MR. GLYN-JONES' OPEN LETTER to the members of the Pharmaceutical Society (see *ante*, p. 445), advocating the candidature of Messrs. Cooper, Gibbons, Taylor, and Wootton, has been supplemented by a circular with the same object in view, signed by numerous members of the Society and sent to all the voters. But, as a natural result of Mr. Glyn-Jones' action, another circular—also signed by many members of the Society—has been sent out, advocating the return of the seven retiring members. In that circular, it is suggested that concerted action should be taken by those electors who are in favour of re-electing the retiring members of Council, "who have shown sincere regard for the well-being of the Society, and whose experience should not now be lost." The signatories express the belief that no good object or unity of purpose would be gained by displacing those individuals in favour of others holding divergent opinions, who do not appear to possess any special qualifications, and some of whom, by apparently accepting nomination at the hands of a small section or caucus, would, it is feared, not have the independent position and impartial judgment that is desirable. In conclusion, it is stated that "there is also reason to believe that some of the proposed new members may be prevailed upon to favour a policy of allowing limited companies of unqualified men to legally dispense and deal in poisons, provided some one or more of the directors be qualified." That, it is thought, would be a fatal mistake, and strike at the root of the principle of the Pharmacy Act, 1868.

MR. GIFFORD'S ELECTION COMMITTEE—one member of which, by the way, is not a member of the Pharmaceutical Society, and therefore not justified in interfering in the election—has taken offence at the circular referred to (see p. 502) apparently assuming that retiring members of Council are responsible for it and that none but new candidates are entitled to have their candidature advocated by groups of voters. The letter of Mr. Hills (page 502) suffices to show the inaccuracy of the first assumption, so far as he is concerned, and we have no hesitation in stating that his disclaimer might well have been signed by his six colleagues. With regard to the other point, it only requires to be clearly stated to be at once scouted as absurd. As for the alleged "recantation," it seems pertinent to ask if "electioneering strategy, which is not always above suspicion," is absolutely unknown to Mr. Gifford's committee. How about the postcards sent out by that committee, stating that it is "imperative that every local member should plump in favour of Mr. Gifford," and what of the unauthorised use of a colourable imitation of the Pharmaceutical Society's arms on an electioneering circular issued by the committee? A much neater but yet too ingenious piece of strategy is Mr. Pickering's disinterested advice to the voters (see p. 503) to abstain from voting for the seven candidates who are seeking re-election, as their return "is practically assured," and to vote instead for seven of the new candidates. But, the question may be asked, if the return of the first-mentioned seven is practically assured, why trouble about the rest? "And answer came there none."

MR. ALEXANDER LAING comes forward to amuse our readers, once more, after a somewhat prolonged silence (see p. 504). How he proposes to "disinherit the chaos" we know not, but any attempt of his to do so will assuredly prove interesting reading—ininitely more so than much of the "accumulated rubbish" for which the Journal has of late been a "dumping ground." Mr. Laing

as is well known, is a poet, and even in his prose contributions he seems disposed to claim a poet's licence. In language as picturesque as it is vigorous he falls upon Mr. Glyn-Jones and smites him hip and thigh; he also suggests why it might be a mistaken kindness to elect Mr. Gifford on the Council, and expresses the opinion that the administration of a little Currie will greatly improve the quality of that body, probably on the principle that a little Currie goes a long way. It may be doubted, however, whether anything the poet-pharmacist says can now seriously affect the result of the election, so he had better set himself to remove the wire entanglements and barbed fences he speaks of, initiate the frontal attack, and carry out the rest of the complicated technical manœuvres he refers to. If then the Lord Chancellor and the President of the Board of Trade persist in their attack on the pharmaceutical position, Mr. Laing must even drop into poetry; the result can then hardly fail to prove fatal to some one or something, if only it be to Clause 2 of the Companies Bill.

SQUIRE'S 'LONDON HOSPITALS,' or, to quote also the fuller title of the book, 'The Pharmacopœias of Thirty of the London Hospitals,' has just appeared in its seventh edition. The idea of the book is to present to the general practitioner a collection of formulas used in the hospitals in a tabulated form for comparison, so that he may see at a glance the manner in which the medicines are prescribed at the different London hospitals, and the doses given. So far as pharmacists are concerned, the book is chiefly interesting as supplying the different formulas of all the leading hospitals in a convenient form for reference when prescriptions are received in which any of those formulas are quoted. The new edition contains seventy pages more than its immediate predecessor, and advantage has been taken of the opportunity afforded by re-publication to bring the contents up to date and, more especially, into accord with the new British Pharmacopœia. In the preface to the first edition the late Peter Squire suggested that the different hospital authorities should consider the desirability of modifying many of their formulas so as to assimilate them to those of like nature in the British Pharmacopœia, and thus simplify and reduce the number of compound drugs. Though that suggestion has not been acted upon to any considerable extent, the compilation has done much to minimise the trouble caused by existing differences, and Mr. P. W. Squire, the present editor, is to be congratulated on the fact that so many as seven editions have been required within the space of twenty-seven years.

LONDON UNIVERSITY has now entered into possession of its new premises at the Imperial Institute, and presentation day was celebrated there on May 9, the Prince of Wales being present on the occasion, together with many other distinguished persons. Lord Kimberley, the Chancellor of the University, made the presentations, and afterwards referred to the fact that the University is now about to enter on a new career, becoming a teaching, as well as an examining, body. Sir Michael Foster also addressed the new graduates, and told them how much better off they were than he was when he took his degree. In those days the University was a homeless wanderer. He was examined in different places—more than once at a restaurant, and once certainly in a building which he took for a public-house, because it bore the title of the Thatched Tavern. It seemed to him that practically he was examined in the street, and his degree was conferred by post. How different was the lot of the graduates of to-day! They had been examined in luxury, and they received their honours in a magnificent building, and in the presence of the Prince of Wales. In conclusion, Sir Michael said the University was not merely a London, or even a national, institution. It was imperial—a character which would grow under the new organisation, and in the new home.

ENGLISH NEWS.

WOLVERHAMPTON AND DISTRICT CHEMISTS' ASSOCIATION.—At a meeting, held on Monday, May 7, to consider the views of the candidates for the coming Pharmaceutical Council Election, and to decide whom to vote for, the President (Mr. F. J. Gibson) in the chair, the Hon. Sec. (Mr. J. H. Coleman) stated he had written to each candidate the following questions:—1. Do you agree and heartily support qualified proprietorship? 2. Do you oppose conceding anything to limited companies, either qualified managers or directors? 3. Would you aid in abolishing the Widow's Clause, only allowing a few months to settle up? 4. Do you oppose branches, and so show that ours is a personal business? He said he had received replies from all the candidates, and read a condensed report of their answers. After an interesting discussion, during which several of the letters were read in full, it was proposed: "That this meeting suggest that the members of the Wolverhampton and District Chemists' Association do all in their power to support and secure the election of all the retiring members." This was seconded, and an amendment was proposed that the names of Messrs. Taylor and Gifford be substituted for Messrs. Symes and Storrar, owing to their views on question 4. This was seconded, but, upon being put to the meeting, was lost, and the original resolution was carried, two only voting against it.

ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held yesterday afternoon, May 7, the Duke of Northumberland, K.G., President, in the chair. The following were elected members:—Mrs. E. S. Beale, Mr. E. Callard, Mr. E. J. Duveen, Mr. E. Pearson, Lord Russell of Killowen, and Mr. J. A. Thierry. The special thanks of the members were returned to Professor F. Clowes for his donation of £20 to the Fund for the Promotion of Experimental Research at Low Temperatures. The Chairman announced that he had nominated the following Vice-Presidents for the ensuing year:—Sir F. Bramwell, Right Hon. Lord Lister, Dr. Ludwig Mond, Sir A. Noble, Mr. A. Siemens, the Hon. Sir J. Stirling, Sir J. Crichton Browne and Sir W. Crookes.

THE PHARMACEUTICAL STUDENTS OF BIRMINGHAM have addressed a letter to the local papers pointing out that at present a great grievance exists among them concerning "the poor provisions they have for the purpose of studying for their examinations, there being no recognised pharmacy classes in the town." The letter states that "the students of the Chemists' and Druggists' Chemistry Class, held at the Birmingham Technical School, have, however, attempted to remedy this by presenting a memorial to the School Committee asking for classes to meet the requirements of their examinations. We regret to say, however, that the School Committee, while deeply sympathising with us, say they cannot at present see their way clear to start the new classes as required. We wish to express through your paper our sincere thanks for the hearty support the local chemists and druggists have given to our memorial. On behalf of the Chemistry Class, Chas. F. Spruce, 12, Temple Row." It appears that for some years there has been a class on Wednesday afternoons at the Technical School for the benefit of pharmaceutical students, but the subjects have been limited to chemistry and botany. Now some of the students desire the Council to establish pharmacy classes and lectures in materia medica, and they have approached "the powers" with that object in view, and the letter referred to explains as far as they are able to go, the chief difficulty being expense. Whether it is desirable that those subjects should be taught at such places is an interesting one.

INLAND REVENUE PROSECUTION.—At Lambeth Police Court on Monday, May 7, George Baldwin, herbalist, of Rye Lane, Peckham, was summoned for selling medicine liable to stamp duty without it being so stamped.—Evidence was given of the purchase at the

defendant's shop of a bottle of mixture which was advertised by a card exhibited in the shop window. The bottle in which the article was supplied was unstamped.—In reply to a question by Mr. Hopkins (magistrate), the defendant stated that the mixture was not claimed as a proprietary preparation. It had been on the market for years. The label on the bottle was submitted with many others to the authorities at Somerset House some years ago, and they were satisfied that a stamp was not required.—Mr. Hopkins said that defendant had evidently acted *bonâ fide* in the matter, therefore a nominal penalty of 20s. and costs only would be imposed.

BRISTOL PHARMACEUTICAL ASSOCIATION.—At a meeting of members, held at University College on May 9, Mr. G. T. Turner, President, in the chair, it was unanimously resolved to recommend the members of the Association to vote for the following candidates at the approaching Election of Council of the Pharmaceutical Society:—Messrs. Campkin, Gifford, Grose, Gostling, Hills, Taylor.

SALE OF CAMPHORATED OIL.—John Huson, Chumleigh Street, Camberwell, S.E., was charged at Lambeth Police Court on Thursday, May 3, with selling camphorated oil which was not of the nature, substance, and quality demanded. It appeared that the Camberwell Vestry, being anxious to get at wholesale dealers, obtained the assistance of an oilman, who ordered a quantity of small bottles of camphorated oil; by arrangement an inspector was at the shop when the bottles were delivered, and secured a sample. An analysis showed it to be deficient in camphor to the extent of 73 per cent. and to contain 94.2 per cent. of mineral oil. The bottles of oil were supplied on a card bearing the words, "Campholeum—formerly known to the public as camphorated oil."—The defendant, who, it was stated, was an agent only, was fined £10 and costs.—George Baldwin, herbalist, Rye Lane, Peckham, S.E., was also fined £10 and costs for selling camphorated oil which was not in accordance with the B.P.—William A. Sargood, grocer, Bird-in-Bush Road, Peckham, and Ralph C. Wright, trading as Wright Brothers, Maxted Road, East Dulwich, were each fined 40s. and costs for similar offences.

POISONING BY HYDROCHLORIC ACID.—An inquiry was held at Birmingham on Friday, May 4, concerning the death of Albert Ricardo (2), son of Moses Ricardo, 21, Florence Street. The evidence showed that on Tuesday, May 1, the child obtained possession of a bottle containing hydrochloric acid, which had been left on the premises by some workmen; he drank some of the contents and died. A verdict of "accidental death" was returned.

SALE OF TINCTURE OF OPIUM.—On Friday, May 4, at the Nottingham Summons Court, William Gil, chemist and druggist, Nottingham, was summoned for selling tincture of opium that was alleged to be deficient in proof spirit.—Mr. Glyn-Jones was present on behalf of the Chemists' Defence Association.—Evidence as to purchase having been given, the city analyst, Mr. S. R. Trotman, stated that in the sample examined there was an absence of 41 per cent. of proof spirit.—In reply to Mr. Barlow, for the defence, he admitted that in making his analysis he used the B.P., 1885, as a standard; he also stated that he was aware that the words "proof spirit" had been abandoned in the B.P., 1898. He always used the term "proof spirit," but admitted that it was a mistake.—Mr. Barlow then submitted that the summons was bad, and ought to be dismissed; but Mr. Day, for the prosecution, contended that there is nothing in the Act to say that the public analyst shall use any particular standard for making his calculations, and that he can use what terms he likes in his certificate. Mr. Day admitted that there was no reason why the analyst should not have used the B.P., 1898, as the standard.—The Bench dismissed the case, but refused to allow defendant's costs.

IRISH NEWS.

DEATH OF AN IRISH DRUGGIST.—The death took place last week of a well-known Irish druggist, Mr. Henry Lyons, M.P.S.I. of Omagh, Co. Tyrone, whose pharmacy was one of the leading establishments in that town. The sad event occasioned widespread sorrow, as deceased, who was a most upright man, was held in the highest esteem by all who knew him. His business career was a most successful one, the result of indefatigable perseverance and constant personal supervision.

PHARMACY ACT CASE.—On Monday, May 7, in the Belfast Sessions Court, a summons issued at the instance of the Pharmaceutical Society of Ireland against Mr. W. J. Gibson, Sandy Row, was heard. The complaint was that the defendant kept open shop for the purpose of retailing medical prescriptions, he not being qualified by law to do so. There were two other summonses under the Act arising out of the same case. After evidence was given, the Bench inflicted a penalty of £5 and costs on the first summons. The other two were withdrawn by consent.

FOREIGN NEWS.

THE GERMAN GOVERNMENT has brought in Parliament a Bill to provide measures against perilous diseases, by which it is proposed to establish a new division of the Imperial Sanitary Board—viz., a "Reichs-Gesundheitsrath." This institution, similar to our Local Government Board and the French Comité Consultatif d'Hygiène, is intended for regulating the execution of the sanitary laws in a uniform manner in the federated States. It will be entitled to send representatives for local research, and will be composed of prominent savants of all hygienic and technical branches and of officers of the Administration. The new Board will also take upon itself the duties of the now existing Pharmacopœia Committee, and of the special committees for cholera, bubonic plague, etc.

IN PRUSSIA medical affairs have hitherto been in charge of the so-called "Cultusministerium" (Ministry of Public Worship, Public Instruction, and Medical Affairs). It is now reported that the Government intends to transfer the medical division to the home Ministry (Ministerium des Innern).

THE PRICES OF GLASS-WARES, pasteboard goods, and dressings having been raised by manufacturers, the Berlin Apotheker-Verein has resolved to arrange with certain makers for reduced prices. The members of the Verein will undertake to buy only from such firms as have made arrangements with the special committee appointed for that purpose.

THE PRUSSIAN COMMERCIAL BOARDS have agreed to appoint no chemists in their service unless they have passed examination as food chemists. For special service only such chemists will be employed who have passed the leaving examination on a "Gymnasium" or "Realgymnasium," the University, and a two years' practice.

DR. HEINRICH SALZMANN, hitherto editor of the *Apotheker-Zeitung*, the official organ of the German Apotheker-Verein, has resigned that position in consequence of having received the grant of a concession for establishing a new Apotheke at Wilmersdorf, a suburb of Berlin. He is succeeded by Mr. L. Zumbroich, hitherto owner of an Apotheke at Zell, on the Mosel. The resignation of Dr. Salzmann, who has much contributed to raise the *Apotheker-Zeitung* to the prominent position it now holds in scientific and professional respects, is generally regretted, though the fact that a concession has been granted to him has given much satisfaction to his numerous friends.

PHARMACEUTICAL SOCIETY.

Library, Museum, School and House Committee.

At the ordinary monthly meeting of this Committee, held on Wednesday, May 9, the following particulars respecting the Society's Libraries and Museums were presented:—

ATTENDANCES.

	Total.	Highest.	Lowest.	Average.
Museum (April)	331	29	4	15
Library (April)	264	33	6	12

CIRCULATION OF BOOKS.

	Total.	Town.	Country.	Carriage Paid.
London (April)	112	46	66	13s. 2½d.
Edinburgh (April)	176	129	47	1s. 9d.

DONATIONS TO THE LIBRARY (LONDON).

Chemists' Assistants' Association, London:—Proceedings, 1898-99, No. 15.
Imperial Bacteriologist, India:—Annual Report, 1897-98; Preliminary Note on Rinderpest.

H.M. Secretary of State for War:—Army Medical Department Report for 1898.

Mr. W. A. Knight, Leicester:—Organic Materia Medica and Pharmacognosy, 1900.

Signor G. Dian, Venice:—Cenni storici sulla Farmacia Veneta, 1900.

Missouri Botanical Garden:—Eleventh Report, 1900.

University of the State of New York:—College Department Bulletin, Nos. 5 and 10, 1899-1900.

Messrs. E. R. Squibb and Sons, Brooklyn:—Ephemeris, Vol. 5, No. 4; Vol. 6, No. 1.

Ecole supérieure de pharmacie de Paris:—Thèses par L. Napias, H. Barnouvin, L. C. E. Gautrelet, E. Hallé, et J. B. Charpentier.

DONATIONS TO THE LIBRARY (EDINBURGH).

Chemists' Assistants' Association, London:—Proceedings, 1898-99.

Messrs. E. R. Squibb and Sons, Brooklyn:—Ephemeris, Vol. 5, No. 4; Vol. 6, No. 1.

DONATIONS TO THE MUSEUM (LONDON).

Mr. J. S. Ward, London:—Specimens of Aloe leaves picked out of Zanzibar aloes.

Messrs. Jenkin and Phillips, London:—Specimens of Mamiritta and Chamairi barks from Peru.

Messrs. Hearon, Squiré, and Francis, London:—Very fine specimen of Guaiacum resin in the tear.

Messrs. Wright, Layman, and Umney, London:—A new variety of false Ipecacuanha.

TO THE HERBARIUM (LONDON).

Mr. J. Martin, Chatham:—Specimens of *Lathraea squamaria*.

Mr. W. H. Lenton, Thrapston:—Specimens of *Paris quadrifolia*.

Mr. J. Medley Wood, Natal:—Natal plants, vol. II., pl. I.

PURCHASE OF BOOKS.

The Committee authorised the purchase of the undermentioned works:—

Jackson, Glossary of Botanic Terms.

Rogers, Handbook of British Rubi.

Wiesner, Die Rohstoffe des Pflanzenreiches.

MIDLAND PHARMACEUTICAL ASSOCIATION.

The annual meeting of the Midland Pharmaceutical Association was held on Wednesday, May 9, at the Great Western Hotel, Birmingham, Mr. JEFFREY POOLE (President) in the chair. In the

Annual Report and Accounts,

the work of the session was referred to in detail, the Council expressing surprise and regret at the great apathy existing amongst members of the Association at so critical a period in the history of pharmacy, and at the little interest displayed by so many in the important questions, political and otherwise, affecting the position and well-being of the pharmacist. The financial statement showed that the receipts during the year amounted to £40 2s. 2d., and that, after meeting all demands, there was a balance in hand of £5 19s. 6d. In moving the adoption of the report and accounts, the PRESIDENT congratulated the Association upon the fact that the favourable balance had been so largely

increased, despite the fact that the extraordinary expenditure during the year had amounted to more than £8. The circular sent out with regard to the proposed pharmacy classes at Mason College had been favourably received by the chemists of the district, and, although they regretted that the scheme had not made greater progress, they had the consolation of knowing that the fault did not lie with them. In reply to the circular sent out to local members of Parliament, asking them to oppose the Companies Bill, Mr. Brooke Robinson had replied promising to comply with the request, and other members, including Sir Henry Meysey-Thompson, had promised to give the matter consideration.

Mr. A. SOUTHALL seconded the motion, and it was supported by Mr. C. THOMPSON, who said that, although the report seemed colourless, it was satisfactory. He agreed with the statement that there was far too much apathy shown on the part of members of the trade, and expressed a hope that in the future more energy would be displayed.

The motion was then agreed to.

The New Council.

The PRESIDENT announced that the following had been elected to form the Council of the Association for the ensuing twelve months:—Messrs. J. Barclay, J. Poole, W. Jones, G. E. Perry, T. Wakefield, F. H. Alcock, F. H. Prosser, J. Spilsbury, C. Thompson, J. Wakefield, T. Barclay, Stokes Dewson, F. Barlow, G. H. Brunt, A. Southall, W. Scott, J. T. Gibson (Wolverhampton), F. W. Lowther (Moseley), and F. Smith (Handsworth).

Mr. W. G. Cross (Shrewsbury) proposed a vote of thanks to the President, Secretary, and members of the Council for the admirable manner in which they had conducted the business of the Association during the year. He was particularly pleased to see a large item in the accounts for printing, because that spoke of activity, and activity in pharmaceutical circles was much to be desired. He had been pleased to find that matters of interest in the political and pharmaceutical world were constantly being brought before the Association, and he was glad also to note the soundness of the criticism, as evidenced in the reports of the proceedings published in the *Pharmaceutical Journal*. The vote was seconded by Mr. J. McLANACHAN, and accorded. This concluded the business of the meeting.

A company, numbering about forty, subsequently attended the

Annual Dinner,

which was held at the Great Western Hotel. Mr. JEFFREY POOLE again presided; and there were also present, amongst others, Professor Hillhouse, Alderman W. G. Cross (Shrewsbury), Dr. Carter, Messrs. Glyn-Jones, A. Southall, C. Thompson, J. Barclay, A. W. Gerrard, and Mr. Jones. After the loyal toast had been honoured, Mr. PERRY gave

"THE MEDICAL PROFESSION,"

and coupled with the toast the name of Dr. Carter, who, in response, referred to the fact that he had endeavoured to get a resolution passed by the medical profession in its corporate capacity against the clause in the Companies Bill to which pharmacists had objected so strongly. But there were insuperable difficulties in the way, and, rather than have the resolution rejected, a course which might have given rise to misapprehension, he had withdrawn it as a matter of policy and expediency. At the same time, he was able to assure the pharmacists present that the feeling of the medical profession towards them was kindly and sympathetic, and they would have been glad to have helped forward the object the Pharmaceutical Society had in view, had it been possible to do so without risking the prospects of the clause the medical profession was so anxious to get passed.

The toast of

"THE PHARMACEUTICAL SOCIETY"

was proposed by Mr. GIBSON, who said that, as compared with the indifference displayed in days now, happily, gone by, the toast was now received with enthusiasm. He affirmed that the Society had

obtained for chemists whatever advantages they now possessed. As to the Companies Bill, although that was neither the time nor the place to criticise the Council, he could not help expressing regret that, when it was decided to oppose Clause 2, an amendment was not brought forward at the same time.

Alderman Cross, who spoke first in reply, agreed that most of the good which pharmacists had got, either through legislation or otherwise, had been got through the instrumentality of the Pharmaceutical Society. The action taken by the Society more than fifty years ago to improve the conditions of pharmacy in England had been proved to be right. It stipulated, in the first place, that the pharmacist should be an educated man. Further than that, it had organised what was a somewhat heterogeneous trade into something more than a trade. To-day the Society was continuing the work it entered upon half a century ago, and it largely depended upon pharmacists themselves whether the Society in the future would be a more powerful factor, as regarded the well-being of pharmacy, than it had been hitherto. Formed on democratic lines, the Society enabled its members to replace officers who did not follow a course popular with the majority of members. He urged, in conclusion, that no stone should be left unturned to prevent all that had been done by the Society being thrown away.

Mr. GLYN-JONES, who also responded, said he was in hearty agreement with all Mr. Cross had said. To the large increase of the local organisations up and down the country he attributed the fact that the toast of the Society was better received now than formerly. The toast was best received now, and obtained the warmest support, in the towns where active Associations existed.

OTHER TOASTS.

In proposing the toast of "The University of Birmingham," Mr. A. SOUTHALL expressed a hope that the claims of pharmacy would not be forgotten by those who had the control of the new institution.

Professor HILLHOUSE acknowledged the toast, and said that pharmacy might look forward hopefully to the possibility of having a direct share in the benefits of the University. Twelve months ago a member of the Midland Pharmaceutical Association approached the authorities of Mason College with a view of ascertaining what could be done to promote pharmaceutical teaching, in the form of providing classes for pharmaceutical students. He had gone into the matter himself very carefully, and it had suggested itself to him that they might aim at something higher than that. Of course, he could make no promises, but he was hopeful that in a few months they would be able to publish the fact that, amongst the degrees which the new University was prepared to give, was the degree of Bachelor, Master, and Doctor of Science in pharmacy. It was desirable that, when the Senate was approached in this matter, the application should be backed up by pharmacists themselves, who should make it clear that they were sincere and earnest in the matter. He did not suggest that they should put their hands in their pockets, but, at the same time, if they could either directly or indirectly bring influence to bear upon those whose pockets were well lined, he hoped they would not fail to exert it. He was desirous of getting some promise which would enable the authorities to offer scholarships or exhibitions, and so attract students to the University. Towards such a fund one gentleman, on behalf of a very limited group associated with him, had recently promised a sum which ran over the three figures. The object of the fund was to offer for a limited term of years, in order to start the school, scholarships and exhibitions which would enable students, almost without cost or at any rate at a considerable reduction, to pursue in the University pharmaceutical education to the highest point.

The "Health of the President," which was afterwards proposed and received with cordiality, ended the toast-list.

PHARMACEUTICAL SOCIETY OF IRELAND.

The monthly meeting of the Council was held on Wednesday, May 2, at the Society's House, No. 67, Lower Mount Street Dublin, at three o'clock. The PRESIDENT (Mr. George D. Beggs), occupied the chair, and the other members who attended were the Vice-President (Mr. Bernard), Messrs. Tate (Belfast), O'Sullivan (Waterford), Turkington, Brittan, Dr. Walsh, Jameson (Belfast), Grindley, Kelly, Simpson, Porter, and Professor Tichborne.

The minutes of the last meeting and of the special meeting having been read and signed,

THE DEATH OF MR. R. J. DOWNES.

The PRESIDENT said: Gentlemen, before taking up the business on the agenda paper I regret having to allude to an event which was a great shock to each of us—I allude to the death of our late President, Mr. Robert J. Downes. I am sure there are none amongst us who realise the great loss that the Society, and more particularly this Council, have sustained by his death than I do, as when taking the chair I did so in the hope of being able to look to him for counsel and advice on matters connected with the Society. By the death of Mr. Downes the Society at large has lost one of its most able and hard-working members—one who never spared himself in the discharge of his duty—and in him we had a pharmacien of a very high standard. It will be in the recollection of members of the Council that at our last meeting we unanimously asked him to reconsider his resignation as a member of the Pharmacopœia Committee. I had hoped that rest would have enabled him to regain his health and take his place amongst us again; but an all-wise Providence has ordered it otherwise. I am sure it is the fervent wish of all of us that the weight of their heavy affliction may be lightened to his sorrowing widow and family. I move that a letter of condolence be sent to Mrs. Downes from the Council, expressing their grief at his death and their sympathy with her in her bereavement.

Mr. TURKINGTON added an expression of the sorrow which he felt on hearing of the death of Mr. Downes, who, he said, was a man of great capacity and an ornament to the Society.

The motion was unanimously agreed to.

The PRESIDENT: We have a long list of deaths on this occasion. Coming after Mr. Downes there are Mr. John Blair, Mr. Isaiah Gibson Gilmore, Mr. William Mark Oldham, and Mr. William Henry Harman.

The next business was the election of a member of Council in the room of Mr. Downes; and

The PRESIDENT said he had great pleasure in proposing that Dr. Whitla, J.P., who was lately one of the Examiners of the Society, should be co-opted to fill the vacancy.

Mr. JAMESON seconded the motion, which was unanimously agreed to.

CORRESPONDENCE.

A letter from the Home Secretary stated that her Majesty the Queen regretted that she had been unable personally to receive the address of the Council; that it would be received on her behalf by the Home Secretary on the 19th ult., and that her Majesty's reply would be duly forwarded.

The PRESIDENT: I presented the address at the Castle. The representatives of thirty or forty other bodies also handed in their addresses. I am glad that I did so, as only one address was sent by post.

Mr. TURKINGTON: It would have been impossible for the Queen to have received them all in person.

The following letter was received from the *Chemist and Druggist*: "April 12, 1900.—Mr. A. T. Ferrall.—Dear Sir, I was quite shocked yesterday morning to receive your account of Mr. Downes's funeral, as I had not heard of his death. I would be much obliged if you could send me some further particulars in regard to his life if you can possibly obtain them, for publication in our Irish Supplement. Please convey to your Council my deep regret at

the loss of so eminent an Irish pharmacist before his life's work was accomplished.—Yours faithfully, THE EDITOR."

The PRESIDENT: We thanked the editor of the *Chemist and Druggist* for his communication. I may mention that Mr. Wells did supply a slight sketch of Mr. Downes's life to that journal.

Mr. WELLS: Sir George Duffey asked me to state that he was not at the funeral because he did not see the announcement of it in time.

A letter from Mr. James Michie resigned his seat on the Council and thanked the members for the courtesy he had always experienced from them.

A letter from the Secretary of State for the Colonies forwarded a copy of an Act recently passed by the Legislature of New Zealand, amending their pharmacy law, one provision of which excluded any but residents in those islands from being registered as pharmacists there.

The PRESIDENT: So that we are barred from going to New Zealand—even English folk—from this date.

Mr. GRINDLEY: Perhaps there is a way round.

Mr. TURKINGTON: It should be the same all over the whole Empire.

THE REGISTERED DRUGGISTS' EXAMINATION.

Mr. TURKINGTON moved, pursuant to notice, that candidates be admitted to the Examination for Registered Druggists on the acceptance of the declaration according to Sections 8 and 10 of the Amendment Act; and that the direction in Sub-section 3 of Section 8 of that Act as to subjects of examination be more fully observed than it is at present. He understood that the Council were not granting certificates to candidates unless they had attained the age of twenty-one. He wished to know what authority the Council had for this. If he was right in assuming that it was their practice, some apprentices who had entered service understanding that immediately on completing their time they would get their certificates, would be greatly disappointed.

The PRESIDENT: A young man is not a "person" in view of the law until he is twenty-one.

Mr. WELLS said the Council had been advised by their solicitor that they had no legal power to admit candidates to examination until they were twenty-one. The Universities and the medical bodies did not give degrees and diplomas to their students until they had attained that age. The Council could admit candidates under twenty-one to examination, but they could not grant them certificates. They had inadvertently done otherwise on one or two occasions.

Mr. TURKINGTON: There should be some regulation on the subject.

Mr. WELLS: There will be now.

Mr. TURKINGTON said he could understand pharmacists not being granted certificates till they were twenty-one, but he did not see that the rule should apply to druggists.

Mr. WELLS said the certificate enabled a young man to become the proprietor of a business.

Mr. TURKINGTON: Do you permit pharmaceutical assistants to receive their qualifications before they are twenty-one?

Mr. WELLS: Their qualification is only that of an assistant.

PRESIDENT: They cannot keep open shop.

Mr. TURKINGTON: Will they get the qualification?

Mr. WELLS: That's a point that has not been decided by our solicitor, but I am not aware that we have admitted any that are under twenty-one all the same.

Mr. TURKINGTON: It is a great disappointment to many apprentices. I think if the matter were referred to the Castle an opinion different from that of our solicitor would be given.

Mr. WELLS said the only thing Mr. Turkington could do would be to move that the matter be referred back to the solicitor for further information, or to get an opinion of counsel, but he believed that the latter course would be throwing away money, for the law was quite certain and could not be altered.

Mr. JAMESON: A young man is an infant until he is twenty-one.

Mr. WELLS: Suppose he opened shop, in what position would the traders be who supplied him with stuff? One young gentleman actually refused to give us a certificate of his birth, and challenged us and threatened us if we did not give him a certificate.

Mr. TURKINGTON: Was that a druggist?

Mr. WELLS: Yes.

Mr. GRINDLEY: It is usual for all educational bodies to withhold their diplomas until the candidate has become a legal person.

Mr. JAMESON: Will you admit them for examination before the age of twenty-one?

Mr. GRINDLEY: I am afraid it would open up a great deal of illegal trading if we should do so, because then the candidate would say, "I have passed the examination," and then open shop. It is not for employers to tell their apprentices anything about the matter; the apprentices can get all the information they require if they look for it.

Mr. JAMESON: It is for the employers to answer any questions that they may be asked by their apprentices. If I were asked a question I would say that no young man could go up for his examination until he is twenty-one.

Mr. WELLS: The regulation as to the Pharmaceutical License Examination says, "Candidates presenting themselves for this examination must be twenty-one years of age, and must have passed the Preliminary Examination at least one year previously."

Mr. TURKINGTON: Will you allow those who shall have their time in within the next year to go forward?

Mr. SIMPSON: We couldn't.

Mr. KELLY: You are asking us to do for chemists and druggists what we refuse to pharmaceutical chemists.

Mr. TURKINGTON: Yes; because the standard is lower.

Mr. SIMPSON: It makes no difference in the eye of the law.

Mr. TURKINGTON, passing to another topic, said that the provision of Sub-section 3 of Section 8 of the Irish Amendment Act, which provided that candidates for registration as chemists and druggists should be examined as to the "appearance and properties of the various drugs and chemicals in general use," was not carried out by the examiners.

Mr. WELLS: We had a battle as to this at the time the Act was a Bill before Parliament. We wanted to have the examination so stiff that it would ensure thorough knowledge on the part of the candidates, but those were the only words we could get into it. We have tried to get the examiners to ask the questions that Mr. Turkington wants to be asked. All that is required is to make that part of the examination more stiff.

Mr. TURKINGTON: I have heard that an examiner refused to ask those questions lest it might lead into therapeutics.

Mr. KELLY said he did not think therapeutics any part of a druggist's education, but the student might be asked on what parts of the system drugs acted.

Mr. TURKINGTON maintained that a druggist should be acquainted with the Pharmacopœia.

Mr. WELLS: Does Mr. Turkington say that the questions he refers to are not asked at the druggists' examinations in Belfast?

PRESIDENT: They are asked the appearances of the drugs and the doses at the examinations here. I have been present when they were asked their uses.

Mr. WELLS: The advantage of having visitors present is that they can report to the Council if they think that an examination is not what it ought to be.

PRESIDENT: Mr. Turkington, I will give instructions to the examiners to carry out your ideas and take care that the candidates are more closely questioned as regards the different drugs and medicines put before them, their doses and uses.

MISCELLANEOUS BUSINESS.

Mr. WELLS moved that permission be granted to a Committee appointed in connection with the British Pharmaceutical Conference to use the Society's rooms for its meetings.

Mr. GRINDLEY seconded the motion, which was unanimously agreed to.

A donation was received from the Pharmacy Board of Queensland of a copy of their Pharmaceutical List for the year 1900.

Thanks were voted to the donors.

Reports from the Examiners showed that at the Preliminary Examination twenty-six candidates presented themselves, of whom fourteen passed; that fifteen presented from the License, of whom seven passed; and that twelve druggists offered in Dublin and Belfast, of whom eight passed.

An election was held for an Examiner in Practical Pharmacy in the room of Dr. M. R. Whitla, resigned; Mr. James Michie, of Blackrock, Co. Dublin, was elected.

Other business having been disposed of, the Council adjourned.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, May 3, at 73, Newman Street, London, W., the last meeting of the session was held, under the presidency of Mr. F. W. GAMBLE. There was a fair attendance. The occasion being the

Annual General Meeting,

at which the election of councillors takes place, the first business was to appoint scrutineers, the honour of counting the votes falling upon Messrs. Surfleet and Robins.

While the scrutiny was proceeding, the PRESIDENT stated that the Council had this year been able to award the Essay Prize to Mr. H. Hymans for his paper on "The Occurrence of Sodium Sulphate in Nature." He might say that in awarding the prize the Prize Committee—which included past prize-winners—thought it rather unfortunate that the work done did not more nearly touch pharmacy proper; still, the Committee and the Council were of opinion that the paper, judged on its merits, deserved the prize, and he heartily congratulated Mr. Hymans on having earned it. The medal was not ready for presentation that evening, but he hoped it would be presented early in the next session.

Mr. HYMANS expressed his sense of the honour conferred upon him; also a hope that next year there would be more entries for both the Essay Prize and the Research Prize.

The SECRETARY, Mr. J. Evans, then read the twenty-third

ANNUAL REPORT

of the Council, which stated that thirty-three new members had joined the Association, thirty old members had resigned, and the patrons numbered forty-five, being five short of the limit imposed by the rules. Thirteen papers had been read during the session, it being satisfactory to note that a greater proportion of those were read by members than was the case last year. The attendance at the scientific meetings had been about the average. The annual reunion again took the form of a smoking concert, and was a highly enjoyable entertainment. The Council regretted that the Cinderellas had again not proved a financial success, hence the Committee had recommended that they be discontinued next year. The Council regretted that no entries had been received for the Research Prize, but it had given satisfaction to be able to award the Essay Prize to Mr. Hymans for his paper. The financial condition of the Association was sound, as evidenced by the financial report.

The PRESIDENT, in commenting on the report, said it was satisfactory to note that many young pharmacists coming to the metropolis had thrown in their lot with the Association; still, the number that had joined—thirty-three—was comparatively small. He thought it ought to have been at least three times that number. With regard to the Cinderellas, it was unfortunate they should have to be discontinued, but the Association could not afford to conduct them unless they paid for themselves. He moved the adoption of the report.

Mr. JAMES asked why the Cinderellas had declined?—they were at one time very successful.

The PRESIDENT attributed the decline this session very largely to the effects of the war; such functions had been unsuccessful generally.

Mr. PECK seconded the motion for the adoption of the report, which was carried.

The TREASURER, Mr. C. J. Strother, next presented the financial statement, showing receipts—including a balance in hand of £117 14s.—amounting to £182 2s. 6d., expenditure £79 4s. 10d., leaving a balance in hand of £102 17s. 8d. It was stated that a number of members had not yet paid their subscriptions; the cost of producing the "Proceedings" had been greater, owing to an increase in the number of pages; there had been a deficit on the Cinderellas of £8 1s. 3d.; and the surplus from the annual dinner was less than previously; hence the reduction in the amount of the balance in hand.

The report was adopted, on the motion of the PRESIDENT, seconded by Mr. DEWHIRST, and a vote of thanks was accorded to the auditors, Messrs. F. James and J. Sowden.

Mr. H. H. ROBINS then communicated the result of the

COUNCIL ELECTION,

thus:—Thirty-four voting papers had been received, all of which were in order, the number of votes recorded for each candidate being:—J. A. Dewhirst, 33; H. Hymans, 33; A. Latreille, 33; F. W. Gamble, 32; C. Morley, 31; T. M. Taylor, 31; J. Evans, 30; C. J. Strother, 29; H. Martin, 28; J. Fothergill, 25; J. W. Peck, 24; Ellis, 22; G. E. Pearson, 22; A. Goode, 21; those constitute the new Council. The unsuccessful candidates were:—G. Tweedy, 19; H. S. Coupland, 18; C. E. Vallet, 18.

The scrutineers, having been thanked for their services, the PRESIDENT delivered his

VALEDICTORY ADDRESS,

in which he voiced his feelings of thankfulness and gratitude to his colleagues of the Council, and especially to the Secretaries, Mr. Latreille and Mr. Evans, and to the Treasurer, Mr. Strother, for the untiring support they had rendered him in the discharge of his duties. The session, he said, had been productive of much good work, but the Association had been spared a surfeit of unalloyed success. He went on to refer to the occasional paucity of attendance at the scientific meetings, and stated that in his endeavours to discover a reason for the small attendances he was told that the meetings were "too scientific," and "too dull for words." He could only say that if they were sometimes dull, they were certainly also sometimes merry. During the past session the Association had had to contend with serious external forces; there had been a slump in science other than military. The Association had not been able to catch the martial spirit of the time for its steed, as it did not possess a hall suitable for the evolutions of a drill corps. But one of the members had found a grave in the veldt; he mentioned that as a tribute to his memory. The swirling vortex of pharmaceutical politics had detracted something, perhaps, from the ever quiet of their way; and at the present time the singing of the sirens was particularly loud, so that some, with Ulysses, were driven to stop their ears, whilst others, emulating Orpheus, chanted loudly to their harps to drown the sirens' voices. He again had to regret that no paper had been submitted for the prize for practical work. He hoped that next year members would endeavour to remove that reproach from the Association. The President then referred to the Cinderella dances, showing that since their inauguration in 1895 they had been attended by financial success for two sessions only—viz., 1895-6 and 1896-7, when there was a credit balance of £9 and £4 10s. 6d. respectively; the three following sessions debit balances accrued of £6, £2 14s. 4d., and £8 1s. 3d.—a debit balance on the entire series of £3 5s. 1d. Previously to the closing session there had remained a credit balance from the dances; but, in view of the fact that it had now become a debit, the Cinderella Committee recommended that next year the dances be discontinued. That decision would cause many regrets, though the circumstances made it unavoidable. The President concluded his address by expressing his thanks to all for the many

kindnesses extended to him during the two years of his presidency.

On the motion of Mr. ROBINS, seconded by Mr. J. LANGFORD MOORE, a very hearty vote of thanks was accorded to the President for his address and for his services in the chair.

The PRESIDENT having replied, the session closed.

CHEMICAL SOCIETY.

There was an exceptionally poor attendance at Burlington House, on Thursday, May 3, when Dr. THORPE took the chair. It seemed at first doubtful that there would be the quorum necessary for taking a ballot for the election of new members.

Dr. Chattaway and Mr. Orton contributed a paper dealing with THE SUBSTITUTION OF HALOGENS in anilines, anilides and their homologues. Dr. Chattaway has shown in previous publications that when chloro derivatives of these compounds are formed by the action of hypochlorous acid, the process is not a direct one, but the compound obtained is produced by the isomeric change of a substituted nitrogen chloride. By a single treatment with hypochlorous acid a substituted nitrogen chloride is formed which by suitable treatment is transformed into a chloro derivative, the chlorine wandering to a position on the ring. A second treatment with hypochlorous acid gives a similar result, a dichloro derivative being produced; but on treating a third time a stable nitrogen chloride is produced which cannot be transformed. The present paper dealt with the properties of the chloro- and bromo-compounds produced in this way from *o*- and *p*-acet-toluide. The transformations take place in some compounds quite readily at low temperatures in acetic acid solution, in other cases it is necessary to heat up the acetic acid solution strongly in a sealed tube. The authors believe that in the first reaction the nitrogen atom develops its pentavalency.

A paper was next read by Messrs. ORTON and BLACKMAN on the DETERMINATION OF HYPOIODITES, IODATES, AND IODIDES. The outline of the method is to add excess of a standard solution of sodium arsenite, saturate the solution with carbon dioxide and titrate the free arsenious oxide remaining. This gives the amount of hypiodite. Sulphuric acid is next added, and the free iodine produced is titrated. From this the amount of iodate is obtained. With the aid of this method, after its value had been verified, the authors have carried out an investigation upon the properties of hypiodites. They have found that Lunge's statement to the effect that hypiodite remains even after a mixture of iodine and calcium hydroxide has been boiled, is not to be trusted. Ammonium hypiodite is, however, much more stable, there being but a very slow conversion to iodide and iodate. The reaction of iodine and mercuric oxide in presence of water is attended by the formation of very little of either hypiodous acid or hydriodic acid, but, on the other hand, much iodic acid is produced.

Dr. THORPE mentioned that a paper had been recently published before the Society by Mr. Taylor on the same subject, and invited Mr. Orton to make a comparison of his results with those of Mr. Taylor. Mr. ORTON, in reply, said that he had as yet only seen an abstract of Mr. Taylor's work, and was unable to say how far the results were concordant.

Dr. DIVERS rose to make reference to a paper recently published by Schumann on the

INTER-ACTION OF AMMONIA AND SULPHUR DIOXIDE, which had escaped his notice up to the time of publishing his own paper on the same subject; but, since Schumann had obtained quite different results the originality of his own publication remained. Dr. Divers mentioned that he had in progress an interesting investigation upon a substance of the formula $N_2H_4S_2O_3$, for which he was able to suggest the constitution—

although it was rather premature to do so before the work was completed.

Dr. HEWITT inquired whether Dr. Divers thought the substance might be split so as to yield the sulphur analogue of hydroxylamine.

Dr. DIVERS replied that there was such a possibility.

The PRESIDENT added that the Society would await with pleasurable anticipation a fuller communication from Dr. Divers.

A ballot for the election of members terminated the proceedings.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cuspariæ Cortex.

CUSPARIA or ANGOSTURA BARK is obtained from *Cusparia febrifuga*, DC. (N.O. Rutaceæ), a small tree indigenous to the mountains of Venezuela. The dried bark was originally brought to Trinidad, whence it is exported to Europe, from Angostura, on the Orinoco. Hence the name "Angostura bark." It is not very easily detached from the tree, its close adherence to the wood being indicated by the rough, slightly exfoliating inner surface, and by the fact that strips of wood are occasionally found attached to the bark. The properties of the drug are those of an aromatic bitter tonic; it is used in the preparation of Infusum Cuspariæ and Liquor Cuspariæ Concentratus.

A.

B.

CUSPARIA BARK.—A, Outer surface of bark of *Cusparia febrifuga*. B, inner surface of bark.

CHARACTERS.—Cusparia bark occurs in quills or in somewhat thin flattened or curved pieces, with an obliquely cut edge, from 10 to 12 Cm. or more in length, 25 Mm. wide, and 2 Mm. thick. The outer corky layer of the bark is grey or yellowish, being soft and friable in the latter case, easily removed by the finger-nail, and then revealing a dark-brown resinous under-surface; when the cork is greyish, however, it is thin and firmly adherent, the difference

being due to the production of alternate layers of thin and thick walled cork cells. In either case, a hard dark-brown cortex comes next to the cork, and the inner surface of the bark consists of light cinnamon or chocolate brown bast. The latter is finely striated, frequently exhibits a laminated structure, and has numerous short, white, longitudinally arranged lines, which are clearly visible under a lens after the surface has been smoothed with a knife. The lines are formed by axially elongated cells filled with acicular crystals of calcium oxalate, white masses of which can also be seen in smoothed radial or transverse sections. The bark breaks with a short resinous fracture, the calcium oxalate appearing on the fractured surface as white points. A transverse section of the bark exhibits the grey or buff-coloured cork with the adjoining yellowish-brown cortex, and next to that the bast, in which yellowish oblique or wavy medullary rays alternate with darker bast rays. The cells containing calcium oxalate occur throughout both cortex and bast, as well as minute dark cells or glands filled with oil. Usually no sclerenchymatous tissue is present other than small isolated groups of bast fibres, the bark being thus distinguished from others which resemble it. The musty odour of cusparia is due to the volatile oil it contains, and its bitter taste chiefly to angosturin.

NOTES.—The distinctive characters of cusparia bark are the frequently spongy cork, the laminated inner surface, the peculiar odour, and the presence of calcium oxalate. The bark contains about 2.4 per cent. of bitter crystalline alkaloids—galipine, cusparine, galipidine and cusparidine—also certain amorphous alkaloids; volatile oil is present in the proportion of about 1.5 per cent., together with resin, gum, a crystalline bitter principle—angosturin—which is soluble in water or alcohol, and a glucoside which yields a fluorescent substance when boiled with diluted sulphuric acid.

Cusso.

Kousso consists of the dried panicles of pistillate flowers of *Brayera anthelmintica*, Kunth (N.O. Rosaceæ), a tree which is a native of North-Eastern Africa and cultivated in Abyssinia, whence the drug is exported. The long panicles of pistillate flowers are collected after fertilisation, dried, and packed into cylindrical rolls or "hanks," which are bound round with the flexible stem of a monocotyledonous plant. The dried flowers stripped from the panicles are sometimes imported and offered as "loose kousso." The staminate flowers are also collected, but are not official. The drug possesses anthelmintic properties, and is administered in doses of $\frac{1}{4}$ to $\frac{1}{2}$ ounce.

CHARACTERS.—Kousso usually occurs in more or less cylindrical rolls from 3 to 6 Dcm. in length, composed of the dull reddish panicles of pistillate flowers. The stout main axis is covered with shaggy brown hairs and branches repeatedly, the branches arising from the axils of large sheathing bracts and being more or less covered with brownish or greyish hairs and glands, the latter appearing under a lens as a brownish powder adhering to the surface. The numerous small flowers have short stalks, and are mostly unisexual, with two roundish membranous veined bracts at the base of each. The pistillate flowers bear a caducous white corolla and abortive stamens, but no trace of either can be found in the drug; they are also distinguished by two monocarpellary ovaries enclosed in the tube of the calyx. The calyx itself consists of two alternating whorls of five segments each, the conspicuous outer sepals being reddish-veined and externally hairy, whilst those constituting the inner whorl are curved inwards over the young fruit and shrivelled. The drug has a slight tea-like odour, and a bitter acrid taste due to the resin it contains.

NOTES.—The distinctive characters of kousso are its reddish colour, the enlarged reddish-veined outer sepals, and the inner sepals curved over the immature fruit. Those characters serve to distinguish the pistillate from the greenish staminate flowers, which are not official. The latter are often unexpanded; they are said to be much less active than the pistillate flowers, their small outer sepals are densely covered with short hairs, and their stamens are

fertile. Loose kousso, which is also excluded by the official description, frequently contains a considerable admixture of staminate flowers. The chief constituent of kousso is kosotoxin, an

Cusso.—A, Flowering branch of *Brayera anthelmintica* (after Berg and Schmidt), about half natural size; B, Staminate flower, closed; C, ditto, open; D, Pistillate flower; E, ditto, cut longitudinally—*b*, outer whorl of sepals, *k*, inner whorl, *c*, corolla; B, C, D, and E (after Luerssen) enlarged.

amorphous substance, which is a strong muscle poison; other constituents are an inactive crystalline substance named protokosin, a bitter acrid resin, tannin, and volatile oil. An inactive crystalline substance named kosin is probably not a natural constituent of the drug, but a derivative of kosotoxin.

Digitalis Folia.

DIGITALIS or FOXGLOVE LEAVES are the product of *Digitalis purpurea*, Linn. (N.O. Scrophulariaceæ), a biennial herb which is widely distributed throughout Europe and common in England, where it occurs both wild and cultivated. During the first year of its growth the plant produces a rosette of leaves, but the tall, erect, usually simple stem does not appear until the second year. The flowers have a crimson bell-shaped corolla, with darker spots inside the mouth, didynamous stamens, and a conical ovary with two cells containing numerous ovules. The leaves must be collected when the plant commences to flower, as they are considered to be most active then, and the presence of the flower also prevents the risk of the leaves of other plants being collected by mistake. The leaves, which should be dried immediately after collection, are largely imported from Germany. The drug possesses cardiac and

circulatory stimulant and tonic properties; it is used in the preparation of Infusum Digitalis and Tinctura Digitalis. The dose of the drug in powder is from 0.5 to 2 grains.

DIGITALIS LEAVES.—A, Root leaf of *Digitalis purpurea*; B, Stem leaf. Both reduced to one-fourth natural size.

CHARACTERS.—Digitalis leaves are from 10 to 30 Cm. or more in length, and may be as much as 12.5 to 15 Cm. broad. They are broadly ovate or ovate-lanceolate in shape, those on the upper part of the stem being the narrower, with a blunt or subacute apex and crenate or irregularly crenate-dentate margin. The lamina is contracted towards the base of the leaf, and passes into a winged petiole of varying length, down which the lower veins are usually decurrent; the petioles are longest on the lower leaves. The upper, somewhat rugose, surface of the leaves is dull green in colour, and bears short, glandular, simple, usually three-celled hairs; the under surface is paler and densely pubescent, the hairs being simple and unbranched. The midrib is prominent on the under surface, and the majority of the lateral veins leave it at a rather acute angle, gradually curving round towards the apex and passing into smaller ramifications near the margin. A transverse section of a leaf shows the mesophyll to be free from crystals of calcium oxalate. The drug has a faint non-characteristic tea-like odour, but a very bitter taste due to digitoxin and digitalin.

NOTES.—The distinctive characters of digitalis leaves are the crenate margin, winged petiole with decurrent veins, simple unbranched hairs, and the course taken by the lateral veins. In matico leaves (*Piper angustifolium*, Rinz and Par.) the veinlets are depressed on the upper surface, giving it a tessellated appearance; mullein leaves (*Verbascum thapsus*, Linn.) are woolly, with branched hairs; comfrey leaves (*Symphytum officinale*, Linn.) are lanceolate and bear isolated stiff hairs; primrose leaves (*Primula vulgaris*, Huds.) are nearly spatulate or spoon-shaped, with straight lateral veins which divide near the margin; Ploughman's spikenard leaves

(*Inula conyza*, DC.) have a more or less denticulate margin, with horny points to the teeth when present.

DIGITALIS.—Transverse section of leaf showing hairs, etc., enlarged (after Vogl).

The chemistry of digitalis is far from clear. It has been supposed that the leaves contain an amorphous glucoside named digitalein, which is non-cumulative in its action on the heart and causes no irritation when injected subcutaneously, together with four crystalline (? granular) glucosides—digitoxin, digitalin, digitonin, and digitin. According to Schmiedeberg and other investigators, digitoxin is extremely poisonous, and uncertain and cumulative in its action; digitalin is less toxic than digitoxin, and possesses in a high degree the medicinal action of digitalis; digitonin resembles saponin, has none of the physiological action peculiar to digitalis, and in other respects is directly injurious; finally, digitin is physiologically inert. Kiliani, however, has shown that the digitalein of Schmiedeberg is a mixture, and he claims also to have established the identity of digitonin with the crystalline digitalin of commerce. According to

DIGITALIS.—Epidermis of under side of leaf, enlarged (after Vogl).

Merck, digitin is likewise identical with crystalline digitonin and with crystalline digitalin of commerce; he describes the compound as being physiologically inactive, whilst the digitoxin of Schmiedeberg, which occurs in the form of a white micro-crystalline powder, is said to be the substance in which the properties of digitalis assert themselves with the greatest force. On the whole, therefore, it would appear that digitoxin and digitalin must be regarded as the only two substances of definite composition proved to exist in the drug and that Merck's preparation of Schmiedeberg's digitoxin is probably the product which possesses the most definite and constant therapeutic action.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

CONSTITUTION OF BRAZILIN. A. W. Gilbody, W. H. Perkin, jun., and J. Yates have previously shown (*Proc. Chem. Soc.*, **15**, 27) that trimethylbrazilin $\text{OH} \cdot \text{C}_{16}\text{H}_{10}\text{O}(\text{OCH}_3)_3$, when oxidised with chromic acid, is converted into trimethylbrazilone, $\text{OH} \cdot \text{C}_{16}\text{H}_9\text{O}_2(\text{OCH}_3)_3$, and that this substance, when heated, loses water, with formation of dehydrotrimethylbrazilone, $\text{OH} \cdot \text{C}_{16}\text{H}_8\text{O}(\text{OCH}_3)_3$, a compound which yields an acetyl derivative and is evidently identical with the acetyl compound which Herzig prepared by the oxidation of acetyltrimethylbrazilin (*Monatshfte*, 1895, **16**, 913). The authors now find that trimethylbrazilone, on treatment with phenylhydrazine, is reduced to a substance having the formula $\text{C}_{19}\text{H}_{18}\text{O}_4$, which melts at 173° , and dissolves in nitric acid and other concentrated mineral acids, yielding intense purple or orange solutions. When trimethylbrazilin is oxidised with potassium permanganate under various conditions, a variety of substances are formed, the principal of which are, (1) a dibasic acid $\text{C}_{10}\text{H}_{10}\text{O}_6$, melting at 175° , described as methylcarboxyresorcylic acid; (2) a monobasic acid, $\text{C}_{10}\text{H}_8\text{O}_3(\text{OCH}_3) \cdot \text{CO}_2\text{H}$, melting at 129.5° , which has already been described (*Proc. Chem. Soc.*, **15**, 29); (3) an acid very sparingly soluble in water and melting at 208° , which acid has the formula $\text{C}_{19}\text{H}_{18}\text{O}_9$, and (4) an acid very sparingly soluble in water, which melts at $214\text{--}215^\circ$ with vigorous decomposition, and gives also an intense catechol reaction after fusion with potash and treatment with ferric chloride; (5) metahemipinic acid. The results described in this and previous communications, and especially the isolation of methylcarboxyresorcylic acid and of metahemipinic acid from among the products of the oxidation of brazilin, allow of only a very few formulæ as possible expressions of the constitution of this substance, and after carefully considering all the facts, the authors are of the opinion that brazilin probably has the constitution represented by the formula—

—*Proc. Chem. Soc.*, **16**, 105.

CONSTITUTION OF HÆMATOXYLIN. W. H. Perkin, jun., and J. Yates show that when tetramethylhæmatoxylin, $\text{OH} \cdot \text{C}_{16}\text{H}_9\text{O}(\text{OCH}_3)_4$ is oxidised by potassium permanganate under various conditions, it yields the following substances:—(1) Metahemipinic acid, which was characterised by analysis and by conversion into the characteristic ethylimide melting at 230° ; (2) an acid melting at 180° , which evidently corresponds with an acid, $\text{C}_{17}\text{H}_{16}\text{O}_5(\text{CO}_2\text{H})_2$, (m.p. 208), obtained from trimethylbrazilin; (3) an acid melting at 214° which has the formula $\text{C}_{11}\text{H}_{12}\text{O}_7$, and corresponds with the methylcarboxyresorcylic acid obtained from brazilin. The formation of this acid and of metahemipinic acid from hæmatoxylin leads the authors to believe that the constitution of the latter substance is represented by the formula—

—*Proc., Chem. Soc.*, **16**, 107.

VOL. 64. (FOURTH SERIES, VOL. 10.) No. 1560.

BANANA FLOUR. The banana, which grows in almost all tropical countries, is very nutritive, and forms a nearly perfect food. It contains more than 25 per cent. of assimilable organic matter. According to Humboldt, it is forty-eight times more nutritious than the potato, while Crichton Campbell has stated that the banana is twenty-five times more nutritious than the best wheaten bread. The analysis of Thoms shows the presence in the flour of banana of 9.01 per cent. of nitrogenous matter. The best wheaten flour contains no more than 9 to 11 per cent. It is preferable to manufacture the starch from unripe fruits, because the starch is converted into sugar in ripening. In Venezuela the flour of the banana is given especially to children; it is equally good for aged people, convalescents, nursing women, and is of great service in the feeding of those suffering from complaints of the stomach. In Central America, Colombia, and Venezuela the banana flour is prepared on a large scale, and sold under the name of Musarina. The flour of the banana may be used in the same way as wheaten flour, except for the preparation of bread, for which it is unsuitable, inasmuch as it contains no gluten. Various formulæ are taken from the *Tropenpflanzer* for preparing banana flour for dietetic use. Thus a teaspoonful of the flour in a cup of chocolate or cocoa facilitates the digestion of these drinks, and renders them more nutritious. This addition enables cocoa to be taken by those whose stomachs are in a weak state. A sustaining drink may be made by adding a teaspoonful of the flour to an egg yolk beaten up, mixed with milk, and sweetened with sugar. The sale of banana flour in London is insignificant, on account of its high price and the fact that its uses are not yet understood.—*Revue des Cultures Coloniales*, **6**, 52.

TUBERCLES ON LUPIN ROOTS. M. P. Dehérain and M. E. Demousey state that *Lupinus albus* reaches only a very moderate development when it does not produce root-tubercles. *L. angustifolius* is also unable to utilise the nitrogen of the atmosphere without external assistance. It can, however, acquire a normal development without nodosities; but in that case it appears to obtain its nitrogen from bacteria which live parasitically on algæ present in the soil—*Phormidium autumnale* and *Ulothrix flaccida*.—*Comptes rendus*, **130**, 1900.

OXIDISING FERMENT IN FLOWERING PLANTS. Sig. N. Passerini claims to have detected the presence of at least a trace of an oxydase in about 80 out of 100 species of flowering plants examined. It is more constant in the root than in any other organ. The guaiacum reaction is often stronger in the bark than in the pith. In the leaves oxydases are often entirely wanting, or are present only in very small quantities, and are then generally localised in the veins. When present in the flower, they are more abundant in the pistil than in the stamens; in the latter they occur chiefly in the filament. In the fruit, they are most abundant in the pericarp; in the seeds they disappear before maturity.—*Nuov. Giorn. Bot. Ital.*, **6**, 296.

FERMENT OF SEEDS. The carob, *Ceratonia siliqua*, is taken by M. E. Bourquelot and M. H. Hérissé as the type of seeds with a horny endosperm, composed, for the greater part, of mannane and galactane. During germination the embryo secretes a soluble ferment, which hydrolyses the carbohydrates of the endosperm, producing mannose and galactose. Similar results were obtained with the fœnugreek (*Trigonella fœnum-græcum*) and the lucerne (*Medicago sativa*). The action of the soluble ferments is comparable to that of dilute sulphuric acid. For the ferment obtained from these two plants the authors propose the name *seminase*. The reserve carbohydrates are manno-galactanes, capable of being hydrolysed by the seminase.—*Comptes rendus* **129**, **130**, 1899, 1900.

PRARMACOGRAPHIC NOTES.

BY E. M. HOLMES, F.L.S.

Curator of the Museums of the Pharmaceutical Society.

Chaulmugra Seed.

M. Georges Desprez directs attention to a new kind of chaulmugra seed which he has received from Dr. Prain, Director of the Botanic Gardens, at Sibpur, India, and which is stated to come from Sikkim. This seed he says is "analogue à celle décrite par Hanbury" ('Science Papers,' p. 244). But as M. Desprez states that the "teguments" (testa?) "se cassent avec la plus grande facilité," the false chaulmugra evidently cannot be the same as the "Ta-fung-tsze" or Siamese chaulmugra of Hanbury, which is distinctly stated by Hanbury, *l. c.*, p. 245, and 'Pharmacographia,' 2nd ed., p. 76, to have a hard woody outer shell (testa). It is possibly the seed of *Hydnocarpus wightiana*, Blume, which has a thin testa, easily broken. The oil of these seeds has been used as a substitute for chaulmugra oil, and the seeds are only half the price of the genuine seeds of *Gynocardia odorata*. They are illustrated in an excellent 'Report on the Oil Seeds and Oils in the Indian Museum,' by Dr. M. C. Cooke (1876), but as this work is rather scarce, and there seems to be some confusion concerning the seeds sold as chaulmugra, it may be well to draw attention to the three varieties that pass under that name.

(1) GYNOCARDIA ODORATA, R. BR.—Genuine chaulmugra seeds are irregular in size and shape, quite smooth externally, of a greyish colour, or with a pale brownish tinge, 1 to 1½ inch long and ⅝ to ¾ inch broad in the widest diameter (Cooke, 'Report,' *l. c.*, p. 16, Fig. 8). The kernel shows two flat thin cordate ovate cotyledons and a straight radicle, immersed in oily albumen (Fig. 1.).

Fig. 1.

1. GYNOCARDIA ODORATA. SEEDS, natural size, showing cotyledon and radicle *in situ*.

(2) HYDNOCARPUS ANTHELMINTHICA, PIERRE.—These are the seeds figured by Daniel Hanbury (*Pharm. Journ.* [2], 3, p. 23, and 'Science Papers,' p. 244). Dr. F. Porter Smith, in the 'Materia Medica of China' (1871) described them (p. 140) under the name of "Lucrabau (chaulmugra) seeds," imported into China from Siam, and gave the Chinese name as "Ta-fung-tsze." He evidently considered them to be identical with chaulmugra seeds, although he remarked that "the Indian nuts are somewhat different from the Siamese samples, the testa being thin, smooth,

and fragile in the former case." Hanbury showed, *l. c.*, that the Siamese and Indian seeds could not be identical. Subsequently, Dr. Pierre, formerly at Saigon, obtained specimens of the plant and described it as a new species, under the name of *Hydnocarpus anthelmintica*, Pierre (*Pharm. Journ.* [3], 15, p. 41). A specimen from Lu mountain, in the province of Bien Hoa, in Southern Cochin China, was presented by him to the Herbarium of the Society in 1884. The illustration given in 'Science Papers' does not accurately represent the marking on the seed coat. The seeds when freed from adherent dried pulp, with which many of them are coated, are about ½ to ⅔ inch long and ⅜ to ½ inch broad in the widest diameter; marked at one end with short radiating interrupted ridges, occupying about one-third of the length of the seed. The rest of the surface is slightly rough to the touch with very faint raised points and lines running in a longitudinal direction. The embryo resembles in character that of *Gynocardia odorata*, but the radicle sometimes faces the side of the seed and sometimes the base. A dark stain-like chalaza is visible on the outer surface at the end of the seed opposite the radicle. The ridges on the testa are at the chalazal end.

Fig. 2.

Fig. 3.

2. HYDNOCARPUS WIGHTIANA. SEEDS, natural size, showing cotyledon and radicle *in situ*.

3. HYDNOCARPUS ANTHELMINTHICA. SEEDS, natural size, showing cotyledon and radicle *in situ*.

3. HYDNOCARPUS WIGHTIANA, BLUME.—These seeds are rather more uniformly obovate and taper more to one end than the previous two, and are strongly marked with irregular raised rough and minutely warty lines. The rough surface readily distinguishes them at sight, and the colour is more of an ashen than a brownish grey. The embryo also shows three distinct veins on each cotyledon as in the other species. The testa is thin and more easily crushed than in the other two species. The fruit is figured in Cooke's 'Report,' p. 17. The tree is a native of Western India, and the oil is employed on the Malabar Coast in cutaneous diseases and ophthalmia, and for ulcers on the feet. It has been taken internally for leprosy, syphilis, and rheumatism, but, like chaulmugra oil, acts occasionally as a gastro-intestinal irritant (Watt, 'Dict. Econ. Prod. India,' vol. iv., p. 309).

Cannabis Indica.

A contemporary has directed attention to the fact that a stronger variety of *Cannabis indica* than that official in the Pharmacopœia is imported into this country and re-exported again to the West Indies. The attention of the Pharmaceutical Society was directed to this variety so long ago as 1886, by Dr. Geo. Watt, at the Evening Meeting in November of that year, *P.J.* [3], 17, pp. 406 and 415. He pointed out that the difference between the round and the flat ganjah was very great, the former also was taxed in India ¼ more than the flat variety, and in his 'Dictionary of Economic Products of India,' vol. ii., p. 122, he states that "the heavy fiscal restrictions

now imposed on Bengal ganja had in all probability diverted the export trade from Bengal to Bombay, so that instead of the carefully cultivated Bengal article finding its way into Europe, the much inferior but infinitely cheaper ganja of Bombay (known as guaza in the drug brokers' lists in London) and the Central Provinces was in all probability that now used in European pharmacy." Certainly the flat and inferior variety is that generally used in pharmacy in this country and is rendered official in the present Pharmacopœia by the use of the term "compressed," which can only apply to the flat ganja. The use of the Bengal ganja was suggested by the writer for adoption in the P.B., but it was thought that some risk might attach to its use, preparations made from it being much stronger. The Bengal drug was, however, in at least one wholesale warehouse in London last year and was used in physiological experiments by a well-known authority. It may at any time appear in quantity, and less danger would probably accrue from the stronger drug being official in the Pharmacopœia and regularly used than from its occasional appearance in place of the weaker article. That the Calcutta kind does come to this country for re-exportation for the use of coolies in other countries is evident, and at any time when the London market is overstocked with it and the ordinary article scarce, it might easily and unwittingly replace the latter, but not without some danger to patients. The Bengal ganja is in cylindrical, not compressed or flattened pieces, and is usually more resinous.

The Active Principle of Ergot.

Dr. J. S. Meulenhoff, who has carefully followed the observations and processes of previous investigators, finds that only one alkaloid is naturally present in ergot. This is the ergotinine of Keller. The ergotinine obtained by following the process of Tanret, was found by Meulenhoff to be impure and not wholly crystalline, but when the ethereal solution was precipitated by an ethereal solution of citric acid it yielded the pure ergotinine of Keller. The impurity was found to be due to the action of alkali, for on heating Keller's ergotinine with alcoholic solution of hydrate of sodium, the resulting altered alkaloid gave the same green colour with concentrated sulphuric acid that Tanret's ergotinine gives. By treating Keller's ergotinine with a 3 per cent. solution of hydrochloric acid and removing the unaltered ergotinine by acetic ether, Meulenhoff succeeded in obtaining an alkaloid giving the reactions of cornutine, which he, therefore, considers to be a decomposition product of ergotinine.

Besides the alkaloid ergotinine a second constituent is regarded as active, viz., an acid named sclerotic or ergotinic. Under these names four preparations are known; one described by Zweifel, and brought into commerce by Merck under the name of ergotinic acid, one by Dragendorff and Podwissotski, named sclerotic acid, and a form of it modified by Podwissotski, and one by Kobert, named ergotinic acid. But while the first three observers consider ergotinic or sclerotic acid active, Kobert says that his has absolutely no embolic action. Meulenhoff regards it as a more or less pure carbo-hydrate compound, which he succeeded in splitting up by means of boiling with dilute acid into galactose and another substance not yet described in chemical literature. He found that in frogs it produced gradual paralysis.

He further found that when exhausted with cold or warm water or with solution of chloride of sodium, powdered ergot was almost as active as before exhaustion; that petroleum ether did not remove the active constituent nor the alkaloid, but only fatty oil. Ether subsequently removes only a little of the active ingredients, but dissolves scleraurine and ergotinine, and the remains of the oil. Alcohol removed the greatest quantity of the active constituents, the alcoholic extract causing intense colouring of the combs of fowls, an excessive hypnotic condition and violent diarrhoea. But the powder, after exhaustion with petroleum ether, ether and alcohol, still possessed the same properties as the alcoholic extract.

He holds that sphacelinic acid must be considered the active ingredient, and after it the cramp-producing body which is pre-

sent to some extent in Kobert's cornutine and which Meulenhoff himself has detected in some samples of Spanish ergot. Sphacelinic acid he considers does not become so quickly inactive as has been stated. The activity of sphacelinic acid, however, is considerably lessened by the action of alkalis. Sphacelinic acid is soluble in ether to the extent of 0.02 per cent. only. The scleraurine of Meulenhoff is believed by him to be identical with the ergochrysin of Jacobi (1897). It is a weak acid. The secaline of that author Meulenhoff identifies with the ergotinine of Keller. A third very active body, to which Jacobi gave the name of sphacelotoxine, and which he obtained as a green resinous substance, is named by Meulenhoff sphacelia, and was obtained by the latter in larger quantity as a greyish-brown powder. So far as can be gathered, therefore, from recent investigations, ergot yields (1) an acid substance soluble in water, named by Dragendorff sclerotic acid, for which both hæmostatic and oxytoxic properties have been claimed by some authorities; (2) Ergotinine of Keller, a crystalline alkaloid, for which similar properties are claimed; (3) Sphacelinic acid, soluble in alcohol, which is now claimed to be the chief active ingredient; (4) An inactive, weak acid body, named scleraurine, and (5) a poisonous acid named sphacelia acid, or, more appropriately, sphacelotoxine, by Jacobi. In commerce ergotinine and its citrate, cornutine and its citrate, and sclerotic acid are quoted in price-lists, but a report from the medical profession as to their utility and from the chemical side as to the composition of the commercial products is still desirable before it can be said that the very difficult question of the really active constituents of ergot is settled. But there is no doubt that Tanret's ergotinine on exposure to light darkens in colour and on keeping becomes inactive. A portion of specimen presented by Tanret to the Museum of the Society, after it had become slightly brown by keeping, proved inactive as an embolic when experimented with by a medical practitioner.

Vegetable Drugs in the U.S.P.

Under the Editorial Notes and Comments in the *American Journal of Pharmacy* for May, pp. 236-238, some statements occur that almost lead to the supposition that the editor must have been away on a holiday when they were written. Under the heading of "Myrrh," we are told that the Arabian myrrh from Aden is more highly valued than that of the Somalis (the contrary being the case), and that the plants brought home by Mr. and Mrs. (Lort) Phillips were, "they were given to understand by the Somalis," the source of myrrh. As a matter of fact the bark taken from the same tree as the leaves by Mr. Lort Phillips had *genuine myrrh on it*, so that no doubt remains that the plant yielding Somali myrrh is the *Balsamodendron myrrha* figured by Nees von Esenbeck and Bentley and Trimen, and not the *Commiphora myrrha*, Engler, but the so-called variety of his species which he calls "mol-mol"—the native name of the drug with the Somalis—who call the plant "Didthin," see *Ph. Journ.* [4], 8, pp. 26, 27 and 295.

Balsam of Tolu.—We are told that another species, *T. peruvifera* (L.f.), Baill., is also said to yield small quantities of an aromatic balsam resembling that of Tolu. In the first place the proper genus is *Myroxylon*, and in the second *M. pereira*, as shown by Peckolt, yields a black balsamic liquid resembling not balsam of Tolu, but balsam of Peru.

Rheum.—Danmer is quoted as giving as sources of the commercial root, *R. australe*, Don., *R. leucorrhiza*, Pall. (of Central Asia), and *R. rhaponticum* (of Western China). The only rhubarbs the writer has seen in English commerce (except the Chinese rhubarb) have been derived from the roots of *R. rhaponticum* and *R. officinale*, grown in England, and from the roots of *R. undulatum* and *R. compactum*, grown on the Continent. It is very doubtful if the roots of either *R. australe* or *R. leucorrhizum* ever form part of the rhubarb of European commerce.

Ipecacuanha.—The root is referred to *Cephaelis ipecacuanha*, Brotero, whereas Richard is the authority for that name. To this statement is appended another, that "From the results of analyses it would appear that the latter (Carthagena ipecacuanha) is richer

in emetic alkaloids than the former. This remains, however, to be proved." If, instead of emetic alkaloids, the word cephaeline had been substituted it would have been more accurate, *Ph. Journ.* [iv.], 2, p. 321.

Ammoniacum.—Drude is quoted as the authority for African ammoniacum being yielded by *Ferula "tingitaria,"* L. (*tingitana*) and Battandier for the statement that *Ferula communis*, var. *gummifera*, of Algiers and Morocco, "yields a gum-resin which looks much the same as the African ammoniacum." *Ferula tingitana* is mentioned by Pereira as the source of African ammoniacum, and the leaves certainly have the taste of that drug, whilst a *Ferula* obtained by the late Dr. Leared from Morocco, through the Shereef, and which closely resembled *Ferula communis*, cultivated at my request at the Botanical Gardens at Regent's Park, had no taste whatever of the drug in the leaves.

Sumbul.—We are gravely told that this root is the product of not only *Ferula sumbul* (Kffm.) Hook. f., but also of *F. narthex*, Boiss! No one who has touched the leaves of *F. narthex*, could ever be persuaded that the odour was anything but alliaceous. The author has apparently got mixed up in his facts. The root of *Dorema ammoniacum*, scented with tincture or infusion of musk, has been substituted for sumbul, and is the false sumbul mentioned by Pereira. A specimen so treated and received as sumbul is in the Museum of this Society.

Storax.—This is represented as yielded by *Liquidambar orientalis*, and also by *L. styraciflua*, L. The product of the latter, an American tree, is known in the United States as sweet gum, and in this country as "liquidambar." Of this the author might have assured himself by a reference to the 'National Dispensary,' 1894, pp. 946 and 1532. Were it not that such statements appear under cover of the editorial authority in such an important journal, and that articles are so frequently copied from one journal to another, such inaccurate statements would hardly have been worth notice.

PRACTICAL NOTES.

BY F. H. ALCOCK.

TOUGHENED FILTER PAPERS.

During some experiments having for their object the determination of the best means of wholly extracting the alkaloids from cinchona bark, use was made of an aqueous solution of zinc chloride, the liquid was poured off and ammonium hydroxide added in excess, and the alkaloids thus precipitated separated by paper filtration. On drying the paper filter it was found to be tough and more like parchment paper, but retained its filtering power. Some paper was afterwards moistened with solution of ammonio-zinc chloride alone, and after washing with water and drying, it possessed this "toughened quality." Five inch filter papers which gave 2 m.g. of ash, after treatment gave 9 m.g. of ash which contained a little zinc compound. By more perfect washing the method may be found useful for the production of this kind of filtering media.

THE PURIFICATION OF CALCIUM CHLORIDE.

Where much carbon dioxide is required for experimental purposes there is an accumulation of solution of calcium chloride, and as this is made from marble the impurity present is chiefly ferrous chloride. The method of purification of this solution for reagent purposes is usually the addition of chlorinated lime, but if care be not used a trace of this will be found in the final product, or it may be contaminated with some calcium hydroxide, which is also added. A very simple plan, which has been proved to be successful, is to evaporate the solution of crude calcium chloride slowly in a large shallow evaporation dish to perfect dryness, raising the temperature until a light porous mass is obtained. On cooling and solution in distilled water and subsequent filtration the filtrate will be found to be practically neutral, and free from iron compounds.

BACTERIOLOGY FOR PHARMACISTS.—III.

BY C. EDWARD SAGE.

PREPARATION OF CULTURE MEDIA.

Bacteria require very careful feeding if they are to flourish, and successful cultivation depends entirely upon the choice of a suitable culture medium. Although individual specimens are not omnivorous, yet organisms of one kind or another are to be found in all manner of materials and consequently may be cultivated upon equally numerous substances.

Some organisms find the blood of living animals a suitable environment, others the juice of living plants, others water, milk, soil, or even sewage.

In nature it has been found that yeasts require a saccharine and albuminous food, lactic acid organisms grow best in milk, and the pathogenic organisms, *i.e.*, those capable of producing specific diseases, are propagated best on media which contain some of the constituents of flesh or blood. It has, therefore, always been the aim of bacteriologists to imitate nature and cultivate organisms on media which resemble those in which they are found. Needless to say, these media are very numerous, but the student will only require to prepare a few with which to begin the study of micro-organisms.

Pasteur's original experiments were made with liquids, but for purposes of isolation and observation solid media were soon introduced. Micro-organisms are so cosmopolitan that they are not always particular in what company they settle, and the aim of the student must be to rescue some one or other organism from the friends which would so soon overwhelm it by their close attention.

Gelatin offers facilities which enable workers to solidify a liquid medium and so fix each organism in a definite spot where it may multiply without moving far enough away to get mixed with other species. This property of a jelly to fix an organism and at the same time to give it a supply of moist nutriment is the principle on which the present system of cultivation and isolation has been developed.

Students who are careful observers may have noticed specks of mould in paste, by which they know that one single spore has probably started the speck of growth, which will soon extend over the whole surface of the paste. So with bacteria in jelly; where one organism is present a speck soon becomes visible, and, provided there are not too many organisms present, the speck soon extends in size, and forms what bacteriologists call a colony.

For pharmaceutical students only a few media need be mentioned here, as their preparation is essentially the same in most cases, and once the details of manipulation and sterilisation are understood any of the others can be prepared without difficulty. Beer wort, a solution of extract of malt, beef broth, or milk are the essential media, and the methods of preparing these for culture media entails some careful work which by itself teaches the student many things he may or may not do in subsequent experiments.

Beer wort can generally be obtained from a brewery, but in cases where students are not able to procure it, a solution prepared by dissolving one part of extract of malt in twenty of tap water will serve the purpose. Care, however, must be taken that the extract is fresh and contains no preservative antiseptic.

Whichever is used, about a quart should be taken and boiled in a clean 60-oz. flask for ten minutes. The neck of the flask should then be covered with a clean sterile beaker and allowed to stand twenty-four hours. At the end of this time put about a pint of water in another 60-oz. flask and place an 8-oz. funnel in its neck; plait a filter paper and lay it loosely in the funnel, then boil the water in the flask for ten or fifteen minutes with the funnel and paper remaining in the neck. Then place the funnel in a support and sprinkle about $\frac{1}{4}$ oz. of kaolin on the filter and pour the boiling water through the filter paper. This practically sterilises the filter,

so when all the water has run through, put the funnel back in the empty flask and through it filter the wort or malt solution. When it has all filtered, boil it for ten minutes and cover as before. This yields a bright golden yellow liquid which is practically sterile, but which must be absolutely sterilised by boiling again for ten minutes after twenty-four hours. A little of the original wort or solution before it has been sterilised or filtered should be put aside in a small flask and the neck plugged with cotton wool; subsequent observations will probably show that it is undergoing fermentation.

Having sterilised the bulk of the solution, it is best to pour it off into smaller sterile flasks or bottles, to plug these with cotton wool, and place them in the steam steriliser already mentioned and steam them for ten minutes. After this treatment the liquid will keep without fermenting, but to preserve the cotton wool plugs from dust they should each be lightly covered with a paper cap.

To illustrate the use of this wort, take a small portion and to it add as much dried yeast as can be picked up on the point of a needle. After plugging the flask with wool place it in the incubator at 37° C., or, failing this, in the shop window if it has a southern aspect. After a short time the liquid will become turbid, the liquid will froth up and give off CO₂, and all the signs of fermentation will be shown, whilst the yeast will have multiplied many thousand times, and a little can be examined under the microscope.

Bacteriologists are so often supposed to cultivate nothing but organisms connected with disease that the use of beef broth may seem to savour of animal organisms; but the truth is that beef broth has been found such an excellent food for most organisms that its employment is almost universal. The student should prepare some as follows:—

Take a pound of shin of beef, remove any fat there may happen to be attached, and mince it finely, then sprinkle two drachms of common salt over it and put into an enamelled saucepan with a quart of water; let it macerate for three hours, stirring it frequently, then boil for half an hour, and finally strain through muslin and pour enough water over the residue to make thirty-six fluid ounces. To this add 200 grains of Savory and Moore's Peptone and sufficient carbonate of soda solution to make the whole just faintly alkaline to litmus paper, then boil for ten minutes and cover with a clean beaker until it has cooled, and finally pass it through a filter prepared and sterilised as for wort. When it has all filtered, boil for ten minutes, set aside twenty-four hours, and repeat the boiling and setting aside twice, keeping it in the same flask all the time, or it may be bottled off into smaller flasks and sterilised and kept until wanted.

Its use may be demonstrated by making an infusion of chopped hay and adding one drop to a little of the peptone beef broth. After incubating for a short time the broth will most probably become quite cloudy, a scum will develop on its surface and possibly the liquid will stink. Do not shake the flask after starting the experiment or the changes will not be so apparent.

Milk may be almost completely sterilised by heating it in plugged flasks to 70° C., whereby its flavour and nutritive value are unimpaired; but for the student's purpose, when milk is required it should be boiled for fifteen minutes, strained through glass wool and the flask carefully plugged with wool. Heating in the steam steriliser on two successive days for fifteen minutes will generally complete the sterilisation, and milk so treated will keep for years.

If a cow is milked carefully into a sterile bottle by a person with clean hands and in a place free from dust, the milk will be found to contain very few organisms, but under the conditions in which milking is generally carried out the milk as it is retailed to consumers contains a tremendous number of organisms. Any number between one and ten million organisms per cubic centimetre is a common average, and it is quite as well some fastidious people do not know that the consumption of a glass of milk entails the swallowing of about 250 million micro-organisms; but they might be con-

soled by the fact that the majority of these are innocuous or else of some distinct use.

The preparation of these liquid media is very important, but the solid media are more often employed, and all that is necessary in order to prepare the latter is to take one pint of either clarified wort or peptone beef broth in a flask and add to it 3oz. of Coignet's best gelatin, previously cut up so that it can be entirely immersed, and when this has entirely softened, the whole is heated on a boiling water bath for ten minutes and then boiled for five minutes over a Bunsen burner. Care must be taken in applying the heat, for the contents are very likely to froth over, and when boiling the flask make it a rule to have another one close at hand, so that if the flask should crack when it is being boiled the preparation may be saved. The gelatin solutions will set to a jelly when cold, and melt again on warming at about 25° C.; but if they are boiled too long they lose the property of jelling.

For incubation at 37° C. it is essential to have a solid medium which does not melt at that temperature, and for this purpose agar-agar is substituted for gelatin.

To prepare agar-agar jelly, soak 1½oz. of agar-agar in water for half an hour, then rinse it well under the tap and drain off the excess of moisture. Dissolve the softened agar-agar in either wort or peptone beef broth by heating first on a water bath and afterwards over the gas. Gelatin or agar-agar jellies should be at once filled into test tubes and the process of sterilisation completed in them. Test tubes should be cleaned and sterilised as mentioned in the previous chapter, and the hot medium poured into them to the height of about 2in. The filling may be done by means of a stoppered separatory funnel, but after a little practice students will find it quite as easy to pour the medium direct into the tubes without allowing any to touch the sides of the tube.

As a rule the jelly will contain some bits of foreign matter, and in filling the tubes only the clear portion should be poured off. After filling, each tube is plugged with cotton wool and several of them are packed upright in tins or wire crates, these latter being put in the steam steriliser for ten minutes on three successive days. After the third steaming they will be sterilised completely, and while the contents are still liquid some tubes should be laid in a slanting position to cool, so that the jelly sets in a slanting shape on one side of the tube.

The remainder of the tubes are allowed to cool upright, but in all cases great care must be taken not to let the medium touch the cotton wool plugs. When the jelly has quite set, each tube should be capped with tinfoil to prevent loss of moisture, or little rubber caps may be employed for the same purpose.

Milk may be solidified in the same way, but it is generally best to mix a small proportion of milk with peptone beef broth and then add the gelatin or agar-agar to that.

Potatoes are useful for growing some organisms. Before use they must be scrubbed well with 1 in 1,000 perchloride of mercury solution and wiped dry; then cylindrical pieces are cut from them by means of a cork borer, and each piece cut into two diagonally and the pieces placed in test tubes. The tubes must be carefully plugged with cotton wool and heated in the steam steriliser on three successive days. In cutting the potatoes use a silver fruit knife in order to prevent staining the pieces with the iron knife.

CLOVE EXTRACT FOR CORNEAL OPACITY.—Krawtschenko has directed attention to the value of a thin aqueous extract of cloves in the treatment of the opacity of the cornea. It is applied either by instillation or with a camel's hair pencil. As it gives rise to a considerable amount of irritation, it should not be employed when acute inflammation is present. Repeated instillations at intervals of five to ten minutes are made twice daily, the pain produced by the instillation is of such short duration that it is stated that the use of an anæsthetic, such as cocaine, is not necessary.—*Merck's Report*, 1900, 71.

PHARMACOGNOSY—SCIENTIFIC AND APPLIED.*

BY HENRY G. GREENISH, F.I.C.; F.L.S.

Professor of Materia Medica and Pharmacy to the Pharmaceutical Society of Great Britain.

A short time ago a well-known lecturer on pharmacology, finding it necessary to distinguish between pharmacology and pharmacognosy, defined the latter as follows:—

“By pharmacognosy we mean the recognition of drugs by their physical and chemical characters with the detection of adulteration. It means practically the same thing as ‘spotting specimens,’ an expression in common use amongst students.”

This definition exhibits an ignorance of what pharmacognosy really is, that is the more lamentable as it emanated from a lecturer on an allied subject. I believe, however, that a similar impression of the nature of pharmacognosy is by no means unusual, and after reading the above definition I sketched an outline of a paper on the subject which, unfortunately, I had to set aside to make room for other more pressing duties. About the same time, and a little later, several addresses and papers bearing on the subject were published, mostly in German works and journals, and I have thought the present occasion afforded me an opportunity of taking up my deferred sketch, incorporating some of the observations of other writers and offering it to you as an expression of my views on the subject.

Thirty years ago Professor Flückiger, in the first edition of his ‘Lehrbuch der Pharmacognosie,’ defined pharmacognosy as “the simultaneous application of various scientific disciplines with the object of acquiring a knowledge of drugs from every point of view.”

I think we may accept Professor Flückiger’s definition, and proceed to enquire what the scientific disciplines are that would aid the pharmacognosist in acquiring a complete knowledge of drugs. I propose to arrange the steps by which he would endeavour to arrive at that end in order of their importance, and to deal with them in succession. I also suggest that we consider each step from a scientific as well as from a practical point of view; that we make clear to ourselves what knowledge it is desirable to acquire and how that knowledge can be made useful in the daily life of the pharmacist or druggist.

I.—Examination of the Drug.

In the first place, it is of primary importance that the drug should be subjected to a minute examination so that we may know everything that can be learnt by the study of the object itself.

I have no hesitation in assigning to this the first place, because an accurate knowledge of the drug itself is the very foundation stone of that complete knowledge of the drug from every point of view that we have just recognised as the aim of pharmacognosy. Without careful examination it is impossible to familiarise ourselves with the drug and equally impossible to describe it properly and thus render our labours useful to others.

The drugs derived from the animal kingdom being few in number, we may for present purposes restrict ourselves to the consideration of those of vegetable origin. The careful scrutiny of such a drug will show whether it is a part of a plant, as, for instance, leaf, bark, stem, root, etc., or a product of a plant, as gum, resin, inspissated juice, and so on. This is not necessarily so simple as at first sight might appear. Gutta-percha was at one time considered to be a kind of wood, and, indeed, a piece cut from a block of gutta-percha or balata gum is not at all unlike a fragment of reddish grey wood. The determination of the morphological nature of a drug also occasionally presents difficulties. Small fruits may resemble seeds, seeds may be simulated by small flower-heads, roots are often scarcely to be distinguished from rhizomes, and so on. Santonica was for a long time considered to be a seed. Even at the present day our Pharmacopœia describes, under the heading

Radix Rhei, a drug that contains no particle of a root, and the same is probably true of sumbul, which is usually regarded as a root, but which consists principally, if not entirely, of stem.

Not only must the macroscopical characters of the drug be carefully ascertained, but the minute structure must also be investigated by means of the microscope. The classical researches of Schleiden, Berg, Vogl, Tschirch, and others have shown how much is to be learnt in this way. The cells and tissues of which a drug is composed, their distribution and their contents, even in the minutest details, must all be carefully studied, for they all contribute, sometimes in unexpected ways, to a complete knowledge of the drug. Nay, more; it is often impossible to have a correct knowledge of the structure of a drug from the examination of the various tissues found in mature organs, and it then becomes necessary to follow the development from the immature to the mature stage. This is especially the case with fruits and seeds, and Professor Tschirch and his pupils have reaped a rich harvest from investigations that have been carried out on these lines. Meyer followed the development of various rhizomes, and was thus able to add to our knowledge of several drugs. Quite recently Schumann showed that the rhizomes of *Hydrastis canadensis* were obliquely erect branches of a disc-like subterranean organ, and so the form of the rhizome as determined by its growth became really intelligible. How can the origin of the shape of the lycopodium spore or of the structure of the lupulin gland be comprehended unless the development of these or of analogous organs had been followed? Scientific pharmacognosy demands such knowledge and, indeed, much more. The contents of the various cells must be examined and that, too, at different periods of development. Starch grains and their shapes, calcium oxalate and the form of the crystals, aleurone grains and their contents, mucilage and its nature, and so on, must all be patiently studied. The value of the shape of the starch grains in identifying drugs has long been known, and so, too, has that of the calcium oxalate crystals; but it is only recently that attention has been drawn to the fact that the aleurone grains can also be utilised. This is a point of considerable importance, for it may help us to discriminate between the various seeds, especially those that yield oil, even after they have been deprived of their seed-coats. The latter usually furnish the most striking distinctive features, the cells of the endosperm and embryo of the various seeds generally showing great resemblance to one another. Hence the identification of the husked seeds or the cake yielded after the expression of the oil is a task of some difficulty. It is impossible to say what results of eminently practical value may not be the fruit of minute scientific investigation. Indeed, one might almost say that results of practical value are usually the outcome of accurate scientific labour.

From this it will be seen that botany, and, to a less extent, chemistry, are the sciences that will assist the pharmacognosist. We must not, however, lose sight of the fact that whilst botany does assist the pharmacognosist, pharmacognosy in its turn assists the botanist. Pharmacognosists, indeed, have made, and cannot fail to make, valuable contributions to anatomical as well as to physiological botany. Many botanists consider alkaloids to be excreta of the plant, and assume that they are of no further use, but pharmacognosists have shown that the alkaloids contained in stramonium seeds disappear, are used up during germination; that the alkaloid in hemlock fruit rapidly diminishes during the process of ripening; whilst in perennials the alkaloids that are stored in the roots in the autumn are utilised by the plant in the spring. These facts are inconsistent with the hypothesis of the botanist.

Those drugs that consist of products of plants and possess, in themselves, no organised structure would not, you might think, repay minute investigation. By no means. Very interesting results have been obtained by the examination of araroba, aloes, gambier, etc. In the first-named Vogl detected three distinct crystalline substances. The vegetable *débris* accidentally present

* Read before the Chemists’ Assistants’ Association (London), April 26, 1900.

often yield valuable information. The slices of root found in commercial galbanum tell us how part, at least, of that drug is obtained. On one side they usually bear adhering gum-resin, on the other side there is none. If the gum-resin is removed the examination will show that several rows of cork-cells have formed underneath it, whilst on the other side there are none. This tells us that the slice remained long enough on the root to allow of the growth of these cells, during which time the gum resin exuded. The lower surface has no cork cells, because the cells had lost their vitality before any had formed. Evidently the root of the galbanum plant is cut, and several days are allowed for the gum-resin to exude and harden. During this time the plant produces protective cork. The drug is then collected and a slice cut off to facilitate further exudation. The upper surface of this slice has the cork cells upon it, but the lower has none, as the slice will quickly die. This observation, supported by the examination of the punctures in the pieces of ammoniacum stem, controvert the assertion that those plants that yield abundance of gum-resin form no cork when wounded, the secretion being supposed to act as a sufficient protection.

Mastich, when freshly collected, is in transparent glassy tears, and the dull surface of the commercial drug is usually attributed to attrition of the tears against one another. But this is not necessarily the case. Wiesner has shown that mastich tears kept quite free from friction become dull from the formation of minute cracks. These are produced by the gradual contraction of the tear and exhibit characteristic features.

So much for the scientific investigation of the drug. The practical man will ask what useful end this minute examination serves. The answer is as simple as it is practical. It affords us the best and surest means of distinguishing the drug from all other bodies whatsoever. The utility of the macroscopic examination is obvious, but it is often insufficient for the purpose, and we derive help from the microscopic investigation. The researches of Schleiden, Berg, and Vogl have sufficiently demonstrated the value of structure in identifying crude drugs. Van Tieghem, Radlkofer, and others have accumulated a mass of information that Solereder has sifted, enlarged, arranged, and given to the world in his 'Anatomy of the Dicotyledons,' a work that has involved an immense amount of patient labour, and is of infinite value both to the systematic botanist and pharmacognosist.

A knowledge of the anatomy of drugs is also necessary from a practical point of view as being the only definite means of identifying powdered drugs and food-stuffs, and ascertaining their purity. In many cases a knowledge of their minute structure can alone give direct, positive evidence of identity and of adulteration, all other means giving only circumstantial evidence, and that not always of the most reliable nature. This is now so generally recognised that the Institute of Chemistry have added the subject to their examination, although it is not compulsory, and the Local Government Board requires evidence of competence in microscopy from candidates for the post of public analyst.

Do not imagine that we are breaking new ground or heralding a new era in food and drug analysis. No; we are only slowly following our Austrian colleagues, and are now taking steps that ought, in the public interest, to have been taken five and twenty years ago.

But, you will say, the practical man has not the time to investigate each drug as accurately as this. Certainly, he has not. It is rather for those who make pharmacognosy their hobby or profession to read, collate, examine, work, and finally give their results to the world, to point out what characters are generally of value and what particular characters are of special value in individual cases. These are what are called diagnostic characters, and they are determined by comparison. We learn how to distinguish a leaf as such by comparing this organ with others and discovering what characters it possesses that the others do not. We learn how to distinguish one leaf from other leaves by comparing them and

finding out what characters the one leaf possesses that other leaves do not. From a number of such comparisons we learn what characters are likely to be reliable and what are not—that is, what characters are diagnostically valuable and what are not. When this has once been done, it is easy, in examining and describing a leaf, to pay minute attention to such characters as experience has shown are likely to possess a high diagnostic value. And so for all organs.

But the intelligent application of these tests can be made only by one who has had a thorough grounding in the science or sciences upon which they are based—viz., in the first place, comparative botanical anatomy.

II.—Description.

In order that the results of our labours may be made available for others, they must be recorded by suitable descriptions. These may in many cases be framed upon the model of botanical descriptions; but, whilst the pharmacognosist is called upon to describe a leaf so that it may be distinguished from all other leaves, the botanist is seldom so restricted, but has other organs to assist him. The pharmacognosist's description must therefore be more minute than the botanist's; it must include the odour, colour, and taste, as well as such details of the structure as may be necessary. This is by no means so easy a task, although it is extremely important. From a scientific point of view, the description should include every detail, but, from a practical standpoint, it is desirable to limit it chiefly to those characters that are diagnostically valuable.

(To be concluded.)

THE BOTANY AND MATERIA MEDICA OF THE BIBLE.*

BY CHARLES RIDLEY.

Notwithstanding our regard for the writings of our standard authors and poets, even those of the immortal bard, Shakespeare, of Scott, Byron, Burns, Dickens, or Tennyson, I question whether there is any book whose quotations are so familiar to us as the "Bible." This, with the fact that botany and materia medica constitute a part of our professional studies is my only excuse for imposing on you a paper nearly as dry as most of the specimens I am going to show you. The all important point to be remembered in studying this subject is that at the time the Scriptures were written the study of botany was unknown; all they knew about it was what they had been taught by observation. They knew that certain seeds produced certain plants, and afterwards certain fruits. Those of us who, during our school-days, had to struggle through the Latin Georgics will remember that it was all about agriculture and description of trees, but in it there was no attempt at classification or system. The next point to be remembered is the date when our versions were translated, beginning with Wycliffe's in 1380 A.D., and ending with the present authorised version, 1611, A.D., in which forty-seven divines took part, each of whom took a part of the Scriptures to translate, and then the whole was revised by the faithful forty-seven. Even at this time classification of plants was unknown, as these divines, in practically every case, as far as my subject is concerned, simply brought down the translations of Coverdale and Wycliffe. Another point is that the Hebrews named their herbs and fruit after some characteristic it possessed. This has been of very great service to modern botanists in specifying the plants referred to.

ALMOND, *Amygdalus communis*. (Gen. xliii., 11; Numbers xvii., 8; Ex. xxxvii., 17-21.) The almond grows wild, and for ages has been cultivated and improved in Syria and Palestine. The Hebrew name Shâked means to watch, referring to the fact that the flowers appear before the leaves. It is mentioned first when Jacob

* Read at a meeting of the Newcastle-on-Tyne and District Chemists Association, April 11, 1900.

sent almonds as part of his gift to Joseph. Aaron's rod that budded was a branch of an almond tree; the bowls of the golden candlestick were designed from the almond blossom. Even at the present time English workmen call the glass drops for ornamenting candlesticks "almonds."

ALMUG or ALGUM. (1 Kings x., 11, 12.) This wood was used for the pillars and rails of the Temple, and also for musical instruments. It was imported by Solomon from Ophir. There is no doubt whatever that this was the red sandalwood (*Pterocarpus santalinus*), which is very heavy, fine grained, and still used largely in the East for similar purposes.

ALOES, *Aquilaria agallocha*, N.O. Aquilariaceæ. (Psalms lxx., 8; Proverbs vii., 17; Cant. iv., 14.) This is mentioned many times, and has no connection with our Aloes of Medicine, notwithstanding it is often mentioned in connection with Myrrh (Aloes et Myrrh). It was the odoriferous wood of the eagle tree or lign. aloe, which grew in India, which accounted for its high value, being brought several thousand miles by camel transports. It is still largely used as a fumigation amongst the Orientals. It has no odour unless burnt. Only small portions of the heartwood, too, contain the resin. Solomon, speaking of the harlot, says, "She perfumed her bed with myrrh, aloes, and cinnamon."

ANISE. (Matt. xxiii., 23.) Only once mentioned, and incorrectly translated. The *Peucedanum graveolens*, or dill plant, which has been cultivated and largely used as a medicine, stimulant, and condiment from the earliest times. According to the Talmud, its seeds, leaves, and stem were subject to tithe.

APPLE. (Cant. ii., 3; vii., 8; Joel i., 12.) This gives a splendid illustration as to the difficulties which our translators had to face the Hebrew word "Tappach," which has been translated apple, may stand for any fruit with a strong fruity aroma. We read in various parts that the fruit was sweet to taste, that it was pleasing to the nose, and also that the fruit and foliage looked like apples of gold in pictures of silver. There have been many fruits put down as the apple of Scripture, such as the lemon, quince, and orange, but none of them answer the descriptions I have referred to. The apple itself does not grow in Palestine, but the apricot, which is universal throughout the country, answers all these requirements as to taste, smell, and colour, and also the colour of the leaves, which are of a very pale green colour and very glossy, looking almost white in the bright sunlight. The apricot was not introduced into England till 1471 A.D., consequently our early translators were quite unacquainted with its characteristics.

BALM or BALSAM. (Jer. viii., 22; xlv., 11.) An oleo resin, which flows from the stem of the *Balsamodendron gilcadense*, Kunth, a native of Arabia and Abyssinia, but cultivated in Judæa. From Jericho, Cleopatra obtained some of the plants for her gardens at Heliopolis. It is mentioned in Genesis as part of the merchandise (Gen. xxxvii. 25), also as an article of commerce between the Jews and Tyrians (Ezek. xxvii. 17). Judging from the sayings, "Is there no balm in Gilead. Go up into Gilead and take balm," the Jews had evidently great faith in its medicinal properties.

BARLEY (Deut. viii. 8), *Hordeum distichon*, and other varieties, has been cultivated from the earliest times in Palestine; it is mentioned many times. It appears from the Scriptures to have been used for the poorer classes, and the Land of Promise was a land of wheat and barley (food for rich and poor).

BEAN, *Faba vulgaris* (Sam. II. xvii. 28; Ezek. iv. 9), was used both as a vegetable and flour by the Jews. The pulse given to Daniel and his companions was prepared from the bean.

BOX, *Buxus longifolia* (Is. xli. 19; ix. 13).—This is very similar to the box trees growing on Box Hill, but grows to a much larger size. It is largely used for making combs, forks, and spoons.

Brambles and Briers, mentioned in Judges and Ezekiel (Judges viii. 7 and 16; Ezek. xi. 6; xxviii. 24), were probably the blackberry;

the common species in Palestine is the *Rubus discolor*, and the butchers' broom, *Ruscus aculeatus*.

THISTLE (Star Thistle), *Centaurea calcitrapa* (Gen. iii. 18; Matt. vii. 16; Hebrews vi. 8).—Very common in the cornfields all over Southern Europe. It is the most common prickly plant of Palestine, great spines proceeding from the involucre of the flower. The Romans imitated this flower in the caltrop of their warfare, and called it, from "calx," Latin for heel, and "trappa," a snare. It was an iron ball with four spikes which, when resting on three, caused the fourth to be erect, and was used to impede cavalry. Thistles formed part of the punishment, recorded in Genesis.

THORNS (Matt. xxvii. 29).—The Crown of Thorns, mentioned in Matthew, might have been made either of the Christ thorn (*Paliurus aculeatus*, or *spina Zizyphus Christi*). Both grow freely about Jerusalem. Both belong to N.O. Rhamnaceæ.

BULRUSH, *Papyrus antiquorum* (Ex. ii. 3; Is. xviii. 2).—It grew at one time like a forest on the banks of the Nile; it is now extinct in Egypt, but is found in Nubia. The mother of Moses used this to make the ark in which she placed him; it was also used for making swift vessels to carry ambassadors to the scattered nations. Modern Abyssinians still make vessels of it. It was used for making paper till the seventh century, in fact, our word paper is derived from the Arabic name of the plant, "Babeer."

CINNAMON CASSIA, Calamus, *Cinnamomum zeylanicum*; *C. cassia*; *Acorus calamus* (Ex. xxx. 23; Ezek. xxvii. 19) were ingredients in the holy anointing oil; calamus was sold in the market of Tyre. I would like to call your notice to the composition of anointing oil:—

Take thou Myrrh, Cassia of each 500 shekels, Calamus and Cinnamon of each 250 shekels. Olive Oil 1 hin. Make after the art of the Apothecary. Roughly speaking, this would mean 15 lbs. Av. of myrrh and cassia $7\frac{1}{2}$ lbs. calamus and cinnamon, and 1.077 gallon of oil. I think the only way to dispense this very ancient prescription would be to powder the drugs and make into a thick paste.

CAMPHERE, the Henna plant, *Lawsonia alba*, N.O. Lythraceæ (Song of Songs).—The bruised leaves give a reddish orange colour to the nails, it is still used by the women of Cairo for this purpose, even the nails of mummies are found to be stained with it.

DESIRE, Caper berry (Eccl. xii. 5).—The unexpanded flower buds of various species of *Capparis*, abundant in Palestine, and largely used as a stimulating condiment.

CEDAR (Ezek. xxxi. 3; Is. ii. 13; Kings I. v. vi., 4; Ezra iii. 7).—The Cedar of Lebanon, *Cedrus libani*, was the glory of the vegetable kingdom in Palestine, is used in the Scriptures as the symbol of grandeur, and was used in the building of the second Temple. Owing to the want of proper planting it is now rapidly becoming extinct, as it grows to an average height of 100 feet. I could not very well bring a sample into this room, but I have here a section of the branch, and a photograph taken on the spot.

CORIANDEr, *Coriandrum sativum* (Ex. xvi. 31; Numbers xi. 7).—Only once mentioned to illustrate the size of Manna.

COTTON, *Gossypium herbaceum*.—This is not really mentioned in our version, but in Esther i. 6, the word *carpas* has been translated "green." All authorities agree it should have been translated cotton.

CUCUMBER, *Cucumis sativus*, L., *C. melo*, Linn., with the onion, leek, garlic and melon, grow very largely in Egypt, and constitute the principal diet (a very suitable one considering the climate) of the poorer classes. The Israelites acquired the taste for them, and we find them lusting after the good things of Egypt; all the plants I mentioned are enumerated in Numbers xi. 5. Evidently the onion and garlic had the same effect then as it has now on the breath exhaled, as we read the priests were forbidden to eat them.

CUMMIN, *Cuminum cyminum*, Umbelliferae (Is. xxviii. 25, 27; Matt. xxiii. 23).—Cultivated in Palestine, and used as a condiment. We read that the fruits were separated by beating with a rod. Also mentioned as being subject to tithe.

CYPRESS, *Cupressus sempervirens* (Gen. vi. 14; Is. xlv. 14).—A common tree in Palestine, especially about Lebanon. The wood is very hard, and suitable for shipbuilding, and is supposed to be the gopher wood which was used for the Ark. There is excellent corroboration of this, as the Hebrew name for the tree is "Gopher," and Celsius mentions the cypress tree as "Copher"; also it grows abundantly in Chaldæa and Armenia. Some authorities suggest the Syrian juniper (*Juniperus excelsa*).

EBONY, *Diospyros ebenum*, Ebenaceæ (Ezek. xxvii. 15).—The heart wood derived from the date plum tree of Ceylon and Africa. We read of it being imported into Tyre by the men of Dedan.

FIG, *Ficus carica*, Urticaceæ (Kings II. xx. 7).—The fruit was and still is cultivated largely, and used for food. It is generally mentioned along with grapes. The most interesting reference of it, to us, is from Kings, where we read: "Figs were applied to Hezekiah's boil." We all know that figs still are employed as a household remedy for boils, especially gumboils. I think this treatment will take some beating for antiquity.

FIR (Kings II. xix. 23; Kings I. vi. 15, 34; Sam. II. vi. 5).—The Hebrew word "berosh" is a generic name for several cone-bearing trees, the Aleppo pine, *Pinus halepensis*, and the stone pine, *Pinus pinea*, N.O. Coniferæ. We read of the timber being used for floors, ceilings, and doors, also for musical instruments, especially harps.

FITCHES, *Nigella sativa*, Ranunculaceæ (Is. xxviii. 25, 27).—Fitches are the seeds of the plant used for flavouring bread and cakes, much in the same way as we use caraway. The seeds occur in a capsule, and are too small to bear the threshing instrument, and must be beaten with a staff.

FLAX, *Linum usitatissimum*, Linaceæ (Prov. xxxi. 13).—The earliest material known to have been cultivated for the manufacture of clothing. Mummy cloth was invariably made of flax. Solomon, speaking of a good wife, says, "She seeketh wool and flax and worketh them." The process known as combing is referred to in Is. xix. 9.

FRANKINCENSE, *Boswellia carterii*, *B. bhau tajiana*, and *B. frereana*, Birdw., Burseraceæ (Is. lx. 6; Jer. vi. 20; Ex. xxx. 34, 36).—Olibanum is mentioned as being imported from Arabia, but was probably brought from India, "through" Arabia, one of the ingredients of the incense, as also were galbanum, *Ferula galbaniflua*, Stacte (storax), *Styrax officinale*, the other ingredients being "onycha," equal parts of each. This onycha was a horny shield attached to the shell of various shellfish, belonging to the Strombus tribe. When burnt it has a strong pungent odour, and is still used for this purpose in the East.

GALL (Matt. xxvii. 34).—The Hebrew word "rosh" signifies a head, and is supposed to be the capsule of the poppy, probably the *Papaver setigerum*. It was a custom with the Jews to give to dying persons some intoxicant to make them less sensitive to pain, just as we give morphine now-a-days, and, as we read, wine mingled with gall, was given to Christ on the Cross, I think the supposition that it was a poppy head fits in very well.

GOURD, Wild Vine (Kings II. xiv. 38, 41).—The story of the young prophet who mixed the fruit of the wild vine in mistake for a water melon (*Citrullus vulgaris*, Schrad.) into a dish of pottage, called by the prophet Elisha "death in the pot" was, doubtless, the colocynth (*Citrus colocynthis*), which grows plentifully about Gilgal. The gourd mentioned in Jonah (iv. 6, 10), *Lagenaria vulgaris*, N.O. Cucurbit., Gourd. Many old authorities took this to be the castor oil plant, the Hebrew name for which was very similar to that for the gourd, but the circumstances mentioned clearly point to the *Lagenaria* as the correct plant, which is still used as a climbing plant to cover and shade the arbours in the East.

GROVE, *Tamarix gallica*, Tamariscaceæ (Gen. xxi. 33).—The Hebrew word "eshel" denotes a tree, and the tamarisk, which grows plentifully on the Lower Jordan, is probably the correct solution. (It is marked in the margin of the revised version.)

HEATH (Jer. xvii. 6, xlviii. 6).—The word "Arar" has been translated heath. The Arabians have a shrub with this identical name, which is *Callistris quadrivalvis*; there can be little doubt as to identity.

HUSKS, mentioned in the parable of the Prodigal Son (Luke xv. 16), are the pods of the carob tree, *Ceratonia siliqua*, N.O. Leguminosæ, commonly called here the locust bean, containing about 63 per cent. of sugar. It is to be seen in great sacks on the stalls of the market in all Oriental towns. In April and May, these beans fall from the trees in enormous quantities. The natives, being a lazy lot, simply drive the cattle under the trees to feed them. Pigs especially are very fond of them.

HYSSOP, *Origanum* (?) or *Caper* (?) (Ex. xii. 22).—Some consider this was the caper plant, others consider it to be a *Marjoram origanum* sp. Probably in the Old Testament reference *Origanum egypticum*, which was tied up in bunches and used as a flavouring herb, is referred to. In the New Testament, John xix. 29, the caper, *Capparis spinosa*, would be the species intended.

JUNIPER (*Retama retam*, *Genista retam* of modern botanists), N.O. Leguminosæ (Kings I. xix. 4; Psalms cxx. 4).—A large variety of broom growing 12 feet high. Its roots are used for making charcoal still, as mentioned in the Psalms, where it is called coals of Juniper.

LADANUM, *Cistus creticus*, Cistaceæ (Gen. xxxvii. 25; xlii. 11).—It is possible that the word translated myrrh in Genesis should have been ladanum, the Hebrew word for it is "lot." A fragrant resin which was formerly collected from the beard of goats, which were fond of browsing on it. It is still used in Turkey as a perfume; it was part of the present sent to Joseph by Jacob.

LENTILS (Gen. xxv. 34; Sam. II. xxiii. 11).—The seeds of *Ervum lens*. N.O. Leguminosæ.

LILY (Cant. xi. 1, 2; Kings I. vii. 19; Matt. vi. 28, 29).—The Hebrew word "Shushan," which has been translated lily, also lily of the valley, was a generic name given to a mixture of flowers, exactly as we now talk of ferns, herbs, or grass. The Sermon on the Mount was preached near the plain of Gennesaret, and there flourish the anemone (*Anemone coronaria*, *Ranunculus asiaticus*) and *Adonis aestivalis* and *flaminea*, which are exactly of the same colour and succeed each other in close succession, painting the country red, exactly as poppies do in England. It is interesting here to note that the old Hebrews used the name of flowers for the Christian name of their little daughters, just as we christen our baby girls Lily, Poppy, Daisy, and Violet, and the word "Shushan" was the Christian name from which our "Susannah" or "Susan" is derived. A further proof that the *Anemone coronaria* is indicated is that the Arabic name for this plant is "Susan."

MALLOW (Job. xxx. 4).—The word "Malluch," which has been translated "mallow," points to some plant of salt taste. The sea purslane, *Atriplex halimus*, N.O. Chenopodiaceæ, is probably intended.

MANDRAKE, "Love apples," *Mandragora officinalis*, N.O. Solanaceæ (Gen. xxx. 14; Cant. vii. 13).—This has a yellow fruit very similar to our tomato. It acted, or was supposed to act, precisely the same as "Damiana" of the present time, as an aphrodisiac.

MYRRH.—Mentioned very frequently; in most cases our myrrh of commerce is indicated, *Balsamodendron myrrha*. It has been suggested that in certain cases in which the Hebrew word is different, ladanum (which see) may be indicated (Gen. xxxvii. 25; xliii. 11).

MILLET (Ezek. iv. 9).—The small seeds of at least two varieties of millet—*Panicum miliaceum*, N.O. Graminaceæ, *Sorghum vulgare*, N.O. Graminaceæ—which were ingredients in the bread made by Ezekiel.

MINT, *Mentha sativa*, *M. sylvestris*, N.O. Lamiaceæ (Matt. xxiii. 23).—Probably our favourite dinner, lamb and mint sauce, origi-

nated with the Jews, who were ordered to eat it at the Paschal Feast. It was carefully tithed by the Pharisees.

RUE, *Ruta graveolens*, also is mentioned as being tithed.

MUSTARD, *Brassica nigra*, Cruciferae, mentioned in Matthew (xiii 31, 32; xvii. 20) to illustrate the large tree growing from a small seed. In Palestine it grows to a height of 12 feet.

MYRTLE, *Myrtus communis*, Myrtaceae (Neh. viii. 15).—Used at the Feast of Tabernacles, and still used at the Synagogue by modern Jews.

NETTLES, the *Urtica pilulifera* (Is. xxxiv. 13).—The Roman nettle is the most abundant variety in Palestine.

NUTS, *Pistacia vera*, N.O. Anacardiaceae (Gen. xliii. 11).—At the present day these nuts do not grow in Egypt, although very abundant in Syria, and consequently the present sent by Jacob to Joseph would be very acceptable. In the Song of Solomon, "I went down into a garden of nuts," the Hebrew word Egôz should have been translated walnuts, *Juglans regia*.

OAK, *Quercus agrifolia* (Amos xi. 9).—Mentioned very often as an emblem of strength, just as in our patriotic song, "Hearts of Oak." The oaks of Bashan grow to a great size, some specimens attaining 23 feet in girth.

OLIVE, *Olea Europea*.—The olive has long been cultivated in Palestine, and there the oil is one of the first necessities of life. The Turks tax each tree annually. First mentioned when the dove returned to the Ark, and has been a symbol of peace and prosperity ever since.

OIL TREE, *Elæa nus angustifolia*, N.O. Elæagnaceae (Neh. viii. 15; Kings I. vi. 23).—This tree produces a small green fruit, from which an inferior oil is made.

PALM, Date Palm, *Phoenix dactylifera*, Palmaceae.—The Hebrew word was Tamar (from which the names "Tamarinds" and Tamar Indien had their origin). Palestine was known to the Greeks and Romans as "Phœnicia," meaning the "land of palms." When Vespasian wished to commemorate the capture of Jerusalem by Titus, he had a coin struck representing Judæa weeping under a palm tree. The leaves were an emblem of victory, as in the triumphal entry of Christ into Jerusalem.

PLANE, *Platanus orientalis* (Gen. xxx. 37; Is. xii. 19).—In the revised version the plane takes the place in the margin of the chesnut and pine tree of the authorised version, because the Hebrew word signifies "to be tall and naked," owing to the peculiar habit which plane trees have of annually shedding their bark.

POMEGRANATE, *Punica granatum* (Deut. viii. 8).—Mentioned as one of the blessings of Palestine; a most grateful fruit, suitable for the climate. We also read of pomegranate wine.

POPLAR, *Populus alba*.—First mentioned in the story of the peeled rods of Jacob, Gen. xxx. 37.

REED, *Arundo donax*.—A tall cane growing 12 feet high. The stems were used for flutes and pipes. Our English word cane is derived from the Hebrew word "kaneh."

RYE, *Triticum spelta* (Ex. ix. 32).—An inferior kind of wheat grown in Palestine.

ROSE (Cant. ii. 1; Is. xxxv. 1).—The root of the Hebrew suggests an acrid or sharp plant, the *Colchicum autumnale* has been suggested. The Rose of Sharon would probably be the *Narcissus tazetta*.

ROSE OF JERICHO, or Resurrection Flower.—*Anastatica hierochuntica*, N.O. Cruciferae, grows in hot sandy places of the Dead Sea. It derives its name from the curious way in which, when the flowers are dried up, the root becomes detached from the sandy soil, and blows about till it lodges in a damp place, when the closed flower expands and the seeds escape. It is supposed to be the plant referred to in Eccl. xxiv. 14, and the wheel, or rolling thing (Gulgal), Ps. lxxxiii. 13; Isaiah xvii. 13.

SAFFRON, *Crocus sativus* (Cant. iv. 14).—Mentioned only once as a perfume plant.

SHITTAH TREE, or SHITTIM TREE, *Acacia seyal* (Is. xli. 19).—The tree is only once mentioned. The wood was used in the construction of the Tabernacle. This tree yields an inferior gum arabic.

SPICERY.—Mentioned in Genesis xxxvii. 25, is believed by authorities to apply to gum tragacanth; why it should have been translated spicery I cannot fathom. The only reason for supposing it to be tragacanth is that the Hebrew word "nekôth" is similar to the Arabic name for tragacanth, "nakâat," and also that some twenty species of *Astragalus* grow in Palestine.

SPIKENARD, *Nardostachys jatamansi*, N.O. Valerianaceae.—A native plant of Nepal and Bhootan, hence cost of carriage made it very precious, as related in Mark (xiv. 3, 5) and John (xii. 3). Perfumers of to-day would not give a penny a pound for it.

SYCAMINE, *Morus nigra*, *Urticaceae* (Luke xvii. 6), is met everywhere in Palestine. There can be no doubt as to its identity. The Greek word for it being "Sycaminos."

SYCOMORE, *Ficus sycomorus*, N.O. Urticaceae (Chron. xxvii. 28; Kings I. x. 27).—This has no connection with our sycamore. The wood is used for furniture. The top of the fig fruit is cut off to, enable the insects which infest it to escape. It is used as food for the poorer classes. This is the tree up which Zaccheus climbed and Amos was a "gatherer" of these figs.

TARES (Matt. xiii. 24, 30), mentioned in the parable, was the bearded Darnel, *Lolium temulentum*, N.O. Graminaceae.—Compared with wheat the seeds are very dissimilar, but when growing the blades are very difficult to distinguish from those of wheat (*Triicum vulgare*) until the ear appears.

TEREBINTH, Tiel., *Pistacia terebinthus* (Gen. xiii. 18; xxxv. 4; Sam. xviii. 9).—Elâh is the Hebrew word for this, and in some parts it has been translated "oak." Absalom was caught by the head as his mule went under a "terebinth."

THYINE WOOD, *Callitris quadrivalvis*.—A small tree of the cypress family, found in the Atlas mountains, the wood of which is much prized for its beauty. This tree is the source of our gum sandarac. It is mentioned only once, as one of the priceless commodities of the Babylon of Revelation, xviii. 12.

VINE, *Vitis vinifera*.—More often alluded to in the Scriptures than any other plant. Vinegar was wine subjected to the acetous fermentation.

WILLOW, *Salix babylonica*, or other species (Psalms cxxxvii. 1, 2).—"I'll hang my harp on a weeping willow tree," and similar lines from our song books, are all taken from the Psalms.

WORMWOOD, *Artemisia absinthium* (Deut. xxi. 18; Lament. iii 15, 19).—Always used to symbolise calamity and sorrow.

NEW REMEDIES.

TORTOINE.—This name is applied to a product resulting from the action of formaldehyde on cotoine. It occurs in small, yellow, tasteless crystals, having a faint cinnamon odour. It is insoluble in water, sparingly soluble in alcohol and ether, but readily dissolved by chloroform, acetone, glacial acetic acid, and alkalies. It is given in doses of 25 centigrammes three times in 24 hours.—*Journ. de Pharm. d'Anvers*, 56, 138, after *Pharm. Zeit.*

GUAIASANOL.—This is a new preparation of guaiacol, introduced by Einhorn and Heinz, which possesses the advantage of being soluble in water. It is the hydrochloride of diethyl-glycocoll-guaiacol. It occurs in white prisms, melting at 184° C., has a faint odour of guaiacol, and dissolves readily in water. It is not poisonous, is easily absorbable, and possesses deodorising, antiseptic, and anæsthetic properties. It is given in doses of 3 Gms.; as much as 12 Gms. may be taken daily.—*Pharm. Post.*, 33, 35, after *Munich Med. Woch.*

THE APPLICATION OF THE ROENTGEN RAYS IN DENTISTRY.*

BY PROSPER H. MARSDEN.

A few months ago I was invited by a well-known Dental Society to tell them something about the Rays as applied to the particular profession in which the members were interested. Having in less than three years taken several cases requiring X-rays, either for observation or treatment, I approached the subject with a light heart. It was only upon looking through the literature of dentistry since the wonderful discovery of Roentgen that I found out how little had been done in this direction as compared with the great amount of work in general radiography.

A few words on the history of radiography may not be out of place here. In 1650 Otto von Guericke invented the air-pump—a very simple form it was compared with the double-action air-pump familiar to you all, which was the improved form of apparatus introduced a hundred years later by Hawksbee. This type of instrument was used by Faraday in his experiments with exhausted globes, through which currents of electricity were passed, showing strange phenomena. Heinrich Geissler, of Bonn, brought forward later some improved tubes, with platinum terminals sealed into the ends of the exhausted bulbs. A long series of experiments led to the manufacture of special vacuum tubes, and, subsequently, to the "focus" and other tubes now in use for the production of the X-rays. For creating the high vacua required in the Crookes tubes special forms of air-pump were found to be necessary, the general principle upon which their action depends being the exhaustion of the air of the attached bulb by means of a rapidly-interrupted fall of mercury. Crookes showed that the rays produced in these tubes, which he called Kathode rays, would cause gems, and even common glass, to fluoresce, and were capable of imparting motion to a small waggon running upon lines inside the exhausted bulb. In 1894 Hertz found that the rays would pass through a metal film, particularly one of aluminium; and in 1894 and 1895 Lenard succeeded in bringing the rays into the outer air through an aluminium window one ten-thousandth of an inch thick, let into the side of a very highly-exhausted tube. He found that these rays would act upon a fluorescent screen, and would make an impression upon a photographic dry plate.

Prof. Roentgen, of Wurzburg, then began his investigations of the work of Hertz and Lenard, and, employing a glass vacuum tube, he discovered, all by accident, the rays which he modestly described as "X"-rays, and which have made the name of the professor of physics in a small German University town famous throughout the world. At the same time Professor Oliver Lodge, of University College, Liverpool, was at work upon the rays of Hertz and Lenard, and it was just a chance that Liverpool was not the city in which the rays were discovered.

APPARATUS.—The first consideration is the source of electricity. The lighting main may be employed, the current being reduced by means of suitable resistances to the voltage required, at least twelve volts being necessary for the effective working of the 10-inch coil commonly in use in most large hospitals. The electricity may be obtained from primary or secondary batteries. The latter are preferable, as being more constant in output, and less likely to get out of order. At the same time, there is with them an absence of the acrid and odorous vapours usually associated with primary cells. A static machine may be employed for producing the electricity, and then a coil may be dispensed with.

The transformer may be a Rhumkorff or a Tesla apparatus. The induction coil is furnished either with the ordinary hammer break, familiar to you all on the smaller coils, or, better still, a contact breaker, in which the make and break are brought about by a trough of mercury with a wire dipping in and out, the mercury

itself being connected to the other side of the contact. This form of apparatus is worked by a small motor, and by increasing the strength of the current one may get an interruption varying up to some thousand per minute with a good apparatus.

The induced current at a very high potential passes into the generator of electrical radiation—the Crookes tube, before mentioned. This is made in several forms, the "focus" type of Newton and the "bi-anodal" of Dean having given the best results in my hands.

For purposes of observation the Roentgen rays may be allowed to fall upon a fluorescent screen, the object to be seen being between the light and the screen, or if a record is required a photographic plate or film is employed. A radiogram may be taken upon any make of plate, but preference should be given to such as have a thick coating of emulsion. The best results I have obtained have been upon Cadett "Lightning" and Edwards' "Cathodal" plates. Lumiere's special X-ray plates also give excellent detail, but they require a much longer time to develop and fix than the plates mentioned above. Of films I have used Kodak and Austin Edwards' Seteloid and double instantaneous, the last having afforded best results in my hands. The correct development of radiographic negatives requires very much more judgment than that of ordinary negatives, and it is only after much experience that the best results may be obtained.

USES.—The popular uses of the X-rays are numerous. Radiography has been applied to the detection of metallic articles in bales of goods and in passengers' luggage by the French customs authorities. Our neighbours across the Channel have also been able to discover infernal machines in books by means of the rays. The falsification of rubies and diamonds have been discovered by the same means. Coins and jewellery in sealed packages have been revealed, and there is a French-made machine on the "penny-in-the-slot" principle by means of which one can have "pour deux sous de rayon"!

And now we come to the most useful application of the X-rays—the detection of foreign bodies. The Græco-Turkish war was the first in which the rays were employed on the battle-field. The Roentgen rays were used in the Egyptian and in the Indian frontier wars, and ten sets of apparatus are at present working in South Africa. The rays have been useful in the discovery of calculi of various kinds in the bladder and kidneys. Fractures, dislocations, and diseases of bone are also demonstrated by their means. In tubercular diseases, as lupus, the Roentgen rays have been applied with some degree of success.

As one might expect, quite the tallest achievement in X-ray work has been accomplished in America. The entire body of a woman 5 feet 4 inches, was radiographed by Dr. W. J. Morton, of New York.

Now, we would have thought that, with such great possibilities for the discovery of the hidden and unknown, that the X-rays would have been much employed in dental work. Any who have had much experience of this kind of work will know how very frequently the dentist is called upon to decide the best way of treating a denture, maybe with a view of correcting irregularities, or perchance in the way of extraction, when—horrible thought!—there is no sound fang to replace that once removed. By means of the rays, although the screen work must perforce be but limited from the fact that the light from the Crookes tube must pass through both sides of the jaw, one can find out much of value.

In the *Journal of the British Dental Association*, 1896, Mr. Frank Harrison gave some excellent radiograms taken with an exposure of ten minutes with a Newton's focus tube. They showed incisors fitted with D and wire crowns, and right lower second bicuspid and first molar with two amalgam crown plugs. In a later communication (p. 624) the same operator gives full details of his work. The exposures varied from ten to forty minutes, and after a large number of experiments a radiogram was produced

* Read before the Liverpool Chemists' Association, April 26, 1900.

showing the teeth of a child seven years of age, in which "the six-year molar is distinctly seen at the extreme left, and the whole temporary set up to the lateral incisor on the extreme right; below the roots of the temporary molars may be seen the bicuspid enclosed in their respective bony crypts. The pulp cavities in the milk teeth are distinctly visible." Speaking of these results, the same journal in 1897 (p. 179) says:—"We cannot but think that there is still a future for this method of diagnosis in dental surgery, and with the more perfect knowledge of the nature of these mysterious rays, which time will assuredly bring, many of the difficulties attending the production of the radiograph will be removed."

Dr. Morton was also one of the pioneers in radiography as applied to dental surgery. In 1897 he read before the Odontological Society of New York a paper on the utility of the X-rays in dentistry. He holds a very strong opinion on the value of the rays in dental diagnosis. I cannot do better than quote the Doctor's own words. He states that "each errant fang is distinctly placed, however deeply situated, within its alveolar socket; teeth before their eruption stand forth in plain view; an unsuspected exostosis is revealed; a pocket of necrosis, of suppuration, or of tuberculosis is revealed in its exact outlines; the extent, area, and location of metallic fittings are sharply delineated, whether above or below the alveolar line. Most interesting is the fact that the pulp chamber is beautifully outlined, so that erosions and enlargements may be readily detected."

All this appears very simple, and it is only upon actual working that the difficulties become apparent. The first that meets us is the fact that the rays come from the anode in straight lines, and therefore only the one or two teeth which are immediately opposite the tube will be represented in their true value. The others at each side will be distorted, owing to the bending of the film. I have been unable to give as much attention to this branch of radiography as one could wish, chiefly owing to the want of dental subjects seen in a general hospital, but the following may not be without interest.

A young girl, aged seventeen, came to a local dental surgeon for advice. Her two front teeth in the upper jaw had separated in a very short time, and there was a question as to whether a supernumerary tooth was finding its way through and separating the front teeth, or if there was a bony tumour, which would require the extraction of some five teeth for its removal. The Roentgen rays were suggested, and the lady came under my care. Two negatives were taken, one with the plate between the jaws, the film side uppermost, pushed as far back as the patient could conveniently hold it; an exposure of six minutes was given, the distance from the anode to the plate being ten inches, the light being directed from above the nose. A second exposure of seven minutes was made, a corner of a $\frac{1}{4}$ -plate put far back in the upper jaw, and the light directed from in front of the face at an angle of some 45° with the film. Upon an examination of the second negative one can see a rudimentary tooth with its pulp-canal between the front teeth, thus demonstrating the cause of separation.

These negatives show the difficulty experienced in the use of plates, as one of the first rules in successful radiographic work is that the object to be taken must be placed as near the sensitive film as possible. One can readily see that even with a small plate—say, 1 by $1\frac{1}{2}$ inches—it is impossible to get apposition, and this fact led me to use for subsequent cases small films wrapped in black paper and gutta-percha tissue for the exposures. These I have had held in position either by the patient or an assistant; but a suggestion, for which I am indebted to Mr. J. A. Woods, L.D.S., Demonstrator of Dental Anatomy and Histology in the Dental Faculty of University College, that the films should be held *in situ* by means of the red composition used in modelling, is an excellent one.

THE OFFICIAL PROCESSES FOR THE ASSAY OF IPECACUANHA, BELLADONNA, AND NUX VOMICA.

BY F. C. J. BIRD.

II.—Belladonna.

Liquid Extract.—The analytical method given in the Pharmacopœia for the determination of total alkaloid in this preparation may be regarded as the type of a general process which is often successfully adopted in alkaloidal analysis, but it is also an example of the inapplicability, from a practical point of view, of any one process of assay under all conditions. Briefly, the B.P. method consists of three operations:—(1) The liberation of the alkaloid by ammonia and solution of the crude alkaloid in chloroform, (2) partial purification by conversion into sulphate, and (3) complete purification by again rendering alkaline with ammonia and shaking out the alkaloid with chloroform. The emulsification in stage (1) which has proved almost a complete bar to the use of this process as written, is well known, and some twelve months ago a modification was proposed (see *P.J.* [4], 8, 432) which consisted in first acidifying the diluted liquid extract, and then removing fatty and resinous bodies by agitation with chloroform, according to Dragendorff's plan, the acid chloroform being washed and the washings returned to the original liquid. Although this adds two more operations to the three already existing, infinitely less time is consumed in their performance; also the figures obtained are generally about 3 or 4 per cent. higher, owing to there being less loss of alkaloid. Since that time an extended experience of this modified method has proved it to be an absolute preventative of the troublesome emulsifications incidental to the strict process of the Pharmacopœia.

With regard to stage (3), mentioned above, J. A. Dewhirst has made an excellent suggestion (*P. J.* [4], 10, 358). He states that when the modified process has been employed, stage 3 may be omitted, and that if the final chloroform is washed with a little water the residue of alkaloid obtained is quite crystalline and colourless without resorting to further purification. This, however, depends entirely on the character of the liquid extract under examination, and certainly does not hold good of all samples. Colour is a ready means of judging of the amount of impurity present in the final chloroform. With some samples of liquid extract the chloroform washings possess a distinct yellow tint, which only disappears on extraction with acid and shaking out a second time. Other samples, however, yield nearly colourless residues containing but 4 or 5 per cent. of impurity, whilst this figure in the coloured residues rises as high as 15 per cent. No residue has been found too deep in colour to admit of exact titration, so that although the gravimetric results from the more coloured residues lose their value as checks on the volumetric figures, the latter are quite reliable and generally a trifle higher than when the process is continued on through stage (3).

The complete extraction of alkaloid from an alkaline solution containing other dissolved substances is much more difficult than at first sight appears, especially when the liquid is concentrated and the accompanying bodies are of the nature of fat, resin, or extractive. Generally speaking the passage of an alkaloid or an alkaloidal salt from one to another of two immiscible solvents depends on the relative solubilities of the alkaloid, its salt, and the solvents; the relative volumes of the solvents themselves; and the degree of solubility of one solvent in the other. Atropine and hyoscyamine, being freely soluble in chloroform and only very slightly soluble in water, would therefore, in view of the above considerations, be capable of being extracted from alkaline aqueous solution with unusual facility were it not for the presence of other bodies, chiefly of a fatty nature, which influence the behaviour of the alkaloid to a considerable extent. This is well evidenced by the

great difficulty of washing out the last traces of alkaloid removed in company with other substances by chloroform in the preliminary acid extraction in the modified process already mentioned, even repeated treatment with warm dilute acid still leaving an appreciable amount of alkaloid in solution in the chloroform. When the chloroform is evaporated to a soft extract and treated with warm diluted acid the resulting liquid gives a considerable precipitate with alkaloidal reagents, and this appears to be the only plan of recovering the whole of the alkaloid from the acid chloroformic extract. Water is sometimes recommended for washing out alkaloid associated with fatty and other substances in the preliminary acid washing of an assay process. This it does very imperfectly, however, as further washing with dilute acid will always take out more alkaloid. Both the modified and B.P. processes share in common a slight loss of alkaloid which remains dissolved in the mother liquor from the first alkaline chloroformic extraction.

The conclusion to be drawn from the foregoing is that whenever the modified B.P. process (*P.J.* [4], 8, 432) is adopted for the assay of liquid extract of belladonna, the first washing with alkaline chloroform, if quite white, may be evaporated and titrated at once, as advised by Dewhirst; but should the chloroform be at all coloured it is preferable to proceed with stage 3 of the B.P. process, omitting the final treatment with 3 C.c. of chloroform and water containing one drop of solution of ammonia.

It has been shown that the modified process, although avoiding the chief drawback of the official method, is subject to the disadvantage of a small loss of alkaloid and, occasionally, of requiring five operations for its complete performance. As the method does not appear to be susceptible of further improvement it seemed desirable to select a starting point more in harmony with the principles already alluded to, which govern alkaloidal extraction, and instead of attempting to remove the alkaloid from a large volume of aqueous liquid with a comparatively small volume of solvent to reverse the conditions, and treat a small volume of aqueous liquid with a large volume of a special solvent. The following process was, therefore, devised some time ago. It has proved rapid in execution, is free from emulsification of any kind, it extracts practically the whole of the alkaloid in a pure condition from any sample of extract, and the results are about 2 per cent. higher than by the modified method, and from 5 to 6 per cent. above those of the B.P. process. For this, of course, an allowance should be made when using it as an alternative method.

In the final extraction traces of amylic alcohol pass into the residue and prevent its immediate crystallisation, which may be considered a disadvantage. The alkaloid, however, readily crystallises after a short exposure to the heat of the water-oven.

ALTERNATIVE PROCESS FOR THE ASSAY OF LIQUID EXTRACT OF BELLADONNA.

Liquid extract of belladonna.....	10 C.c.
Strong solution of ammonia	2 C.c.
Amylic alcohol 3 vols. }	16 C.c.
Chloroform..... 1 vol. }	
Ether..... 4 vols. }	

Agitate vigorously in a separator, remove the ethereal layer and wash in a second separator with distilled water 4 C.c., added in two portions. Return the washings to the first separator and extract again with

Solvent (as above)	8 C.c.
--------------------------	--------

Transfer to the second separator and wash again with distilled water 1 C.c. which return to the first separator. Repeat the extraction with 7 C.c. of solvent and washing with 1 C.c. of water a third and a fourth time. Extract the mixed ethereal liquids four times successively with

Normal sulphuric acid	4 C.c.
Distilled water	6 C.c.
Distilled water	3 C.c.
Distilled water	3 C.c.
Distilled water	3 C.c.

To the mixed acid liquids add—

Solution of ammonia	q.s.
---------------------------	------

to alkaline reaction, and shake out the alkaloid four times in succession with—

Chloroform	10 C.c.
Chloroform	5 C.c.
Chloroform	5 C.c.
Chloroform	5 C.c.

Evaporate the chloroform on a water bath, weigh, dry below 100 C. to constant weight and titrate as usual.

All the separations take place immediately, and if the liquids are not quite clear they become so on holding the separator over at steam bath for a few seconds. The difference between the results by weight and titration should not exceed 3 or 4 per cent., the final chloroform being colourless or very nearly so.

THE ASSAY OF BELLADONNA ROOT.

The maceration-pressure principle having been found so effective in the process given on page 415, for the determination of total alkaloid in ipecacuanha root, a method on similar lines was applied to belladonna, and with certain modifications was found to succeed equally well. In any method of assay dependent on the liberation of alkaloid by an alkali, at the first stage of the process preference must be given to that alkali which, whilst completely setting free the alkaloid from the particular state of combination in which it exists in the drug, at the same time has as little action as possible on the saponifiable and resinous substances accompanying the alkaloid. A carbonated alkali is on this account generally to be preferred to a caustic alkali, especially when dealing with a crude drug. The solvent also requires some attention. It should freely take up the whole of the alkaloid, but a minimum of the other constituents, for the purer the solution of the crude alkaloid the more completely and easily can the alkaloid be extracted in the subsequent operations of the process. For this reason it is obvious that no one solvent is capable of being employed with equal success in the extraction of every drug. Sodium bicarbonate, which answers well with ipecacuanha, fails to remove the whole of the alkaloid from belladonna root, recourse was, therefore, had to potassium carbonate. This proved quite effective and yielded the alkaloid in a state of great purity. Extraction by maceration pressure is very rapid with belladonna, about the fifth or sixth maceration the solvent, at first of a full greenish yellow, comes away almost colourless, and shows but a trace of alkaloid with alkaloidal reagents. The residual marc, macerated for two days with a considerable volume of ammoniated spirit, gives up yellow colouring matter and a fluorescent body, but the merest trace of alkaloid.

PROCESS FOR THE ASSAY OF BELLADONNA ROOT.

Belladonna root in fine powder	10 Gm.
Potassium carbonate	2 Gm.
Water.....	6 C.c.

Dissolve the potassium carbonate in the water, and rub the whole in a small mortar to a uniform moist granular powder.

Amyl alcohol	3 volumes	} q.s.
Chloroform	1 volume	
Ether.....	4 volumes	

Add the moistened powder to 20 C.c. of the above solvent, previously placed in D (plugged with cotton wool, as shown at page 176), and macerate for half-an-hour, with occasional shaking. Force out the liquid by compressing H, and cover the powder with 10 C.c. more menstruum. Agitate vigorously, let stand fifteen minutes and again force out the liquid. Repeat this at intervals of a quarter of an hour until six to ten quantities of menstruum have been used or the powder is exhausted.

Agitate the mixed ethereal liquids in a separator with

Half saturated solution of chloride of sodium..	10 C.c.
---	---------

Run this off and reject. Rotate with 1 C.c. water, separate and shake the mixed ethereal extracts successively with—

Normal sulphuric acid	4 C.c.	} q.s.
Water	6 C.c.	
Water	5 C.c.	
Water	5 C.c.	
Water	5 C.c.	

To the mixed acid solutions add—

Solution of ammonia *q.s.*

to render alkaline. Shake out the alkaloid with successive quantities of—

Chloroform 10 C.c.
Chloroform 10 C.c.
Chloroform 10 C.c.
Chloroform 5 C.c.

Run off the chloroform into a tared dish, evaporate, dry, weigh, and titrate as directed in the Pharmacopœia. The figures obtained by weight and titration should not differ by more than 1 or 2 per cent.

(To be continued.)

PHOTOGRAPHIC NOTES—SCIENTIFIC AND PRACTICAL.

BY A PHARMACEUTICAL PHOTOGRAPHER.

For many years now photographers have been accustomed to immerse themselves in dark rooms which have been but darkly illuminated with ruby glass of various kinds. It has for years been considered that no other light was safe, but there is now a considerable reaction against the ruby light, and though the present-day dry plate is far more rapid than even those of ten years ago, the majority of workers are coming round to the opinion that a very much more brilliant and yet equally safe light can be employed. There is also one other factor which has induced many workers to try a brighter light, and it is the intense frontal neuralgia that so frequently attacks a worker after some hours' work in red light. It has been stated on the Continent that a well-known firm of sensitive paper coaters found that it was almost impossible to keep order amongst their female hands whilst the coating rooms were illuminated with ruby light, but that as soon as this was replaced by green all was peace and quietness.

LIGHT FOR RAPID PLATES.

Whether the foregoing story is true I know not; it is, at any rate, *ben trovato*, and expresses a good deal that others have felt. With some of the most rapid plates it is necessary to use a fairly deep light, but a double-flashed orange, such as may be obtained of Hetley's, in Soho Square, is far less trying to the nerves and gives more light. For ordinary plates and bromide papers there is nothing to equal a double thickness of dark chromium green glass, with one thickness of canary fabric. Whilst with colour sensitive, particularly the red sensitive plates, another thickness of green glass will ensure safety, and yet give a good light all over the room. A still more brilliant screen may be made by soaking a gelatinised plate of the required size in a mixture of metanil yellow and eosine, about 12 of the former and 1 of the latter to about 5,000 parts of water, and allowing to dry. It must, of course, always be understood that the plate is kept covered during development, and not exposed more than necessary to the light.

USE OF A LIGHT FILTER.

For the use of some commercial plates a special safe light of extraordinary depth of colour is recommended, but I must confess that I have never found it necessary to use such lights, which serve but to make darkness visible. Still, such a light filter can be made very easily by anyone. All that is required is to obtain two sheets of glass of the required size and coat them with gelatin; personally we use a solution of Cox's gelatin in the proportion of 64 grammes to the litre, and allowing 10 C.c. to every 100 sq. centimetres. This is poured on to the glass, which should have been previously warmed and allowed to set in a level place, and then one is soaked in a saturated solution of aurantia $N(C_6H_2(NO_2)_3)_2 \cdot NH_4$; the other in a saturated solution of naphthol yellow. Both should be allowed to dry, and then one coated with a normal collodion containing 0.1 per cent. of methyl violet. The rationale of the three coatings is as follows: Aurantia cuts

off the bright blue and green of the spectrum, allowing red, orange, and yellow with some ultra-violet to pass; the naphthol yellow cuts off the blue and ultra violet, whilst the methyl violet cuts off the yellow and orange, and leaves nothing but a narrow band of spectral red from A to B. Naphthol yellow, it should be noted, is not very soluble, but the addition of a few drops of caustic soda will give a fairly deep solution.

NON-ACTINIC BACKING.

Considerable discussion has been raised as to the increase of exposure required when a plate has been backed by a non-actinic backing, and at times it has been somewhat acrimonious; but this has arisen purely on a misunderstanding. As all know, the object in backing a plate is to prevent the reflection from the back surface of the glass of those light rays which penetrate through the emulsion, and which, as the angle of reflection is equal to the angle of incidence, must be reflected back on to the emulsion; but as there must be considerable diffusion of the image and the reflected light must necessarily strike the back of the sensitive emulsion, it practically produces general fog, and thus gives the impression of a more fully exposed negative than when the backing has been applied.

OF BACKED PLATES.

The difference between a backed and unbacked plate in the character of the negative, at least as regards what is known as "pluck and sparkle," is very striking, and those who have once used backed plates will not be likely to go back to the ordinary again. It is, of course, but an obvious sequence of thought that if coating the back of the glass with a non-actinic backing reduces the fog generally, the use of a white or reflective surface would certainly shorten the exposure were it possible to reflect the light back direct on to the image without the intervention of the glass. And some experiments by Captain Colson, of Paris, certainly go to prove this, as he found a distinct increase in the light effect when the image was allowed to pass first through the glass, then on to a very transparent emulsion, which was in almost optical contact with white paper. From this one would imagine that some of the films of the present season's introduction will be found somewhat more rapid than when the emulsion is coated on glass.

CORRECTION OF OVER-EXPOSURE.

Talking of the effects of over-exposure reminds me of Mercier's experiments with various reagents to correct over-exposure, and when it is known that such exists I should strongly commend his process, which is to soak the exposed plate in a 2 per cent. solution of tartar emetic, allow to dry, and then develop with a normal hydroquinone developer.

DEVELOPMENT WITH FIXATION.

Development with fixation is one of those subjects which has cropped up during the past twelve months, and it forms the subject of a patent which has attracted some little attention. The sole advantage seems to be that one can thus reduce considerably the time required to develop and fix and also obtain a good negative, no matter what exposure has been given. Dr. Ellon, of Charlottenburg, who is the maker of the best form of pyrocatechin, gives the following formula:

CONCENTRATED DEVELOPER.

Pyrocatechin	7 Gm.
Potassium Hydrate	6 Gm.
Sodium Sulphate	30 Gm.
Distilled Water	75 C.c.

The developer is—

Concentrated Developer	10 C.c.
Sol. Sodæ Hypo (1.5)	20 C.c.
Water	20 C.c.

A perfect fixed negative is obtained in from three to five minutes.

ANNUAL DINNER OF THE PHARMACEUTICAL SOCIETY.

The annual dinner of the Pharmaceutical Society is always an interesting and enjoyable function, but there has, perhaps, never been an occasion in previous years at which greater interest and enthusiasm was displayed than at the annual dinner, 1900, held in the Whitehall Rooms, Hôtel Métropole, on Tuesday last, May 15. Those who have been acquainted with the annual social gathering of members of the Society from its commencement remarked that for the first time the chair was occupied by the Vice-President of the Society. That circumstance was explained, in due course, by the Chairman, Mr. G. T. W. Newsholme, who stated that he regretted to have to announce that, owing to the indifferent health of the President, Mr. Wm. Martindale, he had, on the advice of his medical attendant, gone on a voyage to South Africa.

After a most excellent dinner, the Chairman, in proposing "The Queen," spoke in eulogistic terms of the deep interest her Majesty has recently shown, at some sacrifice to herself, in her subjects, and the toast was honoured by an assembly of over two hundred pharmacists and their friends with enthusiastic loyalty, such as could scarcely have been surpassed had the Queen been present in person. The spirit of patriotism thus aroused was sustained by Mr. Walter Hills (the past-President), who, evidently speaking from the heart, proposed that old toast, "The Army, Navy, and Auxiliary Forces," under a new guise—viz., "The Imperial Forces," referring in terms of praise, not only to the soldiers and Volunteers from all parts of the Empire, but also to those of the medical and pharmaceutical professions who have volunteered for service at the front in South Africa. Colonel Sir Howard Vincent (M.P. for Sheffield), before replying to the toast, thanked the members of the Pharmaceutical Society, on behalf of the people of Sheffield, for the honour they had done that city in inviting his old friend Mr. Newsholme to take the chair that evening.

Leaving military matters—which permeated almost the whole of the evening's proceedings—Mr. R. A. Robinson, L.C.C., in proposing "The Houses of Parliament," turned to matters pharmaceutical by referring to Clause 2 of the Companies Bill, stating the case for pharmacists clearly and distinctly, at the same time pointing out to the members of both Houses present that the decision that the word "person" in the Pharmacy Act, 1868, does not cover a company, however unqualified, ought to be reconsidered, and that if that decision is again upheld, then there is no reason why it should not also apply to the professions of law and medicine. Lord Welby, who replied on behalf of the House of Lords, made no comment on the Companies Bill, except to say that in the present state of affairs he saw little chance of domestic legislation receiving much attention from the Government. Mr. Remnant, however, as the member for the district in which the Pharmaceutical Society has its headquarters, did briefly refer to Mr. Robinson's remarks in that connection, stating, very guardedly, that he would undertake to give very careful consideration to the Bill, and, so far as he could see at present, he had no reason to say that he should differ from what Mr. Robinson had stated.

The Treasurer of the Society, Mr. S. R. Atkins, in proposing "The Medical Profession," made one of the best-received speeches of the evening. Referring to the relations between medicine and pharmacy, he said that pharmacists not only claim to be the fourth estate of medicine, but to be part of it. In regard to the great progress of medicine, and especially surgery, during the Queen's reign, the progress had been past belief, so much so that the old fable of Humpty Dumpty was no longer true, for he ventured to think that a London surgeon would collect the particles and put him together again. Touching upon the services of medical men and pharmacists at the front, Mr. Atkins raised a storm of applause by

referring to his distinguished namesake, Tommy Atkins, of whom he was very proud. The President of the Royal College of Physicians, in reply, congratulated the Pharmaceutical Society on the good work it has accomplished during the last generation. The time had long passed when the pharmacist might be considered to be in any way subservient to the physician; each now has his own work to do, and he was sure both would do it nobly and well. Mr. Michael Carteighe, in his well-known genial style, gave the toast of "Science." He reminded his brethren present that pharmacy is not a science, but an art based upon science. He went on to speak of the enormous strides made by science during the Victorian Era and the beneficial effect of scientific teaching upon the community as distinct from the work of science. Sir William Abney replied, stating that in his opinion the toast of "Science" was misplaced because it should have been included in the three preceding toasts.

Mr. Bailey Saunders, M.A., Secretary of the London University Commission, then delivered what was, literally as well as pharmaceutically, the speech of the evening in proposing the toast of "The Pharmaceutical Society." The report of his remarks at page 537 should receive the careful consideration of all pharmacists interested in education. The Chairman, in responding to the toast, referred to the future connection between the School of Pharmacy and the London University and to the necessity for an Imperial compulsory curriculum if the scheme for reciprocity is ever to be brought to a successful issue. He then proposed "Our Guests," coupling with the toast the names of the Hon. G. Waldegrave Leslie, Sir James Crichton Browne, and Dr. T. E. Thorpe, all of whom replied, the remarks of Sir James being especially interesting, inasmuch as he spoke out very forcibly in regard to the enormous and increasing number of deaths from enteric fever, pneumonia, and dysentery among the troops in South Africa, expressing his regret that the Government had not, when sending out eminent surgeons to the front, also sent out a few great physicians. He thought there should be a careful inquiry into the matter by the sanitary authorities. The idea that medical treatment was of no avail in cases of enteric fever, he said, was fatalistic folly.

The toast list was interspersed by songs and part-songs by the Westminster Glee Singers, the proceedings terminating shortly before midnight.

REPORT OF THE SPEECHES.

The annual dinner of the members and friends of the Pharmaceutical Society took place on Tuesday evening at the Whitehall Rooms, Hôtel Métropole, Mr. G. T. W. NEWSHOLME (Vice-President) in the chair.

At the conclusion of the repast, grace having been sung by the Westminster Glee Singers, who also contributed during the evening a series of charming part-songs,

The CHAIRMAN proposed

The Queen,

a toast which, he said, had been drunk on many similar occasions, but never with more enthusiasm, he was sure, than now, for her Majesty had lately been showing her hearty sympathy with her subjects in all parts of the world, with her brave soldiers and sailors, especially with those who had been wounded in the war, and she had given up her usual trip to the South of Europe to pay a visit to the sister island, where she had been received with heartfelt enthusiasm.

Mr. WALTER HILLS next proposed

The Imperial Forces,

which, he said, ought to be considered the toast of the evening, for he was sure the brave men at the front, including Army, Navy, and Volunteers from all parts of the Empire, and their gallant efforts, were uppermost in the hearts of all. He coupled with the toast the name of Sir Howard Vincent, M.P. for Sheffield, and Colonel of the Queen's Westminsters, who had just returned from South Africa.

Sir HOWARD VINCENT, in responding, gave an interesting account of what he had seen on his recent visit, particularly in the hospitals, and after paying a high tribute to Lord Roberts, said he did not believe there had ever been an army in the field for which the medical and hospital arrangements had been so perfectly organised. He also spoke in eulogistic terms of the Volunteers, both English and Colonial, and reminded his hearers that Mr. Hills had a son serving at the front as a member of the H.A.C. He concluded an eloquent speech by expressing the hope and belief that this toast would always be received with enthusiasm.

Mr. R. A. ROBINSON, L.C.C., proposed

The Houses of Parliament,

which, he said, were always on the side of freedom and liberty of speech, and which had never stood higher in public esteem. He coupled with the toast the names of Lord Welby and Mr. Remnant, M.P. for Holborn, the constituency in which the headquarters of the Pharmaceutical Society were situated. After briefly referring to the Australian Commonwealth Bill, he said, another question to which he should like to refer was the Companies Bill, with regard to which the members of the Society felt they had some grievance. In 1868 the Pharmacy Act stated that no persons should deal in poisonous drugs unless they were properly qualified, and one would have thought that the language was plain, but, unfortunately, it had since been contended that seven or more persons forming themselves into a corporation did not come under that law. The late Lord Chief Justice Cockburn would not listen to that argument, and said that "no person" meant no person, or any number of persons; but, unfortunately, when the case came before the House of Lords it was decided that seven persons did not come under the heading of a person, and therefore, they might do with impunity that which not one of them could do legally in his individual capacity. This was a point in which the Society was intensely interested, and he was sure the members of the Legislature present would carefully consider whether, if that was the intention of Parliament in 1868, that view of the law should not be reconsidered. He only asked that a fair hearing should be given to the question. He also pointed out that the same principle would apply to medicine and law, and he ventured to think it was not to the interest of the community that companies should be able, under cover of qualified servants, to engage in pursuits which were forbidden to individuals.

Lord WELBY having returned thanks for the House of Lords, Mr. J. F. REMNANT, M.P., responded for the House of Commons. After referring briefly to military affairs, and saying he should support the Government in the policy of annexation, he said he should be quite prepared to give full consideration to the points raised by the Pharmaceutical Society with regard to the Companies Bill.

Mr. S. R. ATKINS then proposed

The Medical Profession,

to whom they were all indebted, for that profession assisted them in their arrival upon the earth, and did what they could to retard their departure, and in the interval rendered them every possible assistance. As pharmacists especially, who claimed to be a fourth estate of medicine, they felt beholden to the medical profession. The position which the Pharmaceutical Society had always taken up was that doctors should diagnose and prescribe, and pharmacists should prepare the remedies and dispense them, and he believed that, in the main, that practice had been followed. They all appreciated the enormous progress which medicine and surgery had made, and he hoped that medical men also appreciated the progress made by pharmacy. He was glad to know that they had now reached a point in which pharmacists were recognised in the preparation of the Pharmacopœia, and the Society was very pleased to place their unique laboratories and the services of the qualified professors of chemistry and pharmacy at

the disposal of the Committee of the General Medical Council. He concluded by referring in feeling terms to the great services rendered to the Army by the medical profession, and also by pharmacists. He coupled with the toast the name of Dr. Church, President of the Royal College of Physicians.

Dr. CHURCH, in responding, said medicine was practised in so many different ways and under such diverse conditions that it was extremely difficult for one person to properly represent the whole profession. He might safely say that there was no section of his profession which was not greatly indebted to the Pharmaceutical Society for the good it had done during the last generation, and he might congratulate it on the position it had achieved. When the Society was instituted its main objects were to unite chemists and druggists in order that their interest might be safeguarded, and still more to advance the art and science of pharmacy, and in both they had been highly successful. Every practitioner of medicine must feel grateful for the purity, activity, and portability of the drugs which were now supplied to alleviate the sufferings and cure the diseases of mankind, and he had learnt with great pleasure of the action of the Council during the last few days with regard to a certain question which had been laid before it, as it had also before the Royal Colleges. He could not say what would be the answer of the Royal Colleges, as the matter had not yet been considered, but he must say he heard with great satisfaction the answer which the Council of the Pharmaceutical Society had returned to the Home Office, and he did not think there would be any difference of opinion on the point. The questions he referred to were connected with the subject of standardisation. He had only lately ceased to be a member of the General Medical Council, and felt sure the arrangements now made between that Council and the Pharmaceutical Society with regard to the Pharmacopœia would give satisfaction to both bodies and be of benefit to the whole community.

Mr. MICHAEL CARTEIGHE next proposed

Science.

which he said might be regarded from two main points of view—first, the enormous strides which it had made during the Victorian Era, and, secondly, the effect of scientific teaching in connection with education. In his early days the teaching of science was hardly contemplated, and was certainly not recognised as a method of intellectual training; but the men who fought for it, such as Huxley, Tyndall, and Herbert Spencer, and those who gathered round them, were ultimately successful, and science was now recognised by the two old Universities, and long before was recognised by the Scottish Universities as a proper method of culture. The idea which was current for some time, that examinations would do everything, was falling into disfavour, and the proper teaching of science was being greatly developed. He had the greatest pleasure in associating with the toast the name of Sir William Abney, the head of the Science and Art Branch of the Government and the Controller of the General Elementary Education and Science throughout the country. He was not only a man of science, but an experimental philosopher of the highest type and distinguished for his researches in various branches of physics.

Sir WILLIAM ABNEY, in reply, after thanking Mr. Carteighe for what he had said of himself personally, said this toast really was unnecessary, as it was implicitly contained in the three previous ones, though he must admit that a little more science in Parliament would be welcome. It was with the greatest satisfaction that he found that scientific instruction was increasing so largely throughout the country. When he first had to do with scientific instruction under State control he found that all the laboratories he could muster up for the instruction of the poorer classes could be counted on one hand; at the present time there were nearly 700 scattered throughout the kingdom, giving instruction to between 18,000 and 20,000 students. That was something to boast of in fifteen years, and although Parliament did not quite understand

all scientific subjects, it was always ready to vote money for the purposes. Science was not out of place even in military matters, and was very useful, and had proved as useful in South Africa as the dogged perseverance and bravery of our soldiers, and it was also capable of revealing facts hitherto undreamt of in the realms of industry and commerce.

Mr. T. BAILEY SAUNDERS, M.A., Secretary of the London University Commission, proposed

The Pharmaceutical Society,

coupled with the name of the President. He said he had no special acquaintance with the field in which the Society carried on its work, but as a member of the public he recognised the essential importance of the work it did. The physician was now dependent on the skilled knowledge of others for the preparation of his medicines, which he no longer grew in his own garden, and it was difficult to exaggerate the usefulness of the part which the Society played as one of the recognised guardians of the public interest. It was to the educational side of the Society that he wished specially to refer. He understood that in the course of the present year they were to introduce a new scheme for the Preliminary Arts Examination, which was a matter for congratulation. This would no doubt help them to weed out the incompetent, and to prevent men whom Nature had not designed for the profession of pharmaceutical chemists from wasting their own time and that of their teachers on studies which they could not pursue to any advantage. It had also the special significance that it showed the Society was fully alive to the danger of the too exclusive pursuit of a special subject, and that they were determined that the men they sent out with the stamp of their approval should possess general as well as special education. Side by side with this new scheme there was another development in the educational work of the Society on which they were to be congratulated—a development in which he had had some share—namely, the connection which would henceforth exist between the School of Pharmacy and the University of London. Amongst the recognised teachers of the University, he was happy to say, would be the three professors of the School of Pharmacy—Professors Collie, Green, and Greenish—and all three would be members of the Faculty of Science. The Commissioners had also recommended the Senate to appoint in the University a special Board to look after the interests of pharmacy, and, though they could not pledge the action of the future Senate, he had little doubt that all three professors would be members of the Board, and would be able to advise the Senate on questions connected with pharmacy. A question had been raised as to what would be the practical effect on students of this connection between the School and the University, and it had been asked if students of the School would be able to obtain a degree in the University. He must disclaim any attempt at prophecy, but his personal opinion was that it was more than doubtful when a degree in science was likely to be conferred by examination alone in the subject of pharmaceuticals, but he thought it very likely that degrees in science might be conferred for pharmaceutical research. There was a special provision in the draft statutes providing that the higher degrees of the University might be obtained by research, and also the degree of Bachelor of Science, and he had little doubt that students of the School of Pharmacy who pursued some scientific research would be able to obtain such a degree, but, after all, there was another fact which seemed to him to be more important. The object of recognising the teachers at any Institution was to provide courses of study which the University could approve of, and he had no doubt when it became generally known that the School of Pharmacy was available for University purposes, there would be additional inducements to students to attend, and that in the not distant future no student of pharmacy would think of trying for the qualification who had not gone through a regular course of instruction. One of the main reasons for the reconstitution of the University of London was the recognition of the fact that the mere passing of an examination was not so important or beneficial to the student as the intelligent pursuit of a

regular course of instruction under proper guidance. The French pharmacien took a pride in telling you that not only he passed his examination, but that he studied under a particular teacher, and he remembered when in Brittany meeting a poor pharmacist in a rural village who told him with pride that he had studied under Frémy and Berthelot. He hoped the day would come when pharmaceutical chemists in England, no matter if they were only doing a small business, would in like manner feel proud of having studied under Collie, Green, or Greenish.

The VICE-PRESIDENT, in responding, said he had received telegrams from the President of the Medical Society, from the President of the Royal College of Veterinary Surgeons, and from Sir Frederick Abel, apologising for their absence. He had regretted that Mr. Martindale, the President, could not occupy the chair, but, as they all knew, during the past few months his health had not been very good, and, under medical advice, he had gone for a holiday. Mr. Sanders had referred to the abolition of the Preliminary Examination, the desirability of which had been long recognised by the Council, as it was felt that the standard was far too low. The most important portion of his remarks was that which referred to the further connection of the Society with the London University. This was a very important step in advance, and could not fail to be of immense service to the Society in the future. They were looking forward to a compulsory curriculum, because they felt that any scheme for a degree in science must rest not only on examination, but on evidence of training. However, as he should have to speak at some length on these topics to-morrow, he would not detain them longer on that occasion, but would at once propose the last toast, namely, "The Guests," which he coupled with the names of the Hon. G. Waldegrave Leslie, who took a prominent part in connection with the passing of the Pharmacy Act of 1868; Sir J. Crichton Browne, and Dr. Thorpe, President of the Chemical Society.

The Hon. G. WALDEGRAVE LESLIE having briefly responded and expressed the satisfaction it gave him to assist in the passing of the Pharmacy Act,

Sir J. CRICHTON BROWNE said it was only within the last two minutes that he had the slightest conception that he should be called upon to speak, and, there, unshrived, unhoucelled, and unannealed, with all his imperfections on his head, he came before them. He remembered in the report of a benevolent institution published lately in Dublin the committee stated that "Notwithstanding the large amount paid for medicines, the deaths during the last year had been comparatively few." That statement conveyed a somewhat pessimistic view of the position of pharmacy, and as they knew, the lethal effect of drugs formed a foundation of many of the current jokes of the period. He was accustomed, having been born north of the Tweed, to the slander first provoked by Sidney Smith as to the insensibility of a Scotchman to a joke without a surgical operation; but he always listened to such banter with equanimity, knowing well that there was no more richly humorous nation on the face of the earth than the Scotch. So the pharmacist, when lampooned as to the ravages they worked, might receive that nonsense as the homage of their youthfulness and to the potency of the agents they dispensed. The sceptical views which they often expressed as to the power of medicines was sheer affectation. Never in the history of the world were more drugs consumed than at the present time. Never was there such a multiplication of drugs, and he supposed in this as in other cases the supply must have some relation to the demand. Never before was there a Pharmaceutical Society doing such work, and surely the prosperity of a Pharmaceutical Society must depend mainly on the faith of the public in the materia medica. Sanitation, hygiene, diet, hydrotherapy, massage, and the open air were all playing their part in the conflict with disease and doing good work, and still drugs held their own; and he should be inclined to say that in every department of medicine there was a revival of belief in the beneficial influence of

drugs, both of those old well-established drugs, that had survived from the swarm and swelter unaffected, and in those modern drugs that organoseropathy was giving them. In his own department of drugs, as regarded diseases of the brain and the nervous system, he might say that drugs were sometimes almost magical in their effects, and that in the cases, numerous as they must inevitably be, where they could not affect a cure, they procured an alleviation of suffering to an unquestionable extent. So far as his department of practice was concerned, the pharmacists might rely on continued patronage, but unquestionably they would derive their larger profits from a zone just outside, the zone composed of neuropathic persons, who were, if he might coin a word, drugiferous, and who formed the prey to those lavish bodies of quacks that infested our modern civilisation. It might sound paradoxical, but it was true to say that men and women suffered most from the maladies with which they were not afflicted. Hypochondriasis was widespread, hysteria was abroad, neurasthenia was all but universal. There were many robust invalids who would be greatly shocked to be told there was nothing the matter with them or to be entirely cut off from those drops and tablets and tabloids in which they gloried. There were many unfortunate beings who went through the whole nosology in their own persons. Every epidemic was accompanied by its spurious imitation, and he should be glad to see a man, woman, or child in these islands who had not suffered from influenza on several occasions. There were certain maladies which loomed darkly in the public imagination, such as cancer, that had their counterfeits, and cause terrible alarm, until science had turned her searchlight on them, and he often thought that doctors were entitled to as much credit for dispelling unnecessary fears as irradiating actual diseases. He was not there to suggest means of dealing with the drugiferous classes, but perhaps something might be done for them by satisfying harmlessly their craving by innocuous combinations with very impressive and appalling names, and perhaps in that direction their German cousins might be able to assist, for they were sending the medical profession lists and pamphlets recommending methylpropylpetronium and such-like compounds, the contemplation of which was calculated to produce giddiness in any brain that had not been steeped and hardened in prolonged chemical study. He did not know that the Pharmaceutical Society had been directly concerned in this great and grievous war in South Africa, so often referred to, but the members were entitled to share to some extent in the praise that had been bestowed on the care of the sick and wounded. He had heard no breath of complaint against the medical stores or the surgical appliances that had been supplied. He might express a regret that while a number of great surgeons had been sent out to the seat of war, a few great physicians had not been sent out also. The long lists that were appearing daily of deaths from enteric fever, pneumonia, and dysentery were very distressing, and especially to those who had relatives at the front. The number of deaths from enteric fever alone must very nearly equal to those who had been killed in action or who had died of wounds, and it was now increasing out of all proportion to the strictly military casualties, which, thanks to the careful strategy of Lord Roberts and the economy of life in this campaign, were now comparatively trifling. Every death of enteric fever probably represents four cases of that disease, so that there must be an enormous amount of disability and crippling of our forces from this malady, and every case of enteric fever in which recovery took place was not over when the fever had subsided. It left after effects which were far reaching and serious, and for many a long year to come this country will have to bear the trial of this war, not merely in sorrowful remembrance of those who were lost, but in actual infirmity and diminished health. But enteric fever and pneumonia were preventable diseases. When introduced into a beleaguered place like Ladysmith they must spread, and no doubt enteric fever was epidemic in South Africa, and always prevalent amongst the civil population, but still he thought the occurrence of these maladies at a great number of different stations and camps, some in typically

healthy stations, suggested careful inquiry by eminent sanitary authorities, who might suggest precautions and might, at any rate, collect information which would be useful on future occasions. The idea that in enteric fever medical treatment was of no avail was fatalistic folly. There was no disease in which skilled medical treatment could do more to ward off death, to alleviate suffering, and to promote recovery, and he did think it would be a satisfaction to the friends of those who were struck down by this disease to know that they had had the advice of persons who had devoted their lives to the study of fever, and who were especially skilled in all the niceties of management of that malady.

Dr. THORPE also briefly responded, and the proceedings terminated.

List of Those who were Present.

The following is the official list of those who were present at the Annual Dinner of the Pharmaceutical Society:—

- | | | |
|---|--|---|
| Abney, Sir W. de W.,
K.C.B., F.R.S. (Board of
Education, Science
and Art Branch) | Gerrard, A. W. | Ridley, R. |
| Allen, C. B. | Glyn-Jones, W. S. | Robertson, Dr. W. M. |
| Allen, — | Greenish, Prof. H. G. | Robins, J. |
| Anderson, G. | Gregory, A. C. | Robinson, R. A., L.C.C. |
| Arkininstall, W. | Grosc, N. M. | Robinson, W. P. |
| Arnold, H. | Gulliver, W. F. | Roe, G. |
| Arrow, J. J. | Gunn, A. | Rogers, F. A. |
| Arrowsmith, A. A. | Hall, H. E. | Rogerson, W. J. |
| Atkins, S. R. (Treasurer) | Hanson, A. W. | Royle, H. W. |
| Attfield, Dr. J., F.R.S. | Hardwicke, Dr. R. R. | Royle, J. W. |
| Baiss, Arnold | Harrington, J. F. | Saunders, T. Bailey,
M.A. (Secretary, Lon-
don University Com-
mission). |
| Baiss, W. H. | Harrison, J. | Savory, A. L. |
| Barron, R. | Harvey, Roger M. | Shannon, R. J. |
| Boa, Feter (Chairman
of Executive N.B.
Branch) | Harvey, W. | Sherwood, N. |
| Bolton, H. N. | Heighington, T. G. | Siverlock, H. T. |
| Bolton, H. N., jun. | Hill, A. T. | Simpson, Alderman H. |
| Bottle, A. | Hill, C. A. | Smith, F. Adams |
| Bourdais, I. | Hillen. — | Smith, F. A. Upsher |
| Bourdais, I., jun. | Hills, Walter | Smith, J. H. |
| Boutall, G. S. | Hills, Dr. Rowland | Smith, S. |
| Bowen, J. W. | Hodgkinson, C. | Solomon, A. H. |
| Boxall, Fred | Hodgkinson, — | Squire, G. |
| Bremridge, R. (Secre-
tary) | Hodgson, C.R. (College
of Preceptors) | Stacey, H. G. |
| Bremridge, R. Harding | Holmes, C. J. | Stevenson, H. E. |
| Browne, Sir J. Crichton,
F.R.S. (Treasurer Royal
Institution) | Holmes, E. M. (Presi-
dent, British Pharma-
ceutical Conference) | Stickland, W. |
| Bush, E. | Howie, W. L. | Stickland, W. H. |
| Butt, E. N. | Humphrey, J. | Symes, Dr. C. |
| Carteighe, M. | Ison, E. | Tanner, A. E. |
| Carter, R. C. | Jarvis, C. | Taubman, R. |
| Castle, J. W. | Jones, A. O. | Taylor, G. S. |
| Chalmers, W. | Jone, G. E. | Thompson, Sydney |
| Chater, A. J. | Jones, R. H. | Thomson, Professor J.
Millar, F.R.S. (Presi-
dent, Institute of
Chemistry) |
| Church, Dr. Selby
(President Royal Col-
lege of Physicians) | Joyce, T. G., B.Sc. | Thorpe, Dr. T. E., F.R.S.
(President, Chemical
Society) |
| Clarke, R. Feaver | Kingan, D. | Thurston, J. |
| Collie, Prof. J. N., F.B.S. | Knight, C. J. | Trimmer, E. (Secretary
Royal College of Sur-
geons). |
| Cooper, A. | Lamb, Dr. W. H. (Prosi-
dent Harvean Society) | Tucker, — |
| Cooper, A. J. B. | Lansdown, G. A. | Umney, C. |
| Cooper, J. | Leslie, Hon. G. Walde-
grave | Umney, J. C. |
| Copeland, Dr. W. L. | Lewis, D. | Vincent, Sir Howard,
K.C.M.G., M.P. |
| Cottle, Dr. Wyndham | Linstead, E. | Walker, H. J. D. |
| Coulson, T. | Lloyd, J. | Walker, H. |
| Cownley, A. J. | Lorimer, J. | Want, W. P. |
| Cross, W. Gowen | MacEwan, P. | Waring, A. W. |
| Davidson, P. | Martin, C. T. | Warren, F. W. |
| Davies, T. | Martin, T. C. W. | Warren, W. |
| Davis, W. A. | Martindale, Dr. W. H. | Welby, Lord, G.C.B.,
L.C.C. |
| Dixon, R. | Mathews, J. H. | Weston, S. J. |
| Doran, A. (President,
Obstetrical Society) | Moon, H. | Whiffin, T. G. |
| Duckworth, Sir Dyce
(Treasurer Royal Col-
lege of Physicians) | Moore, J. E. Langford | „ Friend |
| Dumayne, F. J. | Morgan, — | White, Edmund |

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

A Poet on the Situation.

I think Mr. Alexander Laing's letter in last week's *P. J.* introduced the needed element of humour among so much exceedingly serious matter. Not that Mr. Laing is to be taken other than seriously, apart from his eccentricities of language, any more than his "Currie" would be taken by ordinary pharmacists just for the fun of the thing. But in a friendly contest, such as our Council election ought always to be, the effects of the introduction of unavoidable personalities can be greatly softened if the humorous element is not entirely lacking during the inevitable discussion of controversial matter. Mr. Laing has supplied the humour which has been lacking during the last few weeks and urges the maintenance of the "no-surrender policy" in a manner which imparts to the subject a distinct flavour of novelty. He has not written a lot of nonsense about companies and the supposed "right divine" of pharmacists, he does not "cry for the moon," he has not even "dropped into poetry," but nevertheless his letter gives the impression that a definite policy can be formulated, which shall commend itself to ordinary pharmacists, though not necessarily to Mr. Glyn-Jones or to Mr. Lord Gifford. Mr. Currie may or may not be the individual destined to formulate that policy—on the whole I am of opinion that he is not—but the whole-hearted advocacy of his claims by Mr. Laing should appeal to him strongly. And whether Mr. Currie secures a seat on the Council or not, the Larbert poet-pharmacist has now put his hand to the helm and means to make someone or something bump. It does not appear altogether a wise thing to make a drifting ship bump, especially if her boilers are badly corroded, but perhaps the condition of the vessel is not so bad as Mr. Laing, with his poetic licence, would make out.

The P.A.T.A. and the Council Election.

Some members of the P.A.T.A. do not appear to view with equanimity the fact that Mr. Glyn-Jones is the proprietor of the *Anti-Cutting Record*, and that is not altogether surprising if they have been under the impression that the paper was their own property. It seems to me, however, that it is entirely their own fault if any such impression has existed among them, for nothing was easier than that they should ask for and obtain full information on the subject from Stonecutter Street. At the same time, I can sympathise with Mr. Waddington if the facts be as he states, though the conclusions he draws are probably exaggerated. In effect, the position, as it appears to Mr. Waddington, is that the P.A.T.A. has subscribed for copies of the *Record* supplied to its members, and has thereby become committed to advocacy of the candidature of certain individuals who have been seeking election on the Council of the Pharmaceutical Society, owing to the insertion of Mr. Glyn-Jones's circular in the last number of the paper. But Mr. Glyn-Jones doubtless has a satisfactory answer to the implied charge of unduly attempting to involve the P.A.T.A. in the Pharmaceutical Society's affairs, though, if that be so, the sooner it is forthcoming the better, as such interference by another body will not be tolerated by the members. Even though every member of the P.A.T.A. were also a member of the Pharmaceutical Society, it would be decidedly improper for the first body to make use of its organisation to attempt to influence the affairs of the other.

How the Point of View Varies.

In his comparison of Mr. Glyn-Jones with the Society's leaders, I think the local secretary for Bradford distinctly scores, *i.e.*, assuming the accuracy of his contention—that the individual he criticises is "doing exactly the things which he blames our present leaders for doing." I may say, however, that my opinion is that Mr. Glyn-Jones is probably not doing exactly the things he blames others for doing, but refutation of such a charge may safely be left to himself. It may be true that he dominates

the P.A.T.A., but, if so, that is likely to prove advantageous to the body dominated; any success achieved by the P.A.T.A. is chiefly due to him, and it will be an evil day for the organisation when it loses his services. And, in any case, that is entirely a matter for the members of the P.A.T.A. to settle among themselves; if they, or the majority of them, prefer one-man rule and success to a multiplicity of rulers and disaster, they are simply displaying their common-sense and are to be congratulated accordingly. But I should doubt much whether Mr. Glyn-Jones can fairly be accused of carrying on his business in anything approaching an illegal manner. As regards the reference to exercise of economy in publishing the *Pharmaceutical Journal*, much has apparently been effected in that direction since Mr. Glyn-Jones was elected on the Council, though it is not necessarily a case of *post hoc propter hoc*. But, in any case, I fail to see that comparison of the cost and contents of the *P. J.* with the *Anti-Cutting Record* proves much one way or the other.

How the Journal Should Develop.

Reference to the contents of the *P. J.* reminds me, by the way, that the idea of a trade supplement to the Journal, suggested by me last week, has presented itself to at least one other member of the Society. Not that there is anything surprising in the coincidence, for, as a matter of fact, "T. G." represents a large and increasing number of pharmacists who are of opinion that one journal—and that their own property—may well be made to include everything that is of interest to them in their daily round. And though, as "T. G." remarks, it may seem a large order to demand that the official organ shall be the best trade journal as well as the best scientific journal, "that is the order." How long or how short a time may elapse before the order is filled depends largely upon the actual proprietors of the *P. J.*—the members of the Pharmaceutical Society. I suppose we may assume that all the numerous changes in the Journal which have taken place during recent years have been due, directly or indirectly, to demands made by members for such information as they were being driven elsewhere to procure; that being so, past experience would seem to indicate clearly what "T. G." and others who share his views must do to secure the realisation of their desire that the official organ—in its supplement or elsewhere—should contain, week by week, the fullest collection of matter and advertisements interesting to the pharmacist in his business.

Of Pharmaceutical Research.

Mr. Butt's notice of motion recalls the fact that the Pharmaceutical Society's Research Laboratory was instituted as far back as January, 1888, for the purpose of furthering "pharmaceutical research." How that term has since been interpreted may be judged from the fact that, according to the 'Calendar,' students who seek admission are expected to be "desirous of obtaining information concerning the application of chemistry to the higher branches of pharmacy, or of undertaking scientific inquiries." Again, it is stated that, in the Research Laboratory, advanced instruction is given "in chemistry in its relations to pharmacy and in the methods of chemical investigation." Mr. Butt, who was a member of the Council when the Laboratory was instituted, is apparently desirous that the investigations pursued there should savour less of abstruse chemistry than has been customary for some time past, and that such work as is done should have a more direct bearing on subjects of pharmaceutical interest. In that he is only proposing to adhere to the original proposition and, judging from the somewhat scanty allusions to the work of the Research Laboratory which have recently been published, it appears as though investigations such as Mr. Butt would approve of are already proceeding. But of that we shall doubtless know more when the report of the special general meeting is published. It is gratifying to learn, however, that in connection with future revision of the Pharmacopœia work is now being done under the control of the Council of the Pharmaceutical Society.

LETTERS TO THE EDITOR.

Mr. Glyn-Jones Replies to Mr. Waddington.

A reply to the attack made upon me by Mr. Waddington in your columns last week will perhaps be expected of me. The first part of his letter dealt with my connection with the P. A. T. A. and the *Anti-Cutting Record*; but, as it suggests that the members of the Council of that Association have allowed me to "dominate" them, and that they have paid me moneys for which they have not received value, I have called the attention of the President to it and have left the matter with him. I would simply say that on the 5th instant I received from Mr. Waddington a list of the payments he refers to, with a request for an explanation of them. I wrote him on the 7th instant, fully explaining the items, yet he sent for publication to the Journal a letter, dated the 9th instant, which was full of insinuations but completely ignored my explanations.

Your readers may naturally wonder why, seeing that Mr. Waddington wrote to me for information as to the P.A.T.A. accounts, he did not in the same letter ask for replies to the inquiries he now thinks fit to put to me publicly in your columns as to the conduct of my retail business. I think I can give them the reason. Towards the end of last year I was in Bradford for two or three days on Association business. On one of those days Mr. Waddington entertained me at luncheon. We freely discussed "shop" in general and our own shops in particular, and in reply to his inquiries I explained that I was able to leave my business, because I was fortunate in having a younger brother as one of my assistants. Mr. Waddington further learnt from me, in the course of this friendly chat, that my brother, who has since taken another engagement, was not yet registered, and I had therefore employed a qualified man as manager. There was nothing to justify Mr. Waddington's foolish suggestion that the qualified manager of my business was subordinate to my brother, though there would have been nothing illegal in that. The facts relating to my business are these. I, its sole proprietor, use the trade name of "Glyn and Co.," and if Mr. Waddington's name were "Jones" he might have found it convenient to have adopted a trade name for distinguishing purposes. My trade name appears on my poison and other labels. I employ, and always have, since I ceased giving to the business my close personal attention, a qualified chemist, and he has always been my responsible manager. These are the bare facts, which I am certainly not ashamed for all the world to know.

My work in connection with the trade is public property, and I do not shrink from criticism in connection with it, but I suggest to Mr. Waddington that it is, to say the least, not particularly manly or courageous to attack me by veiled insinuations and questions, which are by most honourable men regarded as a contemptible method of controversy. Mr. Waddington desires your readers to suppose that there is something improper in my mode of conducting my business, and here he is making libellous suggestions; but I prefer to seek no other protection against him than a public statement of the facts and the judgment of my fellow-traders upon them.

London, May 15, 1900.

W. S. GLYN-JONES.

The P.A.T.A. and the Anti-Cutting Record.

May I ask you, in fairness to the Proprietary Articles Trade Association, to insert in your next issue my reply to a letter appearing in your Journal of May 12, and signed Alfred H. Waddington, Bradford. Now, the P.A.T.A., I can positively assert, has no interest in the Pharmaceutical Council election. I found the heading of Mr. Waddington's letter, "P.A.T.A. and the Council election," explained by a statement in the letter "that Mr. Glyn-Jones is practically the P.A.T.A.," and supposed that the letter referred to some personal action taken by our Secretary in his capacity as a member of the Pharmaceutical Society. The Council of the P.A.T.A. consists of ten retail

chemists, elected by over three thousand pharmacists, and twenty of the principals of leading wholesale and manufacturing houses in the drug trade. To suggest that such men are dominated by one man—a servant—however able he might be, is as insulting as it is untrue. It is my duty to defend that Council from the reflection cast upon it by Mr. Waddington that it has put money into Mr. Glyn-Jones's possession without getting adequate value in return. Mr. Waddington's suggestion is due either to malice or ignorance of the facts. It is based upon figures taken from our 1897-98 balance-sheet. Of the items to which Mr. Waddington directs the very serious attention of the members of the Pharmaceutical Society, as well as our own members, he selects for comment that of £635 for salaries, and £244 paid to the *Record*. Those figures cover fifteen months. The item of £635 included the salaries of Messrs. Glyn-Jones and Johnston (two qualified chemists) and four clerks. Even Mr. Waddington will perhaps see that somebody was underpaid during those fifteen months. Knowing nothing about the matter, he suggests that our Secretary did not go short.

Mr. Waddington thinks our payment of £24 towards the *Anti-Cutting Record* expenses was extravagant. Mr. Glyn-Jones, by means of the *Record*, founded the P.A.T.A., and when that organisation came into existence he suggested that the Council should take the responsibility of publishing the *Record*. It was, and is, however, a convenience to us that he should continue to publish it. It is the duty of the P.A.T.A. to send monthly to every chemist in the United Kingdom in business the protected list, with its alterations and additions. We used the *Record* for this purpose. It prints and circulates the list for us—to have printed and posted that list alone would have cost us over £450. The *Record* did it for £244. If Mr. Waddington has a better offer to make we will gladly consider it. So much for our defence as a Council. I think, however, most of our members, indeed, I believe most non-members also, will deplore the personal tone adopted by Mr. Waddington towards our Secretary—the insinuation that to him his work for the trade is a matter of money-making is an extremely mean one. I may tell Mr. Waddington, with the full knowledge of the facts contained in the Association and *Record* balance-sheets, that Mr. Glyn-Jones's connection with the Association and the *Record* involves a pecuniary sacrifice on his part—in plain English, a loss of income. Those of us who best know Mr. Glyn-Jones and his work on behalf of his fellow chemists feel that no money could repay him for the nights—many spent in a railway carriage—as well as days, spent in their service. The energy he has put into his work—his whole-hearted devotion—are worthy of something better from chemists as a body. If Mr. Glyn-Jones had received the whole of the £635 I should even then consider him underpaid for the work he has accomplished.

London, May 15, 1900.

A. TEBBUTT,

President of the Proprietary Articles Trade Association.

Mr. Percy Bean's Explanation.

The fact of my subscription to the Pharmaceutical Society not having been paid is due entirely to oversight. I have been out of the business as a retail chemist for the last five years, and am only interested from a professional point of view—i.e., the protection of my title as a chemist. In excuse for the oversight, I might say that I am just recovering from a four months' illness, ten weeks of which were spent in bed. When I interested myself on Mr. Gifford's behalf it was my intention to at once subscribe to the Society, in order to place myself in touch again. Through a relapse I have not been able to take an active part for the last three weeks, and the letter bearing my signature in the *Pharmaceutical Journal* this week was not signed by me, nor was I at the meeting. Had I been I should have remembered that I had not yet sent up my guinea. Being on the committee for election purposes, my name was attached as usual.

For this I am entirely to blame, as I feel sure not one of the election committee knew that I was not at present a member of the Society. The Journal has just been placed before me, and I am writing at once to put the matter right by sending my subscription. As I am willing to take the responsibility on my own shoulders, I trust you will give my letter the necessary publicity. I am only anxious for the welfare not only of members of the Society, but of all chemists—hence my interest in the work at all.

Blackburn, May 11, 1900.

PERCY BEAN.

Subscriptions to the Pharmaceutical Society.

Does paying the subscription to the Pharmaceutical Society to the local secretary count as if paid to the secretary in London? I paid mine to the local secretary here on April 28, and received a letter from Mr. Bremridge about May 5 saying my subscription had been received after May 1, and my name would have to be submitted to the Council, etc. I wrote him, giving him the particulars, but have received no reply. It is a bit of red-tapeism, I suppose, but it is rather hard, as it disenfranchises me for the Council election. I have been a student, associate, and member for twelve years.

Exeter, May 11, 1900.

GEO. R. HARRIS.

*** All annual subscriptions become due on January 1 in every year, and, in accordance with the Bye-law, must be paid before May 1. They may be paid to local secretaries before March 31, but after that date should be sent direct to Mr. Bremridge. In the present instance, apparently, the difficulty has been caused by the local secretary accepting the subscription after the proper date and neglecting to forward it at once or with an explanation of the circumstances. [Ed., P. J.]

The Companies Bill.

I enclose herewith copy of a letter received to-day from Mr. Alexander Ure, M.P., Linlithgow County, in answer to one I sent him on March 12.

ALEXANDER SPENCE,

Local Secretary, Linlithgow County.

Linlithgow, May 11, 1900.

[ENCLOSURE.]

House of Commons, May 9, 1900.

My Dear Sir,—I have been postponing my reply to your letter of March 12, relative to the clause found objectionable by pharmaceutical chemists in the Companies Bill, until I could say something definite about the prospects of the measure. I now think its chances of passing this session are somewhat remote. But I shall keep carefully in view your proposals relative to the objectionable clause. I may say that I entirely agree with the views you and those who are acting with you urge.—Yours faithfully,

(Signed) ALEX. URE.

To Alexander Spence, Esq., Chemist,
133, High Street, Linlithgow, N.B.

The Pharmacy Acts in Theory and Practice.

For some time past my lot has been cast with a pharmacist of the old school, and I have frequently heard him declare that neither the Pharmacy Act nor the Poisons Bill ever did the trade "a ha'porth of good." Being youthful and optimistic, I at one time frequently joined issue with him on this score. I am wiser now, for facts are stubborn things. Theoretically, the Pharmacy Act, in its essentials, was to provide a body of public servants capable of compounding doctors' prescriptions. Practically, the men who have qualified themselves for the office, according to the Act, are frequently superseded by the errand boy, cook, or groom of the doctor himself. *Vide the Nottingham Evening Post*: "Errand boy wanted by doctor. A suitable one would be taught to dispense and found regular work." Theoretically, the Poisons Act was to protect the public by providing that poisons could only be obtained from those who by their knowledge and experience would be in a position to reduce the possibility of accidents to a minimum. Practically, if you feel tired of life, and want to end it, as the majority

do, go to your oil and colourman, or your grocer, and get a penny-worth of carbolic acid in a tea-cup.

This brings me to the point raised by Mr. Frank R. Dudderidge in the last issue of the Journal. Like him, I have often been amazed by the absurdities perpetrated in the name of the Poisons Schedule; but, unlike him, I have come to the conclusion that to try to explain them is useless, as I am persuaded that they have their rise, not from the plain and straightforward wording of the Schedule, but from the frantic but mistaken efforts of the Pharmaceutical Society to enlarge the scope of the Bill by stretching the list to its utmost limit. I would respectfully suggest that it is undignified for the Society to attempt to get recognised as included in the Schedule articles which, if plain English means anything, should be left out; rather, would it not be better for them to concentrate their efforts on drawing up an amendment of the Bill which would satisfy modern requirements, and then, like the importunate widow, weary the powers that be till they gain their ends? The stereotyped answer to this is, of course, that it is useless to attempt to create a monopoly. Why? The lawyer qualifies in law and enjoys a monopoly, and so does a doctor in medicine with an equally delightful result. Why should not a pharmacist who qualifies in pharmacy enjoy a monopoly, too?

Bridgnorth, May 13, 1900.

WILLIAM J. BROWN.

Glaucium Luteum.

I quite agree with Mr. Druce that ordinary floras and text-books are very deficient in information concerning the soil in which plants grow in a state of nature. A few words, stating whether the soil is calcareous, silicious, peaty or clayey, or volcanic, would be of great benefit to those interested in horticulture. But the conditions as regards soil under which plants can be made to grow are by no means always the same as those under which the plants occur in nature. The degree of moisture normally present in the atmosphere and the retentiveness or porosity of the soil as regards the amount of water it contains, as well as the soluble constituents of the soil itself, have a great deal to do with the conditions under which a plant grows.

I have in my garden three healthy plants of *Glaucium luteum*, which I brought from Devonshire last year. They were growing on the beach at Torcross in shingle, mixed with much finer shingle, almost like sand, and were growing in the blazing sun. Their roots found ample drainage, but sufficient moisture. In my garden they are growing in a mixture of sandy loam, peat, and a little clay, and in the full sun, and have never been given any salt. But plants which prefer the slightly saline soil of the seaside will often occur in the wild state hundreds of miles distant from the sea where the soil is saline, as in the deserts of Turkestan, where varieties of *Artemisia maritima* grow, and in Persia and the N.W. Himalaya, where *Tamarix gallica* flourishes. Doubtless a little salt in the soil is an advantage to seaside plants under cultivation, such as asparagus and seakale. *Cochlearia officinalis* is also growing luxuriantly in my garden without any salt.

Sevenoaks, May 12, 1900.

E. M. HOLMES.

Standardisation of Tincture and Liquid Extract of Cinchona.

In the Journal of April 7 Mr. Dewhirst states in his "Notes on the B.P. Standardisations" that the ether-chloroform solvent recommended by me for the extraction of alkaloid from tincture and liquid extract of cinchona "gives a low result." It is difficult to understand how he arrives at this conclusion. Preliminary treatment with ether in acid solution and then with ether-chloroform and ammonia, as recommended by him, I had formerly discarded, as giving rise to a more unmanageable emulsion than that obtained by the B.P. method of assay, and further attempts to get the process to work satisfactorily have resulted in failure. As regards the tincture, the removal of the alcohol by the ether in the initial step

of the process is anything but advantageous, as it is found that the addition of alcohol to the intractable emulsion causes an immediate separation of the solvent. If the tincture be simply treated with ammonia and ether-chloroform, the solvent separates without difficulty. This would seem to indicate that the removal of the alcohol—the result of the treatment with ether in acid solution—is objectionable. I see no reason for departing from the method of assay which I proposed in my note to the Journal of January last. Ether-chloroform (1 : 9) amply ensures the removal of the alkaloid, and there is rarely any trouble with emulsification, any occasional tendency in this direction is readily overcome by the addition of a few drops of alcohol to the contents of the separator after standing for a few minutes. 5 C.c. of a weak liquid extract of cinchona, which I had in my possession, gave, on assay of the above method, 0.2095 Gm. of alkaloid. Further extraction of the alkaline liquid with ether-chloroform gave a minute residue, which was found unweighable. A third extraction with benzolated amylic alcohol gave a residue weighing 0.0001 Gm. Tincture of cinchona, assayed by the same process, using 3×20 C.c. of the solvent, gave for 10 C.c., 0.1032 Gm. of alkaloid. A second agitation of the alkaline liquid with the same amounts of ether-chloroform gave on reweighing 0.1036 Gm. of alkaloid, an increase of 0.0004 Gm. Ten C.c. of the same tincture, assayed as per B.P., the benzolated amylic alcohol being separated from the alkaline liquid with much difficulty and loss of time, gave 0.0915 Gm. of alkaloid. Additional extraction with ether-chloroform gave an increase of 0.0006 Gm. of alkaloid. These fractions of a milligramme of residue—presumably alkaloid—obtained on additional extraction can scarcely, however, represent the loss of alkaloid that Mr. Dewhurst refers to, and I am still unable to understand how the use of ether-chloroform (1 : 9) “gives a low result.”

Edinburgh, May 15, 1900.

J. STENHOUSE.

Pharmacognosy, Pharmacography, Etc.

I had, up to the present, been under the impression that pharmacognosy was what it meant—viz., the knowledge of drugs, but this, according to “a well-known lecturer on pharmacology,” and also according to Mr. W. A. Knight, is quite wrong. This much, however, is certain, that the *pharmacologist*, or talker about drugs, is not limited to any one class.

In view of the difficulties which encompass those who are anxious to use the right word in the right place, I have attempted the subjoined classification, arranged in a tabular form for the convenience of examination candidates. This I humbly submit to Mr. Knight's consideration:—

Materia Medica or Pharmacognosy (in the broad sense).	Pharmacognosy (in the correct sense)	{	Zoopharmacognosy	{ Megazoopharmacoscropy
			Phytopharmacognosy	{ Microzoopharmacoscropy
			Heteropharmacognosy	{ Megaphytopharmacoscropy
				{ Microphytopharmacoscropy
Pharmacography	{	Pharmacoeology	{ Zoopharmacoeology	
		Pharmacogeography	{ Phytopharmacoeology	
			{ Zoopharmacogeography	
		Pharmacoeconomics	{ Phytopharmacogeography	
{ Heteropharmacogeography				
Pharmacology and Therapeutics	{	Pharmacoeconomics	{ Megapharmacoeconomics	
		Pharmacoeconomics	{ Micropharmacoeconomics	
			Pharmacochemistry (To be carefully distinguished from Pharmaceutical chemistry)	
Pharmacoadulteries	{	Pharmacoadulteries	{ Megapharmacoadulteries	
			{ Micropharmacoadulteries	
With these the pharmacist should have nothing to do. Suffice it to know that Pharmacology consists mainly of animalochemicals, whereas therapeutics is a subject of great complexity, subdivided into a great many branches which are quite beyond the reach of the pharmacist's ken.				

In conclusion, it is to be noted that in most of the above words the letter “k” may be advantageously substituted for the letter “c,” inasmuch as it will show outsiders that we, as pharmacists, are an educated body, well conversant with the Greek language, and worthy of protection at the hands of the British Government.

London, N., May 15, 1900.

P. E. F. PERRÉDÈS.

The Dewsbury Ballot.

“Xrayser” in the *Chemist and Druggist* describes our ballot at Dewsbury as a solemn farce. As the voters were all members of the Pharmaceutical Society, what sort of a farce does he consider a ballot which included non-franchised outsiders and all their progeny? Surely it is time that sensible chemists and druggists had their eyes opened to the ridiculous transparency of such inflated misrepresentations. Whatever our business capacity may be, this constant underrating of our mental calibre is somewhat nauseating.

Batley, May 15, 1900.

R. BROADHEAD.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed “Editor, 17, Bloomsbury Square, London, W.C.,” and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

MARKING INK (S. E. D.—42/6).—You will find a formula for such a preparation in the *P. J.* for September 23 last, page 314.

COD LIVER OIL WINE (S. W.—42/5).—It is probably cod liver oil with iron wine, a combination which is frequently supplied for children.

SHAMPOO POWDER (E. J. L.—42/7).—You would doubtless be liable if you used the name without permission, especially as you say he makes a similar preparation.

NAME OF PLANT (J. A.—42/9).—It is a foreign species of *Epimedium*, probably *E. macranthum* (N. O. Berberidaceæ). Can you procure and send on a root of the plant?

PINOLINE (R. D.—40/16).—Mr. S. Stephenson, pharmaceutical chemist, 98, Kensington, Liverpool, informs us that he is the manufacturer of a preparation named “pinoline.”

TRADE PRICES OF IVORY (M. T. F.—42/2).—The following are the prices:—Elephant tusks, weighing from 50 lbs. and upwards, £50 to £67 per cwt.; 30 lbs. to 50 lbs., £42 to £59; 20 lbs. to 30 lbs., £30 to £50; small stuff, £27 to £36; river horse teeth fetch from 8½d. to 1s. 9d. per lb. The variation in price is due to quality and shape of tusks and the use to which the ivory may be put.

Information Wanted.

*** The Editor will be obliged to any readers who can supply the information asked for by correspondents.

ACME BRAND CAMPHOR OIL.—Address of proprietors?—(A. B.—41/6.)

SULPHOCALCINE.—Particulars regarding liquid named “sulphocalcine,” said to be used as a vaginal injection?—(F. W. H.—40/8.)

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE ‘PHARMACEUTICAL JOURNAL’ must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, ‘Pharmaceutical Journal’ Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MAY 19, 1900.

THE SOCIETY'S ANNIVERSARY.

PERHAPS the most remarkable feature of the annual meeting last Wednesday was the very slight reference made to the matter which has lately received so much attention from chemists and druggists throughout the kingdom. That circumstance is remarkable because of the wide difference of the opinions held by chemists and druggists as to the mode in which the proposed legislation affecting companies should be dealt with on their behalf, some insisting that on no consideration should departure from the principle of the Pharmacy Act be conceded, while others are in favour of some sort of compromise, although compromise to any extent involves sacrifice of the principle involved in qualification. The VICE-PRESIDENT, in his opening address, spoke of the position taken by the Council as being clearly defined in the report, but Mr. CAMPKIN, who chiefly spoke on that subject—while expressing himself in favour of decided opposition to Clause 2 of the Companies Bill or to any temporising with those who would attempt to legalise companies trading as chemists and druggists and, as might therefore be inferred, approving of the decision of the Council to oppose that clause—appeared, from what he said, to complain of being unable to ascertain what the Council has done, or what is likely to be the position it would take up when the clause came up for discussion in Parliament.

It is difficult to understand what reason there could be for uncertainty on that point, although the Council's decision has been the work of a majority, unless it were that Mr. CAMPKIN anticipated that the result of the election would alter the preponderance of opinion in the Council, and have the effect of placing the opponents of Clause 2 in a minority. Moreover, Mr. CAMPKIN appeared to be under the impression that enough had not been done towards giving greater effect to the original intention of the Pharmacy Act of 1868, and that something was wanting in that respect to enable the Council to command the confidence of members of the Society. He

appeared to forget, or to ignore, the repeated attempts that have been made by the Council in that direction during the last nineteen years, and to overlook the fact that those attempts have been defeated by the unwillingness on the part of chemists and druggists to give up or curtail the "Widow's Clause"—which is the foundation of the House of Lords decision, and of Clause 2 of the Companies Bill. The want of unity prevailing in connection with organisation, opinion, and action has had the effect of making the body which the Pharmaceutical Society represents of less account in public opinion than it might have been. In spite of the astonishment felt by Mr. MACKENZIE at the recognition of physicians, surgeons, dentists, and even midwives in the Companies Bill, while a Society with a Royal Charter and Acts of Parliament is absolutely ignored, that position is a perfectly natural one, for highly as the Pharmaceutical Society is esteemed in some quarters, it is still open to the countervailing reproach that the rank and file of chemists and druggists are not of it, that it does not represent the interests which they hold to be of the greatest importance. Hence it is that by the suicidal negligence of those the Society was established to benefit, opportunity has been provided for their enemies to counteract the Society's influence, and to give a false direction to public opinion.

The result of the Council Election—a report of which will be found at page 562—is to give emphatic expression to the divided opinion which Mr. HILLS spoke of some months ago as being a hopeless condition. Two out of the three late members of Council who are not re-elected formed part of the majority which decided to oppose Clause 2 of the Companies Bill, the other one was to some extent in favour of a compromise. Of the newly-elected members who take their places, one is in favour of opposing altogether Clause 2, but the other two, judging from their previous expressions of opinion, may be expected to take an opposite position. The result of the Election, therefore, does not very materially affect the position of the Council in regard to the Companies Bill, as there will still be a considerable majority of the members who support the policy of decided opposition to the provisions of Clause 2 of that Bill. The lamentable indication of incoherence even among members of the Pharmaceutical Society in regard to such an important matter is, however, a most disquieting fact, especially if it may be assumed to represent the existence of a similar condition of the two or three thousand who have not voted. As to what may be the state of mind of the much larger number of registered chemists and druggists who are not members of the Society it would be rash to offer an opinion, though it does point to a general inheritance of chaos such as Mr. LAING lately referred to. The reference made by Mr. R. A. ROBINSON to the recent change in the constitution of the Society, by which every registered chemist has now the opportunity of sharing the privileges of membership and representation, should meet with consideration in that quarter, for if, as Mr. ROBINSON said, the body were so consolidated that in going to Parliament its full influence could be brought to bear, through the Pharmaceutical Society, he fully anticipated that happier results might certainly be looked for when the necessary amendment of the Pharmacy Acts is taken in hand, as it evidently must be before long.

ANNOTATIONS.

THE ANNUAL DINNER of the Pharmaceutical Society, held at the Whitehall Rooms on Tuesday last, must take its place as one of the most successful affairs of the kind on record. It is true the head of the Society was unfortunately absent, but the position of chairman was admirably filled by the Vice-President, Mr. G. T. W. Newsholme. A somewhat novel feature of the evening's entertainment was that the Chairman wisely placed some of the more important toasts in the hands of other members of the Society. Thus, Mr. Walter Hills proposed the toast of "The Imperial Forces," Mr. R. A. Robinson proposed that of "The Houses of Parliament," Mr. S. R. Atkins was in his best form when eulogising "The Medical Profession," and Mr. Michael Carteighe was quite at home when he discoursed upon "Science." The responses to all the toasts were in equally able hands, and the general interest attaching to the utterances of the visitors is clearly shown by the unusual space devoted to the reports of the proceedings in the daily Press. A word of praise must be spared for the excellent dinner arrangements. Everything went as smoothly as possible, and the Dinner Committee, together with the capable Hon. Secretary and his staff, are to be cordially congratulated upon the great success which has attended their joint efforts.

THE ANNUAL MEETING was likewise presided over by the Vice-President, who showed marked ability in dealing with the numerous and varied items in the annual report and statement of accounts. He began with a well-deserved compliment to the gentlemen who have presided over the destinies of the Society for so many years past, and then plunged straightway into one of the most lucid expositions of the Society's financial position that the members have ever been favoured with. It is peculiarly gratifying to note Mr. Newsholme's appreciative reference to the affairs of the *Pharmaceutical Journal*, and his expression of opinion that the considerable saving on the past year's working has been effected without any alteration in the official organ "except in the way of improvement." The examinations, the School of Pharmacy, the Benevolent and Orphan Funds, and the various directions in which the Council has manifested activity during the past year, were all touched upon by the Vice-President—briefly, but yet satisfactorily—and at the conclusion of his long speech Mr. Newsholme was rewarded with earnest and hearty applause. The Society's Treasurer seconded the adoption of the report in his usual eloquent manner, "apologising" for the Society in a most graceful style. The dislike frequently expressed for the Society and its Council, as Mr. Atkins pointed out, is largely explained by the fact that a body which is empowered by Statute to conduct examinations and prosecutions must necessarily be unpopular with a very large number of people affected.

THE COUNCIL WAS CRITICISED upon this occasion, as usual, but the business of the meeting generally was conducted in a spirit of marked good humour. Mr. Mackenzie asked for information which it is not considered necessary or desirable to publish, and Mr. Wells expressed regret that more detailed accounts are not supplied to the members. The Vice-President, however, made it clear why the prevailing conditions are, on the whole, those best adapted to the Society's needs, and the opinion of the meeting evidently was that the Council ought to be trusted fully in such matters. Mr. Umney clearly explained the position of himself and his fellow-auditors, and congratulated the Society upon the excellence of the accounts presented to the members. Mr. Robinson, again, congratulated the Society upon the improved position of its affairs, whilst Mr. Gaubert proved a great success as a humourist, enlivening the tedium of the proceedings, which is almost inseparable on such occasions. Finally, the Vice-President smartly summed up the discussion, replied briefly to such criticisms as had been offered, and put the motion for the adoption of the annual report. That the motion was carried unanimously, it is almost needless to say, for the

critics were all friendly ones, more desirous apparently of gleaning information and testing the capacity of the Executive than of obstructing business for the mere pleasure of the thing.

MR. PERCY WELLS' ABORTIVE MOTION came on for consideration in due course, and it was satisfactory to learn that Mr. Wells does not wish to exclude from the *Pharmaceutical Journal* anything that may interest others. His point is that reports of local meetings and many other matters are of too ephemeral a nature to be made an integral part of the Journal and bound up with it. He would like the official organ to be as it was originally intended by Jacob Bell—a record of pharmacy. But that is just what the Journal now is, and it would be difficult for Mr. Wells to point to anything in, say, the current number of the paper which would have been omitted by Jacob Bell. Mr. Wells, however, would like to see the bulk of the matter now appearing in the Journal published in a separate supplement which could be thrown away after perusal. But his seconder, Mr. Naylor, took an opposite view; he would prefer that the scientific matter should take the form of a supplement. Apparently, then, two distinct journals and supplements will be required to meet the wishes of Messrs. Wells and Naylor. Both cannot be satisfied, and it is perhaps doubtful if either can be. It may be noted, however, that the question of a trade supplement—the Journal's chief need at present—is, as the Vice-President stated, now under consideration. It might be well, therefore, if members of the Society who have views on the subject would communicate with the Editor, explaining clearly to him what they need in the Journal and how they think their needs can best be met.

THE SPECIAL GENERAL MEETING was called to deal with a delicate subject, and the manner in which that was dealt with is worthy of all admiration. Mr. Butt explained his position in a well-considered and judicious speech. Mr. Carteighe, to whom everyone naturally looked for the reply, was equally happy in his explanation of the existing state of affairs, and that, as it happened, sufficed for Mr. Butt's purpose, so that he finally consented to withdraw his motion. As bearing upon his subject, Mr. Carteighe referred to the recognition of the Society's School and professors by the new University of London. He also stated that the General Medical Council has requested the assistance of the Pharmaceutical Society in the attempt to ascertain to what extent the standardising of potent drugs can be carried on with accuracy and success. Moreover, work having that object in view is now being done in the Society's laboratories. There is at present no research laboratory distinct from any other laboratory in the Society's house, but research work is being carried on under the direction of Professors Collie and Greenish in part of the School laboratories. The premises originally used for research work only are now partly employed for teaching purposes and partly for pharmaceutical research under the supervision of Professor Greenish. In fact, the matter may fitly be summed up in Mr. Carteighe's statement that the Society's research work is now merged in that of the School of Pharmacy.

THE RESULT OF THE COUNCIL ELECTION (see p. 562) is that Messrs. Cooper, Cross, Hills, Storrar, Symes, Taylor, and Wootton are returned to represent the interests of the members of the Society for the next three years. The retiring members were Messrs. Bateson, Cross, Grose, Hills, Storrar, Symes, and Warren, so that Messrs. Cooper, Taylor, and Wootton take the place of Messrs. Bateson, Grose, and Warren. The number of voting papers issued was 5,541, or 73 more than last year; the number returned was 3,707, or 26 less than last year, a curious commentary on the apparently increased interest taken in the election by the members on this occasion. The obvious inference is that 1,834 members are so little troubled by the company pharmacy problem, or any other of the questions which concern them so closely, that it is immaterial to them whether

vacancies on the Council are filled or not. Presumably they are content to let things drift; anyhow, they have shown no anxiety to help to shape the course of events, and, if that course should not prove to be altogether what they could have wished, they must be prepared to bear the responsibility and the blame of inaction. Assuming that the company pharmacy problem has been an important factor in determining the issue of the electoral struggle, the result proves nothing so far as that problem is concerned, except that the members of the Society who have taken the trouble to vote are as divided on the subject as they have been for some time past, and that the prospect of unanimity on that subject is still remote.

MR. PERCY BEAN, of Blackburn, has explained his position, in connection with Mr. Gifford's election committee, in a very satisfactory manner, so far as he personally is concerned, but we are unable to agree with his suggestion that the blame in the matter is entirely his. In his letter published at page 540, he very handsomely expresses his willingness to take the responsibility on his own shoulders, but it would not be just to allow him to do so, in view of the fact that he had no hand in drawing up the letter published last week, and, according to his own statement he did not sign that communication, though his name was attached thereto. The blame and the responsibility alike rest with the other members of the committee and with Mr. Gifford. So far as Mr. Bean is concerned, his explanation puts the affair in a proper light, and it may be stated that he has made such further amends as lie in his power by sending up the amount of a year's subscription and asking that his name may be submitted to the Council for election as a member of the Society.

IN REPLY TO MR. WADDINGTON, the President of the Proprietary Articles Trade Association writes to explain Mr. Glyn-Jones's position in connection with that body, more especially as proprietor of the *Anti-Cutting Record* (see p. 540). With all that Mr. Tebbutt says concerning Mr. Glyn-Jones we are most heartily in accord, but it is difficult to agree with the implied suggestion that Mr. Waddington was not within his rights in sending his letter for publication last week. As a member of the P. A. T. A. Mr. Waddington is perfectly justified in criticising the action of that body and its officials; as a member of the Pharmaceutical Society, he is equally justified in making use of the official organ to express his opinion on what he thinks is an unjustifiable method of influencing the election of the Society's Council. Objection might reasonably have been taken to the publication of such statements as those of Mr. Waddington in an anonymous communication, but the latter was properly signed and otherwise quite in order. Moreover, it is always quite open to Mr. Glyn-Jones to reply to any criticism on his conduct which may appear in this Journal, as in fact he has done in this week's issue (see p. 540). But we regret that he should have taken offence at what, after all, should seem very mild criticism to a person of his experience and resourcefulness.

THE DEATH OF M. GRIMAUX last week (see p. 564) removes one who was known to his French *c nfrères* as the politician chemist. As pointed out by the *Lancet*, his studies related chiefly to the constitution of matter, to the position of atoms and molecules and to their relative weights. M. Grimaux will also be remembered for his very interesting literary contributions, amongst which was an important document relating to the death of Lavoisier, who, as is well known, was impeached under the Reign of Terror and condemned to death and executed in the spring of 1794. The nature of the real charge against him was not clear until M. Grimaux published his work, in which it was shown that Lavoisier was condemned to death for originating or participating in an alleged plot against the French nation, the aim of which was to aid the enemies of France. He was alleged to have practised every kind of extortion

upon the people, and to have caused tobacco to be admixed with water and pernicious substances to the detriment of the health of the citizens who used it. In spite of this warning in front of him, as the *Lancet* remarks, M. Grimaux associated himself very keenly with political affairs, and was a conspicuous believer in the innocence of Captain Dreyfus and a vigorous supporter of M. Zola's contentions.

AN INTERESTING DISCOVERY, announced by Sir W. Roberts-Austen, at a meeting of the Royal Society, held on May 10, and reported in the *Standard*, indicates a remarkable advance on former knowledge. Some four years ago, in his Bakerian Lecture, he stated that if gold be placed underneath a column of lead, and the two metals be kept hot, though at a temperature well below that at which the lead melts, the gold will diffuse itself in the lead, so that even in twenty-four hours an appreciable quantity of the gold can be detected in the lower portion of the lead. At that time Sir W. Roberts-Austen put aside similar cylinders of the two metals, keeping them for four years at a temperature of about 65° F. At the end of that period the gold was found to have made its way into the lead; the quantity, as might be expected, diminishing with the distance from the precious metal. Apparently the gold practically evaporates when brought into contact with solid lead, passing into the latter metal as steam might pass into wood. The action, of course, is slow, but it is sure, metal mixing with metal without melting—without any notable elevation of temperature.

THE HUNT AFTER AN ELEMENT, described by Sir William Crookes at the same meeting of the Royal Society, also possesses considerable interest. The compounds of uranium have been shown by M. Henri Becquerel to emit rays capable of affecting a sensitive photographic plate through a material which is opaque to ordinary light. Two other substances, much more rare, called polonium and radium, possess this property in a still greater degree, and it had been suggested that the apparent activity of the uranium compounds might really be caused by small quantities of those metals. But M. and Madame Curie, their discoverers, deemed that to be impossible, and affirmed that the property of emitting rays which can act in the dark on photographic plates belongs to uranium and to thorium. A series of preliminary experiments showed Sir W. Crookes that pitchblende, an oxide of uranium, from which the metal is chiefly obtained for commercial purposes, possesses the property more than any other substance. So active is the compound that a slab in which it occurs in streaks among more ordinary minerals, after being laid in darkness upon a sensitive photographic plate for twenty-four hours, so much affected it that when a print was taken most of the minerals were invisible while the streaks of pitchblende were quite white, and even their edges seemed to emit a faintly luminous haze. It has been found that this singular action does not in any way depend on the particular salt of uranium, and that the effect diminished as the purity of the salt increased. Clearly, then, it could not be due to the uranium, but to some substance present in the compound as an impurity. That substance is, apparently, neither polonium nor radium, both of which occur in pitchblende, but a substance, probably hitherto unrecognised; which possesses the property of affecting a sensitised plate to such an extent that quite small quantities produce these striking effects.

SIR THOMAS LAUDER BRUNTON has informed the Food Preservatives Committee that he has come to the general conclusion that it is almost impossible to prevent the use of preservatives in food, but he thinks that their use should be strictly regulated. If preservatives are not used, he stated, there is a risk of injury from eating food which is decomposing, but, on the other hand, if the preservatives are used in too large a quantity, harm may be done through the preservatives themselves. By the unregulated

use of preservatives there may be a double danger—namely, that from the drug itself which is used as a preservative, and also that from the decomposing food, which may, in spite of the addition of a certain quantity of preservative, still undergo change and become dangerous to health. He is of opinion that it is possible to conduct the milk supply of a large town without the use of preservatives, by cooling and by sterilisation, and that it is desirable to do so. But the data relating to the effect of different chemical preservatives are very imperfect, and, though we are able to form opinions regarding the action of certain drugs, from their administration either to animals or men, the length of time over which such experiments extend is too short to allow a complete opinion being formed with regard to their action. He suggested, therefore, that an authority should be constituted as recommended by the Select Committee on Food Products Adulteration, to act as a Court of Reference upon scientific and other questions arising under the Acts, and empowered to prescribe standards and limits of the quality and purity of food. In order to procure the necessary data, it will be necessary to insist upon the presence, nature, and proportion of the preservative in each article of food being notified by label or otherwise. As an objection to such a declaration, it has been said that it would interfere with trade, but it seems to Sir Thomas that it would not do so. All that would be necessary would be that each article should bear a label stating that it contained such and such a preservative in the proportion licensed or approved of by the authority which it is proposed to constitute. People would then take the article readily enough, and there would be no interference with trade, but, on the other hand, there would be a great security for the consumer.

A CO-OPERATIVE DRUG STORE has been an unknown institution in Edinburgh up to the present, but one has now been started by the St. Cuthbert's Co-operative Association, Limited, a large and wealthy corporation which has a large number of branches in all parts of Edinburgh. Hitherto the Association has let drugs and dispensing severally alone, but it is now to have a fully equipped drug department at its central establishment in Bread Street, and possibly others elsewhere. As the Association numbers many thousands of members who are customers of individual pharmacists the movement is one of serious significance. The initiation of the new department adds immensely to the vested interest on the side of co-operative trading, and will, if it succeeds, prejudicially affect many ordinary retail pharmacies.

THE CULTIVATION OF TONKA BEANS at Borbiviato, in Venezuela, is described by Preuss in his work 'Le Planteur des Tropiques,' from which the *Journal de Pharmacie* quotes the following description:—"The trees, which are of considerable size, have a handsome dark green foliage. The oblong fruits, resembling medium-sized mangos in form, are the product of violet papilionaceous flowers. The flesh of the fruit is yellow and has an unpleasant odour; it covers a hard, very fibrous endocarp, which surrounds the brownish, violet, long, flattened seed. An adult tree will yield 100 lb. of these seeds. The dipterix requires the same conditions of soil and position as cacao trees, which were cultivated in the same plantation under their shade. Ripening of the fruit takes place in August, but the harvest is prolonged for a considerable period, since both flowers and fruit occur on the same tree. Dipterix wood is also much prized." Seeing the facility with which these trees may be grown beside cacao trees, and the ready demand for the "beans" which exists, it is probable that their more extended cultivation would be remunerative.

THE FORMOSA CAMPHOR MONOPOLY has, according to *Commercial Intelligence*, been secured by Messrs. Samuel and Co., an English firm, who have outbid American and other foreign firms and secured it for ten years. The Formosa Government buys crude camphor at

35 yen per picul, and will receive from Samuel and Co. 95 yen per picul for first-class and 85 yen for second-class camphor. The contract provides that the company must place it upon the Hong Kong and London markets at certain prices, and must furnish the Formosan Government with securities to the amount of nearly 2,000,000 yen. The firm is required to keep 3,500,000 yen invested in the business for at least eight years. Formosa will furnish the world's chief camphor supply.

A NUMBER OF WELSH MEMBERS, headed by Mr. Brynmor Jones (Swansea), have introduced a little Bill to place the graduates of the University of Wales on the same footing, as regards privileges and exemptions, as the graduates of the more ancient seats of learning in England. The measure prescribes that whatever office is open to the graduates of the English Universities shall be open to those of the University of Wales, and that the privileges created, or to be created, by Statute or Regulation in favour of persons rejoicing in an English degree, shall be deemed to apply equally to the Principality—a reciprocity project of an extremely satisfactory kind, from the Welsh point of view, at any rate. The weak point about the proposal from a parliamentary standpoint is that one does not know, and cannot readily ascertain, what its effect might be; in fact, it is one of those attempts at *multum-in-parvo* legislation against which many members of the House resolutely set their faces. Next Wednesday is the date assigned for the second stage of Mr. Brynmor Jones's Bill, but it is understood that progress with it then would occasion some surprise, even among its promoters.

ARCHITECTS AND PLUMBERS occupied the attention of the House of Commons on Tuesday, when Mr. Atherley-Jones brought in his Bill for the incorporation of the former, and Mr. Lees Knowles made his annual attempt to persuade his colleagues to acquiesce in the registration of the latter. Though neither of these callings bear directly upon pharmacy, yet the remarks made by Mr. Knowles and his critics are of some interest as indicating the attitude the House of Commons take up in regard to registration and registered—or, as it is viewed in some quarters, privileged—persons. The member for Salford, W., after referring to the sixteen-year-old agitation for national registration of plumbers, had to confess that practically the only argument against the proposals embodied in the Bill of 1892 was the cry of "monopoly," and that cry had been sufficient to stop any advance being made. He disclaimed any idea of monopoly, and pointed out that it was not suggested that the practice of sanitary plumbing (if one may use the phrase) should be restricted to registered persons, but he failed to convince his hearers. Subsequent speakers, even when sympathetic, threw out broad hints of monopolies, aggrandisement of city companies, and so forth, for all the world as though the subject under discussion were pharmacy and the greedy corporate body were the Pharmaceutical Society. Mr. T. W. Russell, on behalf of the Government, expressed sympathy with the principles for which Mr. Knowles was striving, but said that as that gentleman had not succeeded in reconciling the various interests concerned, the Government could not be expected to take up the tangled skein and attempt to harmonise the opinions of those who were not agreed as to what they wanted. There is a moral in those words that merits the consideration of pharmaceutical politicians. A Government, said Mr. Russell, might well be called upon to submit legislative proposals relating to the public health, if there were general agreement on the subject, but could not take the responsibility of forcing upon the nation the particular panacea of any special group of reformers. Is it not possible that an appeal to the Government to undertake or promote the amendment of the Pharmacy Act might meet a similar response?

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MAY 16, 1900.

Present:—

Mr. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Carteighe, Corder, Cross, Glyn-Jones, Grose, Harrington, Harrison, Hills, Savory, Southall, Symes, Warren, and Young.

Several members and student-associates who had paid their subscriptions since April 30 were restored to their respective positions. The Council having arranged the order of business at the annual meeting, adjourned.

THE ANNUAL MEETING.

The fifty-ninth annual general meeting of the Pharmaceutical Society of Great Britain was held on Wednesday, May 16, in the Lecture Hall of the Society at twelve o'clock, Mr. G. T. W. NEWSHOLME, Vice-President, in the chair.

The SECRETARY read the notice convening the meeting. The report and accounts were taken as read.

The Annual Report.

The VICE-PRESIDENT, in rising to move that the report be received, adopted, and entered on the transactions, said:—I should like first to apologise for my position in the chair to-day. You know, most of you at any rate, that I am here because our President (Mr. Martindale) is unfortunately not in good health, and on the advice of his physician has had to take a lengthened holiday. He will be away, I believe, for some weeks, and I am quite certain that I am only expressing your wishes in saying that we all hope he may come back to this country fully restored to health. For a great many years past, certainly, the Vice-President has not been called upon to occupy the chair at an annual meeting—certainly not within my recollection, and I thought it never had happened, but I have been informed on good authority that on one or two previous occasions the Vice-President has had to take the place of his chief. This shows one that our past Presidents for a great number of years have always been willing and ready to do their duty, and I do not remember since I have been a member of the Council, until the last month, that the President on any occasion has been absent from any of the ordinary meetings of the Society. We know that if a gentleman takes up that duty it is a very onerous one, and demands strict attendance to duty, and none of our Presidents have neglected it in the least.

THE SOCIETY'S REVENUE.

Twelve months ago my friend, Mr. Walter Hills, the past-President, in referring to the annual report, prophesied that probably during the coming year the financial affairs of the Society would be in a much better position, and I am here now to say, in the name of the Council, that the prophesy has been in a large measure fulfilled. It has been fulfilled in many ways, as to which I will not occupy your time this morning. You have placed before you the financial statement and the report for the year, which in themselves are explanatory. To deal first with the revenue account, you have placed before you figures which I think will be clear to every member. I know you have looked through and read the report, and therefore it will be unnecessary to refer in detail to many of the items; but I will shortly call attention to some of the more prominent ones, and, first of all, I will take the revenue account. On the income side, we have in connection with the first examinations received £279 more than last year, but perhaps this is rather an exceptional year, because in July next there will be no longer a preliminary examination conducted by the Society.

Whether it is that our young men feel that there will be greater difficulty in getting through the examination in the future or not I do not know, but the fact remains that they seem to prefer to go in for the ills they know than to encounter those they know not of. At any rate, before any change is made they seem very anxious to get through the preliminary in greater numbers this year. The income account is therefore increased by £279, which means that 1,711 entered for that examination, instead of 1,512 last year. With reference to that examination, there will be a little difference in the accounts next year, because we shall have a fixed sum of two guineas, which will appear on the income side of this statement. There will be no expenses incurred in carrying on an examination, because the Society will accept certain certificates which are well known to most of you. Then, to deal with the Minor Examination, we have had an increase over last year in revenue of £648, which means that those who have entered for the Minor this year were 1,830, instead of 1,708 in the previous year. With reference to the Major examination there is, unfortunately, a smaller amount credited. This year the number is 106 as against 111 last year, and if my memory serves me, I think last year was slightly smaller than the year before. It is a little unfortunate that men do not go in for the Major Examination more than they do, because many of us think it is at any rate well worth while to go in for that higher examination. With reference to the School, it will be gratifying to you all to see that it is now in a very flourishing condition, and that we have an increase in fees of about £80 over last year. The most gratifying feature of all to the Council and to the Society is that the membership has increased very largely, the subscriptions being £6,871, as against £4,802, an increase of £2,000 a year. I was sanguine that on the passing of the 1898 Pharmacy Act the increase of membership would be considerable, but I am rather inclined to say that it ought to have been still greater than it is. One thing, I think, shows the satisfactory position of the members of the craft at the present time, that under the heading of subscriptions you will see, Life Subscriptions, £672. That is a very large item, and to my mind it shows that amongst our people money is fairly plentiful, and that rather than pay one guinea per annum, they prefer to pay down a lump sum of £10 for life membership.

THE SOCIETY'S EXPENDITURE.

Taking the other side of the revenue account, the expenditure, I will refer first to a very small item—the carriage of books, which this year is £13 odd, as against £16 last year. Being a provincial man, I am naturally very much interested in provincial pharmacists, and I do think our Library and Museum, particularly the Library, might be made a great deal more use of than it is; and considering the small amount of money it takes to get books down to the country, I am surprised that a great deal more use is not made of the Library. However, it rests with the members themselves. Whether it is too much trouble, or that they can get books in provincial towns easier than they used to do, I do not know; but I think, with such a magnificent Library as we have, greater use should be made of it in the provinces. With reference to the First examination fees, which you will see amounted to £526 for superintendence, hire of rooms, and other charges, and to the College of Preceptors for conducting that examination, these after July next will practically disappear, so that in the next statement of accounts a much smaller sum will appear. There will be a clear two guineas accepted by the Society for each candidate without any expense attached to it for those who wish to be registered before they can pass the Minor Examination. The fixtures and fittings amounted to £180. This sum has been spent in improving the school accommodation and in adding to the shelf space in the Library.

THE SOCIETY'S JOURNAL.

Now I come to the Journal. I think the improved position of the Journal, as appears by its less cost this year, must be very gratify-

ing to the members, as it is to the Council. The balance against the Journal is £1,675 odd, as against £2,252 for the year 1898, which means a saving of £576 on the year's working. This result is the more satisfactory because the Journal has not been pinched in any way, but I venture to think it has been improved. But perhaps what is still more important is this—that whilst the cost has been very much less, there has been an increase of one thousand in the circulation, which is very gratifying. Mr. Hills ventured to prophesy last year with reference to the affairs of the Society, and more particularly to the Journal, that there would be a saving in that year, and I think I may safely make a similar prophecy, because, as far as we have gone, there is a tendency to more economy in that respect, and I venture to say that the President who occupies the chair next year will be able, at any rate, to come to the same conclusion—that he will have profitted by my prophesy, and be able to say, "The Chairman last year said there would be a saving, and there has been." As I have already said, this has been done without any alteration in the Journal except in the way of improvement. I will not say anything more on this now, as I have notice of a resolution dealing with that subject on which, no doubt, there will be some discussion.

OTHER EXPENSES.

With reference to the repairs, if you look you will see on the statement before you that repairs and alterations have amounted to £714 odd. That looks like a large sum, but it has been expended very largely in redecorating the interior of No. 16. You will remember that some money was spent on that in 1891, but practically it has not been touched until the present time, and you will admit that it was necessary after eight years that something should be done, and we do not think the amount is very large, considering the amount of work which had to be done. There is also this to be said: that, having larger premises and increased activity in various departments, there must necessarily be a growing necessity for repairs and alterations. This building is very much larger than it was when I first came on the Council. Therefore the expense of carrying on the work and providing for necessary things in connection with it must necessarily cost more every year. There is a new charge here respecting the electric service and fittings, £299. I do not think anybody will cavil at that, because it was felt by the Council that it was a necessity that the electric light should be put in. You know that our staff have to work on many occasions, particularly at the time of the annual meetings and so on, very late in the evenings. I have found it out more during the last week or two, when I have frequently found the staff working very late at night, and I am quite sure you will all be only too glad to think that they should work under the most comfortable circumstances. There is another item referred to there—expenses of the Pharmacy Act, 1898—which I need not say much about. This is the last occasion that will appear. We are all of opinion that it was money well spent, and, notwithstanding what was said with reference to it being a very small Act, I am inclined to think it was about one of the best things ever done for the Society, and I again venture to hope that it will be the means of increasing very largely the membership. The most gratifying thing of all, of course, is that the balance is on the right side, the balance transferred to the accumulated funds being £1,943 odd, whilst last year there was a balance on the other side of £840. I think, therefore, you will be perfectly satisfied now the balance on the right side is largely accounted for by the increased membership.

THE SOCIETY'S EXAMINATIONS.

Now I will go to the Annual Report, and I will take first of all the paragraph referring to the examinations. The statistics given in the report are self-explanatory. It is worthy of note, however, that the percentage of rejections in the qualifying test appears to have a tendency to still further increase. This may perhaps be due to the rather abnormal conditions brought about by the near approach of the ten guinea fee. At any rate, the experience of the Boards of Examiners during the past year has been that a

very large proportion of the candidates presenting themselves have had an inadequate training, or have been trained on wrong lines, which is worse than no training at all. The Government visitor, in his annual reports for some years past has persistently pointed out the necessity for a definite curriculum, and some of the more sanguine amongst us are not without hope that this much-needed step in the evolution of pharmacy may be taken in the course of the next few years. Certain it is that until an adequate compulsory curriculum has been established, such questions as the division of the qualifying examination must necessarily remain in abeyance. It is perhaps a very important thing, because we frequently see letters and hear from members complaining about the qualifying examination being taken at one sitting. We frequently have suggestions made that the examination should not only be taken in twice, but by subjects, which I think would be most unfortunate. I think there can be no division of the Minor until there is evidence of some good training by a curriculum. With reference to the first examination, as I have already said, it comes to an end in July, and I think it is desirable that local secretaries and members of the Society should take some little trouble to convey to the scholastic institutions in their neighbourhoods the fact that after July next there will be no preliminary examination conducted by the Society. If that is done, I think it should well save a great deal of trouble, because I know at the present time some schools are advertising that they coach students for the preliminary examination, and it would save a great deal of time on the part of schoolmasters and others if they were informed by someone that it no longer exists. There is no doubt that for some time to come there will be a considerable difficulty (those who take apprentices know the difficulty there is now) in getting suitable young men. For some time there will be some difficulty, but our friends must bear with that, because I am satisfied it is a step in the right direction. It may perhaps bring it down to rather a low level to make the suggestion, but it may be some advantage to the pharmacist of the future that there should be fewer men coming into the ranks.

EARLY CLOSING OF THE LIBRARY AND MUSEUM.

With reference to the Library and Museum, there has been a good deal of correspondence in the Journal lately on the question of the Library being kept open in the evening. The reason for the action of the Council in closing the Library and Museum at six o'clock is an extremely simple one—namely, that it is not required. It is evidently not required for use by members and student-associates of the Society. The Council has not acted hastily in the matter, and has not based its action on theoretical statements or expressions of opinion. It has simply consulted the records in the attendance books, and there can be no doubt that those records form a perfect justification for what has been done. If there were the slightest real need for an extension of the time during which the Library and Museum should be available for study, I have no doubt the Council would be prepared to meet that need.

THE SCHOOL OF PHARMACY.

With reference to the school, I need not refer to anything in particular, except perhaps to the last few items under that heading. One event, at least, in connection with the school during the past year appears to call for favourable comment, and that is the recognition of the School of Pharmacy as a part of the new Teaching University of London. Those who were at the dinner last night would have been very gratified to have heard the speech made by Mr. Bailey Saunders on this point, and it was a speech which would be extremely useful to those of our guests who were not intimately connected with us. In the new regulations for the University there is provision for including among the thirty-two Boards of Studies a Board of Pharmacy, and the Society's professorial staff has been added to the list of members of the Faculty of Science of the University. In connection with this, I may also point out that there has been a change in the designa-

tion of one of the branches of study in the Society's School, and I have to formally give notice now that henceforth Professor Greenish is to be known, not as Professor of *Materia Medica and Pharmacy*, but as Professor of *Pharmaceutics*. This title has been adopted by the University Commissioners as a convenient official designation of the scientific subjects hitherto included in our School under the heads of *Materia Medica and Pharmacy*. Such recognition of the School is not only gratifying, but it appears to me to be fraught with possibilities of considerable import, for no doubt some of our pharmacists who have been trained in the Society's School will proceed to utilise that training in obtaining a degree under the new regulations, and in that process I understand that a pass in pharmaceutics in the Science Faculty is likely to play a rather useful part.

THE CARBOLIC ACID QUESTION.

I need not say anything about British Pharmacopœia, or about the evening meetings, but I may be pardoned saying one word about the carbohc acid question, which is not new to us. With regard to the question of placing carbohc acid upon the schedule of poisons, I am glad to be able to tell the members of the Society that there is every reason to hope that this potent substance will shortly be placed under the restrictions imposed by the Pharmacy Act, 1868. When the history of the movement in favour of scheduling carbohc acid comes to be written, I do not think the Pharmaceutical Council need be afraid of criticism, for it has undoubtedly done its duty to the public by repeatedly directing the attention of the Privy Councils to the dangers arising from an indiscriminate distribution of the acid; nor perhaps is the Privy Council so much to blame as one would imagine without looking more closely to all the factors of the case. It is not difficult to perceive that for some years past there has been a suspicion in the official mind that the extension of the schedule is only one of the Pharmaceutical Society's little ways of securing a trade monopoly. I am glad to say that the efforts of our President and Council have resulted in a considerable modification of the official idea in this respect, and I think that I may truthfully say that the Privy Council and the Board of Agriculture have now a more correct perception of the real facts of the case than they had a few months ago.

THE BENEVOLENT AND ORPHAN FUNDS.

The next point is that of the Benevolent Fund. I am sorry to observe, from the Benevolent Fund Revenue account, that the decrease in the income from subscriptions in 1898 was still further accentuated last year. The amount expended on the payment of annuities absorbs the whole of the revenue from invested capital, and nearly £100 a year from annual subscriptions. Sound finance would demand that the annuities should be paid entirely by the interest on capital, but there seems to me to be very little prospect of our reaching that ideal state unless a little more interest in the fund can be aroused among members of our calling. I do not think that we need trouble ourselves very much during the present year about the subscriptions and donations being rather less, because we know that everybody in this kingdom has had to put his hand very deep into his pocket for benevolence in another direction in connection with the war in South Africa. There never was a time in the history of the Society when Britishers have shown their charity more lavishly in connection with the sick and wounded and those left penniless by soldiers who have gone to fight our battles, and therefore, I say, we need not regret that the money is a little less this year. But I do not want to preach or beg for the Benevolent Fund, nor do I feel very strongly that we need provide for the future, because the pharmacists of this country, as well as other people, have always been willing to come forward to help the sick and aged. Whilst on this subject, I should like to direct the attention of the members of the Orphan Fund, of which very little seems to be known. It was founded in 1891 by a legacy from Mr. Thomas Hyde Hills, and the revenue

from the Fund is applicable for the maintenance of an orphan in a public institution. The beneficiary must be the orphan of a person who has been a member of the Society and has been a subscriber to the Benevolent Fund for over three years. These conditions appear to be very simple and easy, but for several years no case has come before the Committee which has fulfilled the conditions, and the revenue has therefore accumulated. I am glad now to say that an excellent case for this particular fund has come before us, and the child will be admitted to the London Orphan Asylum to-morrow, all the necessary preliminary arrangements having been completed. The payment for his admission into and maintenance at the Asylum will therefore absorb some of the accumulated funds.

THE WATERALL LEGACY.

Next I would refer to the paragraph marked Waterall Legacy. The conditions of the Waterall Legacy have been fully published in the *Pharmaceutical Journal*, and I do not think I need refer to them further here, but I will take this opportunity of saying that it is a source of some embarrassment to have money left in trust to the Society under conditions which prevent the Council from administering it in the terms and spirit of the Pharmacy Act—namely, "to all persons who may be or have been duly registered as pharmaceutical chemists and chemists and druggists." The creation of a preferential area by the Waterall bequest is distinctly against that catholic administration of the fund, of which the Council makes a great point. I hope if any of my hearers contemplate benefiting their less fortunate brethren they will bear in mind the remarks I have made.

LAW AND PARLIAMENTARY.

Now I come to Parliamentary. I do not purpose saying anything about this subject, because the Council have had a great deal to say about it during the past few months, and there has been a good deal of correspondence in the *Journal*, especially during the last few weeks, when there has been an election campaign—I might say several election campaigns—and I cannot say anything further about it. You know exactly how it stands and the action the Council has taken. The position is clearly defined in the report, and there is nothing new to be said. As some of you know, the Bill is postponed to May 17—which is to-morrow—but it is not likely to be taken, and there is really nothing to say on that point.

With reference to the legal paragraph, we have spent £240 less this year in law costs than in 1898, but I do not think we have exhibited less statutory activity than usual, though we may have gone more economically to work. I always feel with regard to our legal work that we have a ground for complaint against the public, inasmuch as we are called upon to spend £500 or £600 a year to protect its interests. Logically, the public should as much bear the cost of administering the penal clauses of the Pharmacy Act as it does the cost of putting into operation the Sale of Food and Drugs and similar statutes. It seems rather hard on members of the Society that they have to bear the cost of carrying out the law, and though one does not see how it can be altered, it would appear to most of us that it would be more fair if it were put on the same lines as the Food and Drugs Act.

LOCAL ORGANISATION.

Local organisation is a matter which is at the present time occupying the attention of the Council, and there have been one or two meetings of committees to deal with it. It is a subject which I have very much at heart, and I think it is necessary something should be done—I will not say in the way of altering the system on which our local secretaries are elected, but my wish is that more responsibility should attach to the holders of the office, and in some cases I am bound to say the work of the local secretaries might be better done than it is, although, on the other hand, we have a great number of men who do an immense amount of

honorary work for the Society. Our thanks are due to them, and have been over and over again, for the valuable services they have rendered on many occasions. I do not think I need say more on this at the present time, because it is occupying the attention of the Council, and I may remind you also that there is to be a meeting of local secretaries during the Conference week, and probably they will then give us the benefit of their views.

NAVAL DISPENSERS.

The next paragraph is headed "Naval Dispensers," and you will see what has been done, and I may say that this is only part of persistent attempts by the Council for some years to improve the status and conditions of service, not only of dispensers in naval hospitals, but also of Poor-law dispensers and qualified dispensers in public institutions. The Council are always watching over the interests, I will not say altogether of its own members, but of every person on the Register. We are sometimes charged with not doing this and with neglecting our duty in various ways; but I say that the charge is not true. On all occasions we have representative men on the Council from various parts of the country, and they are constantly looking after the interests of members of the craft. I will take this opportunity of referring again to my friend Mr. Hills, because we on the Council know that he was at a great deal of trouble in connection with this matter of Naval dispensers. He saw the department having this matter in hand on several occasions, and to some extent, one might say, they were somewhat inclined not to improve the position of the qualified men; yet by his persistent persuasiveness and the manner in which he went about it he showed them that men who had been educated and passed the examination ought at any rate to be treated far better than ordinary seamen—for that was what it practically amounted to, for they were treated very little better. A full account of this matter appeared in the Journal of April 14, which shows that the position of the Naval dispensers has been very much improved, and that the thanks of the Society are due to Mr. Hills for the trouble he took.

THE NORTH BRITISH BRANCH.

Now you will see a short paragraph with reference to the North British Branch. There are not many lines, nor does the paragraph, by its language, show the immense value of the services that branch has rendered to the Society, but, in the words of the report, the work of the Society in Scotland is efficiently conducted. You cannot have anything better than that, and there I leave it.

THE OBITUARY.

I now come to the last paragraph—the Obituary. The hand of death has been very heavy, not only on members of the Society, but on those who have been closely connected with us on the Council, and many others directly and indirectly connected with us. I simply mention the names of those who have—at any rate during my recollection on the Council—died during the last twelve months, and first of all there is Mr. Greenish. Reference has been made to the death of these gentlemen on the Council, and it is not necessary for me to say anything about it, but I, as a member of the Council, in my short time remember all these gentlemen—Mr. Greenish, Mr. Richardson, Mr. Watt, Mr. Reynolds, and Mr. Fraser. These men, in their day, did great work for the Society, and they took an active part on the Council. Then there is Mr. Bird, who is perhaps the most recent of all, and who, although not a member of the Council, was a member of the Board of Examiners, and, as most of us know, was a very benevolent man, and not only did a great deal for the funds of the Society, but helped any poor person whenever his attention was called to the matter. We have also lost the distinguished men whose names you see here, but it is not necessary for me to refer to them, because I believe some of you know them better than I did myself. We are all sorry to think there should be such a large loss this year. Perhaps I ought to refer a little more

to the death of Mr. Richard Reynolds, who died recently. He was a Yorkshireman. I was proud to have his acquaintance, being a Yorkshireman too, and I have had on many occasions had conferences with him of different kinds. We corresponded very frequently, and during the whole of the time I was a member of the Council he was exceedingly kind to me. There were several points, of course, that a young member of Council felt he did not know much about, and, naturally, he appealed to one like Mr. Reynolds; who was a father in more senses than one to many young members of our craft. At all times Mr. Reynolds was willing to assist me in every way he could, not only in connection with the Council, and he was also a great friend to pharmacists generally, and was not afraid even of pharmacists in another town, or even in his own, getting into the same position as Richard Reynolds. In fact, he was always ready to help another to get into the same position he himself occupied. He will be missed, no doubt. You have seen in the papers of the Journal his work in years gone by; you know his work as a member of the Council, and you know the distinguished position he held in his own city.

I do not think there is anything more I have to say, and I move the resolution for the adoption of the report.

Discussion.

Mr. R. ATKINS (Treasurer) said: I formally second the adoption of the report. It has been our general rule, and a very wise one I think, on these occasions that the Council should be silent, and leave the discussion in the hands of the official spokesman, whom I congratulate on the able manner in which he has analysed the report presented to the meeting; but let me say before the criticism begins, as the flood will no doubt be open in the course of a few moments, that as a body we do not in the slightest degree deprecate criticism. We absolutely invite it. It is the very salt of our life; but there are two conditions, I think, that ought to attach to criticism on which I lay great stress. The first is that the critic should be well informed; that he should know what he is talking about, and the second is that he should be fair. If criticism be well informed and fair, we cannot have too much of it, at least, within the limits of time. Now, gentlemen, I have often found this—not in this Pharmaceutical Society, but outside it—in going through life that the greatest amount of dogmatism is associated with the least amount of information, and that prejudice is frequently based upon ignorance. I make no personal reference whatever; but you do remember in an ancient document there was an establishment somewhere in the City in which three gentlemen were engaged in the clothing line, and I believe they undertook to regulate the affairs of the Empire. Sometimes it has been the case that we have been proffered an amount of advice which is absolutely overwhelming. Now I venture to think that really to-day this Society occupies a greater position in the nation and in the world than it ever did before. I may be perhaps told that as an apologist for the Society I am playing a very ancient game. I do not agree for an instant with what is said on that point. If I have a conviction and a belief resting on evidence that satisfies my own judgment I shall express it, and I do believe that to-day, notwithstanding our shortcomings, we occupy a more influential position in the world—not limited to Great Britain—than we have ever done before. If that be the case, why in the world should we be disliked as a Society and a Council? You have not far to go to find the reasons for that. A body that examines and that painfully rejects, as it is bound to do by Statute, on evidence, must be unpopular with a very large number of people affected. There are certain friends of mine who have not a kindly word to say of us because their relatives did not pass through the examination room satisfactorily. I am very sorry, but we cannot help ourselves. We are bound to do what the Statute imposes upon us. And you cannot have a body that deals with prosecutions, as we are called upon to do, without becoming unpopular.

But the greatest reason of all perhaps why there is so much dissatisfaction abroad in the pharmaceutical world is one that I have the profoundest sympathy for, and that is the acute and increasing illegal competition of the stores. I am not surprised that men who are feeling the pressure should be dissatisfied. I have a letter to-day from one of the most cultured pharmacists I know, who is "passing rich on £40 a year," who asks me to have his name withdrawn from the British Pharmaceutical Conference, because, he says absolutely, with the pressure of educating his four children, he is unable to continue that small contribution. Yet this man I am proud to recognise as my friend, pharmaceutically; but the outside pressure has been too much for him. It is distressing, and I know how it affects a number of men, and the charge that is sometimes brought against us as a Council is that we have been either unsympathetic or indolent. I deny in the most deliberate terms both those charges. I have had a long innings on this Council, perhaps too long. Let me say, by the way, parenthetically, not a man is living but my friend Mr. Bottle (whom I am delighted to see here to-day, and whom I wish was still on the Council) who was on the Council when I entered it, and two or three times over has the hand of death changed the constitution of that Council. I have known the Council long years, and I say it emphatically to the critics who differ from me that I have in the course of a life given up, perhaps unwisely, to public work, never met with a body of men who were more faithful or more conscientiously seek to perform their duties. I am not here as an apologist for the Council because my seat is imperilled and I am appealing to the voting urn. It is too late to-day. I have no doubt the die is cast, but I stand here loyally to support and defend my comrades on the Council as men of ability, integrity and wide representative capacity in their knowledge of pharmacy throughout the country. I hope you will excuse these observations, because I know from the pressure of business that if I did not get my innings now I should not get it at all.

Mr. J. MACKENZIE said: In the prospect of so much of importance coming forward, it is not so much criticism I have to offer as to seek for the information which our good friend who has just sat down referred to. It would be a strange meeting of the Pharmaceutical Society if we did not see Mr. Atkins here; but I want to call attention to the North British branch, and I endorse what you have said as to the very concrete form in which you have put all reference to the North British branch in the few lines you have in the report. It was not always so, and I want to know why. There are gentlemen who could tell us, but I am ignorant, and I should like a little information; and there are some of my countrymen, and those deeply interested in the welfare of this Society, who would also like to know a little more. We notice under the revenue account for the North British branch what is refreshing in its peculiarity and singularity—an official of the Society having his salary stated £250, the only one which is now to be seen in the list. Unfortunately, there is no statement given either there or in the accounts showing those details which we used to see regarding the work of that branch of the Society, but which has been omitted for some little time. I do not go into particulars—you all know what they are, and I will not take up time. The annual report of the North British branch always did appear, or a summary at least, and I think gentlemen in this hall know there was a sort of promise given that it would be so in future; but it has not appeared. This year it is represented by the few paltry lines to which you have referred. Now, after what was reported in the Journal the other day from Mr. Carteighe, which I know to be true, it is obvious that the Branch in Edinburgh has done a great deal to establish before Scotland, and before the medical faculty of Scotland, that pharmacy is a real thing. It has a man at its head who is noted for his ability, he has almost encyclopædic knowledge in pharmacy and chemistry, and you can get any information from him, and his civility is unequalled. Everyone who goes there is delighted with

him, and they come away expressing how much they enjoyed their interview. I am sure there is no monument in the long history of Mr. Carteighe's connection with pharmacy which will more redound to his credit than the Edinburgh rooms, and the good basis which pharmacy is put on in Scotland, as represented by the North British branch. I am not on the Executive there now, and I take this opportunity because some of my friends there do not like the condition of things which is springing up. They cannot find a reason for it, and it is not conducive to the interests of the Society. I make bold to make this statement at the annual meeting, which I have had the pleasure of attending for so many years, and have always received a fair hearing, and I trust we shall see even yet something that will show us what has been done by this branch of the Society, and also the numbers that enter therein. I had a complaint lately from a young man that the associates and students are not informed of the meetings. There are meetings and lectures which they cannot attend because they are not invited. There was a complaint lodged with the assistant Secretary, and he says: "I am not supplied with any list of you gentlemen, and consequently I cannot help you; but I send a notice to all I know of." If you would kindly look into that I think you would have more young men become associates. Then I think we should get on better if we knew something more of the organisation in detail. The Secretary who draws this up is Secretary to the Society, and the Society naturally looks to him.

Mr. CARTEIGHE: Mr. Mackenzie is a very good financier. May I be pardoned for saying what has been stated many times, that the statement is drawn up by a chartered accountant for the Finance Committee.

Mr. MACKENZIE: The chartered accountant might have instructions to make it as convenient as it used to be. We are getting more important, large sums are passing, and it would be as well to know what they represent. For instance, I will take the very first item—annuities, £500. We used to be told who was getting the annuities, but we are not told that now. I presume that represents the £400 which began in 1881, which represents now over £6,000 paid to our late secretary.

The VICE-PRESIDENT: I think, Mr. Mackenzie, that it is not wise to go into these details.

Mr. MACKENZIE: I see no harm in the names being given. I believe there is another one here represented, who has fallen upon hard times, who was once in our School of Pharmacy, and it used to be put under the column for the School, and not under the general account. I think that is the proper way, and I do not see why it should not be done so now. Then we do not know what the Secretary's salary is here at all. I know it went up from £400 to £600 about 1892 or 1893, but we do not know what it is now. We should know that, too.

A MEMBER: What are the Council elected for? Can we trust the Council or can we not?

Mr. MACKENZIE: It is not a question of trusting the Council at all. Now I come to the question that has been referred to from the chair with regard to the coming Bill which has occupied so much attention. I hope we shall have something better. We have been told about Clause No. 2, but if any pharmacist reads Clause 3, if he is not startled he might be, to think that we, a Society existing so long with a Royal Charter and Acts of Parliament, are absolutely ignored in that Bill, while physicians, surgeons, dentists, and even midwives are to have their position acknowledged and secured. I think we ought to be acknowledged, and I think if a number of gentlemen on the Society would just take the trouble to inform their members in the various localities that there is a Pharmaceutical Society of Great Britain, that it is doing good work, that it has grand intentions which are hampered by restrictions, that some good might be done. All that you and Mr. Atkins have said is right and proper. I only differ from you in what you have said in regard to the time for it. Restrictions are a good

thing and beneficial, but we ought not to have restrictions applied by the Council before we are in a position to have something to live by. If our Council would only cling to that for a time, and our friends would also help the Council, we should be in a far better position than we are now, as we expected twenty years ago. I hope there will be an effort made either to expunge the Bill or to get our position recognised in a way it has never been yet.

Mr. C. UMNEY: Mr. Chairman,—As one of the four auditors appointed to audit the accounts of the Society, I would offer to the Society our congratulations on the excellence of the accounts that you and the chartered accountants have put forward this year. The most pleasing thing there is the balance of £1,906 to the credit; but if I may make a recommendation with regard to it, it would be, Do not accumulate the money, but spend it judiciously. If you accumulate it you will have to pay income-tax upon it, and you had better by half spend the greater part of it judiciously. You alluded to some little drop in the Benevolent Fund, and put it to the credit of Messrs. Kruger and Steyn; but those men have done a harm even deeper than that, and it is to one point in connection with that in the balance-sheet of the Benevolent Fund that I want to call special attention. I have already spoken to the President on the subject. We have there an item of £7,000 worth of Consols, which appear in the balance-sheet as £7,658. I know the practice has been to take everything at cost price, a practice which has worked well in the past, and it is an excellent rule so far as ground rents, freeholds, and other assets are concerned, but with Consols it is not customary when they depreciate, as they did last year, to put them in a balance-sheet at any other sum than the market price of the day. Now, the market price on December 31 was about 99½, and I certainly think the Consols should have been written down to par value. It would not have made any difference to the income, but it would have put the account in a more elegant form. The Bank write their Consols down to 95, and I think ours should be written down to 100, and kept there, not at 114, which they are not very likely to reach again. Then with reference to the assets generally, I think it would not be amiss sometimes, say, decennially, for a sub-committee of the Council to re-value the Society's assets—of course, with power to call in experts—to see that the Society has assets to the value put down. I would suggest that that should be done this year, the closing one of the century. My brother auditors and myself think the accounts this year are excellent, but they hope the little alteration I have mentioned may be made, and I personally hope you will not accumulate money, but spend it.

Mr. GRIFFITHS: You, sir, expressed regret that the Library is not made more use of, especially by country members, and I would suggest that in order to bring its usefulness up to date that a new catalogue be compiled and that a copy be sent to each local secretary, so that chemists in the country may be able to ascertain easily what really the Library does contain. A large Library like ours is no doubt most valuable, but will be much more so when it is known what it contains, especially in the country.

Mr. BARNETT thought young members particularly had not a sufficient knowledge of the Library and how to make use of it. When he first came to London he hardly dared set his foot in the Library, or in the house at all, and had never yet been in the laboratories except on the occasion of his examination. As to the Research Laboratory, he had heard of it, but that was all; he should have liked to go inside it. He feared there was not sufficient welcome given to strangers belonging to the Society, and while that was lacking the Society would not be so popular as it ought to be. They all recognised that it was difficult to leave their business without running great risks, and that prevented their being more social. They were often told they were brakes on the wheel, and complained at for not joining the Society, but if there were something given them to join it would be better. He did not mean in

the way of money, but in the way of welcome. They could not alter the existing circumstances with regard to the stores, and, as Mr. Atkins had well said, there were deserving men who were unable to contribute to the Society simply from outside pressure. He thought ways and means might be found to tempt the younger members to spend more of their time there, and suggested that even non-members might have the use of the Library on the recommendation of a member.

Mr. CLARKE said he could give an unqualified denial to what had just been said. He had at present a young fellow from South Wales who had come up for the purpose of passing his examination, who had never been in London before. When he came there Mr. Holmes took him over the Museum and Mr. Knapman took him over the Library, and he spent a considerable part of his time there.

Mr. STOOK said he was a student there thirty years ago, and he thought it was mainly a question of nervousness. He was only a private student, but he made free use of the Library and Museum, and even went up into the laboratories. The only time he felt nervous was on the day of examination.

Mr. SINCLAIR also said that his first visit to the Society's premises was made about two months ago, when he was received very kindly by an official, who showed and explained everything to him, including the Research Laboratory.

Mr. PERCY WELLS, who said he was probably speaking there for the last time, as he had passed considerably beyond the allotted span of human life, wished to call the attention of the Council and the members to what he considered an omission of duty on the part of the auditors, in not giving that complete information which they ought in the balance-sheet. He wished to draw attention again to an item he had mentioned more than once, as one of the most unsatisfactory—namely, "Journal: Balance of account." He wanted to see the accounts showing the balance. He had always been a seeker after information, and he prided himself that, however small the information conveyed to him might be, he garnered it up, and it might prove of use hereafter. In the accounts of large railway and other companies it was customary to give supplemental accounts, explanatory of certain lines in the general account, and that was what he wanted. The balance given did not include postage, which appeared lower down, but in common fairness the two ought to go together, which would make the balance against the Journal £2,549 16s. 9d. If they had not large funds to fall back upon, how long would the Journal continue at that rate? They would be in the *Gazette* very quickly. It amounted within a fraction to 9s. 5d. for each member of the Society, even with the increased numbers. They did not know how much was paid to the editor, or if he had an assistant to help him use the scissors and paste. Again, in the expenses of the office, why not state the salary of the Secretary? He was a very good man, and they could not pay too much to a good man who had all the responsibility on his shoulders; he was the last to ask anyone to do anything without adequate remuneration, but there was no reason why the amount should not be stated. This was probably the last time he should speak there, but he hoped the seed would not fall on barren ground, but would produce results which he might perhaps live to see.

Mr. CAMPKIN said the Treasurer, in seconding the adoption of the Report, appealed to the sympathy of the members, and assumed that the Society was unpopular with the craft because of its connection with examinations and prosecutions. He (Mr. Campkin) was not prepared to admit that the Society was unpopular in any direction, and certainly not on that account. If there were any criticism that could be passed on the acts of the Council, although it might be made from an imperfect knowledge of the details, still, it was only right that that criticism should be made if it were fair criticism. As a member of an Executive of many years' standing, occupying a responsible position, he could entirely enter into the feelings with which the various criticisms might be regarded by the

members of the Council, every one of whom undoubtedly possessed the confidence of the Society from the fact that they were the elected representatives of the Society from time to time, and that the Council was exactly as the members made it. The members had an opportunity of changing the Council from time to time, and, therefore, there should be no unfair criticism directed to the members of the Council as a body; but what they did desire to know was the action that the Council took from time to time. The question before them at the present moment was one upon which depended their very existence as a body of men connected with a business which should be protected by Act of Parliament. The past year had been a very eventful one, and they found that although the Council as a body was acting on behalf of the members of the Society upon this great question that was so vital to their existence, it was not entirely united. Hence, he took it, they could not expect other than that there should be some amount of criticism at the hands of the members. He would refer chemists generally back to themselves, and ask those who were outside the Society if they criticised and declared the Society unworthy of their membership, if they should not first of all assume the position of members of the Society, which had been thrown open to them by recent legislation, so that as a united body they might have greater power than they had at the present time. They asked if the Council had taken every means in its power to enforce upon Parliament the position to which as a body they were entitled. Some of them had in their respective neighbourhoods, and by association with some who occupied seats in one or other of the Houses of Legislature, endeavoured to bring an influence to bear upon members of the House of Commons with regard to the Bill that was now before them, and more particularly to educate them with regard to the clause of the Bill now before the House which was exercising them so much. But they had not been able to ascertain the extent of what the Council had done in that direction, nor had they been told that morning, for obvious reasons probably, the position that was likely to be taken up when that clause came on for discussion. He was one of those who entirely approved of the action of the Law and Parliamentary Committee, and of the majority of the Pharmaceutical Council in the action that had been taken with regard to that clause, and he had no sympathy with those who attempted to temporise with the clause by amending it in any way whatever, or, at all events, by the means that were open to them. He accepted the assurance of those who were responsible in connection with the Council that the Minister in charge of the clause would not accept an amendment. He was sure he would be speaking the feeling of hundreds and thousands of members in the country when he said that if that was so they would have none of it. Sooner than that clause should pass as it was he would rather that there should be no clause at all, that it should not be amended, and that they should not temporise with those who would in any way attempt to legalise company trading. In that, as the majority of the Council had taken that course, the Council had the confidence of the body of chemists throughout the country, because they were governed by majorities, but what they did wish in addition was that, having secured the rejection of that clause, which was very probable, something should then be done to further define the position of registered and qualified chemists in accordance with the original intention of the promoters of the Pharmacy Act of 1868. Probably enough had not been done in that direction, and although it might be from want of knowledge, there were those who thought that after that monstrous decision was given by the House of Lords some twenty years ago, the Pharmaceutical Council should have taken upon itself to secure further legislation, which should have the effect of defining for good and all the position of chemists under the Pharmacy Act of 1868. He took it that this was all that was asked of the Council at the present time, and if the Council showed itself alive to that it would undoubtedly possess their continued confidence. The subject was

a very wide one, and he hoped there were others who would be able to speak upon it to a fuller extent than he had done. It might be that despite the various criticisms that had been made there would be no change in the constitution of the Council, but he did not think that those who were responsible for the contest that arose from time to time were to be criticised unfairly, because these contests and these extra nominations had this good effect—that they caused an outspokenness on the part of the members of the Council from time to time which was unknown to those who had watched the proceedings of the Council some twenty years ago, and in that direction they had brought up the members of the Council to a higher level, and had caused them to exhibit a greater regard for the interests of chemists generally than they probably had done previously. They confined themselves undoubtedly to matters of detail, and strictly discharged the duties imposed upon them, but, as a body, they asked them to do more in the future than they had done in the past in the directions he had indicated, and if that was the case, the Council would not only possess the confidence of the members of the Pharmaceutical Society, as it did to-day, but that it would be in an increasing ratio, and he trusted that the time would never arise when it would be necessary to pass any resolution suggesting a want of confidence in the Council as a body of their own selection and election.

