes.

May I suggest that your correspondent "T. W. P." has omitted a very good test, that of absorption, which is an extremely useful guide both to the quality of glaze and to the vitrification of a stoneware pipe? A first-class quality stoneware pipe will absorb from $\frac{1}{2}$ to 1 per cent of its initial dry weight after being immersed in water for twenty-four hours, whereas an inferior quality clay or fireclay will absorb anything up to 10 per cent.

In the Transvaal we have two very excellent stone-

ware pipe works, which have so much improved in the past six years that they produce an article equal to the best. The standard of absorption which is generally accepted in the Transvaal is 3 per cent, which was found to be the minimum that local clays would stand without undue distortion in burning.

Another very useful test is that of the insertion of a circular mandril into every pipe, which mandril should be of a diameter $\frac{3}{16}$ in. less than the nominal internal diameter of the pipe under test. This will be found to be more rapid than and equally efficacious to the caliper test.

Your correspondent "T. W. P." does not refer to the annular space for jointing material between the outside of the spigot end and the inside of the socket shoulder, which is rather an important item.

The following extracts are from my specification for stoneware pipes which were made in South Africa and used upon the Pretoria sewerage scheme, where stoneware pipes to the value of about £25,000 were laid. I trust that this communication may be of interest to some of your readers.

EXTRACTS FROM PRETORIA MUNICIPALITY SPECIFICATION FOR STONEWARE PIPES.

DESCRIPTION.

The pipes shall be spigot and socket, made of the very best stoneware clay procurable, and in accordance with the dimensions hereafter specified. They must be straight, truly cylindrical, the thickness uniform, and the outside and inside faces concentric, the whole to be well burned and vitrified, salt glazed internally and externally (except inside sockets, and $2\frac{1}{2}$ in. outside the spigot end). The body and socket are to be in one piece, the clay is to be of a fine grain, and the whole free from air blows, blisters, fire cracks or any other imperfection.

Junctions, bends and specials are to be equal in quality to the above in every respect.

TESTS.

All pipes may be subjected to the following tests:—

(a) A circular mandril 2 ft. in length and in diameter $\frac{3}{16}$ in. less than the nominal internal diameter of the pipe shall be passed through each pipe.

The internal diameter of any pipe shall in no part exceed or be less than its nominal size by $\frac{1}{16}$ in.

(b) They may be subjected to a test pressure of 30 ft. head of water, and under this pressure shall be perfectly sound, watertight and free from weeps or flaws of any description.

(c) They may be weighed, completely immersed in water for twenty-four hours, and then weighed again. Previous to this test, however, the outside of the spigot and the inside of the socket shall, if the contractor so desires, be carefully varnished with shellac in order that those portions of the pipe which will not be exposed in actual work may be protected. No pipe shall, after immersion, weigh more than 3 per cent in excess of its weight before immersion.

(d) The pipes may be tested by crushing in the following manner: The pipe to be bedded firmly throughout its length in sand, the socket being free; on the top of the barrel of the pipe will be placed a wooden bar 1 in. square and 12 in. long; this bar will be loaded with a bridge or platform, upon which will be a weight of approximately 1,000 lb., which will be applied suddenly, but without undue shock; a further weight will be applied by means of bricks, and no pipe shall crush, or show any deformity or sign of failure whatever with a less weight than 2,000 lb.

Any pipe failing to satisfy any of the above tests will be rejected, and shall be immediately broken up or removed to another part of the works by the contractor.

Should 10 per cent or more of the pipes in any one consignment fail to satisfy any of the above tests, the engineer may reject the whole consignment without further testing.

Of the above tests, that marked (a) shall be applied to every pipe, and the remainder at the discretion of the engineer.

All pipes which have been passed by the engineer must immediately have the word "passed" and the date painted thereon.

DIMENSIONS.

The thickness of barrel, depth of socket and length of pipe for all straight pipes and specials will be as

given in the table below, and contractors must tender for the supply of pipes in exact accordance with this table.

Internal diameter of pipe.	4"	6"	8"	9"	12"	15"	18"
Thickness of barrel ...	$\frac{5}{16}$ "	$\frac{3}{8}$ "	$\frac{7}{16}$ "	1"	$1\frac{1}{16}$ "	$1\frac{1}{4}$ "	1 $\frac{1}{2}$ "
Depth of socket ...	$2\frac{1}{4}$ "	$2\frac{3}{4}$ "	$2\frac{3}{4}$ "	3"	$3\frac{1}{2}$ "	$3\frac{1}{2}$ "	3 $\frac{1}{2}$ "
Length of pipe ...	2' 0"	2' 6"	2' 6"	2' 6"	2' 6"	2' 6"	2' 6"
Annular space for jointing material	$\frac{1}{8}$ "	$\frac{1}{8}$ "	$\frac{1}{8}$ "	$\frac{1}{8}$ "	$\frac{1}{8}$ "	$\frac{1}{8}$ "	$\frac{1}{8}$ "

The length of pipes for the specials will be the same as for straight pipes of the same diameter, unless otherwise shown on the drawing which accompanies this specification. The thickness of barrel and depth of socket will be exactly the same as for ordinary pipes of the same diameter.

IRISH LABOURERS' COTTAGES.

DELAYED SCHEMES.

In the House of Commons on Thursday of last week Mr. Vincent Kennedy asked the names of the rural district councils in Ireland whose schemes had been lodged with the Local Government Board and delayed owing to money shortage, giving the number of representations in each case and date of lodgment; also would inquiry be made as to how many schemes were ready for lodgment with the Local Government Board by rural district councils throughout Ireland.

Mr. Birrell said the following was a list of the rural district councils which had submitted schemes for the erection of labourers' cottages which had not yet been inquired into:—

Rural District.	Number of cottages in scheme.	Date of lodgment of scheme.
Bellymena, No. 1 Scheme ...	106	31st March, 1914
" No. 2 " ...	39	"
Ballymoney ...	81	7th March, 1914
Bandon ...	114	30th October, 1911
Borrisokane ...	63	11th October, 1913
Carlow ...	51	11th April, 1914
Cork ...	643	7th December, 1911
Croom ...	150	23rd March, 1911
Delvin ...	101	19th October, 1910
Fermoy ...	256	10th June, 1911
Gortnahoe, No. 1 Scheme ...	20	11th September, 1912
" No. 2 " ...	8	"
Kanturk... ..	305	11th November, 1911
Kells	117	1st June, 1912
Killadysert	41	30th April, 1912
Kilmallock	243	12th December, 1910
Kinsale	169	21st March, 1911
Limerick, No. 1 Scheme ...	257	31st January, 1913
Listowel	397	12th July, 1912
Mallow	249	11th October, 1912
Manorhamilton	51	18th February, 1914
Michelstown, No. 1 Scheme ...	99	23rd November, 1913
" No. 2 " ...	28	2nd September, 1911
Mullingar	185	15th February, 1912
Newcastle	132	15th April, 1913
Rathkeale	304	28th July, 1913
Slievemary	55	7th March, 1913
Thomastown, No. 1 Scheme ...	82	19th December, 1913
" No. 2 " ...	23	"
Tulla	28	7th June, 1911
Urburford	7	11th February, 1911
Wexford	145	23rd August, 1911
Youghal, No. 1 Scheme ...	59	6th February, 1912
" No. 2 " ...	28	21st November, 1912

The Local Government Board had no reason to suppose that any schemes which were ready for lodgment had been kept back.

The Removal of Shingle.—The East Lancing Sea Defence Commissioners have referred to the Local Government Board a report by the engineer in reference to the removal of shingle from the foreshore between certain points within the commissioners' district. As the result of a survey made by him between Ferry-road and the Shoreham Harbour entrance, he found that high-water mark had advanced landwards from between 20 ft. to 50 ft. since 1909. This encroachment had been most marked to the east of the spot from where the spoil had been removed. There could be no doubt, he considered, that the removal of spoil accelerated the encroachment. Before very long it would be necessary, in order to ensure the future safety of the bungalows on the shore, to erect groynes.

WIGTOWNSHIRE ROADS.

MACHARS DISTRICT SURVEYOR'S REPORT.

In his annual report as surveyor of Machars, Wigtownshire, district roads and bridges, Mr. D. H. Robb mentions that those roads under his control which are not used by heavy motor traffic, although not strong, show continued improvement of surface. The roads which are subject to heavy motor traffic, however, show increased wear in the way of tracking and potholes.

Mr. Robb considers that many of the roads are too narrow, and through excessive paring have become too deep at the water tables to permit of vehicles passing in comfort, or even with safety. There is, in his opinion, pressing need for the raising and widening of the sides of these roads, and a considerable quantity of metal should be allowed annually for this purpose.

For the repair of potholes, machine-broken gravel was used on several roads, but with indifferent success, as the heavier classes of motor vehicle tend to scatter these gravel patches before they become consolidated. It is pointed out that, in order to secure a proper repair, the gravel would require to be treated with an adhesive binder of a tarry or bituminous nature. It is proposed to patch one or two of the main roads with tarred gravel during the summer months, and for this purpose a "Midget" tar-boiler is included in the estimates. This method of repair, Mr. Robb mentions, has proved successful in some of the English counties.

The quantity of metal, including 1,420 cub. yds. for improving sides, is increased this year to 15,000 cub. yds. This gives an average of 59 cub. yds. per mile, or a quantity sufficient to coat a road of average width for a distance of 200 lin. yds. "To coat a mile, therefore," adds Mr. Robb, "requires a period of over eight years, and as the average life of a road in an agricultural district like the Machars may be taken as six years, the estimated quantity still falls short of that required for proper maintenance."

A Town Planning Conference at Hull.—The National Housing and Town Planning Council will hold a conference at Hull, on the 21st and 22nd inst., to consider the practical administration of the Housing and Town Planning Act, 1909, and especially the subjects of cottage building in urban and rural areas.

ASSOCIATION OF SOMERSET SURVEYORS.

MEETING AT STREET.

A meeting of the Association of Somerset Surveyors was held at Street on Saturday afternoon last, those present including the president (Mr. W. Alexander Collins, Bridgwater), Messrs. F. Parr (Bridgwater), H. Sunderland (Midsomer Norton), T. Orchard (Clutton), C. Durie (Williton), R. Davey (Clutton), G. Hunt (Watchet), W. R. Lamacraft (Williton), J. K. Dunster (Axbridge), E. H. Padfield (Wells), E. J. Padfield (Wincanton), E. A. Wadmore (Bridgwater), D. Hinchcliffe (Shepton Mallet), G. Alves (Glastonbury), W. H. Cousins (Street), H. Hayman (Bridgwater), G. Ponsford (Bridgwater), W. G. Berry (Bridgwater), E. T. Howard (Wellington), C. Pursey (Wells), C. B. Borthwick (Wincanton), H. B. Rogers (Wells), G. Stevens (Somerset County), R. Nicholls (Somerset County), J. Lovell (Axbridge), L. F. N. Blake (Wincanton), E. H. Vallis (Langport), Edward Stead (Somerset County), R. Stephens (Chard), D. Edwards (Taunton), hon. secretary, together with the chairman of the urban council, Mr. A. W. Stacey, J.P., and other members, Mr. S. T. Clothier, clerk of the urban district council, and Mr. J. Pursey (late surveyor to the Street Urban District Council).

At the kind invitation of the chairman and members of the Street Urban District Council, the association met at lunch at the Bear Hotel, Mr. A. W. Stacey, J.P., chairman of the council, presiding.

The association were heartily welcomed to Street by the chairman.

A hearty vote of thanks to the chairman and members of the Street Urban District Council was proposed by the president and seconded by Mr. Parr, and carried with acclamation. The members then visited the recently completed houses erected by the Street Urban District Council, Mr. Pursey and the architect, Mr. Clothier, acting as conductors to the party. A return was then made to the Vestry Room, where a business meeting was held.

The minutes of the last meeting were read and confirmed.

Apologies for non-attendance were received from Messrs. J. Johnson (Keynsham), F. W. Jones (Frome), G. W. Warry and T. G. Crump (Taunton).

The president reported the action of the executive committee in their proposal to inaugurate a premium scheme for the best papers read during the year, and the conditions and rules regarding the competition were read. For the present year a prize to the value of £2 2s. is to be presented by Mr. H. T. Chapman, county surveyor of Kent, and a prize to the value of 10s. 6d. by Mr. F. Parr, borough surveyor, Bridgwater, for the best paper by associates or junior members of the association.

The president reported that the steps taken by the executive committee had resulted in the association becoming affiliated with the National Association of Local Government Officers at an annual fee of 10s. 6d. The association are entitled to two representatives on the National Council. It was proposed by Mr. E. Stead, county surveyor, and seconded by Mr. T. Orchard, Clutton Rural District Council, that the president and secretary be appointed as representatives on the National Council.

The president also reported that, at the invitation of Mr. Chas. Durie, surveyor to the Eastern Division of the Williton Rural District Council, the executive committee had arranged a meeting of the association at Williton for July 18th next.

A paper—reproduced on another page of this issue—on the "Financial and other Aspects of Housing," was then read by Mr. W. H. Cousins, P.A.S.I., surveyor to the Street Urban District Council, an animated discussion following.

A hearty vote of thanks to Mr. Cousins, proposed by the president and seconded by the hon. secretary, was carried unanimously.

The following took part in the discussion—namely, Messrs. Collins, Edwards, Parr, Stevens, Clothier and Pursey, and Mr. Cousins replied to the questions put to him.

A vote of thanks to the chairman and members of the Street Urban District Council for the use of the vestry hall for the meeting, proposed by Mr. Parr and seconded by Mr. Stead, was passed, Mr. Stacey responding on behalf of the urban district council.

The members were entertained to tea at the Bear Hotel by the president, Mr. W. A. Collins, who ex-

pressed, on behalf of the association, the pleasure it afforded the members at seeing among them Mr. Stead, the new county surveyor.

Mr. Stead responded.

A vote of thanks was afterwards accorded to the president for his hospitality.

Royal Sanitary Institute.—The annual dinner of this body will take place at the Langham Hotel, W., on Wednesday, the 13th inst.

PERCO-FILTERS FOR SEWAGE.

DIAGRAM FOR ASCERTAINING THEIR DIMENSIONS.

By R. O. WYNNE-ROBERTS, Regina, and L. W. WYNNE-ROBERTS, B.Sc.(HONS., ENG., LONDON), Regina.

The designing of sewage filters may appear a simple matter, but it often occurs that there are certain conditions which govern their arrangement, dimensions, &c. For instance, in one district the fall may be very slight, and deep filters are not possible without pumping operations; in another district the fall may be great, and reasonably deep filters will economise the area of land required. Between these extremes there are numerous conditions to be considered.

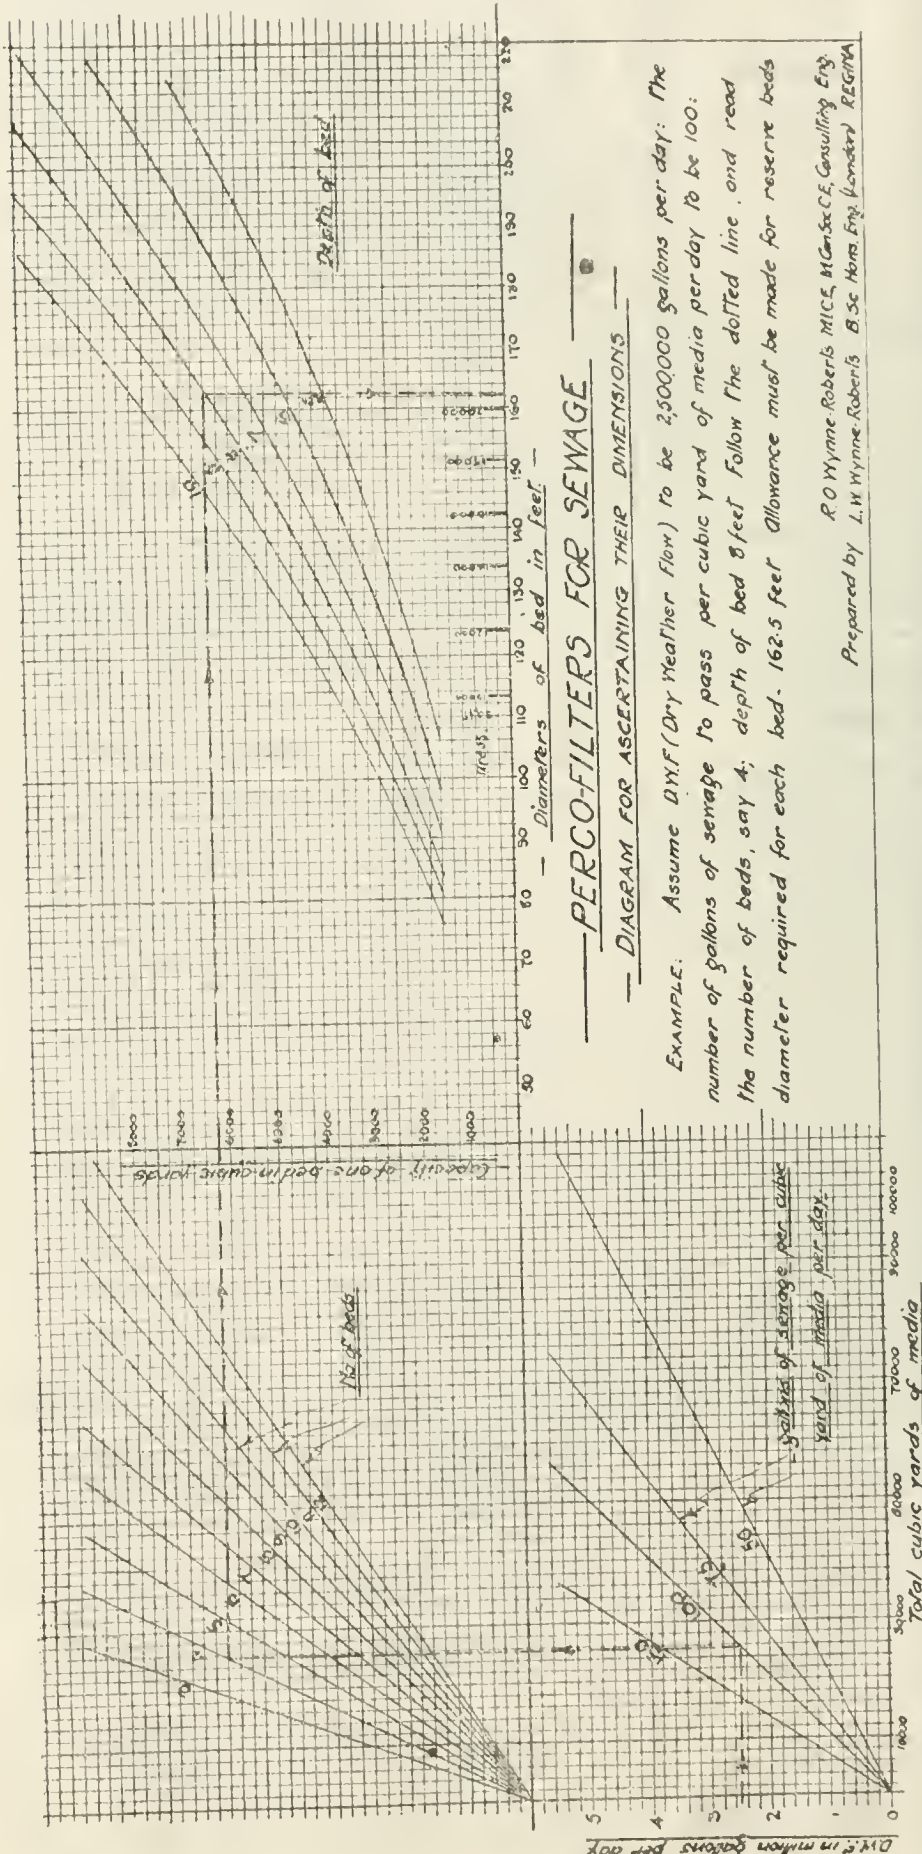

In this article it is not proposed to discuss the advantages and disadvantages of deep and shallow filters; these may be dealt with in a future contribution. There is, nevertheless, a minimum and a maximum depth of filters to obtain the most efficient results, both financially and bacteriologically, and the engineer will be well advised, when designing sewage filters, to consider this matter fully.

The question is often asked what size filters are required to perform a certain work. Before an answer can be made, due consideration must be given to, and much will depend upon, the strength of the sewage, and the efficiency of the settling tank, and the size and material of the filtering media.

The diagram accompanying this short article has been designed to meet practically every condition, and for all dry-weather flows up to 6,000,000 gallons a day. The capacity of any filter per cubic yard of filtering media may be anything from, say, 50 to 150 gallons a day; there may be any number of filter beds, say, from three to twelve, and their depth may range from 5 ft. to 10 ft.

When the engineer has selected any one of these factors, he has simply to trace a line from the dry-weather-flow column clockwise, as described in the diagram, and the final figure will be the diameter of a circular percolating filter. The engineer may reverse the procedure, however, and arrive at the daily dry-weather flow. The diagram is simple and self-explanatory.

Smoke Abatement. The President of the Local Government Board announced in the House of Commons on Tuesday that he was about to appoint a committee to consider the question of smoke abatement, and that the names of the members would be announced in a few days.

Law Notes.

EDITED BY J. B. REIGNIER CONDER, 11, Old Jewry Chambers, E.C., Solicitor of the Supreme Court.

The Editor will be pleased to answer any questions affecting the practice of engineers and surveyors to local authorities. Queries (which should be written legibly on foolscap paper, on one side only) should be addressed to "The Law Editor," at the office of THE SURVEYOR, accompanied by the writer's name and address, but correspondents who do not wish their names to be published should also furnish a "nom de

plume." Where necessary, copies of local Acts or documents referred to should be enclosed. All explanatory diagrams must be drawn and lettered in BLACK ink only, and in such style as to be fit for direct reproduction—i.e., without re-drawing or amendment. Unless these conditions are complied with we cannot undertake to reply to queries.

QUERIES AND REPLIES.

In order to avoid confusion queries are requested to use distinctive words as noms de plume. The letter X, combinations such as X.Y.Z., and words such as "engineer" and "surveyor," should never be used.

HOUSING, TOWN PLANNING, &c., ACT, 1909.—"Ynys" writes: (1) In my district are five cottages leased on life interest to A, the owner proper B being in Australia. A letter on the form approved by my council (copy enclosed), drawing attention to the defects found in the houses and requesting to have such defects remedied within a period of three months, was sent to A as the person who receives the rents of the houses. In reply, A states that he holds the houses on lease, which may expire at any moment, having only one life interest on it, and suggesting that the question of repairs should be deferred until something is heard from B. I observe that "owner" is defined in sec. 49 of the Housing, Town Planning, &c., Act, 1909, as including all lessees or mortgagees of any premises, except persons holding, or entitled to, the rents and profits of such premises under a lease, the original term whereof is less than twenty-one years. But as A is not covered by this definition, and as B is in Australia, I shall be glad if you will kindly advise what course to pursue under the circumstances. (2) On another matter. At the last meeting of my Health Committee my suggestion that where defects found can be remedied under the Public Health Act, 1875, notices should be served thereunder was adopted, and I have accordingly been instructed in future to proceed with the house-to-house inspection, including the preparation of records on cards, as before and as required by order of the Local Government Board, dated September 2, 1910, but in all cases where the defects can be met by the application of the Public Health Act, 1875, to include such cases in my ordinary journal. My difficulty in this case arises from the fact that my inspections under the Housing, Town Planning, &c., Act, 1909, include several items which I doubt are covered by sec. 94 of the Public Health Act, 1875—*c.g.*, walls very rough require plastering, floors uneven and require cementing of joints, ceilings of calico require to substitute lath and plaster, windows not opening, and absence of windows on top of stairs, garret approached by unprotected ladder, exterior paving required to avoid lodgment of water, &c. I believe that the Housing, Town Planning Act, 1909, covers such defects by the word "fit" for habitation in sec. 15; but in cases where the houses are still occupied by the tenants in occupation previous to the passing of the Act there does not appear to be any remedy. Will you also kindly advise how to get over this difficulty? I am a constant reader of your answers to questions in the "Notes and Queries" column, and find them most useful and instructive.

(1) "A" being a lessee for life is undoubtedly "owner" of the premises within the statutory definition. A lease for life is not a lease, the original term whereof is less than twenty-one years, and a lessee for life is a freeholder. The council should proceed against "A" as "owner." (2) If the houses are in a state so dangerous or injurious to health as to be unfit for human habitation, the council can proceed under sec. 17 of the Act of 1909.

WATER SUPPLY FOR STREET WATERING, &c.: DISAGREEMENT.—"Inspector" writes: The waterworks in this urban district is in the hands of a company which, for a lump sum payment, has for many years supplied my council with water for the purposes mentioned in sec. 37 of the Waterworks Clauses Act of 1847. My council has adopted the practice of tarring its principal streets, and consequently do not use so much water as hitherto, but the company refuses to reduce its charge. My council is desirous of taking the water by meter at a rate per 1,000 gallons. Under the above section of the Waterworks Clauses Act it would appear that the matter in dispute has to be settled by two justices until an "inspector" has

been appointed. From the definition of "inspector" contained in the Act it would appear that I, as surveyor to the urban district council, am that official, and therefore should fix the rate and manner in which the water should be supplied. Will you please say if you consider this interpretation of an "inspector" in sec. 37 of the above Act to be the right one? There is no special Act in the district relating to the appointment of an inspector.

"Inspector" is defined in sec. 1 of the Act of 1847 as "an officer appointed under any local Act relating to the town or district supplied with water under the special Act for the purpose of inspecting or superintending works connected with the paving, drainage, or supply of water of such town or district, or an officer appointed under any general Act for executing the like duties with respect to such town or district together with other towns or districts." It would appear, therefore, that a surveyor appointed under a general Act for one town or district only is not an "inspector" within the statutory definition, and consequently that unless an appointment has been made under a special Act the terms and conditions of supply under section 37 must be settled by two justices.

BUILDING BY-LAWS: APPROVAL OF PLAN CONTRAVENING BY-LAWS.—"Hockey" writes: A property owner in an urban district submitted plans for converting certain buildings into cottages. The plans contravened the by-laws in many respects, more particularly with respect to the open space about the buildings, but the council approved the plans, and the work was carried out. This occurred over twenty years ago, but the present by-laws were then in force. The council now threaten to put in a closing order under the Housing, Town Planning, &c., Act, unless certain alterations are made to increase the air space. Will you kindly say (1) if they can issue a closing order in these circumstances? (2) In the event of the answer being in the affirmative, if the owner cannot recover the expense of the alterations and the value of depreciation of property on the score of negligence of the council?

(1) The council cannot make a closing order merely on account of the contravention of the by-laws. But they can (and must) do so if, on the representation of the medical officer of health, or any other officer of the council, or other information given, the cottages appear to them to be in a state so dangerous or injurious to health as to be unfit for human habitation (Housing, &c., Act, 1909, sec. 17). (2) In my opinion he cannot.

HIGHWAY: SURFACE WATER.—"Subscriber" writes: Alongside the public highway a district council have made openings through the wall so as to take off the surface water from the roads. These discharge on to the adjoining fields, and have been in existence several years. The owner of the field has asked the council to stop up these openings and lay a drain to the stream, as he alleges damage is done to his land through the road water flowing thereon. The council consider that, these openings having been in existence so long, they have a perfect right to turn the surface water on to his land. I shall be glad of your opinion thereon.

The council are not entitled to discharge surface water from the roads on to adjoining lands, unless they have acquired an easement by continuing to do so for a period of twenty years at least.

OFFICER OF LOCAL AUTHORITY: INSURANCE AGENCIES.—"Salvo jure" writes: A borough accountant, who has held office as such for about fifteen years, and is agent for several assurance companies, has all the town's officials and workmen insured under the Workmen's Compensation Act, and a large amount of corporation property and effects insured against fire, in the offices of which he is a commissioned agent, and it occurs to me he is acting illegally. I shall be glad of your opinion.

By sec. 193 of the Public Health Act, 1875, officers employed under the Act by a local authority must not in anywise be concerned or interested in any bargain or contract made with the authority for any of the purposes of the Act. Assuming that the insurances in question are made for the purposes of the Act, the borough accountant, in my opinion, in taking commission from the insurance companies is concerned or interested in the insurance contracts made with the council within the meaning of the section.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Burnley T.C. (April 16th. Mr. W. M. Cross).—£7,179 and £2,902 for the provision of a recreation ground and refuse tip in Barden-lane (including the execution of works of street improvements in connection therewith), and £500 for the erection of a lodge at Ightenhill Park. The borough surveyor, Mr. A. R. Pickles, supplied the inspector with the details of the scheme, and, in reply to Mr. Cross, said that the corporation bowling greens were not only popular, but also remunerative.

Bury T.C. (April 23rd. Mr. R. C. Maxwell).—This was an application for a Provisional Order for the repeal of sec. 141 of the Bury Corporation Act, which provides that no street shall be laid out for building purposes exceeding 100 yds. in length without at least one intersecting street in every 100 yds., except in the case of sites for any one building or works. The deputy town clerk, Mr. R. Battersby, said that, when in 1909 the Bury Corporation were seeking to obtain their Act of that year, the Local Government Board reported against the inclusion of the sections which the town council now asked to be repealed. The council, however, persisted in their desire to have the section, and it was eventually included. Very soon afterwards they found they had made a mistake. In 1910 they applied to the Local Government Board for their approval to a municipal housing scheme, and the board insisted upon the scheme being carried out in compliance with sec. 141, with the result that they had to make at least one cul-de-sac street which was practically of no use at all. The council now wanted to carry out another housing scheme in the Walmersley district, and they found themselves up against a similar difficulty. The borough engineer, Mr. J. A. Settle, stated that if the section were repealed the cost for street works in the Walmersley scheme would be reduced by about £800, and that would enable them to reduce the rents of the houses by 2½d. and 3d. per week.

East Grinstead U.D.C. (April 16th. Major J. Stewart).—£3,700 for a refuse destructor, £470 for a public sanitary convenience in Cantelupe-road, and £630 for the purchase of the Mounty Noddy allotments.—The engineer, Mr. W. E. Woolham, stated that the council collected about 40 load of refuse a week, ranging in weight from 13 to 22 cwt., with an average of 17 cwt. per load. The actual site of the destructor was selected because it was by the side of an already raised road, only the surface of which would require making up. With reference to the proposed public convenience, it was stated that the cost of the actual works was estimated at £250.

Herne Bay U.D.C. (April 15th. Major J. Stewart).—£2,620 for the extension of the East Cliff Pavilion.—The surveyor, Mr. F. W. J. Palmer, gave details of the proposed scheme. Explaining the increased cost of certain items, he said, as to the hydrants, that, as this was a ferro-concrete building, he thought there would be no need for them; but afterwards he thought that, as this was an important public building, they should be put in, more especially as they had rooms adjoining, ladies' and gentlemen's lavatories, and refreshment rooms. With regard to the radiators, he did not know at the time that the hall would be used for dancing and other things in the winter time as it had been used. Mr. Palmer also explained that they had put in a lath-and-plaster ceiling instead of the material at first proposed, because they had come to the conclusion that that material would rust easily and would be noisy.

Honiton T.C. (April 24th. Mr. A. W. Brightmore).—£4,000 for sewerage and sewage disposal.—It was explained that it was proposed to purchase 15 acres of land for the scheme, and the borough surveyor, Mr. A. Tillotson, said it was intended to make provision for a dry-weather flow of 40,000 gallons per day.

Liverpool T.C. (April 27th. Mr. Courtenay Clifton).—£34,500 for the purchase of lands in the Gore-street, Sparling-street, and Jordan-street areas, in the southern part of the city, for the erection of working-class dwellings, and for the appropriation of corporation lands for the same purpose.—It was

stated that all the land other than that owned by the corporation had been purchased by agreement for £8,500, including costs. It was estimated that the buildings would cost £22,000. On the principle of rehousing 50 per cent of the people dispossessed there there was a balance of accommodation for 600 due from the corporation, in addition to half of the 156 people dispossessed in the Gore-street and Sparling-street areas. The plans showed accommodation for 492 people. Only persons actually dispossessed would be allowed to occupy the new houses. The deputy surveyor, Mr. Turton, stated that in the Gore-street area and in the Jordan-street area a third and a fourth respectively of the land would be set aside for playgrounds.

Manchester T.C. (April 24th. Mr. F. H. Tulloch).—£3,310 for purposes of the city parks and recreation grounds.—The proposals were explained by the deputy town clerk (Mr. Heath), who stated that £3,000 of the amount was required for the purchase of land to extend the Delamere-street Recreation Ground, Ashton Old-road, and the remainder was for carrying out various works at Heaton Park, Platt Fields, Sunny Brow Park, and Prussia-street Blackley estate, and Debdale Recreation Grounds.

Rotherham T.C. (April 29th. Mr. T. C. Ekin).—£19,956 for additional plant, and an extension of the electricity works.—Evidence was given showing that in the first year of the works (1911-2) 87,174 units were sold. For the year just closed (1913-14) 4,797,222 units were sold—an increase of 1,100,000 units on the previous year. The borough electrical engineer, Mr. E. Cross, estimated that within the next three years, owing to the price of coal and the popularity of electric driving in local industries, the undertaking would be required to supply 10,000,000 units per annum, or more than twice the quantity supplied last year.

Walton-on-the-Naze U.D.C. (April 14th. Mr. Edgar Dudley).—£315 for the purchase of land at Southcliff for the purpose of public walks and pleasure grounds, and £200 for land situate between old Pier-street and Portobello-road for the purposes of a town yard.—The surveyor, Mr. H. W. Gladwell, stated that the land at Southcliff had slipped on an average of 2 ft. during the last six months. The distance by road to Frinton was now about 1½ miles, and by the cliffs it would be only about ¼ mile. It would be necessary to build a sea-retaining wall, and to build another stone breakwater, and there would have to be a main drain at the back of the wall, with cross drains, while the whole of the cliffs would require levelling. The construction of a promenade at the foot of the cliff, and a main road on the top, would have to be considered, and he estimated that the whole work would cost about £50,000, which was a fair estimate based on his experience of local work. The inspector: If you had carried out this work of protection, do you think it would prevent the cliffs slipping? The surveyor said he thought there would be something necessary for maintenance. With reference to the proposed purchase of land for a town yard, Mr. Gladwell was asked if he considered the site was large enough for the council's stores, stables, offices, fire engine, escape, council room to seat fifteen councillors, the public, and the Press, public lavatories and caretaker's room. The surveyor said that, candidly speaking, he did not think the site was large enough, as he had told the committee of the council when they inspected it.

APPLICATIONS FOR LOANS.

Barrow T.C.—£31,000 for new schools.

Bournemouth T.C.—£1,911 for public conveniences, £5,600 for road improvement, and £5,400 for school enlargements.

Darlington U.D.C.—£600, supplemental loan for sewerage.

Haslingden T.C.—£375 for paving works.

Llandudno U.D.C.—£930 for improvements at the gasworks.

Longbenton U.D.C.—£5,000 for private street improvement.

Southend T.C.—£2,675 for the purchase of a recreation ground.

Stirling T.C.—£3,000 for electricity extensions.

Winchcombe R.D.C.—£325 for the purchase of a site for cottages.

Woking U.D.C.—£3,319 for road improvement.

Wycombe R.D.C.—£1,350 for sewage disposal works.

LOANS SANCTIONED.

Barnet U.D.C.—£945 for a motor fire engine and appliances.

Bournemouth T.C.—£3,590 for laying out a cemetery (repayable in twenty years), and £1,410 for the erection of a lodge and drainage (repayable in thirty years).

Bridlington T.C.—£3,750 for workmen's dwellings and street improvements.

Buckhurst Hill U.D.C.—£850 for street improvement.

Carlton U.D.C.—£675 for making up a street.

Congleton T.C.—£600 for gas mains and services.

Denbigh T.C.—£10,000 for new municipal buildings.

Dover T.C.—£2,665 for repaving footpaths.

Exeter T.C.—£312 for a handicraft centre, and £1,110 for public conveniences.

Hemsworth R.D.C.—£375 for road improvement.

Holbeach U.D.C.—£2,500 for the erection of twelve working-class dwellings.

Londonderry C.C.—£2,500 for a new courthouse.

Mansfield T.C.—£2,000 for the purchase of gas stoves, and £3,600 for open spaces.

Redditch U.D.C.—£7,128 for building thirty-six workmen's cottages.

CORRESPONDENCE.

Sir, though I would persuade, I'll not constrain; Each man's opinion freely is his own Concerning anything, or anybody.

—MASSINGER: "The Fatal Dowry," Act. ii., 2

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—With reference to Mr. J. Hutchinson's letter appearing in your issue of the 17th inst., I quite agree that a lot of confusion and misunderstanding would be saved by dropping the word "bituminous" altogether.

Such terms as "bituminous," "asphaltic," &c., are generally attached to materials that are inferior to either bitumen or asphalt, and require "puffing."

Tar and pitch treated roads are invariably described as "bituminous roads," but this is a most misleading term, and there is no need for it whatever. The correct term, of course, for a road grouted with bitumen is a bitumen-macadam or bitumen-grouted road, and it is not necessary to refer to natural bitumen as "bituminous," as this is the genuine article itself.

Mr. Hutchinson is of the opinion that possibly coal-tar products and bitumens "will find a place together in the making of British roads, the more powerful (according to de Smedt) being used in the form of tar or pitch-grouted macadam as a sub-crust, and the other as a wearing surface."

This is not likely to come about for several reasons, one being that pitch-grouted macadam has failed terribly, and it is obvious that this will always be so as pitch and all artificial products are affected by atmospheric conditions.

Again, bitumen—*i.e.*, the natural material itself—should never be mixed or laid in connection with any coal-tar product, as the latter destroys the good properties of the bitumen.

I fail to see how tar or pitch, having no "body" or strength, can be said to be "more powerful" than bitumen. A fluid material like tar, and a brittle substance such as pitch, has no strength whatever; but natural bitumen, being of a rubbery nature, and containing a good proportion of natural mineral matter, is considerably stronger than any other known material. On the other hand, a road grouted with *natural* bitumen does not deteriorate, and is suitable for constructing both a sub-crust and a wearing surface combined.

I do not think much responsibility, as Mr. Hutchinson says, rests with the Standardisation Committee, "who have the nomenclature of bitumens in hand," as, in view of the statement made by Colonel Crompton some time back that "it was his intention, and that of those associated with him, to confer with certain American engineers, and, as the result of their united action, and, presumably, the co-operation of the Engineering Standards Committee, to obtain the classification of petroleum pitch as bitumen," no weight or importance is to be attached to any definitions this committee publishes. It would, of course, be necessary to correct these if they were not in accordance with past practice.

Bitumen, &c., have been known almost since the days of Noah, and were used many years ago for preserving mummies, &c., so I do not think it can be said that bitumen and asphalt are new materials that now require defining. I contend it would be as absurd for a few manufacturers of bitumen to inform Colonel Crompton that in future the definitions of the words "volts," "amperes," and other electrical terms were to be revised as it is for Colonel Crompton to give out, as he did, that he and those associated with him propose to draw up fresh definitions of bitumen, asphalt, &c.

No! I do not think there is anything to fear from these private meetings behind closed doors.—Yours, &c.,

ENGINEER.

April 28, 1914.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works, of which particulars appear below: Buildings—Bournemouth, Pudsey; housing and town planning—Edinburgh; refuse collection and disposal—Bridlington; roads and materials—Birmingham, Musselburgh; sewerage and sewage disposal—Kiveton Park; water, gas and electricity—Chester, Hemel Hempstead, Walsall. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Aberdeen T.C.—It has been agreed to erect a shelter at the bathing station, at an estimated cost of £450.

Bacup T.C.—The borough surveyor, Mr. W. Elce, has submitted a report in which he estimates the cost of the conversion of the Mechanics' Institution into municipal offices at £2,036. The building, he stated, did not lend itself readily, and at a reasonable cost, to adaptation. Stubbyloe Hall, another building upon which he was instructed to report, could be adapted at a cost of £384.

Bournemouth T.C.—The borough engineer, Mr. F. W. Lacey, has been instructed to report on the provision of swimming baths upon land belonging to the council.—A resolution that the borough engineer should be instructed to prepare plans for the extension of the Boscombe Pier landing-stage at a cost of £5,000, the cost to include an experimental groin under the pier, constructed of the old piles, has been referred to the Pier Committee to consider and report. The borough engineer informed the council that he could not carry out his scheme with respect to this pier for less than £7,500, but if the proposal for £5,600 was carried by the Pier Committee, he would have to do the best he could.

Carlisle T.C.—The tender of Messrs. J. & R. Bell, Carlisle, at £5,918, has been accepted for the building of the new council school at Newtown.

Cleethorpes U.D.C.—The surveyor, Mr. C. H. Waithman, has received instructions to prepare a revised scheme for a public hall.

Folkestone T.C.—The council are recommended by the General Purposes Committee to erect a band pavilion on the Leas promenade.

Hendon R.D.C.—The council have approved the plan of the surveyor, Mr. J. A. Webb, for the construction of a concrete invert at a section of the river Pinn, at an estimated cost of £240, a moiety of which will be met by the Middlesex County Council.

Monmouthshire C.C.—The Health and Housing Committee have come to an agreement with the seven urban councils in the west of the county for the erection of two isolation hospitals.

Pudsey T.C.—At the last meeting a motion that plans for a fire brigade station and public swimming baths, to cost £10,000, be referred back for reconsideration was defeated.

Scarborough T.C.—A large bathing pool is to be constructed in the South Bay, at an estimated cost of £5,000.

HOUSING AND TOWN PLANNING.

Barry U.D.C.—A decision has been reached to erect ten houses in Salisbury-road and ten in Jewel-street at a cost of £200 each.

Diss U.D.C.—A committee has been appointed to prepare the details of a housing scheme, with power to engage the services of an architect.

Edinburgh T.C.—The council have approved the recommendations of the Streets and Buildings Committees for the inclusion in the town planning scheme of an area at Fountainbridge, at an estimated cost of £19,000.

Evesham T.C.—The council resolved on Wednesday to ask the Local Government Board to grant a loan of £1,800 for the purchase of land at Bengeworth for the erection of workmen's dwellings.

Evesham R.D.C.—Plans and estimates for the erection of sixteen cottages at Harvington under the Housing Act have been approved by the council.

Frimley U.D.C.—The council have accepted from Major-General Dalrymple a model cottage he has built at the isolation hospital. Major-General Dalrymple stated that he had fixed the rent at 3s. 3d. per week inclusive, the council to pay rates, insurance, income-tax, water and repairs, and, subject to the approval of the Sanitary Committee, he had selected the first tenant. The total cost of the cottage, including plans and fencing, was £127 1s. 3d., and the following figures showed how the rent was calculated: Poor and general district rate, at 6s. 6d. per annum, £1 4s. 6d.; water rate, 11s.; insurance, 2s.; income-tax, 6s. 8d.; repairs (estimated one-sixth gross rent), £1 8s.; nett rent, £4 16s. 10d.; gross rent, £8 9s. He suggested that the nett rent should be deposited in the savings bank, and allowed to accumulate there at compound interest until it aggregates the initial cost of the cottage, which it should do in twenty-one years, and then the council, if they so desired, could build another without any charge on the rates. Major-General Dalrymple expressed an earnest hope that a decision on the proposed modification of the building by-laws would be arrived at shortly. The council decided, if practicable, to deal with the nett rent in the manner suggested.

PARKS AND OPEN SPACES.

Blackburn T.C.—It has been agreed to lay out Roc Lee Park with two bowling greens, a tennis court, and a recreation ground for children, at an estimated cost of £7,000. In addition, it has been decided to develop the recently acquired land at the Aqueduct, Ewood, by constructing a couple of bowling greens and a playground, at the estimated cost of £3,500.

REFUSE COLLECTION AND DISPOSAL.

Bridlington T.C.—The Sanitary Committee have been authorised to prepare a scheme for a dust destructor, and, if necessary, send a deputation to inspect installations.

Poole T.C.—The council have approved a report by the Sanitary Sub-committee appointed to consider the desirability of employing motor conveyance for the removal of house refuse, stating that the General Purposes Committee had arranged under contract for the conveyance of road material by traction in lieu of horse-drawn vehicles, and that the committee thought it would be wise to allow the further consideration of the present question to stand over for a year to see the result of this experiment.

ROADS AND MATERIALS.

Birmingham T.C.—The Public Works Committee recommend the widening and improvement of Harborne-road, Metchley-lane, and Somerset-road, at an estimated cost of £2,050.—A scheme for the widening of Park-street, at an estimated cost of £5,124, is also recommended for acceptance, and the council are advised to borrow £10,078 for widenings and improvement in Peddings-lane, Shaftmoor-lane, Forman's-road, and Weston-lane.

Cardiff T.C.—The city engineer, Mr. W. Harpur, has prepared a scheme for the widening of Duke-street, which the Public Works Committee have sent to the Parliamentary Committee with a request to consider the advisability of including the scheme in a Provisional Order or in their next Bill.

Dulverton R.D.C.—The clerk has been authorised to interview the Road Board with reference to a proposed grant and loan for the improvement of the Brendon-road on Exmoor, which is estimated to cost £2,000.

Hove T.C.—The council have agreed to the making up of a road 55 ft. wide on the east side of the recreation ground on the Stanford estate.

Leeds T.C.—A long discussion took place at a recent meeting of the General Purposes Committee on the scheme for reorganising the highways and cleansing departments, and consideration was adjourned. The suggestion is that the former department should be done away with altogether and the work put out to contract.

Loftus U.D.C.—It has been agreed to approach landowners and other interested parties with a view to consideration being given to the project of a new

road across the valley between Loftus and Carlin How, and thus avoiding the troublesome banks which have now to be traversed.

Musselburgh T.C.—The council have adopted a scheme prepared by the burgh surveyor, Mr. George Landale, for the renewal of the whole of the surface of the main street, together with certain widenings, at an estimated cost of £25,000, and has made an application to the Road Board for a grant in aid.

Richmond (Surrey) T.C.—The council have accepted the tender of Messrs. Johnson Bros., at £76, for the supply of a machine for tarring road surfaces.—The tender of Messrs. Mowlem & Co., at £736, has been accepted for making up Leyborne-park.—The Surveyor's Committee has been authorised to sell a steam roller that has been in use for twenty-two years, and to purchase a lighter roller, either steam, petrol, or paraffin driven, at a cost not exceeding £450.

Scarborough T.C.—A provisional scheme has been approved for dealing with insanitary areas in the old part of the town, and the construction of a new roadway running through its centre. It was indicated at the recent council meeting that the work would extend over several years.

Shoreditch B.C.—A resolution has been adopted offering to contribute £5,000 towards the scheme of the London County Council for widening Old-street and Kingsland-road.

Woodford U.D.C.—Estimates for tar-paving and tar-dressing amounting to £350 have been passed.

SEWERAGE AND SEWAGE DISPOSAL.

Aberystwyth T.C.—The council have adopted the scheme of sewerage prepared by Messrs. James Diggle & Sons, and the Local Government Board is to be asked to sanction a loan for the work.

Belper R.D.C.—The surveyor, Mr. Robert C. Cordon, has received instructions to construct a new filter and reconstruct the existing filter at Holbrooke sewage disposal works, at an estimated cost of £130. The filtering media at the sewage disposal works for Darley Abbey and Duffield is to be taken out and washed. The council have decided to pay the surveyor one half his fee for preparing a scheme for dealing with Crich sewerage.

Birmingham T.C.—The Public Works Committee recommend the borrowing of £5,910 for the extension of sewers in Cole Bank-lane, Swanshurst-lane, and surface-water sewerage in the Billesley district.

Chippenham R.D.C.—The tender of Mr. A. Skull, Corsham, at £257, has been accepted for sewerage work.

Kiveton Park R.D.C.—It is proposed to carry out sewerage works at an estimated cost of £3,400.

Nottingham T.C.—Stoke farm, where the sewage of the city is dealt with, and which has hitherto proved unremunerative, yielded on last year's operations a profit of about £180.

WATER, GAS, AND ELECTRICITY.

Ballycastle R.D.C.—Arrangements have been completed for the Cushendun water supply, and an engineer is to be appointed to superintend the scheme.

Banff C.C.—It has been agreed to construct a new reservoir on a higher site, at an estimated cost of £1,050, in order to augment the Gardenstour water supply. Negotiations are also in progress for carrying out the Blairmaud water scheme for Whitemills.

Bantry R.D.C.—The Local Government Board have written calling the attention of the council to the unsatisfactory nature of the Glengariff water supply.

Bathgate T.C.—The estates of Kirkton and White-law, containing 457 acres, have been purchased for £6,860, in order to secure the water rights.

Belper R.D.C.—The surveyor, Mr. Robert C. Cordon, has been instructed to prepare a scheme for the water supply of Allestree.

Chester T.C.—The Electricity Committee recommend the extension of the electricity cables, at an estimated cost of £3,282, and also extensive conversions to metallic filament lamps in the street lighting.

Chirk R.D.C.—Consideration is to be given to alternative schemes for a water supply for Glyn and Dolywern.

Frodingham U.D.C.—The tender of Messrs. Smith & Sons, of Grimsby, at £94, has been accepted for the sinking of a new bore at the waterworks.

Hemel Hempstead R.D.C.—The surveyor, Mr. T. H. Lightbody, has prepared a scheme for a water tower and hydrants in connection with a water supply scheme for Flamstead and Trowley.

Howden R.D.C.—The water supply question has been the subject of an interview between the representatives of the council and Mr. H. H. Law, deputy chief engineering inspector to the Local Government Board. No definite result was reached, but at the meeting on Saturday the council resolved that the supply of water in the Ings, at South Newbald, and the right to take the water, be investigated at a cost of £100.

Inverurie T.C.—A scheme is being prepared for a supply of electric light for the burgh.

Walsall T.C.—It is proposed to effect extensions at the electricity works, at an estimated cost of £3,000.

Wolverhampton T.C.—It has been agreed to provide a stock pattern pump capable of raising 2,000,000 gallons per day, at Cosford works, at an estimated cost of £1,500.

MISCELLANEOUS.

Hove T.C.—The Watch Committee have appointed a sub-committee to go into the whole question of the fire brigade and to report as to whether they consider it advisable to recommend the formation of a municipal fire brigade.

Leeds T.C.—At a meeting recently of the General Purposes Committee, instructions were given that the recommendations of the former Special Committee (now merged in the General Purposes Committee) for the control of the labour employed by the corporation should be given effect to by establishing an office in Swinegate, at which all applications for work under the municipality will be received and considered.

PERSONAL.

Mr. H. C. Parkinson has been appointed surveyor to the Armagh Rural District Council.

Mr. J. J. Estridge, surveyor to the Dorchester Rural District Council, has received an increase of salary.

Mr. F. J. Dixon, borough engineer of Ashton-under-Lyne, has been elected a member of the Royal Sanitary Institute.

Mr. J. Urban Smith, son of the Hertfordshire county surveyor, has been elected an associate-member of the Institution of Civil Engineers.

Mr. W. A. Doig, of the borough engineer's office, Taunton, has been admitted as a student of the Institution of Civil Engineers.

Mr. E. O. Hilyard, a member of the Scarborough borough engineer's department, has accepted an appointment at Birmingham.

Mr. A. Percy Harcourt, of the borough surveyor's department, Deptford, has been elected an associate-member of the Institution of Civil Engineers.

Mr. H. W. Bowen, county surveyor, West Sussex, has been transferred from the class of associate-member to that of member of the Institution of Civil Engineers.

Mr. S. K. Gibson, surveyor to the Cockermonth Rural District Council, is to receive an allowance of £30 per annum towards the upkeep of a motor cycle provided by himself.

Mr. George Rodley, clerk of works on road schemes under the West Suffolk County Council, is the selected candidate for the position of district main road surveyor, Downham district, under the Norfolk County Council.

Mr. Harold Sanderson, chief assistant to the borough surveyor of Keighley, has been appointed to a similar position in the office of the Accrington borough surveyor, and Mr. J. Kay, of the Ulverston surveyor's department, has been appointed general assistant at Accrington.

Mr. J. H. Brett, who recently retired from the office of county surveyor of Antrim, was at Tuesday's meeting of the county council presented with a solid silver salver. The presentation was made by Mr. McCance, who observed that Mr. Brett had always been found to be a good friend and a zealous official. Mr. Greer, speaking for the officials, also expressed appreciation of Mr. Brett's merits. Mr. Brett, in reply, said he had always met with much kindness from the members of the council and their predecessors, the grand jury.

ARTERIAL ROADS.

THE QUESTION OF GOVERNMENT GRANTS.

The President of the Local Government Board was asked on Wednesday whether, for the information of local authorities and sectional committees constituted at the recent conferences who would have under consideration the question of the proposed new arterial roads in relation to town planning schemes, he was in a position to make a definite statement as to the proportion of the cost of such roads which the Government would be prepared to bear.

Mr. Herbert Samuel said that one of the main objects of the conferences referred to had been to ascertain how far what was necessary in the direction of additional or improved through roads could be secured by means of town planning schemes. So far as this can be done, any large immediate expenditure might be avoided, and he was very hopeful that this would be found possible. With respect to grants in aid of maintenance, he could not anticipate any statement which the Chancellor of the Exchequer might have to make in introducing the Budget.

FOR OTHER ADVERTISEMENTS

See End of Paper.

WANTED, a thoroughly qualified Architectural Assistant in the County Surveyor's Department, Flintshire, North Wales. Salary, £3 per week. None but thoroughly qualified men, especially experienced in School and Hospital Design, need apply. For full particulars apply to the undersigned.

SAML. EVANS,

County Surveyor, Bridge Master,
and Architect.

County Buildings,
Mold, Flintshire.
April 29, 1914.

**THE URBAN DISTRICT COUNCIL OF
HINDLEY.
SURVEYOR'S (TEMPORARY) GENERAL
ASSISTANT.**

Applications are invited for the appointment of a Temporary General Assistant in the Surveyor's Office for a period of not less than 12 months. Salary £78 per year.

Candidates must have had experience in a Municipal Engineer's Office.

Applications, enclosing three recent testimonials, endorsed "General Assistant Surveyor," to be sent to the undersigned not later than Saturday, the 16th May, 1914.

(By order)

THOMAS ROBEY,
Clerk to the Council.

Council Offices,
Hindley,
Wigan.

April 29, 1914.

(1,577)

**BOROUGH OF BRIDLINGTON.
BOROUGH SURVEYOR.**

The Corporation invite applications for the post of Borough Surveyor, at a salary of £275, rising by annual increments of £25 to £350 per annum.

Particulars and Forms of application may be obtained from me on receipt of stamped addressed foolscap envelope.

Applications, stating age, experience, and qualifications, together with copies of not more than three recent testimonials, must be received by me before 5 p.m. on Thursday, the 14th of May.

Canvassing Members of Council will disqualify candidates.

(By order)

A. E. MATTHEWMAN,
Town Clerk.

Town Hall, Bridlington.
May 1, 1914.

(1,578)

NOTTINGHAMSHIRE MAIN ROADS.

EXTENSIVE RECONSTRUCTION SCHEME.

At a meeting of the Notts County Council on Tuesday the Highways Committee submitted a report stating that for some time they had been in communication with the Road Board with a view to a more complete scheme for the reconstruction and improvement of the county main roads, so as to enable the county council to proceed with the work at a more rapid pace than had been possible under the old system of annual grant. A provisional scheme had now been approved by the Road Board dealing with the reconstruction of 24 miles of main road in the urban districts, and 90 miles in the rural districts of the county. This mileage, added to the 23 miles of urban and 70 miles of rural main roads already reconstructed, would make a total, when the scheme was completed, of 207 miles of reconstructed main roads, capable of carrying the present ordinary traffic of the county. The total cost of reconstructing 90 miles of rural main roads will be £95,040, and in respect of that amount the Road Board will make a grant of £36,000, and advance a loan of £39,500 free of interest, leaving £19,540 to be contributed by the council.

The cost of reconstructing the 24 miles of urban main roads will be £34,364, the grant from the Road Board being £13,000, and the loan which the board will advance amounting to £31,000, leaving £3,364 to be provided by the county council. The proposed loan of £39,500 will be repaid by the council by 1922, and the smaller loan by 1920.

The committee recommended the council to approve of the scheme, and to apply to the Local Government Board for sanction to borrow the necessary money. It will only be necessary to borrow £11,000 in respect of the rural main roads in the current financial year, as the advancing of the loan of £39,500 will be spread over three years; but the whole of the £18,000 for the urban roads will be required to be raised at once.

The contracts with the urban authorities are affected by the new scheme, and the grant would be handed over to them as it was received. In some cases the work would be spread over one and a-half years, in others two years, and in other cases two and a-half years. The committee recommended that sums amounting to £1,529 should be paid in respect of the grant-in-aid roads in the county, and contracts sealed for the next year.

The Road Board have agreed to pay half of the further expenditure, to the amount of £2,000, for additional work in connection with the Nottingham and Bawtry road. The Newark Town Council had made a further application for an improvement on the Great North road at the corner of Lombard-street and Castle-gate in Newark, but the Road Board declined to make a grant in respect of the improvement, and consequently it was not possible for it to be carried out.

The report was adopted with the exception of that part of it referring to the Great North road, with respect to which it was resolved that the Road Board be asked to reconsider their decision.

Birmingham Gas Profits.—The report of the Birmingham Gas Committee, published on Monday, states that £70,000 will be handed over to the city treasurer in relief of the rates.

Royal Institute of British Architects.—The annual general meeting of this body will take place on Monday evening next. On the 11th inst. a special general meeting will be held to resume consideration of the draft revised schedule of professional charges.

Loans for Private Street Works.—The Warrington Town Council have adopted a resolution urging upon the Local Government Board the necessity of granting an extension, from seven years to twenty years, of the time allowed for the repayment of loans taken up by local authorities to meet the cost of making and paving private streets.

A Use for the Brighton Aquarium.—The special committee appointed by the Brighton Town Council to consider the provision of a permanent home for the municipal orchestra, have recommended that the Aquarium should be the site. Instead of the elaborate £100,000 scheme, defeated by the ratepayers, an expenditure of about £10,000 is contemplated in the enlargement of the present Winter Garden and improvements on the terrace, enabling outdoor orchestral performances to be given. Eventually it is hoped to link up the terrace with the Madeira-road terrace.

ROADS IMPROVEMENT ASSOCIATION.

ANNUAL GENERAL MEETING.

In the unavoidable absence of Prince Arthur of Connaught, the Hon. Arthur Stanley, M.P., presided at the annual general meeting of the Roads Improvement Association held at the Institution of Civil Engineers, Westminster, London, S.W., on the 23rd ult. Lord Montagu of Beaulieu (vice-president), Mr. Robert Todd (chairman), Colonel R. E. Crompton, C.B., and Mr. H. Percy Boulnois (vice-chairman), Mr. E. S. Shrapnell-Smith (hon. treasurer), and a number of members of the council supported the chairman.

The adoption of the annual report—a summary of which appeared in *THE SURVEYOR* of the 17th ult.—was moved by Mr. ROBERT TODD, who reviewed the various activities of the association during 1913, and especially drew attention to the successful results attending the association's frequent conferences with the local authorities and their executive officers. In the main local authorities were making strenuous efforts to improve their roads, and it was essential that road users, who place traffic of various types, weights and speeds upon the roads, should co-operate with and support them in every way. He noted with pleasure the approval that had been expressed for the need for the reclassification of the roads in this country, so long advocated by this association. The promise of State assistance for road maintenance was also a cause for satisfaction, as the time had now fully arrived for a more equitable distribution of this burden.

LORD MONTAGU OF BEAULIEU, who seconded the report, referred to the large field of usefulness before the association, and to the wide measure of success that attended its extensive activities. He drew attention to the limited powers of the Road Board to initiate road improvement schemes, and stated that the board were always anxious to receive and consider well-thought-out proposals put forward by the Roads Improvement Association in the interests of road users, in addition to those submitted by the local authorities. Lord Montagu deprecated the present destructive use of the roads. A small proportion of heavy vehicles frequently did not make fair use of the highways; they often exceeded the regulations regarding speed and weights, and caused abnormal damage to the roads. Hints had already been given that these regulations would shortly be revised and more stringently enforced. Referring to the rounding-off of dangerous corners and the trimming of obstructive hedges, Lord Montagu said it was sometimes suggested that motorists merely wanted roads denuded of all hedges, and similar features. This was quite wrong; motorists were more and more touring the country for pleasure, and were most appreciative of the beauties of the countryside. Anything savouring in the slightest degree of vandalism would be most abhorrent to them; they only asked that hedges should be trimmed, and roads altered where necessary, for the safety of the general road user.

Colonel R. E. CROMPTON, who supported the report, specially emphasised the great importance of the association's campaign for special facilities to be provided for the training of road engineers. He gave examples of how essential it was that road engineers of the future should have a thorough knowledge of the scientific principles underlying good road making, and expressed himself as strongly in favour of a movement being initiated here, as in the United States, to establish Chairs of Highway Engineering at certain of our large universities and colleges. Cyclists were greatly benefiting from the improved roads campaign, the modern smooth surface in the country enabling them to travel quite 30 per cent more than formerly without additional fatigue.

The report was unanimously adopted.

Mr. E. S. SHRAPNELL-SMITH, in moving the adoption of the accounts, stated that the association's income for the first time had exceeded £1,000; it was £1,126. He thanked Lord Montagu for the special gift of £99 5s., being the balance of *The Car Dustless Roads Fund*. This had enabled the association to hold its first conference of the members of the provincial branches, and publish various papers in connection therewith. Last year's expenditure was, roughly, £1,069. Although the association's individual subscribers numbered only 700, the Roads Improvement Association represented, with the constituent bodies, nearly 250,000 of all classes of road users. The work

the association was able to do had cost less than 1d. per head of its supporters.

Mr. H. PERCY BOULNOIS, in seconding the adoption of the accounts, remarked upon the pleasant relations that existed between the association and the Government departments, local authorities, and other bodies concerned with the administration and use of the roads.

The accounts were unanimously adopted.

In moving a vote of thanks to the Institution of Civil Engineers for placing their rooms at the disposal of the association, the chairman, Mr. ARTHUR STANLEY, referred to the establishment of the Road Board and the funds at its disposal. He thought that in this case the Chancellor of the Exchequer, Mr. Lloyd George, was deserving of thanks. In a year when there was a large deficit, when motorists were undoubtedly unpopular, and when it was recognised that to raise a large sum of money from motorists—who were supposed to be the idle rich—would be a popular move, it did require great strength and courage to raise that large sum of money, and to insist that the whole of it should be spent upon the roads of England. He did think that in this particular case they who were dealing simply and solely with the improvement and maintenance of roads, had every reason to be grateful for the fact that Mr. Lloyd George was at that time Chancellor of the Exchequer. They who travelled over country roads which had become subject to heavy motor traffic, like lorries and motor omnibuses, would realise that an enormous amount of money would have to be spent in fitting those roads for the traffic which was being put upon them. It would be unfair to expect the particular localities to bear the entire cost, and the whole question of road improvement and maintenance had now passed into the sphere of national matters, and must be dealt with as a national question.

A vote of thanks to the chairman concluded the meeting.

At the subsequent council meeting the following officers were re-elected:—

President—H.R.H. Prince Arthur of Connaught, K.G., G.C.V.O.

Vice-presidents—The Hon. Arthur Stanley, M.V.O., M.P.; The Right Hon. Lord Montagu of Beaulieu; W. Joynton-Hicks, M.P.; E. Manville, M.I.E.E.

Chairman—Mr. Robert Todd.

Vice-chairmen—Colonel R. E. Crompton, C.B., M.I.N.S.T.C.E.; H. Percy Boulnois, M.I.N.S.T.C.E.

Hon. Treasurer—E. S. Shrapnell-Smith.

Secretary—Wallace E. Riche.

The various committees for the ensuing year were reappointed.

The committee appointed by the council to consider various questions connected with the weights now carried by heavy motor vehicles, and the regulations appertaining thereto, reported that they had obtained considerable data, and hoped shortly to issue a comprehensive report. A number of other matters of general importance were also dealt with.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

King's Lynn and Vancouver.—Mr. J. H. Kerner-Greenwood, King's Lynn, writes: "A subscription has been set on foot at King's Lynn to place a portrait of Vancouver in the town hall. The cottage where Vancouver was born still exists in the Quakers' Meeting House yard. It is a half-timbered, tiled house with a Mansard roof. Vancouver was baptised in St. Margaret's Church at Lynn (as recorded in the register), on March 16, 1761, but he was buried at Petersham. If any architect or surveyor visits Lynn this summer, I shall be very pleased to show them not only Vancouver's cottage, but several other interesting houses, also the churches, ancient gateways, and relics of the old monasteries which exist in Lynn."

* *A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities.* By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

Institution of Municipal Engineers.

NORTHERN DISTRICT MEETING AT DARLINGTON.

At a meeting of the Northern District of the Institution of Municipal Engineers held at Darlington on April 18th, there were present Messrs. John Davison (chairman of the district), J. W. Plewes (Ripon), R. Atkinson (Durham), H. W. Marsden (Richmond), L. Simpson (Middleton-in-Teesdale), L. Holbrook (Houghton-le-Spring), W. J. Pallister (Darlington), P. W. Byles (Darlington), G. Packer (Northallerton), E. J. Emberton (Redcar), John R. Johnson (Darlington), M. Turnbull (Shildon), E. C. Tomkins (Darlington), John Heslop (Bishop Auckland), J. W. Holbrook (Houghton-le-Spring), W. Wallin (Newcastle-on-Tyne), W. M. Stephenson (Darlington), W. W. Davison (Darlington), H. S. Sutherland (Darlington), W. Noble (Darlington), and John Robinson (hon. district secretary).

THE DARLINGTON FORGE COMPANY'S WORKS.

Members and their friends assembled at Bank Top Station at 11 o'clock, and at 11.15 proceeded by special tramcar to the Darlington Forge Company's works, where, by the kind permission of Mr. Thos. Putnam, J.P., managing director, they were received by Messrs. Pearson, Hogg and Patterson, members of the staff, and were taken first through the large new pattern shop, where a number of patterns were being made for heavy ship's castings. The members then passed into the "fettling shop," and saw castings of all descriptions being cleaned and dressed. Special interest was manifested in several huge castings which, it was stated, were ships' propeller brackets for the Admiralty.

Proceeding next to the small foundry, which is served by two stock patent oil-fired converters, the party were shown how moulds were made for what were termed "small castings," weighing from a few pounds up to 6 tons. The Stock process of steel manufacture was fully explained, though, unfortunately, it being after 12 o'clock, the men had left work, and no steel was actually being produced at the time. When, however, it was explained how each of the furnaces could produce about 3 tons of steel every two hours, starting from the cold pig iron, the value of the process was very evident.

The large foundry was the next department visited, and here were seen huge castings for which the firm are famous. The furnaces used in this foundry are two Siemens open-hearth furnaces, one capable of turning out 70 tons and the other 50 tons. In this building are ingot pits where solid ingots, weighing up to 100 tons, are cast. On the floor of the foundry were moulds in all stages of making and for all classes of work, including stern frame castings, a large spur wheel 18 ft in diameter, loco. wheels, and many other types of castings.

In the press shop the members were met by Mr. Blaylock, who explained to them the working of the two hydraulic presses, one capable of exerting a pressure of 4,000 tons, and the other one of 3,000 tons. The cranes in this department are of great interest, there being three 75-ton electric cranes and one capable of lifting 200 tons. All these cranes are controlled from ground level. The members were shown several heavy tubes for the largest naval guns.

The last department to be visited was the machine shop, and here most of the work from the other departments comes to be finished before despatching. Here are machines of all kinds, all electrically controlled, including one huge 93-in. lathe capable of taking up to 15 ft. in diameter, and with an available length of 65 ft. This is probably the largest lathe of its kind, and is specially designed for large turbine rotors, and was, in fact, turning a large rotor drum for a battleship at the time of the inspection. Another notable machine was the trepanning machine for boring large ingots and billets. In the same shop were seen several very large rotor wheels cut out by specially designed band saws from solid steel discs made under the hydraulic presses previously described. In the erecting shop were seen several large stern frame castings in the finished state, notably that for H.M.S. "Resolution," weighing about 80 tons.

The members were finally shown through the company's power station, where the electricity for the whole works is generated by a large low-pressure Parsons turbine driven by waste steam. This turbine

has replaced three Allan engines, which are, however, kept in reserve.

DARLINGTON CORPORATION GASWORKS.

The members next visited the Darlington Corporation gasworks, where they were met and shown over the works extensions by Mr. Tarratt, gas-works engineer and manager, and Mr. Ruffhead, assistant engineer and manager. The extensions consist of a new vertical retort-house of a capacity of 2,000,000 cub. ft. per diem, and coal and coke handling plant. The extensions are expected to be completed within the next two months. The coal is brought in from overhead railway sidings and gantries, and stored in a huge brick and concrete building to a height of 20 ft. to 25 ft. The coal is drawn from the store into an underground feeder hopper, from which it passes through crushers to an elevator boot, and is elevated to a height of about 60 ft. above the storage house floor. It is next conveyed by a push-plate conveyor into a range of bunkers, from which it is fed into receiving hoppers over the retorts. The coke is discharged into skips travelling on bogies by means of a ropeway, to a position under the telpher, where it is picked up and deposited into the coke yard or on to screens, being then graded into bunkers for local sale. The telpher, which runs at a height of about 50 ft. above the yard, can also be used to load coke into railway wagons for shipment, or for unloading any other material delivered to the works.

NORTH-EASTERN RAILWAY OFFICES.

Through the courtesy of Mr. Vincent L. Raven, chief mechanical engineer to the North-Eastern Railway Company, the members were permitted to inspect the magnificent and up-to-date offices which the North-Eastern Company erected two or three years ago on their land at Stooperdale for the chief mechanical engineer and his immediate assistants and headquarters staff.

From this building some 19,000 or 20,000 men are controlled, and the designing, building and upkeep of the company's locomotives, carriages and wagons, and the hydraulic and electric appliances at the company's numerous docks, wharves, &c., are supervised.

The members were also shown over all the offices, including the locomotive drawing office, where Mr. Heppell laid before them the general drawings of the smallest engines up to the heaviest goods and most modern passenger engines. Both this drawing office and the carriage and wagon drawing office adjoining are splendidly arranged and lighted. In the building there is also an up-to-date laboratory for the testing of stores and other material used by the company, also for the testing of articles which might be dangerous for railway conveyance. The party then visited the test-house—where samples of manufactured material are subjected to tensile, bending, &c., tests to ensure that they are up to the company's specification—and the Stooperdale boiler shop, this latter being 513 ft. long and 219 ft. wide, and its turn-out amounting to 150 locomotive boilers per year. In addition, they were fortunate enough to see there also under course of construction a number of the new electric locomotives which Mr. Raven has designed, and which will be put to work between Shildon and Newport, Middlesbrough. These engines will be able to deal with a train of as much as 1,400 tons. Finally, an inspection was made of the company's dynamometer car, with its store of wonderful mechanism. From its records, when it is attached to a train, the following, among other data, can be obtained: Speed of train, pull exerted by engine, water used, coal consumed, strength of wind blowing, distance of run. As an example of the wonderful accuracy of the car, the recorded measurement of the distance from Darlington to King's Cross made by it did not vary from the actual distance to the extent of a yard. Mr. Weatherburn, who has charge of the dynamometer car, gave a lucid and able explanation of what the car does, and the purposes its records are put to.

Mr. HOLBROOK, on behalf of the members, proposed a hearty vote of thanks to Mr. Raven for enabling them to spend such an interesting afternoon, similar compliments being paid to Messrs. Heppell, the chief

locomotive draughtsman, Mr. Pettifor, chief clerk, and Mr. Weatherburn.

DINNER.

The members afterwards adjourned to the Bull's Head Hotel for dinner. Mr. JOHN DAVISON (Morpeth), who occupied the chair in the unavoidable absence of the chairman, Mr. Finch, county surveyor, Carlisle, stated that they had had a programme that day that was certainly worthy of a better attendance. It had been one of the most interesting days that he had ever experienced with the members of the institution. At the Darlington Forge Works, the Corporation Gasworks, and the North-Eastern Railway Company's new offices and boiler shops, they had seen a great deal that had been very instructive, and most of them, he was certain, were greatly indebted to the gentlemen who had so kindly given up their Saturday afternoon to explain the workings in the various departments.

