(5) Seeing the efforts now being made to increase the membership of the British Pharmaceutical Conference, we commend its objects and advantages to the Local Associations.

(6) The Federation suggests for discussion the desirability or otherwise of holding the Society's Annual Meeting during the meeting of the British Pharmaceutical Conference.

The Companies Bill.

In connection with the recommendation (1) to oppose the Companies Bill, the Secretary, acting on the instructions of the Executive Committee, has sent a circular letter to all local associations and to the local secretaries of the Pharmaceutical Society, giving a statement of reasons for amending Clause 2 of the Companies Bill, together with copies of two suggested clauses, one of which is to be selected and sent with the circular to the local member of Parliament. It is suggested that copies of the letter should be signed by the president of each local association and by each local secretary of the Pharmaceutical Society, also by as many individual chemists as possible, the signed copies to be dispatched—with the selected draft clause enclosed in each case—to the members of Parliament for the respective districts, who should also be interviewed on the subject if possible. The Secretary further requests that the letter should be utilised as promptly as possible, and asks to be informed at once how many additional copies can be put to profitable use. Individual chemists can obtain copies of the circular letter and suggested clauses by applying to the Secretary of the local association for the district, to the nearest local secretary of the Pharmaceutical Society, or to Mr. James Cocks, 8, Edgcombe Street, Stonehouse, Plymouth.

Rules and Questions for Local Associations.

The following rules are recommended by the Executive Committee for conducting committees and small associations:—

1. Its objects are the cultivation of mutual trade interests and social intercourse (and educational where possible).
2. A member shall be elected annually as chairman, and another as secretary and treasurer.
3. Meetings will be held as required, the holding of which shall be at the discretion of the chairman and secretary, or at the written request of any two members.
4. At a meeting, the membership of which is under ten members, two shall form a quorum, and from ten to twenty members, three shall form a quorum.
5. The amount of the annual subscription shall be 2s. 6d., or the expenses of the year equally divided.
6. The members should try and arrange for an annual dinner or supper, also an excursion in the summer, to the latter ladies should be invited to attend.

The following questions of a personal nature were sent to the various associations:—

1. Would you kindly forward the numbers of your Association?
2. Please elect your delegates for the Federation before the end of the Session.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, February 22, at 73, Newman Street, London, W. Mr. F. W. GAMBLE, President, took the chair at a meeting of this Association, when Mr. R. E. LOWNSBROUGH communicated some

NOTES ON ENTOMOLOGY.

In his introductory remarks, he said the chemist had many calls made upon him to view the "insect world" with a greater regard and more esteem than the majority of people. The dislike, often aspiring to hatred, for such members of that group of animals as bugs, fleas, mosquitoes, wasps, earwigs, and black-beetles offered to the enterprising chemist the opening to earn an honest coin; a commercial prospect in the direction of insect powders, fly-catchers, sticky or otherwise, in every variety, moth crystals and papers, phosphor paste for the benefit of black-beetles, remedies for mosquito and gnat bites, anodyne for bee-stings, wheat dressings for the agriculturist to protect his seeds from their many enemies, tobacco sheets and arsenical washes for the horticulturist to wage war on plant lice, sheep dips for the farmer, concoctions for the fruit grower to protect his trees from the onslaught of the larvæ of many moths. Those were some of the chemist's business calls. In their student days they acquired a knowledge of cochineal, cantharides, *Blatta orientalis* the cockroach, *Apir mellifica* the honey-bee, gallflies, those coccidæ which produce "lac," which is largely used in the manufacture of sealing wax and varnishes. They studied the aid rendered by insects in the cross-fertilisation of flowers, and the unwilling assistance given to the nourishment of fly-catching plants such as the sundew, butterworts, and Venus fly-trap. Other connections might also be quoted, but he thought the foregoing would suffice to form an excuse for offering a paper on entomology, a branch of natural history that was very extensive, divided into many groups, giving ample scope for investigation. His attention had chiefly been devoted to the group to which butterflies and moths belong, but it was not his intention to adhere to any one group, but to give a short sketch of insect life generally. He then went on to define an insect as an invertebrate animal, which possesses a head with mouth parts, eyes and antennæ, a many-segmented body with six legs (three pairs) on the segments immediately following the head, and, when mature, having either one or two pairs of wings. Having described the various parts, he stated that no insect possesses any bones, their outer covering being horny, taking the place of a skeleton, and to that the muscles are attached. Neither have they any lungs; the breathing being effected by means of tubes, usually eighteen in number, placed

along the side of the insect, the terminations being known as spiracles. The eighteen tubes give rise to 236 smaller tubes, which branch and divide into all parts of the insect's body, hence the reason why insects are so soon overpowered by strong fumes, such as chloroform, ammonia, cyanide, etc. Those were the general characteristics of insects, but of course they had many variations, and these Mr. Lownsbrough proceeded to describe, mentioning another distinguishing feature of a true insect, viz., that it passes through four distinct periods of life, (1) the egg period; (2) the larval or masked period, better known as the caterpillar stage; (3) the pupal or enshrouded period, or chrysalis stage; and (4) the imaginal or perfected period. He then dealt with the thirteen different orders into which the insect world is divided, describing the characteristic features of the various classes of insects during the four stages of their existence, giving a brief outline of their habits, food, etc. At the conclusion of a most entertaining paper, which was illustrated by numerous specimens of the beautifully decorated butterflies and moths, and of the less attractive, but none the less interesting, beetle family, flies, etc., the author said he had endeavoured to put before those present some views of the great scenes in insect life, with the hope that they might see in them some gain beyond that of business, that as they walk by woodland path, or over wide expansive moor, by murmuring brook or placid lake, they might find some pleasure in reading nature's secrets.

The PRESIDENT having congratulated Mr. Lownsbrough on his intensely interesting paper, a short discussion followed; a hearty vote of thanks to the author bringing the meeting to a close.

ROYAL INSTITUTION.

A lecture was given on Friday, February 23, by Professor JOHN H. POYNTING, D.Sc., F.R.S., on

RECENT STUDIES IN GRAVITATION.

By the law of gravitation every particle of matter attracts every other particle of matter with a force that is proportional to the product of their masses, inversely as the square of the distance between them, and in the direction of a straight line joining their centres. Soon after Newton formulated this law an experiment was made to determine the mass of the earth by observing the angle of deflection from the vertical of a plumb-line hung in position near a mountain. It was, in other words, an attempt to determine the mass of the earth in terms of that of the mountain. Chimborazo was the mountain chosen, but, from various causes, the result was not quite accurate; the climatic conditions were unfavourable, inasmuch as observations were made at different points of the compass, and so the apparatus might be working at one station in a snowstorm and at another in a storm of sand. Then again, the mass of the mountain was only approximately determined, chips were taken from the sides, their specific gravity taken, and a complete survey of the mountain was made.

The next attempt to determine the mass of the earth was made by Cavendish. His result has been verified in recent times by Boys, who used a similar apparatus to that of Cavendish, but with the dimensions reduced to gain exactness. Then a German worker took infinite pains to devise an apparatus wherein air currents might be reduced to a minimum, by obtaining a partial vacuum (one two-hundredth part of an atmosphere). This worker, living in the country, far from towns, made his own apparatus, and obtained the same result as Boys—viz., that the earth has a mean density 5.527 times the density of water.

The author has given considerable attention to this subject, and has obtained the figures 5.49 as his result. He considers 5.5 to be the correct result, as nearly as is possible to determine it.

Newton said that the mass of the earth would prove to be five or six times what it would be if it consisted only of water;

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting of the above Association, held on Wednesday, February 21, the PRESIDENT, Mr. F. Maitland, in the chair, a discussion took place on

THE COMPANIES BILL.

The CHAIRMAN considered that pharmacists should most vigorously oppose Clause 2 of the Bill and strive to obtain a new Pharmacy Act. There was such a diversity of opinion among chemists on the subject that he believed it would be impossible to alter the proposed clause so that it would be workable and satisfy all. The Pharmaceutical Council, to which they naturally looked for their policy, had not yet made up its mind, and it would be simply waste of time and effort to approach Parliament unless chemists were perfectly unanimous in the matter. It would be a great pity if, for lack of combination and agreement among themselves, this opportunity for strong opposition should be allowed to slip by pharmacists.

Mr. J. DAVY TURNER proposed that the Association should recommend that the clause affecting chemists be most strenuously opposed, and that the resolutions passed at a previous meeting be confirmed—viz., (1) that chemists' titles should be protected; (2) that it is illegal for unregistered persons to keep open shop for the sale of scheduled poisons. He thought the one thing all were agreed upon was the necessity of fighting for the protection of titles. It was indeed a crisis in their history as chemists when they were called upon to do this. Every effort should be made to oppose the clause in this Bill which gives the right to unqualified persons to assume the title of chemist and druggist or pharmaceutical chemist.

Mr. C. T. WEARY, in seconding the resolution, suggested that it was highly important, in connection with any clauses suggested, that they should remember the old adage, "Do not put all your eggs into one basket." The two main suggestions were:—First, that a company should not call itself a pharmaceutical chemist or chemist and druggist under any circumstances; and, secondly, that a company shall not keep open shop for the sale of scheduled poisons. Would it not be wise to embody these two suggestions in two clauses instead of one, so that in case of the second being lost chemists would still have a chance of saving their titles?

Mr. J. COCKS, in replying to a question respecting the policy of the Federation, said that whatever the individual opinions of the Executive Committee of that body might be, it was distinctly opposite to its policy to dictate what should be done, its object being to ascertain and collect the opinions of local associations and act accordingly.

Mr. W. H. WOODS considered the protection of chemists' titles a vital necessity, and looked upon the qualified directorate as a thing that should be strongly opposed. He would oppose the proposed clause *in toto*, in the hope that a new Pharmacy Bill doing justice to the craft might be introduced.

Mr. C. J. PARK said that he could only repeat the remarks which had fallen from him on a former occasion, that in addition to the protection of their titles they should endeavour to present an unbroken front, and demand that it should be unlawful for companies to sell or dispense medicines containing any of the scheduled poisons. He was of opinion that it was contrary to both the interests of the public and the craft that company trading in this respect should be permitted, and in the case of certain firms of registered chemists—who had converted their concerns into limited liability companies for the sake of convenience, chiefly because they were doing a wholesale business in addition to the retail portion—he thought they should be dissociated.

The resolution was then put to the meeting and unanimously carried.

MIDLAND PHARMACEUTICAL ASSOCIATION.

A well-attended meeting of the members of the above Association was held at Mason College, Birmingham, Mr. JEFFREY POOLE presiding, on Thursday, February 22, at which Mr. H. W. JONES, Coventry, delivered a lecture on

THE RISE AND DEVELOPMENT OF MODERN PHOTOGRAPHIC PROCESSES.

The lecture was illustrated with a fine series of lantern slides and examples of paper prints, showing the various processes in use or now obsolete. A short account was given of the state of knowledge relating to light and its action on salts of silver previous to the year 1777, the year when Scheele first made out that under light action silver chloride lost chlorine in the darkening process. Boulton and Watt, of Birmingham, in 1799 produced "sun pictures," but left no account of their method; and the early work of Wedgwood and Davy and others was alluded to. The first experiments of Nièpce with bitumen, and Daguerre with silver plates coated with iodine films, were discussed in relation to the final production of the first practical process of Daguerreotype. An early negative by Fox Talbot's process and a print from the same were both thrown on the screen as illustrations of Fox Talbot's work, the result of which was the production of negatives in the camera capable of indefinite multiplication as positive prints. The collodion process was next explained, and examples prepared by the lecturer, showing the difference between positives and negatives, were shown in the lantern, along with a series of views printed by the collodion process. The evolution of the modern dry plate through the progressive stages of collodion emulsion processes was discussed, and attention drawn to the fact that a Birmingham company produced the first commercial dry collodion plates by the process of Dr. Hill Norris as far back as 1856. Finally collodion as an emulsifying medium was practically abandoned in favour of gelatin, first suggested by Dr. Maddox. Bennett, Stuart Wortley, and Mansfield improved the emulsion by suggestions for heating the gelatin compound, which they found added unusual sensitiveness, the dry plate being practically completed in 1879. As illustrating the effect of heat, photo-micrographs prepared by Mr. Jones were projected from the lantern, and showed the difference in size and physical condition of the particles of bromide of silver forming the sensitive surface of slow and rapid plates. As examples of the extreme rapidity of modern dry plates, slides were shown of flying bullets taken by the spark process of Prof. Boys, flashes of lightning, and the positive discharge of the induction coil. Mr. Jones also showed X-ray slides; an example of lace, the image of which had been produced in his own dark-room entirely by the light of phosphorescent bacteria; "pressure lines," resulting from pressure brought to bear on the plate, and showing on development an action similar to that resulting from light; and the "chemical image," the result of the action of peroxide of hydrogen, evolved by zinc, printer's ink, and other substances, as determined by Dr. Russell's experiments. The use of the modern dry plate to the astronomer was illustrated by slides of the moon taken in various phases, whilst its employment by the naturalist was exemplified by a series of bird studies taken from life with the aid of the tele-photographic lens. As additional examples of photography prints by various methods were displayed on the lecture table, and slides by the pigment or carbon process were thrown on the screen, showing the various tints that could be produced. In illustration of attempts made to produce photographs in colours, an account was given of the three-colour method of producing transparencies by Mr. Sanger Shepherd's process, and a fine set of slides in natural colours, photographed from nature by the inventor, was shown.

At the close of the lecture, Mr. Jones was cordially thanked.

BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting of this Association was held at the County Restaurant, Bradford, on Tuesday, February 27, when Mr. H. G. ROGERSON presided over a fairly large gathering. A vote of condolence having been passed and directed to be conveyed to the relatives of the late Mr. A. Foster, President of the Dewsbury Association,

Mr. GEORGE WARD, of Leeds, proceeded to deliver a lecture on

PHYSICAL TESTS OF THE PURITY OF DRUGS.

The lecturer, who illustrated his remarks with interesting references, said that very large additions had been made in the British Pharmacopœia of 1898 with regard to tests which he described as of a physical character, and they would find that the question of the solubility of different substances in a given volume was in many instances made a definite test. A number of additions had also been made with regard to the testing of solid bodies by the melting point. A great amount of care and trouble must have been devoted to the compilation of these tests, which were given in greater detail than formerly. They also had quite a novel addition, for this was the first time that the specific rotary action of a body as a test of its purity had been included in the Pharmacopœia. The lecturer proceeded to point out that alterations had been made with regard to carbolic acid, with the object of excluding more clearly than was done before the cresylic acid. It had been felt for many years that in carbolic acid a purer article might very easily be obtained. Dealing with the melting point test, Mr. Ward said that there had not been for a very long time any uniform method of taking the melting point of a substance, every operator doing it in the manner he preferred. He cited various methods, and said that the Pharmacopœia was justified in insisting upon a more definite melting point than that which formerly existed. The authorities were apparently striving after as great a degree of purity as was commensurate with the freedom of trade. They were endeavouring to obtain as pure an article as they could for medicinal purposes. Every pharmacist would recognise that his very existence as a craftsman depended upon his trying to bring his business into line with this determination. The people who had the rush and push, and who were anxious to sell at the lowest price, irrespective of quality, might supply the impure article; but let true pharmacists be determined that they would strive for purity of material, and endeavour to conscientiously discharge their duty to the medical man as well as to the patient, and, although they might have to wait a little while, there would come a time when the pure article at a reasonable price would have preference over rubbish at the lowest price.

On the motion of Mr. JACKSON, seconded by Mr. R. SILSON, a vote of thanks was accorded to the lecturer.

NEW REMEDIES.

CHLÔRETONE: A NEW HYPNOTIC.—Chlôretone, tri-chlor-tertiary butyl alcohol, has been brought forward by Houghton and Aldrich as an anæsthetic and hypnotic. Applied locally, in aqueous solution, to lacerated wounds or burns, it acts very efficiently in lessening pain, while it possesses distinct antiseptic properties. Internally, it relieves gastric pain and vomiting, and has proved specially useful in this respect, in a case of gastric carcinoma. Experiments have shown that it renders the mucous membrane of the alimentary canal insensible to irritants. As a hypnotic, it has been specially successful in cases of persistent insomnia in the aged, and in cardiac diseases with renal complications and high arterial tension. It has succeeded in many instances where morphine, chloral, and other hypnotics have failed. The usual dose given is from 6 to 20

grains, in tablets, followed by a draught of water or of milk.—*Therap. Gaz.*, **22**, 738 and 758.

PASSIFLORA INCARNATA.—Fisher has found May Pop (*Passiflora incarnata*, Lin.) a valuable sedative, antispasmodic and hypnotic; also especially useful in the insomnia of old age, spasms from indigestion in children, and hysteria, and in the restless vigil of typhoid fever. It can be substituted for opium, chloral, and bromides in many cases, and the sleep produced is more natural; the patient is easily awakened, and is not so stupid. It does not produce the unpleasant after effects which follow the use of the former hypnotics and sedatives.—*Inter. Med. Mag.*, **7**, 929.

THE THERAPEUTIC VALUE OF COLLOIDAL SILVER.—A. Schlossmann has investigated the therapeutic value of the colloidal metals, and finds that, in this form, metallic silver is a non-irritant and non-poisonous antiseptic, and is also valuable for internal medication, and that no other remedy effects such a rapid cure. He is also of the opinion that the simple solution of the pure metal should not be used, but it should be combined with albumin, the white of one egg to 200 C.c. of solution. This form should also be adopted for ointments.—*Deuts. Am. Apoth. Zeit.*, **20**, 109.

FORMALIN SPRAY-INHALATION IN PHTHISIS.—The following spray-inhalation of formalin has been found by J. Lardner Green to be useful in the treatment of phthisis, and is suggested as an adjunct to the open-air *regim*; now so widely employed in the treatment of the disease:—Formalin, 1 drachm; glycerin, 4 drachms; water, 5 fl. oz. To be used four or six times in twenty-four hours. Should there be more than usual sensitiveness in the air-passages, aromatic spirit of ammonia, 10 minims, may be added to the above mixture.—*Brit. Med. Journ.*, **1**, 1900, 139.

GUAIACOL CACODYLATE IN TUBERCULOSIS.—Barbary has given hypodermic injections of guaiacol cacodylate with good results in cases of tubercule. The dose employed has been from 3 to 5 centigrammes.—*Bull. Comm.*, **28**, 35.

SODIUM CARBONATE FOR ULCERATED LEG.—In experimenting with the dressing of sodium bicarbonate as suggested by Guéorguievski (*P. J.* [4], **8**, 214c), A. Brunner finds that, although it acts favourably, a 2.5 per cent. solution of dried sodium carbonate is even more efficacious, particularly in the case of chronic indolent ulcers of the leg. The affected part is first washed with warm sublimate solution; a layer of aseptic gauze, lightly spread with yellow vaseline, is next applied, upon which a layer of absorbent cotton, saturated in the 2.5 per cent. sodium carbonate, is placed; and finally a layer of lint, the whole being kept in place by a bandage. The dressing is removed daily. A cure will generally be effected in from ten days to one month, according to the extent of the lesion. Some patients are intolerant of vaseline, which sometimes causes eczematous eruptions. In those cases lanoline may be substituted, or the compress of sodium carbonate may be applied directly to the surface.—*Bull. Gen. de Therap.*, **138**, 794.

REMOVAL OF CERUMEN.—To remove hardened cerumen which will not yield to syringing with water warmed to 98° F., the following solution may be employed, as directed:—Sodium bicarbonate 5, glycerin 100, water 100. Six drops of this, previously warmed, are dropped into the ear three times a day, a plug of cotton being inserted after each instillation. In two days, syringing with tepid (98° F.) water is practised, and if the lump is still immovable the instillations are repeated. After the extraction the ear should be dried and a small tampon of cotton placed in the entrance and allowed to remain there for two days.—*Pract.* **54**, 117.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Calumbæ Radix.

CALUMBA ROOT is obtained from *Jateorhiza columba*, Miers (N. O. Menispermaceæ), a lofty, climbing plant, indigenous to Portuguese East Africa, which produces swollen fleshy roots. Those are dug up in the dry season, cut into transverse slices, and dried. The drug is a bitter stomachic and tonic; it is used for preparing Infusum Calumbæ, Liquor Calumbæ Concentratus, and Tinctura Calumbæ.

CHARACTERS.—Calumba root occurs in irregular slices, which are irregularly circular or oval in shape, and usually from about 2.5 to 5 Cm. in diameter and from 3 to 12 Mm. in thickness, though both larger and thicker pieces may be found. They are more or less uniformly yellow in colour, break with a short starchy fracture, have a feeble, musty colour, and a marked bitter taste, due to the bitter principles the drug contains. If the dull greyish or greenish-

developed parenchymatous tissue, short fracture, and abundance of starch. The drug contains three bitter principles—columbic acid and its anhydride columbin, both of which are colourless crystalline bodies, and the yellow crystalline alkaloid berberine, to which the colour of the root is chiefly due. Much starch is also present, together with some mucilage and a fluorescent body, but tannin is absent. Slices of the stem of *Coscinium fenestratum*, Colebr. (N.O. Menispermaceæ) are distinguished from calumba by being dark yellow in colour, hard and woody, free from starch, and not depressed in the centre; slices of the root of *Frasera caroliniensis*, Walter (N.O. Gentianæ), contain tannin, and are usually smaller and thicker than those of calumba, besides being free from starch.

Cambogia.

GAMBOGE is a gum-resin, obtained from *Garcinia hanburii*, Hook. f. (Guttiferae), a tree which grows near the south-west coast of Cambodia, Siam, and on some adjacent islands, as well as in the southern parts of Cochin China. Secretory ducts filled with a yellow, milky gum-resin occur in the cortex of the tree and in the bast, the two systems being connected by transverse canals at the

CALUMBA ROOT.—A. Transverse section (nat. size). B. Transverse section, showing microscopic structure. C. Transverse section of bark. D. Transverse section of column. E. and F. Starch granules. B., C. and D. Magnified. After Berg and Schmidt.

yellow surface be shaved off with a knife the colour will be found to be much brighter inside, and the yellow tint most marked near the cork and the cambium. The circumference of the sections consists of a thin dark-brown, wrinkled, corky layer; the cork is easily separated from the yellowish-brown bark, which occupies about one-fifth of the diameter of the root, is marked with radiating lines of sieve tissue, and is divided from the central woody portion by the dark cambium line. The wood is of a lighter colour than the bark, and contains vessels arranged in narrow radially-elongated groups. The parenchymatous tissue is largely developed, and contains numerous starch-grains, both in the wood and bark; the starch-grains are mostly simple, with an eccentric or non-central hilum. The slices are usually somewhat shrunken and depressed in the centre, the greater contraction there on drying being probably due to the central tissue being less woody and less loaded with starch than the outer portions.

NOTES.—The distinctive characters of calumba root are its yellow colour, the depressed centres of the slices, the thick bark, largely

nodes. During the rainy season spiral cuts are made in the bark in a longitudinal direction, to a height of about ten feet above the ground, and the gum-resin as it exudes is received in hollow bamboos, from which it is transferred to smaller ones, in which it is allowed to solidify. After the lapse of a month the solidified gamboge is removed from the bamboos by heating the latter over a fire until they crack and peel off. The pipes of gum-resin are then allowed to harden before being further packed. The drug is exported from Bangkok and Saigon, that known by the name of the last-mentioned place being in cakes or masses which bear the impression of leaves in which they have been wrapped. Pipe gamboge is the best, and that alone is official. The drug is a powerful hydragogue cathartic and, in small doses, diuretic; it is used for preparing Pilula Cambogiæ Composita. The dose of gamboge is from 0.5 to 2 grains.

CHARACTERS.—Gamboge should be in cylindrical solid or hollow rolls or pipes, from about 2.5 to 5 Cm. in thickness and from 10 to 20 Cm. in length, the pipes being marked with longitudinal furrows

caused by ridges on the inner surface of the bamboos in which they have been dried, they are either separate or agglutinated into masses which reveal traces of the pipe formation. When broken gamboge shows a smooth, uniform, conchoidal or shell-like fracture, the freshly broken surface having a dull gloss and being of a uniform reddish-yellow or brownish-orange colour. The drug is easily reduced to a bright yellow powder, possesses little or no odour, but has a very acrid taste, due to the resin it contains. When rubbed with water a yellow emulsion is formed, the gum dissolving and the resulting mucilage holding the resin and other constituents of the drug in suspension. The resin is soluble in alkaline solutions and by successive treatment with 90 per cent. alcohol and water gamboge should be completely dissolved. Powdered gamboge should be free from added starch, the presence of that substance as an adulterant being indicated by making a decoction with boiling water, allowing to cool, and adding solution of iodine; if more than traces of starch be present, the cooled decoction turns green, the blue of the compound of starch and iodine blending with the yellow of the decoction. When incinerated gamboge should not yield more than 3 per cent. of ash.

NOTES.—The distinctive characters of gamboge are the distinct or agglutinated pipe-shaped masses with longitudinal striations and conchoidal fracture, the rich yellow colour, and the complete solubility of the gum-resin in alcohol and water used successively. The drug contains from 66 to 82 per cent. of resin (gambogic acid), 15 to 25 per cent. of gum, about 4 per cent. of wax, 2.5 per cent. of moisture, and traces of starch. The chief adulterants of gamboge are starch, sand, vegetable debris, etc., all of which are insoluble in alcohol or water (used successively), or in dilute ammonia. More than traces of starch can be detected by the iodine test; inorganic substances, if present, will increase the percentage of ash left upon incineration. Inferior gamboge is of a dark brownish colour, and breaks with a dull, rough, granular fracture, the fractured surface often exhibiting small cavities.

Camphora.

CAMPBOR is a white crystalline substance obtained from *Cinnamomum camphora*, Nees and Eberm. (N.O. Laurineæ), a large tree which grows in Formosa and Japan, whence the drug is exported to Europe. All parts of the tree contain a volatile oil, one of the constituents of which is camphor, but the drug is obtained exclusively from the wood. After the tree has been felled the wood is reduced to chips, and heated with water in a rude still. The camphor is carried over with the water-vapour, and sublimes in an earthenware dome. The crude mass thus obtained is exported to London or Hamburg in tubs and there purified by re-sublimation. The drug possesses stimulant, sedative, expectorant, and slight antiseptic properties; it is used to prepare Aqua Camphoræ, Linimentum Camphoræ, Linimentum Aconiti, Linimentum Belladonnæ, Linimentum Camphoræ Ammoniatum, Linimentum Opii, Linimentum Saponis, Linimentum Sinapis, Linimentum Terebinthinæ, Spiritus Camphoræ, Tinctura Camphoræ Composita, Unguentum Hydrargyri, and, indirectly, Linimentum Chloroformi, Linimentum Hydrargyri, and Linimentum Terebinthinæ Aceticum. The dose of camphor is from 2 to 5 grains.

CHARACTERS.—Camphor occurs in three forms—(1) in solid, colourless, transparent, crystalline pieces or "bells" of tough consistence, (2) in rectangular masses, and (3) in pulverulent masses, known as "flowers of camphor." Its specific gravity is about 0.995, varying from 0.986 to 0.996. The powerful penetrating odour is characteristic, and the pungent, bitterish taste is followed by a sensation of cold. Camphor burns readily with a bright smoky flame, it volatilises at ordinary temperatures, and it sublimes when heated, without leaving any residue. One part of camphor dissolves in about 700 parts of water, in 1 part by weight of 90 per cent. alcohol, or in 4 parts of olive oil; chloroform dissolves 4 times its weight and ether 12 parts in 7. On triturating camphor

with an equal weight of chloral hydrate or with one-third its weight of carbolic acid in crystals an oily liquid is formed; a similar result is attained by triturating it with menthol or thymol.

NOTES.—The distinctive characters of camphor are its general appearance, odour, and taste. Its composition corresponds to the formula $C_{10}H_{16}O$, and it should probably be regarded as a ketotetrahydro-cymene, its behaviour with hydroxylamine being in accordance with that view. It may be prepared artificially by oxidising camphene—a solid terpene ($C_{10}H_{16}$)—by chromic acid mixture. Crude camphor yields a yellowish oil, known as camphor oil, which is really a mixture containing safrol, eugenol, etc. Camphor which is distinctly oily or excessively brittle does not meet the official requirements.

Obituary.

ALLEN.—On February 19, William Hart Allen, Chemist and Druggist, Catford. Aged 87.

BOND.—On February 18, Henry Bond, Chemist and Druggist, Liverpool. Aged 74.

FOSTER.—On February 24, Abraham Foster, Chemist and Druggist, Heckmondwike, Dewsbury. Aged 60. Mr. Foster, who was a member of the Pharmaceutical Society, was one of the best-known and highly-esteemed chemists in the West Riding of Yorkshire. He was apprenticed to the late Mr. T. H. Gloyne, Chemist and Druggist, Market Place, Dewsbury, with whom he remained seventeen years. He then took over the business of the late Mr. T. M. Brooke, Market Place, Dewsbury, where he conducted a very successful business for nearly thirty years. Four or five years ago he removed to Robinson Street, where he also carried on the business as a wholesale druggist. It was chiefly through his influence and exertions that the Dewsbury and District Chemists' Association was formed a few years ago. He was elected first President, and continued to hold that office up to the time of his death. All movements which had for their object the improvement of the position of chemists found in Mr. Foster a warm supporter, who expressed himself in favour of the Dewsbury Association, if necessary, being represented at the House of Commons when the new Companies Bill came up for discussion. He was for three years President of the Dewsbury Tradesmen's Association, and was also President of the West Yorkshire Federated Chamber of Trade, and chairman of the directors of the Dewsbury and District Mutual Plate Glass Association. He was also connected with several companies in the locality. Mr. Foster was a Freemason, for many years being a member of the Three Grand Principles Lodge at Dewsbury, and of the Amphibious Lodge at Heckmondwike, being a Past Grand Master of the latter.

HUGHES.—On February 19, Thomas Hughes, Chemist and Druggist, Talybont, Cardiganshire. Aged 63.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

CHEMISTRY OF LAVENDER OIL.

By examining the volatile oil of lavender at different periods during the flowering of the plant, E. Charabot finds that the amount of free and of total alcohols, and also that of the free acids, diminishes until the flowers are fully expanded, while the amount of esters increases. When however, the flowers fade, the amount of alcohols increases, and that of the esters diminishes. This shows that the esters are derived directly by the action of free acids on the alcohols. Under these conditions, during the development of the plant, a portion of the linalol is converted into esters, and another portion becomes dehydrated, so both the amount of the free and total alcohol is lessened. On the other hand, as soon as etherification is completed, which is when the flowers begin to fade, the proportion of total alcohol rapidly increases. These changes are stated to take place in the chlorophyll-containing portions of the plants. The following table shows the results obtained with the oil in these various stages:—

	Sp.g.	Esters.	Free alcohols.	Total alcohols.
Flowers in buds	0.8849	36.6 per cent.	21.0 per cent.	49.8 per cent.
Flowers fully expanded	0.8854	40.4 "	16.7 "	48.4 "
Flowers fading	0.8821	39.75 "	18.9 "	50.25 "

By distilling identical quantities of the herb in the three stages of development and determining the acidity, in terms of acetic acid per litre, of aqueous distillate, the results obtained were: Buds, 0.5241 Gm.; fully expanded flowers, 0.4716 Gm.; flowers faded, 0.3846 Gm.—*Comp. rend.*, **130**, 257.

MEXICAN DRUGS.

Continuing his communication on Mexican drugs to the Brussels Royal Society of Pharmacy, Duyk describes two more, both toxic. The first "Yoyote," yielded by an Apocynaceous shrub, *The etia yocotli*, D.C., is a heart poison. The seeds contain, besides fixed oils, two toxic glucosides, tevetosin and tevetin, also a yellow colouring matter, pseudo-indican. The presence of the latter in the urine leads to detection of the poison, when taken internally. Tevetosin has been suggested as a substitute for digitalis in the treatment of cardiac disease. Externally it has been used in an ointment as an anodyne for hæmorrhoids. The second drug, *Tzompantle*, is derived from the Leguminous tree *Erytrina coralloides*, D.C., which bears poisonous seeds. These have a bright red shining perisperm, and yellow cotyledons. Altamirano has found in the extract of these seeds coraloidine, which causes convulsions; erytroidine, a powerful paralytant of the motor system; erytrosisin, an emetic; coralin and erytric acid. The extract of the seeds is suggested as a substitute for curare, and may be useful in the treatment of tetanus.—*Bull. Comm.*, **28**, 33, and *Bull. Soc. Pharm. Brux.*

NEW POMEGRANATE ALKALOID.

A liquid alkaloid from pomegranate root-bark has been isolated by A. Piccinni. In the preparation of methylgranatonine (pseudo-pelletierine) there remains, after crystallisation from petroleum ether, an oily mass, from which the author has recovered an oily alkaloid having the composition $C_9H_{18}ON$, which differs from the methylpelletierine of Tanret in that it is miscible with water. It is a tertiary alkaloid of a ketonic character, and possibly may be considered as a "nucleus homologue" of the hygrine of Liebermann and Cybulski.—*Pharm. Zeit.*, **44**, 870, after *Chem. Centralbl.*, **2**, 879.

VOL. 64. (FOURTH SERIES, VOL. 10.). No. 1550.

GROWTH OF THE POLLEN-TUBE.

B. Lidforss has made some interesting observations on the attractive force exercised by the secretion of the stigma on the pollen-tube, chiefly on *Narcissus tazetta*. No distinct influence on the growth of the pollen-tubes was exhibited by artificially prepared organic acids—formic, acetic, lactic, succinic, tartaric, malic, or citric—nor by amides, glucosides, or tannins; but the almost immediate effect of introducing into the medium a few grains of diastase was to cause a deflection of all the pollen-tubes towards the grains. The constituent of the diastase which produced this effect appeared to be the proteid. The classes of substances which attract pollen-tubes are chiefly two, carbohydrates and proteids, the most important food-materials of plants. This indicates that the movements of the apex of the pollen-tube are simply a search for food-material. Similar results were obtained with other plants.—*Ber. Deutsch. Bot. Gesell.*, **17**, 236.

RESIN IN THE LEAVES OF CONIFERS.

From a series of observations on a number of species belonging to the genera *Pinus*, *Abies*, *Picea*, and *Juniperus*, E. Schwabach states that in the young leaves the resin is formed in the resin-passages, and is from them excreted into the canal. In *Abies*, *Pinus*, and *Juniperus*, the walls of the epithelial cells do not thicken, and continue to pour out resin into the canal. In *Picea*, on the other hand, the walls of the epithelial cells begin to thicken in the first year, so that the cell-cavity often almost entirely disappears. The thickened membranes subsequently become absorbed.—*Ber. Deutsch. Bot. Gesell.*, **17**, 291.

RESISTANCE OF SEEDS TO MERCURY.

According to M. Casimir De Candolle (*Arch. Sci. Phys. et Nat.*, **8**, 517), grains of wheat which have been immersed in mercury for four years are still capable of germination, and have been found to produce normal plants.

ATROPINE IN DATURA SEEDS.

From observations made on germinating seeds of *Datura stramonium* and on growing plants, Dr. J. Thomann states that the greater part of the atropine contained in the seed is absorbed during growth, even when the culture is kept entirely free from bacteria and mould-fungi. He concludes, therefore, that the alkaloid is a reserve-food-material rather than a product of excretion.—*Bot. Centralblatt*, **80**, 461.

ENZYMES.

According to J. Grüss, the enzyme of *Penicillium glaucum* possesses the property of energetically splitting up cane-sugar, but has a less powerful action on starch and reserve-cellulose; it does not act as an oxydase. Malt-diastrase, on the other hand, does play the part of an oxydase; it acts energetically on starch, less powerfully on cane-sugar, and only very slowly on reserve-cellulose.—*Beih. z. Bot. Centralblatt*, **9**, 11.

SOLUBILITY OF COPPER IN GELATIN SOLUTION.

A. Lidof finds that when a spiral of bright metallic copper is suspended in an alkaline solution of gelatin, the liquid acquires a violet tint in twenty-four hours and becomes darker in a longer period, the copper rapidly losing weight, equivalent in forty-seven days to 3.4 per cent. When the violet solution thus obtained is heated under pressure, or is treated at ordinary temperatures with formaldehyde, it is decomposed, the precipitate thrown down being a compound of copper with organic bodies. To the formation of this soluble organic copper compound, the author attributes the so-called "biuret" reaction.—*Bull. Soc. Chim.*, **24**, 33, after *Journ. Soc. Physiol. Chim.*

DATURA ALBA (NEES) AS A SOURCE OF HYOSCINE.*

BY DR. O. HESSE.

In a paper by Frank Browne,¹ describing the medicinal use of the flowers of *Datura alba* in China, these flowers were stated to contain a considerable amount of alkaloid, having the characters of hyoscine, and yielding, on analysis, results agreeing with the formula $C_{17}H_{23}NO_3$, originally assigned to that base by Ladenburg in 1880.² Having already shown that this formula is incorrect, I was interested in making an examination of the alkaloid from *Datura alba*, and at my request Mr. Browne kindly provided me with a quantity of the flowers for that purpose. Hitherto only three kinds of *Datura* have been examined for alkaloids—viz., the indigenous *Datura stramonium*, the Indian *Datura fastuosa*, L., and the *Datura arborea* cultivated in Europe.

Geiger and Hesse obtained from the first-named plant a base which they named Daturine.³ It was afterwards found by Walz in the seeds of *Datura arborea*.⁴ Then v. Planta put forward the opinion that this datura alkaloid was identical with atropine,⁵ a view that was disputed by Schroff,⁶ Erhard,⁷ Pohl,⁸ and others; while E. Schmidt supported the identity of daturine with atropine.⁹ Subsequently Ladenburg described a sample of daturine supplied to him by E. Merck as being almost pure hyoscyamine, and another sample of crude daturine, distinguished by the name of "heavy daturine," and also obtained from E. Merck, was described as a mixture of hyoscyamine and atropine.¹⁰ When it is remembered that in the preparation of these alkaloids hyoscyamine may be very readily converted into atropine, there is not much difficulty in understanding that in one instance atropine should be found, while in another there was hyoscyamine, or a mixture of the two bases.

More recently Schutte has taken up the investigation of thorn-apple seeds,¹¹ and found that the alkaloid they contained was almost entirely hyoscyamine, with only a very small proportion of atropine and a very minute quantity of a third base that was considered to be hyoscine, and had previously been obtained from thorn-apple seed by E. Schmidt. Schutte gives this base the name of scopolamine, but it really was hyoscine.

Datura alba, which is abundantly cultivated as an ornamental plant in South Germany, was examined by Peinemann,¹² who found in the seeds, roots, and leaves, cultivated at Dresden, 0.541, 0.315, and 0.41 per cent. of alkaloid, while I found in the air-dried flowers of the plant cultivated at Stuttgart as much as 0.5 per cent. of alkaloid, and in the leaves and one-year-old stalks 0.3 per cent. The alkaloid I obtained was like that obtained by Peinemann, amorphous, and by precipitation with gold chloride it yielded a crystalline gold salt having a melting point of about 195° C. The quantity of material at my disposal was too small to admit of the exact nature of this base being ascertained, but it may be safely inferred that it consisted essentially of hyoscine, and was the same as the base obtained by F. Browne, in the state of gold salt, to the extent of 0.485 per cent., from Chinese datura flowers.

Operating upon a small portion of the flowers received from Browne, and containing 13.2 per cent. of moisture, I obtained 0.55 per cent. of alkaloid, which had the appearance of varnish, and showed no sign of crystallisation after being kept for a long time over sulphuric acid in a vacuum. I have reason to believe that the comb-like crystals mentioned by Browne (*P. J.* [4], 3, 197), were ammonium chloride.

The hydrochloric acid solution of the base was mixed with gold chloride, and the first fraction of the precipitate formed was in yellow laminae; that melted at 196° C. with considerable frothing. The second fraction had a similar appearance, and melted with decomposition at 197° C. The two fractions were mixed, and when recrystallised from hot water gave a salt that melted at 198°-199° C., and contained 30.84 per cent. gold, corresponding with the amount required by the formula $C_{17}H_{21}NO_4 \cdot AuCl_4H$, 30.63, while the gold salt of an alkaloid having the formula $C_{17}H_{23}NO_3$ would require 31.31 per cent. gold.

The mother liquor from the second fraction of gold salt gave a further precipitate consisting of granular aggregations of laminae, which, after shrinking in bulk at 187° C., melted at 195° C. with frothing, and were evidently a mixture of the gold salts of hyoscyamine and hyoscine. On evaporating the filtrate from the last precipitate a few crystals were obtained, presenting much resemblance to the atropine gold salt, and melting at 142° C., after shrinking in bulk.

From the results of this preliminary examination the alkaloid obtained from the datura flowers appeared to consist chiefly of hyoscine, probably some hyoscyamine and a little atropine. In the preparation on a large scale by a suitable method special attention required to be given to avoiding any alteration of the bases present. For that purpose the flowers were extracted with ether under a reflux condenser, and in that way four-fifths of the alkaloid present could be obtained without the addition of any basic substance. The ether solution was shaken out with dilute sulphuric acid, the acid solution again shaken out with chloroform and ammonia; the chloroform solution, washed with water and then evaporated, left the alkaloid in the state of a brownish syrup.

The partially extracted material was then moistened with a solution of sodium bicarbonate, and when extracted with ether as before it yielded a further quantity of alkaloid, which was found to be of essentially the same nature as the first quantity, so that in subsequent operations the powdered leaves were at once treated with an alkaline solution before being extracted with ether, etc. The temperature at which that operation was conducted was from 25° to 30° C.

The extracted alkaloid was neutralised with hydrobromic acid, and when the clear filtered solution, evaporated to a small bulk, yielded a tolerably abundant crystallisation, strong alcohol was added, the crystals separated, washed with alcohol, and then recrystallised from hot, strong alcohol.

The crystallised hydrobromide contained in two portions from 5.7 to 8.5 per cent. of water, and the optical rotation of each in water solution was $[\alpha]_D = -25.57$ and 25.90 .

On recrystallisation from water the salt was obtained in fine, large, perfectly colourless rhombic crystals, having the same faces as Fock¹³ observed in hyoscine hydrobromide. These crystals effloresced readily in dry air, and lost the whole of their water of crystallisation when exposed in a coarsely powdered state over sulphuric acid at the ordinary temperature. The melting point of the perfectly dehydrated salt was found to be 192° C. in Roth's apparatus.¹⁴ The loss of weight in drying was 12.69 per cent., and the quantity of silver bromide yielded by the dry salt was 20.84 per cent., these results corresponding with the formulæ $C_{17}H_{21}NO_4 \cdot HBr + 3H_2O$ and $C_{17}H_{21}NO_4 \cdot HBr$, which have already been given as representing the composition of these salts.¹⁵

For the hydrobromide containing three molecules of water the value of $[\alpha]$ ¹⁶ was then given as -22.05 ,¹⁷ consequently for the

anhydrous salt it would be $25^{\circ}66$, and for the salt now referred to it was found to be $25^{\circ}86$, so that the absolutely pure salt has a slightly higher rotatory capacity than was hitherto observed.

The watery mother liquor from which the first hydrobromide crystals had been separated were evaporated to a small bulk, and when left for some time, dried up, leaving only a varnish-like residue. The salt was therefore converted into chloride by digestion with silver chloride, and this solution precipitated in fractions with gold chloride. The first fraction was brownish, and aggregated to a reddish brown resinoid mass that was not further examined. The following fractions were crystalline, and, as they did not appear to differ, gold chloride was added until no further precipitate was formed, the whole precipitate heated being with water to the boiling point, and the solution then filtered. On cooling an abundant deposit of crystalline laminae separated, which was again recrystallised from hot water, and thus separated into three portions. The largest melted at 196° - 198° C. with frothing, and was therefore hyoscyamine salt; another melted at 156° - 160° C., and was apparently hyoscyamine salt; while a third melted at 137° C., and was obviously atropine salt. Each of these three fractions, recrystallised from hot water, were respectively found to have a melting point of 198° C. (frothing), 158° , and 138° C. Dried at 100° C. they gave respectively 30.53, 31.55, and 31.65 per cent. gold, the calculated amounts being for hyoscyamine 30.63, and for hyoscyamine or atropine 31.31 per cent.

The alcoholic mother liquor obtained in recrystallising the hydrobromide from alcohol, yielded on evaporation some crystals which were washed with alcohol, and when converted into chloride gave a gold salt melting at 198° C. with frothing, and was, therefore, hyoscyamine salt. The mother liquor from the crystalline hydrobromide yielded in the same way a gold salt melting at 192° C. with some sign of frothing, and when once recrystallised from water melted at 198° - 199° C. From the mother liquor of this gold salt a few crystals were obtained on evaporation which melted at 187° and frothed at 195° , so that in the first crystallisation the hydrobromide salt retained small proportions of the alkaloids associated with hyoscyamine.

The further examination of the datura alkaloid obtained in largest amount, and of its gold salt, was then undertaken for the purpose of demonstrating that its composition was not $C_{17}H_{23}NO_3$ but $C_{17}H_{21}NO_4$.

The water solution of the hydrobromide was mixed with excess of potassium carbonate solution, and shaken out with chloroform; the chloroform solution, washed with water and evaporated, left a colourless varnish-like residue that was perfectly liquid at 55° C. This was dried at 80° C. until constant, and when analysed gave results agreeing with the formula $C_{17}H_{21}NO_4$.

The hydrobromide was converted into chloride with silver chloride and the solution precipitated with gold chloride; the gold salt thus obtained recrystallised from boiling water in large toothed laminae, melting at 198° - 199° C., with frothing, and yielding 30.56 per cent. gold.

Further proof that the datura alkaloid has a composition represented by the formula $C_{17}H_{21}O_4$ is afforded by its conversion into atropic acid and oscine, when heated with hydrochloric acid to 100° C., as shown in the following equation—

The formation of atropic acid being preceded by the formation of tropic acid.

In other respects the characters of this datura alkaloid agree with those which I have previously described as belonging to Ladenburg's hyoscyamine, and the following supplementary details may be added.

The alkaloid then referred to was obtained only in an amorphous condition, having the appearance of varnish and becoming liquid at 55° C. Meanwhile Luboldt has stated that the base named scopolamine, and described by E. Schmidt as the chief constituent of what was known as hyoscyamine, could be obtained without difficulty in crystals¹⁸. For that purpose a water solution of the hydrobromide was to be made alkaline with potash and shaken out with chloroform. The syrupy residue left on evaporating the chloroform solution was then to be dissolved in a little ether and a small quantity of water, corresponding to the calculated amount of water of crystallisation, added, the turbidity thus caused removed by the addition of a little absolute alcohol and a few crystals then dropped into the solution to promote crystallisation.

I have found that this proceeding is always effectual when applied to Luboldt's scopolamine hydrobromide, even without the addition of crystals, but when applied to the datura alkaloid now referred to no crystallisation takes place.

As the result of numerous observations extending over several months I have come to the conclusion that hyoscyamine is perfectly amorphous and incapable of crystallisation. Moreover, it is readily soluble in water, at 18° C. to the extent of 1 in 9, and even at 15° to the extent of 1 in 9.5. The solution has a strong alkaline reaction, and on the addition of concentrated potash or soda the base is precipitated almost entirely as an oily liquid.

This great solubility of hyoscyamine in water affords means of ascertaining whether the base undergoes alteration in its rotatory power when it is separated from the hydrobromide by potassium carbonate. For that purpose 1.412 gramme of the salt was dissolved in water, the solution mixed with excess of solution of potassium carbonate and shaken out with chloroform. The chloroform solution, washed with water, filtered and evaporated to a small bulk, was finally turned into a glass dish to get rid of the chloroform, and the residue dried at 55° C. The quantity of anhydrous base obtained was 0.959 gramme, as against the calculated quantity 0.970. This was dissolved in water and diluted at 15° C. to 25 C.c., so that p was 3.836 at that concentration and $t=15^{\circ}$; the value of $[\alpha]_D$ was $-24^{\circ}3$. Comparing that result with the rotatory power of the anhydrous hydrobromide under the same conditions, the result would be for the alkaloid:—

$$[\alpha]_D = -\frac{25.86}{303} \frac{384}{1} = -32^{\circ}77$$

Hence it might be thought that this result showed there was some reduction of rotatory power when the alkaloid was separated by the action of potassium carbonate. The solution was therefore evaporated down again to ascertain the actual quantity of alkaloid present in it, and this was found to be 0.886 gramme. It was then dissolved in dilute hydrobromic acid, so that the solution had a very slight acid reaction, and when diluted at 15° C. to 25 C.c. $[\alpha]_D$ was found to be $-33^{\circ}1$ with $p=3.544$, or rather more than was calculated for the alkaloid in the hydrobromide, the excess being probably due to the slightly acid condition of the solution. The solution was then evaporated at a low temperature, and it deposited fine, clear crystals of the hydrobromide, which, when dissolved in water at 15° , gave $[\alpha]_D -25^{\circ}0$ in relation to anhydrous salt. These experimental results serve to prove that when hyoscyamine is separated from its salt by means of potassium carbonate it does not undergo any alteration.

That result might also have been foreseen because the alkaline bicarbonate which was in the first instance used for separating the alkaloid must have been for the most part converted into monocarbonate by the long-continued heating to 25° or 30° C. for the purpose of extraction, and if the optical activity of hyoscyamine were really influenced by potassium carbonate the hydrobromide salt obtained would have had less action on polarised light than hydrobromide which had not been so altered. Hence it follows that when potash or soda is used in the preparation of hyoscyamine this base does not undergo any sensible alteration. That conclusion is in satisfactory

¹⁸ *Ibid.*, 230, 12.

agreement with the observation of E. Merck that hyoscyne hydrobromide obtained from henbane always has a rotatory power deviating but little from 24° - 25° .¹⁹

On a previous occasion I have shown that the commercial salt called scopolamine hydrobromide is a mixture consisting of hyoscyne salt and atropine salt. When the basic constituents of this mixture are separated and, after evaporating to the consistency of syrup, some water is added, by exposure for a time to a temperature of 5° C., atropine crystallises out, which has a composition represented by the formula $C_{17}H_{21}NO_4 + 2H_2O$, and according to E. Schmidt this inactive alkaloid is very readily formed from hyoscyne by the action of silver oxide or a little caustic soda.²⁰

Applying my experience of the preparation of atropine to the treatment of the hyoscyne obtained from *Datura alba*, I mixed a water solution of 2.5 grammes of the hydrobromide with moist silver oxide, separated dissolved silver from the filtered solution by hydro-sulphuric acid, evaporated the clear liquid, and left it to crystallise. At the same time an equal quantity of the commercial scopolamine salt was treated in the same manner. In this latter case there was very soon a crystallisation of atropine; but in the former case no crystals were formed, although the sides of the basin were rubbed with a glass rod. After the lapse of five months the experiment was given up as hopeless. For further trial a solution of 3 grammes of the hydrobromide from datura was made alkaline with sodium bicarbonate and shaken out with chloroform. After evaporating the chloroform solution the residue was dissolved in water, a drop of caustic soda added, and the whole left in the exsiccator until syrupy. It was then exposed to the air, frequently moistened with water, and stirred with a glass rod; but after the lapse of five months there were no crystals, while the commercial scopolamine salt treated in the same way yielded an abundant crystallisation of atropine in the course of a few days.

The alkaloid obtained from hyoscyne hydrobromide in both instances above mentioned was then mixed after this long exposure, and the rotatory power of a water solution determined: with $p=7.5$ and $t=15^{\circ}$ C. $[\alpha]_D$ was $-15^{\circ} 3$. In this case there had been a reduction of the rotatory power, which was probably caused by the long-continued action of light. At the same time it may be mentioned that the hydrobromide salt of this alkaloid did not undergo any alteration of its rotatory power when exposed to the action of light for the same time, either in the state of crystals or in solution. The effect produced by exposure of the free alkaloid to light will be further investigated, but it may be positively stated that under the conditions above described there is no conversion of hyoscyne into atropine.

Lastly, in regard to the relative proportions in which these bases are present in the flowers of *Datura alba* the hyoscyne amounted to 0.51 per cent. hyoscyamine to 0.03, and atropine to 0.01 per cent., so that the hyoscyne amounted to 92 per cent. of the total alkaloid present. This observation is, in my opinion, of considerable practical importance. Hitherto hyoscyne has been obtained only from henbane and from scopolia roots; from the first-named material it may be prepared with comparative ease, since it has only to be separated from hyoscyamine, which constitutes 70 or 80 per cent. of the total alkaloid, amounting to about 0.25 per cent. In the case of the wild growing scopolia root the case is different, especially with *Scopolia atropoides*, containing about 0.4 per cent. of alkaloid, of which only 0.03 is scopolamine according to Luboldt,²¹ and as I have previously shown, that is really a mixture of hyoscyne with atropine, sometimes perhaps a mixture of three different alkaloids, whose composition is represented by the formula $C_{17}H_{21}NO_4$. But how far such a mixture is admissible as a medicinal agent cannot well be determined when the action of its several ingredients is unknown. Generally speaking, good results

have been obtained with scopolamine in ophthalmic practice, but I have known the contrary to be the case, and very serious results were apprehended.

Luboldt found the rotatory power of scopolamine hydrobromide prepared by Gehe (anhydrous) $-14^{\circ} 58'$ or $14^{\circ} 97'$, while that of a similar salt prepared by G. Merck was $-13^{\circ} 47'$. Assuming that the salt consisted—as I have actually found to be the case—of hyoscyne and atropine, it would, with a rotatory power of $-14^{\circ} 97'$ contain 58 per cent. of hyoscyne salt. That would reduce the amount of actual hyoscyne in scopolia root to 0.0174 per cent., or about 4 per cent. of the total alkaloid present in that material. That circumstance alone would make the preparation of the alkaloid very difficult. In addition, the separation of hyoscyne from its isomers is practically impossible, and hence it may be understood why the commercial scopolamine salt is not pure hyoscyne. On the contrary, the flowers of *Datura alba* yield hyoscyne of excellent quality, and it is probable that the purer product from that source will supersede the mixture known by the name of scopolamine salt.

GOLD AND GOLDBEATING.*

BY G. H. C. ROWLAND.

Pharmacists are interested in the familiar goldbeater's skin, and occasionally, even yet, the once common direction to roll pills in gold leaf is to be met with. One day I met a citizen of Edinburgh who, I found, was engaged in the "art and craft" of goldbeating. Thinking some details of the process would interest pharmacists, I arranged to visit this gentleman's works, and met him for that purpose one night in one of the most historic spots of the old town of Edinburgh, and was conducted to the old Wynd, where this ancient art is still carried on.

Goldbeating is of great antiquity, being referred to by Homer (1,200 B.C.) and Pliny (23-79 A.D.). The latter states that 1 oz. of gold was beaten to 750 leaves 3 inches square, about three times the thickness of the present average. Gold was largely used by Solomon, when, doubtless, a great deal of gold leaf was used for covering purposes. The art appears to have originated among Oriental tribes, and in India is still practised under conditions involving many mysteries and great difficulties. On the coffins of the Theban mummies specimens of original leaf gilding occur where the leaves are so thin as to resemble modern gilding. The Incas of Peru appear only to have been able to reduce gold to plates which were nailed for ornamentation on the walls of their temples.

Gold-beating was confined to London in this country till well within the present century, and even yet is principally centred in that city. It was introduced into Scotland about 1860. At one time there were four goldbeaters in Edinburgh, but only two remain. The industry is declining owing to foreign competition. Gold for the purpose of beating is principally obtained from the refiners in Sheffield, Birmingham, or London, and is granular in appearance. Fine gold is commonly supposed to be incapable of being reduced to thin leaves. This, however, is not so. Its use for ordinary purposes is undesirable because of the greater cost and the fact that leaves of pure gold tend to adhere to one another. It is preferred for outside work because it does not tarnish. The Albert Memorial, in London, and some other statues are covered with pure gold. The fine gold is alloyed before using according to the colour required. There are ten degrees of colour—namely, red, pale red, extra deep, deep, citron, yellow, pale yellow, lemon, green or pale, and white. The proportions of alloy for the shades in common use are: For red, 18 grains copper to each ounce; pale gold, 5 dwt. of silver; deep or medium, 12 grains copper and 12 grains

* Read at a meeting of the Edinburgh Chemists, Assistants', and Apprentices' Association. (See p 270.)

silver. Pure gold is seldom required, and the same applies to double gold—that is, double the usual thickness. The deep or medium is that mostly used. Foreign leaf is thinner than British, and contains more alloys. The chief use of gold leaf is in the bookbinding and allied trades. Picture and mirror frame makers and gilders and decorators also use large quantities. One thousand books of gold leaf were used in decorating the interior of the Edinburgh University Library. The cross on the summit of St. George's Church, Charlotte Square, is covered with double gold. A proposal was made to cover the whole dome, but the estimated cost, £1,700, caused the dropping of the scheme.

The first stage in the process of gold-beating is to melt the gold in an earthenware crucible with the requisite amount of alloy, at a temperature higher than the fusing point, so as to increase its malleability. This is then cast into an ingot 3 in long and $1\frac{1}{4}$ in. broad. When cool, the ingot is rolled between powerful steel rollers, which are gradually tightened. After it has passed through half-a-dozen times it requires to be annealed. It is then passed through the rollers twice and again annealed, and this is repeated six times. The ingot of 3 ins. has, at the end of this operation become a ribbon 20 yards long, and about the thickness of ordinary note paper. The width remains the same as extension takes place only in one direction. This ribbon is divided into two 10-yard lengths each weighing about 3 ounces, and constituting a "piece" of work for one man.

The beater marks off the "piece," and with a pair of shears divides it into 180 smaller pieces. Each of these is placed separately into a tool called a "cutch," with a piece of skin or membrane about 3 ins. square between each, and the whole is enclosed in two membranous bands. This is placed on a block and beaten for half-an-hour with a wooden hammer weighing about 17 pounds, the labour being considerably reduced by the elasticity of the skin causing the hammer to rebound. At the end of this time each piece of gold foil, originally about 1 in. square, will have extended to the edges of the membranes, and is taken out leaf by leaf, and each quartered so as to give 720 pieces.

Each of these 720 is placed in a tool called a "shoder," which is similar to the "cutch," but the skins are considerably finer and 4 ins. square. This is hammered for about two hours, until the gold again reaches the edge of the skins. The leaves are taken out and again quartered, giving 2,880 pieces.

The next tool is called a "mould," and is made up of the finest skins. A full "mould" contains 950 skins 5 ins. square, so that three such tools are required for the 2,880 leaves resulting from the previous operations.

The skins or membranes which comprise the "mould" are about double the thickness of the goldbeater's skin as met with in pharmacies. Like the previous tools, they are prepared in France from the outer coat of the cœcum or blind gut of the ox, the gut of 380 oxen being required to furnish sufficient skins for one mould. The gut is first stripped off in lengths of 25 to 30 ins., freed from fat by dipping in caustic potash solution and scraping with a dull knife, and stretched on a frame. Two membranes are glued together, treated with a solution of aromatic substances or camphor in isinglass, and coated with yolk of egg. The price of a "mould" is sometimes as high as £10 10s. It will stand years of beating before being relegated to the pharmacist to be cut up and sold as goldbeater's skin. Many substitutes have been tried for this gut, but none have been found successful.

The beating of the gold in the "mould" occupies five hours, and this is the most difficult stage in the process, the thinness of the gold leaf depending on the fineness of the skins and the judgment of the workman. At the end of two hours, when the gold is about $\frac{1}{150000}$ part of an inch in thickness, it permits the passage of a ray of light for the first time, the transmitted light being green, or, if

much silver is present, violet. Some leaves when heated transmit ruby red light. For some time at the commencement of the beating the blows are necessarily struck in the centre of the skins. This produces heat, which tends to curl up the skins, as a hot iron does in plaster spreading. This must be carefully guarded against, and occasionally the beating must be suspended for a time. As the leaves extend in size the beating is more generally distributed, and this lessens the danger of heating. At the end of five hours the leaves are taken out, and each is cut on a cushion with an instrument called a waggon, the cutting edges of which are simply split rattan canes. The usual size is about $3\frac{1}{4}$ inches square. The leaves are now ready for putting up in the familiar tissue paper books, twenty-five leaves being the usual number to each book. The leaves of the books are previously dusted with rouge to prevent the gold sticking to the pages. Transfer gold, which is used for outdoor work, is simply ordinary gold leaf pressed on to sheets of tissue paper so as to adhere, but readily coming away when pressed on to a varnished surface, thus enabling outdoor work to be carried on even in windy weather.

Between each time of using each membrane of the "mould" requires to be separately cleaned, each side being brushed with tale by means of a hare's foot. It is afterwards put in a hot press to remove damp. The degree of dryness is very important. If the membranes are not sufficiently dry the leaves of gold do not extend evenly, and over-dryness diminishes the brilliancy of the gold.

The limit to which gold has been beaten in the manner described is 1 grain to 75 square inches. Taking the cubic inch of gold as 4,900 grains, this gold leaf is $\frac{1}{367650}$ part of an inch in thickness, or about 1,200 times thinner than ordinary writing paper. One grain of silver has been beaten to 98 square inches, but, owing to difference in specific gravity, the leaf was thicker than the gold leaf. This experiment does not determine the malleability of either metal, as the means of testing it failed before there was any appearance of the limit of malleability of the metals being reached. In practice gold is not nearly reduced to such a degree of thinness as the above.

Many attempts have been made to beat gold by machinery, but without success. The practised eye and the skilled hand seem indispensable.

EXTRACTS FROM CONSULAR REPORTS.

A COPPER SULPHATE TRUST, formed by the British and American copper mine proprietors during last year, caused a rise in the price of copper sulphate; so much so, that it is stated to have created a great sensation among Italian agriculturists, who use it largely for the vines. Several substitutes are said to have been suggested, such as copper acetate, a mixture of lime and colophony, and a mixture of copper sulphate, sodium carbonate and lime; but all appear to have proved either more expensive or inefficient. A mixture consisting of equal proportions of copper sulphate and lime and a combination of sublimate and ground sulphur, equal parts, are stated to have given satisfactory results. There are a number of copper sulphate manufactories in Italy, but the demand being greater than the supply, a very large quantity is imported every year, chiefly from Great Britain.

THE CHEMICAL COMPOSITION of the sweet and salt sands of Venice, combined with some climatic influence, was at one time thought to be so essential in the manufacture of glass beads as to prohibit the possibility of them being made elsewhere than in Venice, which was formerly the only place where beads were made. Manufactories now exist, however, in France, Bohemia, and Antwerp. Still, there are at present over three thousand men employed in the industry in Venice, the exportation in 1898 being 639 tons, valued at £144,362.

THE PUBLIC PHARMACY of the Seychelles Islands it was originally anticipated would pay its way. But according to the report of Acting-Administrator Brown, the gross amount of the sales of drugs during 1898 only amounted to Rs. 1,782 85 cs., as against Rs. 2,000 estimated. The cost of maintaining the pharmacy amounted to Rs. 1,120, being the dispenser's special allowance for attending to the sales. Thus, instead of paying its way, the pharmacy was worked at a loss.

THERE IS AN EXCELLENT OPENING in Portugal for British enterprise. Such, at least, is the opinion of Mr. Harrison, commercial attaché to her Majesty's Legation at Lisbon, who states in a recent report that a Portuguese industry well worth the attention of Englishmen is the manufacture of olive oil for the European markets. Portugal is an important olive-growing country, and nearly 26,000 hectolitres of olive oil, valued at £72,000, were exported in the year 1898. The manufacture of the oil is, however, so indifferent that, in spite of the large demand for olive oil, less than 1,000 lectolitres was consumed in Europe, the rest being exported to Brazil and the Portuguese colonies. On the other hand, imported olive oil is used to a large extent in Portugal, Italian oil valued at about £6,000 being imported in 1897. Given facilities for the proper preparation of the oil, the British trade alone, it is anticipated, could be depended upon for a large consumption.

IN THE EXPORT OF GUMS AND RESINS from the Somali coast a considerable decrease is reported for the year 1898-99. At Berbera the decrease was 3,352 $\frac{3}{4}$ cwts. in quantity, and Rs. 78,977 in value, as compared with the corresponding period of the previous year. At Bulhar there was a falling-off of 395 $\frac{3}{4}$ cwts. in quantity and Rs. 9,734 in value. The decrease is alleged to be due to the falling-off of price in the ports and less demand from Europe. Gum arabic is stated to have sold at Rs. 20 to Rs. 24 per cwt., and gum myrrh at from Rs. 26 to Rs. 30 per cwt. The trade in these gums is said to be fluctuating, the supply varying with certain climatic conditions, a wet year being less productive than a dry one.

A SPECIES OF ALOE, the *Sanseveria ehrenbergii*, which grows in profusion over many parts of the Somali Coast Protectorate, produces a fibre that is used all over the country by the natives to manufacture the ropes they require for loading their canels. The qualities of the fibre have attracted attention in the United Kingdom, and it is stated that a British firm has taken the matter in hand, there being every hope that the industry will be developed.

THE IMPORTATION OF DRUGS, CHEMICALS, AND COLOURS into Servia in 1898 was valued at £52,814, or £5,035 less than in 1897. Of the total Austria-Hungary furnished to the value of £39,174; Germany, £8,247; Great Britain, £1,433. Chemicals and drugs amounted to £17,844, or £2,184 less than the previous year. Made-up drugs and medicines, £18,870, an increase on the import of 1897 of £2,146. Dyes, £16,100, a decrease of £4,997. The importation of raw colours fell off by half, the total value being £4,388. During the first nine months of 1899 the importation under the above general heading was valued at £66,733, an improvement on the corresponding period of 1898 of £29,426.

THE P. A. T. A. IS NOT REQUIRED in Servia, so far as the sale of "patent" medicines is concerned, as the Servian Government claims the right to fix the price of all such medicines sold in the country. Special attention is directed to the foregoing fact by Consul Macdonald, who also points out that in addition to "patents," the sale of made-up drugs is regulated by the internal sanitary laws of Servia, which require an official analysis and licence,

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

Possible Good out of Evil.

Looking at the matter without prejudice, one is forced to the conclusion that the Government is unwittingly doing pharmacists good service by responding with a blank negative to the request that companies carrying on business as chemists and druggists should be compelled to submit to the same legal restrictions as individuals engaged in that occupation. For such, in brief, is what our representatives have been deputed to ask the Government, after explaining the injustice of the position that a combination of individuals—who are totally devoid of the necessary qualification—may secure the practical equivalent of registration under the Pharmacy Act by forming themselves into a limited company and so putting themselves outside the law, while individuals are compelled by Statute to qualify themselves in certain ways prior to securing that registration which alone entitles them to practise pharmacy without restriction. But unanimity has been lacking among us, with the almost necessary result that our case has not been presented half so forcibly as it might have been. We have spent precious months in academic discussions as to what the Government ought to do, what would constitute an ideal state of affairs, and in deploring the assumed neglect of our predecessors. That waste of time in misapplied activity, and in doing everything but unite together to make the vigorous effort which alone is likely to prove effective in securing any remedy for existing grievances, has permitted things to come to their present pass. But now the blow has fallen, and we know that the Government is indisposed to do anything whatever in the direction of effecting the reforms we have long considered necessary. That, however, as I have already suggested, will not be an unmixed evil if the more or less immediate result is to make clearly manifest to ourselves the danger which attends disunion, and the folly of "crying for the moon" without taking practical steps to attain to the possession of that luminary, or some reasonable substitute for it.

The Parting of the Ways.

We are, as it appears to me, at the parting of the ways, and it is at present incumbent upon us to decide, in case of need, what we are prepared to sacrifice for the sake of our chosen profession—comfort, leisure, or perhaps even some of our most cherished prejudices regarding our so-called privileges and rights. It may not be amiss if, for the benefit of the younger generation, I venture to occupy a little space with a very brief statement of what the steps were which led directly to the existing pharmaceutical position in regard to legislation. It is just fifty years since the then vague and nebulous ideas concerning the establishment of a recognised pharmaceutical qualification began to crystallise and assume definite form, the immediate predisposing cause being the announcement that the Government proposed to introduce a Sale of Arsenic Bill. Such a measure became law in 1851, and during the same Session of Parliament Jacob Bell secured the second reading of the first Pharmacy Bill. That Bill proposed originally to make it unlawful for any unregistered person to exercise the business, or use the title, of pharmaceutical chemist unless he were duly registered, but when the Bill passed during the following year the restriction of the right to carry on the business was omitted, as it was held to be incompatible with the principles of free trade. A similar fate befel all subsequent attempts to restrict the dispensing and sale of medicines to duly qualified persons, and finally, of all that the leading pharmacists of the day endeavoured to secure, the protection of titles alone remained. But, in deference to public opinion, the Government was compelled to do something in the direction of restricting the sale of certain poisons, and so the Pharmacy Act of 1868 was made to serve the dual purpose of protecting the public safety in the matter of retailing poisons, and of establishing a professional

qualification. But nothing was done in the way of regulating the practice which required that qualification, and it is a great wonder to me how the Act has borne the strain of years, and endured the extreme wear and tear so long.

The Present Danger.

At present the Act seems nearer breaking down than at any previous period, its most important provisions having been interpreted in a sense that could never have suggested itself to those who drafted the measure, and serious flaws having been detected where they were never anticipated. The qualification of the individual chemist is threatened, and there is a grave risk that nothing but restriction of the sale of poisons will remain. Regarding the latter, we pharmacists need not concern ourselves in the least, for the Government will be compelled, in any event, to preserve and even increase that restriction. But the question of qualification is another matter altogether, affecting ourselves alone directly, and we must needs be prepared to fight for the retention of the position assured to us as individuals, the more especially as it bids fair to be a struggle for our very existence as a specialised class. Neither the Government, nor the medical profession, nor yet the British public, is likely to care in the least whether the value of our qualification remains what it ought to be or not; the matter, as I have just said, is almost entirely a personal one with us, and we must be prepared to bear the brunt of warding off attacks upon our position. In doing so, we must face an almost inevitable problem; we must be prepared to decide what we consider of least importance and, therefore, what we should be most disposed to sacrifice in case of extreme need. I assume, of course, that our leaders intend to act on the principle of no surrender at the outset, and only to make concessions in the last resort. But, on the other hand, I cannot conceive it as being even remotely possible that any among us is willing to agree to the wholesale surrender that would be implied by acceptance of the Lord Chancellor's clause, which now constitutes part of the Companies Bill.

A Possible Basis for Compromise.

What, then, could we afford to relinquish, assuming that we must submit to some legalisation of the existing state of things? In my opinion, the answer is not far to seek, for, as holders of a professional qualification, we can best afford to give up what accords least with the idea of professional practice and savours most of restraint of trade. Our titles must be regarded as sacred and their possession by individuals, as well as the exercise of the functions to which they imperfectly relate, as an inalienable right; our general practice, unfortunately, is in an inchoate and ill-defined condition, except as regards the sale of poisons, while that in itself cannot be regarded as being, in any sense, part of a strictly professional practice. Why not, then, attempt, if necessary, to improve our professional position at the expense of the trading side? Companies have now got such a grip upon the sale of poisons that the Government seems disposed to consider they have acquired a vested interest in that business, and if we delay much longer they will have secured an equally strong hold upon our titles. We must, in any case, beat them off in the latter respect; but if nothing less will serve, we might perhaps acquiesce in their continuing to retail poisons, so long as they were not permitted to compound or dispense. In other words, it might be expedient to relinquish the shadow represented by the restriction of the mere sale of poisons, if we could but secure the substance represented by the undisputed right to exercise our purely professional functions of compounding and dispensing medicines. Neither pharmacists nor companies would suffer appreciably if such a bargain could be struck, our position would be vastly improved, and the public would reap the benefit. Here, in fact, I think, is a basis for compromise that has not yet been presented, and it possesses a pleasant savour withal.

POLITICAL GOSSIP.

JUSTICE FOR INSPECTORS.—The point in Mr. P. Thornton's Public Health Bill seems a very reasonable one—in fact, it simply illustrates another phase of the unqualified control question. The duties of a sanitary inspector practising under the official ægis of the Local Government Board are varied, responsible, and important, ranging from curing smoky factory chimneys to prosecuting hucksters for dealing in sophisticated drugs or putrid table delicacies. He is the mainspring of the administrative machinery of the Food and Drugs Acts, the Margarine, Horseflesh, and a number of similar statutes having for their object the conservation of the national health; and it seems necessary, therefore, that he should be possessed of certain Crichton-like faculties and attainments. As a matter of fact, sanitary inspectors are required, under the Public Health Act of 1891 (applicable only to the metropolis), to have certain qualifications of a fairly high standard; yet they are subject to the control of parochial authorities constituted of men who may have very excellent grounds for not being able to appreciate activity in an inspector. Outside London the position is rather worse. Local authorities are largely composed of builders, owners of speculative house property, shopkeepers, or manufacturers, and they have absolute power to dismiss or to decline to appoint a good man—in fact, they may bluff the public by filling up the appointment with a complacent or an incompetent individual who may be trusted not to interfere unduly with vested—*i.e.*, local—interests. Mr. Thornton's plan for improving this condition of affairs is to make the provisions of the London Act of 1891 respecting the qualification, appointment, duties, salary, and tenure of office of district medical officers, applicable to sanitary inspectors all over England and Wales. Thus it would become impossible for a sanitary inspector to be removed from office by an Urban Sanitary Authority without the consent of the Local Government Board. Scotland and Ireland are already provided with safeguards in this direction, but up to the present anything has been deemed good enough for England and Wales. It is not at all a certainty that the reform is in sight now, for Mr. Thornton is only a private member, and the legislative efforts of private members are not proverbially crowned with success.

THE DANGER of a little political knowledge, more especially when it is paraded with much flourishing of self-blown trumpets, has been well demonstrated recently by a trade journal which periodically lays claim to pharmaceutical omniscience. The publication in question last week gave as a piece of "Westminster Wisdom" the announcement that Mr. T. P. O'Connor had "blocked" the Companies Bill. The honourable gentleman has done no such thing. He has, however, placed a blocking notice against Mr. Begg's Companies Acts Amendment Bill, which is by no means the same thing. The error did not end with the Parliamentary reporter, for he appears to have deluded his editor into writing a leading article on the information, and talking glibly about Government measures not being taken after twelve o'clock if they are opposed. Of course, even the Macaulayan schoolboy knows that, by the rules of the House, no Government business is ever taken after twelve unless a motion has been specially made and passed to suspend the Standing Orders. It should be pretty obvious that official Bills cannot be retarded like private members' Bills, for what becomes of the ministerial majority if ministers cannot take their own programme at the time they appoint? It is not a commendable practice to point the finger of scorn at those who show their humanity by falling into error; but, when a trade journal has a tendency to pose as the one true guide, philosopher, and friend of the trade, it appears fitting to pen a reminder that political infallibility cannot well be maintained on superficial knowledge.

DRUG COMPANIES—that is to say, limited liability concerns carrying on business as chemists—are evidently persuaded that in politics, as in love or war, nothing can be deemed to be unfair. The latest move of one of the best known of those companies is to order each qualified employee to write in his own name, and on private letter paper, to his Parliamentary representative, urging him to oppose any amendment to the Companies Bill relating to pharmacy. No one can deny the right of the directors of a company to defend their interests, but it looks uncommonly like intimidation to ask their qualified managers, with every show of spontaneity, to destroy the last vestiges of cohesion in their calling. No doubt a number of these letters have been written and despatched, for a request from a director is a thing to be obeyed unless one is prepared to undergo unpleasant consequences; but members of the House of Commons who receive such communications should know that they are utterly worthless as expressions of opinion, inasmuch as the writers are not free agents. Even the form of words to be used by the poor victims have been concocted by the managing director or his co-directors and, after having been typed and duplicated, have been served on the branch managers like so many writs. These tactics very forcibly show the ease with which Parliamentary opinion can be manufactured, but they should also reveal to members of the Society the proper means of destroying the effect of the trick; for if it can be shown to local M.P.'s that they are being used as cat-paws to capture chestnuts for "cash chemists," the smart device of the enemy will work out its own condemnation.

DR. TANNER has joined the number of those who do not like the Hon. A. de Tatton Egerton's Midwives Bill, and he has followed the lead of his friend Mr. T. P. O'Connor by placing against it a motion that it be read a second time upon this day six months. Some curious statistics have been gathered by the *Lancet* as to the attitude of medical men towards this Bill, from which it would appear that the proposals of the Member for Knutsford do not commend themselves to the professional mind. Of 6,299 practitioners who responded to the *Lancet's* invitation to express their convictions only some 1,311 are in favour of the Bill—a mere handful—whilst nearly 4,000 are agreed in thinking it unnecessary or pernicious, though they are not agreed as to what is desirable or proper. A further 600 expressed utter indifference in regard to the subject, and the remainder had various notions which made classification difficult. Evidently there is a healthy independence of thought among the doctors relative to the registration of midwives.

THE BUDGET, or, to speak by the card, the Chancellor of the Exchequer's Financial Statement in Committee of Ways and Means, was disclosed suddenly and mysteriously on Monday, after two days' notice only. The unexpected presentation of the Budget proposals was a subtle device of the Chancellor to checkmate the commercial acumen of dealers in excisable articles, who had already commenced to anticipate the increased duties to the detriment of the Revenue of the ensuing year. The new imposts are as follows:—

Income tax, increased by 4d. to 1s. in £.	
Tea	„ „ 2d. per lb.
Tobacco	„ „ 4d. „
Cigars (foreign)	„ „ 6d. „
Spirits	„ „ 6d. a gallon.
Brokers' contract notes, new tax of 1s.	

The remainder of the amount requisite to meet estimated expenditure will be raised by loan, details concerning which more properly fall within the province of journals unconnected with pharmacy. The interesting point—and it irritates as well as interests—from the pharmaceutical point of view is the reimposition of the paltry 6d. a proof gallon on all spirit distilled in the United Kingdom and on all spirit imported thereto. If the surcharge had been something tangible the retail chemist could have better met it, but

6d. a gallon is a very awkward thing to get back from a public that only buys in ounces. The following list will show the difference in the charges payable on the principal articles subject to Excise duty. The amounts on the left hand refer to last year's duties, and those on the right hand to the newly imposed duties:—

£ s. d.		£ s. d.	
0 10 10	Spirit (excise)	0 11 4	per proof gal.
0 10 10	Spirit (customs).....	0 11 4	per proof gal.
0 17 3	Perfumed spirit	0 18 1	per proof gal.
0 14 8	{Liquors, cordials, mixtures imported un- computed	0 15 0	per gal.
0 1 3	Chloral hydrate	0 1 4	per lb.
0 3 1	Chloroform	0 3 3	per lb.
1 5 0	Collodion	1 6 3	per gal.
0 1 10	Ether, acetic	0 1 11	per lb.
0 15 8	Ether, butyric	0 16 5	per gal.
1 6 2	Ether, sulphuric.....	1 7 5	per gal.
0 13 7	Ethyl iodide.....	0 14 3	per gal.
0 1 0	Ethyl bromide	0 1 1	per lb.
0 15 8	Ethyl chloride.....	0 16 5	per gal.

"PARTURIUNT MONTES NASCETUR RIDICULUS MUS," will probably be largely used just now in writing of the newly-revealed policy of the Council in regard to the Companies Bill, and it is perhaps natural that the phrase should be capable of a pharmaceutical application at the present juncture, for the net result of five months' continuous official deliberation does not commend itself on the score of brilliancy, though it may do on the point of soundness. The Council in resolving to oppose Clause 2 of the Bill mercilessly and strenuously is at least acting consistently; for that line of action is the logical corollary to the policy which dictated the "Suggestions" of February, 1899. The motives actuating the Council were fully discussed at the meeting on Wednesday, and are reported in this issue of the Journal, so that further reference to them is unnecessary here. All that need be done is to urge all pharmacists loyally to give effect to the policy deemed by the Council to be the wisest in the circumstances. It is understood that the Standing Committee of the Law and Parliamentary Committee will cause the immediate issue of definite instructions to the local officers of the Society throughout Great Britain. Meantime, Monday is fixed for the second reading of the Companies Bill, but as the Army Estimates come on for discussion then, Mr. Ritchie will further postpone the Bill. Notwithstanding that Easter is rapidly approaching, Mr. Balfour has again stated (this time to Mr. Galloway on March 1st), that the Government hopes to take up the Company question before Easter.

THE SHOPS BILL narrowly escaped a second reading on Tuesday owing to unexpected progress with the ministerial programme. The House was as surprised as the promoters of the Bill and, rather than pledge themselves to the principle of the measure, members hastily agreed to an adjournment at half-past eight. On the same evening Mr. Tomlinson (Preston) introduced his Bill, which has seen more than one parliamentary session already, to provide for the better organisation of professional accountants. It was read a first time and relegated to Wednesday, May 2, for further consideration—if circumstances permit.

MUNICIPAL TRADING.—Replying to Mr. Kimber, who asked whether, pending the appointment of a Select Committee, the Government would oppose or defend Bills or clauses in Bills relating to municipal trading, Mr. Balfour, on Tuesday, said that no such general principle as was suggested could be adopted. Each case must be considered on its merits, but undoubtedly the fact that a Committee was sitting, or was proposed to sit, on the subject would be a factor that might be taken into account. This reply, so far as lucidity is concerned, would not have disgraced the genius of Captain Bunsby, of oracular memory.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MARCH 7, 1900.

Present :—

Mr. WM. MARTINDALE, President.

Mr. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Bateson, Carteighe, Corder, Cross, Glyn-Jones, Harrington, Harrison, Hills, Johnston, Park, Savory, Southall, Storrar, Symes, and Warren.

The minutes of the last meeting were read and confirmed.

The PRESIDENT read a letter from Miss Frazer, thanking the Council for the expression of sympathy sent last month on the death of her father. He also stated that Prof. Balfour, Dr. Dobbin and Mr. Peter Boa, had undertaken to conduct the examination for the Council prizes, as requested.

Election of Members.

The following persons having tendered their subscriptions for the current year, were elected "Members" of the Society :—

<p>Ardern, John W.; Ashton-under-Lyne Bathurst, Ernest Frank; Kennington Bobby, Charles William; Soham Cooper, Thomas; Blackheath, Staffs Cornhill, George F.; Walsall Dewar, Donald; Portree Glover, Thomas J.; Dovercourt Gooch, Stephen Leeds; Holt Gray, Arthur Thistle; Barnes Heap, Robert Edwin; Hanley Heely, Walter Frederick; Kennington Hodgson, George; Hemsworth Hubble, Wm. Barton; Workington Jones, John Richard; Aberystwith Lenton, Walter Henry; Thrapston Lloyd, Hugh; Walton-on-Naze Lynn, Sam; Bayswater</p>	<p>May, Ernest Douglas; Lewisham Normansell, John William; Stockport Paynter, Alfred John; New Cross Pilgrim, Walter Ernest; Winchester Ransom, William T.; Sheringham Richards, William D.; Aberystwith Ringer, Alick Archdale; Manchester Shelton, William; Stockport Smalley, Robert; Cockermonth Smith, Thomas Connell; Edinburgh Stone, George; Llanelly Strachan, John; Salisbury, S.A. Walker, James; Birmingham Walmsley, Martyn; London Watkins, Alfred; London Wilson, Ralph; Perth Wright, Arthur George; Aylesbury</p>
--	--

Election of Student-Associates.

The following persons having passed the First examination, and tendered their subscriptions for the current year, were elected "Student-Associates" of the Society :—

<p>Anderson, William Purvis; Edinburgh Armitage, Wm. Tyrrel; Huddersfield Austin, John; Burton-on-Trent Banham, Albert Edward; Cambridge Bowling, Wm. Henry; Willesden Green Bradley, Alfred; Newark Cartmell, Edmund; Lazonby Cross, William Henry; Preston Dallman, Arthur A.; Ashton-on-Ribble Dell, George; Northchurch Dick, Andrew Douglas; Douglas Emslie, Francis Henry; Aberdeen Esam, Richard Middleton; Leicester Gaze, Wm. ---	--

Restorations to Register.