Mr. R. A. ROBINSON congratulated the Society upon the improved condition of its affairs. He was very glad indeed to see that the revenue account had now taken a turn, and that they were able to put away money which, he thought, would be useful in future years. He noticed that it was said that the subscriptions from members and associates were £2,000 more than last year, and this must be exceedingly satisfactory. He thought none of them would regret the action that was taken in changing the former membership. It appeared to him that this change was admirably fulfilling its conditions, and he quite agreed that it was to the interest of every one in the country who was not as yet connected with the Society to join it. If men would only do this in order to get the body consolidated so that when they had to go to Parliament, as they would have to go, they would not find there was opposition from any body of chemists throughout the country; if they formulated a policy which had the approval of the vast majority of the chemists of the country, and there were no divergent interests between the London and the country chemists, then he ventured to think they would be much happier and much more likely to successfully go to Parliament to amend their Act. They had seen that the President of the Board of Trade did not see his way in the Companies Acts to himself introduce a clause dealing with medicine and with pharmacy. He fancied, from what he had been told, that it was exceedingly likely that if there was much opposition to the present clauses in the Bill the President of the Board of Trade would declare that he did not think them essential to the Bill, and that they would be dropped out. With regard to the Journal account, as he understood, the Journal was now doing much better, and he thought it a little unfair of Mr. Percy Wells to still say that the Journal was still in such an inferior position. As he understood, the Journal now contained more news than formerly. This is what some of them had asked that it should do, but that it should still keep up its scientific character. He understood that the Council had seen to this, and that the Journal was now much more appreciated than it was before. A much larger number had been printed to the extent of 1,000, and still, with all that, there was a saving on the Journal in six months' work of £500 or £600. They were getting a better Journal distributed among a much larger number of persons, and at the same time they were saving £1,000 a year, which he considered to be most satisfactory. The other point that he wished to refer to was with regard to something not in the report that was the question of Colonial Federation as regards pharmaceuticals. He was very anxious indeed that the Council should take the present opportunity, which was a favourable one, for giving Federation in

pharmaceutics to the Colonies. He had heard the delegates say a night or two ago, in most powerful and eloquent speeches, that they regretted very much any attempt to assume that they were less worthy or less able to manage their own affairs than other Englishmen. They said they were part and parcel of them, which, of course, they were, and they were very anxious indeed for it not to be assumed that in their arrangements they were less capable of managing their own affairs than any other body of Englishmen. With regard to the examinations for the pharmaceutical diploma, he ventured to suggest to the Society to see if they could not give reciprocity so that a man who got his title in England might use it in all their Colonies, and that the degree taken in the Colonies might be available here. Of course, he knew that there must be some safeguard, but he did not regard it at all as an insuperable difficulty to find out sufficient safeguard. Was it too early for the Council to get into communication with the Pharmaceutical Board of Examiners in the Colonies and study their synopsis? He had heard it stated last night that there must be a curriculum. If there must be, the sooner the curriculum came the better; but he ventured to say that this was a most favourable opportunity for advancing in that way, and he would have a clause to that effect in the next Pharmacy Bill. In conclusion, he congratulated the Society upon the improved condition it appeared to be attaining, and also the Council, who had so well managed the affairs of the Society.

Mr. GAUBERT said he took it that there was no one in that room who was inimical to the Council or to the Society. The gentleman sitting at the head of the board of green cloth had courted criticism, and he remembered last year hearing the President say that there was nothing he so much enjoyed as coming down to these annual meetings and listening to the criticisms. He supposed it was on the analogy of being allowed to talk about the sausages because it did not hurt the sausages. The position which Mr. Atkins took up was very much like the clergyman who was very fond of strawberries. He had a most luscious one in his hand. Looking at it he said, "Doubtless God could have made a better berry, but doubtless God never did"—for he said they never had such a Council, and he did not think they would ever get a better. There were some who thought that the Council might be improved by the addition of a little fresh blood, but that was not saying that they were disloyal to the Council, but individually they might change it and like it as much as ever. Something had been said about the members not joining in such numbers as it was hoped they would join; but it struck him that if the Council had done a little more than it had done they would have a larger number of members than they had got. When the Council were asked to do something they turned round and said they might have done it twenty years ago when interests were not so strong; but when they were asked twenty years ago they said they had not sufficient numbers. It did not seem to matter which end of the stick they were. What they wanted to see was something coming out of the Council. It reminded him of the little girl who, on being asked about the natural history of the cuckoo, said it was a bird that did not lay its own eggs. They had been waiting for the Pharmaceutical body to lay an egg; they had laid one in the poisons' bottle, but it was not hatched yet. Whether the Council remained the same or became changed, he hoped to see a good big egg come out of it.

The VICE-PRESIDENT: If no other gentleman wishes to make any observations, I will shortly refer to one or two of the statements that have been made. On the whole, I think I may say that the criticism has been favourable to the Council; at any rate, we have had a good deal of humour put into it, which perhaps has made it more pleasant. I will refer first to what Mr. Mackenzie said with reference to the North British Branch. I think things have altered somewhat during the last few years; at any rate, they are very different to the time Mr. Mackenzie referred to with regard to the report, and so on. You have heard a good deal this morning about the *Pharmaceutical Journal* and the reports of the

proceedings of the North British Branch. I may say that those proceedings are fully reported from time to time in the *Pharmaceutical Journal*, and that there is no necessity now to give any fuller reports. As I said in my opening remarks, although the paragraph referring to the North British Branch was short, it did say that the Branch had done excellent work. I am in the fullest sympathy with that paragraph, and am only too glad to refer to the immense amount of work which has been done in Scotland. I do not want to refer in any particular detail to the question of the salaries. Mr. Mackenzie made it rather a point that the Assistant Secretary's salary was the only one stated in the report. He is, as you know, the principal officer in Scotland—in fact, the only officer, one might say. We all know that Mr. Hill has done for the Society a great amount of work. He is always at hand. I fully endorse what Mr. Mackenzie said—that the establishment of that branch in Scotland has been of immense value to the members of our Society in the North of England and Scotland, and it has a large educational influence on the outside public and the medical profession. With reference to what Mr. Umney has said, I know he is a man of figures, and knows more about accounts than I do, but of course the Council will take into consideration the suggestions that he has made. You will remember that two or three years ago it was decided that it was better to put down the cost price of everything stated here, because the prices of things were fluctuating, and I believe Mr. Umney fell in with that suggestion; but if we think it desirable to alter that we shall do so. With reference to what Mr. Griffiths said about the Library, a catalogue is now being prepared, and will in the course of a short time be ready, and one will be sent to every local secretary. I think that meets the remarks that Mr. Griffiths made with reference to that. Now, Mr. Barnett says that many young people are afraid to come to this house. I have been connected with the Pharmaceutical Society from a very early age, and I must say that I never had that fear, because I well remember the father of our friend the Secretary, Mr. Elias Bremridge, the first time I appeared in this place, was most ready to show me about, and to give a hearty welcome to everyone. The same spirit exists to-day. I was glad to have the testimony of some other gentlemen in the room in answer to Mr. Barnett's criticism, who said that they had the fullest opportunity of seeing the Society's Museum, the Library, and so on. We have had these statements made year after year, that we do not give the accounts in detail with reference to the Journal. But I would ask you, is it good business for us to publish the details concerning the Journal? It is a property that we are very much interested in, and I think there are other journals connected with our own craft which would be very glad to avail themselves of the details which might be given. I think it is better that it should be stated as a balance of account, as it is now. Mr. Wells gave us credit for being men of business. [Mr. Wells: No, he did not.] At any rate, Mr. Wells said the Council had the good sense to value a good officer, and paid him well for his services, and I say that amounts to the same thing as being good men of business. With reference to the Journal, I would remind you that the amount for the Journal is not a loss, but it is the cost of supplying it to the members of the Society. There are a great many things in connection with this which might go to reduce this adverse balance; for instance, I think we are entitled to charge so much per page for the insertion of the official advertisements of the Society, and if we were so disposed we might set that on the other side, and so reduce the balance. I think the other speakers were so fully complimentary to the Society that I need not refer to them. I would just refer to one point that Mr. Robinson raised about the Colonial Federation, and as to there being reciprocity. The Council will not lose sight of that. They have considered this matter for some time. It has been brought forward by Mr. Chater, a member of the Queensland Board of Pharmacy, and I may say that we should be ready to recognise examinations which were carried on on the same lines as our own.

What we have to contend with is the fact that it is very difficult to compare examination with examination. Australia and our other colonies, as you know, are many miles away from this country, and there would be very great difficulty in accepting their examinations, and I would say again that I think the only evidence that we can accept in connection with this is evidence based upon a curriculum. Gentlemen, I am much obliged to you for having listened to me so long. You heard the resolution which I moved at the commencement. Is it your pleasure that that resolution does pass? On the contrary? It is carried unanimously.

Motion by Mr. Wells.

The VICE-PRESIDENT: I now ask Mr. Percy Wells to deal with the motion of which he has given notice. I am not quite sure that it is in the form that Mr. Wells meant, but it is an exact reproduction of his notice of motion. There is a point in it which I might refer to, and that is the date. I am a little doubtful as to what is meant—whether we are to go back for ten years or not. With reference to that point I might ask if you wish to correct it, because, strictly speaking, the whole thing will be out of order unless that is altered.

Mr. PERCY WELLS: If you rule this out of order, I shall ask you, sir, to state the grounds on which you so rule. If, on the other hand, I may, by your graciousness, be permitted to move it, I will go on at once.

The VICE-PRESIDENT: I should like to know whether the date you have inserted here is to stand?

Mr. PERCY WELLS: If I have put 1890 in the paper that I sent to the Secretary, I beg permission to withdraw that and substitute the figures 1900.

The VICE-PRESIDENT: That is all I require. Now you are at liberty to go on.

Mr. PERCY WELLS: I suppose we all know the meaning of the word "annotation," but there has been a remark made, I conclude either by the editor of the Journal, or if not by him then it has passed his criticism, and it appears on page 428 of the issue of the Journal under date May 5 in the present year, in which it is said that possibly the whole thing may be meant as a joke. I believe, as a rule, that chemists are a reflective body, they are taught to think, and they are taught to deal in facts, not fancies, mind. Just realise if you can that if anybody sent you something to analyse you would not deal in fancies, you would deal in facts. Now I put it to any reflective being, how is it possible—and you may hit me as hard as you like, you will never get anything from me but a laugh, and the harder you hit me I will not lose my temper, yet I want to show the wisdom of the annotator, or the commentator if you like, and ask you how is it possible for an austere-minded person to indulge in a joke. I never was more sincere in my life, and it is only in consequence of ill-health that this matter has not been brought on before. I will not waste your time, because I do not like my own time to be wasted, in going through any of these details that are in my notice of motion. I naturally conclude that I have had the courtesy extended to me of their being perused by everybody here. Pray, do not let any speaker who follows me lose sight of what I am going to say. I do not by this notice of motion wish to exclude from the *Pharmaceutical Journal* one single item under the reports, or whatever they may be called under these various headings, but what I say is that they should not be made an integral portion of the Journal and bound up with it. That is my great point. I have no doubt that there are a great many of our members who will not object to see their names in print when they have these local meetings. If so, in heaven's name continue it, let them be published to the world, but what I do say is that you should not treat them differently to what they would be treated in an ordinary newspaper, rather after being perused the communication is frequently consigned to the kitchen fire or for other purposes. With a preliminary remark, I venture to hope that the members present will take it into their serious consideration whether it is advisable to continue that these various matters which I have referred to,

on and after June 13, 1900, shall continue to form a portion of the Journal proper. I will not designate it by its proper name, but there is an insinuation that there has never been a supplement. Now, I beg to differ from that. There has been a supplement up to comparatively a recent date. I cannot call to mind now, but I think it is three years ago that I wrote a letter to the Editor of the Journal, drawing his attention to the expediency of adopting some such resolution, or acting upon some such resolution as that which I have now the honour to submit to you. Whether he was afraid or not I really cannot say. He may be a strong man, or he may be a weak man, for all I know. I have had the pleasure of seeing him but two or three times, and I am not able to form an opinion therefore as to his character. You know more about it than I do. But what do I care—what does anybody here care—about the members, after their Conference, going and having a dance, or a ball, or something of that kind, or indulging in what is more to the taste of an Englishman—a jolly good dinner? Do we want all that incorporated into the Journal? I call it drizzle. Let the Journal be as it was originally intended by Jacob Bell. Let it be a record of pharmacy—of the improvements that are taking place in matters of science. Do not exclude all these things, but keep them separate from the Journal, and I have but little doubt that in 5,000 cases out of 5,400 odd they will meet the position which they are entitled to, which, I suggest, is the waste-paper basket. I have not asked any member of the Society to second this. It may fall through for want of a seconder, and, if so, I should be very sorry. I am not a Radical, nor am I an intense Conservative; but as a rule, I find that chemists are slightly Conservative. But, notwithstanding their Conservatism, I hope there will be some modification in the Journal in the lines I have indicated. Without going into any further details of these twenty-one items of my notice of motion, I could hold them up to austere severe ridicule, and perhaps I might be able to give utterance to a joke or two, but I will spare you that infliction, and therefore content myself in simply moving the motion that stands in my name.

Mr. NAYLOR seconded the resolution. He said there must be a very large number of readers of the Journal who would desire to see some kind of separation of the complex matter which had been referred to by the mover. Many of them had been accustomed to bind their Journals—that is to say, when it was more strictly speaking a scientific Journal than it was to-day. Now they were told that such a large amount of trade matter had appeared in the Journal it had been much more widely read, and, on that account, therefore, one would not be prepared to suggest exactly that this matter, which was so much appreciated, should be excluded; but it would be a great advantage if a re-arrangement were to take place. It seemed to him that a larger portion of the matter of the Journal, which was read so largely, hardly constituted a supplement, because, he supposed, it amounted to something like three-quarters of the Journal, or little more. His suggestion was that the scientific matter might, perhaps, take more the form of a supplement, because it would be so much smaller, and then those who desired to keep that matter would be able to bind their Journals as they had done in the past. He did not know how far the editor of the Journal was satisfied with the articles which appeared under the heading, "Annotations," and he did not know by whom they were written, but it did certainly occur to him on reading them over from time to time that something a little more impartial might be substituted.

The VICE-PRESIDENT: I think we were all very glad to hear what Mr. Wells had to say on this point. I may say at the present time the Council has under consideration the question of a trade supplement, but how far that supplement will go one does not know at the present time. Section 22 of the bye-laws states that the *Pharmaceutical Journal* "shall be edited, printed, and published in such manner as the Council from time to time shall direct." Strictly speaking, I ought to have ruled the motion out of order to begin with. I think it would be well if Mr. Wells

were to withdraw his resolution, because, if passed, the matter must rest with the Council to decide on what lines they carry on the Journal. Therefore, I think it would be better, with the expression of opinion of Mr. Wells and Mr. Naylor, that they should leave the matter where it is, and that the Council should take it into consideration.

Mr. PERCY WELLS: I have a right to reply.

The VICE-PRESIDENT: There is nothing to reply to. You have only the seconder who agrees with you.

Mr. PERCY WELLS: That does not matter. You have quoted a clause in the bye-laws vesting the management of the contents of this Journal in the Council. It is very much to be regretted with that fact looking you in the face that when this notice of motion was laid before the Council, which it must have been, you had not the courtesy to instruct your Secretary to communicate with me and draw my attention to that. You see what you would have saved. You would have saved the infliction of my *austerity*, which has been misnamed a joke upon the members here. You would have saved the whole of their time. You would have saved yourselves the slight castigation which I have had the honour of administering. I submit that, under the circumstances, notwithstanding that you have said it is in order, it is not in order, and I respectfully decline to have it put to the meeting. If you put it I shall distinctly say you are not in order.

The VICE-PRESIDENT: Gentlemen, I take it that Mr. Wells has withdrawn the resolution?

The next business is the

Appointment of the Scrutineers.

The SECRETARY then read a list of names of those gentlemen who had been nominated to act as Scrutineers, and their appointment was unanimously agreed to.

The VICE-PRESIDENT called attention to the following registers, which were placed before the meeting in compliance with the Act of Parliament. The Register of the Members and Students—Associates of the Society, Register of Pharmaceutical Chemists, Register of Assistants, Register of Apprentices and Students under the Act of 1852, and the Register of Chemists and Druggists under the Act of 1868.

Appointment of Auditors.

The VICE-PRESIDENT announced that the following gentlemen had been nominated as Auditors for the ensuing year:—Messrs. Butt, Hodgkinson, Fletcher, Umney, and Francis Yates.

No other gentlemen being nominated, the above gentlemen were declared duly elected as Auditors for the ensuing year.

The meeting was adjourned to three o'clock on Thursday afternoon to receive the report of the Scrutineers (see p. 562).

Special General Meeting.

Mr. BUTT: Mr Vice-President, a notice convening this meeting has been submitted to you, which has been signed by about 120 gentlemen in different parts of the country. The following are the resolutions that I am about to propose:—

"(1) That the Research Laboratory of the Pharmaceutical Society of Great Britain be reconstituted and placed under the control of a Special Committee, consisting of the President, the Vice-President (ex-officio), and two members of the Council, four pharmaceutical chemists—not being members of the Council—and the Professors of Chemistry, Botany, and Pharmacy in the School of the Society.

"(2) That the Research Laboratory be used for the purpose of pharmaceutical investigations and research only, and be placed under the direction of the Professors of Chemistry and of Pharmacy.

"(3) That the Special Committee shall have absolute power in selecting the Research workers, the subjects for investigation and

control, the publication of the results of their investigations. All such workers should preferably be pharmacists, and, if necessary, may be subsidised."

I propose to move the second resolution first. I am sorry it devolves on me to move the resolutions which have just been read. I said, I am sorry; and I am sorry that the occasion should have arisen when it seemed necessary that such resolutions should be brought before you, resolutions which at first sight must seem somewhat extraordinary, because I am sure we must all feel, or, at any rate, we ought all to feel, that the Research Laboratory of the Pharmaceutical Society should already be the home of pharmaceutical research. Such, unfortunately, is not the case, and never has been since its foundation. On the contrary, it has been used almost continuously for pure chemical research, and the purpose for which it was founded has been entirely lost sight of and neglected. Since its foundation, now some eleven years ago, it has cost the Society nearly £3,500 in hard cash. If to that be added interest on the cost of the portion of the building in Galen Place which it occupied, and its due share of rates, taxes, ground rent, gas, water, etc., and also the subsidies received from the Royal Society and the Chemical Society for work done within its walls, it will be found that at least £5,000 has been expended, and I would ask what benefit have the members of the Society derived from that outlay? At the present moment I do not wish to make any further reference to its past history. We will assume that the Committee who had the control of the laboratories did that which they thought best for the interests of the Society in allowing pure chemical research to be undertaken therein. Well, as it is no use to cry over spilt milk, I now say, "Let bygones be bygones," and from this time forth I hope the Council will endeavour to have research carried on in such a manner as will conduce to the interest of pharmacy, and be of benefit to our own members, and leave the Chemical Society and other kindred societies to look elsewhere for papers for their meetings. I will now refer to the recent condition of the Research Laboratory and the work which was carried on in the season 1898-99. By the way, it has been stated that the Laboratory as now conducted is not any expense to the Society. That is only true to the extent that no direct charge appears in the accounts, but as long as any work is being done there must be expenses, if only for house room, wear and tear, gas, water, etc. Again, when the present profession of chemistry was appointed the control and superintendence of the Research Laboratory formed part of his duty and was accordingly considered when his stipend was arranged. Yet, again, there is the Salter Fellowship of £100 a year and certain scholarships, and if their respected holders are not engaged in useful pharmaceutical research, the money which they received is so much money wasted as far as our members are concerned. Now, with reference to the Salter Fellowship, one of the reports of the Research Committee (*vide P.J.*, vol. 53, page 838) states that:—"The Salters' Company have offered a fellowship of £100 a year, tenable for three years, for the promotion of research in connection with *chemical pharmacology*, to be held by a person who, in the judgment of the Director of the Research Committee, is best fitted to carry on *chemical research, especially in its relation to pharmacology*. I see there is no stipulation that the person selected need be a pharmacist. Should we be expected to provide within these walls at much cost facilities for the education of those who are outside our body? especially when there are many young pharmacists who would be only too willing to avail themselves of the advantages which attach to that Fellowship, and would gladly work in pharmacy, especially in its relation to pharmacology. As to the meaning of the words *chemical pharmacology*, I will not now attempt to define them, but I think most of us would consider it had something to do with pharmacy, yet when I refer to the report of the Director of the Research Laboratory for the session 1898-99 (*vide Pharmaceutical Journal*, August 5, 1899, page 143), I find the Salters Fellow has been investigating the "mode of production of some nitro and

amido-oxy-lutidines," "the salts of di-methyl pyrone and the quadrivalence of oxygen." Perhaps someone more learned than myself will explain what these substances have to do with pharmacology. That report is as follows: "In the Research Laboratory good work has been done by Mr. T. Tickle (Salters Fellow) and Mr. E. M. Chapman (Burroughs Scholar). The result of two investigations by Mr. Tickle and myself has been published in the *Journal of the Chemical Society*, whilst Dr. Lapworth and Mr. Chapman have also finished and published in the same journal an investigation on the derivation of camphor. The actual number of publications from the Research Laboratory I give below:—

(1) N. Collie and T. Tickle.—Production of some nitro and amido-oxy-lutidines.

(2) N. Collie and T. Tickle.—The salts of di-methyl pyrone, and the quadrivalence of oxygen.

(3) A. Lapworth and E. M. Chapman.—Homo-camphoronic and camphoronic acids.

(4) A. Lapworth.—Hydroxy di-bromo-camphor sulphonic acid.

(5) A. Lapworth.—Note on nitration substitution in nitro compounds.

(6) A. Lapworth.—Sulphonation of benzo-phenone and of diphenyl methane.

(7) A. Lapworth.—A possible basis of generalisation of intramolecular change in organic compounds.

(8) A. Lapworth.—Action of silver compounds on di-bromo camphor.

Still more recently I find in the *Pharmaceutical Journal* for March 17, 1900, page 297, column 2, under the heading "Chemical Society," that a paper was read at their meeting on Thursday, March 1, on a Di-bromo camphor.

The report is as follows:—

"The authors converted homo-camphoronic acid into a lactone. This hydrolysed, giving a ketonic acid. The ketonic acid combined with hydrocyanic acid, and the resulting compound, after hydrolysis, formed a hydroxy dicarboxylic acid, which was capable of yielding an anhydride; the ketone cannot, therefore, be a δ lactone, but must be a γ lactone. The ketonic acid, moreover, gave a tribromolactone with bromine. The conclusions drawn from these facts and from its derivation from a dibrom-camphor is that the only formula admissible for it is not in agreement with Bredt's formula." All this may be very interesting from a chemical point of view, but I think you will agree with me that not one of these investigations has the slightest bearing on pharmacy. The report also states that some of the papers have been published in the *Journal of the Chemical Society*. Why, I would ask, were they not published in our own official Journal? The only reply which I can imagine would be, either they are unsuited for its pages or else they are much too learned for the comprehension of the ordinary pharmacist. Should such things be? Should the Council allow such work to be done in our Pharmaceutical Research Laboratory?

The week before I read the first of these reports I was reading the report of the proceedings of the British Pharmaceutical Conference at Plymouth, and I noticed that amongst other matters that were discussed there, there was a considerable amount of criticism of the newly-issued Pharmacopœia, and I arrived at the conclusion that if the Research Laboratory had been continuously conducted with spirit from its foundation, on the lines which were laid down at the time it was promoted, much of that criticism could not have taken place, and I then determined, after due deliberation, to make a final effort to get pharmaceutical research substituted for pure chemical research in our Laboratory. With that object I drafted a circular letter, which I sent to each member of the Council in October last. Previous to sending that letter, however, I thought it advisable to ascertain whether my views were likely to obtain any support outside the Council, hence I wrote to a large number of persons in all parts of the country,

including former members of the Council, present and former members of the Boards of Examiners, persons who had taken or were still taking an active part in the work of the Pharmaceutical Conference, and other persons—leaders in pharmacy—who, I thought, took some interest in pharmaceutical research, and enclosed to each of them a copy of the circular letter. I received a reply from each and every person to whom I had written, and with one exception they assured me of their support. As that letter contains the gist of the subject, I will now read it to you:—

I am writing to you as a member of the Council of the Pharmaceutical Society, in the hope of inducing you to assist in carrying out an object in which I have been deeply interested for many years, viz., pharmaceutical research which, I think, in the future ought to be the chief subject for investigation in the Research Laboratory, in contradistinction to pure chemical research, which has been the principal, if not the only, work carried on in the past.

At the meeting of the British Pharmaceutical Conference, held at Plymouth, in July, 1899, Mr. Atkins said (*P.J.*, July 29, 1899, page 128, col. 1), "A great deal of good work had been done by members of the Pharmaceutical Society, and if the Research Laboratory had not done much in this way, he believed it would."

I ask you "When" this good work is to be commenced, and "How" is it to be done?

At the same time and place, Professor Atfield said *P.J.*, July 29, 1899, page 122, col. 2), "There seemed to be an impression that at the back of the Pharmacopœia there were a body of workers who tested all processes, rejected the bad, accepted the good, and added further processes of their own; to do this would take twenty years and cost £20,000.

At a meeting of the Council of the Pharmaceutical Society, held on July 2, 1885 (*P.J.*, vol. 16, pages 6, 7, and 8), it was proposed to establish a Research Laboratory at Bloomsbury-square, and the then President moved as follows:—"That steps be taken for promoting systematic research in pharmacy," and in the course of his subsequent remarks said, "It had often been said that to keep a pharmacopœia abreast of the day it was essential that work should be done continuously," also, "it seemed to him that, quite apart from the political aspect of the question, and the desirability of pharmacists having a voice in the compilation of the pharmacopœia, it was desirable that they should begin with the issue of the new Pharmacopœia (*i.e.*, that of 1885), to do what their resources admitted," and, "If such a project could be carried out *with spirit*, the improvement effected in *pharmaceutical processes* must produce an effect on the medical profession and on the Medical Council which could not fail to be beneficial," and yet later on "In the case of new preparations their value would be discovered, and thus the compilers of the National Pharmacopœia would have an amount of material placed at their command which they could not afford to neglect."

It is needless to point out how little has been done in the above direction during the past 13 years, and in consequence thereof "the compilers of the National Pharmacopœia of 1898" did not "have an amount of material placed at their command"—yet if the work which was foreshadowed above had been earnestly commenced in 1886 and "*carried out with spirit*" instead of the useless research work (*i.e.*, from a pharmaceutical point of view) which has been carried on during the past 12 or 13 years there *ought to have been* "a considerable amount of material" at the disposal of the compilers of the new Pharmacopœia, and both Mr. Atkins and Professor Atfield would have had to modify their statements, and probably there would not have been so much unfavourable criticism of that compilation.

At the Council meeting, held August 2, 1899, it is reported that "Mr. Tickle was admitted to the Research Laboratory, Mr. Chapman was appointed 'Salters Fellow,' and the Burroughs Scholarship remains to be filled."

With this *resumé* of past proceedings, I now most earnestly ask you to use your best efforts in assisting to effect a change in the working of the Research Laboratory, somewhat in the following direction:—

First.—That all workers therein should devote their whole time to pharmaceutical research, with, of course, as much chemical work as is necessary to verify their pharmaceutical work, and that they should commence at once with the 1898 Pharmacopœia, as was intended by the original promoters of the Research Laboratory.

Second.—That the Professor of Chemistry and his assistants, if they have spare time at their disposal, should devote it to pharmaceutical research and not to pure chemical research, as it appears is now the case from the report of the joint investigations and carried out in the Research Laboratory during the past sessional year, for not one of the subjects therein mentioned has the least interest or practical value to the vast majority of the members of the Society, *vide* Report on the Research Laboratory (*P.J.*, August 5, 1899, page 143).

Third.—That all papers relating to work done in the Research Laboratory should be read for the first time at an "Evening Meeting," or at a meeting especially convened for the purpose, and—or—first published in the official organ of the Society, viz., the *Pharmaceutical Journal*.

At the time when the desirability of founding a Research Laboratory was under discussion, I was a member of the Council, and also a member of the

committee appointed to consider the subject, thus I am fully conversant with all that transpired at the time, and in order to show that the intention of the promoters of the Research Laboratory was to carry on pharmaceutical and not pure chemical research, I enclose a copy of a memorandum which was submitted to that committee in either October or November, 1885, and subsequently approved by them and recommended to the Council for adoption.

A reference to the *Pharmaceutical Journal* for July 4, 1885, December 5, 1885, and to other numbers, wherein are published the various discussions which took place on this subject by the Council, must tend to confirm the opinion that the Research Laboratory was established for carrying on pharmaceutical research, pure and simple.

Finally, the Council at its meeting in January, 1888, passed the following resolution:—"That the sum of £300 a year be granted for the next three years to a committee to be appointed annually by the Council, &c., &c.—to make such arrangements with the Professor of Chemistry as will enable advanced students and others to undertake *Pharmaceutical Research, &c.*"

In conclusion, I again ask you "When" is pharmaceutical research to be commenced, "How" is it to be carried on so that the results may prove of some benefit to the members of the Society, and will you use your best efforts to at once attain this most desirable object?

An early reply will oblige.

I then waited four months, and as at the expiration of that time I had not received any official reply, I wrote to the President asking him whether the subject of my letter—viz., "Pharmaceutical Research *vice* Pure Chemical Research"—had yet been officially considered, and, if so, with what result, and, if not, whether the Council proposed taking any notice of it and when. The President replied as follows:—"Dear Mr. Butt,—I duly received yours of the 13th, with enclosed circular letter, of which I had previously received a copy. As I informed you a week ago, the delicate correspondence with the General Medical Council regarding pharmacopœial revision, which includes true pharmaceutical research, is still going on, and when concluded I think the Council of the Pharmaceutical Society will most probably try to affiliate your scheme with that of pharmacopœial revision. The subject of your scheme has been mentioned on several occasions, but as it included the latter wider subject, it has not been definitely taken up. I cannot answer you further at the present time." A reply which is somewhat vague, and one which contained little more than might have been said at any time during the last thirty years. Still more recently, judging from the report of the proceedings of the Council in April last, there has been some furbishing up of the Research Laboratory, for it is stated that "It appeared that, besides the ordinary routine work, the committee had sat as a Research Committee and received reports from Professors Collie and Greenish respecting the progress of certain pharmaceutical work, which, at the request of the General Medical Council, had been undertaken in the Society's laboratories." From this it seems as though the "delicate correspondence" which the President referred to had terminated and the Research Laboratory has not only become the hand-maiden of the Medical Council, but is being subsidised by it. Well, gentlemen, I do not think that is the position in which this Society ought to be placed. We ought to be able to act with perfect freedom—free of that body and every other body, and the Council or its Research Committee should select the subjects for investigation and to see that the workers are occupied in carrying them out with spirit. Those investigations ought to have such relations to the revision of the Pharmacopœia, the improvement of pharmaceutical processes and with pharmacy in general, as past experience has shown to be so urgently needed. Perhaps it would be as well if the Vice-President would explain to this meeting the substance of the arrangement which has been entered into with the Medical Council, the nature of the work which they propose we should undertake for them, and whether the arrangement is only a temporary one, or is intended to be permanent, also whether all the workers in the Research Laboratory are to be engaged in doing that work, and, finally, if the arrangement is to be a permanent one, whether the Pharmaceutical Society is to be represented on the Pharmacopœia Committee of the Medical Council on equal terms with their own members. I do not think there is any reason

for secrecy, neither should there be any mystery in the matter. If the reply to the last question is in the affirmative we shall all be glad to find that at length there is a prospect of the work being carried on on the lines originally proposed.

In concluding my remarks, I would say I think I have succeeded in pointing out that the Research Laboratory was founded for the purpose of pharmaceutical research, and if investigations of that nature had been carried out with spirit during the past ten or eleven years, the pharmacist, the medical profession, and the compilers of the Pharmacopœia ought all to have been much benefited by the results of that work. On the other hand, I think I have also shown that the research work which has been actually carried out has been pure chemical research, undoubtedly of a very high class, but as far I can see the members of the Chemical Society have almost alone derived all the benefit arising from our work; hence I think I have proved the urgent necessity for a change on the lines indicated in the resolutions you have before you, and I feel sure you will all give them your hearty support.

Mr. HILLS: May we know absolutely and definitely what is the resolution that we are to vote upon, because there are three here, and I understand Mr. Butt is only moving one?

Mr. BUTT: I move the second resolution, "That the Research Laboratory be used for the purpose of pharmaceutical investigation and research only, and be placed under the direction of the Professors of Chemistry and of Pharmacy."

Mr. BARNETT: I shall be glad to second it. I should like to say that I hope in the Research Laboratory the researches will be connected in a manner that will standardise the things or give an official standard, so that the new Pharmacopœia, which will be published at some future time, shall be an official standard for all drugs as far as possible. If that be embodied in Mr. Butt's resolution, I think it would be a good thing. The Pharmacopœia ought to be the standard, and I think it might gradually be made the standard which will be in future accepted by the general body.

Mr. CARTEIGHE: I was very glad to have the opportunity of seconding the resolution calling this special meeting at the request of Mr. Butt for two reasons; that there seems to be in his mind, and in the mind of some of the members, some misapprehension as to what has been going on since the Council took up the matter. He has referred a good deal to the past, and, if time permitted, I could also; but, for practical purposes, I do not wish to deal with the past. I do not wish to deal with those satirical remarks he makes about the past. I only wish to say that those of us who remain on the Council, and not, as Mr. Butt has done, left it, have done their best to do what they could under the circumstances in which they were placed, and I will first say that when the President of that time, who happened to be your most obedient humble servant, Michael Carteighe, brought forward this matter of research, he spoke of it as being a thing right in itself, and that its moral influence upon the outside public would be considerable. He said that it would affect our position with regard to the new teaching University of London, which was then in the air, and he said if he did systematic work in research—I do not care what you call it, for pharmacy embraces all that—that the Medical Council will, as a matter of course, almost a matter of duty, ask you to do work for the benefit of the Pharmacopœia. Those two statements are at the present moment absolutely confirmed. This school and these professors have been recognised as part of the teaching body of the University of London. There is to be a Board of Pharmacy. Pharmacy is recognised, if not in Parliament, as a distinct profession. That is worth something, I hope. Then the other thing is that we were asked after the publication of the Pharmacopœia in 1888 to nominate two members of our body to be associated with certain other members of the Medical Council in a body which they call a conference. I want you, gentlemen, to try and follow me with regard to the word "committee" and the word "conference," which are a little bit awkward for us, because we have another conference. But they call it a conference, the

object of which was, as explained to us in official letters, to take advice from the medical, from the physiological, from the pharmaceutical side, in regard to what scientific work should be undertaken forthwith, with the view hereafter of forming a Pharmacopœia Committee to digest it and to put it in form; that is to say, they did what some of us, my friend, Mr. Umney, and myself, for instance, advocated many years ago, long before Mr. Butt took any interest in the question at all, and we find that they say we want a committee of a conference; we want a small body of men to associate themselves together and to decide what set of subjects in each branch of the Pharmacopœia require systematic investigation, and to consider how and when such investigation should take place. The gentlemen appointed by us on that conference were Dr. Inglis Clark and Mr. Charles Ekin, both of them members of the Pharmacopœia Committee of the Society who assisted the Medical Council in producing the last volume, and both of them, not members of the Council, but men of good broad common sense and wide knowledge. Acting upon suggestions made by our representatives on this conference, the Medical Council has officially asked us to do certain things already. This, I think, was some months ago, but that does not matter for the present purpose. Some of the work that they have asked us to do has been going on for some months. They have asked us, in the first place, to ascertain to what extent the standardising of potent drugs can be carried on with accuracy and success. Dr. Collie at this very moment is at work on the premises with that object. I do not know whether that is pharmacy or whether it is not, but that is what he is doing. In order to do it he has to take something that is definite, and he happens to be beginning with coca. He has to begin with the active principle. If he can standardise it with accuracy, he has to see whether it applies to medicine. The other thing they have asked us to do is the determination of boiling points. I do not know whether that is pharmacy or not, but we are going to undertake it. Boiling points are probably physical constants. We have not heard from Mr. Butt anything about physics. I suppose that would be much further off, but it is the work which furnishes important aids to ascertaining the purity of certain substances. They have asked us to determine the percentage of ash in certain drugs, and lastly, so far, they have asked us to determine the solubility of the chemical salts of the Pharmacopœia. I do not know whether that is pharmacy or not, but the professor of pharmaceuticals has undertaken it. Now, there is more there than we can do for some time. They have asked us to do this on these grounds—that the work we have done is to be trusted, that the work that we shall do will be trusted, and they are satisfied that the Council of this Society is sincere in its desire to go in for scientific work and control it, and that it is competent so to do. In fact, they have come to the conclusion that it is not necessary to go behind our backs to our professors, but they come in front to the President and ask us direct. At this present moment we are practically as the Research Committee of the Council directing this work. What more does Mr. Butt want in that direction? He said something in his observations about being independent. We cannot be independent in regard to pharmaceutical work. We cannot be independent of medicine. The whole of the Pharmacopœia is not purely pharmacy, or purely chemistry—the medical element comes in; but what I have contended for is that everything which is not physiology and therapeutics in that volume can be undertaken in this house if we have sufficient workers to carry it out. The question is, can we do it? Can we afford it? At the present moment there is, strictly speaking, no research laboratory as distinct from any other laboratory. There was a time when the laboratories belonged, almost as a matter of trade, to each professor, and we had to get young professors and put them in another part of the house to do work which was called research work. The fact is now, that in the research laboratory of the Upper House every professor has a research department, and he does that as part of his work, as he ought to do, without

any remuneration. It was not made as a matter of change at the time Professor Atfield and Professor Dunstan resigned. The research laboratory where chemical work is now done, under Dr. Collie, is on the same floor as the teaching laboratory, and the pharmaceutical work, under the direction of Professor Greenish, goes on either in this House, or in the other. At the present moment one of the laboratories which Professor Dunstan used for research work is used for the work under Professor Greenish, and the other for teaching our students practical operations in pharmacy in connection with that of our School. Our research work is now merged in the schools. It is part of the schools, and it is right that the control of the whole of it should be vested in the Council, and no one else. This resolution means, if it means anything, that we should give up this direction and place it under the direction of the Professors of Chemistry and Pharmacy. After I have lived as a member of this body for forty years, after we have had to fight with our own officers, are we to give over to our own officers the powers which the Council alone ought to keep? The thing is absurd; it is ridiculous, and can only have been suggested from want of knowledge. I admit that a good deal that I have said to you has not been put in the form of a report, but before I refer to that I will say this first—not only have we been asked to do this work, but it was possible to get one or two men with scholarships and sometimes a third without a scholarship to work at chemical work where extra knowledge was gained without remuneration, it was impossible to get a man to go on working at such things as solubilities and that sort of thing without remuneration. At the time the Research Laboratory was first suggested, many of us thought that on something like £50 a year, or a scholarship of less value, we might find a number of men willing to work. Experience has found that that is not so. I do not say that I am sorry for it, because the value of our men when they have taken their Major qualification is so increased that I am not surprised that they go elsewhere and get £150, rather than take £50 from us. We have, as a Council, to deal with the position as it is placed before us. What we have said to the Medical Council is, broadly, this, that we can get a certain amount of work done on standardising and possibly boiling points without much cost. We may have to supply some persons to assist, and the cost of material is not very great, but in regard to certain things it may be necessary to pay a very respectable stipend to a worker. The Medical Council has practically left us a free hand in that respect, and that what costs us money with regard to the scientific work which they have asked us to do, they will not allow us to be out of pocket by. The professors will do the direction, and the final control comes from the Research Committee of the Council itself, which sits month by month. It will be said, why did you not tell us all this before? I will tell you why. I have had nothing to do with it, because I am not the President. I am acting now for the President, who is in South Africa. There are amongst our own body a number of very good fellows, very capable men, and we have had officers in this house who, in the judgment of some of us, have not been loyal to the Society. I mean to say, and I must speak plainly, that they thought of their personal position, their personal reputation, aye, and, I am afraid, their pocket, before they thought of the incorporated body that created them and had made them eminent. We do not know at this moment whether we have not even officers about us now who may, if they are not looked after, develop in that direction. Have we not had an illustration of it in the fact that I do not know how many were required to make the last Pharmacopœia. We had to do something, somebody had to do something else, and the experts had to look over it all, and have we not heard of experts and officers actually taken from members of our own staff? What can we do if we have men like this about us? Why, we must keep our own counsel, and conduct our own house and our own negotiations. Mr. Butt said in one of his observations that we should do work off our own bat. I admit that. If we undertake this work,

which we have undertaken and which we must do, I assure you that as one of that committee it will take all the men that we can get, whether we pay them or not, for at least a couple of years. This work must be done in such a way that it shall be unimpeachable, that it shall be the standard for all time, and that it shall stand to the credit of this Society that it was done in this house. I hope that we shall not raise the question whether it is physics, or pharmacy, or what. It is work belonging to that wonderful volume which Redwood used to tell us was more a book of physics than anything else; in fact, when you take the physics out of it there is no pharmacy left. As to pharmacy, do not we know that that which was once called pharmacy is fast looming away from us, and may we not have to face the fact that standardised things may sooner or later displace a large part of those very things that we have been in the habit of considering ought to be made by the pharmaceutical chemist under his own personal supervision. We have the most cordial relations with the Medical Council in this matter. Dr. Leech, who is on intimate and friendly terms with me, did some work with Professor Dunstan in the Research Laboratory many years ago, and read a paper in this room on the action of ethyl-nitrate. I do not know whether that was pharmacy, but it was read here, and he has been impressed with the character of the work done. In the course of Mr. Butt's remarks he has referred to publication. Mr. Wells referred to the Journal, but do not we know perfectly well that while some of us are anxious to push along the Society's machine, politically, socially, and scientifically, that a large number of men will not interest themselves in abstract chemical or physical questions, botanical or otherwise, but the great majority of them want more or less popular material. We are happy to do what we can by putting into the Journal matter which is very easily readable and very easily understandable by the side of some which is not so easy. The question of publication and where it is read is a matter, after all, of very little consequence. To accuse the worker of being your paid slave for doing intellectual work which is to be for the benefit of all humanity is to take a very low estimate of research work. We want the men to feel that they get honour, and if they get honour for their work anywhere, why should you interfere with them? I go further, and say with regard to the scientific matters connected with us as I have repeated with regard to politics, that what we want is the publication of what we do to other people besides ourselves. We want the doctor and the educated public to know, we want the chemists all over the kingdom to know, that we do good work and are to be trusted; that we are not a mere trades union, that we are people with higher aspirations, even though we keep small pharmacies—all this is part of the whole machinery of the Society. Of course, if Mr. Butt, or any other active man in his position, takes up a point of this sort and runs it down and asks for signatures to any particular thing, there is not much difficulty in getting them. I am very glad he has taken the trouble. I have had a good many letters which seem to imply that because he was an auditor and a former member of the Council, he was acting under the direction of the Council in this matter. Of course he did not represent that himself. I say when we have something like £1,000 a year so that we may be able to employ about ten competent pharmaceutical chemists at £100 a year each to do the work, then Mr. Butt's aspirations can be carried out, but not before. Even then there will be difficulties; even at £100 a year, such is the demand for well-trained men that it is exceedingly difficult to keep one at the work after they have passed their examination. I beg to move:—"That the work of the Research Laboratory be vested, as heretofore, in the Research Committee of the Council."

Mr. MACKENZIE said he had much pleasure in seconding the proposition. He thought all present would agree with him that a large amount of information had been given to the meeting which was not known before. He was much obliged to Mr. Carteighe

for his clear and distinct address, which was most applicable to the present condition of affairs, and he trusted that the proposition would be received by the meeting unanimously. He did not wish in any way to detract from the good that might result from the matter having been brought forward by Mr. Butt. He quite agreed as to the necessity for research in the present day, and had done his best to assist when the matter was before Parliament.

Mr. UMNEY: Those who know Mr. Butt are well aware that he has this subject much at heart, and that he has moved for a most honest purpose, and having moved that, he will be prepared to subsidise any Research Laboratory that is formed. There is very little difference between what Mr. Butt and Mr. Carteighe said; indeed, there is not one man in this room who is not desirous of seeing a Research Laboratory in this institution—no matter under whose control it is, because that is a mere matter of detail—we are all of one mind that there should be a Research Laboratory, and that the British Pharmacopœia of the future should be properly conducted. I have been on two of the committees that have edited a British Pharmacopœia—indeed, I have thirty-eight years' experience of the work of the matter, and I know that in our last committee we were sadly put about that we had not the opportunity again and again when matters cropped up which were necessary to be investigated of referring them to a Laboratory to be settled; monograms had to be slung together, and we had to accept statements in those monograms that had been copied. You all know what copying from books means—that you copy error after error. On the occasion when Mr. E. White read a paper in this room on sal volatile we all thought we knew something about it, but it appeared there was an error in the Pharmacopœia. Now that has been going on for a very long time. We know there are other errors; for instance, in acetic acid we have two tests—one of titration and one of congealation, and the two do not agree. In the Antipodes the analyst will not test by the titration, and if the article happens to be one-tenth of a degree under 99 per cent., a heavy import duty is imposed. I could give you many other illustrations of the same kind if it were necessary. We learnt for the first time when we had the report put into our hands that the Society were working with the British Medical Council with the object which Mr. Butt has very keenly at heart, and which we all have, but I don't understand this passage: "It has now to be reported that the General Medical Council has asked the further co-operation of the Society in determining certain chemical and pharmaceutical problems requiring elucidation." That is rather putting the cart before the horse; the Medical Council are going to determine the points which require elucidation, and not this Society.

Mr. CARTEIGHE: It is the mixed conference.

Mr. UMNEY: What Mr. Butt wants to prove is that there should be a Research Laboratory in this building, and that its main work should be to keep the Pharmacopœia up to date. I will go further, and say that each six months there should be a report of the work done, and that the report should be published, so that others might check it. I am sure Mr. Butt's object will have been served by bringing this matter before the meeting. He does not care who has the control of the matter so long as it is controlled properly.

Dr. SYMES: I go with Mr. Butt to this extent, that I consider he has done a good thing in bringing the matter before the annual meeting. I have spoken to many pharmacists throughout the country, but I have never met one who was satisfied that the Research Committee was doing the work expected of them when it was appointed. When the new building was put up and the money provided by us pharmacists we had a good right to expect that for our money we should get a *quid pro quo*, but for many years that *quid pro quo* never came. There has been very general dissatisfaction to those who hoped for a great deal from the Research Laboratory. Mr. Butt's remarks have been made, I believe, in all

honesty of purpose. You will remember that he did not deal with the history of the thing; he rather said we will take the past as gone, and will look to the future. Mr. Carteighe has been able to tell us to-day that the future has a brighter prospect, and I hope it will result in a greater interest being taken by pharmacists in the work. I have no doubt that Mr. Butt will feel he has accomplished his object in bringing the matter forward, and that he will withdraw his motion, for I am sure all he wants is to get some good work which will be useful to pharmacists as the result of bringing the matter forward to-day.

MR. WALTER HILLS: I hope that the resolution will be withdrawn. I do not think it necessary to occupy your time, as all I could urge has been already said by Mr. Carteighe. It is rather difficult for us on the Council to realise the extent of knowledge or ignorance on the part of our friends outside on matters which are familiar to us. I am surprised to think that so much ignorance on this point has been displayed by some of my own colleagues. Mr. Butt, in moving the resolution, said he would not refer to by-gones, but I cannot help reminding him that everything he said was about by-gones, and everything Mr. Carteighe said has been about the present and the future. Whatever have been the by-gones, and no doubt none of us think by-gones perfection, we all have to learn by experience, and perhaps it is more profitable that we should occupy ourselves with the present position. The present position, as shown by Mr. Carteighe to-day, is one of great satisfaction to ourselves. We heard from the Secretary of the London University Commissioner last night that we shall now be a part and parcel of the London Teaching University. Is not that something to be proud of? Is not one of the reasons we are taking that position because we have a Research Laboratory, notwithstanding the character of the work, whether it is pharmaceutical or not? I do not know what pharmaceutical means; you may have pharmaceutical botany, pharmaceutical chemistry, and so on, but pharmacy is an art. As allusion has been made to myself in connection with the Pharmacopœia, I may say I had the honour and the responsibility—and it was one of the greatest responsibilities I had during the time I was President of the Society—to be Chairman of the Pharmacopœia Committee of the Pharmaceutical Society of Great Britain, and they gave me a sorry time of it. I do not profess to be a great pharmacist, but to sit in the chair and hear the giants discuss the various points, one swearing it was this thing and another that it was something else, required great moderation on my part to conduct the business at all. I came to the conclusion, after taking the chair at so many meetings and finding it so difficult to arrive at a conclusion, and knowing we were not brought into close personal contact with members of the Pharmacopœia Committee of the Medical Council, that we could only do it by means of one or more communications passing between us and them, and not being able to give the exact reasons always for our conclusion, I came to the conclusion that we wanted to get into close contact. The Legislature has thrown on the Medical Council the responsibility of producing the Pharmacopœia, and until the Legislature sees fit to alter it, that body will continue to have that responsibility, and I came to the conclusion that it would be advisable to get into close and personal contact; and before we finished our labours it was found necessary, as we could not come to a conclusion, to have a conference under the same roof. Of course, your President had to be there. We had a most interesting meeting, and soon knocked off the little points of difference. At the end of the conference I said to my medical friends: "What a pity it is we cannot meet more often and begin to work on the new Pharmacopœia as soon as this one is published." The result of it has been that we have been asked to do work for the new Pharmacopœia; we have been asked in the most pleasant way, and, speaking for Dr. Leach, I know he has the greatest regard for this Society, and that he will be glad to have the systematic work done here, because he and those working with him want systematic

work. He does not want to have work which is not, as it were, guaranteed by such a Society as this. Do not try and look too much at the roots, and do not pull up our tender plant to see how it is growing; give us a little patience for at least twelve months, when I think we shall be able to show you that on these premises we have done work of which we may be satisfied. Do not try and examine too much into the details. There is one condition which is imperative, and that is that the Council of the Society must have the absolute and sole control of all the work that is done here. It must be done through us at any time. I will not be one to agree to there being a reversion to any outside members to take part in the management of this establishment. I do not know whether you are going to give me your confidence in the future, but so long as you give me, or my successors, your confidence, I hope you will give it to them during the twelve months they represent you.

MR. BUTT: Gentlemen, when I sent this circular letter to the members of the Council last October, no information of the kind submitted to-day was available. The letter concludes with this statement: "In conclusion, I again ask you, when is pharmaceutical research to be commenced? How is it to be carried on so that the results may prove of some benefit to the members of the Society?" and to that I had no reply until Mr. Carteighe made his speech. Mr. Carteighe and I to a great extent are in accord on this point. In this memorandum, which was published in 1885, Mr. Carteighe has told us that the Research Committee and the Conference, in conjunction with the Medical Council, have practically agreed to work on the subjects mentioned here. There is not one word which Mr. Carteighe has said that I disagree with; neither did Mr. Carteighe say that there was anything I said which he could disagree with. He may have raised a question whether so and so was pharmacy or pharmaceutical research, and, of course, pharmaceutical research is a very wide and broad question. When after vainly attempting to get a reply to this, I determined to convene a special meeting to consider the question of the Research Laboratory, it was absolutely necessary that something definite should be done, and for that purpose the resolution was drawn necessarily very broad. If we had not received the explanation which we have to-day had from Mr. Carteighe, I should have put the matter to the vote, but I think everyone will agree that the explanation which has been given is perfectly satisfactory and a full answer to everything I require. Under these circumstances, I have much pleasure in withdrawing the resolution; in fact, much more pleasure than I had in proposing it.

THE VICE-PRESIDENT: Gentlemen, I think our thanks are due to Mr. Butt for withdrawing the resolution after hearing the statements made by Mr. Carteighe and others, but still I think the manner in which Mr. Butt has brought it forward has done an immense amount of good, because it has educated many here to-day. Mr. Butt said he knew very little about it until the present time, and that had he known as much as he does now he would not have brought it forward, but I think in bringing it forward he has done an immense amount of good. There is just one point I may mention. Our Charter says, whereas divers persons have associated together "for the purpose of advancing chemistry and pharmacy." I have nothing more to say.

MR. HYSLOP proposed a vote of thanks to the outgoing members of the Council for the services rendered to the Society, and to the Vice-President for presiding over the meeting.

MR. ANDREWS seconded the resolution, which was put and carried.

THE VICE-PRESIDENT briefly acknowledged the vote, and the proceedings then terminated.

SAPODERMIN SOAP.—This is an American specialty which contains soluble mercury albuminate. It possesses powerful bactericidal properties, and is said to be neither irritant nor poisonous. Sapodermin soap is an efficient substitute for sublimate soap in the treatment of parasitic diseases of the skin.—*Pharm. Zeit.*, 45, 116

PHARMACEUTICAL SOCIETY.

ADJOURNED GENERAL MEETING.

MR. G. T. W. NEWSHOLME, VICE-PRESIDENT, IN THE CHAIR

The adjourned meeting for receiving the report of the Scrutineers was held on Thursday, May 17.

The Chairman of the Scrutineers, Mr. E. N. BUTT, read the following report:—

Scrutineers' Report.

We, the undersigned Scrutineers, appointed at the Fifty-ninth Annual General Meeting of the Pharmaceutical Society of Great Britain, do hereby certify that we have examined the voting papers committed to us, and report the following:—

Voting papers reported by Secretary to have been issued	5541		
Voting papers received	3707		
Voting papers issued, but not received	1834		
Voting papers received	3707		
Voting papers disallowed:—			
Informal	31		
Received by post, too late	24		
	55		
	Voting papers registered	3652	
HILLS	2761	WARREN	1482
SYMES	2035	GROSE	1312
WOOTTON	1870	BATESON	1291
STORRAR	1820	CURRIE	708
COOPER	1722	CAMPKIN	686
CROSS	1680	GOSTLING	425
TAYLOR	1618	PICKERING	367
GIBBONS	1617	MORRISON	328
GIFFORD	1587		

EDWARD N. BUTT, Chairman.

W. MURTON HOLMES.	T. H. POWELL.	C. J. L. RUSSELL.

The New Council

The VICE-PRESIDENT, as Chairman of the meeting, then declared that the following gentlemen would constitute the Council for the ensuing year:—

ALLEN, CHARLES BOWEN, 20, High Road, Kilburn, N.W.
ATKINS, SAMUEL RALPH, Market Place, Salisbury.
CARTEIGHE, MICHAEL, 180, New Bond Street, W.
COOPER, ALBERT, 80, Gloucester Road, South Kensington.
CORDER, OCTAVIUS, 31, London Street, Norwich.
CROSS, WILLIAM GOWEN, Mardol, Shrewsbury.
GLYN-JONES, WILLIAM SAMUEL, 159, East India Dock Road, E.
HARRINGTON, JOHN FREDERIC, 45, Kensington High Street, W.
HARRISON, JOHN, 23, Bridge Street, Sunderland.
HILLS, WALTER, 225, Oxford Street, W.
JOHNSTON, JOHN, 45, Union Street, Aberdeen.
MARTINDALE, WILLIAM, 10, New Cavendish Street, W.
NEWSHOLME, G. T. WILKINSON, 27, High Street, Sheffield.
PARK, CHARLES JAMES, 23, Mutley Plain, Plymouth.
SAVORY, ARTHUR LEDSAM, 143, New Bond Street, W.
SOUTHALL, ALFRED, 17, Bull Street, Birmingham.
STORRAR, DAVID, 228, High Street, Kirkcaldy, N.B.
SYMES, CHARLES, 14, Hardman Street, Liverpool.
TAYLOR, JOHN, 210, St. George's Road, Bolton.
WOOTTON, ALFRED CHARLES, Barrymore, North Finchley, N.W.
YOUNG, JOHN RYMER, 42, Sankey Street, Warrington.

After the report of the Scrutineers had been received, the VICE-PRESIDENT moved, and Mr. ANDREWS seconded, a vote of thanks to the Scrutineers for their labours. This was unanimously accorded. A vote of thanks was also accorded to Mr. Butt, who, in reply, stated that the scrutiny had been one of the heaviest jobs the Scrutineers had experienced for the last ten years, owing to the large number of candidates.

ROYAL INSTITUTION.

On Thursday, May 10, Professor DEWAR gave the third lecture of his course on

A Century of Chemistry,

in which he completed his account of Davy's scientific work (see *ante*, p. 499). Davy investigated the allotropic forms assumed by carbon, and, having been consulted by the Government with regard to the corrosion that occurs in the copper-sheathing of ships; he found a remedy by placing in contact with the copper a small area of another metal that would be more easily attacked. The device was successful in stopping the corrosion of the copper, but the bottoms of the ships became foul more quickly than before, owing to the fact that the clean copper surface afforded a favourable situation for marine growths of various kinds. Referring next to Brande, who was connected with the Royal Institution for forty years, the lecturer said he was a man of great culture, and with a high reputation as a lecturer. His chief work was in the borderland between chemistry and physiology, but he was not an investigator of the first rank. It was otherwise, however, in the case of Faraday. In organic chemistry his chief work opened up new ground, for he first prepared compounds of chlorine with carbon, and also combined iodine with a hydrocarbon. He was able to extend the electro-chemical inquiries of Davy by the use of the galvanometer, and his table of electro-chemical equivalents was a development of the determinations he carried out on the amount of various metals, in proportion to the current passing, electrolytically separated from solutions of their salts. He also investigated the limits of evaporation, his work in that direction being parallel to Davy's attempts to get high vacua in order to discover the behaviour of electricity in space as nearly void of matter as possible. Davy perceived that the Torricellian vacuum would be improved by cooling, and experiments performed by the lecturer demonstrated that when a tube full of gas was progressively cooled by liquid air, the electric discharge through it underwent the same successive modifications as would be seen if it were being exhausted by an air-pump. Faraday also did important work in connection with the liquefaction of gases, which began when he obtained liquid chlorine. He appreciated the possibility of utilising liquefied gases for the attainment of very low temperatures, and was the first to employ ethylene, now in common use, for the purpose.

BLACKPOOL AND FYLDE CHEMISTS' ASSOCIATION.

A meeting of members of this Association was held at the Palatine Hotel on Wednesday, May 9, to adopt candidates for the Council Election and perform other business. Mr. Councillor JOHN LAURIE presided. After adopting the minutes of the last meeting,

The SECRETARY reported that very gratifying support had been extended to the Association, every chemist in Blackpool having joined, and a large proportion in South Shore, St. Anne's, Fleetwood, and other places in the district, and the Committee entrusted with the work of calling upon chemists in the district had been met with the utmost cordiality, and a general desire expressed to see the Association placed on a sound basis. The financial position was also very satisfactory.

The report being adopted,

The CHAIRMAN opened the discussion by pointing out that members of the Association had been practically unanimous in favour of restricting titles implying registration to persons who had passed the Pharmaceutical Society's examinations. Should the proposed Companies Act become law at any future time, the present anomalous and absurd position would become legalised, and there would be two methods by which persons could practise pharmacy—one by means of the examinations, the other by forming limited liability companies. Although by adopting the latter course persons could use the title of chemist, yet this had never been recognised in any

Act of Parliament, and it would be better to have a clause to regulate pharmacy omitted altogether than one capable of working so much mischief. It was for the meeting to decide which candidates for the Council would be most likely to vigorously attempt to carry out the wishes of the members of the Association.

Mr. RICHARDSON strongly supported the Chairman, and Mr. ASHTON was of opinion that no harm could possibly be done by asking enough, whether they got it or not. A general discussion followed, and the meeting unanimously resolved to support the following candidates:—Messrs. Taylor, Gifford, Cooper, Hills, Campkin, Currie, and Storrar. The Secretary was instructed to inform all members of the decision of the meeting, and recommended them to vote accordingly:

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A well attended meeting of the above Association was held in the Lecture Theatre, at 17, Bloomsbury Square, on Friday, May 4, Mr. E. W. POLLARD in the chair. The minutes of the last meeting were read and confirmed.

Miss E. RAYNER proposed that the Committee consider the advisability of holding regular debates during next session. This was seconded by Mr. ALLEN. Mr. HESLOP recommended that the matter be discussed next session. This amendment was put to the meeting and carried.

The CHAIRMAN then called upon Miss Rayner to read a paper upon

PLANT HAIRS.

Miss RAYNER classified the different hairs found upon plants, from a physiological point of view, and mentioned several examples of each. Many striking instances of the utility of such structures were noted. Occurring upon seeds, they often materially aided their dissemination. Hairs were also alluded to as a means of identifying certain drugs upon which they occur in characteristic shapes and arrangements. Miss Rayner concluded by thanking Mr. Wallis for the loan of diagrams—by which the paper was well illustrated.

The CHAIRMAN then requested members to put questions. Miss BLUNDELL, Messrs. UPSHER-SMITH, WALLIS, HARRIS, WOOLCOCK, LAWSON, and BATTERSHILL responded. All the speakers expressed their appreciation of an interesting and well-delivered paper. The CHAIRMAN announced that Mr. H. Deane would read a paper at the next meeting, May 18 inst., on "Explosives." The meeting then terminated.

ENGLISH NEWS.

DEATH OF DR. EDMUND ATKINSON.—On Friday, May 4, there passed away, at Camberley, a well-known chemist and physicist, Dr. E. Atkinson, who was for many years professor of experimental science at the Royal Military College, Sandhurst, and at the Staff College. He was born at Lancaster in 1831, and became a student of Owens College, Manchester, in its early days, subsequently assisting the late Sir Edward Frankland in organising the laboratory of that institution. He afterwards studied at the Universities of Marburg, Göttingen, and Heidelberg, and at the Ecole de Médecine in Paris. On returning to England, before taking up the professorship at the Royal Military College, he acted as private assistant to Sir Benjamin Brodie at Oxford, then as science master at Cheltenham College. On several occasions he was elected on the Council of the Chemical Society; he was also for many years the treasurer of the Physical Society, of which he was a founder. He became widely known to scientists by his translations into English of numerous foreign works, including Ganot's 'Elements of Physics,' von Helmholtz's 'Popular Scientific Lectures,' and Mascart's 'Treatise on Electricity and Magnetism.' Since retiring from the professorship he has devoted much time to local affairs at Camberley as a magistrate and in other capacities.

MANCHESTER CHEMISTS AND THE COMPANIES BILL.—On Wednesday, the 16th inst., a deputation of chemists—Messrs. Harding, Kirkby, Ramsden, Robinson, and T. Wild (Mr. Jacklin was prevented at the last moment from taking part in the deputation)—representing the various wards in the South Manchester Parliamentary Division, waited upon Mr. Leif-Jones and the Hon. W. R. W. Peel, the Liberal and Conservative candidates for that division. The deputation laid before the candidates the reasons why chemists desire to have the pharmacy-company clause expunged from the Companies Act Amendment Bill. Mr. Leif-Jones discussed the matter at great length, and expressed himself satisfied that the chemists have a genuine grievance because of unqualified men calling themselves chemists when registered as a limited company. He promised to give the matter his most serious consideration, and asked that the deputation would furnish him with the fullest information bearing upon the whole question of company pharmacy. This they readily consented to do. The Hon. W. R. W. Peel promised that he would oppose the obnoxious clause on the ground that the members of a company should only be able to obtain the title of "chemist" in the same way as an individual, namely, by examination. The deputation was most courteously received by both candidates.

THE SALE OF CAMPHORATED OIL.—At Lambeth Police Court, on Thursday, May 10, George Shambrook, shopkeeper, Heaton Road, Peckham, was summoned by the Camberwell Vestry for selling camphorated oil which was not of the nature, substance, and quality of the article demanded by the purchaser.—Evidence was given to the effect that Inspector Groom caused three penny bottles of camphorated oil to be purchased at the defendant's shop. The contents of the three bottles were mixed together by the inspector, and then divided into three parts, as required by the Act. One portion was submitted to the public analyst, who certified that the sample was deficient in camphor to the extent of 78 per cent., and that it contained 95.3 per cent. of cotton seed oil, there being no olive oil present.—For the defence, Mr. Sydney submitted that the inspector acted contrary to the requirements of section 14 of the Act in mixing the contents of the three bottles together, his contention being that each bottle should have been dealt with separately.—Inspector Groom pointed out that the bottles only contained half an ounce each, and said the analyst told him that it would be impossible to analyse a third of that quantity.—Mr. Francis (magistrate) remarked that at present there was no evidence before him that it would be impossible to analyse the bottles singly, and adjourned the case for the attendance of the analyst.—At the same court, Frederick George Quance, shopkeeper, Wingfield Street, Peckham, was also summoned by the Camberwell Vestry for selling camphorated oil which was not in accordance with the requirements of the B.P., 1898.—It was stated for the prosecution that the wife of the inspector went into the defendant's shop and asked for three penny bottles of camphorated oil, and was supplied with an article labelled "Campholeum—formerly known to the public as camphorated oil." As in the previous case, the inspector mixed the contents of the three bottles together, and submitted a sample of the whole to the Public Analyst, who reported that it was 77 per cent. deficient in camphor and contained 95.2 per cent. of mineral oil which should have been absent.—For the defence, the wife of the defendant stated that she told the purchaser she was being supplied with "campholeum."—Mrs. Groom denied that statement, although she admitted that a card to which bottles of the oil were attached, and which bore the word "Campholeum," was prominently displayed.—Mr. Armstrong took a similar objection to that raised by Mr. Sidney in the previous case as to the division of the article. He contended that each bottle should have been dealt with separately, and said it was not for them to consider the question of whether one bottle was sufficient for the purpose of analysis. He also contended, on the authority of "Sandys and Small," that the sale was not to the prejudice of the purchaser, who had notice of the nature of the

article supplied, and that there could not be a conviction.—Mr. Francis said that to his mind the label conveyed to people buying the impression that "Campholeum" was the same thing as camphorated oil. The case would be adjourned for a week.

THE SACCHARIN CORPORATION (LIMITED) v. QUINCEY.—In the High Court of Justice, Chancery Division, before Mr. Justice Cozens-Hardy, on Tuesday, May 15, his Lordship gave judgment in the action, tried on the 2nd and 3rd inst., in which the plaintiffs are owners of twelve patents, and they allege in their statement of claim that the defendant has infringed and threatens to infringe those several patents, and they seek an injunction and damages. The fact, as stated, was that the defendant in December, 1897, and January, 1898, purchased 33lbs. of saccharin from the Chemical and Drugs Company (Limited), who were then carrying on business at Manchester. That was the only infringement relied upon. The validity of the patents was admitted, the sole issue before his Lordship being that of infringement. He found that the plaintiffs certainly had a right infringed by the defendant; therefore, he directed an inquiry, without mentioning any particular patent, as to whether any and what damages have been sustained by the plaintiffs by reason of the use by the defendant of 33lbs. of saccharin purchased by the defendant in December, 1897, and January, 1898, or any other saccharin purchased by the defendant before June 1, 1899. He reserved the costs of the inquiry, and expected the plaintiffs, before proceeding with the inquiry, to make a definite demand of a particular sum. With reference to the costs of the action, the plaintiffs had partly failed and partly succeeded. He did not regard with sympathy or favour actions of that nature brought against a purchaser. He gave no costs to the plaintiffs up to and including judgment, and the subsequent costs would be reserved.—There were three other similar actions for trial, which counsel agreed could not to be distinguished; similar orders were therefore taken in each action.

POLICE PROSECUTION UNDER SECTION 17.—At Dorchester Police-court on Monday, May 14, Mr. A. H. Evans, chemist and druggist, High East Street, Dorchester, was fined 5s. and costs for selling strychnine to a gamekeeper without recording the sale, as required by the Pharmacy Act, 1868. The case was watched by Mr. Symes on behalf of the South Dorset Hunt.

IRISH NEWS.

EXCISE PROSECUTION.—In the Southern Division Police Court, Dublin, last week, before Mr. Swift, a case was heard in which Messrs. Cantwell and Fitzgerald, wine merchants, of Middle Abbey Street, Dublin, were prosecuted by the Inland Revenue authorities for having in their possession on March 5 last peppermint cordial capable of being used as a beverage, in the preparation of which methylated spirit had been used, contrary to the 130th section of the Spirit Act of 1880.—When the case was called Mr. Collins said his clients did not intend to contest the case, and it might save time and trouble if his worship allowed them to submit to the jurisdiction of the court. The whole thing was a pure error.—On behalf of the Revenue authorities, however, Mr. MacDermot said the case was regarded as a serious one, and, as they would press for the full penalty, it was necessary that the circumstances should be stated. If a manufacturer of peppermint cordial used methylated spirit he would be able to sell the article at a less cost than if he used spirit on which he had paid duty. Almost the only cordial in which methylated spirit of wine was used was peppermint cordial, as it was difficult to detect the addition. On March 5 two Revenue officers and one chemist went to the defendants' premises and took samples of methylated spirit and of peppermint cordial, and it was shown that the foundation and basis of the peppermint cordial in question was not duty-paid spirit, but methylated spirit.—Mr. Collins said his clients could do no more than submit to the juris-

diction of the court. They had committed an error which was no advantage whatever to their business. The whole quantity in dispute was only about two gallons. They did not know they were violating the law in using this spirit to dissolve the oil of peppermint, and it was of no advantage to them to use it at all. He was sure the Revenue Department was not vindictive, and his clients would undertake never to use it again.—After a little further discussion, Mr. Swift said he was disposed to impose the minimum fine of £25, and let them fight it out with Somerset House if the latter wished to press any further litigation.—Mr. MacDermot, while accepting the decision, said the Revenue Department held the opinion that the penalty of £25 would not represent the injury done to the Department, to the public, and to other traders who used duty-paid spirits.—The defendants were accordingly fined £25.

FOREIGN NEWS.

THE DEATH OF PROFESSOR EDOUARD GRIMAUX, the well-known French chemist and pharmacist, occurred at Paris on May 3, at the age of sixty-five years. M. Grimaux, who succeeded Cahours as professor in the Ecole Polytechnique (Military College) at Paris, and also held a chair at the Agronomic Institute, was born at Rochefort on July 3, 1835, and studied pharmacy under his father, who was professor at the School of Medicine at Rochefort. He afterwards served seven years in the French Navy as a pharmacist. On leaving the service he commenced in business at Sainte Hermine, Vendée, where he commenced his researches on ethyl gallate. In 1861 he took his pharmacist's diploma, and in 1865 became doctor of medicine. In 1866 he was appointed assistant professor at the Paris Faculty of Medicine, and in 1874 assistant professor of chemistry at the Ecole Polytechnique, succeeding to the professorship in 1881. He made many valuable contributions to organic chemistry, and was the author of several chemical treatises. He also published in 1884 an admirable biography of Lavoisier. He was an officer of the Legion of Honour and a member of the Academy of Sciences. During the Dreyfus case M. Grimaux came prominently before the notice of the public on account of his declaration, at the trial of Zola, of his belief in the innocence of Dreyfus. For this expression of opinion he received his dismissal as professor at the Ecole Polytechnique, notwithstanding services rendered to the Army during the Franco-German war, on account of want of respect for the Army.

PHARMACEUTICAL BOARDS IN PRUSSIA.—In several of the smaller German States there are general official organisations of the pharmaceutical craft, and the "Gremien," or "Landesvereine," are consulted by the respective Governments on every important question to be considered by the authorities. In Prussia pharmacists do not yet enjoy such a privilege, though there is a "technical committee for pharmaceutical affairs," consisting of four Berlin pharmacists, presided over by a medical councillor, and a "pharmaceutical board" (Apothekerrath), composed of three medical councillors and eight pharmacists, with the ministry of medical affairs. The members of these two bodies are appointed by the Government, while the craft desires to have them elected by itself. For many years the German Apotheker-Verein has made efforts in the interest of Prussian confrères, but has not yet been successful. It seems probable, however, that it will attain its aim. The "Apothekerrath" has been convoked to discuss the question whether it is advisable or not to establish pharmaceutical boards. The reporters of the body on that matter—Mr. Froelich, of Berlin, a pharmaceutical assessor of the Ministry and the late President of the Verein, with Dr. Hartmann, a medical councillor of Magdeburg and a pharmacist—have answered in the affirmative. Surely the rest of the body will also do the same, and the Government will then take the initiative. The organisation will probably consist of an "Apothekerkammer" (pharmaceutical board) in each province, and a "Landeskammer" (State board) for the whole of the Kingdom, the latter being composed of delegates of the provincial boards.

THE CHEMICAL INSTITUTION OF THE BERLIN UNIVERSITY has been transferred to the new building in the Hessische Strasse, where the Pharmaceutical Institution will also be located for a certain time, until it removes into its new home at Dahlem, near Berlin. In the premises of the former Chemical Institution will be procured quarters for the Institution of Oceanography.

VACHER'S BRAIN.—It would appear that Vacher, the French "Jack the Ripper," who was executed some time ago at "La Roquette," had seriously mistaken his vocation if we might judge by the report rendered at a recent meeting of the Académie de Médecine by Dr. Laborde, who gave his result of a minute examination of the criminal's brain. The prime factor of the doctor's report was that Vacher's brain, though diseased, was that of a born orator, the seat of speech being developed to a remarkable degree. In a certain measure the conformation of the brain was the same as that of Gambetta. He thought, says the *Matin*, that under other conditions Vacher might have made a great orator and a great citizen.

AN AMUSING "DRUGGING" CASE came on for hearing at the Paris Courts the other day. A youth named Vagellet was rather sweet on the servant of a Madame Thomas, a rich Paris widow, and gained access to the house by feigning an undying affection for the widow. After a brief acquaintance the latter soon discovered that her maid was the real recipient of his affections, and her jealousy being aroused, she decided upon revenge. To this end she invited him to dinner, and persuaded him to partake liberally of a certain dish which apparently suited his palate. The dish, however, was drugged, and as soon as Vagellet was insensible, the widow stitched him up in a blanket and then proceeded to thrash him with a thick stick, leaving him on the floor helpless and bleeding until next morning, when his sweetheart, the maid, discovered him. The widow was arrested, but allowed out on bail. The maid, however, has disappeared.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Elaterium.

ELATERIN, $C_{20}H_{23}O_5$, is the active principle of elaterium, of which it may constitute as much as 33.6 per cent., although the commercial drug usually yields much less. It may be obtained by exhausting elaterium with chloroform, precipitating the solution with ether, then washing the crystalline deposit with ether, and re-crystallising from chloroform. Elaterin is the most powerful hydragogue cathartic known, and is administered in doses of 1/40 to 1/10 grain; it enters into the composition of Pulvis Elaterini Compositus.

CHARACTERS.—Elaterin occurs in minute, colourless, hexagonal scales or prismatic crystals, which are odourless but have a slightly acrid bitter taste. They are neutral to litmus and almost entirely soluble in water, though sparingly soluble in ether or 90 per cent. alcohol, and readily soluble in boiling alcohol, carbon bisulphide, amylic alcohol, or chloroform. When heated with access of air elaterin melts (209° C.), and then burns without leaving any residue. It is dissolved by solutions of alkalis and re-precipitated on supersaturating with an acid.

TESTS.—Elaterin added to melted phenol yields a solution which becomes crimson on adding sulphuric acid, though the colour rapidly changes to scarlet. It is not coloured by chlorinated alkalis, and its alcoholic solutions should not yield a precipitate with solution of tannic acid, test solution of mercuric chloride, or solution of platinic chloride, thus indicating absence of alkaloids.

NOTES.—Elaterin represents all the activities of elaterium, but it is neither an alkaloid nor a glucoside, nor does it possess the pro-

perties of an acid; though, if solid potassium hydroxide be added to a boiling alcoholic solution, the neutral elaterin is converted into an acid body which is devoid of cathartic power.

Elaterium.

ELATERIUM is the sediment from the juice of the fruit of the squirting cucumber, *Ecballium elaterium*, A. Richard. (N.O. Cucurbitaceæ), a prostrate trailing plant which is common in Southern Europe, particularly in countries bordering on the Mediterranean, and is cultivated to a limited extent in England. The fruit of the plant is about 37.5 to 50 Mm. long, and resembles a small hairy gherkin; when ripe the fruit separates suddenly from its stalk, and the seeds and juice are forcibly ejected from the aperture left where it has parted from the peduncle. The fruit is collected, therefore, before it is quite ripe. It is then sliced and pressed, the slightly turbid juice, which becomes more turbid on standing, being allowed to deposit. The sediment after being collected, drained, and dried, constitutes the commercial elaterium, which may be prepared in England or imported from Malta. Elaterium is a powerful hydragogue cathartic, and its dose is from 1/10 to 1/2 grain.

CHARACTERS.—Elaterium occurs in light, friable, flat or slightly curved, opaque pieces, about 2.5 Mm. thick. It is pale green, greyish-green, or yellowish-grey in colour, has a finely granular fracture, a faint tea-like odour, and a bitter acrid taste, due to the presence of elaterin, of which it should contain from 20 to 25 per cent. or more.

TESTS.—Elaterium should not effervesce with dilute acids or give a blue colour when iodine is added to a cooled decoction of the drug, indicating freedom from calcium or other carbonate or starch. It should yield half its weight to boiling 90 per cent. alcohol, and not less than 20 to 25 per cent. (elaterin) to chloroform.

NOTES.—The distinctive characters of elaterium are its colour and general appearance. As prepared in England it is bright green in colour, owing to the presence of chlorophyll, but with age it becomes greyish-green and, finally, yellowish-grey, besides exhibiting minute crystals of elaterin on the surface. The Maltese drug contains less elaterin, and is yellowish-grey when imported. In addition to elaterin, the active principle of the drug, elaterium is stated to contain other bitter principles—prophetin, a crystalline bitter glucoside which is soluble in ether and gives a brown-red with sulphuric acid; ecballin, or elateric acid, a yellow amorphous substance; hydro-elaterin, said to be soluble in water, and elaterid E, described as insoluble in ether or water. But it is now generally accepted that elaterin represents the whole activity of the drug.

Ergota.

ERGOT is the sclerotium of *Claviceps purpurea*, Tulasne, being the resting stage in the development of that fungus. It grows in the inflorescence of *Secale cereale*, Linn. (N. O. Graminaceæ), and other grasses, though only that which develops in the ovary of the rye plant must be used for medicinal purposes. The spores of the fungus are conveyed by the wind during the spring or early summer and germinate in the ears of rye, producing colourless hyphæ which almost entirely envelop some of the very young ovaries. The hyphæ penetrate the outer part of the pericarp, a soft white felted mass gradually replacing the destroyed ovary and constituting the mycelium stage (sphaecelia) in the life-history of the fungus. The sphaecelia identifies itself with the outer parenchyma of the ovary, and in some measure replaces it, taking the form of the ovary and almost obliterating its cavity. Meanwhile, the hyphæ have produced a saccharine secretion known as "honeydew," which contains an abundance of conidia—asexual reproductive cells. After the felted mass has attained its full development, the sclerotium is gradually produced at its base, where the hyphæ form a dense, compact mass which, as it grows, projects from the ear of rye, bearing on its apex the remains of the sphaecelia, together

with the abortive ovary, etc.; in this second stage of its development the ergot must be carefully separated from the unaffected grain and dried. The drug possesses emmenagogue, ecbotic and hæmostatic properties, is administered in doses of 20 to 60 grains, and is used in the preparation of *Extractum Ergotæ*, *Extractum Ergotæ Liquidum*, *Infusum Ergotæ* and *Tinctura Ergotæ Ammoniata*; also, indirectly, of *Injectio Ergotæ Hypodermica*.

ERGOT.—Ear of Rye attacked by the Ergot fungus.

ERGOT.—Sclerotium of Ergot showing between the Paleæ of Rye.

noid matters present in the drug. If it is musty, the ergot has become deteriorated by keeping; deterioration may be caused by damp, by oxidation of the fixed oil present, or by the attacks of mites of the genus *Trombidium*.

ERGOT.—A, Spanish; B, Russian; C, Canary Islands. All natural size.

NOTES.—The distinctive characters of ergot are its shape, colour and odour. The most important constituent of the drug appears to be the crystalline alkaloid ergotinine, of which it contains from 0.1 to 0.26 per cent. A second alkaloid, named cornutine, is probably a decomposition product. Other active constituents of ergot are sclerotic or ergotinic and sphacelinic acids. Ergot also contains about 33 per cent. of fixed oil, together with proteids, choline, lecithine, and other bodies. The chief commercial varieties of the drug are the Spanish, Russian and German, but Austrian, Swiss, Norwegian, and Swedish ergots also come into the market occasionally. A variety exported from the Canary Islands is here illustrated. The Spanish is generally largest and of the finest appearance, but it contains much starch and yields less ergotinine than the Russian. Ergot affords an interesting case of homologous alternation of generations, two kinds of gametophyte being met with. The first form—known as the sphacelia—is the felt-like mass of mycelium which fills the ovary of the rye, wheat, or other graminaceous plant, and gives rise to numbers of conidia. The mycelium becomes very dense and hard later in the year, and protrudes from the ear of rye, etc., as a black, elongated mass—the sclerotium or ergot of commerce—bearing on its apex the remains of the sphacelia, abortive ovary, etc. After resting during the winter the sclerotium, or second form of gametophyte, germinates and puts out a number of stromata—short protrusions composed of a number of hyphæ, and each bearing a rounded head, on which there are a number of slight depressions. Each depression constitutes the mouth or opening of a deep nearly closed cup called a perithecium, in the closed cells or asci of which the spores arise. In each ascus are developed eight slender, thread-like ascospores which, when they germinate on the flowers of the rye or other host-plant, again produce the sphacelia form of ergot.

Obituary.

BARRACLOUGH.—On May 11, William Barraclough, Chemist and Druggist, late of Ecclesfield (Yorks). Aged 64.

ROBERTS.—On May 2, William Roberts, Chemist and Druggist, Beaumaris (Anglesey). Mr. Roberts, who had long been connected with the Pharmaceutical Society as an associate, and latterly as a member, was for many years assistant to Mr. John Slater, chemist and druggist, Castle Street, Beaumaris, succeeding to the business on his own account on Mr. Slater's retirement a few years ago, but, unfortunately, a few months later he was attacked by the malady which caused his death, after a long and painful illness. He was greatly respected in the district, and was a borough councillor, a pier guarantor, and for many years acted as the honorary secretary of the Horticultural and Allotment Gardens Committee, also to the Ladies Bathing-place Syndicate.

TITLEY.—On May 8, Thomas Titley, Chemist and Druggist, Charlotte Street, London, W. Aged 58. Mr. Titley had been a member of the Pharmaceutical Society since 1873.

CHARACTERS.—Ergot occurs in very dark violet-black grains, which are about 1 to 4 Cm. long, subcylindrical or somewhat triangular in shape, as is clearly shown in a transverse section, tapering towards the ends, and generally curved. At one end of the grain may sometimes be found the whitish remains of the sphacelia, etc. The grains are longitudinally furrowed, especially on the concave side, and often bear numerous small irregular transverse fissures. They break easily, with a very short fracture, are whitish or pinkish-white inside, and do not exhibit any definite structure when examined with a lens. The peculiar odour and oily taste of ergot are alike disagreeable. The odour is probably due to the liberation of a volatile alkaloid, in consequence of a slow decomposition of a compound of that body. The drug should not be exposed to damp, or it will deteriorate, especially if in the powdered state.

TESTS.—Ergot gives off its peculiar odour in a more marked degree if the powdered drug be triturated with potassium hydroxide solution. That is probably due to the formation of methylamine, trimethylamine, or some similar decomposition product of albumi-

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

THUJONE AND THUJOL.

Experiments with oils of *Artemisia absinthium* have borne out the hypothesis previously advanced by Eugene Charabot, that the changes undergone by the terpinic constituents of essential oils take place in two distinct phases, corresponding to the chief stages in the development of the plant (*P. J.*, ante, 249, 277). The first is that of the formation of the terpinic alcohols and of their transformation, by the elimination of water, into compound esters or into esters and terpenes. These changes take place in the organs furnished with chlorophyll, and synchronise with the development of the green parts of the plant. The second stage coincides with the period of maximum respiratory energy, when the flowering is in process. The amount of oxygen absorbed is then considerable, and thereby the primary alcohols are transformed into aldehydes, and the secondary alcohols into corresponding ketones. This theory is borne out by the results, obtained with two specimens of wormwood oil. The first was distilled on June 8, 1899, when the plants had only begun to develop. The second was distilled on July 12, when the growth of the plants had attained its maximum. The following were the figures obtained:—

	June Distilled Oil.	July Distilled Oil.
Yield (on fresh plant).....	0.1429 per cent.	0.2450 per cent.
Sp.g. at 24° C.	0.9307	0.9253
Combined thujol	7.6	10.3
Free	9.0	9.2
Total	16.6	19.5
Esters calculated as acetate....	9.7	13.1
Thujone	43.1	35.0

—*Comptes rend.*, 130, 923.

CULTIVATION OF GINGER.

Gaston Landes points out that the cultivation of ginger in Jamaica, where it has proved remunerative to the 25,000 cultivators who prepare it for shipment, has led to its cultivation in St. Lucia, Dominica, and Barbadoes. He describes the cultivation of *Zingiber zerumbet*, Rosc., in Martinique. The best quality consists of plump pieces, of a uniform light colour, free from moisture. Lower grades are black, or otherwise coloured, wrinkled, damp, and less aromatic. If the ginger be gathered before it reaches maturity, it will wrinkle during drying, and be less aromatic and pungent than if it had been gathered at maturity. The drying process must be perfectly carried out, otherwise the rhizome will become mouldy. It is packed in barrels for shipment.—*Revue des Cultures Coloniales*, 5, 329.

FORMALDEHYDE IN PLANTS.

According to Sig. G. Pollacci, the presence of formic aldehyde can be determined by the ordinary tests, in the first portion of the distillate, when leaves which have been long exposed to light are macerated and distilled with water.—*Boll. Chim. Farm.*, 38, 601.

FORMATION OF OIL IN THE OLIVE.

According to Sig. G. Spampani, olive oil is actually formed in the cells of the epicarp, and especially in those of the mesocarp, of the fruit of the olive, where it is ultimately found. The presence of a small quantity of an oily substance in active protoplasm is a universal phenomenon, and the oil of the olive presents only a strongly marked illustration of this law. The oil is not a result of the degeneration of the protoplasm, but is formed when that substance is in its most active condition.—*Bull. Soc. Bot. Ital.*, 1899, 139.

VOL. 64. (FOURTH SERIES, VOL. 10.) No. 1561.

PINENOL.

A new terpenic alcohol $C_{10}H_{16}O$ has been obtained by P. Genvresse by the action of nitrous fumes, or of nitrogen peroxide, on pinene, cooled by means of a freezing mixture of ice and salt. On distilling in steam, the unattacked pinene is first volatilised, then pinenol, with a trace of a nitrogen derivative. This last is decomposed by distillation under ordinary pressure, and then the pinenol is distilled off under reduced pressure. It is a pale yellow fluid with a characteristic, agreeable odour. It boils at 225° C. at 740 Mm. pressure, and at 143° C. at 38 Mm. Its sp.g. at 0° C. is 0.9952 and its refraction index, 1.497. It is insoluble in water, but dissolves in all proportions in alcohol; it is laevogyre, the rotation being $-14^{\circ}.66$. With phosphoric anhydride it parts with a molecule of H_2O , forming cymene, $C_{10}H_{14}$. When acetylated, it forms the ester $C_{10}H_{15}O \cdot CH_3$, which has a lavender odour, and boils at 150° C. under 44 Mm. pressure. When treated with chromic anhydride and sulphuric acid, it forms the ketone, pinenone, $C_{10}H_{14}O$, having a pleasant odour, and an optical rotation of $-21^{\circ}.12$, and a sp.g. of 0.9953 at 0° C. With hydroxylamine hydrochloride it forms pinenonoxime $C_{10}H_{14} : NOH$ in ortho-rhombic crystals, melting at 89° C. With bromine this body gives a dibromo-compound $C_{10}H_{14}Br_2NOH$, melting at 152° C., and with benzoyl chloride it yields the derivative $C_{10}H_{14}NO \cdot CO \cdot C_6H_5$, crystallising in fine crystals which melt at 105° C.—*Comp. rend.*, 130, 918.

EFFECT OF ACIDS ON FUNGI.

According to J. F. Clark, fungi are in general much more resistant to most deleterious agents than are the higher plants. In the case of mineral acids, a concentration of from 200 to 400 times the strength fatal to the higher plants is required to prevent the germination of mould-spores under otherwise favourable conditions. Different kinds of fungi exhibit very great differences in their power of resistance to different agents. Even spores taken from the same culture may differ from one another in this respect. Hydrocyanic acid is a violent poison to moulds, while strychnine is nearly innocuous.—*Bot. Gazette*, 1899, 289, 378.

A NEW GAS.

Sulphur perfluoride is a new gas, recently prepared by H. Moissan and P. Lebeau. It is colourless, odourless, without taste, and is neither combustible nor a supporter of combustion. It solidifies towards $-55^{\circ} C.$ to a white crystalline mass, which melts and boils at a little above its congealing point. It is almost insoluble in water, and dissolves sparingly in absolute alcohol. Although rich in fluorine, it is curious that this new gas is so inert as to resemble nitrogen in many of its properties. Concentrated solution of caustic potash is without action on it, it is not attacked by potash and lead chromate in fusion, nor by cupric oxide at a dull red heat. It is unaltered by heat at the temperature of the softening of glass, and the glass is unaffected by the gas, nor does any combination take place when it is heated with hydrogen, unless an induction spark be passed through the mixture; then a diminution of volume takes place, and a dull yellow solid body is formed. The residual gas is found to be pure hydrogen, while the solid substance is decomposed by water furnishing a milky, strongly acid liquid consisting of hydrofluosilicic acid, sulphur, and silica. Oxygen is also without action on the new gas, except at the temperature of a powerful induction spark. SF_6 is obtained by burning sulphur in an atmosphere of pure fluorine in a special apparatus, liquefying the gases thus formed at a temperature of $-80^{\circ} C.$ by means of solid CO_2 suspended in acetone, and fractionating the gases liberated from the liquid thus produced, as the temperature rises on removing the freezing mixture. The gases thus obtained are placed over concentrated potash solution, and the residue, dried over melted KHO , is almost pure SF_6 , which is finally purified by recongealation and refractionation.—*Comp. rend.*, 130, 865.

LATIN RENDERING OF FRACTIONAL PARTS OF A GRAIN.

BY JOSEPH INCE.

I have reason to believe that in the reading of prescriptions, students are in doubt as to the method of translating fractional numbers into correct technical Latin. The explanation offered may, it is hoped, put the matter in a clearer light. The following remarks, based upon the fractional parts of a grain, will apply to fractional parts of weights in general.

Grani (gen.) of a grain, is put first in the sentence. The fractional parts, being quantities, are put in the accusative case when governed by Recipe. $\frac{1}{2}$, in English 'half,' or 'the half,' is expressed in Latin by ;—

(a) dimidius, a, um, adj., agreeing in the nominative with pars, (a part) or in the accusative singular with partem, after an active transitive verb.

Grani pars dimidia, *half a grain.*

Sumat æger partem dimidiam, pro dosi.

Let the patient take half for a dose.

℞ grani partem dimidiam.

Take half a grain.

(b) Dimidium, n. subs.

℞ Grani dimidium, *take half a grain.*

(c) Semigranum, n. subs. [One word.]

℞ Hydrargyri subchloridi, semigranum.

Take half a grain of calomel.

(d) $\frac{1}{2}$ combined with an integer, in English, x and a half, is translated in Latin by cum semisse.

℞ Tincturæ Aloes, drachmam cum semisse, ꝓiss, $1\frac{1}{2}$.

$\frac{1}{4}$, in English, a fourth part, or a quarter, is expressed in Latin by ;—

(a) Pars quarta; or partem quartam, accus. sing., and partes quartas, accus. plur. when governed by an active transitive verb as Recipe, Sumat, Mitte, or Habeat.

Morphinæ Acetatis grani pars quarta sit pro dosi.

A quarter of a grain of Morphine Acetate for a dose. gr. $\frac{1}{4}$.

℞ Extracti Strophanthi, grani partem quartam. gr. $\frac{1}{4}$.

Take a quarter of a grain of Extract of Strophanthus.

More than one quarter will have the accusative in the plural. (partes.)

(b) Quadrans, antis. m. subs. a quarter.

Quadrantem, antes, accus. sing. or plur. after Recipe or other active transitive verb.

Extracti Belladonnæ Alcoholici. grani quadrans. gr. $\frac{1}{4}$.

℞ Extracti Cannabis Indicæ grani quadrantem. gr. $\frac{1}{4}$.

Unus, one, is not expressed as a numerator;

Pars (a part) supplies its place.

Thus $\frac{1}{6}$ (one sixth) is rendered, pars sexta;

$\frac{1}{9}$ (one ninth) pars nona; $\frac{1}{10}$ (one tenth) pars decima.

Examples will explain the technical method of rendering, better than abstract rules which occasionally are more perplexing than instructive.

Take $\frac{2}{3}$, $\frac{3}{4}$, $\frac{4}{5}$, $\frac{5}{6}$, $\frac{6}{7}$, $\frac{7}{8}$, $\frac{8}{9}$, $\frac{9}{10}$ of a grain.

The denominators of these fractions represent as ordinals third, fourth, fifth, sixth, seventh, eighth, ninth, and tenth parts of a grain. They are to be put when latinised in the accusative case, because governed by Recipe. Of these parts there are respectively two, three, four, five, six, seven, eight and nine in number; hence these sets of figures (cardinals) are called the numerators, giving the numbers of the divisional parts. They also, when latinised, are put in the accusative case, because also governed by Recipe. Two are declinable, two (duo) and three (tres); the rest are indeclinable; better stated in the rule, cardinal numbers from quatuor are indeclinable.

℞ Grani partes tertias, duas. $\frac{2}{3}$.

Take two-thirds of a grain.

Literally—take of a grain third parts.

How many? Two.

The order of the words is stereotyped owing to the Latin construction of the sentence.

The remaining fractions on the list will read;—

℞ Grani partes quartas tres. } $\frac{3}{4}$
or grani tres quadrantes. }

Grani partes quintas quatuor. $\frac{4}{5}$.

Grani partes sextas quinque. $\frac{5}{6}$.

Grani partes septimas sex. $\frac{6}{7}$.

Grani partes octavas septem. $\frac{7}{8}$.

Grani partes nonas octo. $\frac{8}{9}$.

Grani partes decimas novem. $\frac{9}{10}$.

Observe.—Numerals from 13, tredecim, down to 17, septendecim, when ordinals, that is indicating thirteenths, fourteenths, fifteenths, sixteenths, and seventeenths, are translated:—

13th	tertius	} decimus.
14th	quartus	
15th	quintus	
16th	sextus	
17th	septimus	

℞ Grani partes septimas decimas tredecim.

Take $\frac{13}{17}$ of a grain. [Imaginary fraction.]—

Also note—

Cardinals.	Ordinals.
18 duodeviginti	18th duodevicesimus
19 undeviginti	19th undevicesimus
20 viginti	20th vicesimus
21 unus et viginti	21 primus et vicesimus <i>one and twentieth</i>
22 duo et viginti	22 alter et vicesimus <i>two and twentieth</i>

'One' or 'first,' after 20, 30, 40, etc., is translated primus.

'Two' or 'second,' after 20, 30, 40, etc., is translated, alter.

In further illustration of the subject, the technical Latin of the fractional doses contained in the British Pharmacopœia, 1898, other than those already mentioned, is appended.

Minima decem Tincturæ Chloroformi et Morphinæ Compositæ, grani partem undecimam Morphinæ Hydrochloridi continent.

Ten minims of Compound Tincture of Chloroform and Morphine contain $\frac{1}{11}$ grain of Morphine Hydrochloride. gr. $\frac{1}{11}$.

℞ Ferri Arsenatis, grani partem sextam decimam. gr. $\frac{1}{16}$.

℞ Apomorphinæ Hydrochloridi, grani partem vicesimam ad grani partem decimam (hypodermic). gr. $\frac{1}{20}$ to $\frac{1}{10}$.

℞ Antimonii Tartarati, grani partem

quartam et vicesimam } ad grani partem octavam (diavicesimam quartam } phoretic). gr. $\frac{1}{24}$ to $\frac{1}{8}$.

℞ Picrotoxini, grani partem quintam et vicesimam. gr. $\frac{1}{25}$.

Lamellæ Cocainæ singulæ fere grani partem trigesimam pendentes.

Discs of Cocaine, each weighing about gr. $\frac{1}{30}$.

℞ Hydrargyri Perchloridi, grani partem

alteram et trigesimam } gr. $\frac{1}{32}$.
trigesimam alteram }

Trochiscus Morphinæ, grani partem sextam trigesimam Morphinæ Hydrochloridi continens. gr. $\frac{1}{36}$.

℞ Sodii Arsenatis, grani partem quadragesimam. gr. $\frac{1}{40}$.

Lamellæ Atropinæ singulæ pendentes fere grani partem quinquagesimam, et grani partem quintam millesimam Atropinæ Sulphatis continent.

Discs of Atropine, each weighing about $\frac{1}{50}$ grain; and containing $\frac{1}{5000}$ grain of Atropine Sulphate. gr. $\frac{1}{50}$. gr. $\frac{1}{5000}$.

℞ Acidi Arseniosi, grani partem sexagesimam ad grani partem quintam decimam. gr. $\frac{1}{60}$ to $\frac{1}{15}$.

℞ Homatropinæ Hydrobromidi, grani partem octogesimam. gr. $\frac{1}{80}$.

℞ Atropinæ, grani partem ducentesimam ad grani partem centesimam. gr. $\frac{1}{200}$ to $\frac{1}{100}$.

Lamellæ Physostigminæ, singulæ grani partem millesimam Physostigminæ Sulphatis continentēs.

Discs of Physostigmine containing each $\frac{1}{1000}$ grain of Physostigmine Sulphate. gr. $\frac{1}{1000}$.

THE DISPENSING OF PROPRIETARY ARTICLES.*

BY FRANK A. ROGERS.

The conditions of present-day life in matters medical and pharmaceutical are as much influenced by the stress of competition as any of the other professions or businesses, and the pharmacist, being a sort of hybrid, has to see to it that both sides of his calling are equally advanced. He must keep his professional side in touch with the thoughts of the leaders in medical therapeutics and at the same time must take care that his purely business side is keenly alert to enable him to reap the benefits of his other exertions. Specialism is one of the most advanced signs of the times, and it seems to me that a pharmacist abreast of his times has to be a sort of specialist in specialties. A dispensing chemist's *raison d'être* is primarily to carry out the wishes and intentions of others—a position which to some may appear a derogatory one, but one which, if conscientiously fulfilled, can carry with it nothing but the esteem of all.

I ask you to keep clearly in mind that the subject I have chosen for discussion is not the prescribing of proprietary articles, but the dispensing of such, and that the retail transactions of handing over the counter articles for which no responsibility is assumed do not come under our consideration now. One of the greatest difficulties with which we as dispensing chemists have to grapple, so as to render the transactions profitable and not unprofitable ones, is the dispensing of proprietary articles and so-called patent or secret remedies. There are certain things about dispensing which, to me at least, are regarded somewhat as axioms.

(1) Never to question the right of a physician to order for his patient whatever he may think fit.

(2) To give the patient, in the best manner one's skill can devise, exactly what has been ordered—neither more nor less, poisonous doses, incompatibles, etc., excepted.

(3) To consider the question of cost and charge after it is dispensed, and in no way whatever to let it interfere with the purity of its contents and the care with which it is compounded.

There are three points of view from which this subject can be considered—(1) the doctor's, (2) the patient's, (3) the chemist's.

With the former aspect I do not propose to deal to-night; it has, I believe, been dealt with elsewhere, and at any rate would afford an evening's discussion in itself, but I would like to say that I believe it to be perfectly justifiable to order a proprietary article and to expect it to be ordered, when it is *prima facie* a new article, or shows some distinct advance and improvement on existing preparations, but I cannot defend instances where proprietary names are attached to articles which almost any chemist can make equally well for himself. Taking a concrete instance—

℞ Tab. Antipyrin, gr. 5.

All chemists keep such, and the time has gone by when such were so compressed that they have entered the body on the one side and appeared on the other unchanged and all unharmed.

Without questioning the right of the doctor to prescribe whatever he may think best, I believe it to be a bounden duty on his (the chemist's) part to provide (if he is able) formulas for elegant preparations for the medical man's use in the place of some secret remedies, many of which are only introduced, in the first instance, through medical channels—with Latin names and directions, preparatory to being launched (with the recommendations thus

received) as full-blown proprietary articles upon an all-too-confiding public.

The second aspect appears to me simple. The patient has paid his fees (more or less, as he thought best), obtained his instructions, partly in the form of a prescription, and this he desires to have made up in such a manner as to obtain the best results. That the same prescription can be dispensed in more than one manner is becoming only too well understood by the average patient, and it behoves the dispensing chemist to remember that while a patient's faith and trust in him may go a long way, it can only be permanently retained by a scrupulous attention to the means by which the best results can be achieved both in kind and knowledge. The combination of the finest drugs with imperfect knowledge being almost as fatal in the long run as second-rate drugs covered with a veneer of scientific attention. One often hears the cry nowadays, with a complaining wail, that the general public is getting too knowing. Pursue the subject further, and you will often find it simply means that it is too knowing to accept anything but the best. Let the patient be as "knowing" as he may, he will then appreciate the better between good and indifferent work.

But it is with the third aspect of the case that I propose to deal in the few minutes at my disposal this evening—viz., that of the dispensing chemist, and to consider very briefly the question of his relation as distributor to the wholesaler or more general provider of these articles.

If being acknowledged that this class of proprietary preparation has come to stay, either on account of elegance or convenience in prescribing, or for any of the various reasons assigned, we should take steps to defend our position as dispensers so that the patients' chances of doctoring themselves and their friends are reduced to a minimum. All traces of the article being a proprietary one should be removed, one's own bottles or packages and dispensing labels being used which afford no clue to its origin, and, even if this entail an additional expense, I believe it will be found to more than repay the outlay. I do not think it policy to affect any ignorance of the contents of such prescriptions when questioned by the patient, but, at the same time, I cannot defend the practice of repeating such prescription for other than the person for whom it was originally prescribed.

Then as to charge. Many of the patents and proprietaries, as we are only too painfully aware, bear a total profit at full prices of only a few pence. Under no circumstances would I dispense such at less than the *full* retail price, and only in exceptional cases at that. I think an additional shilling should be charged, but this should include any extras in the shape of bottles, etc.; and if, as sometimes happens, the process of dispensing removes the necessity of affixing the Government stamp, the cost should be taken on the stamped article, and the additional 3d. or 6d., as the case may be, going into the pocket of the chemist. I am prepared to defend this on ethical grounds, if necessary.

Roughly speaking, the price for, say, a half to two or three dozen tablets, etc., should be charged at corresponding pill prices, but I would take the hundred or gross quantities at something like the scale just mentioned. I may say here, for the sake of any manufacturer who cares to take the hint, that there is a great want of a simple and inexpensive means of preparing extemporaneously or of filling small quantities of *flexible* capsules as required. The hard oval ones are a great convenience, but the ordinary flexible one is wanted.

But our crowning difficulty lies in the stocking of these proprietaries, and in the fact that almost without exception the proprietors only supply their preparations in certain sized packages, sometimes as much as a dozen times larger than the quantity ordered in a prescription; and in many cases, unless the chemist is doing a large turnover in such things, the transaction may become a profitless one. It seems to me to be the imperative duty of all wholesale chemists, makers of and agents for proprietary articles to mak

* Read before the Western Chemists' Association (of London), on Wednesday, May 23, 1900 (see p. 585).

some arrangements whereby their preparations can be obtained in any quantities, however small. Unless this is done they cannot expect sympathy and co-operation whilst the present deplorable condition of the "odds and ends shelves" is such a constant eyesore, such a source of irritation, and such a distinct discount upon our dispensing profits as it is at the present time.

Cases in which dispensing chemists, who are daily meeting with the above difficulties, themselves resort to the same practices with their own preparations, and in some cases allow a beggarly 10 per cent. all told, are hard to explain, and make it extremely difficult to arrive at any practical *modus operandi*.

I do not agree that it is in any way defensible for, say, a hundred tablets, etc., to be given to a prescription order for, say, thirty-six or fifty, and I cannot on ethical grounds defend a charge being made for the whole bottle when only a part has been actually supplied.

I am strongly of opinion that the best means of overcoming the present difficulty would be the establishment of some central dépôt, where all the preparations of the various makers could be had in just whatever small quantities were ordered, and not the establishment of numerous dépôts for individual makers. Such a wholesale dépôt would, I believe, be of incalculable benefit to every dispensing chemist, not only in the metropolis, but all over the country. It need not clash with the interests of wholesale houses themselves, as the question of wholesale quantities would not apply.

The class of proprietaries which most deserves our support are those which are evidently produced with a previous thought for the position of the dispensing chemist, in as far as they can be written in full Latin, and be dispensed in the same way as if no proprietary right were indicated.

I would suggest that if a preparation is brought out *bonâ-fide* for the use of the medical profession, it should be done so that it may be easily rendered into Latin (pure or not, as taste may dictate); and, in the second place, that it should not carry behind it a probable adaptation for retail purposes. The thing is simple enough; we are not using a new dot and dash of a Morse or other system which may in process of time become associated with the name of some individual, but with one of the oldest languages of world's history, which has become, and I hope may do so still further, the cosmopolitan language for prescription rendering.

The medical man's endeavour, then, being to cure his patient, the patient to be cured, and the chemist to see that his art conduces to the much-desired end, we may with advantage, at our leisure, ask ourselves whether, in the rush to get through the day's work and to render it as profitable as possible, the "art of dispensing" is not somewhat sacrificed to the result of warehouse machinery; and at the same time, while many declaim vehemently against compressed or capsuled drugs *et hoc genera*, dispassionately consider how far, under existing circumstances, it would be possible for us, with anything like a reasonable staff, to actually compound each and every prescription received.

I must apologise for the incomplete and disjointed nature of these remarks. I have had no time to carefully dovetail the parts together into proper form. They are simply thoughts, more or less connected, which have occurred to me at various times when some phase of the question has arisen. No attempt is made to present them to you as a solution of various difficulties, but they are simply emphasised to afford points for discussion, in the hope that from your collective decision of these and others which have occurred to yourselves, as a body of practical men, some plans may be adopted which will enable us to feel that our individual procedures are to a great extent in uniformity. I have not hesitated, in some instances, to express my own opinion for the sake of eliciting yours.

METHYL-PROPYL-CARBINOL-URETHANE is a new hypnotic which has been discovered by Dreser. It is said to be much more powerful than urethane, and to be twice as active as chloral hydrate. It is given in doses of 0.5 to 1 Gm. in water, or as a 50 per cent. solution in alcohol (90 per cent.).—*Merck's Report*, 1900, 106.

ON COMMERCIAL PEPSIN.*

BY SIR CHARLES A. CAMERON, C.B., M.D.,
Professor of Chemistry, R.C.S.I., etc.

The enzymes termed pepsin and trypsin are expensive substances used as aids to digestion. Pepsin is obtained from the mucous membrane of the pig, sheep, or calf. Trypsin, or enzyme, which, like pepsin, is a proteolytic ferment, is procured from the pig's pancreas. Pepsin is an official preparation of the British Pharmacopœia, the dose being from 5 to 10 grains. It is, however, much more frequently employed as glycerin of pepsin (*Glycerinum pepsini*), a solution of pepsin in water, hydrochloric acid, and glycerin. Of this solution 1 drachm contains 5 grains, or 1 cubic centimetre, 0.0914 gramme.

Trypsin is not used in a separate state, but it is the principal constituent of the official liquor pancreatis. This is a solution of the non-fatty part of the pancreas in alcohol of 20 per cent. strength.

Great care should be taken in the preparation of pepsin, and the stomachs which yield it should be fresh and healthy. If it is heated much above 50° C. its digestive properties are impaired, and at 100° C. completely destroyed. The same observations apply to trypsin.

According to the Pharmacopœia, pepsin should dissolve 2,500 times its weight of hard boiled white of egg. The process, as laid down in the Pharmacopœia, is as follows:—12.5 grammes of white of egg, 125 cubic centimetres of acidulated water, containing about 0.2 per cent. of hydrochloric acid, and 0.005 gramme of pepsin are digested together at 105° F. (40.5 C.) for six hours, and shaken freely, the coagulated white of egg dissolves, leaving only a few small flakes in an almost clear solution. There are some details to be attended to which I need not particularise.

As regards the pancreatic solution, it is tested as follows:—If 2 cubic centimetres of the solution, together with 0.2 gramme of sodium bicarbonate and 20 cubic centimetres of water, be added to 80 cubic centimetres of milk, and the mixture be kept at 113° F. (45° C.) for one hour, coagulation should no longer occur on the addition of nitric acid.

By a recent order of the Local Government Board for Ireland the Guardians of the Poor-law Unions are required to have specimens of the drugs supplied to their infirmaries and dispensaries periodically examined. Since June 27, 1899, twenty-one specimens of glycerin of pepsin have been sent to me for examination. On that date a specimen received from Shillelagh Union was found to possess no digestive properties whatever—it was absolutely inert. In July a sample received from Galway Union was a fairly good one. A second sample from Shillelagh Union was little superior to the first; it came to hand on July 29. A sample from Gorey Union, examined in August, had one-half the digestive power which it should possess. In the same month a sample from Athy Union proved to be practically worthless. A specimen received in August from Sligo Union was found to be unfit for use. A specimen from Galway Union was tested in September. Five times the quantity of the glycerin of pepsin specified in the Pharmacopœia did not quite digest the prescribed quantity of egg albumin. In September a specimen from Armagh Union was found to be worthless. In September three specimens were received from Swinford Union. One had lost by far the greater portion of its digestive power, and the others were practically useless. A sample from Downpatrick Union, received in September, was practically useless. In September a specimen was examined for Tullamore Union; it possessed one-tenth only of the digestive power. A sample examined for Cavan Union in September retained most of its digestive power. A sample from Cookstown, tested in October, had one-tenth only of the proper strength. A sample received in the same month from Limerick Union had lost nearly all its fermentative power. In November a specimen from Carrick-on-Suir Union was found to possess the full power of dissolving albumin which the Pharmacopœia ascribes to pepsin. In December a specimen from Shillelagh Union proved to

* Read before the Royal Academy of Medicine, Dublin.

be practically correct. One specimen of liquor pancreatis was sent; it came from Cookstown Union, and was practically useless.

In February, 1900, a specimen of pepsin examined for Mullingar Union had no appreciable effect on albumin when used in the proportion mentioned in the Pharmacopœia. Employed in ten times the prescribed quantity, about three-fourths of the albumin was dissolved.

In March specimens of pepsin examined for Naas and Donegal Unions were found to be as slightly operative as the Mullingar sample.

A specimen of pepsin from Swinford Union, examined in March, was found to possess only one-fourth the power of digesting albumin which it should possess.

Pepsin examined in March for Magherafelt Union was fairly good, as it dissolved 75 per cent. of the prescribed quantity of albumin.

In March a specimen from Dunfanaghy Union, when used in ten times the prescribed quantity, digested three-fourths the proper amount of albumin.

A specimen of glycerin of pepsin examined in March for Athlone Union was found to be only slightly deficient in digestive power. Such also was the case with a specimen from Claremorris Union.

Three specimens of pancreatic liquor were examined in March; one from Donegal Union was good, the others from Dingle and Carrickmacross Unions were only slightly deficient in the power of coagulating milk.

It will be seen that out of twenty-one specimens of glycerin of pepsin tested only four were perfectly correct, nine were wholly useless, and eight had lost from 25 to more than 90 per cent. of their digestive power. There did not seem to be any difference between the samples due to temperature, as both good and bad samples came in hot and cold weather.

Of five specimens of pepsin itself, three had less than one-tenth the proper albumin dissolving power; two were deficient to the extent of 25 per cent. Of the four specimens of liquor pancreatis one was correct, two were slightly defective, and one was useless.

As I was not informed as to the dates on which the samples were received in the infirmaries and dispensaries, it is impossible to declare whether the want of digestive power was due to instability of the article or to original defect. In future the date on which the drugs are received will, I understand, be communicated to the analyst.

It is to be regretted that the Pharmacopœia does not give a good process for preparing pepsin, for I have no doubt imperfectness in the preparation of this article is the cause of so many bad specimens being met with.

PHYSICS FOR PHARMACISTS.

PRÉCIS DE PHYSIQUE PHARMACEUTIQUE. Par le Dr. C. SIGALAS. Pp. 656. Price, 7f. 50c. Lyon: A. Storck and Cie, 1900.

This is a work intended primarily for French pharmaceutical students. It is one of a series of scientific works, of which several have already appeared, and more are announced as being in the press. The completed series will apparently cover the whole course of study for French students, and each book is written by a professor attached to one of the schools of pharmacy, or the faculty of medicine and pharmacy at a French university. Judging from the range of the series and the scope of the work under consideration, it is fairly evident that the French pharmacien is expected to be a much more highly-trained man of science than his English *confrère*. Subjects such as bacteriology and mineralogy, which find no place in our course of study, are included in this *Bibliothèque de l'Étudiant en Pharmacie*, and tend to show that French pharmacists have already realised that the practice of their profession demands more than a knowledge of pharmacy pure and simple. The evolution of medicine and surgery is continually adding fresh subjects to the medical curriculum, and many things—such as the

microscopical and chemical examination of pathological products, the management of electrical apparatus for treatment and radiography—may profitably be undertaken by the pharmacist who possesses the requisite knowledge and manipulative skill. This condition of affairs is already largely realised on the Continent; in this country, however, it is somewhat exceptional. This is due, not so much to our lower standard of examination, but chiefly to the absence of an enforced curriculum. This alone will ensure practical training, as distinct from the possession of a certain standard of knowledge which can be tested at an examination of limited duration. The medical profession in this country is not slow to recognise the value, as a scientific coadjutor, of the pharmacist who has voluntarily submitted himself to such a curriculum as is provided at our own School of Pharmacy; but until the curriculum is universally imposed, pharmacists, as a body, will not receive this recognition which is at present only extended to individuals by virtue of their own voluntary efforts.

Dr. Sigalas' book covers the usual ground with the exception of acoustics, the treatment of which is not undertaken owing to its secondary importance in connection with pharmacy. The range of the other subjects is more extended than our own Major Syllabus, and elementary mathematical treatment is adopted throughout. The book provides very interesting reading, and we can recommend its perusal to students sufficiently familiar with French. It is divided into four parts. Part I. treats of the general properties of bodies, Part II. of heat, Part III. of light, and Part IV. of electricity and magnetism. The essential difference between Dr. Sigalas' book and the ordinary treatise on elementary physics lies chiefly in the application of principles to explain technical operations and the full explanations of the construction and working of apparatus employed in scientific observations having a direct bearing upon medicine and pharmacy. The practical employment of instruments is hardly ever described fully enough in elementary treatises, but Dr. Sigalas' book furnishes a welcome exception in this respect. Principles are explained wherever possible by means of appliances already familiar to the pharmaceutical student, and in this way he learns not only the principle involved, but also the reasons for the employment of the appliance under discussion. The technical applications of principles are of primary importance to the pharmacist, and examples occur throughout all parts of the book. Among these may be mentioned the following, having special interest for pharmacists:—

In Part I., treating of general principles, the articles on the balance, division of solids, filtration, and formation of emulsions.

In Part II. the articles on thermometers, melting and boiling points, distillation, determination of specific gravity, construction of laboratory ovens.

In Part III., the spectroscope, microscope, polariscope, apparatus to correct defects of vision, and photography.

In Part IV., the application of electricity for medical purposes, radiography, electrolytic analysis, and the technical application of electricity in the Arts.

The enumeration of these is sufficient to show that the 'Précis de Physique Pharmaceutique' is a marked variation of the ordinary text-book, and one which should be acceptable to students of pharmacy, not perhaps so much in relation to the preparation for examination as to the acquirement of a large amount of useful information of every-day use in the practice of their profession.

A SIMPLE BEETLE TRAP.—Desiré Maes, in *La Nature*, gives the following simple method of making a beetle trap:—Into a china wash-hand basin, half filled with water, pour a glass of beer; cover the basin with a newspaper, in the centre of which a small round hole is cut. Place it so that the edges of the paper lie on the floor and the hole is over the centre of the basin. At night the beetles, attracted by the smell of the beer, climb the paper and fall through the hole into the liquid. In this way hundreds may be caught in a night.—*L'Union Pharm.*, 160.

PHARMACOGNOSY—SCIENTIFIC AND APPLIED.*

BY HENRY G. GREENISH, F.I.C., F.L.S.

Professor of Materia Medica and Pharmacy to the Pharmaceutical Society of Great Britain.

3. Chemical Constituents of the Drug.

The next point that I propose to discuss is the investigation of the drug with a view of isolating its chemical constituents. The last edition of Husemann's 'Pflanzenstoffe,' published in 1882, contains a list of over 1,200 substances that have been isolated from plants; but this list by no means represents the number at present known. Some of these are crystalline and well defined; others are amorphous and ill-defined; but all are important. Some have been found by experiment to produce well-marked, physiological effects; they are accordingly termed active principles. Others possess less prominent physiological properties. Their investigation has rendered invaluable aid to science and to mankind. Consider the effect of the discovery of morphine, of its alkaloidal nature, of the investigation of alkaloids, of the synthesis of natural ones, and the production of entirely new ones; the discovery of the glucosidal nature of amygdalin, and so on. From the scientific point of view, there is no question but that the investigation of the constituents of drugs has been productive of results most important in their nature and far-reaching in their influence. Chemistry and Physiology are the two sciences chiefly involved in this investigation, and, although the pharmacognosist must relegate this work in great part to the chemist and the physiologist, yet it behoves him to make himself acquainted with the results of their labours and to incorporate them in his account of his drugs.

The isolation and examination of the constituents of drugs lose none of their importance when considered from a practical standpoint. I need not allude to the direct benefit conferred upon mankind by the discovery of quinine and morphine. Such knowledge as I have indicated is absolutely necessary before the pharmacognosist can determine how drugs shall be dried and preserved; it indicates the rational means for the manufacture of galenical preparations. The identification of the substance to which the activity is due is a problem for the physiologist; but it is no less necessary for the pharmacognosist to possess that knowledge, no matter who obtains it for him. By devising suitable means for the determination of the proportion of active constituent present, we can obtain an insight into the relative value of different parcels of the drug, of different parts of the plant yielding it, and at different periods of growth. In fact, it opens up an immense field for scientific work, yielding eminently practical results.

Occasionally the difference in the active constituents of two drugs forms the only means by which those drugs can be distinguished. I know of no means by which true coto bark can be distinguished from paracoto bark, other than the examination of the constituents. Appearance, odour, taste, structure, etc., fail to afford sufficient evidence.

4. Botanical Source.

Let us deal now with the determination of the botanical source of the drug. This point is of importance as contributing to a complete knowledge of the drug, and also as affording an indestructible criterion to which we can always refer when the question of identity is raised.

Very great difficulties stand in the way of the discovery of the botanical source. If with every drug flowers, fruits, and leaves were sent, the identification by systematic analysis, with the aid of our national herbaria, would often be possible, even easy. But, unfortunately, this is seldom the case. Usually the drug consists of one organ only, and frequently of the root, the rhizome, or the bark of large stems, that, for practical reasons, are excluded from the botanical specimens collected and brought home by explorers and preserved in herbaria. It becomes necessary to ascertain, first,

the country, and then the district in which the drug has been collected, and to endeavour to procure leaves and flowers of the plant yielding it. Even then the identification is attended with some uncertainty, and often requires years for its accomplishment.

Fortunately, however, it is by no means necessary that a drug should be excluded from use until its botanical source is known. If this were the case we should have to expunge from our materia medica rhubarb, sumbul, myrrh, asafetida, galbanum, and many others. Jaborandi leaves were known, used, and investigated long before the botanical source was discovered. Till quite recently we were not sure that stavesacre seeds were obtained from *Delphinium Staphisagria*, and only a few weeks ago Schumann reported that the large cola seeds that we prefer as the best were not obtained from *C. acuminata*, but from a hitherto undescribed species, which he names *Cola vera*. Probably no course of lectures on pharmacognosy has ever been delivered in which erroneous statements respecting the botanical origin of drugs have not been made. Such errors do not, however, interfere with the use of the drugs, because the identity of the latter is established by our knowledge of the drugs themselves, and not of their botanical sources simply. This knowledge of the drug is acquired by accurate and sufficiently minute examination. It is scarcely conceivable that two distinct drugs should exist that cannot be distinguished either by their physical characters, chemical constituents, or physiological action, and if, indeed, two such drugs exist, there is no adequate reason for insisting on their separation.

The botanical source furnishes a criterion of identity available at all times to all people. A standard sample of the drug preserved in a museum would also furnish a criterion of identity that is, in some respects, preferable to the botanical source, inasmuch as possible error in the determination of the latter is avoided. Such standards would, however, be liable to change and to accidental destruction.

5. Geographical Source.

Let us turn our attention next to the geographical source of the drug, and the route by which it reaches this country. These may be conveniently considered together, as the determination of the former is often impossible without a knowledge of the latter.

This knowledge is often difficult to acquire, and demands an acquaintance with physical geography, with the conditions that facilitate the transport of merchandise, such as navigable waterways, level countries, and advanced civilisation, as well as with those that hinder transport, such as high mountain chains, difficult country, etc. The port of export is not necessarily near the place of production, for local native craft often convey drugs from the smaller towns to the larger ports, where the ocean-going vessels call. These smaller towns may, in their turn, receive the drugs from villages far distant in the interior, and the villagers may have to traverse considerable distances in search of them. The opening of new trading centres, as well as various political influences, may divert well-established routes. All these considerations render the discovery of the true geographical source a matter of considerable difficulty.

From a practical point of view, this need give us little concern. While an acquaintance with the geographical source and commercial route adds to our knowledge of the drug, points to possible sources of adulteration, and sometimes indicates the true origin of the drug, yet it gives no sufficient guarantee of identity. It is true that the official jaborandi is exported from Pernambuco, but it by no means follows that nothing but the genuine is exported, and therefore the wholesale dealer has no guarantee that what he buys is genuine jaborandi, even though it came from that port. Geiger has pointed out that any one variety of this very drug is by no means restricted to one port. And if the geographical source were to be taken as a guarantee of genuineness what a temptation would be offered to convey spurious drugs to that port and ship them as genuine. The retailer, buying at second-hand, is even worse off than the wholesaler, but both of them must seek a criterion of identity in comparison with a genuine specimen.

* Read before the Chemists' Assistants' Association (London), April 26, 1900, and concluded from page 527

The identity will be the more assured the more accurate and minute the examination of each has been.

I have dealt with this and the preceding section somewhat at length, because I wished to point out how in each case we are referred at last to the foundation of our knowledge—viz., the accurate and sufficiently minute examination of the drug itself. The scientific pharmacognosist makes this minute examination, whilst the practical pharmacognosist selects such points as suit his purpose, and applies them to distinguish one drug from another.

6. Production and Preparation.

I should like now to refer to the production of drugs and to the manipulations they undergo before reaching the market.

With the exception of seeds and dry fruits, and of those few plants that are grown in this country, and used in the fresh state, it is probable that all drugs have undergone more or less important changes. Even the simple drying of a leaf induces alteration in its constituents; the change in odour, taste, and colour frequently afford proof of this. In many cases we believe these changes to be slight, but in some they are certainly considerable, and of great importance. *Orris* rhizomes, when freshly dug, are almost odourless; if quickly dried, they remain so, but if slowly dried and kept, they gradually acquire a strong and distinctive perfume. *Valerian* root when kept slowly develops its characteristic odour. *Gentian* root, colourless and nearly odourless when fresh, and will remain so if sliced and rapidly dried; the dark colour and particular odour are produced by slow drying, and it is recorded on good authority that the roots are sometimes heaped and submitted to a "fermentation" with that object in view. It is well known that *cascara sagrada* and *alder buckthorn* bark when stored undergo certain changes by which their therapeutic value is enhanced. *Tea*, *cocoa*, *tobacco*, and *vanilla* are all submitted to operations destined to effect certain changes. What can be more interesting than an inquiry into the nature of these changes? What can, from a practical point of view, be more important than to know how they can be regulated? Who can say but that the aroma of *orris* rhizome or *vanilla* might be doubled by suitable treatment? and what a fortune awaits the man who shall so treat European tobacco leaves as to successfully produce *Havana* cigars. Attempts have not been wanting to gain an insight into such processes, and the sciences of Chemistry and Bacteriology have certainly thrown much light upon them.

Amongst the plant-products, too, there is much still to be learnt. We are not yet sufficiently well-informed of the nature of the changes that result in the production of *benzoin*, nor of the alteration which that drug undergoes, during the drying and hardening that takes place after its secretion. *Moeller* has shown that the ducts in which *storax* is produced are formed by the plant after certain injuries have been inflicted upon it, but not otherwise; the healthy tree produces no *storax* at all. Probably the same is the case with *balsam of Peru*, *balsam of Tolu*, and other drugs. Certainly, the largely-increased secretion of *turpentine* that takes place after the hacking of the trees is due to a similar cause, and, no doubt, there are other instances of which we have no knowledge.

7. Commercial Varieties.

The consideration of these may well next engage our attention, for certainly no account of a drug can be complete that does not deal with its commercial varieties.

We find generally classed together under this heading (1) drugs derived from distinct but allied species; (2) drugs derived from one and the same species. The members of the first class, although styled commercial varieties, are in reality distinct drugs, such, for instance, as the roots of *Aconitum Napellus* (English or German aconite), *A. Fischeri* (Japanese aconite), and *A. ferox* (Indian aconite). All the remarks made under the various previous headings apply equally to these drugs, the fact of their being known as "commercial varieties of aconite" serving to increase, if possible, the minuteness and accuracy of our description.

To the second class belong the varieties of such drugs as *cloves*, *anise*, *fennel*, etc.; these are derived from the same species which, however, from climatic or other conditions, often show certain variations. Intermediate between the first and second class are such drugs as *aloes*, *benzoin*, *indiarubber*, etc., the botanical origin of which is often obscure or unknown. In each variety there also occur various grades.

The comparison of the different varieties of drugs, whether they be obtained from the same species or from different species, yields results of great scientific interest respecting the distribution of the various constituents, and the differences in appearance or structure that may be found in nearly allied drugs. It is interesting to know that *Brazilian* and *Carthagenan* *ipecacuanha* contain the same two chief alkaloids, viz., *emetine* and *cephaeline*, and it is very interesting to learn that the proportion of *emetine* to *cephaeline* is larger in *Brazilian* than it is in *Carthagenan*. The physiologist has shown how this variation affects the therapeutic action of the drugs, and explained the reason why *Carthagenan* *ipecacuanha* has undesirably strong emetic properties. This knowledge has apparently led to the exclusion of *Carthagenan* *ipecacuanha* from the *Pharmacopœia*, and the result of this is that wholesale druggists are liable to expose themselves to charges of fraud, for the substitution of *Carthagenan* for *Brazilian* *ipecacuanha* is by no means uncommon.

For the commercial druggist who will view the matter mainly from the practical point of view, the subject resolves itself into two questions:—

- (1) How can the commercial varieties be distinguished from one another?
- (2) What is their relative quality?

The first of these questions can be answered simply and solely by the accurate examination of the drug, including, if necessary, that of its constituents as previously indicated. The second question is not so easily answered. We should anticipate that the relative quality would be determined by the relative proportion of active constituent present, and this, no doubt, is often true. *Ambony* and *Penang* *cloves* are preferred to *Zanzibar* because they contain more volatile oil; *Alicante* *anise*, for a similar reason, is preferred to *Russian*, and so on. But *cassia* bark is considered inferior to *cinnamon*, although it contains more oil, because the oil has a less delicate aroma. Custom and conservatism have also much to answer for in establishing certain ideas of superiority which are by no means supported by scientific evidence. The leafy tops of the second year's *henbane* plant are preferred to the leaves of the first year; yet they contain no more alkaloid. First year's *foxglove* leaves yield as much *digitoxin* as second year's. *Alexandrian* *senna* is often preferred to *Indian*, but who shall say whether it is really better or worse? The authorities that compile the *British Pharmacopœia* have a very difficult task before them when they are asked to decide which of the several commercial varieties of a drug shall be admitted and which not. They must know first what are the constituents of the drug; secondly, upon which its activity depends; thirdly, which variety contains most; fourthly, whether the supply of this variety is equal to the demand. Two varieties of *rhatany* root are used, because the supply of each is liable to be intermittent. *Brazilian* *ipecacuanha* is preferred to *Carthagenan* because scientific enquiry has shown that the latter has a pre-eminently emetic action, whilst the former has a pre-eminently expectorant action, and is to be preferred. *Java* *coca* leaves are less esteemed than *Bolivian*, not because they contain less alkaloid, but because they contain an undesirably large proportion of alkaloids other than *cocaine*.

Here, too, the question of grade has to be considered. *Shensi* *rhubarb* realises a much higher price than *Canton*; but I know of no experiments that would lead me to believe a high grade of *Canton* to be inferior to a low grade of *Shensi*.

So that, although commerce offers to us a certain number of varieties of most drugs, yet it is left to the examination of these varieties to say by what means one can be distinguished from the

other and, with the exception of certain technical examples, to scientific investigation, to say which variety shall be preferable for the particular purpose for which it is used.

8. Cultivation of the Drug.

The difficulty of procuring some drugs, the danger of extermination, the desire for a larger output at a cheaper rate—these and other considerations induce us to attempt the cultivation of the mother plant. Unfortunately, this has not always been made upon rational lines.

In the first place, it is desirable to know which species of a genus yields the best drug. We have already discussed the means by which that can be determined, but, unfortunately, botanists do not always take the trouble to have this done. Next, the conditions under which that species flourishes in its wild state must be ascertained. Soil, position, drainage, shade, temperature, rainfall; all these conditions must be studied before it is reasonable to hope for success. They are unfortunately difficult to ascertain, but once determined, it should not be a hard task to find in one of our colonies a locality in which they are reproduced.

Once established in cultivation, it becomes a question of scientific interest to determine the influence of varying methods of cultivation, manure, etc., on the constituents. Professor Tschirch has more than once insisted on the possibility, nay, probability, of our being able to increase the active constituent by suitable cultivation. It is by this means that some of the most valuable fruits and most beautiful flowers have been produced. We know that cinchona trees under cultivation have yielded far more alkaloid than was ever found in the bark harvested from wild trees. Hooper has shown that under suitable manuring ipecacuanha plants will double their yield of root, and there can be little doubt that the same may be done with other plants if the necessary conditions can be ascertained. Favourable results would be of immense practical value.

9. History.

This, too, we may regard as necessary to complete our knowledge of a drug. Although perhaps of less importance, either from a scientific or practical point of view, the results are most interesting. There are probably few drugs of vegetable origin that have been discovered and introduced into use in recent times. The vegetable kingdom has been so thoroughly ransacked with the object of discovering medicinal plants that little remains to be done in that direction, and our efforts are now chiefly confined to ascertaining what plants other nations have found to be useful, testing their value, and introducing them to our colleagues. Every drug has a history, and a history extending often over thousands of years; this is especially the case with the spices, such as cinnamon, pepper, cloves, etc. Philology here renders valuable assistance, for the drugs have often to be traced by their names.

Chemistry, botany, zoology, physiology, geography, agriculture, philology, climatology, all contribute their quota to an exact and complete knowledge of drugs, and we should be wrong in ignoring any other science or discipline that could contribute towards that end. "Science," says the Century Dictionary, "is knowledge gained by systematic observation, experiment, and reasoning; knowledge regarding any special group of objects, co-ordinated, arranged, and systematised." It is this work that scientific pharmacognosy undertakes for drugs. It observes, experiments, and reasons; it collects, arranges, and systematises all the details that contribute to a complete knowledge of drugs, and it does so without reference to the question of practical utility. It is as free from any mercenary consideration as the science of chemistry, or that of botany.

There is, however, an applied pharmacognosy, as there is an applied chemistry. Applied pharmacognosy provides those whose business it is to deal in drugs with a means of identifying them, of ascertaining their quality, and of guarding against deception. It ensures the supply to the public of drugs of the nature and quality that they are entitled to have; it can even improve them,

extend our trade in them, and found commercial enterprises of vast magnitude.

It is the duty of the pharmacist to remember that of all persons none alone is qualified from the outset to deal with the problems of Scientific and Applied Pharmacognosy. His scientific training in chemistry, botany, and pharmacognosy, and the technical training that is coupled with the daily handling of drugs, fits him as no other is fitted to undertake such work. Neither the chemist nor the botanist is a competent expert in pharmacognosy. The field is the pharmacist's; chemistry, botany, geography, and all the sciences and disciplines serve as means to enable him to cultivate it. I find myself in complete sympathy with Professor Tschirch and other Continental authorities in advocating that pharmacognosy should occupy a much more important position in the education of the pharmacist than is at present the case.

"The pastor's function," said Ruskin, "is to teach, the physician's to heal, and the merchant's . . . to provide. That is to say, he has to understand to their very root the qualities of the things he deals in and the means of obtaining or producing it; and he has to apply all his sagacity and energy to the producing or obtaining it in a perfect state, and distributing it at the cheapest possible price where it is most needed." The pharmacist deals with chemicals and drugs; it is his duty to supply these or preparations of them, alone or combined, to the public. To enable him to discharge his duty as a merchant, pharmacognosy is as essential as chemistry; it should, therefore, occupy a correspondingly important position. But, although the business of the pharmacist consists largely of commercial transactions in drugs and chemicals, he should never for a moment lose sight of the fact that there is a scientific as well as applied pharmacognosy. There is a scientific pharmacognosy which searches out every detail without a thought of pecuniary recompense; there is also an applied pharmacognosy that points to possible advantages and averts possible fraud. A thorough training in scientific pharmacognosy is as essential as a thorough training in scientific chemistry. The man that has not enjoyed such a training is incapable of intelligently applying the results of scientific pharmacognosy, just as the man who has not been trained in chemistry is incapable of intelligently applying the results of scientific chemistry.

REVISION OF THE U.S. PHARMACOPŒIA.*

The following are the general principles to be followed in revising the U.S. Pharmacopœia, submitted by the Committee of Revision and Publication of 1890, in accordance with the instructions of the Convention of 1890, and adopted by the Convention of 1900:—

1. SCOPE OF THE PHARMACOPŒIA.

The Committee of Revision is authorised to admit into the Pharmacopœia any product of nature of known origin, also any synthesised product of definite composition which is in common use by the medical profession, the identity, purity, or strength of which can be determined. No compound or mixture shall be introduced if the composition or mode of manufacture thereof be kept secret, or if it be controlled by unlimited proprietary or patent rights.

2. DOSES.

After each pharmacopœial article (drug, chemical, or preparation) which is used or likely to be used internally or hypodermically, the Committee is instructed to state the average approximate (but neither a minimum nor a maximum) dose for adults, and, where deemed advisable, also for children. It is to be distinctly understood that neither this Convention nor the Committee of Revision created by it intends to have these doses regarded as obligatory on the physician, or as forbidding him to exceed them whenever in his judgment this seems advisable. The Committee is directed to make a distinct declaration to this effect in some prominent place in the new Pharmacopœia.

3. NOMENCLATURE.

It is recommended that changes in the titles of articles at present official be made only for the purpose of insuring greater accuracy,

*From the *Pharmaceutical Era*.

or safety in dispensing. In the case of newly admitted articles, it is recommended that such titles be chosen as are in harmony with general usage and convenient for prescribing; but in the case of chemicals of a definite composition a scientific name should be given at least as a synonym.

4. ASSAY PROCESSES.

The Committee is instructed to append assay processes to as many of the potent drugs and preparations made therefrom as may be found possible, provided that the processes of assay are reasonably simple (both as to methods and apparatus required) and lead to fairly uniform results in different hands. As regards the products of such assays, tests of identity and purity should be added wherever feasible. Physiological tests for determining strength should not be introduced by the Committee.

5. PURITY AND STRENGTH OF PHARMACOPŒIAL ARTICLES.

The Committee is instructed to revise as carefully as possible the limits of purity and strength of the pharmacopœial chemicals and preparations for which limiting tests are given. While no concession should be made towards a diminution of medicinal value, allowance should be made for unavoidable, innocuous impurities or variations due to the particular source or mode of preparation, or to the keeping qualities of the several articles. In the case of natural products the limits of admissible impurities should be placed high enough to exclude any that would not be accepted by other countries.

Regarding the strength of diluted acids, tinctures, and galenical preparations in general, it is recommended that the Committee keep in view the desirability of at least a gradual approach upon mutual concessions towards uniformity with similar preparations of other Pharmacopœias, particularly in the case of potent remedies which are in general use among civilised nations.

6. GENERAL FORMULÆ.

It is recommended that general formulæ be introduced, as far as the particular nature of the several drugs will permit, for fluid extracts, tinctures, and such other preparations as are made by identical processes, and that the general formula to be followed in each case can be merely indicated by reference.

7. WEIGHTS AND MEASURES.

The Committee is instructed to retain the metric system of weights and measures adopted in the Seventh Decennial Revision.

8. PROVISION FOR A SUPPLEMENT.

The Committee of Revision is hereby authorised to prepare a supplement to the Pharmacopœia whenever that body believes such action advisable. (This amendment as here stated is not a verbatim copy of the official record.)

9. PRECEDENTS.

In all matters not specially provided for in these "General Principles," the rules established for previous revision, if there are any, should be followed.

PRACTICAL NOTES AND FORMULÆ.

Corn Ointment.

(1) Salicylic acid, 36; lanolin, 6; cocaine hydrochloride, 0.05; alcohol (90 per cent.), *q.s.*; creosote, 4.8; white wax, 2.4; vaseline, 2.4. (2) Salicylic acid, 1; lactic acid, 1; wax ointment, 8.—*Oesterr. Zeits. für Pharm.*, 54, 100.

Scurf Pomade.

Benzoated lard, 120; precipitated sulphur, 4; wool fat, 20; alcohol (90 per cent.), 20; salicylic acid, 1; geranium oil, 1; rose water, 60. Any other perfume may be substituted for the geranium oil.—*Oesterr. Zeits. für Pharm.* 54, 100.

Antiseptic Water.

Menthol, 2 grains; thymol, 8 grains; wintergreen oil, 5 drops; eucalyptus oil, 6 drops; alcohol (90 per cent.), 2 to 4 ozs.; fluid ex-

ract of baptisia, 20 mm.; boric acid, $\frac{1}{2}$ oz.; water to produce 20 fluid ozs.—*Deuts. Amer. Apoth. Zeit.*, 20, 158.

Pepsin Syrup.

Pepsin, 6 Gm., are dissolved at ordinary temperatures in water, 20 Gm., and filtered after two hours' standing. The filtrate is mixed with cherry juice, 80 Gm., and hydrochloric acid, 4 drops, is added.—*Oesterr. Zeits. für Pharm.*, 54, 100.

Menthol Formulæ.

Menthol-Chloral:—Menthol, 30; chloral hydrate, 30. To be melted together. *Menthol Cholera Drops*:—Menthol, 6; tincture of ginger, 8; tincture of opium, 10; spirit of ether, 76. Take 10 to 15 drops each half hour. *Menthol Ice*:—Spermaceti, 10, is melted with liquid paraffin, 10, and menthol, 10, is added. To be applied to the nostrils for cold in the head. *Menthol Vinegar*:—Menthol, 8; vinegar, 97; to be added to gargles. *Mentholin*:—Menthol, 10, is dissolved in alcohol (95 per cent.), 77, and solution of ammonia, 12, is added. *Menthol Oil*:—Menthol, 16, is dissolved on the water-bath in olive oil, 14. *Menthol Ointment*:—Lanolin, 85, paraffin, 5, are melted together, and menthol, 10, added. To be applied to the forehead for headache. *Menthol Snuff*:—Menthol, 15; boric acid, 30; ammonium chloride, 55. *Menthol Wine*:—Menthol, 2, is dissolved in cognac, 6; to this is added glycerin, 6; Tokay wine, 86. *Menthol Toothache Drops*:—Menthol, 8; chloroform, 8; alcohol (95 per cent.), 84. To be applied on wool to the decayed tooth.—*Pharm. Post*, 33, 65.

Pharmacy of Epicarin.

Kaposi gives the following formulæ for compounding epicarin:—(1) *Emollient Ointment for Scabies*:—Epicarin, 10; simple ointment, 100. (2) *Ointment for Prurigo and Eczema*:—Epicarin, 10; cod liver oil, 5; vaselin, 95. (3) *Solution for Drops*:—Epicarin, 1; brandy, 10; spirit of lavender, 2.5; glycerin, 1. (4) *Anti-irritant Solution*:—Epicarin 10; ether, 40; alcohol (90 per cent.), 40; glycerin, 5. (5) *Lubricant Ointment*:—Epicarin, 2; French chalk, 1; vaseline, 18. (6) *Epicarin Paste*:—Epicarin, French chalk, starch, of each, 1; vaselin, 3. (7) *Solution for Painting*:—Epicarin, 2; glycerin, 1; alcohol (90 per cent.), 19; spirit of soap, 2. (8) *Ointment for Squamous Eczema*:—Epicarin, 15 Gm.; flowers of sulphur, 5 Gm.; zinc ointment, 100 Gm.; neroli oil, 1 drop. (9) *Ointment for Herpes tonsurans*:—Epicarin, 3; soft soap, 40; zinc oxide, 2. (10) Epicarin, 1; liquid petroleum, 10; to this other ingredients, such as liquid storax, oleum rusci, may be added as prescribed.—*Pharm. Post*, 33, 111.

Hair Lotion.

Castor oil, 7.5; eau de Cologne, 18; alcohol (90 per cent.), 18; tincture of capsicum, 0.4; tincture of cantharides, 0.4; tincture of galls, 8.—*Pharm. Post*, 32, 721.

Hair Restorer.

Precipitated sulphur, 60; lead acetate, 60; glycerin, 360; rose water, 300; distilled water, 1440; lavender oil, 45; bismuth nitrate, 3.75.—*Oesterr. Zeits. für Pharm.* 54, 100.

Hair Wash.

(1) Tincture of cantharides, 3; bay oil, bergamot oil, of each a sufficiency; alcohol (68 per cent.), 9; rose water to produce 24. (2) Orange flower water, 44; glycerin, 3; tincture of cantharides, 15; solution of ammonia, 15.—*Pharm. Post*, 32, 721.

Platinum Toning.

Valenta employs the following formula for a platinum bath:—Water, 100; potassium platino-chloride solution (1:100), 5 to 10; meta-phenylenediamidine solution (1:100), 5 to 10. The washed copies are immersed in this bath, and quickly take an intense platinum tone; they are then fixed in 10 per cent. fixing bath.—*Amat. Photog.*, 14, 15.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Council Election.

I must confess to a feeling of disappointment that the proportion of votes recorded at the Council election last week was not much larger than on previous occasions, as it is far from satisfactory to reflect that only two-thirds of the members of the Pharmaceutical Society have been induced to show that they take a practical interest in affairs at the present juncture. Apparently, the members may be divided into three classes which are almost equal numerically—first, those who are content with the manner in which their affairs have been conducted during the past year; secondly, those who have desired a change in their representatives; and, lastly, those who do not care the proverbial tinker's curse what happens until they are personally inconvenienced. The individuals constituting the third class had the destinies of the Society, and probably of British pharmacy, in their hands on the present occasion; they have chosen to remain neutral and allowed the rest to fight the matter out. Though the issue was not clearly stated in so many words, the struggle has turned on the attitude to be adopted towards Clause 2 of the Companies Bill, and it is useless to disguise the fact that the balance seems to have turned in favour of the opponents of the "no-surrender" policy.

The Successful Candidates.

Of the seven successful candidates not one is committed to that policy, except in so far as concerns the protection of titles. And on that point I believe there is absolute unanimity, both on the Council and amongst pharmacists generally. But Mr. Walter Hills has, of late, made it clear that he has no faith in the virtue of uncompromising hostility to the Government proposals, and he is returned at the head of the poll, with a much larger "plurality," as our American cousins would term it, than graced Mr. Carteighe's return last year. Again, second on the list comes the name of one who is deeply interested in the fortunes of a limited company, whilst the third place is taken by one about whose opinions on the subject there is not the least shadow of a doubt. In spite, therefore, of the editorial opinion expressed in last week's *P.J.*—to the effect that the result of the election does not alter the position of the Council as to the company pharmacy problem—I am driven to the conclusion that the majority of those who have voted at this year's election see no way out of existing difficulties, except by yielding to the force of circumstances and accepting some form of compromise, which shall reserve the use of pharmaceutical titles to duly qualified individuals.

Other Effects of the Change.

Otherwise, the result of the election indicates nothing beyond the fact that—given a good organisation—seats not strongly held are easily captured when the electorate is in the mood for variety. Three former members of the Council have been replaced by three fresh hands, and for once a change of such magnitude has resulted in the assignment of an additional seat to the metropolitan district. That is to say, London members now fill nine out of the twenty-one seats, instead of eight, a minor result of the contest, which is nevertheless one of some importance in view of the serious demands made upon the time of London members. Another effect of the change is that Mr. Glyn-Jones will now be in a position to realise how much or how little can be done by three individuals altogether reversed in the details of the Society's administrative work, even when coached by himself. He may be congratulated upon the success of his well-devised attempt to influence the result of the election, and upon the opportunity that now presents itself to show what a small combination of new parliamentary hands can do, but probably he is also to be pitied if he is depending upon the means now at his command to enable him to bring about, forthwith, all he may be supposed to desire in the way of reform. Though such pity would probably be quite misplaced, for he is essentially a man who has learned to labour and—to wait.

The P. A. T. A. Disclaimer.

I notice that, in the *Anti-Cutting Record* which has just come to hand, great pains are taken to dispute the suggestion that the Proprietary Articles Trade Association has taken action with regard to the election of members to the Council of the Pharmaceutical Society. But I fail to see that "it must . . . be sufficiently patent to any unprejudiced mind that the P. A. T. A., as such, has taken no action whatever in regard to this election." There is, doubtless, much virtue in that "as such," but it does not get over the real difficulty, which is that the P. A. T. A. stands accused of using its organisation, or allowing that organisation to be used, in an attempt to influence the affairs of the Pharmaceutical Society. No one, I take it, supposes for a moment that there has been a general meeting of the P. A. T. A. to consider ways of interfering in the election, or that an official "whip" has been sent out to members of the P. A. T. A. who also happen to be voters, or that the Executive of the P. A. T. A. has sent round canvassers with brass bands, banners, and all the other usual adjuncts of the electioneering expert. But I think there can be no question that the organisation of the P. A. T. A. has been pressed into the service of Mr. Glyn-Jones and his friends. Sufficient proof of that is furnished by the fact that the official organ of the body has been the medium exclusively employed for distributing an election circular to the voters—and to many non-voters—whilst I have no doubt that much has been done of late by the P. A. T. A. staff, in the P. A. T. A. offices, which might not unfairly be construed as employment of the Stonecutter Street organisation in support of the candidature of the Glyn-Jones nominees.

The Long and Short of it.

The fact of the matter is that no one occupying such a prominent position as Mr. Glyn-Jones can entirely dissociate what he does in his private capacity from his public actions. We are told that "Mr. Glyn-Jones, in his private capacity as a member of the Council (*sic*), addressed a circular letter from his business address at Poplar, and knowing that a copy of the *Anti-Cutting Record* reached every chemist actually in business in the United Kingdom, made use of this medium to reach those whom he desired to influence." The matter might have been put plainer by simply stating that Mr. Glyn-Jones did, in his private capacity, what no member of Council had ever been known to do before; that he also made use of his position and knowledge as Secretary of the P. A. T. A. to influence the votes of members of the Pharmaceutical Society. To that extent, I fear, he has unquestionably involved the P. A. T. A. in the Society's affairs, whatever he or Mr. Tebbutt may assert to the contrary. Of course, the P. A. T. A., "as such," had no interest in the election, but every communication from Mr. Glyn-Jones to a voter who was also a subscriber to the P. A. T. A. would naturally be received as if inspired by that body, coming as it did from the individual known to be its creator and paid secretary. Under the circumstances, such an assumption would not be so entirely wrong as Mr. Glyn-Jones would prefer that it should appear, for I doubt if he can say that he made no use, during the recent electioneering campaign, of means at his command as Secretary of the P. A. T. A.

Curiosities of the Election.

Apparently, some fifteen or sixteen hundred voters represent the strength of the anti-cutters in the Pharmaceutical Society—sufficient, as events proved last week, to secure the return of three new members of Council and almost that of a fourth. Curiously enough, whilst the first name on the list this time secured nearly two hundred more votes than Mr. Carteighe, when he headed the poll last year, something like a hundred and fifty votes less were recorded for the seventh successful candidate than for the individual who occupied the same position twelve months ago. Then, Mr. Bottle was rejected with more than seventeen hundred votes to his credit; now, Mr. Taylor is returned with a hundred less. Last year the only new candidate elected received more than six hundred votes

less than the candidate at the head of the poll, and was sixth on the list; this year Mr. Wootton is nearly nine hundred behind Mr. Hills, yet he takes the third place. The conclusion I draw is that whilst the Glyn-Jones quartette received a solid vote of sixteen hundred, the seven old members of Council were supported generally by some three hundred less, and the small revolution we have witnessed has therefore been effected by about three hundred voters. A transference of that number of votes would have returned the old seven, with Mr. Wootton eighth on the list.

LETTERS TO THE EDITOR.

The Council Election, 1900.

I would esteem it a favour to be allowed to express, through the medium of your columns, my thanks to all those who supported my candidature at the recent Pharmaceutical Election. If in the capacity of member of Council I can be of service to any of your readers, I hope and anticipate they will give me the opportunity.

80, Gloucester Road, South Kensington, ALBERT COOPER.
May 21, 1900.

I beg to thank those members of the Pharmaceutical Society very much who so kindly voted for me at the last Council Election.

8, Temple Street, Swansea, May 21, 1900. N. M. GROSE.

May I express my hearty thanks, through the Journal, to the 1,618 members who voted for me at the recent poll, and also to all those, to me unknown, friends who in various parts of the country have added to their votes their influence and interest. I will try so to serve the interests of all pharmacists as to give no cause for regret at my success.

Bolton, May 22, 1900.

JOHN TAYLOR.

It becomes my pleasant duty to thank the 1,587 members who recorded their opinion that personal qualification and personal responsibility must be the basis of any pharmacy law which can develop naturally. May I say that our (*sic*) reason for entering the contest was solely to test this issue. We have had the Council at a deadlock for the last six months, and this, in the interests of progress, we (*sic*) thought should be removed by the electorate; but as to which half of the Council was right and which wrong, as an issue, we have found it impossible to get before the electorate. On the one hand we have had the traditional policy for the return of former Councillors, because of their eminent respectability, on the other a policy of unmeaning change, which was supported by a strong organisation. This "caucus" we refused to join, because in our view it was desirable I should join the Council with a mandate or not at all. In face of these, as events prove, insurmountable difficulties, we have come within thirty of being able to say—there you have a specific instruction! I therefore urge that the 1,587 positive opinions deserve—as they will doubtless receive—the serious consideration of the new Council. That so many votes should be recorded, under such circumstances, for one who, whilst unknown and without influence refused the strongest support, is a fact of which I am very proud.

Blackburn, May 22, 1900.

R. LORD GIFFORD.

The result of the election should be a series of object lessons. All previous Councils have been elected by members of the trade who have the welfare and advancement of pharmacy sufficiently at heart to make some sacrifice for their principles. The late Council was composed of men who, individually and collectively, gave their time, their brains, and their experience for the benefit of the class

to which they, and we, belong. Their experience taught them that undue haste at a critical moment is not usually progression but retrogression. A weak Act, a House of Lords reverse, a powerful opposition, and, worst of all, discords in our own ranks showed them that *Festina lente* is the proper motto of the Council. And because that Council would not rush madly into a doubtful fray we were asked to stiffen it with a batch of incendiaries. Two-thirds of those who have a vital interest in the work of the Council are invertebrate. A large percentage of those who possess the franchise were too indifferent to exercise it, or too busy accumulating wealth. Legally, the Council of the Pharmaceutical Society is restricted in its powers; but we have stiffened it now; the worst it can do is to neglect its proper sphere of action and contribute its quota towards the gaiety of nations.

Batley, May 22, 1900.

R. BROADHEAD.

The P.A.T.A. and the Council Election.

The Journal for last week has been sent to me here, but the letters of Mr. Glyn-Jones and Mr. Tebbutt are written in a strain that leads me to refuse to continue the correspondence further. Such adjectives as foolish, unmanly, uncourageous, dishonourable, contemptible, ignorant, insulting, untrue and libellous I should not attempt to compete with or refute.

Colwyn Bay, May 22, 1900.

ALFRED H. WADDINGTON.

The Federation and the Conference.

Permit me, on behalf of the Executive Committee of the Federation of Local Pharmaceutical Associations, to commend to the notice of the local associations the special effort now being made to increase the membership of the British Pharmaceutical Conference. The work that is done by that body entitles it to the support of every pharmacist, and it is believed that the local associations, through their Councils or officers, can do much towards making its objects more widely known. In addition to the claims of the Conference upon all who are interested in the progress of pharmacy, its annual meetings afford the only real and attractive opportunity for chemists from all parts of the country to meet in social intercourse and to exchange expressions of opinion with prominent men in the pharmaceutical world, to have those opinions first-hand, and to make their own known. Will the local associations, or responsible members thereof, do what they can in their districts to strengthen the Conference?

Stonehouse, Plymouth, May 22, 1890.

JAMES COCKS,

Hon. Secretary, Federation of Local Pharmaceutical Associations.

The Materia Medica of the Pharmacopœia.

In common with the majority of your readers, I am much interested in "The Students' Columns." The plan appears to be encyclopædial, and is a decided gain in the literature of pharmacy. It is encouraging when members of our ancient craft devote attention to science and are taking notes of the daily surroundings that keep us in touch with nature and the beauties and wonders of creation. Whilst one is taking a geological survey in order to determine the habitats of various plants, another is engaged in studying the arrangement of species and nomenclature. May I suggest that such suggestion might be rendered of permanent value if converged to a focus?—the "local habitation" being the Pharmaceutical Society, resulting in a standard work of priceless value—not only in the present generation, but for all future times, after the plan of the 'Encyclopædia Britannica,' and published at regular intervals. Of material there is a superabundance, and with such names as Attfeld, Holmes, and Martindale, and with a host of amateurs dotted over the entire kingdom, the labour of editorship would be

much diminished, the domain of pharmacy vastly enlarged, and the Pharmaceutical Society of Great Britain sustained in the exalted place of honour to which it is entitled.

Richmond, May 20, 1900.

R. GOODWIN MUMBRAW.

Glaucium Luteum.

I would like to add what little I know about *Glaucium luteum* to what has already appeared in the Journal. Mr. Ashton mentioned some few weeks ago that the plant is to be found in this neighbourhood. I have noticed that the spot on which it grows most abundantly is about two and a half miles from here, and close to the works of the Brighton and Hove Gas Company, at Portslade. There, apparently on shingle, a bed of cinders, about an acre in extent, has been spread. There is no soil except for the small amount of débris that has been blown over the bed. Salt water is on both sides of the bed, to the north an arm of the Shoreham Canal, and to the south the sea. Here, then, the ground is distinctly porous, and saline matter and moisture would be furnished whenever the wind was blowing from the sea. That these conditions are suitable to the plant is evidenced by the luxuriance with which it grows in this particular spot. In the late summer it forms quite a pretty sight with its large green leaves, bright yellow flowers and long swaying capsules.

Brighton, May 19, 1900.

W. W. HOLE.

This plant used to grow near Plymouth in two marine localities. On the Whitsand Bay at Tregantle it flourished on the beach under the hill where the fort now is, with the *Eryngium maritimum* growing in the sand. I have gathered it there, say, from 1848 at intervals of years. It also grew a few large plants on hardened sand some ten to twenty feet above shore on a low cliff in a bay just beyond Bovisand to the east, but out of reach except to climbers. I have picked fruits there over two feet long (*Ceratum*). I can remember the plant there in 1840; when a lad I lodged at a cottage near by. It remained there a great many years. When last that way, about 1888, I was surprised to find that *Lathyrus latifolius*, which has been naturalised on the cliffs by an old flagstone quarry, near Bovisand, but within Plymouth Sound, was growing plentifully along the hedges running down the valley to the Bay, where the *Glaucium* grew. In July, 1867, I found *Glaucium luteum* on Slapton sands, together with *Borago officinalis*, *Cynoglossum officinale*, and *Solanum nigrum*, and at other places round the coast, but I never met with it except on the shore. The river here being very low I noticed for the first time last week the rhizomes of *Nymphaea lutea* as large as one's wrist, of nearly uniform size for a yard in length till branching; it had plenty of roots $\frac{1}{4}$ to $\frac{1}{2}$ inch across, and lay on the mud some three feet below the usual level of the river. Other plants were three feet lower, and immersed to that depth. The branches of rhizome anastomosed. The first racemes I picked this year of *Veronica chamaedrys* had about three flowers, with only three divisions in the corolla; there were a dozen such, but all on one plant.

Evesham, May 22, 1900.

F. P. BALKWILL.

Cod Liver Oil Wine.

Might I suggest that possibly the preparation needed by "S. W." is Stearn's "Wine of Cod Liver Oil." My customer always asks for it as cod liver oil wine.

Gosport, May 21, 1900.

E. S. BALCHIN.

The Roentgen Rays in Dentistry.

In my paper published last week (see p. 531), the word "hundred" should be inserted in the fourth line, which should read "several hundred cases requiring X-rays, etc." As a matter of fact since we had the apparatus here I have radiographed some 600 patients at least.

Liverpool, May 22, 1900.

ROSPER H. MARSDEN.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C." and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

ETHER SOAP (D. J. W.—42/23).—In the Journal for September 23, 1899, page 296.

VASELINE (A. E. B.—42/16).—When vaseline is ordered in a prescription, yellow vaseline should be supplied.

REMOVAL OF FIXTURES (E. H. B.—42/12).—Yes, if they are removed prior to the determination of the tenancy.

NAVAL HOSPITAL DISPENSER (C. E. F.—42/14).—Apply to the Director-General of the Medical Department of the Navy, Northumberland Avenue, London, W.C.

"PHENYLE" (W. E.—42/11).—We have no information regarding this ingredient of "bee syrup." Write to the editor of the *British Bee Journal*, 23, Paternoster Row, London, E.C.

FIELD BOTANY (A. P. M.—42/19).—The best introductory book for the purpose is Shirley Hibberd's 'Field Flowers' (Groombridge, 4s.), which might later be supplemented by John's 'Flowers of the Field' (S.P.C.K., 6s.).

STICKY FLY PAPERS (E. B.—42/13).—Birdlime, 10; castor oil, 8; treacle, 4; yellow resin, 18. Melt the resin, finely powdered, in the castor oil; then incorporate the birdlime and the treacle. Spread while hot with a broad spatula on unsized paper.

DISPENSERS IN THE NAVY (H. M. H.—42/22).—There is no such post in the Navy, but a limited number of registered chemists are employed as dispensers in naval hospitals. See reply to "C. E. F." this week; for further particulars see the *P. J.* for April 14 last, page 403.

STARCH GLOSS (G. H. L.—42/20).—The wax tablets are used by scraping off about a teaspoonful to each tablespoonful of dry starch, mixing the two well together, then pouring on boiling water in the usual manner. A polish can also be imparted to linen by passing a warm iron over it and immediately rubbing the surface with paraffin, white wax, or other suitable polishing agent.

POLARISATION OF LIGHT (J. H. C.—42/21).—There is something wrong in your question as stated. Ordinary light is visible through the polariscope—which, by the way, is not usually constructed with tourmaline plates—when the prisms are in the required position. But the monochromatic sodium flame becomes visible under conditions which do not allow the passage of ordinary white light, the explanation being that the rotatory action of optically active substances is not the same for all colours.

Information Wanted.

. The Editor will be obliged to any readers who can supply the information asked for by correspondents.

ACME BRAND CAMPHOR ICE.—Address of proprietors?—(A.B.—41/6.)

SULPHOCALCINE.—Particulars regarding liquid named "sulphocalcine," said to be used as a vaginal injection?—(F. W. H.—40/8.)

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MAY 26, 1900.

HISTORY MADE TO MEASURE.

IF long-continued reiteration of romantic representations may eventually induce the repeater of them to believe they are true, some explanation, and perhaps some kind of excuse, might be found for the views put forward in an article entitled "Genesis of the Pharmacy Act." It is even conceivable that under the influence of such a condition a statement as to the aim of the Pharmaceutical Society having been strenuously opposed from outside, might well appear "intolerable" in certain quarters, without the defective toleration being remarkable or much worth notice in these pages. But when the statement referred to is described as a "deception," and as being based on a "perversion of the facts," the limits of charitable construction are overstepped and recourse must be had to the direct evidence of the accuracy of that statement, which can be readily found recorded in the publications of the last forty years; though it is now either quite unknown or forgotten by many. The emphatic denial that in 1864 the "educational efforts" of the Pharmaceutical Society were strenuously opposed by "outside" chemists and druggists is scarcely sufficient, even as an assertion, for anything more than evading the point at issue. What that is may best be stated by recalling the terse and at the same time comprehensive description given by WILLIAM ALLEN of the aim of the Pharmaceutical Society, viz., to make the chemist and druggist "respectable," meaning that he should be taught his business and certified capable of conducting it. The business referred to was that of keeping open shop for compounding and dispensing medicines prescribed by duly qualified medical practitioners. Upon that basis the entire body of chemists and druggists was to be united and incorporated as the Pharmaceutical Society. The original object of the Society was therefore neither pretentious nor illiberal, and in 1864 it was, authoritatively, admitted to be a very desirable object for satisfying a public want. Opposition to the Society's efforts to supply

that want was commenced at an earlier period, through another organisation, originated in 1860—as already stated at page 511—at the same place as the journal which now regards mention of its past work "intolerable." The intimate relationship of that journal and the "United Society" is established on authority which cannot well be disputed and, that being the case, the question whether, like some forms of animated nature, they had a common origin by fission, is immaterial in regard to the fact that they were the source of opposition to the aim of the Pharmaceutical Society.

The object of the "United Society" by which it is now alleged that "a larger measure of protection might have been secured with as full educational provision as the Pharmaceutical Society obtained" was, however, of a very different and essentially antagonistic nature. That is sufficiently apparent from the published descriptions of its intention to maintain "free trade for chemists and druggists," and to "protect the right of a chemist and druggist to prescribe." The chief contentions of its promoters were that physic was no less to be dealt with according to free trade principles than other commodities, and that vendors of physic should be quite unfettered by legislative regulation: those contentions were quite incompatible with the more modest project of making the chemist and druggist "respectable" in the eyes of the public and of the medical profession. At the very outset the ridiculous pretence that "as a trading community" the united chemists represented fifty thousand persons, "not the least educated, not the least intelligent of those engaged in trade in this great country," was in itself an attempt to show that, in comparison, the Pharmaceutical Society, numbering only two thousand members, was an unimportant body. That representation was persistently pressed upon the notice of the public, members of Parliament, etc., with the same object. But before 1865, the period of comparison adroitly selected in the article now referred to, the free trade shibboleth had been considerably discredited by the discovery that legal qualification had a practical value for its possessors, and by the exemption of pharmaceutical chemists from jury service on that account. It was not until the advantage of being distinguishable, as a proper recipient of that privilege, became evident, that the position of the United Society and its representative of necessity underwent some alteration. It was then discovered that, instead of a monopoly being the result of applying a "test of pharmaceutical examination," legal qualification was necessary for the proprietor of a chemist's business, since "the principal's constant personal supervision" was absolutely necessary for the security of the community at large. After some show of indignant protest against the iniquity of "exclusive legislation," the free trade doctrine was abandoned; there was a clamour for an "Act of Incorporation," resulting eventually in an appeal to the Pharmaceutical Society for assistance that could no longer be depised. That was not made, however, until the action of the Select Committee of the House of Commons had been prejudicially influenced by the evidence afforded of division in the ranks of chemists and druggists, and of opposition to the aim of the Pharmaceutical Society,

The resemblance of the Bill No. 2 to the Bill No. 1 does not therefore prove that the two societies were "at

one"; because the Bill No. 2 was to a great extent necessarily imitative, even in 1865. Moreover the main feature of the Pharmaceutical Society's object was subsequently omitted from its Bill in the process of watering down to suit the desires of chemists and druggists "as a trading community." Pharmacy was thus wiped out of the Bill; the Poison Schedule took its place, and the minor qualification was adopted in response to the plea that to insist on the qualification of pharmaceutical chemist would violate "the first principle of commercial freedom." Those stages of dilution mark the genesis of the Pharmacy Act, 1868, and the simultaneous evolution of the wretched Poisons Act, which has brought general disappointment. So likewise the elimination of part of the original preamble, relating to compounding and dispensing, was the effect of the opposition which had been directed against the original proposal of the Pharmaceutical Society's Bill by that section of the drug trade which the United Society had professed to represent. It may, indeed, be said, with some semblance of accuracy, that before 1865 the programme of the United Society was in a certain sense "wider" than that of the Pharmaceutical Society; but it was not a programme that would ever have led to the attainment of the object the Pharmaceutical Society has always had in view. The watering down of the Society's object from the professional to the trade position gave chemists and druggists a heritage which—considering the results it has produced—may well be regarded as a curse bequeathed to them by the defunct United Society, as well as a present demonstration of the mischief that was done to the rank and file of chemists and druggists by that Society and its progenitor. Chemists and druggists are now told "that it was Parliament, and not any section of the drug trade," that lopped off everything except protection of titles and the sale of poisons; but the literal accuracy of that statement cannot conceal the fact that the action of Parliament was brought about by the opposition which had been made to the aim of the Pharmaceutical Society to establish a true qualification for the practice of pharmacy for the entire body. To suppose, as Mr. BROADHEAD remarked last week, that "the ridiculous transparency of such inflated misrepresentations" cannot be recognised by chemists and druggists, even though they are not members of the Society, is to give them little credit for mental capacity.

PHARMACEUTICAL SCHOLARSHIPS.

PARTICULARS are published in this week's Journal of the conditions under which three scholarships are offered for competition to subscribing student-associates of the Pharmaceutical Society. There are two Jacob Bell Memorial Scholarships, each of the annual value of thirty pounds, in addition to which the successful candidates will receive free laboratory instruction, and be admitted free to the lectures in the Society's School of Pharmacy during the Session 1900-1901, besides receiving a gift of books to the value of fifty shillings. The Manchester Pharmaceutical Association Scholarship is of the annual value of twenty-six pounds. Further particulars regarding the scholarships can be obtained on application to Mr. RICHARD BREMRIDGE, 17, Bloomsbury Square, London, W.C.

ANNOTATIONS.

WHETHER PHARMACISTS WOULD HAVE BEEN BETTER OFF if—forty years ago—the Pharmaceutical Society had been allowed to have its own way in legislation to regulate the qualifications of chemists and druggists, is scarcely worth argument, because it is a question which belongs to the unprofitable categories of might have been and may be. Moreover, opinion, or belief in regard to it, would largely depend on the point of view from which pharmacy was considered. Munyon and Mother Seigel would probably come to a conclusion different from that formed by persons connected with any of the historic houses which helped to establish the Pharmaceutical Society. But, leaving pharmacy out of consideration, it may safely be said that if the legal qualification for carrying on the business of a chemist and druggist had been adapted more to the professional side of that business, the present position of the rank and file of chemists and druggists would have been very much better than it is, and less open to interference by companies or other unqualified persons.

THE GENERAL MEDICAL COUNCIL met on Tuesday, May 22, when it was announced that, owing to severe illness, Dr. Leech would not be able to attend and present in person the report of the Pharmacopœia Committee. The chair was taken by the president, Sir William Turner, whose address contained little beyond matters of purely medical interest. It was stated that a short Bill had been prepared with the object of obtaining additional powers for penal and disciplinary purposes, and that the members of Parliament for the Universities of London, Oxford, Cambridge, Dublin, and for the Scottish Universities, had acceded to a request to support the measure. Reference was again made to the question of the infringement of the copyright of the British Pharmacopœia by certain publications. It appears that the Chairman of the Pharmacopœia Committee and two other members were asked to prepare a statement on the subject and to report to the president; the statement, which has since been received, recommended that the opinion of counsel should be taken on several questions of importance and that recommendation has been acted upon by the Executive Committee.

THE "MEDICAL PRESS" rejoices that Mr. A. C. Wootton, late editor of the *Chemist and Druggist*, has been elected a member of Council of the Pharmaceutical Society, as—"with something like thirty years' experience of the trade and its yearnings"—it is thought that he cannot fail to be a useful acquisition to that body as "a vigorous dissentient." The new councillor is credited with "the not unmerited reputation" of being able to explain distinctly what he approves and what he objects to, but that commendation is carefully qualified by expression of a hope that he will not allow the sentiments of hostility to the medical profession "which characterised most of his utterances when he directed the *Chemist and Druggist*" to vitiate the atmosphere of his new surroundings. Not, it is asserted, that those sentiments would ever be likely to be productive of positive harm, but because the constantly reiterated expression of such feelings tends to cloud the friendly relations which ought naturally to exist between medical practitioners and those engaged in the "ancillary calling" of pharmacy. It is interesting also to note that Mr. Wootton is regarded by his friend on the *Medical Press* staff as "a vigorous dissentient," and that, in his new position, he is expected to "find ample scope for activity in this sphere."

AN INLAND REVENUE CASE, particulars of which appear in the *Anti-Cutting Record* for May, does not convey a very favourable impression of the manner in which the Inland Revenue authorities conduct some of their business. It is stated that a chemist received a letter from Somerset House, informing him that he was liable to a penalty for having sold a certain preparation unstamped,

though liable to duty. As it happened, the preparation referred to was a new one of which only nine bottles had been put up and five sold; the chemist had put them up himself, and was confident that he had attached medicine stamps to all of them. On writing to Somerset House to that effect, he received a curt reply, in which he was told that the information upon which the letter demanding a penalty had been written appeared to be incorrect, and regret was expressed that he had been troubled in the matter. The chemist wrote again, asking for an explanation, and was informed that the officer who purchased the medicine had been misled by the fact that the stamp on the bottle was entirely concealed by a paper cap. Apparently, then, neither the officer nor his superiors to whom he reported had taken the trouble to examine the bottle properly before demanding the penalty alleged to have been incurred, and the thought suggests itself that other chemists may, not improbably, have been illegally fined as the result of similar carelessness on the part of the authorities.

THE SOCIETY OF CHEMICAL INDUSTRY is to hold its annual meeting in London this year, the week before the British Pharmaceutical Conference. Unlike those of the latter body, the proceedings will be mainly of a social and festive nature, the only serious business being transacted before luncheon on the opening day—Wednesday, July 18. The president's address will then be delivered and the Society's medal presented at the Royal Institution, where the Davy-Faraday Laboratories will be open for inspection. Luncheon at the "Criterion" will precede visits to the Government Laboratories, to printing offices, art glass works, the Guildhall School of Music, and the headquarters of the Metropolitan Fire Brigade. The day's proceedings will conclude with the annual dinner, to be held at the Hotel Cecil. On the second day parties of the members are to visit the Shoreditch Municipal Dust-Destructor and Electric Light Station, the Linde Refrigeration Works, the Mint, St. Saviour's Church, Southwark, the Jenner Institute of Preventive Medicine, the Tate Art Gallery, and numerous other places of interest. The third day will be devoted to an excursion to Oxford, where the Colleges, Museums, Libraries, etc., will be visited. The Paris Excursion is an extra, a special train leaving London early on Saturday, July 21, and the programme being so arranged that those who take advantage of this opportunity of visiting the French capital may spend seven or fourteen days there at a moderate cost. As the International Congress of Applied Chemistry will be in session in Paris during the week commencing Monday, July 23, the English chemists who visit Paris by the excursion will be able to take part in the proceedings.

SO-CALLED CHEMISTS' TRAVELLERS have been troubling a medical correspondent of the *British Medical Journal* until, at last, he has written to complain of their methods and to ask some one to suggest a method of stopping the constant touting for orders by wholesale druggists and other firms. Every day, he says, circulars are received through the post, or samples which have been forwarded for approval and purchase by medical men, this method being adopted largely by American houses, whilst certain British firms are to a certain extent following the example set. Only the other day this M.D. received a letter from an American graduate, who represented a wholesale drug store, recommending some tonic, and he is greatly troubled by commercial travellers and representatives of various firms, who are constantly gaining admission to his waiting-room during consulting hours and at other inconvenient times. He has a notice in his hall to the effect that he cannot interview commercial travellers who call on business, and that has had some effect in stopping them, but he thinks the only effectual remedy will be for medical men as a body to return or destroy all letters, circulars, or samples received from such sources, and to refuse to see any representatives from wholesale druggists or instrument makers. In conclusion, he says: "A firm with a German name is continually forwarding medical tablets in pill-boxes glued on to the envelope. These I do not open, as I consider that these chemists simply require professional men to find a sale for their

drugs and to serve their own ends. Medical tablets I never recommend or prescribe. Only recently a patient of mine, when in the country, had some maker's ergot tablets written down in a prescription, to be taken every four hours. The consequence was that they were purchased at various shops and at various times and taken *ad libitum!* I discovered this after about fifteen or sixteen had been taken in about twenty-four hours." With reference to this complaint, all we can say is that medical men have brought the trouble on themselves by encouraging the makers of medical novelties to an undue extent. If the remedy suggested by "M.D." were generally applied it would undoubtedly prove efficacious. Meanwhile, it rests entirely with medical men to apply a remedy, and none will thank them more than duly registered chemists who strive continually to conduct their business in a legitimate manner.

THE DAUGHTERS OF LUCINA are, apparently, not perfect on the Continent, observes the editor of the *Practitioner*, for a Commission which has been considering the question of a reform of medical laws in Belgium has ventured to hint at possible improvement in the manner in which midwives perform their necessary duties. But a small storm has been raised by the suggestion that, in the practice of their avocation, midwives should wear sleeves of gutta-percha or of clean linen, the lady editor of one obstetrical journal protesting against such "extraordinary regulations." It is urged that midwives are just a little vain of their appearance, as their arms are not ugly, and that it is not disagreeable to them to roll up their sleeves and show their arms "plump, fresh, and rosy." A French commentator on this effusion somewhat characteristically suggests that, if the Belgian Government insists on making the midwives hide the beauties of their upper extremities, they might wear a ballet girl's skirt of antiseptic gauze with tights of sterilised tartan, thus finding consolation for the loss of opportunity of showing their arms in a consolatory display of the nether limbs.

THE DISPENSING OF PROPRIETARY ARTICLES has been discussed by the Western Chemists' Association (see p. 585), the discussion being opened by a thoughtful paper read by Mr. F. A. Rogers and printed in full at page 569 of this week's Journal. Mr. Rogers is of opinion that a pharmacist abreast of the times must be, as it were, a specialist in specialties, and that a dispensing chemist should feel that he exists to carry out the wishes and intentions of others—a position which is far from derogatory, being, in fact, that of all true craftsmen. The three axioms stated by the author may safely be regarded as such by everyone who is called upon to dispense medicines; in fact, they should constitute the basis upon which every pharmacist ought to build up his dispensing practice. As regards the three points of view defined by Mr. Rogers, it is sufficient to say here that he approaches all of them in a distinctly healthy, if critical, frame of mind. The physician has an undoubted right to prescribe what he thinks best and the patient may reasonably expect to have his medicines dispensed in the most satisfactory manner, but the dispenser is nevertheless justified—whilst faithfully carrying out his instructions—in having a proper regard for his own interests. The difficulties of the situation are fairly put in Mr. Rogers' paper and, though he does not pretend to offer solutions for all the problems that present themselves in connection with the dispensing of proprietary articles, what he says should be sufficiently suggestive to enable pharmacists to consider the matter fairly and arrive at some point of common agreement in regard thereto.

REVISION OF THE UNITED STATES PHARMACOPEIA takes place in a much more systematic and satisfactory manner than we are accustomed to on this side of the Atlantic, and the publication of a detailed explanation of the general principles to be followed in preparing the U.S.P. of 1900 (see p. 574) may be usefully supplemented by referring briefly to the manner in which the work of revision is carried out. A Convention is held every ten years, delegates attending on each occasion to represent all properly-constituted medical and pharmaceutical associations and colleges throughout the United States. Committees are appointed for

various purposes, officers are appointed, and the manner in which the work of revision is to be performed is agreed upon; all needful preliminary arrangements having thus been made, the Convention closes for the year, leaving the committees of revision and publication to proceed with the actual work. Not that the work of preparation for revision only begins at this stage; that work is always steadily progressing, from the date when a new pharmacopœia makes its appearance to the time when revision proper commences and the contents of the new volumes are being prepared for the press. It is important to note that pharmacists preponderate in the committees and are mainly responsible for producing what is, beyond question, one of the most practical pharmacopœias extant. The Eighth Decennial Convention began at Washington, D.C., on May 2 and adjourned on May 4, Dr. Horatio C. Wood, of Philadelphia, having been elected president. The body will reassemble to report progress next year, but the new pharmacopœia will not be published before 1905.

KELLY'S 'DIRECTORY OF CHEMISTS AND DRUGGISTS' for 1900 includes the names of more than 49,000 persons, being an increase, as compared with the previous edition, of about 9,000. It is pointed out, in the preface to the work, that less than 16,000 of those persons are registered chemists and druggists. In addition, the 'Directory' contains the names of manufacturing chemists, dentists, veterinary surgeons, wholesale druggists, druggists, mineral water manufacturers, photographers, photographic material dealers, surgical instrument makers, and other kindred trades and professions. In this edition also the names for the Isle of Man and Channel Islands are included for the first time. It is worthy of note that the names of all pharmaceutical chemists in the general lists are distinguished by an asterisk; it would be as well if a similar arrangement could be adopted with regard to the names of those persons who are duly registered chemists and druggists, so that they may be distinguished from unqualified proprietors of shops where drugs are sold.

ELECTRIC TRACTION ON THE UNDERGROUND RAILWAY has come at last, as intending visitors to London will be glad to learn, though only to a limited extent as yet. Electric trains, of course, are not new in the London district, but this is the first application of the principle to the old "Underground," and it is a matter of general interest that during the past week an electric train has been running regularly to and fro several times daily between Earl's Court and High Street, Kensington, over the portion of line which has been fitted jointly by the Metropolitan and Metropolitan District Railways for an experimental trial of electric traction. It was brought into use on Monday last for ordinary passenger service between the two stations, though the somewhat prohibitive fare of one shilling was charged for a return ticket, to cover the double journey over a single mile of railway. As described in the *Times*, the train consists of six long coaches, each carried on two four-wheeled bogie trucks, and is capable of holding some three hundred passengers. It is fitted with the Westinghouse continuous brake, the air-pump being worked by an electric motor. The lighting, which also is electrical, is particularly good. The carriages are slightly wider than usual, and their fittings and upholstery are distinctly superior to the accommodation at present to be found on the underground railways, comfortably stuffed cushions being provided everywhere except in the third-class smoking compartments, where shaped wooden seats are substituted. The two end coaches, portions of which are reserved for the drivers and guards, carry the driving-motors; of those there are eight in all, one on each axle of the motor-coaches, but normally only the four on the leading coach are in use at any one time. As to speed, this train is faster than one drawn by the usual steam locomotive over the same route, owing to the rapidity with which speed is gained, but it is not very easy to say exactly what pace it is capable of on the level, since there are practically no level portions on the trial line; on a stiff up-hill gradient, however, the train is stated to have attained a speed of twenty-eight miles an hour.

POLITICAL GOSSIP.

THE ADVOCATES of noisy insistence and bull-at-a-gate tactics in parliamentary warfare may, with advantage, be reminded of the instructive fact that the Companies Bill is, at the commencement of a more than usually prolonged Whitsun recess, still in the position it occupied early in March—that is to say, awaiting hopelessly a second reading. Whether consideration of that circumstance will stimulate the development, in future, of more reasonable relations between the bulk of registered persons and the Council of the Society would be hard to prognosticate; but it is just as well to point a moral now and then for the benefit of those pharmacists who may—either by natural inclination or through the operation of journalistic insinuations—be disposed to regard the Executive body as effete and incompetent. The most rabid censor of the *festina lente* doctrine should now admit the wisdom of the Council in postponing active political hostility to Clause 2 of the Bill until the arrival of an opportune moment: he might also concede the possibility of the official leaders of the Society knowing something more of the real trend of parliamentary affairs than the rank and file knew. A bellicose and enthusiastic spirit is a very good thing in a body that is threatened by a powerful enemy; it is a very excellent spirit to have among chemists and druggists; but what practical utility can it serve if the cream of its vitality be expended in "demonstrations" and shadow-fighting? "Keep your powder dry, lie low, and wait for the signal," are the essential items in the policy of the Council regarding the Companies Bill, and now that the measure is to be stationary, at least, until June 14, the soundness of the official attitude appears amply justified. It may be mentioned that the commercial opposition to the Bill is growing, and Mr. Kimber has been joined on the notice paper by Sir J. Maclure and Mr. Crombie.

THE OLD ORIGINAL Early Closing Bill, which kept the name of Lubbock green in the Commons through many dreary sessions, had a meteoric career in the House of Lords on Tuesday—brilliant and beautiful, but very transitory. The Peers have not had a previous opportunity of considering the local option proposals of Lord Avebury, but under the diplomatic guidance of the Marquis of Salisbury they made up their minds very quickly not to have the unjust thing which would give to a majority of shopkeepers in a given district the power of imposing its will (at the ratepayers' expense) on the minority. There were sixteen peers in favour of the second reading of the Bill and seventy-seven non-contents, so that the Shops (Early Closing) Bill was thrown out by quite a large majority, in spite of the very plausible historical memorandum prefixed to the printed copy of the Bill, and notwithstanding the array of accumulated medical and commercial testimony adroitly submitted by its promoter. In short, the House of Lords recognises, as everyone must recognise, that the intentions of Lord Avebury are entirely praiseworthy; but the means by which he seeks to realise those intentions do not appear, as yet, to commend themselves to old parliamentary hands. As the Premier very pertinently stated—and the statement is not novel—it is a very serious thing to ask Parliament to interfere with the right of a tradesman to conduct his business in the manner he thinks fit.

THE REGISTRATION OF FIRMS BILL, which, as was announced in this column some time since, was referred to a Select Committee, has languished somewhat owing to the delay in appointing that committee. The tribunal has, however, now been set up, for on Tuesday last the following thirteen members were nominated to deal with Mr. Emmott's measure:—Mr. M. Austin (Limerick, W.), Mr. Emmott (Oldham), Sir R. Finlay (Inverness Burghs), Mr. Vicary Gibbs (St. Albans), Mr. H. D. Greene (Shrewsbury), Mr. Hazell (Leicester), Mr. Holland (Rotherham), Sir Seymour King (Hull, Central), Mr. C. J. Monk (Gloucester), Mr. G. Palmer (Reading), Sir J. Rankin (Leominster), Sir A. Rollit (S. Islington), and Sir J. Stirling-Maxwell (Glasgow, College). Five members will

form a quorum, and the usual powers will be accorded to the committee. Though the legal element is somewhat prominent, commerce is well represented, for many of the luminaries of the Law are intimately connected with large industrial concerns. We do not expect to see the Bill emerge from the committee in time for consummation this Session; but chemists would do no harm in helping it on by timely representations to their members, more especially if those members happen to be serving on the Select Committee. The Pharmaceutical Council has already expressed approval of the principle of the Bill. A petition in favour of the measure has also been recorded from the Incorporated Society of Law Agents in Scotland.

ANOTHER SELECT COMMITTEE has just been constituted to consider a far-reaching question—namely, whether it is desirable, in the public interest, that hospitals and similar institutions for the care and treatment of the sick should be relieved, either wholly or in part, from liability in respect of local rates. The committee is asked to report not only on the expediency of making this concession, but as to what extent it should go, and with what conditions, if any, it should be coupled. The principal members of the committee are Dr. Farquharson, Sir Cameron Gull, Mr. T. W. Russell, Sir J. Maclure, and Sir James Woodhouse.

MR. W. F. LAWRENCE, of the Abercromby Division of Liverpool, has notified his intention of voicing the woes of tradesmen who innocently employ borax or boric acid to keep their wares sweet, and are prosecuted for so doing. He will ask the President of the Board of Agriculture whether, pending the publication of the report of the Departmental Committee now inquiring into the use of food preservatives, he will bring pressure upon local authorities to stop such prosecutions as those to which his attention has been directed. Of course Mr. Long has no power to interfere with the due operation of the law, and he will no doubt so inform Mr. Lawrence; but the question is another indication of the unsatisfactory, not to say chaotic, nature of the present condition of things in respect to preservatives. If local authorities are to be pressed to suspend prosecutions for the sale of heavily "preserved" commodities until the Board of Agriculture Committee has reported, the ingenious masker of stale products is likely to have a rare good time.

THE VETERINARY SURGEONS BILL for extending the disciplinary powers of the Royal College of Veterinary Surgeons passed its second reading unopposed during the early hours of Tuesday last, and was duly committed to the Grand Committee on Law. There is every prospect of this simple, non-contentious measure becoming law this Session.

FATE IS UNKIND to the Petroleum Bill, Mr. Bousfield's Weights and Measures Bill, and to the Architects' Registration Bill. The first-named is deferred until the last Wednesday in June, when Mr. Balfour hopes the House will not be sitting; the second is down for Tuesday, when the Whitsuntide clearance will be in full swing; and the last-named is postponed until Friday, June 15, when members will be in no mood to discuss very much, as it will be the first working day after the holidays. Other badly-placed measures are Mr. Lloyd Morgan's Payment of Jurors Bill, down for June 11—right in the heart of the recess—the various Shop Hours Amendment Bills, and the Street Noises Bill. The Midwives Bill, which has been amended by the Standing Committee on Law, has been awaiting consideration for some time. It is now tabled for Wednesday, June 27, when it will be third on the list; it is, however, opposed by several members who are not satisfied with it even in the amended form, and the chances of the debate, which is sure to arise, being concluded by half-past five, as required by the rules of the House, are rather slender.

THE INCORPORATED LAW SOCIETY draws £2,500 a year from the Treasury in aid of its expenses incurred in keeping the profession

clear of untrustworthy persons. According to Mr. Gibson Bowles, the Society does not perform its duties either effectively or satisfactorily. Other persons have said similar things about the Society and then let the matter rest. Not so Mr. Bowles, who, like a sworn enemy of the Tite Barnacle family, "wants to know" with a persistence there is no withstanding. He has given notice that on June 19 he will move that it is inexpedient to continue the grant in aid of £2,500 a year from public funds to the Incorporated Law Society without an audit of such grant by the Comptroller and Auditor-General, and without any return being made of what becomes of the unexpended balance of the grant. The temperament of the energetic member for King's Lynn must indeed be sanguine to the highest degree if he imagines that a House of Lawyers will accept this motion, but it may have a salutary effect for all that.

ENGLISH NEWS.

CAMBRIDGE APPOINTMENTS ASSOCIATION.—The Secretary of this Association, writing from 73, Trumpington Street, Cambridge, says: "Will you kindly give publicity to the fact that we have upon our books a large number of those who are just completing their career at the University, and who are anxious in the course of the summer to enter upon various departments of practical life both in England and abroad. This Association has met with so much sympathy during the short time it has been started that we feel confident that many, especially old Cambridge men, need only to be reminded of its existence to avail themselves of its aid if opportunity occurs."

COAL TAR AND ITS PRODUCTS.—On Friday, May 18, the students of the Imperial College of Chemistry visited the works of Messrs. Burt, Boulton, Haywood and Co., Silvertown. The works deal with coal tar and the products obtainable therefrom. The party were met by Mr. Hubert Fergusson, who explained the points of interest. The tar is fractionated from Tower Stills into light and heavy oils, the light oils or naphthas containing benzol, toluol, xytol, phenol, and cresylic acid, etc.; the heavy oils or creosotes subsequently yielding phenol, cresylic acid, naphthalene, anthracene or paranaphthalene, acridine, etc. The pitch from the Tower Stills being run off into beds, from which it is afterwards cut out and removed in barges. The crude phenol is purified by treatment with caustic soda and subsequent addition of sulphuric acid, but the purest of commercial carbolic acid always contains aurin, and it is the presence of this substance which causes phenol to become pink upon exposure to light. The students were well pleased with the methods adopted for purifying naphthalene, the melting and beautiful fluorescence in the liquid state, the subsequent cooling and pressing into tablets of various shapes under a force of four thousand pounds by merely raising a lever. The workmen ascertain the quality of the anthracene oil by throwing it on to water; the anthracene crystals then separate. Anthracene is employed in making alizarin, purpurin, etc. The students were afterwards shown specimens of sulpho-naphthalene compounds with chromium, cobalt, copper, manganese, iron and lead, etc. Mr. Frederick Davis thanked Mr. Hubert Fergusson on behalf of the students, and the proceedings terminated.

READING AND DISTRICT CHEMISTS' ASSOCIATION.—The chemists of Reading and district met together on Tuesday, May 15, to discuss the advisability of forming a local association. Mr. C. Bradley acted as host, and after supper those present settled down to the business of the meeting. Twenty-seven invitations had been sent out, to which seventeen responded by their presence and others sent letters expressing regret at their inability to attend. It was unanimously decided to form an association to be called "The Reading and District Chemists' Association," and all those present pledged themselves to support the same. The objects of the association will be to promote good-fellowship among the members, to discuss all questions affecting the interests of the trade, to watch

any proposed legislation affecting the interests of pharmacy, and if necessary to take action thereon, and to promote the education of the body. An Executive Committee was elected to draw up rules to be submitted to a future meeting of the members. Mr. C. Bradley was elected president, Mr. G. W. Harrison hon. secretary, and Mr. F. Tunbridge hon. treasurer. A vote of thanks to the host brought a very pleasant evening to a close, the spirit of the meeting auguring well for the future of the association.

EXPORTATION OF PICRIC ACID AND PHENOL.—The *London Gazette* of May 18 contained an Order in Council taking off the prohibition, subsisting under her Majesty's Proclamation of January 11, on the exportation out of the United Kingdom or the carrying coastwise of picric acid (trinitro-phenol), trinitro-cresol, carbolic acid (phenol), and cresylic acid (cresol).

DEFICIENT SEIDLITZ POWDERS.—A woman named Margaret Jane Smith, described as a huckster, was charged at the Solihull (Birmingham) Police Court, on May 22, with selling seidlitz powders deficient of the proper drugs—in the blue paper to the extent of 37·2 per cent., and in the white paper to the extent of 58 per cent. Mr. Cross, who prosecuted on behalf of the Warwickshire County Council, remarked upon the serious aspect of the case. Dr. Bostock Hill, who analysed the powders, said the effect produced by them would not be such as would be prescribed by a physician, and might be serious. The boxes were labelled "superior to the ordinary pharmaceutical preparation." Defendant informed the magistrates that she bought the powders from a traveller unknown to her, who called at her place of business. A fine of £2 and costs was imposed.

SALE OF CAMPHORATED OIL.—At Lambeth Police Court, on Thursday, May 17, Mr. Francis concluded the hearing of summonses taken out by the Camberwell Vestry against George Shambrook, Heaton Road, Peckham, and Frederick George Quance, Wingfield Street, Peckham, for selling camphorated oil which was not of the nature, substance and quality demanded by the purchaser. (See *ante*, p. 563.) The evidence given at the previous hearing was, briefly, to the effect that the article purchased from the defendants was not up to the standard prescribed by the British Pharmacopœia.—For the defence it was contended that the Inspector, who in each case had purchased three penny bottles of the oil, acted contrary to the requirements of Section 14 of the Act in mixing the contents of the three bottles together, the contention being that each bottle should have been dealt with separately. In the case of the defendant Quance it was also stated for the defence that notice was given to the purchaser that the article supplied was not camphorated oil, but "campholeum."—Both cases were adjourned for the attendance of the public analyst, Dr. Frank Teed, who now stated that the mixing of the contents of the bottles was necessary in order to provide a sufficient quantity for analysis; one-third of the contents of one of the small bottles would not be enough to perform a proper test.—Mr. Francis said that it was argued that he could not convict because the Inspector had no right to mix the contents of the bottles together and then divide the article. Upon the analyst's evidence he came to the conclusion that it would have been almost impossible to come to a satisfactory decision upon an analysis of a third of the contents of one bottle, and he felt, moreover, that no hardship was inflicted upon the defendants by what was done. Though the Statute stated that the article must be divided into three parts, he did not see that the Act said that the stuff should not be mixed together and then divided, and he saw nothing to prevent that being done. In the second case, apart from Section 14, it was contended that there could not be a conviction, because under Section 6 the person who bought the article got what was asked for. It was argued that the words on the bottle, "Campholeum, formerly known to the public as camphorated oil," was enough to convey to the purchaser that the

article supplied was not camphorated oil, but something different. If the purchaser had been told "This is not camphorated oil, but it is campholeum," he did not think there could have been a conviction, but the label, "Campholeum, formerly known to the public as camphorated oil," seemed to him to convey that campholeum was camphorated oil. He should convict in both cases. He did not think the defendants were the real culprits, therefore he should not impose the heavy fines that had been imposed at that Court in such cases. He should order each of the defendants to pay a fine of 40s. and 38s. 6d. costs.

POISONING BY PRUSSIC ACID.—An inquest was held at Bolton on Friday, May 18, concerning the death of Edmund Parkinson Greenhalgh (27), pharmaceutical chemist, 136, Bradshaw Gate, Bolton. According to the evidence, deceased had recently purchased the business formerly carried on by Mr. Joseph Hamer at the above address. On Thursday afternoon, May 17, about four o'clock, deceased left the shop in charge of Mr. Hamer, who since the transfer of the business had occasionally attended to assist, and went upstairs to the drug store. Shortly afterwards an errand boy went to call him down, but on entering the room found him lying dead with a bottle of prussic acid, a portion of which had been consumed, by his side.—There was no evidence to show that deceased had had trouble of any kind, but Dr. Garstang stated that in his opinion deceased had been seized with an uncontrollable impulse and had hurriedly opened the bottle, the neck being damaged in tearing off the capsule, and drank some of the liquid. He did not think it was a case of inadvertence nor yet of deliberate intention.—A verdict of "Suicide while temporarily insane" was returned.

SALE OF OLIVE OIL.—At Tunbridge Wells Police Court last week, Henry Beeching, grocer, Lower Green, near Pembury, was fined 5s., including costs, for selling cottonseed oil as olive oil.

FOREIGN NEWS.

DEFRAUDING THE CUSTOMS.—There are very many ordinary drugs and specialties and chemicals which, for some reason or other best known to the Customs authorities, are not allowed to enter France upon any account whatever. There are upon the other hand drugs and chemicals, whilst perhaps much more cheaply produced outside France, become much dearer than the "home" article, by virtue of the excessive duties levied thereon. Full of the knowledge of this fact, Monsieur X., a former Customs officer, whom since his retirement has been looked upon as a conscientious "commerçant" in the Val-de-Grace quarter of Paris, has essayed to profit by it. For long enough he has plied pharmacists, analysts, and perfumers with circulars and price lists, in which he offered various foreign chemical and pharmaceutical products and specialties at ridiculously low prices, with the result that he did quite a lucrative business. But, alas for him, the lynx-eyed minions of the law caught a glimpse of one of his circulars, though unaware at the time that they emanated from X.'s bureau. Accordingly Monsieur Leydet, Juge d'Instruction, was ordered to make an inquiry into this roaring piece of illicit traffic, and terminated the same by the arrest of Monsieur X. and one of his employees. The latter was caught whilst receiving at the post-office the correspondence (orders) addressed to his employer "poste restante." Subsequently an order was made out by the authorities of Pontoise authorising a thorough search of the premises of Monsieur X.'s relatives at Bougival, with the result that an enormous quantity of drugs and chemicals (contraband, of course) was seized. Though arrested, they were both liberated forty-eight hours afterwards profiting by Article 113 of the Code de Justice Criminelle, a sort of Habeas Corpus Act. They are, however, under the vigilant eye of the police, and will later on be brought up for defrauding the State.

Obituary.

COOPER.—On May 14, William Henry Cooper, Pharmaceutical Chemist, Holloway, N. Aged 77. Mr. Cooper had been a member of the Pharmaceutical Society since 1862.

GREENHALGH.—On May 17, Edmund Parkinson Greenhalgh, Pharmaceutical Chemist, Bolton. Aged 27. Mr. Greenhalgh, who was the son of Councillor E. P. Greenhalgh, J.P., of Bolton, served his apprenticeship with Mr. Joseph Hamer, chemist and druggist, 136, Bradshaw Gate, and about three months ago purchased the business from his old master. He was of very cheerful disposition and was well-known in the town. The circumstances attending his death (see p. 584) caused great regret amongst those who knew him.

HEADLEY.—On May 12, William Headley, Chemist and Druggist, Bridlington Quay. Aged 67.

HUME.—On May 17, William Andrew Hume, Chemist and Druggist, Middlesborough-on-Tees. Aged 56.

HUDSON.—On May 22, Thomas Herbert Hudson, Chemist and Druggist, Liverpool. Aged 39. Mr. Hudson, who was one of the Assistant Local Secretaries of the Pharmaceutical Society at Liverpool, commenced business for himself about ten years ago, and the last few years especially he devoted much time to local secretaries' duties, with advantage to the Society: His genial and happy temperament made him popular wherever he was known, and Liverpool pharmaceutical circles have sustained a loss by his death. He was recently elected to the Council of the Liverpool Chemists' Association, and was appointed one of the representatives of that body on the Federation of Local Pharmaceutical Associations. His death occurred after a very short illness. He leaves a widow and several children.

MOFFAT.—On May 14, James Close Moffat, Chemist and Druggist, late of Manningham, Bradford. Aged 53. Mr. Moffat was a native of Orton, Westmoreland, and settled in Bradford about twenty-five years ago, a few years later commencing in business on his own account in Carlisle Road, which business he conducted until about four years ago, when he retired owing to failing health.

WESTERN CHEMISTS' ASSOCIATION (OF LONDON).

A meeting of this Association was held at the Westbourne Restaurant, Craven Road, Paddington, on Wednesday, May 23, the **PRESIDENT**, Mr. J. F. Harrington, in the chair.

The minutes of the previous meeting having been read and confirmed, several gentlemen were nominated for membership.

The **PRESIDENT** then stated that the Committee had met to consider the question of the annual dinner, and had decided that, subject to the approval of the meeting, it should be held on the third Wednesday in November at the Café Royal, and that a small committee, consisting of the President, Messrs. Cracknell, Philp, Mathews and Bowen, be appointed to make the necessary arrangements.

The meeting having expressed its approval of the Committee's decision, letters of apology were read from several members who were unable to be present. Before proceeding to the chief business of the evening, Mr. J. H. **MATHEWS** announced that a letter had been received from Mr. Wm. Martindale, stating that he was much better in health. He hoped that by the time Mr. Martindale arrived in England—about June 1—he would be quite himself again.

Mr. F. A. **ROGERS**, of Oxford Street, W., then read a paper on

THE DISPENSING OF PROPRIETARY MEDICINES,
which is printed at page 569.

Mr. R. H. **PARKER** entirely supported the views put forward by Mr. Rogers. The proprietary article was one of the most troublesome phases of modern pharmacy. He considered it struck at the

root of pharmacy, because it takes away from the pharmacist the work for which he has been educated and trained. Therefore, he was of opinion that pharmacists should endeavour to prevent the development of the practice of prescribing proprietary articles in every possible way. Of course, whatever a doctor prescribes pharmacists should carry out his instructions to the best of their power; but at the same time, although it is no business of the pharmacist to dictate to a doctor what he should prescribe, everyone present was fairly intimately familiar with a few medical men, to whom they could point out the difficulties attending the dispensing of proprietary articles and the possible evil results arising therefrom. When a pharmacist receives a prescription to dispense in which, say, a certain article of a particular manufacture is ordered, he has the crude drug on his shelf, yet cannot compound it, but has to send an express messenger either to the manufacturer or to the wholesale house for it, thus causing not only delay in making up the medicine, but also additional cost. He thought that Mr. Rogers' suggestions were distinctly good in regard to the dispensing of proprietary articles—viz., to keep strictly to what is ordered and send out the exact quantity. The necessary corollary was, of course, that the pharmacist must be remunerated for the outlay in having to purchase a larger quantity—probably of an article which would be left on his hands—than that ordered and supplied; therefore he must make a higher charge. It was not the business of pharmacists to bewail the present state of things, but to make the best of them.

Mr. C. B. **ALLEN** supported the remarks of Mr. Rogers and Mr. Parker. He thought that pharmacists could do much good by influencing the doctors with whom they were intimately acquainted. It was, of course, a delicate position, because they assumed that the doctor has some knowledge of what he orders, but he was afraid that very often doctors do not know the nature of the articles they prescribe. Pharmacists were not the only people who were injured by the prescribing of proprietary articles; he believed that doctors themselves were beginning to find that their patients have a knack of finding out what is prescribed for them and where such remedies can be obtained in wholesale quantities. Mr. Allen instanced a case in point. An institution having about three thousand members has a staff of doctors to attend them in cases of illness. At one time proprietary articles were sometimes prescribed, but it was found that the patients began to doctor themselves, to their own injury. Consequently, the doctors consulted together and passed a resolution to the effect that doctors connected with that institution must not prescribe anything that is not included in the British Pharmacopœia, except after special consultation of their committee. One point touched upon in the paper was that the pharmacist is compelled to dispense whatever is ordered. It sometimes happened that a prescription contained three different proprietary articles. "How is it possible," he asked, "for me to dispense that prescription as ordered with the dispatch that I should like and could, if I were allowed to compound the preparations myself?" He thought that doctors who prescribe such medicines must take the responsibility of any delay in supplying what they order. He had known cases in which a week, or even as much as three weeks, had elapsed before a prescription could be made up; not that an effort was not made, but because of the out-of-the-way nature of the preparations prescribed. Mr. Rogers deserved their thanks for the temperate way in which he had brought the matter forward.

Mr. A. **COOPER** was of opinion that the prescribing of proprietary articles was caused by the insufficient training of the younger generation of medical men. It was to be regretted that there were not more medical men like Sir William Broadbent, who, on one occasion at least, mildly rebuked a doctor who had called him in to a consultation. Noticing a bottle of a certain make of tablets, he asked if they had been prescribed. The doctor admitted that he had prescribed them. Sir William then stated three reasons why such preparations should not be prescribed. "First," he said, "there is the danger of inaccurate doses; second, it is not fair to your

patient; and third, it is not fair to yourself." He (Mr. Cooper) thought pharmacists should take every opportunity of condemning the practice of prescribing proprietary articles. His own opinion was that they must look to the medical profession to help them before a remedy would be found.

Mr. NORTON thought that Mr. Rogers' suggestion to form a central establishment where the many different proprietary preparations could be obtained, was an admirable one.

Mr. GAUBERT said that the matter resolved itself into the question of how to get rid of factory-made articles. Unless the factory itself could be crushed he saw no chance of the problem being solved. Personally, he frequently got prescriptions to dispense containing things he had not in stock; consequently, as he lived some distance out of town, it took quite a day to get the required articles. Then, too, there was the additional cost of railway fares. He thought an effort should be made to interest the General Medical Council in the matter. He believed the difficulty arose through the inability of the present generation of medical men to prescribe, hence they were ready to accept the statements made by the proprietors of the various preparations as to their efficacy.

Mr. HYSLOP said the matter was a case entirely of education. Mr. Rogers had said that it was not a matter of prescribing the article, but of dispensing it. What was required was to find out the root of the evils under which pharmacists suffer, and to try to bring about a better state of things. In the old days the proprietors of so-called "patent" remedies used to bribe chemists to stock and push their goods; now they had thrown over the chemist and gone to the medical man. The medical faculty at its head was above suspicion, but the young men just passed through their examinations were often heard to say in plain English that they knew nothing about the B.P., and didn't want to. All they wanted was a multitude of patients to prescribe for, and the manufacturer or wholesale house would provide them with the remedy. He believed, however, that in the future a better system of education would largely do away with that state of things. Pharmacists must make love to the medical faculty, and not coquette with the baser forms of quackery, and so spoil their case.

Mr. WORSLEY suggested that it might facilitate matters in any particular locality if each pharmacist occasionally prepared a small list of the preparations he had in stock and passed it round among his friends. By that means he thought they would be able to get rid of superfluous stock.

Mr. HICK questioned Mr. Hyslop's remark about the bribing of chemists, but Mr. Hyslop maintained, and was supported by the assent of others present, that it was correct.

Mr. ALLEN suggested that it would be a good thing if the various medical associations in different parts of the country would set apart a day for the discussion of purely business matters, to which they might invite a few pharmacists, to confer upon subjects of interest to both. Until some such conference between medical men and pharmacists was brought about he thought it was not possible to find any remedy for the present state of things.

Mr. ROGERS then replied, pointing out that his object was to deal not with the prescribing of proprietary articles, but with the difficulties attending the dispensing of them, with a hope of being able to overcome those difficulties.

The PRESIDENT commented upon the paper and the discussion. He hardly agreed with Mr. Hyslop's remark, about bribery; he thought "persuasion" was the better word.

Mr. HYSLOP: Undue persuasion.

A vote of thanks was then accorded to Mr. Rogers for his paper.

DELEGATES TO THE CONFERENCE.

It was unanimously agreed, on the recommendation of the Committee, that the President and Vice-President attend the next meeting of the British Pharmaceutical Conference as the delegates of the Association.

The meeting then adjourned until October 24 next.

CHEMICAL SOCIETY.

A meeting was held on Thursday, May 17, Dr. T. E. THORPE, F.R.S., President, in the chair.

A paper was given by Messrs. SELL and DOOTSON, of Cambridge, on

SOME NEW AMINO CHLORO PYRIDINES.

A trichlor amino pyridine has been obtained by the steam distillation, in presence of alkali, of an uncrystallisable residue obtained in previous work. Mr. Sell believes it to be produced from the decomposition of a compound containing a double pyridine nucleus existing in this residue. He explained the method by which he had recognised the orientation of the substituting components therein.

Doctors CHATTAWAY and ORTON produced a paper dealing further with

SUBSTITUTED NITROGEN CHLORIDES

obtained by the action of hypochlorous acid on anilides and toluides. They showed that ortho and para chloro compounds could be separated by the steam distillation of the mixture partly neutralised with sulphuric acid. The ortho compound is distilled over while the para compound remains behind. By this method they were able to show that ortho compounds are formed as well as the para compounds by a direct process in the transformation of the substituted nitrogen chlorides.

Dr. WYNNE remarked that it was an exceedingly interesting thing to have proved this direct formation of ortho compounds.

Dr. HEWITT stated that he believed the method of separating ortho and para chloro derivatives used by the authors was not new, but had previously been discovered and used by Beilstein and another.

Professor COLLIE suggested to the authors that they might obtain meta chloro derivatives by attacking a compound in which the nitrogen was not bound directly to the ring as in aniline, but bound to an intervening carbon atom.

Dr. CHATTAWAY in reply, said, that this had been attempted, but all the compounds produced were so unstable as to break down at once.

Dr. DIVERS gave a preliminary note announcing the existence of

AMMONIUM IMIDO SULPHITE,

$\text{HN}(\text{SO}_2\text{NH}_4)_2$, a colourless crystalline substance, from which by decomposition with potash he has been able to obtain the corresponding potassium imido sulphite, $\text{HN}(\text{SO}_2\text{K})_2$.

Dr. JOCELYN THORPE gave the theoretical deductions drawn from the work described in three papers communicated by him on

ETHYL SODIOCYANACETATE,

and a condensation product of it with dimethyl acrylic ether. Cis and trans forms of an acid obtained by this condensation may be separated even in small quantities by the action of hydrogen chloride on the amides, an imide of the cis acid being produced while the other compound is hydrolysed to the trans acid.

Professor PERKIN remarked that the work of the author showed that cyanacetic ester must have a form different from that of malonic ester.

The PRESIDENT now announced an interesting communication from Messrs. W. J. Pope and S. Peachey on

THE OPTICAL ACTIVITY OF TIN COMPOUNDS,

the first installation of which was offered a short time ago. It will probably be remembered that the asymmetric compound on which the authors have been working is one in which three valencies of the tin atom are united to methyl, ethyl and propyl groups respectively, while the fourth valency is united to an acid radical, such as that of dextro-camphor sulphonic acid or dextro-bromo camphor sulphonic acid.

When a solution of one of these salts of the asymmetric tin radical is evaporated on the water-bath, nothing but the salt of the dextro tin base is obtained. This was believed to be due to the progressive racemisation of the base on the continued removal of the salt of the dextro base due to its smaller solubility, so that on evaporating to dryness the whole became converted. That this is true was proved as follows:—the molecular rotation of the dextro-rotatory acid used is 270° , that of the dextro-rotatory tin base is 45° . This gives a total rotation of 315° , while the number actually observed was 318° , which is as close an approximation as could be expected. Now the compound of dextro base and dextro acid must racemise on heating if the supposition be correct, yielding equal quantities of the dextro and lævo base combined with the dextro acid, the optical activity of which mixture would be that of the dextro acid alone. A one per cent. solution of the dextro base with the dextro acid had a molecular rotation of 318° , after heating this fell to 273° , showing that the base had racemised. A measured volume of this was evaporated to dryness and diluted again to its former volume. The molecular rotation now rose to 315° . That is, the evaporation had converted the racemic base into the dextro base once more. When again heated in a sealed tube the molecular rotation dropped to 275° , showing that the process can be conducted over and over again. Moreover the solution of dextro base and dextro acid prepared in the cold, and decomposed with potassium iodide, yielded a methyl ethyl propyl tin iodide, having a molecular rotation of 23° . But the same solution which had been heated and afterwards decomposed with potassium iodide yielded an iodide which was inactive.

Professor PERCY FRANKLAND said he had listened with, he might say, almost breathless interest to the artistic expositions given by Mr. Pope. He could only ask whether Mr. Pope was able to explain why these compound had so much greater mobility than analogous carbon compounds.

Mr. POPE, in reply, said that all present ideas of stability are derived from carbon compounds, but when those are left different behaviour must be expected. It was not altogether surprising to find such intramolecular mobility. It probably occurred in nitrogen compounds, by the study of which, together with tin compounds, something of the nature of that mobility may be learnt.

ROYAL INSTITUTION.

On Tuesday, May 15, Dr. ALEXANDER HILL, Master of Downing College, Cambridge, gave the first of two lectures on

BRAIN-TISSUE CONSIDERED AS THE APPARATUS OF THOUGHT.

Thought was described as the product of the grey matter of the brain. In strictness, observation, memory, the statement of likes and dislikes, are not thought, in which there is an element of prophecy. But without the senses there can be no intelligence, and without memory, in the absence of sensations, we should be permanently asleep. To study the apparatus—the brain-tissue—of which the product is thought we must begin with the brain of some of the lower animals in which the product is the definite sum of the sensations supplied. The actions of a jelly-fish are purely reflex, while the frog is capable not only of acting reflexly, but also of deciding how to act and of declining to act. It is significant that the first action that deserves to be called mental is negative rather than positive, consisting not so much in positive action as in the power of refusing to act.

On Thursday, May 17, Professor DEWAR gave the fourth and last of his course of lectures on

A CENTURY OF CHEMISTRY IN THE ROYAL INSTITUTION.

In this he continued his account of Faraday's work, and described the second stage of that investigator's experiments on the liquefaction of gases. Reference was also made to Faraday's studies in the

solution and opacity of metals and to his elucidation of the nature of indiarubber. In organic chemistry Faraday succeeded in replacing the hydrogen in an organic body with an electro-negative substance like chlorine; he was also the first to obtain what would now be called a sulpho-acid, by dissolving naphthalin in sulphuric acid, and he discovered benzene, which constitutes the basis of the whole coal-tar industry. Faraday's successor, Sir Edward Frankland, greatly extended his work in organic chemistry. The scope and variety of Frankland's researches making him second to none as an experimenter of the modern type. His work was largely identified with organic synthesis, one of his early successes being the isolation in a free state of certain of the compound radicals whose existence Wöhler and Liebig had pointed out. His organometallic bodies were instances of substitution, in which the hydrogen of certain organic substances was replaced by zinc and other metals; zinc ethyl, for example, is a very active body which takes fire spontaneously in air, and by the aid of which many organic syntheses have been effected. Frankland was the first to formulate the conception of atomicity; he investigated the theory of flame, finding that the luminosity varied as the pressure of the atmosphere in which the flame was burning, and concluding, therefore, that it could not be due altogether to the presence of solid incandescent particles; his technical work included elaborate investigations on water supply and on the manufacture of coal gas. The work of Dr. Odling and Dr. J. H. Gladstone was finally referred to by Professor Dewar, who said the former was distinguished by his philosophic grasp of the whole field of chemical theory, while Gladstone's name would be remembered for his studies of the relation between the refractive index of bodies and their destiny.

On Friday, May 18, Professor J. A. EWING, M.A., F.R.S., lectured on

THE STRUCTURE OF METALS.

Most people think, said the lecturer, that a metal is the nearest approach to a homogeneous structureless mass. Until Sorby's work of thirty years ago this was generally thought to be the case even by men of science. After Sorby the work was neglected for about twenty years, when it was taken up by many able metallurgists, including Roberts-Austen, Arnold, and Stead.

The lecturer stated that his remarks would bear largely on the work done by himself and a colleague, Mr. Rosenheim, in his own laboratory. To the latter was due the credit of some beautiful high-power microphotographs that were shown on the screen by means of the lantern.

In examining the structure of a metal, the surface is first polished to a high degree, and then lightly etched with an acid. When so treated, the microscope reveals the presence of minute granules on the surface, with irregular boundaries. These granules are crystals, having a regular internal structure, though not possessing the geometric form and regularity so typical of ordinary crystals.

When the metal is subjected to strain and the surface again examined under the microscope, the granules are seen to slip over each other, but they still remain crystalline. This is well seen in the case of ordinary plumber's lead. The metal may be strained by compressing, twisting, stretching, bending, hammering, or rolling it.

Strain also causes twin crystals to appear, through one of the pair moving through a definite angle. Besides this effect, it has been observed that the crystals grow in size, slowly at atmospheric temperatures, and more so on heating. This growth of crystals, as a result of strain, is explained by a theory which is due to Mr. Rosenheim. He supposed that in the boundary between one crystal and another there is some impurity, which forms a more fusible cement, or eutectic alloy. Perhaps an electrolytic process goes on, one crystal undergoing solution, and being deposited on a neighbouring crystal. The theory that an impurity on the surfaces caused the growth of the crystals was proved to be true by means of

the following experiments. Two perfectly clean surfaces of metal were welded together, with the result that no crystals formed across the boundary. The experiment was repeated, this time sprinkling some impurity on the surfaces. The crystals were found to grow across the weld in this case.

NOTICES OF BOOKS AND OTHER PUBLICATIONS.

'OCCASIONAL LECTURES ON THE PRACTICE OF MEDICINE.' By W. B. CHEADLE, M.D., F.R.C.P. Pp. 324. With seven illustrations. Price, 7s. 6d. London: Smith, Elder and Co., 1900.—Dr. Cheadle's lectures should be read by everyone who is engaged in the practice of medicine. They reflect faithfully the daily problems of the bedside and the consulting-room, and give the author's experience in the most natural and human and, hence, the most impressive way. This small work is an example of the best kind of clinical teaching. Such works form a necessary corrective to the systematic works that treat of therapeutics. Here in a few sentences a wholesome caution is given to the student:—"One evil result of learning medical treatment almost entirely from books, and partly also of the dogmatic way in which therapeutics are necessarily taught to the student, is that it creates a tendency to a mechanical and routine practice. In a certain disease give a certain drug or drugs." With many practitioners the practice of medicine is little more than a repetition of the same routine treatment in all cases of the same disease; given the disease, the appropriate remedy is ready labelled for use in its pigeon-hole, and is brought out and applied without doubt or hesitation. The student on his first entrance into practice, having little personal experience, is naturally tempted, or, indeed, obliged almost, to rely upon what is put down as the proper treatment, or to give what he has seen given in like cases. And thus he is led to treat all cases much alike, according to regulation formulæ. Ipecacuanha and squill and ammonia for bronchitis, aconite or an ice-bag perhaps for pneumonia, salicylate of soda for acute rheumatism, stramonium for asthma, digitalis for heart-disease, and so on. Now this rule-of-thumb procedure has the advantage of simplicity, and it saves much anxious thought and mental labour; it cannot, however, be regarded as satisfactory to the patient, or as a high form of medical art. The lectures include subjects such as: The Use and Abuse of Tonics; The Clinical Uses of Opium; Prevalent Fallacies in the Diagnosis and Treatment of Certain Minor Diseases of Childhood; Chronic Constipation and Dilatation of the Colon; Rickets in its Medical Aspects; Some Practical Points in the Treatment of Diseases of the Lungs and Air Passages; The Rheumatism of Childhood. Every subject is approached chiefly from the clinical standpoint, but in such a way that the essential nature of the disorder or disease is kept in view, and the result is one of the most profitable and enjoyable of the smaller works on clinical medicine that have appeared in recent years.

'A TEXT-BOOK OF MEDICAL TREATMENT.' By NESTOR TIRARD, M.D. (Lond.), F.R.C.P. 1 Vol. Pp. 692. 15s. London: J. and A. Churchill.—In the preface of this work the author explains that it has been written to supply a want created by the present system of medical education:—"Students learn practical pharmacy at an early stage in their career; they also attend lectures on pharmacology, which frequently include only the physiological actions of drugs. When they have to apply their knowledge of therapeutics at the bedside they feel the need of further guidance, since in most of their text-books on medicine the subject of treatment is dealt with not only briefly but in general terms, thus affording little help in practical work." The subdivisions of the work are made upon the physiological basis; thus diseases of the circulation, respiration, digestion, nervous diseases, specific infectious diseases, and, finally, constitutional diseases form the headings of sections of the book. Under the heading of the separate affections such symptoms as afford definite indications for treatment

are alone mentioned. This method of subdivision of the matter works practically well, although the author is obliged here and there to explain that such an arrangement is but partially in accord with the facts of disordered physiology; for instance, insomnia, which is placed among nervous diseases, is thus introduced:—"Insomnia is symptomatic of so many conditions that, although it is not to be regarded as a disease, it may save time and reference to different parts of this book to consider the treatment of this symptom in one place." As an instance of the manner in which the author deals with each subject, some extracts may be made from this same section:—"No treatment of insomnia is satisfactory which ignores the conditions under which the symptom arises. It may originate in some trifling error of diet, or of habit, or it may be a symptom of some serious organic disease, and it is obviously impossible and irrational to deal with all forms of insomnia by the routine administration of hypnotic measures without endeavouring to ascertain the exciting cause. With regard to the errors which are capable of alteration, the chief perhaps are those which depend upon consumption late in the evening of some indigestible article of diet or some cerebral stimulant. Strong tea or strong coffee will frequently cause insomnia, and a full meal taken late at night may have the same effect. On the other hand, however, sleeplessness sometimes results from an insufficiency of food. Those who dine early and work late at night frequently suffer from sleeplessness, which can readily be controlled either by discontinuance of work for an hour or so before retiring to rest, or by taking some slight nourishment just before going to bed. . . . When the habit depends upon disorders of digestion, such as acidity, or upon habitual constipation, these conditions can readily be dealt with, the former by the use of a little sodium bicarbonate with hot water, the latter by purgatives. . . . In conclusion, I would once more lay stress upon the importance of ascertaining the cause of insomnia before attempting to deal with the condition by hypnotic drugs. Although frequently dependent upon some physiological error, insomnia is also frequently the result of habit, and perhaps a firm conviction that wakefulness will persist until some drug has been taken. . . . It must be admitted, however, that occasionally insomnia may persist in spite of almost every known drug, even when given in large doses, while it may ultimately yield to a combination of two or three hypnotics in small doses." These extracts serve to show the practical and reliable character of the information supplied by this work. The admirable index, the clear print and convenient size of the book aid in rendering the mass of information readily accessible, and the author is to be congratulated on having written a work which constitutes a valuable addition to the library of the medical practitioner.

NEW REMEDIES.

SIDONAL AND UROSINE.—Under this name a combination of piperazine and quinic acid has been introduced as a uric acid solvent. The value of the piperazine has been long known, and lately quinic acid has been found to give beneficial results in the treatment of gout, etc., so that the combination should prove valuable; compounded with lithium citrate sidonal is known as urosin.—*Oesterr. Zeits. für Pharm.*, 54, 247.

LOW TOXICITY OF CHINOSOL ON ANIMALS.—According to J. Schneider, although chinisol is a very active antiseptic and germicide, it has a relatively low toxicity for animals. He fixes the toxic dose at 130 Gm., and 35 Gm. for the ox and the sheep respectively. For the dog, toxic action only commences at 0.75 Gm. per kilo. of body weight. As the usual antiseptic is a 1:5000 solution, it is obvious that it is practically harmless.—*Vet. Record*, 12, 599.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Eucalypti Gummi.

EUCALYPTUS OR RED GUM is a ruby-coloured exudation from the bark of *Eucalyptus rostrata*, Schlecht. (N. O. Myrtaceæ), and other species of *Eucalyptus*, the product of *E. rostrata* being preferred for medicinal purposes. The tree is very common on the banks of the Murray River, New South Wales, and other species—*E. marginata*, *E. amygdalina*, *E. sideroxylon*, *E. fissilis*, etc.—which yield similar kino-like gums, are also natives of Australia. The gum is secreted as a treacly liquid in cavities in the wood, or between the bark and the wood. It may exude naturally and be found in the dry state in cavities of the trunk, but it is usually collected by making incisions in the trees, inserting trough-shaped pieces of tin, and allowing the viscid liquid to drain into buckets or tins. The average yield of each tree is rather more than a litre; some yield none, others have been known to yield as much as 18 litres. The liquid dries into a solid mass in a few days, but it is sometimes evaporated by the aid of artificial heat. The gum possesses astringent properties, is administered in doses of 2 to 5 grains, and is used in the preparation of Trochiscus Eucalypti Gummi.

CHARACTERS.—Eucalyptus gum occurs in grains or small masses, thin fragments being transparent and of a ruby-red or garnet-red colour; the powdered gum is pale red. Fragments of the gum are somewhat tough and have a very astringent taste, owing to the presence of much tannin; when chewed, the gum adheres to the teeth and the kino-red it contains gives the saliva a reddish tinge.

TESTS.—Eucalyptus gum should be almost entirely soluble in 90 per cent. alcohol dissolve and to the extent of 80 to 90 per cent. in cold water, forming a neutral solution. Good qualities of gum may yield more than 90 per cent. to cold water.

NOTES.—The distinctive characters of eucalyptus gum are its reddish colour and dusty appearance. Its principal constituent is kinotannic acid, of which it contains about 47 per cent.; other constituents are catechin, pyrocatechin, kino-red, gum, etc. The original red gum tree is undoubtedly *E. rostrata*, but the product of several other species satisfies the official requirements. Many red gums are only imperfectly soluble in alcohol or water, and it is to be noted that the solubility of all eucalyptus gums may be affected on keeping.

Euonymi Cortex.

EUONYMUS, OR WAHOO BARK, is the dried root-bark of *Euonymus atropurpureus*, Jacquin (N. O. Celastraceæ), a tall erect shrub, common in shady woods in the eastern United States, southward to Florida and westward to Wisconsin. The plant bears small dark purple flowers, which are succeeded by crimson fruits, and the bark of both root and stem is collected, though that of the root alone is official. The drug possesses tonic, cathartic, and diuretic properties; it is used in the preparation of Extractum Euonymi Siccum.

CHARACTERS.—Euonymus bark occurs in small, more or less irregular, quilled or curved pieces, varying in thickness from 2 to 4 Mm., and not usually exceeding 7.5 Cm. in length, or 12.5 Mm. in width. The outer layer of the bark is a soft, friable, finely-fissured cork of a light ash-grey colour; it is friable and easily removed with the finger nail. There are occasional small transverse scars and darker lines or patches on the bark. The inner surface of the bark is of a pale tawny white or buff colour and smooth, except when some of the whitish or pale yellow dense wood adheres to it, as is sometimes the case owing to the difficulty experienced in separating the bark from the root. The bark breaks with a very short fracture, the fractured surfaces appearing yellowish and—when separated very gently—connected by delicate silky threads, said to be formed by the mucilaginous contents of some of the cells of the bast. A transverse section exhibits, when moistened, a narrow whitish cork, a pale cortex and the darker bast. The faint but characteristic odour of

the bark is due to the presence of a pungent principle; the drug tastes somewhat mucilaginous at first, but afterwards the euonymin it contains causes it to taste bitter and slightly acrid.

EUONYMUS BARK.—A, Root-bark, outer surface; B, Ditto, inner surface; C, a stem bark; D, transverse section of bark.

NOTES.—The distinctive characters of euonymus bark are the friable grey cork, the silky threads connecting fractured surfaces when carefully separated from one another, and the bitter taste. Euonymus stem-bark, which must not be used, occurs in long, thin, narrow strips, and has a dark greenish-grey cork, green cortical portion and fibrous bast. The chief constituent of the root bark is euonymin, a nearly colourless, amorphous, and intensely bitter principle, which is soluble in alcohol or water. The bark also contains dulcitol, or an isomer thereof, together with the pungent principle to which its characteristic odour is due, citric, tartaric, and malic acids, resin, fixed oil, wax, starch, pectin, etc. Commercial euonymin is usually a powdered extract of euonymus bark; the name "euonymin" is also applied to the mixture of substances precipitated from a concentrated alcoholic tincture on adding water.

Fel Bovinum Purificatum.

PURIFIED OX BILE, or ox gall, is prepared from the contents of the gall-bladder of the domestic ox, *Bos taurus*, Linn. (Order Ruminantia). The fresh viscid greenish or brownish-green liquid is evaporated to one-fourth its bulk, freed from mucin, etc., by precipitation with 90 per cent. alcohol, and evaporated to the consistence of a thick extract. The product possesses antiseptic and purgative properties; it is administered in doses of 5 to 15 grains, usually in the form of keratin-coated pills, as it is not desirable that it should come in contact with the stomach.

CHARACTERS.—Purified ox bile is a yellowish-green hygroscopic substance, with a bitter-sweet nauseous taste. It is soluble in water or in 90 per cent. alcohol, but insoluble in ether. The aqueous solution should give no precipitate on adding 90 per cent. alcohol.

TESTS.—Purified ox bile should be free from mucin and other substances insoluble in alcohol. Its aqueous solution (1 in 20 or 30) should gradually acquire a cherry-red colour—changing in succession to carmine, purple and violet—on adding a drop of freshly-made syrup (sugar, 1; water, 4), followed by strong sulphuric acid, added cautiously until the precipitate at first formed is redissolved.

NOTES.—The distinctive characters of purified ox bile are its colour, consistence, and taste. It contains the bile salts (sodium glycocholate and taurocholate), lecithin (a complex fat), cholesterol (a monatomic alcohol), and various colouring matters—bilirubin, biliverdin, bilifuscin, etc. Lecithin is a characteristic constituent of nerve substance, brain, yolk of egg, etc., which breaks up on saponification into choline, glycerin-phosphoric acid, stearic acid and palmitic acid; it may therefore be regarded as glycerin, in which the three hydroxyl hydrogens have been replaced by the phosphoric, stearic, and phosphoric acid residues, the first still remaining in

ethereal combination with choline. Glycocholic acid is decomposed by alkalies into cholic acid and glycocholl (amido-acetic acid); taurocholic acid, under similar conditions, yields cholic acid and taurin (amido-ethyl-sulphonic acid).

Ficus.

FIGS are the dried fleshy receptacles of *Ficus carica*, Linn. (N.O. Urticaceæ), a native of Persia and neighbouring countries, but now cultivated in most warm and temperate climates. By the abnormal growth of lateral shoots, green, hollow, pear-shaped receptacles are produced, each of which has a small aperture closed by bracts and bears numerous small flowers on its inner fleshy walls. As ripening proceeds the latex or milky juice disappears from the laticiferous vessels contained in the walls, sugar is formed, and the receptacles become pulpy, sweet, and agreeable to the taste. They are then collected and, after being dried in the sun, constitute the figs of commerce. The so-called "natural" figs have been packed loose, and retain their original shape, more or less; "pulled" figs are such as have been pressed and kneaded to make them supple and with a translucent "skin"; they are packed in small boxes for exportation. The pressed figs alone are official. Figs are nutritious, laxative, and demulcent; they enter into the composition of *Confectio Sennæ*.

CHARACTERS.—The fig consists of the enlarged, hollow, succulent receptacle (syconus), bearing very numerous minute one-seeded fruits (achenes) on its inner surface. As met with in commerce figs are compressed, irregular in form, soft, tough, brownish or yellowish, with a sweet taste and pleasant fruity odour.

NOTES.—The distinctive characters of figs are their shape, taste, and odour. They contain from 60 to 70 per cent. of grape sugar,

proper constitutes only about half the thickness of each piece, the rest being made up by the dark-brown bases of the petioles that have been left attached. Those are usually about 25 Mm. in length, from 6 to 12 Mm. in thickness, hard, persistent, curved and angular. They are also more or less densely covered with numerous dry brown membranous scales, the marginal cells of which are seen under the microscope to be prolonged at intervals into simple hair-like processes, each consisting of two parallel and contiguous cells; glandular hairs are usually absent, though sometimes there are two at the base of the scale. The bases of the petioles should be green internally and exhibit in smoothed transverse sections from seven to nine fibro-vascular bundles (steles), arranged in a diffuse circle. The brown rhizome should also be green internally, and exhibit in transverse section about as many principal steles as the petioles. Peculiar secreting cells occur in intercellular spaces in the parenchymatous tissue of the rhizome and petioles. The drug possesses a faint disagreeable odour, and a taste which is sweetish and astringent at first, but subsequently bitter and nauseous. The same odour and taste characterise the impure fixed oil, obtained from the drug by extraction with ether.

NOTES.—The distinctive characters of male fern are the presence of secreting cells in the parenchymatous tissue, the number of bundles or steles at the base of the petiole, and the absence of glandular hairs from the margins of the scales. The lady fern, *Athyrium filix-fœmina*, has no secreting cells, and only two large bundles in the base of the petiole; the shield fern, *A. spinulosum*, produces glandular secreting cells on the margins of the scales. The activity of male fern is generally assumed to be due to filicic acid, an amorphous substance, of which it may yield as much as 5 to

MALE FERN.—A, rhizome, as met with in commerce; B, transverse section of base of rachis.

and stellate crystals of calcium oxalate occur in small quantity. Smyrna figs are most esteemed, being thin-skinned, soft, and luscious; Greek figs are thicker-skinned, tougher, and less pulpy.

Filix Mas.

MALE FERN consists of the rhizome of *Aspidium filix-mas*, Swartz (N.O. Filicineæ), one of the commonest indigenous British ferns. It produces a circular tuft of fronds, which attain a height of 30 to 90 Cm., and have a pinnately divided lamina, while the petiole (rachis) bears numerous brown scarios scales, especially on the lower part. The rhizome is collected late in the autumn—when it is richest in filicic acid—and dried, after being divested of rootlets, leaves, and dead portions. It possesses slight tonic and astringent properties, but is generally used, in the form of *Extractum Filicis Liquidum*, as an anthelmintic for tapeworm.

CHARACTERS.—Male fern usually occurs in pieces from 7.5 to 15 Cm. in length and from 2 to 2.5 Cm. in diameter. The rhizome

8 per cent., though it is frequently present in traces only. If the rhizome be kept more than a year the filicic acid tends to degenerate into its inactive crystalline anhydride—filicin; a similar change may take place in preparations of the drug. Other constituents of the drug are about 6 per cent. of fixed oil, together with volatile oil, tannin, glucose, resin, etc., whilst Boehm claims to have isolated several crystalline bodies, including aspidin, albaspidin, aspidinin, aspidinol, and flavaspidic acid. All the substances named are probably formed in the peculiar secreting cells previously referred to, and they are present in the ethereal extract of the drug, which is the fixed oil in an impure state, containing volatile oil, resin, etc. It has been asserted by Boehm that the anthelmintic value of the drug depends upon the presence of aspidin as well as filicic acid, and he is of opinion that a preparation rich in aspidin is preferable to one containing filicic acid, which, as previously stated, may be present in the drug in traces only.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

R. T. Baker describes an apocynaceous plant, *Parsonia paddisoni*, which yields large edible tubers. The plant is a woody climber, and has been found at New Angledool, New South Wales. It is interesting to note that one plant yielded 101½ lbs. of tubers after a drought of four years. They have been termed locally "native yams," from their resemblance to the yam of the South Sea Islands, obtained from species of the family Dioscorideæ. A chemical analysis of one of the tubers shows this new food to be inferior as an article of diet, being deficient in nitrogenous and carbonaceous compounds. Water constitutes 90.774 per cent. of the weight of the tuber.—*Proc. Linn. Soc., N.S.W., 1899, 385.*

SYRUPUS PRUNI VIRGINIANÆ.

F. W. Haussman states that syrup of wild cherry will not keep unless glycerin be present. He recommends 75 C.c. per litre, as against 62.5 C.c. in the B.P. formula. The glycerin prevents precipitation in both syrup and infusion of wild cherry to a marked degree, though not entirely. It is best to add the glycerin as part of the percolating menstruum. This is especially necessary in summer, when a slowly percolating infusion, even if allowed to drop upon glycerin, will rapidly become cloudy. It is noted that the addition of glycerin causes the infusion to assume a darker colour.—*Am. Journ. Pharm., 72, 71.*

AKAKIA.

David Hooper brings the knowledge of the ancient Eastern medicine Akakia up to date. This substance has been used in the East, especially among the Muhammadan community, as a panacea. The drug is an astringent extract of an *Acacia*, and is imported into India *via* Bombay from the Red Sea ports and the Persian Gulf. As sold by the native apothecary the drug is unsatisfactory owing to its variability.—*Journ. Asiatic Society, Bengal, 68, 245.*

BASIC BISMUTH SALICYLATE.

L. F. Kebler has examined the basic bismuth salicylate, which various workers have found to vary in composition. He criticises the alcoholic test in the B.P. for free salicylic acid, and regards it as too rigid, because the alcohol decomposes the salt. In seven samples examined, the percentage of oxide varied from 61.60 to 66.20. The indigo test for nitrates is recommended. It is applied as follows:—Mix 0.5 gramme of the salicylate with 3 C.c. concentrated sulphuric acid, add 4 drops of indigo test solution, when the bluish colour will gradually disappear if much nitrate be present, while a small amount will rapidly destroy the colour on warming. Bismuth salicylate is a white or pinkish-white micro-crystalline amorphous powder, nearly odourless and tasteless, insoluble in water, alcohol, and glycerin, but is slowly decomposed by these liquids. It should not contain more than traces of chlorides, sulphates, nitrates, or arsenic.—*Am. Journ. Pharm., 72, 66.*

PREPARATION OF GALENICALS BY DIALYSIS.

E. Kremers, in an introductory paper on galenicals and solvents, refers to a method of obtaining galenical preparations as free as possible from what Professor Lloyd terms "plant-dirt," involving the use of dialysis. Fresh plants are used and their juice subjected to a process of dialysis, avoiding as much as possible all solvents and reagents that might produce chemical change. From a purely scientific standpoint the process seems to approximate the ideal, but whether these new dialysates—which are made by Golaz, of Saxon Switzerland—will meet with practical success remains to be seen.—*Pharm. Rev., 18, 109.*

VOL. 64. (FOURTH SERIES, VOL. 10.) No. 1562.

RESIN IN BEESWAX.

H. V. Army directs attention to an error that may creep into the test for resin in beeswax if the strongly alkaline hot solution be filtered through paper, the subsequent addition of hydrochloric acid causing a flocculence, due to the cellulose dissolved from the filter paper. He suggests that the text of the test in the next U.S.P. should be amended to read: "after filtration through glass wool or asbestos." This suggestion is equally applicable to the B.P. test.—*Am. Journ. Pharm., 72, 74.*

SYRUPUS ROSAE.

F. W. Haussmann points out that a brighter coloured syrup, with an agreeable acidulous taste, is obtained by the addition of diluted sulphuric acid (10 C.c. per litre). It is open to the disadvantage, however, that the sugar is liable to inversion, and consequently a deposit of grape sugar may form on standing.—*Am. Journ. Pharm., 72, 73.*

COAGULABILITY OF ALBUMIN.

Professor J. B. Farmer finds that when albumin is dried at a temperature of 52° to 55° C. in an incubator it is not altered as regards solubility and coagulability, but resembles the unheated material in these respects. If precautions are taken to ensure appropriate desiccation it is possible to heat albumin for, at any rate, thirteen hours to a temperature varying between 102° and 110° C. without producing any change in its ultimate molecular structure. This investigation was undertaken with a view to studying the influence of high temperatures on seeds. Dr. Morris found such treatment did not necessarily destroy their power of germinating, even when they were exposed to the action of boiling water or even heated to a higher temperature in an oven. It has been noticed that, in heating seeds in water, if the seedcoat becomes ruptured, softens or swells, the seeds so affected lose their vitality, possibly through the admission of water to the living cells.—*Chem. News, 81, 207.*

NATURE OF OINTMENTS.

Louis Kahlenberg and L. F. Ruschhaupt have performed a series of experiments on ointments which prove that the ointment of lead carbonate, U.S.P., is merely a mechanical mixture of the carbonate and lard; so also are ointments of zinc oxide and of mercuric oxide with vaseline. Zinc ointment made with lard contains but an insignificant amount of zinc oleate at atmospheric temperature; this amount is increased when heated to 150° C., though it is not great. Zinc ointment made with simple ointment, U.S.P., contains, especially at higher temperatures, more zinc salts, probably because of the free cerotic acid contained in the wax. Lanolin is much more saponified by zinc oxide than lard. What is said of zinc ointment applies also substantially to the red oxide of mercury ointment. Therapeutically it would seem that those ointments in which a certain amount of saponification takes place would prove more effective than those that are mere mechanical mixtures. If this be the case, the ointments made with lard plus wax as the base are superior to those in which vaseline is used; but lanolin is a better base than either of these. Again, an ointment prepared at a high temperature is better than one prepared in the cold.—*Pharm. Rev., 18, 156.*

COLLECTION OF HAMAMELIS LEAVES.

Grace E. Cooley has compared the leaves of *Hamamelis virginica* collected in spring with those gathered in autumn. The leaves contain more tannin in the autumn than in the spring. The cell walls of the hairs are comparatively thin in the spring, and thicken gradually towards autumn, when a dark line often marks the lumen of the cell. At the same time the colourless walls become coloured yellow and the granular and oily contents disappear. The autumn leaves are official in the U.S.P.—*Journ. Pharmacol., 7, 52.*

DISPENSING ON ACTIVE SERVICE.

BY E. A. H.

The Royal Army Medical Corps is having a busy time in South Africa just now, and a fair sample was seen in a recent visit to the Base Hospital (No. 2 Stationary) at East London. The Agricultural Show buildings came in very handy to the Military authorities when hundreds of poor fellows were being sent down from the front to the base just after operations had started in real earnest. At present, it presents a remarkable sight. The long sheds or sections have been converted into regular wards, "fever" and "surgical" cases being kept separate as far as possible. Over three hundred patients were at the time under the care of Major James, R.A.M.C., who is officer in charge here, and three civil surgeons. It speaks well for these medical men and their attendants that very few deaths occur, and these are extreme cases. All the beds are fitted with mosquito-nets, and on entering one of the long wards the appearance is that of a transparent military camp, the light muslin bell-tent shaped net giving it that effect. Most of the cases were of enteric fever, which has been so very prevalent and weakened the ranks of several of the Divisions. It was in the dispensary where the busiest part was found. This had been temporarily fitted up with shelving, etc., and everything was handy to the dispensers on duty. Hundreds of bottles of solid and liquid drugs were about, bearing the labels of Messrs. Davy Hill and Son, Yates and Hicks, who have the Army contract for drug supplies. Antiseptics were the most in evidence, carbolic and boric acids, iodoform, etc., in $\frac{1}{2}$ lb. and 1 lb. bottles ready for use or distribution. Poisons were under lock and key, also the dental and surgical instruments.

Tablets of Messrs. Burroughs Wellcome and Co., lamellæ of Messrs. Savory and Moore, everything in a compressed form were here, all to a purpose—that of obtaining a *multum in parvo*. The wicker-cases (panniers) for field use, field-surgical, and field-medical, were very compact, and fitted up with a few of the most used drugs in the "medical," the "surgical" containing antiseptics, lint, bandages, tourniquets, etc. These are made to be carried by mules, slung on either side of the animal pannier-fashion, and as they open outwards they need not be taken off but used direct, the mule being able to move in and out among the wounded where a waggon could not go. There are also reserve duplicates of these panniers ready packed, and when a "wire" is received at the base for a field medical or surgical pannier it is immediately sent off through the "lines of communication" to the field. When one sees these things in the naval and military hospitals at home in times of peace, the compactness and portability receive just a passing glance, but out here on the spot at the present time it is wonderful how they have been of use in saving precious time and space. Another notable item was the large medicine chest, fitted with numerous drawers and divisions, each filled with liquids and sundries, The lid on being raised, and a sliding-board drawn out, a capital dispensing counter is obtained, with scales, weights, etc., to hand, and everything "get-at-able." The chests are intended for carrying quantities of drugs, etc., sufficient for a battalion either on a voyage in a troopship or on the march in a pharmacy-waggon. Field cases of compound splints, etc., for serious accidents and spare stretchers were here for transit, also pocket-cases of tablets, hypodermics, syringe and needles for injection.

The water used is purified by means of a pumping Berkefeld filter, which is a great boon in a country where the water is not of a "nectar" variety. Care is taken on the field, where possible, to use one of these filters, thereby lessening the liability to enteric fever. As to the *personnel*, the dispensary is under the control of a Sergeant-Major, with Staff-Sergeant and Sergeant compounder, also an extra compounder, enlisted on the recent short service system, all practical men, some holding the full qualification of the Pharmaceutical Society. The nursing is done by the privates, who are similar to the sick-berth attendants in the Navy. These see to the carrying out of the treatment ordered by the doctors, and come

more in contact with the painful side of the war. Each man has had a training in "first aid," "ambulance," and "nursing," and is as useful on the field at the "front" as he is in the hospital at the "base." Just now they are under-staffed, and twelve are doing the work of twice their number, but withal they are a cheerful lot considering the amount of sickness with which they are continually surrounded. On the Boer side the treatment of the sick is far from being so methodical and thorough, except in the cases of the foreign Ambulance Associations, who have come out in the cause of humanity, regardless of the issue at stake. The Dutchman is his own doctor, and with his Borst-, Versterk-, Endres-, or Pijnstillende-droppels, and the inevitable "Wonder-Essentz," will cure most of the ills that come his way. It is the surgeon he will need, and not the physician.

PHARMACY AND PHARMACISTS IN CAPE TOWN

AS THEY APPEAR TO A SIX MONTHS' RESIDENT.

Probably six months' residence in Cape Town under present warlike conditions hardly justifies one in pronouncing too emphatically on the prospects of pharmacy in this quarter of the globe. But there are certain tendencies observable (to me, at any rate) which are worth presenting in a concrete form. One of these—and of most importance to the average chemist—is the paramount sway of the wholesale druggist and his gradually increasing control of the retailer. All the big wholesale firms run retail pharmacies under their own names. Each of them has an imposing establishment in Adderley Street, the Regent Street of Cape Town. They also have direct financial interests in many other retail firms besides, carried on under other names. As they are keen rivals their prices, while favourable as compared with those prevailing at home, are unapproachable, except at a loss, by the general retailer; for in many instances they supply the public at wholesale rates, and sometimes below it. Against such competition as this the chemist has but a dubious remedy. He is, as often as not, financed by the wholesaler, in which case he is helpless; and when he is not he is exposed to the risk, if his business be a good one, of being cut out by the more powerful and less scrupulous of his wholesale rivals, one of whom, I am informed, in particular, has an unpleasant habit of intimating to the independent one that unless he can see his way to increasing his account with them they must start a branch establishment in his immediate neighbourhood! This kind of rivalry is difficult to cope with.

There are a few obvious methods open to the small man, none of which are unattended with serious drawbacks. For instance, he may import his goods himself, in which case the Revenue requires him to take out an annual licence costing £12, over and above his trading licence of £5 per annum. With the extra labour and other incidental expenses thus incurred, and the carrying of unnecessarily large stocks, he may still obtain better remuneration than by local purchase. But it is precarious, and it may at once be said that there are very few retail concerns whose business is of sufficient extent to justify such expenditure on the large scale. Still, this difficulty can be overcome by several retail chemists combining their order and negotiating through the ports as one individual or firm. This is probably the best plan to adopt, and is frequently done. The method is not free from friction, and has the disadvantage of letting other retailers know the extent of your business.

Another "plan of campaign," and one familiar to all at home, lies in pushing your own specialties. This is only possible by persistent advertising—*i.e.*, persistent spending in which, as always, the initial outlay is altogether disproportionate to the immediate returns. With plenty of cash, plenty of patience, and a good thing to push, you may do very well if you live long enough; though I am of opinion that there are many investments in which the return on your money will be far less remote and quite as substantial.

There is a novel and unpleasant feature about proprietaries here which I never remember to have met with at home, and that is the difficulty one has in persuading the average colonist, Dutch or English, that anything good can be made at the Cape of Good Hope. You may import it from England, France, Germany, Greenland's icy mountains, India's coral strand, the States, in fact, from *anywhere* outside South Africa, and you may be quite confident of disposing of it; but let it be known that it is a Cape product, you will then find that you must double your efforts and expenses to sell it; that the "judicious blarney" of your "ads." must be judicious indeed; and that you will need the persuasive powers of the American drummer.

The natural outcome of such a phenomenon is that the big chemists represent themselves as sole agents for some purely fictitious English firm (or French one in the case of perfumes and toilet preparations), who are vaguely known as "Squealer and Co., The Laboratories, London, England."

These imaginary firms possess a wonderful facility in getting up substitutes of all the well-known patent medicines—*i.e.*, the saleable ones, and as they are offered at slightly lower prices than the genuine they do surprisingly well at it, and the public are certainly impressed. English customers have said to me: "Squealer and Co.! Oh! I know them quite well. I saw their place just before leaving London"; whereat one has difficulty in restraining a smile.

A feature which strikes me as odd is the manner in which chemists are distributed throughout Cape Town. They are like carbuncles: they invariably occur in groups of two, three, or more. In Adderley Street (which is scarcely as long as Cheapside) and its few bye-streets there are seven, in another street there are five within sight of each other, in another three. It is the same in the suburbs; in fact, if you happen to be looking at a chemist's shop you may safely conjecture that within a stone's throw of your back, or your right hand, or your left, there is one or more of the same fraternity—if such a term be allowable to such close rivals. But you will need to go a long way before seeing another. Elegant pharmacies exist here, but are rare as angel's visits, being very few and far between. The average is no worse than at home, though the worst are in a much more deplorable state than any I have seen in England.

The Pharmacy Act appears to be well respected in the town, as infringements are rare, the Pharmaceutical Society's efforts towards maintaining such purity being (from the chemist's point of view) commendably prompt. On the other hand, the dearth of infringements may be due in some measure to the fact that there is little difficulty in acquiring the Society's diploma, the examination, from what I have heard of it, requiring no great intellectual effort. The secretary of the Society is a Government gentleman—*i.e.*, he combines his secretaryship with a post under Government; a fact which increases the Society's prestige, besides constituting an ingeniously economical arrangement.

At present the position of the English qualified assistant is good; that is, the single ones. I refer to those in first-class houses, though, to be sure, only first-class houses can afford them. So far as personal treatment by such firms is concerned, it varies considerably. Some could not be better, and I presume most men at home know which firms to avoid. The three years' system, with passage paid out, £12 monthly first year, £13 10s. second, £15 third, and commission and room are the best terms now available, and—as the vernacular has it—"they are not to be sneezed at either." Out of such salary there is only clothing and food to be found, and the latter need never cost more than £4 per month. Hours are long, but are so arranged among the assistants that they pan out a little easier than at home.

Of scientific pharmacy I have as yet seen no evidence. It is not encouraged. Commercialism is too rampant. It predominates over all other interests. Local productions and manufactures seem to me to be in a less advanced state than any other of our

colonies. It is difficult to assign the cause. Even the "manufacturing chemist" makes very few drug preparations. Nearly everything is imported, and quite everything is taxed, and yet very few seem to think it worth while to produce those things which they need most and which could be done with considerable profit.

Owing to the large numbers of military men which the war has dumped down here the Army and Navy Stores of London have decided to start a branch of their establishment here, and as an obvious consequence there is considerable fluttering among the local tradesmen. What the effect on the chemists' business may be is a moot point. Any way, the chemists themselves, strangely enough, do not seem particularly perturbed. Some even go so far as to say "that if the present Pharmacy Act is not comprehensive enough to deal with such a case it can quickly be made so." That is refreshingly optimistic. Such complacency in their ability to refashion Acts of Parliament has a strange and wild sound to English ears. I can only say that one of the officials whom I heard give utterance to this expression is a gentleman who seldom speaks without knowledge. However, whether or not the Pharmaceutical Society of Cape Town possess, or can acquire, powers to overwhelm such a powerful and influential organisation, and prevent them trading as chemists and druggists, it seems to me it will be of little benefit to the ordinary retailer, seeing that the big wholesale qualified men are as great sinners in undue cutting as any stores or "Shoes, Limited." So that here, as at home, the common every-day chemist is chronically between the devil and the deep sea; or, to vary the simile, he is either going to blazes or on the verge of falling into liquidation.

For the first time since history began, we have had the President of the Pharmaceutical Society of Great Britain in South Africa. A dinner in his honour was given on May 15, on his return from Durban, when there was a good attendance. For we all esteem Mr. Martindale, and trust he will return home a healthier man—it would be invidious to say a better man.

FORTY YEARS IN THE DRUG TRADE.*

BY DAVID MACLAREN.

On March 14, 1859, I found myself dressed in a clean striped shirt and white linen apron duly installed, on trial for a month, in a shop in a little country town. I had no care as to being plucked in the Preliminary Examination, and was not in any way pressed to attend classes of botany or chemistry. All that was required of me was to turn out at 7.30 a.m., and remain till nine p.m. on five days and eleven p.m. on Saturdays. My employer was a most excellent man, who had a thorough grasp of all the details of the drug business and many other businesses. The salary was 2s. 6d. a week, and my career made a bad start, as the second week's pay was withheld, because in trying the experiment with a No. 10 mortar on a doorstep as to their several powers of resistance, the mortar got the worst of the trial and was shattered beyond the hope of even cementing. However, the trial must have pleased the governor, as it did not come to an end till March 26, 1863. The four years spent in this place still linger in my memory as a time pleasantly and profitably spent. I had plenty of hard work—the usual routine of cleaning windows, outside and in, washing once a week the pavement in front of the shop, filling up spare time by amusing myself by mixing in a No. 10 mortar a paste of rottenstone and soft soap, and filling up a few grosses of 6d. pots and sending it to various wholesale houses in the cities of Scotland. As a change in amusements I would have my attention taken up with an emulsion of turpentine, wax, and XX pale soap. This was put into 8d. and 1s. bottles and similarly treated. Yet still another preparation, and with this I will finish: This time an

* Read at a meeting of the Edinburgh and District Chemists' Trade Association, March 28, 1900.

infusion, or, as we called it, essence of coffee, which, in 20-gallon lots, after being treated *secundem artem*, we also disposed of in the same way as the two former pharmaceutical products.

I was initiated into the sale of coffee, snuff and tobacco, sweets and biscuits, gold watches and penny brooches, Java and Patna rice, sago and manna croup, and had an occasional trip to some country house two or three miles out of town with a barrow-load of drugs. This was, you will say, a most excellent training for one who was expected to follow out the profession of a chemist and druggist. Be that as it may, I have yet to learn of another establishment wherein a better ground work was laid down for my after work. Prescriptions were plentiful. Whom did they belong to? Were they the property of the client or the chemist? No such question was ever raised. The medical men wrote their recipes in the shop, the medicine was dispensed, the piece of paper on which it was written finding its way at once to a file under the counter, and, as a rule, never looked at again.

There were three chemists in the town, and the customary friendly relations existed among them. True, they had in some mysterious way entered into an agreement that their several pharmacies were to be kept closed on the Lord's Day, and that only in cases of emergency would medicine be given out on that day. On speaking terms? Yes; when they met in the street they passed each other without even a nod of recognition, and woe betide that commercial man who did business with one of them if he were seen to go into the opponent's place of business. As frequently happened, say in the case of a medicine chest requiring to be filled in a hurry, we were short of some drug or chemical, it was the duty of the junior to doff his apron, put on his coat and hat, get a supply of cash, and go to a neighbouring town by rail some seven miles off, and get the required article. One of the three departed this life, and only two remained, till a gentleman from Edinburgh had the hardihood to open a shop in the town. The two old friends shortly after this met at the funeral of a mutual friend, and going along the street to the place of graves, our opponent came up to my employer, shook hands with him, hoped he was well, that they might agree to let bye-gones be bye-gones, and join hands and crush the newcomer.

The outlander is still there and doing well, the other two have departed this life.

One of the parties referred to wore a wig and dressed so shabbily that on one occasion a medical friend of his offered to provide a new wig and also a new rig-out if he would give his consent to the depositing of the more ancient remains in the local museum. If any out-of-the-way article was inquired for he used to reply, if he had it not in stock, "Perhaps you will get this in Cumming's Bazaar or Irvine's toy-shop."

Enough has been said of personal matters to enable you to form an opinion on the position and prospects of the drug trade there and then. The man with the wig died, leaving a sum of over £40,000.

In spite of all our hard work we had plenty of leisure. Many a respectable citizen had cause to remember our peashooters fired from the top of the roof. We early adopted a system of early closing, which now and again was successful. The governor was a man of very studious habits and literary tastes, and if things were not very brisk in the shop he used to retire to a cosy corner and be busily engaged with his pen. Then was our opportunity—8.30 p.m., out with boards, on with your garments, and off like shot. We had no pharmacy athletic club, but we had our morning and Sunday evening rambles, four or five miles before 7.30 a.m. on week days and fifteen to twenty miles after two Church services and Bible class attendance on Sundays. These rambles with apprentices of other trades have to me tender memories, and did more than anything else to form the man of the future. So much for the town of Alloa and its old and hallowed associations.

The neighbouring town I referred to was Stirling, where at that time four chemists lived very much on the same footing as their friends on the Carse. My old friend and relative, Robert Haldane,

had a little shop in Baker Street, where he for forty years sold drugs during the day and slept in a little room behind at night, till, compelled by a severe attack of rheumatic gout and the fortunate death of a cousin, who left him some money, he at last retired from business.

Price lists? No need for such. Only one instance may be quoted to show how uniform the prices were: Twelve pills by prescription in one place, 8d.; in another, 4d., and there being a third place where such could be had, my friend, though not requiring more, took his prescription to the third party, and he, modest man, charged 6d. His deliberate judgment was that the one was extortionate, the other a fool, and the third an honest man.

Some of my friends' present will be able to speak of their experiences in Forfar towns, where their apprentice days were spent under the sweet odours of aloes, myrrh, and cassia, the fragrant aroma of which, particularly the first, still haunts them in their dreams. We do not for a moment forget the pounding up of gum scammony, which was a favourite pastime with many. Nor do we pass over the very enticing occupation of weighing out hellebore powder. Putting aside all this, what has been the result? Good men and true, chemists and druggists above suspicion have been made, and some still remain with us to carry on the work.

In the Juteopolis of Scotland, with the notable exception of one drug shop, it was a red letter day when a prescription was handed in to be dispensed. I can well remember going on my usual rounds and waiting upon a certain wholesale and retail chemist in the High Street. He had been on the sick list, had to call in a medical man and get a prescription. On handing the formula to my customer, the doctor, quite forgetful of where he was, said: "You'll send this over to Hardie's and get it made up." My friend's retort was long, but very expressive.

I have heard that things have changed there, in the interests of the trade in general, for the better.

Time will not permit me to speak at any length on the trade as carried on in the West of Scotland, say, in such centres as Glasgow, Paisley, and Greenock. Few good chemist and druggist shops, and plenty, far too many, surgeries. Of the South of Scotland much may be said, where in the shop of Messrs. Fala and Peters, Jedburgh, a young man, Rutherford, first learned how to dispense physic, and in his leisure moments he mastered that delicate and telling instrument, the violin. The two combinations, I feel sure, were the foundation on which his future destiny was built. Under Dr. Fala he was trained as a medical practitioner, and Mr. Peters did the practical pharmacy. Sufficient to say that both in the south-west and south-east of Scotland not so very long ago doctors' shops were all the go: Advice gratis and eight doses of medicine for 2s. 6d.

These were indeed the merry days. Even entrance into the sacred realms of the Pharmaceutical Society and obtaining the style and title of Pharmaceutical Chemist was like going to a reception. Our late respected friend, Mr. Richard Raimes, when in one of his more humorous moods, used to tell of how he was admitted. In a large room, at the one end of which stood the examiner and at the other the examinee. The former held in one hand a bladder of lard and in the other a bath brick. The question was put, which was which, and if answered correctly the candidate was admitted, and on payment of his entrance fees, received in due course his diploma. There were no female aspirants in those days. It was a genteel profession. Ministers, teachers, and others of like pursuits, when failing to prosper in their own proper sphere, took to the selling and compounding of drugs. Well do I remember the genial faces of such men as the late James Duucan, of Penicuik, trained for the ministry, or David Jamieson, Auchtermuchty, who, though not trained to the trade, were ornaments to the profession of their adoption.