Mr. W. WALLIN (Newcastle-on-Tyne) moved a vote of thanks to the gentlemen who had so kindly given them the opportunity of getting over the various works that day. He quite agreed with the chairman that the programme was one that deserved a better attendance. Every member present that day should try and impress upon the other members the work entailed in obtaining the privileges that they had had. It was not only a pleasure, but he submitted it was a duty, to attend the meetings and make them a success.

Mr. J. W. HOLBROOK (Houghton-le-Spring), in seconding the vote of thanks, said that it had been one of the red-letter days in connection with their meetings. He also referred to the somewhat small attendance, and stated that it may have been largely due to the fact that the meeting had been held so soon after the Easter holidays. They were undoubtedly indebted very much to the friends at the Darlington Forge Company, the gasworks, and to the North-Eastern Railway Company and the Slag and Tar Macadam Company, Limited (for light refreshments), for the very interesting day they had had. The vote of thanks was carried with acclamation.

Mr. HEPPELL, chief draughtsman for the North-Eastern Railway Company, replied on behalf of that company, and Mr. H. S. SUTHERLAND replied on behalf of the Slag and Tar Macadam Company, Limited.

Votes of thanks to the hon. secretary (Mr. John Robinson) and Mr. Johnson (streets superintendent), Darlington Corporation, for making all the arrangements, closed the proceedings.

SOME RECENT PUBLICATIONS.*

INVESTIGATING AN INDUSTRY. By William Kent. Price 4s. 6d. nett. London: Chapman & Hall, Limited.

A good deal has been written of late regarding the necessity of efficient labour if a business is to succeed. In the book before us, the author views business prosperity from the standpoint of efficient management, and expounds the principles of scientific management as applied to all industrial problems, including those of distribution and selling. The subject is dealt with in a series of articles which will cause every reader—even those who may disagree on points of detail—to think. It is clearly shown that it is not only upon undertaking a new enterprise or starting a new business that problems of management should be considered, but that a constant watch should be kept upon the methods adopted in old-established concerns to ensure that they are kept thoroughly abreast of the times. Mr. Kent has produced an arresting book, which will prove an excellent investment by reason of the economies to which it introduces the reader.

Chicago's Sanitary Problems.—Three well-known sanitary experts in the persons of Dr. George A. Soper, president of the Metropolitan Sewerage Commission of New York, Mr. John D. Watson, chief engineer to the Birmingham, Tame and Rea District Drainage Board, and Mr. A. J. Martin, Westminster, are in consultation at present in Chicago with a view to determining the proper future policy in regard to the drainage and water supply of that city.

* Any of the publications reviewed, or referred to as received, will be forwarded by the St. Bride's Press, Limited, on receipt of published price, plus postage in the case of nett books.

STREET REPAIRS IN LONDON.

(From a Correspondent.)

The question of the ever-increasing problem of the metropolitan traffic is exercising the minds of the public and of the Press, and various suggestions are frequently made as to the manner in which this congestion of the traffic can be remedied. There can be little doubt that before very long some drastic measures will be necessary for the further regulation of the traffic, but, in addition to this, before any great improvement can be made, it will be necessary to consider the question of the manner in which our streets are now broken up for gas, water mains, electric conduits, and so forth, and also the manner in which surface repairs are executed.

To anyone who has lived in a great provincial city like Liverpool, Glasgow or Manchester it must be evident, if he is at all observant, that the work in the streets of these towns is carried out in a much more expeditious manner than is the case in London.

In the provinces it is realised that obstruction to traffic means loss of money to the community, and consequently all street work is carried out as expeditiously as possible. It is usual to work night and day with gangs of men of three shifts of eight hours. The work is carefully organised so that there shall be sufficient men, but not too many. There is no "running over each other," and the men keep steadily to work under the eye of an experienced foreman. There are no night watchmen to pay at 5s. a night, with expensive fires to warm them and lights to keep off the traffic; there is no delay in starting the work in the morning and no similar delay before knocking off in the evening. The work in the provinces goes like clockwork, and it is a pleasure to see the men's activity and the interest they take in their work.

What do we find in London? A few men working so leisurely that one would think that time was no object; whereas in such a job as this it is of paramount importance. No wonder that a policeman once said to the writer of this article, when he was watching a street-repairing job in which the "stiff" backs of the men were a very prominent feature, "I'll tell you what it is, sir, there's a new trades union order just come out: 'If any man is found sweating while at work, he will be fined five shillings.'" It certainly looked like it.

One cannot but observe that in many works of street opening there is an absence of judgment as to the lengths and widths which should be disturbed at once. A little forethought in this direction would often save an infinite amount of traffic disarrangement. Another point is that the barricades, or temporary enclosures, of such work are clumsy and quite out of date, and take up a great deal more room than is necessary.

It is surprising that in a great city like London (said to be the largest city in the world) the inhabitants should be content to allow their streets to be under repair for weeks where days should suffice, and that they should not insist that such work should be carried out night and day until finished. Unfortunately, London is so big that what is everybody's business is nobody's business, and we suffer from having no London newspaper, all our own, in which such grievances can be aired and discussed.

It is useless to try and grapple with the traffic question until this anomaly of street disturbance has been removed and a remedy discovered. It is too late now to talk of subways for the numerous pipes and cables, which so often have to be "got at" for repairs or connections. We have to take things as we find them, and surely it should not be a difficult matter to devise some scheme by which the work in our streets could be carried out more expeditiously, and with less disturbance of the traffic.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

Scavengers' Pay in Liverpool and Manchester.—Answering a question in the House of Commons on Tuesday, Mr. Herbert Samuel, President of the Local Government Board, said he was informed that in Liverpool the rates of pay of scavengers ranged from 25s. to 27s. per week. The men were employed fifty-one hours per week and were entitled to six days' holiday annually with pay. In Manchester a uniform rate of 26s. per week was paid.

SPRAYING "FLUXPHALTE."

"FLAPPER" MACHINE DEMONSTRATION AT PUTNEY-HILL.

Since the introduction, about two years ago, of Fluxphalte—the liquid Mexican bitumen for road spraying—considerable progress has been made in its use on the roads of this country. This progress is likely to be distinctly accelerated by the introduction

EMPTYING FLUXPHALTE BARRELS INTO BOILER.

(A small air pump supplies air at a pressure of 10 lb. through a spigot in each barrel to facilitate discharge.)

of the new spraying machines for which the Anglo-Mexican Petroleum Products Company, Limited, have registered the word "Flapper," which describes the principle of its action.

The new machine was used on Wednesday and Thursday of last week for the first time at Putney-hill, where the Wandsworth Borough Council sprayed about 1,000 yds. super.

In connection with the machine, boilers fitted with the company's anti-frothing tray were used for heat-

FILLING THE "FLAPPER" MACHINE WITH HOT FLUXPHALTE FROM THE BOILER.

ing the material, and a temperature of over 400 deg. Fahr. was readily attained. The Flapper machine, which is filled from these roadside boilers, contains 50 gallons of the liquid bitumen, and, as will be seen from the accompanying photographic views, is drawn by hand. Immediately the valve was released the Fluxphalte was sprayed on the road by means of the blades of a rapidly rotating "flapper," and a very fine even film was laid. This was followed by an application of 1/2-in. granite chippings, and it says much for the process that after this top dressing the portion of the road treated was at once thrown open to the

traffic, which includes a frequent service of motor buses. The improvement this machine effects over the ordinary spraying machines is seen in the fact that the bitumen appeared to set hard within an hour or so of its application.

A number of surveyors and others inspected the work on Wednesday and Thursday, and were favourably impressed by the simplicity of the operations and the rapidity with which the work was carried out.

The Anglo-Mexican Petroleum Products Company, Limited, the proprietors of Fluxphalte, have arranged to loan these "Flapper" machines to all municipal engineers spraying Fluxphalte during the ensuing season.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, is intended as the first of a series of similar volumes

THE 50-GALLON HAND-DRAWN "FLAPPER" MACHINE.

which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying

COMPLETED ROAD OPEN TO TRAFFIC AFTER APPLICATION OF GRANITE CHIPPINGS.

natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . . —*Engineering News*, New York.

ROAD MAINTENANCE IN SHANGHAI.*

By CHARLES H. GODFREY, M.INST.C.E.,
Engineer and Surveyor.

In my reports of the three previous years the maintenance of roads has been discussed at length, more particularly as an engineering question; but after three years' experimental work it can safely be claimed that the matter is no longer a question of engineering, but of finance and public interest. The past year has been a busy one so far as work in connection with improved methods of maintenance is concerned.

It might be pointed out that with the exception of the paving of the Szechuen-road, all experimental work has been carried out with the funds allocated for the ordinary maintenance of roads, and, if full advantage is to be taken of the results obtained, it is absolutely essential that considerably more money be allocated for the purpose of improvement. If public opinion demands a higher standard of roads than we possess at present, the public must be prepared to find the money. The increasing number of self-propelled vehicles using the roads is a factor not to be neglected, and I would advocate the consideration of regulations governing the construction and maintenance of handcarts and wheelbarrows, which at present constitute the most injurious class of traffic so far as road maintenance is concerned. A few simple regulations regarding the widths of tyres and diameter of wheel with regard to the load could be introduced without causing any undue hardship on those concerned.

In most countries road construction and maintenance has been considered of such importance as to constitute a national question. The magnitude of the question is difficult to realise, but it was impressed upon me at the International Road Congress held in London last June. In Shanghai we can, of course, look for no outside assistance, and it is consequently the more important that special financial provision should be made to deal with the question. I think it is admitted on all hands that permanent paving is necessary, particularly in the more congested streets in the settlement, and at first sight it would appear advisable to raise a large loan and carry out the work at once. I would certainly recommend this course if I were satisfied that the best systems are at present available.

At the Road Congress I was particularly struck with the number of new systems of permanent paving which are coming to the front. To commit ourselves now to any one system would, in my opinion, be unwise. A more sound policy would be to raise a loan each year . . . for the purpose of carrying out permanent paving in the more congested streets. We should then be in a position, year by year, to profit by experience gained not only locally, but in other cities. For bituminous (and other improved) treatment of the less heavily trafficked roads, the yearly grant for the maintenance of roads should be considerably increased, bearing in mind that such work as tar-painting and tar-macadam roads cannot be considered as permanent paving, and consequently any additional expense should be met out of current revenue. Under this heading also provision should be made for providing new foundations for a number of the present macadam roads.

The length of roads under the control of the Shanghai Municipal Council is 117 miles, over 70 miles being macadamised, nearly 29 miles paved, and nearly 27 miles unmetalled. Of the 97 miles of footways, 84½ miles are paved.

The Rating of Sewers.—The Sewers (Exemption from Rating) Bill, which has been introduced into Parliament by Sir J. S. Harwood-Banner, has for its object, as the title implies, the exemption of underground sewers from rating. It was always understood that such sewers were not rateable until the recent decision to the contrary in the case of West Kent Main Sewerage Board *v.* Assessment Committee of the Dartford Union. Since that decision many municipal and local authorities have directed their attention to the matter. At a conference of representatives of the metropolitan rating authorities, which was held at the Westminster City Hall on March 13th last, this question was considered, and the conference expressed the opinion that it was inexpedient that sewers in the administrative county of London should be rated. A similar view is being adopted generally.

* Extracts from annual report for 1913.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

NORTH-EASTERN DISTRICT.

A meeting of the North-Eastern District of the Institution of Municipal and County Engineers is to be held at Sheffield to-morrow (Saturday).

PROGRAMME.

- 2 p.m. Meet at the town hall to inspect the plans of the town planning scheme.
- 2.30 p.m. Leave town hall for Wincobank to inspect the sewage disposal works.
- 4.30 p.m.—Leave sewage disposal works to view the High Wincobank Corporation model dwellings.
- 5.30 p.m.—Return to town hall, where tea will be provided by the kind invitation of the Right Hon. the Lord Mayor (Colonel G. E. Branson, J.P.).
- 6.30 p.m.—District business.

J. P. WAKEFORD, M.I.C.E., F. MASSIE, M.I.C.E.,
Hon. District Secretary. *District Chairman.*
Wakefield. Wakefield.

DOVER MEETING.

A meeting of the institution is to be held in the South-Eastern District at Dover on Saturday, May 9th.

PROGRAMME.

- 11.30 a.m.—Members will assemble at the town hall. Welcome by His Worship the Mayor (Mr. Councillor E. W. T. Farley, J.P.). District business (council chamber).
- 1 p.m.—Members will partake of luncheon at the Grand Hotel, facing the Granville Gardens. (Tickets 3s. per head.)
- 2 p.m.—Start from Grand Hotel and proceed:
 - (1) To inspect the ferro-concrete viaduct and workmen's dwellings, in course of construction in the pier district (W. C. Hawke, Assoc.M.INST.C.E., borough engineer).
 - (2) To inspect the new Marine Station, in course of construction on the Admiralty Pier, by the kind permission of Mr. P. C. Tempest, M.INST.C.E., engineer, S.E. and C. Rly.
 Mr. A. T. Walmisley, engineer, Dover Harbour Board, will briefly explain the provision of a site for this station in the area reclaimed by the Harbour Board.
- 3 p.m.—The Dover Harbour Board have kindly granted the use of one of the tugs for an inspection of the National Harbour works (Captain Iron, harbour master).
- 5 p.m.—Members will partake of tea at the town hall as guests of the mayor.

Other works of interest to surveyors and engineers in Dover: The waterworks, pumping station, Castle Hill; slipper and Turkish baths and electricity station adjoining the town hall; swimming baths, sea front; sewage pumping station, pier district.

Arrangements can be made for any members who desire to do so to inspect any of the above works of interest.

H. W. BOWEN, ASSOC.M.INST.C.E.,
Hon. District Secretary.

County Surveyor,
West Sussex, Horsham.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury on Saturday, May 16th.

PROGRAMME.

- 11.30 a.m.—Reception in the council chamber by the Right Worshipful the Mayor of Salisbury, Mr. Councillor J. Macklin, J.P.
- Papers by Mr. W. J. Goodwin, Assoc.M.INST.C.E., city engineer, "Some Notes on the Municipal Works of Salisbury"; and Mr. J. H. Blizard, Assoc.M.INST.C.E., on

"The Bemerton and Wilton Pumping Station for Sewage Disposal."

Discussion.

- 1.15 p.m.—Lunch in the banqueting room at the invitation of the Right Worshipful the Mayor.
- 2.15 p.m.—Leave council house in motor char-a-banc to visit the following works—viz., Salisbury sewage disposal works and refuse destructor.
- 3.15 p.m.—Leave for Salisbury waterworks, chief pumping station.
- 3.45 p.m.—Leave for Bemerton pumping station.
- 4.15 p.m.—Return to council chamber, where tea will be provided, at the invitation of Mr. Alderman C. J. Woodrow, J.P., chairman of the Salisbury Sanitary Committee. (Cost of conveyance, 2s. each.)

By the kind consent of the chief officer of the fire brigade, the fire station will be open all day for inspection.

DISTRICT MEETING.

Members of the Southern District are asked to assemble in the council chamber at 11.10 a.m., to elect the Executive Committee and to consider any other district business.

P. R. PHIPPS, ASSOC. M. INST. C.E.E.
Hon. District Secretary.

Town Hall,
Basingstoke.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.

The following papers will be read—viz.:—

"A Town Planning Scheme: Its Effects on Housing and Architecture," by Mr. Raymond Unwin.

"Edinburgh and Its Early Examples of Town Planning," by Mr. A. Horsburgh Campbell.

"Town Planning from a Lawyer's Point of View," by Mr. John L. Jack.

"The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

ANNUAL MEETING.

A town planning, housing and road conference and the forty-first annual general meeting are to be held at Cheltenham from June 24th-27th.

The following is a preliminary list of the papers to be read and discussed at the conference:—

- (1) "Town Planning Large Areas," by Mr. W. A. Clarry, borough surveyor, and Mr. R. A. Reay-Nadin, town clerk, Sutton Coldfield.
- (2) "The Housing, Town Planning, &c., Act, 1909 (Part 2) as Applied to Commercial and Industrial Districts," by Mr. J. C. Midgley, deputy city surveyor, Newcastle-upon-Tyne.
- (3) "Town Planning and Architectural Issues," by Prof. S. D. Ahead, Liverpool University.
- (4) "The Abnormal Development of Coventry and some of its Town Planning and Housing Problems," by Mr. J. E. Swindlehurst, city engineer, Coventry.
- (5) "Town Planning Amended Procedure Regulations," by Mr. H. E. Stilgoe, city engineer, Birmingham.
- (6) "Town Planning Procedure," by Mr. Fred. W. Pearce, engineer to the Twickenham Urban District Council.
- (7) "Town Planning Practice in America," by Mr. C. M. Robinson, Rochester, N.Y.
- (8) "Some Notes on Highway Law as Affecting the Municipal Engineer," by Mr. S. G. Turner, Barrister-at-Law, London.

- (9) "The Training of the Highway Engineer of the Future," by Mr. H. Percy Boulnois, London.
- (10) "The Control, Management and Maintenance of Roads," by Mr. J. Fred. Hawkins, county surveyor, Berkshire.
- (11) "The Prevention of Sub-Crust Movement in Roads," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.
- (12) "The Economics of Modern Methods of Road Construction," by Mr. Francis Wood, borough engineer, Fulham.
- (13) "Some Notes on Grouting and Penetrating Methods of Road Surfaces," by Mr. Geo. Green, borough engineer, Wolverhampton.
- (14) "The Organisation of a Municipal Engineer's Department," by Mr. E. Willis, surveyor to the Chiswick Urban District Council.
- (15) "The City of Worcester Sewage Disposal Works," by Mr. T. Caink, city engineer, Worcester.
- (16) "Notes on the Protection of the Foundations of Chepstow Bridge over the river Wye in Ferro-Concrete," by Mr. E. S. Sinnott, county surveyor, Gloucestershire.

The conference will be opened on Wednesday afternoon June 24th (when the delegates will be welcomed by the Mayor and Corporation of Cheltenham), and continued during the two following days. Visits will be made on Thursday afternoon, June 25th, and Saturday morning, June 27th, to the corporation new sewage purification works, waterworks, destructor, concrete slab factory, &c.

An important exhibition of plans, maps and models of town planning and housing schemes, &c., will be held during the four days of the meeting. A large number of local authorities, engineers, architects, and others interested in the town planning and housing movement, both in this country and abroad, have kindly undertaken to forward exhibits, and it is believed that the collection will be one of great educational and practical value.

PROGRAMME.

Wednesday, June 24th (Morning).—General business of the institution.

Presidential address and presentation of premiums.

Afternoon.—Conference—Town planning and housing; conference—Roads, &c.

Evening.—Exhibition of town planning and housing schemes, &c.

Thursday, June 25th (Morning).—Conference—Town planning and housing; conference—Roads, &c.

Luncheon given by mayor to members of the institution and delegates.

Afternoon.—Drive to inspect planned areas of town. Visit to refuse destructor, concrete slab factory and new sewage purification works.

Evening.—Annual dinner.

Friday, June 26th (Morning).—Conference—Town planning and housing; conference—Roads, &c.

Afternoon. Conference—Town planning and housing; conference—Roads, &c.

Evening.—Open-air concert—Montpellier Gardens.

Saturday, June 27th (Morning).—Visit to corporation waterworks at Tewkesbury, &c.

J. W. DUDLEY ROBINSON, B.Sc.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF WATER ENGINEERS.

SUMMER MEETING AT STOCKPORT.

The annual summer meeting of the Institution of Water Engineers will be held this year on June 11th, 12th and 13th at Stockport (headquarters at Midland Hotel, Manchester). Candidates for election at the council meeting to be held on June 11th should see that their proposal forms (duly filled in and signed) are received by the secretary, Mr. Percy Griffith, 20 Victoria-street, Westminster, S.W., not later than June 1st.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Hull on Saturday, May 16th.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

The Hexham meeting arranged for to-morrow (Saturday) has been postponed.

GENERAL MEETINGS.

A meeting will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C. (corner of Savoy-street, Strand), on Monday, May 11, at 7.30 p.m., for the discussion of a paper,

GREATER NEW YORK'S WATER SUPPLY SCHEME, which has been presented for that purpose by Mr. William T. Taylor, Fellow A.M.I.E.E., M.I.E.E., M.A.M. SOC.M.E., A.M.I.MECH.E., F.R.G.S. (Member).

The meeting is being held jointly with the Society of Engineers.

A visit will be paid to the works of the General Electric Company, Limited, Witton, Birmingham, on Thursday, May 21st.

Members will meet at the offices of the company at Witton at 1.45 p.m. proceeding at 2 p.m., on the kind invitation of the company, on an inspection of the engineering works, small motor, switchboard and switchgear departments, foundry, test-house, and conduit works. The works are among the first and best equipped in the country, and the visit will be one of extreme interest, and should command a large attendance.

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Finedon and Kettering on Thursday, May 7th, when a visit will be paid to the works of the Excelsior Stone Company at Finedon, and certain municipal works inspected at Kettering.

PROGRAMME.

12.20 a.m.—Meet at the works of the Excelsior Stone Company at Finedon, and inspect the manufacture of patent stone slabs, kerbs, channels, architectural dressings, &c.

Proceed thence by motor 'bus to Kettering for lunch at the Royal Hotel, at the kind invitation of the Excelsior Patent Stone Company, when a short paper will be read by Mr. W. B. Mortimer, managing director of the firm.

An inspection will afterwards be made of works in Excelsior stone at Kingsley-avenue, the new Co-operative Clothing factory, and the county police station.

G. BELSON CHILVERS,
Hon. District Secretary.

Council Offices,
Oundle.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

NORTH-WESTERN DISTRICT.

A visit will be paid by the members of this district on Saturday, May 16th, to the "grease extraction plant" at the Oldham sewage works. The plant was dealt with in a paper read recently before the institution by Dr. Grossmann, and great interest attaches to it. Full programme will be published later.

R. J. McKENN,
Hon. District Secretary

Heywood.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

B. WYAND,
Secretary.
39 Victoria-street, S.W.

CONCRETE INSTITUTE.**FORTHCOMING MEETINGS.**

The next meeting of the Concrete Institute will take place at Denison House, Vauxhall Bridge-road, S.W., on Thursday, May 14th, at 7.30 p.m., when a paper on "Sand and Coarse Material and Proportioning Concrete" will be read by Mr. John A. Davenport, M.Sc.(VICT.), B.ENG.(LIVERPOOL), ASSOC.M. INST.C.E., A.M.I.MECH.E., M.C.I., and Prof. S. W. Perrott, M.A.I.(DUBL.), M.INST.C.E., Professor of Engineering at Liverpool University, M.C.I.

The fifth annual general meeting of the institute will take place on Thursday, May 28th, at 4.30 p.m., and the fourth annual dinner will take place on the evening of the same day at 8 p.m., at the Connaught Rooms, Great Queen-street, W.C., Prof. Henry Adams presiding.

H. KEMPTON DYSON,
Secretary.

APPOINTMENTS OPEN.

CITY OF LICHFIELD.

APPOINTMENT OF CITY SURVEYOR AND SANITARY ENGINEER.

The Corporation of Lichfield invite applications for the above offices. Salary £200 per annum, with use and occupation of the house and garden in the Corporation-yard, Stowe-street, rent free. The candidate to be appointed must be an active man, and be between 25 and 40 years of age, have had some years' experience of similar duties, and will be required not to undertake, or be directly or indirectly concerned in any other business than that of the Council, and he will be required to devote the whole of his time to the duties of the Offices.

Form of Application will be forwarded by the undersigned upon receipt of stamped addressed foolscap envelope, which must be filled up in the Candidate's own handwriting, and returned with not more than three recent testimonials not later than Monday, the 13th May, 1914, endorsed "City Surveyor."

Selected Candidates will have notice to attend on the day of election.

Canvassing in any form will be a disqualification.

HERBERT RUSSELL,

Town Clerk.

Lichfield.

April 28, 1914.

(1,565)

COUNTY BOROUGH OF BOLTON.

ARCHITECTURAL ASSISTANT.

The Corporation invite applications for the appointment of an Architectural Assistant in the Borough Engineer and Surveyor's Department.

Canvassing, directly or indirectly, will be deemed a disqualification.

Salary commencing at £120 per annum.

Application, in candidate's own writing, stating age, experience, qualification, and accompanied by copies of three recent testimonials, must be delivered at the Town Clerk's Office, Town Hall, Bolton, not later than 9 a.m. on the 13th May, 1914, addressed to "The Chairman of the Streets Committee," and endorsed, "Architectural Assistant."

SAMUEL PARKER,

Town Clerk.

April 24, 1914.

(1,554)

THE URBAN DISTRICT COUNCIL OF KINGSWOOD (Near Bristol).

APPOINTMENT OF SURVEYOR.

The above-named Council invites applications for the appointment of Surveyor.

Salary £150 per annum, with annual increments of £5 up to £180.

The person appointed will be required to carry out the duties attached to the office of Surveyor, including the preparation of Plans and Specifications, the keeping of all necessary Books and Accounts, the Supervision of the Sewerage Outfall Works, and to devote the whole of his time to the duties of the office, and provide security in the sum of £200.

Applications, endorsed "Surveyor," stating age, qualifications, and experience, with two recent testimonials, to be sent to me by the 18th May next. Canvassing, either directly or indirectly, will disqualify.

PERCY BALDWIN,

Clerk.

Council Offices,
Kingswood, Near Bristol.

April 25, 1914.

(1,555)

URBAN DISTRICT OF BILSTON.

SEWAGE WORKS MANAGER.

The Council invite applications for the appointment of Sewage Works Manager.

Wages £2 per week, rising by 2s. 6d. per week per annum, to a maximum of £2 5s., with house, rates, and water free.

Applicants must have held a similar appointment, and be capable of making the usual analyses.

Particulars of duties and conditions of appointment will be forwarded on application.

Applications, accompanied by copies of not more than three recent testimonials, should be delivered to the undersigned not later than the 13th May, 1914.

Canvassing, directly or indirectly, will be a disqualification.

JOSEPH L. ARLIDGE,

Clerk to the Council.

Town Hall, Bilston.

April 28, 1914.

(1,570)

THE BLACKWELL RURAL DISTRICT COUNCIL.**SURVEYOR'S GENERAL ASSISTANT.**

The undersigned is prepared to receive applications from persons who must have had previous experience in the routine duties pertaining to the office, be a neat Draughtsman, and have a knowledge of Surveying.

Candidates should not be less than 21 years of age, and must be prepared to reside in Mansfield.

Salary £75 per annum (payable fortnightly), rising by annual increments of £5, to £90.

Applications, on the Form to be supplied by me upon receipt of a stamped and addressed foolscap envelope, accompanied by three copies of recent and brief testimonials.

Canvassing in any form will be a disqualification.

H. SILCOCK,
Surveyor of the Council.

67 Westgate,
Mansfield, Notts.

April 27, 1914. (1,561)

WHITLEY AND MONKSEATON URBAN DISTRICT COUNCIL.

The Council invite applications for the appointment of General Assistant in the Surveyor's Office. Salary £101 per annum.

Candidates must be good Draughtsmen and experienced in the general work of a Municipal or District Council Surveyor's Office, including the Design of Sewers, Public and Private Street Improvement Works, &c.

Applications, endorsed "General Assistant," stating age, present appointment, qualifications, and experience, together with copies of two recent testimonials, to be sent to me on or before Monday, 18th day of May, 1914.

Canvassing members of the Council, directly or indirectly, will disqualify.

Dated this 27th day of April, 1914.

AUGUSTUS WHITEHORN,
Clerk to the Council.

60 Saville-street,
North Shields. (1,560)

- Gumleigh-road,
- Elers-road (portion),
- Ealing Park-gardens (portion).

The Drawings and Specifications may be seen, and Forms of Tender, together with Schedule of Quantities and other particulars, obtained from Mr. W. R. Hicks, Assoc. M.INST.C.E., Borough Engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d. for each road, which will be returned upon receipt of a *bona-fide* Tender.

Sealed Tenders, in the envelopes provided, endorsed "Tender for Making Up," must be delivered at my office not later than 9.30 a.m. on Tuesday, the 5th day of May, 1914.

The Council does not bind itself to accept the lowest or any Tender.

The Tenderer whose offer is accepted shall be held to have bound himself to an agreement, and may be compelled to carry out the obligation arising from his Tender even though he may not have signed a formal contract.

Dated this 20th day of April, 1914.

(By order of the Council)

GEO. E. BRYDGES,

Town Clerk.

Town Clerk's Office,

Town Hall, Ealing, W.

(1,536)

MIRFIELD URBAN DISTRICT COUNCIL.

Tenders are invited for the Supply and Delivery at Mirfield Station of about 800 tons of 4 in. by 6 in. Granite Setts within the next four months.

Sample setts and prices should be forwarded to the undersigned not later than May 11, 1914.

EDWIN GILL.

Council Offices,

Mirfield.

(1,563)

NOTICE.

CORPORATION OF MADRAS, WORKS DEPARTMENT.

MOTOR FIRE ENGINE.

The President, Corporation of Madras, will receive Tenders for the Supply and Delivery of Two Petrol-driven Motor Fire Engines. Specification containing further particulars can be obtained from the Editor of this Journal. Tenders shall be enclosed in sealed covers, superscribed "Tenders for Motor Fire Engines," and shall be addressed to "The President, Corporation of Madras, Ripon Buildings, Madras."

Each Tender shall be accompanied by a draft on a Madras Bank for £20.

Tenders will be opened by the President at 12 noon on Monday, 1st June, 1914, in the presence of such Tenderers as may attend. No Tender received after 12 noon on Monday, 1st June, 1914, will be considered.

JAMES R. COATS, B.S.C., ASSOC. M.INST.C.E.,

Engineer.

Corporation of Madras,

Madras.

April 9, 1914.

(1,550)

BRUMBY AND FRODINGHAM URBAN DISTRICT COUNCIL.

The above Council invite Tenders for Supplying about 800 tons of Whinstone, also about 200 tons of Tar-macadam for Footpaths, more or less, up to March 31st, 1915, to be supplied at such times and in such quantities as ordered by the Surveyor, and delivered at Frodingham and Guinness Stations (G.C.R.).

The Council do not bind themselves to take the above quantity, but more or less as required.

The lowest or any Tender not necessarily accepted.

Specifications and Form of Tender may be had from the undersigned, to whom Tenders, sealed and endorsed "Tender for Whinstone," must be sent not later than Saturday, the 9th day of May, 1914.

JOE GREEN,

Surveyor.

Council Offices,

New Frodingham,

Lincolnshire.

April 28, 1914.

(1,560)

CITY OF WAKEFIELD.

TO PUBLIC WORKS CONTRACTORS.

MAIN AND SUBSIDIARY DRAINAGE WORKS.

Contractors desirous of tendering for the works comprised in:—

CONTRACT No. 1.—The construction of a Main Out-fall Sewer in the Pugneys Valley from Portobello Mills to Newmillerdam, comprising 4,000 yds. or thereabouts of pipe sewers varying in diameter from 24 in. to 12 in., and the necessary pumping station, and/or for

CONTRACT No. 2.—The construction of subsidiary branch sewers in the Western area of Sandal, comprising 5,800 yds. or thereabouts of pipe sewers varying in diameter from 21 in. to 6 in.,

are requested to send their names to the undersigned not later than Friday, the 8th May, after which date the Bills of Quantities and Forms of Tender will be forwarded to them. Applications must be accompanied by a £5 Bank of England Note for each Contract, which will be refunded upon receipt of a *bonâ-fide* Tender or Tenders and the return of the documents supplied. Applicants must state their experience in carrying out work of a similar nature.

Tenders, sealed and endorsed, "Tender for Main Drainage, Contract No. 1 or No. 2," must be delivered

to me not later than 12 o'clock noon on Monday, the 25th May, 1914.

A. C. ALLIBONE,

Town Clerk.

Town Hall, Wakefield.

April 24, 1914.

(1,552)

COUNTY BOROUGH OF SOUTHAMPTON.
TO CONTRACTORS AND OTHERS.

The Corporation invite Tenders for Laying about 4,000 super. yards of Tar-paving.

Plan may be seen, and Specification and Form of Tender obtained, at the Borough Engineer's Office upon production of the Borough Treasurer's receipt for a deposit of £1 1s.

Deposits will be returned, after the Council have dealt with the Tenders, to Contractors who have submitted *bonâ-fide* Tenders.

Sealed Tenders, endorsed "Tender for Tar-paving," must be delivered at the Town Clerk's Office on or before the 11th proximo.

No pledge is given to accept the lowest or any Tender.

R. R. LINTHORNE,

Town Clerk.

Town Clerk's Office,

Municipal Offices, Southampton.

A road-bed laid with 6-in. of concrete and reinforced with B.R.C. Mesh is stronger than a 12-in. road-bed without reinforcement.

B.R.C. Road-bed Reinforcement consists of a high-grade steel wire mesh, the transverse wires of which are securely welded to the horizontal wires by a patent electrical process.

The material is made in rolls 6 ft. wide and to any length required. It is easy to unroll or otherwise handle, and requires no expert labour to instal. The effect of B.R.C. Reinforcement in a Road-bed is to spread loads over a wide area thus relieving and reducing the strain immediately below the point of impact.

A road reinforced with B.R.C. Mesh lasts longer, costs less to maintain, takes less time to construct, and needs much less supervision during construction.

Minutes of Proceedings.

River Pollution by Trade Effluents.

The decision of the King's Bench Division in the case of *West Riding Rivers Board v. Linthwaite Urban District Council* (noted at page 686 *ante*) is one of considerable importance to local authorities. Briefly, it amounts to this, that proceedings under sec. 4 of the Rivers Pollution Prevention Act, 1876, for the pollution of a river by trade effluents can only be taken against the manufacturer producing the effluents, and not against the local authority through whose sewers they are discharged. So far as sewage pollution is concerned, it was decided in 1882 that proceedings under sec. 3 of the Act could not be taken against a local authority merely because a sewer vested in them polluted a stream, they themselves not having constructed or interfered with the sewer. (*Attorney-General v. Guardians of Dorking Union*, 20 Ch.D., 595.) But in this respect the law was altered by the passing of the Rivers Pollution Prevention Act, 1893. Sec. 1 of that Act, it will be remembered, expressly provides that where sewage flows into a stream, after passing through a channel vested in a sanitary authority, the latter shall, for the purposes of sec. 3 of the Act of 1876 be deemed knowingly to permit the sewage so to flow. But trade effluents are not within sec. 3, being dealt with by sec. 4. Clearly, therefore, the latter Act (the effect of which is restricted to sec. 3) has no application to trade effluents. This restriction, of course, does not conclusively negative the liability of the authority for trade effluents, because it leaves open the question whether such liability exists under the earlier Act. The contention of the Rivers Board in this case was that, upon the true interpretation of sec. 4, the council were liable for the trade effluents passing through their sewers. In support of this view it was argued that the opening clauses of the two sections 3 and 4 are almost identical, sec. 3 dealing with "every person who causes to fall or flow or knowingly permits to fall or flow, or to be carried into any stream any solid or liquid sewage matter," while sec. 4 is concerned with "every person who causes to fall or flow or knowingly permits to fall or flow or to be carried into any stream any poisonous, noxious or polluting liquid proceeding from any factory or manufacturing process." "Person," by sec. 20, it is to be noted, includes any body of persons, whether corporate or unincorporate—thence local authorities are, no doubt, within the scope of both sections, provided, of course, that they are guilty of the prohibited offence. Nor is there anything more in the language of sec. 4 to limit the class of "persons" against whom proceedings may be taken than there is in the language of sec. 3.

But this does not dispose of the question. The Act is divided into several "Parts." Part II. comprises the "Law as to Sewage Pollutions," and consists solely of sec. 3. Part III. consists

of secs. 4, 5 and 6, and comprises the "Law as to Manufacturing and Mining Pollutions." Now although sec. 4 taken alone corresponds so closely with sec. 3, when we look at sec. 6 we find it there enacted that "proceedings shall not be taken against any person under this part of this Act, save by a sanitary authority." Is it a legitimate inference that such proceedings cannot be taken against a sanitary authority? It is not an inevitable inference, because one sanitary authority might be permitting manufacturing pollution to flow into a stream in another district. But looking further into the section we find: (1) that no proceedings are to be taken without the consent of the Local Government Board; (2) that the board are not to give their consent in a district which is the seat of a manufacturing industry unless satisfied that means for rendering the effluents harmless are practicable and that no injury will be inflicted on the industry; and (3) that any person against whom proceedings are proposed to be taken is to have an opportunity of being heard before the sanitary authority against such proceedings being taken. Having regard to these provisions, the Court came to the conclusion that sec. 4 is aimed at the manufacturer producing the polluting liquid, and not at the sanitary authority through whose sewers it passes. This conclusion seems to us not only to be amply warranted by the language of sec. 6, but to be wholly in accordance with the equity of the matter, especially bearing in mind that under sec. 7 the sanitary authority is bound (subject to certain qualifications) to give facilities for enabling manufacturers to carry the liquids proceeding from their factories or manufacturing processes into the sewers.

* * *

Motor Omnibuses on Country Roads.

At a meeting of the Dorking Rural District Council a short time ago there was some discussion of the position with respect to the service of motor omnibuses now running between Guildford and Leatherhead by way of Shalford, Gomshall, and Dorking. The route, although it lies within the valleys of the Tillingbourne, the Pip Brook, and the River Mole, and includes some miles which are nearly level, has fairly steep ascents, and one very stiff one. The Shalford-Dorking road is, of course, a part of the Shalford-Reigate road, the widening of which is at present under consideration, although, it may be remarked in passing, a new road on the other side of the valley would probably be a cheaper and more useful work. At present there are two motor omnibuses services a day, each way, between Guildford and Leatherhead, and two more between Shalford Green and Guildford—a ten minutes' run. For the whole distance of some 18 miles the time allowed is from about one hour thirty minutes to one hour forty minutes, permitting of average speeds of 12 miles

an hour and a little less, and, in view of the nature of some of the hills, speeds of considerably over 12 miles an hour over the easier portions of the route. This motor service is of much interest to road surveyors, since it differs in character from services such as those to Whyteleafe, in the Caterham valley, and Kingswood, by Walton Heath, and those to Reigate and Godstone, these being Sunday extensions of London services or run in connection with the radiating services of Greater London. The Leatherhead-Guildford service will, no doubt, be linked up with London, or overlapped by the proposed service to Dorking, through Epsom, but from its cross-country character and the nature of the roads traversed it may be regarded as essentially a country coaching service, like that from Reigate to Dorking.

At the meeting referred to above there seemed to be a general opinion that such services should be under some effective control; but it must not be supposed that a local veto on the use of the roads would be tolerated by the public, and it may be pointed out that there is suitable machinery for dealing with the case of any road which is really unsuited to any particular form of motor traffic. One member of the council, a clergyman, said that it was not right that people should be brought down in crowds on Sundays "to fill our villages," but surveyors must not count upon any check being imposed to traffic developments on such grounds as these. Looking at the subject as a whole, it must be contended that there are sufficient indications that there will be no insuperable difficulty in dealing with traffic developments. In this connection, and as bearing upon the invasion of country roads by motor omnibuses and motor coaches, attention may be directed to the main points of an article by "A Civil Engineer," which appeared in the issue of the *Dorking Advertiser* containing the report of the meeting to which reference is made above. The writer advocates, from the administrative point of view, common action on the part of local authorities, who should, he contends, ask the Road Board to give special consideration to roads over which motor omnibuses are soon to run, and to give priority, in point of time, to the making of these grants, and similarly should pass resolutions, in identical terms, asking that the Road Board may be empowered to make grants in aid of the maintenance of roads. In the meantime, this writer suggests, works of reconstruction and of general improvement should precede, by a considerable period, the provision of new and costly forms of road crust; partly for engineering reasons and partly because the local authority would then be able to apply to the Road Board for successive grants, each coming under the head of "improvement." This policy may be recommended to the attention of rural authorities generally, the more so that in some cases the applications for the later grants of a series would be backed by traffic statistics showing increases in the numbers of heavy motor vehicles using the road.

Institution of Municipal and County Engineers.

At the last meeting of the council of the Institution of Municipal and County Engineers, some extracts from the official report of which are given on another page of this issue, many important matters arose for consideration. Our younger readers should take careful note of the fact that alterations to the examination syllabus have been proposed, and that the final recommendations of the board of examiners will be made to the council at their next meeting. Moreover, consideration is being given to a suggestion for the establishment of a preliminary examination for junior candidates,

which would be an entirely new departure. The Roads Committee reported that they had received from Mr. E. J. Lovegrove certain representations from a meeting of the engineers to the North Metropolitan local authorities in regard to arterial roads in Greater London. This question is one upon which the municipal and county engineers of the Greater London area are entitled to express an opinion, and we observe with satisfaction that the council of the institution have agreed to convene sectional conferences to consider the proposals of the Local Government Board and the Board of Trade, such sectional conferences to report to a central committee. We entirely agree that this subject is eminently one in the discussion of which the institution should take an active and important part. One other matter which was before the council is worthy of remark. We refer to the resolution which was unanimously passed expressing the view that it is not in the best interests of the institution to follow the practice of nominating the president or vice-presidents according to seniority. The system hitherto adopted has worked well, and the institution has always been fortunate in those who have consented to preside over its destinies. Nevertheless we agree that the principle of fitness, rather than seniority—although naturally both qualifications usually exist in the same person—is the one which should be placed first in filling any post of importance.

The Sheffield Meeting.

The North-Eastern District meeting of the Institution of Municipal and County Engineers held at Sheffield on Saturday last must be accounted a complete success. Honoured by civic hospitality, and having the opportunity of examining some most interesting town-planning designs, and of hearing papers from Mr. Wike, descriptive of the sewage disposal works, and dealing with housing in the city, those present at the meeting were fully catered for. In the discussion which followed the visit to the disposal works Mr. Steele voiced the general opinion of the members when he said that he was impressed alike with the boldness of the conception of the scheme and the efficiency and the wonderful economy with which it had been carried out. During the afternoon a visit was paid to the High Wincobank Corporation model dwellings. This must have reminded many of those present of the paper dealing generally with town planning and housing in Sheffield which Mr. Wike read at Great Yarmouth last July. In that paper it was pointed out that the purchase of the High Wincobank estate in the year 1900 was one of the first steps which the corporation took towards town planning. Situated in a good position, both as regards elevation and convenience of access, the difficulties in developing this estate have not been so great as is often the case. The site has been laid out with full regard to the future development of the surrounding estates and district. Before erecting any houses it was agreed that every house should have an area of at least 200 yds. of land exclusively appropriated to it. Competitive plans were advertised for, and fifty-three cottages were erected in the form of a quadrangle, in the centre of which is a green, instead of a separate garden being appropriated to each house. Additional houses have been erected on the estate on several subsequent occasions, and, as inspected by the members last Saturday, the development and design met with general approval.

During the course of the district meeting the question was raised as to whether such meetings should be considered to be private, and, after a general discussion, it was resolved to ask the executive to take this matter into consideration.

The point made by Mr. Fowlds, who introduced the matter, was that if the district meetings were private members could express themselves more freely and informally. The matter is, of course, purely a domestic one, but it occurs to us that at these district meetings papers are often read and discussions take place which are certainly of very much more than local interest. Surely the case might be met by resolving the meetings into private conferences on those occasions when, by reason of the particular subject under discussion, it is thought desirable to do so.

* * *

The Cheltenham Meeting. We print on another page of this issue the final programme of the annual general meeting and housing and town planning and roads conferences to be held next month at Cheltenham. From this it will be seen that the number of papers to be submitted for discussion during the several days over which the proceedings will extend has now grown to the somewhat formidable figure of twenty-two, no fewer than ten referring to town planning and housing and seven to questions connected with roads, the remaining five dealing with such varied subjects as office organisation, sewage disposal, bridge construction, and geology. If there is anything in the arrangements for which there may be reason for regret, it is that the amount of business to be transacted is so great that it is necessary, as at Yarmouth last year, for the two conferences to be held simultaneously. The question of housing is now receiving from numerous municipal engineers an amount of attention little short of that bestowed on the problems connected with road construction, and the choice of sections may therefore present some difficulty to not a few members. The remedy seems to be to make the housing conference a gathering quite unconnected with the annual meeting.

* * *

An Islington Repaving Inquiry. The general question of the cost of repaving London streets came incidentally under review at an inquiry held recently into an appeal by the Islington Borough Council against the decision of the London County Council, who refused to grant a loan of £5,744 for the repaving of certain roads in the borough. These roads were in 1894 changed from macadam to paved roads, at a cost of nearly £10,000, and the borough council had asked for sanction to a loan to meet a repaving scheme. The refusal of the county council to grant a loan is based upon what may be in theory a very laudable conception of their duty to the ratepayers, though it is easy to see that it may entail in certain cases a good deal of inconvenience and a certain amount of injustice. Both the inconvenience and the injustice were pressed upon Mr. H. S. Bidwell, the Local Government Board inspector, on behalf of the borough council, and in his evidence Mr. J. Patten Barber, borough engineer of Islington, made the forcible point that, owing to the motor bus and heavy traffic of a similar type, roads subjected to this traffic had to be pulled up four or five years before they would be worn out by horse traffic. This alone would seem to us to supply an example of the "exceptional circumstances" under which the London County Council occasionally feel justified in relaxing the stringency of their practice with respect to the granting of loans. It is admitted that in the matter of road upkeep the metropolitan boroughs have been very severely handicapped for some years past, and with rates on an ascending scale a strong inducement is held out to borough councils to reduce the expenditure upon the roads to an insufficient limit. This deplorable contingency must be avoided at all

costs, and one way out of the difficulty, until, say, the basis of metropolitan rating is re-adjusted, or the principle of adequate Government grants is conceded, would be for the London County Council to sanction loans for such repaving works as were the subject of the official inquiry alluded to. Whether these ends will be attained by the Budget introduced this week is yet to be seen.

* * *

Evasion of By-laws.

The ingenuity which is expended by builders in this country in the evasion of by-laws is sufficiently remarkable at times, but judging from the last annual report of Mr. Charles H. Godfrey, the engineer and surveyor to the Municipal Council of Shanghai, the Chinese architect and builder must be considered as the supreme exponents of this practice. The main fault of the system adopted appears to be that the responsibility of the architect ends with the preparation of plans and the securing from the municipality of a permit to build, the result being that he has nothing to do with supervising the actual work of construction. The plans as submitted and upon which the permit to build is granted, may comply with every by-law, but as soon as building operations are started the single aim of the contractor and owner is to scamp the work, and particularly to rush through any alterations of the original design which are contrary to the by-laws. For example, in the report referred to, Mr. Godfrey quotes a case in which the partitions between the rooms of a large hotel were shown on the plans to be constructed of brickwork. These partitions were all hurriedly erected within the space of a few days, but were constructed of hollow lath and plaster—a method which was not only in direct contravention of the plan and by-laws, but which seriously increased the danger from fire and afforded a convenient harbour for rats and vermin. The result of these evasions has been that additional building inspectors have had to be appointed, thus throwing upon the rates the cost of supervision which ought in fairness to be borne by the building owner. Mr. Godfrey suggests the compulsory registration of architects—and presumably the compulsory extension of their responsibility to supervision—as a remedy. An alternative method of dealing with the situation would be to make the building owners pay the building inspectors by fees, in a way similar to that which obtains under the London Building Acts.

* * *

Is the Tramway Doomed?

As will be seen from our report of the sitting of the Select Committee of the House of Commons who have under consideration the western approach road scheme of the Middlesex County Council, the chief engineer to the latter body, Mr. H. T. Wakelam, is not yet convinced that the days of the tramway are over. Like the motor buses, the tramways, he points out, are doing a great service, but, unlike the former, they have to pay for the maintenance of the roads, and his view appears to be that the new vehicles should not be allowed to escape a similar contribution. A recent article in the *Auto-Motor Journal* suggests that there is growing up among road engineers a strong feeling that the tramway will eventually give way to the "more modern and flexible methods of traction," but even admitting that this is the case, the statements of Mr. Wakelam before the Select Committee tend to show that the officials referred to are likely to insist that the free use of the public highways by motor buses should be conditional upon the companies bearing a proportion of the additional cost of maintenance.

Institution of Municipal and County Engineers.

NORTH-EASTERN DISTRICT MEETING AT SHEFFIELD.

Sheffield was the scene of a meeting of the North-Eastern District of the Institution of Municipal and County Engineers on Saturday last. There was a large attendance of members belonging to the district, and an attractive programme kept the meeting going until a late hour in the evening.

Mr. Frank Massie (Wakefield), district chairman, presided, and there were present Messrs. J. H. P.

MR. CHARLES F. WIKE, M. INST. C. E.,
City Engineer and Surveyor of Sheffield.

Mr. Wike was appointed city engineer and surveyor of Sheffield in 1888, and prior to this was deputy borough surveyor of Leicester. He is a member of the Institution of Civil Engineers, and a member of council of the Institution of Municipal Engineers, and was for several years vice-president of the latter body. Among the principal works carried out by Mr. Wike since his appointment in Sheffield may be mentioned the construction of the majority of the permanent way of the tramways on the overhead electric system at an approximate cost of £500,000, together with the erection of two car sheds. Within the past fifteen years various local Acts of Parliament and Provisional Orders have been obtained for improvements in Sheffield, involving an expenditure of about £1,000,000. One of the principal thoroughfares of the city—High-street—has been widened under his supervision at a cost of £260,000. In addition to these, other street improvements of a more or less important character have been executed, bringing the total cost of improvement schemes to a sum of about £2,000,000. Mr. Wike has designed and carried out the installation of a new sewage disposal works on the bacteriological process, which is capable of dealing with a maximum rate of flow of 64,500,000 gallons per twenty-four hours, at an estimated cost, exclusive of land and second-contact beds, of £270,000, including the construction of an additional 6 ft. 6 in. by 7 ft. outfall sewer nearly 1 mile in length. Various bridges, both steel girder and stone in construction, have been built across the canal and River Don, at a cost of nearly £50,000. Two large boundary extension schemes have been carried out under his direction, resulting in the addition of 4,688 acres to the area of the city. The scheme for the clearance of the Crofts insanitary area was undertaken by Mr. Wike at a cost of about £100,000, and in 1900 60 acres of land at High Winebank were purchased for the erection of artisan dwellings, Mr. Wike being responsible for the lay-out of the estate and the erection of the majority of the 175 houses now built there. Prior to the appointment of a city architect in 1909, Mr. Wike had control of the whole of the architectural work carried out by the corporation, including the erection of baths, libraries, police stations, and two refuse destructors. The lay-out and maintenance of parks, recreation grounds, and allotment gardens come within his jurisdiction, together with the planning of new cemeteries. Since the adoption by the corporation of the Town Planning Act in 1910, Mr. Wike has prepared schemes involving an area of over 4,250 acres. The areas, which in some cases are of a very hilly nature, include over 15 miles of new main roads varying in width from 55 ft. to 100 ft. The area of the city is 24,347 acres, and about 11 miles between the eastern and western boundaries, and 6 miles from north to south. The population is 459,923, having increased from 312,795 since Mr. Wike's appointment at Sheffield.]

with-Hexthorpe), W. M. Green (Castleton), W. J. Hadfield (Sheffield), T. H. Hailstone (Birstall), H. L. Hall (Batley), F. Hewitt (Kiveton Park), A. C. Hodge (Sheffield), F. C. Jenkinson (Rotherham Rural), F. Oscar Kirby (Doncaster), W. T. Lancashire (Leeds), H. Leadbeater (Rotherham), A. E. Loach (Wakefield), J. A. Lough (Parkgate), C. Lund (Cleckheaton), S. H. Newsome (Sheffield), W. H. Price (Leeds), A. Rothera (Liversedge), J. Rowbottom (Ashton-under-Lyne), T. Salvin (Rotherham), J. Saville (Heckmondwike), F. Simms (Sheffield), J. Southwart (Rothwell), F. W. Spurr (York), W. J. Steele (Newcastle-on-Tyne), F. Thackray (Heyburn), J. P. Wakeford (Wakefield), E. H. Whiteford (Derwent), H. Gilbert Whyatt (Grimby), F. Wilkinson (Prestatyn), C. F. Wike (Sheffield) and J. Wrest (Dewsbury), members; F. D. Tunnicliffe (Dewsbury), J. P. Tutin (Sheffield) and H. Walker (Sheffield), visitors.

The members assembled at the town hall, where they were received and welcomed by the Lord Mayor (Colonel G. E. Branson, J.P.).

The members having examined the plans of the town planning scheme, which were on exhibition in the council chamber, then proceeded in brakes to Winebank to inspect the sewage disposal works.

A paper by Mr. C. F. Wike, the city engineer, descriptive of the sewage works, was distributed to the members, and greatly facilitated the work of inspection.

SHEFFIELD SEWAGE DISPOSAL WORKS.

Mr. Wike stated that, on his advice, after full consideration of the results of careful investigations, the difficulties with the State, the trade wastes peculiar to the city, and other local circumstances, it was decided by the corporation, in 1905, to adopt a scheme for the purification of the Sheffield sewage by the bacteriological process, consisting, in its main principles, of continuous-flow settling tanks and contact beds.

The scheme, which is now partly completed, is so designed that a single contact may be given to the effluent from the tanks, which it is hoped may prove to be adequate treatment; but second contact beds can be added if required by the Local Government Board or the river authorities. It was only after a long series of experiments, carried out with every care, and on strictly scientific lines, that sufficient experience was obtained to warrant the confident recommendation of the present scheme to the city council. This met with the sanction of the Local Government Board and the approval of the West Riding Rivers Board. The Local Government Board held an exhaustive inquiry, lasting two days, in December, 1905, and finally approved of the proposed scheme, at an estimated cost of £270,369, exclusive of land and second contact beds, and sanctioned the borrowing of this sum. Steps were taken for the acquisition of land, and in the Session of 1900 Parliamentary powers were obtained for the acquisition of 99½ acres. It was, however, then felt that this area was not sufficient for the extensions, which would be necessary to meet requirements due to increase of population, and for the treatment of sewage from the outside districts which drained naturally into its system. Therefore, an application was made to the board for sanction to the purchase of a further 81½ acres. The gross area of the land, including the site of the existing works, which will ultimately be available is 204 acres. The total cost is, approximately, £84,000. If second contact beds should be insisted upon, these will be placed on the 81½ acres referred to.

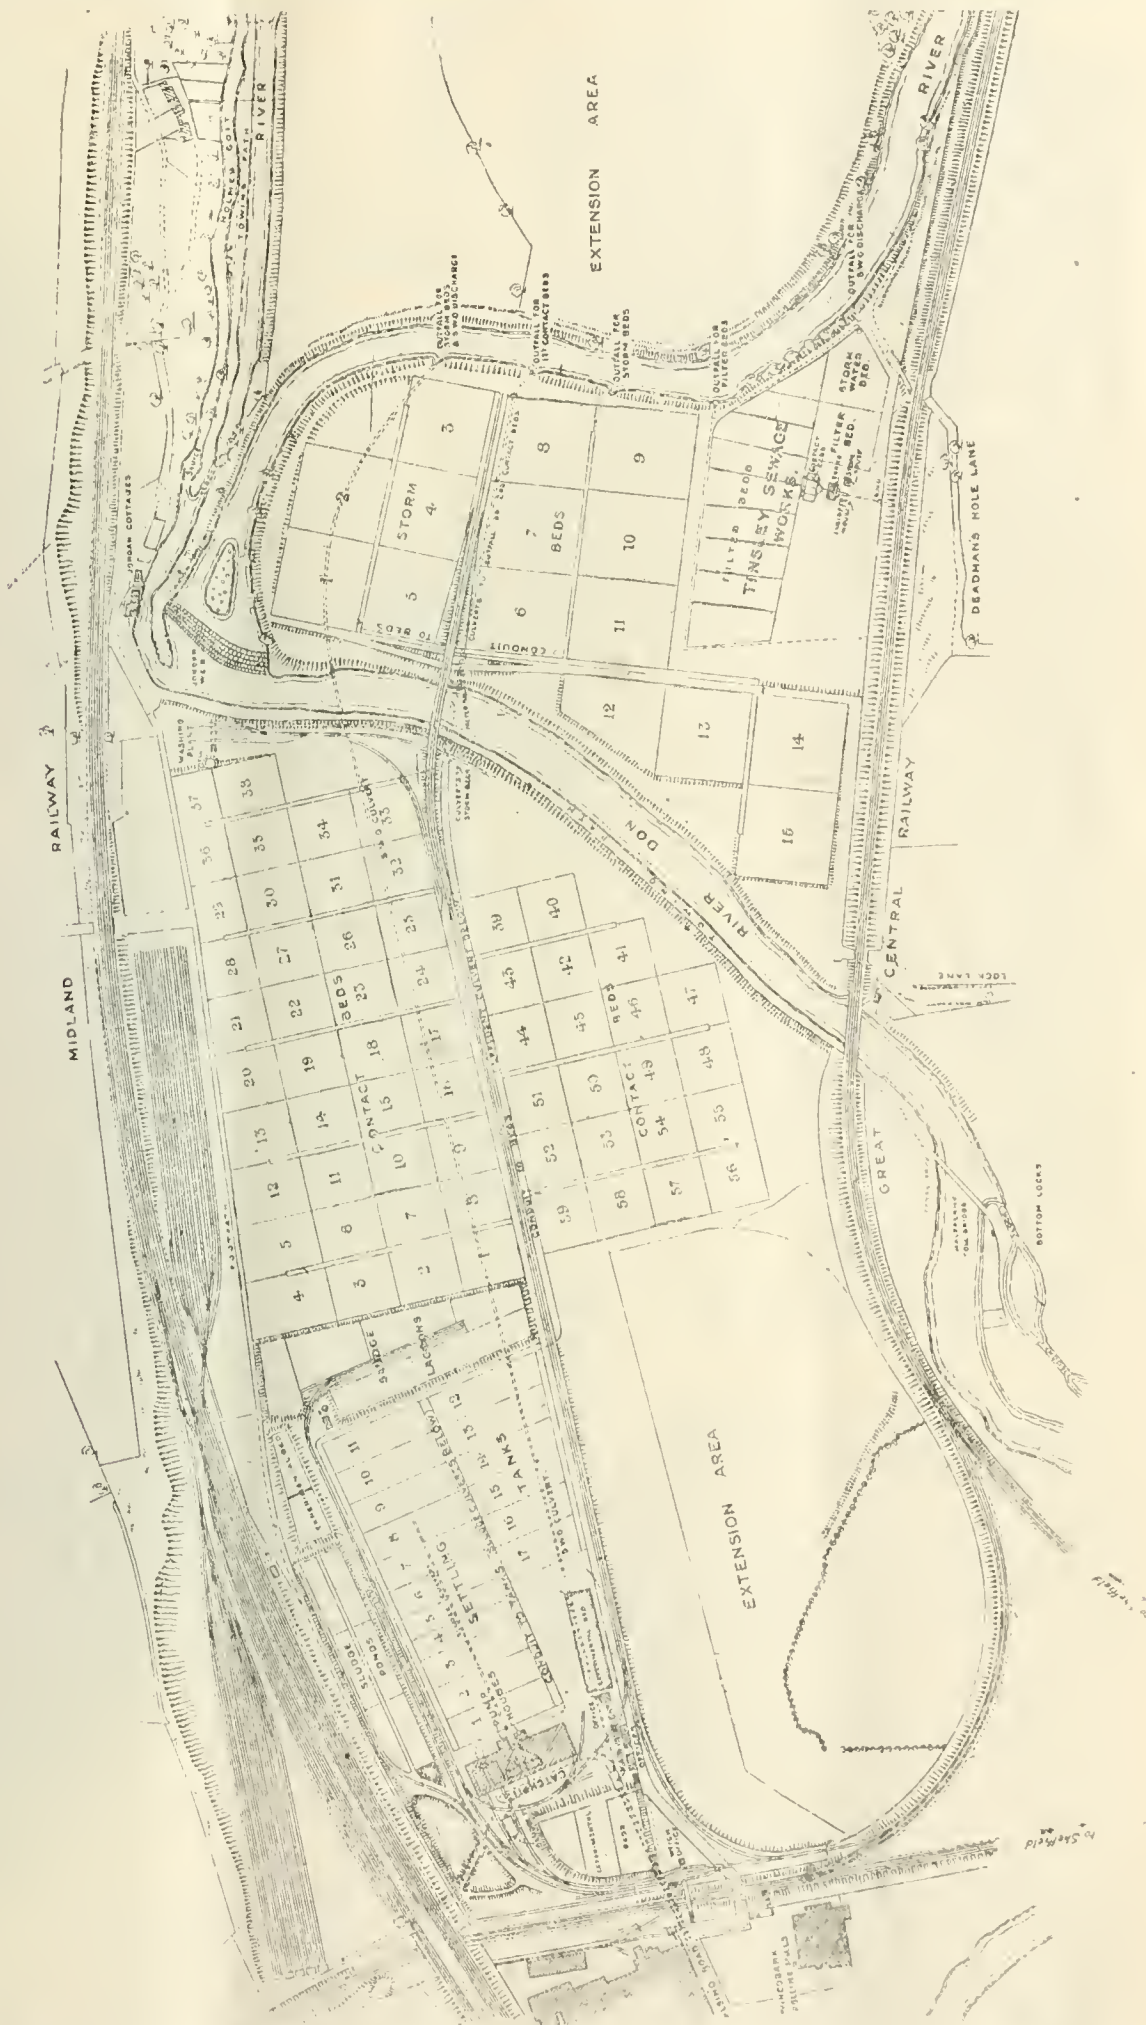

The original estimate for the work in progress was £270,000, but later experience and economies in carrying out the work indicated that probably £250,373 would be sufficient to cover the cost. This sum may eventually be slightly exceeded, but the works will undoubtedly be completed for less than the original estimated cost.

The scheme comprises the construction of (1) new main valve chamber to receive the original 5-ft. and the new 7-ft. barrel sewers, fitted with a new storm-water overflow; (2) two new catchpits and the re-modelling of the existing catchpits; (3) nine new

settling tanks, and the conversion of the present tank area into eight additional tanks, having a total capa-

(5) sixty contact beds, each 1/2 acre in area; (6) sixteen storm beds, each, approximately, 1 acre in extent;

SCALE

SILEFIELD SEWAGE DISPOSAL WORKS: GENERAL PLAN.

city of 15,000,000 gallons; (4) deepening the existing sludge wells, and remodelling the pumping plant;

(7) bridge and four syphon tubes across river Don; (8) roads and railways, including diversion of a public

footpath which divided the site, and a footbridge over the Great Central Railway.

CONTRACT WORK.

Messrs. Logan & Hemingway, of Nottingham, have completed contracts for the following works: (1) The removal of 220,000 cub. yds. of excavation; (2) the construction of six settling tanks and twenty-four contact beds; (3) the construction of three further settling tanks and thirty-five contact beds; (4) the building of a bridge over the river Don to give access to the storm-bed area; (5) the laying of four inverted syphon tubes, each 4 ft. in diameter, beneath the river, to convey the first contact-bed effluents and storm water across the river; (6) the construction of 16 acres of storm beds; (7) the laying of four 48-in. Venturi tubes and building of a meter-house, to be fitted with Venturi recorders, for the accurate measurement of the flow of sewage, supplied by Messrs. Kent & Co., of Luton and London.

ADMINISTRATION WORK.

The following works have been executed by men directly employed by the corporation: The new main valve and storm-water overflow chamber. The old catchpits have been remodelled, and new feed and effluent conduits constructed. The sludge wells have been deepened and remodelled, and fitted with new pumps. The public footpath across the site of the works has been diverted and fenced. The laboratory has been enlarged and equipped for the special work required. The lime precipitation tanks have been converted into eight settling tanks, and the necessary sludge culverts, valves, and conduits have been added. The concrete floors to the contact and storm beds have been laid, and the necessary underdrainage provided. Fifty-nine contact beds have been provided with clinker; 227,000 tons of clinker have been placed in position in the beds. The total quantity needed is about 230,000 tons.

This has been obtained from the Lumley-street destructor and private firms, and about 80,000 tons by aerial ropeway from Messrs. Steel, Peach & Tozer's tip. The construction of two new catchpits of modern design, fitted with electrically driven dredging apparatus and mechanical screens, have been completed, and the works have been lighted by electricity, including generating plant and new boilers. The additional work remaining to be done is chiefly the construction of permanent roads and railways, and the completion of the clinker filling to the storm beds. At the present time there are in operation 17 settling tanks, 59 contact beds, and 11 storm beds.

The following is a summary of the total expenditure on the sewage works extension scheme since the works were commenced:—

Works executed by contract	£142,494
Works executed by administration	105,051
Total	£247,545

CAPACITY OF NEW WORKS.

The works will be capable of dealing with a maximum flow of 64,500,000 gallons per twenty-four hours. The whole of the sewage will pass through the catchpits and settling tanks, and a flow up to 34,250,000 gallons will be treated on the contact beds. The subsequent 32,250,000 gallons will be treated on the storm beds. The scheme is based on a dry-weather flow, including trade wastes, of 12,000,000 gallons per day; the dry-weather flow at the time the scheme was designed was 15,000,000 gallons, but this included 3,000,000 gallons of dilution with clear water from works and other sources.

A volume of sewage averaging 19,205,000 gallons per day has been treated on the contact beds for the year ending March 25, 1913, and, in addition, storm water has received tank treatment. The average flow of sewage treated has been 21,505,000 gallons per day. The contact beds have been put into operation as completed, and some are necessarily not yet in a mature condition. In consequence of this, the average analytical results will still improve. The total volume of sewage treated during the year ending March 25, 1913, is 7,849,190,000 gallons. The effect upon the river has already become apparent, and the West Riding Rivers Board have reported on the improved condition of the stream; 59,346 tons of sludge have been conveyed to Kilnhurst to be tipped, and 325 tons have been sent to farmers. The follow-

ing table shows the quantity of sludge produced per 1,000,000 gallons of sewage during several years:—

Year ending	Volume of	Tons per
March 25th.	sewage treated.	1,000,000 galls
1906-7	5,836,250,000	8.80
1907-8	6,362,520,000	8.11
1908-9	5,693,430,000	11.34
1909-10	6,999,100,000	8.44
1910-11	6,701,403,000	8.97
1911-12	7,726,567,000	6.99
1912-13	7,849,190,000	7.60

The strength of the sewage delivered at the works shows indications of increasing strength by reason of the addition of water-closets and increase in trade wastes.

The cost of the sewage disposal of the city may be briefly summarised as follows:—

Original cost of lime precipitation works	£33,028
Cost of lands for scheme	84,127
Estimated cost of construction of present extension scheme	270,000

Total cost of scheme (including land and old works) £37,155

N.B.—To this total it will be necessary to add the cost of second contact beds should these be required eventually.

Although this sum is a large one, and has been incurred only after very mature consideration, exhaustive experiments and inquiries, and under extreme pressure by the Local Government Board and West Riding Rivers Board, it is fully anticipated that the city will be provided with an efficient sewage disposal works sufficient to meet all requirements for many years to come.

DUPLICATE OUTFALL SEWER.

A main outfall sewer, 5 ft. diameter, was laid twenty-eight years ago, but owing to the rapid growth of the city it was found absolutely necessary to construct a new and additional brick barrel sewer 6 ft. 6 in. diameter, increasing to 7 ft. diameter, for about three-quarters of a mile, laid alongside the old main outfall sewer in Meadow Hall-road and Alsing-road, terminating in the main valve chamber at the sewage works. This sewer has a fall of 1 in 1,894.

When crossing beneath the Barnsley branch of the Great Central Railway, near the sewage works, it has been necessary to raise the level of the railway and to modify the section of the sewer, giving a flat top formed in girder and concrete work. At the Blackburn Brook in Alsing-road the sewer has been carried over the brook in a steel tube 7 ft. diameter, lined with brick, and here the storm-water overflow chamber has been entirely remodelled and improved, so as to serve both the old and new sewers. The junction chamber in Meadow Hall-road, at which difficulty has frequently arisen owing to the deposit of silt, has been removed, and a new chamber built on improved lines.

Just above this point the 5-ft. sewer draining the Carbrook and southern portion of the city crosses the river in the form of two inverted syphon pipes, each 3 ft. 3 in. diameter, a third syphon pipe 4 ft. diameter has been laid beneath the river, and the chambers on each side of the river have been remodelled and extended. Owing to the flow of sewage having to be maintained, this work has been of a tedious and difficult character. The inverted syphon carrying the main sewer from Brightside district under the Bagley Brook has been removed, and the brook syphoned under the sewer. A direct and uninterrupted passage of the sewer is now obtained at this point. The work was complicated by the presence of numerous culverts, water, gas, and other pipes. The storm-water overflow near the river crossing in Meadow Hall-road, and those at Weedon-street Bridge, Weir Head, and Sanderson's Weir, have been constructed; the overflow culvert to the last named being carried under the Midland Railway in tunnel work.

The combined capacity of the old and new sewers is equal to 96,000,000 gallons per day, which is well above the present requirements.

A loan of £20,127 was sanctioned for the work by the Local Government Board, and the work has been executed well within the estimate.

The works have been designed by the author and his staff, and carried out partly by contract and partly by administration under his supervision.

[For further details and photographic views of the

undertaking described by Mr. Wike readers may be referred to the supplement which accompanied our issue of November 5, 1909.]

At the conclusion of the inspection, and before leaving the works,

Mr. FRANK MASSIE, chairman of the district, proposed a vote of thanks to the Lord Mayor (Colonel G. E. Branson) for his kindness in granting the use of the town hall for the meeting, and for his hospitality to the members of the institution. He said they greatly appreciated the kindness of the Lord Mayor in granting them facilities for the holding of their meeting, and for the generous hospitality which he had shown in inviting them to tea on their return to the town hall.

Mr. W. T. Lancashire (Leeds), who seconded, also spoke of their indebtedness to the Lord Mayor for the kindly manner in which he had received the institution.

The vote of thanks was heartily accorded.

Mr. J. P. WAKEFORD (Wakefield), hon. district chairman, then proposed a vote of thanks to Mr. Councillor Osborne, chairman, and the members of the Sewage Committee for their kindness in allowing the members to visit the sewage disposal works, and for the hospitality extended to the members at the works. He spoke of the great advantage it was to the members and to the authorities which they represented to be able to visit works of the character of Sheffield, and thus see what was being done by other municipalities.

Mr. H. DEARDEN (Dewsbury) seconded the vote of thanks, which was accorded by acclamation.

Mr. W. J. STEELE (Newcastle-on-Tyne) moved a vote of thanks to Mr. Wike for his paper descriptive of the sewage disposal works. The members of the institution, he said, were greatly indebted to Mr. Wike for the opportunity of inspecting the carrying out of what was a great problem. Personally, he was impressed not only with the boldness of the conception of the scheme, but with the very efficient manner in which it had been completed. The remarkable feature of the scheme was the wonderful economy with which it had been carried out. That works of such magnitude had been executed for an outlay of £300,000 was highly creditable to Mr. Wike. He was impressed with the Sheffield works as one of the most economical schemes on a big scale which had ever been undertaken.

Mr. F. W. SPURR (York) seconded the vote of thanks, which was unanimously approved.

Mr. WIKE, in acknowledgment, thanked Mr. Steele and the members for the appreciation expressed of the sewage works, and his pleasure at seeing so many members of the institution in Sheffield. It had been a great pleasure to him to prepare the paper, and to arrange for the meeting.

The members then proceeded to visit the High Wincobank Corporation model dwellings. The visits proved so full of interest that it was after 6 o'clock in the evening before the members arrived at the town hall for tea and the transaction of district business.

BUSINESS MEETING.

The district meeting was held after tea in the council chamber, Mr. Frank Massie presiding.

The district secretary read the minutes of the district meeting at Wakefield, which were confirmed.

THE NEW DISTRICT CHAIRMAN.

Mr. WIKE said he wished to make a personal explanation with regard to the appointment of chairman of the North-Eastern District. He supported the nomination of Mr. W. J. Steele, of Newcastle, as chairman of the district. He found that some person, without his knowledge, had been good enough to nominate him for the chairmanship, and put him in rivalry with Mr. Steele. He thought it right to make that explanation.

The CHAIRMAN remarked that if any member wished to make a nomination for any office they should first communicate with the member and get his consent before putting his name forward.