The names of the following persons who have severally made the required declarations and paid a fine of one guinea were restored to the Register of Chemists and Druggists :—

Frederick William Fowles, 6, Prince Albert Street, Brighton.
Robert Joures, 6, Violet Terrace, Berwick-on-Tweed.
John Strachan, Salisbury, Rhodesia, S.A.
Stephen Nobbs Stevens, 9, Liverpool Street, Southampton.
Thomas Henry Tyrrell, 146, Southampton Street, Camberwell, S.E.
Frederick Harcourt Witney, Wrotham, Kent.

Additions to the Register.

The Registrar reported that—

Duncan Neale
and
Moses Neale } of Sherston Magna

having made declarations that they were in business as Chemists and Druggists prior to the passing of the Pharmacy Act, 1868, and

those declarations having been duly supported, their names had been duly placed on the Register.

Restorations to the Society.

Several persons were restored to membership upon payment of the current year's subscription.

Finance Committee.

The SECRETARY read the report of this Committee, recommending various accounts for payment.

The PRESIDENT, in moving the adoption of the report and recommendations, said that the financial condition of the Society was sound, and he had no doubt that more money would be received during the current month than in February. The Benevolent Fund had received 25 guineas from the Chemists' Ball Committee; 10 guineas from the Pharmacy Club, and 100 guineas from Mr. Chas. Maw, who had given several previous donations.

The motion was adopted unanimously.

Library, Museum, School and House Committee.

The PRESIDENT moved the adoption of the report of this Committee, which included the following particulars :—

RECEIPT OF DONATIONS.

Several donations to the Library and Museum had been received (see *P.J.*, February 17, 1900, p. 164), and the Committee had directed the usual letters of thanks to be sent to the respective donors.

ATTENDANCES.

	Total.	Highest.	Lowest.	Average
Library (January)	395	29	2	15
Museum (January)	490	44	3	18

CIRCULATION OF BOOKS.

	Total.	Town.	Country.	Carriage Paid.
London (January)	134	82	52	11s. 3d.
Edinburgh (Year 1899)	1,785	1,521	264	15s. 3d.
„ January, 1900	158	135	23	1s. 7d.

The Committee recommended that the undermentioned books be purchased :—

FOR THE LIBRARY IN LONDON :—

Maisch's 'Materia Medica,' 7th edition, 1899.
Muter's 'Analytical Chemistry,' 8th edition.

FOR THE LIBRARY IN EDINBURGH :—

Maisch's 'Materia Medica,' 7th edition, 1899.
Braithwaite's 'Pharmaceutical Formulary.'
Muter's 'Analytical Chemistry,' 8th edition.

The Committee also recommended that the President, Vice-President, and Treasurer be appointed delegates to the Ninth International Pharmaceutical Congress, to be held in Paris. The Committee had considered the communication from the General Medical Council with regard to Pharmacopœia revision, and proceeded to take the necessary steps in connection therewith. It had also dealt with various matters affecting the School of Pharmacy.

Mr. GLYN-JONES thanked the Committee for acceding to his request and furnishing members of the Council with copies of this report. He asked if it was the intention of the Committee to report to the Council (in committee, if it were not advisable to do so in open Council) or to the General Purposes Committee what steps were taken with reference to the Pharmacopœia revision. That was one of the most important matters they had to deal with.

The PRESIDENT said he would refer to this matter later on in committee.

The resolution was then put, and carried unanimously.

Benevolent Fund Committee.

The report of this Committee recommended the grant of £79 in the following cases :—

Widow (77) of a member and subscriber to the Fund. Has had one previous grant. (Liverpool.)

Widow (66) of a member who had two grants. Has had one previous grant. (Norfleet, Kent.)

Widow (70) of a member and subscriber to the Fund. Has had nine previous grants. (Doncaster.)

Widow (56) of a registered chemist and druggist, and subscriber to the Fund. (Stroud.)

A registered chemist and druggist who has had two previous grants. (Liverpool.)

The death of Mr. J. B. Watson, aged 91, who had been an annuitant since 1894, was reported.

The Committee also recommended that Edwin Bennett be selected for admission, by payment from the Orphan Fund, into the London Orphan Asylum.

The VICE-PRESIDENT, in moving the adoption of the report, said he noticed that on the present occasion several of the recipients were connected with the Society either as members or former subscribers to the Fund.

Mr. ATKINS seconded the adoption of the report. The Council would remember that at the last meeting he referred to the death of a Mrs. Naftel, of Guernsey, an old lady of 83, who had been an annuitant since 1877, and had received from the Society a large sum of money. He was requested by the family of the deceased lady to express to the Council their deep sense of indebtedness and gratitude for the help which Mrs. Naftel had received. Whatever might be said about the defects of the Council or the Society, certainly one part of the Charter had been honourably fulfilled, and that was the relief of distress. He did not know of anything that had been to him in his connection with the Society a source of profounder gratitude than the consciousness which he had that they had been enabled to relieve distress in the way they had done.

The PRESIDENT, in putting the resolution, said the deserving cases were sometimes a little difficult to apportion. The Benevolent Fund was not a life assurance fund, therefore they gave from that Fund without considering whether the recipients had been subscribers to the fund, but applied it in cases of necessity.

The VICE-PRESIDENT drew the attention of members of the Society who are Freemasons to the case of Harriet Parkes, who was a candidate for the Royal Masonic Benevolent Institution, and who was the widow of a pharmaceutical chemist; he hoped she would be largely supported.

The PRESIDENT then moved a formal resolution for payment from the Orphan Fund for the admission into the London Orphan Asylum of Edwin Bennett.

The VICE-PRESIDENT, in seconding the motion, said the Benevolent Fund Committee went into this case very thoroughly, and he would point out that the father of this boy was connected with the Society practically since its formation, and had subscribed to the Benevolent Fund. Although he had ceased any practical connection with the business for some seven or eight years before his death, he still kept up his subscriptions both to the Society and the Benevolent Fund. There could not be a more suitable case.

The resolution was at once agreed to.

Assistant Local Secretaries.

Mr. J. A. Mitchell and Mr. S. N. Pickard were appointed Assistant Local Secretaries for Bradford.

The Annual Report of the Council.

The preparation of the annual report of the Council was referred to the Library, Museum, School and House Committee.

The Annual General Meeting.

On the motion of the PRESIDENT, the fifty-ninth annual general meeting of the Society was fixed for Wednesday, May 16 next, at noon precisely.

Mr. CARTEIGHE said some three months ago he had stated that the new bye-laws would probably be ready for approval at the annual meeting. To avoid confusion he would now state that on going through them it was found that they could not arrange that

they should come into force until the end of August. It would be necessary to begin with a clean draft set of bye-laws to be approved after the existing bye-laws with regard to the examinations had died out. They were being drafted and prepared and would be submitted to the June, July and August meetings of the Council, and a special meeting would have to be held in August to confirm them.

The Waterall Legacy.

The Secretary read the report of the Committee which was appointed to draw up a scheme for the administration of the legacy left by the late Mr. Waterall, of Nottingham. The following scheme was recommended:—

SCHEME FOR THE ADMINISTRATION OF THE WATERALL LEGACY OF £1,000.

The Committee appointed to consider and report on the best method of carrying into effect the provisions of the will of the late George Edwards Waterall, recommends for adoption the following scheme:—

(1) The legacy of £1,000 shall be invested in the Public Funds, and the income received therefrom shall be paid into a separate account at the Society's bankers, which account shall be called the "Waterall Legacy Fund," and a separate account of the receipts and disbursements of the Fund shall be kept by the Secretary of the Society.

(2) Subject to such deductions as may be requisite to defray the cost of administering the Fund, the income derived from the investment of the capital of £1,000 shall be applied for the benefit of deserving poor persons in the manner hereinafter indicated, that is to say:—

(a) The person who shall have precedence as a first recipient or as a recipient to be afterwards appointed at any time by the Council of the Pharmaceutical Society of Great Britain to receive such income, shall be a member of the Pharmaceutical Society who shall have carried on business in the City of Nottingham for a period of at least ten years prior to the date of his appointment by the said Council to receive such income.

(b) Should there be no such member of the said Society in the said city of Nottingham who shall, in the opinion of the said Council, be qualified to receive such income, then the said Council shall pay or apply the said income for the benefit of any registered chemist or druggist who shall have carried on business in the City of Nottingham for a like period of ten years prior to the date of his appointment by the said Council to receive such income.

(c) In the event of the failure of the said Council to find any member of the Society or any registered chemist or druggist as aforesaid, then the said Council shall pay or apply the said income for the benefit of any member of the Society or any registered chemist or druggist wherever resident as in its absolute discretion shall be deemed fit.

(d) The said Council may at any time discontinue the payment or application of the said income if in its opinion the person receiving the same shall have become unfit to receive the same by reason of bad conduct or of improved circumstances, or for any other reason, and the said Council shall then appoint another person to whom the said income shall be paid or applied.

(e) Upon the death of any recipient of the said income, or if the payment or application of the said income shall be discontinued by the said Council as hereinbefore provided, the said Council shall as soon as conveniently may be after the expiration of one month from such death or discontinuance appoint another person to or for whom the said income shall be paid or applied under the foregoing conditions.

(3) The Council shall in the month of April, 1901, proceed to the appointment of a person to receive the net income derived from the invested capital of the Fund, having previously announced its intention so to do by advertisement in the *Pharma-*

ceutical Journal not less than one calendar month before the date of appointment. If, after having advertised the date fixed for appointment as aforesaid the Council should not be in receipt of any application from or on behalf of any of the persons contemplated as having a preferential claim upon the Fund by the terms of Clause 2 of this scheme, then the said Council shall be entitled to assume that there are no preferential claimants within the meaning of the terms of the bequest, and the Council shall then have absolute discretion to apply the income of the Fund for the benefit of any registered chemist and druggist as it may think fit.

(4) In the event of any recipient being elected an annuitant on the Benevolent Fund of the Society, such recipient shall forthwith cease to receive the benefits of the "Waterall Legacy Fund."

(5) Applications must be made in a form to be prescribed by the Council from time to time, and subject to such regulations and conditions as the Council may from time to time prescribe, and announce in the *Pharmaceutical Journal*.

(6) No portion of the income derived from the invested capital of the Fund may be used for the purposes of, or become merged in, the Benevolent Fund of the Society.

The PRESIDENT moved the adoption of the scheme. He said the annual income would probably be about £25 a year.

Mr. ALLEN, in seconding the motion, said he had gone carefully through the draft, and must congratulate the members of the Committee on the able way in which they had discharged the duty committed to them.

The resolution having been carried—

The VICE-PRESIDENT moved a vote of thanks to the Committee for the trouble it had taken, which was carried unanimously.

Law and Parliamentary Committee.

The report of this Committee was read, the purport of it being that having heard a report from the President and Mr. Carteighe as to the result of an interview they had had with Mr. Ritchie, President of the Board of Trade, the Committee recommended the Council to oppose Clause 2 of the Companies Bill.

The PRESIDENT said two letters had been received bearing on this subject. The first was from the Sunderland Chemists' Association, enclosing a resolution calling upon the Council to do all in its power to oppose the Companies Bill now before Parliament, so far as it affects chemists. The second was from the Preston Chemists' Association, enclosing a resolution passed by that body on February 1, urging the Council to proceed at once with the drafting of a Pharmacy Bill as an independent measure which would restrict the titles and practice of the profession to legally qualified chemists. Acting on the instructions of the Committee he went down to the House of Commons accompanied by Mr. Carteighe on February 20, saw Mr. Ritchie, and they explained the position to him as it presented itself to them. They pointed out that the Act of 1868 was intended to give qualified individuals the sole right to keep open shop and carry on the business of a chemist and druggist, and that it was entirely by accident that companies were held to be outside the Act. After the decision of the House of Lords in 1880, companies which had been growing up between 1868 and that date had gradually encroached more and more, and now claimed the right to carry on the business of pharmacy. This they considered inconsistent with the intention of the Act, and they asked Mr. Ritchie if it would not be possible to restore the position conferred by the Act of 1868, previous to the judgment of the House of Lords. The reply was that it was absolutely impossible, that the intention of the Government was to regulate the condition of things now existing; and Mr. Ritchie pointed out that in many cases the public had less protection in the case of individual chemists who carried on several branch shops, than they had with a company pharmacy conducted by a qualified man. Mr. Carteighe then referred to the protection which was given to medical men and dentists by Clause 3 of the Companies Bill, and asked that similar

protection should be afforded to chemists on the same grounds, but Mr. Ritchie still remained obdurate, and expressed himself as disinclined to make any concession. Another attempt was then made to obtain some protection for titles, which were essentially personal in their character, but they saw no hope of any concession being offered in the desired direction. Mr. Ritchie said Clauses 2 and 3 were the Lord Chancellor's clauses, and could not be altered. He (the President) therefore moved "That the Law and Parliamentary Committee be empowered to take immediate steps to oppose Clause 2 of the Companies Bill."

Mr. STORRAR, in seconding the motion, said he was glad of the opportunity of doing so, because this was the first opportunity he had had of expressing his views since the introduction of the Bill. No doubt the reasons which induced him to support the recommendations might not be generally accepted by the Council. In October last the Council came to a distinct and definite resolution that an amended clause should be drawn up by the Council in the hope that it might be accepted by the Government. That was referred to the Law and Parliamentary Committee, with instructions to frame such a clause. No doubt the motion now proposed was really going back on the previous resolution of the Council, but that resolution was passed before the present Companies Bill was introduced into the House of Commons. Therefore, on that ground, and also on the ground that the President of the Board of Trade positively declined to listen to any amendment, they were justified in now coming to a different resolution. In the first place they had asked themselves what, as a Council and as a Society, they thought they ought to get under a Pharmacy Act; and, secondly, what they were likely to get under this clause. The intention of the Act of 1868 was that dispensing and selling poisons should be restricted to legally qualified individuals, and it was a breach of faith that that privilege should be withdrawn; it was also against the safety of the public, which was the ruling motive of the Pharmacy Act. The Courts, amongst other things, had decided that so far as companies were concerned, they were quite outside the Act, and they had also stated that the safety of the public was sufficiently guaranteed by companies employing qualified persons for the sale and dispensing of poisons. Looking at it as a chemist, he would prefer that the Council should reaffirm what chemists believed to be the principle of the Pharmacy Act; but, as an individual, he recognised that the clause in the Companies Bill was an honest endeavour on the part of the Lord Chancellor and the Board of Trade to square the practice of pharmacy with the law. The Pharmacy Act could not be amended by any clause in the Companies Bill. All they could do was to bring companies into line with the common law as it stood at the present moment. It appeared to him that the only possible policy to adopt with regard to the clause in the Companies Bill was to oppose it on the ground that it took from chemists the titles which they were justly entitled to. He scarcely thought the question of keeping open shop for the sale of poisons could be argued. He did not believe that the Companies Bill could interfere with that; it could only affirm the state of the law at the present time; but, on the other hand, in giving the use of titles to companies they had gone beyond the law; therefore he would support very strongly the recommendation of the Committee—viz., that the Council should oppose, but not attempt to amend, the clause. The Council was unanimous that it was an infringement of their rights; but whenever they began to attempt to amend the clause they all fell to pieces. One section said that the clause should be amended so as to make it entirely illegal for companies to trade in these poisons; but he held that it was incompetent to bring such a clause into a Companies Bill. Another section wanted to square the thing by having qualified directors. He did not think that was a good thing at all, because, although they might appoint qualified directors, the law would never insist on those qualified directors being actually *bonâ-fide* directors. Then again, a qualified manager was proposed, and many other amendments. The matter had been going on for

six months, and it was still as impossible as it had ever been to get the Council or the Society generally unanimous on any amendment; therefore, they should not go beyond what they were unanimous upon, and not attempt in any way to amend the clause. He had no hope whatever of ever being able to get rid of company trading; still, he felt, as a member of the Council and as a representative of the Society, that they should not give away their position. He felt that if they began to tinker with the clause and recommend some amendment it would be giving away the position which they had held all along; it would be agreeing with the principle of controlling company trading instead of abolishing it altogether. He thought they should look forward to the time when they could go to Parliament with an amended Pharmacy Act. Even if the proposed clause were carried they would be in a better position than they were at the present time, more especially if they could convince the Lord Chancellor and Mr. Ritchie that they had a good case on the question of titles. On the other hand, if the clause were dropped altogether they would be no worse off than they were at present; but they would have their case clear for an amendment of the Pharmacy Acts.

Mr. HILLS then moved the following amendment:—"That the Watch Committee be instructed to secure, if possible, the amendment of Clause 2 of the Companies Bill, in the direction of securing to qualified persons the exclusive use of their titles and a regulation of companies, which will to the satisfaction of the Committee provide that persons controlling the business of a chemist and druggist shall be qualified. That in the event of their failing to secure either of these objects, the Committee be instructed to oppose the whole clause." After the eloquent remarks from Mr. Storrar, it was unnecessary for him to say anything in support of the amendment, because that gentleman had shown that the Law and Parliamentary Committee as long ago as last October was asked to frame a clause, which from that time to this it had not succeeded in doing. It was patent to all that there was considerable difference of opinion amongst the members of the Council on the subject, and he took the opportunity of bringing forward his amendment in order that every member of the Council might have an opportunity of expressing his views on this burning question. Those who voted for his amendment would practically admit once for all that the carrying on of the business of a chemist and druggist by limited companies was there and would remain. He had not found anyone yet who would say that he really believed the Legislature would pass a law to prevent companies from carrying on the business of a chemist and druggist.

The VICE-PRESIDENT asked Mr. Hills to say what the business of a chemist and druggist was.

Mr. HILLS said it was defined by the Pharmacy Act. There should be some regulations which would render it more difficult for companies to carry on the business of a chemist, and make it more safe for the public. The question was whether they as a Council representing the Society should oppose the Government's proposals, or whether they should in some way assist the Government. It would be said that the result of voting for his amendment would be practically the same as that come to by the Committee, and that it would be useless to propose any amendment in face of the Government having said that it would not accept any. They were all practically unanimous that companies which were not controlled by pharmaceutical chemists or chemists and druggists should not have the right to use the title in a corporate capacity. On the other hand, there was a small section of their own body who carried on businesses perfectly legitimately, such businesses being absolutely controlled by registered persons, and they did not see why they should not be able to use the title in their corporate capacity. In view of the strong desire that had been expressed both north and south of the Tweed, that they should go to Parliament with the request that the use of the title should be so restricted as to imply qualification and registration, they ought to take every measure in that direction. They could appeal to any member of

either House not only for sympathy but support on the question of preserving their titles for those who were qualified to bear them. He disagreed with Mr. Storrar when he said that if the clause were dropped out of the Bill altogether they would be in no worse position. As he had so recently given expression to his view at the meeting of the Western Chemists' Association, he did not propose to say much on the subject. He suggested that the Watch Committee should undertake this duty, because it was evident that the Law and Parliamentary Committee could not come to a unanimous conclusion, and the Watch Committee had the advantage that, while it was composed of men representing different views, it could be called together and act quickly if necessary. If he were asked how he would define the "control of a business" which should be confined to qualified men, he could only say that the Council and the Parliamentary Committee had hitherto failed in giving such a definition, and while he would be willing to take something less than some of their friends, he would endeavour to get as much *bonâ-fide* control as he could. There had been no encouragement to frame a clause, because the majority of the Council were opposed to touching "the unclean thing" at all. If the amendment were carried, it might come to the same thing in the end, but he did think an attempt ought to be made to deal with the matter in a practical way, and secure that there should be a qualified person in control of every open shop in which poisons were dispensed or sold.

Mr. HARRINGTON seconded the amendment. He thought it would be a mistake simply to oppose the clause, without making some attempt to secure protection for titles.

The VICE-PRESIDENT said he agreed entirely with Mr. Storrar in thinking that Clause 2 recognised something which the Pharmaceutical Society ought not to be a party to at all, and in view of the interview with Mr. Ritchie, the result of which had been narrated, it was their duty to oppose the clause. If the Government were so anxious to legislate for pharmacy, it would still come to the Society for information and advice, and no doubt something could be recommended which would be advantageous not only to their own members, but to the public. For years they had been in close touch with the Privy Council, which had consulted the Society on more than one occasion, and it would certainly have been only proper for the Government, before legislating in any way with regard to pharmacy, to ascertain what the Society's views were. Notwithstanding all Mr. Hills had said, his opinion had not changed one iota; it was their duty to administer the Pharmacy Acts of 1852 and 1868 in their spirit. What had taken place of late years was an excrescence on pharmacy, which ought not to be recognised in any way. He believed in going on doing what they believed to be right, and carrying out the principles of the Act, especially in respect to the protection of titles, in which he did not think they had been as energetic in the past as they might have been. It was quite evident that no clause could be framed which would meet with unanimous approval, and therefore he thought the only safe plan was to adhere to the principles which had guided them so many years. The amendment suggested that certain persons should "control" a pharmacy; but the important point was the conduct, not the control. One man could control any number of pharmacies all over the country. If a limited company were allowed to do that, the next step would be that an individual might do it.

Mr. GLYN-JONES said he would support the amendment. He thought the Law and Parliamentary Committee was largely responsible for the present position of affairs. Having recapitulated what had taken place with regard to this matter since October last, he said a most serious step was taken when the Committee decided to communicate to the Government the views of the Society. Very wisely, the President, in the exercise of his judgment, wrote in his own name, but the opinion he expressed was that of the Committee, and he had no hesitation in saying that it was drawn up by the Committee, deliberately knowing that it meant two or three different things. It suggested that it should not be lawful for any

company to assume the title, etc., and later on it said it was not desirable in the public interest that a person not qualified should exercise any control. He contended there was no authority from the Council for making any such statement, and he protested against any committee taking upon itself to represent to the Government what the views of the Council were.

Dr. SYMES rose to order, suggesting that Mr. Glyn-Jones was going into ancient history instead of discussing the amendment.

Mr. GLYN-JONES said he was referring to what had taken place, as a basis for his argument.

The PRESIDENT said the details to which Mr. Glyn-Jones had referred were pretty well known, and it would be as well if he would keep to the question before the Council.

Mr. GLYN-JONES said his contention was that the Committee ought either to have drafted a clause, or reported that it could not do so, and then the Council could have decided what should be done. When the Committee was asked to draft a clause the Government Bill had not been produced. No doubt Mr. Ritchie thought he had received a deputation from the Council; but he (Mr. Glyn-Jones) contended that there had been no official communication from the Council to the Government. The proposition was that they should do nothing but simply oppose the clause, and the majority, at any rate, agreed that it would be impossible to get a clause which would prevent companies carrying on the business of chemists and druggists. Well, there would be no better chance in a private Bill. If they failed to induce the Government to amend their own Bill in the direction desired, what chance would there be of carrying a private Bill of their own with a similar clause? He contended that they would be putting themselves in a false position if they simply opposed this clause without suggesting anything in its place. If they could not get such an amendment as they would like, they would still have the same chance of opposing the clause entirely. The real question was, were they to oppose any attempt on the part of the Government to deal with company pharmacy in this Bill? They were all agreed in opposing Clause 2 as it stood at present, but he should support the amendment because the object of it was to get the clause amended.

Dr. SYMES said the Law and Parliamentary Committee had devoted a great deal of time and consideration to the subject, and if it had to do all the work over again it would only arrive at the same result. With reference to the dreadful things that Mr. Ritchie said their own members were doing, of course there were black sheep in every flock, but he did not think there were more in their own profession than in any other.

Mr. CARTEIGHE said that what Mr. Ritchie said was practically that in asking companies to put up the name of the man who was conducting a business, they were being asked to do more than some chemists were doing.

Dr. SYMES, continuing, wished to direct the attention of the Watch Committee to a very useful measure, of which notice had been given in the House of Commons—namely, the Registration of Firms Bill, which he thought would be very useful to them. There were certain incongruities in the Companies Bill; for example, there were medical companies existing, which were, as far as they knew, legal at the present moment, yet there was no attempt on the part of the Government to recognise the practice of medicine by companies; but they were told that this was an honest attempt to deal with pharmacy. They had asked for bread and had been given a stone. If that memorable case against the London and Provincial Supply Association had been fought against an individual it would have had a different result. He had been told over and over again that the question of titles was a very small matter, but he would support Mr. Storrar in saying they had at present a means of protecting their titles, and that anything else would be better dealt with in a Pharmacy Bill. In attempting to tinker with the clause they would weaken their power for opposing it definitely. The Government was very strong on having that clause or nothing, but still,

he thought if they set their mind to have it knocked out they would succeed.

Mr. HARRISON supported the Committee's report. He said he should feel perfectly free, in spite of his vote that day, to give his support to any amendment if he could agree with it. The amendment then before the Council, he took it, was a direct negative to the motion of the Law and Parliamentary Committee. They had been told that Mr. Ritchie would accept no amendment, therefore was he likely to accept an amendment which struck out the principle of the Bill? The principle underlying the Act of 1868 was that the business of a chemist and druggist should only be carried on by persons who were duly qualified and registered under the Act, and that that qualification should not be relegated to an employee or other employer; but an attempt was being made to square that principle and so adapt it that companies trading under the Act should be qualified by those whom they employed. He saw great difficulties in the working of the proposed Bill, especially in defining what was meant by *bonâ-fide* conducted. As he believed the clause to be virtually rescinding the Pharmacy Act, 1868, he would vote for the resolution, which said they were to give an uncompromising and absolute opposition to the clause. He did not speak against companies, as such, with ill feeling; but he did see great difficulty in bringing them into conformity with the Act. There was nothing in the clause which could be squared with an honest attempt to deal with a difficulty that was pressing very sorely on them all. In his opinion, it was putting the companies in a very much better position than individual traders were placed. After thirty years of the working of the Pharmacy Act, had the chemists so grievously failed in their duty that the Government had a right now to rescind that Act? If they had failed in their duty he could understand the position, but as he contended that they had carried out their duties loyally to the country, he failed to see why they should be insulted by a clause like the one proposed. The chemist placed in his business his personal capacity, his character, and his capital to the very last penny. A limited company could not prove its personal capacity, it had no personal character, and it only placed capital in its business to a limited extent. In one case they had three hostages for the conduct of the business, and in the other only part of one. Without adopting a policy of *non possumus*, he hoped at this juncture they would be so firm and united in opposing the clause before them that when it was dropped, as he believed it would be, then they could meet together to see whether there was not some *modus vivendi* by which the grievances might be removed; but they were not justified in attempting to deal with the matter until the board was perfectly clear.

Mr. SOUTHALL said he would support the amendment, because he was inclined to think that with the help of the Government they might be able to do something. There was no doubt the position was very difficult, but they had to accept the position, whether they liked it or not, and make the best of it. They were constantly reminded that companies were come to stay, which might be true or not, but, at any rate, if they could do anything to protect the titles it would be something worth having, and possibly they might be able to do even more.

Mr. ALLEN supported the motion, and said he felt a certain sense of relief at finding that there was now something like a clear issue before them. By supporting the amendment, he feared they would be weakening the position, because a direct opposition to the clause would have some chance of being effective, but once amendments were introduced, there would be a risk of its being carried with some comparatively unimportant alteration. It appeared to him that in adopting the amendment they would be surrendering the principle which had guided the Society for more than fifty years. He did not think he should be justified in doing so, even as an individual, but certainly the Society, officially, ought not to do so. Some people said companies were come to stay. He did not know whether they had or not. He was rather inclined to think that the course of years would work out the company question far better than any

Acts of Parliament. They heard a good deal nowadays about Uitlanders; but these companies were not Uitlanders, they were outlaws at present, and he wished them to remain so. If they were brought within the scope of the Pharmacy Acts by a side wind, all the education and examination of the individual was put on one side. This clause might be an honest attempt on the part of the Government to deal with the present condition of things, but there had been no practical attempt to educate members of Parliament and the public as to what the business of a chemist really was.

Mr. ATKINS said he should vote in favour of the motion for opposing this clause altogether. He understood that the President, at his interview with Mr. Ritchie, gathered the impression that Mr. Ritchie himself was not very strongly in favour of this clause, regarding it as one which was somewhat extraneous to the main purview of the Bill, and there was therefore all the more hope of a strenuous opposition to it being successful. He would be no party to any regulation of stores, as that was altogether opposed to the spirit of the Charter and the Acts of Parliament, and to the system of education they had instituted, which they hoped would ultimately eventuate in an authorised curriculum. It would be unjust to the qualified man, as it would subject him to illegitimate competition.

The PRESIDENT, in putting the amendment, said if the clause were opposed, as the resolution proposed, it would still be open to accept any amendment later on if an acceptable one were brought forward.

Mr. GLYN-JONES said he did not understand that at all. He understood the meaning of the proposed resolution was that the clause, as it stood, or any amendment of it, should be opposed.

Some desultory discussion ensued on this point, in the course of which

Mr. STORRAR pointed out that the purport of the motion was to oppose the clause, and to negative the attempt to amend it on the part of the Council, but if any amendment were brought forward afterwards by anyone else, the position could be reconsidered. The amendment proposed that the Council should attempt to amend the clause.

Mr. BATESON said he was almost the only member of the Council who was not on the Law and Parliamentary Committee. He would like to see the titles preserved, though he did not think there was so much in that as some gentlemen thought. A title was a personal qualification, and ought to be preserved inviolate. He did not think the Government would ever come to them for advice, and the best way would be to promote a Pharmacy Bill of their own.

The amendment was then put, when there were six votes in favour of it and twelve against. It was therefore lost.

The PRESIDENT next put the original motion, which was carried by fourteen votes, one hand only being held up against it.

Mr. HILLS said he understood, as the result of this vote, that no amendment would be recognised or supported unless it had previously been brought before the Council.

The Appointment of Local Secretaries.

The VICE-PRESIDENT moved, according to notice:—"That the General Purposes Committee be requested to take into consideration the desirability of rearranging the districts at present represented by local secretaries, with a view of making the districts correspond with the Parliamentary divisions of England, Scotland and Wales, except in the cities of London and Edinburgh, which are now represented by divisional secretaries." He would add to the proposed resolution, which he had written out hurriedly, "And also to consider if any rearrangement of the duties of such officers should be made, and the desirability of their appointment by the Council direct." He had thought for a long time that they did not avail themselves sufficiently of the opportunities which they had of appointing local secretaries throughout the country. In past years they had found considerable benefit from appointing local secretaries, especially in times of crisis; but on looking into the matter it appeared that they had only a partial representation. He

thought the Committee should consider the advisability of the Council appointing these officers direct, a system which had worked very well with regard to the divisional secretaries in London. It was a question whether the duty of collecting subscriptions should be imposed on the local secretaries; most other societies had subscriptions sent direct to the head office, and he thought it would be better if that method were adopted. Many chemists said the local secretary only called on them when he wanted money.

Mr. HARRISON seconded the proposition, not from any desire to find fault with the work now done by the local secretaries, but simply that there might be improved relations between those gentlemen and their constituents and the Council.

Mr. CROSS said he would not oppose the resolution, as it only referred the question to the Committee, but he thought it introduced a considerable amount of contentious matter. He thought the appointment of local secretaries from London would be a mistake. With regard to the readjustment of their duties, there were many things to be said in favour of taking away the collection of subscriptions from them, but on the other hand a good local secretary collected subscriptions for the Benevolent Fund, and if the members were to remit direct to the office he feared there would be a shortage in the receipts of the Benevolent Fund.

Mr. JOHNSTON said he agreed with Mr. Cross. In Aberdeen they had one secretary for each division of the county, and an assistant in the city. He thought it would be a great mistake to leave members to send their subscriptions direct to London; the Benevolent Fund would inevitably suffer.

The resolution was then put and carried.

London Teaching University.

The SECRETARY reported the receipt of a copy of the new regulations of the London University, which the Commissioners, under the University Act of 1898, had drawn up.

Mr. CARTEIGHE, referring to the effect of the regulations, said that the Council would be interested to know that a Board of Pharmacy was provided for in the scheme, and it was also gratifying to note that the names of Professors Collie, Green, and Greenish were included in the list of teachers recognised by the University.

General Purposes Committee.

The Council then went into committee to hear and consider the report of the General Purposes Committee, which was entirely of a legal character. On resuming, the report and recommendations were unanimously adopted, and special resolutions were passed authorising the Registrar to take proceedings against the persons named.

NOTE ON BISMUTH SALICYLATE.

BY H. W. GREEN AND A. H. WINDRIDGE.

Brucine is stated in Dragendorff's 'Plant Analysis' to be unaffected by pure sulphuric acid, but the samples procurable have each given a faint rose tint, not unlike that which is produced with minute traces of salicin and sulphuric acid. If now nitric acid, or a nitrate, be added to this mixture the usual bright red colour is produced, so that the rose tint does not affect this reaction.

These reactions have been applied to detect the presence of nitrate in bismuth salicylate, and it constitutes a very delicate test. All commercial samples which have been examined exhibit this reaction. The trade samples of bismuth salicylate give a lemon yellow colour with sulphuric acid alone, and if the rose-coloured mixture of sulphuric acid and brucine be now added, the peculiar red colour due to nitrate and brucine is developed in a greater or less degree of intensity, according to the amount present. With the view of finding out whether other bismuth salts responded to this nitrate reaction, we tried the test with other salts of bismuth, with the following results: Bismuth oxy-sulphate and phosphate, known to be free from nitrate, gave no change of rose tint, but bismuth citrate, oxy-carbonate, and oxide, and bismuth and ammonium citrate showed a distinct change from rose to salmon red. The sulphuric acid did not contain any nitrate.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MARCH 10, 1900.

THE COUNCIL MEETING.

LAST Wednesday will undoubtedly be a memorable day in the annals of the Society, inasmuch as it was the occasion for an outspoken declaration on the part of the members of Council in regard to their convictions as to the principles which constitute the basis of the Society's existence, and though that interesting stage in the proceedings was not reached until the report of the Law and Parliamentary Committee came under discussion, it merits mention in precedence of the more routine transactions.

The additions to the Society comprised 34 members, two restorations to membership, and 40 student-associates. The SECRETARY also reported restorations to the Register of Chemists and Druggists and two additions which he had made in accordance with statutory declarations that the persons referred to had been in business before 1868.

The report of the Finance Committee presented no unusual features and was referred to by the PRESIDENT, in moving its adoption, as showing that the financial condition is sound as well as promising, a view which was endorsed by the silent adoption of the report. The Benevolent Fund account, however, was augmented by the donation of twenty-five guineas by the Chemists' Ball Committee, ten guineas by the Pharmacy Club, and a further hundred guineas by Mr. CHARLES MAW, who has been a liberal donor to the Fund on many previous occasions.

The report of the Library, etc., Committee contained, in addition to the usual records of attendances at the Libraries and Museums, donations, etc., a recommendation that the PRESIDENT, VICE-PRESIDENT, and TREASURER should be appointed delegates to the Ninth International Pharmaceutical Congress, to be held in Paris this year. The report stated that a communication from the General Medical Council in reference to the revision of the British Pharmacopœia had been considered, and that certain steps had been taken in that respect.

On the recommendation in the report of the Benevolent Fund Committee five grants, amounting to seventy-nine pounds, were ordered to be paid, and the Committee recommended that the admission of EDWIN

BENNETT to the London Orphan Asylum should be promoted by a payment from the Orphan Fund.

The SECRETARY reported the death of Mr. J. B. WATSON, who has been an annuitant since 1894.

The VICE-PRESIDENT, in moving the adoption of the report, mentioned, with satisfaction, the fact that several of the recipients had been connected with the Society as members and as former subscribers to the Fund.

The TREASURER communicated to the Council that he had been requested by the relations of the late Mrs. NAFFEL to express their deep sense of gratitude for the help she had received from the Society, adding that whatever might be said about the defects of the Society and its Council, one object of its Charter, viz., the relief of distress, had been most honourably fulfilled, and that nothing had been to him a source of more profound satisfaction than the consciousness of having been able to relieve distress in the way that had been done by the Benevolent Fund.

The VICE-PRESIDENT, in putting the motion, remarked that there was sometimes a difficulty in deciding as to the most deserving cases, but in dealing with applicants, the Committee gave without considering whether the recipients had been subscribers to the Fund or not. Mr. NEWSHOLME also drew attention to the case of HARRIETT PARKES, a candidate for the Royal Masonic Benevolent Institution, who was the widow of a pharmaceutical chemist, and expressed a hope that she would be largely supported by the votes of members of the craft who are freemasons.

A resolution was then passed, on the motion of the PRESIDENT, authorising a payment for the admission of EDWIN BENNETT to the London Orphan Asylum, and the VICE-PRESIDENT mentioned that the boy's father, who had been connected with the Society since its formation, had continued to be a subscriber, although he had long ceased to be connected with the business.

Mr. J. A. MITCHELL and Mr. S. N. PICKARD were appointed assistant local secretaries for Bradford.

Mr. CARTEIGHE then mentioned in reference to a statement he made, some months ago, as to the new bye-laws being probably ready for approval at the annual meeting, that on going through them it was found they could not come into force until the end of August, as it would be necessary to wait until after the existing bye-laws died out. The draft of the new bye-laws, which had been prepared, would therefore be submitted to the Council at the June, July, and August meetings, and a special general meeting of the Society would be held in August to confirm them.

The SECRETARY read the report of the committee appointed to draw up a scheme for the administration of the Waterall Fund (see page 258), and the plan recommended was adopted, a vote of thanks to the committee for the trouble taken in the matter being passed on the motion of the VICE-PRESIDENT.

The report of the Law and Parliamentary Committee stated that having heard from the PRESIDENT and Mr. CARTEIGHE the result of their interview with Mr. RITCHIE, the President of the Board of Trade, the committee recommended that the Council should oppose Clause 2 of the Companies Bill.

The PRESIDENT then mentioned two letters that had been received on the subject, one from the Sunderland

Chemists' Association enclosing a resolution requesting the Council to oppose the Bill, another from the Preston Chemists' Association urging the Council to proceed at once with the drafting of a Pharmacy Bill to restrict the use of titles and the practice of pharmacy to legally qualified individuals.

The PRESIDENT further added that acting on the instructions of the committee, and accompanied by Mr. CARTEIGHE he had seen Mr. RITCHIE and explained to him the view taken of the position by registered chemists, pointing out that the Act of 1868 was intended to give qualified individuals the sole right to keep open shop and carry on the business of a chemist and druggist; that it was entirely by accident that companies were held to be outside the scope of that Act, and that the encroachment of companies, since the decision of the House of Lords in 1880, was an interference with the privileges conferred by the Act. In reply to the request that registered chemists should be restored to the statutory position they occupied before that decision, Mr. RITCHIE expressed the opinion that the Government regarded that as impossible, stating that the intention was to regulate the state of things now existing by compelling companies carrying on the business of a chemist and druggist to have it conducted by a legally qualified individual, which the Government considered would afford the public greater protection than is now the case in the shops of some registered persons. In reply to Mr. CARTEIGHE's argument that the protection of practice given to medical men and dentists by Clause 3 of the Bill, should also be afforded to chemists, Mr. RITCHIE was equally obdurate. No less unsuccessful was the attempt to press the view that titles, indicating a qualification, being purely personal should not be assumed by companies, for even in that respect Mr. RITCHIE said that he could not give any hope of concession being made. That being the position taken by the Government, the PRESIDENT moved that the Law and Parliamentary Committee should be empowered to take immediate steps to oppose Clause 2 of the Companies Bill.

Mr. STORRAR, in seconding the motion, said the reasons which induced him to support it might not be generally acceptable to members of the Council, for though it was going back from the resolution of the Council in October last, the fact that the President of the Board of Trade positively refused to listen to any amendment of the clause, materially altered the conditions the Council had to deal with. The intention of the Act of 1868 was that the dispensing and selling of poisons should be restricted to legally qualified individuals; to withdraw that privilege, as the Government proposed, would be a breach of faith, as well as against public safety which was the ruling motive of the Pharmacy Act. He should prefer, as a chemist, that the Council should contend for what chemists believed to be the principle of the Pharmacy Act; but since the Courts had decided that companies are outside the Act and that the safety of the public is sufficiently guaranteed by companies employing legally qualified persons for the sale and dispensing of poisons, he recognised, as an individual, that the clause in the Companies Bill was an honest endeavour on the part of the Government to square the practice of companies with the law as it

exists. He thought the defect of the Pharmacy Act could not be amended by a clause in the Companies Bill, and that the only possible policy to adopt was to oppose Clause 2 on the ground that it proposed to take from chemists the titles they were justly entitled to, and, in doing so, did not merely affirm the present state of the law as regards keeping open shop for the sale of poison; but it went beyond the law and, for that reason, he would support the recommendation of the committee that the Council should oppose, but not attempt to amend, the Clause in question.

The VICE-PRESIDENT agreed with Mr. STORRAR that the Pharmaceutical Society ought not to acquiesce in the propositions of Clause 2, and that, in view of Mr. RITCHIE's statement as to the views of the Government, it was the duty of the Council to oppose that Clause. Notwithstanding Mr. HILLS' argument, he held that it was the duty of the Council to adhere to the spirit of the Pharmacy Acts, especially in respect to protection of titles, regarding what has taken place of late years as an excrescence not to be recognised in any way.

Dr. SYMES also supported the recommendation of the Committee to oppose Clause 2 of the Companies Bill on account of its incongruity, and because he regarded the attempt of the Government to deal with the inconsistency between the law and existing practice as misguided rather than honest. The present opportunity of protecting their titles should not be missed by making any attempt to tinker Clause 2, in regard to which a strong Government has declared itself determined to have that or nothing.

Mr. HARRISON also supported the recommendation of the Committee, adding, however, that in the event of any amendment of Clause 2 being brought forward which he could agree with, he would support it, but as they had been told by Mr. RITCHIE the Government would accept no amendment, it was not to be expected that one striking out the principle of the Bill would have any chance. The attempt being made to square the principle of the Pharmacy Act with the practice of companies carrying on the business of chemists and druggists, involved an inconsistency, for if successful it would result in rescinding the Pharmacy Act, and it should meet with uncompromising opposition from registered chemists. He held that nothing in Clause 2 could be squared with an honest attempt to deal with difficulties which have pressed sorely upon all chemists, but that its proposals would have the effect of putting companies in a better position than legally qualified individuals, a result that could not be justified after thirty years' working of the Pharmacy Act to the benefit of the public. In conclusion Mr. HARRISON contrasted the position of the registered chemists with that of a joint-stock company, as showing how unjust and unreasonable was the proposition that the personal interests of individuals who have invested in their business certified capacity, character, and their whole capital, should be sacrificed to the interests of limited companies which possess neither capacity nor character, and have only a comparatively small financial interest in the business they carry on.

Mr. ALLEN joined in supporting the recommendation of the Committee, because he did not think the Council

would be justified in surrendering the principle which had for more than fifty years guided the action of the Society. Whether companies have come to stay or not, and whether Clause 2 was, or was not, an honest attempt by the Government to deal with a difficult position, the consequence of its proposition to place a company in the same position as an individual, would be to destroy all the work of the Society.

Mr. ATKINS also supported the motion for opposing Clause 2 altogether, as he would not be a party to a regulation of companies that would be in contradiction to the spirit of the Society's Charter, to the Acts of Parliament and the system of education it had instituted, and, as he hoped, would eventually develop into an authorised curriculum. To acquiesce in such a proceeding would be unjust to all legally qualified persons, and subject them to illegitimate competition.

Mr. HILLS moved as an amendment that the Watch Committee should be instructed to secure the amendment of Clause 2, if possible, in the direction of securing to qualified persons exclusive use of their titles, with a regulation of companies that would, to the satisfaction of the Committee, provide that persons controlling the business of a chemist and druggist should be qualified, and only in the event of failing to secure either object, to oppose the Clause. He did so partly in view of the fact that the Law and Parliamentary Committee had not been able to agree to an amending clause and, also, to enable members of Council to express their individual opinions. The amendment if carried would, once for all, recognise that the business of a chemist and druggist, as defined by the Pharmacy Act, might be carried on by a limited company. Mr. HILLS referred to the recent expression of his views in support of that position at the Western Chemists' Association.

The amendment was seconded by Mr. HARRINGTON, and supported by Mr. GLYN-JONES, Mr. SOUTHALL, and Mr. BATESON. The former expressed his opinion that the Law and Parliamentary Committee was responsible for the present position of affairs, and proceeded to criticise the action taken by the Committee, until Dr. SYMES rose to order, and the PRESIDENT suggested that the question before the Council should be kept to. Mr. GLYN-JONES then contended that the Committee should either have drafted a clause or reported that it could not agree upon one, but that it was not authorised to communicate with the Government. As to the proposition to oppose Clause 2, he objected that if they succeeded there would be no greater chance of carrying a private Bill with a clause to prevent companies from carrying on the business of a chemist and druggist, and, therefore, he held that the Council would be placing itself in a false position by opposing Clause 2 of the Companies Bill without suggesting anything in its place.

Mr. SOUTHALL supported the amendment because he thought chemists have to accept the position whether they like it or not, but if they could do anything to protect their title the attempt might be worth making.

Eventually the amendment was rejected by twelve votes to six, and the motion was carried with fourteen votes.

ANNOTATIONS.

THE COMMERCE OF DRUGS is more or less a sealed book to the average pharmacist, and it is satisfactory, therefore, to find that Mr. E. M. Holmes has promised to read a paper on that subject at the Evening Meeting of the Pharmaceutical Society, to be held at 17, Bloomsbury Square, London, on Tuesday next. The veteran Curator knows as much as anyone about drugs of vegetable origin, and vastly more than most people; moreover, his knowledge is not of the mere text-book order, compiled from other sources, but gained at first hand. He proposes, we understand, to give facts which appear to support the suggestion that the scarcity of some drugs in the European market, at irregular intervals, probably arises chiefly from the prevailing keen competition in trade, which leads wholesale buyers to purchase at as low a rate as possible. Jaborandi, strophanthus, aconite, pareira, scammony, and saffron are among the drugs concerning which facts will be quoted, and it may be anticipated that the reading of the paper will give rise to a useful discussion. The meeting will open at eight o'clock precisely, when the chair will be taken by the President, Mr. William Martindale, and it is hoped that there may be a large attendance of pharmacists, wholesale druggists, and other persons who may be interested in the subject.

THE FEDERATION CIRCULAR has gone out to the local associations, with the result that meetings are being held to consider the desirability of approaching members of Parliament and submitting to them reasons why Clause 2 of the Companies Bill should not be adopted as it stands. But, unfortunately, the expected is happening—and whilst most of the associations are recommending or are likely to recommend, the substitution of a total prohibition clause—a few are content to push the claims of one of a less satisfactory nature, from the pharmaceutical point of view. The result will be that the minds of a certain number of members of Parliament will be imbued with the idea that chemists, as a class, object altogether to company trading in pharmacy; on the other hand, a smaller number of M.P.'s will gain the totally different impression that chemists as a class see no great harm in company trading in pharmacy, so long as the directors who control the business, and the managers who conduct it, are qualified in accordance with the Pharmacy Act. The net result, if no other factors intervened, would be that the House of Commons might be expected to consist of four groups—those who were pledged to oppose or support company-trading in pharmacy respectively, those who were pledged to regulate companies, and, finally, those who were not disposed to commit themselves in any way until they knew what the intentions of the Government were.

BUT OTHER FACTORS WILL INTERVENE, as local secretaries of the Pharmaceutical Society and other individual chemists are receiving copies of the Federation statement of reasons for signature and presentation to members of Parliament, and many of them are certain to take advantage of the opportunity. Some of the chemists in certain districts may be expected to disapprove of the line adopted by the local associations for those districts, and if members of Parliament receive identical circulars from the dissentients, with a different clause enclosed, it is not difficult to see that much confusion may arise in the minds of the recipients. It is quite conceivable that each member of Parliament may receive, at least, a copy of the Federation circular letter enclosing suggested Clause 2 (A), another copy of that letter enclosing suggested Clause 2 (B), a manifesto issued by a trade journal, and another which proceeds from the companies affected. In addition, he may be interviewed several times, but the net result can hardly be favourable to the adoption of any course except that of simple opposition to Clause 2. So many different courses will have been recom-

mended, with equally plausible—if not identical—arguments in the different cases, that the average long-suffering M.P. will probably decide either not to move in the matter or to object to the Clause in its entirety.

THE RESULT MAY THEN BE that the Minister in charge of the Bill will drop the Clause altogether, and decline to consider the subject further in connection with the Companies Bill. Mr. Ritchie has already expressed the opinion that neither the pharmacy nor the medical clause should have been included in the Bill, but he has stated that he is not indisposed to allow them to remain there, so long as he is not asked to alter them. Otherwise, both will be dropped, and the subjects left for consideration in connection with measures for amending the Pharmacy and Medical Acts. In any case very little sympathy can be looked for by registered chemists who expect the present Government to do anything to improve their position, particularly in relation to companies. For, as has already been explained in the Journal (see *ante*, p. 204), the President of the Board of Trade, who represents the Government in this matter, sees no sufficient reason why company trading in pharmacy should be prohibited. He thinks there is no more risk to the public in the existence of a well-conducted company pharmacy than in that of a registered chemist's branch shop, and that all the requirements of the case can be met by imposing suitable regulations.

ABSOLUTE REJECTION OF CLAUSE 2 is, as it happens, the policy finally agreed upon by the Council of the Pharmaceutical Society at its meeting this week, and an intimation of the Council's position will probably, as explained above, find most members of Parliament in a suitable condition of receptivity. It may almost be taken for granted, therefore, that the Government will shortly drop the Clause. But it must not be thought that the matter will then be ended, for it is quite within the limits of what is both possible and probable that the Clause will be heard of again before the Companies Bill becomes law. If that measure should pass through all the necessary stages in the House of Commons, and come before the House of Lords with Clause 2 omitted, it will be open for the Lord Chancellor to propose its reinsertion. Assuming that course to be followed by the author of the Clause, it may come up for reconsideration in the House of Commons, together with other amendments from the House of Lords, and, if the time should be too short to permit of full discussion, as is not unlikely to be the case at the fag-end of the session, Clause 2 may become law after all. It will be necessary, therefore, to exercise unceasing vigilance and to neglect no precaution that may be required to prevent the statutory recognition of companies which carry on business as chemists and druggists. Every registered chemist in Great Britain should write to his Parliamentary representative, requesting him to oppose Clause 2 of the Companies Bill, and be prepared to do the same again if the danger of its reintroduction should threaten later.

SECRETARIES OF LOCAL ASSOCIATIONS are requested to note that, in the event of meetings being held to consider what course of action should be pursued in connection with the Companies Bill, it will be unnecessary to send detailed reports of the discussions for publication, since all that is of any importance to persons not present at the meetings is a knowledge of the conclusions arrived at. The main question has been discussed and rediscussed more than enough; what is now required is for all registered chemists—individually and collectively—to protest to Parliament against the declared intention of the Government to grant statutory recognition to companies of unqualified persons, carrying on the business of a chemist and druggist. That they may best do, perhaps, by procuring from the Secretary of the Federation of Local Pharmaceutical Associations copies of the statement of reasons why such companies

should not be recognised by the law, and sending them—after being signed—to members of Parliament. Since Mr. Balfour has twice stated publicly that the second reading of the Companies Bill will be taken before Easter—*i.e.*, within the next five weeks—no time should be lost in taking action. In reply to correspondents who have asked for guidance in the matter of selecting one of the alternative clauses suggested by the Executive of the Federation, it may be pointed out that Clause 2 (A) was strongly commended in last week's Journal. It states the extreme case for registered chemists, providing as it does that "No company may use the description of a pharmaceutical chemist, or chemist and druggist, or any other title implying registration under the Pharmacy Act, 1868; and no company may carry on the profession or business of compounding, dispensing, or retailing poisons; and if any company contravenes this enactment it shall be liable, on summary conviction, to a fine not exceeding five pounds for every day during which the contravention happens." At the very least, if this suggested clause is sufficiently supported, the rejection of Clause 2 of the Companies Bill will be assured.

MISQUOTATION AS A FINE ART may approach perilously near to lying. How near, may be judged by our readers, after careful comparison of a published "quotation" from the *Pharmaceutical Journal* of February 24, with the words which actually appeared in our columns. The sentence referred to (see *ante*, p. 199), read as follows:—"The position taken by the Government is that *the condition of things, actually existing at the present time, requires to be regulated, and from that point of view the question presents itself whether the public is any better served or protected when registered chemists carry on branch-shops, even without qualified assistants, than in the case of limited companies.*" But as misquoted in an advertisement headed "Boots, Cash Chemists," which appears in the *Manchester Guardian* and other provincial papers, the words italicised in the foregoing passage are wilfully rearranged so as to distort the meaning of the sentence. Thus, the Journal is represented as referring to "*the condition of things actually existing at the present moment, when (private) registered Chemists carry on branch shops even without qualified assistants.*" The malicious intention of the change is obvious, but such a puerile manifestation of petty spite as has been indicated is not worthy of attention, except in so far as it seems desirable to place the facts on record. It may be that some chemists keep branch shops in which no qualified assistants are engaged, but the fact, if it be such, is not officially known. Further, anything which would be an offence under the Pharmacy Act would be as promptly dealt with by the Council of the Pharmaceutical Society if committed in the branch or other shop of a registered chemist, as though the offence were reported to have taken place in any other shop.

THE IMPORTANCE OF RESEARCH WORK in the training of chemical students is insisted upon by Mr. J. B. C. Kershaw in the *Journal of Education* for February. He states that from personal observation of the industrial and university position of chemistry in this country and in Germany, he is convinced that the special faculties called forth by research work in chemistry can be cultivated in no other way, and that our failure to compete successfully with Germany in many branches of chemical manufacture is due to our neglect of this side of chemical training. That many English chemists have themselves recognised this is thought to be proved by the fact that the register of the Institute of Chemistry contains the names of seventy-four Fellows who have studied abroad and have obtained the German Ph.D. degree; and fifty-nine of those possess no other science degree. It is, of course, improbable, even if greater facilities had been offered in English university colleges for research work, that the whole of those students of chemistry would have remained to pursue their studies in this country. Had it been possible, however, to obtain a university degree in three years by similar work, Mr. Kershaw believes that a large propor-

tion of the number would have preferred to carry on their studies at an English college. He continues: "This enforced exile of some of the most earnest and promising of our chemists during their period of study has another aspect. The professors and demonstrators in the chemical departments of our university colleges are continually deploring the fact that few of the students undertake research work in their laboratories. In both organic and inorganic chemistry the contribution of our country to original research is small compared with that of Germany. A change can only occur when the shorter period of university education covers and includes original research." The fact that the German educational authorities are even now discussing some modification of the existing system for training chemists may be urged as showing that "specialisation" has its drawbacks; but it is pointed out that the modifications now being discussed in Germany relate to a more thorough knowledge of theoretical and applied chemistry, and not to a more general education in science.

A NEW PROCESS FOR LINING CASKS, described in the *Times*, consists in coating the interior of the casks with a thin, tenacious layer of refined paraffin wax. The cask is gently warmed and then placed over a jet, from which the wax, heated to such a temperature as to be quite fluid, is ejected under an air pressure of about fifteen pounds to the square inch, with the result that it is forced into the pores of the wood, which becomes coated with a smooth impervious coating of "Sterax," as the preparation is termed. For the surface thus formed it is claimed that it does not allow organic matter to stick, and that therefore the cask can be effectively cleaned by a simple rinsing with cold liquor. The wax, too, is stated to be quite insoluble in the beer, and to be neutral, so that, while it does not encourage the multiplication of bacteria on its surface, the action of the yeasts and other legitimate organisms in the cask is not interfered with. The process, moreover, is held to tend to keep the contents in good condition, because the sealed-up pores of the wood do not allow the carbonic acid to pass out of the barrel.

THE PROPOSED PROTECTION OF SMALL SHOPKEEPERS IN PRUSSIA, by legislative action, continues to attract attention in Berlin, the debate on the first reading of the Bill, which imposes exceptional taxation on shops bearing the character of "universal providers" having begun in the Lower House of the Prussian Diet on February 26. As already stated in the *Journal* (see *ante*, p. 158), the measure deals with four categories of goods and imposes a progressive tax upon the turnover of all firms dealing in commodities which fall under more than one of those categories. The object of the Government is to protect the ordinary shopkeeper by hindering the development of the "universal provider" system. According to the *Times* correspondent at Berlin, the Bill has excited a considerable amount of opposition. It is described as an unwarrantable attempt to interfere with trade and as a tax upon enterprise and intelligence. Great exception is taken to the fact that the Government proposes to tax the turnover of the shops and not their profits. Dr. von Miquel introduced the measure in what is described as a very half-hearted speech. He said he recognised that there were many objections to attempting to solve social questions by means of taxation, but he hoped the House would give the Bill careful and friendly consideration. During the debate the Government scheme was attacked by representatives of the Radical parties and defended by the Conservatives. The spokesman of the Clericals thought the Bill did not go far enough, and that the tax ought to increase with the turnover in such a manner as absolutely to prevent a business from exceeding certain limits. The National Liberals thought it a mistake to tax the turnover instead of the profits of the shops, but were willing to refer the Bill to a committee. The debate had not been concluded when the House adjourned. Meanwhile many protests against the alleged injustice of the proposed tax appear in the Press.

LETTERS TO THE EDITOR.

The Companies' Bill.

It seems a pity that at this crisis chemists should be divided in their opinions as to what course of action should be taken by the Pharmaceutical Society or others respecting Clause 2 of the Companies Bill. A company may be composed of rogues or thieves, who are perhaps unable to qualify for want of brains, yet are anxious to conduct and participate in the practice of pharmacy. The law is to be specially lenient to these gentlemen, for it says:—Register yourselves under the Companies Acts, and as you have capital, you may buy the brains of a qualified man. It is quite easy! How generous of the law! But to the candidate who impersonates another and wins for him the coveted certificate—such an act would be identical—it demands penal servitude. In view of the necessarily increasing stringency and expense of the pharmaceutical qualification, will parents in future educate their sons to become the dispensers of medicines at nearly cost prices, with an alternative of hiring their services to grocers, draper, and others, all of whom will surely take advantage of the privilege conceded them by the new clause? Chemists will become very few, and the present pharmacies must deteriorate in value, while the profession of pharmacy will drift into the hands of incompetent persons, with, I should imagine, disastrous consequences to the community. If Parliament is to grant to outsiders—who have not even asked for, nor have any possible right to—our legally-earned title, while protecting by a special clause the interests of doctors, dentists, and even midwives, then, I think, we should not hesitate to proclaim the injustice and possible menace to future public safety until we have been rewarded for our energies.

Spiritus Ammoniae Aromaticus.

The difference between the '85 and '98 solutions of barium chloride had not escaped my attention. I had at first thought the difference might influence the value of the test; but since it did not I deemed it unnecessary to refer to the '85 solution. The compilers of the '85 B.P., however, did make the mistake of taking Thresh's figures, which related to a 1 in 10 solution, and applying them to a 1 and 10 solution without allowance for the difference.

London, March 5, 1900.

EDMUND WHITE.

Tannin in Kino.

With regard to Mr. Hooper's statement concerning the amount of tannin present in kino, I should like to say that the figures referred to in Southall's "Materia Medica" were first mentioned in the fourth edition of that compilation, which was written by myself in 1886, and I find on reference to the manuscript that they were taken from a paper by Professor Redwood (see *P.J.* [1] 1, 401), in which it is stated, on the authority of an analysis by Vauquelin, that kino contains 75 of tannin and peculiar extractive, 24 of red gum, and 1 of insoluble matter. The lower figure was mentioned in my "Square" lecture notes, 1879, an intermediate figure—viz., 73.26 per cent. (Royle's "Materia Medica," Ed. 1876; see also "U.S. Dispensatory," page 531, Ed. 1879), being given for another kino then in commerce. Other figures of constituents were also mentioned in that edition, the origin of which are now given in parentheses—"a minute quantity of pyrocatechin" (F. A. Fluckiger Y.B.Ph., 1872, page 150); kinoin 1.5 per cent. (Y.B.Ph., 1879, page 154); and mineral matter or ash, 1.3 per cent. (Pharmacographia, Ed. 1874).

ENGLISH NEWS.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.—A well-attended meeting of this Association was held on Friday, February 26, in the Lecture Theatre at 17, Bloomsbury Square. Mr. E. M. Chapman was in the chair, and a paper, "Tin-mining in Cornwall, with Historical Notes," was read by Mr. C. T. Allen. At the opening of the meeting Mr. Harris asked if anything had yet been done by the committee appointed to revise the rules. The Secretary replied, informing him that, owing to pressure of work due to organising the drill class and getting it into working order, the committee had been unable to meet, but hoped to do so shortly. No member had further business to bring forward, and the Chairman therefore called on Mr. Allen to read his paper. The paper, which dealt with the rise and decline of the tin-mining industry in Cornwall, and included a description of the shaft-mining of the present day, was illustrated by diagrams and by sketches on the blackboard. Several members had questions to ask after the paper had been read, and Mr. Allen having answered them, the Chairman thanked him for his paper, which, he said, had been followed with great interest by all present.

LANCASHIRE CHEMISTS AND THE COMPANIES BILL.—On March 3 a deputation, consisting of Messrs. P. Bean, C. Parkinson, J. Booth, R. L. Gifford, and W. Wells (Blackburn), and Councillor Shorrocks (Darwen) waited upon Sir Harry Hornby, M.P. for the borough of Blackburn, and Mr. J. Rutherford, M.P. for the Darwen division, with reference to the Companies Bill now before the House of Commons. Mr. Percy Bean introduced the deputation to Sir H. Hornby, and, having explained the objections they entertained to clause 2 of the Bill, urged that they, as qualified chemists, had a right to expect to be included in clause 3 along with "physicians, surgeons, dentists, and midwives." Sir H. Hornby asked: "But how would you deal with a limited company consisting of seven qualified men? Would you allow them the title of chemist?" Mr. Wells replied in the negative. As a matter of principle, they could not allow the title on the same grounds that companies had been able to evade the Act of 1868—they lost their individuality by limiting their responsibility, and the law had shown that a limited company had no individuality. Their title as chemists was necessarily individual, for how could a company pass an examination? In answer to further questions by Sir H. Hornby, Mr. R. Lord Gifford said that a limited company under clause 2 could become chemists, and have a right to the title by simply employing a qualified man; but an unlimited company could not describe itself as a chemist, nor could a private individual employing a qualified chemist do so. Sir Harry said he sympathised with the deputation, and thought it most illogical that a limited company should be enabled to do what a private individual might not do. He asked what steps were being taken by the Pharmaceutical Society, as he could only promise the influence of one member of Parliament, while the Society could bring influence to bear on the Minister in charge of the Bill? Mr. Gifford replied that the Pharmaceutical Society was acting in the matter, and that the deputation was in harmony with the Council. Mr. Bean also introduced the deputation to Mr. Rutherford, who showed a keen appreciation of the points at issue, and finally remarked: "It is most unfair that a limited company may do what an individual may not." Mr. J. Booth asked Mr. Rutherford to disabuse his mind of the idea that they were seeking protection or a monopoly as traders. All they asked was that their title of "chemist," which they had qualified for at the invitation of the State, should be protected. It was a principle they were fighting for—that it was impossible for the State to go back on its bargain after they had complied with the conditions laid down by the State. Mr. Booth's remarks were emphasised by other members of the deputation. Messrs. Shorrocks and Parkinson point-

ing out that the training-ground for young men who desired to become pharmacists was slowly but surely disappearing through limited companies being allowed to absorb the privileges and rights of qualified chemists. Mr. Rutherford also asked what the Pharmaceutical Society was doing in the matter, and received the same reply as that given to Sir H. Hornby. The deputation withdrew, satisfied of having made a good impression as to the strength of their case upon the hon. member.

NORTH OF ENGLAND SCHOOL OF CHEMISTRY AND PHARMACY.—The students of this School, accompanied by the Principal, Mr. F. R. Dudderidge, F.C.S., paid a visit on Wednesday, March 1, to the works of Palmer's Shipbuilding and Iron Company, Jarrow-on-Tyne, by kind permission of the managers, Messrs. F. Morris and F. W. Dick. The party was conducted by Mr. A. T. Bill. First the rolling mills were visited, where the rolling of ships' steel plates from red-hot ingots was seen. Next the five huge blast furnaces claimed the attention of the party, the operation of tapping the molten slag and pig iron being viewed with great interest. The engine-house and gas-works for the supply of gaseous fuel were then seen, and followed by a visit to the Siemens-Martin furnaces, where attention was riveted by the tapping of a charge of thirty-five tons of white-hot molten steel into the huge ladle and its subsequent drawing off into ingot moulds. The party then proceeded to the ship-yard, where the chief centre of interest lay in H.M. battleship "Russell," now in course of construction. Lastly the processes for analysis of metal and ores were seen and described in the laboratory, thus terminating a most instructive afternoon, for which one and all joined in an enthusiastic expression of appreciation.

GREAT YARMOUTH CHEMISTS' ASSOCIATION.—The first annual dinner of this Association was held at its headquarters, the Angel Hotel, on Thursday, March 1. Mr. W. S. Poll occupied the chair, and Mr. H. Palmer the vice-chair. There was a capital muster of the members, all but two being present. After the usual loyal toasts had been duly honoured, Mr. Pechey gave the toast of the evening, "Success to the Association," which was ably replied to by the Chairman. Altogether the dinner was a great success, and enjoyed by all present.

PUBLIC DISPENSERS' ASSOCIATION.—A meeting of this Association was held at St. Bride's Institute, London, E.C., on Wednesday, February 28, Mr. F. N. Clark in the chair. There was a fair attendance. The preliminary business dispatched, Mr. F. Davis communicated a paper entitled "Some Points in Practical Pharmacy." The paper was followed by a discussion on the various prescriptions, Messrs. L. J. Moore, R. Jones, Clark, Forster, and others taking part. Various Poor-law members stated that Major Herbert, the Local Government Board Inspector, had been round, and in nearly all cases expressed his satisfaction with the way members of the Association had carried out the Poison Regulations. Letters were read from several county members, Messrs. Bates, Stoke-on-Trent; Howard, Liverpool; Thomas, Cheltenham; and others. A hearty vote of thanks was given to Mr. Davies for his paper. The Secretary reported that the Association was increasing its membership rapidly; that at the next meeting, on March 28, Mr. T. W. H. Idris, J.P., L.C.C., had promised to take the chair.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.—A meeting of this Association was held at the Old Cock Hotel on Thursday night last, the 1st inst., the President, Mr. H. C. Brierley, in the chair. It was decided to forward to each local M.P. a letter from the Association, pointing out the deficiencies of the Companies Bill, and suggesting an amendment to Clause 2. A vote of condolence with the Dewsbury Association was passed in the loss they have sustained by the death of their President, Mr. Foster.

SOUTHPORT CHEMISTS' ENTERTAINMENT.—The chemists and assistants of Southport Parliamentary division met at the Scarisbrick Hotel on February 27, when Mr. George Ball presided over a large attendance. The meeting, which was mainly of a social character, consisted of recitations, readings, and vocal and instrumental music, the whole concluding with a very fine cinematograph exhibition, several films being pictures of incidents which have occurred during the present war. These were very highly appreciated. In an interval the Chairman asked Mr. John Smith (President of the Federation of Local Pharmaceutical Associations) to give the meeting some information respecting the Federation, as to its aims and objects. Mr. Smith, in reply, briefly outlined those points, laying stress particularly on the fact that it was neither rival nor opponent to the Pharmaceutical Society, but that by more-efficient local organisation the Society would be much strengthened and made more representative. The Chairman then expressed the opinion that the great weakness of the Pharmaceutical Society seemed to be that it represented less than a moiety of the registered chemists, and that it should endeavour to find means to alter this condition, so as to represent, not only those who paid their annual subscriptions, but every chemist on the register. Perhaps this could best be done by making every chemist, by reason of his registration, a member of the Pharmaceutical Society, and he urged the Council to find a speedy means of settling this very urgent matter. These views received very marked support. Many of those present gave in their names as wishing to join the local association, and the proceedings were closed by votes of thanks to Chairman and entertainers, and by the singing of the National Anthem.

PRESENTATION TO MR. G. S. V. WILLS.—On Wednesday, the 14th ult., Mr. G. S. V. Wills, Principal of the Westminster College of Pharmacy, was the recipient of a very useful present from his students, consisting of a beautifully finished kit-bag and silver match-box. Mr. Kemp, on behalf of the students, presented the testimonial as a token of respect and esteem, and acknowledgment of the benefit they had derived from Mr. Wills' tuition and the personal interest he had taken in their welfare and advancement, and wished him "Many happy returns of the day." In accordance with the annual custom on his birthday, Mr. Wills took the students of the College for a trip to Kew on the 21st (owing to the very inclement weather on the 14th). The afternoon was spent botanising in the Gardens. A good substantial tea was provided at the Rose and Crown Hotel at 5.30, after which a musical evening followed. During the evening Mr. Tillott proposed "Success to the Westminster College of Chemistry and Pharmacy," and the health of the Principal in highly eulogistic terms. The speech was received with cheers and followed by the singing of "For he's a jolly good fellow." Mr. Wills, on rising, was received with his usual welcome, and said he was delighted to see such a large gathering. It was impossible for him to express anything like his feelings on this occasion. He referred to the great success which had attended the students of the College at the last two examinations, and promised that everything that could be done, regardless of expense to maintain that success, should be done. The company returned to town about 9.30.

EXPOSING ARTICLES OF AN IMPROPER NATURE.—A few weeks ago Mr. Glyn-Jones warned certain of his fellow chemists of the risk they may run by exposing for sale articles of an improper nature (see *ante*, p. 74). It is, therefore, interesting to note that at Bow Street Police Court, on Tuesday, February 27, Lewis Roberts, described as a rubber merchant, of 19, Villiers Street, Strand, was charged with unlawfully exposing in the window of his shop certain articles of an improper nature. On behalf of the defendant it was contended that the goods complained of could be purchased in many of the chemists' shops in London. Mr. De Rutzen (magistrate)

said that although everything possible had been said in favour of the prisoner, there was no doubt that an offence had been committed, hence prisoner would be sentenced to three months' hard labour. Notice of appeal was given.

USE OF MEDICAL TITLES: CASE UNDER THE MEDICAL ACTS.—At North London Police Court on Wednesday, February 21, before Mr. Paul Taylor, Edward William Alabone, Lynton House, Highbury Quadrant, N., was summoned at the instance of the General Medical Council for wilfully and falsely pretending to be a doctor of medicine, and that he wilfully and falsely took and used titles and descriptions implying that he was recognised by law as a practitioner of medicine.—Mr. Lushington, for the prosecution, stated that the proceedings were taken under Section 40 of the Medical Act, 1858, the provisions of which were intended to enable the public to distinguish between qualified and unqualified medical men. In the present case defendant described himself as being "Edwin W. Alabone, M.D., Bellevue College, M.D. Phil., U.S.A., D.Sc., F.R.M.S., Ex-M.R.C.S. Eng." The prosecution contended that by using those descriptions defendant was likely to deceive the public into the belief that he was registered under the Medical Act. It was admitted that at one time defendant was a member of the Royal College of Surgeons of England, and as such was registered under the Act as a medical practitioner. But in 1886 the college removed Mr. Alabone's name from its list of members for "disgraceful conduct," and subsequently his name was also removed from the Medical Register.—Mr. H. S. Schultess-Young, for the defendant, said that the prosecution had no justification in initiating the proceedings. Mr. Alabone was careful to state the origin of his degrees, so that no one could be deceived. He further stated that in 1886 a laudatory article on Dr. Alabone's cure for consumption appeared in *Moonshine*; that article was considered by the Royal College of Surgeons to be derogatory to the profession, and defendant's name was removed from the list of members. Efforts had been made to get the name reinstated, but without avail. Since then Mr. Alabone had been careful to state that he was an ex-member of the College, and that all his other degrees were American.—Mr. Paul Taylor found that defendant described himself accurately and without intention to mislead the public; hence the case would be dismissed, with £10 costs. He refused to state a case for the opinion of the Superior Court.

ACTION AGAINST A CHEMIST.—On Saturday, February 17, the case of Barclay and Sons, Limited, *v.* Riches was tried before Mr. Justice Channell, without a jury, in the Queen's Bench Division. This was a claim by plaintiffs to recover £71 odd for goods supplied to the defendant, who carried on business as the Northern Drug Company—between July and December, 1899. Defendant, Frank Riches, formerly carried on business at 448, Kingsland Road, and 99, Mile End Road, as the Northern Drug Company. The business at the latter address was managed by a Mr. E. C. Roberts, and the question was whether the goods were supplied to defendant or Mr. Roberts. It appeared that defendant disposed of the business to Mr. Roberts in June, taking a mortgage some months after Roberts went away, and Mr. Riches again took possession under his mortgage. The question was whether by doing so he made himself liable for the goods supplied to Roberts during his ownership. Plaintiffs had sued Roberts and got judgment. His Lordship, on these facts, held that plaintiffs had no claim against Mr. Riches, and entered judgment for defendant with costs.

SALE OF CAMPHORATED OIL.—As a sequel to the appeal case, reported in the Journal for February 17 (see page 160), the charge against John Walton and Co., grocers, etc., of Maiden Bradley and Mere, Wilts., was reheard by the magistrates at Warminster on Thursday, March 1. Defendants were summoned for selling camphorated oil certified to contain only 8 per cent. of camphor; the case was originally heard on November 2, 1899, and was then dis-

missed on the technical objection that proceedings should have been taken under section 7 of the Food and Drugs Act instead of section 6. It was now stated for the defence that camphorated oil was only kept on the premises for the convenience of customers, and that defendants had no knowledge of its tendency to evaporation.—A fine of £1 and costs was imposed.

ALUM IN BAKING POWDER.—At Chippenham, Wilts., on Thursday, March 1, John Henry Harding, grocer, of Bath and Chippenham, was summoned for selling food—"Alpine Baking Powder"—to the prejudice of the purchaser.—The county analyst certified that the article in question contained at least 14 per cent. of alum, and it was stated for the prosecution that if 14 per cent. of alum was used in baking a 2 lb. loaf, there would be about sixty grains of alum in the bread, whereas there should only be about five grains.—Defendant admitted selling the powder, but pleaded that he sold it as received from the manufacturer, Mr. H. Matthews, 67, High Street, Plymouth, having no idea that it was adulterated.—The Chairman of the Bench said that, while of opinion that defendant was ignorant of the ingredients, he should not sell an article as described unless he got a guarantee, as the whole onus fell on the retailer. For the benefit and protection of the public they were obliged to administer the law, but in the present case only a mitigated penalty of £3, including costs, would be inflicted.

SALE OF SEIDLITZ POWDERS.—Jane F. Hodson, Vauxhall Road, Liverpool, was summoned on Wednesday, February 28, at the Liverpool Police Court, for selling seidlitz powders certified to be deficient in the proper ingredients.—Defendant, who stated that the powders were manufactured by Messrs. Bell, Sons, and Co., Liverpool, and that there was a label upon them stating that they were genuine, was bound over.

CARBOLIC ACID POISONING.—At an inquest held on Tuesday, February 27, on the body of Frances Dicker (48), wife of a cellarman, living at 97, Grosvenor Park, Camberwell, it was stated that on the previous Friday deceased sent her daughter, aged 12, to a chemist's for twopennyworth of carbolic acid. The chemist refused to serve her, as she was unable to say for what purpose it was required. The girl went back to her mother, who told her to say it was for disinfecting purposes. She then obtained the poison and took it home. Some minutes later the girl saw the bottle which had contained the acid lying on the floor, and noticed that her mother looked strange. She screamed; the landlady hastened to her assistance and got the woman on to the bed. A doctor was sent for, and on his arrival ascertained that deceased had taken $1\frac{1}{2}$ oz. of carbolic acid, and was past medical aid. The immediate cause of death was coma.—It was stated that deceased had been worried in consequence of one of her children becoming insane.—A verdict of "Suicide whilst of unsound mind" was returned.—In the case of Isaac Patrick Downey (26), of 69, Ballance Road, Homerton, he wanted to be a soldier, but being rather short-sighted, was on that account rejected by the authorities. On Friday, February 23, he received from his two brothers, who were at the front with their regiment, one of the Queen's chocolate boxes. He took the box to a number of public-houses, and was supplied with drink. On Sunday, February 25, he went home drunk, and was reproved by his father. Shortly afterwards he drank a quantity of carbolic acid, death occurring about twenty minutes later. An inquest was held on Thursday, March 1, and a verdict of "Suicide whilst temporarily insane" was returned.

SALE OF SPIRIT OF NITROUS ETHER.—On Saturday, February 24, at St. Augustine's Petty Sessions, Canterbury, Fred H. Neale, chemist and druggist, Herne Bay, was summoned for selling spirit of nitrous ether which was not of the strength required by the B.P., 1898.—Defendant was represented by Mr. Potter, who submitted that the case must fall through, as the analyst's certificate—which stated that the drug was considered to be adulterated, as it

did not contain the proper amount of nitrous ether—was not in accordance with the requirements of the Act. He did not dispute the facts of the case as they stood, but, inasmuch as the certificate did not show the constituent parts of the article, and also failed to show that the article in question was liable to decomposition, the case must be dismissed on the ground that the certificate of analysis was not a good one.—The Bench, after a consultation, decided that the case must fall through, owing to the certificate being a bad one, although there was no doubt that the article supplied was not up to its proper standard. The Bench also intimated that the County Analyst, who made out the certificate, should be warned to be more careful in future.

A CORONER AND CHEMISTS' PRESCRIPTIONS.—An inquest was held at Liverpool on Thursday, March 1, by the City Coroner, with reference to the death of Annie Maud Corbett (5), daughter of a dock labourer.—The evidence was to the effect that the child had suffered from severe cough and headache, and was taken on February 15 to Mr. B. Cluett, pharmaceutical chemist, St. James-street, Liverpool, where medicine was prescribed by him. A few days later the mother went to the shop and said that the child was suffering from measles. Another medicine was then made up, and on the 26th ult. a bottle was given to improve the appetite. The child died next day. The mother subsequently called on the chemist, taking the last bottle supplied to her and, it was stated, with her permission, Mr. Cluett threw away a portion of the contents of the bottle, and advised her to inform the City Coroner, but to say nothing about the last bottle. According to the medical evidence, death was due to tubercular meningitis, and also to pleurisy, resulting from the same cause. The medicine prescribed was suitable for measles, with accompanying bronchitis. The coroner having commented on the extreme danger of a chemist prescribing in a case in which he had insufficient information, the jury returned a verdict in accordance with the medical evidence.

SCOTTISH NEWS.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The eighth meeting of the twenty-second session was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Wednesday, February 28, at 9.15 p.m., Mr. David Harley (Vice-President) in the chair. The minutes of the last meeting having been read and approved, a paper was read on "Gold and Gold-beating," by G. H. C. Rowland (see p. 252), after which Mr. J. Rutherford Hill gave some notes on "The Pottage Herbarium," in the course of which he described the methods usually adopted for collecting, drying, and mounting specimens, and explained many points in structural and systematic botany, and in the naming of plants, as illustrated by the plants included in the Pottage Herbarium, which was on exhibition. After discussion, the Chairman moved a vote of thanks to Messrs. Rowland and Hill, which was cordially passed, and the meeting then closed.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION.—At the weekly meeting of this Association, held on March 2, the once-popular game of "Spelling Bee" was revived with great success. Mr. J. P. Gilmour, President, officiated as examiner and judge, and endless amusement was afforded by the outrageous mistakes of some of the competitors. After half-an-hour's frantic wrestling with the "slimness" of English spelling as she is taught, only two survivors "faced the music." These were Messrs. B. Cockburn, Ph.C., and J. Davie, M.P.S., to whom accordingly, the first and second prizes were awarded respectively. Dr. Coull's lecture on "Stereo-Chemistry" has now been definitely fixed for the 23rd inst., and the first annual dance of the Association is to take place on the 28th inst. Tickets—double 5s., gentlemen's 3s. 6d., and ladies' 2s. 6d.—may be had from Mr. J. P. Gilmour, 419, Victoria Road, Glasgow, or any member of committee.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

The annual meeting of this Association was held on March 5 at the Dewsbury Town Hall, when Mr. G. WALKER (Vice-President) presided, and members were present from Dewsbury, Savile Town, Mirfield, Cleckheaton, Liversedge, Heckmondwike, Batley, and Ossett.

THE DEATH OF MR. FOSTER.

Before the ordinary business was proceeded with, the Chairman referred in feeling terms to the sad loss the Association had sustained by the death of the President, Mr. A. Foster. Their meetings were always brightened by his cheery presence and his genial manner. His long experience and knowledge of business affairs were always at the service of the Association, and when they happened to tread on anyone's corns, Mr. Foster's advice was always of a conciliatory nature. He (Mr. Walker) proposed a vote of condolence and sympathy with the relatives of the deceased.

Mr. W. STEAD (Heckmondwike) seconded the motion, observing that his acquaintance with Mr. Foster extended over more than fifty years. They were first associated as playmates, then as school-fellows, and were afterwards apprenticed to the late Mr. T. H. Gloyne. In recent years they had been associated as members of the Dewsbury and District Chemists' Association.

Mr. R. GLEDHILL (Dewsbury), who was apprenticed to Mr. Foster, supported the resolution, and observed that the deceased was one of the pioneers of their Association.

The motion was passed in silence, all the members standing.

Letters were read from Mr. Herbert C. Brierley, on behalf of the Halifax Association, and Mr. J. A. Mitchell, on behalf of the Bradford Association, sympathising with the Dewsbury Association on the loss they had sustained.

THE ANNUAL REPORT.

Mr. GLEDHILL then read the second annual report, which congratulated the members upon the sound financial position of the Association. Various items of interest had been discussed during the year, including the Lord Chancellor's Bill to amend the Pharmacy Act, the election of members on the Council of the Pharmaceutical Society, and the Companies Bill. The Chemists' Defence Scheme had also been discussed, Mr. Glyn-Jones having come down to lay the scheme before the Association. The Association had again proved itself one of the foremost in defending the rights and privileges of the chemists throughout the country, and had invariably taken the lead in all matters which had for their object and aim the wellbeing of their brother pharmacists.

The CHAIRMAN expressed the opinion that the report was a very satisfactory one. They had done some solid work, which had resulted in some good.

On the proposition of Mr. J. W. CUSONS (Ossett), seconded by Mr. C. CROOK (Mirfield), the report was adopted, as was also the financial statement, submitted by Mr. W. STEAD.

ELECTION OF OFFICERS.

Mr. Stead, who has been one of the most active members of the Association, was unanimously elected President, and Messrs. R. Gledhill and J. W. Cusons were appointed Vice-Presidents. Mr. G. Walker was elected Secretary, and Mr. R. Broadhead (Batley), Treasurer.

On the motion of Mr. BROADHEAD, seconded by Mr. CROOK, a hearty vote of thanks was given to Mr. Gledhill for his past services as Secretary, and the compliment was duly acknowledged.

THE COMPANIES BILL.

A long discussion then took place on the Companies Bill of 1900, the matter being introduced by Mr. CUSONS, and it was ultimately decided that the local members of Parliament should be approached and asked to support the amendment of the Bill by the insertion of Clause B suggested by the Federation, in place of the Clause now in the Bill.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

A special general meeting of the members of this Association was held at the White Bull Hotel, Blackburn, on March 6, to consider the recommendation of the Executive that the Hon. Sec., Mr. R. Lord Gifford, should be nominated for election to the Council of the Pharmaceutical Society.

Councillor CRITCHLEY (President) read letters from Messrs. Heaton and Brown (Burnley), Whitehead (Morecambe), Williamson (Preston), and Jepson (Darwen) promising support to Mr. Gifford, if nominated. Before proceeding to vote upon the matter, he would ask Mr. Gifford to explain his views, premising that he personally would be very glad if he consented to stand.