I might go on enlarging on such matters, but time will not permit. All through Scotland the same tale might be told. How poisons were sold in large quantities by unqualified hands, and such articles as arsenic, uncoloured, stored in barrels of a similar

style, alongside of cream of tartar and bicarbonate of soda. Were accidents of more frequent occurrence? I trow not. The boys and men of those days acquired habits of observation and care, which seem to be wanting to-day.

Leaving the home of my childhood on the morning of March 28, 1863, I found myself located in 29, Hanover Street as a full-fledged assistant, engaged at the magnificent salary of £25 a year, rising in six months to £30, if found suitable. I left after eighteen months' service, as under no circumstances could a salary of £39 be paid. Since that date on till now I have taken an active part in all that pertains to the furtherance of good fellowship among the members of our craft. I at once got into touch with the members of the Wilsonian Association, which met once a week in McLaren's Temperance Hotel, St. Andrew Street, and which had as its Honorary President the late Professor Archer, of the Museum of Science and Art, and among its first Presidents was Mr. James Mackenzie, Forrest Road. There are still others remaining in the town who at that early date took an active part in its affairs. I can well remember the first edition of the British Pharmacopœia and the many meetings held to discuss the merits and demerits of the work. I attended the meetings in the Bible Society's Rooms, and looking back now, am convinced that there was much talk and little wisdom. An effort was made about this time to get the shops closed at a more reasonable hour. Well do I remember the deputation waiting on the proprietor of 29, Hanover Street to ask him to give his name to close an hour sooner. "Certainly not; but I will shut two hours in the middle of the day, if you like."

But I must hurry on. How did the drug trade stand in Edinburgh forty or fifty years ago? From an Edinburgh directory, 1849-50, I find that at that date there were in the city and in Leith forty-nine apothecaries. The name "chemist and druggist" was not in vogue then. That is to say, that between doctors and chemists or druggists there were forty-nine open shops. The only names I have been able to identify in the directory of that date are Baildon, 73, Prince's Street; Duncan, Flockhart, and Co., 52, North Bridge and 139, Prince's Street; Duncan, Flockhart, and Powell, 18, Bernard Street, Leith; J. F. Macfarlan and Co., 17, North Bridge; John Mackay, 121, George Street (now John Mackay and Co., Canning Street); Raimes and Co., Smith's Place; Robertson and Watson (now James Robertson and Co.), 35, George Street; and Lindsay and Shaw (now Lindsay and Gilmour), 11, Elm Row. With these exceptions, all the others, even in name, have ceased to exist. There was at that time, and still is, in this city, a firm of manufacturing chemists (who are now looked upon as chemists and druggists under the meaning of the Pharmacy Act), who, though in business prior to 1849 and for ten or twelve years thereafter, were not in the opinion of the framers of the Edinburgh and Leith Post Office Directory considered worthy to be placed on the list of apothecaries. The firm of T. and H. Smith and Co., to whom I refer, was then designated as surgeons and druggists and manufacturers of aerated waters.

The only one who still lives, and was in business at that date, known to me is the honoured name of James Robertson Young, in 1849, druggist, 39, St. Leonard Street.

In 1860-61 the number had increased to fifty-three, 1869-70 to eighty-seven, 1880-81 to 109, till in 1898-99 the number of separate places of business had increased to 159. Can I account for the very rapid increase of open shops during these latter years? The Pharmacy Act, laying down rules for the conduct of, and making it compulsory for, anyone desiring to enter into business as a chemist and druggist to pass an examination, was passed in 1868. I have heard it said, and possibly there is something in it, that to this cause can be assigned much of the increase. Has pharmacy improved under these altered conditions, or were the former days better than these? Are the public better served and the prescriptions of our medical friends more accurately and neatly dispensed than formerly? That is a difficult problem to solve. True it is,

however, that it is more difficult than ever to secure the services of suitable apprentices. We hear this referred to on all sides. Should we insist upon them passing their preliminary examination before we take them into our service, or, having taken them in and they subsequently pass their examination, should they be obliged to serve at least three years after the date on which they passed? Some such regulation should, I think, be made.

Having got apprentices to train, is it our duty to give them time and opportunity to attend classes and supply other means to enable them to prepare for passing their qualifying examination? I think duty to a large extent binds us to see that this privilege is granted.

The vexed question of titles still remains. The 1868 Act in spirit, if not in word, meant that the names "chemist and druggist" could only be applied to those who had passed through the necessary ordeal. If the title cannot be conserved for use by qualified men or women, we had better move that the Act be repealed, and the chemists and druggists of Great Britain be set free from the fetters which at present bind them, and let us return to the former state of free trade, and let all who care to deal in poisons do so without let or hindrance.

PLANTS AND PLANT PRODUCTS.

DIE ROHSTOFFE DES PFLANZENREICHES. By JULIUS WIESNER, Professor of the Anatomy of Physiology of Plants in the University of Vienna. Second Edition. Parts 1, 2, and 3. Price, 5s. each part. Leipzig: Wilhelm Engelmann, 1900.

It is now nearly a quarter of a century since Professor Wiesner published the first edition of his "Rohstoffe." During this period great strides have been made, not only in our knowledge of the various materials treated of, but in the applications to which they are put. A complete revision of the work will therefore be most acceptable.

Under the title of 'Rohstoffe des Pflanzenreiches,' or, 'Crude Materials of the Vegetable Kingdom,' Professor Wiesner deals with all those vegetable substances that are put to technical use, and includes not only parts of plants, but such products of plants as have not undergone any far-reaching changes during their production for the market. In fact, the work deals with substances that are used technically, just in the same way as a modern pharmacognosy does with substances used medicinally. The author's object has been to show how such crude materials may be identified and their varieties distinguished; he also discusses their sources, constituents, and properties, with especial reference to their application.

Whilst taking into account the botanical and geographical sources, the cultivation of the various plants and production of the material for the market, Professor Wiesner very properly lays great stress on the necessity for familiarity with the morphological nature of the substance and on the importance of the microscopical examination. The latter he has extended to the examination of the minute vegetable debris present in many unorganised drugs, and even to the examination of the physical characters of the latter, independent of any extraneous debris that may happen to be present. Such examinations have yielded interesting results, for many substances that appear homogeneous to the naked eye present an unsuspected diversity when examined by the microscope.

The matter dealt with has been divided into natural groups, and the consideration of each group has been sub-divided into a general and a special account, the former including the physical characters, the chemical constituents, formation and occurrence of the group, whilst the special section contains a detailed account of the members. Thus, in that part of the work that deals with gums, under the heading, 'Occurrence of Gum,' no fewer than 119 gum-producing plants are enumerated, those that are of technical importance being indicated by spaced type. These more important gums are considered in detail. They are classified, in the first

place, according to their botanical sources as Acacia gums, etc. The Acacia gums are sub-divided into Arabic or (better) Nile gum, Senegal gum, German African, East Indian, Australian, and so on. The description of the Acacia gums occupies twenty-one pages, whilst that of the gums other than Acacia fills twenty-five pages. Although the latter are, in general, well selected, one would like to have seen such a gum as Ghatti receive a little more notice than the bare mention of its source; in this country, at least, it has its technical uses.

Part two deals with resins, gum-resins, oleoresins, etc., and the method of treatment is the same as that adopted for the gums. Several of the substances dealt with, such as galbanum, ammoniacum, asafetida, myrrh, etc., are of pharmaceutical interest, whilst colophony, copal, dammar, shellac, and others are of much greater technical importance. Here, too, the occurrence and formation of the members of the group, their physical characters and chemical constituents are dealt with in detail. Particular allusion might be made to the interesting description of dammar and copal and to the results of the minute examination of the surface of the latter resin and that of mastic.

The third part of the work contains the completion of the section on resins, and deals as well with caoutchouc, opium, aloes, indigo, catechu, and allied substances. The last five sections have been written by some of Prof. Wiesner's collaborators, viz., Professor Mikosch (caoutchouc, catechu, vegetable fats), Professor Vogl (opium, aloes), and Professor Molisch (indigo). The same arrangement is adopted as in Parts I. and II., and the numerous citations form a very complete introduction to the principal literature of each section. That dealing with the caoutchouc group (50 pages) is a particularly excellent résumé of the subject, being very clearly written and well brought up to date. Under kino, in the catechu group, it would have been well to furnish more particulars about the commercial varieties of kino, and the percentages of kino-tannic acid that they contain, for the published figures vary considerably. African kino, for example, is worthy of more than simple mention. But, like its predecessors, this section is full of valuable information.

In all three parts the chemistry has been written by a collaborator of the author's, a division of labour that is most advantageous, as in all cases it is clearly written and well up-to-date. The work teems with valuable and accurate information, and is, therefore, indispensable to all who have to deal with such matters. It is written in so attractive a style that it cannot fail to prove an incentive to younger men who are commencing their studies. "Investigations that have a practical object in view," says the author in his preface, "must be founded upon a scientific basis," and it is to the scientific investigation and examination of the crude materials that are already known that he would especially direct their attention.

COMMERCIAL ORGANIC ANALYSIS.

COMMERCIAL ORGANIC ANALYSIS. (Volume II., Part II.) By ALFRED H. ALLEN, F.I.C., F.C.S. With revisions and addenda by the author and Henry Leffmann, M.A., M.D. Pp. 330. Price 14s. London: J. and A. Churchill. 1900.

The second part of Volume II. of Mr. Allen's treatise on Commercial Organic Analysis deals with hydrocarbons, petroleum products and coal tar products, asphalt, phenols and creosotes. The section on hydrocarbons and on the products obtained in the distillation of petroleum, coal tar, and shale occupies two-thirds of the book, whilst the remainder treats of the phenols and the allied bodies. There is much interesting matter on the products obtained in the distillation of petroleum and shale oil—petroleum spirit, burning and lubricating oils, vaseline, paraffin—and the tests described (which include the English close test as well as other flash tests) are those generally adopted by most experts in the examination of these products.

The results are given of an examination of the rival burning oils of America and Baku, from which it appears that the Russian kerosine is usually of higher specific gravity than the American. It is also stated that the Russian kerosine gives less light than the American, but, on the other hand, there is less diminution in luminosity as the level of the Russian oil sinks in the lamp reservoir. A useful comparison can be made between samples of kerosine by burning them in similar lamps fitted with a loosely-woven wick and noting the rate of consumption and the intensities of the light yielded under the same conditions. Kerosines containing a larger proportion of light oils are said to give a better light, but burn faster than the others, while the presence of heavy oils retards the consumption and seriously diminishes the light. The requirements necessary in a lubricating oil are well set out, and methods are given for arriving at some idea of the value of an oil for lubricating purposes by determining the viscosity of the oil, which has no relation to its specific gravity, the thickening of the oil, flash, and burning points, gumming, acidity, etc. This part has evidently received the careful revision of Dr. Leffmann. The de-blooming of a mineral lubricating oil, it is said, can be produced by treatment with nitric acid, or the bloom obscured with turmeric or picric acid; but more usually it is treated with dinitro-toluene in the proportion of four pounds to the ton of oil. There is, however, no mention made of deodorising kerosine oil, which is a matter of as much interest to some persons as de-blooming. Benzene, nitro-benzene, "benzols," naphthalin, naphthol, anthracene, and the various commercial methods of testing these products are all described in detail, and the same can be said of the part dealing with the phenols. The determination of the phenols, or so-called tar acids, in carbolic powders and in coal-tar emulsions of the lysol and creolin character will be found of little trouble when followed in the manner here described. The author is no doubt correct in stating that the mixing of tar oils or other hydro-carbons of little value as antiseptics has been practised to an enormous extent, inasmuch as "carbolic acid and carbolic powders sold to corporations and other sanitary authorities afford a fertile field for the operations of the blender." There are also articles on blast furnace creosote, guaiacol, creosol, resorcin, hydroquinone, and one or two illustrations of new extractors for use with volatile solvents, and specific gravity and thermometric tables. It may be said, in conclusion, that Volume II. maintains the high standard of the previous volumes of this revised series, especially in containing the latest information bearing on the subject, and as far as possible the modern methods adopted in examination. Analysis of such materials is more a matter of expert knowledge—that is, in the sense of an acquaintance with recognised methods of procedure—than scientific exactness, and Mr. Allen has done his best to satisfy this requirement throughout his work on "Commercial Organic Analysis."

THE EXAMINATION OF POWDERED DRUGS.

DIE MIKROSKOPISCHE ANALYSE DER DROGENPULVER. BY DR. LUDWIG KOCH, Professor of Botany in the University of Heidelberg. Vol. I. Barks and Woods, Part I. Pp. 76 and plates. Price 3m. 50pfg. Berlin: Gebrüder Borntraeger.

There is no lack of evidence that, in the near future, the pharmacopœias of the more advanced nations will contain much more minutely detailed descriptions of drugs than has heretofore been the case. In the British Pharmacopœia of 1898 details of the structure were introduced in those instances in which they were considered to add precision to the description, and the Permanent Commission for the German Pharmacopœia, admitting the fact that many drugs are bought by the pharmacist in the condition of coarse or fine powder, has recommended that the descriptions should be so framed as to include the identification of the comminuted drugs. The work that Dr. Koch is now publishing has for its object the description of powdered official drugs, so as to enable the pharmacist to identify them and ascertain their purity.

It stands in sharp contrast with the Anatomical Atlas of Tschirch and Oesterle, for the latter deals principally with the anatomy, and briefly alludes to the characters of the powder, whilst Dr. Koch deals almost exclusively with the latter.

The first thirty-five pages are devoted to a consideration of the method of examination, and will well repay careful perusal. The advantages and disadvantages of the three principal mounting media, viz., water, glycerin, and chloral hydrate, are very clearly stated, whilst of the reagents in common use, three are treated of in detail; the others simply mentioned. Next follows a description of the particles that usually constitute a powdered drug, viz., fragments of cell-walls, contents of cells, isolated cells and collections of cells; the order in which they may be best studied, the magnification most suitable, the methods of mounting, the difficulties that may present themselves, and how they may be overcome, are successively treated of. All such information is extremely valuable, and is as interesting to the expert as it is to the student.

Dr. Koch very properly lays great stress upon the necessity for sketching, and recommends the outlines to be drawn with the aid of a camera lucida; the advantage of this is that the relative size is always preserved, and exact measurements can be made from the sketch if the magnification has been recorded. He also insists upon the necessity for determining whether or not admixture has taken place, the identification of the admixed substance being of much less importance. This is very true, for the number of possible adulterants is practically inexhaustible, and an adulteration once detected and published is likely to be abandoned in favour of another.

Each section is prefaced by a general exposition of the anatomical elements present and their distinguishing characters; in the section dealing with barks and woods no less than twenty-two pages are devoted to this exposition. The description of each drug is also very carefully written in tabular form, an arrangement that certainly has the advantage of lucidity.

The plates are lithographs of the author's own sketches, and as they form the most important part of the work, they deserve very careful consideration. It may at once be said that, with respect to the number of elements shown, to detail and elegance they surpass anything that has hitherto been published. Moeller's Atlas unfortunately contains too little of the separate cells and fragments that constitute a powder, Vogl deals but little with barks, and Tschirch's Atlas treats principally of the anatomical structure, whilst Collin, in his little work on official powders, has restricted his descriptions too much, and paid too little attention to the detail in the illustrations. Thus it will be seen that Dr. Koch's Analysis fills a distinct gap.

In regard to his illustrations there is, perhaps, a tendency to multiply unnecessarily the number of times each element is figured. Thus, in the illustration of powdered cascarilla (Plate II.), the cork cells are shown four times in section and nine times in surface view, bast fibres nearly as often, and so on. Such repetition tends to complicate the illustration, and this complication is increased by the representation of granular matter that is certainly to be found in the powder, but is of doubtful diagnostic value, and might, therefore, well be omitted or only figured in one portion of the plate. Accuracy of delineation is the most important point, but in this instance the cork cells have not been accurately drawn. Meyer has already pointed out the peculiar contents of the cork cells of this bark, and treatment with hydrochloric acid and phloroglucin would have accentuated that which is perceptible even in the unstained cell. So distinctive are these cells that by their means alone cascarilla bark can at once be distinguished from all other official drugs.

This indicates the desirability of a more extended use of micro-chemical reagents than the author apparently thinks necessary, and it also indicates the desirability of making oneself familiar with the anatomy of the entire drug by the examination of the

necessary sections before proceeding to the examination of the powder.

These observations are mainly differences of opinion that do not in the slightest detract from the value of the work. If the author's programme is carried through to the end the Analysis of Powdered Drugs will form a most valuable supplement to Tschirch and Oesterle's Atlas. It will repay the most careful, critical examination, and will be indispensable to everyone interested in such work.

PILL-EXCIPIENTS.*

BY ALFRED I. COHN, PH.G., NEW YORK.

The proper preparation of a pill mass, while apparently a simple affair, is in reality not quite so easy as it seems. Many facts must be taken cognisance of; for instance, the characteristics peculiar to the several ingredients, the possible action of one ingredient on another, the object for which the pill is prescribed, the coating, the solubility (whether slow or rapid) which the pill is to have, etc. Naturally, all of these considerations directly lead back to the employment of a suitable excipient, supplemented by proper and skilful manipulation.

From the great diversity of substances which may be prescribed in pill form, and from the varying characteristics exhibited by the medicaments, it can readily be seen that no one excipient will answer for all cases, but the one which is best suited for the particular instance in hand must be chosen. Frequently the correct choice is a matter of doubt; and it not infrequently happens that a great deal of time, labour, and material are wasted because the use of an improper excipient has resulted in an unexpected liquefaction, or made the pill mass so crumbling that pills cannot be formed, or the pills are so large and heavy that they cannot well be dispensed.

An excipient, to be considered suitable, must be capable, when used in minimum quantity, of thoroughly binding the various ingredients prescribed, and yield a stiff, yet plastic mass, which, when rolled and cut, will yield pills exhibiting no tendency to flatten, attract moisture, or harden so as to become insoluble, but which will perfectly retain their shape and be completely and rapidly disintegrated in the system.

Among the individual excipients in general use, clarified honey is perhaps the best. Glucose is also good, but its tendency to ferment rapidly is a bar to its general employment. Glycerite of tragacanth, glycerite of starch, and mucilage of acacia are also serviceable in a great number of cases, particularly where white pill-masses are to be made. With many, simple syrup or sugar is a favourite; while among Germans powdered extract of liquorice with a few drops of water is held in deservedly high esteem. All of these, and many more having similar properties, constitute one class of excipients which may be designated as "binders" or "coherers," so to speak; for they are used, as a rule, to bind powders which themselves have but little cohering power, so as to form a pilular mass.

There is another class of so-called excipients which possess little or no binding power, and are employed in cases where the substances prescribed are very soft or liquid, or where but very small quantities are to be made into pilular form. These substances may be termed "fillers," and to this class belong such articles as powdered liquorice-root, powdered althea, kaolin, magnesia, starch, flour, etc.

Frequently both binders and fillers are employed together, as when oils, fluid extracts, or other liquids having little cohesiveness are to be massed, or where very small quantities of drugs, like potent alkaloids, are to be made up in pill form. It is self-evident that the excipient used should, in addition to its cohesive properties, be perfectly innocuous in the quantity required for massing, and should have no tendency to incite or promote any reaction between any of the ingredients of the mass.

* From Merck's Report.

The substances generally employed as excipients, and their special values, may be epitomised as follows:—

ACACIA, in the form of powder, or aqueous solution (mucilage).—When used alone is too apt to afford pills which are very hard, and which dissolve but very slowly. Hence a little glycerin should be added, say about from one-eighth to one-fourth part. Such a mixture is useful for an extended range of work, and especially where a white pill is desired. If it is intended to coat the pills with gelatin, sugar, etc., the proportion of glycerin must be reduced, and particularly if a gelatin coating is to be applied, because in this case the hygroscopic character of the glycerin tends to retain the mass in too soft a condition, and the pills, on immersion in the hot gelatin solution, may either become very soft and fall off the pins, or the coating pills may "sprout" as the gelatin coating contracts strongly as it dries.

ADEPS LANÆ.—This, in connection with kaolin, etc., is of considerable use in the preparation of pills which are intended to contain phosphorus, potassium iodide, potassium acetate, and deliquescent salts in general. The latter may be dissolved in a minimum quantity of water, bolus alba or kaolin added to take up the liquid, and the whole massed with the adeps lanæ (wool fat). With silver nitrate, potassium permanganate and other very readily reducible substances, the excipient is not suitable because of its organic character.

ALCOHOL.—Many substances, such as gum resins, may be massed by the aid of alcohol alone. It is also very useful in enabling a minimum quantity of another excipient to be used. On adding a few drops of alcohol to the powder to be massed, it will be found that less excipient will be required to form a suitable mass than if no alcohol is used. This is advantageous in that the risk of using too large a quantity of excipient is avoided.

ALTHEA.—Powdered althea root is probably the most absorbent of all the powders used as fillers, and for this reason is very useful in many cases where the ingredients of a pill mass are naturally very soft, or even fluid. It has the serious drawback, however, of swelling up greatly, and making the mass prone to be elastic, or "rubbery," and consequently difficult to properly cut and roll. In practice it will be found best to mix with it some other inert filler, such as kaolin, which does not swell.

BREAD CRUMB (MICA PANIS).—Bread crumb is of frequent use as an excipient for oils. It is useful only, however, when the oil to be incorporated is in small proportion to the bread crumb, otherwise the oil will "work out" and appear on the surface of the pill. It is suitable for exhibiting croton oil or any other oil given in small doses. Bread crumb has also been recommended as an excipient for silver nitrate. In the writer's opinion, however, it is unsuitable for this, not only because of its organic character, but because of the sodium chloride usually present in dough. The sodium chloride reacts with the silver nitrate and forms silver chloride, and this foils the object of the prescriber.

CACAO BUTTER is but little adapted for use as an excipient for pill-masses because of its low melting-point. It has been used for preparing pills containing oils by melting the latter with the oil, and then massing with kaolin, bolus alba, powdered althea root, etc.

DEXTRIN.—This may be used like powdered acacia; it is not as effective as the latter, however. Only the white dextrin should be used because of the disagreeable odour which the yellow dextrin is likely to impart to pills made by means of it.

EXTRACTS.—Several of the extracts are extremely useful as excipients, and among those most in favour are the extracts of malt, gentian, taraxacum, and liquorice. Confection of roses is also good, and is a favourite in England. The extracts of gentian and taraxacum are particularly useful where inorganic soluble substances are to be massed, and where it is desirable to secure at the same time a bitter- tonic effect. In massing powders with the extracts the labour is sometimes very tedious, and even quite painful when a large bulk of powder is being massed, if care is being taken to avoid using

an excess of extract so as to obviate a tendency on the part of the pills to flatten. To avoid these contingencies it is well to first moisten the powder with a little alcohol and then incorporate with the extract; or, better yet, triturate the extract with a very little water or diluted alcohol, carefully avoiding an excess, of course, and when dissolved gradually add the powder to the solution.

POWDERED EXTRACT OF LIQUORICE is an exceedingly useful general excipient. It possesses very great binding power, and very little of it suffices to yield a firm and rather hard pill. The addition of too much of the powdered extract must be carefully guarded against, else the pills will not dissolve readily. When too much has been used a drop or two of glycerin will remedy the defect and tend to prevent the undue hardening. This extract has the advantage in that it may be added directly to the powders to be massed, and the pills made by simply adding a few drops of water. It is not eligible, of course, where pills are to have a very light colour. (Further information on extract of liquorice as a pill-excipient is given below.)

EXTRACT OF MALT constitutes another very efficient general excipient. Either the syrupy liquid or powder will answer, but the liquid is preferable, because of the proneness of the powder to "cake" or "lump" on account of its hygroscopic character. The extract possesses excellent cohesive power, and pills made with it readily disintegrate.

FLOUR constitutes a good means of massing creosote, guaiacol, and oils generally, a fairly workable mass being afforded by adding a few drops of water, honey, syrup, glucose, extract of malt, etc., after the oils have been triturated with the flour. The extract of malt is particularly good for oils because of its tendency to emulsify these.

GLUCOSE is used just like honey. It is inferior to the latter, however.

GLYCERIN.—This by itself must be used with great caution as an excipient, because, on account of its hygroscopicity, pills made by means of it are prone to become gradually soft, and ultimately flatten out and run together; or, if liberally rolled in powder, the latter forms an uneven, unsightly coating, and the pills present a very poor appearance. Combined with other substances, however, such as powdered acacia, powdered extract of liquorice, dextrin, powdered tragacanth, etc., it is useful because of its ability to prevent pills from completely drying out.

HONEY is one of the best excipients for general use. Besides possessing considerable cohesive power, it in drying yields a porous, crystalline mass of saccharine matter, which is promptly disintegrated on contact with water. Only a despumated light-coloured honey should be used, and this may be even employed with light-coloured powders such as quinine, salicylic acid, salicin, etc., as the finished pills will possess but a very slight, scarcely noticeable, colour. The excipient is particularly useful, because of its saccharine content, in cases where it is desirable to prevent the oxidising action of the air on the pill substance, as in Blaud's pills, in which the ferrous carbonate is effectually preserved from oxidation to ferric oxide by it. It should, however, never be used in pills containing calomel, mercuric chloride, or readily reducible metallic salts.

(To be concluded.)

TREATMENT OF ALOPECIA.—Balzer, to arrest the progress of the disease, treats the hair daily, after thorough washing, with the following solution:—Mercuric chloride, 0.2; acetic acid, 1.0; alcohol (90 per cent.), 100; ether and spirit of lavender, of each 50. To restore the functions of the hair follicles and of the atrophied papillæ the following hair wash is used:—Solution of ammonia, 5; oil of turpentine, 25; spirit of camphor, 125; or, acetic acid, 1.5; chloral hydrate, 5; ether, 25. For the last two the following may be substituted:—Lactic acid, 15; distilled water, 30. To be rubbed into the skin until redness is produced; or, instead of this, an alcoholic solution of acetic acid 1 in 3 may be used.—*Pharm. Post.*, 33, 188.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

Of Minority Representation.

It is not quite obvious why Mr. Broadhead should assume that two-thirds of those who have a vital interest in the work of the Council of the Pharmaceutical Society are invertebrate. If he had said one-third I should have been in agreement with him, but surely he does not consider that the two-thirds of the members who took the trouble to record their votes are to be blamed for so doing. For the one-third who did not vote no valid excuse can be advanced, the more especially as their inaction has resulted in the newly-elected members of Council being returned by a minority of those they now represent. Mr. Hills, whose name comes first in the list of successful candidates, was not supported by half of the electorate and only one of those who had not previously served on the Council received the support of more than one-third of the members of the Society. The result is that the seven members of the Council recently elected are only minority representatives, a state of affairs which could easily have been prevented if a comparatively small proportion of the apathetic members of the Society had recorded their votes. There is, of course, nothing new in the position, but it is so unsatisfactory to find—concurrently with long-continued complaint about the alleged inactivity of the Council—such limited interest taken in the election of our executive body that I cannot refrain from referring to the matter once more, and pointing out to the majority of the members of the Society that they have missed a capital opportunity of making their influence felt in the direction of formulating a definite policy. It may be that many were so contented with the manner in which the Society's affairs have been conducted of late that they did not think it necessary to indicate approval or disapproval by returning their voting papers, but they ought to see that anything like a general prevalence of such a frame of mind may lead to more or less disastrous results, and that it is positively wrong to refrain from recording their votes as they have done.

Appearances may be Deceptive.

Let us, for example, consider the moral deduced from the result of the election by a trade journal, the conductors of which have for many years past been on the watch for opportunities to injure the Society. We are told in the latest issue of that publication that the members of the Society have shown themselves to be distinctly opposed to the position which has been taken up by the Council in regard to the Companies Bill. But though, as I pointed out last week, the balance seems to have turned in favour of the opponents of the "no-surrender" policy, it does not follow that appearances must necessarily be accepted as representing the facts of the case. Indeed, I think there is but little doubt that appearances are quite deceptive on the point in question, and that a poll of the members of the Society, taken now, would fully justify the action which has been taken by the Council. The election did not turn on the company pharmacy problem, and I am firmly of opinion that there is no general desire on the part of British pharmacists to offer concessions which they are not forced to make. If anything, I should imagine the election of three new members on the Council is due to a widespread feeling of dissatisfaction that a definite policy was not decided upon and disclosed much earlier than was actually the case. Those who were dissatisfied—a minority of the electors—wisely made full use of the ballot box to record their views; on the other hand, a large proportion of those who were content that events should progress on the lines which have been followed of late appear to have been too indifferent to back their own opinions. Naturally, therefore, enthusiasm prevailed over indifference, and an attempt is now being made to persuade us that the expressed voice of the minority represents the views of all. But what about the expressed voice of that other minority—almost equal in number—which, as

Mr. Gifford points out, has specifically instructed the Council to surrender nothing and to repudiate anything in the nature of compromise? Are the views of nearly sixteen hundred members of the Society to be totally ignored because rather more than sixteen hundred other members are—according to trade journalists—eager to emulate Esau?

Continuity of Policy Desirable.

I am far from convinced, however, that the minority by which the seven members of Council have been returned is solid on the question of company trading in pharmacy, nor do I see any reason whatever for assuming that the other fourteen members of the executive body—or any portion of them—ought to decide forthwith to abandon the position they have taken up because a trade journal chooses to thrust upon the Council its views regarding the manner in which the result of the election should be interpreted. It is altogether too absurd to suppose that the majority of the Council should sacrifice their most deliberate convictions because three of their late colleagues have been displaced by the caucus, especially since that one of the three who had least votes recorded in his favour was far from being a supporter of the "no-surrender" policy, while the most ardent advocate of that policy narrowly escaped election in spite of his name not appearing on the caucus list. Mr. Hills, therefore, will be well advised to hesitate before acquiescing in the trade journal's direction that he should adopt its "wonderful panacea," and, by so doing, sacrifice his reputation for consistency. Loyalty to his colleagues is a strong point with our past-president, and, as he is to a considerable extent bound by the recent decision of the Council that the only course open is to oppose Clause 2 of the Companies Bill, he can hardly go back on that decision so soon by supporting the retention of the Clause in a slightly modified form. Not that any such step would count for much now that Parliament is about to dissolve and the Bill virtually doomed, but it should hardly be possible for any past-president to propose such an entire change of policy within the space of a few brief months, and certainly not at the dictation of an irresponsible trade journal. Important questions of policy are not to be so lightly decided by administrative bodies, and when once a decision on a momentous question has been arrived at a certain measure of continuity is desirable.

An Important Factor in the Situation.

So far as the future policy of the Council is concerned much may be expected to depend upon the election of a president for the next twelve months, and, in that connection, it is interesting to find that—during the period of the year when the most important business of the Society has to be transacted—a country member of the Council has proved himself fully competent to cope with all the difficulties that presented themselves. It has become customary to consider that, as a matter of course, a London member of the Council should be president of the Society, but the experience of the past few weeks—during Mr. Martindale's regrettable absence on account of ill-health—has shown that there is no reason to suppose that the interests of the Society would suffer in the hands of a country president. Mr. Newsholme, who has for three years acted as vice-president, is generally acknowledged to have fulfilled the difficult duties, which so unexpectedly devolved upon him, in a highly efficient manner. If, therefore, as rumour has it, there is any prospect of London failing to supply presidents, why should not past usage be set on one side and a country member of Council—who has on an emergency officiated in such a thoroughly satisfactory manner—be elected to the highest office with a London member to act as his deputy in case of need? The General Medical Council is now presided over by a distinguished individual who is not resident in London, and it cannot reasonably be contended that the interests committed to the charge of that body are in any degree less important than those over which the Council of the

Pharmaceutical Society has to keep a watchful eye. It will, no doubt, be a heavy tax on a country member of Council to do justice to the office of president, but it is not inconceivable that certain duties which have come to be regarded as inseparable from the position might with advantage be delegated to others. In any case, the Society must have an efficient individual as its head, and, if the London supply should fail, a country member must be prepared to step into the breach. But I would prefer to see the matter considered on general grounds rather than as a case of necessity, and, if the Editor permit, it might be worth while to have the question discussed in the correspondence columns of the Journal.

POLITICAL GOSSIP.

EARLY CLOSING BILLS are evidently subjects upon which political gossipers must touch gingerly. Last week in this column the attitude of Lord Salisbury and the House of Lords in regard to Lord Avebury's Bill was clearly summarised, but we have the misfortune to know that that summary has occasioned some irritation to one of our friends carrying on a retail business in Nottingham, who forwards a post-card of more or less gentle remonstrance. After associating the writer of the "Gossip" with the Premier in a common condemnation, our correspondent asks, "What liberty do you think there is in being compelled to keep one's shop open just because your next door neighbour wishes to work all the hours God sends?" Whatever relevancy or force there may be in this question is, surely, rather for the House of Lords to determine than the Editor of this Journal, for the hostile views put forward in the last issue were expressed at Westminster, not manufactured in Bloomsbury. One other point may also be advantageously stated—namely, that even if Lord Avebury's Bill were passed into law forthwith, it would not benefit retail chemists one jot, for it contains a saving clause expressly designed to meet the special position occupied by the pharmacist in relation to the public. The correspondent referred to, as well as others who may have erroneously imagined us to be opposed to the principle of earlier closing, are hereby assured that if there were the slightest grounds for supposing that the Shops (Early Closing) Bill could beneficially affect chemists and druggists, it would be supported in this Journal in no ambiguous words, and with no suspicion of "faint praise."

SPEAKING OF SHOP HOURS, it is of interest to know that Mr. Cameron Corbett, M.P. for the Tradeston Division of Glasgow, has notified his intention of moving at the first convenient opportunity a resolution in the House of Commons respecting the excessive and unnecessarily long hours of labour in shops. The motion is to be much after the model of the one submitted a session or two ago by Sir John Lubbock, and will assert that long hours are injurious to the comfort, health, and well-being of all concerned. Mr. Corbett's remedy is that local authorities should be granted powers to enable them to carry out the general wishes of the shop-keeping community with reference to the hours of closing. It will probably occur to a good number of the members of the House that the lawful "general wishes" of any aggregation of individuals may be carried into effect now by general agreement without the necessity for interference either by Parliament or by local authorities. It is the lack of that general agreement among the parties concerned that blocks the way to improvement, rather than any political objection to a reduction of shop hours.

CARBURETTED WATER GAS has been impeached several times of late in the Commons. Only a few weeks ago Mr. T. Healy referred to the alarming increase in the death-rate of Dublin, and wanted to lay the blame on the Gas Company, which was alleged to have been surreptitiously sending an increasing quantity of carbon monoxide into the city mains; and now it is Mr. Steadman (Tower

Hamlets) who has raised the question of the use of this poisonous gas—four times as poisonous, he says, as coal gas. Mr. Steadman asked the President of the Board of Trade last week whether there were any regulations or restrictions in reference to the use of this gas by London companies, and, if not, whether he would, upon medical and sanitary grounds, take steps to initiate legislation on the subject. Mr. Ritchie, in reply, admitted that no restrictions existed, and thought that any legislation proposed should not be confined to London, but should have a general application. In the case of general legislation, added the astute chief of the Board of Trade, the Home Office and the Local Government Board would have something to say, and, therefore, it would be impossible for him to make any promise at this period of the Session. This response brings to mind the smooth and efficient dual diplomacy of Messrs. Spenlow and Jorkins!

THE COMPANIES BILL is deferred till Monday, June 18, and, though the trade journals announced this last week, they have only to thank their good fortune that the postponement has fallen so luckily as to prevent their confusion of the measure with the Companies Acts Amendment Bill being detected. As a matter of fact, Mr. Ritchie's Bill was not placed until last Monday, and it is a pure coincidence that it should have been relegated to the precise day upon which Mr. Faithfull Begg's Bill had, the week previously, been tabled. So fortune brings in some boats that are not steered. With Mr. Begg's Bill we need have no concern—it is purely commercial, is thirty-nine down the list, and is "blocked." With the Companies Bill proper there need be very little more anxiety either, for it stands number nine on the agenda, and is preceded by such debate-provoking items as the Australian Commonwealth Bill and the Prevention of Railway Accidents Bill. Moreover, the rumours of approaching dissolution are gathering strength, and even the *Times* is contemplating as an imminent probability the winding-up process of the Session. Mr. Channing reminded Mr. Balfour of his pledges the other night, and asked, through Mr. Bryn Roberts, what the hopes of the Government were in respect to the Companies Bill and the Money Lending Bill. The reply was, perhaps, what might be expected, for though the First Lord did not point a moral by employing the Franklin dictum that they who live on hopes will die fasting, he gave just as little encouragement by saying that the hopes of the Government in respect to the legislation mentioned were embodied in the Queen's Speech. To those who recollect the wording of the speech from the Throne, Mr. Balfour's reply will appeal as being richly humorous.

THOUGH THE FATE of the Companies Bill is now pretty definitely settled, Mr. D. A. Thomas (Merthyr Burghs) will on June 14 make an effort to elicit a ministerial statement on the subject. He has given notice that he will ask the leader of the House whether the Companies Bill embodies the amendments which were said by the Government to be required in the law relating to limited companies, and which occupied the first place in the ministerial programme at the commencement of the Session. Further, the honourable member will allude to the length of time the subject of company reform has been before Parliament, and will ask point blank whether there is any intention to proceed with the Bill this Session—if so, when will the second reading be taken?

PATENT LAW REFORM may not be so far distant as one, knowing the strength of departmental armour, might be supposed to imagine. Sir J. Leng has often raised his voice against the system which enables a patent to be granted in respect to a device or a process that possesses no novelty, and has nothing of intrinsic value to recommend it. The Pharmaceutical Council, too, has, time after time, tried to prevent the granting of patents for medicinal preparations which were as old as the hills, and were only passed through the Patent Office for the purpose of escaping

the jurisdiction of the Pharmacy Acts, but such action has always been in vain, inasmuch as the Comptroller had no power to notice objections of that kind, and was obliged to inform objectors that they must go to the Chancery Court and put in motion expensive, slow-moving legal machinery if they wished to quash a bad patent. Now, however, a Departmental Committee has been appointed by the Board of Trade to consider, amongst other things, whether any, and if so, what, additional powers should be given to the Patent Office to control, impose conditions on, or otherwise limit the issue of letters patent in respect of inventions which are obviously old, or which have been previously patented in Great Britain. The members of the Committee are Sir E. Fry, the Master of the Rolls, the Solicitor-General, Sir W. Houldsworth, M.P., Mr. J. Fletcher Moulton, Q.C., M.P., Mr. F. J. S. Hopwood, C.B., Mr. S. E. Spring-Rice, C.B., Col. T. W. Harding, Mr. Herbert Hughes, and Mr. Arthur Paget as Secretary. It is understood that the Board of Trade is not disposed to act upon any suggestions for the institution at the Patent Office of a regular system of examination as to novelty of applications for patents that may be sent in, but it is gratifying to find that the possibility of doing something towards stopping outrageously bad patents has found official recognition at last.

MUNICIPAL TRADING is in course of investigation by the Joint Committee of both Houses of Parliament recently appointed. Up to the present the hybrid body has had two sittings, under the presidency of Lord Crewe. Sir C. Boyle, the Chairman of Committees of the House of Lords, and one of the principal clerks to the Home Office, have been examined, but only in so far as concerns the procedure officially adopted in regard to local authorities applying for powers in respect to gas, water, electric lighting, and tramway concerns. Apparently there is no intention to go beyond these items of local activity.

PROCEEDINGS UNDER THE PHARMACY ACTS.

ILLEGAL SALE OF LAUDANUM.

The Procurator-Fiscal (Wigtown) v. Richmond.

At the Sheriff Court, Wigtown, on Tuesday, May 1, before Sheriff Watson, Henry Richmond, stationer, North Main Street, Wigtown, was charged, at the instance of the Procurator-Fiscal, who was acting on instructions from the Lord Advocate, with selling a quantity of laudanum in contravention of Section 15 of the Pharmacy Act, 1868, and with keeping open shop for the retailing, dispensing, and compounding of poisons, he not being a duly registered pharmaceutical chemist, or chemist and druggist. Defendant pleaded guilty to the first charge, and was fined 10s., and £1.9s. 6d. costs.

Pharmaceutical Society v. Robertson.

At the Sheriff Court, Linlithgow, on Friday, May 25, 1900, before Sheriff McLeod, Kate Robertson, assistant in the shop of Dr. Alexander Scott, Main Street, Broxburn, was charged, at the instance of the Pharmaceutical Society, with selling a quantity of laudanum in contravention of Section 15 of the Pharmacy Act, 1868.

Mr. Peter Morison, jun., S.S.C., appeared for the Society. Accused pleaded guilty.

Dr. Scott, who was allowed to make a statement, said he had only taken over this business about eight months ago. Miss Robertson was his apprentice, and there was also in the shop an unqualified chemist, who was studying for his examination and expected to pass in July next. The shop was under his (Dr. Scott's) supervision and that of his medical assistant, who were out and in during the day several times. It was not on economic principles that he employed only unqualified assistance, as he paid as large a salary as he would have to do if he had employed

a qualified chemist. These unqualified assistants were in the shop when he took it over, and to have dismissed the assistants would have damaged his relations with the people in the town. He was helping them to get qualified. The shop was generally in charge of the unqualified chemist, but on this occasion he was out for tea, and it was just an accident that Miss Robertson sold the laudanum. She had instructions not to sell laudanum.

The Sheriff: If a prescription had been brought into the shop, who would have made it up?

Dr. Scott: I usually see them made up. If the unqualified chemist was in he would make it up.

The Sheriff: I am afraid, Dr. Scott, that your own admission comes to this, that if the unqualified chemist had been in he would have sold the laudanum without hesitation, so that in any case an offence would have been committed. He is no more qualified to sell laudanum than Miss Robertson. I do not see that your only course was to dismiss these assistants; you might have taken in a qualified man for a month or two till your assistants qualified.

Dr. Scott: I only use the shop for my club medical practice, and it is conducted at a financial loss.

Mr. Morison said these proceedings have been taken in consequence of complaints made to the Registrar that poisons are being illegally sold in this shop. Dr. Scott's statement is really an aggravation of the offence, for he admits that he could have employed a qualified chemist for the salary he at present pays. The unqualified chemist is no more entitled to sell poisons than the accused. The doctor knows the law quite well. It is far too common for doctors to keep open shop for the general sale of all kinds of poisons, and to employ no qualified assistants at all. The last case we had was in Airdrie, where laudanum was sold in a doctor's shop by an unqualified person to a little child, whose mother committed suicide. It is very unfortunate that we should have to bring this lady before your lordship, but the law provides that the actual seller is liable, and we have no means of getting at the doctor. He is the real offender, and surely he will see to it that he shall pay any penalty which the Court may impose. I have to ask your lordship to impose the penalty provided by the Statute.

The Sheriff: The last case before me was a sale of belladonna plaster. I regard this as a more serious case. I must tell you, Miss Robertson, that when an interesting and attractive young lady like yourself is brought here on any charge there is a natural inclination to allow you to go with an admonition. But there is a very obvious reason why I cannot do so. If I did, then all the chemists in the country would engage attractive young ladies as their assistants, and the object of the Statute would be defeated. I must impose a penalty just as if you were a man. The penalty will be £3, with £1 7s. 8d. of expenses.

Accused: I cannot pay the fine.

The Sheriff: Shall I, Mr. Morison, insert in the judgment power to recover by poinding or imprisonment?

Mr. Morison: I am informed by Dr. Scott that he does not intend to pay the fine, and therefore I must ask your lordship to insert recovery by poinding in the conviction. But imprisonment is not competent.

The Sheriff: I think it is. Section 8 of the Summary Jurisdiction Act, 1881, surely gives that power to the Sheriff. It is evident that in this case there is nothing to poind, and that means of recovery will be of no avail. In such a case, if there is no power to imprison, no real punishment can be inflicted, and the whole prosecution becomes a farce.

Mr. Morison: There is a decided case in Law Reports 35, which lays it down that where a particular Act provides a specific method of recovery imprisonment is excluded. That is our position, because the Pharmacy Act, 1852, specifies poinding.

The Sheriff: Very well, I shall say poinding, but the sooner you seek to have that Act amended so as to permit of imprisonment in a case of nonpayment of the penalty the better.

LETTERS TO THE EDITOR.

Gelatin Capsules in Pharmacy.

Noticing in the current issue of the *P. J.* the desire of Mr. Rogers for soft gelatin capsules, may I make a suggestion? The preparation of soft gelatin capsules in small quantities is very simple; all that is requisite is to have a small stock of moulds, say, three sizes (half dozen of each). I have found those to be the best which are recommended in the 'Art of Dispensing,' and the formula given in that book is the one I have been most successful with. The moulds are very slightly oiled with almond oil and dipped in the melted gelatin basis to a short distance up the stalk, so that when the capsule is removed, as it can be in a few minutes, a small funnel of gelatin is left above the capsule. The capsule may now be filled with powders or liquid, as the case may require, the funnel of gelatin preventing waste. When the capsule is full the funnel is cut off, and the orifice closed by dropping a little of the melted gelatin basis on it from a glass rod; the capsules are left a few minutes to harden, and are then ready.

London, May 28, 1900.

F. MIDDLETON.

Standardisation of Cinchona Preparations.

Mr. Stenhouse states that he finds it difficult to understand how I arrive at the conclusion that his process for determining the alkaloids in cinchona liquid extract and tincture "gives a low result." He goes on to say that he sees no reason for departing from the method of assay which he proposed in the *Journal* of January last, and that a mixture of ether and chloroform in the proportion of 1 of the former to 9 of the latter amply ensures the removal of the alkaloid. Mr. Stenhouse cannot be aware that in his original process he recommends the use of a mixture of ether and chloroform in the proportion of 9 of the former to 1 of the latter, which is a very different solvent from one consisting of 1 of ether to 9 of chloroform, which he now recommends. I can only repeat that the solvent in which the ether predominates separates excellently and causes no trouble, but "gives a low result." On the other hand, the one in which chloroform predominates produces in my hands almost insuperable emulsions. His process involves the shaking of the diluted galenic with ammonia and the chloroform mixture in the first place, and this principle is practically obsolete. That of a preliminary shaking with acid and the solvent takes its place with advantage.

Income-tax Overcharges.

Although it is generally understood that the cost of the South African war will ultimately have to be borne by the Transvaal and Free State, we fear that the British taxpayer will not for some time obtain any relief in regard to the rate of the income-tax, which now stands at no less than five per cent. of the assessed income. It is, therefore, the more necessary to bear in mind that while the rate of the tax may remain the same, it is possible in many cases to obtain relief by way of abatements that have not already been allowed. In the matter of overcharges under Schedule D, the small trader often fails to obtain relief through his inability to furnish accounts satisfactory to the Inland Revenue authorities, consequent on the fact that he has kept no complete record of his business transactions. It is noteworthy that those who are thus compelled to submit to over-assessment are the very class upon whom the tax falls most heavily. If proper accounts be kept, or even if a cash account be presented—which, by the use of 'The Taxpayer's Cash-Book,' becomes a perfectly simple and easy matter—there is very seldom any difficulty in establishing a just claim. Those who paid too much for the year 1899-1900 should at once appeal against the assessment for that year, or they may be told that they are too late. Thousands of people who pay tax for which they are not liable can now claim repayment for three years; the amount

recoverable might in the case of many amount to upwards of £30. We shall be pleased to advise your readers gratuitously whether they are entitled to any repayment in respect of tax deducted from rents, interests, dividends, annuities, etc., whether paid "free of income-tax," or not, and also in respect of life assurance premiums, on their sending us full particulars of their incomes from all sources and a stamped directed envelope for reply.

THE INCOME-TAX ADJUSTMENT AGENCY, LIMITED.

12 and 13, Poultry, London, E.C., May 30, 1900.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

PYROCATECHIN DEVELOPER (R. D.—42/24).—Yes, it should be sodium sulphite.

SALARY (C. W. C.—42/26).—It is difficult for us to say, but probably about £80 per annum.

BACTERIOLOGY (F. J. Y.—42/27).—Crookshank's 'Bacteriology' is published by H. K. Lewis, at one guinea net.

WALNUT JUICE (D. L.—42/25).—There is no difficulty about staining the skin with it, as you will find if you apply a little. The stain cannot readily be removed, but it wears off in time.

BOTANICAL WORKS (J. H.—33/21).—Of the books you possess, let him begin with Edmonds', with as much practical work as possible on fresh material. He should begin field work, with the aid of Shirley Hibberd's 'Field Flowers' (Groombridge, 4s.).

SOLUBLE ESSENCES (O. D. N.—42/3).—Foreign houses who prepare "terpeneless essence of lemon" are (1) Heinrich Haensel, Pirna-on-the-Elbe, Germany; London agent, William Poppelreuter, 19, St. Dunstan's Hill, E.C. (2) Messrs. Schimmel and Co., Leipsic, Germany; London agent, Mr. McCrombie, Mincing Lane, E.C. Citral, or geranic aldehyde, is contained in essence of lemon to the extent of about 7-10 per cent. Terpeneless oil of lemon contains other oxygenated constituents besides citral, e.g., citronellal. Citral does not therefore exactly represent the flavour of essence of lemon. This is readily observable if citral, instead of essence of lemon, be used in flavouring sherbert. A process for preparing the concentrated or terpeneless oil of lemon is given in 'Notes on Essential Oils,' by T. H. W. Idris. Oil of verbena, or lemon grass oil, contains, according to J. C. Umney, 44-75 per cent. of citral. It is also present in considerable quantity in the oils of *Backhousia citriodora* and *Eucalyptus staigeriana*. For methods of preparing citral artificially see Gildemeister and Hoffman 'Die Ätherischen Oele' (p. 212-213), published by Julius Springer, Berlin, 1899. Citral is used to add to ordinary essence of lemon to increase its strength. Thus the proportion of 7½ grammes of citral to a kilogramme of normal essence of lemon is recommended by Messrs. Schimmel and Co. (*Bericht*, April, 1897) to double its strength and 22½ grammes of citral to quadruple its strength, on the supposition that 7½ per cent. of pure citral is the average percentage present in normal essence of lemon. A soluble essence of lemon is also sold which is prepared from the fresh lemon peel by means of alcohol, which dissolves the oxygenated constituents but not the terpene (citrene). We are not aware of any book devoted especially to the manufacture of soluble essences. You will find a chapter on the subject in MacEwan's 'Pharmaceutical Formulas.'

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, JUNE 2, 1900.

WHAT IS THE MANDATE ?

BEFORE the passing of the Pharmacy Act, 1868, a present member of the Council—who then occupied the position of a local secretary and, in that capacity, had been requested to assist the Council by obtaining an expression of opinion on the Bill which had been proposed—wrote a letter to the Journal in which he said “it is a source of regret that a more cordial spirit of co-operation does not exist among ourselves as chemists and druggists. We present another illustration of the sad truth that ‘a man’s foes are they of his own household.’ Our greatest difficulty will not be the House of Commons or the nation, but our divided position before them both.” Notwithstanding the lapse of time since that statement was made, a similar condition exists—in spite of the provision that has since been made, by legislation and otherwise, for protecting the interests of chemists and druggists, for bringing them into harmony with the interest of the public and, on that basis, securing protection of those who carry on the business—the incoherence prevailing at the present time among chemists and druggists is as great as, if not greater than, it was when that letter was written. In the first place the Pharmaceutical Society—the only possible means through which protection of the interests of chemists and druggists can be made effective—numbers only about one-third of the persons who are engaged in the business and are, thus, brought into continual contact with conditions which make them feel the want of protection. That such a state of things should continue is almost inconceivable, especially since the support of other attempts to provide protective organisation has proved the want and should, with experience of the failure of those attempts, have brought conviction as to the mode in which protection is alone possible.

Even in the narrower range of members of the Society, there is similar evidence of incoherence and of great diversity of opinions relating to matters of primary importance, which suggest the divided house and its natural consequence. Thus, for instance, on the subject of company trading, as it affects the position of chemists and druggists, the views entertained seem either unintelligible or quite irreconcilable. After all that has been said and written about that subject by chemists and druggists, the fact that one-third of the Society’s members, apparently, took no part whatever in an election that was supposed by some to involve decision as to

the mode in which that subject should be dealt with, is in itself passing strange. Is it to be inferred that the non-voters were absolutely indifferent to this matter? Or can it be that where, as some say, their very existence is at stake, they are content to leave their interests to chance and altogether in the hands of others? What, moreover, is to be inferred from the action of those who voted in the recent election of members of Council, but the existence of division that is most perplexing? One of the newly elected members of the Council—who takes a very liberal view of pharmacy—has emphatically declared that it is no part of the Society’s business to take part in the regulation of companies that undertake to sell or dispense poisons; that its protective action should be strictly confined to defending the right of registered chemists to exclusive use of the title indicating their qualification. Two others, on the contrary, are willing to sacrifice the principle of qualification by compromise; they propose that the Society should undertake the task of regulating companies; while one of them has advocated the recognition of such companies—in the position of legally qualified persons—provided they are “controlled” by qualified directors or managers—a proceeding which appears to be like hanging on to the shadow of proprietary qualification after the substance of it has been lost, besides having the further objectionable feature of failing to secure public safety by requiring effective qualification of the actual seller or dispenser of poison.

The opinion expressed in a recent article as to the unaltered position of the Council in regard to the Companies Bill as it now stands, will probably not be adopted by every one; it may even be that, in some quarters, the result of the Council election will be considered as affording some indication of a course to be taken different from that hitherto adopted by the Council. How far that view is justified is, however, a question that is not, by any means, settled by the election results, for—without any reference to the effect produced by abnormal efforts to counteract what is scoffingly spoken of as “the Bloomsbury clique”—it is evident that each of the newly-elected members of Council has only been returned by about one-third of the members of the Society, the other two-thirds in each instance either voting against them or remaining inactive. If, therefore, the judicial decision—that, when a company employs a qualified seller or dispenser, the public object of the Act, 1863, is sufficiently secured—has to be accepted by chemists and druggists as an authoritative construction of the Act, it is by no means a necessary consequence that Clause 2 of the Companies Bill could be opposed only in so far as it proposes to give away the title by which the qualification of individuals to sell or dispense poisons is to be indicated for the safety of the public. That proposal is utterly irrational, whatever may be said of the common-sense view that seems to have been taken by the LORD CHANCELLOR of the claim to keep open shop when considered in conjunction with the provisions of the Widow’s Clause. But keeping open shop for the sale or dispensing of poison, and the use of a title denoting qualification, are so closely connected that they, almost of necessity, go together. If either be admitted, the other must also be admitted. Consequently Clause 2 must be opposed altogether. There is no reason for supposing that, by augmented membership, the interests to be protected by the Society—either as a representative

or as an administrative body—have been changed as well as enlarged: they are still the interests of legally qualified persons. Unless regard for the “enlarged interests,” by which it is suggested that the action of the Council is to be regulated, means a return to free trade in physic, the purport of the electors’ mandate would seem to amount to nothing more or less than continuance of the policy the Council has already decided upon. In any case no reason has been shown for the action of the Council being controlled by those who have abused, bullied and—as far as they could—injured the Society.

COMPANIES BILL.

As substitutes for Clauses 2 and 3 of the Companies Bill, the following suggestions may be useful inasmuch as they would serve to bring companies within the operation of the Pharmacy Act, but would not, like the proposed amendments, involve sacrifice of the principle of qualification and of the use of a title to distinguish qualified persons.

2. No company may carry on the business of retailing, dispensing or compounding any article that is, or may be hereafter declared, a poison within the meaning of the Act, 31 and 32 Vic. cap. 121, unless the sale, dispensing or compounding of such article is, in every instance, conducted on behalf of the company by a person duly qualified under that Act, who shall conform to all statutory regulations relating to such business, and in case of any contravention of this enactment, either by a company or by the negligence of any person acting in its behalf, the company shall be liable, on summary conviction, to a fine, etc.

3. It shall be unlawful for any company to assume, use, or exhibit the title of physician, surgeon, dentist, pharmaceutical chemist, or chemist and druggist, or any name, title, or sign, implying legal qualification to carry on the profession or business of a physician, surgeon, dentist, pharmaceutical chemist, or chemist and druggist, and any company contravening this enactment shall be liable on summary conviction to a fine not exceeding five pounds for every day during which the contravention happens.

THE CHIEF OBJECT OF THE SOCIETY.

In the report of the Nottingham Association meeting which was received shortly before going to press, Mr. FITZHUGH—in returning thanks for his re-election as President for the twentieth time—spoke of the benefits which have been conferred by the educational work of the Association, and of the progress it has recently made. While advocating “a more severe test for students,” he expressed a hope that the Pharmaceutical Society would at the same time give more benefit to the outside members. If we do not misunderstand Mr. FITZHUGH in supposing that he referred to more systematic teaching that would enable candidates to acquire the requisite knowledge, and pass the qualifying examination with greater certainty, his further remark in reference to protection to the trade is but an expression of the view which has always been held by the Society, viz., that protection of those engaged in the business can be expected only as a result of systematic educational training, and that whatever the nature of the particular trade carried on by a chemist and druggist, it is only from the professional side that he can look for advantage over other traders.

ANNOTATIONS.

THE PRESIDENT OF THE PHARMACEUTICAL SOCIETY has always been a member of the Council residing in London, and in the course of the past sixty years it has come to be regarded as a necessity of the situation that such should be the case, though there is nothing in the Royal Charter or elsewhere to restrict the choice of the Council in the matter. The probability is that—as the Council consisted almost exclusively of London members during the early years of the Society’s existence, but few provincial members being elected on the representative body until after the Pharmacy Act of 1868 was passed—there was originally no option in the matter, and that what was thus at first a matter of necessity became an established custom in the course of years. It is a fact worthy of note, by the way, that only three out of the twelve Presidents prior to 1868 were not members of the original Council of the Society; since 1868 there have been only eight Presidents, not one of whom was a member of the original Council. The whole twenty, however, have resided during their term of office in the metropolitan district and, as a matter of convenience, it has been found distinctly advantageous for the President to reside in London. In the early days, when travelling facilities were not what they are at present, it would have been impossible for country members of Council to attend at headquarters as frequently as is desirable in the case of the President, and grave inconvenience might have been caused to everyone concerned when affairs of weight were under prolonged consideration. That difficulty is now minimised, though it will still remain a serious undertaking for any member living at a distance from headquarters to bind himself to spend a considerable portion of the year in London. That consideration, however, will not arise if a country member should be found willing, in case of need, to act as President, and, the conditions to-day being so different generally from those of twenty or thirty years ago, the only reasons that can be advanced for maintaining the old custom are that it has always prevailed, and that the Council has never thought it necessary or worth while to alter it.

IN VIEW OF THE FOREGOING FACTS it is quite easy to see both why the early Presidents should all have been London pharmacists and why, when the custom had been established for more than a quarter of a century, a habit should have been formed, which has never since been broken. Nevertheless, it is only an unwritten rule that the President of the Society should be a London pharmacist and, in case of need, it would be quite easy to suspend that rule. As will be seen at page 599, it is suggested by “An Ordinary Pharmacist” that, in view of the possibility of any difficulty being experienced in filling the presidential chair after Mr. Martindale’s retirement, the Council might do well to take advantage of the opportunity which, in his opinion, now appears to present itself for making such a change. This is not the first time the suggestion has been made, and only a few months ago a letter was received from a member of the Society, in which the appointment of a country member of Council as President was advocated. It was felt at the time, however, that since the selection of President is essentially a matter for the Council to deal with, the topic was hardly suitable for discussion in the correspondence columns of the Journal, the more especially as there appeared to be no immediate necessity for its consideration. But since there are now indications that the point may have to be dealt with before long, and there is no particular reason that members of the Society should abstain from expressing their views on the matter, as on all others connected with the affairs of the body corporate, no objection need be taken to the publication of suitable letters on the subject.

SO FAR AS ABILITY is concerned, there have always been country members of Council as capable of fulfilling the duties associated

with occupancy of the presidential chair as any of their London colleagues. Whether or not Mr. Newsholme would be willing to accept the responsibilities of the higher office we are unable to say, but, as recent experience has proved, there is no question of his ability to perform the duties of President in a manner that would give general satisfaction. The same may be said of other country members of Council, but, though the interests of the Society would undoubtedly be properly cared for in their hands, the difficulty remains that no one living at a distance from London may be prepared to devote the necessary time and attention to the conduct of the Society's affairs. The appointment of a London member as Vice-President would, of course, go far to meet that difficulty, and possibly, as our contributor suggests, certain duties which have come to be regarded as inseparable from the position of President might with advantage be delegated to others. In fact, there is good reason for believing that matters could be quite satisfactorily arranged in case of need. But whether the occasion to effect so novel a change may arise in the immediate future remains to be seen. Apart from that, however, it is well to be prepared for all eventualities and, as the constituents of a purely democratic body, the members of the Society may do well to devote careful consideration to the subject and to accustom themselves to an idea which, after all, is not so revolutionary as it may appear to them at first sight.

THE PRELIMINARY EXAMINATION conducted by the Pharmaceutical Society will be held for the last time in a few weeks from the present date, and it is satisfactory to find that opposition to the coming change in that direction is dying out, particularly in Scotland, where objection to the raising of the standard of elementary education has been most strongly manifested. At the annual meeting of the Forfarshire and District Chemists' Association (see p. 611) Mr. Kermath is reported to have said that, though he had been opposed to the change, he had since been looking into the matter, and was now inclined to think the new scheme might work out better than he had previously thought. There is not the least doubt that it will work out much better than the existing system, and any little difficulty that may be experienced in securing apprentices, because of the increased severity of the preliminary test, should be much more than compensated for by the better class of youths who may, in future, be expected to take up pharmacy as a profession. Registered chemists must rid themselves of the notion which leads so many of them to regard apprentices as a source of cheap labour. That idea has been responsible for much of the trouble which has come upon pharmacy as a trade and retarded its progress as a profession. But an opportunity now presents itself for getting rid, once for all, of the inferior material which it has been customary to introduce into the ranks, and it would be as well for chemists to resign themselves to the inevitable and endeavour to help themselves in a more creditable manner than is implied in lamenting the lack of cheap labour which is, in reality, dear at any price. Above all, it should be remembered that the desirable reform which involves the raising of the standard of elementary education among pharmaceutical students was initiated in Scotland.

THE QUALIFYING EXAMINATION was the subject of discussion at the same meeting, Mr. Kermath having introduced the topic by moving that the examination regulations should be altered, to the extent that candidates may be credited with the pass marks they obtain in any subject, even though they fail to satisfy the examiners in other subjects. His plea was that an endeavour should be made to lessen the burden of the examination to candidates, a thing which is eminently desirable in itself, provided nothing is done which may impair the standard of efficiency. Mr. Kermath thinks it is very hard that a candidate who has been successful in part of the examination should be compelled to present himself a second

time for that part because he has previously failed in other subjects. But it would be equally hard, if not harder, upon the public if a sense of pity were allowed to prevail and a number of unfit persons were sent out with the Pharmaceutical Society's hall-mark, nominally qualified to handle and distribute potent remedies with the skill and discretion such duties demand. As long as the State insists upon the due qualification of those who compound, dispense, or retail poisons, so long must the Society maintain a proper standard of efficiency, and that cannot be done if ill-prepared candidates are permitted to pass the qualifying examination in instalments. In drafting his original proposition Mr. Kermath evidently intended to permit candidates to pass in one subject at a time, but such a relaxation of the existing conditions would obviously lend itself to great abuse. Under such conditions cram would be more rampant than ever and registration would cease to be synonymous with qualification.

ALL MR. KERMATH'S ARGUMENTS might fitly be advanced in favour of imposing a compulsory curriculum, the one thing which would thoroughly justify splitting up the qualifying examination in a manner that would commend itself to many pharmacists. It is unfortunately true that pharmaceutical students are not, as a rule, educated at public schools, but that is no reason why apprentices should be taken from a very inferior class. If youths of the better classes prefer to enter some other profession, that is probably because too many of those who profess to practise pharmacy have not been careful to maintain the standard of their profession at a proper elevation. If the right class of youth is to be attracted to pharmacy, let it be understood that no one can secure registration as a pharmacist unless he is well educated generally, has been trained by a practising pharmacist for three years or more, and has gone through a compulsory course of study, supplemented by examination. As it is, the ranks have been crowded with illiterates who have been unable to secure the necessary technical training and, finding no real apprenticeship or proper course of study essential, have delivered themselves into the hands of the crammers and—presenting themselves for examination—attempt to foist themselves off as duly qualified individuals fit to be registered. Mr. Kermath thinks there is a danger of aiming at too high an ideal, which can never be attained; but even if so, that is better than attempting to fathom the bottomless depths of illiteracy and inefficiency. Fill the ranks of registered chemists with individuals who are unfit to enter any profession, and neither protection of titles nor any other privilege need be looked for. That is the moral to be drawn from the report of Mr. Kermath's utterances; no one has put the case for a compulsory curriculum better for many a long day.

THE PHARMACOPŒIA COMMITTEE of the General Medical Council, in its latest report, which was adopted by the Council on Wednesday, states that 31,500 copies of the British Pharmacopœia of 1898 have been printed, and 28,783 of those have passed into circulation, leaving in hand 2,717 copies. A communication from the Privy Council, forwarding a copy of a Note addressed to the Secretary of State for Foreign Affairs by the Belgian Minister, on the subject of a proposed International Pharmacopœia limited to drugs of a drastic nature, has been referred to the Committee, and it is recommended that, should an International Conference on the subject in question be arranged, the Council should be prepared to appoint representatives to participate in it, and to authorise the President to appoint one or more members to act as delegates. Another meeting has been held of the Conference of members of the Pharmacopœia Committee with representatives of the Pharmaceutical Society of Great Britain and the Pharmaceutical Society of Ireland, and on its recommendation certain questions of a pharmacological and pharmaceutical nature have been referred to experts for further investigation and report.

THE CANADIAN SUGGESTION, recently referred to in the Journal (*ante*, p. 483), appears to have been taken up by the authorities, since the report of the Pharmacopœia Committee states that communications have been opened with the United States authorities with a view to bringing about greater uniformity in the official preparations contained in the British Pharmacopœia and the United States Pharmacopœia respectively; and the hope is expressed that, by mutual concessions, important approximations and assimilations in the contents of the two works may be ultimately secured. Further communications have been received with reference to the Indian and Colonial Addendum, and important suggestions from Canada have been considered by the Committee in detail and reported on. It is hoped that a final draft of the Addendum may be presented to the Council at the November meeting, and that the Addendum itself may be authorised for issue by the end of the year. In conclusion, it is stated that, by the assiduous efforts of Dr. Leech, a valuable collection of British and foreign works bearing on the history and development of the Pharmacopœia has been got together and deposited in the Council's office. Thanks are expressed to Dr. Leech, Mr. Bryant, Mr. Ekin, and Mr. Walter Hills for important contributions to that collection, and the Committee hopes that from time to time further additions may be made to it by members of the Council and others. A list of the works already deposited has been printed, and occupies sixteen octavo pages.

A PHARMACY ACT CASE, reported at page 601, is interesting as showing how prosecutions under the Act may, as Sheriff McLeod expressed it, become a farce. The defendant, a female assistant in a shop belonging to a medical practitioner, was charged with the illegal sale of laudanum, and pleaded guilty, but is unable to pay the fine imposed by the Sheriff. Her employer, who is morally responsible, declines to pay the fine, and as the terms of the Pharmacy Act, 1852, do not permit of imprisonment in default, the defendant gets off scot free. Another Scotch case, brief particulars of which are given this week, is remarkable for the fresh light it throws upon the operation of the Pharmacy Act of 1868 in Scotland. In England and Wales, as is well known, the Pharmaceutical Society alone can institute proceedings under Section 15 of that Act, and it has been thought that, in spite of the great difference in procedure in the English and Scottish Courts, the same was the case in Scotland. It is claimed, however, that, in accordance with Scotch law, a Procurator-Fiscal, in virtue of his office as public prosecutor, has a concurrent title to prosecute for offences under Section 15, the procedure in such cases being governed in Scotland by the provisions of the Summary Jurisdiction Acts. Until the case reported at page 601 was instituted, the Lord Advocate—who instructs the Procurator-Fiscal—has always contented himself with notifying the Pharmaceutical Society of offences under Section 15, when reported to him, but in the present instance he has authorised a prosecution without referring the matter to the Society, a penalty has been imposed, and what appears to be a further complication is introduced in connection with the administration of the Pharmacy Acts in Scotland.

THE SECRETARY OF THE PHARMACEUTICAL SOCIETY has been surprised at receiving from the postal authorities on Thursday, May 24, 1900, a voting-paper posted at Bristol by a member of the Society on May 25, 1891. It appears to have travelled from Bristol to London without delay, the post-mark of the W.C. district office being dated May 26, 1891. But the space of nine years, less two days, elapsed before the voting-paper reached its destination at 17, Bloomsbury Square. Moreover, the sender has now been dead for three years

ENGLISH NEWS.

THE STUDENTS OF THE MANCHESTER COLLEGE OF PHARMACY spent a most enjoyable and instructive afternoon on Wednesday, May 23, in looking over the extensive warehouses and works of Messrs. Evans, Sons, and Co., Liverpool. The party, which numbered about fifty, left Manchester in two reserved saloons at 1.30, and on their arrival proceeded, under the guidance of Mr. Wellings, to see the enormous stores of drugs, etc. The Montserrat lime-juice, of which there were piles of pipes, evolved a most appetising odour. Mr. Bird took charge of the party at the works in Fleet Street, and described fully the many stills, drug mills, and other pharmaceutical appliances—in one pan there was being prepared 200 gallons of ext. cascar sagrad. liq. in a percolator of gigantic size, a ton of podophyllum rhizome was being exhausted for the preparation of resin, and a similar percolator was at work with a ton of scammony root. The ingenious contrivances for the recovery of the spirit were explained. The hydraulic tincture press, working at 300 tons pressure, was most interesting. Mr. Evans jun., joined the party later in the afternoon, and afterwards went with them to the tea which had very kindly been provided by Messrs. Evans for the visitors. A cordial vote of thanks was proposed to the firm by Mr. J. L. Scott, seconded by Mr. Boothroyd and carried with hearty goodwill.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.—A meeting of this Association was held in the Lecture Theatre, at 17, Bloomsbury Square, on Friday evening, May 18, Mr. E. M. Chapman in the chair. The minutes of the previous meeting having been read and confirmed, the Chairman called upon Mr. H. Deane to read a paper on "Explosives." Mr. Deane, after giving a brief *résumé* of the history of the development of explosives used in war, proceeded to give an account of the manufacture of the more important explosives in use at the present day, paying particular attention to nitroglycerin and gun-cotton. Specimens of gun-cotton, blasting-gelatin, roburite, and fuses of different kinds were handed round for inspection. At the conclusion of the paper many members expressed their thanks to Mr. Deane for the interesting manner in which he had dealt with his subject, and several questions were asked. Mr. Deane having answered the questions put, the Chairman thanked him for the paper. Mr. Chapman also called the attention of the meeting to a specimen of *Utricularia* on the table, kindly lent by Mr. Pollard. Some discussion with regard to this plant had arisen at the previous meeting of the Association.

POISONING BY CARBOLIC ACID.—The Birmingham coroner held an inquest on May 23 with respect to the death of a child named Charles Henry Docker (4), of Paradise Terrace, Darwin Street. Evidence showed that on the previous Sunday, while alone in the bedroom, he picked up a bottle containing carbolic acid, of which he swallowed a quantity. "Death by misadventure" was the verdict.—Another death from the effects of carbolic acid poisoning occurred at Shenfield on Friday, May 25, Henry Linsell, a jobbing carpenter of Ilford, being found lying dead in a field. At an inquest, held on Saturday, a verdict of "Suicide by carbolic acid poisoning while in an unsound state of mind" was returned.

SALE OF SPIRIT OF NITRE.—On May 16 at Fenton Petty Sessions, before the Stipendiary Magistrate, Isaac Bowers, grocer, Fenton, was ordered to pay the costs, 16s., for selling sweet spirit of nitre deficient in ethyl nitrite to the extent of 33 per cent. It was stated that the deficiency was due to improper storage, and the magistrate remarked that it was indiscreet for small tradespeople to keep drugs, the properties of which they know nothing.

SCOTTISH NEWS.

WEST OF SCOTLAND COLLEGE OF PHARMACY.—On Thursday May 24, being the Queen's Birthday holiday, the students, conducted by Mr. Thomas E. Barrie, botanised along the Clyde from Cambuslang and Carmyle to Kenmuir. The turn-out of students was the largest on record, and in honour of the event Mr. Barrie had the party photographed. A large number of specimens was collected and studied, the following being a selection:—*Caltha palustris*, *Ranunculus ficaria*, *R. acris*, *Barbarea vulgaris*, *Cardamine amara*, *C. pratense*, *Lychnis diurna*, *Stellaria holostea*, *Pyrus padus*, *Geum rivale*, *Cytisus scoparius*, *Vicia sepium*, *Myrrhis odorata*, *Taraxacum officinale*, *Doronicum pardalianches*, *Petasites vulgaris*, *Lamium album*, *Myosotis palustris*, *Symphytum officinale*, *Agraphis nutans*, *Allium ursinum*.

POISONING BY POTASSIUM BICHROMATE.—Robert Smith, the one-year-old child of William Smith, Renfrew, died on May 23 from the effects of chrome poisoning. While the mother was making breakfast on Sunday the baby picked up from the floor a piece of potassium bichromate, which had been used for some laundry purpose, and sucked it. A doctor was at once called in, but the child died, after great suffering.

POISONING BY CARBOLIC ACID IN EDINBURGH.—On Sunday morning last, about two o'clock, Mrs. Susan Elliot, fifty-nine years of age, 12, Haddington Entry, Canongate, Edinburgh, took a draught of carbolic acid in mistake for a kind of non-alcoholic ale. The deceased's husband and other members of the family were in the house at the time. She at once noticed the mistake she had made and a doctor was sent for but life was extinct before he arrived. There were, it seems, two bottles, alike in shape and appearance, standing together on a shelf, the one containing carbolic acid and the other the ale, and it was by taking up and drinking from the wrong bottle that the unfortunate fatality occurred.

IRISH NEWS.

OVERDOSE OF LAUDANUM.—An inquest was held on May 24, at Kingston, co. Dublin, concerning the death of Dr. Edward Finucane (45), evidence being given to the effect that deceased had been invalided out of the Cunard steamship service, and had since suffered from lumbago and sleeplessness. On the evening of May 23 he was found in his bedroom unconscious, a bottle containing laudanum being near at hand. Medical aid was summoned, but death occurred early the following morning from the effects of an overdose. The jury returned a verdict that deceased died from an overdose of laudanum, taken as a remedy for insomnia.

ANALYSIS OF DRUGS.—At the last meeting of the Guardians of the Mitchelstown (Co. Cork) Union a communication was read from Sir Charles Cameron, Dublin, analyst for the Union, to the effect that the pepsin supplied by the contractor and analysed by him contained only 5 per cent. of the proper strength. The Clerk said that the medical officers of the Union had complained of the length of time that elapsed before a report was obtained from Sir Charles Cameron on the medicines and drugs sent by them for analysis. In fact, all the medicines were used up before a report on them was received from the analyst. The matter was referred to the medical officers.

FOREIGN NEWS.

THE GERMAN PATENT OFFICE has struck out the words "Lanolin" and "Lanolinum" from the register of trade-marks. The words will for the future be free to use in Germany.

ACCIDENTAL POISONING.—Of late there seems to be quite an epidemic of poisoning by "canned" fish, etc., in Paris. The latest is that of a gas-lighter, upon whose body Dr. Socquet has just held a post-mortem examination at the Morgue. Monsieur Villette, his wife and daughter, who inhabited the Ternes quarter of Paris, partook of a box of sardines which was purchased from a neighbouring grocer. All were seized with violent pains in the intestines, and medical aid was summoned. Notwithstanding careful treatment Monsieur Villette died on April 30. His wife and daughter are by no means yet out of danger. Acting upon a mandate issued by Monsieur Josse, Juge d'Instruction, Monsieur Chapel, Commissaire de Police, has seized all the boxes of sardines of the incriminated brand, and will order an analysis to be made at the Municipal Laboratory.

AUSTRALASIAN NEWS.

PHARMACEUTICAL SOCIETY OF AUSTRALASIA.—The forty-third annual meeting of this Society was held on March 30, the formal business, as on the last occasion, being disposed of in the early part of the day, while the annual distribution of prizes to the successful students at the Melbourne College of Pharmacy was associated in the evening with a conversazione and concert, which attracted a large number of members and their lady friends. There is nothing of special interest in the report that has not already been dealt with in these notes. The statement of receipts and expenditure presented were of the usual satisfactory character, and it says much for the solid position and prosperity of the craft in Victoria that the claims made on the Benevolent Fund during the year were covered by the small amount of £3.

AMONG THE SUCCESSFUL STUDENTS for the past year one, Mr. Thomas Stawell Hutchings, established an almost phenomenal record, having secured no less than six prizes—viz., silver medal for chemistry, silver medal for materia medica, silver medal for botany, lecturer's prize in chemistry, lecturer's prize in botany, and the gold medal of the Society to the victor in the Honour Examination. Next in order to Mr. Hutchings came Mr. Stanley Lehman, who secured the bronze medal for chemistry, bronze medal for botany, and the lecturer's prize and certificate of honour for materia medica. Both the young gentlemen were warmly complimented on their success by the President, and hopes were expressed that they would in due time attain to high positions in the scientific and professional world.

AT THE APRIL MEETING OF THE COUNCIL of the Pharmaceutical Society of Australasia the President (Mr. Witt), Vice-President (Mr. E. T. Church), and the Hon. Treasurer (Mr. E. G. Owen) were re-elected for the ensuing year, and leave of absence for six months was granted to two members, Messrs. D. Rankin and D. Shaw, who are about to pay a visit to the "old country."

MELBOURNE COLLEGE OF PHARMACY.—A further proof of the high estimation in which the educational facilities afforded by the College of Pharmacy are regarded by the authorities of the Melbourne University has recently been given, the curriculum for 1900-1901 having been so altered that the course in materia medica, as well as that in practical pharmacy, will be taken by medical students at the College instead of at the University, as hitherto. The Faculty of Medicine is further prepared to recommend to the Council of the University that one of the College teachers be appointed University Examiner for the year, and that it be open for the other teacher to make application for a similar appointment. And not only this, but that the senior lecturer be accorded a seat on the Faculty, an honour which has given very considerable satisfaction to Victorian pharmacists. When it is remembered that the College also provides for a special course of lectures and practical work in

chemistry for students of the Australian College of Dentistry and a course of instruction specially adapted for those desirous of qualifying themselves for the responsible work undertaken by public analysts—its certificate of examination being recognised by the Public Health Department—it will be seen that, apart from its more immediately pharmaceutical purposes, it occupies a very important position among the educational forces of the Colony.

APPRENTICES' INDENTURES.—Some interesting questions in connection with apprentices' indentures came before the Pharmacy Board of Victoria at the April meeting. In one case, where an indentured apprentice was reported to be devoting a portion of his time to other business, the question arose as to the competency of his master to furnish the necessary declaration to be approved by the Board that the apprentice had faithfully and without unreasonable intermission served for the time required by the Medical Act, 1890. The Board were advised that an apprenticeship would mean that the whole of the time of the apprentice should be devoted to his master's service during the ordinary hours of business, and it was not competent for him to elect to serve at any period it might be agreed upon. It was therefore resolved that both the apprentice and his master be informed that should these conditions not be complied with the Board would not feel bound to accept a declaration on the completion of the term stated in the indenture.

A SECOND POINT WAS RAISED by several apprentices, who, being desirous of serving in the Victorian contingent for South Africa, wrote asking that their indentures might be suspended during their absence. In these cases it was decided that a reply should be sent to the effect that the Board had no legal right to interfere in the indenture between master and apprentice, but that if it could be shown that the applicants were engaged in the Queen's service, and that a supplementary apprenticeship had been served completing the full period of four years, the Board, on being satisfied as to the *bona fides* of the service, would be willing to accept the declarations.

IN NEW SOUTH WALES an effort has recently been made to secure the recognition by the Pharmacy Board, as a school or college of pharmacy, of an institution known as the Technical College, situated at Bathurst. After mature deliberation the Board has decided to refuse, for the present, at least, this and any similar applications, being of opinion that such an education as is requisite for pharmaceutical students in New South Wales can only be supplied by the Sydney University, with the authorities of which the Board has made arrangements to carry on the lectures in botany, materia medica, and chemistry, and to conduct examinations in these subjects.

THE PHARMACEUTICAL SOCIETY OF NEW SOUTH WALES held its twenty-fourth annual meeting on March 29, when the balance-sheet presented showed an income of £231 16s. 6d., and expenditure of £229 13s. 10d., while, according to the statement of assets and liabilities, there is a surplus "capital" of £623 19s. 9d. Apart from the Early Closing movement, social functions, and the alteration of the Articles of Association, there was not much of general interest to report. Messrs. C. A. Marshall, S. Mears, and W. Short, the Councillors retiring by effluxion of time, were re-elected without opposition.—At a recent meeting of the Council a proposal was made by Mr. Marshall that a Defence Fund should be initiated, and as this would, according to legal advice, necessitate an alteration in the Articles of Association, the following draft of an amendment has been submitted by the Society's solicitors for consideration:—"That the following shall be an additional article of association of the Pharmaceutical Society of New South Wales, namely:—"That the Council of the Society shall without delay set apart the sum of £50 to be devoted to a defence fund, and shall add the sum of £10 yearly thereto till the sum of £100 shall be accumulated, and

such defence fund shall be available for any member of the Society who is and has been subscribing for two years, and provided that the Society's solicitors for the time being consider the case one of blackmail and not due to the fault of the defendant, and should the fund by reason of appropriations therefrom at any time be reduced to a less sum than £100, the sum of £10 shall be added yearly thereto until the fund shall amount to the sum of £100, the intention being that there shall at all times be the sum of £100 to the credit of such defence fund.'"

SOUTH AFRICAN NEWS.

MR. WILLIAM MARTINDALE, President of the Pharmaceutical Society, has been having a tour in Cape Colony, having arrived there by the s.s. "Scot." The chemists in Cape Town, Port Elizabeth, East London, Durban, and other towns, who have had the pleasure of meeting Mr. Martindale—and they are not numerous on account of that gentleman's retiring disposition—wish him a pleasant trip, and that on his return to the Old Country he may find his visit to South Africa has been beneficial in renewing his health. He expects to arrive in London on June 2.

MR. VICTOR BROWNE, one of the directors of Lennon, Limited, is, unfortunately, in a serious state of health. Since leaving Johannesburg, where he was the resident director, at the outbreak of the war, Mr. Browne has resided in Cape Town, and the change from the dry air of the Rand to the coast has proved far from advantageous. His friends wish him a speedy recovery.

MR. A. MASTERTON, senior assistant with Lennon, Limited, East London, and formerly with Bathgate and Co., Calcutta, and Grattan and Co., Belfast, has purchased the business of Mr. Leyshon Andrew, pharmaceutical chemist, of Grahamstown, Cape Colony.

THE WEST COUNTRY ASSOCIATION DINNER held in King William's Town on St. George's Day, was a notable event in the Eastern Province. Much of its success was due to the energy of the popular secretary, Mr. A. G. Doble (Tavistock.)

ONE OF THE EFFECTS OF THE WAR on the commercial element is felt in the transporting of goods from the ports to the inland and up-country towns. The military authorities have found it necessary to "commandeer" nearly all the railway trucks for sending stores and ammunition to the front, so that the traders and business men find that their goods are left on the wharves to the extent of thousands of tons. A good deal is being sent by the old method of the bullock-waggon, which is slow, indeed, compared to the "iron horse," and even the teams of oxen are being bought up by the Imperial Government for transport service, so that things are a bit awkward. The chemists in the coast towns have a great advantage just now over their up-country confrères in that respect.

AMERICAN NEWS.

SOME RETAIL DRUGGISTS OF NEW YORK have been caused a shock by the receipt of an apparently official "First Notice," dated New York, May 3, 1900, reading as follows:—"Your attention is called to the fact that under the provisions of Chap. 494, Laws of 1900, it is a misdemeanour to charge liquids with gases under pressure (manufacture soda water, mineral waters, sarsaparilla, ginger ale, root beer, etc.) in any building occupied in whole or in part by persons for living purposes, and the punishment for each and every violation is a fine not exceeding 500dols., or imprisonment not exceeding one year, or both. (Signed) James Jackson, Deputy Factory Inspector, Fruit Juice and Carbonator Department." The "notice" was evidently intended to scare the druggists, and to prevent them from making their own soda water. That it partially

succeeded in its object, in so far that it was taken seriously by many, is evinced by the fact that the subject was discussed by the King's County Pharmaceutical Society, the Legislative Committee being empowered to employ counsel for the defence of any member against whom a test case might be brought. Senators and Assembly men were interviewed on the subject, also several of the principal druggists in the district, all expressing surprise and indignation that an attempt should be made, through the Legislature, to prevent aerated drinks being made and sold by druggists, some freely expressing the opinion that the Bill had been introduced solely in the interests of certain manufacturers. Others pointed to the necessity for a closer watch being kept, in the interests of druggists, on legislative proceedings.

THOSE WHO MIGHT BE ANNOYED in any way by threats to enforce the alleged "law" were advised by the *American Druggist* to follow the advice of the State Factory Inspector—viz., to call a policeman. For inquiry at the office of the official referred to showed that no person named James Jackson was in the employ of the department mentioned, and that no law containing the provisions cited in the notice had passed the Legislature or been signed by the Governor. A Bill has, however, recently become law relating to the manufacture of explosives and liquid or compressed air or gases in buildings occupied in whole or in part as dwelling places, the section relating thereto stating that:—"A person who manufactures gunpowder, dynamite, nitro-glycerin, liquid or compressed air or gases, except acetylene and other gases used for illuminating purposes, naphtha, gasoline, benzine, or any explosive articles or compounds, or manufactures ammunition, fireworks, or other articles of which these substances are component parts, in a cellar, room, or apartment of a tenement or dwelling house or any building occupied in whole or in part by persons or families for living purposes, is guilty of a misdemeanour." The editor of the *American Druggist* remarks that "the average retail druggist appears to fall an easy victim to all and sundry swindling schemes that may be invented," and he goes on to state that "the language of the law has been purposely misapplied to frighten druggists into discarding the use of liquid carbonic acid gas."

AN ACT TO AMEND THE STATE PHARMACY LAW, which will come into operation in New York State on January 1, 1901, provides for a new State Board of Examiners. For the purposes of the Act the State is divided into three sections, by counties—eastern, western, and midland sections. The State Board of Pharmacy will consist of fifteen members, five from each of the sections, no person being eligible for election unless he be a citizen of the State of New York and a resident and licensed pharmacist of that section of the State for which elected. Each member of the State Board of Pharmacy will be entitled to receive five dollars for each day actually engaged in the performance of services as a member of the Board, or any one of its branches, provided that no member shall receive more than 150dols. in any one year, together with his necessary expenses and disbursements.

THE POWERS AND DUTIES OF THE BOARD are:—(1) To make such by-laws, rules, and regulations not inconsistent with the laws of the State as may be necessary for the protection of the public health and the lawful performance of its powers. (2) To regulate the practice of pharmacy. (3) To regulate the sale of poisons. (4) To regulate and control the character and standard of drugs and medicines dispensed in the State. (5) To investigate all complaints as to quality and strength of all drugs and medicines, and to take such action as may be necessary to prevent the sale of such as do not conform to the standard and tests prescribed in the latest edition of the United States Pharmacopœia. (6) To regulate the number of hours constituting a day's work of employees in a drug store or pharmacy, in cities having at the last State or United States census a population of a million or

more inhabitants, which shall not exceed one hundred and thirty-six hours in each two consecutive weeks. (7) To employ inspectors of pharmacy, and to inspect during business hours all pharmacies, dispensaries, stores, or places in which drugs, medicines, and poisons are compounded, dispensed, or retailed. (8) To hold meetings as often as its business shall require, and to conduct examinations of applicants for licences monthly, when so determined by the Board, except in July and August, and not less frequently than once in three months. Two grades of licences will be issued, known as "licensed druggist" and "licensed pharmacist," and one grade of certificates as "registered apprentice," except that in cities having a population of a million or more inhabitants a licence for the grade of "licensed druggist" will not be issued.

THE BOARD IS ALSO AUTHORISED to investigate all alleged violations of the provisions of the Act, or any other law of the State regulating the dispensing or sale of drugs, medicines, or poisons, or the practice of pharmacy, which may come under its notice, and whenever there appears to be reasonable cause therefor to take and hear evidence with reference to the same, and, in the discretion of the Board, to bring such cases to the notice of the proper prosecuting authorities, or bring actions in the name of the State Board of Pharmacy.

THE ANNUAL REGISTRATION OF EVERY PHARMACY, store, dispensary or place in which there is compounded, dispensed, or sold drugs, medicines, or poisons, is provided for by the new Act, the State Board of Pharmacy being empowered to require as a pre-requisite for such registration the furnishing of evidence satisfactory to the Board that the same is conducted in full compliance with the law and the regulations of the Board, and to charge and to receive the sum of two dollars for each such registration. It also has power to revoke any licence issued by any Board of Pharmacy of the State.

THE LEGAL DEFINITION OF A PHARMACY is as follows:—Every place in which drugs, medicines, or poisons are retailed or dispensed, or physicians' prescriptions compounded, shall be deemed to be a pharmacy, or a drug store, and the same shall be under the personal supervision of a licensed pharmacist, or druggist, respectively. And it is provided that every person, partnership, association, or corporation doing business as the proprietor, or proprietors, of a pharmacy, or a drug store, shall cause the actual name of such proprietor, or proprietors, to be displayed upon a sign, which shall be kept conspicuously placed upon the exterior of the premises where such business is conducted. It is also provided that every person practising as a licensed or registered pharmacist, assistant pharmacist, or druggist, must at all times display his certificate of licence or registration, conspicuously in the place in which he practises under such licence or registration.

THE LEGAL STANDARD for strength, quality, or purity of all pharmaceutical preparations sold or dispensed in a pharmacy, dispensary, store, or place, unless otherwise prescribed for, or specified, by the customer, will be the latest edition of the United States Pharmacopœia. And every proprietor of a wholesale or retail drug store, pharmacy, or other place where drugs, medicines, or chemicals are sold, will be held responsible for the quality and strength of all drugs, chemicals, or medicines sold or dispensed by him, except those sold in original packages of the manufacturer of those articles, or preparations known as patent, or proprietary medicines. Persons guilty of fraudulently falsifying or adulterating any drug, medical substance, or preparation authorised or recognised in the United States Pharmacopœia, or used, or intended to be used, in medical practice, or fraudulently offer for sale, sell, or cause the same to be sold will be guilty of a misdemeanour, all drugs, etc., so falsified or adulterated being forfeited to the Board, and, by the Board, destroyed.

NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION.

The annual meeting of the Nottingham and Notts Chemists' Association was held at the Albert Hotel, Derby Road, on Wednesday, May 30, Mr. R. FITZHUGH (President) occupying the chair. There were also present Mr. R. H. Beverley (retiring Vice-President), Mr. J. Wilford (Hon. Treasurer), Messrs. A. Middleton, J. Smith, E. Gascoyne, W. Gill, W. H. Smith, J. Rufford, jun., E. Turton, F. R. Sergeant, C. A. Bolton, A. E. Beilby, R. Widdowson, T. Wilson.

The SECRETARY read the annual report, which reviewed the work of the past year, and on the motion of Mr. BEVERLEY, seconded by Mr. GASCOYNE, the report was adopted.

The CHAIRMAN moved, and Mr. SERGEANT seconded, a vote of thanks to Messrs. Newball and Mason for their donation of £5 towards providing prizes in connection with the students' classes, and the the proprietors of *The Pharmaceutical Journal* for supplying the Journal.

The Treasurer's report showed that the year began with £11 6s. 9d. in hand, and the total receipts, including this, amounted to £73 12s. 6d., while the payments during the past year absorbed the income within £8 16s. 11d.

ELECTION OF OFFICERS.

The election of officers was then proceeded with. To the nominations of President (Mr. R. Fitzhugh), Vice-President (Mr. W. Gill), Hon. Treasurer (Mr. J. Wilford), and Hon. Secretary (Mr. A. Eberlin), there was no opposition. The voting for the Council resulted in the following being elected:—Messrs. R. H. Beverley, F. R. Sergeant, C. A. Bolton, A. E. Beilby, E. Gascoyne, A. Middleton, T. Wilson, and J. S. Radford.

VOTES OF THANKS.

Mr. GILL, after returning thanks for his election, proposed a vote of thanks to the Vice-President for his services during the year, to which Mr. BEVERLEY suitably replied.

The PRESIDENT thanked the Association for re-electing him as President. He assured them that it had been a very great pleasure to preside over their meetings for the last twenty years. He could not expect for many years longer to preside over the Association, but so long as they were willing to elect him he hoped he should always be able to fulfil the position to their satisfaction. Like their late Vice-President, he had not done much during the past year, but he had left it to the Executive and the Council, and he tendered to them his sincere thanks for carrying on the business in such an efficient manner. He regretted they had not been so successful in the educational part of their work as before, but he was still in the hope that during the coming year they might have a larger number attending the classes. He thought he might say that it was the unanimous opinion of the Council that they should not attend the classes at the University were they to be thrown open to the general trade. He quite concurred in that opinion. He had held that opinion from the commencement of the Association, and up to the present time they had been able to have the classes kept for their own purposes; and he might say that they had been successful. He always looked back to those round that table who had received great benefits from that Association, and he wished they could look forward to that Association being as successful in this matter in the future as in the past. They should have a more severe preliminary examination for students, but he hoped that as it increased in severity the Pharmaceutical Society would give more benefit to the outside members than they had received in the past. He said that, because for all the trouble and expense they had been put to, he did not think they had received sufficient protection of the trade to encourage their continuing to support the Society as they had done. They must not think

that he was running down the Society, but if they got more representatives from the country they would understand the trade better than some of those gentlemen who lived in London and were on the Council, and who knew very little of what the country trade of a chemist and druggist was. He hoped he was not treading upon the toes of any of those gentlemen by expressing those opinions, but they were his opinions. He should like their business to be called a profession, but it would be some little time before that was a fact. While, however, they dealt in soft soap, blacklead, and other similar things, he did not think they would be able to call themselves a profession. He did not mind himself being called a tradesman. With regard to their Association, he hoped they might continue to increase their numbers, and that they might continue to be a flourishing Association. They were always looked upon in different parts of the country as an organising society—a fact of which they were proud, and he hoped they would not lose the esteem of their fellow tradespeople or of the country at large.

Mr. BOLTON proposed a vote of thanks to the Secretary, who, he said, was the right man in the right place for that Association, and their trade in the city at the present juncture. With regard to the classes at the University, it had been a disappointment to him that it had been thought desirable by certain people, who had taken a very narrow view indeed from a technical misunderstanding, to favour the course they had done. He was glad they had Mr. Eberlin at the helm, because he thoroughly understood the needs and requirements of the Association, the assistants and masters in reference to the coming changes in the examinations. They thought that the University College certificate might be accepted by the London authorities. If the College did not carry out the obligations which they felt they were under to the Association, to a certain extent they would have to fall back upon themselves. He had no fear about that, however, because he felt that the members of the trade would stand shoulder to shoulder, and would not leave the assistants and the apprentices without the means of being able to study for the examinations which were before them. He thought when that came to pass they would support the hands of the Secretary, the Executive of the Association, and their Chairman, so that if they were debarred the use of part of University College they would be able to make up that loss by providing proper and suitable classes. In that matter they could rely upon Mr. Eberlin at the present time. Mr. Eberlin did not begrudge any time, labour, and study, so long as he furthered the interests of the Association.

Mr. EBERLIN thanked the members for the hearty manner in which they had accorded him the vote of thanks. He felt, nevertheless, in spite of the extremely flattering way in which Mr. Bolton had spoken of him, that there were many shortcomings and that he had not carried out the work of the Association in the best manner. Pressure of time had prevented him from doing that, and nothing but a sincere desire to see the cause of education carried through had induced him to take the position of Secretary again. He was very anxious indeed that they should provide some very efficient system of education for their students. Of course, it was not possible for him to go into details. At any rate, they could rely upon whatever was done in the interests of the students being well considered, and he believed they would be able to formulate a scheme whereby the education of the students would be advanced. For some time past he had felt that they had not kept quite abreast of the requirements. He felt that they needed some further developments of their educational scheme, and he believed they would be able to carry out successfully what was wanted, and that they could make Nottingham what it had been in the past—the premier provincial town for the education of pharmaceutical chemists. He sincerely hoped that they would be able to accomplish this.

On the motion of Mr. GASCOYNE, a vote of thanks was also accorded to the Treasurer,

FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION.

The annual business meeting of this Association was held at the Star Hotel, Montrose, on Wednesday, May 23, 1900. Mr. CHARLES KERR, Dundee, occupied the chair, and there was a good attendance. The CHAIRMAN referred to the

WORK DONE DURING THE YEAR

in connection with the scheduling of carbolic acid, the Companies Bill, the need for seeking additions to the schedule of poisons, the regulation of the practice of pharmacy in hospitals and surgeries, etc. In regard to the resolution adopted at the March meeting, asking the Council to suspend the contemplated imposition of a higher standard in the Preliminary Examination, a printed card had been received from the Secretary, stating that the communication had been received, and would be attended to, but beyond that they had not heard that anything had been done. Although it would be much against their getting apprentices, he feared nothing would be done, and they would just have to submit. He had received from the Secretary a circular asking him to let it be known that July next would be the last occasion on which the present Preliminary Examination would be held.

Mr. KERMATH said he had opposed the proposed

NEW PRELIMINARY EXAMINATION

on the last occasion. He had since been looking into the matter, and was now inclined to think it might work out better than they thought then. He observed that the leaving certificates of the Scotch Educational Department were to be accepted, and if they got into touch with teachers in the secondary schools, though at present they had difficulty in getting apprentices, they would ultimately find themselves not so badly off.

MESSRS. ROBERTSON, CUMMINGS, and LINDSAY expressed the feeling that the tendency of the new standard was unduly severe.

Mr. JACK said the Educational Institute of Scotland had indicated a readiness to hold

SPECIAL EXAMINATIONS FOR PHARMACY STUDENTS

at fixed dates in Edinburgh, Glasgow, Dundee, and Aberdeen, if a sufficient number of candidates were forthcoming. As to the apprentice difficulty, he was inclined to think the problem would solve itself.

The SECRETARY read

THE FINANCIAL STATEMENT,

which was adopted, showing a balance of £4 6s. 10d. in hand.

The CHAIRMAN said they were much indebted to the Secretary (Mr. William Cummings, Dundee) for the able, energetic, and courteous way in which he had attended to all the business of the Association. The Association had given good reason for its existence, and their finances were entirely satisfactory.

The following were elected

OFFICE-BEARERS

for the ensuing year:—President, Baillie William Doig, Dundee; Vice-President, W. R. Kermath, St. Andrews; Secretary, William Cummings, Dundee; and as members of Committee, Messrs. Anderson, Dundee; Davidson, Montrose; Ferrier, Dundee; Ferrier, Brechin; Ford, Kirriemuir; Kerr, Dundee; Macfarlane, Naysmith, Arbroath; Park, Broughtyferry; Russell, Dundee; and Thomson, Lochee. Mr. Peter MacEwan, Editor of the *Chemist and Druggist*, as a Dundee man, was elected an honorary member of the Association.

On the motion of Mr. THOMSON (Lochee), seconded by Mr. W. L. CURRIE (Glasgow), a cordial vote of thanks was unanimously awarded to the retiring President (Mr. Charles Kerr) for the valuable services rendered to the Association during the three years he had occupied the chair.

Mr. KERR acknowledged the vote, and said during the thirty-seven years he had been in business in Dundee he had always endeavoured to do what he could to promote the interests of his craft.

DIVISION OF THE MINOR EXAMINATION.

Mr. KERMATH moved—"That the time has now arrived when the method of conducting the Minor Examination should be altered, and that the same rules should apply as in medicine and law—namely, that candidates be credited with the subject, or subjects, in which they obtain pass marks." He said this was a matter that was exercising the pharmaceutical world. He would refer to the latter part first. Candidates in medicine were allowed to enter for four subjects, and if they passed in any two they got credit for those. Indeed, if they got good marks in even one of the four they passed in that one. In law they had a choice of seven subjects, and they got credit for any one of those at any examination. In the Minor Examination candidates were required to pass in six subjects in two days. That was a large order when one remembered that pharmacy students were not educated at Eton or Harrow. They had to consider the class from which their apprentices were drawn, or from which they were offered pupils. They did not come from the class attending secondary schools. When lads of that class came to see what was required of pharmacy students they preferred to go in for a profession, or to a bank, or some similar employment. They should therefore endeavour to lessen the burden of the examination. Last year the standard was very greatly increased, and the fee had been changed from £3 3s. to £5 5s. in 1892, and now it was to be increased to £10 10s. The great increase in the requirements of candidates demanded something being done. It was very hard that when a candidate has successfully passed the first day's work and failed in the first subject of the second day's work he should have to come back again and pass the first day's work a second time. He had made no progress at all, and if only he got credit for what he had done he would make a fresh start with the remaining work, and some such concession as this would tend greatly to make the Society popular. He found support for this view in a statement of Mr. Boa, the present Chairman of the Scotch Board of Examiners, who said, in November last, that, in his opinion, the Minor Examination might be divided into two parts, with an interval of three months between them. Mr. Ewing, the ex-Chairman, also said he agreed that it would be an advantage to divide the examination, and he would go further and say that candidates might get credit for what work they had done. He had a letter from an eminent teacher to the same effect, deploring the apathy on this question shown by the members of the Society generally, who ought to insist on some alteration being made. Mr. Proctor, in 1899, expressed views of a similar kind. He questioned the need for imposing so severe a test as the present Minor Examination. It looked like a condemnation of the men who had passed during the last twenty years, as if they had proved themselves incompetent, and therefore a higher standard must be exacted. They were in danger of aiming at too high an ideal, which would never be attained. The risk they ran was that they would throw the trade more and more into the hands of drug stores, for the average man would not take out any qualification. Unless they could have protection of their titles and a reasonable standard of entrance to the ranks, they would be better without the Pharmacy Act of 1868 altogether. He thought the raising of the fee unnecessary, for the finances of the Society were good to-day, and the examination conditions were too hard on the candidates. A number of people seemed to think they were training men for the best districts of London. They should remember that in many towns and even villages of 1,000 to 2,000 inhabitants they had pharmacists who dispensed as skilfully as in the larger places, and in fixing a standard the general requirements of the whole country should be kept in view. It was no use to condemn the Council. Every pharmacist should enfranchise himself by joining the Society. They had to pay the piper and had a right to call the tune, and by joining the Society they could control its business and get effect given to what they desired to have done in this matter.

Mr. LINDSAY, as a recently-examined man, in an eloquent and humorous speech, full of trenchant criticism of the Council and the examiners, seconded the motion. He said the Council looked at the question too much from the point of view of the frock-coated gentry to be found in Oxford Street, and seemed entirely oblivious of the man in the short jacket who pursued his calling in the provinces.

Mr. JACK said he was quite of opinion that the time had come when a strong appeal should be made to the Council to consider seriously the whole question of dividing the Minor Examination. But he was not prepared, and did not consider it prudent, to commit himself to the details in the latter part of the motion. He would therefore propose that these be deleted.

Mr. WHITE having seconded the amendment,

Mr. CURRIE said that was also the view he favoured. It would perhaps be better to have the subjects of the examination taken in groups. It was doubtful if the Council, under the existing Acts, had power to divide the examination. The Privy Council alone could decide that point. It might be necessary to get a new Act of Parliament. He heartily supported the proposal to reduce the present very severe test of having to pass all the six subjects of the examination at one time, and agreed with much that Mr. Kermath had said.

Mr. THOMSON supported the amendment. It would be better to divide the examination into groups of subjects.

Mr. JOHN ANDERSON also supported the proposal for division of the examination.

Mr. KERMAITH said he had no desire to press the latter part of his motion, and, with the consent of his seconder, he would make the motion read:—

That the time has now arrived when the method of conducting the Minor Examination should be altered.

That was sufficient to show the Council that there was a decided feeling in favour of some change, and it would be for the Council to consider what change should be made.

The amended motion was then put to the meeting and unanimously agreed to, and, on the motion of Mr. NAYSMITH, it was remitted to the President, Vice-President, and Secretary to communicate the resolution to the Council of the Society.

FESTIVITIES.

The members then adjourned, and had a most pleasant drive of about ten miles, in beautiful weather, round the Basin and back by way of Bridge of Dun.

Returning to the Star Hotel, about thirty members sat down and did full justice to an excellent dinner, Mr. Alexander Davidson, Montrose, acting as Chairman, and Mr. Charles Kerr, Dundee, as Croupier. After dinner followed toasts. "The Navy, Army, and Volunteers" was acknowledged by Mr. NAYSMITH, "The Pharmaceutical Society," proposed by Mr. W. L. CURRIE, was acknowledged by Mr. RUTHERFORD HILL, in the absence of Mr. Storrar. "The Forfarshire Chemists' Association" was proposed in eloquent terms by the oldest member, Mr. HODGETON, Brechin, and acknowledged by Mr. KERR. In his reply, Mr. Kerr said it had been suggested that the British Pharmaceutical Conference might be invited to meet in Dundee in 1902. Of course, they would need to meet again to consider the matter more fully. The suggestion met with a favourable reception, and it was agreed to consider the matter more fully at a subsequent meeting.

Mr. Davidson, the Chairman, was cordially thanked for the excellent arrangements he had made, and which were carried out most successfully.

THE FUNGUS-DESTROYING ACTION OF HOP OIL has been investigated by T. Bokorny, who finds that in saturated solution (1:20,000), no antiseptic value could be observed, while with other oils, such as turpentine, clove, thyme and peppermint, in considerably greater dilution, the antiseptic action was manifest. This action is ascribed to the phenols—eugenol, thymol, menthol, etc.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Fœniculi Fructus.

FENNEL FRUIT is obtained from *Fœniculum capillaceum*, Gilib. (N.O. Umbelliferae), which is apparently indigenous to the countries bordering on the Mediterranean, and is cultivated in France, Germany (Saxony and Thuringia), Russia, Galicia, Roumania, India, Japan, Persia, etc. The dried ripe fruit collected from cultivated plants is alone official. That grown in Saxony is the largest and best, and the official description is apparently based on the characters of Saxon fruit; but the Russian, Galician, Roumanian, and Japanese varieties are also suitable for pharmaceutical purposes, though not all in accordance with official requirements as to size. Fennel fruit possesses stimulant, aromatic, and carminative properties, its action being similar to that of anise; it is used for preparing Aqua Fœniculi and Pulvis Glycyrrhizæ Compositus.

FENNEL FRUIT.—1, German; 2 and 9, French (sweet); 3, Galician; 4, Russian; 5, French (bitter); 6, Indian; 7, Japanese; 8, Persian. All natural size.

CHARACTERS.—Fennel fruit should be from 5 to 10 Mm. in length and about 3 Mm. in diameter, oblong in shape, more or less curved, and capped by a conspicuous stylopod and two styles. The fruit is glabrous, greenish-brown or pale yellowish-brown in colour, and consists of two mericarps united and attached to a pedicel about the same length as the fruit. The mericarps are easily separated and each one bears five paler primary ridges which are so prominent as to give the fruit a winged appearance. In transverse section a mericarp exhibits six large vittæ—four on the dorsal and two on the commissural surface. The aromatic odour and sweet, agreeable, aromatic taste of the fruit are due to the volatile oil it contains.

FENNEL FRUIT.—A, Entire fruit, side view, magnified 3 diameters; B, half-fruit, showing commissural surface, magnified 3 diameters; C, transverse section of fruit, showing vittæ (u) and ridges (k), magnified 14 diameters; D, portion of transverse section, much enlarged. After Berg.

NOTES.—The distinctive characters of fennel fruit are the very prominent ridges, large vittæ, and characteristic odour and taste. It varies in size and colour according to its place of origin, as has been clearly shown by J. C. Umney. Thus, Saxon fennel is from 8 to 10 Mm. long, 3 Mm. wide, and greenish-brown or yellowish-brown in colour; the Galician variety is only 5 to 6 Mm. long, and from 1 to 1.5 Mm. wide; Russian fennel is from 4 to 5 Mm. long, 1.5 to 2 Mm. wide, and usually brownish-green in colour. Those three varieties of fruit yield between 4 and 5 per cent. of volatile oil which contains about 18 to 20 per cent. of fenchone and differs only as regards the three varieties in

the proportion of anethol present. The Japanese fruit is less pungent, as it contains only 2 to 3 per cent. of volatile oil; the fruit is also very small, pale greenish-brown in colour, from 3 to 4 Mm. long, and 2 to 3 Mm. wide. French sweet fennel is 7 to 8 Mm. long, 2 to 3 Mm. wide, pale yellowish-green in colour, and yields rather more than 2 per cent. of volatile oil which contains little or no fenchone, though it is richer in anethol than other varieties. French bitter fennel is from 4 to 5 Mm. long, 2 Mm. wide, and darker in colour than the sweet variety. The oil obtained from the Persian fruit is also very rich in anethol, though containing only 3 per cent. of fenchone; the fruit is very green, from 6 to 7 Mm. long, and less than 2 Mm. wide. Indian fennel fruit is from 6 to 7 Mm. long, browner in colour than usual, and contains less than 1 per cent. of volatile oil. The relative sizes and shapes of the different varieties are clearly shown in the accompanying illustration. The chief constituents of the volatile oil obtained from fennel fruit are fenchone, anethol, and two terpenes—pinene and phellandrene—which do not appear to affect the odour or taste of the oil. Fenchone is an isomer of camphor, possesses a pungent camphoraceous odour and taste, and is probably the most active constituent of the oil. Anethol is the substance of which oil of anise almost entirely consists; it is present in all fennel oils, but in greatest proportion in those oils which contain least fenchone. Pinene is present in all fennel oils, and phellandrene is found in appreciable quantity in the French and Indian varieties.

Galbanum.

GALBANUM is a gum-resin obtained from *Ferula galbaniflua*, Boiss. and Buhse (N.O. Umbelliferae), and other species. It appears to be produced by two plants growing in Northern Persia—*F. galbaniflua*, and *F. galbaniflua*, var. *β-Aucheri*, Boiss.; *Ferula schair*, Borszczow, a plant growing on the confines of Siberia and Turkestan is also stated to yield galbanum. Numerous schizogenous ducts, which secrete a milky gum-resinous juice, occur in the cortical portion of the stem and root of the plants yielding galbanum, and some of the juice appears to exude naturally in the form of tears. But the major portion of the gum-resin is probably obtained by removing the stem near the crown and collecting the juice as it exudes and hardens, successive slices of the root being removed at intervals of a few days. All varieties of commercial galbanum appear to come from or through Persia, but the gum-resin is imported by way of the Levant, Bombay, and Russia. Two chief varieties of galbanum are known in commerce—Levant and Persian. The so-called Levant galbanum may occur (1) in opaque or translucent tears; (2) in small lumps mixed with pieces of stalk and, sometimes, fruits; (3) in sticky masses containing slices of root, and consisting of small translucent yellowish fragments mixed with larger soft bluish or greenish portions. All three kinds have a decided musky odour, and the last-described is the kind usually met with in commerce; it is probably exported from Persia to India, and thence finds its way to Europe by way of Bombay, Egypt, or Turkey. Persian galbanum, definitely known by that name, may occur (1) as a brownish or reddish-brown liquid of the consistence of Venice turpentine; (2) in masses of small sticky tears with a varnished appearance, mixed with fragments of stem, fruit-stalks, etc. Those two kinds have a distinct turpentine odour, in addition to that characteristic of the galbanum usually met with; they appear to be exported from Persia to India, but some Persian galbanum also reaches Russia by way of Astrachan and Orenburg. Galbanum possesses antispasmodic and stimulating expectorant properties, resembling those of asafetida, though in a less marked degree. It is administered in doses of 5 to 15 grains, and enters into the composition of Pilula Galbani Composita.

CHARACTERS.—Galbanum should be in distinct tears or in irregular masses of agglutinated tears, both tears and masses vary-

ing in colour from opaque yellowish or orange-brown to translucent bluish-green. The latter appears to be the original colour of the gum-resin, but it becomes opaque and darker coloured with age. The tears are rounded or irregular in form, sometimes rough and dirty on the surface, and, on the average, about the size of a pea, though sometimes much larger. In cold weather they are hard and brittle, breaking easily with an irregular granular fracture and then usually appearing opaque, yellowish and soft internally, though sometimes translucent and of a bluish-green colour. The tears soften as the temperature rises, the heat of the hand sufficing to render them ductile and sticky. When agglutinated in masses, they are imbedded in a brownish mass and mixed with various foreign substances, including transverse slices of root. Similar slices, about an inch or more in diameter, may be found mixed with galbanum in tears; they frequently bear on one side some of the gum-resin which has dried there on exuding from the freshly cut surface of the root. The characteristic bitter and unpleasant taste of galbanum is due to the resin it contains; the equally characteristic aromatic odour is due to the volatile oil, umbelliferone and resin.

TESTS.—Galbanum contains umbelliferone and on heating a small fragment to redness, in a dry test-tube, that substance is liberated from its combination with the resin; its presence may then be detected by boiling the contents of the tube with water, filtering the resulting solution and adding solution of ammonia, which causes the same peculiar blue fluorescence as in the case of asafetida.

NOTES.—The distinctive characters of galbanum are the soft yellowish-brown or bluish-green tears, the peculiar odour, and the presence of umbelliferone. Umbelliferone, $C_9H_6O_3$, is the anhydride of umbellic acid and an oxycoumarin; it has an odour resembling that of coumarin (cumaric anhydride), behaves similarly with caustic potash, and shows a blue fluorescence when dissolved in dilute alkalies. It can be formed synthetically by heating resorcin with malic and sulphuric acids. Ammoniacum contains no umbelliferone, but it is present, both free and in combination with resin, in galbanum. According to Conrady the purified resin may contain 20 per cent. of combined umbelliferone. The resin, of which the drug may contain as much as 60 per cent., is an alcohol—galbaresinotannol—which yields resorcin when fused with caustic potash; other constituents of galbanum are 20 per cent. of gum and 5 to 10 per cent. of volatile oil. When submitted to dry distillation the resin yields a thick oil of brilliant blue colour, with an aromatic odour and bitter acrid taste, which deposits crystals of umbelliferone on cooling. By fractional distillation of this oil a product agreeing with the oil obtained from the flowers of *Matricaria chamomilla* can be obtained. Good qualities of galbanum should contain not more than 10 per cent. of moisture, should yield at least 50 per cent. to alcohol, and leave not more than 10 per cent. of ash on incineration.

Galla.

GALLS are excrescences on *Quercus infectoria*, Olivier (N.O. Cupuliferæ), which result from the puncture of the bark of young twigs by the female of *Cynips gallæ-tinctoriæ*, Olivier (Order, Hymenoptera), and subsequent deposition of eggs by that insect. Many plants are thus punctured by insects for the purpose of depositing their eggs, with the result that galls are formed, but only "Aleppo" galls, produced upon the particular plant named, and by the insect specified, should be used for medicinal purposes. The young twigs are pierced by the gall-wasp with its ovipositor nearly to the cambium, and one or more eggs are deposited. Those increase in size, and probably secrete a particular fluid which promotes the formation of a gall. As a result abnormal development of the vegetable tissues takes place, the eggs or larvæ hatched therefrom becoming completely enclosed in a nearly spherical mass, which projects from the twig and furnishes the larvæ with a supply of starchy and othe

nutritive material. The growth of the gall continues only so long as the egg or larva lives, or until the latter reaches maturity and passes into a chrysalis, from which the fully developed gall-wasp emerges and escapes into the air through a hole bored in the side of the gall with its mandibles. The best Aleppo galls are those collected before the insects escape. They are collected in Asiatic Turkey, particularly in the province of Aleppo, but they are also exported from Persia and Greece. When not perforated the galls are of a dark olive green colour, comparatively heavy, and known in commerce as "blue" or "green" galls; if collected after the insects have escaped the galls are of a paler yellowish-brown hue, lighter in weight and are known in commerce as "white" galls. The latter are less esteemed, being supposed to contain less gallotannic acid than the "blue" or "green" galls, which alone are official, though there is no definite information on that point. The drug possesses marked astringent properties and is used in the preparation of Acidum Gallicum, Acidum Tannicum, Unguentum Gallæ and Unguentum Gallæ cum Opio.

GALLS.—A and B, Aleppo galls; C, transverse section of gall. All natural size

CHARACTERS.—Galls should be hard and heavy, dark bluish-green or olive-green in colour, nearly spherical (sub-globular) in shape, and from 12 to 18 Mm. or more in diameter. Aleppo galls are tuberculated on the surface, the short bluntly pointed projections being most numerous on the upper portions; both projections and intervening spaces are smooth. On breaking a gall it appears yellowish or brownish-white within, and there is usually a small cavity containing the remains of a larva or gall-wasp. Galls have no marked odour, but they are characterised by their taste—due to the tannic acid present—which is intensely astringent, but followed by a slight sweetness.

NOTES.—The distinctive characters of galls are their shape, colour and astringent taste. English oak-galls or "oak-apples" are smooth, globular, brown, usually perforated, and much less astringent than Aleppo galls, containing only 15 to 20 per cent. of gallotannic acid. Chinese galls—produced by a species of *Aphis* on *Rhus semialata*, Murray (N. O. Anacardiaceæ)—are also of commercial importance, but they are employed chiefly for the manufacture of tannic and gallic acids, pyrogallol, ink, etc. They are not spherical but of extremely diverse and irregular form, their reddish-brown colour is masked by a covering of thick, grey, velvety down, and they contain about 70 per cent. of gallotannic acid. Aleppo galls contain from 50 to 70 per cent. of gallotannic acid and 2 to 4 per cent. of gallic acid, together with sugar, resin, etc.

Gelatinum.

GELATIN is an albuminoid substance extracted from animal tissues—such as skin, tendons, ligaments, and bones—by the action of boiling water. On cooling, the aqueous solution sets into a jelly, but if the water be driven off a thick syrupy liquid results which forms horny sheets on cooling and drying by exposure to the air. The crude product so obtained is known as glue, but by purification the odour and colour are removed, and commercial gelatin—the better varieties of which are known as "French gelatin"—is obtained. It has no medicinal properties, but is used in the preparation of the official Lamellæ and of Suppositoria Glycerini.

CHARACTERS.—Gelatin occurs in translucent and almost colourless sheets or shreds. When dissolved in 50 parts of hot water it should form an inodorous solution which will solidify to a jelly on cooling. It is insoluble in 90 per cent. alcohol, ether, or chloroform, but dissolves in acetic acid.

TESTS.—Gelatin is soluble in acetic acid, being thus distinguished from chondrin—a substance obtained from cartilage by boiling—which is precipitated from aqueous solutions by that acid. Aqueous solutions of gelatin yield no precipitate with solutions of any acid except tannic acid, the reaction in the latter case being the same as that which occurs during the conversion of hides into leather. Gelatin solutions are also unaffected by alum, lead acetate, ferric chloride, or the majority of metallic salts which precipitate proteids. Chondrin resembles gelatin in being precipitated from its solutions by tannic acid, but it also gives the reactions of mucin, being precipitated by acetic acid, lead acetate, and other reagents which do not affect gelatin.

NOTES.—The distinctive characters of gelatin are its translucency, practical freedom from colour and odour, and its solubility in hot water. It is not dissolved by cold water, but when immersed in that liquid it absorbs several times its weight, and is then readily reduced to the liquid form by the application of gentle heat. Gelatin is employed in pharmacy exclusively for its gelatinising power and, as that is apt to vary, Squire has suggested a simple test for the substance. He is of opinion that, on soaking 5 grains of gelatin in 250 grains of water for half an hour, then warming gently until dissolved, and finally cooling the test-tube in water at 15°·5 C. for half an hour, a jelly should be formed of such consistency that it will remain in position if the test-tube containing it be inverted.

Obituary.

HAYCROFT.—On May 10, at Florence, John Haycroft, Chemist and Druggist. Aged 55. For thirty years with Messrs. H. Roberts and Co., Florence. Mr. Haycroft was a member of the Pharmaceutical Society, his connection with the Society dating back to 1869.

WICKENS.—On May 26, at 78, Osborne Road, Southsea, Thomas Isaac James Wickens, Chemist and Druggist. Mr. Wickens had been connected with the Pharmaceutical Society since 1895, when he became a student in the Society's School of Pharmacy. After leaving the School he served for some time with Messrs. T. Morson and Sons, of Southampton Row, W.C.

WILSON.—On May 29, John Sheperd Wilson, Chemist and Druggist, Southsea (Hants). Aged 72.

Publications Received.

CHARTS FOR THE DETECTION OF ALKALOIDS, GLUCOSIDES, AND INSOLUBLE SUBSTANCES. For the Use of Minor Students. By F. PILKINGTON SARGEANT, Ph.C. Pp. 8. Leeds College of Pharmacy. 1900. From the Author.

NOTES ON ESSENTIAL OILS, With Special Reference to Their Use, Composition, Chemistry, and Analysis. By T. H. W. IDRIS, F.C.S. Second Edition. Pp. ix. + 234. London: Idris and Co., Pratt Street, Camden Town. 1900. From the Publishers.

AGRICULTURAL BOTANY, THEORETICAL AND PRACTICAL. By JOHN PERCIVAL, M.A. (Cantab), F.L.S. Pp. xii. + 798. Price 7s. 6d. London: Duckworth and Co., 3, Henrietta Street, Covent Garden, W.C. 1900. From the Publishers.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

MANGANOUS FLUORIDE.

Manganous fluoride, MnF_2 , has been obtained by H. Moissan and Venturi in the form of a crystalline powder, by the action of aqueous solution of hydrofluoric acid, or of the gas, on metallic manganese; by the decomposition of manganous fluorosilicate, and by the decomposition of manganous carbonate with aqueous hydrofluoric acid. When the aqueous acid is employed, a pale rose-coloured solution of the hydrated fluoride is obtained; on heating this solution the anhydrous fluoride is precipitated in minute crystals. To obtain this in the form of well-formed larger crystals advantage is taken of the fact that it is soluble in anhydrous manganous chloride. A platinum crucible containing a mixture of manganous chloride and fluoride is placed in another porcelain crucible which in its turn is packed with charcoal in an earthen crucible. The whole is heated to redness so as to fuse the mixture and then allowed to cool slowly. The chloride is dissolved away with water and the crystals of manganous fluoride left are washed, first with dilute acetic acid and then with water. It forms handsome rose-tinted prisms, 1 Cm. long, having a density of 3.98, melting at $85^\circ C$. It is practically insoluble in water, in alcohol, and in ether. It is slightly soluble in ammonia, forming a definite crystalline compound having the composition $3(MnF_2)2NH_3$. Manganous fluoride is easily reduced by metals and metalloids, and readily combines with fluorine to form the sesquifluoride MnF_3 .—*Comp. rend.*, **130**, 1158.

CRURIN.

Crurin is the name now given to quinoline-bismuth-sulphocyanide; it is employed as an antiseptic. It has the composition $(C_9H_7N \cdot HSCN)_2 Bi(SCN)_2$, it melts at $76^\circ C$. and occurs as a coarse powder of reddish yellow colour with a somewhat sharp odour; it is insoluble in alcohol, water and ether. By treatment with excess of cold water, or by heating with diluted mineral acids, or by prolonged heating with alcohol, it is decomposed, otherwise the salt is very stable and may be kept for long periods. When dusted on slight secretions it forms a brown scab under which the wound rapidly heals.—*Pharm. Zeit.*, **45**, 27.

CHAULMOOGRA SOAP.

Gynocardia or chaulmoogra oil has long been known as a remedy for leprosy; but its continued use is difficult, on account of the unpleasant secondary action on the stomach and intestines. To obviate this difficulty, Unna proposes the use of chaulmoogra soap in pills prepared in the following manner:—Chaulmoogra oil, 1,000, are heated on the water-bath with a solution of caustic soda, 175, in water, 750 until the resulting soap solution is completely soluble in diluted alcohol (sp.g. 0.895). This soap is then heated to boiling with water, 2,500, then a solution of sodium chloride, 300, in water, 900, is added, and the whole again heated. The separated soap is then collected, washed, and pressed free from adhering moisture. A yield of from 1,400 to 1,500 is obtained. To mass into pills Unna employs, besides kieselguhr, a mixture of tallow and wax, compounded as follows:—Beef suet, 500, is shredded and melted with yellow wax, 100, then strained; to this cumarin, 0.5, in alcohol (90 per cent.), 5, is added. The pills are prepared according to the following recipe:—Chaulmoogra soap, 300; distilled water, 200. Melt together on the water-bath, then add of the above mass 200; kieselguhr, 100. Mass and divide into pills, each weighing 45 centigrammes. Coat with keratin. Each pill contains 0.18 Gm. of soap. corresponding to 0.15 Gm. of chaulmoogra oil. The daily dose of ten pills corresponds to chaulmoogra soap 1.8 Gm., or 1.5 Gm. of chaulmoogra oil.—*Oesterr. Zeits. für Pharm.*, **51**, 154.

VOL. 64. (FOURTH SERIES, VOL. 10.) No. 1563.

INTERACTION OF DIGESTIVE FERMENTS.

By means of the distinctive colour reactions of tyrosinase with the products of digestion V. Harlay has been able to show that panchreatin and papain are without any destructive action on each other, and that their individual activity in mixtures of the two ferments is unimpaired. Pepsin acts slightly on papain; while papain, in a neutral or acid liquid, partially destroys pepsin.—*Journal de Pharmacie*, [6], **11**, 466.

CHEMISTRY OF OLIBANUM.

According to H. Halbey, the resinous constituents of frankincense consist mainly of boswellinic acid, $C_{32}H_{52}O_4$, and olibanoresin $(C_{14}H_{20}O)_n$ in equal proportions, with a little of the former acid in the state of ester. Olibanum gives 4.7 per cent. of volatile oil, containing pinene, dipentene, phellandrene and cadinene; the gum resin also contains a small quantity of a bitter principle, which has not yet been examined. The gummy portion consists partly of calcium and magnesium gummate and partly of bassorin.—*Archiv.*, **236**, 487.

TUBERCULIN AND SUCCINIC ACID.

Koch has pointed out that the tubercle bacillus contains two unsaturated fatty acids, one of which is soluble in alcohol. Viquerat now shows that the compound present consists entirely of salts of palmitic and succinic acids, the outer integument containing the former, thus preventing its insolubility in water, the inner portion of the bacillus containing a definite body which is an alkaline succinate, thus proving that tuberculin TO or TR is not a proteid. To verify this the author has heated tuberculin to between 150° - $200^\circ C$. and finds that the reaction on tuberculous animals is not modified. At $235^\circ C$. tuberculin is sublimed; the sublimate showing distinct crystals of succinic acid under the microscope. Tuberculin gives a succinic acid reaction with barium chloride and with iron chloride. Tuberculous animals react as readily to the smallest dose of succinic acid as to tuberculin. Tuberculin glycerin extract TO or TR simply contains an aqueous solution of an alkaline succinate. It is suggested that the tubercle bacillus should be renamed the succinic acid bacillus.—*Schweiz. Woch.*, **38**, 87.

MALIC ACID IN HIPPOPHÆ RHAMNOIDES.

From the richness of the fruits of *Hippophæ rhamnoides* in malic acid Erdmann recommends it as a source of this body. The juice of the golden berries contains, as well, another acid, which was separated with difficulty from the mother liquor of calcium malate, owing to the large proportion of mannate present: it melts at about $150^\circ C$., but for want of material has not yet been identified.—*Pharm. Centralh.*, **41**, 200.

MANGANESE SELENIDE.

Fonzes-Diacon has obtained manganese selenide, $MnSe$, in a crystalline condition, both by wet and dry processes. When H_2Se is passed to saturation through a solution of manganese acetate containing a little hydrochloric acid, and the solution is allowed to stand for some days, protected from the air, it deposits fine greyish-black, opaque crystals of $MnSe$. When a mixture of nitrogen in H_2Se is passed over dried $MnCl_2$ heated to redness, a black mass is obtained which contains in the interior minute grey prisms which are yellowish grey by transmitted light. These crystals also have the constitution $MnSe$. Amorphous $MnSe$ obtained by precipitation, when heated in the electric furnace fuses to a button with a metallic lustre, which has a markedly crystalline fracture and structure. In an atmosphere of oxygen it is converted entirely into manganese selenate; this salt when heated in a current of hydrogen is reduced, SeO_2 is sublimed and a greenish friable mass, manganese oxyselenide, is left, mixed with some black $MnSe$.—*Comp. rend.*, **130**, 1023.

PHARMACEUTICAL NOTES.*

BY HERBERT SKINNER,

Pharmacist to the Great Northern Central Hospital.

CHRYSAROBIN AND PYROGALLOL.—The past year has not been a very prolific one in regard to new dermatological preparations. New formulæ have appeared, but no distinctly new and satisfactory remedy. In looking through Merck's Report for 1899, I find that opinions concerning the chrysarobin and pyrogallol substitutes have somewhat modified. Eugallol is still claimed to be more powerful than pyrogallol, but lenigallol, as far as my experience goes, is much too mild. Eurobin, the substitute for chrysarobin, also fails on the mild side, though it is claimed to be effective in psoriasis. Evidently reliance must still be laid on the old remedies, as the new ones are very uncertain; most of them are still on trial, and are more within the physician's province than mine at present. There is one new antiseptic, I notice, in this excellent report—asterol—chemically paraphenolsulphonate of mercury with ammonium freely and clearly soluble in warm water, though it is said to be seven times weaker than mercuric chloride in bactericidal power.

ANTISEPTIC SOAPS.—Many experiments have been made recently with antiseptic soaps. It is openly stated with regard to many that they are antiseptic in name only. Especially is this the case with sublimate soap, and this is what one would naturally expect. I have pointed out before how transitory their properties are, and when only a 1 per cent. of any antiseptic is used it follows as a matter of fact that scarcely any action could possibly result. It must of necessity be very strong to exert any action, and the majority of them do not contain half the antiseptic needed. Their number is increasing so largely that in prescribing them the object aimed at should be well considered, and the soap used as subsidiary only. True, the lather may be allowed to dry on, but that is a poor substitute for an absorbent ointment with an aqueous base and of a known definite strength. This leads me to a formula for an ethereal solution of soap which can be made extempore. It is a very useful one, and can be rendered antiseptic, not with mercuric chloride, but with the biniodide freshly prepared—that is, mercuric chloride dissolved in a strong solution of potassium iodide.

℞ Acidi oleici.
Spirit. vini. meth., of each ½ fl. oz.
Liquor ammon. fort., a sufficiency.
Ether. methylat. to 2 fl. oz.

The first two are mixed, and the ammonia added in order to neutralise the acid; care should be taken not to add excess. A little heat is evolved, but nothing to speak of; then add the ether, which may be increased to three ounces if a weaker solution is required. Petroleum spirit or benzene may replace the ether if necessary. It is undoubtedly very excellent for cleansing ointment-laden surfaces—far and away superior to any ordinary soap. It is better adapted for a physician's use in examination than for a patient. Any other antiseptic may be used, such as ether-soluble oils, IZAL, or Sanitas. Caustic tar preparations, such as Lysol and Creolin, are not excluded, but, naturally, should be sparingly used, as an ethereal solution is very penetrating. Liquor Picis Carbonis may be used instead of the spirit, providing it is made without resin soap—that is, prepared according to the Pharmacopœia. I saw an excellent ichthyol wash made with it, the hands requiring several hours to entirely get rid of the odour.

LIQUOR PICIS CARBONIS, WITH LIQUOR PLUMBI SUBACETATIS.—Mentioning Liquor Picis Carbonis brings to my mind a very useful modification of the well-known "Liquor Picis cum Plumbo."

℞ Liquor picis carbonis P.B. ¼ fl. oz.
Liquor plumbi subacet. 80 m.
Glycerin ad 1 fl. oz.

It is a small addition, but a very useful one. It suspends the flocculent precipitate, and when diluted is more soothing and cooling in

its application. When diluted to form a lotion, of course double the quantity should be used.

DUSTING POWDERS WITH BORIC ACID.—A conversation recently on dusting powders led me to try one of carbolic acid, and as it was required to be free from the old clogging fuller's earth, the following was devised:—

℞ Phenol. granul. 56 grs.
Ac. boric. pulv. subtil. to 1 oz.

The skin was found to absorb it readily, and in one case was rather irritating, so that a reduction in the amount of phenol was made. Boric acid is a slowly soluble base, and should never be used unless passed through a No. 60 sieve. There can be very little doubt that when a close application of anything that will admit of being mixed in this way, there is nothing equal to a good dusting powder, and boric acid, together with the other ingredient—be it chinol, izal, lysol, or sanitas oil—is slowly but continuously absorbed. The effect does not last so long as an insoluble base, and the medicament may be weaker. If a liquid is added the acid must be dried and passed through a No. 60 sieve, as in the case of the well-known creolin dusting powder.

CARBONATE OF ZINC.—One of the most common things the dermatologist uses is oxide of zinc; rarely, if ever, does he order the pure carbonate of zinc as distinct from calamine. It is to be regretted that the pure carbonate is not always used, as commercial calamine is often a far from desirable application to an inflamed epidermis. The oxide or carbonate used in the form of the so-called creams is one of the best ways of applying it:—

℞ Glycerin amyli.
Adeps lanæ hydros.
Zinci carbonas.
Glycerin of each ½ oz.

They are easily mixed, the first two together, then the second two, finally both together. The zinc may be increased to 50 per cent., or decreased, as the physician thinks necessary. A solidified "Lotion calaminæ" may be made on the same principle, and might prove more acceptable:—

℞ Glycerin amyli to 1 oz.
Zinci oxidi 1 drm.
Calamin 1½ drm.
Glycerin 1 drm.
Liquor calcis 2 fl. drms.

GELATIN APPLICATIONS.—I have been making many experiments to ascertain how far gelatin or agar agar can be used as an aqueous varnish, as hitherto the results are anything but satisfactory. The test for gelatin given in Squire's 'Companion' is that five grains dissolved in water, to produce 250 grains, just produces a solid mass. This can be preserved with thymol and applied to the skin; it then forms a very thin film, but it dries quickly, and it may then be felt on the skin. Agar agar is not suitable at all; a small quantity of acid liquefies it, but then it is worse than useless for the purpose. Gelatin, on the other hand, is more tractable, but any formula given will depend on the gelatin used. No two samples seem alike, whilst half an hour's heating will make two samples from the same lot behave differently. In trying to solve the difficulty I had recourse to the solvent action of acids, chloral, and sodium salicylate. In the first, half an ounce of gelatin in two ounces of water required three and a half fluid drachms of lactic acid to keep it in a pasty condition. The second, using the same quantity of gelatin and water, required 160 grains of chloral. This produced a beautiful thick film, comparable to collodion, and dried in two or three minutes. Sodium salicylate had much the same effect as chloral, using the same quantity. Going to the other extreme, I found that a 1 per cent. of chloral kept in a pasty condition a 5 per cent., and 1 of sodium salicylate a 6 per cent. solution of gelatin. All these solvents are somewhat objectionable, but where they are not the physician may find them very useful. In each case they formed a film varying in thickness according to their strength, but very durable and satisfactory in every way.

* From the *British Journal of Dermatology* for May, 1900.

Whilst dealing with gelatin I found an aqueous ointment base could be very easily made with oleic acid partly saponified:—

R	Glyco gelatin	1 oz.
	Ac. oleic.....	10 fl. drms.
	Liquor ammonia.....	15 m.
	Aqua dest.	2 fl. ozs.

It mixed well with aqueous preparations or oily ones.

In conclusion, I give two formulæ—one a modification of the Pharmacopœia, and the other a simple application of camphor, which is a very satisfactory way of applying it:—

R	Picis. liq.	5 ozs.
	Paraf. dur.	2 ozs.

The paraffin is melted, then the tar stirred in, the stirring being continued until cold.

R	Spirit camphoræ.....	2 fl. drms.
	Tinct. benzoin simp.....	½ fl. drm.
	Glycerin	½ fl. oz.
	Aqua dest.to	1 fl. oz.

Misce, secundum artem.

BACTERIOLOGICAL NOTES.

THE CLINICAL THERMOMETER AS A GERM CARRIER.—It is pointed out by Conklin (*Buffalo Med. Journ.*, February, 1900) that physicians are not always as careful as they might be over the sterilisation of their clinical thermometers. The degree marks, scratches, and other imperfections in the glass of the instrument form excellent situations for the lodgment of micro-organisms. A degree mark, for example, magnified 1,000 diameters, would measure 5ft. in length and nearly a foot in width! In this area 280,000 tubercle bacilli could be accommodated in a single layer. Conklin urges that not only should the thermometer be washed and wiped after use, but that the case should be large enough to contain some strong antiseptic solution in which the instrument would soak until used again.

BACILLUS PYOCYANEUS AND ITS PIGMENTS.—Jordan contributes a lengthy paper on the pigments of *Bacillus pyocyaneus* to the *Journal of Experimental Medicine* (IV., 1900, Nos. 5 and 6, p. 627), and the following are some of his conclusions:—The fluorescent pigment formed by some varieties of *B. pyocyaneus* is produced under conditions identical with those governing the production of pigment by other fluorescent bacteria. The production of pyocyanin is not dependent upon the presence of either phosphate or sulphate in the culture medium and occurs both in proteid and in non-proteid media. The fluorescent pigment may be oxidised slowly by the action of light and air as well as by reagents into a yellow pigment, and pyocyanin may be similarly oxidised into a black pigment. The power of producing pyocyanin under conditions of artificial cultivation is lost sooner than that of producing the fluorescent pigment.

INFLUENCE OF THE TEMPERATURE OF LIQUID AIR ON BACTERIA.—Macfadyen has subjected cultures of various bacteria to the temperature of liquid air (-183° to -192° C.) for twenty hours. The cultures of the organisms were young and vigorous and were tested both on solid and on liquid media, viz., gelatin, agar, potato, and broth. The organisms used in the experiments were *B. typhosus*, *B. coli communis*, *B. diphtheriæ*, *Spirillum cholerae asiaticæ*, *B. proteus vulgaris*, *B. acidi lactici*, *B. anthracis* (sporing culture), *Staphylococcus pyogenes aureus*, *B. phosphorescens*, and *Photobacterium balticum*. After being taken out of the liquid air, the cultures were carefully thawed and examined. In no instance could any impairment of the vitality of the micro-organisms be detected. The fresh growths obtained by subculturing were normal in every respect, and the functional activities of the bacteria were equally unaffected. The colon bacillus curdled milk, fermented

sugar, and formed indol, the *Staphylococcus aureus* retained its pigment-producing properties, anthrax its pathogenic action upon animals, and the phosphorescent organisms their luminosity. With regard to the latter, the cultures when cooled down became non-luminous, but on thawing the luminosity returned with unimpaired vigour. Plate cultivations made with liquid air itself gave colonies of the ordinary forms met with in air. (*Proc. Roy. Soc. Lond.*, vol. 66, February 1, 1900.) Further experiments by Macfadyen and Rowland confirm the foregoing results, but the test was more severe. ("Roy. Soc. Paper," April 5, 1900. *Lancet*, 1900, I., p. 1,130.) Cultures of the various organisms mentioned above, and also a sarcina, a yeast, and unsterilised milk were placed in a broth emulsion in fine quill tubing hermetically sealed. These were immersed in the liquid air, which, as before, was supplied by Professor Dewar, and a temperature of about -190° C. maintained uninterruptedly for seven days. Notwithstanding the enormous mechanical strain to which the organisms must have been subjected, not the slightest structural alteration could be detected, and their vitality and biological characters were unimpaired and unaltered. It is hoped at a future date to undertake experiments with liquid hydrogen.

ISOLATION OF THE BACILLUS TYPHOSUS AND OF THE BACILLUS COLI FROM WATER.—Hankin describes a method for the isolation of the typhoid bacillus from a polluted water, which he states is frequently, but not always, successful. Five tubes are taken, each containing 10 C.c. of neutral bouillon. To four of the tubes one, two, three, and four drops respectively of Parietti's solution are added; to the fifth tube no addition is made, it serves as a control of the bouillon for the growth of micro-organisms. Each tube is infected with a few drops of the water to be tested, is capped and placed in the incubator at 37° C. for twenty-four hours. On the following day a variable number of these tubes will be found to be turbid. The tube containing the highest number of drops of Parietti that is yet turbid should be discarded. Usually the tube next below this in the series should be chosen, unless it has a thick scum, or has growth only in the depth. A tube should be preferred which has a uniform turbidity, without gas-bubbles, and is usually the one containing two or three drops of Parietti. The selected tube is then used to inoculate a second series of Parietti broth tubes, four or five; the first tube has the same addition of Parietti as the selected tube, the second tube one drop more, and so on. For example, if the tube with three drops is the selected one, the first tube of the second series has an addition of three drops of Parietti, the second tube four drops, etc. Two or three drops of the broth of the selected tube are used to inoculate each tube of the second series. They are capped and incubated as before. On the following day a tube is selected from the second series, as from the first series, and a third series of Parietti broth tubes is inoculated and incubated similarly to the second series. Again, from the third series a tube is similarly selected and either used to inoculate a fourth series, from which again a tube is selected for inoculation onto agar, or is used for inoculation onto agar. The tube chosen is now inoculated onto agar-tubes, the agar having a dry surface, so that colonies shall not run together. A loopful, on a glass bristle, is drawn from the bottom to the top of this sloping dry agar in a zig-zag manner, several tubes being so inoculated. These are incubated at 37° C. until the following day, when the colonies are examined. Each colony that is at all suspicious is then sub-cultured on to a fresh litmus-agar tube; this necessitates 5-10 tubes for a comparatively pure water, 10, 20, or more if obviously polluted. The tubes are incubated at 37° C. On the day after inoculation some of the tubes will have turned red, these may be discarded; after another twenty-four hours others may turn red, these may also be discarded. Of the tubes that remain blue, those in which the growth is obviously different from that of the typhoid bacillus may be disregarded. The remaining tubes are

then subjected to a microscopical examination, and those resembling typhoid are sub-cultured into milk, potato, etc., and tested with typhoid serum as to their agglutination. The litmus agar employed is prepared by liquefying a litre of ordinary nutrient agar-agar in the autoclave, grinding up in a little water in a mortar 25 grammes of litmus and 30 grammes of milk sugar, straining through muslin, and adding to the liquefied agar, which is shaken, distributed into test-tubes, and sterilised in the autoclave. (*Centr. f. Bak.*, xxvi., 18/19, p. 554.) Pakes also suggests a method for the isolation of typhoid and of coli, a method which again sometimes fails for typhoid. The medium employed is a glucose formate broth (0.4 per cent. of sodium formate). A measured quantity of the water is added to the broth tubes, which are incubated at 42° C. anaerobically by Buchner's method (alkaline pyrogallol). The high temperature (42° C.) and strictly anaerobic conditions inhibit the growth of most organisms, except typhoid and coli. At the end of eighteen to twenty-four hours the tubes are examined, and any which show signs of growth are further examined by plate cultivations. The other tubes are replaced in the incubator for another twenty-four hours, and if at the end of this time there be still no growth, for a third twenty-four hours. Tubes which show a growth are examined as before, but if there is no growth after seventy-two hours the tubes are discarded. For the examination of water for the *Bacillus coli* the same procedure is adopted, but the water is concentrated by filtration through a Berkefeld filter. (*Public Health*, XII., No. 6, March, 1900, p. 385.)

SIGNIFICANCE OF THE PRESENCE OF THE BACILLUS COLI IN WATER.—In the same paper Pakes draws the following conclusions from the presence of the *Bacillus coli communis* in water. Drinking water from a deep well should contain no *B. coli*; water from other sources which contains the *B. coli* in 20 C.c., or less, should be condemned; that which contains the organism in any quantity between 20 C.c. and 50 C.c. should be regarded as suspicious; between 50 C.c. and 100 C.c. as slightly suspicious; and only in greater quantities than 100 C.c. as probably safe. If no *B. coli* be obtained from two litres, it may be regarded as absolutely safe. Pakes believes that the bacteriological examination of water affords more information as to the kind of contamination than the chemical. Oxidised organic matter, as evidenced by nitrates, for example, would probably be undetectable by the bacteriologist, but in another case where the water originally contained no *B. coli* in 50 C.c., and yielded 0.003 parts of albuminoid ammonia and absorbed 0.01 parts of oxygen per 100,000, after contamination there was one *B. coli* in every 5 C.c.—undoubted evidence of contamination—yet the figures for the chemical examination were only 0.004 albuminoid ammonia and 0.02 oxygen absorbed per 100,000.

INFLUENCE OF FIXING AGENTS UPON STRUCTURE.—It has been stated by Gulland that when salmon enter our estuaries there has begun an extensive desquamative catarrh of the mucous lining of the intestines, which spreads upwards to the stomach. The specimens on which this statement was based were fixed in perchloride of mercury. Barton now shows that if the stomach and intestine of the salmon be placed at once in a mixture of equal parts of spirit and $\frac{1}{2}$ per cent. chromic acid, so far from there being any desquamative catarrh, the mucous membrane reveals the most perfectly natural epithelium. It is most important, in order to obtain the normal appearances, to avoid post-mortem change, and not to fix in perchloride or formalin. (*Journ. of Anat. and Physiol.*, April, 1900.)

PURIFICATION OF LINSEED OIL WITH OZONE.—The oil is heated to a suitable temperature by means of steam and then ozonised air is passed through it. The impurities are destroyed without affecting the characteristic properties of the oil.—*Pharm. Centralh.*, 41, 255.

RECENT WORKS IN BOTANY.

A GLOSSARY OF BOTANIC TERMS. By B. D. JACKSON. Pp. 327. Price 6s. net. London: Duckworth and Co. 1900.

It is now nearly thirty years since a work on botanic terms was published in this country, notwithstanding that the science of botany has made rapid progress, especially in the departments of vegetable physiology and anatomy. The natural result has been a large increase in the number of botanical terms, the whole of which cannot be found in any one text-book, and many not in some of the most recent dictionaries, as witness the recent letters in this Journal on the words "ecology" and "perennate." Mr. Jackson has taken great pains to make the 'Glossary' as complete and up-to-date as possible, and has succeeded in bringing up to 15,000 the number of terms explained in it, or about three times as many as in any previous work in the language.

The difficulty of giving definitions of terms in a concise form can only be fully appreciated by a teacher. Thus the terms used to define colours differ so much in their significance to different people that the author had to make a special study of that department, the results of which he published in the 'Journal of Botany,' xxxviii. (1899), p. 97-105. Perhaps no better illustration of the conciseness of the explanations given could be taken than the definition of the word purple—"a secondary tint, a mixture of red and blue in varying proportions." Another difficulty has naturally been in the matter of pronunciation, and in this Mr. Jackson has wisely endeavoured to follow the best discoverable usage, and has employed English accentuation for words that have become thoroughly Anglicised.

An ingenious plan has been adopted by the author to economise space and reduce the book to a portable and convenient size—viz., the grouping into paragraphs of all terms derived from the same leading word. Thus under the paragraph beginning "micrandre" the terms included number over forty, from micro-aerophilous to micro-zyme. The plan of using a capital initial letter for terms that are nouns and a small initial letter for those that are adjectives is rather confusing, in spite of the fact that the leading term in each paragraph stands out in the margin, since in long paragraphs the slightly heavier type does not sufficiently distinguish the adjectival terms from the text. Indeed, the work might be much improved by the use throughout the text of a heavier and more distinctive type for the botanical terms. Of course, a number of terms have been used only by single writers, and in such cases the inventor's name is given, so that some idea of the general or limited use of a word is thus indicated. The superabundance of terms is sometimes instructively, but necessarily without comment, given; thus, under "Symbiosis, the living together of dissimilar organisms with benefit to one only or both; also styled commensalism, consortism, individualism, mutualism, nutricism, prototrophy, and syntrophism," the superfluity of synonyms is rendered very prominent. The 'Glossary' should be useful not only to the student, but to the coiner of new terms, since the author occasionally indicates the wrong use of terms, thus under macro the frequently erroneous use of the word is pointed out as follows:—"Macro (*μακρὸς*, long) in Greek compounds = long; frequently, but improperly, used for *mega*, or *megalo*, large." There is no doubt that in such words as macrospore and macroscopic the half-word *mega* would lead to less confusion, especially as *macro* is used in the correct sense of long in the words macrophyllous and macranthus. Doubtless for this reason the word megascopic was introduced in Knight's 'Materia Medica,' but too late to find a place in this 'Glossary.' The terms ecological (preferably spelt *œcological*) and perennate with their variations are, however, fully given. The inclusion of the names of chemicals derived from plants seems to the writer rather outside the range of a 'Glossary of Botanical Terms.' The author is here going a little out of his own line, and one must expect perhaps such lapses as *Thein* and *Theobromine*, and to find *Thein* described as the most important alka-

loid in the leaves of *Thea*, the tea-plant, whilst caffeine is described as an alkaloid from coffee berries, *Coffea arabica*, Linn.

The definition of balm ("*βάλσαμον*, balsam), a thick, usually resinous, exudation of reputed medical efficacy; balsam, a similar exudation, generally of resin mixed with volatile oil"; would hardly satisfy the student of materia medica or pharmacognosy. Gamboge, however, has a shadow of a claim to appear, since the name, as a type of a yellow tint, is sometimes applied to flowers. The definition given, however, is "a yellow resinous gum from several species of Guttiferæ," and as such it scarcely comes within the range of botanical terms, and would more likely be looked for in works on economic botany. The author, however, disarms criticism on such points by remarking in the preface "How far it is advisable to include terms from those overlapping sciences which lie on the borderland is a question on which no two people might think alike." It is evident that Mr. Jackson has had no easy task, and he has done his work well and as thoroughly as possible. He has availed himself of the botanical knowledge obtainable from the Royal Gardens at Kew and the British Museum, and from many of our leading botanical professors and officers in botanical establishments, and frankly and freely acknowledges his indebtedness to them. The result of his labours is a work which may be cordially recommended to every student of botanical science as a most valuable book of reference, and we venture to prophesy a ready sale for it and a call for a new edition within a few years. The author may well be congratulated on such an excellent and useful work.

AGRICULTURAL BOTANY: THEORETICAL AND PRACTICAL. By J. PERCIVAL, M.A., F.L.S. Pp. 798. Price, 7s. 6d. net. London: Duckworth and Co. 1900.

This work is an attempt to meet the demand for a botanical text-book suitable for agricultural students and containing information of practical value, in addition to a scientific explanation of known facts. The author has had considerable experience in lecturing to students, as well as to practical farmers and gardeners, being Professor of Botany at the South-Eastern Agricultural College at Wye, in Kent, and the clearness of style and careful explanation of terms used affords internal evidence of the fact. The first three divisions of the book are devoted to General External Morphology, Internal Anatomy, and Physiology, and contain a great deal that would be known to the ordinary student of botany, but many points on which little stress is laid in ordinary text-books, such as leaf buds, are treated here at considerable length, and are used as pegs on which to hang much useful practical information. Thus under this heading are given the means of recognition of trees by the buds on their twigs in winter, the development of spurs or fruit buds on different fruit-trees, the methods and principles of budding and grafting, the artificial development of adventitious buds as a means of propagating begonias, hyacinths, and other bulbs, etc. In other words, these three sections contain ordinary botanical scientific facts with their practical application in horticulture and agriculture in addition. Section iv. is devoted to some of the more important natural orders, with special reference to the plants employed in agriculture. The chapter on grasses should be very useful to veterinary students, from whom a knowledge of fodder plants is generally required, and every farmer who wishes to cultivate fruit-trees or roots or vegetables successfully on scientific methods should not fail to read carefully the chapters devoted to the Chenopodiaceæ, Cruciferae, and Leguminosæ and cereals. Part v. is devoted to the weeds of the farm, and here the ordinary gardener may glean much valuable information, since instructions are given as to the period at which, and the methods by which, they may most successfully be prevented from propagating their kind. Part vi. is given over to farm seeds, and this contains information valuable alike to the seedsman and the farmer and to the analyst who has to test seeds. Part vii. is remarkable for the very lucid treatment it gives to the subject

of fungoid diseases of plants and the methods to be adopted in preventing and curing them. Part viii. refers to the bacteria that affect plants and animals or are concerned in the processes of fermentation, putrefaction, nitrification, etc. The work may be recommended for careful perusal, not only to the agricultural student, but to the florist, market gardener, seedsman, veterinary student, amateur gardener, and, indeed, to anyone who has a garden and takes an interest in the cultivation of plants. All the drawings in the work are stated to be original, a feature by no means common in modern works. As many as 334 paragraphs in smaller type are scattered throughout the book, giving directions to students how to carry out experiments illustrative of the descriptions in the text. These should be a great help to the student preparing for examinations in agriculture. It is one of the text-books that should find a place in every library where technical works form a prominent feature.

PRACTICAL NOTES AND FORMULÆ.

Prevention of Guttering in Candles.

This is prevented by immersion in a solution of magnesium sulphate, 3; dextrin, 3; water, 20. The solution dries rapidly and does not influence the burning.—*Deuts. Am. Apoth. Zeit.* **20**, 131, after *Ph. Rundsch.*

Ointment for Hæmorrhoids.

Lanolin, 120; petrolatum, 75; glycerin, 45; extract of hamamelis, 30; tannic acid, 4; tincture of opium, 4.—*Pharm. Post*, **32**, 721, after *Bull. of Pharm.*

Remedy for Chapped Hands.

The surest preventive is thoroughly to dry the hands after washing, and then to smear them with a fat, free from water, e.g. olive oil or wax ointment. To cure chaps, use (1) Menthol, 1; salol, 2; olive oil, 10; lanolin, 30. To produce a smooth and white skin use zinc oxide, 5, and bismuth oxychloride, 2.5, rubbed down with oil, 12; then add glycerin, 5, and lanolin, 30; finally perfume with rose water, 10. *Lanolin Powder*.—Lanolin is dissolved in ether, and this solution mixed with magnesium carbonate to a stiff mass, and this rubbed down with talc and starch.—*Schweiz. Woeh. für Pharm.*, **38**, 3, after *Pharm. Zeit.*

Pharmacy of Terpin Hydrate.

Elixirs of Terpin Hydrate:—Terpin hydrate, 17.5 Gm., is dissolved in alcohol, 400 C.c.; glycerin, 400 C.c., are added, and the solution is made up to 1,000 C.c. with distilled water. The terpin hydrate remains dissolved at ordinary temperatures; when abnormally cold it crystallises out, but is easily re-dissolved on warming. Terpin hydrate, 2; alcohol (80 per cent), 30; glycerin, 67; tincture of vanilla, 1. *Terpin Hydrate Syrup*:—Terpin hydrate, 2; alcohol (90 per cent.), 30; glycerin, 67; tincture vanilla, 1; simple syrup, 100.—*Pharm. Post*, **23**, 111, and *Oesterr. Zeits. für Pharm.*, **54**, 100.

Removal of Silver Stains.

As substitutes for the poisonous potassium cyanide, Crédé recommends the following methods for removing silver stains. (1) The article to be cleaned is immersed for five minutes in a sublimate-sodium chloride solution and washed twice or thrice with pure water. (2) To a 20 per cent. ammonium chloride solution, tincture of iodine is added until it is tinted from yellow to brown; this solution is allowed to react on the spot for five minutes, and then several crystals of sodium thiosulphate or ammonium chloride are placed on the treated portion, which is finally washed out with water. (3) The silver stains are treated with eau de Javelle, and after five minutes, washed with water containing 0.5 per cent. of hydrochloric acid.—*Pharm. Centralh.*, **41**, 168.

ASSAY OF DRUGS BY THE USE OF LIVING PLANTS.*

BY HENRY KRAEMER.

While I have a certain amount of hesitation in presenting the results recorded in this paper at the present time, it nevertheless seems to me that more would be gained by such a procedure than by withholding them for a longer time in order to accumulate more data, and in support of this position permit me to quote the following from Montesquieu: "When you treat a subject, it is not necessary to exhaust it, it is enough if you cause thought."

The subject of the testing of drugs by means of their effects upon living plants is not an entirely new one, as I supposed and ventured to state in my paper on "The Valuation of Drugs and Foods" a year ago. In fact, methods of this kind have been employed to a considerable extent in Europe and appear to be of fundamental importance in ascertaining the toxic properties and therapeutic value of drugs. No less an authority than Kobert, in his "Lehrbuch der Intoxicationen" (1893), says that, after one has obtained the substance relatively pure and made a neutral solution, "Der Gang der Untersuchung ist nun der, dass man erst den Einfluss auf möglichst niedrige Wesen pflanzlicher und thierischer Natur, dann auf höhere kaltblutige und deren einzelne möglichst isolirte Organe oder Stückchen derselben und zuletzt auf die Warmblüter in aufsteigender Reihe untersucht, so dass von Längern (*sic*) erst Pflanzenfresser, dann Fleischfresser, dann Omnivoren, dann körner- und fleischfressende Vögel und erst dann Menschen als Reagens benutzt werden und zwar zuerst der Experimentator, dann andere gesunde Menschen, dann Patienten. Das Leitmotiv für alle Versuche und namentlich für die Reihenfolge derselben soll das Mitgefühl für die armen gequälten Geschöpfe sein. Man stellte daher Punkte, welche an niederen Wesen untersucht werden können, nicht ohne Noth an höheren fest. Das am wenigsten gequälte Wesen soll natürlich der kranke Mitmensch sein. Es muss daher als ein Act der Bärerei und mangelhafter pharmakologischer Erziehung gebrandmarkt werden, dass sich noch immer Aerzte finden lassen, welche Mittel von schwankender oder unbekannter Zusammensetzung und Wirkung sofort an den Patienten ihrer Praxis auf Gerathewohl hin zu prüfen sich bereit finden lassen."

The following plants or parts of them have been employed in experiments of this kind: Bacteria, Oscillaria, Spirulina, Nostoc, Zygnema, Spirogyra, Chara, Drosera, Tradescantia, yeasts, spores of mucor, Elodea, Lemna, Pistia, Potamogeton, Myriophyllum, Ceratophyllum, grasses, lentils, beans, peas, &c. (See Kobert, *loc. cit.*)

The data herewith presented are the results of experiments which were carried out under my direction by Willard Ohliger in the Botanical Laboratory of the Philadelphia College of Pharmacy. When the work was undertaken it was hoped that a number of drugs could be experimented with and also a number of plants, but up to the present it has been found impossible to extend the experiments further than those which follow. The plants used in these experiments were: Seedlings of *Lupinus albus* and *Pisum sativum*, L. The following are the substances which were used in experimenting upon these plants: Ethyl alcohol, strychnine nitrate, brucine sulphate, tincture of nux vomica, U.S.P., and tincture of nux vomica, free from fat.

Method of Testing.

The seeds of the above-named plants were first soaked in water for twenty-four hours, after which they were placed on moistened

excelsior, arranged in such a manner as to be covered with a bell-jar. This was then placed in a dark room and germination of the seeds allowed to proceed until the radicles acquired a length of from 25 to 30 millimetres. The radicles were then marked with India ink 20 millimetres from their tips and placed in the solutions of the different drugs. The containers used for the solutions were 50 C.c. glass vials, which were perfectly clean. The method found best adapted for supporting the seedlings was as follows: The vials containing the solutions were arranged in a circle on a plate, and a large cork placed over them in such a way as to come partly over the mouth of each vial. To this cork the seedlings were attached by means of small staples or double-pointed tacks, so as to immerse the radicles in the solutions. The vials were then covered with a bell-jar and placed in a dark room. After a period of twenty-four hours the seedlings were removed from the solutions, and the radicles carefully measured to ascertain their length of growth. They were then replaced in the solutions and allowed to stand another twenty-four hours, when measurements were again made.

In cases of death the radicles presented a flabby and transparent appearance, and in a few cases they were shorter than at the beginning of the experiment.

In the first series of experiments alcoholic solutions were employed in order to obtain the constant for that liquid, as it was likely to be employed in the preparation of the solutions of the various drugs to be tested.

The following table gives the strength of alcohol employed, the actual growth of two seedlings of *Pisum sativum* and two of *Lupinus albus* in twenty-four hours and the temperature at which the experiments were performed, this temperature being adopted likewise for the succeeding experiments.

In the foregoing experiments it is seen that no growth of the root occurred in the solution containing 7 per cent. of alcohol, and that in the solutions containing between 6 per cent. and 0.5 per cent. there was a gradual increase in the length of the root according as the strength of alcohol in the solution was diminished, and that in the solutions containing 0.1 per cent. and 0.5 per cent. there was a slight increase in growth over those contained in weaker solutions. It may be stated here that in distilled water *Pisum sativum* grew 18 millimetres and *Lupinus albus* 19 millimetres in twenty-four hours.

In the following table the lengths of the roots at the end of the second twenty-four hours are given:

* Presented at the Richmond Meeting of the American Pharmaceutical Association, May, 1900.

These experiments show that the seedlings growing in the solution containing but 0.01 per cent. alcohol still grew slightly less than those in the solutions containing 0.1 per cent. and 0.5 per cent. alcohol, and that in the solutions containing over 5 per cent. there was no further growth.

In the following experiments aqueous solutions of strychnine nitrate (Merck's) containing the following amounts of the alkaloid to 50 C.c. of distilled water were used: $\frac{1}{30}$ grain, $\frac{1}{20}$ grain, $\frac{1}{15}$ grain, $\frac{1}{12}$ grain, $\frac{1}{10}$ grain, $\frac{1}{8}$ grain, $\frac{2}{8}$ grain, $\frac{3}{8}$ grain, $\frac{4}{8}$ grain, 1 grain.

It is interesting to note that in the above experiments the maximum growth of both the *Pisum sativum* and *Lupinus albus* occurred in the solution containing $\frac{1}{15}$ grain of the alkaloid, while those in solutions of weaker strength grew slightly less. The solution which proved toxic contained 1 grain of strychnine in 50 C.c. of distilled water.

In the following table the lengths of the roots at the end of the second twenty-four hours are given :—

Strychnine Nitrate.

Temperature (16°-21° C.).

Second 24 hours.

The above experiments show that the seedlings growing in the $\frac{1}{15}$ grain solution still grew more than those in solutions of $\frac{1}{30}$ and $\frac{1}{20}$ grain, and that in solutions containing between $\frac{1}{15}$ and 1 grain there was a gradual decrease in growth as the amount of strychnine was increased.

The following experiments give the results with solutions of brucine sulphate (Merck's) containing $\frac{1}{30}$ grain, $\frac{1}{20}$ grain, $\frac{1}{15}$ grain, $\frac{1}{12}$ grain, $\frac{1}{10}$ grain, $\frac{1}{8}$ grain, $\frac{2}{8}$ grain, $\frac{3}{8}$ grain, $\frac{4}{8}$ grain, 1 grain, in 50 C.c. of distilled water :—

	2 "		3 "	
1 gr. or .065 gm.	No growth	Dead	2.5 "	"
1 gr. or .065 gm.	—	—	No growth	Dead

Comparing the above experiments with those in which strychnine was employed, we notice that the growth of the seedlings in all cases was slightly more than that in the corresponding strengths of strychnine, and that death occurred in the solution containing $\frac{1}{15}$ grain of the alkaloid, whereas with strychnine the toxic percentage was 1 grain in 50 C.c. of water.

(To be concluded.)

PILL-EXCIPIENTS.*

BY ALFRED I. COHN, PH.G., NEW YORK.

KAOLIN, in conjunction with some mineral fat like petrolatum, is invaluable for massing drugs which are readily oxidisable by organic matter, but which it is desirable to exhibit in pill form. Among the drugs for which it is especially adapted are silver nitrate, the permanganates, and phosphorus. In making pills of silver nitrate or a permanganate it is only necessary to reduce the substance to very fine powder, thoroughly triturate it with the kaolin, and then simply mass with sufficient petrolatum. In place of petrolatum, resin cerate, cacao butter, adeps lanæ, and similar fats have been recommended, but these are all objectionable because of their organic character, in consequence of which the drugs are more or less rapidly decomposed. Many workers have recommended water to be used in conjunction with kaolin in making pills of silver nitrate or a permanganate. Whoever has tried both ways here detailed will never use the "water" method any more. In the first place, it is difficult to gauge the correct quantity of water necessary, and the mass is hence likely to be either too dry or too moist. Then, again, great rapidity and expertness are required in cutting and rolling the mass, as the latter sets quickly, and when once hard cannot be well worked over again. In addition to these drawbacks, the water dissolves the silver nitrate or potassium permanganate, and in either case the operator is reasonably sure of having his fingers disagreeably stained. The use of petrolatum avoids all this; and the pills rapidly disintegrate in the stomach. Kaolin is also of use as a means of exhibiting hygroscopic substances, such as bromides, iodides, chlorides, acetates, etc., in pill form, using petrolatum, adeps lanæ, resin, cerate, etc., as an excipient. Pills so made keep perfectly, and do not show any tendency to become moist.

LIQUORICE EXTRACT.—Powdered extract of liquorice is a favourite excipient with German pharmacists and physicians, and deservedly so. It possesses very great binding power, and it is useful in a large number of cases, water only being necessary to insure a good mass. It is particularly useful in cases where the ingredients ordered are likely to afford a soft mass with other excipients. Care must be taken, however, not to use too much of it, as the pill mass then becomes "rubbery," and difficult to roll, while the pills are prone to become too hard, and difficultly soluble. A great advantage in using it is that it may be added directly to and triturated with the pill ingredients. It is excellently adapted for use in pills which are to be coated with silver, keratin, or salol.

LIQUORICE POWDER.—Powdered liquorice root is used very much like althea powder. It does not, however, swell up so, as the latter does, and is inferior as a filler. It is nevertheless an excellent diluent for drugs which are ordered in small doses in pill form, and with the addition of a little powdered extract of liquorice, it affords an excellent mass with water. The powder is universally used for dusting the dry pills with, and for dusting the mass while rolling. For this purpose only the powdered Russian liquorice root should be used—it is lighter in colour and free from the bitterish taste exhibited by the ordinary powder.

MAGNESIA is chiefly used as a means of massing balsam of copaiva, with which it unites to form a rather stiff mass. It may be used for oleoresins, in general, as well as for oils. In massing copaiva balsam, about one-sixteenth of the weight of the latter in magnesia is sufficient; the solidification may be accelerated by slightly warming the mortar. Magnesia cannot, however, be considered as an ideal substance for the purpose, because pills made by means of it are prone to become very hard in time, and quite insoluble. The hardening may be materially retarded by adding a little adeps lanæ, say about one-twelfth of the entire mass.

SOAP.—Powdered Castile soap with a drop or two of water or alcohol is useful as an excipient for resins, oils, camphor, opium, camphor monobromated, etc. Too much must not be used, how-

ever, otherwise the mass is apt to become too soft. Should this occur, it may be amended by adding a little kaolin.

STARCH is used as an excipient only in the form of a glycerite. The latter preparation is particularly applicable where white pill masses are desired. As generally made, however, it is altogether too soft, and lacks sufficient cohesive power for practical purposes, while the quantity of glycerin it contains tends to result in too soft a pill mass, and, in consequence, of the flattening of the finished pills. The addition of a little powdered tragacanth will largely overcome these defects and render the preparation of greater utility.

Starch in powder form is frequently used for dusting the pill machine when rolling white pill masses, and also dusting the finished pills.

SUGAR.—This, in the form of powder or as a syrup, is a favourite with many pharmacists. It is effective in a large variety of cases, but is inferior to honey, glucose, or tragacanth glycerite. Its proneness to become sour in time on exposure, when in the form of syrup, is an additional disadvantage.

TRAGACANTH.—In the form of a powder, or as a glycerite, tragacanth is one of the most useful of excipients, combining great cohesive powers with ready disintegration unless used in too large a quantity. The powder may be added directly to the substances ordered, and the massing effected by water, honey, glucose, syrup, or glycerin. Water usually suffices, and is to be preferred. Care must be taken not to use too much of the powdered tragacanth, otherwise the mass becomes rather elastic, shows numerous fissures on the surface, and cannot be readily rolled and cut. By the use of the tragacanth glycerite these drawbacks are avoided, but, on the other hand, there is again the danger of having too soft a mass, and considerable labour is required, as the glycerite must be added in very small quantities and each addition thoroughly worked in, in order to avoid getting a mass which will require some filler to stiffen it again. Excellent excipients may be made by combining tragacanth with other substances, such as acacia, glucose, etc. Suitable mixtures are the following:—

1.—Powdered Acacia	1 part.
Powdered Tragacanth	2 parts.
Glucose	10 parts.
Glycerin	10 parts.
2.—Powdered Tragacanth	1 part.
Glycerin	3 parts.
Water	1 part.
Glucose	5 parts.

WATER is only occasionally used by itself as an excipient, and is then only applicable when the substances to be massed contain considerable quantities of powdered or solid extracts, gums, or gum resins.

WAX has been widely advocated as a means of exhibiting oils, when ordered in considerable quantities, in pill form. It can scarcely be considered as an ideal excipient for oils, however, because of its insolubility in the gastric juice, and its high melting-point, characteristics which combine to make pills massed by means of it insoluble, and hence inactive, as they are very likely to pass through the system entire.

Many substances, because of their peculiar characteristics, require special treatment or excipients, in order to properly mass them. The most important of these, and the means that afford suitable masses, are as follows:—

ACID CARBOLIC.—Soap and liquorice (or althea) root; soap, althea and honey; powdered liquorice and powdered extract liquorice; flour, soap, and glycerin; flour and honey (or glucose); althea and starch (or tragacanth) glycerite.

ACID BENZOIC, GALLIC, SALICYLIC, TANNIC, ETC.—Powdered tragacanth and honey (or glucose); extract gentian; powdered extract of liquorice and water (or honey); glycerite of tragacanth.

ALKALOIDS.—Those given in very small doses are triturated with starch, milk sugar, kaolin, sugar, etc., and massed with glucose, honey, syrup, etc.; manna is also serviceable.

* From *Merck's Report*. Concluded from page 598.

ALOES.—Water alone with a warm mortar; soap and water; confection roses; extract gentian; when combined with gum resins, soap and honey (or syrup) is effective.

AMMONIUM CARBONATE.—Tragacanth and glucose; avoid the use of glycerin.

AMMONIUM VALERIANATE.—A little starch (or kaolin) with powdered tragacanth and honey (or glucose); extract gentian; powdered extract liquorice and honey.

BALSAM COPAIVA.—Calcined magnesia (about one-sixteenth of the weight of the balsam) and a very little water; kaolin, powdered tragacanth, and a little water. When magnesia is used, a little adeps lanæ, say about one-twelfth of the entire mass, should also be added in order to counteract the tendency of the pills to become exceedingly hard and insoluble in time.

BROMIDES OF ALKALIES.—Kaolin with petrolatum, or adeps lanæ; althea with honey; powdered starch, powdered tragacanth and honey.

CALOMEL.—Powdered starch, powdered tragacanth and water; bread crumb. Glucose, honey, confection of roses, manna, and other glucose-like substances are best avoided, as these act like reducers on the calomel with the production of black mercury oxide. Tragacanth glycerite, or kaolin and petrolatum, are also serviceable, but acacia and mucilage of acacia must be avoided, because a cement-like compound is formed with the calomel, and the pills become absolutely insoluble.

CAMPHOR.—Soap and powdered starch (or althea), with honey or glucose; extract of gentian; soap and a very little alcohol.

CHLORAL HYDRATE.—Starch, powdered tragacanth, and glucose or honey; althea or powdered liquorice with tragacanth glycerite; powdered liquorice, powdered extract of liquorice and water.

CREOLIN.—Kaolin alone affords a good mass.

CREOSOTE.—Soap (1) and powdered liquorice root (5); powdered liquorice root and fresh egg albumin, flour and a little syrup; kaolin, powdered extract of liquorice and honey; soap, powdered extract of liquorice and powdered liquorice root, balsam of tolu and a little alcohol and magnesia.

CROTON OIL.—Flour and a little water or syrup; bread crumb; kaolin and petrolatum or adeps lanæ; powdered liquorice root, powdered tragacanth, and honey or glucose.

DELIQUESCENT SALTS.—Canada balsam; soluble cream of tartar; kaolin and petrolatum.

EUCALYPTOL.—Like creosote.

ERGOTIN.—Kaloïn, sufficient to mass. Althea is not eligible, as it makes the mass too bulky and elastic; powdered liquorice is not sufficiently absorbent, and the pills become too large.

EXTRACT MALE FERN.—Powdered male fern, powdered tragacanth, and water.

GUAIACOL.—Like creosote.

IODIDES.—Like bromides.

ODOFORM.—Powdered gentian and extract of gentian; powdered liquorice root and powdered extract of liquorice with water.

LEAD ACETATE.—Like iodoform.

METHYLENE BLUE.—Triturate with a little petrolatum and then add kaolin to mass. This process will prevent the distribution of the finely-powdered blue and the consequent staining of the linen and objects near at hand upon which the dust may settle.

OILS.—Like creosote.

OLEORESINS.—Kaolin; flour and a little water; kaolin, powdered tragacanth and honey.

OPIUM POWDER.—Soap and a very little water; powdered liquorice, powdered extract of liquorice and water.

OX GALL, INSPISSATED.—Heat in a warm mortar, triturate with a very little warm water, and add kaolin to mass.

PEPSIN.—Extract of malt; extract of gentian; powdered liquorice, powdered extract of liquorice and a little water.

PERMANGANATES.—On account of their ready reducibility, all contact with organic matter must be avoided, hence the best ex-

ipient is kaolin with sufficient petrolatum; kaolin and water. Roll pills in talcum.

PHOSPHORUS.—Dissolve in carbon bisulphide or chloroform, add a little petrolatum and triturate until the solvent has been dissipated, then add sufficient kaolin to mass; phosphorised oil, adeps lanæ, and althea.

POTASSIUM ACETATE.—Like deliquescent salts.

PRYKTANIN.—Like methylene blue.

QUININE.—Mixture of tragacanth 6, glycerin 50, and water 75, gives good results; powdered tragacanth and glucose or honey; glycerite of starch; tartaric acid with a little water, or, better, glycerin and water. Pills made with tartaric acid are quite small, but are apt to become very hard in time. Avoid the use of syrup or of acacia, as the surface of the mass or pills is prone to harden and crack, many fissures will be formed, and slightly pills cannot be obtained.

SCALE SALTS OF IRON.—A very little powdered tragacanth and sufficient glucose or honey.

SILVER NITRATE.—Like permanganates.

TAR.—Powdered althea and magnesia; kaolin.

TERPIN HYDRATE.—Starch, powdered tragacanth, and honey or glucose; powdered liquorice root, althea with extract of gentian.

TERPINEOL.—Like creosote.

VALERIANATES.—Extract of gentian or taraxacum; powdered liquorice, powdered extract of liquorice and water; glucose or honey alone.

ZINC OXIDE.—Extract of gentian.

“AN EVENING WITH ‘PUNCH.’”

It would be useless to recommend this work to our readers for purchase, since it is already out of print, and is not to be republished. Those who wish to have in their possession the best things that appeared in *Punch* during the first fifty years of its existence must buy the complete collection of the volumes from 1848 to 1898. All opportunity of acquiring the well-made selection issued under the title of “An Evening with *Punch*” is now at an end. It is a volume much to be prized; more—much more—for its pictures than for its letter-press; every picture published in *Punch* being complete in itself whereas its most famous literary contributions have appeared in the form of serials, from which, as a matter of course, only extracts can be given.

The contributions of Mark Lemon, first sole editor of *Punch* (he was preceded for a brief period by a triumvirate), are, to say the least, deplorable. Fancy the editor of the first comic paper in Europe writing and causing to be printed such idiocy as the following:—

“‘You’re very hot’—as the roast beef said to the horse-radish.”

“‘Mind your eye’—as the thread said to the needle.”

It is well known, however, that Mark Lemon wrote very little—indeed, scarcely at all—for the paper which he edited with such marked ability. On one celebrated occasion he certainly gave proof of literary taste and discernment. Hood had sent in to *Punch* his immortal “Song of the Shirt,” with a letter expressing some doubt as to whether so sad a poem would be found suitable to the columns of so lively a periodical. Mark Lemon read the poem at the *Punch* dinner; when a majority of the contributors pronounced against it. In the strange language of the writer who edits the “Evening with *Punch*,” they considered it “praiseworthy,” but too painful for *Punch*. The epithet “praiseworthy” might have been applied to Hood by Lord Verisopht, who declared Shakespeare to be “clever.” Mark Lemon, however, saw that the “Song of the Shirt” was an inspiration and a masterpiece and, regardless of the views of the majority of his contributors—a farcical lot in those days—did himself the honour of publishing Hood’s poem, and, at the same time, tripled the circulation of his paper. Against the judgment of Mark Lemon as

editor may here be cited his notorious rejection of one of the very best of the Bab Ballads. Mr. W. S. Gilbert tells us in the preface to his volume that the ballad of the "Nancy Bell" was offered to *Punch*, and that Mark Lemon returned it to him, saying that it was "too cannibalistic" for the taste of his readers.

The editor of the "Evening with *Punch*" has done his work exceedingly well. But he is surely wrong when, speaking of the comparative merit of a few of the most famous contributions to *Punch*, he places the Snob papers above the "Song of the Shirt." Such an estimate would never—modesty apart—have been accepted by Thackeray himself. Why does he declare, moreover—as though there was nothing to be ashamed of in the fact—that the author of 'Pelham,' 'Night and Morning,' 'The Caxtons,' and 'The Parisians,' of the 'Lady of Lyons' and 'Money' is an object of "aversion" to *Punch*? Why, moreover, does he not gently reprove Mr. Ruskin, instead of appearing to agree with him, when the admirable critic, whose judgment is so unerring on almost all artistic and literary matters, says nevertheless of Du Maurier's delightful children that "the charm of Du Maurier's extremely intelligent and often exquisitely pretty children is dependent, for the greater part, on the dressing of their back hair and the fitting of their boots." Du Maurier—suggests the editor—might have retorted that "the care with which a mother dresses her child is, in its way, a very charming exhibition of the maternal instinct." Had he cared to defend himself against an accusation so amiably so flatteringly put, Du Maurier might have pointed out that his children, as described by Ruskin himself, are "extremely intelligent, and often exquisitely pretty," and that intelligence and beauty cannot be dependent on mere externals. Du Maurier is well represented in the "Evening with *Punch*," not only by his graceful pictures of women and children, but also by his laughter-moving caricatures of æsthetes, and by his ludicrous drawing of the larky but innocent minded page, who, to amuse that solemn justice of the peace, his master, gives him at his breakfast, on the First of April, an empty egg-shell instead of a full egg.

What an eloquent answer to Ruskin's criticism is furnished by the "Whispered appeal," in which a charming little girl, with the most tender expression of sympathy in her face, says to her mother, in reference to her young brother, who has just been put in the corner, "Mamma, mamma! Don't scold him any more—it makes the room so dark."

If Du Maurier did not absolutely invent the æsthete—thus giving the æsthetically inclined something definite to "live up to"—he observed the earliest specimens of the genus and pinned them with pen and pencil to paper. It was not until after Du Maurier had created the type that Mr. W. S. Gilbert did such wonders with it in the satirical opera of "Patience." Teapot worship and the contemplation of a lily in lieu of dinner formed the subject of two of Du Maurier's happiest designs in connection with the æsthetic craze—both reproduced in the volume before us.

Leech cultivated, for the most part, one style, the comic; and in this he had no equal, though Charles Keene sometimes ran him hard. Charles Keene, however, had a style of his own. The "Bang went saxpence" picture was Charles Keene's; but the joke was Sir John Gilbert's. He, that is to say, heard the actual words spoken at a Glasgow railway station, saw that they were good, repeated them to Birkett Foster, who also saw that they were good, until at last they got to the ears of Charles Keene, who saw that they were excellent, and presented them to the world in a picture made to suit them. The joke about the Curaçao at the tenants' dinner, when old Turniptops told the footman who was handing round the liqueurs that he would "tak zum o' that in a moog" was given to Leech by Dean Hole of Rochester. But it was Leech who drew the head of old Turniptops. Leech was celebrated for his pretty women. But in their antiquated ringlets and their old-fashioned bands they look

pretty no longer. Du Maurier's are of more recent date. But, apart from that, they are so full of grace that something of their present charm must remain always with them. On rare occasions Leech became serious; and he was terribly serious when he represented the Emperor Nicholas struck down by the icy figure of that "General Janvier," with whose terrors he had threatened the allied armies in the Crimea.

The most powerful pictures in the collection are, of course, from the pencil of the veteran Tenniel—now in his eighty-second year and still vigorous. Doyle's sea-serpent—the sea-serpent of revolution upsetting in its irresistible course the cockboats of royalty—ought to have been included in the volume as an example of the sort of work done by Tenniel's predecessor. Doyle, however, in his lighter moods has not been forgotten. The famous picture of Bismarck as the dismissed pilot has its place in the "Evening with *Punch*," and no finer specimen of Tenniel's genius could be desired; though several of almost equal value are presented.

What places *Punch* far above all other periodicals of the same character is the fact that it has succeeded in securing the services, from the beginning until now, of the best artists and also of the best writers. The Paris *Charivari* numbered among its artists Gavarni, Daumier, and "Cham"—Anglicè, "Ham"—as the second son of the Count of Noah used facetiously to call himself. But it never at any time published articles or poems by writers who could be compared to Tennyson and Hood, to Thackeray and Jerrold. *La Vie Parisienne* has depended for its literature on such writers as Edmond About, Alphonse Daudet, Gustave Droz, and "Gyp." But the style of its tales, articles, and dialogues, while rendering it indispensable to all London clubs, renders it inadmissible into most English houses. No illustrated comic paper, in fact, at all comparable to *Punch* had ever existed until *Punch* was started, nor, in spite of many imitations, has *Punch* ever been approached since its first establishment.

Among the celebrated jokes published by *Punch* the most celebrated is certainly the one which first saw the light in the Almanac for 1845:—"To persons about to marry. Don't!" This was the jest of Henry Mayhew. Paid by the line it must have brought him in very little money.

An equally brilliant witticism in quite another style was the one, word dispatch in which Sir Charles Napier was said to have announced his conquest of Scinde—"Peccavi!" There are persons, however, so ignorant as not to know that the English of "Peccavi" is, "have sinned"; whereas Henry Mayhew's pleasantry about marriage—that fertile subject of jocularity—is intelligible even to the meanest capacity. The author of the "Peccavi" witticism is unknown to us. *Punch's* metaphysical definitions—"What is mind? No matter! What is matter? Never mind!"—have been attributed to Charles Kenney; also to Edward Draper. The first half of the amusing conceit belongs in any case to Byron, who writes in "Don Juan":—

"When Bishop Berkeley said there was no matter, it was no matter what he said."

In addition to contributors who only wrote for the paper and contributors who only drew for it *Punch* has had a good many who supplied it both with articles and with drawings. The most eminent of these was Thackeray, who intended in his early days to become a painter, but who showed, again and again, by his unfortunate attempts at drawing that he never could have succeeded in the art he so much loved. The picture of the homely "Fanny," the momentary occupant of Thackeray's "Cane-bottomed Chair," is enough to suggest that that curious ballad—too good for a parody, too bad for anything else—was never intended as a serious poem. It was evidently written as a burlesque of Eliza Cook's popular, but common-place ballad, beginning—

"I love it, I love it, and who shall dare
To chide me for loving that old arm-chair?"

Punch's "Family Trees" show numerous cases of intermarriage between contributors and the relations of other contributors, and of the descent of modern contributors from ancient ones; James Hannay married a niece of Kenny Meadows. Mr. R. C. Lehmann and Mr. Barry Pain are relations or connections of Mr. W. H. Wills. Henry Mayhew was the son-in-law of Douglas Jerrold. Mr. Clement Scott's first wife was the sister of Du Maurier. After the death of Shirley Brooks, second editor of *Punch*, his son, Reginald, became a contributor to the paper. The first husband of Mrs. Jopling Rowe was brother-in-law to Mark Lemon. Alfred Chantrey Corbould was a nephew of Charles Keene. Both Gilbert à Beckett's sons became contributors to *Punch*; and one of them, Mr. Arthur à Beckett, is now its sub-editor. A relative through marriage of Mark Lemon became the wife of Robert Brough. Every name given in this paragraph is that of a contributor to *Punch*.

Robert Brough, by the way, and William Brough were brothers; and Frank Talfourd used to distinguish between them by calling them respectively "Clean Brough" and "Clever Brough." Both were clever and both were clean. But the distinction between them, all the same, was easily seized.

Punch has now been fifty-nine years in existence; and Sir John Tenniel is probably the only contributor to the paper who remembers the publication of the first number. It has never been better than under the direction of its present editor, Mr. F. C. Burnand, and never so good as in its latest development—with its admirable literary supplement.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Weak Spot in Our Defences.

On surveying the pharmaceutical situation I am led to the irresistible conclusion that, if our defences were absolutely sound otherwise, they must prove weak in one important respect which lays us open to the constantly reiterated charge of attempting to establish a trade monopoly. Free trade may be regarded by some as a fetish, but it is, nevertheless, a principle which appeals with considerable force to individuals—and there are many in our own ranks—who are anxious that the purchasing power of their money shall not be limited unreasonably by artificial means. The establishment of close corporations among professional men has been accepted by the British public as a necessary evil, but where trade is concerned a different state of opinion prevails, anything in the nature of a trade monopoly being strongly resented as a rule. The business conducted by pharmacists, unfortunately, has been kept on the border-line between a profession and a trade, with the result that any legal limitation of the pharmacist's business has tended to partake of the nature of a restriction of trade as well as regulation of the manner in which certain professional functions are performed. In fact, so far as Great Britain is concerned, the interference with trade has preponderated to such an extent that regulation of the practice of pharmacy has virtually been lost sight of. And that is the weak spot in our defences.

How to Strengthen the Weak Spot.

It seems to me that, to strengthen the weak spot effectually, we must get rid of all appearance of seeking to gain advantage from a trading point of view when we invoke the aid of the Legislature to advance our professional interests. We need no trade monopoly, we should ask for no restriction of the sale of medicinal substances; but we are fully justified in demanding that our professional titles should be secured to us, and we shall not be unreasonable if we ask also that duly qualified persons alone shall be

entitled to dispense medicines. What the qualified pharmacist has the right to expect is that he alone shall be in a position to describe himself and to practise as such; it is hopeless for him to anticipate that, in this country, he will ever have a monopoly of the sale of substances that may be used for medicinal purposes. The founders of the Pharmaceutical Society did not even ask for a monopoly of the sale of scheduled poisons; that was forced upon them as the outcome of the labours of the United Society of Chemists and Druggists, fostered by a trade journal which has since openly rejoiced at the trade protection thus afforded to chemists and druggists. But that protection has proved a source of weakness to us in the past. Moreover, such protection is as unnecessary to the development of pharmacy as to that of any other profession, and it must be dispensed with if we are to make our defences as strong all round as they ought to be. To put the matter briefly, trade protection of any kind or in any degree is inimical to the welfare of pharmacy as a profession, and must therefore be avoided.

Direct Amendment of the Pharmacy Acts Needed.

How, then, are we to provide for development on professional lines? To my mind, we must first give up all hope of securing any amendment of existing conditions through the medium of a Companies Bill. The Companies Acts are intended to serve two distinct purposes and two only—first, to protect the public as against associations which trade with limited liability and, secondly, to protect the interests of shareholders in those concerns. It is, I think, quite foreign to the purpose of those measures to regulate the practice of any profession, and any such regulation effected by means of a Companies Bill can be, at best, but a makeshift arrangement. Such, at least, is my view of the matter, and I quite fail to see how medicine, dentistry, or pharmacy can be permanently benefited by anything that can be done in connection with a Companies Bill to bring corporate bodies within the scope of pre-existing Medical, Dental, or Pharmacy Acts. If those Acts are insufficient for their purpose, let them be amended in a direct manner, rather than leave the regulation of the practice of medicine, dentistry, or pharmacy—even to the most limited extent—under the control of the Board of Trade or any authority other than those which now conduct the affairs of the professions concerned. What I advocate, therefore, is the most strenuous opposition to Clause 2 of the Companies Bill, 1900, if that measure should be proceeded with further—a most unlikely contingency—on the ground that the amendment of the law proposed by the Lord Chancellor is insufficient and generally unsatisfactory.

What a Pharmacy Bill Should Include.

Accepting that view of the matter, I see nothing for it but direct amendment of the Pharmacy Acts and, to that end, I think a Pharmacy Bill should be drafted with as little delay as possible, so that everything may be in readiness to begin our struggle for professional recognition at the opening of the new Parliament which is soon likely to be called into being. With regard to the provisions of such a Bill, there should be general agreement among pharmacists upon the necessity of avoiding any suggestion of seeking to establish or perpetuate a trade monopoly, whilst there should be equal unanimity as to the necessity for making registration under the Pharmacy Acts cover a distinctly professional qualification. I should propose, therefore, that we boldly advocate abolition of the existing restriction of the sale of poisons to registered chemists, and recommend, in lieu thereof, that the business of all vendors of drugs and poisons should be legally regulated. But, over and above that, I would seek to restrict the dispensing of medicines and the use of titles implying registration under the Pharmacy Acts to legally qualified individuals. The keeping of open shop for the compounding, dispensing, or retailing of poisons should no longer be an offence in the eye of the law, but the act of compounding or dispensing

medicines by any but duly qualified individuals should be so. To establish their right to such professional protection as is here suggested pharmacists must, of course, be prepared to offer something in return. And that ought to be the establishment of an educational curriculum comparable with those which are compulsory in the medical and legal professions. Pharmaceutical students should be compelled to register as such at the outset of their professional career, and not less than three years before being entitled to present themselves for the qualifying examination. Division of the qualifying examination might then be effected without risk, as candidates could present themselves for the different parts of the examination at definite intervals during the period of training, and thus would be provided an efficient check to evasion of study at the proper time. Here then is the rough outline of a Pharmacy Bill which ought to meet with the approval of all pharmacists, afford a minimum of ground for opposition by limited companies, and commend itself to the Government as an honest and unselfish attempt to remedy the existing unsatisfactory state of affairs without interfering in any degree with existing freedom of trade.

LETTERS TO THE EDITOR.

The Council Election, 1900.

The recent surfeit of election literature has produced mental obfuscation in some of our brightest intellects, and therefore I can excuse "An Ordinary Pharmacist" for his mixed misinterpretation of my recent remarks on the *Invertebrata pharmaceutica*. On broad principles every chemist on the Register is interested in the actions of the Pharmaceutical Society. I have always maintained this axiom (of which there is ample proof), and had I prefixed it to the paragraph criticised it would have been obvious, not merely as an assumption, but as a relentless fact, that two-thirds of those who are interested in and derive benefit from the legal and educational work of the Council are pitifully invertebrate.

Batley, June 2, 1900.

R. BROADHEAD.

Standardisation of Cinchona Preparations.

In my letter of May 15 (see *ante*, p. 541) *re* the above, the statement that the solvent was ether-chloroform (1:9) was a clerical error. It ought to have been ether-chloroform (9:1). I should much like if Mr. Dewhirst would publish the figures showing amount of alkaloid lost in following the process recommended by me, as also those obtained in assaying the same preparations according to his method.

Edinburgh, June 2, 1900.

J. STENHOUSE.

The Presidency of the Society.

Most decidedly there is nothing revolutionary in the idea of a member of the Society who happens to reside outside the metropolitan area being elected to the presidential chair. One member of the Society is surely as good as any other member, so far as mere membership goes, and though I do not live in London I see no reason why I should not look forward to occupying the position of President if ever I should happen to be elected on the Council. Whether or not there is any such thing as a "Bloomsbury clique," it appears to me extremely desirable that no subterranean organisation of the kind should be allowed, or even supposed, to govern all the Society's internal arrangements. But I am sceptical about the existence of any such clique, and if the election of Mr. Newsholme or any other non-Londoner as President will help to disabuse the minds of members generally on that point no one will rejoice more than

June 5, 1900.

"A COUNTRY MEMBER" (34/51).

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

NAME OF PLANT (E. B.—43/6).—*Salix cinerea*.

NAME OF PLANT (H. S. A.—43/1).—It is the frog orchis, *Habenaria viridis*.

FLY GUM (T. W.—42/32).—You will find formulæ for fly gum in the *P.J.* for July 29 last, at page 86.

GERMAN PRESCRIPTION (T. J. W.—42/8).—If you could send the original prescription we might be able to assist you, but it is difficult to determine from the copies received what is intended.

FRUITS AND SEED (J. A.—42/34).—The fruits are myrobalans, the rounded ones being from *Terminabis bellerica* (Combretaceæ), and the oval ones from *T. chebula*. The seed is that of *Entada scandens* (Leguminosæ).

GOLD-BLOCKING POWDER (G. R. T.—42/29).—Very finely powdered sandarac is largely used for the purpose, but practical bookbinder informs us that powdered copal resin is the best thing. In MacEwan's 'Pharmaceutical Formulas' the following recipe is given:—Powdered resin, 9; powdered sandarac, 1. Mix. You can obtain a suitable powder from Messrs. Barry and Roberts, Bride Street, London, E.C.

SOLUBLE ESSENCE OF GINGER (R. H. S.—42/33).—Strong tincture of ginger, 30; soluble essence of lemon, 2; glycerin, 4; distilled water, 12. First add the water to the tincture, then add the essence and glycerin. After standing 24 hours, add powdered pumice, 1, with burnt sugar, *q.s.*, shake well and set aside until required, then filter. A little capsicin added to the tincture will make a more pungent product.

FORMULÆ (H. E. D.—42/30).—The St. John's Hospital formula for Unguentum Petrolati Compositum is:—Solution of coal tar, $\frac{1}{2}$ drachm; ammoniated mercury, 10 grains; soft paraffin, to 1 ounce. The formula for Mistura Ferri Arsenicalis is:—Diluted phosphoric acid, 10 minims; tincture of perchloride of iron, 10 minims; hydrochloric solution of arsenic, 6 minims; glycerin, $\frac{1}{2}$ drachm; water, to $\frac{1}{2}$ ounce.

HOME PORTRAITURE (C. R. P.—42/31).—Write to Messrs. Dawbarn and Ward, 6, Farringdon Avenue, London, E.C., for their latest list of books on the subject. Their "Photo-Miniature Series" contains two useful works—'Photography Outdoors' and 'Photography at Home,' published at 6d. each. Other excellent books in their list are Penlake's 'Home Portraiture,' price 2s. 6d., and Mills' 'Exterior and Interior Photography,' price 3s.

EVAPORATING SUGAR IN VACUO (D. W.—42/28).—You would not obtain the same consistence by evaporating the sugar *in vacuo* as by evaporating in the open at 310° F., since it does not depend merely upon the loss of water, but is partly due to a molecular change in the sugar itself by which it loses its power of crystallising. If you heat the sugar *in vacuo* you will merely drive off the water. It is precisely for this reason that sugar boilers employ vacuum plant for evaporating, so as to avoid the production of this non-crystalline sugar.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, JUNE 9, 1900.

SOME DEFECTS OF THE PHARMACY ACT, 1868.

DESIRE for the amendment of this Act has been so long expressed in various quarters that an inference may safely be drawn as to its failure to accomplish some of the objects that were contemplated by its promoters and by the Legislature. That there should have been such failure, in some respects, will not be matter for surprise when the conditions existing before 1868 are considered. When due allowance is made for the great difficulties which had then to be overcome, before application of the principle of the Pharmaceutical Society's Charter and of the Act establishing a pharmaceutical qualification, could be extended, with the sanction of the Legislature, to all persons who could then claim to be carrying on the business of chemists and druggists, there is not much reason for disappointment. Nor, for the same reason will the satisfaction that was given by the passing of the 1868 Act appear greater than was reasonable at that time, or at all inconsistent with the fact that experience of the operation of the Act has revealed the existence of some serious defects which require its amendment. That the Act has been beneficial, in regard to its main object of protecting the public against danger from poison, may reasonably be taken for granted and probably its effect, in that way, has not been sufficiently appreciated. But there is some reason for regret that the particular provision adopted for the safety of the public should have been of such a nature as to be capable of being regarded, even incorrectly, as constituting a trade monopoly. Unfortunately the restriction of the sale of poisons to persons qualified under the Act, as well as the prohibition of keeping open shop for that purpose by any but qualified persons, have been so regarded, and unfounded prejudice has thus been created.

At the time the Act was passed public feeling was so strongly impressed with the necessity of protection against poison that probably no other means than absolute restriction of the sale of such poisons as were most commonly used for criminal or suicidal purposes would then have been satisfactory. That was, indeed, shown by the adoption of a measure apparently opposed to the free trade views which were at that time so much in favour, and in spite of considerable opposition on that account. But there is reason for thinking that if qualification under the Act had conferred no other privilege than exclusive use of the title chemist and druggist, as in the case of the superior qualification under the Act of 1852, much subsequent trouble would have been avoided. Chemists might at present have been in a better position than they have been since the decision that

besides persons qualified in conformity with the provisions of the Act, there are other persons (*i.e.*, companies) who, though they cannot possibly be qualified as the Act provides, may, nevertheless, keep open shop for the sale of poisons and carry on the business of chemist and druggist without being compelled to observe any provision of the Pharmacy Act. Exclusive right to use the title denoting qualification would probably have been even more effectual as protection to the public than the restriction as to keeping open shop, while at the same time, more advantageous to qualified persons, in giving them reasonable protection and in being free from objection on the ground of creating trade monopoly. If that view of the matter be correct, the provision of the Act relating to keeping open shop must be regarded as a serious defect; one which requires amendment in order to secure the object of placing qualified persons in a position analogous to that occupied by other persons engaged in professional occupations for the exercise of which special qualification is requisite. That was undoubtedly as much the object of the Pharmacy Act, 1868, as provision for public safety by securing the corresponding advantage of a body of persons specially educated for the performance of certain duties. But owing in great measure to the defect above mentioned, that object has not been fully attained.

Another very important feature of the Pharmacy Act is its recognition of the claims of special education in regard to the practice of pharmacy. In that respect experience has shown that the necessity of passing an examination, in order to qualify, does not sufficiently provide for such systematic education as is desirable for all persons seeking to obtain the advantage of registration as being capable to perform the duties of pharmacy. That is probably the most serious defect of the Act, because it affects the fundamental principle underlying all its provisions. The number of candidates presenting themselves for examination sufficiently shows that a value is attached to the title of chemist and druggist, but the very large proportion of those who fail to pass must be taken as evidence that they have not had that systematic education which would enable them to pass with credit. Evidently the compulsory provisions of the Act require to be applied to a period earlier than that at which legal qualification to carry on the business of a chemist and druggist is sought for. The conditions of apprenticeship are probably in some instances better adapted to supply the educational wants of the apprentice now than they were before the passing of the Act; but there is no reason for supposing that the average apprentice is made to recognise what he ought to do in the way of study, nor is there any likelihood that he will do it, except under compulsion to go through a specified course of study. The objection that the business of a chemist and druggist is sometimes of a nature that would not repay the cost of scientific education is as poor as that urged on the ground that the country chemist and druggist has no pharmaceutical duties to perform. In either case the necessity of qualification under the Act would not exist, nor would there be in connection with such business any occasion for using the title of chemist and druggist. Unless that title indicates the person using it to be a competent pharmacist it would be a mere deception, and the entire significance of the Pharmacy Act would be destroyed.

ANNOTATIONS.

THE GENERAL MEDICAL COUNCIL decided last week that, from and after January 1, 1902, no person shall be registered as a medical or dental student who has not attained the age of sixteen years; also that, for the purpose of ensuring the observance of the new regulation, every applicant for registration in the 'Students' Registers' shall be required to produce satisfactory evidence that the specified age has been attained. A step has thus been taken by the General Medical Council, the importance of which cannot be over-estimated, and it is the more noteworthy inasmuch as it immediately followed the reception of a report by the Education Committee on raising the standard of preliminary examinations recognised by the Council. In that report it is stated to be impracticable in the existing conditions to require of all intending medical and dental students the standard of general attainments represented by the so-called senior and higher grade examinations. It is thought, however, that a substantial advance on the present requirements can be made by insisting on improvements in the character and stringency of those junior examinations which can be directly influenced by the Council and, in the case of others, by requiring that candidates offering the corresponding certificates have obtained a higher standard than that of a simple pass. Detailed suggestions were offered with the object of bringing about the desired advance and, on the motion of Sir John Batty Tuke, the Council authorised the Education Committee to take all needful steps to give effect to the recommendations and suggestions of the expert advisers for the improvement of the preliminary examinations.

THE RECOMMENDATIONS OF THE EXPERTS have been made with the immediate object of securing the gradual raising of the standard of the lower junior examinations to the level of those which rank highest. In the first place it is suggested that for a pass in any subject a minimum of 40 to 45 per cent. be required. Then, it is thought that a fair number of riders should be made obligatory for a pass in Euclid; also questions involving general principles in algebra, and questions involving some thought and the application of more than one of the ordinary rules in arithmetic. The principal tests proposed in classical and modern languages are fairly long passages from unprescribed books for translation into English, and an easy passage of continuous prose for translation from English into Latin and modern languages. Finally, it is suggested that in English an essay and a passage for paraphrasing should form essential parts of the examination. "In paraphrasing more weight should be given to the candidates' understanding of the meaning of the passage paraphrased than to the language used. The subjects chosen should not include such abstract subjects as 'ambition,' 'instinct,' etc., or such hackneyed subjects as the 'Life of Nelson' or 'school games,' but should set out some question requiring a definite answer to be obtained by reasoning." No list is published of the junior examinations which are supposed to require improvement by having their standard raised, as much of the information upon which the experts base their classification is of a confidential character and, in addition, it is felt that public criticism of particular examinations might alienate some of those examining bodies upon whose cordial co-operation the General Medical Council must depend in bringing about a genuine reform.

THE TAKING OF SAMPLES by inspectors for the purpose of analysis in accordance with the provisions of the Sale of Food and Drugs Act, 1875, has been under consideration by Justices Darling and Bucknill, in connection with a camphorated oil case. It is customary for small shopkeepers to purchase the oil from wholesale dealers in small bottles, which are retailed at 1d. or 2d. each, and, as a single bottle does not contain sufficient oil for the necessary subdivision and analysis, inspectors have experienced

some difficulty in complying with the requirements of the Act. In a recent case, in which a conviction was obtained (see *P.J.*, ante, p. 584), the inspector had purchased three small bottles, mixed the contents in the shop, then subdivided the oil in the usual way. In the present instance (see p. 630) the inspector purchased six small bottles and put two into each of three paper bags which were afterwards duly sealed and one handed to the purchaser, whilst another was sent to the analyst. On analysis the contents of the two bottles were found to be lacking in camphor, but the justices who heard the case were of opinion that the division of the bottles as described was not in compliance with Section 14 of the Sale of Food and Drugs Act, and they were also not satisfied that the contents of the two bottles analysed were identical with those of the other two lots of bottles. The case was therefore dismissed, and on appeal the decision of the justices has been upheld. Mr. Justice Darling, with whom Mr. Justice Bucknill concurred, said that what the inspector did was to buy six articles and then to divide those six articles into three. In his opinion each of the bottles purchased was an article within the meaning of Section 14, for it did not matter for the purposes of the Act how small the article was. But as the appellant did not divide any one of the bottles into three parts, he did not comply with the provisions of the Statute.

THE USE OF IRON AS A TONIC may be overdone, according to a writer in *Food and Sanitation*, who has been studying the results of investigations by German physiologists, and commences a note on the subject with the assertion that the quantity of iron annually administered to patients would, if it could be collected, stock a wholesale hardware establishment or instal a fair-sized furnace. It is alleged that the German investigators have found that the quantity of artificially prepared iron actually absorbed and assimilated in the system is quite infinitesimal. Moreover, the human organism is said to need and contain only the merest trace of the metal, whilst even that may be accidental and extraneous rather than a necessary constituent of the body. In any case, the quantity found is asserted to be entirely derived from animal or vegetable food, in which the iron exists in a much more readily assimilable form than in the medicinal preparations usually administered. The sole medicinal value of iron, we are told, is as an oxygen carrier, pure oxygen having been declared to be the only true muscle tonic, any iron present probably merely facilitating a greater absorption of oxygen. Hence its mission in anæmia and all debilitated states. If exhibited in excess it becomes an irritant and ends in inflammation. From overdoing it many have lost faith in it as a remedy and neglect it entirely, but used with discrimination, in connection with other needed elements, it undoubtedly performs an important function.

THE SALE OF SCHEDULED POISONS, contained in preparations used for technical and trade purposes, has been found an unprofitable business by certain seedsmen, etc., who have been fined under Section 15 of the Pharmacy Act, 1868, for indulging in that luxury. The matter was commented on by the *Gardeners' Chronicle* some months ago (see *P.J.*, ante, p. 159), and the latest issue of that publication contains a letter on the subject by the secretary of a trade protection society with a very long name—The Traders in Poisons and Poisonous Compounds for Technical and Trade Purposes Protection Society. He contends that the Pharmacy Act, 1868, was merely intended to prevent unqualified persons acting as pharmacists, or to sell or keep open shop for retailing, dispensing, or compounding poisons, "either for the preparation of medicine or for medicinal use." He brings forward no evidence in support of that contention, but alleges that the trade in poisonous weed-killers, etc., has been chiefly carried on by tradesmen who are not registered chemists, and denies that the safety of the public is better cared for when a sealed packet of a pro-

prietary article containing poison is sold by a registered chemist than it is when the sale is conducted by a seedsman. He is also of opinion that no amount of legislation, or of "proper and well-defined restrictions"—which can be as well complied with by a respectable nurseryman as by a trading chemist—will ever prevent the "designedly wicked" obtaining and making improper use of poison. He argues, therefore, that it is utterly useless, as well as unreasonable, to hamper unnecessarily a large, important, and thoroughly experienced body of commercial experts in favour of a small section of the trading community—*i.e.*, registered chemists—"who are undoubtedly specialists in their own particular line, but who have little or no practical acquaintance with an old-established industry of which they now claim an unauthorised monopoly." Mr. T. G. Dobbs, who writes thus, again omits, at this point, to adduce evidence in support of his statement, and we imagine that he would find it difficult to prove that chemists have ever claimed any such monopoly. At the same time, the law must be respected, even by the members of societies with very long names.

THE INDIAN AND COLONIAL ADDENDUM is specially reported on by Dr. Attfield, who states that from the seventy British colonies and provinces beyond the shores of the United Kingdom there have come requests for the official recognition, in the projected Indian and Colonial Addendum to the British Pharmacopœia of 1898, of something like forty or fifty medicinal plants and about as many pharmaceutical preparations of those plants, though the number of the preparations may be extended. Those plants and preparations may be grouped under four sections—the articles in the Indian section to be officially recognised for use in India, those in the Australasian section for use in the respective Australasian colonies, those in the Eastern section for use in the respective Eastern colonies, those in the Canadian section for use in the North American colonies. It is suggested that in the Addendum the bibliographical treatment of the articles might be that of the Pharmacopœia. Not one of the medical and pharmaceutical incorporated authorities consulted has expressed opinions adverse to the expansion of the British Pharmacopœia into an Imperial British Pharmacopœia (*a*) by the removal of former (1885) restrictions as to medicinal plants grown in Britain; (*b*) by the adoption in the current Pharmacopœia of most of the large number of "suggestions" received from Indian and Colonial authorities, as printed in the Indian and Colonial Report of May 29, 1895: and (*c*) by the publication of the projected Indian and Colonial Addendum to the British Pharmacopœia of 1898.

THE MANCHESTER AND WEST RIDING OPTICAL SOCIETIES send a copy of their memorandum of affiliation, which embodies an agreement between the two Societies, for the purpose of securing to the members thereof mutual co-operation and benefit. It is provided that each Society shall retain its own individuality and independence of government, but it is intended to secure the exchange of books, novelties, and ideas generally, also of such papers, lectures, and demonstrations as may prove of interest at the Societies' meetings, and to mutually assist each other in all educational matters; as well as to have and effectively work a common policy in all desirable matters of trade interest. Every member of either Society will be a member by courtesy of the other Society in all respects, except that there will be no financial liability of any kind arising from such membership, nor any voting power in that Society. This is a feature of the new arrangement which should commend itself to local pharmaceutical associations. All ordinary Society meetings are, of course, to be open to all members of the affiliated Society, as well as all the various conversaciones, exhibitions, etc., that may from time to time be arranged. Finally, in the event of the removal of a member of one Society into the area of the other Society, voting membership in the latter is to follow immediately if applied for, and all the usual formal preliminaries will be waived.

THE ERGOTINS OF COMMERCE.

Merck in his 'Annual Report,' for 1899, pp. 65-67, gives a comparison of the various brands of ergotin met with in commerce.

ERGOTINUM BONJEAN.—This is an aqueous, reddish-brown extract purified by the addition of alcohol. One part corresponds to 5 to 6 parts of ergot. The dose is 10 to 30 centigrammes in pills or hypodermically.

ERGOTINUM BONJEAN DEPURATUM PRO INJECTIONE.—This is a further purified preparation of the former, 1.5 part corresponds to 1 part of ergotin Bonjean. Dose, 50 to 60 centigrammes subcutaneously for uterine or internal hæmorrhage.

ERGOTINUM BONJEAN SICCCUM CUM DEXTRINO is ergotin Bonjean mixed with an equal weight of dextrin. It is a brown powder and used similarly to ergotin Bonjean, but in twice the dose.

ERGOTINUM BONJEAN SICCCUM CUM SACCHARO LACTIS contains equal parts ergotin Bonjean and milk sugar. It is a brown hygroscopic powder soluble in water. Use and dose same as above.

ERGOTINUM BOMBELON FLUID (*Cornutine ergotas*).—This is a dark brown fluid which is employed subcutaneously or internally in labour. The dose for internal use is 2 Gm., to be repeated in ten minutes. For subcutaneous injection, 0.2 to 0.5 C.c. of the preparation is aspirated into a 1 C.c. syringe, which is then filled with water, shaken up, and the freshly prepared mixture injected.

ERGOTINUM BOMBELON SPISSUM.—This is a solid extract for internal use exclusively, in the form of pills. Ergotin solutions in distilled water soon develop fungoid growths, so that they should either be freshly prepared or have alcohol added. A solution which keeps very well is obtained as follows:—Ergotin Bombelon spiss., 10; Aq. Laurocerasi, 7.5; Alcohol (90 per cent.), 2.5. 4 to 15 drops for a dose according to requirements.

ERGOTINUM DENZEL (FLUIDUM).—A purified extract of ergot which has the same dosage as that of the German Pharmacopœia. The following formula are recommended for its administration:—

(*a*) *Internal*. Ergotin Denzel, 2; Cinnamon water, 180. Two or three tablespoonfuls to be taken daily.

(*b*) *Subcutaneous*. Ergotin Denzel, 2.5; Borax, 0.25; Distilled water, 7.25. 0.5 to 1 C.c. to be injected.

ERGOTINUM KOHLMANN FLUIDUM.—This is a dark brown fluid miscible with water, 16 drops (1 Gm.) of this preparation corresponds to 1 Gm. ergot, the effect is the same as that of fresh ergot. Single dose for uterine atony 4 to 5 Gm. For hæmorrhage the same dose is given in portions in twenty-four hours. For inducing labour, at first 8-12 drops hourly may be given, the dose increased gradually, as required, to 20 or 30 drops.

ERGOTINUM PURUM DIALYSATUM SPISSUM WERNICH is a dialysed aqueous extract of ergot which has previously been treated with alcohol and ether, and is, therefore, specially suitable for subcutaneous injection. This preparation is very rich in salts and is given in relatively large doses (2 Gm. and over).

ERGOTINUM PURUM DIALYSATUM LIQUIDUM WERNICH.—About 2 parts of this preparation corresponds to 1 part of the last mentioned; the dose is proportional.

ERGOTINUM PURUM DIALYSATUM WERNICH SICCCUM.—The active constituents of 1 Gm. of ergotin Wernich spissum are contained in 0.7 part of this preparation, so that the dose is 1.4 Gm.

ERGOTINUM PURUM SICCCUM WIGGERS is a dried alcoholic extract of ergot, partly deprived of oil, which, according to Kobert, consists chiefly of sphacelinic acid. It forms a brownish red powder which dissolves in warm alcohol; the solution may be diluted with water without precipitation. Dose from 2 to 5 up to 10 centigrammes for each injection. Maximum dose in twenty-four hours 50 centigrammes.

ERGOTINUM YVON.—A dark brown fluid extract which contains cherry laurel water, prepared by extracting fat-free ergot with solution of tartaric acid; 1 C.c. of ergotin Yvon contains the equivalent of 1 Gm. of ergot. Dose for internal use 10 to 20 drops, subcutaneously 1 C.c. each day, the injection to be repeated every second or third day.

ENGLISH NEWS.

PROCEDURE UNDER THE SALE OF FOOD AND DRUGS ACT.—On May 31 the case of *Mason v. Cowdary* came on for argument before Mr. Justice Darling and Mr. Justice Bucknill, sitting as a Divisional Court in the Queen's Bench Division. Mr. Bonsey appeared for the appellant, and Mr. R.D. Muir for the respondent. This was a special case stated by the Justices of Bedford. It stated that at a Petty Sessions held at Luton, January 8, 1900, an information was preferred by Geo. Mason, under Section 6 of the Sale of Foods and Drugs Act, 1875, against Ellen Cowdary, that she on November 16 did unlawfully sell to the prejudice of the appellant camphorated oil which was not of the nature, substance and quality demanded (see *ante*, 107). The respondent kept a small shop in the village of Leagrave, Beds., and the appellant purchased from her six 2d. bottles of camphorated oil. The oil was exposed for sale in bottles which were not apparently prepared by respondent, but each of them bore a label with the name of a chemist in the neighbouring town of Luton. There was no evidence whether or not the bottles were identical in character or appearance, or whether or not the labels all bore the name of the same chemist, but the six bottles were all purchased at the same time. At the time of the purchase the appellant intimated to the respondent his intention to have the oil analysed, and he divided the six bottles into three lots of two bottles, each of which he sealed up, handing one lot to the respondent, keeping one lot, and sending the other lot to be analysed. Appellant did not open any one of the bottles of oil or mix or divide the contents, but the two handed to the respondent were in the same condition as when purchased. The appellant received from the public analyst a certificate of the analysis of the contents of the two bottles submitted to him, and the analysis was put in evidence. It showed that the camphorated oil in the bottles analysed contained only 17.5 per cent. of camphor, whereas proper camphorated oil should contain 20 per cent. of camphor. For the part of the appellant it was contended that the requirements of Section 14 of the Sale of Foods and Drugs Act had been complied with by him, inasmuch as he had divided the article into three parts, each of which were marked and sealed, but the justices were of opinion that the appellant had not complied with the requirements of Section 14; and, further, that they were not satisfied that the two bottles analysed by the analyst were identical in nature and substance with the other two sets of bottles in the hands of the seller and the appellant respectively. They accordingly dismissed the summons.—Mr. Bonsey said the appeal had been made because the appellant wished the point decided whether or not it was necessary to divide up each bottle in order to comply with Section 14.—Without calling on the other side, their lordships held this was a purchase of six separate articles, and therefore each required dividing and analysing. The appeal was therefore dismissed with costs.

MINERAL CAMPHORATED OIL.—On Thursday, May 31, at Lambeth Police Court, Frederick High, oilman, East Dulwich Road, S.E., was summoned for selling camphorated oil containing 96.5 per cent. of mineral oil.—Defendant pleaded that he did not sell the oil as camphorated oil, but as "campholeum," which was indicated by the label on the bottles.—Fined 10s. and costs.

SALE OF MAGNESIA.—At the County Petty Sessions, Trimdon, on Saturday, May 26, Thomas Ellis, grocer, was ordered to pay the costs of a case in which he was summoned for selling magnesia not of the strength prescribed by the B. P. 1898, it being certified to contain 57.10 per cent. of carbonic acid and combined water.

SPIRIT OF NITROUS ETHER CASE.—At Sheerness (Kent) Police Court, on Thursday, Mr. D. Sturdy, chemist and druggist, was summoned for selling deficient spirit of

nitrous ether. For the defence it was stated that the sample submitted to the analyst had been placed in a defective bottle, and that seeing that it was not analysed for eleven days after its purchase the wonder was that it had any of its active properties. It was pointed out that eleven other samples taken at Mr. Sturdy's premises on other occasions turned out to be correct.—The Stipendiary Magistrate dismissed the summons, stating that he was not satisfied that the sample was in the same condition when analysed as it was when purchased.

DEFICIENT SPIRIT OF NITRE.—William Price, grocer, Newbridge, was summoned at Abercarn, on May 24, for selling sweet spirit of nitre which was not of the nature, quality, and substance demanded.—The prosecution did not suggest intentional fraud, as it was thought that the article might have deteriorated through a defective cork.—The county analyst, however, stated that it was not possible for deterioration to have taken place, because the alcoholic strength of the liquid had not deteriorated, whereas the sample was only about half strength.—Defendant was ordered to pay the costs.

ALLEGED FALSE PRETENCES.—At Clerkenwell Police Court on Thursday, May 31, William Bishop (30), described as a chemist, of 164, Millfield Road, Lower Clapton, was charged on a warrant, before Mr. Chapman, with obtaining twenty-four boxes of pills, value £2 7s., the property of James Crispe, manufacturing chemist. It appeared from the evidence that the prisoner had been employed by Messrs. Blackham and Co., and, after being discharged from their employ, he presented to Mr. Crispe's representative several orders for "Dr. Williams's Pills." Believing the orders to have been written with the authority of Messrs. Blackham, the representative supplied the pills. Subsequently it was discovered that the orders were not sent out with Messrs. Blackham's authority. The prisoner, in reply to the charge, said, "Yes, it is quite true. I sold the pills to a chemist." Remanded.

CARBOLIC ACID FOR GINGER-BEER.—On Tuesday, May 29, George Buckley (33), a fitter, living at 4, Gorsebrook Terrace, Stafford Road, Bushbury, went into the pantry, at his house, shortly after 11 p.m. to get a drink of "pop." There were several bottles of ginger-beer on the shelf, and amongst them their happened to be a stout bottle nearly full of liquid carbolic acid. As frequently occurs in such cases, the man took the wrong bottle in the dark, and drank part of the contents before he realised that it was carbolic acid. He was taken into a doctor's surgery, and the usual remedies were applied, but the man died while in the surgery.—At a subsequent inquest the jury returned a verdict of "Accidental death."

THE MANCHESTER CORONER AND A CHEMIST.—At the adjourned inquest before the Manchester City Coroner (Mr. Sidney Smelt) on the 31st ult., touching the death of George Sennett, an impecunious actor, three empty laudanum bottles were produced, two of which bore the label of "Edmund Holt, medical chemist, 268, Deansgate, Manchester," and the other "Boot's, Cash Chemists, Limited." These bottles had been found on the table in the bedroom of the deceased. They were all empty.—Joseph Oakey, chemist and druggist, was called as a witness.—Coroner: What are you?—Chemist and druggist, and manager of the Deansgate shop of the executors of the late Ed. Holt.—Where do you live?—At Weaste.—Coroner (taking up a register): How long have you been the manager of this shop?—Two years.—Why have you not registered?—I am registered by the Pharmaceutical Society. They send me a journal every week.—Your address is registered as at 157, Liverpool Road, Cadishead. Did you not send them notice that you have removed?—No.—You ought to have done, and let them know. We are bound by these addresses. What is the No. in Deansgate?—268.—Do you manage this shop for the executors of the late Mr. Edmund Holt?

—Yes.—There is no Holt?—No.—How is it your name is not on these labels; the Act says that the name and address of the chemist who supplies the stuff has to be put on the label—not the name of a dead person? Is that not so?—Yes, these labels have the name of Holt upon them.—He is dead—he can't be the seller.—The executors are the firm.—The executors are not members of the Pharmaceutical Society?—No answer.—You have to supply these bottles?—Yes.—They ought to be labelled with the name and address of the seller; not the name of a dead person, who cannot be the seller.—Boots, Limited, name is on their poison bottles, and they are not all qualified men.—I have nothing to do with that, Edmund Holt is not the name of the seller?—No.—It is not a matter for me to deal with. It is a question for the Home Office. You manage this shop?—Yes.—Do you remember serving a man answering to the description of the deceased on May 18 with laudanum?—Yes.—Did you serve him in a bottle like this?—Yes, I served him with twopennyworth on Friday, and with threepennyworth on Saturday. I asked him what he wanted it for, and he said it was for his wife for outward application.—Did he tell you that on both occasions?—Yes, each time.—How was it that you gave him twopennyworth on the Friday, and another threepennyworth on the Saturday?—He said he wanted it for outward application.—Did you doubt him?—No.—Had you any reason to doubt him?—No; he passed a remark about the weather.—Did he not look like a man who drank heavily?—He was not drunk then.—Had he the appearance of a heavy drinker?—He might have been.—If a man came for laudanum on a Friday, and then again on the Saturday, would you not think it suspicious?—No, not from what he said.—A man is not likely to tell you what he really wants it for if he is going to kill himself. I have never heard of a man going to a chemist and saying "I want some laudanum with which to poison myself." He says he wants it for toothache or for outward application, and when a man like the deceased came to your shop on succeeding days I should have thought it would have put you on your guard, but it didn't, and you let him have it?—Yes.—No doubt a great quantity of laudanum is used, and there is no sale restriction. You have used the label of a person who has no existence. I don't know what is meant by "medical chemist." It is an absurdity.—A Juror: It is to distinguish him from an analytical chemist.—Coroner: An analytical chemist is a medical chemist. I can understand you (witness) serving the deceased on Friday; but I cannot understand you letting him have the second lot on Saturday.—Twopennyworth is not a large quantity for fomentation.—If he had asked for a pint would you have given it him?—No, I should say that would be too much.—But, if people used laudanum for fomentations every day, wouldn't a pint soon go?—Yes.—Would you think 8oz. out of the way?—I never supplied an 8oz. bottle.—Would it not be as well to exercise a little control over these poisons when you see a man of his appearance come for poison?—He wasn't drunk.—No, but he might have been.—I should not have served him the second time if he had come again on the first day.—If you make it difficult for these people to get poisons you may preserve life. That will do.—The inquiry resulted in a verdict of "Suicide while insane."

SCENE IN A CHEMIST'S SHOP.—At Gravesend (Kent) Police Court on May 31, Clarence Morrison, chemist and druggist, was charged with being drunk and disorderly on the previous Saturday. Accused had acted as manager to Mr. J. C. Mitchell, chemist, West Street, Gravesend, and his notice to leave expired on May 26. During the evening Mr. Mitchell's assistant at Grays, William Dalton, was sent to the West Street pharmacy to take charge of the keys and lock up the shop. He found Morrison drunk, and on asking for the keys defendant struck him in the face twice. As defendant declined to deliver up the keys,

Mr. Mitchell and the police were sent for, and as he used bad language and refused to go away he was arrested.—Defendant stated that earlier in the day Mr. Mitchell permitted him to take charge of the shop until 11 o'clock at night, the usual closing time. He asserted that the assistant was impudent, and that when he refused to deliver up the keys until he received orders from Mr. Mitchell, he was thrown down and illused by the police.—Defendant was fined 5s., in default seven days' hard labour.

POISONING BY PRUSSIC ACID.—The coroner for Central Warwickshire held an inquest at Leamington, on Friday, June 1, concerning the death of Edwin James Bloomfield, chemist and druggist, of the Parade, who committed suicide the previous day by taking a dose of prussic acid. The evidence showed that deceased was depressed through illness, and had confided to his medical attendant that he had got into difficulties through betting.—A verdict of "Suicide whilst temporarily insane" was returned.

THE STORAGE OF CALCIUM CARBIDE.—At Bristol Police Court on May 16, four summonses under the Petroleum Act (1871) were heard against Matthew W. Dunscombe, 5, St. Augustine's Parade, two for keeping on his premises a quantity of calcium carbide on May 1 and May 2 without certain labels being affixed to the tins, and two for keeping on the same days 44 lb. of calcium carbide without having a licence from the local authority.—It was stated for the prosecution that calcium carbide now comes under the provisions of the Petroleum Act of 1871, the regulations providing that the substance must bear a label to the effect that it must be kept in a dry place, and that it was dangerous if it became damp. On the days in question two vessels, one containing 35 lbs. and one 9 lbs. were found on Mr. Dunscombe's premises. The maximum quantity that might be kept without a licence was 5 lbs., and it must be kept in separate 1 lb. vessels. Neither of the two vessels bore a label in accordance with the Act.—For the defendant it was stated that about three years ago when he noticed in the newspapers that it was necessary to have a licence he sent his son to the police-station to make inquiries. He was there referred to the Council House, and at the Council House he was referred to the police. They appeared to know nothing about the licences at the Council House. He had no desire to evade the law, and if the police had told him that it was necessary to have a licence he would have taken out one at once.—Fined £4 and costs.

FOREIGN NEWS.

SUNDAY CLOSING IN GERMANY.—A petition to the German House of Deputies in favour of enabling small apothecaries' shops in country districts to close on Sundays has been rejected on account of a technical informality.

VITRIOL OUTRAGE.—In the early hours of Monday morning a man called at the surgery of Dr. Coustols, 3, Rue Gosselin, Ivry, in the suburbs of Paris, and summoned him to a critical case. The doctor dressed himself hurriedly, and was about to accompany his caller to the patient's abode, when he received, without warning, the contents of a wide-mouthed bottle of vitriol full in the face. The poor doctor was badly burned. Not having been on bad terms with anyone to the best of his knowledge, he is at a loss to assign a motive for this dastardly outrage upon his person. The police are actively bestirring themselves to trace the aggressor, but as yet have found no clue.

THE LATE DR. EVANS' HOUSE.—By virtue of the fact that he was personally instrumental in assisting the Empress Eugénie to escape to England after the war in 1870, the late Dr. Evans, formerly dentist in the Rue de la Paix, gained for himself no small measure of notoriety. His house—a palatial residence in the Avenue du Bois de Boulogne, has recently been inspected by the

President of the Republic with the view of utilising it as a residence for personages of Royal or Imperial rank who may visit Paris during the Exposition. Monsieur Loubet expressed satisfaction at the manner in which the mansion had been decorated and furnished. It is generally supposed that King Oscar of Sweden will be the first distinguished guest to reside therein.

THE LAST YEAR OF THE CENTURY has been particularly and unfortunately notable by the number of deaths of scientific men which have been recorded. We regret to announce the death of Monsieur Hippolyte Stupuy, Keeper of the Artistic Collections of the City of Paris, and formerly Councillor-General of the Seine Department. He was seventy years of age, being born at Paris in 1830, and was a nephew of the Academician Youy. At an early age he devoted himself to literature. He was collaborator of Littré in "Philosophie positive," and some years since published a remarkable work on the celebrated mathematician Sophie Germain. He had held the appointment of Keeper of the Artistic Collections of the City of Paris since 1894. Monsieur Ravaisson-Mollieu, senior member of the Académie des Inscriptions and Belles Lettres, also died rather suddenly the other day. He was a man of great intellectual culture and deep learning, and added a considerable lustre to French metaphysics. He was also a member of the Académie des Sciences Morales et Politiques and Grand Officer of the Legion of Honour. Military honours were therefore rendered at his funeral, which took place at the church of St. Thomas d'Aquin.

THE ESTABLISHMENT OF DR. ACCOLAS, 6, Rue du Château, Neuilly, where about thirty patients were under treatment for nervous disorders, has been completely destroyed by fire. All the patients were, however, rescued and temporarily lodged in neighbouring houses. The outbreak is attributed to an electric circuit. The damage wrought by the fire is estimated at 50,000 francs (£2,000).

AMERICAN NEWS.

THE FORTY-EIGHTH ANNUAL MEETING of the American Pharmaceutical Association was held at Richmond, Va., during the week commencing on May 7, and was presided over by Professor A. B. Prescott, Ph.D., M.D. The Association having been welcomed to the city by Governor Tyler and Mayor Taylor, the President delivered his annual address, in which he reviewed the more important work of the nineteenth century in the various departments of pharmacy and chemistry. The meeting is reported to have "maintained the high standard of preceding meetings, though resulting in no very notable contribution to the sum of our pharmaceutical knowledge." Many of the papers were of a practical character appealing directly to the ordinary pharmacist, others were more or less scientific.

THE PROMINENT FEATURE of the meeting was the yearning after a better and more uniform system of pharmaceutical education. To aid in bringing about a more satisfactory condition of affairs in connection with American pharmacy, the Section on Education and Legislation has caused to be drafted a "Model Pharmacy Law" which was prepared and presented by Professor J. H. Beal and formally adopted by the Association. It is intended to serve as a model or basis for pharmaceutical legislation in States where it may be proposed to amend the existing law in regard to pharmacy. The chief object of the draft law appears to be to bring about a greater degree of uniformity in the education of rising pharmacists. It provides that the apprentice must possess a good preliminary education and that before taking out his licence to practise pharmacy he shall not only first serve as an assistant, but he is also required to go through a systematic course of instruction in a college of pharmacy, in order that he may be better able to meet the conditions laid upon him by the progress of scientific pharmacy. In other words, a compulsory curriculum is considered to be necessary.

THAT THE COMING PHARMACIST must be a better educated man than even the best of those now in business seemed to be generally recognised, the *Pharmaceutical Era* states, by those present at the annual meeting of the A.P.A. There was no dissent to the proposition that hereafter no one should be admitted to examination by a board of pharmacy unless he holds the diploma of a recognised college of pharmacy. It was also realised that pharmacists should be better business men, and it was suggested that the only means, under the circumstances, for affording them a business education is to establish in the colleges of pharmacy a course in commercial training designed and arranged for the especial use of pharmacists. Such a course, which has recently been instituted in one of the colleges, was described and commented on in the meeting, being warmly approved.

COMPANY PHARMACY would be affected to some extent should the provisions of the draft law ever become universally adopted in the United States, inasmuch as it requires the owner of a drug store to be himself a licensed pharmacist. The much discussed "suggestions" of the Pharmaceutical Society of Great Britain would appear to have been noted, and the "suggestion" which received perhaps the most attention from adverse critics—being by them described as "absurd" and "ridiculous"—has apparently been adopted by their American confrères; for by the proposed law the sale of medicinal agents, quack nostrums, etc., by unqualified persons is absolutely prohibited.

THE REPORT OF THE SPECIAL COMMITTEE OF RESEARCH of the A.P.A., which was read by Mr. A. B. Lyons at the second session of the Scientific Section, consisted principally of suggestions regarding the possibilities of usefulness in the future of the committee. The object that was sought in the original appointment of the committee was to secure concerted action on the part of those desiring to advance the interests of pharmacy by research work. The committee, under the able leadership of Dr. Prescott, has already accomplished valuable results in giving direction to effort by keeping prominently in view a single important object—the standardisation of crude drugs and galenical preparations. A suggestion was made at the previous meeting of the Association that an effort be made to secure, through the committee, a co-operation of the professions of medicine and pharmacy, but since then no meeting of the American Medical Association has been held, so the matter is held in abeyance.

TO GIVE TO THE COMMITTEE OF RESEARCH the standing that it ought to have, it is thought desirable that it should be able to point to its laboratory facilities for the carrying out of details of investigation; to have a laboratory of its own, under the directorship of a competent man, who should be able to give his whole time to it. At the same time, the committee point out that though it does not possess a laboratory, it does command the laboratory facilities of all the schools of pharmacy in the United States. It also points out that the medical schools of the country have laboratory facilities, and it is suggested that the work of those laboratories be reported year by year by a committee of medical men appointed for that purpose, and the reports of each committee made accessible to pharmacologists in both professions.

THE "COMMITTEE ON PHARMACOLOGICAL RESEARCH" is the suggested title for the combined committee, the scope of its work to be a critical study of the therapeutic agents in common use with reference to their fitness to do the therapeutic work the physician expects from them. This would involve for the more active crude drugs a thorough study of assay methods, not so much from the chemical as from the therapeutic standpoint; physiological experiment to verify claims made for remedies newly introduced, as well as to confirm conclusions reached by chemical analysis. In the division of labour between the pharmacist and physician, the larger

share of the purely chemical work would be done by the former and the physiological by the latter.

THE COMMITTEE ON ARRANGEMENTS AND ENTERTAINMENT had provided an excellent programme, somewhat on the lines of the entertainment usually provided for members of the British Pharmaceutical Conference, including President's reception and a reception by the Governor of the city, concerts, carriage drives, excursions, visits to local manufactories, lectures, etc. Altogether, a very pleasant and enjoyable time was spent, the world-famed "Southern hospitality" fully keeping up its reputation.

AN AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES was inaugurated on May 8 at Jefferson Hotel, Richmond, Va. Advantage being taken of the annual gathering of the A.P.A., a call was issued by the Secretary of the Maryland College of Pharmacy, Mr. H. P. Hynson, to the faculties of the leading pharmaceutical colleges of the United States, with the object of forming an organisation. Representatives from the various colleges responded to the call, and temporary organisation was effected with Mr. H. P. Hynson, of Baltimore, Chairman, and Professor W. J. Jackson, of San Francisco, Secretary. Committees were then appointed, and at a subsequent meeting they reported, and on their reports it was decided, as already intimated, to form an American Conference of Pharmaceutical Faculties, the officers for the ensuing year being:—President, A. B. Prescott; Vice-President, J. P. Remington; Secretary and Treasurer, W. H. Bradbury; Executive Committee, Professors J. H. Beal, W. Simon, Ed. Kremers, J. M. Good and Geo. C. Dickman. The constitution states its object to be "the promotion of the interests of pharmaceutical education," and it provides for annual meetings coincident with the meetings of the American Pharmaceutical Association.

THE KING'S COUNTY PHARMACEUTICAL SOCIETY has, according to the *Pharmaceutical Era*, obtained an expression of opinion from its attorneys, Messrs. Perkins and Butler, with regard to the new law relating to the manufacture of explosives or combustible materials (see *ante*, 608). Put briefly, their opinion is that upon the face of the law, and for the reason that the making of soda water involves the manufacture of carbonic acid gas, it is unlawful to manufacture soda water "in a cellar, room or apartment of a tenement or dwelling-house or any building occupied in whole or in part by persons or families for living purposes." They point out, however, that, so far as they are aware, the manufacture of carbonic acid gas and the making of soda water have never been regarded as dangerous; but if carbonic acid gas can be shown to be dangerous in its manufacture or use, to the general public, then the law must be obeyed. If, on the other hand, carbonic acid gas in its manufacture and use is harmless, then the attorneys are of opinion that the courts will not sustain the law, on the ground that it is unconstitutional.

AUSTRALASIAN NEWS.

THE REGISTERED PHARMACISTS' SOCIETY OF NEW SOUTH WALES held its first annual meeting on March 13, when the President was able to say, in reference to the report and balance-sheet, that from the time when the preliminary meeting was called progress had been steady, sure, and satisfactory, and now, "with no back bills to meet, and cash in hand for future requirements," the outlook was very promising. Suitable premises had been secured and furnished, a series of popular lectures had been inaugurated, and a number of dances had been held during the winter months, which had proved very enjoyable to members and their friends. The President indicated that among other subjects which would command attention

during the ensuing year would be included a Benevolent Fund and a register for chemists out of employment. A scheme to regulate the prices of patent medicines—that is, to bring chemists into agreement as regards a minimum selling price—is also suggested. Mr. J. R. Willows has been elected President, Mr. Newman Vice-President, and Mr. Wells Treasurer, for the ensuing year.

THE EARLY CLOSING ACT.—Mr. R. T. Bellemey, Hon. Sec. of the R.P.S., and Mr. C. E. Newman, another well-known pharmacist, have raised an important question with regard to the operation of the Early Closing Act (N.S.W.) in connection with chemists' shops. Both of the gentlemen named were recently charged on summons at the Central Police Court, Sydney, with having their shop doors open after 9 p.m. on certain dates. In their defence it was argued that what was meant by the word "close" in the Act was "closed for the purposes of trade." At nine o'clock they put up a card informing the public that they were so closed, and it was urged that in the event of a pharmacist living on the premises it would convert his dwelling into an unhealthy prison if the door was not permitted to be left open for purposes of ventilation and convenience. The magistrate dismissed both cases, and counsel for the prosecution mournfully remarked that this decision meant that in order to secure a conviction it would be necessary to prove that a sale had actually been made after closing hours.

THE PHARMACY BOARD OF NEW ZEALAND, at a recent meeting, received the following report of a Committee appointed to consider the reciprocity question:—"Your Committee is of opinion that the only basis on which reciprocity can become an accomplished fact is that founded on the interchange of certificates obtained by examination. It is hoped that within a reasonable time one system of pharmaceutical education and examination may prevail throughout the Australasian Colonies, administered from a central position. When this is arrived at no objection can be entertained as to reciprocity." It was then resolved that the above report should be forwarded to the Pharmacy Boards of New South Wales and Queensland as an expression of opinion from the New Zealand Board.

THE NEW ZEALAND BOARD has arrived at the conclusion that it would be impossible for it to carry out its duties with the fees prescribed by the Pharmacy Act, and it has decided to ask the Governor in Council to raise them to the same standard as that existing under the old Act, and in addition to grant the Board permission to levy a fee of 10s. 6d. per annum upon all members of the Society, in order to raise the necessary working expenses of the Board. The Colonial Secretary having been interviewed, expressed himself as being entirely in accord with the wishes of the Board, and promised to do all in his power to assist in their being carried out when the new regulations adopted by the Board came up for approval.

THE OFFENSIVE PUBLICATIONS ACT.—A Wellington (N.Z.) chemist, Mr. D. T. Orr, who sold a packet of Clark's B 41 pills to a local detective, was recently charged under the provisions of the Offensive Publications Act, 1892, with having "offered certain printed matter of an indecent nature." Inside the packet were found wrappers having on them printed matter relating to certain diseases, while outside was another wrapper, placed there by Mr. Orr, referring to pills manufactured by himself. Although Orr admitted that he had been selling the pills for twenty-five years, he denied that he had until now been aware of the contents of the package. The magistrate decided that Mr. Orr's own leaflet was intended to relate to the diseases referred to in the Statute, and when taken in conjunction with the printed matter in the packet, there seemed to be no doubt that a breach of the Act had been committed.—A fine of 20s. and costs was inflicted.

CAPE PHARMACEUTICAL SOCIETY.

A complimentary dinner in honour of Mr. William Martindale, President of the Pharmaceutical Society of Great Britain, was given by the Cape Pharmaceutical Society in the Oak Room, Dix's Café, on May 15, and the following report is taken from the *Cape Times* of the following day. Mr. L. JONES presided, the vice-chair being occupied by Mr. A. J. Radcliffe.

A capital meal having been partaken of, the CHAIRMAN proposed the toast of

THE QUEEN,

observing incidentally that in that country loyalty was not a mere sentiment, but was a thing one could catch hold of, and they had to hold on to it, while the loyalty of the colonies recently manifested had been an object lesson to the world.

The toast was heartily pledged, and a verse of the National Anthem sung.

The VICE-CHAIRMAN submitted the toast of

HIS EXCELLENCY THE GOVERNOR,

remarking that in the troublous times through which they had gone Sir Alfred Milner had been an example to all men, while he also commanded the honour and respect of everyone.

The toast was warmly drunk.

The CHAIRMAN then gave the toast of

OUR GUEST.

He did not think he need introduce Mr. Martindale to them, for he believed they had all heard his name before; in fact, he was afraid they uttered it rather familiarly sometimes. He did not think there was a single doctor, chemist, or apprentice who did not know the name of Martindale. When he heard that Mr. Martindale was coming out on a visit to South Africa he thought there was a chance for that gentleman, as the country was full of medicinal herbs whose properties were as yet unknown. He hoped Mr. Martindale on his return to England would take the greetings of probably the youngest Pharmaceutical Society in the world to that of the oldest—the parent Society. The Cape Pharmaceutical Society was quite a young one, and they had a lot to learn; for the last two years they had been engaged almost solely in legal matters and deputations to the Premier. He hoped that when Mr. Martindale went back he would do his best to help them. The next thing they had to pay attention to was the question of education; the apprentices there had nowhere to go to be taught, and he did not wonder at the number of failures in the examinations.

The toast having been drunk with musical honours,

Mr. MARTINDALE, in acknowledging the toast, referred at the outset to the troubles through which South Africa was passing, and to the great field for enterprise offered by the country, especially agricultural enterprise. The Imperial Yeomanry at present in South Africa included some of the picked agriculturists of Great Britain, and these were the men to make the best of the two colonies. He trusted that the war would soon be concluded, and that a number of the Yeomanry would remain behind, but if they did not stay there they would carry back such glowing accounts of the possibilities for agricultural work there that they would send out a number of the men who would be the making of the colonies agriculturally. Proceeding, Mr. Martindale said he was glad to know that they had a Board of Pharmacy, which examined the credentials of those wishing to follow the calling of pharmacy, and that they were instituting examinations which would at all events prevent ignoramuses starting. They must have to start with a fairly good primary education, and afterwards they required a secondary education, especially in the two sciences of chemistry and botany. He hoped they would be able to establish courses of instruction, either independently or in connection with the S.A. College, that would give the youths apprenticed in the colony a training in chemistry, botany, and physics.

so that they would be able to pass the examinations creditably. He was told that to get good assistants they had to import them, but the Colonial youth should have the chance of becoming good applied pharmacists, who would be a credit to them. In some of the Australian colonies they had established schools or classes in connection with the colleges, so that they could train their own apprentices to become fairly accomplished pharmacists. There should not only be lectures, but demonstrations, and a practical laboratory class, working under a well-trained chemist. Mr. Martindale concluded by referring to the South African flora, which he said was a surprise to him; some of the plants were quite new to him.

OTHER TOASTS.

The other toasts were: "The Ladies," proposed by Mr. BARLOW, and responded to by Mr. SAINSBURY; "The Press," by Mr. DANCK; "The Land We Live In," by Mr. FRENCH, acknowledged by Mr. FICK.

Dr. MABERLEY, as representing the medical profession, paid a tribute to the guest of the evening, and went on to refer to the medicinal properties of South African drugs.

The speeches were interspersed with songs and recitations.

The arrangements were admirably carried out by the following committee: Messrs. J. Jones, J. S. North, A. H. Mathews, A. J. Radcliffe, and W. Fick (Hon. Secretary). It was close upon midnight before the gathering separated.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

The quarterly meeting of the above Association was held on Wednesday, May 30, at the Rooms, Wimpole Street. Mr. F. MAITLAND (President) occupied the chair, a large number being present.

The minutes having been read, the position of the Association financially was thoroughly discussed and a committee appointed with a view to securing new rooms at a less expensive rental.

ANNUAL SUMMER OUTING.

It was decided to hold the annual outing at Totnes on Wednesday, July 11, meeting the Exeter chemists at that town, and also to invite all chemists of the surrounding district to join them.

PRESENTATION TO MR. C. J. PARK.

The CHAIRMAN said he had a very pleasing duty to perform. On hearing of the approaching marriage of Mr. C. J. Park, many of the members thought it a good opportunity to show their appreciation of the very many services which he had rendered the Association and pharmacy generally, both as President on more than one occasion, and also as a member of the Committee ever since it had been formed. He had given valuable assistance, and a great deal of the present prosperity of the Association was due to Mr. Park's energy. As a member of the Pharmaceutical Council, he had spared neither time nor expense in representing chemists in the West of England generally. The idea of a wedding gift had only to be mentioned and it was taken up most heartily. He (the speaker) had very great pleasure in asking Mr. Park's acceptance of a tea and coffee service as a small token of their high appreciation, hoping it would remind him of the very many pleasant hours spent amongst members of the Association.

Several members added their congratulations and good wishes, all testifying to the great help Mr. Park had been to the local Association.

Mr. PARK, in responding, said he could only very inadequately return very sincere thanks for the very handsome present and, what he valued equally, or even more, the very kind remarks of members present had been good enough to make in reference to his services on behalf of the Association in endeavouring to bind the members together in bonds of mutual commercial interest, re-

spect, and good fellowship. He should always look back to that evening with the greatest of pleasure, and the handsome gift would remind him of the great indebtedness he owed to the members for the honour and confidence which they had placed in him by electing him on three occasions to be their President. He trusted it would prove as an incentive, if one should be required in the future, to fresh efforts to make the Association useful to its own individual members and to the whole of the craft in the country. In conclusion, he again thanked the numerous gentlemen who had subscribed towards this token of esteem, and he valued more than he could express the knowledge that he had won a place in their hearts and esteem.

LINNEAN SOCIETY OF LONDON.

The anniversary meeting was held on Thursday, May 24, Dr. A. GÜNTHER, F.R.S., President, in the chair. The minutes of the last meeting having been read and confirmed, the Secretary reported the deaths, withdrawals, and elections during the past year, and the obituary notices of deceased Fellows were laid before the meeting.

REPORTS AND ACCOUNTS.

The Librarian's report having been read announcing the additions to the Library by donation and purchase, the Auditors' accounts were presented by Mr. Henry Groves. The Treasurer thereupon made his annual financial statement, and having pointed out the great inconvenience caused by the non-payment of subscriptions, and the unreasonable conduct of those who withhold payment for three or four years and pay no heed to the repeated applications from the Treasurer, it was moved by Mr. ALFRED O. WALKER, seconded by Mr. F. G. SMART, and carried:—

That the Council be requested to frame such an alteration of the by-laws as may compel defaulting Fellows to pay their subscriptions, and to submit the same to the Society at their next general meeting.

On the motion of Mr. WILFRED H. HUDLESTON, seconded by Mr. THOMAS CHRISTY, a vote of thanks for their valuable services were accorded to the Treasurer and to the Auditors.

ELECTION OF OFFICERS.

The PRESIDENT then opened the chief business of the day, when the Fellows present proceeded to ballot for the President, Officers, and Council for the ensuing year. Scrutineers having been appointed, and the votes counted, the result was declared to be as follows:—The following members were removed from the Council:—Mr. F. Darwin, Mr. H. W. Monckton, Mr. G. R. M. Murray, Mr. H. Saunders, and Mr. W. P. Sladen, and the following were elected into the Council to replace them:—Mr. Clement Reid, Dr. D. H. Scott, Rev. T. R. R. Stebbing, Prof. S. H. Vines, and Mr. A. Smith Woodward; and as President, Prof. Sydney Howard Vines, F.R.S.; Treasurer, Mr. Frank Crisp; Secretaries, Mr. B. Daydon Jackson, and Prof. G. B. Howes, F.R.S.

ANNUAL ADDRESS.

The retiring President then delivered his annual address, choosing for his subject "The unpublished Correspondence of William Swainson with contemporary Naturalists (1806-1840)," lately acquired by the Society. On the motion of Mr. F. D. GODMAN, seconded by Mr. HOWARD SAUNDERS, it was resolved that this address should be printed and circulated.

PRESENTATION OF GOLD MEDAL.

The Gold Medal of the Society was then presented to Prof. Alfred Newton, M.A., F.R.S., in recognition of his important contributions to zoological science. Prof. NEWTON having suitably acknowledged the presentation, and expressed his indebtedness to the Council for having selected him this year as the recipient of the highest honour which it is in the power of the Society to bestow, the proceedings terminated.

ROYAL INSTITUTION.

The Friday evening lecture that was announced to be given by Sir Henry Roscoe, F.R.S., was read by Sir WILLIAM CROOKES, F.R.S., in the absence of the author through illness. The subject was the same as that recently dealt with by Sir Henry Roscoe before the Chemical Society, viz.:—

BUNSEN.

Some few points connected with this eminent scientist that were not touched on in the former lecture are worthy of note. Bunsen, who was born at Göttingen in 1811, may be said to have laid the foundations of many branches of chemical science; in pure chemistry, in chemistry applied to the arts and industries, in physical chemistry and in chemical geology, his researches, said the lecturer, have long ranked as classics, and would remain so for many years to come.

The research that stamped him as a first-rate experimentalist was his investigation of the cacodyl compounds. This research, the only one of importance carried out by him in the domain of organic chemistry, was destined to exert so great an influence on the later developments of that branch of science that he might with truth be regarded as one of the pioneers of organic chemistry. This difficult research occupied him closely for six years, and was so fraught with danger that in 1846 he was nearly poisoned, but it gave an impulse to workers who have since gained distinction in organic chemistry, notably the late Sir Edward Frankland and Kekulé.

The burner which bears his name was invented for use in his laboratories. He was dissatisfied with the kind then in use, an argand burner with a wire-gauze cap and a copper chimney, because it gave an unsteady flame. His inventive genius soon found a remedy in the Bunsen burner so familiar all over the world.

Among the metals that he was able to produce electrolytically were magnesium, calcium, strontium, cerium, lanthanum, and didymium.

The lecturer referred to a story that is told of the late Emperor Frederick who, on being shown the grease spot photometer, said: "For the first time in my life I now know the value of a spot of grease."

Bunsen's visit to Iceland in 1846 was next referred to. Hecla had been in eruption the previous year, and he spent three and a-half months on the island procuring specimens of gases and substances of various kinds that enabled him to investigate many volcanic and pseudo-volcanic phenomena. This research laid the foundation of modern petrology.

Just as it has been said that Davy's greatest discovery was Faraday, so it may be said of Bunsen in regard to Kirchhoff. It was mentioned of Bunsen that with 17 grammes of caesium chloride which he obtained from 40 tons of material he was able to determine all the constants of that element.

The last of Bunsen's researches that the lecturer mentioned was the measurement of the chemical action of light, in which he himself had the good fortune to be associated.

Passing to the more personal side of Bunsen's life the lecturer said that he was always a believer in holiday travelling, but before the long summer vacation was over he would be back again steadily working in his laboratory at some research that demanded closer attention than he could give to it during term-time. It was his custom, after delivering his daily lecture on general chemistry at eight o'clock, to go into the laboratory and visit his students, and of these even the most elementary was not neglected by the great master. In this way he unconsciously endeared himself to all. He generally had about twenty advanced students working out researches under his direction, and the task of supervising these, added to his other duties, gives cause for wonderment as to how he found time for his own researches. This may be partly explained by the fact that he was an early riser.

ANALYTICAL NOTES.

• **SELENIUM IN SULPHURIC ACID.**—Schlagdenhauffen and Pagel have recently found selenium to be present in many samples of so-called pure sulphuric acid. To detect it, they apply the well-known Dragendorff test with codeine. A few drops of the acid are placed in contact with a particle of codeine, when a green or bluish green tint will be produced in a few minutes if selenium be present, on warming the mixture gently on the water bath.—*Journ. de Pharm.* [6], **11**, 261.

NEW REACTIONS FOR SESAME OIL.—F. Breinl finds that sesame oil gives marked colour reactions in the presence of hydrochloric acid with many aldehydes of the aromatic series, from an orange colour with benzoic aldehyde to a red violet tint with vanillin, piperonal, and orthoxy-benzoic aldehyde. 10 C.c. of the oil are shaken for half a minute with 0.1 C.c. of the aldehyde solution and 10 C.c. of concentrated hydrochloric acid: even a 0.5 per cent. solution of sesame oil gives with the three last-mentioned aldehydes a distinct reaction. The colour does not develop at once, but in a few minutes becomes more intense than that given, under similar conditions, with furfural. The author, therefore, considers these aldehydes preferable to furfural as employed in Baudoin's test for sesame oil, since not only is the bluish tint developed by them less likely to be masked than the reddish colour of the original test with furfural, but these bodies are very stable in alcoholic solution, so that the reagent will keep for months.—*Mon. Scient.* [4], **14**, 250.

DISTINCTIONS BETWEEN ARTIFICIAL AND NATURAL SILKS.—In the course of an interesting *résumé* of the history of the production of artificial silk substitutes K. Hassack gives the following distinctive characters of natural silk and the manufactured articles as at present made. The size of the threads alone, as shown by the micrometer, is sufficient to distinguish them, the smallest natural silks having a diameter of 9 to 15, never exceeding 20 micro-Mm., whereas that of the smallest fictitious silk is 40 to 50 micro-Mm., the largest being as much as 132 micro-Mm. All artificial silks, except that made from gelatin, are birefringent. They do not give the peculiar unpleasant odour on burning that is evolved by natural silk. Heated to 200° C. in sulphuric acid they char and fall to powder, while natural silk is not sensibly attacked. Those that are made from nitrocellulose are not always completely denitrated, as may be shown by the reaction with a solution of diphenylamine in concentrated sulphuric acid. According to Herzog, nitrocellulose silk may be quantitatively separated from natural silk by means of an alkaline solution of copper and glycerin. True silk is dissolved in this menstruum, but not the artificial fibres. A saturated solution of zinc chloride dissolves natural silk at 100° to 110° C., but not nitrocellulose silk until the temperature reaches 120°, while the "wild" Tussah silk requires a still higher temperature, approaching 140° C., for its solution. Aqueous iodine solution stains artificial silks brown; natural silks yellow. The latter is coloured brown by the action of sulphuric acid and iodine, while cellulose silks are coloured blue by the same reagent.—*Mon. Scient.* [4], **14**, 259, after *Oesterr. Chem. Zeit.*

DETECTION OF FORMALIN IN MILK.—Leys points out that as formalin very quickly forms an albuminoid compound with casein, it should be tested for in milk within ten to sixteen hours of the possible addition, and that only very sensitive reagents should be employed. He recommends testing the distillate with Gayon's reagent: Fuchsin solution (1:1,000), 1,000 C.c.; bisulphite solution, sp. g. 1.264, 10 C.c.; pure hydrochloric acid, 10 C.c. This serves to detect the presence of 1:100,000 parts of formalin in milk. On account of frothing, 100 C.c. of the milk should be distilled in a 4-litre flask till 20 C.c. come over. As confirmatory tests, the author recommends the phloroglucin reaction, in which to 25 C.c. of milk

10 C.c. of phloroglucin solution (1:1,000) are added, and then 5-10 C.c. of solution of potash, and the colour developed compared with that obtained from pure milk with the same reagent. He also applies the Gayon reagent direct to the milk; pure milk gives a red coloration, due to the action of the casein, but this disappears on the addition of several drops of strong hydrochloric acid, while milk containing formalin gives a blue colour, lasting from eight to twelve hours.—*Pharm. Centralh.*, **41**, 133.

DETECTION OF SALICYLIC AND BENZOIC ACIDS IN MILK.—G. Breustedt gives the following process which obviates the difficulty due to emulsification: 10 C.c. of the milk is heated with 10 C.c. fuming hydrochloric acid, until it develops a red colour. After cooling, the acid liquid is shaken out with 20 C.c. of ether, and the solvent evaporated off. The residual fat is immediately shaken with 5 C.c. of hot water, filtered, and a few drops of a 1 per cent. solution of ferric chloride added to the filtrate. A distinct reaction will be obtained with 0.0005 Gm. of salicylic acid in 10 C.c. of milk. To test for benzoic acid (and at the same time salicylic acid) 25 C.c. of milk is mixed with 25 C.c. of water and 10 C.c. of Fehling's cupric sulphate solution, then about 2.5 C.c. of normal caustic potash solution is added, leaving the solution with an acid reaction. The mixture heated for a short time on the water bath and the copper caseinate which will contain the fat is separated. The clear serum is treated with several drops of dilute hydrochloric acid, and shaken out with ether. The residue after evaporation of the ether may be tested as above for salicylic acid, or for benzoic acid by dissolving in a little water and heating the solution for several minutes with a 10 per cent. solution of ferric chloride when, if benzoic acid be present, a brown flocculent precipitate of iron benzoate will be thrown down.—*Pharm. Zeit.*, **44**, 396, after *Archiv. d. Pharm.*, 1899, 3.

QUANTITATIVE SEPARATION OF FATTY ACIDS.—K. Farnsteiner proposes the following method for the determination of the unsaturated fatty acids, based on the solubility of the lead salts of the solid acids in warm benzol and their relative insolubility in cold. 0.6 to 1 Gm. of the fat is saponified in Erlenmeyer's flask with excess of alcoholic potash and titrated back with acetic acid (phenol-phthalein indicator). The alcohol is evaporated off as far as possible, the soap is then dissolved in 100 C.c. of boiling water, and precipitated with 30 C.c. of boiling lead acetate solution, containing about 1 Gm. of the salt; the mixture is cooled, filtered, and washed. The lead soap is now replaced in the flask and heated with water until it aggregates into a compact mass. This is allowed to cool, the water poured away, and the soap dried. It is then dissolved in 50 C.c. moderately warm benzol, allowed to stand for fifteen minutes at an ordinary temperature, and finally for two hours at 8° to 12° C. Filtration is then conducted through a syphon tube packed with cotton wool. The precipitate is washed with 10 C.c. benzol at 10° C., and this drawn off in the same manner. It is then dissolved twice in succession in 25 C.c. benzol, this being filtered off in a similar manner, after cooling for one hour at 8-12° C. For the separation of the fluid acids, the benzol solution is shaken with an equal volume of 10 per cent. hydrochloric acid, washed with water, filtered through cotton wool, and the benzol distilled off in a current of steam. To prevent loss through oxidation, the fatty acids should not stand long in contact with the benzol. If the iodine number of the acids is required, the benzol solution is divided into three parts of 25 C.c. In two of these the iodine number is determined, and the fatty acids determined by distilling off the third portion. Farnsteiner has further found that the barium salts of the oleic acids dissolve in warm benzol containing 5 per cent. of alcohol, and separate out again on cooling, while the unsaturated fatty acids remain dissolved, but this process is not absolutely quantitative.—*Pharm. Cent.*, **40**, 198, after *Zeit. f. Untersuch. d. Nahr. und Genussmittel.*

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Gelsemii Radix.

GELSEMIUM ROOT is obtained from the yellow or Carolina jasmine, *Gelsemium nitidum*, Michaux (N.O. Loganiaceæ), a climbing plant indigenous to the southern United States, which ascends lofty trees and forms festoons from one to another. The smooth, shining, twining stem bears perennial dark green leaves, and deep yellow fragrant flowers in axillary clusters. The plant grows in rich, moist soils along the sea coast from Virginia to the south of Florida, and its flowers are said to be poisonous. The drug consists of the dried rhizome of the plant with the larger roots attached, but sometimes smaller roots and portions of slender aerial stems are also present. The drug is collected in the autumn; it possesses antispasmodic and analgesic properties, and is used in the preparation of *Tinctura Gelsemii*.