INSTITUTION MEETING AT SCARBOROUGH.

Mr. J. P. WAKEFORD announced that the borough engineer of Scarborough had offered them an institution meeting at Scarborough on the last Saturday in September (the 26th). They had communicated that to the council, who had approved the date. Mr. Smith was going to some trouble with the meeting, and they ought to have a good attendance.

Mr. WAKEFORD then announced the receipt of a telegram from Mr. L. Roseveare, of South Shields, expressing his regret at not being able to be present.

SHOULD DISTRICT MEETINGS BE PRIVATE?

Mr. W. FOWLDS (Keighley) then raised a question as to whether the district meetings of the institution should be private. He thought it would be much better if the district meetings were private. Members could then express themselves more freely and informally than if their speeches were reported in the "Journal" and the technical press. He did not say that a short summary of the meeting should not be sent to the "Journal" and the technical press by the secretary, but not reports of the speeches.

Mr. C. LUND (Cleckheaton) asked if it was usual to have reporters present at district meetings? Was it an order of the council?

Mr. J. P. WAKEFORD, district secretary, said they received a circular from one of the districts which stated "Visitors are not admitted to this meeting." He immediately wrote to Mr. Cole and asked him where this came from, and if it was a fact that visitors were not to be admitted, and whether there was any order of the council to that effect. Mr. Cole replied that so far as he knew there was no order by the council, and he saw no reason why visitors should not be admitted. Later there came a circular asking the district secretary to send reports of the meetings.

The CHAIRMAN remarked that it was inadvisable to make up their minds hurriedly as to the best course to be taken. It was rather aggravating to Mr. Fowlds, after he had generally let himself go at the Wakefield meeting, to find that he was reported. They ought to think it over before the next meeting, and find out from other districts as to whether these district meetings should not be considered conversational among themselves. The original idea of these meetings was that they would bring the members more closely together, and he thought that object would be better served if the meetings were not reported.

Mr. W. FOWLDS (Keighley) then proposed that the executive take into consideration the question of district meetings being private.

This was seconded and carried unanimously.

TOWN PLANNING IN SHEFFIELD.

By CHARLES F. WIKE, M.INST.C.E.,
City Engineer and Surveyor.

The total area of town planning schemes at present in hand in Sheffield is about 6,000 acres, out of a total area of about 12,000 acres of land available for development and inclusion in town planning schemes.

The number of schemes in hand at the present time is seven, and sanction has been received from the Local Government Board to prepare schemes in respect of four of these. The board will shortly be approached for authority to prepare the further schemes.

One of the most important features of these town planning schemes is the earmarking of certain areas as open spaces, and advantage has been taken to secure lands possessing natural woodland scenery, in order that they may be preserved as open spaces for ever.

The town planning of a city with contours like Sheffield is a very different matter to that of some cities and towns in England, which are practically flat, and the hilly nature of the sites and the great difference in level makes the planning of roads a difficult one.

Prior to the passing of the Housing and Town Planning Act there was nothing to prevent an owner laying out his estate irrespective of any other owner, at any rate so far as Sheffield was concerned. This resulted in many cases in the formation of numerous cul-de-sacs, which by a little rearrangement on a give-and-take principle might have become good through roads. In some instances, especially in the case of large landowners, the estates have been laid out on very satisfactory lines.

The service of the various notices and preparation of the plans and estimates to comply with the regulations of the Local Government Board, the prolonged negotiations with landowners respecting the laying out of the different estates, and other work, occupy a great amount of time and a large staff. Five assistants are employed solely on town planning work, with additional assistance when required.

The following are the particulars with regard to the various schemes in hand:—

AREA 1.—GREYSTONES AND BANNERDALE.

Area	188½ acres.
Approximate length of new roads	6 miles.
No. of houses to the acre	12
Approximate area of open spaces	85 acres.

Principal Road Widening:—

	Present width (approx.) Feet.	Proposed width. Feet.
Eccleshall-road (from Banner Cross to Eccleshall Church	50	80
Carterknowle-road (for a length of 700 yards)	25 & 40	50

One of the principal new roads in this scheme is Bannerdale Valley-road. This road will be 1,300 yds. long, and have a width of 55 ft., and it is intended to have a macadam roadway with asphalt footpaths and grass margins on either side. Among other new roads is one suggested from Porter Bridge, skirting Whiteley Woods, to Stainlon-road, which will be 1,300 yds. in length, and have a width of 40 ft. In addition to Whiteley Woods, the High Storrs estate of the corporation is included in this area.

This area, for which sanction to town plan has been obtained, contains land near some of the large works, which is in immediate demand for workmen's dwellings, and is a most important area from a town planning aspect, as it adjoins a densely populated neighbourhood. It has been decided to vary the requirements as to the number of houses to be erected to the acre, to suit the varying circumstances.

This area is a good illustration of the difficulty in fixing a limit for the whole of one scheme.

The houses or cottages already built immediately abutting upon a portion of the area average as many as thirty-five (gross) to the acre, and it would be scarcely reasonable or desirable to fix a limit of twelve to the acre (as in some of the schemes) for the area immediately adjoining. The committee therefore decided upon a limit of twenty-four to the acre for this portion, reducing the number to twenty-two and twenty as the area recedes from the overcrowded district.

HIGH WINCOBANK ESTATE.

This area also includes the High WincoBank estate of the corporation. This estate was purchased in

SECTION OF PROPOSED 80-FT. ROADS.

On Area 1 it is suggested to set apart as open spaces the plantation adjoining Brincliffe Edge-road, the land adjoining Bingham Park and Whiteley Woods, and the plantation on the central portion of the High Storrs estate.

This is one of the areas for which the Local Government Board gave authority for a town planning scheme to be prepared, and the preparation of the scheme and plans for submission to the board is in hand.

AREA 2.—SANDYGATE.

Area	97 acres.
Approximate length of new roads	2 miles.
No. of houses to the acre: 20 on the North side, tapering to 12 on the South	
Approximate area of open spaces	Nil.

	Present width (approx.) Feet.	Proposed width. Feet.
Manchester-road (portion of)	36	80
Sandygate-road	50	80
Watt-lane	30	80

This scheme is comparatively small, and was taken in hand on account of impending building operations which threatened an undesirable development. The principal new main road here is one 80 ft. wide, from east to west of the area. This new road was not originally part of the scheme, as it was then intended to widen Sandygate-road (an existing road about 35 ft. wide), but the alteration has been made to meet the wishes and suggestions of the landowners, and also on account of the much better gradient.

Sanction has also been received from the Local Government Board to prepare a scheme for this area.

AREA 3.—BRIGHTSIDE, FIRTH PARK, AND SHIREGREEN.

Area	62½ acres
Approximate length of new roads	6 miles.
No. of houses to the acre	20, 22 and 24
Approximate area of open spaces	90 acres

Principal Road Widening:—

	Present width approx. Feet.	Proposed width. Feet.
Barnsley-road (for a length of nearly a mile)	45	80
Hadfield House-lane	37	60
Shiregreen-lane	38	60
Stubbin-lane	25	55

the year 1900, and contains about 60 acres of land. The estate is in a good position on account of its elevation, and is very convenient for housing purposes. It is nearly 400 ft. above sea level, with an easy reach of some of the large engineering works, and is a few minutes' walk from the tram terminus. Altogether, 228 dwellings (including flats) and two shops have been erected, the rents being 4s. and 4s. 3d. per week for flats, and varying from 5s. to 10s. per week for dwellings, the majority of which are provided with baths. Forty-four of the dwellings were erected in connection with a model cottage exhibition, and afterwards purchased by the corporation, one of the conditions of the competition being that the competitors should sell at the price stated for the particular class of cottage. A further fifty-nine dwellings, all provided with baths, to let at from 5s. 8d. to 7s. 6d. per week, are shortly to be erected.

AREA 4.—FULWOOD AND STUMPERLOW.

Area 1,530 acres.

This is a further area, abutting on areas 1 and 6, which the committee have decided to town plan. The contouring of the maps and the surveying and levelling for road widenings and suggested new roads are being proceeded with, and when this work is completed a draft scheme will be prepared.

AREA 5.—KENWOOD PARK ESTATE.

Area, 140 acres.

This is another small area to be dealt with as a town planning scheme with a view to limiting the number of houses to be erected to the acre, and to preserve the amenities of the district.

The necessary maps for submission to the Local Government Board are in course of preparation.

AREA 6.—ECCLESALL, ABBEYDALE, AND WOODSEATS.

Area	1,618 acres
Approximate length of new roads	8 miles
No. of houses to the acre	8 Abbeydale, 20 Woodseats, and 12 Ecclesall and Millhouses
Approximate area of open spaces	121½ acres

Principal Road Widening:—

	Present width (approx.). Feet.	Proposed width. Feet.
Ecclesall-road (from Church to City boundary)	37	80
Abbey-lane (part of)— Abbeydale-road to Woodseats	35	100
Do. do. Abbeydale-road to Wood Lodge	40	80
Abbeydale-road	37	80
Chesterfield-road	40	80

This area adjoins Area 1, and is situate in the South-Western portion of the city. The Ecclesall part of the scheme contains Ecclesall Wood (area, 372 acres, approximate), and it is proposed to set about 75 acres of this aside as an open space to prevent it being absorbed for building purposes, and also Hutcliffe Wood, abutting on the Midland Railway.

The principal new roads are, one from Millhouses to Whirlow Bridge, and a branch road from this to Abbeydale; one from Silver Hill to Limb Bridge, and a branch road to Dore, all of which it is proposed to make 80 ft. wide. Other new roads are shown to be 60 ft. and 50 ft. wide.

One of the most important road widenings is Ecclesall-road, from the church to the city boundary, a length of about 1½ miles, which is in continuation of the widening of the short length mentioned in Area 1.

There is considerable motor and other traffic on this road, and the committee decided to include the widening in the town planning scheme, the improvement to be carried out as opportunity arises. The existing width of the road is about 37 ft., and it is proposed to widen it to 80 ft.

Another very important road widening is Abbey-lane, from Abbeydale-road to Woodseats, which is to be widened to 100 ft., and along which it is proposed to run a double line of tramways or trackless trams. The roadway will be constructed of tar-macadam carriageway, grass margins and trees, and pathways.

The statutory meeting was held on February 10th last, and the Local Government inquiry into the application of the corporation for authority to prepare a scheme for this area on July 15, 1913.

At this inquiry there was opposition to the inclusion of certain portions of the area in the scheme, and also to the scheme itself. The Local Government Board inspector explained that the inquiry was only for the purpose of ascertaining if the area was suitable for town planning, and that he could not go into details at this stage.

Authority to prepare a scheme has now been received from the board, and its preparation is well advanced.

AREA 10.—HILLSBOROUGH, MALIN BRIDGE, STANNINGTON AND CROOKES.

Area, 1,400 acres.

The boundary of this area is rather irregular, as the line has been arranged to follow closely built-up portions of districts adjoining. Portions of the Loxley and Rivelin Valleys run through this area, which adjoins and contains some of the most beautiful and attractive parts of Sheffield; portions of Hillsborough, Walkley and Crookes are included, and as these are districts which will probably be inhabited by a working-class population, it is of the greatest importance that they should be included in a town planning scheme before they are built up on lines which in the past have done so much injury to the city.

The posting up and contouring of the maps, the surveying and levelling for road widenings and suggested new roads is being proceeded with, and a draft scheme is in course of preparation for submission to the committee.

Set-backs.—With respect to set-backs, the following have been arranged for the different areas:

Existing and new main roads	25 and 15 feet
Secondary main roads	15 feet
Subsidiary streets	10 feet

Estimates.—The estimates already prepared have been based upon the assumption that the owners would give up, without charge, the necessary land for widening the roads, the corporation paying for the street works over the width required by the by-laws *i.e.*, 40 ft. as has already been arranged in several cases.

STATISTICS AS TO TOWN PLANNING.

Total area of the city	Acres.	24,347
Population of the city, 471,662		
Area densely population	Acres.	5,000
Area sparsely built upon		2,500
Area which cannot be dealt with under the Town Planning Act		7,500
Area not available for building purposes, such as moorland, reservoirs, parks, recreation grounds, precipitous ground, &c.		5,000
		12,500
		11,847
Approximate area of land available for further development and inclusion in town planning schemes		12,000
Areas for which sanction has been received from Local Government Board to prepare schemes:—		
Area 1	Acres.	488½
„ 2		97
„ 3		624½
„ 6		1,618
		2,828
The total approximate area proposed to be reserved as open spaces in connection with these four schemes is 296½ acres.		
Areas for which sanction will be asked to prepare schemes:—		
Area 4		1,530
„ 5		142
„ 10		1,400
		3,072
Total area of schemes receiving attention at various stages		5,900

DISCUSSION OF MR. WIKE'S PAPER.

Mr. F. J. THACKRAY (Hoyland Nether) said there was one question he wished to ask with regard to the housing problem. It was a question which he had to face and answer himself, and probably it was a question which Mr. Wike had had to face himself. The question was this: The council purchased some land for the purpose of street improvement, and having carried out that improvement had a surplus area of land available. Two-thirds of that area was resold at a price almost equal to the original purchase price, leaving a small area of land practically free of cost. The council had decided to erect houses on that site, but the type of house they decided to erect upon it was not such as would be erected for the poor or dispossessed slum dwellers. The question came in arriving at the rent what value should be taken for the land. Should the land be taken as of no value, the council having recovered the purchase price, or most of it, or should it be taken at the ordinary price as building land, the rents based upon that price, and the profits derived go to the ratepayers generally instead of to the tenants of the houses. If they took the land as of no value, then the persons who were privileged to inhabit the houses would derive the benefit instead of the whole of the ratepayers. In his opinion, if application were made to the Local Government Board they would object to the proposed arrangement. If the land was utilised for housing slum dwellers at cheap rents, it would be different, but he wished to know whether they must not take into consideration the value of the land, having regard to the class of housing which the corporation were putting up.

Mr. Wike said he thought it quite optional on the part of the local authority to fix what value they liked on the land. The London County Council, in the making of improvements, put a good deal of the cost down to the improvement. That had been done in Shetfield, when they cleared a slum area, and the value of the land was fixed at a good deal less than they gave for it.

Mr. W. T. LANCASHIRE (Leeds) mentioned that with some of the slum areas they had cleared in Leeds the value of the land was probably 30s. or 40s. per yard, but to have some housing done plans were prepared, and the land was sold to builders at 12s. 6d. per yard on the understanding that they would build to those plans. He thought it was a matter for the

council to decide as to the value to be fixed on the land.

Mr. W. J. STEELE (Newcastle-on-Tyne) remarked that it was a matter of expediency. Financially it was extremely unsound.

Mr. WIKE said they had to clear an area on which were public-houses and works, and then they had to put flats on the land, and they had to fix a price for the land. They could not fix the price at what it had cost.

The CHAIRMAN agreed with what Mr. Steele had said that financially it was unsound, and they ought not to do anything of the sort. The private speculator did not get his land given to him at less than the market price.

Mr. C. LUND (Cleckheaton) said he thought they should take the value of other land in the vicinity and base it on that.

The CHAIRMAN said he agreed that that was the proper way to do it—to take not the price paid for the land, but what it would sell for if put on the market.

Mr. WIKE: If it was sold for works it might fetch a good deal more than land sold for private dwellings.

Mr. THACKRAY said he held that he must take the market price as building land, taking as the basis the value of adjoining land. He based the scheme on that, but it had been altered, and would go in the altered form to the Local Government Board. He had asked the question really to see what chance the amended scheme would have. It was very hard to make out a good case for an inspector under the circumstances. If they had turned poor people out of their houses it would be different; but they were housing people who could afford to pay a decent rent, and they had no right to house them at the expense of the general body of ratepayers.

Mr. LUND asked whether Mr. Wike had any case where, in carrying a scheme through undeveloped land, he had obtained anything under the betterment clauses for opening up the land for building.

Mr. WIKE: We have not got as far as that. We have got plenty of threats for compensation.

Mr. LUND: Oh, compensation! Nothing the other way.

THE HON. DISTRICT CHAIRMAN.

The CHAIRMAN said he was very pleased they had had a good meeting in Sheffield. He hoped they would support Mr. Steele as they had supported him (Mr. Massie) during the two years he had held the position of chairman of the district.

COUNCIL MEETING.

At a council meeting of the institution of Municipal and County Engineers held on the 25th ult. the following applications were approved for election to membership:—

Members: Messrs. J. D. Hurst, surveyor to the Wardle Urban District Council; D. Megaw, assistant county surveyor, Antrim; F. H. French, borough surveyor, Harwich; W. W. Shennan, engineer and surveyor to the Wirral Rural District Council; P. Darroch, surveyor to the Newport, Salop, Urban District Council; J. E. Swindlehurst, city engineer and surveyor, Coventry; T. A. M. Brownlie, municipal engineer, Amritsar; C. A. Mackenzie, burgh surveyor and engineer, Monifieth; C. W. Hall, engineer and surveyor to the Felling Urban District Council; and D. C. Fidler, engineer and surveyor to the Hayes Urban District Council.

Associate-members: Messrs. A. P. Howell, engineering assistant to city engineer, Birmingham; J. W. Turner, engineering assistant to borough engineer, Southend; P. F. Spiller, chief assistant surveyor, Devon County; E. B. Wray, chief assistant surveyor to the Paignton Urban District Council; J. A. Burnett, resident engineer, Arley sewerage scheme; F. Stewart, assistant burgh engineer Paisley; and R. V. Toms, assistant water engineer, Town Hall, Torquay.

Students: Messrs. G. R. B. Mazengarb, surveyor's office, Town Hall, Anerley; A. H. Edymann, surveyor's office, Brentford Urban District Council; E. B. Cook, surveyor's office, Tilbury Urban District Council; J. C. Fairfax, surveyor's office, Town Hall, Southall; J. W. Williamson, surveyor's office, Town Hall, Southall; and K. G. Foster, Assistant surveyor to the Buckfastleigh Urban District Council.

Transfer from Associate-member to Member: Messrs. K. C. Bannerjee, assistant engineer to the Calcutta Improvement Trust, and R. Blakeway-

Phillips, surveyor to the Wellington Rural District Council.

The council received with regret the notification of the deaths of Mr. J. P. Wilkinson and Mr. R. S. Anderson.

APRIL, 1914, EXAMINATIONS.

Upon the report of the acting examiners for the examinations recently held at London, the following candidates, having satisfied the examiners, were granted the testimony of the institution. Messrs. C. H. Bradbury, B. V. Bradforth, A. E. Cockerton, A. S. Culham, H. S. Ganderton, T. S. Griffin, W. A. Hill, O. Hilton, R. Humphreys, J. K. Hunter, W. H. Jarvis, W. H. Lewis, H. E. Lunn, F. N. McRae, G. E. H. Ross, H. R. Sayer, H. Taylor, B. D. Tracy, G. A. Waite and R. K. Wortley.

DISTRICT ELECTIONS.

Upon the report of the scrutineers as to the scrutiny of the district ballot lists, the following were found to be elected as district officers for the year 1914-1915:

METROPOLITAN DISTRICT.—Chairman, J. Patten Barber; representatives, N. Scorgie and O. E. Winter; secretary, N. Scorgie.

NORTH WALES DISTRICT.—Chairman, J. P. Evans; representative, W. Jones; secretary, J. England.

WEST MIDLAND DISTRICT.—Chairman, H. E. Stidgoe; representative, F. C. Cook; secretary, F. C. Cook.

SOUTHERN DISTRICT.—Chairman, R. Read; representative, L. S. McKenzie; secretary, F. R. Phipps.

IRISH DISTRICT. Vice-president, W. E. L. Duffin; chairman, J. F. Delany; representative, R. H. Dorman; secretary, M. Sellars.

EAST MIDLAND DISTRICT.—Chairman, E. G. Mawbey; representative, E. P. Hooley; secretary, E. H. Crump.

SOUTH-WESTERN DISTRICT. Chairman, J. Paton; representative, T. Moulding; secretary, D. Edwards.

SOUTH WALES DISTRICT.—Chairman, W. Harpur; representative, G. A. Phillips; secretary, H. Alex. Clarke.

NORTH-EASTERN DISTRICT. Chairman, W. J. Steele; representatives, E. B. Martin and F. Massie; secretary, J. P. Wakelord.

SCOTTISH DISTRICT.—Vice-president, A. Stevenson; chairman, J. Young; representative, T. Nisbet; secretary, D. A. Donald.

SOUTH-EASTERN DISTRICT. Chairman, A. Dryland; representative, F. Harris; secretary, H. W. Bowen.

EASTERN DISTRICT. Chairman, H. T. Wakelam; representatives, E. J. Ellord and W. H. Prescott; secretary, J. A. Webb.

NORTH-WESTERN DISTRICT.—Chairman, J. S. Brodie; representatives, C. Brownridge and W. Stubbs; secretary, A. W. Bradley.

The report was received and adopted.

BOARD OF EXAMINERS.

The Board of Examiners reported consideration of the alterations proposed to the syllabus, which had been referred to a sub-committee for further report. The final recommendations of the board will be made to the council at their next meeting.

The board do not see their way to recommend the council to add a subject, "Gas Engineering," to the examination syllabus.

The board are unable to recommend the council to hold an examination at Cairo.

The board are considering the geographical division of India for examination purposes, and will report later.

The board are considering a suggestion as to a preliminary examination for juniors, and will report later.

The report was adopted.

ARTERIAL ROADS IN GREATER LONDON.

The Roads Committee reported that they had received from Mr. E. J. Lovegrove representations sent up from a meeting of the engineers to local authorities in the northern section of London. The representations set forth that the meeting was unanimously of opinion that the subject of arterial roads in Greater London should be considered as a whole by the engineers to the local authorities within the area claimed as Greater London, and that to this end conferences should be held by each section, and a central committee formed to receive the report of the sectional conferences with a view to preparing a comprehensive statement upon the proposals of the Local Govern-

ment Board and the Board of Trade, and the question generally. The committee recommended that the council should agree to the institution undertaking the direction of the matter of convening the proposed conferences. They feel that, unless the question is considered in this way, the views of the municipal and county engineers of Greater London cannot be satisfactorily expressed, and that the subject is eminently one in which the institution should take an active and important position. The committee recommended that the report of the central committee should, in due course, be forwarded to the Local Government Board, the Board of Trade, and the Road Board, in addition to it being placed at the service of the county and local authorities concerned through their respective engineers. The committee also recommended that the engineers to the several counties of which the area planned forms part, the engineers to the London County Council and the City Corporations should be asked to be members of the conference.

SPECIAL EXAMINATIONS.

The committee recommended that the Road Board be informed that the institution have arranged to hold special examinations in connection with the construction and upkeep of highways and highway engineering generally.

The report was adopted.

TOWN PLANNING CONFERENCE.

The Town Planning Committee reported that Mr. Thomas Adams has consented to open the forthcoming Town Planning Conference at Cheltenham, and to give an address.

ALTERATIONS TO ARTICLES AND BY-LAWS.

The Constitution Committee reported that they had given careful consideration to the suggested class of associates, and did not see their way to recommend the council to take steps for the formation of this class at present.

NOMINATION OF PRESIDENTS AND VICE-PRESIDENTS.

On the motion of Mr. W. H. Prescott, seconded by Mr. P. H. Palmer, it was unanimously resolved:—

"That this council is of opinion it is not in the best interests of the institution to follow the practice of nominating the president or vice-presidents according to seniority of service, and it is hereby agreed that the practice be not observed in all future elections."

London County Hall.—At Tuesday's meeting of the London County Council on a vote of £460,000 on capital account for the new county hall, Mr. J. D. Gilbert moved a nominal reduction of £1 in order to give the chairman of the Establishment Committee an opportunity of offering an explanation of the slow progress which had been made with the building. Up to the end of last December the council had, he said, passed votes amounting to £806,725, and of this only £375,000 had been spent. The hall was to be open in 1917, but he believed that it would be five years later than that before it was finished. The chairman of the Establishment Committee said there was every desire to press on with the work, and he hoped the hall would be ready in 1917. The trouble in the building trade had, however, delayed the work. The amendment was withdrawn.

Street Repairs in London.—Mr. R. A. Norton, 15 Queen's-terrace, Jesmond, Newcastle-on-Tyne, writes: "I read with much interest the article in your last issue with reference to the breaking up of streets for repairs to gas, water mains, &c. I would wish to point out that, as far as manholes, gullies, hydrants, gas and water covers are concerned, my patent surface boxes will minimise the difficulties stated by your correspondent. The special advantages are that broken, smooth, or dangerous covers can be removed and new ones refixed in a few minutes without disturbing the roadway, &c., thus preventing their disfigurement and inconvenience to traffic. These cases have been universally adopted by public bodies in the North of England. I note your correspondent emphasises the expedient methods of work carried out in the provinces. It was owing to the repeated complaints from engineers and surveyors of local authorities of interference with their roads and inconvenience to traffic that I went thoroughly into the pros and cons of this matter, the result being I devised a surface box that will entirely overcome many of the objections raised by your correspondent."

IS THE STREET TRAMWAY DOOMED?

(From the *Auto-Motor Journal*.)

From correspondence which is appearing in *THE SURVEYOR* it would seem that there is growing up a strong current of feeling among road engineers that the day of the tramway is fast passing away. As a matter of fact, there does not, among the correspondents of that journal, appear to be one who has the courage to say that the tramway will eventually hold its own with the more modern and flexible methods of traction by motor vehicle. The most pronounced of the anti-motor writers—though "anti-motor" hardly expresses the matter, since none actively disapprove of the motor 'bus—predicate that the time is arriving when motor traction must be more heavily taxed for the upkeep of the roads. That is a matter of argument which does not, however, affect the main proposition of motor traction v. tramways, which is really all that matters as a main issue. In the issue of *THE SURVEYOR* of the 17th ult. there is an interesting letter on this subject from the pen of Mr. Reginald Ryves, whom the older members of the *Auto* may remember as a contributor to its pages some years ago. After justifying the opinions he expressed before a meeting of the Institution of Civil Engineers, to the effect that the tramways are doomed, Mr. Ryves proceeds to say that:—

"A belief that the tramway is doomed involves no adverse criticism of the work of tramway engineers. The tramway system is a fine example of engineering skill; the trouble is that it is in the wrong place on public roads and streets, and prevents the application of methods of construction and maintenance proper to such highways. The authorisation of trailers on certain lines only hastens the end, being at once a challenge and an admission that the tramway is a railway. While they have been occupying the public roads, the natural sphere of the tramways has been to some extent filled by branches and loops of steam railways intended for local traffic, and possibly less suitable for that traffic than would have been tramways of the ordinary type occupying roads of their own. The railways strangled the first-born of the motor-vehicle family, and put a changeling in its cradle, and the proper place of that changeling is now occupied by the legitimate offspring of the railways, while the younger and more vigorous children of the motor-vehicle family are struggling for their birthright."

That has been our attitude from the time when first we began to realise that the development of above-ground traction meant a fight to the death between motors and tramways. There is no quarrel with the tramway engineer, who has done his work admirably well, but there most decidedly is one with bodies like the London County Council, who have rushed into a suicidal tramway policy, spending the money of the ratepayers like water in an endeavour to balance two wrongs into a right. It is not as though these bodies had not had ample warning of what was likely to happen. Not only did those warnings come from those interested in the development of motor traction, whose views, it is true, might have been somewhat tinged by enthusiasm for the new locomotion, but road surveyors as long ago as 1905 warned them of what would ultimately happen. Therefore, if they find themselves committed to huge, money-wasting enterprises which they are unable to justify, they have only themselves to blame. The pity is that it is not their own money with which they are playing. We venture to think that if it had been, there would not have been so much of it sunk in an obviously hopeless attempt to make ends meet.

Sewage Disposal in Linlithgowshire.—The new sewage disposal works for the district of Broxbourn, Linlithgowshire, were recently formally inaugurated. The works were designed and carried out under the supervision of Messrs. Hunter, Duff & Middleton, Edinburgh, Mr. David Gibson, Glasgow, being the contractor. The works deal with the sewage from the drainage districts of Broxbourn, Broxbourn West End, Uphall and Dechmont, besides that from Bangour Asylum, the total population being about £12,500. The cost of the purification scheme, including nearly ½ mile of an extension of the main sewer, will be somewhat over £9,000. The revolving distributors were supplied by the firm of Adams-Hydraulics, Limited, York.

Skidding Vehicles and Street Pavements.

CAMBER: WHEEL DIAMETER: DRIVING.

The friendly discussion on the subject of the skidding of vehicles, which has been a feature of some of the recent issues of the *Commercial Motor* and *THE SURVEYOR*, has reached a point at which it is convenient, and may be profitable, to summarise briefly the most important of the considerations brought forward. Attention may be directed to an article in the *Commercial Motor* of April 23rd, and to one in the *Motor* of April 21st, the latter being a somewhat unexpected contribution to the discussion in the form of an acceptance of certain conditions conducing to skidding as being inevitable, an expression of agreement with *THE SURVEYOR* and the *Commercial Motor* up to a certain point, and the conclusion that the most important means of preventing skidding is careful driving. "Skidding," we read, "is, and will be, an ever-present difficulty under certain weather conditions; it will always necessitate careful driving in order to limit the accidents that are likely to occur." The same idea is repeated in the closing words of the article: "Having regard to all the factors, it would seem that it is careful and experienced driving that will enable the car to escape from skidding difficulties with success."

CAMBER.

The view that camber is a very important element is supported, in the *Commercial Motor*, by certain data relating to the coefficient of friction between rubber tyres and asphalt surfaces; in different conditions of those surfaces. The resolved part of the weight of a vehicle parallel to the slope on which it is travelling is taken into consideration; and it is assumed that the portion of the coefficient of friction used in driving, a fore and aft resistance, is not available as a coefficient of sideways friction, preventing side-slip. An important omission, or what would be an omission if it had been attempted to show the relative importance of camber, may be noticed. No calculation is made of the amount of deviation from a straight path which, at a given speed, corresponds to a given amount of crossfall, or corresponding to the skidding point with the given coefficient of friction. A very moderate amount of deviation from a straight path introduces a force demanding an appreciable coefficient of friction parallel to the axle of the wheels. On a perfectly flat surface this factor would set a limit to the efficiency of a pavement with a given coefficient of friction between its surface and the tyres of the wheels; and it is evident that the combined effect of speed and deviation is very important indeed. This is a subject to which we shall recur at an early opportunity. It seems to be the view of the *Commercial Motor* that the alteration of the cambers of a considerable mileage of streets should at once be carried out. Against this idea *THE SURVEYOR* has brought forward two considerations. First, that in the places where camber is steeper than it ought to be there are usually a number of difficulties in the way of altering that camber; and some of these are connected with matters not controlled by the road authority, and not such as are decided on the advice of the highway engineer. Secondly, it has been pointed out, the proper camber for a street surface cannot be decided without reference to considerations other than the tendency of certain classes of vehicles to skid; while, in any case, the coefficient of friction which can be counted upon in the near future has not yet been determined even within fairly wide limits. Developments in vehicle design proceed apace, and it cannot be said that the solid rubber tyre, in its present form, is certain to be the heavy motor vehicle tyre of the near future. Considerable and costly alterations to street pavements and their foundations ought not to be made until this subject has been further considered. *THE SURVEYOR* also points out that the diameter of wheels has a considerable influence upon the tendency of vehicles to skid, and supports this view by considerations based on natural laws, though, having regard to the applications made and the manner in which they are made, the *Commercial Motor* considers that the main arguments are dependent on assumptions "in so far as they can be applied to any differences due to variations of wheel diameters on public service

vehicles." The *Commercial Motor* concludes its article with the following paragraph: "We will concede that the points, each admirably and simply put forward, are not to be disregarded, but we cannot believe that the editor of *THE SURVEYOR* himself believes or imagines that they approach in importance, severally or jointly, in these days of increasing rubber-tyred motor traffic, the resultant of more appropriate cleansing of surfaces and reduction of camber."

The fairest way to answer this is to say that if we are to consider all the adaptations of camber to traffic that should ultimately be made by the time that stable traffic conditions are established, as well as all the improvements in cleansing that can ultimately be called for, within the limits of an economic but liberal expenditure, then wheel diameter, though still important, would not be sufficiently so to "approach in importance" these two elements taken together. To-day, however, the financial conditions, and the uncertainty of developments in surfaces and tyres, are such that, for the time being, wheel diameter, as a matter that could and should receive immediate attention, has an immediate importance certainly approaching the combined importance of the other two elements. The essential difference between the position as regards wheel diameters and that as regards camber and cleansing is that the influence of diameter is one which it will be felt under any conditions, while the actual amount of camber or of cleansing which may be desirable will depend upon the coefficients of friction between the particular kinds of tyres chiefly in use, upon the particular kinds of street surface on which the hold of the wheels is least effective, and upon other factors. It is contended that we should do first what will anyhow be right, and in the meantime seek the best solution as regards matters which cannot be decided except after further study and trial. Such changes of camber as are obviously desirable should be made as circumstances permit, and the best practice in street cleansing should be steadily extended, and any further improvements that are desirable should be adopted.

It may be remarked that, having regard to the importance of the coefficient of friction as a factor affecting the allowable deviations occurring when a vehicle is steered along a busy street, there are many cases in which wheel diameter is a more important factor than camber, within the limits of the worst camber that would be tolerated and the least that would be practically convenient. Some of the steepest cambers should be altered as soon as is convenient, and there are many places which should be marked down for attention as soon as some definite conclusions can be arrived at with respect to the worst coefficients of friction that can be tolerated, whether the fault lies with the pavement or with the tyres. That is to say, we must first decide what coefficient should be demanded as the result, if necessary, of improvements in the street surface or in the tyres, or both, and then, not before, decide what are the steepest crossfalls that may be allowed with different classes of pavings. As regards the cleansing of street surfaces, it is difficult to assign a definite meaning to the word "improvement" in the paragraph quoted above. Assuming that the conditions are those where cleansing is most efficiently carried out, wheel diameter is more important than any further measures that can be thought of, under the head of cleansing. Under conditions which are those of the streets in which watering, sweeping, and sanding are least efficiently carried out, the improvements that can be effected under this head are probably greater than those which would result from increases in the diameters of wheels. Between these two classes of cases there is a large number in which considerable improvement could be effected by further expenditure in cleansing, and especially in watering and sweeping combined, in drizzling weather. As regards these cases we may look for a steady development of a sound policy, not due to outside pressure, but the result of friendly competition between municipal engineers in producing sufficiently good results with a reasonable expenditure. This seems to be the view expressed in the *Motor*.

The writer of the article in that journal evidently realises, perhaps instinctively rather than as a matter of reasoning, that even on a perfectly flat road surface the deviations necessary in steering, and the effects of braking, produce skidding; and he perceives therefore that camber is not so important a factor as it is considered to be by the *Commercial Motor*. "Road Engineer" also regards the perfecting of street surfaces as an impossibility; and he therefore considers careful driving to be the most important factor. This interesting article is reproduced below, and a few remarks are necessary with reference to the third paragraph. It cannot, of course, be admitted that we "scoffed," however "amiably," at the suggestion that camber is a factor in skidding; and we did, in fact, agree that the figures put forward in the *Commercial Motor* were significant, though not conclusive. We did not advocate the use of broader tyres as a means of reducing side-slip, chiefly because they would, on the whole, increase side-slip. Nor did we state that "larger diameter wheels were the solution." To recognise an important factor is not the same thing as finding a solution. Nor was our advocacy of larger diameters based in the least on the assumption that the larger the area in contact with the road surface the greater is the resistance. What we did say was that one of the *least important* of the advantages of large wheels is that they give a *longer* contact with the road. We gave other and more important reasons, based on a study of the elastic strains on wheels.

In stating that he is inclined to think that "all of the writers have missed the real causes of skidding, and how difficult it is to deal with them," "Road Engineer" is, in effect, strongly supporting municipal engineers against those whose comments on skidding are so made as to give the impression that the municipal engineer is chiefly responsible, and for this reason we forgive him for his misreading of our own arguments.

The most valuable contribution that could now be made to the discussion would be the presentation of further data similar to those put forward in the *Commercial Motor*, and relating to the actual coefficients of friction between tyres and pavements. The importance of most other factors can be indicated partly by calculation or by considerations based on the laws of dynamics; but the coefficients of friction provide the prime data. The only substitute for directly observed coefficients of friction is the estimation of these coefficients from the behaviour of vehicles travelling at known speeds and skidding at measurable deviations from a straight path under recorded conditions of the street surfaces. It would, of course, be possible to come to certain conclusions as the result of observations made without measurements, but it seems a pity to rely only on these. Lastly, it may be pointed out that the humble receptacle for banana skins, other fruit refuse, and loose papers is by no means an unimportant factor in the prevention of skidding.

THE ARTICLE BY "ROAD ENGINEER" IN THE "MOTOR."

To all intents and purposes we are at the beginning of the season when the most careful driver feels that he is free from the unnerving "skid" which renders him helpless, and causes dismay to all who happen to be in the immediate vicinity.

In the early part of the year, a writer in the daily Press was so evidently annoyed—probably from a painful personal experience—that he quite calmly suggested that a time limit should be given to horsed traffic, because he was obsessed with the idea that the horse manure was the cause of the trouble.

Then the editor of the *Commercial Motor* and the editor of *THE SURVEYOR* endeavoured to deal with the problem of skidding; one suggested that the contour of the road is a factor and gave interesting figures, the other amiably scoffed at the suggestion, and brought to bear an exposition that broader tyres and larger-diameter wheels were the solution—on the assumption that the larger area in contact with the road surface the greater the resistance.

The writer is in agreement with both of these solutions up to a certain point, but he is inclined to think that all of the writers have missed the real causes of skidding, and how difficult it is to deal with them.

Skidding is, and will be, an ever-present difficulty under certain weather conditions; it will always necessitate careful driving in order to limit the accidents that are likely to occur.

Generally speaking, the road is in its most dan-

gerous state, in this respect, when a gentle, drizzling rain falls; this rain acts as a washer to the atmosphere, and brings down a large quantity of carbonaceous matter—soot—which acts as a lubricating agent to the surface of the smooth-faced roads. A heavy rain also brings down the soot, but it is washed away into the channels, so that in such circumstances skidding is not so prevalent. Then there is another cause: When motors or other vehicles constantly and continuously use a road, a certain amount of very finely divided material is abraded from the surface of the road material. In dry weather this material is in the atmosphere, and if the dust that is blown on to pavements, shops, houses, &c., is microscopically examined, it will be found that it is composed mainly of wood fibre from the wood pavements, and very little material that can be said to be horse manure. In the case when the gentle rain occurs, this finely divided material is retained on the road surface, and, not being a part of the pavement, it is in a sense loose, and, like all very finely divided material, acts just as a lubricant will act, and also, unless there is sufficient weight on the tyre to cut through it to the actual road surface, the wheels will fail to grip the road, and, consequently, will skid.

The suggestion that larger and broader wheels should be used is a very proper one, and will apply in certain circumstances; such a policy appeals to the road engineer because it reduces the wear of the structure, and it would be equally satisfactory to the vehicle owner; but it is doubtful whether it would prevent skidding, although it may minimise it.

The broad and long-bladed ski distributes the weight of the sportsman who slides over the surface of the snow. The same person, however, uses a thin and short skate if he does not wish to slide over ice.

For the same reason non-skid tyres are steel-studded; these studs reduce the area in contact with the road, and thus the greater weight than is the case with the plain rubber tyre enables it to cut through the slimy material between the wheel and the actual road surface more effectively. Parsons chains perform the same function as do the steel studs placed in horses' shoes, and the wheels of tractors in winter weather.

The writer was travelling on a tar-painted road, the surface of which was like glass, because at the time a heavy rain had chilled the surface and had hardened it, and at the same time had washed it free from any extraneous material. The surface was level, and the car was travelling in the centre of the road. Having suddenly to slow down, the brake was applied, and, before it was realised, the car had turned completely round in its own length and faced the opposite direction. One wheel was fitted with a steel-studded tyre and the other with rubber. It was a case in which the rubber tyre had gripped the road, and the steel-studded tyre had glided over the surface. The front wheels, being lightly loaded, were willing to do anything, and, consequently, the wheel that gripped was the pivot or centre, while the other wheels made the half circle.

In another case, where the two rear wheels were fitted with non-skids (steel-studded), and travelling on a perfectly dry wood pavement, the car, in turning a corner, skidded half round; here the wheels should have been fitted one with a non-skid and the other with plain rubber, because the steel studs could not cut into the pavement, and the broader tyre would have given the resistance which the studs failed to do.

On macadam roads so much fine material is abraded in the interior of the structure that in wet weather it is forced upwards, and it is this muddy mass, in a pasty condition, which has to be cut through by sheer weight in order to prevent a skid.

It will have been observed when a very powerful engine in a car is exerting full power, and the driver is careless enough to allow this power to be suddenly transferred to the driving wheels when the car is at rest, that the wheels suddenly revolve without the car moving. The power is probably sufficient to enable the car, under other circumstances, to travel 30 miles per hour. Suppose that the car is actually travelling 30 miles per hour, and the brakes are suddenly applied, then the vehicle is bound to skid, because the wheel surface in contact is not sufficiently broad to take up the resistance that the road offers. The same argument applies if the vehicle is travelling at 10 or 15 miles per hour if the road surface has, by any contingency, had its coefficient of friction reduced by hardening, as in the case of the tarred surface above described—in such circumstances the suggestion of the broader wheel and larger diameter is

applicable—but when it is a film of lubrication that lies on the surface, then the tyre which gives the greatest weight on the unit of area in contact with the road will give the most satisfactory results.

During the dry summer weather there is no necessity to use steel-studded tyres; they should be used as a "spare" wheel for wet weather only, and otherwise for winter use.

Having regard to all the factors, it would seem that it is careful and experienced driving that will enable the car to escape from skidding difficulties with success.

CORRESPONDENCE.

*Sir, though I would persuade, I'll not constrain;
Each man's opinion freely is his own
Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—May I trespass on your courtesy to make a few brief remarks on "Engineer's" letter, which appears in the current issue of your journal?

The letter from me (THE SURVEYOR of April 17th), which is referred to by "Engineer," was addressed to laymen. It was, in fact, a few suggestions from a layman to laymen with a view to our adopting greater uniformity in the application of road terms.

I am disappointed that an engineer should have used the publication of my letter as an opportunity to attack the Standardisation Committee. Surely the chairman of the committee is entitled to confer with the American engineers—I would respectfully suggest it is his duty to do so—and thus bring British road terminology into line, as closely as possible, with that which is now under review in the States. Surely, if the result of the co-operation is to be, as "Engineer" surmises, to classify petroleum pitch as "bitumen," no harm will have been done to either science, usage or commerce. Bitumen is a generic term which can be correctly applied to a number of substances which have physical properties.

When one comes to consider what material may be defined as "natural asphalt bitumen" and "asphalt bitumen," differences may—I do not say they will arise; but that would be dangerous ground for a layman to tread upon. Yours, &c.,

JOHN HUTCHINSON.

THE DOVER MEETING: RAILWAY FACILITIES.

To the Editor of THE SURVEYOR.

SIR,—I am endeavouring to obtain reduced fares for a party travelling to the above meeting from Charing Cross (South-Eastern and Chatham Railway).

Provided that a sufficient number of members assemble at the third-class main line booking office, Charing Cross (South-Eastern and Chatham Railway), not later than 8.40 a.m., I hope to get tickets issued at the reduced fare of 8s. 9d., third-class return, available by the 9.7 a.m. from Charing Cross, reaching Dover at 11.28 a.m.—Yours, &c.,

J. W. DUDLEY ROBINSON
Secretary.

Institution of Municipal and County
Engineers.

92 Victoria-street, S.W.
May 6, 1914.

Bristol Tramways. Bristol Corporation—one of the very few municipalities not owning a tramway system—on Monday succeeded in getting passed by a House of Lords Committee a Bill empowering them to work tramways. The committee insisted on the insertion of a clause providing for the purchase by the corporation of the undertaking of the Bristol Tramway Company within six months after May 1, 1915.

Chadwick Public Lectures.—At the Royal Sanitary Institute, on Thursday of last week, Mr. E. P. Hill, M.INST.C.E., member of the firm of G. H. Hill & Co., Manchester and Westminster, delivered the first of the present year's series of Chadwick Public Lectures, taking "Water Supply" for his subject. The lecture was an epitome of the course of Chadwick lectures delivered at the Birmingham University a year ago, and was repeated with the special object of showing a London audience the very fine series of illustrations which have been collected by Mr. Hill.

ROYAL SANITARY INSTITUTE.

A YEAR'S WORK.

One of the most interesting features in the work of the Royal Sanitary Institute during the past year is the progress made in its development in other Dominions of the Empire. An additional branch of the institute has been formed in British Columbia, and meetings for discussion have already been held. New examination centres have been established in Rangoon in conjunction with the Government of Burma, in the provinces of Quebec and Manitoba in Canada, and in British Guiana. Branches and examination centres are now established in every Continent of the world, and in every Dominion of the Empire, and in nearly all cases courses of training for sanitary officers have been arranged by the authorities concurrently with the establishment of the examinations.

A number of new exhibits has been added to the museum during the year, and the exhibits in the water supply section have been connected up with the water main so that they may be shown in working order. Alterations were made to the roof of the museum with the object of securing more light in the building, glass being substituted in place of the louvres at one end of the roof.

The statement of accounts shows a steady improvement in the general finances of the institute. The establishment charges have naturally increased with the growth of the institute, and the additional branches of the institute have involved further expenditure, and rather more expenditure than usual has been incurred in general repairs and office furniture; this cost has, however, been more than met by an increase in the receipts, especially those from membership subscriptions and examination fees, which are considerably higher than last year. The accumulated fund has been increased by the balance on the year's working. The total balance of the assets over liabilities, £17,555, is greater than last year by an amount of £300.

The total membership of the institute is now 4,434. The total of the elections to membership during last year is the highest reached in any one year, and the nett addition to the membership roll is larger than that for many years.

BUILDINGS AND STREETS CONSTRUCTION BY-LAWS.

APPOINTMENT OF A DEPARTMENTAL COMMITTEE.

The President of the Local Government Board has appointed a Departmental Committee to consider the control exercised in England and Wales over the erection of buildings and the construction of streets by means of by-laws and local regulations and their effect upon building and development, and to make recommendations.

The committee will consist of Mr. J. Herbert Lewis, M.P. (chairman), Sir Randolph L. Baker, Bart., M.P., Mr. A. E. Collins, M.INST.C.E., Mr. Eustace Piennes, M.P., Mr. E. J. Gowen, Mr. E. V. Hiley, Mr. W. T. Jerred, C.B., Mr. F. R. Harding Newman, Mr. J. Pointer, M.P., Mr. W. T. Postlethwaite, Mr. Raymond Unwin, and Mr. Henry Vivian, with Mr. A. N. C. Shelley, of the Local Government Board, as secretary.

Mr. A. E. Collins, who is the city engineer of Norwich, and engineer to the River Yare Commissioners, was in his early years engaged in railway construction in connection with Messrs. Tanzy Brothers, Birmingham. Afterwards he became chief engineering assistant to the borough engineer of Salford, and was subsequently appointed town engineer and water engineer at Weston-super-Mare, becoming three years later borough engineer of Reading. He was appointed city engineer of Norwich in 1894, and in 1905 he was elected president of the Institution of Municipal and County Engineers. Many of the municipal works of Norwich have been entirely revolutionised during his tenure of office there. Mr. Collins has had a wide experience as an expert witness on municipal and cognate works.

Mr. Gowen is clerk to the Croydon Rural District Council, Mr. Hiley town clerk of Birmingham, Mr. Jerred an assistant secretary of the Local Government Board, Mr. Harding Newman a land agent, Mr. Postlethwaite clerk to the Swinton and Pendlebury Urban District Council, Mr. Raymond Unwin an architect, and Mr. Henry Vivian chairman of Co-Partnership Tenants, Limited.

Exchequer Grants in Aid of Roads.

MEMORANDUM BY SIR GEORGE GIBB, CHAIRMAN OF THE ROAD BOARD.

Being Appendix XVI. of the Final Report of the Departmental Committee on Local Taxation.

(Concluded from last week.)

There can be no doubt that the growth of motor traffic does entitle highway authorities maintaining roads used by that traffic to claim special contributions from Imperial sources of revenue. It is generally through traffic in relation to most of the districts, and in many districts it forms a very large percentage of the total traffic. The Road Board have received seven-day returns of traffic on certain roads in several counties on the form which is appended hereto (Document No. 6 in Appendix), and, although the number of these is not yet sufficient for any general conclusions, the following instances may be given from returns received from the county of East Sussex, from which the most complete set of returns has been obtained.

It will be seen from the above figures that the percentage of motor traffic on some roads is very high, and the bulk of it is undoubtedly through traffic.

Moreover, the damage done by motor traffic (especially motor omnibuses, traction engines, heavy

wards which Exchequer contributions amounting to 50 per cent of the cost of maintenance should be given.

(2) Subsidised county roads, comprising roads towards which Exchequer contributions amounting to 30 per cent of the cost of maintenance should be given.

(3) County local roads, comprising roads maintained by or at the cost of county councils out of county rates.

(4) District roads, comprising all other public roads.

It is also suggested that, in addition to the regular grants suggested above, a general annual grant should be given to be administered by a central authority to enable special grants to be given in those special cases which would not be equitably met by the percentage grants.

No estimate can at present be made as to the amount of money involved in these proposals, because

motors and trailers) in the case of roads which have not been constructed of adequate strength and suitable materials for bearing such traffic is out of all proportion to the number of vehicles. The problem which has to be faced by highway authorities solely because of motor traffic, and mainly because of the heavy commercial motors, is a most serious problem, and a very large expenditure must yet be incurred in almost all counties (except in those counties, of which there are a few, which have already greatly strengthened and improved their roads) in strengthening the road crusts and substituting bituminous-bound methods of construction for the water-bound method.

Having regard, therefore, to the increase which has already taken place in maintenance cost, and to that which is certain to occur in the future, it is evident not only that the amounts and apportionment of the existing Exchequer grants should be revised, but also that the system should be altered as recommended above, so that the grants may represent a definite proportion of the expenditure on the roads to be classed as main roads, and thus increase with the increase of expenditure.

PROPOSED CLASSIFICATION.

As regards the reclassification of roads and the grant of proportions of actual expenditure, it is suggested that all roads should be classified into (1) urban roads, (2) rural roads, and that each of these groups should contain four classes, of which two classes should receive percentage grants as follows:—

(1) Subsidised main roads, comprising roads to-

this would depend on the result of the classification; but it is suggested that either a money limit should be fixed for the first year's grant, or that a mileage limit should be fixed for the mileage of roads to be included in the classes of subsidised main roads and subsidised county roads.

It is doubtful whether even maintenance grants on the scale suggested will sufficiently meet the case. There are many miles of road in nearly every county which were excellent roads before motor traffic commenced, and which could have been maintained as good roads on the water-bound system even under a large increase in ordinary horse-drawn traffic. But these roads have not sufficient strength to bear traction engines and heavy commercial motors or motor omnibuses, and the use of the roads by even a small number of these vehicles causes great damage, involving heavy cost of repair. The fast and light motor traffic also damages such roads and materially shortens the life of the surface coatings, thus causing heavy increases in expenditure, due to the necessity for more frequent renewal of the surface coatings. An increase in ordinary maintenance expenditure by frequent renewals of surface coatings in water-bound material is a most extravagant and wasteful way of meeting the difficulty. What is required is an alteration in method and materials, and the adoption of bituminous binding. Improvements of this character would check the waste and the increase in maintenance expenditure which is now going on, and would undoubtedly repay the highway authorities for the extra initial cost by reducing the future cost of re-

newals. In the case of a road having an average width of 18 ft. and carrying a volume of traffic which involves re-coating the surface in water-bound material once in four years on the average at an assumed cost of 18d. per super. yard, which on the basis of the assumed width is equal to £792 per mile, the adoption of tar-macadam at an assumed extra cost of £528 per mile would, if the extra cost were spread over eight years, probably save the highway authority as much as 10 per cent on the average annual cost for repairs and renewals. But the provision of the money for the extra cost is the difficulty. It is quite impracticable for highway authorities generally to pay for this extra cost out of the rates, and no system of grants towards maintenance expenditure will enable them to do so.

It is so important, however, that the crusts of main roads should be strengthened and improved in order to enable them to bear the motor traffic, which is certain to increase, that in any revision of the system of grants to road expenditure, an endeavour should be made to provide means whereby highway authorities might be enabled to protect themselves against the further increases of expenditure which are certain to occur unless many miles of road crusts are strengthened and improved.

It is suggested, therefore, that a loan fund should be created to be administered by a central authority from which highway authorities might borrow, without interest, for the purpose of enabling them to strengthen and improve road crusts. A fund of £5,000,000 would enable loans to be made for periods varying, say, from three to ten years, which would at an average extra cost of £500 per mile enable about 10,000 miles of road to be improved in the manner indicated. This would be the most useful form in which assistance could be given to road authorities. It would also be an economical form for the State, as the cost would merely be the loss of interest on outstanding loans.

The Road Board have power under the development and Road Improvement Funds Act, 1909, to make grants and loans to highway authorities out of the Road Improvement Fund, the income of which is now estimated at about £1,250,000 per annum.

The board have no power to make grants "for ordinary repairs essential for placing a road in a proper state of repair," and it is undesirable that any part of the Road Improvement Fund should be diverted to such purposes. Grants and loans are being made for the purpose of strengthening and improving road crusts, but these diminish the amount which would otherwise be available for improvements in the widths, alignment, and gradients of roads and for the construction of new roads, and the total amount which can be granted or advanced by way of loan for road crust improvement is not sufficient to meet the urgent need to strengthen roads to enable them to carry motor traffic without undue increase in the expenditure on repairs and renewals. If this increase is to be checked it can only be done by carrying out the work of strengthening and improving the road crusts on an extensive scale, promptly, and inasmuch as the expenditure required is of the nature of capital expenditure, and would result in savings on maintenance account, the best way of dealing with the situation would appear to be the creation of a substantial loan fund in the manner suggested.

The case of London and county boroughs needs separate consideration. There are no main roads in the technical sense of the term in these areas, but county boroughs in the year 1909 shared to the amount of £290,947 in the proceeds of the assigned revenues. Probably some part of this amount represented an equivalent for abolished earmarked grants which were paid in respect of roads formerly county main roads and now included within county borough areas.

TRAFFIC RELATIONS BETWEEN COUNTIES AND COUNTY BOROUGHS.

It is difficult to justify any claim for State assistance to the maintenance of roads within county boroughs by the same arguments as are used to justify grants to roads in rural or small urban areas. If the object in view is merely, on general grounds, to make payments from national sources of revenue for the relief of local ratepayers, it may be convenient to contribute part of the total relief to the item of road maintenance, but none of the factors on which reliance is placed in order to establish that road maintenance is a national service are present in the case of county borough roads. The traffic using

these roads is preponderantly local or regional, and the standard of maintenance required is not raised or materially affected by the small percentage of through traffic which may use some of the roads. The total burden of maintenance cost in the year 1909 amounted in county boroughs to 5.5d. per £ of assessable value, and 27.3d. per head of population, the corresponding figures for metropolitan boroughs being 4.22d. and 36.7d. These figures contrast with an expenditure in the administrative counties of 14.2d. and 72.4d. respectively, or, after deduction of the Exchequer contributions to main roads, 11.2d. and 57d. Measuring the burden, therefore, by its ratio to assessable value, it is much less in county and metropolitan boroughs than in the administrative counties, and it cannot be said in the former case, as it can in respect of some roads in the latter case, that the burden is materially affected by through traffic.

It must also be remembered that county boroughs enjoy an advantage in not contributing like urban authorities in administrative counties to the maintenance of county main roads. There is no doubt an exchange user of the roads inside and outside of county borough areas, but there can be no question that the burden thrown upon adjoining outside roads by county borough traffic greatly exceeds the burden thrown upon inside roads by county traffic. Each year this excess of burden thrown upon the outside roads becomes greater as motor traffic increases, and especially the practice of delivering goods over wide areas by means of motor vans and heavy commercial vehicles. The account may be fairly adjusted by the additional rateable value of premises in the proximity of the outer boundary of county boroughs, but the point certainly requires consideration in connection with any claim on the part of county boroughs to share in funds drawn from national taxation for assisting road maintenance.

It may be useful to illustrate this point by a concrete example:—

Coventry and Birmingham are on the main London-Holyhead road. They are situated 17 miles apart, and the intervening road is a main road maintained by the Warwickshire County Council. It is probable that on the Warwickshire section 90 per cent of the traffic originates either in the county boroughs of Coventry and Birmingham, or from outside the county of Warwickshire. If Warwickshire maintained this road for the 10 per cent of local traffic originating in its own county, its expenditure would be very small compared with the expenditure that it has to incur to maintain the road in a strong enough condition to carry the through traffic on the Holyhead road, and the commercial and pleasure traffic originating in Coventry and Birmingham.

Neither Coventry nor Birmingham contribute to the Warwickshire roads, and the case of Warwickshire for some assistance in respect of this section of road is, therefore, on these grounds a strong one.

Consider now the position as regards that section of the Holyhead road which is situated within the county borough of Birmingham. In the central parts of the city the proportions of local and through traffic are reversed, and it may be assumed that at least 90 per cent of the traffic on that road originates or terminates in the city of Birmingham, and only 10 per cent or less is through traffic. Birmingham must, therefore, make and maintain a good and strong road in order to carry its 90 per cent of local traffic, and to satisfy the demands of its own ratepayers, and once a strong road has been laid down the 10 per cent of additional traffic from the outside imposes practically no additional burden upon the city.

On the outskirts of the city the proportions will vary and approximate more to those prevailing in the county, but, generally speaking, it is impossible to say that in the case of large county boroughs like Birmingham, Leeds, Liverpool, Manchester, as well as in the administrative county of London, the through traffic doubles or quadruples the cost of maintaining the roads, as it does, in fact, on many a county main road connecting two important county boroughs.

It would be very difficult to select particular roads within county borough areas for the purpose of classifying these as subsidised main roads in the manner suggested for county areas. Perhaps, on the whole the best conclusion on this matter would be that county boroughs should be left to bear the comparatively slight burden which the maintenance of roads throws upon them, and that any relief to their local taxation should be given under other heads of expenditure; but if it is thought desirable in principle that

county boroughs should share in road maintenance grants, then the share should be fixed by one or other of the following methods:—

(1) Roads to be selected and classified by central authority as subsidised main roads in county borough areas, and to receive subsidies calculated as near as practicable at the same rate per square yard on the selected roads as the average grant to subsidised main roads in the adjoining county or counties.

(2) Grant a small annual percentage, say 5 to 10 per cent of the total cost of maintaining all roads in county boroughs.

(3) In lieu of grants to maintenance, grant a fixed annual sum based on population to each county borough, to be spent either on the widening of roads or the construction of new roads to relieve traffic congestion.

It would probably be right to treat London in the same way as county boroughs.

SURVEYORS' QUALIFICATIONS AND SALARIES: PROPOSED STATE CONTROL AND CONTRIBUTIONS.

Questions in regard to the improvement in the condition of roads and savings in expenditure which might be effected by extending the practice of direct maintenance of main roads by county authorities are probably beyond the scope of the inquiry by the Departmental Committee, but there is one point of considerable importance which may be mentioned. The work of road maintenance under modern conditions requires a high standard of engineering skill and knowledge, and the organisation of a county surveyor's establishment cannot be carried out on a proper footing without an adequate and efficient staff. There is great risk of waste in any attempt to reduce the salaries and numbers of staff, or travelling expenses in the county surveyor's department below what is necessary to secure a good organisation and thoroughly efficient administration and supervision of the road work. It is desirable, therefore, to attract to the position of county surveyor men of good education and technical knowledge.

It would assist in gaining this result if one-half of the fixed salaries of county surveyors and, say, one-fourth of the salaries of staff, limited to a fixed sum per 100 miles of road under direct maintenance, were paid by the State, subject to a central authority being satisfied as to the qualifications, duties, and tenure of office of the county surveyor.

There are precedents for this course. One-half of the salaries of chief constables, medical officers of health, and sanitary inspectors are paid by the State, subject to their qualifications being approved by a central department. Any arguments that might apply for a State grant towards the salaries of these officers would apply in even a stronger measure to that of county surveyors.

SUMMARY OF PROPOSALS.

The following is a summary of the suggestions indicated in this memorandum, and of the procedure suggested for giving effect to them:—

(1) All public roads to be classified into the following groups:—

Urban roads—

- (1) Subsidised main roads.
- (2) Subsidised county roads.
- (3) County local roads.
- (4) District roads.

Rural roads—

- (1) Subsidised main roads.
- (2) Subsidised county roads.
- (3) County local roads.
- (4) District roads.

All bridges repairable by county councils on subsidised main roads or subsidised county roads to be deemed to be included in the expression main road or county road respectively.

(2) The classification to be made by some central authority after conference with highway authorities, and with power on its own initiative or on the application of a highway authority to determine the classification of each and every part of any road, and to alter the classification from time to time. Provided that the mileage to be included in the classes of subsidised main roads and subsidised county roads shall not exceed a prescribed limit.

No objection to sections of a continuous length of road being in different classes.

(3) All provisions contained in any existing Act of Parliament relating to main roads to remain applicable to roads classed as main subsidised roads, county sub-

sidised roads, and county local roads, except that secs. 15 and 16 of the Highways and Locomotives (Amendment) Act, 1878, shall cease to apply to main subsidised roads.

This would involve county councils taking over any district roads which may be classified as main roads in their existing condition. (See sec. 11 (7) of the Local Government Act, 1888.)

(4) The central authority to be empowered to determine whether any expenditure proposed or incurred in connection with any subsidised main road or subsidised county road, or district assisted road may be charged to—

- (1) Maintenance, or
- (2) Improvement.

Provided that all expenditure on works of drainage, widening of metalled carriageway or footpaths without purchase of additional land bottoming, strengthening or improving the road crust or footpath construction, plant and machinery required for the purposes of maintenance, and in addition thereto all works of improvement the aggregate cost of which does not exceed in any one year 10 per cent on the aggregate cost (including establishment charges) of maintaining all the subsidised main roads and subsidised county roads in the area of such highway authority shall be deemed to be properly chargeable to maintenance.

(5) Annual estimates of the cost of (1) maintaining, and (2) widening or improving all subsidised main roads and subsidised county roads to be prepared by the highway authorities liable to maintain such roads, and submitted on or before November 30th in each year to the central authority, who should prepare therefrom and submit to the Treasury a statement showing the total estimated cost of maintaining subsidised main roads and subsidised county roads in the following financial year, and should, subject to Treasury sanction, certify the amount payable by the Exchequer to the credit of the road maintenance fund in respect thereof.

(6) The amount so certified by the central authority, after approval by the Treasury, to be paid by the Exchequer to the credit of the road maintenance fund.

(7) The central authority to be empowered to authorise contributions by county councils (in addition to any contributions which county councils may make under existing statutory powers) to the cost of maintaining any district roads, which contributions are referred to in these recommendations by the expression "authorised contributions," and the roads in respect of which such authorised contributions are made are referred to by the expression "district assisted roads."

(8) The central authority to pay out of the road maintenance fund to each county council, non-county borough council, and urban district council in respect of roads maintainable by them:—

- (1) Fifty per cent of the certified estimated cost of maintaining subsidised main roads.
- (2) Thirty per cent of the certified estimated cost of maintaining subsidised county roads.
- (3) Special grants towards the maintenance of any main roads, and such percentage as the central authority may determine, not exceeding 25 per cent of authorised contributions by county councils to the cost of maintaining district assisted roads, but the total amount to be allowed under this head not to exceed a prescribed sum in any one year.

(9) Within two months after the close of each financial year highway authorities to submit to the central authority in prescribed form statements of the cost incurred in the maintenance and improvement of subsidised main roads and subsidised county roads, and differences between the estimated and actual cost of maintenance may be taken into account by the central authority in distributing the grants in aid of maintenance from the road maintenance fund in the succeeding financial year.

(10) The central authority to be empowered to cause inspections to be made of the work of maintenance on all subsidised main roads, subsidised county roads, and district assisted roads, and to withhold or reduce any grants in aid of the cost of maintenance of any road or roads if they consider that such road or roads have not been properly and adequately maintained.

(11) In addition to the above grants an annual grant to be made to cover one-half of the cost of the salaries of county surveyors, and one-fourth of the

cost of the staff employed in the county surveyor's department, limited to a prescribed amount per 100 miles of road directly maintained by county councils.

(12) Roads in county boroughs to be dealt with in one or other of the three following alternatives:—

- (1) Roads to be selected and classified by a central authority as subsidised main roads in county borough areas, and to receive subsidies calculated as nearly as possible at the same rate per square yard on the selected roads as the average grant to subsidised main roads in the adjoining county or counties.
- (2) Grant a small annual percentage, say 5 to 10 per cent of the total cost of maintaining all roads in county boroughs.
- (3) In lieu of grants to maintenance grant a fixed annual sum, based on population to each county borough, to be spent either on the widening of roads or the construction of new roads to relieve traffic congestion.

(13) Roads in London to be dealt with in the same way as in county boroughs.

ENGINEERING JOTTINGS.

3.—SUBSOIL WATER.

By HERBERT G. COALES, ASSOC.M.INST.C.E., F.S.I.

Water is a very excellent commodity in its right place. But it has a way, sometimes, of hiding itself in positions where it is distinctly detrimental to the interests of man, particularly in the neighbourhood of towns. Natural and artificial channels for conveying away surface water are common—in fact, no town could comfortably exist without them. A point for consideration is: Should the subsoil water be similarly dealt with?

(1) *What is Subsoil Water?*—By subsoil water we mean the water that lies under the top soil of the earth. It may be only a few feet from the surface, or a considerable distance; it may saturate a foot or two of earth or a great many. Usually the subsoil water is held in its position by basins or pockets of impermeable strata. Probably most town engineers know, more or less, where to find the water, for only too often, to their annoyance, it makes its appearance in sewer trenches or foundations. With the additional aid of boreholes, judiciously put down, the basin or basins holding the subsoil water may be mapped out with a fair degree of accuracy. To what end? To let the water off to the sea as fast as possible; for, broadly speaking, it does no good bottled up under a town, but a great deal of harm.

(2) *Of What Good is Subsoil Water?*—Except so far as it may be, in some localities, passing on water to feed deeper water-bearing strata, or giving drink to certain classes of vegetation, we know of no benefit. It may be said that it is the source of supply to shallow wells, and the indispensable friend to the dwellers in country villages. In the abstract—on paper—it may be so, but not in reality. Everybody knows that subsoil water is dangerous for dietetic purposes. Not only is surface impurity taken down into the supply, but the drainage from churchyards, farmyards, manure heaps and defective sewers is duly assimilated too. It is, in fact, in too many cases, both soil-polluted and drain-polluted. An analysis of well water that would condemn it as a town supply is euphemistically styled "good" in a village, because it compares so favourably with another that is little better than sewage!

(3) *What Harm can be Attributed to Subsoil Water?*—The earth must be allowed to breathe, for, like man, she insists upon taking air into her lungs, and it is essential to our health that we who live upon her surface should only breathe, as far as possible, a dry air, and not one surcharged with moisture from a wet subsoil. A too often damp atmosphere is our national heritage, and any means we may take to make it more salubrious is in the line of common sense and good hygiene. A damp town is an unpopular and a shunned resort for men, whatever it may be for guats and frogs. Even inanimate objects, like bricks or timber, are prejudicially affected by damp, and as they are universally employed in the building of our homes, we as individuals suffer through them in pocket and general vitality. Consumption, so we are told, is only to be stamped out by a proper regulation of the conditions under which we breathe the air. Open-air sanatoria are not placed in damp places, but in dry ones.

Sanitarians have, for several decades, recognised

the unwisdom of neglecting the evils of dampness under dwelling houses. Hence the by-laws calling for dampcourses and for beds of concrete under floors. No doubt it is true these essentials to a dry house will always be necessary, even where there is no subsoil water beneath; but how much more so where there is!

Perhaps equally with the point of view of damage to health comes the economic one—the utter waste caused by subsoil water during the construction of public and private work, and the loss in the subsequent working or use. Dare one calculate the amount of subsoil water which finds its way into the public sewers, and, having to be raised by pumping, ultimately augments the necessary area of the precipitation tanks and the bacteria beds? This subsoil water, which ought to have been drained away into the nearest stream running seawards, has added to the initial cost of the sewers, the pumping arrangements, and the sewage disposal works. Water is the great bugbear of the sewerage contractor. How much has many a tender been increased by the fear of subsoil water? The engineer, too, has been obliged to specify a more expensively constructed sewer or culvert because of his dread of subsoil water.

The permanent lowering of the saturation level of the subsoil water in a town would cheapen the cost of all underground works of construction. One calls to mind the increased cost of the reinforced-concrete and asphalt floors and walls of basements, subways, tanks, and so forth, which the appearance of subsoil water in the excavations has necessitated.

In some of the older towns it is not an uncommon thing for basement floors in certain districts to be covered periodically with several inches of subsoil water. When, at last, a builder is called in, he probably prescribes "connecting with the sewer," which frequently means that the last state of that basement (say during a thunderstorm) is worse than the first.

There may be difficulties in locating or tracing the extent of the subsoil water, and of finding suitable outfalls for the discharging drains, for the underground strata is not like a sponge that one can seize and squeeze out. It is the province of the engineer, however, to realise and overcome such difficulties. The cutting through the lip of a clay basin might be sufficient to allow the imprisoned subsoil water to escape from beneath a favourably situated town, while in another it might be necessary to lay a system of underdrainage, either separately or during the construction of main sewerage.

It has been noticed in sewerage a village for the first time, the complaint is often raised that the water in the wells has been lowered, plainly showing that the subsoil water has been given a new diversion or outlet somewhere. On a bigger scale in cities and towns the level of the subsoil water might at least be lowered, to the raising of the standard of health, and of the pecuniary interests of the community.

Abertillery Water Scheme.—The Abertillery and District Water Board Bill, to enable the board to make an additional reservoir to be used as a compensation reservoir, has passed the Committee of the House of Commons, and sent for third reading to the House.

Wakefield Improvement Scheme.—On Wednesday Mr. W. H. Collins, an inspector of the Local Government Board, held an inquiry respecting the application of the Wakefield Corporation for an Order to confirm an improvement scheme under the Housing of the Working Classes Acts. The property involved is at the bottom of Westgate, on the northern side. It is proposed to demolish houses which at the present time accommodate sixty-eight persons, who will, it was mentioned, be offered new council houses which the corporation propose to build at Alverthorpe.

Cumberland Roads and Bridges.—At Wednesday's meeting of the Cumberland County Council, Mr. W. Dixon, in moving the minutes of the Highways Committee, said they were bringing all the roads into thoroughly good order, and during last year they received from the Road Board £9,355. The bridges were also being attended to, and that morning the committee had made their final selection of the tender for the new bridge at Floriston to substitute the old "Metal Bridge." The tender was that of Henry Holloway, Brothers (Limited), of Westminster, for £17,285 14s. 6d., being £15,829 14s. 9d. for new ferro-concrete bridge, and £1,456 19s. 9d. for road works and approaches.

Road Maintenance—Past and Present.*

By A. McARTHUR, Highways Surveyor to the Cuckfield Rural District Council.

It is with some diffidence that I venture to deal with this all-important subject, having no illusions as to my unworthiness in this respect; even so I will endeavour to present briefly the main everyday issues as they appear to me.

During the past decade, and especially during more recent years, the profession has been rich in theory as well as in practice. Much also has been done by commercial enterprise and speculation; inventive genius has been much in evidence, and brain and fortune have been freely requisitioned and expended in the praiseworthy efforts made to secure some more permanent means to combat the ill-effects of the revolutionised traffic, in the upkeep and maintenance of highways.

Of late years we have lived in a changed and quickened atmosphere. An Imperial Road Board and numerous associations have been formed, and International Road Conferences have been held. A prudent yet critical Press has followed each movement, reproduced each venture, and marked each stage in this history-making epoch.

In pre-motor days . . . we had apparently reached our goal or limit and become apathetic and inactive, so far as advancement was concerned, to an almost culpable degree. True, the nature and amount of traffic did not demand any great upheaval, and little serious effort was therefore made to think out the niceties now practised; the traffic conditions then were of the jog-trot order, but the fast running, mechanically propelled products of to-day have, as it were, thrown out a challenge to which no self-respecting road engineer could remain passive; hence the experimental and general activity now present with us. . . .