Mr. R. LORD GIFFORD said his position was that the Pharmaceutical Society should exist for the members, and to administer the Pharmacy Acts. Nobody could deny that those functions had been neglected, and the only reparation required was that they should put the members into a rational and possible position. For a number of years they had been observers of the methods of the Council, and of individual members of the Council, and it had impressed them as strange that it had never been thought necessary to awake and arrest the intelligent interest of the drug trade in its own affairs. The Council seemed to imagine that if it had questions before it in committee, and decided, or failed to decide, upon them, that was sufficient for the members of the Society; but they emphatically denied this. Questions of broad policy should be discussed in open Council, and his first declaration of policy was full publicity on all public questions. His second was that the Council's policy should be active more than defensive. They had been so little assertive that people thought they had no rights, and when they claimed them the public thought they were asking for something to be given them. In that connection they were strongly of opinion that the present policy of the Council should be the establishment of the Act of 1868 as it was passed—"in the interests of the public it shall be unlawful for anyone to sell or keep open shop for retailing, dispensing, or compounding poisons, or use or assume the title chemist and druggist," etc. He ventured to assert that there was no difference of opinion among qualified chemists that the least they ought to aim at was the Act of 1868, and that it is in the power of the Council to bring forces into operation that will effect that object. They heard much as to what was feasible and what was not, but surely they would be best occupied in first deciding what were their rights: secondly, in claiming them; and thirdly, in establishing them. There was evidently floating in the nebulous haze around the Council an idea that in some simple manner a real "gilt-edged" pharmacy would be evolved, but that was quite unlikely. Granting special privileges were quite foreign to the present temper of the Legislature, and there was every evidence that that temper would become stronger rather than weaker. The policy the committee advocated was one it had consistently supported all through the agitation—the Act of 1868 and nothing less. Anything less was a confiscation of their rights; anything more was out of the question. But more was not needed. The Act of 1868 was persistently called "a wretched Poisons Bill." But was it? The much-maligned Act was a common-sense one intended to enable the public to distinguish a duly-qualified person. It gave them a title, but it also established the principle that in the interests of the public it was desirable and necessary to place poisons outside the operations of free trade principles, confining their distribution to persons specially trained. In virtue of that they were quite justified at any future time in agitating for the inclusion in the schedule of fresh poisons or proved dangerous drugs, such as carbolic acid, colocynth, digitalis, strophanthus, and acetanilid. In a word, they were determined on the establishment of the principles of the Pharmacy Acts, and refused to complicate the issue with either trade questions or theoretical fancies. The Council could not have realised the importance of

holding tight that which chemists already had. They must be given credit for having efficiently built up and consolidated the profession on its educational side, but they forgot that while they were making entrance to the profession more difficult they were allowing its privileges to be curtailed. His position was that in view of the coming increased stringency in the examinations, the Council's absolute duty was to establish the 1868 Act in the spirit of the Legislature of that time. That was the irreducible minimum, and if the Council could not secure it, it stood condemned as incompetent to safeguard the professional interests in its charge. He attributed the Council's former inability to conserve the interests of qualified chemists primarily to its lack of sympathy with its members, which was proved by the smallness of the number connected with the Society, and next to its neglect to organise, which was proved by the existence of the Federation. If the Society had due appreciation of its responsibilities there would be no necessity for a Federation. Lastly, former Councils had not actively insisted on the retention of their status. There was no pretence of the present policy of the Council being anything but futile on account of the internal dissension in the matter of the Companies Act. The time had come when, he thought, the Council would see that it had either to fight and win or lie dormant and lose; and he hoped and trusted that the present week's meeting of the Council would have results which would spur the country on to a hopeful if difficult fight. The grounds on which he should ask the support of members of the Pharmaceutical Society were:—

- (1) The Pharmaceutical Society for its members.
- (2) Apathy of Council must be remedied.
- (3) Organisation must not be delayed.
- (4) An active policy and publicity in all matters of public interest.
- (5) We must have the full effect of the Act of 1868.

Councillor SHORROCK (Darwen), in moving that Mr. Gifford be nominated to the Pharmaceutical Council, said he was quite with Mr. Gifford with regard to the Federation. He had supported that body through thick and thin, but in the matter of the Companies Bill they had two strings, one of which was out of tune. Chemists wanted the title—that was their minimum demand—and he thought they were quite as much entitled to the benefits of the Medical Clause as any of those included in its scope. He moved the proposition with great pleasure.

Mr. PERCY BEAN seconded the proposition. He was the first secretary of the Association, and he could testify to the higher level and the greater popularity attained by the Association since it had insisted upon a principle outside mere trade matters. Mr. Gifford was a typical Briton, who never knew when he was beaten, and he would be a credit to Lancashire and the North on the Council.

Messrs. WELLS and HINDLE also supported, the latter stating that they wanted live men on the Council—men with honesty of principle and prepared to fight for the trade as they knew it.

Mr. W. HOLT supported the nomination. Mr. Gifford had so closely studied and got such a grip of the political position of pharmacy that his opinions were asked for and valued by men in high position in the pharmaceutical world, while his persistency and energy were something to marvel at. Such men were sadly needed on the Council, where the pitiable weakness exhibited in dealing with a matter of such vital interest to the qualified man as the clause in the Companies Bill was apparent to every chemist who took an intelligent interest in the affairs of pharmacy. It had been positively painful and disheartening to read month after month: "There is no report, because we have nothing to report." It was more painful still to learn from one of its twenty-one members that almost every one of them held a different opinion as to the remedy that should be applied. The Council seemed to quite fail to realise the seriousness of the position. Some members seemed willing to hand over the charter of incorporation to Mr. Jesse Boot, so that he could form a Pharmaceutical Society of his own. Others appeared to be incompetent to form a strong opinion at all, and

although some two or three were willing to work on right lines they failed to make their opinions prevail, and so things drifted along. They might depend upon it that the President of the Board of Trade knew all that, and as a sensible man he would not take into consideration the arguments of such a divided and incompetent body. Strong and resolute men, with opinions firmly set and founded upon principle, ought only to be on the Council, and he ventured to think Mr. Gifford would prove to be one of those. He put it to members throughout the country whether the time was not ripe for a change? In urging favourable consideration of Mr. Gifford's views, he hoped that increased interest would be taken in the elections of members of the Council. Mr. Gifford's success would enable him to continue, perhaps more successfully, his policy of securing due and proper recognition, professionally, of the qualified chemist.

Mr. LOMAX (Darwen) said nobody outside the committee had any idea of the time and work Mr. Gifford had devoted to the work of the Association. He had a thorough grip of the situation, especially as to what chemists wanted under the 1868 Act. Only those who had passed the qualifying examination should be entitled to style themselves chemists, and he could not understand how any misunderstanding on the point could exist on the Council. It was necessary for the protection of the public that the title should be confined to properly qualified men, and he hoped Mr. Gifford, when he got upon the Council, would make that very plain.

Mr. PICKWORTH said they heard at times that chemists were seeking a monopoly, but he failed to see that. If Mr. Boot wished to be a cash chemist and use the title of chemist legitimately, he should follow the same course as the speaker and pass his examinations. There could be no monopoly, for it was open to any person to become a chemist by going through the proper gate instead of climbing over the wall by the aid of £ s. d. If Mr. Gifford stuck to his present position on the qualification question he would have the solid support of the whole mass of working chemists in the country.

The resolution was carried with acclamation, and Mr. GIFFORD briefly acknowledged the confidence reposed in him.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.

Mr. P. H. MARSDEN presided over a good meeting on Thursday evening, the 1st inst., at the Liverpool School of Pharmacy.

It was decided to send a letter of condolence to Mr. J. P. Catford, who has just been bereaved in the death of his father, who was known in his own county of Devonshire and considerably beyond its borders as the oldest member of the Volunteer forces of this country.

Specimens were handed round by the President for naming; one, on the authority of Mr. Wardleworth, was possibly a small *Pentactydra* seed, or a *Mucuna* according to Mr. Marsden, and the others tanning material of the *myrabolan* class.

Mr. HAROLD WYATT, Jun., then read a paper, entitled—

Dispensing Notes.

He said: These notes are a continuation of a series of similar remarks on my everyday work, which I have at various times brought before the notice of the Students' Society, and for which no claim is made either as to originality of matter or novelty of treatment. They are intended for the guidance of young dispensers who may meet with similar peculiarities in prescriptions passing through their hands, to whom I trust they may afford some assistance if it be only that of suggesting methods by which some formulæ of apparently hopeless incompatibility may be compounded with credit to the dispenser and satisfaction to both prescriber and patient.

MIXTURES.

- (1) R Antipyrin ʒii.
 Quininæ Sulph. gr. xxiv.
 Acid Hydrobrom. Dil. fl. ʒiiij.
 Syrupi ʒi.
 Aquæ ad ʒviii.
 M. ft. Mist.

With some samples of hydrobromic acid a yellowish red colour is caused if the quinine and antipyrin are mixed with the acid in strong solution—this, however, disappears on further dilution. This is due, perhaps, to the salts causing over-concentration of the acid, a trace of free bromine being produced, and this forming a red compound with the antipyrine.

Dilute hydrobromic acid and antipyrine when mixed in the above proportion give a yellow solution.

- (2) R Sodii Salicylatis ʒii.
 Syrupi Limonis ʒss.
 Aquæ Chlorof. ad ʒvi.
 M. ft. Mist.

Contrary to expectation there was no separation of salicylic acid in this. The citrate of sodium, formed by the action of the citric acid in the lemon syrup, dissolved the salicylic acid, the chloroform water also assisting to keep the acid in solution. This solvent property of citrates towards salicylic acid is well known.

- (3) R Tinct. Ferri Perchlor. mʒo.
 Acid Phosph. Dil. ʒii.
 Tinct. Nucis Vom. ʒii.
 Sp. Chlorof. ʒiv.
 Aquæ ad ʒviii.
 M. ft. Mist.

A precipitate of ferric phosphate is unavoidable in this, but the density of this precipitate varies with the way of mixing. If the tincture of iron and acid be mixed together and then diluted a heavy precipitate will fall at once, increasing in density until about the third day, when its maximum is reached. Dilution of the iron tincture and acid separately before mixing causes the precipitate to fall slowly, and in a very finely divided, almost gelatinous condition.

Prepared in this last way the mixture is more slightly, the precipitate is readily diffused, and even after keeping exposed to the light for six months the density of the precipitate is not anything like that formed when the ingredients are mixed before dilution.

- (4) R Sp. Ætheris Nit. ʒii.
 Potass. Bicarb. ʒii.
 Tinct. Aconiti mxxiv.
 Syr. Rhœados. ʒss.
 Aquæ ad ʒii.
 M. ft. Mist.

Dissolve the bicarbonate in an ounce of water, then add the spirit of nitre, shake well, and lastly add the syr. rhœados. As most samples of sp. æther. nit. are acid it is necessary to neutralise them before adding to the syr. rhœados, or the colour of the syrup may be bleached to such an extent that the blue colour of the finished mixture will vary considerably.

- (5) R Potassii Iodidi ʒii.
 Quininæ Hydrochlor gr. ʒ2.
 Syrupi Aromatici ʒi.
 Aquæ ad ʒviii.
 M. ft. Mist.

The intention of the prescriber was evidently to give a salt of quinine in combination with potassium iodide, and aware of the fact that quinine in acid solution gives with iodide of the alkalies a precipitate of iodide of quinine which rapidly becomes coloured by liberation of iodine until an iodo salt of the alkaloid is formed—he had chosen the most soluble salt of quinine for his purpose as being in his opinion the least acid. The precipitation of quinine iodide, however, cannot be avoided, still if dilute hydrochloric acid be added drop by drop, this iodide is redissolved, but on standing traces of the iodo salt of an orange colour separate and the mixture

becomes deep yellow in colour. Bearing in mind the wonderful effect of a trace of hypophosphorous acid in preventing liberation of iodine I made a series of experiments and found that the mixture could be made so as to remain permanently clear and free from colour, even when exposed to sunlight, if about 20 minims of dilute hypophosphorous acid were used to dissolve this precipitate of quinine iodide.

- (6) R Syrupi Ferri Iodid. ʒii.
 Olei Morrhuæ. ad ʒvi.
 M. ft. Mist.

This is a combination in great favour at various public institutions about Liverpool, and one which is by no means elegant, however efficacious it may be.

Most specimens of cod liver oil contain hydroxyl compounds or at any rate bodies capable of liberating iodine from iodides. The amount of those iodine liberating substances present is inversely as the freshness of the oil and the care with which it has been kept. When the syrup of iodide of iron is added to cod liver oil a brown colour is first formed, and this goes on increasing in depth until the mixture is a deep red. A slightly and presentable emulsion is easily made from this formula by shaking half the oil in a dry bottle with 6 grains of powdered tragacanth and then pouring in the syrup of iodide of iron diluted with ½ oz. of water containing 6 minims of dilute hypophosphorous acid, and making up with oil to 6 fluid ounces and well shaking. So made this will keep well for a considerable time.

- (7) R Liq. Calcis ʒiv.
 Liq. Bismuthi ʒi.
 Nepenthe mxxv.
 Sp. Chlorof. ʒiss.
 Aquæ ad ʒviii.
 M. ft. Mist.

When the solution of bismuth is added to the lime water a white precipitate of bismuth hydrate falls if the liq. bismuthi is free from more than a trace of ammonium citrate. With the old liq. bismuthi a precipitate is formed which is gradually taken up (after standing a while) by the ammonium citrate present.

- (8) R Calcii Chloridi,
 Potass. Bromidi aa gr. ʒ20
 Syrupi Ferri Iodidi ad ʒiv.
 M. ft. Mist.

This gave considerable trouble and varied in colour when made by different operators. The chief cause of this was alkalinity of the calcium salt. A good mixture was turned out by dissolving the bromide in 2 oz. of simple syrup by the aid of heat, and allowing to cool: then dissolving the calcium chloride in ½ oz. water and ½ oz. syrup, with enough dilute hydrochloric acid to produce a non-alkaline solution. Mix these solutions and finally add sufficient concentrated liq. ferri iodidi (made with hypophosphorous acid as a preservative) to correspond with 4 oz. of syrup of iodide of iron, making up to 4 fluid oz. with simple syrup.

PILLS.

- (9) R Argenti Oxidi gr. viii.
 Ext. Belladonnæ gr. viii.
 Aloin gr. x.
 Pil. Aloes et Ferri gr. xxx.
 M. fiat massa et divide in pil. xvi.

To protect the oxide against reduction it was rubbed to a paste with cacao butter 8 grains. The other ingredients were massed separately with honey, the oxide mass then quickly and lightly worked in, and the mass cut into sixteen pills. Weight of mass 65 grains. The pills kept well, and were often repeated.

- (10) R Codeinæ gr. ¼.
 Argent. Oxid. gr. ¼.
 Pepsinæ gr. ii.
 Taka Diastase gr. iii.
 M. fiat pilula. Mitte xii.

Proceed as in No. 9, viz., make a mass of the codeine, pepsin and diastase with honey, and afterwards rub in the oxide massed with cacao butter. Weight of mass 80 grains.

(11) R Resinæ Guaiaci	gr. ii.
Resinæ Podophylli	gr. ½
Olei Cajuputi	m ii.
Massa Pilul.	q. s.
Ut ft. pilula. Mitte xxx.	

Melt the resin of guaiacum with 22 grains of beeswax and stir until nearly cold, when add the essential oil and the resin of podophyllum. Beat hard until homogeneous and make up to 150 grains, mass with very dry and finely-powdered marshmallow root, and cut into 30 pills. These retain their shape though fairly soft, and are not so large as would appear from the formula. The marshmallow prevents them falling and helps in their disintegration.

(12) R Ferri Sulph. Exsic.	gr. i.
Niccoti Sulphatis	gr. ¼
Extracti Belladonnæ	gr. ¼
Ext. Nucis Vom.	gr. ¼
Aloin.	gr. ¼
Olei Menthæ Pip.	m ½
Ft. pil. Mitte xii.	

This formula was brought before the notice of the L.P.S. Society last year on March 2, by Mr. P. G. Jenner. The best excipient in my hands turns out to be beeswax, used in the following fashion:—Rub the salts to powder with the aloin and powdered extracts of nux and belladonna, turn out of the mortar and proceed to work up the essential oil of peppermint with 6 grains of beeswax in fine shavings, to which when smooth the powder may be added and the mass cut. These pills are small, firm, and, in consequence of the salts present, easily soluble.

(13) R Digitalin (Codex)	gr. 1/100
Strychninæ	gr. 1/30
Fiat pilula. Mitte 50.	

A medical friend wished these made up for a fastidious lady patient, desiring them to be small and as smartly turned out as possible. Triturations of digitalin and strychnine were made with sugar of milk, and for every fifty pills, 10 grains of compound tragacanth powder and sufficiency of sugar of milk were used, massing with enough compound tincture of cardamoms. The pills turned out well, and looked very attractive. However the patient complained that they must be manufacturers' pills, and were not hand-made, which brought the doctor down to inquire. He was more than satisfied on looking at the prescription register and seeing the working formula written up opposite his order. This was one of the few cases in which one seems to err through taking too much pains over one's work.

OINTMENTS.

(14) R Acidi Oleici	ʒss.
Lanolin Hydros.	ʒss.
Pot. Carbonatis	gr. iv.
Potass. Iodidi	gr. xxx.
Olei Gerani	miv.
M. ft. Unguentum.	

One of our members, Mr. Jenner, had made this up and found that it turned brown owing to the iodide being acted upon by the oleic acid.

If the oleic acid be old and deep coloured this may take place, but if a fairly fresh, good sample of light colour be used, no colour appears when the ointment is made in the following way, viz., dissolve the carbonate and iodide in 72 minims of distilled water, add the oleic acid by degrees, then the essential oil, and lastly, anhydrous lanolin, 168 grains; well rubbing to a cream.

(15) R Hydrarg. Perchloridi	gr. iiiiss.
Cretæ Præparatæ	gr. 75.
Acidi Carbolici	m150.
Olei Olivæ	m150.
Unguenti Zinci	ʒviiss.
M. ft. Unguentum.	

The oxide in the zinc ointment, together with the creta præp., it was at once seen would have an action on the perchloride if this were not protected in some way, accordingly the creta præp. was rubbed fine with oxide of zinc, ʒi. ʒi., and the lard in which the

carbolic acid had been dissolved by heat was stirred in until well and smoothly mixed. When cool, to this was added the perchloride dissolved in absolute alcohol, ʒii., and olive oil in 150, and the whole well stirred. This was often repeated, and after keeping gave no visible signs of the perchloride being converted into oxide.

(16) R Ung. Hydr. Oxid. Rubr.	ʒii.
Acid. Carbolici	miii.
Ung. Sulphuris	ʒii.
Ung. Petrolei	ʒvi.
M. ft. Unguentum.	

If the liquid carbolic acid is used, this is apt to darken in colour, but where phenol in crystals is employed it keeps for long periods.

A good discussion followed the reading of the paper, after which the proceedings terminated.

Obituary.

BROOKE.—On February 28, Frederick Brooke, Chemist and Druggist, Hackney. Aged 61.

EVANS.—On February 27, Thomas Benson Evans, Chemist and Druggist, Denbigh. Aged 44. Mr. Evans was a native of Tregaron, Cardiganshire, and went to Denbigh about twenty years ago as an assistant to Mr. J. Harrison Jones, Chemist and Druggist. A few years later he succeeded to the business of the late Mr. William Edwards, High Street, Denbigh, where he quickly established a good business connection. He was associated with the Calvinistic Methodist body, and for some years had filled the office of deacon at Capel Mawr.

FLEWITT.—On March 3, at his residence, Wylde Green, Charles T. M. Flewitt, formerly a well-known chemist of Birmingham. Aged 87. Mr. Flewitt was a native of Birmingham, and after completing his education became a dispenser at the Birmingham Dispensary in Union Street. Subsequently he began business as a chemist at Snow Hill, afterwards removing to High Street, where he established a thriving business, and continued it for fifty years. Sixteen years ago he retired.

ILEY.—On March 1, John Iley, Chemist and Druggist, Wolsingham (Durham). Aged 58.

INMAN.—On March 1, Joseph Henry Inman, Chemist and Druggist, Newcastle, late of Sheffield.

WATSON.—On February 28, James Burscough Watson, Chemist and Druggist, Preston. Aged 91.

PRACTICAL NOTES AND FORMULÆ.

Almond Cream.

Sweet almonds, 120 Gms., are rubbed into a perfectly smooth paste with water, 480 Gms., and mixed with a previously-melted mixture of white wax, 7.5 Gms., white Castile soap, 7.5 Gms., and spermaceti, 15 Gms.; finally, 16 drops of rose oil, dissolved in 180 C.c., of alcohol, 90 per cent., are added.

Polish for Linoleum.

Mineral oil (0.885) odourless and free from opalescence, 35; hard paraffin, 7.5; Japan wax, 0.5. Melt together and allow to cool.—*Pharm. Post*, 32, 721.

Solder for Different Metals.

Solder for tin, zinc, lead and white metal may be obtained by fusing tin 10, lead 15, melts at 223° C.; tin 10, lead 10, melts at 200° C.; tin 10, lead 6, melts at 190° C.; tin 10, lead 5, melts at 185° C.; tin 10, lead 4, melts at 181° C. Soft solder for zinc, copper or brass, may be made from tin, 100, lead 20, melts at 240° C. Tin solder for cast iron is composed of tin, 1; lead, 1; bismuth, 1.—*Pharm. Centralth.*, 40, 633; after *Central Ztg. f. Optik. u. Mechanik.*

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cannabis Indica.

INDIAN HEMP is derived from *Cannabis sativa*, Linn. (N.O. Urticaceæ), an annual, diœcious herb, indigenous to Central and Western Asia, and largely cultivated in temperate climates for the sake of its strong fibres (hemp) and oily seeds. The source of the drug, however, is the female plant grown in India, as that alone secretes any quantity of the resin to which the medicinal properties of the drug are due. The pistillate or female plants, therefore, having been pruned to produce flowering branches, have their flowering or fruiting tops collected and, without removing the resin, pressed into the more or less compact masses known commercially as "ganja" or "guaza." Other varieties of Indian hemp occur in more or less cylindrical pieces; they are sometimes much stronger than the official drug, and are therefore unsafe substitutes for it. The drug possesses sedative, anodyne, hypnotic, and antispasmodic properties; it is used to prepare Extractum Cannabis Indicæ and, indirectly, Tinctura Cannabis Indicæ and Tinctura Chloroformi et Morphinæ Composita.

CANNABIS INDICA.—a, Young leaf. b, Female flower, with linear bract. c, Perianth unrolled. d, Longitudinal section of ovary. e, Fruit. f, Ditto, transverse section. g, Ditto, longitudinal section.

CHARACTERS.—*Cannabis indica* occurs in rough, compressed, flattened masses of a dusky-green colour, consisting of the branched upper part of the stem of the plant, from 50 to 300 Mm. long, bearing leaves and pistillate flowers or fruits, matted together by a resinous secretion. The straight stem has ascending branches, is longitudinally furrowed, and bears numerous small, one-celled, curved, appressed hairs and occasional stalked glands. The upper and more important leaves are simple, alternate, and 1-3 partite; the lower leaves are opposite, digitate, and consist of five to seven linear-lanceolate leaflets with distantly serrate margins. The pistillate flowers are small, the single ovary in each being surrounded by a perianth and supported by a bract, beyond which protrude two long brown stigmas; the ovoid and slightly reticulated fruit contains a single oily seed and is supported by an ovate-lanceolate

bract. Both leaves and bracts bear numerous leaves and glands, like those on the stem; the leaves are enlarged at the base, and contain cystoliths; the glands secrete a viscid adhesive resin.

CANNABIS INDICA.—I. Transverse section of leaf. II. Lower epidermis showing hairs and stomata. III. Hairs (h) and glands (d). After Vogl.

NOTES.—The distinctive characters of Indian hemp are the rough, dusky-green masses in which the drug occurs, the curved appressed hairs, and the linear-lanceolate leaflets on the lower leaves. It has a powerful odour, is almost devoid of taste, and its chief constituent is the resin, which is freely soluble in 90 per cent. alcohol. In preparing "ganja" a quantity of the resin separates and constitutes the drug known as "charas" which, when distilled under reduced pressure, yields certain inactive terpenes and cannabiniol. The latter is a viscous resin which melts to an oily liquor when warmed and appears to constitute the intoxicating principle of Indian hemp. A thick, yellowish, oily liquid termed cannabiniol has also been isolated from the drug, as well as colourless crystals of an alkaloid—tetano-cannabine—which resembles strychnine in its action.

Cantharis.

CANTHARIDES are the dried beetles, *Cantharis vesicatoria*, Latr. (Order Coleoptera), which are widely distributed over Southern Europe and collected in Spain, France, Russia, Sicily, and Hungary. The insects are gregarious, and are collected by shaking them from the trees—ash, privet, elder, etc.—which they frequent, the time selected being before sunrise, whilst they are unable to use their wings. After being shaken on to cloths the beetles are killed by the aid of heat or by exposing them to the fumes of ammonia or of burning sulphur. Cantharides possess rubefacient and vesicant properties, and act as an irritant poison when taken

internally; they are used to prepare Acetum Cantharidis, Emplastrum Calefaciens, Emplastrum Cantharidis, Liquor Epispasticus, Tinctura Cantharidis, Unguentum Cantharidis and, indirectly, Collodium Vesicans.

CANTHARIDES.—A. *Cantharis vesicatoria*, exact size. B. Same with elytra and wing sheaths expanded.

CHARACTERS.—Cantharides are from 18 to 25 Mm. long, about 6 Mm. broad, and have a strong, disagreeable odour which diminishes on keeping. They have two long, narrow elytra or wing-sheaths, of a shining green or coppery-green colour, under which are concealed two thin brownish transparent membranous wings; each insect has six legs and two antennæ.

NOTES.—The distinctive characters of cantharides are their colour, odour, and narrow shape. The rose beetle—*Cetonia aurata*, Linn.—is similar in colour, but broader; Chinese blistering beetles—*Mylabris sp.*—are shorter, and their wing cases are marked with transverse black and yellow bands. Cantharides contain about 12 per cent. of fixed oil and from 0.5 to 1 per cent. of a definite crystalline substance—cantharidin, $C_{10}H_{12}O_4$, a lactone of cantharidic acid—to which the vesicant properties of the beetles are due. It is insoluble in water, but unites with potassium or sodium hydroxide to form compounds which are soluble in water. In alcohol it is only sparingly soluble, but it dissolves readily in acetic ether or in chloroform. It exists chiefly in the soft parts of the insect, partly in the free state and partly in the form of salts soluble in water. The Chinese blistering beetles yield from 1 to 1.2 per cent. of cantharidin.

Caoutchouc.

INDIA-RUBBER is the product of *Hevea brasiliensis*, Muehl. Arg. (N.O. Euphorbiaceæ) and other species indigenous to Brazil. Inferior varieties of it are produced by species of *Castilloa* and other plants growing in tropical climates. It occurs in the milky juice or latex of the plants, associated with fat, albumin, resin, etc.; and is obtained by incision. By coagulation of the albumin contained in the exuded juice, the suspended particles of caoutchouc are collected in a curdy mass, which becomes tough and elastic when dry. Para rubber, as it is termed in commerce, is used in the preparation of Liquor Caoutchouc and, indirectly, of Charta Sinapis.

CHARACTERS.—India-rubber (Para) occurs in elastic masses, of varying form and size, the brownish-black colour externally shading off into a paler tint internally. Each mass consists of a number of thin layers, which appear to be separated by dark lines, the superposition being due to the coagulation of successive coats of the alkaline latex by exposure to acid vapours contained in the smoke from burning wood. Some rubber is milk-white internally, and little, if any, can properly be described as "mottled." India-rubber is insoluble in water, ethylic alcohol, alkaline solutions, or in dilute acids, but more or less soluble in chloroform, oil of turpentine, carbon bisulphide, benzol, and in petroleum spirit. It has a characteristic, somewhat empyreumatic, odour, is nearly tasteless, and melts at about $125^{\circ}C.$, remaining soft and adhesive after cooling.

NOTES.—The distinctive characters of India-rubber are its elasticity and behaviour to solvents. Thus, in chloroform, benzol, etc.,

it swells and becomes soft and gelatinous, a portion of it appearing to dissolve, whilst the rest remains in a more or less disintegrated condition. It seems to consist chiefly of two hydrocarbons, its more soluble portion being soft and ductile, while the less soluble part is tenacious and elastic. When subjected to dry distillation, oil of caoutchouc—a mixture of various hydrocarbons—is obtained. Alcohol removes from Para rubber about 1.5 per cent. of resin; other impurities naturally present are fat, colouring matters, and mineral substances. Pure caoutchouc is a white, amorphous substance— $(C_{10}H_{16})_x$ —and can be obtained by dissolving the crude material in chloroform and precipitating with alcohol. It absorbs oxygen from the air, and is converted into vulcanite when treated under pressure with sulphur.

Capsici Fructus.

CAPSICUM is the product of *Capsicum minimum*, Roxb. (N. O. Solanaceæ), a small erect shrub with spreading branches, which is probably a native of Southern India, and is cultivated there and in other tropical countries—Eastern Africa, South America, etc. The fruits of the plant are collected when ripe and dried. The drug possesses stimulant, stomachic, and tonic properties; it is used to prepare Tinctura Capsici and Unguentum Capsici, and the tincture enters into the composition of Tinctura Chloroformi et Morphine Compositus.

CAPSICUM.—Fruit of *Capsicum minimum* with peduncle attached; also detached peduncle. Natural size.

CHARACTERS AND TEST.—Capsicum fruits are scarlet when fresh, but of a dull orange-red colour when dried. They are oblong-conical in shape, obtuse at the apex, from about 12 to 20 Mm. in length, and not exceeding 6 Mm. in diameter. The fruit is superior, and sometimes remains attached to a small, inconspicuous five-toothed inferior calyx and a straight, slender peduncle about the same length as the fruit, or rather longer. The pericarp of the fruit is somewhat shrivelled and flattened; it is glabrous, shining, more or less translucent, and also leathery in texture. A transverse section of the fruit shows that it is two-celled, each cell containing from five to ten small, flat, whitish seeds, either loose or attached to the thin reddish membranous dissepiment which separates the two cells. The seeds are nearly circular in shape, and have a characteristic thickened margin. The odour of capsicum fruits is characteristic, and the taste intensely pungent, being most marked in the dissepiment that divides the fruit. On incineration, powdered capsicum should not yield more than 6 per cent. of ash, thus showing freedom from adulteration with inorganic substances.

NOTES.—The distinctive characters of capsicum are the shape and size of the fruit and peduncle, the presence and pungent taste of the dissepiment, and the shape of the seeds. The fruits of *Capsicum annuum*, Linn., cultivated in Europe, are large, with a short peduncle and conspicuous green calyx; the fruits of *C. frutescens*, Linn., and other species cultivated in tropical countries can only be distinguished from those of *C. minimum* by minute differences in their external appearance. The chief constituent of capsicum fruit is capsaicin, to which its pungency is entirely due; it has been isolated in a crystalline form, and is contained chiefly in the dissepiment, being secreted by the cells of the epidermis between the cuticle and the outer cell-wall. Other constituents of the fruit are two non-pungent alkaloids—one crystalline (capsicine) and the other volatile; a fixed oil and resin are also present.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

DRYING CRYSTALLISED SALTS.

F. H. Setman describes a simple apparatus he has devised for drying crystallised salts. A large-sized cylindrical porous cell has a central hole bored at the bottom, large enough to receive a fair-sized cork bored with a single hole. The mouth of the cell is similarly fitted with a cork bored with a single hole, and through the two corks are passed pieces of glass tubing of convenient length. The glass tubes should project slightly into the cell, and the external portions be long enough to support the cell between the two ends of a wooden box, so that the cylinder can be rotated on its axis. The salt to be dried is placed in the cylinder, the corks are fixed tightly, and the cylinder is placed in position in the box; one tube is then connected with a drying tube, the other with an aspirator, and a current of dry air—cold or hot, as necessary—allowed to pass. By turning the cylinder from time to time a fresh surface of salt is exposed to the current of air.—*Chem. News*, 81, 91.

ABSORPTION OF IODINE BY PLANTS.

P. Bourcet has experimented with certain edible plants with the object of determining how they absorb the iodine they require, and he publishes a table which shows that under identical conditions of soil, moisture and exposure, some plants absorb much more iodine than others, whilst some do not absorb a trace. The Liliaceæ and Chenopodiaceæ were found to accumulate much more iodine than the Solanaceæ or the Umbelliferae. In the case of the Compositæ and Cruciferae the absorption of iodine varies in different species.—*Bull. Soc. Clinn.* [3], 23, 40.

NEW METHOD OF METHYLATION.

M. Prud'homme describes a new method of methylation, which depends on the combined action of formic aldehyde and nascent hydrogen in an acid medium. By its means he has been able to transform a certain number of colouring materials and leuco bases, containing NH₂ groups. The equation of the reaction is—

Fuchsine was transformed into hexamethylated violet, rhodamine of *m*-aminophenol into methylated rhodamine, thionine into methylene blue, and pheno-safranin into a blue colour which is probably an induline.—*Mon. Scient.* [4] 14, 73.

T'UNG OIL.

This oil is extracted from the seed of the paint tree (*Dryandra cordasa*) which, according to the United States Consul at Shanghai, is extensively cultivated in the Yangtze Valley, also in Chekiang Province. The seeds of the paint tree are poisonous, and the oil is used occasionally for poisoning rats, also to produce vomiting in would-be opium suicides; though for the latter purpose it is neither so safe nor so effective as zinc sulphate or the stomach-pump. The chief use of t'ung oil is as a standard paint, and as such it is in great demand by the natives. When boiled, it makes one of the best drying oils; it is also extensively used in varnishing with the famous Ningpo varnish, "t'si," *i.e.*, the dried sap of the varnish tree (*Rhus vernicifera*), a good coating of which will stand considerable heat without leaving a mark, and will last for years. The various shades for colouring are produced by animal, vegetable, and mineral substances—pig's blood is the favourite for a first coating in varnishing. To give body and lustre to paint, finely powdered galena and other ores are mixed with the oil used.—*Journ. Soc. Arts*, 48, 397.

VOL. 64. (FOURTH SERIES, VOL. 10.). No. 1551.

SEMINASE.

E. Bourquelot and H. Hérissey consider that the ferment of leguminous seeds possessing a horny albumin, previously described by them (see *Ph.J. ante*, p. 91), is a specific zymase, for which they suggest the name "Seminase." They find that this ferment, precipitated from aqueous extracts of the seeds of fenugreek and of lucerne, differs from malt diastase in rapidly effecting the hydrolysis of the albumin of the locust bean, which diastase attacks but slowly, whereas seminase, on the other hand, is very much less active on starch paste than diastase. Even this action is probably due in great part to the trace of diastase which these seeds contain, as well as seminase. Since the cotyledons of both fenugreek and lucerne contain, during the first period of germination, considerable quantities of starch which ultimately disappear, it is evident that this small quantity of diastase plays an important part in the nutrition of the growing plant.—*Comp. rend.*, 130, 340.

AMBER AND COPAL.

Among the objects found by Schliemann at Troy and Mycenæ were a number of amber trinkets. As amber is derived from the shores of the Baltic, the question arose whether they were made of true amber or of fossil copal of African origin brought to Troy by the Egyptians and Phœnicians. Roessler, however, has proved them to be true amber by a simple test, based on the fact that amber contains sulphur, whereas copal does not. A minute particle is placed in a test tube, and heated until fumes are given off. On allowing the fumes to come into contact with a piece of moistened lead acetate test paper the characteristic black colour will be given if the specimen be amber, while with copal no such colour will be obtained.—*Journ. Pharm. Chim.* (6), 11, 113, after *Arch. iv. der Pharm.*

CHEMISTRY OF PEPPERMINT OIL.

The formation of menthol and other constituents of peppermint oil during various stages in the development of the plant has been investigated by Eugène Charabot. The oils examined were derived from plants at three different stages of growth; the first as soon as the inflorescence appeared, and before the formation of flower buds, the second when flower buds were formed, the third when the flowers were fully expanded.

	Before formation of flower buds.	After formation of flower buds.		Flowering plants.
		(a) leaves	(b) inflorescences.	
Sp. g. at 18° C.	0.9025	0.9016	0.9081	0.9200
Opt. rot. at 18° C.	- 24° 10'	- 26°	- 20° 15'	- 2° 37'
Esters (as menthyl acetate).....	3.7 per cent.	10.3 per cent.	7.5 per cent.	10.7 per cent.
Combined menthol ..	2.9 " "	8.1 " "	5.9 " "	8.4 " "
Free menthol.....	14.3 " "	12.2 " "	29.9 " "	32.1 " "
Total menthol	17.2 " "	50.3 " "	35.8 " "	40.5 " "
Menthone	5.2 " "	4.2 " "	16.7 " "	10.2 " "

It will thus be seen that at the first stage the plant yields an oil rich in menthol, but containing a relatively small proportion of esters, and in which menthone is only present in small quantity; as, however, the development of the green parts of the plants progresses, the proportion of esters increases, and this etherification takes place in the leaves, for when the oil passes from them towards the inflorescences, it becomes less rich in esters. Menthone, however, would appear to be chiefly formed in the flowers, where it increases during the development of the inflorescences, while the proportion of the total menthol diminishes. It is concluded therefore that, as in the case of lavender (*P.J.* [4], 10, 249), etherification is confined to the chlorophyll-bearing parts, and that menthone is formed in the flowers by the oxidation of menthol.—*Comp. rend.*, 130, 518.

THE COMMERCE OF DRUGS*

BY E. M. HOLMES, F.L.S.,

Curator of the Museums of the Pharmaceutical Society.

There is a scarcity of some drugs, at irregular intervals, in the European market, which probably arises from various causes, but chiefly from the keen competition in trade, which leads buyers to purchase at as low a rate as possible. This may be illustrated by some facts in connection with some of the drugs that have recently been scarce or high priced. Genuine leaves of *Pilocarpus jaborandi* are at the present moment so scarce that it is probable that it would be almost impossible to purchase 1 cwt. of them in London, although there would not be a similar difficulty about the Rio Janeiro drug (*Pilocarpus selloanus*) or the Maranham drug (*Pilocarpus microphyllus*). The reason of this appears to be that the last time genuine jaborandi became scarce and dear, not only were large supplies of it shipped to England, but the other varieties were also sent over in abundance, and as a cheaper price was asked for them, and the leaves of genuine and the Rio Janeiro kind are much alike in size and appearance, and buyers have not always a knowledge of pharmacognosy, the cheaper drug was largely bought by wholesale dealers. The small leaf was also bought by makers of pilocarpine, chiefly for Germany, it having been discovered in that country that *P. microphyllus* afforded a remunerative yield of the alkaloid, and that it paid better, owing to its low price, to manufacture the alkaloid from these leaves than from the genuine kind. Consequently the genuine drug became "a drug in the market," and, as it would not pay the merchants who held it to go to the expense of warehousing it until the existing stock in the possession of wholesale druggists was exhausted, it had to be sold for what it would fetch, which was 4½d. per lb., whereas the drug cost at least 9d. to collect and send to Liverpool. The result is that shippers, finding that they only lost money over the drug, will not now send it unless they have a certainty of not losing by it. There is little doubt that if 1s. per lb. was offered for a definite quantity it could easily be procured from Pernambuco. The plant being tolerably hardy in subtropical climates, there is little doubt that after a time the cultivated leaves will be placed in the market if a price can be obtained for regular but limited supplies. The difficulty in this case, as in many others, is that, owing to absence of means of communication between producer and consumer, and want of trade agencies to limit the output, the market is flooded when drugs become scarce.

STROPHANTHUS.—It is not at the present moment possible to obtain pure seed giving the characters described in the Pharmacopœia. In this case the difficulty is due partly to the ignorance or carelessness of the first exporters and partly to their attempt to create a monopoly. The first exporters of the drug from Nyassa Land, thinking, apparently, that all strophanthus seed possessed the same properties, or finding only a limited amount of the genuine Kombe seed, adopted the practice of sending three varieties of seed from different districts in the same country, and from three different species, but all of these seeds are very similar in size and colour, and not distinguishable by ordinary observers. One of these species, *S. emini*, has soft, velvety leaves, and flowers very like those of *S. kombe*, but the pod is quite distinct, having a dense, woolly coat. Another, *S. courmontii*, has flowers which do not possess the curious long-tailed petals which form so striking a feature in the other two, and, moreover, has smooth leaves, whilst those of *S. kombe* have stiff hairs. The mixture was detected by the fact that whilst the seeds of *S. kombe* give a green colour, those of the other two species give a pink or reddish colour, with strong sulphuric acid. At first the seed was exported in pods, but subsequently the loose seed was shipped, the seeds being freed from pods and awns by native girls employed for the purpose, and the different seeds once mixed cannot

possibly be separated. The exporters attempted to secure a monopoly by keeping botanists in this country in ignorance of the exact plant which yields the drug, with the natural result that the high price of the drug led to competition, and seeds of other species were imported from West Africa at a cheaper rate. But different species of strophanthus, like different species of aconite, vary much in potency, and when it was found that in some cases teaspoonful doses of the tincture produced no poisonous effect, whilst in others a few drops produced the desired effect, medical men lost confidence in the drug, and the demand has very considerably fallen off. Attempts are now being made to obtain a uniform product in commerce, and the East African exporters have promised a definite brand in future of one kind of seed alone, which it may be hoped will reinstate this valuable drug in favour.

The present state of the market is, therefore, due in this case partly to the attempt to lower the price by importation of a cheaper article, and partly to the ignorance of the producer.

ACONITE ROOT.—Until some years ago German aconite root formed the staple article in commerce. Then Japanese aconite appeared in the market in the form of a carefully-prepared drug of good quality, but as it appeared to the taste more powerful than the German, many wholesale firms hesitated to use it for tincture, although the price was lower than the German. The lowering in price of the German root led to very careless collection and preparation of the drug, and to the adoption in the British Pharmacopœia of the root cultivated in England and collected when at its best. But a drug so cultivated and carefully dried had to meet with the competition of the German and Japanese drugs, and the low price of these was utilised to lessen the price of the English article. As the grower must of necessity know what stock to grow, which he must judge from the sales he can effect, the result of beating down the price is a less acreage under cultivation and an increase in the price of the drug in consequence. Thus, three years' sales of the English drug at 6d., 1s., and 1s. 6d. per lb. respectively indicate that the average (1s. per lb.) is the price which it would pay the grower to produce it. It must be remembered that, apart from the rent of land and the expense of drying, 4-lb. of root yield only 1 lb. of dried root, and that, much of the root being small, it takes 4 lb. or 5 lb. of fresh root to yield 1 lb. of root of uniform size and mature growth.

PAIREIRA BRAVA.—In this drug the conditions of its scarcity are much the same, but differ in some respects. The stems and roots of plants of this family resemble each other so closely as to deceive the uneducated eye, and consequently spurious drugs often find their way into the market. Wholesale druggists who have already a stock of the root hesitate to buy the genuine when it does appear, unless they can be certain of its genuineness, the drug being in small demand. Hence the genuine drug is often sold at a loss to the shipper, and consequently becomes scarce and dear subsequently. In times of scarcity anything that resembles it is offered, and generally purchased by those on the look out for "cheap" lots. In this way a Menispermaceous root from Bahia that was placed in packages of feathers was offered and sold, and a native medicinal root from Africa belonging to the Menispermaceæ was also sold as *Paireira brava*. In such cases, therefore, it is no wonder that a drug loses its reputation.

SCAMMONY.—The cause of the inferior quality of scammony is in reality the demand in certain markets for an inferior article. Thus, Skilip scammony, containing only about 40 per cent. of resin, and worth barely half the price of the pure drug, is largely in demand for the South American market, where buyers will not pay the price of the pure drug. This has led to the introduction of the root and the resin prepared from it by using alcohol as a solvent, although here again the competition in prices has led to the production of two forms of the drug, one containing the resin only, the other some watery extract in addition, due to percolating with water after exhausting with spirit.

* Read at an Evening Meeting of the Pharmaceutical Society, March 14, 1900. (See p. 283.)

SAFFRON.—The demand for a cheap saffron for colouring purposes, as in Cornwall, where buns and cakes are almost universally coloured with it, has led to the regular supply of inferior (Alicante) saffron, at least 1s. per oz. cheaper than the Valencia or best quality. It cannot be too widely recognised by pharmacists that cheapness in drugs means, as a rule, inferiority in quality. It naturally follows that those who sell cheaply must buy cheaply, and the public must suffer. Only dealers in large quantities can buy cheaply, and unless they have a rapid sale the expenses of warehousing and the deterioration of many vegetable drugs by keeping necessitates an increase in price. The publication of market prices in the journals of pharmacy, and the difference between these and the prices of drugs in the wholesale drug lists, leads to an attempt on the part of retailers and hospitals, etc., to obtain drugs at the lowest possible price, often leaving a bare working margin for expenses to the wholesale dealers. Thus, many crude drugs, such as senna, myrrh, etc., have to be sifted free from dirt, screened into various sizes, and picked by hand. Sarsaparilla has to be split by hand and cut by machinery. The loss in weight by these processes, and the expenses of preparation, as well as the loss of interest on money lying idle in stock, all add to the cost of the drug. In the case of powder there is always a considerable loss of weight in drying before a drug can be powdered, the average amount of moisture lost on drying being 10 to 12 per cent. Besides this, there is always a remainder or "gruffs" that has to be allowed for when a quantity of a drug is ground, which it does not pay to regrind and sift.

The wholesale dealer in drugs has to supply the varying demands of different countries, and must either lose business or keep in stock and sell drugs of quality often very much below the B.P. standard. But he is always willing to procure drugs of the best quality for those who will pay the price for them.

Unfortunately, the retail chemist has often only the knowledge derived from text-books, and very little practical knowledge of commerce. Few, probably, could pass a successful examination if asked questions as to the different grades of drugs in wholesale price lists and their relative values for purposes of pharmacy.

Thus, a man may purchase a very nice-looking sample of gum arabic at a cheap rate and think he has got a bargain, but finds on dissolving it that it either has very little adhesive property or that it gives a glairy mucilage, or that it has a considerable proportion insoluble; or he may buy cheap myrrh, and find that it yields only a small quantity of good gum fit for mist. ferri co., and that it requires careful picking to separate the pieces of different flavour (Bissabol, etc.), that would spoil the flavour of the tincture; or he may buy cheap saffron, and find it loaded with sulphate of baryta or soluble salts of the alkalies, or containing *Calendula* coloured with aniline dye. Or he may buy a cheap aloes, and find that he has bought Natal instead of hepatic, or Socotrine aloes; or Barbados, which seemed cheap, but yields only an amount of watery extract proportional to its cost. The only possible way of buying cheaply is buying in large quantity when there are "drugs in the market"—i.e., when the supply exceeds the demand; but even then if a price less than the cost of production is paid he will probably have to make up that price in the long run when the drug gets scarce again. It will be found, if inquiry is carefully made, that the most successful drug businesses are those in which the greatest care is taken to secure the purest and best drugs. A medical man soon finds out whether good ipecacuanha has been used in a case of croup, and the public are not slow to discriminate between medicine conscientiously prepared and that which is not.

HOW TO GARGLE.—In gargling, the nose should be held, and the head thrown well back. In this way the gargle will effectively reach every surface of the pharynx. As usually done, the upper anterior surface of the uvula and of the soft palate are reached.—*Pract.* 54 117, after *Charlotte Med. Journ.*

SOME WEST AFRICAN DRUGS.*

BY J. SLINGER WARD.

Much notice is now being taken of the products of our West African colonies, and efforts are being made to extend our knowledge of their resources. The drugs shown form an interesting selection of some which are used by the natives on the Gold Coast. They were sent by an inhabitant of Sierra Leone, Mr. Onacoe Amnah, to Mr. Samuel Potter, of 7, Fowke's Buildings, Great Tower Street, who handed them to me, together with a manuscript description of their uses. In describing them I will first give the native name, followed by extracts from the manuscript, which you will find in instances is very quaint. Many terms used by the writer are more vivid than polite.

This being the last evening meeting of the session, and having only a limited time for preparing this paper, some of the specimens are unidentified, but I hope that on a future occasion I may be able to communicate further investigations on the, at present, unknown drugs. The pepper of Western Africa used in the various formulæ is probably the fruit of *Piper clusii*, which grows abundantly in the mountainous districts of Sierra Leone. It has a camphoraceous taste, moderately acrid, and in a fresh state diffuses a rich aromatic odour. The natives employ it in the place of black pepper.

Akotompoteng.

"This root is very useful in many diseases; it has a nice smell after it is preserved for a month or so. For cure of pain in the waist: Take or remove the skin of the root and grind same with a little pepper, guinea pepper, or guinea grains, and water; to be injected every three days. For bellyache: As above. For Dysentery: Boil the roots with pepper and drink a tumblerful three times a day till relieved. For free bowels: Make an infusion of this with either rum, whiskey, schnapps, or gin, or any other spirit-liquor, and drink a few minutes before chop (food). For excess menses: Grind the peel of the root with guinea grains quite smooth, make it into a ball, dry it well, and put some into cornflour or any light chop, and eat it."

This root is probably from a species of *Xylopia*; it certainly is derived from a plant belonging to the N.O. Anonaceæ. Mr. Cole informed Professor Scott Elliot that it is an astringent and styptic of great power, and certain in activity. It will check bleeding when other remedies fail; it is a native specific for piles, and is useful in menorrhagia, epistaxis, hæmaturia, hæmatemesis, and hæmoptysis.

Toantin.

"This root, as well as the leaves, are very useful, especially in disorder of the bowels and in diarrhœa; also for women as well as for men, in strengthening the system. As a tonic: Chew the root (the peel or bark), alone or with guinea grains, as much as you like or can, and swallow the juice. For coughing: Chew the inner bark in the same manner. For bitters: Macerate the root with guinea grains in rum, whiskey, or schnapps for a week, and you make a nice bitters suitable for every liquor, which at the same time makes a tonic. Waist pain: Peel the root, grind it well with pepper, mix with so much water, and inject, say, every morning for a week or so, according to constitution. For chronic sores: Scrape the root and grind it very well to powder with guinea pepper (not with water) very dry, and put it on the face of the sore after it is well cleaned, and it will cure it in a few days."

This is probably the "Tumardiahbah," which it much resembles. presented to the Museum by Messrs. T. Christy and Co., but which has not been identified.

Ekum-Nkura.

"The meaning of the name of this bark is 'killing mice.' Poison, especially for mice, when well ground and mixed with chop (food) for them. For swollen part of the body: Grind this well

* Read at an Evening Meeting of the Pharmaceutical Society, March 14, 1900 (See p. 286.)

with water and rub over any swollen part; it will cure it. As smelling salts or sneezing powder, etc.: Grind this very well and smoothly, dry it well, and make it into a very dry powder; put it into a dry phial well corked, and in case of one fainted put a little into the nostril of the patient to induce sneezing; especially boys; after sneezing, he will be in his senses. As far as this bark is known, it does not kill a human being, but it makes them very dull; however, it is not advisable to use it internally."

This bark has not been identified, but a leaf sent with it is probably from a *Bauhinia*, N.O. Leguminosæ. It is very peculiar and interesting. It sinks in water; this is caused by masses of a hard horny deposit in the corky layer. On incineration, this deposit leaves an ash consisting chiefly of lime. Exhausted with 90 per cent. alcohol, the tincture is red in colour with a purple tint; evaporated, the residue is nearly entirely soluble in water. Sulphuric acid added to the aqueous solution throws out a reddish precipitate which is darkened in colour, but not dissolved by ammonia. This alcoholic exhaustion shows no indication of alkaloid or glucoside. Extracted with benzolated amylic alcohol, the solution, shaken with acidulated water, gives a trace of alkaloid. On aqueous extraction, water removes colouring matter; sulphuric acid acts with it in the same manner as with the alcoholic exhaustion. This shows no reaction for alkaloid, neither does acidulated water nor chloroform. Cells containing colouring matter run in distinct rows in the bark; between the colour cells fibrous tissue occurs; prismatic crystals in great abundance are interspersed through the whole structure, especially in rows alongside the lines of colour cells; the intervals between the colour rings are occupied by bast fibre and tissue. The masses of horny tissue of the corky layer are composed of stone cells. The seeds of *Chailletia toxicaria* are used as a rat poison in Sierra Leone, and are said to produce the same effect as strychnine. This plant is probably the bark in question.

Nkokobesah, or Inconchery.

"This root is very nice in smell, and is sometimes used in making soups to diminish smell of fish or meats, such as herring or turtle, meats, etc., and otherwise used as medicine in many diseases. As an ingredient it is ground and put into soups, such as sea turtle soup, to lessen its smell, and into fowl soup to increase its relish and render it more palatable; hence the first name, which means 'fowls will finish.' Tonic: Clean the root and chew it, swallow the juice; or grind the bark of the root very smooth, mix it with palm-wine and guinea grains well ground, strain it and drink. For cure of waist pain: Remove the bark from the root, grind same with pepper, guinea grains or guinea pepper, mix it with a pint or so of fresh water, strain it well, and inject. Cure for weak men: It restores the weak system; if by one reason or the other one is weak, prescribe any of the foregoing, and the result will be found almost in every case successful. Bitters: Wash the root in water, cut it up, put it into a bottle with rum, gin, schnapps, whiskey, or any drinking spirit, and three days after commence to drink it, either alone or with any other spirit liquor."

This drug has not been identified.

Adesekanchie.

"This root and the bark have the same properties. They are very serviceable in many diseases. They are especially good for women during pregnancy. For bellyache, waist pain, gout, etc.: Grind the bark of the tree or that of the root with pepper, mix with fresh water, and inject every morning until relieved. Free bowels, etc.: The stick or the bark of the root is macerated in rum, gin, or whiskey for one day; the resulting tincture is taken alone or in other alcoholic drinks. The tumbler or any glass vessel used with this medicine is to be quickly cleaned after its services are dispensed with, or it will stain it. For external pain: Grind the bark with guinea grains and lime, and apply to the affected part, and after half-an-hour it will be relieved. If burning during the application, it is advisable to remove the medicine; but do not cool the place by washing, or it will burn intensely."

Sarcocephalus esculentus, N.O. Cinchonaceæ, is the plant yielding this drug, and has been exported from West Africa as "peach root." It is understood to be the base of an African peach bitter sold in London. It is the Doundaké noted in the *Pharm. Journ.* [3], 15, 614, and 16, 49, and there described as an astringent and febrifuge capable of replacing Cinchona bark. The authors of that paper find that chloroform removes from the bark several bodies, one containing nitrogen, of a resinoid nature and soluble in alcohol, the others being a mixture of wax and fatty bodies extracted with alcohol. The tincture was of an intense yellow colour, with a very pronounced green fluorescence. From this they were able to separate three bodies—one of a yellow red colour, very bitter, soluble in hot water and alcohol; another, yellow, insoluble in boiling water but soluble in alcohol; the third, brown, insipid, insoluble in boiling alcohol or water, but soluble in caustic potash. Both the first and second can be used to dye silk or linen, and give, with indigo blue, fine shades of green. The *Sarcocephalus* is distributed widely in Africa, from Senegal to the Gaboon. In Sierra Leone the natives call the fruit the peach or fig of the country. The fruit eaten in excess acts as an emetic. The plant prefers the neighbourhood of the sea coast, but it is also met with in the interior. The Doundaké bark on the coast of Africa is liable to be mixed with that of some species of *Morinda*, which it resembles, and are used for the same purposes.

Yarney Crop.

"This crop is used for many things, and is almost good in all diseases, except dysentery or diarrhoea. Powder: Grind it smoothly, allow it to dry in its juice; after that, grind it again. For fainted persons: Put a little of this powder into the patient's nostril, and if he or she sneezes there is hope for life or recovery, and will be able to answer any question put. Purgative: Mix a little of this powder with an ounce or two of castor oil, with the juice of one lime, stir well before drinking, and it will purge almost instantly. If it is wanted to be used alone as a purgative, take a small part, and after well grinding mix with some water, strain and drink so many ounces according to constitution."

This is from a species of *Gladiolus*, probably the *spicatus*.

Atsunobie Bark.

"The use of this bark appears to be to check uterine hemorrhage. It is described as being very powerful, and a decoction with palm nuts is advised to reduce the astringency."

This bark contains a peculiar form of tannin. It has not been identified.

Peyarebiasah.

"This bark is very useful in many diseases, and almost everyone describes it differently in any disease. For consumption or cough: Boil the bark with or without pepper, guinea grains, or guinea pepper, and drink (when cool), say, three times a day a tumblerful till relieved. It makes or induces coughing easy—that is, the phlegm or the mucus could easily be spat out."

This bark has not yet been identified.

Bongbo.

This is a pod of the *Cassia sieberiana*. The tree producing it grows to a height of 30ft. Gum from the bark and pounded fruits applied to open sores, which are said to cure in a remarkable manner.

OTTO OF ORRIS.*

BY J. C. STEAD.

This otto, a golden yellow oily fluid, is in appearance somewhat similar to sweet almond oil, but of a much less viscosity. It has an extremely persistent sweet fatty smell, and on dilution fully develops the characteristic odour of orris root to several times the extent which a similar quantity of the ordinary concrete oil would produce. To the tongue it is at first bland, but this is followed by a lasting somewhat biting and bitter after effect.

*Read at an evening meeting of the Pharmaceutical Society, March 14, 1900. See p. 286.)

It is miscible in all proportions with ether, 90 per cent. alcohol, chloroform, petroleum-ether, and benzene. It dissolves in about 8 volumes of 70 per cent. alcohol, and to a very small extent in water. Applied to moistened litmus paper, the alcoholic solution produces a distinctly acid reaction. Added to caustic potash solution a milky mixture is produced, from which on standing a curd separates and the odour of the otto appears to be a little intensified.

Treatment with a hot 30 per cent. solution of sodium acid sulphite does not cause any perceptible diminution, and the odour of the otto is not apparently affected. When one drop on white demy paper is placed in a water oven, the greasy stain soon disappears, leaving but a slight discoloration. Subjected to distillation at atmospheric pressure it is decomposed; the first portion of the distillate retains a little of the original odour of the otto, and is dextrogyrate.

An examination of the otto has furnished the following figures:—

Specific Gravity	15° 5 C.	0.9489
	15° 5 C.	
Optical rotation, 100 M.m.		—20°25
Treated with alcoholic semi-normal caustic alkali.	100 = 6.4 KHO	
Acetylated otto	100 = 17.76 KHO	
Congealing temperature		—5°
Viscosity compared with that of almond oil		34.6 : 100 at 20°

These figures are fairly constant for the different batches that have been prepared, and the otto is of a satisfactory standard value which is not reduced by age.

The otto has been in use for some time past, and has given very good results. When one considers that the concrete oil is largely composed of non-odorous matter, that the odour value of different samples varies, and how rapidly it deteriorates under the ordinary conditions of storage, it can be reasonably claimed that this new preparation of orris root, which is equivalent to the ordinary concrete oil minus its solid fatty non-odorous constituents, is a distinct advance on the older products.

STANDARDS FOR DRUGS FROM A WHOLESALER'S POINT OF VIEW.

BY H. WIPPELL GADD.

The same scene wears a different aspect, according to the position from whence it is viewed, and the same subject must always be differently viewed in accordance with the varying positions of those to whom it appeals. It is therefore in no spirit of opposition to the excellent work which is being done by Mr. C. G. Moor and his coadjutors that I venture to write a few lines on the above subject from a somewhat different point to theirs. I hold no brief for the wholesalers, and possibly some of them may repudiate my views, but opposition is better than apathy, and the subject seems to demand discussion. As to the advisability of standards being fixed, there can hardly be two opinions. The analysts need them, the wholesalers would welcome them, and the retailers would be wise to insist on their being established.

For the safety of the public, for the convenience of the medical profession, and in the interests of all honest traders, it is imperative that standards should be defined. But if they are to be generally applicable they must be settled by a general consensus of opinion. Analysts, in spite of, or perhaps because of their training, are too often zealous without being discreet. They seem to lack a sense of proportion, and forget that absolute purity is seldom compatible with commercial conditions. If left to them only, the standards would probably be fixed too high. The wholesale druggist, on the other hand, with his experience of the wide variation in natural products, may possibly be tempted to make the standards too broad, whilst the retailer is apt to draw general conclusions from limited data and isolated cases.

But if it be granted that standards should be fixed, a fresh difficulty arises in the question as to how they are to be maintained.

The tendency of the age is towards factory-made goods, and the responsibility of maintaining the standards is therefore likely to be thrown back on those pariahs of pharmacy, the wholesale houses. Already, not content with the definite statements on labels, lists and invoices, retailers are advised that they should demand special guarantees from the manufacturers. But no section of the trade can repudiate its own peculiar responsibilities. If retailers cease to make, they are still responsible for what they sell, and must, after satisfying themselves that the goods are right when taken into stock, see that they do not deteriorate whilst in stock. I am confident that all wholesale houses are prepared to stand by their labels, and, if necessary, to specially guarantee that any particular article is up to standard when sent out; but no firm could be responsible for goods which have been perhaps for months beyond its control, and it is for the retail pharmacist to prove that he and his servants have kept the stock in a proper manner after it was received.

The recent statement made in the Pharmaceutical Society's own house—that not 1 per cent. of pharmacists ever tested their chemicals—will, I trust, speedily be contradicted, for nothing could be more fatal to the best interests of the trade than for such a statement to be generally accepted as a fair description of the condition of pharmacy. If it were so, who could blame the Lord Chancellor and other distinguished laymen for thinking that any number of pharmacies may be efficiently controlled by unqualified directors, if only a tame pharmacist is carefully preserved at headquarters. Personally, however, I am hopeful that all the various classes interested in the fixing of standards will contribute to the elucidation of the subject, and that the very desirable end of greater uniformity of products will ultimately be attained.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Council and the Companies Bill.

And so the Council has actually made up its mind at last, though hardly even with what it is the fashion nowadays to term practical unanimity, meaning thereby that those who do not vote with the majority do not necessarily disapprove of the position taken up by that majority. There were nineteen members of the Council present at the meeting held on Wednesday last, and, according to the official report, only fourteen of those voted in favour of opposing Clause 2 of the Companies Bill absolutely. But, stranger still, only one member appears to have voted against the motion. Apparently, two who supported the amendment so ably moved by Mr. Walter Hills subsequently found grace and voted for the original proposition, whilst three members could not make up their minds on the second occasion, and decided to trust to Fate or Providence. One who was present displayed a sublime impartiality by not voting at all; whatever happens, therefore, he will be in the proud position of being able to say that he did nothing to prevent it happening. Probably, however, he is far from desirous of finding himself blushing at some future time if ever he should find himself famous on that account. But, to return to my subject, the decision arrived at strikes me as being just a little feeble. Here is a body which has for some years past been expressing its anxiety to have the chief problem which puzzled it solved in a Companies Bill, and lo, when an opportunity presents itself, the issue has to be shirked—positively shirked—because no constructive policy can be agreed upon. Five months' division of opinion has ended in a resolution to end rather than mend the Lord Chancellor's clause; and now we are left to depend upon the somewhat weak reed of trusting that the Government will be so impressed by the opposition offered as to decide to drop the unfortunate clause which has been the cause of so much mental perturbation during the past twelve months.

The Next Step to be Taken.

I am quite aware, of course, that this is probably what will happen; but I am, nevertheless, concerned about the future. If we secure the rejection of the Lord Chancellor's proposals we shall certainly have accomplished something, but that something will not have the effect of altering the existing condition of things in the least degree. The great anomaly of companies being able to do what individuals cannot do will still prevail, and it must be a matter for serious consideration what the next step is to be, and how soon it may be taken. The company pharmacy problem cannot be permitted to remain unsolved for ever, and the fact that a satisfactory solution is difficult to find must not be allowed to prejudice our position indefinitely. The most logical thing, I opine, would be to proceed forthwith to appoint a committee to draft a Pharmacy Acts Amendment Bill, and, though it would be impossible to get such a measure introduced during the present session of Parliament, I see no sufficient reason why that should be allowed to interfere with necessary reforms being initiated, at least. As a matter of fact, we need not now expect to accomplish much, if anything, whilst the present Parliament exists. It cannot last much longer than twelve months, if so much as that; and during the remainder of its brief existence the reform of pharmacy law is not likely to receive an inordinate share of its attention. But with a new Parliament may come a change of Government, and whilst everything is fresh it would be a good thing to impress upon Ministers the desirability of doing something in the direction of disentangling matters. It would be absurd, however, to wait until the critical time is close upon us, and I sincerely hope that a new policy of procrastination will not succeed that of waiting upon opportunity and failing to take advantage of the opportunity when it arrives.

The Approaching Council Election.

It has been stated more than once, and frequently by individuals who did not seem to know what they were talking or writing about, that we need live men on the Council of the Pharmaceutical Society. The statement is undoubtedly true so far as it goes, but it only expresses part of the truth; and I should suggest as a modification that what we require is representatives with a good business capacity, who can retain their business habits when they come to deal with the affairs of a corporate body. Why a level-headed man of proved business capacity should fail when he attempts to cope with the larger affairs of life need not be considered here. It is sufficient to recognise the fact, and, having recognised it, to take such steps, when the proper time comes, as will tend to replace those who have failed to do what was required of them by others who may reasonably be expected to grasp the situation better. Membership of the Council of the Pharmaceutical Society is a thankless office at best, and probably but few of the members who stand for re-election at any given time would worry much if they failed to secure a renewed lease of the supposed privilege of being permitted to attempt to make bricks with little or no straw. There need, therefore, be no compunction about the matter on the part of those members of the Society who may hold the opinion that certain persons might make better representatives than certain other persons. And, after all, no great revolution is to be feared, for the chief difficulty must always be the securing of enough candidates for the position, and not the recording of a sufficient number of votes to insure the return of a given candidate. There is always sufficient voting power lying latent to place a really capable man among the successful seven, if only those who desire to see him returned will exert themselves to the extent of seeing that the votes which might otherwise be wasted are duly recorded.

The Duty of Members of the Society.

I am not, of course, at present aware how the nominations are proceeding; but I would point out that, whilst any member of the Society can nominate one or more other members as candidates for seats on the Council, the necessary letter must be sent to the Secre-

tary of the Society at once, if it has not already been sent, in accordance with the very explicit instructions given in the *P. J.* a fortnight ago (see *ante*, p. 238). At the April meeting of the Council the names of the candidates will be duly notified, and the voting papers will shortly afterwards be sent out. It should hardly be necessary to state that it will then obviously be the duty of every member of the Society to vote for the seven candidates whom he thinks best qualified to represent him in carrying on the administrative work for which he, in common with every other member, is responsible. But neither is there any ground for supposing that the experience of May next will differ greatly from that of former years, and the surprise be in store for us of finding that nearly all those who possess voting power have exercised their privilege. Much, however, may be done to help to secure the realisation of that ideal if everyone who makes up his mind to vote also does what he can to persuade others to follow his example. Personally, I would rather see that a thousand more votes than usual had been recorded than that my own favoured candidates had secured election, since the result would then reflect the actual views of the Society, regarded as a whole, better than has ever been the case during recent years. And, though I am not sufficiently sanguine to imagine that any change of so distinctly revolutionary a character is likely to come about on the present occasion, I do hope that a strong effort will be made by my fellow members to show that they are not unmindful of one of their most important duties. Last year the number of voting papers issued exceeded five thousand four hundred, but of those more than seventeen hundred were not returned. Recognising the weakness of poor human nature, and the inherent tendency to laziness that afflicts most of us at times, I am willing to acknowledge that such a result is not surprising. At the same time, however, there is no reason why it should not be improved upon, and I trust a strenuous effort will be made this year to keep the wasted votes below a thousand in number. Of course, I am assuming that there will be a contested election, but even in that respect I may be disappointed. There is none too much enthusiasm in our ranks at present and, as I have already stated, membership of the Council is a thankless office at best.

POLITICAL GOSSIP.

THE POLITICAL SITUATION in regard to the Companies Bill was not materially changed since last week, though the Bill has approached a little nearer the top of the Government programme. Last Monday it was the eighth item on the Orders of the Day, and next Monday it may probably be fourth, as far as one may judge by the present rate of progress with public business. There are now, exclusive of Wednesdays, only some fourteen days of Parliamentary time available before the commencement of the Easter recess, and if, as Mr. Balfour has promised, four days notice of the second reading is to be given, it seems pretty safe to anticipate no debate this side of the holidays. But one never knows what may turn up; the four days notice may not be forthcoming, for, as La Rochefoucauld has it, "Nous promettons selon nos espérances, et nous tenons selon nos craintes," which, being interpreted, means that Mr. Balfour's fears for the progress of the measures to which the Ministry is pledged may render his hopeful promise untenable. Opposition on the commercial clauses of the Bill is foreshadowed by a question which Mr. Kimber (Wandsworth) asked on Monday last. One of the clauses inserted by the Select Committee of the House of Lords last year provides for a preferential right of payment to simple contract creditors in cases of liquidation, and Mr. Kimber sought to ascertain the Government attitude in respect to this proposal, which has so vital an effect on existing securities. Mr. Ritchie, in reply, first repudiated on behalf of the Ministry the paternity of the clause, just as he has done in the case of the Pharmacy clause, and then proceeded to say that he could make no statement as to the official attitude to be adopted in regard to any proposal in the Bill; he expressed

the hope, however, that the House would refer the whole Bill to a Grand Committee.

COMMITTEE PROCEDURE is apt to lead to confusion unless one bears in mind the provisions of the Standing Orders which regulate the House. There are Select Committees, which are specially appointed to discuss specific questions; Joint Committees, consisting of members of both Houses and having defined duties; Committee of the whole House, which requires no explanation; and Standing Committees, also called Grand Committees, which are set up at the commencement of the Session to deal with measures containing clauses affecting particular departments of national activity. Thus, there is a Committee on Law, and another on Trade. It is usual when referring a Bill to the Standing Committee to which it pertains to add to that Committee some dozen or fifteen representative members of the House who are interested in the measure, or who have manifested a desire to investigate the probable effects of some of its more important clauses. A case in point is the Food and Drugs Bill of last year, which went to the Committee on Trade and received the active attentions of Mr. Strachey and Sir Charles Cameron, who, if we remember rightly, were temporarily added to the Committee. The proceedings of these Committees terminate before each sitting of the House, and cannot be prolonged without permission of the House, which, it may be added, is frequently given when time presses. It must not, however, be supposed that Grand Committee takes the place of the Committee of the whole House, through which the Bill has to pass prior to its third reading—it is supplementary to the popularly-called "Committee stage," and serves as an additional refining process for highly controversial measures. With these rough facts in view, one may evolve an opinion as to the length of time during which it will be possible, if the Watch Committee deem fitting, to worry the Government in respect to Clause 2.

THE QUESTION of Municipal Trading is to receive investigation at the hands of a Joint Committee of both Houses of Parliament which will be very shortly constituted in pursuance of a promise given late last Session and repeated early in the present Session. It is understood that the terms of reference to the Committee will be confined to considering and reporting as to the principles which should govern the powers given by Bills and Provisional Orders to local authorities for industrial enterprise either inside or without their sphere of jurisdiction. The motion for effecting the appointment of this Committee is down on the paper as we go to press, and stands in the name of the Government Whip—Sir W. Walrond, Bart. (Tiverton).

GREAT OPPOSITION is promised to the Chancellor of the Exchequer's proposal to extend the duty on brokers' contracts hitherto confined to share operations, to contracts on the sale of all goods. Mincing Lane is in revolt, and several London M.P.'s, headed by Sir A. Rollit, have memorialised the Chancellor on the subject. Sir W. Houldsworth (N.W. Manchester) on Friday, 9th, asked the representative of the Treasury whether the word "broker" in the Budget resolution contemplated the inclusion of all sales or purchases by agents acting on commission for a principal, and if not, what limitation was to be understood. Mr. Hanbury, in reply, defined "broker" to refer only to persons carrying on the business of a broker, and it would not therefore have so wide an application as was suggested. He did not, however, attempt to specify what constitutes "carrying on the business of a broker," and his answers will scarcely satisfy the trading community. Mr. Harwood, of Bolton, asked a question with reference to memoranda of sales or purchases forwarded to principals by agents, but he was asked to wait until the Finance Bill was circulated. It is hinted that a fitting compromise will be arrived at by Sir Michael Hicks-Beach after his consultation with representatives of the various chambers of commerce.

PHARMACEUTICAL SOCIETY.

Evening Meeting.

The fourth evening meeting of the Society took place at 17, Bloomsbury Square, London, W.C., on Tuesday, March 13.

The PRESIDENT, Mr. Martindale, occupied the chair. The first communication was a paper on

THE COMMERCE OF DRUGS,

by Mr. E. M. HOLMES, and is printed at page 278.

Mr. HOLMES added that since the paper was written some "Uganda aloes" had come under his notice. Upon first hearing of that drug he thought it was strange that aloes should come from Uganda, and he had since ascertained that the drug in question had come from Mossel Bay, at the Cape of Good Hope. It was prepared from *Aloe ferox*, by Mr. S. A. Deacon, of Herbertsdale. The drug was entirely sun-dried.

The PRESIDENT said that vagaries of commerce sometimes produced such a scarcity of supply of the true drugs that pharmacists had to scour the country to get small quantities of them. Commerce had even failed at times to produce such a common thing as gum arabic.

Mr. J. S. WARD said the Pharmacopœia required that the amount of resin in scammony should be 70 per cent. and the amount of ash 3 per cent. True natural scammony with only 3 per cent. of ash was never found without vastly more than 70 per cent. of resin. The amount was generally 80 to 85 per cent.

Professor GREENISH said that what Mr. Holmes had told them that evening appeared to afford some support to his contention regarding the importance of as absolute and minute a study as was possible of the genuine drugs, and not so much a comparison of them with the substitutes for them. It seemed to him that by the actual study of the drug—chemically, microscopically, and physiologically, as well as macroscopically—they would be able to identify the genuine drug, even though it might be a matter of some patience and difficulty. If they were not able to do that, they did not know the genuine drug with sufficient accuracy. If they had no means by which they could distinguish one drug from another, he could not see what was the object of separating them. With regard to the weight they should place on the study of commercial varieties of drugs, it seemed to him that if a student had received a careful grounding in the scientific part of the subject he would be able to apply the knowledge which he got in that way to the discrimination of those drugs which were presented to him in the course of his ordinary business dealings. Mr. Holmes had mentioned the case of acacia. Anyone carefully instructed would be able to compare the acacias with the Pharmacopœia description, and he would detect without much difficulty those drugs which were not fit for pharmaceutical use. Amongst the subjects which Mr. Holmes had chosen there were other drugs which were specially interesting, saffron being an instance. Recently a former student of the school sent some saffron, which had been sold as ordinary saffron, and was found upon examination to be half calendula, dyed possibly with aniline dye. It was common in Germany, and could be mixed with genuine saffron just as one pleased. Aconite was also a subject which seemed to have a good deal of interest, for he believed they were apt to ascribe to their colleagues on the Continent less discrimination than they possessed. He had formerly always thought that the aconite was collected very carelessly in the summer when it ought to have been collected in the autumn, but he now believed that the Germans were of opinion that the summer root of the aconite plant was the best and the strongest. If one examined the ordinary German aconite he would find that it had evidently been collected in the summer. He was by no means convinced that English aconite was so much superior to the German, and he did not think that its superiority had ever been

proved. He did not know how it could be proved except by a physiological test. Japanese aconite was interesting. Some little time ago he saw a notice to the effect that there were two kinds of Japanese aconite root sold in the market. He went into the subject at the time, and the difficulty was solved in a very simple way. He found in one parcel of the roots two kinds joined together, and the difference was simply that the one root was a parent root and the other the daughter root. He believed they were generally separated, but if a parcel were searched through they would be sure to be found combined. No one knew how difficult it was to get reliable information concerning the commerce of drugs. It could not be obtained by reading books. One must go into the market and see for himself.

Mr. UMNEY said the commerce of drugs must always be an interesting matter to everyone who handled drugs, and to a wholesale druggist it was a matter of vital necessity to understand the commerce of drugs and the great laws upon which markets depended. He referred more especially to the law of supply and demand. Mr. Holmes had done good service in calling attention to these matters. He should like to state publicly that there was no man to whom wholesale druggists and drugbrokers on the east side of Temple Bar—and, indeed, all persons who handled drugs in the City—were more indebted than to Mr. Holmes. With regard to such a simple drug as aconite, he had found that he had bought it at 4d. a lb. and sold it at 3s. a lb., and he had bought the same drug back at 16s. a lb. Could a better instance be found of the fluctuation of drugs? That had all happened within the last four or five years. Kino came into the London market till London was simply glutted with it, and no purchasers could be found except those who bought it up quietly and stealthily to retain it till it would pay them handsomely. At last it became a monopoly. It went up to 16s. a lb., and it had gradually gone down again to 1s. 6d. Cubebs, which were now worth 20s. a cwt. in the London market, had formerly been sold at £25 a cwt. The conditions of growth had altered. The Dutch now grew cubebs very largely in Java, and the conditions of the production of this and other drugs differed enormously from the conditions which prevailed in days gone by. No better instance of that fact could be given than cinchona bark. Ninety per cent. of the whole cinchona bark of the world was now grown at Java. England was no longer the drug market of the world. For instance, cinchona bark for making quinine could now be bought at Amsterdam. With regard to jaborandi, ninety per cent. of the import went to Liverpool, and varieties of the drug were only seen occasionally in London. While pharmacists were desirous of upholding the Pharmacopœia preparations of *Pilocarpus jaborandi* for galenicals and fluid extracts, he saw no reason why other kinds of jaborandi should not come in and be used. They did not confine themselves to one variety of cinchona bark for making quinine, but they took whichever happened to be the cheapest. With reference to strophanthus, Mr. Holmes was quite right. He (Mr. Umney) had again and again seen different varieties, but he had always been most particular to look for *Strophanthus kombe*, and he did not think that he had ever had any other variety in his warehouse, but the brokers who sold drugs by auction were not particular about what they sold. Mr. Holmes had not mentioned Indian aconite. That came in occasionally in considerable quantity, and the market was now almost constantly supplied with Japanese aconite. English aconite was put into the Pharmacopœia because the subject of the aconites was thought to be in a chaotic condition, and it was considered that the best way out of the difficulty would be to prescribe English aconite root, so that the tincture might be made from a root which had been grown under their very noses. Mr. Holmes spoke of the root being sold at 6d. and at 1s. 6d. If the root could be bought to-morrow for 4d. he (Mr. Umney) would buy it at that price; but, on the other hand, if he had to pay 3s. for it he should do so. The same consideration applied to all drugs, almost without

exception. As to scammony, there was a little bit of ancient history attaching to it. In the 1867 Pharmacopœia the standard scammony was then 80 per cent., and there was an action in the Law Courts on the subject. The matter was taken up very strongly by Mr. William Squire, and it was proved that 80 per cent. natural scammony was only obtainable with very great difficulty, though it could be got occasionally. Then the standard was put down to 75 per cent., and in the last Pharmacopœia unfortunately it had been put down to 70 per cent. He had for years known that the British Pharmacopœia ash standard was too high, and certainly the resin stood too low. He believed that a 75 per cent. standard would be better. Resin of scammony had become responsible for the almost entire displacement of natural scammony. He should think that the proportion of natural scammony, as compared with the resin of scammony extracted from the root, was not a one-hundredth part of what was used formerly. The root had come very largely into London. Sometimes it could be bought for 17s. 6d. a cwt., and sometimes it fetched 40s. As to saffron, he had recently examined samples with 15 per cent. of ash, and he always regarded the ash more than the colour. He believed that the Pharmacopœia proportion of ash was not to exceed 6 per cent. He had recently examined some with 10 per cent. It was a common practice in some parts—not in Valencia—to load saffron with sulphate of baryta. Hanbury showed that fact twenty-five years ago. The sulphate of baryta was made adherent to the saffron by means of glycerin. When an infusion was made and allowed to stand the subsidence of the mineral matter was seen. With regard to grinding, they did not always take a uniform loss of 10 per cent., as Mr. Holmes had said. Opium lost 20 per cent. and some drugs lost 5 per cent., but perhaps the average was 10 per cent.

Mr. HEAP expressed the interest with which he had listened to the paper. He was inclined to agree with Mr. Holmes rather than with Professor Greenish on the necessity of studying drugs from a commercial point of view. Mr. Umney had emphasised the importance of that point not only to the wholesale druggist but to the pharmacist as well. The instance with regard to acacia which Mr. Greenish had mentioned illustrated the point. There was a distinction between the scientific knowledge and the scientific nomenclature of gum arabic and the commercial, and he did not think that anyone could reconcile the two. As to scammony, he thought that Mr. Umney would agree that there would not be much difficulty in obtaining a sample which would give the high proportion of 80 per cent. of resin. As to saffron, it was commonly known that the Alicante saffron was little more than an adulterated form of the saffron which was exported in a comparatively pure condition from Valencia.

Mr. GLYN-JONES joined in thanking Mr. Holmes. He wished to ask him whether there was any reason why the Government should not take to some extent the same action with regard to imported drugs that they took with regard to imported articles of food, and compel the importers to properly designate and describe the articles which they imported. It had been suggested to him that the reason was that there were not any producers of drugs in this country to be protected, as there were producers of agricultural products. But it seemed to him that the distributors of drugs had a right to be protected. He agreed with Mr. Umney that the importation of crude drugs which were beneath the standard might be allowed, but he thought that druggists had a right to insist that they should be properly designated or labelled, so that if there was a wrong description the blame might be allocated.

Mr. UMNEY, replying to the last speaker, said that he was one of the deputation which waited on Mr. Walter Long with reference to the question of separating drugs from the Sale of Food Act, and he strongly put before Mr. Long the question of having an inspector of drugs in London. He pointed out to Mr. Long that some of his confrères objected very strongly to an inspector of drugs, because it was supposed that he would destroy all the goods which were not up to a certain standard, and that then chemists and druggists

would be to a certain extent undone. There was no reason why cummin seed and anise seed which might have been damaged by water should not be used for producing essential oil, and there was no reason why cinchona bark which had been damaged should not be used for producing quinine, just as much as bark which was absolutely sound. When he was chairman of the chemical section of the London Chamber of Commerce some three years ago he went before the Committee which was dealing with the Sale of Food and Drugs Bill. The question involved had been urged upon the Legislature from different points of view. It was very much to be regretted, of course, that many points in the recent Act had been passed, and that there was not such a strong move as there might have been to give the Act its proper position.

Mr. MACEWAN said that one point in connection with supply and demand which Mr. Holmes had not touched upon was excellently illustrated at present by cascarilla, the quality of which drug had been deteriorating immensely during the last few years. There was considerable scarcity, and, as far as his information went, that condition was due to a great extent to the difficulty of getting at the trees. He believed that the plant had become extinct in one or two places where formerly the drug was collected. There was an allied instance in the case of ipecacuanha. Apparently the region from which the official ipecacuanha was derived was becoming to some extent depleted of the plant. It was supposed to have been very much depleted when the price was low, but the price had recently gone up to three times the normal value, and the consequence was that ipecacuanha was now pouring into London. It was said that labour had been taken from collecting rubber in order that it might be used for collecting ipecacuanha. Pareira root was rather interesting to him from the fact that when he was examined in the Minor and Major the spurious drug was the one which was recognised as official. He did not know why that should have been the case, but it was so when he left Edinburgh.

Mr. GLYN-JONES said that he judged from Mr. Umney's answer to him that he had not made his question quite clear. The question he asked was not whether there was any reason why the authorities should not have the same power with regard to drugs as with regard to tea, which was, under certain conditions, to destroy it. He quite saw that it would be unfair to destroy an article that was not up to the B.P. standard. But under the present law the authorities had power to fine the importer of an article of food, not for importing it, but for not properly designating it and describing it. He only asked why a similar power should not be enforced with regard to drugs? He did not suggest that drugs should be destroyed.