CHARACTERS. — *Gelsemium* rhizome usually occurs in nearly straight and cylindrical pieces, about 15 Cm. or more in length, and from 6 to 18 Mm. in thickness, brown or dark brownish-violet in colour, or marked with a network of purplish lines with yellowish-brown intervening spaces. The difference in colour is due to the outer cork cells being filled with a dark reddish-brown substance, whilst the inner ones contain a yellowish deposit; as growth proceeds the outer dark layer of the rhizome becomes fissured and the pale inner layer is thus partly disclosed. The roots are fibrous and somewhat smaller, on the average, than the rhizome; they are of a uniform yellowish-brown colour, finely wrinkled on the surface, and somewhat tortuous or sinuous in shape. The drug is hard and woody, breaking with an irregular splintery fracture, and the rhizome frequently exhibits silky fibres in the bast, similar to the more conspicuous ones found in the aerial stems. A transverse section of rhizome or root exhibits a distinctly radiate appearance, the thin cortex or bark enclosing a large pale yellowish-white wood, which consists of narrow bundles with small pores, alternating with straight whitish medullary rays. In the case of the rhizome a small pith—frequently divided into four nearly equal parts—is also present, particularly in smaller and younger pieces; the silky fibres in the bast are isolated or occur in groups of two or three and form an interrupted ring, whereas in the aerial stem they are grouped in bundles. The bitter taste of the drug is due to the alkaloids, which occur chiefly in the bark; the slight aromatic odour is communicated by the volatile oil present.

NOTES.—The distinctive characters of *gelsemium* are the purplish colour of the rhizome, the yellowish colour and tortuous appearance of the roots, the splintery fracture, and the radiate structure of a transverse section. The active principles of *gelsemium* are present only in small quantities, if at all, in the stem. The chief constituent of the drug is the intensely bitter and poisonous amorphous alkaloid *gelseminine*, which forms amorphous salts. A second alkaloid, *gelsemine*, is crystalline, probably non-toxic, and forms crystalline salts. The resinoid known as "*gelsemin*" is a mixture of substances obtained by evaporating a tincture of *gelsemium* to dryness. *Gelsemic* or *gelseminic* acid is a crystalline substance found in *gelsemium* bark, which exhibits an intense bluish-green fluorescence in alkaline solutions; it appears to be identical with the β -methyl-*æsculetin* or *chrysotropic* acid found in *belladonna* root. *Gelsemium* preparations sometimes produce toxic symptoms, and in such cases artificial respiration should be kept up very steadily for at least three hours. Suitable antidotes are an emetic of mustard and water, atropine, morphine, aromatic spirit of ammonia, brandy, and digitalis.

GELSEMIUM ROOT.—a, Rhizome with rootlets; b, root; c, transverse section of root, d, ditto of rhizome e, piece of rhizome with aerial stem, attached Allnatural size.

Gentianæ Radix.

GENTIAN ROOT is obtained from the yellow gentian, *Gentiana lutea*, Linn. (N.O. Gentianaceæ), a perennial herb which is indigenous to Central Europe and collected in the mountainous

districts of Germany, Switzerland, France and Spain, that imported from France being preferred. The plant has a long, thick, branching perennial root, from which an erect round stem rises to the height of three or four feet, bearing opposite bright green leaves and large beautiful yellow flowers. The drug consists of the erect rhizome or root stock and large fleshy roots of the plant, collected in the autumn and dried, the pieces being occasionally sliced longitudinally. When fresh the pieces are whitish internally and almost odourless, but the colour darkens and a distinctive odour develops during the drying process, the fresh root being sometimes made into heaps and allowed to heat and ferment in order to facilitate those changes. The drug possesses bitter tonic properties; it is used in the preparation of *Extractum Gentianæ*, *Infusum Gentianæ Compositum* and *Tinctura Gentianæ Composita*.

GENTIAN ROOT.—A and B, pieces of root; C, root-stock with bud, showing point of attachment with the root B; D, transverse section of root; E, ditto of rhizome. All natural size.

CHARACTERS.—Gentian usually occurs in nearly cylindrical yellowish-brown pieces about 15 to 20 Cm. long, and seldom exceeding 2.5 Cm. in thickness. Occasionally the pieces are longitudinally split and they may also be obtained in thin transverse slices. The roots are much shrivelled and longitudinally wrinkled; the rhizome is often longer and thicker, without conspicuous longitudinal wrinkles, but marked by close transverse annulations, caused by leaf scars, and frequently terminated by a large bud protected by dry scaly leaves. Pieces of the drug are tough and flexible when slightly moist, but brittle when dried, the fractured surface being of a nearly uniform reddish-yellow colour. A transverse section shows a dark cambium ring separating the rather thick bark from the soft wood, the latter consisting almost entirely of parenchymatous tissue and exhibiting no radiate structure. Roots

which have been longitudinally sliced before drying frequently exhibit transverse instead of longitudinal wrinkles, and are paler than usual internally. The characteristic odour of gentian is probably due to some fermentation product formed during the operation of drying; it is more prominent when the drug is moistened. The sweetness noted when gentian is first tasted is due to the sugar present; the bitter after-taste is caused by gentiopicrotin.

GENTIAN ROOT.—D, transverse section of root; E, ditto of rhizome. Both enlarged.

TEST.—Gentian root contains no starch, and should not, therefore, yield any definite reactions with the tests for that body. Calcium oxalate and tannin are also absent, the reaction with ferric chloride, which has been supposed to indicate the presence of tannin, being more probably caused by oxysalicylic acid.

NOTES.—The distinctive characters of gentian are the uniform yellowish-brown colour of the drug, the longitudinal wrinkles on the root, the encircling leaf-scars on the rhizome, the absence of any evident structure in the transverse sections, and the absence of starch. The roots of other species of *Gentian*—*G. purpurea*, Linn., *G. pannonica*, Scop., *G. punctata*, Linn., etc.—are collected and dried in Switzerland and Austria; they are smaller, as a rule, than the roots of *G. lutea*, but all of them appear to possess similar properties. The most important constituent of gentian is gentiopicrotin, a neutral crystalline bitter substance, which is soluble in water or in diluted alcohol, insoluble in ether, and yields amorphous bitter gentiogenin and glucose when decomposed with a dilute mineral acid. Another constituent of the drug is a pale yellow crystalline substance named gentianin or gentisin, which forms intensely yellow crystallisable compounds with alkalies, and yields straw-coloured crystals of gentisein on boiling with hydriodic acid. An uncrystallisable sugar—gentianose, pectin, and fixed oil are also present in the drug. The dark olive-green coloration produced when ferric chloride is added to gentian preparations is believed to be caused by oxysalicylic acid (gentianic, gentisic, or gentisinic acid), a decomposition product, which can be formed by treating gentianin with caustic potash, phloroglucin being produced at the same time.

A REVIEW OF CURRENT WORK.

JABORANDI BASES.

The publication of a brief abstract of a paper by Dr. Jowett on "Pilocarpine and the Alkaloids of Jaborandi Leaves" (see *ante*, p. 297), has called forth a communication from A. Pinner and E. Kohlhammer, stating that they had been engaged in the investigation of pilocarpine during the past year and giving the results of their observations. In the main, they agree with Dr. Jowett in regarding the statements of Hardy and Calmels as to the constitution and alleged synthesis of pilocarpine as incorrect. They also throw some doubt on the statement of Petit and Polonowski—already questioned by Merck—as to pilocarpine being convertible into an isomeric base when heated with sodium alcohol, while Dr. Jowett finds that such a change does take place, but that the isomeric base so formed—isopilocarpine—is like pilocarpine, a viscid oil, instead of being crystalline as described by Petit and Polonowski under the name of pilocarpidine. The remainder of the paper by Pinner and Kohlhammer relates to the attempt to solve the question as to the constitution of pilocarpine by the investigation of bromine derivatives.—*Berichte*, **33**, 1424.

WALLFLOWER ALKALOIDS.

Reeb points out that cheiranthine acts solely on the heart; that the paralysis of the nervous system, which is occasioned by cheiranthus extract, is due to the presence of another alkaloid, obtained by him in a crystalline condition, and named cheirinine. This alkaloid is extracted by ether from neutral or faintly alkaline aqueous solutions. It crystallises from water in small colourless needles, insoluble in cold water and in petroleum ether; soluble in warm water, in alcohol, in ether, in chloroform, and in acetic ether; it melts to a transparent colourless mass at 73° to 74° C. The aqueous solution is neutral, and gives a voluminous precipitate with most alkaloidal reagents. Analysis points to the formula $C_{18}H_{35}N_3O_{17}$. The author has also established the presence of choline in the seeds of the wallflower.—*Chem. Zeit. Repert.*, **23**, 293, after *Arch. experiment. Pathol.*

SEPTICIDIN.

This is a serum preparation employed in veterinary practice for swine fever or chicken cholera. It is prepared from the blood of highly immunised animals. It remains active for six months, if kept cool, but not if frozen. The serum is injected under the skin of the loose tissue, in swine best behind the ear or behind the knee joint, and under the wing or on the neck of a bird. For swine which are suffering from contagious diseases or from fever, septicidin "A" should be employed; if the animal weighs less than 50 kgm. 10 C.c. is injected; if heavier, 20 C.c. is given. If after three to five days no improvement has occurred, a second injection is necessary. To immunise small healthy birds from cholera, 0.5 C.c. is sufficient; for large birds, 1 C.c.; for birds already attacked, 2-3 C.c. is injected, and repeated in twenty-four hours if necessary. To immunise swine septicidin "B" is employed.—*Pharm. Zeit.*, **45**, 27.

ALBUMINOID FROM SNAILS.

A constituent of *Helix pomatia*, the Roman snail, which arrests the circulation of the blood, has been experimented on by Paderi. The glycerin maceration of this mollusc contains a substance which when injected into the jugular vein of a dog stops the circulation, and in a short time kills the animal. This substance, which is to be investigated further, contains sulphur and phosphorus, and differs from the peptones in its behaviour towards precipitants.—*Chem. Zeit. Repert.*, **23**, 294.

ESTER-FORMING BACTERIA.

According to A. Maassen, several species of bacteria—notably *Bacillus esterificans* and *B. præpollens*—produce, under certain conditions, an agreeable odour, resembling that of fruit-ether. *B. esterificans* is a spore-forming species, which on certain media develops a strong ethereal odour closely resembling that of fresh apples. *B. præpollens* has strong peptonising properties, which enable it to dissolve and decompose coagulated albumen. It produces ester strongly in all media. It attacks albumen and carbohydrates simultaneously, and produces such a quantity of ammonia from the albumen that the acid formed from the carbohydrates is neutralised. It splits up urea, and decomposes nitrites with production of free nitrogen. It imparts a very agreeable aroma to milk.—*Arbeiten aus der k. Gesund-Anst.*, Berlin, 1899, 500.

OIL IN DIATOMS.

G. Kramer and A. Spilker suggest a very important practical result from the oil which is always secreted in the protoplasm of diatoms, viz.:—that it is one of the most important sources of petroleum-beds. From the oily secretion of diatoms a wax can be obtained resembling ozokerite in appearance, chemical composition, and properties. The decay of the diatoms probably gives rise to ammonium carbonate which hydrolyses the wax. From the resulting acids, carbon dioxide and monoxide and water are eliminated, and ozokerite formed. Further pressure again converts this ozokerite into petroleum.—*Ber. Deutsch. Chem. Gesell.*, **32**, 2,940.

CRYSTALS IN DATURA STRAMONIUM.

The form and arrangement of the crystals of calcium oxalate differ somewhat in this species, according to H. Kraemer, from those in other Solanaceæ. The crypto-crystalline crystals which are formed in such abundance in the parenchyma of the root and stem are replaced in part, in the petioles and veins of the leaf, by prisms, pyramids, and rosette aggregates, while in the lamina the prisms and pyramids are combined to form rosette-shaped aggregates only. All the crystals belong probably to the monoclinic system.—*Bull. Torrey Bot. Club*, 1900, 37.

ALKALINE EARTHS AS PLANT POISONS.

According to M. H. Coupin, the alkaline earths are poisonous in their influence on plants in proportion to the atomic weight of the metal, viz., in the order calcium, strontium, barium. Most of the salts of barium and strontium are poisonous, barium chlorate especially so, as also are the chlorates of sodium and potassium.—*Comptes rendus*, **130**, 791.

FUNGI IN DWELLINGS.

The injurious fungi found in human dwellings belong, according to G. Marpmann, to three categories: they are either themselves pathogenous, or they produce poisonous products of decomposition which are given off into the air; or they produce poisonous products from certain special substances which they decompose, especially compounds of sulphur and arsenic. By far the largest number of these fungi are to be found on or in wall-paper; a list of twenty-four such species is given.—*Zeitschr. f. angewandte Mikroskopie*, 1900, 297.

FUNCTION OF SOLANINE.

According to G. Albo this alkaloid is present in all the organs, but especially in the seed, of several species of Solanaceæ. It decreases in amount during germination, and again increases as the plant approaches maturity. It appears to be not a migratory form of proteinaceous substances, nor a mere excretory product, but a true reserve substance which the plant utilises during early periods of growth.—*Ann. Agron.*, **25**, 621.

PRACTICAL NOTES.

BY F. H. ALCOCK.

Remarks on a Prescription.

The following prescription presents some peculiarities which are worthy of record:—

℞ Bismuthi Subnitrat̄is, grana triginta
Pulveris Tragacanth̄æ, quantum sufficiat
Tinctur̄æ Nucis Vomicāe, minima triginta
Potassii Iodidi, grana triginta
Spiritus Chloroformi, minima quadraginta
Aquæ pluviatilis ad f. uncias tres.

M. f. m.

When first prepared no apparent change is observed, but after standing some time the sediment assumes a bright scarlet red colour. By experiment it was found that chemical change took place between the bismuth salt and the potassium iodide, the acidity of the former being the cause. The usually suggested alternative use of bismuth sub-carbonate in such cases was adopted, and then the red colour was not developed, although some colour did appear which was never more yellow than pale straw colour, and this was found to be dependent upon the variable amount of the nitric radical present in the sub-carbonate of commerce. Indeed, it could be utilised as a test for this impurity.

Whether the tincture of nux vomica is affected was not inquired into, but it is very likely that its alkaloids would be found in the sediment.

[The Separation of Antimony and Arsenic.]

The solutions left from experiments made early in this year, and described in *P.J.*, page 362, were used as analytical exercises for students, and during their examination it was found that the antimony was wholly precipitated from them by means of hydrogen sulphide, even before previous addition of hydrogen chloride. For convenience it may be stated that the solutions were tartar emetic, antimony chloride, and the antimony oxide made into aqueous solution with cream of tartar, to each of which were added much Rochelle salt and a large excess of sodium bicarbonate. As this result seemed to be unusual, experiments were made having for their object to ascertain whether under similar conditions arsenic was precipitated. It was not. Mixtures of the two were made in various proportions, and it was found that the antimony sulphide was precipitated and did not contain arsenic in any appreciable quantity, and that the filtrate contained all the arsenic and no antimony, and from this the arsenic was precipitated by the addition of hydrochloric acid in excess.

BAMBOO MANNA.

BY DAVID HOOPER, F.C.S.

The recent occurrence of a sweet secretion on the stems of bamboos growing in the Central Provinces is a most interesting fact to students of antiquarian medicine. Bamboo manna derives its name from the Sanskrit words—*Tvak-kshira*, "bark milk"; *Vansa-sarkara*, "bamboo sugar"; and *Vansa-karpura*, "bamboo camphor." *Vansa-lochana* is the name by which it is known by Indian physicians at the present day. These terms would signify a manna-like substance exuding from the stem of the tree, but what is known and used as *Vansa-lochana* all over India is quite a different article.

That bamboo manna is not a sugar, but a white, gritty body, now called *Tabáshir* by Europeans, is gathered from the account of Dioscorides, and from the fact that no kind of sugar prepared from the sugar cane answering to this description was known in India in his time. Dioscorides writes: "What is called *σάκχαρον* is a kind of concrete honey, found in reeds in India and Arabia Felix, in consistence like salt, and brittle between the teeth like salt." *Tabáshir*, or bamboo manna, was known to the early Arab travellers in the East, and the port of Thana, on the western coast of

India, was famous for this product in the twelfth century. *Tabáshir* is employed as a medicine for its cooling, tonic, aphrodisiac, and pectoral properties. In its crude state, when taken from the inside of the bamboo stems, it is mixed with insect remains, and has a blackish appearance; but on gently calcining it becomes quite white, with a pearly lustre. It consists of about 80 per cent. of pure silica, with variable proportions of alkalis, water, and organic matter. The history and properties of *tabáshir* have been very fully discussed by Sir David Brewster (*Philos. Trans.*, 1819; *Edin. Journ. Science*, vol. viii., p. 286); Sir George Birdwood (*Bombay Products*, pp. 95-96); Dr. F. A. Flückiger (*Zeit. des Allg. Osterr. Apoth. Ver.*, 1887, No. 14), and by Sir D. Brandis (*Indian Forester*, March, 1887).

The only modern work which alludes to a sugar in the bamboo is the 'System of Botany,' by La Maout and Decaisne. The authors remark:—"The young shoots of these two trees (*Bambusa arundinacea* and *B. verticellata*) contain a sugary pith, which the Indians seek eagerly; when they have acquired more solidity a liquid flows spontaneously from their nodes, and is converted by the action of the sun into drops of true sugar. The internodes of the stem often contain silicious concretions of an opaline nature, named *tabáshir*." Here a distinction is made between the manna forming on the outside of the stem and the *tabáshir* found inside, but no reference is made to any record where the first-named exudation was observed or examined. Dr. Watt, when writing the article on *Bambusa* for his 'Dictionary of Economic Products of India,' sums up the general experience with regard to this point, and says:—"Nor has the spontaneous excretion of sugar on the outside of the stem ever been recorded by Indian travellers."

The strange appearance of manna on the stems of the bamboo was reported last March by the Divisional Forest Officer, Chanda, Central Provinces, and notices of this phenomenon have been published in the local papers. The bamboo forests of Chanda consist of *Dendrocalamus strictus*, the male bamboo, a bushy plant from 20 to 30 feet in height, and affecting the cooler northerly and westerly slopes of Central and Southern India. This is said to be the first time in the history of these forests that a sweet and gummy substance has been known to exude from the trees. The gum has been exuding in some abundance, and it has been found very palatable to the natives in the neighbourhood, who have been consuming it as a food. The occurrence of the manna at this season is all the more remarkable, since the greatest famine India has known is this year visiting the country, and the districts where the scarcity is most keenly felt are in the Central Provinces.

An authentic specimen of this bamboo manna was sent to Dr. Watt, Reporter on Economic Products, Calcutta, and was subsequently handed to me for examination. It occurred in short stalactiform rods about an inch long, white or light brown in colour, more or less cylindrical in shape, but flattened or grooved on one side, where the tear had adhered to the stem. It was pleasantly sweet, without the peculiar mawkish taste of Sicilian manna (*Fraxinus rotundifolia*). It was soluble in less than its own weight of water, and the solution, when allowed to repose, deposited white, transparent crystals of sugar. The manna contained 2.66 per cent. of moisture, 0.96 per cent. of ash, 0.75 per cent. of a substance reducing Fehling solution, and a small quantity of nitrogenous matter. The remainder consisted of a sugar which became inverted in twenty minutes when boiled with dilute hydrochloric acid (1 per cent.), and from its solubility, melting-point, and crystalline nature, appeared to be a saccharose, related to, if not identical with, cane sugar. It contained no mannite, the saccharine principle peculiar to true manna.

The bamboos and sugar canes belong to the same natural order of grasses, and perhaps it is not unnatural to expect them to yield a similar sweet substance which can be used as a food; but it is a coincidence that the culms of the bamboo, hitherto regarded as dry and barren, should in a time of great scarcity afford sustenance for a famine-stricken people.—*Nature*.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Invertebrate Two-Thirds.

I must apologise to Mr. Broadhead for misinterpreting his reference to the pharmaceutical invertebrates; but, in view of the fact that the Council election was the subject under consideration at the time, the confusion was excusable. For, although it is a truism that all whose names appear in the Register of Chemists and Druggists are interested in and derive benefit from the legal and educational work carried on by the Council, only those who are members of the Pharmaceutical Society are immediately concerned in the Council election. Of the latter, one-third failed in their obvious duty by not recording their votes last month; but, after all, a much more serious matter is the inability of those who are not connected with the Society to see that their chief interests are bound up in the prosperity of the only body which can effectively represent them. Whilst every chemist on the Register is undoubtedly interested in the work of the Society, it is painfully evident that something like two-thirds of the total number will not recognise that fact in a practical manner. They are willing to take advantage of anything the Society may do to improve their position, but they are not disposed to pay the piper, though many of them are quite ready to call the tune and always prepared, at a moment's notice, to grumble at what is done or not done by the legally constituted authorities.

Irrelevant Complaining.

Some complain that the preliminary examination is an unreasonable test, because they attribute to its existence any difficulty they may experience in obtaining cheap labour. Whilst prepared to pay an errand boy six or seven shillings a week, or even more, they think they ought to be able to get apprentices to do similar work to errand boys or porters at a merely nominal wage, if even they do not demand a premium for allowing youths to discover how little proper pharmaceutical training is to be had in their pharmacies. Then, again, objection is taken to the standard of the qualifying examination, because assistants cannot be engaged at such absurdly low salaries as commend themselves to the would-be hirers of cheap labour. The existence of poison regulations is another grievance, whilst excise regulations and restrictions imposed by various Acts of Parliament are equally abhorrent to those who refuse to support the Pharmaceutical Society, and yet blame that body for all the inconveniences they experience in attempting to evade, rather than comply with, statutory requirements. It cannot be too clearly recognised that the Society is to blame for none of the ordinary pharmacist's worries, but it is hard to persuade a large number in our ranks that they are infinitely better off than they would be if the representative body did not exist. And, unfortunately, it is quite out of the question to convince them that their worries would be appreciably lessened if they all came into the fold. No, they prefer to remain outside, and rave in a meaningless fashion against the institutions to which they are most indebted for their present comparatively advantageous position.

Cash-box versus Reputation.

I realise, of course, that individuals with no thought for anything beyond the trade aspect of their business cannot be expected to see things in the same light as those whose constant endeavour is to improve their general position rather than keep their souls locked up in the till and the cash-box. And a very large proportion of the nine or ten thousand registered chemists outside the Pharmaceutical Society put the main chance before everything else, keeping it prominent both in season and out of season. It is of greater importance, from their limited point of view, to induce

the proprietors of certain widely sold articles to do what is possible to prevent the cutting of prices, than it is to secure any recognition on the part of the authorities of London University or of the General Medical Council. So long as their net profits can be maintained at twenty-five rather than twenty or fifteen per cent. they care not in the remotest degree whether the business of a pharmacist shall be of greater repute ten years hence than it is to-day. And we are bound to recognise that this is a source of very great weakness.

Unreasonableness Rampant.

It seems to me that if only we could persuade all the unreasonably selfish individuals in the ranks of pharmacy to remain quiescent for a moderate length of time much might be effected in the way of reform, and none would be more surprised than the chronic grumblers at the ultimate benefit that would accrue to all of us. But so long as some prefer to depend upon apprentices to do the work of errand boys, packers, and even of qualified assistants; so long as the branch shop scandal and others of an equally objectionable nature persist among us; and so long as every attempt to put matters pharmaceutical upon a proper footing is bitterly opposed from within, it appears hopeless to look for any very decided amelioration in the existing state of affairs. Let every legally qualified person stick to his last, and not pretend that he is able to do things equally well by deputy or in two places at once, and the public will soon become accustomed to the idea that the pharmacist really is a professional man. But the qualification must be inseparable from the individual, not capable of being hired by unqualified persons or used to cover unqualified assistants. The ideal of the professional position is that a duly qualified individual shall neither delegate to others the functions for which his qualification is strictly required, nor make use of his qualification to cloak the illegal or extra-legal acts of those who are not privileged as he himself is. More than that, he should not incur the odium of appearing to seek a monopoly, by attempting to make his qualification a legal necessity for doing what can be equally well and satisfactorily done by an unqualified person.

Justifiable Selfishness.

And that brings me back to the point where I left off last week. By an accident, which some may choose to consider lucky, the sale of certain dangerous articles is nowadays restricted to registered chemists, though the persons responsible for drafting and passing the Pharmacy Act, 1868, never anticipated anything of the kind. Now, I do not propose that we should throw away what I prefer to regard as a more or less valuable asset, but I certainly think we should act wisely if we offered to exchange that asset for something of greater pharmaceutical importance. The sale of poisons adds but little to the average chemist's profits during the year, much less than he would derive from the dispensing of a few more prescriptions than he is now favoured with. I am strongly of opinion, therefore, that we should be making an excellent bargain if, in exchange for a certain modification of the existing restrictions on the sale of poisons, we could obtain the sole right to compound or dispense medicines. It appears that there is already an external movement in the former direction, the seedsmen and florists having decided to organise themselves and endeavour to secure a partial repeal of the Pharmacy Act, so that they may be able to sell sealed packets containing poisonous compounds for horticultural and agricultural purposes. With the regulations proposed, such a change in the prevailing conditions would not be to the public detriment, but it involves the partial loss of our asset and, before we acquiesce in the proposal, I think we ought to make sure of receiving something substantial in return. That is selfish, no doubt, but it is justifiably so. What was forced upon us thirty odd years ago has proved to possess a certain limited value, and I see no reason why, if we are to part with it, something of at least equal value should not be received in exchange.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, JUNE 13, 1900.

Present:—

Messrs. Allen, Atkins, Carteighe, Cooper, Corder, Cross, Glyn-Jones, Harrington, Harrison, Hills, Johnston, Martindale, Newsholme, Savory, Storrar, Symes, Taylor, Wootton, and Young.

The chair was taken by Mr. Martindale.

The minutes of the previous Council meeting on May 2 and of the special meeting on May 16 were read and confirmed.

The CHAIRMAN said he was sorry not to have been able to be present at the last two meetings of Council, but he felt very much unstrung after the April meeting, and found it necessary to adopt the course which he had found beneficial on previous occasions and take a voyage. He was very glad, in his travels in South Africa, to find the high esteem in which the Society was held. On his landing in Durban he found a deputation of the Natal Pharmaceutical Society, which had come to meet him, and Mr. Champion, the President of the Society, and the Secretary were both exceedingly kind to him during his stay. On leaving Cape Town again he was entertained at a festival, given by what was claimed to be the youngest English-speaking Pharmaceutical Society in the world, in honour of the oldest. He was glad to see that pharmacy was recognised both by the colonies and by the pharmacists themselves, in a way which would, he hoped, advance its interests in both those colonies.

Letters of Thanks.

The CHAIRMAN said letters had been received from the Registrar of the Pharmaceutical Society of Ireland, Miss Bird, the family of M. Planchon, Mr. Fred. Reynolds, and the families of Sir Douglas Maclagan, Mr. Hugill, and Mr. Watt, thanking the Council for the resolutions of sympathy passed last month. Messrs. Peck and Pinches had also written accepting the duty of conducting the examination for the Bell Scholarship.

Election of President.

The ballot having been taken in the usual way, Mr. G. T. W. Newsholme was elected President, and took the chair accordingly. The PRESIDENT said he was exceedingly obliged to the Council for the great honour conferred upon him. It was an innovation, because for many years—practically since the formation of the Society, no provincial chemist had been President; but one recognised that circumstances had changed, and it was much more easy now for provincial men to attend meetings in London than it was in early days. He did not think for one moment that he possessed greater ability than some of his predecessors in office as Vice-President, but owing to the unfortunate illness of the late President he had perforce to step into his shoes and conduct the business at the last Council and the annual meeting, and, having his hand in, he supposed it was thought that he might be called upon to follow Mr. Martindale. It was the duty of every man to fulfil as far as he could the duties of any office he was called to, but had any other man been selected, he should have felt it a privilege to serve under him, and to recognise, as he did, that every member of the Council was qualified to act as President, though they were not all able to spare the requisite time. He again thanked the members for the honour conferred upon him.

Election of Vice-President.

A ballot having been taken, Mr. C. B. Allen was elected Vice-President.

The VICE-PRESIDENT said he had had a fairly long experience of the work of the Council, and had attained to a sufficient faith in the wisdom of the majority of the Council to believe that they would do what was right. He was proud also to feel that they believed in his ability to fill this office, though when he remembered those who had occupied it before he felt that in his person the

office would lose something. He would, however, do everything he could to further the interests of the Society to the best of his ability. He should like, before sitting down, to congratulate the President on his appointment.

Election of Treasurer.

On a ballot being taken, Mr. Atkins was re-elected Treasurer.

Mr. ATKINS, in returning thanks for this renewed mark of confidence, said the finances were in a sound condition, and were progressing favourably, which was very satisfactory. He would also join with the Vice-President in congratulating the President.

Thanks to the Retiring President.

The PRESIDENT moved that the Council express its thanks to Mr. Martindale for the zealous manner in which during the past twelve months he had filled the office of President of the Society, and desires to express its regret that the condition of his health should have broken the continuity of his services in the chair. They were much indebted to Mr. Martindale for the zealous manner in which he had performed his duties, and regretted that his health had for a time given way. They would all hope that the rest and change had fully restored him, and that they might have his assistance in the work of the Society in the coming year. He knew how valuable that help was, and should depend upon him and on the other past-Presidents to assist him in his duties.

The VICE-PRESIDENT, in seconding the motion, said he much regretted that Mr. Martindale had not felt himself equal to continuing in office another year. He was much encouraged in taking office himself by knowing that he should have Mr. Martindale at hand to advise him, and also the other gentlemen who had passed the chair.

Mr. HILLS, in supporting the motion, as Mr. Martindale's immediate predecessor, said they were all much indebted to him for the conscientious manner in which he had endeavoured to carry out the duties of his office; indeed, the very fact of his having done so had unfortunately led to his temporary breakdown in health.

The motion having been carried unanimously,

Mr. MARTINDALE thanked the Council for their kind expressions of sympathy. He was sorry not to have been able to continue his duties to the end, but he would endeavour to help the President as far as he could, and he knew how well qualified he was for the work he had undertaken. He had often been in communication with him during the year, and had always had valuable advice from him, as well as from both the past-Presidents. He had worked for the Society for many years, both as Examiner and Councillor, and hoped he might still be able to be of some service.

Standing Orders.

The Standing Orders of the Council were re-enacted for the ensuing year.

Reappointment of Officers.

Mr. Richard Bremridge was reappointed Secretary and Registrar for the ensuing year; Dr. B. H. Paul was reappointed Editor, and Mr. John Humphrey Sub-Editor, of the Journal; Mr. E. M. Holmes was reappointed Curator of the Society's Museum, and Mr. J. Rutherford Hill was reappointed Assistant Secretary in Scotland.

Election of Members.

The following persons having tendered their subscriptions for the current year, were elected "Members" of the Society:—

Axe, William John; Liverpool	Gilchrist, John; Airdrie
Bean, Percy; Blackburn	Grimditch, William Jas.; Tower Froyle
Bennett, Oswald, E.; Peckham	Hawkins, Philip; Hull
Bryce, James; Falkirk	Hill, John Stableford; South Shields
Cheyne, Charles August; Montrose	Horton, Wm. John; Woburn Sands
Cooper, John; Sawston	Hunt, Fredk. Ed.; Wellington, Salop
Dawson, Frederic William; Perth	John, Benjamin; Bath
Dowell, James; Stirling	Kilvert, Bertrand Walter, Crewe
Downing, Alfred; Stonehouse	Latham, Frank; London
Duncanson, James; Stirling	Marshall, John George; Mansfield
George, Henry Attwood; Pentre	Moorhouse, George Henry; Burnley

Northen, Charles; Brockley
Perry, John; Congleton
Pollard, William; Wakefield
Pratt, Edward J.; Chatteris
Robinson, Alfred Ernest; Norwich
Smith, Percy Lewis; London
Westlake, William

Spicer, Malcolm; London
Strother, Alfred E.; Newcastle-on-Tyne
Taylor, Samnel; Southport
Tillott, John Booty; London
Toon, Arthur; Hinckley
Venn, Samuel Ernest Markey; Ford
Smalley; Sutton

Election of Student-Associates.

The following persons having passed the First examination, and tendered their subscriptions for the current year, were elected "Student-Associates" of the Society:—

Baker, E. H. S.; Newcastle-on-Tyne
Bell, Sydney; Brigg
Brennan, Dorothea Wigzell; Derby
Brown, Richard Robinson; Padiham
Burt, May; Croydon
Camplin, Harold Ralfs; Southampton
Cathcart, Percival James A.; Buxton
Chapman, Charles Neville; Grimsby
Cockroft, Wilfred C.; Manchester
Cope, Arthur George; Congleton
De Faye, George Kinsey; Jersey
Dietzsch, Theodor; London
Edis, Sarah Winifred; Liverpool
Edwards, Herbert; Hastings
Evans, Percy; Carnarvon
Evans, Robert Arthur; Denbigh
Francis, Herbert Stanley; London
Francis, Reginald J.; Leamington Spa
Fullalove, William Arthur; Lincoln
Gadsby, James; Nottingham
Gardner, Albert Ernest; Lancaster
Gibbons, Charles; Liscard
Grange, Henry; Northwood
Grant, Alfred Ernest; Frome
Gray, James Qswald W.; Strichen
Hamer, Thomas; Heywood
Hardwicke, Eva E.; Bury St. Edmunds

Hicking, Joseph Edgar; Barnstaple
Johnson, Herbert; Abergavenny
King, Katherine M.; London
Lewis, Susan Frances; London
Lewis, Thomas Edward B.; Grimsby
Logan, John; Beith
Loxley, Frederick Lionel K.; Oxford
MacGregor, Jessie B.; Charlestown
Meyler, Llewellyn J.; Cardiff
Mildred, Hilda Gertrude; London
Newill, Ethel C.; Birmingham
Newman, Edward Charles; Southsea
Norris, George; Long Sutton
Pellow, Howard James; Exeter
Philpot, Philip Howard; Walsall
Rogers, Henry Josiah; Christchurch
Sampson, Howard Alfred C.; Barnet
Spreckley, Alfred Ernest; Leicester
Stiles, Henry W.; Doncaster
Thompson, Etheldreda; Rhyl
Tickell, Reginald Thomas S.; Bodmin
Warren, Margaret G.; Catford
Waterhouse, Harry; Dewsbury
West, Harry Dawson; Keighley
Widgery, Alfred Ernest; Tamworth
Williams, Walter David; Penarth
Yates, John; Blackburn

Restorations to the Register.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists:—

John Wm. Andrews, 49, West Avenue Road, Walthamstow.

Alfred Sarjeant, 219, High Street, Watford.

Albert Jas. Watson, 20, High Street, Oldham.

Several persons were restored to membership upon payment of the current year's subscription.

Appointment of Committees.

The Council went into Committee to consider the arrangement of the different Committees, as the result of which the following arrangements were made:—

General Purposes Committee.—The whole Council to meet on the evening before the meeting of the Council, and at such other times as may be necessary.

Finance Committee.—The President (Mr. G. T. W. Newsholme), Vice-President (Mr. Allen), Messrs. Carteighe, Glyn-Jones, Harrington, Hills, Martindale, Park, Savory, Storrar, and Wootton.

Benevolent Fund Committee.—The President (Mr. G. T. W. Newsholme), Vice-President (Mr. Allen), and Messrs. Atkins, Cooper, Corder, Cross, Harrison, Johnston, Southall, Symes, Taylor, and Young.

Library, Museum, School and House Committee.—The President (Mr. G. T. W. Newsholme), Vice-President (Mr. Allen), and Messrs. Atkins, Carteighe, Glyn-Jones, Harrington, Harrison, Hills, Martindale, and Savory.

Mr. YOUNG suggested that the meetings of this Committee should be held either the day before or the day after the Council meeting, which he suggested would be more convenient to the provincial members, as it would save the necessity of a second journey to town in the middle of the month.

The PRESIDENT, in reply, said it would be almost impossible to change the day, as it would be very difficult for the office to make the necessary arrangements.

Law and Parliamentary Committee.—The whole Council to meet as occasion may require.

Standing Committee to Watch Parliamentary Business and take action thereon in the interests of Registered Chemists.—The President (Mr. Newsholme), Vice-President (Mr. Allen), Treasurer (Mr. Atkins), and the London members of Council.

Research Committee.—The President (Mr. Newsholme), Vice-President (Mr. Allen), and the members of the Library, Museum, School and House Committee.

Evening Meetings.

It was resolved that the Editor and the staff of the Society's School be asked to assist in making arrangements for holding the Evening Meetings.

Finance Committee.

The SECRETARY read the report of this Committee, which recommended certain payments to be made. Mr. MARTINDALE, in moving the adoption of the report, referred to the late Mr. Hugill's legacy of 100 guineas, which had been received on behalf of the Benevolent Fund. During the month a considerable amount of subscriptions had been received, and the account showed an increased balance of £1,000 over the beginning of May, which was very satisfactory.

The report was adopted unanimously.

Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £69 in the following cases:—

Widow of a P.C. Member (71). Has had a previous grant. (Holywell.)

Widow of an Associate who had grants previous to his death (56). Has had previous grants. (Upper Bangor.)

Widow of a registered C. and D. (52). (Grimsby.)

Widow of a registered C. and D. (70). (Newbury.)

Widow of a registered C. and D. (63). (Liverpool.)

One case was not entertained.

The PRESIDENT moved the adoption of the report, and that was carried unanimously.

Library, Museum, School, and House Committee.

The report of this Committee stated that reports had been received from the staff of the School, and that various administrative matters had been dealt with.

The Committee had sat as a Research Committee and received reports respecting the work in connection with the Pharmacopœia standards now in progress. Also, in conference with Professor Collie, the Committee considered an application for the Burroughs Scholarship, and recommended that it be awarded to Mr. W. H. Lenton.

The PRESIDENT moved the adoption of the report and recommendations, which was at once agreed to.

The PRESIDENT then moved that the Burroughs Scholarship be awarded to Mr. W. H. Lenton. The Committee had every confidence in recommending him, as the work he had done under Professor Collie thoroughly warranted the Committee in recommending him for this appointment, feeling satisfied he would do good work.

The resolution was passed unanimously.

The Society's Investments.

Mr. CARTEIGHE moved "That the corporate seal of the Society be affixed to the lease of the Strawberry Hill property granted to Mr. Cooper, and to the agreement with Mrs. Bone, whose house adjoins the Society's property at Twickenham, acknowledging and reserving certain rights of the freeholders." He pointed out that the agreement with Mrs. Bone had been entered into for the purpose of preserving the Society's rights to ancient lights.

Mr. MARTINDALE said he had been through the agreement entered into with Mrs. Bone, and in his opinion it was a necessary agreement to enter into.

The resolution passed unanimously.

Appointment of Freehold Investments Committee.

Mr. CARTEIGHE moved "That the President, Vice-President, and Treasurer, and Messrs. Carteighe, Hills, and Martindale, together with Mr. E. N. Butt, be appointed a Freehold Investments Committee, with power to take all necessary steps to purchase suitable ground rents when opportunity occurs, with the amount standing to the credit of the Benevolent Fund."

The resolution passed unanimously.

Mr. CARTEIGHE moved "That the seal of the Society be affixed to a power of attorney for the sale of stock not exceeding £6,000 Consols on the Benevolent Fund Account." This resolution (Mr. CARTEIGHE explained) was in view of a contemplated purchase of ground rents, a portion of the purchase money of which would have to be paid before the Council met again.

The resolution passed unanimously.

Mr. CARTEIGHE moved "That the Treasurer be authorised to pay the purchase money, together with solicitors' and surveyors' charges, of any property purchased by the Freehold Investments Committee."

The resolution passed unanimously.

The British Pharmaceutical Conference.

The PRESIDENT moved that the following be appointed delegates to the forthcoming meeting of the British Pharmaceutical Conference in London: The President, Vice-President, Messrs. Harrington, Young, Glyn-Jones, Harrison, Cross, Atkins, Cooper, Johnston, Wootton, Symes, Carteighe, Hills, and Martindale.

Correspondence.

The SECRETARY reported the receipt of a resolution passed at the annual meeting of the Nottingham and Notts Chemists' Association on June 8: "That this meeting—whilst giving its support to the Pharmaceutical Council in opposing Clause 2 of the Companies Bill,—regrets that the Council has not seen well to endeavour to procure some amendment to the Bill whereby titles would be secured to registered persons only."

This communication was referred to the Law and Parliamentary Committee.

The SECRETARY also read a resolution sent up from the Forfarshire and District Chemists' Association as having been passed at a meeting held at Montrose on May 23: "That in the opinion of this meeting the time has now arrived when the method of conducting the Qualifying Examination should be altered."

This resolution was referred to the General Purposes Committee.

The SECRETARY also read a resolution passed unanimously at a meeting of the Liverpool Chemists' Association, approving the action of the Pharmaceutical Council in opposing Clause 2 of the Companies Bill.

General Purposes Committee.

The report of this Committee stated that the sub-committee appointed to consider the question of rearranging the districts of local secretaries had held two meetings, and presented a draft scheme which, after consideration, had been deferred to another meeting. The sub-committee appointed to consider the alterations and additions desirable in the bye-laws had presented a report, which the Committee had considered, and after making some further alterations, presented an amended code of bye-laws for the approval of the Council.

Mr. CARTEIGHE said it had been suggested by Dr. Symes that it might be well to alter one word, "Minor," as applied to the examinations, and substitute the word "Qualifying." Mr. Wootton also had a suggestion to make with regard to the word "Major," and he thought on the whole the better plan would be to refer the bye-laws back to the sub-committee, plus the new Vice-President, and let them come up again for approval at the next meeting of the General Purposes Committee. He would point out that the bye-laws must be verbatim correct when read the first time by the Council; they could not be altered afterwards in any way. He was not prepared off-hand to say whether the suggested alteration could be made, though he hoped it could, and it would be possible to call a special meeting, if necessary, to read the bye-laws a third time so as to allow of their being passed in August.

Dr. SYMES said the bye-laws were gone through very carefully, and the only alteration he suggested was to substitute the word "Qualifying" for "Minor" wherever it occurred.

The PRESIDENT thought it would perhaps be better that the whole matter should go back to the Committee.

Mr. CROSS supported the suggestion that it should go back.

Mr. GLYN-JONES hoped the Committee would reconsider the question of allowing voting papers to have distinguishing marks.

Mr. CARTEIGHE said no doubt the Committee would have power to reconsider any point which was brought before it.

The bye-laws were accordingly referred back to the Committee.

The Company Trading Question.

Mr. WALTER HILLS, pursuant to notice, then moved:—

That the Law and Parliamentary Committee be requested to take into immediate consideration the present position of the Companies Bill, and to report as to the line of policy which appears most expedient to adopt in reference to Clauses 2 and 3 of that Bill in the present Parliamentary session, or in the next session should these clauses be again introduced into this or any similar Bill. Also to consider the position of pharmacy in respect to company trading and to suggest such action in reference thereto as may be deemed expedient.

He said the conditions at this present moment were such that it was advisable for the matter to be re-considered by the Law and Parliamentary Committee. The question of company trading was always before them. He was inclined to think that it was one of the things that had knocked up their past-President, and, judging by the editorial comments in the official Journal, one would think there was hardly anything else to be considered. But the question of company trading was their *bête noir*, and, if Parliament did not deal with it in the present or next session of Parliament, they would have to deal with it themselves. Personally, he wanted a curriculum, and he was quite ready to consider the question of dividing the qualifying examination when they had a system of training. If they did not deal with the question of company trading the Government would in any Pharmacy Bill that might be brought forward. He hoped to have the unanimous support of his colleagues, as he only asked them to send the whole question back to the Committee to deal with it under the present conditions. The end of the Parliamentary session was approaching, and it was thought likely that the Bill would be dropped, and if he was sure of this he would eliminate the word "immediate" from his motion, as he did not wish to hurry the matter. They were told that Mr. Ritchie would accept no amendment, but even Ministers were amenable to a little pressure, and if they would impress the point on which they were unanimous—viz., the restriction of titles to qualified individuals—on the members of the House of Commons, they would be able to carry the point. In his opinion the question would have to be settled in a practical way sooner or later, and no advance would be made in pharmaceutical legislation so long as the question remained as it was. He believed that company trading was increasing every year, and, therefore, he was not content to lie low. Like many others, he should like to revert back to the time before the House of Lords' decision was given, but that was impossible. He would ask, was it a satisfactory state of things for them to meet month after month in the General Purposes Committee and take action against the various employés, who were more sinned against than sinning? Had the policy of doing nothing been satisfactory? He thought not. He was anxious that the matter should be considered in all its bearings, immediately if need be, but at all events during the next six months.

Mr. HARRISON seconded the motion. He considered that the present time was an opportune one to re-open the question. Company trading was increasing, and in a large number of instances was, in the way in which it was carried on, a direct scandal to the country. Only last night they had an instance before them of a man who had several times failed to pass the qualifying examination, but who got over his difficulties by taking advantage of the Companies Act.

Mr. STORRAR supported the motion, which he hoped would be passed unanimously. On a previous occasion the Council resolved to confine itself simply to opposing Clause 2, because that was the only thing on which the Council were unanimous, for though they all agreed there should be some amendment, directly they came to details they were divided. If they had resolved on endeavouring to amend the clause the only amendment which would

have been accepted by one-half of the Council would have been entire prohibition of company trading, whilst the other half were in favour of regulation. To-day they were in a different position. The result of the late election had shown that there was a feeling on the part of the Society that regulation was the only possible course for the future. For that reason he hoped the question would be recommitted to the Law and Parliamentary Committee, but that should not be done simply for the reasons given by Mr. Hills, who seemed to assume that the only possible opposition to the Bill would take the form of amending it. He knew, however, that a large number of members agreed with him that the only proper way of dealing with the company question was through an amendment of the Pharmacy Act.

Mr. HILLS pointed out that he had specially referred to an amended Pharmacy Bill.

The PRESIDENT said he thought all would agree to the motion.

Mr. WOOTTON said he could not very well give a silent vote on this question. Apparently there was to be no opposition now, but he hoped it would be understood that this was a reversal of the decision arrived at in March last.

The PRESIDENT said they could not tie the hands of the Committee.

Mr. WOOTTON said the vote at the late election was, in his opinion, distinctly a mandate to the Council to reverse its decision.

Mr. STORRAR did not want to interrupt, but if Mr. Wootton pursued this line he should claim the right to explain what he considered was meant by opposition to the Companies Bill.

Dr. SYMES said if they were going to discuss the matter in detail now, there was no object in sending it to the Committee.

The PRESIDENT said the motion if carried would refer the matter to the Committee, where it would be considered under the widest possible aspect.

Mr. WOOTTON said he wished the Council to be definitely committed to something, and he thought the motion ought to say that the Committee should report to the next meeting of the Council. This was a most urgent matter, and he, as an outsider, had been surprised to see that the Council had not so considered it during several years past. It was a matter of extreme difficulty, but that was no reason for neglecting it. The great difficulty which was almost insuperable some few years ago was to get the subject discussed in Parliament at all, but when the Lord Chancellor by his own motion, three times repeated in different Bills, had opened the door, it seemed extraordinary that the Pharmaceutical Council should have refused the opportunity of discussing it. They all thought that they had such a strong case, that if they only had the opportunity they could convince members of Parliament of the justice of it. If it was thought better to discuss the matter in Committee rather than in open Council, he would not pursue it further, though there were several things he wanted to say.

The PRESIDENT said when the Committee brought up its report it could be discussed in open Council; it was not a secret matter in any sense.

Mr. WOOTTON said Mr. Hills had referred to the possibility of the Companies Bill being withdrawn or of Parliament being dissolved, but it was just as urgent in either case that they should take an opportunity of securing, if possible, an interview with the Lord Chancellor and discussing the matter with him. His clause did not meet with the approval of any pharmacist that he knew of, but it went some way towards it, and he had strong hopes that if the Council were unanimous and determined they could bring a good deal of pressure to bear. He presumed the Lord Chancellor was amenable to reason.

Mr. TAYLOR said he should vote for this motion, but he took quite an opposite view to that stated by Mr. Wootton, that it implied a reversal of the last resolution of the Council. It was precisely because it did not imply such a reversal that he was

ready to vote for it. It might lead to a reversal; circumstances might arise under which he might vote for a reversal, but until the matter was gone into it would be very unwise to regard it as closed, either for the life of the present Parliament or in any other way. Had they considered how far—if company pharmacy were regulated either by a Pharmacy Act or by a clause in the Companies Bill—the regulation and legal recognition of company pharmacy would affect the status of the Society itself, not merely that of individual traders, in meeting competition—legal and illegal—inside or outside their own ranks? If company pharmacy were legally recognised, they would have to face an entirely new state of affairs; the Society would find itself in the position of a teaching, examining, and registering body for the purposes of limited companies.

Mr. GLYN-JONES said he would have been glad if Mr. Hills had suggested that the matter should be brought up before the next meeting of Council. It had been said by some that the present Government was dying, but still the Lord Chancellor was determined to deal with the question, therefore it was surely wise that the Council should come to some decision on the matter, and that they should see the Lord Chancellor with the view of educating him upon their side of the question.

Mr. ATKINS did not object to the matter going back to the Committee, but he was not prepared to admit that there would be any reversal of its decision. If by the introduction of the new light into the Council a solution of the difficulty could be arrived at, by all means let them take advantage of it; but he did feel strongly that if they put their fiat of approval by regulation on the company principle for all time and for ever, it seemed to him the question was gone.

Mr. HILLS, in replying, said he took credit to himself for the clever way in which he had worded his motion, as all his opponents seemed to be coming to his way of thinking. He would ask the President that a meeting of the Law and Parliamentary Committee might be held next week, when, if they could not come to any decision the subject might be brought before the next Council.

The motion was then put and carried unanimously.

Mr. GLYN-JONES then moved that the Committee be asked to report to the Council on this question. Last year the matter was with the Law and Parliamentary Committee for several months, and no report was brought up before the Council, and he did not wish that to occur again.

Mr. WOOTTON seconded the motion.

Dr. SYMES said there could be no object in insisting on a report at the next meeting of the Council. If there had not been such a hurry to report to the Council, when the matter was originally dealt with, he believed it would have been dealt with more satisfactorily.

The PRESIDENT ruled that the motion was out of order.

Carbolic Acid.

Mr. MARTINDALE said he thought this matter was being delayed unnecessarily. Both Mr. Carteighe and he had been in communication with the Privy Council on the subject of the inclusion of carbolic acid in the schedule, and they were told that the matter was awaiting the deliberations of the Agricultural Department, to whom it had been referred. He thought the Privy Council should be further communicated with on the subject.

The PRESIDENT did not think any useful purpose would be served by this, as the Privy Council were fully alive to all the circumstances, and were quite as anxious as they were to deal with the matter.

Dr. SYMES questioned the statement that the Privy Council were fully alive to the matter. He did not see what the Board of Agriculture had to do with it; they were only brought into the question by the misrepresentations that had been made as to the effect of including carbolic acid in the schedule. He thought a personal interview by the President would do much to clear away the many misrepresentations that had been made on the subject.

Mr. GLYN-JONES said the Society and the Council had been made to appear in a false light. In the House of Commons the Government were asked why carbolic acid was not scheduled, and the answer given was that the Government were in communication with the Board of Agriculture and the Pharmaceutical Society, which implied that the latter body shared in causing the delay which was taking place. In his opinion, the Pharmaceutical Society had clearly done its duty in the matter.

The PRESIDENT suggested that if no action was taken during the ensuing month some member of the Council should give notice of motion for the next meeting. It would be out of order to move a resolution on the subject now.

Legal Business.

The Council then went into committee to consider the legal portion of the report of the General Purposes Committee.

On resuming, the report and recommendations of the Committee were adopted, with the exception of the paragraph approving the draft bye-laws, which were referred back to the Special Committee.

The usual resolution authorising the Registrar to take proceedings against certain named persons was also passed.

PRACTICAL NOTES AND FORMULÆ.

Acetylene Generation and Purification on a Small Scale.

A very useful and practical communication from the Havemeyer Laboratories, Columbia University, upon this subject, appears in the *Journal of the American Chemical Society*. It starts by pointing out that for most purposes the purification is unnecessary, providing that the gas has been generated in a proper manner, the chief factor being that the action upon the carbide is not allowed to produce heating. This cannot be done by the slow drip of water which often causes frosting and ejection of solid particles into the reservoir of gas. The carbide, preferably contained in a wide bucket or a wide-mouthed bottle, is covered with 95 per cent alcohol. Slow generation at once begins, and enough gas is produced to expel all air present. Water now being added drop by drop, a gradual generation of acetylene occurs without material rise in temperature. Where economy is desirable, the alcohol can be distilled off and collected again. As to purification, the account states that no single one of the many published methods is sufficient, and a combination of some of them is recommended. The gas produced as above is passed through an aqueous solution of 15.6 per cent. cupric sulphite, to which has been added 5 per cent. of 20 per cent. volume sulphuric acid, the mixture absorbing the alcohol, ammonia, and hydrogen sulphide and phosphide. The gas may be further passed through one or two columns of pumice stone, saturated with an acetic or sulphuric acid solution of chromic acid. A small amount of these purifying minerals serves for a large quantity of gas. When properly carried out the product is dry powder, and in lieu of the well-known nauseous odour possesses a faint and agreeable smell.—*Brit. Journ. Phot.*

Record Ink.

The specifications for an official Standard Record Ink in Massachusetts are that it must be a gallate and gallotanate of iron ink, not inferior in any essential quality to one properly prepared after the following formula:—Tannic acid, pure dry, 23.4 parts; gallic acid, 7.7 parts; ferrous sulphate, 30.0 parts; acacia, 10.0 parts; diluted hydrochloric acid, 25.0 parts; carbolic acid, 1.0 part; water sufficient to make up the mixture at the temperature of 60° F. to the volume of 1,000 parts by weight of water. The ink writes very pale at first but turns jet black on standing. But a pale writing ink is not popular, and something must be added to give an immediate coloration. Indigo, carmine or indigotin is the

best for this purpose. Some two years ago Mr. J. A. S. Woodrow, Ph.G., tried about thirty different formulas and modifications of record inks, and found the following formula to give the best results:—Tannic acid, 80 grs.; gallic acid, 14 grs.; salicylic acid, 1 gr.; purified sulphate of iron, 102 grs.; indigotin, 90 grs.; water, 1 pint. Dissolve the acids in 8 ozs. of water, the iron and indigotin each in 4 ozs. of water and mix the solutions.—*Spatula*.

Percentage Solutions.

As the fluid ounce of distilled water contains 437.5 grains, assuming we require, say, two fluid ounces of a 1 in 40 solution of phenol in water, the simplest method of procedure is as follows:—Two fluid ounces of distilled water equals 875 grains, hence

$$\begin{array}{r} 40 : 875 :: 1 \\ 875 \times 1 \\ \hline 40 = 21.8 \text{ grains} \end{array}$$

of phenol, and if this be made to measure two fluid ounces by the addition of distilled water we have that which is required.—*American Druggist*.

Manufacture of Laundry Soda.

The constituents of commercial laundry soda vary considerably. Various manufacturers prepare it by mixing sodium silicate, 2.5; with calcined soda, 1; and powdering the resulting hard mass. Another form is composed of calcined soda, 34; sodium silicate, 25; borax, 3; soap powder, 5; starch powder, 3; water, 30. Another usual formula is crystal soda, 4; sodium silicate, 1; though very often it only consists of powdered soda crystals.—*Pharm. Zeit.*, 45, 88, after *Seifenfabr.*

Application of Ink to Relieve Pain.

Leistikow recommends the use of a 10 per cent. solution of tannin, mixed with a 2 to 5 per cent. solution of ferrous sulphate, to relieve the inflammation of various skin diseases. These solutions should be mixed immediately before use.—*Pharm. eit.*, 45, 88, after *Monatsch. f. prakt. Derm.*

Therapeutic Value of Validol.

Goldmann characterises this body as a very useful, perfectly innocuous remedy for the treatment of various neurasthenic symptoms, as well as flatulence; its value is not impaired by continued use. It has also given good results as an anodyne.—*Pharm. eit.*, 45, 88, after *Klin. therap. Wschr.*

Remedy for Baldness.

Gessner gives the following recipe, which he states has yielded good results in the treatment of premature baldness. Resorcin, 2.5, chloral hydrate, tannic acid, of each 5, tincture of benzoin, 1.5, castor oil, 4, alcohol (90 per cent.) to 250. For the treatment of alopecia syphilitica, Gaucher gives the following method of treatment. The hair is kept short and the scalp is washed, and treated daily with the following hairwash and ointment. (1) Corrosive sublimate, 0.2, chloral hydrate, 4, resorcin, 2, castor oil, 1, alcohol (90 per cent.) to 200. The hair wash. (2) Calomel, 2.5, salicylic acid, 0.5, vaseline, to 50, to make an ointment. For simultaneous seborrhœa and pityriasis of the scalp the author recommends precipitated sulphur, 1.5, vaseline to 30, make into an ointment.—*Pharm. Zeit.*, 45, 87, after *Mitth. Med. Woch.*

Thickened Collodium Cantharidium.

If this preparation has gelatinised and is insoluble in alcohol and ether, rub up with oleum betulæ to a soft paste and then with alcohol and ether. When thus treated, the preparation is quite as active as when first made.—*Oesterr. Zeits. für Pharm.*, 54, 183, *Giorn. di Farmacia*.

PROPOSED PHARMACY ACT AMENDMENT.

A draft Bill has been prepared by an association called "The Traders in Poisons and Poisonous Compounds for Technical and Trade Purposes Protection Society," for the purpose of amending the Pharmacy Act in reference to the sale of poisons, and with the object of allowing persons not registered under the Pharmacy Act, 1868, to retail poisons for "agricultural, horticultural, trade and technical purposes." It does not apply to poisons sold for medicinal purposes.

It is stipulated in the measure that the poisonous preparations shall only be sold in closed packets, as sent out by the manufacturers; also that such packets shall be labelled with the name of the poisonous ingredient, with the word "Poison," and with the name and address of the manufacturer and retailer respectively. In addition, it is proposed that each sale shall be registered by the seller, stating the name and quantity of the poisonous compound sold, and the purpose for which it is required, the name and address of the purchaser being also duly recorded.

The qualification of the retailer of the poisonous compounds referred to is to be the holding of an Excise licence, for which an annual fee will be payable. Such a licence is to be granted to any person whose fitness is vouched for by a justice of the peace or the local police authorities. The penalty suggested for selling without a licence or for any breach of the regulations as to labelling, registration of sales, etc., is five pounds.

The Secretary of the Society which is promoting the Bill is Mr. T. G. Dobbs, 5 and 6, Clement's Inn, Strand, London, W.C., and the Hon. Treasurer is Mr. G. H. Richards, 128, Southwark Street, London, S.E.

A strong representative committee has been formed, and the Society is now seeking support by way of subscription or donation from all classes of traders, its objects being stated shortly as follows:—

(1) To promote and protect the interests of Traders in Poisons and Poisonous Compounds for Technical or Trade Purposes.

(2) To take steps as the Executive Committee may consider desirable for opposing legislation which is calculated to injuriously affect such Traders.

(3) To secure the removal of repressive and vexatious restrictions in regard to the sale of Poisons and Poisonous Compounds to technical and trade purposes by Traders other than Pharmacists.

(4) To promote and support by all constitutional means the passage through Parliament of any Bill or Bills comprehending the above objects.

(5) To advise and assist Members of the Society in any litigation in which the general interests of the Traders in Poisons and Poisonous Compounds for Technical or Trade Purposes are in the opinion of the Executive Committee injuriously affected.

A petition to Parliament in favour of the proposed Bill has been drawn up for the signature of seedsmen, nurserymen, gardeners, corn dealers, ironmongers, oil and colourmen, hardwaremen, agricultural agents, farmers, and other classes of tradesmen and users of chemical compounds containing poisons but only intended for technical and industrial purposes. The text of the petition is given below.

Copies of it are being sent out from the offices of the Society to persons in various localities who will interest themselves in the matter; and with the view of making the movement of a popular character, the minimum annual subscriptions for membership of the Society has been fixed at 5s., whilst donations are invited.

[TEXT OF PETITION.]

Petition in favour of Pharmacy Act Amendment Bill.

To the HONOURABLE THE COMMONS of the UNITED KINGDOM of GREAT BRITAIN and IRELAND in PARLIAMENT ASSEMBLED.

THE HUMBLE PETITION of the undersigned, being Persons or Traders in the Kingdom of Great Britain and following the occupation set opposite our respective signatures.

SHEWETH as follows:—

1. BY the Pharmacy Act, 1868, it is enacted that it shall be unlawful for any person to sell or keep open shop for retailing, dispensing or compounding poisons unless he be a Pharmaceutical Chemist, or a Chemist and Druggist within the meaning of the Act, and be duly registered.

2. THAT numerous poisonous compounds necessary for Horticultural, Agricultural and other Trade and Technical Purposes are now being manufactured, but by reason of the Pharmacy Act, the Agents in these industries are prevented from retailing such compounds, and for the benefit of trade generally and the convenience of the Public it is expedient that poisonous compounds which are *not* for medicinal use *nor* intended for the preparation of Medicine may be retailed by Traders (as well as Pharmacists) for any Trade or Technical Purpose *in original sealed packages* as received from the wholesale dealer or manufacturer.

3. THAT many of the poisonous compounds used for Trade or Technical purposes are of a heavy or bulky character, and it frequently happens that Pharmacists have neither room nor accommodation for the storing of such goods.

4. THAT in many of the Country districts a Pharmacist is not to be found within a radius of some miles, and it would be materially to the convenience of many of us the undersigned Farmers, Gardeners, and others, were we able to obtain such compounds from the Seedsmen, Nurserymen, Corn Dealers, Iron and Hardware Dealers, Agricultural Agents and other Tradesmen in our respective districts.

5. A BILL entitled "An Act to amend the law relating to the sale of poisons and alter and amend the Pharmacy Act, 1868," is now pending in your Honourable House, whereby it is proposed to make it lawful for other persons (in addition to Pharmacists) to sell or keep open shop for the sale of poisonous compounds for the express purpose *only* of such Compounds being used for Trade or Technical Purposes, and under proper restrictions provided for in such Bill.

6. YOUR PETITIONERS represent consumers or users of such poisonous compounds and also several branches of trade to which the provisions of the Bill would be of great utility and value, and such Bill would in their opinion confer a great benefit upon the public generally, and tend to the improvement of trade, and to the removal of defects which your Petitioners have found to exist under the present law.

YOUR PETITIONERS therefore pray your Honourable House that the Bill may be allowed to pass into Law.

AND YOUR PETITIONERS will ever pray, etc.

EXAMINATION OF AMMONIACUM, BDELLIUM, GALBANUM, OPOPANAX AND SAGAPENUM.*

BY K. DIETERICH.

The determination of the acid number in the case of ammoniacum and galbanum, by direct titration, is very unsatisfactory, as the end reaction is very indefinite; if the resin is only allowed to stand for five minutes with the alkali the free acids are not completely neutralised, and if allowed to remain longer in contact, saponification ensues.

AMMONIACUM.—The author finds the following to be a satisfactory method:—About 1 Gm. ammoniacum is rubbed to very fine powder in the cold; it is then heated under a reflux condenser, first with

* From the *Pharmaceutische Centralhalle*, 40, 467. Abstract.

water 50 Gm. and then with alcohol 100 Gm. for fifteen minutes. After cooling, the whole volume is made up to 150 Gm. and filtered. To 25 Gm. of the filtrate 10 C.c. semi-normal alcoholic potash are added, allowed to stand for five minutes and titrated back with semi-normal H_2SO_4 and phenol-phthalein. As the result of the examination of twenty-three samples, the author gives the limits for acid number as varying from 85 to 105. The resin and saponification number (fractional saponification) is then determined by the following method:—Two separate portions of ammoniacum, each of 1 Gm., are treated with 50 C.c. petroleum ether (sp. gr. 0.700 at 15° C.). 25 C.c. semi-normal alcoholic potash are added to each, and allowed to stand for twenty-four hours at ordinary temperature, in two closed flasks.

The one portion after the addition of 500 C.c. of water is titrated back with semi-normal acid; this gives the resin number; to the second portion is now added 25 C.c. semi-normal aqueous KOH and 75 C.c. of water, and the mixture is again allowed to stand with frequent shaking for twenty-four hours; it is then diluted with 500 C.c. of water and titrated with semi-normal sulphuric acid and phenol-phthalein; this gives the saponification number. The following limits were found by examination of various samples:—

Resin number	99.4 to 155.4
Saponification number	145.6 to 162.4

An African ammoniacum (*Ferula tingitana*) gave the following values:—

Acid number	64.29	51.56	47.58	92.21
Resin	103.89		104.59	
Saponification	105.3		108.10	

Showing that the African gum is not so pure as the Persian.

BDELLIUM.—The following are the figures obtained for African bdellium:—

Acid numbers range from	10 to 21
Ester numbers from	69 to 85
Saponification numbers from	82 to 111

In the case of Indian bdellium, the figures show a considerable difference:—

Acid number about	36
Ester	47
Saponification	84

GALBANUM.—The acid, resin, and saponification numbers of galbanum are determined as for ammoniacum. The limits for acid number were found to vary from 25 to 65.

Resin number	107.5 to 122.5
Saponification number	116.2 to 135.8

Adulteration of galbanum with ammoniacum raises the acid number. With asafetida it is lowered, thus:—

	Acid Number.
Galbanum with 5 per cent. ammoniacum	29.28 to 37.68
" " 10 " " "	33.00 " 47.00
" " 20 " " "	42.34 " 66.51
Galbanum with 5 per cent. asafetida	34.77 " 46.13
" " 10 " " "	29.84 " 36.66
" " 20 " " "	21.45 " 29.87

The acid and saponification numbers of Bdellium, Opopanax and Sagapenum were determined by the following modified process:—

Acid Number.—One Gm. of the finely powdered gum resin is heated for 15 minutes under a reflux condenser, with distilled water 30 C.c.; strong alcohol 50 C.c. is now added and the mixture heated for 15 minutes under reflux condenser, on the water bath; when cold, the solution is titrated with semi-normal KOH with phenol-phthalein as indicator. The number of C.c. of semi-normal KOH used up $\times 28 =$ acid number.

Saponification Number.—About 1 Gm. of the gum resin is allowed to digest for thirty minutes with 30 C.c. water; 25 C.c. semi-normal alcoholic potash is now added, and the whole heated under a reflux condenser for thirty minutes on a water bath; allowed to cool, diluted with alcohol, and titrated back with semi-normal acid. The number of C.c. semi-normal KOH used up $\times 28 =$ SN. The ester number is obtained by subtracting acid from saponification number.

OPOPANAX AND SAGAPENUM.—For *Opopanax* (Burseraceous) the figures obtained are:—Acid number, from 10 to 30; ester number, 82 to 125; saponification number, 96 to 152; while umbelliferous *Opopanax* gives acid number, from 32 to 58; ester number, from 105 to 142; saponification number, 138 to 200. *Sagapenum* gives, acid number about 14; ester number, from 32 to 40; saponification number, 45 to 54.

TESTING CLINICAL THERMOMETERS.*

BY DR. CHARLES RICE.

The clinical thermometer is an important factor in the diagnosis and prognosis of disease at the present day. Without its aid the approach or advent of numerous dangerous diseases or pathological conditions cannot be recognised with certainty, until the disease or condition has advanced to a stage where it may become less amenable to treatment, and where the result depends largely upon the vital resources of the patient, which might have been materially fortified if the physician or surgeon could have utilised the information conveyed by a reliable thermometer.

The general public scarcely realises the extent to which the business of manufacturing clinical thermometers has progressed at the present time. While, some twenty-five years ago, the clinical thermometer was looked upon rather as a curiosity and hypercritical appliance, its annual production and consumption now reaches into the millions.

THE VARIOUS KINDS OF THERMOMETERS.

Of course, the only practically useful clinical thermometer is the self-registering one; and this may be of two kinds, either with plain front or with magnifying front lens. Of either of these there are again various grades or classes, differing as to the shape of the bulb or stem, length of stem, colour of glass, sensitiveness, etc., etc. It is assumed that the reader is familiar with the several kinds; hence a description is deemed superfluous here. Moreover, for our purposes, all these distinctions can be disregarded, since the method of testing their accuracy, which will be described below, can be applied to all.

As a rule, clinical thermometers are graduated between about 94° and 110° F., in one-fifth of a degree. For special purposes, where unusually high temperatures are to be measured (as sometimes in cases of insolation, etc.), some may be had on which the graduation is carried to 115° F., or even higher.

EXPENSE OF THE CERTIFICATED INSTRUMENTS.

If it is the object to examine the absolute accuracy of a thermometer for every degree of its scale, the mode of procedure is much more complicated than that below given, and requires special apparatus and considerable practical experience. For this reason so-called "standard" thermometers are rather expensive, and even the commercial certificated clinical thermometers are rather high in price. Of course, if these have been tested by a reliable authority, they are fully worth the money. But the general public and most of the hospitals and charitable institutions in this country cannot afford to pay this high price, and therefore have to content themselves with uncertificated ones. But here they run the risk of getting worthless instruments. While much trust may be placed in the names of certain manufacturers, it is nevertheless a fact that even the best brands will be found now and then—sometimes even a good deal—deficient.

AN OPPORTUNITY FOR PHARMACISTS.

Among the pharmacists in this country there are many who do a large business in clinical thermometers, and whose professional reputation is of such a character that their certification would be accepted by medical men of their acquaintance, and eventually also by others and the public, as a satisfactory guaranty of the accuracy of any thermometers tested by themselves. There is hence a chance here of expanding their business in a legitimate direction, and the writer hopes that this suggestion will be followed by those who may find it worth their while.

*From the *Bulletin of Pharmacy*.

In the course of many years' experience the writer has examined many thousands of thermometers, and has long ago settled down to a method which aims to avoid errors of observation as far as possible, it is believed, and which permits to ascertain the accuracy of instruments within limits that are considered sufficient in practice—namely, one-tenth of a degree, though for ordinary clinical purposes an accuracy to one-fifth of a degree is amply sufficient.

VALUE OF "SEASONING" IN A THERMOMETER.

Of course, the first requisite for testing thermometers is the possession of a standard thermometer. This need not be an expensive instrument, but may be any well-seasoned clinical thermometer which has been carefully compared with a standard one and found to be sufficiently accurate, or whose deviations from the standard are exactly known for every degree of its scale. "Well-seasoned" in this case means that it must have been made several years before it was graduated, as it is well known that the calibre or bore of a thermometer suffers slight changes for some time after it has undergone the process of manufacture. The best reputed makers of thermometers state that they never graduate and sell any thermometers that are not fully seasoned. Unfortunately, there is no test by which a seasoned thermometer can be distinguished from an unseasoned one at the time of purchase. And while honest makers no doubt adhere to the rule, it is well known that the majority disregard it altogether.

TESTING.

It is not at all necessary to test a clinical thermometer throughout the whole scale of degrees that is marked upon it. In most cases it will be sufficient to ascertain its accuracy at some point between about 97° and 104° F. But, if time is not pressing, it is best to make at least two tests, one at a temperature between about 97° and 102° F., and one at a few degrees higher. If a thermometer agrees with the standard at both points within one-fifth of a degree, it may be regarded as sufficiently accurate for all practical purposes. Any that agree with it exactly, or within one-tenth of a degree, may be put aside as particularly accurate, and these may, of course, be sold at a higher price with a corresponding certificate.

Now, if only one clinical thermometer, or only a few, are to be tested, this may be done simply by first shaking down the "index" or mercury in all of them and immersing them with the standard—best tied together—in a rather large volume of water at the proper temperature. If the thermometers are inserted cold, there will, of course, be a "cold wave" produced around them, which will last until the temperature has become equalised by diffusion or by stirring. If the volume of water is large, the final result will not vary by any appreciable degree from the theoretical one, because the stored-up heat in the volume of water practically neutralises the slight chill introduced by the few cold thermometers.

Some thermometers have the peculiarity of apparently registering correctly, but losing their register or index more or less rapidly when withdrawn from the source of heat. For this reason it is necessary to re-examine them twenty-four hours (or, if time is available, after a longer interval) after each of the before-mentioned tests, when they should be found to offer the same reading as when they were first examined. A retrocession of the mercurial index by as little as one-tenth of a degree renders the rejection of the respective thermometer advisable.

DEGREE OF SENSITIVENESS IN THERMOMETERS.

A further classification of the thermometers that have successfully passed all the tests may now be made, to ascertain their sensitiveness. For this purpose they are once more (but only once, at any optional part of the scale) tested as before described, and removed from the warm water after an immersion of an exactly known period of time. For instance, those that are found to have attained the correct temperature (according to the standard—which,

if sluggish, may have been previously inserted for a sufficient length of time), after the lapse of sixty seconds, or one minute, may be set aside as one-minute thermometers. Similarly, there may be separate groups of two, three (or more) minute thermometers, which will often be found useful, as many purchasers lay value on the time within which a thermometer responds.

In making contracts for clinical thermometers there are many features which permit an exact definition or description, so that a control of the articles delivered is not difficult. The only feature that is not definable or controllable is the age or ripeness of the thermometers. Nothing beyond the word of the maker can tell whether they had been allowed to become seasoned or not. It may be of interest to some of the readers of this paper to know what conditions are prescribed for the clinical thermometers bought, under contract, for the public hospitals of the city of New York. The specifications read as follows:—" . . . gross of clinical thermometers (to be delivered in instalments as required), four inches long, to be substantially made, with single bulb, plain front, indestructible index, each even degree plainly numbered, the graduation between 94° and 110° F. extending over a space of not less than 1½ inches, and to be correct within 0.2 of a degree as determined by the standard thermometer of the Department." It was found useless to add a condition as to sensitiveness, because among a gross or more delivered at one time there are always found a number which are more sensitive than others, and these are reserved for special purposes. The higher sensitiveness is mainly due to the fact that the glass of the bulb is thinner, for which reason these sensitive thermometers are much more easily broken. For all ordinary purposes a good solid three or four-minute thermometer is much preferable.

RE-EXAMINATION.

Thermometers remaining in stock should be examined again at the expiration of every six months, and a record should be kept of the number and condition of all those which have retained their accuracy after the first six months. After every further lapse of six months, if they are still found to be accurate, their value will have proportionately increased, as they may then be certified in good faith as being seasoned.

LETTERS TO THE EDITOR.

What a Pharmacy Bill Should Include.

I take a great interest in "Facts and Fancies," as the right kind of reading for chemists, but I do not quite agree with "An Ordinary Pharmacist" in his suggestion that we should relinquish the substance of our present business to grasp at the shadow of future professionalism. Let us rather firmly secure real professionalism first, then relinquish our present substance—*i.e.*, the monopoly of the sale of poisons—if need be. A direct amendment of the Pharmacy Acts is certainly desirable, and, if I may be permitted to say so, should run on the following lines:—(1) Sole right to our titles and the sole use of them also. (2) Sole right to the practice of pharmacy—*i.e.*, dispensing of physicians' prescriptions solely by pharmacists. (3) The restriction of sale of poisons to persons qualified and reliable to execute such duties—*i.e.*, chemists and druggists. (4) Exemption from jury service. (5) One man one pharmacy. (6) Systematic education, comprising three or four stages. (a) First examination, as at present constituted for entrance to apprenticeship. (b) Second or intermediate examination at end of apprenticeship, whereby candidates would be enabled to take up assistants' certificate—A.P.S. (c) Third or qualifying examination—M.P.S. (d) Honours examination, the Major—Ph.C. or F.P.S. (Fellowship). (7) Benevolent Fund as at present constituted.

It would be interesting to invite discussion on the above rough suggestions so as to obtain the opinions of others on this important

subject. Going back to No. 1, the chemist should stick hard and fast to his titles—Ph.C., Chemist and Druggist, Pharmacist, Dispensing Chemist—and demand them for himself alone. With strenuous opposition to Clause No. 2 of the Companies Bill, 1900, as advocated by "An Ordinary Pharmacist," lies our whole existence as individuals, and we should use our exertions to the utmost; if we fail, it will be our own fault; chemists, as a rule, being so short-sighted and indifferent to their own power. Unity of purpose is what is required. Imagine for one moment the alas! almost impossible desideratum of a united will of 15,000 chemists. Imagine the possibilities of such a thing. Yes. Unity! Unity!! Unity!!! and, again, Unity!!!! is what is required. United opposition, say, of 10,000 of that 15,000 to the hateful thing that is slowly strangling us, that horrible incubus whose tentacles are sucking our life blood—company pharmacy. Surely they could overpower such a monster with their united power. Then, again, No. 2, with its war cry, "Prescribing for the doctor and dispensing for the chemist," no one being allowed to dispense physicians' prescriptions or medicines but pharmacists, chemists alone, except in villages without the radius of five miles of a pharmacy, when, no chemist being available, the medical practitioner should be allowed to dispense his own medicine. That should put down those who are so far below the usual standard of a medical man as to give attendance and physic for the ridiculously low fee of 1s., such persons being a disgrace to their profession.

Another evil is the traffic in dispensing for medical men's own patients at so much a bottle, usually 6d., whereby the chemist is robbing himself and his *confrères* of their legitimate profit. This is certainly a growing evil, and should be stopped, so much so that in a few years a genuine prescription will be a *rara avis* in a pharmacy, and there will be no need for dispensing chemists. Exemption from jury service would be extremely beneficial to the chemist who is obliged to "run his own show," it being obviously more important to him to dispense medicines than attend inquests, etc.; whereas there are always good men and true to be found in other trades for the service. Now is the time to formulate our plan of campaign. Now is the accepted time for our new blood members of Council to exert themselves and demonstrate sincerity to their pledges, by showing that their electioneering utterances are not merely vapour, but are their earnest convictions and intentions for the betterment of our future state. Let them recognise our local associations, bring them all in touch with one central authority, say, the Council, under the name of the General Pharmaceutical Council, for the utilisation of the above-mentioned power of the united chemists and druggists of the United Kingdom, undertaking the protection and preservation of the interests, aims, rights (pharmaceutical), and the advancement and betterment of the status of what is to be in the near future the pharmaceutical profession.

Brighton, June 9, 1900.

A BRIGHTON CHEMIST (34/33).

Ninety-Six Doses for a Shilling.

The other day the following prescription was handed in at our establishment to be dispensed:—

R Acid. nit. mur. dil.	ʒiiss.
Ac. phos. dil.	ʒvi.
Liq. strychnin.	ʒiv.
Inf. calumbæ	ad ʒxii.
M. ft. Guttæ.	

Sig. ʒi. ex cyatho aq. ter die.

The prescription bore the name of several Wakefield "chemists," not "stores." When asked what the price would be, said: "2s. 3d. for ʒxii., 1s. 3d. for ʒvi." To which the customer replied that he had never paid more than 1s. 3d., and usually 1s. for the ʒxii. Needless to say he went in search of another chemist, and may we even go so far as to hope that he had to resort to his kind friends at Wakefield.

York, June 12, 1900.

J. WINSHIP.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

SOLIDIFIED SPIRIT (E. J. L.—43/9).—The preparation you ask about is evidently "Spiratine," an article supplied by Messrs. Barclay and Sons, Limited, 95, Farringdon Street, E.C.

STAMPED MEDICINE LICENCE (F. C. W.—43/8).—Any person who retails medicinal preparations requiring the Government stamp attached must hold a licence.

SPECIALISTS (W. J. L.—43/7).—The patient's regular medical attendant is the person best qualified to recommend a specialist. We are unable to do so.

DEVELOPER (E. J.—43/13).—As you do not say what your difficulty is, it is impossible to say. Could you not get a clear solution, or were the negatives at fault, or what was the trouble?

ANALYST (A. B. G.—43/12).—There is no qualification required by law for the position of analyst, but Fellowship of the Institute of Chemistry is gradually becoming recognised as the most desirable qualification.

SOLUBLE ESSENCE OF LEMON (R. H. S.—43/18).—Macerate 10 oz. of fine-cut fresh lemon peel with 20 fl. oz. of rectified spirit, for fourteen days, then strain, press, add 1 drachm of terpeneless lemon oil and filter bright through powdered pumice.

PETROLEUM EMULSION (J. D.—43/11).—Make a smooth mixture with 24 parts of liquid paraffin, B.P., 6 of powdered gum acacia, 2 of powdered gum tragacanth, and 2 of tincture of quillaia; then add, all at once, 16 parts of water, and rub together until the emulsion is formed.

SPRAY FOR GOOSEBERRY MOTH CATERPILLARS (T. W. P.—43/31).—Dissolve naphthalin, 1 lb., in paraffin oil, 1 gallon. Then dissolve soft soap, 1 lb., in boiling water, 2 gallons. Pour the paraffin and naphthalin solution into the soap solution while hot, stir briskly, and then work a fine-rose garden syringe in the mixture until a uniform emulsion results. Set aside for several hours, then again stir well. For use, dilute 1 pint of this strong emulsion with 1½ gallons of water, and syringe the infested trees with the mixture at dusk. Repeat the application in a couple of days. This is also very effective for aphids on rose trees.

CONCENTRATED TONING SOLUTION (J. A.—43/10).—The probable cause of the precipitation of the gold is the neutralisation of the gold chloride and the dilution of the solution; the stronger a solution of a soluble gold or platinum salt the less liable it is to decompose. Then, again, if the solution were exposed to light that would at once cause incipient decomposition, which would continue. It is doubtful whether such a dilute solution could be kept for any length of time without precipitating, but at any rate it should not be neutralised, as any free hydrochloric acid would merely displace some of the sulphocyanic acid from its salt, and that acid has but slight action on the silver image. A more stable bath can be made by using potassium sulphocyanide, and the following formula should be satisfactory:—Dissolve (1) 90 grs. of potassium sulphocyanide in 3 ounces of distilled water, and (2) 6 grs. of gold chloride in 1 ounce of distilled water; add (2) gradually to (1), shaking well after each addition, then bottle and keep in the dark. For use dilute 1 part of the mixture with 3 parts of water.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, JUNE 16, 1900.

THE COUNCIL MEETING.

NOTWITHSTANDING the infusion of new blood and the notice of motion by Mr. HILLS, the proceedings of the newly constituted Council last Wednesday were not remarkably eventful. The chair was taken by Mr. MARTINDALE, and after some brief conversation as to the presidential election, in the course of which Mr. MARTINDALE made known his intention not to venture upon another year of office, the minutes of the preceding regular and special meetings were read and confirmed. Mr. MARTINDALE then expressed his regret that he had not been present at the last two meetings, and the satisfaction with which during his travels he had found the Society to be held in such high esteem in South Africa.

The receipt of letters of acknowledgment from the Pharmaceutical Society of Ireland, Miss BIRD, the family of M. PLANCHON, Mr. FRED REYNOLDS, the families of Sir DOUGLAS MACLAGAN, Mr. HUGILL, and Mr. WATT was mentioned.

In the ballot for election of President, Mr. NEWSHOLME received a very large majority of votes, and on taking the chair thanked his colleagues for the honour conferred upon him, adding that, though the opportunity had come about unexpectedly in consequence of his having been recently called upon to take the place of the President, he felt that it was incumbent on every one to fulfil as far as he could the duties of the position in which he was placed.

In the ballot for Vice-President, Mr. ALLEN was elected by a considerable majority of votes and, in thanking his colleagues for their expression of confidence, expressed himself desirous of making his past experience of Council work serviceable in his new position for the utmost advantage of the Pharmaceutical Society.

In the ballot for Treasurer, Mr. ATKINS was unanimously re-elected to that office and thanked the members of Council for that renewed mark of their confidence.

The PRESIDENT then moved a vote of thanks to Mr. MARTINDALE for the zealous manner in which he had filled

the office, which was seconded by the VICE-PRESIDENT, supported by Mr. HILLS, and carried unanimously, with a general expression of regret that the state of his health had prevented his continuance in the chair.

Mr. MARTINDALE, in reply, thanked the Council for the kind expression of sympathy and appreciation of his endeavours to serve the Society, which he hoped to be still able to continue in some way.

Mr. RICHARD BREMRIDGE was reappointed Secretary and Registrar, as well as the Editor and Sub-editor, Mr. E. M. HOLMES as Curator, and Mr. J. RUTHERFORD HILL as Assistant-Secretary in Scotland.

The additions to the Society comprised 33 members, 54 student-associates, and a considerable number of restorations.

The appointment of Committees was then proceeded with (see page 643).

The report of the Finance Committee was adopted on the motion of Mr. MARTINDALE without comment.

On the recommendation of the Benevolent Fund Committee five grants, amounting in all to sixty-nine pounds, were ordered to be paid.

The report of the Library, etc., Committee referred chiefly to routine work, and was adopted.

Mr. W. H. LENTON was appointed Burroughs Scholar.

On the motion of Mr. CARTEIGHE some resolutions were passed in reference to the lease of the Society's property at Strawberry Hill, and to the committee entrusted with the settlement of investments in freehold ground rents.

The PRESIDENT and several other members of Council were appointed delegates to the forthcoming meeting of the British Pharmaceutical Conference.

The SECRETARY reported that a letter had been received from the Nottingham Chemists' Association with a resolution expressing approval of the opposition of Clause 2 of the Companies Bill, and regret that no endeavour had been made to secure titles to registered persons by some amendment of that Bill. It was referred to the Law and Parliamentary Committee (see page 644).

A resolution from the Forfarshire Chemists Association expressed the opinion that the time has arrived for altering the method of conducting the qualifying examination. This was referred to the General Purposes Committee (see page 644).

Another resolution, passed at a meeting of the Liverpool Chemists' Association, expressed approval of the Council's decision to oppose Clause 2 of the Companies Bill.

In the report of the General Purposes Committee, the scheme for rearrangement of the districts of the Society's local secretaries was mentioned as having been under consideration and deferred; the alteration of the bye-laws was also mentioned. In accordance with a suggestion by Mr. CARTEIGHE the draft bye-laws were referred back to the sub-committee in order to give opportunity to consider proposed alterations of the distinctive terms now applied to the examinations.

Mr. HILLS then brought forward the motion of which he had given notice (see page 644), proposing that the present position of the Companies Bill and the position of pharmacy in relation to company trading should be considered by the Law and Parliamentary Committee, with a view to suggesting the policy and action most

expedient to adopt in reference to Clauses 2 and 3 of the Bill, arguing, in explanation, that under existing conditions further consideration of the company trading question is desirable because the Council would eventually have to deal with it if Parliament does not do so in the present or next session.

Mr. HARRISON seconded the motion, because he thought the present time opportune for reopening the question, since company trading is increasing and is being carried on in a way that is scandalous in leading to evasion of the law.

Mr. STORRAR supported the motion, because he thought the result of the Council election was to show that a feeling existed as to regulation of companies being necessary, notwithstanding the divided views of the Council on that point, which had led to the decision to oppose Clause 2 of the Companies Bill. He did not, however, support the motion simply for the reasons given by Mr. HILLS, but also because he knew many agreed with him in thinking that the only proper way to deal with companies trading as chemists and druggists is by amendment of the Pharmacy Act.

Mr. WOOTTON hoped that the vote on this motion would be understood as a reversal of the decision arrived at by the Council last March. That remark gave rise to some expression of objection by Mr. STORRAR and Dr. SYMES, the PRESIDENT explaining that if the matter were referred, as proposed by Mr. HILLS' motion, the Council could not tie the hands of the Committee. The subject would be considered in its widest aspects.

Mr. WOOTTON then added that he wished the Council to be definitely committed to something, and that the Committee should report to the next meeting of Council, urging that the voting at the Council election was—in his opinion—a distinct mandate to the Council to reverse its decision in regard to a matter which he was surprised to see had, for several years past, not been considered most urgent; also that the Council should have an interview with the LORD CHANCELLOR to discuss the matter with him, as he presumed he was amenable to reason.

Mr. TAYLOR said he should vote for the motion, but from an opposite point of view to that taken by Mr. WOOTTON, not because it implied a reversal of the Council's decision, but because it did not do so. Circumstances might lead to such a result, but until the matter was gone into it could not be regarded as closed. He questioned whether they had considered how far any regulation of company pharmacy might affect the status of the Pharmaceutical Society, and not merely the position of individuals in regard to competition. Legal recognition of company pharmacy would bring about an entirely new state of affairs, and the Society might find itself in the position of a teaching, examining and registering body for the purposes of limited companies.

Mr. GLYN-JONES urged that the Council should see the LORD CHANCELLOR with a view to educating him on the question at issue.

Mr. ATKINS was not prepared to admit that there would be any reversal of the Council's decision. If a solution of the difficulty could be arrived at by all means take advantage of it, but he was strongly adverse to approving regulation of companies.

Mr. HILLS, in reply, expressed satisfaction that his motion was so well received even by those who held views opposite to his own, and proposed that a meeting of the Committee should be held next week so that if a resolution could not be come to, the subject might be brought before the Council again at its next meeting.

Mr. GLYN-JONES then moved that the Committee be asked to report so as to avoid the delay which occurred last year; but, though Mr. WOOTTON seconded the motion, the PRESIDENT ruled it out of order.

In reference to the scheduling of carbolic acid, Mr. MARTINDALE said he thought the matter was being delayed unnecessarily. When he and Mr. CARTEIGHE saw the Privy Council officials they were told that the Agricultural Department had the subject under consideration, and he thought the Privy Council should be again written to.

The PRESIDENT doubted whether any useful purpose would be served in that way.

Dr. SYMES expressed doubt as to the Privy Council being fully alive to the urgency of the matter, and as to what the Board of Agriculture has to do with it, except as the result of misrepresentations that had been made as to the effect of placing carbolic acid in the poison schedule, and an interview with the PRESIDENT would do away with the influence of those misrepresentations.

Mr. GLYN-JONES thought the Society and the Council had been placed in a false position by the statement in the House of Commons that the Government was in communication with the Board of Agriculture and the Pharmaceutical Society.

At the suggestion of the PRESIDENT, it was arranged that in the event of nothing being done during the next month, a member of the Council should give notice of motion on the subject for the next meeting of Council.

THE COUNCIL AND THE COMPANY TRADING QUESTION.

THE motion of which notice had been given by Mr. WALTER HILLS, prior to the meeting of the Council on Wednesday last, was chiefly remarkable for the skilful manner in which it had been drawn up. The fact that it was carried unanimously should suffice to prove that it commits the Council to nothing in particular, nothing more indeed than it has been doing for a long time past, *i.e.*, carefully watching the progress of events. The Law and Parliamentary Committee, *i.e.*, the whole Council, is requested to take into immediate consideration the present position of the Companies Bill, and to report as to the line of policy which appears most expedient to adopt if any further step should be taken in the matter by the Government during the existence of the present Parliament. In addition, the Committee is requested to consider the position of pharmacy in respect to company trading, and to suggest what the Council should do in the circumstances. The special point which is thus referred should not be difficult to report upon, as the present position of the Bill does not differ from that of any other abortive measure which the Government introduced with the declared intention of passing. But the wider question will not be so readily answered; perhaps a Pharmacy Bill is the most likely outcome of the Committee's deliberations.

ANNOTATIONS.

THE PRESIDENT OF THE PHARMACEUTICAL SOCIETY is, for the first time on record, a member of the Society not resident in the Metropolitan area. Mr. Newsholme, who now occupies the position, resides in Sheffield, and has for the past three years fulfilled the duties of Vice-President in a manner that has been generally approved. During the past two months also he has been the virtual head of the Society, acting as President during the enforced absence of Mr. Martindale, whom he now succeeds. No better choice could have been made by the Council in thus breaking away from custom that has been established more by accident than for any special reason. While Mr. Newsholme is to be cordially congratulated upon being the first provincial member of the Society elected to the highest position in the body corporate, the members of the Society may esteem themselves fortunate in having so capable a pharmacist to preside over the deliberations of their elected representatives. In accepting the responsibilities of the office, Mr. Newsholme is undertaking a more serious task than any of his predecessors, on account of the greater difficulty in his case of devoting the necessary time and attention to the conduct of the Society's affairs. But that difficulty should be minimised by the appointment of a London member—Mr. C. B. Allen—as Vice-President, and, as previously suggested in these pages, by the delegation to others of certain duties which it has been customary to regard as being inseparable from the position of President. In any case, however, Mr. Newsholme's year of office is likely to be far from an uneventful one. The company trading question has again presented itself for consideration, new bye-laws are to be made and established, the local organisation of the Society is about to be remodelled, it may be decided to draft a new Pharmacy Bill, and in various other ways the year promises to be a full one.

A NEW PHARMACY BILL may be the best solution of the existing deadlock in connection with the company trading question, but agreement as to what such a measure should include may be as difficult to arrive at as unanimity on the company pharmacy problem itself. Already, however, suggestions on the subject have begun to come in, and it may be anticipated that many others will be forthcoming during the next few months. Those published in last week's Journal (see p. 625) appear to have disturbed the serenity of some readers, but it is interesting to note how the ideas then mooted blend with those embodied in the draft Bill (see p. 647) about to be promoted by the Society of which Mr. T. G. Dobbs is Secretary. It is not at present possible to print the text of that draft in full, but a fair idea of its scope can be gathered from the summary which is printed this week, together with the text of the petition in favour of the measure, and other information kindly furnished by Mr. Dobbs's representative. It is evident that a determined effort is about to be made on behalf of seedsmen and other unregistered persons, with the object of enabling them to retail certain poisonous compounds in sealed packets, and it is far from improbable that the matter may be considered sympathetically by many members of Parliament. There is, however, one inherent defect in the proposals, inasmuch as the Bill appears to be somewhat loosely drafted and the safeguards suggested do not appear altogether sufficient in the public interest. The statement that the provisions of the Bill do not apply to poisons sold for medicinal purposes is probably meant to minimise the opposition of registered chemists, but it will be found difficult in practice to determine whether or not a particular poison is intended for medicinal or technical purposes. Detailed criticism on such a point, however, is obviously premature, and must be deferred until the full text of the Bill is available.

THE DESIRES OF "A BRIGHTON CHEMIST" are, it is to be feared, unattainable. He does not object in the abstract to modification

of the existing restrictions on the sale of poisons, but he would prefer not to relinquish his hold in that direction until he has secured all else he thinks desirable. That indicates a cautious but hardly a diplomatic frame of mind. Briefly, he asks that the existing position should be improved—so far as chemists are concerned—by preventing the use of chemists' titles by associations of unqualified persons, by restricting the dispensing of physicians' prescriptions to duly registered persons, and by exempting chemists and druggists from service on juries. Beyond that, he would apparently agree to abolish branch shops, impose a compulsory curriculum and establish an assistant's qualification. Unfortunately, he wishes for more than the Government is likely to agree to. Titles can be protected if the legitimate holders of them will only work together with that object in view: The sole right to dispense is the privilege which British pharmacists chiefly desire to possess, but it is doubtful if it can ever be secured unless something important is offered in return, such as assent to what would virtually be the addition of a third part to the poisons schedule. Exemption from jury service is not likely to be obtained by chemists and druggists, except by becoming pharmaceutical chemists and, at present, that can only be done by passing the Major examination. The abolition of branch shops will be opposed by none more bitterly than by the registered persons who own them. The curriculum idea has been steadily opposed by registered chemists for years, and there is no immediate prospect of its realisation. Finally, the institution of an assistants' qualification would be a fatal error, and should, therefore, not be advocated. Division of the qualifying examination, following the establishment of a compulsory curriculum, is quite another matter, but it remains to be seen whether chemists generally would support, or refrain from opposing, a Bill in which the joint proposals were embodied.

DEGREES IN PHARMACY or, rather, mingled feelings of dread lest such degrees should be instituted in this country and inability to prevent such a movement, appear to constitute a cause of constant worry—a veritable nightmare in fact—to the *Medical Press*. In this week's issue of that doughty organ, it is somewhat incorrectly stated that for years past an agitation has been in progress in the pharmaceutical world to obtain university recognition of "the claims of pharmacy to be a science deserving of a titular stamp." As might be expected, our medical contemporary fails to see any sufficient ground for that claim; but it is not clear what is meant by the statement, advanced as a reason, that "pharmacy is a calling rather than a profession." But the fact remains that many medical practitioners fear lest the granting of degrees in pharmacy and the consequent right to the use of the title "Doctor" should obliterate the distinction between pharmacists and themselves. They appear to possess so little confidence in their own ability to maintain such a distinction in the public mind that they would like to prevent pharmacists using a title which they think would facilitate the carrying on of "illegitimate counter practice." But it is not obvious why the use of the title "Doctor" should not be equally objectionable in the case of pharmacists who obtain a degree in science, which the *Medical Press* suggests they should do if they have any desire for that academical distinction to which pharmacy is held not to lend itself. And though the leaders of pharmacy are advised to recognise the futility of the movement in favour of securing university recognition for pharmacists, and the undesirability of its accomplishment, it is safe to state that, before many years have elapsed, it will be possible to obtain a science degree in pharmacy at more than one university in England, and that it will be both futile and undesirable for medical practitioners—most of whom, by the way, hold no degrees—to attempt to stop the movement in that direction.

THE NEW CLINICAL LABORATORIES which have been added to the Westminster Hospital were opened, on June 12, by Lord

Lister, President of the Royal Society, in the presence of a large company of medical and scientific gentlemen. The laboratories have been added to the hospital for a more scientific and systematic examination of disease than can be carried out satisfactorily in the wards. According to the *Times*, they are equipped with the latest apparatus, and the most recent microscopical, chemical, and bacteriological methods will be applied in the diagnosis of the diseases from which the hospital patients are suffering. Since improvement of medical treatment must of necessity follow upon improvement in diagnosis, the establishment of clinical laboratories is a step which is calculated to increase the efficiency of the hospital as a means whereby real benefits are made available for the sick poor. Acting on this belief, the hospital authorities have drawn heavily upon their capital in order to make the laboratories thoroughly efficient, and rely upon the public to see that their expenditure on this improvement does not impair the efficiency of the hospital in other directions. The opening of the laboratories was preceded by a reception in the board-room of the hospital held by Sir J. Wolfe-Barry, chairman of the House Committee, who, on behalf of the House Committee, thanked Lord Lister for his presence. He said thirty thousand pounds had been spent in bringing the hospital up to modern requirements. The main purpose of the clinical laboratories was the elucidation of disease in the hospital. They were not for independent research, but the benefit to the hospital patients from the researches which would be carried out would extend to all classes. At present application has not been made for a licence to make experiments on animals. In time it is hoped to institute an electrical laboratory fitted with apparatus for Röntgen-ray work and micro-photography.

LORD LISTER, after inspecting the laboratories, said they would give the physicians of the hospital an opportunity of bringing to bear on their cases the most advanced knowledge and the most refined methods of investigation. Many a diagnosis which would otherwise be obscure would be rendered clear in those rooms, and he felt convinced that those who had worked in the laboratories would not only benefit patients in the hospital, but would also, unfailingly, be able to extend the boundaries of knowledge and promote the now rapid advance of pathological and therapeutic knowledge. The laboratories would also be of service as a powerful means of affording sound practical knowledge to the student. He considered that the public owed a debt of gratitude to the governing body of Westminster Hospital for having wisely and boldly devoted a large sum of money to the creation of these laboratories. He felt sure that, before many years were over, it would be recognised that those laboratories were among the most important means of doing good service to the community which hospitals could contain.

THE IDEA OF REGULATING "COMPANY PHARMACY" continues to fascinate some registered chemists, and Mr. Glass has submitted to the Edinburgh and District Chemists' Trade Association what he may regard as a "full blown" suggestion for amending Clause 2 of the Companies Bill. Starting with the assumption that "company pharmacy" cannot be stopped, but without defining what he means by that term, he proposes to amend the Clause in a way that does not differ materially from several others that have been suggested. In fact, the proposed clause is not markedly different from that of the Lord Chancellor; it would do no more to protect the public against inefficient service, while it would operate in an equally objectionable manner against the professional interests of those who are legally qualified to practise pharmacy. As Mr. Taylor urged at the Council meeting on Wednesday (see p. 645), it is necessary to consider how far the regulation and legal recognition of company pharmacy would affect the status of the Pharmaceutical Society and, it may be added, of individual chemists. It will probably then be recognised that the effect would be far-reaching and inevitably bad.

ENGLISH NEWS.

ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held on June 11, Sir James Crichton-Browne, Treasurer and Vice-President, in the chair. The following were elected members:—Mr. C. E. Baxter, Mr. C. Coward, Mr. A. Dupré, Mr. L. V. Harcourt, Mr. W. C. Prescott, and Mrs. M. F. Thorne. The special thanks of the members were returned to Mr. Harold Swithinbank for his donation of £50 to the Fund for the Promotion of Experimental Research at Low Temperatures. The Managers reported that at their meeting held that day the following resolution was unanimously agreed to:—
"The Managers of the Royal Institution of Great Britain, on the occasion of the retirement of Sir Frederick Bramwell from the office of Honorary Secretary, desire to place on permanent record an expression of their high appreciation of the admirable way in which he has performed the duties of that office and of his signal services to the Institution generally. Elected a member of the Royal Institution in 1876, Sir Frederick Bramwell has since then delivered seven Friday evening discourses on subjects cognate to that branch of applied science with the progress of which in this country, during the Victorian Era, his name must ever remain honourably associated. Having joined the Board of Managers in 1879, he was induced in 1885, notwithstanding professional engagements of the most onerous and responsible character, to undertake the additional burden of the duties of Honorary Secretary to the Institution. For fifteen years these duties have absorbed no inconsiderable proportion of his time, and have been discharged with incomparable energy, business ability and courtesy. Himself a generous patron of the Institution, and foremost to support every project for its advantage, he has been able to suggest improvements in the administration of its property which have added to its material resources. Mainly concerned in the arrangement of the courses of lectures and Friday evening discourses, he has succeeded with no small expenditure of labour in maintaining these at a high level of educational value and in making them attractive and popular and representative of every modern advancement in the arts and sciences. While extending the usefulness of the Institution in every direction, and introducing into it many new members, he has by his genial personality done much to promote smoothness and harmony of working in its several departments. The managers feel that the Royal Institution has been singularly fortunate in having so long enjoyed the services of Sir Frederick Bramwell in the capacity of Honorary Secretary, and they rejoice to know that although he is no longer to fill that office, they are still to have the benefit of his counsels at their Board. Sir Frederick Bramwell's name is indelibly stamped upon the history of the Royal Institution for the last quarter of the nineteenth century. He will always be gratefully remembered by its members, but the managers wish to add to personal remembrance this formal record of their cordial recognition of his merits."

ALLEGED FALSE PRETENCES.—At Clerkenwell Police Court on June 7, William Bishop (30), described as a chemist, of 164, Millfield Road, Lower Clapton, was charged on remand, before Mr. Cluer, with obtaining twenty-four boxes of pills, value £2 7s., the property of James Crispe, manufacturing chemist (see *ante*, p. 630). Evidence having been given for the prosecution, for the defence it was stated that Bishop had a wife and four children, and was in impecunious circumstances. He had once been in business himself, but failed.—Mr. Cluer ordered him to be imprisoned for twenty-one days.

DIVISION OF SAMPLES FOR ANALYSIS.—A case came on for hearing at Trowbridge on Wednesday, June 6, in which the decision given in the Divisional Court, Queen's Bench Division, on May 31 (see *ante*, p. 630), appears to have been applied. John Sainsbury, grocer, Hill Street, Trowbridge, was summoned for selling mag-

nesia consisting of magnesium carbonate, and not magnesium oxide, as required by the B.P.—An objection to the Pharmacopœia being put in as evidence to show the proper composition of magnesia was disallowed, but the solicitor for the defence was more successful when he submitted that the case for the prosecution must fail because the inspector sent to the analyst a third of the number of the packets purchased, instead of a third part of the contents of a single packet, the case being dismissed on that ground.

THE NECESSITY FOR A GUARANTEE.—John Nicholl, grocer, Ripponden, was advised by the magistrates at Halifax Police Court, on Saturday, June 2, to obtain a written guarantee with all articles which come under the provisions of the Food and Drugs Act when purchasing from the wholesale dealer. He was summoned for selling camphorated oil which was not in accordance with the B.P., 1898, it being certified to contain camphor, 9 per cent.; olive oil, 48 per cent.; mineral oil, 43 per cent. He showed that he had ordered the "very best camphorated oil," and had paid a price such as ought to have secured that quality. The magistrates accepted defendant's statement, pointing out, however, that he did not obtain a guarantee of purity, but had, no doubt unknowingly, retailed to the public an adulterated article.—Fined 20s. and costs.

A GUARANTEE, BUT NO REDRESS.—Following the preceding case, Walter Thorpe, grocer, Mellor Royd, Soyland, was summoned at the same court (Halifax) for selling sweet spirit of nitre absolutely destitute of ethyl nitrite.—It was stated for the defence that the label guaranteed the contents of the bottle to be "sweet spirit of nitre, absolutely pure," the label thus constituting a guarantee from the wholesale dealer, but through ignorance of the law defendant had allowed the seven days to elapse during which he could give notice that he possessed such a guarantee.—The Inspector pointed out that defendant could proceed against the wholesale dealer, who, however, it was stated, is in the bankruptcy court, hence no redress could be expected in that quarter.—Fined 10s. and costs.

A CORONER ON COUNTER PRESCRIBING.—At the Fulham Coroner's Court, Mr. Drew recently held an inquest concerning the death of Robt. Clark (36), a carman, of 35, Seagrave Road, West Brompton.—Evidence was given to the effect that the man for some time prior to his death had a cough, for which he obtained some medicine from Mr. James Dickson Stewart, chemist and druggist, of 100, Richmond Road, South Kensington.—According to Dr. James Young, of Melmoth Place, the medicine contained ether and chlorodyne. Personally he should have been careful about giving chlorodyne to the man on account of the enlarged condition of his heart, which was the cause of death, as it would be injurious. He could not say, however, that in this case it accelerated death.—The Coroner, after questioning Mr. Stewart as to the circumstances under which he supplied the medicine, said that by his action he had constituted himself an apothecary, and apparently gave a mixture indiscriminately, without knowing the condition of the person. It was injurious, but, fortunately for the chemist, did not accelerate death. Chemists were not entitled to prescribe; they were not educated to diagnose internal disease, and it was certainly a very injudicious action on the part of Mr. Stewart. He recognised the difficult position in which chemists were placed, because if one did not prescribe someone near by would; still, the law said it must not be done (*sic*).—A verdict was returned in accordance with the medical evidence.

STOCK PRESCRIPTIONS IN LIVERPOOL.—Mr. E. Gibson, Deputy Coroner, held an inquest at the Liverpool Police Buildings, on June 8, on the body of Michael Melvin, dock labourer, of Upper Frederick Street.—Melvin was a heavy drinker, and had called at a chemist's shop, complaining of feeling unwell. An assistant made up a mixture from a stock prescription, two ingredients of

the medicine supplied being digitalis and acetanilide. The deceased, who took six doses during the evening, had taken medicine in this manner for years, having gone to the same chemist for it. He died next morning.—As a result of post-mortem examination, Dr. Foulston said that both lungs were affected with pneumonia, and death was due to double pleuro-pneumonia. Nothing whatever would have saved the life of the man except hospital treatment. Taking into consideration the condition of the patient, he did not think it was the right mixture to prescribe.—Mr. E. Gibson, Deputy Coroner, considered it extremely improper for any chemist, whether qualified or not, to prescribe in the manner just described. He would like it to be understood that when he presided over an inquiry into such cases a close examination would be made, and the person who had prescribed the medicine would be severely censured. It was neither to the good nor to the safety of the public for unqualified persons to prescribe medicine for patients.—The jury found a verdict of "Natural causes," and endorsed the remarks of the Deputy Coroner.

OVERDOSE OF CHLORODYNE.—On Friday, June 8, an inquest was held at Milford Haven respecting the death of George Warmley Hodgson (38), of Edinburgh, which occurred the previous Tuesday on board his yacht "Aura."—It transpired that deceased, who was a gentleman of independent means, was in the habit of taking sleeping medicine, but when out at sea and the medicine was exhausted he used chlorodyne, and on the day in question had apparently taken an overdose of Dr. Collis Browne's chlorodyne.—A verdict of "Accidental death" was returned.

OVERDOSE OF LAUDANUM.—An inquest was held at Yarmouth on June 2 with respect to the death of Francis Ellen Iles, masseuse and nurse, of 133, Havelock Road.—Evidence showed that deceased had a large practice, and occasionally, after night cases, suffered from sleeplessness. On the previous Friday evening she complained of feeling ill, and lay down to try to obtain a little sleep before attending a case for which she was engaged. Shortly afterwards she was found in a profound state of narcotism, having apparently taken a large dose of laudanum, and in spite of medical attention died early the next morning.—The jury found that "death was due to misadventure from an overdose of laudanum."

POISONING BY COCAINE.—An inquest was held at Hampstead on Monday, June 11, relating to the death of Florence Mary Smith, wife of a doctor residing at 24, Pandora Road, West Hampstead.—It appeared that she had suffered from internal pains, and on the previous Thursday morning had gone to her husband's room stating that she had taken some cocaine three hours before, and was afraid she had poisoned herself. He, however, did not think seriously of the matter, but a few hours later she died.—A verdict of "Death from misadventure" was returned.

POISONING BY CARBOLIC ACID.—The properties of carbolic acid, it might, not unreasonably, be thought, are sufficiently well known to prohibit its use as a cure for pain; yet, according to the evidence given at an inquest held on June 4 at Hove, William Marchant (58), a laundryman, of 109, Montgomery Street, Hove, took a dose of carbolic acid, kept in the house for the drains, thinking it would ease a dreadful pain with which he was troubled.—The jury returned a verdict of "Death from misadventure."—At another inquest, held at Hove on the same day, it was stated that Dennis Hogan (39), a labourer, had been a teetotaler for some time past, but on Mafeking night he got drunk, and subsequently behaved so wildly that his wife was afraid to stay in the house with him. On the following Monday he took a bottle of carbolic acid, which was used for the drains, and after telling his ten-year-old daughter that he was "going to sleep for ever," went into the bedroom, where he was found later, suffering from carbolic acid poisoning and pneumonia, to which he succumbed on the following

Friday.—The jury returned a verdict in accordance with the medical evidence, adding that the deceased had taken the carbolic acid while of unsound mind.—In the case of Mary Ann Vardy (20), domestic servant, of Bedlington, it was stated at an inquest held on June 6 that she had frequently threatened to commit suicide, and on the previous day carried out her threat by swallowing a quantity of carbolic acid. There being no apparent motive for the action the jury returned a verdict of "Suicide while temporarily insane."—At an inquest held at Ramsgate on June 8, on the body of Edward James Wood, a draughtsman, belonging to Plumstead, the evidence showed that the deceased had taken from a thousand to fifteen hundred minims of carbolic acid. It was stated that he had been in bad health for some time, and was depressed owing to the fact that he could not get employment because men would not work with him on account of an ugly, though harmless, skin disease with which he was troubled.—A verdict of "Suicide while temporarily insane" was returned.

IRISH NEWS.

THE SALE OF POISONS.—In the Queen's Bench Division, Dublin, on Monday, June 11, before the Lord Chief Baron and Judges Madden and Boyd, an application was made on behalf of Alexander Thompson, a sergeant of the Royal Irish Constabulary, stationed at Roscommon, and also inspector of weights and measures in the district, for a *certiorari* to bring up and quash three orders made by the magistrates at Roscommon Petty Sessions on April 10, dismissing three summonses which had been issued by him against Jane and James Jones, Castle Street, Roscommon, for offences alleged to have been committed by them against the Pharmacy Act and the Sale of Poisons (Ireland) Act. Counsel also applied for a *mandamus* to compel the magistrates to hear and determine the three summonses issued by Sergeant Thompson. The application was grounded on an affidavit made by Sergeant Thompson, which stated that on February 5 last Michael Tiernan, of Carrigeens, Tuesk, aged fifty-two years, purchased two ounces of spirits of salts and two ounces of corrosive sublimate at the defendant's shop. Those poisons were sold and delivered to Michael Tiernan by Robert Walker, an assistant in defendant's shop, and were contained in an ordinary noggin bottle, on which a label bore the words "Joseph O'Neill, old malt whisky, Roscommon," and the said bottle was not labelled with the name of the article sold, nor did it bear the word "Poison," nor did the name and address of the vendor appear on the bottle, as required by the provisions of the 33rd and 34th Vic., cap. 26, sec. 2. On the evening of February 5, Michael Tiernan drank a portion of the contents of the bottle so supplied to him, believing it to be whisky, and died the same night. An inquest on the body was held, and Walker, who attended as a witness, admitted, after having been cautioned, that he had sold to Tiernan the contents of the bottle in question, and the coroner's jury had returned the following verdict:—"That the death of Michael Tiernan was caused by having accidentally taken and drunk a quantity of spirits of salts and corrosive sublimate, from the effects of which he died in Roscommon on February 5, 1900." The affidavit further stated that the defendants carried on business as grocers and ironmongers, neither of them being registered pharmaceutical chemists and druggists. The matter, on being reported to the Pharmaceutical Society of Ireland, applicant was instructed by the Council of that body to prosecute Jane and James Jones for unlawfully keeping open shop for retailing and dispensing of poisons, and for having sold poisons not labelled with the word "poison." When the case came on for hearing it was dismissed on the ground of improper prosecution, the contention being that it was the Pharmaceutical Society, and not Thompson, should have prosecuted.—The Court granted both applications.

ANOMALOUS RATES.—As an evidence of the anomalous rates on merchandise in Ireland it is stated by the Port and Docks Board, Dublin, that a merchant in Birmingham can send his goods to Sligo cheaper than they can be sent from Dublin to the same town. A Commission is being asked for to inquire into the matter.

FOREIGN NEWS.

SUNDAY CLOSING IN GERMANY.—We are informed that the petition in favour of enabling small apothecaries' shops in country districts, referred to in our last number, was not submitted to the German Reichstag, but to the Prussian House of Deputies. It has been rejected by that body because the matter of Sunday closing belongs to the privileges of imperial legislation, and not to those of a single federated state. The rejection was therefore only a formal one. In principle the Prussian Government is not at all disinclined to meet the wishes of the owners of small pharmacies, who are constrained to do their hard work without any assistance. The Minister of medical affairs has sent an inquiry to the Presidents of the provincial governments, asking whether there is any need of closing the small pharmacies for some hours on Sunday afternoon.

THE NEW GERMAN PHARMACOPŒIA.—The new (IV.) edition of the German Pharmacopœia will come in force on January 1, 1901.

MEDICAL COURTS OF HONOUR.—By the rules of the Courts of Honour, established by the official Medical Boards in Prussia, the Presidents of the Courts were bound to communicate to the Attorney-General every punishment inflicted upon a medical man by the Court. Several Presidents have therefore, on that account, declined to take their oaths of office, and the Government will probably abandon that claim.

AMERICAN NEWS.

THE MEDICAL PROFESSION OF THE UNITED STATES, it is stated, does not properly appreciate and support the United States Pharmacopœia; at least, there is said to be a widespread feeling to that effect. Dr. H. C. Wood, in his Presidential address at the recent decennial Convention for the Revision of the U.S.P., referred to that feeling, and while admitting that there is some foundation for it, thinks it is exaggerated. It is true, he states, that owing to the activity of manufacturing pharmacists, and the number and skill of their commercial salesmen, aided by the deficiencies of medical education and the peculiar, childlike credulity which is so common in doctors, all kinds of proprietary mixtures and proprietary articles, and extra pharmacopœial remedies, are largely used in the United States.

LAZY DOCTORS FIND IT SO EASY to write for Smith's Panacea for human ills, and it is so easy for the doctor who knows neither materia medica nor therapeutics to order Jones's Consumption Cure or Thomas's Kamiaulia, that so long as laziness and incompetence remain, so long, Dr. Wood is of opinion, will such things be done. No blame is attached to the Pharmacopœia for the existing state of affairs and no perfection of the Pharmacopœia is expected to influence it.

ANY ATTEMPT TO REDUCE THE PRODUCTS OF THE PHARMACOPŒIA to the level of the proprietary or patent medicine would, however, be to destroy the dignity of the work, to bring it into contempt, and finally to uproot its influence. Hope for the future, Dr. Wood states, lies in the rapid and steadily improving education of the

American medical profession, and not in anything that the Convention or its Committee can do.

THE INTENSITY OF THE FEELING that the American medical profession is not so thoroughly interested in the Pharmacopœia as it ought to be is attributed largely to a misconception of the intent of the Pharmacopœia and its relations to the medical profession. Dr. Wood points out that a pharmacopœia is not intended to be a guide to practice, or a working-book to be used by a doctor, but is really a hand-book of the apothecary. He does not believe that at any time or in any country pharmacopœias ever had much sale among the medical profession; and each year as the doctor becomes less of a pharmacist, he believes the tendency of the doctors to buy pharmacopœias must grow less rather than more.

TO POPULARISE THE PHARMACOPŒIA in the medical profession, Dr. Wood thinks it would be necessary to make it a treatise on therapeutics; or, in other words, cause it to cease to be a pharmacopœia. So long as it is a pharmacopœia it is the basis upon which text-books and dispensatories are to be written, thus becoming, through those treatises, a guide to the medical profession. It remains the apothecary's *vade mecum*, with which, in hand, he does his work; consequently its sales must be chiefly among the apothecaries. In the opinion of the President of the Convention for the Revision of the U.S.P., there may have been a time when the medical horizon was so narrow that the doctor had time to concern himself as to how the druggist made laudanum, but at present the doctor has as much as he can do to store his mind with purely medical facts; he wants simply to know what laudanum does when he administers it to the patient, and he trusts to the pharmacist to give him laudanum when he requires it.

IN REGARD TO THE INVESTIGATION OF NEW DRUGS, the Medical Society of the State of New York has passed a resolution urging that the interests of medical science require the establishment of a bureau of materia medica in order that "disinterested investigation" may be made into the character and value of new drugs. The Society recommends to the decennial Convention the creation of such a bureau by and under its authority, with the provision that it shall report annually upon the matters falling within the scope of its work.

REGIMENTAL PHARMACISTS in the National Guard of the State of New York have now a recognised commissioned rank equal to that of first lieutenant, a Bill amending the military Code and elevating the hospital stewards in rank and increasing the corps having become law on May 3. The amendment, which was brought about largely by the efforts of the *American Druggist*, provides for the appointment in each regiment of a military pharmacist with the rank of first lieutenant; the appointment of two hospital stewards in the place of two assistant stewards, as now provided in each regiment, and for an increase in the hospital corps from thirteen to twenty-five men. It also provides that the military pharmacists, as well as the hospital stewards must be registered pharmacists. To qualify for appointment as a military pharmacist, it is necessary to serve one year, preceding appointment, in the National Guard or the Naval Militia of the State.

THIS RECOGNITION OF PHARMACISTS' PROFESSIONAL QUALIFICATIONS, the *American Druggist* states, will have more far-reaching results than most pharmacists have at present any idea of; for when the Federal Government and the State legislatures accord to pharmacists in the service of the State equal recognition with the other professions, much will have been accomplished towards the elevation of pharmacy, inasmuch as "public favour invariably follows official recognition, and every step in the direction referred to means fuller recognition from the public."

Obituary.

BATES.—On June 10 (suddenly), at 38, George Street, Oldham, Elizabeth, wife of Hiram Bates, M.P.S. Aged 57.

DRIFFIELD.—On June 3, W. G. Driffield, Chemist and Druggist, Spilsby. Aged 86.

FRYER.—On June 8, Charles John Fryer, Chemist and Druggist, Wandsworth Road, London, S.W. Aged 46.

HARRIS.—On June 8, Joseph Bastable Harris, Chemist and Druggist, South Molton. Aged 36.

NETTLE.—On June 5, at St. Blazey, William Robert Pett Nettle, Pharmaceutical Chemist, Upper Tooting. Aged 41. Mr. Nettle had been a member of the Pharmaceutical Society since 1881.

THARRATT.—At 55, Myrtle Street, Liverpool, on June 4, Lucy Ellen, the wife of George R. Tharratt, Pharmaceutical Chemist.

NEW REMEDIES.

NEW MORPHINE PREPARATION.—A patent has been granted in Paris for the manufacture of a new local anæsthetic, containing morphine in a readily soluble form. Morphine hydrochloride or sulphate is mixed with an excess of borax, or other alkaline salt and iodoform. Phenol is added to this mixture to form an easily soluble phenate.—*Oesterr. Zeits. für Pharm.*, 54, 248.

EXTRACT OF VACCINIUM MYRTILLUS IN COLIC.—Straus uses suppositories of extract of bilberry as a remedy for intestinal colic, employing the following formula: Extract of bilberry, 30 Gm.; potassium carbonate, 3 Gm.; distilled water, 7 Gm.; cacao butter 60 Gm. To make 30 suppositories; 2 to be used daily.—*Oesterr. Zeits. für Pharm.*, 54, 247.

DESICCATED EXTRACT OF SUPRA-RENAL CAPSULE IN ACUTE CORYZA.—Millener (*Buffalo Med. Journ.*) finds that a solution of 20 grains of dried extract of supra-renal capsule, dissolved in half a fluid ounce of water, is very effectual in reducing the congestion of the nasal mucous membrane in coryza. The nose and nasopharynx should first be cleansed with an alkaline wash of sodium bicarbonate, sodium salicylate, and boric acid. The solution is applied on pledgets of cotton.—*B.M.J. Epit.*, 1, 1900, 64.

KINEURINE.—Quinine glycerophosphate has been recently introduced under this name. It is stated by Moncour that the patient does not become inured to its effects as is the case with most of the salts of quinine. It is given in doses of 30 to 60 centigrammes as an antiperiodic at the beginning and end of the febrile symptoms. The same dose is given per diem for neuralgia. As a tonic 10 to 20 centigrammes is administered.—*Merck's Report*, 1899, 49.

PHARMACEUTICAL SOCIETY OF IRELAND.

On Wednesday, June 6, the monthly meeting of the Council was held at 67, Lower Mount Street, Dublin.

The PRESIDENT, Mr. George D. Beggs, occupied the chair, and the other members of the Council present were the Vice-President, Mr. J. J. Bernard, and Messrs. Grindley (Treasurer), Wells, Montgomery (Belfast), Kelly, and Simpson.

On the motion of the PRESIDENT, seconded by Mr. SIMPSON, Mr. George Browne was co-opted a member of the Council, in the room of Mr. Michie, resigned.

THE LATE MR. DOWNES.

The following letter was received from Miss S. Downes, daughter of the above-named gentleman:—"Dear Mr. Ferrall,—Please convey to the members of the Pharmaceutical Council our sincere thanks for their sympathy in our sad bereavement. My father took the keenest interest in the Society and all its concerns.—Again thanking you and the Council, yours sincerely, SARA J. DOWNES. We are deeply touched by the appreciation shown by the English

Society in the journal you kindly sent, which we now return, with thanks.—S. J. D."

The REGISTRAR read a letter, dated May 4, from Mr. Richard Bremridge, Secretary of the Pharmaceutical Society of Great Britain, enclosing a copy of a resolution which had been passed at a previous meeting of the Council of the Society, and also directing attention to sympathetic remarks which were made at the Council meeting in reference to the character and services of the late Mr. Downes. The resolution was as follows:—"Resolved that this Council learns with sincere regret the death of Mr. R. J. Downes, the late President of the Pharmaceutical Society of Ireland, and desires to express its deep sympathy with the Pharmaceutical Society of Ireland in the loss of so able, earnest, and zealous a leader." Moved by the VICE-PRESIDENT, and seconded by Mr. WALTER HILLS.

PRESIDENT: It is very gratifying to get such a letter from the Pharmaceutical Society of Great Britain acknowledging the worth of the late Mr. Downes.

The Registrar was directed to reply, stating that the Council thoroughly appreciated the kindness of the Society in passing the resolution.

CORRESPONDENCE AND OTHER BUSINESS.

A letter from the Privy Council of Ireland enclosed their Order approving of the appointment of Mr. James Michie, M.P.S.I., as one of the Society's examiners.

A letter from Mr. Joseph Donnelly, solicitor, of Belfast, forwarded £3 5s. 4d., being the Society's share of a fine imposed on James Hogg, jun., of Hogg and Co., Limited, Belfast, for compounding without being qualified to do so. The letter also reported that two fines of £5 each had been imposed on Mr. William James Gibson, chemist and druggist, of 71 and 73, King Street, Belfast, for illegal compounding; but that the presiding justice had recommended Mr. Gibson to memorialise the Lord Lieutenant for the remission of one penalty, or a portion of it. The following letter from Mr. Gibson was also read by the REGISTRAR:—"Gentlemen,—I beg to inform you that I have forwarded a memorial to the Lord Lieutenant regarding the case which you had against me some weeks ago for shop known as Mahon and Co., Sandy Row. I feel satisfied had you been fully aware of the facts of the case you would not have instructed the prosecution to be issued against me, but hope that when the matter will be brought before you, you will give it your favourable consideration.—Thanking you in anticipation, I remain, yours truly, W. J. GIBSON."

The Registrar was directed to acknowledge the receipt of Mr. Gibson's letter, and to request him to furnish the facts.

Donations were received from the Pharmacy Board of Victoria of a copy of their Report for 1899; from the Director of the Missouri Botanical Garden of a copy of his Eleventh Report, 1900; and from the Director of the Wellcome Chemical Research Laboratories of copies of three pamphlets.

On the motion of Mr. GRINDLEY, seconded by Mr. WELLS, thanks were voted to the donors.

The PRESIDENT moved, pursuant to notice, that the Regulations for the examination for licence as a registered druggist be amended by the addition of the following words:—"Candidates presenting themselves for this examination must be twenty-one years of age."

Mr. GRINDLEY seconded the motion, which was unanimously agreed to.

On the motion of Mr. GRINDLEY, seconded by Mr. WELLS, Mr. John McGratty, of Ennistymon, was elected a member of the Society.

On the motion of Mr. O'SULLIVAN, seconded by Mr. WELLS, Mr. George Robinson, of New Ross, was elected a member of the Society.

Mr. James Pollard, of Callan, was, on the motion of the VICE-PRESIDENT, seconded by Mr. SIMPSON, elected an associate druggist.

Other business having been disposed of, the Council adjourned.

ROYAL INSTITUTION.

The Friday evening lecture on June 8 was given by Dr. ALLAN MACFADYEN, Director of the Jenner Institute of Preventive Medicine, on

THE EFFECT OF PHYSICAL AGENTS ON BACTERIAL LIFE.

The lecturer gave some particulars as to the size, number and distribution of bacteria, and pointed out that the subject is important, not merely as a biological question, but also because micro-organisms fulfill such important functions in the various processes of Nature, in industrial operations, and in connection with the health of man and animals.

Given a suitable soil and a sufficiently high temperature, the propagation of bacteria is extremely rapid, but in the absence of these primary conditions they do not multiply, remaining quiescent or dying. The surface layers of the soil constitute the great storehouse in nature for bacteria, which may be said to exist there under natural conditions. In the air the physical conditions are entirely unfavourable to micro-organisms, and the majority to be found in it are derived from the soil, the number lessening when the surface-soil is moist and increasing when it is dry. The relative bacterial purity of the air is largely a question of dust, and while of the bacteria which the air contains the large majority are quite harmless, a few injurious organisms have been found in it. It has been proved, however, that the atmosphere is not one of the important channels of infection.

The continued existence of bacteria in air is rendered difficult by the influence of desiccation and sunlight. The former is one of Nature's favourite methods for getting rid of these micro-organisms, because moisture is necessary for their development and vital processes, and, indeed, constitutes about 80 per cent. of their cell-substance. Direct sunlight is a most deadly bactericidal agent, and diffuse light, though slower in action, is also injurious. Sunlight, too, has an important effect on the spontaneous purification of rivers; thus, the conditions favouring the presence and multiplication of bacteria in water are a low altitude, warmth, abundance of organic matter and a sluggish or stagnant condition of the water. The freezing of water, while stopping the multiplication of organisms, may preserve the life of disease-producing germs by eliminating the destructive action of commoner competitive forms.

The lecturer said that, as regards electricity, there is little or no direct evidence of its direct action on bacterial life, nor, so far as he was aware, has any direct action of the X rays yet been definitely proved. Of all the physical agents that do affect bacterial life temperature is the most important. The range of temperature under which their growth is possible ranges from zero to 70° C. There is an extensive group of organisms, termed thermophylic, which grow best between 55° and 65° C., temperatures at which ordinary protoplasm becomes inert or dies. It is a striking fact that these organisms are widely distributed, and as an instance of their activity, it was mentioned by the lecturer that cellulose—a substance exceedingly difficult to decompose—is by their action completely disintegrated in from ten to fourteen days.

As to the inimical effects of temperature, an organism grown above its *optimum* temperature becomes attenuated and may eventually die, while if placed below its *minimum* temperature it may cease to develop. To thoroughly destroy bacterial life it is useless to apply a dry heat. Moist heat is the best form of disinfection. No spore can stand exposure to steam at a temperature of 140° C. To non-sporing organisms the boiling point is fatal in a few minutes, but the spores themselves are much more resistant to heat. Thus the anthrax bacillus is killed by exposure to a temperature of 70° C. for one minute, but the spore stage resists that temperature for hours.

Dr. Macfadyen illustrated the varying thermal death point of organisms and the problems of sterilisation by the case of milk, a liquid which is able to carry the infection of various diseases.

IN ORDER TO RENDER MILK INNOCUOUS

freezing and the addition of preservatives are inadequate. Heat is the one and only efficient and trustworthy agent. The temperature employed must be sufficiently high to be fatal to the organisms producing rapid decomposition of the milk as well as to those producing disease in man, and must be followed by rapid cooling in order to preserve the fresh flavour and prevent the multiplication of the bacteria that still remain alive in the liquid. It has been found that if the milk be passed first through a hot and then through a cold coil of metal tubing, so that it is quickly heated to 70° C., and then as quickly cooled in iced water, complete destruction of about 90 per cent. of the bacteria is effected in about thirty seconds. This destruction of about 90 per cent. of the bacteria is known as Pasteurisation; the 90 per cent. includes the diphtheria, typhoid, tubercle, and pus organisms.

It was pointed out by the lecturer that Pasteurisation is partial, not complete, sterilisation. Thus the butyric organisms are not destroyed until they are subjected to a temperature of 100° C. for an hour. If the heat be maintained for a further period of three to six hours the destruction of all remaining organisms is accomplished. However, Pasteurisation at 68° C., coupled with rapid cooling, suffices for all practical purposes. The heating may be accomplished for large quantities either by passing the milk in a thin steam over a heated metal surface or by heating the liquid in bulk.

Bacteria are much more sensitive to high than to low temperatures, as has been shown by some experiments recently carried out at the Royal Institution. Some multiply at zero, others remain alive when frozen under ordinary conditions.

A typical series of bacteria, including the cholera Asiatica and the anthrax bacilli was exposed to the temperature of liquid air, about -190° C., for twenty hours, but in no sense could any impairment of vitality be detected. The fresh growths obtained from the exposed tubes were normal in every respect, and the functional activities of the bacteria were unaffected. In the case of certain phosphorescent species, the luminosity vanished when they were cooled in liquid air, and returned when they were warmed again. In a further series of experiments bacteria were cooled in liquid air for a week, but without affecting their vitality.

At the instance of Sir James Creighton Browne, and under the personal supervision of Professor Dewar, the same series of bacteria has quite recently been subjected by Mr. Rowland to the temperature of liquid hydrogen, about -250° C., and again the results were *nil*. The bacteria renewed their ordinary life processes on regaining normal temperatures, with unimpaired vigour, having undergone no structural alterations. This is the more remarkable since the conditions were such as to subject the organisms to an enormous mechanical strain.

The lecturer pointed out that this temperature is only 23° C. above the zero of absolute temperature, at which, on our present theoretical conceptions, molecular movement ceases, and the entire range of chemical and physical reactions with which we are acquainted either stop or assume an entirely new phase. The fact that life continues to exist under such conditions affords new ground for reflection as to whether all life is dependent for its continuance on chemical reactions. Biologists will therefore follow with the keenest interest Professor Dewar's heroic attempts to reach the absolute zero, as upon his success must rest the settlement of the vexed question of vitality. Meanwhile, said Dr. Macfadyen in conclusion, biologists are led to reconsider many of the main issues of the problem, and by providing a new realm for experiment, Professor Dewar has placed in their hands an agent of investigation from the effective use of which they may hope to gain a little further insight into the great mystery of life itself.

CHEMICAL SOCIETY.

A meeting was held on Thursday, June 7, the President, Dr. T. E. THORPE, C.B., in the chair.

The SENIOR SECRETARY (Mr. Wyndham R. Dunstan) rose to express to the President the congratulations of the Society on the honour recently conferred upon him by her Majesty the Queen; it was, in addition, an honour to the Society that it had taken place during his presidency.

The PRESIDENT, who was received with hearty applause, briefly expressed his thanks.

Dr. RUHEMANN and Mr. STAPLETON read a paper describing

SYNTHESES OF ACONITIC ACID.

This acid ought to exist in two stereoisomeric forms, namely maleic and fumaric varieties, and it was to produce these that the work of the authors was directed. Condensations were made of ethyl aceto-acetate with the ethyl salts of chloromaleic, chlorofumaric, and acetylene dicarboxylic acids respectively. The compounds obtained from the chlorofumaric and acetylene dicarboxylic esters proved identical.

Dr. RUHEMANN also described compounds derived from the reactions of guanidine with aceto acetic ester, and of benzamidine with acetylene dicarboxylic ester.

Another paper was read by Dr. RUHEMANN, describing work carried out with Dr. Beddow, on the

REACTION OF SODIUM PHENOLATE WITH PHENYL-PROPIOLIC ESTER.

Sodium phenolate, produced by dissolving sodium directly in phenol reacts readily, yielding β -phenoxy cinnamic ester, the sodium becoming attached to the electro-negative group of the molecule.

A paper was read by Dr. JOWETT, on

THE CONSTITUTION OF PILOCARPINE.

The experiments of Dr. Jowett have been carried out upon isopilocarpine, on account of its stability being greater than that of pilocarpine. The more stable substance is more suitable for experiment, and its constitution being known; that of the other would probably readily follow. It was found that by treatment of the alkaloid with methyl iodide and decomposing the product with silver oxide a methyl compound was obtained, but by a similar treatment of the product a second methyl group could not be introduced.

By oxidation with alkaline permanganate a lactonic acid of the formula $C_7H_{10}O_4$ is produced, which by further oxidation gives an almost quantitative yield of isobutyric acid. No acetone is produced in the second oxidation, hence the author believes the lactonic acid to be the β -lactone of hydroxy isobutyl malonic acid.

Dr. CROSSLEY pointed out that if the lactonic acid had the constitution suggested it could hardly be oxidised without the formation of acetone, and suggested that the author would probably find it by testing with *p*-brom phenyl hydrazine.

Doctors CHATTAWAY and ORTON described further experimental work on the

CHLORO AMINO DERIVATIVES.

obtained by the action of hypochlorous acid on anilides.

By the transformation of these substituted nitrogen chlorides ortho and para derivatives are always obtained, but no meta derivatives. By starting with meta-chlor-acetanilide a chloro amino derivative is obtained, which on transformation yields two dichloro acetanilides, each of these in its turn gives two trichloro acetanilides while the latter yielding to a further treatment give one and the same tetrachloro acetanilide. These reactions showed a marked difference from those previously studied in the tardiness with which the transformation of the nitrogen chloride took place.

The rate of transformation was observed by the help of the hydriodic acid test, the production of free iodine showing the presence of the untransformed substance.

A paper was read by Dr. LOWRY on an investigation carried out with Mr. WEST on

PERSULPHURIC ACID.

It was discovered by Berthelot that persulphuric acid is formed by the reaction of sulphuric acid and hydrogen peroxide, but the equilibrium of the reaction had not been studied.

Berthelot also found that the oxide S_2O_7 was produced by the silent electrical discharge on a mixture of oxygen and sulphur dioxide or trioxide.

He dissolved the oxide S_2O_7 in sulphuric acid, and obtained an acid of the properties of persulphuric acid, but did not analyse the acid obtained. Since hydrogen peroxide reduces potassium permanganate, while persulphuric acid is inactive, it is possible to determine the progress of the reaction between sulphuric acid and hydrogen peroxide. The authors have determined the conditions of equilibrium of this reaction, and have sought to apply to them the laws of mass action. By a study of the curve of concentration of the reacting substances and products Dr. Lowry has been led to the conclusion that the reaction is chiefly of the following order:—

while there also exists small quantities of the compound $H_2S_2O_8$. By observing the behaviour of acids of different concentration it appears that the oxidising property in the concentrated acid is chiefly due to the compound $H_2S_4O_{14}$, while in dilute solution the action of $H_2S_2O_8$ predominates. This was shown by the oxidation of aniline to nitrosobenzene by the former, and the production of a brown precipitate (Marshall's test) by the latter.

The PRESIDENT remarked that however suggestive the results shown by the curves might be the proof of the nature of the acid is still light.

Dr. LAPWORTH pointed out that instead of plotting the concentrations of the reacting substances it would have been better if the concentration of the reacting ions could have been plotted.

Other papers being taken as read the proceedings then terminated.

EDINBURGH AND DISTRICT CHEMISTS' TRADE ASSOCIATION.

The annual meeting was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Friday, June 8, at 11.30 a.m., Mr. DAVID MACLAREN, Chairman of the Association in the chair.

The minutes of last meeting were read and approved.

Mr. C. F. HENRY, Honorary Secretary, read the annual report, from which it appeared that there was an increase of five members during the year. The Association had suffered a heavy loss in the death of their Honorary Treasurer, Mr. William Burley. The chief work of the year had been in connection with the Companies Bill. It would be satisfactory to members to note that one of the recommendations made by the Association in regard to this question viz., that the name of the qualified person in charge of any company's shop should be conspicuously posted on the shop or other place in which the business is carried on, had been embodied in Clause 2 of the amended Bill. The report expressed a hope that the question of titles would also be satisfactorily settled before the Bill was passed.

On the motion of Mr. BOA, seconded by Mr. GLASS, the report was adopted.

The HON. SECRETARY then submitted the financial statement, showing a credit balance of £34 16s. 0d., which was adopted on the motion of Mr. BOWMAN, seconded by Mr. DEWAR.

COMPANIES BILL.

Mr. W. S. GLASS then submitted his proposed amended form of Clause 2 of the Companies Acts Amendment Bill as follows:—

No company may carry on the business of a pharmaceutical chemist or chemist and druggist unless such business is *bona fide* conducted by a

manager or assistant being a duly qualified pharmaceutical chemist or chemist and druggist, and unless the name of the person so qualified is conspicuously posted in letters easily legible in the shop or other place in which the business is carried on, and unless any name or title implying registration under the Pharmacy Acts be taken, used, or exhibited only in connection with the name of the duly qualified manager or assistant aforesaid, but subject to this provision—anything which would be an offence under Sections 1 and 15 of the Pharmacy Act, 1868, if committed by an individual, shall be an offence if committed by a company.

The present situation in regard to the matter, he said, might be summarised under the following four points:—

1. Can what is called "company pharmacy" be stopped? There could be very little doubt that the only answer to such a question was clearly "no."

2. Is it possible to secure regulation of "company pharmacy"? To this he saw no difficulty in answering "yes."

3. How can regulation be secured? This could be done by insisting that every shop belonging to a company should be *bona fide* conducted by a registered chemist.

4. Companies should be made liable to penalties for any failure to comply with statutory regulations. He therefore proposed that the Association should adopt the amended form of Clause 2, which he now submitted as a suitable and sufficient way of securing what they desired and could reasonably hope to attain.

Mr. LUNAN said he thought the association as such was really committed by their past action to a policy on the lines of this motion. It was a practical proposal of which he was in favour, and he would therefore second the motion that it should be approved of.

The SECRETARY said Mr. C. A. Macpherson, who was prevented attending the meeting, had sent him a letter saying he would have liked to define his position by going into details for which there was no time. Briefly, he did not approve of the amendment any more than he did of the original clause itself. It asked too much, and conceded too much. It sought to prevent a company carrying on the business of a chemist and druggist without defining what that business was, and would thus place a company in a worse position than a single individual. It also approved and would statutorily recognise vicarious qualification, which if granted to a company could not be withheld from an individual. While he thought the efforts of chemists ought to be directed to having it declared to be illegal for companies composed of legally unqualified persons to retail poisons, and to have it enacted that the business of other companies shall be managed by legally qualified persons, and that they shall be subject to all the provisions of the Pharmacy Acts the same as individuals are, he did not think there was much need to be concerned about the present Companies Bill. It was a highly contentious measure in other than its pharmaceutical aspects, and had very little chance of passing this session in the present state of affairs.

After some further discussion, the clause suggested by Mr. Glass was put to the meeting and unanimously approved.

On the motion of Mr. GLASS it was agreed to send copies of the clause to the Lord Chancellor, the Secretary of State for Scotland, the members of Parliament for the city of Edinburgh and all other members of Parliament representing constituencies included in the district covered by the Association, to the members of the Council of the Pharmaceutical Society, and to the Council.

ELECTION OF OFFICE BEARERS.

The following were elected office bearers for the ensuing year:—Chairman, George Lunan; Vice-Chairman, W. S. Glass; Secretary, C. F. Henry, 1, Brandon Terrace, Edinburgh; Assistant Secretary, R. J. MacDougall; Treasurer, R. L. Hendry; and as members of Committee, Messrs. Baker, Boa, Bowman, Brindle, Dewar, D. McGlashan, McLaren, MacPherson, W. Smith, and F. Stephenson. Mr. Thomas C. Smith (T. and H. Smith and Co.), was elected a member in place of Mr. D. MacKenzie removed to London.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Glycyrrhizæ Radix.

LIQUORICE ROOT is obtained from *Glycyrrhiza glabra*, Linn. (N.O. Leguminosæ) and other species, but chiefly the former, the peeled root and peeled subterranean stem being official. The plants are widely distributed over Southern Europe and eastward to Central Asia, being largely cultivated for the preparation of extract; *G. glabra* is also cultivated to a limited extent in England, near Mitcham and in Yorkshire, but the dried official root is chiefly imported from Spain and the South of France. There are several other varieties in commerce, such as Russian, Persian, etc., but they do not agree with the official description. The plants produce tall, erect, herbaceous stems and stout perennial roots which divide, a few inches below the surface of the ground, into several long straight descending branches, beset with slender wiry rootlets.

runners, minute dark buds. When peeled the pieces are shorter, yellowish in colour, and have a smooth fibrous surface. The pieces break with a coarse fibrous fracture, and a transverse section exhibits a yellow wood—consisting of narrow, porous wedges of vascular tissue, alternating with numerous medullary rays—encircled by a thick cortex with groups of bast fibres arranged in radial lines, the groups appearing as rows of dark points opposite to the wedges of vascular tissue. In addition, the pieces of subterranean stem, which constitute the greater portion of the drug, are distinguished by the presence of a small dark pith. The characteristic sweet taste of liquorice is due to the presence of glycyrrhizin and sugar; the faint but peculiar earthy odour also appears to be due to glycyrrhizin.

NOTES.—The distinctive characters of Spanish liquorice, which is the only imported dried root, etc., that appears to satisfy official requirements, are its sweet taste free from bitterness, the yellow colour of a transverse section, the fibrous bark, and the presence of minute buds and pith in most of the pieces. Russian liquorice, is usually imported in the peeled condition, and differs from

LIQUORICE.—A, Root of Spanish liquorice B, rhizome of ditto.

Long horizontal subterranean stems (runners or stolons) are also given off by the principal roots near the surface, those being provided with buds which develop into aerial stems if the runners be allowed to remain undisturbed until the following year. The whole of the underground part of the plant is collected in the autumn, carefully dried, and peeled if intended for medicinal purposes. Liquorice root possesses demulcent and expectorant properties, and its preparations help to disguise the taste of nauseous medicines; it is used in the preparation of Extractum Glycyrrhizæ, Extractum Glycyrrhizæ Liquidum, Liquor Sarsæ Compositus Concentratus, Pilula Hydrargyri and Pulvis Glycyrrhizæ Compositus, whilst the Liquid Extract, in turn, enters into the composition of Mistura Sennæ Composita and Tinctura Aloes.

LIQUORICE.—A, Transverse section of Spanish liquorice root; B, ditto rhizome, showing pith. Both enlarged.

CHARACTERS.—Liquorice is imported from Spain and the South of France in bundles of long, nearly cylindrical, dark, reddish-brown pieces, which are usually longitudinally wrinkled and not scaly, but bear on the surface small transverse root-scars and, in the case of

Spanish in being slightly bitter; it is also larger as a rule, and consists chiefly of purplish roots with scaly cork, the pieces being destitute of pith and exhibiting no traces of buds. It is the product of *G. glandulifera*, W. and K.; other varieties of liquorice root, derived from *G. echinata*, Linn., have a similar bitter taste to the Russian and, like that, should not be used for medicinal purposes. The chief constituent of liquorice is the sweet principle glycyrrhizin, which appears to be a compound of glycyrrhizic acid with ammonia, and may be present to the extent of more than 7 per cent. It has been obtained as a transparent yellow substance, soluble in boiling water or cold alcohol. By treatment with glacial acetic acid, it yields glycyrrhizic acid, which, on boiling with dilute acids, breaks up into a tasteless crystalline powder named glycyrretin and parasaccharic acid. Glycyrrhizic acid is obtained from hot aqueous solutions as a gelatinous mass; when dry it forms an amorphous solid which swells up in cold water. It is soluble in boiling acetic acid but only very slightly soluble in ether or alcohol. It has a sweetish taste and acid reaction, combining with alkalis to form crystallisable soluble salts which are intensely sweet. A substance resembling it has been obtained from the rhizome of *Polypodium vulgare*, the leaves of *Myrrhis odorata*, and the bark of *Lucuma glycyphlæa*. Other substances which have been found in liquorice root are sugar, asparagin, starch, albumin, resin, and various salts, whilst a small quantity of tannin is said to occur in the outer bark. An amorphous bitter substance named glycyramarin is also said to have been isolated, but that would appear to have been obtained from *G. glandulifera* or *G. echinata*. The resin found in liquorice is stated to yield para-oxybenzoic acid when fused with caustic potash

Gossypium.

COTTON or COTTON WOOL consists of the hairs of the seed of *Gossypium barbadense*, Linn. (N.O. Malvaceæ), and of other species of *Gossypium*, cultivated in tropical and sub-tropical countries. The plants yielding it are herbs, shrubs, or small trees, which produce three- to five-celled capsular fruits containing numerous seeds covered with a wool-like mass of long white or yellowish hairs. Those are removed from the seeds, separated from impurities by means of special machinery, and freed from adhering fatty matter, so as to render them more absorbent. That is effected by boiling the crude "wool," under pressure, with a dilute caustic alkali, after which it is washed, bleached by the action of chlorinated lime and hydrochloric acid, again washed, dried, and the fibres mechanically loosened and separated, so as to make a fleecy, wool-like mass. The purified cotton is used in the preparation of Pyroxylin, but is more largely employed in medicine as a surgical dressing, being frequently medicated for that purpose with boric, carbolic, or salicylic acid, mercuric chloride, iodoform, etc., etc.

CHARACTERS.—Cotton wool occurs, when purified, in long, white, soft filaments, about 2 to 4 or 5 Cm. long, and 0.02 Mm. broad, each consisting of an elongated cell which appears, when magnified as a flattened twisted band, with slightly thickened, rounded edges. It is inodorous, tasteless, and should absorb water readily, the absence of fatty matter being thus indicated.

TESTS.—Cotton should impart to water in which it is immersed neither an alkaline nor an acid reaction, thus showing that it has been thoroughly washed after being freed from fatty matter and bleached. On incineration in air it burns, leaving less than 1 per cent. of ash. Concentrated solution of copper ammonio-sulphate should dissolve cotton almost completely, the dissolved cellulose being thrown out of solution again on adding an acid. Cotton is insoluble in hot solution (8 per cent.) of potassium hydroxide, is not permanently stained yellow by picric acid solution, and contains only traces of nitrogenous substances, being thus distinguished from animal fibres. Iodine solution colours it yellow, the colour changing to blue on treatment with sulphuric acid, this cellulose reaction distinguishing cotton from many other vegetable fibres.

NOTES.—The distinctive characters of purified cotton are its wool-like appearance, absorbent properties, solubility in solution of copper ammonio-sulphate, and the appearance of the hairs under the microscope. They consist principally of cellulose, associated with traces of inorganic matter, albuminoids, etc. The fatty matter which forms a thin coating on crude cotton consists of a wax (m.p. 86° C.) soluble in alcohol and ether, mixed with stearic and palmitic acids.

Granati Cortex.

POMEGRANATE BARK is obtained from the stem and root of *Punica granatum*, Linn. (N.O. Lythraceæ), a shrub or small tree indigenous to North-Western India, but cultivated in countries bordering on the Mediterranean and in sub-tropical regions generally. It has small deciduous foliage, handsome scarlet or crimson flowers, and bears a pulpy spherical fruit about the size of an orange, with a leathery skin which becomes hard and brittle on drying. The dried bark of both stem and root is official. It possesses astringent and anthelmintic properties, and is used in the preparation of Decoctum Granati Corticis.

CHARACTERS.—Pomegranate bark seldom occurs in quills, but usually in irregular curved or channelled pieces, varying from 5 to 10 Cm. in length, and from 12 to 25 Mm. in width. The root bark has a rough, yellowish-grey outer surface, marked with irregular conchoidal depressions due to exfoliation of the outer portion of the bark; the inner surface is smooth and yellow, with irregular brownish blotches. The bark breaks with a short fracture and the fractured surface is nearly white; a transverse section exhibits fine tangential and still finer radial lines when examined with a lens. The stem bark is in straighter channelled pieces than the root bark and may also occur in quills. It frequently bears the

minute apothecia of lichens, is smoother than the root bark and exhibits no conchoidal depressions, though it presents occasional shallow longitudinal furrows and bands of pale cork. Neither root nor stem bark has any distinctive odour, but both possess an astringent, slightly bitter taste, due to the presence of tannin and alkaloids respectively.

POMEGRANATE BARK.—A, Outer surface of root bark; B, inner surface of ditto; C, transverse section of bark, slightly magnified.

NOTES.—The distinctive characters of pomegranate bark are the rough surface with conchoidal depressions of the root bark, the comparatively smooth outer surface with lichens of the stem bark, the short fracture with pale fractured surface, and the yellow inner surface with brown patches. The chief constituents of the bark are the three liquid alkaloids, pelletierine (punicine), isopelletierine (isopunicine), and methylpelletierine (methyl-punicine), and the crystalline alkaloid pseudo-pelletierine (pseudo-punicine). The first two, to which the anthelmintic property of the bark is due, constitute the pelletierine used in medicine; the other two

POMEGRANATE BARK.—Outer surface of stem bark.

bases are inactive. The root bark may contain more than 3 per cent. of alkaloids, but the stem bark does not often contain more than 0.5 per cent. The proportion diminishes when the bark is kept, and the average in commercial bark, which is chiefly obtained from stems, is said to be only about 0.35 per cent. In addition, the bark contains about 22 per cent. of tannin, together with mannite, sugar, gum and pectin. The bark of *Buxus sempervirens*, which may be mixed with pomegranate bark, is bitter, but not astringent, as it contains no tannin.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

The appearance of a paper with this heading in the current number of the *Berichte* of the German Chemical Society is a circumstance calculated to excite no little astonishment, but it is a fact nevertheless, and the paper contains an experimental refutation by Winkler of a statement recently published by F. Fittica as to the convertibility of phosphorus into arsenic. That was stated to have been effected by heating amorphous phosphorus with ammonium nitrate to 200° C., and on the assumption that arsenic was a nitrogenous compound of phosphorus, PN_2O , its synthesis was represented by the equation—

The presence of arsenic in commercial phosphorus is known to be due to the use of arsenical sulphuric acid for decomposing calcium phosphate; it has been found by Wittstock to amount to as much as 0.76 per cent., and it may even be more than double that amount, as sulphuric acid made from Rio Tinto pyrites may contain 0.202 per cent. of arsenic. Fittica does not state how much arsenic there was in the phosphorus used in his experiments, and his assumption that he had converted phosphorus into arsenic to the extent of 8 or 10 per cent. was merely an estimate as unfounded as the fanciful formula PN_2O . Winkler's determinations of the arsenic in several portions of phosphorus, subjected to oxidation in different ways, and in another portion subjected to Fittica's treatment, show that, in all instances, the amount was the same, and that the supposed convertibility of phosphorus into arsenic is one of those errors which result from the endeavour to support theories by imperfectly observed facts.—*Bericht*, **33**, 1693.

Professor Armstrong points out that A. Bach, in contending (*Ber.*, 1900, **33**, 1506) that the liquid obtained on mixing a solution of hydrogen peroxide with sulphuric acid probably contains hydrogen tetroxide, has obviously failed to take into account the existence of persulphuric acid in such a solution. In all his experiments—both in those in which palladium hydrogen was oxidised and in those with peroxides—a large excess of normal sulphuric acid was added; the solution was then titrated with permanganate, and the oxygen which was given off was collected and measured. It is noteworthy that the liquid was shaken during several minutes after the titration was completed in order to expel the gas. It is open to question whether, in these cases, some persulphuric acid was not formed by peroxidation of the sulphuric acid, and whether the extra oxygen obtained by Bach was not derived from this. Bach regards the fact that other dehydrating agents besides sulphuric acid—for example, hydrogen chloride—produce effects, when mixed with hydrogen peroxide, similar to those obtained on using Caro's reagent, as evidence in favour of the view that hydrogen peroxide is converted into tetroxide by dehydration: $3\text{H}_2\text{O}_2 = \text{H}_2\text{O}_4 + 2\text{H}_2\text{O}$. It is pointed out, however, that the effects produced by Caro's reagent are merely such as it might be anticipated would be exercised by hydrogen peroxide acting in presence of a powerful dehydrating and hydrolysing agent, and it is the use of hydrogen peroxide under such conditions that characterises the novelty in procedure.—*Proc. Chem. Soc.*, **16**, 134.

SICCO.

This is the name given to dry hæmatogen by Schneider. It forms red brown tasteless and odourless crystals, which keep well without any addition of glycerin, alcohol, or other preservative. It is free from all blood impurities, dissolving completely in cold water, and coagulating on heating. Gastric juice digests 99 per cent. of the preparation. It contains, in 100 parts, albumin, 89.52; organic iron, 0.332; mineral salts, 2.6; fat, 0.11; the remainder being water. For the extemporaneous preparation of hæmatogen by means of this body, the following process is recommended:—Hæmatogen sicco., 80, is dissolved in distilled water, 400; to this is added a solution of caustic soda, 2, in water, 278, and then simple syrup, 120, alcohol (90 per cent.), 120, and aromatic mixture, 5.5. Allow to stand for three days, then filter.—*Pharm. Zeit.*, **45**, 87.

From experiments made, chiefly on *Phascolus*, G. André concludes that the regeneration of insoluble albuminoids takes place in plants at the expense both of asparagin and of the nitrogen of amide-acids. This takes place concurrently with the absorption of phosphoric acid. The soluble carbohydrates are apparently, in part at least, oxidised directly in respiration. Starch, and the cellulose which can be saccharised by dilute acids at 100° C., decrease progressively from germination until the period when the weight of the plant is greater than that of the seed; while the amount of cellulose, properly so-called (*i.e.*, not capable of being saccharised by dilute acids), continually increases, that being largely due to the transformation of starch.—*Comptes rendus*, **129**, 1262, and **130**, 1198.

INHERITANCE OF PARENTAL PROPERTIES IN HYBRIDS.

Hugo de Vries lays down the law that a hybrid never "halves" any of the special characters either of the father or of the mother. It inherits some characters from the one parent, some from the other. When the parents differ in only one point, the hybrid does not occupy an intermediate position between the two, but resembles one or the other parent. In the hybrid the simple differential character of one of the parents is evident or "dominant," the antagonistic character of the other parent being latent or "regressive." These antagonistic characters usually remain combined during the whole of the vegetative life of the hybrid, the one dominant, the other latent; but in the reproductive period they become separated; each pollen-grain and each oosphere receives only one of the two.—*Comptes rendus*, **130**, 845.

VOLUMETRIC DETERMINATION OF BORATES.

Jules Wolff employs a solution of ferric salicylate in sodium salicylate as an indicator for the titration of boric acid and its salts by acidimetry. Thus, in the case of borax, the solution is treated with a known volume of standard acid, in excess, the salicylate indicator added, and the amount of free acid titrated until the violet tint is replaced by a clear madder red colour. The end reaction is very sharp. The difference between the amount of acid used, and that found, gives the equivalent of the sodium in the salt. If needed, the amount of boric acid may then be titrated direct in the same experiment by the addition of glycerin, using phenolphthalein as an indicator. In the presence of ammonium salts, excess of soda is first added, the ammonia driven off by boiling, then excess of acid is run in. The indicator is prepared thus: from 5 to 6 Gm. of sodium salicylate are dissolved in 25 C.c. of water, then solution of ferric chloride is added drop by drop, until a slight permanent turbidity results. The solution is filtered and divided into two parts; to one half sufficient dilute soda solution is added to give a deep orange tint, the other is sensitised with acid to the point of developing a red tint, the two portions are mixed, and 10 Gm. of sodium salicylate dissolved in the mixture.—*Comptes rendus*, **130**, 1128.

BUTEA KINO.

BY DAVID HOOPER, F.C.S.

Butea frondosa, Roxb., the Dhak, Palás, or Bastard Teak Tree, is very common in Central and Northern India. Plassey, the scene of Clive's victory over Suraj-ud-daula, in 1757, is situated in the Nadiyá district of Bengal, and owes its name to the presence of these trees in the neighbourhood. In February and March the scarlet flowers appear on the trees, and the natives imagine that they resemble tigers' claws steeped in blood.

Dr. Roxburgh was the first to describe the kino from this tree. He remarked that a red juice issued from natural fissures and wounds made in the bark during the hot season, which hardened into a ruby-coloured, brittle gum. Dr. J. Forbes Royle, in a communication* to the Royal Asiatic Society in 1838, described the character and possibilities of this gum before the Committee of Commerce and Agriculture. The astringent exudation is not only obtained from *B. frondosa*, but also from *B. superba*, *B. minor*, and *B. parviflora*. It is sold in most Indian bazaars under the names of *Kamar kas*, *Dhak-ka-gond*, and *Kueni-ka-gond*, the first name signifies "binder of the loins," which sufficiently describes its medicinal action. The natives of North Western India formerly used the gum for precipitating their indigo, and it is reported to have been used by others for dyeing and tanning purposes. A specimen of this gum having been sent to M. Guibourt, the famous French pharmacognosist, he identified it as "Gomme astringente de Gambie," which he stated had entirely disappeared from commerce as a substitute for African kino.

Mr. E. Solly, F.R.S., undertook a series of experiments with butea kino with a view to its application in dyeing. He found that from the careless manner of collection it often contained 25 per cent. of impurities, consisting of wood, bark, small pebbles, and sand, and that the colour of the gum darkened considerably on exposure to the air. A specimen of the kino purified by solution in water, so as to separate the impurities, contained in one hundred parts 73.26 parts of tannin, 5.05 parts of difficultly soluble extractive and 21.67 parts of gum, with gallic acid and other soluble substances. The fact that its properties became altered on exposure for any length of time to air, light, and moisture, considerably diminished its value.

Butea kino has, however, a reputation which approaches that of Malabar kino, the product of *Pterocarpus marsupium*, and by many writers, mainly on the evidence of Dr. Roxburgh, that "pure water dissolves it perfectly," it was recommended as an efficient substitute, and in due time found a place in the 'Pharmacopœia of India.' In a useful work 'Bazaar Medicines' (ed. 1883, p. 31), Dr. E. J. Waring remarks that "almost all, if not the whole of the kino met with in the bazaars is the produce of the butea trees; but this is a matter of little moment, as it appears to be equally effectual as an astringent."

Two samples of butea kino, evidently of fresh and selected gum, were forwarded by Mr. Moodeen Sheriff, of Madras, and Dr. J. Newton, of Bellary, to the authors of the 'Pharmacographia,' and were duly examined (p. 197). The Madras sample was in dark ruby-coloured tears, and free from earthy contamination, and boiling alcohol dissolved 46 per cent. of what was inferred to be kino-tannic acid, leaving a residue of soluble mucilaginous matter. The sample from Bellary was paler in colour, and dissolved almost completely in cold water. The only remark to make in the light of these examinations is that the residue left after the spirit extraction is reported as soluble mucilaginous substances, whereas in tests made by me the residue was invariably insoluble in water. During the compilation of the 'Pharmacographia Indica,' I examined a fresh sample of butea kino received from Madras, and the result of its examination was responsible for the following paragraph appearing in the article on *Butea frondosa*

(vol. 1, p. 456) in that work. "The secretion in a fresh state is ruby coloured, and is soluble for the most part in water; when kept for some time it darkens in colour, swells up like bassorin, and only partially dissolves. Both fresh and commercial samples behave in the same manner with rectified spirit, giving up less than half their weight of tannin to the solvent, and leaving a large quantity of insoluble gum."

In the proposed 'Indian and Colonial Addendum to the British Pharmacopœia of 1898,' butea or Bengal kino is recommended for use as an equivalent of the official (East Indian, Malabar or Madras) kino, and its characters and tests are described according to the 'Pharmacographia.' The remark that it "should be free from an admixture of corky or woody particles" anticipates a process of purification which is almost impracticable since these impurities constitute one of the chief features of the kino. In an additional report on the Indian Section of the Addendum published in February of this year, the editor, as if doubtful about the conflicting results of former investigators of Bengal kino, asks the question—Is it fairly soluble? I have recently endeavoured to answer the question with regard to the official kino,* and I shall now try to effect a solution of the present one.

The following seven authentic samples of butea kino have been submitted to analysis during the past year. The moisture and ash were first determined in the usual manner. A portion of each specimen in a powdered condition was next extracted with alcohol of 90 per cent., to dissolve out the available tannin, and this principle was determined in the aqueous solution of the residue of the extract after evaporating off the spirit. The insoluble matter was calculated by difference.

	Water.	Tannin.	Non-Tannins Soluble.	Insoluble.	Ash.
1. Garhwal, N.W.P.	10.15	15.45	3.55	42.95	35.70
2. Saharanpur, N.W.P.	14.35	23.10	10.90	46.10	5.55
3. Lucknow, N.W.P.	12.60	30.05	10.60	36.35	10.40
4. Ganjam, Madras.....	14.05	35.30	8.50	36.40	5.75
5. Bengal.....	11.20	27.70	9.80	19.50	31.80
6. Rajputana.....	13.40	34.70	10.70	28.95	12.25
7. Panjab.....	13.30	62.20	7.65	9.90	6.95

Nos. 1, 2, and 3 were specimens from the collections in the Indian Museum, Calcutta; No. 1 having been in store for about seventeen years, while Nos. 2 and 3 were received in 1894.

No. 4 was sent in 1898 by my friend, Mr. E. D. M. Hooper, Conservator of Forests; the sample was of a light red colour, and appeared to have been freshly collected.

The Bengal gum was obtained from a drug bazaar in Calcutta; the grains were of a dark colour and the impurities were of a gross description.

The specimen from Rajputana was purchased from a bazaar in the Pachbadra Salt Region, and like the previous one, was largely contaminated with foreign matters.

The Panjab sample was in bright red tears, with a certain admixture of brown corky bark and dried muddy particles. It was received in the office of the Reporter on Economic Products only a few weeks ago.

Butea kino lends itself to ignorant admixture by the careless collector, or criminal adulteration by the dealer much more than Malabar kino. In the first place, butea kino is not collected by any systematic tapping of the trees, and then as the juice is thinner than that of the *Pterocarpus*, it spreads itself over the bark and dries in little tears instead of pouring out of a wound and drying in large masses. It forms in older trees where the corky bark is developed, and young trees will bleed sparingly or not at all in the dry season. The jungle tribes of the Central Provinces gather the naturally exuded gum, and with it the light

* An abstract of this paper appears in *Pharm. Journal*, vol. 5, p. 500.

* The tannin value of Malabar kino, *Pharm. Journal*, March 3, 1900, p. 224.

brown corky bark to which it adheres. The presence of bark becomes, on this account, a characteristic feature of this kino.

Besides the bark of the tree, stones and dirt and foreign seeds are invariably found in the commercial gum. The following impurities have been recognised by me in some of the specimens received for analysis:—Seeds of *Celastrus paniculata*, grains of rice, wheat, lentils, raisin pips, debris of insects, mice excrement, fragments of capsules, sticks and leaves. When it is considered that the price of the gum is from one to three annas (or pence) per pound, it can hardly be expected that much care could be taken to clean the gum before it is sold.

The samples of kino in the above table of analyses are arranged as far as possible according to age. It is not possible to exactly determine the age of supplies purchased in the market, but a fair indication may be obtained from the date of receipt of these samples in the Museum. The most noticeable feature in the table is the small amount of soluble tannin in the old sample compared with the large proportion in the most recent specimen. The gums from the North West Provinces, received in 1894, are also inferior in astringency to those of Bengal and Rajputana received within the last year. Although the analysed samples are not very numerous, I consider that there is ample evidence to show that butea kino is rendered less soluble in spirit as time advances, and that for medicinal purposes the gum should be used when it is recently collected.

In order to account for the disappearance of the soluble tannin the figures in column marked "Insoluble" might be studied with advantage. The insoluble matters consist of portions of bark and dirt, with a dark-coloured substance, possessing mucilaginous properties. In the early part of this paper this is referred to as an insoluble gum, but if the original exudation had been a mixture of insoluble gum and tannic acid, alcohol would remove the latter, and leave the gum lighter in colour. Besides, the chief forms of insoluble gum are either soluble in boiling acid (pararabin) or boiling alkali (metarabin); but the residue of butea kino, remaining after treatment with spirit, dissolves immediately in warm caustic soda with the formation of traces of pyrocatechin, this indicates the existence of a catechol-tannic acid altered by oxidation or other form of decomposition. In the fresh sample of kino from the Panjab the action of spirit revealed an exceptional composition, since the residue consisted of bark and earthy ingredients, with little or no dark-coloured slime.

The gelatinisation of the official tincture of kino from *Pterocarpus marsupium* is attributable to the production of an insoluble body from the tannic acid. In this connection an experiment was made with three tinctures of butea kino, sample No. 7. The first tincture was made with 1 part of kino dissolved in 10 ounces of alcohol (90 per cent.). The second was made with the same proportions, but the alcohol used contained 25 per cent. by volume of distilled water. The third tincture was made with diluted spirit consisting of equal volumes of alcohol (90 per cent.), and distilled water. The first tincture had a turbid appearance but the second and third had a clear deep-red colour. They were filtered after a week's maceration, but the process was very tardy in the cases of No. 1 and No. 2, so that some of the tincture gelatinised before it passed through the filter paper. Tincture No. 3 was clarified in a very satisfactory manner, leaving only the woody and earthy impurities behind. The three tinctures were left in beakers, loosely covered to prevent the entrance of dust, when it was noticed that on account of the evaporation of spirit in the first tincture it was showing signs of solidification; the second tincture was somewhat thicker than when it was first made, but it was perfectly fluid; while the third sample appeared to lose none of its limpid character on exposure.

The formation of a resinous insoluble body in the crude juice of most kinos has often been noticed, and this property has been

utilised in connection with the exudation from one of the wild nutmeg trees of Assam. In the Khasi Hills, the stem of *Myristica gibbosa*, Hook., yields a red juice, which is called "wild varnish," and is employed by the natives for painting over their furniture and door-posts to render them impervious to water. The juice has been examined by me, and, as pointed out by Dr. Schaer* with respect to that obtained from Javanese species of *Myristica*, it is composed almost entirely of tannin, with a small amount of calcium tartrate.

With regard to the official recognition of butea kino in the 'Indian and Colonial Appendix to the Pharmacopœia,' it would seem that the kino from the present official source is of such a high standard and sufficiently abundant to meet all requirements for medical practice in India. Butea kino in its crude state is very impure, and it would be a matter of difficulty to adequately clean it for medicinal purposes. Moreover, butea kino, as a rule, is very inferior in its soluble properties, and its apparently rapid alteration from the soluble to the insoluble condition would render it objectionable for preparing tinctures.

PHARMACOGRAPHIC NOTES.

BY E. M. HOLMES, F.L.S.

Curator of the Museums of the Pharmaceutical Society.

Kola Seeds.

The kola nuts in commerce have for some time puzzled botanists and pharmacognosists on account of their variation in colour and form. Evidence has not hitherto been forthcoming to show whether these seeds are the produce of different species, or of

COLA ACUMINATA.—A, Flowering twig, reduced; B, Ovary, enlarged, showing free acuminate stigmas.

varieties of one species, and the literature on the subject has to a certain extent been overlooked. Dr. K. Schumann, of Berlin, who has recently investigated the matter, and has written a mono-

graph on the genus *Cola*, has divided that genus, which now comprises thirty species, into sub-genera. He includes the kola nut in his sub-genus *Autocola*, which is characterised by the stamens, or rather sessile half-anthers being arranged in two rows one above the other, and not in a single row as in the majority of species.

Dr. Schumann describes the fruit of *Cola acuminata* as having a fleshy yellow pericarp, with an odour resembling that of a *Maréchal Niel* rose, and containing four or five large seeds. The seeds have a white testa, which becomes brown when the fruit dehisces, and they become exposed to the light. The embryo consists of four cotyledons, of a "carmine" red colour, which, when separated, present a triangular, or externally a convex form. These remarks apply to the kola nut brought to Germany from the Cameroons.

C

D

E

COLA ACUMINATA.—C, Young fruit; D, Seed; E, Germinating seed.

Examination of specimens of the kola plants in the Herbarium of the Botanical Museum at Berlin showed that one plant from Ashanti collected by Cummins, and another from Sierra Leone collected by Afzelius differed from the true *Cola acuminata* in having the stigmas broad, obtuse, and closely pressed to the ovary. Specimens of the kola nut with two cotyledons obtained direct from Togoland, and of the tree yielding it, proved to Dr. Schumann that the kola nut of commerce having two cotyledons is the produce of the tree having obtuse appressed stigmas, and not of *C. acuminata*, which has pointed, free, curved stigmas. This new species he has named *Cola vera*. It has seeds also of a carmine red colour when fresh. But the two seeds germinate in a totally different manner. In the one, *C. acuminata*, the four cotyledons spread open and the plumule grows up in the centre; in the other, *C. vera*, the two cotyledons remain closed, and the plumule arises outside them.

These two are not the only species yielding edible seeds. The *C. lepidota*, Schm., which belongs to the same subgenus, having the anthers in a single row only, but seeds with two cotyledons, and another species used by the Bali people, are also eaten. How much these different seeds vary in the amount of the caffeine

and theobromine they contain has not yet been ascertained, but the seeds of *Cola vera* are the most highly prized. The large leaf in which they are wrapped is identified as that of *Cola cordifolia*.

A

B

COLA VERA.—A, Flowering twig, reduced; B, Ovary, enlarged, showing stigmas.

The two different kola seeds above described were noticed as long ago as 1860. C. Barter, in his account of the plants found during the Niger Expedition, given in the *Journ. Linn. Soc.*, iv., p. 19, states that there are two kinds of kola nuts, one with four cotyledons, called "Fatak," by the Foulahs, and the other with two cotyledons, called Gonja, by the same people. The latter were said to come from the Ashanti country, but he had not seen the tree.

C

D

COLA VERA.—C, Germinating seed; D, single cotyledon.

The species with four cotyledons he had seen at Fernando Po, and in many parts of the lower Niger, abundant at Onitsha occurring also at Prince's Island, and apparently common along the coast, the flowers being variable in colour, cream-coloured, greenish yellow and pale red. The seeds appeared to be carried in about equal quantities into the interior, but the one with two cotyledons (Ganja), in the Nupe country is worth about 100 cowries, whilst the other (Fatak), averages about 80 only. The value of cowries at Rabba was 2,500 for the dollar of 4s. 4d.

HYPNOTICS ANTAGONISTIC TO COCAINE.—Gioffredi points out that chloral hydrate, paraldehyde, urethane and other hypnotics counteract the physiological action of cocaine, although the latter has no reciprocal action on hypnotics.—*Chem. Zeit. Repert.*, 24, 93.

ASSAY OF DRUGS BY THE USE OF LIVING PLANTS.*

BY HENRY KRAEMER.

The following experiments give the results at the end of the second twenty-four hours.

Brucine Sulphate.

Temperature (16°-21° C.).

Second 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.

$1\frac{1}{5}$ gr. or .078 gm.	{ — }	{ — }	{ No growth }	{ Dead, flabby }

In the above experiments, as in those of the first twenty-four hours, we notice an increase over that in the corresponding strengths of strychnine.

A series of experiments upon alcoholic solutions of strychnine nitrate (Merck's) containing $\frac{1}{20}$ grain, $\frac{1}{10}$ grain, $\frac{1}{5}$ grain, $\frac{1}{5}$ grain of the alkaloid to 50 C.c. of the solution were carried out, with the following results:—

Strychnine Nitrate and Ethyl Alcohol.

Strychnine nitrate . . . 0.3 gm.
Alcohol, 94 per cent. . . 75 C.c.
Water 25 C.c.

Temperature (16°-21° C.).

First 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.
$\frac{1}{20}$ gr. in 50 C.c. of sol. or 1 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 5. mm. " 5.5 " "	{ Apparently normal }	{ 9. mm. " 9.5 " "	{ Apparently normal }
$\frac{1}{10}$ gr. in 50 C.c. of sol. or 2 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 2.5 " " 2. " "	{ " "	{ 4. " " 4. " "	{ " "
$\frac{1}{5}$ gr. in 50 C.c. of sol. or 2½ C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 1.5 " " 2. " "	{ " "	{ 3. " " 3. " "	{ " "
$\frac{1}{5}$ gr. in 50 C.c. of sol. or 4 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ No growth }	{ Dead, flabby }	{ No growth }	{ Dead, flabby }

In the above experiments, the maximum growth of the seedlings occurred in the solution containing $\frac{1}{20}$ grain in 50 C.c. of the alcoholic solution, and death in the solution containing $\frac{1}{5}$ grain.

The following table gives the results at the end of the second twenty-four hours:—

Strychnine Nitrate and Ethyl Alcohol.

Strychnine nitrate . . . 0.3 gm.
Alcohol, 94 per cent. . . 75 C.c.
Water 25 C.c.

* Presented at the Richmond Meeting of the American Pharmaceutical Association, May, 1900. Concluded from page 621.

Temperature (16°-21° C.).

Second 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.
$\frac{1}{20}$ gr. in 50 C.c. of sol. or 1 C.c. sol. H ₂ O q.s. 50 C.c.	{ 6. mm. " 6. " "	{ Apparently normal }	{ 14. mm. " 15. " "	{ Apparently normal }
$\frac{1}{10}$ gr. in 50 C.c. of sol. or 2 C.c. sol. H ₂ O q.s. 50 C.c.	{ 3. " " 3.5 " "	{ " "	{ 5. " " 5. " "	{ " "
$\frac{1}{8}$ gr. in 50 C.c. of sol. or 2½ C.c. sol. H ₂ O q.s. 50 C.c.	{ 2. " " 2.5 " "	{ " "	{ 4. " " 4. " "	{ " "
$\frac{1}{5}$ gr. in 50 C.c. of sol. or 4 C.c. sol. H ₂ O q.s. 50 C.c.	{ No growth }	{ Dead, flabby }	{ No growth }	{ Dead, flabby }

In the second twenty-four hours we notice a corresponding increase in growth as was noticed in previous experiments.

In the following experiments, alcoholic solutions of brucine sulphate containing $\frac{1}{20}$ grain, $\frac{1}{10}$ grain, $\frac{1}{5}$ grain and $\frac{1}{5}$ grain of the alkaloid to 50 C.c. of the solution were used:—

Brucine Sulphate and Ethyl Alcohol.

Brucine sulphate . . . 0.3 gm.
Alcohol, 94 per cent. . . 75 C.c.
Water 25 C.c.

Temperature (16°-21° C.).

First 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.
$\frac{1}{20}$ gr. in 50 C.c. of sol. or 1 C.c. sol. H ₂ O q.s. 50 C.c.	{ 6. mm. " 6. " "	{ Apparently normal }	{ 10. mm. " 10. " "	{ Apparently normal }
$\frac{1}{10}$ gr. in 50 C.c. of sol. or 2 C.c. sol. H ₂ O q.s. 50 C.c.	{ 3.5 " " 4. " "	{ " "	{ 5.5 " " 6. " "	{ " "
$\frac{1}{8}$ gr. in 50 C.c. of sol. or 2½ C.c. sol. H ₂ O q.s. 50 C.c.	{ 2.5 " " 3. " "	{ " "	{ 4.5 " " 4.5 " "	{ " "
$\frac{1}{5}$ gr. in 50 C.c. of sol. or 4 C.c. sol. H ₂ O q.s. 50 C.c.	{ No growth }	{ Dead, flabby }	{ No growth }	{ Dead, flabby }

In these experiments with brucine, alcohol and water, we again notice an increase in growth over the experiments with strychnine, thus tending to show that brucine is a less powerful alkaloid upon plants than strychnine.

The following table gives the results of the experiments at the end of the second twenty-four hours:—

Brucine Sulphate and Ethyl Alcohol.

Brucine sulphate . . . 0.3 gm.
Alcohol, 94 per cent. . . 75 C.c.
Water 25 C.c.

Temperature (16°-21° C.).

Second 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.
$\frac{1}{20}$ gr. in 50 C.c. of sol. or 1 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 7. mm. " 7. " "	{ Apparently normal }	{ 16. mm. " 16. " "	{ Apparently normal }
$\frac{1}{10}$ gr. in 50 C.c. of sol. or 2 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 4.5 " " 4.5 " "	{ " "	{ 7. " " 7.5 " "	{ " "
$\frac{1}{8}$ gr. in 50 C.c. of sol. or 2½ C.c. sol. H ₂ O q.s. 50 C.c. . .	{ 4. " " 3.5 " "	{ " "	{ 6. " " 6.5 " "	{ " "
$\frac{1}{5}$ gr. in 50 C.c. of sol. or 4 C.c. sol. H ₂ O q.s. 50 C.c. . .	{ No growth }	{ Dead, flabby }	{ No growth }	{ Dead, flabby }

In the second twenty-four hours the same conditions remain throughout the experiment; the maximum growth occurred in the solution containing $\frac{1}{20}$ grain and death in the $\frac{1}{5}$ grain solution.

In the following table are given the results with alcoholic solutions of strychnine nitrate and brucine sulphate, containing $\frac{1}{20}$ grain, $\frac{1}{10}$ grain, $\frac{1}{5}$ grain and $\frac{1}{2}$ grain of the alkaloids in equal proportion to 50 C.c. of the solution:—

Strychnine Nitrate, Brucine Sulphate and Ethyl Alcohol.

Strychnine nitrate . . 0.15 gm.
Brucine sulphate. . . 0.15 gm.
Alcohol, 94 per cent . . 75 C.c.
Water. 25 C.c.

Temperature (16°-21° C.). First 24 hours.

Per Cent.	PISUM SATIVUM.		LUPINUS ALBUS.	
	Actual Growth.	Remarks.	Actual Growth.	Remarks.

$\frac{1}{5}$ gr. alkaloids in 50 C.c. or 4 C.c. tinct. H ₂ O q.s. 50 C.c.	No growth	Dead, flabby	No growth	Dead, flabby

In these experiments we still notice an increase in the growth of the radicle over that of tincture of nux vomica free from fat.

Conclusion.

At the present time, when the assaying of drugs is of so much importance to the physician and also to the pharmacist, it is needless to say that any methods which will enable us to arrive at results which can be used directly, or calculated so as indirectly to be of value to the professions, are of considerable importance. The question arises, how can the figures obtained be translated so as to be of practical value. From the results obtained we may say generally that the rate of growth of the radicles in the solutions containing toxic principles is inversely proportional to the toxicity of the solution.

The results of the foregoing experiments tend to show that there is a definite solution of alcohol or nux vomica alkaloids that is

toxic, and that with solutions containing different amounts of alcohol or nux vomica alkaloids there is a definite measure of growth depending upon the quantity contained therein. Inasmuch as this is to be taken as a measure of the amount of alcohol or alkaloids affecting the plants experimented upon, it is seen that we have here a direct means of measuring the quantity of alcohol or alkaloids in the respective solutions.

VEGETABLE DRUGS IN THE U.S.P.*

Whatever may be the views of anyone concerning the work upon vegetable drugs, not only in the U.S.P., but in the pharmacopœias of any country, it is apparent that there are some statements in definition and description which are too narrow when we look at the drugs practically. The question of origin of drugs is in some cases still obscure, and in other cases greater freedom should be given in the selection of commercial varieties. We mention the following instances:—

Myrrh.—Deffers has shown that *Commiphora myrrh* (Nees), Engl., is without any odour, and that the stems do not yield any resin. Deffers and Schweinfurth consider genuine myrrh to be derived from *Commiphora abyssinica* (Berg.), Engl. A part of the myrrh from Arabia is supposed by Engler to be obtained from *C. schimperi* (Berg.), Engl. It appears that in commerce the Arabian myrrh from Aden is more highly valued than that of the Somalis. Very recently Mr. and Mrs. Philips have collected plants which are similar to that figured in Bentley and Trimen as the source of myrrh, and what the Somalis gave them to understand yielded myrrh. The whole question, therefore, resolves itself into one of great uncertainty as to whether only one species yields the myrrh of commerce.

Copaiba.—According to Taubert, a good many American species of *Copaifera* yield copaiba. The balsam yielded by *C. officinalis*, Jacq. (of Guiana, Colombia, and Venezuela), is considered to be the best. Good balsams are also yielded by *C. guyanensis* (Desf.), O. Ktze (Amazon region); *C. multizuga* (Hayne), O. Ktze (Amazon region); *C. confertiflora* (Benth.), O. Ktze (Pianhy); *C. coriacea* (Mart.), O. Ktze (Bahia); *C. langsdorffi* (Desf.), O. Ktze, and *C. oblongifolia* (Mart.), O. Ktze (both from Rio Janeiro and Minas Geraes).

Balsam of Tolu.—Besides *Toluifera balsamum*, L., another plant, *T. peruifera* (L. fil.), Baill., is also said to yield small quantities of an aromatic balsam resembling that of tolu.

Tamarind.—This fruit is not only yielded by *Tamarindus indica*, L. (of tropical Africa), but also by *T. indica*, var. *occidentalis*, Gaertn. (of West Indies and Ecuador), the fruit of the latter being more yellowish in colour, more mucilaginous, and less cohesive in consistency and with less of an acid taste.

Rheum.—It is quite possible that other species besides *Rheum officinale*, Baill., furnish the commercial root. Dammer mentions: *R. australe*, Don. (of the Himalayas), *R. leucorrhiza*, Pall. (of Central Asia), and *R. rhaponticum*, L. (of Western China).

Ipecac.—Besides the root of *Cephaelis ipecacuanha*, Brotero (or Rio Ipecac), there are quantities of another root—viz., Carthage—which find their way into commerce. From the results of analyses it would appear that the latter is richer in emetic alkaloids than the former. This remains, however, to be proved.

Sarsaparilla.—The E. Mexican of Vera Cruz root is yielded by *Smilax medicā*, Schlecht. et Cham. The origin, however, of the Jamaica sarsaparilla (given as *S. officinalis*, H. B. K.) and of Para sarsaparilla (given as *S. papyracea*, Duham., of Guiana and Brazil) is not at all certain, but is open to question.

Ammoniac.—Not only does *Dorema ammoniacum*, Don., yield ammoniac, but also the following species:—*D. aucheri*, Boiss. (of Persia), and *D. aureum*, Steks (of Beluchistan). Drude says that African ammoniac is yielded by *Ferula tingitaria*, L. Battandier

* From the *American Journal of Pharmacy* for May, 1900.

is authority for the statement that *Ferula communis*, var. *gummifera*, of Algiers and Morocco, yields a gum resin which looks much the same as the African ammoniac.

Sumbul.—This root is the product of not only *Ferula sumbul* (Kffm.), Hook. f., but also of *F. narthex*, Boiss.

Storax is yielded by *Liquidambar orientalis*, Mill., and by *L. styraciflora*, L.

We find, further, that in looking at the definitions and descriptions of the drugs in the U.S.P. a more liberal interpretation must be given the subject from a practical point of view. Under Crocus, for instance, only the stigmas are supposed to be present in the commercial article. The article on the market, even under the most favourable circumstances, does not possess 100 per cent. of stigmas. The amount of foreign material that ought to be allowed in the best commercial specimens must be carefully borne in mind by the practical pharmacist (see *Amer. Journ. Pharm.*, 1900, p. 123).

Quite a number of cases might be mentioned where, in addition to the drug as specified by the U.S.P., other parts of the plant from which it is derived are generally present, as in *Belladonnæ folia* (includes stems, petioles, flowers, and fruits), *Matico* (includes fruits), *Caryophyllus* (includes some stems), etc. In some other cases other plants are present, as in *Chondrus* (a number of algæ). Prof. D. M. R. Culbreth has shown ('*Proc. A. Ph. A.*,' 1898, p. 765) in a number of vegetable drugs the inferiorities with per cents. that are contained in the drugs upon the market—viz., *cimicifuga*, *hydrastis*, *podophyllum*, *geranium*, *senega*, *wild cherry*, *black haw*, *veratrum viride*, *poke root*, *wild ginger*, *angelica*, and *sassafras bark*.

There are a number of groups of drugs to which rather stringent definitions, descriptions, and limits of admixture may be applied, as in seeds, fruits, roots, barks, and flowers. In other cases, the difficulty of giving specific definitions is very clear, as for example in the case of leaves and herbs, rhizomes, and plant exudations. To say that certain drugs consist "chiefly" of certain parts covers the ground a little better—e.g., *Crocus*, chiefly of stigmas; *chondrus*, chiefly of *Chondrus crispus*, etc. It would be better, however, if, as in the case of *crocus*, the percentage of stigmas present in the commercial product were given.

SOME PHARMACOPŒIAL PROBLEMS.*

BY CHARLES RICE, PH.D., NEW YORK.

While each new pharmacopœia, at the time of its appearance, represents, in a general way, the then existing state of therapeutic and pharmaceutical progress, there is, naturally, no lack of new problems, which continue to present themselves for consideration, not only after the work is issued, but sometimes also while it is still passing through the press. In the case of our own pharmacopœia, a number of quite serious problems were encountered during the last two revisions, some of which, as, for instance, the admission of "patented" synthetics, were solved by the dictate of the National Convention, while others, such as nomenclature and standardisation of all drugs except *cinchona* and *opium*, were left to the discretion of the Committee of Revision. The committee endeavoured to solve these problems to the best of its ability, and its decisions and action have, on the whole, met with approval on the part of competent judges.

Among the more important problems which confronted the present Committee of Revision was that of emancipating the pharmacopœia from the control of the publishing trade, and of setting it up on an independent financial basis. This problem may be regarded as definitely solved, and, therefore, may be omitted from consideration here. Disregarding the minor problems which affect the details and minutiae of the text of the articles contained in the pharmacopœia, there remain certain subjects which stand out more prominently, and are worthy of general discussion. They

are, moreover, of such a nature that they should be definitely passed upon and settled by the National Convention, so that the next Committee of Revision will be relieved of all responsibility regarding their rejection or adoption. These subjects are not new, and have frequently been written and talked about. But, in the course of time, our knowledge has made material advances, some of our views have undergone changes, certain prejudices may have been abandoned, and conditions in general appear to have so changed that it is perfectly proper to disregard former arguments and deductions, and to consider the subjects anew.

The pharmacopœia was originally intended to be the official guide both for the physician and the pharmacist. During the earlier period of its existence in this country the physician took a greater interest in, and had, at least officially, a larger share in its preparation or revision than the pharmacist. That this is no longer the case is generally known and acknowledged. While, theoretically, the medical profession has not lost its interest in it, and is well represented at every Decennial Convention, yet, practically, the pharmacopœia has ceased to be a work of reference for the physician. And why? Chiefly because it does not contain the information which the physician requires regarding the nature, properties, and doses of some of the most important remedies he uses. To a large extent he is himself responsible for this condition of things, for he has, very likely, been one of the large group of medical men who opposed the admission into the pharmacopœia of the very things regarding which he needs information, and for which he must now look elsewhere. Most physicians do not take much interest in botanical or chemical descriptions, or in tests of identity and purity.

The main objects which a physician usually has, or would have, for consulting a pharmacopœia are to ascertain:—

- (1) What form or forms of administration are officially available in the case of a certain drug?
- (2) What is the strength of the respective preparations?
- (3) What are the ordinary doses?

Under present circumstances he may find in the book an answer to the first two questions, but, knowing that he will find none to the last-named one, which to him is probably the most important, he simply ignores the pharmacopœia, and turns at once to sources which he has found by experience to afford the desired information. There is no use whatever in trying to make the pharmacopœia better known to, or "more popular" with, the physician, unless it is made worth his while to consult it. To restore the pharmacopœia to its former status among medical men is a task which requires their co-operation in this, that the next Committee of Revision may be authorised to give the average doses in connection with the several drugs and preparations. It may be taken for granted that the committee will exercise its best judgment in arranging this part of the text so that no harm can result to either profession.

The pharmacist, particularly at his prescription counter, also often has occasion to look for precisely the same information that the physician wants, and, knowing that he would look for it in vain in the pharmacopœia, he at once consults some other work of reference, preferably one which will give him at the same time all other needed information regarding physical or chemical properties, solubilities, incompatibilities, etc. Is it to be wondered at that the pharmacopœia is not a "popular" book among pharmacists?

As to the so-called "*newer remedies*," and more particularly the "patented" synthetics, a curious anomaly may be observed in the position taken with reference to them by many physicians, who in their daily practice freely prescribe such as *trional*, *sulphonal*, *phenacetin*, and others, and who treat of them and advocate them in their medical writings, and even on the lecture platform, yet who are disinclined to vote for their admission into the pharmacopœia. This may be regarded as an ethical riddle. If the pharmacopœia is to be gradually purged of old and useless drugs and

* From the *American Journal of Pharmacy*.

preparations, and not to be brought up to date by the introduction of the newer drugs of recognised value used universally by the medical profession, it might just as well remain unrevised, and go out of existence. Medical and pharmaceutical schools have for a number of years past found it necessary to supplement the official series of remedies from other text-books. The time might eventually arrive when the pharmacopœia would cease to be of service even as a text-book in schools.

In view of all this it can hardly be doubted that the next Decennial Convention will authorise the new Committee of Revision to introduce into the pharmacopœia such of the "newer remedies"—irrespective of any consideration of patent rights, etc.—as shall be found worthy of a place therein. It will not be very difficult to decide their respective merits, because if the following conditions are exacted in every case, the number that will deserve consideration will probably be less than a dozen. The conditions or characteristics that ought to be complied with are the following:—

(1) If the remedy is a definite chemical compound, its chemical composition and physical and chemical properties should be known and controllable. (Examples: antipyrin, aristol, chloralamid, phenacetin, salophene, sulphonal, trional.

(2) It should have passed the experimental period, and should be in regular and general use by the medical profession as a remedy of a definite and recognised therapeutic value.

Statistics as to the regular and general use of any such remedy can readily be obtained from reliable sources, such as the larger dispensing pharmacies, large hospitals, the Government medical service, etc. As to how and under what titles these remedies are to be introduced is of minor importance. This may safely be left to the Committee of Revision.

In former times the pharmacopœia was a work chiefly concerning itself with what its name expresses, namely, the *making* of medicines. At the present day the name has already become, at least partly, a misnomer, and the time may not be far distant when it should rather be called "pharmaconomia" or "pharmacographia," that is, a book *prescriptive* for, or *descriptive* of, medicines. This gradual transition is, however, quite natural, and in normal proportion to the changes that have taken place in the condition and status of the profession of pharmacy. When we consider the exacting demands which are made at the present day, under various laws, upon the quality of medicines dispensed by pharmacists, it is not to be wondered at that the latter become more and more unwilling to assume full responsibility for the quality, and particularly the exact strength, of the preparations they dispense, but that they prefer to shift this responsibility upon the manufacturer, more especially when the latter assures them that he is willing to assume the responsibility himself.

This matter of responsibility for the quality of medicines in combination with considerations of economy, particularly by the saving of time, space, labour, and wages, has brought it about that the manufacture of certain classes of pharmaceutical preparations is becoming more and more concentrated in the hands of large firms, and that the function of the pharmacist—at least of the conscientious pharmacist—is chiefly confined to an examination of the preparations which he buys by means of such tests as are available to him.

Recognising these conditions, modern pharmacopœias have, at each new revision, eliminated working processes for preparations which were known to have passed almost entirely into the large manufacturers' hands, and have substituted for them more detailed descriptions and tests. Among the tests, those which are intended to show the strength of the preparations by gravimetric or volumetric assays have been made more and more rigorous, and their application has been extended to drugs and preparations which formerly were not subject to strict regulations.

The progress made in organic proximate analysis, notably during the past fifteen years, brought forth a demand for the *standardisa-*

tion of the preparations of potent drugs, often, unfortunately, on the part of persons who were not sufficiently familiar with the technical difficulties that stood in the way of a more general application of the then known methods of assay. In 1890 the present Committee of Revision was directed to give processes of assay for two drugs only, namely, cinchona and opium, it being left at liberty to extend standardisation to others. By the time the committee was ready to go to press, only one more drug, viz., nuxvomica, was added to the list, it being deemed unwise to proceed further at that time. Since then, however, a very material advance has been made in the methods of proximate analysis, and there is every reason to hope that processes of assay can be provided at the next revision for such drugs as belladonna, coca, colchicum, gelsemium, hyoscyamus, ipecac, physostigma, pilocarpus, stramonium, and, perhaps, some others.

The term "standardisation," as applied to pharmacopœial preparations, comprises three distinct features, which are not seldom confounded, and one of which is commonly overlooked. They are as follows:

(1) *Quantitative Determination of the Active Principles.*—The quantity of the active principle (or principles, as the case may be) in the drug or preparations to be standardised must be determinable by a fairly simple process yielding practically uniform results in different hands.

(2) *Identification of the Active Principle.*—It should be possible to identify the active principle by some fairly simple process. This applies, of course, only to preparations not made directly from the original drug, but purchased ready-made in the market, possibly of unknown or doubtful brand or origin. This is the feature which is often overlooked. It is manifestly insufficient merely to determine the amount of alkaloidal or other active substance present, particularly in the case of preparations made from expensive drugs, unless it is shown that the separated principle is unaccompanied by matters foreign to the drug, such, for instance, as some cheap foreign alkaloid that might have been added to bring out a favourable "assay." While this feature (the identification) is quite important in actual practice, it can be disregarded in the pharmacopœia, since the latter generally directs to start a preparation from the drug itself, about the identity of which there can be no question.

(3) *Adjustment of Strength.*—This is the final end and aim of "standardisation." It is, of course, comparatively easy to standardise the preparations of any drug, the active principle (or principles) of which can be correctly determined quantitatively. It will merely be necessary to agree upon some definite strength or upon an upper and lower limit of the active principles. Of course, standardisation need be applied only to drugs of importance and potency. There is no need of standardising preparations of gentian, quassia, sarsaparilla, squill, senna, etc., even if it were possible in each case to do this.

But there are some drugs which, with our present knowledge, it is not possible to standardise in the sense above-mentioned. One of these is ergot. It is claimed by some that its physiological action is due to Keller's "cornutine," and some manufacturers assay it and standardise it on the basis of this alkaloid. But it is not by any means certain that other principles in ergot do not participate in its peculiar action.

Another case in point is digitalis. We know that digitoxin is the most active of the cardiac principles it contains. But there is no certainty as yet that it is the only one that should be considered. If we knew for certain that the proportion of digitoxin to the other principles present in digitalis were at all times the same, we could accept it as a measure to gauge the activity of digitalis by. But even this point is not cleared up. And our experience with other drugs makes it likely that the proportion between the various principles of digitalis varies more or less at different times.

Strophanthus may be mentioned as another drug for which we have no practical assay process.

Realising these facts, and yet desiring to give to their customers reliable preparations, some of the larger manufacturing houses have adopted the plan of testing these and certain other drugs "physiologically." This is a quite laudable undertaking, and we have no reason to doubt that it is actually carried out. The method of testing employed by one of these houses has been published, but we have no knowledge as to the methods used by the others. It is safe to infer, however, that as long as a *uniform* method of physiological testing (for each separate drug requiring it) has not been agreed upon, the products of the different houses will turn out to be uniform only by accident.

It would be interesting to ascertain what results would be attained by the several "standardisers," acting independently of each other, from samples of one and the same lot of a preparation, say of ergot, submitted to them without information as to the origin, age, or mode of preparation. Under present conditions it seems hardly probable that their results would agree. Who, then, shall standardise the standardisers? This is a problem for which a solution is sought, but not readily found.

But whenever the medical profession will be able to offer methods of physiological testing which will show both the *quality* and the *quantity* of effect, and which are accepted by a majority of competent judges, then such tests may well be introduced into the pharmacopœia, even if they should involve special skill and knowledge not possessed by the average pharmacist at the present time. By the time when such tests will have been brought forward and proven practically reliable, the conditions will probably have so changed that nearly all users of the pharmacopœia will be able to apply them, or else such tests will have to be made only upon wholesale lots by some experts of acknowledged skill and reputation, whose verdict or certificate will be generally accepted.

If physiological tests are to be applied to such drugs at all, it would manifestly be a waste of time, labour, and valuable material for the pharmacist working on a small scale to test each separate small lot of a preparation when it is finished. He will find it much more advantageous to purchase either the drug itself or the respective preparation, already tested and "standardised" by some recognised expert assuming full responsibility for its standard. Although this standard will, no doubt, be affected by the "personal" error of the expert (until a method is discovered which will exclude or neutralise this error), yet the results will be comparable among themselves, and thus a practical uniformity attained. This shifting of the responsibility back on the manufacturer would, in these particular cases, not be an evil to be regretted, but a positive gain, as it seems to be the only way by which a practical uniformity in such variable drugs as are mentioned above can be brought about.

To sum up, the writer offers the following recommendations:—

(1) That the next Committee of Revision be authorised to introduce doses into the pharmacopœia (details to be left to the committee).

(2) That the committee be authorised to introduce such of the newer remedies as fulfil the conditions above-mentioned.

(3) That the committee be instructed to extend the principle of standardisation to as many of the potent drugs, and preparations made from them, as may be found possible, but that no physiological tests be introduced at the next revision.

BRACHYCLADUS STUCKERTI.—An aqueous infusion of the roots and leaves of this new species of Argentine Composite is employed with great success by the natives for the relief of asthma, and also to counteract mountain sickness, due to living at great elevations. For asthma it is smoked in cigarettes, and has the advantage that in many cases it induces sleep, whereas cannabis indica prevents it. The infusion of the herb taken internally is also very efficacious in preventing the attacks of spasmodic asthma.—*Merck's Report*, 1899, 145.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

Our First Provincial President.

Hearty congratulations to Mr. Newsholme on his elevation to the presidential chair, and also to the members of the Pharmaceutical Society, who are now presided over for the first time by a provincial pharmacist. It is much to be regretted that Mr. Martindale, whom we all respect so highly as a pharmacist, should not have seen his way clear to take office for a second year, but apart from that I fail to see that any better arrangement could have been made at present than the one which has actually been carried into effect. With Mr. Allen, who is fully conversant with all the routine work of the Society, as Vice-President, the difficulties which must necessarily present themselves at the outset, with a President non-resident in London, should prove far from insuperable, the more especially since the unusual circumstances of the case may be expected to act as a special incentive to the whole executive body to see that nothing is left undone which may conduce to the success of the year's work.

The Company Trading Question.

Already we find things shaping themselves satisfactorily with regard to the company trading question, so far as it concerns pharmacy, as witness the report of last week's meeting of the Council. Without attaching undue importance to the fact that the Council decided unanimously to act on the suggestion which Mr. Hills brought forward at the meeting, it is satisfactory to note that our representatives are agreed as to the desirability of devoting immediate attention to the all-engrossing problem. As pointed out in the editorial columns of the *P.J.* last week, it should not be difficult for the Law and Parliamentary Committee to report as to the line of policy which appears most expedient to adopt in reference to the Companies Bill; for that measure is virtually defunct so far as the present Session of Parliament is concerned, and it is doubtful if there will be any "next" Session. But the matter is certain to crop up again early in the new Parliament which may be expected to assemble before many months have elapsed, and it is imperative that matters should be properly in train in view of that eventuality.

The Next Step.

That the wider question will not be so readily answered I can also see, but it should be obvious that one very emphatic way of presenting a reply would be to embody the views which commend themselves in a draft Pharmacy Acts Amendment Bill, and such a measure, we are told, is the most likely outcome of the Committee's deliberations. Meanwhile, however, the Council is committed to nothing beyond immediate consideration of three points—the present position of the Companies Bill, the line of policy to be adopted in reference to Clauses 2 and 3 of that Bill, and the position of pharmacy in respect to company trading. That is to say, nothing has been decided by the new Council beyond the re-opening of the whole question. It is gratifying to know that the consideration is to be "immediate," and we shall all hope that some definite result may be arrived at before the time comes for taking action. The lines upon which action should be taken appear obvious to many of us but, unfortunately—and that is our chief difficulty—we do not all see alike in the matter. If, however, the Council should be able to agree upon a definite policy, I see no reason why similar accord should not prevail among the rank and file.

The Definite Issues Raised.

Leaving generalities and coming to particulars, we are faced with the necessity of deciding three main questions:—first, whether we should continue to oppose any attempt to allow unqualified persons—alone or in combination, or under any condition—to use our titles; second, whether we should acquiesce in the regulation of limited companies carrying on the business of a chemist and druggist; third, whether we should seek to gain for the profession of pharmacy any privileges with which it is not endowed at present. My own views, already expressed clearly enough, are in favour of an affirmative reply being given to the first and third questions only; the “unclean thing,” as Mr. Rymer Young has aptly termed the proposed regulation of companies, I would much prefer not to touch at all. If companies are to be regulated they must be registered, but that need only be as licensed retailers of poisons and is a police matter; pharmacists can afford to ignore that point, which is entirely the business of the Government, as representing the public. It would be absurd for pharmacists either to take any part in the operation or to vex their souls about the manner in which it may best be performed. The Government ought to consult the Pharmaceutical Society, as representing experts in the matter, but, in any case, we should leave ourselves free to oppose whatever is proposed if, in our opinion as experts, what is suggested does not commend itself to us as being best adapted to meet the circumstances of the case.

An Open Mind Should be Kept.

Mr. Taylor, whose speech at the Council meeting afforded sufficient justification of the action of his supporters in electing him on the representative body, is probably better able to keep an open mind on this subject than the majority in our ranks, but he will do good service if he can imbue many other pharmacists with a reasonable measure of the impartiality which is so strongly characteristic in his case. He was able to vote without hesitation for the motion brought forward by Mr. Hills, because the difficulty facing the Council is not yet surmounted, and he is, apparently, of opinion that the matter must be fought out sooner or later. But he seems far from considering that the motion implied condemnation of the Council's former action, though—as he was compelled to point out—circumstances may arise which would justify him in voting for a reversal of the former resolution, the effect of which was to commit the Council to unqualified opposition to Clause 2 of the Companies Bill. Other recently elected members of Council seem to be possessed with the mistaken notion that they have been returned with a mission to secure an immediate reversal of the former resolution. But their new Lancashire colleague has a clearer perception of the situation, and his speech summed up the matter admirably.

What Regulation May Imply.

It is significant, by the way, to note how well Mr. Taylor has gauged the problem facing us. He sees clearly that if company pharmacy were legally recognised as the Lord Chancellor proposes, the Pharmaceutical Society would find itself reduced to the level of a body for teaching, examining, and registering managers and assistants for limited companies which carry on the business of a chemist and druggist. As such, it would soon cease to be a representative body, and its administrative functions might as well be taken over by the General Medical Council or even the Board of Trade. But the work of Jacob Bell and his friends should hardly be productive of so ridiculous a result as that. If such a peril indeed threatens, it must be averted, not by the legal recognition and regulation of companies, but by the promotion of the professional idea in pharmacy and the maintenance of an inflexible determination to save the position gained by the founders of the Pharmaceutical Society and strengthened by their successors during a period of more than half a century.

LETTERS TO THE EDITOR.

A Disclaimer.

In the *Pharmaceutical Journal* of June 9, appears a report of police court proceedings at Gravesend, on May 31, at which “Clarence Morrison,” described as a chemist and druggist, was charged and fined for disorderly behaviour. As I am, I think, the only Clarence Morrison registered as a chemist and druggist, I would be grateful if due publicity were given in the *Journal* to the fact that I was in no way connected with this case.

Carshalton, Surrey.

CLARENCE P. A. MORRISON.

June, 14, 1900.

The Dispensing of Proprietary Articles.

The paper read by Mr. Frank A. Rogers before the Western Chemists' Association on the dispensing of proprietary articles, and the discussion to which it gave rise, published in the *P. J.* of May 26, draw the attention of members of the trade to the more prominent evils of this method of prescribing, which seems to have insidiously acquired a supreme ascendancy over the medical profession. Medical men are by no means unaware how disadvantageous to their own interests this ready-made system of prescribing is, for some of them strongly deprecate it, and even assert that they will never prescribe tablets again, yet continue to do so. The fact is, that all customs, when once established and confirmed by continued use, acquire a dominating vitality which the efforts of isolated individuals are powerless to overthrow. A reformation of this kind cannot be suddenly effected at all, and only in a reasonable time by the combined and judicious exertions of those interested in its realisation. Dr. William Murrell, of Westminster Hospital, writing in the *Medical Annual* on “Medical Progress in 1899,” says that—“The younger men in our hospitals have long ceased to regard pharmacology as a paying subject, and have consequently ceased to devote any attention to it. A race of men is growing up who know nothing about drugs or their actions, and who are often incapable of prescribing the simplest mixture.” The *British Medical Journal* of May 26, p. 1,301, in an article on “Incompatibility in Prescribing,” says:—“The decline in the art of prescription writing, now so frequently observed in various ranks of the profession, but especially amongst physicians attached to large hospitals, has frequently been lamented. The increasing prominence given to the study of pathology and bacteriology, and the constant employment in private practice of ready-made preparations of the tablet class, have induced a condition of atrophy of disuse which has blighted the capacity of the average physician to evolve and indite a really good prescription free from technical errors.” The many serious disadvantages to all parties concerned—doctors, chemists, and the public—of the systematic prescribing of tablets call for some combined plan of action in order to bring about a salutary change in this direction.

Bristol, June 18, 1900.

MAURICE L. JOHNSON.

HYDROGEN PEROXIDE IN PERTUSSIS.—Baroux finds the treatment of pertussis by the vapour of hydrogen peroxide to give good results. The peroxide used is of the strength of 12 volumes, 80 Gm. of which is poured upon a clean white linen cloth, 1 metre square, every four hours, the wet cloth being suspended from a line in the middle of a small room in which the patient is confined. It is preferable to have two such chambers, one occupied by day, the other by night. In addition to this he prescribes a mixture of tincture of drosera, aconite and belladonna. He claims that any case of whooping-cough, irrespective of the stage of the disease, may be cured by this treatment in eight days.—*Pediat.*, 9, 432.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

PLANTS (A. W. H.—43/16).—(1) *Carex vesicaria*, var. *B. involuta*; (2) *C. æderi*; (3) *C. panicea*.

MEDICAL HALL (G. P.—43/19).—There is nothing to prevent the use of the name, but it seems an absurd title for a pharmacy.

BLEACHING BLACK WOOL (J. L. G.—43/21).—Probably the cautious use of solution of chlorinated soda would have the desired effect.

DENTAL POWDER (F. A. H.—43/14).—It appears to be powdered porcelain, as it consists of aluminium silicate, with some iron and traces of magnesium, barium, and calcium.

CRUCIFER (G. C.—43/20).—It is *Bunias erucago*, Linn., a native of Southern Europe. Can you send the lower leaves of the plant? There is no specimen in the Pharmaceutical Society's Herbarium.

FIXING AGENT (T. T. C.—43/17).—Sodium hyposulphite should give satisfactory results. Possibly you have not exposed sufficiently, or there may be something wrong with your fixing bath.

CORN SOLVENT (J. L. G.—43/21).—*Liquid*: Extract of Indian hemp, 2 drachms; salicylic acid, 6 drachms; methylated collodion, 6 fl. oz. Dissolve. *Ointment*: Salicylic acid, 1; resin ointment, 5; benzoated lard, 5. Melt together.

UNIVERSAL HEALING OINTMENT (A. A. M.—43/22).—Yellow wax, 3¼oz.; white wax, 2½oz.; Peruvian balsam, 2oz.; lead plaster, 3¼oz.; yellow resin, 3¼oz.; olive oil, 5oz.; lard, 7½oz. Melt together, and when nearly cold stir in 1 fl. oz. of alcohol, 90 per cent.

SOCIETY OF CHEMICAL INDUSTRY (F. A. P.—43/23).—It is necessary to be proposed by a member to whom the candidate is personally known. The entrance fee is one guinea, and the annual subscription twenty-five shillings. Write to the Secretary, 9, Bridge-street, Westminster, S.W., for the particulars.

LIABILITY TO STAMP DUTY (D. L.—43/25).—The simplest and best way of satisfying yourself upon the point is to send copies of the proposed card and advertisement to the Inland Revenue Department, Somerset House, London, asking for an official opinion as to whether they will render the preparation liable to stamp duty.

DISPENSING PROBLEM (T. D.—42/15).—We cannot suggest any cause for the coloration, and believe nothing has been published which will explain it. We have not been able to reproduce your results with the materials at our command, so perhaps the colour was due to some impurity in one or other of the reacting substances. Have you examined your materials by the official tests?

SOLUTION OF CALCIUM POLYSULPHIDE (J. T.—43/15).—Presumably your solution is intended for use as an insecticide; for that purpose an iron pan will answer perfectly well. The trace of iron present will not materially affect the result. The finished solution should be of a deep orange yellow colour. Cheap iron enamelled pans may be employed if you desire to obtain a purer preparation.

PATENTING OR REGISTERING (H. F. W.—43/24).—It is much less expensive to register a label than to take out Letters Patent. In the latter case you can secure provisional protection for one pound, but three pounds more must be paid within nine months. On the other hand, you can register a trade mark at an inclusive cost of twenty-five shillings. Apply to the Comptroller, Patent Office, 25, Southampton Buildings, Chancery Lane, London, for further particulars.

PRESCRIPTION DIFFICULTIES (F. W.—42/10).—We are unable to offer any opinion respecting the difference between the examiner and examinee. The prescription for the mixture is an obvious instance of chemical incompatibility and should not be dispensed. The ferric chloride will liberate a dangerous quantity of iodine from the iodide, being itself reduced to ferrous chloride. This explains the production of the brown colour referred to in your letter. Substitution of a ferrous salt for the ferric salt must, of course, be subject to approval of the prescriber. With regard to the ointment, perhaps it would have been advisable to dissolve the salt in a little water before mixing with the vaseline.

FERROPRUSSIAN PAPER (T. T. C.—43/17).—Use a bleach-free paper, such as Saxe's or Rive's raw paper; preferably that which goes twelve kilos per ream. This you will obtain from Messrs. Mawson and Swan. Pin the sheet to a drawing board, and make two brushes—a Blanchard and a buckle brush. To make the former take an old quarter plate cutting glass and a piece of swansdown, or well-washed and dried lint, not less than 4 × 4½ inches, double it with the fluffy side outermost, and insert the glass between the folds so that it reaches to within half an inch of the bottom. Then put one or two stout india-rubber bands round the cloth to hold it in position. The buckle brush is made with cotton wool and glass tubing thus:—Take some absorbent cotton, about 4 inches long and 1 inch thick, pass a bit of stout twine round the middle of the wool, and pass the free ends of the string up the glass tube, which should be about ¾ inch bore. Pull the string and wool up the tube until about 1½ inches of the wool projects, then, with a sharp scissors, cut it square across the bottom. The sensitising solutions are composed as follows:—(a) Ammonio-citrate of iron, 96 grains; distilled water to make 1 fl. oz. (b) Potassium ferricyanide, 172 grains; distilled water to make 1 fl. oz. (c) Potassium bichromate, 5 grains; distilled water *q.s.* to dissolve. The ammonio-citrate should be in good scales, which have not been exposed to light. The ferricyanide should be in crystals, free from powder, and it is advisable to weigh two or three grains more than the prescribed quantity, washing the crystals first with a little water, and pouring this quickly away. To coat, mix the solutions in a saucer, apply with the Blanchard brush, then remove all brush marks with the buckle brush, employing a circular motion. Dry as quickly as possible, and operate by gas-light. Dextrin is sometimes added to the solution, but it is preferable to size the paper first with arrowroot starch, 5 grains to the ounce. Store in a tube containing calcium chloride.

DIVIDED RESPONSIBILITY.

A NUMBER of chemists have recently received a circular relating to a granular preparation, in which it is explained that some "phosphate of soda" lately supplied to the maker had been reported by the manufacturers to contain a dangerous percentage of an arsenical preparation. The statement was said to apply to all "phosphate of soda" supplied by the chemical manufacturers from November 15, 1899, to the end of April last. Apparently, some at least of the compound received during that time had also been converted into granular phosphate of soda and supplied to retailers in the ordinary course of business. The firm in question, therefore, requested that all granular phosphate of soda supplied by it should be returned, lest any of the arsenical preparation had entered into it, and that, if any had been sold or otherwise disposed of, it should be traced, obtained, and returned with the utmost despatch. The foregoing particulars are published in the current issue of *Truth*, where the circular referred to is printed in full. In view of the considerable time that appears to have elapsed since discovery was made of the deleterious nature of the phosphate, it seems strange that early intimation of the fact was not made to registered chemists through the medium of the *Pharmaceutical Journal*, so that every particle of the preparation might have been promptly traced and returned, before any mischievous results ensued. A special difficulty of such a case is that a warning circular will probably only be sent to those who do business direct with the firm issuing it. But persons who obtain granular preparations, in small quantities, through middlemen, may, in many instances, remain in ignorance of the possibly mischievous nature of the preparation in question, unless and until something of a disagreeable nature happens, as in the present instance. For, as a result of several cases of arsenical poisoning being reported, the Medical Officer of Health for the Paddington Vestry appears to have become acquainted with the circumstances, and purchases of granular phosphate

of soda have been made of certain chemists in the district by inspectors under the Sale of Food and Drugs Acts. Some of the samples thus obtained are stated to contain arsenic, and on Friday, June 15, application was made to Mr. CURTIS BENNETT (see p. 630), on behalf of the Paddington Vestry, for summonses—which were granted—against two chemists. It is reported that one is to be charged with selling effervescent phosphate of soda containing three and a-half grains of arsenic per pound, and the other with selling a preparation containing eight and three-quarter grains per pound.

It will thus be seen that the position is an extremely serious one for retail chemists: however the matter may be settled finally, they are almost certain to incur some degree of unmerited blame and suspicion. Already, the affair has been commented on in *Truth* and other lay newspapers, so that before many days are past their perhaps too sensational comments on the case will be read all over the country. It will, doubtless, be suggested that the retailer should be properly conversant with the nature of every article that he sells, testing it, if necessary, to assure himself that it is strictly what it professes to be. But, unfortunately, matters are complicated somewhat by the fact that granular effervescent preparations are largely supplied by wholesale dealers as packed goods—bottles of various sizes being supplied ready for sale—and bearing labels with the retailer's name and address printed thereon. That, it may be urged, by critics, is a form of business which should not be encouraged; but, in reply, the wholesaler protests that it is the tendency of the times, whilst the retailer contends that competition compels him to resort to this method, because such articles can be purchased ready packed much more economically than they can be put up by himself. Whether or not those reasons are to be accepted as valid, the fact remains that the custom of purchasing medicinal preparations in closed packages ready for distribution to consumers prevails widely and, as a result, retailers are generally in the peculiar position of being unable to vouch personally for the genuineness of the contents. To open, say, a four-ounce bottle of granular effervescent phosphate of soda, for the purpose of examining the contents, renders that bottle unfit for sale, and it is not surprising to find, therefore, that no such examination takes place as a rule. The retailer usually contents himself with the reflection that he buys from a reputable house, upon whose discretion he can thoroughly rely. And it is only in a case like the present that he is disappointed.

But if the chemist will not protect himself and the public in such matters, or finds himself unable to do so, a remedy must be sought elsewhere. And in looking around for such a remedy one cannot help being struck with the fact that, whilst the retail chemist is legally compelled to comply with regulations as to keeping, dispensing, and selling poisons, such regulations are quite inoperative so far as chemical manufacturers and wholesale dealers are concerned. Some of the latter voluntarily adopt regulations similar to those which are compulsory in the case of every pharmacy, but they constitute the exceptions to the general rule under which manufacturers and wholesale dealers handle the most poisonous substances at the same time and in the same manner as harmless chemicals and drugs. Such a state of affairs is

far from what the public has a right to expect, but there is no illegality involved, and, that being so, there is some danger that more regard may be paid to a saving of trouble and expense than to higher considerations. Pharmacists are especially interested in this matter, and public opinion can do much to remedy the prevailing abuse. If the mistake to which attention has been directed should have the effect of bringing about a drastic reform in methods which admit of a possibility of poisonous substances being confused with innocuous ones, the resulting benefit will be very great. It is imperative in the public interest that all poisonous substances should receive special treatment when stored, manipulated, or distributed—whether in the factory, warehouse, or pharmacy, and a model Poisons Act should make suitable provision for every case. The old cry of "restriction of trade" will doubtless be raised by interested parties if any such measure should be introduced into Parliament, but that can safely be ignored if due consideration be given to the greater safety and freedom from anxiety that must necessarily accrue in the event of such a measure becoming law.

THE LONDON CONFERENCE ARRANGEMENTS.

THE programme for the London meeting of the British Pharmaceutical Conference was finally adopted at a meeting of the Local Committee held on Wednesday, and every member of the Conference should shortly have a copy of the usual pink circular in his hands. The proceedings will begin on the evening of Monday, July 23, when the President of the Conference—Mr. E. M. HOLMES—will hold a reception at the Whitehall Rooms, Hôtel Métropole, London. On the following day the President of the Pharmaceutical Society will welcome the Conference to the Society's House in Bloomsbury Square, and after the delivery of the presidential address the serious business of the meeting will commence, being continued on the following day as usual. Luncheon will be provided on both days at the Holborn Restaurant. On the Tuesday afternoon there will be a garden party at the Royal Botanic Gardens, Regent's Park, and on Wednesday evening there will be a ballad concert, followed by a dance, at the Whitehall Rooms. The excursion on the last day of the meeting will be held on the Thames, from Henley to Maidenhead Bridge, the members and their friends being conveyed from London to Henley by special train, then taken aboard pleasure barges and conveyed down the river. Luncheon and tea will be provided on board, and dinner will be served at Skindle's Hotel, Maidenhead Bridge, the party subsequently returning to town by special train from Taplow. The No. 1 book of tickets, price half-a-guinea, will admit to the reception at the Whitehall Rooms, the luncheons, garden party, concert, and dance. No. 2 book covers the entire expense of the excursion day, the price being half-a-guinea if purchased on or before July 19; after that date the price will be advanced to one guinea. Applications for tickets should be addressed to Mr. WILLIAM WARREN, 24, Russell Street, Covent Garden, W.C. In conclusion, it may be stated that a Ladies' Committee, over which Mrs. MARTINDALE will preside, has been formed to ensure the comfort of lady visitors.

ANNOTATIONS.

RESEARCH IN PHARMACY appears likely to be taken up by the British Pharmaceutical Conference, a proposition to that effect having been placed before the Executive by the President, Mr. E. M. Holmes (see p. 678). The idea seems to be that, as many problems in what may be regarded as pharmacy proper are awaiting solution, a paid worker should be appointed by the Executive to investigate suitable subjects included in the B.P. research list (see *P.J.*, December 30, 1899), the work to be systematic and continuous. With the view of ascertaining what prospect there is of obtaining sufficient pecuniary support for such a scheme, we understand that a limited number of prominent firms and individual pharmacists have been approached, with the result that sixteen subscriptions of the annual value of five guineas have been promised for three years. The eighty guineas per annum thus available for the period mentioned will suffice for the support of one young pharmaceutical chemist, trained in the methods of research, and probably also cover the cost of such materials as he may use, but it has been decided to throw the list open so that means may yet be obtained for supporting other research workers.

THE SUBVENTION OF SCIENTIFIC INVESTIGATION was under consideration in the House of Commons last week, in connection with the vote to complete the sum required for that purpose. The discussion on the subject was chiefly remarkable for the speech delivered by Mr. Balfour, who said that the question of Governmental subvention of scientific investigation was a very important subject, and that there was no doubt this country had, from a traditional policy, lagged greatly behind other nations in this respect. It never occurred to us to do what the Germans, the French, or the Americans did in making certain grants for investigations; and whether we were right or wrong he did not undertake to say. His own personal inclination was rather in the direction of Governmental aid in cases where private aid could not be expected; but at the same time he confessed that he often thought how strange it was that, in a very rich country like ours, there were not some people who—in a difficulty to find other and more profitable investments—were induced to earn glory for themselves by carrying on those investigations with the money that was required. Unless Mr. Balfour was unaware of the fact that one or two people are to be found in this country who endeavour to promote scientific investigation with some of their surplus money—two cases in point being those of Dr. Ludwig Mond and Mr. Henry S. Wellcome—his remark may have been suggested by the reflection that, in the country of Cavendish, Davy and Faraday, the insight and enterprise which lead to such undertakings apparently require to be imported.

THE NEW WELLCOME CHEMICAL RESEARCH LABORATORIES, which are situated in King Street, Snow Hill, E.C., have now been completed and were open for inspection on Monday last, June 18. The original laboratories were established in 1896, the first announcement of Mr. Wellcome's plan being made on the occasion of the dinner given to Dr. Power, at the Holborn Restaurant, London, on July 21, 1896 (see *P.J.* [4], 3, 78). The new premises consist of a handsome modern building, four stories high. On the ground floor are the office of the director—Dr. Power—and the library, the latter being a well-selected one, including all works needed for the special requirements. The laboratories, which occupy the other three floors, are similar in arrangement, being provided with gas and electricity for illuminating and heating purposes, and completely equipped with all the necessary apparatus and appliances for conducting chemical investigations. Telephones on each floor bring the different laboratories into communication with the director's office. In the basement of the building are a combustion furnace and all

the appliances for conducting ultimate analyses, a large electric motor for working shaking and stirring apparatus, a drug mill, a dark room for polarimetric and photographic work, and storage vaults, a small lift serving as a convenient means of transport from the basement to any floor of the building. In every way the appointments of the laboratories have been made as complete as possible, so as to fit them for conducting important investigations in both pure and applied chemistry. The result is one of the most completely appointed establishments in this country for other than what may be termed academic research.

THE "FIRST, OR PRELIMINARY, EXAMINATION" conducted by the Pharmaceutical Society will be held for the last time next month, and all entries for that examination must be in the hands of the Registrar (Mr. Richard Bremridge) by five p.m. on Tuesday next, June 26. Attention is directed to that fact by the Registrar in the advertising columns of this week's Journal, and he also asks us to state that persons who allow the day specified to pass without entering for the examination will have no subsequent opportunity of repairing the omission. The regulations which will apply in the case of persons desirous of obtaining registration as "apprentices or students," and of thus becoming eligible to enter for the Minor or Qualifying Examination after June 26, 1900, will be found in the 'Calendar of the Pharmaceutical Society' for the current year.

THE LAST YEAR OF THE CENTURY appears to be furnishing a series of records so far as pharmaceutical-examination entries are concerned. The *ultima Thule* has no doubt been reached this week. We understand that the entry just closed is phenomenal, though not unexpected, no fewer than 760 persons having notified their intention of presenting themselves for the Minor or Major examination. In London there are 497 Minor and 32 Major candidates; in Edinburgh, 218 and 3 respectively. The arrangements made involve starting the practical work on June 25 in both London and Edinburgh, and continuing at the former place without intermission till July 9. The oral portion of the examination will commence on July 12, and is expected to finish just in time to make room for the Conference meeting in London on July 23.

THE FUTURE OF THE COMPANIES BILL attracts spasmodic attention from time to time on the parliamentary stage, but the general outlook remains unchanged and devoid of a gleam of encouragement. Pursuant to notice, Mr. Thomas (Merthyr Burghs) welcomed the re-assembling of ministers on Thursday, June 14, by asking Mr. Balfour whether the Companies Bill represented the alterations in the law which the Government thought desirable; also whether any further progress was to be made with the measure, and, if so, when. The Leader of the House, in a delightfully naïve manner, replied that he really could not at present name the day for the second reading. A similar reply was made to Sir W. H. Fowler on Monday last, on the debate arising from the motion to give precedence to Government business for the remainder of the Session. The ex-Cabinet Minister gave it as his opinion that if the Companies Bill were not proceeded with this Session it would be a public scandal, and he further stated that there seemed no adequate reason for postponing the matter; it had been before the House of Lords three years, had received the consideration of judges and others for a longer period, and could not therefore be said to be incomplete, and, moreover, there was general assent in commerce and law regarding many of its proposals. Naturally, "party" inspiration figured largely in Sir W. Fowler's remarks, but all the same, there is a very considerable proportion of truth in them. From the formal Ministerial reply to the Opposition, it may be deduced that, a little later on in the Session, a statement will be made of the Bills to be passed and the

"innocents" to be massacred, and that the Companies Bill will be numbered with the "innocents." It is of significant interest to remember in connection with Mr. Balfour's attitude that the medical authorities have already assumed the Bill to be dead for this year. Is it from "information received," as they say in the police courts? Meantime the companies item will grace next Monday's agenda.

THE CONSPIRACY LAW has, so far, been invoked in vain by Boot's Cash Chemists (Lancashire), Limited, in the action brought by that company against certain members of the Printsellers' Association. The latter body, finding that certain non-subscribers to its funds were being supplied by two or three firms with prints at half-price, issued a circular with the object of stopping supplies, as the retail prices were being cut. In consequence of that action, the Association was sued for conspiracy, but on June 17, in the Queen's Bench Division, a motion by the defendants to dismiss the action—on the ground that the statement of claim disclosed no cause of action—proved successful. Mr. Justice Phillimore, in delivering judgment, said the question was whether the combination by several against one for the purpose of depriving him of his trade gave to the person so injured a cause of action. There were some injurious acts which one person might do towards another without committing a crime, and those, when done by several persons in combination, might become criminal. He should hold that all confederacies to prevent a man carrying on his business and earning his livelihood were indictable conspiracies. He thought that if a confederacy in this case, for the motives and purposes alleged in the statement of claim were proved, it would be indictable, and at least equally, if not *a fortiori*, actionable.

IN OTHER WORDS, according to Mr. Justice Phillimore, given a confederacy, the motive and purpose made all the difference. If a number of persons, because of political or religious hatred, or from any spirit of revenge for previous real or fancied injury, combined to oppress a man, and deprive him of his means of livelihood, for the mere purpose of so-called punishment, he thought the sufferer had his remedy. Mr. Justice Bigham, however, thought the intention of the circular complained of was to induce printsellers to refrain from dealing with those who sold to the plaintiffs at low prices. One man was entitled as against all the world to ask another to refrain from doing an act which the other man could lawfully omit to do. It was said that the acts of the defendants were calculated to damage the plaintiffs in their business, and were unlawful and in restraint of the plaintiff's right to trade freely. He did not find in this case that the acts of the defendants were unlawful. A conspiracy existed when two or more persons combined to do an unlawful act, but no conspiracy could give rise to an action unless it violated or threatened to violate the rights of an individual as distinguished from the rights of the public at large. He could find in this case no acts alleged against the defendants which amounted to a violation of those rights, and he therefore came to the conclusion that the statement of claim disclosed no cause of action. To allow such an action to go for trial would cause unnecessary expense, and a waste of the public time. As their Lordships differed, Mr. Justice Phillimore withdrew his judgment, and the action was dismissed, on the ground that the statement of claim disclosed no cause of action.

THE LONDON POST OFFICE is at present in a state of semi-chaos, owing to re-arrangements at headquarters, and, as a result, letters and newspapers are being delayed one or more posts, or sometimes days. The *Times* and other leading papers have protested against the disorganisation which seems to prevail, but it may be some time before matters resume their normal condition, and readers of the Journal who may chance to receive belated copies are hereby informed of the probable cause.

PHARMACEUTICAL SOCIETY.

Library, Museum, School and House Committee.

At the ordinary monthly meeting of this Committee, held on Tuesday, June 19, the following particulars respecting the Society's Libraries and Museums were presented:—

ATTENDANCES.

	Total.	Highest.	Lowest.	Average.
Museum May	601	33		22
Library (May)	540	33	7	20

CIRCULATION OF BOOKS.

	Total.	Town.	Country.	Carriage Paid.
London (May)	126	64	62	12s. 2½d.
Edinburgh (May)	185	143	42	11d.

DONATIONS TO THE LIBRARY (LONDON).

Mr. E. Merck, Darmstadt:—Manual of Materia Medica, 1899.

Mr. J. O. Braithwaite, Chingford:—Steggall's First lines for Chemists and Druggists, 2nd Ed., 1857; Parkinson's Chemical Pocket-book, 4th Ed., 1809; Wurtz's History of Chemical Theory, 1869.

The Wellcome Research Laboratories, London:—Three papers by Dr. Jowett.

DONATION TO THE LIBRARY (EDINBURGH).

Pharmacy Board of Victoria:—Report for 1899.

DONATIONS TO THE MUSEUM (LONDON).

Messrs. Hodgkinson, Clarke and Ward:—Specimens of false stramonium and adulterated stramonium leaves.

TO THE HERBARIUM (LONDON).

Messrs. T. Christy and Co.:—Fresh flower of *Vanilla planifolia*.

Mr. R. J. Mellor, Hemel Hempstead:—Fresh specimens of *Menyanthes trifoliata*, *Orchis latifolia*, and *Eriophorum polystachyon*.

Mr. Lenton:—Fresh specimens of *Echium vulgare*, *Cephalanthera grandiflora*, *Gymnadenia conopsea*, *Habenaria bifolia*, *Ophrys muscifera*.

PURCHASE OF BOOKS.

The Committee authorised the purchase of the undermentioned works:—

Squire, Pharmacopœias of London Hospitals, 7th ed., 1900.

Perkin and Kipping, Organic Chemistry, 1900.

Beilstein, Organische Chemie, latest edition and supplement.

Schmidt, Konstitution der wichtigen Pflanzenalkaloide.

Koch, Die mikroskopische Analyse der Drogenpulver.

BRITISH PHARMACEUTICAL CONFERENCE.

A meeting of the Executive Committee was held at 16, Bloomsbury Square on Wednesday, June 14.

Present:—Mr. E. M. HOLMES (President, in the chair), Dr. Attfield, Dr. Symes, and Messrs. Atkins, Martin, Martindale, Hills, and Harrington (Vice-Presidents), Mr. J. C. Umney (Hon. Treasurer), Professor Greenish, Messrs. Atkinson, Bowen, Bird, Collier, Druce, Peck, Wells, and White, Messrs. Warren and Cracknell (Hon. Local Secretaries), and Messrs. Naylor and Ransom (Hon. General Secretaries).

Letters, expressing regret at not being able to be present, were received from Messrs. Payne and Turney.

The minutes of the previous meeting were read and confirmed.

It was resolved, on the motion of Dr. ATTFIELD, seconded by Mr. J. C. UMNEY, that a letter of condolence be sent to the family of the late Mr. Richard Reynolds, a former President, and one of the founders of the Conference.

It was also resolved, on the motion of Mr. WELLS, seconded by Dr. SYMES, that a letter of condolence be sent to the widow of the late Mr. R. J. Downes, a Vice-President of the Conference.

Mr. WARREN, on behalf of the Local Committee, presented a draft programme of the arrangements for the London meeting.

On the motion of Mr. MARTIN, seconded by Mr. BROWN, and supported by Mr. ATKINS, the draft programme was accepted, and the hearty thanks of the Executive were tendered to the Local Committee for the trouble it had taken in the matter.

APPOINTMENT OF A RESEARCH WORKER.

The PRESIDENT again introduced the question of the proposed appointment of a research worker, the consideration of which was postponed from the last meeting. After considerable discussion the following resolution was proposed by the PRESIDENT, seconded by Dr. SYMES, and unanimously carried:—"That, having promises towards the payment of a research worker, and recognising that the research laboratory of the Pharmaceutical Society of Great Britain is the best place for such work to be carried out, a sub-committee be appointed to confer with the Council of the Pharmaceutical Society, its President, or a Sub-Committee of it, on the subject."

The PRESIDENT announced that he had received promises of a subscription of five guineas per annum for at least three years from each of the following sixteen firms and individual pharmacists:—Messrs. Allen and Hanburys, London; Mr. F. B. Benger, Manchester; Messrs. J. L. Bullock and Co., London; Messrs. Burroughs, Wellcome, and Co., London; Mr. E. N. Butt, London; Messrs. Duncan, Flockhart, and Co., Edinburgh; Messrs. Evans, Sons, and Co., Liverpool; Messrs. Hearon, Squire, and Francis, London; Messrs. Horner and Sons, London; Messrs. Howard and Sons, Stratford; Messrs. Idris and Co., London; Messrs. T. Morson and Sons, London; Messrs. Parke, Davis, and Co., London; Messrs. Ransom and Son, Hitchin; Mr. P. Wyatt Squire, London; Messrs. Wright, Layman, and Umney, London.

The hearty thanks of the Executive were accorded to each of the firms and individuals named, and it was agreed that the list should now be thrown open for further promises of support from all members of the Conference and others interested in the object of the fund.

It was moved by Dr. ATTFIELD, seconded by Mr. MARTIN, and unanimously carried, that a vote of thanks be accorded to the President for the services which he had already rendered in the matter.

On the motion of Mr. NAYLOR, seconded by Mr. PECK, the following gentlemen were appointed to serve on the Sub-Committee to confer with the representatives of the Council of the Pharmaceutical Society on the subject:—The President, and Messrs. J. C. Umney, Druce, Bowen, and Ransom.

MISCELLANEOUS BUSINESS.

A draft list of officers for the ensuing year for recommendation to the annual meeting was considered.

Mr. NAYLOR announced that, owing to failing eyesight, which threatened to terminate in blindness, Mr. Nightingale felt compelled to send in his resignation as Assistant Secretary.

On the motion of Mr. NAYLOR, seconded by the PRESIDENT, the resignation of Mr. Nightingale was accepted with regret, and the deep sympathy of the Executive was accorded to him in his affliction. The Secretaries were authorised to engage Mr. J. Hearn to undertake temporarily the duties of Assistant Secretary.

Mr. WELLS intimated that an official invitation to the Conference to visit Dublin in 1901 would be given at the annual meeting.

ELECTION OF MEMBERS.

The following sixty gentlemen, having been duly nominated, were elected to membership:—J. H. Chin, London; Ed. Jones, London; B. Cockburn, Hawick; P. A. E. Richards, F.I.C., London; H. T. Escritt, London; Jno. A. Heaton, Burnley; S. Roberts, London; F. Davis, London; L. C. Deverell, London; G. Watson Gray, Liverpool; A. H. Dawes, London; G. W. Hatfield, London; John D. Cussons, Ossett; F. Andrews, London; C. W. Turner, Worcester; L. G. Golds, Norwood; C. T. Cornwell, Hanley; J. Cumming, Crewe; W. Stanley Scott, Cocker-mouth; W. Barron, Cheltenham; J. H. Gough, Leeds; Wm. Mair, Edinburgh; R. P. Rees, Down-lais; C. Ridley, Newcastle-on-Tyne; R. M. Ewell, Dover; T. C. Milton, Exeter; L. A. Woodhead, Uckfield; Thos. Macfarlane,

Ottawa; S. E. Lock, Fordingbridge; J. T. Roberts, London; Alfred C. Chapman, F.I.C., F.C.S., London; G. Heuley, Lyme Regis; A. C. Spreckley, London; J. B. Harrison, M.A., F.I.C., Georgetown, British Guiana; J. P. Catford, Liverpool; W. Cummings, Dundee; W. B. Nelson, London; A. R. Smith, Kettering; Chas. A. J. Troughton, Holywood, Co. Down; J. C. McCorquodale, Markinch, Fife; J. H. Nidd, Manchester; J. R. Johnson, Walthamstow, E.; J. E. S. Suddaby, Hull; J. Hearle, London; G. J. Turner, Clifton; A. R. Arrowsmith, London; Richard Pain, London; E. Kemp, St. Leonards-on-Sea; G. F. Forster, London; E. H. Church, Cambridge; A. Deck, F.C.S., Cambridge; M. Charlesworth, Frizinghall; H. A. Potter, London; R. Cranfield, London; Sydney P. Jacques, London, B. S. Campkin, Cambridge; Richard Sturton, Cambridge; A. Frayn, Stonehouse; Alf. Downing, Stonehouse; and Wm. Harrison Martindale, London.

ENGLISH NEWS.

ROYAL SOCIETY'S CONVERSAZIONE.—The second of the two conversazioni held annually in connection with the Royal Society took place at the Society's rooms, Burlington House, on Wednesday evening, June 20. There was a large attendance of distinguished scientists, who were received by the President, Lord Lister, and Mrs. Kempe, the wife of the Treasurer of the Society. The greater part of the exhibits were of a biological or physical character, the remainder representing archaeology and anthropology; there were also several collections of photographs, including a number of photographic and other observations of the total solar eclipse on May 28, 1900, taken under the auspices of the Eclipse Committee of the Royal and Royal Astronomical Societies. Mr. Dunstan showed a living specimen of a poisonous lotus, which has given great trouble to the authorities in Egypt, owing to its injurious effect on horses, sheep, and goats; also dried plants from Nubia, and the new glucoside lotusin, to which the plant owes its mischievous properties. When the plant is crushed with water prussic acid is generated, the glucoside being decomposed into prussic acid, sugar, and a colouring matter, to which the name lotoflavin has been given. Several Japanese books on botany were exhibited by Mr. Gowland, showing that the Linnean system of classification was not introduced into Japan till 1856, and that since then science has gone far in the East, Japanese students having long held their own with the investigators of the West in original biological research. Several practical demonstrations were also given.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.—At a meeting of this Association, held on Friday, June 15, Mr. F. Maitland (President) in the chair, the programme of the annual outing was submitted by the committee and confirmed. Messrs. F. Maitland, C. J. Park, J. D. Turney, F. W. Hunt, W. H. Woods, and J. Cocks were then appointed delegates to the British Pharmaceutical Conference meeting in London, in July next.

THE STRENGTH OF BELLADONNA PLASTERS.—At the City Police Court, Liverpool, on June 20, before the Stipendiary Magistrate, William Budden and Co., trading as the City Drug Stores, 19, London Road, Liverpool, were summoned for selling a belladonna plaster not of the nature and substance and quality demanded. Mr. Cripps, who conducted the prosecution, said the plaster was only one-tenth the strength prescribed by the British Pharmacopœia. On the plaster was the following label:—"These plasters were made with the green alcoholic extract of belladonna, which is not a B.P. preparation. Belladonna plasters B.P., 1898, are made with root extract, and are reddish brown in colour." Mr. Cripps said if a person bought a belladonna plaster he expected to get one. If a belladonna plaster had only one-tenth of the strength

necessary to do a person good it was a swindle. Defendants' manager appeared, and stated that the public would not have the other plasters, but a fine of £5 and costs was imposed.

DEFICIENT SPIRIT OF NITRE.—On Wednesday, June 13, two cases were heard before the North London magistrate, Mr. Chapman, against Isabella Miller, wife of Edward Miller, chemist and druggist, 247, Lower Clapton Road, London, N.E., and Sydney G. H. Long, chemist and druggist, 197, Lower Clapton Road, London, N.E., for selling sweet spirit of nitre which was deficient in ethyl nitrite to the extent of 77 and 34 per cent. respectively. The defence in both cases was that the deficiency was caused by evaporation, and that it was practically impossible to retail the spirit from a stock bottle without deterioration taking place.—It was urged for the prosecution that the British Pharmacopœia allows for loss by evaporation to the extent of 20 per cent. by volume of nitric oxide, or a reduction of 1.75 per cent. by weight of ethyl nitrite, and that any loss of strength beyond that is to the prejudice of the purchaser. It was also stated that the drug should be retailed in small well-stoppered bottles to counteract its tendency to deteriorate.—Mrs. Miller was fined 5s. and 12s. 6d. costs. In the case against Mr. Long, the Chemists' Defence Association defended and called Mr. C. G. Moor, analyst to the Association, to give evidence as to the extremely volatile properties of the drug and the important point that by the act of dividing the sample a loss of between 6 and 7 per cent. might occur. Briefly, Mr. Moor's evidence was to the effect that his analysis of the sample left with Mr. Long agreed with that of the public analyst, while an analysis of a large bottle received from Mr. Long in the same condition as sent out by the wholesale house, showed the same specific gravity as the sample, thus proving that no water had been added. In dividing a portion of the contents of the large bottle as the inspector had done, he found that a loss of between 6 and 7 per cent. occurred during the operation. On receiving the spirit the volumes of nitric oxide yielded by one volume of the spirit were 5.5; subsequently he extracted by means of a pipette an ounce on each of six consecutive days, the results being as follows: 5.2, 5.0, 4.7, 4.6, 4.4 and 3.4 volumes respectively. To check those figures another bottle was obtained from the wholesale firm who had supplied the first bottle; he found on receiving it that it contained 6.8 volumes, and that on June 13 it contained 6.1 volumes, a loss of about 10 per cent. It was also stated for the defence that Mr. Long had done all that was possible to prevent evaporation, and it was submitted that the Vestry was at fault in providing the inspector with a large bottle, as it necessarily entailed a greater loss.—The magistrate said there was no doubt that the article in question was deficient, and the law made defendant responsible; at the same time he had done everything in his power to keep the evaporation at a minimum, for which he was to be commended, the circumstances casting no slur upon him. The case would be dismissed on payment of 12s. 6d. costs.

POISONING BY BELLADONNA.—Marshall Street (38), tool-fitter, living in lodgings in Duke Street, Ashton, suffered from pains in the back and had obtained some medicine, also a bottle of liniment for rubbing purposes. On Saturday, June 9, he swallowed a quantity of the liniment in mistake for the medicine, and died from belladonna poisoning. At an inquest held on June 13 a verdict of "Death by misadventure" was returned.

POISONING BY PRUSSIC ACID.—At Barrow, on June 10, Mary Musson (14), went to the shop of Charles H. Smith, chemist, Dalton Road, Barrow, and asked for a pennyworth of carbolic acid to poison a vicious dog. Mr. Smith is reported to have suggested prussic acid as an easier means of death for the animal, and to have supplied the girl with threepennyworth of the poison, offering to accompany her and administer it. She, however, said her mother and several men who were with her could manage nicely. Then she went home and drank the poison. The local coroner subse-

quently severely censured the chemist for what he described as the reckless and careless manner in which he had discharged his duty. Had he exercised a little common sense the suicide would have been prevented. The provisions of the Pharmacy Act had not been complied with, and it would rest with the police whether a prosecution would follow.

PROSECUTION UNDER SECTION 17 OF THE PHARMACY ACT.—At Barrow Police Court on Monday, June 18, Charles H. Smith, chemist and druggist, Dalton Road, Barrow-in-Furness, was prosecuted by the police under Section 17 of the Pharmacy Act, 1868, for selling poison—to wit, prussic acid—contrary to the provisions of the Act, in a bottle which did not bear his name and address.—The prosecution arose out of the poisoning case reported above, and after hearing the evidence the magistrates fined defendant 10s. and costs.

IMPURE MILK OF SULPHUR.—At Matlock Police Court on Wednesday, June 13, John Henry Lusby, Matlock Bath, described as a drug dealer, was charged with selling four ounces of milk of sulphur which was certified by the county analyst to contain slightly over 50 per cent. of calcium sulphate.—It was stated for the defence that an order was given to a wholesale house, and by an error the impure article was sent. The firm was written to, and they at once replaced the article and took the whole of the responsibility for the error.—Captain Sandys, for the prosecution, said he did not want a conviction against defendant, who had just started in business, but suggested that as the wholesale firm assumed full responsibility they should pay the full penalty of 40s. and costs as compensation, and no conviction be recorded.—The Bench thought the case a very bad one, and ordered £2 to be paid for damages.

ARSENIC IN PHOSPHATE OF SODA.—At Marylebone Police Court on Friday, June 15, an application was made to Mr. Curtis Bennett, on behalf of the Paddington Vestry, for summonses against two chemists for selling a laxative drug, known as effervescent phosphate of soda, which, upon analysis, was found to contain, in one case, $3\frac{1}{2}$ grains and, in the other, $8\frac{3}{4}$ grains of arsenic per lb. It was stated that the Medical Officer of Health had advised the Vestry that, if taken in that contaminated state, the drug was undoubtedly dangerous to life, and liable to produce fatal results. He thought the public should know that, and thus be put on their guard. The summonses were granted.

SCOTTISH NEWS.

EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.—The annual excursion took place on Wednesday, 13th inst., to the picturesque and romantic district of Aberfoyle. About 120 members and friends left Waverley Station, Edinburgh, by special corridor train at 9 a.m., travelling by Forth Bridge, Dunfermline, Alloa, Stirling, and Bucklyvie, and reaching Aberfoyle about 11.20. The weather, which was dull on starting, had now brightened up, and the day promised sunshine and heat. Before dinner a party drove in magnificent weather along the Pass of Aberfoyle, at the base of Craigmore, to Loch Ard by the Bailie's Rock and Tree, and the famous Cave of Rob Roy. A splendid view was obtained of Loch Ard, which by many is believed to rival in beauty the more famous Loch Katrine. Others visited the Camahlatair Waterfall and other places of historic and scenic interest in the neighbourhood. At one o'clock the company dined in the Bailie Nicol Jarvie Hotel, the chair being occupied by Mr. George Lunan, and Mr. W. S. Glass acting as croupier. After doing ample justice to a sumptuous dinner, apologies for absence were intimated from Messrs. Storrar, Kirkcaldy; Kerr, Dundee; Ayre, Perth; and Ford, Kirriemuir. A characteristically humorous letter of apology from the Bard of Stenhouse-muir, Mr. Alexander Laing, was read by the Secretary. The loyal

toast having been enthusiastically honoured, Mr. David Jamour, Dunfermline, proposed "Success to the Annual Picnic," coupled with the name of the Honorary Secretary, Mr. C. F. Henry, who replied. Mr. David McLaren proposed "Prosperity to Aberfoyle and its local industries," coupled with the name of Rev. Mr. Taylor, minister of the parish. After dinner a large party started to drive by Duchray's Old Castle and the Glasgow Corporation Waterworks viaduct, and round Loch Ard, a distance of fully thirteen miles; but most unfortunately encountered a somewhat sharp thunderstorm, with heavy rain, which marred the day's pleasure not a little. Others visited the parish church, a beautiful modern building built in memory of Mr. Richard Hampson, of Glassert, a retired Manchester merchant prince, who owned the local estate. In consequence of the heavy rain, the large dining hall was converted after tea into a concert room, where several ladies and gentlemen entertained the company with songs and recitations. At 7 p.m. the train started for Edinburgh, which was safely reached about 9.30. The committee had made excellent arrangements for the comfort and enjoyment of the company, and the only undesirable item was the afternoon rain.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The members had a very successful botanical excursion to Colington Dell on Friday last, leaving Caledonian Station by train at 8.30 p.m., and walking back to town. Among plants collected were *Ranunculus acris*, *R. repens*, *R. ficaria*, *Lychnis diurna*, *Stellaria holostea*, *Tilia intermedia*, *Hypericum perforatum*, *H. quadrangulum*, *Acer pseudo-platanus*, *Geranium robertianum*, *Cytisus scoparius*, *Trifolium repens*, *Lois corniculatus*, *Prunus padus*, *Spiraea ulmaria*, *Geum urbanum*, *G. intermedium*, *G. rivale*, *Fragaria vesca*, *Rubus idaeas*, *Rosa canina*, *Alchemilla vulgaris*, *Crataegus oxyacantha*, *Epilobium alpinum*, *Hedera helix*, *Ægopodium podagraria*, *Heracleum sphondylium*, *Chaerophyllum sylvestris*, *Sambucus nigra*, *Asperula odorata*, *Valeriana officinalis*, *V. pyrenaica*, *Taraxacum officinale*, *Arctium lappa*, *Carduus lanceolatus*, *Centaurea nigra*, *Pectasites vulgaris*, *Tussilago farfara*, *Senecio jacobaea*, *Chrysanthemum leucanthemum*, *Fraxinus excelsior*, *Veronica chamædrys*, *Scrophularia nodosa*, *Lamium album*, *Stachys sylvatica*, *Symphytum tuberosum*, *Plantago lanceolata*, *Mercurialis perennis*, *Urtica dioica*, *Ulmus campestris*, *Quercus robur*, *Salix alba*, *Taxus baccata fastigiata*, *Allium ursinum*, *Scilla nutans*, *Dactylis glomerata*, *Lastræa filix-mas*, *Scolopendrium vulgare*, *Equisetum arvense*, etc. It was noted that the cold dry season had greatly retarded vegetation, the ash, for instance, was not yet in full leaf, and official valerian will not be in flower for probably a week yet. Mr. J. Rutherford Hill conducted the excursion.

SALE OF CAMPHORATED OIL.—On Wednesday, June 13, at the Paisley Sheriff Court, Robert Thomas McCowan, chemist and druggist, Paisley, was charged with having sold eight ounces of camphorated oil which was 20 per cent. deficient in camphor.—Dr. William Russell, Paisley, was also charged with selling camphorated oil 45 per cent. deficient in camphor and containing 60 per cent. of cottonseed oil.—Thomas Horne, chemist and druggist, Paisley, was charged with having sold camphorated oil wholly made up with sesame oil instead of olive oil.—Alexander Fraser, chemist and druggist, Paisley, was summoned for selling camphorated oil deficient in camphor to the extent of 30 per cent.—Evaporation was stated to be the cause of the deficiency in the first and the last cases; Dr. Russell pleaded that his assistant had made up the article in question pending a new supply of the proper article; on behalf of Mr. Horne it was submitted that there was nothing to show that sesame oil was prejudicial to the public, or that it had been used with any fraudulent intent.—The Sheriff said that none of the defendants had attempted to defraud the public, still chemists must keep their drugs up to the proper standard.—Each defendant was ordered to pay £1 1s. expenses.

FOREIGN NEWS.

PROPRIETARY ARTICLES' TRADE IN GERMANY.—The demand for proprietary articles has undergone considerable development of late, and the trade in such articles has to a great extent taken the place of the dispensing business. There is now a movement on foot to secure a sufficient and uniform profit to apothecaries selling these articles. It was commenced in Saxony, where the pharmaceutical associations have resolved to fix by their own authority the prices of proprietary articles, the sale of which is restricted to pharmacists in a manner to secure them a profit of 37½ per cent. The manufacturers were applied to, and many of them have allowed the selling prices to be fixed by the pharmaceutical associations. The pharmaceutical corporations of Bavaria and Baden have also followed the example of their Saxonian *confrères*.

EARLY CLOSING IN GERMANY.—From the first of October it will be unlawful for anyone in Germany, except the pharmacist, to keep his shop open after nine o'clock in the evening. The assistant pharmacists had presented to the Reichstag a petition asking that the new law might be applied to pharmacies also, but their suit has not been granted. It is, however, to be expected that the pharmacies will soon spontaneously join in the practice of early closing, their competitors, the druggists, not being exempted from the early closing regulation.

MEDICAL DUEL.—An interesting duel has been fought at Louveciennes between two eminent Paris doctors. The affair did not last more than a minute, one of the combatants being severely wounded in the hand. The circumstances leading up to the encounter are as follows, says the *Libre Parole*:—The "Club Medical" in the Avenue de l'Opéra, which has as members the principal medical men of Paris and the provinces, gives a dinner and a reception on the 7th of each month. Among those present at the dinner on Wednesday evening was Dr. Devillers, an intimate friend and travelling medical attendant of the now exiled Paul Déroulède. The President of the club is Dr. Pozzi, of 10, Place Vendôme, the well-known Senator who, during the sittings of the High Court, voted for the banishment of M. Déroulède. Dr. Pozzi did not attend the dinner, but came to the reception which followed it. As soon as Dr. Devillers saw him he came up to him, and said: "I am glad to meet you. I have not seen you since the sitting of the High Court; but, unfortunately, I cannot congratulate you on what you did there. It is an infamy to have dared to condemn Déroulède, who was acquitted by the jury." "Let us leave all that alone," replied Dr. Pozzi. "We are not here to talk politics," saying which, he walked into another room, followed closely by Dr. Devillers, who said he wanted to tell Dr. Pozzi that his conduct had been unbecoming. He also flung his glove in Dr. Pozzi's face, and after friends had tried in vain to arrange the affair, cards were exchanged and seconds appointed to arrange this "affaire d'honneur," which, according to French ideas, can only have one logical ending—the letting out of over-heated blood. The implement chosen for this operation was the sword, admitting the accomplishment of graceful poses and manœuvres more than the "pistolet" does. Dr. Pozzi, in company with his seconds—Messrs. Ranc and Bérardi, as also his chief de clinique, Dr. Jayle—was the first to arrive at the appointed rendezvous. His antagonist came on the scene half an hour later, accompanied by Messrs. Dumonteil and Beauvais-Devaux. The former was "directeur du combat." It might almost be said that the result was a foregone conclusion, for whereas Dr. Deviller is one of the best known swordsmen of Paris, Dr. Pozzi has never handled a sword for ten years, and at the outset was at a disadvantage. The conditions of the duel were that unstarched shirts be worn, and coat and waistcoat discarded. The points of

the swords being sterilised to avoid accidents, positions were taken up and blades crossed. Then the signal was given for hostilities to commence. Scarce a minute had elapsed ere the combat was ended, for Dr. Devillers sword skimmed clean into Dr. Pozzi's hand, penetrating deeply, and gliding along the bones at a depth of a couple of centimetres. Dr. Pozzi being disabled, the fight was stopped, and "honour satisfied."

SERIOUS EXPLOSION.—Fortune does not smile kindly upon that busy manufacturing quarter of the Paris suburbs known as Saint Denis, for fires seem to be peculiarly epidemic there. Many thousands of francs damage was done there only two or three months ago by an explosion in an oil refinery, and now an explosion has occurred in the sulphur works of Henri Deiss in the Rue du Laudit. This factory consists of three parallel buildings, of which one contained a steam engine, supplying power to the machines in the other buildings. At either end of this building, under the ground level, were two reservoirs filled with sulphur. The workmen at the factory, numbering fifty, went on in two shifts, one night and one day, in order that the work might be continuous. At half-past seven in the morning the boiler exploded, and the fireman, François Lemaire, a middle-aged man, was killed instantly. For a distance of hundreds of yards in the vicinity bricks, etc., showered down. Windows in neighbouring houses were shattered by the force of the explosion. Fire engines were speedily on the scene, and checked the spread of the flames, but the buildings are an utter wreck.

WHATEVER HIS SHORTCOMINGS may be politically, General de Galliffet has scored one point in associating himself with the set purpose to put down with an iron hand the sale of alcoholic liquors in the canteens of the French army. To be denied his "nip of absinthe," that most pernicious of all vile concoctions, goes hard with the French Tommy Atkins; still, General de Galliffet is bent upon doing him out of it, and has prohibited its sale. Wine, coffee, milk, etc., may be had as usual at the canteens, and as the soldiers cannot leave barracks without permission there is a chance that they may yet be weaned off "liquor." The idea is a laudable one, but has not escaped the attention of the vile caricaturist, a special breed of which is indigenous to French soil. Upon one of these sheets is depicted a cow following a regiment of soldiers, and upon the cow's udder are the words, "Canteen Galliffet."

EXTRACTS FROM CONSULAR REPORTS.

THE PRODUCTION OF CACAO IN SAMOA is in its infancy, the value of the export for 1899 being about £240; but it is expected that in the course of a few years cacao will represent the most valuable export and will add appreciably to the general income. According to Mr. J. H. Moore, one of the planters, at the present time there are about three hundred acres of land planted with cacao by the foreign residents, two-thirds of which property is in bearing condition. There has also been a certain amount planted on the native lands, but to what extent has not been ascertained; it is understood, however, that the natives, as well as the foreigners, are now commencing the cultivation of cacao in good earnest in several districts. The quality of the Samoan cacao is said to be of the highest class.

THE EXPORTATION OF SULPHUR from Carthage to Great Britain would increase, it was anticipated, during 1899, but it was found that the whole of the native production could be more advantageously disposed of in the locality, principally in the form of flowers of sulphur for dusting the vines. The total export of sulphur to Great Britain from the district only amounted to 1,880 tons.

THE DESTRUCTION OF CHESTNUT TREES in Corsica, for the production of gallic acid, has drawn a mild protest from the Director

of Customs. In his annual report he directs attention to the large and rapid increase in the exportation of gallic acid—from 2,319,650 kilos. in 1896, to 3,932,088 kilos. in 1897, and to 4,561,532 kilos. in 1898; an increase of 2,241,882 kilos. in two years—remarking that as the chestnut forests constitute one of the riches of the island, it is lamentable to see so large a number of proprietors sacrificing their trees to the exigences of the moment. When it is explained that chestnuts and chestnut flour form the staple food of the peasant in the district where the trees grow, and as the British Vice-Consul at Bastia observes, that the replanting of the trees is not compulsory, the protest of the Director of Customs will be seen to be amply justified.

THERE WAS A GENERAL FALLING OFF in the export of drugs from the Vilayet of Aleppo during 1899. Sesame, poppy, and castor oil seeds fell off by some 507 tons, value £8,158, the total being 755 tons, value £8,457, as against 1,262 tons, value £16,615; olive oil decreased by 172 tons, value £3,970; the latter article—135 tons, value £5,400—was exported mainly from Antioch and Killis, three-fourths of it going to Turkey and Egypt, and one-fourth to France and Belgium. The liquorice trade decreased 6,616 tons in volume, and £40,966 in value—5,248 tons, value £41,984 compared with 11,864 tons, value £82,950—but this is attributed to the fact that the American buyers last year postponed the shipment of a portion of their goods until the spring of this year. The export of albumin and yolk of egg—an industry of the city of Aleppo—fell off by 156 tons, value £7,800—227 tons, value £11,350, against 383 tons, value £19,150—the reason apparently being that a cheaper market has been found at Latakia and Tripoli. The greater part of the albumin and egg-yolk was exported to France, the remainder going to Germany, Austria, and Italy.