THE ENGINEER AND SURVEYOR.

Times are changed for the surveyor; his life is now one of ceaseless activity, onerous duties and heavy responsibility; old forms of maintenance are rapidly becoming inapplicable and lapsing into disuse, and many old ideas and traditions are exploded. The expert surveyor of to-day must think more and must combine a first-rate education with a thorough professional training. A rigorous schooling in fact is also an essential; as he necessarily comes into contact with all shades and classes, he must be well versed in the psychology of human nature.

ROADMEN.

Many people have the impression that any old man can be a roadman. This is a delusion. Too much care cannot be exercised in the choice of suitable workmen, for the well-instructed and skilled, able-bodied roadman is a valuable asset to his employers, and, incidentally, I might say, makes the office of the surveyor a lighter and pleasanter one.

The full-fledged surfaceman in this district has charge of $\frac{3}{4}$ mile section of road, and occasionally assists in other parts of the district. He is provided with a complete set of tools, a book of rules and instructions, also note books and stationery; nothing is left to chance, so that there can be no bar, real or pretended, to the proper execution and discharge of his duties.

In this connection I understand that an interesting, novel and practical method is in vogue on the Continent. Each responsible roadman carries with him a staff with a pointed end, about 5 ft. long, upon the top of which is attached a weatherproof box. It is the roadman's duty before commencing work to place this staff upright on the grass margin or other suitable place where it is in a prominent position. This is an indication to the surveyor or other supervisor that he is actually at work on that length. In this box is kept the roadman's note-book. The surveyor or supervisor is thus enabled to find out exactly where the roadman is at work and the nature of the work he is doing, and any incident that has happened worth noting.

The surveyor can also by this means inscribe in the note-book any instructions he may wish to convey, feeling sure that this is a reliable method of conveying the desired instruction or information.

Much depends on the character and the intelligence of the workman employed. The raw recruit has a great deal to unlearn as well as to learn. One frequently meets with the indifferent type, clumsy, and with little natural aptitude—the man who cannot see many inches beyond his own proboscis. Occasionally one discovers the born roadman, as in other spheres, the man with the innate faculty of doing the right thing in and at the right time. The former, however, if he is to be of any real service, must be placed in the hands of an expert and trustworthy lengthsmen until he is drilled into shape and acquires the necessary skill to be placed in charge of a section of his own.

ROADSTONE.

In my late district in Mid-Perthshire, Scotland, we unearthed and provided our own stone; a variety of excellent stone abounded in the district, and several good quarries were worked. Steam power was used in the rock drilling and breaking and grading of the quarried material, and a 3-mile aerial ropeway—at that time, I believe, the second longest in the world—was used to convey the broken stone from the main quarry to the nearest local railway station, whence it was distributed over the district.

Here, in the South of England, we have things made comparatively easy for us in this respect; imported broken material is almost exclusively used, there being only some pit-stone and flints available locally, both of which are, however, now practically "taboo" for surface maintenance. A fine range of granite is, however, placed on the market, but no little discrimination is required in regard to its selection.

The only sure test of roadstone is, of course, its actual wearing capacity on the road. Price, while it must have considerable influence on the question, should not be the only ruling factor; attrition and crushing tests serve as a valuable first guide, but such questions as impermeability to moisture, sub-soil, drainage, class of traffic, and other conditions should be well and carefully considered, and the material selected, compatible with a reasonable price, the best adapted for the general conditions prevailing. Other factors not the least important are the size, shape, and uniformity of gauge as well as delivery and specific gravity as applied in its relation to the covering capacity of the material. Perhaps these two latter points are sometimes overlooked, but they are things that matter; the best of organised systems may be seriously dislocated by belated deliveries, and result in considerable expense and inconvenience to the authority, and as regards the covering capacity of the stone, though the increased cover per ton gained may be slight, it counts for a very great deal where it is necessary to use many thousands of tons.

The following is a brief description of the special granites used in this district—viz.:

Quenast Granite.—Quenast is certainly one of the best granites used in this country for road-making purposes. It was introduced into England over thirty years ago, and we find it now used very extensively in all the counties in the South and East parts of England. It is a "porphyry" of exceptional hardness and toughness, and breaking, as it does, with a very rough fracture, there is a great advantage in using this material on roads where tar or other bituminous substances are to be applied. It comes from a town in Belgium which gives it its name, and the quarry itself is the largest in the world. It consists of one huge working, the dimensions of which are 1 mile long, $\frac{1}{2}$ mile broad, and over 300 ft. deep. The method of transporting the granite from the depths of the quarry and distributing it to the breakers and other parts is very interesting. This is done by means of an endless chain working throughout the quarry. The length of this chain is over 10 miles. This quarry supplied over 1,000,000 tons a year, the output going to such countries, besides England, as France, Germany, Belgium; in fact, it is sought after all over the Continent. It has the advantage of a very low specific gravity, and consequently a high covering capacity. Roads made with this granite have excellent wearing results, and at the same time maintain a smooth running surface until the material is entirely worn out.

Penmaenmawr.—Penmaenmawr granite is quarried

at Penmaenmawr, North Wales. These quarries are without doubt the largest and the most up-to-date in equipment in these islands. This granite is an "Estate diorite," and is probably used by a larger number of county councils and other public authorities than any other granite. It has the combined advantages of hardness, toughness, and consequent general durability, and, being of low specific gravity, its covering capacity is large.

Alderney Granite.—The Alderney granite is a diorite, which, as macadam, breaks very cubically, and without flaky pieces. Owing, however, to its peculiar "toughness," it is found quite impossible to cut or cleave it so as to make kerb, setts or cubes; but this quality, of course, gives it a special value as a macadam. It is largely selected on account of the high tarring value of the rock, for use in the new asphalt-macadam roads.

ROLLING.

Prior to the advent of the steam roller the stone applied on the roads usually received a heavy coating of earthy binding material, and was then left to be worked in by the traffic; occasionally a horse roller was used, but this was of little practical use either. The roads were therefore in a rough macadam condition for months together. Now the steam roller and the scarifier have become indispensable to the road maker, and a return to the old conditions would seem inconceivable to all of us; in spite of this fact, however, I was astounded when told recently that there are still some parts of England where the steam roller is not in use. It is into such areas I should like to consign the unlovely road-hog.

I am afraid that in the consolidation of metal sheer weight has too often been taken as the main factor. This, however, is a costly mistake, wasteful in material, and wholly unsatisfactory in results. The great aim in rolling should be to get as nearly as possible the perfectly formed crust, well keyed to the original surface, and the whole rendered compact with the body of the metal preserved intact or with a minimum of wastage. In my opinion, a 10-ton roller is quite heavy enough for use in the formation of the water-bound crust, and a still lighter engine is advisable for tar-macadam or other mobile material.

On weak, narrow roads the large roller is fatal, the tendency being to flatten the cross-section, and the carefully moulded camber so necessary to the construction of a well-made road is never secured.

This is especially conspicuous when the abutment of the road is weakened by open ditches close to the

hardway, and where this combines with the piecrust and clayey subsoil the road takes a concave instead of convex surface, becomes wavy in contour, and banks out until the ditches become choked. With the lighter and more narrowly built engine the camber is gradually worked up from the sides to the centre of the road, thus forming a well-shaped and properly keyed crown.

A minimum of water and foreign binder should be used in the manufacture of the new crust. Personally, I use a quantity of Mendip screenings and flint gravel as a supplementary binder. This, I find, facilitates the rolling process, and results in a well-knit mosaic finish containing a minimum of damaged aggregate.

I think I may also claim for this a better surface for tar-dressing, and in the case of flint gravel, which I use mainly for the steeper gradients, the horse traffic finds a more suitable surface, a better bite than could be obtained by the use of granite only.

A good deal of interest has recently been evinced in the question of the transverse corrugations that appear in the road crust. This is undoubtedly an important question, and I agree with many others that these waves first take their formation in the process of rolling. Whether a three-wheeled roller is to eliminate this waving tendency I very much doubt. Personally, I consider that an increased diameter of the front rollers would at least minimise the effect now produced. As it is, the weight, width and intense curvature of the smaller wheels must, especially with a mobile class of material, provoke this billowing tendency, and I cannot help thinking that the flatter segment obtained in the larger wheel would give a more even surface. This, I have no doubt, the mechanical engineer has under consideration, and will ere long, we hope, introduce some effectual adjustment.

Let me add, however, that there are contributory agents. Much of this corrugation is the result of excessive fatigue, unstable foundation, and is often aggravated by injudicious scarifying, careless application of the stone, and, in the case of the water-bound roads, the misuse of water and binding material. Excellent results can be obtained with the steam roller now in use if the materials used are suitable and the work judiciously carried out. I have myself seen newly rolled roads left in a deplorable condition, covered with slurry and full of water—a quaking and quivering mass when the traffic passed over it. The ultimate effect of such work is obvious, and cannot be expected to do justice to any type of roller.

ROAD CRUSTS.

I do not wish to further enlarge on the activity displayed in the endeavour to secure the ideal conditions, and I do not here propose to make any attempt to enumerate or describe the many types of road crust now practised.

Through the public-spirited kindness of my council I have been able, to some extent, to keep in touch with the progressive movement, and, so far as I can see, taking the subject in a general way, tarred slag macadam still holds its own. In this connection I may say that only quite recently I carefully examined the trial lengths at Sidcup, and, in my opinion, although the work was generally of a very high standard, the superiority of the tarred slag lengths laid by Messrs. Constable, Hart & Co., was indubitable, yet this form of crust has been in use for many years, though, no doubt, much improved of recent years.

Personally, I laid several lengths of tarred slag, supplied by Messrs. Smart & Son, in Balcombe Village about six and a-half years ago, and except where disturbed by sewerage operations the road is in an almost perfect condition at the present moment. The length not disturbed carries all the traffic to and from the railway station and goods yard, as well as general traffic, which is tolerably heavy, but not a penny has been spent in the way of repairs or dressing since the macadam was first laid in September, 1907. The cost per yard was 2s. 3-57d.

I might also say that nearly eight years ago I put down several experimental lengths of tar and pitch-grouted macadam (tarred macadam in situ); the aggregate was quenast and quartzite. The voids in the coarser aggregate were filled in with graded material and finished with a coating of fine screenings.

For the purpose of comparison I may mention that one of the experimental sections had three years previously been well coated with water-bound granite, which, however, by the end of that time was completely worn out.

The cost of the experimental work was under 2s.

per super. yard, which, with a dressing of tar every two years, may be put down at 2s. 6d. against 1s. 9d. for ordinary macadam. Practically no mending was necessary till the end of last year, so that having regard to the life of the respective crusts, the tarr-grouting system has everything in its favour.

SURFACE DRESSING.

The efficient surface dressing of a modern road is undoubtedly one of the most important items in the duties of an up-to-date surveyor. Although the process of construction may have been perfect to a point, a slight mistake in the surface treatment may go far to undo the good that is done. Weather conditions certainly, in my view, have such bearing upon the success or failure of surface painting that it is essential to have ample plant at hand so that at short notice full strength may be put on to take the first advantage of warm, fine days, which in this country are unfortunately too few.

The tarring of a surface which contains even the least moisture is, I believe, doomed to failure, or at least the risks are so great that waste of money in the form of materials and labour are more than likely.

Choice of materials is also of great importance, and I have found excellent results to be obtained by the use of carefully distilled tar or proprietary compounds, such as Tarvia. It is clear to me that there are two most important factors to be reckoned with, and more especially in surface dressing a macadam road which has not been previously treated, first to obtain the maximum of percolation, and second, to obtain a skin of the compound being used to resist the wear. This can be accomplished, I believe, by giving two coats, the first and ample one of light grade tar, allowing ample time for percolation before spreading the grit or chippings, and following in due course with a second coat of more thoroughly distilled tar or compound, and upon this a good coating of coarse grit or chippings.

The expense of twice treating is one of considerable importance, and in many instances no doubt would be found prohibitive; but the outlay will be well justified when the efficiency of the work and the durability of the road are taken into account.

With regard to blinding material, personally, I almost invariably have used a good local pit sand, and with this combination a good wearing pad has been obtained at a minimum of cost. I consider, however, that the best results will follow on the use of compo sand—a mixture of pea beach and sea sand. This gives a wonderfully effective and lasting armouring.

I do not favour an all-round use of coarse granite chippings or gravel. Such dressing may have a carpeting effect, and may answer fairly well on roads with light carriage traffic, but where heavy traffic conditions obtain I contend that their use is unwise. The chips are usually charged with moisture, and unless keyed in with the main road crust they are in a short time crushed by the traffic, leaving a pitted and damaged surface, a prey to adverse weather conditions.

Having reference to the methods of application, the relative merits of machine and hand dressing, I personally hold the view that the improved modern machine, on a properly prepared surface, gives equal, if not better, results, the work besides being carried out more expeditiously, which is a thing that matters much in tarring. I grant, of course, that there may be exceptional circumstances where the hand work is warranted. . . .

DRAINAGE.

It would be idle for me to lay any special emphasis on the importance of securing a proper and complete system of drainage, knowing as I do that this is a fundamental principle which is fully recognised by the road engineer.

Surface and underground drainage are the first essentials in good road making, although from experience it is obvious that this must have been sadly neglected in the past. Ditches, outlets, and underground carriers of surface water should be made adequate and equal in capacity to the maximum demand, and it should be the roadman's first care to make himself conversant with all his drains and maintain these in a proper state of efficiency, reporting at once to the surveyor any faults found. Underground conditions should be carefully diagnosed, springs should be tapped, and other sources should be intercepted and drained off to a natural or other drain where no harm can accrue.

I have personally known places that have received

large quantities of material, which, however, were practically swallowed up by the wet, clayey subsoil and the road was soon again in the incipient stages of deformation. These places frequently are found where the roads are in cutting, and where the roadway becomes literally a channel for the discharge of the soakage from the surrounding land.

Intermittent springs also frequently appear, so that the roads become really dangerous to the traffic. My method of dealing with this is the cutting of a deep trench at the sides of the roadway, at the bottom of which is laid an open-jointed pipe drain; the remainder of the trench is filled in with large surface-picked flints or hard brick rubble, filling up to the underside of the road crust. The springs I tapped by arterial drains constructed in a similar manner, and made to discharge into the main drain. This is a most effective way of dealing with such conditions, as in the result all suspended moisture is attracted to the open rubble and a dry, hard road is secured, thoroughly drained and permanently safeguarded against any lateral movement, the road being held intact by the interposition of the abutment of coarse material forming the drain.

I have the utmost faith in the value and ultimate economy gained by the increased stability of a solid shouldering; the once-upon-a-time theory held by some that if one made up the centre the sides made up themselves being farcical.

REPAIRS.

In this connection we should always bear in mind the old adage "A stitch in time saves nine," and in its application to road repairs a stone in time probably saves nine. It is here that road craft may be seen to advantage or otherwise, and many are the ways and means employed. The prolific pothole, for example, I have known to be simply filled up with half a shovelful or so of screenings and a little dry road grit. Of course, this was rudely displaced and scattered by the first passing motor car. The system, however, was pursued with a zeal worthy of better results.

Personally, I think that tar-macadam is the best pothole mender. It may not answer so well with a water-bound, untreated surface, but even there, I think it may be used to advantage if it receives a surround of tar dressing. A proper boxing should be made for the reception of the material. Prevention, however, is better than cure, and it is well to look to such details as referred to under the heads of rolling and drainage. The careful removal of mud and other detritus, and the cutting of hedges and trees also, cannot be too closely observed, and a tactful word to the farmer when carting from the fields may save much heartburning.

In conclusion I may, perhaps, be allowed to repeat my assertions as to the consistent efforts made by the road engineer to grapple with this vexatious question. Yet, while granting that much has been accomplished, and that the almost ideal conditions may now be obtained by large expenditure of money, I think it must be admitted that, taken as a broad whole, the road problem still remains unsolved.

West Hartlepool Town Planning Scheme.—The West Hartlepool Corporation have decided to proceed with a town planning scheme for an area of 1,200 acres within the borough, and 4,000 acres without the borough boundaries.

Preliminary Studies in Bridge Design.—This little book,* a reprint of articles which appeared in THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, is intended as the first of a series of similar volumes which, taken together, will form a treatise on the design of ordinary highway bridges of moderate spans. This first volume goes further back in the evolution of the bridge than do most treatises, and considers the bridge in its essential elements, that is as the means of providing a crossing for man and beast across a watercourse. The bridge engineer is apt to forget this primary purpose and to consider his bridge merely as a framework or a carrier of stresses. Mr. Ryves, in a refreshingly original manner, has emphasised the necessity for studying natural and economic predispositions, one might say, of the bridge site, with a view toward producing, not the best type of bridge, but the best method of getting the river and the traffic across one another. . . .—*Engineering News*, New York.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 21, Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

393. Surveying.—In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. (Give proofs of any formulæ involved. (T. W. P., *Bexhill-on-Sea*.)

394. Building Inspection.—In carrying out the duties of a building inspector, state what are the common errors to be looked for when inspecting a deposited plan, and also the chief faults that are met with on the actual building. (T. W. P., *Bexhill-on-Sea*.)

395. Plumbing.—A lead pipe has to convey both hot and cold water in horizontal and vertical directions. Show by a sketch how it should be fixed, and give reasons. (B. W., *Tadcaster*.)

396. Strength of Materials.—A horizontal uniform bar 18 in. long, is laid over two supports, each 4 in. from its ends. Find two points at which the bending moments are zero.

397. Testing Cement.—Explain in detail, giving sketches where necessary, how a sample of cement would be tested in practice. (B. W., *Tadcaster*.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

391. Concrete Floor.—A concrete floor is to be constructed as shown in the sketch, with 4-in. by 3-in.

FIG. 1.

R.S. joists, and woven mesh steel wire with a 3-in. lap. The R.S. joists have a 4 1/2-in. wall hold, and the floor a 2-in. wall hold. The size of the room is 16 ft. by 13 ft. Calculate the safe distributed load per super. foot, also the breaking load. (Assistant.)

The strength of the concrete floor shown in the sketch will be equal to the strength of the R.S. joists, plus the additional resistance given to them by being embedded in the concrete. The wire mesh will transfer the load to the joists and bind the floor into a homogeneous mass, tending to localise any cracks which might occur in the concrete; it cannot, however, be taken into the calculations in this instance.

First calculate the safe distributed load on a 4x3x9 1/2 lb. R.S. joist for a span of 13 ft. As the ends have a wall hold of only 4 1/2 in., and this is nearly the same as the depth of the joist, it cannot be considered as having fixed ends. Therefore the maximum bending moment due to a distributed load will be given by the formula—

$$Mb = \frac{w L^2}{8} \times 12 \dots \dots (1)$$

Where w is the load in pounds per foot-run on the joist; L =span in feet.

The resisting moment is given by the expression—

$$Mr = fZ \dots \dots (2)$$

Where f =safe stress on steel in lb./in.², and

Z =modulus of section of the particular joist. Now equating expressions (1) and (2) we get—

$$\frac{w L^2}{8} \times 12 = fZ \dots \dots (3)$$

The safe stress on mild steel may be taken as 7 1/2 tons/in.², or, say, 17,000 lb. in round figures. The section modulus may be found from the dimensions of the joist (see Fig. 2) and it will be sufficiently accurate if we use the approximate method of multiplying the area of one flange by the mean depth from centre to centre of the flanges—*i.e.*—

$$Z = (3 \times 0.34) \times 3.66 = 3.73 \text{ inch units.}$$

FIG. 2.

By inserting the known figures in expression (3) we now get—

$$\frac{w (13)^2 \times 12}{8} = 17,000 \times 3.73$$

$$\therefore w = \frac{17,000 \times 3.73 \times 8}{169 \times 12}$$

$$= 234.5 \text{ lb. per foot run.}$$

The additional resistance due to the joist being embedded in the concrete depends upon the ratio existing between the thickness of the floor and the depth of the joist, and may be ascertained by multiplying the above figure by the formula—

$$\left(0.6 \frac{t}{d} + 0.6 \right) \dots \dots (4)$$

Where t =thickness of concrete, and d =depth of joist. Therefore we get—

$$234.5 \times \left(0.6 \times \frac{6}{4} + 0.6 \right) = 352 \text{ lb.}$$

This load is distributed over a width of 4 ft., therefore the weight per super. foot will be—

$$352 \div 4 = 88 \text{ lb. ft.}^2$$

The floor itself will weigh about 60 lb./ft.², so that the safe additional load will be about 28 lb./ft.². The breaking load would be between four and five times the total safe load—that is, about 400 lb./ft.². (E. E. W., *Manchester*.)

Hull Municipal Telephones.—The Hull Corporation on Wednesday formally took over the telephones purchased from the Government, and Alderman Brown, the chairman of the Telephones Committee, signed a cheque for £192,423, the purchase price. The amount of capital now invested by Hull in telephones is more than £250,000.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Harrogate T.C. (May 5th. Mr. Edgar Dudley).—This was an inquiry respecting an application for consent to letting, for a term of twenty-one years, a part of the Ripon-road farm for the purposes of a golf course.—The town clerk, Mr. J. Turner Taylor, stated that the farm originally consisted of 308 acres, acquired by compulsory purchase for £19,763, the total cost, with costs of arbitrations, valuations, legal expenses, &c., being £21,861, or a little over £71 per acre. The land was utilised for sewage disposal until 1905, and was afterwards let as a farm to the highest tender, and let at £270 per annum. Mr. Taylor then explained the numerous appeals made by residents for a municipal golf course, but there were difficulties in the way, and the officials of the Local Government Board advised him to advise the council to lease the land to a club or syndicate for the purpose of a golf club. Evidence was given by Mr. F. H. Gray (borough treasurer) and Mr. C. E. Rivers (borough surveyor). It was urged on behalf of the opposition that the land should be laid out for building purposes. The town clerk said there was no likelihood of the land being wanted for twenty-one years for building purposes.

Honley U.D.C. (April 22nd. Mr. M. K. North).—£3,000 for the widening and improvement of Eastgate.—It was explained that Eastgate, or Towngate, was the chief means of access to the town of Honley. It was a very steep road, having in one part a gradient of 1 in 8½, and in another part, where the gradient was 1 in 11½, the road took a sharp turn almost at right angles. The proposed improvement scheme, which had been prepared by the surveyor, Mr. R. Beaumont, involved the removal of certain existing buildings, and the purchase of a total area of 587 sq. yds. of land, inclusive of the land on which the buildings at present stood.

Keighley R.D.C. (April 29th. Mr. M. K. North).—£2,250 for the provision of a cemetery in the township of East and West Morton, and for an order declaring the cost of the provision and maintenance of the cemetery to be special expenses chargeable on the township.—It was stated that the area it was proposed to acquire was 2 acres, and that it would suffice for the needs of the parish for over 100 years.

APPLICATIONS FOR LOANS.

- Antrim C.C.**—£1,300 for converting a building into a technical school.
Garshalton U.D.C.—£540 for rebuilding a bridge.
Coventry T.C.—£331 for a road improvement.
Dublin T.C.—£19,008 for a housing scheme.
Evesham T.C.—£1,800 for the purchase of land for a housing scheme.
Hastings T.C.—£3,535 for a new sea wall.
Marylebone B.C.—£5,524 for electricity plant.
Northam U.D.C.—£6,250 for Appledore improvements.
Oswestry R.D.C.—£1,100 for a water supply for Morda.
Rowley Regis U.D.C.—£10,000 for street improvement works.
St. Asaph R.D.C.—£1,008 for a water supply for Llansannan.
Stoke-on-Trent T.C.—£11,113 for paving certain streets with setts.
Sutton Coldfield T.C.—£2,525 for special instruction centres.
Tamworth T.C.—£1,400 for public walks and pleasure grounds.
Wakefield T.C.—£13,850 for the extension of the infectious diseases hospital.

LOANS SANCTIONED.

- Cheltenham T.C.**—£1,000 for wood paving.
Girencester U.D.C.—£800 for a new fire engine.
Darwen T.C.—£626 for a recreation ground.
Essex C.C.—£3,228 for the enlargement of Chipping Ongar school.
Exeter T.C.—£394 for a handicraft centre.

Hereford T.C.—£1,500 for electrical mains.
Houghton-le-Spring U.D.C.—£11,738 for the erection of fifty two houses.

Hull T.C.—£1,589 for alterations at the Marfleet school.

Lichfield R.D.C.—£7,517 for sewerage and sewage disposal works.

Stoke-on-Trent T.C.—£1,650 for a road improvement, and £1,179 for alterations to Stanfield Hospital.

Torquay T.C.—£11,650 for medical bath buildings and electric lighting, repayable in thirty years; £1,015 for baths and dressing boxes, repayable in twenty years; and £2,305 for boilers, machinery, heating apparatus, hot water supply, and furniture and fittings, repayable in fifteen years.

FORTHCOMING INQUIRIES.

MAY.		£
11.—	Horsham. For the erection of artisans' dwellings (Mr. H. A. Chapman) ...	1,500
11.—	Romford. For road improvement (Mr. F. H. Tulloch) ...	1,974
11.—	Sidmouth. For the provision of pleasure grounds (Mr. W. O. E. Meade-King) ...	4,400
12.—	Bury. For the electricity undertaking (Mr. H. R. Hooper) ...	55,000
12.—	Dolgelly. For works of water supply (Mr. W. M. Cross) ...	1,000
12.—	Grimsby. For works of paving and sewerage (Major J. Stewart) ...	1,733

15.—	Coventry. For the purposes of baths, streets, and a recreation ground (Major J. Stewart) ...	20,300
16.—	Bushey. For drainage and street works (Mr. R. H. Bicknell) ...	270
18.—	Heckmondwike. For the provision of a disinfecting station (Dr. F. Seymour) ...	450
19.—	Barking. For street improvement (Major J. Stewart) ...	2,150

Liverpool Corporation Surveyor.—The Liverpool City Council on Wednesday decided to appoint a surveyor—age not to exceed forty-five—at a salary of £1,200 a year, in succession to Mr. T. Shelmerdine, retired.

Newcastle-on-Tyne Town Planning Scheme.—The Local Government Board are understood to have given authority for the preparation of nine further town planning schemes under the Housing and Town Planning Act, 1909. The schemes are authorised to be prepared by the corporations of Manchester, Newcastle-upon-Tyne, and Wrexham; the urban district councils of Beckenham and Oldbury, and the rural district councils of Wrexham and Rotherham. In the case of Newcastle-upon-Tyne the scheme is to extend to an area of 1,265 acres in the eastern portion of the city.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Glasgow, Hastings £3,535, Wallasey; housing and town planning—Bootle, Hereford; roads and materials—Bellast, Bilston, Birmingham £31,612, Grimsby, Liverpool, Wallsend; sewerage and sewage disposal—Bath, Fleet £36,400; water, gas and electricity—Newport (Mon.), Rotherham £8,300; miscellaneous—Rhyl. Particulars of other works projected will be found in our "Local Government Board Inquiries" page.

BUILDINGS.

Burnley R.D.C.—The surveyor, Mr. H. Pritchard, has submitted plans and estimate of a proposed new bridge at The Hole, Blacko, and tenders are being invited for the erection of the structure.

Cork T.C.—A special committee has been appointed to go into the question of the site for the proposed cattle market.

Glasgow T.C.—The council have accepted the tender of Messrs. J. Emery & Sons, Potmadie, at £67,124, for the excavation, masonry and brickwork in connection with the extension of the municipal buildings.

Guildford R.D.C.—The tender of Messrs. Kavanagh & Co., of Surbiton, at £1,533, has been accepted for the construction of three bridges in the parish of Send and Ripley, and the tender of Messrs. John Garrett & Son, of Balham-hill, at £1,295, has been accepted for the reconstruction of Broadmead Bridge.

Hastings T.C.—The council have approved a report from the Sea Defence Committee recommending the erection of a new sea wall at Marine-parade and East-parade, at an estimated cost of £3,535. The additional space gained by the proposed demolition of the old wall, which is in a rotten state, will be utilised for widening the roadway, while steps are also to be taken to stop the flooding of the adjoining district.

Hereford T.C.—Plans have been submitted for the improvement of the front of the art school in the Castle Green. The intention is to remove the present unsightly portico, and to erect a new one.

Lewisham B.C.—The London County Council have agreed to contribute one-half (not exceeding £150) of the cost of constructing nine refuges in High-street. The Works Committee recommend the council to establish a tuberculosis dispensary.

Shropshire C.C.—Subject to the co-operation of the Worcester County Council, and sufficient local support being assured, the council have agreed to consider favourably the erection of a bridge over the river Severn near Highley.—It has been agreed to purchase a site for a school in Clun Union area, consisting of 8 acres, for £1,200.

Southampton T.C.—The Baths Committee have been asked to consider the provision of slipper baths for the Shirley district.

Stepney B.C.—It has been agreed to build the new municipal offices on a site in Arbour-square.

Stoke-on-Trent T.C.—The Parks Committee propose to erect a pavilion in Longton Park, at a cost not exceeding £1,500.

Taunton T.C.—The tender of the British Steel Piling Company, at £3,935, has been accepted for the proposed new works on the river Tone, at French Weir.

Tavistock U.D.C.—Mr. I. B. German, a councillor, has presented the council with a pavilion for the recreation ground.

Wallasey T.C.—The tender of Messrs. William Moss & Sons, of Loughborough, at £82,140, has been accepted for the erection of the new town hall. With site and equipment the building is estimated to cost £103,000.

Woodford U.D.C.—It has been decided to erect a new chief fire station, with officers' quarters, at an estimated cost of £820, and to purchase a motor fire engine for £660.

Worcester T.C.—A tender, at £9,073, has been accepted for the erection of a council school in Stanley-road.

Worthing T.C.—The borough surveyor, Mr. F. Roberts, has been authorised to obtain tenders for repairs to the town hall.

HOUSING AND TOWN PLANNING.

Bootle T.C.—The Health Committee have been instructed to take into consideration the question of providing housing accommodation for artisans.

Bridlington T.C.—It is proposed to carry out a housing scheme, at an estimated cost of £2,450.

Eastbourne T.C.—The Housing Committee are considering the purchase of 6 acres of land at the east end of the town for the purposes of a housing scheme, and the borough surveyor, Mr. A. E. Prescott, with the building surveyor, are preparing details of a second scheme for the erection of dwellings at Victoria-drive.

Falmouth T.C.—It has been agreed to proceed with a second scheme for the provision of twenty-two workmen's dwellings.

Hawarden R.D.C.—The council have adopted a housing scheme to consist of forty houses. Twenty of the dwellings are to be let at a rental of 4s. 3d. per week, six at 4s. 9d., and four at 5s. 6d.

Hereford T.C.—The Housing Committee have accepted the tender of Mr. George Field, of Blackheath, near Birmingham, at £10,474, for the erection of workmen's dwellings.

Kilryth T.C.—In a report on the housing problem the burgh surveyor states that to build houses of two or three rooms with modern conveniences at a low rent seems to be impossible under present circumstances.

PARKS AND OPEN SPACES.

Hindley U.D.C.—It is proposed to lease a plot of land for the purpose of a bowling green.

Liverpool T.C.—The council on Wednesday decided to purchase from Lord Derby land at Roby adjacent to the Bowring estate for £4,500. The land will probably be used as an extension of the municipal golf links.

REFUSE COLLECTION AND DISPOSAL.

Risca U.D.C.—The council have decided to alter the system of dust collection by resorting to the contractor, and tenders were received in due course for the work. After discussing the matter, however, it was decided not to accept the proffered tender, but to revert to the system of direct labour.

ROADS AND MATERIALS.

Belfast T.C.—With a view to the improvement of the thoroughfares, it has been agreed to proceed at once with a series of experimental street pavements.

Bilston U.D.C.—A scheme is proposed for the improvement of that portion of the Holyhead road running through Bilston which comprises two of the principal streets in the town Oxford-street and Wellington-road. The estimated cost is £20,000. The Road Board have offered to contribute £5,000 towards the outlay for the principal portion of the work, leaving the net cost at £13,773. The county council are said to approve the scheme.

Birmingham T.C.—The Public Works Committee has been authorised to carry out works for paving portions of Harborne-road, and High-street, Harborne, Ryland-street, Ledsam-street, and a part of Booth-street, Handsworth, at an estimated cost of £31,612. It is proposed to pave Harborne-road from Augustus-road to The Green Man public-house with Durax paving, on concrete foundation; continuing from the Green Man, through the village to the junction with Lordswood-road, with wood paving; and Ryland-street, Ledsam-street, and part of Booth-street with 4-in. by 4-in. by 5-in. granite setts, on concrete foundation.

Blackburn T.C.—The Highways Committee have adopted a scheme for the development of the land lying westward of Revidge, and extending from Preston New-road to Brownhill. The scheme provides for the construction of nine new streets and the widening of two existing highways to 60 ft.

Blackpool T.C.—The borough surveyor, Mr. J. S. Brodie, has received instructions to prepare the necessary plans for making up six streets and three passages.

Bridlington T.C.—A scheme has been adopted for the widening of one of the main thoroughfares to 60 ft., at an estimated cost of £2,500.

Camberwell B.C.—The members of the Works and General Purposes Committee, accompanied by the borough engineer and surveyor, Mr. W. Oxtoby, M.I.N.S.T.C.E., recently visited a number of roads in other metropolitan boroughs, and examined the methods and conditions of the various roadway pavings. They report that they were impressed with the good condition and wearing quality of "Cornastic asphalt," and have instructed the borough engineer to prepare estimates of the cost of paving the following roads with this material—viz.: 'Bus routes—Trafalgar-road, Summer-road (part), and Willowbrook-road; Nunhead-lane (from pitched portion to Nunhead-green), Nunhead-green and Evelina-road (from Nunhead-green to Kimberley-road); South Croxted-road; Crystal Palace-parade; Half Moon-lane and Red Post-hill (Beekwith-road to Dulwich Village). They have also asked the borough engineer to submit an estimate of the cost of laying a trial length of "Lithofalt" blocks in Rye-lane.

Dumbarton C.C.—The widening of the Loch Lomond road south of Tarbet has been completed, the minimum width having been increased from 12 ft. to 16 ft. The cost of the scheme was £5,000, of which the Road Board have consented to pay £1,000. It is intended to tar pave the whole length of the road. The council contemplate extending the widening to Luss village.

Grimsby T.C.—The borough engineer, Mr. H. G. Whyatt, in conjunction with the engineer to the Great Central Railway, is engaged on the preparation of a scheme, estimated to cost £80,000, for linking up Grimsby with Immingham by means of a direct road.

Kirkby-in-Ashfield U.D.C.—A sum of £450 is to be paid in respect of a proposed improvement at Thompson's-corner.

Leek U.D.C.—The surveyor, Mr. W. E. Beacham, has received instructions to prepare a plan and estimate for making up Milk-street from Ball-Hay Green, so far as the roadway is 36 ft. wide.

Leicester T.C.—With regard to the scheme for widening Belgrave Gate it has been agreed to purchase property at a cost of £16,739.

Lewisham B.C.—The General Purposes Committee recommend the council to accept the terms offered by the London County Council with respect to the proposed improvement in Bromley-road, south of Beckenham-lane. These are that the London County Council shall pay two-thirds of the estimated cost (£1,100) of the work.—The London County Council are proceeding with the construction of the Park-road to London-road, Forest Hill, tramways, and the Works Committee of the borough council have directed that advertisements be issued inviting tenders for wood paving the breasts of the carriageway along this route.—The Works Committee recommend the council to accept the offer of the London Asphalt Company, Limited, to lay "Durophalt," 2 in. thick, with a creosoted-timber edging, across Blackheath, at 4s. 10½d. per yard super., and maintain it free of cost for five years.—The Works Committee also recommend that Parkeroff-road, Lee, be paved as a new street, at the cost of the owners.

Liverpool T.C.—The Health Committee propose to construct, at an estimated cost of £67,500, a new street from Matlock-avenue to Walton-vale.

Romford R.D.C.—An improvement is to be effected at the corner of Church-street and Station-lane, Hornchurch, at an estimated cost of £825.

St. Austell R.D.C.—The county surveyor, Mr. A. E. Brookes, wrote last week that the Main Roads Committee were recommending the county council to take over the direct control of the main roads in the eastern division as from April 1, 1915, and that if the district council were not prepared to enter into a contract on the basis of the approved estimate for the maintenance of the main roads for the period expiring on March 31, 1915, they were to be asked to continue the repair and maintenance of the main roads within their district as agents for the county council, such to be carried out under the direction of the county surveyor,

the expenditure to be limited to the amount of the approved estimate except by written permission of the county surveyor. The rural district council decided to agree to the terms of the county surveyor.

Southend T.C.—Tenders have been accepted for making up and sewerage a number of streets, and several other streets have been ordered to be placed on the list of streets to be made up.

Wallsend T.C.—The council on Tuesday resolved to make a start with the construction of the new roads at Willington.

Ware U.D.C.—Negotiations are in progress for the purchase of properties in Star-street for a widening scheme.

SEWERAGE AND SEWAGE DISPOSAL

Bath R.D.C.—The tender of Messrs. Firth & Co., at £19,172, has been accepted for the Monkton Combe sewerage scheme.

Dalkeith T.C.—A new system of dealing with the sewage is to be carried out at an estimated cost of £9,500. The engineers are Messrs. Gilbert Thomson & Ferguson, Glasgow, and the contractor Mr. John Monteith, Dalkeith.

Fleet U.D.C.—The main drainage scheme prepared by Mr. Moss-Flower has been approved, and the Local Government Board are to be asked to sanction a loan of £36,400 for carrying it out.

Loanhead T.C.—It is intended to effect extensions and improvements at the sewage disposal works.

Rugby R.D.C.—The surveyor, Mr. T. W. Willard, is engaged in the preparation of a sewage disposal scheme for Clifton.

Uckfield R.D.C.—The plans for the Waldron drainage scheme are being amended, and will be forwarded to the Local Government Board in due course.

Wallsend T.C.—The tender of Mr. J. Douglas, of Newcastle-on-Tyne, at £1,822, has been accepted for the construction of a new sewer at the colliery houses, and the tender of Mr. J. Ogston, amounting to £413, for a sewage scheme at the Edward Pit.

WATER, GAS, AND ELECTRICITY.

Bexhill T.C.—The electric lighting at Cooden and Little Common is to be improved, at an estimated cost of £2,500.

Carnarvon T.C.—Another year of prosperity in the gas undertaking was reported on Wednesday, it being stated that there was a profit on the twelve months' working of £674.

Chard T.C.—The long-standing difference between the corporation and the rural district council with respect to the proposal of the corporation for bringing water by a gravitation scheme from the village of Combe St. Nicholas, 3 miles from the town, has been settled satisfactorily, and the Local Government Board have notified their consent to the scheme being carried out.

Coventry T.C.—The council on Tuesday decided to allocate £6,000 from the profits of the electricity undertaking in relief of rates, and place £16,250 to reserve fund.

Dundee T.C.—It has been agreed to clean the water mains in Newport, at an estimated cost of £300.

Hayes (Middlesex) U.D.C.—The surveyor, Mr. C. Bidler, has been authorised to purchase hydraulic plant for lifting water from a local well for the purpose of street watering.

Kinross T.C.—As the result of a poll of the rate-payers the council propose to negotiate for the purchase of the undertaking of the local gas company.

Llanvbyther R.D.C.—Writing with reference to the Llanvbyther water scheme, the Local Government Board stated that under sec. 229 of the Public Health Act, 1875, the expenses incurred by a rural district council for providing a supply of water for a contributory place would be chargeable as special expenses. The board, however, pointed out that by the exercise of the powers possessed by the council of charging rates and rents the council might to a large extent throw the cost of the works on the actual consumers of the water. Any deficiency would, of course, have to be met out of revenue.

Newport (Mon.) T.C.—The Water Committee recommend the corporation to apply to Parliament in the session of 1915 for power to construct an additional reservoir at Henllys.

Norton R.D.C.—The engineer, Mr. Henry Tobey, has submitted a revised estimate for the works in connection with the Leavening water supply, amounting to £775, as compared with the previous estimate of £636, and the council have agreed to apply for powers to borrow the difference.

Penistone U.D.C.—The sum of £998 has been allocated to the general rate from last year's profits of the water undertaking.

Pontardawe U.D.C.—An agreement has been reached with the Swansea Corporation for a supply of water.

Rotherham T.C.—The scheme for the new service reservoir, including pump-house and caretaker's lodge, is estimated to cost £8,300. The reservoir will have a storage capacity of 1,000,000 gallons.

St. Asaph R.D.C.—The council have approved the scheme of the sanitary surveyor, Mr. H. F. Evans, for the proposed water supply for Llansannan.

Smethwick T.C.—A new gasholder is to be erected on the High Park-road site, at an estimated cost of £50,000.

Southend T.C.—The borough surveyor, Mr. E. J. Elford, has prepared for the Gas Committee an exhaustive report with regard to the Leigh gasworks, dealing with the question of the possibility of extending the works on the existing site, and on the ground adjoining, purchased by the Leigh Urban Council for the purposes of the gas undertaking, and also upon the question of transferring the works to other sites. Meanwhile instructions were given the borough surveyor to prepare plans for extending the existing retort-house westwards, and to submit the plans to the committee.

West Bromwich T.C.—The Electricity Committee recommend the town council to approve of the installation of a storage battery at an estimated cost not exceeding £5,000, in order to meet next winter's demand for current.

MISCELLANEOUS.

Birkenhead T.C.—It has been decided to construct a model yachting lake at a cost of £283.

Edinburgh T.C.—The Plans and Works Committee recommend that the three remaining horse-driven steam fire engines should be substituted by petrol motor engines fitted with the reciprocating type of pump, also that a motor lorry, which would dispense with an additional pair of horses, should be provided.

Liverpool T.C.—Corporation workmen's wages were on Wednesday raised to a scale equivalent to the rate of 25s. weekly.

Manchester T.C.—It was suggested on Wednesday at the meeting of the council that the time has come when the corporation should seriously consider the desirability of providing municipal crematoria rather than extend the existing cemeteries.

Rhyl U.D.C.—The advice of an expert is to be taken on the question of the erosion of the coast between Rhyl and Prestatyn. The surveyor, Mr. A. A. Goodall, stated that the total width of land eroded since 1871 is about 250 ft. From a point opposite the Rhyl boundary to Ty Coch (near the recently damaged golf links) an area representing 20 acres has disappeared. Not only is erosion taking place at the feet of the sand dunes, but the bed of the shore at low-water mark is considerably lower than a few years ago.

West Hartlepool T.C.—There was a nett profit last year on the tramways undertaking of £1,663, and a loss on the electricity undertaking of £1,878.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

PERSONAL.

Mr. D. H. Brown, of Preston, was on Wednesday appointed chief engineering assistant to the county surveyor of Durham.

Mr. A. R. Finch, ASSOC.M.INST.C.E., borough engineer and surveyor of Kensington, is to be supplied by the council with an official motor car costing £572.

Mr. Nelson F. Dennis, M.INST.C.E., borough engineer of West Hartlepool, has had his salary increased by £100 per annum, with a further advance of £50 next year.

Mr. H. Percy Boulnois, M.INST.C.E., of 7 Victoria-street, Westminster, has been unanimously elected an honorary member of the Quantity Surveyors' Association (Incorporated).

Mr. John M. Jackson, supervising architect to the Municipality of Singapore, was married recently in Glasgow to Miss Lily Lindsay, youngest daughter of Mr. G. B. Smith, of Glasgow.

Mr. Alfred J. Price, ASSOC.M.INST.C.E., assistant to the borough engineer and surveyor of Eccles, has been appointed resident engineer on the Eccles main drainage scheme, which is estimated to cost £61,000.

Mr. David Davies, county surveyor for the Southern Division of Cardiganshire, and Mr. T. E. Owen, surveyor for the Northern Division, have each received an increased allowance of £40 a year for travelling expenses.

Mr. C. E. Boast, engineering assistant in the city engineer's office, Coventry, read a short paper on "Heading Driving" at a recent meeting of the Birmingham Association of Students of the Institution of Civil Engineers.

Mr. J. T. Hall, M.R.SAN.L., manager of the Staines outfall works, has suffered a bereavement in the loss of his wife, after a painful illness. Mr. E. J. Barrett, surveyor to the Staines Urban District Council, represented the council at the funeral, which took place on Friday last at the Ashford Cemetery, a large gathering testifying to the esteem in which the deceased was held.

Mr. W. J. Isaacs, of Warrington, and Mr. F. L. James, of York, are recommended by the York Streets and Buildings Committee as architectural and engineering assistants respectively in the city engineer's department, each at a commencing salary of £100, rising by annual increments of £10 to a maximum of £150. The city engineer stated that he might very shortly have a vacancy in his office for another engineering assistant, owing to a prospective resignation of one of his staff, and it was decided in such event that the appointment should be offered to Mr. Wm. Walker, of Chesterfield (third of the above selected candidates), at the same salary as the two assistants already mentioned.

Jack of All Trades.—A vacancy having arisen for a roadman, the surveyor to the Linton (Cumbria) Rural District Council proposes to appoint a handy man at 18s. per week who could also do the council's brick-laying, carpentering and blacksmithing!

Municipal Furnished Houses.—The Manchester City Council on Wednesday approved a scheme to provide for the erection, at a cost of £8,973, of furnished houses in Rochdale-road, a thickly populated working-class district. It was stated that the estimated number of people using lodging-houses in Manchester is from 60,000 to 80,000, and that something must be done for this roving population of casual labour. It was the problem of the man who, during his lifetime until his death, had not sufficient goods to fill a handcart. A large number of houses in Manchester have been condemned as insanitary and demolished. This scheme for municipal furnished houses (the *Yorkshire Post* states) is purely experimental. It is proposed to build houses with three independent living-rooms, and each room will be let at a nominal rent by the day or the week. Nearly all the furniture will be fixtures. It is further proposed to provide cookery utensils and crockery. The opponents of the scheme maintained that the rooms would not be used by those for whom they were intended. A deputation of clergy recently waited upon the Lord Mayor and denounced the system. They feared that a percentage of the houses would be hotbeds of vice.

COLCHESTER BOROUGH SURVEYORSHIP.

SELECTED CANDIDATE WITHDRAWS.

A report of the Colchester Town Council in committee, presented at a subsequent ordinary meeting on Wednesday, stated that Mr. C. Owen Baines, engineer and surveyor to the Paignton Urban District Council, who had been recommended for appointment as borough engineer and surveyor, had withdrawn his candidature. The committee recommended that the matter should be referred back to the Roads and Drainage Committee, with power to review the applications received, and to select candidates for consideration by the council in committee.

Applications to the number of 141 (not including four received after the stipulated time) were submitted for the position, which was recently vacated by Mr. H. Goodyear. Of seven candidates interviewed by the Roads and Drainage Committee, Messrs. Baines, Harold Collins, deputy city engineer of Norwich, F. M. Harvey (Great Yarmouth), and Eric A. Slater, acting borough surveyor of Colchester, were in the first place selected, the first-named, as stated, finally being recommended for appointment.

Municipal Daylight Saving.—The municipal staffs at the Wood Green Town Hall have been permitted by the district council to adopt a "daylight saving" scheme of their own. Instead of beginning work at 9 and finishing at 5 they now start at 8 and leave off at 4.

FOR OTHER ADVERTISEMENTS

See End of Paper.

BOROUGH OF CHESTERFIELD. JUNIOR ASSISTANTS, SURVEYOR'S DEPARTMENT.

The Corporation invite application for two Junior Assistants in the Surveyor's Department. Salary £78 per annum.

Applications in candidate's own handwriting, stating age, experience, and accompanied by copies of not more than 3 recent testimonials, to be sent to Vincent Smith, Borough Surveyor, endorsed "Junior Assistant," not later than Friday, the 22nd of May, 1914.

JOHN MIDDLETON,
Town Clerk.

Chesterfield.
May 6, 1914. (1,594)

COUNTY OF SOMERSET. MENTAL DEFICIENCY ACT, 1913.

Wanted, by the County Council of Somerset, a person to undertake the duties of Clerk to the Committee for the Care of the Mentally Defective.

The salary will commence at the sum of £130 per annum inclusive. An office will be provided at, and the person appointed will be required to reside in or near, Weston-super-Mare in the first instance, and all reasonable office and travelling expenses will be paid.

Candidates must have had some previous experience of the law and practice of local government administration, and of general office work, and the duties of the officer will be (subject to the control of the Clerk of the County Council) to transact the whole of the business of the County Council relating to the mentally defective.

The appointment will be determinable by three calendar months' notice on either side.

The officer will be required to give the whole of his time to the business of the County Council.

Applications, stating candidate's age, present occupation, qualifications and experience, to be sent to the undersigned by the candidate, with copies of not more than two recent testimonials, not later than noon on Saturday, 23rd instant.

Personal canvassing of members of the County Council will be deemed a disqualification.

G. I. SIMEY,
Clerk of the County Council.

Sidney House, Boulevard,
Weston-super-Mare.
May 6, 1914. (1,592)

COUNTY OF WEST SUSSEX.

Applications are invited for the appointment of an Assistant to the County Surveyor. Salary £130 per annum, rising by annual increments of £5 to £150 per annum.

Preference will be given to candidates who have passed the examination of the Institution of Municipal and County Engineers, and who have had experience in up-to-date methods of road construction. Applications, in the candidate's own handwriting, stating age and qualifications, accompanied by three recent testimonials, and endorsed "Assistant," to be sent to the undersigned not later than Friday, May 15th, 1914.

Canvassing, either directly or indirectly, will disqualify.

H. W. BOWEN, M.INST.C.E.,
County Surveyor.

North-street,
Horsham.
Sussex. (1,595)

COUNTY OF DURHAM. APPOINTMENT OF COUNTY SURVEYOR AND ARCHITECT.

The County Council of Durham are prepared to receive applications for the position of County Surveyor and Architect.

The person appointed will be required to devote the whole of his time to the duties of the office, and the annual salary will be at the rate of £800 per annum, to be increased to £900 per annum on the 1st April, 1916, and to £1,000 per annum on the 1st April, 1918.

The appointment will be subject to four calendar months' notice on either side.

Applicants must have special qualifications as to the construction of roads and bridges, and preference will be given to those who are under the age of 45 and who are corporate members of the Institution of Civil Engineers.

Applications, endorsed "County Surveyor," together with copies of not more than five recent testimonials, to be sent to the undersigned not later than Monday, the 25th day of May, instant, from whom a Statement of the duties and conditions of the office may be obtained.

Canvassing will be deemed a disqualification, but candidates may circulate copies of their applications and testimonials.

(By order)
HAROLD JEVONS,
Clerk of the County Council.

Shire Hall, Durham.
May 6, 1914. (1,593)

COUNTY OF HERTFORD. APPOINTMENT OF COUNTY SURVEYOR.

The Hertfordshire County Council invite applications for the appointment of County Surveyor.

Applicants must be not less than 30 or more than 45 years of age. Commencing salary, £800 a year. Offices and staff will be provided, and all reasonable travelling expenses and other disbursements will be borne by the County Council. The County Surveyor will also be provided with a motor car and chauffeur free of expense to him.

An applicant must either be a Member or an Associate Member of the Institution of Civil Engineers, or be serving under the Road Board or under some County Council or other Local Authority.

Applications must be accompanied by a summary of particulars as to previous service, &c., to be inserted in a form which can be obtained from the undersigned, and by copies of not more than three recent testimonials.

Candidates may send printed copies of their applications, and of any statement or testimonials they desire to send, to the Members of the Finance and General Purposes and Highways Committees, a list of whom can be obtained on application.

The person appointed will be required to commence his duties on the 1st October, 1914, and to devote the whole of his time to the duties of his office.

Applications must be sent in to the undersigned not later than the 4th June, 1914.

Further particulars of the terms of the appointment can be obtained from the undersigned.

CHARLES E. LONGMORE,
Clerk of the County Council.

Clerk of the Peace Office,
Hertford.
May 4, 1914. (1,591)

The Control of Stream Pollution.*

By PAUL HANSEN, Engineer, State Water Survey, Urbana, Ill.

In uninhabited, or even rural, districts the evil results of stream pollution are practically negligible, but in urban districts streams are rendered exceedingly foul by the enormous quantities of sewage and industrial wastes poured into them from city sewers. These streams become totally unfit for pleasure purposes, the land along the banks is depreciated in value, and public water supplies drawn from the streams may be grossly contaminated and constitute an extreme danger to public health. An enormous toll in human lives is annually exacted as a result of polluted streams, not to mention the economic loss due to depreciation in property values.

To prevent the evils of stream pollution gaining too great headway, central governmental control, backed by an intelligent public opinion, is essential. The moulding of an intelligent public opinion is, however, a rather difficult matter, for even among persons who have given considerable thought to sanitary subjects there exist gross misconceptions as to the logical and practicable way to treat the problem of stream pollution. There has been a tendency to permit sentimentality to get the upper hand, and this has resulted in giving wide currency to some extravagant demands that are wholly impracticable. There is, however, a group of sanitary engineers who have come into intimate contact with actual problems relating to the prevention of stream pollution, and among these engineers there has gradually come about a unanimity of opinion regarding certain essential factors relating to the stream pollution problem. It will be the object of this paper to present these opinions, and the statements made will be largely based upon recent careful inquiries among sanitary engineers and others interested in sanitation.

The subject may best be treated by first considering in a broad way what the functions of a stream really are. Having reached a satisfactory conclusion upon this point, it will be possible to consider certain special uses of streams with respect to stream pollution.

GENERAL FUNCTIONS OF STREAMS.

The proper conception of a stream recognises the dual function of watering and draining the country through which it passes. Some pollution of streams is inevitable, for with increased density of population, increased cultivation of the soil and increased numbers of urban communities, it is practically impossible to prevent the discharge of all deleterious matter into streams. It is only reasonable to require that the pollution of streams be maintained at less than a certain fixed maximum, and this permissible maximum pollution must vary according to the character of the stream, the population along the banks of the stream and the uses to which the waters of the stream are placed.

STREAMS USED AS SOURCES OF PUBLIC WATER SUPPLIES.

Since streams in the ordinary course of events must receive more or less contamination, it follows that public water supplies drawn from surface streams must of necessity be polluted, and should not be delivered to the consumers unless the water is first adequately purified. One exception may be made to this general rule—namely, in the case of water supplies diverted from streams draining comparatively small watersheds. In such cases it is sometimes feasible for the water supply authorities to own the entire watershed, and control it in such manner as to make contamination of the watercourses impossible. But in general we have this question to contend with: How much pollution may be permitted to enter a stream before the water thereof is polluted to a point beyond redemption by water purification methods? This is a question that taxes the greatest ingenuity of sanitary experts, and it is always necessary for any specific problem to be considered on its particular merits in order to obtain what is the best and most economical solution.

Notwithstanding the great difficulty in defining that degree of pollution which is permissible in streams which are to be used as public water supplies after

purification, there would seem to be an advantage in attempting to approximate a general rule for the control of such streams. A rule has been formulated in the light of the present available evidence, but it must be admitted that this rule is not based upon any very scientific data, and it can, therefore, only be put forward tentatively, with the expectation that it will be modified from time to time as more and more experience is acquired. This rule may be stated as follows:—

The time in hours required for the passage of a particle of water from a sewer outlet to the point of waterworks intake during high water, multiplied by the dilution available during low water in cubic feet per second per 1,000 persons tributary to the sewers, should equal a constant, and this constant should not equal less than 40. This may be expressed mathematically as follows:

$$T + D = C$$

in which T = time in hours required for the passage of a particle of water from the sewer outlet to the waterworks intake at high water;

D = dilution available during low water in cubic feet per second per 1,000 persons tributary to the sewers; and

C = constant which it is recommended be not less than 40.

The above formula applies to streams in which there is no appreciable increase in volume of flow between the sewer outlet and the point of waterworks intake. In the case of streams which receive the discharge of large tributaries between the point of sewer outlet and the point of waterworks intake the formula must, of course, be modified. Generally, it will be merely necessary to assign a value of D which represents the mean of the quantity of water flowing past the sewer outlet and that flowing past the waterworks intake. If the factor of safety proves to be more than 40, purification of the sewage will not be necessary for the protection of the water supply. If the factor of safety is less than 40, some form of purification will be necessary, and this may vary all the way from plain sedimentation to intermittent sand filtration followed by sterilisation.

The formula, of course, is intended to be used merely as a rough guide, and it is conceivable that there are instances where it will not apply. Take, for example, the case of a very large stream, where a sufficiently large factor of safety may be obtained with the sewer outlet at a very short distance above the point of waterworks intake, and on the same side of the stream; here it is manifest, due to the impracticability of securing a mixture of the sewage with the entire volume of the stream, that the sewage must receive treatment or the waterworks must be extended to a point above, or at any rate beyond, the influence of the sewer outlet. As a rough guide, however, such a formula may serve a useful purpose in narrowing down the widely divergent practice of the present time.

FISH AND SHELLFISH.

Many streams are valuable to the community on account of their fish life. It may be said, in general, that there is rarely necessity for so polluting a stream as to endanger fish life, though there are some circumstances where the continuance of certain liquid waste-producing industries injurious to fish is of so great importance to the general welfare that fish life in certain streams must be sacrificed.

The maintenance of fish life does not necessarily imply an unpolluted stream. It is merely necessary that the alkalinity of the water be maintained, and that the pollution be not so great as to absorb the dissolved oxygen in the water to an extent that will suffocate the fish. The fact is that a moderate degree of pollution favours fish life, in that it favours the growth of microscopic aquatic organisms which constitute valuable fish food. Certain difficulties have been encountered in the contamination of fish by polluted water which causes the fish to decay rapidly and become unfit for human consumption. The danger of infection of human beings with specific disease through eating fish taken from polluted streams is almost negligible, for the reason that, in

* From a paper read at a recent convention of the Illinois Academy of Science.

this part of the world, at any rate, fish are not eaten raw. With shellfish, however, the case is quite different, because they are very frequently eaten raw. The problem of protecting the shellfish industry is a very complicated one, and all its intricacies have not been worked out. Here, again, the services of experts are needed to study each zone of shellfish pollution in the light of diverse local conditions.

DISCHARGE OF MANUFACTURING WASTES INTO STREAMS.

Many of our important industries, such as paper mills, woollen mills, dye works, starch factories and tanneries require large volumes of water to carry on their industrial operations, and they also produce large volumes of waste which are capable of undergoing offensive putrefaction. The discharge of these waters into streams often causes unsightly and malodorous conditions; yet, with the exception of tanneries, these waters do not menace the public health, since they do not contain the specific infections of disease. (Tannery waters may contain anthrax bacilli.) In fact, some of the processes are such that the wastes are quite inimical to the existence of disease germs. In some cases it is practicable to treat the wastes so that offensive conditions in a stream may be in part or wholly relieved, but for certain industries such treatment of the wastes is prohibitively expensive.

Enjoining industries against causing objectionable stream pollution may, and in some instances actually has, necessitated the shutting down of works. It is conceivable, in the case of large industries upon which are dependent a considerable population, that an order to cease stream pollution, which is virtually an order to shut down the works, might result in great hardship without adequate returns accruing from the cleaner conditions of the stream. There may be instances, therefore, where a limited few of the streams of the country may legitimately be turned over to the manufacturing interests. Now that the stream pollution problem has become more acutely an issue, and the disadvantages of filthy streams are better understood, it would not seem wise to permit waste-producing industries to be located upon any but very large streams which have an ample volume to dilute the wastes to an inoffensive condition. That is to say, the streams which are now clean should be maintained clean, for the reason that we have an ample number of large streams which can effectually take care of wastes from waste-producing industrial plants for an indefinite period in the future.

LEGAL CONTROL OVER STREAM POLLUTION.

A discussion of stream pollution would not be complete without some consideration of legal control. As already indicated, the cleanness of streams cannot be conserved unless under a central governmental supervision. If left to individual communities very little could be expected in the way of results. Communities are not likely to be altruistic enough to spend large sums of money for sewage purification works to protect neighbours on the stream below, unless such altruism is induced by damage suits which render sewage purification the cheapest way out of the difficulty. But lawsuits are costly if long drawn out, and the results are often unsatisfactory.

For successful solution it is essential that specific problems relating to stream pollution be placed in the hands of experts. It is therefore necessary, or at least strongly advisable, that every State have an expert commission. Among many there is a strong prejudice against commissions, inasmuch as the multiplication of commissions is looked upon as a delegation of legislative and executive powers to others than direct representatives of the people. This need not necessarily be so, however, for a law may be framed requiring in general terms that streams must be maintained in an inoffensive condition, and that they shall not be detrimental to health. This leaves to the commission not arbitrary powers, but the simple function of determining points of fact within limits prescribed by prior legislative enactment. That is to say, the commission will determine when a stream is in danger of being made offensive and when it is in danger of being made detrimental to health, and thereupon decide what purification of sewage and industrial wastes is necessary, whether water supplies may or may not be taken from streams, and to what extent they must be purified. Such a commission should be supplied with ample appro-

priations to enable it to obtain all necessary information for its guidance, whether this consists in maintaining laboratories or in carrying on experimental research work. As even the best of commissions may at times grow arbitrary, or become unduly biased in its views, there should always be made provision for ready appeal from the decisions of a commission to an independent special arbitration board of experts, and, of course, there must exist the inalienable right of appeal to the courts.

MOTOR 'BUSES AND ROAD MAINTENANCE.

MIDDLESEX COUNTY COUNCIL'S ATTITUDE.

Evidence was taken on Tuesday by the Select Committee of the House of Commons, presided over by Colonel A. B. Bathurst, who have under consideration the Bill authorising the Middlesex County Council to construct a new road, about 5 miles long and 20 ft. wide, beginning with a junction with the High-road in Chiswick, passing through Brentford, Osterley, Lampton and Heston, into the main Bath-road. The estimated cost of the project is £562,000.

Mr. H. T. Wakelam, M.INST.C.E., the county engineer, after giving it as his opinion that the scheme proposed by the Bill was the best possible, taking into account the contour of the country, proceeded to quote figures in support of the clause in the Bill which provides for vehicles such as motor 'buses contributing specially to the maintenance of the new road if they wish to use it. His view was that Middlesex had probably had more experience of damage done by motor-'bus traffic than any other county. They had had to spend £33,000 on the resurfacing of the Bath road owing to damage by motor 'buses, and were reconstructing the Golders Green-road to the north-east at a cost of £55,900. On the St. Albans-road works were in progress, because of motor-traffic damage, which would entail an expenditure of £14,000. The council had before the Road Board schemes which would cost £372,000 for resurfacing roads. During the two years ending March, 1913, Middlesex had ten roads affected by motor-'bus traffic. Previous to motor-'bus traffic coming on these roads the average expenditure was 6'16d. per yard per annum. After a year, or two years, the expenditure increased to 12'85d. Giving further particulars as to the damage done by motor 'buses, Mr. Wakelam mentioned the incurring of expenditure in Richmond and Isleworth to the amount of £8,600, and stated that four months after a certain thoroughfare at Wood Green had been relaid with wood blocks, owing to motor 'buses the blocks began to move in all directions. It was necessary to repave another section of the same road, and expenditure was incurred to the amount of £4,622. The damage caused by motor-'bus traffic on the roads of Middlesex had already run into hundreds of thousands of pounds.

Mr. Wakelam, cross-examined by Mr. Balfour Browne, K.C., on behalf of the London General Omnibus Company, said that taxicabs would pass freely on the road, also vegetable carts on the way to Covent Garden. There was not a continuous user in the case of these, and they did not damage the road as motor 'buses did. Asked whether motor 'buses had not a right to go free on every road out of London, he replied that it was a right which ought not to be allowed. On the question as to whether motor 'buses were not doing a great service to the public, Mr. Wakelam answered: "So are the tramways, but they have to pay for the maintenance of the roads."

Mr. Balfour Browne: Are not the tramways a little out of date?

Mr. Wakelam: I think not.

A Cumberland Water Scheme.—Representatives of interested localities at Wigton (Cumberland) last week considered a proposed comprehensive gravitation water scheme for a large area of North-West Cumberland, to cost about £20,000. The proposal is to tap the Aspatria, Silloth, and District Joint Water Board's main at Watch Hill, and convey the water a distance of 40 miles to ten Wigton district parishes right on to Bowness-on-Solway. There is also a possibility of a further extension of the scheme in the Holm Cultram district. If the proposal goes through, it will replace a scheme already under consideration to supply Bowness, Kirkbride, and Aikton parishes from the Carlisle Corporation's main.

A FORWARD STEP IN GAS MANUFACTURE.

(Communicated.)

The recent decision of a House of Lords' Committee, presided over by Lord Clinton, upon the methods to be adopted in future for ascertaining the quality of coal gas, marks an era in the history of the gas industry.

Hitherto, and ever since gas testing methods were prescribed by Parliament (for the protection of the public), the standard by which the quality of gas was judged was the amount of light given by a flame.

So long as the only method of obtaining light from gas was by burning it as a luminous flame, and its use as a fuel for cooking, heating and power had not been fully developed, this test for "illuminating power" was both scientific and equitable.

Since the famous discovery of the incandescent mantle by Welsbach, following upon the equally famous invention of the atmospheric or non-luminous burner by Bunsen, made the only economical and sensible method of obtaining light from gas dependent upon the heating power of the flame (which, though burnt so as to give no light itself, raises the mantle to a glowing heat), and since the use of gas for fuel in both home and factory has become almost universal, the only practical standard by which gas can be judged is its heating power, or, as scientists and technicians would say, its "calorific value" as expressed in British thermal units per cubic foot of gas burnt.

That is what the House of Lords' Committee, on the evidence of Sir Corbet Woodall, B.Sc., and other eminent experts, have now agreed shall be the standard of the future, so far as the largest company in the world is concerned; and this decision will speedily be applied to the gas undertakings of the country as a whole.

The result will be, no doubt, to effect material economies in the cost of gas manufacture, from which, under the wise provisions of the sliding scale system (by which increased dividends are made to depend upon decreased prices to the consumer), the public will benefit to the extent of about five-sixths of any savings made.

With almost every commodity of household and industrial consumption tending to rise in price—and not least the other forms of fuel—it is good news for the public that Parliament has determined to abolish an out-of-date method of gas testing, and to substitute one which, while meeting all practical requirements of to-day, relaxes in no way the stringent stipulations as to purity laid down in former days, and yet secures economy in production with resultant gain to the purchaser.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

The Fire Resistance of Partitions.—The British Fire Prevention Committee has issued a volume recording the results of its earlier fire tests with partitions, the results of the tests being presented in tabular form which facilitates comparison and makes the record particularly useful for reference purposes. These earlier tests, which were conducted between 1898 and 1905, have been forgotten by many, yet they deal with many materials used to-day, in respect to which particulars are required. The seventeen partitions dealt with in the report are grouped according to their classification under the British Fire Prevention Committee's Standards of 1903. They vary in thickness from 2 in. to 5½ in., but for modern everyday uses those of from 2 in. to 3½ in. thickness merit primary attention. Among these, a 2½ in. porous terra-cotta partition obtained the 2½-hour classification of affording "Full Protection," and a 3½-in. pumice slab partition the classification of affording "Partial Protection" on a 2-hour test. The fire tests are run up to temperatures of about 2,000 deg. Fahr., and are followed by the application of water under pressure. The issue of the volume is intended mainly for the committee's subscribers, but a small edition will also be available for the public (at 10s. 6d.) after May 11th, and will be obtainable at the committee's Waterloo-place offices.

BUILDING REGULATIONS IN SHANGHAI.

EVADING THE BY-LAWS.

In his report for 1913—some extracts from which appeared in our last issue—Mr. Charles H. Godfrey, M.INST.C.E., engineer and surveyor to the municipal council, emphasises the necessity for the proper supervision of the erection of buildings in Shanghai. The tendency among the landlords of the settlement at present is to cover every available foot of their property which is permissible under the building rules, and although sufficient open space is always provided for each block, generally by courtyards, an alleyway at the rear is often omitted on account of the high price of the land upon which the houses are erected. It is no uncommon occurrence for plans for a large building to be prepared by an architect who receives payment for his services as soon as a permit to build has been obtained. The plans as submitted may be quite in order, but as soon as operations are commenced the contractor and the owner think of nothing but scamping the work, and endeavouring to rush through certain alterations which would be prohibited by the building rules.

A recent case in point is a large Chinese hotel, where the partitions between the rooms were shown on the plans to be constructed of brickwork. Within the space of only two or three days the majority of the partitions were rushed up, but were constructed of lath-and-plaster hollow partitions, which would not only be dangerous from a fire point of view, but would also help to harbour rats and vermin. When complaint was made to the owner he appeared to feel injured, and suggested that he ought to have been told before that lath-and-plaster partitions would not be allowed, and promptly proceeded to complete the work. He was then informed that, unless the hollow partitions were either removed or rendered ratproof, a licence would not be issued for the hotel when building operations were completed. This caution apparently had the desired effect, as shortly afterwards portions of the partition were removed to allow coke-breeze concrete to be rammed between the lathing, each 4ft. of filling being then inspected by the district building inspector, and passed as satisfactory when properly completed, the result being a solid partition of light construction with no spaces in which rats can form a run. "It is, of course, quite possible," observes Mr. Godfrey, "that the owner had no idea that hollow partition walls are not allowed in houses of Chinese construction. The 'architect' for the buildings, being a Chinese, would naturally omit from the plans anything which might tend to prevent the early issue of the permit, as his entire responsibility ceased after the permit had been obtained and handed over to the owner, in whose name it was made out. The present system of Chinese 'architects' preparing plans and having the application form for a permit 'chopped' by the owner, causes a great deal of unnecessary trouble to the department, as frequently, when the building work is bad, or not in accordance with the by-laws, it is very difficult to find the owner, who, in many cases, is away from Shanghai, and the 'architect' frankly admits that it is none of his business to supervise the work.

"The remedy for this unsatisfactory state of affairs is registration of architects, as, had this incident happened with the work under the supervision of a registered architect, the consequences to him might have been serious. It is true . . . that the council is empowered to pull down any work being done without a permit, or in contravention to the building rules, and this means has been resorted to on several occasions, but the procedure has the appearance of high-handedness, and is lacking in dignity. Arrangements have been made—at any rate temporarily—to detail two district inspectors for nothing but building inspection work in the areas where the majority of building operations are going on, but this means increasing the salary list of the department. In other words, the public is providing and paying for supervision which should be provided and paid for by the owners. Some improvement might be effected by charging a very much higher permit fee, unless a declaration was lodged with the application that the work was to be supervised by an architect to be approved by the council."

Surveyors' Institution: Country Meeting.—The council have accepted the invitation to hold the next country meeting at York on May 22nd and 23rd.

SKEGNESS MUNICIPAL WORK.**SURVEYOR'S ANNUAL REPORT.**

Mr. R. H. Jenkins, in his report for 1913, as surveyor to the Skegness, Lincs. Urban District Council, states that the rapid growth of that popular holiday resort continues, adding that the rateable value has risen from £21,958 to £24,205.

With regard to roads, he mentions that the total cost of maintenance during the period with which he deals was £643 17s. 9d., which equals £177 per mile. Now that nearly all the roads in the district are either tar-macadam or tar-painted, there is very little binding material for road making available, and slag chippings have had to be used for this purpose. A total area of 39,258 super. yds. were tarred during the year, gasworks and distilled tar and Fluxphalte and Tarvia being used, the analysed cost-per yard being as follows: Gasworks tar tar 0.36d., slag chippings 0.20d., labour and fuel 0.23d., total 0.79d.; distilled tar tar 0.75d., slag chippings 0.38d., labour and fuel 0.19d., total 1.32d.; Fluxphalte Fluxphalte 0.93d., slag chippings 0.37d., labour and fuel 0.22d., total 1.52d.

Mr. Jenkins states that the total cost of disposal of the sewage, exclusive of loan repayments and interest for the year, was £727, which is equal to 13s. 2d. per house. The loan repayments and interest on this account for the year ending March 31st last amount to £831, which is equal to just over 15s. per house, or the cost, including loan repayments and interest, is equal to a rate of nearly 1s. 5d. in the £.

The cost of house refuse removal was 9s. 8½d. per house per annum, exclusive of loan repayments for the destructor. In this connection it is noted that, as the result of Mr. Jenkins' advice that the emptying of privies attached to houses within 100 ft. of the sewers should be discontinued the privies have been abolished and connections made to the sewers.