Mr. HILLS said that Mr. Holmes had not told them whether they could get the Pareira root which was described in the present British Pharmacopœia. He had something to do with the present British Pharmacopœia, because in his official capacity he was Chairman of the Pharmacopœia Committee, and he recollected that medical men were very anxious that the drug should be retained in the Pharmacopœia. He believed that the pharmacists were rather anxious to get rid of it. Medical men said that it was of considerable value, but when the experts set to work to determine what the drug was, there was very considerable difficulty, and the Committee did not quite know what drug it was that the medical men had found to be of so much advantage to their patients. Would Mr. Holmes in his reply be good enough to tell them whether there was any of the genuine drug easily obtainable, and whether he thought there was any difference in therapeutic value between the one and the other?

Mr. FORSTER said that he had heard Mr. Holmes with great pleasure. Unfortunately, they were not all leading pharmacists, and they wanted a few more of Mr. Holmes's lectures in order to improve their position in that respect. He had sometimes worried Mr. Holmes with questions with regard to strophanthus, and he

believed that he had regularly bored him on the subject. He thanked him very much for his paper, and hoped that he would give them more such productions.

The PRESIDENT said that Mr. Holmes had mentioned something about jaborandi. He (the President) found many years ago that he got the best from Pernambuco. Apparently the nearer to the Equator the drug was grown the richer it was in alkaloid. One sample which he got from Assumption, two thousand miles further south, was void of all alkaloid. He remembered an importer once showing him specimens of strophanthus, and telling him that several importations had arrived at once, and that they were all different, but he mixed them all together, as he wanted to sell the whole lot, and it was of no use to keep them separate. *Strophanthus kombe*, which was now official in the Pharmacopœia, had a dull bluish-green appearance, with silky hairs. With regard to aconite the Japanese was not true *A. napellus*. It had a strong tingling taste, even a more tingling taste than the *A. napellus*, or the German, or the English, or even than the *Aconitum ferox*. The action on the tongue was well marked, and undoubtedly the drug was very poisonous. It ought not to be used in place of the true aconite. The latter could now be got of English growth without much difficulty, but it was higher priced than the German. He was afraid that life was too short to allow them to go into the histology of the whole of the official drugs, as Professor Greenish would have them to do, but the study of a few should be taken up by students. They knew the expert knowledge which Mr. Holmes had acquired, principally by looking at things, although Mr. Holmes was a histologist to some extent as well. Mr. Umney had, of course, acquired a similar experience by his long attendance at the drug market. He believed that the rule of the London drug market sales was *Caveat emptor*. A drug was sold under the hammer for what it was. The buyer bought it with his eyes open, or if he did not like it he could leave it. He believed that the vagaries of commerce were such that the fluctuations of the market were greater in drugs than in any other class of goods which came into the market. He had in stock some quinine which had cost him 13s. 4d. an ounce. It was a special brand, and was sometimes wanted. The bark from which it was obtained varied almost as much in price as the salt obtained from it. When he was in Jamaica last year the planters told him that there were some millions of cinchona plants in the Blue Mountains, which were almost entire waste in consequence of the competition with the growth in Java and other parts of the East. Cane sugar also had been displaced by competition, and the only yield of any importance was that of bananas. The planters were now taking to growing bananas and sending them to the United States instead of growing sugar and cinchona bark. As to the contract system in hospitals, he thought that it would be very useful if dispensers would pay attention to getting samples of drugs and seeing that the bulk was equal to the sample.

Mr. HOLMES, in reply, said that he was very much obliged to Mr. Ward for pointing out a weakness in the Pharmacopœia with regard to scammony. He believed that scammony with 70 per cent. of resin would contain more ash than the Pharmacopœia stated. He held very strongly that they ought not to use crude drugs in medicine at all. A crude drug was always liable to vary in strength. As to Professor Greenish's remarks, they represented one point of view, and he (Mr. Holmes) perhaps represented the other. There was a good deal to be said for both. What Professor Greenish taught he taught as thoroughly as anybody could teach it. But, on the other hand, it was to be remembered that a man who went into business had to buy and to sell, and he had his living to get. If he wished to do business he must know the difference between senna at 7d. a lb. and senna at 2s. or 2s. 6d., and he did not think that histology would teach him that. There was a commercial side to the question as well as a scientific side. As to aconite, it might be true, as Professor Greenish said, that the German aconite gathered in summer was as rich in alkaloid as the

English root gathered in the autumn, but there were twenty varieties of aconite known. They were not all of equal strength. There was an alkaloid which gave the bitterness but did not give the tingling taste, which occurred in those species which were gathered when the flowers were on the plant. Those persons who cultivated aconite were very careful, if they grew different varieties, to keep them separate. He had listened with very great interest to Mr. Umney's remarks. Mr. Umney always told them something worth hearing. He had had a knowledge of the trade for more years than he (Mr. Holmes) could remember, and he was a most careful business man. It was quite true that kino had varied exceedingly. He had been told that the reason why it was such a high price was that it was now used for colouring wine. As to jaborandi, much of the drug came to Liverpool. Some varieties contained only half as much pilocarpine as the genuine jaborandi, but there was no reason why they should not be used for hair washes. For use in medicine, however, they ought to have something which they could depend upon. They did not want to use as a medicine something which would not produce the proper effect. Alicante saffron was the kind which was chiefly adulterated now. Formerly Barcelona saffron was very much adulterated. One of the most interesting adulterations of late years was made with soluble salts. Nitrate of potash was one of the things used, and it was found that the saffron deflagrated when it was burnt to ash. He might answer Mr. Glyn-Jones by saying that a jaborandi came into the market some time ago quite different from the ordinary jaborandi. He did not know its proper name. It was not possible to name all the things which came into the market and to say what they were. The importers offered the drugs in the names under which they received them. As to cascarrilla, which had been mentioned by Mr. MacEwan, he did not think that the tree was extinct, for two months ago he saw some very fine quills as big as his finger. Pareira root, which had been referred to by Mr. Hills, was a drug which had a history. Mr. Hanbury, who was a very conscientious man, sent over to Jamaica to get some of the drug, and when the root came to England it was found that it was not what the Pharmacopœia described. It had only one ring, for instance, whereas the true variety had several rings. Obviously there was a mistake somewhere. Shortly afterwards he (Mr. Holmes) got some samples from Messrs. Hearon, Squire, and Francis, and took them to the British Museum and compared them. He found that they were *Chondrodendron tomentosum*. In the meantime Mr. Hanbury had named his specimen according to the specimen in the Kew Herbarium, but it was wrongly named there. Therefore he (Mr. Hanbury) had practically to take the name found at the British Museum to describe the article. As to the question whether the genuine drug was obtainable, he believed that several firms could supply as much as Mr. Hills was likely to want. As to Japanese aconite, he could only say that he got a specimen from Japan and that it did not correspond with *Aconitum fischeri*. He had now some plants labelled *Aconitum fischeri* which had been obtained from the Botanic Gardens, Edinburgh. He was growing them, and perhaps he should be able to give some information about it another year.

Mr. J. SLINGER WARD next read a paper on

SOME WEST AFRICAN DRUGS,

which is printed at page 279. At the conclusion of the paper,

The PRESIDENT said that thanks were due to Mr. Ward for bringing the paper forward. It might contain the nucleus of some very interesting further researches.

Mr. HOLMES thanked Mr. Ward for the trouble which he had taken in examining the drugs. It must be remembered that the drugs which had been described were offered in the markets in Sierra Leone just as herbs were offered in country places in England, and they were used by the natives for different diseases. What Mr. Ward had read gave an idea of the way in which drugs were used by the natives. Guinea grains meant grains of paradise. As to the

pepper, a small quantity was in London some time ago. The guinea pepper he believed was something quite different. It had a very useful action on the mucous membrane. The fruit generally grew in clusters. It had a hot taste, something like pepper, and for that reason it was called guinea pepper. The third drug of which Mr. Ward spoke was an exceedingly interesting bark, and it possessed some peculiarities which he had never noticed in any other barks. Differences could be discerned by means of a lens in different specimens. With regard to the African peach root that article was used right away from Sierra Leone down the west coast, and also on the east coast to Natal, as a sort of tonic for indigestion, and he believed that it was used with great success. He noticed that the expression in the paper "If he sneezes he will recover" had amused the meeting very much. It would be remembered that when the prophet raised the son of the Shunamite woman the child sneezed. The sneezing was mentioned as a sign of life and an indication that the child would recover.

Professor GREENISH said that the collection of drugs which had been shown by Mr. Ward opened out a very important field for investigation. Here were a number of drugs which awaited identification. He believed that Mr. Holmes would tell them that in the Museum upstairs there were others which awaited identification. The number of workers at present was only very small. No doubt the examination of the drugs would give very interesting results to anybody who had time to undertake it.

Mr. HOLMES then read a paper by Mr. J. C. Stead on

OTTO OF ORRIS,

which is printed at page 280. At the conclusion,

Mr. HOLMES said he thought that the paper showed them that English chemists were not at all behind others in the preparation of essential oils.

Mr. W. C. ALLEN said that the subject before the meeting was certainly one of very great interest to him. Although the ordinary concrete oil of orris root which had been referred to was very peculiar, the particular oil which had been brought before them that evening was one which they had not at present touched at all. He did not feel able to add anything to the discussion upon the article itself, but the matter was of very great interest, and particularly so because on former occasions they had met in commerce with an article which had been called liquid oil of orris, but which was an entirely fictitious and sophisticated article. It had received the name of oil of orris because it had the flavour of the orris root. The name was given that the article might be sold.

Mr. UMNEY said that the oil which had been described was quite a novelty, and they were very much indebted to Mr. Stead for bringing the subject forward. The process by which it was produced was not given, but he imagined that now that attention had been called to the subject there would be other workers, and certainly the matter would be taken up in Germany, and they would soon know something about it. He should strongly commend the subject to manufacturers of essential oils in this country. English pharmacists might learn something about it. The concrete oil of orris had to be kept at a certain temperature, or it would solidify. Only those persons who could distil on a very large scale could work with the essential oils, because the yield was very infinitesimal. Even the ordinary concrete oil of orris was worth 24s. or 25s. an ounce in large quantities. The oil described was very expensive indeed. It was well worthy of investigation.

EXHIBITION OF SPECIMENS.

Mr. HOLMES subsequently exhibited and described various specimens. One was a substance called dionin, a hydrochloride of ethyl morphine. It has the action of morphine, but is nearly four times as soluble as the hydrochloride of that alkaloid. Its use is not followed by the morphine craving, and the salt does not cause irrita-

tion when injected. Another substance shown was iodipin. It is intended for internal use. It does not produce symptoms of iodism when used. Another substance was bromopin. It does not produce what was known as bromism, or irritation when used for hypodermic injections. Attention was also directed to a sample of fat which had been sent for investigation from Jamaica, by the director of the Botanic Gardens there.

Library, Museum, School and House Committee.

At the ordinary monthly meeting of this Committee, held on Wednesday March 14, the following statements respecting the Society's Libraries and Museums in London and Edinburgh were presented:—

ATTENDANCES.

	Total.	Highest.	Lowest.	Average.
Museum (February)	462	40	7	19
Library (February).....	502	30	9	21

CIRCULATION OF BOOKS.

	Total.	Town.	Country.	Carriage Paid.
London (February)....	163	89	74	18s. 10d.
Edinburgh (February)	135	108	27	1s. 8d.

DONATIONS TO THE LIBRARY (LONDON).

- Radcliffe Library, Oxford:—Catalogue of books added during 1899.
 University College of South Wales and Monmouthshire:—Calendar, 1899-1900.
 Geological Survey of Canada:—Annual Report for 1897.
 Mr. David Hooper, Calcutta:—Akakia, an ancient Eastern medicine, 1899.
 Mr. R. T. Baker, Sydney:—On an Apocynaceous plant yielding large edible tubers; Contributions to a knowledge of the Flora of Australia.
 Pharmaceutical Society of Ireland:—Calendar, 1900.
 Royal College of Physicians of London:—List of Fellows, etc., 1900.

DONATIONS TO THE LIBRARY IN EDINBURGH.

- Dr. L. Dobbin, Edinburgh:—Lectures on the History of the Development of Chemistry, by A. Ladenburg, 1900.
 Pharmaceutical Society of Ireland:—Calendar, 1900.
 Mr. Alex. Noble, Edinburgh:—*Pharmaceutical Journal*, 1896-99. Seven vols.

DONATIONS TO THE MUSEUM IN LONDON.

- Mr. J. Medley Wood, F.L.S., Botanical Gardens, Durban:—Fruits of *Cola natalensis*.
 Mr. J. G. Whiffen, London:—Specimens of commercial nux vomica seeds including Bold Bombay, Bold Cochin, Saigon, and Madras varieties.
 Professor W. G. Greenish, F.I.C., etc.:—Specimen of Anise bark from Madagascar.
 Messrs. Hodgkinsons, Clarke, and Ward:—Specimens of native African remedies from the Gold Coast.
 Mr. W. E. Miller, London:—Forty-three specimens of Chinese drugs.
 Messrs. Wright, Layman, and Umney:—Specimen of flat bark of *Cinchona Calisaya*, var. *boliviana*.
 Mr. A. Heap, London:—Specimen of "Uganda" aloes.

DONATIONS TO THE MUSEUM IN EDINBURGH.

- Messrs. Wyleys and Co., Coventry:—Specimens of an average and a selected sample of Asafetida in the tear.
 Mr. H. W. Jones, Coventry:—Specimen of Uganda Aloes.
 Dr. R. Stewart McDougall, M.A.:—Galls of *Retinia resinella* on *Pinus sylvestris*.

PURCHASE OF BOOKS.

The Committee authorised the purchase of the undermentioned works:—

FOR THE LIBRARY IN LONDON:—

- Ladenburg's History of Chemistry, by Dobbin, 1900.
 Lowson's Text-Book of Botany.
 Collective Indexes of the Journal of the Chemical Society, 1873-1892.
 Index of the Bulletin de la Société Chimique, 1889-98.

FOR THE LIBRARY IN EDINBURGH:—

- Lowson's Text-Book of Botany.
 Wurtz's Elements of Modern Chemistry.

Publications Received.

ANÆSTHETICS: THEIR USES AND ADMINISTRATION. By Dudley WILMOT BUXTON, M.D., B.S. Third edition, pp. 320, cr. 8vo. Price 6s. London: H. K. Lewis, 136, Gower Street, W.C., 1900. From the Publisher.

A TEXT-BOOK OF MATERIA MEDICA FOR PHARMACEUTICAL STUDENTS. By W. A. KNIGHT, Ph.C., Pereira Medallist. Pp. 320. Price 9s. net. London: Clive and Co., Bookseller's Row, W.C. 1900. From the Author.

PHARMACEUTICAL REGISTER OF VICTORIA for 1899. Printed and published under the direction of the Pharmacy Board of Victoria. Melbourne: Robert S. Brain, Government Printer. 1900. From the Publishers.

AKAKIA: AN ANCIENT EASTERN MEDICINE. By DAVID HOOPER, F.C.S. Reprinted from the *Journal, Asiatic Society of Bengal*. Vol. LXVIII., Part II., No. 4. 1899. From the Author.

LECTURES ON THE HISTORY OF THE DEVELOPMENT OF CHEMISTRY SINCE THE TIME OF LAVOISIER. By Dr. A. LADENBURG. Translated from the second German edition by Leonard Dobbin, Ph.D. (With additions and corrections by the author.) Pp. xvi. + 373. Price, 6s. 6d. net. Edinburgh: The Alembic Club (W. F. Clay, 18, Teviot Place). 1900. From the Publishers.

THE MEDICAL ANNUAL AND PRACTITIONER'S INDEX, 1900. Pp. lxxx. + 871. Price 7s. 6d. net. Bristol: John Wright and Co., Stone Bridge. 1900. From the Publishers.

MORLEY'S PHILATELIC JOURNAL. Vol. I., No. 3. March, 1900. Edited by A. PRESTON PEARCE. London: Walter Morley, 15, Brownhill Gardens, Catford, S.E. From the Editor.

THE CALENDAR OF THE PHARMACEUTICAL SOCIETY OF IRELAND, 1900. Corrected to January 3, 1900. Vol. XXIV., pp. 206. Price, paper cover, 1s. 6d. Dublin: The Registrar, 67, Lower Mount Street. From the Registrar.

DIE SCHMERZLINDERNDE WIRKUNG DES ASPIRIN. Von Dr. R. WEIL. Sonderabdruck aus "Allgem. Med. Central-Zeitung." 1900, No. 4. WELCHES EISENPRAPARAT SOLL MAN BEI CHLOROSE ANWENDEN? Von Dr. JULIUS WEISS. Separatabdruck aus "Die Heilkunde Monatsschrift für Praktische Medicin." December, 1899. MITTEILUNGEN UBER HEROIN. Von Dr. JACOB WIESNER. Separatabdruck aus der "Deutschen Aerzte-Zeitung." Heft 3 February, 1900. UEBER ASPIRIN, EIN NEUES ANTIRHEUMATICUM. Von Dr. E. ROELIG. Sonderabdruck aus der "Deutschen Medicinischen Wochenschrift." 1900, No. 5. Elberfeld: Fried. Bayer, and Co. 1900. From the Publishers.

UNIVERSITY COLLEGE, BRISTOL.—Meeting of the Governors and Report of Council for the Session 1898-99. Pp. 43. Bristol: University College, 1899. From the Secretary.

NEW REMEDIES.

DIURETIC ACTION OF MULBERRY LEAVES.—In Siberia an infusion of 2.5 Gm. of mulberry leaves in two cupfuls of boiling water is a popular diuretic. The leaves are infused for eight or ten hours, and a cupful of the infusion, which is not unpleasant to take, is drunk night and morning for three days.—*Bull. Gen. de Theran.*

SILVER SALTS IN ACUTE PNEUMONIA.—Ciccainiga reports on sixty cases of acute lobar pneumonia in which treatment by silver nitrate was clearly beneficial—only three of the cases were fatal. The dose given was 10 centigrammes for children from eight to ten years, up to 25 to 30 centigrammes for adults, in pills or suspension. In urgent cases an injection of a 0.5 per cent solution of protargol was injected hypodermically. Beyond some vomiting, no ill effects were observed.—*B.M.J. Epit.*, 1, 1900, 24.

ROYAL INSTITUTION.

A lecture was given on Friday, March 2, by Major RONALD ROSS, D.P.H., M.R.C.S., on

Malaria and Mosquitoes.

Malaria, or malarial fever, is a complaint of considerable importance because of the large number of people that suffer from it. For example, in 1897 the white and black troops in India numbered 178,000 men; out of these no less than 75,000 were admitted into hospital for malarial fever, without counting those cases of fever which did not necessitate taking the patient into hospital. The complaint is not in itself serious, but is responsible for a mortality of five million people a year in India alone.

The symptoms of malaria are recurrent attacks of fever. It comes and goes, every third or second day, or even daily, hence receiving the name quaternian, tertian, or quotidian fever. The discovery of quinine in the seventeenth century led to the differentiation of malaria from other forms of fever, because it was found that this drug is a specific for malaria.

Pringle, a celebrated Anglo-Indian army surgeon, studied the mode of spread of malaria and connected it with stagnant water. He thought it was caused by a mist rising from the ground. In the middle of the nineteenth century a black pigment, called the malarial pigment or melanin, was found in the blood, liver, and spleen of malarial patients. In 1880 Laveran discovered the parasite of malaria by observing in its body the substance melanin. The parasite is a unicellular organism, one of the Protozoa. He and other scientific men made an exhaustive study of these parasites within the human body. They found that the organisms increase in the blood by means of spores. A spore enters a corpuscle, increases in size, reaches maturity, and divides into a number of spores which are liberated by the bursting of the mass. This process is continued *ad infinitum*.

There are several types of this organism, which are found in men, monkeys, bats, frogs, and birds. It is a curious fact that there are produced also other bodies, crescentic in shape in one species; they are sexual, and therefore are termed gametocytes.

In the blood they have no function, but after exposure to air for a few minutes these crescentic bodies become oval, then spherical, and after fifteen minutes develop into a number of wriggling bodies. Several theories were put forward to account for their presence; Laveran held that they were part of a living process, while others considered their production to be associated with the death of the organism.

In 1883 King found that malaria was conveyed by mosquitoes, and various theories were put forward by Laveran, Manson, and Bignami. Manson's theory was the only one of these which was of practical value, and it was Manson's theory alone which led to the solution of this great problem. Manson considered that the wriggling bodies were connected with the disease, being disseminated by some suctorial insect, just as the Texas cattle-fever is carried by a tick. The author undertook to verify Manson's theory and began work in India, at Secunderabad, in 1895. The task was attended by great difficulties. Over 1,000 mosquitoes of the genus *Culex* were examined during two and a quarter years, without result; he then went into a malarial district and found a different species—*Culex fatigans*, of the genus *Anopheles*—with spotted wings. On examination, the parasite was found in its stomach.

Next year he completely traced the development of the malaria parasite of birds in the mosquito, and finally succeeded in infecting a number of certain healthy birds—viz., sparrows and larks—with malaria by the bites of mosquitoes in July, 1898. It was proved that the wriggling bodies were not zoospores, but microgametes of two sexes, by the fusion of which a zygote was formed. One interesting point may be mentioned in speaking of the mosquito. It is not, as is generally supposed, an ephemeral insect living only for a day, but is capable of living for months if regularly fed.

Indeed, Bancroft has kept them alive for two and a half months in Australia.

In December, 1898, these investigations were repeated and confirmed by Koch and Grassi, and by Bignami and Bastianelli, who also succeeded in infecting healthy men by the bites of mosquitoes in Italy. Since then great developments have taken place in the investigations. In August, 1899, the malaria expedition was sent to Sierra Leone, in order to study the habit of the malarial mosquito in that colony, with a view to the prevention of the disease. The mosquito theory explains all the facts known about malaria, and no objections are raised against it. The prevention of the malaria may be attained by the destruction of *Anopheles*.

The first of a course of lectures was given at the Royal Institution by the Right Hon. Lord RAYLEIGH, M.A., D.C.L., LL.D., F.R.S., on Saturday, March 3, the subject being

Polarised Light.

Double refraction, the first phenomenon that led up to the discovery of the polarisation of light, was observed by Erasmus Bartholinus. A crystal of Iceland spar or a thin slice of tourmaline is generally employed in order to get double refraction of a beam of light. If, for experiment, a thin slice of tourmaline be arranged in a lantern so that it allows light to pass through perpendicularly, two images may be obtained. If another thin slice be now added, the light passes through partially, but on turning round the second at right angles to the first, the part where they overlap is quite dark. This experiment shows the sided character of polarised light. In considering wave-motion three main characteristics have to be borne in mind—(1) The wave-length, which has nothing to do with the direction of the light or the distance traversed, but is applied to the distance from the crest of one wave to the crest of the next; (2) the velocity of propagation; (3) the periodic time, the distance which a wave advances in unit time.

The vibrations of light are transverse, and not like those of sound, longitudinal. This statement is seen to be correct, because otherwise the phenomenon of polarisation would be unexplained. When the refracted and reflected ray together make a right angle, then the best conditions are obtained for getting polarised light. Brewster formulated a law which is of great importance—the angle of incidence of light on water must be such that the tangent is equal to the index of refraction. Light may be oppositely polarised; it should be mentioned that in this connection the opposite of north and south is east and west, and not south and north.

In order to demonstrate the polarisation of light, a board about thirty feet in length may be placed in a vertical position. At a distance of about three feet from the top a bar is fixed transversely at about three inches from the board, so as to allow a long rope hanging from the top of the board to pass between it and the bar. The rope may be manipulated from the ground; on giving it a succession of shakes at right angles to the board waves are set up which are stopped by the bar; but when the rope is shaken in a direction parallel with the board, from side to side, the waves pass beyond the bar. By shaking the rope in a circular manner a compound wave runs along it, part of which—the perpendicular component—is stopped by the bar, but the remainder, which is a horizontal wave, travels beyond the bar. Again, if the bar be replaced by a grating of parallel bars arranged at right angles to the board and the rope similarly shaken, it will be found that waves perpendicular to the board pass through the grating, and horizontal waves are stopped by it.

These preliminary experiments form an introduction to the subject of the polarisation of light. Just as a circular motion set the rope vibrating with a compound wave, so light may vibrate transversely in two directions—say, north and south, and east and west. Light, on passing through one Nicol's prism, vibrates in one direction only; on passing it into a second Nicol's prism arranged at right angles to the first, no light passes through, since that which was vibrating in the second direction is now cut off.

LETTERS TO THE EDITOR.

The Approaching Council Election.

I have been strongly pressed by numerous friends to come forward again as a candidate for the Pharmaceutical Council, and this I should have liked to have done, but I am met by a difficulty which is, I fear, insuperable—namely, that the date and time of meeting of the Council is the same as that fixed by our City Council at Oxford, at the meeting of which I must be present, as, being chairman of the Sanitary Committee, with its numerous sub-committees, there are often matters of importance brought forward which demand my presence. Moreover, I do not believe in half-hearted work. Therefore, I regret very much to say that I shall not be able to avail myself of the kind offices of my friends, who expressed a wish to nominate me. At the same time, I offer them my hearty thanks, and also the large number of my *confrères* who so kindly supported me at the last election. As I am starting for North Africa on Tuesday next, I thought it would be well at once to communicate the sole cause which prevents me from standing as candidate at the forthcoming election.

Oxford, March 10, 1900.

G. CLARIDGE DRUCE.

I believe that there are a large number of members of the Society who, like myself, are convinced of the necessity for securing the return of at least three or four new members to the Council at the forthcoming election. Past experience has shown that unless some concerted action is taken the success of new candidates is doubtful. I believe that if those, who feel strongly the need for change in the personnel of the Council, will act together, that we should be able to achieve our object. I should therefore be glad to receive a post-card from every member of the Society who shares these views. I should also be obliged if any member who has been nominated as a candidate, and who would appreciate such organised support, will communicate with me.

159, East India Dock Road, Poplar, E. W. S. GLYN-JONES.
March 14, 1900.

The Federation Circular.

Three copies of the Federation Circular Letter and Clause A have been signed by David Lister (South Queensferry), James Chapman (Kirkliston), Findlay Stuart (Broxburn), A. Tweedie (Bowness), Thomas Lumsden (Linlithgow), Annie Y. W. Spence (Linlithgow), Francis Rae (South Queensferry), David Reid (Bathgate), John Freeland (Bathgate), Marshall Thomson (Bowness), C. M. Spence (Linlithgow), Edward Spence (Linlithgow), Alexander Spence (Linlithgow), and I have been asked to send a copy to each of the three following M.P.'s: Alexander Ure, Esq., M.P., Linlithgow County; John Wilson, Esq., M.P., Falkirk Burghs, which includes Linlithgow; and also to Campbell Bannerman, Esq., M.P., Stirling Burghs, which includes South Queensferry. You will notice that every registered chemist resident in the county of Linlithgow has signed.

Linlithgow, March 12, 1900.

ALEXANDER SPENCE,
Local Secretary, Linlithgow County.

Stamping Fees—Glass Measures.

Having read in your Journal, of March 3, the report of the Deputation of the City of London Corporation to the Board of Trade, will you permit me to state, for fear of misapprehension among chemists and druggists, that the question of stamping fees brought under the notice of the President of the Board of Trade, on the 12th ult., had reference only to publican's glass measures and not to the fees charged on apothecaries' graduated glass measures, or any other denomination of weight or measure.

Weights and Measures Office,
42-6, Whitecross Street,
March 12, 1900.

A. J. STREET,
*Chief Insp'ctor of
The Corporation of London.*

The Duties of Local Secretaries.

In your report of the Council's proceedings I notice that a motion to consider something about local secretaries was agreed to. The local secretary is not much "in the know," and so is not in his proper position to advocate the need there is for all those on the Register being members of the Society. If the motion is intended to keep the local secretaries "posted" as to what the Council are purposing doing for the welfare of the members of the Society, well and good. If not, I fear that any motion will be useless. To my mind, the real use of the local secretary is to have the members in his particular district well in hand, so that matters of importance may be dealt with promptly. I would suggest that (1) the local secretary should be required to send in a complete report as to how the practice of pharmacy is carried on in his district; (2) the number of shops and by whom conducted, principals or assistants; (3) population of each town (or burgh); (4) whether dispensing is done by the medical man. This suggested report would furnish instructive reading to the London authorities, and they could then compare the conditions of pharmacy in the Scotch provinces with that which obtains, say, in Oxford Street, London.

March 10, 1900.

A LOCAL SECRETARY (23/41).

The Pharmaceutical Society and Public Dispensers.

I venture once more to beg space in your columns for the purpose of ventilating this question, but not in a "shrieking, hysterical" spirit, with a view to claiming a "divine right" for those licentiates of the Society holding public appointments. Still, I am bold enough to maintain that we have a right to expect more help and encouragement from the Society than we have received hitherto, and I also think that any improvement we obtain with regard to our professional status and pay will have a favourable reaction on the position of our brethren engaged in the retail trade, because medical men, and others too, would learn to look on chemists generally as being worthy of more confidence and respect than is generally at present accorded to them. Personally, I have little ground for complaint, chiefly, I suppose, on account of the high esteem earned by my predecessor during many years' service, but I know some important institutions where the porters receive greater consideration at the hands of the authorities than do the dispensers many of the latter, too, are men of considerable ability and irreproachable character, and I cannot help feeling indignant that such things are possible. There is no doubt that some medical men make their dispensers the scapegoats for the injuries they imagine themselves to suffer at the hands of prescribing chemists, etc. I am ready to admit that in past years these appointments have not always been held by men of the best class, but better men would be obtained for the very responsible work if proper inducements were held out. The Dispensers' Association will, I hope, prove a very good means by which dispensers can unite to bring about an improvement in their status, but I think that both the Society and the trade at large ought to support its efforts. It may be that the Society's officers are afraid of coming into conflict with the Apothecaries' Hall, as I believe the latter body claims that theirs is the only proper qualification for these posts, but I don't think it would need much effort to convince the authorities that such a claim is preposterous, considering what a farce the Apothecaries' Hall examination is. Besides, that body's influence in the medical profession even is on the wane. What is needed not only in this, but in other difficulties connected with the pharmaceutical profession, is more grit and determination on the part of the Society in supporting the just claims of the body it is supposed to represent.

March 8, 1900.

A HOSPITAL DISPENSER. (23/35.)

The New Spirit Duty.

I think it was well to call the attention of the trade to the alteration in the spirit duties, but in my opinion the matter in the

second column at page 256 has not been put quite as it should be, and for this reason:—The duty on spirit of proof strength before the alteration was made was not 10s. 10d. as you state, but 10s. 6d.—the additional impost of 4d. being upon foreign spirit of wine—whereas the 10s. 6d. was on home produced spirit. Any spirit exported from the colonies was charged with the duty of 10s. 8d., and any spirit from Hamburg 10s. 10d. per proof gallon. The addition to these prices therefore would be 6d., in other words the duty now on home-produced spirit is 11s., upon colonial proof spirit (say Jamaica rum) 11s. 2d., and upon Hamburg spirit 11s. 4d. per proof gallon.

London, March 13, 1900.

CHAS. UMNEY.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

REMEDIES FOR BLUSHING (J. W. M.—40/1).—We regret we have no information regarding the composition of the so-called remedies you refer to.

SYRUP OF CHERRIES (W. J.—39/34).—Cherry juice and sugar, *q.s.*, to produce a syrup of *s.g.* 1.33. Heat till the sugar is dissolved, and strain as soon as boiling commences.

SQUILL AS A MOUSE POISON (D. M.—39/33).—The recipe you refer to appeared in the *P. J.* for August 19 last. Wheat is soaked thoroughly in an infusion of fresh squill bulbs (1 to 5) and dried quickly.

MICROSCOPIC PREPARATIONS (H. W. W.—40/2).—You will find working formulæ for all the preparations you mention in Squire's 'Methods and Formulæ' (Churchill, 3s. 6d.), a copy of which you ought to possess.

SEMIVITRIOUS OF LEAD (G. A. T.—39/25).—The old name for litharge was semivitrified oxide of lead—Plumbi oxydum semivitreum. It was so called in the *P. L.*, 1836. You should specify flake or scale litharge when ordering it.

THE COMPANIES BILL (A. W. H.—24/9).—The letter drafted by the Federation of Local Pharmaceutical Associations fully answers the purpose. Why not procure a copy of that to send to your Parliamentary representative, and persuade your friends and neighbours to do the same.

SHORT DISTANCE TELEPHONE (J. L. G.—39/31).—You should be able to procure what you require of Messrs. H. W. Cox, Limited, manufacturing electricians, Cursitor Street, Chancery Lane, London, W.C. You will also find numerous advertisements of low-priced instruments in the *English Mechanic*.

WORKS ON CELLULOID AND GUNCOTTON (W. B.—38/31).—We know of no work devoted solely to the subject. You will probably find more information on the subject by referring to the *Journal of*

the Society of Chemical Industry than in any other publication. M. Eissler's 'Handbook of Modern Explosives,' which you would probably obtain from Lippincott, 10, Henrietta Street, Covent Garden, W.C., may be useful to you.

HAIR DYE.—(C. F. G.—39/23).—It is difficult to advise you as to the exact tint you wish to produce, but possibly the following will answer:—Pyrogallol, 1 Gm.; 70 per cent. alcohol, 60 Gm.; balsam of Peru, 2 Gm.; solution of ferric acetate, 12 drops. The hair should be well washed with rain water containing a little solution of ammonia, and then thoroughly dried before applying the dye. Try a little first on some of the hair cut from the head to see if it produces the desired tint.

BACTERIAL TREATMENT OF SEWAGE (J. T. G.—39/19).—You will find the information you require in the London County Council report on the subject, also in a paper on the subject in the *Journal of the Royal Agricultural Society* of last year by D. Pidgeon, and another paper published in the *Imperial Institute Journal* for this month. You will also find several valuable papers on the subject in recent volumes of the *Journal of the Society of Chemical Industry* and the *Journal of the Society of Arts*.

PREVENTION OF CAKING IN BISMUTH MIXTURES (F. C. I. W.—39/29).—We do not see that your suggestion is practicable. In the first place, the "pellicle" you speak of cannot well be pear-shaped, since a pellicle is a very thin skin such as collodion forms. Probably you mean "pellets." It would scarcely be safe to send out a bottle of mixture containing small pear-shaped pellets of glass, especially an opaque mixture such as you mention, for the patient might easily swallow one. If larger pellets were made inside the bottle it would be rather costly, and the bottle would have to be thicker than ordinary, or the pellets, when shaken up, would break it. We should not advise you to patent your idea.

ASSAY OF CRUDE "CARBOLIC" ACID (T. G. S.—39/5).—The following methods are given in Allen's 'Commercial Organic Analysis,' vol. i., pp. 310-311:—*Determination of tar oils.*—Introduce 5 C.c. of the sample into a graduated tube, and add gradually 10 C.c. of 9 per cent. soda solution, agitate well, and set aside. The phenol on cresols will dissolve, while the neutral oils will form a layer above or below the alkaline liquid according as the admixture consists of heavy or light tar oils. The volume occupied by this oily layer is then read off. The separation of the tar oils is facilitated by the addition of a known volume of petroleum spirit, which must, of course, be deducted from the total oily layer which separates. Lowe's method for the approximate assay of crude carboic acid is as follows:—100 C.c. of the sample is placed in a retort without any special condensing arrangement and distilled, the liquid which passes over being collected in graduated tubes. Water distils first, followed by an oily fluid. When 10 C.c. have distilled the receiver is changed, and the volume of water read off. If the oily liquid floats it contains light tar oil. If it sinks it may be regarded as hydrated phenol, containing about 50 per cent. of pure carboic acid. The next portion of the distillate consists of anhydrous acids, 62.5 C.c. of which are distilled off. The relative proportion of carboic and cresylic acid in this distillate may be approximately determined by observing its congealing point. Mixtures of pure carboic and cresylic acids are then made in varying proportions until the same solidifying point is obtained. The residue in the retort consists wholly of cresylic acid and the higher homologues of phenol. Another method is to liberate the mixed acids from the alkaline liquid after separation of the tar oils and to submit a portion of them to fractional distillation. Phenol boils at 182° C., cresol from 198-203° C.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MARCH 17, 1900.

OF CRYING FOR THE MOON.

SINCE the LORD CHANCELLOR first intimated his concern about the fact that the Pharmacy Acts do not cover the case of drug stores carried on by joint-stock companies or corporations, a year and eight months have elapsed; but it is very doubtful whether the position of affairs has been appreciably altered since. It has certainly not been altered for the better, whether regarded from the standpoint of pharmacists or of the general public. Lord HALSBURY then urged that a common-sense view of the question requires that companies should be treated in exactly the same way as individuals, and the late Lord HERSHELL supported that contention; but other views have since prevailed with the LORD CHANCELLOR, and he must now be regarded as one of the most prominent persons who consider that there is no occasion to impose the same legal obligations on companies as on individuals. In fact, he has placed himself in the somewhat invidious position of posing as the chief legal opponent of the just claims of registered chemists and, to that extent, he must be regarded as a foe rather than a friend. Whatever the reason may be, Lord HALSBURY must now be reckoned as an adverse factor and, unfortunately, he appears to be able to carry the Government with him in this matter; as witness the exposition of Mr. RITCHIE's views as given by the PRESIDENT of the Pharmaceutical Society at the meeting of the Council last week. It would appear that the Government is indisposed to interfere with company trading in pharmacy otherwise than to regulate it. The PRESIDENT of the Board of Trade insists that in many cases the public has less protection in the case of individual chemists who carry on branch shops than they would have in the case of company pharmacies conducted by legally-qualified persons, and he is even disinclined to accept the view that chemists' titles are essentially personal in their character. The position of affairs is thus an extremely serious one, and it is incumbent upon every registered chemist to face these facts and to make up his mind whether or not he is prepared to give up all or anything that the Legislature was understood to have secured to him conditionally upon his satisfying the duly-con-

stituted authorities of his fitness to undertake the duties appertaining to his qualification.

The Council of the Pharmaceutical Society, as recorded in last week's Journal, has decided to oppose the clause in the Companies Bill, which would have the effect, if it became law as it stands, of recognising a right on the part of unqualified individuals who associate themselves together to carry on business as corporate bodies to usurp the privileges connected with the qualifications of registered chemists. But successful opposition of the clause will have no other effect than that of leaving matters in the same unsatisfactory position as they now are. The real fight will yet have to take place; companies will remain outside the scope of the law then as now, and the whole question involved in the usurpation of chemists' titles and practice by associations of unqualified individuals will have to be reopened sooner or later. In all probability that will be in connection with a measure intended to amend the Pharmacy Acts directly, and dealing with other matters as important in their way as the question of company trading. Notwithstanding that, however, any clause dealing with the company pharmacy problem may be expected to constitute the most contentious part of a Pharmacy Acts Amendment Bill, and it must be regarded as an absolute necessity that there shall be complete agreement on the subject within the ranks of registered chemists. It has been simply pitiful to note of late to what extent disunion can pervade those ranks, and how, with regard to a point on which all might not unreasonably have been expected to agree, the most diverse opinions have existed and been allowed to instigate support of more or less antagonistic policies. Such conduct is the more to be deplored when it is borne in mind what almost overwhelming forces are arrayed against chemists. So great and well-organised are those forces that it may be a matter for serious consideration whether any further action will be justified on the pharmaceutical side unless a proper sense of discipline can be maintained in the ranks and full trust reposed in those who have been selected as fit and proper persons to watch over and protect the interests of their fellow-craftsmen.

It has been repeatedly urged by representative pharmacists that it is no use "crying for the moon," and those who have been most conspicuous in ignoring that injunction have probably done as little as anyone in the direction of taking or suggesting steps of a practical nature to assist in the accomplishment of their desire. The "moon," in the present instance, may be taken to represent the abolition of what is spoken of as company trading in pharmacy, and that, it is safe to say, is now as unlikely of attainment as the most impossible thing that any reader of the Journal can conceive of. It would have been a difficult object to attain twenty years ago, if the whole of the registered chemists of Great Britain had been united in supporting the demand for it; how much more difficult then must it be to persuade an unwilling Government and a sceptical Legislature of the reasonableness of such a demand at the present time, with the chemists of the country split up into several distinct groups, supporting views more or less opposed? The suppression of bogus companies, the regulation of genuine concerns, and the restriction of titles and strictly

professional practice to duly qualified individuals may fairly be regarded as the utmost that can be secured. Moreover, it is safe to say that the successful carrying through of a policy based on those lines would be of the greatest possible advantage to chemists, as well as to the general public, and that anything further in the nature of protection might safely be left to individual enterprise. The properly trained chemist with a fair business aptitude neither requires nor desires to be perpetually coddled and hampered by the State in the practice of his calling. He need only ask that none shall be permitted to assume what it has cost him much to take up, without paying the same price. Beyond that, he should demand nothing except a fair field and no favour, and he ought to consider it an absurdity to "cry for the moon" when everything he really requires can be supplied under reasonable conditions in this prosaic workaday world.

JAMES WATT.

By the death of JAMES WATT, Pharmaceutical Chemist, which took place at his residence at Haddington, on Sunday, March 11, there has passed away another of the older generation of Scottish Pharmacists. Mr. WATT was born at Lybster, Caithness-shire, in 1822, and was educated at a private school, where the study of Latin was a prominent feature. He served an apprenticeship of seven years with the late Mr. BREMNER, of Thurso. After its completion opportunities for starting business on his own account presented themselves at Tain, in the north, and Haddington, in the south. He had almost decided on the former when, on the advice of Mr. BREMNER, he resolved to go south, and commenced business in Haddington in 1845, and has continued there ever since. The business gradually grew to be one of the largest and most typical provincial pharmaceutical practices in Scotland. In 1853 he became a member of the Pharmaceutical Society, and has acted as local secretary from 1870 till the present time. He took considerable interest in the work of the Society, and for six years he was a member of the North British Branch Executive and for four years a member of the Council, from both of which he retired in 1889, owing to age and infirmity. On the death of his younger son, who conducted the business, about two years ago, he assumed as partner a former apprentice, Mr. W. P. WILSON, who now becomes sole proprietor. Mr. WATT took a deep and lively interest in public life. He was for forty years a member of the Haddington Town Council, and filled the offices of magistrate and Provost. He was also a Justice of the Peace for the county of East Lothian. He was a lifelong abstainer and non-smoker, and was one of the founders of the original temperance movement in Scotland. He took an interest in literature, and was Con- vener of the Haddington Library Committee, which he was the means of removing from an old obscure building to new premises, where it is much more serviceable to the community. In politics he was an ardent Liberal. He was a member of the Free Church, but though often asked to accept office in it, he always declined. In his younger days he was a keen sportsman, and in bowling and curling proved himself a match for all comers. He had been married for fifty-one years and he and

Mrs. WATT who survives him, celebrated their golden wedding about eight months ago. He had nine children, including two sons, the elder of whom, FRANK WATT, survives. He is a barrister in London, and has also made a name in literature, among his books being a 'Life of John Bright' and 'Picturesque Scotland.' Mr. WATT was greatly respected by all who knew him as a man of integrity and high principle. He possessed a good deal of Scotch tenacity and caution, carefully considering every detail before expressing an opinion. A few weeks ago he appeared in better health than for many years, but he was suddenly struck down by a paralytic shock about a fortnight ago and passed away peacefully on Sunday last at the ripe age of 78 years. His brother, DONALD WATT, chemist, Lybster, Caithness, died in 1895.

PHARMACY AND THE UNIVERSITY OF LONDON.

THE new Regulations made for the University of London by the Commissioners appointed under the University of London Act, 1898, which have now been published, confirm in the main the information published in the *Pharmaceutical Journal* for September 16, 1899, page 289. Provision is made for the existence of thirty-two Boards of Studies, including a Board of Pharmacy, and the names of the Pharmaceutical Society's three professors appear in the list of members of the teaching staffs of public educational institutions, within the appointed radius, who are recognised as teachers of the University, thus:—

AT THE SCHOOL OF PHARMACY OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN

Collie, John Norman	Ph.D. (Würzburg), F.R.S., F.L.S.	} <i>Chemistry</i>
Green, Joseph Reynolds	Sc.D. (Cantab), F.R.S., F.L.S.	
Greenish, Henry George	F.I.C., F.L.S.	} <i>Pharmaceutics</i>

The names of the three professors also appear as Teachers of the University, in the list of members of the Faculty of Science of the University.

An interesting point in the new regulations is that Students of the University are to be permitted to submit the results of research as qualifying them to receive the degree of Bachelor of Science. The intermediate examination must previously have been passed, and, at least two years before it is proposed to submit the results, application must be made to the Senate for permission so to do. Each application must be accompanied by (i.) a certificate that the Student is at least nineteen years, (ii.) a statement of the general nature of the research, and (iii.) evidence of the applicant's fitness to prosecute it. The application may be referred for consideration to the Board or Boards of Studies dealing with the subject in which the Student proposes to prosecute his research, and the Senate may cause the Student to be registered as a research Student, in the event of the Board or Boards making a report to the effect that the proposed research is suitable for the purpose, and that the Student is fit to undertake it. In any list of successful candidates for the degree, successful research Students are to be placed in a separate division.

ANNOTATIONS.

THE APRIL EXAMINATIONS will witness a departure from the course of procedure hitherto followed in respect to the conduct of the Major examination. Hitherto it has been the practice for the Major questions—that is to say for the written portion of the examination—to be prepared jointly by certain of the members of the Society's two Boards of Examiners, but experience has clearly shown that the postal consultations necessitated by that rather cumbersome system involve not only great inconvenience without appreciable advantage, but also possibilities of still graver moment. In future, therefore, the Council has decided that each Board of Examiners shall examine its own Major candidates, precisely as it now conducts the test for its own Minor candidates. To guard against the danger of evolving a condition favourable to a divergence in the standard of examination at the two centres, the questions set in London and those set in Edinburgh will be published in the Journal side by side, unless it be found impossible to arrange for a simultaneous examination. It so happens that the April Major dates cannot be made to dovetail; for in London the practical chemistry test will probably have to be taken on the 7th and 9th of April and the written work on the 10th and 11th, whereas in Edinburgh circumstances render March 29, 30, and 31 more convenient days. Henceforth, however, it is expected that a very much nearer approach to simultaneity will be possible.

THE ANNUAL DINNER OF THE PHARMACEUTICAL SOCIETY is to be held at the Hôtel Métropole on Tuesday, May 15. It was decided at a preliminary meeting of members of the Society, held on March 14, that the time, price of tickets, and general arrangements should be as last year, the details being left as usual to the discretion of the Committee. That body will consist of the President, Vice-President, and Treasurer of the Society, together with Messrs. Allen, Arkinstall, Attfield, Bourdas, Carteighe, Eastes, Hill, Hills, Hopkins, Mathews, Paul, Robinson, Taylor, Umney, and Warren, with Mr. Richard Bremridge as Hon. Secretary. Members of the Society desirous of having their names included in the list of Stewards should promptly notify the fact to Mr. Bremridge.

THE NEW SPIRIT DUTY was referred to at page 256 of last week's Journal, but an error inadvertently crept into column 2, line 6, in copying the figures from the official documents. The line referred to should read "10s. 6d. spirit (excise) . . . 11s. per proof gallon," instead of 10s. 10d. and 11s. 4d. respectively. A letter from Mr. Charles Umney in this week's issue (see p. 289) directs attention to the matter.

ANOTHER BASELESS SLANDER ON CHEMISTS is being circulated, this time in a trivial publication called *Morley's Philatelic Journal*. The March issue of that record of human weakness, as revealed by the stamp-collecting craze, contains some suggestions for improvements in "patent" medicine labels, by a person who styles himself "A Manufacturing Chemist." But the slander referred to is embodied in an editorial note referring to those suggestions, wherein chemists are accused of deliberate fraud. The writer of the editorial note states that he recently visited a number of vendors of "patent" medicines with the double object of securing any old stamps that might be found on preparations now unfashionable, and of asking for such labels as dealers are accustomed to detach from proprietary articles sold in lesser quantities, or used in the course of business. To his great surprise he found, as he alleges, that "it is the almost invariable practice to use over again all the current labels thus obtained, and that this is done as a matter of course without any attempt at concealment." Further, he alleges that "chemists of high repute and eminent respectability have freely admitted their habitual fraudulent evasion of what seems to be regarded as 'an unreasonable duty,' and that "the Exchequer is annually defrauded to the extent of many thousands of pounds by the general indulgence

in this practice." With regard to all the statements quoted an unqualified denial may be offered; in fact, we venture to stigmatise them as deliberate falsehoods.

THE POSITION IN BRIEF, in connection with the Companies Bill, is thus pithily stated by the Secretary of the Pharmaceutical Society, in a circular letter sent to all local officers of the Society:—"The ultimatum of the Government, clearly conveyed through the Minister in charge of the Bill, is—*Clause 2, or nothing*. The Council feels that circumstances do not justify the acceptance of Clause 2, and that the present condition would be preferable both on public and pharmaceutical grounds." It is also explained, as already reported in the Journal, that at the Council meeting last week the President explained the result of his interview with the President of the Board of Trade in regard to Clause 2 of the Companies Bill, and stated that, in view of the strong expression of opinion by Mr. Ritchie, the Law and Parliamentary Committee had felt that in the circumstances no other course was open to the Council than to oppose the Clause. After careful and prolonged discussion, the conclusions of the Committee were adopted, and the Parliamentary Watch Committee, which has been charged with the duty of arranging details for opposing the Bill, hopes to have the cordial co-operation of all local officers of the Society in carrying the decision of the Council into effect when the Bill reaches the Committee stage. Meanwhile, those officers are asked to intimate to their Parliamentary representative their strong desire that they should oppose Clause 2 of the Bill when it reaches the Committee stage, also to suggest similar action on the part of their colleagues. It is further intimated that, immediately before the Committee stage, all local officers and other members of the Society will again be asked to communicate with members of Parliament on the subject.

THE COMPETENCY OF PUBLIC ANALYSTS is, in future, to be properly attested, the Local Government Board having issued an order prescribing regulations with respect to the appointment of such officials. Subsection (1) of Section 3 of the Sale of Food and Drugs Act, 1899 (62 and 63 Vict., c. 51) provides that it shall be the duty of every local authority entrusted with the execution of the laws relating to the sale of food and drugs to appoint a public analyst; and Subsection (5) of the same Section provides that any public analyst appointed under the Sale of Food and Drugs Act shall furnish such proof of competency as may from time to time be required by regulation framed by the Board. The Board has, therefore, framed a regulation requiring that every person appointed on and after January 1, 1900, to the office of public analyst shall furnish such proof as the Board may deem sufficient of his competent skill in the knowledge of (a) analytical chemistry; (b) therapeutics; and (c) microscopy; and the order proceeds to indicate the nature of the documentary evidence to be comprised in such proof. Such evidence of competency is to be furnished by the public analyst to the local authority by whom he is appointed; and it is to be transmitted to the Board by that authority when applying for the Board's approval of the appointment. In the case, however, of any person who was appointed to the office of public analyst with the approval of the Board between January 1, 1891, and the date of the order, or who is appointed to that office for the first time after the last-mentioned date, the regulation will not apply in the event of his subsequent appointment as public analyst.

THE BRITISH PHARMACOPEIA has been so freely quoted from by the compilers of works of reference during recent years that the book has come to be looked upon as common property, the contents of which might be drawn upon and utilised at will. Apparently, however, the Executive Committee of the General Medical Council is of opinion that the time has come to protest against such a view of the matter, for a small committee has been appointed to prepare

statement on the subject and report to the President, with the view of obtaining the opinion of Counsel as to whether extracts from the Pharmacopœia which have been incorporated, or are proposed to be incorporated, in certain publications infringe the copyright of the work.

BOTANICAL MATERIAL FOR MICROSCOPIC WORK can now be obtained with much less difficulty than was the case a few years ago, but many readers of the Journal will doubtless be glad to know that Messrs. James Backhouse and Son, Limited, of York, are now prepared to supply such material, having established a special department for the purpose, under the management of Dr. Arthur H. Burt. Specimens can be obtained to illustrate the myxomycetes, algæ (including diatoms), characeæ, fungi, hepaticæ, musci, pteridophyta (prothallia and vegetative organs), gymnosperms, and the more important orders of angiosperms. The histological section includes carefully made microscopical preparations guaranteed to illustrate all the more interesting and important structural and anatomical features of the usual types of plants employed in botanical demonstrations. The list issued by the firm consists of fifty quarto pages, and a number of convenient order forms bound up with it are arranged so as to facilitate the ordering of specimens for class purposes.

THE PROPOSED TAX ON PRODUCE CONTRACT NOTES does not commend itself to traders, and deputations from the London Chamber of Commerce and London and Liverpool trades have waited upon Sir M. Hicks-Beach to explain their objections to the tax. It was pointed out that it would be a heavy and unjust burden on brokers, would be easily evaded, and would embarrass trade operations. The Chancellor of the Exchequer, in reply to both deputations, explained the precise nature of his proposals, expressed his sense of the value of the views set before him, which he undertook carefully to consider, and mentioned as a matter which he might have to weigh, the expediency of repealing one of the exemptions to the Stamp Act of 1891, which would make the proposed taxation more general in its application.

THE OXFORD AND DISTRICT CHEMISTS' ASSOCIATION, at its annual meeting, has unanimously passed a resolution urging—as a just protection of chemists' titles—the amendment of Clause 2 of the Companies Bill, and suggesting that the Clause should provide that no company of unqualified persons may use the description of a pharmaceutical chemist or chemist and druggist, or any other title implying registration under the Pharmacy Act, 1868. It will be seen, by reference to the reports at page 296, that the Manchester and Sheffield Associations have also adopted resolutions on the same subject.

THE MANX PHARMACY BILL has been further modified, the clause referring to companies now providing that “No joint-stock company may carry on the business and use the description of chemist and druggist, or chemists and druggists, unless at each place of business of such company the retailing, dispensing, and compounding of poisons or medical prescriptions is conducted exclusively by a pharmaceutical chemist, or by a person registered as a chemist and druggist under the provisions of the Pharmacy Act, 1868, and unless the name of the person so qualified is conspicuously posted in the place where the business is carried on. Anyone acting in contravention of this section shall be liable to a penalty not exceeding £10.” As thus amended, the Bill has again been passed by the House of Keys, after a conference between a deputation from that body and the Legislative Council. It was also agreed to strike out certain additions to the Poisons Schedule and to arrange that any future addition to the British Schedule should become automatically included in that of the Isle of Man.

ENGLISH NEWS.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.—The annual supper of this Association was held at Wilson's Guildhall Restaurant, High Street, on Tuesday, March 13. The newly-elected President (Mr. T. C. Milton) occupied the chair, and Mr. P. F. Rowsell (vice-President) the vice-chair. After supper the Chairman, in patriotic terms, proposed the loyal toast, which was musically honoured.—Mr. C. J. Moor (City Analyst), in proposing “The Exeter Association of Chemists and Druggists,” took the opportunity of thanking the members for electing him a member of the Association, and said that if the different Chemists' Associations throughout the country adopted that course and elected their local analysts members, a good deal of that friction which sometimes existed would be avoided.—The President, who was received with musical honours, regretted that although that was one of the largest gatherings of chemists the Association had held, many of the Exeter chemists were not present. Some, it appeared to him, did not know the value of such an Association as theirs. In his opinion subjects were discussed at their meetings which were of great benefit to the members. He then referred to Mr. Moor's recent address to the Association, and said that as honest traders they should endeavour to support him whenever circumstances might arise to necessitate it. He concluded by expressing the hope that in future Exeter chemists generally would attend their meetings. The meetings were not confined to principals, but they would be delighted to see managers and assistants present.—Alderman Gadd gave “The Visitors,” to which Mr. F. W. Kitts responded.—Mr. D. Reid suggested that arrangements should be made for the holding of an outing next summer, if possible in conjunction with the Plymouth and District Chemists' Association.—The President and Mr. J. H. Lake concurred in the suggestion, which was referred to committee.—The remainder of the evening was spent in conviviality, and the proceedings terminated with the singing of “God save the Queen” and “Auld Lang Syne.”

LANCASHIRE CHEMISTS AND THE COMPANIES BILL.—On Friday, the 9th inst., Sir Wm. Coddington, M.P. for Blackburn, invited a deputation of the North-East Lancashire Chemists' Association to meet him at the County Club, Blackburn, on the matter of the Companies Bill. Councillor Critchley, Messrs. C. Parkinson, W. Wells, and R. L. Gifford attended, and Mr. Wells gave Sir William a concise account of the history of the grievance complained of, and showed how it came about owing to the omission of the words “or persons” in the Act of 1868. He said the intention of the Act was to institute personal qualification and personal responsibility, but the whole effect of the Pharmacy Act had been nullified by limited companies being able, by this fault of the Act, to practise as chemists. The hon. member discussed the matter thoroughly, asking for information on cardinal points. Mr. R. Lord Gifford asked him to note that it was not a “trade” question. “Quite so,” replied Sir William; “I am quite clear about that. It is a professional matter, just as in the case of a doctor or a lawyer. The two clauses are a contradiction, and I cannot understand their appearance.” In further answer to the hon. member's questions, Mr. Gifford said the Lord Chancellor had been impelled to try to regulate the matter by the absurd extent to which the abuse had grown, and the fact of its being included in the Companies Bill was doubtless due to expediency. The hon. member said no settlement would be just except the putting of chemists in Clause 3. He was informed that a suggestion had been made that a qualified directorate would meet the case, but he said that would be impossible and unworkable; in fact, the House would not listen to any such scheme. In conclusion, Sir William said the deputation had a clear case. No limited company should be enabled to do that which it was illegal for individuals to do, and no employé could properly control the business. He hoped the Pharmaceutical Society and the chemists in other towns were enlightening members of Parliament on the

subject, because the opinion of two or three, without general support, would be useless.

ADULTERATED DRUGS IN YORKSHIRE.—In his latest annual report as public analyst to the West Riding of Yorkshire, Mr. A. H. Allen states that out of seventy-eight samples of camphorated oil examined no less than twenty-eight were found to be seriously defective. In most of these the proportion of camphor was materially below the prescribed amount, varying from 17.5 per cent. to as little as 1 per cent. In addition, mineral oil was sometimes substituted for olive oil, and in other cases a mixture of mineral and vegetable oils was so substituted. In one case, where the preparation was found to consist of 5 per cent. of camphor and 95 per cent. of mineral oil, the bottle containing the sample bore a printed label with the following words:—"Camphorated Oil, Beehive Brand. Prepared with finest olive oil and pure camphor." The numerous variations were, he thought, intentional, or due to gross carelessness in the preparation of the article. There was no foundation for the statement, sometimes urged by the defence in mitigation, that the preparation is liable to deteriorate on keeping, owing to the volatility of the contained camphor. Spirit of nitrous ether, or sweet spirit of nitre, is liable to deteriorate by keeping, especially if kept in an imperfectly closed bottle or if exposed to light. It is evident that the potency of a drug depends upon the proportions of its active ingredient, and it is eminently important that its activity should be as nearly constant as practicable. Nothing is more dangerous than a drug which varies materially in its composition, and therefore in its medical activity. That is fully recognised by pharmacists, but unqualified shopkeepers naturally have not the knowledge of the character of drugs which is desirable, nor do they in many cases appear to recognise the responsibility attached to their sale. The plea that a drug has lost its active principles through long or careless storage may be used in mitigation of an offence by such a vendor, but the sale of a drug thus unfitted for use is comparable to the sale of fish or meat unfit for human consumption. A practical difficulty in all proceedings in connection with the sale of defective drugs arose from the fact that the British Pharmacopœia is not established by law as the official standard for the drugs named therein, but is simply accepted as evidence of what such drugs may reasonably be expected to be.

SALE OF BEESWAX.—Cornelius Ryan, grocer, 223, Broadway, Bexley Heath, Kent, was fined 10s., at Dartford Police Court, on Saturday, March 3, for selling beeswax which was not of the nature, quality, and substance demanded, it being certified to contain 41 per cent. of resin. For the defence it was stated that the beeswax in question was part of the stock taken over by defendant with the business.

SCOTTISH NEWS.

ABERDEEN PHARMACEUTICAL ASSOCIATION.—The sixty-second annual meeting of this Association was held in the Governor's Hall, Robert Gordon's College, on Wednesday evening, the 7th inst. There was a good attendance of members, and Mr. Charles Simpson, President, occupied the chair. The various reports for the year were adopted. The secretary's report showed that the Association had been very active throughout the year. Besides the quarterly meetings there were six special meetings to discuss such questions as the storage of Poisons Regulations and the adopting of a uniform poisons' bottle, the Federation suggestions, etc. The membership again showed a gratifying increase, there being now 53 members, which include almost every registered chemist in business in the city. The treasurer's report was likewise very satisfactory, showing a good balance in favour of the Association, notwithstanding that £6 6s. had been paid out of the funds for the year as prizes to the students at the evening school of pharmacy in the

college. Mr. Giles, convener, submitted the Education Committee's report, which dealt with the progress of the classes in the pharmaceutical department of the college, under Messrs. Ellis and Morris. There was a larger attendance at the evening school than last year, and the number who had passed the qualifying examination of the Pharmaceutical Society since the school was established augured well for its future success. All the office-bearers were, re-elected, viz., President, Mr. Charles Simpson; vice-President, Mr. Andrew Craig; Secretary, Mr. John Cruickshank; Treasurer Mr. Jas. Paterson. It was remitted to the Executive Committee to draw up a petition to be presented to the Hon. Jas. Bryce, M.P., and Mr. Buchanan, M.P. (acting for Captain Pirie, M.P., who has gone to the front), asking them to oppose Clause 2 of the Companies Act.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—The annual supper of this Association took place in the Imperial Hotel, Market Street, on Friday, March 9, when upwards of eighty members and friends assembled, and Mr. Fraser McDiarmid, President, occupied the chair. Mr. J. Lennox, in proposing "The Pharmaceutical Society," said the Pharmacy Bill of 1898 rearranged the Society's atoms, and assistants were much obliged to the Society for the different position in which it had placed them. The membership of the Society had increased by about a thousand, and the change had the effect of creating increased interest in the Society with regard to the Companies Bill. All were united as to the restriction of statutory titles to qualified men, but outside that there was endless diversity. The Scotch view was to secure the exclusive use of titles and a regulation of company pharmacy that would secure control by registered chemists. There had recently been a spasmodic discussion on the question of dividing the Minor examination, but it had, apparently, led to no result, as the Council seemed wedded to the idea of uniting a compulsory curriculum to any plan for division. He trusted the matter would not be lost sight of because the present state of affairs called for early amendment. They were all deeply interested in the Society and he felt sure they would all heartily join in wishing it continued prosperity and usefulness. In the absence of Mr. Boa, owing to family bereavement, the toast was acknowledged by Mr. Lunan, who congratulated Mr. Lennox on proposing the toast in a less critical mood than was often adopted at these gatherings. He thought they must recognise the fact that company pharmacy had come to stay and that no policy was possible other than that of securing some satisfactory regulation. One point he wanted to emphasise about the Companies Bill was that the crux of the whole situation was the protection of titles. If that were sufficiently secured they had not much to fear. Mr. J. P. Gilmour, in an eloquent speech, proposed "The Edinburgh Chemists', Assistants', and Apprentices' Association," which was acknowledged by the President. Mr. Rutherford Hill proposed "Kindred Associations," to which Mr. C. F. Henry, Secretary of the Edinburgh District Chemists' Trade Association replied; Mr. W. L. Currie also spoke, and said he believed companies had come to stay, and what they had to do was to see that they carried on the business of dispensing and selling poisons in a perfectly legal manner. The qualified directorate idea was of no use. He did not think they would obtain the sole right to sell and dispense medicines, and should therefore insist that companies carrying on a drug business must do so by the hands of a registered man, and that his name must appear in a conspicuous place both on the place of business and on labels. Mr. Taylor replied for the "Glasgow Chemists' Assistants', and Apprentices' Association," and the evening's proceedings were enlivened by songs, etc., by Messrs. Currie, Murray, Alexander, Rowland, Tait, and Crichton, the latter acting also as accompanist. Dr. Coull proposed "The Chairman," who replied, and a pleasant evening concluded with "Auld Lang Syne" and "God Save the Queen."

FAT STANDARDS FOR MILK AND CREAM.—Some interesting evidence on these points was submitted at a meeting of the directors of the Scottish Chamber of Agriculture in Edinburgh recently. Mr. McCracken, Dunragit, Wigtownshire, whom it is proposed to send as an expert witness to give evidence before the Board of Agriculture Departmental Committee, said that milk and cream, being natural products of varying quality and not manufactured, should be bought and sold without the imposition of any arbitrary standard. If, however, a standard was insisted on, he approved of 2.75 per cent. and 15 per cent. of butter fat as a minimum for milk and cream respectively. Dr. Drinkwater had analysed a number of samples for the Edinburgh Dairy-keepers' Association. He found that the quality of milk stood much higher during the summer months, and especially July, than it did during a winter month like February. The average of twenty samples of morning milk in July was 3 per cent. of butter fat, while the average of forty-five samples of February milk was 2.67 per cent. In the case of individual cows the average varied from 2.1 per cent. to 4.52 per cent. Cows getting a generous feeding of oat straw gave the best results so far as butter fat was concerned. It was a case of breeding for quality of the milk and feeding for quantity. The Ayrshire breed stood very high in regard to quality, though the quantity was small, while Shorthorns gave quantity with less of quality. Cream was found to vary from 15 to 35 per cent. of butter fat. Cream yielding 25 per cent. was regarded as of very good quality, and 15 per cent. was considered the proper minimum. A majority of the Dairy-keepers' Association favoured 2.55 per cent. as a milk standard. Mr. Spier, an expert, considered 3 per cent. not too high, but the Chamber ultimately agreed to 2.75 per cent.

PHARMACEUTICAL SOCIETY OF IRELAND.

At the monthly meeting of the Council, held on March 7, the PRESIDENT, Mr. George D. Beggs, took the chair, and the other members of Council who attended were Dr. Walsh, and Messrs. Bernard, V.P., White, J.P. (Sligo), Kelly, Wells, Grindley, and Simpson. It was stated that the *Medical Press* had apologised for the inaccurate statement referred to at the previous meeting. The receipt of several donations was announced, and a letter was received from a member of the Society stating that through the occurrence of a fire at his premises his license had been burned. It was decided to send him a letter stating that he had passed the license examination. A letter from Dublin Castle sanctioned an arrangement of the Council to commence the Easter examination on the Tuesday before Good Friday. A letter from the Under-Secretary enclosed a copy of a memorial which had been sent to the Lord Lieutenant by James White, of Castleblayney, praying that a penalty of £5, which had been imposed on him for an illegal sale of poison, might be remitted. The matter was referred to the Law Committee to draft a reply, stating that the Council did not think the penalty should be remitted. Some other business having been disposed of, the Council adjourned.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

At a meeting held on March 14, Mr. GEORGE S. WOOLLEY, President, in the chair, some "Pharmacy Notes" were read by Mr. J. H. Hoseason, after which a discussion took place on the Federation suggestions with regard to

THE COMPANIES BILL.

The discussion was taken part in by Messrs. Woolley, Walton, Philips, Kemp, and Pidd, and the unanimous decision of the members present was that the only possible and reasonable course to adopt was to support the Council of the Pharmaceutical Society in opposing Clause 2 of the Bill.

Mr. Kemp moved the following resolution, which was seconded by Mr. Philips:—"That this Association confirms the action of the Pharmaceutical Society, and promises to do all in its power to carry out the advice in the letter tendered this evening."

Mr. KEMP said the danger of having no settled policy was very great, and it was hoped that pharmacists would see the advantage of supporting the Council in opposing Clause 2 as the only feasible plan under the present circumstances. It was also agreed that each individual member would write his member of Parliament to that effect.

Mr. Woolley also moved "That this meeting respectfully suggests to the Pharmaceutical Council the desirability of further agitating for the inclusion of pharmacists along with medical men and dentists in Clause 3 of the Companies Bill."

This was seconded by Mr. KIDD, and carried unanimously.

SHEFFIELD PHARMACEUTICAL AND CHEMICAL SOCIETY.

At a meeting held on March 14, Mr. G. SQUIRE, President, in the chair, the prizes won by students who read papers on "How to Spend a Profitable Half-Holiday" were awarded to A. G. Yates (first) and A. Wright (second).

Mr. SQUIRE then read a paper on "Pharmaceutical Topics," in which he dealt with the present aspect of affairs in connection with

THE COMPANIES BILL,

and explained the position taken up by the Council of the Pharmaceutical Society.

Mr. J. AUSTEN subsequently proposed the following resolution:—"That this meeting is of opinion that the conclusion arrived at by the Council of the Pharmaceutical Society at its meeting on Wednesday last in reference to Clause 2 of the Companies Bill is a correct one and should have the universal support of the chemists of the country."

Mr. J. W. J. TURNER having seconded the motion,

Mr. NEWSHOLME, in supporting, did not think the chemists would be a little better off if Clause 2 were passed. He could not see how it would benefit the chemists of the country. The Companies Bill was brought out to protect capital. If the clause were passed it would place the companies in a far superior position to their present one and the chemists in a much inferior one, from the fact that capital would be used to a far greater extent than at present in running the so-called drug stores, and limited companies would be placed on a far higher pedestal than ever. He did not admit that the companies had any vested interest in the trade. The decision which allowed them to carry on placed companies outside the Pharmacy Act, and those who gave that decision ought to have made it say also that there must be no company pharmacy. It ought to be made perfectly clear that chemists had neither the wish nor the power to prevent the stores from selling ordinary drugs. The Act placed responsibility upon pharmacists in selling poisons, and that really was the only privilege—if he might use the word—that the chemists of the country had. What they were fighting for at present was simply the question of titles and the compounding and selling of poisons. They would like to be able to control the sale of every drug in the Pharmacopœia, but they knew that that was utterly impossible. He believed that if they made their views known to members of Parliament, they would see the matter in a new light. He agreed with the President that nothing ought to be done in connection with pharmacy except in a Pharmacy Act, and he was also of opinion that before the Board of Trade did anything they should consult the Council of the Pharmaceutical Society.

The resolution was carried, and a copy will be forwarded to the Pharmaceutical Society.

CHEMICAL SOCIETY.

There was an unusually large number of contributors present at the meeting held on Thursday, March 1, the President, Professor T. E. THORPE, occupying the chair, therefore requested the authors to communicate the results of their work as briefly as possible.

A paper was read by Dr. JOWETT, on

PILOCARPINE AND THE ALKALOIDS OF JABORANDI LEAVES.

Dr. JOWETT said he had taken up this subject on account of the conflicting accounts given by previous workers. He has repeated the experiments described by them, and finds that he can mainly confirm the results of Petit and Polcnowsky, but entirely disagrees with the statements of Hardy and Calmels, who claimed to have not only proved the constitution of the alkaloid, but also to have synthesised it. He gives the name isopilocarpine to an alkaloid of the same composition as pilocarpine, namely, $C_{11}H_{16}N_2O_2$, which appears to have been mistaken in an impure condition for a pilocarpidine. He has also failed to confirm the existence of jaborine; that which is sold as jaborine being a mixture.

It is probable that the confusion of pilocarpidine and iso-pilocarpine arose from the fact that the leaves now on the market are not those of the original plant *Pilocarpus jaborandi*. Iso-pilocarpine is the principal alkaloid of the leaves now in use.

Mr. Kingzett rose to point out that the composition of the alkaloid was almost identical with that stated by himself in 1876, and should have been noticed by the author.

Mr. DUNSTAN said he was glad to see that the existence of jaborine had been finally disposed of; he hoped the Society would soon hear further results of the continuation of the work. He also reassured Mr. Kingzett that reference was made in the paper to his own work.

Two papers were then communicated by Professor Kipping, one by himself on

ISOMERIC PARTIALLY RACEMIC SALTS CONTAINING PENTAVALENT NITROGEN,

and the other by himself and Mr. Harold Hall on

A NEW SYNTHESIS OF INDENE.

The former paper was a continuation of work begun by the author, together with Mr. W. J. Pope at the Central Technical College, on pseudo-racemic substances. He now attempted to resolve into its dextro and laevo optically active components the externally compensated substance hydrindamine.

The bromo camphor sulphonate of this base was made, and by fractional crystallisation, two different salts, which were not enantiomorphous, were obtained. A long series of experiments upon the nature and differences of these salts was made, but they were undoubtedly composed of the same acid and base in one proportion. It was clear also that their inactivity was not due to autoracemisation. The chloro camphor sulphonate was also made and gave two corresponding salts. Further, if the acid from one salt was regenerated, then, on again neutralising with the base, it gave the two salts as before. The explanation of this behaviour Professor Kipping intimated was difficult; he was prepared to suggest an explanation, but since he had arrived he had been advised not to do so. He believed, however, that four substances were formed, and that these united in pairs to form partially racemic compounds. Professor Armstrong said that although he had been one to advise Professor Kipping not to give this explanation, yet there was here an important discovery in the chemistry of nitrogen. Mr. Pope offering a few comments upon the subject, said that the matter required mature consideration, and suggested that another a symmetric carbon atom might be introduced into the molecule of hydrindamine, and so render it capable of resolution into its optically active components.

Professor KIPPING in reply, stated that derivatives of hydrindamine were being made with this object in view.

The PRESIDENT next announced papers by E. Divers, D.Sc., F.R.S., and T. Haga, D.Sc., on

CERTAIN POTASSIUM SALTS,

the first on potassium nitrito-hydroximido sulphates, and the non-existence of dihydroxylamine derivatives, and the second on the identification and constitution of Fremy's sulphazotised salts of potassium.

Dr. DIVERS rose to say that as time was so limited, he did not wish to say anything of his paper, but on the wish of the President he briefly described the nature and properties of the substances named in the title of the paper.

SOME ACIDS FROM α -DIBROMOCAMPHOR.

A paper by A. Lapworth, D.Sc., and E. M. Chapman, from the laboratory of the Pharmaceutical Society, was read by Dr. LAPWORTH.

The authors converted homocamphoronic acid into a lactone. This hydrolysed giving a ketonic acid. The ketonic acid combined with hydrocyanic acid, and the resulting compound after hydrolysis formed a hydroxy dicarboxylic acid which was capable of yielding an anhydride; the ketone cannot therefore be a δ lactone, but must be a γ lactone.

The ketonic acid, moreover, gave a tribromolactone with bromine.

The conclusions drawn from these facts and from its derivation from α dibromcamphor is that the only formula admissible for it is not in agreement with Bredt's formula.

A paper by W. N. Hartley, F.R.S., and J. J. Dobbie, M.A., D.Sc., was also read on

SPECTROGRAPHIC STUDIES IN TAUTOMERISM,

showing the value of spectrographic method in recognising stereoisomeric compounds, and distinguishing enolic from ketonic forms.

Other papers were taken as read.

It was announced by the President that at an extra meeting of the Chemical Society on Thursday, March 8, at 8.30 p.m. a lecture will be given by Professor Warrington, F.R.S. on "Recent Researches on Nitrification."

At an extra meeting held on Thursday, March 8, the PRESIDENT Professor T. E. Thorpe, F.R.S., in the chair, a lecture was delivered by Professor Warrington, F.R.S., entitled

RECENT RESEARCHES IN NITRIFICATION.

The PRESIDENT remarked that it was not necessary for him to introduce the lecturer, as Professor Warrington had so long occupied a distinguished position among the Society, while his father had been one of its founders.

Professor WARRINGTON said he should chiefly deal with what had been done on the subject since nine years ago, when great advances were made through the researches of Winogradsky, of St. Petersburg. There was at that time a great difficulty in obtaining pure cultures of the micro-organisms concerned in the conversion of ammonia into nitrites and the conversion of the latter into nitrates. Pure cultures were obtainable by two methods. The first was the principle introduced by Dr. Percy Frankland of diluting the solution containing the culture and separating it into drops on the chance of each drop containing a separate individual from which a colony could be produced. The other method was to allow a solution of ammonia to ferment until it was just all converted into nitrite. Since a day or two usually elapses before the nitrate fermentation begins, if a drop of the solution in that condition be put into a fresh ammonia solution, then only the nitrite organisms are nourished. By repeating the treatment the nitrate organisms are ultimately crowded out. Similarly, by excluding ammonia from the culture of nitrate organisms, they were obtained free from the other class. Winogradsky had done much in adding to the methods of working and improving them. He was the first to show that solid mediums could replace the mineral solutions

previously used. By dialysing a 2 per cent. solution of silicic acid a silica jelly is obtained. Magnesium carbonate is mixed with this to neutralise the nitrous acid produced. The growth of the colony can then be observed by the clear spots in the medium where the magnesia has been dissolved by the nitrous acid formed. Since the solution of ammonia has to be very weak, a useful and ingenious method of gradually feeding the organisms was invented by the same scientist. Up to a year ago silica jelly was the best medium known, but a mixture of calcium sulphate with magnesia, called magnesia gypsum, is now used. It is less troublesome to prepare, and the organisms grow on it more quickly. Attempts to grow cultures in agar jelly had always failed until recently, when it was found that by soaking the agar in several successive quantities of water, a peculiar fermentable substance inimical to the organisms was removed, and agar now serves very well for the culture of both the nitrous and nitric kinds. The presence of a little ferrous sulphate in the culture, though apparently favourable, has little effect. As to the nature of the organisms, many different soils from various parts of the world have been examined, and while only one species of the nitric kind has been found, many and often very decided differences have been found in the nitrous. Specimens were shown collected from different countries. They all occur as zooglea, a jelly-like mass of individuals; but some species are capable of changing the zooglea form for a mobile one, in which each individual is free and provided with a tail. They are all capable, including the nitric kind, of absorbing carbon dioxide and converting it into organic material. Quantitative determinations upon this phenomenon have been made by Winogradsky. The conversion of nitrites to nitrates may go on in a neutral medium, and the presence of carbonate is beneficial; but the presence of carbonate is not sufficient for its nourishment; it must have free carbon dioxide. This fact contains a subject of great interest: from whence is the energy derived? It has been suggested that it is supplied in the oxidation of the ammonia and nitrous acid, and it is found that there are as much as thirty-five parts of nitrogen oxidised for one part of carbon fixed; but, on the other hand, bacteria have been found which live in inorganic solutions, use up carbon dioxide, and do not nitrify at all. Sensible heat has been suggested as the source of energy of these, but this is as yet hardly acceptable by scientists. The interesting features of nitrifying organisms have been studied, notably their behaviour towards organic substances. Experiments have been made taking into account the time occupied by similar numbers of bacteria in doing work under different conditions, the basis being the time taken in a totally inorganic solution. In no case was it found that organic substances favoured the action, but with an increase of the amount present the action became suspended, although the organism was not killed. One instructive case occurred, when a solution containing sufficient glucose to render it inactive became accidentally contaminated with a species of mould. The mould ate up the glucose, and nitrification ensued. A remarkable feature of this effect is that the quantity of glucose or peptone necessary to suspend the action of the organism is quite as small as the quantities of carbolic or salicylic acids generally sufficient to stop the action of bacteria. Moreover, it is possible to educate the organism by gradually changing its surroundings. A little ammonia prevents the conversion of nitrites into nitrates. The lecturer had found long ago that sixty-four parts per million was sufficient to prevent the action. According to Winogradsky, as little as five parts per million perceptibly retards the conversion, and although this action of ammonia is so energetic as to compare with that of mercuric chloride on bacteria, yet nitrites are not found in soils at any stage of the fermentation, it is all as nitrate from the beginning. The reason of this is probably twofold: the ammonia solution in the soil is very weak, since the soil absorbs it from solution, and secondly it is due to the large proportion of the nitric organism existing there. An instructive experiment recently published in the *Comptes Rendus* showed that after intensifying the action of the nitric germ, more and more ammonia could be added up to

240 parts per million. Winogradsky has carefully studied whether asparagin urea, and such nitrogenous substances, can be broken up by the ferment, and he finds that when ammonia is excluded and the solution is filtered through porcelain to free it from other organisms the action ceases. The help of other organisms is required to break down such organic substances, and therefore in sewage decomposition the septic chamber is necessary for this breaking down before nitrification can take place. Concluding, the lecturer remarked that one cannot help admiring the organism and its marvellous working. We can chronicle what he does, but there our knowledge ends.

Sir WILLIAM THISTLETON DYER proposed a vote of thanks to the lecturer, remarking that he had said a great deal of Winogradsky's work, but had modestly omitted mention of his own.

The vote of thanks was seconded by Dr. HUGO MULLER and carried with hearty applause.

CHEMISTS' ASSISTANTS' ASSOCIATION.

Thursday, March 8, was "Queen's Day" in London; it was also Chemists' Assistants' Day—the one day of the year when the assistant occupies the higher, and the master the lower, seat at table. Consequent on the first-mentioned event the Holborn Restaurant had been gaily decorated outside with flags, banners, and plants; inside—very appropriately—that magnificent room the "King's Hall" was set apart for the use of some two hundred odd of her Majesty's loyal pharmacists.

The occasion was, of course, the

Annual Dinner

of the Chemists' Assistants' Association, being the twenty-second such.

The PRESIDENT, Mr. F. W. Gamble, was in the chair, Mr. Wm. Martindale (President of the Pharmaceutical Society) being on the right, and Dr. Wm. Murrell, F.R.C.S., on the left. There were also present, in addition to representatives of most of the wholesale houses, Mr. E. M. Holmes (President of the British Pharmaceutical Conference), Mr. G. T. W. Newsholme (Vice-President of the Pharmaceutical Society), Professor Greenish, Dr. J. Attfield, Mr. W. S. Glyn-Jones, and other well-known pharmacists. The spur tables were presided over by Messrs. Arrowsmith, Hymans, Latreille, Martin, Morley, Pearson, Solomon, and Strother.

After a well-served dinner came dessert and a flash-light photograph of the company; then the toast of

THE QUEEN EMPRESS,

proposed in a right loyal manner by the PRESIDENT, and honoured as only a British assembly can honour the toast—with patriotic fervour.

Mr. A. LATREILLE then proposed the toast of

THE MEDICAL PROFESSION.

He said it was, of course, covering old ground to point out the close relationship that existed between pharmacists and members of the medical profession in general. Probably there was never a time in the history of the Association when the affinity and mutual esteem was so great as that which holds at present. The toast was one which had always held an honourable position at the annual dinner of the C.A.A. It was of special interest on that occasion, when the thoughts of all were turned to the South African war. He thought all would agree with him that one of the brightest spots in the campaign was the admirable and most complete way in which the whole of the medical arrangements had been carried out. Our Continental neighbours might venture—with small success, it was true—to sneer and cavil at British methods of military administration, but he did not think for a moment that even the most bitter of the critics could possibly find fault with the way in which the hospital and ambulance work had been and is being carried out for friend and foe alike. No one, on reading Mr. Treves' graphic article in the *British Medical Journal* of the battle of Spion Kop, could fail to realise, with much thankfulness, the account of the

manner in which the tending of the wounded was proceeded with. And again, they must recognise the great patriotism which has been shown by so many members of the medical profession in offering their services for the front. He might instance the splendid example set by Sir William MacCormac—an example which had been cheerfully followed by scores of others, many of whom had gone out with probably small chance of much glory or distinction, but who, nevertheless, had the satisfaction of knowing that they were fulfilling a duty not less noble than those who might be more actively employed. In associating the name of Dr. Murrell with the toast, he, Mr. Latreille thought, required little or no introduction on his part. He was probably well known to most of those present, and the fact of his having connected himself with work which was of great interest to all chemists would insure the cordial welcome which he (Mr. Latreille) anticipated would be extended to him that evening.