THERE WAS AN INCREASE in the 1899 export of almonds and apricot kernels from Aleppo of 73 tons, and in value of £1,840, the total being 260 tons, value £6,975, as against 187 tons, value £5,135; also in the export of opium, viz., 10 tons, value £8,450, as against 3 tons, value £2,460, in 1898. It should be noted, however, that at least seven-eighths of the export was supplied by Malatia, in the province of Kharpoot, and the remaining eighth only from Aleppo. The bulk of the opium was shipped to India, a lesser part was absorbed in Turkey, and a small residue came to France and the United Kingdom. Scammony root increased from 23 tons, value £575, in 1898, to 42 tons, value £1,050, in 1899.

THE IMPORTS OF DRUGS AND CHEMICALS into Japan during 1899 were valued at £328,496, as compared with £413,560 the previous year. The chief item under the above heading is alcohol, the value of the import being £210,405 in 1899, against £275,623 in 1898; other items are caustic soda, £53,272 and £43,152 respectively; potassium chlorate, £42,756, against £64,338; and phosphorus amorphous, £22,063, against £30,447. In aniline dyes and indigo the import was valued at £388,716, compared with £356,216 in 1898.

THE IMPORTS OF CHEMICALS, dye stuffs, and tannin substances from foreign countries and British possessions into the United Kingdom during the month ending March 31, 1900, amounted in value to £666,646, as compared with £744,106, the value of the imports for the corresponding period last year, showing a decrease of £77,460. The imports for the three months ending March 31 were valued at £1,765,505, as against £1,965,872 for the same period last year, or a decrease of £200,367 in value. The March imports of oils show an increase; also for the three months ending March 31, the total value of the imports being respectively £999,229 and £2,662,263, as against £697,645 and £2,108,382 for the corresponding periods in 1899.

ANALYTICAL NOTES.

DETERMINATION OF BISMUTH IN ORGANIC SALTS.—Duyk has proposed the precipitation of bismuth in the form of oxalate. Dietze has applied the process to several organic bismuth salts. 1 Gm. of the salt is heated to boiling with 0.4 Gm. of oxalic acid and 50 C.c. of water, the boiling being continued for five minutes; it is then filtered through a tared filter, washed, dried, and weighed. Bismuth oxalate contains, according to Duyk, 72.06 per cent. Bi_2O_3 ; according to Dietze, 74.12 per cent. The results obtained by the latter were:—

Bismuth benzoate ("about 40 per cent.")	43.49 to 43.53.
" salicylate " " "	39.59 " 39.81.
" subgallate " 55 "	58.12 " 58.24.
" subsalicylicum, Ph.G.III.	62.82 " 62.99.
" tannate ("about 40 per cent.")	41.99 " 42.37.
" valerianate " 73.75 "	77.86 " 78.12.
Dermatol.	48.17 " 48.25.

FICTITIOUS NUTMEGS.—J. Vanderplankin calls attention to the presence in commerce of spurious nutmegs, composed of a compressed powder mixed with earthy matter. On cutting these nutmegs the absence of vegetable structure is observed, and by heating for three minutes in boiling water they are softened and fall to pieces on rubbing between the fingers. The ash varies from 11 to 18 per cent., while the pure nutmeg only gives 2 to 3 per cent. The adulterated samples are also, in general, heavier. F. Ranwez has analysed various samples of these spurious nutmegs; he observes that in appearance they are similar to the genuine seeds, but the odour and taste are not quite normal. The fictitious nuts, freed from adhering white powder, gave the following figures as compared with the results obtained by Koenig from genuine nutmegs:—

	False nuts.	Genuine nuts.
Moisture.....	11.09	7.38
Ash.....	11.34	2.70
Ash insoluble in HCl (SiO_2)	3.90	—
Concrete nutmeg oil (ether extract) ..	15.42	34.27
Volatile oil.....	1.76	3.05
Cellulose	7.24	9.92

The author obtained the following results in the examination of genuine nuts:—

	3 samples whole nuts.	2 samples pure powder.
Moisture	15.53 .. 14.54 .. 15.47	8.59 .. 9.09
Ash.....	1.27 .. 3.29 .. 2.73	1.78 .. 4.88
Concrete Oil....	31.38 .. 33.40 .. 37.62	39.60 .. 32.02

—*Chem. Zeit. Repert.*, **24**, 31, after *Ann. Pharm.*

DETERMINATION OF URIC ACID AS AMMONIUM URATE.—E. Woerner publishes the following method for the determination of uric acid:—150 C.c. of urine is heated to 40–45° C. in a beaker and 30 Gm. of ammonium chloride is dissolved therein. The precipitate of ammonium urate is filtered, after standing about an hour, in such a manner that the precipitate is first placed on the filter and then the mother liquor passed through. The ammonium urate is now washed free from chloride with 10 per cent. ammonium sulphate solution, and then dissolved on the filter in 1 to 2 per cent. caustic soda solution. The filter is now washed with warm water, and the filtrate and wash water heated until all the ammonia is driven off. The ammonia free solution is now heated in a Kjeldahl flask with 15 C.c. of concentrated sulphuric acid and several crystals of copper sulphate, until the solution becomes bluish green. The cooled contents are then washed into a distillation flask and after the addition of 60 C.c. of 33 per cent. caustic soda solution, the ammonia is distilled off into 25 to 30 C.c. of decinormal H_2SO_4 solution, which is then titrated in the usual manner. Each 1 C.c. of acid used corresponds to 0.0042 Gm. of uric acid.—*Pharm. Zeits.*, **45**, 48, after *Zeits. für Physiol. Chem.*, **29**, 1.

THE PARIS EXHIBITION.

Chemistry and Pharmacy.

One of the most instructive lessons to be learnt from the Paris Exhibition has reference to the development of manufacturing industries in Germany. By comparison with the relative position those industries occupied at the time of the first International Exhibition in 1851, it will be seen that not only has there been remarkable progress, but that in many respects Germany has made a disproportionately greater advance than other countries, and has even become prominent in branches of manufacture which were formerly of comparatively small magnitude in Germany. In no respect is this changed position more conspicuous than in the various chemical industries, some of which have come into existence since the Exhibition of 1851, while others that were then almost exclusively located in this country have since that time been carried out in Germany to such an extent as to offer serious competition with this and other countries, which formerly had almost a monopoly of the trade in certain kinds of produce.

The display of products by which some estimate can be formed of the importance of chemical industry in Germany at the present time will, therefore, constitute one of the chief attractions of the great show, which will soon bring together a multitude of visitors from all parts of the world. When it is remembered that at the close of last century the science by which such gigantic results have been brought about, was then only, as it were, a seedling plant that had been reared in the laboratory of the apothecary, the admiration of its capabilities, which cannot well be avoided, should, in the case of pharmacists, be accompanied by a hearty desire to continue the intimate relationship which then existed between pharmacy and chemistry.

A general description of this part of the Exhibition has been given by Dr. Zipperer in recent numbers of the *Pharmaceutische Zeitung*, and, as a preliminary to more detailed reports on the exhibits relating to chemical and pharmaceutical industries, the following particulars, taken from that source, will serve to give some idea of the manner in which those industries are represented by Germany and by other countries.

The exhibits representing the chemical industries of Germany, as they now exist, have been contributed by a number of firms, who have agreed to abstain from mention of their names as the manufacturers of particular articles, in order to give greater prominence to the display in a national point of view.

The arrangement of these exhibits has been carried out by Drs. E. A. Merck, Laubenheimer, H. Brunck, A. Steche, W. Heraeus, and Messrs. J. Stroof, W. Dittmar, H. Stücklen, under the general direction of Dr. Holtz, and for that purpose a classification under eight heads has been adopted:—

1. Alkali manufactures, salts, artificial manures, etc.
2. Fine chemicals, pharmaceutical products.
3. Materials used in dyeing, calico printing, photography.
4. Pigments, lacs, varnishes, glue, gelatin, etc.
5. Tar products.
6. Artificial dyestuffs.
7. Ethereal oils.
8. Apparatus and appliances for laboratories and factories.

The glass cases and stands containing the articles shown are distributed in the German Court over a superficial area of about 1,050 square yards.

HEAVY CHEMICALS.

In Section 1 the products of the Stassfurt factories occupy a prominent place, together with those representing various stages of the sulphuric acid manufacture, the Leblanc and Solvay processes, as well as the production of cyanides, ammonia salts and superphosphate, phosphorus compounds, chromates, permanganates, barium-, calcium-, aluminium-, and tin salts. In connection with all of these products, the exhibits in this section illustrate the great

progress that has been made in the methods of working, by the introduction of new sources of raw material and by the production of new compounds, such as calcium carbide, compressed gases, etc., which mark the difference between the chemical industry of the present time and that of fifty years ago.

SYNTHETICAL PRODUCTS.

In Section 2 the exhibits are of more especial interest to pharmacists, inasmuch as they comprise the various synthetic and other products that have been introduced for medicinal use during the last ten or fifteen years. Together with these are included the albuminoids, fats and carbohydrates of animal and vegetable origin, as well as other products which are at present chiefly of interest from a scientific point of view, such as the xanthin bases lately obtained by E. Fischer, the new elements extracted from pitch-blende. The objects of pharmaceutical interest in this section have been arranged by Dr. E. A. Merck, who has devoted special attention to the work, and has been assisted by Drs. C. Duisberg, F. Engelhorn, C. Kolbe, and Weller. Besides the salts of alkaloids and synthetic products, some of the organo-therapeutic preparations are shown, but principally those which have been found practically useful. Some very interesting bacterial products are also shown, such as a pure culture of the diphtheria bacillus, Behring's solid and liquid products, Koch's tuberculin, tetanus anti-toxin in solid form, mallein, lepraserum, and germ-free lymph. These exhibits will attract attention also as showing the very great development that has taken place, as the result of German research, in this department. Another class of new products that will attract notice are the food preparations which have been recently introduced under the names of somatose, tropon, etc. These are at present almost entirely manufactured by German firms.

HISTORICAL DISCOVERIES.

Closely connected with the exhibits of Section 2 are a number of specimens in two cases, which occupy a position near the centre of the court. They are chiefly of historical interest, as marking the progress of chemical science during the nineteenth century. This group has been arranged by Dr. H. W. Wichelhaus, at the request of the German Chemical Society, and it serves to illustrate, in ten sections, the progress of chemical discovery and the consequent improvements made in various branches of chemical industry—relating to the production of pigments, photographic preparations, matches and explosives, lighting materials, paper-making, perfumery articles, pharmaceutical preparations, dyeing materials, natural and artificial. One of the earliest discoveries of the nineteenth century is represented in the collection by a specimen of morphine, which bears the label, "Discoverer, F. Sertürner, 1811," with a reference to the paper on the subject then published in Gilbert's 'Annalen der Physik und Chemie,' 55, 61, *et seq.* Next in order of date is a specimen to illustrate the German discovery of artificial ultramarine by C. G. Gmelin in 1828, and also the same discovery claimed to have been previously made by L. Guimet at Lyons in 1826.

Other specimens illustrate various discoveries made by German chemists during the century, to the number of upwards of two hundred, and in the case of dyeing materials they are accompanied by samples of dyes or printed fabrics, which serve to show the application for which the several products are suitable.

RECENT TECHNOLOGICAL RESEARCH.

In Sections 3 and 4 the exhibits illustrate progress in several different branches of chemical industry, such as the production of formalin, fluorine salts, rare oxides for incandescent gas burners, glycerin, lubricating oils from petroleum, etc., artificial perfumes, photographic and Röntgen ray materials, which mark some of the discoveries at more recent periods.

CHEMISTRY OF DESTRUCTIVE DISTILLATION.

Sections 5 and 6 are especially devoted to the illustration of results following from the chemical investigation of the different

kinds of tar and from the study of the general chemistry of destructive distillation.

In their economic relations and effects those results have been manifold and very important, one of the latest—the artificial production of indigo—is now being developed by the Badischen Anilin and soda Fabrik with every prospect of success.

ESSENTIAL OILS AND ALLIED BODIES.

Section 7 contains specimens of ethereal oils, etc., and the various materials employed for their preparation; also the oils used in medicine and perfumery, as well as the synthetic products discovered within recent years and applied for the same purposes. One of these products—ionone—discovered by Tiemann, and now largely used as a substitute for the natural violet perfume, is exhibited in Section 3.

APPARATUS.

In Section 8, which occupies a considerable portion of the court, all kinds of apparatus and appliances for laboratory operations and for use in factories are exhibited. Among the more recent novelties is the air-liquefying machine of Dr. Linde, which will be kept working to give visitors opportunity of witnessing its capability and of observing the remarkable characters of atmospheric air in a liquid form. Pharmacists will be interested in the machines for making compressed tablets, exhibited by C. W. E. Lindörfer, Strassburg, and by Fritz Kilian, Berlin. The platinum retorts for concentrating sulphuric acid, exhibited by W. C. Heraeus, of Hanau; the acid pumps and other appliances, exhibited by Plath and Piepmayer, of Cassel; the acid-resisting evaporating pans, exhibited by Baron de Dietrich, of Niederbronn, in Alsace, and by the Mannheim Iron Foundry and Machinists, bear testimony to the enormous development of chemical industries in Germany; they also show that the incidental requirements which have thus arisen have been very efficiently provided for in the immediate vicinity of the various factories.

MISCELLANEOUS.

The British Section does not offer anything like such a complete representation of the chemical and pharmaceutical industries of the country as that given in the German Section. Some of the large alkali makers have exhibits. Macfarlane, Howard, and Smith exhibit opium and cinchona alkaloids and their salts, but otherwise there is little more than soap and perfumery.

In the Russian Section petroleum products are conspicuous, together with platinum vessels, candle and paper making, while pharmacy is represented by the exhibits of R. Koehler, of Moscow, and A. Poehl, of St. Petersburg.

In the Austrian Section the principal exhibitors are the Chemical and Metallurgical Association at Aussig, the Chemical Works at Hruschau, where the manufacture of alkalis, chlorine, etc., is being carried out by the electrolytic method. The ceresin and fat industry is represented by Wagenmann and by Sarg. Pharmaceutical products form part of the exhibits, and Ch. Olszewski exhibits the apparatus constructed by him for liquefaction of gases in 1884 and 1890.

The chemical industries of Hungary are represented in a separate section, chiefly by the exhibits of Nobel's Dynamite Factory at Poszony, and pharmacy by the exhibits of several makers of specialties.

The Italian Section is chiefly remarkable for the exhibits of essential oils and perfumes.

The Belgian Section is still too incomplete to admit of description, and the exhibits representing Spain, Roumania, Denmark, Holland, and the United States do not offer much of interest beyond perfumery and tobacco.

The French Section contains a much larger number of exhibits than that of any other country. Chemical industries are represented by the Société de St. Denis and the Usines du Rhone, by the Usine de St. Gobain, the Société de Goemons, and others, too numerous to particularise, while the number of exhibitors of pharmaceutical products is still larger, and will offer abundant material for more detailed description.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Guaiaci Lignum.

GUAIACUM WOOD or LIGNUM VITÆ is obtained from the stem of *Guaiacum officinale*, Linn. (N.O. Zygophyllaceæ), and *G. sanctum*, Linn., two evergreen trees which grow to a great height—the first in Hayti, Jamaica, and other parts of the West Indies, while the second occurs in Cuba, the Bahamas, etc. The trunks of the trees consist chiefly of a dark heartwood, in which brown zones alternate with darker olive-green or nearly black ones; it is surrounded by a narrow ring of yellowish sapwood and a grey or ash-coloured bark. The wood of *G. sanctum* is smaller than that of *G. officinale*, and is said to be paler and less dense. After the trees are felled, the bark is removed and the heartwood cut into logs or billets for export. The wood is used for medicinal purposes in the form of chips, turnings, or raspings. It possesses stimulant, diaphoretic and alterative properties, which depend upon the presence of resin; the wood is used in the preparation of Liquor Sarsæ Compositus Concentratus.

CHARACTERS.—Guaiacum wood should be dark greenish-brown in colour, dense, hard, and so heavy that it sinks in water. Any lighter, pale yellow chips or turnings consist of the sapwood, and should be rejected. The taste of the heartwood when chewed is acrid, owing to the presence of resin, which also causes it to give off a somewhat aromatic odour, recalling that of benzoïn, when heated.

TESTS.—Guaiacum wood contains a dark resin which gives a deep blue colour when treated with oxidising agents, so that an alcoholic tincture of the heartwood assumes a blue colour on the addition of a dilute solution of ferric chloride.

NOTES.—The distinctive characters of guaiacum wood are its dark green colour, great weight, and acrid taste. When examined with a lens the medullary rays are seen to be straight, narrow, and closely approximated; the vessels are distinct, usually single, and arranged in concentric zones. Resin is present to the extent of 20 to 25 per cent. in the heartwood, but only about 3 per cent.—and that of different composition—occurs in the sapwood.

Guaiaci Resina.

GUAIACUM RESIN is obtained from the stem of *Guaiacum officinale*, Linn., or *G. sanctum*. It may exude in tears spontaneously or after deep cuts have been made in the stem or branches, but it is chiefly extracted by the aid of heat. Billets about three feet long are bored longitudinally with an auger, and one end of each is then placed on a fire, the heat of which causes the resin to flow out of the boring at the other end. Or, the wood may be reduced to chips or sawdust and boiled in a solution of common salt, the resin being skimmed off as it rises to the surface. The resin in tears is the best, containing less insoluble matter than the masses; that extracted by boiling the wood is most inferior in quality. The resin possesses the same properties as the wood, but in much greater degree; it is used in the preparation of Mistura Guaiaci, Pilula Hydrargyri, Subchloridi Composita, Tinctura Guaiaci Ammoniata, and Trochiscus Guaiaci Resina. The dose of the resin is 5 to 15 grains.

CHARACTERS.—Guaiacum resin may occur in rounded tears about 25 Mm. in diameter, but is usually seen in large, dark-coloured masses, often more or less covered with a greenish powder. It is brittle, breaking with a clean, glassy fracture, and thin splinters are transparent, their colour varying from yellowish-green to reddish-brown. The latter is the natural colour of the resin prior to oxidation taking place. The powdered resin is greyish, but becomes green on exposure to light and air, as the result of oxidation. The taste of the resin is slightly acrid, and its odour when warmed is somewhat balsamic, recalling that of benzoïn.

TESTS.—Guaiacum resin is easily identified by its behaviour with oxidising agents, a solution in 90 per cent. alcohol assuming a deep blue colour on the addition of a dilute solution of ferric chloride. The colour is destroyed by reducing agents, but restored by oxidising agents.

NOTES.—The distinctive characters of guaiacum resin are the greenish powder with which it is usually more or less covered, its peculiar odour and taste, and the varying colours it exhibits when splinters are viewed by transmitted light. The resin consists chiefly of guaiaconic, guaiaretic (guaiacinic), and guaiacic acids. All three have been considered to be probably condensation products from tiglic aldehyde and guaiacol. The first is amorphous, constitutes about 70 per cent. of the resin, and produces the blue colour with oxidising agents. Guaiaretic and guaiacic acids are crystalline, as is also guaiac yellow, the colouring matter of the resin. Another constituent, distinguished as beta-resin, does not appear to differ greatly from guaiaconic acid in composition. By dry distillation, guaiacum resin yields guaiacene (the aldehyde of tiglic acid), guaiacol (pyrocatechin methyl ether), creosol, and pyroguaiacin. Guaiacum resin in tears leaves about 1.5 per cent. of residue—gun, vegetable debris, etc.—when dissolved in strong alcohol; the masses may leave from 7.5 to 25 per cent.

Hæmatoxyli Lignum.

Logwood is obtained from the stem of *Hæmatoxylon campechianum*, Linn. (N. O. Leguminosæ), a tree of medium size, indigenous to Campeachy, Honduras, and other parts of Central America, but naturalised in Jamaica and other West Indian islands. The heartwood alone is used, being exported in logs or billets, from which the bark and sapwood have been removed. It is usually seen in chips or coarse powder, which has mostly been prepared as a dye-stuff by being exposed in large moist heaps and fermented. When required for medicinal use, however, care should be taken to secure logwood which has not been fermented; it has then a sweeter taste and is more astringent. Logwood is employed in medicine for its antiseptic and astringent properties, and is used in the preparation of Decoctum Hæmatoxyli.

CHARACTERS.—Logwood is hard, compact, and heavy, dull orange to purplish red externally, and reddish-brown internally, the colour varying with the proportion of colouring matter present. A transverse section of the wood exhibits narrow and closely approximated medullary rays, also narrow concentric dark zones alternating with paler ones in which the presence of colouring matter is less evident. The chips or coarse powder should be unfermented, the taste then being sweet and astringent, owing to the presence of hæmatoxylin and tannin respectively; the slight and somewhat agreeable odour, recalling that of violets, is probably due to the presence of a trace of volatile oil. When chewed the wood colours the saliva dark pink or violet, a similar colour being imparted by logwood to dilute aqueous solutions of caustic alkalies.

NOTES.—The distinctive characters of unfermented logwood chips are their reddish-brown colour and the violet coloration they impart to alkaline solutions. The colourless hæmatoxylin—a crystalline body which is present in logwood to the extent of about ten per cent.—is oxidised by alkalies to hæmatein, which forms dark reddish-brown plates with a yellowish-green lustre and is soluble in alkaline solutions, a blue or reddish liquid resulting. The same change is brought about by the fermentation of logwood; the chips darken in colour and the hæmatein formed causes patches of a dark beetle-green lustre to make their appearance on the surface. Hæmatoxylin (hæmatin), when pure and unoxidised, occurs in colourless crystals, which have a sweet taste, resembling that of liquorice, without bitterness or astringency, and are feebly antiseptic. The crystals tend to become yellowish or of a yellowish-rose colour on keeping, and may, as oxidation proceeds, become bitter, acrid, and slightly astringent, owing doubtless to the formation of hæmatein. Other constituents of logwood are tannin, resin, and a trace of volatile oil.

Hamamelidis Cortex.

HAMAMELIS or WITCH HAZEL BARK is obtained from *Hamamelis virginiana*, Linn. (N.O. Hamamelidaceæ), a shrub indigenous to the United States and Canada. The plant attains a height of about ten feet, and bears leaves and edible fruit resembling those of the common hazel. The bark should be collected in the spring and dried. It possesses astringent and hæmstatic properties, and is used in the preparation of Tinctura Hamamelidis.

HAMAMELIS BARK.—A, Outer surface of bark with cork attached; B, ditto^o with cork partly removed; C, inner surface of bark; D, transverse section through A. All natural size.

CHARACTERS.—Hamamelis bark occurs usually in thin channelled or curved pieces about 1.5 Mm. thick and varying from 0.5 to 2 Dcm. long. They are sometimes covered with a smooth silvery grey or ash-grey cork marked with transverse lenticels; in older pieces the cork is darker in colour, fissured and scaly. Frequently, however, the pieces of bark are free from cork, the smooth reddish-brown cortex being then exposed and exhibiting under the lens slight transverse striations. The inner surface of the bark is pale reddish-pink in colour and finely striated longitudinally, small portions of dense white wood with numerous fine medullary rays being frequently found adhering to it. The cork and cortex break with a short fracture, but that of the inner portion of the bark is coarsely fibrous, the bast tending to separate into laminæ, owing to the presence of numerous tangentially elongated groups of bast fibres. A smoothed transverse section of the bark exhibits those groups of bast fibres and a dark narrow cortex, the latter separated from the bast by a pale tangential line of sclerenchymatous cells; in some pieces of bark those sclerenchymatous cells may form the outer layer, owing to the

removal of much of the cortex, in addition to the cork. The bark has no marked odour; its astringent taste is due to the presence of tannin.

NOTES.—The distinctive characters of hamamelis bark are its pinkish colour, pale grey but not glossy cork, and the line or ring of sclerenchymatous cells. Oak bark has a silvery, glossy bark, and is usually of a brownish colour; willow bark has a dull greenish-brown cork, is usually striated on the outer surface, and does not exhibit a line of sclerenchymatous cells. The most important constituent of hamamelis bark is tannin, of which it contains about 6 per cent.; gallic acid, resin, traces of bitter and pungent principles, volatile oil, etc., are also present. The tannin is partly crystalline—hamamelitannin—and partly amorphous. The powdered extract known as “hamamelin” is a mixture of substances.

Hamamelidis Folia.

HAMAMELIS or WITCH HAZEL LEAVES are obtained from *Hamamelis virginiana*, Linn., both fresh and dried leaves being employed. They are usually collected in the autumn and occur in commerce in a somewhat indifferent state of preservation, being frequently discoloured, broken, and pressed together into more or less compact masses. Like the bark, they possess astringent and hæmostatic properties. The fresh leaves are used in the preparation of Liquor Hamamelidis, but Extractum Hamamelidis Liquidum is prepared from the dried leaves; the liquid extract enters into the composition of Unguentum Hamamelidis.

HAMAMELIS LEAF.—Under surface, showing veins and veinlets. Exact size.

CHARACTERS.—Hamamelis leaves are from 7 to 15 Cm. in length, dark green or brownish-green on the upper surface and paler on the under surface. They are broadly oval in outline, obtuse at the apex, and have a sinuate margin. Towards the base the lamina becomes narrowed and oblique; it is also slightly heart-shaped and shortly stalked. The leaves are pinnately veined, the veins being more prominent on the under surface. The lateral veins, which run direct from the midrib to the margin, are practically the only ones that can be seen on the upper surface. In the angles formed by the lateral veins branching or stellate hairs may usually be found, being more frequent on young leaves. The

slight odour of the leaves is not characteristic; their astringency is due to tannin and the presence of some bitter principle is also indicated by the taste.

HAMAMELIS LEAF.—Upper surface, showing lateral veins. Exact size.

NOTES.—The distinctive characters of hamamelis leaves are the sinuate margin, the lateral veins running direct to the margin, and the branching or stellate hairs. Very young leaves are brown in colour and densely hairy. The drug contains tannin, gallic acid, a bitter principle and a trace of volatile oil. On distilling either fresh or dried leaves with water or dilute alcohol some decomposition appears to take place, as the distillate possesses an odour differing from that of the leaves, owing apparently to the formation of some aromatic body. The official liquid extract also contains a trace of protocathechuic acid. The name “hamamelin” is given to a powdered alcoholic extract of the leaves or bark, that prepared from the leaves being the more efficacious.

Obituary.

FRYER.—On June 8, Charles Hart Fryer, Dispenser, Holborn Union Infirmary, Highgate, N. Aged 46. Owing to incorrect information having been supplied, the name of Mr. Charles John Fryer, Chemist and Druggist, of Wandsworth Road, S.W., was inadvertently included in the Obituary column last week, instead of that of Mr. C. H. Fryer. Sincere apologies are hereby tendered to Mr. C. J. Fryer for the error which, it is trusted, has not resulted in any serious inconvenience.

KERR.—At Panama, on May 18, suddenly, from yellow fever, William Alexander Kerr, “La Esperanza” estate, Salvador, Central America. Aged 25. The younger son of Charles Kerr, pharmaceutical chemist, Dundee.

KNIGHT.—On May 13, Jesse Knight, Chemist and Druggist, Fenton (Staffs). Aged 35. Mr. Knight was a life member of the Pharmaceutical Society, and had been connected with the Society as an Associate and latterly as a member since 1889.

NEWBY.—On May 22, Richard Irving Newby, Chemist and Druggist, Truro. Mr. Newby had been a member of the Pharmaceutical Society since 1869.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

BROMOFORM
POISONING.

An instance of the danger due to the separation of bromoform from an aqueous vehicle on standing, even when suspended by means of tragacanth, is afforded by the case communicated by C. E. Stokes to the *British Medical Journal*, for June 2 (p. 1340), in which two children nearly lost their lives after taking each a dose of whooping-cough mixture, which chanced to be the last in the bottle. After vigorous medical treatment, including the practice of artificial respiration in each case for an hour and a half, both patients were saved.

ALUMINIUM
PHOSPHIDE.

Fonzes-Diacon has succeeded in obtaining the combination of phosphorus and aluminium by igniting, by means of a magnesium ribbon, a mixture of amorphous phosphorus and powdered aluminium, in the molecular proportions of the formula P_2Al_2 . Even better results are obtained by employing a cartridge of agglomerated aluminium and barium dioxide to start combination of the mixture of aluminium and phosphorus. When this is done in a covered crucible, a friable black mass is obtained, containing a central cone of pure yellowish aluminium phosphide. This body is likely to prove useful as a source of pure phosphoretted hydrogen, that gas being liberated in large volumes when the phosphide is treated with water. It is not spontaneously inflammable, but ignites on contact with a flame. From the low atomic weight of aluminium, the yield of the gas from a given weight of the phosphide is large. Aluminium forms similar combinations with sulphur, selenium, arsenic, and antimony, and all these compounds, when treated with water, give the respective hydrogen gases in a state of great purity.—*Comptes rend.*, 130, 1314.

ETHER TEST
FOR

SCAMMONY RESIN.

P. Guigues finds that the solubility of scammony resin in ether is not, as is generally supposed, a simple and reliable test of its purity, since the same sample of resin varies greatly in solubility with ethers from different sources. He finds that the chief cause of these discrepancies is the presence of alcohol and of water in the ether. Thus, scammony resin that was soluble in ether, sp.g. 0.735, containing 15.5 per cent. of 98 per cent. alcohol, was much less soluble in absolute ether; while in a sample of pure ether, containing only 0.6 per cent. of water, 23.8 per cent. of the same resin was undissolved. Marked discrepancies were also noted in the solvent power of different specimens of ether having the same sp.g., 0.720, and free from either impurity, but of different origin. Not only does the quality of the ether affect the solubility of the resin, but also the quantity of the solvent employed. Thus after a clear saturated solution of scammony resin in ether is obtained, it precipitates, in most cases, on the further addition of the solvent.—*Journal de Pharm.* [3], 11, 529.

KALAGUA,
A KOLA
SUBSTITUTE.

From its effect as a stimulant on the digestive system of animals, Hendrickx and Coremans consider that *Theobroma kalagua* is likely to prove a useful substitute for kola and cocoa. Experiments conducted with the dried leaves given to various herbivorous domestic animals, in the form of an electuary, in the dose of 1 gramme to each 70 kilos of body weight, give evidence of its powerful stimulating effect on the processes of nutrition. It has a distinct diuretic action, but it is without influence either on the heart, the respiration, or the temperature, nor does it possess any antiseptic properties.—*Schweiz Woch. für Pharm.*, 38, 526.

LITHIUM
IN
PLANTS.

Herr E. Tschermak finds lithium to be a much more widely diffused element in the vegetable kingdom than has hitherto been supposed. It was detected chiefly in the leaves, the finer portions of the stem, the flower, and the fruit.—*Zeitsch. Landw. Vers.-Wesen Oesterreich*, 2, 560.

NEW SULPHO-
PHENYLATES.

J. Baldacinni has prepared the sulpho phenylates of cadmium, lithium and magnesium; all three combinations give, when pure, the characteristic reactions for the metals and the acid. The cadmium salt may find useful application in eye diseases, while lithium sulphophenylate is recommended as an antiseptic uric acid solvent, and the magnesium compound as an anti-putrefactive purgative.—*Oesterr. Zeits. für. Pharm.*, 54, 99.

KOSAM
SEEDS.

Kosam seeds, the product of *Brucea sumatrana*, a remedy for dysentery, are the subject of long articles in the *Revue des Cultures Coloniales* (vol. 6, pp. 97, 129, 193). Heckel and Schlagdenhauffen deal with the botanical source and description of the drug as well as its chemical composition, and show that it is not a new remedy for dysentery, as has been stated by Dybowski. Indeed, the Abyssinians have used it for this purpose from time immemorial. Mongeout has shown that the stem and root barks are preferable to the seeds for internal administration, owing to the large amount of fat present in the seeds, which delays digestion and hinders the action of the drug. Dybowski later maintains that the drug constitutes a new remedy for dysentery inasmuch as experiments recently conducted by Bertrand and Physalix demonstrate that the activity of the drug is not due to the quassin found by Schlagdenhauffen but to a glucoside, which Bertrand has named kosamin.

ALBUMIN OF
STRYCHNOS
SEEDS.

Em. Bourquelot and J. Laurent find that the horny albumin of the seeds of *Strychnos ignatii* and of *Strychnos nux vomica* contain the same carbohydrates, mannane, and galactane, as the leguminous seeds already examined by them, but that the proportion of galactane is remarkably high; this is notably the case in *nux vomica*, so that crystalline galactose may be easily obtained by the hydrolysis of its albumin, the yield being greater than that obtained from lactose, the source from which this sugar has hitherto been prepared.—*Comptes rend.*, 130, 1411.

RADIOLARIA
FROM THE
UPPER CHALK.

W. Murton Holmes, in a paper recently communicated to the Geological Society, describes some radiolaria contained in the cavities of two small flints which were thrown out of the new cutting between Coulsdon Station and the new Merstham tunnel on the L. B. and S. C. Railway. They were probably derived from the zone of *Holaster planus*. After treatment with hydrochloric acid, the material yielded silicified casts of foraminifera as well as radiolaria. The surface of the radiolaria is so much altered by corrosion that specific identification is in most cases impossible. Twenty genera have been recognised, and the organisms appear to belong to 41 species of these genera. A list of the radiolaria is given, accompanied by a short description of each form, and four new species are described. The *Discoidea* appear to have the predominance, and the species of *Dictyomitra* come next in numerical order.

MERCURY
CHLORO-
SULPHIDE.

When a dilute aqueous solution of mercuric chloride is precipitated with a solution of calcium polysulphide the resulting white precipitate obtained is not, according to F. Bordroux, a polysulphide of mercury, but a chlorosulphide having the constitution $Hg_2S_5HgCl_2$. It is very stable at ordinary temperatures, but is slowly decomposed by light.—*Comptes rend.*, 130, 1398.

TESTS FOR ARSENIC.

BY DR. B. H. PAUL AND A. J. COWNLEY.

Though absolute purity is a condition rarely attainable in regard to any material, whether it be a natural or manufactured product, the unsuspected presence of a foreign substance in any article may be a source of considerable inconvenience, or even of danger. In no case is that consideration of greater importance than in regard to articles employed for medicinal purposes. Hence the desirability of exercising such a control of the quality and character of those articles as is provided for by the tests prescribed in pharmacopœias for ascertaining that they come up to required standards of purity. Neglect of those precautions may sometimes be attended with no more serious consequence than that of misleading even academic professors to erroneous conclusions as to the chemical convertibility of one substance into another, as in the alleged conversion of brucine into strychnine or of cinchonine into cinchonidine, and, more recently, of phosphorus into arsenic; but some of the possible impurities of articles used for medicinal purposes may be of a deleterious character, and, more especially in such cases, the greatest care should be taken to ensure the utmost attainable approximation to official standards of purity. Such standards are necessarily relative and are established from consideration of a variety of circumstances applying to particular instances.

Arsenic, from its poisonous character, requires corresponding care to be exercised in the testing of articles which may be liable to contain it as an impurity. Consequently, methods for readily and accurately ascertaining that such articles are practically free from arsenic are worth the attention of those whose business it is to guarantee the purity of articles employed for medicinal purposes. The tests for arsenic given in the British Pharmacopœia are of very unequal value and applicability, and some fuller indications on those points would have been very useful. Thus, for instance, the test which depends upon the formation of arsenous sulphide by treatment with sulphuretted hydrogen is quite useless in many instances, and in many others it would be very likely to mislead unless the precipitate could be obtained in sufficient quantity for further testing and identification as arsenous sulphide.

Some years ago, when attention was directed to the occurrence of arsenic in glycerin, it was pointed out that a fluid drachm of that substance—an ordinary dose—might contain a quantity of arsenic making it equivalent to a dose of such a potent preparation as Fowler's solution. The test since introduced into the British Pharmacopœia should prevent any possibility of such impure glycerin being used medicinally, for its application is capable of affording evidence that the arsenic in glycerin, which satisfies that test, does not amount to more than 1/250,000th part instead of 1/5,000th part, as was frequently the case formerly.

Among the methods of detecting small quantities of arsenic, those known as Reinsch's test and Marsh's test will give satisfactory indications with skilful manipulation and when suitably applied; but much depends upon those conditions and the exercise of discrimination by the operator. Thus, for instance, in Reinsch's test, which consists of boiling a solution of the suspected substance, strongly acidulated with hydrochloric acid and a piece of bright copper foil, the presence of a minute amount of arsenic may be easily overlooked, or rendered doubtful, if the sublimation of the arsenic from the copper foil is not successfully carried out. Some of the directions given in books for conducting this test are also of questionable utility, as, for instance, repeatedly washing the copper foil and finally drying it over a Bunsen flame before the sublimation, might more likely lead to a negative result than a confirmatory one, except when the quantity of arsenic was very considerable.

Marsh's test is certainly a very valuable means of ascertaining the presence of arsenic in small amounts; but the statements made as to its capability in that respect are questionable, if they are not altogether exaggerated. It must be remembered that only part of the arsenic present in the substance tested is converted into arseniuretted hydrogen and that the quantity of material operated upon

cannot be very large. Then the decomposition of the arseniuretted hydrogen, so as to form a mirror at the heated portion of the tube through which the evolved gas is passed, is only partial in any case, and the absence of a mirror may be consistent with the presence of 1/100th of a milligramme of arsenic in the quantity of substance operated upon. If that were 10 grammes the amount of arsenic would be one in a million, and the result obtained would not be very conclusive either way, for in order to obtain a distinctly recognisable mirror in the heated tube a quantity of arsenic much less than 1/10th of a milligramme would probably be insufficient.

The reduction of arsenical compounds in Bettendorf's test, by solution of stannous chloride in hydrochloric acid and the consequent separation of arsenium as a dark-coloured precipitate, is the test relied upon to indicate practical freedom from arsenic in the German Pharmacopœia; but the conditions there directed to be observed in order to obtain an indication of practical absence of arsenic from such a substance as glycerin or sodium phosphate are not given in the British Pharmacopœia.

Gutzeit's test, as modified by Siebold, and described under the head of glycerin in the British Pharmacopœia, appears to be very much more delicate than any other, but it is at present open to some suspicion as regards its positive indications, since sulphuretted hydrogen or phosphoretted hydrogen might produce the same kind of yellow stain upon the mercurial paper as arseniuretted hydrogen. A minute trace of sulphur compound capable of being reduced by nascent hydrogen under the conditions of the experiment might produce an effect that would simulate that due to the presence of arsenic and thus lead to an erroneous conclusion. Whether in testing phosphates there may not be a similar source of error as a consequence of reduction and formation of phosphoretted hydrogen is uncertain, though it is not an inconceivable possibility.

But, however much the positive indications obtained with Gutzeit's test may be open to question as proof of the presence of arsenic in minute proportions, a negative result with that test may very safely be taken as evidence that the article tested is practically free from arsenic, and as that is precisely the evidence required in regard to articles employed for medicinal purposes, this test of Gutzeit's is one of great utility, especially as it can be applied very readily. In testing glycerin according to the directions given in the British Pharmacopœia, a negative result would mean that the two cubic centimetres of glycerin tested did not contain the least quantity of arsenic that is capable, under the conditions, of producing a faint yellow stain upon the mercurial paper within fifteen minutes. That quantity may be taken to be about one-hundredth of a milligramme, so that the glycerin would thus be shown to contain not more than one part of arsenic in 250,000 parts.

Applying the test to sodium phosphate that had been supplied as a chemical reagent for analytical purposes and might, therefore, be expected to be chemically pure, one gramme of the salt gave such a dark stain to the mercurial paper that no estimate could be formed of the amount of arsenic present according to that indication. From further experiments with smaller quantities and comparison of the results with those given by known quantities of arsenic, the amount of arsenic thus indicated was estimated to be one in 2500 of the salt tested, or 2.8 grains in the pound. Several other articles tested in the same manner gave results which might be regarded as indicative of the presence of arsenic. Among these were syrupy phosphoric acid, sodium bicarbonate, effervescent sodium sulphate, but in all instances the yellow stain was not produced within fifteen minutes and only after the lapse of several hours. Hence the amount of arsenic indicated as present in the articles tested could be regarded as in any case less than would count as objectionable impurity and, in addition, the uncertainty existing as to the precise meaning of very faint indications with this test would warrant their being ignored.

The use of iodine to counteract the disturbing influence of sulphur compounds in using Gutzeit's test has been recommended by Siebold, and though the addition of iodine does sometimes make a difference in the result obtained within fifteen minutes, it is questionable whether the interference due to sulphur can be counteracted in that way. As the reaction is one of reduction, any sulphur oxidised by addition of iodine might be expected to come again to its original condition under the influence of the nascent hydrogen continuously evolved.

In cases where, by the application of this test, a faint yellow stain is produced with one or two grammes of the substance tested, the safest plan is to have recourse to Marsh's test as a control of the questionable result.

Analytical Laboratory, 13, Fenchurch Avenue, E.C.

PRARMACOPŒIA NOTES.

BY J. CLOWER, NORTHAMPTON.

Suggested Improvements in Processes.

LINIMENTUM AMMONIA.—The formula of the new B.P. yields a softer soap than that of the 1885 B.P. The latter was very troublesome and frequently required thinning by addition of very dilute ammonia in order to make it pour from a bottle. The newer preparation is not readily poured from a bottle after being made a week or two. The suggested improvement merely adds 1 oz. of water to about 16 ozs. of the liniment, thus:—

Take of

Almond oil.....	4 oz.
Olive oil	8 oz.
Solution of ammonia	4 oz.
Distilled water	1 oz.

Mix the oils, add $3\frac{1}{2}$ ozs. of the liquid ammonia, shake well, mix the remaining $\frac{1}{2}$ oz. liquid ammonia with the water, add and shake.

The liniment improves by keeping, that is, it gets whiter without becoming thick. Why not order the oils by weight?

LINIMENTUM CAMPHORÆ.—Why not weigh the oil? Thus, taking twenty times the B.P. quantities and using a pottle bottle of 6 pints or so capacity:—

Camphor in flower, $1\frac{1}{4}$ lb. (20 oz., if preferably so written).
Olive Oil, $4\frac{1}{2}$ lb. (a pint weighing 1 lb. 2 oz.).

If the camphor is lumpy it may be powdered gently in a mortar, then by shaking up with the oil twice or thrice daily complete solution soon occurs. No loss of camphor by heat. It is surprising to read so many convictions against registered chemists for deficiency of camphor. Are there any statistics as to loss, if any, by keeping in the ordinary way?

UNGUENTUM HAMAMELIS.—Possibly this formula has been altered in reprints of the B.P., but I have not seen any notice of the same in the Journal. To make a pound requires some time and much trituration, then part of the fluid readily oozes out. Patients complain of smarting on application. Of course, the wool fat is overloaded with fluid, and on recognising this a batch was prepared by using anhydrous wool fat (adepts lanæ), with excellent results.

Suggested Re-insertions in the B.P.

TINCT. ZINGIB. FORT.—This preparation is omitted from the 1898 B.P. This is surprising when strong preparations of several drugs are additions to the work, and used for making the weaker preparations. Also it is what we have sold as "Essence of Ginger" for years, and must be made whether in the B.P. or not.

LIQUOR AMMON. ACET. CONC.—This preparation ("fortior" it was called in the 1885 B.P.) undoubtedly keeps better than the diluted one, and will always be used by surgeons doing their own dispensing. It was very convenient in xii. = zi., and should be re-introduced. Or, if thought preferable, a 1 to 7 formula might be given by using some glacial acetic acid.

FRUIT ESSENCES AND FLAVOURS.*

BY G. WEINDEL.

PINEAPPLE ESSENCE.—A ripe, but not too soft pineapple, weighing about 500 Gms., is mashed up in a mortar with Tokay 200 Gm. The mass is then brought into a flask with water 500 Gm., and allowed to stand two hours, alcohol (90 per cent.), 400 Gms. is then added, and the mixture distilled until 700 Gms. of distillate have been collected; cognac, 300 Gms. is then added to the distillate.

APPLE ESSENCE.—30 fresh ripe apples are peeled thin and the peel thus obtained, about 350 Gms., is covered with alcohol (90 per cent.), 1,000 Gms., and water 2,000 Gms., and allowed to stand for 24 hours. 1,250 Gms. is then distilled off, and vanillin, 10 Cgms., bitter almond water, 50 Gms., added to the distillate. This may be coloured with 10 drops of saffron tincture.

SWEET ORANGE ESSENCE.—25 large oranges, about 500 Gms., are thinly peeled, and the finely cut peel macerated for 24 hours with alcohol (90 per cent.), 1,000 Gms., and water, 3,000 Gms.; 5 drops of lemon oil and 10 drops orange oil are added, and 2,000 Gms. distilled off. The distillate is allowed to stand for eight days and is then filtered. Vanillin, 0.05 Gm., is dissolved in the filtrate, and two drops saffron tincture, and caramel tincture 3 Gms., added.

BANANA ESSENCE.—12 bananas are peeled, the thick peel sliced, and macerated with Burgundy, 300 Gms.; cognac, 200 Gms.; alcohol (90 per cent.), 300 Gms.; water, 1,000 Gms.; 1,000 Gms. distillate is now recovered, and saffron tincture, 3 drops; and coumarin, 10 Cgms., added.

PEAR ESSENCE.—40 muscatel or bergamot pears, are peeled, and the peel, about 430 Gms., macerated with alcohol (90 per cent.), 1,000 Gms.; Moselle wine, 250 Gms.; water, 2,000 Gms., for six hours; and then 1,500 parts distilled off. To the distillate, which may be coloured a faint green, coumarin, 5 Cgms., and sweet orange oil, 5 drops, are added.

BITTER ALMOND ESSENCE.—Bitter almond water 16 Gms.; alcohol (90 per cent.), 18 Gms.; water, 12 Gms.; rose essence, 1 Gm. Mix.

BISHOP ESSENCE.—Tincture of bitter orange, 30 Gms.; aromatic tincture, 3 Gms.; bitter almond water, 3 Gms.; orange flower water, 20 Gms.; alcohol (90 per cent.), 50 Gms.; water, 100 Gms. Distil off 100 Gms., and colour with caramel.

CARDINAL ESSENCE.—Green orange peel, 10 Gms.; unripe orange, 4 Gms.; cloves, 0.5 Gm.; cinnamon, 0.5 Gm., are macerated for five days with alcohol (90 per cent.), 50 Gms.; water, 80 Gms., to which is added bitter orange oil, 4 drops; lemon oil, 1 drop; bitter almond water, 5 Gms.; 100 Gms. is then slowly distilled and coloured with caramel.

CINNAMON ESSENCE.—Cinnamon, 10 Gms., is macerated for five days with alcohol (90 per cent.), 70 Gms.; water, 70 Gms.; and 100 Gms. distilled off; this is coloured with caramel.

CHAMPAGNE LEMONADE ESSENCE.—Vanilla essence, 1 Gm.; celery essence, 5 Gms.; woodruff essence, 1 Gm.; cognac, 4 Gms.; Burgundy, 2 Gms. Mix.

LEMON ESSENCE.—25 medium size lemons are peeled, and the finely-cut peel macerated for 24 hours with alcohol (90 per cent.), 1,500 Gms.; water, 3,000 Gms.; lemon oil, 10 drops; sweet orange oil, 5, are then added; 3,000 Gms. distilled off. This is set aside for eight days and filtered. Vanillin, 10 Cgms., is added, and the product coloured with tincture of turmeric, 60 drops; saffron tincture, 4 drops; caramel tincture, 60 drops.

STRAWBERRY ESSENCE.—Fresh dry strawberries, 750 Gms., are pulped in a mortar, and then put into a retort with Tokay, 200 Gms.; cognac, 200 Gms. Then add vanilla 1.5 Gms.; alcohol (90 per cent.) 300 Gms.; water, 500 Gms. This mixture is allowed to stand for an hour in the warm, and 1,000 Gms. is then slowly distilled over, and coloured light red.

* From the *Pharmaceutische Zeitung*, 44, 750.

CLOVE ESSENCE.—Cloves, 15 Gms., are macerated for five days with alcohol (90 per cent.), 70 Gms.; water, 70 Gms. Distil 100 Gms.; colour with caramel.

RASPBERRY ESSENCE.—Fresh raspberries, 200 Gms., are pulped in a mortar, allowed to remain for two days at a temperature of 20° C., and then mixed with water, 100 Gms. 50 Gms. is then distilled off, and alcohol (90 per cent.) 25 Gms., in which 0.01 vanillin has been previously dissolved, is then added to the distillate.

GINGER ESSENCE.—Ginger, 100 Gms., is macerated for five days with alcohol, 90 per cent., 600 Gms.; water, 800 Gms. The whole is then put in a retort and 1,000 Gms. distilled off and coloured with caramel.

MELON ESSENCE.—Two or three large ripe melons peeled, and the finely cut peel macerated for three hours with alcohol (90 per cent.), 1,000 Gms., and water, 2,500 Gms.

ORANGE FLOWER ESSENCE.—Orange flower water, 100 Gms.; alcohol, 90 per cent., 50 Gms.; water, 50 Gms.; rose essence, 20 Gms.; lemon oil, 2 drops; orange oil, 1 drop. Mix.

PEACH ESSENCE.—20 ripe peaches are stoned and bruised in a mortar. The kernels are made into a paste with water, 200 Gms. After half-an-hour the mixed pulp is placed into a retort; water, 600 Gms.; alcohol, 90 per cent., 400 Gms.; and 1,000 Gms. distilled off. To the distillate, coumarin, 0.1 Gm.; orange flower water, 100 Gms.; orange oil, 5 drops, are added, and the mixture coloured with saffron tincture, 5 drops; safflower tincture, 3 Gms.

QUINCE ESSENCE.—25 ripe quinces are peeled, and the fine cut peel allowed to stand in a retort for two hours with water, 500 Gms., alcohol (90 per cent.), 300 Gms. is then added, and 500 Gms. distilled off. To the distillate, coumarin, 0.5 Gm.; vanillin, 0.1 Gm.; bitter almond water, 25 Gms.; lemon oil, 5 drops; citronella oil 2 drops; saffron tincture, 3 drops, are added.

GREENGAGE ESSENCE.—30 fresh ripe greengages are stoned and bruised in a mortar, the kernels are also made into a paste with water, 200 Gm. After 30 minutes both are mixed in a retort with water, 600 Gms.; alcohol (90 per cent.), 400 Gms., and 1,000 Gms. distilled off. Vanillin, 0.05 Gm.; bitter almond water, 20 Gms.; lemon oil, 5 drops, are added. Colour green.

ROSE ESSENCE.—Rose oil, 1 Gm.; alcohol (90 per cent.), 70 Gms.; water, 30 Gms. Mix and colour rose tint.

VANILLA ESSENCE.—Vanillin, 1.5 Gm.; alcohol (90 per cent.), 700 Gms.; water, 300 Gms.; turmeric tincture, 30 drops; caramel tincture, 20 drops. Mix

ORRIS ESSENCE.—Finely-sliced orris root, 500 Gms., is macerated for 3 days with alcohol (90 per cent.), 500 Gms.; water, 800 Gms., then 1,000 Gms. is distilled off. Vanillin, 0.5 Gm.; coumarin, 0.02 Gm., are dissolved in distillate.

WALNUT ESSENCE.—500 bruised green walnuts; cloves, 2 Gms.; cinnamon, 5 Gms.; mace, 1 Gm.; are macerated for four days in alcohol (90 per cent.), 750 Gms.; and water, 500 Gms. Another 500 Gms. of water is then added, and 1,000 Gms. distilled off: to this is added bitter almond water, 100 Gms., and the mixture coloured deep green.

WOODRUFF ESSENCE.—Bruised tonka beans, 100 Gms.; alcohol (90 per cent.), 480 Gms.; water, 140 Gms., are macerated for 7 days, water, 400 Gms., is added, then 700 Gms. is distilled; mixed with orange flower water, 50 Gms., and coloured green.

LEMON WINE.—The fine cut peel of 4 to 5 lemons is treated with sherry, 1,000 Gms.; cognac, 300 Gms.; and filtered after 24 hours. To the filtrate add orange flower water, 50 Gms..

PINEAPPLE WINE.—A pineapple of about 500 Gms. and one quarter of a vanilla pod are cut up and macerated with port wine, 1,300 Gms.; cognac, 200 Gms.; allowed to stand two days filtered without strong pressure.

ORANGE WINE.—Two blood oranges are stuck with cloves, and the whole fruit is then covered with Burgundy, 1,000 Gms.;

cognac, 300 Gms.; alcohol (90 per cent.), 200 Gms., and filtered after standing for four days.

ARTIFICIAL ORANGE JUICE.—Tartaric acid, 2 Gms.; citric acid, 80 Gms.; water, 300 Gms.; lemon essence, 10 Gms.; orange essence, 50 Gms.; caramel, 0.2 Gm.; mix.

ARTIFICIAL LEMON JUICE.—Citric acid, 10 Gms.; phosphoric acid, 1 Gm.; water, 40 Gms.; lemon essence, 50 Gms.; mix. These juices mix clear and bright, have a pleasant odour and taste, and do not become mouldy in less than three to four months.

FROTH HEADING.—(1) Quillaia bark, 5, is covered with water, 15, allowed to stand for three hours, and then heated for four hours on a water bath. It is now filtered, the filtrate evaporated to 8, and glycerin, 2, added. (2) Saponin, 5, are dissolved in water, 80, and alcohol (90 per cent.), 20, added.

THE OFFICIAL PROCESSES FOR THE ASSAY OF IPECACUANHA, BELLADONNA, AND NUX VOMICA.

BY F. C. J. BIRD.

II.—Belladonna (Continued from p. 534).

Emplastrum Belladonnae.—This preparation, according to the Pharmacopœia, contains 0.5 per cent. of the alkaloids of belladonna root. The absence at the time of publication of the Pharmacopœia of any tried processes for the determination of alkaloid in a substance presenting such analytical difficulty as belladonna plaster probably accounts for a statement of official strength alone appearing, the provision of a means of accurately verifying the alkaloidal percentage of the preparation having been left to future investigation. An inspection of the formula for belladonna plaster shows that no loss of alkaloid is assumed to occur during manufacture, and, provided that the liquid extract be carefully evaporated and excessive heating avoided, this assumption is quite correct; indeed, there is often a slight gain in strength owing to evaporation during the mixing of the warm ingredients.

A reliable process for the assay of belladonna plaster, B.P., has been already described in the *Pharm. Journ.* [9], 4, 146, where full details will be found. The plaster is dissolved in a mixture of chloroform and glacial acetic acid, and decomposed with dilute sulphuric acid. The sulphate of lead having been removed by filtration, the chloroform is separated from the aqueous liquid, the former being washed with a little dilute acid, and the latter, which contains the alkaloid, treated in the usual manner by shaking out with chloroform, re-agitating with acid, and extracting a second time with chloroform. A number of experiments have been made with the view of shortening this process by finding some way of obtaining the alkaloid in a pure condition without resorting to the second extraction with chloroform, but so much foreign matter passes with the alkaloid into the first chloroformic solution that the gravimetric and titration figures often differ by as much as 25 per cent. or more. The impurity, however, is so little coloured that it does not interfere with the changes of the indicator during titration, and if the weight of the residue be disregarded the titration figure may be accepted as correct whenever the assay is merely wanted for confirmatory purposes. But the superior analytical value of results in which weight and titration are in close agreement cannot be too strongly insisted upon, so that in all important cases it is better to carry the process through to the second extraction.

As very little alkaloid accompanies the oleic acid, resin, etc., in the chloroformic layer of the filtrate from the lead sulphate, the second washing with dilute acid recommended in the process may always be omitted, and traces only of alkaloid are retained in the lead sulphate precipitate.

A sample of belladonna plaster, B.P., carefully prepared with a liquid extract testing 0.75 per cent., yielded by the process referred

to above 0.51 per cent. of alkaloid, and another portion of the sample, independently assayed by Dr. S. Rideal, who used the same process, gave 0.512 per cent. The method is only intended for the assay of plaster made according to the Pharmacopœia or similar formula.

Extractum Belladonnae Alcoholicum (B.P.).—The presence of milk sugar in alcoholic extract of belladonna does not interfere to any serious extent with the application of the modified B.P. process for the liquid extract, referred to on page 532, to the assay of this preparation. Owing to the somewhat syrupy nature of the solution formed by the dissolved lactose, the separations are a little sluggish, and it is always advisable to force the whole of the liquid by air pressure through cotton wool placed in the neck of a separator (see page 176), a procedure which is also advantageous and which effects a considerable saving of time when working the modified B.P. process for the liquid extract.

Process (modified B.P.).—Alcoholic extract of belladonna, B.P., 7.5 Gm.; water 10 C.c. Triturate in a small mortar to a uniform liquid, transfer to a separator and rinse the mortar with more water, using 50 C.c. in all. Add diluted sulphuric acid, 10 C.c.; chloroform, 20 C.c.; and continue the process as given on page 532.

As might be expected, this method possesses the disadvantage that with certain samples the alkaloidal residue cannot be obtained in a sufficiently pure condition without resolution in acid and a second shaking out with chloroform.

The employment of a carbonated alkali in place of ammonia for the liberation of the alkaloid offers advantages in several directions, more particularly when the non-alkaloidal constituents of the preparation of the drug under assay possess emulsifying properties themselves, or are capable of forming compounds of that nature. Ammonia dissolves in most immiscible solvents, and in doing so carries with it much saponifiable and resinous matter, thus often rendering the first alkaloidal extraction unduly impure. The immiscible solvent, too, is generally soluble to a slight extent in a dilute aqueous ammoniacal liquid, especially if alcohol be present, and this fact distinctly interferes with the complete removal of the last traces of alkaloid. On the other hand, an alkaline salt like potassium carbonate when dissolved in adequate proportion in the aqueous layer furnishes a fluid of high specific gravity, which with a light immiscible solvent not only separates readily, but also precipitates saponified bodies, thus obviating all tendency to emulsification. Further, the action of the immiscible solvent is facilitated on account of the very sparing solubility of the alkaloid in a strong saline solution, and the immiscible solvent itself being practically insoluble more complete extraction of the alkaloid is possible.

Ammonia is selected in the alternative process for the liquid extract (page 533) because of the ease with which it dissolves the whole of the water-precipitable constituents, forming a clear, heavy liquid, which separates instantly. In this case carbonate presents no advantage.

A 1 in 2 (w/v) solution of carbonate of potassium separates instantly and completely from the special solvent recommended for belladonna. A solution of this strength is used for washing the first ethereal extract in the assay processes (to be subsequently described), as it removes but the faintest trace of alkaloid, the amount present in the washings being hardly capable of detection by delicate alkaloidal reagents. A stronger solution (1½ in 2) removes no alkaloid whatever, but the washing out of the coloured impurities is not so complete.

In general it will be found that when a carbonated alkali has been employed to set free the alkaloid in the first stage of an assay process, water agitated with the immiscible solvent containing the alkaloid will remove very heavy traces of the latter, and it therefore follows that in those instances in which displacement of residual carbonate solution by a little water is recommended

care must be taken to avoid any agitation of the water and ethereal liquid.

The washing with half-saturated brine in the assay of belladonna root (see page 533) may with advantage be repeated a second or even a third time should the brown colouring matter appear to be incompletely removed by the first treatment.

The selective properties of the solvent recommended for belladonna (amylic alcohol, ether and chloroform) are markedly evident during the extraction of belladonna leaves, in which process, by reason of the large proportion of chlorophyll present, etc., the ethereal solution becomes of an intense green colour. On washing with solution of carbonate of potassium a small quantity of a brown substance is removed, and the ethereal liquid, which changes to a very pure green, yields on agitation with dilute acid an almost colourless solution of the alkaloidal salt.

None of the carbonate processes are liable to emulsification. They have all been verified by being applied to the analysis of preparations of known strength, and the results have come out almost identical with the calculated figures, rarely exceeding 1 per cent. below the actual amount present. When compared with the adaptations of the modified B.P. process, referred to on page 532, a larger yield of alkaloid has been obtained.

For the reasons already given, the absolute extraction of all alkaloid, by a *simple* process, from galenical preparations of such complex composition as those under consideration is a matter of extreme difficulty. Under ordinary conditions traces will always remain, principally in the first impure mother liquor, and if an immiscible solvent has been used to remove fatty bodies from acid solution, in that immiscible solvent. Other sources of loss have to a great extent been obviated in the processes described. Whilst it would probably be quite possible to devise methods which would ensure the extraction of absolutely the whole of the alkaloid, it would be at the expense of inconvenient complication, and as long as an analytical process does not involve an error greatly exceeding 1 per cent. below the truth, it may be considered sufficiently accurate for all the practical purposes of pharmacy.

It sometimes happens when ammonia has been used as the precipitant in the final extraction, that the chloroformic layer exhibits a milky appearance and refuses to immediately separate in a clear and bright condition. The addition of a few C.c.'s of a saturated solution of ammonium carbonate followed by reagitation of the contents of the separator rarely fails to remedy this, and at the same time there is generally a slight gain in the purity of the alkaloidal residue.

ALTERNATIVE PROCESS FOR ALCOHOLIC EXTRACT OF BELLADONNA—

Alcoholic extract of belladonna, B.P. 7.5 Gm.
Solution of potassium carbonate (1 in 2) 20 C.c.

Place the solution of potassium carbonate in a separator, add the extract of belladonna, warm gently and shake until dissolved. Then add—

(Solvent) Amylic alcohol 3 vols. }
Chloroform 1 vol. } 20 C.c.
Ether 4 vols. }

Agitate vigorously, separate and extract again with three successive quantities of—

Solvent 10, 10, and 5 C.c.

Wash the mixed ethereal liquids three times with successive quantities of—

Solution of potassium carbonate (1 in 2) 5, 2 and 2 C.c.

Reject the aqueous washings, displace the last portions with 1 C.c. of water added without agitation, then extract with—

Normal sulphuric acid 4 C.c. }
Water 6 C.c. }

Separate and repeat three times with—

Water 3, 3 and 3 C.c.

Render the mixed acid liquids alkaline with—

Solution of ammonia q.s.

and shake out the alkaloids four times in succession with—

Chloroform 10, 5, 5, and 5 C.c.

Evaporate the mixed chloroforms in a tared dish on a water bath, dry below 100° C. to a constant weight, weigh and titrate as directed in the Pharmacopœia.

Strong Alcoholic Extract of Belladonna, 3.0 per cent.—A solid alcoholic extract of belladonna root prepared without milk sugar, and containing 3.0 per cent. of total alkaloid is convenient for making methylated liniment. It can be assayed by either of the processes described under ext. belladon. alcoholic., 2 Gm. being taken for the determination. The extract, having been weighed in a small tared dish, is rubbed to a smooth cream with a small quantity of water. The liquid is then transferred to a separator, the dish rinsed with more water, 40 C.c. being used in all, and the process continued as for the liquid extract (p. 532 and P.J. [4] 8, 432).

A purer residue and higher figures may be obtained with potassium carbonate. The following are the details of the process:—

Strong alcoholic extract of belladonna root . . .	2 Gm.
Potassium carbonate.....	10 Gm.
Water.....	15 C.c.

Triturate the extract and potassium carbonate with a little of the water to a smooth cream in a small mortar. Transfer to a separator, rinsing out the mortar with the remaining water, and add

(Solvent) { Amylic alcohol	3 vols. }	20 C.c.
{ Chloroform	1 vol. }	
{ Ether	4 vols. }	

and continue the process as described under ext. belladonnæ alcoholicum, B.P., p. 691.

The only comment necessary here is that the final chloroform on first separating occasionally exhibits a milky appearance, which, however, disappears at once on the addition of a little saturated solution of ammonium carbonate and re-agitation of the liquids. The difference between weight and titration by this process does not usually exceed one or two milligrammes on a 0.060 Gm. result.

Linimentum Belladonnæ, B.P.—No mention is made in the Pharmacopœia of any percentage of alkaloids required to be present in this preparation, but it is obviously half the strength of the liquid extract and should therefore contain 0.375 per cent. of the alkaloids of belladonna root.

The modified B.P. (acid extraction) process, p. 532, used for the liquid extract, answers well for the assay of this liniment, the camphor being easily removed from the acidified liquid by the preliminary washing with chloroform. Take 10 C.c. of the liniment, dilute with 40 C.c. of water, and proceed as for the liquid extract. The yield of alkaloid obtained will probably be from 2 to 3 per cent. below the amount actually present in the preparation, but slightly higher than could be expected from any application of the official analytical method.

Tinctura Belladonnæ B.P., on evaporation to a low bulk and subsequent treatment by the analytical process employed for "Extractum Belladonnæ Liquidum," is required by the Pharmacopœia to yield not less than 0.048, nor more than 0.052 Gm. of alkaloid from 100 C.c. of tincture. This preparation of belladonna is notable as being the only one in which a definite variation is permitted from the standard alkaloidal strength, which latitude may have been allowed on account of some uncertainty at the time of compilation of the Pharmacopœia as to the combined effects of the precipitation which occurs in mixing the tincture and, during the analysis, of the heat of evaporation and preliminary removal of alcohol on the percentage of alkaloid indicated by the final titration.

The comparatively large quantity of tincture required for an assay and the amount of alcohol present effectually prevents the adoption of any simple shaking out process for the determination of the alkaloid. Several modifications of processes were tried with the object of avoiding evaporation, but there was always a loss of alkaloid, and evaporation, in this instance, appears inevitable.

PROCESS.

Tincture of belladonna B.P..... 100 C.c.

If necessary, add tartaric acid to faint acid reaction, and evaporate on a water bath to 30 C.c. Transfer to a separator, and rinse the dish with

Diluted sulphuric acid 7 C.c.

Extract the mixed acid liquids twice with successive quantities of Chloroform..... 14 and 7 C.c.

Wash the mixed chloroform with

Diluted sulphuric acid..... 1 C.c. }
Water..... 4 C.c. }

and return the washings to the separator. Render the liquid alkaline with

Solution of ammonia q.s.

and shake out three times in succession with

Chloroform 7, 7, and 7 C.c.

Evaporate in a tared dish, dry, weigh and titrate as directed in the Pharmacopœia. This alkaloidal residue frequently exhibits a difference between weight and titration of 15 to 20 per cent. A purer residue may be obtained by extracting with acid and shaking out the alkaloid a second time with chloroform, which lowers the impurity to from 3 to 5 per cent. The results by this process are from 2 to 3 per cent. below those by the alternative method.

ALTERNATIVE METHOD FOR TINCTURA BELLADONNÆ, B.P.

Tincture of belladonna B.P..... 100 C.c.

Faintly acidify with tartaric acid, if necessary, and evaporate on a water bath to 13 C.c., transfer to a separator, rinsing the dish with Water, 2 C.c. Add Potassium carbonate, 10 Gm., and

(Solvent) { Amylic alcohol 3 vols. }
{ Chloroform..... 1 vol. } 20 C.c.
{ Ether 4 vols. }

and continue the process as described under "alternative process for the assay of liquid extract of belladonna," on page 533, using ammonia, and, if necessary, solution of ammonium carbonate for the final liberation of the alkaloid.

Only traces of alkaloid can be detected in the mother liquors from the different stages of this alternative process for the tincture, and the residue is of a high degree of purity.

Unguentum Belladonnæ, B.P.—In a note appended to the B.P. formula for this preparation it is stated that "100 parts of this ointment should contain 0.6 part of the alkaloids of belladonna root," but, possibly, for a similar reason to that suggested under emplastrum belladonnæ, no indication is given of any method by which the alkaloidal content can be verified.

On the score both of simplicity and convenience it appeared desirable to ascertain if a direct shaking out method could be adopted in this assay. Two processes were found to be available, one based on the acid extraction, and the other on the potassium carbonate method. They both answer well, and, in this instance also, the latter invariably gives the higher figures.

PROCESS.

Belladonna ointment, B.P. 10 Gm.
Benzol 20 C.c.
Water 10 C.c.
Diluted sulphuric acid 7 C.c.

Melt the ointment in a small dish, pour into a separator, rinse the dish with the water and acid, add the benzol and agitate vigorously. Separate the benzol, and wash the aqueous layer twice with successive quantities of

Benzol 10 and 10 C.c.

Warm the mixed benzol washings with

Diluted sulphuric acid 3 C.c. }
Water 3 C.c. }

agitate well and separate. Shake a second and third time with

Water 10 and 10 C.c.

Reject the benzol and return the acid liquids to the separator. Then make alkaline with

Solution of ammonia q.s

Shake out with three successive quantities of
 Chloroform 10, 10, and 10 C.c.
 adding if necessary
 Saturated solution of ammonium carbonate *q.s.*
 Wash the mixed chloroforms with
 Water 3 C.c.
 Solution of ammonia 10 drops. }
 Solution of ammonium carbonate 2 C.c. }

Evaporate in a tared dish, dry below 100° C., weigh and titrate as directed in the Pharmacopœia.

Although ether can be employed in place of benzol, the latter is preferable, as it is cleaner in working and the separations are sharper. As a final check upon this process, a sample of belladonna ointment was carefully made with a liquid extract testing 0.75 per cent. of alkaloids, and the total weight adjusted so that the sample of finished product should contain exactly 0.6 per cent. On analysis by the foregoing method it yielded a residue showing about 14 per cent. of impurity, but indicating by titration the presence of 0.585 per cent. of alkaloids. The same sample assayed by an alternative method, details of which are given in the following paragraphs, came out at 0.6 per cent.

(To be continued.)

THE SALE OF FOOD AND DRUGS.

FOOD AND DRUGS: A MANUAL FOR TRADERS AND OTHERS. By CHARLES JAS. HIGGINSON. Pp. xvi. and 179. 2s. 6d. net. Effingham Wilson, 11, Royal Exchange, E.C.

It is perhaps not altogether a kind or beneficial proceeding to encourage the "man in the street" to be his own professional adviser, for one can only say of the majority of the publications issued for the purpose of persuading him to dispense with experts that they are really little less than humbug and little more than delusions and snares. The legal handy-books published by Effingham Wilson, however, are, generally speaking, not to be classed with the pernicious variety that mar good citizens by transforming them into bad amateur lawyers, and the latest addition to the Royal Exchange—a Food and Drugs Manual—may be commended as a carefully-compiled and clearly-expressed digest of facts relating to the sale of food and drugs quite worthy the close attention alike of vendor and purchaser, retailer and consumer. To the former a *résumé* of the law relating to adulteration has become an absolute essential—a protective necessity; whilst to the ordinary member of the general public such a work should prove instructive in so far as it reveals how particularly zealous the Legislature has been in protecting him from swallowing sophisticated substances, liquid and solid, alimentary and pharmaceutical.

The manual now in question is a consolidation of the three Food and Drugs Acts (1875, 1879, and 1899) and the Margarine Act of 1887, and, as might be expected, there is rather more margarine and food in the book than drugs. It is illustrated by extracts from judicial decisions, and is addressed more especially to traders, though the epitomiser—C. J. Higginson, barrister of the Inner Temple—modestly suggests a wider application by adding the words "and others" to his title-page. The codification of piecemeal legislation is a very trying task, more particularly with statutes of the kind now in force for the restraint of adulteration—nothing is easier in the progress of such work than to fall into error, whereas few things are more difficult than the detection of a fault when committed.

On the whole, Mr. Higginson may be congratulated on the manner in which he has performed his work, and the admirable summary of the general effects of the 1899 Food and Drugs Act, with which the manual opens, is not the least successful or valuable of his efforts to guide the dealer in foods or in drugs, in spite of the fact that a trivial error of date is to be noted on the very first line. Naturally, there is room for criticism, but the defects from the pharmaceutical point of view are, perhaps, rather those of arrangement than of matter. If Mr. Higginson had dealt in a somewhat fuller manner with the relations of the Acts to the sale of drugs—

giving, for instance, a separate chapter or division to the subject as it affects chemists and druggists, registered persons could have more heartily welcomed the publication. As it is, the items of special moment to the calling that are recorded are by no means prominent, whilst several points of doubt and difficulty of constant occurrence in pharmacy and badly needing a little forensic elucidation are overlooked altogether. It is true that the chief decisions of the courts on cases under the Acts are generously sprinkled throughout the book, and might furnish material for very useful study by the legal mind, but laymen are apt to find them somewhat perplexing, for it is extremely difficult to detect the true inwardness of the position when a bare record is given of cases in which the defendant in *A versus B* is convicted for what is held in *C versus D* to be no offence. The determining circumstances effecting the differentiation in two such cases are essential, but they are rarely, if ever, given.

The beeswax, camphorated oil, and arsenical soap cases are mentioned, but nothing is recorded of cases turning upon the labelling of substitutes for Pharmacopœia articles or of those involving questions as to the proper division of samples where medicinal substances are put up in small containers. The use of preservatives and colouring admixtures is just touched upon, but no guidance is offered, nor, perhaps, in the present unsettled state of the law, could any be expected; the only comfort offered is the information that a Departmental Committee is engaged in investigating the subject. But these are blemishes rather than defects, for it must be remembered that the pharmaceutical portion of the Food and Drugs Acts is very much like the chapter on snakes in the legendary account of the fauna of Iceland, whilst the clauses dealing with drugs lack definition, and, indeed, invite a variety of interpretations. Moreover, Mr. Higginson is not a chemist, and is doubtless unacquainted with the special nature of the business of a chemist and druggist.

The manual is very thoroughly indexed, and possesses a good deal of virtue in its tail, for, in addition to the statutes *in extenso*, there are printed in an appendix the Local Government Board's General Orders relating to margarine factories and to the qualifications and appointment of analysts, the latter of which may be worth the perusal of pharmacists. Altogether, the manual may be profitably added to the reference library of the careful and conscientious chemist.

PROCEEDINGS UNDER THE PHARMACY ACTS.

Illegal Sale of Poisons.

Pharmaceutical Society v. Brownrigg.

At the Sheriff Court House, Linlithgow, on Saturday, June 23, 1906, William Brownrigg, assistant in the drug shop of Dr. Alexander Stewart, Uphall, was charged at the instance of the Pharmaceutical Society with selling laudanum and Budden's Balsam to the Society's officers on April 28 last.—Mr. Peter Morison, jun., S.S.C., Edinburgh, appeared for the prosecutor.—Accused pleaded guilty to both offences, and made a long explanation, alleging that he was a registered medical student acting under the supervision of Dr. Stewart, and he had written to Mr. Bremridge saying he did not know he was committing an offence. In reply to the Sheriff, he admitted that Dr. Stewart was not present when he sold the poisons, and was very angry when he heard what had happened. He was not thinking about it being an offence when he sold the poisons, his only object being to sell as much as possible and show a good cash return when the doctor came back. He had been born and brought up in the drug trade, and expected soon to be a qualified medical practitioner.

Mr. Morison said he had to ask the full penalty for both offences. The accused, in reply to a direct inquiry by Mr. Hill, claimed to be a registered chemist at the time he sold the poisons. Mr. Hill said there was no Brownrigg on the Register as being a chemist in Uphall. Accused then said the address on the Register would be

Liverpool. He was registered in 1884. In consequence of this claim the Registrar made inquiry, and found that the John Brownrigg, Liverpool, the only person of the name on the Register, was a very old man, and not the accused at all. In reply to an inquiry, accused wrote a letter to the Registrar stating that he was a registered medical student, and did not know that he came under the Act. But for this delay, consequent on the accused's claim to being registered, this case would have been before the Court along with the last case. The statement to Mr. Hill was quite contrary to the statement in the letter to Mr. Bremridge, and from his own admissions it was quite evident that accused was well aware that he was committing an offence in selling poison.

The Sheriff: Are you any relative of the John Brownrigg of Liverpool?

Accused: Yes, your worship. I am his son.

The Sheriff said: I am inclined to impose the full penalty in this case. Technically, there are two offences, and that would be £10. But in respect that both poisons were practically sold at the same time, and virtually to the same party, with the consent of the prosecutor I will impose the full penalty of £5 for the first offence and admonish accused in respect to the second offence. The costs will be £1 5s. 6d., making a total of £6 5s. 6d. I grant warrant to point in the event of non-payment.

Accused said he could not pay. He supposed Dr. Stewart would have to see to it.

There was no appearance for Dr. Stewart, and the penalty was not paid.

POLITICAL GOSSIP.

THE PUBLIC SCANDAL which, according to Sir Henry Fowler, threatened to leave an indelible stain upon the reputation of the present Administration has been averted, for on Tuesday last the unexpected happened, and the Companies Bill passed its second reading. Thus the conjectures and calculations of lay politicians have been wholly and entirely falsified and frustrated. Hardly a living creature outside the House of Commons contemplated the possibility of progress being made with the Bill this Session; indeed, there is good reason for believing that Ministers themselves did not until recently entertain any very sanguine hopes in that direction; but in spite of all signs and portents of fierce and unyielding opposition to the measure, its principle was adopted after a mild debate of three hours in a House that very narrowly escaped a "count-out"! The Government must certainly be congratulated on having skilfully engineered a pre-arranged opportunity. Naturally, the chief features in the changed situation are the remarks of Mr. Ritchie in reference to Clauses 2 and 3, indicative of his attitude towards the pharmaceutical and professional aspect of the company question, and the observations of Mr. Balfour, revealing an intention to press on the Bill in a vigorous manner. So far as Mr. Ritchie is concerned, he has consistently maintained from the very first that the Lord Chancellor's additions are not germane to the Bill, and from the signs of assent with which his reiteration of that statement was received on Tuesday night, the majority of the members of Parliament think with him. Consistency is not largely cultivated in Parliamentary circles, but pharmacists may be reminded that in almost every case where the Pharmaceutical Council has approached Departments of the State or Officers of the Crown, from the sitting of the Departmental Committee in 1895 down to the completion of the labours of the House of Lords' Select Committee last year, the official view expressed has always been that the proper remedy for a defect of the Pharmacy Act is an amendment of that Act. It follows, therefore, that the President of the Board of Trade is not likely to support the retention of the clauses by the Standing Committee on Trade to which the Bill now stands committed, and that his colleagues will no doubt give effect to his implied advice to delete them. Should this assumption of the course of events prove accurate, the line of policy enunciated by the Council in March will have been

consummated without the necessity for any active pharmaceutical fighting.

EXPEDITIOUS PRUNING is evidently Mr. Balfour's conception of what the Standing Committee on Trade should undertake in regard to the Bill, for he estimated two days as the period requisite for the Committee's labours, basing his remarks on the very favourable reception of the measure on Tuesday. If this estimate be correct, a fortnight or three weeks should see the question transferred to the House of Lords again, and it is interesting to speculate as to what may happen if the pharmaceutical clause should be dropped by the Commons. Will Lord Halsbury, having regard to the public danger arising from companies being outside the jurisdiction of the Pharmacy Act, re-insert it? And if he should do so—which, if he adhere to his public utterances, he seems bound to do—what action can the Pharmaceutical Society take to preserve its interests? The position is even now somewhat delicate, and may possibly become more intricate, but it happens rather fortunately that the Law and Parliamentary Committee is specially charged to consider it *de novo*, with the advantage of three new advisers. It is expected that there may be something to report to the Council at its meeting next Wednesday. By that time the members of the House to be added to Grand Committee for the Consideration of the Bill may have been appointed, and it may be possible to furnish them with an official *communiqué* of the Council's views on the subject.

WHAT HAS BECOME of the opposition to Clause 2, which was expected to be brought about by the Secretary's circular of March 8 last to local secretaries? Not a single ordinary member who took part in the Companies Bill debate on Tuesday had a word to say about it! Yet it is common knowledge that some 300 M.P.'s. were asked to oppose the clause or to object to it in some form or other. Are they conserving their energies for a later stage, or must it be admitted that by comparison with the enormous financial interests involved the pharmaceutical aspect of the case is of infinitesimal importance? Any average person who thoughtfully reads the report of the debate must be struck with the fact that by the side of the national—nay, Imperial—importance of the main principles involved in the Companies Acts and the present Bill, the cry of the pharmacist must appear to statesmen as the "trouble of ants in the gleam of a million million of suns."

AMENDMENTS for the Standing Committee on Trade in respect to the Companies Bill are already flowing in. On Wednesday—before the date of meeting was fixed—Mr. Harwood (Bolton) notified that he will move for the insertion of the word "dentist" after the word "druggist" in Clause 2, lines 23 and 25, and for the deletion of the word "dentist" from Clause 3—quite a novel variation of anti-professional tactics. Mr. Galloway (S.W. Manchester) has also notified an alteration for the benefit of corporate bodies usurping professional practice. He proposes that Clause 3 shall not come into operation until January 1, 1903. This gentleman, it will be remembered, was with difficulty persuaded that the Pharmacy Acts Amendment Bill of 1898 was not an attempt to extend an already powerful monopoly!

MR. BEGG'S Amendment Bill has been dropped now that the Government is in earnest in dealing with Companies; the Cheap Trains, Street Noises, Jurors' Expenses, Bank Holiday Amendment, and Weights and Measures Bills have followed or preceded it into oblivion.

THE CHAMBER OF COMMERCE at Huddersfield has petitioned the House for alteration of the Companies Bill. Amongst other things it objects to is Clause 3, which is subtly represented to be calculated to put an end to the system at present very generally adopted at hydrophathic establishments where the medical attendant is a salaried officer of the company. The Huddersfield traders also protest against the Pharmacy Act being applicable to companies.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Conference Arrangements.

Though my pink circular has not yet come to hand, I take it that I shall be quite in order in assuming that the editor was officially inspired last week and in forthwith applying for the books of tickets I shall require. Apparently, it is anticipated that there will be a rush for the excursion tickets, and, as I gather that the accommodation will be somewhat narrowly limited, it would appear desirable to make early application for those. The capacity of the pleasure barges and of Skindle's Hotel is, I imagine, none too great, and the number of persons who can be comfortably arranged for is probably much smaller than the number of those who would like to be present. Any reasonable number of persons can be accommodated at the Whitehall Rooms or the Royal Botanic Gardens, but Thames pleasure barges and river-side hotels are not built with the idea of entertaining a very large number of people at one and the same time. Those who wish to attend, therefore, should apply early for tickets, and be careful not to ask for an unreasonably large number, as it may happen that others will be equally desirous of taking part in the last day's festivities.

The Latest Poison Scare.

Arsenic in effervescing sodium phosphate appears distinctly out of place, but it may be doubted if the crude phosphate is ever entirely free from that noxious impurity. Nothing, however, like eight or nine grains of arsenic in the pound should ever be possible in the purified article, and it would seem to indicate gross carelessness on the part of someone if such a proportion were found to be present. Rumour has been busy, as usual, in supplying far-fetched explanations of the matter, but I think it is safe to discard the extreme suggestion that sodium arsenate was accidentally mixed with some phosphate, owing to an assumed lack of system in the manufacturer's storage arrangements. It is much more probable that the crude phosphate operated upon has contained more arsenic than usual, and that the manufacturers have depended upon recrystallisation to purify the salt sufficiently. If, however, the arsenic were present in the form of sodium arsenate, that compound would probably crystallise out with the sodium phosphate. The check that is obviously required in such a case is that the crude phosphate should be tested for arsenic, and, if that impurity be present in any appreciable quantity, the recrystallised salt should be specially examined before any of it is sent out to wholesale or retail dealers in chemicals for medicinal use. That does not appear to have been done in the present instance, and the result is not one which pharmacists generally will regard with equanimity.

Unreasonable Delay.

A strange feature in the case is the unreasonable length of time that has been allowed to elapse before "the trade" was properly notified. The chemical manufacturers involved acknowledge that they have been supplying sodium phosphate which probably contained arsenic, from the middle of November until the end of April last. Presumably, therefore, the presence of the poisonous impurity was detected nearly two months ago, but we ordinary pharmacists were not informed of the existing serious state of affairs until last week. I find that warning circulars were sent out by the manufacturers of granular preparations to some of their customers early in May, but that notification was not general, and was useless so far as most retail chemists were concerned. What ought to have been done, and done promptly, was for the chemical manufacturers and granulators to send such particulars to the *P. J.* and other trade journals as would have enabled the conductors of those organs to put all retailers on their guard at the earliest possible moment, in addition to sending carefully-worded circulars to all their cus-

tomers and supplying printed warning slips for insertion in the monthly prices current issued by all wholesale druggists and druggists' sundriesmen. No words could be too strong to express condemnation of the "policy of hush" which has apparently been adopted, and the probability is that a very heavy price will have to be paid by all the manufacturers concerned before the matter is allowed to sink into oblivion, if ever that stage is arrived at. Though the pharmacist recognises that his position is to stand between the public and possible dangers that may arise from the careless handling of poisonous substances, he has the right to expect that those who supply him with the articles he dispenses should at least supplement his efforts by exercising a thorough supervision over all that goes on in their establishments.

Research in Pharmacy.

According to the official organ, research in pharmacy "appears likely to be taken up" by the British Pharmaceutical Conference, but little credit, seemingly, being given to that body for what it has attempted to do in the past by making grants to research workers and, it may be added, by holding annual meetings at which the results of original investigations can be presented and discussed. But what follows in the paragraph from which I quote shows that no such slight is intended, as it is made clear that the proposed novelty is not the mere encouragement of research, but the suggested appointment of a paid investigator to work systematically and continuously at the solution of problems in what used to be known as the "Blue List." In regard to this matter, by the way, a good deal of nonsense was published by the *C. & D.* last week. It appears to be assumed by that organ that the decision of the B.P.C. Executive to support Mr. Holmes' proposal was due to the supposed unsatisfactory nature of Mr. Carteighe's reply to Mr. Butt at the special general meeting of the Pharmaceutical Society, held a few weeks ago. But it is quite beside the question to insinuate anything of the kind or to state that "well-informed members of the Conference Executive feel that the Pharmaceutical Society is not able to give all the pharmaceutical assistance that the General Medical Council requires." The real reason why Mr. Holmes' scheme was not adopted at the outset is, I am credibly informed, because the scheme, as originally presented, did not commend itself to the Executive. Important modifications were subsequently introduced, notably one substituting the words "research worker" for "research scholar," and by skilfully avoiding some very thin ice, Mr. Holmes at last succeeded in inducing his colleagues to assent to the general principle that, having promises of sufficient pecuniary support, the B.P.C. should endeavour to promote research in pharmacy directly. But that "research worker" has not yet been appointed.

Magnesia and Shot.

What has poor Mr. Carteighe been doing to the leader-writer of the *C. & D.*, who keeps up such a persistent policy of pin-pricks with regard to the pharmaceutical Nestor? Our former leader for fourteen years is blamed—directly or by implication—in one and the same editorial in the Cannon Street organ (1) for what is euphoniously described as "the mess that the Pharmaceutical Council had made of the Bloomsbury research scheme"; (2) for not welcoming with open arms an American chemist who happens to be earning his livelihood in London and thus supplanting a Britisher; (3) for the decision of the B.P.C. Local Committee not to ask to be received by the Lord Mayor or the Chairman of the London County Council; and (4) for endeavouring, in some mysterious way, to prevent the President of the Conference receiving the honour which is his due. It is not clear what all the trouble is about, but perhaps Mr. Carteighe has omitted to arrange for an extra guest at one of his dinner-parties, or to strive in some other way to propitiate the would-be presiding genius of British pharmacy. Anyhow, the fuss that was made last week was quite

irrelevant, and if there is one person more than another who desires to be saved from his "friends," it ought to be Mr. E. M. Holmes, to whom so much that is published in the article referred to must be distasteful in the extreme.

The Law and Conspiracy.

I see it is reported that Mr. Justice Bigham thinks a conspiracy exists "when two or more persons combine to do an unlawful act." If that be so, what a pity it is that Mr. Justice Bigham and others of his way of thinking were not on the bench when the case of the London and Provincial Supply Association was before the courts. If ever there was an instance of two or more persons combining to do an unlawful act, such a case surely exists when seven persons without the necessary legal qualification combine to do what only individuals holding that qualification are legally entitled to do. It is true that by a legal fiction the seven individuals, by combining, place themselves outside the penal clauses of the Act which prevents them, as individuals, doing what they wish; but none the less the seven have combined to do what constitutes an act that would be illegal if done by any one of them. That kind of combination, according to Mr. Justice Bigham, amounts to a conspiracy, and surely such a conspiracy "violates or threatens to violate the rights of an individual as distinguished from the rights of the public at large"—the condition which that learned judge lays down as essential if a conspiracy is to give rise to an action.

Trivialities v. Serious Business.

Life is too short to take all one's critics seriously and, though I am honoured by his attention, I fail to see that I need say anything about the latest effusion of the Scottish member of the Pharmaceutical Society who is so fond of burying his opinions in an opposition trade journal, beyond expressing regret that he, of all people, should prefer to bolster up existing anomalies rather than remove them. The present is no time for petty squabbling or hair-splitting, and my Scottish critic would turn his talents to better account if he were to sit down and write something that might influence the Grand Committee on Trade, to which I see the consideration of the Companies Bill has now been submitted. Mr. Ritchie, I note, is satisfied that Clauses 2 and 3, "or something analogous to them," would effect a beneficial alteration in the law, but he sticks to his opinion that those provisions are not really germane to the Bill. However, he has left it for the Committee to decide whether the clauses should be proceeded with, or struck out and relegated to "some other Bill at some other time." In other words, the President of the Board of Trade is of opinion that the carrying on of pharmaceutical or medical practice by companies requires the attention of the Legislature, though not necessarily in connection with a Companies Bill. If, however, that point is to be dealt with in the Bill, Clauses 2 and 3, "or something analogous to them," will suit Mr. Ritchie and, presumably, other members of the Government. Wherefore, I would suggest that the time is about ripe for pharmacists to make it clear that they have serious objections to Clause 2 and will have none of it. After it is dropped, we shall be quite prepared to consider "some other Bill," though always, of course, keeping a watchful eye on the Lord Chancellor, who may be tempted to re-insert Clause 2 when, if ever, the Companies Bill reaches the House of Lords.

Touting for Pupils.

Why cannot the Council of the Pharmaceutical Society do something to keep Galen Place clear of touts, who worry candidates up for examination by thrusting advertisements of certain proprietary schools into their hands? A student-friend had the prospectus of one such institution with a high-sounding name given to him in this way a few days ago, but it does seem to be stooping unnecessarily low to seek to get business in the manner indicated. Perhaps a hint to the policeman on beat would stop the nuisance.

PHARMACEUTICAL SOCIETY.

SCHOOL OF PHARMACY EXAMINATIONS.*

Session 1899-1900. Elementary Course.

CHEMISTRY.

1. A substance on analysis has the empirical formula CH . 0.195 gramme introduced into a Victor Meyer apparatus, heated in boiling sulphur, expelled a quantity of air which measured 28 C.c. at 0° and 760 Mm. What is the most probable formula of the substance?
2. How would you determine the volume of a small solid by means of Nicholson's hydrometer? Give a numerical example to illustrate your answer.
3. What facts may be brought forward to prove that water is a compound substance? What volume of hydrogen would be produced (measured at 91° and 380 Mm.) when 3 grammes of water are entirely decomposed by an electric current?
4. Give a description of the following substances; what are their formulæ? and state what happens when they are treated with a solution of caustic soda:—Chromyl dichloride, aldehyde, phosphoric anhydride, chloral hydrate, chlorine.
5. Describe the methods employed for the preparation of chloroform. What are the usual impurities in chloroform that render it unfit for use as an anæsthetic; how may they be tested for, and how is it that they are present in the chloroform?
6. State in detail the action of the following substances on carbon dioxide, gas:—Lime water in excess; a small quantity of lime water; heated sodium; heated carbon; heated sodium carbonate; also state as fully as you can the action of cold and of pressure on carbon dioxide gas.

PRACTICAL CHEMISTRY.

1. Determine the specific gravity of the sulphuric acid in bottle A. Having determined the specific gravity, calculate from the following table whether it is stronger or weaker than N sulphuric acid:—

Supposing

Sp. Gr.	Per cent. H_2SO_4 .	Sp. Gr.	Per cent. H_2SO_4 .
1.014	= 2.3	1.060	= 7.2
1.022	= 3.1	1.067	= 8.0
1.029	= 3.9	1.075	= 8.8
1.037	= 4.7	1.083	= 9.7
1.045	= 5.6	1.091	= 10.6
1.052	= 6.4	1.100	= 11.5

Determine by means of the sulphuric acid the strength of the sodium carbonate solution in bottle B.

2. There are two substances in box A. Find out what they are.

BOTANY (A).

Not more than Four Questions are to be answered.

1. Give some account of the phenomena known as heliotropism, and point out the advantages afforded to the plant by this form of sensitiveness.
2. Describe the manner of the formation of the vacuole in a vegetable cell. How does the vacuole aid in the life of the cell?
3. Give an account of the composition and structure of the cell wall. What changes in constitution are known to occur as cells increase in age?
4. Give an account of the different modes of branching which are met with among flowering plants. Upon what does the formation of a branch system depend?
5. Give a sketch of the general lines of classification of plants adopted in England. Describe the main divisions of the Spermatophyta.

BOTANY (B).

Not more than Four Questions are to be answered.

1. Give an instance of the localisation of some special sensitiveness in some part of a plant. Explain how the possession of this property benefits the plant in question.
2. What is sclerenchyma? Describe the structure of the cells composing it and explain its purpose. Give an account of its distribution in the rhizome of a fern.
3. What is periderm? Describe the structures which enter into its composition, and show how it contributes to the formation of a bark of a tree.
4. What is phyllotaxis? Describe the varieties which are met with among flowering plants.
5. Compare the following pairs of Natural Orders, and draw the floral diagram characteristic of each:—

Ranunculaceæ.	Compositæ.
Rosaceæ.	Umbelliferae.

PRACTICAL BOTANY.

1. Make a microscopic preparation to show the structure of A. Mount it in glycerin. Leave with it a lettered sketch calling attention to its distinctive features.
2. Identify and briefly describe the microscopic preparations B, C, D.
3. Comment on the morphology of E, F, G.

* The time allowed for each paper was three hours. The papers marked A were given to part of the candidates, and those marked B to the remainder.

MATERIA MEDICA.

1. Two varieties of Rhatany root are official. Describe them, pointing out how they may be distinguished from one another. Give the botanical source, natural order, and habitat of each. Which is to be preferred, and why?
2. What is the morphological nature of liquorice root, nutmeg, Iceland moss, soap bark, cousoo, hops? Adduce evidence in support of your assertion.
3. How may the following drugs be distinguished from one another: oak bark from willow bark; henbane seed from poppy seed; Socotrine aloes from Barbadoes, aloes; foxglove leaves from first biennial henbane; Brazilian ipecacuanha from Carthagenia; hemidesmus root from sarsaparilla; Chinese star anise from Japanese?
4. Write a short essay on guttapercha.

PHARMACY.

1. Describe and explain the official process for making Extractum Ergotæ; compare it with that for Extractum Ergotæ Liquidum and Tinctura Ergotæ Ammoniateda. Bearing in mind the active constituents of ergot, to which process would you give preference, and why?
2. What is the best method of concentrating weak percolates? Give reasons for your selection. Describe and sketch the apparatus you would use for quantities of about half a gallon.
3. Describe the processes of levigation and elutriation. Give two examples of each.
4. How would you proceed to prepare 2 ounces of glyco-gelatin pastilles, each of which shall weigh about 15 grains and contain $\frac{1}{2}$ grain cocaine hydrochloride?

PHARMACY.—PRACTICAL DISPENSING (A).

Dispense the following prescriptions, label, wrap, and address each to yourself:—

1. R Acid. carbolic. gr. j.
Pulv. capsici gr. j.
Ext. nucis vom. gr. $\frac{1}{2}$.
Ol. menth. pip. gtt. $\frac{1}{2}$.
Ft. pil. j. Mitte xij. Varnish. Sig. Cap. j. nocte maneque per hebdomada.
2. R Extract. ergotæ gr. iij.
Ft. supp. Mitte iv. Use one occasionally.
3. Infus. caryopb. ζ ss.
Sodii bicarb. gr. x.
Acid. arsen gr. $\frac{30}{100}$.
Bis die sumend post jentaculum et post prandium. Mitte ζ vj.
4. Potass. bicarb. gr. x.
Creosoti gtt. j.
Ol. menth. pip. gtt. j.
Spt. amm. ar. m. v.
Aquæ ad 3ij.
Ter die. Mitte ζ iv.

PHARMACY.—PRACTICAL DISPENSING (B).

Dispense the following prescriptions, label and wrap each, and address to yourself:—

1. Bismuth subnit gr. iv.
Podophyll. gr. $\frac{1}{2}$.
Hydrarg. perchlor. gr. $\frac{1}{10}$.
Acid. arsen. gr. $\frac{30}{100}$.
Ext. nucis vom. gr. $\frac{1}{5}$.
Ft. pil. Sumat j. bis die post cib. ad vices vj.
Mitte xij. Pearl coat.
2. R Sodii salicylat. ζ j.
Quininae phosp. gr. xij
Aq. ad ζ iv.
Ft. mist. Cap. ζ ss ter in die post cibos.
3. R Acid. gallic. gr. ij.
Ext. bellad. gr. j.
Ft. supp. Mitte v. Sig. "The Suppositories."
4. R Paraffin. liquid.
Paraffin. moll. aa 3ij.
Liq. potass. ζ j.
Spt. Amm. Ar. ζ j.
Aquæ ad ζ iv.
Fiat mistura. Cap. partem sextam si opus sit.

Obituary.

CLEMENTS.—On June 21, Charles Frederick Clements, Chemist and Druggist, Sheerness. Aged 28. Mr. Clements was a member of the Pharmaceutical Society.

DAVIES.—On June 20, David Sidney Davies, Pharmaceutical Chemist, Bayswater, W. Aged 34. Mr. Davies was a member of the Pharmaceutical Society.

FITZHUGH.—On June 15, of enteric fever, at the Imperial Hospital, Deelfontein, Civil Surgeon Richard Truman Fitzhugh, M.B. London, only son of R. Fitzhugh, Pharmaceutical Chemist, Nottingham.

WILSON.—On June 20, George Wilson, Chemist and Druggist, Wolsingham. Aged 56.

LETTERS TO THE EDITOR.

Medicated Waters.

In the *P. J.* of April 28 last, page 437, different methods of preparing medicated waters are compared, the following conclusion being formed:—"All the evidence is in favour of the method depending upon impregnation of and filtration through cotton. . . the same result was noted (in testing the waters) in the case of medicated waters prepared by agitation with cold water." Of course, the cotton method is not new. Some years back I prepared several waters by it with success, but one batch resulted in little odour and taste of the oil, proving that great care was necessary in packing the wool (with which the oil had been triturated) tightly in the neck of the funnel. The wool process was abandoned as decidedly uncertain. Since then I have shaken the oils with warm water, having the idea that warmth is necessary to break up the oil globules. If shaking with cold water really answers as well I should be pleased to know it. A useful fact brought out in the notes is that kieselguhr or talc are preferable to magnesium carbonate or calcium phosphate as filtering agents. Many of these waters prepared by the shaking process require no filtering except through a plug of absorbent wool, which is easily done each time the shop bottle is replenished from the stock.

Northampton, June 25, 1900.

J. CLOWER.

The Examinations.—A Suggestion.

The proposal of the Council to consider the name of the qualifying examination of the Pharmaceutical Society, which shall entitle those who pass it to be registered as chemists and druggists, leads me to offer a suggestion. Everyone who has had the training of youths knows the great difference there is in their mental capacities, manual dexterity, and taste in artistic display, as shown by the neatness with which a bottle of medicine, a box of pills, suppositories, lozenges, or similar article is put up, wrapped and made ready for delivery. In the acquisition of knowledge there are indications of the same want of power to assimilate the facts in every department, and whilst one youth easily masters the descriptive words in botany and seems quite at home in the subject, another finds it most difficult to learn, though easily mastering the symbols and characters of chemical science; both may be untidy and lack the neatness which a West-end pharmacist would like, whilst another, though not a genius in one particular science, is a good all-round student and particularly neat and methodical in his work. It is on this account that I find it difficult to believe that all the rejected candidates for the Minor examination during the past twelve months are incompetent and I would ask the Council to consider whether it is feasible to allow the examiners to give certificates of merit of first, second, and third class, making the "Pass Examination" a thoroughly practical one so far as it applies to our business; but when a candidate shows superior training and knowledge of analytical chemistry, microscopic manipulation, urine analysis, or extra quickness, neatness and care in dispensing, the examiner can indicate the fact by awarding a certificate accordingly. If a candidate wished to obtain a higher class certificate he might be allowed to present himself for a further examination at the end of three months on payment of a small fee. None of these certificates should supersede the Major, but they should be signed by the chairman of the examiners before whom the candidate appeared, and by the Registrar of the Society, and be numbered and registered. They would be of great service to the holder, as evidence of his abilities, and to the pharmacist as a guide in the engagement of an assistant.

Leeds, June 26.

EDWIN YEWDALL.

Percentage Solutions.

May I be permitted to point out that the paragraph headed "Percentage Solutions" in the *P. J.* for June 16, quoted from the

American Druggist, is an excerpt from a paper by myself, read before the Public and Poor Law Dispensers' Association of London a short time since. Although the conductors of the *American Druggist* have thought fit to publish the bulk of the paper in full, they have removed the portion in question, and published it as emanating from themselves, although using my verbiage exactly. To me this is a small matter, but it serves as an illustration how some journals use matter without acknowledgment.

London, June 22, 1900.

FREDERICK DAVIS.

* * Since publishing the note referred to by Mr. Davis, the *American Druggist* has explained that the paragraph was inadvertently omitted from its report of his paper.—[Ed. P. J.]

Assistants' Salaries: A Suggestion.

It might prove an item of interest to many readers of the Journal—especially those who are engaged as assistants, qualified and unqualified, and, indirectly to apprentices—if some means could be devised for obtaining reliable and periodical information as to the different rates of pay ruling in different parts of the country. I understand that much higher wages are paid in England, particularly in the southern and central counties, than in Scotland. If such is the case, what is the cause? Is the expense of living greater in these parts, or are the profits made by employers larger than in Scotland, thus enabling better wages to be paid, or is it due to a more liberal spirit in the masters. We chemists seem to be much behind other trades in knowledge of such matters relating to our welfare. In many trades—take that of an engineer or carpenter, for example—the wages ruling in different towns seem to be well and almost universally known among the individual members of the trade. Among our craftsmen it is different. If one asks a commercial traveller, who hails from, say, London or Liverpool; what the average wages paid in those towns are, or in others in which he is constantly doing business, he either tells one that he does not know, or pretends not to know, but says that he only put the employee into touch with the employer, but knows nothing of the average wages paid in these towns. When advertising for assistants masters almost invariably invite the applicant to state the wages he requires. Why is this? Is it in the hope of getting assistants to ask for a smaller salary than might otherwise be paid if a wage was offered? At any rate, I think this method of procedure tends to keep wages lower than they might be. How many qualified men have at present got the wage of an average carpenter or engineer, calculated per hour worked? Can nothing be done by united action to improve matters? Some readers of the Journal, perhaps, may be in a position to furnish or obtain the information sought, or make suggestions for obtaining the same. If such news could be procured a small space in the Journal might be devoted to this quite as appropriately as to reports of the drug markets, and would be as interesting to many of the readers of the Journal.

June 25, 1900.

"LABOR" (36/9).

A University Degree in Pharmacy.

Great Britain has long been behind all Continental countries in granting recognition to pharmacy as a subject worthy of study for a university degree. It is probably this fact which induces our brethren on the Continent to sneer at British pharmacy as mere shopkeeping, unlearned by any trace of learning or science. There would now appear to be a chance that the grievance may be remedied. It has been stated that the new Birmingham University contemplates conferring the degrees of B.Sc. and D.Sc. in the department of pharmacy. It is also thought that the authorities might be induced to grant the degrees on terms not necessarily involving residence at Birmingham to pharmaceutical chemists already registered as such, just as the Universities of Oxford and Cambridge grant the D.P.H. to registered practitioners who comply with the conditions. If, therefore, British and Irish pharmacists have any wish to remove the stigma that their calling is considered unworthy of a degree in any of the universities of the Empire, it

is surely necessary that they should take steps to have the reproach removed. The meeting of the Conference would seem a very fitting occasion for pharmacists to come together and present a petition to the latest university to give them an opportunity of obtaining a degree in subjects pertaining to their calling.

J. C. McWALTER, D.P.H., L.R.C.S.I., etc.

Dublin, June 26.

ANSWERS TO QUERIES.

SPECIAL NOTICE.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When the formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

SPIRITINE (W. B. W.—43/30).—The composition of the preparation is unknown to us.

FLOWERS (K. C. B.—43/27).—A, *Galium uliginosum*; B, *Polygala vulgaris*; C, *Linum catharticum*; D, *Trifolium minus*.

GUNPOWDER (W. B. W.—43/29).—Presumably, because of the tendency to oxidation, and consequent risk of explosion.

SEM. PSYLLIUM (W. C.—43/28).—They are the seeds of the fleawort, *Plantago psyllium*, which is common in Southern Europe. The seeds contain mucilage and are used as an aperient medicine.

RETOUCHING MEDIUM (F. W. S.—43/32).—(1) Dissolve sandarac 1, shellac, 6, and mastic, 6, in ether, 120, then add benzol, 20; or, (2) dissolve amber, 1, in benzol, 40. In either case filter or allow to stand until clear.

SMOKING (H. L. H.—43/33).—(1) We do not think so; (2) it will be inadvisable to take it except on a physician's advice. Why not gradually reduce the quantity, from day to day, or only indulge after meals?

DELIVERY OF JOURNAL (G. N.—36/4).—Your letter, which should have been addressed to the Secretary of the Pharmaceutical Society, was not received until Friday morning, several hours after all the copies of the Journal had been despatched. Any delay in delivery last week was doubtless due to the cause mentioned at page 677 of last week's issue.

BELLADONNA POISONING (J. P. T.—43/34).—You will find numerous cases recorded in back volumes of the *Pharmaceutical Journal*, the *Lancet*, and the *British Medical Journal*; also in standard works on toxicology, which can be referred to in the Society's Library. Half a grain is the smallest known fatal dose of atropine for an adult.

DENTAL POWDER (H. J.—43/40).—It appears to be a preparation of zinc oxide, such as is mixed with syrupy phosphoric acid to make osteo-plastic cement. A powder of that kind can be prepared by adding strong nitric acid to the oxide, stirring until the reaction is complete, heating until red vapours are no longer given off, and afterwards raising the mass to a white heat. It is then allowed to cool gradually and finely powdered.

ESSENCE OF RENNET (W. W.—44/1).—Dried calves' stomachs, preserved with salt, are used in Forret's process (see *P. J.*, August 1, 1896, p. 112). Cut three such stomachs into small pieces and macerate for about an hour, with frequent stirring or shaking, in a solution of 5 oz. of salt in 50 oz. of water. Strain through muslin and repeat maceration, etc., twice with the same quantity of brine, then dissolve $\frac{3}{4}$ oz. of boric acid in the mixed strained liquors, add 15 oz. of rectified spirit, and filter.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, JUNE 30, 1900.

ARSENICAL CONTAMINATION.

THE alleged discovery of considerable proportions of arsenic in a medicinal preparation that may be considered as belonging to the class of domestic remedies is calculated to excite some serious reflections. If the statements that have been made in regard to this matter should be substantiated at the public inquiry, which may be expected shortly to take place, it would appear that neither the Arsenic Act nor the provisions of the Pharmacy Act relating to the retail sale of poisons are adequate to effect the objects for which they were intended. Outside the scope of those enactments there appear to be possibilities of public safety being imperilled in various ways, and among others by the sale of medicinal articles which are not included in the schedule of statutory poisons. Another disquieting reflection is suggested by the possibility that retailers of, presumably, harmless preparations might be innocently and unconsciously exposed to serious risk. The preparation of many articles used for medicinal purposes is now so much carried out on a large scale, that to some extent the practice of pharmacy has been transferred to large manufacturers or wholesale druggists, and retailers will require to take suitable means for ensuring the quality of articles supplied to them. In that respect the standards and definitions of the Pharmacopœia acquire great importance, and it is somewhat strange to find that among other directions for standardising, etc., the possibility of sodium phosphate being contaminated with arsenic seems to have been overlooked.

The sulphuric acid used as a chemical agent in a great variety of manufacturing operations is, perhaps always, made from pyrites and as that material generally contains more or less arsenic, there is an obvious probability that the products of such operations may be more or less

contaminated with arsenic. That such might be the case with sodium phosphate does not appear to have been recognised by the authorities charged with the preparation of the British Pharmacopœia; for though in reference to many articles of the official materia medica, from acetic acid to zinc valerianate, arsenium is indicated as an impurity to be tested for, that is not the case in regard to sodium phosphate and several other salts which would naturally be much more likely to contain arsenic. A similar oversight on the part of chemical manufacturers may have been, in some way, the cause of the alarm recently created by the discovery that a familiar laxative preparation containing sodium phosphate gave indications of the presence of arsenic as a contamination. The information obtainable as to this occurrence is at present too slender to admit of any positive expression of opinion; but there is some reason for thinking that the alarm may have been to a great extent exaggerated and premature. Ordinary sodium phosphate no doubt does contain a minute amount of arsenic, and in the German Pharmacopœia a specific test is given for ascertaining that the proportion of arsenic is not too great to be disregarded. If the absence of directions for applying such a test in the British Pharmacopœia can be taken as showing a belief that the presence of arsenic was not to be expected in sodium phosphate, its discovery in that salt may have been somewhat startling at first sight.

The foregoing remarks must not be understood as applicable to such minute proportions of arsenical contamination as would be practically unobjectionable, but to amounts so considerable as those mentioned when applications were made at the Marylebone Police Court for proceedings against sellers of effervescent sodium phosphate. From three and a-half grains to eight and three-quarter grains of arsenic in a pound of that preparation would correspond to an arsenical contamination of the sodium phosphate used in making it that would be far in excess of an allowable limit. It will be interesting, therefore, to learn on what evidence those serious charges are founded. For as stated, they convey the idea that a full dose of one of the samples of effervescent sodium phosphate—half-an-ounce—would contain more than a quarter of a grain of arsenic, or more than four times the maximum medicinal dose of arsenous oxide (one-fifteenth of a grain), while the other sample would contain nearly twice the maximum dose of arsenous oxide. Consequently, the sodium phosphate used in making these preparations would have contained in one instance 17.5 grains in the pound ($= \frac{1}{400}$ th), and in the other 7 grains in the pound ($= \frac{1}{1000}$ th). Having regard to the doses, therefore, the preparations made with them would be decidedly dangerous and, in future, it will be imperative to ascertain that the sodium phosphate employed for medicinal purposes is practically free from arsenic. Probably a limit of one part in one hundred thousand would be sufficient for the purpose, or 0.07 of a grain in the pound; but evidently provision will have to be made in the Pharmacopœia to prevent this dangerous contamination of sodium phosphate from being overlooked. If GUTZEIT'S test is adopted for that purpose, one-tenth of a gramme of the salt should give only a very faintly visible yellow stain to the mercurial paper.

ANNOTATIONS.

THE COMPANIES BILL has at last been read a second time in the House of Commons, and was referred on Tuesday last to the Grand Committee on Trade. Referring to Clauses 2 and 3, Mr. Ritchie said there were some provisions in this Bill which were not in the original Bill, and some of them had given rise to a very considerable amount of discussion and a very large amount of opposition. One of those clauses dealt with the sale, etc., of drugs, and the other with the carrying on of medical practice by a company. He supposed he had received representations with regard to those provisions that numerically outnumbered by one hundred-fold those referring to any other provision in the Bill, both for and against. He was bound to say, however, that he did not think those provisions were really very germane to the Bill. He had no doubt that provisions something analogous to the provisions contained in the Bill would be a very beneficial alteration of the law, but he was bound to say they were not in a proper place in a Bill amending the Companies Act, and if they were to be dealt with it would be much better they should be dealt with in a separate Bill rather than introduced in the Bill before the House. However, it would be for the committee to decide whether or not they should be proceeded with, or struck out of the Bill and relegated to some other Bill, to be brought forward at some other time. In reference to this matter, readers will be gratified to learn that the Law and Parliamentary Committee of the Pharmaceutical Society is taking prompt steps to deal with the matter, and members of the Society are warned to be ready to take action in connection with the Bill at very brief notice.

THE MEMBERSHIP OF THE SOCIETY IN SCOTLAND is now, according to Mr. Peter Boa (see p. 704), higher than at any former period, the number of members being 583, as against 570 in 1899 and 412 in 1898, prior to the passing of the last Pharmacy Act. As the total membership of the Society is 5,541, it would appear that rather more than 10 per cent. of the members are resident in Scotland. But the total number of registered chemists, according to the latest Registrar's Report, is 15,595, of whom Mr. Boa assumes about 1,400 to be in Scotland, so that "the trade" is proportionately better represented by the Society in Scotland than in England and Wales. As Mr. Boa puts it, the membership in Scotland is about 42 per cent. of the registered chemists and druggists, and, as compared with the number on this side of the border, about 10 per cent. better. That is a very good record, so far as it goes, and the members generally will share Mr. Boa's gratification that the chemists of Scotland support the Society so well, the more especially as he is convinced that they do so with the intention of increasing the prestige and honour of the body to which they belong, and not for simply local purposes.

MR. GILMOUR'S REMARKS (see p. 707) on the same subject are also of great interest. He asked how the Society can be strong in Scotland, or how can it be made better, with a membership of only 583 out of 1,400. The bulk of the existing prejudice against the Society, as he points out, has its origin in ignorance, a great many persons having the idea that the Society ought "to do something" for them—something which it is not doing—and that until that something is done they are justified in refusing to join the Society. The same class of individual exists largely in England and Wales, and, unfortunately, as in Scotland, the something to be done is never specified by the dissentients. It is difficult, therefore, to avoid attributing their refusal of support to anything but pure selfishness. They are willing to benefit to an unlimited extent by anything the Society has done or may yet do, but they may be expected to remain outside the ranks indefinitely, accepting all the benefits that come to them in the natural course of events without paying for any.

THE QUALIFYING EXAMINATION of the Pharmaceutical Society was last week shown to have been entered for by a record number of candidates, seven hundred and fifteen persons having announced their intention of presenting themselves for the examination, in London or Edinburgh. The "First" or Preliminary Examination of the Society is having its discontinuance celebrated by the establishment of a similar record, more than a thousand individuals being anxious to secure registration as "apprentices or students" under the expiring arrangements. Those who fail on this occasion—a large proportion, it is to be feared—will, of course, be unable to re-enter for examination on payment of a reduced fee, as formerly; they must begin anew, as it were, and attempt to pass one of the examinations referred to at page 67 of the 'Calendar' of the Pharmaceutical Society for the current year. After passing that they must pay a registration fee of two guineas to the Pharmaceutical Society before becoming eligible to enter for the Minor Examination.

THE DISTRIBUTION OF POISONS of all kinds is, beyond question, best left in the hands of persons who may be expected to exercise a proper discretion in the performance of that function, even to the extent of declining to supply them in cases where they consider such a course desirable. Registered chemists do exercise such discretion, and they are accustomed to regard the sale of scheduled poisons as a professional function rather than a mere trading transaction. Limited companies, on the other hand, exist simply for the sake of earning dividends, and, as has previously been pointed out in these columns, the managers or assistants of such companies are not free to exercise their discretion in regard to the sale of poisons. Their business is to sell as much as possible—whether the substance be poisonous or not—and the effect of allowing companies of unqualified persons to deal in poisons, even though the actual sellers are qualified, is to increase the danger to the public in a most insidious manner. A Pharmacy Act case reported in this week's Journal (see p. 693) affords proof that the position here stated is not an exaggerated one. The defendant is the unqualified assistant in a drug shop belonging to a medical man, and pleaded guilty to a charge of illegally selling scheduled poisons. In extenuation of his offence he said he did not consider the question of his action being an offence against the Pharmacy Act; his "only object" in conducting the business was "to sell as much as possible and show a good cash return when the doctor came back!" That is precisely what may be expected to happen in the case of limited companies, whether the assistants be legally qualified or not, their duty being, above all else, "to sell as much as possible and show a good cash return." But that does not conduce to public safety.

TRULY, THE WAR IS INSATIABLE, observes a writer in the *Daily Chronicle*, who says he knew that most trades were affected by the calling out of the reserve, but it had not occurred to him before that the Army Medical Corps drew so many of its recruits from the "chemist's shop." But the particular recruits that the newspaper man heard about appear to have been drawn from a large West-end drug store and not from a "chemist's shop," though the individual imparting the information is reported to have said that "it isn't often a chemist's assistant can afford to be independent." He may be right in describing it as "a wretched business," considering the cost of the training, but it is not quite accurate to say that one pays nearly as much to qualify as a chemist as to become a doctor. The young man behind the counter appears to have impressed the *Daily Chronicle* paragraph-writer, for the latter thinks it is a pity that young man is in a "chemist's shop," and expresses the opinion that he ought to be in a Bernard Shaw play.

PROFESSOR OLIVER LODGE, who has been appointed Principal of the University of Birmingham, is a distinguished physicist. According to the *Times*, he was born at Penkull, Staffordshire, in 1851, and has held the Chair of Experimental Physics at Liverpool since 1880, practically since the establishment of the University Col-

lege there. In 1887 he was elected a Fellow of the Royal Society, and in the following year the University of St. Andrews conferred upon him the honorary degree of LL.D. He has been an examiner for London University and for the Science and Art Département. Professor Lodge was originally destined for a commercial career, but early showed a strong bent for experimental physics. He took his D.Sc. degree at London University in 1877, and has devoted himself largely to the study of electrical phenomena, his experimental work in connection therewith having resulted in several notable discoveries. His researches concerning the alternating character of lightning and other discharges, and the propagation of electro-magnetic waves, have been especially interesting. His contribution to the practical utilisation of wireless telegraphy has been considerable, and his discovery that metals cohere readily under electrical influence opened up a train of experiments which produced the most sensitive detector of electric waves known. He has pursued other branches of the problem of signalling across space in co-operation with Dr. A. Muirhead.

THE PRICE OF GAS in London has been raised to an outrageous extent by the Gaslight and Coke Company, and Professor Silvanus P. Thompson writes to the *Times*, pointing out that the remedy obviously is that, either by private or municipal enterprise, there should be created a public supply of non-illuminating gas. That, he states, can be supplied profitably at less than two shillings per thousand cubic feet, or at half the price to which illuminating gas has now been raised. Though only half the price, it will be equally good for propelling gas-engines and for supplying gas stoves. There will be nothing to prevent any consumer of it from using it to heat the mantles of incandescent lights, or any other thing that he desires to heat. Neither need he be debarred from himself manufacturing in his own house an illuminating gas from the non-illuminating by enriching it by means of naphthalin ("albo-carbon") or other hydrocarbons.

MEMBERS OF THE PHARMACEUTICAL SOCIETY residing abroad are naturally unable to receive official communications from headquarters so promptly as those who reside in Great Britain, and a correspondent directs attention to what he regards as a "flagrant anomaly," that certain members are "disfranchised by living away." He has been induced to write by receiving a letter from a member resident in India, who points out that he did not receive his voting paper for the recent Council election until twelve days after the time when it ought to have been returned. In the circumstances, he thinks it is a mistake and a waste of postage stamps to issue voting papers to members residing at such a distance from home, and the person to whom he addresses his letter thinks "a remedy is very simple and urgent." We doubt if any such remedy is possible, and a little explanation may put matters in a clearer light for the benefit of the member who writes from far-away India. It was formerly the custom, as regulated by a Bye-Law, to send voting papers to all persons entitled to vote and residing in Great Britain, but not to those residing abroad. Some years ago, however, it was decided that, though it was physically impossible for members residing in the Colonies, India, etc., to record their votes, there was no reason why they should not be kept fully conversant with all that was taking place in connection with the Society of which they were supporters. Accordingly, the Bye-Law was altered and voting papers have since been sent to every member entitled to vote, whether residing in Great Britain or not. But it must not be overlooked that they were originally sent with the object of conveying information only, not with any idea that the recipients would be able to record their votes. Difficulties of time and space seem to offer insuperable obstacles to that being done in the case of places so far from home as India or any of the Colonies. At the

same time, any really "simple" remedy that can be suggested may be expected to receive full consideration from the Council, and now is the time to deal with the matter whilst revision of the Bye-Laws is actually proceeding.

THE SALTERS COMPANY RESEARCH FELLOWSHIP, which is tenable in the Research Laboratory of the Pharmaceutical Society, again becomes vacant this year, and applications for it are now invited in an official notice published in the advertisement columns of this week's Journal. The subject of the Fellowship is chemistry considered especially in its relation to pharmacology. The Fellowship is of the annual value of one hundred pounds, and, though nominally tenable in the Society's Laboratory for one year only, it may be renewed under certain conditions. The Fellowship is not limited to pharmaceutical chemists and members of the Society, and applications must be sent in writing to Professor Collie, 17, Bloomsbury Square, London, W.C., so as to be received by him not later than Saturday, July 7.

AS AN HERBARIUM PRIZE, a silver medal is annually offered to student-associates of the Pharmaceutical Society who are under the age of twenty-one years, for the best herbarium, containing not more than a hundred and fifty specimens, collected in any part of the United Kingdom, the Channel Islands, or the Isle of Man, between January 1 in one year and July 1 in the year following. Should there be more than one collection possessing such an amount of merit as to entitle the collector to reward, a second prize, consisting of a bronze medal, and also certificates of honour, will be given at the discretion of the Council. Collections for this year's competition must be received by the Registrar of the Society not later than Monday, July 2.

THE NUMBER OF CLINICAL THERMOMETERS EXAMINED at Kew during 1899 was 16,020, a decrease of 1,942 on the preceding year. The number rejected on account of excessive error, or for other reasons, was 149, a decrease of 24. It is noteworthy that, according to the report of the Kew Observatory Committee for the year ending December 31, 1899, the percentage of rejections—0.96 and 0.93 in 1898 and 1899 respectively—was very low in both years. The Kew Observatory, which has hitherto been managed by a Committee, has now been incorporated with the National Physical Laboratory, for the establishment of which Parliament has voted a sum of money, but the work will continue to be carried out by the existing staff, subject to the control of the Executive Committee, which is nominated by the Royal Society and includes six members of the late Committee. A director is to have sole control and direction of the National Physical Laboratory, and of the work done within it. Mr. R. T. Glazebrook, F.R.S., has been appointed to that office.

THE CONFERENCE ENTERTAINMENT FUND now exceeds four hundred pounds, but we understand that another hundred pounds will probably be required to cover the expenses of the programme which has been arranged. The Hon. Secretary, Mr. William Warren, 24, Russell Street, Covent Garden, W.C., will therefore be glad to receive promises of further subscriptions. The first list of subscriptions was published in the *Pharmaceutical Journal* for March 3 last (p. 236), a second list will be found in this week's issue, and if London pharmacists who have not yet sent in their names will do so forthwith, it should be possible to publish within the next week or two a third list, which will bring the total to the desired amount. The pink circulars are being sent out this week, and applications for tickets should be sent in without delay. They may be addressed either to Mr. Warren, as above, or to his Honorary co-Secretary, Mr. H. Cracknell, 17, Craven Road, London, W.

ENGLISH NEWS.

BOTANICAL EXCURSION.—On Saturday, June 16, the students attending the School of Pharmacy, Bloomsbury Square, held a botanical excursion in the Caterham district, the party being conducted by Mr. Horrell, starting from Charing Cross at 9.24 a.m. On arriving at Caterham a start was made in the direction of Godstone, by way of the hills, and in a short time a very fine spot was found, where the party gathered a great number of specimens, including *Paris quadrifolia*, *Orchis muscifera*, *O. maculata*, *Listera ovata*, *Cephalanthera grandiflora*, *Gymnadenia conopsea*, and *Poterium sanguisorba*. Lunch was partaken of on the summit of a hill, whence lovely views were obtained, stretching beyond Reigate and Dorking to the west, and a greater distance to the east. The ground was a carpet of *Helianthemum vulgare* and *Thymus serpyllum*, while *Orchis pyramidalis* was scattered here and there. But of greater interest to pharmacists was a huge clump of belladonna in full flower, and fine specimens of *Bryonia dioica* growing on the bushes. Some enthusiasts dug up a huge root, which has since been presented to Professor Greenish. The party then separated, some proceeding straight to Godstone, others through Bletchingley and Nutfield to Redhill. On the way some fine aconite plants were seen growing in a garden. The gardener was indignant at its being called aconite, "That was *Delphinium formosum*. Aconite was a yellow flower, blossoming in February (*Eranthis hyemalis*). He had worked there twenty years, with forty men under him, and he ought to know." The entire party assembled at the Godstone Hotel at 4.30, where tea was provided, afterwards journeying back to Caterham, and thence to London, arriving about eight o'clock, having spent a most enjoyable and profitable time.

CHEMISTS' ASSISTANTS' ASSOCIATION (LONDON).—The following is the list of officers for the new session:—President, J. A. Dewhirst, Ph.C., F.C.S.; Vice-Presidents, J. Evans, Ph.C., H. Hymans; Hon. Vice-President, F. W. Gamble, Ph.C.; Hon. Secretaries, A. F. Goode, Ph.C. (literary), A. Latreille (financial); Hon. Treasurer, C. J. Strother; other members of Committee, W. N. Ellis, J. Fothergill, Ph.C., H. A. Martin, C. Morley, Ph.C., G. E. Pearson, J. W. Peck, Ph.C., T. M. Taylor, Ph.C.

SHEFFIELD COLLEGE OF PHARMACY.—On Thursday, June 21, some of the students of this College, accompanied by the Principal, went by train to Manchester for an educative outing, the first place visited being that of Messrs. Woolley, Sons, and Co., Limited, Victoria Bridge. The party were conducted over the five-storey building by Mr. Lane, and among the multitudinous array of goods stored there only a few are mentioned—rare chemicals, very poisonous ones, kept in locked cupboards in large jars and in 1oz.-1lb. bottles for wholesale. One room with shelves full of coated pills of their own manufacture. In others men were fashioning the steels for trusses, afterwards to be padded and covered by dextrous women for infants to largest size to order. Then on to glass bottles of every kind. A visit to the firm's analytical laboratory for checking chemicals on the premises before going out, also for bacteriological work for customers. A few of the less familiar apparatus were explained by Mr. Duncan. Floor three was devoted entirely to the leaves, roots, barks, gums, in their dried form and in powder, stored in 500 capacious bins—in all, about fifty tons. No one could fail in materia medica with experience in the dry room. On the second floor a large array of surgical, physical, and photographic appliances met the eye, and the students were shown by Mr. Twiney many interesting apparatus. One microscope, £21, of Watson's make, and another of £15 were examined *scrutim*. Some excellent short beam balances were seen. On this floor were the manager's and staff's offices and counting-house for over fifty clerks. Two directors—Mr. James Woolley and Mr.

Johnstone—were introduced to the Principal. On the first floor were receiving and despatch departments, also the town and export counters—the whole a busy scene. In the basement were stored 10,000 gallons of B.P. galenicals, and 5,000 gallons of oils, and two fireproof vaults provided with sprinklers. The fire hydrants have 2,000 gallons of water in reserve. Rows of tinctures, syrups, liquors, ointments, in alphabetical order; eighty gallons each of liq. morphin., liq. hyd. perchlor., forty gallons liq. strychninae, etc., were kept in locked-up compartments, each with keys kept on an indexed board. The visit to the manufacturing department at Cheetam had to be deferred, owing to other engagements. Mr. Lane was cordially thanked for his able guidance through the well-ordered buildings. The students next visited the renowned chemists, Jewsbury and Brown, who devote the whole of their energies to the manufacture of aerated waters and their celebrated tooth paste. One of the partners, Mr. Bardsley, kindly took them round. The preparation of syrups (a fine art with this firm), the brewing of ginger beer, preparation of cordials, syphon-filling—being the first in England to fill syphons. The laboratories are in charge of Mr. Kirkby, Ph.C., ably seconded by Mr. Lionel Stones. Mr. Kirkby is Lecturer in Pharmacognosy at Owens College. A feature in the manufacturing plant is that no filtered water comes in contact with lead in any form, only grain tin being used. The syphon tops are made of the same material. The firm make their own syphon cases. Orders were being executed for as far remote as Central Brazil. The manufacture of the tooth paste was witnessed. The whole building was noted for being scrupulously clean throughout. In the evening the chemists' exhibition in St. James's Hall was visited. The model pharmacy by Messrs. Evans, Sons, and Co., Liverpool, engaged the most attention. A most enjoyable half-day was made by the students.

NORTH OF ENGLAND SCHOOL OF CHEMISTRY AND PHARMACY.—The students of this establishment, accompanied by the Principal, Mr. F. R. Dudderidge, F.C.S., and Mr. J. S. Hill, Demonstrator, went on a botanical excursion to Morpeth on Saturday, June 16. The hot-houses and gardens of Mr. Edward Hopper, were visited in the forenoon, his choice collection of rare and valuable orchids and other exotics exciting great admiration. After lunch the party proceeded along the banks of the River Wansbeck to Newminster Abbey, and thence through the woods to the village of Mitford, a large variety of wild flowers being gathered on the way. On the homeward route calls were made at the gardens of Mitford Castle and Spital Hill, where many beautiful specimens of vegetation were inspected, great interest being shown in some mistletoe growing upon an apple tree. On the return to Morpeth the party was entertained to a substantial tea by the Principal, after which Mr. F. E. Schofield presented the prizes gained in the recent school examination to the successful candidates, and addressed a few kind and well-chosen words of encouragement and advice to the students. The first prize—'Walker's Physical Chemistry'—was gained by Mr. J. W. Patterson, and the second—'Aldous' Physics'—by Mr. H. Longstaff. After the usual votes of thanks the nurseries of Mr. Mathesen claimed attention, thus concluding a long and thoroughly enjoyable day.

IMPERIAL COLLEGE OF PHARMACY.—On Friday, June 22, the students of this College spent a profitable and pleasant afternoon, under the direction of their principal, Mr. Frederick Davis, in the Geological Museum, Jermyn Street, Piccadilly, the metals, their ores and extraction being the object of the visit, and subsequently the making of steel and the tempering processes were minutely traversed; the extraction of sulphur and its allotropic modifications; carbon, its allotropism, and the cut models in glass of the historic diamonds, together with the Nicol prism of calcite, and the beautiful polished specimen of malachite proved attractive and interesting; the "emetic cup," the ancestral and family aperient pill giving the students an insight *re* pharmacy in its pre-elegant bygone days.

A TRADEMARK CASE.—On Tuesday, June 26, Mr. Justice Farwell, in the Chancery Division, had before him an application by the Formalin Hygienic Company, Limited, to register the word "Formalin" as a trademark. The matter came before the Court on an appeal from the Comptroller, who had already refused the application.—The applicant's case was that a 40 per cent. solution of formic aldehyde, manufactured by the Chemische Fabrik auf Aktien vormals E. Schering, of Berlin, was first placed on the English market by Messrs. A. and M. Zimmermann as sole agents for Messrs. Schering, in 1892, under the name "Formalin," which name was registered in Germany as a trademark. It was then sold for the purposes of disinfection and general antiseptics. The applicant company was formed in 1897, and acquired all the rights of sole agency from Messrs. Schering for the sale of their manufacture of "Formalin." The applicants applied the word "Formalin" to various other articles besides the 40 per cent. solution, such as "Dry Formalin," or Paraform; "Normal Formalin," a weak solution for domestic use; "Formalin Powder," "Formalin Gelatine," and "Formalin Soap." There was also a lamp, in which paraform is burnt for disinfecting purposes, called the "Formalin Lamp."—Drs. Rideal and Passmore and Mr. Bevan deposed that the word "Formalin" *per se* conveyed no meaning to the chemist upon his hearing it for the first time.—Mr. Hughes, Q.C., and Mr. Ward Coldridge appeared in support of the application; the Attorney-General (Sir Robert Finlay, Q.C., M.P.) and Mr. Ingle Joyce appeared for the Comptroller.—Mr. Justice Farwell, in dismissing the application, held that it was a fatal objection to it that it was not made by the proprietors of the article in question. He was convinced on the evidence that the word "Formalin" had never in England represented to the trade at large or to the public any manufacture of any particular individual. He held that there had not as a fact ever been acquired in England any such association of the name "Formalin" with the manufacture of the German company or of Schering as would entitle either of them to say that it connoted their manufacture and nothing else. The application failed, and would be dismissed with costs.

DESTROYING SYPHONS FOR THE PEWTER.—At the Bath City Police Court on Saturday last, Frederick Henry Fry, 3, St. Anne's Place, Dolemeads, was summoned for wilful damage to sixteen glass syphons, the property of Messrs. Brook and Co., to the value of £2. Mr. Mawer (Bristol) prosecuted on behalf of the Bristol and District Bottle Exchange Association. The defendant smashed the syphons with the object, he said, of getting the pewter tops to sell. In Court he said a servant at Weston gave them to him.—Defendant was sentenced to fourteen days' imprisonment with hard labour.

UNSATISFACTORY SEIDLITZ POWDERS.—The recently-published quarterly report of Dr. Alfred Hill (Analyst for the City of Birmingham) contains a lengthy reference to seidlitz powders. Dr. Hill states that during the three months he analysed five samples. Four white powders of one contained from fourteen to twenty-two grains of tartaric acid, instead of thirty-eight grains, as directed by the B.P. Four blue powders in the same sample contained from 116 to 137 grains, instead of 160 grains; each powder on the average contained thirty-nine grains of Rochelle salt, instead of 120 grains, while the cheaper ingredient, bicarbonate of soda, was in excess, fifty-eight grains being present instead of forty. The powders were wrong, both in quantity and quality, and were very unevenly divided. What made the matter worse was that each pair of powders was labelled as follows:—"Caution to the public.—Thousands of boxes of a common imitation of the genuine seidlitz powders are being sold by unprincipled traders for the sake of extra profit. We guarantee all our powders to be genuine. (Signed) —." The vendor, who, as Dr. Hill points out, was not a qualified chemist, was fined £10 and 9s. costs, there having been a previous conviction for adulterated glycerin. Dr. Hill re-

marks that, considering the scandalous nature of the offence, the fine does not appear to err on the side of leniency. Six samples were purchased under the Pharmacopœia name of effervescent tartarated soda powders. The white powders of one sample contained from thirty to forty grains of tartaric acid, instead of thirty-eight grains; while the blue powders were practically correct in composition.—A fine of £1 and 10s. costs was inflicted. The blue powders of the remaining nine samples were very uniformly divided, thirty of the thirty-six powders being within five grains of 160 grains—the proper amount. One powder contained 147 grains only, and five had from 166 to 169 grains. In each case the bicarbonate of soda and Rochelle salt were present in the proper proportions, or nearly so. The tartaric acid in the white powders was not so well divided. One paper contained thirty-three grains, six from forty-one to forty-three grains, one had forty-four grains, one forty-five grains, and the remaining twenty-five papers contained thirty-six to forty grains of tartaric acid. Six samples of Friar's Balsam received were all of satisfactory quality. They contained from 16.9 to 18.5 grammes of solid matter per 100 cubic centimetres, and had a specific gravity of 0.893 and 0.902.

SALE OF CAMPHORATED OIL.—On Wednesday, June 20, William Tonkinson, grocer, Stafford Street, Wolverhampton, was charged at the local police court with selling camphorated oil not of the nature, substance, and quality demanded, it being certified to contain 38 per cent. of mineral oil instead of olive oil.—For the defence it was stated that the oil was purchased by the defendant in 1897 before camphorated oil was included in the B.P.; but the magistrate pointed out that the article in question was retailed after the inclusion of camphorated oil in the new edition of the Pharmacopœia. Defendant had, however, acted innocently in the matter, and little harm had been done; still, he must be more careful in future. On payment of the costs of the case the summons would be dismissed.—On Friday, June 15, John V. Lewis, grocer, was summoned at the Blackwood (Mon.) Police Court for selling as camphorated oil a substance containing no olive oil and deficient in camphor to the extent of 74.6 per cent. Eli Marshall, wholesale dealer, was summoned under the Merchandise Marks Act for applying a false description to the article with intent to defraud.—It was stated on behalf of the defendant Lewis that in 1897 he bought a quantity of the oil at the Grocers' Exhibition in London, each bottle being stamped as "prepared in strict accordance with the British Pharmacopœia." For the defendant Marshall it was stated that about the time the oil was bought certain things having come to the notice of the firm the managers were dismissed.—The magistrates decided not to convict the defendants, but ordered Lewis to pay three guineas costs and the court fees, and Marshall to pay five guineas costs and the court fees. Lewis's costs were paid by Mr. Marshall.—At Kingston Police Court, on June 14, Mary Robinson, 9, St. Mary's Road, Surbiton, was charged with selling camphorated oil 60 per cent. deficient in camphor; also with selling camphorated oil 75 per cent. deficient in camphor.—In the first case the label of the bottles bore the words, "Campholeum, formerly known to the public as camphorated oil. P. H. Galloway, M.P.S., qualified chemist by exam., Walworth, London, S.E."; in the second case the words on the label were "Camphoric, formerly known as camphorated oil. Packed by Samuel Dodman, London, S.E. Established 1881." The latter article was stated to contain mineral oil, and both were described by the prosecution as heartless adulterations at the expense of the poor, who chiefly purchased them, but for whose purposes they were useless. The terms "Campholeum" and "Camphoric" had been devised since camphorated oil had been included in the B.P. In reply to the Chairman the Inspector said it was too late to prosecute the persons who supplied the articles, but, if convicted, defendant could proceed against them.—Fines of 1s. with 19s. costs on each summons were inflicted.

SALE OF MAGNESIA.—At Belper Police Court, on Thursday, June 14, Eugene Walters, shopkeeper, Crich, was summoned for selling magnesia not of the nature and quality demanded, magnesium carbonate having been supplied.—Fined 5s. and £1 2s. costs.

OVERDOSE OF LAUDANUM.—An inquest was held at Sheffield on Thursday, June 21, concerning the death of James Barlow (77), head of the firm of James Barlow and Son, razor and scissor manufacturers, Sheffield.—From the evidence it appeared that on the previous Monday evening deceased purchased an ounce and a-half of laudanum at the shop of Mr. G. T. W. Newsholme, High Street, stating that he required it for outward application. On Tuesday morning he was found in his bedroom suffering from poisoning, death occurring early on Wednesday morning. It was stated that deceased had on other occasions taken laudanum, but for what purpose was not known.—The jury returned a verdict to the effect "that deceased died from an overdose of laudanum administered by himself, but there was not sufficient evidence to show for what purpose he had taken it."

POISONING BY SPIRIT OF SALT.—Thomas Carter (48), glass beveller, was admitted to the Queen's Hospital, Birmingham, on Sunday morning, June 24, suffering from the effects of poison. It was stated that he had swallowed some spirit of salt. He died during the day.

SUICIDE BY PRUSSIC ACID.—An inquest was held at Westminster on Monday, June 25, relative to the death of David Sidney Davies (34), pharmaceutical chemist, of Craven Road, Bayswater, W. From the evidence it appeared that deceased had been in ill-health for several months past, and had worried a great deal about his business not making satisfactory headway. He was in no financial difficulties, but on Wednesday, June 20, while in Hyde Park, he swallowed the contents of a bottle of prussic acid. He was immediately taken to St. George's Hospital, death occurring on the way.—A verdict of "Suicide during temporary insanity" was returned.

IRISH NEWS.

DR. BURNES, M.P.S.I., proprietor of the Queen Street Pharmacy, was prosecuted under the Shop Hours Act, at the Dublin Police Court on June 22, for failing to exhibit in his establishment the notice as to hours of work, required to be on view according to the Statute. A fine of 10s. and 10s. cost was imposed. Mr. Thomas Coulter, trading as Checketts and Co., chemists, was similarly summoned, and was fined a corresponding amount.

MESSRS. BEWLEY AND DRAPER, LIMITED, chemists and druggists, Mary Street, Dublin, last week summoned a Birr trader named Lowry for an infringement of their rights by using bottles embossed with their name. The defence was a plea that complainants did themselves what they complained of. A fine of 1s. and costs in each of four cases was imposed upon the defendant.

TRENCH'S REMEDIES.—In the Queen's Bench Division, Dublin, before the Lord Chief Baron and Judges Andrews and Johnson, the case of Mr. John Townsend Trench, a bankrupt, came on for hearing on an application by Mr. T. B. C. Hardman for a new trial. The case had been previously before the Court in February last, and it related to the sale by Mr. Trench to Mr. Hardman of the Medical Remedy Business known as "Trench's Remedies," carried on by the bankrupt in South Frederick Street, Dublin. Mr. Hardman had acted as solicitor for Mr. Trench for a considerable time, and after the adjudication in bankruptcy the assignees alleged that the sale of the business to Mr. Hardman was fraudulent and void, as against the creditors of the bankrupt. Certain issues had been submitted to the jury, and they found

that the assignment to Mr. Hardman of the business had been executed with intent to "defeat, delay, and hinder" the creditors of Mr. Trench. Mr. Hardman now applied to have these findings set aside on the ground that there was no evidence to sustain them. When the case was half-way through, counsel announced that a consent had been entered into between the parties by which the findings of the jury, which were challenged by Mr. Hardman, would be set aside, the proceedings on the charge and discharge to be discontinued, each party paying his own costs.

PORTUMNA DRUG CONTRACT.—The Portumna District Council recently accepted from Messrs. Goldon and Co., chemists, Birr, a contract for twelve months' supply of drugs and surgical appliances at 15 per cent. off the scheduled list. A large number of other firms tendered unsuccessfully at only 5 per cent. off. The Local Government Board have since refused to confirm the appointment, on the ground that Messrs. Goldon (who have been medicine contractors to Birr and other unions for a number of years) have not satisfied the Board that they have in their establishment "a large assortment of medical and surgical appliances." The Council hold that no precedent exists for such a stipulation, and are determined to stand by their ruling already made in favour of Messrs. Goldon.

PHARMACEUTICAL SOCIETY.

NORTH BRITISH BRANCH.

A meeting of the Executive of the North British Branch was held in the Society's House, 36, York Place, Edinburgh, on Friday, June 22, at 10.30 a.m., Mr. PETER BOA in the chair.

Present:—Messrs. Boa, Cowie, Currie, Fisher, Gilmour, Henry, Kerr, McAdan, McLaren, Mitchell, Russell, Strachan, and Tocher.

The minutes of last meeting were read and approved.

Apologies for absence were intimated from Messrs. Ayre, Ewing, Johnston, and Storrar.

The report of the Scrutineers of voting papers for the election of Executive was read and arrangements made for the business of the annual meeting.

This was all the public business.

ANNUAL MEETING.

The annual meeting of members residing in Scotland was held in the Society's House, 36, York Place, Edinburgh, on Friday, June 22, 1900, at 11 a.m., Mr. PETER BOA in the chair.

The minutes of last meeting were read and approved.

Apologies for absence were intimated from Messrs. Ayre, Ewing, Johnston, Storrar, and Wilson.

Chairman's Address.

The CHAIRMAN said he would not trouble them with an elaborate speech, but merely confine himself to a few running observations on the work of the past year, and one or two items of interest to this branch of the Society. Referring to the membership in Scotland, he said that in the beginning of 1895 they had 383 members; in 1896, 400; in 1897, 412; and in 1898 412. 1899 was the year in which the new Act came into force in regard to the membership, and in that year the membership went up from 412 to 570. They had hoped that the membership in 1900 would have been 599, but there were twenty-three names to be deleted from the list of members in Scotland for the current year. Still, they had for this year an increase of thirteen, so that the membership at that moment was 583. He was sorry to see the number of names that had lapsed, but he fancied it was not due to any desire on the part of members to cut their connection with the Society, but was probably merely forgetful-

ness on their part to send their subscriptions. It seemed to him that some method could be devised of reminding such members; if they could get someone to wait upon them, their names would not require to be deleted. A good many years ago, at a meeting in that house, he made the suggestion that it would be a good thing if the Society had someone to take a run through the country and

HOLD MEETINGS AT CERTAIN PLACES

and explain the connection of the Society with various matters, and also lead them to understand properly the advantages to be derived from membership of the Society. He was not sure at the time he was very serious in making the suggestion, but it was only a few months after that suggestion was made that Mr. Michael Carteighe came to that part of the country and further north, and treated them to a series of expositions of the aims of the Society, and he thought it did a great deal of good. He thought they were all the better for Mr. Carteighe's visit, and he thought the Society might almost select a suitable representative to be continually on the road. In regard to the position they took in Scotland, as regarded the proportion of eligible men in the country and across the border, he should say there were altogether about 15,600 registered men, and assuming that 1,400 were in Scotland, and taking the membership, the proportion worked out to about thirty-two or thirty-three per cent. across the border, and in Scotland about forty-two per cent. That was to say, the membership in Scotland was about forty-two per cent. of the registered chemists and druggists, and, compared with the approximate number of those on the other side of the border, they were about ten per cent. better. So that, so far as their position with regard to supporting the Society was concerned, they in Scotland had no reason to be ashamed of themselves. He thought it was matter for gratification to all that they supported the Society so well. He was quite sure they did that with the intention of increasing the prestige and honour of

THE PHARMACEUTICAL SOCIETY

in general, and not for simply local purposes. When they had a branch such as theirs, supported in great measure by men from the surrounding district, it was quite impossible to get absolute freedom from a certain amount of what he might call provincialism from attachment to the centre to which they all gravitated. He said that because he had on several occasions formed the impression that they were regarded as being selfish—as looking more to themselves than to the general good of the Society. He deprecated any such feeling. Their efforts were always directed for the general good of the pharmaceutical community. He was sorry they had lost during the year so many members by death, and he particularly mentioned Mr. Daniel Frazer (Glasgow), Mr. Watt (Haddington), Mr. Burley (Edinburgh), and Sir Douglas Maclagan, their oldest honorary member. With regard to the finances of the Society, he said they had spent last year rather less than in the year before.

AS TO THE EXAMINATIONS,

it was matter of regret to them all that the percentage of failures had been so large in past years, but it was matter for some satisfaction that for the past two years, at any rate, there had been a very gradual, but at the same time a very steady improvement in this respect. That was to say, that from thirty-three per cent. one year they increased to nearly thirty-five per cent., and in the third year to nearly thirty-nine per cent. of those examined. These failures were no doubt deplorable, but he hoped that if they obtained some slight breaking-up of the qualifying examinations they would get better results. The Minor examination was at present a somewhat heavy undertaking, and the fact that they had no compulsory curriculum made young men come up for it perhaps before they had taken a sufficient course of training. He had nothing whatever to say against a young man doing that. It was quite natural for him to try and get

through as soon as possible. He went up and took his chance, and he did not blame him. In regard to

THE EVENING MEETINGS,

although many societies which held scientific meetings had had great difficulty in getting suitable papers, he was glad to say they had been quite full up at their evening meetings with very good material. He was not prepared to say they obtained the material for these meetings without a little trouble. Still, they did better than some societies which took a great deal of trouble and did not get papers. They were very much indebted to those who supported the evening meetings, not only by their presence as part of the audience, but as contributors of papers. In regard to the suggestion made at last Executive meeting by Mr. Gilmour to have a scientific meeting in the forenoon, he was quite sure the General Purposes Committee, which was usually entrusted with that matter, would do its best during the coming session to arrange, if there was any prospect at all of suitable support coming from the surrounding district, to hold such a meeting in the forenoon or afternoon in order to give those outside Edinburgh reasonable opportunity to attend such a meeting. One of the most pleasant features of the annual report was the extent to which

THE LIBRARY

was used. The increase in the circulation of books was 140 over the year before in the town, the number being 1,446, as compared with 1,306 in the previous year. Considering that the increase in the year before was 523, he thought the still further increase was very satisfactory. In the country there had been a decrease of twelve, but the total increase was still 128. Some of those books went to the north of England. He might emphasise the information that the Society paid the carriage of books one way, and so far as personal opinion went, he might say he did not understand how men in business in the country did not see it to be to their advantage to pay a guinea a year of membership to the Society for nothing else than to get the advantages of the library. He further stated that the books in the library in Edinburgh could be obtained by members of the Society resident in England, and that the books of the London library could be obtained by members resident in Scotland. So far as quality was concerned for the purposes in view, the two libraries were second to none among the libraries of the country. They had quite a unique museum, but he did not think the facilities for using it were quite as good as they might be at present. The Executive had the matter in hand with the view of making it more useful by providing greater facilities for examining the specimens, and with more comfort. So far as the specimens were concerned, they had probably an unrivalled collection. As to matters political, he was just afraid he was not a sufficient adept to be able to say anything that would be of much value in that connection. He was aware that the leader of the House of Commons was asked the other day by a gentleman interested when

THE COMPANIES BILL

would likely be taken up, but the leader of the House of Commons did not choose to indicate what he thought on the matter, so they had no information on the subject at all. He should say, however, that even if the Companies Bill were passed, it would be without Clause 2, which the Society had given them all the hint to object to. At the present moment he thought legislation was distinctly unsatisfactory, so far as the practice of pharmacy in legitimate ways was concerned, and he did not see that any substantial remedy would be obtained by tinkering at pharmacy by clauses in the Companies Bill, and he did not think they need expect any radical improvement until they simply went the whole hog and tried to get a new Bill to fit pharmacy in the country. As an example of the disadvantage under which the Society laboured, he might mention a recent case which

occurred not far from Edinburgh, where a lady dispenser was prosecuted for selling poisons in a doctor's shop, and the usual penalty was imposed, but the lady could not pay. The doctor distinctly declined to pay, and he really wanted to ask who was punished in that sort of case? So far as he could see, it was the Society who had to pay all the legal expenses involved. That was merely one example of the distinctly unsatisfactory character of legislation.

The ASSISTANT SECRETARY then read

The Report of the Scrutineers.

At a meeting held on April 27, 1900, the Executive appointed June 22, 1900, as the date of election for the ensuing year.

Five hundred and ninety-nine nomination papers were issued by the Assistant Secretary on May 19, 1900. The nomination papers returned showed that sixty-nine members had been nominated, of whom the following twenty-nine signified their willingness to act if elected:—

Boa, Peter, 119, George Street, Edinburgh.
 Cowie, William Beverly, 26, Clyde Street, Edinburgh.
 Cruickshank, John, 42, George Street, Aberdeen.
 Cummings, Charles, 49, Reform Street, Dundee.
 Currie, Archibald, 162, Ferry Road, Leith.
 Currie, William Little, 223, Byres Road, Dowanhill, Glasgow.
 Dey, Alexander John, 19, Duke Street, Edinburgh.
 Doig, William, 9, High Street, Dundee.
 Dunlop, Thomas, 181, Albert Road, Pollokshields, Glasgow.
 Ewing, James, Laidlaw, 104, South Canongate, Edinburgh.
 Fisher, John Hutchison, 66, High Street, Dunfermline.
 Gilmour, David, 40, Bridge Street, Dunfermline.
 Glass, William Stephen, 193, Morningside Road, Edinburgh.
 Henry, Claude Francis, 1, Brandon Terrace, Edinburgh.
 Hunter, Andrew, 4, North Bridge, Edinburgh.
 Kerr, Charles, 56, Nethergate, Dundee.
 Key, George Brown, West End, Kirkcaldy.
 M'Adam, Robert, 34, Virginia Street, Glasgow.
 M'Dougall, Rea Ireland, 1, Gladstone Place, Leith.
 Macpherson, Colin Allen, 97, Dalry Road, Edinburgh.
 Mitchell, Donald, 30, Union Street, Inverness.
 Naysmith, Andrew, 211, High Street, Arbroath.
 Robertson, David Stewart, 170, Main Street, Rutherglen.
 Russell, James Anderson, 212, New City Road, Glasgow.
 Spence, Alexander, 135, High Street, Linlithgow.
 Stewart, Jeanie, 81, Glasgow Road, Dumbarton.
 Strachan, Alexander, 138, Rosemount Place, Aberdeen.
 Tocher, John, 84, High Street, Dumfries.
 Wilson, William Potter, 36, High Street, Haddington.

A voting list was accordingly drawn up, and on June 13, 1900, 583 voting papers were issued.

The scrutineers met last night at 7 o'clock, and proceeded to examine the voting papers.

The result was found to be as follows:—

Voting papers issued	583
Voting papers returned	282
Voting papers informal	4

There were thus 278 votes to be recorded.

The following gentlemen have a majority of votes:—

Boa, Peter, 119, George Street, Edinburgh.
 Cowie, William Beverly, 26, Clyde Street, Edinburgh.
 Currie, William Little, 223, Byres Road, Dowanhill, Glasgow.
 Doig, William, 9, High Street, Dundee.
 Dunlop, Thomas, 181, Albert Road, Pollokshields, Glasgow.
 Ewing, James, Laidlaw, 104, South Canongate, Edinburgh.
 Fisher, John Hutchison, 66, High Street, Dunfermline.
 Gilmour, David, 40, Bridge Street, Dunfermline.
 Henry, Claude Francis, 1, Brandon Terrace, Edinburgh.
 Kerr, Charles, 56, Nethergate, Dundee.
 M'Adam, Robert, 34, Virginia Street, Glasgow.
 Mitchell, Donald, 30, Union Street, Inverness.
 Naysmith, Andrew, 211, High Street, Arbroath.
 Russell, James Anderson, 212, New City Road, Glasgow.
 Spence, Alexander, 135, High Street, Linlithgow.
 Strachan, Alexander, 138, Rosemount Place, Aberdeen.
 Tocher, John, 84, High Street, Dumfries.

The voting papers and all documents connected with the election are submitted herewith.

JOHN BROWN.

GEORGE COULL.

PETER BOA, *Chairman*.

GEORGE L. MCGIBBON.

JOHN ROBERTSON.

R. L. HENDRY.

The result of the poll was as follows:—

Boa	238	Doig	111
Currie, W.	230	Dunlop	102
Ewing	219	Glass	101
Henry	218	Cruickshank	100
Kerr	207	Wilson	97
Strachan	201	McPherson	85
Gilmour	200	Hunter	83
Cowie	194	Key	79
McAdam	188	Cummings	71
Mitchell	177	Dey	67
Fisher	175	Robertson	66
Tocher	173	Stewart	66
Russell	169	Currie, A.	54
Spence	141	McDougall	48
Naysmith	114		

Mr. FORGIE moved the adoption of the scrutineers' report. Being a comparative stranger at the meetings, he did not think it would be discreet for him to say very much. He would, therefore, formally propose the adoption of the report.

Mr. LUNAN seconded the motion, and said the work of the scrutineers was very anxious work, and they were very much indebted to the gentlemen who performed it year after year. He referred to the signature of Mr. Robertson as appearing as one of the scrutineers for a number of years past.

The motion was agreed to.

The CHAIRMAN then declared that the seventeen persons whose names appear in the following list, together with the President of the Society (Mr. G. T. W. Newsholme), the Vice-President (Mr. C. B. Allen), Mr. John Johnston, Aberdeen, and Mr. David Storrar, Kirkcaldy, would constitute the Executive for the year 1900-1901:—

Boa, Peter	Kerr, Charles
Cowie, William Beverly	McAdam, Robert
Currie, William Little	Mitchell, Donald
Doig, William	Naysmith, Andrew
Dunlop, Thomas	Russell, James Anderson.
Ewing, James Laidlaw	Spence, Alexander
Fisher, John Hutchison	Strachan, Alexander
Gilmour, David	Tocher, John
Henry, Claude Francis	

On the motion of the CHAIRMAN, a vote of thanks was awarded to the scrutineers, Dr. George Coull and Messrs. John Brown, R. L. Hendry, George L. McGibbon, and John Robertson.

The Society's Examination Syllabus.

Mr. KERR (Dundee) asked leave to bring a matter before the meeting. He said he was local secretary for Dundee and had charge of the examinations there, and in view of the new system of examinations, he had had applications for syllabuses and inquiries regarding the examinations by several gentlemen and by young men likely to become candidates. On that account he wrote to Mr. Bremridge, and asked if he would send him a number of the pamphlets giving the information regarding the new examinations which were about to come into force. The reply he received from Mr. Bremridge was: "Anyone applying for these circulars please advise them to write to me for them." He (Mr. Kerr) thought that was a very curt and peculiar reply. He did not think that was the way to get people to interest themselves in the Society; it was not complimentary, and it showed that they wanted real business habits to bring to bear on the interests of their trade and what would do them good. They did not seem to understand that those circulars should be given freely to young men who were desirous of becoming members of their business. That would do more good than telling them to write to London for them. The probability was that if they were told to do so they would not take any further trouble about it. He thought it was most desirable that local secretaries everywhere should be supplied with

these circulars in abundance to give away, as anyone would in advertising their business. They should do everything in their power, in prospect of these new examinations, to circulate information regarding them, so as to attract young men to come forward as apprentices, instead of putting obstacles in the way of their coming forward. That was against the interests of their business and of the Society. Mr. Bremridge was taking a very wrong position in sending him such a letter. A schoolmaster came to him the other day asking for a circular, and he gave him the only one he had. Another gentleman came to him for one, and he had to tell him to write to Mr. Bremridge. He thought that was very hard. Two or three young men had come to him, and he had to tell them the same thing. He thought that was not right. He therefore thought he would bring the matter before the members of the Society, speaking as a local secretary, and not as a member of the Executive at all. He thought the members should have an opportunity of expressing an opinion regarding it.

Mr. W. L. CURRIE said he had great pleasure in supporting what Mr. Kerr said, because he had found some trouble in connection with the same matter himself. He thought it was a disgrace that one individual should have the power of refusing a supply of these materials of information. He would like to ask the question, Was Mr. Bremridge empowered by the Council to make replies of that kind to letters without first consulting the Council? It appeared to him that he "bossed" the Pharmaceutical Society of Great Britain. They wanted to know whether he was the Pharmaceutical Society or no? He was very much surprised to have put into his hands the other day a booklet issued by a teacher of pharmacy in Scotland, and on turning it up and reading it for his own satisfaction he found a complete reprint of the examination syllabus as an introduction to the prospectus. He would like to ask why it was that a teacher of pharmacy had to put himself to the expense and trouble to reprint a thing like that. He thought it ought to be had for the asking for the purposes of their own local officials. It was much better printed than the one in the calendars or the one Mr. Kerr had in his hand. It had the correct and proper spelling and orthography, which was more than could be said of the official one. He did not think it was right that such things should be allowed, and a very strong representation should be sent up from Scotland that these things ought to be in the hands of the officials of the Society resident in Scotland. To have to write to London for them was a perfect farce—red-tapeism, pure and simple.

Mr. LUNAN asked if Mr. Kerr was to submit a motion.

Mr. KERR said he had only thought of bringing the matter before the meeting—that it was desirable they should know how local secretaries were treated.

Mr. McLAREN said there was another matter. The Chairman had spoken of the advantage to chemists of using the library more. He would like to know if any member could get a copy of the catalogue of the Edinburgh library.

The ASSISTANT SECRETARY: Every member of the Society is entitled to receive a catalogue on applying for it.

Mr. McLAREN: He has to apply for it?

The ASSISTANT SECRETARY: He has to apply for it.

Mr. KERR: It is well to know that.

Mr. McLAREN: That should be advertised freely—that catalogues are to be had on application free. I do not think it is known generally. It might help towards utilising the library more.

Mr. GILMOUR asked if it was necessary to write to London for them?

Mr. CURRIE asked the Assistant Secretary if he could supply any member with copies?

The ASSISTANT SECRETARY: I am not allowed to supply them.

Mr. CURRIE: Have you got a supply?

The ASSISTANT SECRETARY: No.

Mr. CURRIE: Well, you cannot supply them.

The ASSISTANT SECRETARY: I have copies of the syllabus for my own use. I apply for them every two or three weeks.

Mr. GILMOUR: Would it not be possible for you to ask for 100 or 200, so as to supply local secretaries?

The CHAIRMAN: I am afraid he would not be allowed to do that.

Mr. McLAREN said there was no doubt of this, that Mr. Bremridge had taken very high and unjustifiable ground. He not only would not supply Mr. Hill; but when a local secretary wrote to the Council he tells him to tell the candidates to address him. The thing was ridiculous, and a strong representation should be made on the matter.

Mr. GILMOUR thought it should go through their own Secretary.

Mr. CURRIE asked who was the Secretary.

Mr. GILMOUR: Mr. Hill.

Mr. CURRIE said Mr. Hill was only Assistant Secretary. There was a legitimate remedy for this grievance, and they ought to have it laid before the Council in London.

Dr. COULL said he felt very strongly on this matter. He had had some correspondence with Mr. Bremridge about the existence of a certificate that was accepted by the Royal College of Physicians by simply passing certain subjects. Mr. Bremridge said there was a rule that it would not be accepted. He looked through the Journals for a number of years, and he never came across that rule. Mr. Bremridge was entirely wrong and quite illogical.

Mr. KERR suggested that this discussion would bring the matter before the Council and would show them the feeling they had with regard to the syllabus.

Mr. McLAREN thought it would carry out the idea better if they remitted the matter to the Executive. They represented the body of members in Scotland, and they should ask the Executive to make a strong representation to London in regard to it. He moved to that effect.

Mr. CURRIE said the matter had been left in the hands of the Executive, and nothing came of it. It should go from the annual meeting of the North British Branch of the Society.

Mr. KERR then moved: "That this meeting represent to the Council that there is a widespread feeling among members that the present arrangements for obtaining papers for examinations is unsatisfactory, and that all such papers should be obtainable from the Society's office in Edinburgh or from any local secretary."

Mr. C. F. HENRY asked if Minor forms were obtainable at that office.

The ASSISTANT SECRETARY said they were not.

Mr. HENRY quoted a portion of a reply he had received from Mr. Bremridge to a letter he had written about the Minor papers and other matters, in which Mr. Bremridge wrote that if he had inquired of Mr. Hill he could have informed him "that, with the exception of the Preliminary entry form, which is non-existent after Tuesday 1st, the various papers distributable are freely supplied."

The ASSISTANT SECRETARY: You see it is only what he regards as distributable. I have none of these papers for distribution. Nor will he supply them. They used all to be obtainable here.

The resolution was seconded by Mr. ROBERTSON and unanimously adopted, and the subject then dropped.

Membership in Scotland.

Mr. GILMOUR then said he thought the most important general remark made by the Chairman in his speech was as to the membership of the Society. He had the idea of bringing the matter up, and he thought they required to come more closely to the point. How could the Society be strong with a membership of 583 out of 1,400. It never could be strong at that figure, and the question was, how could it be made better? The bulk of the prejudice against the Society had its origin in ignorance. A great many had the idea that the Society ought to do something for them, and it was not doing it, and therefore they were not

going to become members. There was more in coming to close quarters with these men than they possibly thought. If it was possible to get hold of them it might be well to make that effort. They had local secretaries who did the work, but they could not always do it. They could not talk about it in other people's premises, and he felt perfectly convinced that if the proper opportunities were taken for doing it, it would be advantageous to the Society. The Chairman referred to the benefit which followed the visit of Mr. Carteighe. That was done in large centres, and the public meetings and speeches gave a stimulus to their interest. To bring the matter to a point, his idea would be that Mr. Hill should be let free for a certain time each year to visit local secretaries, and with the local secretaries see the members of the trade, either through meetings, or, better still, through calling on these men. He was pretty sure that by doing so they would get 50 per cent. of the outsiders right away. He did not know how far they could make a rule or order that Mr. Hill should be set free for this purpose, but in whatever way it would be in order he would be quite prepared to move.

Mr. HENRY said the Secretary would not be able to do it on account of his other duties.

Mr. FORGIE said that, as a local secretary, he endorsed what Mr. Gilmour had said. He thought a visit from Mr. Hill or any other travelling secretary would be of great benefit to the Society. He did not know about the other districts of Scotland or the country generally, but he thought that in his district there was a great deal of good work that a travelling secretary could do that for a local secretary to do might attach a good deal of odium to him.

Mr. LUNAN said they would have to appoint a man from London occasionally. Mr. Hill's time was too much taken up.

The CHAIRMAN said he understood that what Mr. Gilmour wished was a visit from a secretary somewhat after the manner in which an insurance company sent a man to visit the local manager. If there were any grievances against the Society he might be able to explain them away.

Mr. McLAREN said there was one thing quite unusual for an officer of the Society to do. Mr. Hill sometimes took a trip to Dundee or Arbroath in the interests of the Society, and he did so at his own expense. He thought that was most unfair and unworthy on the part of the Society. When Mr. Hill went out as an official of the Society his expenses in going and coming and, for that matter, of staying while he was away, ought to be paid by the Society.

Mr. HENRY asked what steps had been taken to get the twenty-three members who had lapsed to rejoin.

Mr. HILL said he had only got the list, and had not been able yet to inquire. But he felt quite satisfied that most of them had simply forgotten or neglected to send their subscription.

Mr. ANDERSON RUSSELL said there were two in his district. One of them was thinking of becoming a life-member, and had failed to keep himself right for the year. The other was a man in business who had failed.

Mr. HENRY, referring to the Chairman's statement that there were 42 per cent. of the registered chemists in Scotland members of the Society, against 33 per cent. in England, said he had seen official statements to the effect that the membership was much lower in Scotland than in England, and that they were not doing much for the Society.

The meeting closed with votes of thanks to the Chairman and the retiring Executive, proposed by Mr. GILMOUR and Mr. R. L. HENDRY respectively.

SODIUM PARA-FLUORO BENZOATE.—This is a white powder soluble in cold water, which is recommended by Philipsson as a substitute for sodium fluoride. It is administered internally in three doses of 0.5 Gm. for lupus.—*Pharm. Centralh.*, **41**, 156.

FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of the Committee of this Association was held in Dundee on June 21, Bailie DOIG presiding. The Secretary (Mr. W. Cummings) read the replies to inquiries on the question of inviting

THE BRITISH PHARMACEUTICAL CONFERENCE to Dundee, and after discussion it was unanimously agreed to invite the Conference to Dundee in 1902. The following were appointed delegates to the Conference meeting in London:—Messrs. C. Kerr, A. B. Anderson, James Russell, John Anderson, W. Cummings, Dundee; A. Naysmith and J. Jack, Arbroath; A. Davidson, Montrose. To the Federation:—Messrs. A. B. Anderson and A. Naysmith.

EVENING CLASSES.

Mr. KERMATH (St. Andrews) then said he thought the Association should take steps to get classes arranged for the benefit of their apprentices, so that they might obtain instruction in botany, chemistry, etc., year by year, instead of the few months' cramming so many took just before examination.

Bailie DOIG said the facilities in Dundee for instruction in these subjects were ample, and the fees most moderate, and yet they had had no success for lack of pupils. It seemed to him that one of the principal reasons for the absence of youths from the classes was the long hours during which they were kept at the counter. It was not reasonable to expect them to show much enthusiasm for study after nine o'clock at night. In this connection he wished to say how very much he regretted that the proposal to close the central shops in Dundee an hour earlier during the summer months had failed this year. Returning again to the subject in hand, Mr. Doig said there was another thing badly wanted in order to interest youths in the trade—namely, an up-to-date volume, on the lines of Christison's, to lie upon the desk, so that they could get all the particulars of the preparations they were daily handling brought before them in an interesting way. The Pharmacopœia, with all its merits, was a most unattractive volume to a budding chemist.

After a lengthy discussion, taken part in by Messrs. FORD (Kirriemuir), NAYSMITH (Arbroath), THOMSON (Lochee), and others, it was remitted to the President to report on evening classes to next meeting.

MATERIA MEDICA CABINET.

It may be mentioned for the benefit of studious apprentices in Dundee that a cabinet of materia medica is at their service, and may be had on application to Mr. W. Cummings, Hon. Secretary of the Chemists' Association, 49, Reform Street.

Publications Received.

FOOD AND DRUGS: A Manual for Traders and Others, being a consolidation of the Sale of Food and Drugs Acts, 1875, 1879, 1899, and the Margarine Act, 1887. By CHARLES JAMES HIGGINSON. Pp. xvi. + 179. Price 2s. 6d., net. London: Effingham Wilson, 11, Royal Exchange. 1900. From the Publisher.

FALLOWFIELD'S PHOTOGRAPHIC ANNUAL AND COMPREHENSIVE CATALOGUE OF PHOTOGRAPHIC MATERIALS, CHEMICALS, AND APPARATUS, 1900-1. Pp. 888. Price 1s. 6d., post free. London: Jonathan Fallowfield, 146, Charing Cross Road, W. From the Publisher.

FINCH'S SCIENTIFIC AND NOVEL SANITARY APPLIANCES FOR HOSPITALS AND ASYLUMS. Pp. 47. London: B. Finch and Co., Ltd., 82, Belvedere Road, Lambeth. From the Publishers.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Hemidesmi Radix.

HEMIDESMUS ROOT or INDIAN SARSAPARILLA is obtained from *Hemidesmus indicus*, R.Br. (N.O. Asclepiadaceæ), a climbing plant, with slender, twining, woody stems, which is indigenous to India and Ceylon. The opposite petiolate leaves of the plant vary much in size and shape; they are entire, smooth, shining, and of a firm consistence. The small green flowers are purple inside and disposed in axillary racemes. The fruit consists of two long slender, spreading follicles. The dried root alone is used in medicine, and has long been employed in India as a substitute for sarsaparilla. It possesses alterative and tonic properties, and is used in the preparation of Syrupus Hemidesmi.

root was derived from *Smilax aspera*. Starch occurs in considerable quantity in the parenchymatous tissue of the drug, and tannin is found in the cork.

Hirudo.

LEECHES for medicinal purposes are of two kinds—the speckled leech, *Sanguisuga medicinalis*, Savigny, and *S. officinalis*, Savigny—both fresh-water species, belonging to the class Annelida, family Hirudinea. They are imported from various parts of Europe, and are used to abstract blood from congested parts of the body. Inside the anterior sucker, by means of which the leech attaches itself, are three curved chitinoid plates, placed radially, and having finely serrated edges. The leeches bite through the skin with those jaws or “teeth,” and continue to draw blood until they are gorged, when they drop off. The blood takes several months to digest in the ordinary course, but the gorged leeches can be made to give

HEMIDESMUS ROOT.—A and B, Pieces of root, natural size. A showing loose cork; C, transverse section of root, enlarged.

CHARACTERS.—Hemidesmus root occurs in long, rigid, nearly cylindrical pieces, which are tortuous, longitudinally furrowed, and transversely fissured at intervals. They are hard and woody, often more than 30 Cm. long, but seldom exceed 6 Mm. in thickness. In colour they vary from reddish-brown to dark-brown or nearly black. The pieces branch occasionally, bear a few fibrous rootlets, and may have portions of the slender aerial stems—marked with opposite leaf scars—attached to one extremity. At one side of the root the thin cork is frequently separated from, and raised above, the cortex. A transverse section exhibits a thin greyish bark or cortex containing numerous laticiferous cells, surrounding a larger, porous yellowish wood, which is not distinctly radiate. The fragrant odour—recalling that of tonka beans—and somewhat sweet taste of the root are due to the presence of coumarin.

NOTES.—The distinctive characters of hemidesmus root are its rigid and tortuous character, the transverse cracks, easily separable cork, and large yellowish wood. Sarsaparilla is free from transverse cracks, has a firmly adherent cork, and the wood is small. Coumarin is the only important constituent of the root that is known. It is apparently the substance extracted from hemidesmus, and described as a “crystalline stearopten,” to which the name smilaseric acid was given, under the erroneous impression that the

it up readily by placing them in a 16 per cent. aqueous solution of common salt, then taking them by the tail, one by one, dipping them into hot water, and passing them lightly between the fingers. After being replaced in fresh water they should be fit for reapplication at the end of eight or ten days.

CHARACTERS.—Leeches have a soft, smooth body, 5 Cm. or more in length, tapering to each extremity. A section of the body appears plano-convex, the convexity being on the dorsal surface, which is olive-green in colour, with six rusty-red longitudinal stripes. The body is also divided into twenty-six segments, each of which, except those at the extremities, is marked by five fine rings, the total number of those annulations being from ninety to a hundred. The anterior end of the body is terminated by a small sucker surrounding the tri-radiate jaws, and the posterior end is similarly terminated by a large adhesive sucker. In *S. medicinalis* the ventral surface is greenish-yellow, with black spots; in *S. officinalis* the ventral surface is olive-green, without spots.

NOTES.—The distinctive characters of leeches are the possession of two suckers, the presence of five rings on each segment except those at the extremities, and the absence of bristles and “foot-tubercles” such as are found in the higher Annelida. The speckled (Swedish or German) leech is found in Central and Northern Europe.

The habitat of the green (Hungarian) leech is Southern Europe. They occur in fresh-water ponds, swimming with a vertical undulat-

LEECHES.—A, Speckled leech, dorsal surface; B, ditto, ventral surface, showing spots; C, green leech, dorsal surface.

ing motion; when out of the water they move by the aid of their suckers, fastening themselves first by one and then by the other, and alternately stretching out and contracting their bodies.

Hydrastis Rhizoma.

HYDRASTIS RHIZOME or GOLDEN SEAL is obtained from *Hydrastis canadensis*, Linn. (N.O. Ranunculaceæ), a small herbaceous perennial plant, which is widely distributed in the United States and Canada, being found in moist, rich woodlands. It has a thick, fleshy, yellow rhizome, from which numerous long roots arise, and an erect, simple, pubescent stem, from 15 to 30 Cm. in height. There are usually only two leaves, one being sessile at the top of the stem and the other attached a short distance below by a thick footstalk; they are pubescent, roundish-cordate, with from three to seven pointed and unequally serrate lobes. A solitary whitish, rose-coloured, or purplish flower without a corolla rises from the base of the upper leaf; the fruit bears a close resemblance to the raspberry, but is not edible. The dried rhizome and roots alone are official, but the remains of stems are frequently found attached to the drug, which is collected in the autumn after the leaves have withered. Hydrastis possesses tonic, nervine, stimulant, hæmodynamic, astringent and stomachic properties; it is used in the preparation of Extractum Hydrastis Liquidum and Tinctura Hydrastis.

CHARACTERS.—Hydrastis rhizome is yellowish-brown, becoming darker with age, and occurs in rough, knotty and tortuous pieces from 12 to 38 Mm. long and from 3 to 12 Mm. thick. They are usually simple, though sometimes divided into two equal branches, and frequently give off short ascending branches, which terminate in cup-shaped scars left by the aerial stems of previous years.

These branches are found on the upper surface of the rhizome, and bear encircling scars of cataphyllary leaves, which are much more distinct than the scars found on the rhizome proper. Numerous thin, shrivelled, yellow roots are given off from the sides and under surface of the rhizome; as they are wiry and brittle they tend to break off, leaving small protuberances. The rhizome is hard, and breaks with a clean, short, resinous fracture, the surface thus exposed being smooth and of a dark brownish-yellow or greenish-yellow colour. A transverse section exhibits a comparatively thick bark and a ring of bright yellow narrow wood-bundles, which are occasionally somewhat distant, surrounding a large pith. The root also has a dark bark and small bright yellow wood. The slight but characteristic odour of the drug appears to be due to the presence of an unknown volatile principle; the bitter taste is due to hydrastine and berberine.

HYDRASTIS RHIZOME.—A, Upper surface, natural size; B, under surface, ditto; C, transverse section, enlarged.

NOTES.—The distinctive characters of hydrastis rhizome are its yellow colour, the appearance of a transverse section, and the characteristic odour. Bloodroot, from *Sanguinaria canadensis*, is usually of a dark reddish-brown colour, and a transverse section exhibits a more or less pronounced red colour, whilst there are no evident wood-bundles. The chief constituents of hydrastis rhizome are the alkaloids hydrastine (1.5 to 2 per cent.), berberine (3.5 to 4 per cent.), and canadine (tetrahydroberberine). Hydrastine crystallises in bitter, colourless, four-sided prisms, and is converted by oxidising agents into hydrastinine, a white crystalline base which forms a pale yellow crystalline hydrochloride. Berberine constitutes the colouring matter of the drug, and is obtainable in bitter yellow needles. Canadine occurs in the form of brilliant small white nodules, and yields yellow berberine iodohydrate when dissolved in alcohol and treated with iodine. Other constituents of the drug are a fluorescent compound, resin, starch, sugar, and probably a volatile principle to which its odour is due. An eclectic remedy named "hydrastin" is said to consist principally of berberine hydrochloride, with some hydrastine, but it probably also contains canadine and resin. Hydrastis rhizome is employed by the American Indians for staining and dyeing; it is said to impart to wool, silk, and cotton a rich and permanent yellow, or, when combined with indigo, a fine green.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LONDON, THURSDAY, JANUARY 4, 1900.

As might have been expected, there has been somewhat of a revival in the Drug and Chemical Trade after stocktaking, and it is gratifying to be able to report that there has been a fair amount of business passing, while prices have, on the whole, been fairly maintained, and have, in fact, in some instances, rather hardened. There has been renewed activity in Quinine, which is again dearer, while everything would appear to point to the probability of even higher prices ruling for this staple article in the near future. Quicksilver remains firm, as also do Mercurials, Camphor, Carbolic Acid, Cod Liver Oil, and Bromides. Iodides are steady. Glycerin slightly firmer. Cocaine in a somewhat undecided position. The following are the prices actually ruling for some articles of principal interest:—

ACETANILIDE—Continues dull and weak, at 9½d. to 10½d. per lb., according to quantity and make.

ACID ACETIC.—A new maker has appeared on the scene, which was hardly necessary, in view of the number of manufacturers already competing for orders on this market. The agent states that the article is made by a new process in vacuum, and that it is chemically pure. Our readers will probably prefer to stick to the makes which they have been accustomed to buy, and which they have probably hitherto found quite satisfactory, although perhaps not made by a new process. Present quotations are 30 per cent., £11 10s. to £13 per ton; up to £31 10s. to £32 10s. per ton for 98-100 per cent. Carboys free, casks being charged extra.

ACID AND SODA SALICYLATES.—There has so far been no further advance in makers' prices for these two articles. It will be remembered that same were, chiefly in consequence of rise in value of the raw material (acid carbolic), lately advanced 2d. per lb. for the acid and 5d. per lb. for the soda. Makers will, however, it is understood, only book 10-cwt. lots, at the cheapest figure, instead of ton lots as hitherto, and everything would appear to point to the probability of a further tangible advance in the price of salicylates.

ACID BORACIC—Higher crystals being quoted 25s. 6d. per cwt., and powder 28s.

ACID CARBOLIC—Very firm, the prices being 10d. for 35° to 36° C. ice crystal in large bulk; 11d. for 39° to 40° C.; 1s. for 39° to 40° C. detached crystals, B.P. quality. Crude, 60° F. 2s. 9d. per gallon; 75° F. 3s. 6d. per gallon; liquid, of pale straw colour, 1s. 6d. to 1s. 8d. per gallon, in 40 gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC—Dull and weak, there being sellers at 1s. 2d. per lb. on the spot for crystals in 5 cwt. casks. Makers, however, are unwilling to book forward at this figure, in fact, they are not anxious to sell forward at all.

ACID OXALIC.—¾d. to ¾d. per lb. nett, delivered free London.

ACID TARTARIC.—English is quoted 1s. 0½d. to 1s. 0¾d. per lb., and Foreign 11¾d. to 1s.

ALUM.—Lump, 5s. 9d. to 6s. per cwt.; ditto ground, 6s. 9d. to 7s. per cwt.

AMMONIA COMPOUNDS.—Bromide: 2s. 2d. per lb. Carbonate: ¾d. to ½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto, commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide: 13s. 7d. per lb. Sulphate dull: Gray, 24 per cent., London, prompt, £11; Hull, prompt, £10 17s. 6d.; Leith, prompt, £10 17s. 6d.; Beckton, prompt, £10 17s. 6d.; January-March, £11; Beckton terms, prompt, £10 15s. Sulpho-cyanide, 1s. 2d. to 1s. 3d. per lb.

ANTIMONY.—Regulus is still quoted £39 to £40 per ton, and crude Japan (black sulphide) £23 10s. to £24 per ton.

APOMORPHINE—Makers quote 19s. 6d. to 20s. per oz.

ARSENIC.—Lump is quoted 32s. to 32s. 6d. per cwt., and powdered 20s. 6d. to 21s. 6d.

ASHES.—Pots, 28s. 6d.; Pearls, 34s. per cwt.

BISMUTH—Is unchanged in price, both for the subnitrate, which is still quoted 5s. 1d. per lb., and for the carbonate, at 5s. 8d. per lb. The commercial quality of the metal is also still quoted 5s. per lb. So far, therefore, the anticipated advance in value has not taken place.

BLEACHING POWDER (CHLORIDE OF LIME).—£6 10s. to £7 per ton for English make.

BORAX—Dearer at 16s. 6d. per cwt. for crystals, and 17s. 6d. per cwt. for powder.

BROMIDES—Are firm and unchanged, at 1s. 10½d. per lb. for potassii bromid, 2s. 1½d. per lb. for sodii bromid, and 2s. 2d. per lb. for ammon. bromid. Bromine is also unchanged, at 2s. to 2s. 2d. per lb. in cases of 60lbs.

CAMPHOR.—English refiners' quotation remains unaltered at 2s. per lb. for Bells and Flowers in ton lots, while Hamburg has again stiffened up to 1s. 11d. for spot and 1s. 11½d. per lb. for delivery. Crude is quiet, with practically nothing doing, Japan being quoted to arrive 167s. 6d. per cwt. c.i.f.

CINCHONA BARK.—The exports of Java bark for December were 626,000 Amsterdam lb., against 1,018,000 Amsterdam lb. last year, making a total for the twelve months of 11,390,800 Amsterdam lb., against 11,150,000 Amsterdam lb. in 1898.

CLOVES.—The market for Zanzibar is strong and dearer for delivery, with sales for January-March at 3¾d., and March-May at 3⅞d.; also some on the spot at 3⅝d. cash, less interest.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 3½d. per gallon; pure, 2s. 4d. Benzole, 50 per cent. 10½d. per gallon; 90 per cent., 8½d. per gallon. Creosote, 3½d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5½d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A., 4½d. per unit; B., 2¾d. per unit. Pitch, 36s. per ton, f.o.b. Tar: refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE.—Market continues in a rather undecided position. The makers maintain their quotation of 20s. 6d. per oz. for the Hydrochlorate in 25-oz. tins for 200oz. lots, but do not appear to be doing much business in the article; on the other hand, stock in second-hand appears to be very much reduced, and it would probably not be easy to buy any considerable quantity of the brands most in favour at much below makers' price. It is stated that shipments of crude are advised on a more liberal scale, and some of the makers appear to think that a reduction in price is more probable than an advance.

CODEINE—Remains very firm, at 12s. 11d. to 13s. 6d. per oz. for the pure and 1s. per oz. less for the salts.

COD LIVER OIL.—Market is quiet, but firm, quotations being nominally 77s. 6d. to 82s. 6d. per barrel f.o.b., according to brand, for non-congealing Norwegian Oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—First white crystals are quoted 73s. per cwt. on the spot. Powder, 75s.; ditto, 95 per cent., 76s. per cwt.

DRAGONS' BLOOD.—A fair business has been done in medium grades at £8 10s. to £9 per cwt., brighter lump being held for £11 per cwt., whilst fine bright is strongly held for £21. Reeds are in good supply, 14 cases having just arrived. These are held for £10 10s. per cwt.

ERGOT.—This article, which has been excessively dull for some time, has during the week been exceedingly active owing to urgent orders from the United States, and Russian Ergot, which a week ago was unsaleable at 2s. 3d. per lb., has touched 2s. 6d. per lb., some few tons having been done. It is doubtful if there is much now available, and to import the article would cost fully 2s. 9d. per lb.

ESSENTIAL OILS—Of all descriptions have been very quiet and business unimportant.

ESERINE (PHYSOSTIGMINE)—Makers are firm at the late advance in price to 2s. 6d. per gramme for the Sulphate and Salicylate, and 3s. 6d. per gramme for the pure, in lots of at least 10 grammes.

EXTRACT FELICIS MARIS (Oil of Male Fern)—Is firm at 4s. 6d. to 5s. per lb., according to make, packing, and quantity.

GLYCERIN.—Rather firmer, both for crude and for refined, the former from candle-making being quoted £39 to £40 per ton, and ditto from soap lees £31 to £32, while refined is quoted 55s. to 57s. 6d. for English, and 56s. to 65s. per cwt. for German, according to brand, for best white double-distilled, chemically pure 1260° quality in tins and cases.

IODIDES—Are unchanged at 10s. 6d. per lb. for potassii iodid, 11s. 10d. per lb. for sodii iodid, 13s. 10d. per lb. for ammon. iodid,

13s. 10d. per lb. for iodoform crystal, powder, or precipitated; 12s. per lb. for iodine resublimed, and 7½d. per oz. for crude iodine.

MENTHOL—Is very firm, at 10s. 6d. per lb. for good dry white crystals on the spot, in case lots, while to arrive a still higher price is asked.

MERCURIALS—Remain very firm, at 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive Sublimatc.

MORPHINE—Is quiet and unchanged. Very little business has been passing in the article during last few days.

OILS (FIXED) AND SPIRITS.—Linseed: The market is strong at advanced prices. On the spot, pipes, London, quoted £22 5s. to £22 10s.; barrels, £22 10s. to £22 12s. 6d.; Hull, spot, naked, £21 5s.; Feb.-April, £21 5s. Rape firm; ordinary brown, on the spot, £23 5s.; refined, spot, £24 15s.; Ravison, naked, spot, £21 10s. Cotton very firm at higher prices; London, crude, spot, £19; refined, spot, £20 5s. to £20 15s., according to make; Hull dearer, naked, refined, spot, quoted £19; crude, spot, £17 15s. Olive: Mogador, £34 5s.; Spanish, £35 10s.; Levant, £34 5s. Cocoonut steady; Ceylon, on the spot, £25 10s.; Cochin, spot, £20 10s. Palm: Lagos, on the spot, quoted £26. Castor Oil firmer; Belgian, first pressing, spot, £27 10s.; Jan.-June, £26 10s., f.o.b.; Antwerp, second pressing, spot, £26 per ton, ex-wharf; Hull manufactured, guaranteed cold drawn pure pharmaceutical, £29 5s. per ton in barrels, 3½d. per lb. in cases; pure firsts, £26 15s.; seconds, £25 15s. per ton in barrels; firsts, 3½d. per lb. in cases, seconds 3 1-32d., ex-wharf, London. Lubricating Oil: Pale American, spot, 7s. 6d. to 11s.; black, 7s. to 9s.; Russian, black, 5s. 6d. to 6s.; pale, 8s. to 9s. 6d. Petroleum Oil quiet; Russian, spot, qoted 6½d. to 6½d.; American, spot, 7¼d. to 7½d.; water white, 8½d. to 8¾d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine very firm at slightly higher prices; American, spot, 38s. 1½d. to 38s. 3d.

OPIUM.—Druggists' and manufacturing kinds have been in good request, and a large business has been done at slightly dearer rates. A considerable quantity has been withdrawn from the market, and higher prices are anticipated. "Soft Shipping" has also been dealt in to a fair extent at full rates. Persian kinds are inactive at unaltered prices.

PARAFFIN WAX.—Crude, 2½d. to 3d. per lb.; refined, 3¼d. to 4d.

PHENACETIN.—Good makes are firm at 3s. 6d. per lb. as the very lowest price for either powder or crystals in 5 cwt. lots, while the probability of a further advance in price does not appear very remote. Even at the advanced figure the article is still very cheap, too cheap to leave anything like a satisfactory profit to the makers.

PILOCARPINE.—Makers' price remains firm at the late advance to 41s. 9d. per oz. for 8-oz. lots, smaller quantity being quoted higher in proportion.

PITCH.—8s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt. Bichromate, 5d. per lb. Bromide, 1s. 10½d. Chlorate spot London crystals, 3¾d.; Powder, 3¾. Iodide, 10s. 6d. per lb. Permanganate: Small Crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow English makes 7¾d.; Beckton, 7d. Red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER.—Importer is firm at £9 12s. 6d. per bottle, while second-hand offers at 1s. per bottle less money.

QUININE.—The agents here for makers of the favourite German brands of Sulphate, after advancing their price to 1s. 3½d. per oz. for 1,000-oz. lots in 100-oz. tins, now decline to book orders at all, while in the speculative market there have been buyers at 1s. 3½d. per oz. for spot and 1s. 4d. per oz. for March delivery. Cause of the increased firmness in the article has been the very moderate bark shipments to Amsterdam for December, and it looks very much as if we were on the eve of a further decided advance in price of quinine, much will, however, depend upon the result of next Thursday's Bark sales in Amsterdam.

ROSIN—Steady, at 5s. per cwt. for strained on the spot, and rather firmer to arrive, at 4s. 9d. per cwt., ex ship conditions, for January-March shipment, per sailing vessel.

SALICINE—Remains very firm, at 12s. to 12s. 6d. per lb., according to quantity.

SANTONINE.—The agents for the makers quote 11s. 3d. to 11s. 9d. per lb., according to quantity, while stock in second-hand appears to be practically exhausted.

SHELLAC.—The market exhibits a dull tone, and, in the continued absence of demand, few sales of consequence have occurred, but prices are about steady. The shipments from Calcutta (per "Reuter") to the United Kingdom were for the last half of December 7,500 cwt., making 8,400 cwt. for the month, against 7,300 cwt. last year, and to the United States for the last half of December 11,300 cwt., making 12,200 cwt. for the month, against 4,500 cwt. last year. To the Continent the shipments were 4,100 cwt., making 9,200 cwt for the whole month, against 5,400 cwt. last year. The landings in London in December were 2,220 chests, against 4,101 chests; the deliveries 2,727 chests, against 3,225 chests; and the stock on December 31, 41,599 chests, consisting of 34,103 chests Orange, 2,033 chests Garnet, and 5,463 chests Button, against 49,068 chests last year.

Statement of the Landings, Deliveries, and Stocks of Shellac the last three

	years:—		
	1899.	1898.	1897.
Landed chests	45,955	48,028	73,062
Delivered	53,424	50,908	56,793
Stock, Dec. 31	41,599	49,068	51,948

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 4¼d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1½d. Caustic: 70 per cent. white, £10; 60 per cent., £1 less. Hypo-sulphate (Antichlor), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate, quiet on spot; refined, £8; ordinary, £7 15s.

SPICES.—No public sales have been held this week. The usual weekly auctions will be resumed on the 10th inst.

SULPHATE OF COPPER—Rather easier at £24 2s. 6d. to £25 10s. per ton, according to quantity and make, for spot delivery.

SULPHONAL.—The two principal makers maintain their price of 17s. per lb. for both crystals and powder, while less reputable makes are being offered at 14s. to 14s. 6d. per lb.

SULPHUR.—Roll, 6s. 9d. to 7s. per cwt.; flour, 7s. 3d. to 7s. 6d.

TAR.—Stockholm, 25s. to 25s. 6d.; Archangel, 18s. to 18s. 6d.

THYMOL—Remains firm at 10s. 6d. to 11s. per lb., according to quantity.

VERATRIA—Is firm, at the late advance to 4s. 8d. per oz. for the pure.

LIVERPOOL, JANUARY 3, 1900.

In consequence of the holiday season, business has been somewhat curtailed, but inquiry in most staple articles is good, and prices continue steady, with higher quotations in several important items. A distinct firmness is noticeable in Linseed Oil and Cottonseed Oil of Liverpool makes, due to rise in the price of material. Honey has been inquired for rather more of late, and good sales of Chilian have been arranged.

CANARYSEED.—No business has been done, but a good inquiry for Turkish exists, with holders asking 35s. to 36s. per 464 lbs.

CHILLIES.—24 bags of common Sierra Leone fruit were sold ex quay at 25s. per cwt.

CREAM OF TARTAR.—Early last week the quotations were 74s. to 80s. per cwt., but business has since been done at 73s. to 79s.

HONEY.—Chilian has been sold to about 120 barrels in all, Pile 3 at 21s. 6d. to 22s. per cwt., Pile 1 at 25s., and Pile X at 30s. 6d. per cwt.

LINSEED—Is firm, but there is little doing. Some Calcutta 4 per cent., to arrive shortly, has been sold at 46s. 3d. per 416 lbs.

NITRATE.—Chili is selling slowly at 7s. 7½d. to 8s. per cwt., according to quality.

OILS (FIXED) AND SPIRITS.—Castor, Calcutta is offering at 2¼d. to 3d. per lb. French 1st pressure, 2¾d. to 2¼d. and 2¾d., with business at 2¾d. per lb.; and 2nd pressure Belgian at 2½d. per lb. Olive is firm, but in limited demand at £36 10s. to £37 per ton for Spanish. Linseed is held at an advance of 3d. per cwt. for Liverpool pressed oil, makers asking 22s. 9d. to 23s. 6d. per cwt. Cottonseed is very firm, Liverpool refined being priced at 20s. 9d. to 21s. per cwt. Spirits of Turpentine have advanced to 39s. per cwt. with a fair trade doing.

PEARLASHES—Are quiet at 33s. 6d. to 35s. per cwt.

POTASHES—Are firm, at 26s. 9d. to 27s. per cwt.

NEWS IN BRIEF.

SIR JOHN LUBBOCK has been created a Peer of the United Kingdom, on the same occasion.

CAPTAIN ABNEY, the eminent photographic authority, has been promoted to be K.C.B.

DR. LAUDER BRUNTON has received the honour of Knighthood, on the occasion of the award of the New Year honours.

MR. W. MURTON HOLMES has again consented to deliver a course of lectures on pharmacy at the Westminster College of Chemistry and Pharmacy.

MESSRS. HOWARDS AND SONS, Stratford, E., have issued an eye-letted card, on which the solubility and equivalent value of the chief salts of quinine are conveniently tabulated.

MESSRS. BURROUGHS, WELLCOME AND Co., London, are supplying, as a gift, the entire medical equipment of the City of London Imperial Volunteers throughout the present war in South Africa.

MESSRS. EVANS, SONS, AND Co., 56, Hanover Street, Liverpool, have admitted into partnership Mr. James Herbert Everett Evans, son of Mr. John James Evans.

MR. F. W. GAMBLE has been appointed manager of Messrs. Allen and Hanburys' West End Branch, 7, Vere Street, W. Mr. Gamble is well-known as President of the Chemists' Assistants' Association.

MESSRS. I. and M. COHEN, 53 and 54, Houndsditch, and 66, St. Mary Axe, London, E.C., have presented to the hospital ship "Maine" a large case containing one thousand selected medical sponges.

MR. BAGGALLAY, at West Ham Police Court, has dismissed a case against a retailer of compound rhubarb powder containing magnesium carbonate, on the ground that the British Pharmacopœia is not a legal standard under the Sale of Food and Drugs Acts.

MR. JOHN C. UMNEY, of Messrs. Wright, Layman, and Umney, Limited, London, has published some useful notes (No. 4) on current chemical and pharmaceutical topics, dealing with a few difficulties of the British Pharmacopœia, 1898.

MESSRS. EVANS, GADD AND Co., Bristol and Exeter, notify that they are now standardising their tinctures in accordance with the figures given in Messrs. Wippell Gadd and Moor's 'Synopsis of the British Pharmacopœia'—4th edition.

MR. JOSIAH AUSTIN, M.P.S., F.S.A., Nechell's Green, Birmingham, in his almanac for 1900, publishes a readable article, written by himself, on "The Catacombs of Rome." There is also the usual local, postal, and other information, and an interesting compilation of literary matter.

MESSRS. ALLEN AND HANBURYS, LIMITED, LONDON, have introduced, under the name "Kapsol," an improvement on the ordinary pill or compressed tablet. It consists of a particularly soft, homogeneous and easily absorbed pill-mass, enclosed in a thin jujube coating, which is soft and flexible.

MESSRS. J. AND A. CHURCHILL state that a disastrous fire at the printers has caused the destruction of the sheets and type of the 'Medical Directory.' Steps are being taken to replace them, but a delay in sending out the subscribers' copies is inevitable. It is hoped, however, to publish the volume for 1900 early in February.

MESSRS. JAMES TOWNSEND and SON, label printers, of Exeter and London, having amongst their staff from fifty to sixty volunteers, have promised, should they be called upon to serve with the colours, to keep their situations open for them, also to provide or their wives and families during their absence.

MR. THOMAS BEECHAM, St. Helens, Lancs., intimates that he will be pleased to send a gratis box of Beecham's Pills, postage paid, to any individual soldier now on active service in South Africa, in whom readers may be interested, if they will send to St. Helens an address which will find their absent friend at the seat of war.

MESSRS. HELBING AND PASSMORE, analytical and consulting chemists, 63, Queen Victoria Street, London, E.C., state that, in order to meet the increase of business and provide accommodation for a larger staff, they have now completed the installation of a large auxiliary laboratory, conveniently situated in the neighbourhood of their office.

MR. J. C. C. PAYNE, Oxford Buildings, Medical Hall, 18, Shaftesbury Square, Belfast, in removing his branch at Holywood from one building to another, has taken the opportunity of having his new premises entirely refitted, and the effect is now extremely handsome. The whole of the work has been carried out by Messrs. Ayrton and Saunders, Liverpool.

MR. J. THOMPSON, Beswick, Manchester, has patented a simple wire poison-guard. It is intended to be attached to dispensing bottles when sent out from the works, various sizes being also kept for attaching to stock-bottles and jars, so as to convert them into safe poison receptacles. The guard is so shaped that without purposely raising it, the stopper or cork cannot be removed from the bottle.

MESSRS. HARKER, STAGG AND MORGAN, London, announce that they have been compelled, owing to the increased cost of bottles and stoneware, to revise their prices charged for the different sizes. For some time to come the firm will affix to all packages where there is an alteration in price, a circular red label bearing the date 1900, so as to prevent any confusion in crediting.

THE HIGHEST AWARD granted by the National Export Exposition, recently held at Philadelphia, and diploma, were conferred upon Messrs. Seabury and Johnson, for the excellence of their plasters, dressings, surgical appliances, etc. The exhibit of "Seabury" products is reported to have been the handsomest in the Drug and Chemical Industries' section.

MR. R. LORD GIFFORD, on Tuesday, January 2, addressed the Darwen members of the North-East Lancashire Chemists' Association on "The Present Pharmaceutical Position." He took as his text a quotation from an editorial article in the Journal for December 16 last, p. 589, viz.: "The privileges appertaining to the statutory qualification of the Pharmacy Act, 1868, are like the qualification itself, and the acts to which it relates altogether of an individual nature." His address was virtually an expansion of that article.

THE STAFF OF SOUTHALL BROS. AND BARCLAY, LIMITED, Birmingham, gave a complimentary dinner on December 28, to Mr. E. F. Elwell, who, after representing the house in the Midlands for some twenty-two years, is now retiring. Mr. W. Heal occupied the chair, and formally presented a handsome piece of plate, which had been subscribed for by the staff, to Mr. Elwell. After Mr. Elwell had suitably responded, a smoking concert followed, in which the following gentlemen took part:—Messrs. F. G. Hughes, Felix Powell, H. W. Hunt, D. Davies, H. Firkin, R. Howard, J. Nield, and J. Kennard.

MINIMS, DRACHMS AND FLUID OUNCES TO MILLIMETRES, AND PINTS TO LITRE

	Minims to Ml.	Drachms to Ml.	Ounces to Ml.	Pints to Litres.
1	0.05916	3.552	28.412	0.568
2	0.11832	7.103	56.825	1.136
3	0.17748	10.655	85.237	1.705
4	0.23664	14.206	113.649	2.273
5	0.29580	17.758	142.065	2.841
6	0.35496	21.309	170.474	3.409
7	0.41412	24.860	198.886	3.977
8	0.47328	28.412	227.298	4.545
9	0.53244	31.964	255.711	5.111

EXPLANATION OF TABLE.—The first column represents the number of minim drachms, fluid ounces, or pints. Thus: 4 minims = 0.23664 Ml.; 4 drachm = 14.206 Ml.; 4 fl. = 113.649 Ml.; 4 pts. = 2.273 Litres.

Calendar for the Week.

Sunday, Jan. 7.	1st after Epiphany.	Sun rises 8.7; sets 4.6
Monday, Jan. 8.	☾ 5.40 m.	Sun rises 8.7 sets 4.8
SOCIETY OF CHEMICAL INDUSTRY, Burlington House, Piccadilly, W., at 8.30 p.m.—Papers on "Colour Photography," by J. W. Hinchley; "Cinchona," by J. M. V. Vergara; "Microscopic Characters of Vicuna, Camel-hair, and Alpaca," by R. M. Prideaux.		
Tuesday, Jan. 9.		Sun rises 8.6; sets 4.9
ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—The sixth lecture on "Fluids in Motion and at Rest," by C. Vernon Boys.		
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—Paper by W. B. Ferguson, on "Toning and Intensification with the Salts of Copper."		
Wednesday, Jan. 10.		Sun rises 8.6; sets 4.10
EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, 36, York Place, at 9.15 p.m.—Apprentices' Night: Short Papers by Messrs. Grainger Kidd, and Murdoch.		
MANCHESTER PHARMACEUTICAL ASSOCIATION, Chemical Club Rooms, Victoria Hotel, at 7.30 p.m.—W. S. Glyn-Jones on "The P.A.T.A. and its Defence Fund."		
NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION, Hotel Metropole, at 8.30 p.m.—Discussion on various Items of Interest to the Trade generally.		
PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London W.C., at 11 a.m.—Meeting of the Council.		
SHEFFIELD PHARMACEUTICAL SOCIETY, at 8.30 a.m.—Students Night.		
Thursday, Jan. 11.		Sun rises 8.5; sets 4.11
Friday, Jan. 12.		Sun rises 8.4; sets 4.13
GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masnic Chambers, 100, West Regent Street, at 9.15 p.m.—"Mirth and Music."		
aturday, Jan. 13.		Sun rises 8.3; sets 4.14

London Gazette Notices.

PARTNERSHIPS DISSOLVED.

Josiah Pring Starling and Edward Sweetland, Photographers, High Wycombe.
James Harry Toplis and Thomas Henry Bradley, Wholesale and Retail Chemists and Druggists, at Chesterfield, Staveley and Whittington Moor. Debts will be received and paid by James H. Toplis.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Andrews, Austin, Burns, Churchill, Crossley, Cumber, Dent, Fleming, Forrest, Forster, Gilderdale, Gilmour, Guyer, Helbing, Hodge, James, Johnstone, Jones, Kirkby, Lennox, Melbourn, Moulton, Spencer, Summers, Umney, Walton, Warren, White, Williams, Winton.

Publications Received.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LONDON, THURSDAY, JANUARY 11, 1900.

Business has been somewhat quiet during past few days, the unfavourable news from South Africa having, it would appear, rather acted as a damper on intending buyers. Prices at the same time continue to be fairly well maintained, the chief excitement having again centred in Quinine, which is dearer on the week; what the immediate future of the article will be apparently now depends upon the course of to-day's Bark sales in Amsterdam, results of which were not known at the time of our going to press. Acid Carbohc remains very firm, with an upward tendency, while Ipecacuanha is lower and looks like further receding in value. Sulphonal appears to have assumed a more settled position. Price of Cocaine is also stiffening up, in spite of more liberal arrivals of the crude. Ergot of Rye is dearer, and continues very firm. Otherwise there are no changes in value of any importance to report. Bank rate was to-day reduced to five per cent., and it is hoped that the advent of cheaper money, with perhaps the arrival of more favourable news from South Africa, may help towards making business more active. As a matter of fact, the wholesale drug houses and wholesale chemists have been, and are, extremely busy, in consequence of the prevailing epidemic of influenza; this, however, refers to retail business, but must in the end also have an influence in promoting orders for wholesale quantities. The following are the prices ruling for some articles of principal interest.

ACETANILIDE—Remains dull and weak at 9½d. to 11d. per lb., according to quantity.

ACID CARBOHC.—Very firm at advanced prices—namely, 10¾d. for 35° to 36° C. ice crystal in large bulk; 11¼d. for 39° to 40° C.; and 1s. 0¼d. for 39° to 40° C. detached crystals, B.P. quality. Crude, 60F., 3s. per gallon; 75° F., 3s. 9d. per gallon. Liquid of pale straw colour, 1s. 8d. per gallon in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC—Quiet at 1s. 2½d. to 1s. 3d. per lb. for crystals in 5 cwt. casks.

ACID OXALIC—Is quoted 3d. to 3¼d. per lb., nett free, delivered London.

ACID TARTARIC.—English is still quoted 1s. 0½d. to 1s. 0¾d. per lb., and foreign 11¾d. to 1s. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 7d. per lb. Sulphate dearer. Grey, 24 per cent., London, prompt, £11 10s.; Hull, prompt, £11 7s. 6d. to £11 10s.; Beckton, prompt, £11 10s.; Beckton, terms prompt, £11 7s. 6d. Sulphocyanide, 1s. to 1s. 2d. per lb.

ANTIMONY.—Regulus is still quoted £39 to £40 per ton; while Crude Japan (Black Sulphide) is cheaper at £21 to £21 10s. per ton.

BISMUTH—Is unchanged both for the Metal and for the Salts.

BLEACHING POWDER.—English still quoted £6 10s. to £6 15s. per ton.

BORACIC ACID.—The advance is maintained, Crystals being now quoted 25s. 6d. per cwt. and Powder, 27s. 6d.

BORAX.—Crystals are now quoted 16s. 6d. per cwt. and Powder 17s. 6d.

BROMIDES—Are steady at unchanged prices.

CAMPHOR.—Refined is unchanged at 2s. per lb. for Bells and Flowers in ton lots. For crude the market remains very quiet, without any business being reported, quotations for arrival are—for China 160s. per cwt., and for Japan 167s. 6d. per cwt., c.i.f.

CLOVES.—At auction the small supply of Zanzibar sold well at rather dearer prices, good bright at 3¾d., ordinary to fair at 3¼d. to 3¾d. Penang: 12 cases of dark picked were bought in at 6¼d. Privately Zanzibar are strong and again dearer. A fair business has been done, comprising of spot at 3⅞d. cash, less interest; January-March delivery at 3⅞d., March-May at 3½d. and buyers, and June-August at 3⅞d. to 3½d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 2s. 3d. Benzole, 50 per cent, 10½d. per gallon; 90 per cent., 8d. per gallon. Creosote, 3¼d. per gallon. Crude Naphtha, 30 per cent., at 120°C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160°C., 1s. 7d. per gallon; 90 per cent. at 160°C., 1s. 4d. per gallon; 90 per cent. at 190°C., 1s. 3d. per gallon. Anthracene, A., 3¾d. per unit; B., 2¾d. per unit. Pitch, 35s. per ton, f.o.b. Tar, refined and crude, 12s. 6d. per barrel; 2d. per gallon.

COCAINE.—Makers' price remains 20s. 6d. per oz. for the Hydrochlorate in 25-oz. tins for 200-oz. lots. It is, however, stated that in view of the more liberal arrivals of crude a reduction in makers' price is more probable than a further advance. On the other hand, while sales of the favourite brands of this article have been made from second-hand at 19s. to 19s. 6d. per oz., the supply of good makes in second-hand appears to be practically exhausted, which should help the makers (who have lately been somewhat out in the cold as regards orders for this article) to obtain their price, for a time at least.

CODEINE.—Very firm at 12s. 11d. to 13s. 6d. per oz., according to quantity for the pure, and 1s. per oz. less for the muriate, phosphate, and sulphate salts.

COD LIVER OIL.—Market is just a shade easier, there having been small sales of "Jervals" brand from second-hand at 77s. 6d. to 80s. per barrel. The quotation from the other side remains however nominally unchanged at 75s. to 82s. 6d. per barrel, according to quantity and brand, f.o.b., for best non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR.—First White Crystals quoted 73s. per cwt. on the spot; Powder, 75s.; ditto 95 per cent, 76s.

ERGOT OF RYE.—Is exceedingly scarce, as much as 2s. 9d. to 3s. per lb. being asked for fair to good sound Russian, while really fine sound Spanish is hardly procurable at all. Any further activity in the demand would probably drive the price still higher, especially as the new crop cannot become available for many months to come. The various preparations of Ergot have naturally been advanced in proportion, 15s. 6d. to 19s., according to quantity and make, being now asked for Ergotin Bonjean.

GAMBIER.—The market for arrival remains firm, although quiet, and no business is reported; January-March steamer quoted value 15s. 3d. On the spot whole bales are selling at 15s. 3d. At auction 276 bags Cube offered and bought in at 23s.

GINGER.—At auction the moderate supply of Cochin was slow of sale, and of 137 cases and 660 bags offered only 62 bags sold at steady prices, comprising washed, rough, medium, plump, and small at 29s., the remainder bought in, including medium and small, cut and scraped limed at 45s. Japan: The 100 bags offered were all bought in, fair limed, at 23s. Jamaica: Only ten barrels sold out of 109 offered, good common at 58s.

GLYCERIN.—Refined is steady at 54s. 6d. to 57s. 6d. per cwt. for English and 56s. to 67s. 6d., according to brand, for German best white, double distilled, chemically pure, 1260° quality, in tins and cases. Crude quiet but firm at nominally unchanged rates.

GRASS TREE GUM.—19 bags offered and bought in at 8s.

HYPOPHOSPHITES.—Makers' prices are 3s. 3d. per lb. for the Lime, Soda, and Potash Salts.

IODIDES—Quiet and without change in price.

IPECACUANHA.—Market is weaker at 11s. 9d. to 12s. 6d. per lb. for Rio and 8s. to 8s. 6d. per lb. for Carthagenia; and it looks very much as if the article would go still lower.

MENTHOL.—Spot price remains 10s. 6d. to 10s. 9d. per lb. for good brands of dry white crystals in case lots (12 × 5 lb. tins in a case).

MERCURIALS.—There is no change in makers' prices to report.

MYRABOLANS—Dull of sale and 886 bags Bhimlies in auction were bought in at 8s. 6d.

OILS (FIXED) AND SPIRITS.—Linseed dull. On the spot pipes London, £23 15s.; barrels, £24; Hull, spot naked, £22 10s. Rape very firm. Ordinary brown on the spot quoted £24 10s.; refined spot, £25 15s.; Ravison naked spot, £22 10s. Cotton firm. London crude spot, £20 5s.; refined spot, £22 5s. to £23, according to make; Hull naked refined spot, £20 5s.; crude spot, £19 5s. Olive: Mogador, £34 5s.; Spanish, £35 10s.; Levant, £34 5s. Coconut steady. Ceylon on the spot, £25 10s.; Cochin spot, £28 10s. Palm: Lagos on the spot quoted £26. Castor firmer. Belgian first pressing, spot, £27 10s.; January-June, £26 10s., f.o.b. Antwerp second pressing, spot, £26 per ton ex wharf; Hull manufactured, guaranteed cold drawn pure pharmaceutical, £29 15s. per ton in barrels, 3⅞d. per lb. in cases; pure firsts, £27 5s.;

seconds, £26 5s. per ton in barrels; firsts, 3³/₁₆d. per lb. in cases; seconds, 3¹/₁₆d., ex wharf London. Lubricating Oil: Pale American spot, 7s. 6d. to 11s.; black, 7s. to 9s.; Russian black, 5s. 6d. to 6s.; pale, 8s. to 9s. 6d. Petroleum Oil flat. Russian spot quoted 6¹/₂d. to 6¹/₂d.; American spot, 7³/₁₆d. to 7¹/₂d.; water white, 8¹/₂d. to 8³/₄d. Petroleum Spirit: American, 9³/₄d.; deodorised, 10d. Turpentine dull. American spot, 38s. 1¹/₂d.

OPIUM—Has been very quiet during past few days, prices being nominally without change.

PHENACETIN.—Price is maintained at 3s. 6d. per lb. for Crystals and Powder in 5-cwt. lots, smaller quantities being quoted higher in proportion.

PLUMBAGO.—At auction the fair supply of 667 barrels and 3 cases offered and 100 barrels sold, ordinary LL at 62s., good OL at 62s. 6d., Chips ordinary to fair at 15s. to 27s., Flying Dust at 8s. to 11s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 33s. to 36s. per cwt.; Bichromate, 5d. per lb.; Bromide, 1s. 10¹/₂d.; Chlorate, spot, London, crystals, 3³/₄d.; powder, 3¹/₂d.; Iodide, 10s. 6d. per lb. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 7³/₄d.; Beckton, 7d.; Red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER—Firm at £9 12s. 6d. per bottle from the importer and 1s. per bottle less from second hand.

QUININE.—The market for best German brands shows further improvement, and prices are again dearer. The demand continues, and sales to the extent of 100,000oz. have been made, comprising B&S and/or Brunswick March delivery at 1s. 4³/₄d. to 1s. 5d., April at 1s. 5d., May at 1s. 5d., and June at 1s. 5¹/₂d. 10,000 oz. Amsterdam also sold at 1s. 4d. Makers decline to sell, pending results of to-day's Bark Sale in Amsterdam becoming known.

SEEDLAC.—At auction 23 bags Kurrachee offered and bought in, fine pale clean at 60s.

SHELLAC.—The market privately is without alteration, a very quiet tone prevailing in all departments, with little business passing. The auctions to-day produced moderate supplies, but owing to the firmness of sellers only a small proportion sold at steady private rates, the value of fair TN Orange being 62s., against 63s. last sale. A total of 602 cases offered and 77 cases sold. Second Orange: 316 cases offered and 42 cases sold, strong palish flat free at 65s., ordinary reddish ditto at 62s., livery reddish 61s.; fine LM&Co., No. 1 bought in at 76s., and AA in circle at 72s. to 75s. Garnet: Of 117 cases Rangoon 30 cases sold, fair cakey at 59s., blocky 55s. to 56s.; good tree "Eagle" mark bought in at 63s. Button: Of 109 cases 5 sold, ordinary circle 2's at 56s.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 4¹/₂d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1¹/₂d. Caustic, 70 per cent., white, £10; 60 per cent., £1 less. Hypo-sulphate (Antichlor.), 6s. 6d. to 8s. 6d. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate, quiet on spot; refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper: At auction no Singapore was offered; 216 bags Aleppy bought in at 5³/₄d.; 2 bags Ceylon offered and sold at 5³/₄d. White Pepper in slow demand at auction. Of 72 cases and 501 bags Singapore offered only 31 bags sold, good at 9¹/₂d. to 9¹/₂d., siftings at 6³/₄d., the remainder bought in, including finest selected in cases at 1s. 2d.; 75 bags good Siam bought in at 9d.; 39 bags Ceylon offered and sold, good to fine, at 9d. to 9¹/₂d., mixed white and black at 6d.; 149 bags fair Penang bought in at 8¹/₂d. Chillies quiet; 106 packages Japan offered and 6 cases sold without reserve, fair yellowish, at 37s. 6d. Pimento in fair supply met a moderate demand at about previous rates; 835 bags offered, and about 200 bags sold, ordinary to fair, at 3¹/₄d. to 3⁵/₁₆d.; common, 3d. to 3¹/₂d. Cinnamon neglected; 469 packages Ceylon offered in auction, and only 11 cases sold, cuttings, 7¹/₂d.; featherings, 7¹/₄d. Cinnamon chips, etc., in moderate request. Of 524 bags offered, 238 sold, ordinary chips, at 2¹/₄d. to 2¹/₂d., and bark at 1¹/₂d. to 2d. Cassia Chips: 100 cases offered and sold at 41s. 6d. Wild Cassia Buds: 45 bags offered and bought in at 26s. Mace slow of sale and barely steady; 21 cases Penang bought in, fine pale, at 2s. 3d. to 2s. 4d.; fair red, 1s. 6d. to 1s. 7d.; broken pickings at 1s. 4d. 42 packages Singapore offered, and only 7 cases sold, broken red, at 1s. 4d. 13 cases Bombay bought in at 1s. 6d. to 1s. 8d. West Indian: 16 cases sold, good bold pale, at 1s. 11d.; good reddish, 1s. 8d. to 1s. 9d.; fair, 1s. 5d. to 1s. 6d.; broken,

1s. 3d. to 1s. 4d. Nutmegs dull and easier. Of 53 cases Penang in auction 32 cases sold without reserve, 80's to 82's, at 1s. 6d. to 1s. 7d., remainder bought in, including 66's at 2s. 3d. 6 cases Bombay bought in, wormy and defective, at 4d. West Indian: 20 cases and 128 barrels offered and mostly sold. 63's and 65's at 2s. 2d.; 78's, 1s. 5d.; 84's to 85's, 1s. 4d. to 1s. 5d.; 95's at 1s.; 122's to 123's at 9d. to 9¹/₂d.; 124's to 129's, partly shrivelled, at 9d.; broken and defective at 2¹/₂d. to 3¹/₂d.

STICKLAC—Quiet, and 317 cases Siam in auction were all bought in at 40s. to 45s.

SULPHATE OF COPPER—Rather easier at £24 2s. 6d. to £25 10s. per ton, according to quantity and brand.

SULPHONAL.—It is reported that the outside makers of this article have now joined the convention, and also fixed their price at the same figure as that quoted by the two hitherto best-known manufacturers of Sulphonal—viz., 16s. 6d. to 17s. per lb for both Crystals and Powder, with a certain reduction for large contracts. If this arrangement holds good it is probable that the price will remain steady during the immediate future at least.

THYMOL—Continues firm at 10s. 6d. to 11s. per lb.

TURMERIC—Quiet, but steady. At auction 6 bags Bengal offered and sold at 30s.; 368 bags Madras bought in, ordinary dull finger at 35s., and whole bulbs at 25s.

LIVERPOOL, THURSDAY, JANUARY 11, 1900.

A firm upward movement has set in during the last few days in Linseed Oil, Cottonseed Oil and in Spirits of Turpentine, which promises to continue. Quotations otherwise are in much the same state as last week, prices being well maintained and demand and inquiry continuing both good. Business has been done in Californian Honey at high figures, and in Chilian at fully recent rates. Amongst the miscellaneous sales worth noting are Syrian Fœnugrec, Chilian Spermacti, Quillaya Bark, and American Beeswax. In the Chemical Market, business has been quiet, but, as before Christmas, Caustic Soda, Bleaching Powder, and Chlorate and Bichromate of Potash continue scarce and very firm.

AMMONIA SALTS.—Carbonate 3³/₄d. per lb. Sal Ammoniac 38s. to 40s. per cwt. Sulphate dull, £11 per ton.

BEESWAX.—American has been sold at £7 5s. per cwt.

BLEACHING POWDER—Is very firm at £6 15s. per ton.

CANARY SEED.—600 bags of Turkish sold at 34s. to 36s. per 464 lbs., demand is quiet.

COPPERAS—Is firm at 39s. per ton for Lancashire, and 37s. for Welsh.

COPPER SULPHATE—Enjoys more inquiry, and is quoted at £25 per ton.

FŒNUGREC.—50 bags of Syrian made 7s. 3d. per cwt., ex quay.

HONEY.—Fine Californian made 46s. per cwt., and 54 barrels of Chilian brought for Pile 1 24s. per cwt., and for Pile 2 22s. 6d. per cwt.

LINSEED.—300 tons of Calcutta 4 per cent. sold, ex quay, early in the week for 46s. 6d. per 416, but no transactions have taken place since owing to high figures asked.

OILS (FIXED) AND SPIRITS.—Castor: Spot parcels are in good demand. Calcutta at 2¹⁵/₁₆d. to 3d. per lb.; and French 1st pressure at 2¹³/₁₆d. to 2⁷/₁₆d. Several lots of French have been sold at the first figure. Belgian 2nd pressure has also been selling at 2³/₄d. per lb. Olive: Transactions have not been numerous, but the figures reached have been quite up to the high rates ruling of late. Spanish Oil has been sold at £36 10s. per tun. Linseed: In consequence of the extreme prices asked for material, crushers have raised their price for oil in export casks to 24s. 6d. per cwt., and are very firm in their demands. Cottonseed has considerably improved in price, and is now firm at 22s. 3d. to 22s. 9d. per cwt. in export barrels. Spirits of Turpentine, 39s. 6d. per cwt., and are firmly held with moderate demand.

POTASH SALTS.—Bichromate scarce at 4¹/₂d. to 4³/₄d. per lb. Cream of Tartar is steady at 74s. to 80s. per cwt. for "finest white." Patras has sold ex store at 62s. 6d. Pearlashes are quiet at 33s. 6d. to 35s. per cwt., and Potashes firm at 26s. 9d. to 27s. per cwt., but demand is slow. Prussiate 7³/₄d. to 7³/₄d. per lb.

QUILLAYA BARK.—5 tons Chilian sold at £13 per ton ex store.

SODA SALTS.—Bicarbonate £6 5s. per ton. Borax quiet, 16s. per cwt. Caustic very scarce, 76 to 77 per cent. is dearer, £10 7s. 6d. per ton, 70 per cent. £9 5s. Crystals are firm at £3 5s. per ton. Nitrate is only a slow market at 7s. 7¹/₂d. to 8s. per cwt.

SPERMACE TI.—A lot of crude Chilian was disposed of privately, ex quay.

NEWS IN BRIEF.

THE CHEMISTS' BALL will be held at the Portman Rooms, Baker Street, W., on Wednesday next, January 17. Tickets (lady's, 12s. 6d.; gentleman's, 17s. 6d.) can be obtained of Mr. W. Warren, 24, Russell Street, Covent Garden, W.C.

MR. G. C. DRUCE, M.A., F.L.S., 118, High Street, Oxford, is engaged in the preparation of a 'Flora of Buckinghamshire,' on the same lines as his 'Flora of Berkshire,' and will be glad to receive any notes on the botany of the country.

PROFESSOR RAMSAY, during the course of a lecture delivered on Friday, January 5, in the Urania, at Berlin, on "The Atmosphere," declared that there no longer remained any unknown constituents to be discovered in the atmosphere.

MESSRS. J. and J. COLMAN, LIMITED, of Norwich, direct attention to the fact that the new Food and Drugs Act, which came into operation on January 1, this year, will not affect their existing mustard labels or their trade in any way.

MESSRS. PARKE, DAVIS AND Co., 451, Oxford Street, London, W. have introduced several new and important pharmaceutical preparations into the 1900 edition of their price list, the latest being chloretone, a new hypnotic remedy, particulars concerning which will be supplied by the firm on application.

MESSRS. WILKINSON AND SIMPSON, LIMITED, of Newcastle-on-Tyne, have again had placed with them the contracts for the supply of drugs, etc., to the Fleming Children's Hospital, Moor Edge, and the Lady Armstrong Memorial Hospital, City Road, Newcastle-on-Tyne, during the present year.

THE SECOND CINDERELLA DANCE of the session in connection with the Chemists' Assistants' Association was held at the Portman Rooms, Baker Street, W., on Thursday, January 4. There was only a moderate attendance, but the programme was as attractive as usual, and the evening was pleasantly spent by those present.

MESSRS. WILLIAMSON AND HOGG, chemists, North Shields, on January 4 had their shop, at the corner of Saville Street and Camden Street, threatened by a fire, which broke out on the top floor of the premises. Fortunately, the fire was confined to the upper rooms, but the stock in the shop was greatly damaged by water.

THE LIEBIG'S EXTRACT OF MEAT Co., LIMITED, has declared a half-yearly interim dividend of 5 per cent., the same as last year, being 20s. per share free of income tax, payable on and after February 15 next, to the proprietor's registered on the company's books on February 8, and to holders of share warrants to bearer.

MR. J. H. WATSON, M.P.S., 36, Westgate, Shipley, has again published his annual illustrated family almanac (1900), this being the twentieth year of publication. A photograph of the shop-front appears on the front outside cover, together with the particulars of the hours of business. The literary matter is largely historical. There is also the usual local information.

CAMWAL, LIMITED, announces an issue of 29,258 £5 per cent. cumulative preference shares of £1 each at par. The new prospectus is now ready, and on January 16 will be posted to every chemist on the Register. Any chemist who does not receive a copy of the prospectus by January 18 should apply for a copy to the Secretary, at 112, Pembroke Street, Caledonian Road, London, N.

THE SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY will hold its annual ball at the Masonic Hall, Sheffield, on Tuesday, February 13. As it will be necessary to limit the number of tickets sold, it is suggested that early applications should be made for the same. Tickets, including supper (single, 7s. 6d.; double, 12s. 6d.), may be had from the Hon. Secretary, Mr. H. Antcliffe, Union Offices, Westbar.

MR. JAMES STUART HILLS, son of Mr. Walter Hills, past President of the Pharmaceutical Society, has been selected to go to

South Africa with the battery of the Honourable Artillery Company attached to the City of London Imperial Volunteers. Mr. Hills has been a student at the School of Pharmacy since October last, and will carry with him the best wishes of his fellow students, as well as those of the professors and other officers of the Pharmaceutical Society.

MR. G. LORIMER, junior town traveller for the firm of Messrs. Lorimer and Co., has been selected for active service in South Africa with the battery of the Honourable Artillery Company about to sail shortly for the front. Mr. Lorimer is a good all-round athlete and horseman, and was at one time a player in the School of Pharmacy football team. Mr. Alec. Wink, son of Mr. John Adam Wink, M.P.S., of Devonshire Square, London, E., has also been selected for active service at the front, and will accompany the battery of the Honourable Artillery Company to South Africa.

MESSRS. BURROUGHS, WELLCOME and Co. are supplying the whole surgical equipment, as well as the medical equipment, as a gift to the City of London Imperial Volunteers. This equipment includes medical companions and water bottles (Army pattern), surgical haversack and water bottle (Army pattern), two pairs field medical and surgical Army regulation panniers fitted complete, one pair surgical saddle bags, ten stretchers (Army pattern), two stationery boxes, two aluminium Congo tabloid medicine chests, fitted complete, and supplied with six complete sets of refills, two solid antiseptic cases, fitted complete, and supplied with six complete sets of refills, field dressings, etc., etc.

Publications Received.

PHILADELPHIA HOSPITAL FORMULARY. Pp. 42. Edited by Dr. DANIEL E. HUGHES and JOSEPH W. ENGLAND (Chief Druggist). Published by the Department of Charities and Correction, Bureau of Charities, of Philadelphia, 1899. From the Editors.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

50,000 Choicest Microscopical Objects, Microscopes, Cabinets, Mounting Materials.—Suter, Highweek Road, Tottenham.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Complete Pill-making Plant, Pindar hand machine (10 lbs. per hour), with 2 sets rollers, 3 and 4 grain; pill-piper, with 2 piping-gauges; pill-coater (with sieve), for 5 lbs. at a time; total value, £22; unused; half-price.—Marshall, 27, Red Lion Sq., London.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Erasmic Soap, Frog, Vanilla Pods, Swandown Powder.—Eastman, Forest Lane, Stratford.

Chemist and Druggist Diary, 1900.—Lowest price to W. J. M., 75, Elsley Road, Lavender Hill, London, S.W.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

A Large Number of second-hand copies of Wills's "Materia Medica"; half price will be paid for copies in good condition, latest edition.—Apply to Mr. G. S. V. Wills, Westminster College, Trinity Square, Borough, S.E.

Calendar for the Week.

Sunday, Jan. 14. 2nd after Epiphany. Sun rises 8.3; sets 4.16.

Monday, Jan. 15. 07.8 A. Sun rises 8.2; sets 4.17.

Tuesday, Jan. 16. Sun rises 8.1; sets 4.19.
 BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION, County Restaurant, at 9 p.m.—Musical evening, arranged by Mr. Hanson.
 ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Professor E. Ray Lankester, on "Fishes."
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—W. Gamble, on "Screen Gears for Half-Tone."

Wednesday, Jan. 17. Sun rises 8.0; sets 4.20.
 CHEMISTS' BALL, Portman Rooms, Baker Street, London, W.—The last ball of the nineteenth century.
 PHARMACEUTICAL SOCIETY, 36, York Place, Edinburgh, at 8.30 p.m.—Evening Meeting, when Papers will be read by G. F. Merson on "Commercial and Powdered Myrrh" and "Tincture of Myrrh."
 ROYAL MICROSCOPICAL SOCIETY, 20, Hanover Square, London, W., at 8 p.m.—Address by the President.

Thursday, Jan. 18. Sun rises 7.59; sets 4.22.
 CHEMICAL SOCIETY, Burlington House, Piccadilly, London, W., at 8 p.m.—Papers by Julius Stieglitz and E. E. Slosson; W. J. Sell and F. W. Dootson A. Lapworth and E. M. Chapman; and E. C. Szarvasy.
 CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—W. S. Glyn-Jones on "The Chemist and the Laws that particularly affect him."
 LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers by H. M. Kyle and G. Massee.
 ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Dr. W. H. R. Rivers, on "The Senses of Primitive Man."

Friday, Jan. 19. Sun rises 7.58; sets 4.23.
 GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masnie Chambers, 100, West Regent Street, at 9.15 p.m.—A Lecture by Dr. James Devon.
 ROYAL INSTITUTION, Albemarle Street, London, W., at 9 p.m.—Lord Rayleigh on "Flight."

Saturday, Jan. 20. Sun rises 7.57; sets 4.25.

Marriages.

VALLANCE—WOOLLEY.—On December 6, at St. John's Church, Higher Broughton, Manchester, by the Rev. H. J. B. Armstrong, M.A., Rector, Arthur Clayton Vallance, Ph.C., to Gertrude Daisy, second daughter of the late Percy Woolley, of Manchester.

SAGE—BROOKS.—On January 6, at St. George's Church, Bloomsbury, by the Rev. A. B. Boyd-Carpenter, M.A., Charles Edward Sage, F.C.S., Ph.C., to Bella, eldest daughter of Mr. W. F. Brooks, of Bloomsbury.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Antcliffe, Bartlett, Bennett, Chard, Durrant, Fawcett, Ferrall, Forster, Gilmour, Grimshaw, Hebb, Hudson, Keith, Lee, Mallinson, Merriam, Merson, Nottingham, O'Halloran, Soar, (Miss) Spencer.

PARTNERSHIPS DISSOLVED.

Samuel Job, Robert Timothy Matterson, Frederick Henry Appleby, and Henry Percy Job, carrying on business as Surgeons, at Newark-upon-Trent, under the style of Job, Matterson, and Appleby.

Anne Iredale and James William Worthington Huddleston, Dry Soap Manufacturers, trading as Iredale's Patent Soap Co., at Vauxhall Road, and Upper Milk Street, Liverpool.

Edward Mansel Sympson and John Thomas Collier, Physicians, Surgeons, and General Medical Practitioners, at 2, James Street, and 7, West Parade, Lincoln. Debts will be received and paid by either E. M. Sympson or J. T. Collier.

James Wigmore, 26, Green Park, Bath, and Henry Charles Heathcote, Twerton Villa, Twerton-on-Avon, practising as Surgeons and General Medical Practitioners.

Caroline Emilie Goode and Mildred Grogono, Proprietors of a Surgical Home, or Private Hospital, at Welbeck, Shorncliffe Road, Folkestone.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LONDON, THURSDAY, JANUARY 18, 1900.

While there has not been a very large volume of business passing in drugs and chemicals during the past week, except, perhaps, in Sulphate of Quinine, there is a very steady undertone, and prices for most articles remain very firm, with even, in many instances, a further upward tendency. Price of Salicine has been advanced, and there has been quite a flutter in Quinine, which, if the small bark shipments from Java continue, may prove to be the commencement of a very important upward movement in price of this article. Acid Carbohc, owing to the action of the Government, has assumed a somewhat peculiar position, and this may very likely affect values of Salicylates. Prices of other articles usually quoted in these columns are generally firm, without, however, any important changes, with the exception of those referred to above, the following being those ruling for some articles of principal interest. Bank rate was to-day reduced to 4½ per cent. :—

ACID CARBOLIC—Very firm, at the following prices :—10½d. to 11d. for 35° to 36° C. ice crystal in large bulk; 11½d. to 1s. for 39° to 40° C. ice crystal in large bulk, according to quantity, etc. 1s. 0¾d. to 1s. 1d. for 39° to 40° C. detached crystals, B.P. quality. Crude, 60° F., 3s. per gallon; 75° F., 3s. 9d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 8d. per gallon; ditto, 25-30 per cent. of dark colour, 9d. to 11d. per gallon. The position of this article has become somewhat peculiar in consequence of the issue of a Royal Proclamation, as follows :—“Whereas, by the Customs and Inland Revenue Act, 1879, section 8, certain goods may by proclamation be prohibited to be exported or carried coastwise, and whereas, by advice of our Privy Council, we deem it expedient and necessary to prohibit the goods hereinafter mentioned to be exported or carried coastwise, We, by the advice aforesaid, do hereby order and direct that from and after the date hereof the following goods, being articles which we have judged capable of being converted into or made useful in increasing the quantity of military stores—viz., picric acid, trinitro-phenol, trinitro-cresol, carbohc acid phenol, cresylic acid cresol, shall be and the same are hereby prohibited either to be exported from the United Kingdom or carried coastwise. Given at our Court, at Osborne, this eleventh January, 1900. God save the Queen.” With regard to the above Proclamation, it may be mentioned that the articles enumerated therein are all employed in the composition of high explosives, such as lyddite and mélinite, in both of which picric acid figures largely. The substances the export of which is now prohibited are the bye-products of gas manufacture. It remains now to be seen what effect this will have upon the article. Many people think that the requirements of the British Government will be so large that the price of the article will at least be fully maintained; that, in fact, one object of the proclamation will have been to ensure the Government getting all they may require. Anyhow, the prohibition to export the article will prove a serious inconvenience to wholesale druggists who receive regularly export orders for the article in larger and smaller quantities for medicinal and sanitary purposes only, and where the question of same being used for purpose of manufacture of explosives does not arise. We understand that representations will be made to the Government on this point, but whether they will be successful in bringing about any amendment of the matter remains to be seen.

CINCHONA BARK.—The opening auctions of the year were held to-day. Small supplies were catalogued, amounting to 1,610 packages of all descriptions, as compared with 2,793 packages at the closing-sale last year. East India kinds comprised the bulk of the offerings, which met a good demand, and about two-thirds sold at very full to extreme prices in many instances, the average unit showing an advance of ⅓d., being 1¼d. against 1½d. last sale, or rather above the values obtained in Amsterdam last week. Ceylon: 137 bales offered and sold, according to analysis—Suceirubra, stem chips, fair to good at 4¾d. to 5¾d., good shavings at 7½d. East Indian: 1,140 packages offered and about 700 sold, red stem chips, ordinary to fair at 2½d. to 4¾d., fair root at 4d.; Officinalis, stem

chips and shavings, ordinary to fair at 2½d. to 4¼d.; renewed ditto, fair to good rich at 4d. to 7¾d.; Ledger, stem chips, fair to good rich at 6½d. to 8¼d., branch at 4¾d. Java: 273 packages offered and 200 sold, Ledger, natural stem chips, fair at 5¾d. to 6d., ditto dusty at 4¾d. to 5d., root at 4½d. to 5½d., branch from 2¾d. to 4¾d. South American: 60 bales Bolivian cultivated Calisaya quills offered and sold, good quill at 10d., damaged 5½d.

CLOVES.—At auction, only 14 bales Zanzibar offered and sold, fair at 3½d.; 10 cases picked Penang bought in at 6¼d. Privately, the market for Zanzibar is strong, business done including January-March delivery at 3 15-32d., March-May at 3 16-6d., and June-August at 3 16-6d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 2d. per gallon; pure, 2s. 3d. Benzole, 50 per cent., 10d. per gallon; 90 per cent., 8d. per gallon. Creosote, 3¼d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A, 3¾d. per unit; B, 2¾d. per unit. Pitch, 35s. per ton f.o.b. Tar, refined and crude, 12s. 6d. per barrel, 2d. per gallon.

GINGER.—Cochin in slow demand; and of 694 bags and 77 cases, only 55 bags sold, without reserve. Calicut, rough, medium, and small, some bold, but rather wormy, at 24s. to 24s. 6d., the remainder bought in; medium and small native cut at 47s.; and washed rough, fair to good bright, at 28s. to 32s. Of Jamaica, only 1 barrel offered and sold, common at 53s. Japan: 221 bags bought in; rather small and little wormy at 23s.

OILS (FIXED) AND SPIRITS.—Lined firm. On the spot pipes London, £23 10s. to £23 15s.; barrels, £23 15s. to £24. Hull, spot naked, £22 7s. 6d. Rape strong. Ordinary brown on the spot quoted £25 10s.; refined spot, £26 15s.; Ravison naked spot, £23 5s. Cotton firm. London crude spot, £21 15s. to £22; refined spot, £23 15s.; to £24 10s., according to make. Hull naked refined spot, £21 10s.; crude spot, £20 5s.; Olive Mogador, £34 5s.; Spanish, £35 10s.; Levant, £34 5s. Coconut firm. Ceylon on the spot, £25 10s.; Cochin spot, £28 10s. Palm: Lagos on the spot quoted, £26 10s. Castor dearer. Belgian 1st pressing, spot, £27 10s. January-June, £26 10s., f.o.b. Antwerp second pressing, spot, £26 per ton ex wharf. Hull manufactured, guaranteed cold drawn pure pharmaceutical, £30 5s. per ton in barrels; 3½d. per lb. in cases. Pure firsts, £27 15s.; seconds, £26 15s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3¼d. per lb. ex wharf, London. Lubricating Oil: Pale American spot, 8s. to 9s. 6d.; black, 7s. to 9s. Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum oil steady. Russian spot, quoted 6d. to 6¼d. American spot, 7½d. to 7½d. Water white, 8½d. to 8½d. Petroleum spirit: American, 9½d.; deodorised, 10d. Turpentine dull, and easier American spot, 38s. 6d.

QUININE.—The advice of small shipments of bark from Java, same being given as under 250,000 lbs. for first half of January, has caused quite an excitement in quinine, and if these small shipments continue we shall see the article shortly at quite a different figure than has hitherto been the case. Makers now decline to sell, while prices for B & S and/or Brunswick Sulphate in the speculative market are :—Spot, 1s. 5d. to 1s. 5½d. per oz.; March, 1s. 5½d.; May, 1s. 5½d. to 1s. 5¾d.; and July, 1s. 6d., at which figures the market is very firm.

SALICINE.—Has been advanced 3s. per lb., to 15s. 6d. per lb. Scarcity and poor yield of the raw material is stated to fully justify the advance.

SALICYLATES.—The prohibition on the part of the British Government of the export of acid carbohc may very likely have an important effect on value of acid and soda salicylic, although the makers, while declining to commit themselves to accepting further orders, have so far made no alteration in their quotations.

SALOL.—What we have written about salicylates applies also to salol, price of which is, however, so far unchanged.

THURSDAY'S DRUG SALES.

As might have been expected after so long an interval, to-day's drug auctions comprised a considerable number of catalogues and a large number of lots. Some articles sold well, for instance, Senna, at the same time many lots had to be bought in. The results show no very startling changes in value, the following being the particulars as far as it has been possible to give same up to time of going to press.

ACONITE ROOT.—20 bags Japan bought in at 28s. per ewt.

ALOES.—11 kegs Socotrine part sold at 75s., 17 cases ditto being bought in at 57s. 6d. 230 gourds Curaçoa part sold at 56s. per

cwt. for good pale livery. 18 cases Zanzibar part sold at 34s. to 37s. 68 kegs Socotrine part sold at 72s. 6d.

ANTIMONY.—40 cases Japan crude (black sulphide) were taken out nominally at 24s. per cwt. Other 50 cases at £23 10s.

ARECA NUTS.—22 bags of fair quality bought in, only 17s. 6d. per cwt. being bid.

BALSAM (CANADA).—1 cask was taken out at 1s. 7d. per lb.

BALSAM COPAIBOE.—7 barrels were bought in at 1s. 4d. per lb., other 7 cases at 1s. 8d. per lb.

BALSAM PERU.—1 case bought in at 8s. per lb.

BALSAM TOLU.—9 cases bought in at 1s. 10d. per lb.

BUCHU LEAVES.—31 bales part sold at 11d. to 1s. per lb. for fair to good green rounds and 9½d. to 10½d. for yellowish.

CARDAMONS.—Of 60 cases Ceylon, a few only sold, at 1s. 10d. to 2s. 4d. per lb., remainder being bought in, chiefly at 2s. 2d. per lb. One case Wold was taken out at 3s. 6d. per lb. Of other 129 cases, really fine bold, fetched 3s. 10d. per lb. Other 61 packages nearly all sold at 1s. 6d. to 2s. 9d. per lb., 2 cases Wild fetching 3s. 7d. per lb. Other 16 cases sold at 3s. 9d. to 3s. 10d. for good bold Mysore, and at 3s. 5d. per lb. for ditto second size; good seeds sold at 2s. 2d. to 2s. 3d. per lb.

CALUMBA ROOT.—69 bags all bought in at 60s. per cwt. for good washed, and 28s. to 30s. for fair sorts.

CASCARA SAGRADA BARK.—124 bags, of fair quality bought in at 35s. per cwt.

CASCARILLA BARK.—11 bales fair bright quill bought in at 65s. to 75s. per cwt.; thin at 50s. Other 11 bales of fair quill part sold at 75s.

CASTOR OIL.—73 cases East Indian were bought in at 3½d. to 4d. per lb.

CHILLIES.—2 cases fine Japan bought in at 45s. per cwt.

CINCHONA BARK.—71 packages crown and grey bark, sold at 1s. 1d. per lb., down 4d. per lb. for 2CCD; 24 bales yellow bark realised 9½d. per lb. for the sound; 19 bales Maracaibo bark taken out at 6d.; 11 bales Carthagenas, at 7d.; and 11 cases Cinchona, consisting of very bold, mossy quills, at 10d. per lb.; 4 bales small Cuprea sold at 1d. per lb.

CIVET.—2 horns bought in at 10s. 6d. per oz.

COCA LEAVES.—15 bales of fair quality taken out at 1s. 4d. per lb.

COD LIVER OIL.—5 barrels Norwegian offered without reserve fetched 65s. per barrel.

COLOCYNTH.—15 cases Turkey part selling at 1s. 3d. to 1s. 4d. per lb. for 1 C.S.D. good medium apple, and at 1s. 1d. per lb. for ditto 2 C.S.D. 3 cases sound ditto were taken out at 1s. 7d. per lb.

CROTON SEEDS.—58 bags, bought in at 60s. per cwt., for fair bright; another lot partly sold at 38s. per cwt.

CUBEBS.—67 bags, of only very medium quality, realised 22s. per cwt.

CUMMIN SEED.—75 bags good Malta bought in at 35s. to 38s. per cwt.

CUS CUS ROOT.—4 bales rather sandy bought in at 22s. per cwt.

CUTTLE FISHBONE.—10 cases medium to bold taken out at 7d. to 9d. per lb.

DRAGONS' BLOOD.—12 cases bought in at £10 per cwt for reeds, and £12 per cwt. for fair mixed block, good bright lump at £22, and dull saucers at £10 per cwt. 1 case dull lump sold at £7 12s. 6d. per cwt.

DRIED TURTLE.—20 cases part sold at 2s. 6d. to 2s. 9d. per lb.

ERGOT OF RYE.—6 bags fair but small Spanish were taken out at the high figure of 3s. 6d. per lb.

ESSENTIAL OILS.—2 half-cases Bergamot taken out at 7s. 9d. per lb. 10 cases fair commercial Oil, Eucalyptus, at 1s. 3d. per lb. Other 30 cases at 10d. 4 cases good Oil, Cinnamon, at 1s. 6d. per oz. 20 cases oil Citronelle at 1¾d. per oz. 15 cases Cajeputa at 2s. 8d. per bottle. 10 cases dementholised Japan Oil, Peppermint (Kobayashi brand), at 3s. 10d. per lb. 28 cases Lemongrass at 3½d. per oz. 6 cases Bergamot, offered without reserve, sold at 4s. 1d. per lb. 1 tin Anethol (Russian) bought in at 8s. per lb. 3 cases 2 barrels Bitter Orange at 6s. 6d. per lb. 1 case Nutmeg at 2½d. per oz. 1 bottle Ylang-Ylang taken out at 8s. 6d. per oz. 4 cases West Indian Oil of Limes at 3s. 6d. per lb. Other 9 cases ditto at 3s. 7d. 1 case hand-pressed ditto fetched 7s. 1d. per lb.

FENNEL SEED.—10 bags sold at 19s. 9d. per cwt.

GALANGAL ROOT.—34 bales, of fair quality, were bought in at 25s. per cwt.

GENTIAN ROOT.—31 bags cut root bought in at 14s. per cwt.

GUM ACCROIDES.—17 bales bought in, a bid of 28s. per cwt. not being entertained.

GUM AMMONIAC.—10 cases taken out at 35s. per cwt.

GUM ARABIC.—29 bales Turkey sorts bought in at 80s. per cwt., and 70s. to 75s. for fair siftings, 1 case picked at 85s., 1 bag Australian at 20s. per cwt.

GUM ASAFETIDA.—Of 424 packages, a considerable part was withdrawn; rest was nearly all brought in at prices varying from 40s. to 60s. per cwt., according to quality. 3 cases good loose gum selling at 60s. per cwt.; other 64 cases sold at 65s., down to 20s. to 22s. 6d. for dark heavy.

GUM BENZOIN.—12 cases part sold at £7 17s. 6d. per cwt. for medium Sumatra seconds and £5 7s. 6d. for inferior. Really fine was bought in at £9 5s. to £10s., 1 case good realising £8 12s. 6d. 23 cases Siam sold at 97s. 6d. per cwt. for good almondy block down to 41s. to 51s. per cwt. for low inferior quality. 1 case glassy Penang sold without reserve at 85s. per cwt.

GUM ALBANUM.—15 packages all bought in at 1s. 1d. per lb. for fair, 1s. 3d. per lb. for good almondy lump, and 9d. per lb. for fair blocky.

GUM GUAIAECUM.—5 cases part sold at 1s. 3d. for good glassy, 5 barrels dull lump being bought in.

GUM MASTIC.—16 cases yellow, part medium, part good, were bought in at 1s. 6d. per lb.

GUM MYRRH.—36 cases part sold at 52s. 6d. per cwt. for fair sorts, 7 cases of inferior quality only realising 18s. per cwt. Other packages, part sold at 81s. per cwt., for good pale sorts.

GUM SAGAPENUM.—4 cases offered without reserve sold at 6s. 6d. to 6s. 9d. per cwt.

GUM TRAGACANTH.—6 packages of fair quality were all bought in at £14 to £15 per cwt., other 10 packages part sold at £14 5s. down to 62s. 6d. for low inferior, offered without reserve.

HONEY.—11 casks good Jamaica were taken out at 35s. per cwt.

IGNATIUS BEANS.—10 bags of fair quality taken out at 6d. per lb.

IPECACUANHA.—Fair to good Rio sold at 11s. 9d. to 12s. 3d. per lb., Carthagenas at 7s. 3d. to 7s. 6d. per lb.

KOLA NUTS.—3 bales of fair small nuts were taken out at 4d. per lb., other 25 bags good bold at 1s. per lb., 1 half barrel mouldy sold at 2¾d.

LICORICE ROOT.—10 bales decorticated impalpable powder taken out at 41s. per cwt.; 31 bags good cut natural, at 14s. per cwt.

MATICO.—16 bales were bought in at 7d. per lb.

MENTHOL.—1 case Japan, consisting of fair white dry crystals, bought in at 10s. per lb.

MORPHINE.—500 oz. of Winks' hydrochlorate powder all sold readily at 4s. 6½d. per oz. nett.

MUSK.—5 caddies Tonquin bought in at 40s. to 70s. per oz.; 1 case skins at 3s. 6d. per oz.

OPIUM.—4 cases Turkey failed to find a buyer, while 3 tins, containing about 60 lb. of ditto powder, were taken out at 10s. per lb.

ORANGE PEEL.—26 packages, thin cut, chiefly bought at 1s. per lb. 3 cases offered without reserve, selling at 2d. per lb. 8 bags thick cut, were taken out at 8d. per lb.

ORRIS ROOT.—28 bags Florentine taken out at 35s. for medium, and 55s. per cwt. for fair quality.

OTTO OF ROSES.—5 vases bought in at 13s. per oz.

PISTACHIO KERNELS.—6 cases were taken out at 2s. 3d. per lb.

QUINCE SEEDS.—3 bales fair bought in at 1s. 6d. per lb.

QUININE.—A somewhat "scratch" lot of sulphate, together with some salicylate, valerianate, muriate, and bisulphate, consisting of Brunswick, Lombarda, and Boehringer brands, partly in 100 oz. and partly in kilo, ½ kilo, and ¼ kilo tins, failed to find buyers, and were all bought in at 1s. 6d. per oz. for the sulphate, it being intimated that 1s. 4½d. per oz. was price required. Later on in the auctions 1 case of 10 × 100 oz. tins = 1,000 oz. sulphate, of Paris make (Pointet and Girard), guaranteed PB, in accordance with Dr. Paul's analysis, weight being also guaranteed, fetched 1s. 4d. per oz.

RHATANIA ROOT.—3 bales of fair quality bought in at 5d., 2 bales stained selling at 4½d. per lb. Other 74 bales all bought in at 4d. per lb.

RHUBARB.—96 cases part sold at 2s. 6d. per lb. for Shensi round, and 2s. 8d. to 2s. 11d. per lb. for flat ditto; flat Canton held for 1s. 1d. per lb.; round ditto for 1s. Demand was by no means active.

SARSAPARILLA.—38 bales good Jamaica sold at 1s. 7d. to 1s. 9d. per lb. 17 bales fair Lima bought in at 1s. to 1s. 3d. per lb. 14 bales Guayaquil realised 1s. 1d. per lb.

SCARMONY.—10 cases taken out at 20s. to 22s. per lb.

SCAMMONY ROOTS.—25 bales of fair quality bought in at 21s. per cwt.

SENEKA ROOT.—4 bales fair Western were taken out at 2s. 6d. per lb.

SENNA.—78 packages Alexandria, part consisting of good half leaf, part fair leaf; part fair stalky, part obovata, chiefly bought in at 3d. to 9d. per lb., 2 cases selling at 9d. 6 packages Alexandria pods had been sold previously at a price which did not transpire. 391 bales Tinnevely all sold at 4½d. per lb. down to 1¾d., according to quality.

STROPHANTHUS SEEDS.—4 bags fluffy Kombé seeds were bought in at 2s. 6d. per lb.

TAMARINDS.—14 barrels Barbadoes sold at 13s. per cwt.

TONQUIN BEANS.—4 cases inferior black beans were taken out at 1s. 3d. per lb. 10 casks Angastura at 3s. 6d.

TURMERIC.—101 bags Madras bought in at 40s. per cwt.

VANILLOES.—6 tins New Zealand sold, without reserve at 6s. 6d. to 6s. 9d. per lb. for 4½in. by 6in., 7s. for 3½in. by 6½in., and 7s. 9d. per lb. for 5in. by 6in.

WAX.—1 cask Mogador bought in at 95s. per cwt.; 20 cases Italian at £6 10s. per cwt., fair to good Jamaica sold at £7 to £7 2s. 6d.; Mozambique at £6 17s. 6d. 1 case Zanzibar bought in at £7 per cwt.

LIVERPOOL, THURSDAY, JANUARY 18, 1900.

A considerable amount of business has been done in oils recently and prices will be found to have altered largely since last report. The amount of attention bestowed upon Linseed and Canaryseed has not increased, and sales of spot lots have been very small. With the exception of an advance in the price of Ammonium Sulphate, chemicals generally are in the same position as last week.

AMMONIA SALTS.—Sulphate is in better demand at the high rate of £11 12s. 6d. to £11 13s. 9d. per ton.

CANARYSEED.—The inquiry for Turkish has only been moderate. 50 bags sold at 34s. per 464 lbs. About 60 bags good Spanish found purchasers at 45s. to 47s. 6d.

CARNAUBA WAX.—21 bags of grey made 45s. per cwt.

GUINEA GRAINS.—Small sales have been effected at £6 per cwt.

LINSEED.—The market is very firm at fancy prices. Calcutta is nominally at 50s. per 416 lbs for spot lots. North American at 47s. per 424 lbs., and River Plate 47s. About 50 bags of Turkish sold from store at 49s.

OILS (FIXED) AND SPIRITS.—Castor has improved in demand, and prices are very firm. Of Calcutta, 100 cases sold at 2½d. per lb., then 150 cases at 2¼d., and at the close 3d. was asked. French, 1st pressure, 5 tons sold at 2¼d., and 5 tons "to arrive" went for 2¼d.; 2nd pressure, Belgian is quoted at 2¼d. Olive is firm, with both inquiry and business limited. Spanish oil is quoted at £36 to £36 10s. per ton. Linseed is selling well at 24s. to 25s. per cwt. Cottonseed continues very firm, with a marked hardening tendency, the rate since last week having gone up to 23s. 9d. and 24s. 3d. per cwt. for Liverpool refined oil in export barrels. Spirits of Turpentine is firm, with fair inquiry, at 40s. per cwt.

POTASH SALTS.—Bichromate is in good demand at 4½d. to 5d. per lb. Pearlashes 33s. 6d. to 35s. per cwt. Potashes 26s. 9d. to 27s. per cwt. Prussiate 7¾d. per lb. Saltpetre 21s. per cwt.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Borax is quiet at 16s. per cwt. Caustic is still scarce, 76 to 77 per cent., at £10 2s. 6d. to £10 7s. 6d. per ton, 70 per cent., at £9 5s. per ton. Crystals, £3 5s. per ton. Nitrate is quietly steady at 7s. 7½d. to 8s. per cwt.

NEWS IN BRIEF.

MR. J. RUTHERFORD HILL will conduct an open meeting of the Edinburgh Chemists', Assistants', and Apprentices' Association at 36, York Place, on Wednesday, January 24, at 9.15 p.m.

MR. A. S. BUCK, M.P.S., President of the Liverpool Chemists' Association, will deliver the inaugural address at the annual meeting of the Association on Thursday next, at the Royal Institution, Liverpool.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.—On January 16 Mr. Hanson and a party of friends gave a musical evening in the County Restaurant. There was a fair attendance, and a very enjoyable time was spent.

MESSRS. LORIMER AND COMPANY notify that the conversion of their business into a limited company is done for convenience and family reasons, and that practically all the shares are held by Mr. Lorimer and Mr. Brocklesby, the partners of the old business.

MR. C. RIDLEY, President of the Newcastle-on-Tyne and District Chemists' Association, will preside at the third annual dinner of the Association, to be held at the Hotel Metropole, on Wednesday, January 24, at 7.45 p.m. Tickets 4s. each (exclusive of wine), may be obtained from F. Gilderdale, Hon. Sec., 19, Groat Market, Newcastle-on-Tyne. Application should be made not later than Monday, January 22.

MR. S. A. STURTON, M.P.S., 9, Goldhawk Road, W., in presenting his Bouquet Almanack for the year 1900 to his customers, has furnished them with a very dainty and extremely useful publication. In addition to a descriptive list of preparations supplied by Mr. Sturton, there is ruled space for memoranda, rules for a sick room, postal information, and, of course, a complete calendar for the year; all contained in thirty-two pages, 3½ in. × 2¼ in., and enclosed in a neat cover, printed in colours.

FREEMASONRY.—On Friday, January 12, at the Festival of St. John of the Sutherland Lodge of Unity, No. 460, held at the Castle Hotel, Newcastle, Staffordshire, Brother Edward Turner, chemist, who has been a member of the lodge for fifty years (having joined in December, 1849) was presented by the Brethren with a Master Mason's Jewel as a mark of esteem. Brother Turner suitably responded. At the same lodge, Brothers D. H. Oxen and C. J. Wain, chemists, were installed Senior Deacon and Senior Steward, respectively.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Magnificent Model Vertical Engine, tubular boiler, glass gauge, whistle, double-action slide-valve cylinder, bronzed stand, exhibition model, silver-plated, high speed and perfect; worth 42s., accept 12s. 6d. free; photograph, 1d.—Manager, Hassall's Chemical Works, Stratford, London.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Surplus Stock.—3 Martin's bandages, 7½ by 2½, 1s. 10d. each, 8 ditto, 5 by 2½, 1s. 6d. each; 1 ditto, 10½ by 3, 3s.; 2 ditto, 21 by 2½, 6s. each. 2 American ball-nozzle douches, 7/6 each; 8 celluloid stethoscopes, 2s. each; 3 wood stethoscopes, 1s. each; 6 probangs, 1s. 6d. each; 5 flannel pilches, 7d. each; 4 Terry's pilches, 9d. each; 14 plain pilches, 6d. each; 9 Zwank's pessaries, 1s. 4d. each; 4 doz. Hodge's vulcanite pessaries, 3s. doz.; 20 yards pink jacconette, slightly faded, 1s. 3d. per yard.—WOODRUFF, Chemist, Clifton Road, Heaton Moor, near Stockport.

WANTED.

Chemist and Druggist Diary, 1900.—Lowest price to W. J. M., 75, Elmsley Road, Lavender Hill, London, S.W.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Good Second-hand Chemical Balance, also Westphal Balance and other laboratory apparatus. Will exchange Natural History of Plants, by Kerner and Oliver (unbound), and The Dispensatory, latest editions, or will purchase or sell for cash.—KIRKPATRICK, Analyst, Taunton. Please send full particulars.

Calendar for the Week.

Sunday, Jan. 21. 3rd after Epiphany. Sun rises 7.56; sets 4.27.

Monday, Jan. 22. Sun rises 7.55; sets 4.29.
LONDON COLLEGE, 323, Clapham Road, S.W.—Dinner and Distribution of Prizes, Venetian Chamber, Holborn Restaurant, at 7 p.m.

Tuesday, Jan. 23. 11.53 a. Sun rises 7.54; sets 4.30.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor E. Ray Lankester, on "The Structure and Classification of Fishes." (Lecture II.)
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—Note on "Dr. Vogel's Method of Preparing Subhaloid Salts of Silver," by Major-General J. Waterhouse.
CHEMISTS' ASSISTANTS' UNION, Horseshoe Hotel, Tottenham Court Road, London, W., at 9 p.m.—General Meeting.

Wednesday, Jan. 24. Sun rises 7.53; sets 4.32.
EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, 36, York Place, at 9.15 p.m.—Open Meeting conducted by J. Rutherford Hill; notes on "What are the Statutory Functions of a Pharmacist?" and "Botany in January," by J. R. Hill; "Dispensing Notes," by D. B. Kidd.
NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION, Hotel Metropole, at 7.45 p.m.—Annual Dinner.
WESTERN CHEMISTS' ASSOCIATION, Westbourne Restaurant, Craven Road, Paddington, W., at 9 p.m.—Smoking Concert.

Thursday, Jan. 25. Sun rises 7.51; sets 4.34.
CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Impromptu Discussion.
MIDLAND PHARMACEUTICAL ASSOCIATION, Mason University College, Birmingham.—Paper by J. Spilsbury and T. G. Joyce, on "Balsam of Tolu."
LIVERPOOL CHEMISTS' ASSOCIATION, Royal Institution, at 7 p.m.—Annual Meeting: President's Inaugural Address.

Friday, Jan. 26. Sun rises 7.50; sets 4.36.
GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masnie Chambers, 100, West Regent Street, at 9.15 p.m.—"The Druggist as a Civil Servant," by J. P. Taylor.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—The Hon. Charles A. Parsons on "Motive Power—High-Speed Navigation—Steam Turbines."