A complete reorganisation of the lighting department is reported, a consequence of this being a very considerable saving, and an improvement in the lighting—which is by gas—has been effected. The total cost, excluding capital charges, is at the rate of £2 1s. per burner.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A.,
Borough Surveyor, Great Yarmouth.

DOVER MEETING.

A meeting of the institution is to be held in the South-Eastern District at Dover to-morrow (Saturday), May 9th.

PROGRAMME.

11.30 a.m. Members will assemble at the town hall. Welcome by His Worship the Mayor (Mr. Councillor E. W. T. Farley, J.P.).

District business (council chamber).

1 p.m.—Members will partake of luncheon at the Grand Hotel, facing the Granville Gardens. (Tickets 3s. per head.)

2 p.m.—Start from Grand Hotel and proceed:

(1) To inspect the ferro-concrete viaduct and workmen's dwellings, in course of construction in the pier district (W. C. Hawke, Assoc.M.INST.C.E., borough engineer).

(2) To inspect the new Marine Station, in course of construction on the Admiralty Pier, by the kind permission of Mr. P. C. Tempest, M.INST.C.E., engineer, S.E. and C. Rly.

Mr. A. T. Walmsley, engineer, Dover Harbour Board, will briefly explain the provision of a site for this station in the area reclaimed by the Harbour Board.

3 p.m. The Dover Harbour Board have kindly granted the use of one of the tugs for an inspection of the National Harbour works (Captain Iron, harbour master).

5 p.m. Members will partake of tea at the town hall as guests of the mayor.

Other works of interest to surveyors and engineers in Dover: The waterworks, pumping station, Castle Hill; slipper and

Turkish baths and electricity station adjoining the town hall; swimming baths, sea front; sewage pumping station, pier district.

Arrangements can be made for any members who desire to do so to inspect any of the above works of interest.

H. W. BOWEN, ASSOC.M.INST.C.E.,
Hon. District Secretary.

County Surveyor,
West Sussex, Horsham.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury on Saturday, May 16th.

PROGRAMME.

11.30 a.m.—Reception in the council chamber by the Right Worshipful the Mayor of Salisbury, Mr. Councillor J. Macklin, J.P.

Papers by Mr. W. J. Goodwin, Assoc.M.INST.C.E., city engineer, "Some Notes on the Municipal Works of Salisbury"; and Mr. J. H. Blizard, Assoc.M.INST.C.E., on "The Bemerton and Wilton Pumping Station for Sewage Disposal."

Discussion.

1.15 p.m.—Lunch in the banqueting room at the invitation of the Right Worshipful the Mayor.

2.15 p.m.—Leave council house in motor char-à-banc to visit the following works—viz., Salisbury sewage disposal works and refuse destructor.

3.15 p.m. Leave for Salisbury waterworks, chief pumping station.

3.45 p.m.—Leave for Bemerton pumping station.

4.15 p.m.—Return to council chamber, where tea will be provided, at the invitation of Mr. Alderman C. J. Woodrow, J.P., chairman of the Salisbury Sanitary Committee. (Cost of conveyance, 2s. each.)

By the kind consent of the chief officer of the fire brigade, the fire station will be open all day for inspection.

DISTRICT MEETING.

Members of the Southern District are asked to assemble in the council chamber at 11.10 a.m., to elect the Executive Committee and to consider any other district business.

F. R. PHIPPS, ASSOC.M.INST.C.E.,
Hon. District Secretary.

Town Hall,
Basingstoke.

EASTERN DISTRICT.

An Eastern District Meeting is to be held at Ipswich on May 16th.

PROGRAMME.

12 noon.—Meet at town hall. Business meeting: Read minutes; elect sub-district secretary for counties of Norfolk, Suffolk and Cambridge.

Afterwards, Mr. John R. Mead will describe the proposed accommodation which is about to be provided for the Ipswich medical officer of health, which includes the school clinic and tuberculosis dispensary. After this, he will open a discussion on road making, road maintenance, and the use of dust palliatives.

1.15 p.m.—Luncheon. (Tickets, 2s. each.)

2.15 p.m. Visit Ipswich sanatorium, recently completed.

3.30 p.m.—Visit new vertical retort-house at gasworks.

4.30 p.m.—Visit St. Helens School, recently completed at a cost of £13,000; accommodation provided for 1,900 children.

5.30 p.m.—Tea. (Tickets, 1s. each.)

J. A. WEBB, H. T. WAKELAM, M.I.C.E.,
Hon. District Secretary. District Chairman.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.

The following papers will be read—viz.:—

"A Town Planning Scheme: Its Effects on Housing and Architecture," by Mr. Raymond Unwin.

"Edinburgh and Its Early Examples of Town Planning," by Mr. A. Horsburgh Campbell.

"Town Planning from a Lawyer's Point of View," by Mr. John L. Jack.

"The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

PAPERS.

The following papers for discussion will, as far as possible, be taken in the order in which they appear, and at the sessions referred to in the programme; but the chairman of each section may vary the sequence at his discretion. Should the papers be taken as read, each author will be asked to give a brief *résumé* of his paper.

Town Planning and Housing:—

(1) "Town Planning and Architectural Issues," by Prof. S. D. Adshad, Liverpool University.

(2) "Town Planning Amended Procedure Regulations," by H. E. Stilgoe, M.INST.C.E., city engineer, Birmingham.

(3) "Town Planning Procedure," by Fred W. Pearce, F.S.I., surveyor to the Twickenham Urban District Council.

(4) "Summary of Final Scheme of Town Planning, Ruislip-Northwood," by W. Louis Carr, surveyor, Ruislip-Northwood Urban District Council.

(5) "The Abnormal Development of Coventry, and Some of its Town Planning and Housing Problems," by J. E. Swindlehurst, M.INST.C.E., city engineer, Coventry.

(6) "Town Planning Large Areas," by R. A. Reay-Nadin, town clerk, and W. A. H. Clarry, Assoc.M. INST.C.E., borough surveyor, Sutton Coldfield.

(7) "The Housing, Town Planning, &c., Act, 1909 (Part II), as Applied to Commercial and Industrial Districts," by J. C. Midgley, deputy city surveyor, Newcastle-upon-Tyne.

(8) "The Latest Practice of Town Planning in the United States," by C. M. Robinson, Rochester, N.Y.

(9) "Housing in Rural Districts," by E. Holloway, surveyor to the Evesham and Pebworth Rural District Councils.

(10) "Town Planning Practice in Canada," by J. P. Hynes.

Roads:—

(11) Paper by Sir George Gibb, chairman of the Road Board.

(12) "The Training of the Highway Engineer of the Future," by H. Percy Boulnois, M.INST.C.E., London.

(13) "Some Notes on Highway Law as Affecting the Municipal Engineer," by S. G. Turner, Barrister-at-law, London.

(14) "The Control, Management and Maintenance of Rural Roads," by J. Fred Hawkins, county surveyor, Berkshire.

(15) "The Prevention of Sub-crust Movement in Roads," by E. S. Sinnott, M.INST.C.E., county surveyor, Gloucestershire.

(16) "The Economics of Modern Methods of Road Construction," by Francis Wood, M.INST.C.E., borough engineer, Fulham.

(17) "Some Notes on Grouting and Penetrating Methods of Road Surfaces," by Geo. Green, M.INST.C.E., borough engineer, Wolverhampton.

General Subjects:—

(18) "The Organisation of a Municipal Engineer's Department," by E. Willis, Assoc.M.INST.C.E., surveyor to the Chiswick Urban District Council.

(19) "The City of Worcester Sewage Disposal Works," by T. Caink, Assoc.M.INST.C.E., city engineer, Worcester.

(20) "Notes on the Protection of the Foundations of Chepstow Bridge, over the River Wye, in Ferro-concrete," by E. S. Sinnott, M.INST.C.E., county surveyor, Gloucestershire.

(21) "Applied Geology in Municipal Engineering," by H. Lapworth, D.Sc., Assoc.M.INST.C.E.

(22) "Descriptive Paper on Municipal Works of Cheltenham," by the president.

Members unable to attend are invited to send typewritten remarks on any of the papers. These will be read at the discussions should time permit. The contributions should be brief, and delivered to the secretary not later than three days prior to the meeting.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

COUNCIL MEETING.

At a meeting of the council, held in London on April 29th, the following applicants were recommended for admission:—

To Membership: Messrs. W. J. Edwards, assistant surveyor, Carnarvonshire County Council, and E. Hanson, deputy borough surveyor, Macclesfield.

Transferred to Membership: Mr. F. A. Rawlin, King-street, Hoyland, near Barnsley.

(Under the new by-laws these elections will be ratified at the next council meeting if no written objections are lodged within fourteen days.)

To Studentship: Mr. Cyril Beaumont, assistant surveyor, Thurnscoe Urban District Council.

New Members, &c.—From the applicants recommended for admission at the last meeting, two members and one associate-member were elected, and one associate-member was transferred to membership.

Defence Fund.—Two applications from members were considered by the council, and the secretary was instructed to lay the cases before the solicitors of the institution for their opinion.

Nominations for Council.—Nominations for ordinary members of council must now be deposited with the secretary by June 20th in each year. Nomination forms may be obtained on application.

Applications for Admittance.—It was resolved: "That all applications for admittance to the membership and other classes of the institution be submitted, before consideration by the council, to the respective district committees in whose districts candidates may be, provided that, in any case where no reply may be received from a district committee within one month, the application be considered in the ordinary way."

The next meeting of the council will be held in London on Wednesday, May 27th.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Hull on Saturday, May 16th.

A Northern District meeting, in combination with

Yorkshire, will be held at Harrogate on Saturday, September 12th.

NORTH-WESTERN DISTRICT.

A visit will be paid to the Oldham sewage disposal works on Saturday, May 16th.

PROGRAMME.

3 p.m.—Meet at Middleton Junction Station.

3.15 p.m.—Arrive at Oldham sewage works, where members will be received by Dr. J. B. Wilkinson, medical officer of health, Oldham, and Dr. Grossmann, licensee of the grease extracting plant which has been described by him in a paper read before the institution.

5.15 p.m.—Tea.

R. J. MCKENN.

Hon. District Secretary

Heywood.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

GENERAL MEETINGS.

A meeting will be held at the Institution of Electrical Engineers, Victoria Embankment, W.C. (corner of Savoy-street, Strand), on Monday next, at 7.30 p.m., for the discussion of a paper,

GREATER NEW YORK'S WATER SUPPLY SCHEME, which has been presented for that purpose by Mr. William T. Taylor, Fellow A.M.I.E.E., M.I.E.E., M.A.M. SOC.M.E.E., A.M.I.MECH.E., F.R.G.S. (Member).

The meeting is being held jointly with the Society of Engineers.

A visit will be paid to the works of the General Electric Company, Limited, Witton, Birmingham, on Thursday, May 21st.

Members will meet at the offices of the company at Witton at 1.45 p.m., proceeding at 2 p.m., on the kind invitation of the company, on an inspection of the engineering works, small motor, switchboard and switchgear departments, foundry, test-house, and conduit works. The works are among the first and best equipped in the country, and the visit will be one of extreme interest, and should command a large attendance.

B. WYAND,

39 Victoria-street, S.W.

Secretary.

INSTITUTION OF WATER ENGINEERS.

SUMMER MEETING AT STOCKPORT.

The annual summer meeting of the Institution of Water Engineers will be held this year on June 11th, 12th and 13th at Stockport (headquarters at Midland Hotel, Manchester). Candidates for election at the council meeting to be held on June 11th should see that their proposal forms (duly filled in and signed) are received by the secretary, Mr. Percy Griffith, 20 Victoria-street, Westminster, S.W., not later than June 1st.

CONCRETE INSTITUTE.

FORTHCOMING MEETINGS.

The next meeting of the Concrete Institute will take place at Denison House, Vauxhall Bridge-road, S.W., on Thursday next, at 7.30 p.m., when a paper on "Sand and Coarse Material and Proportioning Concrete" will be read by Mr. John A. Davenport, M.Sc.(VICT.), B.ENG.(LIVERPOOL), ASSOC.M. INST.C.E., A.M.I.MECH.E., M.C.I., and Prof. S. W. Perrott, M.A.(DUBL.), M.INST.C.E., Professor of Engineering at Liverpool University, M.C.I.

The fifth annual general meeting of the institute will take place on Thursday, May 28th, at 4.30 p.m., and the fourth annual dinner will take place on the evening of the same day at 8 p.m., at the Connaught Rooms, Great Queen-street, W.C., Prof. Henry Adams presiding.

H. KEMPTON DYSON,

Secretary.

BURY.—May 20th.—For the supply of floor girders, stanchions, and staircase and chequered plates at the generating station, for the corporation.—Town Clerk.

MARKET HARBOROUGH.—May 22nd.—For the erection of a brick and puddle gasholder tank, for the urban district council.—Mr. A. T. Harris, engineer, Gas Offices.

GLOUCESTER.—May 25th.—For the installation of pumping machinery, for the corporation.—Messrs. Fox, Moore, Bateman & Fox, 5 Victoria-street, Westminster, S.W.

MADRAS.—June 17th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer, and Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster, S.W.

BRITON FERRY.—May 19th.—For the supply of 2,337 lin. yds. of cast-iron plates 7 in. in diameter, 1,317 lin. yds. 6 in. in diameter, and 15 lin. yds. 3 in. in diameter, for the urban district council.—Mr. Alex. Clarke, engineer and surveyor.

BRITON FERRY.—May 19th.—For laying, jointing and completing cast-iron pipes, for the urban district council.—Mr. H. Alex. Clarke, engineer and surveyor.

Roads.

SOUTHAMPTON.—May 11th.—For laying about 4,000 super. yds. of tar paving, for the corporation.—Borough Engineer.

HORNCASTLE.—May 11th.—For the supply of 340 tons of X granite, 220 tons of XX granite, 115 tons of X slag, and 90 tons of slag chips, for the urban district council.—Mr. F. Weber, surveyor, Foundry-street, Horncastle.

MIRFIELD.—May 11th.—For the supply and delivery of about 800 tons of 4-in. and 6-in. granite setts within the next four months, for the urban district council.—Mr. Edwin Gill, Council Offices.

HARPENDEN.—May 11th.—For making up part of Spencer-road, for the urban district council.—Mr. John H. Leverton, surveyor.

FAREHAM.—May 11th.—For the supply of granite, basalt, or other hard stone, for the rural district council.—Mr. J. F. Whitcar, surveyor, Southampton-road, Fareham, Hants.

WARRINGTON.—May 11th.—For the supply of 1,000 tons of granite or syenite setts, for the corporation.—Borough Surveyor.

SOUTHAMPTON.—May 11th.—For laying 4,000 super. yds. of tar paving, for the corporation.—Borough Engineer.

LEEDS.—May 11th.—For surfacing work with tar-macadam, for the corporation.—Highways Committee.

SKIPTON.—May 11th.—For making up certain streets, for the urban district council.—Mr. A. E. W. Aldridge, engineer and surveyor.

SWANSEA.—May 12th.—For the execution of private street works, for the corporation.—Mr. George Bell, borough surveyor, 13 Somerset-place, Swansea.

WHITSTABLE.—May 12th.—For the supply of picked flints, hoggin, and crushed flints, for the urban district council.—Mr. F. Laurens, surveyor.

LITTLEBOROUGH.—May 12th.—For making up certain streets, for the urban district council.—The Surveyor.

SOUTHAMPTON.—May 12th.—For the execution of private street works, for the corporation.—Borough Engineer.

ASHTON-UPON-MERSEY.—May 12th.—For laying tar-macadam and asphalt, for the urban district council.—Mr. F. Hutton, surveyor.

COLCHESTER.—May 12th.—For the construction of tar-paved roads and surface-water drainage, and the supply of material for bottoming and surface metalting, for the Committee of Visitors of the Essex and Colchester Lunatic Asylum.—Mr. H. H. Gapp, clerk, 57 New-street, Chelmsford.

MOUNTAIN ASH.—May 12th.—For the execution of private street works, for the urban district council.—The Surveyor.

BRIGG.—May 12th.—For the supply of 400 tons of 2½-in. granite to be delivered during the year for the urban district council.—Mr. G. S. Sowter, clerk.

SOUTHALL-NORWOOD.—May 12th.—For works of road widening, for the urban district council.—Mr. R. Brown, engineer and surveyor.

COLCHESTER.—May 12th.—For making up tar-paved roads, paths, and surface-water drainage, for the Committee of Visitors of the Asylums.—Mr. H. H. Gepp, clerk, 57 New-street, Chelmsford.

ST. MELLONS.—May 12th.—For widening and improving part of Lighthouse-road, for the rural district council.—Mr. Gomer S. Morgan, engineer, Pontypridd.

WOOLWICH.—May 12th.—For resurfacing roads in Woolwich, Plumstead, and Eltham with asphalt, asphalt macadam, and wood and other material, for the borough council.—Mr. J. Rush Dixon, borough engineer.

FULHAM.—May 13th.—For making up two roads, for the borough council.—Mr. F. Wood, borough surveyor.

STOKE-ON-TRENT.—May 13th.—For making up certain streets, for the corporation.—Borough Surveyor.

LITTLEHAMPTON.—May 13th.—For scarifying and surfacing work, for the urban district council.—Mr. H. Howard, surveyor.

BARNET.—May 13th.—For the supply of any quantity up to 1,100 tons of 2½-in. broken granite of approved quality, for the urban district council.—The Surveyor, 49 High-street, Barnet.

HESTON AND ISLEWORTH.—May 14th.—For laying wood paving, for the urban district council.—Mr. J. G. Carey, engineer and surveyor.

REIGATE.—May 15th.—For the execution of private street works, for the rural district council.—Mr. Arthur J. Head, surveyor.

GRAVESEND.—May 15th.—For the supply of Kentish ragstone and hassock, for the Commissioners of Sewers.—Mr. A. C. Hurtzig, engineer, 2 Queen Square-place, Queen Anne's Mansions, Westminster, S.W.

SOUTHBOROUGH.—May 16th.—For the supply of 800 tons of basalt or granite, for the urban district council.—The Surveyor.

HALIFAX.—May 16th.—For the construction of a tar-macadam road, for the corporation.—Mr. J. Lord, borough engineer.

NORTH WALSHAM.—May 16th.—For the supply of granite, tar and road rolling, for the urban district council.—Mr. J. W. Stevens, surveyor.

BOGNOR.—May 18th.—For the supply of granite chippings, for the urban district council.—Mr. O. A. Bridges, surveyor.

BELCHAMP.—May 19th.—For the supply of broken slag, for the rural district council.—Mr. S. Allpress, surveyor.

KENT.—May 20th.—For the supply of about 11,000 yards of Guernsey, Norwegian, Pennant, Scottish or other kerb, for the county council.—County Surveyor, St. Peter-street, Maidstone.

RAWTENSTALL.—May 20th.—For paving and sewerage certain streets, for the corporation.—Mr. J. Johnson, borough surveyor.

ROWLEY REGIS.—May 25th.—For work of road improvement, for the urban district council.—The Surveyor.

WEST HAM.—May 26th.—For making up part of Saville-road, part of Leonard-street, Eclipse-road, part of Cumberland-road, part of Chadwin-road, and part of Varley-road, for the corporation.—Borough Engineer.

TANGIER.—June 8th.—For the construction of about 10 miles of road, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

EPSOM.—June 16th.—For making up Leigh-road, School-road and Spencer-road, for the rural district council.—Mr. T. E. Ware, surveyor of highways, Waterloo-road, Epsom.

SKIPTON.—For the supply of a portable stone-drying and tar-macadam mixing plant, for the rural district council.—Mr. A. Rodwell, surveyor.

Sanitary.

WARMINSTER.—May 11th.—For the construction of stoneware pipe sewers, for the urban district council.—The Surveyor.

NEWPORT (Mon.).—May 11th.—For the construction of stoneware pipe and cast-iron pipe sewer, for the corporation.—Borough Engineer.

GRIMSBY.—May 11th.—For the construction of 160 yds. of 24-in. diameter earthenware sewer, for the corporation.—Mr. H. Gilbert Whyatt, borough engineer and surveyor.

WOOLWICH.—May 12th.—For the construction of main and subsidiary sewers, for the borough council.—Mr. J. Rush Dixon, borough engineer.

GATESHEAD.—May 12th.—For the supply of disinfectants, for the corporation.—Mr. H. G. Whyatt, borough engineer and surveyor.

LITTLEBOROUGH.—May 12th.—For the construction of a 9-in. pipe sewer, for the urban district council.—The Surveyor.

RICHMOND.—May 12th.—For the supply of Welsh steam coal, house coal, lime for precipitation, lime for sludge pressing, sulphate of ammonia, green copperas, and filter press cloth, for the Main Sewerage Board.—Mr. William Fairley, engineer, West Hall-road, Kew Gardens.

KINGSTON-UPON-THAMES.—May 13th.—For the supply of 300 tons of bauxite for the sewage works, for the corporation.—Mr. R. Hampton Clucas, borough surveyor.

WARE.—May 13th.—For laying foul and surface-water sewers, and constructing manholes, for the urban district council.—Mr. H. Fox Hill, surveyor.

CHEADLE.—May 14th.—For the construction of about 519 yds. of 9-in. sewer, with manholes, for the urban district council.—Mr. E. Sykes, surveyor.

RHYMNEY.—May 18th.—For the construction of outfall sewer, storage tank, discharge pipe, and storm overflow pipe, for the Sewerage Board.—Mr. J. S. Alford, 9 Victoria-street, Westminster, S.W.; Messrs. Wilcox & Raikes, 63 Temple-row, Birmingham; and Mr. T. J. Thomas, 36 High-street, Bargoed.

BRADFORD.—May 19th.—For emptying middens and ashpits, for the corporation.—Mr. F. Stevens, town clerk.

PETERBOROUGH.—May 22nd.—For the construction of Eye drainage works, with manholes, flushing chamber, and ventilating pipe, for the rural district council.—Mr. G. A. Penwill, 33 Queen-street, Peterborough.

ECCLES.—May 23rd.—For the construction of outfall sewer, storm overflow manhole, junction manhole, screening and raking apparatus, detritus elevators, machinery, engines, penstocks, and circular storm-overflow sewer, for the corporation.—Mr. Thomas S. Picton, borough engineer.

DURSLEY.—May 23rd.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. G. P. Milnes, 7 Rowercroft, Stroud.

LEEK. May 25th.—For laying and jointing about 2,840 yds. of 9-in. and 6-in. stoneware pipe sewers, and constructing manholes, flushing chambers, engine house, pump well, liquefying tanks, bacteria beds, sludge beds, approach road, and other works, for the rural district council.—Messrs. Willeox & Raikes, 63 Temple-row, Birmingham.

DEUDRAETH. May 25th.—For laying glazed stoneware and cast-iron socket-pipe sewers, and constructing manholes and other works, for the rural district council.—Mr. L. Lloyd Jones, Lloyd's Bank Chambers, Carnarvon.

WAKEFIELD. May 25th.—For the construction of a main outfall sewer, comprising 4,000 yds., or thereabouts, of pipe sewers, pumping station, and subsidiary branch sewers, comprising 5,800 yds., or thereabouts, of pipe sewers, for the corporation.—Mr. A. G. Alibone, town clerk.

WARBLINGTON.—May 25th.—For laying laterals or branch drains from the public sewers, and the connection of existing drains, with all necessary inspection chambers and other works, for the urban district council.—Mr. Arthur J. Martin, engineer, 7 Victoria-street, Westminster, S.W.

CHEPPING WYCOMBE.—May 28th.—For the supply and erection of steam engines, air compressors, air lifts, ejectors, and all necessary appurtenances in the extension of the sewage outfall works at Wycombe Marsh, for the corporation.—Mr. T. J. Rushbrooke, borough engineer and surveyor.

DEWSBURY.—May 30th.—For the construction of sewage disposal works, for the corporation.—Mr. Henry Dearden, borough engineer.

Stores.

MILNROW.—May 14th.—For the supply of kerbs, flags, granite, limestone macadam, sanitary pipes, pitch and creosote oil, for the urban district council.—Mr. R. Jones, clerk.

BELFAST. May 14th.—For the supply of stores, for the Gas Committee.—Engineer and Manager, Gas-works.

BRIERLEY HILL.—May 18th.—For the supply of Rowley ragstone setts, chippings, broken furnace slag, blue kerbs, paving bricks, hard burned and common bricks, scavenging brushes, shovels, picks, gully grates, stoneware pipes, sanitary articles, and disinfectants.—Mr. William Waldron, clerk.

WALSALL. May 18th.—For the supply of requisites for the gas department.—Town Clerk.

Miscellaneous.

DUNDALK.—May 12th.—For the supply of electricity plant, for the urban district council.—Mr. P. A. Spalding, engineer and manager, Electricity Works.

MADRAS.—June 1st.—For the supply of two petrol-driven motor fire engines, for the corporation.—Mr. James R. Coats, engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

BLAYDON.—For making up certain streets, for the urban district council.—Mr. G. Symon, surveyor:

STREET AT BLAYDON (WHITMORE-ROAD).

J. Friend, Blaydon	£391
G. Armstrong, Whitley Bay	384
E. R. Davison, Blaydon	325

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

URBAN DISTRICT OF BILSTON. SEWAGE WORKS MANAGER.

The Council invite applications for the appointment of Sewage Works Manager.

Wages £2 per week, rising by 2s. 6d. per week per annum, to a maximum of £2 5s., with house, rates, and water free.

Applicants must have held a similar appointment, and be capable of making the usual analyses.

Particulars of duties and conditions of appointment will be forwarded on application.

Applications, accompanied by copies of not more than three recent testimonials, should be delivered to the undersigned not later than the 13th May, 1914.

Canvassing, directly or indirectly, will be a disqualification.

JOSEPH L. ARLIDGE,

Clerk to the Council.

Town Hall, Bilston.

April 28, 1914.

(1,570)

EPSOM URBAN DISTRICT COUNCIL. WATERWORKS.

The above Council invite applications for the position of Engineer-Manager for the Waterworks of the town.

The Works, which at present supply a population of about 20,000 persons, comprise Pumping Machinery actuated by steam suction gas, and electric current, and applicants must have had a thorough mechanical training and experience of such Plant, as well as the ordinary routine work of main laying, plumbing, waste prevention, control of workmen, and the usual office work of a Waterworks Undertaking.

The person appointed must devote the whole of his time to the duties of the office as may be required

by the Council, and the applicant must not exceed 45 years of age.

The salary will be £200 per annum, rising, subject to approved service, by annual increments of £12 10s. per annum to a maximum of £250, with house, rates and taxes thereon, fuel and light free, and £27 6s. per annum motor car allowance (if used).

Applications, stating age, present employment, salary and other emoluments, and previous experience (with copies only of not more than three testimonials of recent date), must reach me not later than Thursday, the 21st day of May, 1914, at 9.30 a.m., endorsed "Waterworks Engineer-Manager."

Canvassing, either directly or indirectly, will be a disqualification.

Dated this 1st day of May, 1914.

E. G. WILSON,

"Duncannon,"

Church-street,

Epsom.

Clerk.

(1,585)

BOROUGH OF BRIDLINGTON. BOROUGH SURVEYOR.

The Corporation invite applications for the post of Borough Surveyor, at a salary of £275, rising by annual increments of £25 to £350 per annum.

Particulars and Forms of application may be obtained from me on receipt of stamped addressed foolscap envelope.

Applications, stating age, experience, and qualifications, together with copies of not more than three recent testimonials, must be received by me before 3 p.m. on Thursday, the 14th of May.

Canvassing Members of Council will disqualify candidates.

(By order)

MAY 15, 1914.

No. 1,165.

Minutes of Proceedings.

The Proposed Revival of the Toll Gate System.

The Bill promoted by the Middlesex County Council for the construction of the Great West Road was reported for third reading last Friday by the House of Commons Committee, which has accepted a clause empowering the council to impose upon the omnibus companies using the road a toll of 3d. per vehicle-mile. It is to be hoped that Parliament will not accept this clause, the principle of which is opposed to the equalising tendencies of other proposals for the redistribution of the burdens of road maintenance. The Chancellor of the Exchequer has accepted the recommendations of the Departmental Committee on Local Taxation with respect to Exchequer contributions towards the cost of maintenance of main roads, and it can hardly be doubted that Parliament will pass the necessary measures for putting these proposals into effect. The sum so to be administered is estimated at nearly £4,500,000, a very substantial proportion of the whole cost of main road maintenance, and the Great West Road, or the greater part of it, will presumably fall into the first class, half the cost of maintenance of which will be borne by the Exchequer. Under the circumstances it seems most undesirable to superimpose another method of reducing the cost to the ratepayers, unless this method be adopted generally, in the form, for instance, of an additional fuel tax, a wheel tax, or what might be quite as effective, regulations for wheel diameters and tyre widths. We hold no brief for the motor vehicle, but feel bound to point out that the imposition of differential taxes can be carried too far. The extent to which a vehicle wears the road cannot be the only criterion of liability to tax or toll—else why should those ratepayers who own no vehicles pay road rates? The roads have to be maintained for the public at large, and it is not equitable to raise funds for road maintenance without regard to this broad fact. Further, as regards this particular proposal, there seems to be no justification for the selection of this one type of motor vehicle: the point is, rather, that without the use of toll gates the other classes cannot be charged with a share of the cost of road maintenance. The passengers who travel by motor omnibus are to be made to pay more than others pay for the use of the road because there is an easy way of making them pay. Already the motor omnibus pays more than any other vehicle towards the improvement of roads, since the consumption of petrol is much greater, in proportion to the "passenger-comfort-mile," in the case of a vehicle which has to stop and start frequently and rapidly, and keep to a regular timetable in all weathers, than it is in the case of a private motor carriage, or even in that of a delivery

van, relatively to the importance of the load carried.

Sources and Objects of Contributions.

The toll-gate principle is not essentially unsound, and it is successfully applied in some countries, notably in India: but, although tolls are graduated in proportion to the sizes of vehicles and the average amounts of the loads carried, there is, so far as we know, no country in which a particular kind of vehicle is made to pay tolls while other vehicles go free. It is true that tramway undertakings have to pay for roads, but these payments are mainly based upon the extent of the alterations necessary in order that the road may be made fit for tramways, and upon the extent to which the tramway is a railway carried along the road and altering its highway character. Payments with respect to maintenance are, by many municipal engineers, held to amount to no relief of the cost of maintenance to the road authority, and even if it be held that tramways contribute substantially towards the cost of road maintenance, this is not the same thing as saying that they ought to do so, or that the principle should be extended to vehicles which are not in fact strictly tied to particular routes. If, on the whole, the wear per vehicle caused by motor omnibuses justifies a special tax upon them, this tax should be a general one, collected by existing machinery, and not such as to give to a county road authority the character of a turpuke trust. The payment, by Government, of half the cost of maintenance, and the payment to Government of the petrol tax, for road funds, provide for the equitable adjustment of road maintenance burdens in such cases, and generally. At present the petrol and vehicle taxes are expended on road "improvement," but the artificial and arbitrary distinction between improvement and maintenance, and the separation of Road Board grants from other grants cannot be justified, and will no doubt disappear in the near future. The allocation of the proceeds of certain taxes to the Road Board, and for alterations as distinguished from upkeep, was a matter of guesswork, and the respective amounts of Road Board revenue, Exchequer grants, and loan funds (if such be provided) will not be so adjusted as to be proportionate respectively to the expenses of current alterations, ordinary maintenance, and special alterations. All these funds will probably be administered by the Road Board, and that body should be free to decide what proportion, up to some maximum, may be spent on alterations. It is really highly illogical to apply petrol and vehicle taxes to improvement as distinct from upkeep.

The idea that the Great West Road may be

treated as an undertaking in itself rather than as a part of the general network of highways is unsound—it is too much of the John Company order. The motor omnibuses using this road will no doubt go further afield, and it would not be equitable to allow a toll to be imposed on a road subsidised up to half the cost of maintenance, no toll being paid on roads receiving only a quarter of the cost, or nothing at all. Moreover, the proposed toll is very high. A ten-minute service both ways at 3d. per mile amounts to over £100 a mile per annum; and although such a service might raise the cost of a narrow and weak road by such an amount, this could hardly be the case on a first-class main road of ample width and used by many other vehicles. But if it were so it would not be fair to charge motor omnibus passengers, who are by no means a wealthy class, nor one burdensome as regards municipal and police funds, with the whole cost of maintenance due to their travelling along the road. At the most they should not pay for more than the excess wear due to their choosing a vehicle of a particular type. It may also be contended that motor omnibus passengers do not wear the roads more per head than do those who travel in other vehicles—a heavy and luxurious limousine motor carriage, for instance. The weight of a motor omnibus per passenger is probably lower than that of any other ordinary vehicle. If, however, a special tax is to be imposed upon motor omnibus passengers, it should be a part of a general scheme for the details of which the Road Board would be responsible, and in which any unfair burden on tramway passengers would be readjusted. Certainly no such tax should be specially imposed with respect to a road one-half of the cost of the maintenance of which will be paid out of Imperial funds; and should this proposal take effect, the Middlesex County Council would no doubt be satisfied to see their special tax disallowed. On district roads maintained, as a rule, wholly at the cost of the ratepayers, heavy delivery vans, and, in many counties, carts and wagons with absurdly narrow tyres, are allowed to travel without paying anything for the extra wear and tear of the roads. If a central authority would make it obligatory for county councils to pass by-laws regulating the dimensions of wheels and tyres, it would then be reasonable to insist also on certain changes being made in motor omnibus design, which changes, especially an increase in wheel diameters, would have the effect of considerably reducing the wear and tear of the roads traversed by these vehicles, an effect possibly startling to some vehicle designers and road engineers. The whole subject demands the attention of the authorities, the first step, we may suggest, being a report to be made to the Road Board by two or three engineers conversant with the principles involved and with the facts. In the meantime, attempts to impose such tolls as can be imposed, rather than await a general settlement, are much to be deprecated; and, in view of the far-reaching proposals of the Budget, local authorities will no doubt see the force of this contention.

* * *

Drainage By-laws in London. On Monday last the Institute of Sanitary Engineers listened to a paper by Mr. Guy B. Grave, entitled "A London Builder's Experiences with Sanitary Officials in the Metropolis." The title suggests that the author is a man with a grievance, so that it is without surprise that we observe that the paper concludes with a sigh of relief at having secured an opportunity of communicating that grievance to others. Mr. Grave has evidently not formed too high an opinion of the way in which those who are responsible for sanitary administration discharge their duties. On the whole, their task is one of great delicacy and difficulty, but the paper contained not a word concerning the ingenuity so often displayed by builders who are

anxious to evade by-laws or to avoid inspection altogether. Nor was anything said as to the burden which is being borne by the present generation of ratepayers in the repair of pipes which, though technically "sewers," are in reality "drains," the legal character of which has been changed by the surreptitious execution of unlawful work. So far as the paper is descriptive of the author's personal experiences it is, of course, impossible to criticise it, except by pointing out that it is not entitled to any more weight than that which usually attaches to an *ex parte* statement. We take leave, however, to differ entirely from his legal expositions, being emboldened to do so by his own admission that not only is he not a lawyer, but, further, that he is "not particularly well versed in legal enactments." Thus there are some notable omissions in his review of the sanitary legislation affecting the Metropolis. But this is comparatively unimportant. What is of much greater consequence is the misapprehension under which Mr. Grave evidently labours as to the scope and effect of the drainage by-laws made by the London County Council in 1901. He expresses surprise that a sanitary inspector should have told him that the powers of a borough council went beyond these by-laws, and inasmuch as misunderstanding on this point appears to be widespread, it may not be out of place to review the actual state of the law.

The drainage by-laws just referred to were made by the London County Council pursuant to their powers under sec. 202 of the Metropolis Management Act, 1855, and they are in force throughout the county. By sec. 76 of the same Act, however, before making a drain, notice must be given to the borough council, "and every such drain shall be made in such direction, manner, and form, and of such materials and workmanship . . . as the borough council shall order . . ." Now, the question as to whether or not a borough council, acting under sec. 76, have power to make requirements which are in excess of the London County Council by-laws has been determined by the High Court in *London v. Westminster City Council* (1909), 7 L.G.R., 446. In that case the city council had made requirements in regard to ventilation which were in excess of the strict requirements of the by-laws, and the Court held that they were perfectly entitled to do so. One other matter needs some explanation. Mr. Grave told of an official who had to his knowledge seriously expressed the opinion that he could demand a silver soil pipe, if such were thought by the borough council to be necessary. Provision is made for meeting extravagant or improper demands of this kind by sec. 211 of the Act of 1855, which empowers any person who deems himself aggrieved by any order of a borough council in regard (*inter alia*) to the construction or repair of a drain to appeal to the Appeals Committee of the London County Council. The matters with which Mr. Grave dealt are of some difficulty and complexity, and we are not here concerned to defend the system as it now exists. It is as well to remember, however, that the success of this or of any other system must depend to a large extent upon a mutual good understanding between officials and those whose work they are called upon to supervise.

* * *

New York Water Supply. The extraordinarily rapid growth of Greater New York has necessarily involved the solution of many engineering problems of great magnitude and difficulty, but none of them probably has been more gigantic than the inauguration of a scheme of water supply from the Catskill Mountains, 127 miles distant from the city. The tremendous character of the task which the engineers responsible for this work were called upon to undertake may be gathered from the paper on "Greater New York's Water Supply

Scheme," by Mr. William T. Taylor, which was read and discussed on Monday last at a joint meeting of the Institution of Municipal Engineers and the Society of Engineers. The watersheds from which the supply to the city is at present derived have already been developed practically to the economic limit, and with a normal annual increase of population of something like 135,000 persons, it has for some time been recognised that additional sources of supply would have to be sought. The scheme which has been undertaken is estimated to cost no less than £35,000,000 sterling, and it is interesting to observe that the city authorities had to secure the approval of the State Water Supply Commission before commencing the work. The supply will ultimately be drawn from four drainage areas having an aggregate extent of nearly 900 square miles. Of these, only one—the Esopus watershed—is being developed immediately, but the Ashokan reservoir, the only one belonging to this area, is by far the largest and most important of the whole scheme. It is situated in the foothills of the Catskill Mountains, and has a total capacity of no less than 132,000,000,000 gallons, and a water surface of nearly 13 square miles. From this enormous lake the water will have to travel for a distance of 127 miles—approximately a three days' journey—before it is available for use in the city. To use Mr. Taylor's own words, "In traversing this distance the Catskill aqueduct skirts along many a steep hillside, pierces mountains, descends between rivers and wide, deep valleys, and crosses the narrows of New York Harbour." The story of the conception and construction of these gigantic works is indeed one of the romances of engineering. The aqueduct is the longest and deepest in the world, having an easy flow of 500,000,000 gallons a day. This water is at a natural pressure sufficient to force it to the eighteenth story of the city "skyscraper." The tunnel under the city of New York is 34 miles in length—being the longest in the world—and lies from 200 ft. to 750 ft. below the street level. Altogether, we may say that Mr. Taylor's paper gives a very good description of a most fascinating work. It is reproduced in the present issue, and next week we propose to give a report of the excellent discussion—unavoidably held over this week owing to lack of space—which followed its reading at Monday evening's meeting.

* * *

An Extraordinary Traffic Case.

Judgment was given this week in the High Court in a case of some interest (*Ledbury Rural District Council v. Lady Henry Somerset*), in which the plaintiffs claimed a sum of £1,233 in respect of extraordinary expenses which they had incurred in repairing a certain road, alleged to have been damaged by extraordinary traffic passing over it by the order of the defendant. It appears that Lady Henry Somerset is the proprietor of a stone quarry adjoining the road in question, and that from June, 1912, until May, 1913, stone from this quarry was conveyed along the road by means of a traction engine. The evidence was to the effect that other persons, including the local authority, also conveyed stone over the same road in a similar manner, the quantity sent by the defendant being larger than that of any other single person, and slightly more than half the total traffic. The road was well adapted to traction traffic, had been used for it for many years, and there was no sudden increase in such traffic. The learned Judge gave judgment for the defendant on the dual ground that her business was a recognised local industry, and that the road in question was properly adapted to or used for the traffic which was put upon it. The cases on this subject are by no means easy to reconcile, but we still regard the judgment of Justice Wills in *Hemsworth Rural District Council*

v. Micklethwaite as being authoritative. The learned Judge there said: "Traffic must of necessity, as time goes on, vary in its character, according to the development of the various industries in the neighbourhood, and traffic which in one year or at one given time may be extraordinary traffic will, in the course of time—and it may be in the course of a comparatively short time—become ordinary traffic. Therefore I think that, in considering whether traffic is extraordinary or not, it is not sufficient to take simply the year to which the question relates, and compare other traffic on the road during that year with the traffic complained of. That would be a fallacious test. The test is whether the particular traffic in question has, by the usage of trade and of society, and by the varying circumstances applicable to the case, by that time, become such as can fairly be called ordinary traffic."

* * *

A Holiday for Roadmen.

At a recent meeting of the Repton Rural District Council it was reported that the Highways Committee had given consideration to an application of the roadmen in the employment of the council that they should be allowed to cease work on Saturdays at 1 o'clock, instead of 10 o'clock as hitherto, and had come to the conclusion that an alteration on the lines suggested would be undesirable, in view of the fact that farm-hands in the district were obliged to work on Saturday afternoons. The discussion of this motion was made the occasion of certain observations which can only be described as at once outside the jurisdiction of the council and calculated to cast gratuitous reflection upon the conduct of its workmen. Mr. G. L. White, a member of the council, questioned whether the men would be any better off for the three hours' extra leisure, or whether it would not be a case of "Satan finding some mischief still for idle hands to do," and he suggested that some of the men might be inclined to spend their time and money at the public-house. Mr. White's speech drew from one of the men a letter of protest to the *Burton Mail*, a local newspaper, and the matter has received further comment in an open letter addressed to Mr. White, and appearing in the columns of *John Bull*. That letter puts the matter in characteristically blunt fashion, but we are not disposed to disagree with its substance. In addressing Mr. White, *John Bull* says: "I do not understand what business it is of the council how the men spend their money whether on Saturday afternoons or any afternoon in the week; indeed, it is no more a concern of yours than how you spend your money is a concern of theirs."

* * *

New York Sewage Disposal.

The tidal phenomena of New York Harbour are the subject of the seventeenth preliminary report of the Metropolitan Sewerage Commission of that city. The nett result of all the tidal studies is in harmony with the opinions derived from the exhaustive analytical investigations of the water which the commission has carried on. Every essential fact that has been capable of withstanding serious criticism indicates that the nett or resultant flow seaward of water from the most congested parts of the harbour is small and not to be depended upon as a means of carrying the sewage of New York promptly to the open sea. The water oscillates under the tidal influences in such manner as to cause the sewage substances which are discharged into the Harlem, Lower East River and some other parts of the harbour to remain for long and indefinite periods. The disposal of the sewage, in so far as it disappears, is ascribable chiefly to natural assimilative processes which the commission has described in its reports under the general title of Digestion.

Greater New York's Water Supply Scheme.*

By WILLIAM T. TAYLOR, Fellow AM.I.E.E., A.M.I.MECH.E., M.A.M.SOC.M.E., F.R.G.S.

The total estimated cost of the Panama Canal is £75,000,000, as compared with the estimated cost of the world's greatest water supply system—the creation of the Catskill aqueduct and the Ashokan reservoir, for the city of New York, which is £35,400,000.† However, as an exploit of purely technical engineering, the creation of the Catskill aqueduct and the Ashokan reservoir exceeds that of the Panama Canal. Apart from the unique methods of handling materials on the Panama Canal, it may be roughly stated that

[Apart from his engineering experience, Mr. Taylor, in spite of his comparative youth—he is only thirty-six years of age—has had a not uneventful military career. A native of Burnley, Lancashire, he went to South Africa in 1896, and, serving with the Kimberley Light Horse in the Bechuanaland Campaign, was present at the battle and the death of the native chief Galishu, which ended the rebellion. During the South African War he served with the Imperial Light Infantry, and was present at the battles of Spion Kop and Laing's Nek, and at the relief of Ladysmith. As a member of the Standerton mounted police he saw further active service, in the course of which he was wounded and contracted enteric fever. He has the Bechuanaland Medal, with one clasp, and the Queen's Medal, with five clasps, in respect of the South African Campaign. Mr. Taylor has regularly followed the practice of mechanical, hydraulic, and electrical engineering since 1897, in South Africa, England, the United States, Mexico, India, Brazil, Chili, and Peru. He is a member of the American and British Institutions of Electrical Engineers, the Institution of Municipal Engineers, and the American Society of Mechanical Engineers, and is an associate-member of the Institution of Mechanical Engineers, and a member of the Royal Society of Arts. He is the author of a text-book, "Transformer Practice," and has contributed various papers to the proceedings of the Institution of Electrical Engineers, the Institution of Municipal Engineers, and the Royal Society of Arts. It may be added that Mr. Taylor is the inventor of an alternating current apparatus, the manufacture of which has been carried on since 1907 by a Pittsburg firm. For a collection of art treasures and curios from India, Mexico, and Peru, which he presented to the borough of Burnley, and which are installed in the Towneley Hall art gallery and museum, a "Taylor" Room was dedicated to him by the corporation. Mr. Taylor is now engaged in practice in New York.]

the problem meant merely digging out earth and rock on a larger scale and dredging channels; to build the aqueduct meant piercing mountains and undermining rivers, traversing deep, broad valleys, and tunnelling through the bowels of the city of New York from end to end. The tunnel alone is 34 miles long—the longest in the world—and lies 200 ft. to 750 ft. below the city streets.

In a few months the first link of the world's

* Paper read at a joint meeting of the Institution of Municipal Engineers and the Society of Engineers, held on Monday evening in London.—The author made several inspection trips over the most important parts of the scheme, with engineers of the works and also with excursionists from engineering societies.

† Up to January 12, 1914, no fewer than 283 men have been killed, and 8,833 injured, while engaged on the works; also, up to this date, the estimated cost of the undertaking and the actual amount spent for the work is £40,000,000 (nearly).

greatest water system will be completed.* One hundred and twenty-seven miles away the water will begin its three days' journey to the southernmost end of the Metropolis from Ashokan reservoir in the Catskill Mountains, and, running through a giant aqueduct, pass down the westerly side of the Hudson River, cross under through a huge, deep syphon at Storm King, thence to the Croton reservoir system, and through the present distribution pipes to New York. The aqueduct, the longest and deepest in the world, outrivalling those of ancient Rome, which have stood unsurpassed through the centuries, has an easy flow of 500,000,000 gallons a day. Present natural pressure only carries the city water to the sixth story, but the new scheme, which is 590 ft. above tide water, will force water to the eighteenth story of New York's skyscrapers under natural pressure. The number of labourers employed on the whole undertaking was 17,240; they have been working slightly over seven years, and they are estimated to finish the undertaking in the year 1915.

It has been estimated that the population of Greater New York will be 7,000,000 by the year 1930. To supply such a community with 100 gallons per capita per day would require 700,000,000 gallons, and to meet an average demand for 150 gallons would require 1,050,000,000 gallons per day. New York at present obtains practically all its water from the Croton and Bronx watersheds in Westchester, Putnam and Dutchess counties, and the Ridgewood watershed in Nassau county. Each of these watersheds has already been developed to practically the economic limit, and with the city's growth the draft on them has come to be an excess of their safe yield during a period of dry years. On account of the already high development of these catchment areas very little more water could be obtained from them by the construction of additional works. Greater New York's total average daily consumption of water is at present over 500,000,000 gallons, from all sources. Its population is 5,373,000, exclusive of the hundreds of thousands of "commuters" and other "transients."

To keep pace with its growth of approximately 135,000 persons per year, it was long ago recognised that additions to the city's water supply system would be inevitable. On October 9, 1905, the Board of Water Supply submitted for approval to the Board of Estimate and Apportionment a plan for obtaining from the Esopus, Rondout, Schoharie and Catskill creeks a supply of not less than 500,000,000 gallons of water daily, at an estimated cost of £35,000,000. On October 27, 1905, this plan was unanimously approved by the Board of Estimate and Apportionment, and on November 3rd of that year application was made to the State Water Supply Commission for its approval, as provided by law. On May 14, 1906, this approval was granted, and in less than six months the first construction contract, for 11 miles of aqueduct, was let.

CATSKILL WATER SYSTEM.

There are four drainage areas from which the supply under development is to be drawn. These watersheds are situated west of the Hudson River in the Catskill Mountains, and lie between lines 75 and 135 miles from New York's city hall. This region is practically unsettled. In the aggregate these watersheds have an area of nearly 900 square miles, and individually as follows: Esopus, 255 square miles; Schoharie, 228 square miles; Rondout, 131 square miles; Catskill creek, 163 square miles; to which can be added several small contiguous areas, helping to make up the grand total. From this it is estimated that even in a series of dry years 770,000,000 gallons daily can unfailingly be drawn the year round. To collect these waters for the city's use several large impounding reservoirs are to be created from time to time, as found necessary, and interconnected by aqueducts. Only the Esopus watershed is being developed now, but its only reservoir, known by the Indian name of Ashokan, is to

* Mayor Mitchel, of New York, blew up the last ledge with the blast that will mark the official opening of the great underground passageway—this occurred Saturday morning, January 10, 1914. This final shot—439 ft. below the street surface—opened the greatest tunnel in the world.

be by far the largest and most important of them all. From this reservoir the Catskill aqueduct will convey the water into all the five boroughs of the city. Although in a series of dry years the Esopus watershed cannot be depended upon to supply more than 250,000,000 gallons each day, the Catskill aqueduct is, for economic reasons, being constructed of 500,000,000 gallons daily capacity.

Developments have been in progress for seven years, and the aqueduct is now nearly completed to some of the boroughs. From the Ashokan reservoir, situated in the foothills of the Catskill Mountains, it is almost a three-days' journey for the water, at the average velocity of flow through the aqueduct, to the borough of Richmond, which is Staten Island, surrounded by the sea, at the southerly entrance of New York bay. In traversing this distance of 127 miles the Catskill aqueduct skirts along many a steep hillside, pierces mountains, descends between rivers and wide, deep valleys, and crosses the Narrows of New York Harbour. From Ashokan reservoir to the city's northern boundary there are 92 miles of aqueduct, and between that reservoir and Croton Lake, the principal basin on the Croton watershed, there are 64 miles. All the engineering, legal, and other difficulties and problems have been met and overcome.

The principal quantities of work and materials

For the construction of the main dams of the Ashokan reservoir the following are the quantities as given in the engineers' approximate estimate:—

- Earth excavation, 2,055,000 cub. yds.
- Rock excavation, 425,000 cub. yds.
- Embankment and refilling, 7,200,000 cub. yds.
- Portland cement, 1,100,000 barrels.
- Masonry, all classes, 874,000 cub. yds.
- Rubble paving and riprap, 105,000 cub. yds.

For the construction of the Hill View reservoir, the principal items of work include the following:—

- Excavation, 3,200,000 cub. yds.
- Embankment, 2,800,000 cub. yds.
- Concrete in walls and lining, 130,000 cub. yds.
- Concrete masonry in tunnels and shafts, 14,400 cub. yds.
- Portland cement, 215,000 barrels.

The Board of Water Supply consists of three commissioners, who were appointed by the Mayor of New York. Its forces, shown in Fig. 1, are divided into Administration, Real Estate, Police and Engineering Bureaus. In the former are the secretary, the auditor, the chief clerk, in charge of pay-rolls, emergency expense accounts and purchasing of supplies, the examiner of real estate and damages, a real estate claim officer, the adjuster of taxes and assessments, and the superintendent of the aqueduct patrolmen. The engineering bureau is composed of five departments—namely, headquarters, reservoir,

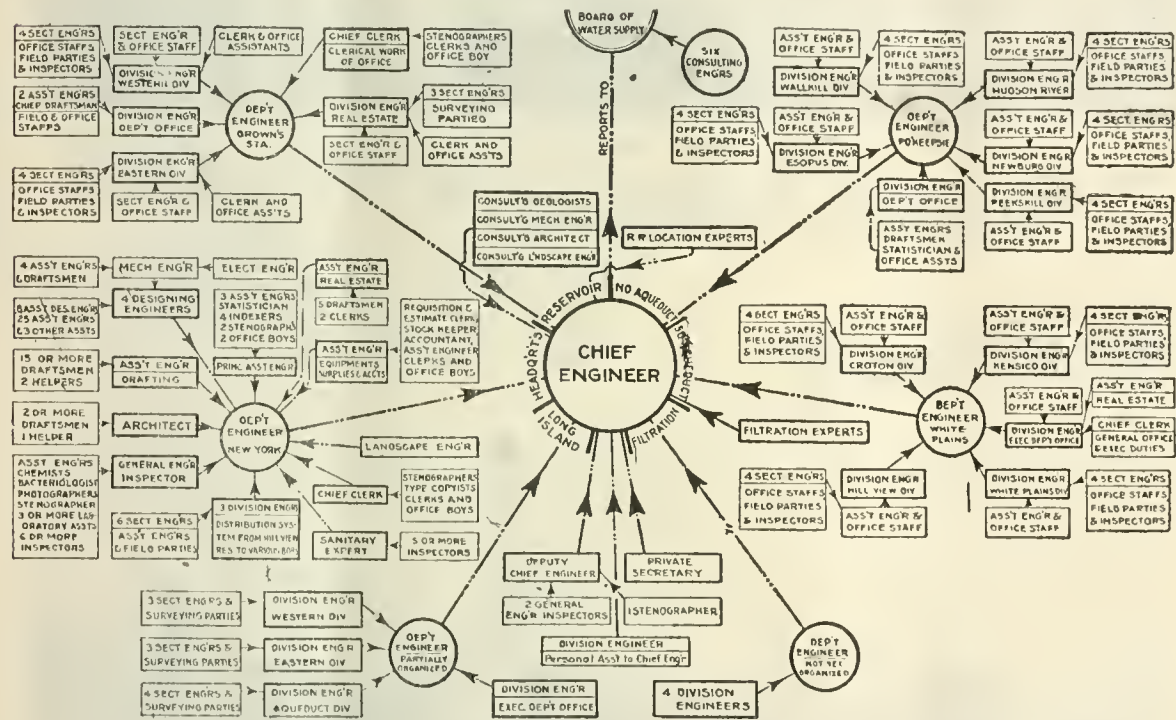

FIG. 1.—ENGINEERING BUREAU ORGANISATION.

involved in the Catskill system, as planned for the first development from the Ashokan reservoir to Hill View, are approximately as follows:—

Cyclopean masonry in dams	1,425,000	Cub. yds.
Other masonry in dams and gate-houses	425,000	
Concrete in core walls of earthen dams	325,000	
Concrete masonry in cut-and-cover aqueduct	1,525,000	
Concrete masonry in grade tunnels	250,000	
Concrete masonry in pressure tunnels and shafts	480,000	
Total masonry	4,430,000	
Excavation earth for dams	6,670,000	
Excavation rock for dams	820,000	
Excavation for open cut aqueduct	7,665,000	
Excavation for grade tunnels	835,000	
Excavation for pressure tunnels	1,180,000	
Total excavation	17,170,000	
Embankment (rolled) for dams	8,080,000	
Embankment (other) for dams	4,335,000	
Embankment (aqueduct) for dams	6,010,000	
Total embankment	18,425,000	
Tons of steel-pipe and other metals	21,250 tons.	
Barrels of Portland cement	5,450,000 barrels.	

Very good progress has been maintained on practically all contracts, and what are believed to be three interesting monthly peaks of work are:—

- Hard rock tunnelling in one heading, 468.5 ft. per month.
- Shaft sinking in one shift, 138.0 ft. per month.
- Cubic yards of masonry placed in dam, 35,260.0 per month.

northern aqueduct, southern aqueduct, and city aqueduct.

During the past five years of active construction operation the contractors' forces have ranged from a minimum of 500 to a maximum of 17,240, counting only men actually and directly at work for the contractors. To these must be added men engaged upon incidental work, the men in camp, but for one reason or another idle on any given day, and the large number of men in cement, metal and other manufacturing establishments, widely scattered over the country, engaged on the production of materials, equipment and supplies for the work. It is safe to say that, in addition to the above number of men, thousands of persons have been indirectly employed upon this great undertaking of the city of New York, aggregating about a maximum total of 25,000 men.

THE ASHOKAN RESERVOIR.

This is situated about 14 miles west of the Hudson, at Kingston, and is being built under contracts amounting, together with the expense for relocating highways and the Ulster and Delaware Railroad, to nearly £3,600,000. The Olive Bridge Dam across Esopus Creek, the Beaver Hill and Hurley Dykes across smaller streams and gaps between the hills forming the natural walls of the reservoir, the dividing wall and weir dividing the reservoir into two basins, and the waste weir over which the surplus flood waters may safely be discharged, are the principal structures

of the reservoir. Up to the end of 1912 fully 73 per cent of the work on these structures was completed.

The general statistics of the Ashokan dam are:—

- Capacity, total, 132,000,000,000 gallons.
- Capacity, available, 128,000,000,000 gallons.
- Water surface, 12.8 sq. miles, or 8,180 acres
- Land acquired, 15,222 acres.
- Elevation of water (full reservoir), above tide, 590 ft.
- Elevation of top of dam, above tide, 610 ft.
- Length of reservoir, 12 miles.
- Length of shore-line, 40 miles.
- Length of dam and dykes, 5.5 miles.

will contain several months' supply of Catskill water, and will act as an emergency storage reservoir, so that the supply will not be interrupted in case of inspection, cleaning or accident to the 77 miles of aqueduct between it and the Ashokan reservoir. It is being constructed under contracts amounting to nearly £1,700,000. It will be formed by the Kensico dam across the valley of the Bronx River, about 3 miles north of White Plains and 14 miles north of Hill View reservoir. Its normal flow line will be at an elevation of 355 ft. above mean sea level, and will

FIG. 2.—SKYSCRAPERS, LOOKING DOWN-TOWN.

Site of Woolworth building across Broadway from Post Office.

- MAIN DAM.
- Length, 4,650 ft.
 - Height, 220 ft.
 - Thickness at base, 190 ft.
 - Thickness at top, 23 ft.
 - Width of reservoir (maximum), 3 miles.
 - Width of reservoir (average), 1 mile.

cover 2,218 acres. Its total capacity will be nearly 40 billion gallons, and the available capacity will be 29 billion gallons, or about sixty days' continuous supply at 500 million gallons daily, the present approximate total consumption of Greater New York.

FIG. 3.—SKYSCRAPERS, LOOKING UP-TOWN.

Tall building in the centre shows the Metropolitan Tower building; "Flat-iron" building to the right. Panorama showing the city pressure tunnel. The tower to the left-centre shows the famous Madison-square roof garden.

- Depth of reservoir (maximum), 190 ft.
- Depth of reservoir (average), 50 ft.
- Villages to be submerged, 7.
- Cemeteries removed, 32.
- Bodies reinterred, 2,800.
- Railroad being relocated, 11 miles.
- Highways to be discontinued, 64 miles.
- Highways to be built, 40 miles.
- Bridges to be built, 4.
- Earth and rock to be excavated, 2,936,000 cub. yds.
- Embankment to be placed, 8,069,000 cub. yds.
- Masonry to be placed, 984,000 cub. yds.
- Cement to be used, 1,187,000 barrels.
- Maximum number of men employed, 3,000.

THE KENSICO RESERVOIR.

East of the Hudson is the Kensico reservoir, and 30 miles from the city hall (New York). This reservoir

The maximum depth of water behind the dam will be 155 ft.

General statistics of the Kensico reservoir are:—

- Capacity, total, 38,000,000,000 gallons.
- Capacity, available, 29,000,000,000 gallons.
- Water surface, 2,218 acres.
- Land acquired, 4,500 acres.
- Elevation of water (full reservoir), above tide, 270 ft.
- Elevation of top of dam, above tide, 370 ft.
- Length of reservoir, 4 miles.
- Length of shore-line, 40 miles.
- Length of dam and dykes, 3,300 ft.

MAIN DAM.

- Length, 1,843 ft.
- Height, 300 ft.
- Thickness at base, 280 ft.

Thickness at top, 28 ft.
 Width of reservoir (maximum), 3 miles
 Width of reservoir (average), 1 mile.
 Depth of reservoir (maximum), 155 ft.
 Depth of reservoir (average), 100 ft.
 Highways to be discontinued, 14 miles.
 Highways to be built, 9 miles.
 Bridges to be built, 4.
 Earth and rock to be excavated, 2,496,000 cub. yds.
 Embankment to be placed, 2,003,000 cub. yds.
 Masonry to be placed, 1,286,000 cub. yds.
 Cement to be used, 1,224,000 barrels.
 Maximum number of men employed, 1,000.

The work on the Ashokan dam has employed an army of 3,000 men, who have lived, many of them with

tractors at the Ashokan dam and the Kensico reservoir was, approximately, £500,000. The assembled plant of the Kensico reservoir, consisting of machinery, railroads, derricks, &c., owned by the contractors, cost about £200,000, while the plant for carrying on the work of the Ashokan dam cost much more than this amount.

When completed the Kensico dam will be a masonry structure 1,843 ft. in length, with a maximum height of about 300 ft. It will be more than 170 ft. high for 1,000 ft. of its length. The top thickness of the dam just under the coping will be 28 ft., and at the base

FIG. 4. -CATSKILL WATERSHED AND AQUEDUCT.

their families, in a camp built by the contractors near the work. The work on the Kensico reservoir employed 1,000 men, who, with their families, lived a few hundred feet on the downstream side of the dam site. An interesting feature of both these camps is a

of the maximum section will be more than 250 ft. It will contain about 1,000,000 yds. of masonry. It will be a gravity masonry dam of cyclopean concrete. The downstream side will be of concrete blocks. The concealed portion of

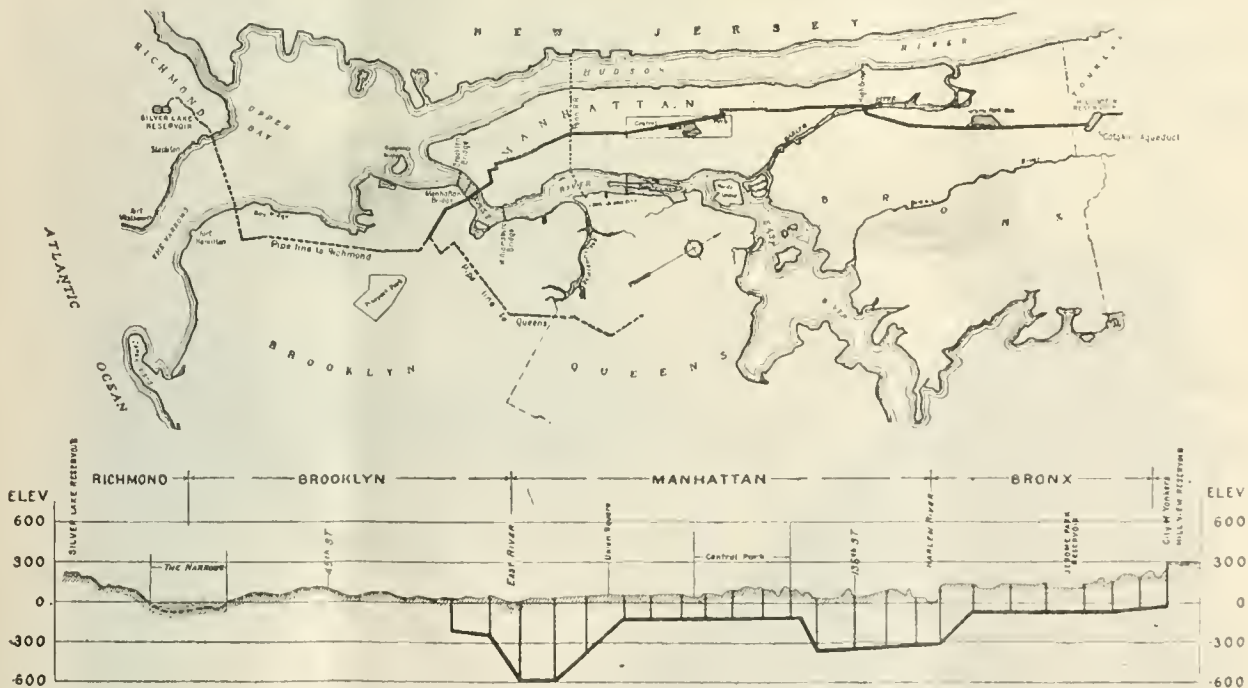

FIG. 5. NEW YORK AQUEDUCT, SOUTH OF HILL VIEW.

night school for the men. The school is operated by the Civic League of North America, and is encouraged and personally assisted by the commissioners. Other interesting features of these two camps are a savings bank, churches, hospitals, post-office, police and fire protection, children's day school, and a Young Men's Christian Association.

The cost of construction plant owned by the con-

the downstream face below the final grading will be moulded against forms, above which the remainder of this face will be of cut-stone masonry. The exposed portion will have a height exceeding 170 ft. for more than 1,000 ft. of its length. The entire dam is divided into sections by transverse expansion joints about 79 ft. apart longitudinally; these expansion joints will be faced on one side with concrete

blocks forming a series of vertical tongues and grooves against which the masonry of the inner side will be built. Near the upstream face a copper strip will be built across the expansion joint to act as a water

upstream face to an inspection gallery near the level of the reservoir bottom, which in turn connects with a transverse drainage gallery leading to the downstream face of the dam.

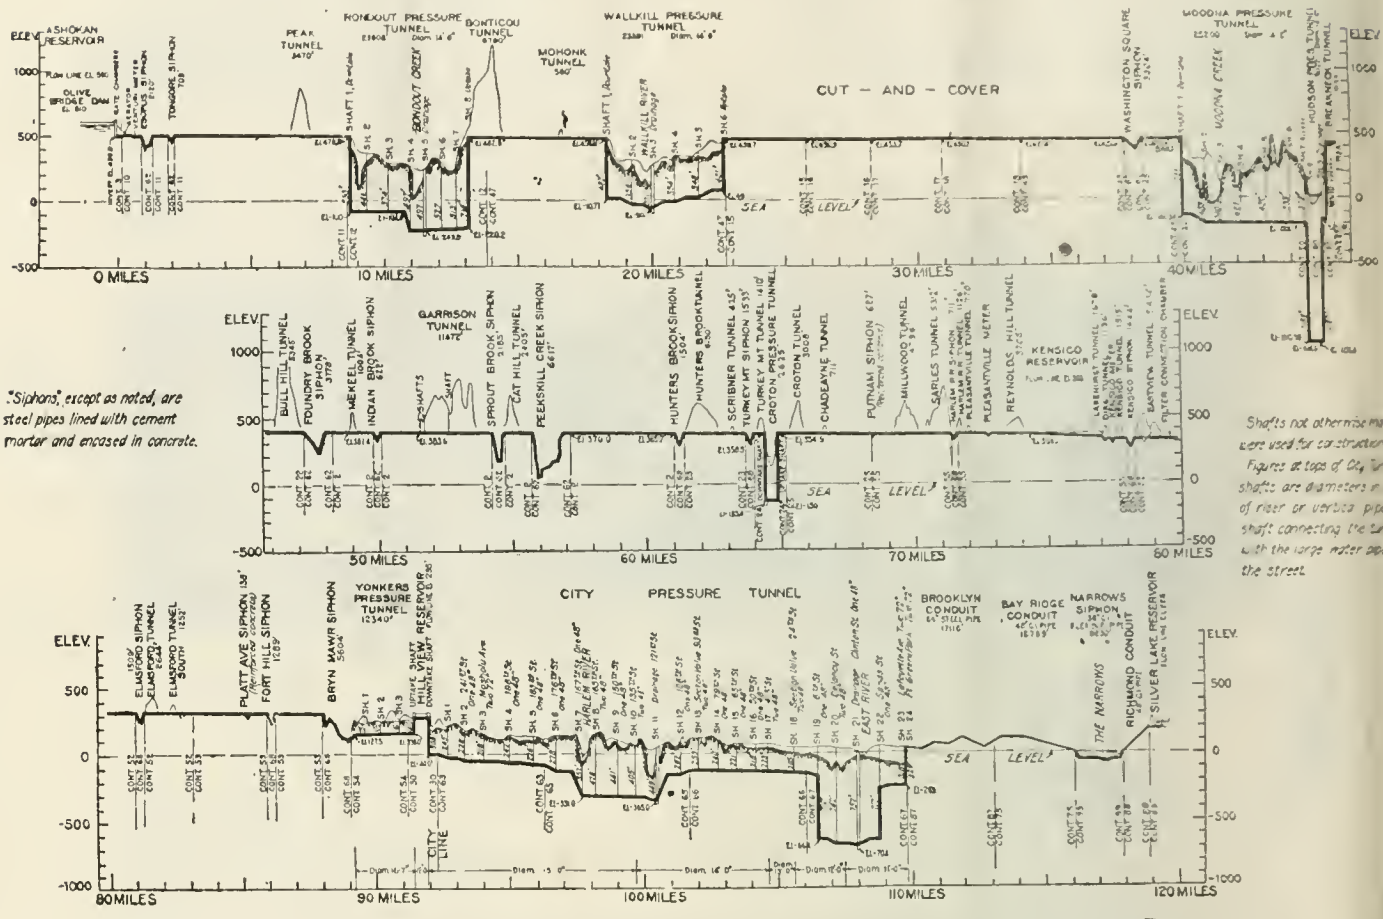

FIG. 6.—CATSKILL AQUEDUCT: PROFILE FROM ASHOKAN RESERVOIR TO SILVER LAKE RESERVOIR.

stop, continuous from bottom to top. Drainage wells 15 ft. apart, longitudinally, formed of porous concrete blocks, will extend from the top of the dam near the

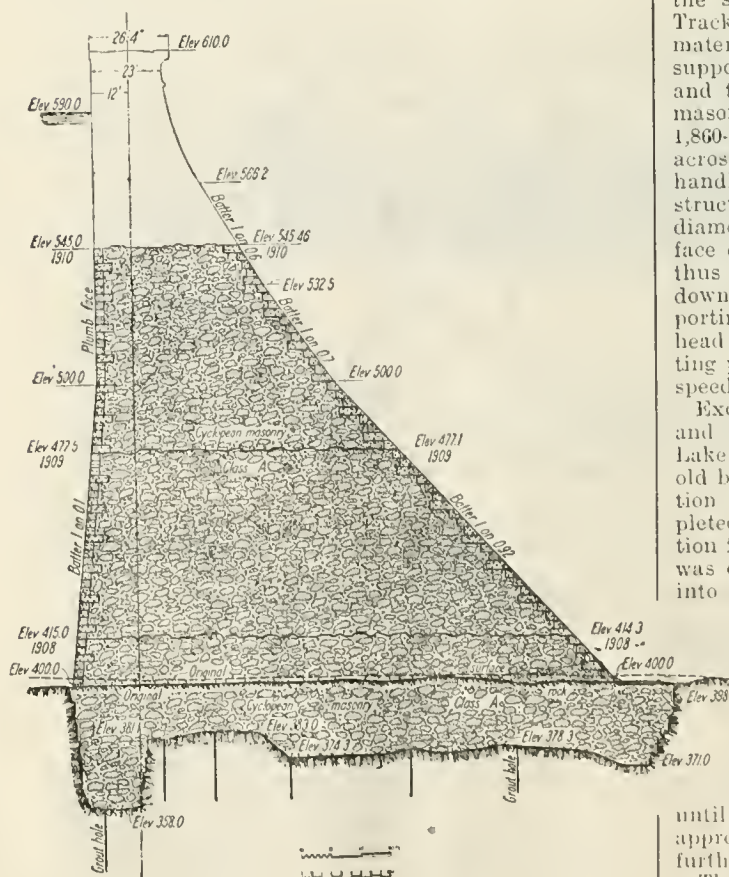

FIG. 7.—OLIVE BRIDGE DAM: PROGRESS IN LAYING MASONRY TO JANUARY, 1911.