Dr. WM. MURRELL, in reply, thanked those present for the cordial way in which the toast had been proposed and received. He especially wished to thank the Association for the honour conferred upon him by associating his name with the toast. He found it by no means an easy task to speak to that toast when he remembered that in previous years they had been addressed by so eminent a man as Sir James Crichton Browne. However, his presence there that evening recalled the days when he was a student at University College, and had for his teacher in pharmacy and dispensing the present President of the Pharmaceutical Society, Mr. Wm. Martindale. At that time he thought Mr. Martindale was a very exacting man. His teaching was thorough and practical; the knowledge he (Dr. Murrell) gained in those days he had carefully treasured up, and had since often palmed it off on students of his own. It was greatly to be regretted that pharmacology had been, practically, dropped out of the medical curriculum. Students were now educated and turned out as medical men knowing little or nothing about pharmacy and dispensing, consequently being unable to prescribe intelligently. Dr. Murrell related several instances bearing out that view of the present system of medical education. One case in point was that of a physician at one of the hospitals, who when prescribing simply indicated the drugs to be compounded, leaving the quantities and dose to be decided by the dispenser. The latter raised an objection to dispensing such prescriptions. On the matter coming before the hospital authorities, the physician said it was the dispenser's business to know the quantities and doses; if he did not know his business he had better be discharged. Having related a few more incidents, Dr. Murrell went on to say that it seemed to him new remedies are now much more frequently introduced by pharmacists than by physicians, and that the pharmacists try them on themselves. The moral of it all was that pharmacists and physicians should work together as much as possible, and in his opinion the more highly educated the physician, the less chance there will be of his dispensing.

A slight digression from the programme was made at this point to enable Mr. E. M. Holmes, the proposer of the toast of

THE CHEMISTS' ASSISTANTS' ASSOCIATION,

to leave at an early stage in the proceedings. Mr. HOLMES having expressed his regret at being compelled to interfere with the arrangement of the programme, said that he thought the members of the British Pharmaceutical Conference who were present should feel highly complimented that their president was asked to propose what he ventured to say without hesitation was the toast of the evening. He said so because the chemists' assistants of to-day will be the masters of to-morrow, and from their ranks will be chosen the future members of Council and presidents of the Pharmaceutical Society; the officers and professors of pharmacy, and possibly other branches of pharmaceutical science. Even the Executive of the Conference and its presidents must be selected from the same source. Moreover, the politicians of pharmacy like Jacob Bell, the men of science like Daniel Hanbury, the men of boundless

energy, the born leaders of men, like the past president of the Society, Mr. Michael Carteghe; the princes of pharmacy, like the present president, Mr. William Martindale—men who have made the name of British pharmacy respected all over the world. All the men of light and leading in pharmacy of the future were bound to arise from the ranks of the chemists' assistants of to-day. He then congratulated assistants as a body on the progress they have made during recent years. Fifty years ago there was no Chemists' Assistants' Association, neither was there any Conference or a "Year-Book of Pharmacy" to keep them up to date in pharmaceutical progress. He hoped the Association would continue to prosper, and he called upon all his fellow members of the Conference present—and the others who ought to be, but as yet are not—to drink the toast in the heartiest manner. He coupled with the toast the name of the President, Mr. F. W. Gamble.

The PRESIDENT, in reply, mentioned that the dinner this year was being held a week later than usual, otherwise they would have been able to celebrate the good news of the previous Thursday—the relief of Ladysmith. However, they were assembled that night on but a little less auspicious an occasion—the Queen's visit to London. Having read a letter from Mr. J. F. Harrington, President of the Western Chemists' Association (of London), regretting his inability to be present, he then referred to a remark made by Mr. Holmes, to the effect that the Association was a training ground for pharmacists of the future. He thought Mr. Holmes had spoken truthfully in that respect. The Association had suffered somewhat during the war-time, as many of the assistants had left the feet of Minerva to follow the god of Mars. He should be delighted if he could persuade all present to join the three bodies mentioned by Mr. Holmes—the Chemists' Assistants' Association, the Pharmaceutical Society, and the Conference, but he could ask all to join the Association, and he felt sure they would then gain that devotion to their craft that they would doubtless join the other bodies. On behalf of his colleagues and himself, he thanked those present for the cordial reception they had given to the toast.

Mr. C. MORLEY (Vice-President) said it was down in his name to propose the toast of that most maligned body,

THE PHARMACEUTICAL SOCIETY.

Although he called it a "maligned body," it was possessed of one or two virtues; he would not enumerate them, however, for he thought they were well known by the general body of chemists. He believed that the reason why many, after passing the Minor examination, became dissatisfied with the Society was because it does not confer upon them all the benefits which they think they ought to have. Of course all present knew that it was quite beyond the power of the Society to confer the benefits many chemists would like to have. Still, he believed that the Society does very well, on the whole, and that the Council does the very best it can, under the circumstances. He would couple with the toast the name of the worthy President and illustrious pharmacist, Mr. Martindale.

Mr. MARTINDALE thanked all for the manner in which the toast had been proposed and received. Mr. Morley had said that the Pharmaceutical Society possessed some virtues. It not only possessed some virtues, but it had many duties to perform. Those duties Mr. Martindale enumerated, and then went on to say that the members of the Council of the Pharmaceutical Society are something like the members of the House of Commons, in that they are part of the great unpaid, and suffer, like members of Parliament, by being the most criticised and maligned of bodies. Both suffer for the doings of their predecessors. He meant that they had their Majuba Hill. The Parliamentary Majuba Hill was being avenged at the present time; that of the Pharmaceutical Society had not yet been avenged. He referred, of course, to the case that the Society lost in the House of Lords twenty years ago. Mr. Martindale here referred to the decision of the Pharmaceutical Council the previous day, to oppose Clause 2 of the Companies Bill, and said it came to that conclusion as being the best way to meet the wishes of

pharmacists generally. They certainly could not accept the clause as it passed the House of Lords last session, and they could not quite agree to regulate pharmacy to be carried on by limited companies. With regard to the judgment of the House of Lords twenty years ago, it gave chemists' assistants a place in pharmacy which much improved their position. He meant that the assistant now takes the place of the qualified proprietor. It necessitated that the actual seller of poison must be the qualified pharmacist. However, he hoped that assistants would be true to their calling and endeavour to uphold the traditions of their craft. He asked them to remember who trained them. They were trained and educated by pharmacists, not by limited companies; therefore he hoped they would not become slaves to the Moloch of free trade. He should be sorry to see pharmacy degraded to big limited companies. In reference to Dr. Murrell's remark about the instruction he received at University College, he was glad to know that his teaching was not quite in vain. He was afraid at the time that the seed sown fell on rather stony ground. It was a pity that medical students were not better trained in pharmacy; they would then be better qualified to prescribe. The practice of keeping ready-made medicines did not enable medical men to select their drugs as they used to do. He again expressed his thanks for the kind way in which the toast had been received.

The next toast should have been that of

THE VISITORS,

but owing to some misunderstanding on the part of the usher, it was not proposed by Mr. Hymans as per programme, Mr. Charles Umney being called upon to respond to the toast before it had been proposed. However, he made the best of the matter, and, commenting on the fact that although forty years ago there was not such an association of chemists' assistants as at present, yet they had the evening meetings of the Pharmaceutical Society, which all the youth of the trade attended. He expressed a hope that they would not neglect the opportunity now, but would attend the evening meetings of the Society in large numbers.

An excellent musical programme had been arranged, and was gone through with but slight alterations.

LIVERPOOL CHEMISTS' ASSOCIATION.

A meeting was held at the Royal Institution on Thursday evening, the 8th inst., the PRESIDENT, Mr. A. S. Buck, in the chair.

Dr. SYMES gave a short account of the work done at the last meeting of the Council of the Pharmaceutical Society and of the position it was intended to take with reference to the Companies Bill. This was followed by a short discussion, and then the PRESIDENT made several announcements, which were as follows:—

1. The annual dinner of the Association will take place at the Exchange Station Hotel on Thursday, the 22nd instant, at 7.15 for 7.30 prompt. Tickets 5s. each.

2. The General Purposes Committee of the Association had proposed that a book should be kept at the Royal Institution in which members should be invited to enter the names of any new or out-of-the-way drugs, chemicals, or other preparations in their stock, so that other members in want of such preparations for filling prescriptions might know where to obtain them.

3. It was proposed to hold a meeting at an early date to consider the terms of the Companies Act.

A telegram had been received from Mr. Theo. H. Wardleworth, F.L.S., who was down for a lecture during the evening on his "Reminiscences of a Tour in the Western Hemisphere," saying that as he was confined to the house with a bad chill, he would not be able to attend. In his absence an address was given by Mr. R. C. COWLEY on the

STORAGE OF DRUGS AND GALENICALS, AND PHOTO-CHEMICAL INFLUENCES.

After some preliminary remarks upon the phenomena of sight, and the effects of various parts of the spectrum in causing chemical

changes in substances, Mr. Cowley considered in detail the various bodies and preparations of the Pharmacopœia and the action of light upon them. The changes in silver, mercury, and iron salts were alluded to; the deoxidation of permanganates, and solution of H_2O_2 , the conversion of soluble morphine and other alkaloidal salts to basic and less soluble compounds, the coloration of phenol and resorcin as well as of santonin, and the complex and interesting effects of light upon fats and oils (both fixed and volatile) were explained as fully as the amount of knowledge of these phenomena existing at the present time enabled the lecturer to venture. In conclusion, it was remarked that the best way to ensure activity and permanence in either drugs or chemicals was to guard them carefully from the light, and that one of the best methods of doing this was to use orange or red glass bottles and jars, so as to prevent the violet and other highly refrangible so-called actinic rays from coming in contact with the contents.

Dr. SYMES proposed a vote of thanks to Mr. Cowley for having filled the hiatus caused by Mr. Wardleworth's enforced absence with such an instructive and practical address. The influence of light on many substances was due to the presence of organic matter, silver salts being more readily reduced in contact with organic matter than when in a pure atmosphere or solution.

The vote of thanks was seconded by Mr. J. SMITH, and supported by Mr. H. O. DUTTON, the latter remarking on the difficulty of obtaining—from English glass-makers, at any rate—shop rounds and jars of the colour advised by Mr. Cowley.

The darkening of silver nitrate in the ordinary white glass bottles was due to the alkalinity of the glass in part, Mr. H. WYATT, jun., observed, but principally owing to the traces of chlorides contained in the air covering the salts with a thin layer of silver chloride, and this being reduced by the light to the silver reduction product.

Mr. COWLEY having replied, the proceedings terminated.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION.

The thirty-first annual dinner under the auspices of this Association was held at the Albert Hotel, Derby Road, on Thursday, March 8. Mr. RICHARD FITZHUGH, J.P. (President of the Association) presided, and Mr. R. H. BEVERLEY (Vice-President) occupied the vice-chair. There was a large attendance, including Mr. G. Squire (President of the Sheffield Pharmaceutical Society), Mr. A. Russell Bennett, Mr. A. Eberlin (Secretary), and Mr. J. Wilford (Treasurer), and the Chief Constable of the city (Mr. P. S. Clay).

Mr. A. RUSSELL BENNETT proposed the toast of the

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

He said the Society had been abused by many people, but those people were not its adherents. They all knew it was weak, but at the same time they wondered how they could best strengthen it, as it was quite apparent that, considering the number of chemists on the Register, there was an abnormally small number of members of the Pharmaceutical Society. He thought the Council was not sufficiently representative; there were too many London members. A pharmaceutical territorial representation would do more for the Pharmaceutical Society than anything else. In that way they would get representative members from all parts of the two countries. He thought they ought to be elected by constituencies, as was the case with members of Parliament. Even though it were a mixed Council, it would be more thoroughly representative, and that was what was needed. He thought he was right in saying that half of the present members of Council were in possession of high-class and well-to-do businesses, and did not feel the brunt of commercialism as those engaged in the trade on a more modest scale. They in the provinces had to be content with all sorts of things, and he thought all chemists ought to adapt themselves to their environment. If they found that their business was affected by large companies, the chemist was the proper man to do analyses for doctors,

and to deal with optical, photographic, and scientific goods. The Minor examination at present was far too searching in science and too little searching in commercialism. He did not think that any person could become a very successful chemist if he was filled with scientific principles and lacked a commercial training.

Mr. F. R. SERGEANT, whose name was coupled with the toast, said he was the local secretary of the Pharmaceutical Society, and it was a great pleasure to him to call upon different chemists in the city and help the Society to prosecute those people who broke the laws by which they were governed. There was a time when there were only fifteen subscribers to the Society in Nottingham, but they were now reaping the benefit of the services rendered by Mr. Bolton, for the subscribing members of the Society in Nottingham now numbered nearly sixty. During the ensuing year the Society would enter upon a new system of examination which would be beneficial, and, he thought, would keep out many men who ought never to be in the trade. The higher and more difficult the examination, the more likely were they to get a better class of men in the Society. Personally, he would like to see the Minor examination divided. If a man at the conclusion of his first three years' service could be examined in botany, materia medica, and prescription-reading, it would be a distinct advantage, for he could devote his energies to those subjects only, and the remainder of his apprenticeship could be given to the more strictly scientific subjects of chemistry and physics. The welfare of their profession was bound up with the Pharmaceutical Society, and as it increased in power local associations would continue to prosper.

Mr. G. SQUIRE next submitted the toast of

THE NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION.

He spoke in very complimentary terms of the Association, and said that in its educational work Sheffield had imitated the Nottingham Association. With regard to Mr. Newsholme's local organisation scheme, they in Sheffield were already prepared for it, and they hoped that before very long the matter would be dealt with by the Council in London. Mr. Eberlin told him that the Nottingham Society was likewise already prepared, and he was sure they would all drink with heartiness to the Nottingham and Notts' Association.

The CHAIRMAN, in reply, said that he and the Executive Committee had endeavoured to do what they could for the benefit of the young men who had adopted pharmacy as their profession, and he did not think they had laboured without success. Up to the present time the Association had held a position which the country had respected. They had taken a prominent position in the education of the young members, and shown an anxiety to see them prosper in life, and he only hoped that the work of the Association in the future in that direction would not be less marked than it had been in the past. He was afraid that he was little more than a figure-head to the Association now, but his interests in it did not wane, and, if it was their wish, he hoped to retain the presidency for some years to come.

The VICE-PRESIDENT, who also acknowledged the toast, said he should like to recognise the great benefit he had derived from the Association thirty years ago as an apprentice, when they used to meet in the little room in Pelham Street. They had some very pleasant classes there, and it had always been the business of the Association to do what it could for the young members. He should like to see the members of the trade take up the Association better than they did. Many of them showed a great deal of apathy. Their President was not so much a figure-head as he had tried to make out. Personally, he looked upon Mr. Fitzhugh as the Lord Roberts of the pharmacists of Nottingham, and that really they ought to take up the enthusiasm of their President and work shoulder to shoulder, the same as our Army was doing in South Africa, and do all they could for the good of the trade and pharmacists generally.

Mr. EBERLIN said there were a number of chemists who ought to belong to the Association, and if nothing was done by the Association except hold the annual dinner, he thought that should be enough to attract them. There they met on common ground, came

into contact with each other, and rubbed off a great many of those angles that might make their relationships not quite so smooth. But they also kept in order a piece of machinery which was ready to be set in motion at any time when called upon. That machinery might at any time be wanted to bring them in contact with legislators, as at present. The Executive had kept in touch with the local Members of Parliament, and kept those Members informed upon their position, and that in itself was something. Recently he had thought that they must do something more. Depend upon it, when their enemy began to attack them in public, there was something more about the Association than it was usually given credit for. Recently, as they knew, they had been attacked in public most unjustly and unfairly because of the position they had taken up as an Association. When it was necessary to use the public Press to attack them, there must be some justification for their existence. It was something like the fortieth year of the Association's existence, and during that time it had never been stronger than it was at the present moment. The membership now stood at fifty-five or fifty-six, and there were others waiting to be members, which would bring the membership up to about sixty. Quite recently the Council of the Association adopted what he thought was a very wise course when it decided to admit to membership qualified assistants. That had been the means of increasing the roll of membership, and he was sure it was bringing into the Society just the very element they most required; so that at the present moment he might say that the Association was flourishing, and he, as their secretary, would spare no effort to ensure a continuance of that prosperity.

The other toasts included "Prosperity to the City of Nottingham," proposed by Mr. R. FRANK VALLANCE, and responded to by Mr. E. GASCOYNE; "The Visitors," submitted by Mr. A. E. BIELBY, and acknowledged by Mr. G. SQUIRE and the CHIEF CONSTABLE; and "The Chairman," proposed in very fitting terms by Mr. C. A. BOLTON. The speeches were punctuated by a delightful little musical programme, Messrs. G. F. Sands, A. C. Vallance, W. Brinson, and Bert Clarke contributing songs, and the Chief Constable clarionet solos, which were greatly enjoyed.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.

A well-attended meeting of the above Association was held in the Lecture Theatre, at 17, Bloomsbury Square, on Friday, March 9, Mr. T. E. WALLIS in the Chair. The minutes of the last meeting having been read and confirmed, the Chairman called upon Mr. R. GOMPERTZ, B.Sc., to read a paper upon—

THE PHYSIOLOGY OF THE CENTRAL NERVOUS SYSTEM AND THE RESULTS OF INJURIES TO IT.

Mr. GOMPERTZ introduced the subject from an anatomical point of view, and then pointed out the many peculiar effects which are produced in animals by injuries to the brain. The paper was concluded by notes on the effect of certain drugs upon the central nervous system. The CHAIRMAN rose to thank Mr. Gompertz for his interesting paper, and remarked upon the excellency of the diagrams with which the paper was illustrated. He then invited members to bring forward questions.

Miss E. Rayner, and Messrs. Pollard, Lenton, Garsed, Deane, Heslop, Woolcock, and Allen, thanked Mr. Gompertz, and asked various questions.

Mr. GOMPERTZ having replied, the CHAIRMAN, said that before closing the meeting he had a very pleasing announcement to make, viz., that the President of the Association, Professor J. Norinan Collie, Ph.D., F.R.S., F.I.C., had consented to deliver a lecture on Friday next, March 16, upon "The Alps." Microscopic slides showing the structure of the various parts of the brain and spinal cord were arranged under microscopes upon the lecture table, explanatory sketches being placed beside each. Great interest in these was displayed by many of those present.

Obituary.

BOA.—On March 5, at Rose Cottage, Dailly, Ayrshire, Andrew Boa, late of Balkail, Glenluce (father of Peter Boa, Chairman of N.B.B. Executive, Pharmaceutical Chemist, 119, George Street, Edinburgh). Aged 70 years.

BURLEY.—On March 13, William Burley, Chemist and Druggist, Edinburgh. Aged 51. Mr. Burley, who was a native of St. Cyrus, near Montrose, completed his education at Montrose Academy and thereafter served an apprenticeship with the late Mr. George Burrell, Montrose. In 1873 he went to Edinburgh to manage the retail business of the late John Mackay, at whose death, in 1881, he started business for himself at 137, George Street. In 1896 he acquired the old-established business of James Robertson and Co. 35, George Street, and disposed of his other business to Mr. John Brown, a former assistant. He was a member of the Society, and took an active interest in its affairs, becoming a member of the Executive of the North British Branch last year. He also took an interest in the Edinburgh District Chemists' Trade Association, of which he was Treasurer at the time of his death.

GILES.—On March 3, Theophilus Ridgway Giles, Chemist and Druggist, Liverpool. Aged 47. Mr. Giles had been a member of the Pharmaceutical Society since 1895.

MALTBY.—On March 7, Joseph Maltby, Chemist and Druggist, Lincoln. Aged 69. Mr. Maltby who had been a member of the Pharmaceutical Society since 1869, was a native of Faldingworth, Lincolnshire. He was educated at Lincoln Grammar School, and after leaving school was apprenticed to his uncle Alderman Battle, of "Battle's Vermin Killer" fame, and eventually became a partner in the firm. He was for many years the Society's local secretary for Lincoln, and on one occasion was an unsuccessful candidate for a seat on the Pharmaceutical Council. He was actively associated with the municipal life of Lincoln, having been connected with the City Council since 1867. In 1873 he was elected mayor, and in 1878 was made a magistrate of the city. Among other public offices which Alderman Maltby held was Chairman of the Waterworks Committee of the Corporation; President of the Lincoln Chamber of Commerce; Chairman of the Directors of the Lincoln Tramways Company, and of the Lincoln Coffee Palace Company; a Director of the Royal Insurance Company. He was also a Governor of Christ's Hospital, and a Representative Governor of the Grammar School.

MCDIARMID.—On March 7, John Buckwell McDiarmid, Pharmaceutical Chemist, Deal. Aged 70. Mr. McDiarmid had been a member of the Pharmaceutical Society since 1853, and had carried on the business of a chemist in Deal for upwards of forty-nine years.

MCLAREN.—On March 8, at Alloa, Mrs. McLaren, mother of David McLaren, President of the Edinburgh District Chemists Trade Association. Aged 78.

MALCOLM.—On March 10, at 3, High Road, Willesden Green, N.W., Ellen Frances, wife of James Malcolm, Chemist. Aged 32 years.

NEWSHAM.—On February 23, William Newsham, Chemist and Druggist, Preston. Aged 57.

SAYERS.—On March 7, William John Sayers, Chemist and Druggist, Lewisham. Aged 63.

SLATER.—On March 1, Arthur Slater, Chemist and Druggist, late of New Whittington, Derbyshire. Aged 89.

THOM.—On March 5, John M. Thom, Chemist and Druggist, Forest Gate, London, E. Aged 35. Mr. Thom was a member of the Pharmaceutical Society.

WATT.—On March 11, James Watt, Pharmaceutical Chemist, Haddington. Aged 78. Mr. Watt had been a member of the Pharmaceutical Society since 1853. (See p. 292.)

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Carbo Ligni.

WOOD CHARCOAL is the carbonaceous residue of wood charred by exposure to a red heat without access of air, the wood of the beech, hazel, oak, poplar, and willow being employed for the purpose. It possesses antiseptic, absorbent, and deodorising properties. The powder is administered diffused in water, mixed with chocolate, prepared in the form of biscuits, or enclosed in capsules or cachets. The dose is from 60 to 120 grains.

CHARACTERS AND TEST.—Wood charcoal is a black, tasteless, and odourless powder, free from gritty matter; it should not leave more than 7.5 per cent. of ash when heated to a high temperature, with free access of air, and may leave considerably less.

NOTES.—The distinctive characters of wood charcoal are its freedom from taste and odour, and the small proportion of inorganic matter left when the powder is burned. Animal charcoal, prepared by burning bones in partly-closed iron vessels, contains about 90 per cent. of calcium phosphate, and is not absolutely free from taste and odour, even when purified.

Cardamomi Semina.

CARDAMOM SEEDS are obtained from *Elettaria cardamomum*, Maton (N. O. Scitamineæ), a plant which grows wild in the forests of Southern India and is cultivated near the Malabar coast, as well as in Ceylon. The inflorescence of the plant is a long, loose raceme, and the small, inferior, capsular fruits are cut from the rachis before they are quite ripe. They are then bleached and cured by exposure to the sun whilst wet, the bleaching being sometimes assisted by subjecting the fruits to the action of steam and then exposing them to the vapour of sulphurous acid. The cured fruits are trimmed and freed from impurities by picking. The dried, ripened seeds should be preserved in their pericarps until required for use; fruits which have fully ripened on the plant open and discharge the seeds, which are then exported freed from their pericarps, but such seeds are excluded by the official description. The seeds possess carminative, stimulant, and stomachic properties; they are used for preparing *Extractum Colocynthis Compositum*, *Pulvis Cinnamomi Compositus*, *Pulvis Cretæ Aromaticus*, *Tinctura Cardamomi Composita*, *Tinctura Gentianæ Composita*, *Tinctura Rhei Composita* and, indirectly, *Decoctum Aloes Compositum* and *Mistura Sennæ Composita*.

CARDAMOM SEEDS.—a, b, c, d, Commercial varieties of cardamom fruits. e, Transverse section of fruit. f, Seeds, natural size.

CHARACTERS AND TESTS.—Cardamom fruits occur in several varieties, which differ in size and shape. They are usually from 10 to 20 Mm. in length, ovoid or oblong in shape, bluntly triangular in section and three-celled; they are also usually shortly beaked at the apex with the remains of the calyx, pale buff or yellowish in colour and longitudinally striated, though sometimes they are nearly smooth, the striations having disappeared during the process of bleaching. Each cell contains two rows of small dark reddish-

brown seeds, about 3 Mm. in diameter, attached to axile placentas; they are irregularly angular in shape, transversely wrinkled, and enclosed in thin, colourless, membranous arils, which become more evident when the seeds are soaked in water. The hilum is depressed and the position of the raphe is indicated by a channel extending from the base to the apex of the seed on one side. A transverse section of a seed shows the thin dark seed-coat, enclosing a whitish perisperm grooved on one side, a small yellowish translucent endosperm, and a minute embryo. The odour and taste of the seeds are agreeably warm and aromatic, owing to the presence of volatile oil, of which they may contain as much as 5 per cent. On incineration the powdered drug should not yield more than 4 per cent. of ash, but if the pericarps have been ground up with the seeds the proportion of ash will be 5.5 per cent. or more.

CARDAMOM SEEDS.—A, Transverse section of fruit with seeds *in situ*. B, Seed magnified, showing base of arillus. C, Longitudinal, and D, transverse section of seed. E, Transverse section of pericarp. F, Transverse section of seed. G, Transverse section of integuments of seed. After Berg.

NOTES.—The distinctive characters of cardamom fruits are their pale colour, plump appearance, and abruptly tapering apex; those of the seeds are the dark reddish-brown colour, aromatic taste, transverse wrinkles, depressed hilum and raphe, and the appearance of transverse sections. Mysore, Malabar, and Mangalore cardamoms all meet the official requirements. The first are the largest, varying from about 6 to 20 Mm. in length; their cream colour and the smoothness of their pericarps are due to the use of artificial bleaching agents. Malabar cardamoms are somewhat smaller, rarely exceeding 12 Mm. in length; they are generally pale brown or yellowish in colour, have a pointed apex, and are longitudinally striated. Mangalore cardamoms are less common than the other two varieties; they resemble the Malabar fruits, but are small and almost globular in shape. Grey cardamom seeds and shrivelled (unripe) seeds are inferior and should not be used. Ceylon (wild) cardamom fruits, the product of *Elettaria cardamomum*, var. β *major*, Smith, vary in length from 25 to 38 Mm., are commonly greyish brown in colour, and not plump in appearance; the seeds

are larger and paler than those of the Malabar cardamom. Siam cardamoms, from *Amomum cardamon*, Linn., and Korarima cardamoms, from *A. korarima*, Pereira, are also occasionally met with (see *P. J.* [4], 6, 280). Grains of Paradise are distinguished from cardamom seeds by their rich reddish-brown colour, minutely and irregularly wrinkled surface, and the presence of the remains of a thick fibrous funicle.

Carui Fructus.

CARAWAY FRUIT is the product of *Carum carvi*, Linn. (N. O. Umbelliferæ), an erect biennial herb distributed over Central and Northern Europe, and cultivated in Holland, Germany, Sweden, Norway, Russia, France, Mogador, and England. The inferior, two-celled ovary of the caraway develops into a cremocarp (schizocarp), the component carpels (mericarps) of which separate by splitting

CARAWAY FRUIT.—a, Russian variety, natural size and magnified. b, English ditto. c, Mogador ditto.

away from the central axis or carpophore, without liberating the seeds. Caraways possess aromatic, carminative, and stomachic properties; they are used for preparing Aqua Carui, Confectio Piperis, Oleum Carui, Pulvis Opii Compositus, Tinctura Cardamomi Composita, Tinctura Sennæ Composita and, indirectly, Pilula Aloes Barbadosensis.

CHARACTERS AND TEST.—Caraways usually consist of the separate mericarps, which are each 4 to 6 Mm. long and about

CARAWAY FRUIT.—A, Entire fruit magnified, showing ridges. B, Longitudinal section, showing embryo and albumen. C, Transverse section of fruit. D, Portion of ditto, showing structure. After Berg.

1 Mm. broad. They are quite glabrous, brown in colour, slightly curved, tapering towards the ends, and traversed from base to apex by five narrow yellow primary ridges. Each ridge contains a fibrovascular bundle, and is thus distinguished from the secondary ridges on coriander and other umbelliferous fruits. There are no secondary ridges on caraway fruits, but in the depressions between

the primary ridges are situated elongated vittæ or oil glands, imbedded in the pericarp and extending from base to apex of the fruits. Four such vittæ occur on the dorsal or outer side of the mericarp, between the ridges, and two on the commissural or inner surface, by which it was originally attached to the carpophore. The vittæ are best seen in a transverse section, appearing as minute dark brown spots or cavities. The section will also exhibit the narrow pericarp, enclosing a large oily endosperm which is not grooved near the commissural surface; the embryo occurs near the apex of the fruit. The agreeable aromatic odour and taste of the fruit are due to the presence of volatile oil, of which about 5 per cent. of can be obtained from the fruits by distillation. Powdered caraways should not leave more than 8 per cent. of ash on incineration, this test serving to detect the presence of sand or other extraneous mineral substances.

NOTES.—The distinctive characters of caraway fruits are their glabrous surface, the presence of six vittæ in each mericarp, and the ungrooved endosperm. The volatile oil contains carvol, which is also found in oil of dill. English caraways are of brighter tint than the Dutch, the latter being of a dark brown colour. Russian fruits are smaller and often mixed with much dirt and debris of the fruit stalks; Mogador fruits are large and pale in colour.

Caryophyllum.

CLOVES are the dried flower-buds of *Eugenia caryophyllata*, Thunb. (N.O. Myrtaceæ), an evergreen tree native to the Molucca Islands, where it is still cultivated, though the bulk of the cloves now produced come from the islands of Zanzibar and Pemba. Small quantities are also exported from Java, Ceylon, the Seychelles, etc. The inflorescence of the plant is a compound raceme which bears white buds that turn green as they develop,

CLOVES.—*a*, Natural size (Penang clove). *b*, Longitudinal section, magnified. *c*, Transverse section through the ovary, magnified. *d*, Pollen grain, magnified. *e*, Bast fibre

and finally become crimson. They are collected before the corolla expands and dried in the sun, the crimson colour changing to dark reddish-brown in the process. Cloves possess aromatic, carminative, and stimulant properties; they are used in the preparation of Infusum Aurantii Compositum, Infusum Caryophylli, Oleum Caryophylli and Pulvis Cretæ Aromaticus, the oil being contained in *Pilula Colocynthis Composita* and *Pilula Colocynthis et Hyoscyami*.

CHARACTERS.—Cloves are about 15 Mm. long, and consist of the dark-brown, wrinkled, nearly cylindrical, but somewhat angular,

calyx tubes, which taper downwards and are each crowned by four thick, rigid, divergent teeth, within which appear four paler coloured, unexpanded, overlapping petals. On removing the petals, after soaking for twenty-four hours in water, the presence is disclosed of a stiff, erect style and numerous stamens; the style arises from a small disc, below which is a two-celled ovary containing numerous ovules. The solid, fleshy, lower part of the clove contains a large number of oil-glands and similar glands occur in the calyx-teeth and petals. The volatile oil present imparts a fragrant, spicy odour and a pungent, aromatic taste.

CLOVES.—Transverse section of half the calyx tube. After Planchon and Collin.

TESTS.—Cloves should emit oil on indenting them with the finger-nail, and they should also sink in water, thus showing that the oil has not been removed. On incineration cloves should not leave more than 7 per cent. of ash, the absence of clove stalks and, in the case of powdered cloves, inorganic adulterants being thus indicated.

NOTES.—The distinctive characters of cloves are their general appearance, odour and taste. The cloves imported from the Molucca Islands are the best, those from Penang being large, and of a bright brown colour, and those from Amboyna rather smaller and of a darker brown. Zanzibar and Pemba cloves are still smaller, dark coloured, with the buds frequently broken, and with stalks and foreign matters intermixed. Cloves contain from 10 to 13 per cent. of gallo-tannic acid, to a crystalline substance—caryophyllin—which is colourless, and odourless, and about 15 to 20 per cent. of volatile oil of which 77 to 90 per cent. consists of eugenol. Spent cloves, "clove stalks," or peduncles, and "mother cloves" or ripe clove fruits have been used as adulterants of whole and powdered cloves. The first emit no oil when indented with the finger-nail, and do not sink in water, the other two are readily distinguished by their general appearance, also by their microscopic characters (see *P.J.* [4], 6, 513). The stalks are dry and woody, contain much less oil than cloves, and yield a greater percentage of ash. The ripe fruits are ovoid in shape, brown about 25 Mm. long, and contain but little oil; they also contain starch, which is not present in the flower-buds.

CINNAMON IN TROPICAL DIARRHŒA.—Henderson, of Shanghai, has directed attention to the remedial value of cinnamon bark in the treatment of psilosis and chronic diarrhœa, while Myers, of South Formosa, has used it with success in all cases, ranging from ordinary diarrhœa to severe dysentery. A. Norris Wilkinson, of Twatutia, North Formosa, again states that the powdered bark, taken in drachm doses night and morning together with a quinine mixture, is a valuable remedy in severe tropical diarrhœa.—*B.M.J.*, 2,041, 317. [Since the remedial action is probably due to the volatile oil of the bark, it might be interesting to determine its value in such cases; the oil would be both more pleasant and more convenient to take than the crude powdered bark.—Ed. *P.J.*]

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

PSATHURA ANGUSTIFOLIA.

The leaves of *Psathura angustifolia*, a Rubiaceae plant, indigenous to Réunion and Madagascar, have been stated by Kobers to yield caffeine. E. Heckel and F. Schlagdenhauffen, however, state that neither this nor any other alkaloid or glucoside is contained in the leaves of the plant, or of other members of the same genus.—*Repertoire*, 56, 54.

FUMING NITRIC ACID.

L. Vanning points out that fuming nitric acid can be prepared by allowing polymerised formic aldehyde to react with ordinary nitric acid and heating moderately. Hyponitric acid is given off, and gives a product rich in nitrogen binoxide when passed into nitric acid. An acid rich in nitrous fumes can be obtained, without distillation, by gradually adding polymerised formic aldehyde.—*Verichte*, 32, 1392.

BOTANICAL NOMENCLATURE.

C. B. Clarke read a paper on this subject at a recent meeting of the Linnean Society. He showed that the new rule adopted at Berlin—not to disturb names that had fifty years' user, on the ground of priority alone—resulted in a practical uniformity with the system of naming adopted by Mr. Bentham and Sir J. D. Hooker. The Old World, he said, had thus reached a fair general agreement in nomenclature. The American botanists follow a new system which aims at finality on a so-called "non-shifting basis" in which the genus or species, as the case may be, is established on a type-specimen. Mr. Clarke's paper was devoted mainly to showing by selected instances that this system did not ensure finality; that the errors in determining what should be ranked as the type are enough to discredit the system; and the author commented on the disputed question whether a plant should be given the oldest specific name bestowed upon it, or the oldest specific name it bears in the genus in which it is now placed.

MANGANESE OXALATE.

According to B. Denigès, the formation of manganese oxalate from citric acid and permanganate of potassium may be shown as follows:—Citric acid 300 Gm. is dissolved in water 600 Gm., cooled to 15°-16° C., and poured into a solution of potassium permanganate 90 Gr., in water 3,000 Gm., similarly cooled, the mixture being surrounded by water cooled to 10°-12° C. The mixture quickly changes colour and evolves abundance of CO₂; the temperature rises, but should not be allowed to exceed 30°-35° C. When gas ceases to be given off the liquid should be rapidly cooled to 25°-28° C., and then set aside for four or five days. It will then be found that a plentiful crop of crystals has formed, and that the acetone-carbonic acid, which was at first present in the mother liquor in considerable quantity, has totally disappeared. On washing the crystals by decantation, and drying over H₂SO₄, they will be found to consist of two forms. Some much larger rose-coloured prisms may easily be picked out from the smaller groups of white hexagons. The former on analysis are found to contain 3 molecules of H₂O, the latter 2 molecules. The larger crystals may be obtained direct by the double decomposition in the cold, of solutions of ammonium oxalate and manganese sulphate, acidulated with acetic acid; and the small hexagonal form by the same means, employing boiling solutions. It is evident, therefore, that in the case of the citric acid mixture the smaller, less hydrated crystals are deposited first from the tepid solution; the larger, trihydrated prisms, formed by the gradual decomposition of the acetone-carbonic acid, are more slowly deposited in the cold liquid.—*Journ. Pharm. Chim.* [6], 11, 102.

POISONING BY CASTOR OIL SEEDS.

A fatal case of poisoning, following the eating of two castor oil seeds, is recorded. The victim, a dock labourer, succumbed to exhaustion due to irritant poisoning six days after swallowing the seeds. The necropsy showed the stomach to be highly congested, with attenuation of the mucous coat, and with scattered small erosions; the small intestine was extremely congested, the duodenum and cæcum were less affected, and the large intestine least of all.—*Brit. Med. Journ.*, 2041, 317.

GUAIAMAR.

This is a glycerol ester of guaiacol obtained by the action of anhydrous glycerin on guaiacol. It forms a white crystalline powder melting at 75° C.; its solubility in water is 1:20, and it is dissolved by most solvents. It is not hygroscopic, and has a bitter, aromatic taste. It is given in doses of 20 centigrammes to 1 Gm. G. Butler has employed guaiamar in twenty cases of typhoid with the best results; it appears to act as an excellent intestinal antiseptic. It has also been applied to the joints, in cases of acute articular rheumatism, in the form of an ointment composed of guaiamar, 7 to 8 Gm., lanoline, 30 Gm. In cases of gonorrhoeal arthritis, guaiamar, combined with belladonna ointment, or with mercurial ointment, has been serviceable. Guaiamar has also given good results in pulmonary affections, and has the advantage of acting as a digestive tonic. In the form of lotions its antiseptic properties have been shown in many directions, in the treatment of burns, ulcerations, and syphilitic sores. Internally it has also been beneficial in cystitis, chronic gonorrhoea, and all kinds of gastro-intestinal affections.—*Nouv. Rem.*, 16, 32.

MECONIN AND ITS DERIVATIVES.

Emile Leroy finds that the calorimetric constants obtained by the combustion of meconin confirm the theory that it is a dimethyl-oxypthalide. On oxidation it furnishes the acid aldehyde, opianic acid, C₁₀H₁₀O₅, which forms crystalline salts with alkalis, and gives two isomeric methyl esters. One of those, melting at 82°-84° C., is obtained by the action of methyl iodide on silver opianate; the other, melting at 103°-104° C., is derived by boiling a solution of opianic acid with methyl alcohol. By oxidation, opianic acid yields hemipinic acid, C₁₀H₁₀O₆, which, from its calorimetric constants, is shown to be a dimethoxyphthalic acid.—*Comp. rend.*, 130, 508.

NITROGEN IODIDE.

The different formulæ given by various experimenters for the detonating substance obtained by the action of ammonia on iodine has induced C. Hugot to investigate the matter. He finds that when iodine, contained in a tube surrounded by a freezing mixture, is treated with gaseous ammonia under pressure, the black liquid at first formed becomes decolorised, and deposits a crop of dark green crystals. This body appears to be fairly stable below 10° C., but above that temperature it readily undergoes decomposition. Direct decomposition is only effected by violent explosion. The constitution of the body was therefore determined by allowing it to decompose slowly and spontaneously. In this way results were obtained which established the formula, NI₃·3NH₃ for these crystals. The mother liquor from which they were separated was found to consist of the triammonio-ammonium iodide NH₄I·3NH₃ formerly described by Troost. The reaction may be expressed by the equation, 16NH₃ + 6I = 3(NH₄I·3NH₃) + NI₃·3NH₃. The green crystals, maintained *in vacuo* at a temperature of 30° C., lose a molecule of ammonia, and leave a yellowish white crystalline residue, NI₃·2NH₃. That, when exposed to 0° C. *in vacuo*, parts with another molecule of ammonia, the fine violet crystals left having the formula NI₃·NH₃. This last body decomposes *in vacuo* without explosion when slowly warmed to 30° C. If heated above that temperature a violent detonation results. The author was unable to remove the last molecule of ammonia.—*Comp. rend.*, 130, 505.

THE OFFICIAL PROCESSES FOR THE ASSAY OF IPECACUANHA, BELLADONNA, AND NUX YOMICA.**

BY F. C. J. BIRD.

I.—Ipecacuanha (Continued).

The Relation of the Results of the Official Method to Those Given by Other Processes.—The figures hitherto published indicate a very wide variation between the gravimetric determinations of the Pharmacopœial process and the gravimetric and volumetric results of other methods. H. Wilson* obtained figures higher by about 8 per cent., and Farr and Wright† found that Wilson's process gave an excess of from 7 to 16 per cent. W. A. H. Naylor,‡ on the contrary, records one instance in which Wilson's process came out below the B.P. method, the deficiency amounting to about 0.5 per cent. Farr and Wright and W. A. H. Naylor have given examples of results obtained by their respective processes in which the gravimetric figures have been in most cases very much higher and the titration figure generally lower than the corresponding ones by the official method. No constant relation has

approximate, but a second titration with ether-amyl-alcohol gave results in much closer agreement. On the other hand, the residues from B, being quite pale, permitted of exact titration.

The composition of any liquid extract likely to be met with will probably fall between that of A and B, which may be taken as representing two extreme types. The one, A, as has been already mentioned, was dark in colour, less resinous than B, and evidently contained a considerable amount of free alkaloid and its decomposition product, whilst B was an example of a carefully prepared extract in which the proportion of free alkaloid had been kept low and undue exposure to heat avoided. When assayed by the B.P. process, the gravimetric yield from A was 1.75 per cent, but the wash water continued to extract colour from the precipitate, and even when 400 C.c. had been used the filtrate was still coloured, showing that continued washing would have further increased the gravimetric percentage. With the amount of washing described this figure became 1.84. It is, therefore, evident that when dealing with an extract containing much free alkaloid, such as the one under consideration, very prolonged and tedious washing is

Process.	Quantity taken for Assay.	(Liquid Extract (A.))			(Liquid Extract (B.))		
		Weight per cent.	Titration per cent.	Colour of Residue.	Weight per cent.	Titration per cent.	Colour of Residue.

(d) (four washings)	5 C.c.	(d) 1.76	1.36	brown	(d) 2.00	(d) 1.76	
(4) W. A. H. Naylor's ‡	5 C.c.	1.76 (d) 1.76	(1.35) (d) (1.34)	"	2.0	1.76	darker than (5)
(5) F. H. Alcock's §	5 C.c.	2.0 (d) 2.04 (d) 2.0	(1.22) (d) (1.24) (d) 1.41	" very deep brown	2.1 (d) 2.1	1.8 (d) 1.8	pale brown

therefore been shown to exist between the weight of the residues obtained by the several published processes and those of the B.P. method, although there is an exception in the statement by H. J. Henderson§ that Alcock's method yields a residue corresponding very closely in weight with the residue yielded by the B.P. method. The variable composition of the samples of liquid extract used for comparison would prevent any accurate deductions being made from the figures referred to above. Therefore, in order to observe the working of the various processes with the same sample of liquid extract the two extracts A and B were assayed by all the published methods and the results tabulated.

Whenever the figures appeared abnormal they were confirmed by a duplicate experiment (d), and in some instances the assay was performed a third time. With cochineal as an indicator, very great difficulty was experienced in determining the end-point in the titration of the residues from sample A, on account of their intense brown colour. The figures obtained with cochineal are placed between brackets in the table, and must only be considered

necessary in order to avoid figures considerably below the truth, and that entire solution of the sparingly soluble free alkaloids by repeated treatment with water is the only means of arriving at a correct result when working the strict B.P. process.

This latter fact probably accounts for the lower gravimetric figures credited to the B.P. assay by previous workers, for the discrepancies would be still further intensified (See result 1c in Table) if treatment of the precipitate as a gelatinous magma on an ordinary conical filter were adopted in place of the mode of manipulation described on page 176. Nor by this method have the differences (in some cases as high as 0.50* per cent.) between the figures given by the B.P. method and the published alternative processes, been found to exist.

Although as might be expected there is some want of concordance amongst the gravimetric results from sample A and the titration figures (cochineal having been used as an indicator in an intensely brown solution) appear rather erratic, the latter process applied to the residues from A in ether amyl-alcohol solution and directly to those from sample B show very fair agreement. Some

* P.J. [4], 7, 3. † P.J. [4], 9, 86. ‡ P.J. [4], 9, 88. § P.J. [4], 9, 602. ¶ P.J. [4], 8, 494.

* P.J. [4], 9, 88.

of the residues were much paler than others; the depth of colour appeared to roughly correspond with the titration value, the pale residues giving the highest figures.

The five processes, placed according to their results, fall into the order indicated by the numerals :—

Process.	Liquid Extract. A.		Liquid Extract. B.		Excluding Alcock's process. Compared with B. P.									
	Weight.	Titration.	Weight.	Titration.	A.		B.							
					W't	Tn.	W't	Tn.						
Alcock's (highest)	1 (2.0)	1 (1.41)	1 (2.1)	1 (1.8)	Greatest excess of any process....	0.0	0.0	0.05	0.00					
Naylor's ..	3 (1.76)	3 (1.35)	2 (2.0)	3 (1.76)										
B.P.	2 (1.84)	2 (1.36)	3 (1.95)	2 (1.77)										
Farr and Wright's	3 (1.76)	2 (1.36)	2 (2.00)	3 (1.76)						Greatest deficiency of any process	0.09	0.01	0.05	0.04
Wilson's..	4 (1.75)	2 (1.36)	4 (1.90)	4 (1.73)										

Alcock's process with both A and B gave the highest results, the excess being, in the case of A, 0.16 per cent. weight and 0.06 titration, and with B, 0.15 per cent. weight and 0.03 titration. Probably the latter figure is very near the actual truth, as the lower B.P. result would be increased by alkaloid retained in the lead precipitate, and the mother liquor.

In processes 1b and 1c the mother liquors from (A), after washing out the alkaloid with Chloroform were further extracted, three times each, with the same solvent. The weighed alkaloidal residue from 1b amounted to 0.09 per cent., and that from 1c to 0.06 per cent.

As the two samples, A and B, may be considered to represent extreme types, it is evident that the B.P. method operated as described, either with preliminary acidification or (as a more troublesome alternative) thorough washing of the precipitate, gives about the same gravimetric figures as processes 2, 3, and 4, the difference being less than 0.10 per cent., and, consequently, only affecting the second decimal place when those processes are employed. No. 5 gives the highest figures of all (about 0.15 above the B.P.), and it is necessary to remember this fact when using it as an alternative method of assay.

All the samples yet submitted to the modified B. P. method, as described, have behaved in a similar manner, as far as the time required for the assay is concerned. With the alternative processes the time is lengthy or otherwise, according to the nature of the liquid extract under examination; none of the processes are more expeditious (No. 5 takes about the same time), and all are liable, with certain samples of extract, to some delay through failure to obtain an immediate and sharp separation of the immiscible solvent owing to the presence of precipitated matter and partial emulsification. So much of the latter took place with Process No. 4 that four washings with chloroform were necessary before the whole of the alkaloid was extracted.

The following considerations point to the conclusion that the impurity in the alkaloidal residue, indicated by titration, probably consists in great part of some decomposition product of the alkaloid rather than of any constituent existing naturally in the drug. (1) A strong percolate from ipecacuanha, obtained without heat or the use of lime, yields a nearly pure residue, pale in colour and having a high titration value, with a difference between the two figures rarely exceeding 5 per cent. (2) The residue from extracts prepared with lime, and which have been subjected to excessive heat in distillation, is usually of a very dark colour, and the figures by weight and titration exhibit a great discrepancy, sometimes 25 per cent. or more. (3) With such extracts the chloroformic solution of the alkaloids is dark brown in colour and highly fluorescent. Fluorescence is a known characteristic of the heat-decomposition product of cephaeline.*

* Paul and Cownley, P.J. [4], 1, 2.

Chloroform as a Solvent in the final Extraction of the Alkaloids.
—The foregoing processes including that of the B.P., prescribe either chloroform, or a mixture of chloroform and ether, for the final washing out of the alkaloid from ammoniacal solution. That chloroform alone, or any combination containing it, is the most suitable for the purpose appears doubtful when the behaviour of this solvent, as compared with others, towards a coloured solution of ipecacuanha alkaloids is taken into consideration. The free alkaloids themselves, dissolved in either petroleum ether, ether, benzene, chloroform or amyl alcohol, give colourless or at most pale straw-coloured liquids. If, however, the solvents named be employed in combination with ammonia for extracting a coloured acid alkaloidal solution the resulting washings with petroleum ether and ether will be observed to be very pale in colour, those with benzene slightly deeper, with chloroform still more coloured, and with amylic alcohol of an intense brown colour, showing that the last mentioned extract other substances besides the alkaloid. But ether alone is not entirely satisfactory as a solvent, for it is very difficult to remove the last traces of alkaloid from an alkaline solution by this agent. In order, if possible, to throw some light on the question of the suitability or otherwise of chloroform for washing out the alkaloid in the final stage of the B.P. and other processes the following experiments were made with the acid filtrate from 10 C.c. of liquid extract (A) after the precipitation of the lead sulphate. The solution whilst acid was of a bright yellow colour, but the addition of ammonia changed it to deep brown, light brown flocks of alkaloid being at the same time precipitated. Ether was then added, the washing with ether repeated until traces only of alkaloid were removed, and the mixed ethereal extracts, which were of a light straw colour, evaporated, weighed and titrated, the residue being quite pale. The mother liquor was still found to contain alkaloid when acidified and tested by Mayer's reagent; it was therefore agitated with successive quantities of benzene. The benzene washings were of a greenish yellow colour, rather deeper in tint than the ethereal washings, and the evaporated benzene extract light reddish brown. The highly coloured liquid which remained after treatment with ether and benzene was washed three times with chloroform. This removed the greater part of the colouring matter and became itself of an intense brown hue, almost opaque by reflected light, with a green fluorescence. The mother liquor now contained the merest trace of alkaloid; extraction was therefore complete. A small portion of the deep orange brown chloroformic residue dissolved in acid to a yellow solution which afforded an orange flocculent precipitate with Mayer's reagent, but whether this precipitate was due to the substance itself or to the coloured bodies carried down with a trace of precipitated alkaloid, is uncertain.

The following figures were obtained on weighing and titrating the three residues :—

FROM 10 C.C. LIQUID EXTRACT (A).

	Colour.	Alkaloid per cent.	
		Weight.	Titration.
Ether extract	Pale greenish yellow..	1.34	1.22
Benzene extract	Greenish yellow	0.12	0.09
Chloroform extract.....	Intense orange brown	0.39	0.08

Whilst ether alone is not a satisfactory solvent for extracting the alkaloids of ipecacuanha from alkaline solution a mixture of ether and benzene (3 and 1) effects their removal more completely, and the evaporated residue is quite pale, even when the alkaloids have been shaken out of a highly coloured liquid. From the figures given above it is evident that the presence in dark-coloured residues of the substance causing the greater part of the

discrepancy between the results by weighing and titration is due to the employment of chloroform for the final extraction of alkaloid. Further experimental evidence is needed before it can be decided whether the brown decomposition substance dissolved by chloroform should or should not be included in the weighed residue. It would be reasonable to assume that it does not possess the same physiological effect as the alkaloids themselves, but a careful comparative trial of two preparations similar to A and B, or administration of the decomposition product itself, isolated and purified, can alone settle this point satisfactorily.

(To be continued.)

ON THE ACTION OF CHLOROFORM AND SIMILAR SOLVENTS ON ALKALOID SALTS.

BY PROFESSOR EDW. SCHAER, STRASSBURG.

The observations relating to "Strychnine Salts and Chloroform," published by Mr. J. Rutherford Hill (*Pharm. Journ.*, Feb. 24, 1900, p. 185), seem to me to be of such great interest, theoretically and in their practical bearing, that they will induce me to carry out an already devised plan for a thorough investigation of the behaviour of solvents not miscible with water towards neutral as well as acid aqueous solutions of alkaloid salts.

Apart from the theoretical aspect of the matter a knowledge of the action of solvents like chloroform, ether, benzene, etc., on alkaloid salts is of importance in relation to methods for isolating and identifying vegetable or animal poisonous alkaloids for toxicological purposes. In fact, as the author of the paper referred to justly says, the methods of Stas-Otto, Erdmann-Uslar, Dragendorff, etc., are based on the assumption that, generally speaking, alkaloid salts are scarcely at all soluble in the above-mentioned liquids, and, therefore, that ether, chloroform, and analogous solvents will not extract alkaloids from aqueous solutions of their salts though those liquids readily extract them from alkaline solutions containing the free alkaloids. That is the leading principle in forensic analysis, also of many methods introduced into pharmacopœias for ascertaining the amount of alkaloid in various drugs, and even of some processes for extracting alkaloids on a commercial scale by manufacturing chemists.

In most manuals of analytical and toxicological chemistry it is stated that some alkaloids, as, for instance, caffeine, colchicine, some of the opium alkaloids, like narcotine, as well as atropine and veratrine, are extracted by ether or chloroform from their acid solutions to an extent depending upon the physical and chemical conditions of the liquids. This abnormal behaviour has been taken advantage of for separating certain bases from others which are only extracted from alkaline solutions by the above-mentioned solvents. Observations relating to that difference of behaviour are very limited, applying especially to ether and chloroform, and to a relatively small number of alkaloids.

The effect produced by these liquids upon alkaloids in acid solution may be attributed either to the solubility of certain salts of some alkaloids, like narcotine or colchicine in ether or chloroform, or to dissociation of the salts of alkaloids in aqueous solutions when shaken with liquids which are good solvents of the alkaloids. This latter view is generally held, and it may be considered quite beyond question in reference to caffeine or narcotine, which are but feebly alkaline, and, therefore, do not form stable compounds with many acids. The very weak stability, for instance, of some salts of these alkaloids may account for the fact of caffeine being extracted from an acid solution by chloroform, and, in like manner, narcotine by ether. Such cases of extraction of sensible quantities of alkaloids out of solutions of their salts are generally considered to be exceptional, but whether or not it is a more general phenomenon has not been ascertained, nor is it known whether the alkaloid extracted by one or other solvent is extracted as free alkaloid or in the form of salt. That may not be dependent upon the so-called alkalinity of an alkaloid, so that

while a feebly alkaline base like colchicine was extracted from an acid solution by ether, a strongly alkaline base like atropine would be extracted only in the state of the salt. In a paper published some years ago* I endeavoured to show that many chemical reactions, especially those with coloured "indicators," commonly used for the determination of the alkaline nature of vegetable bases, are not at all uniform in their expression of the value to be assigned to their indications with regard to different alkaloids, and that sometimes an apparently strong vegetable base may show but a low degree of alkalinity with one indicator, and the contrary with another. The observations of Mr. Rutherford Hill point to the conclusion that a knowledge of the chemical stability or the tendency to dissociation of an alkaloid salt does not afford any certain indication concerning the behaviour of acid or neutral solutions of the respective salts when shaken with ether or chloroform. For instance, it is stated that chloroform extracts from solutions of strychnine hydrochloride a certain amount of the alkaloid as hydrochloride, while, on the contrary, from solutions of the arsenate and of the sulphate the alkaloid is extracted by chloroform in the state of free alkaloid with only a very small proportion of the salt. From a theoretical point of view it might rather be thought that the salts of strychnine with the two oxygen acids would be least liable to dissociation and that the alkaloid would not be extracted from their aqueous solutions although the salt might be. Still, it must be borne in mind, that similar unexpected irregularities exist in other cases, as, for instance, in the hydrolytic dissociation of ferric salts, shown years ago by the magnetic experiments of G. Wiedemann, as well as by observations of my own, which I hope to publish before long in another periodical.

In toxicological analyses conducted by students in the Pharmaceutical Institute of this University numerous observations have been made, showing that the extraction of alkaloids from solutions of their salts by solvents like chloroform and ether is not restricted to the cases of caffeine, colchicine, narcotine, papaverine, atropine, delphinine, and veratrine, but seems to be a more general occurrence well deserving thorough investigation. We have been especially struck by the relatively large quantities of veratrine salt extracted, even from acid solutions, by chloroform, a fact already noticed by Otto in his excellent manual. A certain quantity of veratrine dissolved in a weak solution of tartaric acid was extracted, when the solution was treated with pure chloroform, which, by evaporation, yielded a mixture of veratrine tartrate and some free tartaric acid. The extraction of the alkaloid was relatively less considerable in cases where there was a large excess of tartaric acid in the solution. While chloroform extracted a rather considerable percentage of veratrine from an acid solution of the alkaloid, ether extracted very much less, especially in cases where the solutions were distinctly or even strongly acid. Similar results were obtained in extracting solutions of atropine salts with chloroform or ether; for instance, a solution of 0.102 Gm. atropine in water, acidified by tartaric acid, yielded to chloroform by successive treatment with 30 C.c. (*in toto*) of this liquid, 0.0623 Gm.; under equal conditions ether extracted the larger quantity of 0.0913 Gm., or almost the whole of the alkaloid present in the aqueous solution. The two alkaloids veratrine and atropine appear from these data to differ, the first being more easily taken up by chloroform, and the latter by ether from acid aqueous solutions.

To settle the practically important questions of the behaviour of alkaloid solutions to solvents, it will be necessary to make an extensive series of experiments: (1) as to the action of different solvents on neutral and acid solutions of the most important alkaloid salts, with special regard to the behaviour of different acids and concentrations; (2) as to the influence exercised by inorganic and organic substances, present in the aqueous alkaloid solutions, upon the extraction of alkaloids by ether, chloroform and similar liquids.

THE ASH PERCENTAGE OF COMMERCIAL COCHINEAL.*

BY GEORGE F. MERSON, F.C.S.

Recently there came under my observation a sample of cochineal which was so obviously adulterated that I had the curiosity to ignite a little of it, and was surprised to find the yield of ash to be nearly half the weight of the sample weighed out. The Pharmacopœia allows 6 per cent. of ash, and the question at once suggested itself to me why should an insect such as this contain so much inherent mineral matter. Reference to authorities gave no satisfactory answer, one stated that genuine cochineal gave about 0.5 per cent. The examination of thirty-one commercial samples gave results shown in column 2 of the tables 1 and 2. The samples included both D.G. and silver insects. I arranged them according to their colour value; as is to be expected the dark variety is much the better as far as freedom from adulteration is concerned, although a considerable amount of sand and grit was adherent to the insects, and readily noted on rubbing a little down in a mortar.

TABLE I.

The first six samples were Dark Grain Cochineal, and the remainder Silver Grain. The ash determinations were made in duplicate. When ash percentage is small removal of last traces of carbon is difficult. Ignition is facilitated by intimately mixing a little pure silica with the powdered sample. The known weight of silica being deducted from the total residue.

The samples of Dark Grain Cochineal call for no special comment. Numbers 5 and 6 were sandy, and the adherent grit readily separated on maceration in water. The Silver Grain insects varied much in size and appearance. Genuine silver grain has the ridges well defined, or grooves or crinkles only have a white appearance, while the sophisticated article looks in many instances like a bad sample of a badly coated pill. In some cases two or three insects are aggregated into a nugget with the facing or coating over all. Less glaring instances, of course, are common, but they are all easily detected by the naked eye. The ridges are all more or less blurred and ill-defined, owing to the filling up of the crevices with adulterant. It is remarkable that commercial samples of slightly and bold appearance are more or less faced with powder, and prices seem based upon the appearance of the insect rather than upon its

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh, March 21, 1900. (See page 314.)

tinctorial value. In some instances, a nice slightly lot of insects conforming to the official requirements in ash, is seen to be a mixture of light and dark varieties, probably in order to reduce the ash to proper limits. On picking a sample such as this the lighter coloured insects yield more ash than the darker variety, although the latter cannot be said to be a truly Dark Grain insect—quite grey in appearance—yet lacking the characteristic striated conformation of the genuine silver grain. The figures for ash in the table are based upon the commercial condition of the insects. On drying at 100° C., the loss varies from 10 to 15 per cent., and this will materially increase the ash percentage, more especially as the most heavily faced samples contain, as a rule, most moisture. The process adopted in “doctoring” cochineal is described by Loewe in ‘Year-Book of Pharmacy,’ 1883, page 254. If the insects are moistened in any way in order to make the surface adhesive the coating is more or less tinted pink or purple. Number 3 sample illustrates such a product. It yields over 40 per cent. of ash. Numbers 30 and 31 on the table were very similar in appearance to number 2 sample shown herewith. From my experiments I judge that the average normal percentage of ash in genuine cochineal does not exceed 2.5 per cent., and this being so, I fail to see why the Pharmacopœia should allow so wide a margin as 6 per cent. An article can be had on the open market without the slightest trouble which will conform easily to a lower ash standard than that which is official. Not only that, but the price for such is very much lower than that which rules for many of the adulterated kinds. Granted they are not so slightly, but that surely is immaterial seeing that cochineal is official simply as a colouring agent. I am inclined to think from data in my possession that the “preparing” of this drug is a special branch of manufacture, and is carried out after the insects have been exported from the collecting districts.

A SIMPLE METHOD FOR VALUATION OF COCHINEAL AND CARMINE.*

BY GEORGE F. MERSON, F.C.S.

The results of my experiments on the ash yields of cochineal were such that, having regard to the Pharmacopœia giving only an ash limit as the standard of quality, I determined to compare each of the samples with a view to finding if there was any relationship between the ash content and the colour value. The potassium permanganate process published by Merrick some thirty years ago I did not find so speedy nor so accurate as the following, by means of which a dozen samples can be comparatively valued in an hour. Several bleaching agents were tried, but chlorinated lime (or soda) solution was finally fixed upon as a decolorising agent. Various methods of preparing a solution of the colouring matter of the insect were also tried, keeping in view simplicity of manipulation, economy of time, and an assurance of concordant results.

The valuation is conducted as follows:—

Weigh 0.5 gramme of finely-powdered cochineal; place in a 100 C.c. flask with 30 C.c. of distilled water and 5 drops of liquor ammonia. Heat to boiling point, strain through cotton wool into a 100 C.c. flask, and wash with sufficient water to produce 100 C.c. The marc on the wool should now be quite colourless. Put 25 C.c. of the liquid into a 100 C.c. stoppered test mixer, add 5 C.c. of strong hydrochloric acid and sufficient distilled water to produce 100 C.c. Run in 0.5 C.c. at a time of solution of chlorinated lime (or soda) containing 1 per cent. available chlorine till the cherry-red colour changes to dull orange, shaking briskly after each addition. Continue adding chlorinated solution in 0.1 C.c. portion as long as the colour is being bleached. When almost completed note the burette reading, and after adding a further 0.1 C.c. of solution, shake the liquid slightly, and see if the top layer is lighter than the lower. If there is no difference the reaction is finished; if the lower stratum is darker continue to add

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh March 21, 1900. (See page 314.)

chlorinated solution drop by drop till the reaction is quite complete. The description may seem complicated, but in practice it can be performed with the utmost ease, and the end point is well-defined and reliable. The titration should be performed a second time more carefully. The number of C.c. of chlorinated solution used, multiplied by eight, gives the quantity of solution required to destroy the colouring matter of 1 gramme of cochineal. In examining a series of samples it is immaterial what strength of chlorinated solution is used. The official solution of either lime or soda, diluted with an equal volume of distilled water, answers very well, and gives the relative values of a series of samples, but for strict comparison, I suggest a 1 per cent. solution as a convenient standard.

In columns three and four of the table under the previous paper I give respectively the number of C.c. of 1 per cent. chlorinated solution required to decolorise 1 gramme of cochineal and the colour value of each sample, assuming as a standard that 20 C.c. are required to bleach 1 gramme of high-grade cochineal, and counting that as 100. On comparison of the colour value with the yield of ash, it is seen that there is no relation between the two factors. Numbers 11 and 13, with ash, yield respectively of 17.3 and 23.2 per cent., are almost 20 per cent. better in colour value than number 22, with 2.9 per cent. of ash. Again, numbers 17 to 21 inclusive have a uniform colour value of 80, while the ash yield ranges from 2.9 per cent. up to as much as 24.8 per cent. The next four lower samples are equal to 76 in colour value, with ash from 2.9 to 25.4 per cent.

The samples of dark grain relatively of better quality than the silver variety.

It may be objected that lime salts precipitate the colouring matter of cochineal, but while this is so, it does not in the slightest degree affect the delicacy of the reaction, nor the accuracy of the results. Mineral acids act as precipitants, whilst 50 per cent. acetic acid is a solvent of the colouring principle. As, however, it is not advisable, even if practicable, to titrate in presence of a large bulk of acetic acid of this strength, and as any precipitate of the colouring matter by the hydrochloric acid is so finely divided and diffused through the liquid, the latter is preferably employed.

Experiments were made to see whether a larger or smaller proportion of acid added to the cochineal decoction before titration in any way modified the results. Too little acid—say, just what is theoretically necessary to decompose the chlorinated solution—does not liberate the chlorine with sufficient rapidity, and consequently does not give so sharp a reaction as the proportion I suggest, whilst a larger amount is in no way objectionable. In preparing the cochineal decoction the trace of ammonia is used to ensure perfect and rapid exhaustion, thus ensuring the uniformity which might not be attained using water only. The fineness of the powder in different samples might vary, and the proportion of fatty matter is by no means constant. Some insects powder much more readily than others which contain more fat. One cannot judge of the value of a sample of cochineal with any degree of accuracy simply by its appearance. Its colouring power may be defective, either through careless collection, or storage, or by other causes, such as partial exhaustion and redrying with or without mineral facing. Moreover, one cannot judge quality from the depth of colour or "body" possessed by a decoction made with distilled water. Dark grain yields an infusion of a brighter red than does silver grain, the latter being brought to the tint of the former by a trace of acid. In other words, the dark grain is more acid than the silver. On moderately acidulating two such samples it is noticed that the infusion made from the dark grain is of greater tinctorial power. This is not universal, but it goes to show that cochineal cannot be judged by the eye from the depth of colour it imparts to distilled water.

From the foregoing, together with the results obtained in the ash estimations, I suggest (1) That the ash limit given in the

Pharmacopœia is too high, and should, if retained in future issues, be placed at not more than 4 per cent. This is a liberal margin to allow; (2) that in view of the wide variation in tinctorial power shown by commercial cochineal, as also the absence of any relationship between the ash content and the colour yield, some test for colour valuation on the lines indicated above should be added to the present official tests.

Time has prevented the examination of the whole series of ash residues to ascertain the adulterant used. Barium sulphate undoubtedly exists largely in some of them, also fragments of earthy impurity, French chalk, etc. I hope later on to be able to report if any noticeable feature occurs.

The foregoing process also answers admirably for the valuation of commercial carmines. I append results obtained in seven samples which I examined:—

TABLE II.

No. of Sample.	Ash.	C.c. Chlorinated Solution used.	Colour Value.
	Per Cent.	Per Gramme.	
1	6.5	32	100
2	8.5	31	97
3	7.0	30	94
4	6.0	28	87
5	4.8	24	75
6	5.2	24	75
7	6.8	10	31

As in the case of cochineal, moisture present is of no moment, and ash content is only of secondary importance and unreliable. Note samples 1 and 7, which have practically the same ash yield, and yet sample 1 has more than three times the colour value of sample 7. The colour value, therefore, is the only reliable basis upon which to form an opinion as to the quality of the sample. In estimating the colour value, 0.1 gramme of the sample is treated precisely in the same way as the cochineal, except that boiling and filtration are not necessary. A high-grade carmine is taken as standard and called 100.

THE VOLUMETRIC DETERMINATION OF RED LEAD.*

BY JAMES F. TOCHER, F.I.C.

On examining a few samples of red lead recently, I was struck with the unsatisfactory end reaction in the volumetric method described by Sutton as suitable for technical work. It is true that the percentage of Pb_3O_4 may readily be calculated from the result of gravimetric determination of Pb in the PbO_2 produced by the interaction of Pb_3O_4 and nitric acid. But an accurate and rapid method of volumetric determination is very much to be desired, and none of the methods described seem to be both accurate and rapid. With this object in view, a large number of experiments with various substances and samples were carried out by myself and Mr. John Don, B.Sc., who has assisted me in these experiments.

It was apparent that the transient character of the permanganate coloration was to be attributed to the excess of nitric acid, and, accordingly, the object was to secure the permanency of the coloration by suitable means. Acetic acid and other solvents were tried instead of nitric acid with indifferent success. It was found, by using normal nitric acid (sp. gr. 1.05) in place of the comparatively strong acid (sp. gr. 1.2) recommended by Sutton, that very satisfactory results could be obtained. It may be here mentioned that Sutton's method is as follows:—"2.064 grammes of red lead is placed in a 300 C.c. porcelain basin, and 20-30 C.c. nitric acid (sp. gr. 1.2) poured over it, then warmed gently with stirring. In a few minutes the lead oxide is dissolved and the peroxide left insoluble. 50 C.c. of N/5 oxalic acid is added and the mixture boiled. This decomposes and dissolves the peroxide,

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh March 21, 1900. See page 314.)

leaving undissolved any adulterant such as baryta, lead sulphate, oxide of iron, gypsum, or sand; while still hot N/5 permanganate is added in moderate portions until the colour is permanent for a few seconds. The volume of permanganate deducted from 50 gives direct the percentage of lead existing as peroxide." Red lead is easily decomposed by very dilute nitric acid (sp. gr. 1.05) approximately of normal strength. If the quantity recommended above (2.064 grammes) is treated with 50 C.c. of nitric acid (sp. gr. 1.05), the Pb₃O₄ is completely resolved into PbO₂ and Pb(NO₃)₂ in the cold. If now the mixture is brought nearly to boiling, and 50 C.c. of N/5 oxalic acid run in, the PbO₂ is almost completely dissolved, and, after boiling, some dilute H₂SO₄ is added, and the mixture is ready for titration. A little water is added and the mixture treated with N/5 permanganate until a permanent coloration is obtained. Several experiments were conducted with nitric acid (sp. gr. 1.2) and various means tried for the purpose of removing the excess of acid or reducing its strength, keeping in view that the amount of oxalic acid present had to remain intact. After many unsuccessful trials with such substances as Zn, Mg, etc., etc., Ba(HO)₂ was tried with complete success. The introduction of this substance after decomposition of the residual peroxide by N/5 oxalic acid and the nitric acid sufficiently neutralises the solution, at the same time partly precipitating the oxalic acid. Neutral sodium sulphate solution is now added, forming NaNO₃ and BaSO₄. The addition of dilute H₂SO₄ releases any oxalic acid that may have gone into combination with the barium, and prepares the mixture for titration, which is now simple and certain. A third and very suitable technical method suggested itself on noting the breaking up of the peroxide by oxalic + nitric acid; but for complete success the nitric acid must be strong (sp. gr. 1.3). If about 50 C.c. of nitric acid of this strength is added to a weighed quantity (2.064 Gm.) of red lead, and, after heating, N/5 oxalic acid gradually run in, the final disappearance of the dark PbO₂ can be readily noted. Towards the end the mixture clears up and the remaining peroxide settles in small grains at the bottom of the basin, and on the addition of sufficient oxalic acid, the mixture being kept nearly boiling and well stirred, it completely disappears. To properly note the end of the reaction, the Bunsen is momentarily removed and the fumes blown aside. Very accurate results were obtained in each case except No. 1, which was very poor in red lead, and contained much lead sulphate, but even in this case the difference was only 0.5 per cent. The following were the results obtained. If 2.064 Gm. of red lead are taken, it is obvious that 1 C.c. of N/5 oxalic or N/5 permanganate is equivalent to 1 per cent. of Pb, while if this is multiplied by 3.3, the percentage of red lead is ascertained, as is evident from the following equation:—

It is the quantity of lead in the PbO₂ which is determined.

The molecular weight of Pb₃O₄ is 683.5 and $\frac{683.5}{206.4} = 3.3$.

Sample.	Nitric Acid 1.05 and H ₂ SO ₄		Nitric Acid 1.2 Ba(OH) ₂ and H ₂ SO ₄		Nitric Acid 1.3 and oxalic acid alone.		Gravimetric as sulphate.	
	Pb	Pb ₃ O ₄	Pb	Pb ₃ O ₄	Pb	Pb ₃ O ₄	Pb	Pb ₃ O ₄
No. 1	3.4	11.2	—	—	3.3	10.89	3.79	12.5
No. 2	17.8	58.7	18.0	59.4	17.9	59.0	18.45	60.9
No. 3	21.4	70.6	21.5	70.9	21.6	71.2	21.51	71.0
No. 4	24.1	79.5	24.0	79.2	23.9	78.8	23.99	79.2

In determining gravimetrically, the PbO₂ was well washed and treated with dilute nitric acid and hydrogen peroxide. The PbO₂ was completely decomposed by this means, and the lead was then thrown down as sulphate.

An entirely different method of approaching the problem is

indicated by the reaction which occurs when strong pure HCl is brought into contact with Pb₃O₄:—

This method has not been mentioned as suitable and applicable to commercial red lead, although, of course, it is well known that metallic peroxides can be most accurately determined by collecting the Cl in the usual apparatus. Where other peroxides are found to be present, the chlorine method is inapplicable to red lead. This is seen in sample No. 1, where the difference is 4.3 per cent.; otherwise the method is very applicable, as great accuracy is obtained. The sample was placed in a small flask fitted with a paraffin-soaked cork, through which a glass tube was passed and connected with a bulbed U tube containing a suitable quantity of a saturated solution of KI. A small U tube was connected to the other end of the large tube containing also a little KI. The U tubes may be put in a large beaker and surrounded with water to keep them cool during the operation. Strong HCl was added to the flask and the apparatus connected together. This apparatus is described by Fresenius. A desirable improvement would be the substitution of glass throughout for cork. An apparatus of this character is being made and will be shown at a future meeting. If 3.415 grammes of red lead is taken and N/10 thiosulphate used each cubic centimetre of thiosulphate will represent 1 per cent. of Pb₃O₄. The following results were obtained by this method:—

Sample.	Pb ₃ O ₄ per Cent.	Gravimetric Figures.
No. 1	16.8	12.5
No. 2	61.2	60.9
No. 3	70.2	71.0
No. 4	78.4	79.2

The percentage of red lead may be accurately determined by applying Mohr's alkalimetric method. There was here, however, a difficulty. When sugar, alcohol, etc., were used with HNO₃ to decompose the PbO₂, it was found, naturally enough, that other bodies of an acidic nature had been developed to an uncertain extent in the reaction, and consequently the results were unreliable. However, a method that promised so well was not to be abandoned without an attempt to discover a solvent which was free from the objections attached to those already mentioned. The solvent satisfying these conditions was found to be hydrogen peroxide, which proved to be an excellent medium. The sample was first treated with dilute nitric acid, as before, which decomposes the Pb₃O₄, and forms PbO₂ and Pb(NO₃)₂ with excess of nitric acid. The point of neutralisation was not easily distinguished owing to the presence of the dark PbO₂, but filtration and washing was resorted to, and as the filter paper with its contents can be subsequently digested together with a known quantity of normal nitric acid, the determination by normal alkali may be readily performed. Filtration may be dispensed with by the pouring of the decomposed mixture on to a concentrated solution of KNO₃ (or better, a mixture of NaNO₃ and KNO₃) contained in a conical vessel, which permits the PbO₂ to sink through the heavy liquid, leaving the acid at the surface to be subsequently siphoned off. The following results were obtained by the alkalimetric method just described:—

Sample.	Filtration.	Method of Subsidence.
No. 1	3.7	—
No. 2	18.1	—
No. 3	21.4	21.5
No. 4	23.9	—

Arising from the foregoing, it will be interesting to show a ready method of determining volumetrically the total lead present in commercial samples. The fact that H_2O_2 was found to effect the complete solution of the oxides at once suggested the means of obtaining this result. A standard solution (N/5) was prepared and 20 C.c. poured on to a weighed quantity of the sample along with about 20 C.c. of neutralised H_2O_2 . The operation was conducted in a retort, the drawn-out neck of which dipped into standard (N) soda. The lead oxides all decompose and dissolve as the liquid is brought to boiling. The source of heat is removed, and the normal soda (which is not in excess) is quickly drawn into the retort. Neutral sodium sulphate is now added, and phenolphthalein as indicator, and the excess of acid determined. If 1.032 gramme of red lead is used, 10 times 100 (representing 20 C.c. N/5 nitric acid) — number of C.c. of N soda required for neutralisation give the percentage of total lead in the sample. The amount of total lead by this method agrees closely with the results from gravimetric analysis and assay:—

Sample.	Alkalimetric.	Gravimetric.	Assay.
No. 3	89.4 to 91.5	90.9	90.3

Several other rather interesting facts were brought to light in the examination of red lead, but they were not considered of practical importance. What is of chief practical interest in this paper is the fact that the percentage of red lead can be determined by several methods very accurately and in a few minutes:—

(1) Nitric acid 1.05, with H_2SO_4 with oxalic acid and permanganate.

(2) Nitric acid 1.2, with $Ba(OH)_2$, Na_2SO_4 , H_2SO_4 , with oxalic acid and permanganate.

(3) Nitric acid 1.3, with oxalic acid alone.

(4) Hydrochloric acid, with KI and thiosulphate.

(5) The alkalimetric method with subsidence.

The first three modifications of the nitric acid method are distinct improvements and can be recommended, particularly Nos. 1 and 2, where ease, rapidity, and accuracy are all combined, and pharmacists interested in this substance can arrive at the commercial value of red lead with very little trouble, waste of time, or inconvenience.

ANALYTICAL NOTES.

RAPID DETERMINATION OF URIC ACID.—The following rapid method for the clinical determination of uric acid is due to E. Gautrelet. Twenty C.c. of unfiltered urine are taken, exactly neutralised with weak alkali, then acidulated with 5 C.c. of 15 per cent. acetic acid. An indicator, freshly prepared from potassium ferricyanide, 20 centigrammes; hydrochloric acid, 5 drops; distilled water, 100 C.c., is spotted out on a white porcelain plate. The acidulated urine is then titrated with the following standard copper solution, added drop by drop. Copper sulphate, 2.4 Gms.; sodium sulphite, 5 Gms.; acetic acid, 5 Gms.; distilled water to 1,000 C.c. A drop of the urine is repeatedly removed during titration and applied to a drop of the indicator. The end of the reaction is shown by the appearance of a red colour in the mixed drops. Every 0.1 C.c. of standard solution used is equivalent to 0.01 Gm. of uric acid per litre of urine.—*Bull. Com.* 27, 519; after *Bull. de Pharm. de Lyon*.

COPAIBA BALSAM.—Gehe and Co. dispute the value of K. Dietrich's figures for copaiba (see *ante* p. 227), and assert that the data obtained by the latter's method of examination yield results which would pass as pure, Para and Maracaibo balsams adulterated with 20 to 40 per cent. of colophony. They point out that it is not so much East Indian balsam, as the thin fluid Para copaiba balsam, which is used for the adulteration of Maracaibo balsam. They give the following comparative figures:—

	Sp. gr.	Acid No.	Ester No.	Sap. No.
Balsam Copaiba Para (pure)	0.931	30.32	8.11	38.43
With 20 per cent. Colophony	0.956	55.11	7.44	58.55
" 35 " " "	0.973	70.94	5.8	76.02
" 40 " " "	0.982	77.73	2.27	80.00

While the figures given by Dietrich are:—

	Sp. gr.	Acid No.	Ester No.	Sap. No.
For Para balsam	0.95 to 0.97	40-60	2-8	30-60
For Maracaibo balsam	0.98 to 0.99	75-85	3-6	80-90

—*Pharm. Centralkh.* 40, 269.

HAZELNUT OIL.—I. Hanus gives the following characters for this oil:—Specific gravity at 15° C. 0.9169; saponification number 193.7; Hehner number 95.6; Reichert number 0.99; iodine number 90.2; acetyl number 3.2; saponification number of the fatty acids 200.6; iodine number of fatty acids 90.6; saponification number of the unsaturated fatty acids 198.5; iodine number of the unsaturated fatty acids 91.3; mean molecular weight of the unsaturated fatty acids, 272; rise in temperature by Mauméné's reaction, 36.2 C. The oil, on examination, gave—Oleic acid, 85 per cent.; palmitic acid, 9 per cent.; stearic acid, 1 per cent.; glycerin, 10.41 per cent.; phytosterin, 0.5 per cent.—*Pharm. Zeit.* 44, 779, after *Chem. Zeit. Repert.*

DETERMINATION OF ESSENTIAL OIL IN CINNAMON WATER.—Duyk accomplishes this by converting the cinnamic aldehyde into the corresponding hydrazone. The cinnamon water is treated at ordinary temperatures with an excess of a 1 per cent. aqueous solution of phenyl-hydrazine hydrochloride containing 15 per cent. of potassium acetate. The mixture is thoroughly shaken, and filtered off from the precipitated hydrazone, which is washed, dried, and weighed. From 100 C.c. of cinnamon water he obtained 0.175 Gm. of hydrazone, corresponding to about 1 per cent. of cinnamic aldehyde.—*Chem. Zeit.*, 23, 264, after *Annal. Chim. anal.*

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Commerce of Drugs.

The gratifying success of the Evening Meeting at which the Pharmaceutical Society's Curator discoursed upon the commerce of drugs goes to prove two things—first, that there is no difficulty in attracting an audience on such an occasion, when the weather is favourable, provided an appropriate subject is to be dealt with; second, that Mr. Holmes has, up to the present, missed a great opportunity in not disclosing to the world of pharmacy more of the lesser known facts with which he is conversant regarding drugs. As he well remarked, the knowledge of drugs possessed by the retail chemist is often derived exclusively from text-books, and, as a rule, he is only imperfectly equipped so far as practical commercial knowledge is concerned. The obvious remedy is that a book should be published in which drugs shall be primarily treated from the commercial point of view, and I am sure no one is more competent to produce such a work than Mr. E. M. Holmes. He has published an enormous mass of matter during his long and useful career, but I hope to see an important book from his pen before the world is many years older, and no work is so likely to do justice to his reputation as a well-planned and exhaustive treatise on the commerce of drugs. Naturally, the task of producing such a work will be far from easy, particularly in connection with the accumulation of up-to-date information regarding the different commercial varieties of drugs, but surely there are enough persons sufficiently interested in the subject to render Mr. Holmes any assistance in their power. He has given assistance to so many people, so willingly and so freely, during a long series of years, that he need not hesitate to call upon some of those he has helped to collect information to assist him in return. Moreover, the work would be for the common good and everyone who assists in it would thereby be helping himself.

Why Drugs Become Scarce.

Some of the drugs referred to in Mr. Holmes' interesting paper were among those concerning which I had occasion to write a few weeks ago, in connection with the question of B.P. standards, and it is gratifying to find that our worthy Curator's opinions correspond so closely with my own. He attributes the occasional scarcity of some high-class drugs to "the keen competition in trade, which leads buyers to purchase at as low a rate as possible," and that undoubtedly is the key to the situation. For shippers will not send drugs to the London market if they are faced with the almost certain prospect of loss thereon, and, naturally, collection of those articles will flag or even cease entirely when the demand falls off. Jaborandi leaves and pareira root were specifically mentioned by Mr. Holmes as drugs which have been sold at a loss to the shipper, and, consequently, become scarce and unnecessarily high-priced. Again, English aconite root, which may or may not be better than German, can readily be procured if only the growers are assured of a fair remuneration; in fact, there is plenty to be got at the present time, though we have been told that in consequence of the supply failing, it is necessary to use foreign aconite root to make certain official preparations. Indeed, we may safely assume that almost any high class drug can be procured in ample quantities, and at a reasonable price, if there is a steady demand for it. But if there is too great a tendency to buy cheaply, and the price drops below the cost of production, the natural results will be scarcity and unnecessarily high prices. The chief moral to be derived from the discussion on this subject is, evidently, that pharmacists should educate themselves regarding the commerce of drugs. They will then learn that it is not to their advantage to know enough only to enable them to classify drugs as "B.P." and "not B.P." respectively.

What to Know about Drugs.