Saturday, Jan. 27. Sun rises 7.49; sets 4.37.

Marriage.

Gill—Robathan.—On January 10, at St. James's, Ashted, Birmingham, by the Vicar, Herbert Edward Gill, M.P.S., eldest son of E. H. Gill, of Belbroughton, to Ada Beatrice, youngest daughter of J. W. Robathan, of Handsworth, Birmingham.

London Gazette Notices.

PARTNERSHIPS DISSOLVED.

James Thomas Haines Cory and Benjamin Dixon, Wholesale Perfumers, trading under the style of H. Sardou and Co., at 62, Golden Lane, and 3, Joiners' Hall Buildings, London.

Frederic Louis Perken, Edgar Theodore Perken, and Arthur Rayment, Manufacturers and Importers of Optical and Scientific Instruments, trading as Perken, Son, and Rayment, at 99, Hatton Garden, London, E.C. Debts will be received and paid by F. L. Perken and E. T. Perken, who will in future carry on the business under the style of Perken, Son, and Co. Arthur Rayment will in future carry on business on his own account, at a separate address.

RECEIVING ORDERS IN BANKRUPTCY.

Edward Henry Cole, Chemist and Druggist, late of 171, North Street, Leeds, now residing at 8, Carlisle Terrace, North Street, Leeds.

John and William Gorsuch, Photographer, 48, Junction Road, Upper Holloway, and 67, Highgate Hill, London.

James Walker McEwen, Mineral Water Manufacturer, Clifton Street, Aberdare, Glamorgan.

William Opie Piper, Surgeon, Denmark Place, Stockport Road, Ashton-under-Lyne, late of Albert Road, Colne.

Publications Received.

LESSONS ON PRESCRIPTIONS AND THE ART OF PRESCRIBING. By W. HANDSEL GRIFFITHS, Ph.D., L.R.C.P.E. New and revised edition, adapted to the British Pharmacopœia, 1898. Pp. x + 148, Price 3s. 6d. London: Macmillan and Co., Limited, 1899. From the Publishers.

PROCEEDINGS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, at the Forty-seventh Annual Meeting held at Put-in-Bay, O., September, 1899. Also the Constitution, By-Laws and Roll of Members. Pp. xxx. + 891. Price 5.50 dols. Baltimore: American Pharmaceutical Association, 1899. From the Secretary.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Arrowsmith, Bates, Brown, Burrell, Churchyard, Clarke, Cruickshank, Fairley, Ferrall, Gilderdale, Gill, Greaves, Hickman, Hill, Horsfield, Hyslop, Jackson, Leicester, Lennox, Marsden, Matthews, Merson, Mitchell, Osborne, Oxen, Parry, Prebble, Prescott, Price, Radcliffe, Sturton, Treacher, Turver, Vogel, Wallis, Whineray, Wolff

NEWS IN BRIEF.

THE DUKE OF TECK's death creates a vacancy in the Presidency of the Royal Botanic Society.

MESSRS. BRYANT AND MAY are about to abolish entirely the use of ordinary white phosphorus in the manufacture of matches.

SIGNOR G. MARCONI will deliver a lecture at the Royal Institution, Albemarle Street, W., on Friday, February 2, on "Wireless Telegraphy."

MESSRS. MIDDLETON and Co., Middlesbrough, have again been entrusted with the contract for the supply of drugs to the North Ormesby Cottage Hospital.

MR. C. B. CLARKE, M.A., F.R.S., will read a paper at a meeting of the Linnean Society of London, on Thursday, February 1, on "Botanic Nomenclature."

SIR MICHAEL FOSTER has consented to stand as a candidate for the seat in Parliament held by Sir John Lubbock as representative of the University of London.

MESSRS. I. AND M. COHEN, of 53, Houndsditch, have presented the Imperial Yeomanry Hospital with a case containing about a thousand sponges for medical and surgical use.

DR. W. S. SQUIRE, F.I.C., F.C.S., will read a paper before the Society of Chemical Industry, on Monday, February 5, on "Recent Objections Urged Against the Adoption of the Metric System."

MR. J. O. MOULSON, M.P.S., is to open a debate at a meeting of the Bradford and District Chemists' Association, on Tuesday, January 30, on "Proprietary Articles; How far is Substitution Justifiable?"

MESSRS. E. SACHSSE AND Co., manufacturers of essential oils, of Leipzig and Liesing, near Vienna, notify that Herr Cust Conrad Friedrich Wilhelm Ritzhaupt is retiring from the firm, with which he has been connected for nearly thirty years.

WILLIAM ALLEN, the first President of the Pharmaceutical Society, is the subject of a long biographical article contributed by Mr. William Weare, Sub-Librarian of the Whitechapel Library, to the *East London Advertiser*, as the first of a series on "East-end Men of Mark."

THE JUNIOR PHARMACY BALL will be held at the Portman Rooms, Baker Street, W., on Wednesday, February 7, and tickets (7s. 6d. each, including supper and light refreshments during the evening) may be obtained of the Hon. Secretary, Mr. Ralph L. Cassie, 49, Newgate Street, E.C.

HOMOCEA, LIMITED, announce that the company is now under an entirely new board of directors and management, and that in future the only address will be 98, Strand, London, W.C. All the Homocea preparations are on the P.A.T.A. list. Retailers will be supplied gratis with advertising matter on application to the office.

MR. G. LORIMER, junior traveller to Messrs. Lorimer and Co., Limited, Britannia Row, Islington, who is about to sail for South Africa with the battery of the Honourable Artillery Company, has been accorded a hearty "send-off" by the town travellers and "heads of departments" at a dinner given in his honour at "The Trocadero," the company afterwards adjourning to the Palace Theatre.

MR. A. W. HANKINSON, M.P.S., Grange-over-Sands and Carnforth, has transferred the Carnforth branch of his business to Mr. J. P. Porteus, M.P.S., who has acted as manager at Carnforth for several years. Considerable alterations have been completed in Mr. Hankinson's pharmacy at Grange-over-Sands. The shop has been carried back to the extent of 30 feet, and is now a decidedly handsome and well-equipped pharmacy.

MR. BENSON HARRIES, M.P.S., of Newport (Mon.), has removed from 83, Commercial Road, to new premises next door, No. 84, built specially to his own design, all the ground floor, arranged in a most convenient manner, being used for shop purposes. Mr.

Harris has also taken over the business known as "The B.S.S. Co.," 32, Commercial Road, and intends to run it as a branch. One establishment will be devoted more particularly to pharmacy, and the other carried on as a drug store in the broad sense.

MESSRS. CRESSWELL BROTHERS AND SCHMITZ have purchased the goodwill, stock, and book-debts of Mr. A. Louis, sponge merchant, 65, Aldersgate Street, E.C., and have transferred the same to their establishments in Red Lion Square, Holborn. Messrs. Cresswell Brothers and Schmitz also announce that in consequence of the rapid growth of their Paris branch, they have taken a large and roomy warehouse adjoining their own at 175, Rue du Temple. This branch is managed by Mr. George Cresswell, a relative of the Messrs. Cresswell, of London.

THE SCHOOL OF PHARMACY ANNUAL DINNER will take place on Wednesday, February 21, at the Holborn Restaurant, in the Caledonian Salon. It is hoped that all past students and all interested in the work of the School of Pharmacy will endeavour to be present, in order to make it, as usual, a thoroughly representative gathering. Full particulars will be published in due course. All inquiries or application for tickets (price five shillings each), should be addressed to Mr. Edgar M. Chapman or Mr. John Lawson, Hon. Secs. of the Dinner Committee.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, JANUARY 24, 1900.

Prices generally are unchanged since last week, with the exception of those Castor Oils which are advancing. General sales include Beeswax at full rates, small parcels of Californian Honey at recent high figures, and a parcel of Scammony Root. Higher prices rule for Caustic Soda (which is 10s. a ton dearer) and Chlorate of Potash, whilst both Bicarbonate of Potash and Borax are firmer.

AMMONIA SALTS.—Carbonate, 3½d. per lb. Sal Ammoniac is firm at 38s. to 40s. per cwt. Sulphate is in slightly less demand at £11 12s. 6d. to £11 15s. per ton.

BEESWAX.—44 packages of Gambia made £6 17s. 6d. per cwt. and small lots of Sierra Leone went for £6 7s. 6d.

COPPERAS.—Continues firm at 39s. per ton for Lancashire and 37s. for Welsh.

COPPER SULPHATE.—Is quiet at £24s. 7s. 6d. per ton.

GUM.—A moderate inquiry exists for Arabic sorts; small lots of Niger have sold for 42s. 6d. per cwt.

HONEY.—Sales of fine Californian are reported at 46s. per cwt.

OILS (FIXED) AND SPIRITS.—Castor Oils are in good demand, firm in tone, and advanced rates are being paid. Calcutta has risen to 3½d. per lb., and business has been done at 3d. and 3½d.; of French, 1st pressure, 10 tons sold at 2½d. per lb., 35 tons at 3d., and latterly 3½d. has been asked. Belgian, 2nd pressure, has been selling at 2½d., but holders want 2½d. French, 2nd. Sulphur is quoted at 2½d. per lb. Olive maintains its high price, and a little business has been done in Spanish at £36 to £36 10s. per tun. Linseed is firm at 24s. to 25s. per cwt. Cottonseed, after a momentary decline of a fraction, has recovered, and is now at 23s. 9d. to 24s. per cwt. again. Spirits of Turpentine are steady at the higher rate of 40s. per cwt., with a fair inquiry.

POTASH SALTS.—Bichromate is scarce at 4½d. to 5d. per lb. Chlorate 3½d. to 3¾d. per lb. Cream of Tartar is quiet but firm at 74s. to 80s. per cwt. Pearlashes are dull of sale at 33s. 6d. to 35s. per cwt. Potashes are nominal at 26s. 9d. to 27s. per cwt. Prussiate is firmer 7¾d. per lb.

SCAMMONY ROOT.—16 bags sold ex-quay at 21s. per cwt.

SEEDS.—Canary seed is selling fairly well. 250 to 325 bags of Turkish made 33s. 6d. to 34s. per 464 lbs., and 55 bags of Spanish sold at 45s.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer at 16s. per cwt. Caustic soda is dear and scarce, 76 to 77 per cent. at £10 2s. 6d. per ton, 70 per cent. at £9 15s. Crystals, £3 5s. per ton. Nitrate is in quiet demand at 7s. 10½d to 8s. 1½d. per cwt.

LONDON, THURSDAY, JANUARY 25, 1900.

Business in Drugs and Chemicals without being very active has, nevertheless, been fairly brisk during past few days, and it is hoped that the news received from South Africa this morning, combined with cheaper money (Bank rate having to-day been reduced to 4 per cent.), may lead to the commencement of an era of renewed prosperity in the trade of the country. The changes in value during the week have not been numerous, but prices remain very steady all round. Bicarbonate of Potash is dearer, as also is Sulphonal, the advance in price of this latter article having taken many people by surprise. Otherwise, prices are chiefly unchanged, the following being particulars of those ruling for some articles of principal interest:—

ACETANILIDE.—There is again a rumour that an advance of price is impending in this article. Meanwhile price remains nominally unchanged at 9½d. to 1s. per lb., according to make, quantity, etc.

ACID BORACIC.—Steady at 25s. 6d. per cwt. for crystals, and 27s. 6d. for powder.

ACID CARBOLIC.—Continues in very good demand for home consumption, the export abroad remaining prohibited, although it has been intimated by the authorities that certain reasonable exceptions and concessions will be made in case of *bonâ-fide* exporters for medicinal or sanitary purposes, according to who the exporter may happen to be, quantity, mode of packing, and eventual destination. Information to this effect only became definitely known this afternoon, and will probably have the effect of again stiffening the market. Meanwhile prices remain nominally unchanged at 10¾d. to 11d., according to quantity, brand, etc., for 35/36° C. ice crystal in large bulk packing, 1s. per lb. for 39/40° C. ice crystal, and 1s. 1d. per lb. for the B.P. quality, 39/40° C., in detached crystals; Crude, 60° F., 2s. 3d. per gallon; 75° F., 3s. per gallon; liquid, 95-98 per cent. of pale straw colour, 1s. 8d. per gallon; ditto dark, 25-30 per cent., 10d. to 1s. per gallon.

ACID CITRIC.—Market is gradually hardening. Makers now quote 1s. 3d. per lb. for crystals, in 5 cwt. casks, and are by no means too willing sellers at the price, except for prompt delivery, a further advance in price being considered to be a certainty.

ACID OXALIC.—Steady at 3d. to 3¼d. per lb. nett, free delivered in London.

ACID TARTARIC.—English spot is quoted 1s. 0½d. to 1s. 0¾d. per lb., and foreign, 11¾d. to 1s. per lb. c.i.f.

AMMONIA COMPOUNDS.—Bromide 2s. 2d. per lb., Carbonate 5½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate steady; grey 24 per cent., London prompt, £11 15s.; Hull, prompt, £11 12s. 6d.; I cith, prompt, £11 15s.; Beckton, prompt, £11 16s. 3d.; Beckton, terms prompt, £11 12s. 6d. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus £39 to £40 per ton. Crude Japan (black sulphide), £22 10s. to £23 per ton.

ARSENIC.—Is steady at firm prices.

ASHES.—Pots, 28s. 6d.; Pearls, 34s.

ATROPINE.—Makers remain very firm at 15s. 6d. per oz. for the sulphate B.P., and 17s. 10d. per oz. for the pure alkaloid.

BISMUTH SALTS are unchanged at 5s. 1d. per lb. for the subnitrate and 5s. 8d. per lb. for the subcarbonate; price of the metal is also without change, at 5s. per lb. for the commercial quality.

BORAX.—Unchanged, at 16s. 6d. per cwt. for crystals, and 17s. 6d. per cwt. for powder.

BROMIDES.—Very firm at 1s. 10½d. per lb. for Potassii Bromid, 2s. 1½d. per lb. for Sodii Bromid, and 2s. 2d. per lb. for Ammon. Bromid. Bromine is also unchanged at 2s. to 2s. 2d. per lb., according to quantity, in cases of 60 lbs. each.

CAMPHOR.—Refined is firm, English makers' price being unchanged at 2s. 1d. per lb. for Bells and Flowers. Crude dearer, 16s. 6d. per cwt. c.i.f. being stated to have been paid for China, while 16s. per cwt. c.i.f. is asked for Japan.

CASTOR OIL.—Firm. Belgian first pressing spot, £28 10s.; January-June, £28, f.o.b. Antwerp; second pressing spot, £27 per ton, ex wharf. Hull manufactured, guaranteed cold drawn pure pharmaceutical, £30 5s. per ton in barrels, 3½d. per lb. in cases. Pure firsts, £27 15s.; seconds, £26 15s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3½d., ex wharf London.

CLOVES.—At auction, 170 bales Zanzibar sold at firm prices, good bright fetching 3¾d., and dull stalky 3½d. 14 cases of picked Penang, dull, to good bright, were bought in at 6½d. to 9d. Privately, Zanzibar is in good demand, and large sales have been done at firm rates, comprising spot, 3¾d.; January-March delivery at 3 21-32d. to 3 1½d., March-May at 3 1½d., and January-August 3 25-32d. to 3 1¾d.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 90 per cent., 1s. 2d. per gallon; pure, 2s. Benzole, flat, 50 per cent., prompt, 10d. per gallon; 90 per cent., prompt, 8d. Creosote, 3d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d.; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene A, 3¾d. per unit; B, 2¾d. Pitch, 35s. per ton, f.o.b. Tar, refined and/or crude, 12s. 6d. per barrel, 2¼d. per gallon.

COCAINE.—Remains steady at the late reduction, makers' price of the Hydrochlorate being 18s. 3d. per oz. for smaller lots, 18s. per oz. for 100-oz. lots in 25-oz. tins, and 17s. 9d. per oz. for 200-oz. lots. The pure alkaloid is quoted 2s. 9d. per oz. higher than the above-named salt.

CODEINE.—Very firm, at 13s. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the Muriate Phosphate and Sulphate Salts.

COD LIVER OIL.—Market remains quiet at 75s. to 80s. per barrel, according to brand, for best non-congealing Norwegian oil in tin-lined barrels of 25 gallons each.

CREAM OF TARTAR.—Steady but unchanged at 73s. per cwt. for first white crystals on the spot, 75s. for powder, and 76s. per cwt. for ditto 95 per cent.

ERGOT OF RYE.—Remains extremely scarce, and very high prices up to 3s. 3d. per lb. are asked for good and sound.

ESERINE (PHYSOSTIGMINE).—Maker's prices are very firm at 2s. 6d. per gramme for sulphate and salicylate. The continued scarceness and advancing value of the raw material (Calabar Beans) would point to the possibility of a further advance in price of this preparation, present quotations being still low, as compared with prices ruling not so very long ago.

GINGER.—At auction the moderate supply of Cochin was firmly held, and only a small part sold at full rates. Of 110 cases and 384 bags offered, 85 packages sold. Fair small, but plump cut and scraped, at 40s.; small and tips ditto, 34s.; native cut, small and medium, at 35s., with one lot at 34s. 6d.; small ditto, at 32s.; Calicut rough, in cases, good bold, some medium bright, at 40s. Privately, not much doing; some sales of Cochin resulting in prices again being dearer.

GLYCERIN.—Market is fairly steady at nominally unchanged prices, both for the crude and also for the refined article.

IODIDES.—Fairly steady, at 10s. 6d. per lb. for Potassii Iodid, 11s. 10d. per lb. for Sodii Iodid, 13s. 10d. per lb. for Ammon Iodid, 13s. 10d. per lb. for Iodoform cryst powder and precipitated, 12s. per lb. for Iodine resublimed, and 7½d. per oz. for crude Iodine.

MENTHOL.—Steady, at 10s. 3d. to 10s. 9d., according to quantity and brand, for good dry white crystals.

MERCURIALS.—Are firm but unchanged at 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive Sublimate.

MORPHINE.—Makers are very firm at 5s. to 5s. 3d. per oz., according to quantity, for the Hydrochlorate Powder.

OILS (FIXED) AND SPIRITS.—Linseed is steadier. On the spot pipes, London, £23 10s. to £23 15s.; barrels, £23 15s.; Hull, spot naked, £22 10s. Rape steady. Ordinary brown on the spot quoted £25 10s.; refined spot, £26 15s.; Ravison naked spot, £23 10s. Cotton quiet. London crude spot, £21 to £21 5s.; refined spot, £23 to £24, according to make; Hull naked refined spot, £21 2s. 6d.; crude spot, £19 17s. 6d. Olive: Mogador, £34 10s.; Spanish, £36; Levant, £34 10s. Coconut Oil: Ceylon on the spot, £26; Cochin spot, £29 5s. Palm nearly 10s. dearer. Lagos on the spot quoted £27. Lubricating Oil: Pale American spot, 8s. to 9s. 6d.; black, 7s. to 9s.; Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum Oil steady and quiet. Russian spot quoted 6 7/8d. to 6¼d.; American spot, 7¼d. to 7½d.; water white, 8¾d. to 8½d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine firm and advancing. American spot, 39s.

OPIUM.—Steady, with but little doing, prices of all kinds being nominally without change.

PARAFFIN WAX.—Crude is still quoted 2¾d. to 3d. per lb., and refined 3¼d. to 4d.

PHENACETIN.—It is rumoured that the peculiar position of the raw material may lead to a change in an upward direction in price

of this article. Price for best brands remains, however, so far unchanged at 3s. 6d. per lb. for both Powder and Crystals in 5-cwt. lots.

PITCH.—18s. 6d.

POTASH COMPOUNDS.—Bicarbonate, 36s. to 39s. per cwt. Bichromate, 4½d. to 4¾d. per lb. Bromide, 1s. 10½d. Chlorate spot London crystals, 3½d.; powder, 3¾d. Iodide, 10s. 6d. per lb. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English make, 7¾d.; Beckton, 7d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER.—Firm at £9 12s. 6d. from the importer and 6d. per bottle less from second-hand.

QUININE.—Makers still decline to book larger orders, price of the favourite German brands of sulphate—viz., B&S and Brunswick, being nominally 1s. 5d. per oz. for 1,000-oz. lots in 100-oz. tins, while in the speculative market there are buyers of these brands at 1s. 4¾d. per oz. for spot, 1s. 5d. per oz. for March, and 1s. 5¼d. per oz. for May delivery. Should the Bark shipments from Java for second half of January again prove small, or even moderate, we shall no doubt see an excited market, with further advancing prices.

ROSIN.—Strained, spot 5s. per cwt., ex-wharf, and 4s. 9d. per cwt. for March-May shipment per sailing vessel.

SALICINE.—Continues very firm at the advanced price of 15s. 6d. per lb, anything offering from second hand at even a trifle below makers' prices being eagerly snapped up. It is stated that makers are short of the article and that they can deliver only limited quantities promptly.

SALICYLATES.—Remain nominally unchanged in price. Makers, however, refuse to book further orders, while some of their agents appear to be unable to deliver promptly against existing contracts, and everything appears to point to the practical certainty of higher prices ruling in the near future.

SALOL.—Is in same position as are salicylates, and what has been written above with reference to these latter applies more or less also to salol.

SANTONINE.—Makers' price is still 11s. 3d. to 11s. 6d. per lb., according to quantity.

SHELLAC.—The market remains quiet, and privately only moderate sales have been effected at previous rates, including TN Orange on a basis of 62s. for fair. Futures continue dull and inactive, with sellers January-March shipment at 61s. c. f. and i., and March delivery at 63s. 6d. At auction to-day the fair supplies, part of which were offered without reserve, attracted a good attendance of buyers, and with fair competition for TN qualities, the larger proportion sold. At the opening prices were irregular and easier, but closed steady at about previous sales' rates. Fine Second Orange partly sold at steady prices. No Garnet was offered. Button went off slowly at about late rates. A total of 1,008 cases offered and 485 cases sold. Fine Second Orange: Of 134 cases 35 sold, fine lemony DJ in diamond at 75s., BO in diamond reddish of the mark bought in at 72s., BJ in diamond, fine bright but cakey to blocky, sold at 66s. TN Orange: 675 cases offered and 437 cases sold, partly without reserve, fair bright free at 61s. to 62s., ordinary to middling reddish part cakey at 60s. to 61s. Button: Of 199 cases 11 sold, good pale slightly cakey at 73s., ordinary blocky thirds at 56s., low dark broken at 43s.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 4¼d per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1½d. Caustic, 70 per cent., white, £10 10s.; 60 per cent., £1 less. Hyposulphate (Antichlor) 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate, quiet on spot; refined, £8; ordinary, £7 15s.

SPICES (VARIOUS).—Black Pepper was barely represented in auction. Only 35 bags Singapore were offered and bought in at 6d., and 80 bags Tellicherry fair at 6¼d. White Pepper: Only a small quantity was offered in auction, 90 bags Singapore being bought in, good fair at 9½d. Pepper Dust: 32 bags Penang offered, and 28 bags sold, fair shelly, at 2¾d. Capsicums quiet but steady. Of 66 bales Bombay 16 bales country damaged sold; the remainder, fair, bright red, long, stalky, bought in at 36s. Pimento in fair supply met a good demand; of 838 bags offered about 600 bags sold at steady rates, good at 3½d. to 3¾d. Cinnamon Chips and Bark: Of 493 packages chiefly wild only 97 sold, fair quillings at 6½d., cuttings at 2d. to 2¼d., chips and bark at 2d. Nutmegs were poorly represented in auction, and only partly sold at about previous rates. Of 12 cases Penang 8 sold, including 110's, without reserve, at 11d. to 1s.; 65's bought in at 2s. 4d. 10 cases Singapore bought in, 30's at 1s. 7d., and 8 cases wormy Bombay at 5d. West Indian: 6

cases 90 barrels, etc., offered and sold at easy rates, 58's at 2s. 4d., 64's to 68's at 2s., 69's at 1s. 8d., 81's slightly mouldy at 1s. 3d., 87's and 88's at 1s. 2d., 94's at 1s., 102's at 1s. 1d., 110's to 114's at 10d. to 10½d., 131's at 7½d., defective from 3¾d. to 6½d. Mace in slow demand; 33 cases Penang in auction were mostly bought in at 1s. 5d. to 1s. 7d., one case sold, fair red, at 1s. 5½d. West Indian: 22 cases sold, good bold pale, at 1s. 8d. to 1s. 9d., ordinary to fair red at 1s. 5d. to 1s. 7d., broken at 1s. 4d.

SULPHATE OF COPPER.—Quiet at £23 10s. to £24 10s. per ton, on the spot, according to quantity and brand.

SULPHONAL.—It has come rather as a surprise all round that makers, after having brought the outside sellers of the article into line, have advanced the price of the article 3s. 6d. per lb., nearly everyone having rather anticipated a reduction in price. Makers now quote both powder and crystals 20s. 6d. per lb., with a reduction of 6d. per lb. for 10 lb. lots in bulk and a certain further reduction for 4 cwt. contracts. From second-hand there appears to be but little offering below makers' figures.

TAR.—Stockholm, 25s. to 25s. 6d.; Archangel, 18s. to 18s. 6d.

THYMOL.—Firm, at 10s. 6d. to 11s. per lb. for good white crystals.

TUMERIC.—At auction 26 bags offered and bought in. Cochin finger, ordinary to fair rather rough at 30s. Privately business continues on a small scale. Bengal firm at 32s. for the small quantity offering. Madras quiet at 36s. to 40s. for fair to good bright finger. Cochin split bulbs 12s.

URANIUM.—Owing, it is stated, to scarcity of the ore, prices of uranium salts have been advanced very considerably; in fact, to just double the figures previously ruling, acetate being now quoted 25s. per lb. and nitrate 16s. to 18s. per lb., according to degree of purity.

TRADE NOTES.

THE "EVER-READY" SURGICAL AND DENTAL LAMP.—Messrs. Allen and Hanburys, Limited, 48, Wigmore Street, London, W., have recently introduced a very neat and compact electric lamp for surgical and dental work. For handiness and portability it will be hard to beat. It is easily replenished, and in operative work gives a direct and brilliant illumination. Held in the closed mouth in a dark room, it shows foreign bodies, if existing in the framework of the face, almost as easily as by means of X-rays. It may be used efficiently in eye, nose, and throat cases, for gynecologic practice or in rectal examinations. The lamp is fixed at the end of a rubber tube in silver, and is run by a dry battery, which slides out of bottom of case, and can be replaced by a new one in a few seconds. The cost of maintenance is 2s. for about 500 brief examinations. The price of the apparatus, complete, with short tube, 3½ volt lamp, battery and connections in box of polished hard wood 4½ by 3½ by 3 inches, is 25s.; with long tube, box 7½ by 4 by 3½, with 5½ volt lamp, etc., 35s.

BLAUD PILL LENTIFORMS.—Messrs. F. Newbery and Sons, 27 and 28, Charterhouse Square, and 44, Charterhouse Street, London, E.C., submit samples of sugar-coated iron tonic tablets (Blaud), prepared by Messrs. Wm. R. Warner and Co., of New York. The tablets afford an agreeable form for the administration of iron, and are of excellent finish, being well coated. They are put up in screw-capped bottles, which are sold at a nominal retail price of 6d.

EFFERVESCENT KISSINGEN AND VICHY TABLETS.—Messrs. Newbery and Sons submit specimens of effervescent Kissingen and Vichy tablets, prepared by Messrs. Warner and Co., and put up in screw-capped bottles packed in a neat cardboard box, containing a bottle of each variety, to be sold at 2s. per box. These tablets are intended for use in the treatment of obesity, and afford a convenient and economical method of administering Kissingen and Vichy, while they possess an advantage over the natural water in the fact that each dose is accurate. The salts are also put up in the granular effervescent form.

BRITISH EMPIRE BOUQUET PERFUME.—Messrs. Ayrton and Saunders, Liverpool; submit a sample of their "British Empire Bouquet" Perfume, which at the present time ought to be an attraction. The perfume is put up at 9s., 12s., 18s., 21s., 24s., 30s., 48s., and 60s. per dozen. With each bottle a copy of Mr. Rudyard Kipling's poem, "The Absent-minded Beggar," is presented. The label is very effective, and the perfume is excellent.

Calendar for the Week.

Sunday, Jan. 28. 4th after Epiphany. Sun rises 7.47; sets 4.39.

Monday, Jan. 29. Sun rises 7.46; sets 4.41.

Tuesday, Jan. 30. Sun rises 7.45; sets 4.43

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION, County Restaurant, at 9 p.m.—Debate. "Proprietary Articles. How far is Substitution Justifiable?" Introduced by J. O. Moulson.

CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by W. J. Sell and F. W. Dootson; S. Ruhemann and H. E. Stapleton; W. J. Pope and S. J. Peachey; and M. O. Forster.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor E. Ray Lankester on "The Structure and Classification of Fishes." (Lecture III.)

Wednesday, Jan. 31. • 1.23M. Sun rises 7.43; sets 4.44.

PUBLIC AND POOR LAW DISPENSERS' ASSOCIATION, St. Bride's Institute Ludgate Circus, E.C., at 8 p.m.—Short Papers and Dispensing Notes by the Chairman, F. Noad Clark, and other members.

ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—Exhibition of a selection of J. Craig Annan's work.

Thursday, Feb. 1. Sun rises 7.41; sets 4.46.

CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Paper on "Aquatic Plants," by T. E. Wallis.

LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers by C. B. Clarke, and Prof. E. Ray Lankester.

Friday, Feb. 2. Sun rises 7.40; sets 4.48.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, West Regent Street, at 9.15 p.m.—"The Medicinal Plants of the Clydesdale Flora," by W. Bowie.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Signor G. Marconi on "Wireless Telegraphy."

Saturday, Feb. 3. Sun rises 7.38; sets 4.50.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Camera, Half-plate, very compact, 3 slides, four-fold tripod, good R.-R. lens, excellent condition, £3; without lens, £2; or exchange good lantern.—Speedie, Crieff, Perthshire.

Overstocked.—1 lb. Potass. Iodid., 9/6; 4 lb. 36/-. 1 lb. Iodof. Xtal., 12/-. 1 lb. Bism. Carb. and Subnit., 5/3; 4 lb. £1. 1 oz. Cocain Hyd., 18/-. 3oz. ditto, 51/-. 1 oz. Morph. Mur. and Acet., 5/-. Frog, 5/-; 3 Doz., 4/9. Offers wanted for 3 Gross, carr. forward.—Eastman, Forest Lane, Stratford.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Balances.—Advertiser wishes to purchase 4 or 6 Balances, secondhand; good condition. Give maker's name and price.—Chemist, "Pharm. Journal" Office, 5, Serle St., London, W.C.

"SANITAS" EMBROICATION

In Bottles to Retail at 8d., 1s., and 2s. 6d.

"SANITAS"

AND OTHER

DISINFECTANTS

SULPHUR FUMIGATING CANDLES (Kingzett's Patents), 6d., 9d., and 1s. each.

PRESERVED PEROXIDE OF HYDROGEN (Kingzett's Patent).

MOTH PAPER, BLOCKS AND CRYSTALS.

WEED DESTROYER, &c., &c.

THE "SANITAS" CO., Ltd., BETHNAL GREEN, LONDON,

AND 636—642, W. 55 STREET, NEW YORK.

MINIMS, DRACHMS AND FLUID OUNCES TO MILLILITRES, AND PINTS TO LITRES.

	Minims to Ml.	Drachms to Ml.	Ounces to Ml.	Pints to Litres.
1	0.05916	3.552	28.412	0.568
2	0.11832	7.103	56.825	1.136
3	0.17748	10.655	85.237	1.705
4	0.23664	14.205	113.649	2.273
5	0.29580	17.758	142.065	2.841
6	0.35496	21.309	170.474	3.409
7	0.41412	24.860	198.886	3.977
8	0.47328	28.412	227.298	4.545
9	0.53244	31.964	255.711	5.111

EXPLANATION OF TABLE.—The first column represents the number of minims, drachms, fluid ounces, or pints. Thus: 4 minims = 0.23664 Ml.; 4 drachms = 14.206 Ml.; 4 fl. oz. = 113.649 Ml.; 4 pts. = 2.273 Litres.

London Gazette Notices.

PARTNERSHIPS DISSOLVED.

Henry Llewellyn Williams and John Law Adam, General Medical Practitioners, 15, Kensington Square, and 16, Vicarage Gate, Kensington. The business will in future be carried on by H. Llewellyn Williams, at 15, Kensington Square.

Walter Frederick Enness, Chemist and Druggist, and Thomas Elders, carrying on business as Chemists, under the style of Bell and Co., at 9, Bank Buildings, Wandsworth, Surrey. Debts will be received and paid by W. F. Enness.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Allenby, Bailey, Baker, Bartlett, Bell, Bostock, Buckle, Cassie, Chambers, Dompe, Doward, Ellington, Elliot, Fischesser, Gair, Gifford, Giles, Gilmour, Harries, Hill, Hoit, Jones, Kohn, Ling, McNeill, Maunder, Pilcher, Taylor, Yates.

NEWS IN BRIEF.

A QUALIFIED LADY ASSISTANT has taken up an appointment with Mr. Eric Lemmon, pharmaceutical chemist, of High Street, Exeter

BRITISH PHARMACEUTICAL CONFERENCE.—A meeting of the Executive Committee will be held at 16, Bloomsbury Square, W.C., on Wednesday, February 7, at 4.30 p.m.

PROFESSOR J. REYNOLDS GREEN, Sc.D., F.R.S., is to deliver the Friday evening lecture at the Royal Institution on February 9, at nine o'clock. His subject will be "Symbiosis and Symbiotic Fermentation."

THE VICTOR MEYER MEMORIAL LECTURE will be delivered by the President of the Chemical Society (Professor T. E. Thorpe, F.R.S.) at a meeting of the Society at Burlington House, Piccadilly, W., on Thursday, February 8.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' ASSOCIATION.—At the weekly meeting on January 26, Mr. J. P. Taylor read a paper on "The Druggist as a Civil Servant." An animated discussion ensued, chiefly of an adverse character.

MR. W. P. BRAWN, chemist and druggist (late assistant with Messrs. Southall Brothers and Barclay), left England on Tuesday last for South Africa, as Lance-Corporal in the Warwickshire Battalion of Imperial Yeomanry.

ALDERMAN BENJAMIN ROBINSON, Pharmaceutical Chemist, of Pendleton, at a meeting of the Justices held on January 26, was unanimously elected Chairman of the Visiting Committee of Her Majesty's Prison, Manchester.

"SHAKESPEARE AT HOME" is the title of a lecture to be delivered at a meeting of the Royal Photographic Society, 66, Russell Square, W.C., on Tuesday, February 6, at eight p.m., by Mrs. Catharine Weed Ward. The lecture will be illustrated by slides from her own photographs.

THE NEW TRIAL in connection with the case of alleged poisoning by atropine (see *P. J.*, last volume, pp. 430b, 562b) will not take place, as the plaintiff has withdrawn the action and agreed that the £5 paid into Court by Mr. Spanton should be returned to defendant.

MR. C. G. MOOR, Exeter City Analyst, is to deliver a lecture on "Bacteriology," illustrated by lantern slides and cultures, under the auspices of the Plymouth, Devonport, Stonehouse, and District Chemists' Association, on Wednesday, February 7, at the Foresters' Hall, The Octagon, Union Street, Plymouth. Chair to be taken by the President at eight o'clock.

WEST OF SCOTLAND COLLEGE OF PHARMACY.—On Wednesday, January 31, the students, accompanied by Mr. T. S. Barrie, Principal, visited the mills and laboratories of the Glasgow Apothecaries' Company. Mr. Bowie met the party and conducted them over the premises and aroused the enthusiasm of all by his lucid and humorous remarks on the various operations going on.

THE "APOTHEKER ZEITUNG" at the end of a long account of the agitation relating to company trading in this country, speaking of the President's letter to the President of the Board of Trade, says that, while not interfering with the formation of companies, it unquestionably lays down the principle which cannot be disregarded without destruction to pharmacy.

BURNLEY AND DISTRICT CHEMISTS' ASSOCIATION.—At a meeting of this Association, held on Tuesday, January 30, it was decided to hold a dinner shortly. Mr. Coates read an interesting paper

entitled "Test your Drugs," in which he pointed out that the greatest mistake chemists could make was to endeavour to supply articles as cheaply as possible without consideration as to quality.

MESSRS. WRIGHT, LAYMAN AND UMNEY, Southwark Street, S.E., have recently bought at public auction a considerable quantity of gum sagapenum, a drug that was at one time plentiful, but latterly has been exceedingly scarce. They will be pleased to present a sample of one or two lbs. to any local association which would like to have a specimen of the drug and will apply to the firm.

MR. J. YOUNG, chemist and druggist, Torquay, has obtained over £30 as a "tobacco fund" for the Devon Regiment, now on active service in South Africa, by means of a tambourine placed in his shop window. He has already sent out 500 lbs of tobacco, 5,000 cigarettes, and about six boxes of clothing, etc. Mrs. Young also sent, as a Christmas present for the regiment, a case of plum puddings (about 200 lbs.), and has received a letter from the captain and adjutant to say how much the gift was appreciated.

A "DAISY" POWDER administered to Ethel Jones, aged six years and ten months, was held by a medical witness who gave evidence at an inquest held by the Liverpool City Coroner on January 25, to have caused her death. The whole of the powder had been given instead of half, as directed on the label. A verdict of "Death by misadventure" was returned by the jury, and on its recommendation the "Daisy" manager undertook that the directions on the label should be made more explicit.

AN AMATEUR PRESCRIPTION for "bichromide of potassium, $\frac{1}{4}$ oz. to be taken in water," was taken to a "chemist in Great Mersey Street," Liverpool, who is reported to have said there must be some mistake, but gave potassium bichromate, labelled "poison," in the usual manner. A dose of the poison was swallowed by Elizabeth Milton (21), a young married woman, as a remedy for neuralgia, and caused her death. At the inquest, held on January 24, a verdict of "Death by misadventure" was returned, the jury being of opinion that greater care should have been exercised by the chemist, who might have made further inquiries as to the purpose for which the drug was required.

FOOTBALL.—The match which was no doubt the turning point in the contest for the Inter-Pharmacy Cup was contested on Saturday last at Shepherd's Bush. The opposing teams representing the "Square" and the Metropolitan School of Pharmacy were no doubt the pick of the men from either school, and considering the result of their last meeting a close game was expected; in consequence there was a good representative gathering of past and present students of both schools. The ground, unfortunately, was in the worst possible condition, having been quite under water the previous day, and rain also fell during the progress of the game. The ball was started by the Metros. at a quarter to three, and it was quite evident from the start that the "Square" had come to win, for during the whole of the first half the ball was kept almost entirely in their opponents' quarter, and numerous were the shots put in by their forwards, with the result that at half-time three goals were placed to the credit of Messrs. Jones and Addison, two of the Square forwards. On changing over the Metros. made a great effort to retrieve their fortunes, but without avail, for the Square backs were equal to their task, and hardly a single shot was put in at the Square goal. On the whistle sounding, four more goals were found to have been added to the Square score, making a total of seven, thus winning with a handsome margin of seven goals to nil. Goals were scored by:—Jones, 3; Addison, 3; Warren, 1. Such a victory must surely place the Square as favourites in the running for the Cup, and since by this victory they are neck-and-neck with the Metros., granting that they can repeat their victories over the other schools, it seems highly probable that with such a combination as was put in the field on Saturday, the Square team should bring home the trophy. Previous to the match a photograph of the Square team was taken. The team was composed of:—Goal, Metcalfe; backs, Fox and Owen (capt.); half-backs, Gray, Spurge, Garsed; forwards, Addison, Godolphin, Jones, Buckingham, Warren.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, JANUARY 31, 1900.

AMMONIA SALTS.—Carbonate, $3\frac{1}{2}$ d. per lb. Sal ammoniac, 38s. to 40s. per cwt. Sulphate is firm at £11 15s. per cwt.

BLEACHING POWDER—Is firm at £6 12s. 6d. per ton.

CANARY SEED—Continues dull at 34s. per 464lbs. for Turkish.

CARNAUBA WAX.—Grey has been offered in some amount, and 30 bags of Ceara have sold for 47s. 6d. per cwt.

COPPERAS—Is firm at 37s. per ton for Welsh and 39s. for Lancashire.

COPPER SULPHATE—Exhibits a stronger feeling, and is slightly advanced in price, £24 5s. per ton.

GINGER.—18 bags of green African sold at auction for 17s. per cwt. ex quay.

HONEY.—40 cases of fine Californian made 46s. per cwt., and Chilean Pile 1 has sold for 24s. and 25s. per cwt.

LINSEED—Is very strong, and prices have advanced 6d. to 1s. per 416lbs. Calcutta is not offered, and River Plate is quoted at 45s. per 416lbs. on a 2 per cent. basis and 44s. on a 4 per cent. basis. Advices from Rosario inform us that as the bubonic plague exists there trouble may be experienced in getting shipments away. Some Turkish has sold, ex store, at 49s. per 416lbs., and a little Calcutta on passage early in the week was offering at 50s.

OILS (FIXED) AND SPIRITS.—Castor has become firmer, and both French and Calcutta are firmly held for $3\frac{1}{2}$ d. per lb. 12 tons of French first pressure sold for $3\frac{1}{6}$ d. per lb. early in the week, but $3\frac{1}{2}$ d. is the lowest asked at present. Olive continues to sell steadily and in fair amount at £36 to £36 10s. for Spanish per tun. Linseed is very firm at a slight advance—viz., 24s. 3d. to 25s. per cwt. Cotton Seed is steady and unchanged at 23s. 9d. to 24s. per cwt. for Liverpool refined in export packages. Spirits of Turpentine are selling moderately at the steady and improved rate of 40s. per cwt.

POTASH SALTS.—Bichromate is very scarce, $4\frac{3}{4}$ d. to 5d. per lb. Chlorate has again become dearer, $3\frac{1}{2}$ d. to $3\frac{3}{4}$ d. per lb. Cream of Tartar is quiet at 74s. to 80s. per cwt. Pearl Ashes are nominal at 33s. 6d. to 35s. per cwt. Pot Ashes have advanced to 27s. per cwt. Prussiate is dearer, $7\frac{3}{4}$ d. to 8d. per lb.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer at 16s. per cwt. Caustic, 76 per cent. to 77 per cent., £10 12s. 6d. per ton; 70 per cent., £9 15s. per ton. Crystals are firm at £3 5s. per ton. Nitrate is firmer and dearer at 8s. 6d. to 8s. 9d. per cwt.

SPERMACEIN.—12 bags of crude Chilian sold at 85s. 3d. per cwt., ex quay.

LONDON, THURSDAY, FEBRUARY 1, 1900.

Business has been somewhat quiet during the past week, but prices generally remain very firm, and in some cases with an upward tendency. The chief events of the week of interest to the drug and chemical trade have been the sudden increased firmness of citric acid, an advance in price of phenacetin, and a further reduction in price of cocaine. Bromides remain very firm. Iodides only fairly steady, the rumour of increased imports of iodine preparations from Japan having tended to produce an unsettled feeling and to make buyers very cautious. It is hinted that an advance in price of caffeine is not improbable, in that present prices cannot, it is said, be remunerative to the makers. Salicine is very firm at the late advance. The following are the prices actually ruling for articles of chief interest.

ACID CARBOLIC—Remains very firm, with practically no change from the prices quoted last week, it being stated that the demand from the Picric Acid makers (for purpose of manufacture of Lyddite) continues to swallow up all that the makers are able to offer. Crude 60°F ., 2s. 3d. per gallon; 75°F ., 3s.; liquid, 95-98 per cent., of pale straw colour, 1s. 8d. per gallon; ditto, dark, 25-30 per cent., 11d. to 1s. 1d. (according to quantity), in 40-gallon casks.

ACID CITRIC.—Makers refuse now to sell, while there are few sellers from second-hand at 1s. 5d. per lb., with buyers at 1s. $4\frac{1}{2}$ d.

ACID TARTARIC—Remains steady at unchanged price.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, $3\frac{1}{2}$ d. to $4\frac{1}{2}$ d. per lb., according to make, quantity, and

packing. Muriate: Chemically pure, small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate weak: Gray, 24 per cent., London prompt, £11 15s.; Hull prompt, £11 12s. 6d.; Leith prompt, £11 15s.; Beckton prompt, £11 16s. 3d.; Beckton terms prompt, £11 12s. 6d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

BLEACHING POWDER (CHLORIDE OF LIME)—Is rather dearer at £6 15s. to £7 per ton for English.

BORAX AND BORACIC ACID—Are unchanged in value.

CAMPHOR.—No change to report.

CASTOR OIL—Very firm. Belgian first pressing, spot, £29 10s.; January-June, £28 10s., f.o.b.; Antwerp second pressing, spot, £27 10s. per ton, ex wharf. Hull manufactured: Guaranteed cold drawn pure pharmaceutical, £31 15s. per ton in barrels, $3\frac{1}{4}$ d. per lb. in cases; pure firsts, £29 5s.; seconds, £28 5s. per ton in barrels; firsts, $3\frac{7}{8}$ d. per lb. in cases; seconds, $3\frac{5}{8}$ d., ex wharf London.

CLOVES.—At auction 102 bales out of 246 of Zanzibar sold at full rates, good fair at $3\frac{3}{4}$ d. Penang dull of sale, and 12 cases were bought in. Privately Zanzibar continues in good demand, and fair business has been done for delivery at full rates, including March-May at $3\frac{3}{4}$ d. and June-August $3\frac{3}{4}$ d.; January-March sellers at $3\frac{3}{4}$ d. Stems: 200 bales Zanzibar bought in at auction at $1\frac{3}{4}$ d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 2s. Benzole, 50 per cent., $10\frac{1}{2}$ d. per gallon; 90 per cent., 8d. Creosote, 3d. per gallon. Crude Naphtha, 30 per cent. at 120°C ., $5\frac{1}{2}$ d. per gallon. Solvent Naphtha, 95 per cent. at 160°C ., 1s. 7d.; 90 per cent. at 160°C ., 1s. 4d.; 90 per cent. at 190°C ., 1s. 3d. per gallon. Anthracene, A, $3\frac{3}{4}$ d. per unit; B, $2\frac{3}{4}$ d. per unit. Pitch, 35s. 6d. per ton. Tar, refined and crude, 12s. 6d. per barrel; $2\frac{1}{4}$ d. per gallon.

COCAINE.—Somewhat to the general astonishment, not to say disappointment, of holders of the article, the makers again reduced their prices at the end of last week 1s. 6d. per oz., making the price of the Hydrochlorate 16s. 3d. per oz. for 200-oz. lots in bulk packing and 16s. 6d. per oz. for 100-oz. lots. There is now a rumour that the move is after all considered to lack justification, and that the makers are thinking of putting their heads together with a view of advancing the price again. Whatever steps they may however now take, they will find it difficult to re-establish confidence in the future stability of the price of the article. There are now practically no sellers from second hand below makers' present prices.

CODEINE—Very firm at 13s. to 13s. 6d. per oz. according to quantity for the pure.

CREAM OF TARTAR—Is unchanged.

GALLS.—China are quoted, to arrive, 64s. per cwt., c.f.i., and Japan 61s.

GINGER.—At auction the moderate supply of Cochin went off slowly. A small parcel of new crop sold at full rates, other kinds steady. Out of 877 bags and 26 cases offered 114 packages sold, medium, little bold, roughly cut and scraped, without reserve, at 51s.; Calicut, rough, medium, plump, rather mouldy and wormy, at 35s.; washed, rough, new crop, medium, and small plump, part mouldy, at 32s.

MERCURIALS—Are firm at unchanged prices.

MORPHINE—Is very steady at 5s. to 5s. 3d. per oz., according to quantity, for the Hydrochlorate powder.

OILS (FIXED) AND SPIRITS.—Linseed firm: on the spot, pipes, London, £23 12s. 6d. to £23 15s.; barrels, £23 15s.; February-April, £23 10s.; May-August, £22 15s.; Hull, spot, naked, £22 10s. Rape steady: ordinary brown, on the spot, quoted £25 10s.; refined spot, £26 15s.; Ravison, naked, spot, £23 5s. to £23 10s. Cotton firm: London crude spot, £21 10s.; refined spot, £23 5s. to £24 5s., according to make; Hull naked refined spot, £21 5s.; crude spot, £20. Olive: Mogador, £34 15s.; Spanish, £36 10s.; Levant, £34 15s. Coconut: Ceylon on spot, £26; Cochin spot, £29. Palm: Lagos on spot quoted £27. Lubricating: Pale American spot, 8s. to 9s. 6d.; black, 7s. to 9s.; Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum oil: Russian spot quoted $6\frac{1}{8}$ d. to $6\frac{1}{2}$ d.; American spot $7\frac{1}{8}$ d. to $7\frac{1}{2}$ d.; water white, $8\frac{3}{8}$ d. Petroleum Spirit: American, $9\frac{3}{4}$ d.; deodorised, 10d. Turpentine easier: American spot, 39s. 3d.

OPIUM.—The market for this drug has been very quiet, prices for all kinds being nominally unchanged.

PHENACETIN—Has at last commenced to move. A day or two ago the Bayer Co. advanced their price 2s. per lb. for both crystals

and powder, while to-day it is reported that the other makers have decided upon an advance of 1s. 9d. per lb., making their price for both crystals and powder, therefore, 5s. 3d. per lb. for 5 cwt. lots. Absolute official confirmation of this latter advance has not yet been received. It is, however, nearly certainly correct.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½d. to 4¾d. per lb. Bromide, 1s. 10½d. Chlorate, spot, London, crystals, 3¾d.; powder, 3½d. Iodide, 10s. 6d. per lb. Permanganate, small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English make, 7¾d.; Beckton, 7½d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER—Steady at £9 12s. 6d. per bottle from the importer.

QUININE.—The market has been firmer yesterday and to-day in consequence of the report that the shipments of Bark from Java for the month do not much exceed 600,000 lbs. Makers' prices for the Sulphate remain nominally unchanged, while in the speculative market there are buyers of the favourite B&S and/or Brunswick brands at 1s. 5¾d. for March, and 1s. 5½d. per oz. for May delivery. It looks as if we were on the eve of another boom in the article.

SHELLAC.—Market continues extremely quiet, price being rather weaker at 62s. 6d. per cwt. for T.N. for March delivery.

SODA COMPOUNDS.—Crystals, barrels quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 3¾d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1½d. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet, on spot, refined, £8 10s.; ordinary, £8 5s.

SPICES (VARIOUS).—Black Pepper: At auction the limited supplies were all bought in, comprising 227 bags Singapore and 117 bags Tellicherry, fair at 6¼d. White Pepper quiet: 426 bags and 37 cases Singapore were all bought in, including fine bold selected in cases at 1s. 1½d., and fair to good fair at 9¼d. to 9¾d. Chillies firm and of 94 bales Zanzibar 69 bales sold, fair stalky at 42s.; the remainder bought in at 50s. Capsicums firm: 27 bundles sold out of the 177 packages of Bofbay, good bright long on stalks at 39s. 6d. Pimento in small supply chiefly sold in small lots, greyish at 3¼d. to 3½d. Cassia Ligna: 8 cases offered and sold, without reserve, new selected at 41s. Cassia Vera: 40 bales offered and bought in, coarse Padang Quills at 30s. Cinnamon slow: 66 bales Wild were bought in. Cinnamon Chips and Bark in little demand, and 481 packages all bought in or withdrawn. Nutmegs neglected: 25 cases Penang in auction were bought in, including 90's at 1s. 4d., and 110's at 1s. 1d. West Indian: 7 barrels sold, 131's at 8½d., 163's wormy and broken at 4½d. Mace rather firmer: of 34 packages Penang in auction only 2 cases sold, good pale and reddish, part wormy, at 1s. 10d.; 13 cases Bombay offered and 11 sold, pale and reddish, rather broken and wormy, at 1s. 5d.; Bombay Wild: 6 packages were bought in. West Indian: 3 packages sold, ordinary red at 1s. 5d. Coriander Seed: 159 bags Morocco were bought in.

SULPHONAL.—The makers all now quote 20s. 6d. per lb. for Powder and Crystals in bulk, with a reduction of 6d. per lb. on 10-lb. orders.

THURSDAY'S DRUG SALES.

To-day's drug auctions passed off somewhat quietly, the number of catalogues, as also of the lots offered, being restricted. Senna sold readily. Ipecacuanha was disposed of at prices which show a further decline in value. The following are the particulars:—

ALOES.—6 cases East India, in skins, were taken out at 45s. per cwt.; other 10 cases fair Zanzibar were bought in at 60s.

ANATTO SEEDS.—18 bags bought in at 3½d. per lb.; other 18 bags sold cheaply at 2d. per lb.

ARECA NUTS.—80 bags, part somewhat wormy, were all bought in, only 12s. per cwt. being bid; other 16 bags sound sold at 17s. 6d. per cwt.; other 21 bags realised only 15s. 6d. per cwt.

BALSAM PERU.—6 cases part sold at 6s. 6d. per lb., balance being bought in at 7s.

CANELLA ALBA.—13 bales were bought in at 45s. per cwt.

CARDAMOMS.—43 cases Ceylon sold readily at 3s. 10d. down to 1s. 9d. per lb. 4 cases seeds realised 2s. 2d. to 2s. 5d. per lb. 2 cases wild, catalogued as long Ceylon, were bought in, only 2s. 10d. per lb. being bid. Other 20 cases sold at 3s. 10d. down to 2s. 3d. per lb., 1 case wild fetching 3s. 8d. per lb. Other 33 cases part sold at 2s. 7d. to 3s. 2d. per lb., according to size.

CASTOR OIL.—20 cases catalogued as finest Italian were bought in at 28s. per cwt.

CINCHONA BARK.—62 Serons Crown Bark sold at 1s. per lb. sold to 6½d. for ICWD.

COCA LEAVES.—Of 5 bags, only 1 bag sold at 7d. per lb.

COD LIVER OIL.—25 barrels non-freezing Norwegian were taken out at 70s. per barrel.

CUMMIN SEED.—54 bags were all bought in at 25s. per cwt.

DRAGONS' BLOOD.—4 cases of dull powder were bought in at 65s. per cwt.; 15 cases fair to good reeds, part sold at 610; balance being bought in at £10 10s.

ERGOT OF RYE.—19 bags fair Russian were all bought in at 3s. 3d. to 3s. 6d. per lb.

ESSENTIAL OILS.—4 drums Citronella were bought in at 1s. 1d. per lb. 5 cases Portuguese Eucalyptus Oil at 2s. 5 cases West Indian Oil of Limes part sold at 3s. 2d. per lb. 1 case containing 12 bottles of hand-pressed oil realising 7s. 1d. per lb. 17 cases Japan Peppermint (Kobayashi brand) held for 3s. 10½d. per lb. 9 cases Oil Nutmeg for 2d. per oz. 3 cases Lemongrass for 4d. per oz. 1 case Dodge and Olcott's Oil of Wintergreen bought in at 12s. per lb.

GOLOCYNTH.—12 casks Turkish part sold at 1s. 5d. for good medium apple, 2 cases broken selling at 1s. to 1s. 1d. per lb. Other 10 cases were all bought in at 1s. 7d. per lb. for fair apple.

GAMBOGE.—Of 40 cases part sold at £4 12s. to £6 12s. 6d., fair to good bright lump being bought in at £7 10s. to £9 per cwt.

GUAZA (HERBA CANNABIS INDICA).—50 robbins were bought in at 6d. to 8d. per lb., and 18 bales siftings at 4½d. per lb.

GUM BENZOIN.—Good to fine Sumatra seconds sold freely at £8 10s. to £9 5s. per cwt., down to £7 5s. to £7 10s. for medium. 54 cases Palembang sold readily at 67s. 6d. to 70s. per cwt.

GUM MYRRH.—18 packages all sold at 92s. 6d. per cwt. for good pickings down to 50s. for siftings, 5 bags inferior dark lump fetching only 17s. 6d. per cwt.

GUM SANDRAC.—10 casks were taken out at 57s. 6d. per cwt.

HONEY.—5 barrels good Jamaica realised 30s. per cwt. 22 cases Canadian were bought in at 42s.

IPECACUANHA.—2 bags Carthagenia were bought in at 8s. per cwt. 15 bales Rio part sold at 10s. 8d. for 1 CCD down to 10s. 5d. for 2 CCD, better quality being taken out at 12s. to 12s. 3d. per lb. for sound and 11s. 9d. for 2 CCD. Other 30 bales Rio sold at 9s. 9d. to 11s. per lb., 14 bags Carthagenia catalogued having been sold prior to the auctions. Other 8 bags and 5 cases fair Carthagenia all bought in at 8s. per lb.

JALAP.—10 bales were bought in at 7d. per lb.

LIME JUICE.—21 packages West Indian were bought in nominally at the high price of 3s. 4d. per gallon.

ORANGE PEEL.—3 cases inferior thin cut were bought in at 4d. to 5d.; other 24 cases good thin cut all taken out at 9d. to 1s. per lb.

MENTHOL.—25 cases each 12 × 5lb. tins, Kobayashi brand, were bought in at 10s. 6d. per lb.; somewhat less would, however, probably have been accepted.

ORRIS ROOT.—4 casks good Florentine were bought in at 55s. per cwt., other 17 bales of fair quality at 53s., 2 barrels powder sold after somewhat keen competition at 33s. 6d. per cwt.

QUININE.—3 cases containing 10 × 100 oz. tins Sulphate, Taillandier brand, were bought in at 1s. 5d. per oz., it being intimated that 1s. 4½d. per oz. was the price which would be accepted.

RHUBARB.—Medium to fairly bold but somewhat spongy flat Canton sold without reserve at 9d. to 9¼d. per lb.; fine but rather dull-coated round Shensi was taken out at 2s.; bright, high-dried, small to bold, at 10d. per lb.

SARSAPARILLA.—50 bales Jamaica sold at 1s. 6d. for sound, 1s. 4d. to 1s. 5d. for 1 CCD, 1s. 3d. to 1s. 4d. for 1 CSD, 11½d. for 2 CSD, 9d. for 3 CSD, and 5d. to 6½d. for 4 CSD. 8 bales Lima sold at 11d. per lb. for 1 CCD and 10d. for 2 CCD.

SENNA.—37 bags low Tinnivelly bought in at 2d. per lb. Other 623 bales all sold readily at 1d. for low inferior up to 3½d. per lb., according to quality and condition. Other 38 bales part sold as high as 4d. per lb. for large leaf somewhat off colour.

WAX.—20 cases bleached Calcutta bought in at £7 10s. per cwt. 13 packages fair Jamaica part sold at £7 5s. 30 packages Zanzibar sold at £6 17s. 6d. to £7 for good, and at £6 10s. for medium, while for 5 cases of lower quality £5 17s. 6d. per cwt. was accepted, subject to holders' approval. 7 pockets Nyassaland wax fetched £6 15s. per cwt. 70 cases China sold at £6 7s. 6d. to £6 10s. 15 cases Madagascar at £7 2s. 6d. 80 cases fair Japan realised 32s. 6d. per cwt.

Calendar for the Week.

- Sunday, Feb. 4.** 5th after Epiphany. Sun rises 7.37; sets 4.52.
- Monday, Feb. 5.** Sun rises 7.35; sets 4.54.
- SOCIETY OF CHEMICAL INDUSTRY, Burlington House, Piccadilly, W., at 8 p.m.—Dr. W. S. Squire on "Recent Objections urged against the Adoption of the Metric System," and H. R. Le Sueur on "Oil of Carthamus Tinctorius (Safflower Oil)."
- Tuesday, Feb. 6.** ☽ 4.23A. Sun rises 7.34; sets 4.56.
- ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, W.C., at 8 p.m.—Mrs. Catherine Weed Ward on "Shakespeare at Home."
- Wednesday, Feb. 7.** Sun rises 7.32; sets 4.58.
- PHARMACEUTICAL SOCIETY, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of the Council.
- BRITISH PHARMACEUTICAL CONFERENCE, 16, Bloomsbury Square, London, W.C., at 4.30 p.m.—Executive Meeting.
- JUNIOR PHARMACY BALL, Portman Rooms, Baker Street, W.—Tickets may be obtained of the Hon. Secretary, R. L. Cassie, 49, Newgate Street, E.C.
- EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION, 36, York Place, at 9.15 p.m.—Papers on "Murcia Lemons," by Miss Flora C. Madgshon, and "Serums" by Harry Smith.
- PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION, Forester's Hall, The Octagon, Union Street, at 8 p.m.—Lecture on "Bacteriology," by C. G. Moot.
- Thursday, Feb. 8.** Sun rises 7.31; sets 5.0.
- CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8.30 p.m.—Victor Meyer Memorial Lecture, by Professor T. E. Thorpe.
- CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Paper on "Quinine," by H. A. Martin.
- Friday, Feb. 9.** Sun rises 7.29; sets 5.1.
- GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, West Regent Street, at 9.15 p.m.—Play and Pleasure.
- ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Professor J. Reynolds Green on "Symbiosis and Symbiotic Fermentation."
- Saturday, Feb. 10.** Sun rises 7.27; sets 5.3.
- INTER-PHARMACY FOOTBALL LEAGUE.—The following matches will be played:—Square v. London College at Wormholt Farm; Muter's College v. Westminster. Referees supplied by Metropolitan College and the Square, respectively.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Offers wanted *Chemist and Druggist*, 1880 to 1885 complete, 1886, 1887, 1891, 1895, 1898, 1899, several numbers short; 2 doz. 1s. 6d. Welch's grape-juice; 5 doz. 6d. Zomela soap; 20 doz. 3d. Acme metal-polish.—Lees, Drug Stores, Stalybridge.

Surplus Stock.—Enterprise screw press, good as new, 10/-; 2 gall. pear-shaped carboy on black pedestal, 5/9, packed; 6 doz. Jameson's Arsenical soap, unsoiled, 5/6 per doz. tablets; 6 doz. Oppenheimer's Bland's Bipalatinoids, gross bottles, 24/- per doz.; just received as exchange order.—Mortimer, Mall Pharmacy, Clifton.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

FREE FORMULÆ

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE 1s. 8d. per oz. Tin, with Labels, Post free or through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—"I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable."

F. W. B., Manches er:—"Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much."

J. J. G., Folkestone:—"I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation."

D. R., Swansea:—"I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production."

R. N., Darlington:—"I have made our Tooth Paste from your formula for years."

TRADE NOTES.

THE "ABSENT-MINDED BEGGAR."—Messrs. Ayrton and Saunders, of Liverpool, forward us a specimen of Mr. Rudyard Kipling's poem, printed in miniature type, and given away with each bottle of the "British Empire Perfume," which we noticed last week.

JUBILEE FETE AT LIEBIG'S FACTORY.—A very interesting fête and ceremony took place at Liebig's factory at Fray Bentos, on November 7 last, when silver medals were distributed to the employees who had been in the company's service for twenty-five years or over. The recipients numbered fifty-nine, including the works manager, the office manager, the ferry boat manager and the chief engineer. The medals bear on the face a portrait of

Justus von Liebig, and on the reverse side the name of the recipient, etc. The ceremony was accompanied by a rural banquet, at which all the employees were present, and an extra month's pay, to the amount of some 4,000 dols., was distributed amongst them.

The medals were distributed by the manager of the factory, Mr. Otto Gunther, Mr. W. Bertram, Chairman of the Local Board, presiding.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Balchin, Blyth, Breeze, Burns, Chapman, Coleman, Davis, Hill, Hobson, Mair, Merson, Metcalfe, Miller, Paterson, Pickering, Ridyard, Smith, Taylor, Thomas, Triana, Wamsley, Yates, Yoxall.

NEWS IN BRIEF.

MR. REGINALD MACLEOD, C.B., has been appointed Registrar-General in the place of Sir Brydges Henniker, retired.

THE UNITED ALKALI COMPANY has purchased the Wilmboldsley estate of Sir Joseph Verdin.

THE CITY IMPERIAL VOLUNTEERS had their clothing marked with John Bond's "Crystal Palace" Marking Ink.

THE HISTORY OF MATERIA MEDICA will be the subject of a paper to be read before the Liverpool Pharmaceutical Students' Society, on Friday next, February 16, by Dr. J. B. Nevins.

TRADE MATTERS are to be discussed by members of the Bradford and District Chemists' Association, at a meeting held in the County Restaurant on February 13.

THE SPECIAL ISSUE of the *Pharmaceutical Journal*, to be published on February 24, will be sent to more than seventeen thousand persons, including everyone whose name appears on the Register of Chemists and Druggists.

MR. GEORGE SQUIRE will deal with "Pharmaceutical Topics" in a paper to be read before the Sheffield Pharmaceutical and Chemical Society, on Wednesday, February 14, the day following the Sheffield Chemists' Ball.

THE CHEMICAL TRADE is reported never to have been more prosperous than at present, so much so that Messrs. Brunner, Mond and Co., Ltd., are stated to have decided to double the caustic plant at their Winnington Works, near Northwich.

MR. JOHN TAYLOR, of Bolton, is to address the members of the Manchester Pharmaceutical Association on "The Outlook in Pharmacy," at a meeting to be held in the Chemical Club Rooms, Victoria Hotel, on Wednesday next, February 14.

AN EVENING MEETING of the Pharmaceutical Society will be held at 17, Bloomsbury Square, W.C., on Tuesday next, February 13, when Mr. Edmund White will contribute a paper on "Aromatic Spirit of Ammonia." The chair will be taken by the President at 8 o'clock.

OLD "SQUARE" STUDENTS are reminded that the School of Pharmacy Annual Dinner will take place on Wednesday, February 21, in the Caledonian Salon, Holborn Restaurant. Tickets may be obtained from the Hon. Secretaries of the Dinner Committee, Mr. E. M. Chapman and Mr. J. Lawson.

SALE OF CAMPHORATED OIL—AN APPEAL CASE.—In the Queen's Bench Division of the High Court on Wednesday, February 7, before Mr. Justice Channell and Mr. Justice Bucknill, an appeal was heard against the decision of the Warminster magistrates in a Food and Drugs Act case, *re* the sale of camphorated oil (see last volume, page 480c). Briefly, the facts were that the oil in question was alleged to contain only 8 per cent. of camphor, but it was contended by the defendants, Messrs. John Walton and Co., Ltd., grocers, of Marden, Bradley, and Mere, Wilts, that inasmuch as camphorated oil is a compounded drug, the summons was issued under the wrong section—section 6. The magistrates accepted that view and the case was dismissed. It was now contended that the summons should have been issued under section 7, whereas the appellants argued that proceedings could be taken under either section 6 or section 7.—Mr. Justice Channell, in giving judgment, said he thought the effects of the sections was that nothing shall be an offence under section 6 in reference to compounded drugs, unless it was also an offence under section 7, which more specifically defined that offence. The appeal was allowed, with costs, and the case remitted for further consideration.

Marriage.

FRASER—THOMSON.—At Roslyn, Craw Road, Paisley, on the 6th inst., by the Rev. Walter Mursell Thomas Coats, Memorial Church, Alexander Fraser, chemist and druggist, to Ellen Wilson, youngest daughter of Andrew Thomson.

TRADE NOTES.

REFILLING OF SYPHONS.—Some retailers of mineral waters appear to be under an impression that a retailer is not liable for damages in the case of siphons improperly bearing the trademark and name of a manufacturer, and refilled with another manufacturer's product. Messrs. Jewsbury and Brown, of Ardwick Green, Manchester, call attention in our advertisement columns to a case where they have succeeded in obtaining from both fillers and retailers an apology, with costs of advertising same, etc., etc., and an undertaking not to infringe again.

THE "ALLENBURYS" MILK PASTEURISER (patented) is a recent introduction of Messrs. Allen and Hanburys, Limited, London. It has been devised by Dr. Hewlett for the sterilisation or pasteurisation of milk, and is at once efficient, simple, inexpensive, and thoroughly adapted to popular requirements. The process of pasteurisation consists in heating the milk to a temperature of 150° F. and retaining it at that temperature for about twenty minutes. A lower temperature would not with certainty kill the disease-germs; a higher temperature alters the quality of the milk. The "Allenburys" milk pasteuriser has been devised to carry out this somewhat delicate process with certainty and without the use of a thermometer or any complicated apparatus. It is of the simplest construction and cannot get out of order. The price complete is 6s. 6d.; japanned, 7s. 6d.

THE NEW UNIVERSAL ADJUSTABLE SPLINT (R. Hoppe's Patent) is manufactured for Great Britain and Ireland solely by Messrs. Allen and Hanburys, Limited. It consists of a jointed rod, to which are fixed adjustable aluminium plates. The joints of the rod can be locked at any angle, and the aluminium plates can be set and clamped at any required position on the rod. The splint is made in two sizes, suitable for adults and children, and is capable of adaptation to either arm or leg, and can be placed anteriorly or posteriorly, on the inside or on the outside. Being made of aluminium, it is as light as a wooden splint, and possesses a great advantage over other splints in that it can be adapted to the exact requirements of the injured limb instead of the limb having to be adapted to the somewhat arbitrary requirements of the splint. The price of the splint is 15s.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

William Thomas Nichols and Johann Gottfried Schütte, Manufacturers of Artificial Musk, 11, Idol Lane, London. Debts will be received and paid by J. G. Schütte.

Edward Sanger Shepherd, William Saville Kent, and Robert Lincoln Cocks, Manufacturers of Instruments and Apparatus for Colour Photography and Photo-Mechanical Processes, etc., 5, 6, 7, Gray's Inn Passage, Red Lion Street, Holborn. Debts will be received and paid by E. S. Shepherd and R. L. Cocks, who will carry on the business under the style of Sanger, Shepherd, and Co.

Samuel Farrant and Wadham Bruce Winckworth, Surgeons and Apothecaries, Taunton, Somerset.

Charles Butler Stiles and John Reginald Fuller, Medical Practitioners, Hornsey. Debts will be received by either partner, and paid by J. R. Fuller.

Thomas John Paice and Frederick William Stephens, trading as the Crystalline Chemical Company, 69 and 70, Mark Lane London, E.C.

Alfred William Gerrard and Charles William Birch, trading under the style of Swann and Co., Chemists, Druggists, and Mineral Water Manufacturers, Staines, Middlesex. Debts will be received and paid by C. W. Birch.

William Lander and William Edward Jolliffe, Photographers, Regent's Parade, Station Road, Shanklin, Isle of Wight. Debts will be received and paid by W. Lander.

Arthur Edgley, Charles and Alfred Sargeant, trading as the Wembley Fruit Essence Company, Watford. Assets will be the sole property of A. Sargeant.

RECEIVING ORDER IN BANKRUPTCY.

James Stevens, Photographer, 1, Lower Park Street, and Victoria Studio, Holyhead, Anglesey.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, FEBRUARY 7, 1900.

Since last report a little more has been done in linseed at full prices with a rising market, but canaryseed continues slow of sale. High figures rule generally for oils, with advances in olive for shipment, and a continued firm tone in spirits of turpentine and cottonseed and linseed oils. Chemicals are very strong generally, with better rates and improved demand.

AMMONIA SALTS.—Carbonate, $3\frac{1}{2}$ d. per lb. Sal ammoniac is very firm at 38s. to 40s. per cwt. Sulphate is a turn easier, £11 15s. per ton.

BEEWAX.—7 tons Chilian sold at £7 5s. per cwt.

BLEACHING POWDER—Is firm at £6 12s. 6d. per ton.

COPPERAS—Is firm at 37s. and 39s. per ton.

COPPER SULPHATE—Is dull at £24 2s. 6d. to £24 5s. per ton.

OILS (FIXED) AND SPIRITS.—Castor is in good demand both for spot and future delivery. Calcutta, at $3\frac{1}{2}$ d. to $3\frac{3}{4}$ d. per lb.; French, first pressure, at $3\frac{1}{2}$ d. per lb.; second Belgian, at 3d.; second sulphur French, $2\frac{3}{4}$ d. 5 tons sold lately at this price. Olive is in limited demand, but for shipment prices show an inclination to advance. Malaga for shipment cost and freight is quoted at £34 10s. to £35 per tun. Spot price for Spanish oils £36 to £36 10s. Linseed, of Liverpool pressure, is very firm at 24s. 3d. to 25s. per cwt. Cottonseed: Liverpool refined is steady at 23s. 9d. to 24s. per cwt. Spirits of Turpentine are in moderate demand at 40s. 6d. per cwt.

POTASH SALTS.—Bichromate easier, $4\frac{1}{2}$ d. to $4\frac{3}{4}$ d. per lb. Chlorate dearer, $3\frac{1}{2}$ d. to $3\frac{3}{4}$ d. per lb. Cream of Tartar is unchanged, 74s. to 80s. per cwt. Pearlash is quiet at 33s. 6d. to 35s. per cwt. Potash in slow demand at 27s. per cwt. Prussiate is a shade firmer at 8d. per lb. Saltpetre, £21 10s. per ton.

LINSEED—Is exceedingly firm. Salcs of Turkish from store at 51s. per 416 lbs. have been effected, also of North American 25 tons at 47s. 6d. to 48s. River Plate has been offering at 43s. 3d. to 43s. 9d., and 400 tons have been sold for future delivery, 43s. 9d. for shipment during first half of this month, and 43s. 3d. in the latter half.

CANARYSEED—Is only nominal at 33s. 6d. to 34s. per 464 lbs. for Turkish.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Borax continues firm at £16 to £16 10s. per ton. Caustic is very scarce and dearer, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s.; and 60 per cent., £9 5s. Crystals are firm at £3 5s. per ton. Nitrate is very firm, and only offered sparingly at 8s. 6d. to 8s. 9d. per cwt.

LONDON, THURSDAY, FEBRUARY 8, 1900.

Business in Drugs and Chemicals has not been especially active during the past week. Prices generally, however, remain decidedly firm, some having even still an upward tendency. Acid Carbollic continues very firm, while an advance in price of Salicylates and Salol would appear to be impending. Chlorate of Potash is dearer, as is also Refined Camphor, which in view of the continued advance in price of the crude is thought likely to go still higher. Quicksilver and Mercurials are steady. Bismuth Salts unchanged. Bromides firm. Iodides steady. Cod Liver Oil appears to be tending downwards. Glycerine rather firmer. Menthol lower. Cocaine unchanged. Citric Acid firmer. The following are the prices ruling for some articles of chief interest:—

ACETANILIDE.—There are still sellers at $9\frac{3}{4}$ d. to 11d. per lb., according to quantity and make.

ACID BORACIC—Steady at unchanged prices—viz., 25s. 6d. per cwt. for crystals and 27s. 6d. for powder.

ACID CARBOLIC—Remains very firm at $10\frac{3}{4}$ d. to 11d. per lb. for 34-35° ice crystal in bulk packing; 39-40° C. ice crystal, $11\frac{1}{2}$ d. to 1s.; and 39-40° C. detached crystals (the B.P. quality), 1s. $0\frac{1}{2}$ d. to 1s. 1d. per lb., according to make. Crude, 60° F., 2s. 9d. per

gallon; 75° F., 3s. 6d. per gallon. Liquid, 95-98 per cent. of pale straw colour, in 40-gallon casks, 1s. 7d. to 1s. 8d. per gallon; ditto, 25-30 per cent. of dark colour, $9\frac{1}{2}$ d. to 11d. per gallon.

ACID CITRIC—Very firm, makers' price being nominally 1s. 5d. per lb. for crystals in 5 cwt. casks, but they will only sell quite small quantity, and for prompt delivery at this or, in fact, at any price.

ACID OXALIC—Is quoted 3d. to $3\frac{1}{4}$ d. per lb. nett, free delivered London.

ACID TARTARIC—Unchanged at 1s. $0\frac{1}{2}$ d. to 1s. $0\frac{3}{4}$ d. per lb. for English on the spot, and $11\frac{3}{4}$ d. to 1s. for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 2d. per lb. Carbonate, $3\frac{1}{2}$ d. to $4\frac{1}{2}$ d. per lb., according to make, quantity, and packing. Muriate: Chemically pure small crystals, 33s. to 36s. per cwt.; ditto commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac: First, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate strong and advancing. Gray, 24 per cent., London prompt, £11 17s. 6d. to £12; Hull prompt, £11 17s. 6d.; Leith prompt, £11 17s. 6d.; Beckton, February-April, £12; May-June, £11 17s. 6d.; Beckton, terms prompt, £11 17s. 6d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY—Is quiet at £39 to £40 per ton for Regulus and £22 10s. to £23 per ton for crude Japan (black sulphide).

ARSENIC—Is firm. Prices remain, however, so far unchanged.

ASHES.—Pots, 28s. 6d.; Pearls, 34s.

ATROPINE—Firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure alkaloid.

BELLADONNA ROOT.—Really good root remains exceedingly scarce, while for fair quality 45s. per cwt. nett here is asked.

BISMUTH—Unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 1d. per lb. for the subnitrate, and 5s. 8d. per lb. for the subcarbonate.

BLEACHING POWDER (CHLORIDE OF LIME)—Firm at £7 10s. per ton for English.

BORAX—Unchanged at 16s. 6d. per cwt. for crystals and 1s. per cwt. more for powder.

BROMIDES—Are firm but unchanged at 1s. $10\frac{1}{2}$ d. per lb. for Potassii Bromid, 2s. $1\frac{1}{2}$ d. per lb. for Sodii Bromid, 2s. 2d. per lb. for Ammon. Bromid, and 2s. and 2s. 2d. per lb. for Bromine in 60-lb. cases.

CAMPHOR.—Crude continues firm, and for arrival 300 piculs China have changed hands at 163s. 6d. to 164s. per cwt., c.i.f., for February-March and March-April shipment. For Japan importers continue to quote extreme prices, which has tended to check business. Refined is again dearer, English makers having advanced their price on Monday last 1d. per lb., to 2s. 1d. per lb. for Bell's and Flowers in ton lots, price of tablets being also higher in proportion.

CASTOR OIL—Very firm. Belgian, first pressings, spot, £30 10s.; Feb.-June, £30, f.o.b. Antwerp; second pressing, spot, £28 10s. per ton, ex wharf. Hull manufactured, guaranteed cold-drawn pure pharmaceutical, £32 per ton, in barrels; $3\frac{1}{2}$ d. per lb. in cases; pure firsts, £29 10s.; seconds, £28 10s. per ton, in barrels; firsts, $3\frac{7}{8}$ d. per lb. in cases; seconds, $3\frac{5}{8}$ d. per lb., ex-wharf, London.

CLOVES.—No Zanzibar or Penang were offered in auction. Privately, activity has prevailed for Zanzibar, resulting in large sales at higher rates, including March-May delivery at $3\frac{3}{8}$ d. to $3\frac{31}{32}$ d., and June-August at 4d. to 4 $1\frac{32}{32}$ d. Stems: At auction 100 bales Zanzibar were offered and bought in at $1\frac{7}{8}$ d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 2d. to 1s. 3d. per gallon; pure, 2s. Benzole rather easier at $9\frac{1}{2}$ d. per gallon for 50 per cent. for prompt delivery; and $7\frac{1}{2}$ d. for 90 per cent. Creosote, 3d. per gallon. Crude Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 4d.; 90 per cent. at 190° C., 1s. 3d. Anthracene, A., $3\frac{3}{4}$ d. per unit; B., $2\frac{3}{4}$ d. Pitch, 36s. per ton f.o.b. Tar, refined and crude, 13s. per barrel, $2\frac{1}{2}$ d. per gallon.

COCAINE—Rather firmer at unchanged price, say 16s. 3d. per oz. for the Hydrochlorate in 25-oz. tins for 200-oz. lots, the pure being quoted 2s. 6d. per oz. more. From second-hand there is now practically nothing offering at below makers' price.

CODEINE—Very firm at 13s. 1d. to 13s. 6d. per oz., according to quantity for the pure and 1s. per oz. less for the Muriate, Phosphate, and Sulphate Salts.

COD LIVER OIL—Appears to be on the down grade; agents are seeking orders and quote 65s. to 75s. per barrel, according to brand, etc., for best new non-congealing Norwegian Oil in 25-gallon tinned barrels.

CREAM OF TARTAR—First White Crystals are quoted 73s. per cwt. on the spot; powder, 75s.; ditto 95 per cent., 76s. per cwt.

ERGOT OF RYE—3s. to 3s. 3d. per lb. is asked for good sound Russian, and as much as 3s. 6d. per lb. for fair Spanish.

GALLS—Are without alteration, and few sales in any description are reported. China to arrive quoted 65s., and Japan 61s. c.f. and i.

GINGER—At auction the small supply of Cochin was in small demand, and only a small quantity sold at steady rates. Of 311 bags and 53 cases offered, only 69 packages sold, partly without reserve, good cut B.'s at 60s., medium and small, rather roughly cut and scraped, at 54s. to 55s.; new crop washed, rough, medium, and small plump, slightly mouldy, at 32s. Japan: 611 bags at auction were all bought in, including fair limes at 25s.

GLYCERIN—Crude remains firm, while rather higher prices are quoted for refined, say, 56s. to 57s. 6d. for English and 58s. to 65s. for German, according to brand, for best white, chemically pure, double distilled 1260° quality, in tins and cases.

IODIDES—Continue fairly steady at 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 13s. 10d. per lb. for Iodoform crystals, powder, and precipitated, 12s. per lb. for resublimed Iodine, and 7½d. per oz. for Crude Iodine.

MENTHOL—Is rather weaker, there being sellers of Kobayashi brand on the spot at 10s. per lb. in case lots (12 tins each 5lb. in a case).

MERCURIALS—Are firm at 3s. 2d. per lb. for calomel and 2s. 10d. per lb. for corrosive sublimate.

MORPHINE—Remains very firm at 5s. to 5s. 3d. per oz., according to quantity, for the Hydrochlorate Powder, Crystals costing 2d. per oz. more money.

OILS (FIXED) AND SPIRITS—Linseed firmer; on the spot, pipes, London, £23 15s.; barrels, £23 17s. 6d. Hull, spot, naked, £22 15s. Rape very firm; ordinary brown, on spot, quoted £25 10s. to £25 15s.; refined, spot, £27 to £27 5s. Ravison, naked, spot, £23 10s. Cotton firm; London, crude, spot, £22; refined, spot, £23 15s. to £24 5s., according to make; Hull, naked, refined, spot, £22 paid; crude, spot, £21. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut in better demand and dearer for shipment. Ceylon, on spot, £25 10s.; Cochin, spot, £28 10s. Palm: Lagos, on spot, quoted £27 10s. Lubricating: Pale American, spot, 8s. to 9s. 6d.; black, 7s. to 9s.; Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum oil steadier inclined; Russian spot quoted 6½d. to 6¼d.; American, spot, 7½d. to 7¾d.; water white, 8¼d. to 8½d. Petroleum Spirit: American, 9¾d.; Deodorised, 10d. Turpentine further advanced; American, spot, 39s. 9d. to 40s.; March-May, 40s.; May, 39s. 3d. to 39s. 6d.

OPIUM—Market is firm at nominally unchanged prices, there being no business of any particular importance passing in the article.

PARAFFIN WAX—Unchanged at 2¾d. to 3d. per lb. for crude, and 3¼d. to 4d. for refined.

PHENACETIN—Makers quote 5s. 3d. per lb. for crystals and powder in 5-cwt. lots. There are, however, sellers from second-hand at something below these figures. Bayer's make is held for a fancy price, say, 8s. to 9s. 6d. per lb., according to quantity and packing.

PITCH—8s. 6d.

POTASH COMPOUNDS—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, spot, London, crystals and powder, 4d. to 4½d. nett. Iodide 10s. 6d. per lb. Permanganate: Small crystals quoted, 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow, English make, 7¾d.; Beckton, 7½d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER—Steady at £9 12s. 6d. per bottle from the importer and 6d. less from second-hand.

QUININE—After the small shipments of bark from Java for last month comes the report that not only will the quantity of bark to be offered at next auctions in Amsterdam be small, but also that the Quinine contents of same will be low. In consequence, the market has hardened perceptibly, there being buyers of B&S and/or

Brunswick at 1s. 5½d. per oz. for spot and March, 1s. 5¾d. for May, and 1s. 5¾d. to 1s. 6d. per oz. for July delivery.

ROSIN—Strained, spot, 5s. 3d., ex-wharf. For shipment, 4s. 10½d., March-May and April-June sailer.

SALICINE—Remains very firm at late advance to 5s. 6d. per lb.

SALICYLATES—It is rumoured that an advance is impending in these, as also in Salol; meanwhile, prices remain nominally unchanged, but makers decline to book fresh orders; buyers even experience considerable difficulty in obtaining delivery against existing contracts.

SANTONINE—Makers still quote 11s. 3d. to 11s. 9d. per lb., according to quantity.

SHELLAC—The market remains quiet, and business privately on the spot is of a retail character, but prices are fully steady. For arrival no sales have transpired in TN Orange and quotations are unaltered, but a good business is said to have been done in AC Garnet for March-May shipment at 60s. c.f. and i. For March delivery 100 cases TN Orange have been sold at 63s. per cwt., which shows a slight advance in value. The supplies at auction to-day were moderate and much less than originally advertised. Second Orange met a fair demand at steady last sales' rates to rather better, fair TN selling on a basis of 62s. No Garnet was offered. The small quantity of Button partly sold at about previous prices. A total of 711 cases offered and about 500 cases sold at and since the sale. Second Orange: Of 627 cases about 450 sold, partly without reserve, fair bright free TN at 62s., ditto rather broken at 61s. to 62s., fair reddish at 61s., broken ditto at 60s., strong curly livery at 58s. to 59s., good cakey TN at 60s., blocky red at 59s. to 59s. 6d. Button: Of 84 cases 27 sold, partly without reserve, broken palish at 67s., fair seconds at 60s. to 62s.

SODA COMPOUNDS—Crystals, barrels quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 3¾d. per lb. Bicarbonate landed, £7 5s. Bromide, 2s. 1½d. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet on spot; refined, £8 10s.; ordinary, £8 5s.

SPICES (VARIOUS)—Pepper (black): At auction no Singapore was catalogued. 63 bags Aleppy sold, grayish stalky, rather dusty, at 6d. 12 bags fair Ceylon sold at 6½d. White Pepper firmly held. Of 110 bags and 20 cases Singapore in auction only 38 packages sold; good bold, at 10½d. to 11d. No Penang offered. Chillies firm. 20 bags fine bright Japan bought in at 60s. Pimento firm. 302 bags sold at 3¼d. to 3¾d. for middling to fair. Cinnamon: At auction 23 bales Wild sold without reserve at 7½d. Cinnamon Chips and Bark: 231 packages Wild were difficult of sale, and all bought in. Nutmegs: Neglected, and 21 cases Penang were bought in. West Indian, 6 boxes and 91 barrels, etc., sold; 68's at 1s. 9d., 73's slightly wormy at 1s. 2d., 85's ditto at 1s. 1d., 97's long brown at 9d., 106's limes at 9d. Mace quiet, and 13 cases Penang bought in; good pale and reddish part mouldy at 1s. 7d. West Indian, 16 cases sold; good to fine pale, 1s. 9d. to 1s. 11d.; fair red, 1s. 5d. to 1s. 6d.; broken, 1s. 2d. to 1s. 3d.

STICKLAC—At auction 25 cases Madras offered and bought in at 57s. 6d.

SULPHATE OF COPPER—Is quoted £23 15s. to £24 10s. per ton on the spot, according to quantity and make.

SULPHONAL—Firm at makers' prices, which remain at 20s. per lb. for 10lb. lots in bulk paper-packing for both crystals and powder, there being practically nothing offering from second-hand below this figure.

TAR—Stockholm, 25s. to 25s. 6d.; Archangel, 18s. to 18s. 6d.

THYMOL—Remains very firm at 10s. 6d. to 11s. per lb., it being reported that fresh supplies of the raw material (Adjowan Seed or Wild Thyme) cannot become available for a considerable time to come.

TURMERIC—At auction 621 packages Madras met a slow demand and all bought in, including good bright finger at 35s., and ordinary dull at 32s. Privately there is little business to report, but previous rates are maintained for all descriptions, Bengal at 32s., Cochin split bulbs at 12s., and good bright Madras finger at 35s.

TURPENTINE—Has displayed increased activity (fully 7,000 to 8,000 barrels changed hands), large resales were placed on the market which were quickly absorbed, and prices closed strong, and at best. American, spot, 40s.; March-April, 39s. 9d. to 40s.; May, 39s. 3d. to 39s. 6d.; June, 37s. 3d.; July-December, fully 5,000 barrels sold at 33s. 10½d. and 34s., and 34s. 1½d. asked at the close.

Calendar for the Week.

Sunday, Feb. 11. Sexagesima Sunday. Sun rises 7.25; sets 5.5.

Monday, Feb. 12. Sun rises 7.23; sets 5.7.

Tuesday, Feb. 13. Sun rises 7.21; sets 5.9.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION, County Restaurant, at 9 p.m.—Conversational Evening on Trade matters.

PHARMACEUTICAL SOCIETY, 17, Bloomsbury Square, London, W.C., at 8 p.m.—Evening Meeting. Paper by Edmund White on "Aromatic Spirit of Ammonia."

ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, W.C.—Annual General Meeting.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY, Masonic Hall.—Annual Ball.

Wednesday, Feb. 14. O 1.50A. Sun rises 7.19; sets 5.11.

MANCHESTER PHARMACEUTICAL ASSOCIATION, Victoria Hotel.—J. Taylor on "The Outlook in Pharmacy."

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION, Hotel Metropole West Clayton Street, at 8.30 p.m.—"Some Notes on the Pharmacopoeia," by F. R. Dudderidge, and "The Deterioration of Spt. Ether. Nit.," by F. W. Pittuck and G. F. Mersou.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.—Paper on "Pharmaceutical Topics," by G. Squire.

Thursday, Feb. 15. Sun rises 7.17; sets 5.12.

CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by E. Divers and Masataka Ogawa; S. Young and Emily C. Fortey; E. J. Russell, and N. Smith, and A. G. Perkin.

CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, W., at 9 p.m.—W. A. Knight on "Insects which Infest Crude Drugs."

LINNEAN SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—J. C. Shenston on "Photography of British Plants." Dr. R. F. Scharff on "A New Land Planarian from the Pyreuees."

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION, White Bull Hotel, Blackburn.—Annual Dinner.

Friday, Feb. 16. Sun rises 7.16; sets 5.14

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, West Regent Street, at 9.15 p.m.—A communication by J. Lothian and B. Cockburn.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY, School of Pharmacy, 6, Sandon Terrace, Upper Duke Street, at 8.30 p.m.—Paper by Dr. J. B. Nevins on the "History of Materia Medica."

ROYAL INSTITUTION, Albemarle Street, London, W., at 9 p.m.—H. Warrington Smyth, on "Life in Indo-China."

Saturday, Feb. 17. Sun rises 7.14; sets 5.16.

INTER-PHARMACY FOOTBALL LEAGUE, Wormholt Farm.—Metropolitan College v. Westminster. Referee supplied by the "Square."

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock, Alexander, Beaumont, Bradley, Davis, Deck, Ferrall, Fleming, Forster, Gifford, Giles, Gilmour, Hadwen, Herbert, Irving, Mason, O'Halloran, Patridge, Poppelreuter, Priese, Reynolds, Robson, Walton, Waterhouse.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Publications.—Valuable books in Chemical and Technical subjects for sale at reduced prices, post free; in good condition.—Technical Library, 15, Drummond Road, Bournemouth.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Attfield's Chemistry, Latest Edition. Cash.—L. F. Elmitt King Street, Newcastle, Staffs.

B.P. and Squire's Companion, Latest Editions.—E. A. Rixen, Stanley Road, Teddington.

Old Electric Lamps and Scrap Platinum for prompt cash. P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Publications Received.

GOLDEN RULES OF PHYSIOLOGY, by J. WALKER HALL, M.B. Ch. B. (Vict.) and J. ACWORTH MENZIES, M.D.C.M. (Ed.) "Golden Rules" Series, No. VI. Pp. 80. Price 1s. Bristol: John Wright and Co. 1900. From the Publishers.

MATRICULATION DIRECTORY, No. xxvii., January, 1900, with articles on the Special Subjects for June, 1900, and January and June, 1901. Pp. 142. London: University Correspondence College, 32, Red Lion Square, Holborn, W.C. From the Publishers.

NEWS IN BRIEF.

NEXT WEEK'S JOURNAL will be sent to every registered chemist in Great Britain, the total issue exceeding seventeen thousand copies.

THE EXHIBITION OF PHOTOGRAPHS by Mr. J. Craig Annan, now being held at the Royal Photographic Society's House, 66, Russell Square, London, W.C., will remain open from 10 a.m. to 4 p.m. till the end of the month.

MR. F. A. UPSHER SMITH, Demonstrator in Pharmacy at the Pharmaceutical Society's School of Pharmacy, has been successful in passing the Matriculation Examination of the University of London, held in January, his name appearing in the First Division.

MR. ALEX. NAPIER, of Newcastle-on-Tyne, who has been on the staff of Messrs. Armour and Co., has transferred his services to Messrs. Harkness, Beaumont, and Co., of Edinburgh, and will now represent that firm in the North of England and Midlands.

Mr. URE (*Linlithgow*) has brought in the Petroleum Bill rejected last year, or, at any rate, one very much like it, and Mr. Provand (*Glasgow*) is jogging the Ministerial memory about the Government Bill on the same subject, promised last session.

FOOTBALL.—The return match between the Metropolitan College of Pharmacy and Kensington Rangers was played at Acton on Saturday, February 10, and resulted after an even game, in a draw, one goal all.

MR. JAMES ELLIMAN, of Slough, has given ten beds to the Imperial Yeomanry Hospital, and he will maintain them for twelve months. This is equivalent to a donation of £1,500. Mr. Elliman has also given £1,000 towards the cost of a new drill-hall for the Slough Volunteers.

PRESENTATION OF MEDALS TO LORD RAYLEIGH AND SIR H. E. ROSCOE.—A special meeting of the Manchester Literary and Philosophical Society was held on Tuesday, for the presentation of the Wilde medal for 1900 to Lord Rayleigh, a Dalton medal to Sir Henry Roscoe, and the Wilde Premium for 1900 to Professor A. W. Flux. There was a large attendance.

ANOTHER BOILER RESTRICTION BILL made its appearance on Tuesday, viz., that of Mr. J. Samuel (*Stockton*), which aims at the certification of persons in charge of steam generating apparatus. Mr. Galloway (*S.W. Manchester*) has notified his intention of blocking the Boiler Bills, and it may be worth while for manufacturing chemists to urge other members to do likewise, and to keep an eye on Mr. Fenwick, Mr. Samuel, and Sir William Houldsworth, and their respective followings of registration enthusiasts.

KING'S COLLEGE EXTENSIONS.—The dinner postponed from last autumn, in aid of King's College, will be held next Wednesday in the hall of Lincoln's Inn, under the presidency of Mr. A. J. Balfour. In order to meet increasing demands for space, and to keep pace with modern requirements, the Council have been obliged to undertake very extensive additions to and improvements in the departments of physiology, bacteriology, anatomy, botany, geology, public health, architecture, and applied mechanics. For those purposes, and for the resulting equipments and adaptations, an expenditure of not less than £18,000 has to be met immediately. The Hon. W. F. D. Smith is the hon. treasurer.

SHEFFIELD CHEMISTS' BALL.—The annual ball, under the auspices of the Sheffield Pharmaceutical and Chemical Society, one of the objects of which is to benefit the Benevolent Fund of the Pharmaceutical Society, was held at the Masonic Hall on Tuesday, February 13, and was very successful. About seventy guests attended. At supper, the loyal toast was enthusiastically honoured, and Mr. G. Squire (president) proposed "Success to the Chemists' Ball," which was drunk with heartiness, and responded to by Mr. Carr. Messrs. H. Antcliffe and C. F. Carr were the M.C.'s, and the stewards were Messrs. G. Squire, G. T. W. Newsholme, J. B. Pater, A. R. Fox, and E. C. Exell. Mr. Only's band was in attendance, and a very enjoyable evening was spent.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, FEBRUARY 14, 1900.

Good and varied business has been done during the week, with advances in several important and staple articles, oils particularly. Heavy sales of Kola Nuts of good quality will be noticed together with Chilian Honey, Beeswax, and Quillaya Bark. A little more attention has been shown as regards Linseed and Canary Seed, of which fair amounts have moved off. In the Chemical Market Caustic Soda and Bleaching Powder are scarce, whilst Chlorate of Potash is dearer, and also Ammonium Sulphate.

AMMONIUM SALTS.—Sulphate, £12 per ton; Sal ammoniac, 38s. to 40s. per cwt.

BEEWAX.—Small sales of Chilian have been made at £7 5s. per cwt.

BLEACHING POWDER.—Is dearer and selling now at £7 to £7 10s. per ton.

CANARY SEED.—Business has been better, and some 800 bags of Turkish have changed hands at 31s. 9d. per 464 lbs., with an advance in holder's price to 32s. 6d. Early in the week 50 bags made 33s. 6d. Of Spanish, 30 bags sold for 45s. per 464 lbs.

CARNAUBA WAX.—7 bags of medium went for 62s. 6d. per cwt.; 80 bags of grey at 55s.; and yellow offers at 80s. per cwt.

CHILLIES.—27 bags of common Sierra Leone found buyers ex-quay at 32s. per cwt. A little has been done in good ditto privately.

COPPER SULPHATE.—Is in improved demand at the advanced rate of £24 10s. to £24 12s. 6d. per ton.

FOENUGREC.—About 10 tons of Syrian sold ex-store at 6s. 6d. per cwt.

HONEY.—60 barrels of Chilian in all have changed hands at 30s. per cwt. for Pile X., and 25s. 6d. for Pile I.

KOLA NUTS.—10 tons of fine dried fruit found buyers at 1½d. per lb. ex-quay, and 5 tons ex-store at the same price.

LINSEED.—Considerably more business has been done this week than of late. River Plate, "to arrive," Jan.-Feb. shipment, has been selling at 43s. per 416 lbs. 4 per cent. basis, and Calcutta ditto, Feb.-March, at 45s. 6d. ditto. 50 tons of Karachi went for 46s. 6d., and 35 tons of North American at 47s. 6d. to 48s.

OILS (FIXED) AND SPIRITS.—Castor of all sorts continues very firm, with higher rates expected. Calcutta is at 3½d. per lb.; French: 1st pressure at 3¼d.; 2nd pressure, 3d.; and 2nd Sulphur, 2½d. Sales include 250 cases of Calcutta at 3¼d.; also lots March-May and April-June shipment at 3⅜d. 15 tons of French, 1st pressure, at 3⅜d., and 18 tons of 2nd Sulphur at 2⅞d. per lb. Olive is steady at £36 to £36 10s. for Spanish, but the demand is limited. Linseed Oil of Liverpool make has experienced a further advance, and is firmly held for 24s. 6d. to 25s. per cwt. Cotton Seed Oil: Liverpool refined, packed for export in barrels, is firm at 24s. 6d. to 25s. Spirits of Turpentine have advanced to 41s. 9d. per cwt., and are very firmly held.

POTASH SALTS.—Chlorate dearer, 4d. per lb. Cream of Tartar quiet of sale at 74s. to 80s. per cwt.

QUILLAYA BARK.—Is firm at £13 5s. to £13 10s. per ton.

SODA SALTS.—Caustic is very firm and scarce at 76 to 77 per cent. £11 per ton; 70 per cent., £10 5s. per ton. Crystals, £3 5s. to £3 7s. 6d. per ton. Nitrate, 8s. 6d. to 8s. 9d. per cwt., in easy demand.

LONDON, THURSDAY, FEBRUARY 15, 1900.

Business in Drugs and Chemicals has been extremely quiet during past week. Prices, nevertheless, keep very firm, some articles showing a tendency to further advance in value. Carbolic acid is again dearer, as also is Chlorate of Potash. Camphor very firm; same may also be said of Salicine and Salicylic Acid and Salicylate of Soda. Salol has advanced in price. Quicksilver and Mercurials, Bromides, Iodides, and Bismuth Salts steady. Cod Liver Oil quiet.

Glycerin rather firmer. Cocaine also firmer. Citric Acid firm. Acid Tartaric and Cream of Tartar unchanged. The following are the prices ruling for some articles of chief interest:—

ACETANILIDE.—There are persistent rumours of an impending advance in price. The article meanwhile, however, remains dull and weak at nominally unchanged prices.

ACID CARBOLIC.—Very firm at 1d. per lb. advance, makers now quoting 35/36° ice crystals, in large bulk packing, 1s. per lb.; 39/40° ice crystals, 1s. 0½d. to 1s. 0¾d. per lb.; and 39/40° detached crystals (the B.P. quality), 1s. 1½d. to 1s. 2d. per lb. Crude, 60° F., 3s. 3d. per gallon; 75° F., 4s. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 7d. to 1s. 8d. per gallon; ditto 25-30 per cent. of dark colour, 11d. to 1s. per gallon in 40-gallon casks.

ACID CITRIC.—Remains firm, makers quote 1s. 5d. per lb. for crystals in 5 cwt. casks, but are not ready sellers thereat.

AMMONIA COMPOUNDS.—Bromide 2s. 2d. per lb., Carbonate 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt.; ditto, commercial, 30s. to 32s. 6d. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate steady; gray, 24 per cent., London prompt, £11 17s. 6d. to £12; Hull, prompt, £11 17s. 6d.; Leith, prompt, £11 17s. 6d.; Beckton, Feb.-April, £12; May-June, £11 17s. 6d.; Beckton terms, prompt, £11 17s. 6d.

BORAX AND ACID BORACIC.—Are steady at unchanged price.

BROMIDES.—Are firm, without alteration in value.

CASTOR OIL.—Dearer. Belgian first pressing, spot, £30 10s.; February-June, £30, f.o.b. Antwerp; second pressing, spot, £28 10s. per ton, ex wharf. Hull manufactured guaranteed cold drawn pure pharmaceutical, £32 10s. per ton in barrels, 3½d. per lb. in cases; pure firsts, £30; seconds, £29 per ton in barrels; first, 3½d. per lb. in cases; seconds, 3½d., ex wharf London.

CLOVES.—No Zanzibar were offered in auction; 2 cases picked Penang were bought in. Privately, Zanzibar continue strong at advancing prices, closing again ¼d. higher, but business has been of less volume, owing to the reservation of sellers. Sales have taken place, including spot, on a basis of 4 1/16d. for fair, Jan.-March delivery, at 4½d., sellers. For arrival no sales are reported, closing buyers March-May shipment at 4d., c.i.f.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 2s. Benzole, 50 per cent., 10d. per gallon; 90 per cent., 8½d. Creosote, 3d. per gallon. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon; Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d.; 90 per cent. at 160° C., 1s. 4d.; 90 per cent. at 190° C., 1s. 3d. per gallon. Anthracene: A, 3½d. per unit; B, 2¾d. Pitch, 36s. per ton, f.o.b. Tar: refined and for crude, 12s. 6d. per barrel, 2¼d. per gallon.

COCAINE.—Has become decidedly firmer at 16s. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, this being makers' present price, while there appear to be no sellers of good brands from second-hand below above figure.

COD LIVER OIL.—Dull at about prices quoted last week.

CODEIA.—Remains very firm at unchanged price.

CUTCH.—Business continues on a small scale at previous rates. The shipments of Cutch from Rangoon (as per Messrs. Bulloch Bros. and Co., Limited, telegram) from January 1 to February 13 to all parts were 1,480 tons, against 500 tons in 1899, and 680 tons in 1898.

GAMBIER.—Is without alteration, there being still no business to report; for arrival March-May steamer nominally quoted at 17s. 4½d.

GINGER.—Of 917 bags and 56 cases Cochin offered, only 116 packages sold at about previous rates. Small and ends rather roughly cut and scraped, little wormy, at 33s. 6d. to 34s. New crop Calicut rough bought in at 37s. for fair bright, plump, medium and small; old crop, medium and small, little bold but rather wormy, sold at 31s. 6d.; new crop, washed rough, bought in at 35s. for medium and small plump; old crop, small and wormy, sold at 26s. Jamaica: 115 barrels and 10 half-barrels offered, of which 55 barrels sold, common to fair bright at 52s. to 61s. 6d.

IODIDES.—Remain fairly steady at the prices quoted last week.

MERCURIALS.—No change in price to report.

MORPHIA.—Is unchanged at 4s. to 4s. 3d. per oz., according to quantity, for the Hydrochlorate Powder.

PHENACETIN.—Makers maintain their advanced price of 5s. 3d. per lb. for crystals and powder in 5 cwt. lots; there are, however, sellers from second-hand at a rather lower figure.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½d. per lb. Bromide, 1s. 10½d. per lb. Chlorate, spot London, crystals and powder, 4½d. to 4¾d. nett. Iodide, 10s. 6d. per lb. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate yellow: English makes, 7¾d.; Beckton, 7¾d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity.

QUICKSILVER is still quoted £9 12s. 6d. per bottle from the importer, and 6d. per bottle less from second hand.

QUININE.—Has been extremely quiet, and business on a small scale, but prices are firm; the sales comprise about 10,000 oz. B&S and/or Brunswick, March delivery at 1s. 5¾d. and sellers, and May at 1s. 6d.

SALICINE.—Appears to be very scarce; makers are declining to look fresh orders at the advanced price of 15s. 6d. per lb., stating that they have none to offer.

SALICYLATES.—Makers have postponed any alteration in price for a few weeks in order, if possible, to be able to judge what the future price of the raw material (acid carboic) is likely to be, say, during the present year. Meanwhile, the agents for the makers say that they have instructions not to book further orders, for the present, at any price. As far as can be judged, an important advance in price of acid and of soda salicylate would appear to be inevitable.

SALOL.—Makers have advanced price 6d. per lb. to 3s. 8d. per lb.

SHELLAC.—The market remains quiet in all positions. On the spot only retail sales have occurred at steady rates. For arrival business continues suspended and quotations are nominal, March delivery TN is quoted buyers at 62s., August value, 64s.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 3¾d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 1½d. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent, £1 less. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet on spot. Refined, £8 17s. 6d. ordinary, £8 12s.

SPICES (VARIOUS).—Black Pepper: 161 bags Singapore damages sold at 5¾d. to 6 1/16d., according to quality. White Pepper: 8 cases and 17 bags Singapore sold at full rates, good bold at 10½d. to 11½d., good fair at 9¾d. Capsicums easier: Of 165 bales Bombay only 22 sold, fair red on stalk at 35s. Cassia Vera: 50 bales Padang quills sold, coarse, partly broken, at 26s. Cassia Lignea: 6 boxes sold, without reserve, new selected at 43s. 6d. Broken Cassia: 200 bales new import offered and 100 bales sold at 32s. Cinnamon Chips and Bark in good supply, and mostly sold at previous rates: 578 bags wild sold, quillings at 1½d. to 2¾d., ordinary chips at 1d., coarse bark at 1d. to 1¼d. Mace slow of sale: 41 cases Penang bought in, fair to good pale at 1s. 7d. to 1s. 10d. 1 case of Bombay sold, fair red at 1s. 6d. Nutmegs: 9 packages West Indian sold, 79's at 1s. 3d., 102's at 10d., 120's at 8½d. to 9d. Pimento dearer: Of 551 bags 121 sold, ordinary to good at 3 7/16d. to 3¾d.

SULPHONAL.—Is firm at late advance in makers' prices to 20s. 6d. per lb. for both crystals and powder.

THURSDAY'S DRUG SALES.

To-day's drug auctions comprised sixteen catalogues, and included a very considerable number of lots. On the whole, the sales passed off quietly. Senna sold fairly well at slightly higher rates. Ipecacuanha showed a weaker tendency; otherwise, there is nothing special to which attention might be drawn, the following being the particulars:—

ACONITE ROOT.—16 bags Japan bought in at 28s. per cwt.

ALOES.—190 gourds Curaçoa part sold at 25s. per cwt., subject to approval, balance being bought in at 40s. 36 cases Cape all bought in at 27s. to 30s. per cwt. 10 cases Zanzibar sold at 42s. 6d. 47 kegs Socatrine were taken out at 75s. per cwt.

ANISEEDS.—40 bags good Spanish were taken out at 25s. per cwt.

ANNATTO SEEDS.—13 bags bought in at 3½d. per lb.

ANTIMONY.—30 cases crude Japan (black sulphide) bought in at £23 per ton.

ARECA NUTS.—30 bags bought in at 21s. per cwt.

ARGOL.—4 bags Cape part sold at 45s. per cwt. Other 26 bags sold at 55s. for good quality down to 35s. per cwt.

ASAFETIDA.—148 cases all bought in at 37s. 6d. per cwt., with exception of a few cases of very low quality offered without reserve, and which sold at 7s. to 19s. per cwt.

ASPHALT.—44 cases Syrian were taken out at 33s. per cwt.

BALSAM PERU.—5 cases were taken out at 7s. per lb.

BALSAM TOLU.—12 cases part sold prior to the auctions, balance being taken out at 1s. 7d. per lb.

BUCHU LEAVES.—17 bales, part sold at 1s. per lb. for good rounds, good longs being bought in at same figure.

CALUMBA ROOT.—75 bags sold at 25s. to 25s. 6d. per cwt., other 40 bags held for 26s. to 30s.

CAMPHOR.—1 case Formosa sold, subject to owner's approval, at 1s. 10d. per lb. 25 cases refined Japan bought in at 2s. 1d. for 1 oz. tablets, and 2s. 2d. per lb. for ¼ oz. tablets.

CARDAMONS.—142 cases were chiefly bought in, good bold Ceylon being held for 3s. 6d. per lb.; medium for 2s. 10d. per lb., 1 case of lower quality and slightly mouldy selling at 2s. 1d. per lb. Fair seed sold at 2s. 2d. per lb.; other 113 cases Ceylon part sold at 3s. for fairly bold pods down to 1s. 6d., 2 cases seeds realising 2s. 2d. per lb. 32 cases pods offered, without reserve practically all sold at 1s. 5d. to 1s. 8d. per lb.

CASCARILLA BARK.—10 bales chiefly bought in at 65s. per cwt., 1 bale selling at 42s. 6d.

CASTORUM.—2 boxes bought in at 70s. and 75s. per lb.

CHILLIES.—3 cases Japan taken out at 45s. per cwt.

CHINA SOY.—20 casks were bought in at 1s. 3½d. per gallon.

CINCHONA BARK.—Of 49 packages Crown and Grey 6 bales sold at 9½d. per lb., the damaged realising 6d. down to 1d. per lb. Balance bought in at 9d. to 1s. 1d. 20 bales Carthagena bought in at 7d. to 8½d. per lb.

COCA LEAVES.—6 packages chiefly bought in at 1s. 4d. to 1s. 6d. per lb., 1 case selling at 1s.

COLOCYNTH.—8 cases broken Turkey taken out at 1s. 7d. per lb., 9 cases Persian at 5d.

CROTON SEED.—84 bags were all bought in at 65s. per cwt. for good bold, bright seeds.

CUBEBS.—10 bags of only medium quality realised 22s. per cwt. Of other 84 bags, 11 bags sold at 20s. per cwt., balance being held for 25s.

CUMMIN SEEDS.—10 bags fair Malta were taken out at the nominal price of 40s. per cwt.

CUS CUS ROOT.—9 bales bought in nominally at 20s. per cwt.

DRAGON'S BLOOD.—2 cases good saucers sold at £12 5s. to £13 per cwt., while fair bright lump in bags was taken out at £17; other 6 cases bought in at £10 5s. 6 cases reeds offered, without reserve, realised £7 15s. to £7 17s. 6d. per cwt.

ESSENTIAL OILS.—3 cases Cinnamon Leaf taken out at 2d. per oz.; 4 cases Nutmeg at 2½d. per oz.; 2 cases Star Aniseed at 6s. 2d. per lb.; 10 cases Cajaputa at 2s. 8d. per bottle; 4 cases dementholised Japan Oil Peppermint, Kobayashi brand, at 3s. 9d. per lb.; 10 cases fair Commercial Oil Eucalyptus at 1s. 4d. per lb.; 2 cases Globulus at 2s. 1d.; 5 drums Citronella at 1s. per lb.; 26 cases Lemon Grass at 3d. per oz.; 1 case Distilled West Indian Oil of Lime sold at 3s. 3d. per lb. 1 case West Indian Oil of Orange at 5s. 11d. per lb.

GAMBOGE.—Two cases medium pipe taken out at £8 5s. per cwt.

GENTIAN ROOT.—26 bags of fair medium quality were taken out at 14s. per cwt.

GUAZA.—20 robbins of fair tops were taken out at 7d. per lb.

GUM ARABIC.—21 bales medium to fair Turkey sorts bought in at 70s. to 82s. 6d. per cwt.

GUM BENJAMIN.—Good seconds Sumatra realised £8 7s. 6d. to £9 5s., lower quality ditto selling at £6 12s. 6d. to £6 15s. per

cwt. 75 cases Penang all sold at 60s. to 61s. 6 cases medium Siam taken out at £9 15s. per cwt., 6 cases low quality ditto selling without reserve at 60s. per cwt.

GUM GALBANUM.—14 packages part sold at 1s. 3d. per lb. for fair almonds, dark, blocky, and inferior being taken out at 9d. to 1s. 1d.

GUM GUAJACUM.—1 case good bright lump bought in at 2s. 6d. per lb.

GUM KINO.—4 cases blackish Cochin were taken out at 2s. per lb.

GUM MYRRH.—15 bags dark siftings were bought in at 35s. per cwt., 8 casks of good quality at 85s.

GUM SANDARAC.—6 casks were taken out at 57s. 6d. per cwt.

GUM TRAGACANTH.—8 packages all bought in at £13 10s. to £15 per cwt., according to quality.

HONEY.—18 packages good Jamaica were bought in at 35s. per cwt., other 22 packages of only medium quality sold at 27s., subject to approval. 182 cases California bought in at 39s., 14 cases Italian at 34s.

IPECACUANHA.—14 bales fair Rio all bought in at 10s. to 10s. 6d. per lb., 9s. 9d. being refused for 1 case ICCD. Of 10 packages Carthagena 2 cases sold at 7s. and 1 case at 6s. 11d. per lb.; balance bought in at 8s. 6d.

JALAP.—4 bags fairly heavy tubers were taken out, 6d. per lb. being the limit.

KOLA NUTS.—97 bags were taken out at 2½d. to 3d. per lb.

KAMALA.—Nine cases were taken out at 6d. per lb.

LIME JUICE.—10 puncheons Jamaica bought in at 3s. per gallon.

LIQUORICE ROOT.—52 bales, all bought in at 14s. to 15s. for good natural, broken and cut. Ten bags good decorticated powder at 39s. 6d. per cwt.

MATICO.—16 bales were bought in at 3½d. per lb.

ORANGE PEEL.—26 cases all bought in at 9d. to 1s. per lb. for fair to good thin cut and 6d. per lb. for inferior quality.

ORRIS ROOT.—21 bags all bought in at 50s. to 55s. per cwt. for medium to fair Florentine.

RHATANIA ROOT.—74 bales were all taken out at 4d. to 4½d. per lb.

RHUBARB.—Fair round Shensi was taken out at 2s. 8d. per lb., flat at 3s., medium bold ditto at 2s. 2d., medium round selling at 2s., and inferior ditto at 1s. 6d., trimming root at 1s. 11d., pickings at 1s. 1d. to 1s. 2d. per lb. 21 cases Canton were all bought in at 11d. per lb., fair flat high dried at 9½d. to 10d. per lb., 2 cases round selling at 5½d. per lb. Without reserve, 4 cases round and flat Shensi sold at 9½d. per lb., other 4 cases at 5¾d., 2 cases flat at 1s. 1d., other 3 cases at 8¾d., bold flat Canton at 9½d. to 10d., round at 9½d. per lb.

ROSE OIL.—2 pots were bought in at 4d. per oz.

SARSAPARILLA.—Three bales low Honduras sold at 6d. per lb., subject to owner's approval. 22 bales Jamaica were held from 1s. 6d. to 1s. 8d. Twenty-six bales Lima, part sold at 1s. per lb. for 1 CCD.

SENA.—14 packages Alexandria, part fair, part broken leaf and off colour, were all bought in, 7d. per lb. being price mentioned. Other 53 packages Alexandria also bought in at 9d. per lb. down to 5d., 1 bale sea damaged selling at 5½d. per lb. 7 packages Alexandria pods taken out at 8d. 68 bales Tinnively all sold at 4d. per lb. for fair down to 3d. per lb. for inferior stained and broken leaf, 1 bale 4 CSD selling at ½d. per lb., other 36 bales all sold at about same parity, 4 bales good leaf fetching 7d. per lb.

SQUILLS.—20 bags were all bought in at 3d. to 3½d. per lb.

TAMARINDS.—40 casks East Indian were taken out at 10s. to 10s. 6d. per cwt.

TONQUIN BEANS.—Fair Angosturas were bought in at 3s. 6d. per lb., 1 case low inferior beans selling at 1s. 1d. per lb.

VANILLOES.—1 tin from Sydney bought in at 7s. 3d. per lb. for 3½" × 6", and one tin from Auckland at 7s. 3d. per lb. for 5" × 6".

WAX.—Fair Jamaica was bought in at £7 10s., medium East Indian at £5 15s., fair Madagascar sold at £7 2s. 6d. to £7 5s. per cwt., medium Zanzibar at £5 17s. 6d., fair ditto at £6 17s. 6d. to £7. Good Australian bought in at £7 15s.

Calendar for the Week.

- Sunday, Feb. 18.** Sexagesima Sunday. Sun rises 7.12; sets 5.18.
- Monday, Feb. 19.** Sun rises 7.10; sets 5.19.
- Tuesday, Feb. 20.** Sun rises 7.8; sets 5.21.
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m. Professor R. W. Wood, of America, will read a paper on "The Diffraction Process of Colour Photography" or other subject.
- Wednesday, Feb. 21.** Sun rises 7.6; sets 5.23.
PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 36, York Place, Edinburgh.—Evening Meeting.—Papers will be read by Dr. L. Dobbin on "The Detection of Sulphates in Presence of Thiosulphates"; and by J. Rutherford Hill on "Strychnine Hydrochloride and Potassium Arseniate."
SCHOOL OF PHARMACY, Caledonian Salon, Holborn Restaurant, W.C.—Annual Dinner at 7 p.m.
WESTERN CHEMISTS' ASSOCIATION (of London), Westbourne Restaurant, Craven Road, W., at 9 p.m.—General discussion on Items of Interest.
- Thursday, Feb. 22.** £ 4.44 A. Sun rises 7.4; sets 5.25.
CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Notes on "Entomology," by R. E. Lownsbrough.
MIDLAND PHARMACEUTICAL ASSOCIATION, Mason University College, Birmingham.—Lecture by H. W. Jones, on "The Rise and Development of Modern Photographic Processes."
- Friday, Feb. 23.** Sun rises 7.1; sets 5.27.
GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Rest and Recreation.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Professor J. H. Poynting on "Recent Studies in Gravitation."
- Saturday, Feb. 24.** Sun rises 6.59; sets 5.29.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

What Offers?—One Cwt. English beeswax; new.—Thomas, Chemist, Newcastle Emlyn.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

What Offers?—Bound separate volumes "Pharmaceutical Journal," 1841 to 1853, 1858 to 1870. Good Condition.—Goodess, Chemist, Leicester.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Publications.—Valuable books in Chemical and Technical subjects for sale at reduced prices, post free; in good condition.—Technical Library, 15, Drummond Road, Bournemouth.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Chemical Balance, good condition. Also Hand Camera; about one guinea.—W. Nall, Chemist, Milnrow.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Microscopes.—Advertiser requires 5 or 6, second-hand, good condition. State price, objectives and maker's name.—Phlox, "Pharm. Journal" Office, 5, Serle St., London, W.C.

FREE FORMULÆ

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE 1s. 8d. per oz. Tin, with Labels, Post free or through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—"I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable."

F. W. B., Manches er:—"Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much."

J. J. G., Folkestone:—"I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation."

D. R., Swansea:—"I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production."

R. N., Darlington:—"I have made our Tooth Paste from your formula for years."

Received too late for Classification.

QUALIFIED; 23½; disengaged. London and provincial experience.—A. COLLINS, Regent St., Halifax.

JUNIOR.—Family and Dispensing business, also photography, sundry, and cash. Indoors; alternate week half-day off. Plenty of work and exceptional chances of early promotion to smart man.—Usual references, etc., to LAKE'S Select Pharmacy, Tiverton.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock, Baird, Barker, Bartlett, Booth, Botham, Chapman, Christy, Clark, Cross, Dowdy, Elliot, Fielding, Gilmour, Harri dance, Hill, Martin, Philp, Pickering, Richardson Smith, Sturton, Taylor, Winston.

NEWS IN BRIEF.

DR. GEORGE COULL is to address the Chemists' Assistants of Glasgow on Friday, March 2, on the subject of "Stereo-Chemistry."

MR. JOHN JOHNSTON, of Aberdeen, member of the Pharmaceutical Council, has been appointed on the Commission of the Peace for the City of Aberdeen.

SOME "DISPENSING NOTES," by Harold Wyatt, jun., will be considered by Liverpool pharmaceutical students on Thursday next at the School of Pharmacy, 6, Sandon Terrace, Upper Duke Street, Liverpool.

MR. F. PILKINGTON SARGEANT, Principal of the Leeds College of Pharmacy, and Demonstrator in Toxicology, etc., at the Medical School of the Yorkshire College, has been elected a Fellow of the Chemical Society.

AN EXTRA MEETING of the Chemical Society will be held on Thursday, March 8, at 8.30 p.m., when a lecture on "Recent Researches on Nitrification" will be given by Professor Warington, F.R.S.

TICKETS FOR THE ANNUAL SUPPER of the Edinburgh Chemists', Assistants', and Apprentices' Association, which will be held at the Imperial Hotel, on Friday, March 9, can be obtained from the secretary, Mr. James Lennox, 139, Prince's Street, Edinburgh.

"THE PHYSICAL TESTS OF THE PURITY OF DRUGS" is the subject of a paper by Mr. George Ward to be read at a meeting of the Bradford and District Chemists' Association, held on Tuesday, February 27, at the County Restaurant, at 8.30 p.m.

ALL PUBLIC AND POOR LAW DISPENSERS are invited to attend at St. Bride's Institute, Bride Lane, Ludgate Circus, on Wednesday, February 28, at 8 p.m., when Mr. F. Davis will read a paper on "Some Points in Practical Pharmacy." A special invitation is extended to lady dispensers.

THE LONDON COLLEGE OF CHEMISTRY AND PHARMACY will hold a "Smoker" at the Ganden Hotel, Clapham, on Thursday, March 1, when Mr. Wootton, the principal, will take the chair. All old students will be cordially welcomed.

THE PAPER ON "QUININE," by Mr. H. A. Martin, read at a meeting of the Chemists' Assistants' Association on February 8, should have been published in this week's Journal, but is held over for the present, having been unavoidably crowded out by pressure of other matter.

MESSRS. HARKER, STAGG, AND MORGAN, we understand, have recently been compelled to make very extensive additions to steam manufacturing plant and machinery in their laboratories in order to keep pace with the continually increasing demands on this department of their business.

THE MARCH EXHIBITION of the Royal Photographic Society, at 66, Russell Square, London, W.C., will be provided by the National Photographic Record Association, and will be opened at 8 p.m. on Wednesday, March 7, by Sir Benjamin Stone, M.P. Mr. J. Craig Annan's exhibition will close on Wednesday, February 28.

LITERARY ANATOMY is sometimes curious, as the following instances, collected by *Practical Medicine*, tend to show:—A colonel was "shot in his ticket office," a man was fatally "shot through his door," another received a fatal wound "in his window." He kissed her "upon her reappearance." A poor woman was "shot in the oil regions." The man was fatally "stabbed in the rotunda." Another was "kicked on the highway." A tramp was "kicked upon his sitting down."

TRADE NOTES.

"DYLISSIA" PREPARATIONS.—These preparations, offered by Messrs. Durant and Co., 19, Mount Pleasant, London, W.C., only require to be tried to be appreciated. Dylissia soap is superfatted, pleasantly perfumed, and one of the most satisfactory things of its kind on the market; it lathers freely, and is most agreeable in use. The Dylissia shaving stick is an equally well-made and satisfactory article. Dylissia cream is a preparation with a wool-fat basis, which is supplied both for toilet and medical purposes, and is well suited for either. Dylissia powder is a fine, absorbent, and delicately perfumed toilet preparation, and, like the other specialties of Messrs. Durant and Co., is put up in an attractive style.

SKINNER'S INVALID DELICACIES.—Messrs. G. H. Adams and Co., 101, Leadenhall Street, London, E.C., are the agents in this country for this excellent line in delicacies for invalids, imported from Queensland, and including preserved "turtle for invalids," "invalid turtle jelly," potted dugong, etc., etc. Though tinned, the turtle preparations are of exceptional quality, soups made therefrom being highly nourishing, and possessing a delicious flavour. The potted dugong is prepared from choice parts of young dugong; it is a favourite Queensland relish, and is useful for invalids because of the readily-assimilated fat it contains.

VIROL.—The preparation of bone-marrow known as Virol is now being pushed extensively. It was introduced as a perfect fat food, and has been described by medical experts as an ideal form of fat for children and invalids who cannot take codliver oil. Virol is palatable, easily digested, possesses great nutrient properties, and contains iron in the natural form of red bone marrow. It is supplied by Bovril, Limited, in jars to retail at various prices, from 1s. upwards.

TELEGRAPHIC ADDRESS.—Kay Brothers, Limited, of Stockport, desire their customers to know in future their registered telegraphic address will be "Linsced, Stockport."

FRAGRANT FROSTILLA.—Messrs. Thos. Christy and Company intimate that the labels and literature in connection with Holmes' Fragrant Frostilla have now been so worded as to place the preparation outside the scope of duty. It will, therefore, for the future be supplied unstamped at the price of 7s. 3d. per dozen.

THE BUSINESS OF MESSRS. T. AND H. SMITH AND CO., wholesale druggists and manufacturing chemists, Edinburgh and London, carried on by the trustees and executors of the late Peter Shanklie Smith, has been made over to his sons, Henry Ewing Smith and Thomas Connell Smith, chemists and druggists, who will carry on the business under the same name as previously. Arrangements have been made whereby those gentlemen who have conducted the business as trustees continue to superintend the departments with which they have been identified. The old staff remains with the firm and the business will be continued on the same lines as formerly.

NEWSHOLME'S PORTABLE AMMONIUM CHLORIDE INHALER.—Mr. G. T. W. Newsholme, 27, High Street, Sheffield, has recently introduced a very simple, compact, and portable apparatus for the inhalation of ammonium chloride. A glass tube, closed at one end, has a sponge placed at the bottom; the open end is fitted with a rubber cork, through the centre of which is suspended a glass bulb containing glass wool; near the edge of the cork an inhaler tube is inserted. When required for use, ten drops of ammonia solution is placed on the sponge, and ten drops of acid solution on the glass wool in the bulb. The inhalers are sold at 1s. 9d. each. Spare fittings can be obtained separately.

NEWSHOLME'S POCKET SPITTOON.—To prevent the spread of tuberculosis through the inhalation of the dried and pulverised expectoration of consumptives Mr. Newsholme has also brought out and registered a pocket spitoon, designed on the lines suggested by the Medical Officer of Health for the City of Sheffield. The spitoon is made of stout blue glass with a funnel-shaped neck, fitted with a metal cap. It is of a convenient size for the pocket, and is retailed at 1s. 6d. An Antiseptic Inhaler has also been introduced by Mr. Newsholme. It consists of plaited straw, and is made to fit over the nose and mouth; in this is placed a pad, held in position

by a piece of flexible cane, the necessary solution being dropped upon the pad. Special solutions are prepared for use in catarrh, influenza, bronchitis, and pulmonary affections. It is elegant in appearance and cheap, the price being 1s., thus placing a most effective inhaler within the reach of all classes.

BARCLAY'S 1900 PHOTO CATALOGUE.—Messrs. Barclay and Sons, Limited, 95, Farringdon Street, London, E.C., have this year practically doubled the number of pages in their price list of photographic apparatus and materials, etc. A special feature of the list is that portion devoted to spectacles, the illustrations showing the different styles almost as well as the goods themselves. The photographic section, however, comprises some 160 pages, that devoted to spectacles, barometers, etc., comprising some twenty pages. All chemists who do a photographic trade will find a copy of this list extremely useful.

SYPHONS AND SELTZOGENES.—Messrs. Idris and Co., Ltd., Pratt Street, Camden Town, London, N.W., in addition to their extensive mineral water works, have for many years manufactured their own syphons, owing to the difficulty of procuring syphons with pure tin tops. From simply manufacturing for their own use, Messrs. Idris and Co. now possess what is probably the largest syphon factory in the United Kingdom, with the largest home syphon trade and an important export business. The special attention of one of the directors is devoted to this department, which includes silver-plating, glass engraving, etc., the different processes being conducted by a staff of mechanics skilled in the respective branches of syphon making.

CHEMISTS' OWN-NAME SPECIALTIES.—Messrs. Lorimer and Co., Limited, Britannia Row, Islington, London, N., who claim to be the pioneers of chemists' own-name specialties, have issued a well-printed illustrated price list of their goods, together with an alphabetical list of "own-name" specialties corrected to date (February). The list also contains alcohol percentage tables, a table for making any quantity of percentage solutions, and notes on the metric system of weights and measures.

PETROLEUM EMULSION, ETC.—Messrs. Harker, Stagg, and Morgan, 15, Laurence Pountney Lane, London, E.C., direct attention to their petroleum emulsion, a preparation for which they have an enormous sale. Specially purified petroleum jelly is used in its manufacture, and the firm claim for it permanence and palatability, and that it will keep without change for a very considerable time. Petroleum Emulsion with Hypophosphites, contrary to the opinion sometimes expressed that the hydrocarbon has but little medicinal value, appears to have gained an established position as a remedy, and to be in steadily increasing demand. This excellent product of Messrs. Harker, Stagg, and Morgan will certainly assist in maintaining their reputation.—Deemetinised Ipecacuanha, to the manufacture of which the firm has given special attention, still continues to be used as an effective remedy in dysentery. Concentrated Oil of Lemon, ten times the strength of the ordinary essence, retains in a concentrated form the full flavour of the lemon fruit. It is more satisfactory in use than many of the so-called terpenes oils of foreign manufacture. Messrs. Harker, Stagg, and Morgan make a series of concentrated infusions which really represent the fresh article when diluted, as an inspection of samples will prove. The firm also make a Liquid Annatto (Horseshoe brand) and Golden Butter colouring, which are great favourites in the Midlands, both preparations being of a high degree of strength and not communicating the slightest objectionable flavour to the articles for which they are used.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

John Woodrow Dennis and Fred Woodrow Dennis, trading as John W. Dennis and Son, Chemists and Druggists and Wine and Spirit Merchants, 77, Eastgate, Louth. F. W. Dennis will continue to carry on the business of Chemist and Druggist and Wine and Spirit Merchant, at 77, Eastgate, Louth, under the same style as formerly, while J. W. Dennis will continue to carry on in his own name, and on his own account, at Northgate, Louth, the manufacture and sale of his specialties.

Arthur Simmons Davis and Ernest Isaac Davis, trading as the Elite Portrait Company, 267, High Holborn. Debts will be received and paid by E. I. Davis, who will in future carry on the business.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, FEBRUARY 21, 1900.

Castor-oils have become very firm in tone, with higher rates both spot and forward. More attention has been given to canary-seed during the week, and prices have an upward tend. Good prices are obtainable both for beeswax and better sorts of Carnauba, and several lots have changed hands. A slight advance has taken place in potashes, and at the time of writing they are being firmly held. As regards chemicals prices rule high, with a consequence that business is circumscribed. Further advances have taken place in chlorates and in sulphate of copper.

AMMONIA SALTS.—Salammoniac is firm, 38s. to 40s. per cwt. Sulphate is steady at £12 per ton.

BEEWAX.—25 sacks of Chilian sold for £7 5s. per cwt., and 40 packages of Gambia at £7 per cwt.

BLEACHING POWDER.—Is exceedingly firm at £7 to £7 10s. per ton.

CANARYSEED.—Has been in better inquiry, and sales are fairly numerous; about 500 bags of Turkish have changed hands at 32s. to 33s. 6d. per 464 lbs.

CARNAUBA WAX.—16 bags of good medium went for 73s. per cwt. from store.

COPPER SULPHATE.—Is dearer, £25 per ton.

COPPERAS.—Is firm at 37s. to 39s. per ton.

LINSEED.—Is firm, but idle. Early in the week 858 bags of River Plate sold at auction for 45s. 6d. to 48s. 3d. per 416 lbs., ex quay; and 152 bags Turkish from quay at 49s.

OILS (FIXED) AND SPIRITS.—Castor is firm, but quieter. Sales include Calcutta, 25 cases spot, at 3 $\frac{3}{4}$ d. per lb.; 100 cases forward, January to March shipment, 3 $\frac{1}{4}$ d. per lb.; 100 cases March to May, 3 7-32d. per lb. 3 $\frac{1}{2}$ d. per lb. is now asked for spot parcels. French, 1st pressure, is quoted at 3 $\frac{1}{4}$ d., and 2nd at 3 $\frac{1}{8}$ d. per lb. Olive is held for £36 to £36 10s. per tun for Spanish, and business has been done at the former figure. Linseed oil has gone up a shade, and is in fair demand at 24s. 9d. to 25s. per cwt. Cottonseed oil is in slow demand at 24s. 6d. to 25s. per cwt. Spirits of Turpentine continue steady at 41s. 3d. per cwt.

POTASH SALTS.—Chlorate, 4 $\frac{1}{2}$ d. per lb.; Cream of Tartar, 74s. to 80s. per cwt.; Bichromate, 4 $\frac{1}{2}$ d. per lb. Pearlash quiet at 33s. 6d. to 35s. per cwt.; Potashes have advanced to 27s. 3d. and 27s. 6d. per cwt., and are firm and in fair request. Saltpetre, £21 10s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, £16 per ton. Caustic, 73 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton, and very scarce. Crystals, £3 5s. to £3 7s. 6d. per ton. Nitrate is steady with fair business at the improved price of 8s. 6d. to 8s. 10 $\frac{1}{2}$ d. per cwt.

LONDON, THURSDAY, FEBRUARY 22, 1900.

Business in Drugs and Chemicals has been somewhat quiet during past week. Prices as a rule, however, continue exceedingly firm, and in some cases with a further upward tendency. There has been another flutter in Quinine, which advanced tangibly in value, relapsing again slightly later on. Bromides have also advanced in value. Acid Carbolic, Salicylates, and Salol continue very firm. Acid Citric steady. Acid Tartaric firm; same may be said of Glycerin. Quicksilver and Mercurials very firm. Cod Liver Oil dull and weak. Codeine very firm. Opium and Morphine unchanged, as also are Bismuth Salts. Borax and Acid Boracic steady. The following are the prices actually ruling for some articles of principal interest.

ACETANILIDE.—Is still unchanged, quotations varying from 9 $\frac{1}{2}$ d. to 1s. 5d. per lb., according to quantity and make, the higher figure being asked for a special make of so-called Antifebrine.

ACID BORACIC.—Steady at 25s. 6d. per cwt. for Crystals and 27s. 6d. per cwt. for Powder.

ACID CARBOLIC—Strong and in fair demand at 11½d. to 1s. for the 35°-36° C. ice crystal, in 2½ cwt. drums and overcasks; 1s. 0¼d. to 1s. 0¾d. for the 39°-40° C. ice crystal; and 1s. 1½d. to 1s. 1¾d. for the 39°-40° C. detached crystals, which is now the form and quality required by the B.P.; crude, 60° F., 3s. 3d. per gallon; 75° F., 4s.; liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 9d. per gallon; ditto, 25 to 30 per cent. of dark colour, 10d. to 1s. per gallon, in 40 gallon casks.

ACID CITRIC—Market is fairly steady at 1s. 4½d. to 1s. 5d. per lb., according to quantity and make for Crystals in 5-cwt. casks.

ACID OXALIC—Is still quoted 3d. to 3¼d. per lb., net, free delivered London.

ACID TARTARIC—Quotation for English remains nominally 1s. 0½d. to 1s. 0¾d. per lb., but makers are not willing sellers; foreign, 11¾d. to 1s. per lb.

AMMONIA COMPOUNDS—Bromide 2s. 3d. per lb. Carbonate 3½d. to 4½d. per lb., according to make, quantity, packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 16s. 10d. per lb. Sulphate firm; gray, 24 per cent., London, prompt, £11 17s. 6d. to £12; Hull, prompt, £11 17s. 6d.; Leith, prompt, £12 to £12 2s. 6d.; Beckton, Feb.-April, £12; May-June, £11 17s. 6d.; Beckton terms, prompt, £11 17s. 6d. to £11 18s. 9d. Sulphocyanide, 1s. 1d. to 1s. 3d. per lb., according to quantity and packing.

ANTIMONY—Regulus, £38 10s. to £39 10s. per ton; Crude (Black Sulphide), £22 10s. to £23 per ton.

ASHES—Pots, 28s. 6d.; Pearls, 34s.

ATROPINE—Firm at 15s. 6d. per oz. for the Sulphate B.P. and Salicylate and 17s. 10d. per oz. for the pure Alkaloid.

BELLADONNA ROOT—Continues scarce and dear, 45s. per cwt. being asked for fair quality on the spot.

BISMUTH—The commercial quality of the metal is unchanged at 5s. per lb., the Subnitrate being quoted 5s. 1d. per lb., and the Subcarbonate 5s. 8d. per lb.

BLEACHING POWDER (CHLORIDE OF LIME)—English is quoted £7 per ton.

BORAX—Crystals are still quoted 16s. 6d. per cwt. and Powder 17s. 6d.

BROMIDES—Makers to-day advanced their price 1d. per lb., quoting now Potassii Bromid. 1s. 11½d. per lb.; Sodii Bromid., 2s. 2½d. Ammon. Bromid., 2s. 3d. per lb., with a reduction of 1d. per lb. for half-ton lots. Bromide is so far unchanged at 2s. to 2s. 2d. per lb., according to quantity, in 60-lb. cases.

CAMPHOR—Market for crude is quiet, but prices continue very firm. China, for March-May shipment, cabled 173s. per cwt., c.i.f., while buyers only offer 167s. 6d. Japan, for Feb.-March steamer shipment, is offering at 175s. per cwt., c.i.f., without, however, finding buyers. English refiners maintain their price of 2s. 2d. per lb. for bells and flowers, tablets being quoted higher in proportion, while German refiners quote bells slightly below price named.

CASTOR OIL—Dearer. Belgian, first pressing, spot, £30 10s.; April-June, £30, f.o.b.; Antwerp, second pressing, spot, £28 10s. per ton, wharf. Hull manufactured, guaranteed cold-drawn, pure pharmaceutical, £35 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts, £31; seconds, £30 per ton in barrels; firsts 3½d. per lb. in cases; seconds 3½d., ex-wharf, London.

CINCHONA BARK—The second of the series of these auctions was held to-day. Larger, but still moderate, supplies were catalogued, the total of all kinds amounting to 2,129 packages against 1,610 packages at the opening sale of the year. A good demand prevailed and a fair proportion found buyers, at and since the sale, at a further advance, the prices obtained for manufacturing bark being fully up to the last Dutch sale, the average unit being 2d., against 1½d. at the previous London auctions. Cinchonidine Bark averaged 2½d. per unit. Ceylon: 228 packages offered and 140 sold. Succirubra, stem chips and shavings, ordinary to good rich from 3½d. to 10½d., fair root at 4¾d., Ledger branch at 2¼d. East Indian: 1,252 packages offered and 850 sold. Red stem, chips and shavings, fair to good at 4¾d. to 5¾d., ordinary to fair at 2¾d. to 4d.; root, ordinary to good at 2½d. to 4¼d.; Officinalis chips and shavings, inferior to good rich at 3¾d. to 8¾d., branch at 2¼d. to 3¾d.; renewed stem chips, good to fine at 7¼d. to 9½d.; Ledger stem chips, fair to good rich at 6¾d. to 9d., ordinary at 3¾d. to 4¾d., branch at 3½d. to 5¼d.; Hybrid stem chips at 3¾d. to 4d.;

good Ledger root at 6½d. Java: 80 bags and 9 cases offered and 63 bags sold. Ledger stem chips at 8¼d. to 9d., ditto branch at 5d. to 6¾d., root at 5½d. South American: 184 bales Calisaya offered and 128 bales sold, fair to good Bolivian cultivated quilts at 7½d. to 11½d.; damaged flat at 6d. to 8½d. 376 packages soft Colombian offered and 61 packages sold, cultivated quilly chips at 10¾d., ordinary chips 5½d. to 6¾d.

CLOVES—Zanzibar: Out of 190 bales at auction that were offered 141 bales sold at full rates, fair to medium, at 4½d. to 4¼d. Penang: 4 cases of good bright picked were bought in at 8d. Amboyna: 67 bags of fair, rather stalky, were bought in at 5d. Privately, Zanzibar have been quiet, and only a moderate business done, the prices being steady at the close. The sales comprise spot at 4¼d., Jan-March delivery at 4¼d. Stems: 40 bales Zanzibar were bought in.

COAL TAR DISTILLATION PRODUCTS—Toluol, commercial, 1s. 2d. per gallon; pure, 2s. Benzole, 50 per cent., 10d. per gallon; 90 per cent., 8d. Creosote, 3d. to 5d. per gallon, according to quantity, etc. Crude Naphtha, 30 per cent. at 120° C., 4½d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 7d. per gallon; 90 per cent. at 160° C., 1s. 3d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 3¾d. per unit; B, 2¾d. Pitch, 38s. per ton, f.o.b. Tar, crude, and/or-refined, 12s. 6d. per barrel; 2d. to 2¼d. per gallon.

COCAINE—Makers quote the Hydrochlorate 16s. 3d. to 16s. 9d. per oz., in 25 oz. tins, the lower figure being for 200 oz. lots. The market has, however, assumed a distinctly firmer tone, and there are practically no sellers of the brands most in favour at a lower figure than named above.

CODEINE—Is very firm at 13s. 1d. to 13s. 6d. per oz. for the pure and 1s. per oz. less for the muriate, phosphate, and sulphate salts.

COD LIVER OIL—Market appears to be drifting downwards, 65s. to 67s. 6d. per barrel, according to brand, being nominally the quotation for best new non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CREAM OF TARTAR—Quiet, at 73s. per cwt. for first white crystals, on the spot; powder, 75s.; ditto, 95 per cent., 76s. per cwt.

ERGOT OF RYE—There has been more inquiry for the article this week, but holders continue very firm in their ideas.

ESERINE (PHYSOSTIGMINE)—Unchanged at 2s. 3d. per gramme for the Sulphate and Salicylate and 3s. 6d. per gramme for the pure.

GENTIAN ROOT—15s. 6d. to 16s. per cwt. is asked for good dry root, on the spot.

GINGER—Jamaica: 133 barrels offered and 73 sold, ordinary to fair bright at 57s. to 58s. The small supply of Cochin met little demand, and only a few bags sold at previous rates. 281 bags and 78 cases were offered and 40 bags sold, Calicut rough, fair bright medium and small, rather lean at 34s.

GLYCERIN—Is decidedly firmer at 55s. to 57s. 6d. per cwt., according to quantity and make for good English, while German is quoted 57s. 6d. to 67s. 6d. per cwt., according to brand, for best white double-distilled, chemically pure, 1260 quality, in tins and cases (2 or 4 × 56 lb. tins in a case). Crude is dearer, as much as £2 per ton more being asked than price hitherto ruling for the quality most suitable for refining purposes. The higher price asked for the crude has, however, rather tended to check business.

IODIDES—Unchanged and fairly steady at 10s. 6d. for Potassii Iodid., 11s. 10d. per lb. Sodii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 13s. 10d. per lb. for Iodoform, cryst., powder, or precip., 12s. per lb. for Iodine resublimed, and 7½d. per oz. for crude Iodine.

IPECACUANHA—Quiet but fairly steady at 10s. 6d. to 11s. per lb. according to quality, for Rio and 6s. 9d. to 7s. 6d. for Carthage.

LYCOPodium—Is firm at 1s. 11d. to 2s. per lb. for sifted.

MENTHOL—Somewhat weaker at 9s. 6d. to 10s. per lb., according to brand, quantity, and holder.

MERCURIALS—Are very firm in sympathy with the metal, makers, however, so far, made no change in their prices, which remain at 3s. 2d. per lb. for calomel and 2s. 10d. per lb. for corrosive sublimate.

MORPHINE—Is steady at 5s. to 5s. 3d. per oz., according to quantity, for the Hydrochlorate powder, the crystal salt being quoted 2d. per oz. more money.

OILS (FIXED) AND SPIRITS.—Linseed has further advanced, closing firm. On the spot pipes, London, £24 10s. to £24 15s.; barrels, £24 10s. to £24 15s. Hull, spot naked, £23. Rape steady: Ordinary brown on the spot quoted £25 10s.; refined spot, £26 15s. to £27; Ravison naked spot £23 15s. Cotton quiet: London crude spot, £22 to £22 5s.; refined spot, £23 10s. to £24, according to make; Hull naked refined spot quoted £22; crude spot, £20 15s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut firm: Ceylon on the spot, £25 15s.; near, £24 15s.; Cochin spot, £29. Palm: Lagos on the spot, quoted £28 10s. Lubricating: Pale American spot, 8s. to 9s. 6d.; black, 7s. to 9s.; Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum Oil steady: Russian spot quoted 6½d. to 6¾d.; American spot, 7¾d. to 7½d.; water white, 8½d. to 8¾d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine quiet: American spot, 40s. 1½d. to 40s. 3d. to 40s. 4½d.

OPIUM—Market remains excessively quiet, with practically no business of any importance passing, either in soft shipping, druggists', or manufacturing kinds.

PARAFFIN WAX—Decidedly dearer, at 3¼d. to 3½d. per lb. for crude, and 4d. to 4¾d. per lb. for refined.

PHENACETINE—Makers' price continues at 5s. 3d. for crystals or powder in 5 cwt. lots. There are, however, still sellers from second-hand at 4s. 6d. to 4s. 9d. per lb., according to brand. Bayer's make continues to be held for a fancy price.

PILOCARPINE—Quiet, but firm, at 41s. 6d. per oz. for the Nitrate and Muriate Salts, in 8 oz. lots.

PITCH—8s.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½d. per lb. Bromide, 1s. 11½d. per lb. Chlorate: Spot London, crystals and powder, 4½d. to 4¾d. net. Iodide, 10s. 6d. per lb. Permanganate small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow, 7¾d. for English makes; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity.

QUICKSILVER—Is very firm at £9 12s. 6d. per bottle from the importer, there being practically nothing offering from second-hand.

QUININE.—The report current last week that shipments of Bark from Java for first half of February were only 180,000 lbs. caused quite a flutter in the speculative market, and B. and S., and Brunswick Sulphate was bought eagerly for 1,000 oz. lots, in 25 oz. tins, at 1s. 6¾d. per oz. for March delivery; 1s. 6¾d. to 1s. 6¾d. for May; and at 1s. 6¾d. for June. Market has, however, since quieted down, and there are now sellers at ¾d. per oz. below above figures. Messrs. Howards and Sons have raised their price for sulphate 1d. per oz., quoting 1s. 8d. per oz. for 1 oz. vials, in 100 oz. lots.

ROSIN—Dearer, at 5s. 6d. to 5s. 9d. per cwt. for strained, on the spot, 5s. 1½d. to 5s. 2d. per cwt. being asked for April-June and July-September shipment, per sailing vessel.

SALICINE—Continues very scarce and price is firm at late advance to 15s. 6d. per lb. A further rise would appear by no means improbable.

SALICYLATES.—Acid Salicylic and Soda Salicylate are nominally unchanged in price. Makers, however, continue to decline all fresh orders, and can only deliver slowly against existing contracts.

SALOL—Market is very firm at late advance to 3s. 8d. per lb.

SANTONINE.—While makers' price continues firm and unchanged at 11s. 3d. to 11s. 9d. per lb., there are sellers from second at 10s. 6d. per lb. and even perhaps below this figure, which tends to make buyers cautious to cover their requirements in the article only from hand to mouth.

SHELLAC.—The demand on the spot is slow, and only restricted sales have taken place at previous rates. The "Future" market is steady, although quiet, with a further sale of 100 cases TN March delivery at 63s., closing buyers at 62s. 6d. and August at 64s. 6d.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s., bags 57s. 6d.; Ash, £6 to £7, according to percentage, etc. Bichromate landed £7 5s.; Bicarbonate landed £7 5s.; Bromide, 2s. 2½d.; Caustic, 70 per cent, white, £10 15s. to £11; 60 per cent., £1 less; Hyposulphite (Antichlor) 7s. to 9s., according to make; Iodide, 11s. 10d. per lb.; Nitrate quiet on spot, refined, £8 17s. 6d., ordinary £8 12s. 6d.

SPICES (VARIOUS).—Black Pepper: At auction 583 bags Singapore went off with difficulty, only 8 bags selling at 6½d. for fair. 139 bags Trang bought in at 6½d., also 109 bags Penang at 5¾d. White Pepper inactive, and 148 bags Singapore in auction were

bought in, fair to fine, at 9¾d. to 11d. 57 bags fair Siam bought in at 9¾d., and 301 bags fair brown limes Penang at 8¾d. to 8¾d. Chillies quiet, 80 bales Zanzibar were bought in at auction, fair at 47s. Capsicums freely offered, and a small quantity sold at again lower rates. Of 558 packages Bombay 37 bales sold, fair bright red cherry pods, at 32s. 6d. to 33s.; long red on stalk, bought in at 35s. Pimento slow of sale, and 292 bags were bought in. Cassia Lignea quiet but steady, 350 cases in auction were offered and only 40 cases sold, new selected at 44s.; fine old bought in at 49s. to 50s. Cassia Chips: 200 bales offered and bought in. Cinnamon: At auction 155 bales, chiefly wild, offered and mostly bought in, a few bales quill selling at 1d. Cinnamon chips and bark neglected and in good supply; 520 bags offered, chiefly wild, and 69 bags sold privately, price not reported. Nutmegs: At auction 3 cases Penang offered but taken out. Mace slow of sale; 3 cases Penang offered and sold, dull pale and reddish at 1s. 6¾d.; 2 cases Bombay fair red, part broken, bought in at 1s. 7d.; Bombay, wild, 7 cases good bright offered and bought in at 5d.

SULPHATE OF COPPER—Is quoted £24 to £24 10s. per ton, on the spot.

SULPHONAL—Makers are firm at the late advance to 20s. 6d. per lb., with a certain reduction for quantity, for both Crystals and Powder in bulk packing, there being now practically nothing offering at cheaper rates from second hand.

TAR.—Stockholm, 26s.; Archangel, 18s. 6d.

THYMOL—Continues firm at 10s. 6d. to 11s. per lb.

Metric Measures of Mass with Imperial Equivalents.

THE GRAMME (Gm.) equals 15.432 grains, and was originally the mass of one-thousandth part of a cubic decimetre of water at 4° C.; it is now equal to the mass of one-thousandth part of a solid cylinder of iridio-platinum 39 Mm. high and the same in diameter, a copy of which is in the possession of the Board of Trade.

The subdivisions of the gramme are the

Decigramme (Dgm.)	= 0.100 Gm.	= 1.543 grain.
Centigramme (Cgm.)	= 0.010 Gm.	= 0.154 grain.
Milligramme (Mgm.)	= 0.001 Gm.	= 0.015 grain.

The multiples of the gramme are the

Dekagramme (Dkgm.)	= 10.0 Gm.	= 0.3527 oz.
Hectogramme (Hgm.)	= 100.0 Gm.	= 3.5274 oz.
Kilogramme (Kilo.)	= 1000.0 Gm.	= 2.2046 lbs.
Myriagramme (Mygm.)	= 10.0 Kilo.	= 22.0462 lbs.
Quintal (Q.)	= 100.0 Kilo.	= 1.9684 cwt.
Millier or Tonne (T.)	= 1000.0 Kilo.	= 0.9842 ton.

CONVERSION OF METRIC TO IMPERIAL UNITS.

Grammes × 15.432 = Grs.	Grammes ÷ 31.104 = Ozs. (Troy).
Grammes ÷ 0.065 = Grs.	Grammes × 0.035 = Ozs. (Av.).
Grammes ÷ 1.296 = Scr. (Ap.).	Grammes ÷ 28.344 = Ozs. (Av.).
Grammes ÷ 3.888 = Drs. (Ap.).	Kilogram. × 2.205 = Pounds.
Grammes × 0.032 = Oz. (Troy).	Kilogram. ÷ 0.454 = Pounds.

CONVERSION OF IMPERIAL TO METRIC UNITS.

Grains ÷ 15.432 = Gms.	Ounces (Troy) × 31.104 = Gms.
Grains × 0.065 = Gms.	Ounces (Avoir.) ÷ 0.035 = Gms.
Scruples (Ap.) × 1.296 = Gms.	Ounces (Avoir.) × 28.344 = Gms.
Drachms (Ap.) × 3.888 = Gms.	Pounds (Avoir.) ÷ 2.205 = Kilo.
Ounces (Troy) ÷ 0.032 = Gms.	Pounds (Avoir.) × 0.454 = Kilo.

GRAINS AND OUNCES TO GRAMMES, AND GRAINS PER FLUID OUNCE TO GRAMMES PER 100 MILLILITRES.

	Grains to Grammes (Gm.)	Ounces to Grammes. (Gm.)	Grains to the Ounce — Grammes to 100 ML.
1 ..	0.06479	28.350	0.228
2 ..	0.12958	56.699	0.456
3 ..	0.19437	85.049	0.684
4 ..	0.25916	113.398	0.912
5 ..	0.32395	141.748	0.140
6 ..	0.38874	170.097	1.368
7 ..	0.45353	198.447	1.597
8 ..	0.51832	226.796	1.825
9 ..	0.58311	255.146	2.053

EXPLANATION OF TABLE.—The first column represents the number of grains or ounces. Thus: 4 grains = 0.25916 Gm., 4 ounces = 113.398 Gm. The fourth column shows how many grammes to 100 millilitres (ML) are equivalent to a given number of grains to 1 fluid ounce, thus: 4 grains to 1 fl. oz. = 0.912 Gm. to 100 ML.

Calendar for the Week.

Sunday, Feb. 25. Quinquagesima Sunday. Sun rises 6.57; sets 5.30.
Monday, Feb. 26. Sun rises 6.55; sets 5.32.
Tuesday, Feb. 27. Sun rises 6.53; sets 5.34.
 BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION, County Restaurant, at 8.30 p.m.—"The Physical Tests of the Purity of Drugs," by George Ward.
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8.0 p.m.—"Electricity in Connection with Photographic Action," by A. Friese-Greene.
Wednesday, Feb. 28. Sun rises 6.51; sets 5.36.
 EDINBURGH CHEMISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, 36, York Place, at 9.15 p.m.—"Gold and Gold Beating," by G. H. C. Rowland, and "Notes on the Pottage Herbarium," by J. Rutherford Hill.
 PUBLIC AND POOR LAW DISPENSERS' ASSOCIATION, St. Bride's Institute, Bride Lane, Ludgate Circus, E.C., at 8 p.m.—"Some Points in Practical Pharmacy," by F. Davis.
Thursday, March 1. ● 11.25 M. Sun rises 6.49; sets 5.37
 CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by H. A. D. Jowett; F. S. Kipping and Harold Hall; E. Divers and T. Haga; A. Lapworth and E. M. Chapman.
 CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Paper: Subject not announced.
 LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers on "Botanic Nomenclature," by C. B. Clarke; and on "Some Foraminifera of Tithonian Age from the Limestone of Nesseldorf," by F. Chapman.
 LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY, 6, Sandon Terrace, Upper Duke Street, at 8.30 p.m.—"Dispensing Notes," by H. Wyatt, jun.
 LONDON COLLEGE OF CHEMISTRY AND PHARMACY, Gauden Hotel, Clapham, at 8.0 p.m.—Smoking Concert.
Friday, March 2. Sun rises 6.47; sets 5.39.
 GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Dr. Geo Coull on "Stereo Chemistry."
 ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Major R. Ross on "Malaria and Mosquitos."
Saturday, March 3. Sun rises 6.44; sets 5.41.
 ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Lord Raleigh on "Polarised Light."

Publications Received.

HUNDERTFÜNFZIG JAHRE EINER DEUTSCHEN DROGENHANDLUNG 1750-1900. Ein Beitrag zur Geschichte ihrer Firma herausgegeben am 7. Februar, 1900. Von Brückner, Lampe and Co., Leipzig, Berlin, Hamburg. From the Publishers.

OUR PATENT LAWS. Revised Edition, to suit the present situation, with an additional article on "American Competition," closely bearing on the subject, by JAMES KEITH, C.E. Pp. 20, London: Unwin Brothers, January, 1900. From the Publishers.

JAAROVERZICHTEN BETREFFENDE DEN HANDEL IN KOLONIALE PRODUCTEN, 1899. Bijvoegsel van "De Indische Mercur." Februari 13, 1900. Pp. 80. Amsterdam: J. H. De Bussy. From the Publishers.

REPORT ON THE HEALTH, SANITARY CONDITION, ETC., OF THE BOROUGH OF HASTINGS, for the quarter ending December 31, 1899. By A. SCARLYN WILSON, D.P.H., Medical Officer of Health. Hastings: Town Clerk's Office. From the Town Clerk.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Cask finest Lofoten non-freezing Cod Liver Oil, 70s.—Floyd & Co. (Lim.), Bury St. Edmunds.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

2 lb. Pot. Iodid., 19s.; 2 oz. Morph. Hydroch., 10s.—Eastman, Forest Lane, Stratford.

What Offers for 38 volumes "Pharm. Journal" (1841 to 1879)? Bound in half calf; good condition.—Lines, Market Place, Hertford.

What Offers, in cash or exchange, for 4 gross Ivory floating soap, 3 by 2 tablets, wrapped in box, clean and new?—Oldham, Chemist, Wisbech.

Forty-three Materia Medica Micro. Slides by Möller and Rodig, price 30s.; also a very fine Objective, 4 inch, by Swift, 22s.—Callaway, Salisbury.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Herbarium (Sale or Exchange) consisting of 174 specimens, arranged into 56 natural orders. 2 guineas. (Correctly named).—R. W. Tildesley, Parkgate, Rotherham.

Sells Like Magic.—Straw Hat Polish; shop boy or apprentice can make it; cent. per cent. profit. Instructions and recipe, 2s.—Huntley, Chemist, Kidderminster.

Offers solicited for 40 volumes of "Pharm. Journal," strongly bound in good library bindings, and in perfect condition. Dates 1859-79.—F., 194, Staveley Road, Wolverhampton.

Good Painted Lantern Slides (second-hand), including Religious, Temperance Effects, Mottoes, Comic, 4½d. each; Boer War, 6d. each. Lists free.—T. Wing, Photographer, Chatteris.

Magazine Hand Camera, excellent, cost £2 new, 15s. on approval. Kemshead's Chemistry, enlarged, 1s. Hogg's "The Microscope," published 6s., sell 2s.—Williams, Chemist, Llanfyllin.

Pharmaceutical Journal, and "Chemist and Druggist," practically complete, from about 1860 to date; about half of them bound, remainder unbound; what offers? Room wanted.—H., 4, King's Parade, Clifton.

50,000 Choicest Microscopical Objects of every variety. Catalogues free. New and second-hand Microscopes by all leading makers. Cabinets, Mounting Materials, etc.—Suter, 10, High-week Road, Tottenham, Middlesex.

Copper Drying Oven, 4 by 6 by 5 in.; Water-bath, 8 by 8 in., 4 holes with covers. 5 in. Copper Water-bath, 5 rings; Sikes' Hydrometer, doubly gilt; Mohr's Burette and polished stand; Erdman's Float; 10 C.c. Pipette; Brass Troy Weights (cup), ¼ oz. to 16 oz.; Ganot's Physics. Offers requested.—Gossling, East Borough, Wimborne.

Otto Roses, Virgin, ounce, original (gilt), 25s.; Neroli, extra, ounce, original, 7s. 6d.; Ylang-Ylang, ounce, original, 7s. 6d.; Otto Jasmin, ounce, 15s.; Otto Violet, ounce, 21s.; Geranium, Bulgarian, 4 oz. bottle, 10s.; Lavender, Mitcham, 1 lb., original, 25s. Carriage paid, cash returned if sold.—Warnes, 333, Gray's Inn Rd., W.C. Salcable Patents wanted.

Solid Mahogany, Brass-Bound Telescopic Camera, 12 by 8½, extending to 16 in., taking largest size, 7½ by 9; 3 mahogany holders and dark slide; single lens (Ross), 3 in. diameter, focus about 12 in.; solid mahogany legs; £4, or exchange. Carte de Visite, solid mahogany box camera, size 6 by 6 by 4, extending to 6; 3-shot dark slide; double lens; 2 in. diameter rack and pinion, about 5 in. focus. Cost £6, take £3, or exchange.—C. R., 56, Coombe Rd., Croydon.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once

EXPLANATION OF TABLE.—The first column represents the number of minims, drachms, fluid ounces, or pints. Thus: 4 minims = 0.23664 Ml.; 4 drachms = 14.206 Ml.; 4 fl. oz. = 113.649 Ml.; 4 pts. = 2.273 Litres.

EXCHANGE COLUMN—*continued.*

OFFERED.

£21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Pharmaceutical Journal, present (enlarged) series. Stat^e lowest price for volumes or separate numbers to Analyst, "Pharm. Journal" Office, 5, Serle Street, London, W.C.

Wanted, recent editions Clowes' and Colman's Quantitative Analysis, Gattermann's Practical Organic Chemistry, Greenish's Materia Medica.—Davis, 90, Cotham Brow, Bristol.

FREE FORMULÆ

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE 1s. 8d. per oz. Tin, with Labels, Post free or through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—"I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable."

F. W. B., Manches er:—"Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much."

J. J. G., Folkestone:—"I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation."

D. R., Swansea:—"I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production."

R. N., Darlington:—"I have made our Tooth Paste from your formula for years."

ROUSE BROS., MANUFACTURING LONDON, W. DRUGGISTS,

KOLA-ASTIER

(GRANULATED).

Contains all the active principles of the Kola Nut, Caffeine, Theobromine Kola Red and Tannin in a soluble, agreeable, and portable form. Recommended as a powerful stimulant of the physical and mental forces.

Retail 3/6 per bottle; Wholesale 34/- per dozen.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Allan, Barrie, Bartlett, Bostock, Daykin, Epton, Ford, Forster, Grier, Harwood, Hearson, Herman, Hewlett, Hill Hodge, Hudson, Hymans, Knight, Lloyd, Lothian, Maben, Martin, Meadows, Philp, Smith, Stonham, Symes, Taylor, White, Williams, Wilson.

HOOPER'S
MARKING INK

It is supplied in 2/6, 1/- and 6d. bottles, neatly put up.

It can also be had in bulk, by the gallon, pound or ounce.

If desired, the Ink can be put up with purchaser's own name on labels in quantities of not less than

Six dozen 1/ size, or One gross 6d. size,

or a mixed order equivalent. Prices on application.

It does not wash out nor dry up, neither does it injure the Fabric. See one or two testimonials from well-known firms, selected from hundreds of a similar nature.

Messrs. SWEARS & WELLS, who have used the Ink now for very many years, tell us that it is the only Marking Ink worth using; and in connection with this firm, a Lady from Hampshire writes: "Please send me some Marking Ink like you supply Messrs. SWEARS & WELLS with, for I have noticed the things they have marked for me are done with particularly good Ink."

Messrs. THRESHER & GLENNY, Hosiery to H.R.H. the Prince of Wales, say "We have used Hooper's Marking Ink for many years, and no Ink gives such satisfaction, or so black or permanent an impression."

PRICES ON APPLICATION TO—

W. HOOPER & Co., 24, Russell Street, London, W.C.

ARTIFICIAL HUMAN EYES

PRIZE MEDALS AWARDED.

PACHE & SON,

Manufacturers to the Birmingham Eye Hospital,

Also to the Principal Hospitals in the United Kingdom.

71, STATION STREET (Corner of Hill Street)

BIRMINGHAM.

Makers of the New Thickened Artificial Eye as recommended by Professor Snellen.

NEWS IN BRIEF.

BACTERIA AND SEWAGE is to be the subject of the Friday evening discourse at the Royal Institution on March 9, the lecturer being Professor Frank Clowes.

THE CHEMISTS' ASSISTANTS OF BIRMINGHAM are to hold a smoking concert at the Exchange Restaurant, Stephenson Place, Birmingham, on Wednesday next, March 7, at 9 p.m.

THE CHEMISTS' ASSISTANTS' ASSOCIATION did not hold its usual weekly meeting on Thursday, March 1, owing to the fact that no paper was forthcoming for the occasion.

THE ANNUAL DINNER of the Chemists' Assistants' Association will be held in the King's Hall, Holborn Restaurant, London, on Thursday, March 8. Tickets (5s. each) may be obtained of Mr. Herbert Hymans, 34, Devonshire Street, W.

THE CHEMISTS' BALL COMMITTEE met on Wednesday, when the Secretary reported that there was a surplus fund from the 1900 ball of £34 14s., and it was decided to hand over twenty-five guineas to the Benevolent Fund of the Pharmaceutical Society.

THE SALE OF MESSRS. BURROUGHS, WELLCOME, AND CO.'S PREPARATIONS came up for discussion by the Council of the P.A.T.A. at its recent meeting, and it was decided to invite the firm to meet a deputation of a few members of the Council on the subject.

MESSRS. T. AND H. SMITH AND CO., of London, Edinburgh, and Glasgow, have been exhibiting at their Edinburgh house a case of medicinal drugs which has been prepared for the Paris Exhibition. The collection chiefly consists of alkaloid derivatives of opium, one specimen of "codeine" being valued at £300.

OXALIC ACID was employed by James Blount (40), an insurance agent, of Ashton-under-Lyne, to relieve himself of the depression of mind with which he had been troubled for some time past. A verdict of "Suicide whilst temporarily insane" was subsequently returned by a jury on Thursday, February 22.

DR. COULL'S LECTURE on "Stereo-Chemistry" to the Glasgow Assistants' Association, announced to take place this week (March 2), has, we understand, been interchanged with the "Spelling Bee" which was to be held on Friday, March 9, at the Masonic Chambers, West Regent Street, Glasgow.

THE NOTTINGHAM CHEMISTS' ASSOCIATION is to hold its annual dinner at the Albert Hotel, Derby Road, Nottingham, on Thursday, March 8. Tickets (4s. each) should be obtained of the Hon. Secretary, Mr. A. Eberlin, 2, Chapel Bar, Nottingham, not later than Monday, March 5.

SALE OF FOOD AND DRUGS ACT, 1899.—Mr. Hedderwick has given notice that on Monday, March 6, he will ask the President of the Board of Agriculture whether any, and what, steps have been taken by the Board in exercise of its powers under section 4 of the above-mentioned Act to settle the standard of quality in respect to milk, butter, and cheese. It will be interesting to know what official tests will be required, say in the case of Stilton.

THE REPORT OF THE EXECUTIVE COMMITTEE OF THE P.A.T.A., submitted at a meeting of the Council, held on February 22, stated that since the last meeting of the Council sixty retail members and seven manufacturers had joined the Association. Also that the Chemists' Defence Association, Limited, had been registered on November 23 last, with a nominal capital of £10,000, and up to the present 600 shares had been allotted.

WITH REGARD TO HOMOEOPATHIC MEDICINES, the P.A.T.A. Executive reported that an attempt had been made to bring about an understanding between makers of those articles with a view to regulating wholesale and retail prices, but while the principal makers were willing to negotiate on those lines, Messrs. Ashton and Parsons declined to co-operate, hence an amicable arrangement had not yet been arrived at.

THE OVER-STOCKING OF PROTECTED ARTICLES was brought under the notice of the Council of the P.A.T.A., and the Chairman suggested that, inasmuch as the Association cannot be held responsible

in any way for the inability of members to dispose of their stocks, they should only purchase in such quantity as would meet their every-day wants, and not, on account of the extra discounts, to purchase a large stock, which would probably take a considerable time to dispose of.

THE KINNINMONT PRIZE, which takes the form of a gold medal and books, is competed for in an annual competition, instituted by Mr. Alexander Kinninmont, held in Glasgow in May or June of each year, and is open to chemists' assistants in Glasgow and the neighbouring counties. The subjects of examination are botany, magnetism, and electricity. Intending competitors should send in their names before the end of April to the Secretary, Mr. W. L. Currie, 223, Byres Road, Dowanhill, Glasgow.

THE POSITION OF PARLIAMENTARY BILLS directly or indirectly affecting pharmacists may be briefly indicated as follows:—

Companies.—Second Reading threatened on Mondays, Tuesdays, and Thursdays.

Boilers.—No. 1, Second Reading March 7; No. 2, Second Reading March 7; No. 3, Second Reading March 7; No. 4, First Reading March 1.

Companies Amendment (Begg).—Second Reading April 4.

Midwives.—On the Notice Paper for Second Reading most Wednesdays.

Registration of Firms.—Second Reading May 2.

Shops.—Second Reading March 6.

THE INCOME-TAX ADJUSTMENT AGENCY, LIMITED, writes to point out that so many persons fail to recover overcharges through not lodging their claims in time, that it is desirous of reminding our readers that no claim for repayment of tax deducted from rents, dividends, annuities, etc., in respect of the year ended April 5, 1897, will be allowed unless the same be lodged before April 5 next. Where the income has been received and tax paid, a claim can now be made for four years. With few exceptions, all persons whose incomes do not exceed £700 are entitled to exemptions or abatements, even when the income is said to be "free of income-tax," and on an income not exceeding £400 the amount repayable might amount to £42. All claims should, however, be made with the least possible delay, as the time allowed for making some of them is strictly limited.

Marriage.

BATES—KIRBY.—On February 26, at the Parish Church, Bicester, by the Rev. G. P. Crawford, Vicar, John Bates, M.P.S., to Florence Ellen, daughter of the late George Kirby, solicitor.

TRADE NOTES.

NEW PHOTOGRAPHIC LABELS, ETC.—Chemists who deal in photographic requisites, and are about to renew their supply of labels and other printed matter relating to photography, should write to Messrs. James Townsend and Son, Medical Label Printers, of Exeter and London, for specimens of their printing for photographic chemists. The specimen labels submitted to the Editor are clearly printed in colours, with chemists' own name and address, the circulars *re* amateur photography being exceedingly pretty, printed on coloured paper half-pink and half-green.

PROTARGOL SOLOIDS.—Messrs. Burroughs, Wellcome, and Co., Snow Hill Buildings, London, E.C., submit a specimen of protargol soloids, gr. 4. This preparation will be issued in two strengths, gr. 1 and gr. 4, thus enabling suitable quantities of solution of any desired strength to be quickly prepared. Protargol soloids gr. 1 and gr. 4 are both issued in bottles containing 100 in each.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

Alexander Ingram and Matthew Wright Talbot, Medical Practitioners, Preston. The practice will in future be carried on by M. W. Talbot in his own name.

RECEIVING ORDERS IN BANKRUPTCY.

Sydney Firth, Physician and Surgeon, Avenue Road, Grantham.

Thomas Bottomley, Chemical Manufacturer, residing at Scholes, near Liversedge, Yorks, and carrying on business at Tannerfield Works, Hightown, Liversedge.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, FEBRUARY 28, 1900.

During the week good business has been done in Castor Oils, which close very firm, with good demand. Chilian Honey has been selling well for full rates, and Beeswax has made good prices. Of West African produce, Chillies have engaged some attention, and a parcel of dried Kola Nuts made a shade better price than that lately ruling. The Chemical market is but slightly changed, Carbonate of Ammonia and Muriate being the only advances.

AMMONIA SALTS.—Carbonate, $3\frac{3}{4}$ d. to 4d. per lb. Muriate scarce, £24 10s. to £32 per ton. Sal ammoniac, 38s. to 40s. per cwt. Sulphate is steady at £12 per ton.

BEE SWAX.—10 sacks of Chilian sold at £7 12s. 6d. to £7 15s. per cwt.

BLEACHING POWDER.—£7 to £7 10s. per ton.

CANARY SEED.—Sales include 170 bags of Turkish at 32s. 6d. per 464 lbs.; price at present ruling is 32s. 6d. to 33s. 6d.

CARNAUBA WAX.—Maranham grey made 72s. 6d. per cwt.

CHILLIES.—Sierra Leone fruit, common to fair, sold to the extent of 37 bags, at 42s. 6d. to 45s. per cwt., together with 20 bags of fair on private terms.

HONEY.—Chilian is in good demand, and 250 barrels have changed hands, Pile 1 at 24s. to 25s. per cwt., Pile 2 at 23s. 6d., and Pile X at 30s. 6d. per cwt.

KOLA NUTS.—7 bags of dried sold at $1\frac{3}{4}$ d. per lb.

LINSEED.—Is firm, with River Plate offering at 46s. to 48s., quay, and Calcutta forward at 46s. per 416 lbs. Sales include 200 tons of River Plate forward, February shipment, at 43s. 9d. to 44s.

OILS (FIXED) AND SPIRITS.—Castor is brisk and in good demand, Calcutta at $3\frac{1}{2}$ d. per lb., 1st French at $3\frac{1}{4}$ d., and 2nd Belgian at $3\frac{1}{6}$ d. Sales of about 1,200 cases of Calcutta have been effected at $3\frac{1}{4}$ d. to $3\frac{5}{8}$ d. for forward delivery, January to June shipments. Olive is steady, with sales of Spanish at £36 10s. per tun (about 70 barrels). Linseed Oil is again a trace higher, 25s. 6d. per cwt. Cotton Seed Oil is easier, 24s. 3d. to 24s. 9d. per cwt. Spirits of Turpentine is 41s. 3d. per cwt., and steady.

POTASH SALTS.—Bichromate, $4\frac{1}{2}$ d. per lb. Chlorate, $4\frac{1}{2}$ d. per lb. Pearlashes, 33s. 6d. to 35s. Potashes, 27s. 3d. to 28s. 6d. per cwt., and firm. Prussiate, 8d. per lb. Saltpetre, 21s. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer, 16s. per cwt. Caustic scarce, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton. Crystals are firm at £3 5s. to £3 7s. 6d. per ton. Nitrate is higher at 8s. $7\frac{1}{2}$ d. to 9s. per cwt.

LONDON, THURSDAY, MARCH 1, 1900.

Business has again been quiet in drugs and chemicals during the past week. A very firm undertone, however, continues to prevail, some articles still showing a tendency towards a further advance in value. Quinine, after being very flat, is again better. Bromides, Mercurials, and Quicksilver very firm, while in Salicine, Salol, and Salicylates an advance would appear to be impending; has, in fact, already taken place as regards Salicine. Carbolic continues very firm, and especially for early delivery. Cocaine very steady. Glycerin firm. Cod Liver Oil dull. Opium and Morphine very quiet. Codeine firm. Citric and Tartaric steady, and especially the latter. Cream of Tartar quiet. It may reasonably be hoped that the favourable news from the seat of war may give a flip to business generally, not excepting the drug and chemical trade. The following are the prices ruling for some articles of chief interest:—

ACETANILIDE.—Remains very quiet at unchanged price.

ACID CARBOLIC.—Market remains firm, especially for prompt delivery, at $11\frac{1}{2}$ d. to 1s. for 35-36° ice crystal in bulk packing, other qualities and packing being quoted in proportion. Crude, 60° F, 3s. $2\frac{1}{2}$ d. per gallon; 75° F, 4s. Liquid, 95-98 per cent. of pale straw colour, 1s. 7d. to 1s. 9d. per gallon; ditto, 25-30 per cent. of dark colour, 10d. to 1s. per gallon, in 40-gallon casks.

ACID CITRIC.—Is steady but unchanged.

ACID OXALIC.—There is no change to report.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, $3\frac{1}{2}$ d. to $4\frac{1}{2}$ d. per lb., according to make, packing, and quantity. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate firm; gray, 24 per cent., London prompt, £12; Hull prompt, £12; Leith prompt, £12 1s. 3d. to £12 2s. 6d.; Beckton February-April, £12; Beckton terms, prompt, £11 17s. 6d. Nitrate, £32 10s. per ton. Phosphate, 5d. per lb. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

BORAX AND BORACIC ACID.—Are steady at unchanged prices.

BROMIDES.—Are very firm at the late advance; a further rise would appear not improbable.

CAMPHOR.—Has become quiet, and business in the crude article is at a standstill, but quotations are firm, with sellers of China March-May shipment at 170s., and Japan at 177s. 6d., importers asking 182s. 6d. c. f. and i. Refined is firm at unchanged prices.

CASTOR OIL.—Firm; Belgian, first pressing, spot, £31; April-June, £30 10s., f.o.b.; Antwerp, second pressing, spot, £28 10s. per ton, ex wharf. Hull manufactured, guaranteed cold drawn pure pharmaceutical, £33 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts, £31; seconds, £30 per ton in barrels; firsts, $3\frac{5}{8}$ d. per lb. in cases; seconds, $3\frac{1}{2}$ d., ex-wharf, London.

CLOVES.—At auction 14 cases Penang bought in, fair bold picked at $7\frac{1}{2}$ d., small dark ditto at $5\frac{1}{2}$ d. 148 bales Zanzibar offered and 114 bales sold at firm rates, barely fair at $4\frac{1}{2}$ d. Privately, Zanzibar opened steadily at yesterday's improvement, closing strong and active at a further advance of 3-32d. Some bales have changed hands, comprising March-May delivery, at $4\frac{1}{4}$ d., chiefly June-August at $4\frac{5}{8}$ d. to $4\frac{3}{8}$ d., closing sellers at $4\frac{3}{8}$ d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 90 per cent., 1s. $2\frac{1}{2}$ d. per gallon; pure, 2s. Benzole, 50 per cent., 9d. per gallon; 90 per cent., $7\frac{1}{2}$ d. Creosote, $3\frac{1}{4}$ d. to 5d. per gallon, according to quantity, etc. Crude Naptha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent., at 160° C., 1s. $5\frac{1}{2}$ d. per gallon; 90 per cent. at 160° C., 1s. $2\frac{1}{2}$ d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene, A, $3\frac{3}{4}$ d. per unit; B, $2\frac{3}{4}$ d. per unit. Pitch, 38s. per ton, f.o.b. Tar, refined, 15s. per barrel, $3\frac{1}{4}$ d. per gallon; crude, 12s. 6d. per barrel, $2\frac{1}{2}$ d. per gallon.

COCAINE.—Is firm at 16s. 3d. to 16s. 9d. per oz., according to quantity, for the hydrochlorate, in bulk packing and for 100-oz. lots.

CODEINE.—Is firm at unaltered price—viz., 13s. 1d. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the salts.

COD LIVER OIL.—Is quiet and still weak in price at nominally unchanged quotations.

CREAM OF TARTAR.—Remains very steady.

CUTCH.—Continues slow of sale, and business is unimportant at previous rates.

ESSENTIAL OILS.—Remain very quiet at previous quotations for all descriptions, and few sales have transpired.

GALLS.—Show little alteration, the demand being slow for all descriptions, and sales restricted. China to arrive are still quoted 65s., and Japan 61s. c. f. and i.

GAMBIER.—The market for arrival remains firm, with sales of 50 tons January-March steamer at 16s. 6d. On the spot business has been retail, including old landing at 16s. 6d.

GINGER.—At auction the small supply of Cochin went off quietly at steady rates. Of 211 bags and 120 cases offered 39 packages sold, small, rather roughly cut and scraped, at 45s.; washed rough new crop, bright, medium and small, at 33s. 6d. Japan: 241 bags offered and bought in, fair lined at 28s. Jamaica quiet but steady. Of 178 barrels offered 78 barrels sold, low middling to fair, at 55s. to 63s.; common to middling lean Rhatoon, first of the new crop, at 46s. to 50s. 6d.

GLYCERIN.—Market remains firm for both crude and refined, without, however, any special alteration in value.

IODIDES.—Are steady at unchanged price.

MERCURIALS.—Are very firm, in sympathy with Quicksilver, prices being, however, so far, unchanged.

MORPHINE.—Market is quiet and unchanged, at 5s. to 5s. 3d. per oz. for the hydrochlorate powder.

OILS (FIXED) AND SPIRITS.—Linseed quiet and easier; on the spot, pipes, London, £24 17s. 6d. to £25; barrels, £25. Hull, spot, naked, £22 10s. Rape firm; ordinary brown, on the spot, quoted £25 10s.; refined, spot, £26 10s. to £27; Ravison, naked, spot, £23 15s. Cotton easier; London crude, spot, £21 15s.; refined, spot, £23 5s. to £23 15s., according to make. Hull naked, refined, spot, quoted £21 2s. 6d.; crude, spot, £20 2s. 6d. Olive,

Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut firm. Ceylon, on the spot, £25 15s. Cochin, spot, £29 to £29 10s. Palm: Lagos, on the spot, quoted £29. Lubricating: Pale American, spot, 8s. to 9s. 9d.; black, 7s. to 9s. Russian, black, 6s. to 6s. 6d.; pale, 8s. to 9s. 6d. Petroleum Oil steady; Russian spot quoted 7d. to 7½d.; American, spot, 7½d. to 7¾d.; water white, 8¾d. to 9d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine: There is no business to speak of. American, spot, 40s. 1½d.; March-April, 40s. 3d.

OPIUM—Continues extremely quiet, there being practically nothing doing in the article.

PHENACETIN.—Makers still quote both crystals and powder 5s. 3d. per lb. for 5-cwt. lots. There are, however, cheaper offers from second hand.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals and powder, 4½d. to 4¾d. net. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals 5s. per cwt. more. Prussiate, yellow, 7¾d. per lb. for English makes; 7½d. for Beckton; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship. Muriate, 80 per cent., £9 per ton.

QUICKSILVER—Is very firm at £9 12s. 6d. per bottle, it having been expected that price would be still further advanced by the importer to-day.

QUININE.—It is reported, although the report lacks absolute confirmation, that yesterday's sale of Quinine by public auction in Batavia (Java) went off well, buying orders which had been sent out at full limits not having been executed, in consequence of better prices having ruled than was anticipated would be the case. Here the article is rather steadier at about 1s. 6d. per oz. for B&S and/or Brunswick Sulphate on the spot in 100-oz. tins for 1,000-oz. lots for prompt and ½d. to ¾d. per oz. more for later delivery. Prices are expected to further advance.

SALICINE.—Makers now quote nominally 20s. to 21s. per lb., but decline all orders.

SALOL AND SALICYLATES—Are so far unchanged. It is, however, rumoured that negotiations are pending which may result in prices being further tangibly advanced.

SHELLAC.—The market in all positions is quiet, and no business of importance has occurred, but prices are steady, TN Orange on the spot at 62s. for fair, afloat 60s., and February-April shipment 62s. c. f. and i. 100 cases March delivery have been sold at 62s. and buyers.

SODA COMPOUNDS.—Crystals, barrels, quoted 60s.; bags, 57s. 6d. Ash, £6 to £7, according to percentage, etc. Bichromate, 3¾d. per lb. Bicarbonate, landed, £7 5s. Bromide, 2s. 2½d. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Hyposulphite (Antichlor), 7s. to 9s., according to make. Iodide, 11s. 10d. per lb. Nitrate quiet; on spot, refined, £8 17s. 6d.; ordinary, £8 12s. 6d.

SPICES (VARIOUS).—Black Pepper: No Singapore was offered in auction. 12 bags of Tellicherry sold out of 63 bags offered, damaged at 6d. White Pepper very quiet; 118 bags Penang were bought in, including fair brown limed at 8¾d. No Singapore offered. Chillies quiet, and 15 packages Japan were bought in, fine bright, at 60s.; mixed yellowish and seedy at 52s. Capsicums dull. 50 bales Bombay were bought in, long, red on stalk, at 32s. Pimento firm and in fair demand; of 360 bags offered 182 bags sold, ordinary to good, at 3¾d. to 3½d. Cassia Lignea: 100 cases offered and bought in, fine old, at 51s. Cinnamon chips steady but quiet; 60 bags fair bought in at 4½d. Nutmegs steady but quiet; of 6 cases Penang 1 case sold, 143's, partly shrivelled, at 8d.; 3 cases Ceylon sold, 140's, defective, at 8½d. West Indian: 5 cases 44 barrels, etc., sold, 64's, at 2s. 1d.; 113's and 114's at 9½d. to 11d.; 130's at 9d.; 143's, defective, at 3d. Mace quiet but firm; of 21 cases Penang offered 2 cases sold; pale and reddish, rather wormy, at 1s. 7d. to 1s. 8d. 8 cases Bombay bought in. 1 case Ceylon sold, thin curly red, at 1s. 4d. West Indian: 25 packages sold, fair to good pale, at 1s. 6d. to 1s. 8d.; fair red at 1s. 5d.

SULPHONAL—Unchanged, at 20s. 6d. per lb. from the makers for both crystals and powder.

TARTARIC ACID—Is firm but without change.

TURMERIC—Has been very quiet, and few sales have occurred, but prices are steady and unchanged. Bengal quoted nominally 33s., in the absence of supplies; Cochin split bulb retail sales at 12s.; Madras quoted 32s. 6d. to 35s. for good bright finger.

THURSDAYS' DRUG SALES.

To-day's drug auctions passed off quietly, the number of catalogues, as also of lots, being small, owing, no doubt, partly to the fact that only goods which have not been up before are offered at these alternate fortnightly sales. There were no changes of any importance. Cardamoms selling well, as also did Sumatra Gum Benzoin and Buchu Leaves, the following being the particulars:—

ALOES.—45 boxes East African, catalogued as Uganda, sold readily at 40s. to 45s. per cwt. Other 5 cases East Indian sold at 70s. to 72s. 6d. per cwt.

ARGOL.—17 bags Cape were all bought in at 37s. 6d. to 42s. 6d. per cwt.

ASAFETIDA.—73 cases were all bought in at 60s. for fair quality, down to 35s. per cwt.

BALSAM TOLU.—8 cases were taken out at 1s. 9d. per lb.

BUCHU LEAVES.—14 bales part sold at 1s. for good round and 10d. for stalky. Other 16 bales part sold at about same parity.

CARDAMOMS.—29 packages Ceylon, part sold at 3s. 9d. per lb. for fair bold, down to 1s. 5d. per lb. for small and inferior. 6 cases Wild were taken out at nominally 4s. per lb. Of another lot of 80 cases, part realised as much as 4s. per lb. for good bold, down to 1s. 10d. per lb., according to quality. Another lot of 65 cases Ceylon practically all sold at 3s. 2d., down to 1s. 1d. per lb., 1 bag Seed realising 2s. 1d. per lb. Other 127 packages also sold readily at 3s. per lb., down to 1s. 4d. per lb. for poor, broken and wormy.

CINCHONA BARK.—20 serons Crown and Grey Bark sold readily at 11d. per lb. down to 6d. for inferior, country damaged.

CIVET.—8 horns of not very excellent quality were taken out at 8s. per oz.

COLOCYNTH.—6 cases Turkey were bought in at 1s. 7d. per lb.

ESSENTIAL OILS.—8 cases Eucalyptus were taken out at the somewhat fancy price of 3s. per lb. 1 case West Indian oil of limes bought in at 3s. 6d. per lb., 1 case Citronella at 1s. 3d. per oz.

GUAZA (HERBA CANNABIS INDICA).—84 robbins were all bought in at 5d. to 7d. per lb.

GUM AMMONIACUM.—7 bags medium to fair, part almondy, part dark, lump sold at 36s. to 38s. per cwt.

GUM BENZOIN.—59 cases Palembang (each about 1¾ cwt. net, in 8 tins) part sold at 65s. per cwt., subject to owner's approval. 45 cases Sumatra bought in at £6 7s. 6d. to £6 15s. per cwt. for inferior seconds. Other 113 cases part sold at £10 for very fine seconds down to £6 5s. to £6 17s. 6d. for lower quality.

GUM GUAIAECUM.—7 boxes part sold at 1s. per lb. for fine glossy, 9½d. per lb. for medium, down to 1½d. per lb. for low inferior quality in damp condition.

GUM SANDRAC.—13 casks and 2 bags were bought in at 35s. to 55s. per cwt.

IPECACUANHA.—20 bales Rio part sold at 10s. 10d. to 11s. 3d. per lb. for medium to fair quality, balance being bought in at 11s. 6d. 11 cases fair Carthage were all bought in at nominally 8s. 3d. per lb., other 3 packages selling at 7s. 3d. to 7s. 4d. per lb.

MUSK SEEDS.—2 packages sold at 1s. 6d. per lb.

ORANGE PEEL.—24 packages were all bought in at 1s. per lb. for good bright thin cut, and at 6d. to 10d. per lb. for the lower qualities.

QUININE.—2 casks, each containing 120 4 oz. bottles Howard's Sulphate, were bought in at 1s. 8d. per oz. 1 case containing 7 100 oz. tins bearing the name of a firm hitherto not known as manufacturers of Quinine, was taken out at 1s. 6d. per oz., it transpiring that 1d. per oz. less than this figure was the limit.

RHUBARB.—25 cases Canton sold cheaply at 10d. to 1s. for flat and at 9d. to 10½d. per lb. for round and 8½d. for flat and round mixed. 7 cases offered without reserve sold at 7¾d. per lb. for flat and 6d. per lb. for round.

SENNA.—12 packages Alexandria part sold at 6½d., good half leaf sold at 6½d. per lb.; 4 cases good bold leaf, of fair colour, being bought in at 1s. 5 bales pods realised 9d. to 9½d. per lb.

TONQUIN BEANS.—10 cases Paras were all bought in; other 9 cases part sold at 1s. per lb., balance of better quality being bought in at 1s. 9d. to 2s. per lb.

WAX.—Fair New Zealand was taken out at nominally £7 10s. per cwt. Less money would, however, have been accepted. 51 mats fair Madagascar part sold at £6 15s. to £7 5s., 1 case fair Zanzibar realising £6 17s. 6d. per cwt. 18 cases white Calcutta were bought in at £7 2s. 6d. per cwt., 7 packages fair Jamaica at £7 10s. to £7 12s. 6d. Of other 8 casks 2 casks sold at £7 5s., remainder being bought in at £7 7s. 6d. per cwt. Other 6 packages all sold at £7 5s. per cwt.

Calendar for the Week.

- Sunday, March 4.** First Sunday in Lent. Sun rises 6.42; sets 5.43.
- Monday, March 5.** Sun rises 6.40; sets 5.44
 DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION, Town Hall, at 8.30 p.m.—Annual General Meeting; Election of Officers.
 SOCIETY OF CHEMICAL INDUSTRY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by R. W. Allen and Arthur Marshall.
- Tuesday, March 6.** Sun rises 6.38; sets 5.46.
 NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION, White Bull Hotel, Blackburn.—Special Meeting to Select a Candidate for the Council Election.
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—Lecture on "Some Beauty Spots of English Scenery," by John A. Hodges.
- Wednesday, March 7.** Sun rises 6.36; sets 5.48.
 MIDLAND CHEMISTS' ASSISTANTS' ASSOCIATION, Exchange Restaurant, Birmingham, at 9.0 p.m.—Smoking Concert.
 PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of the Council.
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8.0 p.m.—Opening of the March Exhibition by Sir Benjamin Stone, M.P.
- Thursday, March 8.** Sun rises 6.34; sets 5.50.
 CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8.30 p.m.—Professor Warington on "Recent Researches on Nitrification."
 CHEMISTS' ASSISTANTS' ASSOCIATION, Kiug's Hall, Holborn Restaurant, London, W.C.—Annual Dinner.
 NOTTINGHAM AND NOTTS CHEMISTS' ASSOCIATION, Albert Hall, Derby Road, at 8 p.m.—Annual Dinner.
- Friday, March 9.** Sun rises 6.31; sets 5.51.
 EDINBURGH CHEMISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Imperial Hotel.—Annual Supper.
 GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Dr. Coull's Lecture on "Stereo-Chemistry."
 ROYAL INSTITUTION, Albemarle Street, London, W., at 9 p.m.—Professor Frank Clowes on "Bacteria and Sewage."
- Saturday, March 10.** Sun rises 6.29; sets 5.53.
 ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Lord Rayleigh on "Polarised Light."

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

- Potass. Iodid.**, 2 lb., 19/-; Morph. Hydroch., 5/-, 4oz. 19/-.—Eastman, Chemist, Stratford.
- Moulds.**—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.
- Microscope**, large, excellent. Cost £7 7s. Sacrifice, £3 15s. Great bargain.—Weddle, Chemist, Gateshead.
- Photographic Mounts**, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.
- Good Painted Lantern Slides** (second-hand), including Religious, Temperance Effects, Mottoes, Comic, 4½d. each; Boer War, 6d. each. Lists free.—T. Wing, Photographer, Chatteris.
- Otto Roses**, Virgin, ounce, original (gilt), 25s.; Neroli, extra, ounce, original, 7s. 6d.; Ylang-Ylang, ounce, original, 7s. 6d.; Otto Jasmin, ounce, 15s.; Otto Violet, ounce, 21s.; Geranium, Bulgarian, 4 oz. bottle, 10s.; Lavender, Mitcham, 1 lb., original, 25s. Carriage paid, cash returned if sold.—Warnes, 333, Gray's Inn Rd., W.C. Saleable Patents wanted.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum for prompt cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Wootton's "Problems in Chemical Physics and Specific Gravities"; second-hand copies. 1/- will be sent in return for every copy received in fair condition by the Secretary, London College, 323, Clapham Road, S.W.

FREE FORMULÆ

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE 1s 8d. per oz. Tin, with Labels, Post free or through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—"I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable."

F. W. B., Manches er:—"Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much."

J. J. G., Folkestone:—"I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation."

D. R., Swansea:—"I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production."

R. N., Darlington:—"I have made our Tooth Paste from your formula for years"

Publications Received.

AIDS TO PRACTICAL PHARMACY FOR MEDICAL STUDENTS. By A. CAMPBELL STARK. Revised according to the Pharmacopœia of 1898. Pp. xiii. + 170; foolscap 8vo. Price 2s. 6d. cloth, 2s. paper covers. London: Bailliere, Tindall, and Cox, King William Street, Strand, W.C. 1900. From the Publishers.

KIRKE'S HANDBOOK OF PHYSIOLOGY. By W. D. HALLIBURTON, M.D., F.R.S. Sixteenth edition, with upwards of 650 illustrations, including coloured plates. Pp. xxiv. + 872. Price, 14s. London: John Murray, Albemarle Street, W. 1900. From the Publisher.

THE FLOWERING PLANT: As illustrating the First Principles of Botany. By J. R. AINSWORTH DAVIS, M.A., F.C.P. Third edition, Pp. xv. + 195. Price 3s. 6d. London: Charles Griffin and Company, Limited, Exeter Street, Strand, W.C. From the Publisher.

THE PHOTO-MINIATURE. A Magazine of Photographic Information. Edited by JOHN A. TENNANT. Vol. 1., no. 9. Lantern Slides. Pp. 427-479. Price 6d. London: Dawbarn and Ward, Limited, 6, Farringdon Avenue, E.C. From the Publishers.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Abram, Barlow, Bates, Burrell, Condy, Cowdery, Cross, Currie, Dunning, Eberlin, Ferrall, Foster, Gadd, Gilmour, Gray Hill, Hooper, Hornblow, Hymans, Jesper, Jones, King, Knight, Lewis, Maben, Meldrum, Metcalfe, (Miss) Moore, Oliver, Ruff, Sholl, Smith, Thursfield, Turner, Warren, Wilson, Windridge, Wyles.

NEWS IN BRIEF.

THE PHARMACEUTICAL SOCIETY'S PROFESSORS have been included in the list of teachers recognised by the new regulations of the London University.

MR. H. F. BOURNE, M.P.S., who for several years has managed the business of Messrs. Guyer and Shapley, 11, Strand, Torquay, has now purchased the business.

THE MANX PHARMACY BILL has been under consideration by the Legislative Council of the Isle of Man, on its return from the House of Keys, and, after some discussion, it was decided to ask the Keys for a conference on the measure.

LORD RAYLEIGH, F.R.S., will not deliver the second of his course of lectures on "Polarised Light" at the Royal Institution on Saturday afternoon, March 10, owing to the sudden death of his mother, the Dowager Lady Rayleigh.

THE RETURN "CUP MATCH" in connection with the Inter-Pharmacy Football League, between the Metropolitan College and London College, was played at Wormholt Farm, Shepherd's Bush, on Saturday last, resulting in a win for the "Metros." by eight goals to one.

EXETER CHEMISTS AND DRUGGISTS are to hold their annual supper at Wilson's Guildhall Restaurant on Tuesday, March 13, at 9 p.m., Mr. T. C. Milton, President of the local association, in the chair. Tickets (3s. 6d. each) may be obtained of the Hon. Secretary, Mr. H. Wippell Gadd, Fore Street, Exeter.

CAPTAIN W. B. ROBINSON (director of Messrs. Robinson and Sons, Limited, Chesterfield) is the officer selected to go out to South Africa in command of the second contingent of Derbyshire and Notts. Volunteers, consisting of 110 men, who have been ordered to hold themselves in readiness to proceed to the front.

MR. SAMPSON HANBURY, of Wyvenhoe Park, Colchester, died on Monday, March 5, aged 73. He was the elder brother of the late Mr. Daniel Hanbury, F.R.S., of the firm of Allen and Hanburys, Plough Court, Lombard Street. Mr. Hanbury was a director of the City and South London Railway.

THE SECOND SMOKING CONCERT in connection with the London College of Chemistry and Pharmacy Football Club, was held on March 1, at the "Gauden" Hotel, Clapham Road, when a large number of past and present students attended, and spent a very enjoyable evening. Being "Ladysmith Day" the toast of "The Queen," proposed by Mr. Wootton (Principal), was received with great enthusiasm, the National Anthem being sung with much fervour. A good musical programme had been arranged, the feature of the evening being the violin solos by Messrs. Douglas and Kieft

INTER-PHARMACY FOOTBALL LEAGUE.—Owing to a protest by the South London School of Pharmacy, the second contest with the "Square" team was replayed on Saturday last at Shepherd's Bush. It will probably be remembered that in the first match the "Square" team gained an easy victory by seven goals to nil. On the present occasion "Muters" showed much better form than previously, but were unable to cope with the superior play of the "Square" men, who, playing up-hill, and against a slight wind in the first half, scored two goals. On changing over the "Square" forwards put in numerous shots, out of which four found their billet, the game thus ending in another victory for the "Square" by six goals to nil. This was the last match for the "Square" in the round for the Cup; they are now equal with the "Metros." who, if they win the rest of their matches, will play the final with the "Square."

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

James Dow and William Rees Williams, Veterinary Surgeons, Bridgend, Glamorgan. Debts will be received and paid on behalf of J. Dow and W. R. Williams by their attorney, Samuel Henry Stockwood, solicitor, Bridgend.

William Dobie and William Scatterty, Physicians and Surgeons, Keighley. Debts will be received and paid by W. Dobie.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MARCH 7, 1900.

Since last report canary seed and castor oil have increased in price, whilst linseed oil and cottonseed oil are easier. At auction Calabar beans found buyers at a low rate ex quay, but Chilian honey and Quillaya bark fully maintained recent good prices. A steady tone is prevalent in chemicals generally, and chlorate of potash has again advanced.

AMMONIA SALTS.—Carbonate, 3 $\frac{3}{4}$ d. per lb. Sal Ammoniac is very firm, £38 to £40 per ton. Sulphate is firm, £12 5s. per ton.

CALABAR BEANS.—13 bags went for 3 $\frac{1}{4}$ d. per lb., ex quay.

CANARYSEED—Has commanded more attention, and closes at 33s. 6d. to 34s. per 464lbs. for Turkish, 400 bags selling early in the week at 32s. 6d. and 200 later at 33s.

COPPERAS.—37s. per ton Welsh, 39s. Lancashire.

COPPER SULPHATE—Is very firm at £25 to £25 5s. per ton.

HONEY—60 barrels of Chilian made 25s. 6d. per cwt. for Pile I. and 30s. to 30s. 6d. for Pile X.

LINSEED—The market is very quiet, but prices are steady, sales are small, and confined to River Plate "feeding" quality, ex quay at 48s. per 416 lbs. In Calcutta seed nothing is offered.

OILS (FIXED) AND SPIRITS.—Castor oils are very firm as to price, but the amount of business done is not great. Calcutta has sold forward January to March shipment at 3 $\frac{7}{8}$ d. per lb., spot lots offered at 3 $\frac{3}{8}$ d., French 3 $\frac{1}{4}$ d. to 3 $\frac{5}{8}$ d. per lb., Belgian 2nd quality 3 $\frac{1}{8}$ d. per lb. Olive Oil: Spot price for Spanish is £36 to £36 10s. per tun. Prices for shipment have become firmer, owing to decline in the rate of exchange. Linseed: Oils of Liverpool make are selling steadily at 24s. 9d. to 25s. 3d. per cwt. Cottonseed Oil: Liverpool refined is quiet at 24s. to 24s. 6d. per cwt. Spirits of Turpentine are in fair demand at 41s. 3d. per cwt.

POTASH SALTS.—Bichromate, 4 $\frac{1}{2}$ d. per lb.; chlorate, 4 $\frac{1}{2}$ d. to 5d. per lb. Cream of tartar is unchanged. Pearlashes are selling slowly at 33s. 6d. to 35s. per cwt.; potashes at 27s. 3d. to 27s. 6d. Saltpetre, 21s. per cwt.

QUILLAYA BARK.—20 tons Chilian made £13 5s. to £13 7s. 6d. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, 16s. to 17s. per cwt. Caustic: 76 per cent., £11 per ton; 70 per cent., £10 5s. per ton. Crystals are firm at £3 5s. to £3 7s. 6d. Nitrate is firm on the spot at 8s. 9d. to 9s. per cwt.

LONDON, THURSDAY, MARCH 8, 1900.

There has been rather more business passing in Drugs and Chemicals during the week, and especially during the past day or two, in consequence probably, firstly, of the more favourable news from South Africa, and, secondly, from the fact that the Budget proposals now being known, an end has been put to the certain feeling of uncertainty which previously prevailed. Of course, the advance in duty on spirits will have affected price of Ethers, Tinctures, etc., also to a moderate extent that of Chloralhydrate. Oil of Cloves is again dearer, as also is Borax. Glycerin firmer. Cod Liver Oil dull and weak. Quicksilver and Mercurials very firm, as also are Bromides. Quinine, although firm, as far as makers' quotations are concerned, has turned very sick in the speculative market. Salicylates and Salol remain unchanged, but very firm. Acid Carbohc steady. Price of Salicine has not yet been settled by the makers. Iodides steady, as also is Sulphonal. Cocaine rather firmer. Opium and Morphine very quiet. Codeine firm. Citric Acid quiet. Tartaric and Cream of Tartar steady. The following are prices ruling for some articles of principal interest:—

ACETANILIDE—Is still quoted 11d. per lb., down to 9 $\frac{1}{2}$ d. per lb. for 1 cwt. lots.

ACID BORACIC.—Prices are now 26s. per cwt. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC—Remains somewhat quiet, but prices are steady at 11 $\frac{1}{2}$ d. to 1s. per lb. for the 35°-36° C. ice crystal, in 2 $\frac{1}{2}$ cwt. drums and overcasks; 1s. 0 $\frac{1}{2}$ d. to 1s. 1d. per lb. for 39°-40° ditto; and 1s. 2d. per lb. for 39°-40° C. detached crystals (the P.B. quality). Crude, 60° F., 3s. per gallon; 75° F., 3s. 9d. Liquid, 95-98 per cent. of pale straw colour, 1s. 7d. to 1s. 9d. per gallon, in 40

gallon casks; ditto, crude, 25-30 per cent. of dark colour, 10½d. to 1s. per gallon, in same packing.

ACID CITRIC—Is somewhat quiet at 1s. 4½d. to 1s. 5d. per lb. for crystals in 5cwt. casks.

ACID GALLIC—Is firmer, in sympathy with Acid Tannic, makers quoting 2s. 2d. to 2s. 6d. per lb., according to quantity, make, and packing.

ACID OXALIC—Is still quoted 3d. to 3½d. per lb. net free delivered, London.

ACID TANNIC—Makers are very firm, in consequence of the continued dearness of raw material, and now quote 2s. 3d. per lb. for the leviss. P.B. quality, down to 2s. 2d. per lb. for 2-cwt. lots.

ACID TARTARIC—Is firm at 1s. 0½d. to 1s. 1d. per lb. for English, and 1s. per lb. for foreign.

AMMONIA COMPOUNDS—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate firm; gray, 24 per cent., London, prompt, £12 2s. 6d.; Hull, prompt, £12 1s. 3d.; Leith, prompt, £12 2s. 6d.; Beckton, March-April, £12; Beckton terms prompt, £11 17s. 6d. to £11 18s. 9d. Nitrate, £32 10s. per ton. Phosphate, 5d. per lb. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY—Regulus is quoted £38 10s. to £39 10s. per ton, and Japan Crude (Black Sulphide), £22 10s. to £23 10s. per ton.

ASHES—Pots 28s. 6d., Pearls 34s.

BISMUTH—Unchanged, at 5s. per lb. for the commercial quality of the metal; 5s. 1d. per lb. for the Subnitrate Salt, and 5s. 8d. per lb. for the Subcarbonate.

BLEACHING POWDER (CHLORIDE OF LIME)—Is still quoted £7 per ton for English.

BORAX—Has advanced in value, and is now quoted 17s. per cwt. for crystals and 18s. per cwt. for powder.

BROMIDES—Are very scarce for immediate delivery, and prices are firm at 1s. 11½d. per lb. for Potassii Bromid, 2s. 2½d. per lb. for Sodii Bromid, 2s. 3d. per lb. for Ammon. Bromid. Bromine is firm at 2s. to 2s. 2d. per lb., according to quantity, in 60lb. cases.

CAMPHOR—Continues very quiet, refined being firm at unchanged price—viz., 2s. 2d. per lb. for English Bells and Flowers; while crude is dull at nominally unchanged quotations.

CASTOR OIL—Firm; Belgian, first pressing, spot, £31; April-June, £30 10s., f.o.b. Antwerp, second pressing, spot, £28 10s. per ton, ex-wharf; Hull manufactured, guaranteed cold-drawn pure Pharmaceutical, £33 10s. per ton in barrels, 4d. per lb. in cases; pure firsts, £31; seconds, £30 per ton, in barrels; firsts, 3½d. per lb., in cases; seconds, 3½d. per lb. ex-wharf, London.

CHLORAL HYDRATE—In consequence of the increased duty (attendant on the higher rate of duty on spirits) of 1d. per lb., this article may be considered to be 1d. per lb. dearer at 4s. per lb. for crystals and 3s. 10½d. per lb. for cake.

CLOVES—At auction no Penang were catalogued, and out of 120 bales Zanzibar that were offered 60 bales sold at about steady rates, fair at 4½d. Privately, Zanzibar remain quiet and barely steady. A small business has been done, comprising March-May delivery at 4½d. and sellers and June-August at 4¾d., closing sellers at 4 13-32d.

COCAINE—Is rather firmer, makers' prices remaining unchanged at 16s. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, while there are practically no sellers from second-hand of the brands most in favour at anything tangibly below makers' prices.

CODEINE—Continues very firm at 13s. 6d. per oz. nett, down to 13s. 1d. for 500 oz. lots, and 1s. per oz. less for the Muriate Phosphate and Sulphate Salts.

COD LIVER OIL—The market continues weak, the very finest brands of new Norwegian oil being quoted 58s. 6d. to 60s. per barrel, in tin-lined barrels of 25 gallons.

COAL TAR DISTILLATION PRODUCTS—Toluol, commercial, 1s. 3d. per gallon; pure 2s. Benzole, 50 per cent., 9½d.; 99 per cent., 7½d. to 8d. per gallon. Creosote, 3½d. to 6d. per gallon, according to quantity. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 6d. per gallon; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2½d. per gallon. Anthracene: A, 3¾d. per unit; B, 2¾d. Pitch, 38s. per ton, f.o.b. Tar, refined, 15s. to 15s. 6d. per barrel; 3d. per gallon; crude, 12s. 6d. per barrel; 2¼d. per gallon.

CREAM OF TARTAR—First white crystals are quoted 73s. per cwt.; powder, 75s.; ditto 95 per cent., 76s. per cwt.

CUTCH—Quiet, and 89 boxes offered were nearly all bought in, only 19 boxes selling, without reserve, ordinary block at 10s.

ESSENTIAL OILS—Remain extremely quiet, with no business of any importance passing.

ETHER—Owing to the increased duty of 6d. per gallon on spirits, price of ether has been advanced 3d. per lb.

GALLS—Business in all descriptions continues limited, but prices are steady and unchanged. China for arrivals are still quoted 65s., and Japan 61s. c.f. and i. Persian continue to be firmly held, Blues at 95s., and Greens at 85s., with small sales thereof of the latter; White quoted 65s.

GAMBIER—The market remains firm, but quiet, and little business has occurred. Whole bales on the spot now quoted 17s. for old landed; for arrival the nominal price is 16s. 9d. for Feb.-April shipment.

GINGER—At auction no cut kinds were offered, and a moderate supply of 437 bags of Cochin went off slowly, and only 82 bags sold at about steady rates, fair bright medium and small, little wormy, washed rough at 32s., dullish rather lean ditto at 30s. Japan: 100 bags offered and bought in, fair lined at 26s. Jamaica steady, but quiet: Of 145 barrels and 3 half-barrels, old import, offered 33 barrels sold, middling to good middling at 55s. to 61s. 6d. Green Ginger: 2 barrels offered and sold at 67s.

GLYCERIN—Is decidedly firmer. Crude continues very scarce and dear, the few parcels that offer being eagerly snapped up at prices considerably above the parity of prices ruling for the refined article, which latter is quoted 57s. to 58s. 6d. per cwt., according to quantity and make, for English, and 58s. to 67s. 6d. per cwt. for German, according to brand, etc., for best white double-distilled, chemically pure 1260° quality in tins and cases (2 or 4 × 56lb. tins in a case).

IODIDES—Are steady at 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 13s. 10d. per lb. for Iodofom. cryst. powder and precip., 12s. per lb. for Iodine resublimed, and 7½d. per oz. for crude Iodine.

MENTHOL—Is rather firmer; it is, however, still possible to buy good dry white crystals, in case lots, on the spot, at 9s. per lb.; while for arrival, a tangibly higher price is quoted.

MERCURIALS are very firm at unchanged prices—viz.: 3s. 2d. per lb. for 3s. 2d. Calomel, and 2s. 10d. per lb. for Corrosive Sublimite.

MORPHINE—Quiet, but steady, at 5s. to 5s. 3d. per oz. for the Hydrochlorate Powder, and 2d. per oz. more for the Crystal Salt.

LYCOPodium—Is very firm, and as much as 2s. 5d. per lb. has been paid for sifted.

OILS (FIXED) AND SPIRITS—Linseed: A slow market. On the spot pipes, London, £25; barrels, £25; April, £24 10s.; Hull spot naked, £22 15s. Rape quiet: Ordinary brown on the spot quoted £25 5s.; refined spot, £26 10s. to £27; Ravison naked spot, £23 10s. Cotton quiet: London crude spot, £20 10s. to £20 15s.; refined spot, £23 to £23 10s., according to make; Hull naked refined spot, £20 17s. 6d.; crude spot, £19 15s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut steady, spot easier forward: Ceylon on the spot, £25 15s.; Cochin spot, £29 to £29 10s. Palm: Lagos on the spot quoted £29. Lubricating: Pale American spot, 8s. to 9s. 9d.; black, 7s. to 9s.; Russian black, 6s. to 6s. 6d.; pale, 8s. to 9s. 9d. Petroleum Oil quiet: Russian spot quoted 6¼d. to 7½d.; American spot, 7½d. to 7¾d.; water white, 8¾d. to 9d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. Turpentine quiet: American spot, 40s. 3d.; April, 40s. 3d.; May, 39s.

OIL OF CLOVES—In consequence of further advance in value of cloves, price of the oil has been further advanced 2d. per lb.

OPIUM—Market has remained exceedingly quiet for some considerable time, there having been practically nothing doing, either in Persian Manufacturing Druggists or soft shipping kinds, prices remaining nominally unchanged.

ORRIS ROOT—Best select Florentine is quoted at 60s. to 65s. per cwt.; fair to good sorts 50s. to 55s.

PARAFFIN WAX—Crude is quoted 3¼d. to 3½d. per lb., and Refined 4d. to 4¾d. per lb.

PHENACETIN—Makers still quote 5s. 3d. per lb. nett for crystals or powder, in 5-cwt. lots, while second-hand offers at 6d. to 9d. per lb. below this figure. Bayer's make is held for the fancy price of 7s. 6d. per lb., in bulk packing.

PITCH—9s.

POTASH COMPOUNDS—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot London, crystals, 4½d. net; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent., to 80 per cent., £22 per ton. Iodide, 10s. 6d.

per lb. Nitrate, refined, £21 5s. per ton. Permanganate small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow English makes, 7½d.; Beckton, 7¼d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex ship. Muriate, 80 per cent., £9 per ton.

QUICKSILVER—Is very firm at £9 12s. 6d. per bottle, both from the importer and from second hand.

QUININE.—While makers are very firm, the agents for the favourite B&S brand quoting 1s. 6½d. per oz. for 1,000-oz. lots in 100 oz. tins, there has been quite a slump in the speculative market for this article, and B&S and/or Brunswick has been done as low as 1s. 5d. per oz. for spot delivery. Market manipulations, combined with weakness of some of the speculative holders, are said to be the cause of the decline, and a speedy recovery is confidently looked for by those who may be presumed to be the best judges on the subject.

ROSIN.—Strained spot, 5s. 6d. to 5s. 9d. per cwt. ex wharf, and 5s. 1½d. per cwt. to arrive April-June and July-September shipment per sailing vessel.

SALICINE.—The makers do not appear to be able to agree what price shall be, whether 20s. 6d. or 21s. 6d. per lb. There are, however, sellers from second hand at 19s. to 19s. 6d. per lb.

SALICYLATES AND SALOL—Remain very firm, but so far without change in makers' prices.

SANTONINE.—There have been sales from second hand as low as 9s. 3d. per lb., makers' price being 11s. 3d. to 11s. 9d. per lb., but stock in second hand appears now to be practically exhausted, and the possibility of makers still further advancing their price is now even hinted at.

SEEDLAC.—At auction 50 bags Kurrachee offered and 10 bags sold, fine pale red at 58s., subject.

SHELLAC.—The market remains quiet, and privately few sales have occurred in any position. At auction to-day good supplies were catalogued, a large proportion of which consisted of Second Orange, without reserve, which sold most irregularly at variable prices. In some cases a material decline was established, while in others steady last sales' rates were obtained. The nominal value of fair TN is 61s. Garnet was all bought in. Button: Only a few cases sold at easy rates. A total of 1,200 cases was offered and 565 cases sold. Second Orange: Of 786 cases 529 sold, chiefly without reserve, fine SR in diamond matted at 72s., TN qualities ranging from 57s. to 64s. for ordinary livery to good bright. Garnet: 71 cases offered and bought in, comprising blocky AC and common weak flat at 57s. Button: Of 343 cases 36 sold, mostly without reserve, fair to good firsts at 68s. to 72s., fair seconds at 61s., cakey ditto at 60s., ordinary circle 2's at 56s., good dark at 55s.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Ash, £5 to £6, according to percentage, etc. Acetate, £14 per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bichromate, 3¾d. per lb. Bicarbonate, 3¾d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 76 per cent., £11; 74 per cent., £10 12s. 6d.; 70 per cent., £10 2s. 6d.; 60 per cent., £9 2s. 6d. Chlorate, 4½d. per lb. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, 95 per cent., 8s. 9d. per cwt. Nitrite, 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. per ton. Sulphate (Salt Cake), £1 7s. 6d. per ton. Glauber Salts, £1 10s. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction there was a slow demand and chiefly bought in, comprising 25 bags ordinary Singapore at 6d., and 54 bags Penang, weight 40 lb., dust 2.58 per cent., at 6d. Of 160 bags Tellicherry, only 10 bags damages sold at 6¼d., the remainder good taken out at 6¼d. White Pepper neglected and all bought in, comprising 90 bags fine Singapore at 10¾d., and 61 bags fair brown lined Penang at 8½d. Chillies quiet, and 6 bags fair bright, but seedy. Japan were bought in. Capsicums freely offered and cheaper. Of 393 packages Bombay, 62 bales sold, without reserve, fair bright cherry pods at 29s. to 29s. 6d.; 74 bags from Egypt sold, fine bright Natal character at 62s. to 65s.; dull reddish at 60s. to 60s. 6d. Pimento quiet, and in slow demand. Of 470 bags offered, only 18 sold, fair to good at 3½d. to 3¾d. Broken Cassia dull; 160 bales in auction were all bought in. Cassia Buds: 14 bags Wild offered, and sold, without reserve, at 21s. 6d. Cinnamon: out of 550 packages, chiefly Wild, only 34 packages sold at 1½d. Cinnamon Chips and Bark neglected, and of 470 bags offered, 53 bags sold, good quillings at 6¼d.; fair chips at 3¾d.; and Wild bark at ½d. to 1½d. Nutmegs rather firmer; 15 cases Penang offered, and 1 case sold, 80's defective, at 1s. 3d.; remainder bought in, including 65's and 66's at 2s. 4d. to

2s. 5d. 5 cases Singapore sold, 80's at 1s. 7½d. 9 cases Bombay sold, fair broken at 4d. No Mace was offered in auction. Cassia Vera: 209 bags Japan offered, and 100 bags sold at 22s. 20 bales Padang Quills were bought in at 30s.

SULPHATE OF COPPER—Is quoted £24 to £24 10s. per ton for spot delivery.

SULPHONAL.—Second-hand holders appear to be cleared out, and makers, therefore, now have it all their own way, their price being 20s. 6d. per lb. for both crystals and powder, in bulk packing with a reduction of 6d. per lb. for not less than 10 lbs. in one delivery.

THYMOL—Firm at 10s. 3d. to 10s. 6d. per lb. from the makers.

TURMERIC—In slow demand, and 59 bags in auction were bought in, fair bright lean Madras finger at 31s.; also ordinary rough Cochin split bulbs.

VANILLA.—The quantity brought forward at the auctions to-day comprised 787 tins, and, with a moderate demand, about one-half sold at lower prices, good to fine qualities being 1s. to 2s. cheaper, and middling 2s. to 4s., whilst ordinary qualities steady, unchanged. Seychelles: Of 639 tins, 256 tins sold, fair to good colour, 7 to 8 inch, at 21s. 6d. to 23s.; 7 to 7½ inch at 19s. to 22s. 6d.; 6½ to 7 inch at 17s. 6d. to 21s.; 3 to 6½ inch at 15s. 6d. to 19s.; common, 5 to 8 inch, at 15s. 6d. to 18s.; 3 to 7 inch at 13s. 6d. to 17s. Mauritius: Of 58 tins 19 sold, good colour, 6½ to 7 inch, at 21s. 6d. to 22s.; 4 inch at 17s. Bombay: Of 39 tins 15 sold, common to fair, 4 to 6 inch, at 13s. to 15s. Tahiti: Of 27 tins 4 sold, fair, 4 to 6 inch, at 6s. 2d. to 6s. 3d. Australian: Of 18 tins 2 sold, brown, fair flavour, 7½ to 8 inch, at 18s.; 5 inch at 15s. The remainder and American bought in.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Morph. Hydroch., one ounce 5/-, 4 ounces 19/-.—Eastman, Forest Lane, Stratford.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

Friday, March 16. O 8.12 M. Sun rises 6.14; sets 6.4.
 GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—"The Distribution of Plants in Time and on the Earth," by T. S. Barrie.

ROYAL INSTITUTION, Albemarle Street, London, W., at 9 p.m.—Sir Benjamin Stone, M.P., on "Pictorial Historical Records."

Saturday, March 17. Sun rises 6.12; sets 6.6.
 INTER-PHARMACY FOOTBALL LEAGUE, Wormholt Farm.—Metropolitan College v. Muter's. Referee supplied by London College.

ROYAL INSTITUTION, Albemarle Street, London, W., at 3 p.m.—Lord Rayleigh on "Polarised Light."

TRADE NOTES.

SYPHON REPAIRING.—Messrs. Idris and Co., Limited, Pratt Street, Camden Town, London, N.W., issue a pamphlet on "Syphon Repairing," containing numerous useful hints which should greatly assist those pharmacists who manufacture mineral waters and have occasion to repair their syphons. It is fully illustrated, showing specimens of the tools required, and how to handle them, section of syphon, method of cleaning, etc. Messrs. Idris will be happy to send a copy of the pamphlet free of charge to any syphon users.

ADDITIONAL DUTY ON SPIRIT.—Messrs. C. R. Harker Stagg and Morgan, 15, Laurence Pountney Lane, London, E.C., intimate that in consequence of the imposition of an additional duty of 6d. per gallon on proof spirit they are compelled to raise their prices for all preparations which they manufacture containing spirit or by its aid. On and after March 6 the prices will be advanced as follows:—Rectified spirit, 1s. per gallon; alcohol absolute, 2d. per lb.; æther pur., 3d. per lb.; æther acetic, 2d. per lb.; chloral hydras, 3d. per lb.; chloroform pur., 3d. per lb.; decocta and liquors, 1d. per lb.; extracts liquid, 2d. per lb.; infusions, 1d. per lb.; perfumes, 3d. per lb.; spiritus æther. nit., 2d. per lb.; spiritus ammon. arom. B.P., 2d. per lb. Tinctura—Rectified spirit, 2d. per lb.; tincturæ, 60 per cent. alcohol and lower strengths, 1d. per lb. The price of all other preparations containing alcohol will be advanced in similar proportion.

SOUTH AFRICA.—ASSISTANTS open to accept situations in South Africa should apply to LENNON LIMITED, 75, Leadenhall St., London, E.C., who frequently hear of vacancies.

WANTED, an APPRENTICE in a good-class Chemist's business. Comfortable home, time for study; low premium, by arrangement.—Apply, AJAX, "Pharm. Journal" Office, 5, Serle St., W.C.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Attfield, Barnes, Bartlett, Bennett, Cocks, Forster, Gadd, Geddes, Gilmour, Gray, Green, Hill, Hooper, Keen, Lawrie, Lennox, Metcalfe, O'Halloran, Palmer, Parker, Righton, Robinson, Schaer, Walton, Whitehead.

NEWS IN BRIEF.

"SOME MODERN EXPLOSIVES" is the title of a lecture to be delivered at the Royal Institution on Friday evening next, March 23, by Sir Andrew Noble.

MR. WILLIAM S. L. JOHNSTONE, M.P.S., of Coventry, has purchased the business lately carried on by Mr. Bell at 56a, Wilmslow Road, Withington, Manchester.

"THIRST QUENCHERS" FOR TOMMY ATKINS.—Messrs. Robert Gibson and Sons, Limited, of Manchester and London, have given and sent out to the soldiers in South Africa five thousand tins of "Thirst Quenchers."

LEICESTER CHEMISTS are to meet at the Victoria Coffee House on Thursday, March 22, to consider the clauses in the Companies Bill which affect the interests of chemists. Mr. T. Howard Lloyd is to take the chair.

THE PHOTOGRAPHIC EXHIBITION arranged by the National Photographic Record Association is now open in the rooms of the Royal Photographic Society, 66, Russell Square, W.C. Admission from 10 a.m. to 5 p.m., on presentation of visiting card.

LIVERPOOL CHEMISTS will hold the annual dinner of the fifty-first session of their Association at the Exchange Station Hotel, on Thursday, March 22, at 7.15 p.m. Tickets (5s. each) may be obtained of the wholesale houses in the city, or of Mr. R. C. Cowley, 6, Sandon Terrace, Upper Duke Street, Liverpool.

THE THIRD CINDERELLA DANCE of the session, in connection with the Chemists' Assistants' Association, will be held in the Dorset Hall, Portman Rooms, Baker Street, W., on Thursday, March 22. Tickets may be obtained of the Hon. Secretaries, Mr. C. Morley, 3, Bucklersbury, E.C., and Mr. H. H. Robins, 113, Ridley Road, Forest Gate, E.

SHOPS BILL.—This is postponed until Tuesday, April 24, when its chances will be remote. Mr. Provand has come to the fore with a Bill to amend the Shop Hours Act, and its second reading is tabled for Friday, April 27. He is supported by Mr. Samuel Smith (Flint), and Mr. Seton-Karr (St. Helens).

SHEFFIELD COLLEGE OF PHARMACY.—On Tuesday, March 13, the students of this College, through the kindness of Major W. G. Blake, J.P., of Mylnhurst, Ecclesall, and Mr. F. A. Kelley, of Holly Court, Ecclesall, visited their grounds and conservatories, and were shown round by the head gardener of each place. Among the specimens in flower were: *Ac ypha sanderiana* (Euphorbiaceæ), *Garrya eliptica* (Incompletæ), both with pendulous inflorescences—the latter borne on a fine tree on the terrace of Major Blake's grounds—*Epidendrum stamfordianum*, *Dendrobium luehianum* and *Laelia harpophylla* (Orchidaceæ), *Freesia refracta* (Liliaceæ), *Skimmia japonica* (in fruit), as well as an interesting show of cinerarias, camellias, callas, begonias, primulas, azaleas, spiræas, acacias, etc.

A COMBINATION OF GERMAN CHEMICAL MANUFACTURERS has been formed for the purpose of showing their products as a collective exhibit at the Paris International Exhibition to represent the chemical industries of Germany. The objects to be shown are arranged in eight sections, of which the second is to comprise products relating to pharmaceutical chemistry, and Dr. E. A. Merck, of Darmstadt, has undertaken to arrange the different exhibits, numbering about thirteen hundred, of a value of more than £12,000. These exhibits are classified in twenty-five groups, which occupy six large show cases, and some days ago Messrs. E. Merck invited a number of local officials, professors and others to an inspection, which was very numerously attended.

CONVERSION OF BUSINESS.—Mr. Benjamin Robinson, Church Street, Pendleton, Manchester, has decided to convert his business into a private limited liability company, to be registered and carried on in future as the firm of "Benjamin Robinson and Company, Limited." The undertaking being strictly private, no shares will be offered either to the trade or the public. The directors will be Mr. B. Robinson as chairman, his two sons, Mr. W. B. Robinson and Mr. E. H. Robinson, and Mr. R. S. Noar, who for upwards of twenty years has taken an active part in the business.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MARCH 14, 1900.

There is no great change in prices since last report, the tone of the market is steady, and the business done has been quite up to the average. Considerable amounts of Chilian Honey have been disposed of readily and at good prices, and Beeswax has been largely dealt in at firm rates. There is a good demand experienced in the Chemical market for Caustic Soda, Bleaching Powder, and Chlorates, with an advance in Copper Sulphate.

AMMONIA SALTS.—Carbonate, 3 $\frac{3}{4}$ d. per lb. Sal ammoniac is firm at 38s. to 40s. per cwt. Sulphate is very firm at £12 7s. 6d. per ton.

BEESWAX.—4 blocks of Sierra Leone made £6 15s. per cwt. 10 sacks of Chilian sold at £7 10s. per cwt. and American at £7 5s.

BLEACHING POWDER.—Is extremely firm at £7 10s. per ton.

CANARY SEED.—Is without demand, and is simply nominal at 33s. 6d. per 464lb. for Turkish.

CARNAUBA WAX.—Ordinary grey has been seeling in retail amount at 80s. per cwt.

COPPER SULPHATE.—Is dearer and now sells at £26 per ton.

COPPERAS.—Steady at 37s. to 39s. per ton.

GINGER.—25 bags of Sierra Leone were sold ex store privately.

HONEY.—Pile 1 Chilian early in the week sold at 25s. 6d. Later 30 barrels found buyers at 25s. to 25s. 6d. per cwt. privately; whilst at auction 27 barrels Pile 3 brought 22s. 6d. to 23s. 3d. per cwt.

KOLA NUTS.—4 bags of dried changed hands at 1 $\frac{1}{2}$ d. per lb.

LINSEED.—Is very inanimate, with plenty offering on the spot, but few buyers, crushers having large stocks on hand. River Plate future delivery near has been offering at 44s. 9d. per 416lb., March delivery 44s., and Calcutta March and April at 44s. 9d. per 416lb.

OILS (FIXED) AND SPIRITS.—Castor is quiet on the spot, with only small sales, mostly of French, at 3 $\frac{1}{4}$ d. to 3 $\frac{5}{8}$ d. per lb. Calcutta offers at 3 $\frac{3}{4}$ d. and French second at 3 $\frac{1}{8}$ d. Olive only enjoys a small retail business at £36 to £36 10s. per ton. Linseed is steady at 24s. 9d. to 25s. 6d. per cwt. Cotton Seed is quiet at 23s. 3d. to 23s. 9d. per cwt., a slight decline since last week. Spirits of Turpentine are selling moderately well at 41s. per cwt.

POTASH SALTS.—Bichromate, 4d. to 4 $\frac{1}{2}$ d. per lb. Chlorate, 4 $\frac{3}{4}$ d. to 5d. per lb. Pearl Ash is very nominal at 33s. 6d. to 35s. per cwt. Pot Ashes sell moderately at 27s. 3d. to 27s. 6d. per cwt. Prussiate, 8d. per lb. Saltpetre, 21s. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer, £16 to £16 10s. per ton. Caustic, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton. Crystals, £3 5s. to £3 7s. 6d. per ton. Nitrate is improved in inquiry, and sells at 8s. 9d. to 9s. per cwt.

LONDON, THURSDAY, MARCH 15, 1900.

Business in Drugs and Chemicals has been very quiet during the past few days, but, with the exception that Quinine Sulphate, Acid Carbolic, and Menthol are lower, there are no changes in value of any particular importance to record. Iodides are rather unsettled; Cod Liver Oil nominally dearer; Glycerin firm, Morphine quiet; Codeine firm; Opium steady; Camphor quiet; Quicksilver and Mercurials firm; Salicylates and Salol unchanged, it being reported that makers have decided to make no alteration in prices for the moment; Acid Tartaric and Cream of Tartar steady; Acid Citric quiet. The following are prices actually ruling for some articles of chief interest:—

ACETANILIDE.—Continues dull and weak at 9 $\frac{1}{2}$ d. to 11d. per lb. according to quantity, etc.

ACID CARBOLIC.—Refined is about 1d. per lb. lower as against prices quoted last week. Crude is quiet at 2s. 9d. per gallon for the 60° F. and 3s. 6d. per gallon for the 75° F. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 9d. per gallon in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 10d. to 1s. per gallon in 40-gallon casks.

ACID OXALIC.—Quiet and unchanged.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure small crystals, 33s. to 36s. per cwt. Sal ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate steady; gray, 24 per cent., London, prompt, £12 1s. 3d. Hull, prompt, £12 to £12 1s. 3d. Leith, prompt, £12 5s. Beckton, March-April, £12. Beckton, terms prompt, £11 17s. 6d. Nitrate, £32 10s. per ton. Phosphate, 5d. per lb. Sulpho cyanide, 1s. 1d. to 1s. 2d. per lb.

BLEACHING POWDER (CHLORIDE OF LIME).—English is still quoted £7 per ton.

BORAX AND ACID BORACIC.—Are steady at the late advance.

CAMPHOR.—Crude is quiet, but steady, with, however, but little business passing. China near at hand is quoted, buyers at 165s. per cwt. c.i.f., and Japan at 170s. For refined Hamburg reduced price 1d. per lb. to 1s. 11d. per lb. for Bells and Flowers in ton lots for spot delivery and 1s. 11½d. forward. English refiners maintain their price of 2s. 1d. per lb. for Bells and Flowers in ton lots.

CASTOR OIL.—Belgian, first pressing, spot, £31; April-June, £30 10s., f.o.b., Antwerp; second pressing, spot, £28 10s. per ton, wharf; Hull manufactured, guaranteed cold drawn pure Pharmaceutical, £33 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts, £31; seconds, £29 10s. per ton, in barrels; firsts, 3½d. per lb. in cases; seconds, 3½d., ex-wharf, London.

CINCHONA BARK.—These periodical auctions, the third of the series, were held to-day. Increased supplies were catalogued, amounting to 4,440 packages of all descriptions, as compared with 2,129 packages at the preceding sales. The proportion of old import Bark was large, about one-third of the offerings, which had an adverse effect on the sale. A somewhat dragging demand prevailed, and prices were irregular, but good rich bark realised full rates, the average of the auctions, however, being rather below the previous London sale, with a unit of barely 2d., against a full 2d. in February last. The quantity which changed hands at and since the sale was fully 2,000 packages, being considered satisfactory. Ceylon: 168 packages offered and about 100 packages sold, according to analysis. Succirubra, fair stem chips and shavings, at 4¾d. East Indian: 1,967 bales and 111 cases offered and about 1,200 packages sold. Red, stem chips and shavings, fair to good at 3½d. to 5½d., ordinary to fair at 2¾d. to 3¾d.; root, fair to good at 3½d. to 4¾d.; fair silvery quill at 5½d.; renewed chips and shavings, fair to good at 3d. to 4¾d.; officinalis, stem chips and shavings, fair to good rich at 5d. to 7½d.; ordinary to fair at 2¼d. to 4¾d.; renewed ditto, fair to good rich at 4¾d. to 7¾d.; fair root at 3d.; ledger, stem chips, fine rich at 11d.; fair to good at 5d. to 7d.; root, good ledger at 6¾d.; ordinary to good Hybrid at 3¾d. to 5d. Java: 439 bales and 10 cases offered and about 120 packages sold, good ledger chips and branch at 8d. to 9¾d. South American: 96 bales Bolivian cultivated Calisaya offered and 31 bales flat sold at 9¾d.; quills all bought in. Soft Columbian: 853 bales offered, the bulk old import, and 84 bales sold at 5½d. Cuprea: 677 bales of old import offered and 100 bales sold at 2d. Red: Of 113 bales 70 sold, damages at 3¼d. to 4¾d. Carthagena: 6 bales offered and sold at 4d., subject.

CLOVES.—At auction no Zanzibar were catalogued, and 26 cases Penang offered were bought in, good bright picked at 8d. Privately there has been little done, and the prices of Zanzibar are easier. A few hundred bales have changed hands at 4 7-32d. for Jan.-March delivery, and 4 9-32d. for June-August. Stems: 100 bales Zanzibar bought in at 1¾d.

COAL TAR DISTILLATION PRODUCTS.—Toluol commercial, 1s. 1d. per gallon; pure, 2s. 6d. Benzole, 50 per cent., 10d. per gallon; 90 per cent., 8d. per gallon. Crocote, 3d. to 6d. per gallon, according to quality. Crude Naphtha, 30 per cent. at 120° C., 6d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 6d.; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 3¾d. per unit; B, 2¾d. Pitch, 38s. per ton, f.o.b. Tar: Refined, 14s. per barrel, 2½d. per gallon. Crude, 12s. 6d. per barrel, 2d. per gallon.

COD LIVER OIL.—Has had a decided advance in value, some agents quoting 65s. to 72s. 6d. per barrel, according to brand, while others state that they are at the moment unable to offer.

GALLS.—Continue quiet, and business in all descriptions is unimportant. China, on the spot, is scarce; for arrival, 67s. 9d., c. f. and i., is quoted. Japan, to arrive, sellers at 61s., c. f. and i.

GINGER.—In auction a small supply of Cochin was dull of sale, and were nearly all bought in. Of 367 bags and 38 cases offered, 61 bags damages sold, the remainder bought in; fair bright Calicut rough, at 38s.; ditto washed, rough medium and small plump, at

35s.; 38 cases medium and small, roughly cut and scraped, bought in at 47s. Japan: 100 bags offered and bought in; fair lined, at 26s. Jamaica sold at barely steady to lower rates for common quality. Of 403 barrels offered, 289 barrels sold, common to good common at 50s. to 52s.; middling to good middling, 54s. 6d. to 60s. 6d.; new crop Rhaton, low to fair, at 44s. to 48s. 6d.

MENTHOL.—Is decidedly weaker in consequence of the forced sale at to-day's drug auctions. Price is nominally 8s. 9d. to 9s. per lb. for good dry white crystals.

OILS (FIXED) AND SPIRITS.—Linseed, steady spot, quiet, forward. On the spot, pipes, London Ordinary, £24 7s. 6d. to £24 10s.; barrels, £24 10s.; Hull, spot, naked, £22 10s. Rape firm. Ordinary brown, quoted £25 5s. to £25 10s.; refined spot, £26 15s. to £27; Ravison, naked spot, £23 10s. Cotton easier. London Crude, spot, £20 5s.; refined, spot, £22 to £22 15s. according to make. Hull naked refined spot, £20 2s. 6d.. Crude spot, £18 15s.; Olive Mogador, £35; Spanish, £36 10s.; Levant, £35. Cocomnut, easier. Ceylon, on spot, £25 15s.; Cochin, spot, £28 10s., accepted. Palm Oil: Lagos, on spot, quoted £29. Petroleum Oil, Russian spot, quoted 7d. to 7½d.; American spot, 7½d. to 7¾d.; water, white, 8¾d. to 9d. Lubricating pale American, spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian, black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum Spirit, American, 9¾d.; Deodorised, 10d. to 10½d. Turpentine, closing strong, American, spot, 40s. 3d. to 40s. 4½d.

OPIUM.—Steady, there having been some business passing for America both here and in Smyrna, on basis of 9s. to 9s. 6d. per lb. for fair to good manufacturing kinds.

PHENACETIN.—Makers are firm at 5s. 3d. per lb. for both crystals and powder, in 5 cwt. lots, while there is less desire on part of second-hand holders to sell at much below the basis.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4½ per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot London, crystals, 4½d.; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7¾d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship. Muriate, 80 per cent., £9 per ton.

QUININE.—Has remained extremely quiet, with only a small business passing, but prices are steady. About 20,000 ozs. B&S and/or Brunswick have been sold, on the spot at 1s. 5½d. to 1s. 5¼d., and June delivery at 1s. 5½d. to 1s. 5¾d. The agents for the favourite B&S brand of sulphate remain firm at 1s. 6½d. per oz. for 1,000-oz. lots.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Ash, £5 to £6, according to percentage, etc. Acetate, £14 per ton, ex-ship. Bichromate, 3¾d. per lb. Bicarbonate, 3¾d. Bromide, 2s. 2½d. per lb. Caustic, 76 per cent., £11; 74 per cent., £10 12s. 6d.; 70 per cent., £10 12s. 6d.; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, 95 per cent., 8s. 9d. per cwt. Nitrate, 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Sulphate (salt cake), £1 7s. 6d. per ton. Glauber salts, £1 10s. per ton. Sulphide crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction no Singapore was offered; 200 bags Penang, weight 4 lb., dust, 2.58 per cent., bought in at 5¾d., and 225 bags fair Lampong at 6d. White Pepper in little demand; 70 bags Singapore were bought in, good fair, at 9½d. No Penang offered. Cayenne Pepper: One case Napaul bought in at 1s. Chillies quiet but steady; 40 bags good bright Japan bought in at 57s. Capsicums: At auction, 30 Robbins Bombay were bought in, fair bright, long on stalk. Pimento firm but quiet, and of 492 bags offered only 91 bags sold in small lots at 3¼d. to 3½d. for fair to good. Cassia Buds: 20 bags wild offered and sold without reserve at 21s. Cassia Vera: 100 bales coarse Padang quills offered and bought in at 27s. Cinamon: 145 packages wild bought in, quills at 2d., bark at 1d. Nutmegs steady; of 17 cases Penang offered 10 cases sold, 98's at 1s. 3d., 114's, rather mixed, at 11½d.; of 11 cases Bombay 5 sold. Ceylon: 1 case sold, 117's at 10½d. West Indian: 2 cases and 16 barrels partly sold, including 98's at 1s. 1d. Mace quiet and barely steady. Of 22 packages Penang offered 16 packages sold without reserve, fair red to palish, at 1s. 5d. to 1s. 7d. West Indian: 3 packages sold, good palish, at 1s. 7d.

THURSDAY'S DRUG SALES.

To-day's Drug auctions passed off quietly, and there are no changes in value of any special importance to record. The following are the particulars:—

- ACONITE ROOT.**—11 bags Japan were taken out at 28s. per cwt.
- ALOES.**—136 boxes Curaçoa sold readily at 31s. per cwt. for fair, down to 19s. 6d. per cwt. for the inferior lots. 6 cases East Indian, in skins, realised 34s. per cwt. 4 casks Zanzibar fetched 33s. 40 kegs Socotrine were bought in at 75s. per cwt.
- ARECA NUTS.**—30 bags part sold at 16s. per cwt., balance taken out at 17s.
- ARGOL.**—18 bags Cape part sold at 49s. per cwt., rest bought in at 38s. per cwt. downwards, according to quality.
- BALSAM COPAIBA.**—4 barrels of inferior quality were taken out at 1s. 3d. per lb.
- BALSAM PERU.**—4 cases offered, without reserve, sold cheaply at 6s. 3d. per lb.
- BALSAM TOLU.**—8 cases were taken out at 2s. per lb.
- BUGHU LEAVES.**—33 bales were all bought in at 1s. per lb. downwards.
- CALABAR BEANS.**—5 bags were taken out at 6d. per lb.
- CAMPHOR.**—5 cases Japan refined in $\frac{1}{2}$ -oz. tablets were bought in at 2s. per lb. 45 boxes English Flowers sold cheaply at 1s. 11d. per lb.
- CAMPHOR OIL.**—30 cases good clear were taken out at 30s. per cwt.
- CANELLA ALBA.**—8 bales part sold, at 40s. per cwt.
- CARDAMOMS.**—25 packages Ceylon were chiefly bought in, only 4 cases selling at 1s. 8d. per lb., 1 pocket seed realising 2s.; another lot of 19 cases sold at 1s. 5d. to 1s. 6d. per lb. for small Malabar and at 6d. per lb. for shells; another lot of 23 cases were all bought in at 1s. 8d. to 1s. 10d. per lb.; another lot of 19 cases also chiefly bought in at 1s. 9d. to 2s. 6d. per lb.; another lot of 140 cases part sold at 2s. 10d. per lb. for good bold, and 2s. 8d. for long wilds; another lot of 62 cases all sold up to 3s. 5d. for good bold, one case realising the high price of 4s. 3d. per lb.
- CASCARILLA BARK.**—38 bales all bought in at 80s. per cwt. for good bold down to 30s.
- CHILLIES.**—4 cases Japan, each 2 cwt., were taken out at 50s. per cwt.
- CHINA SOY.**—17 casks were bought in at 1s. 3d. per gallon.
- CINCHONA BARK.**—20 serons Crown bark part sold at 1s. 2d. per lb. down to 5d. for IC paraffin damaged. Other 14 bales Crown and Grey sold at 9 $\frac{1}{2}$ d. per lb. for the best lots. 5 bales yellow realised 6d. per lb. 4 packages red were bought in at 2s. to 4s. per lb.
- COCAINE.**—2 tins each of 25oz. or scenering's Hydrochlorate were bought in at 15s. per oz.
- COD LIVER OIL.**—10 barrels old Norwegian sold at 56s.; 25 barrels new oil were bought in at 75s. per barrel.
- COLOMBO ROOT.**—75 bags fair quality taken out at 30s. per cwt.; good at 60s.
- COLOCYNTH.**—4 cases Turkey apple part broken were taken out at 1s. 6d. per lb.
- CUBEBS.**—41 bags of fair quality were taken out at 26s. per cwt.
- CUS CUS ROOT.**—9 bales were taken out at 10s. per cwt.
- CUMMIN SEED.**—20 bags good Malta were taken out at the fancy price of 40s. per cwt.
- DRAGONS' BLOOD.**—7 cases dampish dull lump bought in at £10, fair to good at £12 to £20, good siftings selling at 75s. per cwt.
- ESSENTIAL OILS.**—20 cases Eucalyptus of fair commercial quality were bought in at 11d. per lb.; 39 cases ditto part sold at 9d., subject to owner's approval. 5 cases West Indian distilled Oil of Limes taken out at 3s. 6d.; other 3 cases sold at 3s. 2d. 36 cases Lemon Grass, of somewhat dark colour, bought in at 3d. per oz. 1 case Citronelle at 1s. 3d. per oz.; 4 drums ditto sold at 11d. per lb., subject to owner's approval. 5 cases Oil Nutmeg bought in at 2d. per oz.; 19 cases Cajeputa at 2s. 6d. per bottle; 8 cases Pimento at 8s. 6d. per lb.; 8 W. Qts. English Oil of Carraway at 5s. per lb.; 5 cases Cassia at 4s. 6d. per lb.; 21 cases Cinnamon at 4d. per oz. (only 3d. being bid); 10 cases dementholised Japan Oil Peppermint at 3s. 9d. per lb.
- GENTIAN ROOT.**—1 bale sold at 13s. 6d. per cwt.
- GUAZA.**—135 robbins and 98 ditto Siftings, part sold at 4d. to 4 $\frac{1}{2}$ d. per lb., and at 3d. per lb. for the Siftings.
- GUM ARABIC.**—2 casks white Mogador taken out at 47s. 6d. per cwt. 2 cases fair grain at £6 10s.
- GUM BENZOIN.**—Of 12 cases Siam, fair small almonds fetched £8 15s.; ditto, of less desirable quality, £6 15s. per cwt. Good

almondy was held for £15 10s. to £16; bean size for £9 10s. to £11. Only fair Sumatra seconds were bought in at £7 10s.; good ditto at £9 10s. 1 case Palembang sold at 57s. per cwt.; other 89 cases were bought in at 35s. to 60s. per cwt.

GUM ELEMI.—1 case of good quality was taken out at 150s. per cwt., only 110s. being bid.

GUM EUPHORBIIUM.—4 cases Mogador sold cheaply at 16s. per cwt.

GUM GUAIAACUM.—4 cases part sold at 1s. 4d. per lb. for good glassy, subject to owner's approval.

GUM KINO.—1 case fair Cochin was taken out at 2s. per lb.

GUM MYRRH.—15 bags siftings realised 20s. per cwt. 5 cases picked pale blocky Gum part sold at £5 10s. down to £4 2s. 6d., according to quality. 7 cases good pickings were taken out at 65s. per cwt.

HONEY.—6 packages fair Jamaica sold cheaply at 25s. 6d. per cwt. Of 6 casks and 2 cases ditto 3 casks sold at 27s., balance being taken out at 30s. to 34s.

IPECACUANHA.—Of a lot of 15 bales Rio about half sold at 10s., balance being taken out at 10s. 6d. to 11s. per lb.; another lot of 23 packages Rio, of rather inferior quality, part damaged, was bought in at 10s. down to 8s. per lb. 4 cases Carthagenas were all bought in; other 18 packages also met with no demand, and had to be taken out.

KAMALA.—5 cases, offered without reserve, sold at 3d. to 3 $\frac{1}{4}$ d. per lb.

LIME JUICE.—62 pkgs. West Indian bought in at 2s. 3d. per gallon; only 1s. 9d. being bid.

LIQUORICE ROOT.—5 bags decorticated impalpable powder taken out at 41s. per cwt. 52 bags cut root part sold previously, part bought in at 16s. per cwt.

MENTHOL.—11 cases Japan offered, without reserve, sold cheaply at 7s. 9d. per lb. for fair dry white crystals, and 8s. 1d. to 8s. 3d. per lb. for the favoured Kobayashi brand, which shows a decided fall in value of the article.

ORANGE PEEL.—6 casks and 2 cases thin cut were all bought in at 8d. per lb. for the cases; other 33 packages were held for 9d. to 1s. per lb.; other 12 cases inferior red thin cut, part dark, were taken out at 2d. to 4d. per lb.

ORRIS ROOT.—7 bags damaged Florentine offered without reserve, sold at 28s. to 29s. per cwt.

QUININE SULPHATE.—30 cases Pelletier's sulphate in 1-oz. vials offered without reserve all sold at 1s. 5d. per oz. 1 case containing 1,000 oz. in 100-oz. tins Taillandiers was taken out at 1s. 6d. per oz.

RHATANIA ROOT.—50 bales taken out at 4d. per lb.

RHUBARB.—24 cases offered, per one catalogue, met absolutely no demand, and were all bought in. Other 58 chests were also practically all bought in, at 5d. to 6d. per lb. for very common rough very wormy high dried; 11d. for better ditto; 11d. to 1s. for round Canton; 1s. to 1s. 4d. for flat ditto; and 1s. 2d. per lb. for common round Shensi. Another lot of 72 cases, part sold, without reserve, at 9 $\frac{1}{2}$ d. to 11d. for common flat Shensi, 7 $\frac{1}{2}$ d. to 9 $\frac{1}{2}$ d. for round ditto; and at 1s. per lb. for trimming root; fair to good round Shensi part sold at 2s., part held for 2s. to 2s. 6d.; flat ditto, at from 1s. 2d. to 2s. per lb.

SARSAPARILLA.—6 serons fair Honduras were taken out at 1s. 7d. per lb. Fair Jamaica was held for 1s. 9d. to 1s. 10d. per lb. 5 bales Lima sold at 1s. 1d., and 4 bales Guayaquil at same figure.

SENNA.—Of 526 bales Alexandria a considerable portion sold at low prices, from 2 $\frac{1}{2}$ d. per lb. downwards, quality being very inferior. Other 81 bales ditto practically all sold at 3 $\frac{1}{2}$ d. down to 1 $\frac{1}{2}$ d. per lb. 55 packages Alexandria chiefly bought in at 9d. per lb. for good down to 4d. per lb., pods being taken out at 7d. per lb.

SQUILLS.—35 bags part sold at 1 $\frac{1}{2}$ d. per lb.; balance bought in at 3d.

TAMARINDS.—10 barrels Antigua bought in at 10s. per cwt. 3 barrels East Indian were withdrawn at same price, only 7s. 6d. per cwt. being bid.

TONQUIN BEANS.—5 hhds. fair Angostura were taken out at 3s. per lb.; another lot of four cases, inferior Paras, at 1s. 3d. per lb.

TURMERIC.—311 bags Bombay split bulbs were taken out at 12s. to 12s. 6d. per cwt.

WAX.—12 cases bleached Calcutta were taken out at £7 to £7 15s. per cwt.; 29 cases Yellow East Indian at £6 10s. Fair Jamaica realised £7 to £7 7s. 6d. 13 bags fair Italian were bought in at £6 10s.; fair Madagascar at £7 10s. 12 bags good Mozambique realised the relatively high price of £7 7s. 6d. Fair Bombay sold at £5 15s.; good Australian at £7 5s. per cwt. 50 cases yellowish Japan bought in at 35s. per cwt.

Calendar for the Week.

Sunday, March 18. Third Sunday in Lent. Sun rises 6.9; sets 6.7.
Monday, March 19. Sun rises 6.7; sets 6.9.
Tuesday, March 20. Sun rises 6.5; set 6.11.
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—A demonstration of "The Heliogravure Process," by Ignatz Herbst.
Wednesday, March 21. Sun rises 6.2; sets 6.12.
 PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 36, York Place, Edinburgh, at 8.30 p.m.—Evening Meeting. Papers on "The Volumetric Determination of Red Lead" by James Tocher; (a) "The Ash Percentage of Commercial Cochineal;" (b) "A Simple Method for Valuation of Cochineal and Carmine," by George F. Merson.
Thursday, March 22. Sun rises 6.0; sets 6.14.
 CHEMISTS' ASSISTANTS' ASSOCIATION, Portman Rooms, Baker Street, London, W., at 7.30 p.m.—Third of the Fifth Series of Cinderella Dances.
 WESTERN CHEMISTS' ASSOCIATION (OF LONDON), Westbourne Restaurant, 1, Craven Road, W., at 9 p.m.—Discussion on Subjects of Interest to Members of the Association.
 LEICESTER CHEMISTS' SOCIAL UNION, Victoria Coffee House, at 8.30 p.m.—Meeting of the trade to consider the clauses in the Companies Bill as affecting the interests of chemists.
 LIVERPOOL CHEMISTS' ASSOCIATION, Exchange Station Hotel, at 7.15 p.m.—Annual Dinner.
Friday, March 23. Sun rises 5.58; sets 6.16.
 GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS' AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15.—Dr. Coull's lecture on "Stereo-Chemistry," postponed from March 2.
 ROYAL INSTITUTION, Albemarle Street, Piccadilly, London, W., at 9 p.m.—Sir Andrew Noble on "Some Modern Explosives."
Saturday, March 24. ☾ 5.36 M. Sun rises 5.56; sets 6.17.
 ROYAL INSTITUTION, Albemarle Street, Piccadilly, London, W., at 3 p.m.—Lord Rayleigh on "Polarised Light."

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

1oz. Morph. Hydroch. 5/-, 4oz. 19/-; 1 lb. Iodoform Xtal. 12/-.—Eastman, Stratford.

Young German Canaries in full song. 7/6 each.—Bennett, Chemist, Widnes, Lancashire.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Bargain.—A Magnificent Binocular Field Glass, silver plated, eight powerful achromatic lenses, superb definition, leather case. Accept 9/9.—Squire, Corfe Villa, Stanley Rd., Woodford, Essex.

Good Painted Lantern Slides (second-hand), including Religious, Temperance Effects, Mottoes, Comic, 4½d. each; Boer War, 6d. each. Lists free.—T. Wing, Photographer, Chatteris.

Pharmaceutical Journal, 1869 to 1870, 1872 to 1876, 1880 to 1885, January to June, 1886; 1889, 1892, July to Dec., 1879; 1884, 1888, 1891. Chemist & Druggist, 1859 to 1860 (1st vol.), 1863, 1866, 1867; 1873 to 1876, 1880, 1882 to 1895, 1897 and 1898, in yearly bundles. What offers, all or part?—Hocken, 31, Oldhall Street, Liverpool.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Bottles, Drawers, Show-Cases, etc., for new branch, immediately.—Wood, Chemist, Stonehouse, Plymouth.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

FREE FORMULÆ

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE 1s. 8d. per oz. Tin, with Labels, Post free or . . . through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—"I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable."

F. W. B., Manchester:—"Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much."

J. J. G., Folkestone:—"I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation."

D. R., Swansea:—"I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production."

R. N., Darlington:—"I have made our Tooth Paste from your formula for years."

Advertisements

Received too late for Classification.

LONDON, N.W.—Wanted, an ASSISTANT (unqualified) or Junior, indoors; two afternoons, one evening off per week.—Apply personally, or with photo, to BELL & Co., 2, Malvern Road, West Kilburn.

SECOND COUNTERMAN wanted, must be qualified, of good address and used to good-class business. London experience not essential, but preferred.—State full particulars and enclose photo to CINCHONA, 5, Serle St., W.C.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Barrie, Bartlett, Cocks, Cruickshank, Gair, Gammie, Garnett, Harrap, Hill, Hodder, Jackson, Jones, Knight, Lloyd, Marchant, Metcalfe, Morrison, Norris, Paynter, Potts, Robins, Street, Turner, Umncy, Wallis.

NEWS IN BRIEF.

B.P. STANDARDISATIONS are to be considered by the members of the C.A.A. on Thursday, March 29, when Mr. J. A. Dewhurst will communicate some notes on the subject.

THE LONGSTAFF MEDAL will be presented to Professor W. H. Perkin, Jun., F.R.S., on Thursday next, at the Annual General Meeting of the Chemical Society, at 3 p.m.

THE BUNSEN MEMORIAL LECTURE will be delivered in the rooms of the Chemical Society, Burlington House, Piccadilly, W., by Sir Henry E. Roscoe, F.R.S., on Thursday, March 29, at 8.30 p.m.

PHARMACY AND MEDICINE will be the subject of an address delivered by Dr. Alfred H. Carter to the members of the Midland Pharmaceutical Association on Thursday evening next, March 29, at Mason University College, Birmingham, at 8.30.

THE FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION will hold a meeting in Mathers' Hotel, Whitehall Street, Dundee, on Wednesday, March 28, at 4.30 p.m., to discuss the subjects suggested by the Federation circular, the approaching election of Council, and any questions of local interest. Tea may be had at 4 o'clock.

MR. R. A. ROBINSON, L.C.C., M.P.S., delivered an address on Wednesday, March 21, under the auspices of the Kensington Ratepayers' Association, on "The London Government Act, 1899, and the Duties of Mayor, Aldermen, and Councillors of the New Boroughs." The chair was taken by General Lord Chelmsford, G.C.B.

MR. EDWARD B. KENDALL, pharmaceutical chemist, York, has upon the door-post of his shop a red cross on a white disc, as a sign or trade mark. Recently a Colonel Saunders, R.A.M.C., has been greatly troubled by the appearance of the red cross on the shop, and he has written to Mr. Kendall telling him that the Geneva Red Cross should be "held sacred" and not "prostituted for trade purposes," and that its use puts him "on a level with the most ignorant class of Boers." No notice was taken of the Colonel's impertinent letter, so he wrote again, this time upon War Office paper, stating that as no notice had been taken of his previous communication he was writing to the Pharmaceutical Society and the Red Cross Society, bringing to their notice Mr. Kendall's "flagrant conduct in using the international Geneva Red Cross for trade purposes," and expressing his determination not to let the matter drop until the sign is removed. In view of the Colonel's declaration not to let the matter drop, *Truth* this week remarks: "It might be well if some one in authority were to tell him to mind his own business, for presumably he has official business of some kind at York which requires his attention, and at present he seems to be rather wasting his time, as well as the Government stationery."

Marriage.

CHALMERS—DRYSDALE.—On March 14, at Morton Place, E. Aberdour, Fife, by the Rev. W. H. Gray, B.D., Andrew Chalmers, M.P.S., Newcastle-on-Tyne, to Mary Jane, daughter of Thomas Drysdale, Aberdour, Fife.

TRADE NOTES.

MESSRS. HORNER AND SONS, Mitre Works, Cordova Road, Bow, E., inform us that the otto of orris described by Mr. J. C. Stead at the last evening meeting of the Pharmaceutical Society in London is now a commercial article, and can be supplied by them.

SPIRIT DUTY.—Messrs. Evans, Sons and Co., Liverpool, have issued a supplement to their price list giving the new prices to the articles affected by the increased duty on spirits.

"PRACTICAL POINTS CONCERNING TABLOID PHOTOGRAPHIC CHEMICALS" is the title of a pamphlet issued by Messrs. Burroughs Wellcome and Co., Snow Hill Buildings, London, E.C. Supplies

of the new edition, just published, which contains numerous useful hints, will be sent, on application, to any chemist or photographic dealer who desires to have them.