The lower part of the dam is being built by travellers, each equipped with two derricks, four travellers in a group of pairs facing each other across the space between the adjacent expansion joints. Tracks for these travellers, and for the cars bringing materials to them, extend across the valley, and are supported on concrete piers. This system of tracks and travellers is elevated from time to time as the masonry progresses. Two movable cableways of 1,860-ft. span, on timber towers 125 ft. high, stretch across the dam site, these being used principally for handling the equipment used on the masonry construction. The cables are of lock-bar type, 2 1/2 in. in diameter. The towers can travel from the upstream face of the dam for a distance of 220 ft. downstream, thus covering all of the dam site except the extreme downstream toe in the gorge. The lifting of the transporting apparatus is operated by wire rope from the head towers at the east end of the dam. The operating plant for each cable consists of an electric two-speed double-drum hoist.

Excavation for the Kensico dam was begun in 1911, and at the beginning of 1912 the old dam forming Lake Kensico had been breached, excavating in the old bed of Lake Kensico was in progress, the excavation of a flume for carrying off the water was completed, and the flume about two-thirds built. Excavation for a length of 250 ft. at the west end of the dam was carried on by hand, the material being loaded into 2-yd. skips, and removed by guy-derricks. At first the excavated material was used for grading for the cableway tail towers, but later it was used for fill below the dam. On May 20th the West Lake drive was closed, and the excavation was extended east. For 1,000 ft. across the bottom of the Kensico lake the excavation was largely with steam shovels. The shovels removed both earth and rock, after the rock had been blasted, until the general level of the bottom had been approximately reached, after which the bottom was further excavated by hand.

The Catskill water conduit consists of four distinct types of aqueduct—namely, cut-and-cover, grade tunnel, pressure tunnel, and steel-pipe siphon. The cut-and-cover forms 55 miles of the aqueduct, is of

horseshoe shape, in cross-section, 17 ft. high by 17.5 ft. wide inside, and constructed of concrete. As com-

pleted, it is covered with an earth embankment. This is the least expensive type, and so is used wherever

FIG. 8.—OLIVE BRIDGE DAM. COMPLETED CUT-OFF TRENCH LOOKING NORTH.

pleted, it is covered with an earth embankment. This is the least expensive type, and so is used wherever

FIG. 10.—HUNTER'S BROOK STEEL PIPE SYPHON: ERECTING STEEL PIPE ON CONCRETE CRADLES PREVIOUSLY PLACED. (Pipe will be embedded in concrete.)

impossible to circumvent them, tunnels at the natural elevation of the aqueduct are driven through them.

FIG. 9.—OLIVE BRIDGE DAM: BLOCK YARD AND CEMENT STORAGE FROM CONCRETE PLANT. (Tracks at right lead to Sand Pits and Quarry.)

There are twenty-four of these grade tunnels, aggregating 14 miles. These, also, are horse-hoe shape, 17 ft. high by 13.38 ft. wide, and lined throughout with concrete. Where deep and broad valleys must be crossed, and there is suitable rock beneath them, circular tunnels have been driven deep in the rock and

of all waters encountered in tunnel work. A number of these waters were found to contain sulphates and chlorides of magnesium and calcium in such concentration as to be injurious if such waters were permitted to percolate through concrete for protracted periods. Special precautions were therefore taken to

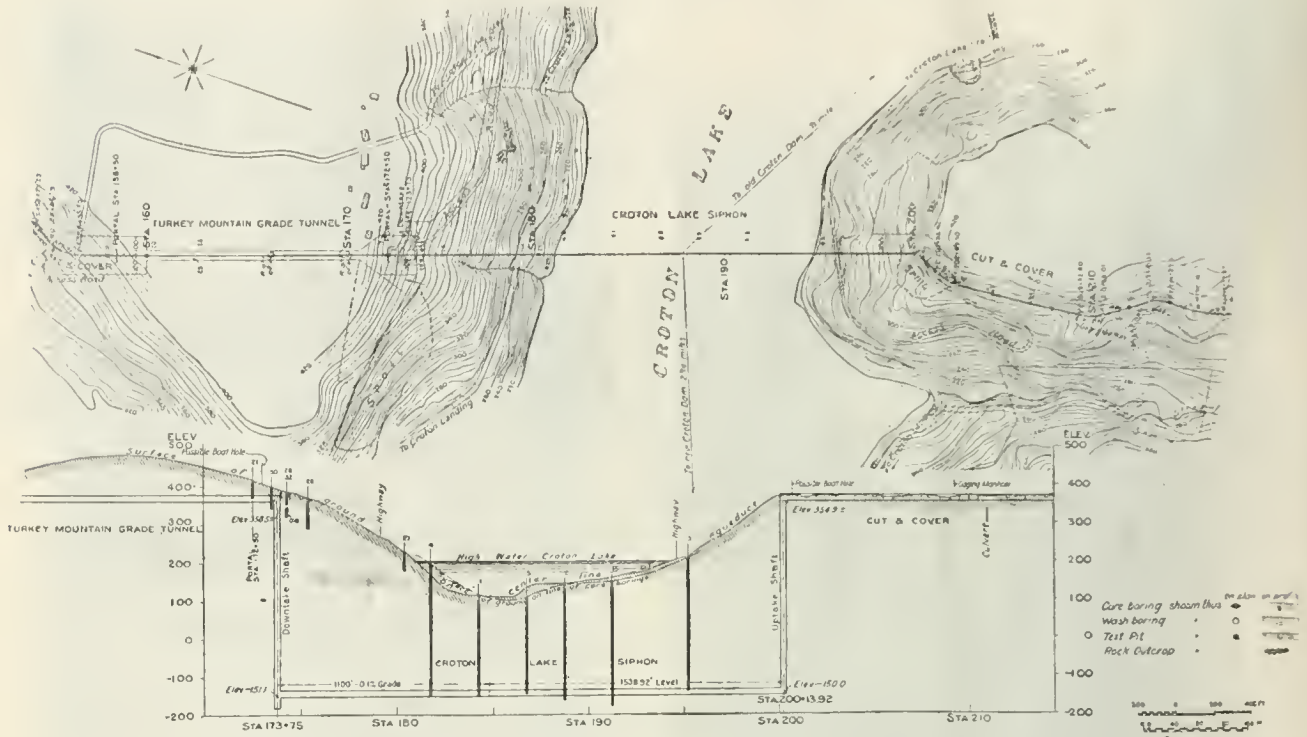

FIG. 11.- CROTON LAKE SYPHON PLAN AND PROFILE.

lined with concrete. There are seven pressure tunnels, totalling 17 miles, with a diameter of 14 ft.

Where the rock is not sound, or where, for other reasons, pressure tunnels would be impracticable, steel-pipe siphons are used. These steel pipes are made of plates riveted together, from 7.68 in. to 0.75 in. in thickness, and are 9 ft. and 11 ft. in diameter. They are lined with 2 in. of cement mortar, embedded in

get dense and impermeable concrete in those portions of the tunnels in which such injurious waters were met. These waters were generally neutral or slightly alkaline in character, with the single exception of a water from one part of the city aqueduct, which showed an acidity equivalent to 8 parts per 1,000,000 of sulphuric acid. In order to discover what effect, if any, the water coming from the rock in the Hudson

FIG. 12. PROGRESS IN EXCAVATION FROM HILL VIEW RESERVOIR TO TERMINAL SHAFTS IN BROOKLYN, SHOWN BY FULL BLACK SECTION.

concrete and covered with an earth embankment. There are fourteen of these siphons aggregating 6 miles. Three pipes are required in each siphon for the full capacity of the aqueduct.

SOME CONCRETE AND METAL TESTS.

In the year 1912 a systematic examination was made

siphon would have on the concrete linings of the shafts, six 8-in. by 16-in. concrete cylinders of 1:1.96:4.24 mixture were immersed in the running rock water of one of the shafts of the Hudson pressure tunnel for two years. A similar set of six specimens was stored in the ordinary way in damp sand in the laboratory for the same period. When these speci-

mens were crushed the two sets gave almost identical results, showing that immersion of this rich, dense concrete in the shaft water had not had the least effect upon it. The shaft water was of such character that considerable deterioration would undoubtedly have resulted if the water had percolated through the concrete, as was indicated by experiments carried out in previous years. In these experiments small specimens of concrete, purposely made lean as well as permeable by the use of sand composed of grains of practically uniform size, were found to be materially weakened after a year's percolation under pressure.

CEMENT TESTS.			
	1910.	1911.	1912.
Barrels of cement tested ..	1,175,800	1,820,550	1,288,300

Per cent rejected (all causes)	4.56	9.69	6.54

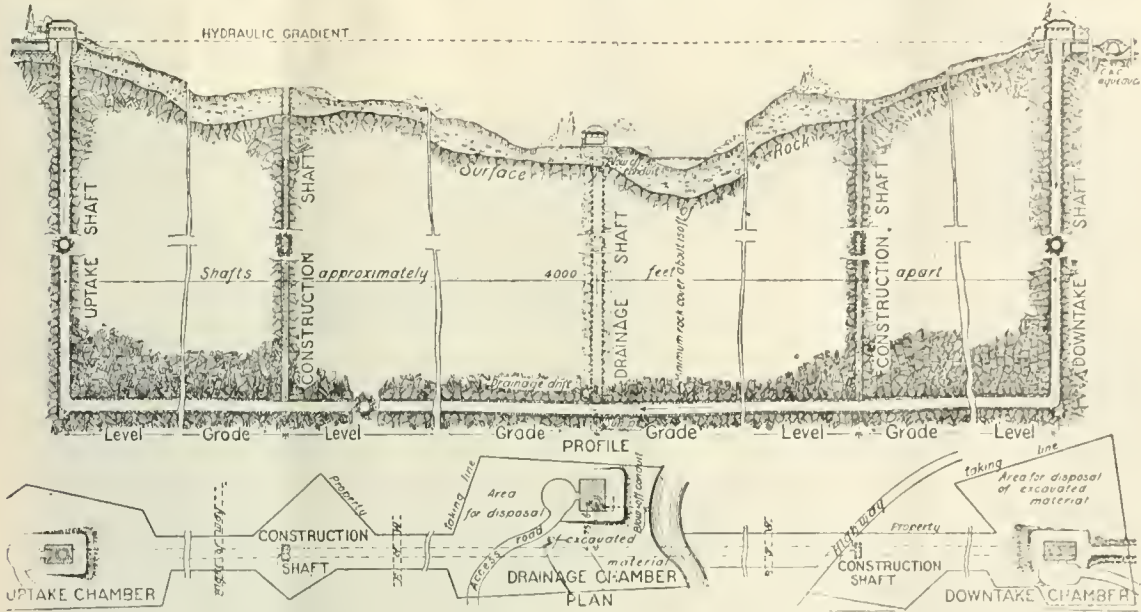

FIG. 13.—CATSKILL AQUEDUCT: TYPICAL PRESSURE TUNNEL.

For the Department of Bridges sixty-four concrete specimens were tested. To determine the suitability of materials for construction fifty-six tests were made of specimens of concrete used on aqueduct construc-

A series of experiments was undertaken to determine the relative deterioration a metal suffers from corrosion when embedded in concrete alone and in contact with another metal. Weighed specimens of

FIG. 14.—TYPES OF PRESSURE TUNNEL FOR CROSSING DEEP DEPRESSIONS IN AQUEDUCT LINE.

tion, and 714 tests were made of concrete aggregates from localities along the aqueduct, including strength tests of mortar and concrete. All cement used in construction was inspected and tested, the records of these tests being:—

steel, manganese bronze, lead, copper and Monel metal were embedded in damp concrete singly, and in couples in contact. At the end of two months the concrete blocks were broken and the metals removed, cleaned, dried and reweighed. The resulting losses

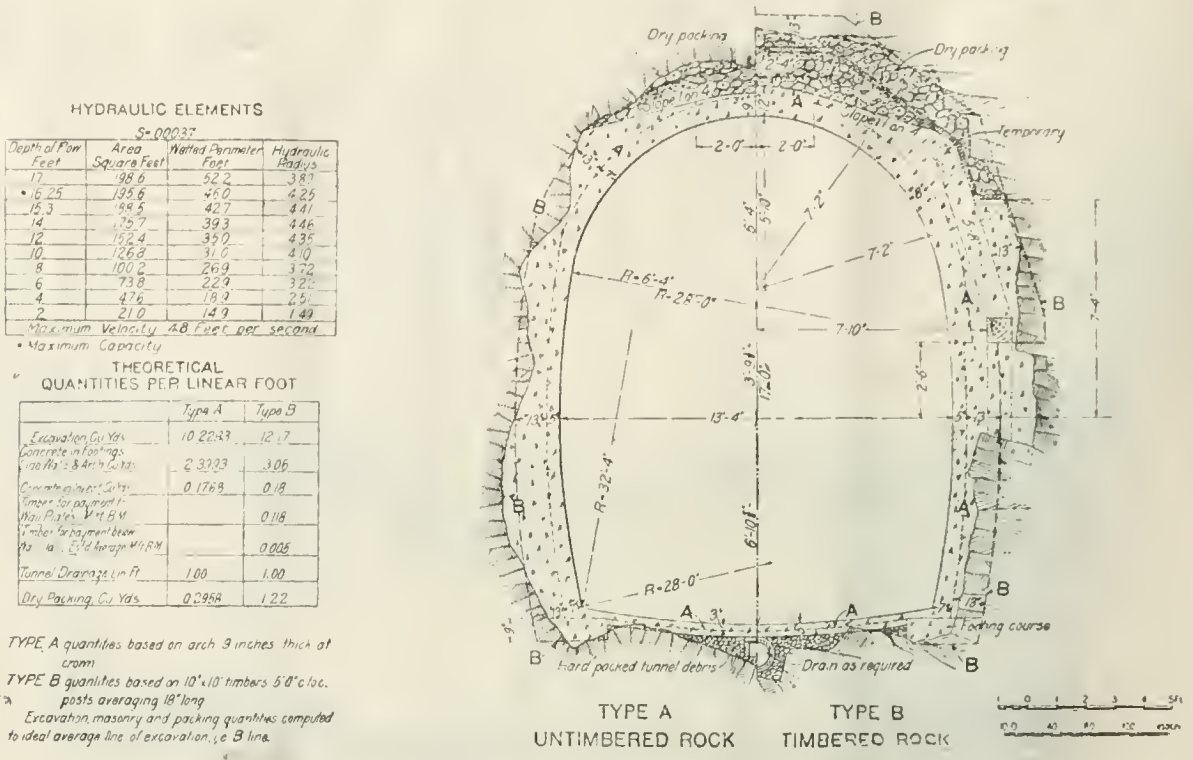

FIG. 15.—TYPES OF CONSTRUCTION OF TUNNEL AT HYDRAULIC GRADE.

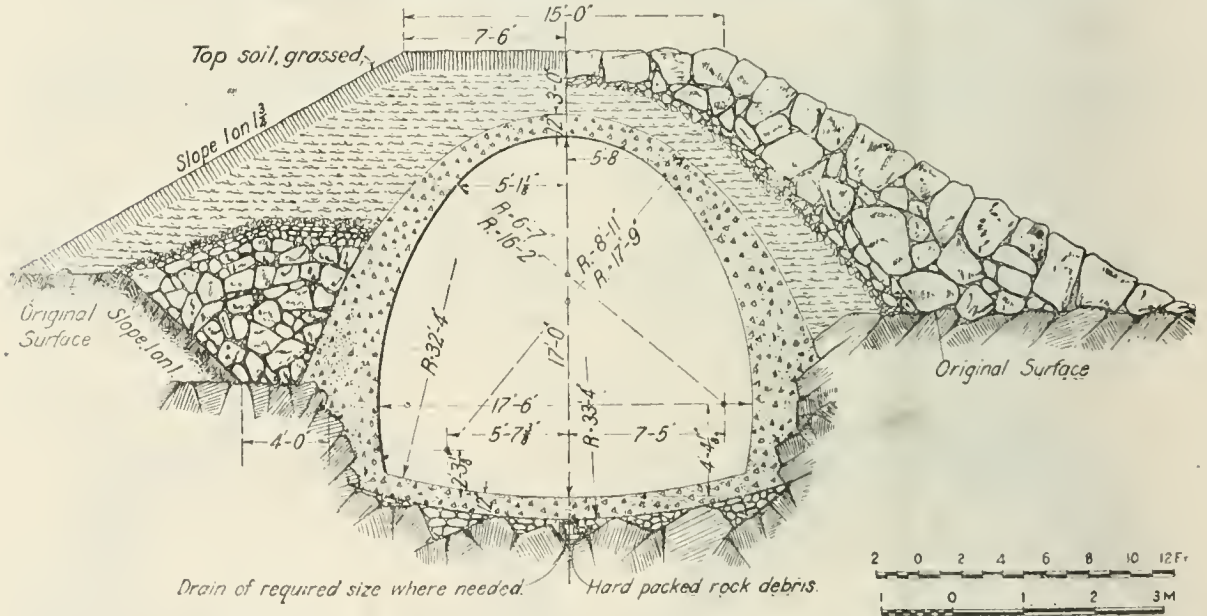

FIG. 16.—TYPICAL CUT-AND-COVER CONSTRUCTION IN PARTIAL AND TOTAL ROCK TRENCH.

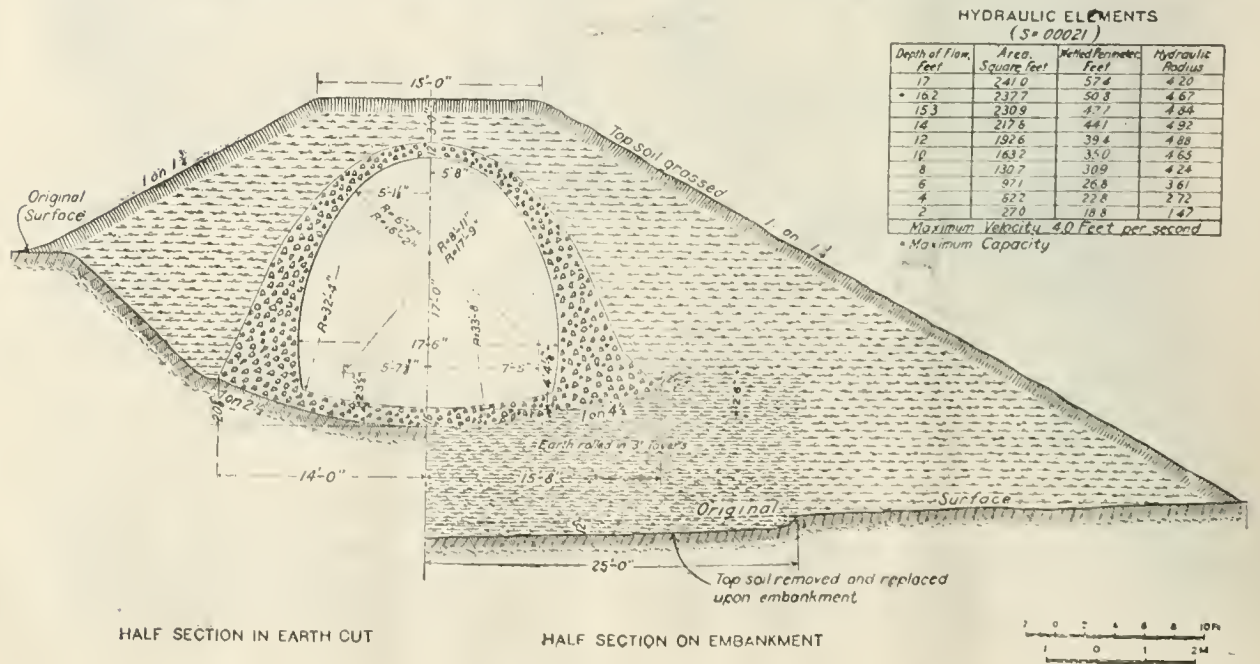

FIG. 17.—TYPICAL CUT-AND-COVER CONSTRUCTION IN EARTH TRENCH AND ON EMBANKMENT.

in weight showed but slight differences, whether the metals were alone or in contact, and gave no evidence of electrolytic action in the latter case. With the exception of lead, the corrosion of all the metals was slight, that of Monel metal being almost nil. The action of lead confirmed previous experience, and showed that this metal may suffer appreciably in alkaline as well as in acid mediums; the corrosive action was observed to be solvent in character, no protective coating being formed to arrest further change. Specimens of iron and steel, 12 in. by 24 in. by ¼ in. thick, from various manufacturers, were subjected to corrosive influences by exposure to the atmosphere and by immersion in Esopus creek. At the end of a year the specimens were cleaned of their accumulated rust with dilute sulphuric acid, while in galvanic contact with zinc, which effectually removed

GLOUCESTERSHIRE ROADS.

The annual report of the Highways and General Purposes Committee of the Gloucestershire County Council, which is signed by the chairman, Mr. F. W. B. Cripps, and the county surveyor, Mr. E. S. Sinnott, shows that the total expenditure on the county roads during the year ended March 31st last was £109,463, while the total cost of rural roads was £97,143—an average of £98 14s. 10d. per mile, inclusive of salaries, bridges, and footways. Superintendence cost 3.55 of the total outlay. The quantity of stone used amounted to 118,166 tons, made up as follows: Granite or basalt, 56,269 tons; tarmac, 4,244 tons; 2½-in. tarred macadam, 5,784 tons; carboniferous limestone, 40,024 tons; granite and mill grit tarred binding and patching.

FIG. 18.—CROSS-SECTION OF HUDSON RIVER AT CATSKILL AQUEDUCT TUNNEL CROSSING, SHOWING DIAMOND DRILL EXPLORATION HOLES.

the rust without attacking the metal or scale, and were washed, dried and weighed. The relative deterioration of some of the metals, due to corrosion, are:—

MATERIALS.	(A)	Loss per square foot in grams.	
		(B)	(C)
Wrought iron	4	17.01	20.41
Especially pure, extra low carbon, open-hearth steel (a)	2	13.61	19.28
Especially pure, extra low carbon, open-hearth steel (b)	2	21.55	23.81
Open-hearth steel	4	17.01	18.14
Copper steel, containing ¼ per cent copper	2	6.80	11.74
Bessemer steel	1	20.41	26.08

(A) is number of specimens in average; (B) is for exposure on laboratory roof; (C) is for immersion in Esopus creek.

Other series of similar experiments are being made, the metals being stored in various soils and kept continually wet, but no determinations of value have as yet been made.

To measure the water drawn from the big reservoirs some very large Venturi meters have been built on the line of the aqueduct. These are probably the largest water meters ever built. There is one just below Ashokan reservoir, a second just above Kensico reservoir, and a third where the water is drawn from Kensico reservoir. Each of these meters is 410 ft. long, of reinforced concrete excepting for the bronze throat castings and the piezometer ring, which is also of cast bronze.

1,490 tons; oolitic limestone, 1,045 tons; slag, 3,548 tons; Naisheombe quartzite, 2,688 tons; land, 74 tons.

It is proposed to purchase three 10-ton steam rollers, to be used in connection with the consolidation of tarred material. It is found from experience that the putting down of tarred macadam or tarmac is best affected by two rollers working in pairs—i.e., 15-ton roller for consolidating the larger material, and the tighter roller for finishing the surface. It is also proposed to purchase a 6-h.p. traction engine and six steel-lined side-tipping trailers (6 tons capacity each).

The estimates show an advance of £29,198 over and above the expenditure of last year, which has been necessitated in consequence of the increase in traffic. The Road Board propose to contribute £20,000 out of an expenditure of £40,000 upon improved surfaces—i.e., those constructed with tarmac or tarred macadam, which are to be laid on the lengths due for resurfacing on the 354 miles of trunk routes. It is intended to lay the improved surface for an average width of 12 ft. in the centres of such roads, making up the sides with water-bound macadam, and it is estimated that 40 miles will be coated during the current year. The board will also contribute £1,500 towards tar-spraying.

“Pudlo.”—According to the report of the Inspector of Ancient Monuments, H.M. Office of Works, in restoring Weobley and Monmouth Castles, used Pudlo for making the structures waterproof.

Institution of Municipal and County Engineers.

THE DOVER MEETING.

There was a surprisingly small attendance at last Saturday's meeting of the Institution of Municipal and County Engineers at Dover, and the extreme brevity of the initial business proceedings at the town hall was another somewhat unexpected feature of the gathering. Following an address from the Mayor, and a short acknowledgment by the president, votes of thanks were immediately accorded to Messrs. W. C. Hawke, the borough engineer, P. C. Tempest, engineer to the South-Eastern and Chatham Railway, and A. T. Walmisley, the engineer to the Harbour Board, for their papers on the several undertakings with which they are concerned, and although Mr. Dryland, the district chairman, seemed anxious that something in the shape of a discussion should take place, the meeting was forthwith adjourned—barely half-an-hour after the start—for luncheon. The minutes of the previous meeting, if they happened to be available, were not read, and the new secretary to the institution, Mr. Dudley Robinson, who was among those present, found no opportunity of responding to a few words of welcome addressed to him by Mr. Cockrill. A good part of the next half hour was spent, more or less happily, by the members in posing in a group before a local photographer, who, having completed his preparations for a picture, was brought to a temporary standstill by an absence of cloud and a consequent excess of sunlight, which he explained, during the period of waiting, did not make for the best results in his art. This ordeal over, the party proceeded to the Grand Hotel for lunch, but the disinclination for speech making, shown so markedly at the morning meeting, was again evident here, the customary toast list being conspicuous by its absence. A collection for the Orphan Fund, however, realised the substantial sum of £7 9s. 6d., one contribution, from "A Friend of the Institution," being for five guineas. In spite of the inclemency of the weather, the subsequent visits, which included inspections of a ferro-concrete viaduct and workmen's dwellings in course of construction in the pier district, the new marine station on the Admiralty Pier, and the National Harbour Works, passed off pleasantly, and the members, on returning to the town hall, were the guests of the Mayor at tea. The attendance at the meeting included Messrs. S. P. Andrews (Faversham), W. Banks (Rochester), H. W. Barker (Walmer), R. Brown (Southall-Norwood), T. F. Bunting (Maidstone), T. A. Busbridge (Maidstone Rural), H. T. Chapman (Kent County), J. W. Cockrill (Great Yarmouth, president), A. Dryland (Surrey County, district chairman), T. C. Golder (Deal), F. Harris (Tonbridge Rural), W. C. Hawke (Dover), H. O. Jones (Folkestone), E. R. Lewis (Cranbrook), A. E. Nichols (Folkestone), J. L. Redfern (Gillingham), T. G. Robinson (Dover), W. Crowhurst Rubie (Birmingham) and J. W. Dudley Robinson (Westminster, secretary).

The MAYOR (Councillor E. W. T. Farley), in receiving the members, expressed the hope that, although the visit of the institution to the ancient port and borough of Dover was a short one, it might be one of profit and pleasure.

The PRESIDENT (Mr. J. W. Cockrill) said he was sure all appreciated the kind words of his Worship, and that the visit would prove instructive to them.

Mr. A. DRYLAND (Surrey County), district chairman, also voiced the indebtedness of the members to the corporation for the kind welcome which had been extended to them. They had, at the same time, to extend their thanks to Mr. Hawke, the borough engineer, for consenting to arrange for the meeting, and to Mr. Walmisley and Mr. Tempest for the facilities they had given for the inspection of the harbour and railway station works. Dover was a familiar place to him, for he spent some thirteen or fourteen years in that part of the country, and he would experience considerable pleasure in going round with the members that day.

On taking the chair, the PRESIDENT moved a vote of thanks to the readers of the three papers which had been prepared in connection with the meeting. Interest in their institution, he observed, was maintained very considerably by those who were kind enough to read papers before them. Proceeding, Mr. Cockrill observed that they had present with them that day their new secretary, Mr. Dudley Robinson.

He came to the institution as a young man. Mr. Cole had held the office of secretary for forty years, and if Mr. Robinson held the position for another forty years it was reasonable to hope that the institution would number between 3,000 and 4,000 members. He gave him a hearty welcome, and hoped that, under his guidance, the institution would go on and prosper.

Mr. REGINALD BROWN (Southall-Norwood), seconding the votes of thanks, remarked that in coming to an old town like Dover they expected to, and would, no doubt, see some works of unusual interest. The harbour works spoke for themselves, and Mr. Hawke's work was so well known that he thought his mere offer to throw them open to their inspection showed that he had an interest in the institution.

The votes of thanks were carried.

In a short acknowledgment of the compliment paid to him, Mr. WALMSLEY said he felt gratified at meeting that day a number of gentlemen whom he had met out of Dover on previous occasions. Mr. HAWKE, who also replied, excused the shortness of the paper which he had prepared on the ground that he preferred practice to theory. Answers given to questions asked on the job were, he added, of far more service to engineers than pages of descriptive matter. He was personally delighted to see them in Dover, and so far as he was concerned should use every endeavour to make the meeting successful in every way.

Mr. DRYLAND recalled that at the recent district meeting at Tunbridge Wells a certain amount of business was transacted and there might be a subject which they could deal with on that occasion. At the meeting he referred to the wish was expressed by some of the junior members that they should hold meetings of their own, and he was asked whether he would support them in arranging these. He expressed himself in favour of the idea, and a meeting of junior members was actually in course of arrangement. Papers would be prepared by junior members, and while all members of the institution could attend, it would be largely a meeting of the junior members themselves. It seemed to him most desirable that the junior members should be encouraged to take an active interest in the institution, and he thought the general body of members should give their assistance in the matter.

After lunch an inspection was made of the ferro-concrete viaduct and workmen's dwellings, which are in course of construction in the pier district, and which are fully described in the paper of Mr. W. C. Hawke, the borough engineer, reproduced on another page of this issue. Subsequently the members proceeded to the new marine station works. This station is being built for the railway company on land reclaimed by the Dover Harbour Board by constructing a sea wall on the eastern side of the Admiralty Pier from the shore to the Turret Fort, and filling the intervening space with chalk. In order to provide a solid foundation for the station buildings, nearly 1,200 reinforced-concrete piles (Consideré system) have been driven through the chalk filling to the sea bed, and the heads of the piles have been connected together with reinforced-concrete slabs and beams. A carriage shed, the sides of which will be constructed of reinforced concrete, is being erected contiguous to the station building, of sufficient size to take four of the company's longest trains at the same time. The roof of the station is of the braced-arch type. The main trusses are placed every 35 ft., and rest upon stanchions independent of the walls. The platform buildings and the side walls are to be built principally of brick, granite being used for dressings in the case of the side walls. The front of the station at the shore end will be faced entirely with granite. The station and works in connection therewith, including the foundations, have been designed by Mr. P. C. Tempest, the engineer to the company, and they are being carried out under the supervision of his new works assistant, Mr. F. C. Stainton, the resident engineer being Mr. W. Nightingale. Messrs. S. Pearson & Son, who were the contractors to the Dover Harbour Board for the reclamation works, constructed the piled foundations of the station for the railway company; the Butterley Company, of Derby, are the contractors for the steelwork generally; while Messrs. W. E.

Blake, Limited, of Fulham, are carrying out the works in connection with the front and side walls of the station and the platform buildings, and other general work.

DOVER HARBOUR WORKS.

Some interesting details with regard to the national harbour works were supplied in the paper prepared by Mr. A. T. Walmisley, M.INST.C.E., engineer to the Dover Harbour Board.

The construction of the shore end of the Admiralty Pier at Dover followed the Royal Commission of 1844. It was commenced in 1847, completed in 1871, and was designed to serve as a breakwater or western

MR. A. T. WALMSLEY, M.INST.C.E.

[Mr. Walmisley is a Fellow of King's College, London, and lecturer on Waterways, Harbours, and Docks at University College (University of London). He is a member of the Institution of Civil Engineers, and the auditor of that body for 1914-15; also an hon. associate of the Royal Institute of British Architects, and member of the Royal Institute of British Architects Reinforced Concrete Advisory Committee. He was appointed engineer to the Dover Harbour Board in 1888, and has been in private practice at 9 Victoria-street, Westminster, since 1877, being the senior partner of the firm of A. T. Walmisley & White. It may be recalled that Mr. Walmisley read a paper on the subject of groynes at the meeting of the Institution of Municipal and County Engineers held at Dover in 1897; and he is the author of "Iron Roofs" (Spon)—which has attained a second edition—and "Field Work and Instruments," and "Land Surveying and Levelling" (Whittaker & Co.). In the coronation year of 1911 he was Master of the Worshipful Company of Makers of Playing Cards.]

arm of a harbour of refuge. The embarkation and disembarking of railway passengers was arranged subsequent to its inception by the addition of timber landing stages on both sides of the pier. The stages on the west side are still existing.

The length of the Admiralty Pier was 2,100 ft. prior to its extension in 1899-1909 by the Government for the National Harbour, and with 2,000 ft. extended in a south-easterly direction is now 4,100 ft. long, or about $\frac{3}{4}$ mile in length.

Alongside the extension a deep water landing stage 780 ft. 3 in. in length by 20 ft. in width has been built in open pile work, being furnished with berths for Continental steamers and double decks to suit tidal levels for the service of the Calais and Ostend mail boats until the completion of the Marine Station already described. About 11 $\frac{1}{2}$ acres have now been reclaimed by the Dover Harbour Board upon the east side of the Admiralty Pier to obtain a site for the railway company's Marine Station, with sidings for Continental traffic in connection with the four berths provided by the Harbour Board for passenger steamers, one of the latter being constructed as an onset landing for the use of paddle mail boats at low water with a subway leading to the new station.

Spring tides rise 18 ft. 9 in., neap tides 15 ft., and range 11 ft. High water ordinary spring tide is 10.35 ft. above ordnance datum.

The retaining wall to the reclaimed area, designed by Mr. Walmisley, is a 50 per cent wall 2,260 ft. in length, formed of concrete blocks having its width at the base half the height, as portions had to stand

isolated until the filling, consisting of deposited chalk obtained from the cliff east of the harbour, was completed. The work up to coping level was executed by Messrs. S. Pearson & Son, Limited, Messrs. Baker & Hutzig being engaged as consulting engineers, and Mr. H. Sadler, M.INST.C.E., as resident engineer. Reinforced concrete piles on the Considere system support the foundations of the station and of the inset landing subway.

In the building of the wall there were three processes to be carried out from a temporary stage carrying goliath cranes capable of travelling longitudinally, and each furnished with a steam winch or crab with transverse movement. First the excavation of mud down to a chalk foundation by means of grab dredging, then the levelling of the chalk surface by aid of a diving bell, and finally the setting of the blocks at required level by a helmet diver were undertaken.

Portland cement was first used for concrete blocks of 3 to 7 tons in weight at the original pier in 1849. In the extension, blocks of 40 tons weight were employed, and the face blocks above low water level were dowed in position, timber fenders being provided at regular distances apart. A conduit 6 ft. in height by 4 ft. in width runs beneath rail level down the east side of the original pier between the entrance gates and the turret to convey electric cables and other pipes.

The Prince of Wales Pier was commenced in 1892 to the designs of Messrs. Coode, Son & Mathews, Sir John Jackson being the contractor, and marks the boundary of the area now available for the Harbour Board's outer harbour. The shoreward end for 1,260 ft. is formed by an iron viaduct having a clear headway of 15 ft. above high water ordinary spring tide, so as to allow the tide to run through in the supposition that no outside seaworks would then be constructed. The seaward end is formed of concrete blocks faced with granite, having a coping level 10 ft. above high water ordinary spring tides, and the total length of the pier is 2,910 ft.

Subsequent to its completion a landing stage was added in 1904 upon the Eastern side of the Prince of Wales Pier, with the provision of railway communication in connection with the mail lines at Dover Harbour Station. This was arranged by the Dover Harbour Board, and carried out by Messrs. S. Pearson, with a swing bridge across the Wellington Dock entrance, designed by Mr. A. T. Walmisley. The hydraulic power is actuated by an electric engine which raises an accumulator to generate a pressure of 750 lb. per square inch, and the machinery was inspected by the members present on their return from the Prince of Wales Pier.

THE HAMBURG MEETING.

Those members of the institution who intend to take part in the visit to Hamburg at Whitsuntide will leave London on Wednesday, May 27th (Liverpool-street Station), by the 8.30 p.m. service, *via* Harwich and the Hook of Holland, and reach their destination shortly before three o'clock on the following afternoon. At ten o'clock on Friday morning the party will proceed to the municipal waterworks at Rothenburgsort, Billhornerdeich, and in the afternoon will visit the sewers and hear a lecture on town planning. On the next day an inspection of the gas-works and public lighting system will be made, and visits paid to the town hall and the principal places of interest in Hamburg, the arrangements including a journey by steamer through the harbour. On Monday visits to the Altona flower exhibition and Blankenese will take place, while the following morning will be devoted to an excursion to Hagenbeck's Tierpark. Hamburg will be left on Wednesday, June 3rd.

The inclusive fare for the trip, it may be mentioned, is £11 19s. 6d.

SOUTHEND MEETING PROGRAMME.

The programme of the meeting of the institution to be held at Southend-on-Sea on Saturday, June 6th, was issued yesterday, and is as follows:—

11 a.m. Members will assemble at the Palace Hotel. Reception by his Worship the Mayor (Alderman Joseph Francis, J.P.).

11.35 a.m.—Leave hotel to inspect the following works in course of construction: (a) Pier extensions (electric cars to pier head, kindly provided by the Pier Committee); (b) Esplanade improvement and sea wall; (c) large swimming bath.

1.30 p.m.—Lunch at the Palace Hotel by kind invitation of the Mayor.

- 2.15 p.m.—Discussion on paper by Mr. E. J. Elford, M.INST.C.E., on "The Main Sewerage and Sewage Disposal Works, and other Recent Municipal Works, Southend-on-Sea."
- 2.45 p.m.—Leave hotel to inspect the following works: (d) Reinforced-concrete loading pier; (e) tramway boulevard; (f) sewage disposal works.
- 4.45 p.m.—Tea on the site of the sewage works at the invitation of Mr. E. J. Elford, followed, if desired, by further discussion on paper.

LYTHAM DISTRICT MEETING.

The arrangements for the North-Western District meeting of the institution to be held at Lytham on Saturday, June 13th, include the reading and discussion of a paper by Mr. A. J. Price, the engineer and surveyor, entitled "The Municipal Works of Lytham," and visits to the town's West End outfall sewage works (in course of construction), the East End sewage and destructor works and the slaughter-houses.

Efforts are being made to arrange for a two days' district meeting in Cork towards the end of July, and it is hoped that a district meeting will be held in Leicestershire in the near future. Provisional arrangements are also in hand for a meeting (probably an institution meeting) to be held at Cleethorpes in September.

SUSSEX ROADS.*

By A. McARTHUR,

Highways Surveyor to the Cuckfield Rural District Council.

In these parts, not so very long ago, a road maintained and repaired with broken sandstone was the vogue; flints came later, and the use of granite, when first introduced, was deemed a luxury. It is these earlier days of pit-stone and flints that give us the little bed or foundation that now appears in our roads, obtained only by process of accumulation, for except in the case of some of our main trunk roads and roads of recent construction there is a complete absence of initial foundation. This certainly is borne out by the conditions which were said to obtain in the earlier periods, and to a great extent aggravates the problem of maintenance as it exists to-day.

I might here say that I am not unmindful of the magnificent work achieved by Macadam and Telford, and, among exponents of a later school, Kinchin, of local fame. Let me, however, quote the following extract from Smiles, as I think it has some bearing on the question:—

"In the seventeenth century it is recorded that roads were in many cases but rude tracks across heath and common as furrowed with deep ruts as ploughed fields. In the winter to pass along one of these was like travelling in a ditch. The attempt made by adjoining occupiers to mend them were for the most part confined to throwing large stones in the bigger holes and filling them up. They were horse tracks in the summer and rivulets in the winter."

This rather sweeping, yet no doubt authentic, record applied generally; but, "in Sussex," it adds that "the roads had long preserved an infamous notoriety, and it was satirically alleged that the Sussex girls were so long-legged because of the tenacity of the mud in that county. The practice of pulling the foot out of it, by the ankle, tending to stretch the muscle and lengthen the bone." Further, according to local history, it is stated that children were drowned in the ruts, on one occasion this forming the subject of a coroner's inquest at Cuckfield; and among parochial possessions in the past there was the plough used to fill in the ruts when the spring, or early summer, rendered the ground sufficiently dry. These old-time implements probably rested by the roadside for the remainder of the year waiting for their period of usefulness, as does the aggressive-looking, ever-ready snow-plough of to-day. Be this as it may, I venture to express the view from personal observation that, in spite of the transformation of the mud track into the well-macadamised highway of to-day, our fair friends in Sussex still retain the physical characteristics referred to.

* Extract from paper on "Road Maintenance—Past and Present," read at a recent meeting of the Public Health and Local Government Officers' Association for Sussex.

COLCHESTER BOROUGH SURVEYORSHIP.

APPOINTMENT OF MR. HAROLD COLLINS.

As the result of the second competition for the position of borough engineer and surveyor of Colchester, Mr. Harold Collins, ASSOC. M.INST.C.E., M.I.M. AND CO.E., deputy city engineer, Norwich, has been successful.

Mr. Collins was articled to his father, the present city engineer of Norwich, afterwards being appointed assistant to the resident engineer of the Lancashire and Yorkshire Railway, when some very extensive works in and around Wakefield, including tunnelling and other heavy operations, were carried out. He was subsequently selected as assistant by Mr. H. T. Wake-

ham, M.INST.C.E., county engineer and surveyor of Middlesex, under whom he was engaged upon very important electric tramways and main road improvements.

Since his appointment by the Norwich Council in April, 1903, as deputy city engineer of that city, he has assisted the city engineer in all the numerous ramifications of special and routine works, and when his chief was disabled by accidents on two occasions, and by overwork on a third, Mr. Harold Collins carried on the whole work of the department with complete satisfaction to the authority. During the great flood of August, 1912, the city engineer was at sea taking his annual holiday, and the grave responsibility for meeting the demands on the department devolved upon his deputy, who thoroughly rose to the occasion, winning the commendations of Mr. John Burns, the President of the Local Government Board, who was an unrecognised observer of the work in progress to reduce the effects of the floods, and protect and help sufferers. Mr. Harold Collins received the thanks of the council, conveyed to him by the Lord Mayor, for his valuable services and exertions on that occasion.

The Colchester appointment carries with it a salary of £400, rising by annual increments of £20 to £500 per annum.

Bury Sanatorium Extension.—The Bury and District Joint Hospital Board have decided to proceed with a scheme for providing an additional 150 beds for adults and 50 beds for children, and for this purpose it is proposed, subject to the approval of the Local Government Board, to purchase the whole of an estate adjacent to the existing Aitken sanatorium at Holcombe.

London and Lancashire Fire Insurance Company.—In moving the adoption of the report and statement of accounts at the fifty-second annual meeting, Mr. John H. Clayton, the chairman, stated that the total reserves of the company now amounted to £3,286,043, or 125 per cent of their total premiums. Looking broadly and even analytically, at their accounts, he thought it would be the opinion of all that they were not only up to their standard, but a little better. They evidenced steady progress and substantial profit in every department.

Ferro-Concrete Viaduct and Pier District Workmen's Dwellings at Dover.*

By W. C. HAWKE, ASSOC. INST. C.E., Borough Surveyor, Dover.

The Viaduct, which is authorised by the Dover Corporation Acts of 1901 and 1912, is being constructed in accordance with designs prepared by the borough engineer under the Hennebique system of ferro-concrete, and to details supplied by Messrs. L. G. Mouchel & Partners, Limited, of Victoria-street, Westminster, S.W. It will, when completed, be about 700 ft. in length, running from the junction of Beach-street and

bottom, narrowing to 4 in. at road level, with counterforts every 9 ft. 6 in., and tied together by ferro-concrete tie beams every 19 ft., resting on ferro-concrete slabs of widths varying with the rise of the road from 5 ft. 3 in. to 8 ft. 3 in. From that point the roadway is carried on arches of varying spans which average about 31 ft. The road will cross the Dover and Deal Railway by a ferro-concrete bowstring girder bridge of 65 ft. clear span. The arches are formed of four main longitudinal beams, each carried by an 18-in. column, the external beams being finished as elliptical arches for the sake of appearance.

A system of grouting the gravel, which overlies the chalk to within 2 ft. or 3 ft. of the surface, with a thick Portland-cement grout to form a monolithic mass in situ, was eminently successful, and on the gravel thus prepared the ferro-concrete slabs and tie beams of the retaining walls were laid.

The foundations of the columns are taken down to the solid chalk at a level of about 22 ft. below ground level, at the point at which work is now proceeding. The level of the solid chalk coincides almost exactly with ordnance datum. A considerable quantity of water was met with, especially during spring tides, but this was overcome sufficiently during neap tides by a 4-in. electrically driven centrifugal pump to carry out the work of excavation. The high water level of spring tides is about 10.35 ordnance datum. It was considered unnecessary to carry the ferro-concrete slabs and columns themselves down to the chalk; therefore, it was decided to bring up Portland cement columns, 5 ft. by 5 ft. square, 6 to 1, through the water to above rest-water level, upon which the ferro-concrete slabs were laid with the 18-in. columns springing from them.

Ferro-concrete piles are to be driven for the abutments of the bridge over the Dover and Deal Railway on the south side, owing to the closeness of the abutment to the permanent way.

The Viaduct is carried over the sewage pumping station by a ferro-concrete bowstring girder bridge of 70-ft. clear span. The existing pumps are to be replaced by electrically controlled centrifugal pumps.

The existing roof will be removed, and the underside of the Viaduct will form the new roof. From the pumping station the Viaduct falls with a grade of 1 in 38.5 to the junction of Elizabeth and Limekiln streets, being slightly bell-mouthed at the junction.

A spur of about 270 ft. in length will run from the Viaduct to the junction of Limekiln-street, Bulwark-street and Bulwark-hill. This spur will be of exactly similar design to the Viaduct, but will be 40 ft. in width, carrying a 30-ft. road without tramways, and two 5-ft. footpaths.

Detached from the Viaduct itself, but included in the same scheme, is a new bridge over the S.E. & C.R. main line.

This bridge, which will be 68 ft. clear span, will be of similar design to the two other large-span bridges detailed above, and will replace the existing "Oil Mills Bridge" carrying Limekiln-street.

All the ferro-concrete work is composed of spiral bars and 3 to 1 Portland cement concrete. When completed, and before taking over, the Viaduct will be subjected to a test of 15 tons axle load at 6-ft. centres, and a superficial live load of 210 lb. per super. foot.

PIER DISTRICT WORKMEN'S DWELLINGS

Under the Dover Corporation Act, 1912, a scheme was submitted to and approved by the Local Govern-

Front Elevation.

Back Elevation.

DOVER WORKMEN'S DWELLINGS.

Clarence-place to the junction of Limekiln-street and Elizabeth-street, and will carry a 30-ft. road, with double line of tramway and two 7 ft. 6 in. footpaths, making a total width between parapets of 45 ft.

For the first 152 ft. from the Beach-street end the road runs between retaining walls, 5 in. thick at

* Paper presented at the meeting of the Institution of Municipal and County Engineers at Dover on Saturday last.

ment Board for the rehousing of the working classes. The scheme included the widening of Beach, Bulwark, Limekilo and Oxenden streets, in which there are twenty-four, fourteen, twenty-five and seventeen houses respectively to be erected.

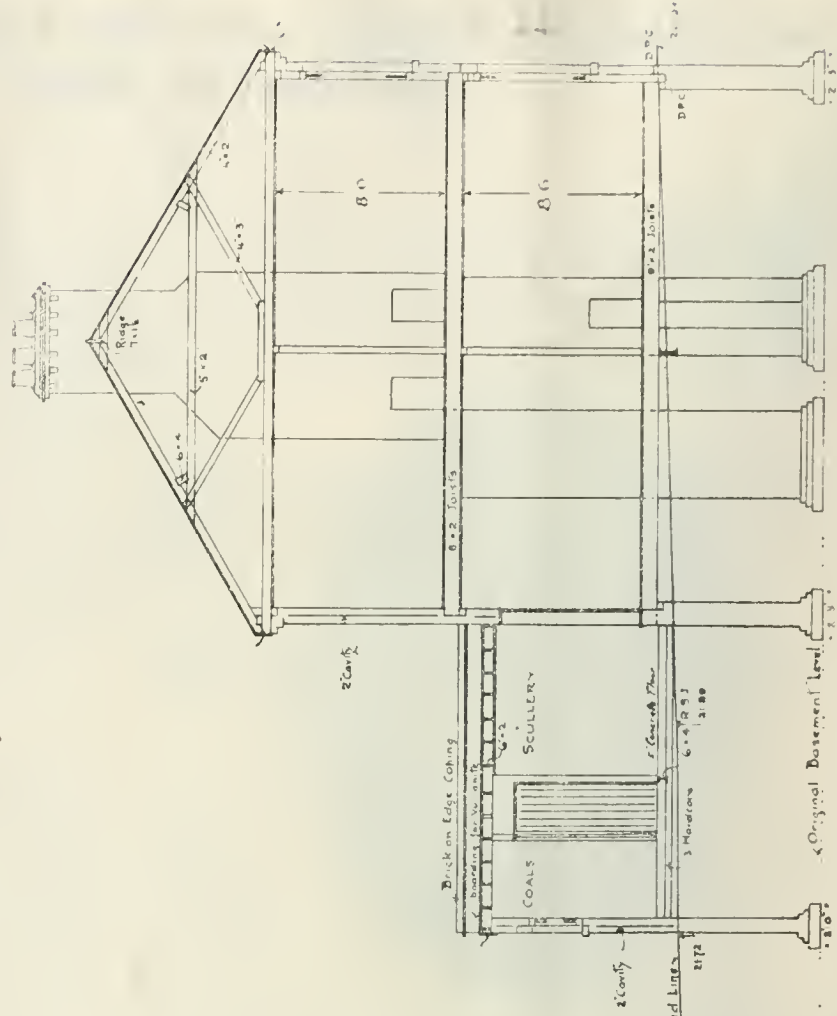

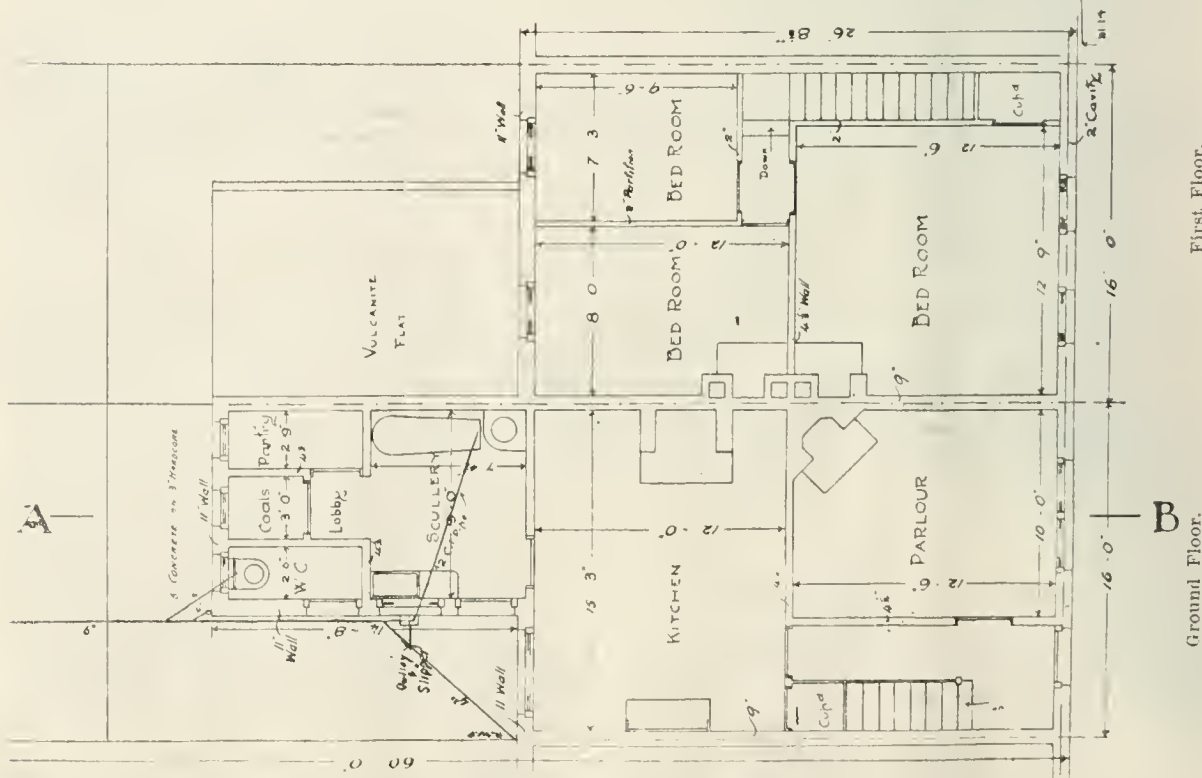

Two types of cottages were approved by the Local Government Board, one being a parlour cottage of six rooms, together with coals, larder, &c., and the other being a five-roomed cottage.

Up to the present contracts have been let for twelve of the six-roomed type, and four of these are now completed.

The contract price per cottage is £249. This sum may seem somewhat excessive at the first glance, but there are numerous difficulties in building these cottages which add to their expense. Nearly all the old houses which have been pulled down were basement houses, and it has been necessary to go down to 8 ft. for the foundations, since basement houses could not be allowed in such a waterlogged area; further, in some cases, where the ground surface is below high water ordinary spring tides, the existing road levels must be raised an average of at least 5 ft., and concrete-rafts will have to be constructed for foundations.

The cottages are brick built, with hollow walls having 2½-in. cavity, and have slated roofs, the ground floor and outbuildings having yellow stock facings, above which is a red-brick stringcourse at the first-floor level. The facing to the first floor is rough cast on Portland cement rendering.

The joinery is deal, painted three coats to approved tints.

and the internal walls are Portland cement rendered, and set in Sirapite.

The partitions on the first floor are "Acton" patent slab partitions, 2 in thick, finished with setting coat of Sirapite. The whole of the internal walls are distempered in approved tints with Hall's distemper.

The kitchen is fitted with a dresser, and the kitchen range has a Bailey's patent geyser boiler attached for supplying hot water to the bath and copper in the scullery.

The following are the sizes of the rooms:—

Ground floor—	
Parlour	10 ft. 0 in. by 12 ft. 6 in.
Kitchen	15 ft. 3 in. by 12 ft. 0 in.
Scullery	9 ft. 0 in. by 7 ft. 4 in.
Water-closet	6 ft. 3 in. by 2 ft. 6 in.
Pantry	6 ft. 3 in. by 2 ft. 9 in.
Coals	3 ft. 0 in. by 3 ft. 6 in.
First floor—	
Bedroom	12 ft. 9 in. by 12 ft. 6 in.
Bedroom	8 ft. 0 in. by 12 ft. 0 in.
Bedroom	7 ft. 3 in. by 9 ft. 6 in.

There are 15,290 cub ft. in a cottage, taken to the foundation level, giving a cost of 39d. per cubic foot.

If foundations were only 2 ft. below ground, the cubic contents would be 11,828 cub. ft., and the cost would have been £232, which is 47d. per cubic foot.

Motorists' £5,000,000 Road.—The *Daily Chronicle* states that proposals will come before Parliament next year for the construction of a new road for motor traffic between London and Brighton, at an estimated cost of about £5,000,000. The scheme is being put forward by the London, Brighton and South Coast Motor Road Syndicate, Limited. The proposed road will start from Robin Hood Gate, Richmond Park, which has been chosen as the most convenient point to the West End of London. The route, avoiding villages and towns as much as possible, skirts Sutton on the west and Horsham on the north-east. At Poyning's it will turn to the south-east into Brighton. Wherever the present main roads cross the new route over or under bridges will be built, so that the traffic on neither will be interfered with. The road itself will be 150 ft. wide, and it will be provided with three tracks—the first for fast motor traffic, the second for heavier vehicles, such as motor omnibuses and char-à-banc, and the third for motor cycles and cyclecars. Each track will be shut off from the other by a barrier, so that various speeds may be indulged in in safety. There will be facilities for leaving the tracks at certain points. There will be no speed limit.

CORRESPONDENCE.

Concerning anything, or anybody.*

—MASSINGER: "The Fatal Dowry," Act. ii., 2

ROAD TERMINOLOGY.

To the Editor of THE SURVEYOR.

SIR,—I am somewhat surprised to learn from Mr. Hutchinson's letter which appeared in your issue of the 8th inst. that he considers petroleum pitch can rightly be classified as bitumen.

Petroleum pitch is, of course, the residuum from the distillation of petroleum oil in the same way as coal-tar pitch is obtained from the distillation of tar, and there are many other such pitches of various kinds. Will Mr. Hutchinson therefore say if he considers coal-tar pitch and all other pitches should be classified as bitumen? If any one kind of pitch is entitled to the term bitumen, then the same must apply to all others. I cannot think, however, we have all these years been incorrectly describing and giving inferior titles to the materials referred to, but that is what Mr. Hutchinson's argument amounts to, and he also states that no harm will be done to either science, usage or commerce if petroleum pitch is classified as bitumen.

With regard to science—i.e., knowledge—Mr. D. A. Sutherland, F.I.C., F.C.S., one of the leading authorities on asphalt, bitumen, &c., says: "Bitumen is a natural product as opposed to bituminous products obtained as the result of destructive distillation, or by other artificial means. . . . The characteristics of native bitumen are not shared by artificial products, and the natural product, even at a higher price, is preferred to the artificial."

As to usage and commerce, does Mr. Hutchinson consider that manufacturers, merchants, and others, who for many years have only sold the genuine natural products as bitumen, would suffer no harm if any particular pitch or residuum is now sold under the title of bitumen? What is wrong, however, with the term petroleum pitch, a name which to my knowledge this material has been known under for more than forty years, and what is the object of robbing the term "bitumen" of its value and giving petroleum pitch a higher sounding title?

I shall be interested to hear Mr. Hutchinson's further views and explanations of these points.

I may say that I had no intention of using the publication of Mr. Hutchinson's letter as an opportunity to attack any particular committee, and it was Mr. Hutchinson himself who first referred to the Standardisation Committee.—Yours, &c.,

ENGINEER.

May 13, 1914.

We find that, owing to a printer's error, certain essential words were omitted from the final sentence of the third paragraph of Mr. John Hutchinson's letter on "Road Terminology" in last week's issue. The sentence in question should have read: "Bitumen is a generic term, which can be correctly applied to a number of substances which have certain physical properties in common."—Ed. SURVEYOR.

CALCUTTA IMPROVEMENT TRUST ENGINEERSHIP.

To the Editor of THE SURVEYOR.

SIR,—I believed fully that I had informed you, prior to your recent review of my report on Calcutta improvement, that I was no longer chief engineer to the trust, that the title was at present held by no one, and has been in abeyance from a date soon after I left Calcutta ill up to the present time.

I very much regret to find you did not receive the above information, the omission causing me to be mistakenly called chief engineer in your review, and I shall be indebted if you will give this letter full prominence in your next issue. It is only proper and fair to add that my late deputy engineer, Mr. James Maden, was, at the time of the *pro tem.* abolition of the post of chief engineer, created "trust engineer" with higher emolument, that he holds this post to-day, and is in full engineering charge of his department at Calcutta. Yours, &c.,

E. P. RICHARDS.

Assistants' and Students' Section.

CONDUCTED BY SYDNEY G. TURNER, ASSOC. M. INST. C. E.

All communications in regard to this page must be addressed to The Editor, St. Bride's House, 24 Bride-lane, Fleet-street, E.C. Envelopes must be marked "Assistants' Section" in the top left-hand corner. Correspondents are invited to submit questions for consideration and answers

to the questions which appear. For the contributions considered to be the most meritorious, one or more premiums in books will be awarded monthly. Diagrams must be drawn to scale on separate sheets, ready for reproduction.

QUESTIONS.

This week answers are invited to the following questions:—

393. Surveying. In carrying out a large survey (by triangulation) describe in full detail how you would use the centre of a tower or shaft as a station on the ground without actually setting up the theodolite inside. Give proofs of any formulae involved. (T. W. P., *Berkhill-on-Sea.*)

395. Plumbing. A lead pipe has to convey both hot and cold water in horizontal and vertical directions. Show by a sketch how it should be fixed, and give reasons. (B. W., *Tadcaster.*)

396. Strength of Materials.—A horizontal uniform bar 18 in. long, is laid over two supports, each 4 in. from its ends. Find two points at which the bending moments are zero.

397. Testing Cement.—Explain in detail, giving sketches where necessary, how a sample of cement would be tested in practice. (B. W., *Tadcaster.*)

398. Road Construction.—Should the stones in a macadam road be all of one gauge, or are varying sizes preferable? Give reasons. (Junior.)

[The Editor is at all times glad to hear from readers who desire to submit questions regarding matters of general interest, points of daily practice, &c., for insertion in the "Assistants' and Students' Section." Questions which are published are taken into consideration, as well as other matter, in awarding the Monthly Premium.]

REPLIES TO QUESTIONS.

394. Building Inspection.—In carrying out the duties of a building inspector, state what are the common errors to be looked for when inspecting a deposited plan, and also the chief faults that are met with on the actual building. (T. W. P., *Berkhill-on-Sea.*)

Every local authority should possess a set of building by-laws, and when plans are deposited they should be looked over carefully to see if any contravention of the by-laws is on the plan, and if the by-laws are contravened the plan requires modification. The chief points to be looked for are usually:—

(1) That provision is made for sufficient open space.

(2) That sufficient and suitable closet and ashpit accommodation is provided, in accordance with by-laws.

(3) That sufficient drainage is provided, and that the drain does not pass under the building, except where unavoidable, and then the drain must be iron with caulked lead joints, and ventilated at both sides of the building.

(4) That the building does not encroach beyond the building line.

(5) That provision is made for sufficient light in every room.

(6) That the building is protected from dampness, by subsoil drainage, &c., where necessary.

In carrying out the inspection of the actual building the following points should be carefully noted:—

See that all materials are good. The bricks should be practically impervious, or the building will become damp. Drain pipes should also be impervious. Both these materials should be subjected to the absorption test.

The foundation should be taken to a sufficient depth to prevent uneven settlement (this depends on the nature of the ground).

All drains should be laid to a true gradient, and all connections made in manholes. They should be properly jointed, ventilated and trapped, and no waste pipe should discharge over a gully, but should be conducted thereto by open channel.

The damp-course should be carefully examined, as this is very important; it should be at least 6 in. above the adjoining ground, and below the first timbers.

Mortar should not be mixed with dirty water, as this causes the growth of vegetation in the wall.

All joints in brickwork should be made solid.

No unseasoned timber should be used.

All windows should be made to open, and where no chimney is provided in sleeping rooms, other means of ventilation should be provided.

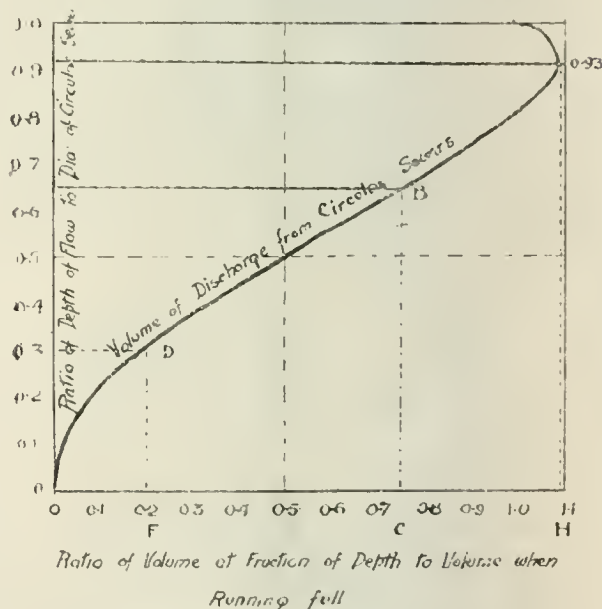

The whole site should be covered with concrete to exclude ground moisture.

The essentials of building are: Light, warmth, dryness, ventilation, and stability. (Sanitas)

NOTES.

We are indebted for the following to Mr. Oswald J. Wilkinson, ASSOC. M. INST. C. E., of Manchester:—

With further reference to the query No. 386 in your "Students' Section, I think it would be interesting to your younger readers to see how such a problem is easily solved in this office, in fixing the heights of the sills of this type of overflow weir, especially where

the height of a large number of sills has to be determined, as in the case of the revision of an existing scheme of sewers.

This discharge of a sewer of any regular cross-section varies as the depth of flow, provided that the other determining factors, such as gradient and material, remain constant. Hence, such a figure as that shown can be drawn for a circular section giving the ratio which the discharge at any given fraction of the full depth bears to the discharge when running full. It is, of course, well known that the maximum discharge occurs at a depth just short of the full value, but it is to be noted that the value of the fraction varies slightly with the formula used. Taking Kutter's formula, which is the one probably most commonly used by municipal engineers, the maximum discharge will be found to occur somewhere about 0.93 of the full depth, the reflex shape of the curve being due to the fact that above this depth the wetted perimeter increases at a greater rate than the sectional area of flow.

Let OE in the figure represent the depth of flow corresponding to the mean dry-weather flow when OG represents the discharge of the sewer running full. Then by drawing ED horizontally to cut the ratio curve at D, and drawing DF vertically to meet the base OH in F, OF will represent the fraction of the total discharge corresponding to OE.

Therefore OE will equal a certain fraction of OG,

and OF of OH—i.e., $OE = C_1 \times OG$, say, and $OF = C_2 \times OH$, and if OG and OH are taken as unity, then—

$$OE = C_1 \text{ and } OF = C_2.$$

Let it be desired that the overflow sill come in operation at m times the average dry-weather flow, then the fraction of the discharge when full, giving this discharge will be that represented by mC_2 .

Let this be represented by OC, then $OC = mC_2 \times OH$, or simply mC_2 .

Draw CB vertically and BA horizontally, and we obtain OA the fraction of the depth corresponding to the required level of sill, and OA will correspond to OE just as OC does to OF.

Let $OA = C_3 \times OG = C_3$, then, knowing C_2 from the diagram, we simply multiply it by the actual depth of the sewer in question and obtain the desired result.

The special point to be noted is that the actual discharge, the gradient, and the coefficient of friction need not enter into the problem after once calculating OE; but, on the other hand, this method is only applicable as long as OC and OA fall within the limits of the diagram.

If OC comes beyond OH, the sewer is surcharged, and the problem becomes an example of Bernouilli's theorem. Some research on this latter part of the problem has been undertaken by one of my assistants, and will probably be shortly available for publication.

WHAT IS A BUILDING?

This point was argued for some hours on Wednesday in an appeal of a Yorkshire landowner against the valuation of his farm, and the arbitrator reserved his decision. Mr. H. F. Dickens, K.C., contended that 11 miles of walls on this moorland farm were specially built for sheltering sheep, and were therefore "buildings" within the meaning of the Finance Act of 1909-10. He produced a dictionary in support, which gave an alternative definition of the term as "a fabric built for the shelter of animals." That covered his case completely, said Mr. Dickens. In one case he recollected that a railway embankment was held to be a building! Mr. Kingdom, on the other hand, insisted that walls were not "buildings," though he admitted they were "structures." Carriage builders "built" carriages, but were they "buildings" or "constructions"? He submitted that the normal meaning of the term was "a structure of the nature of a house built where it is to stand"—a definition he quoted from another dictionary.

The Drainage of Eye.—At their meeting on Wednesday the Eye Town Council had before them a report of Mr. E. J. Silcock, M.INST.C.E., on the drainage of the borough. Mr. Silcock suggested two new drains to take all the sewage, and that this should be purified before being allowed to pass into the river. He estimated that the cost would be £5,652, or a modified scheme with all new sewers would cost £6,382.

Beauty in Sewage Works.—A contributor to the *Erith Observer* writes: "Sewage disposal works cannot always be recommended as health or pleasure resorts, but those belonging to Erith are, in some respects, far more attractive than several I have visited. With the exception of a very slight aroma occasionally to be detected in the air, the surroundings remind one of those associated with well-kept reservoir grounds, and at the present time are looking particularly smart with the banks of spring flowers in full bloom. I believe there is one official who really believes that the sewage disposal works is the most healthy spot in the district, and points to the robustness of his staff in confirmation of that assertion. Whether that is so or not, the fact is evident that the low death-rate in the district is, to a great extent, due to the way in which the sanitary department is managed generally. As a proof of the excellence of the arrangements for the disposal of the effluent, it may be stated that, although the Port of London Authority officials make frequent unexpected visits to the works, and take away samples of the water which has passed the last treatment, so far no complaint has been received as to the condition of the liquid, which has the appearance of being pure water. I have even seen men interested in local government work test samples in the same way as tea is tested, and they have declared that it is quite tasteless. I am content to take their word for it."

ROYAL SANITARY INSTITUTE.

THE ANNUAL DINNER.

Members, associates, and guests assembled in goodly numbers at the annual dinner of the Royal Sanitary Institute, which took place at the Langham Hotel on Wednesday night. The chair was occupied by the Earl of Plymouth, president, and the company included Sir Henry Tanner, C.B. (chairman of the council), Sir Rickman J. Godlee (president of the Royal College of Surgeons), Mr. David Davies, M.P., Sir Aston Webb, C.B. (vice-president), Dr. A. News-holme, C.B. (medical officer, Local Government Board), Principal E. H. Griffiths (University of South Wales and Monmouthshire), Mr. H. Percy Boulnois (deputy chairman of the council), Major-General F. W. B. Landon, C.B. (director of transport and movement, War Office), Prof. A. Bostock Hill, Mr. Percy B. Tubbs (president of the Society of Architects), Surgeon-General Sir Lionel D. Spencer, K.C.B., M.R.C.S., Sir Shirley F. Murphy (vice-president), Sir Thomas Barlow (president of the Royal College of Physicians), Councillor R. W. Granville-Smith (Mayor of Westminster), Very Rev. W. R. Inge (Dean of St. Paul's), Dr. A. Wynter Blyth (registrar and vice-president), Mr. Baldwin Latham (vice-president), Dr. S. Rideal, Dr. Louis C. Parkes (chairman of the museum, library, and Education Committee), Mr. Henry Rolfe, Mr. John S. Brodie (borough engineer of Blackpool), Mr. Edwin Ralphs (hon. secretary Hong Kong Board of Examiners), Colonel J. Lane Nottter (treasurer), Mr. H. D. Searles-Wood (chairman of Congress, Referee, and Editing Committee), Mr. J. Osborne Smith (chairman of examiners), and Mr. E. White Wallis (secretary and director).

The toast of "The Houses of Parliament" having been proposed by the MAYOR OF WESTMINSTER,

Mr. DAVID DAVIES, M.P., in reply, said he was pleased to find that Parliament was taking a keener interest in the subjects which the institute was formed to promote. There had been a movement in favour of sanitation in all directions of late years, and public opinion was being translated, slowly, into Acts of Parliament. There had been passed the Public Health Grants Acts, the Housing Acts, and a host of minor Acts, good, bad, and indifferent, all dealing with the improvement of public health and kindred subjects. That showed that Parliament was beginning to interest itself in these matters, and he ventured to think that an institute like this could be of great assistance in moulding and advising upon measures which came before Parliament. Certainly there never had been a time when Parliament needed more the advice of scientific minds.

The EARL OF PLYMOUTH, in proposing "The Royal Sanitary Institute," said the days were long past since it was the idea that scientific investigation should be concerned exclusively with the cure of diseases, however important that was. It was now recognised generally that ultimately far more benefit would be derived by the population of the country by a strict inquiry into the prevention of diseases. It was very difficult to get what were now called minor measures passed through Parliament without the assistance of the Government, so he was afraid that there was still a rather heavy list of measures of considerable importance to public health which had been brought before the Houses of Parliament, but which had been withdrawn or dropped. He felt that the Royal Sanitary Institute was drawing public attention of a most valuable kind towards those measures which affected the welfare of the whole country, and which had not been lost sight of; and though they might not be able to point to measures that had been passed, they could be absolutely confident that the work of the institute was of the very greatest assistance, and that year by year the question of hygiene and sanitary improvement, which would affect the future of the country very largely, would be more and more brought into public notice, and the nation would insist that sufficient time should be given to their consideration. They were glad to recognise that in the Budget recently introduced a certain amount of money had been set apart to enable the local authorities to deal with greater freedom with the questions in which the members of the institute were interested. The institute had now branches in every one of the Dominions of the British Empire; it was getting increasing support from all the Dominions, and lately in British Columbia they had a considerable accession in the establishment of a new branch. They were making

satisfactory progress with the arrangements for Health Week at Blackpool, and in this connection they were pleased to welcome as guests that night the medical officer and the borough engineer of that town. The general financial state of the institute was now, he believed, satisfactory, and the total number of members and associates had increased during the year from 4,257 to 4,434. That showed that there was a constant increase taking place in the work of the institute, and that quiet, but valuable, work was surely drawing the appreciation of a wider public year by year.