I sympathise strongly with Professor Greenish's views that pharmacists should acquire as complete a knowledge as possible of genuine drugs, and depend mainly upon that knowledge to help them to guard against the use of substitutes. It is a hopeless task which faces anyone who sets out with the idea of attempting to make himself familiar with the characteristics of all substitutes for official drugs, as well as those of the genuine articles; perhaps only one person in a thousand can expect to attain to an intimacy with the subject that will enable him to succeed in such an attempt. But it ought not to be beyond the powers of most of us to learn that a certain article is not what it professes to be. We may not be able to declare positively, say, what is the origin of a particular sample of gum, but we ought to be able to assert that it is not gum acacia, B.P. Again, we may be unable to say what species of aconite has yielded a particular sample of foreign root, but we need be under no misapprehension with regard to the point whether it is English root or not. Nor is it necessary for this purpose that pharmacists should "go into the histology of the whole of the official drugs," as Mr. Martindale put it, at the Evening Meeting. I hardly think that even Professor Greenish would suggest anything of the kind as a necessity in every instance. A rational view appears to be that if the macroscopic characters of a genuine drug clearly suffice to distinguish it from everything else, nothing further need be considered in an ordinary way; whether a histological, chemical, or physiological examination is required in addition must depend entirely upon the circumstances of each particular case.

Is there a New Panacea?

Is Mr. Glyn-Jones' circular letter, published last week, to be regarded as the precursor of another "wonderful panacea," or does it simply indicate a natural curiosity to know what is going to happen? There are various recognised ways of attempting to find out before the first Wednesday in April what persons have been nominated as candidates for seats on the Council, and which of them have accepted nomination, but all possess the same defect—that of yielding incomplete and, therefore, unsatisfactory results. I doubt much whether Mr. Glyn-Jones' new method, if such it be, will prove any more satisfactory in that respect, but it is certainly ingeniously conceived, as—for the matter of that—are all schemes evolved from the same fertile brain. Apart, however, from the novelty and ingenuity of Mr. Glyn-Jones' latest move, it comes somewhat as a shock to find a member of the Council, whose own seat is secure for two years to come, inviting the electors to assist him in ousting three or four of his colleagues. Presumably, however, he despairs of doing all he could wish, unassisted, and the idea has occurred to him that the members who elected him may be disposed to elect three or four other persons who hold similar views. It was rumoured that he was arranging to run seven candidates whose chief qualification should be that they had never before held office as Councillors; but, apparently, the stock of suitable material available will not permit of more than three or four persons being put forward as being, in all respects, free from any taint that might be supposed to be acquired by sitting at the Council table. Are we to assume, by the way, that Mr. Glyn-Jones himself will, by his own reported ruling, be ineligible for re-election in 1902, or is the coming demonstration intended only for the instruction and improvement of the representatives of historic houses? The retiring members of Council are Messrs. Bateson, Cross, Grose, Hills, Storrar, Symes, and Warren. Are two of those to be opposed, if they offer themselves for re-election, because they are Londoners and representatives of historic houses? Of a surety, either reason would be an absurd one for rejecting a past-President of the Society, who has done much good work for the Society, or an Hon. Secretary of the B.P.C., who, I understand, does equally good work in a modest and unobtrusive manner, as will probably be proved to a large number of us when,

four months hence, we become personally acquainted with him. It is the height of absurdity to assume that a member of Council, and particularly a London member, does nothing in the Society's interest because he does not deliver long speeches when reporters are present. But, unfortunately, the reports of such speeches afford the only clue available to electors who are anxious to have their interests properly cared for. So far as the five retiring country members are concerned, it is difficult to see what reason can be advanced in favour of rejecting any three or four that will not apply to the lot. But, doubtless, Mr. Glyn-Jones will solve his own problem, and disclose his new panacea, if such a thing exist, in his own good time.

PHARMACEUTICAL SOCIETY.

Evening Meeting in Edinburgh.

The fourth evening meeting of the session was held in the Society's House, 36, York Place, Edinburgh, on Wednesday, March 21, Mr. PETER BOA in the chair. The minutes of last meeting were read and approved, and apologies were intimated for Messrs. Ewing, Davidson, Coull, Merson, and Tocher. The Chairman referred to the loss sustained by the Society in Scotland, in the death of Mr. James Watt, of Haddington, and Mr. Wm. Burley, of Edinburgh, and the meeting agreed to send letters of sympathy to the relatives of each.

The first paper read was on

THE VOLUMETRIC DETERMINATION OF RED LEAD,

by Mr. James Tocher, F.I.C. It is printed in full at page 310.

Dr. DOBBIN said one good point was that Mr. Merson had attacked the problem of devising an apparatus for this determination, in which the great objection due to absorption of chlorine or iodine by the cork was obviated by using glass throughout. He understood an apparatus on that principle had recently been put upon the market in Germany, but was not to be had yet in this country. He hoped Mr. Tocher's would be an improvement even on that one. A curious use of red lead had recently come under his observation. Some ingenious person had discovered that when flashed with an aniline dye it could be sold as vermilion. The sophistication was discovered in the examination of a so-called vermilion which on analysis yielded no mercury. The sample had given rise to great trouble among some students to whom it was given as vermilion.

Mr. LUNAN said this practical paper was an object lesson in what a pharmacist could do in adapting himself to the work of his district.

Mr. DOTT said that for nearly all purposes for which red lead was used the presence of small quantities of impurities was unimportant.

Mr. HILL said that, being used for technical purposes, in which a little impurity was not important, red lead seemed liable to considerable contamination, which unfitted it for those technical purposes. In glass-making other metallic oxides, such as those of iron and copper, were especially objectionable.

The next papers, printed at page 309, were on

THE ASH PERCENTAGE OF COMMERCIAL COCHINEAL and

A SIMPLE METHOD FOR VALUATION OF COCHINEAL AND CARMINE,
by Mr. George F. Merson, F.C.S.

Dr. COULL had sent a note of ash percentages of cochineal samples, examined by him during the last six years. Those varied from 1.6 to 27.9 per cent. A sample giving 9.5 was priced a halfpenny per pound dearer than one yielding 1.6, and one yielding 2.4 was a halfpenny cheaper than the first. In another case a sample giving 10.5 was quoted one penny per pound dearer than one yielding 2.8; four samples approached 20 per cent., two 30 per

cent., and one 25 per cent. The average of good samples was between 2 and 4 per cent., and he thought it reasonable that the pharmacopœial limit of ash should be altered from 6 to 4 per cent especially as the enormous percentages of ash cannot but be the result of flagrant adulteration.

Mr. LUNAN said he was astonished at the statement that the colour value of cochineal could not be estimated by the eye. The chlorine bleaching method was open to the danger that other substances than the colouring principle of cochineal might use up the chlorine.

Mr. DOTT said it was evident that in this case, as perhaps in some others, the official ash standard was not satisfactory. The one weak point in the colour valuation process was that other colouring matters, such as aniline colours, might mislead. Still the papers were very interesting, and would be useful in determining the value of cochineal and carmine.

Mr. COWIE said he could corroborate Mr. Merson's statement that ash percentage in no way distinguishes good or bad cochineal. He had examined a sample containing 20 per cent. of barium sulphate.

Mr. BOA said he had observed it stated that cochineal yielded about 1 per cent. of ash. He thought the eye could pretty well determine the colour value, and would also detect any aniline dye tint. He had been so dissatisfied with cochineal as a colouring agent that he had discarded it altogether. He was surprised to hear that dark grain was considered the best, as that was contrary to his experience.

EXHIBITION OF SPECIMENS.

The ASSISTANT SECRETARY directed attention to a fine sample of asafetida in tears, sent by Messrs. Wyleys, Limited, Coventry; a sample of so-called Uganda aloes, sent by Mr. Jones, Coventry; and galls of *Retinea resinella*, on *Pinus sylvestris*, presented by Mr. R. Stewart Macdougall.

On the motion of the CHAIRMAN, votes of thanks were awarded to the authors of papers and the donors of books and specimens. The meeting then closed.

EXTRACTS FROM CONSULAR REPORTS.

ENGLISH PHOTOGRAPHIC MATERIALS of all descriptions, are, according to Consul-General Hertslet, much appreciated in France, although the difference between the standard sizes in the two countries is a hindrance to their general use. One English firm is stated to have produced an excellent illustrated catalogue of fifty-four pages, entirely in French, with the photographic sizes measured according to the French standards, and with the prices given in French currency.

THE SOLE RIGHT TO SELL DYNAMITE in Venezuela is possessed by the French Nobel (Monopoly) Company, which charges thirty-seven dollars (about £6) per box of 50lb. of dynamite supplied to the mines. This, according to Consul de Lemos, is double what it would cost to import the same article from the United Kingdom or Germany; and he is informed that the price charged is found to be so excessive by the consumers, that they have to restrict their mining works in consequence.

THE VALUE OF VANILLA exported from Tahiti (Polynesia) in 1898 was £15,000, as against £16,000 in 1896. Owing to an exceptional rise in price in 1897, vanilla then ranked far higher than in 1898. The price is reported to have again fallen seriously, but it is estimated that the production will increase from 20 to 30 per cent. during the next two years, as the result of the formation of new plantations.

CHEMICAL SOCIETY.

At the meeting held on Thursday, March 15, the PRESIDENT, Professor T. E. Thorpe, F.R.S., in the chair, the papers on the list contained an unusually large proportion of inorganic research.

A paper by H. BRERETON BAKER, M.A., was first communicated, on the

VAPOUR DENSITIES OF DRIED MERCURY AND MERCUROUS CHLORIDE.

Since ammonium chloride when perfectly free from water has been found to vaporise without dissociation, the author determined to investigate the vaporisation of mercurous chloride in as dry a condition as possible. Pure mercurous chloride was prepared by precipitation and washed until a large quantity of washings gave no opalescence with silver nitrate after concentration. On account of the action of light upon it the pure substance was preserved in the dark, and the experiments were carried out in a room kept as dark as it was possible to work in.

The determination was made by Victor Meyer's method, using a bath of boiling sulphur.

The experiments came to a successful issue in showing that the drier the condition the more nearly the vapour density approaches to that value calculated for no dissociation taking place. The apparatus required to be made of hard glass, since soft glass always gave a result indicating dissociation.

The experiments made on mercury itself to determine whether in a very dry condition its vapour has any greater complexity have led to no affirmative conclusions; hitherto it has always appeared as monatomic vapour, but although it has been dried until the water present amounts to no more than the thousandth of a milligramme, the influence of such infinitely small quantities may be very great, and the possibility may still remain of obtaining such a degree of desiccation that the molecule of mercury vapour is diatomic.

The author has also attempted to obtain undissociated phosphorus pentachloride vapour, but has not been able to obtain a sufficiently pure substance until recently, when one experiment gave a result of 89.4 as the vapour density, but he had not had time to repeat the determination.

This contribution gave rise to an animated discussion, in which everyone freely congratulated the author.

Professor ARMSTRONG said he was sure there must be an important personal equation in Mr. Baker's work. He also thought it was to be regretted that the important results of his previous researches on dissociation had not received more recognition.

Professor DEWAR stated that Lord Rayleigh had made a determination of the weight of hydrogen freed from water by condensing the latter with liquid air, and the result agreed so well with that obtained with the use of chemical drying agents that he might suggest the use of liquid air as a drying agent.

Professor McLEOD inquired if the author had determined how great a quantity of water was sufficient to give complete dissociation, to which Mr. Baker replied that the quantity was very small.

Dr. SCOTT, of the Davy-Faraday research laboratory at the Royal Institution, read a paper on the

PREPARATION OF PURE HYDROBROMIC ACID.

He had found some trouble in obtaining pure hydrobromic acid with the use of red phosphorus, owing to the arsenic present in the latter. The method he had to communicate was by covering a quantity of pure bromine with six times its volume of water and blowing sulphur dioxide into the mixture until nearly all the bromine disappeared. On distilling the liquid the remaining bromine goes over first, and is easily got rid of.

If a very pure acid is required it is advisable to distil in hydrogen. To show that the acid obtained is free from sulphur compounds the acid was analysed by Stas's method with silver, and by a remark-

able coincidence the mean of the author's results corresponded to the sixth figure with that given by Stas. Pure sulphuric acid, it was to be noticed, was obtained as a by-product.

A NEW SULPHIDE OF ARSENIC

was described by the same author.

When arsenious oxide is treated with phosphorous acid and sulphurous acid, if heated the sulphurous acid is completely reduced and ordinary yellow arsenious sulphide is precipitated, but if the mixture be allowed to stand for a few hours at the ordinary temperature a brown sulphide of arsenic is precipitated. The analysis of this sulphide indicated a formula As_3S , and the question arose as to whether it was a mixture of arsenic sulphide with elemental arsenic. To answer this question the substance was treated with three successive quantities of freshly-made ammonium hydro-sulphide, and an analysis of the residue made after each treatment. Since the composition remained unaltered by this treatment, it was assumed that this substance could not be a mixture.

It is soluble in yellow ammonium sulphide.

Several members took part in discussing the subject. The PRESIDENT remarked that Dr. Scott had added hydrochloric acid to the solution of arsenic, and inquired if it was necessary; he recalled an experience of his own, in which hydrogen sulphide had failed to produce any precipitate in a solution of arsenic fluoride until hydrochloric acid was added. Professor TILDEN inquired if other evidence had been sought to prove that the substance was a pure compound. The existence of As_3S was readily conceivable, as it is easily seen to be realgar in which an atom of sulphur is replaced by an atom of arsenic.

Mr. DUNSTAN inquired whether the action of heat upon this sulphide had been observed.

In reply to this question Dr. SCOTT stated that realgar volatilises and elemental arsenic is left behind.

A paper was next given by R. L. TAYLOR on

THE ACTION OF IODINE ON ALKALIES.

Mr. TAYLOR recapitulated the work of other authors on the subject, and summed up the conclusions he had arrived at in the statement that the behaviour of iodine is in every respect analogous to that of the other halogens.

The strong bleaching power of a solution of iodine in alkali suggests the existence of a hypoiodite, and this he pointed out was recognised by Schönbein. If sufficient alkali be added to a solution of iodine to completely discharge its colour it still gives a blue reaction with starch, indicating that the reaction indicated by the equation, $I_2 + KOH = KI + KIO + H_2O$, is a reversible and balanced one.

The author showed that the carbonic acid of ordinary aerated water immediately restores the colour of iodine to a colourless solution in potash, whence it must be concluded that the liquid contains hypoiodite when it is not boiled. Another experiment was made in which two decinormal solutions of iodine were decolorised with alkali, and then treated with sodium bicarbonate; to one of these the sodium bicarbonate was added instantly, while to the second it was added after the lapse of a few minutes, by which the first solution became much more deeply coloured with liberated iodine than the second, showing that the action of iodine is first like that of chlorine, but that in a strong solution there is a rapid change, iodide and iodate being formed. Moreover, the action of iodine on mercuric oxide is parallel with that of chlorine, hypoiodous acid being undoubtedly produced. The reason why this has escaped notice is probably because hypoiodous acid does not bleach by itself, but only when alkali is added.

This was experimentally demonstrated by Mr. Baker in concluding, when the hearty applause of the members expressed their appreciation of his contribution.

A discussion followed, in which the suggestion was made by two or three members that alkali alone bleached certain blue pigments

sold as indigo, and, at the President's suggestion, Mr. Taylor proved that his indigo solution was not bleached by alkali alone. The President remarked how much more interest it gives a paper at its reading to give practical demonstrations as Mr. Taylor had done.

A paper, by Dr. EDWARD DIVERS and T. HAGA, on

THE INTERACTION BETWEEN SULPHITES AND NITRITES, was also read.

When nitrous fumes are passed into an ice-cold solution of sulphurous acid the principal reaction is expressed as follows:—

oximid sulphuric acid being produced.

The action must be stopped while excess of the sulphurous acid remains, which may be expelled by boiling or a current of air. In the presence of alkali no action whatever takes place between a sulphite and a nitrite; acid must be present although carbonic acid is strong enough, while it is unimportant what base is present. Claus had stated that when potassium nitrite and potassium sulphite are mixed the following reaction occurred:—

That was a mistake which arose from assuming that a solution of sulphite, neutral to litmus contains, the normal salt, which is not the case.

A paper by W. A. BONE and C. H. G. SPRANKLING on the propyl substituted succinic acids was also read.

PROCEEDINGS UNDER THE PHARMACY ACTS.

Recovery of Penalties.

Pharmaceutical Society v. Mottram.

At Birmingham County Court on Tuesday, March 20, before His Honour Judge Whitehorne, the Council of the Pharmaceutical Society of Great Britain sought to enforce a judgment summons against Charles Mottram, chemist's assistant, Balsall Heath. In January judgment was given against the defendant in an action brought by the Society to recover a penalty of £5 under the Pharmacy Act (see *ante*, p. 49).

Mr. Cohen appeared for the plaintiffs, and Mr. Rigby for the defendant.

Mr. Rigby reminded His Honour that this was not an ordinary debt, but a case where the defendant had incurred a penalty for contravening the Pharmacy Act of 1868. The defendant was earning 15s. a week, and out of this had to pay 12s. to his parents for his maintenance. In consequence of this summons and in consequence of his employer having taken over the shop, the defendant would soon be out of a situation. He asked that no order should be made.

Mr. Cohen said no doubt His Honour would remember that this was a quasi-criminal offence.

Charles Mottram, sworn and examined by Mr. Cohen, said he was a chemist's assistant in the employ of Mr. Freeman, chemist, Balsall Heath.—Mr. Cohen: And you are his manager, are you not?—Witness: I am in charge of the shop.—Continuing, witness said he earned 15s. a week. He had to provide his own board and lodgings, and got no commission. He made no offer.

Mr. Cohen submitted that it was a case for a small order.

Mr. Rigby: The defendant has had notice to leave his situation.

Replying to the Judge, the defendant said this statement was quite true.

His Honour: I cannot make any order.

Mr. Cohen: Will your Honour make a new order?

His Honour: You see, the judgment was only obtained in January last, and the defendant has had no chance to pay. He

has only earned between £6 and £7 since, and he has never had the means.

Mr. Cohen: This is not an ordinary judgment summons.

Mr. Rigby: It is worse than an ordinary judgment summons, being a penalty.

His Honour: Your point, Mr. Rigby, is that it is not a debt at all?

Mr. Rigby: It is a debt by Act of Parliament, but not an ordinary trade debt. The defendant is an employé, and it is rather hard upon him that he should be liable for selling the poisons.

His Honour: I can easily see there may be a good deal to be said. It is rather a curious question as to whether the penalty in this action should be paid by the man or his employer.

Mr. Cohen: The proceedings were taken for the public benefit, your Honour.

His Honour: You don't incur debts for the public benefit—that is, within the Debtors' Act. However, I need not go into the question now, because, debt or no debt, you do not prove any means.

Mr. Cohen: Then I ask for a new order. There is a judgment of your own court under which I apply for an order for payment.

His Honour: I am not quite easy in my mind about this.

Mr. Rigby: It is impossible to commit for either, and this is a similar kind of thing.

His Honour: I shall have to decide it sooner or later. I will grant a new order—not under the Debtors Act, but in the action. What do you ask for?

Mr. Cohen: £1 a month.

His Honour: £1 a month! Is it worth your while to ask for that?

Mr. Cohen: I shall have to issue a judgment summons for the first pound.

His Honour: Very well.

PRACTICAL NOTES AND FORMULÆ.

Deep Black Ink.

Extract of logwood, 200, is dissolved in water, 100, on the water bath; the solution is allowed to settle, and poured off from the precipitate. 200 of the solution of the extract is diluted with water, 500, and heated to 90° C.; a mixture of potassium bichromate, 2; chrome alum, 50; oxalic acid, 10; dissolved in water, 150, is slowly added. The whole is now heated to 90° C. for 30 minutes; diluted to 1,000 with water, and carbolic acid, 10, added; allowed to stand two or three days, then filled into bottles.—*Pharm. Post*, **32**, 721.

Wool Fat Cold Cream.

Wool fat (hydrous), white vaseline, wool fat soap, and rose water, in equal parts, are mixed. The soap is dissolved in the water, the wool fat and vaseline are melted together, and the soap solution mixed in.—*Pharm. Post*, **32**, 721.

Tooth Paste.

Powdered orris root, 1,200; powdered myrrh, 30; powdered pumice, 30; precipitated chalk, 240; clove oil, 3.75; lemon oil, 3.75; rose oil, 0.75; glycerin and honey *q.s.*, carmine solution *q.s.*, mix.—*Pharm. Post*, **32**, 721.

Coryza Remedies.

(a) Menthol 1; boric acid, coffee, of each 10. (b) Boric acid, 2.5; powdered starch, 15; cocaine, 0.2; tannic acid and menthol, of each 10. (c) Menthol and iodoform, of each 1; sugar of milk, and powdered coffee, of each 10. (d) Menthol, 1; dermatol, 2; sugar of milk and powdered starch, of each 6.—*Pharm. Post*, **32**, 721.

Waterproof Gum for Paper.

Paper treated with a solution of formalin, to which an ammoniacal solution of casein is added, is rendered waterproof.—*Pharm. Post*, 32, 721.

Mouth Wash.

Alcohol (90 per cent.), 24 Gms.; water, 12 Gms.; glycerin, 3.5 Gms.; white soap, 6 Gms., are mixed, and peppermint oil, 20 drops; wintergreen oil, 40 drops, are added, and the whole is coloured with cochineal.—*Pharm. Post*, 32, 721.

Scurf Pomade.

Benzoated lard, 120; precipitated sulphur, 4; lanolin, 20; alcohol (90 per cent.), 20; salicylic acid, 1; geranium oil, 1; rose water, 60.—*Pharm. Post*, 32, 721.

Squills for Rat Poison.

Cæsar and Lorentz recommend for putting in the rat holes small pieces of a cake made by baking together dough and fat, 2; squill bulbs (finely grated), 1.—*Deuts. Am. Apoth. Zeit.*, 20, 129, after *Ph. Rundsch.*

THE B.P. TEST FOR PHENACETIN.

BY F. H. ALCOCK AND H. W. GREEN.

The B.P. test for phenacetin, in which 0.1 Gm. of the substance is recommended to be boiled with 2 C.c. of hydrogen chloride for half-a-minute, and diluted with ten times its volume of water, cooled and filtered, and solution of chromic acid added to filtrate, does not always prove a success, the resulting liquid frequently being of a green colour, due to reduction of the chromate and formation of chromic chloride. If the boiling with strong hydrogen chloride be conducted for five minutes or more in a flask in the fume chamber, on dilution and cooling no precipitate appears, and on then adding a solution of chromic acid, or potassium chromate or potassium bichromate, the beautiful violet-coloured solution referred to in the test is formed, which passes on much dilution with water to a port wine tint. The colour is said to be due to formation of mauveine, which was the first dye of this nature produced by Perkin.

LETTERS TO THE EDITOR.**The Approaching Council Election.**

I notice in last week's Journal a short letter (in the shape, no doubt, of a feeler) emanating from Mr. Glyn-Jones, a member of the Council, and appealing to the members of the Society, soliciting their views on the important question of the coming Council election, also asking for opinions on the subject and for names of new candidates, so that some concerted action may be taken, with a view, I presume, to the introduction of new blood on the Council. Coming, as this appeal does, from a member of the Council, at a critical period, when it is absolutely necessary for that body to be united and harmonious, it certainly seems remarkable and has a serious claim on our consideration. It is very apparent that Mr. Glyn-Jones is under the impression (rightly or wrongly so) that the present Council would be considerably improved for the better if a few of its present members could be quietly relegated to other spheres, and their places filled by new and inexperienced men. When we carefully read Mr. Glyn-Jones's letter we are driven to ask ourselves these important questions: Can it be possible that a clique still exists on the Council? If so, would it be to the benefit of that body and of all concerned if, through the coming election, it could be broken up or removed?

I hold no brief for Mr. Glyn-Jones, but taking, as I do, a more than ordinary interest in pharmaceutical matters, I have carefully followed him since his election, and must admit that the Council

would be a considerable gainer if it included in its ranks a few more men of the same grit, perseverance, and sound common sense that he has shown since he was elected. That we have most excellent men on the Council, of the Rymer Young and Newsholme type, we admit; we are very proud of them and, at a time like this when it behoves us to be united, we have no desire to drag into light the past apathy, indifference and, perhaps, incapacity of the Council; but if at the present time there is a clique on that body so short-sighted that it still clings to its old, antiquated, worm-eaten policies, that have brought us to our present deplorable and almost desperate condition, the sooner members speak out clearly the better; so that the matter may be known and an understanding may be arrived at, with a view to using concerted action to remedy it once and for all.

Burnley, March 19, 1900.

JOHN A. HEATON.

The Pharmaceutical Position.

The curious anomaly has now existed for more than twenty years that it is not absolutely necessary that a man need pass any examination in order to style himself a chemist and druggist. Whilst the law says that no one shall keep open shop for the retailing and dispensing of poisons without passing the examination which gives the legal qualification, the House of Lords, in *The Pharmaceutical Society v. the London and Provincial Supply Association*, has practically said to young men: "There is really no need to spend time and money over this legal qualification. You can go into business without doing so. All that is necessary is that you allow six of your friends or relations to have at least one share each in your concern, which you may pay for yourself if you like, make a present to them of the share, call the firm a limited liability company, and keep one qualified man as cover to serve out the poisons; then, as far as we care (*i.e.*, the House of Lords in this matter the law), we have not the slightest objection to your describing yourself as a 'chemist and druggist' over the shop door, and on all your printed matter, or to your trading as such, with that magic word 'limited' after your name. Then it will be all right. No one can interfere with you, and to show you how delightfully safe you are, if you like, one or two of us very clever, learned law lords will take a few shares in the concern."

Now, is it not time this condition of things should be put a stop to? What is the good of the law saying that one person must qualify by examination, and the judges saying that, if he so chooses, he need not bother, and they point out the *modus operandi* for evading the Pharmacy Acts as related above? Nothing short of a new clause added to the 1868 Act can remedy this absurd position and make it impossible for seven or more persons to do what one alone is forbidden to. There is the time coming when the trade—at least, that portion which is attached to the Pharmaceutical Society—may show its determination to put an end to this trouble by returning to the Council seven members pledged to do all in their power to alter the preposterous anomaly of one firm qualifying by examination and another by limitation of financial liability.

We hear of vested interests when this is mentioned. In my humble opinion, the only vested interest is that of the properly qualified man. The mere capitalist should not be considered at all, since he has stolen a position which never could be rightfully his. Why should he be allowed to sneak the living of so many chemists whilst the assistant has probably left business for awhile to qualify as a future master? The attitude of the Government in attempting to legalise and regulate the evil from which we, as a class, have patiently and foolishly suffered so long shows plainly that, unless chemists will themselves combine to prevent this grievance extending, then the Government must control it themselves.

London, March 19, 1900.

C. E. PICKERING.

The Companies Bill.

I append herewith copies of letters I have received from John Wilson, Esq., M.P., Falkirk Burghs, and Sir H. Campbell-Bannerman, M.P., Stirling Burghs.

Linlithgow, March 19, 1900.

ALEXANDER SPENCE,

Hon. Local Secretary, Linlithgow County.

[ENCLOSURES.]

(1)

House of Commons,
13th March, 1900.

Dear Sir,—I beg to acknowledge receipt of your letter of 12th inst., along with statement of reasons as to Clause 2 in the Companies Bill coming before Parliament.

Any such representation so largely and influentially signed should have due consideration, and you may depend upon my attention to the same.—I am, yours very truly,

(Signed) JOHN WILSON

To Alexander Spence, Esq.

(Falkirk Burghs).

(2)

House of Commons,
16th March, 1900.

Dear Sir,—I am obliged to you for your letter, with enclosure, written on behalf of the registered chemists of the County of Linlithgow, on the subject of Clause 2 of the Companies Bill, and I will give my best attention to the matter when it comes to be dealt with.—Yours very truly,

(Signed) H. CAMPBELL-BANNERMAN.

To Alexander Spence, Esq., chemist, Linlithgow.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

BOTANICAL (H. H.—40/12).—It is *Cyanoglossum officinale*.

MAJOR EXAMINATION QUESTIONS (J. W.—40/13).—We fear your suggestion is an impracticable one.

SOAP FOR LAUNDRY PURPOSES (G. H. L.—40/7).—The specimen you send is a piece of ordinary white castile soap.

POWDERS FOR PHOTOGRAPHIC DEVELOPERS (W. B. J.—40/15).—Certainly the ingredients should be dried and mixed before wrapping in paper.

GLAUCIUM LUTEUM (E. P.—40/6).—See the report of the Chemists' Assistants' Association at page 328 of this week's issue. The note you refer to appeared in the *P. J.* for January 28, 1899, page 91.

POLISHING MARBLE (N. E. M.—40/14).—You will find the information you require in the first volume of Spens' 'Workshop Receipts,' which you can see in the Society's Library. The details are too full to be given here.

METALLIC CALCIUM (G. D.—40/10).—It is hardly worth the sum you mention, but the prices quoted for the metal are, nevertheless, very high. You might offer your stock to Messrs. Harrington Brothers, Shandon Chemical Works, Cork.

SIGNATURE TO LETTER (E. W. R.—24/28).—We find the signature appended to the letter at page 267 should have been "O. Routly," but like many other signatures it was indistinctly written, and the compositor had to interpret it as best he could.

MERCURY "SILVERING" SOLUTION (F. W. R.—39/32).—Mercury, 1, nitric acid, 2, by weight. Granulated tin, 1; nitric acid, 4. Dissolve separately and mix. Apply a very little to the surface with a soft rag and rub well. The "silvering" is very bright, but it does not last long.

MYCETOZOA (W. H. B.—39/13).—You will find much information regarding the group in De-Bary's 'Comparative Morphology and Biology of the Fungi, Mycetozoa and Bacteria.' The same author's 'Lectures on Bacteria' may also assist you. Both works are published by the Clarendon Press, Oxford, and can be consulted in the Society's Library.

WIMSHURST MACHINE (G. D.—40/11).—You can obtain a Wimshurst influence machine from any dealer in scientific apparatus. The price will depend upon the length of spark the machine is capable of producing. Messrs. H. W. Cox, Ltd., 10, Cursitor Street, Chancery Lane, London, will quote prices upon application.

BOOK ON PHOTOGRAPHY (A. J. P.—40/5).—You do not explain whether you require a work dealing with the subject from a scientific or a practical point of view, or simply a general work of reference. For the last-mentioned purpose, Wall's 'Dictionary of Photography' (published at 7s. 6d.) is probably as useful a book as you can obtain.

VETERINARY CHEMIST (E. G. C.—40/9).—The only action brought to prevent the use of the description "veterinary chemist" failed in May, 1893. The defendant had described himself as a "pharmaceutical and veterinary chemist," and the judges of the High Court held that the use of the latter term implied only that the chemist laid himself out for the preparation of medicines for animals.

COLOURED FIRES (G. A. B.—39/29).—The recipes you name are very good. You may make them slower burning by mixing a small proportion of fine sawdust with them. For sticks, use sawdust with just enough linseed powder (free from oil) to bind the mass, then roll into sticks, using a piece of wood as a support in the middle. These will want very thorough and cautious drying. Of course, you know that the making of such things, without a special licence, is illegal.

DISPENSING DIFFICULTY (W. G.—39/28).—The result described by you was probably due to the chloroform water containing some free chlorine. That would occur as a result of the decomposition of some of the chloroform. The free chlorine would then liberate an equivalent amount of iodine, which would dissolve in the oil that separates from the mixture. You should try some experiments with the mixture, using distilled water in one case, and omitting the spirit of peppermint in another.

Information Wanted.

**The Editor will be obliged to any readers who can supply the information asked for by correspondents.

PINOLENE (R. D.—40/16).—The address of the makers of "Pinolene," said to be a similar preparation to "Sanitas"?

SULPHOCALCINE (F. W. H.—40/8).—Particulars are wanted regarding a liquid called "Sulphocalcine," believed to be an American preparation, recommended in some pocket formulary as a vaginal injection?

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MARCH 17, 1900.

PHARMACEUTICAL QUALIFICATION.

WHATEVER may be the result of the action taken by registered chemists and druggists in reference to the provisions of Clause 2 of the Companies Bill now before Parliament, there cannot be much doubt that, in spite of the diversity of opinions prevailing on that point, the general tendency of such action will be opposition to the clause. To that extent it may be assumed that the entire body of registered chemists are now agreed and as unanimous as the Council of the Pharmaceutical Society. It is certainly matter for regret that equal unanimity could not be secured in regard to the particular mode in which amendment of the clause might have been attempted that would obviate the necessity of direct opposition; but since the uncompromising attitude of the Government, as well as the irreconcilable nature of the views held by different sections of the body immediately concerned, render such a course impracticable, nothing now remains but to hope for the best that can be effected by opposition to the clause that will be to some extent divided as to the principle on which it is founded. But whatever may be the fate of this clause in the Companies Bill, when its proposals come to be considered by Parliament, whether it be carried or dropped, the experience gained in various ways under the operation of the Pharmacy Act, 1868, will have made clearly apparent the defective nature of that measure, and the urgent necessity of further legislation relating to the practice of pharmacy that would be more consistent with those circumstances of the case which are of chief importance. The very slender success that has hitherto attended the efforts to establish an adequate pharmaceutical qualification is scarcely matter for surprise when the adverse conditions under which those attempts were made are taken into account. In face of the chaotic state into which the practice of pharmacy had fallen, and become confounded with the trade in drugs, druggery, etc., when the Pharmaceutical Society first endeavoured to secure a statutory qualification that would be compulsory, and would require a definite course of education, a certain degree of failure was natural. In the subsequent attempt to extend the voluntary pharmaceutical chemist qualification to all

chemists and druggists, legislation took the form of trade protection to such an extent that it has been very generally regarded as constituting a monopoly, though in reality failing to afford legally qualified persons such privileges in the exercise of their business as should reasonably be expected to result from a professional qualification.

In both these respects the provisions of the Pharmacy Act, 1868, have proved inadequate and unsatisfactory. Under the construction put upon the Act by the House of Lords the exercise of no part of the business of a chemist and druggist is secured to legally qualified persons, while on the other hand the restrictions on the sale of poisons are held to be in some respects an undue limitation of trade without affording such security to the public, in regard to the supply of medicinal agents, as is desirable. Not long ago those views were put forward in the House of Commons when amendment of the Pharmacy Act was under consideration. The arguments then advanced did not call in question the soundness of the abstract principle that, in regard to poisons, the education and training of the vendor constitute the best protection for the public; but they disputed the applicability of that principle to trade transactions in the same manner that it would apply to the preparation of medicine. The Government has always been disposed to take a similar view of the matter and to trust to mechanical regulations for securing public safety, in connection with the sale of certain articles, rather than to the scientific qualification by which individuals are fitted to perform the professional duties appertaining to pharmacy. In other countries procedure is very largely regulated by such considerations, and while the practice of pharmacy, in the more restricted professional sense, is as strictly limited to persons possessing ample educational qualification as the practice of medicine, trade transactions in poisons are made the subject of licences, granted periodically, and of regulations to be carried out under supervision of the police authorities.

Whenever the task of drafting a Pharmacy Bill is undertaken it will therefore probably be desirable, if not absolutely necessary, to distinguish between ordinary trade transactions and pharmaceutical functions more effectually than seems to be possible by making the pharmacist's establishment the only place where poisons can be lawfully dealt in. If that were done the preparation of medicine should be made more completely the business of the pharmacist, and in that way the original object of the pharmaceutical chemist qualification might be more fully realised than it has yet been. As pointed out by Mr. TAYLOR in the paper he read at Manchester on the outlook in Pharmacy, such a discrimination between real pharmacy and the trading transactions accessory to the business of a chemist and druggist may yet be necessary in order to meet all requirements. The protection of the title of pharmaceutical chemist afforded by the Act of 1852 makes it a true Pharmacy Act, and that qualification might reasonably be associated with the professional function of dispensing medicines, while the Act of 1868 being more essentially rooted, on the poison side, in the Arsenic Act of 1851, its provisions place reliance upon mechanical safeguards as the means of effecting its object. The term pharmacy

as now understood comprises so much more of the business of a chemist and druggist than the Pharmacy Act, 1868, applies to, or was ever intended to apply to, that competition in those unrestricted parts of the business cannot be avoided; but the connection between pharmacy and poison, within the meaning of the law, is to a great extent arbitrary and inappropriate; it overlooks the facts that from a medical or pharmaceutical point of view all medicines may be regarded as more or less poison, and that a special qualification is as requisite for preparing and dispensing medicine as for its use in the treatment of disease. While some registered chemists may find advantage in devoting their attention to those branches of the business which are wholly or comparatively open to trade competition, there are many who desire to have a more professional status. Consequently more intimate association of the title of pharmaceutical chemist with the exercise of the art of compounding and dispensing might reasonably be established for those who prefer to qualify for such occupation rather than to rank as members of "a trading community."

CHEMICAL MANUFACTURES.

IN the course of a long review of the progress of chemical industries during the nineteenth century, that has appeared in the *Chemiker Zeitung*, a chapter is devoted to the subject of the remarkable developments that have taken place in the production of preparations for medicinal and pharmaceutical applications. Commencing with the early years of the century, when the discovery of morphine by SERTÜRNER opened up a new era, and was soon followed by the equally important discovery of the cinchona alkaloid by PELLETIER and CAVENTOU, reference is made to STRAKER'S investigation of the constitution of quinine as having been the starting point of research in that direction. Though the object then contemplated, viz., the artificial production of the alkaloids, is far from having been accomplished, a number of compounds have been produced which appear to be more or less adapted to serve as useful substitutes for some of the alkaloids existing naturally in drugs. Thus, in the case of morphine, the ethyl derivative has been recommended under the name of dionine as being less poisonous than morphine, and more certain in its action. Diacetyl morphine or heroine is said to have similar merits, though not altogether free from objectionable characters. Cocaine has been in a similar manner the object of research, which has led to the production of several substitutes, such as eucaine, which is prepared synthetically from triacetoneamine, and as a substitute for quinine the ethyl carbonic ester of that base is said to be probably advantageous on account of its freedom from bitter taste.

As a result of PASTEUR'S investigation of the means of preventing putrefactive changes, pharmacy and medicine were enriched with numerous antiseptic agents, such as carbolic acid, which enabled LISTER to effect an important change in the treatment of wounds, and more recently thymol, resorcin, pyrogallol, β -naphthol, and various derivatives. An especially useful medicinal agent was the methyl ester of pyrocatechin or guaiacol, and no less important than phenol was salicylic acid, when KOLBE effected its synthesis. Next in succession to phenol,

salicylic acid, and its phenol ester, salol, came the multitude of other antiseptics; and lastly formic aldehyde and hydrogen peroxide, both useful on account of their power of killing bacteria, while formic aldehyde in combination with proteids and other substances yields products which are, like dermatol, applicable as substitutes for iodoform. Synthesis has also been successful in producing iodised compounds without odour and free from the poisonous character of iodoform, as iodol, soziodol salts, airol, and europen. Among other useful products may be mentioned the compounds of proteids and fats with halogens and other elementary substances, as well as tannin, etc., as, for instance, protargol, argonin, ichthalbin, etc., and quite recently iodipin and bromipin have been introduced by the firm of E. MERCK.

The successful results of chemical synthesis in the production of useful medicinal articles stimulated investigation with the view of producing quinine artificially or a substitute that would be less costly than quinine then was. Starting from the view that quinine was a quinoline derivative, the first products of this kind were kairine and thalline, which had only a brief application on account of their poisonous properties. Shortly afterwards KNORR produced antipyrine, which still remains unequalled as an antipyretic agent, and has given rise to a number of subsidiary products, such as salipyrine, tolypyrine, etc. The mother substance of a great number of antipyretics, antineuralgics, and anti-rheumatics is aniline—its derivatives, acetanilide and phenacetine, and their variations, play the most prominent part as remedial agents. By mixture of antipyrine with caffeine and citric acid the much used migranine was produced, and pyramidon, more remotely related to antipyrine, has recently been found useful in many cases of consumption by KOBERT.

The high price of cocaine, and its potent toxic properties, have opened up a field for investigation from which valuable results have been obtained. A great number of other synthetic products have come into use as medicinal agents, and, being unfitted for preparation in the pharmacy, have helped to promote manufacture on a large scale, which is now extending to the preparation of tinctures, extracts, etc., a change which requires that the pharmacist should perfect the analytical methods of testing, by the application of which the value of medicinal preparations is to be ascertained. To supply deficiencies in this respect is one of the chief pharmaceutical problems of the present time.

THE PRESIDENT AND THE COMPANIES BILL.

THE reasons why it is undesirable to accept Clause 2 of the Companies Bill, as it stands were clearly put by the PRESIDENT of the Pharmaceutical Society on Wednesday night, and the report of his remarks at page 327, should be carefully connd by readers of the Journal. He showed that it is distinctly inimical to the interests of pharmacists to acquiesce in any scheme for the regulation of companies of unqualified persons, which carry on business as chemists and druggists, for if a duly registered person were now permitted to act as cover for seven unqualified persons, there would be only too good reason to fear that, before many years were past, a similar concession would be demanded by individual capitalists who are not possessed of the legal qualification.

ANNOTATIONS.

THE APPOINTMENT OF LOCAL SECRETARIES is one of the minor problems which, from time to time, engage the attention of the Council of the Pharmaceutical Society, and, as readers of the Journal have already been informed, the General Purposes Committee of the Council has been requested to consider the desirability of rearranging the districts for which local secretaries are appointed, and also of rearranging the duties of those officers. As is well known, Mr. Newsholme, on whose initiative the matter is being taken up at the present time, is anxious to have a local officer of the Society appointed for each Parliamentary division of England, Scotland, and Wales. It has also been suggested that the duties of local secretaries might be revised with advantage to the body they are supposed to represent in their respective districts, and that some better method of appointment might conceivably be hit upon than that which prevails at present. With regard to the last-mentioned suggestion, the question presents itself whether all the local officers of the Society are the best possible occupants of the position of local secretary. If so, how is it that some of them have no clearer conception of what a proper sense of loyalty to the Society demands of them than to hasten to dispatch to the editors of antagonistic trade journals copies of official documents sent to them from headquarters? There was no particular reason why the circular letter sent to all local officers of the Society a few days ago (see *ante*, p. 293) should have been regarded as a strictly confidential document, but it was scarcely a loyal action for recipients to send copies forthwith to adorn the pages of journals which devote themselves in great measure to weakening the Society and thwarting the efforts of the Council to benefit pharmacy.

INCALCULABLE MISCHIEF MIGHT BE DONE by a single local officer of the Society who should feel free to divulge to irresponsible critics the contents of any document of a confidential character sent to him from headquarters, and the fact that one or more individuals are troubled with misconceptions regarding the nature of their duties as local secretary is, unfortunately, proved by what happened last week. Though the information then divulged was not of a private nature, the letter conveying it should have been regarded as such by those to whom the copies were originally addressed. How is the Council to see its way clear to take local officers more into confidence and keep them informed of every move in the difficult game that must be played in dealing with Government departments and other official bodies, when there are individuals of unduly communicative proclivities in the ranks? The great majority of the Society's local officers are beyond the faintest suspicion of disloyalty, but a few are undoubtedly indiscreet, and, with the best intentions in the world, help the enemy by their thoughtlessness much more than is expedient or desirable. To return, then, to the question raised anew by the Vice-President, it is clear that some suggestions which have been offered with regard to the position and duties of local secretaries cannot be seriously entertained. Districts may be rearranged, duties varied, and a much greater scope offered in the direction of improving local organisation, but the Council, as the executive body appointed by Statute, must continue to exercise discretion in deciding what may safely be communicated to its local officers.

THE EARLY CLOSING OF THE LIBRARY at 17, Bloomsbury Square appears to have caused some inconvenience to a few members of the Pharmaceutical Society, one of whom referred to the matter at the last meeting of the Chemists' Assistants' Association. According to the report of Mr. T. Morley Taylor's remarks at that meeting, he has been prevented from investigating a dispensing problem

which presented itself to him, because now that the Library is closed in the evening, an ordinary member has not the chance of looking up references for himself. By that, presumably, he means that he and other pharmacists are prevented from taking advantage of the facilities provided, because they are unable to leave business before the Library closes. In this connection, it may be pointed out that the Library in London was formerly kept open from 9 a.m. to 10 p.m. daily, except on Saturdays. The small and diminishing attendance, however, has been thought by the Council to afford sufficient reason for curtailing the hours from time to time, and at present the Library is open from 9 a.m. to 6 p.m. only, except on Evening Meeting nights, when the Librarian remains in attendance until 8 p.m. But though the evidence afforded by carefully kept statistics appears fully to justify the Council in saving expense by keeping the Library closed in the evening, a member of the Society, who at any time has occasion to make a number of references, not unnaturally feels somewhat aggrieved when he finds he is prevented from doing so because he and others have not combined to keep up a large average of attendances after 6 or 7 p.m. The remedy, however, is with the members themselves, as it rests with them to satisfy the Council that the expense of keeping the Library open in the evening would be justified.

THE EDINBURGH LIBRARY, by the way, is open daily from 10 a.m. to 4 p.m., and from 8 p.m. to 10 p.m., and if any further change is to be made at headquarters, it will be a point worthy of consideration whether a rearrangement on similar lines would not meet the circumstances of the case. But everything, apparently, turns upon the question of what the members and students of the Society actually need. Like so many other problems, the opening of the Library resolves itself into a matter of demand and supply. If there is a reasonably large demand for an extension of the hours during which the Society's premises shall remain open, the arrangements will be adapted to supply that demand. But it must be a genuine demand and seriously made, not embodied in an objectionable paragraph in a trade paper, where it is more than hinted that the opportunities of making references in the Society's Library have been unreasonably diminished to fit the convenience of the Librarian. Mr. Taylor has explained the difficulty of the position, so far as it affects himself, in a fair and open manner; other members of the Society may be expected to do the same, if they feel it necessary, but there is no occasion whatever for impertinent observations by irresponsible critics, who write scurrilous paragraphs about subjects that do not concern them, and of which, apparently, they know but little.

THE EVENING MEETING REPORT in last week's issue contains an error in Mr. Umney's remarks, at page 284, column 1, line 24, where the word "aconite" should read "kino." The error appears to have been caused by the similarity of the shorthand outlines for the two words. The report was unusually long, and the work of transcribing the reporter's notes delayed matters so that, unfortunately, time did not permit of proofs being revised by those who spoke at the meeting.

THE PEREIRA MEDAL AND COUNCIL PRIZES COMPETITION is fixed for Saturday, April 21. Competitors can take the examination either in London or in Edinburgh, and every person entitled to compete will in due course receive from the Secretary a communication furnishing particulars of the conditions of entry. No eligible person can therefore be shut out from the examination, except by his own negligence.

THE LIST OF DINNER STEWARDS for the May dinner at the Whitehall Rooms is assuming respectable proportions, and early publication is contemplated. Gentlemen desirous of being associated with the last annual dinner of the nineteenth century should send their names as Stewards to the Secretary, 17, Bloomsbury

Square. It is understood that musical aids to digestion will again be furnished after the dinner by the Westminster Glee Singers.

REFERRING TO THE COMPANIES BILL, a writer in the *Weekly Times and Echo* points out that the directors of one of the companies affected by Clause 2 of that measure have issued a circular to the heads of their departments and branches "asking" them to copy it out on their own notepaper, as if coming from themselves, and send it to their respective representatives in the House of Commons, asking them to oppose any amendments to the Bill. Such procedure is described as "disingenuous and unfair," and the writer continues; "Men of education, such as the registered chemists are, who serve these big drug companies, ought not to have pressure of this sort put on them by their employers, and members of Parliament who are receiving these requests may judge for themselves what they are worth."

THE CHEMIST'S ASSISTANT is now being misrepresented by a new periodical bearing his name and incorrectly purporting to be the official organ of the Chemists' Assistants' Association. It is a curious production, published at the modest price of twopence per month, and edited in a manner that ought to make the presiding genius of journalism weep. The first number is understood to have had a fairly wide circulation, in spite of the fact that its free distribution was to some extent checked by an indisposition to accept copies on the part of many to whom it was offered, but merit is certain to be rewarded, sooner or later, and the newcomer in the ranks of pharmaceutical journalism may yet come to be a power in the land. Meanwhile, the editor of the new publication has something to answer for in allowing the blood of a member of the staff of the *Star* to be curdled by an article on checking mixtures. A romance about a case of careless dispensing appears in that article, unfortunately, in the guise of a true tale, and as such it has been swallowed by a *Star* young man. He has lost no time in repeating it to the radicals of London who indulge in the luxury of an evening paper, and it is far from improbable that this evidently fictitious case may some time be quoted against pharmacists as evidence of incapacity to dispense medicines in a satisfactory manner. If only the author had located the hero of his tale in a drug store belonging to a company of unqualified persons he might have performed a public service, but alas! he has missed his opportunity, and the mischief is done.

MEDICAL ELECTRICITY was the subject of an interesting paper read at a recent meeting of the Institution of Electrical Engineers, by Dr. H. Lewis Jones, Medical Officer in charge of the Electrical Department at St. Bartholomew's Hospital, and reported in the *Times*. In the course of his paper, which gave an account of the conditions in which electricity has been found to exercise curative effects, and of the apparatus used, Dr. Jones said it was now a hundred and fifty years since the beginning of medical electricity, and during all that time it had to fight its way in the face of many obstacles, the most serious of which had been the passive resistance of medical men themselves. The vitality it had shown under adverse circumstances was very significant. During the last decade progress had been very great, and the commercial application of electricity and its house-to-house distribution had called into existence many new instruments and modes of treatment, while the study of medical electricity was being helped by the simplification of the means for obtaining the current. The discovery of the X-rays and their application to medicine and surgery had done good by bringing electrical apparatus into more extended use. Most of the London hospitals had electrical departments. At St. Bartholomew's about six hundred cases were referred annually to the electrical department from all quarters of the hospital, exclusive of the

cases for X-ray photography, the numbers of which were even greater. There was no branch of medical practice upon which the light of criticism beat more fiercely than upon medical electricity. From conversations with engineering friends, the lecturer said he was disposed to think that the number and extent of the applications of electricity to medical practice were not generally realised by electrical engineers; indeed, any reference he had observed at all to medical electricity in the proceedings of the institution and kindred societies had usually been one of disavowal and dislike. He therefore felt that in making the present communication he was undertaking the task of trying to show that electrical applications had a large and legitimate field of usefulness in medical practice, that it was quite possible to practise medical electricity without thereby becoming an outcast, and that the advertisements of electropathic or magnetic appliances did not represent the position of medical electricity.

SHAMROCK DAY was more widely celebrated on Saturday last, than ever before; but there was a great variety in what was worn as shamrock by different persons. That, however, was quite in accordance with the diversity of opinion prevailing as to what shamrock really is. Some authorities favour the wood sorrel *Oxalis acetosella*, concerning which Bentham says, in his 'British Flora,' "This is believed to be the original of the Irish shamrock, although that emblem is now represented by *Trifolium repens*." He also states that the white or Dutch clover is believed to be of comparatively recent introduction in Ireland, "although it is now taken as the national emblem in substitution of *Oxalis acetosella*, which is asserted by some writers to have been the original shamrock." It is related by a writer in the *Times* that some seven or eight years ago specimens gathered by experts were obtained from eleven Irish counties. The majority of the plants proved to be *Trifolium minus*, a small clover known to farmers as the yellow suckling; the others turned out to be *Trifolium repens*. Cork, Derry, Wicklow, Wexford, Queen's County, and Clare declared for yellow suckling; whilst Antrim, Mayo, and Roscommon were in favour of white clover. Armagh and Carlow divided their votes, for two specimens from each county turned out to be, the one *Trifolium minus* and the other *Trifolium repens*. The seeds of both species are sown largely in Ireland every year and they produce nutritious pasture plants. Putting sentiment on one side, it is thought to be quite certain that either of the species named will serve as an adequate representative of "the sweet little plant," though for choice the yellow suckling may be preferred, as the smaller and rather more elegant. "This, indeed, appears to be the true shamrock, the flowerless shoots of which there should be no difficulty in finding in our meadows and pastures at mid-March."

THE QUESTION OF RECIPROCITY, as between Great Britain and the British colonies, was raised at a meeting of the Western Chemists' Association, held on Wednesday, March 21. The subject was introduced by a visitor—Mr. A. B. Chater, of Brisbane, past-president of the Pharmaceutical Society of Queensland—whose name appears in the British Register of Chemists and Druggists. He stated the case for the colonies in an able and reasonable manner, and his remarks met with much sympathy from the President of the Pharmaceutical Society and other representative pharmacists. The chief objections urged against the interchange of certificates at present are that the colonies themselves are not yet agreed upon the point, and that all colonial certificates are not equal in value to British ones. But, as Mr. Chater pointed out, dissenting colonies might soon be expected to follow the lead of Great Britain, and there is no reason why unsatisfactory certificates should be accepted. Reciprocity must come in time, and, as many of the colonies seem to be ready to deal with the question, it appears only courteous and reasonable to discuss it as a probability of the immediate future.

POLITICAL GOSSIP.

PILLS AND CASTOR OIL evidently represent Mr. James Lowther's conception of medical stores, and it is just possible that he conceives the historic Colonel Pryde to have been a former prominent officer of the Army Medical Corps, and his famous "purge" to have consisted of a particularly efficient cathartic combination of items in charge of the Army Compounder. At any rate, the Right Hon. gentleman strayed into very unfamiliar paths when the House of Commons was in Committee of Supply on the Army Estimates. He had been deeply impressed by the recent disclosures in regard to Army contracts and unscrupulous contractors, and desired to raise a discussion on the whole question of War Office contracts, together with the inadequacy of the punishment awaiting purveyors of putrefaction. All of which was very laudable, but somewhat out of accord with Parliamentary procedure. The only legitimate way to discuss contracts on the medical vote of £555,000 was to talk about medical contracts or stores, and this Mr. Lowther proceeded to do more or less relevantly until chided by his namesake, the Chairman of Committee. He inquired what steps had been taken to prevent fraudulent exactions with regard to medical stores, spoke of medicines over long in stock, and finally showed his profound knowledge of the subject by making supposititious vendors of "bad pills and castor oil" serve as a basis for a £100 reduction in the vote. As no one had ever suggested, or even heard suggested, that malpractices exist in connection with the supply of medical stores, Mr. Lowther's shot lacked direction and fell without effect; but chemists would be glad to know the honourable member's conception of a bad pill, and his personal views on the particular ills and frailties which that class of medicament is heir to.

INCIDENTALLY, in the course of a subsequent discussion on the fraudulent contractor, the advantages of company machinery as a means of dodging Nemesis was well exhibited. It appears that the War Office contracted with A. and Co., Limited, for certain supplies, and received bad goods for good money. Detection of the irregularity—to use a mild term—was followed by the erasure of A. and Co. from the list of official contractors, and the Departmental officials, with the proud consciousness of having performed a fitting sacrifice to Justice, thereupon transferred their custom to B. and Co.—also limited and impersonal. It turns out, however, that B. and Co., the new providers, are merely the old firm under another alias, and on developing the same old fraudulent characteristics they also have to be removed from the list. The contract then goes to C. and Co., and so the game proceeds through the whole gamut of alphabetical variations of A. and Co., with the result that the War Office cannot get out of the vicious circle of deception in which it is invested by the operation of the Companies Acts. Perhaps the outcry in the House may stimulate the progress of Mr. Ritchie's Companies Bill, and lead to some unexpected amendments of the same.

THE NEW PETROLEUM BILL of Mr. Ure and company, which was introduced on the 15th, is brevity itself, for all its virtue is contained in the words: "Section 2 of the Petroleum Act, 1879, from the commencement of the section down to and including the words 'seventy-three degrees of Fahrenheit's thermometer' is hereby repealed." On turning to page 209 of the Society's Calendar, readers of the Journal will be able to see the full effect of the amendment, Section 2 of the 1879 Act, in fact, substitutes the "close test" for the "open test" described in the Act of 1871, but it also substitutes 73° for the 100° mentioned in the earlier Act. Mr. Ure and his associates desire simply to remove all reference to 73° from Section 2, and thus to re-enact the old 100° limit without removing the provision for the Abel "close test." A summary of the objects of the Bill accompanies the printed measure, and informs all who are concerned that the pur-

pose of the promoters is to substitute the "accurate or close test for the inaccurate or open test in the Act of 1871, and to restore the 100° flash point prescribed by that Act." Mr. Alexander Cross, Mr. Tully, and Mr. John Burns are among the scientific advisers of Mr. Ure, who endorse this summary. It is understood that the Government will resist the passage of the Bill.

THE VIGOUR OF DR. TANNER is a thing to tremble at and to admire. On the 15th inst. he was in excellent form, and signalled his appreciation of the approaching Royal visit to Ireland by depositing with the Clerks at the Table fourteen notices to "block" and obstruct the progress of as many Bills—truly a characteristic piece of Cork humour. Among the measures which came in for the attention of the hon. member were Mr. Begg's Companies Acts Amendment Bill and the No. 3 Boilers Bill. The former was opposed by Mr. T. P. O'Connor, but that gentleman withdrew his "block" last week, and left the field clear for the Doctor. With regard to the Boilers Bill, its fate is not in the slightest degree altered by the opposition of the member for Mid-Cork; it was doomed with its contemporaries when the Home Secretary announced the intention of the Government to deal with boiler registration, regulation, and inspection. At the present time Sir W. Walrond has on the Journals of the House a notice for the appointment of a Select Committee to consider and report on the advisability of legislation to secure systematic inspection and certification of boilers. The safeguarding of life and property is a consideration to which Ministers are quite ready to devote earnest attention, but the various proposals introduced this Session to harass employers of steam power do not commend themselves from the purely national point of view.

THE NEW STAMP DUTY, or at any rate the operation of it, is to be modified as the result of concerted action by the Associated Chambers of Commerce and other trade bodies throughout Great Britain. Replying to Sir W. Houldsworth on Monday, the Chancellor of the Exchequer said that in view of the representations made to him and the considerations submitted with which he had not been previously acquainted, he would not press the present clause of the Finance Bill which referred to stamps on brokers' contracts. He further promised to consider the matter and, if necessary, to place a clause on the paper for the Committee stage. This is something of a triumph for Mincing Lane, and conveys so obvious a moral that it would be mere superfluity to state it in words.

REFERENCE was made last week to Mr. Kimber's attempt to soften the sternness of the President of the Board of Trade in regard to those clauses of the Companies Bill which did not originate in Whitehall Place. The hopelessness of the task has now impelled Mr. Kimber to give notice that on the second reading of the Bill he will move that no sanction should be given to a Bill which places contract creditors in a superior position to debenture holders, interferes with freedom of contract, and invalidates millions of commercial securities created in good faith. This bears the semblance of a charge with some go in it, and we should not be surprised if a good deal of the work of the House of Lords Committee were effectually undone in Committee of the House of Commons. Meantime the second reading is not yet in sight, though Easter is drawing nearer. Thursdays and Mondays generally see the Company item on the agenda, but there is no indication of immediate progress. Mr. Balfour is to be asked to give a week's notice of the second reading.

THE FORTUNE of the Shops Bill appears to be at rather a low ebb just now, for there are three notices against it for postponing its second reading six months. The obstructors are General Goldsworthy (Hammersmith), Sir J. Colomb (Great Yarmouth), and Mr. G. Lowles (Haggerston), and as the first-named, at any rate, is a

constant attendant at the House, he is not likely to let the Bill slip through, as it nearly did a week or so ago, by default of opposers. Mr. Provand's Bill to amend the Shop Hours Act has now been circulated, but as it deals only with the hours of employment of females, it possesses little interest for retail chemists. The gist of the amendment is that no woman or young person shall be employed in or about a shop in any capacity for more than sixty-eight hours a week, including meal times, or for a longer period than fourteen hours in any one day, and this does not seem to be an unreasonable thing to ask Parliament to accept, but there will be objections on principle, as there have been to all attempts at legislative interference between employers and employed. The second reading is fixed for April 27.

THE VETERINARY SURGEONS have a Bill before the House which was introduced by Sir T. Gibson-Carmichael on the 15th inst. Before the Bill was printed one rather wondered whether the Veterinary College had decided to revenge itself on the Lord Chancellor for omitting veterinary surgeons from Clause 3 of the Companies Bill, but the appearance of the measure reveals no such intention. The object of the amendment is merely to bring licencees of the Highland and Agricultural Society of Scotland within the jurisdiction of the disciplinary powers vested in the Royal College by virtue of the Veterinary Surgeons Act of 1881. At present the College has no power to punish for unprofessional conduct any holder of a certificate granted prior to 1881 by the Highland Society, for the Veterinary Act does not apply to them, and it is therefore proposed to place such persons in all respects in precisely the same position as those on whom the Statute already imposes the liability to deprivation of professional privileges. It is rather curious that the clause dealing with the use of titles by individuals suffering the contemplated disability should not have been worded in such a manner as to include a possible corporate association of individuals who have been deprived of the right to practise. Dr. Farquharson supports the Bill, and also Lord Dalkeith, Mr. Tennant, Mr. Shaw-Stewart, and Mr. C. Douglas.

NOTICES OF BOOKS AND OTHER PUBLICATIONS.

'THE CALENDAR OF THE PHARMACEUTICAL SOCIETY OF IRELAND,' 1900. Pp. 206. Price, 1s. 6d. Dublin: Pharmaceutical Society of Ireland, 67, Lower Mount Street.—Containing as it does the text of the Irish Pharmacy and Sale of Poisons Acts, and full information concerning the Pharmaceutical Society of Ireland, this 'Calendar' constitutes a necessary work of reference for everyone interested in the practice of Pharmacy in Ireland. The statistics of the Irish Society at the end of each of the past two years are compared in the following table:—

Class.	1898.	1899.
Pharmaceutical Chemists.....	573	596
*Members of the Society	190	199
Chemists and Druggists.....	294	292
Registered Druggists	444	458
*Associate Druggists	45	43
Assistants to Pharmaceutical Chemists	23	33

Subscribers to the Pharmaceutical Society of Ireland are indicated in the foregoing table by an asterisk (*), and the total strength of the Society in December, 1899, was 242, as against 235 a year earlier.

'THE MEDICAL ANNUAL AND PRACTITIONER'S INDEX,' 1900. Pp. 729. Price 7s. 6d. net. Bristol: John Wright and Co., Stone Bridge.—There is no handier work of reference for medical practitioners than this annual, now in its eighteenth year of publica-

tion. The therapeutic review of the past year and dictionary of new remedies occupy the first sixty pages, but the bulk of the work is taken up with a series of special articles on new treatment. Other features of the book are an article on "Radiography in 1899," descriptions of new inventions, improvements in pharmacy and dietetic articles, a list of the principal medical works published during 1899, and lists of asylums, nursing institutions, medical and scientific societies, etc., etc.

'AIDS TO PHARMACY FOR MEDICAL STUDENTS,' by A. Campbell Stark. Pp. 170. Price, 2s. 6d. London: Ballière, Tindall, and Cox, King William Street, Strand.—This book is adapted for the examination in "practical pharmacy" of the Conjoint Board, and is intended to replace the author's 'Practical Pharmacy for Medical Students,' of which it is virtually a new and revised edition. It possesses no special interest for pharmacists, but is probably as useful and concise a guide as any to the study of the nondescript subject termed "practical pharmacy," by the Conjoint Examining Board of Physicians and Surgeons in England.

'KIRK'S HAND-BOOK OF PHYSIOLOGY,' by W. D. Halliburton, M.D., F.R.S. Sixteenth Edition. Pp. 872. Price 14s. London: John Murray, Albemarle Street. It is just twelve months since the fifteenth edition of this work made its appearance; but the rapid sale of the book has necessitated a further issue. At the same time this is not a mere reprint, the subject-matter having been brought fully up to date where necessary. There is no better or handier text-book on the subject of which it treats.

'THE FLOWERING PLANT AS ILLUSTRATING THE FIRST PRINCIPLES OF BOTANY,' by J. R. Ainsworth Davis, M.A., F.C.P. Third edition. Pp. 195. Price 3s. 6d. London: Charles Griffin and Company, Limited, Exeter Street, Strand.—The chief purpose for which Professor Davis' book was originally written was to illustrate the first principles of botany by means of common flowering plants, no previous knowledge of the subject being assumed, and the style made as simple as possible. But the book was also adapted for the use of candidates preparing for elementary examinations in botany, and for that purpose it has doubtless been more especially used. In the third edition a special chapter on ferns and mosses has been added, so as to help to give a clearer idea than would otherwise be possible of the life-history and classificatory position of flowering plants. This new matter occupies eleven pages, and will be found a useful addition to the book, which is also enriched by a number of new illustrations.

'EARLY CHAPTERS IN SCIENCE,' by Mrs. W. Awdry. Edited by Professor W. F. Barrett. Pp. 348. Price 6s. London: John Murray, Albermarle Street.—This is described as "a first book of knowledge of natural history, botany, physiology, physics and chemistry for young people." Such a book is, as Professor Barrett points out in the preface, a distinct want, but it is a question whether that want is more than partially supplied by the book under consideration. The work is divided into two parts, the first dealing with "the world of life"—including the animal and vegetable kingdoms; the second part is devoted to "the world of experiment," being an account of the forces of nature. But everything is treated in much too advanced a fashion to appeal to the sympathies of very "young people," using that term in the sense of boys and girls from six or seven up to ten or twelve years of age, *i.e.*, of the class for which a suitable book in general science is most badly wanted. For older persons, indeed for many "grown-ups," Mrs. Awdry's book is probably as well-arranged as is possible with a mass of matter of such extensive scope, and it is admirably got up. The illustrations are numerous, and though the text is somewhat stilted in character, the explanations should suffice to convey fairly clear ideas to readers who are not too young.

ENGLISH NEWS.

SCHOOL OF PHARMACY STUDENTS' ASSOCIATION.—A large number of members and their friends gathered in the Lecture Theatre at 17, Bloomsbury Square, last Friday evening, March 16, to hear a lecture on "The Alps," illustrated by lantern slides, delivered by Professor Collie, the President of the Association. Professor Greenish was in the chair. The minutes of the previous meeting having been read and confirmed, Professor Greenish said that no one who had had the pleasure of hearing Dr. Collie lecture on the Rockies and the Himalayas would need any stimulus to thoroughly appreciate the lecture they were to hear that evening. He thought the Alps would have for the majority possibly a greater interest than either the Indian or North American mountains, because they are nearer home, and those who had not already visited them were probably looking forward to doing so some day. Professor Collie, who was greeted with loud applause, said he had no story of exploration to give that night, but intended to show some lantern slides made from photographs taken during a pleasure trip in the Alps last year, and to tell them something about the places they represented. He then described how he, in company with Dr. Travers and an officer in the Indian army, who was accompanied by his Ghurka servant, ascended Monte Rosa, Mont Blanc, and other Alpine peaks, and took photographs of glaciers and precipitous rocks. An account of a wonderful and dangerous piece of rock-climbing performed by the Ghurka was greeted with great applause and cheers. All listened intently while Dr. Collie told them how his friend's servant was one of the men who so distinguished themselves at the storming of the Nit Forts in the Hunza-Nagar campaign at the end of 1891, when, under Lieutenant Manners-Smith, they scaled a precipitous cliff and rushed the enemy's sangars. The students of "the Square" were interested to hear that their Professor of Chemistry had attempted to ascend Mont Blanc by a ridge which he had heard no one had been able to climb, the reason being, as he found out, that climbing it is impossible, and, as was remarked afterwards: "If Professor Collie says it's impossible, it is impossible." At the termination of the lecture Professor Greenish moved a vote of thanks to the lecturer, which was carried with enthusiastic applause. Those present then proceeded to the Examination Hall, where coffee and light refreshments were provided.

LONDON COLLEGE OF PHARMACY.—A very pleasant meeting took place at this College on Friday, March 9, in connection with the presentation of a handsome silver cigarette case, a fountain pen, and an illuminated address to Mr. J. Griffith Edwards, on the occasion of his retirement from the College Staff for the purpose of entering the medical profession. Mr. H. Wootton, B.Sc., Principal, presided, and spoke in a very appreciative manner of Mr. Edwards' capabilities as a teacher, and regretted he was losing such an efficient fellow worker, and on behalf of the staff wished him every success in his future career. Mr. Frederick Ashford, in making the presentation on behalf of the students, referred to the great kindness and assistance Mr. Edwards had rendered them, and wished him all possible success in the new profession he was about to enter. Mr. Griffith Edwards, who was received with cheers, in thanking the students for their very handsome presents, stated that they would be very highly appreciated by him, and would help to remind him of the happy days he had spent at the London College, he in return wishing all the students success in their examinations.

LIVERPOOL PHARMACEUTICAL STUDENTS' SOCIETY.—The winter session of the above concluded on Thursday, 15th instant, with a smoking concert, held in the Kardomah Café, Church Street. The President, Mr. Prosper H. Marsden, F.C.S., had the satisfaction of seeing a good attendance of members, and at a late hour several of the members of the senior local association dropped in

at the conclusion of their meeting. As usual, an excellent programme of vocal and instrumental items was submitted for the approval and entertainment of members and their friends, who, by their repeated "encores," were evidently satisfied with the efforts of Messrs. Jenner and Patridge to provide amusement of the artistic standard of excellence for which the "students'" smokers are noted. The accompanists were Messrs. Woodward and Matthew Hall, and the following gentlemen contributed songs of uniform excellence:—Messrs. Nicholson, Matthew Hall, Smith, Rousell, and Layfield. Recitations were given by Messrs. Bottomley, Sutton, and Frederick, whilst Mr. W. C. Cooke played a flute solo in good style and with taste. Votes of thanks to the artistes for their kindness, and to the Chairman and officers, were passed, and a collection was, as usual, made for the Benevolent Fund, resulting in a sum of £1 12s. being raised, after which a very pleasant evening was brought to an appropriate conclusion by singing "God Save the Queen."

LEEDS COLLEGE OF PHARMACY.—The students of this College started the summer botanical season on Saturday, March 17, by a visit to "Rural Yorkshire" in the direction of Harrogate. A great number of specimens were found and examined, and everyone thoroughly enjoyed themselves. During the summer botanical excursions will take place to Bolton Woods, Ilkley, Settle, Windermere, and other places.

NORTHAMPTON CHEMISTS' ASSOCIATION.—At a meeting of this Association, held on Wednesday, March 14, it was unanimously agreed that Clause 2 of the Companies Bill should be opposed. Subsequently, a circular addressed to the Parliamentary representatives of the borough was drawn up asking them to do their utmost to secure the rejection of the clause. That was afterwards signed by the whole of the registered chemists of the town, and a copy has been sent to each of the borough M.P.'s.

THE SALE OF FLUID SOAP.—In the case of *Cassie v. Horn*, which came before Mr. Justice Kekewich in the Chancery Division of the High Court of Justice, on Tuesday, March 20, the plaintiff sought an injunction restraining the defendant from manufacturing or selling a preparation known as Dr. Horn's Transparent Fluid Soap, or any other preparation for use in connection with diseases of the scalp, hair, or skin, under or in conjunction with the use of the name O. E. Horn, D.Sc., or otherwise in such manner as to lead the public to believe that such preparations are any of the preparations the sole right to manufacture and sell which was assigned to plaintiff on December 18, 1893. For some time prior to the execution of the indenture of December 18 the defendant had practised as a specialist in diseases of the hair, scalp, or skin, and had invented and manufactured various preparations which he used in the course of his business, and had registered trade marks to protect and distinguish the same. The plaintiff, who carries on business as a chemist and druggist at 49, Newgate-street, E.C., had acted at one time at the agent of the defendant, but on December 18, 1893, he purchased all the right, title and interest in the invention and preparations of the defendant for the sum of £3,600. Defendant covenanted that he would not divulge the secret to anyone else, or sell any preparation himself in connection with diseases of the hair, scalp, or skin. Plaintiff alleged that defendant, who now practised as a specialist at Bournemouth, was selling preparations which were an infringement of the covenant. Defendant contended that the preparations sold by him were totally distinct from the preparations assigned to the plaintiff, and that the covenant was unreasonable, because the business sold dealt with one subject matter and the covenant dealt with another. Mr. Warrington, Q.C., and Mr. Chubb appeared for the plaintiff, and Mr. Robert Frost for the defendant. His lordship found in favour of the plaintiff and granted an injunction, with costs, and an inquiry as to damages.

SALE OF CAMPHORATED OIL.—At Tottenham Police-court on Thursday, March 15, Arthur Henry Jenkins, chemist and druggist, of Green Lanes, Tottenham, was summoned for selling camphorated oil which was deficient in camphor to the extent of 40 per cent.—Defendant stated that he did not dispute the analysis. He made the oil two days before the inspector called, and the sample in question was the first quantity that was sold out of the jar. He was certain he used the proper parts. The Pharmacopœia did not say whether hot or cold oil should be used, and as he used cold oil the camphor did not readily dissolve.—The Chairman (Dr. Daly) observed that it said, "Dissolve camphor in oil." If it would not dissolve in cold oil, warm oil should be used.—The Inspector said he had tested goods at the defendant's shop before and found them genuine.—The Bench imposed a fine of 5s. and costs, with the analyst's fee.

POISONING BY AMMONIA.—On March 16, at Foleshill Workhouse, Dr. Iliffe held an inquest with respect to the death of Charles Johnson, watchmaker, of Foleshill. He was employed at Edgewick and on March 8 complained of headache. He was recommended to take a good sniff at a bottle containing ammonia, but apparently drank some. Subsequently he could not take food, death occurring through exhaustion. The jury returned a verdict of "Death from misadventure."

SCOTTISH NEWS.

GLASGOW CHEMISTS' ASSISTANTS' ASSOCIATION.—At a meeting held on Friday, March 16, Mr. J. P. Gilmour in the chair, Mr. Thos. S. Barrie, Ph.C., delivered a very well received lecture on "Plants and Their Distribution." The lecture was fully illustrated by fossil plants and lantern views of many epochs in the earth's history. Among others, a number of views were shown depicting the flora of Madagascar, New Zealand, and Coral Islands, the dense forest vegetation of Ceylon and Palmyra palms, views in the Scilly Islands, showing tropical vegetation, brought the lecture to a close. There was a very large attendance of members and friends, and a number of ladies were present. At the close of the lecture the Chairman spoke of the pleasure it had given him to listen to Mr. Barrie. He also spoke of the decease of one of their most devoted members, Mr. J. Scott Davie. It was agreed to send a message of condolence to the relatives of the deceased. He then spoke of the arrangements of the Committee for March 23 and 28. On the first date Dr. Coull will deliver a lecture on "Stereo-Chemistry," when a large attendance is hoped for. On the second date the first annual dance of the Association will be held. Tickets may be had from Mr. Gilmour or from members of the Committee. A vote of thanks to Mr. Barrie, also to Mr. Maben, who operated the lantern, and to Mr. Bowie, brought the meeting to a close.

EDINBURGH PHARMACY ATHLETIC CLUB.—The annual general meeting was held in the Pharmaceutical Society's House on the 13th inst. Mr. Geo. Somerville, President, occupied the chair. The Secretary's report showed the club to be in a flourishing condition. The Treasurer's financial statement was likewise very satisfactory. The accounts showed an expenditure of nearly £100, but the income exceeded this, and a substantial balance was carried forward. The ninth annual sports and football competition were intimated for Wednesday evening, May 23. The following office-bearers were elected:—Hon President, John Bowman; President, G. H. C. Rowland; Vice-President, A. R. Smith; Secretary, J. P. Gibb, 8, Cobden Crescent; Assistant Secretary, John Aikman; Treasurer, D. S. Napier; Committee, C. R. Brown, L. S. Lamb, J. McBain, J. L. McIlwrick, A. G. Paterson, George Somerville, and W. C. Taylor. Votes of thanks were awarded to the retiring office-bearers, and also the Pharmaceutical Society for the use of the House for meetings. £1 1s. was unanimously voted to the Benevolent Fund of the Pharmaceutical Society.

EDINBURGH DISTRICT CHEMISTS' GOLF CLUB.—The annual meeting was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Thursday, 15th inst., at 9 p.m., Mr. George Robertson, captain, in the chair. The Secretary's and Treasurer's reports were submitted and approved. It was resolved to make the annual subscription five shillings in place of seven shillings and sixpence. The following were elected office-bearers for next year: Councillor Richard Clark, J.P. (Raines, Clark and Co.), honorary president; George Lunan, captain; W. Charles Baker, vice-captain; James Stott, 10, Royal Crescent, secretary; James Robb, assistant secretary; W. B. Cowie, treasurer; and as members of committee: H. D. Alexander, G. Robertson, A. J. Dey, C. F. Henry, W. Lyon, and J. Kilpatrick.

IRISH NEWS.

PHARMACEUTICAL SOCIETY OF IRELAND.—At the monthly Evening Meeting on March 19, Dr. J. C. McWalter communicated a note on "The Dialysis of Drugs." He pointed out that in the index to the contents of the British Pharmacopœia the word "dialysis" is no longer to be found. For some inscrutable reason the term dialysis had been deleted, and the student of the volume must no longer be assumed to be familiar with the term. That fact served Dr. McWalter as an apology for referring to a few details about a pharmaceutical process which, he said, is familiar to all. He then entered into the question of its wider application, showing that dialysis is the quickest and best process for many purposes. In the course of his lecture, Dr. McWalter compared continental pharmacists favourably with their British colleagues. He also commented on the fact that he found no reference to dialysis as applied to drugs in the last three volumes of the proceedings of the British Pharmaceutical Conference.

CONTRACTS FOR THE YEARLY SUPPLY OF DRUGS to the Irish Unions are now being tendered for. In some instances considerable feeling has been aroused by the proceeding of certain Boards of making themselves acquainted with the tenders of contracting firms and then on the pretext of getting cheaper rates (but with a motive well understood to be a breach of commercial trust), re-advertising the contract. The opinion of the Local Government Board will be sought whether such a method is *bonâ fide*.

POISONER SENTENCED TO DEATH.—At Waterford Assizes, Patrick Dunphy, sixty years of age, was sentenced to death for poisoning with strychnine his young son. Another child had similarly met his death. The vehicle of administration was a bottle of lemonade. The motive alleged was a small insurance and Mr. Justice Johnson condemned the child-insurance system as a direct temptation to crime by placing a premium on the deaths of children.

WESTERN CHEMISTS' ASSOCIATION (OF LONDON).

A meeting of this Association was held at the Westbourne Restaurant, Craven Road, W., on Wednesday, March 21; the President, Mr. J. F. Harrington, in the chair.—The minutes of the previous meeting having been read and confirmed, the President announced that two visitors were present—Mr. A. B. Chater, of Brisbane, Queensland, and Mr. Goldby, of Enfield—and in the name of the Association he extended to them a hearty welcome. With regard to Mr. Goldby, they would be very glad to enrol him a member of the Association, as Enfield was quite within the district covered by the Association. Mr. Chater, who was over in this country on a visit, he believed, would like to speak a few words on a subject he was greatly interested in, and he (the President) was sure they would be very pleased to hear him.

Mr. CHATER expressed his thanks for the kind reception given to him, and explained that it was entirely by accident that he was present there that evening. The subject he had at heart was one which they in the colonies considered as very important—that of

RECIPROCITY OF DIPLOMAS

between the British and Australian pharmaceutical authorities—They considered the present to be a very opportune time for the Pharmaceutical Society of Great Britain—which they all looked up to as the parent Society—to seek for reciprocity with those colonies which have a pharmaceutical examination equal with the examination of Great Britain. They were given to understand that the Pharmaceutical Society has not power to reciprocate with the colonies; it seemed to be a great shame that the mother of them all has not the power to reciprocate with her children. Had not the children done their duty by the mother country; were they not doing something for her at the present time in South Africa? They felt rather modest in proposing the subject; they thought that the parent Society should have mooted it first, because the pharmacists of Great Britain had more to gain than the colonies. "How many pharmacists," he asked, "come from the colonies to settle in the old country, and how many go from Great Britain to the colonies?" They, in Queensland, brought this subject forward at the present time because the mother colony—New South Wales—has shut her doors to Great Britain. They did not want to do that, they wanted a united pharmaceutical body of the whole English-speaking race. The question was sometimes asked: "Why don't you reciprocate among yourselves?" The answer to that was that they considered that if the Pharmaceutical Society of Great Britain would take the initiative and fix a standard, her children could then follow suit. If the colonies fixed the standard it might be considered too low, whereas if the Pharmaceutical Society of Great Britain were to fix a standard of examination the colonies would endeavour to bring themselves into line. Now that the Federal Government of Australasia is almost established—and he felt sure that it will be—they wished to be united. They, in the colonies, had a little influence with the authorities, and he thought that union would tend to strengthen the hands of pharmacists in the old country.

Subsequently the President, and Messrs. R. H. Parker, Andrews, and Glyn-Jones spoke on the subject—patriotically—and all expressed themselves favourable to reciprocity, provided that a uniform examination was established in the colonies and Ireland and Great Britain, otherwise the value of the British examination would be lowered. Mr. Glyn-Jones thought that at any rate the Pharmaceutical Society of Great Britain should seize the present opportunity, now that the Imperialistic spirit is in the air, to acquire the necessary power to reciprocate with the colonies.

Mr. WM. MARTINDALE, President of the Pharmaceutical Society, also spoke. While in no way desirous of throwing cold water on the subject, he pointed out the difficulties attending it. If reciprocity was established, the chief difficulty would be to draw a line which would prevent those colonies where the qualification for carrying on the business of a pharmacist is not equal to the British qualification, from participating in its advantages. He was aware that in some respects the British standard of examination is below that of Brisbane, in that they have a curriculum. He also recognised that it would be to Great Britain's advantage to reciprocate with certain of the colonies. Still the subject required a great amount of discretion, and he thought any initiative must come from the colonies; then, when it had been officially brought before the Pharmaceutical Society, it could be discussed. In the meantime it was a subject well worthy of discussion, and he hoped that the associations in various parts of the country would consider it.

Mr. CHATER, with due deference to Mr. Martindale, asked to be allowed to point out that the matter had been brought before the

Pharmaceutical Society of Great Britain on four or five occasions. They in Queensland did not suppose for a moment that the Pharmaceutical Society would accept reciprocity with all the colonies. He only wished that the British Society would send a deputation to Australia to inquire into the examinations held there. He could assure for it a most cordial and hospitable reception.

The PRESIDENT having mentioned that the next meeting of the Association would take place on April 25, when a smoking concert would be held,

Mr. MARTINDALE, on the suggestion of Mr. Hick, referred to

THE COMPANIES BILL,

and the decision of the Council to oppose Clause 2. It came to that decision as the only consistent policy to follow. If the clause passed it would certainly put limited companies in a better position than at present, inasmuch as it would enable them to say that they were regulated by the Pharmaceutical Society. There is now a void in pharmacy law as regards companies, and it was better that it should remain than that it should be filled up by Clause 2 of the Companies Bill. Mr. Martindale went on to point out the difficulty in which the Pharmaceutical Society had been placed by the action of the Federation of Local Pharmaceutical Associations in putting before the country an alternative proposal. With regard to the regulation of companies it was against the interests of pharmacists so to do. It was, so to speak, making a rope to hang themselves. It would give power to the servant to qualify the master. If they consented to allow the qualification of an assistant to cover seven persons there was no reason why in the future individual capitalists should not ask to be allowed to employ a qualified man. The difficulty the Society had to contend with was the lack of unity in the trade.

Mr. MATHER said he had taken advantage of the Federation circular to send resolution (A) to the gentleman who represents him in Parliament, and had received in reply a communication to the effect that he fully recognised the injustice of companies being able to use the titles of chemists, and that it was a matter for legislative consideration. Personally, he (the speaker) was of opinion that titles are the only thing that pharmacists are justified in asking for, and he thought the Pharmaceutical Council should have nailed that to the mast, and gone strong for titles.

Mr. MARTINDALE said that in his interview with Mr. Ritchie, he did, definitely and strongly, claim the chemist's right to his title, pointing out the great injustice in giving companies the right to use it. His reply was that he could go no further than to say that he believed that many of the qualified chemists were not protecting the public as they ought to do, alleging that they ran branch shops by means of unqualified assistants. All he (Mr. Martindale) could say was that the Pharmaceutical Society had always gone strongly for offenders in that respect whenever such cases were brought under its notice.