MESSRS. PERKEN, SON, AND CO., manufacturing opticians, 99, Hatton Garden, London, E.C., intimate that the firm has been registered as a limited liability company under the title of "Perken, Son, and Co., Ltd." As this course has been taken for purely family reasons no shares have been, or will be, offered to the public.

REYNOLDS' MARCH PRICE LIST.—Messrs. Reynolds and Branson, Ltd., 13, Briggate, Leeds, in their March wholesale prices current, announce the extension of their premises, providing large new showrooms for their complete and classified stock of surgical instruments and appliances. Published with the list are two excellent full-page interior photographs of the new rooms, showing the fitting-rooms adjoining.

"PEPULE" DIGESTIVE PRODUCTS.—Messrs. Fairchild Brothers and Foster (New York) announce that the "Fairchild" Digestive Products which Messrs. Burroughs Wellcome and Co. have put up and issued under their registered trade mark brand "Tabloid" will in future be put up by themselves under their registered trade mark brand "Pepule," and will be supplied to the trade by Messrs. Burroughs Wellcome and Co. as agents.

SHAVING SOAPS.—Every one who shaves can appreciate the luxury of a soap yielding a rich, creamy lather which does not evaporate immediately after it has been applied to the face. Till quite recently we were under the impression that English soap specialists had not given the attention it deserved to this department; in fact, we were unacquainted with home products equal to those of foreign, and especially American, manufacture. Judging from samples handed us by Messrs. D. and W. Gibbs, of the City Soap Works, it is, however, evident they have recently devoted a great deal of attention to the subject, and with very satisfactory results. Their Cold Cream Shaving Soap and Floral Cameo Shaving Soap are all that can be desired by the most exacting, and there is no longer any necessity either to use or to recommend imported shaving soaps.

SPIRITINE.—Messrs. Barclay and Sons, Limited, 95, Farringdon Street, London, E.C., send particulars of a new article, which is

likely to have a large sale. The danger and inconvenience attending the use of spirit in liquid form has long been experienced; but those difficulties now appear to have been overcome by "Spiritine," otherwise solidified spirit, which, it is claimed, may be used with safety

for many of the domestic and other purposes to which liquid spirit has previously been put. The illustrations show how "Spiritine" is packed for sale and in use. Messrs. Barclay are the wholesale agents, and they will be pleased to forward prices and particulars upon application.

VALTINE MEDICATED GLOBULES.—The Valentine Extract Company, Limited, 33, Tooley Street, London, S.E., is making a specialty of medicated globules, containing meat and malt; meat and quinine; meat and pepsin; meat, malt and pepsin. The globules are packed in tins of one size, suitable for the pocket, each containing twenty globules. They are made from "Valtine" Extract of Meat, and represent "the full concentrated strength" of the meat, with the addition of quinine, malt extract, and pepsin, in quantities of one grain, six grains, and two grains respectively. The meat, malt, and pepsin globules each contain six grains of malt extract, and two grains of pepsin, the remainder being "Valtine" Extract of Meat. The globules can be taken whole or dissolved in a little hot water. The prices of the new medicated globules range from 2s. to 2s. 6d. per tin.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MARCH 21, 1900.

Business generally has been somewhat quiet during the week, both as regards drugs and chemicals. The amount of honey sold has been again worthy of remark, full prices being realised. A fair amount of Cochin ginger has been sold at a good rate, and some 65 bags of good Sierra Leone chillies found purchasers on private terms. Oils generally are in much the same position as last week, with minor alterations in cottonseed oil and spirits of turpentine.

AMMONIA SALTS.—Sal ammoniac is firm at 38s. and 40s. per cwt. Sulphate is quiet at £12 5s. per ton.

BEEWAX.—5 cases of Peruvian went for £7 5s. per cwt.

BLEACHING POWDER.—Continues very firm at £7 10s. per ton.

CANARYSEED.—There is more inquiry. 500 bags Turkish sold at 33s. to 33s. 6d. per 464 lbs., and later 300 bags (also Turkish) went for 33s.

CHILLIES.—65 bags Sierra Leone sold on private terms.

COPPER SULPHATE.—Steady at £25 15s. to £26 per ton.

GINGER.—About 100 bags of Cochin found buyers at 30s. per cwt.

HONEY.—125 barrels of Chilean Pile 1, made 25s. 6d. per cwt.

LINSEED.—Is firm. River Plate is worth 43s. on the spot or to arrive. As for Calcutta, there is none offering. 50 tons of River Plate sold ex-quay at 43s. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils are moderately in demand, with prices almost identical with last week. French 1st pressure being a little lower—i.e., 3 $\frac{3}{8}$ d. to 3 $\frac{1}{4}$ d. per lb.; Calcutta, 3 $\frac{1}{2}$ d. to 3 $\frac{5}{8}$ d.; and French or Belgian, 2nd pressure, 3 $\frac{1}{8}$ d. per lb. Olive are quiet, with small business passing in Spanish at £36 to £36 10s. per tun. Linseed Oil of Liverpool pressure is a little cheaper—viz., 24s. 9d. to 25s. per cwt. in export packages. Cotton seed of Liverpool refining is steady at 23s. 3d. to 24s. per cwt. Spirits of turpentine are in fair demand at the improved rate of 41s. 6d. per cwt.

POTASH SALTS.—Bichromate is firm at 4d. to 4 $\frac{1}{2}$ d. per lb. Cream of Tartar, 74s. to 80s. per cwt. Chlorate, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d. per lb. Pearlash is quiet at 33s. 6d. to 35s. per cwt. Potashes are steady in tone, with fair inquiry at 27s. 3d. to 27s. 6d. per cwt. Prussiate, 8d. per lb.; Saltpetre, £21 5s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer, 16s. to 17s. per cwt. Caustic, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s.; 60 per cent., £9 5s. Crystals, £3 5s. to £3 7s. 6d. per ton. Nitrate is not quite so active, but price continues 8s. 9d. to 9s. per cwt.

LONDON, THURSDAY, MARCH 22, 1900.

Business in Drugs and Chemicals has been quiet and disappointing during the past week, while although there have been no very serious declines in value, prices for several articles are decidedly less firm, not to say lower. Glycerin is rather dearer, as also is Cod Liver Oil. Quinine has had a decided set-back, and the price in the speculative market is about 2d. per oz. lower. Makers' price in America has been reduced, but it is understood that makers are awaiting the results of to-day's Bark Sales in Amsterdam (which were not known up to the time of going to press) before deciding as to what their price here shall be. Other articles of interest remain quiet but fairly steady, the following being some of the prices actually ruling:—

ACETANILIDE.—Is dull and quiet at 9 $\frac{1}{2}$ d. to 11d. per lb., according to make, quantity, and packing.

ACID BORACIC.—Steady at 26s. per cwt. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC.—Refined quiet and rather easier at 10 $\frac{1}{2}$ d. to 11d. per lb. for 35°-36° ice crystal, in 2 $\frac{1}{2}$ cwt. drums and over-casks; 11 $\frac{1}{4}$ d. to 11 $\frac{3}{4}$ d. for the 39°-40° ice crystals; and 1s. 0 $\frac{1}{4}$ d. to 1s. 1d. per lb. for the 39°-40° detached crystals, which is now the quality prescribed by the B.P.; crude, 60° F., 2s. 9d. per gallon; 75° F., 3s. 3d. per gallon; liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 9d. per gallon; ditto, 25 to 30 per cent. of dark colour, 10d. to 1s. per gallon, packed in 40 gallon casks.

ACID CITRIC.—Is, if anything, a shade easier, quotations remaining, however, nominally unchanged at 1s. 4d. to 1s. 5d. per lb., according to make and quantity for crystals in 5 cwt. casks.

ACID OXALIC.—Is still quoted 3d. to 3 $\frac{1}{2}$ d. per lb. nett, free delivered London.

ACID TARTARIC.—English spot, 1s. 0 $\frac{1}{2}$ d. to 1s. 1d. per lb., and foreign, 1s.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3 $\frac{1}{2}$ d. to 4 $\frac{1}{2}$ d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate dull. Gray, 24 per cent., London, prompt, £12 2s. 6d. Hull, prompt, £12 to £12 1s. 3d. Leith, prompt, £12 2s. 6d. Beckton, March-April, £12. May-June, £12. Beckton, terms prompt, £11 17s. 6d. to £11 18s. 9d.

ANTIMONY.—Regulus is quiet at £38 10s. to £39 10s. per ton. Crude Japan (Black Sulphide), 22s. to 22s. 6d. per cwt.

ASHES.—Pots, 28s. 6d.; Pearls, 34s.

ATROPINE.—Makers are very firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure Alkaloid.

BISMUTH.—There is no change to report either in the metal or in the salts, the commercial quality of the metal being still quoted 5s. per lb., the subcarbonate 5s. 8d. per lb., and the subnitrate 5s. 1d. per lb.

BLEACHING POWDERS (CHLORIDE OF LIME).—English is still quoted £7 per ton.

BORAX.—Quiet but firm at 17s. per cwt. for crystals and 18s. per cwt. for powder.

BROMIDES.—Are firm at unchanged prices, and Potassii Bromid. remains very scarce for prompt delivery.

CAMPHOR.—The crude article remains firm, with buyers of China near and March-April steamer at 169s. c. f. and i., but no business is reported. Japan: There are second-hand sellers at 177s. 6d. c. f. and i. Importers quote 180s. and 185s. c. f. and i. respectively. Refined is unchanged at 2s. 2d. per lb. for English Bells and Flowers. German refiners have raised their prices $\frac{3}{4}$ d. per lb. to 2s. 0 $\frac{3}{4}$ d. per lb. for Bells and Flowers in ton lots for prompt delivery, and 1d. per lb. more for forward.

CASTOR OIL.—Quiet; Belgian, first pressing, spot, £31; April-June, £30, f.o.b. Antwerp; second pressing, spot, £28 10s. per ton, ex-wharf. Hull manufactured, guaranteed cold-drawn pure Pharmaceutical, £33 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts, £31; seconds, £29 10s. per ton, in barrels; firsts, 3 $\frac{5}{8}$ d. per lb. in cases; seconds, 3 $\frac{1}{2}$ d., ex-wharf, London.

CLOVES.—At auction, no Zanzibar were offered; 32 bags Ceylon bought in, fair bright picked at 6 $\frac{1}{2}$ d. Privately, no business in Zanzibar, but quotations are not altered.

COAL TAR DISTILLATION PRODUCTS.—Toluol. commercial, 1s. 2d. per gallon, pure 2s. to 2s. 6d. Benzol, 50 per cent., 9d.; 90 per cent., 8d. per gallon. Creosote, 3d. to 6d. per gallon, according to quantity, etc. Crude Naptha, 30 per cent., at 120° C., 4 $\frac{1}{2}$ d. to 5d. per gallon. Solvent Naptha, 95 per cent. at 160° C., 1s. 6d.; 90 per cent. at 160° C., 1s. 1d. per gallon; 90 per cent. at 190° C., 1s. 2d. Anthracene, A, 3 $\frac{3}{4}$ d.; B, 2 $\frac{3}{4}$ d. Tar, refined, 14s. 6d. per barrel, 3d. per gallon. Crude, 12s. 6d. per barrel, 2 $\frac{1}{4}$ d. per gallon.

COCAINE.—Makers are firm at 16s. 3d. per oz. for the Hydrochlorate in 25 oz. tins for 200 oz. lots.

COD LIVER OIL.—Is nominally again firmer, and it is reported that business has been done in the best brands of new non-congealing Norwegian oil at 80s. per barrel, f.o.b. Quotations appear to vary from 70s. to 82s. 6d. per barrel, of 25 gallons, according to brand.

CREAM OF TARTAR.—Steady at 73s. per cwt. for first white crystals, 75s. for powder, and 76s. per cwt. for ditto 95 per cent.

GALLS.—Business continues on a small scale in all kinds, but prices are unaltered. China: Nothing to be done on the spot; near at hand the last price paid was 65s. c. f. and i. Japan to arrive sellers at 61s. c. f. and i. Persian Blues have been dealt in to a small extent at 95s., and Greens at 85s.

GINGER.—At auction 530 bags and 20 cases offered of Cochin, but went off slowly: 64 bags sold without reserve, washed rough, slightly wormy, dark common, at 27s., rough brown medium and small bright bought in at 30s. to 32s. Jamaica: 184 barrels offered and bought in, meeting little demand, but since about 100 barrels have changed hands at steady rates. St. Lucia: 23 bags offered, but bought in, fair bright medium at 52s.

GLYCERIN.—Crude has further advanced, and is quoted £32 to £40 per ton, while Refined is also rather dearer at 58s. 6d. to 60s.

per cwt. for English and 58s. to 70s. per cwt., according to brand, for German, for the best white double distilled chemically pure, 1,260 quality in tins and cases (2 or 4 x 56 lb. tins in a case).

ISINGLASS.—These periodical auctions were held to-day, with the moderate supply of 919 packages of all descriptions, as against 841 packages at the previous sale. A dull tone prevailed throughout, and holders being generally firm, only a very small part sold. Brazil brought about steady rates, except for Para Lump, which was 1d. lower. West Indian steady. Maracaibo again bought in. Bombay, in large supply, represented more than half of the offerings, but the high limits effectively checked sales, and only a few packages sold at about previous rates. Penang unchanged, and only a small part sold. Saigon firmly held, and all bought in. China about steady. Japan bought in. Russian quiet and unaltered. Para: 44 packages offered (10,947 lb.) and about 40 packages sold; lump, pile 1, good yellow at 3s. 4d. to 3s. 5d., fair ditto at 3s. 3d., fair reddish at 2s. 10d. to 2s. 11d., dark ditto and fatty at 2s. 8d.; tongue, fair stout open palish at 3s., small thin at 1s. 8d.; honeycomb, fair stout 2s. 2d., thin at 1s. 2d. Maranhão: 13 packages offered (1,765 lb.) and sold; lump, fair yellow and reddish at 2s. 11d., dark reddish and fatty at 2s. 7d. to 2s. 8d.; tongue, good open pale at 3s. 5d. to 3s. 7d., fair ditto at 3s. 3d. to 3s. 4d., fair reddish at 2s. 5d. to 2s. 6d., small thin at 1s. 7d. to 1s. 9d. West Indian: 7 packages offered (732 lb.) and sold; lump, fair reddish at 3s., dark red mixed fatty at 2s. 7d. to 2s. 8d.; tongue, fair reddish, part open at 2s. 9d.; purse good small yellow at 1s. 9d. Bombay: 576 packages offered (115,517 lb.) and about 75 sold; Kurrachee leaf, good stout pale at 3s. 7d., good reddish mixed yellow at 3s. to 3s. 2d., fair reddish rather mixed fatty at 2s. 6d. to 2s. 9d., thin reddish and dark at 2s. 3d. to 2s. 10d., small fair yellowish at 1s. 9d. to 1s. 10d., common dark at 1s. 6d.; tongue, fair stout dark at 2s. 3d.; purse, good heavy yellow at 2s. 6d., fair stout yellow at 1s. 11d., bold to medium yellow at 1s. 6d. to 1s. 8d., medium and bold dark little fatty at 1s. 4d. to 1s. 5d., common rough dark at 1s.; bladderpipe, fair stout reddish mixed darkish at 2s. 6d. to 2s. 10d., mixed common and thin dark at 1s. 1d. to 1s. 9d. Penang: 103 packages offered (35,345 lb.) and 25 sold, long leaf, fair yellow at 4s. 5d.; leaf, good bright pale at 4s. 4d. to 4s. 6d., good reddish at 3s. 8d. to 3s. 10d., fair ditto at 3s. 2d., thin red at 2s. 4d.; tongue, fair reddish mixed dark at 2s. 3d. to 2s. 6d., dark mixed at 2s. 1d.; purse, good yellow at 1s. 7d., fair ditto mixed thin at 1s. 3d. to 1s. 4d., common dark 1s. Saigon: 38 packages offered (2,543 lb.) and all bought in. Senegal; 5 packages offered (354 lb.) and withdrawn. Maracaibo: 12 bales offered (2,319 lb.) and bought in at 2s. China: 62 packages offered (13,302 lb.) and 12 bales sold, without reserve, at 1s. 11d. Japan: 4 bales offered (784 lb.) and bought in. Rangoon: 4 cases offered (966 lb.) and withdrawn. Russian: 64 packages offered (4,676 lb.) and sold at 1s. to 1s. 2d. The next auction will be held on April 24.

JAPAN WAX.—Continues firm. On the spot sales of good squares have been made at 34s. 6d.; for arrival March-April steamer 32s. c. f. and i. is quoted.

LYCOPodium.—Continues very scarce and dear at 2s. 4d. to 2s. 6d. per lb. for good sifted.

MENTHOL.—Is quiet at 9s. to 9s. 3d. per lb. for best brands of good dry white crystals in 5 lb. tins (12 tins in a case).

OILS (FIXED) AND SPIRITS.—Linseed very firm at fully 2s. 6d. advance. On the spot, pipes London ordinary, £25; barrels, £25 2s. 6d. Hull spot naked, £22 17s. 6d.; April, £22 12s. 6d. Rape market strong, and holders are asking about 10s. to 20s. advance. Ordinary brown, on the spot, nominally, £27; refined spot, £20 5s. to £28 10s. Ravison naked spot, £24 to £24 5s. Cotton easier. London crude spot, £20 12s. 6d.; refined spot, £22 10s. to £23, according to make; Hull 5s. easier; naked refined spot, £20 10s.; crude spot, £18 17s. 6d. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Cocoonut quiet: Ceylon on the spot, £25 10s. to £25 15s.; near, £24 7s. 6d. c.i.f. Cochin spot, £28 10s., March-May, £25 10s. c.i.f. Palm: Lagos on spot quoted £29. Petroleum dull: Russian spot quoted 7d. to 7½d.; American spot, 7½d. to 7¾d.; Water White, 8¾d. to 9d. Petroleum Spirit: American, 9¾d.; deodorised, 10d. to 10½d. Turpentine: business has been passing at lower prices; American spot, 40s.; April, 40s.; May, 39s. 6d.; June, 36s. 6d.

OPIUM.—Is firm at dearer prices, say at 4d. to 6d. per lb. advance on prices ruling last week. There, however, has not been very much doing in the various kinds. People, who should be best able to judge, appear to think that there is more than a possibility of the article going still dearer. Quotations are:

manufacturing and druggists' kinds, 9s. to 10s. 6d. per lb.; soft shipping, 9s. 6d. to 11s. 6d.; and Persian, 12s. 9d. to 13s. 3d. per lb.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate spot, London crystals, 4½d. net; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: yellow English makes, 8d.; Beckton, 7¾d.; red, 1s. 2d. to 1s. 3d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship.

QUININE.—A drop in the American price to-day has had an adverse effect on this market, and prices have been most erratic, but more steadiness prevails at the close, values leaving off rather below the best of the day. A fair business has been done, about 75,000oz., comprising B & S and/or Brunswick, on the spot ranging from 1s. 4d. to 1s. 4½d., May delivery at 1s. 4¾d. to 1s. 4¾d., and June from 1s. 4½d. to 1s. 5½d., closing at 1s. 4½d., 1s. 4¾d., and 1s. 4¾d., respectively. So far makers made no change in their prices, apparently waiting first to hear the results of to-day's bark sales in Amsterdam, at which bark containing about 26 tons of Sulphate of Quinine comes under the hammer.

SHELLAC.—The market is lifeless, and privately no sales on the spot of importance have occurred. Futures are steady, but quiet; 100 cases TN Orange near at hand have been sold at 59s. c. f. and i., and 100 cases August delivery at 63s. At auction to-day the moderate supplies of Second Orange met a slow demand, and about one-third sold. Steady prices were paid at the opening, but at the close a decline of about 1s. was established, fair TN being now 60s. Garnet: Only a few cases offered. Button partly sold, without reserve, at lower prices. A total of 556 cases offered, and 187 cases sold. Second Orange: of 371 cases 120 sold, fair bright flat TN at 60s. to s., broken flat req at 58s. to 59s. Garnet: 12 cases good flat Rangoon offered and bought in at 62s. Button: of 173 cases 67 sold, chiefly without reserve, middling firsts, fair condition, at 66s., but mostly more or less blocky; firsts at 60s. to 62s.; circle 2's at 56s.; and thirds at 55s.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, £7 5s. per ton. Bichromate, 3¼d. Bromide, 2s. 2½d. per lb. Caustic, 76 per cent., £11; 74 per cent., £10 12s. 6d.; 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 15s. Nitrate, 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. per ton. Sulphate (salt cake), £1 7s. 6d. per ton. Glauber Salts, £1 10s. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: 153 bags Singapore offered and bought in, fair at 6½d.; 11 bags Ceylon sold, good at 6d. to 6¼d. White Pepper: Only 16 bags Singapore offered and bought in, good at 10d.; 40 bags fair brown limes Penang at 8½d. Chillies quiet. 18 packages Japan bought in, including fair bright country damaged, selected, at 45s. Capsicums, in fair supply, met a slow demand; 345 packages Bombay offered and 60 bales sold privately, fair bright, long on stalk, at secret prices; remainder bought in at 28s. to 32s. 6d.; also fair red cherry pods off stalk at 40s. Pimento dull of sale, and 308 bags in auction bought in at 3¾d. to 3¾d. Broken Cassia: 140 bales offered and bought in at 35s. Cinnamon: 9 bales Ceylon offered and 5 bales sold at 6d. to 8d. Of 198 bales Wild 47 sold at ¾d. to 2½d. Cinnamon Chips and Bark dull: Of 514 bags offered chiefly Wild 140 bags sold, coarse bark at 1½d. to 1¾d.; fair chips bought in at 4d. Nutmegs quiet, and 28 cases Penang bought in, 80's to 81's at 1s. 8d.; 91's to 92's at 1s. 5d.; and 206's shrivelled at 6d. 3 cases Ceylon sold, 90's at 1s. 5d. 5 cases Bombay sold, wormy and defective at 3¼d. to 3½d. West Indian: 20 cases and 29 barrels sold, 67's at 1s. 8d. Mace slow of sale: Of 12 cases Penang only 1 case sold, fair palish, rather wormy, at 1s. 7d. 1 case Ceylon sold, fair pale, at 1s. 5d. West Indian: 6 packages sold at 1s. 5d. to 1s. 6d.

STICKLAC.—Slow of sale, and 60 cases Siam in auction were all bought in, fair sifted at 45s., unsifted, rather woodv. at 38s.

SULPHATE OF COPPER.—Is quoted £24 5s. to £26 per ton on the spot.

Calendar for the Week.

Sunday, March 25.	Fourth Sunday in Lent.	Sun rises 5.54; sets 6.18.
Monday, March 26.		Sun rises 5.52; sets 6.20.
Tuesday, March 27.		Sun rises 5.49; sets 6.22.
BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION, County Restaurant, at 9 p.m.—“Glimpses of Lake Country. Life and Scenery, with Lantern Illustrations,” by P. Lund.		
Wednesday, March 28.		Sun rises 5.47; sets 6.24.
FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION, Mather's Hotel, Whitehall Street, Dundee, at 4.30 p.m.—Meeting to discuss the Federation Circular, the approaching Election of Council, and Questions of Local Interest.		
PUBLIC AND POOR LAW DISPENSERS' ASSOCIATION, St. Bride's Institute, Ludgate Circus, London, E.C., at 8 p.m.—S. B. Donnan, on “Proteids in Urine.”		
Thursday, March 29.		Sun rises 5.45; sets 6.25.
CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 3 p.m.—Annual General Meeting for the election of officers and other business.		
CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newnan Street, London, E.C., at 9 p.m.—“Notes on B.P. Standardisations,” by J. A. Dewhurst.		
MIDLAND PHARMACEUTICAL ASSOCIATION, Mason University College, Birmingham, at 8.30 p.m.—“Pharmacy and Medicine,” by Dr. Alfred H. Carter.		
Friday, March 30.	● 8.30 A.	Sun rises 5.43; sets 6.27.
GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION, Masonic Chambers, 100, West Regent Street, at 9.15 p.m.—Communication by J. Thomson.		
Saturday, March 31.		Sun rises 5.40; sets 6.29.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Lord Rayleigh on “Polarised Light.”		

EXCHANGE COLUMN.

OFFERED.

“**Chemist and Druggist**,” 1898, 1899.—Small offer to J. T. Cross, Wingate, R.S.O.

Moulds.—Suppository, Pessary, Bougie, Capsule; as Maw's.—Warnes, 333, Gray's Inn Rd., W.C.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Clinicals, one dozen each, 30 seconds, 21/-; ordinary, 16/-; each engraved “English make,” plated cases; any post free.—Warnes, 333, Gray's Inn Road, W.C.

Good Painted Lantern Slides (second-hand), including Religious, Temperance Effects, Mottoes, Comic, 4½d. each; Boer War, 6d. each. Lists free.—T. Wing, Photographer, Chatteris.

What offers?—Scott's Botany, Part I. Darwin's Practical Plant Physiology (Bower). Whiteley's Chemical Calculations. Stewart's Heat and Light Problems.—Burrell, 16, Regent Parade, Harrogate.

A profitable line for the coming season.—Formula for lemonade powder, from which considerably over 2,000 packets made from same were sold by one establishment last year; 1s. 1d., post free.—H. L. Mackenzie, 36, Goldhawk Rd., London, W.

Enemas, bought before advance, offer one dozen, highly enamelled, black, green, red, each stamped “guaranteed English make,” complete—pipes, shields, cedar boxes. 24s., carriage paid. Sample posted.—Warnes, 333, Gray's Inn Rd., W.C. Saleable patents wanted.

For Sale.—One nearly new Copper Vacuum Pan, 5 ft. diameter, fitted with Stirring Gear, Condenser and all fittings. One Mild Steel Steam Jacketed Still, 4 ft. diameter, fitted inside with Copper Steam Coils, Stirrer and Pulleys, Galvanised Iron Still Head.—Apply to W. J. Fraser & Co., Engineers, 98, Commercial Road East, London, E.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

EAST LONDON HOSPITAL FOR CHILDREN AND DISPENSARY FOR WOMEN, GLAMIS ROAD, SHADWELL, E.

THE Board of Management invites applications for the post of ASSISTANT DISPENSER. Candidates must have had experience in a Hospital or other Institution. Hours from 9 a.m. to 5.30 p.m., normally. Salary £100 per annum. Dinner is provided in the Hospital.

Applications, in writing, accompanied by recent testimonials, should be sent in on or before Saturday, the 31st inst., and addressed to the undersigned,

21st March, 1900.

THOMAS HAYES, Secretary.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE ‘PHARMACEUTICAL JOURNAL’ must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, ‘Pharmaceutical Journal’ Office, 5, Serle Street, Lincoln's Inn, London.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Barrie, Bartlett, Bird, Brunt, Chalmers, Cheetham, Cowdery, Cummings, Daniel, Dawbarn, Dawson, Dell, Forster, Green, Highfield, Hill, Hunt, Jamieson, Lloyd, Lothian, Melbourn, Reynolds, Routley, Sage, Sargeant, Ward, Wilkison, Young.

NEWS IN BRIEF.

MR. T. H. DOUGHTY, M.P.S., of Catford, has purchased the business at 120, High Street, Wandsworth, lately carried on by Mr. W. J. Morgan.

MR. WILLIAM WARREN, M.C.P.S., is to take the chair at the C.A.A. "musical and social" to be held in the Association's rooms at 73, Newman Street, London, W., on Thursday, April 5.

EDINBURGH DISTRICT CHEMISTS' GOLF CLUB.—At the meeting reported last week (see *ante*, p. 326), the Club unanimously resolved to present one guinea to the Benevolent Fund of the Pharmaceutical Society.

DR. WHITE, Medical Hall, 21, Broad Street, Waterford, has recently had his shop enlarged and otherwise altered, and a complete set of new fittings put in by Messrs. Ayrton and Saunders, of Liverpool.

THE NATIONAL PHOTOGRAPHIC RECORD ASSOCIATION'S EXHIBITION, now being held in the rooms of the Royal Photographic Society, 66, Russell Square, London, W.C., may be viewed on presentation of visiting card.

"FEROCAL" is the registered word which has been chosen by Messrs. Squire and Sons, 413, Oxford Street, London, to distinguish more readily their chemical food from all other brands of chemical food, and it will in future be added to the label.

THE NORTH STAFFORDSHIRE CHEMISTS' ASSOCIATION will hold its annual meeting, followed by the annual dinner, on Thursday next, April 5, at the Grand Hotel, Hanley, at 4 p.m. Mr. W. G. Cross, Mr. R. Lord Gifford, and several prominent pharmacists are expected to be present. Applications for tickets for the dinner (5s. each) should be addressed to the Hon. Secretary, Mr. Edmund Jones, chemist, Miles Bank, Hanley, not later than Monday, April 2.

THE EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION, at a meeting held on March 28 (see page 354), decided not to hold a dinner this year on account of the recent death of the treasurer and the lateness of the season. With regard to the annual excursion, it was suggested that Aberfoyle should be visited this year, but the matter was remitted to the Committee to make further inquiry on the subject. Mr. C. F. Henry was appointed interim treasurer, and Messrs. Boa and Dewar auditors of the accounts.

CINDERELLA DANCE.—The last of the fifth series of Cinderellas held in connection with the Chemists' Assistants' Association took place on Thursday, March 22, at the Portman Rooms, Baker Street, W., and was a great success, about one hundred and twenty persons being present. In fact, any shortcomings in the attendance, etc., at former dances during the session was virtually made up for on this occasion. We are requested to state that a lady lost a brown (natural colour) feather fan on this occasion, and that if the finder will communicate with the Hon. Secretary, Mr. H. H. Robins, 113, Ridley Road, Forest Gate, E., he will return it to the owner.

FOOTBALL.—The annual match between the present and past members of the School of Pharmacy football team was played on Saturday, March 24, at Shepherd's Bush. The past team was under the able captaincy of Mr. Surfleet, and during the first half of the game held their ground well, the result at half-time being two goals to one in favour of the present team. On changing sides three more goals were added, and at the blow of the whistle the junior members were left victorious by five goals to one—a good finish to a successful season. Mr. T. Tickle acted as referee. The teams were as follows:—Square: Goal, Metcalf; backs, Owen (capt.), Garsed; half-backs, Gray, Spurge, Hellyer; forwards, Addison, Reavley, Jones, Buckingham, Warren.—Square Past: Goal, S. A. Sturton; backs, J. Fothergill, W. Hobbs; half-backs, W. B. Nelson, B. Webster, J. Evans; forwards, C. Morley, A. F. Surfleet, C. Happold, W. de F. Collinette, M. Lloyd.

AFTER THE MATCH players and friends adjourned to the Bush Hotel, where a capital spread was prepared, and to which all did ample justice. At the head of the table was placed the trophy which the present team have won—viz., the handsome cup presented by Mr. W. Watson Will.

At the conclusion of the repast a smoking concert was provided. The captain of the Square team, Mr. W. Owen, in the chair, made a few remarks concerning the doings of the present team and the winning of the cup, which, at the instigation of the Old Boys, was filled and passed round. A varied programme of music and songs was provided, the piano being in the able hands of Mr. Newton; songs were given by Messrs. Baker, Tipler, Owen, Jones, Sturton, Morley, Spurge, Metcalf, Happold, etc., finishing up a most enjoyable evening by singing the usual "Auld Lang Syne," after which the company separated.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MARCH 28, 1900.

Towards the close of the week business has taken a better turn, transactions have been more numerous, and prices generally have gone up. Miscellaneous sales have been noticeable both for prices obtained and variety of articles handled. Good sales of Spices have taken place at full rates, whilst Honey, Beeswax, and Canaryseed have engaged the attention of dealers and buyers, some large parcels having changed hands. In Oils prices have risen as regards Castor, Linseed, and Cottonseed, with good business in Calcutta Castor. The chemical trade has been quiet, but prices have not been lowered.

AMMONIA SALTS.—Carbonate, 3 $\frac{3}{4}$ d. per lb. Sal ammoniac, 38s. to 40s. per cwt. Sulphate is quiet at £12 5s. per ton.

BEESWAX.—3 bags and 8 barrels of American made £7 5s. per cwt.

BLEACHING POWDER.—Is very firm at £7 to £7 10s. per ton.

CANARYSEED.—3,000 bags of Turkish having been bought at 32s. 6d. to 33s., prices have risen to 34s. and 34s. 6d. per 464 lbs. Sales of Barbary seed have been made privately, figure not stated.

CARNAUBA WAX.—Is very firm, and 16 bags of yellow brought full prices.

CHILLIES.—65 bags of Sierra Leone fruit, ex quay, found buyers at 30s. to 45s. per cwt., and 27 bags of fair quality were sold privately.

COPPER SULPHATE.—Is very dull at £25 10s. to £26 per ton.

COPPERAS.—Is firm at 37s. to 39s. per ton.

GINGER.—45 bags of Cochin sold, ex store, at 30s. per cwt.; 30 bags of Sierra Leone, ex quay, made 27s. 6d. per cwt.; and 30 tons, to arrive, were bought in transit at 28s. per cwt.

HONEY.—25 barrels of Chilean Pile 1 found ready buyers at 25s. per cwt., and 16 casks of Peruvian at 34s. 6d. per cwt.

LINSEED.—There is little or nothing offering spot or forward, and the market therefore is idle, but prices are a turn higher. 100 bags of Turkish sold at 50s. per 416 lbs., and 200 bags of River Plate, "feeding quality," at 46s., both on the spot; to arrive, Calcutta has advanced at least 2s. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils have been neglected with the exception of Calcutta, of which good sales are reported, resulting in an advance of 3 $\frac{3}{4}$ d. per lb. for spot lots; 200 cases on the spot sold for 3 $\frac{3}{4}$ d. per lb. early in the week, and subsequently 200, to arrive, April-June shipment, made 3 $\frac{5}{16}$ d. per lb.; 1st French is quoted at 3 $\frac{1}{4}$ d. per lb.; and 2nd pressure, Belgian or French, at 3 $\frac{1}{16}$ d. per lb. Olive Oils are in limited demand, Spanish being quoted at £35 10s. to £36 10s. per tun. Linseed Oil is firm at an advance, 25s. 3d. to 26s. per cwt. being now wanted. Cottonseed oil is being held here for 23s. 6d. to 24s. per cwt., a slight advance. Spirits of turpentine are steady and quiet at the easier price of 41s. per cwt.

POTASH SALTS.—Bichromate, 4d. to 4 $\frac{1}{2}$ d. per lb. Chlorate, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d. per lb. Cream of Tartar, brown Patras, has sold in small amount at 60s. per cwt. Pearlashes are quiet at 33s. 6d. to 35s. per cwt. Potashes continue steady at 27s. 3d. to 27s. 6d. per cwt. Prussiate firm, 8d. per lb. Saltpetre, £21 5s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firmer, 17s. to 18s. per cwt. Crystals, £3 5s. to £3 7s. 6d. per ton. Caustic, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton. Nitrate is easier by 1 $\frac{1}{2}$ per cent., and offers at 8s. 7 $\frac{1}{2}$ d. to 8s. 10 $\frac{1}{2}$ d. per cwt.

TURMERIC.—141 bags Bombay bulb sold since auction at 10s. 6d. per cwt., ex quay. 151 bags of Cochin split bulb at 10s., ex store.

LONDON, THURSDAY, MARCH 29, 1900.

Business in Drugs and Chemicals has been quiet during the past week. Quinine continues in the dumps, as far as the speculative market is concerned. Opium is firm, as also are Morphine and Codeine. Glycerin firm and advancing. Cod Liver Oil much dearer. Refiners refused to sell Camphor. The Japanese Government having now secured the monopoly of the crude article, it is anticipated that an important advance in price will probably be the result. Acid Carbohc is quiet and steady. Bromides, Mercurials, and Quicksilver very firm. Iodides somewhat weak, the possibility of a reduction in price on part of the combined makers being freely discussed. The following are particulars of prices ruling for some articles of principal interest:—

ACID, BORACIC AND BORAX.—There is no change to report.

ACID CARBOLIC.—The market is quiet both for refined and for crude at nominally unchanged prices.

ACID, CITRIC AND TARTARIC.—Are quiet at unchanged prices.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries 2s. per cwt. more. Iodides, 13s. 10d. per lb. Sulphate, flat, grey, 24 per cent., London, prompt, £12. Hull, prompt, £11 17s. Leith, prompt, £12. Beckton, March-April, £11 16s. 3d. to £11 17s. 6d.; May-June, £11 16s. 3d. to £11 17s. 6d.; Beckton, terms prompt, £11 15s. to £11 16s. 3d. Sulphocyanide, 1s. to 1s. 1d. per lb.

ASAFETIDA.—Good quality is very scarce, the stock, which is large, consisting of very common. Sales have been made this week of good medium up to 65s. per cwt.

CAMPHOR.—There would appear to be something up in this article. Hamburg refiners quote 2s. 0½d. for prompt, and 2s. 0¾d. per lb. for forward delivery for Bells and Flowers, in ton lots, while English refiners are firm at 2s. 1d., neither being, however, sellers at the moment. It looks, therefore, very much as if an advance in price was imminent, the primary cause being the monopoly in the crude on the part of the Japanese Government, which has now become an accomplished fact.

CANNABIS INDICUS (GUAZA).—Sales have been made this week of good green on stalk, to arrive at 5d., c.i.f., the bulk of the London stock being held above this price.

CASTOR OIL.—Quiet. Belgian first pressing spot, £31; April-June, £30, f.o.b. Antwerp; second pressing spot, £28 10s. per ton, ex wharf; Hull manufactured, guaranteed cold drawn pure pharmaceutical, £33 10s. per ton in barrels; 4d. per lb. in cases; pure firsts, £31; seconds, £29 10s. per ton in barrels; firsts, 3¾d. per lb. in cases; second, 3½d., ex wharf London.

CINCHONA BARK.—These periodical Dutch auctions, the third of the series, were held in Amsterdam on the 22nd. The increased supply of 7,365 packages Java was offered, which went off better than anticipated, the average unit obtained being 10.05 cents., against 10.65 cents. last sale, or a decline of 5 per cent., being equivalent to about 1¾d. London parity. The Quinine contents of the sale were 26,400 kilos, of which about 3,700 kilos were bought in.

CLOVES.—No Zanzibar were offered in auction. Penang steady. 9 cases offered and 6 sold, fair rather dark picked at 6½d. Privately, Zanzibar strong, near positions are fully 1/8d. better, forward also advancing. A fair business has been done, comprising spot 4¾d., and buyers March-May delivery at 4¾d. to 4 7/16d., and buyers June-August at 4 7/16d. to 4 15/32d.

COAL TAR DISTILLATION PRODUCTS.—Are quiet and practically without change in value.

CODEINE.—Very firm at 13s. 1d. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the Salts.

COD LIVER OIL.—Is very firm and much dearer, the agents for some of the brands most in favour now asking as much as 120s. per barrel of 25 gallons for best new non-congealing Norwegian oil.

CREAM OF TARTAR.—Is quiet and unchanged.

DRAGONS BLOOD.—Fine brilliant lump, of which there is only a case or two in stock, is held for £20 a cwt. Sales have been made this week of good lump, £10, and the stock of this quality seems now to be exhausted. Reeds are dearer at £10 10s. to £11.

GINGER.—At auction Cochin in fair supply met a slow demand, and of 704 bags and 188 cases offered only 139 bags sold, rough washed medium and small plumpish rather mouldy without reserve at 29s. to 29s. 6d., dark small, some medium, part shrivelled at 25s. 6d., and fair cuttings at 26s.; cut kinds all bought in. Jamaica: The moderate supply met a fair demand at irregular and slightly easier rates, good hard bold at 69s. to 70s., fair to good bright at 61s. to 65s., middling to good middling at 54s. 6d. to 59s., common to good common 48s. 6d. to 54s. Rhaton, ordinary to fair, at 45s. to 47s. 6d. St. Lucia: 9 bags sold at 44s. 6d.

GLYCERIN.—Is very firm both for crude and refined, prices, although so far unchanged, having a further upward tendency.

IODIDES.—There is a rumour that a reduction may shortly be made in prices fixed by the combined makers. Meanwhile, prices remain steady and unchanged.

MERCURIALS.—Are firm at unchanged prices.

MORPHINE.—Firm at 5s. per oz. for the Hydrochlorate Powder.

OILS (FIXED) AND SPIRITS.—Linseed: Forward positions have declined about 10s., whilst spot value is unchanged. On the spot, pipes, London, ordinary, £25 10s. (E.T. 10s. premium); barrels, £25 10s. Hull, weaker; spot, naked, £23. Rape, quiet; ordinary brown, on spot, £27 5s. to £27 10s.; refined, spot, £28 10s. Ravi-son naked, spot, £24 10s. Cotton quiet. London crude, spot, £21; refined spot, £23 to £23 15s., according to make. Hull: Lower. Naked, refined, spot, £21; crude, spot, £19 10s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35; Coconut, quiet; Ceylon, on the spot, £25 10s.; Cochin, spot, £28 10s. Palm: Lagos, on spot, quoted £29. Petroleum (oil) firm. Russian, spot, quoted 7d. to 7½d. American, spot, 7 1/8d. to 7 3/8d.; Water White, 8 7/8d. to 9d. Petroleum (spirit): American, 9 3/8d.; deodorised, 10d. to 10½d. Turpentine strong and advancing. American, spot, 40s. 3d.; April, 40s. 3d.

OPIUM.—Very firm, and the shade harder in price, without, however, very much business having taken place during the week.

PHENACETIN.—Is firm and unchanged.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals, 4 8/16d. net; powder, 4 5/16d. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 93 per cent., 1s. per lb. Hydrate (caustic potash), 90 per cent., £25 15s. per ton; ditto, 75 to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make. Large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex ship.

QUICKSILVER.—Is still quoted £9 12s. 6d. per bottle by the importer.

QUININE.—The market opened steadily, but has since become dull and easier. Business has continued restricted, about 25,000 ozs. B&S and/or Brunswick having changed hands, May delivery at 1s. 3¾d. and June at 1s. 4¼d., and since at 1s. 4d. and value. Makers of the favourite B&S brand maintain their price at 1s. 6d. per oz. for the Sulphate for 1,000-oz. lots in 100-oz. tins.

SODA COMPOUNDS.—Crystals: Barrels quoted 60s., bags 57s. 6d. Acetate, £14 per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, £7 5s. per ton. Bichromate, 3½d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4 5/16d. per lb. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot refined, £9; ordinary, £8 15s. Nitrate, 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. per ton. Sulphate (Salt Cake), £1 7s. 6d. per ton. Glauber Salts, £1 10s. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: at auction no Singapore offered; 200 bags Penang bought in, weight 4lb., dust 2.58 per cent. at 5 7/8d.; Ceylon: 6 bags sold, fine heavy at 6½d. to 6¼d. White Pepper in little demand: of 100 bags Singapore offered, 20 bags sold, good at 9 7/8d.; 67 bags fair brown lined Penang bought in at 8 5/8d.; Ceylon: 5 bags offered and sold, fine at 10½d.; fair to good at 8¾d. to 9¼d. Chillies quiet: 38 bags Japan bought in, fine bright at 55s.; 5 bales Zanzibar sold, fair stalky at 43s. 6d.

Capsicums easier: 34 bags Bombay sold, good pale cherry pods at 35s. ; fair red long stalky at 29s. ; 1 bale fine bright Natal bought in at 105s. Pimento, in small supply, met a slow demand at steady rates: 126 bags offered and 48 bags sold, fair at 3½d. Cassia Vera: 94 bags at auction bought in, coarse Padang quills at 26s. Cassia Lignea dull: 50 boxes fine old bought in at 52s. Cinnamon: 141 bales Wild bought in, rather coarse quill at 1½d. to 2d. Cinnamon Chips and Bark: 150 bags Ceylon Chips sold without reserve at easier rates, fair at 3½d. ; of 90 bags Bark, 20 bags sold at 1½d. Nutmegs neglected: of 52 packages Penang, only 2 packages sold, 105's, dark and wormy, 1s. ; West Indian: 12 cases and 2 barrels offered and 10 cases sold, 114's at 11½d. Mace dull. 8 cases Penang bought in, fair pale at 1s. 8d. ; broken red at 1s. 5d. ; 1 case Ceylon sold, fair palish at 1s. 6d.

SULPHONAL.—Makers are firm at 20s. 6d. per lb. for both crystals and powder.

THURSDAY'S DRUG SALES.

To-day's Drug auctions consisted of a comparatively small number of catalogues, comprising only a limited number of lots, which, on the whole, sold fairly well, there being, however, no changes in value of any special importance to record. Guaza realised higher prices, while Cardamoms also sold fairly well. The following are the particulars:—

ALOES.—57 cases Cape part sold at 30s. per cwt. for good hard bright down to 28s. 6d. for less desirable quality. 2 cases East India in monkey skins were sold at 62s. 6d. per cwt., subject to holders' approval. 100 boxes Curaçao sold readily at 24s. 6d. to 25s. per cwt. for good livery down to 17s. for capey.

AMBERGRIS.—1 package containing only about 6¼oz. of good quality sold at 112s. 6d. per oz.

ANNATTO SEED.—2 barrels bought in at 2d. per lb., only 1½d. per lb. being bid. Other 4 bags sold at 1¾d. per lb.

ARGOL.—26 bags pale Cape were taken out at 55s. per cwt. ; another lot of 2 bags fair Cape sold at 45s. per cwt.

BALSAM COPAIBAE.—10 cases of fair quality part sold at 1s. 7d. per lb., balance being bought in at 1s. 9d.

BALSAM PERU.—2 cases fair quality were taken out at 7s. per lb.

BUCHU LEAVES.—23 bales were bought in at 1s. to 1s. 1d. per lb. for fair green rounds, and at 8d. to 10d. for medium rather stalky ditto. Another lot of 33 bales were all taken out at 1s. per lb. for good green rounds, and at 9d. to 10d. for stalky yellow to fairly green quality.

CARDAMOMS.—84 cases only medium Ceylon Mysore part sold at 1s. 3d. to 1s. 9d. per lb., balance being taken out at 1s. 7d. to 3s. per lb., and good seed at 2s. 4d. per lb. Another lot of 82 cases Ceylon part sold at 1s. 3d. up to 3s. 11d. per lb., according to quality and size. 18 cases Mangalore realised 3s. 7d. for good bold and only 2s. 2d. for the smaller sizes, which did not appear to be fully ripe. Other 17 cases Mysore sold subject to owner's approval at 1s. 4d. to 2s. 8d. per lb., 1 bag seed fetching 2s. 1d. per lb. Other 58 cases Ceylon sold well at 1s. 3d. up to 3s. 4d. per lb. and at 2s. to 2s. 2d. per lb. for seeds. 7 cases really good bold seeds part sold at 2s. 4d. per lb., balance being taken out at this figure.

CINCHONA BARK.—16 bales flat Calisaya all sold at 10d. per lb. for the sound, and at 9d. per lb. for 1 CCD.

CIVET.—10 horns of very common, inferior quality, failed to find a buyer, and were bought in at nominally 7s. 9d. per oz.

COCA LEAVES.—1 case Ceylon failed to find a buyer.

COLUMBA ROOT.—7 bags brown sorts realised 25s. per cwt.

CROTON SEED.—12 bags were all bought in at 45s. per cwt. for fair bright, and 37s. 6d. for dull.

EGG ALBUMEN.—3 cases China were taken out at 1s. 7d. per lb. for good pale and 1s. 6d. for dark. 2 casks Yolks failed to find a buyer.

ERGOT OF RYE.—5 bags fair sound Russian, but not very bold, were bought in at 2s. 4d. per lb.

ESSENTIAL OILS.—1 case West Indian Bay Oil sold at 6s. 4d. per lb., 5 cases West Indian Distilled Oil of Limes at 3s. per lb.

QUAZA (HERBA CANNABIS INDICA).—58 robbins sold well at full prices up to 8¾d. per lb. for good green tops, green siftings being held for 6d.

GUM ARABIC.—50 bags Turkey sorts were all bought in. 10 cases Kurrachee gum were also bought in, 32s. per cwt. being price mentioned. 6 cases Aden gum bought in at 45s. per cwt. for fair, dark blocky selling at 10s. per cwt. Other four cases Aden gum were taken out at 52s. 6d. per cwt.

GUM BENZOIN.—Fine seconds Sumatra sold at £9 per cwt., fair to good ditto being bought in at £8 10s. to £8 15s., medium to fair at £7. Low thirds sold at £5 per cwt. 50 cases very rough woody Palembang were taken out at 25s. per cwt.

GUM KINO.—4 tins fair Cochin failed to find a buyer.

HONEY.—30 cases pale brown Californian failed to find a buyer, 45s. per cwt. being price required. Other 45 cases of very fine quality were taken out at 47s. per cwt. Good Jamaica fetched 28s. ; dark ditto 23s. ; white ditto being taken out at 32s. per cwt.

IPECACUANHA.—6 bags only fair Carthagena, part mouldy, sold at 6s. 11d. to 7s. 2d. per lb., 1 bale 3 CCD selling at 6s. 3d. 15 bales fair sold readily at 10s. 2d. to 10s. 9d. per lb.

LIME JUICE.—1 hogshead West Indian was taken out at 1s. 10d. per gallon.

MUSK.—1 caddy Tonquin, medium to bold, thin skin, blue, fairly dry, failed to find a buyer. 2 bottles grain musk were bought in at 35s. per oz.

NUX VOMICA.—108 bags only medium Madras sold at 7s. 6d. per cwt. 368 pockets fair Calcutta taken out at 10s. per cwt.

OLIVE OIL.—2 pipes Italian were bought in at 5s. 6d. per gallon of 9lbs.

ORANGE PEEL.—9 cases good thin cut were taken out at 1s. per lb.

ORRIS ROOT.—5 bags fair East Indian were taken out at 25s. per cwt. 15 bags Italian of bad colour were bought in at 32s. 6d. per cwt.

PISTACHIO NUTS.—4 bags were bought in at 1s. 9d. per lb.

RHUBARB.—33 cases Canton offered without reserve, all sold at comparatively cheap rates—viz., 9d. to 10d. per lb. for good bold rounds, 7¾d. to 8d. for fair medium ditto, and 7d. for rough small to part bold and pickings, 1 case rough pickings selling at 6d., while flat realised 9½d. per lb. for small to part bold, 9d. for pale coated small trimming root, 7½d. to 8¼d. for medium, 6½d. for good pickings, and 6¾d. for ditto round and flat mixed.

SARSAPARILLA.—8 bales pale red native Jamaica sold at 1s. 1d. to 1s. 2d. per lb. for the sound, and 9d. to 9½d. for the damaged. 6 bales Lima realised 9¾d. to 10¼d. per lb.

SENNA.—12 boxes medium to fair Alexandria were taken out at 8d. per lb. 37 bales low Tinnivelly sold at 1¼d. to 2d. per lb. Another lot of 224 bales Tinnivelly all sold up to 2½d. per lb., quality in this case also leaving much to be desired.

SOY.—20 casks Chinese sold at 1s. 2½d. per gallon.

TONQUIN BEANS.—10 cases fair frosted Paras were taken out at 1s. 10d. per lb.

WAX.—5 packages fair Jamaica sold at £7 5s. per cwt., subject to owner's approval. 13 cases bleached East Indian were taken out at £7 12s. 6d. per cwt. 25 bags fair Zanzibar sold at £7 per cwt. 92 cases ditto part sold at £7 2s. 6d. ; balance at £7. 1 case dark at £6 10s. 17 packages Bombay part sold at £6 5s., balance being bought in at £6 to £6 5s. 10 bags English were taken out at £3 5s., only £7 15s. per cwt. being bid. 20 cases bleached Calcutta were taken out at £7 7s. 6d. to £7 15s. 9 cases Italian at £7 per cwt.

The next Drug Sale will take place this day month.

TRADE NOTE.

SANITARY BANDELETS.—Mr. Louis Nelicker, 29, Bedford Road, Rockferry, is offering sanitary towels for ladies' use, which are claimed to be four times more absorbent than similar articles made of wadding or wood-wool; it is also stated by the manufacturer that they do not become hard or dry in use, and, consequently, they cause no irritation. The Sanitary Bandelts are said to be rendered antiseptic without the aid of poisonous materials.

Calendar for the Week.

- Sunday, April 1.** Fifth Sunday in Lent. Sun rises 5.37; sets 6.31.
Monday, April 2. Sun rises 5.35; sets 6.32.
 DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION, Church House, Church Street, at 8.30 p.m.—R. Lord Gifford on his pharmaceutical policy in connection with his candidature for the Council.
 SOCIETY OF CHEMICAL INDUSTRY, Burlington House, Piccadilly, W., at 8 p.m.—“The Manufacture of Caramel,” by A. Gordon Salomon and E. N. Goldie.
Tuesday, April 3. Sun rises 5.33; sets 6.33.
 ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—“Slides, Old and New,” by F. P. Cembrano.
Wednesday, April 4. Sun rises 5.31; sets 6.35.
 PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of the Council.
 BRITISH PHARMACEUTICAL CONFERENCE, 16, Bloomsbury Square, London, W.C., at 4.30 p.m.—Meeting of the Executive Committee.
Thursday, April 5. Sun rises 5.29; sets 6.37.
 CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by G. S. Newth, W. H. Sodeau, A. W. Crossley, and J. T. Hewitt and W. G. Aston.

A 4 pp. SHEET OF FORMULÆ is given with

ROUSE'S CARMINE

1s. 8d. per oz. Tin, with Labels, Post free or . . . through Wholesale.

How highly these Formulæ are appreciated by the Trade may be judged by the subjoined extracts from letters received by us:—

C. D. B., Hull, writes:—“I was much pleased with the Carmine, and with the preparations made from it; the latter are admirable.”

F. W. B., Manches er:—“Some time ago I had some of your excellent Carmine, and made a lot of Tooth Paste, which pleased me very much.”

J. J. G., Folkestone:—“I have tried your Carmine, and made some Liquid Cochineal according to your formula, which turned out an excellent preparation.”

D. R., Swansea:—“I made some Liq. Cocci some time since from your Carmine according to formula enclosed. It was a capital production.”

R. N., Darlington:—“I have made our Tooth Paste from your formula for years.”

PARTNERSHIPS DISSOLVED.

Alexander William Woodman Dowding and Frederick Arthur Martin Flegg, Physicians, Surgeons, and Apothecaries, Wanstead, and George Lane, Woodford, Essex.

James Smith Whitaker and Leonard Youatt, Physicians and Surgeons, 20, Regent Road, and 43, Market Place, Great Yarmouth.

John White Hopkins and Thomas Ernest Earl Roddis, Physicians and Surgeons, Snettisham, Norfolk.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE ‘PHARMACEUTICAL JOURNAL’ must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, ‘Pharmaceutical Journal’ Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock, Barrie, Bartlett, Bates, Burgin, Campkin, Carter, Crook, Dudderidge, Goodness, Grimble, Hill, Jamesou, Jones, Kent, Pellow, Riug, Roberts, Robins, Roebuck, Ross, Sharpley, Tilley, Vince, Walton, Ward.

Photography as a Business	1

IT MAY SEEM somewhat unnecessary to try to teach those chemists who have already gone in for the photographic business, but there are many little points which seem, somehow or other, to slip notice, or of which the chemist may actually be ignorant; and even with the danger of being accused of attempting to teach those who are older in photographic experience, a few matters may be referred to with advantage.

OF ALL PEOPLE the amateur photographer is the most omnivorous reader. Frequently a new chemical or a new process is suggested in one of the weekly photographic journals, and the first thing he must do is to try it, of course. A visit to his local dealer frequently leads to disappointment, for the dealer is too often utterly ignorant of the process or the new chemical, and stares in utter amazement, or otherwise betrays his ignorance. To expect a chemist to be thoroughly *au courant* with every new fad is probably to expect too much; but still, if an assistant is kept, whose principal duty is to look after the photographic department, he should most decidedly be allowed and expected to make himself master of the leading journals. If there is no assistant it is not much of a task, and generally a new thing is at once noticed by the photographic journals and pointed out as new.

IF THE CHEMIST OR ASSISTANT is himself a photographer so much the better; there is then a better chance of success in this particular direction. There is hardly anything that is such a relief from the ordinary cares and worries of pharmacy as to turn to for a few moments and experiment with some new formula or some new salt, and frequently chemists have thus discovered some little tip which has enabled them to put up a special preparation which sells well. In addition, if—at least, it has been found to be so—the dealer is himself an amateur, his advice carries much greater weight with his customers.

TALKING OF ADVICE, there is, however, one form which is extremely objectionable except under rare conditions, and as an example one experience may be given which happened last summer during a holiday, in a certain town which shall be nameless. The writer had run out of plates, and went to the local dealer and asked for some of Brown's plates, whole-plate size. "Oh!" says Mr. Pharmacist, "I never keep those. I find that Robinson's plates are so much better and faster—in fact, none of my customers will use anything else, and I never do!" This might or might not have been true, but as Brown's plates had been used for over ten years, and one knew exactly what they would and would not do, one hardly felt inclined to sport Robinson's, although knowing that they had a good reputation.

Trade Catalogues.—All the firms whose goods are referred to in this Photographic Supplement will be pleased to send copies of their priced catalogues post free on application by anyone mentioning the *Pharmaceutical Journal*.

AMATEURS, if they do any serious work at all, are somewhat conservative as regards particular makes of plates and papers; they are chary of changing, for the simple reason that they know exactly what they can and cannot do with a particular make. On the other hand, the beginner in photography is like a butterfly, constantly flitting hither and thither, and to one thing constant never, with the result that it is a long time before he can turn out a decent negative or print, from a technical point of view, at any rate. Now, there is a chance for the practical dealer here. Show such a man a good negative or a good print made on a particular brand that is kept in stock, and, if possible, with a developer of your own make. Get him to try them, and induce him to bring his results for you to see, and administer a little judicious advice, and, if necessary, show him how you work.

IF A NEW PRINTING PAPER comes out it is just as well, if really new, to obtain specimens from the wholesale house, or make some yourself, and show them in the window, which, if properly set out, particularly with a lot of local views, etc., should be a source of a fairly constant crowd, both of amateurs and others. This is a cheap form of advertising, which, from personal experience, we can recommend, and it generally leads to business.

AS AN INSTANCE of window advertising, it may be mentioned that last winter the whole of one shop window was lighted inside by acetylene, and this attracted so much attention that the following week the whole of the shop was lit by it. The actual cost of this was about £7 10s. for the week, generator and carbide, etc., included, and the result has been that no less than five complete installations were sold, at a total return of £73 11s. Then again, one should always be up-to-date as regards pictures. By keeping, during the last few months, a big stock of South African lantern slides, and many of those of the leading men there engaged, the result was that the slide trade in the shop referred to has been a considerable item, with an initial outlay of 30s.

PRINTING AND ENLARGING from amateurs' negatives and developing the same is a fairly lucrative side adjunct to the business, but one has to be fairly well up in photography to be able to undertake this class of work. There are many trade firms who undertake such work, and the only disadvantage is that they are not all prompt, with the result that you probably lose a customer. Retouching is not a job that pays unless the business is of such a size as to warrant the employment of a hand who can do this in the odd moments, and turn his hand to general work in the business, or in the developing, printing, and enlarging room.

CHEMISTS, AS A RULE, are far better educated than the average tradesman; and why more chemists, particularly in the country, do not turn their attention to lecturing and lantern entertainments before schools and private parties we never could understand. It is extremely easy to hire a set of slides on almost every conceivable subject, from the most abstruse science to the silliest nursery rhyme or maudlin song, and nearly always with a reading, and for small parties it is by no means difficult to manipulate the lantern and lecture at the same time. The writer has been fortunate enough to

obtain a very large connection for lantern shows, and has trained the porter to assist at the lantern, so that now all goes merry as a marriage bell.

RADIOGRAPHIC WORK is fast drifting out of the hands of the photographic dealer and chemist into those of the trained specialist or a local doctor, though why this should be it is at first sight not quite so easy to say. A fee of two guineas can be got for a simple radiogram of the hand or foot, an operation that takes, all told, less than half an hour; whilst for more difficult work the fee increases in proportion, and experience proves that this pays better than selling proprietary medicines, or even than dispensing.

OF COURSE, EVERY PHOTOGRAPHIC DEALER should have a list of his own. It may be a modest one at first, but it can be increased later; and, above all things, have plenty of other people's lists; they are wonderfully useful for reference. Much information may be gained from the weekly journals, but the "Photographic Dealer," a monthly trade paper, is wonderfully useful, as is also that ponderous annual, the "British Journal Photographic Almanac," which consists of about 500 pp. of what is called literary matter and 1,000 pp. of advertisements.

BOOKS FORM ANOTHER SOURCE of trade, and a small stock of these may well be kept exposed for sale. All the journals and photographic books may be obtained in small quantities from Messrs. Dawbarn and Ward, 6, Farringdon Avenue, E.C., who also send out a monthly letter telling one what is new.

Pyro should always be obtained in 1-oz. bottles. Asphaltum is preferably kept in powder; not in great demand. Caramel: Liq. sacch. ust. is an extremely unsatisfactory form. The best is the dry powder, "crystal caramel," to be obtained from Lichtenstein and Co., Silvertown Chemical Works, London, E. Dextrine: White dextrine should always be supplied. Pyroxyline: Hopkins and Williams' high temperature, or else Schering's celloidin, is the best. Sodium hyposulphite: The small white recrystallised hypo. should always be supplied. It keeps better, is much cleaner, and gives greater satisfaction, and will always fetch a higher price. Frequently it happens that some out of the way thing, such as an aniline dye, is wanted, and whilst these may sometimes be obtained from the wholesale house, they sometimes may not, and it is necessary to wait while it is obtained for you. As a rule, however, there is not much difficulty beyond a little delay, for the average amateur wants few; it is only the expert faddist who wants out of the way dyes.

PACKED PHOTOGRAPHIC CHEMICALS.

Chemists who are considering the desirability of commencing a photographic trade are often in doubt regarding the selection of

stock. They do not know what chemicals to purchase, or in what quantities they should procure them, and they frequently run the risk of buying too largely of substances liable to deteriorate. Messrs. Harrington Bros., London, have therefore performed a useful service in offering photographic chemicals bottled in convenient quantities for sale to photographers. They supply goods according to the following list at a net cost of £5 10s., packages free:—

1 doz.	4 oz. Acid acetic glacial	Stoppered bottles.
1 doz.	2 oz. Acid citric	Plain bottles.
1 doz.	4 oz. Acid hydrochloric pure 1.16	Stoppered bottles.
1 doz.	2 oz. Acid nitric pure 1.420	" "
1 doz.	1 oz. Acid pyrogallic HBL	" "
1 doz.	4 oz. Alum Chrome comml	Plain bottles.
1 doz.	4 oz. Ammonia Sol. 0.880	Stoppered bottles.
1 doz.	1 oz. Ammonia bromide	Plain bottles.
1 doz.	2 oz. Ammonia bromide	" "
1 doz.	1 oz. Ammonia sulphocyanide	" "
1 doz.	2 oz. Ammonia sulphocyanide	" "
1 doz.	1 oz. Calcium chloride with asbestos ..	" "
1 doz.	1/2 lb. Paper canisters developing salt for platinotypes.	" "
1 doz.	1 oz. Eikonogen	Plain bottles.
1 doz.	15 gr. tubes Gold chloride	" "
1 doz.	1 oz. Hydrokinone	" "
1 doz.	2 oz. Iron perchloride	" "
1 doz.	4 oz. Iron sulphate pure cryst.	" "
1 doz.	8 oz. Iron sulphate pure cryst.	" "
1 doz.	1 oz. Lead nitrate puriss	" "
1 doz.	1/2 oz. Magnesium powder	" "
3 ozs.	Magnesium ribbon in 1 oz., 1/2 oz., or 1/4 oz. coils.	" "
1 doz.	1 oz. Potassium bromide	Plain bottles.
1 doz.	2 oz. Potassium bromide	" "
1 doz.	4 oz. Potassium carb. pure dry	" "
1 doz.	15 gr. tubes Potassium chloroplatinite.	" "
1 doz.	1 oz. Potassium ferricyanide	Plain bottles.
1 doz.	1 oz. Potassium hydrate (caustic or oxide)	" "
1 doz.	2 oz. Potassium hydrate (caustic or oxide)	" "
1 doz.	2 oz. Potassium metabisulphite	" "
1 doz.	4 oz. Potassium metabisulphite	" "
1 doz.	4 oz. Potassium oxalate	" "
1 doz.	1 oz. Schlippe's salt	" "
1 doz.	2 oz. Sodium acetate	" "
1 doz.	4 oz. Sodium carb. small crystals	" "
1 doz.	8 oz. Sodium carb. small crystals	" "
1 doz.	4 oz. Sodium carb. dry	" "
1 doz.	1 oz. Sodium formate	" "
gross	1 lb. paper boxes Sodium hyposulphite gran. small.	" "
1 doz.	1 oz. Sodium hydrate white sticks	Plain bottles.
1 doz.	2 oz. Sodium hydrate white sticks	" "
1 doz.	4 oz. Sodium sulphite	" "
1 doz.	8 oz. Sodium sulphite	" "
1 doz.	16 oz. Sodium sulphite	" "
1 doz.	1/2 oz. Uranium nitrate	Stoppered bottles.
1 doz.	6d. size Varnish negative	Plain bottles.
1 doz.	6d. size Varnish matt.	" "
1 doz.	6d. size Varnish. retouching	" "
1 doz.	1 oz. Amidol	" "
1 doz.	1 oz. Metol	" "
1 doz.	4 oz. Rhodinol	" "

The bottles are stoppered where necessary, and can be supplied either with plain labels or with the chemist's own labels. A similar but more limited stock of chemicals can be supplied at three guineas net. In case the chemist should prefer to purchase the chemicals in bulk—as he is certain to do if his photographic trade develops—he will still find the foregoing list a useful guide, both as to the articles he should stock, and the relative quantities in which he is likely to require them.

LE PAGE'S PHOTO PASTE

A NEW Mountant

for Photographs.

Strongly Recommended for its

SMOOTHNESS, PURITY, FREEDOM FROM LUMPS.

Packed in Boxes of 1 Doz. & 3 Doz.

A Large Bottle Retail at 6d.

Wholesale Houses will supply it, or

Write for Price List to - -

AMERICAN AGENCIES, LTD.

38, SHOE LANE, LONDON.

Quarter actual size.

READY-MADE PHOTOGRAPHIC SOLUTIONS.

There are many amateurs who do not care to make their own solutions, and will frequently bring their own formulæ to be made up, preferring to pay a little extra for the trouble they are saved. But there is a much larger class still who will buy ready-made solutions, particularly if the strength of the principal ingredient be stated on the bottle.

Pyrogallol.

A 10 per cent. solution of this will, as a rule, sell well, and the average price may be considered to be 2s. for the half-pint bottle. A good formulæ is—

Pyrogallol	1 oz. or 100 Gm.
Potassium Metabisulphite	$\frac{1}{2}$ oz. or 50 Gm.
Distilled Water	9 ozs. 55 M. or 1000 C.c.

Label.

Ten per Cent. Pyro Solution.

Every 10 minims are equal to 1 grain of dry pyro.

Ten per cent. solutions of potassium bromide, sodium carbonate, and liq. ammoniæ fort. 0.880 may also be made up.

Hydroquinone.

This cannot be made up in aqueous 10 per cent. solution, but the following will not only keep well but sell well.

Hydroquinone	1 oz. or 100 Gm.
Glycerin	1 oz. ,, 100 C.c.
Methylated Alcohol	to 9 ozs. 55 M. or 1000 C.c.

A typical hydroquinone developer is the following:—

No. 1. Hydroquinone	154 Grs. or 10 Gm.
Sodium Sulphite	308 Grs. ,, 20 Gm.
Sulphurous Acid	60 M. ,, 4 C.c.
Distilled Water	to 10 ozs. ,, 250 C.c.
No. 2. Sodium Carbonate Pur.	3 ozs. ,, 84 Gm.
Potassium Hydrate	154 Grs. ,, 10 Gm.
Distilled Water (to make)	10 ozs. ,, 250 C.c.

Label: For use, mix in equal parts, and add 3 times the quantity of water.

One-Solution Hydroquinone.

Hydroquinone	90 Grs. or 6 Gm.
Sodium Sulphite	2 ozs. ,, 60 Gm.
Sodium Carbonate	2 ozs. ,, 60 Gm.
Eosine	1 Gr. ,, 0.06 Gm.
Distilled Water (to make)	10 ozs. ,, 250 C.c.

When required for use dilute with 4 parts of water.

For a dry powder developer—

No. 1. Hydroquinone	90 Grs. or 6 Gm.
Sodium Sulphite (anhydrous)	45 Grs. ,, 3 Gm.

Mix well.

No. 2. Sodium Carbonate (exsic.)	1 oz. ,, 28 Gm.
--	-----------------

Directions: Dissolve the above in 40 ozs. of water. The powders should be wrapped in waxed paper and tinfoil, and may even be divided up into small powders for lesser quantities of water, or if mixed together they may be put up in screw-capped bottles, the cap being used as a measure.

Eikonogen.

This is but little used now, but it forms a good one-solution developer.

Distilled Water	to 1000 C.c.
Sodium Sulphite (anhydrous)	150 Gm.
Potassium Carbonate	30 Gm.
Eikonogen	20 Gm.

For use mix with three parts of water.

Metol.

One of the newer developers which is not often used alone, but generally in conjunction with pyro or hydroquinone.

(Single Solution.)

Metol	20 Gm.
Sodium Sulphite (anhydrous)	90 Gm.
Potassium Carbonate	80 Gm.
Distilled Water	to 1000 C.c.

For use dilute with three parts of water.

(Separate Solutions.)

No. 1. Water	1000 C.c.
Metol	15 Gm.
Sodium Sulphite	150 Gm.
No. 2. Potassium bromide	2 Gm.
" carbonate	100 Gm.
Distilled water	to 1000 C.c.

For use mix 2 parts of No. 1, 1 part of No. 2, and 3 parts of water.

Metol and Hydroquinone.

(One Solution.)

Metol	12.5 Gm.
Sodium Sulphite (anhydrous)	25 Gm.
Potassium Carbonate	60 Gm.
Hydroquinone	12.5 Gm.
Distilled Water	to 1000 C.c.

For use dilute with 3 parts of water.

(Two Solution.)

No. 2. Metol	20 Gm.
Hydroquinone	24 Gm.
Sodium Sulphite	60 Gm.
Potassium Bromide	8 Gm.
Distilled Water	to 1000 C.c.

No. 2. Potassium Hydrate	84 Gm.
Distilled Water	to 1000 C.c.

For use, mix in equal parts, and add three times the quantity of water.

Metol-Pyro.

No. 1. Pyrogallol	24 Gm.
Metol	20 Gm.
Potassium Metabisulphite	60 Gm.
Potassium Bromide	8 Gm.
Distilled Water	to 1000 C.c.

No. 2. Sodium Carbonate	200 Gm.
Distilled Water	to 1000 C.c.

For use mix 1 part of No. 1 with 4 parts of No. 2.

Glycin.

(One Solution.)

Sodium Sulphite (anhydrous)	80 Gm.
Distilled Water	100 C.c.

Dissolve by the aid of heat, and add

Glycin	35 Gm.
--------------	--------

Heat to the boiling point and add gradually

Potassium Carbonate	150 Gm.
---------------------------	---------

This forms a thin paste, which should be diluted with 12 parts of water for use.

(Two Solution.)

No. 1. Glycin	40 Gm.
Potassium Carbonate	10 Gm.
Sodium Sulphite	120 Gm.
Distilled Water	to 1000 C.c.

No. 2. Potassium Carbonate	100 Gm.
Distilled Water	to 1000 C.c.

For use mix 1 part of No. 1 with two parts of No. 2.

Pyrocatechine.

This has long been known as a developer, and has lately been introduced on the market under the name of "Kachin."

(Single Solution.)

Sodium Sulphite	125 Gm.
Sodium Carbonate	250 Gm.
Pyrocatechine	50 Gm.
Distilled Water	to 1000 C.c.

For use, mix 1 part with 5 parts of water.

(Two Solution.)

No. 1. Pyrocatechine	20 Gm.
Sodium Sulphite	100 Gm.
Distilled Water	to 1000 C.c.
No. 2. Sodium Phosphate	188 Gm.
Sodium Hydrate	20 Gm.
Distilled Water	to 1000 C.c.

For use, mix 1 part of No. 1, 1 part of No. 2, and 2 parts of water.

Ortol.

No. 1. Ortol	15 Gm.
Potassium Metabisulphite	7.5 Gm.
Distilled Water	1000 C.c.
No. 2. Sodium Carbonate	120 Gm.
or Potassium Carbonate	60 Gm.
Sodium Sulphite	180 Gm.
Potassium Bromide	2 Gm.
Distilled Water	to 1000 C.c.

For use, mix in equal parts for rapid work, or for normal use add an equal quantity of water.

Adurol.

For one solution developers this is about the most satisfactory on the market. It is either a monochloro or monobromo derivative of hydroquinone, and keeps for a long time colourless in stock solution, and gives very good soft negatives, and is applicable both to bromide papers and lantern slides.

Adurol	75 Gm.
Sodium Sulphite	375 Gm.
Potassium Carbonate	750 Gm.
Distilled Water	1000 C.c.

Heat the full quantity of water, add the sulphite, then the potash, and finally the adurol.

For use, dilute the above with from 10 to 15 parts of water.

(Two Solution.)

No. 1. Sodium Sulphite	100 Gm.
Adurol	20 Gm.
Distilled Water to	1000 C.c.
No. 2. Potassium Carbonate	120 Gm.
Distilled Water to	1000 C.c.

For use mix in equal parts.

Acid Fixing Bath.

Sodium Hyposulphite	1000 Gm.
Dissolve in	
Water	2000 C.c.
Dissolve also	
Sodium Sulph	100 Gm.
In Water	375 C.c.

And add

Sulphuric Acid	6.5 C.c.
Water	125 C.c.

It is sometimes convenient to be able to send out an acid hypo. in dry powder, and then the following may be used:—

Sodium Sulphite	125 Gm.
Citric Acid	30 Gm.

Mix well, and add to

Sodium Hyposulphite	1000 Gm.
--------------------------------	----------

It should be pointed out that these acid baths should only be used for negatives and bromide papers, and not for silver or printing out papers.

One Solution Reducer (Belitzki's).

Potassium Ferric Oxalate	50 Gm.
Sodium Sulphite	50 Gm.
Water	1000 Gm.

Dissolve and add

Oxalic Acid in Crystals	15 Gm.
------------------------------------	--------

Shake till the blood-red solution turns green, decant from any undissolved acid, and add

Sodium Hyposulphite	250 Gm.
--------------------------------	---------

The negative does not require freeing from hypo before this is applied. The reducer keeps well in the dark, does not stain, and may be used over and over again till quite yellow.

Ceric Sulphate (Lumiere).

(One Solution.)

Ceric Sulphate	100 Gm.
Sulphuric Acid	4 C.c.
Distilled Water to	1000 C.c.

This may be diluted with from 3 to 6 parts of water, according to the rapidity of reduction desired. The solution keeps well and may be repeatedly used.

Copper Corrector.

Under this and fancy names a solution of cupric bromide has been introduced, and it can be used either as a reducer or as an intensifier.

Cupric Sulphate	250 Gm.
Potassium Bromide	120 Gm.
Distilled Water to	1000 C.c.

Immerse the well washed negative in this till bleached, and then rinse and apply an old developer in order to obtain intensification. For reducing, immerse till bleached more or less, then rinse and refix. The amount of reduction depends on the amount of bleaching.

Lumiere's Iodide Intensifier.

(One Solution.)

Mercuric Iodide	20 Gm.
Sodium Sulphite (anhydrous)	200 Gm.
Distilled Water to	1000 C.c.

This can be applied immediately after the negative has been fixed and rinsed. It is advisable to treat the intensified image with an old developer, in order to obtain perfectly permanent negatives.

Copper Intensifier.

(One Solution.)

Potassium Citrate	100 Gm.
Cupric Sulphate	13 Gm.
Potassium Ferricyanide	11.5 Gm.
Distilled Water	1000 C.c.

This may be used for toning bromide papers and lantern slides, and gives warm brown to reddish tones.

Potassio Cyanide of Silver.

(Monckhoven's.)

A very old and favourite intensifier.

No. 1. Mercuric Chloride	20 Gm.
Potassium Bromide	20 Gm.
Distilled Water	1000 C.c.

In this immerse the negative till bleached, wash well, and immerse till blackened, in the following:—

Silver Nitrate	20 Gm.
Distilled Water	500 C.c.

Dissolve and add slowly, shaking after each addition till the white precipitate first formed is nearly dissolved, but not quite.

Potassium Cyanide	40 Gm.
Distilled Water	500 C.c.

Mercuric Sulphocyanide.

Mercuric Chloride	200 Gm.
Distilled Water (hot)	50 C.c.

and add

Ammonium Sulphocyanide (sat. sol.)

till the whole of the sublimate has dissolved. In this the negative is intensified, and it is preferable to rinse and treat with a developer.

Negative Varnish.

Orange Shellac	150 Gm.
Sandarac	150 Gm.
Canada Balsam	10 Gm.
Oil of Spike Lavender	60 C.c.
Methylated Alcohol	1000 C.c.

The negative must be warmed before and after the application of this.

Cold Varnishes.

These are the favourites of amateurs, as they can all be applied with a brush.

Best Japanners' Gold Size	100 C.c.
Benzole	200 C.c.

or

Pyroxylin	30 Gm.
Amyl Acetate	1000 C.c.

Matt Varnish.

Sandarac	60 Gm.
Dammar	60 Gm.
Ether	1000 C.c.
Benzole	350 C.c.

or,

Sandarac	100 Gm.
Ether	1000 C.c.
Toluol	350 C.c.

Platinum Toning Bath for P.O.P.

Potassium Chloroplatinite	6 Gm.
Phosphoric Acid (sp. gr. 1.120)	100 C.c.
Distilled Water to	1000 C.c.

To be diluted with 3 parts of water before use.

Concentrated Sulphocyanide Toning Bath

(Buhler's).

Chloride of gold	5 Gm.
Distilled water	280 C.c.

Heat to 50° C. and add

Strontium Chloride	50 Gm.
-------------------------------	--------

and heat to 98° C.

In another vessel heat to 98° C.

Potassium Sulphocyanide	15 Gm.
Distilled Water	250 C.c.

and add the gold solution to it gradually, stirring well between each addition; then filter, and wash the filter with 100 C.c. distilled water. The solution should be kept in the dark and diluted with 20 times its volume of water before use.

Combined Toning and Fixing Bath.

Hyposulphite of Soda	200 Gm.
Distilled Water	900 C.c.

Dissolve and add

Lead Nitrate	10 Gm.
Distilled Water	100 C.c.

Heat for ten minutes to boiling point, then allow to cool and filter and add

Chloride of Gold	0.5 Gm.
-----------------------------	---------

The prints must be well washed before immersion in this.

THE "HOLBORN GUINEA" 1900 HAND CAMERA

Takes 12 Quarter-Plates.

Two View-finders.

Rotating Stops.

Time and Inst. Shutter.

Automatic Indicator.

Improved Covering (superior to Leather).

21/-

The "VICTO" Camera Set

The "VICTO SET" comprises:

- "Victo" Camera with Wide-Angle Movement, &c. Double Dark Slide.
- Rapid Rectilinear Achromatic Lens with Iris Diaphragm.
- Thornton-Pickard Shutter. Three-fold Tripod Stand.

PRICES, with or without Turntable:

	1/2-plate	1/1-plate
Complete Set with Thornton-Pickard Snap-Shot Shutter	£3 10 0	£5 10 0
Ditto, with Thornton-Pickard Time and Inst Shutter	3 15 0	5 17 6
Extra Double Dark Slides	0 8 0	0 15 0
Camera and Double Dark Slide only	2 2 0	3 12 6

Complete Quarter-Plate Set, without Turntable, £3.

The "Victo" Camera is now also made in 10 X 8 and 12 X 10 sizes. Full particulars on application.

THE PHOTOGRAPHER'S PEERLESS NOTE BOOK

IS indispensable to Amateur Photographers. It provides space for the systematic record of upwards of 500 exposures, and contains tables whereby the correct exposure of all subjects under all conditions may be readily ascertained. Contains also, in an exceedingly concise form, Photographic Formulæ, Weights and Measures, &c., &c. It also includes a £500 Accident Insurance Policy. 1/- complete.

G. HOUGHTON & SON,

Wholesale & Export Photographic Dealers, 88 & 89, HIGH HOLBORN, LONDON, W.C.

SMALL CARRIAGE PAID PARCELS

To bona-fide DEALERS only.

CADETT PLATES AND PAPERS

Together to amount of £1 net parcels, or £1 net parcels of our "Lightning," "Spectrum," or "Lantern" Brands (28 lbs.)

TO MOST TOWNS IN THE UNITED KINGDOM.

We will also send carriage paid £2 to £3 net value of the Cheaper Price Negative Brands.

TERMS:—Cash with order less 2½ per cent. discount, or Monthly Ledger A/c's opened on receipt of usual References. Our Counting House discounts remain as before, the TRADE DISCOUNT being 20 per cent. on all Plates and 25 per cent. on Papers. Cases are charged for half-price. No Booking Fees.

Write for full particulars of all our Specialities.

Advertising matter, Price Lists, Booklets, Pamphlets, Show Cards, &c., post free on application.

Cadett & Neall, Ltd., Ashtead, Surrey

The new plate for amateurs, "The ROYAL," special boxing and packing, also Bromide Paper (Platinum-Black) now ready.

THE PROGRESS OF PHOTOGRAPHY.

Although photography as a science and an art is of necessity of somewhat slow progression, the story of its developments during the twelve months of any recent year would require a goodly-sized volume. When it comes to the enumeration of the various inventions and improvements made in apparatus and materials to enable the photographer to perform his work or to make his path easier, the list for a year, with even the shortest explanatory notes, would require a bulky folio. It is evident, therefore, that in the space at present at our disposal we can but barely touch the fringe of the subject. We have endeavoured, however, within the compass of a brief review, to mention as many as possible of the articles that have been brought to our notice recently.

MODERN LENSES.

In lenses there have been recently no epoch-marking developments. The advantages of lenses free from astigmatism are becoming more fully recognised, and of these there is already ample choice. The quick acting varieties are beginning to supersede portrait lenses in well-appointed studios, the increased flatness of field, and, owing to the better corrections, the apparently greater depth of focus, allowing larger apertures to be used. Messrs. Ross and Co., of 111, New Bond Street, W., have produced a new series of "universal" lenses working at $F/5.6$ of foci varying from 5 in. to 24 in., which give uniformly sharp definitions at a medium angle, and which are anastigmatic. The circle of illumination includes an angle of over 70° , so that by stopping down they become available for most classes of work, in addition to portraiture.

Ross and Co. have also introduced a new series of symmetrical anastigmats as an improvement upon their well-known series of rapid symmetricals. Like the latter, the full working aperture is $F/8$, but the flatness of field and freedom from astigmatism of the new lenses render them far superior for general outdoor work or for copying. With reasonably small stops they cover a wide angle of view and make admirable lenses for architecture, etc.

Messrs. Dallmeyer, Limited, of 25, Newman Street, W., have now completed their Series III. stigmatic lenses. These may be compared to Rapid Rectilinear as regards the class of work for which they are suitable, and are produced at approximately the same prices. The increased flatness of field and freedom from astigmatism will, however, give them a decided advantage over the best lenses of the Rapid Rectilinear type. The "Cooke" lens (Taylor, Taylor, and Hobson, Leicester) has in Series II. been adapted for ordinary work in the studio. The full aperture of the lenses of the new series is $F/4.5$, and they are able to combine the advantages of the "anastigmat"—freedom from astigmatism at the full aperture and flatness of field—with that of allowing the photographer to introduce at will spherical aberration over the whole plate. The adjustment for the latter is made by unscrewing the back lens. The lenses at present issued are 8 and 13 in. focus. The "Simon" anastigmatic lens is a new candidate for approval. The agent is T. T. Hora, 346, York Road, Wandsworth, W. The working aperture is $F/7.2$. The combinations are symmetrical. The angle included is 90° , and it is stated the lenses are made of Jena baryta glass. The specimens of work we have seen speak favourably for the lens. The Rathenower Optische Industrie, (agent, H. F. Purser, 33, Hatton Garden, E.C.) have brought out a series of "casket" lenses, the moderate price and satisfactory performance of which will make them useful to the amateur and professional alike. The No. 1 set consists of four lenses, giving fourteen combinations—five wide angle and five ordinary angle rectilinears, and four landscape lenses. The No. 2 set contains seven lenses, giving in all twenty-nine combinations, of focal lengths from 4 to 30 inches. The lenses are uncorrected, but the difficulties in focussing due to want of achromatism are overcome in a practical and ingenious manner by the use of correcting lenses. Three optically-worked colour screens for use with orthochromatic plates are included in each set.

NEWER DEVELOPING AGENTS.

Of the newer developing agents, ortol appears to have made the most rapid strides into popular favour, and many experienced photographers, whose attachment to pyro it seemed impossible to shake, have now abandoned their old love. The negatives obtained have very much the qualities of those developed with pyro, and while it is possible to obtain a warmish colour of deposit, there is little or no tendency to stain. The original cost of the developing solution is, of course, greater, but as the same solution can be used for

several plates in succession without any appreciable deterioration in the results, it is probably a cheaper developer in the long run. Adurol, a combination of hydroquinone and bromine in the case of Adurol-Schering, and we believe a combination of chlorine and hydroquinone in the case of Adurol-Hauff, has obtained some adherents. As a developer it is certainly an improvement on hydroquinone. It does not require caustic alkali, but with the carbonates it gives softer results and better graduation than hydroquinone. It is much more soluble. The mixed solution keeps almost indefinitely, and does not stain. Its developing action is quicker, and not so sensitive to changes of temperature, and it is not liable to act in the selective way that hydroquinone frequently does. These qualities should commend it in the place of hydroquinone to those who make a specialty of ready-mixed developers. Its sole disadvantage in this connection is its price. Kachin, which we understand to be pyrocatechin, prepared by a new and cheaper method, though, of course, a totally different substance, appears to have very similar good qualities. In our hands it has given negatives full of vigour, and, at the same time, delicate and full of detail in the shadows. It certainly keeps well; a solution in which several plates had been developed gave equally good results after keeping for about two months, though the time of development was longer. A peculiarity we noticed with kachin-developed negatives was that they appeared to lose less in the fixing than we usually find to be the case. This feature should make it valuable to the beginner. It is also claimed for this developer that, by the addition of a certain proportion of hypo, development and fixation can be conducted at the same time. Still more recently introduced developing agents are Diamidophenol, which, like amidol, does not require caustic alkali or alkaline carbonate to form a developer, but acts when dissolved in a solution of sodium sulphite; Diamidoresorcine, which has similar characteristics, and Hydramine, which appears to have remarkable properties. Its energy is such that only a minute quantity is required to make a concentrated developer, which will work until the liquid is entirely exhausted. The accelerator employed is caustic lithia, but only a very small quantity of this is required. How these new agents act when put to the test of everyday work we have not yet heard.

REDUCERS AND INTENSIFIERS.

The persulphate of ammonia reducer has received many testimonials of its value. The claim made for it of reducing the denser portion of the deposit in preference to the half tones has been sustained. Messrs. Lumiere have now introduced in cerium sulphate a reducer which acts in the opposite way. It attacks the lighter deposit first. In many cases this will make the reducer an extremely valuable one. Messrs. Lumiere have also produced a new intensifier. As packed for sale it consists of a pink powder, easily soluble in water, and is a mixture of mercuric iodide and anhydrous sodium sulphite. It is a one-solution intensifier, and its action is similar to that of the "Edwards" intensifier, which is a solution of mercuric iodide in hypo. The latter was extensively used in the early days of gelatin plates, but it was soon found that the results were not permanent. It is not claimed for the Lumiere intensifier that the results will be absolutely permanent, but it is claimed that they will be more permanent than with the other, and that by treating the plate after intensification with any ordinary developing solution, the degree of intensification will not be appreciably altered, and the result will be practically permanent. As a reliable intensifier, the action of which can be watched, is a very great desideratum now, we welcome this attempt to solve the difficulty. In our hands the intensifier has acted perfectly.

GELATIN PLATES AND FILMS.

The manufacture of gelatin plates has reached the point beyond which but little improvement is possible until a new line is struck. Nearly every photographer has his own fancy as to the best plate in the market, but, after all, the best plate is only a matter of fancy. Probably absolutely equal results could be obtained with every make of plate when used upon ordinary subjects, the skill of the photographer being equal in each case. The use of "colour-sensitive" plates is becoming more general, as the special precautions necessary in their employment are better understood. Some of the more advanced in scientific knowledge are using plates such as the Ilford Chromatic and those of a similar kind for their every-day work, a light filter being used when the circumstances of the case demand and admit of it. The special colour-sensitive plates of Lumiere and the Cadett Spectrum plate are finding numerous applications where the critical distinction of colour is imperative, and in this connection may be mentioned the method of producing photographs in natural colours of Sanger Shepherd. The lantern slides we have seen projected on the screen made by this method we can hardly

imagine it is possible to surpass. The Ives' "Kromskop," and its baby relation the "Kromaz," brought out by Watson and Sons, of 313, High Holborn, W.C., also are dependent upon the system of obtaining three identical negatives of a subject as regards point of view and scale, but individually representing a separate colour sensation. Colour-sensitive plates, of course, are necessary to make such a thing possible.

Many attempts have been made to supersede celluloid as a base for sensitive films. In the Secco film the sensitive gelatin emulsion is coated upon a prepared paper support, and after exposure the film is developed as a piece of bromide paper, which it closely resembles, might be. After development, fixing, and washing, another piece of prepared paper, which carries a strengthening film of insoluble gelatin, is squeezed on to the face of the negative, and the whole is allowed to dry. When dry the papers are stripped from the front and the back. A film of somewhat similar character is produced by Wellington and Ward, of Elstree. In this case the film, equally like bromide paper in appearance, is developed, fixed, washed, and dried. When dry the paper backing is stripped off. There is, therefore, one operation less. The Sandell Plates and Films Co., Limited, of Norwood Junction, S.E., have not employed any support in their new Cristoid film. It consists simply of two films of emulsion of differing sensitiveness. It might be described as the sensitive film stripped from a multiple coated plate, and all the virtues of the multiple coated plate are claimed for it, plus the advantage that it forms in itself, both a slow and a rapid film, according to the side which is presented to the rays of the lens in the camera.

PRINTS AND PLATES.

Developed prints are coming increasingly into use. Both amateurs and professionals are recognising the convenience of a system of making prints which is independent of daylight, especially such daylight as the clerk of the weather has treated us to during the past winter. Papers of a low degree of sensitiveness, of which "Velox" was perhaps the first to lead the way, which may be manipulated by ordinary artificial light without resorting to dark room illumination, have become very popular, and several of the photographic paper makers have taken up their manufacture, the Kodak Co., Marion and Co., and the Paget Co. among others. The last-named company

are showing that on their particular product, at least, the ordinary black tone is not the only tone to be obtained, but by variations of exposure and development the tint may be varied from black to sepia, warm brown, and even red. Messrs. Griffin and Sons have introduced a new grade of "Velox," which ought to prove very useful, as it will give soft and delicate prints from negatives possessing the most excessive contrasts, and which it would be impossible to print satisfactorily in P. O. P. or ordinary printing papers.

Plates for lantern slides and transparencies of low sensitiveness, to manipulate in ordinary artificial light, are also becoming well known in the market. Those of B. J. Edwards and Co., entitled the "Kristal," and the Paget Co.'s "Gravura," we have tried with satisfaction, but it should not be forgotten that Marion and Co. have had the same thing on sale for years. Many years ago the Britannia Works Co., of Ilford, brought out under the title of "Alpha" paper and lantern slide plates having the general characteristic of those we have been referring to. It is a curious thing about photography that what one generation of photographers sees no advantage in the next generation takes up with enthusiasm.

CAMERAS, SHUTTERS, ETC.

The camera and apparatus makers have not allowed things to rest. Though the use of the hand camera shows no waning, there is certainly a greater demand among amateurs for stand cameras. They are beginning to find out that for home work the hand camera is not the most convenient instrument, and besides, there is a natural desire to use larger plates than $\frac{1}{4}$ or 5×4 . Several firms are now turning out admirably designed and really well-finished cameras at prices which would have only purchased rubbish half a dozen years ago. A popular line is a set which includes half-plate camera, fitted with turntable, and having reversing and swing back, double baseboard extension and adjustment for the use of wide-angle lenses, a threefold tripod, rapid rectilinear lens with iris diaphragm, and roller blind instantaneous shutter. The whole including one double back, to sell at £3 10s. Camera sets such as that described are to be had from several houses. We have seen those of Perken, Son, and Co., of 99, Hatton Garden, W.C.; Evans, Son, and Co., of 56, Hanover Street, Liverpool; J. Woolley, Sons, and Co., Limited, of Victoria Bridge, Manchester; Barclay and Sons, of 95, Farringdon Street, E.C.; Jonathan Fallowfield, of Charing Cross Road, W.C.;

Taken by an Amateur with Vive No. 1 (actual size).

Home Office—Chicago.

New York.

Boston.

G. Houghton and Sons, of 89, High Holborn; and, although they may differ in details, we can safely say that in each case the set is uncommonly good value for the money, and that it would be an unusually keen critic of cabinet and brasswork who could reasonably find fault.

The roller blind form of instantaneous shutter seems to be almost exclusively bought now when a shutter is required which can be easily attached to, and removed from, the lens. The Thornton-Pickard Co. have made several improvements in the details of their shutters, and have introduced a novel feature in a "time-exposure" valve, which is fitted to the ball of the pneumatic release. The arrangement, which is very simple, permits the photographer to give exposures of longer duration than the slowest marked on the "instantaneous" index, including the larger fractions of one second and up to three seconds. Wallis Bros., of Wellington Street, Kettering, have a new series of shutters, made on the roller blind principle, adapted for various requirements. Their "compound" shutter is adjustable for time or any exposure up to $1/300$ of a second. The feature of the Foreground shutter is that it gives more exposure to the foreground than to the sky, and any variety is especially designed for economising space, so that it is adaptable to the narrow limits of a hand camera. The 'Fairfield' shutter of T. T. Hora, of 346, York Road, Wandsworth, S.W., is an excellent one, and it is also made in stereoscopic form, to fit either before or behind the lenses.

There are at least two good forms of camera stand which, while retaining the rigidity of the studio stand, are reasonable portable. The "Massey" field and studio stand of Marion and Co., and the "Alfred Ellis" stand, of Watson and Sons, though differing in design and construction, have many features in common that render them extremely useful for indoor work away from home. Those who have experienced the many disadvantages attached to the use of an ordinary tripod stand under such circumstances will appreciate either of these stands.

HAND CAMERAS.

In hand cameras new patterns and improvements upon old ones succeed one another in a bewildering procession, and one can hardly imagine a single feature that it is possible to embody in a hand camera which is not provided in one or other of the instruments now upon the market. But while the specialist is catered for the desires of those with more modest requirements and shallower pocket have not been neglected. There are very many cameras now in the market at prices within the reach of most, which are really serviceable instruments. Of the more expensive instruments designed for special as well as for general work we may mention those of J. H. Dallmeyer, Limited, which are made with sufficient extension of body to enable the single component of a stigmatic or Satz lens to be used, and this without any apparent sacrifice of lightness or portability. The well-known cameras of Newman and Guardia, of 90 and 92, Shaftesbury Avenue, are maintaining their reputation, and improvements in details are continually being added. The 'Tella,' that marvel of mechanical ingenuity, manufactured by the Tella Camera Co., of 110, Shaftesbury Avenue, has been found still capable of improvement, and is now made smaller and more compact without sacrificing its reliability—a new size to take 5×4 films has been issued. R. and J. Beck, Limited, of 98, Cornhill, E.C., have kept their series of Frena cameras well up to date. Two useful accessories have been introduced by them. The Frena pneumatic flap shutter, which has been made to fit on to the front of the camera, so as not to interfere with the magnifiers. It consists of a simple flap shutter of the usual kind, but opened and closed by pressure and release of pressure on a ball connected by an india-rubber tube to the mechanism of the shutter. The new pneumatic release can be attached and detached with ease to the release of any of the Frena cameras, it overcomes the risk of shaking the camera in the act of setting off the shutter, and enables exposures to be made even in the most inconvenient positions without such risk. The Gambier Bolton Camera, of Watson and Sons, was constructed in the first place for animal photography, but it has features which will commend it to many for work of other kinds. Its characteristic is that the plate is always ready for exposure. By a mirror arrangement the image of full size is projected on to the finder situated at the top of the camera so that the focus may be adjusted until the moment of exposure. A simple movement dislodges the mirror from the axis of the lens, releases the shutter, and the exposure is made. The Kodak Co. have not been idle. Improved patterns have from time to time been brought out, and in most cases arrangements have been made that those who prefer plates to films can use them. A popular series of hand cameras

is that sold under the title of the 'Victoria' cameras by J. Woolley, Sons, and Co., of Manchester. The No. 1 will do all that most people are likely to require from a hand camera. It has automatic changing arrangement for 12 plates or 24 films, and most of the adjustments that are found in cameras of far beyond its price, 35s. The No. 2, at 22s. 6d., is naturally not so complete, but it will do very good work, and has a good appearance. The 'Cyko' cameras of John J. Griffin and Sons are equally reliable and saleable articles. They are made for $2\frac{1}{2} \times 3\frac{1}{4}$, $3\frac{1}{4} \times 4\frac{1}{2}$, and 5×4 plates. The plate changing arrangement is automatic, the adjustments and accessories are all that are needful for good work, and the prices compare favourably with any in the market of a similar class. The prices range from 16s. to 45s., according to size and finish. A camera that will appeal to those who wish for one instrument to do the work of both a hand and stand camera is the 'Hanover,' of Evans, Sons, and Co., 56, Hanover Street, Liverpool. Though necessarily somewhat more complicated than the self-contained box forms of hand cameras, in actual practice it is simple enough, and there is nothing about its manipulation that should create any difficulty. The R.R. lens and roller blind shutter supplied with it are both good of their kind, and the price is quite a moderate one. The Optimus 'Ubique' camera appears in an improved form. It is now made to take a roll holder for flexible films if required, and can be fitted with an extending baseboard for the use of long focus lenses or for copying. This camera, like the last-mentioned, is equally available as a hand or stand camera, and with the extending base board is a serviceable instrument for every kind of work an amateur is called upon to do.

MISCELLANEOUS.

The prevalence of the practice of making small negatives and enlarging from them has stimulated ingenuity in the construction of apparatus for the purpose in the most simple manner. The 'Photographic Enlarger' of J. E. Lockyer, 87, Evelyn Street, Deptford, seems quite a *multum in parvo* as regards its capabilities. It will with equal facility make enlargements from small negatives, make lantern slides by reduction from large negatives, and can be used as a copying camera to make negatives either larger or smaller than the original print. With this apparatus the trouble and uncertainty of focussing is done away with in a very simple manner. The 'Optimus' enlarging lanterns have kept quite up to date, and are made of several patterns to suit various pockets and requirements. Ross and Co., Limited, have also a skilfully-designed series of lanterns, which can be adopted for any illuminant.

In connection with the enlarging or the optical lantern for projection a very practical form of acetylene generator is manufactured by the Abingdon Acetylene Illuminating Company, 97, Great Hampton Street, Birmingham; also an improved and very serviceable form of two-jet burner, which gives independent control of each burner, and has every adjustment for both lights and reflector. In the four-burner form each burner is controlled by a separate tap, and it is arranged that any one or more of the lights can be used and all manipulations can be made from the back of the lantern.

A very useful adjunct of the dark room is the 'Markus' bottle of F. H. Taylor and Co., 1, Errol Street, Whitecross Street, E.C. The feature is that the bottle has upon it a tablet of white enamel with a mat surface which can be written upon in pencil to form a very distinct and legible label. The writing is practically unattackable by any chemical, and when the bottle is required for another purpose the writing may be removed with a damp cloth. These bottles may be had of various capacities. The same firm have introduced a series of glass graduates, which are particularly suitable for use in the dark room; the scales, which on the usual measures are engraved, and not very easy to distinguish in a dim light, are in white enamel, and are thus easily seen, and the figures appear as transparent upon a white ground.

NOTES ON NOVELTIES.

BARCLAY'S HAND CAMERAS.

Barclay and Sons, Limited, 95, Farringdon Street, London, E.C.

The list of hand cameras in the market is great; Messrs. Barclay and Sons' catalogue alone contains illustrations of some twenty odd varieties. Their specialties include

a GUINEA HAND CAMERA ($8\frac{1}{2} \times 7 \times 4$ in.), which takes twelve $\frac{1}{4}$ -plates, has two brilliant viewfinders, and is fitted with a fixed-focus single lens, revolving diaphragms, time and instantaneous shutter, and is covered with morocco leather; a 45s. article—shown in the illustration—which is exceedingly good value; a FLAT-FILM HAND CAMERA at

52s. 6d., and a New 50s. HAND CAMERA. The latter is fitted with a rapid rectilinear lens, a rack focussing attachment, and a scale of distances. The shutter works at any speed from about $\frac{1}{150}$ th to half-a-second, or for time exposures. Bushes and a T screw for use with a stand are provided, and two brilliant viewfinders.

'HANOVER' QUARTER-PLATE HAND OR STAND CAMERA.

Evans, Sons, and Co., 56, Hanover Street, Liverpool.

This camera bears evidence of much care and attention to detail, hence for all-round work it is as perfect and up-to-date as possible. It is compact, has a mahogany body, covered with morocco leather, and is calculated to stand much harder wear than if made of stained soft wood. For snap-shot photography it has a useful focussing scale marked accurately for each lens supplied. The camera may also be fixed upon a tripod, and the picture composed

on the focussing screen, and for that object it is fitted with a rising front, having a clamp. Three double dark slides of the most reliable form for carrying plates are furnished with the camera; the lens is a best quality Iris rapid rectilinear, working at F/8; the shutter is of the behind lens roller-blind pattern with pneumatic and cord release, and a loose lens panel. Exposures may be made from $\frac{1}{15}$ th to $\frac{1}{10}$ th in. part of a second, or time exposures may be given. The two viewfinders are supplied with hoods to shade the sun's rays and to protect the camera from dust when closed. The price of the camera complete is £4 4s.

THE 'WIZARD' CAMERAS.

Seabrook Bros. and Co., 21, Edmund Place, Aldersgate Street, London, E.C.

The 'Wizard' cameras are made in forty-two styles, and are now being introduced into this country for the first time. The LONG FOCUS WIDE ANGLE

WIZARD (illustrated), is a remarkable line in cameras, complete, for either the amateur or the professional photographer. It combines all the latest movements and adjustments, is substantially built, but is very light and exquisitely finished. It can be used either as a hand camera, or for long focus and wide angle work. The LONG FOCUS CYCLE WIZARD, and CYCLE WIZARD C. are very complete compact forms of cameras, specially made

as light as possible for the use of cyclists and tourists. These cameras appear to have almost every improvement and detail that an amateur could wish for. A cheaper line of cameras is the CYCLE

A and B (illustrated). They are much like the Long Focus Cycle and Cycle C., with one or two of the more advanced improvements omitted; they are, however, exquisitely finished, and suitable for almost any ordinary work. Particulars as to price, etc., of these and other 'Wizard' cameras may be had of Messrs. Seabrook Bros. and Co.

NEW 'TABLOID' BRAND DEVELOPERS.

Burroughs Wellcome and Company, Snow Hill Buildings, London, E.C.

For the coming season Messrs. Burroughs Wellcome and Company have introduced three new developers in tabloid form—ortol, metol-quinol, and glycin. The multiplicity of reducing agents, and the tendency of many amateurs to transfer their allegiance from one to another, is probably no small trouble to the pharmacist with a photographic department. It would be profitless to attempt to stock solutions of reducer and accelerator to provide for every possible demand, and yet to be unable to supply may well create a prejudice. This difficulty is removed by 'Tabloid' Developers, which enable the pharmacist to stock at a small outlay, in a small space, and without risk, a complete range of reducing agents and accelerators to correspond. B., W. and Company's twelve-page booklet, entitled "Practical Points," is full of information concerning the newer photographic chemicals, and contains much which must interest every photographer. One point, typical of the practical nature of the pamphlet, is that under each developer a time for the first appearance of the image with correct exposure is given, and there is also an approximate estimate of the length of time required to complete development. This information will remove one of the chief difficulties experienced by amateurs in deciding how long to develop. The metol-quinol developer supplies a portable developer which is equally serviceable for developing the various 'gaslight' papers now so much in vogue, or for use with ordinary plates, films, bromide papers, or lantern slides. All that is necessary is to vary the quantity of water according to the directions given. It is essentially the developer for the tourist or for those whose limited dark-room accommodation makes the use of one developer for all purposes very desirable. The ortol developer will be appreciated by those who want a negative developer with the quality of pyro without its staining properties. For warm black tones in lantern slides it is as good as anything on the market. The glycin developer serves two distinct and valuable purposes. Using a small quantity of water, it forms a developer for producing negatives of pictures, photographic prints, or black and white drawings. By increasing the quantity of water a 'stand developer' is obtained which produces good negatives almost automatically from plates which have received greatly varying exposures.

VELOX

THE immense increase in sales is due to the perfection of coating, high quality of emulsion, and the permanency of the resulting prints. No other paper has produced such a complete revolution in printing methods. Of the seven grades made, special attention is drawn to

Carbon Velox—Having a delicate Matt Surface and suitable for thin Negatives.

Special Portrait Velox—Giving softness and atmospheric quality, for medium Negatives.

Double-Weight Velox—For Pocket-book prints and slip-in Albums. Requires no mounting.

THE 'HANOVER' OUTFIT.

Evans, Sons and Co., 56, Hanover Street, Liverpool.

For good value in high-class cameras the No. 2 'Hanover' Outfit can be strongly recommended. The camera is made of selected well-seasoned mahogany, highly finished in every detail, best lacquered brass-work, varnished maroon leather bellows, long extension, swing back, reversing back, swing front, sewn leather handle for carrying, plumb indicator, and automatic spring to hold dark slide in position. The camera front slides along brass runners, fixing at any part by a simple, effective arrangement of locking the front; the rising front is of unusual range, and has swing motion for high or low objects; the camera back may be moved close up to the front for wide angle lenses, working smoothly and fixing at any part along the base board. Three double light-tight dark slides are provided, and the shutters have automatic catches to prevent them from being opened accidentally. The lens is of the rapid rectilinear, iris diaphragm order working at $F/8$, covering well and giving excellent definition. The tripod is threefold, the top portion locking automatically, and it has sliding legs for the lower. The outfit complete, with stiff waterproof case, bound with leather, and having shoulder-strap and handle on top, is extremely light and portable. The thickness of the camera when closed is less than two inches, being that of the baseboard and focussing screen. The price for the half-plate outfit is £6 15s.; whole-plate, £9 10s.

COOKE LENSES WITH BAUSCH AND LOMB SHUTTERS.

Taylor, Taylor and Hobson, Stoughton Street Works, Leicester.

This combination of lens with iris diaphragm and shutter can be attached to most of the hand-cameras now upon the market, and is supplied at prices ranging—for Series III., $f/6.5$ —from £4 3s. to £8 11s., and—for Series V., $f/8$ —from £4 5s. to £10 5s., subject to a discount of five per cent. for cash with order. Standard flanges, where required for attaching to cameras, are supplied at 2s. each extra. If desired photographers' own Cooke lenses can be re-mounted in combination with this shutter, at 37s., 47s. 6d., and 60s. each, according to the size of the plate. The firm also undertake the re-fitting of cameras (other than Kodaks) with the above combinations of lens and shutter, and without extra charge unless some structural alteration of the camera is necessary. To facilitate very exact adjustment of Cooke lenses in hand-cameras, when desired, a gauge-bar of the exact length required between the sensitive film and the face of the lens flange is furnished, one shilling being charged for the gauge-bar and the instructions which accompany it. Special arrangements have also been made whereby Cooke lenses may be fitted to photographers' own Kodaks. In some cases the existing Kodak shutters are used; but in others, to utilise the full rapidity of the lens, it is necessary to replace the shutter by one of the Bausch and Lomb type.

GUINEA VIVES CAMERA.

Vive Camera Co., 18, Regent House, Regent Street, W.

The Guinea Vives camera is a distinct novelty in that it takes larger pictures than any other camera of the same class. It carries twenty-four glass plates, or seventy-two cut films, which can be carried and exposed without reloading. The Daylight-loading Tourist Vives are said to be the only daylight-loading camera made and sold for glass plates, cut films (heavy), or cartridge roll films.

LOCKYER'S ENLARGER.

J. E. Lockyer, 87, Evelyn Street, Deptford, S.E.

A simple, efficient enlarging apparatus that cannot go wrong is invaluable to both amateur and professional photographers; Lockyer's combined enlarging, reducing, and copying apparatus answers to that description. It is an improved form of the original "Automatic," and is a non-collapsible camera with a series of grooves on either side. The grooves are accurately cut to proper measurements and are numbered, so that when the board on which the lens is mounted and the dark slide are placed in their respective grooves, according to a key supplied with the apparatus, sharply

FIG. I.

defined enlargements or reductions to the desired size are obtainable at will, in a fraction of the time usually occupied by a focussing arrangement. Among the improvements introduced are an achromatic wide angle symmetrical lens, a rising and cross front, dark slide with rolling shutter, and a copying attachment. Fig. I. gives a view of the apparatus from the back, with lid raised and door at back open, through which image on screen can be seen if desired; Fig. II. shows the apparatus with copying attachment drawn out, and folding board (G) raised. The additional lens board

FIG. II.

for use when copying is shown at H. Mr. Lockyer claims that his enlarger will, without any focussing, make crisp enlargements, or enlarged negatives, from different sized negatives, to all standard sizes within the capacity of the apparatus; that it will make enlargements from any part of the negative when the whole is not required to be enlarged; that it will make brilliant lantern slides from different sized negatives; that it will do copying, and will enable anyone to dispense with using anything larger than a quarter-plate camera, thereby saving cost on the initial outlay and in subsequent working. The price of this combined apparatus was formerly ten guineas; it has now been reduced to £7 10s.

T. H. POWELL'S Compressed Developers and Toning Baths

(Dating from 1889),

Should be in every Dark Room, and are invaluable for Travellers, being Compact, Soluble and Reliable, and give the finest possible results.

May be obtained through all the usual houses.

'VICTORIA' PHOTO. OUTFITS.

J. Woolley, Sons, and Co., Limited, Victoria Bridge, Manchester.

Under the name of 'Victoria,' Messrs. Woolley and Sons supply a series of photographic outfits which, for excellency of finish, workmanship, and value, are hard to beat. The No. 1 'Victoria' quarter-plate outfit, price 21s., consists of camera having a mahogany body, single extension, with reversing and swing back; one double book-form dark slide; achromatic lens of superior quality, with revolving stops, or, if desired, an instantaneous

shutter; and a two-fold, well finished, and varnished tripod stand. The No. 1 half-plate outfit is sold at 30s. The No. 3a (quarter-plate) is a very compact, high-class camera of polished mahogany, with leather bellows, reversing and swing back, double extension, back slides to the front for wide-angle lenses, rising front, and handle for carrying. The half-plate and whole-plate outfits of this series are supplied with a turntable fitted in base-board, but it is not furnished with the quarter-plate outfit. It has, however, a

camera level, book-form dark slide of polished mahogany, with spring catches to the shutters; rapid rectilinear, double achromatic lens, with iris diaphragm; a roller-blind instantaneous shutter, fitted behind the lens, with loose lens panel, speed indicator, and pneumatic release. The stand is of the three-fold ash-rule jointed order, fitted to turntable in the base-board. The price for the complete quarter-plate outfit is £3, half-plate £3 10s., whole-plate £5 10s.

'OPTIMUS' UNIVERSAL PHOTO OUTFIT.

Perken, Son, and Co., Limited, 99, Hatton Garden, London, E.C.

The 'Optimus' Universal Photo Outfit (half-plate size, 6½ in. by 4¾ in., with French R.R. lens, Iris diaphragm, £3 10s.) includes superior well-seasoned mahogany camera with leather bellows, rising front, swing arrangement, square reversing frame, rack and

pinion focussing adjustment, double dark slide of book form, achromatic rapid rectilinear lens, fitted with Iris diaphragm, time and instantaneous roller blind shutter, and folding tripod stand. Extra double dark slides are supplied at 10s. each. This outfit is unequalled for quality and workmanship at the price.

SEABROOK BROS. & CO., 21, Edmund Place, LONDON, E.C.

CYKO CAMERAS.

John J. Griffin and Sons, Limited, 20-26,
Sardinia Street, London, W.C.

Cyko photography is said to mean easy photography; certainly Messrs. Griffin and Sons' "cyko" cameras are calculated to enable the youngest amateur in the art of picture-making, to make a perfect picture with the least manipulation. The cameras are light, neatly finished in black leather, and equipped with first-class lenses and shutters. They are simply constructed, there being no complicated movements to be mastered, every piece of mechanism being fixed in its exact position, requiring no adjustment. They are reliable in action, and there is no tendency for any part to break down; the shutter always does its work at the critical moment, and the plates fall in order with precision. The No. 2 Magazine Cyko ($3\frac{1}{4} \times 4\frac{1}{4}$) is constructed to hold twelve plates, thus

enabling the operator to make a series of pictures without opening the camera to change the plates. All that is necessary is to give the nickle ring at the side a full turn and the exposed plate drops, leaving another ready for exposure. The lens is of the universal focus, achromatic, combination meniscus pattern, and is remarkable for its depth and definition. The shutter is of simple construction always set, requiring but a touch to make an exposure, automatically resetting itself without further effort. When twelve exposures have been made, the camera is opened at the back, and the tray carrying the twelve plates withdrawn. The price of this exceedingly practical camera is 26s. No. 1 ($2\frac{1}{2}$ by $3\frac{1}{4}$) and No. 3 (4 by 5) of the same series are sold at 16s. and 35s. respectively.

The No. 4 Improved Magazine Cyko ($3\frac{1}{4}$ by $4\frac{1}{4}$) is perhaps the most complete and reliable magazine camera ever produced at the price (35s.) It possesses a number of new features, the first in importance being a detachable bulb release which is intended to prevent

possible jarring of the camera, so often the cause of failure, the shutter resetting automatically by merely pressing the bulb; there is also a finger release which may be used. An automatic register shows the number of exposed plates, while the plate-holders are made of aluminium. It also possesses a set of diaphragms permitting three different openings with a cut-off, which, when set, locks the shutter, and so prevents accidental exposures. An unloading attachment permits any or all of the exposed plates to be removed without disturbing or handling those remaining. The lenses are of the combination achromatic meniscus pattern, consisting of a positive crown glass lens, combined with a negative flint glass lens, corrected for actinic light. The No. 5, Improved Magazine Cyko ($4\frac{1}{4} \times 5$) is sold at 45s.

KROMAZ COLOUR PHOTOGRAPHY.

W. Watson and Sons, 313, High Holborn,
London, W.C.

This is a simplified process by means of which the amateur may obtain perfect colour effects, with reasonable care, at a moderate outlay. The apparatus necessary for this process is shown in the accompanying illustration, and consists of—A, frame containing the set of colour screens through which the exposures are made; B, the repeating holder (or multiple back) which fits into the camera and carries at the back the colour screens and dark slide when making exposures; C, the stereoscope in which pictures are viewed to obtain the colour effects. The process may be worked on either quarter-plate or half-plate cameras. In the smaller size, four exposures must be made; in the larger, only two exposures are

required. These are made either by a pair of lenses or with one lens used in conjunction with the Kromaz mirrors, by means of which two stereoscopic images are obtained. The plate on which the exposures are made being half-plate size, the expense of special dishes, printing frames, and other accessories is consequently avoided. The system is based upon the well-known theory that all colours in nature are equivalent to mixtures of the three primary colours, red, blue-violet, and green, and by the use of the Kromaz apparatus, records of the exact quantity and distribution of each of these colours in any subject can be obtained. These records when combined and reproduced in the stereoscope form a faithful image in colour of the original. The prices at which the necessary apparatus for this process is supplied bring it within the reach of practically all photographers.

'CADETT' ROYAL DRY PLATE.

Cadett and Neall, Ashted, Surrey.

The Royal plate, recently introduced by Messrs. Cadett and Neall is likely to become very popular on account of the convenience of the packing, and the boxes marketed specially for amateurs, who, when on tour, under circumstances of difficulty in developing their plates soon after exposure, can repack them in the same way as sent out, film to film, using indiarubber bands to protect the films from damage, slips, accordingly, not being used.

THE 'MIDG' HAND CAMERAS.

W. Butcher and Son, Blackheath, London, S.E.

Among the new hand cameras introduced for the coming season the 'Midg' series—Nos. 0, 1, 2, 3, 4—placed on the market by this firm, at 21s., 42s., 50s., 63s., and 84s. respectively, should become popular. The No. 0 camera weighs 2½ lbs., and measures

$8\frac{1}{2} \times 7 \times 4\frac{1}{4}$. It takes twelve $\frac{1}{4}$ -plates in sheaths; is fitted with a large diameter single achromatic view lens of good quality; time and instantaneous shutter, with speed adjustments; horizontal and vertical brilliant view finders. It is worked on the improved infallible changing system, has a recorder for the number of plates exposed. Screws and bushes are supplied with the camera for fixing to tripod.—The No. 2 'Midg' is marvellous value for money. It measures $9\frac{1}{4} \times 7\frac{1}{4} \times 4\frac{1}{4}$, and weighs 3½ lbs. The camera

carries twelve $\frac{1}{4}$ -plates in sheaths, and is fitted with rectilinear lens, with two adjustable diaphragms, focussing by sunk milled heads for all objects within eight feet. The time and instantaneous shutter has adjustable speeds from about one second to 1-90; it is set by turning a milled head, and released by a simple push. The plates are changed by a lever movement, an indicator showing the number of plates exposed. It has two brilliant finders; bushes for fixing to tripod, both horizontal and vertical way.—The novelty about the No. 4 'Midg' is that one movement only is required to expose the plate, change it, and set the next. This is done by pressing the lever shown in the illustration on the right-hand side of the camera. Like the others of the series, it is covered in handsome grained morocco, and takes twelve $\frac{1}{4}$ -plates in sheaths; it is, however, both larger and heavier, measuring $9\frac{1}{2} \times 7\frac{3}{4} \times 4\frac{3}{4}$, and weighing 4 lbs. It has a double achromatic rapid rectilinear lens, iris diaphragm, and focussing jacket to eight feet; two improved brilliant finders, placing the view correct way; and time and instantaneous shutter with adjustable speeds. In other respects it is somewhat similar to the rest of the series, having an indicator and bushes for fixing to tripod. Stiff waterproof cases, either tan or mail cloth, with shoulder strap, are supplied at an extra cost of 5s. 6d. and 7s. 6d. respectively.

and takes twelve $\frac{1}{4}$ -plates in sheaths; it is, however, both larger and heavier, measuring $9\frac{1}{2} \times 7\frac{3}{4} \times 4\frac{3}{4}$, and weighing 4 lbs. Stiff waterproof cases, either tan or mail cloth, with shoulder strap, are supplied at an extra cost of 5s. 6d. and 7s. 6d. respectively.

THE 'CADETT' ORTHOCHROMATIC LIGHT FILTERS AND P.O.P. PAPERS.

Cadett and Neall, Ashtead, Surrey.

Under the names 'Absolutus' and 'Gilvus,' this firm are issuing two kinds of orthochromatic light filters for use with the 'Cadett' lightning spectrum plates. The 'Absolutus' light filters render all colour luminosities correctly, with a small margin of error. Each filter is carefully tested with the latest form of Captain Abney's colour sensitometer. The best and most easily arranged position for the filter is immediately behind the lens in the camera, care being taken to exclude all reflected light between the filter and the lens; the filter can, however, be placed in any suitable position. When using the 'Absolutus' filter, exposures are increased twenty times under glass or in well-lighted studios, and about forty times out of doors. The 'Gilvus' filters render the violet, blue, and green luminosities correctly, leaving the red luminosities uncorrected. It is a compromise for use where rapid exposures are necessary, and it gives great improvement in landscape and portrait work. The exposure is only increased from four to six times. These filters are of no use for any other orthochromatic plate than the lightning spectrum plates, with which, however, they turn out most excellent work. The 'Cadett' P.O.P. of new tints is now on the market, and has, like the spectrum plates, been practically, by recent improvements, perfected. The bromide paper is certainly one of the best on the market.

ROCKFORD 'TORNADO' MAGAZINE PLATE CAMERA.

W. Watson and Sons, 313, High Holborn, W.C.

The Rockford 'Tornado' Magazine Plate Camera is a new hand camera (prico, 35s.) which Messrs. Watson and Sons have just put on the market. As the name implies, it is of American origin, and is the latest and one of the best cameras of its type. It is of quarter-plate size, carrying twelve plates, or films, the changing of which is done by a novel and ingenious method, which at the same

time records the number of the exposure. The camera is fitted with a shutter available for either time or instantaneous exposures, and the lens is fitted in sliding tube with adjustment for varying distances.

SPECIAL DARK ROOM FOR DEMONSTRATIONS.

'VICTORIA' HAND CAMERAS.

James Woolley, Sons, and Co., Ltd., Victoria Bridge, Manchester.

For hand or stand exposures at long or short range, groups, portraits, interiors, buildings, etc., the 'Victoria' hand cameras are as good as can be produced at the price. The No. 0 (quarter-plate) camera, sold at 22s. 6d., is made of the best materials

throughout, and carries twelve plates, or twenty-four films. The arrangement for changing the plates being of the simplest and most perfect character. It has an accurate indicator, and is fitted with an achromatic meniscus lens, four varied diaphragms, time and instantaneous shutter, and two excellent view finders. The shutter has varying speeds. The No. 1 'Victoria' hand camera (35s.) is of an im-

proved pattern with focussing arrangement, which, however, is not shown in the illustration. It is covered with the best morocco leather, with good leather handle, has a capacity for twelve plates or films in sheaths, and has a very ingenious automatic changing arrangement by a lever movement, which also registers the exposures. It is specially adapted for instantaneous work and groups, being fitted with a superior achromatic lens with iris diaphragm, time and instantaneous shutter, having a speed regulator, and two brilliant view finders. As

each individual camera is subjected to a minute examination before being sent out, purchasers of 'Victoria' cameras may rely on getting a satisfactory instrument.

VELOX; ACID-HYPO CARTRIDGES, AND MOUNTS FOR VELOX.

Messrs. J. J. Griffin and Sons, Ltd., 20-26, Sardinia Street, London, W.C.

It is not generally known that two grades of Velox are made, each having three surfaces—matt, glossy, and rough. The two grades are put on the market in order to meet the requirements of amateurs who wish to print from negatives of varying densities. Ordinary Velox will give black prints from very thin negatives, whereas special Velox will give soft delicate results from negatives so hard that it would be impossible to print from them satisfactorily on ordinary P.O.P. or bromide paper. The special papers furthermore are about three times as rapid as the ordinary, and in manipulation more latitude is allowed to the operator in dodging or modifying solutions. With most of the Velox class the addition of bromide potassium though brightening the result tends to give greenish blacks. This is also the case with ordinary Velox, but with the special paper the restrainer may be added to a very large extent without affecting the beautiful rich

black of the print. Probably very few amateurs are aware that these two entirely different papers are made, hence it may be worth while for dealers in photographic goods to direct their attention to the fact.—*Acid-Hypo*: Messrs. Griffin and Sons now sell their well-known Acid-Hypo Fixing Cartridges in tins, and the quantity of the powder has been increased from 2 to 3 ounces, without any addition to the price. The fixing mixture, it is claimed, will keep in the tins without caking or liquefying for a very long time. The Acid-Hypo, it may be mentioned, is suitable for both plates and films, and has a hardening as well as a clearing action.—*Mounts for Velox*: The firm have a speciality in mounts manufactured to suit the tint of Velox and similar prints.

ROSS' NEW RAPID SERIES OF SYMMETRIC ANASTIGMATS.

Ross, Ltd., 111, New Bond Street, London, W.

Messrs. Ross, Ltd., have recently introduced a new series of symmetric anastigmats, as an improvement upon the 'Rapid Symmetrical' Series. Like the latter series of lenses, the symmetric anastigmats are corrected for the popular aperture F/8, and in

consequence of their extremely sharp definition and freedom from astigmatism extending equally over the whole surface covered, from margin to centre, they are eminently suitable for outdoor groups, and for the numerous requirements of the landscape photographer. With smaller stops they are excellent as wide-angle lenses for views, architecture, interiors, and copying. The shorter foci are specially adapted for hand cameras, the compact and convenient new form of setting with iris diaphragm being particularly suit-

able for that purpose. They are also very suitable for adaptation to between-lens shutters. The 'Universal' series of symmetric anastigmats, however, are the most generally useful lens for the professional or amateur photographer. They are aplanatic, working with the standard aperture F/5.6, superseding the formerly popular 'Universal Symmetricals' in consequence of their freedom from distortion and better covering properties. These lenses are suitable for all kinds of photography, and when adapted to cameras provided with focal plane or other quick shutters, are invaluable for animal studies, racing pictures, street scenes, and other work requiring very rapid exposures.

THE 'HOLBORN' DISH COVER.

George Houghton and Son, 88 and 89, High Holborn, London, W.C.

The 'Holborn' Dish Cover is very useful for protecting plates from the light during the process of development, fixing, etc. It is

made of xylonite, fits any dish of the same material, and can be slid on or off with the greatest ease. It is always advisable to keep a plate protected during development, even from the ordinary non-actinic light of a dark room. When the plate is under-exposed and requires prolonged development, this is especially the case, and the cover will make a dish sufficiently light-tight to allow even of actinic light being used in the dark-room if necessary. The cost of the dish covers is 5d., 6d., and 9d. each, according to size; complete with xylonite dish, 10d., 1s. 2d., and 1s. 8d. each.

DEALERS' PHOTOGRAPHIC CATALOGUE.

W. Butcher and Son, Blackheath, London, S.E.

Those dealers in photographic goods who desire to issue an illustrated catalogue of photographic materials, cameras, lenses, tripods, chemicals, etc., bearing their own names and addresses, and without indicating the maker of the goods, can have their wants met by Messrs. Butcher and Son, who have just published a new edition of such a catalogue, which they are prepared to supply to chemists at a cost of 25s. for two hundred and fifty copies.

DISCOUNTS TO THE TRADE AND PROFESSION ON APPLICATION.

'OPTIMUS' RAPID EURYSCOPE.

The Aperture is F/6. The Lenses are of Special Optical Glass, constructed with the nicest precision of curvatures, so maintaining good marginal definition, coupled with the most extreme rapidity.

5×4	7×5	8×5	9×7	10×8	12×10
63/-	94/6	110/-	126/-	190/-	290/-

'OPTIMUS' WIDE-ANGLE EURYSCOPE.

F/9.50. This Aperture is exceedingly open for wide angle work. The definition, however, is in no way sacrificed, as the curvatures are most perfectly accurate, and the most minute detail in architectural and interior subjects is rendered with the minimum of crispness, and a total absence of distortion.

To cover	5×4	7×5	9×7	10×8	12×10
Price ..	63/-	94/6	126/-	190/-	290/-

'OPTIMUS' RAPID RECTILINEAR.

Aperture F/8. Second only to the above for rapidity, therefore well suited for instantaneous effects, outdoor groups and views, as well as interiors; copying and enlarging are also within the capabilities of this lens—in fact, its work may be styled UNIVERSAL.

5×4	6×5	7×5	8×5	9×7	10×8	12×10	15×12	18×16
36/-	50/-	56/-	70/-	80/-	105/-	120/-	145/-	185/-

'OPTIMUS' WIDE-ANGLE. SYMMETRICAL.

Aperture F/16. Specially adapted for Architecture. Can be used to advantage when very close to the subject.

5×4	7×5	9×7	10×8	12×10	15×12	18×16
42/-	53/-	80/-	105/-	120/-	145/-	185/-

'OPTIMUS' QUICK-ACTING PORTRAIT.

Aperture F/4. Specially constructed for short exposures in Portraiture. They are second to none, definition being maintained by their perfect optical qualities.

'OPTIMUS' IMPROVED PATENT WIDE ANGLE CAMERA.

EXTRA LONG FOCUS.

British Journal of Photography says:—

"The present Model Camera is among the VERY LIGHTEST of actually RIGID Cameras offered to the public. . . ."

"The RAPIDITY of OPENING and CLOSING is greatly facilitated by the additional arrangement for throwing the pinion out of gear from the rack.

"There is NO CURTAILMENT OF VIEW when lenses of short focus and wide angular aperture are in use.

"ALL MOVEMENTS NECESSARY to the modern scientific photographer are included in this COMPACT instrument."

Price includes Three Double Dark Slides—

4 1/4 × 3 1/4	5 × 4	6 1/2 × 4 3/4	8 1/2 × 6 1/2	10 × 8	12 × 10	15 × 12

'OPTIMUS' IMPROVED UBIQUE CAMERA.

ROLLER
BLIND
SHUTTER.

EXTRACT FROM *The British Journal Photographic Almanack*:—

"Since our last reference to this little instrument, two important improvements have been added to it, viz., an arrangement for swinging the back, in either the horizontal or the vertical positions, and a rising and falling front. This hand camera includes rack and pinion focussing adjustment (actuated from outside) and a ground glass screen, an 'Optimus' rapid lens, roller blind shutter, and three double dark slides. As all are enclosed within the camera, it is self-contained. Two threaded nuts are fitted, which receive screws for attachment to a tripod, allowing either the vertical or horizontal positions. The camera being so small—it may be conveniently held in the hand."

The external dimensions are 4 3/8 × 5 3/8 × 3 3/8 inches, and the black outside leather with which it is covered is really of good quality.

With "OPTIMUS" Rapid View LENS	55/-

'OPTIMUS' UBIQUE CAMERA.

Perken, Son, and Co., Limited, 99, Hatton Garden,
London, E.C.

The 'Optimus' Ubiique Camera, which has been on the market now for some years, and year by year has been improved, has now been arranged so that the Kodak cartridge roll-holder can be fitted if desired, and a model is made with an extension arrangement, so that copying can be done or long focus lenses used for distant views. The object of the makers of this camera has been to place on the

market a hand camera fitted with ordinary dark slides for dry plates, and to arrange an instrument that, while essentially a hand camera, and capable of taking snap-shots at a moment's notice, yet is fitted with all the movements of an ordinary stand camera, and so permitting every kind of photographic work to be done. The prices are low, and the discount a good one.

'PRIMUS' PICTORIAL OUTFIT.

W. Butcher and Son, Blackheath, London, S.E.

A very useful outfit is the No. 6 stereoscopic $\frac{1}{2}$ -plate Pictorial Outfit, supplied by this firm at £6 10s. It consists of a mahogany polished camera, having a reversing and swing back, which moves swing and rising front forward, for use with wide angle lenses, turntable in base, and an extra front and stereoscopic division which is removable; mahogany polished book-form dark slide of best quality; a pair of stereoscopic, double achromatic, rapid

rectilinear lenses, with iris diaphragms or a $\frac{1}{2}$ -plate achromatic casket set for pictorial effects, complete in case, giving fourteen different combinations, including ordinary rectilinear mid-angle and wide-angle, also the single combinations; 'Swift' stereoscopic time and instantaneous roller-blind shutter, with speed indicator—can be used also for single lenses—and loose lens panel; rule joint three-fold ash stand, with bottom leg sliding and fitted to turntable. If both stereoscopic and casket set of lenses are required the price of the complete outfit is eight guineas.

GLASS MEASURES AND BOTTLES FOR PHOTOGRAPHIC CHEMICALS.

F. H. Taylor and Co., 1, Errol Street,
Whitcross Street, London, E.C.

Accuracy and legibility of the scale markings on glass graduates are essential to photographers, hence the "Clear Letter" measures manufactured by Messrs. Taylor and Co. will doubtless be highly

appreciated by both amateurs and professionals. The measures are neat and accurate, and are supplied either stamped or unstamped. They show clear transparent letters and figures on a white ground-work, and are specially adapted for the photographic dark room. "Clear Letter" measures are manufactured in two shapes, conical and cylindrical, covering all sizes from 1 drm. to 40 ozs. The

"Nestus" photo measure supplied by this firm is very easy to clean, has a good sound base, and is the cheapest crystal measure manufactured for photography. The chief feature of the "Markus" bottles is that they have a plain white badge upon which may be written

any label that is required. It can be cleaned with a damp sponge and relabelled when the bottle is used for other chemicals. The white badge is permanent and can be changed as often as desired. We also illustrate engraved measures of which the firm keep a very large stock, in all sizes.

SALMON'S VIGNETTER.

Salmon and Son, 169, Hampstead Road,
London, N.W.

Salmon's Vignetter is a perfect device for all contact printing, the operator being able to place the vignetting cards, by means of metal grooves, at various distances from the negative, and at an angle. Twelve vignetting cards are supplied with the vignetter, the price for the $\frac{1}{4}$ -plate size being 2s.

LOCKET EXPOSURE METER.

The "Infallible" Exposure Meter Company,
Wrexham.

Wynne's "Infallible" photographic exposure meter is well known as "an unerring guide to the correct exposure required for every speed of plate on every kind of subject, and under every condition of light." A modified form of that useful apparatus is now made in the shape of a dainty circular locket, 25 Mm. in diameter, and 8 Mm. thick, which is made in sterling silver, and is exceedingly ornamental. The actinometer time is determined by turning the glass face of the locket, and two scales engraved around the periphery are adjusted in a similar manner to those in the ordinary meter made by the same firm.

W. BUTCHER & SON, BLACKHEATH,
LONDON, S.E.

'ROSS' PRISMATIC BINOCULAR GLASSES.

Ross, Limited, 111, New Bond Street, London, W.

Ross' (Patent) Prismatic Binocular Glasses during the past few months have played no small part in the affairs of the British nation in South Africa, they having been supplied to and used by General Sir Redvers Buller and hundreds of officers of the South African Field Force. Combining extreme portability with high power, perfect mechanical construction and exquisite definition, they possess the power of a telescope in the compass of an opera glass. They are constructed in four sizes, with magnifying powers of 6, 8, 10, and 12 diameters, at prices ranging from £8 to £10, and are mounted in two ways for focussing. In the first way (see illustration) each eyepiece has a spiral motion, and may be focussed separately, so as to allow for differences in refraction of the eyes. Once carefully adjusted the operation need not be repeated, as the spiral-moving eyecups have engraved divisions to permit of registering the most advantageous position. In the

second way the focus is obtained by actuating a milled head, conveniently placed between the eyepieces, while one of the eyepieces has a spiral movement to compensate for any inequality of the eyes. Re-focussing is rarely needed, even when lengthened observations are being made, as, if the binocular is focussed on an object at a range of about 100 yards, more distant objects will be quite distinct; also those nearer, within a reasonable limit. Being of great strength and rigidity of construction the Ross prismatic binoculars will remain in perfect alignment and working order unless submitted to rough or undue usage, the prisms and lenses not requiring to be interfered with. Each binocular is supplied with a best quality leather sling case, which is claimed to be smaller and neater in appearance than those supplied with any other prismatic binoculars of equal power.

THE 'REGNA' HAND CAMERA,

George Houghton and Son, 88 and 89, High Holborn, London, W.C.

The 'Regna' Hand Camera is a useful little instrument and, despite its lowness in price (12s. 6d.), is capable of producing first-rate work. It carries six plates ($4\frac{1}{2} \times 3\frac{1}{2}$) in metal sheaths of special design, which are changed automatically by drawing out the small knob in the top of the camera front, and pressing it home again. Exposed plates can be removed through the back of the camera without interfering with the unexposed ones. It is fitted with a chromatic view lens, time and instantaneous shutter, two view finders, and a reliable changing movement

already referred to. The camera is well finished throughout, covered in waterproof material, and fitted with leather handle for carrying.

PHOTOGRAPHERS' PEERLESS NOTE BOOK.

George Houghton and Son, 88 and 89, High Holborn, London, W.C.

This note book, edited by Mr. Walter D. Welford, and published conjointly by Messrs. Charles Letts and Co. and Messrs. George Houghton and Son, is almost indispensable to amateur photographers. It provides space for the systematic record of upwards of five hundred exposures, and contains tables whereby the correct exposure of all subjects under all con-

ditions may be readily ascertained. Photographic formulæ, weights and measures, etc., are also given in concise form, together with a tourists' directory of photographic dark rooms, dealers, etc.; there is also a self-opening memo. tablet and an insurance ticket for £500. The utmost thought appears to have been given to every detail of its production, and the result is a very thin, compact, thoroughly complete and practical note book, which may be had at a cost of one shilling.

'PRIMUS' PHOTOGRAPHIC' OUTFITS.

W. Butcher and Son, Blackheath, London, S.E.

The 'Primus' outfits comprise camera, dark slide, lens, shutter, and stand; and range, from No. 1 to No. 11, at prices from 15s. upwards. The No. 2 $\frac{1}{2}$ -plate outfit, at a guinea, is an extremely useful instrument for the young amateur. The camera is of polished

mahogany, having combed corner body, good cloth bellows, reversing and swing back. It is fitted with a polished mahogany double book form dark slide, having hinged shutters; good quality, single achromatic slide focussing lens, and three speed revolving spring, time or instantaneous shutter. The stand is of the two-fold pine order, with metal top and two straps. No. 3 is a special $\frac{1}{2}$ -plate outfit, sold at £3, and is very good value. It consists of a mahogany

polished camera, with Russian leather bellows, reversing and swing back, double extension, back slides for wide angle lenses, and rising front; turntable; mahogany polished dark slide of book form pattern, doubled hinged with spring catches; double achromatic rapid rectilinear lens, iris diaphragm; 'Swift' snap-shot roller blind shutter, with speed indicator, loose lens panel and pneumatic release; three-fold ash stand, with patent turn button and straps. For 70s. Messrs. Butcher supply a somewhat similar camera to the No. 3, but of an improved type, and is well worth the extra ten shillings.

VARIOUS PHOTOGRAPHIC NOVELTIES.

George Houghton and Son, 88 and 89, High Holborn, London, W.C.

Messrs. Houghton and Son have on view in their fine show-room in High Holborn many novelties in photographic goods, all of which are worthy of attention, but space will only permit of a few being briefly noticed here. The war is at present uppermost in the thoughts of most British people, hence the 'ROYALTY' SERIES OF WAR SLIDES (3s. 6d. each), the first list comprising some forty-four photographs taken since the outbreak of the war by staff officers and others at the front.—The 'WEISS' POCKET FLASHLIGHT APPARATUS (8s.) is constructed to contain every utensil necessary for flashlight photography, including the powder, in a nickel-plated case, similar in size and shape to that of an ordinary cigar case.—The 'PERSPECTOSCOPE' (6s. 6d.) is a simple apparatus for giving stereoscopic effect to single pictures. Scientifically speaking, it is a stereoscope, but it is constructed on quite a different principle, requiring but one picture, whereas the stereoscope requires two pictures.—A new cheap retouching desk, the slope of which can be easily varied, is the 'NO. 5' RETOUCHING DESK (3s. 6d.). It is of novel form, well made in varnished teak, the base and steel frame being detachable, and can be inserted the reverse way of the carriers, thus making the desk suitable for both upright and oblong negatives.—A handsome set of nickelled SCALES AND WEIGHTS, with ebonised base, weighing from ½ drachm up to 4 ounces, may be obtained for 6s. 6d.—To facilitate the work of cutting out perfectly circular photographs of any size, the 'BEAM' CIRCULAR TRIMMER (7s. 6d.) has been introduced, and appears to do its work simply and efficiently. The 'ARGUS' PRINT AND CARD TRIMMER is arranged with the cutting blades on the shear principle, giving clean, smooth edges to the print. Prices range from 6s. 6d. to 28s., according to the length and strength of the cutting blades.—For compactness, rigidity, and neatness the 'PORTABLE' TRIPOD STAND (6s. 6d.) will be hard to beat; while the 'FEATHERWEIGHT' (7s. 6d.), a very light and portable threefold tripod stand, made for use with hand cameras, weighing only 19 oz., and when folded measuring 19 × 1½ × 1½ inches, is a specially suitable stand for cyclists.—The 'HOLBORN' MOUNTANT (in white glass, nickel capped, 3 oz. and 8 oz. jars, at 6d. and 1s. each) has been specially prepared to meet the requirements of both amateur and professional photographers, and is equally serviceable for any purpose for which a mountant is required.—A SET OF THREE TANKS in box for "washing," "fixing," and "alum," respectively, is good value at 3s. 9d. The 'SIMPLEX' WASHING TROUGH, for nineteen ¼-plates and nine ½-plates, is a new, cheap form of trough, black japanned, with syphon and removable zinc back; price 1s. 3d. each. A superior article of an improved pattern in zinc is the 'A. 1' ZINC WASHING TROUGH (3s. 6d.), for fifteen ¼-plates and seven ½-plates.—The 'ANTI-SPLASH' (1s.) is a handy filter, easily fixed to any tap, which prevents splashing; also no solid particles can pass through.—Several improvements have been added to the 'HOLBORN' HAND CAMERAS for the 1900 season, making them as complete and perfect instruments as it is possible to obtain. The additions include, among others, a complete set of magnifiers for taking portraits or near objects at 3 ft., 5 ft., and 9 ft.; bushes and tripod screw for using the camera both upright and

oblong way. The principal improvements in the 1900 'HOLBORN 21s.' HAND CAMERA are new waterproof covering material, equal in appearance to the finest leather, but superior in wear; automatic recorder; new diaphragm plate, and cover of registered design.—In stand cameras the 'EMPRESS' CAMERA SET (¼-plate, 21s.; ½-plate, 32s. 6d.) is a perfect marvel of value. The 'VICTO' complete ½-plate set, with Thornton-Pickard snap-shot shutter, is also good value at £3 10s. A similar set, but of superior finish, is that known as the 'BRASS BOUND VICTO,' specially suitable for export trade and for use in hot climates. This is made in various sizes, at prices ranging from £4 to £14 5s.—The 'SANDERSON' HAND AND STAND CAMERAS are so well-known as to need no mention here, it being sufficient to say that they continue to deserve the high reputation they have already acquired.

POWELL'S COMPRESSED DEVELOPERS AND TONING BATHS.

T. H. Powell, 116, Denmark Hill, London, S.E.

These developers and toning baths are put up in the smallest compass compatible with practical utility. They give the finest possible results and are invaluable to travellers, whether by sea or land, and are equally useful in the dark room, superseding bulky solutions, and being in a dry condition they neither spoil nor decompose. The Pyro "Developoids" shown in the illustration are small, compressed tablets, of such strength that one dissolved in 1½ ozs. of water will develop a quarter-plate. "Developoids" of Hydrokinone, and also for both restraining and accelerating, are supplied by Mr. Powell, who, it may be mentioned, claims to have been the first to introduce compressed developers into Eng-

land (in 1889).

THE 'FARRINGDON' RAPID RECTILINEAR.

Barclay and Sons, Limited, 95, Farringdon Street, London, E.C.

Messrs. Barclay and Sons, Limited, have a large assortment of lenses for all classes of work, a specialty being the 'Farringdon' Rapid Rectilinear—illustrated herewith—working at F/8; with index or ring iris diaphragm. It may be had to cover ¼, ½ or whole-plate, the focal length being 5½, 9, and 11 inches respectively, and the prices 13s. 6d., 15s. and 22s.

The Practical Photographer.

'TABLOID' Brand Chemicals offer many advantages both to experts and beginners. They are made from chemicals of the finest quality, divided, ready for immediate use, into accurate and convenient quantities. They keep perfectly and are always reliable. Dissolved in water they at once produce fresh, active solutions. Their use entirely does away with complicated formulae, weights and scales.

THEY ENABLE THE PHARMACIST to stock a complete equipment of photographic chemicals for all ordinary purposes in a small space and at a small cost. There is no fear of loss owing to deterioration, as with many ordinary photographic chemicals and solutions.

PHOTOGRAPHIC PAMPHLETS GRATIS. — A new and enlarged edition of "Practical Points" is now ready, and supplies will be sent to chemists free on request.

Burroughs Wellcome and Co.

LONDON and SYDNEY.

NEWS IN BRIEF.

MR. W. ELBORNE, of Peterborough, has been appointed Public Analyst for that city.

MR. CHARLES WASS, M.P.S., has purchased the old-established business at Holbeach, carried on for the last twenty-two years by Mr. J. Best, who has retired.

MR. A. G. JEFFREY, of Londonderry, a Student-Associate of the Pharmaceutical Society of Great Britain, has joined the Imperial Yeomanry, and sailed for South Africa on Wednesday last.

THE EASTER VACATION.—The Pharmaceutical Society's premises in London and Edinburgh will be closed on April 13, 14, 15, and 16. Normal conditions will set in on Tuesday, 17th inst., at 9 a.m.

THE MUNICIPAL ENCOURAGEMENT OF PHOTOGRAPHY is to be discussed by Mr. Thomas Bedding (editor of the *British Journal of Photography*) at a meeting of the Royal Photographic Society on Tuesday, April 10.

THE BRITISH PHARMACEUTICAL CONFERENCE, 1900, General Committee, will meet at 16, Bloomsbury Square, London, W.C., on Tuesday next, April 10, to receive the report of the Local Executive Committee, and to discuss future arrangements.

MR. ALFRED FENNINGS, Chemist and Druggist, of Cowes, Isle of Wight, who died on January 7, aged 84, left personal estate valued at £72,526, and bequeathed £1,000 to the Society for the Relief of Aged and Infirm Ministers, and £1,000 to the Society for the Relief of Necessitous widows of Protestant Dissenting Ministers.

MR. JAMES LLOYD (chemist and druggist, 123, Battersea Rise) and his family were very much startled on Tuesday, March 27, whilst having tea in the shop-parlour, by the entrance into the shop, through the closed glass door, of a horse between the shafts of a light cart, the whole door frame and fanlight being smashed up.

MR. HUGH KERR, M.P.S., Dalbeattie, is a volunteer in the Galloway Rifles, and the author of a new spirited patriotic song, "Our Watchword," which appears to have "caught on" locally, and has been favourably noticed by the Scottish press. Mr. Kerr, who is an excellent shot, has made arrangements for his business to be conducted by a qualified manager should he be called to the front.

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.—A meeting of this Association will be held on Wednesday, April 11, at 8.30 p.m., at the Hotel Metropole, Newcastle-on-Tyne. Mr. C. Ridley (President of the Association) will read a paper entitled "The Botany and Materia Medica of the Bible." This being the last meeting of the session, members are requested to make it convenient to be present, as various items of interest will be brought before the meeting.

THE CHEMISTS OF BIRKENHEAD AND DISTRICT, at a meeting held on Tuesday, April 2, decided to form a local association, and that the name should be "The Birkenhead and District Chemists' Association." Mr. Cragg James was elected president, Mr. Dutton vice-president, Mr. Breeze treasurer, and Mr. Hicken secretary. Meetings are to be held quarterly, or oftener when necessary, the object of the Association not being so much educational as for social and trade purposes.

NORTH LONDON CHEMISTS' MEETING.—A meeting of the chemists of Hampstead, St. Pancras, Islington, Hackney, and adjoining districts will be held at "The Old Cock Tavern," Highbury, on Wednesday afternoon next (April 11), at three o'clock. Entrance by saloon door, near Highbury Station doors. The meeting will be in easy, conversational style. Agenda: To discuss the subject of defence against vexatious prosecutions, insurance against risks in selling medicine, and (if time permit) any other business brought forward. The Chairman, Secretary, etc., of the Chemists' Defence Association are expected to be present. Note: Only registered chemists are invited.

TRADE NOTE.

"FORMIC-SULPHUGATORS" (Kingzett's Patent).—The "Sanitas" Company, Limited, Bethnal Green, London, E., has recently introduced some new patented disinfecting and fumigating appliances under the name of "Formic-Sulphugators." These new appliances are portable, safe, thoroughly reliable, and economical for use in the fumigation and disinfection of rooms, etc., and may also be employed for destroying insect pests and vermin. In use, they generate sulphurous acid gas in association with the vapours of formaldehyde or para-formaldehyde, thus affording the most reliable and up-to-date means for disinfecting after cases of infectious illness. There are two forms of "Formic-Sulphugators," retailing at 1s. and 1s. 6d. respectively.

PHOTOGRAPHIC ENLARGEMENTS.—One of the oldest enlarging firms in this country is that of Messrs. Myers and Frost, 46A, Market Street, Manchester, carrying on business as The Manchester Photo-Engraving Company, it having been established nearly forty years. During recent years the business has been so successful that additional premises became a necessity, consequently the proprietors built a new workshop and studios in Urmston, a residential suburb of Manchester. The new premises are fitted with

every appliance that modern knowledge could suggest to adapt them to the needs of photography and photographic enlarging, the various rooms being arranged so that the work of enlarging, developing, washing, etc. may proceed independent of sunlight, as Messrs. Myers and Frost manufacture their own oxy-hydrogen gas; in fact, completeness with simplicity and perfection is evident in every department. The firm work exclusively for the trade, therefore in applying for price list, business card should be enclosed.

THE MANHATTAN OPTICAL COMPANY, of New York, is now represented in this country by Messrs. Seabrook Bros. and Co., 21, Edmund Place, Aldersgate Street, London, E.C., who send a beautifully printed and illustrated catalogue of the 'Wizard' cameras, Manhattan lenses, etc., which have gained a splendid reputation in America for stability, finish, and optical efficiency.

SOUTHALL BROTHERS AND BARCLAY. The annual meeting of the shareholders of this company was held at Birmingham on March 30, Mr. T. Barclay presiding. The balance-sheet showed that after making provision for bad debts, depreciation, and directors' remuneration the profits had been sufficient to pay 5 per cent. on the preference shares and 10 per cent. on the ordinary shares, and to carry forward £1,577 17s. 6d. to next year's account. Mr. Barclay remarked that the business had never been more vigorous. This was illustrated by the departure at Sattley, where new works were rapidly nearing completion, which would introduce a new industry to Birmingham, viz., the bleaching of cotton and weaving of various fabrics. The fact was, the firm now consumes such large quantities of absorbent wool, bandage and cloth in the business that it was necessary to save

manufacturers' profit. It was the intention of the company to increase the output and extend the variety of manufactures, so as to include surgical dressings in all their variety. Referring to the company's cod-liver oil factory in Norway, Mr. Barclay stated that although the present season commenced with the best prospects, it might now be said that the season had been a failure, the fish having left the East Lofoten coast. A recent letter from the manager contained the statement that the number of fish caught up-to-date in the Lofotens was the lowest ever known. Mr. Wilfred Francis Southall having been re-elected a director, the meeting terminated.

THE STEREOSCOPIC "BINOCULAR" CAMERA.—Messrs. W. Watson and Sons, 313, High Holborn, London, W.C., send particulars of the Stereoscopic "Binocular" Camera, which is deceptive in appearance, and has been designed with that intent. It is used and, at a short distance, looks like an ordinary field glass, but while apparently gazing at an object in the far distance, the operator may surreptitiously take a snap-shot of some near object, two lenses being placed in the left tube of the Camera. The shutter is set for exposure by moving the lever "M," shown in the illustration, alternately right and left, along the scale "EE." This movement uncovers one of the two buttons "DD," which must be pressed to make the exposure. The shutter can be set at four different speeds by moving the lever "M" along the scale, the speed increasing according to the distance of the lever from the centre of the scale. The Camera carries twelve plates; when all have been exposed, and changed to the back of the magazine, there remains in front an aluminium sheet, which, by keeping the magazine light tight, enables it to be drawn out in daylight and another magazine inserted. The shutter may be fitted with time arrangement if desired. No focussing is required, all objects from 6 ft. to infinity being focussed sharply on the plate. The cost of the Camera

fitted with pair of first quality rapid rectilinear lenses, and with sling case complete, is £10.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, APRIL 4, 1900.

AMMONIA SALTS.—Sal Ammoniac, £38 to £40 per ton: Sulphate, £12 per ton.

BEESWAX.—6 bags Peruvian at auction at £7 5s. per cwt.

CANARYSEED.—220 bags of Turkish sold at 34s. per 464 lbs.; a further lot of 50 made 34s. 6d.

CHILLIES.—61 bags of Sierra Leone sold on private terms.

COPPERAS.—Is firm at 37s. to 39s. per ton.

COPPER SULPHATE.—Is dull at £25 7s. 6d. per ton.

HONEY.—Some fine Californian sold at 45s. per cwt.

LINSEED.—Is firm in all positions, with little offering and no business of importance to report.

OILS (FIXED) AND SPIRITS.—Castor is quietly steady, with a limited amount of sales. Calcutta is quoted at 3 $\frac{3}{4}$ d. per lb.; French at 3 $\frac{3}{8}$ d. to 3 $\frac{1}{2}$ d., 2nd pressure 3 $\frac{1}{8}$ d.; Madras at 3 $\frac{1}{2}$ d. per lb. Olive continues steady at £35 10s. to £36 10s. per tun. Linseed is steady as regards Liverpool makes at 25s. 6d. to 26s. per cwt. Cottonseed is steadily held for 23s. 6d. to 24s. per cwt. Spirits of Turpentine have advanced to 42s. 3d. per cwt. with a good demand.

POTASH SALTS.—Bichromate, 4d. to 4 $\frac{1}{2}$ d. per lb.; Chlorate, 4 $\frac{1}{2}$ d. to 4 $\frac{3}{4}$ d. per lb. Pearlshes, 33s. 6d. to 35s. per cwt. Potashes, 27s. 6d. to 27s. 9d. per cwt. Prussiate is quiet at 8d. per lb. Salt-petre, £21 5s. per ton.

QUILLAYA BARK.—10 tons of Chilian sold at £13 5s. to £13 7s. 6d. per ton, and superior quality at £13 10s.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is strong at £17 to £18 per ton. Caustic, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton; crystals, £3 7s. 6d. per ton; nitrate, 8s. 9d. to 8s. 10 $\frac{1}{2}$ d. per cwt.

LONDON, THURSDAY, April 5, 1900.

Business in Drugs and Chemicals has been somewhat unsettled during the past few days. Quinine improved and then had a relapse. Camphor is up. Acid Carbohc dull. Bromides very firm. Iodides weak and unsteady. Cod Liver Oil dearer, although buyers are not taking much at the high figures asked by the agents. Quicksilver and Mercurials very firm. Glycerin dearer and still tending upwards. Opium, Morphine, and Codeine very firm. Acid Citric dull. Acid Tartaric and Cream of Tartar quiet, but steady. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE.—There has been some talk of an improvement in this article, which has, however, so far not taken place, prices remaining weak at 9 $\frac{1}{2}$ d. to 1s. per lb., according to quantity, packing and make.

ACID BORACIC.—Steady at 26s. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC.—Has been dull and rather off-colour during past week, owing to slackening off of the demand. Quotations remain nominally 10d. to 10 $\frac{1}{2}$ d. per lb. for 35° ice crystals in 2 $\frac{1}{2}$ cwt. drums and overcasks; 10 $\frac{3}{4}$ d. to 11 $\frac{1}{4}$ d. for 39/40° ice crystal, and 11 $\frac{1}{2}$ d. to 1s. for the 39/40 B.P. quality in detached crystals. Crude 60° F. 2s. 6d. per gallon; 75° F., 3s. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 8d. per gallon in 40-gallon casks; ditto of darker colour, 9d. to 1s. per gallon.

ACID CITRIC.—Quiet at 1s. 4d. to 1s. 4 $\frac{1}{2}$ d. per lb., according to quantity and make for crystals in 5 cwt. casks.

ACID TARTARIC.—English is quoted 1s. 0 $\frac{3}{4}$ d. to 1s. 1d. on the spot, foreign 1s.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3 $\frac{1}{2}$ d. to 4 $\frac{1}{2}$ d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate flat; grey, 24 per cent., London, prompt, £11 16s. 3d. Hull, prompt, £11 15s. Leith, prompt, £11 16s. 3d. Beckton, April-May, £11 15s. Beckton, terms prompt, £11 13s. 9d. Sulphocyanide, 1s. to 1s. 1d. per lb.

ANTIMONY.—Regulus is quoted £38 10s. to £39 10s. per ton, and Crude Japan (Black Sulphide) £22 to £22 10s.

BORAX.—Unchanged at 17s. per cwt. for crystals and 18s. for powder.

BROMIDES.—Are very firm at 1s. 11 $\frac{1}{2}$ d. per lb. for Potassii Bromid., the other Bromides being also unchanged.

CAMPHOR.—The market for crude is firmer, with more business doing, including 100 piculs China afloat at 175s. with sellers April-May steamer at 177s. 6d. and buyers at 172s. 6d., and 400 piculs Japan March-April steamer at 177s. 6d. to 182s. 6d. c.f. and i. Refined makers advanced their price 1d. per lb. to 2s. 3d. per lb. for Bells and Flowers, tablets being quoted in proportion, according to size.

CASTOR OIL.—Easier; Belgian, first pressing, spot, £31; April-June, £30, f.o.b.; Antwerp, second pressing, spot, £28 10s. per ton, wharf. Hull manufactured, guaranteed cold-drawn pure Pharmaceutical, £33 5s. per ton in barrels, 3 $\frac{1}{8}$ d. per lb. in cases. Pure firsts, £30 15s.; seconds, £29 15s. per ton, in barrels; firsts, 3 $\frac{3}{8}$ d. per lb. in cases; seconds, 3 $\frac{1}{8}$ d., ex-wharf, London.

CLOVES.—At auction, 331 bales Zanzibar offered and mostly bought in at 4 $\frac{1}{2}$ d., only a few bales damaged sold. Privately, Zanzibar opened steady, but closed weaker at a further fractional decline. A fairly large number of bales sold, comprising March-May at 4 $\frac{3}{4}$ d., and June-August at 4 $\frac{1}{2}$ d. to 4 $\frac{9}{16}$ d. Stems: 100 bales offered and bought in at 1 $\frac{3}{4}$ d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, 90 per cent., 1s. 1d. to 1s. 3d. per gallon; pure, 1s. 10d. to 2s. Benzole, 50 per cent., 9 $\frac{1}{2}$ d.; 90 per cent., 7 $\frac{1}{2}$ d. per gallon. Creosote, 3d. to 5d. per gallon, according to quantity. Crude Naphtha, 4d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 6d.; 90 per cent. at 160° C., 1s. 1d.; 90 per cent. at 190° C., 1s. 1d. per gallon. Anthracene: A, 3 $\frac{3}{4}$ d.; B, 2 $\frac{1}{2}$ d. per unit. Pitch, 38s. per ton, f.o.b. Tar: refined, 13s. per barrel; 2 $\frac{3}{4}$ d. per gallon; crude, 12s. 6d. per barrel; 2 $\frac{1}{2}$ d. per gallon.

CODEINE—Very firm at 13s. 1d. to 13s. 6d. per oz. for the pure, and 1s. per oz. less for the Muriate, Phosphate, and Sulphate Salts.

COD LIVER OIL.—The reports as to the results of the fishing continue to be anything but favourable, and while buyers remain very unwilling to operate, unless absolutely forced, at present advanced prices, it is reported that 95s. per barrel, f.o.b., has been paid for a good brand of best new non-congealing Norwegian oil, in tin-lined barrels of 25 gallons. In some quarters it is more than doubted whether present comparatively high rates can be maintained, especially in view of the fact that the consuming season is now practically over, and will not recommence until towards the end of the year.

CREAM OF TARTAR—Quiet at 73s. per cwt. for first white crystals on the spot, powder 75s., ditto, 95 per cent., 76s. per cwt.

GALLS.—At auction 150 cases Japan offered and sold, including fair at 65s., being steady; for arrival, April-May steamer, the quotation is 61s. 6d. c. f. and i.

GINGER.—At auction Cochin, in fair supply, met with a slow demand, and of 452 bags and 131 cases only 80 packages sold, small cut tips, partly limed, at 38s. 6d.; medium and small, roughly cut and scraped, much limed, without reserve at 32s. 6d., with one lot at 33s.; bright Calicut tips at 29s. 6d. to 31s.; good cuttings at 27s. to 27s. 6d. Jamaica in small demand, and prices easier. Of 539 barrels offered 104 sold, good bright bold at 70s. to 75s.; middling to good middling, 55s. 6d. to 60s.; good common, 51s. 6d. to 53s. 6d.; common Rhatoon at 43s.

GLYCERIN.—The upward tendency of price of this article continues both as to the crude and also in the case of the refined article. Best double distilled, chemically pure, 1260 S.G., odourless and colourless, B.P. 1898, in tins and cases (2 or 4 × 56lb. tins in a case), is quoted 59s. to 62s. 6d. per cwt. for English and 60s. to 75s., according to brand, for German make.

JAPAN WAX—Is firm on the spot, with little offering, but for arrival the price is cheaper, with sellers April-May steamer at 31s. 6d. c. f. and i.

MERCURIALS—Are very firm at 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive Sublimate.

MORPHINE—Is firm at 5s. per oz. for the Hydrochlorate Powder, and 2d. per oz. more for the crystal salts.

OILS (FIXED) AND SPIRITS.—Linseed strong at about 10s. advance. On the spot pipes, London, ordinary, £25 10s. to £26 (E.I. 10s. premium); barrels, £25 10s. to £25. Hull also stronger and dearer; spot, naked, £23 10s. Rape firm; ordinary brown, on spot, £27 10s.; refined, spot, £28 15s. Ravison naked, spot, £25 10s. Cotton steady; London crude, spot, £21; refined, spot, £22 15s. to £23 10s., according to make. Hull easier; naked refined, spot, £20 10s.; crude, spot, £19 5s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut: Ceylon, on the spot, £25 10s. to £25 15s.; Cochin, spot, £28 10s. to £29. Palm: Lagos, on the spot, quoted £29. Petroleum (oil) quiet; Russian, spot, quoted 7d. to 7½d.; American, spot, 7½d. to 7¾d. Water White, 8¾d. to 9d. Petroleum (spirit): American, 9¾d.; deodorised, 10d. to 10½d. Turpentine dearer; American, spot, 41s. 6d.; April, 41s. 6d.; May, 40s. 9d. to 41s.

OPIUM.—There has been a fair business doing in both soft shipping and manufacturing kinds at full rates; prices remain very firm, with a decidedly upward tendency.

PARAFIN WAX.—Crude is quoted 3¼d. to 3½d. per lb., and refined 4d. to 4¼d.

PHENACETIN.—Makers are firm at 5s. 3d. per lb. for crystals or powder in 5 cwt. lots, while second-hand, which has been offering at a somewhat cheaper figure, is now getting nearly sold out. In view of the position of the raw material, it would appear probable that price of Phenacetin will, at least, be fully maintained for the next few months, and very likely for a still longer period of time.

POTASH COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. Bromide, 1s. 11½d. Chlorate, spot, London, crystals, 4½d.; powder, 4¾d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Per-manganate, small crystals quoted 50s. to 60s. per cwt., according to make. Large crystals, 5s. per cwt. more. Prussiate, yellow, English make 8d., Beckton 7½d.; red 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship.

QUICKSILVER—Very firm at £9 12s. 6d. per bottle from the importer, second-hand not offering.

QUININE—Has been quiet and again lower, with only small sales, including 30,000 ozs. B&S and/or Brunswick May delivery at

1s. 4d., June at 1s. 4½d. to 1s. 4¼d., and August at 1s. 5d., closing sellers at 1s. 4½d. The landings during March were 360,976 ozs. and the deliveries 293,488 ozs., making the stock on May 31 3,161,872 ozs., against 2,107,440 in 1899. Makers of the favourite B&S brand of sulphate maintain their price of 1s. 6d. per oz. for 1,000-oz. lots in 100-oz. tins.

SHELLAC.—The demand privately continues slow, and sales on the spot are of a retail character. Futures are dull, with sellers of TN Orange, August delivery, at 62s. At auction to-day the small supply of Second Orange met a fair demand, and the larger proportion sold, prices opening 1s. lower, but closing at a slight recovery, the value of fair TN being 59s. to 60s. Garnet and Button: Only a few cases sold at easy rates. A total of 475 cases offered and 324 cases sold. Second Orange: Of 386 cases, 303 sold, partly without reserve, fair reddish, little matted, at 59s. to 60s.; fair bright leafy cakey at 59s.; mixed palish broken at 59s.; flimsy flat livery at 57s. to 58s.; claret colour cakey at 55s. Garnet: 30 cases offered and 5 cases sold, without reserve, weak Rangoon at 58s. cash. Button: Of 59 cases, 6 sold, including ordinary thirds, without reserve, at 46s.

SODA COMPOUNDS.—Crystals: barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, £7 5s., landed, per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 50 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £9; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate (salt cake), £1 7s. 6d. per ton. Glauber Salts, £1 10s. per ton. Sulphide, crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction no Singapore was offered; 30 bags Lampong offered and sold at 5¾d. for fair; 545 bags Penang bought in at 5¾d., and 85 bags Aleppy, including good, at 6¼d. White Pepper neglected: 112 bags Singapore bought in at 9¼d. to 9½d. for fair to good, and 62 bags good white limed Penang at 8¾d. Chillies quiet and rather easier: 12 bags Japan offered, and 8 bags sold at 40s. 6d.; remainder, good, bought in at 48s.; of 79 bags Zanzibar offered, 9 bales sold, ordinary stalky at 38s. 6d.; good bright bought in at 45s. Capsicums steady: of 220 packages Bombay, 133 sold, fair bright at 33s.; good bright long stalky, 32s.; fair ditto, 29s. 6d. Pimento: of 658 bags offered, only a few bags damages sold. Cassia Vera: 60 bales offered and bought in, coarse Padang quills at 27s. Cassia Lignea: 300 bales broken sold, without reserve, at 26s. 6d. Cinnamon: 150 packages Ceylon Will bought in. Chips quiet, and 450 bags fair Ceylon bought in at 3¾d. Nutmegs: no Penang offered; 5 cases Bombay bought in, broken at 4d.; West Indian: 86 barrels offered and 74 sold, 65's at 2s.; 78's at 1s. 5d. to 1s. 6d.; 98's at 1s.; 92's at 9d. Mace: No Penang catalogued; 4 packages Bombay Wild bought in, including good bright at 5d.

STICKLAC.—At auction 21 cases Madras offered and sold, fair bright sifted at 47s. 6d. 20 cases Siam bought in, unsifted, little woody, at 40s.

SULPHATE OF COPPER—Steady at £24 5s. to £26 per ton on the spot.

SULPHONAL.—Makers remain firm at 20s. 6d. per lb. for crystals or powder, with a certain reduction for large quantity and bulk packing, while from second hand there is now practically nothing offering from second-hand below makers' prices.

TURMERIC—In slow demand, and 103 bags Madras in auction were bought in, fair to good bright finger at 30s. to 35s.; rough dark ditto at 26s.; ditto finger and bulbs at 28s. 491 bags Cochin offered and bought in, fair bright split bulbs at 10s. 6d. to 11s. 34 bundles Coconada withdrawn.

VANILLA.—At the auctions to-day the fair supply of 281 tins was offered, and with only a moderate demand about 181 tins sold, good qualities being full up to the decline established at previous sale to occasionally rather dearer, whilst medium and fair sorts sold at steady to rather easier rates. Seychelles: Of 168 tins 140 sold, fair to good colour, 9 inch at 26s., 8 to 8½ inch at 23s. to 24s., 7 to 8 inch at 22s. to 22s. 6d., 6½ to 7 inch at 19s. to 22s., 3½ to 6½ inch at 16s. to 20s.; common, etc., 3 to 8½ inch at 15s. 6d. to 16s. 6d. Mauritius: Of 44 tins 20 sold, fair to good colour, 6 to 6½ inch at 19s. to 20s., 4 to 5 inch at 14s. to 16s. 6d.; common, 6½ to 7½ inch at 15s. 6d. Madagascar: 14 tins sold, common, 3½ to 7½ inch at 12s. 6d. to 14s. Bourbon: Of 34 tins 6 sold, fair, 3½ to 6½ inch at 15s. to 16s. Tahiti: Of 15 tins 1 sold, 4 to 6 inch at 6s. 3d. The remainder and Australian bought in.

Calendar for the Week.

Sunday, April 8.	Palm Sunday.	Sun rises 5.22; sets 6.42.
Monday, April 9.		Sun rises 5.20; sets 6.44.
Tuesday, April 10.		Sun rises 5.18; sets 6.45
BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.—Annual dinner.		
BRITISH PHARMACEUTICAL CONFERENCE, 1900, General Committee, 16, Bloomsbury Square, London, W.C., at 3.0 p.m.—Meeting to receive report of Local Executive Committee, and to discuss future arrangements.		
ROYAL COLONIAL INSTITUTE, Whitehall Rooms, Hotel Metropole, London, S.W., at 8.0 p.m.—Sir John C. R. Colomb on "British Defence, 1800-1900."		
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—"The Municipal Encouragement of Photography," by Thomas Bedding.		
Wednesday, April 11.		Sun rises 5.16; sets 6.46.
MANCHESTER PHARMACEUTICAL ASSOCIATION, Victoria Hotel, at 7.30 p.m.—Annual General Meeting.		
NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION, Hotel Metropole, Newcastle-on-Tyne, at 8.30 p.m.—C. Ridley (President) on "The Botany and Materia Medica of the Bible."		
NORTH LONDON CHEMISTS' MEETING, The Old Cock Tavern, Highbury, at 3.0 p.m.—Meeting to discuss the objects of the Chemists' Defence Association.		
SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY, at 8.30 p.m.—Open Night, conducted by Members.		
Thursday, April 12.		Sun rises 5.14; sets 6.48
Friday, April 13.	Good Friday.	Sun rises 5.11; sets 6.50.
Saturday, April 14.		Sun rises 5.8; sets 6.52.

Publications Received.

THE PHOTO-MINIATURE: A Monthly Magazine of Photographic Information. Edited by JOHN A. TENNANT. Vol. I., No. 10.—The "Blue Print" and its variations. January, 1900. Price 6d. London: Dawbarn and Ward, Limited, 6, Farringdon Avenue, E.C. From the Publishers.

PHARMACEUTICAL LIST OF QUEENSLAND FOR THE YEAR 1900. Printed and published under the direction of the Pharmacy Board of Queensland. Price 1s. Brisbane: Edmund Gregory, Government Printer, William Street, 1900. From the Publishers.

LEVENSGESCHIEDENIS EN BESTRIJDING VAN HET TABAKS-AALTJE (HETERODERA RADICICOLA) IN DELI. Door Dr. J. VAN BREDA DE HAAN. Pp. 16. Reprinted from *De Indische Mercur*. Amsterdam: J. H. de Bussy, 1900. From the Publisher.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Quinine, Howard's 100 ozs., 1/6 (ounce posted, 1/8).—Warnes, 333, Gray's Inn Road, W.C.

Clinicals, one dozen as Maw's, 30 seconds, 24/-; ordinary, 16/-; engraved "English make," plated cases; any post free.—Warnes, 333, Gray's Inn Road, W.C.

2-oz. Morph. Hydroch. 10s. 6d.; 1 lb. Iodof. Crystal, 12s.—Eastman, Forest Lane, Stratford.

Photographic Mounts, Plate Sunks, 10 by 8, 30/-; 12 by 10, 45/- 1,000; cabinets, plain, 10/-; G.B.E., 22/6 1,000. Samples free.—Edward Peck, East Dereham.

Eastman's Kodet, 3 double dark slides, in good condition, cost 4 guineas. What offers? Or would exchange for Student's Microscope.—Cornish, 67, Wells Rd., Bristol.

For Sale.—One nearly new Copper Vacuum Pan, 5 ft. diameter, fitted with Stirring Gear, Condenser and all fittings. One Mild Steel Steam Jacketed Still, 4 ft. diameter, fitted inside with Copper Steam Coils, Stirrer and Pulleys, Galvanised Iron Still Head.—Apply to W. J. Fraser & Co., Engineers, 98, Commercial Road East, London, E.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock, Ashton, Bartlett, Booth, Cross, Cummings, Duffield, Eldred, Gairn, Gilderdale, Gilmour, Hobson, Jackson, Jones, Lawson, Longstaff, Lothian, Mumbray, Nourse, Pickering, Reid, Sheppard Smith, Vince, Wass, Wilkinson.

TRADE NOTES.

MARTINDALE'S PORTABLE SPITTOON.—Mr. W. Martindale, 10' New Cavendish Street, Portland Place, W., sends particulars of a portable spittoon which is being brought under the notice of

the public to meet one of the requirements of the now advancing crusade against consumption. It has been designed by Dr. W. Harrison Martindale, in accordance with suggestions of eminent physicians. Its special features are that it is easy to clean, as it can

be boiled with impunity, being made entirely of non-corrosive white metal, in two segments (see illustrations); its non-suggestive and inoffensive appearance; being oval in shape, it may be conveniently carried in the inside or outside breast pocket, and having a broad basis, will stand firmly on the table by side of invalid's chair or bed. Another feature is a convenient folded rim for wiping the mouth; also, that when in use, the lid hides the mouth of the patient from view. Finally, the vessel is easily opened with one hand, by holding it firmly and pressing the front of the lid upwards with the thumb. It is recommended that the spittoon should contain some disinfectant when in use, and for this purpose small antiseptic tablets containing thymol are supplied. The net price is 6s. 6d.; complete with bottle of antiseptic tablets, post free, 7s. 6d.

Another feature is a convenient folded rim for wiping the mouth; also, that when in use, the lid hides the mouth of the patient from view. Finally, the vessel is easily opened with one hand, by holding it firmly and pressing the front of the lid upwards with the thumb. It is recommended that the spittoon should contain some disinfectant when in use, and for this purpose small antiseptic tablets containing thymol are supplied. The net price is 6s. 6d.; complete with bottle of antiseptic tablets, post free, 7s. 6d.

WELLCOME'S PHOTOGRAPHIC EXPOSURE RECORD AND DIARY, 1900.—Messrs. Burroughs Wellcome and Co. announce that the sixth edition of the above-mentioned publication is exhausted, and it is not intended to reprint it for the current year.

CONDY'S CRYSTALS.—Messrs. Condy and Mitchell, 65, Goswell Road, London, E.C., send particulars of several trade mark cases which have been tried in Australia, wherein injunctions have been obtained restraining several persons from selling, under the designation of "Condy's Crystals," permanganate of potash, or any chemical not being of plaintiff's manufacture, or from selling or offering for sale to persons desiring to procure "Condy's Fluid," permanganate of potash, in solution, as the equivalent, and being then the same in composition as "Condy's Fluid."

SANITARY POLISHES AND CLEANSERS.—"Ronuk" is the name given to a series of polishes manufactured by "Ronuk," Limited, Brighton (London depot, 83, Upper Thames Street, E.C.). It is in paste form, possesses a very pleasant aromatic odour, and is said to be much more economical and agreeable to use than the old-fashioned liquid polishes and creams. Moreover, "Ronuk" is an antiseptic polish, hence it is most suitable for application to the flooring and wood fittings of hospitals and other institutions where numbers of persons congregate, and where the existence of disease germs would be a source of danger. "Ronuk" fills the pores of the wood, so that it presents a hard, smooth surface, which will harbour no germs. It also tends to preserve the wood. In addition to woodwork, "Ronuk" is useful in polishing linoleum, leather, bicycles, enamelled goods, etc., while special preparations are made for brown, black, white, or green boots or shoes, and for harness.

It also tends to preserve the wood. In addition to woodwork, "Ronuk" is useful in polishing linoleum, leather, bicycles, enamelled goods, etc., while special preparations are made for brown, black, white, or green boots or shoes, and for harness.

MATERIA MEDICA SPECIMENS AND MICROSCOPICAL SLIDES.—Messrs. Wright, Layman and Umney, Limited, Southwark Street, S.E., have arranged, for the use of students and others, a collection of official and unofficial drugs, consisting of about 230 specimens,

carefully selected with a view to exhibiting their principal characteristics and distinguishing features, and packed in a neat series of slide wooden boxes, each labelled with the name of the specimen, its source, natural order, and habitat. The price of the complete collection, packed in case, is £2 12s. 6d. Messrs. Wright, Layman and Umney have also arranged, for the convenience of students and others, a short series of 48 microscopical slides, showing the typical portions of various plants used in medicine, viz.: Leaves, flowers, fruits, herbs, seeds, woods, barks, rhizomes, roots, starches, glands, etc. Each slide is labelled and the whole packed in a portable case, the price of the collection being £1 5s.

THE 'PEMBROKE' HALF-PLATE OUTFIT.—Messrs. Evans, Sons, and Co., 56, Hanover Street, Liverpool, offer the 'Pembroke' half-plate outfit, at £3 10s., which provides the amateur photographer with a compact, serviceable mahogany camera of sound construction at a reasonable price. The camera is manufactured by the firm, and every attention has been bestowed

to turn out a useful instrument. It has good leather bellows, reversing and swing back, double extension, back slides to the front for wide angle lenses. As may be noticed in the illustration, the rising front is of unusual range; the base board is cut out and fitted with a turntable. One double dark slide is furnished with the camera, a 'Hanover' time and instantaneous shutter with speed indicator, rapid rectilinear lens, iris diaphragms, and a three-fold tripod.

MESSRS. HARRIS AND CO., LIMITED, wholesale chemists and manufacturers of scientific apparatus, Birmingham, have decided to give an interest in the business to their heads of departments. In future Mr. Standley Belcher and Mr. H. S. Shorthouse will be associated with Mr. Charles S. Ellis in the joint management of the business. Mr. Belcher will continue to manage the scientific apparatus department and workshops, and Mr. Shorthouse will continue the management of the laboratories, and will also superintend the wholesale drug department.

MESSRS. WILCOX AND CO., LONDON, direct attention to three novelties of special interest to pharmacists and medical men—Kola Astier, Gonal, and Nitro-Propiol tablets. The first is a standardised granulated preparation which contains all the more

important principles of the kola nut, including 2 grains of caffeine in each teaspoonful, and is soluble in water, wine, etc. Gonol, or gonorol, is a purified preparation of sandalwood oil, which is claimed to contain 99.5 per cent. of pure santalol. It is a colourless oil with a faint odour and is said to produce more uniform and satisfactory results than ordinary sandalwood oils. The Nitro-Propiol tablets contain the reagent in a convenient form for the detection of sugar in urine. One tablet is dissolved in 10 C.c. of water, 10 drops of the suspected urine added, and the mixture boiled slowly for three to five minutes; if glucose be present indigo blue is formed, but no other substance gives the reaction.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LONDON, WEDNESDAY, APRIL 11.

Business in drugs and chemicals has been quiet during the past week. German makers reduced price of quinine, which has caused quite a flutter in the speculative market. Quicksilver and mercurials are very firm, as also are bromides. Iodides weak at, however, unchanged prices for the present. Salicylates and Salol unchanged. Acid Carbohc dull. Camphor, Cod Liver Oil, and Glycerin firm. Cocaine and Phenacetin firmer. Lycopodium again dearer. Bismuth Salts unchanged, as also is Sulphonal. Acetanilide dull and weak. Acid Citric, Acid Tartaric, and Cream of Tartar quiet. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Continues dull and weak at 9½d. to 11d. per lb., according to make, quantity, and packing.

ACID BORACIC—Unchanged at 26s. per cwt. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC—Dull and weak at 9¾d. to 10½d., according to quantity and make for 35-36° ice crystal in large bulk packing, 10¾d. to 11¼d. for 39-40° ice crystal, and 11½d. to 1s. 0¼d. for 39-40° detached crystals (B.P. quality). Crude, 60° F., 2s. 6d. per gallon; 75° F., 3s. 4d.; liquid, 95-98 per cent. of pale straw colour, in 40-gallon casks, 1s. 7d. to 1s. 8d. per gallon; ditto, 25-30 per cent., 10d. to 1s. per gallon.

ACID CITRIC—Quiet at 1s. 4d. to 1s. 5d. per lb., according to quantity and make, for crystals in 5-cwt. casks.

ACID TARTARIC—Quiet at 1s. 0¾d. to 1s. 1d. per lb. for English, and 1s. per lb. for foreign.

ACID OXALIC—Unchanged at 3d. to 3½d. per lb., spot, net, free delivered, London.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate easier. Grey, 24 per cent., London prompt, £11 15s. Hull, prompt, £11 12s. 6d. Leith, prompt, £11 12s. 6d. Beckton, nominal. Beckton, terms prompt, £11 10s. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ARSENIC.—Best white powder is firm at £20 10s. to £21 per ton.

ATROPINE.—Makers are very firm at 15s. 6d. per oz. for the Sulphate, B.P., and 17s. 10d. per oz. for the pure Alkaloid.

BALSAM CANADA—Is very scarce and tending higher, as new crop will not be available until August. Casks, on the spot, 1s. 5d. per lb.

BALSAM TOLU.—Stocks have been greatly reduced, and price is firm at 1s. 6d. per lb. for good quality.

BELLADONNA ROOT—Is quoted 40s. to 45s. per cwt., according to quality, really good root remaining scarce.

BISMUTH—Unchanged at 5s. 1d. per lb. for the Subnitrate and 5s. 8d. per lb. for the Subcarbonate. The commercial quality of the metal is also unchanged at 5s. per lb.

BLEACHING POWDER (CHLORIDE OF LIME)—Unchanged at £7 per ton for English.

BORAX—Is still quoted 17s. per cwt. for crystals, and 18s. per cwt. for powder.

BROMIDES—Are very firm and scarce for prompt delivery, prices being 1s. 11½d. per lb. for Potassii Bromid., 2s. 3d. per lb. for Ammon. Bromid., 2s. 2½d. per lb. for Sodii Bromid. Bromine is also unchanged at 2s. to 2s. 2d. per lb., according to quantity, in 60-lb. cases.

CAMPHOR.—The position of crude is practically unchanged. English refiners are firm at 2s. 3d. per lb. for Bells and Flowers, and it would appear probable that any change in price will be an upward direction.

CANNABIS INDICUS (GUAZA).—It is difficult to get a quotation for this article, as the entire stock seems to be concentrated. It is said that a heavy export duty has been put upon the article, so that it is evident that high prices must rule in the future.

CASCARA SAGRADA.—Some new arrivals are offered at 27s. 6d. per cwt.

CASTOR OIL—Quiet; Belgian, first pressing, spot, £31; April-June, £30, f.o.b. Antwerp, second pressing, spot, £28 10s. per ton, wharf. Hull manufactured, guaranteed cold-drawn pure Pharmaceutical, £33 5s. per ton in barrels, 3¼d. per lb. in cases; pure firsts, £30 15s.; seconds, £29 15s. per ton in barrels; firsts, 3½d. per lb. in cases; seconds 3¼d. ex-wharf, London.

CINCHONA BARK.—The fourth of the series of auctions were held yesterday, with the fair supply of 3,065 packages of all descriptions, as compared with 4,440 packages at the previous sales. Active competition prevailed throughout, and the bulk found buyers, at and since the sales, at prices which showed some improvement on the last Dutch sales, the average unit being 1¾d.; while Cinchonidine bark realised in some cases 2½d. per unit. Ceylon: 249 packages offered and 238 sold, according to analysis, Succirubra, stem chips and shavings, ordinary to good at 2¾d. to 4¾d., good root at 6½d. East Indian: 2,101 bales and 36 cases offered and about 1,850 packages sold. Red stem chips and shavings, fair to good at 3½d. to 5½d., ordinary to good root at 2½d. to 5½d., fair branch at 3½d.; renewed chips and shavings, fair to good rich, at 4d. to 7¾d.; Officinalis, fair to good at 4½d. to 6½d., low to fair at 1¾d. to 4¾d., branch at 1¾d., fair silvery quill at 5d. to 5½d.; renewed chips and shavings good to fine rich at 6½d. to 7¾d., fair to good at 4¾d. to 5¾d.; Ledger stem chips and shavings, good to fine at 5¾d. to 9d., fair at 4¾d. to 4½d., branch at 3d. to 5d., fine root at 8½d.; hybrid stem chips, good at 5¾d. to 5½d., fair branch at 3½d. Java: 226 packages offered and 11 sold, ordinary quill at 4½d. South American: 172 packages Bolivian cultivated Calisaya offered and mostly sold, fair to good quill at 8¾d. to 10¾d., fair to good flat at 6¾d. to 10¾d. Soft Columbian: Of 235 bales 39 sold at 2½d. to 2¾d. for chips and shavings. Cuprea: 5 bales offered and sold, stem chips at 2d. 25 bales flat Carthagena bought in at 6½d., and 13 packages Maracaibo at 6d.

CLOVES.—Zanzibar remain very quiet, but prices are firm. Only a small business has been done, comprising June-August delivery, at 4 17-32d. to 4 7-6d., and August-October at 4 7-6d. March-May closes buyers at 4 7-6d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. per gallon; pure, 1s. 9d. to 2s. Benzole, 50 per cent., 8½d.; 90 per cent., 7d. per gallon. Creosote, 3d. to 5d. per gallon, according to quantity, etc. Crude Naphtha, 30 per cent. at 160° C., 5d. per gallon. Solvent Naphtha, 95 per cent., at 160° C., 1s. 6d.; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene, A, 3¾d.; B, 2¾d. per unit. Pitch, 38s. per ton, f.o.b. Tar, crude or refined, 12s. 6d. per barrel, 2¼d. per gallon.

COCAINE—Is firmer; makers of the favourite B&S brand still, however, quote the Hydrochlorate 16s. 9d. per oz. in 25-oz. tins, down to 16s. 3d. per oz. for 200-oz. lots.

CODEINE—Remains exceedingly firm at 13s. 1d. per oz. for 300-oz. lots up to 13s. 6d. per oz. for smaller quantity for the pure, and 1s. per oz. less for the salts.

COD LIVER OIL.—It is stated that the Lofoten fishery has yielded less favourable results than has been the case for many years past. It now remains to be seen whether the Finnmarken catch will help to make up the deficiency. The agents of the makers quote high prices, up to 100s. and even 110s. per barrel for best new non-congealing Norwegian oil in tin-lined barrels of 25 gallons each. There is, however, practically no business passing at these high prices.

CREAM OF TARTAR.—First white crystals, on the spot, 73s. per cwt.; powder, 75s., and 95 per cent., 76s.

CUTCH—Continues very quiet without any business of importance.

DAMIANA LEAVES—Are dearer at 6d. per lb.

ESERINE (PHYSOSTIGMINE)—Very firm at 2s. to 2s. 6d. per gramme, according to quantity, for the Sulphate and Salicylate Salts, and 3s. to 3s. 6d. per gramme for the pure.

GALLS—Firm; China continue in demand, with buyers for arrival at 67s. 6d. Japan are quoted higher, at 62s., c.i.f., for April-May shipment.

GENTIAN ROOT—Dearer, holders ask 16s. 6d. per cwt. here for good dry root.

GLYCERIN—Continues very firm, both for crude and also for the refined article; for the latter the English makers quote 58s. 6d. to 62s. 6d., and German makers 60s. to 75s., according to brand, for the best white, double distilled, chemically pure, odourless, 1260, S.G. quality, in tins and cases.

GOLDEN SEAL ROOT—This article is in good inquiry, and business has been done at 2s. 6d. per lb.

GUARANA—Is scarce, and 1s. 8d. per lb. is asked for small quantity available.

GUM KINO—The parcel in the last sales which was offered at 1s. per lb. has been cleared, and in addition a good quantity has been sold, and 1s. 9d. per lb. is now asked. Stocks will probably be found to be greatly reduced at the end of this month.

IODINE AND IODIDES—The market remains in a precarious position, and prudent buyers are covering their wants strictly from hand to mouth. So far, the combined makers made no change in their prices, which are: Potassii Iodid., 10s. 6d. per lb.; Ammon. Iodid., 13s. 10d. per lb.; Sodii Iodid., 11s. 10d. per lb.; Iodine Resublimed, 12s. per lb. Iodoform crystals, powder, or precipitated, 13s. 10d. per lb. Crude Iodine is also unchanged at 7½d. per oz.

IPECACUANHA—Firm for Rio at 11s. 6d. per lb., whilst for Carthagena 8s. per lb. is asked.

JAPAN WAX—There are sellers at 30s. 6d., c.i.f., being again cheaper, sellers of good squares, on the spot, at 34s. Business has been done for arrival, but there are no particulars to hand.

LYCOPodium—Is dearer, as much as 2s. 5d. per lb. being asked for double-sifted in case lots.

MENTHOL—There are sellers of the favourite Kobayashi brand at 8s. 6d. per lb. for case lots (12 × 5lb. tins in a case).

MERCURIALS—Are very firm at unchanged prices—viz., 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive Sublimate, other Quicksilver preparations being quoted in proportion.

MORPHINE—Is firm at 5s. per oz. for the Hydrochlorate Powder and 2d. per oz. more for the crystal salt.

OILS (FIXED) AND SPIRITS—Linseed quiet and easier. On the spot, pipes, London, ordinary, £27 (E.I., 10s. premium), barrels £27 5s.; May, £26 7s. 6d.; May-Aug., £26; Sept.-Dec., £24 10s. Hull, spot, naked, £25; May-Aug., £24 10s.; Sept.-Dec., £23. Rape firm; ordinary brown, on the spot, £27 10s.; refined, spot, £28 15s.; Ravison, naked, spot, £25 10s. to £25 15s. Cotton firm; London, crude, spot, £21 to £21 5s.; refined, spot, £23 5s. to £23 15s., according to make. Hull, naked, refined, spot, £21 5s.; crude, spot, £20. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut quiet; Ceylon, on the spot, £25 10s., near £24 5s., c.i.f.; Cochin, spot, £28 10s. to £29, near £25, c.i.f. Palm: Lagos, on the spot, quoted £28 10s. Petroleum (oil) quiet; Russian, spot, quoted 7d. to 7½d.; American, spot, 7½d. to 7¾d.; water white, 8¾d. Lubricating: Pale American, spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian, black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum (spirit): American, 8¾d. to 9d.; deodorised, 10d. to 10½d. Turpentine dull: American, spot, 42s.; April, 41s. 6d. to 41s. 9d.; July, 35s. 3d.

OPIUM—Market is firm at about prices ruling last week, say, 9s. to 9s. 9d. per lb. for manufacturing and druggists', and 11s. to 11s. 6d. for soft shipping. For Persian as much as 13s. per lb. has been paid for fine quality, with very little obtainable even at this high figure.

ORRIS ROOT—Picked Florentine is obtainable in limited quantity at 55s. to 57s. 6d. per cwt. The syndicate in Italy are reported to be holding out for much more than above figures.

QUININE—On Saturday the agents for the favourite German brand B&S reduced their price from 1s. 6d. to 1s. 4½d. per oz. for the Sulphate for 1,000-oz. lots in 100-oz. tins. This caused quite a flutter amongst weak-kneed speculators, and sales were made down to 1s. 3d. per oz. for B&S and/or Brunswick. The speculative market has, however, become steadier again, price being nominally 1s. 3½d. to 1s. 4d., according to delivery. For the moment there is practically no speculative business passing in the article.

PHENACETIN—Is decidedly firmer in second-hand, makers maintaining their price of 5s. 3d. per lb. for powder or crystals in 5-cwt. lots in bulk packing, smaller quantity being quoted higher in proportion.

PILOCARPINE—Makers quote 41s. 9d. per oz. for the Hydrochlorate and Nitrate Salts in 8-oz. lots. There are, however, sellers from second-hand at 37s. 6d. to 40s. per oz., according to quantity.

POTASH COMPOUNDS—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. Chlorate, spot, London crystals, 4½d.; powder, 4¾d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small cryst. quoted 50s. to 60s. per cwt., according to make; large cryst., 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship.

QUICKSILVER—Is firm at £9 12s. 6d. per bottle from the importer, second-hand not offering.

SALICIN—Makers are very firm at 20s. 6d. per lb. down to 20s. for cwt. lots.

SALICYLATES—Acid Salicylic, Soda Salicylate, and Salol are unchanged.

SANTONIN—Makers quote 11s. 3d. per lb. for 2-cwt. lots. There are, however, sellers from second-hand at 10s. 6d. per lb.

SASSAFRAS BARK OF ROOT—This is scarce, and 7d. per lb., c.i.f. terms, is the lowest quotation.

SERPENTARIA ROOT—This article is very scarce and dearer at 1s. 10d. per lb. on the spot.

SHELLAC—An important correction has been made by "Reuter," per mail, of the shipments at Calcutta for the first half of March; they now read U.K. 1,900 cwt., U.S. 11,800 cwt. (returned previously as nil), and Continent 3,100 cwt., against 1,700 cwt., 5,500 cwt., and 2,300 cwt. respectively last year. The altered figures for the whole month, as given below, show a comparative deficiency of 3,200 cwt. to all parts, the total being 24,700 cwt., against 27,900 cwt. last year, U.K. taking 5,500 cwt., and U.S. 2,100 cwt. less, and Continent 4,400 cwt. more than in the corresponding period of 1899. The shipments from Calcutta (per "Reuter") to the United Kingdom were for the last half of March 1,600 cwt., making 3,500 cwt. for the month, against 9,000 cwt. last year, and to the United States for the last half of March nil cwt., making 11,800 cwt. (corrected) for the month, against 13,900 cwt. last year. To the Continent the shipments were 6,300 cwt., making 9,400 cwt. for the whole month, against 5,000 cwt. last year. The market here continues very quiet, and sales on the spot are limited at previous rates. Futures are quite inactive, and prices nominal in the absence of business. TN Orange March-May steamer 57s., c.f. and i., and August delivery 61s., buyers.

SODA COMPOUNDS—Crystals, barrels, quoted 60s., bags 57s. 6d. Acetate, £14 per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, £7 5s., landed, per ton. Bichromate, 3¼d. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphite (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9 5s.; ordinary, £8 16s. 3d.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate (salt cake), £1 7s. 6d. per ton. Sulphide, crystals, £6 10s. Sulphite, £5 15s. per ton.

SPERMACEIN—American is dearer at 1s. 4d. per lb., which, however, is cheap still, compared with the price ruling in New York.

SUGAR OF LEAD—White is quoted £25 to £27 10s. per ton, c.i.f., according to quantity.

SULPHATE OF COPPER—Firmer. Spot, £24 10s. to £26.

SULPHONAL—Second-hand appears to be sold out; makers are firm at 20s. 6d. per lb. for both crystals and powder, with a certain reduction for 4-cwt. lots.

THYMOL—One maker is now hawking this article round at 9s. 3d. per lb. for 7-lb. lots.

TURMERIC—Remains quiet, and business in all kinds is on a small scale. Bengal very scarce, and would command high prices. Cochin slow of sale at 10s. 3d. to 10s. 6d. for fair split bulbs. Madras good bright finger sold in small lots at 35s.

BURROW'S SELTZER AND REAL SODA. Are unequalled for Brandy and Whisky. Six Dozen Carriage Paid.	THE PUREST MINERAL WATERS.	BURROW'S LITHIATED MALVERNIA. The best remedy for GOUT and RHEUMATISM. Six Dozen Carriage Paid.
	<h1>BURROW'S MALVERN WATERS</h1>	
	THE NATURAL WATER Is in Stoppered Reputed Quarts.	
W. & J. BURROW, The Springs, MALVERN.		

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

For Sale.—One nearly new Copper Vacuum Pan, 5 ft. diameter, fitted with Stirring Gear, Condenser and all fittings. One Mild Steel Steam Jacketed Still, 4 ft. diameter, fitted inside with Copper Steam Coils, Stirrer and Pulleys, Galvanised Iron Still Head.—Apply to W. J. Fraser & Co., Engineers, 98, Commercial Road East, London, E.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Calendar for the Week.

Sunday, April 15. Easter Sunday. O 12 M. Sun rises 5.6; sets 6.53.

Monday, April 16. Sun rises 5.4; sets 6.55.

Tuesday, April 17. Sun rises 5.3; sets 6.57.

Wednesday, April 18. Sun rises 5.1; sets 6.58.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 36, York Place, Edinburgh, at 8.30 p.m.—Evening meeting: "Dispensing Notes on (a) Solution of Arsenic and Iron Wine and (b) Glycerin of Codeine," by Archibald Currie; also a Dispensing Query relative to Copper in a Mixture will be dealt with by J. Rutherford Hill.

Thursday, April 19. Sun rises 4.58; sets 7.0.

LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Evening Meeting; Papers will be read on "Alpine Vegetation of Tibet and the Andes," by W. Botting Hemsley and H. H. W. Pearson, and on "Some Mosses from China and Japan," by E. S. Salmon.

Friday, April 20. Sun rises 4.56; sets 7.2.

Saturday, April 21. Sun rises 4.54; sets 7.4.

ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C.—National Record Association's Exhibition will close.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet it is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free.

Full directions and attractive labels and handbills in crimson and black, free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

ROUSE BROS., 61, Charlotte St., LONDON, W.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Abram, Bartlett, Billinton, Burns, Carter, Evans, Ferrall, Findlay, Foster, Hardy, Hill, Johnstone, Judge, Keen, Lowe, Morgan, Passmore, Pound, Prance, Reynolds Sargeant, Surfleet, Wallis, Wheeler, Wright.

NEWS IN BRIEF.

PROFESSOR H. G. GREENISH is announced to communicate a paper to the Chemists' Assistants' Association on Thursday next, April 26.

MESSRS. HICKMAN AND METCALF, of Newbury, intimate that they have fitted up a photographic dark-room, complete with every convenience, for customers' use.

MR. J. WALTON, M.P.S., announces that he has opened a new pharmacy at 1, Alexandra Terrace, South Margate, newly fitted and stocked with everything appertaining to a modern pharmacy.

MESSRS. S. J. D. MANSON AND E. A. RIDER, chemists and druggists, have purchased the business hitherto carried on by Mr. William Pearson at 18, Great George's Road, Waterloo, near Liverpool.

A CENTURY OF CHEMISTRY IN THE ROYAL INSTITUTION is to be the subject of a series of four lectures by Prof. J. Dewar, the first lecture to be delivered at the Royal Institution, on Thursday, April 26, at three o'clock.

THE BRISTOL CHEMISTS are to hold their annual dinner on Wednesday, April 25, at the Royal Hotel, College Green, at 7 p.m. Amongst the visitors expected to be present are Mr. Michael Car-teighe, Mr. F. R. Cross, Dr. P. Watson Williams, and Mr. R. S. Atkins. Tickets, 5s. each, may be obtained of the President, Mr. G. T. Turner, or the Hon. Secretary, Mr. B. Keen.

MESSRS. WRAY AND THOMPSON, chemists, Wheelgate, Malton, narrowly escaped having a serious fire at their shop on Good Friday. The sun, shining brightly through one of the carboys, set fire to the window-blind; fortunately a passer-by noticed the occurrence, an entrance was forced into the shop and the fire extinguished before much damage was done.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, APRIL 18, 1900.

There has been rather a quiet tone about the market here during the week, and miscellaneous sales do not call for much comment. Considerable rises have taken place in Linseed Oil owing to high price of material, and an upward movement has again set in with Spirits of Turpentine. The attention centred in Canary Seed latterly seems to be diminishing, though prices are constant. Spices have not been much in evidence, Chillies alone being dealt in at good figures. Sales of Chilian Honey effected show no falling off in price in any quality. Full rates have been secured for what Carnauba Wax has been offered, "yellow" being in good request. A quiet tone is reported in Chemicals, with less business than usual transacted.

AMMONIA SALTS.—Sal ammoniac is firm at 38s. to 40s. per cwt. Sulphate continues dull at £11 15s. to £11 17s. 6d. per ton.

BEESWAX.—2 cases Peruvian made £7 12s. 6d. per cwt., ex store.

BLEACHING POWDER.—Is firm at £7 to £7 10s. per ton.

CANARY SEED.—90 bags of Turkish have been sold at 34s. 6d. per 464lb., and further amounts at the same rate since.

CARNAUBA WAX.—19 bags of yellow fetched 100s. per cwt. since auction, and grey has sold at 80s. also.

COPPERAS.—Is very firm at 37s. to 39s. per ton.

COPPER SULPHATE.—Is somewhat dull at £25 5s. to £25 7s. 6d. per ton.

HONEY.—60 barrels of Chilian made 23s. 6d. per cwt. for Pile 2 and 25s. 6d. for Pile 1.

KOLA NUTS.—9 bags of dried changed hands at 1½d. per lb., ex quay.

LINSEED.—There is a very firm feeling at present, with little offering forward. 500 tons of River Plate sold on the spot at 44s. 6d., 4 per cent. basis, early in last week. Since then 200 tons sold at 47s., and none is offering now in any position. North American at 48s. per 416lb., store, and Turkish at 52s. Calcutta has been offering, "to arrive" April to May, 49s.; River Plate, on passage, at 47s., and for April at 47s. 3d. to 48s.

OILS (FIXED) AND SPIRITS.—Castor Oils dealt in have been mostly Calcutta, of which 50 cases sold, ex store, at 3½d. per lb. Subsequently 3½d. was asked. First pressure French at 3¾d. to 3¼d. per lb. has been changing hands moderately; second French is at 3¼d., and Madras 3½d. per lb. Olive Oils of Spanish make continue steadily moving off at £35 10s. to £36 10s. per ton for spot lots. Linseed Oils of Liverpool pressure have risen considerably in price, and are selling readily at 27s. 3d. to 27s. 6d. per cwt. Cotton Seed Oil is steadily held for 23s. to 24s. per cwt., with a fair business doing. Spirits of Turpentine are quoted by sellers at 43s. per cwt., but only a small trade is doing.

POTASH SALTS.—Bichromate, 4d. to 4½d. per lb. Chlorate is very steady at 4½d. to 4¾d. per lb. Pearlash, 33s. 6d. to 35s. per cwt. Potashes are in steady demand at 27s. 6d. to 27s. 9d. per cwt. Prussiate is firm at 8d. per lb. Saltpetre, 21s. 6d. per cwt.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firm and in better inquiry at 17s. to 18s. per cwt.

CAUSTIC SODA.—Is very firm and scarce for immediate delivery, 76 to 77 per cent. at £11 per ton, 70 per cent. at £10 5s., and 60 per cent. at £9 5s. per ton. Soda Crystals, £3 5s. to £3 7s. 6d. Hyposulphite is scarce at £7 5s. to £7 15s. per ton. Nitrate is easier and offers at 8s. 6d. to 8s. 9d. per cwt.

LONDON, THURSDAY, APRIL 19, 1900.

As might have been expected, business in Drugs and Chemicals, as well, in fact, as in most other commodities, has been quite restricted during past week; in fact, it may be said that business only really commenced to-day after the holidays, while there are practically no changes at all of any importance to report in value or position of articles of any great interest to the readers of these columns, with the exception that Sulphate of Quinine waked up a bit, but afterwards again suffered a slight relapse. Otherwise prices are practically unchanged, the following being those ruling for some articles of principal importance:—

ACETANILIDE.—Remains dull and weak at 9½d. to 1s. per lb.

ACID BORACIC AND BORAX.—Quiet, but steady at unchanged prices.

ACID CARBOLIC.—Quiet and somewhat weak at nominally unchanged prices. Market for refined acid has, however, somewhat stiffened up during past two days, and makers now look for better prices again rather than a further decline. Crude: 60° F., 2s. 6d. per gallon; 75° F., 3s. Liquid, 95 to 98 per cent. of pale straw colour, 1s. 7d. to 1s. 8d. per gallon in 40-gallon casks; ditto 25-30 per cent. of dark colour, 11d. to 1s. per gallon.

ACID CITRIC.—Quiet at 1s. 4d. to 1s. 4½d. per lb. for crystals in 5-cwt. casks.

ACID OXALIC.—3¼d. to 3½d. per lb. nett, free delivered London.

ACID TARTARIC.—English is still 1s. 0¾d. to 1s. 1d. per lb. on the spot. Foreign, 1s. to 1s. 0¼d. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate, dull gray, 24 per cent., London prompt, £11 12s. 6d.; Hull prompt, £11 10s.; Leith prompt, £11 10s. to £11 11s. 3d.; Beckton, £11 12s. 6d.; Beckton terms prompt, £11 10s. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus, £38 10s. to £39 10s. per ton. Crude Japan (Black Sulphide), £22 to £22 10s.

ASHES.—Pots, 28s. 6d. Pearls, 34s.

BISMUTH.—Unchanged, both for the metal and the salts.

BLEACHING POWDER.—English is still quoted £7 per ton.

BROMIDES.—Remain very firm at prices given in our last, say, 1s. 11½d. per lb. for potassii bromide, the other bromine preparations being also unaltered in value.

CAMPHOR.—Firm but unchanged, both for the crude and for the refined article, price of latter, of English make, being 2s. 3d. per lb. for bells and flowers, tablets being quoted in proportion.

CASTOR OIL.—Firm. Belgian 1st pressing spot, £31 10s.; May-June, £30, f.o.b., Antwerp; 2nd pressing spot, £28 10s. per ton. Hull manufactured: Guaranteed cold drawn pure Pharmaceutical, £33 5s. per ton in barrels, 3 15-16d. per lb. in cases. Pure firsts, £30 15s.; seconds, £29 15s. per ton in barrels; firsts, 3 9-16d. per lb. in cases; seconds, 3 7-16d., ex wharf London.

CINCHONA BARK.—The exports from Java for the first half of the month were 275,000 Amsterdam lb., against 585,000 Amsterdam lb. in the corresponding period last year.

CLOVES.—The market for Zanzibar continues firm, but quiet; a moderate business has been done, and comprises March-May delivery reported at 4 19-32d., closing buyers at 4 ½d., June-August at 4 19-32d. to 4 ½d., and sellers October-December at 4 ½d., and January-March at 4 19-32d. No Public Spice Auctions have been held this week, but they will be resumed on the 25th inst.

COAL TAR DISTILLATION PRODUCTS.—Toluol Commercial, 1s. 2d. to 1s. 4d. per gallon. Benzole: 50 per cent., 8d. per gallon; 90 per cent., 7d. Creosote, 3d. to 6d. per gallon, according to quantity, etc. Crude Naphtha, 30 per cent. at 120° C., 4½d. to 5d. per gallon. Solvent Naphtha: 95 per cent. at 160° C., 1s. 5d.; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 3½d. per unit; B, 2¾d. Pitch, 38s. per ton f.o.b. Tar, refined, 13s. 6d. per barrel, 2½d. per gallon. Crude, 12s. 6d. per barrel, 2¼d. per gallon.

COCAINE.—Makers of brands most in favour remain firm at 16s. 3d. per oz. for the Hydrochloride for 200-oz. lots, in 25-oz. tins.

COD LIVER OIL.—Agents for the refiners are not quite so stiff in their ideas. Prices, however, remain practically quite nominal, there having been no business passing in the article during the past week.

CODEINE.—Very firm, at 13s. 6d. per oz. for the pure and 1s. per oz. less for the salts.

COPPER SULPHATE.—Steady at £24 10s. to £26 per ton, according to make, quantity, and packing.

CREAM OF TARTAR.—Unchanged, at 73s. per cwt. for first white crystals on the spot, 75s. per cwt. for powder, and 76s. per cwt. for ditto 95 per cent.

GLYCERIN.—Both crude and refined are firm at nominally unchanged prices.

IODIDES.—The uncertain feeling reported last week continues to prevail as regards the position of this article. Prices are, however, so far unchanged.

MERCURIALS.—Are very firm at unchanged prices.

MORPHINE.—Firm, at 5s. per oz. for the hydrochloride powder and 2d. per oz. more for the crystal salt.

OILS (FIXED) AND SPIRITS.—Linseed opened firm, but forward positions were rather easier at the close. On the spot, pipes, London ordinary, £27 to £27 5s. (E.I., 10s. premium); barrels, £27 5s.; Hull spot, naked, £25 10s. Rape firm. Ordinary brown, on spot, £28; refined, spot, £29 10s.; Ravison, naked, spot, £26. Cotton firm. London Crude, spot, £21 15s.; refined, spot, £23 10s. to £24 5s., according to make; Hull, naked, refined, spot, £22 2s. 6d.; Crude, spot, £20 12s. 6d. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut quiet. Ceylon, on spot, £25 10s.; near, £24, c.i.f. Cochin, spot, £28 10s. to £29. Palm Lagos, on the spot, quoted £28 10s. Petroleum (oil) quiet. Russian, spot, quoted 7d. to 7½d.; American, spot, 7½d. to 7¾d.; Water white, 8¾d. Lubricating Oil: Pale American, spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum (Spirit): American, 8¾d. to 9d.; Deodorised, 10d. to 10½d. Turpentine opened weak at 39s. 9d. for spot, but subsequently an improved inquiry brought higher prices,

the close being firm throughout. American, spot, 40s.; April, 40s.; May, 39s.; July, 34s.

OPIUM.—Market is firm at nominally unchanged prices. There has, however, been practically no business passing in the article since the holidays.

PARAFFIN WAX.—Crude, 3¼d. to 3½d. per lb. Refined, 4d. to 4½d. per lb.

PEPPER.—There has been more demand to-day for Singapore, and a fair business has resulted at dearer rates. About 75 tons have been sold, largely spot, on a basis of 6½d. for fair, and February-April shipment at 6¾d. The shipments to London for the first half of April were:—Singapore, 40 tons against 20 tons, and Penang 100 tons against 40 tons last year. To America shipments were 20 tons against 240 tons, and to the Continent 40 tons against 70 tons in 1899.

PEPPER, WHITE.—Is without alteration, and business unimportant. The shipments to London for the first half of the month were:—Singapore 30 tons against 20 tons, and Penang 20 tons against 40 tons last year; to the Continent the shipments were nil against 20 tons in 1899.

PHENACETINE.—Makers still quote 5s. 3d. per lb. for crystals or powder in 5 cwt. lots. It is, however, still possible to buy from second hand in limited quantities at somewhat below this price.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate spot, London crystals, 4¾d.; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £20 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton, ex-ship.

QUICKSILVER.—Firm, at £9 12s. 6d. from the Importer; second-hand not offering.

QUININE.—The market opened steadily, but showed more firmness on receipt of the favourable bark shipments, prices closing ¾d. dearer; business, however, has been limited owing to scarcity of sellers, comprising about 15,000 ozs. B. & S. and/or Brunswick, on the spot at 1s. 2½d.; closing value, 1s. 3¼d.; May, at 1s. 2¾d.; closing value, 1s. 3¾d.; June, at 1s. 3d.; closing value, 1s. 3¾d.; and August closing buyers at 1s. 4d., at which prices there are now rather buyers than sellers. Makers of these brands maintained their price of 1s. 4½d. per oz. for 1,000-oz. lots in 100-oz. tins.

SALOL SALICYLATES.—Are without change in price.

SHELLAC.—The market remains very quiet, and with a slow demand few sales have occurred, but prices are unchanged, TN Orange on the spot at 60s. for fair. For arrival 100 cases TN March-May shipment have been sold at about 56s. 6d. c. f. and i.; August delivery quoted rather buyers at 60s.

SODIUM COMPOUNDS.—Crystals, barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 16s. 3d.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate (Salt Cake), £1 7s. 6d. per ton. Sulphide, crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES.—No public auctions have been held this week, and business privately in most articles has been quite unimportant. The auctions will be resumed on the 25th inst.

SULPHONAL.—Makers maintain their price of 20s. 6d. per lb. for both crystals and powder, with a certain reduction for 4-cwt. lots and bulk packing.

TAR.—Stockholm, 26s.; Archangel, 18s. 6d.

THYMOL.—While one maker still quotes 9s. 3d. per lb., other makers hold out for 11s. 6d. to 11s. 9d. per lb.

The Annual Dinner

MEMBERS OF THE PHARMACEUTICAL SOCIETY

OF THE

AND THEIR FRIENDS WILL TAKE PLACE AT

WHITEHALL ROOMS (HÔTEL MÉTROPOLE)

On *TUESDAY, MAY 15th, 1900, at 6.45 for 7 precisely.*

THE VICE-PRESIDENT—MR. G. T. W. NEWSHOLME—IN THE CHAIR.

FIRST LIST OF STEWARDS.

Allen, C. B.	Kilburn, N.W.	Gulliver, W. F.	Lower Belgrave Street, S.W.	Robinson, R. A.	Brompton Road, S.W.

TICKETS, ONE GUINEA EACH (including Wine), may be obtained from RICHARD BREMRIDGE, 17, BLOOMSBURY SQUARE, W.C.

Calendar for the Week.

Sunday, April 22.	1st after Easter. ☾ 2.23 A. Sun rises 4.52; sets 7.6.
Monday, April 23.	Sun rises 4.49; sets 7.7.
Tuesday, April 24.	Sun rises 4.47; sets 7.8.
Wednesday, April 25.	Sun rises 4.46; sets 7.10.
BRISTOL PHARMACEUTICAL ASSOCIATION, Royal Hotel, College Green, at 7 p.m.—Annual Dinner. Tickets, 5s. each.	
PUBLIC AND POOR LAW DISPENSERS' ASSOCIATION, St. Bride's Institute, St. Bride's Lane, Ludgate Circus, at 8 p.m.—Descriptive Lecture on "Practical Photography," by F. Noad Clark. Meeting free to all dispensers.	
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.—Exhibition of F. H. Evans' Photographs (mainly architectural); with an address.	
WESTERN CHEMISTS' ASSOCIATION (of London), Westbourne Restaurant, 1, Craven Road, Paddington, W., at 9 p.m.—Smoking Concert.	
Thursday, April 26.	Sun rises 4.44; sets 7.12.
CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Paper by Professor H. G. Greenish. Subject not announced.	
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor J. Dewar, on "A Century of Chemistry in the Royal Institution." (Lecture I.)	
Friday, April 27.	Sun rises 4.42; sets 7.14.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Lord Kelvin on "Nineteenth-Century Clouds over the Dynamical Theory of Heat and Light."	
Saturday, April 28.	Sun rises 4.40; sets 7.15

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the "Exchange" should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., not later than 5 p.m. on Thursdays.

OFFERED.

Two vols. **Green's Botany**, unsoiled, latest edition. Best cash offer.—Woollatt, Ware.

Ten Incandescent Electric Lamps, 2, 4, 6, 12 volts, well made, new. Also patent 4 volt Flat Accumulator, 7 hours, unused, perfect. Price 18/6 the lot, post free.—H. B. Cox, Charlton Road, Shepton Mallet.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

Robert Milne Beaton and Adam Alexander, Physicians and Surgeons, 183, Kentish Town Road, and 7, Dartmouth Park Road, Kentish Town. Debts will be received and paid by Adam Alexander.

George Taylor and William Smith, trading as A. and G. Taylor, Photographic Colourists, Enlargers, etc., and Manufacturing Chemists, Victoria Works, Stanstead Road, Forest Hill. Debts will be received and paid by George Taylor, who will continue to carry on the business under the same style.

Egerton Charles Augustus Baines, John Arthur Rigge, and Arthur Blackwood Ward, Surgeons, Physicians, Accoucheurs, Apothecaries, and General Medical Practitioners, Henley-on-Thames. Debts will be received and paid by Mr. J. B. Reeves, Chartered Accountant, 3, Church Court, Old Jewry, London, E.C. The business will be carried on in future by Messrs. Baines and Ward.

Richard Heaton and C. F. Baines, trading as the Dalton Chemical Company, at Long Lane, Dalton, Huddersfield. Debts will be received and paid by R. Heaton, who will continue to carry on the business under the same style.

George Cheverton and John Henry Ogle, Chemists and Druggists, 3, The Broadway, Tunbridge Wells. Debts will be received and paid by J. H. Ogle, who will in future carry on the business.

Publications Received.

PROCEEDINGS OF THE CHEMISTS' ASSISTANTS' ASSOCIATION, containing papers and discussions and full particulars of the meetings held during the Session, 1898-1899, etc. No. XV. Pp. 67, Price 2s. 6d. London: Chemists' Assistants' Association, 73, Newman Street, W. 1900. From the Publishers.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Alcock, Bird, Braun, Cooper, Dewhurst, Doe, Dudderidge, Ellul, Evans, Fairley, Ferrall, Forster, Hickman, Hill, Holroyd, Johnston, Keen, Kemp, Pearson, Philp, Pickering, Reynolds, Wright.

NEWS IN BRIEF.

MR. CHARLES A. PRATT, M.P.S., was unanimously re-elected an Overseer of the Poor by the Town Council of Saltash at its last meeting.

THE STATUTORY MEETING OF CAMWAL, LTD., will be held at the Registered Office, 112, Pembroke Street, Caledonian Road, N., at 3 o'clock on Tuesday next, May 1.

MR. F. MAITLAND, M.P.S., President of the Plymouth, Devonport, Stonehouse, and District Chemists' Association, has been unanimously elected Chairman of the East Stonehouse Urban District Council.

A CARBOY OF CARBON BISULPHIDE exploded on Saturday, April 21, in the cellar of premises occupied by Messrs. Max Schliephak, Limited, manufacturing chemists, Charlotte Street, Fitzroy Square, W. The front of the shop was destroyed, also nearly the whole of the contents, and certain damage was done to the adjoining buildings. The explosion was attributed to the sudden change in the weather from cold to heat.

MR. F. D. PHILLIPS, M.P.S., who was for some years senior assistant with Messrs. Davies and John Bath, and latterly managing one of Messrs. Cruse and Co.'s businesses at Southsea, has taken over the old-established business hitherto carried on by Mr. W. Williams, chemist and druggist, at 17, Market Street, Haverfordwest. Alterations are being carried out by Messrs. Parnall and Son, Bristol.

TRADE NOTES.

GILBERTSON'S ILLUSTRATED PRICE LIST.—Messrs. H. Gilbertson and Sons, Limited, 11, St. Andrew Street, Holborn Circus, E.C., have just issued a new "prices current" of their goods, including druggists' sundries, shop fittings, show-cases, etc. The list, which is well printed and illustrated, contains over eighty pages, and the prices bear favourable comparison with those of any other sundry house.

MESSRS. WILCOX AND Co. intimate that they have recently enlarged and refitted their premises in the Haymarket, where business has long been carried on under the name of G. Jozeau, and that after May 1 their wholesale and retail business of importers and dealers in foreign pharmaceutical preparations, etc., will be transferred and continued at the one address—49, Haymarket, under the title of Wilcox, Jozeau, and Co.

KEATING'S NEW PATENT BELLOWS FOR INSECT POWDER.—An effective means of distributing "Keating's" in crevices and the haunts of beetles and other insects is provided by the new patent bellows, recently introduced by Messrs. Keating. The bellows consist of a flat circular tin, having a long thin nozzle, the expelling force being an ingenious arrangement in the lid, which can be removed for refilling. The retail price of the bellows, filled with insect powder, is 9d.

NATIONAL PHOTOGRAPHIC AND ALLIED TRADES' EXHIBITION.—Mr. Fredk. Boehm, 16, Jewry Street, London, E.C., announces that he has secured Stand No. 7 at the exhibition to be held in the Portman Rooms, Baker Street, London, from April 27 to May 5, and intends to exhibit chemical preparations on behalf of the following firms:—Administration der Minen, Buchsweiler; Heidelberger Gelatine-Fabrik (Stoess and Co.), Ziegelhausen; Deutsche Gold and Silber Scheide-Anstalt, Frankfurt a/Main; E. Merck, Darmstadt.

TOWNSEND'S "CENTURY" BILLS.—Messrs. James Townsend and Son, Little Queen Street, Exeter, send a set of attractive, illustrated handbills, assorted in pink, primrose and blue colours, advertising various preparations sold by chemists. Those bills should, if wisely distributed, effectively direct the attention of the public to the articles advertised thereon. A sample set will be sent to any chemist on applying to the firm.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, APRIL 25, 1900.

Business continues quiet here, but prices remain firm. In consequence of the abnormal prices asked and obtained for Linseed during the week, the oil has reached a figure higher than has been reached during the last twenty-five years, and fully 2s. 6d. per cwt. dearer than that quoted last week. Other oils are as last week, except Cottonseed, which has risen, as usual, in sympathy with Linseed Oil. Spirits of Turpentine experienced a rapid fall in price early in the week, due to arrivals from America, but a shortage being again felt the price has risen to last week's quotation. Good sales of Honey, both Peruvian and Chilian, have been made, and Ginger and Chillies, both of West African origin, have been largely dealt in. Chemicals have been quiet, and are without alteration.

AMMONIUM SALTS.—Sal ammoniac still selling at 38s. to 40s. per cwt. Sulphate is quiet at £11 12s. 6d. per ton, an easier rate than last week.

BLEACHING POWDER—Sells well at the firm price of £7 to £7 10s. per ton.

CHILLIES.—Sierra Leone, of good quality, have changed hands at 42s. 6d. per cwt.

LINSEED—Is very strong, and 100 tons of Calcutta 4 per cent. sold, to arrive shortly, at 51s. per 416 lbs.—the highest figure made for 25 years. 6,000 bags, or about 400 tons, of River Plate sold for 48s. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor is firm, with fair inquiry and satisfactory sales. 100 cases of Calcutta to arrive, Jan.-March shipment, sold at 3 31-64d. per lb., 100 ditto 3½d., and 50 3 15-32d. 500 cases to arrive July-August made 3½d., 250 cases to arrive April 3½d., and now 3½d. is asked for oil in similar forward position. Spot prices are: Calcutta 3½d. per lb., French, first pressure, 3½d. (5 tons sold); second pressure, French or Belgian, 3½d., and Madras 3½d. per lb. Olive is only selling to small extent, but is held for £35 10s., and £36 per tun for Seville. Linseed Oils of Liverpool make have advanced rapidly from 27s. 3d. and 27s. 6d. per cwt. to 30s. 6d. and 31s.—a price not reached in 1880. Cottonseed Oil: Liverpool, refined, has advanced to 24s. 6d. and 25s. per cwt., packed in export barrels. Spirits of Turpentine, after dropping to 41s. 6d. per cwt., rose again to 43s., at which figure they are stationary.

POTASSIUM SALTS.—Bichromate, 4d. per lb. Chlorate, 4½d. to 4¾d. per lb. Cream of Tartar is quiet at 74s. to 80s. per cwt. Pearlashes are 33s. 6d. to 35s. per cwt. Potashes have a slow sale on the spot at 27s. 6d. to 27s. 9d. per cwt. Prussiate is firm at 8d. per lb.

SODIUM SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Borax is firm at 17s. and 18s. per cwt. Caustic Soda, 70 to 77 per cent., £11 per ton; 70 per cent., £10 5s.; 60 per cent., £9 5s. Crystals, £3 5s. to £3 7s. 6d. per ton. Nitrate is only in moderate request on the spot at 8s. 6d. to 8s. 9d. per cwt.

LONDON, THURSDAY, APRIL 26, 1900.

Business in drugs and chemicals has been quiet during the past few days, and with the exception of a slump in the speculative market for quinine and a further advance in English makers' price for refined camphor, there are no changes of any particular importance to record. Quicksilver is rather lower, but so far there is no change in price of mercurials. Iodines still unchanged, although the position continues unsettled. Carbolic the turn harder, as also is citric. Cocaine also appears to have a slightly upward tendency. Glycerine remains firm. Cod liver oil dull and weak. Bromides very firm. Acetanilide, phenacetine, and sulphonal unchanged. Salicylates and salol without change. The following are the prices ruling for some articles of principal interest:—

ACID CARBOLIC—Is just a shade firmer, prices remaining nominally about same as quoted last week, both for refined, crude, and liquid.

ACID CITRIC.—There is more inquiry, and tone is decidedly firmer at 1s. 4d. to 1s. 4½d. per lb. for crystals in 5-cwt. casks. It is reported that makers are not willing to make sales for forward delivery.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate very weak; grey, 24 per cent., London, £11 10s.; Hull, prompt, £11 6s. 3d. to £11 7s. 6d. Leith, prompt, £11 7s. 6d. Beckton, £11 10s. Beckton, terms prompt, £11 7s. 6d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

BORAX AND BORACIC ACID.—Steady, at unchanged prices.

CAMPHOR.—Market for crude remains quiet but firm, there being practically no business passing at the moment. For refined English makers advanced their price 1d. per lb. to 2s. 4d. per lb. for Bells and Flowers, Hamburg still quoting a rather lower figure.

CASTOR OIL.—Firm; Belgian, first pressing, spot, £31 10s.; May-June, £30, f.o.b. Antwerp, second pressing, spot, £28 10s. per ton. Hull manufactured, guaranteed cold drawn pure Pharmaceutical, £33 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts £31, seconds £29 per ton in barrels; firsts 3½d. per lb in cases, seconds 3½d., ex-wharf, London.

CLOVES.—At auction, 100 bales Zanzibar offered and bought in at 4½d. 29 cases Penang bought in, good to fine bright picked at 9d. to 1s. 18 cases Ceylon sold, picked dark at 5½d. 6 bags Seychelles sold at 4½d. for fair. Privately Zanzibar are flat and lower, closing with sellers of June-August delivery 4½d., and August-October at 4¾d., but no business whatever has been transacted.

COD LIVER OIL.—Dull and weak. To effect business the agents here would probably accept rather lower prices than they were lately asking, but buyers continue to hang off.

GINGER.—At auction Cochin was more freely offered, but demand was slow and only a little sold at steady rates to some advance for bold Calicut rough. Of 97 cases and 748 bags catalogued 55 packages sold, bold dull rough Calicut, in cases, much limed, at 42s. 6d., cut limed tips at 35s., bright brown ditto at 30s.; the remainder bought in, including good to fine medium and bold cut and scraped at 75s. to 90s.; washed rough, fair to good bright at 32s. to 35s. Jamaica, in large supply and demand, was fair, a good proportion selling at irregular rates. Good to fine quality brought firm prices to 2s. advance. 1,450 barrels and 5 half-barrels offered and 804 packages sold, extra fine bright (½ barrel) at 82s., fair at 61s. 6d. to 65s. 6d., low middling to middling, 54s. 6d. to 60s., good to good common 45s. to 53s., common to fair Rhaton, 40s. 6d. to 44s.

GLYCERIN.—Firm, with a continued upward tendency, although prices are nominally unchanged.

MORPHINE.—Quiet and unchanged, with, however, a firm undertone.

OILS (FIXED) AND SPIRITS.—Linseed quiet, forward positions being 10s. easier. On the spot, pipes, London ordinary, £29 15s. (E. I. 10s. premium); barrels, £29 15s. Hull, spot, naked, £28 10s. Rape quiet, ordinary brown, on the spot, £28; refined, spot, £29 10s. Ravison, naked, spot, £25 10s. Cotton firm; London, crude, spot, £22 10s.; refined, spot, £24 to £24 10s., according to make. Hull, naked, refined, spot, £22 10s.; crude, spot, £21 5s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut steady; Ceylon, on spot, £25 5s. Cochin, spot, £28 10s. Palm: Lagos, on the spot, quoted £28. Petroleum Oil steady; Russian, spot, quoted 6½d. to 7½d.; American, spot, 7½d. to 7¾d.; water white, 8½d. to 8¾d. Lubricating: Pale American, spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian, black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American, 8¾d. to 9d.; deodorised, 10d. to 10½d. Turpentine quiet; American, spot, 41s. 6d.; April, 41s. 6d.; May 40s. 9d. to 41s.; June, 37s.

OPIUM.—Prices are firm. There is, however, but little business passing in the article at the moment.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals, 4½d. net, powder 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small cryst. quoted 50s. to 60s. per cwt., according to make; large crystals 5s. per cwt. more. Prussiate, yellow, English makes, 8d., Beckton 7½d.; red 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUICKSILVER.—The importer reduced his price 2s. 6d. per bottle, to £9 10s.

QUININE.—A fair business has been done in best German brands, but at declining prices. The sales are about 80,000oz., comprising B&S and/or Brunswick May delivery at 1s. 3d. to 1s. 2¾d. and since reported at 1s. 2¾d., June at 1s. 3¼d. to 1s. 3½d., and August at 1s. 3¾d. Makers of these brands maintain their price of 1s. 4½d. per oz. for the Sulphate in 1,000-oz. lots, in 100-oz. tins. With regard to the above reported sales in the speculative market, it is believed that some of them, at least, are "bear" sales, the ultimate result of which may very likely prove anything but advantageous to those who have sold.

SHELLAC.—The market remains very quiet, and privately little business of importance has occurred in any position, but prices show no quotable change. The auctions were resumed on Tuesday, after having been suspended since the 3rd inst. Supplies were small, but demand slow, the few cases of Second Orange sold bringing about previous rates, TN. value being 59s. to 60s. Rangoon Garnet steady. Button all bought in. A total of 502 cases offered and 39 cases sold. Second Orange: Of 250 cases 30 cases sold, good bright reddish at 60s., flat livery at 58s., fine lemony LM& Co. little matted bought in at 73s., and good to fine pale BR&Co. A1, more or less cakey and blocky, at 70s. to 74s. Garnet: Of 46 cases 9 sold, fair flat "Rangoon" at 58s., blocky AC. bought in. 502 cases Button offered and all bought in. Futures continue dull and inactive, with sellers of TN Orange at 55s. per cwt., c.i.f., for April-June shipment, and at 60s. for August delivery.

SODIUM COMPOUNDS.—Crystals, barrels, quoted 60s., bags 57s. 6d. Acetate, £14 per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. Bromide, 2s. 2½d. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 16s. 3d.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate (Salt Cake), £1 7s. 6d. per ton. Sulphide crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: No Singapore offered; 64 bags Alleppy bought in at 6d. to 6¼d., also 200 bags Penang at 5¾d. White Pepper: 43 bags Singapore bought in at 10½d., and 69 bags Penang at 8¾d.; 33 bags Ceylon sold at 8¾d. Capsicums quiet but steady; good bright cherry pods bought in at 45s., and 5 bales fair bright long sold at 31s. Cinnamon Chips and Bark dull; of 720 bags only 20 bags Chips sold, fair at 3¾d. Nutmegs slow of sale; 83 packages West Indian sold, 69's at 1s. 9d., 73's at 1s. 7d., 96's at 1s., 117's to 121's at 10½d. to 11d., 136's at 9d. to 9½d., 140's at 7½d. Mace quiet; 3 cases Penang bought in; 22 packages Bombay wild sold, fair pale at 5d. to 5¼d., reddish at 4d., pickings at 3d. Pimento steady; of 414 bags 115 sold, ordinary to middling at 3¼d. to 3¾d.

SULPHONAL.—It is reported that a Swiss maker who had been selling the article at lower figures than those fixed by the combined makers is not delivering promptly against his contracts, consequently buyers have had to revert to the other makers, who maintain price of 16s. 3d. per oz. for the Hydrochlorate in 200-oz. lots. The market has assumed a firmer tone, and some people think an advance in price not quite improbable.

TURMERIC.—At auction 920 bags Cochin split bulbs met little demand, and all were bought in, including fair bright at 10s. 6d. 69 bags fair Madras finger retired.

THURSDAY'S DRUG SALES.

To-day's Drug Auctions comprised twenty-one catalogues, making up a very considerable number of lots. Ipecacuanha and Cardamoms sold well. The following are particulars, as far as it has been possible to procure same up to time of going to press:—

ACONITE ROOT.—18 bales Japan, which were catalogued, had been sold prior to the sales.

ALOES.—22 cases Cape part sold at 25s. to 29s. per cwt., according to quality. Other 50 cases chiefly bought in at 28s. to 30s. per cwt. for good hard bright quality, the less desirable selling at 25s. to 26s. per cwt. 6 cases Zanzibar in skins sold at 50s. to 57s. 6d. per cwt. for good and 40s. per cwt. for lower quality. 20 kegs Socotrine were taken out at 75s. per cwt.

AMBERGRIS.—4 tins part sold at £5 15s. per oz. for good quality.

ANATTO SEED.—3 bags of fair quality sold at 1¾d. per lb.

ANISEEDS.—30 bags fair Spanish part sold at 27s. 6d. per cwt.

ANTIMONY.—50 cases Japan crude (black sulphide) bought in at £24 per ton.

ARECA NUTS.—90 bags taken out at 20s. per cwt.

ARGOL.—10 bags Cape held for 45s. to 50s. per cwt., only 47s. 6d. being bid for good pale.

ASAFETIDA.—315 packages part sold at 47s. to 81s. per cwt. for medium to fair to good almondy block, heavy sandy block being taken out at 50s. to 55s., lower quality at 30s. to 40s. per cwt. Other 88 cases fair almondy block, some dark, realised about same figures. Other 101 cases, chiefly of low quality, being salvages from a late fire at the docks, and offered without reserve, sold at 6s. 6d. to 18s. per cwt.

BALSAM COPAIBA.—12 barrels thin part sold at 1s. 1d. per lb.

BALSAM PERU.—8 cases were bought in at 6s. 9d. per lb.

BALSAM TOLA.—6 cases were taken out at 1s. 5d. per lb.

BIRD LIME.—8 cases good Japan bought in at 1s. 3d. per lb.

BITTER ALMONDS.—4 cases Bombay taken out at 40s. per cwt.

CAMPHOR.—15 cases Japan refined, each 60lbs. (in ¼oz. tablets and 1lb. tin boxes), were bought in at 2s. 3d. per lb.

CARDAMOMS.—80 cases part sold at 2s. 1d. to 3s. 4d. for medium to fair to good bold Ceylon, Mysore, smaller sizes realising 1s. 1d. to 1s. 3d., 6 cases wild longs part selling at 3s. 2d. per lb., subject to holder's approval. Other 40 cases Ceylon Mysore were chiefly bought in at 2s. 9d. per lb., part selling at 1s. 1d. to 2s. 1d. per lb. 7 cases seeds bought in at 2s. 3d. per lb. Other 26 cases were also chiefly bought in, 3 cases very fine bold at the high price of 4s. 3d. per lb. Another lot of 89 cases sold well up to 4s. 5d. per lb. for fine bold pale Mysore. Seed at 2s. 2d. per lb. 60 cases Mangalores all sold at 2s. 9d. up to 3s. 8d. per lb. for good bold pale.

CASCARA SAGRADA.—60 bags good bright bark bought in at 27s. 6d. per cwt. 143 bags sea-damaged offered, without reserve, sold readily at 15s. to 21s. 6d. per cwt.

CHIRETTA.—15 bales of fair quality part sold at 4½d. per lb.

CINCHONA BARK.—38 serons crown sold at 7d. to 7½d. per lb.

COCAINE.—1 box, about 200 oz. crude, bought in at 14s. per oz.

COCCULUS INDICUS.—64 bags bought in at 8s. 9d. per cwt.

COLOCYNTH.—18 cases fair, small to medium, Turkey bought in at 1s. 6d. per lb. 10 cases fair but broken Spanish were also bought in; 3 cases unpeeled Persian also failed to find a buyer. Other 4 casks good medium Turkey sold comparatively cheaply at 1s. 2½d. to 1s. 3d. per lb.

DRAGON'S BLOOD.—11 cases dull reeds bought in at £11 to £11 10s. per cwt. 20 cases also bought in at 75s. per cwt. for Zanzibar drop.

ESSENTIAL OILS.—Two cases Bergamot bought in at 7s. per lb. 21 cases Lemon at 4s. 3 drums. 8 cases Pimento at 8s. per lb. 10 cases Cajeputa at 3s. per bottle. 9 cases Lemongrass sold at 2¾d. per oz. 15 cases Eucalyptus taken out at 1s. 10d. per lb. Other 7 cases of only commercial quality at 7d. per lb. 4 cases West Indian Distilled Oil of Limes sold at 3s., and one case of superior quality as 7s. per lb. 1 case Citronelle bought in at 1s. 2d. 4 cases Cinnamon Leaf at 1s. 6d. per oz. 5 boxes Bay Oil at 6s. 3d. per lb.

GAMBOGE.—10 cases part sold at £8 17s. 6d. per cwt.; balance bought in at £7 10s. to £9 10s. 5 cases semi-liquid, but of fair colour, offered, without reserve, realised 77s. 6d. per cwt.

GUAZA (HERBA CANNABIS INDICA).—80 bales chiefly fair green tops and 17 bales siftings were all taken out, buyers not being prepared to meet holders' views as to price.

GUM ARABIC.—13 packages sorts were bought in at 45s. to 75s. per cwt. 15 bales Aden gum were taken out at 50s. per cwt.

GUM BENZOIN.—49 bales part sold at £7 15s. for medium to fair Sumatra seconds. Other 23 cases were taken out at £8 and 30 cases Palembang at 55s. per cwt. 13 cases Siam all bought in at £9 to £11 per cwt. for small to loose almondy.

GUM ELEMI.—4 cases of very dark colour taken out at 85s. per cwt.

GUM GALBANUM.—13 bales were bought in at 1s. 1d. per lb. for good blocky and 9d. per lb. for only fair.

GUM GUAIAECUM.—12 bales good glassy block part sold at 1s. 4d. to 1s. 6d. per lb., and at 1s. 2d. per lb. for rather drossy.

GUM KINO.—14 cases genuine black Cochin were taken out at 1s. 6d. per lb., and 2 cases East African at same figure.

GUM MYRRH.—For 19 packages, chiefly dark blocky, part siftings, only 25s. per cwt. was bid, which offer was declined. 3 bales of better quality sold at 48s. per cwt., subject to owner's approval. 9 bales dark blocky, offered without reserve, only realised 15s. per cwt. 5 casks fair sorts were taken out at 55s. per cwt.

GUM TRAGACANTH.—2 cases fair white were taken out at £15 per cwt., lower grades selling without reserve at £5 15s. to £9 15s., according to quality; 1 case, badly sea damaged, at 45s. per cwt.

HONEY.—26 packages fair Jamaica part sold at 30s. for cases and 25s. for barrels. Other 6 casks Jamaica sold at 29s. per cwt. for good quality down to 25s. Other 56 packages Jamaica sold freely up to 31s. 6d. per cwt.

IPECACUANHA.—28 bales fair to good Rio nearly all sold at 11s. 3d. to 11s. 6d. per lb. Other 17 bales all sold at 11s. 5d. to 11s. 8d. per lb. 5 bags Carthage 1 CCD were taken out at 8s. per lb. Other 6 packages selling readily at 7s. 6d. to 7s. 8d. per lb. for 3 and 4 CCD.

JALAP.—39 bales sold at 6d. per lb. for good bold heavy tubers, down to 5d. to 5½d. per lb. for smaller.

LEMON JUICE.—8 hogsheads of new juice were bought in at 1s. 4d.

LIME JUICE.—60 packages West Indian were all taken out at 1s. 9d. per gallon.

LIQUORICE JUICE.—14 cases, each about 2cwt., in 2-oz. sticks, marked "Barone Amarelli," were taken out at 65s. per cwt.

MATICO LEAVES.—8 bales fair green but broken part sold at 2d. per lb., subject to owner's approval.

MUSK.—6 tins of low quality were bought in at 25s. per oz.

NUX VOMICA.—328 pockets dull Calcutta were taken out at 10s. per cwt. 117 bags small dull Cochin all sold at 7s. per cwt.

OPIUM.—4 packages Turkey, quality of which did not, however find favour in buyers' eyes, were taken out at 7s. to 7s. 6d. per lb.

ORANGE PEEL.—9 packages part sold at 2½d. per lb. for thick cut and 6d. per lb. for thin cut.

ORRIS ROOT.—13 bags only fair Florentine were taken out at 50s. per cwt.

OTTO OF ROSES.—5 vases bought in at 12s. to 17s. per oz.

PATCHOULI LEAVES.—14 bales of only medium quality were bought in at 5d. per lb.

SARSAPARILLA.—20 serons fair to good Honduras were taken out at 1s. 6d. to 1s. 8d. per lb. 49 bales Jamaica all sold at 1s. 6d. per lb. for the sound, down to 1s. 4d. per lb. for 1 C.C.D., and 1s. 3d. per lb. for 2 C.C.D.

SCAMMONY.—10 cases were all bought in at 14s. to 22s. per lb., according to quality.

SOY.—12 casks China taken out at 1s. 2d. per lb.

SQUILLS.—14 bags were taken out at 2d. per lb.

TAMARINDS.—20 barrels West Indian sold at 12s. 6d. per cwt.

TONQUIN BEANS.—1 cask good Angostura held for 3s. per lb. 3 cases Paras sold at 1s. to 1s. 8d. per lb.

TURMERIC.—50 bags China sold at 28s. per cwt.

VANILLINE.—300oz. of French make offered without reserve only realised the low price of 1s. 11d. per oz.

WAX.—Fair to good Madagascar realised £6 10s. to £7 2s. 6d. per cwt. Madras and Calcutta bought in at £6 10s. 5 cases bleached American at £8 (only £7 17s. 6d. being bid); good Zanzibar fetched £7. 54 packages fair to good Jamaica sold readily at £7 2s. 6d. to £7 10s. 26 cases Bombay part sold at £6 2s. 6d. per cwt.

EXCHANGE COLUMN.

OFFERED.

2 lb. Potass. Iodid., 19s.; 1 oz. Cocain Hydrochlor., 17s.—Eastman, Forest Lane, Stratford.

To Dispose of, last five years' "Chemist and Druggist," "Pharmaceutical Journal," "British Colonial," unbound; "Enterprise" Tincture Press, never used.—Hamiltons, Chemist, Bangor, Wales.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Calendar for the Week.

Sunday, April 29. 2nd after Easter. ☉ 5.23 m. Sun rises 4.38; sets 7.16.

Monday, April 30. Sun rises 4.36; sets 7.18.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION, Church House, Church Street, at 8.30 p.m.—Selection of Candidates for the Pharmaceutical Council.

Tuesday, May 1. Sun rises 4.33; sets 7.21.

CANWAL, LIMITED, 112, Pembroke Street, Caledonia Road, London, N., at 3 p.m.—Statutory Meeting.

CHEMISTS' ASSISTANTS' UNION, Horse Shoe Hotel, Tottenham Court Road, London, W.C., at 8.30 p.m.—Smoking Concert. All chemists and their assistants invited.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 5 p.m.—Annual Meeting.

Wednesday, May 2. Sun rises 4.32; sets 7.22.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of the Council.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION, Albert Hotel, at 9 p.m.—To discuss (a) Clause 2 of the Companies Bill; (b) Chemists' Defeuce Association, Ltd. Address by W. S. Glyu-Jones.

Thursday, May 3. Sun rises 4.30; sets 7.24

CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers by A. W. Gilbody, W. H. Perkin, jun., and J. Yates; and F. D. Chattaway and K. J. P. Orton.

CHEMISTS' ASSISTANTS' ASSOCIATION, 73, Newman Street, London, W., at 9 p.m.—Annual General Meeting.

LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers on "The Movements in Fishes," by Prof. R. J. Anderson; "New Species of Halimeda, from Funafuti," by Miss E. S. Barton; "West Indian Fungi," by Miss A. L. Smith.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor Dewar on "A Century of Chemistry in the Royal Institution."

Friday, May 4. Sun rises 4.29; sets 7.25.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Professor T. E. Thorpe on "Pottery and Plumbism."

Saturday, May 5. Sun rises 4.27; sets 7.27.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

Charles James Mouncey and James Wood Boyd, Physicians and Surgeons, Haydock Street, Earlestown. Debts will be received and paid by C. J. Mouncey.

Henry Edward Brameld and Ernest Joseph Burnett, Physicians and Surgeons, Saltburn-by-the-Sea. Debts will be received and paid by E. J. Burnett.

Thomas Ingham and Thomas Joseph McCulloch, Manufacturing Chemists and Drysalters, 4, York Street, Manchester, and Green Lane Chemical Works, Padiham, near Burnley.

Roderick Frazer Mackenzie and Arthur James Henry Boyton, Physicians and Surgeons, Grove House, Vauxhall, and 167, Broad Street, Birmingham. R. F. Mackenzie will in future practise at 167, Broad Street, and A. J. H. Boyton at Grove House, Vauxhall.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet it is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

$\frac{1}{2}$ -lb. jars (=3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free

Full directions and attractive labels and handbills in crimson and bl free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

Marriages.

SNOWDEN—COULSON.—On April 18, at the Albemarle Baptist Church, by the Rev. A. E. Dearden, Arthur Sidney Snowden, chemist and druggist, youngest son of the late Jacob Snowden, to Mary Elizabeth, eldest daughter of John Coulson, both of Scarborough.

CROOK—HACKING.—On April 25, at St. Paul's Church, Blackburn, by the Rev. D. E. Davies, Thomas Crook, M.P.S., only son of the late Levi Crook, to Hettie, daughter of the late John Hacking.

Pharmaceutical Society of Great Britain.

ANNUAL GENERAL MEETING.

NOTICE IS HEREBY GIVEN that, in accordance with the provisions of the Royal Charter of Incorporation, the Fifty-Ninth Annual General Meeting of the Members of the Society will take place at 17, Bloomsbury Square, on *Wednesday, May 16th, 1900*, at noon precisely, for the purpose of receiving the Report of the Council, and of Electing the Council and Auditors for the ensuing year.

RICHARD BREMRIDGE,

Secretary and Registrar.

17, Bloomsbury Square, London, W.C

NEWS IN BRIEF.

MR. J. LAIDLAW EWING, J.P., has been elected one of the directors of the Edinburgh Chamber of Commerce.

MR. JAMIESON LAMONT MORTON, M.P.S., has taken over the business formerly conducted by his father at Market Place, Ramsgate.

MR. PERCY KNOTT, M.P.S., at the last meeting of the Bolton Board of Guardians, was unanimously elected vice-chairman for the ensuing year.

MESSRS. MAY'S DRUG STORES, LIMITED, have disposed of their Upper Tooting branch, at 269, Balham High Road, S.W., to Mr. J. E. Monaghan, chemist and druggist. Is this a sign of the times?

MR. GEORGE MACKIE, M.P.S., has purchased the old-established business carried on by the late Mr. D. Gorrie at 31, Minto Street, Edinburgh, of which he has had the sole management for nearly two years.

"ERRAND BOY WANTED, by Doctor; a suitable one would be taught to dispense, and found regular work.—K 36, 'Evening Post' Office." The foregoing advertisement appeared recently in the *Nottingham Evening Post*. Comment is needless.

MR. J. W. DEAKIN, M.P.S., has been re-elected Chairman of the Northwich Urban Council. He has also been the recipient of a beautiful silver cradle, presented to him by his colleagues and the staff of the Council in commemoration of the birth of a son during his first year of office.

DR. FARQUHARSON has introduced a Bill to amend the law relating to medical officers of health, inspectors of nuisances, and sanitary inspectors, and to provide for suitable pension allowances to such persons, as well as to permit of contributions being made towards such allowances by the officers themselves.

MESSRS. MAX SCHLIEPHAX, LIMITED, of 44, Charlotte Street, W., write to say that the cause of the fire and explosion which occurred at their premises on April 21, and was referred to in last week's Journal, has not yet been determined. They state that the carbon bisulphide was stored in a metal drum weighing about one hundred-weight, which not only did not explode, but was taken out intact after the explosion.

MR. SAMUEL LAWRENCE, M.P.S., Oban, has erected a commodious warehouse and laboratory in John Street, where he now conducts his wholesale and manufacturing business, especially in his medical, toilet, household, and veterinary specialties. The new premises adjoin the retail shop in George Street. On the opening day more than 100 of the leading citizens visited the new premises, and were shown over them by Mr., Mrs., and Master Lawrence, and afterwards entertained to cake and wine.

THE CHEMISTS' ASSISTANTS' UNION closed the winter session with a smoking concert on Tuesday, May 1, at the Horse Shoe Hotel. The attendance was not quite so numerous as usual. The chair was taken by Mr. A. Cooper, who in the course of his remarks impressed upon his hearers the necessity of being practical in their work. An excellent programme had been arranged, under the direction of Mr. Cyril Davis, in which Messrs. Tasker, Sillitoe, H. Buckland, Tom Taylor, A. P. Wilkinson, Dyce-Scott, W. Coates, and S. Bryant took part. During the evening Mr. C. E. Pickering, the assistants' candidate, asked his fellow-assistants to support him at the coming election, stating the policy he intended to pursue if elected. Mr. E. Whineray (President) had also a few words to say on the remuneration of assistants and long hours. A vote of thanks to the Chairman, proposed by Mr. A. C. Wootton, followed by the singing of the National Anthem, closed the concert at 11.20 p.m.

THE INTER-PHARMACY FOOTBALL LEAGUE CUP.—The idea of forming a pharmaceutical football league had its origin amongst the "Square" students of the Session 1898-99. A committee, consisting of two representatives from each of the London Schools of Pharmacy, was formed, and met at 17, Bloomsbury Square to

draw up the rules of the league. Subsequently, Mr. W. Watson Will, of the Metropolitan College of Pharmacy, kindly presented the league with its first cup, a photo of which is reproduced herewith. The cup has to be won three times consecutively before becoming the property of the winning team, the proud holders of the cup this year being the "Square" team. The following colleges are associated with the league:—(1) The School of

Pharmacy; (2) the Metropolitan College of Pharmacy; (3) the South London School of Pharmacy; (4) the London College of Pharmacy; (5) the Westminster College of Pharmacy. The officials for the season 1899-1900 were:—President, Mr. Walter Hills; vice-presidents, Professor J. Norman Collie, F.R.S., Messrs. A. H. Mitchell Muter, G. S. V. Wills, W. Watson Will, and H. Wootton; hon. treasurer, Mr. George S. Branch; hon. sec., Mr. J. Evans.

TRADE NOTES.

MERCK'S DIGEST, No. 7, treats of iodipin and bromipin, easily absorbable organic substitutes for iodides and bromides. It is published at Darmstadt by E. Merck.

"BRITISH EMPIRE" SACHET.—Messrs. Ayrton and Saunders, Hanover Street, Liverpool, have introduced the "British Empire" Sachet as a "souvenir of the times." It is attractively got up in red, white and blue colours, with gilt border, and has, in addition to a portrait of the Queen Empress, pictorial representations of the colonies and the national emblems, and a copy of Rudyard Kipling's appeal on behalf of "The Absent-Minded Beggar." Particulars as to price, etc., will be supplied by the firm on application.

KHAKI-COLOURED COURT PLASTER.—Messrs. Max Schliephax, Limited, 44, Charlotte Street, Fitzroy Square, W., intimate that they have taken over the business of Messrs. Glover and Co., 19, Gough Street, W., which firm has manufactured waterproof court plaster since 1827 as a specialty. The latest novelty in that line is a khaki-coloured court plaster which may suitably replace the ordinary black plaster now in use.

MARKET REPORT.

LIVERPOOL, WEDNESDAY, MAY 2, 1900.

The advances in Linseed and its Oil and Cottonseed, together with the high rates for Spirits of Turpentine have not been appreciably reduced during the week. Sales of Honey, Chilian and Californian, have been effected, the latter at high rates; whilst Beeswax of West African and Chilian origin has found ready buyers. In Spices good amounts of Sierra Leone Ginger, both spot and forward, have changed hands, together with Chilies and Madras Turmeric. In the Chemical Market prices remain unchanged, but demand has been limited.

AMMONIA SALTS.—Sal Ammoniac is firm at 38s. and 40s. per cwt. Sulphate is dull at £11 10s. per ton.

BEEWAX.—15 sacks of Chilian sold at £7 10s. per cwt., and 6 of Gambia made £7 5s.

BLEACHING POWDER.—Is firm at £7 to £7 10s. per ton.

COPPERAS.—Is firm at 37s. and 39s. per ton.

COPPER SULPHATE.—Is very quiet at £25 5s. per ton.

GINGER.—25 tons of Sierra Leone, on the spot and for forward delivery, found buyers at 27s. per cwt.

LINSEED.—Is still strong, and business is nil in consequence of the high prices asked by holders in any position. North American, November delivery, has been quoted at 43s. 6d. per 416 lbs. River Plate, to arrive shortly, 49s. 6d. Calcutta, April to May shipment, 49s. 3d.; and a small amount of "spot" River Plate, feeding quality, at 51s.

OILS (FIXED) AND SPIRITS.—Castor Oils remain firm at last week's rulings, but the amount of business done is unimportant; Calcutta at 3⁵/₈d. per lb., 1st French 3³/₁₆d. to 3¹/₄d., 2nd Belgian and French 3¹/₁₆d., Madras 3¹/₈d. Olive Oils of Spanish origin are till quoted at £35 10s. to £36 per tun, but trade is in small compass. Linseed Oils of Liverpool pressure have again advanced, and are selling at 31s. per cwt., firm. Cottonseed Oils, Liverpool refined, have likewise risen further, and are now at 25s. 6d. to 26s. per cwt. in export barrels. Spirits of Turpentine are firmly held for 42s. 6d. per cwt.

POTASH SALTS.—Bichromate, 4d. per lb. Chlorate steady at 4¹/₂d. to 4³/₄d. per lb. Pearlash, 33s. 6d. to 35s. per cwt. Potashes, 27s. 6d. to 27s. 9d. per cwt. Prussiate, 8d. per lb. Saltpetre is scarce at 21s. 6d. per cwt.

SODA SALTS.—Bicarbonates, £6 5s. per ton. Borax is firm at 17s. per cwt. Caustic soda, 76 to 77 per cent., £11 per ton; 70 per cent., £10 5s. per ton. Soda crystal, £3 5s. to £3 7s. 6d. per ton. Nitrate is steady at 8s. 4¹/₂d. to 8s. 9d. per cwt.

TURMERIC.—52 bags of Madras, split bulb, sold at 10s. per cwt. in store.

LONDON, THURSDAY, MAY 3, 1900.

With the exception of a renewed speculative flutter in Sulphate of Quinine (it being rumoured that the "bears" have been "caught short"), business in Drugs and Chemicals has been quiet during past week. Linseed Oil is dearer. Glycerin continues firm, as also does Camphor. Acid Carbolic has slightly recovered. Salicylates and Salol remain unchanged. Iodides weak. Bromides firm. Cod Liver Oil dull and weak. Cocaine the turn harder. Acetanilide, Phenacetin, and Sulphonal unchanged. Quicksilver and Mercurials steady. Acid Tartaric and Cream of Tartar quiet. Acid Citric slightly dearer. Borax and Boracic Acid unchanged. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE.—Continues dull and weak at 9¹/₂d. to 11d. per lb., according to make, quantity, and packing.

ACID BORACIC.—Unchanged at 26s. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC.—Has been in more active demand, and prices are slightly dearer again. Makers of the refined acid quote 34-35° C. ice crystal 9³/₄d. to 10¹/₄d. per lb., according to make, quantity and packing, 39 to 40° C. ice crystal 10¹/₂d. to 11d., and 39 to 40° C. detached crystals, which is now the quality prescribed by the B.P., 11¹/₂d. to 1s. per lb.; crude, 60° F., 2s. 9d. per gallon; 75° F., 3s. 6d.; Liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon, in 40-gallon casks; ditto, 25 to 30 per cent. of dark colour, 9d. to 10d.

ACID CITRIC.—Is decidedly firmer, makers being unwilling to sell, especially for forward delivery. Price is nominally 1s. 4¹/₄d. to 1s. 4³/₄d. per cwt. for crystals in 5 cwt. casks.

ACID TARTARIC.—Quiet but steady at 1s. 0³/₄d. to 1s. 1d. per lb. for English and 1s. per lb. for foreign.

ACID OXALIC.—Is still quoted 3¹/₄d. to 3¹/₂d. per lb. nett, free delivered, London.

AMMONIUM COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3¹/₂d. to 4¹/₂d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate flat; grey, 24 per cent., London, prompt, £11 7s. 6d. to £11 10s.; Hull, prompt, £11 5s. to £11 6s. 3d.; Leith, prompt, £11 7s. 6d. Beckton; £11 10s., nominal. Beckton, terms prompt, £11 5s. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is quoted £38 to £39 per ton, and crude Japan (Black Sulphide) £22 15s. to £23 10s.

ATROPINE.—Makers are firm at 15s. 6d. per oz. for the Sulphate P.B., and 17s. 10d. per oz. for the pure alkaloid.

BISMUTH.—Unchanged, at 5s. per lb. for the commercial quality of the metal, 5s. 1d. per lb. for the Subnitrate, and 5s. 8d. per lb. for the Subcarbonate.

BROMIDES.—Continue very firm at 1s. 11¹/₂d. per lb. for Potassii Bromid., 2s. 3d. per lb. for Ammon. Bromid., 2s. 2¹/₂d. per lb. for Sodii Bromid. Bromine, 2s. to 2s. 2d. per lb., according to quantity, in 60 lb. cases.

CAMPHOR.—Crude is firm, with, however, practically no business passing. For the refined, English makers quote 2s. 4d. per lb. for Bells and Flowers, tablets being quoted higher in proportion, according to size.

CASTOR OIL.—Firm; Belgian, first pressing, spot, £31 10s.; May-June, £30 10s., f.o.b. Antwerp, second pressing, spot, £29 10s. per ton. Hull manufactured, guaranteed cold-drawn pure pharmaceutical. £33 10s. per ton in barrels, 4d. per lb. in cases. Pure firsts, £31; seconds, £29 per ton in barrels; firsts 3⁵/₈d. per lb. in cases; seconds, 3³/₈d., ex-wharf, London.

CLOVES.—At auction no Penang were catalogued. 4 cases of Zanzibar fine bold picked sold at 6d. Privately, Zanzibar weak and prices are further reduced 1¹/₈d. Business has been done comprising March-May at 4⁵/₈d., June-August at 4³/₈d. to 4⁵/₈d., August-October at 4³/₈d., closing sellers in most positions at 4⁵/₈d. Clove stems: 40 bales Zanzibar bought in at 1¹/₂d.

COAL TAR DISTILLATION PRODUCTS.—Toluol, commercial, 1s. 3d. to 1s. 6d. per gallon; pure, 2s. to 2s. 6d. Benzole, 50 per cent., 8¹/₂d. per gallon; 90 per cent., 7d. Creosote, 3d. to 5d. per gallon, according to quantity, etc. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 5d.; 90 per cent. at 160° C., 1s. 2d.; 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 3³/₄d. per unit; B, 2³/₄d. Pitch, 37s. 6d. per ton, f.o.b. Tar: refined, 14s. per barrel; 2¹/₂d. per gallon; crude, 13s. per barrel; 2¹/₂d. per gallon.

COCAINE.—The combined makers are firm at 16s. 6d. per oz. for the Hydrochlorate in 25-oz. tins for 100-oz. lots, there being now practically no good brands offering at a lower figure from second-hand.

CODEINE.—Remains very firm at 13s. 1d. to 13s. 6d. per oz., according to quantity, for the pure, and 1s. per oz. less for the Muriate, Phosphate, and Sulphate Salts.

COD LIVER OIL.—The agents for the refiners would no doubt accept lower prices than those which they quote nominally—viz., 75s. to 82s. 6d. per barrel for best new Norwegian Oil in tinned barrels of 25 gallons, but at the moment there is practically no business passing in the article.