Sir HENRY TANNER, chairman of the council, in reply, remarked that the institute was a pioneer, and had during its forty years of existence introduced, brought into operation, or promoted many of the agencies which had extended a knowledge of sanitary science. Lectures, qualifying examinations for sanitary inspectors and other servants of local bodies, the congress, exhibitions, and the museum for demonstrating purposes had all been brought into being by the institute. Their certificates were current in all the Colonies and in this country, and were accepted by local authorities, and the council welcomed the help and co-operation of all the bodies which had been more recently established. They had now got headquarters suitable for the staff and the functions they had to carry out, and the museum was beginning to be well arranged. The membership had never gone back from the time the institute started, and the finances showed a small margin of income over expenditure. The council were always pleased to render assistance in making Parliamentary Bills workable. These were considered by the Parliamentary Committee, and afterwards by the council, and either petitioned for or against as was considered fitting. They continued to promote Health Week because they thought it should not be dropped, and it had tended to great benefit in the towns in which it was held, as well as the country generally. Their membership comprised the triple professions of architecture, engineering, and medicine, and they found that what might be termed this three-legged basis acted for stability. The institute, in fact, exercised a very potent influence in the promotion of public health, and if they did that, and did it thoroughly, they considered they were carrying out the objects they had in view.

Mr. H. PERCY BOULNOIS submitted "The Visitors," and said that public dinners were of various kinds. The object of the political dinner was to secure votes and patronage, and at the philanthropic dinner the guests were asked to put their hands in their pockets for subscriptions. The object of this dinner was really to advertise the Royal Sanitary Institute. They wished to impress their activities upon their guests and the public, and he might remind them that their activities, in addition to the congress, included the Parkes Museum. Mr. Wells had stated the museum dealt with "interiorities." There was more to see than these, however, and it was a grievous pity the public did not take more advantage of it. The institute kept an eye upon legislation, and the suggestion that in this respect it should act as a sort of clearing-house was well worthy of being carried out. The membership comprised laymen, churchmen, a great many women, and people of all descriptions, and their operations were more widespread than those of a purely scientific institution. Mr. Boulnois commended Health Week to the consideration of the guests, and remarked that Sir Thomas Barlow (whose name he associated with the toast) was taking the keenest interest in the movement. He also coupled the name of Principal Griffiths with the toast.

Sir THOMAS BARLOW, in a brief response, observed that medical men had a weakness for a concrete basis for their work, and they recognised that in the Parkes Museum the Royal Sanitary Institute had established their work on a sound footing. He was very pleased with the quiet, steady, and fundamentally sound policy they pursued.

Principal GRIFFITHS, in his reply, emphasised the value of teaching hygiene in elementary schools, and added that it was due to the work of the Royal Sanitary Institute that such instruction was beginning to bear fruit.

The Civic Engineer's Who's Who, compiled by the editor of THE SURVEYOR AND MUNICIPAL AND COUNTY ENGINEER, for a second annual issue is remarkably complete. The biographical matter is full and methodically arranged. The book is published by the St. Bride's Press, Limited.—*Liverpool Courier*.

LOCAL GOVERNMENT BOARD INQUIRIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

INQUIRIES HELD.

Bournemouth T.C. (May 8th. Mr. H. Shelford Bidwell).—£60,000 for the erection of a pavilion on the Belle Vue site near the pier.—The borough engineer, Mr. F. W. Lacey, who prepared the scheme, stated that the variations in the plans from the original scheme had been made to meet the Local Government Board's requirements. There was an upper and a lower ground floor. On the upper ground floor was the great hall, the lounge, tea and refreshment rooms. The promenade could be enclosed in winter. It overlooked both the sea and the gardens, the views extending over three-parts of a circle. The outer structure would be of brick, covered with cement.

Castle Ward (Northumberland) R.D.C. (May 5th. Mr. H. O. Stanford).—£550, contribution to a joint scheme of sewerage and sewage disposal for Ponteland, Darras Hall, and Little Callerton.—It was stated that the total estimated cost of the scheme was £1,750.

Earby U.D.C. (May 7th. Mr. W. O. E. Meade-King).—£1,310 for the provision of a depot, £140 for widening Victoria-road, £110 for a public urinal in Victoria-road, and £110 for a public urinal at Kelbrook.—The clerk, Mr. J. C. Waddington, explained that the land required for these various purposes belonged to the council. The surveyor, Mr. J. E. Aldersley, gave details of the proposed works. The depot included stabling, cart sheds, and a storehouse for tools and cement. A portion of the yard was to be set apart for the purpose of a fire station. The widening of Victoria-road included the widening of Seal bridge to 36 ft. The proposed urinals would be lined with glazed bricks, and be of up-to-date construction.

Foleshill R.D.C. (May 8th. Mr. F. H. Tulloch).—£1,067 for street work at Bedworth and Foleshill.—Mr. A. P. Oswin, clerk, gave particulars of the proposed expenditure, and there was no opposition to the scheme.

Mansfield T.C. (May 6th. Mr. F. H. Tulloch).—£1,200 for a contribution towards the cost of the construction of a new road from Ratcliffe-gate and Littleworth; £5,700 for street improvements in Albert-street, Belvedere-street, Newgate-lane, Nottingham-road, and Ratcliffe-gate; and £1,600 for works of sewerage.—With respect to the proposed new road from Ratcliffe-gate, the town clerk, Mr. J. H. White, stated that the Mansfield Railway Company proposed to make a private approach road, 28 ft. wide, to their new station. The borough surveyor (Mr. T. P. Collinge), believing it would be a great advantage to have a through public road of full width, brought the matter before the Highways Committee, who entered into negotiations with the company, and ultimately it was arranged to pay £1,200 towards the cost of the road, which was to be made to the satisfaction of the borough surveyor and taken over as a public road. Evidence was also given with respect to the proposed street improvements, and the sewage disposal project.

Rotherham R.D.C. (May 6th. Mr. R. H. Bicknell).—£967 for sewerage works.—It was stated that the proposed work had become necessary owing to the development of the land on the south-west of Swallow Nest, and to the north of the Beighton colliery. The inspector suggested that the work proposed in connection with the Beighton-lane sewer should stand over to await further development, and that a length of sewer should be laid in the Sheffield-road only. He would be prepared to advise the Local Government Board to sanction a loan on that understanding.

Sleaford R.D.C. (May 7th. Mr. R. H. Bicknell).—£1,110 for a supply of water to South Kyme Fens.—Mr. C. Clarke, chairman of the parish council, protested against the cost of laying the mains being borne by the parish, but admitted that the Fen district was greatly in need of pure water. Mr. A. Challand, a large ratepayer in the Fen, stated that there was a great necessity for drinking water in the Fens, many people having to obtain their supplies from shallow wells or dykes. The inspector called the attention of the Sleaford Rural Council to a great need for hydrants opposite large farmsteads in that district. He said it was most annoying in cases of fires to know there was an ample supply of

water in the mains yet not available owing to the absence of hydrants. Mr. W. B. Marsden, the engineer, replied that this matter was under consideration. The inspector suggested that as the ends of the proposed mains would reach within 200 yds. of those now being laid in Heckington Fens, it would be advisable to connect the two.

Sutton-in-Ashfield U.D.C. (May 6th. Mr. A. G. Drury).—£20,000 for sewage disposal works, and £2,895 for private street improvements.—Mr. H. P. Raikes (Messrs. Willeox & Raikes, Birmingham) stated that the new scheme provided for the extension of the present sewage disposal works by additional tanks, also a large area of bacterial beds for the purification of the sewage, and for taking the effluent into the reservoir, but the pollution would be previously removed. The present works, however efficiently managed, were not sufficiently large to deal with the needs of the town. The new works would be large enough for a population of 30,000. Particulars having been furnished by the surveyor, Mr. W. Burn, and Dr. Handford, the inspector visited the present outfall works. The proposal to make up twelve new streets under the Private Street Works Act was unopposed.

APPLICATIONS FOR LOANS.

Bournemouth T.C.—£3,500 for the purchase of land for police barracks, and £650 for sewerage works.

Chester R.D.C.—£6,400 for sewerage works.

Coalville U.D.C.—£1,450 for street widening.

Dartford U.D.C.—£1,400 for a chapel at Watling Street cemetery.

Halesowen U.D.C.—£257 for sewerage works.

Harrogate T.C.—£500, excess expenditure in connection with the Roundhill reservoir, and £6,200 for the provision of a larger stage at the Kursaal.

Herts C.C.—£420 for alterations to the constabulary buildings at Hatfield.

Lewes T.C.—£2,800 for a council school.

Market Drayton R.D.C.—£175 for drainage works.

Merthyr T.C.—£260 for a bandstand.

Middleton T.C.—£7,160 for extensions to the electricity works, and £1,185 for sewerage works.

Northants C.C.—£4,250 for the extension of the Towcester grammar school, and £7,226 for extensions to sessions court and police quarters.

Pontefract T.C.—£1,150 for a street improvement.

Runcorn U.D.C.—£977 for road improvement.

Southampton T.C.—£2,500 for a branch library.

West Ashford R.D.C.—£3,300 for a water supply scheme.

West Ham T.C.—£10,275 for the purchase of land for a recreation ground.

LOANS SANCTIONED.

Bridlington T.C.—£1,300 for road widening.

Brighton T.C.—£1,500 for electricity works extension (for a period of twenty years).

Buckfastleigh U.D.C.—£2,701 for the erection of thirteen houses, and £450 for the purchase of the site.

Chingford U.D.C.—£800 for road improvement.

Dartford U.D.C.—£364 for an electrical system of fire alarms, and £5,550 for paving works.

Dewsbury T.C.—£2,650 for the purchase of land for sewage disposal purposes.

Hampstead B.C.—£1,500 for extension of an open space.

Harrogate T.C.—£8,000 (to be repaid in fifty years) for the erection of a school.

Hemel Hempstead R.D.C.—£650 for a sewerage scheme.

Keswick U.D.C.—£600 for a common lodging-house.

Leyburn R.D.C.—£220 for water supply works.

March U.D.C.—£2,900 for a housing scheme.

Penybont R.D.C.—£1,520 for water supply works.

Swansea T.C.—£11,000 for roads and sewers.

Tavistock U.D.C.—£750 for water mains.

Tunbridge Wells T.C.—£2,700 for the purposes of the cemetery.

Wakefield T.C.—£17,813 for sewerage works.

Woolwich B.C.—£10,000 for the electricity undertaking.

TOWN PLANNING.

19.— Newport. (Mr. George L. Pepler)	—
28.— Nelson. (Mr. George L. Pepler)...	—

Manchester Corporation Bill.—The Manchester Corporation Bill was passed by the House of Lords Committee on Monday and ordered for third reading. If the Bill meets with no further opposition the corporation will have obtained powers covering a variety of municipal activities. Among these are: An electricity generating station at Davyhulme, to cost £1,200,000; street works and improvements, including the widening of Cross-street; extension of time for the construction of tramways and power to provide and run omnibuses.

Municipal Work in Progress and Projected.

The Editor invites the co-operation of SURVEYOR readers with a view to making information given under this head as complete and accurate as possible.

The following are among the more important projected works of which particulars appear below: Buildings—Bradford £57,000, East Riding £10,935, Newcastle-on-Tyne £300,000; housing and town planning—Aberdare, Blackrock, Normanton; roads and materials—East Sussex, West Riding £20,400; sewerage and sewage disposal—Burnham; water, gas and electricity—Bolton, Gwyrfa. Particulars of other works projected will be found in our "Local Government Board Inquiries" pages.

BUILDINGS.

Bournemouth T.C.—The borough engineer, Mr. F. W. Lacey, has received instructions to complete the negotiations for the purchase of the freehold property adjoining the law courts, at £3,500, for the purpose of police barracks.

Bradford T.C.—It is proposed to effect alterations at the Sunbridge-road destructor, at an estimated cost of £3,000. The Tramways Committee also recommend extensions at the workshops at Thornbury depot, which are estimated to cost £54,000.

Durham C.C.—The tender of Mr. G. Mauchlen, of Newcastle-on-Tyne, at £450, has been accepted for the widening of Browney Burn bridge.

East Riding C.C.—Plans are being prepared for an isolation hospital at Driffield, the cost of which is estimated at £10,935.

Edmonton U.D.C.—Alterations are to be carried out at No. 1 fire station, at an estimated cost of £220.

Ely U.D.C.—The council have accepted the offer of Mr. W. Cutlack to provide an isolation hospital to contain twelve beds.

Herts C.C.—New education offices are to be erected at Hertford, at an estimated cost of £3,634.

Kendal T.C.—The tender of Messrs. J. Steel & Co., at £1,858, has been accepted for the general concrete work at the extensions to the sewage disposal works.

Lindsey (Lincs) C.C.—It has been decided to build a school at Crosby for 500 scholars.

Newcastle-upon-Tyne T.C.—Designs are being invited for a new town hall in Eldon-square. The scheme, which means the clearing away of the buildings on the north side of the square right through to Prudhoe-street, furnishes a space of 6,795 sq. yds. on which to erect a town hall, facing an ornamental plot recently laid out. The plan also admits of side streets, 50 ft. in width, from Eldon-square to Prudhoe-street. A town hall, to accommodate about 3,500 persons, and the municipal offices are arranged for, and the estimated total cost is said to be about £300,000.

Perth T.C.—The burgh surveyor has been authorised to obtain tenders for shelters on the North Inch.

Sligo C.C.—A proposal has been adopted for the purchase of Cloonamahan House, situate $1\frac{1}{2}$ miles from Collooney, co. Sligo, at a sum of £1,400, £800 to be expended on repairs and alterations to render it thoroughly suitable for the treatment of tuberculosis patients.

Warwickshire C.C.—Extensions are to be carried out at the Nuneaton high school for girls, at an estimated cost of £6,000.

Wolverhampton T.C.—The council on Monday agreed to the erection of ten firemen's houses, at an estimated cost of £3,000.

HOUSING AND TOWN PLANNING.

Aberdare U.D.C.—In view of the continued dearth of housing accommodation and the urgent duty of the council to close insanitary dwellings, the council on Monday decided to erect 200 houses, to be distributed among the various wards of the district.

Blackrock (Co. Dublin) U.D.C.—Plans have been adopted for the erection of thirty-one houses in Brookfield, with baths and washhouses, and twenty-four in Booterstown. The surveyor, Mr. Powell, estimates the cost of the scheme at £26,734.

Brixham U.D.C.—The Housing Committee are considering plans for the erection of twelve workmen's

houses, estimated to cost £210 each, which have been prepared by the surveyor, Mr. J. Silley.

Chard R.D.C.—The council have instructed their architect to complete his plans for the erection of four working-class dwellings at Combe St. Nicholas, and to invite tenders for their erection.

Gwyrfa R.D.C.—The council had submitted to them on Saturday a draft scheme by their surveyor, Mr. J. Thomas, for the erection of thirty-six workmen's dwellings in the villages of Ebenezer and Clwybont. The sites recommended comprise $2\frac{1}{2}$ acres, and are expected to cost not more than £90, including legal expenses. The total capital charges are estimated at £6,760, and the nett rents £368 a year, leaving a small balance to be paid out of the rates. It was resolved, in the first instance, to apply formally to the Local Government Board for the necessary loan, it being understood that the final selection of sites would come up at a future meeting.

Normanton U.D.C.—Provisional approval has been given to tenders for building seventy-eight houses in Dalefield, at an estimated cost of £17,000.

Renfrew T.C.—The plans of housing schemes on the north side of High-street and Porterfield are under consideration, and a decision has been reached to erect public baths on a site adjoining the police courthouse.

Taunton T.C.—In the course of the last meeting it was reported by the Health Committee that, having had under consideration the question of the provision of a further number of workmen's dwellings, they considered it desirable that the necessary steps should now be taken for the erection of an additional block of houses in String-lane, in continuance of the scheme prepared by the borough surveyor, Mr. D. Edwards. The council was therefore recommended to authorise the committee to advertise for tenders for the erection of a further batch of twelve houses similar to the existing houses previously erected by the council. After discussion, however, the recommendation was referred back to the committee on the ground that such dwellings were required in the West and North Wards.

Truro R.D.C.—It has been decided to build workmen's dwellings at St. Just and Gerrans in the south of the district, and at Kea and Feock in the north.

REFUSE COLLECTION AND DISPOSAL.

St. Andrews T.C.—The council have decided to erect a patent lightning dust manipulator, as manufactured by the Patent Lightning Crusher Company, Limited, of 14A Rosebery-avenue, London, E.C., for the conversion of their house refuse into manure.

Widnes T.C.—The Health Committee recommend the provision of a refuse destructor and tar-macadam plant, at a cost of £6,000. The cost of maintenance was estimated at £720 a year, but against this had to be set off the value of 2,000 tons of macadam, sale of mortar, scrap iron and glass.

ROADS AND MATERIALS.

Aberystwyth T.C.—It is proposed to effect an improvement at the main entrance to the town, and as a preliminary land and buildings have been purchased at a cost of £500.

Banff C.C.—It has been agreed to apply for a grant from the Road Board for the road from the Don to Grantown-on-Spey—the grant to be postponed until the present demands for the upper and lower district are dealt with.

Bournemouth T.C.—The tender of Messrs. William Griffiths & Co., at £3,835, has been accepted for laying wood paving in Charminster-road and Wimborne-road, and the borough engineer, Mr. F. W. Lacey, has received instructions to proceed with the work at once.

Brighton T.C.—The borough surveyor, Mr. H. Tillstone, has received instructions to report upon suggested improvements to the western esplanade by the laying out of greenswards with flower beds and screen seats, extending from the western boundary to the West Pier, and also a proposition that the bandstand should be removed.—It has been agreed to purchase for £7,900 property in Western-road for

street improvement, and property in Marlborough-street, at £1,470, for a similar purpose.

Cardiff T.C.—Acting upon a report by the city engineer, Mr. W. Harpur, the council have decided to pave Kingsway and Park-place with creosoted wood on concrete foundations 8 in. thick.—The council on Monday agreed to pay £1,000 for the purchase of 154 sq. yds. of land for the widening of East Canal wharf.

East Sussex C.C.—The county surveyor, Mr. F. J. Wood, has been authorised to purchase four convertible steam rollers and traction engines, at a cost not exceeding £4,566, and the council have accepted the Road Board's offer to advance on loan the purchase money repayable by five equal annual instalments.

Lancashire C.C.—There was a new departure in the recommendation of the Main Roads and Bridges Committee, presented last week, to treat certain main roads under direct control in the Hundred of Lonsdale, Amounderness, Blackburn, Leyland, and West Derby with calcium chloride in front of abutting property, where, owing to gradients, it was considered inadvisable to tar-spray. But the committee, it was stated, were not in love with the calcium chloride treatment. With respect to the Preston, Chorley, and Bolton main road, the Road Board, it was announced, was prepared to grant £9,772 towards the reconstruction with granite setts of this road at Adlington, for which a loan had been authorised of £45,000. It was stated that the committee had decided to establish a tar-macadam factory at Carnforth, and that the committee had no intention to go into the market to sell any of the macadam which they proposed to make. The factory was simply for the economical supply of a great part, at any rate, of the committee's own requirements.

Lewes T.C.—A horse-drawn automatic pressure tar-spraying machine is to be purchased for £89.

Totnes T.C.—The Road Board have sanctioned a grant of £1,000 towards the cost of widening High-street, and it is hoped also to obtain a substantial contribution from the county council.

West Riding C.C. The Highways Committee propose to expend £20,400 upon tar-paving, an addition of £10,000 upon the estimate for this work which was approved in January. The committee are also seeking to induce the Road Board to increase their grant beyond the limit they had laid down one-third of the expenditure.

Worcester T.C.—The Streets Committee have received authority to proceed with the improvement of St. Martin's Gate, at an estimated cost of £1,200.

SEWERAGE AND SEWAGE DISPOSAL.

Bournemouth T.C.—The tender of Messrs. Tom Wilkinson & Co., at £6,663, has been accepted for the extension of the 9-in., 18-in., and 36-in. outfalls at Alum Chine. It has been decided to construct the Parkwood-road relief sewer, at an estimated cost of £650.

Burnham (Essex) U.D.C.—The question of sewage disposal is under consideration, the surveyor, Mr. J. Cook, accompanied by councillors, being engaged in visiting various sewage works with a view to deciding the best system to adopt.

Cannock U.D.C.—The surveyor, Mr. R. Blanchard, has received instructions to obtain tenders for sewer extension in several streets.

Ottery St. Mary U.D.C.—The council have approved the plans of the surveyor, Mr. H. Finister, for the proposed grit chamber and pumping engine at the sewage works, it being stated that the new equipment would effect a saving of £130 a year.

WATER, GAS, AND ELECTRICITY.

Birmingham T.C. Owing to increased cost of fuel and other circumstances, the Birmingham gas undertaking will yield £12,000 less in relief of the rates this year than last, the sum available from current profits being £65,584. The expenditure has advanced by £100,000, but this is partly accounted for by an increased demand.

Bolton T.C.—The Waterworks Committee have requested the waterworks engineer to prepare a report on the desirability of proceeding with the construction of additional works in the near future.

Bradford T.C. The council are recommended by the Gas Committee to instal Woodhall-Duckham

vertical retorts at the Birkshall gasworks, at an estimated cost of £68,700.

Chelmsford T.C.—The tender of Messrs. F. Smith & Son, Grimsby, at £722, has been accepted for sinking a 14-in. borehole at Admiral's Park.

Coalville U.D.C.—It is proposed to carry out a gas main extension, at an estimated cost of £170.

Conway R.D.C.—The Local Government Board have been asked to approve a water supply scheme for Penrhynside.

Gwyrfai R.D.C. Messrs. Berrington, Son & Watney, Wolverhampton, have prepared a report dealing with the water supply, and offering details of two alternative schemes. One was a proposal to obtain the supply from Marchlyn Bach, a lake with an area of 9½ acres, the storage capacity of which might, at some future time, be increased by about 6,000,000 gallons at a comparatively small cost. They thought it possible to obtain an ample and pure supply of water from this source, without prejudicially affecting riparian owners, for about £3,250, and should it become necessary to construct a dam to meet any objection on the part of the owners, they estimated that it could be provided for an additional £800 or £1,000. The alternative scheme consisted of utilising several springs which rise in the face of the mountain some distance below the lake, and the cost of this they estimated at £3,800.

Hampstead B.C. Additional plant costing £7,600 is to be installed at the electric lighting station.

Loughborough R.D.C.—Mr. F. W. Hodson, engineer, has submitted alternative schemes for a supply of water to Hathers.

Walsall T.C.—Details of the new borough electricity scheme are given in a report of the Walsall Electricity Committee issued on Saturday. This states that it is proposed to erect a power station with a nominal capacity of 9,000 kilowatts in three units of 3,000 kilowatts each, the first to be installed by June, 1915, the second by August, 1916, and the third when required, having regard to the development of the undertaking. The cost of the new power station, when developed to its total ultimate capacity, is estimated by the consulting engineer (Mr. E. M. Lacey) at approximately £80,000, exclusive of £850, the cost of the land, but the expenditure necessary during the next three years to complete the first two units would be £59,000. In addition to the actual cost of the new power station, a system of high tension mains would be required, the approximate total cost of which is estimated at £15,000. The committee have decided to recommend the approval of the plans and estimates submitted to them, and of the borrowing at the present time of £71,850, which will equip the works up to a capacity of 6,000 kilowatts.

MISCELLANEOUS.

Brighton T.C.—Serious inroads of the sea threaten the cliffs and defensive works to the east of the town. The engineers point out that the protective agencies employed cannot be expected to fulfil their purpose until sufficient quantities of sand and shingle have accumulated, and as the process is abnormally slow, it is recommended that beach should be obtained where dredging operations are being carried out, and deposited on the foreshore, as was done successfully at Hove some years ago.

Bristol T.C. Tenders of Messrs. Dennis Brothers, Guildford, at £2,310, have been accepted for the supply of two motor fire engines and a motor van.

East Sussex C.C.—A sum not exceeding £100 is to be expended upon obtaining from Messrs. Coode, Matthews, FitzMaurice & Wilson a report upon the sea defences between Brighton and Newhaven. The salary of the chief assistant to the county surveyor is to be increased from £190 a year to £250 on and from July 11th.

Exmouth U.D.C.—The tender of Messrs. Merryweather, at £1,060, has been accepted for a petrol motor fire engine.

Yarmouth T.C. The tender of Messrs. Aveling & Porter, Rochester, has been accepted for a steam wagon and tractor plant at £499 10s.

Keighley's New Reservoir. At a recent meeting of the Keighley Town Council, the tender of Messrs. Morrison & Mason, Glasgow, at £159,027, was accepted for the construction of the new Lower Laithe reservoir, with filter-beds.

PERSONAL.

Mr. McDougal, burgh surveyor and inspector of Arbroath, has had his salary raised from £150 to £180 a year.

Mr. G. A. Millard, surveyor to the Axminster Rural District Council, has been voted an increased salary of £50 to enable him to provide and maintain a motor cycle.

Mr. J. Stanley Sawdon, ASSOC.M.INST.C.E., assistant borough surveyor of Margate, has been presented with a marble clock and Wedgwood hot-water jug by the borough officials and staff on the occasion of his marriage.

Mr. Fred. J. Dixon was, by a regrettable slip, described as borough engineer of Ashton-under-Lyne in our issue of May 1st. This office is, of course, held by Mr. J. T. Earnshaw, ASSOC.M.INST.C.E., while Mr. Dixon is water engineer.

Mr. Joseph Hall, M.INST.C.E., who for nine years prior to 1890 was surveyor to the Torquay Local Board, and subsequently for twelve years borough surveyor of Cheltenham, died, we regret to state, at Bombay on the 7th inst. He left Cheltenham to take up the post of executive engineer in the city of Bombay, and was honorary secretary of the Indian District of the Institution of Municipal and County Engineers. Mr. Hall was about sixty-three years of age. He leaves a widow and four children.

Mr. N. McK. Barron, water engineer to the Lincoln City Council, having resigned, the council have decided to appoint Mr. Charles Horobin interim engineer at a salary at the rate of £220 a year, and that a consultant engineer, experienced in distribution work, be engaged to report to the council each quarter during the period Mr. Horobin holds office as such engineer. It has been further decided to advertise for applications for the appointment of a temporary assistant engineer for a period of twelve months at a salary of £125.

Mr. J. Cracroft Haller, M.R.SAN.I., of Carlton, Notts, has been provisionally appointed chief assistant engineer and surveyor to the Notts County Council, in order to relieve Mr. E. Purnell Hooley, M.INST.C.E.,

of some of the many onerous duties attached to the office of engineer and surveyor for such a large and growing industrial district. Mr. Haller, since May 5, 1904, has held the position of engineer and surveyor to the Carlton (Notts) Urban District Council, and has superintended and carried out a number of important works rendered necessary by the increase of population from 13,000 to 17,500. The outlay on special works alone during the ten years amounted to over £40,000, and included the erection of a free library and fire station, and the construction of thirty-four new streets, and 9 miles of sewers. Three recreation grounds have also been opened, and the cemetery extended; while 1,600 houses have been erected since 1904. Mr. Haller was articled to his father, Mr. J. C. Haller, ASSOC.M.INST.C.E., at Dew-

bury, and prior to taking up his duties at Carlton was engineer and surveyor at Guiseley, Yorks, for 3½ years. He will take up his position under the Notts County Council on June 1st.—The salary of Mr. Lamb, Mr. Hooley's chief general assistant, has been increased by £50, to £300 per annum.

In the person of Mr. Robert Johnston there has recently passed away one who must have been well known to many of our readers, inasmuch as he was the first to suggest to road engineers the use of basalt stone as a suitable material for road work. That was about fifteen years ago, and Mr. Johnston's supply was at first obtained from the Rhine districts. As, however, he was himself of Ulster extraction, it is not surprising that a few years later he was found devoting his energies to the commercial development of a source of supply much nearer home, and in Ulster itself. It was about five years ago that he founded the Giant's Causeway Columnar Basalt Company, Limited, whose quarries are situated in County Antrim, with an office at Portrush, and whose registered office is in Manchester. We are informed that he afterwards parted with his interest in that company, and that at the time of his death he was interested in an asphalt business in Cork, having the concession for Ireland from one of the Trinidad Lake asphalt companies. Mr. Johnston died at his home in Portrush on the 6th instant, and was buried on Saturday last at Bromborough, Cheshire. He was seventy-one years of age.

Road Maintenance in Axminster Rural District.—The surveyor to the Axminster Rural District Council, Mr. G. A. Millard, presented recently a comparative statement of the cost of main and district road maintenance under contract and direct labour, showing a balance of about £100 in one year in favour of the former system. The chairman (the Rev. A. W. Parke) expressed the opinion that the statement was very satisfactory. Although the direct-labour system had cost a little more than the contract system, he thought that the expense had been warranted in view of the improved condition of the roads. Mr. Perham: They are more than £100 better.

FOR OTHER ADVERTISEMENTS

See End of Paper.

ESSEX COUNTY COUNCIL.

HIGHWAYS COMMITTEE.

RECONSTRUCTION OF LANGFORD BRIDGE, MALDON.

Tenders are invited from Contractors licensed to execute Ferro-concrete Work on the Hennebique system for the Erection of a New Bridge over the river Blackwater, in the parish of Langford, near Maldon.

Drawings may be seen, and Specifications obtained, on and after Saturday, May 16th, 1914, upon application to the County Surveyor of Essex at Chelmsford.

The Council do not bind themselves to accept the lowest or any Tender.

Tenders, sealed and endorsed "Langford Bridge, Maldon," to be delivered to this Office not later than the first post on Monday, June 1st, 1914.

PERCY J. SHELDON, M.INST.C.E.,
County Surveyor.

Chelmsford.

May 14, 1914.

(1,617)

BOROUGH OF MALDON.

Tenders are invited for the Supply and Delivery of Broken Granite and Flints.

Also for Steam Rolling for the year ending March 31, 1915.

Forms of Tender and all particulars may be obtained on application to the Borough Engineer, Mr. T. R. Swales, M.INST.C.E.I., Municipal Offices.

Tenders, endorsed "Tenders for Materials," or "Tender for Steam Rolling," are to be delivered to the undersigned on or before Thursday, June 4, 1914.

The Town Council does not bind itself to accept the lowest or any Tender.

F. H. BRIGHT,
Town Clerk.

Municipal Offices,
Maldon.

May 11, 1914.

Institution of Municipal Engineers.

EASTERN AND NORTH-EASTERN DISTRICT MEETING.

An interesting time was spent in Finedon and Kettering (Northants) by members of the Eastern and North-Eastern Districts of the Institution of Municipal Engineers on Thursday of last week. Those present included the following: Messrs. Chas. Mayfield, district chairman, W. T. Unwin (March), G. F. Bearn (Finedon), G. E. Mathews (Spalding), W. R. Bailey (Holbeach), Selden Hipwell (Chatteris), T. F. Parker (Desborough), J. Bailey (Spalding), G. A. Penwill (Peterborough), Walton Maughan (Northamptonshire), N. E. Dixon (Oundle), E. Madin (Irthlingborough), A. W. Broker (North Witchford), J. S. Parrott (Downham), W. Hadley Darby (Warwickshire), W. A. Clegg (Dorking), members; J. W. Walshaw (Peterborough), J. C. Sturgess (Hardingstone), K. H. J. Parker (Kettering), F. R. Chapman (Bedford), Thomas Northern (Uppingham), George Dolphin (Gretton), A. E. Wiseman (Berkshire), J. F. Jobson (Warwickshire), J. Thomson (Warwickshire), R. E. Spencer (Warwickshire), H. J. Softley (St. Ives), Arthur Harris (Rothwell), W. Forvague (March), W. G. Wilmott (Rushden), L. Blacklock (Bedford), T. Cockrill (Biggleswade), H. E. Broughton (London), visitors; G. Belson Chilvers, hon. district secretary, and B. Wyand, secretary of the institution.

Letters of apology for non-attendance came from a number of prominent surveyors to county, borough, urban district and rural district authorities.

The guests first assembled at the Excelsior Company's works at Finedon sidings. Mr. W. B. Mortimer, managing director of the company, acted as guide. He was careful to emphasise the fact that Excelsior stone was entirely composed of finely crushed and washed granite chippings and best Portland cement. These ingredients are measured out into gauging boxes, and then conveyed by means of elevators to the mixing mill. During the process of mixing water is sprayed on to the requisite proportion, after which the material is taken by spouts to the flag batteries or moulds in which paving slabs are made. The composition is thoroughly puddled with a view to getting rid of all air bubbles, pressure then being applied in order further to consolidate it. The flag moulds used by this company—they are patented—are arranged on such a principle as to allow of the slabs being cast in an edgewise position instead of face upwards, thus rendering it possible for fifty to be cast at once in one battery. In the room where this process was going on no fewer than 500 can be simultaneously made; whereas, placed face upwards, a tenth of that number would fully occupy the same floor space. The flags are allowed to remain in the moulds for three days to set, and an additional three days in the shed before being removed to the yard, and a stay of twelve months in the latter before being sent away. This explained the large stocks that were to be seen in the yard.

The members were very favourably impressed by the main advantage claimed for the edgewise method—namely, that the only part touched by hand is the top edge—thus obviating risk of disturbance after chemical action has taken place, and readers will perceive in this a very important factor, having regard to wearing qualities.

Kerbs are also made by processes similar to those described in the case of flags; likewise the combined kerb-channelling, one of the Excelsior Company's specialities now coming into particularly high favour with many authorities. With regard to the latter, it may be of interest to mention that at the time of the visit to the Finedon sidings a truck was being loaded for Carmarthen in distant Wales. The company make eleven different sections of kerbing, besides the "kerb-channelling," so that the requirements of practically any district can be supplied from stock.

Next on the programme was the machinery at work in the pattern shop, making moulds for copings, cornices, mullions, and various other architectural devices.

The company have started on a contract order for some 2,000 yds. of station platform copings, destined to be incorporated in stations on the Great Northern Railway Company's new line from Enfield to Stevenage. Large quantities of these were seen, as also junction box tunnel-slabs, specially manufactured for the General Post Office as covers for inspection cham-

bers for underground telephone and telegraph wires. The present order—for the latter—is for 10,000, and last year the Government was supplied with about 20,000, while the company naturally set some store by the fact that they are one of the only two firms whose stones are accepted by the General Post Office.

County, urban and rural surveyors are good customers of the reinforced concrete department, which can supply watercourse culverting, sewerage mains, &c. Here were to be seen circular cisterns to be used for water storage, cesspools, and so on; and it was pointed out that these were absolutely watertight, and, unlike brickwork and galvanised iron, would gain rather than lose in reliability from contact with water. The sizes are from 18 in. to 5 ft. in diameter.

As giving some idea of the demand for Excelsior stone, the members were told that the company supply more than a hundred urban and rural authorities, besides eleven county councils, with their kerbs and paving slabs. The output of slabs was given approximately at 50,000 sq. yds. per annum, with about 40,000 yds. run of kerb. About one hundred men are employed on the works.

Leaving the works, the visitors had an enjoyable journey—on a specially chartered motor omnibus—to Kettering, where, at the Royal Hotel, they were entertained to lunch. Afterwards a brief speechmaking was indulged in.

Mr. HORACE BOOT (president of the institution) expressed—in the course of a letter read by the district secretary—his great regret at not being present, and best wishes for a good time.

Mr. C. F. MAYFIELD (district chairman) made a few introductory remarks, saying he himself had been using Excelsior stone with best results.

Mr. MORTIMER highly appreciated the honour done to his company that day by the presence and the manifest interest of so large a gathering of their distinguished profession.

Mr. N. E. DIXON (surveyor to the Oundle Rural District Council) moved a vote of thanks to Mr. Mortimer for his hospitality.

This was seconded by Mr. J. W. Walshaw (city surveyor, Peterborough), who observed that if their host continued to manufacture such slabs as they had seen that day there was a great future before him.

The CHAIRMAN said he was especially glad to see some young members present that day. They would find the institution most helpful, and he would particularly draw their attention to its splendid library. He now proposed that best thanks be accorded Mr. Walton Maughan (Northamptonshire County Council) for having prepared a paper on "Steam and Motor Traction and Motor 'Bus Traffic.'" As time was pressing, they would not have the pleasure of hearing the paper read now, but would doubtless profit from its perusal when published in due course.

The vote was heartily passed.

Thanked for indefatigable labours as district hon. secretary, and at the same time warmly complimented upon his professional ability, Mr. G. BELSON CHILVERS (surveyor and water engineer to the Oundle Urban District Council) said, in reply, that he hoped the time was not far distant when every eligible official would have joined their institution.

Boarding their 'bus again, the company were taken to see Kingsley-avenue, a fine new road paved and "kerb-channelled" with Excelsior stone, the Co-op. factory, and the police station, in the construction of both of which much of the same stone had been used.

On the way out from Kettering attention was called to Barton Bridge and its effective baluster work, and when Finedon town was reached Mr. G. F. Bearn (the urban district council surveyor) showed the party many interesting features, and how he had made use of some thousands of yards of Excelsior kerbing.

In "Ye Olde Tingdene" ("The Bell") Mr. Bearn pointed out the oldest licensed house in England, and although some of the visitors did not appear to be altogether pleased with everything that had been achieved in the way of "restoration," this did not materially lessen their enjoyment of the capital tea provided in this ancient hostelry.

When the meal was over, the CHAIRMAN (Mr. Mayfield) proposed a vote of thanks to Mr. Bearn for

having taken the trouble to make their few hours in Finedon so pleasant and helpful.

While on his feet for the purpose of seconding, Mr. UNWIN (ex-president) also paid a high tribute to Mr. Mayfield, who, he observed, was proving an ideal chairman of the Eastern and North-Eastern Districts, while in Mr. Chilvers they had a secretary second to none.

The vote was heartily endorsed by everybody, Mr. BEARN briefly responding.

On the suggestion of Mr. CHILVERS, the general secretary (Mr. Wyand) was similarly complimented, and in responding he remarked upon the wonderful strides the institution had made in that district since Mr. Chilvers undertook the secretaryship. The future had good things in store for them, including a gathering at Humstanton in July or August, and really they must have a meeting of that district at least every two months.

Before leaving Finedon, the visitors had the pleasure of witnessing a very smart turn-out on the part of the local fire brigade.

ENGINEERING JOTTINGS.

IV. PREVENTION OF WASTE BY STANDARDISATION.

By HERBERT G. COALES, ASSOC. M. INST. C. E., F. S. I.

Possibly the heading may conjure up interminable streets all exactly the same width with the same class of footpath, one kind of tree, and so on; also ghastly row upon row of brick and slated dwellings, all painted green and ornamented with brass door knockers. But if such an abominable state of things could only be obviated by a wasteful expenditure, then let there be waste! Such a monotonous standard of output would be altogether outside the general interest; indeed, it would be against the civic health, for would not the consequent depression of spirits weigh almost as heavily as that from other recognised unpleasant conditions?

What is waste? Would the expenditure by the State of £50,000 for a picture of an old master be waste? Not in the sense in which the word waste is here used, because it would be a matter of opinion. The picture, perhaps, could not be bought at all except on such terms, and it might well be argued that, under the circumstances, it ought to be acquired.

Examples of waste which could scarcely be denied would be the making of a road 2 ft. thick, the putting of 11-in. by 3-in. joists for a cottage floor having only an 11-ft. bearing, or the running of expensive machinery without the proper lubrication of the bearings. Equally there would be waste if the road were made only 6 in. thick, or the joists 3 in. by 2 in., for in both cases the work would have to be reconstructed, and, of course, a deluge of oil over the machinery would be an obvious waste. As we know, there is a happy mean in all things; but if one looks about and listens, are there not evidences of waste all around? This is where standardisation would come in; such matters ought to be governed by a standard of acquired knowledge.

Fortunately, standardisation has been set up, for instance, with such materials as steel, iron, and Portland cement; but why should one town always use 6-in. pipes for house drains when another employs 4-in. pipes which are cheaper and much better suited to their work? If the additional cost per house were only £1 (the difference between a 6-in. and a 4-in. drain), then in a town of 3,000 houses the loss would be £3,000, and for a less efficient service too. Why, for this sum the town might establish public baths free of debt!

If one has motored through several counties in the road-tarring season, one has noticed every man doing what was good in his own eyes. Probably all were first sweeping the dust off the road, but, after the application of the tar, with what was the surface being sprinkled?—with nothing, with sand, with pit gravel, with $\frac{1}{2}$ -in. granite chippings without dust, with $\frac{1}{4}$ -in. granite chippings with dust, or half-a-dozen other substances. Surely there is a "best" gritting material. It cannot, therefore, be economical and sensible to use any other. Either we want the tar into the road, or a film on the road, and we should grit accordingly. Where is the standard? Of course, if the traffic can be kept off the wet tar for a time, until it has sunk into the surface and hardened, it will not be necessary to grit the road at all.

Standardisation should not be set up to extinguish

legitimate experimenting; but every experimenter should be invited to contribute his results to the common stock. However much an engineer might be a benefactor to his own town as the result of a successful experiment, the benefit would be lost to the general community unless the knowledge of it were passed on. Often, no doubt, a standard would not be set up as the result of only one man's success, but through the efforts of many.

It would be of the greatest possible convenience, and in the interests of economy, if one could say: "That's law, and I need not further investigate it." Let us have a table of law for municipal engineers, as binding as the commandments on the Jews. Where judgment on a matter of standard is in suspense, it must not be tabled; but when the absolute rock-bottom truth has been reached, and a standard can be laid down, let it be scheduled. It is not considered necessary every time to calculate the stresses for a tall factory chimney; we take the rules, say, of the London County Council just in the same way as we specify the recognised weights of lead water piping, or accept the tables for safe loads on rolled-steel joists. We may say they are each standardised. What is wanted is an extension of the list.

Every day people are doing, in ignorance, what has been proved elsewhere a failure. New settling tanks and non-filtering "filters" are being provided as a means of sewage disposal for villages. Indifferent concrete flagging, mixed to a home-made recipe, is being laid. Tons of disinfectants are being put down sewers to the discomfiture of the friendly microbe.

At this time of day it is a little exasperating that such a thing as sewer ventilation is treated as an open question. If town A thinks it is necessary to spend thousands of pounds in ventilating its sewers, how is it that town B does not? Town C puts in disconnecting traps, which town D omits, and at E they are optional. Some of these towns must be wasting money. It is therefore apparent that, if standardisation could be agreed upon for ventilation, it would be for the prevention of waste. If it is not always possible at present to inscribe the "Thou shalt" on the table, it may, nevertheless, be quite reasonable to put "Thou shalt not." Thou shalt not use scrapings in the construction of a dustless road! Thou shalt not lay granite setts on the earth without concrete! Thou shalt not pour lukewarm tar on a loose granite road coat to make tar-macadam! Thou shalt not use common bricks containing lime—at least for damp situations! But these things are continually being done.

Prevention is better than cure, and much cheaper. Standardisation should be treated with respect, for it would prevent the making of expensive mistakes, and lead to the saving of a good deal of time and worry. One properly repaired and surfaced road, costing £500 a mile, would outlast two other repairs, costing £400 a time, executed upon inexperienced lines.

Some people dislike standardisation as the curtailment of their liberty in execution; but it would be the means of preventing many a piece of freak construction.

Direct Labour at Taunton.—At the last meeting of Taunton Town Council, the borough surveyor, Mr. D. Edwards, reported that a saving of £180 had been effected in the work of scavenging by direct labour over the amount required by the old system of contract, and the workmen engaged had received 1s. per week increased wages and a half-holiday per week, so that the gross saving effected approached £275 per annum.

Road Maintenance in Tipperary.—In the matter of road management the Tipperary (North Riding) County Council (the *Freeman's Journal* states) has an exemplary record. Ten years ago steam rolling was introduced, two rollers being purchased. During the decade about 220 miles of roads have been steam rolled, and for this work loans amounting to £50,467 have been obtained, while a grant of £2,456 was given by the Road Board, bringing the total expenditure up to £52,922. This works out at about £246 per mile, an average of 15s. per perch. The average width dealt with was 16 ft., and the metalling was $\frac{5}{8}$ in. deep in the loose, consolidating to about 4 in. After the wear and tear of ten years, it has been found necessary to re-roll only about 5 miles of road. The machinery by which this splendid result has been attained is of an extensive character, and includes four steam rollers, six traction engines, five light tractors, five stonebreakers, and six end-tipping wagons.

ECCLES MAIN DRAINAGE.

BOROUGH SURVEYOR'S SCHEME OF RECONSTRUCTION.

The main sewers that were constructed forty years ago in Eccles and district have been found to be altogether inadequate for the requirements of the borough at the present time. Since 1900 the corporation have converted into water-closets over 5,000 privy middens, and with the addition of over 40 acres of paved front streets and back passages since that time serious trouble has arisen during times of heavy rainfall, so that the existing trunk sewers could not deal efficiently with the accumulated water pouring into them. Four years ago the borough engineer and surveyor, Mr. Thomas S. Picton, was instructed by the Highways and Sewers Committee to go fully into the matter and make a report to the committee. For many months the working of the old sewers was under careful observation by the surveyor; gaugings and measurements of the velocity and depth of the sewage were taken daily, the state of the sewers after heavy rainfall and thunderstorms being also noted.

On October 12, 1911, Mr. Picton placed before the Highways and Sewers Committee a comprehensive scheme dealing with the alteration and enlarging of the outfall sewers, the storm-water overflow sewer across the sewage farm, also the provision of new storm-water overflows, &c., in other parts of the borough, at a total estimated cost of over £56,000. As the contemplated expenditure for the carrying out of these proposals amounted to such a large sum of money the committee decided to submit the scheme as to its practicability to an expert engineer, and Mr. John T. Wood, M.INST.C.E., Liverpool, was consulted with regard to it.

On May 24, 1912, Mr. Wood's report, which dealt very fully with Mr. Picton's proposals, and on the whole agreed with what was proposed to be undertaken to remedy the difficulties of the flooding of basements, &c., was received by the committee. This report, and the scheme generally, came before the town council for discussion, and eventually it was decided to apply to the Local Government Board for borrowing powers to enable the works to be carried out in accordance with the scheme of the borough engineer. The inquiry was held on November 27, 1913, by Mr. R. G. Hetherington, M.INST.C.E., inspector of the board. Mr. Hetherington's report to the Local Government Board suggested one or two amendments to the scheme, which were agreed to by the town council. The amendments increased the estimated cost to £60,984. Sanction to proceed with the scheme was received on April 8th last.

The schemes are briefly described as follows: From the pump well at the sewage farm it is proposed to construct a 6-ft. by 5-ft. outfall sewer for a distance of about 30 yds., at a gradient of 1 in 600. The depth to the bottom of the foundations is 19 ft. A storm-water overflow manhole immediately adjoining the catchpit will be connected to this outfall sewer, and in it will be fixed a stone cill, at such a level that the sewage will have to be diluted at least twelve times the dry-weather flow before the storm overflow comes into operation.

The catchpit will be about 42 ft. long and 31 ft. wide, and about 21 ft. deep below ground level. Two 9-ft. by 6-ft. egg-shaped channels will be constructed. Provision is made for two sets of screening and raking apparatus, and two sets of detritus elevators, and two small steam engines of 6 h.p. to work the screens and elevators, with the necessary machinery. Also four large penstocks will be fixed, two at each end of the catchpit, so that if one set of screens or elevators gets out of order, or when cleaning becomes necessary, two of the penstocks can be closed down and the machinery, &c., can have proper attention.

The brick walls of the catchpit supporting the roof will be 18 in. thick at the base, resting on 12 in. of reinforced concrete. The walls of the catchpit 6 ft. below the ground level will be of concrete, 6 ft. thick at the base to 2 ft. thick at the top. Astley and Tyldesley selected common bricks are to be used.

This building will be properly roofed over, using Messrs. Bell's asbestos slates, and Heywood's patent glazing will be fixed on both sides of the roof. The catchpit will be lighted by electricity. At the inlet end of the catchpit there is to be built a junction manhole to receive the 7-ft. 6-in. by 5-ft. egg-shaped sewer, also the 5-ft. 9-in. by 3-ft. 10-in. egg-shaped sewer.

The bricks to be used in these new sewers are

radiated engineering "Winil" from the Winney Hill Plastic Brick Company, Limited, Accrington, and the "Duro" from the Humecoat Plastic Brick and Terra Cotta Company, Limited, Accrington. The Astley and Tyldesley Company's common bricks are being used to back up the square engineering bricks in the manholes.

The existing 4-ft. circular storm-water sewer is to be made larger—namely, to a 7-ft. 6-in. circular storm-water sewer surrounded with 9 in. of Portland cement concrete, 6 to 1, laid at a gradient of 1 in 1,600. At a distance of 842 lin. yds. the construction will be in open cutting at an average depth of 13 ft. 4 in., and 285 lin. yds. in tunnel at an average depth of 23 ft. When this work is nearing completion, the 7-ft. 6-in. by 5-ft. egg-shaped sewer and the 5-ft. 9-in. by 3-ft. 10-in. egg-shaped sewer will be commenced. These sewers are to take the place of the existing 3-ft. 3-in. circular sewers, a size which is now altogether too small for storm water. At present it is only proposed to construct the 5-ft. 9-in. by 3-ft. 10-in. sewer (receiving the sewage from Barton-lane) for a distance of 166 lin. yds., and the 7-ft. 6-in. by 5-ft. (receiving the sewage from Liverpool-road) for a distance of 152 lin. yds. in open cutting, and 355 lin. yds. in tunnel, laid at a gradient of 1 in 1,000, and at an average depth of 17 ft. 6 in. to the bottom of the foundations.

At the junction of New-lane and Liverpool-road the existing 3-ft. 3-in. circular brick sewer along Liverpool-road will be removed, and a 4-ft. by 2-ft. 8-in. egg-shaped sewer constructed in its place for a distance of 415 lin. yds. in tunnel at a gradient of 1 in 300, and at an average depth of 22 ft. to the bottom of the foundations.

It is also proposed to construct a brick storm-water overflow sewer, 5 ft. by 2 ft. 3 in. from Worsley-road, at the junction of Parrin-lane, through private lands, discharging the storm water into Worsley Brook. The length of this sewer is 326 lin. yds. laid at a gradient of 1 in 1,421, at an average depth of 7 ft. to the bottom of the foundations.

For some years past a part of the sewage of Eccles had to be taken into the sewers of the county borough of Salford. It is now proposed to divert this sewage into the Eccles system, using 18-in. pipes protected with 6 in. of cement concrete. This sewer will nearly all be constructed in tunnel, in very hard sandstone rock, and a portion of it will have to be driven under the London and North-Western Railway main line. The length of this sewer will be 201 lin. yds. in open cutting, at an average depth of 12 ft. to the bottom of the foundations, laid at a gradient of 1 in 155, and 619 lin. yds. in tunnel. The average depth of working shafts will be 26 ft.

The whole of the sewers under the above-mentioned schemes will be surrounded with at least 6 in. of Portland cement concrete 6 to 1.

In preparing the schemes provision has been allowed for the quantity of storm water and sewage that may be required to be dealt with fifty years hence, taking the estimated population then at 64,000 persons, and the rainfall has been calculated at $\frac{1}{2}$ in. of rain falling per hour per acre.

Mr. Picton desires to place on record the very able assistance given by his chief assistant, Mr. C. Vernon Hill. He tenders his thanks also to his assistant, Mr. Alfred J. Price, Assoc.M.INST.C.E., for that part of the work which has come under his special care, and to other assistants in the department who have all worked hard in bringing these schemes to such a successful issue so far.

The Surveyors' Institution.—On the 7th instant an important conference between representatives of the universities, the public schools, and the council of the institution was held with the object of ascertaining whether any steps might usefully be taken in order that the usefulness of the institution scholarships might be extended to a wider circle of competitors. Four scholarships, of a value of from £50 to £80 per annum, tenable at Oxford, Cambridge, and the other universities in Great Britain, are offered yearly, and it had been suggested that the conditions attaching to them were such as unnecessarily to restrict competition for them. The conference lasted an hour and a-half, and many valuable suggestions were made, and will be embodied in a report to the council. In the evening the chairman entertained the members of the conference to dinner at the Whitehall Club, Sir Thomas Elliott, K.C.B., Sir Ellis Cunliffe, Mr. Cecil Walsh, K.C., being among those invited to meet them.

ROAD MAINTENANCE IN COUNTY DOWN.

A COMPARISON OF EXPENDITURE.

The Down County Council have referred to the Proposals Committee a report by the county surveyor in which the latter stated: "It is becoming more clear every day that this county is not spending nearly sufficient on the roads, and that the limits of expenditure of the rural districts must be extended. For a number of years the expenditure was sufficient to effect some improvement, particularly in the main roads, but it is now evident that, with the increase in mechanically propelled traffic, the roads are deteriorating, and that if there is not an immediate and substantial increase of expenditure on their maintenance they will get out of hand altogether. Published returns show that County Antrim, with a smaller valuation, population and road mileage, has a much larger road expenditure. In the last ten years, for which the returns are available, Antrim spent on its roads £194,217 more than Down, or an average of more than £10,000 a year. A sum of £10,000 would suffice to supply and steam roll about 36,000 cub. yds. of stones in addition to the present annual quantity in this county of about 100,000 cub. yds. The total permanent statutory limit of expenditure on roads is in Down £64,561, and in Antrim £74,930. The valuation of Down is £847,387, and of Antrim £747,128; population of Down 204,303, of Antrim 193,864."

THE QUESTION OF WHOLE-TIME ASSISTANT SURVEYORS.

Mr. King, on behalf of the Proposals Committee, submitted, at the Down County Council meeting last week, a report by the surveyor on the petition of the assistant surveyors for an addition to their salaries on the grounds of the increased cost of living, and the multiplication of their duties owing to the development of steam rolling, road expenditure having risen, since the Local Government Act was passed, from £44,911 to £62,317, exclusive of special works, the introduction of direct labour, and the preparation of details for the administration of funds from the Road Board.

The surveyor stated that he agreed with the opinion of the committee that it would be much more satisfactory if assistant surveyors were whole-time officers. If the number of assistant surveyors were reduced from twelve to eight, each assistant would have charge, on the average, of 307 miles of road instead of 205 miles as at present, and the salary of each ought obviously to be higher for the larger districts. With eight whole-time assistants he reckoned that each road could be inspected on an average about once in three weeks. He was not quite satisfied that this would be a sufficient number of assistants in view of the volume of road work in progress, which had much increased within the past few years. It might be expected that the amount and cost of such work would, in the future, be added to enormously. If the present number of assistants were retained, the scheme for whole-time assistants could be introduced at once—at any rate, in such cases as the assistant surveyors were willing to fall in with the arrangement, regard being had to the provisions of the Local Government Act as to existing officers, and as to the term of appointment in each case. If the number of assistant surveyors were reduced, say, to eight, the difficulty of introducing the system would be greatly increased. He did not see how it could be done except gradually as vacancies occurred.

Association of Consulting Engineers.—The annual general meeting of the association will be held at Caxton Hall, Westminster, on Monday, May 25th, at 4.30 p.m., when the report of the committee and the accounts for the past year will be presented.

Public Health Law.—This concise little work* has been prepared mainly for the use of all concerned in local government work who may find the larger books too elaborate. In twenty chapters it covers the ground sufficiently for its purpose, including such matters as highways, but omitting rating, elections, &c. For students it should be of assistance in preparing for examinations in Public Health Law, while the practitioner will find its arrangements well suited for easy reference.—*The Law Times*.

* A Manual for Municipal and County Engineers and Surveyors, Town Clerks, Clerks to District Councils, and other officers and members of local authorities. By S. G. Turner, of the Middle Temple, Barrister-at-Law, A.M.I.C.E., &c. London: St. Bride's Press, Limited. Price 10s. 6d.

THE PROPOSED GREAT WEST ROAD.

DECISION OF THE PARLIAMENTARY COMMITTEE.

The House of Commons Committee which inquired into the proposal of the Middlesex County Council to construct a new main trunk road 5 miles in length and 80 ft. in width from Gunnersbury-lane, Chiswick, to Hounslow, joining the old main Bath road, on the 7th inst. found the preamble of the Bill proved, but considered that the Bill required alteration on the following points: In the first place, the Committee desired some modification in connection with the valuation under the Lands Clauses Act of the land required for the road, so that the valuer or arbitrator should be able to make some allowance for loss arising from transfer and investment of capital; and, secondly, that as regards betterment there should be some consideration in respect of increment duty. The Committee were also of opinion that a provision should be inserted in the Bill by which the omnibus companies and the District Railway Company, if they desired to run buses over the road, should be required to contribute towards its maintenance at the rate of 3d. per vehicle-mile. In the opinion of the Committee a width of 14 ft. on each side of the road was quite sufficient to meet the present requirements of the Post Office, the Water Board, and the gas company, and to afford the accommodation necessary for all those bodies.

In the House of Commons on Friday last, Lord Charles Beresford asked the Secretary of State for the Home Department if he would inform the House in what manner companies running motor omnibuses in London and the suburbs contributed towards the upkeep of the roads; what was the total sum contributed by these companies last year, and whether, looking to the amount of damage done to road surfaces by these vehicles, he would consider the desirability of taking steps, by legislation or otherwise, to secure that these companies should pay their fair share of the cost of upkeep of the roads.

In reply, Mr. Herbert Samuel said the companies running motor omnibuses, so far as they were in occupation of rateable premises, contributed as ratepayers to the upkeep of roads, and further contributions in respect of Motor Spirit and Carriage Licence Duty were made to the cost of roads under the Finance (1909-10) Act, 1910, and the Revenue Act, 1911, but the total sum so contributed could not be distinguished. As regarded the last part of the question, the recommendations of the Local Taxation Committee on the subject were under consideration.

At Tuesday's meeting of the London County Council, referring to the proposed contribution of motor omnibuses towards the upkeep of the new western approach road, observed that on the basis of 105,000,000 miles run in 1913 by the cars of the London General Omnibus Company, a corresponding contribution to the rates would exceed £164,000 a year. The contributions made to public funds by the London County Council's tramway undertakings amounted to £200 per car, or 11d. per car-mile. It was estimated that local councils were saving £128,000 annually owing to the tramway undertakings maintaining part of the public highways, this estimate having no regard to the additional expense which would be incurred if the passengers now carried by trams were carried by motor omnibuses.

Intercepting Traps.—Mr. W. Farrington, surveyor to the Woodford Urban District Council, Council Offices, Woodford Green, desires information respecting intercepting traps in house drainage, and would like to hear from surveyors of districts where the traps are not used.

Child Welfare and Housing.—The Child Welfare Housing and Town Planning Exhibition, to be held at the Imperial Institute under the auspices of the Victoria League next week, will be an important contribution to the public knowledge of these subjects. Many of the Colonial Governments will show plans and models of work that is being done overseas, and there will be a full representation of modern housing conditions in the United Kingdom. The Marquis of Salisbury will declare the exhibition open on Monday, and on subsequent days speeches will be delivered by Mrs. Humphry Ward, the Earl of Lytton, and Mr. Waldorf Astor, M.P.

DUBLIN HOUSING.**TWO SCHEMES APPROVED.**

Two schemes for clearing slum areas and building small dwellings for the working class were passed by Dublin Corporation on Monday. One, dealing with the Ormond market area, involves an outlay of £45,803, of which £10,000 will have to go towards the acquisition of the property; the Crabbe-lane scheme involves the expenditure of about £39,350. The dwellings will have two rooms each, and the rent will be 4s. 6d. a week.

INSTITUTION OF MUNICIPAL AND COUNTY ENGINEERS.

President—Mr. J. W. COCKRILL, M.INST.C.E., A.R.I.B.A., Borough Surveyor, Great Yarmouth.

SALISBURY MEETING.

A meeting of the institution is to be held in the Southern District at Salisbury to-morrow (Saturday).

PROGRAMME.

11.30 a.m.—Reception in the council chamber by the Right Worshipful the Mayor of Salisbury, Mr. Councillor J. Macklin, J.P.

Papers by Mr. W. J. Goodwin, Assoc.M. INST.C.E., city engineer, "Some Notes on the Municipal Works of Salisbury"; and Mr. J. H. Blizard, Assoc.M.INST.C.E., on "The Bemerton and Wilton Pumping Station for Sewage Disposal."

Discussion.

1.15 p.m.—Lunch in the banqueting room at the invitation of the Right Worshipful the Mayor.

2.15 p.m.—Leave council house in motor char-à-banc to visit the following works—viz., Salisbury sewage disposal works and refuse destructor.

3.15 p.m.—Leave for Salisbury waterworks, chief pumping station.

3.45 p.m.—Leave for Bemerton pumping station.

4.15 p.m.—Return to council chamber, where tea will be provided, at the invitation of Mr. Alderman C. J. Woodrow, J.P., chairman of the Salisbury Sanitary Committee. (Cost of conveyance, 2s. each.)

By the kind consent of the chief officer of the fire brigade, the fire station will be open all day for inspection.

DISTRICT MEETING.

Members of the Southern District are asked to assemble in the council chamber at 11.10 a.m., to elect the Executive Committee and to consider any other district business.

F. R. PHIPPS, Assoc.M.INST.C.E.,
Hon. District Secretary.

Town Hall,
Basingstoke.

EASTERN DISTRICT.

An Eastern District Meeting is to be held at Ipswich to-morrow (Saturday).

PROGRAMME.

12 noon.—Meet at town hall. Business meeting: Read minutes; elect sub-district secretary for counties of Norfolk, Suffolk and Cambridge.

Afterwards, Mr. John R. Mead will describe the proposed accommodation which is about to be provided for the Ipswich medical officer of health, which includes the school clinic and tuberculosis dispensary. After this, he will open a discussion on road making, road maintenance, and the use of dust palliatives.

1.15 p.m.—Luncheon. (Tickets, 2s. each.)

2.15 p.m.—Visit Ipswich sanatorium, recently completed.

3.30 p.m.—Visit new vertical retort-house at gasworks.

4.30 p.m.—Visit St. Helens School, recently completed at a cost of £13,000; accommodation provided for 1,000 children.

5.30 p.m.—Tea. (Tickets, 1s. each.)

J. A. WEBB, H. T. WAKELAM, M.I.C.E.,
Hon. District Secretary. District Chairman.

WEST MIDLAND DISTRICT.

A meeting of the West Midland District is to be held at Birmingham on May 23rd.

PROGRAMME.

Assemble at Victoria-square entrance to the Council House.

2.15 p.m.—Leave Council House.

2.30 p.m.—Arrive Aston Church-road Bridge (two-span girder bridge, with trough flooring, spanning river Rea and canal).

2.40 p.m.—Leave Aston Church-road, travel *via* Alum Rock-road (60-ft. road laid out with grass margins and trees).

3.10 p.m.—Arrive Kings-road Bridge (single-span brick arch bridge over canal, with retaining walls to street).

3.20 p.m.—Leave Kings-road.

3.35 p.m.—Arrive Stratford-road Bridge (two-span brick arch over river Cole, with stone superstructure; note raising of levels of Stratford-road and new double line of tramway).

3.50 p.m.—Leave Stratford-road.

3.55 p.m.—Arrive Foremans-road Bridge (two-span brick arch over river Cole, with made-up approaches).

4.10 p.m.—Leave Foremans-road.

4.30 p.m.—Arrive Council House, where members will be entertained to tea by Mr. H. E. Stilgoe, city engineer.

District Business:—

Elect district chairman for the year 1914-15.

5 p.m.—Discussion on paper entitled, "Recent Highway Bridges in Birmingham," by Mr. A. S. Parsons, Assoc.M.INST.C.E. (Birmingham).

F. C. COOK, A. T. DAVIS, M.INST.C.E.,
Hon. District Secretary. District Chairman,
Nuneaton. Shrewsbury.

SCOTTISH DISTRICT.

The annual Scottish meeting of the institution will be held in Dunfermline on June 5th and 6th.

The following papers will be read—viz.:—

"A Town Planning Scheme: Its Effects on Housing and Architecture," by Mr. Raymond Unwin.

"Edinburgh and Its Early Examples of Town Planning," by Mr. A. Horsburgh Campbell.

"Town Planning from a Lawyer's Point of View," by Mr. John L. Jack.

"The Advantages of Steam Tractor Haulage over Team Labour for Road Material," by Mr. W. L. Gibson.

On the first day the members are to be entertained to luncheon by the corporation of the city of Dunfermline. On the second day, by the courtesy of the Admiralty and Messrs. Easton, Gibb & Co., the members are to be permitted to visit the works at Rosyth.

SOUTHEND MEETING.

A meeting of the institution will be held in the Eastern District at Southend on Saturday, June 6th.

NORTH-WESTERN DISTRICT.

A meeting of the North-Western District is to be held at Lytham on Saturday, June 13th.

ANNUAL GENERAL MEETING AND TOWN PLANNING, HOUSING AND ROAD CONFERENCES.

The forty-first annual general meeting of the institution will be held at the Town Hall, Cheltenham, on Wednesday, Thursday, Friday and Saturday, June 24th, 25th, 26th and 27th. Conferences will take place with delegates from the various corporations and local authorities of the United Kingdom and representatives of the different bodies interested in the subjects of town planning, housing and roads. An important exhibition of plans, maps and models of town planning and housing schemes has been arranged, and it is believed that the collection will be one of great educational and practical value. The exhibition will be open during the four days of the meeting. Ladies are invited to attend the meeting, visits and annual dinner, and the permission of the president may in their case be assumed, but due notice must be given on the reply form.

SCARBOROUGH MEETING.

A meeting of the institution in the North-Eastern District will take place on Saturday, September 26th, at Scarborough.

J. W. DUDLEY ROBINSON, B.SC.(LOND.),
Secretary.

92 Victoria-street,
Westminster, S.W.

INSTITUTION OF MUNICIPAL ENGINEERS.

President—Mr. HORACE BOOT, M.I.E.E., M.I.MECH.E.

COUNCIL MEETING.

The next meeting of the council will be held in London on Wednesday, May 27th.

NORTHERN DISTRICT.

Meetings will be held in Cumberland in June, at Alnwick on Saturday, July 11th, Sunderland on Saturday, October 10th, Newcastle on Saturday, November 7th, and Newcastle on Saturday, December 12th.

A Northern District meeting, in combination with Yorkshire, will be held at Hull to-morrow (Saturday).

PROGRAMME.

- 11.15 a.m.—Meet near bookstall, Paragon (N.E.R.) Station.
 11.30 a.m.—Proceed to the Hull Corporation electrical power station, Osborne-street.
 12.30 p.m.—Lunch at Imperial Hotel, Paragon-street. Approximate charge, 2s. each.
 1.30 p.m.—Proceed to Guildhall, Alfred Gilder-street, for internal and external inspection.
 2 p.m.—Proceed by tramcar to Garden City, where Mr. P. Runton, architect (or his chief assistant), will meet the members.
 3.15 p.m.—Inspect new municipal boating lake (five minutes' walk from Garden City).
 3.45 p.m.—Proceed by tramcar over two routes to Hull Corporation East District sewage pumping station.
 4.30 p.m.—Inspect Hull Corporation tramcar shed, opposite to sewage pumping station.
 1P TIME—One hour's trip by launch on river Hull.
 6.15 p.m.—Tea.

Darlington.

JOHN ROBINSON.

A Northern District meeting, in combination with Yorkshire, will be held at Harrogate on Saturday, September 12th.

NORTH-WESTERN DISTRICT.

A visit will be paid to the Oldham sewage disposal works to-morrow (Saturday).

PROGRAMME.

- 3 p.m.—Meet at Middleton Junction Station.
 3.15 p.m.—Arrive at Oldham sewage works, where members will be received by Dr. J. B. Wilkinson, medical officer of health, Oldham, and Dr. Grossmann, patentee of the grease extracting plant which has been described by him in a paper read before the institution.
 5.15 p.m.—Tea.

R. J. McKENN,

Hon. District Secretary

Heywood.

WESTERN DISTRICT.

A Western District meeting will be held at Tisbury on Saturday, June 13th, when the municipal works of the town will be inspected and a paper, "Wiltshire Roads, Past and Present," will be read by Mr. E. Plummer Davies (member).

EASTERN AND NORTH-EASTERN DISTRICTS.

A joint Eastern and North-Eastern District meeting will be held at Hunstanton in July.

GENERAL MEETING.

A visit will be paid to the works of the General Electric Company, Limited, Witton, Birmingham, on Thursday, May 21st.

Members will meet at the offices of the company at Witton at 1.45 p.m., proceeding at 2 p.m., on the kind invitation of the company, on an inspection of the engineering works, small motor, switchboard and switchgear departments, foundry, test-house, and conduit works. The works are among the first and best equipped in the country, and the visit will be one of extreme interest, and should command a large attendance.

B. WYAND,

39 Victoria-street, S.W.

Secretary.

CONCRETE INSTITUTE.

The fifth annual general meeting of the institute will take place on Thursday, May 28th, at 4.30 p.m., and the fourth annual dinner will take place on the evening of the same day at 8 p.m., at the Connaught Rooms, Great Queen-street, W.C., Prof. Henry Adams presiding.

H. KEMPTON DYSON,

Secretary.

ASSOCIATION OF MANAGERS OF SEWAGE DISPOSAL WORKS.**METROPOLITAN DISTRICT.**

A visit will be paid to the Surbiton Urban District Council's new sewage disposal and refuse destructor works, Lower Marsh-lane, Surbiton, on Saturday, May 23rd.

Objects of Interest: Modern sewage purification plant, comprising pumping machinery, sludge-pressing plant, precipitation and humus tanks, storm-water diverting apparatus, primary and secondary filters, and a two-cell destructor plant in duplicate with Babcock and Wilcox boilers.

PROGRAMME.

- 2 p.m.—Meet at the works, when a description will be given by the engineer and surveyor, Mr. H. T. Mather, who, afterwards, with the works manager, Mr. C. A. Snook (member), will conduct the party over the works.
 3.15 p.m.—Demonstration of the dissolved oxygen test by Dr. Rideal (past-president).
 5 p.m.—Tea at the Red Lion Hotel, Tolworth, by kind invitation of the chairman of the council, Councillor Stephen Kavanagh, J.P.

J. FIELDHOUSE,

Hon. District Secretary.

INSTITUTION OF WATER ENGINEERS.**SUMMER MEETING AT STOCKPORT.**

The annual summer meeting of the Institution of Water Engineers will be held this year on June 11th, 12th and 13th at Stockport (headquarters at Midland Hotel, Manchester). Candidates for election at the council meeting to be held on June 11th should see that their proposal forms (duly filled in and signed) are received by the secretary, Mr. Percy Griffith, 20 Victoria-street, Westminster, S.W., not later than June 1st.

Wood Paving in Yarmouth.—One hundred thousand Jarrah blocks have been purchased by the Yarmouth Corporation from Millar's Timber and Trading Company, at £7 7s., £8 9s., and £9 11s. per thousand.

APPOINTMENTS VACANT.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

COUNTY SURVEYOR'S ASSISTANT.—May 15th.—West Sussex County Council. £130—£150 per annum.—Mr. H. W. Bowen, county surveyor, North-street, Horsham.

SANITARY AND CLEANSING INSPECTOR.—May 18th.—Perth Town Council. £200 per annum.—Mr. J. Bogg, town clerk.

TEMPORARY WATERWORKS ASSISTANT ENGINEER.—May 18th.—Corporation of Lincoln. £125 per annum.—Mr. W. Bagshaw, town clerk, Guildhall.

CLERK OF WORKS.—May 18th.—Corporation of Cardiff. £3 10s. per week.—Mr. J. L. Wheatley, town clerk.

SURVEYOR.—May 18th.—Kingswood (near Bristol) Urban District Council. £150—£180 per annum.—Mr. Percy Baldwin, clerk.

CITY SURVEYOR AND SANITARY ENGINEER.—May 18th.—Corporation of Lichfield. £200 per annum.—Mr. Herbert Russell, town clerk.

SURVEYOR'S GENERAL ASSISTANT.—May 18th.—Whitley and Monkseaton Urban District Council. £101 per annum.—Mr. Augustus Whitcomb, clerk, 60 Saville-street, North Shields.