Mr. GLYN-JONES said he considered that the Council had made a mistake in not first fighting for what it could get, and then, if not successful, to oppose Clause 2. With regard to Mr. Ritchie's allegation, he denied it point-blank. If Mr. Ritchie knew of such cases he ought to point them out to the Society, so that it could deal with them. When he did so, and no action was taken by the Society, it would then be time for him to use his argument, and not till then. In this connection Mr. GLYN-JONES referred to certain advertisements which have appeared in some of the provincial papers, characterising the action of the advertiser as a piece of sharp and not too honourable practice.

Mr. PARKER expressed his opinion that the members of the House of Commons have a sufficient sense of fair play to see the justice of making titles an exclusively personal matter, and he believed that if the question of titles was dissociated from trade,

the chemists could successfully carry their claim before Parliament.

DISPENSING OF PROPRIETARY ARTICLES.

Mr. ROGERS said he had a little matter he wished to bring before the Association—the dispensing of proprietary articles. It was a matter which they could not ignore, and he thought they should discuss it, and see if it could not be regulated.

The PRESIDENT, referring again to the Companies Bill, said personally he believed the Council would have done better to try for titles, but as a divided house is of no use, and the majority had been against his view, and had decided to oppose Clause 2, he thought the pharmacists of the country should draw together and do their best to oppose the clause, and then go in for a new Pharmacy Act. With regard to Mr. Rogers' suggestion, he had no doubt the Association would be pleased to discuss the matter at the May meeting.

DERBY AND DISTRICT CHEMISTS' ASSOCIATION.

A meeting was held at Smith's Restaurant, Victoria Street, Derby, on Thursday, March 15, 1900, Mr. COPE, President, in the chair, having been specially convened to consider the best means of opposing or amending Clause 2 of the Companies Bill, now before Parliament.

After considerable discussion and divergence of opinion, the following resolution, proposed by Mr. DAWSON and seconded by Mr. PEMBLETON, was agreed to without dissent:—"That this meeting is of opinion that Clause 2 of the Companies Bill now before Parliament should be opposed with a view to its entire elimination from the Bill, and that the local borough and county members of Parliament be communicated with, urging them to do their utmost to prevent its passing."

A letter was accordingly sent to the nine members representing Derbyshire, signed by the President and Hon. Secretary, as follows:

SIR,—At a meeting held on March 15, 1900, it was resolved to communicate with the members of Parliament for the County and Borough of Derby, and draw their attention to Clause 2 of the Companies Bill now before Parliament.

"This clause proposes to legalise the use of the titles 'Pharmaceutical Chemist' and 'Chemist and Druggist' by companies of unqualified persons, whilst individuals can only obtain and use these titles after examination and registration. Your constituents who are qualified chemists consider this proposal most unjust, as it sacrifices the vital vested interests of a legal qualification held by nearly 16,000 individuals for the sake of a number of unqualified persons who have invested surplus capital in a business which they are not legally entitled to carry on as individuals.

"Whilst registered chemists do not seek to interfere in any way with the existing free trade in drugs and medicinal preparations, they consider that so far as their strictly professional duties are concerned they are entitled to be placed on a similar footing to medical practitioners, dentists, etc., whose practice it is proposed to protect as against companies by Clause 3 of the Companies Bill. The title 'Pharmaceutical Chemist' or 'Chemist and Druggist' is as valuable to its owner and should mean as much to the public as that of 'physician,' 'surgeon,' or 'dentist,' and in the public interest, as well as in common justice to the legitimate holder of the title, should be as strictly protected. Your constituents, therefore, respectfully beg you to oppose the clause, with a view to its entire elimination from the Bill.

"It is expected that the Pharmaceutical Society will, in the event of the clause being rejected, obtain the introduction of a private Bill dealing with the question."

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this Association was held on Thursday, March 15, at 73, Newman-street, London, W., the PRESIDENT, Mr. F. W. Gamble, in the chair. The programme announced "Short Papers by Members," and the first communication was a paper—which was read by Mr. H. Hymans in the absence, through illness, of the author—by Mr. J. WICLIFFE PECK, dealing with

GLAUCIUM LUTEUM,

which he described as one of a few plants that are found in somewhat isolated portions of Great Britain whose medicinal qualities have not been appreciated, or, if known to exist, have not been properly examined. Having referred to the superstition regarding certain plants in remote country districts, and to the "Doctrine of Signatures," whereby the medicinal properties of plants were alleged to be discovered by the resemblance of some external feature to some particular disease, Mr. Peck stated that during a walking tour, and also some years' residence in Devonshire, he was interested in ascertaining the uses to which certain plants were put, and especially *Glaucium luteum*, the "yellow-horned poppy," or "sea poppy," a plant that has a distinctly sedative action. He found that the tops of the plant were gathered from the sandy shore during August and September when the flowers and capsules were in all stages of size and development, and dried, forming a drug having the Anglo-Saxon name of "drigan," *i.e.*, to dry. When used for pains, a poultice was made by the aid of boiling water and a handful of the drug; when intended for internal use a "pinch" of the drug was placed in a teacup and boiling water poured over it. A teaspoonful of the cold "tea" was stated to make children have a night of quiet, peaceful slumber. On looking up the plant he found that only one book—'Gray's Supplement' (1847)—mentioned it as being medicinal.*

Since 1847, he believed, no experiments had been made for the purpose of identifying its active principle, a fact which seemed to him strange, since it belonged to so useful a natural order as Papaveraceæ. 'Gray' referred to the plant thus: "*Glaucium flavum*, yellow-horned poppy; *Chelidonium glaucum*, fl. yellow, July, August, biennial, sandy sea shores. Properties of seeds and juice analogous to those of *Argemone mexicana* (G) [called *figo del inferno* by the Spaniards on account of the powerful narcotic effects of the seeds, which are stronger than opium. An emulsion prepared from them acts first anodyne, afterwards purgative. Effects denied by some. Their oil is used for castor oil.]" It would be noticed, in the specimen illustrating the paper, that the long linear capsule, often six or eight inches long, opening in two valves leaves two free linear placentas forming a thin, dry, substance in which the seeds are more or less imbedded. The plant was stated to be found in the west coast of England and Ireland, and throughout the Mediterranean Sea littoral, but the author had found it at Slapton Sands (Devonshire) only, during the whole course of his peregrinations over England and Wales. In conclusion, he thought that the few simple drugs that have been used for generations by country folk might with some interest, and, perhaps, profit, occupy the attention of chemists.

* The plant is also mentioned in Fernie's 'Herbal Simples,' p. 441. The author states: "There is a Welsh Poppy, with yellow flowers; and a horned poppy, named after Glaucus, common on our sea-coasts, with sea-green leaves, and large blossoms of golden yellow. . . . Borlase says that 'In the Scilly Islands the root of the sea poppy is so much valued for removing all pains in the breast, stomach, and intestines, as well as so good for disordered lungs, whilst so much better there than in other places, that the apothecaries of Cornwall send thither for it; and some persons plant these roots in their gardens in Cornwall, and will not part with them under sixpence a root.'"—Ed. P. J.

The PRESIDENT said that was his first experience of *Glaucium luteum*. Their thanks were due to Mr. Peck for bringing it under notice.

Mr. T. MORLEY TAYLOR then communicated a note on some preliminary observations he had made in connection with

QUININE SALTS AND CHLORINE IN SOLUTION.

He said that his attention was directed to the fact that a mixture containing two grains of quinine sulphate in dilute liquor chlori. was found to have lost all smell of chlorine. With a view of satisfying his own curiosity, and bringing the matter before the Association he made a few preliminary observations. Two solutions of chlorine were made estimated to contain (a) 0.15 per cent., and (b) 0.08 per cent. Pure quinine and its sulphate B.P. and hydrochloride B.P. were dissolved, 2 grains per ℥i. in the solutions. After three hours the smell of chlorine had disappeared from the whole series; the solution grew very acid, and displayed a gradually deepening red coloration. Determining the amount of chlorine in one or two at this stage he found that solution (a) containing pure quinine gave 0.05 per cent.; solution (a) containing hydrochloride gave 0.07 per cent.; solution (b) containing sulphate gave 0.01 per cent., thus showing that the hydrochloride solution contained the most free chlorine. The salts were next dissolved in a solution prepared according to Dr. Burney Yeo's prescription, by adding HCl to potassium chlorate in the dispensing bottle. This was found to contain 0.09 per cent. of chlorine. Solutions made thus retained their colour and a strong odour of chlorine twenty-four hours after, but on determination it was found that approximately 50 per cent. of the chlorine had disappeared. Independent of the question as to what compound was formed it appeared to Mr. Taylor that the solution of the hydrochloride in Yeo's solution of chlorine as given above is the most desirable mixture. He had not gone into the chemistry part of the question, but had simply made his experiments from a dispenser's point of view. A dispenser might easily lose his reputation by dispensing a chlorine solution from which the smell of chlorine entirely disappeared after three hours, because the doctor would probably say that the solution was not made as it ought to be as he could not smell chlorine in it. He thought it was a matter for investigation as to the chemical change which takes place in the solution. He had not gone deeply into the matter partly because now that the library at the "Square" is closed in the evening an ordinary member has not the chance to look up references for himself.

The PRESIDENT said he had frequently to dispense a mixture such as that described by Mr. Taylor, but it had never occurred to him to determine the amount of chlorine in the solution after it had been dispensed some time. It would be interesting to know if the red coloration would change to green on the addition of ammonia. He had noticed that Yeo's solution was generally colourless or slightly yellow. It was rather curious that the amount of chlorine in the solution should vary according to the length of time it had been dispensed. One would suppose that the quinine would fix a certain amount of chlorine.

Mr. HYMANS said he could not throw any light on the matter, but he would like to know if Mr. Taylor's experiments were carried out in the dark or in the light.

Mr. TAYLOR: In ordinary diffused daylight.

IODOL WOOL.

Mr. LATREILLE asked if anyone had experience in making iodol wool. He had great difficulty in keeping the wool intact.

The PRESIDENT said he had not much experience of iodol wool, but he thought that the iodol exercises some action on the wool itself, as no better result was obtained by using a long-fibred wool than by using a short-fibred wool.

No further communications being forthcoming, the meeting adjourned.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

At a meeting held on Wednesday, March 14, Mr. FRASER McDIARMID, President, in the chair, Mr. WILLIAM DUNCAN read a short paper on

SOLUTION OF ARSENIC.

He said: In the discussion on Mr. Hill's suggestion that liquor potassii arsenatis might replace the three official arsenical solutions, I mentioned that a stable 1 per cent. aqueous solution of arsenious oxide could be made by addition of a little glycerin and thus avoid many of the incompatible combinations so frequently occurring. The solubility of arsenious oxide depends on the variety used, but I find no difficulty in making a 1 per cent. solution in pure water, which appears to keep perfectly, is practically neutral, and preferable, I think, to Mr. Hill's suggestion. The colouring and perfuming of such a solution, as in the time of Dr. Fowler's "Tasteless Aque Drops," may be now thought unnecessary in these days of poison Acts. Other poisonous solutions are not coloured, and the addition of colouring is to be deprecated, as they are so liable to be prescribed in combinations. I, therefore, suggest that it would be better to have a simple aqueous solution of arsenic instead of the three now official.

Mr. DUNCAN next read a short paper on

LOTIO HYDRARGYRI NIGRA.

He said: On examining the clear fluid portion of this lotion some time ago I was surprised to find mercury in solution apparently in the mercuric condition. It is probable that the mercurous oxide formed from the calomel and Ca2OH, partially breaks down into mercurious oxide and metallic mercury, the water becoming slowly saturated with the former, which is slightly soluble. Most authorities state that mercurous oxide is very unstable, decomposing even by rubbing in a mortar, and it is probable that the calcium chloride in solution hastens such decomposition, forming a soluble mercuric double salt. The question arises to what is the therapeutic activity of black or yellow wash due—the insoluble precipitate or the dissolved salt. If the latter, would it not be better to use a diluted liquor hydrargyri perchloridi and let the black and yellow mercurial lotions be officially things of the past?

Mr. Duncan also contributed some

DISPENSING NOTES.

The first prescription dealt with was for the following ointment:—

℞ Cerat. Galeni,
Adipis Lanæ aa ℥i.
Resorcin 50 per cent.
Ft. unguent.

The difficulty here was to decide what quantity of ointment should be sent, several qualified dispensers said they would send three ounces. The prescriber had certainly ordered a four-ounce ointment—two ounces fat and two ounces of resorcin. A reference to the prescriber confirmed this reading. The prescription was a very good example of the difficulties that beset the path of the careful dispenser, and also of the prescriptions sometimes met with in the examination rooms.

℞ Zinci Carb,
Pulv. Amhli. aa ℥ii.
Glycerini ʒss
M Aquam. ad ℥ii.
Sig. M. D.

Should this be a cream or a paste?

Several dispensers had made it by heat, giving a paste. But he thought it should be made by merely mixing and sending out with a "shake the bottle" label.

℞ Ferri et Quin. Cit.,
Potass. Citrat. aa ʒ ii.
Aquam. ʒ iv.

How should this be dispensed? The citrate of quinine was precipitated by salting out. Some supposed it was due to precipi-

tation of quinine by the occasional alkalinity of the potassium citrate, but a perfectly neutral salt behaved in a similar way. Suspension of the alkaloid by mucilage with a "shake of the bottle" label was preferable to the addition of citric acid as a solvent, as when the latter was added the usual result was the precipitation of a crystalline acid citrate on standing.

The reading of the notes was followed by an interesting discussion and on the motion of the Chairman a cordial vote of thanks was awarded to Mr. Duncan.

LIVERPOOL CHEMISTS' ASSOCIATION.

A meeting was held in the Lecture Theatre of the Liverpool Royal Institution on Thursday, March 15, the President, Mr. ANTHONY S. BUCK, in the chair.

Messrs. G. H. Burroughs and H. C. Featherstone were unanimously elected members.

A lecture was then delivered by Mr. THEO. H. WARDLEWORTH, F.L.S., one of the Association's secretaries, in which he gave a rapid review of his recent visit to the Western Hemisphere. He had found that the gathering of aloes in Barbados, as generally known, has almost been abandoned, and it was with some difficulty that he had the opportunity of seeing one of the plants. The Curaçao aloes seem to have damaged the profitable gathering of the drug to a very large extent. The Botanical Gardens in Jamaica are very fine, all the known methods of cultivation in the West Indies being employed there. One point worthy of mention was the ingenious method of cultivation employed in Jamaica in connection with nutmegs. After nutmeg plants have been grown from seeds and watched over for four or five years, it is frequently found that only two or three out of several hundred would bear fruit. In order to secure bearing trees, a large number of the seedling plants are grown from seeds, and when they reach a certain age they are taken to a recognised female fruit-bearing plant. Taking one of the tender shoots of the female tree, the side of it is cut slightly, and it is grafted on to the growing young plant, the top of which is afterwards cut away. Cocoa-growing is a great industry, especially in Trinidad, and cowhage grew by the roadside. The peasants have a great dread of cowhage, and will not clear ground on which it is growing—they will burn the "bush," but not clear it. Reference was also made to the improved methods of growing ginger and to the cultivation and curing of vanilla in Jamaica. A fine and comprehensive series of specimens was shown, illustrative of the lecturer's remarks, the examination of which afforded considerable satisfaction to the members present. A hand-plaited grass cassava press made by the native Indians was much remarked upon, combining as it did great strength with perfect adaptation to the purpose for which it was intended. Various types of pipe used by Chinese and Hindoo coolies for smoking opium and hashish were commented upon, and the method of use explained, an elaborately made bronze and cane nargileh being much admired. As showing what can be done with cocoanut fat, two samples of a butter substitute were of interest, their flavour and general appearance leaving little to be desired. Two specimens of cacao fruit were also shown, one dried and the other fresh, the latter a very fine fruit.

A vote of thanks was passed to Mr. Wardleworth for his instructive and exceedingly interesting remarks, on the proposition of the PRESIDENT, seconded by Mr. COWLEY, and supported by Dr. NEVINS and MESSRS. MARSDEN and WYATT.

CALCIUM PEROXIDE AS AN INTESTINAL ANTISEPTIC FOR INFANTS.—P. Rochkovsky finds that calcium peroxide is a useful remedy for the digestive troubles of infants. It is a yellowish powder, insoluble in water, and which slowly gives off oxygen. It appears to afford the best results in cases of acid dyspepsia, for which it is given in milk, in daily doses of 18 to 60 centigrammes. It is stated to act both as an antacid and as an antiseptic.—*Bull. Gen. de Therap.*, 139, 267; after *Semaine Med.*

CHEMISTS' DEFENCE ASSOCIATION.

The first statutory meeting of shareholders of the Chemists' Defence Association, Limited, was held at the Holborn Viaduct Hotel, London, on March 15.

The CHAIRMAN (Mr. A. Cooper), in opening the meeting, said that up to that date 667 shares had been allotted to various chemists throughout the country. The Directors had appointed Mr. C. G. Moor, Public Analyst for Exeter, to be analyst of the Association, and Mr. R. J. Beck, solicitor, who was thoroughly conversant with the Acts specially applicable to chemists, as the legal adviser of the Association. The arrangement with the analyst was that he would, once in each year, answer the following question for every member of the Association: "Does this article meet the requirements of the Foods and Drugs Acts?" Members might ask additional questions of a like character for a nominal fee of 2s. 6d. each time. Of course, they would not expect the analyst to answer that question for the above-mentioned fee in relation to articles, the tests for which were very elaborate and expensive.

ELECTION OF DIRECTORS.

The principal business before the meeting was the election of Directors for the ensuing year.—The following gentlemen were then unanimously elected as Directors:—Messrs. F. Andrews, 34, Leinster Terrace, Lancaster Gate, W.; W. R. Barnes, 10, Terrace Road, Plaistow, E.; C. J. G. Bunker, 135, Great Dover Street, London, S.E.; Albert Cooper, F.C.S., 80, Gloucester Road, London, S.W.; T. P. Garrett, 33, Commercial Street, Newport (Mon.); W. Jones, 2 and 3, High Street, Birmingham; S. N. Pickard, 74, Manningham Lane, Bradford; P. F. Rowsell, 74, High Street, Exeter.

ALTERATION OF RULE.

The Directors advised, and it was agreed, that Rule 6 be altered to the following:—

That it shall not be compulsory on the Directors to identify the Association with the defence of any particular case, but that, should they think such a course desirable in the interests of the Association, in lieu of conducting such defence, hand to the member any sum which they may consider has been reasonably expended on such defence, not exceeding £10.

STANDARDS FOR DRUGS.

Mr. C. G. MOOR was asked to speak, and explained that he had been engaged in the study of foods and drugs for some ten years, and for some time had been engaged in preparing a set of standards of purity for all articles of foods and drugs. He did not think that adulteration of articles was practised by chemists in this country to any appreciable extent. The largest number of offences under the Foods and Drugs Acts arose through chemists paying too little attention to the fact that certain articles were liable to decomposition, and that the quality of others was not what it should be. He felt that chemists made a great mistake in buying drugs too cheaply, for they could hardly expect the quality of such articles to be quite up to the mark. In some cases it was practically impossible to get articles in constant use in strict conformity with the requirements of the British Pharmacopœia, and with regard to the standards of purity of some drugs as given in the British Pharmacopœia, some of the descriptions and tests were very loose. He suggested that it would be useful to the members of the Association if they could be informed what articles come under the above group, and he would be very pleased to incorporate the information required in any circular which the Secretary would be sending out. He concluded by wishing every prosperity to the Association.

REMUNERATION OF OFFICERS.

The CHAIRMAN having thanked Mr. Moor for his interesting address, the question as to what remuneration the Directors were to receive for their services, and also what the Secretary and Analyst were to be paid for their labour and time, came under consideration.

The Secretary, Mr. W. S. GLYN-JONES, stated that the whole subject was to be placed before the P.A.T.A., when doubtless a scheme would be drawn up, whereby the expenses of running the two Associations would be divided between them.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cascara Sagrada.

CASCARA SAGRADA, or sacred bark, is the dried bark of *Rhamnus purshianus*, D.C. (N.O. Rhamnaceæ), a shrub which grows freely in North California and in the States of Oregon and Washington, U.S.A. The bark of *R. californicus*, Eschsch., is also known in California as "cascara sagrada," but the name is officially limited here to the bark of *R. purshianus*. It is collected in the spring and early summer, when it is easily peeled from the wood and curls into quills on drying. If collected later, the bark must be cut away and portions of wood are then apt to be removed with it. The drug possesses tonic and laxative properties; it is used in the preparation of *Extractum Cascaræ Sagradæ*, *Extractum Cascaræ Sagradæ Liquidum*, and *Syrupus Cascaræ Aromaticus*.

CASCARA SAGRADA.—Quill showing outer surface, exact size. After Greenish.

CHARACTERS.—Cascara sagrada usually occurs in straight, stiff, single quills, or in channelled or nearly flat pieces, about 10 Cm. long, 18 Mm. wide, and 1.5 Mm. thick. The quills vary from 6 to 25 Mm. in diameter, and pieces of the drug may be obtained as much as 10 Cm. wide, 15 Cm. long, and 4.5 Mm. thick, but the thinner bark is preferable. The corky outer layer of the bark is nearly smooth, of a dark, purplish-brown colour, and marked with scattered, transversely elongated, whitish lenticels. Beneath the cork is a yellowish-grey cortex, in which groups of sclerenchymatous cells form dark, translucent points, and wavy medullary rays may be perceived in the brownish-yellow bast when a smoothed transverse section is examined by the aid of a lens. The greyish-white appearance of the drug in places is due to patches of silvery-grey lichen, which conceal the cork and lenticels; when those patches are removed by scraping, the exposed cork appears at first of a brownish-red colour. The inner surface of the bark is dark reddish-brown, with faint transverse corrugations and longitudinal striations. The bark breaks with a short fracture, which is somewhat fibrous near the inner surface, where the bast occurs. The characteristic odour of the drug is not very powerful, but its taste is persistent, nauseous, and bitter.

NOTES.—The distinctive characters of cascara sagrada are the purplish-brown cork covered with silver-grey lichen, the groups of sclerenchymatous cells in the cortex, and the characteristic odour and taste. The taste appears to be due to one of several resins contained in the bark, which can be removed by treatment with alkalis. Emodin or frangulinic acid has been isolated from the bark in orange-yellow crystals, and frangulin and purshianin—glucosides which yield emodin and a sugar by hydrolysis—are probable constituents of the drug, which also contains tannin, volatile oil, etc. The action of the drug is milder and less emetic when it has been kept for a year or more before use, probably owing to the disappearance of a ferment similar to that supposed to exist in the fresh bark of *Rhamnus frangula*, Linn. The yellow colour imparted to paper in which cascara sagrada is kept is presumably due to the glucoside frangulin, which slowly volatilises at ordinary temperatures. The bark of *R. californicus*, which has been substituted for that of *R. purshianus*, is said to be distinguishable by the uniform coat of lichen, the somewhat reddish, dull grey cork, the small number of lenticels, and the paler inner surface.

Cascarilla.

CASCARILLA is the dried bark of *Croton eluteria*, J. J. Bennett (N.O. Euphorbiaceæ), a shrub which is indigenous to the Bahama Islands. The bark appears to be taken from twigs, branches, and small stems. It possesses aromatic and stomachic properties, and is used for preparing *Infusum Cascarillæ* and *Tinctura Cascarillæ*.

CASCARILLA.—A, Piece of bark, showing outer surface, exact size. B, Transverse section, slightly magnified.

CHARACTERS.—Cascarilla is imported in single quills, from 2.5 to 7.5 Cm. or more in length and from 4 to 12 Mm. in diameter; also in small curved or channelled pieces. The outer layer of the bark is dull brown or dark grey in colour, longitudinally wrinkled, and frequently marked with small transverse and longitudinal cracks, which give it a chequered appearance. A characteristic chalky appearance is presented by the bark, owing to the presence in the cells of numerous crystals of calcium oxalate. The patchy appearance in places is caused by the dark-coloured cortex showing through the white or greyish-white cork, and the minute black dots seen on larger pieces of the bark are the apothecia of a small lichen. The cork is easily separated, and reveals the brown or dark-grey cortex marked with longitudinal and transverse furrows. The bark breaks with a short and resinous fracture; a transverse section exhibits under a lens the pale cork layer, dark brown cortex, and dark reddish-brown bast traversed by numerous thin whitish medullary rays. No groups of sclerenchymatous cells can be detected, thus distinguishing cascarilla from other barks which are sometimes mixed with it. The agreeable aromatic odour of cascarilla is more marked when the bark is burned; the taste is also aromatic but disagreeably bitter.

NOTES.—The distinctive characters of cascarilla are the chalky appearance, longitudinal wrinkles, longitudinal and transverse cracks, short resinous fracture, appearance of a transverse section, aromatic odour, and bitter taste. The bitter principle—cascarillin—is a crystallisable alkaloid; the bark also contains betaine, a base akin to choline, and about 1 per cent. of volatile oil, together with resin, tannin, starch, etc. The barks of other species of *Croton* are distinguished from cascarilla by the absence of the aromatic odour, bitter taste, and sclerenchymatous cells.

Cassia Pulpa.

CASSIA PULP is obtained from the fruits of *Cassia fistula*, Linn. (N.O. Leguminosæ), a tree indigenous to India. The inflorescence of the tree is a pendulous raceme, and each flower has a one-celled, many-seeded ovary, which develops into a long pod, with a thin, hard, and woody pericarp, differing from an ordinary legume in being indehiscent as well as many-celled. The pulp, which alone is official, possesses laxative properties and is used in the preparation of *Confectio Sennæ*.

CHARACTERS.—Cassia pods are from 35 to 50 Cm. long, and from 18 to 25 Mm. in diameter, nearly straight and cylindrical in shape, with a short stalk, and of a dark chocolate-brown colour. They are very hard and indehiscent. The dorsal and ventral sutures are marked by two smooth bands running the whole length of the fruit, but they are not prominent. Internally, each pod is divided into numerous compartments by thin transverse partitions or spurious dissepiments, placed about 6 Mm. apart. Each division contains a single smooth flattish-oval reddish-brown seed, attached to the ventral suture by a long, dark, thread-like funiculus; adhering to each membranous partition is a thin layer of the nearly black viscid pulp, which has a faint, somewhat sickly odour and a sweetish taste.

CASSIA FISTULA.—Lower portion of fruit, with part of the pericarp (a to b) removed; S, seed; w, spurious dissepiments. After Wiesner.

NOTES.—The distinctive characters of cassia pods are the smooth surface and long cylindrical shape, the spurious dissepiments with adhering pulp, and the odour and taste of the latter. The pulp, of which the pods yield about 30 per cent., contains more than half its weight of sugar, together with calcium oxalate and albuminoid matter. Old pods, recognised by the rattling of the seeds when shaken, yield dried pulp, which should not be used. The pods of *Cassia grandis*, Linn., are official in France; they are usually longer, thicker, and heavier than those of *C. fistula*, with a rough surface, laterally compressed seeds, one prominent ridge on the dorsal suture and two on the ventral suture. The pods of *C. moschata*,

H.B. and K., are also official in France; they are smaller and narrower than the pods of *C. fistula*, while the pulp is paler in colour and exhales a musky odour when warmed.

Catechu.

CATECHU, also known as gambier, terra japonica, or pale catechu, is an extract prepared from the leaves and young shoots of *Uncaria gambier*, Roxb. (N.O. Rubiaceæ), a climbing shrub indigenous to the Malay Archipelago and largely cultivated in many of the islands. The leaves and young shoots are boiled with water, the decoction is evaporated to a syrup and cooled, and a soft clayey mass results in which crystallisation has been induced by working a stick up and down in an oblique direction. The crystalline mass is allowed to drain, then cut into small cubes, strips, plates, or discs, and dried. Catechu is a powerful astringent, and is used in the preparation of Pulvis Catechu Compositus, Tinctura Catechu, and Trochiscus Catechu. The dose of the drug is from 5 to 15 grains.

CHARACTERS AND TESTS.—Catechu usually occurs in more or less agglutinated cubes, measuring about 25 Mm. each way. They are fairly regular in shape, deep reddish-brown externally, pale cinnamon-brown internally, porous, friable and very light. When examined under a microscope, preferably after mixing a little with a drop of oil, catechu is seen to consist chiefly of minute acicular crystals. It is free from odour, but has a taste which is at first bitter and astringent, and afterwards sweetish. It should dissolve almost entirely in boiling water, yield 70 per cent. of soluble matter to 90 per cent. alcohol, contain no starch, and leave not more than 5 per cent. of ash when incinerated.

NOTES.—The distinctive characters of catechu are its shape, taste, solubility, and the presence of a fluorescent substance in

the drug. Catechu consists of 7 to 33 per cent. of catechin, and 22 to 50 per cent. of catechutannic acid, the proportions varying according to the care with which the drug has been prepared. It also contains quercetin, catechu-red—a decomposition product of catechutannic acid to which the reddish colour of the drug is due, and a fluorescent substance which is not found in black catechu or in many similar extracts. Starch, clay, or other inorganic matter, and other plant extracts, are possible adulterants of catechu. Starch can be detected by submitting the residue left after exhausting the drug with cold water to microscopical examination; clay and other inorganic matters increase the amount of ash left on incineration; other plant extracts differ in solubility and do not contain any fluorescent substance.

Obituary.

CLARK.—On March 19, Edward Clark, Chemist and Druggist, Lancaster. Aged 80.

DAVIE.—On March 15, John Scott Davie, Chemist and Druggist, Glasgow. Aged 22. Mr. Davie, who was a member of the Pharmaceutical Society, died unexpectedly in his apartments in Glasgow, of acute pneumonia. He was the second son of Matthew Davie, Alexandria; and served his apprenticeship with Dr. James Brown, Alexandria, afterwards going to Glasgow, where he was first assistant to Dr. Kennedy, and latterly with the New Apothecaries Co., 57, Glassford Street. Mr. Davie qualified in April, 1899, and during the past six months acted as Demonstrator in the Glasgow School of Pharmacy. He was a brilliant and enthusiastic student, and had almost completed his studies for the Major examination. His untimely end is deeply deplored by all his friends and fellow students.

PICKARD.—On March 19, Matthew Pickard, Chemist and Druggist, Salford, Manchester. Aged 85.

STREET.—On March 17, Sarah Jane Street, Chemist and Druggist, Crediton, Devon. Aged 74. Miss Street was a woman of remarkable intellect and talents, and had carried on the business of a chemist and druggist in High Street, Crediton, for many years. The business of a chemist appears to have been carried on there for upwards of a century by two spinsters successively. Miss Street had resided in the house for over sixty years, and for over thirty years had conducted the business. The former proprietress was a Miss Wreford, who carried on the business for many years until her death at an advanced age. Miss Wreford appeared to have studied under a medical man, whilst Miss Street learnt the compounding and dispensing of medicines and drugs under Miss Wreford. On the latter's death, Miss Street succeeded to the business which she carried on to the time of her demise. Being a woman of considerable attainment she exhibited great talent in her work. She was not qualified by examination, but being in business before the passing of the Pharmacy Act, 1868, she took advantage of the opportunity of being registered in order that she might sell poisons. That the people of Crediton had confidence in her preparations is apparent from the fact that she carried on a successful business.

YOUNG.—On March 19, George Young, Pharmaceutical Chemist, Millwall, E. Aged 74. Mr. Young had been a member of the Pharmaceutical Society since 1853, and was one of the oldest chemists in the Millwall district, where he was well known and highly respected by all classes of people. Reference to the Society's books brings out the interesting fact that Mr. Young changed his address once only during the period extending from 1853 to the time of his death—namely, from 12, Ebenezer Terrace, to 73, West Ferry Road, Millwall, and that was probably only a re-numbering of the same house.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

LIQUID AIR AND BACTERIA.

Dr. A. MacFadyen finds that bacteria may be kept at a temperature of -190° C. for twenty hours without their vital powers being affected. The organisms with which he experimented possessed varying degrees of resistance to external agents—the extremes being represented by the very sensitive spirillum of cholera asiatica, and the highly resistant spores of the anthrax bacillus. Pure cultures were taken of *Bacillus typhosus*, *B. coli communis*, *B. diphtheriae*, *S. cholera asiatica*, *B. proteus vulgaris*, *B. acidi lactici*, *B. anthracis* (sporing culture), *Staphylococcus pyogenes aureus*, *B. phosphorescens*, and *Photobacterium balticum*. They were simultaneously exposed to the temperature of liquid air (-182° C. to -190° C.) for twenty hours, then carefully thawed and examined. In no instance could any impairment of vitality be detected, the fresh growths obtained being normal in every respect, and the functional activities of the bacteria quite unaffected. Experiments with representative types of organisms usually met with in the air—moulds, bacilli, cocci, torulæ, and sarcinæ—had similar results, whilst a sample of yeast cell plasma (Buchner's zymase) retained its peculiar properties unchanged as regards the production of carbon dioxide and alcohol, after twenty hours' exposure to the intense cold mentioned.—*Lancet*, 3995, 849.

BEQUEREL RAYS.

Attention has several times been directed to the remarkable properties of Becquerel rays and, in particular, of those rays emanating from radium. The theory that the radiations consist of material particles is supported by M. Becquerel's recent observations on the action of screens in cutting off the radiations deviated by a magnetic field. A decisive experiment has now been performed with regard to this point. It has been established beyond doubt that the emanations from radium communicate a negative charge to bodies on which they fall, while the radium itself becomes charged negatively, and it is inferred that the emanations from radium, or, at any rate, a portion of them, consist of material particles carrying negative charges.—*Rev. Gén. des Sciences*, through *Nature*.

CHEMICAL COMPOSITION OF THE TUBERCLE BACILLUS.

Drs. de Schweinitz and Dorset find that cellulose in very minute amount is present in tubercle bacilli grown upon different culture media; it is probable therefore, that cellulose is a normal constituent. The amount of fat in the bacillus is very large, being equal to about thirty-seven per cent. of the weight of the dried germs. The fat is principally a glyceride of palmitic acid. Other fats are present in small quantities. One of those, which is volatile, gives to tuberculous cultures their characteristic odour. The large percentage of fat in the tubercle bacillus suggested the use as a staining reagent of Sudan III., which is a useful stain for fats in histological and pathological work. The result was very satisfactory, and apparently this stain is more selective than carbol-fuchsine. Smegma bacilli, which stain readily with fuchsine, do not stain with Sudan III. The mineral constituents of the tubercle bacillus include sodium, potassium, calcium, and magnesium. The high percentage of phosphorus pentoxide and the absence of other acid radicals were noticeable. Phosphates and cod-liver oil are two materials frequently recommended in tuberculosis. As the germs of the disease seem to demand a large quantity of food containing phosphorus and also rich in fat, it is said to be a fair supposition that in giving those drugs we are supplying to the animal

body those constituents which are very important for its proper nourishment, the supply of which is constantly being drawn upon by the bacilli.—*Brit. Med. Journ.*, 2047, 745.

GONAL OR GONOROL.

Under the trade name of "gonal" a purified sandalwood oil is being offered, which is claimed to consist exclusively of the alcoholic constituents of the crude oil, boiling at a temperature of not less than 300° C. The oil has previously been referred to under the name of "gonorol" (see *P.J.* [4], 9, 34), but the characters of the article now on the market appear to differ somewhat from those previously recorded. Gonal is obtained by saponification of the crude oil and subsequent fractional distillation *in vacuo* or by the aid of superheated steam. It is a colourless oil with a faint odour resembling that of the sandalwood oil, and its boiling point is between 303° and 305° C. Its specific gravity is 0.978 to 0.980, at a temperature of 15° C. It is readily soluble in three parts of 70 per cent. alcohol at a temperature of 20° C., and the solution is odourless and perfectly limpid. Those characteristics distinguish it from the ordinary commercial oil which, as is well known, is of a yellow colour, has a well marked aromatic odour and does not form a clear solution with 70 per cent. alcohol unless mixed with at least five times its bulk thereof. According to Dr. Aufrecht (*Phar. Zeit.*, 1899, Nos. 16 and 29) gonal or gonorol contains 99.5 per cent. of pure santalol and leaves nothing to be desired in respect of purity.

DETERMINATION OF AMMONIA AND NITROGEN.

A. Villiers and E. Dumesnil advocate the gravimetric determination of ammonia as chloride, in preference to the usual methods of alkalimetric titration, the ammonia evolved on distillation with alkali being passed into a weak solution of hydrochloric acid; this is evaporated to a small bulk and transferred to a conical flask, evaporation and desiccation being completed by exposure to a temperature of 105° C. in a drying oven for twenty hours, in which time all water and free hydrochloric acid are completely eliminated, but no ammonium chloride is lost. The following precautions are obviously necessary in the application of method. First, that the apparatus employed in distilling does not allow alkali spray to be carried over mechanically. Those devised by Schloesing, or by Aubin and Alla are recommended. Secondly, that the soda or potash employed is free from ammonia; this is frequently present in the so-called pure alkalis. Thirdly, the fact that the hydrochloric acid used is perfectly free from residue should be experimentally determined. The method is equally available for the Kjeldahl and the soda-lime methods of nitrogen determination.—*Comptes rend.*, 130, 579.

PAPAIN DIGESTION.

From comparative results obtained by digesting fibrin with pepsin, and with the fresh juice of *Carica hastifolia*, V. Harley concludes that the products formed are very similar, and quite distinct from the digestion products of fibrin with pancreatin. He finds that papain is slightly more active in acid than in alkaline solution. The products of digestion in both cases give with tyrosinase at first a reddish colour, then a deep green, which is more intense in the case of papain than with pepsin.—*Journ. de Pharm.* [6], 10, 172.

DANGERS OF CAFFEINE.

According to Zenetz, caffeine is a drug which has been imperfectly investigated and which should not be used in medicine until it has been more thoroughly worked out. He finds that it is very slowly eliminated from the system by the kidneys, and that its action on the heart is cumulative; it is, therefore, absolutely contra-indicated in all renal diseases, in arterio-sclerosis, and all cardiac affections secondary to them. Another danger of caffeine is that the experimentally fixed toxic dose varies enormously with the individual.—*B. M. J. Epit.* 1, 1900, 35.

THE OFFICIAL PROCESSES FOR THE ASSAY OF IPECACUANHA, BELLADONNA, AND NUX VOMICA.*

BY F. C. J. BIRD.

I.—Ipecacuanha (Continued).

Titration of the Alkaloidal Residue.—This is always useful as a check on the gravimetric result, although not referred to in the official analytical method for ipecacuanha. The fact has been previously emphasised (*P. J.* [4], 8, 434) that in delicate determinations and when working with weak volumetric solutions, such as the centinormal solution of soda, the volume of the liquid under titration should be kept as small as possible, and only just sufficient of the indicator added as may be necessary to show the change in colour distinctly. The official indicator, tincture of cochineal, is both reliable and sensitive whenever the alkaloidal residue is sufficiently pale in colour to admit of its use, but with the intense dark orange-brown residues often met with from commercial samples of liquid extract it appears to be anything but satisfactory, and the endpoint of the reaction becomes a mere matter of guess-work.

If the residue under titration is quite pale in colour it should be taken up in a little alcohol, a few drops of cochineal tincture added, and titrated directly with N/10 acid. When the neutral point is reached it should be noted, and 0.2 C.c. more acid added. The liquid may then be gently warmed to ensure solution of the whole of the alkaloid, and titrated back with N/100 or N/50 soda.

Titration in this manner was, however, quite inapplicable to the deep orange brown residues obtained from Sample A. Every possible device was tried to obtain a sharp reading of the endpoint of the reaction, the liquid being largely diluted with water and the tincture of cochineal used in both large and small proportions. Similar solutions were also made up with caramel and red dye to match the alkaloidal solution, but in each instance the intense brown colour of the latter quite masked the changes of the indicator and left the endpoint of the reaction doubtful and indistinct. The only way of overcoming the difficulty appeared to lie in the direction of finding some immiscible solvent which would not only freely take up the alkaloidal residue but would also retain the coloured portion so as to leave any aqueous liquid used in conjunction with it available for observation of the changes of the indicator.

The usual solvents were tried, but only one, viz., amylic alcohol, was found to completely satisfy the above conditions, neither ether nor chloroform being suitable for the purpose. Amylic alcohol retains practically the whole of the colouring matter of the residue; it also has a distinctive effect on certain indicators (methyl orange and hæmatoxylin) by which the changes are rendered sharper and more distinct. Amylic alcohol separates from an aqueous liquid rather sluggishly; for quick working prompt separation is most desirable, an equal volume (not more) of 0.717 ether is, therefore, added to the amylic alcohol, and saturated solution of sodium chloride, a liquid of high specific gravity, substituted for the aqueous layer. The separation of this mixture is quite sharp and almost instantaneous. It proved the best of many other combinations which were tried. If 20 C.c. of the ether amylic alcohol (equal vols. 0.717 ether and amylic alcohol) be mixed with 5 C.c. of saturated sodium chloride solution, both liquids being quite neutral, a few drops of methyl orange solution added and the whole shaken, the upper immiscible layer will be found to separate of a bright greenish yellow colour, whilst the lower layer remains quite colourless. On the addition of 1 drop of centinormal soda and agitation the aqueous layer takes on a pure pink, perfectly free from any tint of yellow, thus giving a very delicate indication.

Hæmatoxylin with ether amylic alcohol and brine is equally sensitive; in this case with 1 drop N/100 soda the immiscible layer is yellow and the lower layer a very decided purple. Both cochineal and litmus may be employed in the same manner, but neither is

quite so sensitive as hæmatoxylin or methyl orange. The following table shows the behaviour of the four indicators mentioned, with ether amylic alcohol and sodium chloride solution in faintly acid and faintly alkaline media:—

ETHER AMYL ALCOHOL AND SODIUM CHLORIDE SOLUTION.

Amylic Alcohol	10 C.c.
Ether 0.717	10 C.c.
Sat. Sol. Sodium Chloride.....	5.0 C.c.

	Acid.	Alkaline.
Hæmatoxylin solvent 4 drops 1 % alcoholic solution aqueous layer	yellow colourless	yellow purple
Methyl Orange..... solvent 3 drops B. P. solution or more according to colour of residueaqueous layer	greenish yellow deep pink	yellow colourless
Cochinealsolvent Tincture, 5 dropsaqueous layer	brick red colourless	colourless purple red
Litmussolvent B.P. solution 5 drops.....aqueous layer	colourless red ppt. at junc. colourless	colourless purple

Iodoeosine changes in the upper layer only, the aqueous portion remaining colourless with either acid or alkali. Although a sensitive indicator this property precludes its employment with ether amylic alcohol for coloured residues. Methyl orange has generally proved the most satisfactory of the indicators mentioned for use with ether amylic alcohol.

The titration is conveniently carried out in a 50 C.c. white blown glass phial furnished with well fitting rubber cork. Commercial amylic alcohol and chloride of sodium solution will rarely be found quite neutral. The precaution should therefore be taken of placing the ether, amylic alcohol and brine in the phial, adding one drop of the indicator and exactly neutralising first with decinormal and then with centinormal acid or alkali added a drop at a time. The upper layer may then be poured off and used to dissolve the alkaloidal residue.

As titration in this manner is not quite so rapidly performed as in the ordinary way, the following mode of operating will be found to save time and quickly complete the determination. Pour off the neutralised solvent into another vessel and use a portion for dissolving the alkaloidal residue. Transfer to the phial, rinsing out the dish with successive quantities of the remainder. Run in about two-thirds the quantity of N/10 acid theoretically indicated by the weight of the residue and continue adding acid, 0.2 C.c. at a time, with agitation between each addition, until a distinct acid reaction is seen in the aqueous layer. Then add 0.2 C.c. extra acid, and return the contents of the phial to the dish so as to take up any remaining traces of alkaloid.

Transfer again to the phial, and titrate back with N/20 soda, run in drop by drop. It must be borne in mind that the smaller the volume of the aqueous layer the sharper and more definite will be the change of colour in the indicator, whence the advantage of conducting the titration as described.

The end of the reaction in this method of titration is perfectly sharp and distinct. It is specially applicable to the titration of those high coloured alkaloidal residues which in the ordinary way presents such difficulty.

It may not be out of place to note here that the impure morphine obtained in the assay of opium and its preparations may be rapidly and accurately titrated by this method. A weighed quantity of the alkaloid, 0.3 or 0.5 Gm., is dissolved by boiling in a test-tube or small flask, with a slight excess (10.8 or 17.8 C.c.) of N/10 acid. The cooled solution is transferred to a stoppered phial, the test-tube

* Continued from page 308.

rinsed with the 20 C.c. neutral ether amyl alcohol and 5 C.c. brine required, and the liquid titrated back with methyl orange and N/20 soda. One drop of the latter is usually sufficient to determine the completion of the reaction with great precision. The impurities in the morphine separate as a dark coloured stratum between the layers of ether amyl alcohol and brine, and leave the remaining liquid so clear that the changes of the indicator can be observed with unusual facility.

Characters of the Liquid Extract.—The specific gravity of liquid extract of ipecacuanha, as represented by commercial samples, varies considerably, at least from 0.885 to 0.915, according to the alkaloidal content of the root employed in the manufacture of the preparation and the extractive, dried at 98-100° C., from about 6 to 12 per cent. Having regard to the unstable nature of the free alkaloids of ipecacuanha when evaporated in alcoholic solution, the process of exhaustion by percolation should, in the preparation of the liquid extract, be pushed as far as possible before adding the lime, and the weak percolate distilled in fractions, commencing with the weakest, so as to avoid undue exposure of the free alkaloid to heat and alkali (lime being distinctly soluble in rectified spirit, and communicating to it an alkaline reaction). The analysis of a liquid extract carefully made with attention to these precautions does not as a rule show a difference between the figures obtained by weight and titration greatly exceeding 10 per cent. of the weight of the residue.

(To be concluded.)

INCOMPATIBILITY AND SOME OF ITS LESSONS.*

BY WALTER G. SMITH, M.D.

Ex-President Royal College of Physicians, Ireland; Physician to his Excellency the Lord Lieutenant; King's Professor of Materia Medica and Pharmacy, School of Physic, T.C.D.

PART II.—SPECIAL. (Continued.)

(5) *Chalybeates.*

The following points should be noted:

The reaction between Syr. ferri iod. and Pot. chloras has been already explained. Potassium chlorate is not incompatible with ferric salts.

Ferrous carbonate is insoluble (Rule 3), and intentional incompatibility is exhibited in Mist. ferri co.; and in Pilula ferri, B.P.

A similar change happens when Blaud's pill comes into contact with water.

Both ferrous and ferric oxides are insoluble (Rule 1).

Therefore, all *inorganic* iron salts are incompatible with alkalies and their carbonates.

To suitably combine perchloride of iron with arsenic, use Liq. arsen. hydrochlor., and not Liq. arsenicalis (K₂CO₃); and, to prescribe iron in effervescence, add the iron salt to the *acid* bottle, or, use a "scale preparation."

The double salts, Ferri et ammon. citr. and Ferrum tartaratum behave differently, and are not precipitated by alkalies in the cold. Hence, this combination—a common one—is justifiable. Ferri et quin. citr. is less stable, and gives a reddish brown precipitate of ferric hydroxide with Liq. potassæ and a white precipitate of quinine with Liq. ammoniæ. Syrup, glycerin, or mucilage retard or inhibit the precipitation of iron salts by alkalies, but ferric chloride and mucilage, unless well diluted, form a tenacious brown jelly. Glycerin or sugar hinders the oxidation of ferrous salts; e.g., Syr. ferri iodidi.

6. *Insoluble sulphates* (Rule 4).

Of these, lead sulphate is the only one of importance in pharmacy.

It is inexcusable to prescribe together soluble lead salts (nitrate acetates) with the "SO₄" radical; e.g., Ac. sulphuric dil., or, Ac. sulphuric. aromat.: alum,* or, zinc sulphate. The last combination is sometimes defended upon the singular ground that insoluble lead sulphate is the really important ingredient (!) Zinc acetate should be substituted for the sulphate. As already explained, either alum or zinc sulphate rubbed up, in the dry state, with sugar of lead, undergo double decomposition.

Liq. plumbi subacet. gives a *green* precipitate with Infus. rosæ acidum (H₂SO₄) owing to a secondary action of the basic lead salt upon the colouring matter of the red rose.

The apparently isomeric sulphocarbolates of zinc and sodium do not react as sulphates, and are compatible with lead salts, because they do not contain the diad ion "SO₄". They are really salts of monobasic sulphonic acid, SO₂^{OH}/_H, and are therefore phenol-sulphonates.

In B.P., 1885, the formula was inadequately presented as—

Sulphocarbolates should not be confounded with true phenol-sulphates (etheral sulphates):

which are decomposed by boiling with HCl, phenol and an ordinary sulphate being produced. Etheral sulphates occur in urine after the administration of phenol.

7. *Insoluble chlorides* (Rule 5).

The most important salt in relation to pharmacy is AgCl, produced whenever AgNO₃ comes into contact with the ion chlorine.

Hence—

(a) The necessity for using pure distilled water (free from chlorides, and from CO₂) in preparing solutions of AgNO₃.

(b) The utility of NaCl as a means of neutralising any excess of AgNO₃ when locally applied, to the eye, or elsewhere; and, as an antidote in poisoning.

(c) The impropriety of prescribing AgNO₃ along with soluble chlorides or hydrochlorides, e.g., hydrochlorides of cocain or morphine. The nitrates of the alkaloids would be admissible.

When chlorine is not in the ionic, *i.e.*, dissociated state, as e.g., in chloral and chloroform, AgNO₃ does not form a precipitate of AgCl, and is, therefore, used as a test for free chlorides in either of these compounds. Stains on the skin resulting from AgNO₃ are best removed by potassium cyanide.

(8) *Insoluble sulphides.*

The sulphides of all the heavy elements are insoluble (Rule 1), and some of them are of distinctive colour, facts of much importance in qualitative analysis.

Most insoluble sulphides are black, hence—

(a) The black stools passed after the use of preparations of iron (FeS) or of bismuth (Bi₂S₃).

(b) Burton's "blue line" on the gums or cheeks, as a result of chronic lead poisoning (PbS).

(c) The incompatibility of Bism. subnitrates with Sodii hyposulph (thiosulphate).

(d) The risk of causing black marks upon the skin if preparations of Hg or Pb are applied along with or followed by sulphur, or by preparations containing it in an unoxidised state.

I have seen a patient's face stippled with black dots (HgS) as the result of a mercurial application followed by a preparation of sulphur. A lad, after taking ichthyol internally for an

* The following stupid prescription was ordered:—

Zinci sulph.			
Alum exsicc.	ʒi.	ʒi.	M. A teaspoonful in a pint of tepid water as a lotion.
Ac. tannici	ʒi.	ʒi.	
Aquæ	ʒi.	ʒi.	

* Reprinted, by permission, from the *Practitioner*. Continued from last volume, page 588.

erythematous eruption of the face, used a "lactate of lead" lotion,* and speedily the pores of the skin were blackened owing to the elimination of some sulphur through the skin (R. Crocker).

Zinc sulphide is white; and accordingly preparations of zinc, if ordered in conjunction with sulphur or sulphides, will not cause discoloration on the skin.

Potassa sulphurata (liver of sulphur) and zinc sulphate are sometimes combined in a lotion, and white zinc sulphide will be precipitated.

(9) *Insoluble tannates.*

Tannic acid precipitates most of the heavy elements, and is incompatible, e.g., with tartar emetic (vinum antimon.). Tartar emetic is a salt very readily decomposed either by weak acids or alkalies.

Tannic acid also precipitates gelatin, starch, albumin, and most of the alkaloids.

(10) *Alkaloids.*

In view of the highly poisonous properties of some alkaloids their incompatibilities deserve careful study.

(a) Nearly all alkaloids in the *free state* are sparingly soluble in water (Rule 1), and they do not readily form carbonates.

Hence their salts should not be prescribed along with alkaline carbonates or hydroxides; e.g., acetate of morphine with bicarbonate of sodium or potassium; or Liq. strychn. with Sp. ammon. aromat. Even borax partially precipitates morphine and codein. If arsenic and strychnine are combined, use Liq. arsen. hydrochlor. Morphine is soluble in excess of Liq. potassæ, and quinine in excess of Liq. ammoniæ.

R Pot. bicarb. ʒv.
Liq. strychninæ ʒiij.
Inf. gent. co. ad ʒviij. M.

The bottle was finished up to the last two doses, and laid aside for a fortnight. A sediment was then noticed in the bottle, and after taking the last dose the patient suffered severely from symptoms of strychnine poisoning.

A lady in Johannesburg died in 1898 as the result of taking a mixture containing Liq. arsenicalis and Liq. strychninæ. The physician who ordered the mixture was indicted for culpable homicide. One of his prescriptions was:—

Liq. arsenicalis..... ʒi.
Liq. strychninæ..... ʒi.
Tr. strophanthi..... ʒiij.
Tr. capsici..... ʒi.
Aquæ..... ad ʒvi.

Chem. and Druggist, October 12, 1898.

In effervescing mixtures the alkaloidal salt should be added to the *acid* bottle.

(b) Most alkaloids are precipitated by—

(i.) Tannic acid (not easily by gallic acid).

Acetate and meconate of morphine are precipitated by tannic acid, but not the hydrochlorate or sulphate.

(ii.) Tincture of iodine, *i.e.*, I+KI.

Iodide of potassium alone precipitates some alkaloids from strong solutions.

R Pot. iodidi ʒiijss.
Ferri et quin. citr. ʒij.
Tinct. nucis vom. ʒij.
Sp. ammon. arom. ʒss.
Aquæ ad ʒviij.
M.

The quinine will be precipitated, in part, by the ammonia, and, slowly, as hydriodide.

(iii.) Double iodides, e.g., Donovan's solution (Liq. arsen. et hydr. iod.); Mayer's reagent (potassio-mercuric iodide).

Caffein and theobromin are not thus precipitated.

R Pot. iodidi ʒi.
Ac. hydrocy. dil. ʒss.
Liq. bismuthi ʒiij.
Quin. sulph. gr. xij.
Ac. hydrobrom ʒiijss.
Aquæ ad ʒvi.
M.

Double iodide of bismuth and potassium is formed (Dragendorff's reagent) which precipitates the quinine.

* The formula given by Crocker for lead lactate (*sic*) is: Solution of tubacetate of lead, ʒi., fresh milk, ʒij. Shake well together in a bottle.

(iv.) Picric acid. This furnishes a convenient test for quinine in the urine. The precipitate is distinguished from albumin by its complete solution when heated, and reprecipitation upon cooling.

(c) Caustic alkalies decompose the solanaceous alkaloids (atropin: hyoseyamin) and impair or destroy their therapeutic efficacy.

A common error, and one of long standing, is the combination of Liq. potassæ with Tinct. or Succus hyoseyami.

(d) Many other salts of alkaloids are sparingly soluble, e.g., quinine acetate, benzoate, borate, citrate, hydriodide and hydrobromide.

R Ferri et quin. citr. ʒij.
Pot. citratis ʒij.
Ac. citrici ʒi.
Aquæ ad ʒvi. M.

In a few hours nearly all the quinine was precipitated as acid citrate in large crystals, and it was impossible to administer the medicine.

R Quin. sulph. gr. x.
Pot. acet. gr. xx.
Ac. sulph. dil. iijv.
Aq. cinnam. ad ʒi. M.

Mixed in any order a voluminous precipitate of quinine acetate is thrown down.

A lady lost her life by taking a mixture containing strychnine and bromide of potassium. The last dose contained nearly all the strychnine.

Salicylate of sodium and quinine solutions form a voluminous precipitate of quinine salicylate, e.g.,

Quin. sulph. gr. xx.
Sod. salicyl. ʒiijss.
Ac. sulph. dil. ʒi.
Aq. pimentæ ad ʒviij. M.

(e) Most of the incompatibilities of alkaloids can be overcome or prevented by dilute HCl, or by alcohol in the proportion of 12 to 40 per cent. of the solution, because alkaloidal salts are usually soluble in alcohol.

In view of the above statements the practical rule emerges:—

All poisonous alkaloids should, so far as possible, be prescribed in simple solution, and not in too concentrated a state.

A woman, aged 57, took the last dose of a mixture containing Liq. strychn. and Liquor bismuthi with Sp. ammon. aromat. In ten minutes she was seized with tonic spasms, involving the face, neck, and body, and was dangerously ill for five hours (*Pharm. Journ.*, March 25, 1893).

In especial, morphine and strychnine should not be prescribed in solution along with large quantities of an iodide, bromide, or chloride.

Liq. hydrarg. perchlor. alone, *slowly* precipitates strychnine from Liq. strychninæ in delicate acicular crystals: also quinine.

Ac. hydrocyan. dil., or even Aqua laurocerasi, may from solutions of morphine slowly precipitate insoluble morphine cyanide.

A few additional examples of unsuitable or dangerous alkaloidal prescriptions are appended in illustration of the foregoing remarks:—

	ʒi. with ʒss. lemon juice.		

The morphine is precipitated by the carbonate, and if the bottle had not been shaken before mixing with the lemon juice, the last dose would have contained nearly all the morphine.

(To be concluded.)

NOTES ON QUININE,

WITH A BRIEF HISTORY OF THE BARKS FROM WHICH IT IS DERIVED.*

BY H. A. MARTIN.

MANUFACTURE.

In Dr. Pareira's manual of 1842 I find the following method given of the manufacture of disulphate of quina, as it was then called:—"Coarsely pulverised yellow bark is boiled with water acidulated with sulphuric or hydrochloric acid. The residum boiled a second or third time and by some a fourth time with the acidulated water. Finely powdered slacked lime is added to the filtered decoction (when cold) until the liquid is sensibly alkaline and acquires a dark colour. The precipitate is collected, drained on a cloth, and then submitted to graduated pressure, usually in a hydraulic press. The cake thus obtained is, when dry, reduced to powder and digested in S.V.R. The filtered tincture is distilled until the residuum (impure quina) in the retort has a brown viscid appearance. This residuum is then to be carefully saturated with very diluted H₂SO₄, the solution filtered and set aside to crystallise. The disulphate thus obtained is yellowish-brown. It is drained in a cloth, compressed, dissolved in water, decolorised by animal charcoal, recrystallised, and dried. This last part of the process must be carefully conducted to avoid efflorescence."

The above process would no doubt yield a sulphate of the whole of the alkaloids, as there is nothing suggested to separate any of them. Here is a quotation from the 'London College' as to the purity of disulphate of quina at that time:—

"Totally dissolved in water, especially when mixed with an acid, quina is thrown down by ammonia, the liquor being evaporated; what remains ought not to taste of sugar. One hundred parts lose eight or ten parts of water with a gentle heat. It is totally consumed by fire. Chlorine first added to it, and afterwards ammonia, it becomes green."

Salicin is also mentioned as an impurity, and can be recognised by oil of vitrol, which it turns red. It does not say, however, where this glucoside is likely to come from.

A method followed out in India is as follows:—

Bark, in fine powder, is mixed in proportion of 100 to 500 parts water (containing eight parts caustic soda), with 600 parts of a mixture consisting of amylic alcohol one part and kerosine oil four parts. This mixture is briskly agitated in large vessels for several hours, allowed to rest, and oily layer removed. The oily liquid is then shaken with dilute sulphuric acid, the acid aqueous solution is neutralised with soda or ammonia and set aside to crystallise, crystals are drained on a cloth, redissolved in fifty times its weight of boiling water, filtered through charcoal, and recrystallised.

Upon inquiry at Messrs. Howards and Sons I was told that the present method of manufacture was as the British Pharmacopœia directs,

with the exception of one thing, and that is, petroleum is substituted in lieu of benzolated amylic alcohol. In fact, the B.P. process could scarcely be improved. The only difficulty which presented itself was the separation of the quinine and cinchonidine, which can only be done at the present time by repeated recrystallisation from boiling water.

SALTS OF QUININE.

So useful is this alkaloid that there are nearly thirty salts of it; some of them in greater use than others. *Acetate*: Rather more soluble in water than sulphate. *Arseniate* and *Arsenite*: Recommended by some doctors as more powerfully ante-periodic than the other salts; contains 29 per cent. acid arsenious and 69.4 per cent. quinine. *Citrate*: Sparingly soluble in water, and has, therefore, little taste. In a number of prescriptions by a West-end physician, I saw quin. sulph. and acid citric frequently prescribed. One day I questioned him as to why, when he kindly told me that it was the most useful salt of quinine to administer to patients having a tendency to acidity. *Chlorate*. *Ferrocyanide*: said to be most efficacious. *Ferrosulphate*. *Fluoride*: Successful in relieving enlarged spleen, and in rickets. *Hydriodide*: Alterative tonic and ante-periodic in scrofulous affections of debilitated subjects. *Hydriodide Acid*: Soluble 1 in 20. *Katine*. *Lactate*: Soluble 1 in 10; used for hypodermic injections. *Hydrobromide*: Excess of hydrobromic acid given to lessen cinchonism sometimes caused by large doses; contains 76.6 per cent. *Hydrobromid Acid*: Well adapted for hypodermic injection, unirritating. (Off.) *Hydrochloride*: Richer in alkaloid than sulphate, 81.8 per cent.; antiseptic; powerful germicide; 1 in 800 stopping growth. (Off.) *Hydrochlor Acid*: Most soluble salt of quinine, 1 in 1; 72 per cent. alkaloid. *Hydrochloro Sulphas*: 74.3 per cent. alkaloid. *Hydrochloro-Carbamidum*: Urea quinine not rich in alkaloid. *Hypophosphite*. *Nitrate*. *Phosphate*: Associated with rickets and stomach affections, 76.2 per cent. *Salicylate*: Contains 70.1 per cent. alkaloid; useful in rheumatic gout. (Off.) *Sulphate*: This salt is the most used of any, contains 73.5 per cent. alkaloid; whenever quinine is ordered by the physician it is invariably understood to mean this salt. *Sulphate Acid*: Soluble 1 in 11 water, and contains 59.1 per cent. alkaloid only. *Sulpho-carbolate*: Really forms carbolate when the alkaloid is used in its manufacture. *Tannate*: Useful for intermittent neuralgia, only 20 per cent. alkaloid in it, almost tasteless, and given to children covered with chocolate. *Tartrate*: Used in India for hypodermic injection. *Valerianate*: Is of no special value, Dr. Hare; anti-spasmodic properties some continue to say it possesses; 73 per cent. alkaloid. Besides the numerous salts above-mentioned there is the *Citrate of Quinine and Iron*, a most useful salt; the *Citrate of Strychnia*, *Quinine and Iron*, *Uranium and Quinine Chloride*, and lamels of quinine, each containing ½ grain.

Herapath, of Bristol, showed in 1852 that quinine forms with sulphuric acid and iodine a peculiar compound, viz., iodo-sulphate of quinine; it possesses optical properties analogous to those of tourmaline, and it was called by Hardinger, *Herapathite*; it is obtained by dissolving quin. sulph. in proof spirit, containing 5 per cent. H₂SO₄, and adding an alcoholic solution of iodine, until a black precipitate is no longer formed. The precipitate is collected on a filter, washed with S.V.R., dissolved in boiling S.V.R., and allowed to crystallise. The tabular crystals are extremely insoluble, require 1,000 parts of boiling water for solution, are remarkable for their dichroism and polarising power; it is also used to separate quinine from its other alkaloids.

100 parts of Herapathite = 56.5 pts. pure quinine.

OLEATUM QUINA.

Made by dissolving 1 of alkaloid in 3 of oleic acid; is applied externally, and very easily absorbed, as the oleic acid is more readily absorbed by the skin than oils.

* Read at a meeting of the Chemists' Assistants' Association, on February 8, 1900. Concluded from page 231.

PHYSIOLOGICAL ACTION.

The action of quinine is so very interesting that I am sure if I go rather deeply into the subject I shall not be trespassing on your time.

When quinine is taken in large doses it causes *quinism*, or *cinchonism*, the symptoms of which are as follows:—Buzzing in the ears, deafness, vertigo, disorders of taste and smell, disturbances of vision in some cases, fulness in the head, and, after prolonged use, the teeth become loose and drop out. I was told by a naval surgeon of three cases in which this last symptom had occurred. A remarkable case is mentioned by Trousseau and Pidoux: A soldier took 48 grains of the sulphate for the cure of an asthma (spasmodic), which returned daily at a certain time. Four hours after taking it he experienced buzzing in the ears, diminished sensibility, giddiness, and violent vomiting. In another three hours' time he was blind and deaf, incapable of walking on account of the giddiness, and vomited bile copiously—in fact, he was in a state of intoxication. The effects subsided in the course of the night. Another case, recorded by Roberts, was that in which a woman, aged thirty-six years, took 5 drachms, and survived, after suffering from deep coma, shallow breathing, slow pulse, absolute deafness and blindness. The loss of sight lasted two weeks, but the retinal changes persisted for several months.

Quinine is fatal to the lowest forms of animal and vegetable life. Its poisonous effect on bacteria, even in so weak a solution as 1 in 20,000, was proved by Dr. Laveran in the treatment of malaria, which is caused, as we know, by a germ, this said germ being carried by the small mosquito, recently proved by Dr. Ronald Ross—in fact, according to the authority of Dr. Hare, it is the best remedy known as a prophylactic or cure of malarial fever.

An instance of taking quinine as a prophylactic is worthy of notice. At the attempt to cut the Isthmus of Panama as much as 200,000oz. of quinine were used annually in combating malarial fever. Many of the employés were in the habit of taking as a prophylactic *large* doses of the drug in rum or vermouth every morning before breakfast—a teaspoonful, in fact, was looked upon as a small dose. The consequence was that when the attack of fever did come the only medicine that might have proved effective to save life was powerless, as the system had become so tolerant of its action.

The effect of quinine on the blood corpuscles is of great interest. Even in full medicinal doses it arrests the diapedesis of the white corpuscles from the capillaries by a direct action on these cells; whilst, on the other hand, if the quinine be given in so small a dose that the proportion to the blood is 1 in 20,000 the white cells cease to migrate, but the ones in the surrounding tissues do not. Medicinal amounts increase the number of red corpuscles very materially in man. It is said that quinine prevents the oxygen-bearing powers of the corpuscles, but this probably does not occur from medicinal doses.

Brinz says that quinine diminishes gaseous interchange in the body, probably by decreasing the affinity of the hæmoglobin for oxygen.

The body temperature is lowered very little, if at all, in health, and in febrile states its influence is governed by the cause of fever. Thus, in malarial fevers, quinine is a very powerful antipyretic, by reason of its peculiar power over the cause. Perhaps some of the antipyretic influence is due to the fact that it tends to arrest oxidation. The reduction of temperature is not permanent, and varies from one to forty-eight hours in length.

Quinine is absorbed from the stomach, not from the intestines, and it is precipitated by the alkaline juices of the bowel. For this reason it should be given in cachets, capsules, or powders, *rather than in compressed tablets*. If pills are used only those which have been freshly prepared should be used.

Quinine escapes through the kidneys chiefly when passing from the body, although some of it is destroyed by oxidation in the liver and tissues. The process is by no means rapid as far as the entire

quantity is concerned, but in rare cases it may be found in the urine fifteen minutes after taking, though it does not disappear for about twenty-four hours. In the urine it is found as quinine and dihydroxyl quinine.

It acts as a depressant upon the tissue waste, and decreases the elimination of nitrogenous material.

Upon the stomach it acts as a tonic and stimulant, but if too frequently taken or in too large a dose it may irritate.

Moderate doses slightly constipate, and large doses may induce colicky pain. Death from an overdose is exceedingly rare. It acts upon the heart by paralysing it, with sudden fall of blood pressure, convulsions, and death. Bouchardat has recorded a case of an adult male who died from taking 45 to 65 grains, but whether the quinine was the cause it is doubtful to say. Tarnier and Budin assert that sufficient quinine may be eliminated by the milk to produce death in a nursing. It is doubtful, however.

The taste of quinine is very difficult to disguise. Dr. Lemanski, of Tunis, says that when taken in coffee, slightly fortified by cognac, or other alcoholic beverage, labourers in malarial regions by this means overcame the repugnance of the taste.

The hydrochloride of quinine is more used than formerly, first, as it is stronger in alkaloid than the sulphate, which is so frequently given; and secondly, it is less likely to upset the digestive organs on account of the hydrochloric acid in the gastric juice.

PRICE.

The price of quinine has fluctuated a good deal. In 1658 Sturm saw twenty doses of the febrifuge sent to Paris which cost sixty florins. About the end of the year 1874 quinine sulphate cost 9s. per oz. In 1881, owing to a temporary scarcity of bark, it reached the large sum of 16s. 6d. per oz., however, the lowest price paid for it was 8½d. per oz., the product of a German firm. At the present time it is rather more than double this price.

CONCLUSION.

Glancing over this brief survey of quinine, one cannot help but see what a grand remedy we have in our hands. Our praise cannot be too great for the explorers who went out and suffered terrible hardships to obtain seeds and plants in order to plant and cultivate it, so as to have a continual supply of this most useful drug constantly to hand, to save the lives of thousands who otherwise might perish. We here at home do not realise the full amount of good done by the cultivation of the tree producing this remedy. It is only in such fever-stricken districts as India, Africa, etc., that we can fully see Nature's wise provision in growing the remedy to cure the disease surrounding. The failures of quinine in curing fevers (chiefly malarial) is only about seven in a thousand. To Science we owe the idea of cultivation, and it seems extraordinary that our efforts should have been awarded with such success.

Let us hope we may always be able to help Nature with Science, for if such is the case, wherever we find the evil our utmost researches must be pursued to find the remedy.

PEPSIN TESTING.*

BY F. H. HOSEASON.

The B.P. test for pepsin is inadequate and of little value. Any trustworthy test must be based on its peptonising, not its solvent, power, although possibly there may be a ratio existent. From experiments made there is reason to believe that a satisfactory process may be arrived at by using syntonin as the basis. The following process is suggested tentatively:—Treatment of known weights of syntonin and pepsin in acid solution for one hour at 100° F., removal of the unaltered syntonin and proteoses by zinc sulphate, precipitation of the peptone by an excess of standard bromine-water, filtration and titration of the residual bromine.

* Abstract of a paper read before the Manchester Pharmaceutical Association, March 14, 1900.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Council and its Critics.

I wonder if Mr. J. A. Heaton knows exactly what he means when he charges the Council of the Pharmaceutical Society with "apathy, indifference and, perhaps, incapacity," or if he is serious when he suggests that there exists in that body a "clique" which clings to "old, antiquated, worm-eaten policies that have brought us to our present deplorable and almost desperate condition." The relevance of the closing words of the quotation is far from evident, and I for one object to be included amongst those who are in the parlous state described by Mr. Heaton. He is, of course, quite at liberty to speak for himself, but it is sad to learn that any registered person, and particularly a Lancashire chemist, should feel compelled to own that he is reduced to such a condition as stated. At the same time, I think it is the height of absurdity for him to endeavour to cast the blame for his own shortcomings on others whose business cares and worries are probably as serious as his own. What in the world does this supporter of the inventor of pharmaceutical panaceas fancy the Council can do, or has failed to do? It would be hard for him or any other similar critic to say, and I am not at all surprised to find that persons who talk and write in such an absurd fashion invariably confine themselves to vague generalities and never come to the point. If the Council, in the past, has displayed "apathy, indifference and, perhaps, incapacity," it has been because it reflected, perhaps too faithfully, the attitude of those it represented. But, as a matter of fact, the Council has always been far better than the mass of which it might not unreasonably be supposed to be a fair sample. A large proportion of the members of the Society and the majority of the registered chemists of Great Britain have undoubtedly been apathetic, indifferent, and incapable of caring for their own best interests; the Council, however, has always consistently represented those to whom all real progress in pharmacy has been due. It is useless for any representative body to attempt to force the pace if the individuals it represents fail to second its efforts and assist it in maintaining things on a proper footing. And it is no part of the duty of the Council to attempt to bring about the millennium now dreamt about by so many who have utterly neglected their own interests in the past.

The Society or the Individual.

The primary duty of the Council of the Pharmaceutical Society, as I conceive it, is to administer the Pharmacy Acts, not to assist persons registered under those Acts to earn a shilling by an expenditure of sixpennyworth of labour. It was never the intention of the Legislature to make the Society a close corporation, with power to restrict the sale of all drugs, proprietary articles, etc., to its own members. Nor was the institution of a pharmaceutical qualification suggested with the idea of enabling dealers in such goods to make a living more easily than if no such qualification existed. But reading such nonsense as Mr. Heaton writes, about "old, antiquated, worm-eaten policies," one might imagine that he, at any rate, held the view that the Pharmacy Acts were passed for the sole benefit of chemists and druggists. If by a "clique" he refers to the majority of the Council which has ever felt itself bound to make the protection of the public safety its main care, I imagine he is not far wrong in assuming its existence, and I hope such a "clique" will long continue to exist. Apart from that, however, why blame anybody or anything, in connection with the administration of the Pharmacy Acts or of the Pharmaceutical Society's affairs, because a registered person is to be found here and there who is so lacking in business capacity that he is unable to conduct his affairs as successfully as he or his friends could wish? Passing the Minor examination and subscribing to the Society do not justify a man in the hope that he has secured a sure means of

livelihood, or, for the matter of that, any means of livelihood at all. Other things being equal, he has thus attained to a more advantageous position than any mere tradesman can aspire to. But, in itself, the chemist's professional qualification is not sufficient to compensate for lack of business capacity, and he who chooses to depend upon that qualification alone, or to any undue extent, need not be surprised that he goes to the wall. The puzzle to me is that such men—and there are a few in our ranks—manage to put off the evil day so long. Perhaps it is because ill experience gradually knocks a little common sense into their heads, and they learn, more or less imperfectly, that a man must work if he wishes to live, and to work hard if he desires to live in comfort.

The Coming Contest.

Apparently, we are actually to have a contest in connection with the filling of the seats soon to be vacated at the Council table, and it is far from improbable that there may even be two candidates for each seat. One of the main features of the election is likely to be the curious preponderance of would-be representatives from Lancashire. One Lancashire chemist remains on the Council, another is expected to stand for re-election, and three new candidates who hail from the County Palatine are understood to intend to go to the poll. But fancy a Council with five Lancashire representatives! What will the advocates of territorial representation say upon that point and how will the doctrine of proportional representation work out, as taught by those who seem to think it is a sinful thing for a London chemist to be a member of Council? But other quaint surprises are also promised us, and I can imagine that the fingers of many old Parliamentary hands in the world of pharmacy are itching to pass the fatal line through some names which have been suggested. The list of candidates will be practically closed by the time the present issue of the *P. J.* is in the hands of most of its readers, and a week hence we shall know what old and tried representatives, panacea-mongers, and ordinary pharmacists are disposed to try their luck in the pharmaceutical ballot-box. Fourteen or more may be called, but only seven can be chosen, and I would impress upon all my readers the necessity of weighing carefully the claims of those whose names appear in the voting paper. Length of service alone is, of course, no sufficient reason for securing re-election; on the other hand, ignorance of the work to be done may conceivably suffice to neutralise the charm of novelty and bring about the rejection of some who have never yet served upon the Council. Scotland and Lancashire stand to lose one seat each, but hope to win more; London has two seats at stake, and the Society would probably benefit if it won four. For whatever may be the respective merits or demerits of London and provincial pharmacists, it must fall to London members—whether few in number or many—to do the bulk of the work that requires to be done by the Council, and in proportion as London is under-represented the Society's affairs risk receiving insufficient attention.

The Companies Bill.

From private information to hand, I gather that Clause 2 of the Companies Bill, 1900, may be regarded as virtually defunct. Mr. Ritchie has confided to friends in the House of Commons that he has been so overwhelmed with suggestions of opposition to the Clause that he has decided to drop it, and the same course will almost certainly be adopted with Clause 3, which refers to medical men and dentists. So far as our own pet aversion is concerned, then, we shall need only to watch lest the Lord Chancellor should reintroduce it if the Bill reaches the House of Lords this Session. The way should, therefore, be clear for the drafting of a Pharmacy Bill, and we may look forward with confidence to the expression of an even greater difference of opinion in respect of such a measure than with regard to Clause 2 of the Companies Bill. That blessed word "unanimity" will be spoken and written more frequently than ever, and the need of the fact it represents will, in all proba-

bility, be more keenly realised than even during the past twelve months. Sooner or later, however, the Government may be expected to take up in earnest the question of the regulation of pharmacy in general, and of the sale and dispensing of poisons in particular. Public needs cannot be ignored permanently, and the fact that the registered chemists of Great Britain cannot agree among themselves with regard to the reforms necessary is more likely to spur the Government on than not. It is necessary to bear in mind, in this connection, that it is really the permanent officials in Government departments who have to be reckoned with in such a matter as this. However the fortunes of political parties may fluctuate, and whatever individuals may constitute the Government of the day, the permanent officials remain unforgetful of what the safety of the public seems to require, and their views are impressed upon successive Ministers as though by a resistless Fate. We are faced, therefore, with the necessity of convincing certain Government officials that our position as professional men requires reconsideration. But, to that end, we must set our house in order. The adoption of poison regulations was one unduly deferred step in the right direction: several others suggest themselves, and the sooner they are taken the more likely are we to be able to control our own destiny to any considerable extent.

PHARMACEUTICAL SOCIETY.

SCHOOL OF PHARMACY—PRIZE EXAMINATION.

SESSION 1899-1900.

PRACTICAL CHEMISTRY (ADVANCED COURSE).

Tuesday, March 20, 1900, from 10 till 1, and 2 till 5.

1. Determine the impurity in the syrup in bottle A.
2. Analyse the mixture of two substances contained in box B.
3. Ascertain what is mixed with the chalk in box C, and determine quantitatively the amount of the substance present.

MATERIA MEDICA (ADVANCED COURSE).

Wednesday, March 21, 1900, from 2 till 5.

1. Enumerate the commercial varieties of rhubarb with which you are acquainted. Point out their diagnostic characters. Compare the constituents of rhubarb with those of allied drugs.

2. State what you know of the constituents of Balsam of Tolu. Discuss the official tests for the balsam.

3. Point out the difference between the Brazilian and Carthagena ipecacuanha—

- (a) in appearance,
- (b) in constituents,
- (c) in physiological action.

Give a process for the assay of the drug, stating the object of each step.

4. It is generally admitted that the official descriptions of certain of the resins, gum resins, etc., are defective. Upon what principles would you base their revision? Illustrate your suggestions by the following drugs:—

Myrrh, Asafetida, Araroba, Kino, Benzoin.

PRACTICAL BOTANY (ADVANCED COURSE).

Thursday, March 22, 1900, from 10 till 1.

[Four questions only to be attempted.]

1. What do you understand by *symbiosis*? Give a short account of two instances of this relationship, selecting one from the higher and the other from the lower plants.

2. Describe the structure of the sporogonium of a moss. In what respects does it resemble, and in what does it differ from, that of a liverwort?

3. Describe two instances in which plants show a power of appreciation of contact with a foreign body. Point out in each case the response made and its purpose.

4. Compare the gametophyte of a Gymnosperm with that of an Angiosperm. What is the nature of the so-called *endosperm* in both?

5. By means of a schedule indicate the differences between the following Natural Orders and the marks by which each can be recognised:—Ranunculaceae, Cruciferae, Solanaceae, Gentianaceae, Malvaceae, Leguminosae, Compositae, Umbelliferae, Polygonaceae, Geraniaceae, Rosaceae, Salicaceae.

PRACTICAL BOTANY (ADVANCED COURSE).

Thursday, March 22, 1900, from 2 till 5.

1. Make such preparations as you think necessary to display the structure of the secondary wood of *Pinus*. Stain each section and mount it in either glycerin or Canada balsam.

Leave with your preparations a written description of each, illustrated by drawings of what you consider its important features.

2. Refer the flowers A, B, C, D to their Natural Orders, stating your reasons in each case.

3. Identify and briefly describe E, F, G.

CHEMISTRY AND PHYSICS (ADVANCED COURSE).

Friday, March 23, 1900, from 10 till 1.

[Only three chemical and two physical questions are to be attempted.]

1. Describe the action of hydrochloric acid, nitric acid, and sulphuric acid on alcohol.

2. Why is arsenic classed among the non-metallic elements?

3. From what sources, and how, is bismuth extracted? Describe two of its more important compounds.

4. What is the explanation given that accounts for four different isomeric modifications of tartaric acid?

5. How would you prepare from ferrocyanide of potassium:—(1) A dilute solution of hydrocyanic acid, (2) anhydrous hydrocyanic acid, (3) urea?

6. Give an account of the changes that take place in a bar of metal when one end of it is placed in contact with a source of heat, and explain clearly the influence of different constants of the metal on the phenomena observed.

7. Define potential. Show by the help of your definition how to calculate the heat generated by the passage of a current of known strength along a wire of known resistance.

8. Describe the polarimeter. How might the relative proportions of cane sugar and grape sugar in a solution be determined by means of it?

ROYAL INSTITUTION.

A lecture was given on Friday, March 9, by Professor FRANK CLOWES, D.Sc., on

Bacteria and Sewage.

He commenced by explaining that the bacteria associated with sewage are rod-like bacilli of various kinds, averaging about a twenty-thousandth of an inch in diameter. They rapidly multiply by fission, one organism increasing to sixteen and a half million in a day, and forty-seven thousand million in two days, while it would take fifty-one figures to express the number at the end of a week. When the conditions are unfavourable spores are produced; these are capable of resisting steam heat as well as extreme cold, as lately shown by Professor Dewar and others; but, curiously enough, it has been shown by Marshall Ward that they cannot resist sunlight.

The dejecta of man and animals swarm with bacteria, whose duty it is to split up the somewhat complicated material into more elementary substances—*e.g.*, hydrogen, nitrogen, ammonia, water and carbon dioxide; the ammonia is further converted into nitrites and nitrates. In this way valuable plant foods are formed, and this explains the value of putting dejecta into earth, following the Mosaic law and the custom in military camps. Certain bacteria have the power of converting solid matter into liquid, and these are termed liquefying bacteria. In order to show the extent to which bacteria are present in liquid sewage Dr. Houston has made a careful investigation, and found six million in one cubic centimetre in summer and three and a half million in the early part of the year.

Among the most important species are *Bacillus mesentericus*, *B. coli communis*, the sewage *Protococcus*, *B. subtilis*, and *B. cuneus*. Many act not directly, but by a secretion which they produce.

Some require oxygen, the so-called aërobic bacilli; others live best in the absence of oxygen, and are termed anaërobic; while a third class, the facultative bacilli, can live under either condition. Several different species may act together or counteract each other, exhibiting either symbiosis or antibiosis. A third group of organisms is termed metabiotic, because different species in the group carry on the work to a certain stage and leave it to be carried on or completed by another species.

As a rule, there is a deficiency of the liquefying bacteria in sewage. Some experiments were recently made to rectify this by putting in a quantity of the culture of the organism. The result was not successful, probably because, as there is every reason to believe, a large number of organisms living together attain an equilibrium. The addition of an excess of one species upsets this equilibrium.

A method of treating raw sewage was devised by the State Board of Health in Massachusetts, which has led to splendid results. It was found that solid matter, stone, wood, coal, coke, or anything offering a surface, exerts a purifying action on sewage. It is not quite known how the action is set up, but it is thought that a solid body may offer a surface of collection for the enzymes produced by the organisms in the sewage. It is certain that the solid bodies take some little time to mature, or, as it is technically termed, "become primed." In order to give this method a trial, Mr. Dibdin, late chemical adviser to the London County Council, had prepared, in 1893, a bed four feet deep and one acre in area. Into this were put lumps of coke in pieces of the size of a walnut, sifted from finer particles. The sewage was allowed to run into the tank until the level of the liquid reached the upper surface of the coke-bed; after it had remained in contact with the bacteria on the coke surface for about three hours, the liquid, now known as "sewage effluent," was slowly run off. After an interval of about seven hours, to allow of aëration, the processes of emptying and filling the coke-bed were repeated with a fresh portion of sewage. In this way the coke-bed was usually filled twice in every twenty-four hours.