CREAM OF TARTAR.—First white crystals are still quoted 73s. per cwt. on the spot. Powder, 75s.; ditto, 95 per cent., 76s. per cwt.

ESERINE (PHYSOSTIGMINE).—Very firm at 2s. to 2s. 6d. per gramme, according to quantity, for the Sulphate and Salicylate, and 3s. to 3s. 6d. per gramme for the pure Alkaloid.

GINGER.—At auction the small quantity Cochinchina offered only partly sold. No cut kinds were offered; rough sold at rather easier rates. 205 bags offered and 105 sold, bright Calicut, rough medium and small, some bold at 31s. to 31s. 6d. Washed rough medium and small bought in at 34s. Japan: 100 bags offered and 40 sold previous to auction, remainder bought in at 26s. Jamaica: The small quantity offered met a good demand, good to fine qualities selling at 2s. advance, common and Rhatoon quiet at previous rates. 629 barrels 15 half-barrels and 25 cases offered and 450 packages sold at and since the sale, good to fine bright at 70s. to 78s., fair bright 63s. 6d. to 69s., low middling to middling 54s. 6d. to 62s., common to good common 46s. to 53s.

GLYCERIN.—Crude remains very firm at £35 to £42 10s. per ton, while refined is also firm at 60s. to 65s. per cwt. for English

and 62s. 6d. to 75s. per cwt., according to brand, for German best double distilled, chemically pure, white and odourless, 1260 S.G., B.P., 1898, quality, in tins and cases (2 or 4 × 56 lb. tins in a case).

IODINE AND IODIDES.—Market continues unsettled, the combined makers, however, so far made an alteration in their prices, which remain as follows: Potassii Iodid., 10s. 6d. per lb.; Ammon. Iodid., 13s. 10d. per lb.; Sodii Iodid., 11s. 10d. per lb. Iodine, resublimed, 12s. per lb. Iodoform, crystal, powder, or precipitated, 13s. 10d. per lb. Crude Iodine is still quoted 7½d. per oz.

LYCOPodium—Remains very scarce and dear, 2s. 3d. per lb. being asked for case lots.

MENTHOL.—The favourite Kobayashi brand is quoted 8s. 6d. to 9s. per lb., according to quantity, packed in 5 lb. tins (12 tins in a case).

MERCURIALS—Continue firm at 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for corrosive sublimate, other Quicksilver preparations being quoted in proportion.

MORPHINE—Makers quote 5s. to 5s. 3d. per oz., according to quantity and packing, for the Hydrochlorate Powder, and 2d. per oz. more for the Crystal Salt.

NITRATE OF SODA.—On the spot refined, £9; ordinary, £8 12s. 6d. From the Permanent Nitrate Committee's statistics: 1. Total exports to Europe, April, 1,037,000 quintals; loading for Europe, May 1, 511,000 quintals. 2. Imports, Europe, April, 151,830 tons. 3. Deliveries, Europe, April, 171,450 tons. 4. Visible supply, Europe, May 1, stocks and afloat, 386,350 tons.

OILS (FIXED) AND SPIRITS.—Linseed strong at 10s. advance. On the spot pipes, London, ordinary, £31 (E.I. 10s. premium); barrels, £31; Hull, spot, naked, £28 15s. to £29. Rape steady: ordinary brown, on the spot, £27 15s.; refined, spot, £29; Ravison naked, spot, £25 10s. Cotton firm: London crude, spot, £22 10s.; refined, spot, £24 to £24 10s. according to make; Hull quiet: naked refined, spot, £22 15s.; crude, spot, £21 10s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut: Ceylon, on spot, £25; Cochin, spot, £28. Palm: Lagos, on spot, quoted £27 10s. Petroleum dull and easier for Russian: spot, 6½d. to 6¾d.; American, spot, 7¼d.; Water White, 8¾d. Lubricating: Pale American, spot, 9s. to 10s. 9d.; Black, 7s. to 9s.; Russian black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American, ordinary, 9½d.; deodorised, 9¾d. Turpentine quiet: American, spot, 42s. 6d.; May, 42s. to 42s. 3d.; June, 37s. 3d.

OPIUM—Steady at nominally unchanged price, there being but little doing in the article, quotations are 9s. 3d. to 10s. per lb. for manufacturing and druggists, and 11s. to 11s. 9d. per lb. for soft shipping. Persian firm at 12s. 6d. to 13s. 3d. per lb. for good to fine.

PHENACETIN.—Makers are firm at 5s. 3d. in 5-cwt. lots for both crystals and powder, very little being now obtainable from second hand at a cheaper figure.

PILOCARPINE.—Makers quote 41s. 9d. per oz. for the Hydrochlorate and Nitrate Salts in 8-oz. lots, while second-hand still offer in limited quantity at 37s. 6d. to 40s. per oz.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot London, crystals, 4½d. net; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystal, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUININE.—The market for best German has been steady, although quiet. The sales are about 50,000 oz., comprising B&S and/or Brunswick, May delivery, at 1s. 4½d.; June, at 1s. 4¾d.; and August, at 1s. 4¾d. to 1s. 5d. The landings during April were 152,480 oz., and the deliveries 47,008 oz., making the stock on April 30 3,428,096 oz. (corrected), against 2,287,376 in 1899. Makers of above-named brands still quote 1s. 4½d. per oz. for the Sulphate for 1,000 oz. lots, in 100 oz. tins. The results of to-day's Bark Sales in Amsterdam, which were not known at time of going to press, will possibly have a decided effect on the price of Quinine.

SHELLAC.—The shipments at Calcutta for the past month (as given below) show a comparative increase of 8,300 cwt., the total being 21,600 cwt., against 13,300 cwt. last year. America and the Continent have taken 6,900 cwt. and 1,800 cwt. more respectively;

while U.K. shows a falling off of 400 cwt. The market here remains dull, and business in all positions is quite unimportant, but prices show no quotable change. On the spot the value of TN Orange is 59s. to 60s. for fair, April-June shipment sellers at 55s. c. f. and i., and August delivery at 59s. 6d. The shipments from Calcutta (per Reuter) to the United Kingdom were for the last half of April 2,700 cwt., making 6,300 cwt. for the month, against 6,700 cwt. last year, and to the United States for the last half of April 4,500 cwt., making 9,400 cwt. for the month, against 2,500 cwt. last year. To the Continent the shipments were 3,300 cwt., making 5,900 cwt. for the whole month, against 4,100 cwt. last year. The landings in London in April were 3,537 chests, against 4,105 chests; the deliveries 4,158 chests, against 3,942 chests; and the stock on April 30, 42,941 chests, consisting of 33,748 chests Orange, 1,898 chests Garnet, and 7,295 chests Button, against 46,366 chests last year. Statement of the landings, deliveries, and stocks of Shellac in the first four months of the last three years: Landed (chests), 1900, 18,052; 1899, 13,901; 1898, 23,259. Delivered, 1900, 16,710; 1899, 16,603; 1898, 15,055. Stock, April 30, 1900, 42,941; 1899, 46,366; 1898, 60,152.

SODIUM COMPOUNDS.—Crystals: barrels quoted 60s.; bags, 57s. 6d. Acetate £14 10s. per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d., per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 12s. 6d.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate (Salt Cake), £1 7s. 6d. per ton. Sulphide crystals, £6 10s. Sulphite, £5 15s. per ton.

VANILLA.—At the auctions to-day the good supply of 679 tins was offered, which met a brisk demand, and the bulk sold at irregular, but generally steady, prices for good qualities, while brown and foxy descriptions brought rather lower rates than those ruling at the April sales. Seychelles: Of 395 tins 321 tins sold, fair to good, 8 to 8½ inch, at 24s. to 24s. 6d.; 7 to 8 inch, at 22s. 6d. to 23s.; 7 to 7½ inch, at 20s. to 21s. 6d.; 6½ to 7 inch, at 18s. 6d. to 20s.; 4 to 6 inch, at 15s. 6d. to 18s.; common and mouldy, etc., 10s. 6d. to 19s. Mauritius: Of 199 tins 177 sold, fair to good, 7½ to 8 inch, at 22s. to 22s. 6d.; 6½ to 7 inch, at 19s. to 20s. 6d.; 3½ to 6½ inch, at 15s. 6d. to 19s. 6d.; common and mouldy, 10s. to 15s. 6d. Madagascar: Of 31 tins 28 sold, mouldy and common, 12s. to 16s. Bourbon: Of 43 tins 15 sold, fair, 4 to 7 inch, at 18s. to 19s. 6d.; 4 to 4½ inch, at 14s. 6d. to 15s.; mouldy, 9s. 6d. Tahiti: Of 9 tins 7 sold, brown and mouldy, 4 to 6 inch, at 3s. 6d. to 5s. 6d. The remainder, also Australian, bought in.

EXCHANGE COLUMN.

OFFERED.

Soda-water Trolley.—A boy of eight can easily convey 3 dozen syphons and cases any distance; 37s., carriage paid.—Arthur & Co., Theatre Buildings, Cambridge.

6 doz. 9½d. Beecham's Pills, at 6s. 6d.; 8 doz. 1s. Avenue Gold, at 3s. 6d.; 2 lb. Vermilion, at 2s. 6d.; 4 lb. Pulv. Rhei. Opt., at 2s. 6d.; 15 gross Glass Unions, at 1s.—Green & Co., 36, Lower Marsh, S.E.

2 lb. Potass. Iodid., 19s.; 1 oz. Cocain. Hydr., 17s.; 1½ oz. Morph. Acet., 7s. 6d.; 1 oz. Morph. Tart., 6s. 6d.; ½ oz. Atrop.; Sulph., 7s. 6d.; 2 lb. Bism. Carb., 10s.; 5 lb. Bism. Subnitr., 25s. 10 oz. Quin. Sulph., 12s. 6d.—Eastman, Forest Lane, Stratford.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Calendar for the Week.

Sunday, May 6.	3rd after Easter. ☉ 1.39 m.	Sun rises 4.25; sets 7.28.
Monday, May 7.		Sun rises 4.23; sets 7.29.
SOCIETY OF CHEMICAL INDUSTRY, Burlington House, Piccadilly, W., at 8 p.m.— "The Production of Nitrate of Soda in Chili," by Dr. W. Newton.		
Tuesday, May 8.		Sun rises 4.22; sets 7.30.
ROYAL PHOTOGRAPHIC SOCIETY, 66, Russell Square, London, W.C., at 8 p.m.— "The Effect of Colour on Gradation," by Chapman Jones.		
ROYAL COLONIAL INSTITUTE, Whitehall Rooms, Hôtel Métropole, London, S.W., at 8 p.m.—Paper on "Swaziland," with Lantern Illustrations, by Allister M. Miller.		
Wednesday, May 9.		Sun rises 4.20; sets 7.32.
MIDLAND PHARMACEUTICAL ASSOCIATION, Great Western Hotel, Birmingham, at 7.30 p.m.—Annual General Meeting and Dinner.		
ROYAL SOCIETY, Burlington House, Piccadilly, W.—Annual Conversation.		
Thursday, May 10.		Sun rises 4.18; sets 7.34.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor Dewar on "A Century of Chemistry in the Royal Institution."		
Friday, May 11.		Sun rises 4.16; sets 7.36.
Saturday, May 12.		Sun rises 4.14; sets 7.38.

Marriages.

DUTSON—THOMAS.—At St. Andrew's Church, Llwynypia, on April 30, by the Rev. J. D. James, M.A., Robert Thomas Dutson, chemist and druggist, St. Helen's Road, Swansea, to Agnes Louisa, eldest daughter of Mr. John Thomas, Llwynypia.

EASTES—COLES.—On April 28, at St. Alban's, Holborn, by the Rev. George Hogg, Ernest John Eastes, F.I.C., of 61, Chancery Lane, W.C., and 32, Carlisle Mansions, Westminster, to Arnaud Coles, of Lyston Ville, Malvern, widow of Colonel Charles Henry Coles, Bombay Staff Corps (9th B.I.), and daughter of the late Christian Jacob Ross.

LONDON GAZETTE NOTICES.

PARTNERSHIP DISSOLVED.

Thomas George Kerans and Robert John Collie, General Medical Practitioners, 6, Southwick Place, and 25, Porchester Terrace, Hyde Park, London, W.

RECEIVING ORDER IN BANKRUPTCY.

Andrew Spearing, Physician and Surgeon, Westfield, Liverpool Road, Patricroft, Lancashire.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Austen, Barrow, Bartlett, Benson, Browse, Brunt, Butler, Currie, Davis, Dutson, Gifford, Griffin, Hackforth, Harris, Jelley, Krischke, Lea, Macdougall, Mackie, Metcalfe, Miller, Murray, O'Halloran, Pickering, Pollitt, Schiephax, Smith, Wallis, Ward, Whaley, Whineray, Wilson, Young, Zimmermann.

The Annual Dinner

OF THE

MEMBERS OF THE PHARMACEUTICAL SOCIETY

AND THEIR FRIENDS WILL TAKE PLACE AT

WHITEHALL ROOMS (HÔTEL MÉTROPOLE)

On TUESDAY, MAY 15th, 1900, at 6.45 for 7 precisely.

THE VICE-PRESIDENT—MR. G. T. W. NEWSHOLME—IN THE CHAIR.

TICKETS, ONE GUINEA EACH (including Wine), may be obtained from RICHARD BREMRIDGE, 17, BLOOMSBURY SQUARE, W.C.

NEWS IN BRIEF.

MR. GEORGE JAMES GOSTLING has been unanimously re-elected Chairman of the Urban District Council of Stowmarket.

MR. T. W. ROBSON, Ph.Ch., Tiverton, N. Devon, was last week gazetted to a lieutenancy in Devon and Somerset Engineers.

THE HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION at a meeting held on May 3 decided to support the candidature of the following gentlemen at the coming Council election:—Messrs. Albert Cooper, Walter Gibbons, John Taylor, and A. C. Wootton.

GOLF MATCH.—A most enjoyable match between representatives of the Edinburgh District and Glasgow Chemists was played over the course of the Western Club at Gales, Ayrshire, on Thursday April 26, in delightful weather, the result being a majority for Glasgow of 19 holes.

MR. F. J. HOUSTON, M.P.S., Market Hall, Chesterfield, had much damage done to the stock in his shop by a fire which occurred on Saturday evening, May 5. Benzoline vapour coming in contact with a lighted lamp is supposed to have been the cause of the outbreak.

INTERNATIONAL PHARMACEUTICAL CONGRESS.—Up to the present only the Pharmaceutical Society of Great Britain and the Apotheker-Verein of Athens, together with two French Associations, have announced their intention of being represented at the Paris Congress. The Roumanian Government will be officially represented by Apotheker Popini.

THE FORTY-FIFTH ANNUAL EXHIBITION held under the auspices of the Royal Photographic Society will take place at the New Gallery, 121, Regent Street, London, W., from October 1 to November 3 next. The exhibition, which will be inaugurated on Saturday, September 29, by a private view, followed in the evening by a *conversazione*, will remain open from 10 a.m. till 5 p.m. daily (Sundays excepted), and on Monday, Thursday, and Saturday evenings from 6 till 10 p.m., when lantern slide exhibitions will be given in the North Gallery. The exhibition will be divided into five sections—viz., Selected Pictorial Photographs; General Professional Work; Photographic Apparatus and Material; Photo-mechanical Processes of Reproduction; Scientific Photography and Photography in its Technical Applications. Particulars regarding exhibits may be obtained of the Hon. Sec., Mr. J. A. Hodges, 66, Russell Square, W.C.

TRADE NOTES.

AN EXTRACT from Heinrich Haensel's 'Quarterly Report on Essential Oils and Fruit Essences,' for April, 1900, is published at Manchester by William Poppelreuter, 54, Portland Street, and gives some useful information regarding essential oils.

MESSRS. BURROUGHS, WELLCOME AND CO., London, submit a specimen of quinine hydrobromide tabloids. As is well known, the hydrobromide appears to be less liable to produce cinchonism than any other salt of quinine, and for that reason it is frequently selected when large doses are required. The tabloids are issued in two sizes containing 3 and 5 grains in each.

'PRIMUS' CATALOGUES.—Messrs. W. Butcher and Son, Blackheath, S.E., have recently issued a complete catalogue of the price lists of their photographic and lantern specialties, together with a special list of trade terms, for the private information of dealers only. The catalogue comprises nearly six hundred pages, including a useful index for reference, and is bound in stiff cloth-boards, with eyelet and loop for suspending in a convenient position. Dealers in photographic goods who wish to possess a copy of the catalogue should apply to the firm.

'TESTIMONIALS AND SEASONABLE LINES' is the inscription on the outside cover of a booklet issued by Messrs. J. H. Smith and Co., Newark-on-Trent. As the title of the publication indicates, it contains, in addition to numerous extracts from letters testifying to the general satisfaction given by the firm's Flydoo fly stickers, particulars of several good selling lines suitable for the coming

season. A feature of the booklet, which is very neatly printed, is that the whole of the work of production has been done in the firm's own works.

"VAMPIRE" SPIRAL FLY-CATCHER and CHESHIRE BIRD LIME.—Messrs. Kay Brothers, Limited, St. Petersgate Mills, Stockport, have considerably improved the spiral fly-catcher, introduced by them last season, by the adoption of a new gum, specially prepared for the purpose, and by the use of new machinery, which coats each spiral thoroughly and equally. A novel show-card is sup-

plied with the fly-catchers, calculated to strike the eye and arrest attention, being designed and printed so as to resemble an official "Death Warrant." Messrs. Kay Brothers make a special feature of Cheshire bird lime, put up in decorated tins, to retail at 1d., 2d., 3d., 6d., and 1s. For easiness of handling this method of packing cannot be beaten—moreover, a paper seal put round the tin effectually prevents any leakage. The quality of the bird lime is good.

IMPROVED STILL-HEADS.—Messrs. J. J. Griffin and Sons, Limited, Sardinia Street, London, W.C., are now supplying a series of improved still-heads made in accordance with the designs of Professor Sydney Young, F.R.S., of University College, Bristol. The advantages claimed by Professor Young for his 'Rod and Disc' and 'Pear' still-heads are that they are simpler and better suited for the distillation of small quantities, and that after the distillation is stopped, the liquid returns almost completely from the still-

head to the still. A further advantage "of the Rod and Disc" variety is that the central rod bearing the discs may, after use, be removed and washed. The 'Pear' still-head possesses a special advantage. In the course of a systematic fractional distillation it is necessary periodically to introduce fractions from previous operations. With nearly all other improved still-heads these (cold) fractions must either be introduced at the top of the still-head—involving some risk of breakage if the boiling point of the liquid be high—or the flask must be detached, a troublesome operation probably involving loss of material. With the 'Pear' still-head, however, cold liquid may be introduced without danger of fracture or loss, by means of a long funnel; a practical point of some importance.

MESSRS. BARCLAY AND SONS, LIMITED, 95, Farringdon Street, London, E.C., have been appointed sole consignees in this country for the soaps and perfumery manufactured by Messrs. Rieger, Frankfurt-on-Main. They have also been appointed as sole wholesale agents by the Icilma Company, of Paris, and for the Venus Artistic Printing-out Paper, which gives very beautiful results with very little trouble.

NEW 'NO. 1 MONROE' CAMERA.—Messrs. George Houghton and Son, 88 and 89, High Holborn, London, W.C., claim that the new 'No. 1 Monroe' camera is as perfect a little instrument as it is possible to produce at the price, and in appearance and finish equal to most cameras of the folding type at twice the cost. Complete with three double dark slides ($4\frac{1}{4} \times 3\frac{1}{4}$) it certainly is marvellous value at 30s. It is beautifully finished in every respect, no pains having been spared to make it a thoroughly efficient and practical instrument. The camera is

covered in morocco grain leather, is fitted with leather bellows, the woodwork inside is polished, and all brass parts highly lacquered. It has a single achromatic lens with rotating stops, time and instantaneous shutter, engraved focussing scale, pivoted view finder, and ground glass focussing screen with sky shade. The camera is made in two sizes, $4\frac{1}{4} \times 3\frac{1}{4}$, and 5×4 , measuring $5\frac{3}{4} \times 4\frac{7}{8} \times 2$ in., and $6\frac{3}{8} \times 5\frac{3}{8} \times 2$ in., and weighing 18 ozs. and 21 ozs. respectively. The price of the larger size is 35s.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MAY 9, 1900.

A varied business has been done during the last week at generally higher rates, this being particularly so in Linseed and in oils generally. In Linseed Oil, Cottonseed Oil, and Spirits of Turpentine phenomenal rates have been reached, which at the moment of writing show signs of continuing. Good sales of Chilian produce, viz., Honey, Beeswax, and Quillaya Bark have been effected, the remaining miscellaneous articles dealt in being in Sierra Leone Chillies and Senegal Gum. Chemicals are in much the same state as they have been in for the last three weeks, prices being steady, but business being quiet.

AMMONIUM SALTS.—Carbonate $3\frac{3}{4}$ d. per lb. Sal Ammoniac firm, 38s. to 40s. per cwt. Sulphate is dull at £11 7s. 6d. per ton.

BEESWAX.—5 barrels of American made £7 5s. per cwt.

BLEACHING POWDER.—Is firm at £7 to £7 10s. per ton.

CANARY SEED.—100 bags of Turkish sold for 34s. 6d. per 464 lbs., and now 34s. 6d. to 35s. is asked, but business is quiet.

CHILLIES.—9 bags of Sierra Leone fruit made 45s. per cwt.

COPPERAS.—37s. to 39s. per ton, and very firm.

COPPER SULPHATE.—Is dull at £25 2s. 6d. to £25 5s. per ton.

GUM.—20 bags of Senegal found buyers at the high rate of 52s. 9d. per cwt.

HONEY.—Pile X Chilian has been selling for 32s. per cwt., and Pile 3 at 23s. 6d. Good Californian has also been moving off well from store at 42s. 6d.

LINSEED.—Considerable business has been attempted, but the high rates asked have limited buyers to providing only for their immediate needs. Calcutta, April and May, has been sold at 50s. 9d. to 56s. per 416 lbs. American at 44s. 6d., September and November delivery. River Plate, due, 49s. 9d. to 50s.; feeding quality, 56s., ex quay (200 bags sold, 1,929 offered).

OILS (FIXED) AND SPIRITS.—Castor Oils of all kinds are exceedingly firm with a good demand, and satisfactory business concluded. Calcutta, 30 cases on the spot sold at $3\frac{9}{16}$ d. per lb., and 700 cases forward April to May $3\frac{7}{16}$ d. to $3\frac{8}{16}$ d., price at close $3\frac{1}{2}$ d. per lb., and very firm. Olive is quiet, with Spanish selling at £35 to £35 10s. per tun. Linseed continues to advance with rapidity, and is now offered at 35s. to 35s. 6d. per cwt. casked for export, or 34s. loose. Cottonseed Oil is very firm at 26s. to 26s. 6d. per cwt. for Liverpool refined oil in export barrels. Spirits of Turpentine are very high at present, and are firmly held for 45s. per cwt.

POTASSIUM SALTS.—Unchanged generally.

QUILLAYA BARK.—6 tons Chilian sold, ex quay, at £13 per ton.

SODIUM SALTS.—Unchanged.

LONDON, THURSDAY, MAY 10, 1900.

Business in Drugs and Chemicals has been somewhat disappointing during past week, but beyond a slight weakness in the speculative market for Sulphate of Quinine, caused by the fact that speculators for a rise in this article felt disappointed at the result of last Thursday's Bark Sale in Amsterdam, no changes in value of any special importance have taken place. Acid Carboic is rather dearer. Camphor very firm and rather dearer in Hamburg. Bromides very firm. Iodides so far unchanged. Opium and Morphine steady. Codeine firm, as also is Glycerin. Cod Liver Oil weak. Salicylates and Salol unchanged. Quicksilver steady. Mercurials firm. Acid Citric and Tartaric steady with rather firmer tendency. The following are the prices ruling for some articles of chief interest:—

ACETANILIDE.—Is rather better, there being less pressure to sell at the low prices lately ruling, especially on part of the best makers.

ACID CARBOIC.—The refined Acid is decidedly firmer at about $\frac{1}{4}$ d. per lb. above the prices quoted last week.

ACID CITRIC.—Rather firmer in tone, at nominally unchanged prices, says, 1s. 4d. to 1s. 5d. per lb., according to make and quantity for crystals in 5cwt. casks.

ACID OXALIC.—Steady and unchanged.

ACID TARTARIC.—Steady at nominally unchanged prices.

AMMONIUM COMPOUNDS.—Bromide, 2s. 3d. per lb.; Carbonate, $3\frac{1}{2}$ d. to $4\frac{1}{2}$ d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 35s. to 36s. per cwt. Sal Ammoniac: Firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate, dull; Gray, 24 per cent., London, prompt, £11 6s. 3d.; Hull, prompt, £11 2s. 6d. to £11 5s.; Leith, prompt, £11 6s. 3d.; Beckton, £11 5s.; Beckton terms, prompt, £11 2s. 6d.; Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

BORAX AND ACID BORACIC.—Are in fair demand at unchanged prices.

BROMIDES AND BROMINE.—Are quiet, and without change.

CAMPHOR.—Market is firm, at unchanged prices, both for crude and for English Refined, while the German refiners slightly advanced their prices to nearly same figure as their English competitors.

CASTOR OIL.—Firm. Belgian, 1st pressing, spot, £31 10s.; May-June, £30 10s., f.o.b.; Antwerp, 2nd pressing, spot, £29 10s. per ton. Hull Manufactured: Guaranteed Cold Drawn Pure Pharmaceutical, £34 per ton, in barrels; $4\frac{1}{16}$ d. per lb., in cases; pure firsts, £31 10s.; seconds, £29 10s. per ton, in barrels; firsts, $3\frac{1}{16}$ d. per lb., in cases; seconds, $3\frac{7}{16}$ d., ex-wharf London.

CINCHONA BARK.—At Amsterdam on 3rd instant, 6,855 packages Java offered, and practically the whole sold at a slight advance, the unit average being 10.10 c. per $\frac{1}{2}$ -kilo, against 10.05 c. realised at the previous auctions. The exports of Java bark for April were 524,000 Amsterdam lbs., against 1,009,500 Amsterdam lbs. last year, and 856,000 Amsterdam lbs. in 1898. The total for the four months is 2,418,000 Amsterdam lbs., against

3,034,500 Amsterdam lbs. last year, and 3,225,000 Amsterdam lbs. in 1898.

CLOVES.—At auction 58 bales Zanzibar bought in, good at 4½d.; also 2 cases Ceylon, fair bright picked, little stalky, at 6d.; darker ditto at 5d. Privately Zanzibar have been depressed, and prices for delivery have further declined, ⅓d. arrival being ⅓d. lower. A fair business has been done, comprising for June August delivery at 4⅓d. down to 4½d., and sellers August-October at 4 7-32d. to 4½d., and buyers, and January-March (1901), at 4½d. to 4 1-32d., and sellers; also for arrival December-February and January-March shipment to Holland, at 4d. to 3½d., c.i.f., and sellers.

COAL TAR DISTILLATION PRODUCTS—Are practically without change since last week, with, however, a somewhat firmer tendency.

CODEINE—Continues very firm at 13s. 6d. per oz. for the pure and 1s. per oz. less for the salts.

CODLIVER OIL—Quiet and weak, the downward tendency in values remaining still apparent.

CREAM OF TARTAR—Firm. First white Crystals on spot 73s. Powder, 75s., and 95 per cent., 76s.

GINGER.—At auction the fair supply of Cochin met little demand and was mostly bought in. Of 763 bags and 29 cases offered, only 3 cases sold, cut ends, rather limed, at 35s.; bold and medium, well cut and scraped, bought in at 90s. to 95s. Calicut, rough, fine bright bold, at 50s.; ditto good medium and bold, at 40s.; washed rough, bright medium and bold, at 36s.; and dull medium small at 32s. 6d. to 33s. Jamaica in large supply met a good demand at irregular prices; good and fine qualities at further advance, common qualities and Rhatoon at barely previous rates; 1,271 barrels and 2 half-barrels offered, and 1,100 packages sold at and since sale, good to fine bright, 74s. to 78s.; fair bright, 67s. to 72s.; Rhatoon, at 40s. to 43s.

IODIDES AND IODINE—Are still without change. Buyers, however, continue to supply their wants from hand to mouth only.

MORPHINE—Continues quiet but steady, at 5s. per oz. for the Hydrochlorate powder, and 2d. per oz. more for the crystal salt.

OILS (FIXED) AND SPIRITS.—Linseed: The market has been irregular. On the spot pipers London ordinary, £34 10s. (E.I. 10s. premium); barrels, £34 15s. Hull, spot, naked, £34. Rape dearer. Ordinary brown, on spot, immediate delivery, £28 10s. Refined spot: £29 15s. to £30. Ravison naked spot, £26. Cotton firmer. London Crude spot, £23 paid, closing £23 5s. Refined spot, £24 10s. to £25, according to make. Hull, naked refined spot, £24. Crude spot, £22 12s. 6d. Olive, Mogador, £35. Spanish, £36 10s. Levant, £35. Coconut, Ceylon, on the spot, £25. Cochin, spot, £28. Palm Lagos, on the spot, quoted £27 10s. Petroleum dull. Russian spot, 6½d. to 6¾d. American spot, 7½d. to 7¾d. Water White, 8¾d. Lubricating Pale American, spot, 9s. to 10s. 9d.; Black, 7s. to 9s.; Russian Black, 6s. 6d. to 7s.; Pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American Ordinary, 9½d.; Deodorised, 9¾d. Turpentine, quiet and easier for forward positions. American spot, 45s.; May, 44s. 9d.; June, 39s.; July, 35s. 9d. to 36s.

OPIUM—Steady at nominally unchanged value, a fair amount of business having been transacted during past week for shipping quality at 10s. to 11s. 6d. per lb. Persian is hardly obtainable in good quality, and very high prices, up to 13s. 6d., would have to be paid for really fine.

PHENACETIN—Firm. Second hand is practically sold out, while makers quote 5s. 3d. per lb. for both crystals and powder in large quantity and bulk packing, smaller lots being quoted higher in proportion.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot: London Crystals, 4½d. nett; powder, 4½d. Carbonate, 90 per cent., £19 10s. per ton ex-ship; Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash): 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate refined, £21 5s. per ton. Permanganate, small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow English makes, 8d.; Beokton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUICKSILVER—Firm at £9 10s. per bottle from the importer, second hand still not offering.

QUININE.—The market for best German brands remains quiet, with only a small business, including 25,000 oz. B&S and/or Brunswick, on the spot, at 1s. 3½d., June delivery at 1s. 4d., and August at 1s. 4½d. The result of last week's Bark sales in Amsterdam appeared disappointing to the speculators, hence the weaker tone in the Quinine market. Makers of above-named brands remain firm at 1s. 4½d. per oz. for 1,000-oz. lots in 100-oz. tins.

SHELLAC.—The market maintains the firmer tone, but sellers are still reserved. There is more business doing, however, for arrival, and about 500 cases TN Orange have been sold, comprising May shipment at 56s. 3d., June-July at 57s., and August-October reported at 55s. 6d. to 56s. and buyers, April-June buyers at 56s. and sellers at 58s., c.f. and i. For August delivery there are buyers at 60s. 6d., but no sellers. The demand on the spot is slow, and privately only small sales have occurred at the auction advance. At auction to-day the moderate supply of Second Orange partly sold without reserve at about 1s. advance on last sales' rates, fair TN on a basis of 60s. 6d. Garnet and Button slow of sale. A total of 473 cases offered and 211 cases sold. Second Orange: Of 368 cases 203 sold, without reserve, fair bright flat red at 59s., with one lot 60s., ordinary red, worked, at 58s., livery reddish shivered at 57s., bronzy red ditto at 56s., common flat liver at 55s. to 56s. Garnet: Of 77 cases 5 cases sold, weak glassy blocky AC at 61s., fine flat free G bought in at 63s. Button: 28 cases offered and 3 cases sold, without reserve, ordinary blocky firsts at 59s.

SODIUM COMPOUNDS.—Crystals, barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 10s. per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate landed £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hypo-sulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 20 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 10s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction no Singapore was offered: other kinds steady. Of 454 bags Tellicherry 408 bags sold, fair at 6d. to 6½d.; good bright heavy bought in at 6½d. 201 bags Malabar shot offered and sold, fair heavy at 6d. to 6½d. 361 bags Wynaad bought in 6d. to 6½d. 74 bags Alleppy, 6 bags small, shelly, and dusty, sold at 4½d. Good fair bought in at 6½d. Pepper Dust: 221 bags offered and 21 bags Alleppy sold at 2¾d. White Pepper: At auction 12 cases Singapore sold, fine bold at 11½d. 184 bags fair limed Penang bought in at 8½d. Capsicums slow of sale, and 336 packages Bombay bought in, good bright long at 35s., pale cherry pods, part perished, at 31s., Nepaul character yellow round at 24s., red 23s. 6d. 3 bags Ceylon sold, good bright round on stalk at 53s. Pimento dull: Of 576 bags offered 157 bags sold, ordinary to good at 3d. to 3¼d. Cassia Vera: 94 bags offered and bought in, coarse Padang Quills at 25s. Cinnamon in slow demand, and 185 bales in auction, chiefly wild, bought in. Cinnamon Chips, etc.: 537 bags chiefly bought in. Only 42 bags sold, fair Ceylon quillings at 6¾d. to 7½d., and bark at 2¾d. Fair chips bought in at 3½d. Nutmegs neglected. Mace quiet: 7 boxes Bombay sold at 1s. 4d. to 1s. 2d. 51 boxes Singapore bought in at 1s. 6d. Bombay Wild: 43 cases bought in at 5½d. to 6d. West Indian: 48 packages sold from 1s. 2d. for broken to 1s. 8d. fair to good pale.

SULPHONAL.—Second-hand appears to be wholly sold out. Makers are firm at 20s. 6d. per lb. for both crystals and powder.

THURSDAY'S DRUG SALES.

To-day's drug auctions passed off quietly and without special change, except that Buchu Leaves showed a decline, and Ipecacuanha a firm market. There were only 14 catalogues, containing a comparatively small number of lots, many of which had to be bought in, the following being the particulars:—

ALOES.—20 kegs Socotrine realised 75s. per cwt. Other 20 kegs were held for same figure. 40 cases Cape part sold at 26s. to 29s. per cwt. Other 17 cases Cape part sold at about same figures, according to quality. 150 boxes Curaçoa practically all sold at 22s. per cwt. for good down to 13s. for inferior. 1,416 gourds part sold at 31s. down to 11s. 6d. per cwt., according to quality.

ANNATTO SEEDS.—25 bags were taken out at 3½d. per lb.
ARGOL.—2 bags Cape realised 42s. per cwt.
BALSAM PERU.—4 cases were bought in at 6s. 3d. per lb.
BUCHU LEAVES.—Of 39 bales, medium rounds, part sold at 6d. per lb., balance being taken out at 8d.
CALUMBA ROOT.—Fair brownish sorts were bought in at 23s. per cwt.; stalky ditto at 20s.; 105 bags dark ditto nearly all sold at 12s. to 12s. 6d.
CARDAMOMS.—60 cases small Ceylon Mysore were taken out at nominally 2s. per lb. Another lot of 42 cases ditto part sold at 2s. 3d. to 2s. 4d. per lb., down to 2s. for splits. Another lot of Ceylon realised 3s. 1d. down to 1s. 2d. per lb., splits selling at 11d. to 1s., and seeds at 1s. 11d. to 2s. per lb. Other 85 cases Ceylon sold up to 4s. 2d. for good pale bold Mysore. 5 cases Mangalore Ceylon were bought in at 3s. 6d. per lb. Other 60 cases ditto sold at 3s. 5d. per lb. for very fine down to 1s. 1d.
CINCHONA BARK.—39 serons yellow bark sold at 1s. 4d. per lb. for the sound down to 8d. to 1s. 2d. per lb. for the damaged.
COCCULUS INDICUS.—64 bags were taken out at 8s. 6d. per cwt.
CUSCUS ROOT.—6 bales were bought in without mention of price.
DRAGON'S BLOOD.—Dull reeds were taken out at £9 10s. per cwt. One case fair lump at 18s.
ESSENTIAL OILS.—20 cases fair commercial quality Oil Eucalyptus were taken out at 11d. per lb. 2 Drums Lime Oil at 3s. 1d. per lb., 3 boxes West Indian Bay Oil at 6s. 3d. per lb.
GALANGAL ROOT.—2 bags were bought in at 25s. per cwt.
GROUND NUT KERNELS.—25 bags bought in at £15 per ton.
QUAZA (CANNABIS INDICA).—23 bales dark siftings were taken out at the fancy price of 1s. per lb.
GUINEA GRAINS.—2 bags sold at £7 12s. 6d. per cwt.
GUM ARABIC.—7 cases fair grain realised £6 10s. per cwt.
GUM BENZOIN.—Medium seconds, Sumatra, sold at £6 5s. to £7 per cwt.; finer quality, at £8 10s., 4 cases fine being held for £9 15s., a bid of £9 12s. 6d. being declined. 23 cases Siam all sold at £8 12s. 6d. per cwt. for almonds, down to 55s. per cwt. for low inferior quality.
GUM GUAIAECUM.—5 barrels part sold at 1s. per lb. for fair glassy block.
GUM KINO.—3 boxes genuine red Cochin were bought in at 1s. 9d. per lb.; 3 cases African at 1s. 2d. per lb.
HONEY.—5 cases fair Jamaica were bought in at 27s. per cwt.; another lot of 59 packages part sold at 24s. to 27s. 6d. per cwt., balance being taken out at 25s. to 32s. Other 2 casks of not so good quality sold at 22s. per cwt.; of other 141 packages Jamaica, a considerable portion sold at 27s. down to 22s. 6d. per cwt.
IPECACUANHA.—7 bales Rio sold readily at 12s. to 12s. 1d. per lb. 10 bags Carthagenia part sold at 8s. 6d. per lb. 3 bags ditto, rather mouldy, at 8s. 3d.
LIME JUICE.—16 packages were bought in at 1s. 8d. per gallon; other 12 puncheons at 2s.
MUSK SEED.—1 box sold at 1s. 3d. per lb.
NUTMEG PASTE.—12 cases taken out at 2d. per oz.
NUX VOMICA.—30 bags medium to fair Calcutta sold at 6s. 6d. to 7s. per cwt. 24 bags Cochin at 12s. 5 ditto pickings at 6s. 6d. per cwt.
ORRIS ROOT.—10 bags Mogador bought in at 20s. per cwt.
SAFFRON.—20 tins Alicante were taken out at 28s. per lb.
SARSAPARILLA.—12 bags red native Jamaica were bought in at 1s. 8d. per lb. Other 7 bales part sold at 2s. 1d. per lb. 14 bags Lima were bought in at 1s. 3d. per lb. Other 12 bales Lima sold at 11d. to 1s. per lb. 20 serons Honduras were bought in at 1s. 6d. per lb.
SENNA.—Inferior small leaf Tinnivelly fetched 1½d. per lb. Other 131 bales Tinnivelly, chiefly also of undesirable quality, all sold at 4¾d. per lb. for good down to 1½d. per lb. for low inferior broken and small leaf. 5 bales good Alexandra pods were bought in at 9d. per lb.
TAMARINDS.—43 barrels West Indian realised 12s. 6d. per cwt.
TONQUIN BEANS.—2 cases frosted Paras were bought in at 2s. 2d. per lb.
TONQUIN MUSK.—7 tins bought in at 70s. per oz.
TURMERIC.—175 bags split bulbs sold at 8s. 6d. per cwt. for the sound, and at 7s. 9d. per cwt. for 1 CSD. 10 bags Cochin were bought in at 10s. per cwt., and 93 bags Madras at 34s. per cwt.
WAX.—Fair Zanzibar sold readily at £6 17s. 6d. to £7 per cwt. down to £6 5s. for the less desirable lots; fair Jamaica fetched £7 5s. to £7 7s. 6d. per cwt. 15 cases White East Indian taken out at £7 15s.

Publications Received.

SEMI-ANNUAL REPORT OF SCHIMMEL AND Co. (Fritzsche Brothers). Pp. 68. April, 1900. Leipzig, New York, and London: Schimmel and Co. From the Publishers.

DIE ROHSTOFFE DES PFLANZENREICHES. Von Dr. JULIUS WIESNER. 2 Lieferung (bogen 11-20), mit textfigur 47-71. Price 5 m. Leipzig: Wilhelm Engelmann. 1900. From the Publisher.

REPORT OF THE PHARMACY BOARD OF VICTORIA FOR THE YEAR 1899. (Medical Act, 1890, Part III., and Poisons Act, 1890.) Pp. 7. Melbourne: H. Hearne and Co., Paragon Printers, 1900. From the Registrar.

Obituary.

BRANFORD.—On May 2, Alfred John Branford, Chemist and Druggist, Strand, London, W.C. Aged 53.

HARRIES.—On April 29, William George Augustus Harries, Chemist and Druggist, late of West Croydon. Aged 28.

LONDON GAZETTE NOTICES.

PARTNERSHIP DISSOLVED.

John Hopkin Davies and John Arnallt Jones, physicians and surgeons, of Aberavon and Taibach.

RECEIVING ORDERS IN BANKRUPTCY.

George Weldon, doctor of medicine, 84, Brompton Road, Middlesex.

William Sykes, soap and chemical manufacturer, in partnership with William Burnside Macphail, under the style of Wm. Sykes and Son, 179, Cleveland Street, Hull, and New Bridge Mills, Meltham, near Huddersfield.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

Pharmaceutical Society of Great Britain.

ANNUAL GENERAL MEETING.

NOTICE IS HEREBY GIVEN that, in accordance with the provisions of the Royal Charter of Incorporation, the Fifty-Ninth Annual General Meeting of the Members of the Society will take place at 17, Bloomsbury Square, on Wednesday, May 16th, 1900, at noon precisely, for the purpose of receiving the Report of the Council, and of Electing the Council and Auditors for the ensuing year.

17, Bloomsbury Square, London, W.C.

RICHARD BREMRIDGE,
Secretary and Registrar.

NOTICE OF MOTION TO BE PROPOSED BY MR. F. T. PERCY WELLS.

"That after June 30th, 1890, the undermentioned shall be omitted from the Journal, and printed in the Supplement— 1, Market Reports ; 2, Publications Received, and Reviews and Notices of Books and Preparations ; 3, Extracts from Consular Reports ; 4, Poisoning Cases ; 5, Food and Drugs Act Prosecutions ; 6, English and Scottish News ; 7, Irish News, including Proceedings of the Pharmaceutical Society of Ireland ; 8, Foreign News ; 9, Pharmacy in Australia ; 10, Facts and Fancies ; 11, Reports of Pharmaceutical, Chemists and Druggists, and Assistants' and Apprentices' Associations and Chemists' Assistants' Unions ; 12, Reports of Pharmaceutical Associations ; 13, Obituary Notices ; 14, Report of dinners, suppers, balls and dances ; 15, Proceedings under the Pharmacy Act ; 16, Annotations ; 17, Political Gossip ; 18, Chemists' Defence Association ; 19, Public and Poor Law Dispensers' Association ; 20, Dental and Photographic Notes ; 21, Chemists' Defence Association."

SPECIAL GENERAL MEETING.

A SPECIAL GENERAL MEETING OF THE SOCIETY will be held at 17, Bloomsbury Square, London, W.C., on Wednesday, May 16th, 1900, at the conclusion of the Business of the Annual General Meeting, for the purpose of considering the future working of the Research Laboratory of the Pharmaceutical Society and, if necessary, of considering the manner in which it has been conducted since its establishment.

By Order of the Council,

17, Bloomsbury Square, London, W.C.

RICHARD BREMRIDGE,
Secretary and Registrar.

NOTICE OF MOTIONS TO BE PROPOSED BY MR. E. N. BUTT.

"(a) That the Research Laboratory of the Pharmaceutical Society of Great Britain be reconstituted and placed under the control of a Special Committee consisting of the President, the Vice-President (*ex-officio*) and Two Members of the Council, four Pharmaceutical Chemists not being members of the Council, and the Professors of Chemistry, Botany, and Pharmacy in the School of the Society.

"(b) That the Research Laboratory be used for the purpose of Pharmaceutical investigations and research only and be placed under the direction of the Professors of Chemistry and of Pharmacy.

"(c) That the Special Committee shall have absolute power in selecting the Research workers, the subjects for investigation and control the publication of the results of their investigations. All such workers should preferably be Pharmacists and if necessary may be subsidised."

Calendar for the Week.

Sunday, May 13. 4th after Easter. Sun rises 4.13; sets 7.39.
Monday, May 14. O 3.37 A Sun rises 4.11; sets 7.41.
Tuesday, May 15. Sun rises 4.10; sets 7.42.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, Whitehall Rooms, Hôtel Métropole, London, S.W., at 6.45 p.m.—Annual Dinner.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Dr. A. Hill on "Brain-tissue considered as the Apparatus of Thought."

Wednesday, May 16. Sun rises 4.8; sets 7.44.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of Council, followed at 12 noon by the Annual Meeting of Members and Election of Council, and a Special General Meeting.

Thursday, May 17. Sun rises 4.7; sets 7.45.

CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Paper on "Chlorine Derivatives of Pyridine VI. The Orientation of some Amino-chloropyridines," by W. J. Sell and F. W. Dootson.

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C.—Adjourned Annual Meeting.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 3 p.m.—Professor Dewar on "A Century of Chemistry in the Royal Institution." (Lecture IV.)

Friday, May 18. Sun rises 4.6; sets 7.47.

ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Professor J. A. Ewing, on "The Structure of Metals."

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION, 17, Bloomsbury Square, London, W.C.—Paper on "Explosives," by H. Deane.

Saturday, May 19. Sun rises 4.5; sets 7.47.

CRICKET.—Wadham Lodge—Allen C.C. v. Allenbury's.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the Exchange Column should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., before 5 p.m. on Thursdays.

OFFERED.

30 Bleasdales. What offers? Purchaser pays cost.—Blade, Poulton-le-Fylde.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dercham, Norfolk.

Anomalies and Curiosities of Medicine, by Gould and Pyle, 20/-, offer. Published 34/-, 8 dozen physiology microscope slides, 21/-, offer.—Dr. John Graham, Paisley.

"**Pharmaceutical Journals**" for sale, 1863 to 1871, 1883-4, 1892 to 1899, 16 years at 5/- per annum, or 3 guineas the lot, all without advertisements. Vols. to 1884 bound.—Dispenser, 5, Serle Street.

Books on Pharmacy, Botany, Qual. and Quant. Analysis; "Pharmaceutical Journal," 1874-1892, inclusive; Journal Chemical Society, 1884-1899, and recent Dental Journals, cheap, for cash.—Gatrell, Barnes, S.W.

For Sale.—A quantity of Chemical Apparatus for gravimetric analysis, water analysis and general chemical experiments; also chemicals for the same. All in first-class order. Highest references can be given.—E. A. Bunyard, Kenmore, Maidstone.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Formula suiting good, saleable. Speciality purchased.—W. Lewis, 15, Shelden Street, London, W.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Adeock, Alcock, Armstrong, Ball, Barrie, Bennett, Coleman, Cowgill, Cummings, Foster, Glass, Golding, Gostling, Hall, Hass, Kemp, Latreille, Lloyd, Mortimer, Mumbray, Picken, Scott, Spence, Wallis, Wright.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet it is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free

Full directions and attractive labels and handbills in crimson and bl free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

NEWS IN BRIEF.

EDINBURGH PHARMACY ATHLETIC CLUB.—The ninth annual sports take place on Tuesday, May 22, at Powderhall, commencing at 6.45 p.m.

THE VINOLIA WAR FUND has now reached the sum of £10,000, the twelfth instalment of £1,600 being paid to the Lord Mayor's Transvaal War Fund on May 11.

MR. WILLIAM HENRY POWER, F.R.S., M.R.C.S., has been nominated to be for five years a member of the General Council of Medical Education and Registration of the United Kingdom.

DR. P. N. EMERSON will open an exhibition of his photographic work in the rooms of the Royal Photographic Society, 66, Russell Square, London, W.C., on Tuesday, May 29, at 8 p.m., when he will deliver an address.

THE DISPENSING OF PROPRIETARY ARTICLES will form the subject for discussion at a meeting of the Western Chemists' Association (of London) on Wednesday, May 23. Mr. F. A. Rogers, of Oxford Street, will open the discussion.

MESSRS. LORIMER AND CO., LIMITED, Britannia Row, Islington, N., have secured the services of Mr. T. Goode Joyce, B.S. (Lond.), A.I.C., F.C.S., as successor to the late Mr. Hendry, who was in charge of their laboratories.

ONE OF THE LONDON MAGISTRATES, Mr. Hopkins, has expressed the opinion that a person cannot sell, as a specific, a medicine compounded by himself and not under a doctor's prescription, without making himself liable to pay duty.

MR. J. PATTISON GIBSON, M.P.S., of Hexham, has been interviewed by a representative of the Newcastle-upon-Tyne *Evening Leader* with respect to the natural beauties of Northumbria, of which he has made—photographically—a special study since the year 1856.

THE ALBERT MEDAL of the Society of Arts has been presented to Sir William Crookes, F.R.S., "for his extensive and laborious researches in chemistry and in physics, researches which have in many instances developed into useful practical applications in the arts and manufactures."

THE COUNCIL OF THE ROYAL SOCIETY, at its meeting on May 10, recommended the following fifteen gentlemen for election as Fellows:—C. J. Burch, M.A., Leonard Hill, M.B., J. Horne, F.G.S., J. J. Lister, M.A., J. G. MacGregor, D.Sc., P. Manson, C.M.G., M.D., T. Muir, LL.D., A. A. Rambaut, M.A., W. J. Sell, M.A., W. Baldwin Spencer, B.A., J. Walker, D.Sc., P. Watts, and C. T. R. Wilson, M.A.

DR. ALFRED HILL, Medical Officer of Health for Birmingham, in his annual report, states that eighty-five samples of drugs were analysed, nineteen samples, or 22 per cent., being found to be adulterated. Of fifty-six samples purchased of registered chemists and druggists eight, or 14 per cent., were condemned. Of twenty-nine samples bought of unqualified persons eleven, or 38 per cent., were adulterated.

LIEBIG'S EXTRACT OF MEAT COMPANY, LIMITED.—At a board meeting, held on May 10, it was resolved to recommend at the next ordinary general meeting of the company, to be held on June 7 next, a distribution of a final dividend for the year 1899 of 15 per cent., free of income-tax, making, with the interim dividend of 5 per cent. paid on February 15 last, 20 per cent. for the year.

THE FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION, at its annual meeting, to be held on Wednesday, May 23 (1 p.m.), at the Star Hotel, Montrose, after the annual report and election of office-bearers, is to consider a motion by Mr. W. R. Kermath with respect to the Pharmaceutical Society's examinations; also to consider a proposal that the British Pharmaceutical Conference be invited to meet in Dundee in 1902. The annual dinner will follow at 4 o'clock. Tickets, 4s. each.

MESSRS. BRUNNER, MOND, AND CO., and Messrs. Bowman, Thompson, and Co. are stated to have completed negotiations

whereby the former company purchases the Lostock Gralam Chemical Works, which comprise bleach, soda, and other plant, owned by the latter company, which has a capital of £382,000, the last dividend paid being 7 per cent. on both preference and ordinary shares. Locally it is feared that the works will subsequently be wholly or partially closed.

THE RACKAROCK mentioned by Lord Roberts in his despatch from the Vet River as having been laid on the railway line and discovered by a West Australian scout is a mixture of potassium chlorate and nitro-benzene. It belongs to the class of explosives invented by Dr. Herman Sprengel, F.R.S., and was extensively used at the blasting of the Hell Gate in New York Harbour. Evidently it was brought into the Transvaal from America, where it is currently employed in railway work.

MR. W. R. FIELDING, M.P.S., Halifax, at an inquest held on May 10 respecting the death of Sarah Ann Wadsworth (44), stated that the deceased had applied to him for a bottle of laudanum, but as her manner excited his suspicion, he supplied her with a harmless mixture; it transpired, however, that she obtained a one-ounce bottle of laudanum from another chemist, and subsequently took an overdose. A remark by the Coroner that Mr. Fielding had acted very properly was approved by the jury, and a verdict of "accidental death" was returned.

CARBOLIC ACID AND PARAFFIN OIL, mixed in the proportion of one ounce of the acid (90 per cent.) to several ounces of oil, was, according to a correspondent in the *Lancet*, recently mistaken for lager beer by an intoxicated person at New Brunswick, the entire contents of a bottle of the mixture being consumed. Mustard and warm water was administered, which caused vomiting. There was, however, no erosion of the lips, mouth, or throat, and the man recovered without a bad symptom. The question is asked: Did the paraffin oil modify the effects of the acid.

A GRAND BAZAAR in aid of the Restoration Fund of St. George's, Bloomsbury, was honoured by the presence of H.R.H. the Princess Henry of Battenberg, who performed the opening ceremony on Tuesday, May 15, at the Portman Rooms, Baker Street. Among the names of the numerous company present who received her Royal Highness we are pleased to note that of Mr. C. Terry-Holloway, M.P.S., who was one of the two gentlemen who carried the St. George's Standards and preceded the Princess in her tour round the rooms. He had also the honour of being presented to her Royal Highness. We hope that the bazaar will prove as successful as its object is deserving.

EARLY CLOSING has not ceased to occupy the attention of Lord Avebury since his translation to the peerage. On Monday last he introduced his original Shops Bill into the House of Lords, and it has been appointed for second reading on Tuesday next. There are, thus, no less than four measures dealing with the question of shop hours regulation now awaiting the consideration of Parliament—viz., Mr. Steadman's Shop Hours Act Amendment Bill, a similar Bill standing to Mr. Provand's credit, Sir Charles Dilke's Shops Bill, and the newly-introduced House of Lords Bill. Circumstances seem to be equally unfavourable for all of them.

THE PREVENTION OF CORRUPTION BILL, which deals with that particular form of commercial canker known as "secret commissions," appears to be following identically the same course through which the Companies Bill passed during its stay within the jurisdiction of the House of Lords. Lord Russell of Killowen, who has charge of the Bill, proposes to move that it be referred to a Select Committee, and that the Committee should consist of Lords Balfour, Lawrence, Burghclere, James, Ludlow, and Avebury, and himself. The predominance of the legal element in this proposed Committee is very marked, for, apart from Lord Avebury—better known to fame by his former title of Sir John Lubbock—commerce does not seem to have direct representation. It must not be forgotten, however, that Lord Balfour was formerly Parliamentary Secretary to the Board of Trade, and that Lord Burghclere attained to considerable administrative eminence at the Board of Agriculture when he was plain Herbert Gardner. The natural outcome of the action proposed to be taken in regard to this Bill is that the species of corruption Lord Russell of Killowen has so eloquently and severely assailed in his public utterances will continue to flourish for at least another session.

TRADE NOTES.

THE 'LUPA' HUMANISER.—Mr. Wm. Toogood, Heddon Street, Regent Street, London, W., submits a specimen of a new apparatus for humanising milk, designed by Dr. Blackler. It is a simple apparatus consisting of two graduated jars, one to contain the milk, the other for measuring the proper proportion of sugar to be added. There is also a glass cover, a piece of bent glass tube, and a perforated indiarubber cork. All the parts are separable and can easily be kept clean.

GOLD PAINT MEDIUM.—It has been found very difficult in the gold paint trade to produce a varnish or medium that, when mixed with the bronze powder, will not tarnish or turn green and retain the brightness of the "metal," owing to the chemical action set up between the copper in the bronze powder and the varnish. The trade has been almost wholly dependent upon foreigners for its supply of varnish or medium until the Weston Manufacturing Company, of Clapham, introduced the untarnishable "Weston," which is manufactured only for the trade, and is claimed to have far greater binding properties than the foreign make, as well as giving great brilliancy to the metallic powder—advantages much appreciated by the putters-up or bottlers of gold paint. The "Weston" Varnish is stated to effect considerable saving to the trade, as the bronze powder and liquid medium can be sent out in one bottle instead of using two, as is generally done. Chemists interested in the gold paint trade should write to the Weston Manufacturing Company for particulars.

THE 'SANDERSON' HAND CAMERA, as far as external appearance is concerned, has a great family likeness to a large percentage of those of other makers now before the public; therefore Messrs. Geo. Houghton and Son, 88 and 89, High Holborn, W.C., have found it desirable to point out, in a booklet just issued, wherein lies the great difference of the 'Sanderson,' and to demonstrate by examples of work some of the special advantages which may not be apparent at first sight. They describe briefly, yet clearly, the principles upon which the camera is based and how it should be used, the details of its construction and parts being explained. We may say that the 'Sanderson' Hand Camera has received the highest praise from experts, who have pronounced it to be most efficient, and capable of any class of work. Those interested in photography should write for a copy of the booklet.

ICILMA PREPARATIONS.—Messrs. Barclay and Sons, Limited, 95, Farringdon Street, London, E.C., who, as announced last week, have been appointed as sole wholesale agents for the United Kingdom by the Icilma Company, Paris, submit samples of the company's preparations. Icilma, stated to be an oxygenised natural mineral water, enters into the composition of some twenty different toilet preparations, including Icilma water (plain and perfumed), antiseptic water, face cream, tooth paste, hair lotion, shaving cream and soap, Iris soap, unscented soap, Icilmine (anti-caustic Icilma), violet powder, etc. Icilma water, it is claimed, will give natural bloom and elasticity to the skin, and by its constant use will prevent and remove the ravages that years produce. The soap preparations are especially good, producing a good lather, and rendering hard water soft to the skin. They may be used without fear of any caustic effects; for very delicate skins, however, Icilmine, a pure essence of Icilma in a gelatinous form, is recommended. A pocket bottle of the antiseptic water or hygienic fluid is stated to be an extremely useful article to take when on a journey, as, should a pimple come out when it ought not, by these agents it may be dissolved—not suppressed—in a few hours without causing any ill effects. Messrs. Barclay and Sons will be pleased to supply further particulars regarding the Icilma preparations on application being made to them.

VARIOUS SPECIALTIES.—Messrs. Harker, Stagg and Morgan, 15, Laurence Pountney Lane, E.C., send particulars and samples of various specialties prepared by them. Among seasonable lines may be noticed their Effervescent Health Salt, put up in tins bearing a neatly-printed coloured label giving directions for use, etc.; a 'Twentieth Century' line of perfume (Lilanthé) in glass stoppered bottles, also a concentrated essence of 'Violette de Parme,' an exquisite, delicate, fragrant, and lasting perfume "distilled from the choicest flowers." Essence of Rennet (Horseshoe Brand) is claimed to be far stronger than most of the rennet essences usually sold, one teaspoonful being sufficient to curdle three pints of warm milk in ten to fifteen minutes. Moreover, it does not com-

municate the slightest taste or odour to the curd, and is said to be unequalled for junkets, curds and whey, cheese making, etc. The bottles are enclosed in printed cartons, with directions, at (2oz.) 3s. 6d., and (4oz.) 7s. per dozen. In pharmaceutical preparations the following may be mentioned:—Liquor Caulophyllin et Pulsatillæ Co., a combination of two well-tried remedies for uterine irregularities, forming an excellent emmenagogue in a most convenient form; Liquor Euonymin et Bismuthi Co., which possesses, in addition to the action of euonymin, the mechanical properties of bismuth; Liquor Euonymin et Cascaræ Sagradæ Co., a preparation combining in an elegant form the cholagogic action of euonymin with the laxative properties of cascara; Liquor Euonymin et Papain Co., a preparation having the same therapeutic strength and value as the Liq. Euonymin et Pepsinæ Co., but indicated in alkaline conditions of the digestive organs. The Liquor Euonymin et Pepsinæ Co. contains in a convenient and agreeable form the valuable hepatic properties of euonymin combined with pepsin in its most active state; Liquor Papain et Iridin Co. is a valuable medicine for use in cases of impaired digestion with complaints of the liver.

HYGIENIC BELTS, BANDAGES, TRUSSES, ETC.—Mr. Vincent Wood, Victoria House, Albion Place, Blackfriars Bridge, London, has introduced into the manufacture of various surgical appliances a cellular fabric having hygienic properties which are unsurpassed, inasmuch as it allows all impure exhalations of the skin to freely escape. His new Cellular (Aertex) Bandage, cut in six yard lengths of varying widths—2½ in. - 11 in. — will probably be the bandage of the future, being cheap, cool, and cleanly, or, in other words, inexpensive, light, porous, and washable. It may be mentioned that with orders for six dozen of these bandages a stock of circulars is supplied printed with retailer's name and address. The cellular fabric is used for covering the new Eureka "Herno"

steel spring truss and may be taken off and washed; it is also used in the "Zephyrine" Belt (24s. per doz.), which allows free exhalation of all perspiration of the body; also for suspensory bandages, various kinds of abdominal and supporting belts, chest and lung protectors, etc. Among Mr. Wood's recent introductions may be mentioned the "Imperial" belt (24s. per doz.), intended for use in every kind of athletics and for general support; the "Empire"

belt (30s. per doz.), for riding or walking and for supporting the back or loins; the "Tourist" belt (24s. per doz.), for the protection of valuables while travelling and for support to the loins; the "Relief" belt (21s. per doz.), ladies' improved supporting belts, corsets, etc.; also improved wrist straps for tennis, cricket, cycling, etc., at prices from 6s. 6d. to 12s. 6d. per dozen pairs. The foregoing articles are all guaranteed to be of English manufacture. Mr. Wood will be pleased to supply further particulars.

FINDLAY'S FIRST-AID AMBULANCE OUTFIT, supplied by Messrs. John J. Findlay and Co., 96, Bath Street, Glasgow, consists of antiseptic gauze, adhesive plaster, wood wool pad triangle bandage,

and safety pins, contained in a neat decorated tin box measuring $5\frac{1}{4}$ by $3\frac{1}{2}$ by 1 in. It is an extremely useful outfit for cyclists and others liable to meet with accidents in remote districts, and, moreover, is moderate in cost.

THE 'WIZARD' CAMERAS, supplied by Messrs. Seabrook, Bros., and Co., 21, Edmund Place, Aldersgate Street, E.C., have already been referred to in the Journal, mention being made of the fact that there are forty-two styles of the 'Wizard' Cameras, and that they are being introduced into this country for the first time. Attention is now directed to the Cycle 'Wizard' B, shown in the illustration. This is admittedly one of the best medium-priced cycle cameras on the market. The box, which is made throughout of highly-polished mahogany, has black seal grain covering, the nickelled fittings are

perfectly adjusted, and the bellows is of rich red leather. After the bed has been lowered the front is drawn out and is clamped to the track by a turn of the lever under the front board. The latter has the vertical as well as horizontal movements. The back of the camera holds the full-sized ground glass, which recedes when the plate-holder is inserted, and is removed entirely when a cartridge roll-holder is used. The camera is provided with the 'Wizard' extra rapid rectilinear lens, the best adapted for universal work, and is mounted in either the 'Wizard' shutter or the 'Wizard' Sr. shutter. Each camera is equipped with a reversible view-finder and two tripod sockets. The price, £3 12s. 6d., 4×5 , includes three plate-holders and a strong seal grain-carrying case for the camera and four holders, fitted with a nickel spring lock and shoulder straps.

TOILET PAPERS AND PERFUMES.—MESSRS. F. Newbery and Sons, 44, Charterhouse Street, London, E.C., have recently introduced medicated "papyleaves," in a neat carton to hang up—suitable for retailing at 1s. or 1s. 6d.—at 8s. per doz. The "papyleaves" are soft, yet do not tear easily, and suit all requirements of the toilet. Packets of 500 manilla curl papers at 2s. per doz. should prove a very saleable line to retail at 3d. each packet. In 'St. Paul's' perfumes the White Hyacinth is a very good 1s. line at 7s. per doz. It is put up in bottles having an ingenious arrangement in the stopper for distributing the perfume, and bearing a new artistic label in colours.

DARK ROOM LAMPS.—Among the numerous photographic novelties introduced this year by Messrs. Houghton and Son, 88, High Holborn, W.C., is the new dark room lamp—No. 48—shown in the illustration. It is triangular in shape, nine inches high over all, and is intended to burn colza oil, has an outside wick regulator, and is fitted with ruby glass on one side and orange glass the other, and a back which slides up. The price of this handy little lamp is 2s.—The well-known "Luna" dark room lamps have been reduced in price. These lamps—Nos. 36, 36A, and 37—constructed to burn paraffin without chimneys, the special construction of the lamp itself acting as a chimney—are now sold at 3s. 6d., 5s., and 5s. 6d. respectively. They are convenient and handsome lamps; the upper part tilts back to light, and the flame can be regulated by outside wick raiser, without uncovering the light. They are fitted with

double glass (orange and ruby) in front, and will not smoke nor heat.

COOKE EXTENSION LENSES.—Messrs. Taylor, Taylor, and Hobson, Stoughton Street Works, Leicester, send particulars of recent improvements in Cooke lenses. By removing the usual back glass of a Cooke lens and substituting one of the extension glasses, the focus of the combination can be lengthened without sacrificing its power of definition over the range of its own plate.

This provision for varying the lens' focus is extremely useful in hand camera and other work. The lenses are supplied in morocco leather pocket cases, and may be adapted to any of the forms of Cooke lenses already issued, but when ordering, it is necessary to send the original lens, both to have the extension lens properly adjusted, and to have its separate index scale engraved upon the iris diaphragm.

When Cooke lenses are permanently fitted to cameras, one or more extension lenses can be mounted together with the normal back glass of the lens, in openings in a wheel or sector, which may then be merely rotated to change the focus of the lens. The forms of these glasses and their separation from the front portion of the Cooke lens, conspire to render each combination comparatively insensitive as regards the adjustment of its back glass. With accurately made screws or with the above-mentioned wheel, there is therefore no risk of disturbing the adjustment of a Cooke lens by using this means of varying its focus.—The Series V. lenses, F/8 aperture, manufactured by this firm have been extended to include all sizes down to $4\frac{1}{4}$ inch focus. This lens gives perfect definition to the corners of its plate without stopping down, and bears strict comparison with the most expensive anastigmats. The illustration shows its small size, and it weighs only $2\frac{1}{2}$ ounces. The prices are $4\frac{1}{4}$ inch focus, £2 18s.; 5 inch focus, £3 3s.; $5\frac{1}{2}$ inch focus, £3 8s.; 6 inch focus, £3 12s.; $7\frac{1}{2}$ inch focus, £4 10s.

COOKE LENS
Series V.
f/8

COOKE LENS IN FOCUSING MOUNTS.—Messrs. Taylor, Taylor, and Hobson, Stoughton Street Works, Leicester, have introduced an improved focussing mount, here illustrated, intended specially for hand cameras.

It contains an iris diaphragm, which is operated by rotating the ring A, and a means of focussing by turning the ring B, which has engraved upon it the scale of distances. The outer flanged jacket C is fastened to the camera by means of ordinary wood screws, and the clamp screw and slot which are shown in this jacket, facilitate final adjustment of the lens to suit the length of the camera. The illustration is full size. The price is in each case 10s. in addition to the price for the ordinary settings. The usual patent screw flanges are not required.

SUGAR-COATED TABLOIDS.—MESSRS. Burroughs, Wellcome and Co., Snow Hill Buildings, London, E.C., intimate that in future the following tabloid products will be issued both plain and sugar-coated, instead of plain only, as formerly:—Aloes and myrrh (B.P. pill), gr. 4; Colocynth and hyoseyamus (B.P. pill), gr. 4; Colocynth Compound (B.P. pill), gr. 4; Ipecacuanha with Squill (B.P. pill), gr. 4. Cascara Sagrada (dry extract) tabloids will in future be issued of gr. 4 and gr. 5 strengths, in addition to gr. 1, 2, and 3, as formerly. Tabloids of the new strengths will be supplied in bottles containing 25 and 100 in each.

EXTRACTS FROM CONSULAR REPORTS.

THE PROPORTION OF COPPER SULPHATE imported from Great Britain into Leghorn (Italy) during 1899, according to a recent report, fell from 96 per cent. of the entire trade in 1898 to 76 per cent., the figures for 1899 being:—Imports from all sources, 3,506 tons, value £65,471; imports from Great Britain, 2,661 tons, value £49,697; as against 3,301 tons, value £61,650, and 3,183 tons, value £59,445, respectively. The falling off in British trade appears to be due to keen United States competition. At the beginning of the season the price offered from America was sometimes 3*l.* a quintal below the English price. The freight from the United Kingdom was 15*s.* a ton, from the United States £1 a ton; thus it will be seen that the American article was the cheaper of the two. Moreover, the American copper sulphate is said to have given every satisfaction to consumers. It has, however, been impossible for American dealers to continue the low prices offered at the beginning of the season, but they have at least succeeded in making their commodity thoroughly well known.

A MORE FORMIDABLE DANGER to British trade with Italy in copper sulphate in the near future, Vice-Consul Carmichael thinks, will be Italian sulphate. Up to the present local manufacturers appear as a rule to have sent to England for the greater part of the raw material; now, however, the flourishing and influential "Società Metallurgica" of Leghorn is busily erecting the necessary plant for the manufacture of copper sulphate on a large scale. Italy produces some 26,000 tons of copper annually, and it is said that the company can depend upon securing its material at home. Should such be the case a formidable competitor will enter the field. In any case the more satisfactory days of the English trade in sulphate seem to be over. If the Italian manufacturing venture prove successful, it will, in all likelihood, sweep half the British copper sulphate out of the market.

THE OLIVE OIL CROP of Tuscany in 1899 was more than half destroyed by the ravages of the olive fly, the quantity of oil obtained being insignificant, while the quality of most of it is said to be distinctly inferior. A full crop of olive oil in Tuscany, according to Vice-Consul Carmichael, may be reckoned at a money value of £10,000,000. The olive maggot—which subsequently develops into the olive fly—is stated to be capable of diminishing the yield of oil by one-half and seriously injuring the quality of the remainder. Thus it will be seen that the fly may actually cause damage in one year amounting to £5,000,000.

NO MEANS OF DESTROYING THE INSECT, it would appear, has so far been discovered, notwithstanding the urgency of the matter, nor does the State appear to have suggested any practical remedy. The attention of English scientists is directed to the matter by the British Vice-Consul, as any discovery which should exterminate the plague would, he thinks, certainly be profitable.

ENTOMOLOGISTS OF EXPERIENCE, it is suggested, should carefully study the habits of the fly, with a view to finding out the hitherto undiscovered winter habitat, in order that proper steps could be taken for its destruction. It has been hazarded that the winter habitat of the fly must be in the bark of the olive trees. If such be the case, it is thought that all that would be needed would be to paint the trees during the winter with a simple solution of lime, and thus rid the country of a very destructive enemy to agricultural prosperity. This system of painting the trees has been tried in some isolated instances; but only a special law, rigorously enforced, could ensure the effective application of such a remedy over an extensive district.

A CRISIS IN THE ORRIS ROOT INDUSTRY is reported to have arisen in Italy, owing to the action of a syndicate, supported by a powerful bank, in securing the whole of the Veronese crop and nine-tenths of that of Florence. Orris root being only obtainable round Florence and in the neighbourhood of Verona, the position is said to be somewhat serious. The small quantity of Florence root still in the growers' hands is being offered at enormous prices, while the syndicate itself is still holding its stocks, and apparently declines for the present to sell. Representatives of a large perfume manufactory of Grasse are said to have recently endeavoured to obtain a small quantity without success. Fifty tons is the outside estimate of the stock of orris root now held at Leghorn. It is thought, however, that the high prices prevailing will eventually benefit the industry by encouraging the growers to persevere in planting. Orris root

is a commodity that is subject to singular fluctuations in price. A fair average price is stated to be £50 per ton. In 1891 as much as £120 per ton was paid, and in 1898 as little as £26.

AN IMITATION OF BEESWAX, Professor Angelo Funaro has pointed out in a recent supplement to the 'Enciclopedia di Chimica,' may be produced by an admixture of seven substances, among which beeswax need not enter as an ingredient even in a small proportion. Some such mixture, according to Vice-Consul Carmichael, has recently been shipped to the United Kingdom from Leghorn as Tuscan wax. He points out that it is very easy for a dealer to be deceived by the appearance of wax, hence the only remedy is for British importers to be sure of the houses they deal with, and to be aware of believing in the possibility of too low a price.

A STRIKING INCREASE IN FOREIGN INDIGO imported into Japan has occurred during recent years, owing to the growth in the requirements of the dyeing establishments. The demand was greater than usual in 1899, on account of the short crop in Japan and the consequent rise in the price of the native article, 1,052 tons realising £236,432, as against £231,792 for 1,075 tons in 1898.

THE OPERATION OF THE JAPANESE CAMPHOR MONOPOLY caused a considerable increase in the value of the camphor export during 1899—about £60,000 greater than in the preceding year—the price of the drug being higher than in 1898. It will probably be remembered that on June 22, 1899, regulations were issued for the Government monopoly of camphor and camphor oil, and for the manufacture of camphor and camphor oil in Formosa by persons who must obtain licences from the Government. It was also decreed at the same time that those products were in future to be shipped only from the ports of Kelung and Tamsui, in Taihoku Prefecture. The regulations, which were put into force on August 5, provide that all camphor and camphor oil produced in the island shall be collected by the Government from the manufacturers, suitable compensation being paid, and forbid any person to own, deal with, or send abroad any camphor or camphor oil other than that sold by the Government. Regulations regarding manufacture were also issued in which the steps to be followed in opening and closing business were specified.

THE CAMPHOR EXPORTED FROM JAPAN in 1899 amounted to 1,642 tons, valued at £179,105, as compared with 1,448 tons, value £121,546, the previous year. The ginseng export was 239 tons, value £48,680, as against 211 tons, value £43,267; vegetable wax, 6,092,817 lbs., value £65,559, against 5,053,054, value £62,246. Of mining products, antimony was exported to the extent of 1,031 tons, value £21,082, the 1898 export being 1,327 tons, valued at £22,111; manganese, 9,320 tons, realised £15,587, as compared with £15,958, the value of 9,905 tons exported in 1898; sulphur, 16,551 tons, was valued at £58,685, the preceding year's export being 12,527 tons, value £48,695.

A NEW STANDARD OF WEIGHT has been introduced in Japan. Prior to January 1 of this year a Japanese kin or catty was in practice taken to be equivalent to 1½ English lbs. (Avoirdupois), though in reality, according to the metric system, it equals 1.322773 English lbs. Under Japanese law only scales and weights inspected and approved by the Government can be used for weighing objects, with the standard weight of kin (catty), and it was notified that persons who should continue to use the English pound for that purpose would be dealt with in accordance with the provisions of the law regarding weights and measures. As a result, all foreign firms are compelled to have scales complying with the Japanese regulations. But, according to Mr. A. H. Lay, assistant in her Majesty's Consular Service in Japan, in actual business, calculations in many cases are still based upon the old system, use of the new scales not being resorted to. Imports, it is stated, are frequently weighed on foreign scales, the method of weighing being apparently immaterial when it is determined by mutual consent. Exports, however, are weighed in Japanese scales, and before long it is expected that the use of the new scales will become universal.

CHEMICALS AND CHEMICAL AND MEDICINAL PREPARATIONS exported from Great Britain in March increased in value by £53,423 over the export for March, 1899, the totals being respectively £933,498 and £880,075. There was also an increase of £271,012 on the export for the three months ending March 31 over the corresponding period in 1899, the total value of the exports for the two periods being £2,585,539 and £2,314,527 respectively.

TURNOVER AND PROFITS.*

PROFIT ASSESSMENT.—The following examples show how the important questions of profits and percentages upon cost and sales can be effectually dealt with. The cost and profit figures may be taken as either pounds, shillings, pence, or farthings.

1. To find the percentage of profit on cost—
Say the cost is 8 and the profit 4.
 $4 \times 100 = 400 \div 8 = 50$ per cent.
2. To find the percentage of profit on sales—
Taking the same figures for cost and profit.
 $4 \times 100 = 400 \div 12(4+8) = 3\bar{3}$ per cent.
3. To find what amount to add to cost to realise a certain rate per cent. upon the cost.
Say the cost is 6 and the rate required 25 per cent.
 $6 \times 25 = 150 \div 100 = 1\cdot5$,
which may be £1 10s., 1s. 6d., or 1½d.
4. To find what amount to add to cost to produce a certain rate per cent. upon sales—
Say the cost is 6 and the rate required 25.
 $6 \times 25 = 150 \div 75(100-25) = 2$.

A HANDY TABLE FOR ASSESSING PROFITS,

By adding to the cost, as follows, the relative percentages of profit are obtained:—

One-half	50·00	per cent. on cost, and	33·00	per cent. on sales.
„ third	33·33	„	25·00	„
„ fourth	25·00	„	20·00	„
„ fifth	20·00	„	16·60	„
„ sixth	16·60	„	14·28	„
„ seventh	14·28	„	12·50	„
„ eighth	12·50	„	11·11	„
„ ninth	11·11	„	10·00	„
„ tenth	10·00	„	9·09	„
„ eleventh	9·09	„	8·33	„
„ twelfth	8·33	„	7·69	„
„ thirteenth	7·69	„	7·14	„
„ fourteenth	7·14	„	6·66	„
„ fifteenth	6·66	„	6·25	„
„ sixteenth	6·25	„	5·88	„
„ seventeenth	5·88	„	5·55	„
„ eighteenth	5·55	„	5·26	„
„ nineteenth	5·26	„	5·00	„
„ twentieth	5·00	„	4·76	„

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MAY 16, 1900.

The recent high prices for oils generally still continue with, in some cases, further advances, though in the case of Linseed a slightly easier feeling is noticeable as regards the seed itself, though the oil has gone up again. Ginger, Honey, and Beeswax, together with Quillaya Bark, have been moving off satisfactorily. Business in Chemicals has been limited, but Caustic Soda and Sulphur have advanced, and a better tone is manifested in Sulphate of Copper.

AMMONIA SALTS.—Carbonate, 3¼d. per lb. Salammoniac, 38s. to 40s. per cwt. Sulphate, £11 7s. 6d. per ton.

BEESWAX.—Four cases of Chilian sold at auction ex-store for £7 17s. 6d. per cwt., and 15 sacks ditto at £7 10s.

BLEACHING POWDER—Is firm at £7 to £7 10s. per ton.

CANARYSEED.—50 bags of Turkish sold at 34s. 6d. per 416lbs., and since then business has been done at 35s.

COPPERAS—Is firm at 37s. to 39s. per ton.

COPPER SULPHATE—£25 to £25 2s. 6d. per ton.

GINGER.—156 bags of Sierra Leone were sold ex-quay privately.

HONEY.—22 barrels of Chilian Pile x made 31s. per cwt.

LINSEED—Is an idle market, with no sales to report with the exception of 1,500 bags of River Plate at 50s. 6d. to 56s. per 464lbs., according to quality. N. American September and Novem-

ber shipment has been offered at 44s. 6d. to 45s., and Calcutta on passage at 54s., and to arrive May shipment 53s. 3d.

OILS (FIXED) AND SPIRITS.—Castor is in good demand at firm rates. The sales are: Calcutta, 225 cases, ex quay, at 3½d. per lb.; 250 cases to arrive March-May, 3¾d.; and 100 cases duly to August, 3 13-32d. per lb. Spot price, 3¾d. French, first pressure, 8 tons, sold at 3¼d., second pressure 3½d., and Madras 3½d. per lb. Olive is quiet at £35 to £35 10s. per tun for Spanish Oils. For shipment these are £34 12s. 6d. to £34 17s. 6d. for Malaga, cost and freight, and £34 to £34 15s. for Seville, ditto. Linseed Oil is steady at 35s. 3d. to 36s. per cwt. Cotton Seed Oil is firm, but quiet, at 26s. to 26s. 6d. per cwt. Spirits of Turpentine are firmly held for 45s. 6d. per cwt., with a fair inquiry.

POTASSIUM SALTS.—Bichromate quiet, 4d. per lb.; Chlorate, 4½d. to 4¾d. Pearlash has dropped to 32s. 6d. per cwt. and Potashes to 25s. per cwt. Saltpetre is firm at 21s. per cwt.

QUILLAYA BARK.—10 tons of Chilian at £13 5s. per ton.

SODA SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is steady at 16s. to 17s. per cwt. Caustic Soda is scarce: 76 to 77 per cent., £11 5s. to £11 10s. per ton; 70 per cent., £10 5s. Soda Crystals, £3 5s. per ton. Nitrate is steady at 8s. 4½d. to 8s. 9d. per cwt.

SULPHUR.—“Recovered” is dearer, £5 to £5 2s. 6d. per ton; Roll, £6 5s. to £6 10s.; Flowers, £6 10s. to £7 10s. per ton.

LONDON, THURSDAY, MAY 17, 1900.

Business in Drugs and Chemicals has been decidedly quiet during the past week, while there are no changes of any particular importance to record. Quinine, after being firmer, has again had a relapse, owing to the view taken by speculators that the half-monthly bark shipments advised from Java are excessive. Acid Carbohc, on the other hand, has stiffened up. Opium, Morphine, and Codeine are steady; Glycerin firm, with a rising tendency. Codliver Oil continues dull and weak; Sulphonal and Phenacetin steady; Salicylates and Salol unchanged, as also are Bismuth Salts. Quicksilver and Mercurials firm; same may be said of Bromides, while Iodides remain in an unsettled state. Linseed Oil dearer. Rape Oil very firm; Acid Citric and Tartaric and Cream of Tartar steady; Borax and Acid Boracic unchanged. Refined Camphor remains firm, while Crude is the turn easier. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Is still weak and can still be obtained in quantity as low as 9½d. per lb.

ACID BORACIC—Steady at 26s. per cwt. for crystals and 28s. per cwt. for powder.

ACID CARBOLIC.—Crude is steady, while refined has been in fair demand at 10½d. to 10¾d. per lb. for 35-36° C. ice crystal in large bulk packing; 39-40° C. ice crystal, 11d. to 11¼d. per lb.; and 39-40° C. detached crystals (the form and quality now required by the B.P.), 1s. to 1s. 0½d. per lb. Crude is quoted, 60° F., 3s. per gallon; 75° F., 3s. 9d. Liquid, 95-98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon in 40-gallon casks; ditto. 25-30 per cent. of dark colour, 10d. to 1s. per gallon.

ACID CITRIC—Steady at 1s. 4d. to 1s. 5d. per lb., according to make and quantity for crystals in 5 cwt. casks, 1 cwt. kegs being charged higher in proportion.

ACID OXALIC—Unchanged at 3¼d. to 3½d. per lb. net, free delivered London.

ACID TARTARIC—Is quiet, but steady, at 1s. 0¾d. to 1s. 1d. per lb. for English crystals, and 1s. per lb. for foreign.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal Ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate firmer: Gray, 24 per cent., London prompt, £11 6s. 3d. Hull prompt, £11 2s. 6d. to £11 5s. Leith, prompt, £11 6s. 3d. Beckton, £11 7s. 6d., Beckton terms, prompt, £11 2s. 6d. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

*Tables compiled by Messrs. J. Bath and Co., of 3, Crooked Lane, E.C.

ANTIMONY.—Regulus is quoted £38 10s. to £40 per ton, and crude Japan (Black Sulphide) £22 15s. to £23 10s. per ton.

BISMUTH.—Still unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 8d. per lb. for the subcarbonate, and 5s. 1d. per lb. for the subnitrate.

BORAX.—Crystals are quoted 17s. per cwt. and powder 18s.

BROMIDES AND BROMINE.—Are very firm at unchanged prices—viz., Potassii Bromid., 1s. 11½d. per lb.; Sodii Bromid., 2s. 3d. per lb.; Ammon. Bromid., 2s. 2½d. per lb.; Bromine, 2s. to 2s. 2d. per lb. in 60-lb. cases,

CAMPHOR.—Market for Crude is quiet and easier, business having been done in Japan, from second-hand, to arrive at below 182s. 6d. per cwt. c.i.f. English refiners are firm at 2s. 4d. per lb. for Bells and Flowers, Tablets being quoted at proportionate prices.

CASTOR OIL.—Firm. Belgian 1st pressing spot, £31 10s.; May-June, £30 10s., f.o.b.; Antwerp 2nd pressing spot, £29 10s. per ton. Hull Manufactured: Guaranteed Cold Drawn Pure Pharmaceutical, £34 per ton in barrels; 4¼d. per lb. in cases. Pure firsts, £31 10s.; seconds, £29 10s. per ton in barrels; firsts, 3¼d. per lb. in cases; seconds, 3⅞d., ex-wharf London.

CINCHONA BARK.—These auctions, the fifth of the series, were held to-day, with the large supply of 3,931 packages, against 3,065 packages at the preceding sales. There was a good demand, and about two-thirds found buyers, at and since the sale, at fully the parity of the last Dutch auction, the average unit of Quinine Bark being 1¾d. to 1¾d.; while Succirubra, containing Cinchonidine, realised an average of 2d. and upwards. Ceylon: 374 packages offered and 308 packages sold, according to analysis. Succirubra, stem chips and shavings, ordinary to good at 3d. to 4½d., renewed ditto at 4½d. to 4¼d. Officinalis, renewed chips at 5¼d., and shavings at 7d. East Indian: 2,319 bales and 77 cases offered and about 1,600 packages sold, red, stem chips and shavings fair to good at 3⅞d. to 5½d., ordinary at 2¾d. to 3¾d., branch at 3¾d. to 3¾d.; root, fair to good at 3d. to 4½d.; renewed, stem chips and shavings, fair to good at 4½d. to 6¼d., ordinary at 3¼d. to 3½d.; Officinalis, stem chips and shavings, fair to good rich at 4⅞d. to 7d., good branch at 5⅞d., silvery quill at 5⅞d.; renewed chips and shavings, good to fine rich at 6½d. to 10⅞d., fair to good at 4d. to 5½d.; Ledger, chips and shavings, good to fine at 6½d. to 8⅞d., ordinary at 2⅞d. to 3¾d., branch at 2½d. to 5¾d.; root, ordinary to good at 3d. to 6¾d.; Hybrid chips at 3d. to 5½d. Java: 150 packages offered and 128 sold; Ledger, chips and shavings, good at 6¾d. to 7¾d., branch at 4d. to 4¾d., root at 5¾d. to 6¾d., quill at 3¾d. to 3¾d. South American: 324 packages Bolivian cultivated Calisaya offered and 220 packages sold; fair to good quill at 8½d. to 11d. Soft Columbian: Of 421 packages 196 sold at 3d. Cuprea: 223 packages bought in. Red: 43 packages offered, chiefly damages, at 4¼d. to 5½d.

CLOVES.—At auction no Penang or Zanzibar were catalogued. Privately, the demand for Zanzibar continues slow, and only a small business has been done for delivery at barely steady rates. The sales comprise June-August and August-October delivery at 4d. to 3 31-32d. and sellers. January-March closing sellers at 3 27-32d.

COAL TAR DISTILLATION PRODUCTS. Toluol commercial 1s. 2d. to 1s. 3d. per gallon; pure, 2s. to 2s. 6d. Benzole firmer at 10d. per gallon for the 50 per cent. quality and 8d. per gallon for the 90 per cent. Creosote, 3d. to 5d. per gallon, according to quantity. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 160° C., 1s. 1d.; 90 per cent. at 190° C., 1s. 1d. per gallon. Anthracene A, 3¾d. per unit; B, 2¾d. Pitch, 37s. 6d. per ton, f.o.b. Tar: Refined, 13s. per barrel, 2½d. per gallon; crude, 12s. 6d. per barrel, 2¼d. per gallon.

COCAINE.—Makers of best brands are firm at 16s. 3d. per oz. for the Hydrochlorate in 25-oz. tins and for 200-oz. lots, while there is practically nothing offering from second-hand below makers' price. Crude is stated to be still scarce and dear.

COD LIVER OIL.—Keeps dull and weak, prices for best new non-congealing Norwegian oil being nominally 75s. to 82s. 6d. per barrel, in tin-lined barrels of 25 gallons each. As far as can be judged, the price is not unlikely to further recede.

CODEINE.—Remains very firm at 13s. 6d. per oz. for the pure, and 1s. per oz. less for the muriate, phosphate, and sulphate salts.

CREAM OF TARTAR.—Firm at 73s. per cwt. for first white crystals on spot; 75s. per cwt. for powder; and 77s. per cwt. for ditto, 95 per cent.

GINGER.—At auction 90 bags Japan sold, small and medium limed, at 24s. 6d. Cochin, in small supply, met little or no demand. Out of 384 bags and 30 cases only 45 bags sold, without reserve, small dark shrivelled pickings, at 24s.; the remainder bought in, cut small and ends, at 45s. Calicut, rough, bright, part plump, small and medium, 33s. to 35s. Jamaica, in reduced supply, met active competition for all good qualities at again dearer rates, medium being firm, but common kinds dull. Out of 477 barrels offered 271 barrels sold, fine bold plump at 87s., good bright at 71s. to 76s., low to middling 54s. 6d. to 66s., fair to good common 51s. to 56s. 6d., common 46s. to 50s.

GLYCERIN.—Continues firm with an upward tendency, both for crude and for refined, price of latter being 58s. 6d. to 60s. per cwt. for English and 62s. 6d. to 75s. per cwt., according to brand, for German best white, odourless, double-distilled, chemically pure, 1260 s.g. quality, in tins and cases (cases of 2 or 4 × 56-lb. tins).

GOLDEN SEAL ROOT (RAD. HYDRASTIS CANADENSES).—Remains scarce, and holders ask 2s. 6d. per lb. for limited quantity.

IODIDES AND IODINE.—Market continues unsettled, there being sellers *sub rosa* below the prices fixed by the combined makers, which are 10s. 6d. per lb. for Potassii Iodid., 11s. 10d. per lb. for Sodii Iodid., 13s. 10d. per lb. for Ammon. Iodid., 13s. 10d. per lb. for Iodoform crystals, powder, or precipitated, and 12s. per lb. for Iodine resublimed. The commercial quality of Iodine is also so far unchanged at 7½d. per oz. In view of the present aspect of affairs, buyers will do well to purchase strictly only from hand to mouth.

LYCOPDIUM.—Remains scarce and dear, price asked varying from 2s. 3d. to 2s. 6d. per lb., according to quantity and holder.

MENTHOL.—The favourite Kobayashi brand is now quoted 8s. 6d. per lb. in 5 case lots. It is stated that the market is likely to still further recede.

MERCURIALS.—Makers are very firm at 3s. 2d. per lb. for Calomel, and 2s. 10d. per lb. for Corrosive Sublimate, other mercurial preparations being quoted in proportion.

MORPHINE.—Very quiet at steady prices, say 5s. per oz. for the Hydrochlorate Salt in powder, and 2d. more for Hydrochlorate and Sulphate crystals.

OILS (FIXED) AND SPIRITS.—Linseed strong and advancing. On the spot, pipes, London, ordinary, £34 10s. (E.I., 5s. premium); barrels, £34 10s. to £34 15s.; Hull, spot, naked, £34. Rape very firm; ordinary brown, on the spot, barrels, £28 15s. to £29; refined, spot, £30 to £30 10s.; Ravison, naked, spot, £27. Cotton quiet; London, crude, spot, £23; refined, spot, £24 10s. to £25., according to make; Hull easier, naked, refined, spot, £23 7s. 6d.; crude, spot, £22. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut quiet for Ceylon but firmer for forward. Cochin: Ceylon, on the spot, £25, ex-warehouse; Cochin, spot, £28. Palm: Lagos, on the spot, quoted £27 10s. Whale Oil: At auction about 30 tuns St. Vincent sold, very full prices being obtained; double compass and stroke, £18 10s. to £19 15s.; single compass and stroke, £18 to £19; single compass and nick, £18 to £18 15s.; nick, £17 to £17 10s.; double stroke and dart, £16; single stroke, £15 to £15 5s. Petroleum flat; Russian, spot, 6¾d. to 6¾d.; American, spot, 7d.; water white, 8d. to 8¼d. Lubricating: Pale American, spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian, black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American, ordinary, 9½d.; deodorised, 9¾d. Turpentine: There have been free buyers of all positions, the market closing strong as follows: American, spot, 45s. to 45s. 3d.; May, 44s. 9d. to 45s.; June, 39s. 6d. to 39s. 9d.

OPIUM.—Quiet, but steady, at nominally unchanged prices, there being practically no business of any importance passing in the article at the moment.

PHENACETIN.—Quiet, but steady; second-hand is practically sold out, and makers are firm at 5s. 3d. per lb. for crystals or powder, in 5 cwt. lots.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate: Spot London crystals, 4¾d., net; powder, 4¾d. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate,

refined, £21 5s. per ton. Permanganate small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUICKSILVER.—The importer quotes £9 10s. per bottle; second-hand not offering.

QUININE.—Makers of the favourite German brands maintain their price of 1s. 4½d. per oz. for the Sulphate for 1,000-oz. lots in 100-oz. tins; while the speculative market, after being firmer at 1s. 4d. to 1s. 4¾d., according to delivery, has had a relapse on the bark shipments from Java for first half of the month—viz., 480,000 Amsterdam lbs. (against 225,400 Amsterdam lbs. for corresponding period of last year) becoming known, and the sale of 5,000oz. B&S and/or Brunswick at 1s. 3¾d. per oz. is reported.

ROSIN.—Strained on the spot is quoted 5s. to 5s. 3d. per cwt., ex wharf, 4s. 6d. per cwt. afloat, and 4s. 7d. per cwt. for July-September and August-October shipment per sailing vessel, ex ship terms.

SALICYLATES AND SALOL.—There is no change in price to report.

SANTONIN.—There has been more inquiry this week, and anything obtainable from second-hand at below maker's price has been snapped up. Second-hand appears now to be sold out. Makers quote 11s. 3d. to 11s. 9d. per lb., according to quantity.

SHELLAC.—The shipments at Calcutta for the half month (as given below) show a comparative increase of 3,000 cwt., the total to all parts being 16,600 cwt., against 13,600 cwt. last year. The market here has been quiet and prices are barely steady, 100 cases August delivery TN having been sold at 62s. and rather sellers, and 100 cases May shipment at 59s., c. f. and i. On the spot small sales at previous rates. The shipments from Calcutta during the first half of May were as follows:—To the United Kingdom, 3,400 cwt. against 4,600 cwt.; to the United States, 8,500 cwt. against 7,500 cwt.; and to the Continent, 4,700 cwt. against 1,500 cwt. last year.

SODIUM COMPOUNDS.—Crystals: Barrels quoted 60s., bags 57s. 6d. Acetate, £14 10s. per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic: 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per tin. Nirtate, on the spot, refined, £9; ordinary, £8 10s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction the small supply met little demand and all bought in, comprising 50 bags Singapore damages at 6d., 200 bags Penang at 5¾d., 101 bags fair Alleppy at 6¼d., and 47 bags bold Malabar at 6¾d. White Pepper: 15 cases fine Singapore bought in at 1s., 6 bags barely fair sold at 9¼d., 5 bags Ceylon, sold good at 9d., mixed with black at 8½d. 115 bags Penang bought in, fair at 8½d. Pimento continues neglected, and of 243 bags only 36 bags sold, at easier rates, fair at 3d. to 3½d. Nutmegs flat: 96 packages Penang offered and 7 packages sold, 65's at 2s. 3d., 104's at 11d. to 11½d.; the remainder bought in, 81's at 1s. 8d., 108's at 1s., and 194's shrivelled at 6d. Mace: 1 case Penang sold, broken red at 1s. 3½d. Bombay wild: 16 cases offered and bought in, fair bright at 5d.

SULPHATE OF COPPER—is quoted £24 10s. to £26 per ton on the spot.

SULPHONAL.—Makers are firm at 20s. 6d. per lb. for both crystals and powder, with a certain reduction for large quantity in bulk packing, smaller packing being charged higher in proportion.

THYMOL.—There are sellers from second-hand at 9s. per lb.

TURMERIC.—Only a small business has been passing in the various kinds at about previous rates, fair bright Cochin split bulbs selling at 9s. per cwt., and good to fine bright Madras finger at 31s. to 32s. 6d. per cwt.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the Exchange Column should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., before 5 p.m. on Thursdays.

OFFERED.

Barclay & Sons' Shares. What offers?—Barlow, Chemist, Barnard Castle.

Moulds.—Suppository, Pessary, Bougie, Capsule.—Warnes, 333, Gray's Inn Rd., W.C.

Diatom Slides—Spread, Selected, Tests, Exhibition Groups, etc. Approval parcels.—Gatrell, Barnes.

Books.—"Chemical Society Journals," "Pharmaceutical Journal," Chemistry, Botany, Analysis, etc.—Gatrell, Barnes.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dereham, Norfolk.

For Sale, Nest of 48 excellent Drug Drawers, glass knobs, with bevelled gold glass labels; free on rails at St. Helens; £5.—Wallbridge, Chemist, St. Helens.

4 gross 1d. tablets Zebril, 14 1s. 1½d. Allan's Child's Cordial, 10 1s. 1½d. Thierry's Balsam, 6 2s. 9d. Thierry's Ointment; first offers taken.—Nelson, Chemist, Blyth.

Anomalies and Curiosities of Medicine, by Gould and Pyle, 20/-, offer. Published 34/-. 8 dozen physiology microscope slides, 21/-, offer.—Dr. John Graham, Paisley.

Lemonade Powder, as used by large mineral water specialists; no advertised article approaches it in body or flavour: very profitable; p.o. 1s. 6d.—Edwards, 36, Pitfield St., London, N.

2 lb. Potass. Iodid., 19s.; ½ oz. Morph. Tart., 3s. 3d.; 1 oz. Morph. Acet., 5s.; 1 oz. Cocain. Hydr., 17s.; 1 lb. Iodof. Prec., 13s.; 1 lb. Crystal, 12s.; 2 lb. Bism. Nitr., 10s., Carriage Paid.—Eastman, Forest Lane, Stratford.

Water-bed (Anderson), 36in. square; water-cushion, 28 by 18; neck-cushion (Maw's), 21in., good as new; air-cushion, 12 by 18, sound condition; seen by appointment.—Ford, Oxford House, Beaconsfield Road, New Southgate, N.

Magnificent model vertical engine, tubular boiler, glass gauge, whistle, double-action slide-valve cylinder, bronzed stand, exhibition model, silver-plated, high speed, and perfect; worth 42s., accept 12s. 6d. free; photograph 1d.—Manager, Hassall's Chemical Works, Stratford, London.

For Sale, Vacuum-pan, 5 ft. diameter, fitted with stirring-gear, condenser, and all fittings; 1 mild-steeled steam-jacketed still, 4-ft. diameter, fitted inside with copper steam-coils, stirrer and pulleys, and galvanised-iron still-head.—Apply to W. J. Fraser & Co., 98, Commercial Road, London, E.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

Overstocked.—22 doz. 1s. Barrow-Evans's hair-restorer, 5s. 3d. doz.; 24 doz. 1s. 1½d. Storcroft's throat-cure, 8s. 9d. doz.; 2½ doz. 2s. 9d. Nurse Powell's pills, 18s. doz.; 6 doz. 1s. 1½d. Dr. Weir's plasters, 6s. doz.; 6 doz. 1s. 1½d. M. F. Thompson's French corn-plasters, 7s. doz.; 6 doz. 6d. Sansom's nursery-oil, 4s. doz.; 2½ doz. 1s. 1½d. Deighton's gout and rheumatic pills, 8s. 6d. doz.; 12 doz. 6d. Mack's double-starch, 3s. 6d. doz.; 24 doz. 6d. Adams's extract herbs, 2s. 9d. doz.; 6 doz. 6d. Bond's marking-ink, 1s. 11d. doz.; 3 doz. 1s. ditto, 3s. 11d. doz.; 2 doz. 9½d. Pectakos, 6s. 3d. doz.; doz. 1s. 1½d. ditto, 8s. 3d. doz.—Walker & Co., the Laboratory, Failsworth, near Manchester.

WANTED.

Gerarde's Herbal, Parkinson's Paradisus Terrestris.—Salmon, Chemist, Western Rd., Hove, Brighton.

Formula suiting good toilet line purchased.—Address, W. Lewis, 15, Shelden Street, London, W.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet
it is best prepared by using

**ROUSE'S
CUCUMBER PASTE**

which produces a uniformly good article, and saves trouble, time, and temper.
Other methods give variable results, and will be avoided by chemists who
wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free

Full directions and attractive labels and handbills in crimson and bl
free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's
Cucumber Paste.

ROUSE BROS., 61, Charlotte St., LONDON, W.

**HOOPER'S
MARKING INK**

It is supplied in 2/6, 1/- and 6d. bottles, neatly put up.
*It can also be had in bulk, by the
gallon, pound or ounce.*

If desired, the Ink can be put up with purchaser's
own name on labels in quantities of not less than

Six dozen 1/- size, or One gross 6d. size,
or a mixed order equivalent. Prices on application.

It does not wash out nor dry up, neither does it injure
the Fabric. See one or two testimonials from well-known
firms, selected from hundreds of a similar nature.

Messrs. SWEARS & WELLS, who have used the Ink now for very many
years, tell us that it is the only Marking Ink worth using; and in connection with
this firm, a Lady from Hampshire writes: "Please send me some Marking Ink
like you supply Messrs. SWEARS & WELLS with, for I have noticed the things
they have marked for me are done with particularly good Ink."

Messrs. THRESHER & GLENNY, Hosiers to H.R.H. the Prince of Wales, say:
"We have used Hooper's Marking Ink for many years, and no Ink gives such
satisfaction, or so black or permanent an impression."

Hodges, Holmes, Hughes, Loosmore, Nicholson, Philp, Wand, Ward, Williams.

NEWS IN BRIEF.

SIR HENRY ROSCOE is to deliver the Friday evening discourse at the Royal Institution next week; subject "Bunsen."

PROFESSOR T. E. THORPE, LL.D., Director of the Government Chemical Laboratories, has been appointed to be C.B.

THE NOTTINGHAM CHEMISTS' ASSOCIATION will hold its annual meeting on Wednesday, May 30, at the Albert Hotel, Derby Road.

CRICKET.—A match was played at Wadham Lodge on Saturday, May 19, between "Allenburys" C.C. and "Allens" C.C., resulting in a score of 76 runs for the former and 52 for the latter team.

"SOME ASPECTS OF PHARMACY" are to be considered at the next meeting of the Public and Poor Law Dispensers' Association, to be held at St. Bride's Institute, Ludgate Circus, on May 30, when a paper will be read by Mr. R. E. Jones, of Poplar.

CARBOLIC ACID FOR COUGH MIXTURE.—The five-year-old son of James Galt, gardener, Elmbank Street, Ayr, is reported to have been accidentally poisoned by his mother on Thursday, May 17. The child was troubled with cough, and Mrs. Galt, it is stated, got out of bed in the early morning to give it cough mixture. Mistaking the bottle, she gave the child a teaspoonful of carbolic acid, from the effects of which it shortly afterwards died.

SIR W. T. THISELTON DYER, Director of the Royal Gardens, Kew, and an honorary member of the Pharmaceutical Society, has just been appointed as the botanical authority on the Board of Agriculture Departmental Committee of Inquiry on Seeds. The object of the committee is to investigate the conditions under which agricultural seeds are now sold, and to devise adequate measures, if necessary, for securing and maintaining a definite standard of purity and germinating power for such seeds. Sir J. Wilson, the Agricultural Adviser to the Board, is also a member of the committee.

EDINBURGH CHEMISTS' GOLF CLUB.—The Spring Holiday competition of this Club was held at Dunbar in pleasant golfing weather with the following results:—Secretary's prize, Mr. T. D. Burt, 105-18=87; 2nd prize, after a tie, Mr. H. D. Alexander, 98, scratch; 3rd prize, Mr. W. C. Baker, 103-5=98. The company put up at the Roxburgh Hotel, and were the guests of the Captain, Mr. Geo. Lunan, at luncheon. There was a good turn-out, and a most enjoyable day was spent. The second competition this year for the "Gibson Handicap Medal" was played last week over the Braid's course with the following results:—1st, Mr. T. D. Burt, 111-18=93; 2nd, Mr. W. B. Cowie, 116-18=98; 3rd, Mr. W. G. McNab, 100, scratch. The second round of the Hole-and-Hole competition, which has been in progress for some time, has now finished. The following is the draw for the third round:—Mr. C. F. Henry, 5, against Mr. W. B. Cowie, 6; Mr. A. F. Dawson, 3, against Mr. H. D. Alexander, 0; Mr. J. G. Anderson, 0, against Mr. T. D. Burt, 6; Mr. Wm. Lyon, 3, against Mr. W. C. Baker, 2.

MR. J. F. BROWN, M.P.S., 1, Cannon Street, Dover, was on Saturday night, May 19, the unfortunate recipient of a considerable amount of public notice in connection with the Dover celebrations of the Relief of Mafeking. According to the *Dover Telegraph*, all went well until about 10 o'clock when "the most awful lies were set going among the crowd" about Mr. Brown, briefly to the effect that he was a pro-Boer, had put the Queen's picture in his window "upside down," called for cheers for Kruger, and had committed many other "crimes." The crowd— or, judging by the subsequent police-court proceedings, the drunken portion of it—thus enraged, "went for" Mr. Brown's shop, completely smashing the window, and doing various other damage to the extent of about £100. Mr. Brown, afterwards, in an interview with a local reporter, gave an emphatic denial to the stories told about him, and stated as his opinion that the people who assaulted his shop "were simply the cat's-paws and tools of some hidden agency which had befooled them by untruthful statements."

EDINBURGH PHARMACY ATHLETIC CLUB.—The ninth annual sports took place on Tuesday, 22nd inst., at Powderhall Grounds. The weather was fine and the programme being extensive and attractive there was a large attendance of friends and the general

public. Mr. D. B. Dott and Dr. George Coull acted as judges of the confined events, and Messrs. J. P. Gibb, G. H. C. Rowland, and G. Somerville acted as handicappers. Among donors of prizes were Mr. John Bowman, Honorary President; Messrs. Duncan, Flockhart and Co.; Harkness, Beaumont and Co.; Raimes, Clark and Co., T. and H. Smith and Co., Fletcher, Fletcher and Co.; R. Gibson and Sons, S. Maw, Son, and Thomson; Vinolia Company, Limited, and Mr. J. H. Haywood. The following were prizetakers in the events confined to members of the trade:—One Mile Bicycle Handicap, W. C. Taylor, 1; A. Noble, 2. Apprentices' (300 Yards) Flat Race Handicap, J. M. Hendry, 1; D. B. Kidd, 2; R. McGregor, 3. 220 Yards Flat Race Handicap, W. T. Simpson, 1; A. Douglas, 2. Half-mile Flat Race Handicap, W. T. Simpson, 1; A. R. Smith, 2. Five-a-Side Football Competition for Anderson Challenge Cup was again won by the present holders of it, John Mackay and Company, who had three goals to two for Duncan Flockhart and Company. Mr. John Bowman, Honorary President, presided at the distribution of the prizes, which were handed to the successful competitors by Mrs. Bowman. Mr. J. P. Gibb, Honorary Secretary, was in charge of the arrangements, which were admirably carried out, and on the motion of the President, Mr. Rowland, a vote of thanks was awarded to Mr. Bowman.

THE STUDENTS OF THE WEST OF SCOTLAND COLLEGE OF PHARMACY, with the Principals, Messrs. Barrie and Maben, on May 15 visited the United Alkali Company's works (Messrs. Tennant), St. Rollox, and were shown over the establishment by one of the staff. The pyrites burners were first noticed; the pyrites burns like coal and the sulphuric dioxide produced is led to the Glover tower, where it both denitrates the nitro-sulphuric acid and concentrates it. The concentration of the acid, which is done in shallow platinum pans, was next observed, then the production of "bleach." The chlorine is liberated by the action of Caucasian or Japanese manganese ore on crude hydrochloric acid obtained in the manufacture of salt cake, and led into brick chambers, on the bottom of which slaked lime is spread. This latter absorbs the chlorine, and when the product contains 37 per cent. of available chlorine it is raked out and sent on to the market. The manganese chloride in the still-liquor is converted into dioxide by the Dunlop process. The liquor is neutralised with milk of chalk, whereby iron peroxide is separated; the clear solution is run off and heated in a converter with more chalk under a pressure of four atmospheres. In this way the manganese is precipitated as carbonate, which is removed and heated to 600° F. in trays in a current of air for forty-eight hours, at the end of which it exists as dioxide, and is then more efficient than it was at the beginning. In the crystallising tanks of the soda crystals department great interest was aroused by the huge crystals of sodium carbonate, some of which were 18in. long. A visit to the cooperage and to the laboratories brought a highly interesting tour to a close.

TRADE NOTES.

THE BERKEFELD FILTER CO., Limited, is just completing a very large contract for filters sufficient to supply every man now on active service in South Africa with perfectly filtered water. The filter, which has been specially constructed for the War Office, under the auspices of the Army Medical Department, and is officially described as "The Berkefeld Field Service Filter," is worked by means of a semi-rotary brass pump, and will supply sufficient filtered water for a unit of a hundred men.

CHINOSOL TABLOIDS.—MESSRS. BURROUGHS WELLCOME and Co. point out that the value of chinisol (potassium oxyquinolinsulphate) as a bactericide and antiseptic in surgical work has met with some recognition. For such purposes it is non-caustic, very diffusible, and it does not coagulate albumin or injure instruments. Chinisol Soloids (gr. 8.75) have been issued by the firm for some time for the convenient preparation of solutions for external application. Chinisol Tabloids (gr. 5) are now prepared for internal administration. The drug has been given in quantities of from 15 up to 30 grains daily in divided doses in the treatment of tuberculosis, especially in tuberculous diseases of the glands and bones. It is also stated to be of service in the febrile conditions which accompany leprosy ulcerations, and in small repeated doses in dysentery. Its administration as a febrifuge in typhoid fever appears to offer a field for further investigation. The new tabloids are supplied in bottles containing 25 and 100 in each.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MAY 23, 1900.

Business has been rather quiet during the week, and with the exception of slightly higher rates in certain oils, prices are about on a level with those of the last fortnight. Good sales of Carnauba Wax have been made at high rates, whilst Chilian Beeswax and Honey have been dealt in extensively at last week's figures. In Chemicals there is a dulness at present existing. Sulphate of Ammonia is firmer and Caustic Soda is in short supply and hard to get for spot delivery.

BEESWAX.—3 bags of Chilian made at auction £7 10s. per cwt., ex store.

CARNAUBA WAX.—10 bags of grey sold at 80s. per cwt., 16 bags of yellow at 95s., and later 44 bags ditto at 105s. per cwt.

GUM.—23 bags of Brazilian Arabic went for 18s. per cwt. Arabic "sorts" are very firm and stocks are small.

LINSEED.—Is still very firm, with prices advancing and inquiry rather better. Calcutta "forward" is 54s. 6d. per 416 lbs.; River Plate 51s., and North American 45s. 6d. to 45s. 9d. 200 tons of River Plate on the spot sold for 50s. 6d. per 416 lbs.

OILS (FIXED) AND SPIRITS.—Castor Oils are firm, with a fair inquiry and average sales. Forward Calcutta 200 cases, June and July, and 100 cases April-June, sold for 37⁷/₈d. per lb., and now 3¹/₂d. is asked—spot price, 3³/₄d. per lb. 1st French 20 tons, 3³/₄d. spot, and 1st Belgian 5 tons at 3³/₄d. 2nd French, 3¹/₈d. per lb. Madras, 3¹/₄d. to 3³/₄d. per lb. Olive is firm, with an upward inclination; on the spot, Spanish Oil is £35 to £35 10s. per tun. For shipment no business is doing, as prices are above those obtaining here. Linseed has advanced further, and Liverpool makes are quoted at 36s. 6d. per cwt. Cottonseed is quiet at 26s. to 26s. 6d. Spirits of Turpentine are firm at a recent advance of 6d. per cwt., and are now in fair inquiry at 46s. Spermaceti: 21 cases of Chilian refined, ex store, sold at auction at 1s. 3d.

LONDON, THURSDAY, MAY 24, 1900.

Business in drugs and chemicals has been somewhat quiet during the past week, the rejoicings over the relief of Mafeking, together with the celebration of the Queen's Birthday, while giving loyal subjects full opportunity of showing their loyalty to her Majesty and their keen interest in the welfare of the Empire, having had rather the tendency to upset trade or to lead intending purchasers to postpone their buying for a few days. There are practically no changes in value of any importance to record, the following being the prices ruling for some articles of principal interest. Bank rate was to-day reduced to 3¹/₂ per cent. :—

ACETANILIDE.—Continues dull and weak at 9¹/₂d. to 11d. per lb., according to make, packing, and quantity.

ACID CARBOLIC.—Is quiet and, if anything, the turn easier for the refined article, crude being also rather lower, while the liquid is firm at full rates.

ACID CITRIC.—Is firm at 1s. 4¹/₂d. to 1s. 5d. per lb., according to make for crystals in 5-cwt. casks.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3¹/₂d. to 4¹/₂d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. per cwt. Sal ammoniac, firsts, 40s. per cwt.; seconds, 38s. per cwt.; ditto, crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate steady: Gray, 24 per cent., London prompt, £11 7s. 6d. to £11 10s.; Hull prompt, £11 5s.; Leith prompt, £11 7s. 6d.; Beckton, £11 10s.; Beckton terms prompt, £11 5s.

CASTOR OIL.—Belgian 1st pressing spot, £31 10s.; May-June, £30, f. o. b. Antwerp; 2nd pressing spot, £29 per ton. Hull Manufactured: Guaranteed Cold Drawn Pure Pharmaceutical, £34 per ton in barrels; 4¹/₈d. per lb. in cases. Pure firsts, £31 10s.; seconds, £29 10s. per ton in barrels; firsts, 3¹/₈d. per lb. in cases; seconds, 3⁷/₈d. ex-wharf London.

CLOVES.—At auction 18 cases Penang bought in, including fine bold picked at 8d. 6 bags Ceylon all sold, good picked at 6d. No Zanzibar offered. Privately, Zanzibar are firmer, closing 7¹/₈d. higher for distant delivery. A fair business has been done, comprising June-August delivery at 4¹/₈d., and sellers January-March at 3¹/₂d., and sellers and for arrival, Oct.-Dec., Nov.-Jan., and Dec.-Feb., at 3 25-32d. to 3¹/₂d., c.i.f., Holland.

COAL TAR DISTILLATION PRODUCTS.—Are without change, with the exception that Benzole is rather dearer at 10d. to 10¹/₂d. per gallon for the 50 per cent., and 8d. per lb. for the 90 per cent.

COCAINE.—Makers maintain their price of 1bs. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, from second-hand the brands most in favour are not offered.

COD LIVER OIL.—Continues dull and weak, price being nominally 75s. to 80s. per barrel, according to brand; for best new non-congealing Norwegian oil in tin-lined barrels of 25 gallons.

CODEINE.—Is very firm at 13s. 6d. per oz. for the pure.

GALLS.—China are offering cheaper for arrival at 68s. c. f. and i., Japan being unchanged, with sellers near at hand at 63s. c. f. and i., delivered weight.

GINGER.—Cochin in moderate supply met slow demand. Of 532 packages 179 sold, fair bright medium and small, some bold, washed rough at 32s.; dullish medium and small ditto at 30s. 6d.; and good bright cuttings at 25s. Japan: 140 bags fair Emed bought in at 25s. Jamaica in fair supply met a good demand at steady to rather dearer rates. Of 559 packages 433 found buyers, good bright, 71s. to 73s.; middling to fair, at 54s. 6d. to 61s.; common to good common, 46s. 6d. to 52s.; low to fair Rhatoon at 42s. to 45s.

GLYCERIN.—Is a very firm market at 58s. to 62s. 6d. per cwt. for English, and 63s. 6d. to 75s. per cwt. for German, according to quantity and brand, for best white, odourless, double distilled, chemically pure, 1260° S.G. quality, in tins and cases. It is thought probable that the article will still further advance.

MENTHOL.—After being decidedly weak, is rather firmer at 8s. to 8s. 6d. per lb., according to brand; while for September delivery there are sellers at somewhat below these figures.

MORPHINE.—Steady, at 5s. per oz. for the hydrochlorate powder.

OILS (FIXED) AND SPIRITS.—Linseed opened quiet, but closed steady. On the spot pipes, London, ordinary, £34 10s. (E.I. 5s. premium); barrels, £34 15s. Hull spot naked, £34. Rape firm. Ordinary brown on the spot, barrels, £29 5s.; refined spot, £30 10s. to £30 15s. Ravison strong and quotations nominal: Naked spot, £27 17s. 6d. Cotton quiet: London crude spot, £22 5s. to £22 10s.; refined spot, £24 5s. to £25, according to make. Hull naked refined spot, £23; crude spot, £21 12s. 6d. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut: Ceylon on spot, £25, ex warehouse; near, £23 5s. to £23 10s., c.i.f. Cochin spot, £23; afloat, £25, c.i.f. Palm: Lagos on the spot quoted £27. Petroleum dull: Russian spot, 6⁷/₈d. to 6¹/₂d.; American spot, 7d.; water white, 8d. to 8¹/₂d. Lubricating: Pale American spot, 9s. to 10s. 9d.; black, 7s. to 9s.; Russian black, 6s. 6d. to 7s.; pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American ordinary, 9¹/₂d.; deodorised, 9³/₄d. Turpentine opened dull and easier, but firmer at close: American spot, 44s. 3d.; May, 43s. 7¹/₂d.; June, 38s. 6d.

PHENACETIN.—Makers are firm at 5s. 3d. per lb. for both crystals and powder in 5-cwt. lots.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11¹/₂d. per lb. Chlorate, spot, London, crystals, 4⁵/₈d. net; powder, 4⁵/₈d. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 93 per cent., 1s. 2d. per lb. Hydrate (caustic potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7¹/₂d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUININE.—Has been dull and prices are barely steady, the sales comprising only a few thousand ozs. B&S and/or Brunswick October delivery at 1s. 3³/₄d. Makers of these brands maintain their price of 1s. 4¹/₂d. per oz. for the Sulphate in 100-oz. tins and for 1,000-oz. lots.

SHELLAC.—There is a steady demand for Second Orange on the spot, and a moderate business has been done at full to dearer rates. For arrival May shipment a sale has been made at 57s. 6d., being cheaper. April-June steamer, there are sellers at 57s. 6d., c. f. and i. For August delivery no business is reported, closing rather buyers at 61s. Supplies at auction were again moderate. TN descriptions of Orange met a good demand at about 1s. advance on last sales' prices, fair being quoted 61s., but fine Second Orange was slow of sale and mostly bought in. Common Rangoon Garnet sold at unchanged rates, Button being neglected and chiefly bought in. A total of 523 cases offered and 217 cases sold. Second Orange: Of 326 cases 190 cases sold.

worked, good palish, at 66s.; good bright at 64s.; pale block at 59s.; unworked, fine bright cakey to blocky, at 67s.; fair red cakey at 59s.; flat livery at 58s. Garnet: 22 cases offered and sold, Rangoon fair thin ruby matted at 58s.; common weak block at 55s. Button: 175 cases offered and bought in.

SULPHONAL.—Second-hand is practically sold out. Makers quote 20s. 6d. per lb. for both crystals and powder.

THURSDAY'S UG SALES.

To-days drug auctions comprised 14 catalogues and a very considerable number of lots, many of which had to be bought in. There are no changes of any special importance to report, the following being the particulars:—

ASPHALTUM.—59 cases Syrian were bought in at 33s. per cwt.

ALOES.—Of 29 cases Cape only 4 cases sold at 28s. to 28s. 6d. per cwt., remainder being taken out at 33s. 24 kegs Soccotrine were bought in at 80s. per cwt. 280 boxes Curaçoa part sold at 15s. 6d. down to 13s. 6d. per cwt.

ARECA NUTS.—43 bags wormy part sold at 17s. per cwt., balance being taken out at 20s.

BITTER ORANGE BLOSSOM.—13 cases dried Italian were bought in at 1s. 6d. per lb.

CANELLA ALBA.—9 bales sold at 40s. per cwt., and 1 case 2 C.S.D. at 36s.

BALSAM COPAIBAE.—9 cases catalogued had partly been sold prior to sale; balance bought in at 1s. 8d. per lb.

BUCHU LEAVES.—5 bales longs of not very desirable quality were taken out at 5½d. per lb., and 4 bales rounds at 7d. Other 13 bales fair ditto at 9d. per lb.

BALSAM PERU.—4 cases part sold at 6s. per lb., balance being taken out at 6s. 3d.

CALUMBA ROOT.—70 bags fair bold washed taken out at 60s. per cwt.; other 25 bags also bought in at 35s. to 60s.; other 68 bags were also all taken out at 25s. per cwt. for medium to fair sorts. 11 bales (part of other 81 bags) sold at 23s. per cwt. for same quality.

CANTHARIDES.—2 casks Russian were bought in at 2s. 3d. per lb.

CASCARA SAGRADA.—14 bags sold at 24s. to 26s. per cwt.

CHILLIES.—25 cases fair Zanzibar bought in at 48s. 6d. per cwt.

CINCHONA BARK.—68 bales Calisaya part sold at 6d. per lb. 7 bales Succirubra were bought in at 3½d. per lb.

CHIRETTA.—10 bales were bought in at 5d. per lb.

COCA LEAVES.—3 cases fair Truxillo were bought in, a bid of 1s. 2½d. per lb. being declined.

COLOCYNTH.—10 cases Spanish were taken out, 3 cases fair unpeeled Persian sold at 4d. per lb.

CORIANDER SEEDS.—30 bags were taken out at 11s. per cwt.

CROTON SEEDS.—31 bags were all bought in at 40s. to 50s. per cwt., according to quality.

CUMMIN SEED.—21 bags bought in at 37s. per cwt.

DILL SEED.—20 bags were taken out at 9s. per cwt.

DRAGON'S BLOOD.—8 cases part sold at £14 per cwt. for good bright, and at £11 2s. 6d. for damp seedy.

DRIED TURTLE.—2 cases were taken out at 4s. 6d. per lb.

FENUGREEK SEEDS.—15 bags were bought in at 6s. 6d. to 7s. per cwt.

GALLS.—10 bags sold at 86s. to 90s. for the sound and 77s. per cwt. for 1 C.S.D.

GUM ARABIC.—2 cases picked were taken out at £5 10s., good drop at £7 per cwt., fair Turkey sorts selling at 75s. per cwt. 10 cases fair Kurrachee Gum bought in at 31s.

GAMBOGE.—4 cases all bought in at £8 to £6 10s. per cwt. for fair to dull pipe. Other 36 cases chiefly bought in, 6 cases dull selling at £6 5s. to £6 17s. 6d.

GUAZA (HERBA CANNABIS INDICA).—79 bales were bought in at 1s. 9d. per lb., and 35 bales siftings at 1s. 3d. per lb.

GUM ASAFETIDA.—99 cases were chiefly bought in at 35s. to 40s. per cwt., low inferior selling, without reserve, at 9s. 6d. to 13s. per cwt.

GUM BENZOIN.—21 cases bought in at £8 per cwt. for fair seconds Sumatra. Other 36 cases were also all taken out. Other 68 cases Sumatra part sold at £7 5s. to £8 10s. per cwt. for medium seconds. 28 cases Siam all bought in at £8 to £15 10s. per cwt. 56 cases fair Palembang sold at 51s. 6d. to 53s. 6d. per cwt.

GUM ELEMI.—6 cases sold at 155s. per cwt.

GUM GALBANUM.—13 packages blocky were taken out at 9d. to 1s. 1d. per lb.

GUM GUAIAECUM.—7 packages were all bought in at 2s. 2d. per lb. for good glassy block down to 1s. 4d. per lb.

GUM KINO.—1 case African taken out at 1s. 6d. per lb. 6 cases Cochin sold very cheaply at 1s. per lb.

GUM MASTIC.—16 cases all taken out at nominally 1s. 6d. per lb. for yellow.

GUM MYRRH.—7 bales medium sorts were taken out at 55s. per cwt.; 21 packages ditto part sold at 47s. 6d. for siftings, good quality being taken out at 80s.

GUM TRAGACANTH.—4 cases were bought in at £14 15s. to £15 per cwt.

HONEY.—32 cases Californian were taken out at 45s. per cwt., other 20 cases at 42s., and 14 cases Honolulu at 30s. per cwt. 6 packages white Jamaica sold at 28s. for good down to 23s. 6d. per cwt. for less desirable quality.

INSECT POWDER.—9 kegs, offered without reserve, sold at 5d. to 6d. per lb.

IPECACUANHA.—2 bales Carthagenæ were bought in at 9s. per lb.; other 7 bales at 10s. 29 bales Rio part sold at 12s. 1d. to 12s. 4d. per lb.; balance taken out at 12s. 6d.; other 15 bales part sold at about same figure.

JALAP.—For 10 bags of fair quality there was no bid.

KAMALA.—8 cases were taken out at 6d. per lb.

KOLA NUTS.—5 bags of fair quality were bought in at 6d. per lb.

LEMON JUICE.—9 pipes and 8 hogsheads new juice, catalogued as containing 8oz. citric acid per gallon, offered without reserve, sold at 1s. 1½d. per gallon.

LIQUORICE ROOT.—36 bags were taken out at 12s. 6d. per cwt.

MUSK.—3 tins Tonquin part sold at 35s. per oz. 1 caddy bought in at 75s., 7 bottles and 1 tin grain musk at 25s. per oz. 1 tin very low quality sold at 10s. 6d. per oz.

ORRIS ROOT.—1 cask medium Verona sold, without reserve, at 29s. 6d. per cwt.; other 25 bags ditto at 29s. to 29s. 6d.; while Florentine was bought in at 52s. per cwt.

ORANGE PEEL.—2 cases thin cut sold cheaply at 6d. per lb.; 2 cases dark ditto at 4d.; other lots of good thin cut were taken out at 7d. to 8d. per lb.

PATCHOULY LEAVES.—6 cases bought in at 5d. per lb.

RHATANIA ROOT.—32 bales taken out at 4¾d. per lb.

SAFFRON.—33 tins were taken out at 25s. to 30s. per lb.

SARSAPARILLA.—12 serons Honduras bought in at 1s. 6d. to 1s. 8d. per lb. Other 6 serons part sold at 1s. 3d. per lb. for 1 CCD. 11 bales Jamaica bought in at 1s. 9d. per lb. for 1 CCD and 1s. 8d. per lb. for 2 CCD. 14 bales Lima part sold at 1s. 1d. per lb. 4 serons Honduras bought in at 1s. 6d. per lb.

SCAMMONY ROOTS.—20 bags all sold at 31s. per cwt.

SOY.—25 casks China bought in at 1s. 1d. per gallon.

SQUILLS.—8 bags sold at 1½d. per lb.

SUNFLOWER SEED.—8 bags bought in at 12s. per cwt.

TURMERIC.—Cochin split bulbs sold at 11s. per cwt.

EXCHANGE COLUMN.

OFFERED.

Barclay & Sons' Shares. What offers?—Barlow, Chemist, Barnard Castle.

Moulds.—Suppository, Pessary, Bougie, Capsule. — Warnes, 333, Gray's Inn Rd., W.C.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dereham, Norfolk.

For Sale, counter scales; 4 rows mahogany shop-drawers, gilt labels, glass knobs, pill machine, and tincture press.—Apply, Mrs. C. Hobson, Jun., Market Place, Beverley.

English Lavender Water, etherised; excellence of quality unrivalled. Sales due to its aroma, containing nine ingredients, including otto. Recipe 5s.—Alldridge, 11, Esher St., Westminster.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—Sir Henry Roscoe on "Bunsen."		
Saturday, June 2.		Sun rises 3.50; sets 8.6.
CRICKET.—Victoria Park—Allen C.C. v. Rose Templars.		

PHARMACEUTICAL SOCIETY.

OFFICIAL NOTICES.

Pharmaceutical Scholarships.

THE JACOB BELL MEMORIAL SCHOLARSHIPS.

Two scholarships will be offered for competition on July 10, 1900. Each scholar will receive £30, in addition to free laboratory instruction and admission to the lectures in the School of Pharmacy for the Session 1900-1901. He will also receive books of the value of £2 10s., given by the late Thomas Hyde Hills.

MANCHESTER PHARMACEUTICAL ASSOCIATION SCHOLARSHIP.

A scholarship of about £26 will be offered for competition on July 10, 1900.

REGULATIONS.

All entries for both the above competitions must be in the hands of the Secretary *on or before June 1*, accompanied by the certificates, etc., required by the regulations under which the scholarship may be competed for and held. Copies of those regulations can be had on applying to the Registrar, 17, Bloomsbury Square, W.C.

Herbarium Prize.

A silver medal is annually offered to subscribing "students" of the Society who are under the age of twenty-one years, for the best Herbarium, containing not more than 150 specimens, collected in any part of the United Kingdom, the Channel Islands, or the Isle of Man, between January 1, in one year, and July 1, in the year following. Should there be more than one collection possessing such an amount of merit as to entitle the collector to reward, a second prize, consisting of a bronze medal and a certificate of honour, will be given, at the discretion of the Council.

LAST DAY OF ENTRY.

Collections for this year's competition must be received by the Registrar of the Society not later than Saturday, June 30.

Publications Received.

DIE ROHSTOFFE DES PFLANZENREICHES. Von Dr. JULIUS WIESNER. 3 Lieferung (Bogen 20-30), mit Textfigur 72-88. Price 5m. Leipzig: Wilhelm Englemann. From the Publisher.

CONTRIBUTIONS TO A KNOWLEDGE OF THE FLORA OF AUSTRALIA. No II. By R. T. BAKER, F.L.S., Curator, Technological Museum, Sydney. Reprinted from the *Proceedings of the Linnæan Society of New South Wales*. Part III. August 30, 1899. From the Author.

KELLY'S DIRECTORY OF CHEMISTS AND DRUGGISTS, including Manufacturing Chemists, Wholesale Druggists, Drysalts, Patent Medicine Vendors, and other trades connected therewith. 1900. Ninth Edition. Pp. 671. Price 20s. London: Kelly's Directories, Limited, 182, High Holborn, W.C. From the Publishers.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet it is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free.

Full directions and attractive labels and handbills in crimson and bl free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

ROUSE BROS., 61, Charlotte St., LONDON, W.

Every Description always on hand.

ONE of the leading and best known Firms of Pharmaceutical Chemists in Germany would receive the GENERAL AGENCY for the sale of Foreign real Specialities, and would also introduce or manufacture chemical-pharmaceutical novelties.—Please address, I. W. 8248, care of Rudolf Mosse, Berlin, S.W.

LONDON GAZETTE NOTICES.

RECEIVING ORDERS IN BANKRUPTCY.

Joseph Chapelow, druggist, 14, Claypath, Durham.

F. Hall, dentist, 97, Edgware Road, Middlesex.

Thomas Dutton, Doctor of Medicine, 13, Holland Park Avenue, Kensington.

PARTNERSHIPS DISSOLVED.

Charles John Denny and Herbert Edward Rayner, surgeons, of Blackwater, Hants, and Camberley, Surrey.

Adolf William Isenthal and Charles Phillip Francis Michael Potzler, electrical engineers, merchants, and manufacturers, 85, Mortimer Street, London, carrying on business as Isenthal, Potzler, and Co. Debts will be received and paid by A. W. Isenthal, who will continue the business.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Abram, Archbold, Ashkanazy, Balchin, Banham, Barrie, Bartlett, Beach, Billinton, Cameron, Clarke, Cuff, Dunlop, Eberlin, Fairley, Forster, Garnett, Griffin, Harrison, Hill, Hodges, Hooper, Jones, Lecney, Lloyd, Marsden, Mortimer, Murray, Nicholson, Philp, Worrall.

NEWS IN BRIEF.

MR. T. C. CORNWELL, M.P.S., Piccadilly Buildings, Hanley, (Staffs.), has fitted up a dark-room for the use of amateur photographers.

MR. J. SAUNDERS, M.P.S., has purchased the business established in 1837, and carried on for the last twenty-one years by Mr. J. Hibberd, at Old Town, Bexhill.

A FIRE, which caused much damage, broke out late on Thursday night, May 24, in the basement of premises occupied by Messrs. Durbin Bros., chemists, at 131, High Street, Putney, S.W.

MR. J. H. SHERWOOD, M.P.S., Withington, Manchester, has purchased the business carried on by Mr. Round, chemist and druggist, 10, London Street, Southport, for the past thirty years.

THE EXECUTORS OF THE LATE ALFRED FENNINGS, of West Cowes, have obtained the sanction of Mr. Justice Cozens-Hardy to carry on the various proprietary medicine businesses. His Lordship also directed certain inquiries to be made with respect to the will of the deceased.

MR. RICHARD BREMIDGE, Registrar under the Pharmacy Act, 1868, writing to the *Lynn Advertiser*, points out that the name of Alfred William Maxey—who was described as a "chemist" in a recent report of an inquest which appeared in that paper—does not appear on the official Register of Chemists and Druggists.

SHEFFIELD COLLEGE OF PHARMACY.—The students, accompanied by the principal, went for a day's botanical excursion to Rock Abbey, belonging to the Earl of Scarborough, when over fifty different flowers were collected and described. An excellent tea was had at Maltby, and the drive home was much enjoyed.

THE DEGREE OF BACHELOR OF MUSIC was conferred on Mr. Geo. R. H. Clark, a member of the Snow Hill Staff of Messrs. Burroughs Wellcome and Co., at a Congregation holden at Oxford, on Friday, June 1. Mr. Clark, who is also a Fellow of the Royal College of Organists, passed the Minor examination of the Pharmaceutical Society in 1892.

MR. A. E. MARSH, M.P.S., of 180, New Bond Street, W., while crossing Regent Street on Saturday afternoon, May 26, was knocked down by a passing cab. He was apparently uninjured, but in scrambling to his feet, another cab coming in an opposite direction struck him on the head. He was taken to Charing Cross Hospital suffering from concussion of the brain.

MR. A. B. GAIRN, Edinburgh, has gained the medal in chemistry, stage I., of the Heriot-Watt College (Professor Gibson) for the session just concluded. He obtained 94 per cent. in theoretical and practical chemistry, the next student having 87 per cent. Along with the medal, he received the "McLaren Robertson" prize of £3 3s. in money. Mr. Gairn is a student-associate of the Pharmaceutical Society, and an apprentice with Mr. Lunan.

HIS HONOUR JUDGE EDGE, Q.C., in giving judgment for the plaintiff with costs, at Clerkenwell County Court, on May 18, stated that had the plaintiff—a clerk engaged on a yearly salary and paid monthly—sued for three months' instead of only one month's money in lieu of notice, he could have awarded him the full amount. If an idea existed that a person engaged on a yearly salary and paid monthly could be dismissed at a week's notice, he could dispel it.

CRICKET.—A match was played at Willesden on Saturday, May 26, between "Johnsen Jörgensen" C.C. and "Allenburys" C.C., the former team scoring forty-eight runs and the latter 103.—Last week, in recording the result of the match played on May 19 between "Allenburys" C.C. and "Allen" C.C., we omitted to mention that owing to the courtesy of Mr. Malcolm Allen, captain of "Allen" C.C., the game was played out, although past time for drawing stumps; otherwise it would have been a drawn match.

THE QUESTION OF BORIC ACID IN MARGARINE came before the Liverpool stipendiary magistrate on Wednesday, May 30, a grocer being summoned for selling margarine adulterated with boric acid

equal to 51 grains per lb. The magistrate, after hearing evidence for and against the use of boric acid as a preservative, said the issue was far too serious to be decided in favour of boric acid in the limited area of a police-court. They knew that preservatives were used to palm off on the market an article which otherwise could not be sold. A penalty of £20 and five guineas costs would be imposed. Notice of appeal was given.

THE PHARMACEUTICAL COUNCIL, according to the *Blackburn Telegraph*, has escaped the sword of the destroyer. "In other words, Mr. R. Lord Gifford has just failed to secure election to this highly respectable, somewhat obtuse, and altogether unprogressive body. Mr. Gifford was the champion of a sweeping and wholesale reform, in which company pharmacy was to disappear as in a consuming fire. He has made himself famous throughout the country by his slashing attacks on the old fogeys who were too sluggish to approve of his Cromwellian policy. Unfortunately for him, the old fogeys have won this time. But of him, as of a greater, we may say that 'a time will come.'"

THE SUPPLY OF BRANDY to certain of the Metropolitan Asylums Board's institutions came under consideration at a recent meeting of the Board, when Professor Smith said that the Board should see to it that agencies of a curative nature in the way of drugs were pure and up to the standard of the British Pharmacopœia. Brandy was in every sense a drug, and according to the British Pharmacopœia it was to be a spirituous liquid distilled from wine and matured by age. The brandy they were asked to purchase for the patients could not be of that description, from the fact of the price being 11s. 6d. per gallon. A pure brandy could not be bought for less than 15s. a gallon.

TRADE NOTES.

MESSRS. BURROUGHS WELLCOME AND Co, Snow Hill Buildings, E.C., announce that during the months of June, July, August, and September, their London offices, warehouses, etc., will be closed at 1 o'clock on Saturdays.

PYRO CRYSTALS.—Mr. J. E. Lockyer, 37, Evelyn Street, Deptford, S.E., intimates that he is now in a position to supply pyrogallic acid crystals of the highest purity in a new and exceedingly practical form only occupying $\frac{1}{16}$ th the space of ordinary pyro. It is employed, however, in the same manner as the usual form. A one oz. sample bottle will be sent post free for 1s. 1d., and special terms for quantity on application.

UROTROPINE TABLOIDS.—Messrs. Burroughs Wellcome and Co. direct attention to Urotropine Tabloids which they are now issuing of a strength of five grains. Some attention has been directed to the use of Urotropine (Hexamethylene-tetramine) as a diuretic, a solvent of uric acid and urates, and genito-urinary antiseptic. It is also claimed to have been of much service in cystitis after other drugs have produced little or no effect. Urotropine Tabloids, grain five, are issued in bottles containing twenty-five in each.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

M. A. Judd (widow) and J. Price, trading as Judd and Co., chemists, Leamington.

John William Emmet and Andrew Murdoch, physicians and surgeons, Bexhill-on-Sea.

John Yeadon, William Salisbury, and Marion Booth Dickinson, trading as the Accrington Surgical Appliances Company. Debts will be received and paid by J. Yeadon and M. B. Dickinson, who will continue to carry on the business under the same style as before.

David Hume and William Spinks Webb, medical practitioners and surgeons, 139, Hanbury Street, E., and 45, White Lion Street, E. Debts will be received and paid by W. S. Webb.

RECEIVING ORDERS IN BANKRUPTCY.

Albert Edward Parsons, soda water manufacturer, Chesterfield Villa, Dorchester.

Harry Angel, mineral water manufacturer, Sunderland Street, Exeter.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, MAY 30, 1900.

Prices still continue steady, notwithstanding the slowness of business generally, and as regards oils the recent full rates reached are steadily maintained with every evidence of further rises. Good sales of West African Ginger have taken place, both Monrovia and Sierra Leone having changed hands extensively at fair rates.

AMMONIUM SALTS.—Carbonate, $3\frac{3}{4}$ d. to 4d. per lb. Sal Ammoniac, 38s. to 40s. per cwt. Sulphate is firmer, £11 12s. 6d. to £11 15s. per ton.

CANARY SEED—Is quiet and in slow demand at 34s. to 34s. 6d. per 464 lbs.

COPPERAS—Is still very firm at 37s. to 39s. per ton.

COPPER SULPHATE—Is dearer, £25 10s. per ton.

GINGER.—33 bags of Monrovia sold after auction at 22s. per cwt. ex quay, 34 bags of Sierra Leone in transit made 22s. 6d., whilst 178 bags of Sierra Leone sold ex quay on private terms.

HONEY.—11 barrels of low quality Peruvian brought 21s. 6d. per cwt.

LINSEED—Still continues high in price, but buyers are few, and prices are likely to come down to buyers' views shortly. Prices which are nominal are Calcutta, 57s. per 416 lbs. on passage, forward, 55s. 6d., May shipment; River Plate, forward, 53s., April-May shipment; North American, 46s. 3d., September and November shipment.

OILS (FIXED) AND SPIRITS.—Castor Oil is very firm, and prices continue full for spot lots. Calcutta, $3\frac{3}{4}$ d. per lb.; 1st French, $3\frac{3}{4}$ d.; 2nd French, $3\frac{1}{4}$ d. per lb.; Madras, $3\frac{1}{4}$ d. to $3\frac{3}{4}$ d. Olive: Spot business is confined to Spanish oils at £35 10s. per tun, and Portuguese at £33. The harvest prospects being far from favourable, a rise of 30s. to 40s. per ton is probable, as the cost here to importers is higher than the rates ruling at present. Linseed oils of Liverpool make, packed in export casks, are quoted at 36s. to 36s. 6d. per cwt., with a fair demand experienced. Cottonseed oil of Liverpool pressure rules quiet at 25s. 6d. to 26s. per cwt. Spirits of Turpentine are in moderate demand at the easier rate of 45s. 6d. per cwt.

POTASH SALTS.—Bichromate 4d. per lb. Chlorate is firm at $4\frac{1}{2}$ d. to $4\frac{3}{4}$ d. per lb. Cream of tartar is only in retail demand at 74s. to 80s. per cwt. Pearlashes are 32s. 6d. per cwt., and potashes are in moderate request at 25s. 6d. per cwt. Prussiate is firm at 8d. per lb.

SODA SALTS.—Bicarbonate £6 5s. to £6 15s. per ton. Borax is steady at 16s. to 17s. per cwt. Caustic soda is still scarce, 76 to 77 per cent. at £11 5s. to £11 10s., 70 per cent. £10 5s. per ton, crystals £3 5s. per ton. Nitrate 8s. $4\frac{1}{2}$ d. to 8s. 9d. per cwt.

LONDON, THURSDAY, MAY 31, 1900.

Business in Drugs and Chemicals has, if anything, been rather brisker during past week. There are, however, no changes of any special importance to record. Quinine continues in the dumps. Iodides are still shaky, otherwise prices remain firm, as a rule, this being partly the result of the fact that second-hand stocks of many articles bought before late advances in value are now practically exhausted; first-hand being, therefore, now better in a position to enforce the full advance, of which the dealers had previously had the advantage. This applies, for instance, to Santonine, Salicine, Phenacetin, Sulphonol, etc. A corner appears to be in course of being created in Jalap, which has already advanced in value, and price appears likely to further advance. It is to be hoped that the good news from the seat of war in South Africa may

be fully confirmed, and that we may then see renewed activity in the Drug and Chemical trade. The following are the prices ruling for some articles of chief interest:—

ACETANILIDE—Continues dull and weak at $9\frac{1}{2}$ d. to 11d. per lb. according to make, quantity, and packing.

ACID BORACIC—Without change, at 26s. per cwt. for crystals, and 28s. per cwt. for powder.

ACID CARBOLIC—Remains firm at 10d. to $10\frac{1}{2}$ d. per lb. for 35-36° C. ice crystals, in bulk packing; $10\frac{3}{4}$ d. to $11\frac{1}{4}$ d. for 39-40° C. ice crystals; and 1s. to 1s. $0\frac{1}{2}$ d. per lb. for the B. I. quality, viz., 39-40° C. detached crystals; crude, 60° F., 2s. 7d. per gallon; 75° F., 3s. 4d. per gallon; liquid, 95 to 98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon, in 40 gallon casks; ditto, 25 to 30 per cent. of dark colour, 25s. to 27s. 6d. per barrel of 40 gallons.

ACID CITRIC—Is decidedly firmer at 1s. $4\frac{1}{2}$ d. to 1s. 5d. per lb., according to brand for crystals in 5cwt. casks. Makers still decline to book orders for forward delivery.

ACID OXALIC—Steady at 3d. to $3\frac{1}{4}$ d. per lb., according to quantity, nett, delivered free London.

ACID TARTARIC.—English is quoted 1s. $0\frac{3}{4}$ d. to 1s. 1d. per lb. on the spot; foreign, 1s. per lb.

AMMONIA COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, $3\frac{1}{2}$ d. to $4\frac{1}{2}$ d., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33 to 36s. Sal Ammoniac, £37 and £39 per ton for firsts and seconds respectively; crushed for batteries 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate dull: Gray, 24 per cent., London prompt, £11 7s. 6d.; Hull prompt, £11 3s. 9d. to £11 5s.; Leith prompt, £11 6s. 3d. to £11 7s. 6d.; Beckton nominally, £11 10s.; Beckton terms prompt, £11 5s. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is quoted £38 to £39 per ton, and Crude Japan (Black Sulphide) £22 15s. to £23 10s. per ton.

ASHES.—Pots, 28s.; Pearls, 33s.

BISMUTH—Unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 8d. per lb. for the subcarbonate, and 5s. 1d. per lb. for the subnitrate.

BORAX—Unchanged at 17s. per cwt. for crystals, and 18s. per cwt. for powder.

BLEACHING POWDER (CHLORIDE OF LIME).—English is still quoted £7 per ton.

BROMIDES AND BROMINE.—Are very firm at 1s. $11\frac{1}{2}$ d. per lb. for potassii bromid, 2s. 3d. per lb. for sodii bromid, and 2s. $2\frac{1}{2}$ d. per lb. for ammon. bromid. Bromine is also unchanged at 2s. to 2s. 2d. per lb., according to quantity, packed in cases of 60lbs.

CAMPHOR.—Market for crude remains steady. Refined is also unaltered at firm prices, say, 2s. 4d. per lb., for English Bells and Flowers.

CASTOR OIL.—Belgian first pressing spot £31 10s., May-June £30 f.o.b. Antwerp, second pressing spot £29 per ton. Hull manufactured: Guaranteed Cold Drawn Pure Pharmaceutical £34 per ton in barrels, $4\frac{1}{8}$ d. per lb. in cases. Pure firsts £31 10s., seconds £29 10s. per ton in barrels, firsts $3\frac{1}{8}$ d. per lb. in cases, seconds $3\frac{7}{8}$ d. ex wharf London.

CLOVES.—The market for Zanzibar continues dull. The small business done includes June-Aug. delivery at $3\frac{1}{2}$ d., and Aug.-Oct. at same figure, with sellers for Jan.-March at 3 25-32d.

COCAINE HYDROCHLORATE.—One maker is very loud in proclaiming the superiority of his make, boldly asserting that it is an absolutely pure preparation, and ranks first in the Cocaine market. Some buyers, however, do not share this *ipse dixit* opinion, and readily pay more money for another make, which, relying on its intrinsic merits, does not appear to require so much pushing and loud advertisement, showing thus the truth of the old adage that "good wine needs no bush." Makers are firm at 16s. 6d. per oz. for 200 oz. lots in 25 oz. tins; while it is reported that decidedly higher prices have lately been paid for the crude article.

COAL TAR DISTILLATION PRODUCTS.—Toluol, 1s. 2d. to 1s. 3d. per gallon for the commercial quality. Benzole quiet at 10d. to $10\frac{1}{2}$ d. per gallon for 50 per cent., and 8d. per gallon for the 90 per cent. Creosote, 3d. to $4\frac{1}{2}$ d. per gallon, according to quantity. Crude Naphtha: 30 per cent. at 120° C., $4\frac{1}{2}$ d. per

gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 4d. per gallon; 90 per cent. at 160° C., 1s. 1d.; 90 per cent. at 190° C., 1s. 1d. per gallon. Anthracene: A, 3½d. per unit; B, 2¾d. Pitch, 37s. 6d. per ton, f.o.b. Tar: crude or refined, 13s. per barrel; 2½d. per gallon.

COD LIVER OIL—Continues dull and weak at nominally 72s. 6d. to 77s. 6d. per barrel, according to brand, for best new non-congealing Norwegian oil, in tin-lined barrels of 25 gallons.

CODEINE—Very firm at 13s. 6d. per oz. for the pure, and 12s. 6d. per oz. for the Muriate, Phosphate, and Sulphate Salts.

CREAM OF TARTAR—Firm at 75s. to 76s. per cwt. for first white Crystals on the spot, and 77s. per cwt. for powder; ditto 95 per cent., 78s.

CUTCH—Dull of sale at previous quotations.

GALLS—Quiet. China offer on the spot at 75s., with buyers at 70s., the arrival price remaining 68s. c. f. and i. Japan spot sellers at 65s., and near steamer at 63s. c. f. and i. delivered weight.

GAMBIER—Remains quiet, and for arrival no business is reported, closing rather buyers May-July steamer at 15s. 3d. On the spot whole bales quoted sellers at 16s. 3d., but few sales are reported.

GLYCERIN—Continues very firm, both for crude and for refined, a further advance being confidently anticipated in price of the former, which would almost certainly lead to dearer prices for the refined article. Present quotations are 60s. to 65s. per cwt. for English, and 65s. to 75s. per cwt. for German, according to brand, for best white odourless, double-distilled, chemically pure, 1,260 S.G. quality, in tins and cases.

IODIDES AND IODINE.—Position remains unchanged, but buyers will do well to continue to cover their requirements strictly from hand to mouth only. The combined makers so far maintain their prices, which are:—Potassii Iodid., 10s. 6d. per lb.; Sodii Iodid., 11s. 10d. per lb.; Ammon. Iodid., 13s. 10d. per lb.; Iodine re-sublimed, 12s. per lb.; Iodoform crystals, powder, or precipitated, 13s. 10d. per lb. Commercial Iodine is also so far unchanged at 7½d. per oz.

JALAP.—It is reported that a corner in this article is being worked in America, quotations from there being now 6¾d. per lb., c.i.f., while here holders ask various prices, from 7½d. to 9d. per lb., according to seller, for good sound heavy tubers; it would appear probable that we may see a further advance in price of this article.

LYCOPODIUM.—Is very scarce here. Most holders appear to be sold out, and very full prices, up to 2s. 6d. per lb., are asked.

MENTHOL—Is, if anything, rather firmer. The favourite Kobayashi brand can, however, still be bought at 8s. 6d. per lb.

MERCURIALS—Are unchanged, makers being very firm, at 3s. 2d. per lb. for calomel and 2s. 10d. per lb. for corrosive sublimate.

OILS (FIXED) AND SPIRITS.—Linseed: On the spot pipes London ordinary, £33 10s. (E.I. 5s. premium); barrels, £33 10s. Hull, spot, naked, £33 5s. Rape quiet. Ordinary brown, on the spot, barrels £29 10s. Refined spot, £31. Ravison, naked, spot, £29. Cotton dull. London crude, spot, £21 15s. to £22. Refined spot, £23 15s. to £24, according to make. Hull, naked, refined, spot, £21 15s. Crude, spot, £20 10s. Olive, Mogador, £35. Spanish, £36 10s. Levant, £35. Coconut, Ceylon, on the spot, £25 ex. warehouse; near, £23 5s. c.i.f. Cochin, spot, £28; afloat, £24 15s. c.i.f. Palm, Lagos, on the spot, quoted £26 10s. Petroleum: Flat Russian, spot, 6¾d. to 6½d. American, spot, 6¾d. to 7d. Water White, 8d. to 8½d. Lubricating: Pale American, spot, 9s. to 10s. 9d.; Black, 7s. to 9s.; Russian Black, 6s. 6d. to 7s.; Pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American ordinary, 9½d.; Deodorised, 9¾d. Turpentine: American, spot, 43s. 9d.; June, 38s. 9d.

OPIUM.—There has not been much business passing in the article during past few days, and prices are steady, high figures being still asked for really fine Persian.

MORPHINE—Steady, but without change in price, the Hydrochlorate powder being quoted 5s per oz., and the crystal salt 5s. 2d. per oz.

PARAFFIN WAX.—Crude is quoted 3¼d. to 3½d. per lb., and refined at 4d. to 4¾d. per lb.

PHENACETIN.—Makers are firm at 5s. 3d. per lb. for Crystals or Powder in 5-cwt. lots, second-hand still offering in limited quantity rather below above figure.

PITCH.—8s. 6d. to 9s.

PLUMBAGO.—At auction 242 barrels offered and bought in, comprising ordinary chips at 16s., good to fine chippy dust at 20s. to 25s., and ordinary flying dust at 7s. 3d. 17 barrels damaged sold, without reserve, for account of whom it may concern, from 8s. to 25s.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals, 4½d.; powder, 4¾d. per lb. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Iodide, 10s. 6d. per lb. Muriate, 80 per cent., £9 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d., according to quantity. Sulphate, 90 per cent.; £9 15s. per ton.

QUICKSILVER.—The importer quotes £9 10s. per bottle, while there appears to be nothing obtainable from second-hand at any thing below this figure.

QUININE.—The market for best German brands is weak, and business unimportant. The only sale reported is 5,000 oz. B&S and/or Brunswick, August delivery, at 1s. 3½d. Market closes rather firmer at 1s. 3½d. per oz. for later delivery. Makers of above-named brands maintain their quotation of 1s. 4½d. per oz. for 1,000 oz. lots in 100-oz. tins.

ROSIN.—Strained on spot is quoted 5s. per cwt. ex wharf; afloat, 4s. 7d. per cwt., ex ship terms for July-September shipment per sailing vessel.

SAL AMMONIAC—Is quoted £37 to £39 per ton.

SALICYLATES AND SALOL—Are firm at unchanged prices.

SANTONINE.—Stocks in second-hand appear now to be completely exhausted, and buyers have now to pay makers' full price—say 11s. 3d. to 11s. 9d. per lb., according to quantity, for crystals, while for powder a still higher price is asked.

SHELLAC.—There is a quiet but steady trade passing on the spot at full rates. The future market maintains a firm tone, but no business is reported to-day. Yesterday the sales included 200 cases TN Orange April-May and September-November steamer at 58s. c. f. and i., and 200 cases August delivery at 61s.

SODIUM COMPOUNDS.—Crystals, barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 10s. per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4½d. per lb. Hyposulphate (Antichlor.), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 10s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide, crystals, £6 10s. Sulphite, £5 15s. per ton.

SULPHATE OF COPPER—Is quoted £24 10s. to £25 10s. per cwt. on the spot.

SULPHONAL.—Second-hand stocks now appear to be cleared, while makers are firm at 20s. 6d. per lb. for both crystals and powder, with a certain reduction for quantity and bulk packing.

TAR.—Stockholm, 26s.; Archangel, lower at 17s. 6d.

THYMOL.—One maker still quotes 9s. 3d. to 9s. 6d. per lb., other makers holding out for more money.

TURMERIC—Continues in slow demand, with only unimportant sales. Madras, good to fine bright finger, quoted 32s. to 34s. Cochin split bulbs, small sales at 8s. 3d. to 8s. 6d.

VANILLA.—At auction the large supply offered—viz., 602 tins—met with a good demand, and 488 tins sold. Sound beans brought very full prices, but a large proportion consisted of out of condition parcels, which realised barely steady rates. Seychelles: Of 433 tins 386 sold, fair to good colour, 8 to 8½ inch, at 22s. to 23s. 6d.; 7 to 8 inch at 19s. to 21s. 6d.; 6 to 7½ inch at 17s. to 20s. 6d.; 3½ to 5½ inch at 16s. to 17s. 6d.; bad flavour and mouldy, 3½ to 7½ inch, at 11s. 6d. to 17s.; various, 7s. 6d. to 8s. 6d. Bourbon: 31 tins offered and sold, fair flavour, 7 to 7½ inch, at 19s. to 20s.; 5 to 7 inch at 17s. 6d. to 19s. 6d.; various, mouldy, etc., 8s. to 11s. Mauritius: Of 60 tins 45 sold, fair colour, 6 inch, at 18s.; brown and common, 2½ inch to 7 inch, at 12s. 6d. Madagascar: 10 tins offered and sold, 5½ to 6½ inch at 16s. Australian: Of 60 tins sold, mouldy, etc., 6s. 6d. to 10s.; various, 5s. Tahiti: Of 23 tins 5 sold, mouldy, etc., 3s. to 5s. 6d.

Calendar for the Week.

Sunday, June 3.	Whit Sunday.	Sun rises 3.49; sets 8.7.
Monday, June 4.		Sun rises 3.48; sets 8.8.
Tuesday, June 5.	☽ 6.59m.	Sun rises 3.47; sets 8.9.
Wednesday, June 6.		Sun rises 3.47; sets 8.9.
Thursday, June 7.		Sun rises 3.47; sets 8.10.
CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m.—Papers will be read on "Diphenyl- and dialphyl-ethylenediamines, their nitro-derivatives, nitrates, and mercurchlorides," by W. S. Mills; "Condensation of ethyl acetylenedicarboxylate with bases and β -ketonic esters," by S. Ruhemann and H. E. Stapleton; "The constitution of pilocarpine," by H. A. D. Jowett; "The nitrogen chlorides derivable from <i>m</i> -chloroacetanilide and their transformations," by F. D. Chattaway, K. J. P. Orton, and W. H. Hurtdley; "Derivatives of cyanocamphor and homocamphoronic acid," by A. Lapworth.		
LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers will be read on "A viviparous syllid worm," by E. S. Goodrich; "The genera <i>Phæoneuron</i> , Gilg., and <i>Dicellandra</i> , Hook. f." by A. Stapf; "The structure and affinities of <i>Echiurus uncinatus</i> ," by Miss Embleton.		
Friday, June 8.		Sun rises 3.46; sets 8.11.
ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 9 p.m.—"The effect of physical agents on bacterial life," by Dr. Allan Macfadyen.		
Saturday, June 9.		Sun rises 3.46; sets 8.12.
CRICKET.—Victoria Park—Allen C.C. v. Hovenden's C.C.		

Marriage.

PILLING—SMITH.—On April 10, at St. Mary's, Illingworth, near Halifax, by the Rev. George Oldacres, M.A., John William (Will), third son of the late George Pilling, of Savile Park, Halifax, to Emily, third daughter of Charles Smith, of Ryburne Villa, Sowerby Bridge, Yorkshire.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the Exchange Column should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., before 5 p.m. on Thursdays.

OFFERED.

2 oz. Morph. Hydroch., 10/6; 2 lb. Potass. Iodid., 19/-.—Eastman, Forest Lane, Stratford.

Pill-machine, 3-grain; iron counter-scales, to weigh 7 lbs.—Fuller, Chemist, Norwich.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dereham, Norfolk.

"**Pharmaceutical Journal**," vols. 1897, 1898, 1899. Complete; unbound. What offers?—Watt, 17, Richmond Terrace, Aberdeen.

Microscope.—One eye-piece, $\frac{1}{4}$ and 1 in. objectives, condenser, mahogany cabinet. Thoroughly reliable instrument. £3.—Watt, 17, Richmond Terrace, Aberdeen.

Spectacles and Pince-Nez; bargain; stock-in-trade; giving up the business; over 100 pebbles, 150 pair various, 50 tinted, 100 folders; prices from 1s. 6d. to 10s. 6d., retail.—Full list on application to Blanchard, 78, Duke St., Barrow-in-Furness.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Recipe suiting toilet speciality purchased.—Particulars to W. Lewis, 15, Sheldon St., London, W.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

NAMES AND FORMULÆ should be written with extra care, all systematic names of plants and animals being underlined, and capital letters used to commence generic but not specific names.

REPRINTS OF ARTICLES cannot be supplied unless the authors communicate with the Editor before publication of the articles. The right to reproduce all original matter and illustrations published in the Journal is strictly reserved.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Atfield, Barrie, Chambers, Cornwell, Daniel, Dennis, Dwelly, Fielding, Gifford, Graves, Hill, Hutton, Lewis, Palmer, Picken, Planchon, Roberts, Sargeant, Saunders, Sherwood, Thwait, Turner, Watson, Williams, Young.

NEWS IN BRIEF.

MR. FREDERICK CHARLES ASHFORD, M.P.S., has opened a business at St. Leonard's Road, Far Cotton, Northampton.

MESSRS. TAYLOR AND BRAWN, chemists, Bedford, have opened a photographic dark room for use by amateur photographers.

THE SWIMMING SECTION of the Edinburgh Pharmacy Athletic Club decided the first of a series of swimming handicaps on Monday, June 4. The finish was a very close one, the race being won by inches only. The result was:—1st, A. G. Paterson; 2nd, L. S. Lamb; 3rd, D. B. Kidd. The next race takes place on July 2, when a large number of competitors is looked for.

EARLY CLOSING.—The following chemists and druggists of Ashford (Kent) are reported to have agreed to close their places of business at 2 p.m. each Wednesday from June 6:—Mr. F. Gutteridge, High Street; Mr. J. Ingall, High Street; Mr. F. W. Stedman, High Street; Mr. J. J. Taylor, Messrs. Walker and Harris, Bank Street; and Mr. C. T. White, High Street.

THE ANNUAL MEETING OF THE SHAREHOLDERS of Brunner, Mond, and Company, Limited, was held at Liverpool on May 30. The report stated that the balance to the credit of profit and loss on the past year's working was £387,722 10s. 5d. A dividend at the rate of 35 per cent. was recommended. The report was adopted, and the retiring directors were re-elected.

THE EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION has made arrangements for an excursion to Aberfoyle on Wednesday, June 13, leaving Waverley Station by a special corridor train at 9 a.m., the route to be by the Forth Bridge, Alloa, Stirling, and Buchlyvie. We are requested to state that anyone connected with pharmacy who may be sojourning in the neighbourhood is welcome to join the party.

MR. LEOPOLD D'ESTREVILLE LENFESTEY, M.P.S.—nominated by the University of London—was gazetted on May 5 as a second lieutenant in the Royal Regiment of Artillery, and will join the "B" Battery of the Royal Horse Artillery on June 10. Readers of the Journal will probably remember a paper on "Starch and Its Formation," by Mr. D'E. Lenfestey, read before the Birkbeck Science Society, which was published in the *Pharmaceutical Journal* for July 15, 1899.

LEEDS COLLEGE OF PHARMACY.—On Monday, June 4, the students of this College travelled to the Lake District on a botanical excursion. Special carriages took the party to Windermere, where a substantial lunch awaited them. After lunch the students were transferred, by means of a small fleet, to various points on the banks of the lake, where an exceedingly large number of specimens were obtained. A most enjoyable day was terminated by the journey home at six o'clock.

MESSRS. SPENCE, chemists and stationers, Linlithgow, have just purchased the premises at 65, 67, and 69, High Street (Cross), where for over a century a chemist's, stationer's, and printing business has been carried on. The premises, according to the *Linlithgowshire Gazette*, have not merely a local, but a general interest, as being those in which the original 'History of Linlithgow' was compiled and published; as, also, the place where chloroform was first brought under the notice of the late Professor Sir James Y. Simpson.

TRADE NOTES.

CODEINE TABLOIDS.—Messrs. Burroughs Wellcome and Co. are now offering tabloids containing codeine, gr. $\frac{1}{4}$ or gr. $\frac{1}{2}$.

THE BUSINESS OF VINEGAR BREWERS and British wine makers, established in 1830 and carried on by Messrs. Hill, Evans and Co., Worcester, is about to be incorporated under the Companies Acts, 1862 to 1898, as Hills, Evans and Co., Limited, with a share capital of £150,000, divided into 80,000 5 per cent. cumulative preference shares and 70,000 ordinary shares of £1 each; and $4\frac{1}{2}$ per cent. First Mortgage Debenture stock, £80,000, issued in multiples of £10 stock. The list of subscriptions will be opened on Tuesday, June 12, and closed on Thursday, June 14, for town and country,

subscriptions at par being invited for the debenture stock and preference shares. The vendors take the whole of the ordinary shares in part payment of the purchase consideration, and will also subscribe for and have allotted to them or their nominees £20,000 debenture stock and 20,000 preference shares. The registered office is, The Vinegar Works, Lowesmoor, Worcester; temporary London office, 33, Eastcheap, E.C.

THE 'VOLVO' DEVELOPING APPARATUS.—Messrs. George Houghton and Son, 88 and 89, High Holborn, W.C., send particulars of the 'Volvo' developing apparatus, consisting of a wheel, stand for same, and two specially shaped dishes—i.e., the whole of the outfit necessary for developing, fixing, washing and drying. It is generally considered that the annoying tendency to curl up is the main objection that many amateurs have to developing their own films. By the use of this apparatus that tendency is entirely overcome, and all handling dispensed with except when connecting the two ends of the film to the apparatus; and the sensitised

surface, after being placed on the wheel, is never touched (except by fluids) till it is developed, fixed, washed and dried ready for the printing frame. Thus treated, rollable films are stated to have as great an advantage over glass plates in point of development as the latter otherwise have over films. The films are under better control than when held by the fingers; they may be inspected at any stage of development, and if half-a-dozen or more exposures be proceeded with at one time, any one may be restrained or accelerated without affecting the others. It is claimed that by using this apparatus anyone may obtain results not merely as good but better than by the old method. By removing the handle, shown in the illustration, and placing the wheel horizontally, it forms a very convenient drying rack. The price of the apparatus complete is 14s. 6d., or for a larger size 16s. 6d.

LONDON GAZETTE NOTICES.

PARTNERSHIPS DISSOLVED.

John Howard and William Wilkins, trading as E. Marsh and Co., mineral water manufacturers and bottlers, Gate Street, Burnt Tree, Tipton. Debts will be received and paid by J. Howard, who will in future carry on the business.

Charles Ogden and William Ernest Jameson, surgeons, 150, Drake Street, Rochdale. Debts will be received and paid by W. E. Jameson, who will in future carry on the practice.

RECEIVING ORDER IN BANKRUPTCY.

James Ross, medical practitioner, 252, County Road, Walton, Liverpool.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, JUNE 6, 1900.

The high rates for Linseed Oil and Cottonseed Oil, as well as for Spirits of Turpentine, have given way, and reductions have taken place to the extent of 1s. to 2s. per cwt. As a set-off to this, the price of Olive Oils of Spanish origin is destined to undergo a considerable increase at no distant date, as rates in Spain have already been advanced 20s. per tun. With these exceptions there are few alterations to report, business having been done at steady rates, though the amount has not been more than average. Chemical transactions have only been limited in extent, and prices are only changed as regards Ammonium Sulphate and Sal Ammoniac, which are lower.

AMMONIUM SALTS.—Carbonate, 3½d. to 4d. per lb. Sal Ammoniac, 37s. to 39s. per cwt. Sulphate, £11 7s. 6d. to £11 10s. per ton.

BLEACHING POWDER—Is flat at £6 10s. to £7 per ton.

CANARY SEED—Does not attract much attention, and sales are confined to 100 bags of Turkish, ex quay, which were disposed of on private terms. Prices ruling are 33s. to 34s. per 464 lb.

COPPER SULPHATE—Is a shade easier, £24 17s. 6d. to £25 per ton.

HONEY.—Californian of fine quality has been sold at 44s. per cwt.

LINSEED.—Shippers have been asking higher prices, consequently business is nil. Calcutta is 52s. for May-June shipment, per 416 lb., and North American is 45s. 6d., per 424 lb., for September and November shipments.

OILS (FIXED) AND SPIRITS.—Castor Oils on the spot are in moderate demand, most quotations demanded being for forward lots. Prices run as follows:—Calcutta, 3½d. per lb.; 1st French, 3¾d.; 2nd French and Belgian, 3½d.; and Madras at 3¼d. to 3¾d. per lb. Olive Oils are in brisk inquiry, in expectation of an advance in price in Spanish oils. Linseed Oils of Liverpool pressure are selling fairly well at the reduced rate of 35s. 6d. to 36s. per cwt. in export casks. Cottonseed Oil, Liverpool refined, finds a fair market at 24s. to 24s. 6d. per cwt. in export barrels. Spirits of Turpentine are steadier at the easier rate of 44s. per cwt.

POTASSIUM SALTS.—Bichromate is firm at 4d. per lb. Chlorate, 4½d. to 4¾d. per lb. Cream of Tartar is steady at 74s. to 80s. per cwt. Pearlashes, 32s. 6d. per cwt. Potashes, 25s. 6d. per cwt. Prussiate is firm at 8d. per lb.

SODIUM SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax, 16s. to 17s. per cwt. Caustic Soda is still exceedingly firm, 76 to 77 per cent., £11 5s. per ton; 70 per cent., £10 5s. per ton. Soda Crystals, £3 5s. per ton. Nitrate is easier on the spot at 8s. 3d. to 8s. 7½d. per cwt.

LONDON, THURSDAY, JUNE 7, 1900.

As might have been expected, business in Drugs and Chemicals has been extremely quiet during the past week. First, the Whitsuntide holidays have naturally interfered with trade, and, secondly, the rejoicings over the success of our army in South Africa has not tended to make business more active. It is anticipated in many quarters that now that there is prospect of the Rand mines being shortly again at work, we shall see a very important revival in trade generally, not excepting chemicals and drugs. The only move of the week has been a slight improvement in the speculative market for Sulphate of Quinine, consequent on an advance in prices obtained at to-day's Cinchona Bark

auctions in Amsterdam. Opium and Glycerin are also very firm. Iodides continue unsettled. The following are particulars as to the position of some articles of principal interest.

ACETANILIDE—Remains weak and dull at 9½d. to 11d. per lb., according to quantity, make, and packing.

ACID BORACIC.—Crystals are quoted 26s. per cwt., and powder 28s. per cwt.

ACID CARBOLIC—Has been in rather more inquiry lately, and prices are rather firmer at about figures given last week, crude and liquid being also somewhat harder in price.

ACID CHRYSOPHANIC—Is rather firmer for really good quality, one maker, who was offering cheaply, and whose products, according to his own account, rank first in the market, having had his Acid Chrysophanic rejected on account of bad colour, buyers will do well to be on their guard to see that they get the right article.

ACID CITRIC—Is the turn dearer at 1s. 4½d. to 1s. 5d. per lb., according to quantity and make, for crystals, in 5 cwt. casks, makers still declining to sell forward.

ACID GALLIC—Remains very firm at 2s. 5d. to 2s. 6d. per lb., an advance of nearly 40 per cent. on price at which the article was being offered a few months ago. The advance in price of galls is chiefly responsible for the rise in price of gallic acid.

ACID OXALIC—Unchanged at 3¼d. to 3½d. per lb. nett, delivered free London.

ACID TANNIC.—The rise in price of galls has also had a serious effect on value of this article, the B.P. quality being quoted 2s. 3d. to 2s. 5d. per lb., as against 1s. 7d. to 1s. 8d., the price ruling not so very long ago.

ACID TARTARIC.—So far, the anticipated improvement in value of this article has not taken place, and prices are still unchanged at 1s. 0¾d. to 1s. 1d. per lb. for English, and 1s. per lb. for foreign.

AMMONIUM COMPOUNDS.—Bromide 2s. 3d. per lb. Carbonate 3½d. to 4½d., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. Sal Ammoniac £37 and £39 per ton for firsts and seconds respectively; crushed for batteries 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate dull; grey, 24 per cent., London, prompt, £11 5s.; Hull, prompt, £11 3s. 9d. to £11 5s.; Leith, prompt, £11 5s. to £11 6s. 3d.; Beckton nominally £11 10s.; Beckton terms, prompt, £11 2s. 6d. Sulpho-cyanide, 1s. 1d. to 1s. 2d. per lb.

BISMUTH SALTS—Are without change

BLEACHING POWDER (CHLORIDE OF LIME)—Unchanged at £7 per ton for English.

BROMIDES—Remain very firm at unchanged prices.

BORAX—Unchanged at 17s. per cwt. for crystals and 18s. per cwt. for powder.

CAMPHOR.—Market both for crude and refined is quiet but steady at unchanged prices.

CINCHONA BARK.—At to-day's Bark sales in Amsterdam the quantity offered was comparatively quite moderate, and a firm tone prevailed, prices realised being reported to run about 3 per cent. in advance of those which ruled at previous auction, which has had the effect of stiffening the speculative price of sulphate of quinine.

CASTOR OIL—Is unchanged, there having been practically nothing doing in the article during past few days.

CLOVES.—The usual weekly auctions continue suspended, and will be resumed on the 13th inst. Privately, the market for Zanzibar is firm with rather more business doing, comprising August-October delivery at 3¾d., but mostly Jan.-March at 3¾d.

COAL TAR DISTILLATION PRODUCTS.—There are no special changes to report. Toluol, commercial, is quoted 1s. 1d. to 1s. 3d. per gallon, and the pure 2s. to 2s. 6d. Creosote, 2½d. to 4d. per gallon. Toluol, 50 per cent., 9½d.; 90 per cent., 8d. per gallon. Crude Naphtha, 30 per cent., at 120° C., 3½d. per gallon; Solvent Naphtha, 95 per cent., at 160° C., 1s. 4d. per gallon; 90 per cent., at 160° C., 1s. 1d. per gallon; 90 per cent., at 190° C., 1s. 1d. per gallon. Anthracene A, 3¾d.; B, 2¾d. per unit. Pitch, 37s. 6d. per ton, f.o.b. Tar, crude and refined, 13s. per barrel, 2½d. per gallon.

COCAINE.—Makers are very firm at 16s. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins. Price of the crude is also fully maintained.

COD LIVER OIL.—Continues neglected, price being, however, nominally unchanged at about the figures lately quoted.

CODEINE.—The pure is very firm at 13s. 6d. per oz. while for the Salts makers reduced prices somewhat in order to meet outside competition in these latter.

COPPER SULPHATE.—Is quoted £24 10s. to £25 10s. per ton on the spot.

CREAM OF TARTAR.—Is very firm at 76s. to 77s. per cwt. for first white crystals on the spot, 78s. per cwt. for powder, and 79s. per cwt. for ditto 95 per cent.

ESERINE (PHYSOSTIGMINE).—Makers quote the Sulphate and Salicylate 2s. 6d. per gramme and the pure 3s. 6d. per gramme.

GALLS.—Are quiet at nominally unchanged prices, there being at the moment no business passing.

GAMBIER.—The market for arrival is firmer, there being rather buyers of May-July steamer shipment at 15s. 6d. per cwt., but so far no business is reported.

GENTIAN ROOT.—Is tending upwards. Good dry root is, however, still obtainable at 17s. per cwt. on the spot.

GLYCERIN.—Both crude and refined remain very firm indeed, especially the former, which has reached a figure which makes profitable working impossible to the refiners. Refined is nominally unchanged at about prices hitherto ruling, or rather is, if anything, slightly dearer.

IODIDES.—Matters remain in *statu quo*. The combined makers maintain their prices, but underselling on part of outside makers continues, and people are asking themselves what will happen next.

JALAP.—Price continues to harden, and it would be difficult to buy good sound heavy tubers below 7½d. to 8d. per lb., and it would probably be difficult to secure much even at these advanced figures.

MENTHOL.—Good dry white crystals are obtainable on the spot at 8s. 3d. to 8s. 6d. per lb., according to quantity and brand.

MERCURIALS.—There is no change to report, prices remaining very firm.

MORPHINE.—Steady, in sympathy with the raw drug, makers still quoting 5s. per oz. for the Hydrochlorate Powder, and 2d. per oz. more for the Crystal Salt.

OILS (FIXED) AND SPIRITS.—Linseed firm. On the spot pipes London ordinary, £34 (E.I. 5s. premium); barrels, £34 to £34 5s. Hull, spot, naked, £33 12s. 6d. Rape quiet. Ordinary brown, on the spot, barrels, £29 10s. Refined, spot, £31. Ravison, naked, spot, £29. Cotton flat. London crude, spot, £21 10s. Refined, spot, £23 10s. to £23 15s., according to make. Hull, naked, refined, spot, £21 12s. 6d. Crude, spot, £20 5s. Olive, Mogador, £35. Spanish, £36 10s. Levant, £35. Coconut, Ceylon, on the spot, £25, ex. warehouse; near, £23 5s. c.i.f. Cochin, spot, £28; afloat, £24 15s. c.i.f. Palm: Lagos, on the spot, quoted £26. Petroleum dull. Russian, spot, 6½d. to 6¾d. American, spot, 6¼d. to 6¾d. Water White, 7½d. to 8d. Petroleum Spirit: American ordinary, 9½d.; Deodorised, 9¾d. Turpentine dull. American, spot, 41s. 9d. to 42s. June, 37s. 6d. to 38s.

OPIUM.—Is very firm in Smyrna, as well as in London, at, if anything, slightly higher values. Here the supply of suitable quality for manufacturing purposes is practically exhausted. Fine Persian is also scarcely obtainable. Although the new crop of Opium promises well, it is anticipated that supplies generally will run very short before the new crop becomes available.

PHENACETINE.—Makers are firm at 5s. 3d. per lb. for 5-cwt. lots for both crystals and powder, second-hand still offering in limited quantity at rather below this price.

PILOCARPINE.—The makers quote 41s. 9d. per oz. for the Hydrochlorate and Nitrate Salts in 8-oz. lots.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 1½d. per lb. Chlorate, spot, London, crystals, 4½d. per lb. net; powder, 4¾d. net. Carbonate, 90 per cent., £19 10s. per ton, ex. ship. Cyanide, 93 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per

cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals, quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d. Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

POTASSIUM CYANIDE.—Market has stiffened up considerably on prospect of the Rand mines recommencing working, and it would not be surprising if a rush for the article set in, tending to cause price to still further advance.

QUICKSILVER.—The importer quotes £9 10s. per bottle, while second-hand is not offering.

QUININE.—Makers have made no change in their price for Sulphate, which remains at 1s. 4½d. per oz. for 1,000-oz. lots in 100-oz. tins for the favourite B&S and Brunswick brands; while the speculative market, which was dull, has hardened on the reported results of the bark sales in Amsterdam, price in the open market of above brands being now 1s. 3¾d. to 1s. 4¼d. per oz., according to delivery.

ROSIN.—Steady at 4s. 9d. to 5s. per cwt., ex wharf, for strained on the spot, and 4s. 7d. per cwt. c.i.f. for July-September shipment per sailing vessel.

SAL AMMONIAC.—Steady at late reduction to £37 to £39 per ton.

SALICINE.—Is steady at 20s. to 21s. per lb., according to quantity.

SALICYLATES AND SALOL.—There is no change in price to report.

SANTONINE.—Is firm at 11s. 3d. per lb. for 2 cwt. lots, nothing being obtainable from second-hand at a lower figure.

SHELLAC.—The market remains quiet. On the spot a small trade is passing at steady prices, including TN Orange on a basis of 60s. cash for fair. For August delivery 100 cases TN have been sold at 61s. 6d., being rather firmer; but for arrival there is nothing to report.

SODIUM COMPOUNDS.—Crystals: Barrels, quoted 60s.; bags, 57s. 6d. Acetate, £14 10s. per ton, ex. ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphate (Antichlor.), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £9; ordinary, £8 10s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide, crystals, £6 10s. Sulphite, £5 15s. per ton.

SULPHONAL.—Second-hand is sold out, and makers are obtaining their full price of 20s. 6d. per lb. for both crystals and powder.

THYMOL.—One maker still quotes 9s. 3d. to 9s. 3d. per lb.; while other makers hold out for tangibly higher prices.

GRAINS AND OUNCES TO GRAMMES, AND GRAINS PER FLUID OUNCE TO GRAMMES PER 100 MILLILITRES.

	Grains to Grammes (Gm.)	Ounces to Grammes (Gm.)	Grains to the Ounce — Grammes to 100 ML.
1 ..	0.06479	28.350	0.228
2 ..	0.12958	56.699	0.456
3 ..	0.19437	85.049	0.684

9 ..	0.58311	255.146	2.053

EXPLANATION OF TABLE.—The first column represents the number of grains or ounces. Thus: 4 grains = 0.25916 Gm., 4 ounces = 113.398 Gm. The fourth column shows how many grammes to 100 millilitres (ML) are equivalent to a given number of grains to 1 fluid ounce, thus: 4 grains to 1 fl. oz. = 0.912 Gm. to 100 ML.

Calendar for the Week.

Sunday, June 10.	Trinity Sunday.	Sun rises 3.45; sets 8.13.
Monday, June 11.		Sun rises 3.45; sets 8.14.
	ROYAL INSTITUTION, Albemarle Street, Piccadilly, W., at 5 p.m.—General monthly meeting.	
Tuesday, June 12.		Sun rises 3.4 sets 8.18
Wednesday, June 13.	○ 3.38M.	Sun rises 3.45; sets 8.15
	PHARMACEUTICAL SOCIETY OF GREAT BRITAIN, 17, Bloomsbury Square, London, W.C., at 11 a.m.—Meeting of the Council.	
	BRITISH PHARMACEUTICAL CONFERENCE, 16, Bloomsbury Square, London, W.C., at 3 p.m.—Meeting of the Executive Committee.	
	EDINBURGH DISTRICT CHEMISTS' TRADE ASSOCIATION.—Excursion to Aberfoyle, starting from Waverley Station at 9 a.m.	
Thursday, June 14.		Sun rises 3.44; sets 8.16.
Friday, June 15.		Sun rises 3.44; sets 8.16.
Saturday, June 16.		Sun rises 3.44; sets 8.17
	CRICKET.—Brockley—Allen C.C. v. Davy Hills C.C.	

EXCHANGE COLUMN.

OFFERED.

Diatom Slides.—Spread, selected, tests, exhibition groups, etc. Approval parcels.—Gatrell, Barnes.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dereham, Norfolk.

Surplus.—4 to 6 lbs. each several triple French essences, 6s. 3d. lb.; violet odours, 7s. lb.; carriage paid; lists and samples sent.—Goodliffe, Bishop's Waltham, Hants.

24 Williams', 24 Carter's, £3 7s. 6d.; 2 oz. Morph. Hydr., 10s.; 1 lb. Iodof. Prec., 12s.; 1 lb. Crystal, 11s.; 2 lb. Bismuth Nit., 10s.; 1½ lb. Bism. S. Carb., 7s. 6d.; 2 lb. Potass. Iodid., 18s.; carriage paid, cash with order.—Eastman, Chemist, Stratford.

Shelving and fittings for shop 23 ft. by 15 ft. and 8 ft. 6 in. high: cornice all round shop, including counter, 17 ft. 6 in. long, with 46 drawers, &c., panelled front, 54 drawers in 4 rows, with glass knobs, suitable shelving with glass doors, and cupboards under, &c.; all complete and in good order; cost about £70, will be sold for £25.—Porteous, Coldstream-on-Tweed, N.B.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Pill-machine, 3-grain; iron counter-scales, to weigh 7 lbs.—Fuller, Chemist, Norwich.

Hair Speciality Formula for growth, &c., purchased.—W. Lewis, 15, Shelden Street, London, W.

Frog-in-throat, Tetlow's Swandown. Lowest price and quantity.—Eastman, Chemist, Stratford.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Marriage.

PARK—STEPHENS.—On June 2, at Emmanuel Church, Plymouth, by the Rev. George Berry, M.A., Charles J. Park, Pharmaceutical chemist, and member of the Pharmaceutical Council, youngest son of the late George Park, Fleet Engineer R.N., to Maud, eldest daughter of Mr. T. R. Stephens, Moor View Terrace, Mutley.

GOLDEN WEDDING.

HANBURY—JANSON.—On June 6, 1850, at Stoke Newington, Cornelius, second son of Cornelius Hanbury, of Stoke Newington and Bonchurch, Isle of Wight, and Elizabeth, his wife, youngest daughter of John Sanderson, to Sarah Jane, only daughter of Frederic Janson and Sarah, his wife, youngest daughter of John Tindall, of Knapton Hall, Yorkshire. [Chairman of Allen and Hanburys, Limited, London.]

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Arnold, Ashford, Austen, Bank, Bartlett, Bennett, Brawn, Hart, Henry, Hill, Jones, Lacey, Lenfesty, Long, Radcliffe, Rice, Sargeant, Smith, Sutcliffe, Taylor, Thwaites, Turney, Wilkinson, Wyatt.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet. It is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free.

Full directions and attractive labels and handbills in crimson and black free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

NEWS IN BRIEF.

MR. W. A. KNIGHT, "Pereira Medallist," has accepted the Lectureship on organic chemistry and dispensing at the Westminster College of Chemistry and Pharmacy, commencing in September next.

PHARMACEUTICAL SOCIETY OF IRELAND.—All applications for the following examinations must be lodged (with the other necessary papers) with the Registrar by eleven o'clock a.m. on the following dates:—For the Preliminary Examination, on Tuesday, June 19; Pharmaceutical Assistants, Monday, June 25; Registered Druggists, Tuesday, June 26; Pharmaceutical License, Wednesday, June 27.

ALDERMAN A. SIMPSON, M.P.S., Mayor of Stalybridge, referring to an outbreak of smallpox in the neighbourhood, at a recent meeting of the Town Council suggested that pressure should be brought upon the proper authorities to include smallpox in the quarantine law, and he was appointed, together with the Town Clerk and the Medical Officer, as a deputation to wait upon the Local Government Board with that object in view.

CRICKET.—A match was played on June 2 at Nunhead, between the Metropolitan College of Pharmacy and London College, resulting in a win for the "Metros." the scoring being:—"Metros.," first innings 54, second innings 43; London College, first innings 10, second innings 28. The return match was played at Wormholt Farm, Shepherd's Bush, on Saturday, June 9, with the following result:—"Metros.," first innings 53, second innings 53; London College, first innings 18, second innings, four wickets for 24.

PAST GRAND MASTER A. SIDNEY CAMPKIN, J.P., of Cambridge, was again elected by a large majority at the recent A.M.C. at Portsmouth. He was also elected for the office of Trustee of the Order to the vacancy caused by the death of P.G.M. S. Diprose, of London, by 280 over P.G. R. C. Graham, of Burton-on-Trent, 234, and also elected by a large plurality as a representative to the Friendly Societies Conference, to which ten were appointed, among whom were the Grand Master, Deputy Grand Master, Corresponding Secretary, and Parliamentary Agent of the Order.

THE GRAND MASTER'S ADDRESS at the annual delegation of the British Order of Ancient Free Gardeners, held at Aberdeen on Tuesday, June 12, was delivered by a member of the Pharmaceutical Society, Mr. J. F. Tocher, of Peterhead, who presided over the proceedings. In the course of his address, he dealt with the question of medical aid, including the supply of medicines, advocating that the medical officer of each lodge should be paid at a certain fixed rate per visit, so that the salary would then depend upon the amount and duration of the sickness and upon the actual work performed by the physician; he also advocated that friendly societies should seek to employ the medical profession for medical attendance only, and to employ the chemist and druggist to dispense their medicines, it being his firm conviction that more true benefits would accrue to lodges by following that course than by the system generally adopted of the medical officer acting both as physician and dispenser.

THE NEW SENIOR WRANGLER, Mr. Joseph Edmund Wright, is the son of Mr. Joseph Wright, M.P.S., 174, Park Road, Liverpool. In January, 1892, he went to the Liverpool Institute, having won a Council of Education Scholarship from Windsor Street Wesleyan School, and in 1894 he crossed over from the commercial to the high school with an Institute Exhibition, subsequently distinguishing himself in the Oxford local examinations and in gaining Lord Derby's prize of £10. In the science and art examinations his successes whilst at the Institute were also conspicuous, numerous honours and prizes being awarded to him, among which was a mathematical scholarship of the value of £75 per annum at Trinity College, Cambridge, whither he went in October, 1897. In the spring of 1898 he gained a major scholarship, tenable for five years, coming out as first in order of merit. Since then he has occupied the proud position of being first in his year, and the high honour just achieved is regarded as being but the natural sequel to so consistently brilliant a career.

ABERDEEN PHARMACEUTICAL ASSOCIATION.—The quarterly meeting of this Association was held in Gordon's College on Wednesday, June 6, Mr. C. Simpson, President, in the chair. There was a

large attendance of members. The Secretary informed the meeting of the arrangements that had been made for the annual outing, which is to be held on June 27. The party will leave Aberdeen by an early train for Aboyne, where breakfast will be partaken; then carriages will convey the party by Tarland, Tillypronie, and over the Birkhill to Strathdon, returning in the evening to Aboyne for dinner, and reaching Aberdeen with the last train. From the Birkhill a magnificent view can be obtained both of the valley of the Dee and also of the Don. Any chemists on holiday in the North wishing to join can communicate with the hon. sec., Mr. John Cruickshank, 42, George Street, Aberdeen. The following were appointed delegates to the Conference and the Federation, viz.:—For the Conference: Messrs. Johnston, Paterson, Simpson, Giles, and John Cruickshank. For the Federation: Messrs. Giles, Simpson, and J. Cruickshank.

TRADE NOTES.

SOLUBLE ESSENCES.—Messrs. E. Sachsse and Co., Luther-Strasse 11, Leipzig, direct attention to the fact that they are manufacturers on a large scale of terpeness oil of lemon and all soluble essences for aerated waters, etc.

MR. E. A. HOLLOWAY, M.P.S., has retired from his position as chairman and managing director of Holloway's Wine Co., Limited, having disposed of his interest therein. His new offices are adjoining in 3, Oxford Mansions, New Oxford Street, W.C., where letters and inquiries from friends will always find him.

THE 'OPTIMUS' UBIQUE CAMERA is the subject of a pamphlet issued by Messrs. Perken, Son, and Co., Limited, 99, Hatton Garden, London, E.C. It gives full instructions for the use of the Ubique camera, and may be obtained free by post on application to the publishers.

PROTECTION OF SELLING PRICES.—In view of the increased charges attending production, and having regard to the generally satisfactory results that have attended their association with the P.A.T.A. movement, the "Sanitas" Co., Limited, have decided that on and after July 1 next their "Sanitas" preparations and appliances shall be retailed as follows: 1s. articles at not less than 11½d. each, and others at *pro rata* prices, and they have consequently adjusted their terms of supply to the trade and wholesale dealers thus:—1s. articles will be charged to the trade at 9s. 6d. per dozen net, and to the wholesale dealers at 9s. per dozen; carriage and other regulations as before. Other articles *pro rata*, according to their prices. Buyers of £5 parcels (net) will be supplied at the lower rates. The new terms will yield a profit on small parcels of 21 per cent., and on £5 orders of over 27½ per cent.

Publications Received.

TRAITE DES ALTERATIONS ET FALSIFICATIONS DES SUBSTANCES ALIMENTAIRES. By A. VILLIERS and EUG. COLLIN. Pp. iii. + 1,173, with 633 figures. Price 20fr. Paris: Octave Doin, 8, Place de L'Odéon. 1900. From the Publisher.

RECEIVING ORDERS IN BANKRUPTCY.

John Rees, chemist and druggist, 21, Cowbridge Road, Cardiff.

Harry John Ison, chemist and druggist, 16, Spoplat, Shrewsbury.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, JUNE 13, 1900.

Considerable alterations in price have taken place in Linseed Oil, Cottonseed Oil, and Spirits of Turpentine, which are all lower. Sodium Nitrate has also gone down, but Cream of Tartar is dearer. Good sales of Honey, Ginger, and Beeswax have been effected at fully recent prices, and Gum Arabic "sorts" have changed hands to some small extent at fair to improving rates. Business in chemicals has been in a very quiet state, owing to the holidays, but there are few changes, and prices are satisfactory.

AMMONIUM SALTS.—Carbonate, 3½d. to 4d. per lb. Sal Ammoniac, 37s. to 39s. per cwt. Sulphate is dull, £11 7s. 6d. to £11 10s. per ton.

BEESWAX.—American has been sold at £7 10s. per cwt.

CANARY SEED.—Small sales of Turkish have been made at 33s. per 464 lbs., and the price remains somewhat nominal at 33s. to 33s. 6d.

COPPERAS.—Is very firm at 39s. per ton for Lancashire, and 37s. for Welsh.

COPPER SULPHATE.—Remains very quiet at £26 per ton.

GINGER.—107 bags of Sierra Leonè sold, ex quay, at 23s. per cwt., and 93 bags, also ex quay, went on private terms.

GUM.—Small lots of Arabic sorts have been moving off at 75s. to 80s. per cwt.

HONEY.—10 barrels of Pile 2 Chilian fetched 24s. per cwt., and 40 cases of fine Californian cleared rapidly at 45s.

LINSEED.—Calcutta, for forward delivery, June-July shipment, has risen to 55s. 3d. per 416 lbs.; North American, October and November, to 47s. 3d. per 424 lbs.; and 1,000 bags of River Plate sold on sample at 51s. 6d. per 416 lbs.; otherwise the market is quite idle.

OILS (FIXED) AND SPIRITS.—Castor Oils are very steady for spot lots, with somewhat more inquiry. Calcutta, spot, 3¾d. per lb.; forward, good business done on private terms; 1st French, 3¾d. per lb.; 2nd French and Belgian, 3½d.; 2nd Sulphur French, 3d. per lb. Olive Oils are in better inquiry, with reluctance to sell on the part of holders. Spanish, spot, £35 10s. to £36 per tun. For shipment, Levant Oil has advanced to £36 15s. per tun c.i.f. Linseed Oils are a shade easier, and Liverpool makes are now quoted at 35s. 9d. to 36s. 6d. per cwt., packed for export. Cottonseed Oils are firm at the easier rate of 23s. 6d. to 24s. per cwt., packed. Spirits of Turpentine have dropped down to 41s. 6d. per cwt. on the spot, and 38s. per cwt. forward, June delivery, and 35s. July to December delivery.

POTASSIUM SALTS.—Bichromate, 4d. per lb. Chlorates, 4½d. to 4¾d. per lb. Cream of Tartar is firm, with an advance likely, at 76s. to 81s. per cwt. Pearlash, 32s. 6d. per cwt. Potashes in fair inquiry at 32s. 6d. per cwt. Prussiate firm, 8d. per lb.

SODIUM SALTS.—Bicarbonate, £6 5s. to £6 15s. Borax, 16s. to 17s. per cwt. Caustic, 76 to 77 per cent., £11 5s. to £11 10s. per ton; 70 per cent., £10 5s. Soda Crystals, £3 5s. per ton. Nitrate is lower, 8s. 1½d. to 8s. 4½d. per cwt., according to quantity.

LONDON, THURSDAY, JUNE 14, 1900.

Business in drugs and chemicals has so far hardly become active since the holidays; a fair number of transactions have, however, taken place, while, taken as a whole, prices remain fairly firm all round. The prospect—or, at least, possibility—of serious trouble in China (and perhaps also in Japan) has so far had a hardening tendency on produce imported from the Far East; while the resumption of business in South Africa, as evidenced by a renewal of orders for drugs and chemicals from that part of the world cannot fail to have a certain effect upon prices. Quinine has again been weak, but has hardened a little at the close. Weak-kneed speculators for the rise are probably chiefly responsible for existing state of affairs in this article. Glycerin continues very firm. Cod liver oil is still dull. No change has so far taken place in prices

of Iodides. Acid Citric very firm, an advance in value expected. The rise in price of Jalap is maintained. The following are the prices actually ruling for some articles of chief interest:—

ACETANILIDE.—Continues dull and weak at 9½d. to 11d. per lb., according to quantity, etc.

ACID BORACIC.—Is steady at 26s. per cwt. for crystals, and 28s. per cwt. for powder.

ACID CARBOLIC.—Firm and in short supply for prompt delivery, quotations being nominally 35°—36°. Ice Crystal in 2½-cwt. drums and overcasks, 10½d. to 11d. per lb., according to quantity and make; 39°—40° Ice Crystal, 11½d. to 11½d. ditto; Detached Crystals, which is now the form required by the B.P., 1s. 0¼d. to 1s. 0¾d. per lb. Crude, 60° F., 2s. 9d.; 75° F., 3s. 6d. per gallon. Liquid, 95—98 per cent. of pale straw colour, 1s. 6d. to 1s. 8d. per gallon; ditto 25—30 per cent. of dark colour, 10d. to 1s. the gallon, packed in 40-gallon casks.

ACID CITRIC.—Very firm at 1s. 4½d. to 1s. 5d. per lb., according to quantity and make for crystals in 5 cwt. casks. The article is generally expected to be dearer, especially in view of the actual position of lemon juice.

ACID OXALIC.—Is still quoted 3¼d. to 3½d. per lb., according to quantity, nett, free delivered, London.

ACID TARTARIC.—Quiet but very steady at 1s. 0¾d. to 1s. 1d. per lb. for English, and 1s. per lb. for foreign.

AMMONIUM COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. Sal Ammoniac, £37 to £39 per ton for firsts and seconds respectively; crushed for batteries 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate flat. Gray, 24 per cent., London prompt, £11 2s. 6d. Hull prompt, £11 to £11 1s. 3d.; Leith prompt, £11 2s. 6d. to £11 3s. 9d.; Beckton, nominal; Beckton, terms prompt, £11. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ATROPINE.—Makers are firm at 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure Alkaloid.

BELLADONNA ROOT.—Is quoted 42s. 6d. per lb on the spot for good dry root.

BISMUTH.—The salts are unchanged at 5s. 8d. per lb. for the subcarbonate, and 5s. 1d. per lb. for the subnitrate, the commercial quality of the metal being also unchanged at 5s. per lb.

BORAX.—Quiet, but steady at late advance to 17s. per cwt. for crystals, and 18s. per cwt. for powder.

BROMIDES AND BROMINE.—Continue very firm at unchanged quotations—viz., 1s. 11½d. per lb. for Potassii Bromid., 2s. 2½d. per lb. for Sodii. Bromid., and 2s. 3d. per lb. for Ammon. Bromid. Bromine is also unchanged at 2s. to 2s. 2d. per lb., according to quantity, in cases of 60 lbs.

CAMPHOR.—Continues firm for both crude and refined, and especially for the latter, English makers still quoting 2s. 4d. per lb. for Bells and Flowers.

CASTOR OIL.—Quiet. Belgian first pressing spot, £31 10s.; July-December, £29 10s., f.o.b. Antwerp; second pressing spot, £28 10s. per ton. Hull manufactured: Guaranteed cold drawn pure pharmaceutical, £34 per ton in barrels, 4½d. per lb. in cases; pure firsts, £31 10s.; seconds, £29 per ton in barrels; firsts, 3½d. per lb. in cases; seconds, 3¾d., ex wharf London.

CINCHONA BARK.—At the late auctions in Amsterdam small supplies of Java were offered, the total amounting to 4,800 packages, against 6,855 packages at the preceding sales. Active competition prevailed, and practically all sold at an advance, the average unit obtained being 10.35 cents, against 10.10 cents last sale. The Quinine contents of the sale were 18,000 kilos, of which only 400 kilos were unsold. The exports of Java bark for May were 816,000 Amsterdam lb., against 943,000 Amsterdam lb. last year, and 672,000 Amsterdam lb. in 1898. The total for the five months is 3,117,000 Amsterdam lb., against 3,959,500 Amsterdam lb. last year, and 3,897,000 Amsterdam lb. in 1898.

CLOVES.—Slow of sale, and the supply of 8 cases of Penang in auction were all bought in, fair picked at 7d. to 8d.; also fifteen cases Amboyna, fair picked at 7d. One case of fair picked Ceylon sold at 6d. No Zanzibar were offered. Privately the market for Zanzibar continues quiet, and prices are barely steady, closing with sellers June-August delivery at 3 27-32d., August-October at 3¾d. No business whatever is reported.

COAL TAR DISTILLATION PRODUCTS.—Toluol Commercial, 1s. 2d. to 1s. 4d. per gallon; pure, 2s. to 2s. 6d. Creosote, 5d. to 5d. per gallon, according to quantity and packing. Crude Naphtha, 30 per cent. at 120° C., 3¾d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 4d. per gallon; ditto 90 per cent. at 160°

C., 1s. 1½d. per gallon; ditto 90 per cent. at 190° C., 1s. 1½d. per gallon. Anthracene: A, 3¾d. per unit; B, 2¾d. Pitch, 37s. 6d. per ton f.o.b. Tar, refined and/or crude, 13s. per barrel, 2½d. per gallon.

COCAINE.—Makers continue firm at 16s. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, none of the brands most in favour being obtainable from second hand at anything below this figure.

COD LIVER OIL.—The market remains very quiet, price for best new non-congealing Norwegian Oil, in tin-lined barrels, varying from 72s. to 77s. 6d. per barrel, according to brand, in tin-lined barrels of 25 gallons each.

CODEINE.—Remains very firm at 13s. 6d. per oz. for the pure, a somewhat lower price, according to quantity, being quoted for the Muriate, Phosphate, and Sulphate Salts.

COPPER SULPHATE.—Is still quoted £24 10s. to £25 10s. per ton, according to make, etc.

CREAM OF TARTAR.—First white Crystals on spot, 77s.; Powder, 79s.; and 95 per cent. 80s.

CUTCH.—Neglected, and 150 boxes in auction were bought in, good softish block at 30s.

GAMBIER.—At auction 200 bales block offered and bought in at 16s. 6d., meeting with no offers, also 76 bags pale cubes rather broken at 29s. Privately the market remains quiet, and no sales are reported, May-July steamer quoted buyers at 15s. 6d.

GENTIAN ROOT.—Is being offered very cheaply from the other side, an offer of 13s. 6d. per cwt., f.o.b., would probably lead to business; on the spot, however, a tangibly higher price is asked.

GINGER.—At auction Cochin was in good supply, but neglected, and of 942 bags and 119 cases offered only 11 bags sold in small lots, washed rough, medium and bold dullish at 31s., medium and small ditto at 29s., small and tips at 27s., and good bright brown tips at 30s.; the remainder bought in, including good bold cut and scraped at 90s. to 95s. medium and small roughly cut and scraped at 55s., limed small and ends at 40s., Calicut rough at 32s. to 35s., and washed rough at 32s. to 33s. Jamaica, which was in unusually large supply, met a rather dragging demand, but a good quantity found buyers; good and fine qualities were proportionately small and brought steady rates, common and medium kinds, of which the bulk consisted, selling irregularly at 2s. to 3s. decline, while Rhatoon was neglected and chiefly bought in, but where sold a drop of 3s. to 4s. was established. Of 2,256 barrels 16 half-barrels and 6 tierces offered about 1,200 barrels sold, fine bold bright at 81s. to 86s., good bright at 68s. to 71s., middling to fair at 60s. to 66s. 6d., low middling at 53s. to 59s., common to good common at 45s. to 52s., low to fair Rhatoon at 37s. to 43s. Japan: 34 bags new crop offered and bought in, leanish small at 28s. African: 10 bags offered and sold, without reserve, small rough at 28s.

GLYCERIN.—Continues very firm, crude, especially, still showing an advancing tendency, while for the refined article 62s. to 63s. per cwt. is asked for English and 64s. to 77s. 6d. per cwt., according to brand, for best white, odourless, double distilled, chemically pure, 1,260 s.g. quality, in tins and cases (2 or 4 × 56 lb. tins in a case).

IODIDES.—There is no change to report. The combined makers still quote Potassii iodid. 10s. 6d. per lb.; Sodii iodid., 11s. 10d. per lb.; Ammon. iodid., 13s. 10d. per lb.; Iodoform cryst., pulv. or precip., 13s. 10d. per lb.; and Iodine resublimed, 12s. per lb. Commercial Iodine is also still quoted 7½d per oz. Whether these prices can be maintained still remains a burning question.

JALAP.—Late advance is fully maintained, and only limited quantity is obtainable at 7½d. per lb. for good sound heavy tubers.

MORPHINE.—Market is very steady at 5s. per oz. for the Hydrochlorate powder and 2d. per oz. more for the crystal salt.

OIL OF LEMON.—Market remains very firm at late advance, which now amounts to nearly 1s. per lb. over prices ruling only a few months since. Quotations vary from 4s. 3d. to 5s. 3d. per lb., according to quantity and brand.

OILS (FIXED) AND SPIRITS.—Linseed decidedly firmer. On the spot, pipes, London, ordinary, £33 10s. to £33 15s. (E.I. 5s. premium); barrels, £33 15s. Hull, spot, naked, £33 5s. Rape dull. Ordinary brown, on the spot, barrels, £28 5s., accepted. Refined, £29 15s. Ravison nominal; naked, spot, none. Cotton steady, quiet. London crude, spot, £21 5s. to £21 10s. Refined, spot, £23 10s. to £24, according to make. Hull, naked, refined, spot, £21 7s. 6d. Olive, Mogador, £35. Spanish, £36 10s. Levant, £35. Coconut dull. Ceylon, on the spot, £24 15s.; near, £23 5s. c.i.f. Cochin, spot, nominally £27 10s. to £28. Palm, Lagos, on the spot, quoted £25 10s. Petroleum dull. Russian, spot, is 6½d. to 6¼d. American, spot, 6½d. to 6¼d. Water

White, 7½d. to 7¼d. Lubricating, Pale American, spot, 9s. to 10s. 9d. Black, 7s. to 9s. Russian, Black, 6s. 6d. to 7s.; Pale, 8s. 9d. to 10s. 3d. Petroleum Spirit: American, ordinary, 9¼d. Deodorised, 9½d. Turpentine firmer after the drop. American, spot, opened 38s.; closed, 38s. 6d. June, 36s. 3d.

OPIUM.—We have very little news this week of the new crop, which is, however, generally expected to be good. Meanwhile stocks available remain small, quotations being therefore somewhat nominal at 9s. 3d. to 10s. 3d. per lb., according to quality, for manufacturing and druggists' kinds, and 10s. 9d. to 12s. per lb. for soft shipping. For really fine Persian as much as 14s. per lb. is asked, but very little being obtainable, even at this high figure.

PHENACETIN.—Is unchanged at 5s. 3d. per lb. for crystals or powder from the makers, second-hand offering at a slightly lower figure, but in limited quantity only.

PILOCARPINE.—Makers are firm at 41s. 9d. per oz. for the Muriate and Nitrate Salts in 8-oz. lots.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals, 4½d. per lb. net; powder, 4¾d. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Nitrate, refined, £21 5s. per ton. Permanganate: Small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow: English makes, 8d.; Beckton, 7¾d.; red, 1s. 1d. to 1s. 2d., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

POTASSIUM CYANIDE.—Demand continues active, and makers are very firm in their ideas, price asked now being 1s. 1d. to 1s. 2d. per lb. for the 98 per cent., according to quantity and delivery.

QUICKSILVER.—Is firm at £9 10s. per bottle from the importer, second-hand still not offering.

QUININE.—Continues very quiet at a further slight decline, and only a small business has occurred, comprising B&S and/or Brunswick on the spot at 1s. 2¾d., and October delivery at 1s. 3¾d.

SALICYLATES AND SALOL.—Remain unchanged in price, but can hardly show the makers much profit in view of present high price of carbolic acid.

SODIUM COMPOUNDS.—Crystals: Barrels quoted 60s., bags 57s. 6d. Acetate, £14 10s. per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11, 60 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphate (Antichlor.), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate on the spot, refined, £8 15s.; ordinary, £8 5s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Black Pepper: At auction there was a slow demand. 78 bags good Alleppy bought in at 6½d., and 51 bags bold Tellicherry at 6¼d. 249 bags Malabar sold, good bold, at 6½d.; good heavy shot at 6d. 463 bags Penang bought in at 6d. White Pepper quiet; 15 cases Singapore bought in, fine bold at 1s. 22 bags Ceylon offered and sold, good at 9d. Pepper dust: 32 bags Penang offered and sold at 2d. to 2½d. Chillies remain quiet, and 17 bags good bright African were bought in at 55s. Capsicums in moderate demand; 2 bales Natal sold, good bright at 92s. to 95s. Of 167 packages Bombay 31 bales sold, good bright cherries, 31s. 6d. 15 robbins yellow Nepaul character, off-stalk, bought in at 28s. Pimento neglected, and 447 bags bought in at 3½d. to 3¾d. Broken Cassia: 400 bales offered and sold, good, 38s. to 39s. 6d. Cinnamon neglected; 133 bales Ceylon offered, and only 6 bales sold, fair Quill, at 9½d. Nutmegs dull of sale. Penang sold very slowly. West Indian, in good supply, sold at rather easier rates. Mace quiet; 6 cases Penang sold at 2s. 2d. to 2s. 4d. 7 boxes Singapore bought in at 1s. 8d. West Indian: 28 packages sold from 1s. 10d. to 1s. 3d.

SULPHONAL.—There is practically nothing obtainable from second-hand below makers' price of 20s. 6d. per lb. for both crystals and powder.

TURMERIC.—In auction was freely offered and met little demand. Of 502 bags Madras, only 35 bags sold, fair bright whole bulb at 24s. 6d., subject; the remainder bought in, fair to good bright finger at 32s. 6d. to 35s., dull rough at 30s.; 41 cases Ground bought in at 32s. 6d. 919 bags Cochin split bulbs offered and bought in at 8s. 6d. to 9s. 6d., and 335 bags Cochin finger at 28s. for good bright bulby. China: 60 bags bright bulby finger bought in.

Calendar for the Week.

Sunday, June 17.	First after Trinity.	Sun rises 3.44; sets 8.18.
Monday, June 18.		Sun rises 3.44; sets 8.18.
	ROYAL GEOGRAPHICAL SOCIETY, University of London, Burlington Gardens, W., at 8.30 p.m.—"The Country between Lake Rudolf and the Nile Valley," by Captain M. S. Wellby.	
Tuesday, June 19.		Sun rises 3.44; sets 8.18.
Wednesday, June 20.	☾ 0.57M.	Sun rises 3.44; sets 8.18.
Thursday, June 21.		Sun rises 3.44; sets 8.19.
	CHEMICAL SOCIETY, Burlington House, Piccadilly, W., at 8 p.m. Ballot for the election of Fellows. Papers on "The Chemistry of Chlorophyll," by L. Marchlewski and C. A. Schunck; "Researches on Morphine, I.," by S. B. Schryver and F. H. Lees; "A new series of Pentamethylene Derivatives, I.," by W. H. Perkin, Jun., J. F. Thorpe, and C. W. Walker; "Experiments on the Synthesis of Camphoric Acid, III.," and "The action of Sodium and Methyl-Iodide on Ethyl-dimethyl-butanetricarboxylate," by W. H. Perkin, Jun., and J. F. Thorpe; "On the Oxime of Mesoxamide and some allied compounds," by (Miss) M. A. Whiteley; "The Oxyphenoxy- and Phenyleneoxy-Acetic Acids," by W. Carter and W. T. Lawrence; "The condensation of ethyl α -bromo-isobutyrate with ethyl malonates and ethyl cyanacetates: α -methyl- α' -isobutylglutaric acid," and "Methylisoanilsuccinic acid, II.," by W. T. Lawrence.	
	LINNEAN SOCIETY OF LONDON, Burlington House, Piccadilly, W., at 8 p.m.—Papers on "Some Scandinavian Crustacea," by Dr. A. G. Ohlin; "The Subterranean Amphipoda of the British Islands," by Chas. Chilton; "Certain Glands of Australian Earthworms," by Miss Sweet; "Notes on Najas," by Dr. A. B. Rendle.	
Friday, June 22.		Sun rises 3.44; sets 8.19.
Saturday, June 23.		Sun rises 3.45; sets 8.19.
	CRICKET.—Finsbury Park.—Allen C.C. v. Bedford Institute.	

Marriage.

WESTLAKE—AINSWORTH.—At Derby, on Thursday, June 7, George Frederick Westlake, M.P.S., Cancer Hospital, London, to Winifred Beatrice Ainsworth, of Derby.

EXCHANGE COLUMN.

PREPAID NOTICES not exceeding TWELVE WORDS are inserted in this column at a fee of Sixpence each, if they do not partake of the nature of ordinary advertisements. For every twelve words (or less) extra, the charge is Sixpence. A price, or two initials, will count as one word. Notices for the Exchange Column should reach the Pharmaceutical Journal Office, 5, Serle Street, Lincoln's Inn, W.C., before 5 p.m. on Thursdays.

OFFERED.

2 oz. Morph. Hydroch., 10s.; **1 oz. Cocain. Hydroch.,** 17s. 6d.—Eastman, Forest Lane, Stratford.

Diatom Slides.—Spread, selected, tests, exhibition groups, etc. Approval parcels.—Gatrell, Barnes.

Photographic Stock-taking List, ready middle May, cameras, lenses, mounts.—Edward Peck, East Dereham, Norfolk.

Magic Lanterns (second-hand) and effects; bargains. Marvellous pamphengos oil lantern pictures, like limelight; £4 4s., reduced to £3 10s. Illustrated lists, 3d. The Universal Lantern, 4-in. 4-wick, 18s. 6d. Cinematographs, Hughes' Patent Photo Rotoscope Peep Show or Outdoor Theatre; 20 can see at once; £21 10s. Greatest money-taker of the 19th century; pays for itself in a week. Animated pictures, like limelight. Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Hair Speciality Recipe for growth, &c., purchased.—W. Lewis, 15, Shelden Street, London, W.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

Information Wanted.—A Gentleman desires to know where he can obtain the late Dr. William Clayton's Bilious Mixture and his other remedies. Dr. Clayton practised in Hammersmith about ten years since, and his formulæ were possibly purchased by a chemist or patent medicine vendor.—Address, Patient, "Pharm. Journal" Office, 5, Serle St., W.C.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Abram, Alcock, Bath, Beach, Bennett, Branch, Browne, Campkin, Cocking, Cole, Crinon, Cruickshank, Davies, Davis, Ferrall, Gairn, Gammie, Hill, Hooper, Holloway, Howorth, Hudson, Jepson, Kempston, Kraemer, Loosmore, McKay, Matthews, Mitchell, Moor, Parry, Perkin, Sachsse, Simpson, Smith, Squire, Sutcliffe, urney, Twinberro, Wardale Wellcome, Wills, Wyatt.

DISSOLVED HAEMOGLOBIN CAPSULOIDS.

V. STEIN'S ANALYTISK-KEMISTRE LABORATORIUM, KOBENHAVEN, K. 28 Nov. 1899. By analysis of a sample of Capsuloids sent the 14th of October, 1899, from the office of the Capsuloid Co., I found that the iron contained in them was absolutely the same form of natural iron which is found in the blood I found 21 grams of pure iron in each 100 grams.

(Signed) V. STEIN, Chief Analyst, Royal Danish Agricultural College. CAPSULOIDS are made of the best gelatine and filled with pure dissolved Haemoglobin extracted from fresh blood. The above analysis, made by one of the best Continental analysts, proves conclusively the purity and excellence of this preparation. Capsuloids are soft, flexible, pear-shaped, and easily swallowed. For children, they may be dissolved in hot milk, gruel, &c. The dose is one or two daily for infants, one or two three times daily for adults. They are unsurpassed in the treatment of anæmia, chlorosis, oligæmia, and all the conditions due to blood exhaustion, also in convalescence after La Grippe, or any exhausting disease or injury. The advantages of having this medicine, scientifically prepared, easy to take, without taste or odour, are very great, and as it agrees with the weakest stomachs it cannot be too strongly recommended to the medical profession. Capsuloids are put up in boxes of 100, for Physicians' use only, and sold at 5/- per box post free. They may be obtained through all chemists or direct from the manufacturers,

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

NEWS IN BRIEF.

MR. E. DENNIS, M.P.S., has purchased the business carried on by Mr. W. Griffith at 113, Admitt Road, Northampton.

MR. H. ROBINS, M.P.S., Market Place, Wantage, has fitted up a photographic dark-room for the use of customers.

MIDLAND PHARMACEUTICAL ASSOCIATION.—At a council meeting held on June 14, Mr. John Barclay, B.Sc., F.C.S., was unanimously elected President for the ensuing year.

THE CHEMISTS OF THE WALLASEY DISTRICT—comprising Seacombe, Egremont, Liscard, New Brighton, and Wallasey—have decided to close their establishments from one to seven o'clock each Thursday.

MR. ROGER PAYNE (Caius College, Cambridge), pharmaceutical chemist, who was one of the successful candidates at the Natural Sciences Tripos Examination last year, has been successful this year in passing the Law Tripos Examination.

THE PUBLIC AND POOR-LAW DISPENSERS' ASSOCIATION will hold the last meeting of the session at eight p.m. on Wednesday, June 27, at St. Bride's Institute, Ludgate Circus, E.C. The first meeting of the next session will be held during October.

DR. P. H. EMERSON'S EXHIBITION OF PHOTOGRAPHS at the Royal Photographic Society's rooms, 66, Russell Square, W.C., will close on Saturday, June 30. The exhibition can be viewed on presentation of visiting card, from ten to four, Wednesdays ten to eight.

CHEMISTS ON HOLIDAY IN THE NORTH who would like to join the annual outing of the Aberdeen Pharmaceutical Association to Aboyne and Strathdon on Wednesday next, June 27, should communicate with the Hon. Secretary, Mr. John Cruickshank, 42, George Street, Aberdeen.

THE SOCIETY OF ARTS has awarded the Albert Medal for the present year to Mr. Henry Wilde, F.R.S., "for the discovery and practical demonstration of the indefinite increase of the magnetic and electric forces from quantities indefinitely small." This principle is the one on which the invention of the modern dynamo machine is based, and is employed in all modern dynamos.

IN CHARGING THE GRAND JURY at the Worcester Midsummer Quarter Sessions on Monday, June 18, the Chairman (Mr. J. Willis Bund) referred to a charge against Susan Sadler of attempting to commit suicide, and said that a child of nine was served with laudanum. They heard a good deal of the wickedness of serving children under sixteen with drink; how much more wicked was it to sell poison to a child of nine!

THE EMPLOYEES OF MESSRS. T. AND H. SMITH AND Co., wholesale chemists, Edinburgh, held their annual stocktaking holiday at Callender on Saturday, June 16. Over eighty sat down to dinner, presided over by Mr. Thomas Connell Smith. After dinner Braclinn Falls and the lovely scenery depicted in Sir Walter Scott's "Lady of the Lake" were visited. The public hall had been specially engaged, where songs, recitations, and games were enjoyed, and the party spent a pleasant day notwithstanding unfavourable weather.

THE ANNUAL OUTING of the Plymouth and District Association will take place on Wednesday, July 11, to Totnes and Berry Pomeroy, the party leaving Plymouth (Millbay) at 2.30 p.m. The train will call at all intermediate stations, arriving at Totnes at 3.31. At 3.45 carriages will leave Totnes station for Berry Pomeroy Castle and grounds, returning to the Castle Hotel, Totnes, at six o'clock for high tea. The excursion is arranged in conjunction with the Exeter Chemists' Association. Chemists and their friends residing in the district are invited to join the party. Tickets, price 6s., including railway fare from Plymouth, carriage drive and tea, may be obtained of the Hon. Sec., Mr. G. Breeze, 41, Union Street, Plymouth, not later than Saturday, July 7. Tickets for drive and high tea only 3s. 6d. each.

THE SPECTACLEMAKERS' COMPANY.—The following is a list of those candidates who have passed the fifth examination of the Worshipful Company of Spectaclemakers, entitling them to regis-

tration by that body:—F. Anderson, Elgin; H. B. De Brent, Beckenham; W. J. Bunt, London; R. A. Chadwick, Streatham; A. Charsley, London; J. R. Clarke, Newcastle; W. D. Eglinton, Lewisham; A. E. Esdaile, Liverpool; F. Fearnley, Leeds; J. J. Forbes, Stirling; S. H. Holroyd, Hull; E. W. Hovenden, Dulwich; H. A. Hughes, London; H. G. Husbands, Bristol; A. F. Iye, Worthing; J. W. Jones, Cricceth; R. P. Layfield, Liverpool; G. W. Lloyd, Sheffield; D. McFarlane, Manchester; C. Palmer, Gloucester; R. J. Scott, Waltham; W. Shelton, Stockport; G. Vogt, Kendal; J. B. Williams, Putney; W. Wood, Melbourne; A. V. Woodward, Derby. The number of opticians who are certified under the examination scheme of the company is thus brought up to 296. The following candidates have passed in visual optics, and will receive the diploma when they shall have passed in the further subjects:—S. B. Adams, London; E. J. Bosch, Sydney; J. Fleming, London; E. Winterhalter, Maidstone.

TRADE NOTES.

OPIMUM EXTRACT ENULES.—Messrs. Burroughs Wellcome and Co., Snow Hill Buildings, London, E.C., have recently made an addition to their list of "Enule" brand rectal suppositories, in the form of opium suppositories gr. 1, issued in boxes containing twelve in each.

THE FIRST BATCH OF LETTERS OF ALLOTMENT AND REGRET for the issue of 4½ per cent. First Mortgage Debenture stock and 5 per cent. Cumulative Preference shares in Hill, Evans, and Company, Limited, was posted on June 19, and the final batch on June 20. The preference shares were applied for about three times over and the debenture stock more than twice over.

CONDY'S CRYSTALS.—In the Supreme Court of Victoria recently, before Chief Justice Madden, Messrs. Condy and Mitchell, Limited, obtained an injunction against Mr. W. A. Taylor, chemist, Melbourne, whereby he and his servants and agents are perpetually restrained from selling, offering for sale, or causing to be sold as Condy's crystals any crystals not being of the plaintiffs' manufacture.

THE RONUK COMPANY, in consequence of largely increased business, asks the indulgence of customers in the unavoidable delay in executing orders, which are carried out in strict rotation as received. The National Gallery, Tate Gallery, Hertford House, and the leading hospitals have adopted this sanitary polish for their floors, and the directors of the company are taking steps to supply the increased demand.

ELECTRIC BATTERIES, ETC.—Messrs. MARKET REPORT.

LIVERPOOL, WEDNESDAY, JUNE 20, 1900.

The amount of business done, both in drugs and chemicals, has been moderate during the week, and as regards fluctuations in price these have been confined chiefly to easier prices for Cottonseed Oil and Spirits of Turpentine and advances in Linseed and Linseed Oil. There has not been any great variety of goods handled, but Castor Oils have been selling better, and small amounts of Beeswax and Carnauba Wax have found buyers at good prices.

AMMONIUM SALTS—Are unchanged, except Sulphate, which sells at £11 5s. per ton.

BLEACHING POWDER—Is quiet at £6 10s. to £7 per ton.

CARNAUBA WAX—Good grey has been selling in small amount at 7s. 6d. per cwt.

COPPER SULPHATE—Has gone down to £24 17s. 6d. and £25 per ton.

GUM ARABIC—Small sales of "sorts" have been effected at 63s. per cwt.

OILS (FIXED) AND SPIRITS—Castor Oils have been selling better, and inquiry has improved, 100 cases, to arrive, May-June shipment, from Calcutta, made 3½d. per lb., spot price, 3¼d. First French, 10 tuns, to arrive, July-August, sold at £28 5s. per tun, f.o.b. Marseilles, spot price 3¼d. to 3½d., with sales at the latter rate; second French and Belgian, spot, 3½d. per lb. Olive is steady, with best Spanish at £35 10s. to £36 per tun. Seville has sold at £35 10s. in small amount. Linseed is firm at 36s. to 36s. 6d. per cwt. for Liverpool oil, with little offering. Cottonseed has dropped to 23s. 3d. and 23s. 9d. per cwt. Spirits of Turpentine, by successive falls, have gone to 39s. per cwt. for spot lots, with 36s. for cargoes near at hand and 34s. 6d. for deliveries in six months.

LONDON, THURSDAY, JUNE 21, 1900.

Business in Drugs and Chemicals has been somewhat quiet during past few days, the near approach of the end of the half-year, combined with the trouble in the Far East, having had the tendency to prevent more orders being passed than was absolutely necessary. At the same time the undertone remains firm. Quinine has been better, as far as the speculative market is concerned, owing partly to the moderate shipments advised from Java for first half of June, and partly to the good results obtained at Tuesday's bark sales in London, particulars of which are given below. Bromides, Quicksilver, Mercurials continue firm. Iodides so far unchanged. Glycerin very firm. Salicylates and Salol unaltered in price. Acid Citric, Acid Tartaric, and Cream of Tartar steady. Same may also be said of Opium, Morphine, and Codeine, as also of Acid Carboic, which continues in good demand. Camphor firm, both for crude and also for refined.

AMMONIUM COMPOUNDS—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small crystals, 33s. to 36s. Sal Ammoniac, £37 to £39 per ton for firsts and seconds respectively; crushed for batteries, 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate dull: Gray, 24 per cent.; London prompt, £11 to £11 1s. 3d.; Hull prompt, £10 17s. 6d. to £10 18s. 9d.; Leith prompt, £11. Beckton nominally, £11 7s. 6d.; Beckton terms prompt, £11. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

CINCHONA BARK—At these auctions, the sixth of the series, increased supplies were catalogued, the total of all descriptions amounting to 4,640 packages, as compared with 3,931 packages at the previous sales. There was again active competition, and the larger proportion was disposed of at fully 5 per cent. advance on the last London sales, and rather better than the previous Dutch auctions, the average unit obtained for Quinine Bark being 1½d. to 2d., while Cinchonidine descriptions realised a higher average. Ceylon: 291 bales and 88 bags offered and 358 packages sold, according to analysis, Succirubra, stem chips and shavings, good at 4½d. to 5½d.; ordinary to fair, at 2¾d. to 4d.; fine renewed ditto, at 7½d.; branch and chips, at 3¼d.; ledger, ordinary stem chips, at 1¾d.; renewed ditto, at 2¾d.; hybrid, chips and shavings, at 3¾d. to 4¾d. East Indian: Of 3,296 bales 30 bags and 96 cases offered 2,937 packages sold. Red, stem chips and shavings, fair to good, at 3¾d. to 5½d.; ordinary at 1¾d. to 3½d., renewed ditto ordinary to fair at 2¾d. to 4d., fair quill at 5¼d., broken at 4½d. to 5½d., root at 3½d. to 4d.; officinalis, stem chips and shavings, fair to good rich at 4¾d. to 8¼d., ordinary at 2¾d. to 3¾d., good branch at 4½d. to 4¾d.; quill,

natural at 8½d. to 9½d., renewed at 10½d.; renewed chips and shavings, good to fine rich at 8¾d. to 1s. 0½d., ordinary to fair at 3¾d. to 6¾d.; ledger, chips and shavings, good to fine at 8¾d. to 10½d., fair at 4d. to 6½d.; ledger, branch at 7d. to 7½d.; hybrid, chips at 4¾d. Java: 244 bags and 10 cases offered and 184 bags sold, ledger stem chips, good to fine at 8½d. to 1s. 0¾d., branch at 7d., root 5¼d. to 5¾d. South American: 199 bales Bolivian Cultivated Calisaya offered and sold, ordinary to good quill at 5½d. to 11¼d., flat at 8¾d. to 8½d.; soft Columbian, 102 bales bought in at 5d. to 5½d., and 184 bales Cuprea at 2½d. to 3½d.; 9 packages red also bought in.

CLOVES—Privately Zanzibar have been more active, sales comprising June-August and August-October delivery at 3¾d. to 3 25-32d., and January-March at 3½d. to 3 21-32d., closing at the best. None offered in auction.

GINGER—Only 80 cases Cochin were offered, and were bought in; bold, some medium roughly cut and scraped at 75s., medium and small ditto at 50s., and small at 45s. Jamaica, in fair supply, found slow demand; of 707 barrels, only 44 sold, fair to good bright at 66s. 6d. to 71s. 6d., good common to middling at 54s. to 60s., common at 43s.

OILS (FIXED) AND SPIRITS—Linseed firm and advancing. On the spot pipes, London, ordinary, £34 15s. to £34 17s. 6d. (E. I., 5s. premium); barrels, £34 17s. 6d.; Hull spot naked, £34 10s. Rape steadier: Ordinary brown on the spot, barrels, £28 10s.; refined spot, £30. Ravison nominal; naked spot none. Cotton firmer: London crude spot, £21 5s. to £21 10s.; refined spot, £23 10s. to £24, according to make. Hull firmer: Naked refined spot, £21 15s.; crude spot, £20 5s. Olive: Mogador, £35; Spanish, £36 10s.; Levant, £35. Coconut: Ceylon on the spot, £24 15s.; near, £23 5s. Cochin spot, £27 10s. Palm: Lagos on the spot, £25. Petroleum flat: Russian spot, 6½d. to 6¼d.; American spot, 6½d. to 6¾d.; water white, 7½d. to 7¾d. Lubricating: Pale American spot, 9s. to 10s.; black, 7s. to 8s. 6d.; Russian black, 6s. to 6s. 6d.; pale, 8s. 9d. to 10s. Petroleum-Spirit: American ordinary, 9¼d.; deodorised, 9½d. Turpentine holders are firm: American spot, 37s.; June, 36s.; July, 33s. 6d.

POTASSIUM COMPOUNDS—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate, spot, London, crystals, 4½d. per lb. net; powder, 4¾d. per lb. Carbonate, 90 per cent., £19 10s. per ton, ex-ship. Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Nitrate, refined, £21 5s. per ton. Permanganate, small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate, yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

SODIUM COMPOUNDS—Crystals, barrels, quoted 60s., bags 57s. 6d. Acetate, £14 10s. per ton, ex-ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3¼d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent., white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphate (Antichlor.), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate, on the spot, refined, £8 15s.; ordinary, £8 5s.; 98 per cent., £26 per ton. Phosphate, £10 10s. Prussiate, 5¼d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

THURSDAY'S DRUG SALES.

LONDON, THURSDAY, JUNE 21, 1900.

To-day's drug auctions comprised no less than 20, mostly long, catalogues, and many of the lots failed to find buyers. Some articles, however, sold well, for instance, Jamaica honey, the following being the particulars as far as has been possible to give same up to time of going to press:—

ALOES—1 case fair Zanzibar sold at 65s. per cwt. Other 64 cases East African taken out at 60s. 24 kegs Socotrine were bought in at 75s. 20 cases East Indian sold at 25s. to 34s. per cwt. 28 boxes Curacoa at 14s. 6d. to 18s. 6d. 20 cases Cape all bought in at 27s. 6d. to 28s. per cwt., other 29 cases selling at 27s. 6d. down to 26s. 6d.

Illustrated particulars, 2d.—Hughes, specialist, Brewster House, 82, Mortimer Road, Kingsland, London, N.

WANTED.

Camwal ordinary and preference. State number and price required.—M., 42, Lee Park, Lee, Kent.

Old Electric Lamps and Scrap Platinum, for cash.—P. Rowsell, 9, Derwent Grove, East Dulwich, London, S.E.

CUCUMBER EMULSION

under one name or another is still the favourite preparation for the toilet. It is best prepared by using

ROUSE'S CUCUMBER PASTE

which produces a uniformly good article, and saves trouble, time, and temper. Other methods give variable results, and will be avoided by chemists who wish to obtain and maintain a sale for this preparation.

½-lb. jars (= 3 lb. Emulsion), 2/3; 1-lb., 4/3; 7-lb., 25/-, post free.

Full directions and attractive labels and handbills in crimson and black free with each jar, also formulæ for Milk of Roses, etc., etc.

N.B.—Cucumbers actually enter into the manufacture of Rouse's Cucumber Paste.

ROUSE BROS., 61, Charlotte St., LONDON, W.

Every Description always on hand.

DISSOLVED HAEMOGLOBIN CAPSULOIDS.

V. STEIN'S ANALYTISK-KEMISTRE LABORATORIUM, KØBENHAVEN, K. 28 Nov. 1899. By analysis of a sample of Capsuloids sent the 14th of October, 1899, from the office of the Capsuloid Co., I found that the iron contained in them was absolutely the same form of natural iron which is found in the blood I found .21 grams of pure iron in each 100 grams.

(Signed) V. STEIN, Chief Analyst, Royal Danish Agricultural College. CAPSULOIDS are made of the best gelatine and filled with pure dissolved Haemoglobin extracted from fresh blood. The above analysis, made by one of the best Continental analysts, proves conclusively the purity and excellence of this preparation. Capsuloids are soft, flexible, pear-shaped, and easily swallowed. For children, they may be dissolved in hot milk, gruel, &c. The dose is one or two daily for infants, one or two three times daily for adults. They are unsurpassed in the treatment of anæmia, chlorosis, oligæmia, and all the conditions due to blood exhaustion, also in convalescence after La Grippe, or any exhausting disease or injury. The advantages of having this medicine, scientifically prepared, easy to take, without taste or odour, are very great, and as it agrees with the weakest stomachs it cannot be too strongly recommended to the medical profession. Capsuloids are put up in boxes of 100, for Physicians' use only, and sold at 5/- per box post free. They may be obtained through all chemists or direct from the manufacturers,

THE CAPSULOID CO., 31, SNOW HILL, LONDON, E.C.

Notices to Correspondents.

ALL COMMUNICATIONS FOR THE 'PHARMACEUTICAL JOURNAL' must be addressed to the Editor, 17, Bloomsbury Square, London, W.C., and, if intended for publication in the current week's issue, should reach the Office not later than Wednesday, though news can be received as late as Thursday, if specially arranged for. Instructions from Members of the Pharmaceutical Society, with reference to the transmission of the Journal, must be sent to the Secretary, 17, Bloomsbury Square, London, W.C. Advertisements and Orders for copies of the Journal must be addressed to the Publishers, 'Pharmaceutical Journal' Office, 5, Serle Street, Lincoln's Inn, London.

ARTICLES AND REPORTS sent for the Editor's approval should be accompanied by stamped directed envelopes, otherwise no guarantee can be given that they will be returned if not found suitable.

CORRESPONDENTS should write in ink, on one side of the paper only, and must authenticate the matter sent with their names and addresses—of course, not necessarily for publication. No notice can be taken of anonymous communications.

DRAWINGS FOR ILLUSTRATIONS should be executed twice the desired size, clean sharp lines being drawn with a pen and liquid Chinese ink. Shading by washes is inadmissible. Photographs can be utilised in certain cases.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Ashford, Bartlett, Brunt, Darwin, Dennis, Forster, Gibbs, Harrison, Hill, Hortin, Howorth, Jepson, Johnson, Kerr, Lewis, Marshall, Morrison, Mumbray, Naylor, Oddie, Payne, Robb, Swales, Williams, Wyatt.

NEWS IN BRIEF.

Mr. F. W. JACKSON, M.P.S., Trafalgar Pharmacy, Ashton-under-Lyne, has had his pharmacy tastefully refitted.

PROFESSOR OLIVER LODGE, of University College, Liverpool, has been appointed Principal of the University of Birmingham.

THE NILSON MEMORIAL LECTURE will be delivered by Professor Otto Pettersson, of Stockholm, before the Chemical Society, on Thursday, July 5, at 8.30 p.m.

THE ANNUAL FETE of the employees of Messrs. Burroughs Wellcome and Co. will take place at the Wellcome Club and Institute, Dartford, Kent, on Saturday, July 14.

AN IMPORTANT CONFERENCE of veterinary surgeons will be held in Dublin during the second week in August. Delegates will be present from all parts of Great Britain.

MESSRS. C. J. HEWLETT AND SON, 40-42, Charlotte Street, E.C., announce that their establishment will be closed on June 30, on the occasion of the annual excursion of the staff.

MR. A. J. DOYLE, M.P.S.I., Belfast, has kindly given a lantern display at Newry, illustrative of the war in South Africa. The proceeds were handed over to the fund for the relief of widows and orphans of deceased soldiers.

MR. R. W. WALDEN, of Eaton Square, S.W., member of the Pharmaceutical Society, was elected a member of the Metropolitan Asylums Board on Wednesday last, representing St. George, Hanover Square, and Westminster districts.

MR. G. F. FORSTER, of the Royal Chest Hospital, read an interesting paper on "Hospital Pharmacopœias," at a meeting of the Public and Poor Law Dispensers' Association, held on Wednesday, June 27. A report of the paper will be published in the Journal next week.

MR. MARSHALL KEITH WATT, M.P.S., of Aberdeen, on Friday, June 22, was presented with a field glass by a few of his colleagues and friends, on the occasion of his leaving to take up a position at Singapore. Mr. Watt was a member of the Aberdeen Junior Chemists' Association.

MR. WILLIAM SMITH has just gained the title of Associate of Science, Durham University, with distinction in chemistry. Mr. Smith served his apprenticeship with Mr. F. R. Dudderidge, Ph.C., Newcastle-on-Tyne, since when he has been a student at the Durham College of Science.

EDINBURGH CHEMISTS' GOLF CLUB.—The third competition this season for the Gibson Handicap Medal was played last week over the Braids course, with the following results:—First, Captain Lunan, 101-10=91; second and third, Mr. W. C. Baker, 99-3=96, and Mr. Wm. Lyon, 106-10=96, a tie.

A MAN FOUND in St. Stephen's Road, Upton Park, in an unconscious condition, with a black eye and a large contusion on the back of the head, and who subsequently died in the West Ham Hospital from concussion of the brain, is reported to have been identified as James Lyons, a chemist's assistant, late of East Ham.

THE EXETER EMPLOYEES OF MESSRS. JAMES TOWNSEND AND SON, chemists' printers, of Exeter and London, held their annual wayzgoose on Saturday, June 23. Southampton was the rendezvous selected, a company of 160 leaving Queen Street station at 6 a.m., returning from Southampton, after a very enjoyable outing, at 8 p.m., all apparently well satisfied with the good fare provided by the firm.

THE CHEMISTS' EXHIBITION, held at Manchester last week, was the sixth of the series, and the first held out of London. In all there were about eighty exhibitors, and St. James's Hall, Manchester, presented the appearance of an immense druggist's shop. There were entertainments in connection with the exhibition, the Northern Military Band playing in the afternoon and evening, and the cinematograph displaying some of the achievements and wonders of science.

MESSRS. G. B. KENT AND SONS, the well-known brush manufacturers, of Farringdon Road and Victoria Park, have decided to form their business into a limited company, particulars of which will be published the end of next week. We understand subscriptions will be invited for 5½ per cent. preference shares, which will also be entitled to half profits after 10 per cent. has been paid on the ordinary shares, and that the trade will have a preferential allotment.

Marriages.

RYALL—SCANES.—On June 19, at the Wesleyan Chapel, High Street, Witney, by the Rev. G. Vipond Byles, assisted by the Rev. W. H. Walker, Frederick John Ryall, M.P.S., chemist, of Devonport, to Catherine Ann (Kitty), eldest daughter of the late John Scanes, of Witney, Oxon.

HILL—BENNETT.—On June 23, at St. James's, Kennington Park Road, by the Rev. S. Bache-Harris, M.P., P. R. Hill, pharmaceutical chemist, of Weymouth, to Elizabeth Maude, youngest daughter of Mr. B. W. Bennett, of Kennington, S.E.

WASS—BOWSER.—On June 26, at Frith Ville, by the Rev. S. Craven, assisted by the Rev. J. Holden, Charles Wass, of Holbeach, to Alice Amy Bowser, youngest daughter of Mr. Charles Bowser, of Frith Ville, Boston.

MARKET REPORT.

The articles quoted here have often to be sorted in order to suit the requirements of the retail pharmacist, and the quotations given are in all cases the lowest cash prices for bulk quantities. The cost of freightage from the chemical and drug works to the various distributing centres must also be considered. It is important that these conditions should be borne in mind in making any comparison between the prices quoted and those of the wholesale drug trade.

LIVERPOOL, WEDNESDAY, JUNE 27, 1900.

In both chemicals and drugs there has been rather a dull market as regards business done and inquiries, but the articles dealt in have been a little more varied than usual. Oils continue firm in tone, with advances in the case of Cottonseed Oil and Linseed Oil, but an easier market for Spirits of Turpentine. Chilian Beeswax and Honey have sold well in amount, and have realised fully late rates.

AMMONIUM SALTS.—Carbonate, 3½d. per lb. Sal Ammoniac, 37s. and 39s. per cwt. Sulphate, £11 1s. 3d. per ton.

BEESWAX.—Three sacks of Chilian made £7 5s. per cwt., 6 cases of Peruvian a like figure, and 13 sacks Chilian £7 10s. per cwt.

BLEACHING POWDER.—Is quiet at £6 10s. to £7 10s. per ton.

CANARY SEED.—Turkish is very dull at 31s. to 32s. per 464 lbs., with no sales reported.

COCHINEAL.—Continues quiet to grey and black Teneriffe at 8½d. to 9d. per lb.

COPPERAS.—Is firm at 39s. and 37s. per ton.

COPPER SULPHATE.—Is very quiet and dull at £24 15s. per ton.

GUINEA GRAINS.—5 bags found buyers at 180s. per cwt.

HONEY.—35 barrels of Chilian made the following figures:—Pile X, 30s. 6d. per cwt.; Pile 1, 24s. 6d. to 25s. 6d.; and Pile 2, 23s. 6d. per cwt.

LINSEED.—Is very firm in all positions; of Calcutta near at hand, 75 tons sold for 56s. per 416 lbs., and now 57s. is asked; for forward delivery 57s. 7½d. is wanted. American and River Plate are not being offered.

OILS (FIXED) AND SPIRITS.—Castor Oils are dull of inquiry, and sales are only of small amount. 400 cases of Calcutta "near at hand" sold at 3½d. per lb., spot price 3¾d. 1st French sells at 3¾d. per lb., with ton lots forward at £29 per ton f.o.b.; Marseilles, 2nd French, and Belgian, 3½d. per lb. Olive Oil is in limited inquiry with steady quotations for Spanish oil on the spot of £35 to £36 per ton. Linseed is held for the advanced price of 37s. to 37s. 6d. per cwt. for Liverpool pressed oil. Cottonseed Oil, Liverpool refined, has advanced to 24s. and 24s. 6d. per cwt., and has a steady sale at that price. Spirits of Turpentine are down to 37s. 6d. per cwt. for spot lots, 35s. 6d. for lots afloat, and 34s. for lots to be delivered between July and December.

POTASSIUM SALTS.—Bichromate, 4d. per lb. Chlorate is steady at 4½d. to 4¾d. per lb. Cream of Tartar is 76s. to 81s. per

cwt., with sales mostly of Portuguese. Pearlashes are slow at 32s. 6d. per cwt. and Potashes at 25s. 6d. Prussiate is firm at 8d. per lb. Saltpetre, 21s. per cwt.

SODIUM SALTS.—Bicarbonate, £6 5s. to £6 15s. per ton. Borax is firm at £16 10s. to £17 per ton. Caustic Soda, 76 to 77 per cent., £11 5s. to £11 10s. per ton; 70 per cent., £10 5s. per ton. Soda Crystals, £3 5s. per cwt. Nitrate is only in moderate inquiry at 8s. 1½d. to 8s. 4½d. per cwt.; 455 bags of loose collected sold at 7s. 3d. to 7s. 6d. per cwt.

LONDON, THURSDAY, JUNE 28, 1900.

Business in Drugs and Chemicals has not been very active during the past week. There is, however, nevertheless a firm undertone as regards values of many articles, while China produce, such as Cassia Oil and Star Aniseed Oil, has decidedly advanced in price. Ergot of Rye is also dearer. Quinine Sulphate is also somewhat higher as far as the speculative market is concerned. Iodides and Salicylates are unchanged, Bromides very firm. Cod Liver Oil continues weak. Menthol is the turn dearer. Glycerin higher, especially for the Crude. Sulphonal and Phenacetin steady. Acetanilide dull and weak, Cocaine steady, Borax and Acid Boracic, Bismuth, Quicksilver and Mercurials unchanged. The following are the prices ruling for some articles of principal interest:—

ACETANILIDE—Keeps weak at low prices hitherto ruling, say, 9½d. to 11d. per lb, according to make, quantity and packing.

ACID BORACIC—Steady, at 26s. per cwt. for crystals, and 28s. per cwt. for powder.

ACID CARBOLIC—Continues in good demand at 10½d. to 11d. per lb. for the 35°-36° ice crystal, according to quantity and make, in large bulk packing, 11¼d. to 11¾d. for the 39°-40° ice crystal, and 1s. 0¼d. to 1s. 0½d. per lb. for the B.P. quality, 39°-40°, in detached crystals. Crude, 60° F., 2s. 8d. to 2s. 9d. per gallon; ditto, 75° F., 3s. 6d. per gallon. Liquid, 95-98 per cent. of pale straw colour, 1s. 5d. to 1s. 6d. per gallon in 40-gallon casks; ditto, 25-30 per cent. of dark colour, 9d. to 11d. per gallon.

ACID CITRIC.—Unchanged at 1s. 4½d. to 1s. 5d. per lb. for crystals in 5-cwt. casks, the makers still declining to sell in quantity for forward delivery.

ACID OXALIC—Still obtainable at 3¼d. to 3½d. per lb., according to quantity, nett, free delivered in London.

ACID TARTARIC.—English is quoted on the spot 1s. 0¾d. to 1s. 1d. per lb., and foreign 1s. per lb.

ACONITE ROOT—Appears to be in demand, while offers are somewhat scarce, and 60s. per cwt. is asked in some quarters.

AMMONIUM COMPOUNDS.—Bromide, 2s. 3d. per lb. Carbonate, 3½d. to 4½d. per lb., according to make, quantity, and packing. Muriate, chemically pure, small cryst., 33s. to 36s. Sal Ammoniac, £37 to £39 per ton for firsts and seconds respectively, crushed for batteries 2s. per cwt. more. Iodide, 13s. 10d. per lb. Sulphate dull, grey, 24 per cent., London, prompt, £10 17s. 6d.; Hull, prompt, £10 15s.; Leith, prompt, £10 15s.; Beckton, nominal; Beckton, terms prompt, £10 15s. Sulphocyanide, 1s. 1d. to 1s. 2d. per lb.

ANTIMONY.—Regulus is quoted £38 to £39 per ton, and crude Japan (Black Sulphide) £22 to £22 10s. per ton.

ASHES.—Pots, 28s.; Pearls, 33s.

ATROPINE—Makers quote 15s. 6d. per oz. for the Sulphate B.P., and 17s. 10d. per oz. for the pure alkaloid.

BELLADONNA ROOT—Is firmer, 42s. 6d., nett, here, having been paid for good dry root.

BISMUTH—Unchanged at 5s. per lb. for the commercial quality of the metal, 5s. 8d. per lb. for the Subcarbonate, and 5s. 1d. per lb. for the Subnitrate.

BLEACHING POWDER (CHLORIDE OF LIME)—Is quoted £7 per ton for English.

BORAX.—Crystals are still quoted 17s. per cwt., and powder 18s.

BROMIDES AND BROMINE—Are very firm at unchanged prices, viz., 1s. 11½d. per lb. for Potassii bromid., 2s. 2½d. per lb. for Sodii bromid., 2s. 3d. per lb. for Ammon. bromid. Bromine also unchanged at 2s. to 2s. 2d. per lb., according to quantity, in cases of 60lbs. each.

CAMPHOR.—The market for crude remains quiet but steady, 100 piculs Japan having been sold for June-August shipment at 180s. per cwt. c.i.f. Refined is firm at 2s. 4d. per lb. for Bells and Flowers, tablets being quoted dearer in proportion, according to size.

CASSIA OIL—Is also very firm, with business reported to arrive in 75 to 80 per cent. at about 3s. 5d., c.f. and i.

CASTOR OIL—Steady. Belgian, first pressing, spot, £31 10s.; July-Dec., £30, f.o.b. Antwerp, second pressing, spot, £28 10s.

per ton; Hull manufactured, guaranteed cold-drawn pure Pharmaceutical, £34 per ton in barrels, 4¼d. per lb. in cases; pure firsts, £31 10s.; seconds; £29 10s. per ton in barrels; firsts 3¼d. per lb. in cases, seconds 3¼d., ex-wharf, London.

CLOVES.—At auction no Zanzibar were offered. 15 cases Penang were bought in, meeting little demand, good bright picked at 10d., rather small and dark at 7½d. Privately Zanzibar flat and lower, with more business passing at the decline, comprising June-August and August-October deliveries at 3 23-32d. to 3¼d. and sellers, and January-March at 3 17-32d.

COAL TAR DISTILLATION PRODUCTS.—Toluol: Commercial, 1s. 2d. to 1s. 3d. per gallon; pure, 2s. 3d. to 2s. 6d. Creosote, 2½d. to 4d. per gallon, according to quantity and packing. Crude Naphtha, 30 per cent. at 120° C., 5d. per gallon. Solvent Naphtha, 95 per cent. at 160° C., 1s. 3d. per gallon; ditto, 90 per cent. at 160° C., 1s. 1d.; ditto, 90 per cent. at 190° C., 1s. 2d. per gallon. Anthracene: A, 3½d. per unit; B, 2½d. per unit. Pitch, 37s. 6d. per ton, f.o.b. Tar: Refined, 12s. 6d. per barrel, 2½d. per gallon; crude, 12s. per barrel, 2d. per gallon.

COCAINE.—Makers still quote 16s. 3d. per oz. for the Hydrochlorate for 200-oz. lots in 25-oz. tins, none of the brands most in favour being obtainable from second-hand at anything below this figure.

CODEINE—Very firm at 13s. 6d. per oz. for the pure, the salts being now quoted 1s. to 2s. per oz. less than the pure.

COD LIVER OIL—Continues dull and in slow demand, nominally at 70s. to 75s. per barrel for best new non-congealing Norwegian oil, in tin-lined barrels of 25 gallons each.

COPPER SULPHATE—Is easier at £24 5s. to £25 per ton, according to make, etc., for spot delivery.

CREAM OF TARTAR—Steady at 77s. per cwt. for first white crystals on the spot, 79s. per cwt. for powder, and 78s. for the 95 per cent.

ERGOT OF RYE—Market is very firm at 2s. 3d. per lb for sound Russian, and 3s. 4d. to 3s. 6d. per lb. for Spanish, latter appearing to be in even more limited supply than the Russian, stocks of which are, however, also probably not large.

ESERINE (PHYSOSTIGMINE).—Makers quote 2s. 6d. per gramme for the Sulphate and Salicylate salts and 3s. 6d. per gramme for the pure.

GALLS—Remain very quiet and privately little business is passing; on the spot China quoted nominally 75s., with sellers of Japan at 65s. For arrival, the season being over, no quotations are forthcoming, but a parcel of China afloat still offers at 68s. 6d. c. f. and i.

GENTIAN ROOT.—Market is firmer, and 16s. 6d. to 17s. per cwt. is asked for good dry root on the spot.

GINGER.—The moderate supply of Cochin in auction went off slowly, only a few packages selling at rather easier rates. Of 500 bags and 163 cases offered 32 packages sold, fair bright at 31s., medium, some small, cut and scraped at 64s. 6d., the remainder bought in, medium, roughly cut and scraped at 70s. to 75s., small and medium ditto at 50s., small at 40s. Jamaica, in fair supply, met a fair demand at firmer rates for good qualities, common being difficult of sale and mostly bought in. Of 585 barrels 13 half-barrels and 1 cask offered, about 400 packages sold at and since sale, fine bright at 76s. to 79s., fair to good bright at 65s. to 72s., common 48s. to 50s., common dark 38s. to 41s. Japan: 163 bags new crop offered and bought in at 25s. to 26s.

GLYCERIN.—Crude has further advanced, and is now at a prohibitive price for refining purposes, unless Refined also responds, which has been the case to a comparatively limited extent so far. Best white odourless, double-distilled, chemically pure, 1,260 S.G., 60s. in tins and cases, being quoted 60s. to 64s. per cwt., according to make, for English, and 65s. to 77s. 6d. for German, the latter price being asked for fancy brands.

IODIDES AND IODINE—Remain in *statu quo*. The combined makers still quote Potassii Iodid., 10s. 6d. per lb.; Sodii Iodid., 11s. 10d. per lb.; Ammon. Iodid., 13s. 10d. per lb.; Iodoform, crystal, powder, or precipitated, 13s. 10d. per lb.; Iodine Resublimed, 12s. per lb. Commercial Iodine is also so far unchanged at 7½d. per oz. Buyers will for the present do well to continue to buy strictly from hand to mouth only.

JALAP—Has been rather quiet during past few days, price being nominally 7½d. to 8d. per lb. for good heavy tubers, according to holder.

MENTHOL—Market is decidedly firmer. Stocks of the favourite Kobayashi brand appear to be sold out; other brands of good dry white crystals are quoted 8s. 3d. to 8s. 6d. per lb.

MERCURIALS—Are firm at unchanged prices, viz., 3s. 2d. per lb. for Calomel and 2s. 10d. per lb. for Corrosive sublimate, the other preparations of mercury being quoted at proportionate prizes.

MORPHINE—Is quiet but steady at 5s. per oz. for the Hydrochlorate powder and 2d. more for the crystal salt.

OILS, FIXED, AND SPIRITS.—Linseed: Forward positions close fully 10s. dearer. On the spot pipes London ordinary, £34 10s. to £34 15s. (E.I. 5s. premium); barrels, £34 15s. Hull, spot, naked, £34 12s. 6d. Rape firm. Ordinary brown, on the spot, barrels £29. Refined, spot, £30 10s. Ravison, nominal, naked, spot, none. September-December, £25 10s. Cotton firm. London crude, spot, £22 5s. Refined, spot, £24 to £24 10s., according to make. Hull, naked, refined, spot, £22 5s. Olive, Mogador, £35. Spanish, £36 10s. Levant, £35. Coconut, Ceylon, on the spot, £24 10s. to £24 15s.; near, £23 5s., c.i.f. Cochin, spot, £27 10s. Palm Lagos, on the spot, £24 10s. Petroleum: Forward positions are in better request, and market closed decidedly firmer. Russian, spot, 6½d.; American, spot, 6½d. to 6¾d.; Water White, 7¾d. to 7¾d. Lubricating Pale: American, spot, 9s. to 10s.; Black, 5s. 9d. to 6s.; Russian Black, 6s. to 6s. 6d.; Pale, 8s. 9d. to 10s. Petroleum Spirit: American ordinary, 8½d. to 9¼d.; Deodorised, 9½d. Turpentine: American, spot, 36s. 9d.; June, 36s. 6d.

OPIUM.—The new crop is expected to be large. Meantime market remains quiet, but fairly steady at 9s. to 10s. 6d. per lb. for manufacturing and druggists' kinds and 10s. 3d. to 12s. 6d. per lb. for soft shipping. Persian remains very scarce, and 14s. to 14s. 6d. per lb. is asked for really fine, there being but very little obtainable even at this fancy price.

PARAFFIN WAX.—Crude is quoted 2¾d. to 3d. per lb., and refined 4d. to 4¾d. per lb.

PHENACETIN.—Makers are firm at 5s. 3d. per lb. for both crystals and powder in 5-cwt. lots, while second-hand still offers in limited quantity at 5s.

PILOCARPINE.—Makers quote the Hydrochlorate and Nitrate Salts 41s. 9d. per oz. for 8-oz. lots.

PITCH—8s. 6d. to 9s.

POTASSIUM COMPOUNDS.—Bicarbonate, 39s. 6d. to 42s. 6d. per cwt. Bichromate, 4d. per lb. Bromide, 1s. 11½d. per lb. Chlorate: Spot London, crystals, 4¾d. per lb. net; powder, 4¾d. per lb. Carbonate, 90 per cent., £19 10s. per ton, ex ship. Cyanide, 98 per cent., 1s. 2d. per lb. Hydrate (Caustic Potash), 90 per cent., £25 15s. per ton; ditto, 75 per cent. to 80 per cent., £22 per ton. Nitrate, refined, £21 5s. per ton. Permanganate small crystals quoted 50s. to 60s. per cwt., according to make; large crystals, 5s. per cwt. more. Prussiate: Yellow, English makes, 8d.; Beckton, 7½d.; red, 1s. 1d. to 1s. 2d. per lb., according to quantity. Sulphate, 90 per cent., £9 15s. per ton.

QUICKSILVER—Is firm at £9 10s. from the importer, second-hand still not offering.

QUININE.—At the late sales of Java-made Quinine, out of 300,000 oz., only part sold at decidedly lower prices than those which were obtained at last sale of Quinine in Java. Here the speculative market has become quiet again, some sales having, however, been effected at 1s. 4d. per oz. for spot, 1s. 4½d. per oz. for August delivery, and 1s. 4½d. per oz. for December delivery, for B&S and/or Brunswick Sulphate; makers of these brands maintain their price of 1s. 4½d. per oz. for 1,000-oz. lots in 100-oz. tins.

ROSIN.—Strained is quoted 4s. 9d. per cwt. ex wharf for spot delivery, 4s. 4½d. per cwt. afloat, and 4s. 7d. per cwt. ex ship terms for July-September shipment per sailing vessel.

SALICYLATES AND SALOL.—There is no change in price to report.

SANTONINE—Is firm at makers' price of 11s. 3d. per lb. for 2-cwt. lots, while second-hand appears to be quite cleared out.

SODIUM COMPOUNDS.—Crystals: Barrels quoted 60s.; bags, 57s. 6d. Acetate, £14 10s. per ton, ex ship. Arseniate, 45 per cent., £13 10s. per ton. Bicarbonate, landed, £7 5s. per ton. Bichromate, 3½d. per lb. Bromide, 2s. 2½d. per lb. Caustic, 70 per cent. white, £10 15s. to £11; 60 per cent., £1 less. Chlorate, 4¾d. per lb. Hyposulphate (Antichlor), 7s. to 9s. per cwt., according to make. Iodide, 11s. 10d. per lb. Manganate, 25 per cent., £15 10s. per ton. Nitrate: On the spot refined, £8 15s.; ordinary, £8 5s.; 98 per cent., £26 per ton. Phosphate, £10 10s. per ton. Prussiate, 5½d. per lb. Stannate, 40 per cent., £3 10s. Sulphate, £1 7s. 6d. per ton. Sulphide Crystals, £6 10s. Sulphite, £5 15s. per ton.

SPICES (VARIOUS).—Pepper: At auction no Singapore was catalogued. 12 packages Wynaad offered and sold, good heavy at 6¼d.; 93 bags Penang bought in at 5¾d. White Pepper con-

tinues in slow demand. 80 bags and 42 cases Singapore bought in, fine bold at 1s., good to fine bold Coriander kind at 10¾d. to 11d. Also 168 bags Penang fair at 8¾d. Chillies quiet, and 30 bags Japan in auction were bought in, fine bright at 50s. Capsicums also quiet. 2 bales Natal offered and bought in; good bright long off stalk at 90s.; darker ditto at 70s. Pimento dull of sale, and 217 bags in auction all bought in. Cinnamon: In auction 4 bales Ceylon sold without reserve, fourths at 5d. to 8d. Nutmegs dull of sale; 30 packages Penang offered, 14 bags sold, defective at 5½d., broken and shelly at 2½d. West Indian: 38 packages sold, 69's at 1s. 5d., 85's at 1s. 1d. Antitoxine

is the only Anti-pyretic and Anti-neuralgic which has been demonstrated by the Spymograph to be a powerful heart stimulant.

NET PRICE:—Reduced to 3/- per ounce for Powder and 5-grain Tablets.

DEAR SIR,

AMESBURY, SALISBURY, WILTS.
In reply to your letter asking my opinion of Antitoxine, I have much pleasure in saying that in Nigraine and certain Neuralgias of the Face I have found the drug almost a specific, and in every case there has never been any sign of cardiac depression, rather the reverse; a "feeling of warmth all over the body," as they have expressed after taking it. I always have it in my surgery, for use in the cases above-mentioned, having up to the present used several ounces of it. Just now I am exhibiting it in a patient with high fever from acute Cystitis, and have every confidence that it will act as an antipyretic in conjunction with other drugs appropriate for this disease. You may make use of my name if you wish it, as I think the drug should be more popularly known by the Medical Profession.

I remain,

(Signed) Yours faithfully,

HENRY BROWNE, M.R.C.S. Eng., L.R.C.P. Lond., L.S.A. Lond.