CLERK OF WORKS.—May 19th.—East Sussex County Council. £3 10s. per week.—Mr. P. J. Wood, county surveyor, County Hall, Lewes.

SURVEYOR.—May 20th.—Carlton Urban District Council. £150 per annum.—Mr. E. W. Turpin, clerk, 23 King-street, Nottingham.

HIGHWAY SURVEYOR.—May 20th.—Keighley Rural District Council. 30s. per week.—Mr. W. Birstow, Bridge House, Steeton, Keighley.

WATERWORKS ENGINEER-MANAGER.—May 21st.—Epsom Urban District Council. £200—£250, with house and motor-car allowance.—Mr. E. G. Wilson, clerk, Church-street, Epsom.

JUNIOR ASSISTANTS.—May 22nd.—Borough Surveyor's Department, Corporation of Chesterfield. £78 per annum.—Mr. Vincent Smith, borough surveyor.

TEMPORARY ASSISTANT.—May 23rd.—Bentley-with-Arksey Urban District Council. £2 10s. per week.—Mr. George Pye, clerk, 17 Priory-place, Doncaster.

CLERK.—May 23rd.—Committee for the Care of the Mentally Defective, Somerset. £130 per annum.—Mr. G. I. Simey, clerk to the county council, Sidney House, Boulevard, Weston-super-Mare.

SURVEYOR AND INSPECTOR OF NUISANCES.—May 23rd.—Bollington Urban District Council. £140 per annum.—Mr. Samuel Knight, clerk.

COUNTY SURVEYOR AND ARCHITECT.—May 25th.—Durham County Council. £800—£1,000 per annum.—Mr. Harold Jevons, clerk, Shire Hall, Durham.

SURVEYOR'S ASSISTANT.—May 29th.—Cannock Urban District Council. £2 2s. per week.—Mr. C. A. Loxton, clerk.

SEWAGE FARM MANAGER.—June 1st. Balby-with-Hexham Urban District Council.—Mr. George Gledhill, surveyor, Council Offices, Low-road, Balby, near Doncaster.

BRIDGE AND MAIN ROAD SURVEYOR.—June 1st.—County Council of Devon. £400 a year, with £200 a year for expenses.—Mr. F. Bailey, clerk, Castle of Exeter.

RESIDENT ENGINEER.—June 1st.—Chard Town Council. 3½ guineas per week. Mr. J. A. Forward, town clerk.

COUNTY SURVEYOR.—June 4th.—Hertford County Council. £800 a year.—Mr. Charles E. Longmore, clerk, Clerk of the Peace Office, Hertford.

ENGINEER AND SURVEYOR.—June 8th.—Cheadle and Gatley Urban District Council. £250 per annum. Mr. Arthur Briggs, clerk, Council Offices, Cheadle, Cheshire.

INSPECTOR OF ROADS.—June 9th. Corporation of Aberdeen. £200 per annum. Mr. W. Dyaek, burgh surveyor, Townhouse.

SURVEYOR.—June 15th.—Board of Trustees for the Improvement of Calcutta. 600—800 rupees per month (rupee valued at 1s. 4d.). Chairman, Calcutta Improvement Trust.

DRAUGHTSMAN.—Government of East Africa. £160—£250.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEERING DRAUGHTSMAN.—Government of Nigeria. £400—£500.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ENGINEERS.—Public Works Department, Government of Federated Malay States. £300—£450 per annum, with duty allowance of £75. Messrs. Gregory, Eyles & Waring, 12 Dean's-yard, Westminster, S.W.

ELECTRICITY SUPERINTENDENT.—Durban Corporation, Natal. £300—£360.—Messrs. Webster, Steel & Co., 5 East India-avenue, Leadenhall-street, London, E.C.

BUILDING ENGINEERS.—Government of Nigeria. £500.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

ASSISTANT ENGINEERS.—Public Works, Government of East Africa. £300—£400.—Crown Agents for the Colonies, Whitehall-gardens, London, S.W.

MUNICIPAL COMPETITIONS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

BALLYCASTLE.—May 19th. Plans for a water supply for the Ballycastle Rural District Council.—Mr. H. McGill, clerk.

CWMAMMAN.—May 25th. Plans for a scheme of sewerage, for the Cwmamman Urban District Council.—Mr. W. M. Knoble, clerk, Commercial Buildings, Glanamman.

SUNDERLAND.—June 23rd.—Designs for a secondary school for 600 scholars, for the Corporation of Sunderland. Premiums, £100, £50, and £25.—Mr. J. W. Moneur, borough engineer and surveyor, Town Hall.

MIDDLETON.—July 16th.—Designs for a town hall, the cost of which must not exceed £18,000. Premiums £100, £50, and £25.—Town Clerk.

LONDON.—September 7th.—Designs for elementary schools, for the London County Council.—Education Officer, Education Offices, Victoria-embankment, W.C.

BELPER.—Designs and estimates for the erection of a bridge over the River Derwent, for the Belper Rural District Council.—Mr. Robert C. Cordon, surveyor, Duffield, near Derby.

CHESTER.—Designs for working-class dwellings, for the Corporation of Chester. Premiums, £50, £25, and £10. Mr. Patrick Abercrombie, M.A., Liverpool University School of Civic Design, has been appointed assessor.—Mr. J. H. Dickson, town clerk.

MUNICIPAL CONTRACTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

Buildings.

CHESTERFIELD.—May 18th.—For the construction of a reinforced-concrete service reservoir, for the rural district council.—Mr. G. Frith, Council Offices.

BRIGHTON.—May 18th.—For the erection of a department for infants at Coombe-road school, for the Education Committee.—Messrs. T. Simpson & Son, 15 Ship-street, Brighton.

SHEFFIELD.—May 18th.—For the erection of a school, for the Education Committee. City Architect.

SALFORD.—May 18th.—For the erection of a sub-station, for the corporation.—Messrs. C. S. Allott & Sons, 46 Brown-street, Manchester.

LEDBURY.—May 18th.—For the construction of a reinforced concrete open-air swimming bath, with dressing-boxes and corrugated iron fencing, for the urban district council.—Mr. R. G. Gurney, surveyor.

SOUTHAMPTON.—May 18th.—For the erection of four cottages, for the corporation.—Waterworks Engineer, 33 and 35 French-street.

LEEDS.—May 19th.—For the diversion and covering of Earsley beck, and the erection of a stone boundary wall, for the corporation.—Mr. W. T. Lancashire, city engineer.

DURHAM.—May 19th.—For the erection of a school, for the county council.—Mr. A. J. Dawson, clerk to the Education Committee, Shire Hall, Durham.

BOOTLE.—May 20th.—For the erection of an electricity sub-station, for the corporation.—Mr. B. J. Wollenden, borough engineer.

WEST RIDING.—May 20th.—For alterations to a school, for the county council. Mr. B. Thornton, divisional clerk, Education Offices, Skipton.

NEWCASTLE-UPON-TYNE.—May 20th.—For the extension of the laundry and mortuary, for the Sanitary Committee.—City and Property Surveyor.

HOVE.—May 20th.—For the construction of an underground lavatory, for the corporation.—Mr. H. H. Scott, borough surveyor.

OLDHAM.—May 20th.—For the supply and fixing of equipment for a public wash-house, for the corporation.—Borough Surveyor.

DORCHESTER.—May 21st.—For the erection of a shelter, for the corporation.—Borough Surveyor.

WEST RIDING.—May 22nd.—For the erection of a school, for the Education Committee.—Education Architect, County Hall, Wakefield.

DUBLIN.—May 23rd.—For alterations and additions to public baths and washhouses, for the corporation.—Mr. M. J. Buckley, borough surveyor, Castle-street.

ESSEX.—May 23rd—June 16th.—For the erection of a school, for the Education Committee. Mr. J. Gleave, Education Offices, County High School, Braintree.

WHITEHAVEN.—May 23rd.—For the supply of cast-iron spigot and socket pipes, bends, junctions,

and valves, cutting trenches, and laying pipes for a water supply, for the rural district council.—Mr. George Boyd, 33 Queen-street, Whitehaven.

ABERDARE.—May 25th.—For the erection of a refuse destructor, for the urban district council.—Mr. D. L. Griffiths, clerk.

DUBLIN.—May 25th.—For the erection of 113 cottages, blocks of flats, and eight-roomed houses, for the corporation.—City Architect, City Hall.

DEVON.—May 25th.—For the erection of a police station, for the Standing Joint Committee.—Mr. E. H. Harbottle, County Chambers, Exeter.

BIRMINGHAM.—May 25th.—For constructional works at generating station, for the corporation.—Electric Supply Department, 14 Dale-end.

HANTS.—May 25th.—For the erection of a teacher's house, for the county council.—Mr. A. L. Roberts, architect, The Castle, Winchester.

BLACKBURN.—May 25th.—For the erection of public halls, for the corporation.—Town Clerk.

CUCKFIELD.—May 26th.—For the erection of six cottages and other buildings, for the urban district council.—Mr. C. H. Waugh, clerk, Boltro-road, Haywards Heath.

WEST SUSSEX.—May 26th.—For alterations and additions to the Midhurst Grammar School, for the Joint Education Committee.—Mr. Haydn P. Roberts, county education architect, Thurloe House, High-street, Worthing.

WEST SUSSEX.—May 26th.—For alterations and improvements to the Shoreham council school, for the Joint Education Committee.—Mr. Haydn P. Roberts, county education architect, Thurloe House, High-street, Worthing.

WEST HAM.—May 26th.—For painting, cleansing, and repairing public buildings in the borough, and certain other institutions, for the corporation.—Mr. J. G. Morley, borough engineer.

HAMMERSMITH.—May 27th.—For the construction of a urinal, for the borough council.—Mr. H. Mair, borough surveyor.

QUEENSTOWN.—May 29th.—For the construction of a water supply, for the urban district council.—Mr. P. H. McCarthy, 39 Westmoreland-street, Dublin.

STAFFORD.—May 30th.—For alterations to the borough hall, for the corporation.—Mr. W. Plant, borough engineer and surveyor.

CAVAN.—May 30th.—For laying cast-iron pipes and valves, and the construction of filter beds at water-works, for the urban district council.—Messrs. Swiney & Croasdaile, Avenue Chambers, Belfast.

CHARD.—June 1st.—For the construction of covered reservoir, well, tunnel, and the laying of 7-in., 5-in., 4-in., 3-in. and 2-in. cast-iron water mains, valves, hydrants and other castings, for the corporation.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

Iron and Steel.

CHORLEY.—May 19th.—For the supply of cast-iron pipes and steel tubes, for the corporation.—Mr. J. W. Allin, gas engineer.

MANCHESTER.—May 19th.—For the supply of steel girder tramway rails, for the Tramways Committee.—Mr. J. M. McElroy, general manager, corporation tramways, 55 Piccadilly.

BRITON FERRY.—May 19th.—For the supply of 2,337 lin. yds. of cast-iron plates 7 in. in diameter, 1,317 lin. yds. 6 in. in diameter, and 15 lin. yds. 3 in. in diameter, for the urban district council.—Mr. Alex. Clarke, engineer and surveyor.

BRITON FERRY.—May 19th.—For laying, jointing and completing cast-iron pipes, for the urban district council.—Mr. H. Alex. Clarke, engineer and surveyor.

GRAYS.—May 20th.—For the supply of 1,000 yds. of 3-in. diameter cast-iron pipes, for the rural district council.—Mr. C. F. W. Marsh, engineer, Grays, Essex.

BURY.—May 20th.—For the supply of floor girders, stanchions, and staircase and chequered plates at the generating station, for the corporation.—Town Clerk.

MARKET HARBOROUGH.—May 22nd.—For the erection of a brick and puddle gasholder tank, for the urban district council.—Mr. A. T. Harris, engineer, Gas Offices.

GLOUCESTER.—May 25th.—For the installation of pumping machinery, for the corporation.—Messrs. Fox, Moore, Bateman & Fox, 5 Victoria-street, Westminster, S.W.

CARDIFF.—May 28th.—For the supply of steel and cast-iron work and small feed tank, for the corporation.—Mr. A. Ellis, electric engineer and manager.

CHARD.—June 1st.—For the supply of, approximately, 450 tons of 7-in., 5-in., 4-in., 3-in. and 2½-in. cast-iron pipes, junctions, bends, tapers, and other castings; also for the supply of 7-in., 5-in., 4-in. and 3-in. sluice valves, fire hydrants, air valves, and surface boxes, for the corporation.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

FLEET (Hants).—June 4th.—For the supply and delivery of 2,700 yds. of 12-in. diameter cast-iron pipes, 1,900 yds. of 10-in., 2,950 yds. of 9-in., 1,060 yds. of 8-in., 2,400 yds. of 7-in., 900 yds. of 6-in., and pipes of smaller diameters, also bends, taper junctions, and other specials, for the urban district council.—Mr. T. J. Moss-Flower, 28 Victoria-street, Westminster, and Carlton Chambers, Bristol.

MADRAS.—June 17th.—For the supply of cast-iron pipes, special castings, sluice valves and hydrants, for the corporation.—Mr. J. W. Madeley, special engineer, and Messrs. J. Mansergh & Sons, agents, 5 Victoria-street, Westminster, S.W.

Roads.

EASTBOURNE.—May 18th.—For the execution of private street works, for the corporation.—Mr. A. Ernest Prescott, borough surveyor.

BLACKBURN.—May 18th.—For the execution of street works, for the Highways Committee.—Mr. W. Stubbs, borough engineer.

ROMFORD.—May 18th.—For works of street improvement, for the urban district council.—Mr. H. T. Ridge, acting surveyor.

PLYMOUTH.—May 18th.—For making up certain streets, for the corporation.—Mr. James Paton, borough engineer.

HOLYWOOD (Ireland).—May 18th.—For the supply of road metal and screenings, for the urban district council.—The Surveyor.

KENSINGTON.—May 18th.—For laying creosoted deal blocks in certain streets, for the borough council.—Borough Engineer and Surveyor.

BOGNOR.—May 18th.—For the supply of granite chippings, for the urban district council.—Mr. O. A. Bridges, surveyor.

BELCHAMP.—May 19th.—For the supply of broken slag, for the rural district council.—Mr. S. Allpress, surveyor.

GLASGOW.—May 19th.—For the construction of certain streets, for the corporation.—Office of Public Works, City Chambers.

HOVE.—May 20th.—For providing and laying wood paving, for the corporation.—Mr. H. H. Scott, borough surveyor.

KENT.—May 20th.—For the supply of about 11,000 yards of Guernsey, Norwegian, Pennant, Scottish or other kerb, for the county council.—County Surveyor, St. Peter-street, Maidstone.

RAWTENSTALL.—May 20th.—For paving and sewerage certain streets, for the corporation.—Mr. James Johnson, borough surveyor.

DEWSBURY.—May 20th.—For widening a road, for the corporation.—Borough Surveyor.

LUTON.—May 21st.—For the execution of private street works, for the corporation.

KILDARE.—May 23rd.—For the supply of a 10-ton compound steam roller, sleeping, water carts, and a force pump, for the county council.—Mr. Thomas Langan, secretary, Courthouse, Naas.

DORKING.—May 23rd.—For the supply of 1,000 tons of tarred slag, for the urban district council.—Mr. W. A. Clegg, surveyor.

LANCASTER.—May 23rd.—For the execution of a highway improvement, for the rural district council.—Mr. W. Dixon, surveyor.

SCUNTHORPE.—May 25th.—For the supply of any quantity up to 500 tons of broken granite of approved quality, for the urban district council.—Mr. Herbert Heap, engineer and surveyor.

EXETER.—May 25th.—For paving a portion of Sidwell-street with creosoted wood blocks, for the corporation.—Mr. Thos. Moulding, city engineer and surveyor.

ROWLEY REGIS.—May 25th.—For work of road improvement, for the urban district council.—The Surveyor.

SHEPPEY.—May 26th.—For the supply of blue ragstone, for the rural district council.—Mr. John Copland, clerk, Sheerness.

TOTTENHAM.—May 26th.—For making up Boundary-road (remainder) and Clifton-gardens, for the urban district council.—Mr. W. H. Prescott, surveyor.

WEST HAM.—May 26th.—For making up part of Saville-road, part of Leonard-street, Eclipse-road, part of Cumberland-road, part of Chadwin-road, and part of Varley-road, for the corporation.—Borough Engineer.

STOWMARKET.—May 27th.—For the supply of 350 tons of best broken granite, for the urban district council.—Mr. P. C. G. Hayward, clerk.

WALTHAMSTOW.—May 27th.—For the supply of Trinidad asphalt macadam and Trinidad Lake bitumen, for the urban district council.—Mr. E. Morley, surveyor.

BRENTFORD.—May 30th.—For the supply of 300 yds. of blue Guernsey or other approved granite, for the urban district council.—Mr. J. W. Croxford, surveyor.

MONMOUTHSHIRE.—May 30th.—For the supply of materials or haulage, for the county council.—Mr. W. Tanner, county surveyor, County Council Offices, Newport (Mon.).

BOULTON.—May 30th.—For the supply of 700 tons of slag rejections, for the urban district council.—Mr. W. J. Holbrook, clerk.

BARNSTAPLE.—June 5th.—For the purchase of a 12-ton steam roller with scarifier.—Mr. E. Y. Saunders, borough surveyor.

TANGIER.—June 8th.—For the construction of about 10 miles of road, for the Moroccan Adjudications Commission.—Commercial Intelligence Branch of the Board of Trade, 73 Basinghall-street, E.C.

EPSOM.—June 16th.—For making up Leigh-road, School-road and Spencer-road, for the rural district council.—Mr. T. E. Ware, surveyor of highways, Waterloo-road, Epsom.

LEWES.—June 19th.—For road rolling and the supply of 600 tons of 2-in. broken granite and 600 tons of broken surface-picked flints, for the corporation.—Borough Surveyor.

LARNE.—June 25th.—For the construction of a new street, for the urban district council.—Mr. W. G. Younge, clerk.

LONDON.—No date.—For the execution of paving works, for the Street Committee.—Town Clerk, Public Health Department, Guildhall.

Sanitary.

RHYMNEY.—May 18th.—For the construction of outfall sewer, storage tank, discharge pipe, and storm overflow pipe, for the Sewerage Board.—Mr. J. S. Alford, 9 Victoria-street, Westminster, S.W.; Messrs. Willcox & Raikes, 63 Temple-row, Birmingham; and Mr. T. J. Thomas, 36 High-street, Bargoed.

GELLIGAER.—May 19th.—For surface-water drainage, for the urban district council.—Mr. F. Read, engineer and surveyor.

BRADFORD.—May 19th.—For emptying middens and ashpits, for the corporation.—Mr. F. Stevens, town clerk.

PETERBOROUGH.—May 22nd.—For the construction of Eye drainage works, with manholes, flushing chamber, and ventilating pipe, for the rural district council.—Mr. G. A. Penwill, 33 Queen-street, Peterborough.

ECCLES.—May 23rd.—For the construction of outfall sewer, storm overflow manhole, junction manhole, screening and raking apparatus, detritus elevators, machinery, engines, pen-stocks, and circular storm-overflow sewer, for the corporation.—Mr. Thomas S. Pictou, borough engineer.

DURSLEY.—May 23rd.—For the construction of sewerage and sewage disposal works, for the rural district council.—Mr. G. P. Milnes, 7 Rowcroft, Stroud.

LEEK.—May 25th.—For laying and jointing about 2,840 yds. of 9-in. and 6-in. stoneware pipe sewers, and constructing manholes, flushing chambers, engine house, pump well, liquefying tanks, bacteria beds, sludge beds, approach road, and other works, for the rural district council.—Messrs. Willcox & Raikes, 63 Temple-row, Birmingham.

DEUDRAETH.—May 25th.—For laying glazed stoneware and cast-iron socket-pipe sewers, and constructing manholes and other works, for the rural district council.—Mr. L. Lloyd Jones, Lloyd's Bank Chambers, Carnarvon.

WAKEFIELD.—May 25th.—For the construction of a main outfall sewer, comprising 4,000 yds., or thereabouts, of pipe sewers, pumping station, and subsidiary branch sewers, comprising 5,800 yds., or thereabouts, of pipe sewers, for the corporation.—Mr. A. C. Allibone, town clerk.

WARBLINGTON.—May 25th.—For laying laterals or branch drains from the public sewers, and the connection of existing drains, with all necessary inspection chambers and other works, for the urban district council.—Mr. Arthur J. Martin, engineer, 7 Victoria-street, Westminster, S.W.

CWMAMMAN.—May 25th.—For the preparation of a sanitary scheme, for the urban district council.—Mr. W. Martin Knoble, clerk, Commercial Buildings, Glamorgan.

CHESTER.—May 25th.—For sewer construction, for the rural district council.—Mr. C. J. F. Owen, 10 Batchelors-lane, Dee Banks, Chester.

BASFORD.—May 25th.—For providing and laying stoneware pipe sewers with Hassall's joints and manholes, for the rural district council.—Mr. S. Maylan, engineer and surveyor.

BLYTH AND CUCKNEY.—May 26th.—For scavenging work, for the rural district council.—Mr. A. E. Hewitt, inspector.

KIVETON PARK.—May 26th.—For the construction of sewers, for the rural district council.—Mr. F. Hewitt, engineer and surveyor.

FARNBOROUGH.—May 26th.—For the construction of sewers and storm-water drains, and making good a road, for the urban district council.—Mr. John E. Hargreaves, surveyor.

CHEPPING WYCOMBE.—May 28th.—For the supply and erection of steam engines, air compressors, air lifts, ejectors, and all necessary appurtenances in the extension of the sewage outfall works at Wycombe Marsh, for the corporation.—Mr. T. J. Rushbrooke, borough engineer and surveyor.

DEWSBURY.—May 30th.—For the construction of sewage disposal works, for the corporation.—Mr. Henry Dearden, borough engineer.

Stores.

BRIERLEY HILL.—May 18th.—For the supply of Rowley ragstone setts, chippings, broken furnace slag, blue kerbs, paving bricks, hard burned and common bricks, scavenging brushes, shovels, picks, gully grates, stoneware pipes, sanitary articles, and disinfectants.—Mr. William Waldron, clerk.

WALSALL.—May 18th.—For the supply of requisites for the gas department.—Town Clerk.

MANCHESTER.—May 19th—26th.—For the supply of requisites, for the Electricity Committee.—Mr. F. E. Hughes, secretary Electricity Committee.

FRIERN BARNET.—May 28th.—For the supply of steam coal, engine slack, coke, hardcore, hoggon, gravel, broken Leicester granite, cartage, and general horse hire, for the urban district council.—Mr. E. J. Reynolds, engineer and surveyor.

LUTON.—May 30th.—For the supply of broken granite for the year ending June 30, 1915, for the corporation.—Borough Engineer.

PAIGXTON.—June 5th.—For the supply of coal, coke, granite, lamp columns, gully gratings, oil, firewood, and other articles, for the urban district council.—The Surveyor.

Miscellaneous.

TYLDESLEY-WITH-SHAKERLEY.—May 25th.—For the supply of gas fuel, cast-iron pipes and special (gas and water) lead pipes, wrought-iron tubes and fittings, and gas meter, for the urban district council.—Mr. Hedley Hoy, gas engineer.

WARWICK.—June 1st.—For the supply of electric motors, centrifugal pumps, switchgear, automatic control apparatus, pipes, and valves, at the Loughbridge pumping station, for the corporation.—Messrs. Dodd & Dodd, County Chambers, Corporation-street, Birmingham.

MADRAS.—June 1st.—For the supply of two petrol-driven motor fire engines, for the corporation.—Mr. James R. Coats, engineer.

TENDERS FOR MUNICIPAL WORKS OR SUPPLIES.

The Editor invites the co-operation of SURVEYOR readers with a view to making the information given under this head as complete and accurate as possible.

* Accepted. † Recommended for acceptance.
‡ Provisionally accepted.

ABERDEEN.—For the erection of a car shed, for the corporation.—Mr. W. Dyack, burgh surveyor:—
Mason Work.—J. Shirras & Son, Aberdeen, £1,238.
Carpenter Work.—G. Lyall, junr., Aberdeen, £1,369.
Track Work.—E. Allen & Co., Sheffield, £1,063.
Plumber Work.—A. McRobb, Aberdeen, £230.
Slater Work.—C. Maitland & Son, Aberdeen, £153.
Asphalting.—Roger & Baxter, Aberdeen, £38.

ALDERSHOT.—For laying a 9-in. stoneware sewer, with two manholes, for the urban district council.—Mr. Fred C. Uren, surveyor:—

CEMETERY-ROAD SEWER EXTENSION.
McCarthy E. Fitt, Reading £137
E. Free & Sons, Maidenhead 85
W. Norris, Farnham* 70

ALDERSHOT.—For main drainage reconstruction, extension of sewage and destructor works, and subsidiary sewers, for the urban district council.—Mr. Fred C. Uren, surveyor:—

	Contracts.		
	1.	2.	3.
McCarthy E. Fitt, Reading	£14,224	£1,986	£1,248
Ford & Co., Willesden Junction	8,135	—	—
E. Free & Sons, Maidenhead	7,333	—	995
Binns & Co., Croydon	6,848	—	1,010
Hardy & Co., Woking	6,600*	—	905
W. Norris, Farnham	—	—	793*
Crosby & Co., Farnham	—	1,150*	—

BRECON.—For paving works in certain streets, for the corporation.—Mr. Hugh L. Griffiths, borough engineer and surveyor:—

BRECON BOROUGH PAVEMENTS IMPROVEMENT.
W. Meredith, Newbridge-on-Wye £885
W. G. Plunkett, Brecon 710
J. R. Morgan, Brecon 709
B. Jenkins, Brecon 685
Lewis Meredith, Brecon 658

BRIDGWATER.—For the supply of 124 tons of 3-in. cast-iron pipes and other castings, for the rural district council.—Mr. W. A. Collins, engineer:—

Clay Cross Iron Company, Chesterfield	£847
J. Oakes & Co., London	844
Staveley Coal and Iron Company, Chesterfield	841
Cochrane & Co., Woodside	835
Jordans, Limited, Newport	838
Stanton Ironworks, Nottingham	835
Sheepbridge Coal and Iron Company, Chesterfield*	819
Iscia Foundry Company, Newport (Mon.)	787
A. G. Cloake, London	700

BUCKS.—For enlargement of county secondary school at

Wolverton, for the Education Committee:—
—Hawkin £1,885
—Green 1,856
Henson & Son 1,855
Hickman & Sons 1,835
Webster & Cannon 1,798
E. Archer & Sons, Limited, Northampton* 1,685

CHESTER-LE-STREET.—For making up certain streets, for the urban district council.—Mr. W. Ridley, surveyor:—

J. Douglass, Newcastle-on-Tyne	£2,692
W. Kennedy, Jarrow-on-Tyne	2,390
J. Wears & Sons, Pelton Fell, S.O., Co. Durham	2,372
E. R. Davison, Blyden-on-Tyne	2,205
E. Edgar, Gosforth	2,172
J. Thompson & Son, Chester-le-Street*	2,009

CHINGFORD.—For making up certain portions of 11all-lane, for the urban district council.—Mr. J. T. Griffin, surveyor:—

W. & C. French, Buckhurst Hill	£898
W. & C. Hampton, Palmer's Green, N.	865
G. Porter, Clapton	809

DURHAM.—For the execution of the Ludworth sewerage and sewage disposal scheme, for the rural district council:—

—Carrick	£2,385
R. Oliver, Gilesgate Moor*	1,789

FELIXSTOWE AND WALTON.—For alterations and extensions at the electric lighting station, for the urban district council.—Mr. H. Clegg, surveyor:—

—Andrews	£395
H. J. Lintell, Felixstowe*	369

LARNE.—For the construction of a new road and repairing bridges and fences, for the rural district council:—
New Road.—W. Hirst, Larne, £2,000.
Footpath.—W. Hirst, Larne, £110.

ST. NEOTS.—Recommended for the supply of broken granite, basalt, slag tar-macadam, and slag dust, for the urban district council.—Mr. J. Edey, surveyor:—

Jees Hartshill Granite Company, Atherstone.—50 tons 1-in., 50 tons 1½-in., 100 tons 1½-in. granite.
Groby Granite Company, Groby.—300 tons of 2-in. to 2½-in.
J. Smart & Son, London.—300 tons slag tar-macadam, and 100 tons slag dust.

TORPOINT.—For making up certain roads, for the urban district council.—Mr. R. H. Beaumont, surveyor:—

T. Dovey, Plymouth.—North-road, £757; Vicarage-road, £204; Liscaun-road, £111; Salamanca-road, £109; Barossa-road, £98.

WOLVERHAMPTON.—Accepted for extensions to buildings at Commercial-road station, for the town council:—
T. & S. Ham, Wolverhampton, £2,595.

WOLVERHAMPTON.—Accepted for the supply of steelwork and bunkers for boiler-house extension at electric generating station, for the corporation:—
W. Hayward & Sons, Wolverhampton, £1,012.

MEETINGS.

Secretaries and others will oblige by sending early notice of dates of forthcoming meetings.

MAY.

- 16.—Institution of Municipal and County Engineers: Meetings at Salisbury and Ipswich.
- 18.—Royal Institute of British Architects: Mr. T. Raffles Davison on "Beautiful London, with Special Reference to the Aims of the London Society," 8 p.m.
- 20.—Institute of Sanitary Engineers: Visit to Metropolitan Water Board's Reservoirs at Chingford.
- 23.—Association of Managers of Sewage Disposal Works: Visit to Surbiton Sewage Works.
- 23.—Institution of Municipal and County Engineers: West Midland District Meeting at Birmingham; Mr. A. S. Parsons on "Bridge Construction."
- 24.—Institution of Civil Engineers (Students' Meeting): Mr. A. A. Hudson, K.C., on "Engineering Contracts," 8 p.m.
- 25.—Association of Consulting Engineers: Annual General Meeting, Caxton Hall, Westminster, 4.30 p.m.
- 27.—Institute of Sanitary Engineers: Visit to Eton Rural District Council's sewage outfall works at Gerrard's Cross. Train from Marylebone, 2 p.m.
- 28.—Concrete Institute: Annual General Meeting, 4.30 p.m.; Annual Dinner, Connaught Rooms, 8 p.m.

JUNE.

- 5-6.—Institution of Municipal and County Engineers: Meeting in Dunfermline.
- 6.—Institution of Municipal and County Engineers: Meeting at Southend.
- 11-13.—Institution of Water Engineers: Summer Meeting at Stockport.
- 13.—Institution of Municipal Engineers: Western District Meeting at Tisbury. Mr. E. Plummer Davies on "Wiltshire Roads, Past and Present."
- 17.—Royal Institute of British Architects: Annual Dinner, Hotel Cecil.
- 24.—Institute of Sanitary Engineers: Visit to Luton sewage farm. Train from St. Pancras, 2.50 p.m.
- 24-27.—Institution of Municipal and County Engineers: Annual Meeting and Town Planning, Housing and Road Conference at Cheltenham.

JULY.

- 4-11.—Royal Sanitary Institute: Annual Congress and Exhibition at Blackpool.
- 6-10.—Institution of Mechanical Engineers: Summer Meeting in Paris.

SEPTEMBER.

- 26.—Institution of Municipal and County Engineers: Meeting at Scarborough.

EX-PUPILS AND JUNIOR ASSISTANTS.

A.R.S.I.—3 years' college course, and 2 years' Articles, seeks appointment, Junior Assistant Sanitary Engineer. Thorough practical experience in all branches of Sanitation; neat draughtsman and good mathematician. Numerous certificates; references exchanged. Willing to undergo any test in Sanitation. Age 23. Salary required £50.—Box 1421, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,614)

APPOINTMENTS WANTED.

PREPAID Advertisements under this heading are inserted at the rate of ONE PENNY per word, with a minimum charge of 2s. THREE consecutive insertions given for the price of TWO.

GENTLEMANLY YOUTH (17), son of an A.M.I.C.E., wishes to enter Civil Engineer or Council Surveyor's Office in London or suburbs. Can trace, sun-print and colour up. Small salary desired.—Box 1,420, office of THE SURVEYOR, 24 Bride-lane, Fleet-street, E.C. (1,615)

APPOINTMENTS OPEN.

OFFICIAL AND SIMILAR ADVERTISEMENTS RECEIVED UP TO 4.30 P.M. ON THURSDAYS WILL BE INSERTED IN THE FOLLOWING DAY'S ISSUE, but those responsible for their despatch are recommended to arrange that they shall reach THE SURVEYOR office by noon on WEDNESDAYS to ensure their inclusion in the weekly list of summaries. Such advertisements may, in cases of emergency only, be telephoned (City No. 1046) subject to later confirmation by letter.

EAST SUSSEX COUNTY COUNCIL.

RECONSTRUCTION OF MONK BRETTON BRIDGE, RYE.

Wanted, a thoroughly competent Clerk of Works. Preference will be given to one experienced in Reinforced Concrete Construction.

Salary £3 10s. per week.

Applications, accompanied by three references, to reach the undersigned on or before Tuesday, May 19th, 1914.

F. J. WOOD, ASSOC. M. INST. C. E.,
County Surveyor.

County Surveyor's Department,
County Hall, Lewes.

And Municipal and County Engineer.

Vol. XLV.

MAY 22, 1914.

No. 1,166.

Minutes of Proceedings.

The Proposed Motor Speedway to Brighton.

It is well known to most of our readers that a scheme has for some time been in course of preparation for the making of a motor road between London and Brighton, and it is now announced that Parliamentary powers for the construction of this road will be sought next winter, the cost of the enterprise being estimated at £5,000,000 sterling. It may be assumed that the syndicate which is responsible for the scheme will publish, before the winter session, such particulars of the route and nature of the proposed road as will enable the public to form, with the help of technical and financial criticism, a clear idea of the objects and scope of the scheme, and of the extent to which it will depend upon attracting custom, in the form of private and trade vehicles, or, on the other hand, in the form of individual passengers or goods, conveyed by vehicles provided and run by the syndicate itself. The project is one which stands by itself: for, if we assume that as much as £1,000,000 sterling may be spent on accessory works and equipment, the cost of the road would be about £80,000 a mile, and it cannot, or need not therefore be considered in the light of the views which one may hold regarding the usefulness and economic importance of a system of motor roads intended to supplement and relieve the general network of highways. As far as present needs are concerned, a road 25 ft. wide would amply suffice to relieve the existing roads to Brighton of such a proportion of their motor traffic as would have to be withdrawn from them in order that they might have the character of ordinary main roads with a fair share of motor traffic. As regards commercial vehicles, it is to be remembered that many, and perhaps most, of them could not conveniently use a through route, serving only a few of the important towns between London and the coast. Up to some limit of divergence special facilities for clear runs and high speeds would attract commercial and private traffic, but, as regards the former, the financial disadvantage of having to pay for the use of the road would render the limit of economical divergence a somewhat narrow one. On Saturdays, Sundays, and on a few important days at certain holiday seasons, the private motor-car and motor-cycle traffic between Brighton and London is very great, but at other times the total traffic at any point on a main road between Brighton and London consists largely of vehicles which enter or leave the road at some distance from Brighton or London, many of them being

vehicles belonging to residents in the wealthy Surrey suburbs and residential towns, who use these main roads simply as the most convenient local main roads, and often as parts of routes which are on the whole easterly or westerly. To pay 3 per cent on a capital of £5,000,000, the syndicate will have to make £150,000 a year, or nearly £3,000 a mile. To meet this they will have, it is understood, their tolls and, it may be assumed, passengers' fares and charges for transporting goods. In all three cases they have to compete with transport by the railways and by the ordinary roads. The transport of passengers and goods is not so profitable a business on ordinary roads as to leave a large margin for the cost of upkeep, and this cost, the wear and tear of the road, has to be deducted from receipts on all three classes of traffic before anything can be allotted to the payment of interest on capital.

If we put the cost of maintenance at, as a preliminary estimate, £600 a mile, we find that it would take 400 penny-per-mile tolls per day to pay for this alone, and another 2,000 penny-a-mile tolls to pay the 3 per cent interest on the capital, without allowing for management expenses. It is necessary, of course, to consider the possibility that petrol "in bond" might be allowed free of the tax on this road, but there is not much in that—a few pence on the whole run. The saving in the cost of running commercial vehicles would be considerable, owing to the relatively few checks to straightforward running, but it cannot be contended that this would suffice to attract vehicles other than those for which the route would provide the shortest, or nearly the shortest, way—and leave a substantial profit to the syndicate, after deducting the vehicles' share of the cost of maintenance. The great width of the road—150 ft.—would make it somewhat costly to maintain, in proportion to the area of the surface, but, from the present point of view, this consideration has not the full force that it would have in a general comparison, as the extra cost may partly be met out of capital expenditure, in the provision of a very large number of cross culverts, and drainage by elements of width instead of across the whole surface. The data now available do not allow of an engineering criticism of the scheme being made, but, on the bare facts at present furnished, it certainly seems that the significance of engineering features in relation to capital cost, the costs of maintenance, and the nature and volume of the traffic have not been adequately and competently considered.

Institution of Municipal and County Engineers. To anyone acquainted with the history of Salisbury, the beauty of the surrounding country, and the efficiency of the municipal administration, the idea of holding a meeting of the Institution of Municipal and County Engineers there must have appeared wholly attractive. Cathedral cities are popularly supposed to possess certain attributes—not all of them desirable ones—but while the visitor to Salisbury finds himself in an atmosphere of holy calm, he soon discovers that those responsible for the public affairs of the city are by no means asleep. Saturday last was the first occasion on which a meeting of the institution had been held in Salisbury, but this fact did not affect the cordiality with which the members were welcomed by the mayor. After the preliminary proceedings, two papers were read. Mr. W. J. Goodwin, ASSOC.M.INST.C.E., the city engineer and surveyor, dealt with the municipal works of Salisbury, and Mr. John H. Blizard, ASSOC.M.INST.C.E., described the Bemerton and Wilton sewage disposal scheme. The former paper completely reviewed the engineering achievements of the corporation and the work of Mr. Goodwin's own department, but the principal matters dealt with were naturally the water supply and sewage disposal. The whole of the water supply is derived from deep wells in the chalk, and the water is not only of unlimited quantity and exceptional purity, but it is also supplied at the phenomenally low price of 6d. per pound of rateable value. When the city boundary was extended in 1904 three small water undertakings which were at that time giving a supply in portions of the added area were acquired by the corporation. Alterations were soon found to be necessary, and their execution and the subsequent maintenance of the whole of the works in a high state of efficiency reflect the greatest credit upon Mr. Goodwin. The extension of the city boundary also necessitated additions to the sewage disposal works, which were carried out under the supervision of Sir Alexander Binnie & Sons. Mr. Goodwin's paper was a complete justification of his concluding remark that although old cathedral cities are usually considered to move slowly and to be more or less behind the times, Salisbury is so much up to date in municipal matters that the councils, past and present, are to be congratulated upon the progressive spirit they have displayed. The reading of the papers was followed by an interesting discussion and the entertainment of the members at luncheon by the mayor. A round of visits in the afternoon brought a highly successful meeting to a close.

A successful meeting of the Eastern District of the Institution was held on the same day at Ipswich, when Mr. John R. Mead, who was elected sub-district secretary for the counties of Norfolk, Suffolk and Cambridge, gave an interesting description of some works recently executed under his supervision. Perhaps the most interesting part of his address was that which was devoted to a description of the new building which is being erected at a cost (including land) of £7,700 for the accommodation of the medical officer of health, the school clinic and tuberculosis dispensary. As Mr. Mead pointed out, recent statutes have so added to the duties and responsibilities of these officials, that special accommodation has become necessary, and special buildings are being erected in many towns. The building at Ipswich is divided into four separate departments—namely, the medical officer's administration department, the sanitary inspector's department and laboratories, the tuberculosis department, and an infants' department. A separate entrance from the open air is provided for the tuberculosis patients. Mr. Mead also

described the municipal tenement dwellings which are about to be erected, and which are intended particularly for persons who are unable to pay an economic rent; also a proposed extension of the sanatorium to provide accommodation for ninety patients at an estimated cost of £4,500. Finally, he dealt with some aspects of road making and maintenance. The address produced a useful discussion.

New York Water Supply.

That a careful and systematic search for leakage or waste of water in the city of New York would probably have saved an enormous outlay of money, required in order to supply 150 gallons per head to the population, is a matter which must come prominently before engineers in this country. It is difficult to imagine why, if we in London require about 30 gallons a day, the inhabitants of New York should need five times the amount. Where trouble has been taken in other American cities an enormous amount of leakage or waste has been detected. For instance, by the prevention of undue waste the quantity of water pumped daily in West Philadelphia was reduced as reported from 45,000,000-48,000,000 gallons to 32,000,000-35,000,000 gallons in one year, and many similar instances might be quoted. On the other hand, the American engineers seem to expect enormous waste and leakage, and to have deliberately provided for it, for it is urged that the greater pressure will carry water to the upper floors of high buildings, formerly supplied by means of separate pumps, and it is expected that with an unrestricted supply more water will be used at these places.

The discussion following the paper read at the joint meeting of the Society of Engineers and the Institution of Municipal Engineers, being the first meeting in this country at which the water supply works of New York have been discussed, shows the difficulty which English water engineers in this country have in accepting the fact that a supply of 150 gallons per head is really necessary. While the discussion did not deal with matters of detail, enough was said to suggest that when the whole matter receives fuller consideration and discussion there will be many points upon which opinions will be divided. Mr. Sandeman drew attention to the fact that the factor of safety allowed for the Olive Bridge dam was greater than that allowed for the Croton dam, and commended the change. He also expressed an opinion unfavourable to concrete core walls used instead of puddle trenches. The construction of a large concrete conduit as a foundation of earth rolled in 3-in. layers was also regarded as risky.

The subject and the meeting are of very great importance. The meeting is of special interest as showing a distinct effort on the part of two engineering societies, entirely different in character and constitution, to co-operate in a friendly manner for the discussion of a matter of common interest. Such co-operation is to be commended as being likely to lead to better meetings and to lessen the number of meetings held by the many different societies in London: for it generally happens that two or three papers on the same subject are read in one session before different societies, each meeting being poorly attended, when by a combination of forces at one meeting much time and money might be saved. The increase in the number of meetings of various societies and institutions is becoming a tax upon the time of the ordinary member too great to be borne, and the smaller number of persons present at such meetings is very noticeable. It is therefore to be hoped that the practice of holding joint meetings will be more generally adopted when

papers of interest to two or more societies are to be read.

**Proportioning
Concrete.**

There is probably no material of construction more widely used than cement concrete, and having regard to the essential part which it plays in the economy of almost every engineering work of any magnitude, too much trouble cannot be taken in investigating its strength and properties. Attention has frequently been directed to the necessity for using only the most suitable ingredients, and for securing thoroughly efficient mixing if good results are to be obtained. From the point of view of economy it is almost equally necessary to see that the several ingredients are present in their proper proportions. As to what these proportions should be no exact rule can be laid down, but the investigations of Mr. John A. Davenport, ASSOC.M.INST.C.E., and Mr. S. W. Perrott, M.INST.C.E., the results of which were incorporated in a paper entitled, "Sand and Coarse Material and Proportioning Concrete," read by those gentlemen at the last meeting of the Concrete Institute, should prove of great assistance in this direction. The general object to be achieved in mixing concrete is to attain the maximum of strength with the minimum of cost; or, in other words, so to grade the materials that the sand will just fill the voids in the coarse aggregate, and the cement will just fill the voids in the resulting mixture and coat each particle with a thin jointing layer. Of course, greater strengths can be obtained by the use of an excess of cement, but any increase of strength secured in this way is out of proportion to the increase in the cost, and so is only justified in special circumstances. The object of the experiments conducted by the authors of the paper referred to was to test the effect of the proportioning of materials upon the strength and other properties of the resulting concrete. The investigation as originally planned was to have included tests as to compressive strength, modulus of rupture, specific gravity, water resistance, and fire resistance, but circumstances compelled the postponement of the last three, which it is to be hoped may form the subject of a subsequent paper. In concluding their paper, the authors state that they do not feel justified in attempting to generalise from the results of their experiments, as they consider that these results do no more than open up the subject of proportioning and grading in relation to cost. We fully agree that the figures already given by them show that the subject is well worthy of special research, and engineers will await the results of their further work with great interest.

* * *

**Second-hand
Road Stone.**

For some time past the urban district council of Leatherhead has been able to obtain at a reasonable price considerable quantities of second-hand road stone, suitable for making up the roads of the district. The surveyor, Mr. S. R. Drake, went into the matter very closely some years ago, and came to the conclusion that the council were saving money by using this material, and the roads on which it was used three years ago are now in a satisfactory state. To some persons it may seem, at first sight, that it would be desirable to use for the roads of a district such as Leatherhead only the best stone of a particular class. Supposing, however, that the second-hand stone of one class has precisely the qualities of the best stone in another class, but costs less, it would obviously be economy to use the second-hand stone. In actual fact, partly worn granite, though it may be somewhat rounded and reduced to a small average size, may be of such a nature that, with moderate expenditure on steam rolling,

it will provide very fair road crusts suitable for roads with considerable traffic or, generally, more lasting crusts than can be made at the same cost with other materials. It is precisely in a district such as that of Leatherhead that one would expect to find the use of second-hand granite an economical advantage, especially if the material has been removed from roads where wood paving was in progress, before the stone was approaching the end of its ordinary life. In the neighbourhood of London, second-hand granite is probably cheaper than it is anywhere else in proportion to the cost of new stuff, and possibly it is as cheap as it is anywhere in proportion to the cost of the best stone of those not reckoned in the first class—in this case probably Kentish rag. The smaller and tougher material can be rolled to a good shape more cheaply than can the larger stone, and if incipient decay of the stone has rendered it somewhat less strong than the new material the resulting tendency to rapid binding may be of some advantage on roads with light traffic.

* * *

**Private Street
Works Loans.**

On Monday in the House of Commons Mr. Keir Hardie asked the President of the Local Government Board whether, in view of the continued diminution in the number of dwellings available for the working classes in urban areas, and in order to encourage local authorities to meet the demands for such dwellings, he could see his way to grant an extension of the time allowed for the repayment of loans taken up by local authorities to meet the cost of making and paving private streets from seven years to twenty years. The question is one which undoubtedly raises an important point. The President of the Local Government Board in his reply did not admit the hypothesis upon which it was based, but at the same time his attitude was distinctly sympathetic. At the present time the usual period allowed for the repayment of loans by local authorities in respect of street works executed by them in connection with housing schemes is twenty years. Mr. Samuel pointed out that where the cost of making up the streets has to be repaid by the frontagers a period of seven years has hitherto been usually allowed. But he promised that in future, if in any case it could be shown that a longer period was desirable on account of the financial position of the frontagers, or for other reasons, and that the local authority was willing to allow the frontagers a longer period, the board would be prepared to consider an extension of the time for repayment of the loan. There would appear to be little objection to this, inasmuch as local authorities have power under section 257 of the Public Health Act, 1875, to declare that the period for repayment by frontagers shall extend to thirty years.

**Proposed
Exchequer Grants
for Road
Maintenance.**

By an unfortunate slip, in the first column of the opening page of our issue of last week, we referred to the sum which the Chancellor of the Exchequer proposes to allot to the maintenance of roads as being nearly £4,500,000. As most of our readers will have realised, this should have been "nearly £2,500,000," the exact sum mentioned in the Budget speech being £2,480,000. The sense of the passage is not affected, as this sum is a very substantial proportion of the cost of main road maintenance: the main roads maintained by or at the cost of county councils, in urban and rural areas, costing at the present time not much more than £3,000,000, allowing for increases on the figures in the last local taxation returns.

Some Notes on the Municipal Works of Salisbury.*

By W. J. GOODWIN, ASSOC. M. INST. C. E., City Engineer and Surveyor.

As this is the first occasion on which a meeting of the institution has been held in Salisbury, the author proposes briefly to outline generally the municipal works of the city rather than to deal in detail with any particular feature. As a matter of comparative practice, the information may be found interesting and, possibly, in some respects useful.

HISTORY AND STATISTICS.

It is not usually known outside the city that the official name is not "Salisbury," but "New Sarum." Old Sarum lies to the north, less than $\frac{1}{4}$ mile outside the present city boundary. It was once an important and flourishing Wessex stronghold dating back to the remote days of the Celt and Belgae, the earliest inhabitants of Britain of whom we have any authentic record. The site is now being excavated by the Society of Antiquaries.

The present city dates from 1220, when the foundation stones of the famous cathedral were laid. The cathedral is too well known throughout the world to require any description here. A Royal Charter was granted in 1228 by King Henry III., whereby the city and borough of New Sarum (then known as Saresbury) was constituted a city for ever.

In the very early days, surrounded as it was by the large plain with immense flocks of sheep, the city became an important centre of the export wool trade. A large proportion of the inhabitants were weavers, fullers, and others engaged in the making of cloth. This industry, however, died away with the introduction of machinery, when it was more economically carried on further north in the region of the coalfields. The splendid merchants' residences, erected several centuries ago, are a feature of the city. They were originally surrounded by immense gardens and orchards, but most of the ground was afterwards sold for building purposes, and now present the curious sight of a fine old house next a number of cottages.

The boundary has only once been extended since the Municipal Act of 1835, and this was in 1904. The area of the city prior to its extension was 600 acres, and the population, according to the census of 1901, was 17,117, the rateable value being £79,424. The present area is 1,710 acres, the population at the last census was 21,217, and the rateable value is £115,962. The average death-rate for the past five years was 10.8.

WATER SUPPLY.

The whole of the water supply is derived from deep wells in the chalk. It is of unlimited quantity, and of exceptional purity. The old city area is supplied from the corporation waterworks (which are under the author's control), and the greater part of the area added in 1904; but a small portion of the added area, shown hatched in Fig. 1, is still supplied by a private company under Parliamentary powers. The quality of the water is the same, the only difference between the two supplies being that three times as much is charged by the private company, and the residents in that area consider that they have a distinct grievance.

The original plant of the corporation was laid down in 1855, and consisted of a well, 82 ft. deep by 8 ft. in diameter, with about 50 ft. of heading and 50 ft. of 9-in. borehole, two compound condensing beam engines, two Cornish boilers, 20 ft. by 6 ft diameter, and the pumps, which were gear-driven. A brick-in-cement covered-in reservoir, shown in Fig. 4, was constructed about $\frac{1}{4}$ mile from the pumping station holding 295,000 gallons, with 12-in. rising and distributing mains. The estimated cost of these works was £12,000.

The whole of this plant is still in use except that a new set of cylinders has been fixed to one engine; the original pumps were replaced in 1905 by a pair of single-acting pumps 2 ft. 9 in. stroke by 14 in. diameter delivering 750 gallons per minute; a surface condenser took the place of the original jet condenser, and one boiler has been renewed so as to provide a duplicate for the new pumping plant (described in the next paragraph), which is worked at higher pressure. These engines work with a steam pressure of 40 lb. per square inch.

In 1894 the entire pumping plant was duplicated at a cost of £5,200 by the provision of a new engine-room, &c.: an additional well of the same depth and diameter as the old one, with about 60 ft. of 15-in. borehole, and a tunnel was driven at the bottom to connect the two wells. A Lancashire boiler was provided, and a compound surface-condensing beam engine erected, with bucket and plunger pump in the well worked by the continuation of the low-pressure piston rod. The low-pressure cylinder is 23-in. diameter by 48-in. stroke, and the high-pressure cylinder 16-in. diameter by 32-in. stroke. The flywheel is 14 ft. in diameter, and weighs 5 tons. The engine works at 100 lb. per square inch pressure, and is 75 indicated horse power.

The double-acting pump of the bucket and plunger type is 18 $\frac{1}{2}$ -in. diameter by 48-in. stroke, the plunger 13-in. diameter. A cast-iron air vessel in the well on the rising main is 12-ft. by 3-ft. diameter, and another, outside the pumping station, is 10-ft. by 3-ft. 3-in. diameter. The capacity of the pump is 70,000 gallons per hour, although it is usually run so as to deliver 1,000 gallons per minute. The whole of the plant, therefore, consists of two wells, three engines and three boilers. The larger pump, just described, is the one ordinarily used, those in the old engine-room being reserved as a stand-by plant. The pump is usually worked for twelve to fourteen hours a day, the afternoon run being arranged so that pumping is stopped about midnight with a full reservoir. The total lift, taking the mean-water level in the well, is 141 ft. The level of the water in the reservoir is electrically indicated at the pumping station.

A 5-ton travelling crane spans the engine-house, commanding every part of the machinery.

Fig. 3 shows that extraordinary pumping, on account of drought, has practically no effect upon the level of the water in the well. During the months of April to September inclusive, in 1911, there were two periods of "absolute drought," and the total rainfall for these months was 6.27 in., according to the corporation rain gauge, whereas the average for the past half-century has been 13.8 in.; yet it will be noticed that after the long days of pumping, the depth of water in the wells was little reduced below the normal, and that during the short period of rest at night, about four hours, the water rose to its usual level. The connecting broken lines for November and December are where the stand-by plant was in use while the large pumps, &c., were being overhauled ready for the summer run. As the rate of pumping is less, the water level does not fall so far, and, for the sake of comparison, the actual recorded level is omitted.

When the city boundary was extended in 1904, in addition to the private company previously referred to, there were three small water undertakings which were at once bought by the council. The mains of one were immediately connected to the city supply and the wells of the other two were used for a few years, but both are now discarded, the whole of the corporation supply being derived from the wells at the chief pumping station. The old reservoirs, however, are still in use, as they supply higher levels than can be reached from the main service reservoir.

The Haruham high level reservoir is on the south side of the river Avon (see Fig. 1), and is supplied from the old pumping station belonging to this undertaking, the water being taken direct to the pump from the city mains and forced to the reservoir, which is 128 ft. above the engine-room floor. Power is derived from a gas engine, with an oil engine as a stand-by. A horizontal three-throw ram pump is now being built by Messrs. Tangyes, Limited, capable of lifting 10,000 gallons an hour against 300 ft. head, and will be fixed in time for the summer demand. This has been necessitated by the growth of that part of the city since it was included.

The Milford reservoir is close to the main service reservoir, and used to be supplied from a separate well, the pumps being driven by an ancient gas engine. When the water tower was erected near, and the rising main extended to supply it, the author took the opportunity of laying a branch main to the reservoir, as shown on Fig. 4, and dispensing with the separate pumping station.

* Paper read at the meeting of the Institution of Municipal and County Engineers at Salisbury last Saturday.

A water tower, shown in Fig. 4, was erected five years ago to supply part of the added area known as Bishops Down. The land is the property of the Ecclesiastical Commissioners, and by agreement they erected the tower and tank, the corporation extending

covered iron tank holding 5,000 gallons. The tank is built of Mather & Platt's cast-iron standard plates. The engineers for the work, on behalf of the commissioners, were Messrs. Lemon & Blizard; the author acting for the corporation.

FIG. 1.—PLAN OF THE CITY OF SALISBURY.

the rising main and laying the necessary distributing mains. The entire responsibility for the upkeep of the structure will shortly devolve upon the corporation. The tower is built of brick in cement, with a

As the engines were called upon to lift the water an additional height of 56 ft., a 9-in. rising main was laid so as to reduce the friction head to a minimum, and a 4-in. by-pass, with indicating and locking

valve, shown in Fig. 4, was provided. This valve is set so that only half of the water pumped is sent on to the tower when the main valve A is closed, thus avoiding unnecessary strain upon the engines. The tank now fills in ten minutes. It will be seen from Fig. 4 that a short length of main connects the tower supply with the distributing main from the Milford reservoir, so that by opening the valve B and closing the outlet valve from the reservoir, a much higher pressure can be obtained in case of fire.

The capacities and levels of the reservoirs are as follows:—

	Depth.	Capacity.	Top water level.
			Feet above O.D.
Main service reservoir	12 ft.	295,000 galls.	291.57
Milford reservoir ...	11 ft.	15,000 galls.	300.30
Harnham reservoir ...	9 ft.	47,100 galls.	355.11
Water tank on tower	6 ft.	5,000 galls.	347.25
Total		362,100 galls.	

The 12-in. rising and 12-in. distributing mains are connected outside the pumping station, so that the main service reservoir really acts as a balancing reservoir, except when the tank and Milford reservoir are being filled. The valve at the pumping station between the two mains is then closed.

Four years ago the corporation laid mains in the district supplied by the private company for three reasons: (1) To supply water for the sewer flushing wells, (2) to provide a more adequate supply in case of fire, and (3) for street watering. The hydrant plates on the company's supply are painted a distinctive colour. The saving of the amount paid to the company for water for sewer flushing meets the sinking fund and interest on the loan.

The charge for water for domestic purposes is the very low one of 6d. in the £ nett rateable value. Water by meter is supplied at 8d. per 1,000 gallons, with a sliding scale reducing to 3½d. per 1,000 gallons. The London and South-Western Railway are large consumers, taking equal to 6.3 gallons per head per day, the present price being 3d. per 1,000 gallons. No additional charge is made for baths or water-closets, and the garden charges range from 5s. for between 10 and 20 rods, to 15s. for 2 rods. These include use of hose, which must be held in the hand. Gardens under 10 rods are free, unless a hose is used, when 3s. is charged.

Baths have been provided to practically all new houses, however small, for many years past, and the number of houses in the city without water-closets can be counted on the fingers of one hand. Considering this, and that the legitimate use of water is in no way restricted, the average of 26 gallons per head per day throughout the year for domestic purposes cannot be considered excessive.

The total quantity pumped per head per day is about 41 gallons. Water used for sewer flushing, street watering and other municipal purposes is charged to the several committees at 1½d. per 1,000 gallons, to cover the cost.

A chemical and bacteriological analysis is made each quarter, taken from different parts of the city, at a house tap as far from the reservoir as possible, except once a year it is taken at the outlet of the reservoir itself. An average analysis is as follows:—

CHEMICAL ANALYSIS.		
Results expressed in grains per gallon.		
Saline ammonia	none
Albuminoid ammonia0070
Nitrogen as nitrate44
Nitrites	absent
Oxygen absorbed in 4 hours at 80 deg. Fahr.004
Chlorine as chloride	1.3
Total dissolved solids	24.0
Earthy carbonates	15.0
Earthy salts, not carbonates	2.0
Hardness	18.0
Poisonous metals	absent
Sediment	none
BACTERIOLOGICAL ANALYSIS.		
Colonies on gelatine plate at 22 Cent.	5 per c.c.
" " " (liquefying)	2 per c.c.
" " " on agar plate at 37 Cent.	0 per c.c.
Bacillus coli	absent
B. enteritidis sporogenes	absent
Streptococci	absent

SEWERAGE.

Until about 1849 there was no system of sewerage in the city, the drainage finding its way into the

rivers direct or by means of channels which ran along the sides of many of the streets. During the next five years £27,000 was spent on laying sewers, the engineers being Messrs. Rammell & Lister. Previously the water rose to the surface, and these sewers had the effect of lowering the level by 3 ft. 6 in., the sewer joints being left open for the purpose. When the city boundary was extended in 1904, Sir Alexander Binnie & Sons were engaged, and practically a new sewerage scheme, on the separate system, was adopted. In some of the side streets the old sewers were relaid or rejointed and made watertight, but all the principal sewers are new, receiving the drainage from those laid, at the same time, in the added areas. Where new sewers were laid, the old ones were converted into surface water sewers. The original 4-ft. 6-in. by 3-ft. brick outfall sewer, which has open joints, is still in use as the surface water outfall sewer; the newer 4-ft. by 2-ft. 9-in. concrete outfall sewer also being retained for sewage.

The sewage from two low parts of the city is raised by means of Shone's ejectors. Those in the Close (No. 1 on Fig. 1) have a capacity of 50 gallons, the ejectors being in duplicate. They are in a cast-iron shaft 9 ft. in diameter. The other ejectors (No. 2 on Fig. 1) lift the sewage from the south side of the river across Harnham Bridge. Again, they are in duplicate, each of 100 gallons capacity, housed in a cast-iron shaft 12 ft. 8 in. diameter, access being obtained from the footpath by a side entrance constructed of reinforced concrete. Compressed air is conveyed by a 2½-in. air main from the air compressors at the sewage disposal works.

SEWER FLUSHING.

The greater part of the city lies on ground which is almost level, and sewer flushing has had to be adopted to a considerable extent. There are twenty-four flushing chambers, with automatic syphons, of which twenty were constructed under the scheme of Sir Alexander Binnie & Sons, and are shown in Fig. 5. The capacities are from 250 to 1,500 gallons, and during most of the year are set to discharge about 1½ times each twenty-four hours. The old sewers in the city are flushed from vans during dry weather.

SEWER VENTILATION.

The sewers of the city are unusually well provided with 6-in. diameter wrought-iron vent shafts, 30 ft. high, which answer well and give rise to no complaint. As previously intimated, the separate system was put into operation when the boundary of the city was extended, and this had a curious result which it was difficult to foresee.

When the author took up duties, he found a great deal of complaint had been made of smell in the neighbourhood of the sewage disposal works. The works themselves (being all that could be seen) were blamed, and a petition was then being signed to send to the Local Government Board asking that they should be removed. The author tried to prevent this being forwarded until it was seen what could be done, but it had gone too far to be dropped. As a result of anemometer and meteorological observations, involving a good deal of night as well as day work by the author and his staff, it was quickly concluded that the works were not to blame, but the cause of the trouble was that the sewage in the outfall sewer was now so much more concentrated through the exclusion of subsoil water. This sewer is not too large in time of storm (when it assists the old brick culvert which is alongside and connected by overflows), but the reduced amount of the dry-weather flow occupied such a comparatively small space that the air in the sewer became polluted, and changes of temperature, in either direction (usually occurring about sunset), resulted in air movement, it being discharged out of the vent shafts. It was found possible to anticipate complaints according to the uniformity or otherwise of the temperature in the sewer during the preceding few hours. The gradient of the outfall sewer being 1 in 1,760, the sewage travels slowly, and is already somewhat stale, having been some hours in flowing from the other ends of the city.

The whole of the ventilating shafts on this length were disconnected, at first temporarily, which resulted in immediate cessation of complaints. They were then cut off permanently. The outlet end of the sewer was connected to the outer cavity of the refuse destructor chimney, with suitable flap valves to prevent the ingress of air at that end of the sewer. The influence of the chimney is noticeable nearly ¼ mile away. Two Webb's ventilating shaft lamps were erected, and these are alight day and night. Three

automatic flushing wells, about 250 gallons each, were constructed to assist the flow in old flat sewers near the affected area, and at week ends, during dry weather, these are set to discharge as frequently as possible—about every half hour. Aluminium flap valves were fixed at the outlets of the branch sewers,

water pipes to be connected direct to the sewers, and in view of the very dilute condition of the sewage at that time, there could be little objection. As it was difficult at times to get results through so much smoke being lost and varying wind conditions, the author intended, after this list of defects had been remedied,

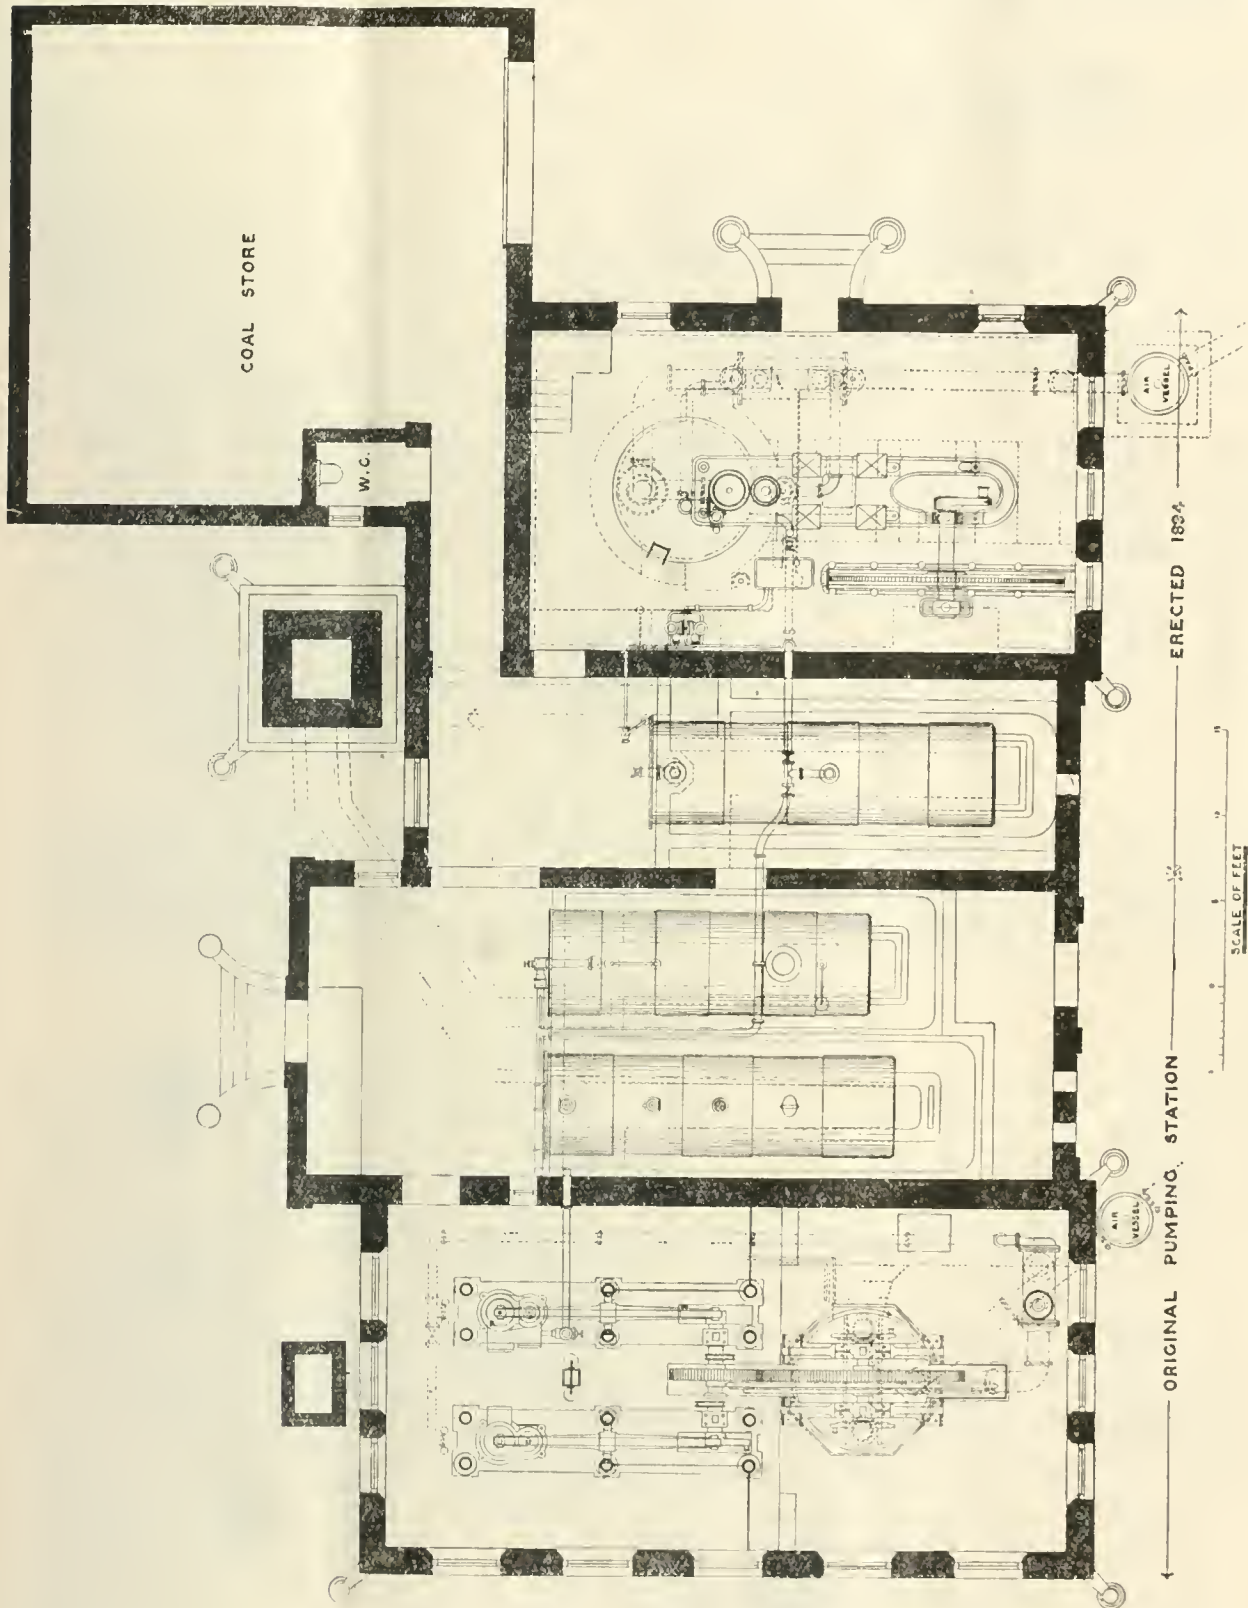

FIG. 2.—PLAN OF CHIEF PUMPING STATION, SALISBURY WATERWORKS.

so as to discourage air movement from the main out-fall sewer.

It was known that a number of rain-water pipes in the district were connected direct to the sewers without an intercepter. A large smoke-testing machine was purchased, and the sewers were put under smoke test in lengths between manholes, with the result that sixty defects were discovered. Nineteen cases were faulty drains, and the owners were called upon to put them in order; the remaining forty-one were untrapped rain-water pipes, and were remedied at the cost of the corporation with the consent of the owners. It must be noted that the building by-laws at that time (which were superseded in 1905) allowed rain-

to test again during the following spring of 1912, but the result of the work done has been so satisfactory that the testing has not been repeated.

HOUSE REFUSE: COLLECTION AND DISPOSAL.

There are only about a dozen ashpits in the city in connection with hotels, schools, &c. These are cleared periodically. The ashbins number 5,214. Rather more than half are emptied twice a week, and the remainder once a week. Those in the old city are emptied by the corporation employees; the added area is still dealt with by a contractor, the refuse being collected once a week. The cost is 9d. per head per annum.

The whole of the refuse is burnt in a two-cell Horsfall destructor, which is fed from the rear; the capacity is 140 tons a week, the quantity burnt being 100 tons per week. The destructor was erected in 1901, and is in connection with the sewage disposal works, the heat being utilised for raising steam to 125 lb. per square inch in a pair of Babcock and Willcox's

SEWAGE DISPOSAL.

Parts of the sewage disposal works date back to the year 1885, when the method adopted was lime precipitation, and the sludge was pressed. There were eight tanks, and these have since been modified except two which have been filled up. In 1901 four of the tanks were converted into two

FIG. 3.—DIAGRAM SHOWING WATER LEVELS IN WELL, &C.

boilers, which can also be coal fired. An economiser of the usual type was fixed in the flue between the furnaces and the dust catcher, but, apparently through the moist gases from garden refuse, &c. (of which a considerable quantity is sent, most houses having gardens) attacking the lower ends of the tubes, they

septic tanks, the walls being raised 9 ft., and a pumping plant was laid down at the same time along with the refuse destructor. The pumps are double acting, the pump rod being the continuation of the piston rod of a pair of Worthington triple-expansion jet-condensing engines. The pumps are capable of lifting

FIG. 4.—PLAN OF RESERVOIRS, &C.

had to be renewed in October, 1907. In June, 1910, the second set of tubes had wasted so much, at the same height, as to be condemned by the insurance company, and the author advised the council not to renew, but to remove the economiser, as the cost of upkeep was more than the saving of fuel. This was done, and a feed-water heater fixed on the exhaust pipe from the air-compressing engines, which raises the heat of the supply up to between 170 and 180 degrees without cost, and its upkeep is nil.

from 2,000,000 to 4,500,000 gallons per day about 14 ft., the necessary height for the sewage to gravitate through the tanks and beds to the outfall. At that time, the subsoil water being purposely admitted to the sewers, the "dry-weather" flow was 2,000,000 gallons per day.

The septic tanks are open, 80 ft. by 55 ft., and 17 ft. deep. Two of the primary filters, marked A and B on Fig. 6, were Stoddart's distributors, and three, marked C, D and E, were Adams' revolving sprinklers,