In dealing with the sewage of the metropolis it seems best to roughly screen raw sewage through coarse gratings, and then allow it to undergo a somewhat rapid process of sedimentation before passing it into the coke-beds. As might be expected, raw sewage is mixed with much inorganic matter. The sand, and grit, and finer mud, arising mainly from the wear of road surfaces, would gradually become deposited upon the coke surfaces and reduce the capacity of the coke-bed. Besides hair, fibrous matter and woody fibres derived from the wear of wooden street pavements, and particles of chaff and straw, mainly derived from the dejecta of horses employed in the street traffic, are also deposited upon the coke-surfaces, and gradually choke the coke-bed. These various substances, which consist mainly of cellulose, are apparently only acted upon by bacteria with extreme slowness under the above conditions. They arrive, however, in a water-logged condition, and rapidly settle down from the sewage if its rate of flow is reduced.

As the purifying action of the coke-bed depends upon the introduction of bacteria from the sewage, so the maintenance of the purifying action is secured by the continuous presence of these organisms or their enzymes upon the coke surfaces, and by the frequently renewed contact of these surfaces with oxygen. The aëration of even the lowest portions of a deep coke-bed seems to be satisfactory in the above method of working, since the air which enters the interstices of the coke between two fillings with sewage usually consists to the extent of seventy-five per cent. of oxygen.

The raw sewage, screened and partially deprived of its larger particles by sedimentation, loses practically the whole of its suspended matter by remaining for two or three hours in a coke-bed charged with bacteria. The suspended particles of faecal matter undergo liquefaction by the bacteria, and do not collect on the surface of the coke. The bed cannot be termed a filter; the process is a chemical one, set up by the agency of liquefying bacteria, and is in no wise a mechanical filtration.

The sewage effluent from the coke-bed is entirely free from offensive odour, and remains odourless even after it has been kept for a month. It is clear except during heavy rain, when a turbidity is produced by fine mud particles. Many pond and river fish have been kept in this constantly renewed effluent for a month, and were found to be perfectly healthy at the end of that period. The chemical character of this effluent may be briefly indicated by stating that on an average 51.3 per cent. of the dissolved matter of the original sewage, which is oxidisable by permanganate, has been removed by the bacteria, and that the portion so removed is evidently the matter which would rapidly become offensive, and would rapidly lead to de-aëration of the river water if it were allowed to pass into the river in the raw state. This percentage was obtained in beds varying from four to six feet in depth. A similar bed, thirteen feet deep, has proved more efficient, and has for some time given a purification of 86 per cent. A repetition of the treatment of the effluent in a second similar coke-bed has produced an additional purification of 19.3 per cent. It should be noted that the above purification is reckoned on the dissolved impurity of the sewage; the previously removed suspended solid matter is not taken into account.

The bacteriological condition of the effluent corresponds in the main with that of the raw sewage. The total number of bacteria undergoes some reduction in the coke-beds, but the different kinds of bacteria present in the raw sewage are still represented in the effluent. The introduction of such a sewage effluent into the lower Thames appears to be unobjectionable. The river water at this part is uniformly muddy, it is always brackish, and frequently salt to taste, owing to the presence of tidal sea-water. It is not, therefore, capable of being used for drinking purposes. The effluent will certainly cause no deposit on the river-bed, and will ordinarily tend to render the muddy river water more clear by mixing with it. No offensive smell can be emitted by the effluent as it is discharged, and the bacteria which it contains will slowly and inoffensively remove the remaining dissolved organic matter from the effluent after it has been introduced into the river. The effluent will be suitable for the maintenance of healthy fish life in the river.

The second of a series of lectures was given by the Right Hon. Lord RAYLEIGH, M.A., D.C.L., LL.D., F.R.S., on Saturday, March 17, on the subject of

The Polarisation of Light.

He said: Young was one of the first to explain many of the simple phenomena of light—*e.g.*, he showed that transverse vibrations exist in light while passing through solid bodies. The behaviour of the ether in respect of the passage of light through space has been a difficult problem. The ether is analogous to a fluid with regard to the projecting of a body through space, but it behaves as a solid with regard to transverse vibrations of light. The theory of the transverse vibration of light once accepted explains the phenomenon of polarisation.

All bodies which have double refracting powers are capable of polarising light. A crystal capable of so polarising light—*e.g.*, A. Nicol's prism behaves as if it had two refractive indices, and the velocity of a given ray of light is different in different parts of the crystal, which is not homogeneous. Any homogeneous medium would not exhibit this property.

To explain how the velocity of a ray of light in a crystal may vary according to the direction of its vibrations, the following pendulum experiment is useful:—Tie two cords of equal length to a weight and attach the free ends to the extremities of a horizontal rod of such a length that it makes an equilateral triangle with the cords. If the weight be moved in a direction parallel to the rod and then released the motion produced is slow; if, however, the weight be moved vertically, at right angles to the rod, the resulting movement is rapid.

The Nicol's prism is much used in polarising light. It has the property of transmitting rays of light that pass in one direction and suppressing all other rays. A second Nicol arranged at right angles to the first cuts off the ray that passes through the first prism. It consists of a piece of Iceland spar cut in two and joined together by a layer of Canada balsam, which serves to reflect the light that would otherwise pass back again through the prism. An analogy has been drawn between the action of a Nicol's prism and the total reflection of a ray of light in water, but the circumstances are so different that the analogy is not a good one.

In the case of reflection we must look upon the change of direction as being quite sudden, because reflection would be appreciably diminished if the change were gradual. To illustrate the action of a Nicol's prism a beaker of liquid paraffin, containing a suspended glass vessel in an inverted position, is placed in the path of a ray of light. The ray behaves practically the same as it would on passing through a Nicol's prism. If now the suspended vessel be likewise filled with liquid paraffin, and placed within the other in its ordinary position, the ray passes straight through, and is not in any way altered. In the production of colour by a mica plate there is no absorption of light, but certain rays are diverted. A double-image prism may be employed to show this, by causing the two colours produced to overlap and form white light. When a colour is produced by a plate of mica the complementary colour always occurs at the same time.

Ordinary glass, when strained, takes on double refracting power. This fact may be beautifully illustrated by passing light through two Nicol's prisms arranged at right angles. If a piece of strained glass be placed in the path of the ray it will then restore the otherwise obscured light.

The third lecture of the series was given by Lord RAYLEIGH on Saturday, March 24, when the lecturer began with an elementary explanation of the fact that the interposition of a doubly-refracting body between two Nicol prisms arranged in the crossed position occasioned a revival of the light which normally could not pass. He then gave some further illustrations of the phenomenon, showing the effect with a number of natural crystals—*e.g.*, of oxalic, tartaric, and benzoic acids, and with organic substances such as horn. A jelly would exhibit the same property of double refraction when a plunger was forced into it so as to set up strains in its substance, and so also would a viscous material like Canada balsam when it was in motion. Leaving these phenomena, in which an approximately parallel beam of light had been employed, and which depended on the fact that the substances used had different thicknesses in different parts, Lord Rayleigh proceeded to discuss the contrasted class of convergent light phenomena. Here the light was concentrated on one point of the object, and the effects produced were due not to the varying thickness of the plates, but to the varying degrees of retardation suffered by the rays in traversing the object in different directions. Several instances were shown, both with uniaxial and biaxial crystals, the former giving one system of symmetrical rings of light, and the second two such systems. Lord Rayleigh finally discussed the phenomenon of polarisation by reflection. When light fell on a reflecting surface like glass or water at the polarising angle, such part of it as was reflected showed the characteristics of polarisation. With a source of light like a candle, it was not difficult to perform the experiment, but when the sun's reflection from water at the proper angle was observed through a Nicol prism, sharpness in the dark band which was seen to traverse the image of the sun could not be obtained. It occurred to him that this lack of sharpness might be due to contamination of the water, and that a perfectly clean surface would act more nearly as theory required. On putting this idea to a practical test he found it was correct, and that the slightest trace of grease on the water was sufficient to ruin the sharpness and beauty of the images.

A lecture was given on Friday, March 23, by Sir ANDREW NOBLE on

Some Modern Explosives.

For many centuries gunpowder was the only explosive in general use. In the present century, owing to the researches of Abel, Dewar, the lecturer and others, many new and more powerful explosives have been invented. Gunpowder itself is not a definite chemical compound like guncotton and lyddite, but a mixture in a state of unstable equilibrium. On explosion six-tenths of its weight remains in the solid form, giving rise to the well-known dense clouds of smoke.

Abel and Dewar have given to the world cordite, an explosive that has come into very wide use. It is made in many various forms, usually in fine threads woven into a cord. Though originally intended for small arms, cordite has been largely employed of late in charging heavy guns. The absence of smoke renders its use very advantageous in warfare. When fired in a gun the time taken to consume the charge is only a small fraction of a second. Many interesting experiments have been devised to show the properties of cordite. Thus it burns in air without explosion, but it will not burn in the absence of oxygen. This has been well shown by Abel, by trying to burn cordite in an exhausted space under a bell-jar. Though the platinum wires with which it is brought into contact became red-hot, yet the cordite refuses to burn in the absence of oxygen. When placed in a confined space the combustion is attended by explosive force. This is seen on wrapping round a charge of cordite with stiff paper, and igniting it. The result is a fizzle such as is heard with many fireworks. Cordite may be burned under water, because the heat developed during combustion is so excessive as to supply the atmosphere necessary for combustion to continue.

Ballistite, a mixture of nitro-cellulose and nitroglycerin, is now used as an explosive in many countries—*e.g.*, Italy and Norway. It is made in various forms, being most commonly found in square slabs, cubes or cylindrical tubes. Another modern explosive is nitro-cellulose; it has a serious defect in that when a certain pressure is attained this substance has the remarkable property of still further increasing that pressure. As is well known, picric acid is largely used nowadays in the production of lyddite shell. It is fusible and difficult to ignite, burns slowly, and is not free from smoke. The green smoke that has been seen and referred to by some war correspondents now at the front is probably due to imperfect methods of preparation.

During the early stages of the present war it was the fashion in certain uninformed quarters to attribute disasters to the inefficiency of the British artillery. It was argued that the troops should be supplied with guns of a high muzzle velocity. Those who understand the subject, however, know well that velocity is not the only point to be considered in choosing artillery. The energy imparted to the missile is of more importance than mere velocity. It is better to fire off heavy missiles at a lower velocity, because the momentum of a heavy body is greater than that of a lighter one moving at a higher speed. Besides, with projectiles of low velocity the resistance of the atmospheric air is less than is the case with light projectiles. The War Office officials know well that guns of greater power are at their command, if needed. The quality of British guns has not been the cause of certain reverses that met the British arms. Whether there were enough guns in South Africa, or whether the guns there were in the right place at the right moment, is quite another matter. Certainly it may be said with truth that the British field artillery is second to none anywhere.

Of the many explosives now in use cordite is inferior to none in ballistic power. In considering the relative explosive force of one explosive with another, it should be remembered that the method of igniting has much to do with the effect, as seen in the case of cordite. To take another example, a slab of guncotton might be burnt in air without any other unpleasant effect than that pro-

duced by the smoke. If, however, a few grains of fulminate of mercury were struck smartly in its neighbourhood a terrific explosion would be the result.

The principal evil to which guns are liable is erosion. Cordite, especially, gives trouble in this way, but it is not of such moment in the case of small arms as it is with big guns.

POLITICAL GOSSIP.

THE SELECT COMMITTEE on Boiler Inspection and Certification, to which allusion was made in these columns last week (*ante*, p. 323), was appointed by the House of Commons during Monday's sitting. Mr. Anstruther (St. Andrews), who is one of the Treasury Lords, officiating in place of Sir W. Walrond, who has been confined to his room for some little time past. The Committee will consist of fifteen persons—five to form a quorum, and will have the usual powers of a Select Committee to take evidence and examine witnesses. As a consequence of this appointment all the various Boiler Bills have been withdrawn, except that standing in the name of Mr. J. Samuel.

THE MUNICIPAL TRADING COMMITTEE has not yet been appointed, partly owing to the illness of the chief Ministerial Whip, but also on account of the unpropitious condition of parliamentary business. Questions as to when the appointment might be expected to take place have been asked in both Houses during the week, and have elicited tributes from the Premier and Mr. Balfour to the importance of the subject. There appears, however, to be some opposition to the inquiry, Mr. Burns with characteristic directness having epigrammatically stated that the whole fuss was created and fomented by "a few company promoters who meet at the Society of Arts." Mr. Galloway (S.W. Manchester), too, promised that the motion to appoint the Committee would give rise to considerable discussion, and that if the Government were so ill-advised as to set the inquiry going, definite notice should be given of intention to take up the motion. That definite notice has now been given, and Thursday of this week fixed for the debate, Ministers being persuaded that the long delay has already occasioned much inconvenience, and that it is highly desirable the Committee should be set to work before Easter.

FORECASTS of coming business have been pretty freely given of late by the Leader of the House, but in none of them has he given any encouragement for the immediate progress of the Companies Bill. It is an open secret that the Government does not propose to proceed with anything but what is absolutely necessary, and is more concerned about the general election than attacks on the rights and privileges of professional men by corporate entities. The Law and Parliamentary Committee of the Council need have no apprehension—and probably has none—that the second reading of the Companies Bill will be taken before Easter. It is tabled for Monday next, but it is stated that only a few small non-controversial measures will be dealt with before the recess. The Boer revolt seems a wholly irrelevant thing in connection with company legislation, but, nevertheless, it has a distinct bearing upon the fortune of the Bill; for if peace should be in sight by the time the financial business of the House is concluded—*i.e.*, by the end of April—the Government would, in all probability, throw business to the winds and solicit the verdict of the country by a general appeal to the constituencies. Whatever fate is reserved for the Bill, Mr. Ritchie has made it tolerably well known in the House that the Government will drop Clauses 2 and 3.

A SWEET PETITION comes from Bolton for alteration of the Companies Bill. It is modestly stated to be the humble petition of the inhabitants of Bolton, and is signed by no less than eleven persons—actually eight more than the signatories of that historic petition of the people of England associated with the clothing trade of Tooley Street. The petitioners view with grave concern the

proposal contained in Clause 3 of the Bill, inasmuch as it would take from them the right to continue the business they are already carrying on in a legitimate way. Moreover, these elect of Bolton state that the public health *and their means of subsistence* (the italics are ours) will be endangered if Clause 3 should become law; therefore, they confidently pray that, according to custom, they may be provided for by being debarred the use of titles only and not the right to practise. Mr. Shepherd Cross, the member for Bolton, presented this very interesting specimen of appeal to the House, and the Committee on Public Petitions has felt impelled to print it in full in its report. The wail of the unqualified would seem to indicate the presage of impending extinction. Perhaps the qualified chemists of Bolton might think it desirable to approach Mr. S. Cross with a second petition on the subject, if only to impress him with the fact that there are other inhabitants of that town who have a prior and much higher claim to consideration.

THE MIDWIVES BILL has been hastily pushed through Grand Committee, which has reported the Bill with a few amendments, not of a very material character. These amendments are down for consideration on Monday, and if the opposition is not of any graver nature than that displayed in Committee, the chances of further progress are particularly favourable. Simultaneously, the House has to consider the motion "that it is expedient to authorise the payment, out of money to be provided by Parliament, of such expenses as the Treasury may certify to have been necessarily incurred by the General Medical Council under any Act of the present Session to secure the better training of midwives and to regulate their practice."

LETTERS TO THE EDITOR.

The Society's Library.

With reference to the change of the time for closing the Library I should like, as a student of the School of Pharmacy, to say that I think the introduction of the 6 o'clock closing every evening places students at some disadvantage, as well as members. The short time available during the day for consulting works of reference and the fact that the best of those are quite properly not allowed to be taken out of the Library, lessens very much, I consider, the practical value of the Library to "Square" students. If the former time of closing could be retained for about two nights in the week I think the opportunity of referring to standard works would be appreciated by students.

London, March 23, 1900.

J. R. JEWSON.

The feeling is very general amongst London members of the Pharmaceutical Society that the facilities for using the Library are insufficient. No encouragement is at present offered to the enquiring mind engaged in business. It is not always easy to select a book that shall certainly contain the information sought; a personal attendance becomes a necessity. I think the difficulty of meeting the wants of both students and business members would be met by the Librarian's attendance each Tuesday evening till 10 p.m.

London, March 26, 1900.

F. W. GAMBLE.

I wish to express my regret that, to many members employed like myself in the public service and in the wholesale trade, who are not free until after 6 p.m., the Library is inaccessible. The great increase in the number of members since the alterations in the conditions of membership is, I think, a sufficient reason for at least trying the experiment of keeping the Library open later, and would, I am sure, be an inducement to many to become members if they could have the use of the Library from 6 till 10 p.m. The time for closing the Library with the new influx of members was not well-chosen, and I believe that an extension of the hours during which it is open will be much appreciated. At the meetings of the Public Dispensers' Association members have expressed their regret at not being able to use the Library after 6 p.m., and it

has been suggested that it would be an excellent place to meet to discuss pharmaceutical matters, without having to adjourn to the Museum Tavern? A visit to the library of the Patent Office in Chancery Lane, the Polytechnic in Regent Street, the Northampton Institute, and the several public libraries will convince any one who is sceptical about the matter how much they are appreciated, and now that the Library at the Square is lit up by electricity, reading there has become a pleasure. An assistant librarian could be employed during the evening to relieve our dear and worthy friend Mr. Knapman, who during the twenty-seven years I have been using the Library I have always found most willing to help in looking up a subject, and regret to think that any one would be guilty of belying him in an anonymous paragraph in a trade journal. I hope the subject will be brought before the Council at an early date.

St. Pancras, N.W., March 27, 1900.

W. E. MILLER.

Exchange of Botanical Specimens.

I should be glad to communicate with any amateur collector of botanical specimens in the North of England, Scotland, or Wales with a view to exchanging duplicate specimens. I find, after putting my herbarium in order, that I have a number of duplicates to spare, collected during the past ten years mainly in the counties of Essex, Sussex, Surrey, Kent, and Herts.

W. L. MARTIN.

381, Mare Street, Hackney, N.E., March 26, 1900.

The Volumetric Determination of Red Lead.

My paper on "Red Lead," published last week, contains a printer's error, which, if not corrected, might probably confuse an operator. In the description of the method of determining the total lead by alkalimetric means (see page 312), N/5 has been printed instead of 5N, or an acid five times the normal strength, 20 C.c. of which is, of course, equal to 100 C.c. normal acid. 20 C.c. of N/5 acid contains only 0.252 gramme nitric acid, a totally insufficient quantity, while the same volume of 5N contains 6.3 grammes.

Peterhead, March 26, 1900.

J. F. TOCHER.

. There was no printer's error, and the foregoing explanation would not have been required but for the fact that the typewritten copy of Mr. Tocher's paper had been carefully edited before being despatched from Edinburgh and "5N" in two places altered to "N/5."—[ED. P. J.]

Local Secretaries.

I note a grumble in the Journal about alleged irregular action by local secretaries. It is just another of the many signs that members of the Society are dissatisfied by the ways of the Council. Most members are desirous of greater activity by the men who are elected to the Council of the Society, and the activity is to be persistent, and not spasmodic, as in the past. The only remedy I can suggest is that the local secretaries should "swear." I don't mean use profane language, because the use of such may be rife enough without the consent of the Council of the Society.

March 26, 1900.

A LOCAL SECRETARY (25/38).

Glaucium Luteum.

The Sussex littoral would seem to have been omitted from Mr. Wickffe Peck's itinerary when he was "peregrinating over England and Wales." The yellow sea poppy is plentiful enough at several spots on the coast between Brighton and Littlehampton, especially in localities far removed from human habitation. Old residents can remember it on Brighton beach, but *Glaucium luteum* does not now show its handsome head nearer than Shoreham, four or five miles distant.

There, bright as gems of fairy lore,
Or Eastern poet's dream,
The hornéd poppies gild the shore
With sunny gleam.

Gerard speaks of finding them "neere unto Rye, in Kent, in the ilees of Shepey and Thanet, at Lee in Essex, at Harwich, at Whitstable, and many other places amongst the English coast." This old writer has some quaint references to the medicinal uses of the plant. "The root boiled in water unto the consumption of the one halfe, and drunke, provoketh urine, and openeth the stopping of the liver. The seed taken in the quantitie of a spoonfull looseth the belly gently. The juice mixed with honie and meale mundifieth o'd rotten and filthie ulcers. The leaves and flowres put into unguents or salves appropriate for greene woundes, digest them, that is, bring them to white matter with perfect guitture or sanies." Modern herbal authorities seem to have allowed the drug to lapse into desuetude. It is not even mentioned in handbooks to herbal medicine or quoted in herbalists' price-lists. Mrs. Pratt, in her 'Flowering Plants of Great Britain,' speaks of the plant as highly acid and dangerous, and says the root is reputed to cause madness if eaten.

Brighton, March 27, 1900.

C. S. ASHTON.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

AUSTRALASIAN CERTIFICATES (A. R.—40/18).—You should write to the Secretaries of the Pharmacy Boards of Victoria (Melbourne), New South Wales (Sydney), New Zealand (Auckland), Queensland (Brisbane), and South Australia (Adelaide), for the information you require. There are Colleges of Pharmacy at Melbourne and Brisbane.

RÖNTGEN RAY APPARATUS (J. H. B.—40/20).—A useful and practical book on the subject is Bottone's 'Radiography and the X-Rays in Theory and Practice.' (Whittaker and Co., 3s.)

SYRUP OF GLYCEROPHOSPHATES (W. J.—40/21).—The formula given in the 'Extra Pharmacopœia' is the original one, the "30 drops" of tincture being regarded as "2 grammes" for the sake of convenience. See *P. J.*, June 22, 1895, p. 1,191, and March 25, 1899, p. 294. There have been several modified formulæ published, and the one you refer to, as you will see, specifies twice as much iron glycerophosphate as the original.

STABLE BLOOD MIXTURE (J. C.—40/17).—Your recipe is not likely to be very stable; aqueous solutions of ammonio-citrate of iron do not keep well. We should recommend you to substitute a small dose of liquor ferri perchlor. for the ferri et ammon. cit., to add a little glycerin, and to use aqua chloroformi as the diluent.

DISPENSING DIFFICULTY (L. A. R.—40/23).—The use of acid is undesirable in such a case and should hardly be necessary, as the salt is so soluble in water. Dissolve it after effecting solution of the other ingredients, heating if necessary to make a clear solution, and send out with a "Shake the bottle" label.

COUGH MIXTURE (H. J. P.—40/22).—We have no such formula and no information regarding the preparation you mention except that it is stated to contain tolu, aniseed and cloves.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MARCH 31, 1900.

THE BUSINESS OF A CHEMIST AND DRUGGIST AND PHARMACY.

MUCH of the diversity of opinion prevailing among registered chemists as to the line of action to be taken in reference to the proposals contained in Clause 2 of the Companies Bill may be attributed to differences as to the definition of "pharmacy" and of the business of a chemist and druggist. The existence of such differences has been very plainly manifested in recent utterances on the subject. Thus, for instance, the reference made to the business of a chemist and druggist by Mr. HILLS, in moving his amendment at the last Council meeting was probably intended to apply to the ordinary interpretation of the term. But in reply to a question put by the Vice-President, he said he referred to the definition given in the Pharmacy Act, and the only definition there given is in Section 3, where the business of a chemist and druggist is defined as "the keeping of open shop for the compounding of the prescriptions of duly qualified medical practitioners." Chemists and druggists within the meaning of the Act, are also there defined as "persons who at any time before the passing of this Act have carried on in Great Britain" that business, while the persons who were to be admitted to registration as chemists and druggists under the Act, on passing a modified examination, are described in Section 4 as those who "had been for a period of not less than three years actually engaged and employed" as assistants "in the dispensing and compounding of prescriptions." The nature of the business there indicated is distinctly the practice of pharmacy in its more professional aspect rather than the business of a chemist and druggist in the narrower sense of "keeping open shop for the retailing, dispensing, or compounding of poisons" which is especially declared by the Act to be unlawful for any persons unless registered under the Act.

In striking contradistinction to that view of the chemist and druggist's business is the definition of "pharmacy" given by Mr. JOHN TAYLOR in the paper lately read by him before the Manchester Pharmaceutical Association, as embracing the whole of the professional and trading operations usually carried on by a chemist and druggist. Without raising the question whether such

an application of the term "pharmacy" is strictly correct, the admission must be made that generally speaking the business of the chemist and druggist partakes much more of the nature of trade than the definition given in the Pharmacy Act would imply, and as Mr. TAYLOR remarks, "pharmacy," as commonly understood, probably never had such a distinctly professional status in this country, or, at any rate, not since the qualification of the Society of Apothecaries became obsolete as a pharmaceutical qualification, and was converted into a qualification to practise medicine. In fact, the position held by chemists and druggists registered under the Pharmacy Act, 1868, has much more relation to trade than to the practice of pharmacy in the strict sense of the term, and the provisions of the Act are so limited in their application as to leave the greater part of pharmacy outside their scope. Out of the 817 articles included in the British Pharmacopœia as drugs and preparations—chemical or pharmaceutical—quite nine-tenths of them can be sold or dispensed by persons without any legal qualification for the practice of pharmacy either compulsory or optional. That is also the case with regard to the business of a chemist and druggist, and there is consequently no ground whatever for the statements frequently made as to the chemists' monopoly and the alleged desire to interfere with the trade in drugs, etc., carried on by general stores belonging either to companies or individuals.

The question to be considered—whether companies should be prevented from carrying on that very small part of a chemist and druggist's business for which an individual qualification is required by the Pharmacy Act, 1868—is, therefore, a very narrow one and it is really a question affecting the public interest more than the interests of chemists and druggists. As Mr. TAYLOR has very justly remarked, "it is not our duty to regulate company pharmacy." If Parliament should consider that the public objects of the Pharmacy Act would be sufficiently secured by persons, qualified under the Act, carrying on the sale and dispensing of poisons on behalf of joint-stock companies, it would probably be futile to attempt any opposition to such an arrangement being adopted as a remedy for that recognised violation of common sense which is at the present time a result of the unhappy interpretation put upon the Act by the House of Lords, viz., that in the sale and dispensing of poisons the safety of the public is sufficiently secured by the qualification of the individual selling or dispensing the poison. That decision was contrary to the principle of the Pharmacy Act; but however the question may now be decided will not much affect the business of the chemist and druggist, and still less the practice of pharmacy. But when such a breaking down of the purport of the Pharmacy Act is proposed to be extended to the use of titles which indicate legal qualification for the performance of responsible duties, another absurd position is reached, and those who have acquired the right to use such titles have no alternative but to defend their position with the utmost determination. That chemists' opposition to the proposal of Clause 2 of the Companies Bill, in regard to titles, will therefore be generally supported by members of Parliament whenever the circumstances of the case are made known to them cannot well be doubted.

ANNOTATIONS.

THE DEATHS BY POISON IN ENGLAND AND WALES during the year 1898, according to the Registrar-General's sixty-first annual report on the subject, numbered 1,114, exclusive of cases of murder and manslaughter, being a decrease of 81 on the total for 1897. The accidental deaths decreased from 691 to 620—407 males and 213 females; and the suicides from 504 to 494—286 males and 208 females. There were two cases of murder by poison, and one of manslaughter, strychnine being the fatal agent in all three cases. In 1897 there were three cases of murder by poison, and one of manslaughter, morphine being used in two cases, and the kind of poison not recorded by the Registrar-General in the third. The total number of deaths by poison during 1898 was therefore 1,117, as against 1,199 during 1897, or a net decrease of 82. A less satisfactory feature of the report is that the number of deaths caused by carbolic acid shows only a slight decrease, both in regard to the accidental and suicidal cases, the total for 1898 being 206 as against 219 during 1897.

THE ACCIDENTAL POISONING CASES were, as usual, mainly caused by unscheduled articles, the deaths caused by scheduled poisons during 1898 numbering 141, whereas other poisons caused 479 deaths. Arsenic was the cause of 3 fatalities; mercuric chloride of 1; oxalic acid, 5; cocaine, 2; opium, laudanum, and morphine, 85; chlorodyne, 6; paregoric, 1; chloral, 10; belladonna, 12; prussic acid and oil of almonds, 5; aconite, 3; strychnine and nux vomica, 7; weedkiller, 1. The deaths caused by chloroform, ether, and other anæsthetics used during operations are now classed separately. Those substances account for 88 cases. Carbolic acid was the cause of 37 accidental deaths, strong mineral acids of 18, and the great bulk of the remaining cases were apparently due to the use of lead and other poisons for manufacturing purposes. Altogether, then, the record speaks well for the care exercised by registered chemists, the more especially as a certain proportion, probably the majority, of the deaths caused by scheduled poisons were cases in which chemists were not concerned as sellers. Apart from that, it is satisfactory to note that only one hundred and forty-one persons lost their lives by accidental poisoning during the year 1898 out of a population of more than thirty millions.

SO FAR AS SUICIDES ARE CONCERNED, chemists have even less control, but even in that case scheduled poisons caused only 194 deaths, including arsenic 4, mercuric chloride 6, mercuric cyanide 1, oxalic acid 34, chloroform 2, cocaine 2, narcotics 62, prussic acid and oil of almonds 27, potassium cyanide 24, strychnine and nux vomica 25, vermin killer 5, weed killer 1, sheep rot mixture 1. Carbolic acid was taken by 169 suicides, strong mineral acids by 47, and various unscheduled poisons used in the arts and manufactures by 84, thus making a total of 300 persons who resorted to unscheduled articles as a means of ending life. The following table shows at a glance the number of deaths caused by scheduled and unscheduled articles respectively:—

Group.	Scheduled.	Unscheduled.	Total.
Accidents	141	479	620
Suicides	194	300	494
Total.....	335	779	1114

It will be seen that scheduled poisons were responsible for less than one-fourth of the accidental deaths and for less than two-fifths of the cases of suicide by poisoning. It must also be borne in mind, as has been pointed out on former occasions, that there is always a certain proportion of the scheduled poisons named in both lists

which have not been procured through the medium of chemists and druggists; otherwise the proportions of fatalities from the misuse of scheduled and unscheduled poisons would undoubtedly differ still more widely.

THE CASE OF CARBOLIC ACID, as presented in the Registrar-General's report, still continues to be a glaring scandal, the number of deaths caused by it—a very large proportion of which could certainly be prevented if the poison were scheduled—being more than one-sixth of the total number of deaths caused by poison, as shown by the following table, which includes figures for seven years in succession:—

Cause of Death.	1892.	1893.	1894.	1895.	1896.	1897.	1898.
Carbolic Acid.....	106	148	202	258	197	219	206
Other Agents	709	819	889	920	894	980	911
Total Deaths..	815	967	1091	1178	1091	1199	1117

During those seven years the proportion of deaths by carbolic acid poisoning has increased from 13 to 18·4 per cent., and it is noteworthy that the great increase during those years has been in the case of suicides, the number of accidental cases remaining almost stationary, as witness the following statement:—

Group.	Poison.	1892.	1893.	1894.	1895.	1896.	1897.	1898.
Accidents	Carbolic Acid.....	33	31	35	34	34	43	37
	Other Agents.....	481	566	553	564	585	648	583
		514	597	588	598	619	691	620

THE PRESIDENT OF THE PHARMACEUTICAL SOCIETY has clearly explained the existing position with regard to the Companies Bill, in his Liverpool speech (see p. 350), and members of the Society are invited to read, mark, learn, and inwardly digest the same. It will not be pleasant reading to many, but the report of what Mr. Martindale said cannot fail to be instructive to all. He has plainly stated that the Minister in charge of the Bill will accept no amendment of Clause 2, and that, even if amendment were possible, members of the Council of the Pharmaceutical Society cannot agree what the terms of the modified clause should be. The only consolation in the matter is that opposition to the clause is so great that Mr. Ritchie proposes to drop it. The existing position will then continue for some time longer, the sale of poisons by companies of unqualified persons being neither illegal nor recognised by the law, but entirely outside the operation of the Statute. The possibility of amending the Pharmacy Act, 1868, by special legislation was alluded to by Mr. Martindale, but he spoke none too hopefully of that. As he remarked, chemists must first agree among themselves what to ask for, and then convince Parliament that what they seek is for the public good, and not simply prompted by self-interest. It is interesting to note, by the way, what value Mr. Martindale places upon the utterances of one of his most distinguished predecessors, who stated, nine years ago, that in 1833 a Bill was submitted, and the then President had interviews with various members of a Government Department with regard

to it. According to Mr. Carteighe, the result was not only that the Government officials would not listen to the proposal of touching company trading, but their idea was to regulate it, and let one individual be considered the manager of the business of the poison department, leaving everything else just where it was. In going to Parliament, the Council had to be guided very largely by the opinion of the Government Department, and the first practical question put to anyone who went and asked members to support a Bill was: "Does the Government approve of it?"

MEETINGS OF COMMITTEES are usually understood to be private, but the report of a meeting of the Committee of the North-East Lancashire Chemists' Association, which appears at page 354, having been sent by a local reporter in the ordinary course, it may be assumed that the proceedings were not meant to be regarded as confidential. Indeed, the solitary speaker at the meeting seems to have prepared his remarks with too great care—and yet too little—to justify the hypothesis that they were meant only for the consideration of his own familiar friends. Whether or not anyone else spoke does not appear, and the subsequent proceedings are wrapped in a mystery, so far as the outside world is concerned. But perhaps it would not be drawing a bow too rashly at a venture if it were suggested that the meeting was called for the especial purpose of enabling the one and only speaker to advertise to the world of pharmacy at large that he disapproves of the speech delivered by the President of the Pharmaceutical Society at Liverpool last week. The arrangements at pharmaceutical meetings held in Lancashire are not always as they should be. Apparently, however, the meeting now reported was properly constituted, and there was a chairman, though whether the reporter was actually present is a point concerning which nothing definite can be stated.

TO REVERT TO THE SPEECH DELIVERED at the Blackburn meeting, like others by the same individual, it bristled with inaccuracies. The Council of the Pharmaceutical Society has not been inactive nor has the official Journal advocated a retrograde policy. To take the case of the Council first, events have shown that whilst about two-thirds of the members have favoured, generally, the no-surrender policy, the others have been disposed, in a greater or less degree, to make concessions, while even the majority have been unable to agree upon anything but what may be termed destructive criticism of Clause 2 of the Companies Bill, those holding opposite views having made up their minds so decidedly as to render any other course impossible. Nor is that position of affairs to be regarded as a fault on the part of the duly constituted authorities. Registered chemists throughout Great Britain are all at sixes and sevens regarding the best course to be pursued, and members of the Pharmaceutical Society have formed no exception in that respect. The members of the North-East Lancashire Chemists' Association may be in thorough accord on the subject, but there is no evidence that they can command support for their views. Lancashire is not Great Britain, and the Blackburn district is only a portion of that county. If the members of other local associations and the majority of the registered chemists who are not connected with any local association were at one with Mr. Gifford and his friends, it would be reasonable to expect to find the Council of the Pharmaceutical Society similarly agreed. As it is, the position of the Council accurately reflects that of the Society and of the trade throughout Great Britain, and Mr. Gifford's strictures on the executive body are both unreasonable and untrue.

MR. GIFFORD'S FALSE ASSERTION regarding the Journal was, wisely enough, not backed up by anything subsequently said. It is not the duty of the Editor of the Journal to attempt to dictate a policy to the Society, and the attempt has simply been made to endeavour to represent the facts of the case as impartially as possible throughout the long controversy which is not yet closed. It is absurd to

be continually repeating parrot-like cries about privileges intended to be conferred by the Pharmacy Act, the confiscation of legally acquired rights, or the iniquity of recognising the existing position. Pharmacists have made up their minds upon all those points for many years past, and the difference of their views has led to the present position. What is required is agreement upon a common ground of action and of that, unfortunately, there appears no immediate prospect. If the election of Mr. Gifford on the Council were to result in the position being materially altered in that respect, no one would be more likely to rejoice than the individual he replaced, but it is distinctly unfair for him to assert what is not true about the present members of the Council, or to reproach them because they have not accomplished what is impossible. Persons who talk much about principle should take care not to be unprincipled in their utterances; those who aspire to take an active part in the administration of public affairs should avoid becoming classed as men of one idea only; and, generally, all who seek to remedy abuses which have persisted unchecked for a number of years, would do well to devote a little serious attention to the question of ways and means.

THE "FIRST" EXAMINATION OF THE PHARMACEUTICAL SOCIETY, which is to be held next month, is the last but one of a very long series, and, to judge from the great number of entries for the examination, it might be imagined that no other opportunity was to be afforded for enabling would-be pharmacists to enter the profession. No less than seven hundred and sixteen candidates have sent in their names, that is to say about two hundred more than the highest number previously recorded. The unusual rush appears to lend support to the contention that the examination is of lower standard and easier to pass than any of the alternative examinations, certificates of having passed which are accepted by the Boards of Examiners in lieu of the "First" examination. Whether that be so or not, it may be conjectured that there will be a still larger entry for the examination three months hence, since that will be absolutely the last time the Society will conduct its own preliminary examination. After that, candidates for the Minor examination must produce certificates of having passed one or other of certain specified examinations conducted by the Universities, or by a few recognised examining bodies.

QUALIFICATION AS A DISPENSER may mean much or little, but as a rule it means next to nothing unless the person who claims to be qualified is registered under the Pharmacy Act. Unfortunately, many public authorities are not conversant with that fact, and individuals with "qualifications" of the most varied kind continue to secure appointments which should properly be filled by registered chemists only. Attention has recently been directed to the appointment as dispenser at a union dispensary of a person who claimed to have "qualified" as a dispenser and gained the necessary certificates in nine months from the time of deciding to enter the profession. What those certificates are is not stated, but they do not include that of the Pharmaceutical Society's qualifying examination. With regard to the length of time required by the individual in question to "qualify" as a dispenser, though it usually suffices for an interesting development which is very familiar to mankind, it may be doubted whether any person can attain proficiency as a dispenser of medicines in so brief a period. Pharmacists who have spent the whole of their working lives in dispensing medicines occasionally find something new to learn about their art, and a term of three years may be regarded as the minimum required to gain even a general acquaintance with the subject. So long as public bodies are so economically-minded as to be content to have their work performed by insufficiently trained individuals, so long will the poorer classes have to suffer. The best remedy that can be suggested is for registered chemists to secure election upon boards of guardians and thus place themselves in a better position to educate public opinion on the subject.

NOTICES OF BOOKS AND OTHER PUBLICATIONS.

'INCOMPATIBILITY AND SOME OF ITS LESSONS,' by Walter G. Smith, M.D. Pp. 36. Reprinted from the *Practitioner*.—Since part of the contents of this pamphlet has already appeared in the *Pharmaceutical Journal*, and the rest is now appearing, it is unnecessary to describe the nature of the matter. The opportunity is taken, however, of directing the attention of pharmacists to Professor Smith's essay, and of congratulating the author upon his attempt to lift the art of prescribing above the dull level to which it has fallen of late.

'LESSONS IN ELEMENTARY PHYSIOLOGY,' by Thomas H. Huxley, LL.D., F.R.S. Enlarged and revised edition. Pp. 611. Price 4s. 6d. London: Macmillan and Co., Limited.—The difficult task of revising the late Professor Huxley's well-known class-book for the present edition has fallen to Sir Michael Foster and Dr. Lea. Whilst preserving as far as possible the original author's own words and form of exposition, they have found it necessary to make considerable changes and additions in order to maintain the usefulness of the book. As a result it continues to be the best general school class-book on physiology published, and with as little resemblance to a "cram" book for examination purposes as it is possible to conceive.

'BUBONIC PLAGUE; ITS COURSE AND SYMPTOMS AND MEANS OF PREVENTION AND TREATMENT,' by Dr. José Verdes Montenegro. Authorised translation by W. Munro, M.D. Pp. 84. Price, 3s. 6d. net. London: Baillière, Tindall, and Cox.—The Spanish edition of this work, which appeared a few months ago, was the first book which contained a *résumé* of the important work that has been done during recent years in the attempt to discover the causes of the propagation of the plague, and to combat its attacks. The English edition is even more complete, as it includes an appendix in which are given particulars regarding later investigations and results than those referred to in the original work. It is believed by the author that his book provides complete information for enabling a successful struggle to be waged with the plague if an epidemic should make its appearance.

'ANÆSTHETICS: THEIR USES AND ADMINISTRATION,' by Dudley Wilmot Buxton, M.D., B.S. Third Edition. Pp. 320. Price 6s. London: H. K. Lewis.—In this edition of Dr. Buxton's now classical work, the whole of the book has been recast, less important matter being omitted and more useful matter added. The introduction serves as a guide to those who are reading about anæsthesia for the first time, the first chapter gives a concise historical *résumé* of the subject, and chapter two deals with the preparation of a patient and choice of an anæsthetic. Subsequent chapters treat of the use of nitrous oxide gas, alone and in combination with oxygen, etc., of ether, chloroform, amylène, pental, ethidene dichloride, ethyl bromide, and of anæsthetic mixtures and solutions. Attention is also specially directed to the employment of anæsthetics in special surgery and in obstetric practice, as well as to the treatment of the accidents of anæsthesia. Finally there is a special chapter on local anæsthesia and another on the medico-legal aspects of the administration of anæsthetics, thus rendering the book as complete in every way as it is possible for a practical handbook to be.

'LANTERN SLIDES,' being No. 9 of *The Photo-Miniature*. Pp. 479. Price 6d. London: Dawbarn and Ward, Ltd.—The making of lantern slides is here described at length, special attention being devoted to photographic processes and working instructions given regarding the colouring of slides. Like all its predecessors, this number of the *Photo-Miniature* is well worthy of a place on the amateur photographer's book-shelf.

'ST. THOMAS'S HOSPITAL REPORTS.' Edited by Dr. Hector Mackenzie and Mr. G. H. Makins. Vol. xxvii. Pp. 120. London: J. and A. Churchill.—This volume contains the usual records of the work of the Hospital for the year 1898, and includes some interesting notes 'From My Jotting Book,' by W. W. Wagstaffe, B.A., F.R.C.S., who shows by the aid of statistics how individuals vary in weight at different times in the day, and that it is consequently important to choose the time for weighing recruits or persons submitting themselves for life insurance.

'BEGINNER'S GUIDE TO PHOTOGRAPHY.' Pp. 139. Price 6d. London: Perken, Son and Co., Ltd. The seventh edition of this little book has just been published, making a total issue of sixty thousand copies. The matter has been re-written and brought quite up to date. The binding is in stiff cloth boards. As the wholesale terms for the book are liberal, it should be found a profitable article for dealers to push, as it is sure to have a ready sale.

ENGLISH NEWS.

OWENS COLLEGE, MANCHESTER.—The students in the Pharmaceutical Department accompanied the chemistry students, under the leadership of Prof. Dixon, in a visit to Brin's Oxygen Works on Tuesday last. The whole process was carefully explained by the manager of the works, and proved most interesting. The pumping of the air into the built-in retorts containing the heated baryta and the automatic arrangement by which every five minutes the pressure is reduced by a reverse action, were fully explained. It was interesting to learn that the baryta is practically never renewed, and is only raked out about once a year and put back again. The preparation and purification of nitrous oxide (laughing gas) next engaged attention; then the pumping machinery by means of which the cylinders are charged with nitrous oxide, hydrogen, coal gas and oxygen; and, lastly, the method of testing the cylinders themselves. This is done by placing the cylinder in a deep well, rendered water-tight by means of a rubber collar fitting the shoulder, and charging the cylinder with water by means of a powerful hydraulic pump. Its expansion is measured by the water in the space outside rising in a long piece of glass tubing, and the cylinder is considered satisfactory if the water falls to its original level when the pressure is relaxed. The following day a visit was paid to the Botanic Gardens, in company with the botany students under Professor Weiss and Dr. Darbishire. A most enjoyable forenoon was spent in the houses, studying the principles of classification, Aloe, Cypripedium, Smilax Caffea, Selaginella, and many other plants of special interest to students of pharmacy, being noted.

NORTH OF ENGLAND SCHOOL OF CHEMISTRY AND PHARMACY.—The students of this school had an object lesson in manufacturing chemistry on Wednesday, March 14, when, accompanied by the Principal, Mr. F. R. Dudderidge, F.C.S., they visited the works of the Bede Metal and Chemical Company, Hebburn-on-Tyne, being conducted by Mr. Stark, of the Company's laboratory, who fully explained all the various processes seen. At these works large quantities of copper are extracted from pyrites cinders by the wet method, the amount being too small to be profitably removed by the ordinary dry processes, averaging three per cent. in the unburnt pyrites, which, after being roasted, yield about 5 per cent. The cinders are first ground with salt and heated in muffle furnaces, whereby the copper is converted into chloride. This is "leached" out in tanks by means of acidulated water derived from the gaseous products of the roasting. The liquor obtained contains a notable quantity of silver and a minute quantity of gold, which are precipitated by the addition of the requisite amount of sodium iodide, and the precipitate reduced by metallic zinc, the iodine being thus recovered as zinc iodide. The copper is now removed by the addition of scrap iron, and purified by refining in the usual dry way.

All the stages of this process were watched with great interest, the students helping to ladle the refined metal into ingot moulds. The "leached" pyrites residue is in great demand for the steel furnaces, as it contains 70 per cent. of metallic iron. For this purpose it is dried into masses of suitable shape. A visit to the laboratory, where the processes of assay of copper, silver, and gold were seen, concluded a most interesting visit, hearty thanks being tendered to Mr. Stark. On Friday, March 23, the students were conducted through the new Laboratory of Messrs. Wilkinson and Simpson, Limited, by Mr. G. F. Merson, F.C.S., thus having an opportunity of seeing pharmaceutical operations upon a manufacturing scale. The hydraulic press, vacuum still, and many other pieces of apparatus were in full working order, thus demonstrating many processes not usually seen in retail pharmacy.

ROYAL BOTANIC SOCIETY.—At a meeting of the Fellows of the Royal Botanic Society, held on Saturday, March 24, in the Society's Gardens, at Regent's Park, Mr. C. Brinsley Marlay presided, and the secretary directed attention to the fact that there had been some controversy lately as to what was the true shamrock. Sowerby, in his "English Botany," gave two plants, the *Trifolium repens* and the *Oxalis acetosella*, both of which were spoken of as the true shamrock, and were usually regarded as such, while Dr. Prior, in his "Popular Names of Plants," gave *Medicago lupulina* and *Trifolium repens*. In Ireland the peasants went out on to the hillsides and pastures and gathered any species which happened to grow there, and regarded this as the true shamrock. The chairman said there was no doubt that in Ireland it was *Trifolium repens* which was almost invariably held to be the shamrock, but it appeared to him that what St. Patrick, if he ever existed, held up was the *Oxalis acetosella*, the leaves of which were far more distinct. The ordinary clover, however, had been used instead. In reply to a Fellow, who asked whether the *Oxalis acetosella* would keep fresh after being gathered, the chairman said he had never seen it sent over from Ireland for use as the shamrock.

POISONING BY LAUDANUM.—An inquest was held at Patricroft, Manchester, on March 20, touching the death of Joseph Haslam (64), an iron-turner, of Patricroft. From the evidence, it appeared that deceased had suffered from chronic rheumatism, and was in the habit of taking laudanum to relieve the pain. On the previous Monday, at noon, his daughter found him breathing heavily, and suspecting laudanum poisoning, administered a cup of strong coffee; death, however, occurred at 3.15 the same afternoon. Dr. Haynes having given evidence, a verdict was returned that death was due to misadventure.

PLYMOUTH, DEVONPORT, STONEHOUSE AND DISTRICT CHEMISTS' ASSOCIATION.—At the last meeting of this Association the following gentlemen, Messrs. C. J. Park, C. T. Weary, and G. Breeze, were appointed as delegates to interview Messrs. Kearley and Morton (Members of Parliament for Devonport) and ascertain their opinions upon the Companies Bill as affecting chemists and druggists. As these members were visiting their constituency during the past week, an interview was arranged with them. The delegates having pointed out to the members the injustice which would be inflicted upon chemists and druggists if Clause 2 in the Bill was passed in its entirety, Messrs. Kearley and Morton expressed the opinion that, as far as the protection of titles went, chemists had a strong point, and also considered that pharmacists might ask that the professional side of their craft, that is, the dispensing of prescriptions of medical men and the sale of scheduled poisons, should be restricted to registered chemists by being included in Clause 3 of the Bill, as in the case of surgeons, dentists, and midwives, and further recommended that a strong effort should be made to have Clause 2 struck out of the Bill, or at least the words "Or to use the term or definition of Pharmaceutical Chemist, or Chemist and Druggist."

FOREIGN NEWS.

PHARMACEUTICAL REFORM IN GERMANY.—After a long and somewhat stormy debate at the last annual meeting, held at Danzig, the German Apotheker-Verein again came to the conclusion that the system of saleable or transferable concessions is deemed by the majority of the craft the best and the most appropriate for being introduced as a general regulation of pharmaceutical affairs in the Empire, and it was resolved to appoint a committee to consider how to give effect to that resolution in practice. The committee has now had a two-days' sitting at Berlin, and has agreed upon the following principles:—In the future every privilege or concession hitherto transferable should remain saleable and inheritable. The now existing not-transferable concessions should become entitled to that right by payment of a certain tax. But no pharmacist should be authorised to purchase shops more than three times without obtaining from the Government of the State a special permission. The concessions to be licensed in the future should be made transferable and inheritable after a ten years' existence, and the holder should pay an annually progressive tax for a certain space of time, beginning from the expiration of a three years' term. The tax should be calculated in accord with the net profits of the business. New concessions should be granted only in places where there is a local need for them, the authorities having consulted in this respect with a committee of pharmacists elected by their confrères. The new concessions should be generally transferred to the eldest of the aspirants. Finally, it should be permitted to let by lease every saleable concession to a qualified pharmacist. It appears that the German pharmaceutical craft is not very content with the present state of things. Indeed, the so-called "mixed system" now prevailing in the Empire—viz., privileges, transferable and not-transferable concessions, is declared to be the principal cause of the high prices of saleable concessions, the number of alienable objects being for an incalculable time restricted. It is plain that the transformation of hundreds of not-saleable concessions into freely transferable ones would be for a certain time an expedient to prevent a further rise of prices, but it is also understood that the federated German Governments are not at all inclined to concede to the wishes of the craft. They continue to insist upon their project of personal not-transferable concessions, the general introduction of which is possible only by the liquidation of the valuable vested interests which have come into existence under the operation of the "mixed system." The majority of the craft being unfavourable to the plan chiefly contemplated by the Prussian Government, it is difficult to understand how the difficulties resulting from that conflict of opinions will be settled. Hence, it deserves notice that there are growing symptoms of inclination to adopt a system of free trade, restricted only by certified evidence of a higher standard of education, rigorous supervision, and the condition that there shall be a certain distance between the shops in the larger towns. Of course, it would be impossible to adopt this system of free establishment without a liquidation of the values of saleable concessions; but numerous proposals have been made to settle that matter. That is certainly a sort of "Zukunftsmusik," but it is not impossible that the adoption of the last-mentioned system will be the solution of the confused situation existing at the present time.

MEDICAL GRADUATES IN GERMANY.—The *British Medical Journal* states that the total number of degrees in medicine conferred by the German universities in the academic year 1898-99 was 1,050. Of these Berlin gave 87, Bonn 22, Göttingen 31, Greifswald 10, Halle 23, Heidelberg 32, Jena 34, Kiel 86, Königsberg 24, Leipzig 55, Marburg 28, München 134, Rostock 14, Strassburg 43, Tübingen 46, and Würzburg 147. The number of degrees awarded by these universities in the previous academic year was 1,208, while the corresponding figure for 1896-97 was 1,268, showing a progressive diminution.

ACCORDING TO A MINISTERIAL ORDINANCE of last year, it was hitherto prohibited in Prussia to keep in stock in pharmacies compounded tablets, the composition of which pharmacists cannot guarantee, and for which they cannot be responsible. These tablets were to be specially prepared each time they were prescribed by a physician. By a new ordinance published last week in the *Apotheker-Zeitung*, that prohibition has been restricted to compressed tablets containing the poisons or potent remedies that are enumerated in the schedules B and C of the German Pharmacopœia. Remedies of organotherapy are not included.

A SERUMTHERAPEUTIC INSTITUTE IN BELGIUM.—According to the *British Medical Journal* the council of the province of Brabant, in Belgium, has decided to establish a provincial institute of serum-therapy and bacteriology with a department for the treatment of rabies. The Institute is intended to be used for analyses and the preparations of serums and vaccines, the rabies department undertaking diagnoses and inoculations. The cost of the establishment is estimated at 150,000 francs, while from 42,000 to 45,000 francs will be required for maintenance.

MALARIA AND ANOPHELES.—According to the *Zanzibar Gazette*, Dr. Spurrier has found *Anopheles* in certain of the notoriously unhealthy districts in that region. In the last district in which they have been found, Dunga, the larvæ of *Anopheles* were present in puddles formed by the spilling of water at the small dip holes made in the dry swamps on the Zanzibar side of the Dunga mountains. A complete map of Zanzibar and the neighbourhood is now being made showing the mosquito-infected localities and the species of mosquito hitherto found in each. Dr. Spurrier has also found larvæ in a disused stone water tank in the town, and in the hollows formed between the ridges of earth on which the sweet potato is cultivated. He points out that in a pool or tank containing reeds or grass the larvæ may be overlooked as they cling to the reeds; when the reeds are touched, however, larvæ shoot into the middle and may be dipped up by a quick hand.

A PHARMACIEN AS A WOULD-BE ASSASSIN.—An extraordinary scene occurred last week at the Fifth Civil Chamber of the Court of Appeal. The President, Monsieur Bérard des Glajeux, had just finished reading the terms of a judgment rendered, when a chemist named Bardin, of St. Maur-les-Fossés, against whom judgment had been previously given, came forward, calmly drew a revolver from his pocket, and fired three times at the President before the attendants or others had time to interfere. Fortunately, his aim was bad. One bullet passed within a foot of the President of the Court and buried itself in the woodwork at the back of him; the other two went wide. The would-be assassin was arrested before he could fire again by the Advocate-General Lombard and the advocates Messieurs Renoult, Bertin, etc., and was at once handed over to the Guards, who quickly appeared on the scene. The hearing was not suspended. The President retained his *sang-froid*, and, ignoring the incident, which might have been expected to have disturbed it, called on Maître Bertin to go on with the next case. It seems that a fortnight ago Monsieur Bardin had taken steps to get Monsieur Lombard to interest himself in a case in which judgment had been given against him. He had then seemed excited. But, taking refuge behind the "profession secret," Monsieur Lombard had refused to have anything to do with the matter.

THE TENTH CORRECTIONAL CHAMBER recently disposed of a case of substitution brought against a chemist from the suburbs of Paris. In dispensing a prescription which was handed to him, the assistant, with the full knowledge and approval of the chemist, put into the cachets an inert powder in lieu of the drugs prescribed, hoping thus to gain additional profit and at the same time "cut" the other chemist of his quarter who had previously dispensed the prescription. The fraud was discovered, and the assistant sentenced to four months' imprisonment, whilst the chemist was mulcted in a fine of 500 francs (£20).

LIVERPOOL CHEMISTS' ASSOCIATION.

The annual dinner in connection with the Liverpool Chemists' Association was held at the Exchange Station Hotel on Thursday, March 22, under the presidency of Mr. ANTHONY S. BUCK. Among the members and friends present were Professors Wm. Carter and J. Harvey Gibson, Mr. W. Martindale, President of the Pharmaceutical Society; Dr. Paul, Dr. Symes, Dr. Brannigan, Dr. Davey, Dr. Barnes, Dr. Gemmell; Messrs. Edwd. Evans, jun., W. P. Evans, Edwd. Davies, J. H. Evans, E. N. Evans, P. MacEwan, H. O. Dutton, Prosper H. Marsden, R. C. Cowley, T. F. Abraham, J. Smith, W. Park, T. H. Wardeworth, etc., etc.

The usual loyal toasts were honoured with more than usual spirit. The CHAIRMAN'S reference to the coming visit of the Queen to Ireland being received with hearty applause.

Mr. PETER MACEWAN proposed the toast of the

LIVERPOOL CHEMISTS' ASSOCIATION,

coupling with the toast the name of the President. In his opinion, the Liverpool Association occupied the premier position among provincial associations, as it was one of the oldest and had an excellent record of work done for the advancement of pharmacy. It had had also connected with it a very large number of famous men, beginning with Jacob Bell, who was instrumental in its institution in 1849. It was worthy of note that the Liverpool Association had the distinction of being the first place at which company pharmacy had been dealt with, for in the year 1849 Jacob Bell made an emphatic pronouncement against the system in the opposition which arose in consequence of the application for a charter by the Liverpool Apothecaries Society. At the same time he observed that Jacob Bell would have nothing to do with short hours or a price list, subjects which had been favourably considered since.

The CHAIRMAN, in responding to the toast, said that it was exceedingly gratifying to the Association to know that during the years they had been in existence they had had a great many of the faculty of medicine, either as ordinary or honorary members. It was interesting to note that their esteemed friend and fellow-member, Dr. Nevins, was present at the inaugural meeting in 1849, to which Mr. MacEwan had referred, and he had been present at an ordinary meeting no later than last week—surely a record in itself. Professor Wm. Carter, whom they were glad to see at that gathering, had also been a valued member for many years. Reference was made to the work done by the Association as a teaching body—a line of activity which they were still following with manifest advantage to pharmacy. Mr. Buck proceeded to give an outline of the legislative work promoted by the Association, and concluded by urging all chemists of the district to co-operate together in order that they might protect their joint interests and resist any attempt which might be made to curtail their privileges.

Professor J. HARVEY GIBSON, in a humorous speech, submitted the toast of

THE PHARMACEUTICAL SOCIETY.

and in the course of his remarks contended that it was high time that chemists recognised that they were members of a profession, and were not merely traders. He was strongly of opinion that pharmacy was a profession, and those who took up its practice should be trained professionally, and their education should be based upon lines similar to those which were necessary for entrance into the profession of medicine.

Mr. MARTINDALE, President of the Pharmaceutical Society, in responding to the toast, said: I have pleasant recollections of Liverpool. My first visit was forty-five years ago, when I stayed with a relative, a shipbroker. I therefore then knew this immediate district well—the Customs House, the Exchange, and the Sailors' Home are still familiar to me. Thirty years ago I attended the first meeting the Pharmaceutical Conference held here, and four years ago it paid its second visit, when, as its President, I

remember meeting most of you. My study and the hobby of my life has been pharmacy, rather than pharmaceutical politics, in which I have lately had to take an active part as a member of the Council of the Pharmaceutical Society, and now its President. The Council is now a more representative body than formerly, as all of you may become full-fledged members of the Society, with an equal voice in the election of its Council, and a seat thereon. The difficult problem most exercising the minds of the Council and of our calling at present is what is spoken of as company pharmacy, and

CLAUSE 2 OF THE COMPANIES BILL,

now under consideration by Parliament, and in regard to which divergent views are held by our supporters, according to the kind of business or profession they are carrying on. During the past six months the Council and its Law and Parliamentary Committee have had under consideration the serious question, "Can we be parties to the Parliamentary or legal regulation of, or restrictions on, companies engaged in the retailing and dispensing of medicines?" Part of retail pharmacy has been declared to be outside our 1868 Act; consequently there is a void, which the law lords wish to fill by bringing limited companies, which were not contemplated by this Act, within its purview. That is distasteful to us, and the majority of our members are opposed to such recognition of companies, as being equivalent to making a rope to hang ourselves with. They therefore decline the task. Still, the clause is for the regulation of company pharmacies in a Companies Bill, and it will have to be faced. To stop company trading in drugs I hold is impossible. As twenty years and more of vested rights have accumulated, it is unattainable; but we may consistently oppose the present Parliamentary action, for if part of the practice of pharmacy is lost to us, we certainly have the statutory right to our personal titles. All would recognise the claim of individuals to that which can only be obtained by personal qualification, examination, and registration, except a few of our men, who have themselves embraced the impersonal advantages of limited liability trading. The protection of the business, if actually conducted by a personally qualified manager, I fear, is gone beyond recall. So divergent are trade and profession in our calling that the Law and Parliamentary Committee of the Council, which consists of nineteen out of twenty-one members of the Council, failed to agree in drafting a clause or the substance of any amendment for one. When you come to think of it, this is not a thing to be surprised at. Even the Federation of Local Pharmaceutical Associations could not do so, but recommended two courses. How, therefore, could unanimous action on the part of the Council be possible? The Law and Parliamentary Committee approached the Government directly and indirectly to get at its views. With Mr. Carteighe I saw Mr. Ritchie, who gave us a direct negative to three issues which we put before him. We all would have liked

TO RESTORE THE PERSONAL QUALIFICATION

of the keeper of open shop. We therefore asked for:—

1. The restoration of the position of chemists as it was before the Selborne judgment—*i.e.*, stopping companies of unqualified persons practising pharmacy or its equivalent.

2. Pharmacists to be in the same position as other professions in Clause 3 of the Companies Bill. The accidental omission in our Act of any reference to corporate bodies placed all these professions in the same position. "Absolutely impossible," was Mr. Ritchie's reply, adding that the Government was merely regulating the condition of things existing at the present time. "There are plenty of your men," he said, "carrying on a dozen or more shops, and have their names exhibited over each. Is the public any better served or protected by that condition of things than by limited companies' shops, when it is not necessary at present to have the name of the manager posted up, which the Government propose to make compulsory in the case of a company?"

3. The third claim was the protection of our titles, which are purely personal, and can only be obtained by qualification and

examination. If titles were given to companies, they would eventually have to be given to individuals—that is to say, to any capitalists who could engage a qualified man, the qualified servant "covering" the unqualified master.

Mr. Ritchie was still obdurate. Hence there is no help from Government. The clause being the Lord Chancellor's, Mr. Ritchie said that he himself could not alter it. The Law and Parliamentary Committee and the Council considered, therefore, that it would be best to oppose Clause 2 in the Committee stage of the Bill. Our present position is considered to be better than it would be with Clause 2, and the Council thinks it would be better to amend the Pharmacy Act by special legislation hereafter if possible. I say "if possible," because we must first agree among ourselves as to the amendment, and then convince Parliament that it is for the public good, and not alone for our self-interest. There are great difficulties in the way. We have

THE "WIDOWS' CLAUSE."

It has been found impossible for years to pass Medical Acts for the benefit of the medical profession, and we have failed to get on to the floor of the House of Commons before with amended Pharmacy Bills. We must be reasonable and logical. Mr. Carteighe pointed out in 1891 (see *P. J.*, February 7, 1891, page 704) that as far back as 1883 the various members of the Government Department concerned had declined to listen to any proposal for doing more than regulate company pharmacy. Later, at the annual meeting of the Pharmaceutical Society (see *P. J.*, May 30, 1891, page 1,089), he said, "You must not lose sight of the fact that we are custodians of the public interest, and, as such, your President must regard the public in the first place, and the members of the Society and the trade in the second."

Those two speeches of Mr. Carteighe's are worthy of your careful study. Time has but intensified the position. I have approached several members of Parliament, with the same result. We must therefore not expect too much. Protection is against the spirit of the times, which is in favour of free trade

BRANDED AND PACKETED GOODS,

much advertised, and factory-made, put up in attractive guise, are a public convenience, which no law will prohibit. A dose of chlorodyne, for example, will relieve a stomach-ache if it fits the complaint, but will not effect a cure where a dose of castor oil or an aperient is necessary—hence the need of medical advice and the pharmacist's art. Remember, drugs are not always freely saleable without advertisement. Many are not even necessaries like food and clothing, and they are not attractive like diamonds or wedding garments, which cannot be sold in packets or tablets. If we push trade in drugs, we must likewise remember that we have the public weal and public health to consider. But we cannot have free trade in poisons, or careless dispensing of medicines. We must support the Lord Chancellor in endeavouring to prohibit that. The formation of pharmacy companies in that sense by company machinery, as at present done, should be stopped, and those at present carrying on our business must be subjected to restrictions. This will be a task for the new Pharmaceutical Council. One thing is quite plain: we cannot accept Clause 2 as it stands. It does not put us in a better position. The Minister in charge of the Bill will admit of no amendment, and even we are not agreed what the amendment should be. The clause is one to regulate company pharmacy in a Companies Bill. Protection, as I have said, is against the spirit of the times which affects legislation and even legal judgments. Still, the Council has decided in any case to oppose the clause, and, as it is out of place in a financial Bill, it will probably be dropped.

Dr. SYMES also responded to the toast, and said that if pharmacy is simply to be carried on for the sole purpose of making money, as would be the case under company pharmacy, then the progress which had been so marked in their calling during the past fifty years would become very slow indeed. He referred to the unselfish labours of those who strove to improve the practice of pharmacy,

and said that there would be no inducement for careful work and investigation, which was so pronounced in the case of the individual worker. The medical profession tells the pharmacist that it depends upon him for the advancement of pharmacy in the bringing out of new remedies and the perfecting of processes already known, and therefore they should expect their medical friends to support them in their present contentions.

Mr. J. HOCKEN gave the toast of

THE CITY AND TRADE OF LIVERPOOL

in a brief speech, in which he referred to the growth and improvement of both during the past few years.

Mr. ED. EVANS, jun., in replying, said that he was proud of being a citizen of Liverpool. Travelling as he did from time to time over the world he had opportunities of seeing other places, and he felt that they had every reason to be proud of their city in every way. As a rule the citizens as a body recognised their responsibility and duties—hence, they had hospitals, infirmaries, an art gallery, and a university of which any community might be proud. Nor was the city lacking in generous impulses otherwise, for he had been told by Lord Derby, when his lordship was Mayor of Liverpool, that he was surprised beyond measure at the readiness with which all philanthropic appeals in the city were met. As to the subject mostly in the minds of those present, he held that where the law required them to pass a certain curriculum for certain specific purposes, then the law should step in and protect them; but as to the ordinary trade he did not think that in these days the law would protect any body of men in that way, and for success the chemist must look more to his own business capacity.

In proposing the toast of

MEDICINE AND PHARMACY,

Mr. JOHN SMITH said that he was pleased to find the two callings grouped together, as he was strongly of opinion that it would be well for the medical profession and pharmacy to combine more to protect their mutual interests, as he clearly saw that the proposed company legislation would be the thin end of the wedge against the privileges of the medical men as well. It was therefore necessary to combine forces, and, if possible, resist the common foe. Professor CARTER and Mr. T. F. ABRAHAM briefly responded. The toast of "Our Guests" was proposed in a short speech by Mr. T. H. WARDLEWORTH, and Dr. BARNES, Mr. H. KEMP, and Mr. R. LORD GIFFORD responded. Mr. R. F. W. ROBINSON gave the toast of "The Officers of the Association," and Mr. R. C. COWLEY and the PRESIDENT responded. In the course of the evening an acceptable programme of music was contributed by Messrs. Tom Barlow, A. J. McCormack, and W. A. Hollis.

PHARMACEUTICAL SOCIETY OF IRELAND.

On Thursday, March 22, a special meeting of the Council of the Pharmaceutical Society of Ireland was held for the purpose of adopting an address to her Majesty the Queen on the occasion of her visit to Dublin.

The PRESIDENT, Mr. George Beggs, took the chair, and there were also present the Vice-President, Mr. J. J. Bernard; Mr. Grindley, Hon. Treasurer; Dr. Walsh; and Messrs. Wells, Simpson, Porter, Kelly and Michie.

The REGISTRAR, Mr. Ferrall, read letters from Mr. White, J.P. (Sligo), Mr. Turkington (Cookstown), and Mr. O'Sullivan (Waterford), members of the Council, regretting their inability to be present, and warmly approving of the object of the meeting.

The PRESIDENT moved, pursuant to notice, that an address of welcome be presented to the Queen on the occasion of her visit to Ireland, and in doing so said he had considered it advisable to summon that meeting in order that each member of the Council might have an opportunity of expressing his feelings in the matter. Personally, he thought they should not be keeping up to the traditions of their Society if they neglected to present a loyal address

of welcome to her Majesty. They presented an address on the occasion of her Jubilee; and as all the other learned bodies in the city, as well as the surrounding urban and county councils, were now doing so, he would be grieved and disappointed if the Council should not be unanimous in the matter. He had had several letters from members of the Council who were unable to be with them, but who approved of his action in the matter.

Mr. WELLS begged to second the motion of the President, and did so with pleasure. As a Council, they had no politics, though, of course, as men they held divers political opinions. Notwithstanding this he was glad to know that they were unanimous on the subject of the proposal now before them. The letters that they had from colleagues who were absent, and who held different opinions from those entertained by some of them, expressed thorough sympathy with the President's notice of motion. It was only right, especially at the present time, that they as a Society should show honour to their Queen, as they had done on other occasions. A noble and good woman, notwithstanding that she was at an age when the comforts of home were preferable, she was coming there to do honour to their country, and to show in a very marked manner her appreciation of the valour of her Irish soldiers who had fought so nobly for her cause. No further words of his (Mr. Wells) were needed to commend the motion to them.

The motion was put from the chair and unanimously carried.

GLASGOW AND WEST OF SCOTLAND PHARMACEUTICAL ASSOCIATION.

A special meeting of the trade was held in the rooms of the above Association on Thursday, March 22, to consider Clause 2 of the Companies Bill. Mr. W. L. CURRIE, President of the Association, occupied the chair, and there was a good attendance.

The CHAIRMAN explained that the Council of the Association had unanimously agreed to support the Council of the Pharmaceutical Society in opposing

CLAUSE 2 OF THE COMPANIES BILL.

By that clause it was proposed to legalise companies of unqualified persons and to confer upon them titles and privileges which clearly should not belong to any but individuals. The Council of the Pharmaceutical Society had failed to agree upon an amendment to the obnoxious clause, but had ultimately decided to oppose the clause as it stood. A united front at the present critical period meant everything and, while recognising that the Council had not toed the line as it ought to have done, the present necessity of the moment compelled him to support that body. At the same time he was of opinion that in doing so chemists should strongly impress upon the Council of the Society the absolute necessity of securing the restriction of titles to individuals and endeavouring to secure some effectual control and regulation of company pharmacy as the only practical policy. In his opinion, the total abolition of company pharmacy was utterly hopeless, and it was consequently a waste of time and energy to discuss such ideas. On the other hand, to confer the proposed privileges on companies was unjust to the trade, and would undoubtedly minimise the protection of the public. As a company could not be examined and registered, it should be unlawful for any company to assume and use any title implying registration. While they would have liked to see an amendment to the clause which would have been satisfactory to all parties, they had to remember that the President of the Board of Trade, who had charge of the Bill, was not prepared to accept any amendment—the clause must either be accepted as it stands or be dropped entirely. In the circumstances, chemists generally could do nothing else but support the Council of the Society.

MR. J. ANDERSON RUSSELL moved that in view of the position taken up by the Government in respect of Clause 2 of the Companies Bill, the meeting, as representative of the chemists and druggists of the West of Scotland, should resolve to oppose the

clause. From the public standpoint he thought it well that chemists should emphasise as strongly as possible the position taken up by limited companies at the present time. The adoption of the title of "chemist and druggist" by them was really in opposition to the law; but, unfortunately, there was nothing in the law which could be brought to punish them. By the abolition of the clause, chemists were simply seeking to retain their present position. With regard to the second part of the clause chemists had a difference of opinion, and it was just possible that it would be necessary to agree upon an amendment after all. Personally, he thought they should stick to their distinctive titles, just as the medicals had done; but at the same time they should not interfere with the financial means afforded by the Companies Acts in the running of a chemist's business, provided they had always individual responsibility. In that case the law would stand towards companies as it did at present towards the chemist and druggist. They should endeavour, however, to keep trade matters out of the Bill. If they were to amend the Pharmacy Act in that respect it should be done by a Pharmacy Acts Amendment Act, and not included in what was, after all, merely a financial measure.

Mr. J. H. RIDDLE having seconded the motion,

Mr. SUTHERLAND pointed out that the proposed resolution was simply destructive, and suggested nothing in the nature of amendment; but, so far as he was concerned, he did not see why the matter should be tacked on to the Companies Bill at all. It seemed to him that the intention of the Government was the regulation of company pharmacy—a very desirable thing, just as the regulation of pharmacy altogether was a most desirable thing. As the Chairman had said, it was almost useless to try and put a stop to company pharmacy altogether; more than that, he did not know it would be a benefit. Unfortunately for the trade, they had acquiesced in the existing position so long that it became very difficult to carry anything in opposition. Their policy ought to be to regulate company pharmacy in the same way as individual pharmacy.

Mr. MOIR said Mr. Ritchie's statement that he would accept no amendment made it clear to him that chemists must oppose the clause for all they were worth. But that did not necessarily mean that they should not go forward to Parliament with an amendment of the Pharmacy Act; a course, he understood, which some members of the present Government favoured. Companies, he was afraid, had come to stay; but if they were to accept Clause 2 as it stood it would give companies titles as chemists and druggists, and chemists would thus lose their only tangible recognition before the public. Whatever they might do to regulate company pharmacy they must conserve their titles. The Pharmaceutical Society ought to introduce a new Pharmacy Bill, and then it would be quite time to consider in what way company pharmacy should be regulated.

Messrs. Boyd, Gilmour, Dunlop, Harvey, and Maben having also spoken, the motion was ultimately carried.

It was also agreed, on the motion of Mr. RUSSELL, that there was urgent need for an amendment of the Pharmacy Act with special reference to companies, and the meeting appealed to the Council of the Pharmaceutical Society to introduce a Bill for that purpose at the earliest possible opportunity.

It was remitted to the Secretary and President to communicate with members of Parliament, and impress upon them the necessity of voting against Clause 2 of the Companies Bill, leaving it to individual members to take a similar course.

At the close of the meeting Mr. SUTHERLAND intimated that Mr. Currie had consented to allow himself to be nominated for a seat on the Council of the Pharmaceutical Society, and he urged on them the absolute necessity of seeing that they made use of their voting powers.

Mr. CURRIE said he would take an opportunity of laying his views before the electorate at an early date.

PUBLIC AND POOR LAW DISPENSERS' ASSOCIATION.

At a well-attended meeting, held at the St. Bride's Institute, Ludgate Circus, on Wednesday, March 28, Mr. T. H. W. IDRIS, L.C.C., took the chair, and said as one whose occupation in days gone by was dispensing, it gave him much pleasure to be present, and he hoped by his presence to gain a knowledge of who public dispensers were and their objects in forming an Association.

Mr. S. B. DONNAN read a paper on

THE PHYSIOLOGY AND CHEMISTRY OF DIGESTION.

The author dealt exhaustively with the subject in a paper of considerable length. Commencing with salivary digestion, he described the process of secretion of saliva and its action upon solid constituents. The action of the saliva was stated to be both physical and chemical, its physical use being to moisten the mucous membrane of the mouth, dissolve soluble substances in the food, the mucin contained in saliva lubricating the bolus of food to facilitate swallowing. The chemical action was said to depend upon the active principle ptyalin, a substance belonging to the class of unorganised ferments or enzymes, or to that special class of unorganised ferments known as amyolytic (starch-splitting) or diastatic. Ferments were next considered, and were divided into two classes—organised and unorganised. The first-mentioned class was subdivided into five classes—*i.e.*, amyolytic, proteolytic, steatolytic (lipolytic), inversive, and coagulative. Ferments were stated to act best at a temperature of about 40° C.; cold stopping their activity, but not destroying them, while too great a heat kills them. The chemical nature of the ferments, the author said, could not be definitely stated, but it was considered that they are either proteids or substances closely allied to them. Peptic digestion was then referred to, and the progress of food through the stomach closely followed. The gastric juice was described as a solution of a proteolytic ferment called pepsin in a saline solution, which also contains some free hydrochloric acid. The pure gastric juice was said to be clear and colourless, having a specific gravity of 1.003 to 1.006; dextro-rotary, giving no biuret reaction, but giving the ordinary proteid reactions. The author then dealt with bile and pancreatic digestion, tracing the passage of the "chyme"—food after the action of the gastric juice—from the stomach into the duodenum and on into the intestines; describing the process of absorption of the carbohydrates, proteids, and fats. The chemistry of the pancreatic juice and bile was discussed and the bacterial action which takes place in the intestines described, the paper concluding with an analysis of the fæces.

The paper was listened to with great attention, and a discussion followed, in which Mr. Russell, of Kensington; Mr. Clarke, Paddington; Mr. Spencer, Marylebone; Mr. Welford, Colney Hatch; Mr. Jones, Poplar; Mr. Forster, and others took part. In moving a vote of thanks to Mr. Donnan for his very instructive paper.

Mr. IDRIS said it must have cost much time and great pains to prepare, and it had afforded him much pleasure to be present to hear it. As a commercial man, his first thought would be how to turn it into money, and hoped those present would endeavour to make use of what they had learnt that evening. He related what he called a fairy tale of how a friend of his, a pharmacist, had made a fortune by making immediate use of what he had learnt at a similar meeting by stopping up all night to put it into practical shape. He also gave a description of how the London County Council purified the London sewage, so that when it ran into the river it was clearer than the water of the Thames itself.

A vote of thanks to Mr. Idris for his kindness in being present, moved by Mr. CLARKE, Paddington, and seconded by Mr. WELFORD, Colney Hatch, brought a very instructive and profitable meeting to a close.

NORTH-EAST LANCASHIRE CHEMISTS' ASSOCIATION.

At a meeting of the Committee of this Association, held at Blackburn on March 27, Mr. J. HINDLE in the chair, Mr. R. LORD GIFFORD reported that he had attended the annual dinner of the Liverpool Association last week and, in view of the speech delivered there by the President of the Pharmaceutical Society, the inactivity of the Council and the retrograde policy advocated in the official Journal, he thought the time had arrived for a straight issue. He had asserted that chemists were united in claiming that the full effect of the Pharmacy Act of 1868 was the least that should be secured for the exclusive exercise of the persons who had satisfied the legal requirements of the Council's official examiners. The privileges intended to be conferred by that Act were (1) the exclusive use of titles, (2) the keeping open shop for the sale of scheduled poisons, and (3) the selling or distribution of those poisons. At present such an anomalous state of things existed—caused through the Council's failure to conserve the rights of chemists—that the eminently practical Lord Chancellor had insisted upon the absolute necessity of reform. Argument as to whether the Lord Chancellor was friend or foe was, in his opinion, puerile and beside the question. Naturally, his lordship took things as he found them. It was their business to object that the present position was contrary to the Statute, that to recognise it would amount to a repeal of the Act of 1868 and confiscation of the legally acquired rights of qualified chemists; that it would destroy the essential principle of the Act—viz., personal qualification and personal responsibility; and that such recognition would be at once monstrous and iniquitous. The President of the Pharmaceutical Society practically said that because Mr. Ritchie said this, and the Lord Chancellor said that, chemists would have to compromise. He denied entirely the right of the President to adopt a policy of compromise. No compromise was possible in dealing with a principle. They either held fast by it or they gave it away, and he maintained that qualified chemists were not prepared to give up their rights at the bidding of anyone. Qualified chemists were chafing for a fight. They cried aloud to the Council for a strong policy and an uncompromising attitude. Why, then, was the Council afraid to show its hand? Why could not it cause every member of Parliament to be educated by his constituents in the elementary justice of their case? The Council proposed to do nothing until the Bill came before Parliament! It was reasonable to suppose if the Council sent out to the local secretaries and combinations of chemists, instructions as to approaching members of Parliament throughout the country and, at the same time, the Council claimed inclusion in Clause 3, the attitude of Mr. Ritchie and the Lord Chancellor might be a little more considerate to the illustrious pharmacist whom all chemists were proud to have occupying the presidential chair. The Dewsbury Association had invited him (Mr. Gifford) to address them on Monday next, and he would then go more fully into what he thought the most desirable policy for the Pharmaceutical Society to pursue.

CAMBRIDGE PHARMACEUTICAL ASSOCIATION.

A meeting was held at Dale's Assembly Rooms on Friday, March 23, to discuss the suggestions of the Federation of Local Pharmaceutical Associations regarding Clause 2 of the Companies Bill. Mr. A. SIDNEY CAMPKIN, J.P., presided, and a lengthy discussion ensued, after which it was unanimously resolved to oppose Clause 2 in its entirety. A resolution that Sir Robert Penrose Fitzgerald, Bart., M.P., should be asked to receive a deputation was also unanimously carried, and, in accordance with that resolution, a deputation, consisting of the President, Mr. Alderman Deck, F.C.S., and the two Vice-Presidents, Messrs. A. Sidney Campkin, J.P., and E. Saville Peck, B.A., waited upon Sir Robert Fitzgerald on Wednesday, March 28. Mr. A. Sidney Campkin explained to Sir Robert Fitzgerald the provisions of the proposed

Clause 2 of the Companies Act, and the injustice that would be created thereby to the whole body of qualified chemists, and explained in detail the collective opinions of the President and members of the Council, as well as those of the pharmacists throughout the kingdom, as expressed by speeches and resolutions. He explained the provisions of the Act of 1868, and urged opposition to the proposed clause, which he believed would represent the opinion of the whole of the registered chemists. Mr. E. Saville Peck followed, and also urged opposition to Clause 2. Sir Robert Fitzgerald gave an attentive hearing, asked many questions, and after an interview of upwards of an hour expressed his opinion as favourable to the views of the deputation, and stated that the subject should have his serious attention.

EDINBURGH AND DISTRICT CHEMISTS' TRADE ASSOCIATION.

At a meeting held on Wednesday, March 28, Mr. DAVID McLAREN in the chair, reference was made to the death of the Treasurer, Mr. William Burley, and it was agreed to send a letter of sympathy to his widow. The Chairman then read a paper entitled "Forty Years in the Drug Trade," after which

Mr. W. S. GLASS read a paper on

THE COMPANIES BILL.

He said that Clause 2 united Great Britain and Ireland in a safe measure of control and protection—control of company pharmacy and protection to chemists, inasmuch as companies would be brought within the provisions of the Pharmacy Act of 1868. Instead of being a nonentity, as at present, the manager would be regarded as the supreme authority in the shop over which his name was posted. The safety of the public would be provided for and the spirit of the Pharmacy Act carried out. It would bring the companies directly under the control of the Pharmaceutical Society. That would be a great improvement, as at present companies were outside the Pharmacy Acts. By placing companies in a responsible position, there would be a guarantee for due observance of the provisions of the Act. There would be the manager responsible to the company and the company responsible to the Society. Chemists should not reject the clause, but neither could they approve of companies using their titles. The title conferred qualification, and therefore could not be obtained by means of a substitute; but that difficulty was more theoretical than practical, as the company's title could only be held in conjunction with and in virtue of the title held by a qualified assistant or manager. If the clause could be amended to restrict the titles, so much the better. It would be better to have the clause as it was than none at all. But unfortunately there was little likelihood of the Council of the Pharmaceutical Society supporting the clause, and if that body opposed the Government in its endeavour to solve a difficult problem, the door of reform would be closed for ten or twelve years to come. The modified clause which he proposed would run thus:—

No company may carry on the business of a pharmaceutical chemist and druggist unless such business is *bona fide* conducted by a manager or assistant being a duly qualified pharmaceutical chemist, or chemist and druggist, and unless the name of the person so qualified is conspicuously posted in letters easily legible in the shop or other place in which the business is carried on, and unless any name or title implying registration under the Pharmacy Acts be taken, used, or exhibited only in connection with the name of the duly qualified manager or assistant aforesaid, but subject to this provision anything which would be an offence under Sections 1 and 15 of the Pharmacy Act, 1868, if committed by an individual shall be an offence if committed by a company.

The members of the Council of the Pharmaceutical Society had not been able to grapple with the situation. Blind leaders of the blind, they had brought about in the country a lack of unanimity, and had shown themselves totally incapable of occupying the position of leaders. The Council must be strongly urged to make up its mind on this company question, and past events ought to convince men of understanding that in regard to legislation companies might be controlled, but never could be stopped.

It was agreed to discuss the paper at an adjourned meeting.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cera Alba.

WHITE BEESWAX is the wax separated from the honeycomb of the hive bee, *Apis mellifica*, Linn. (Order Hymenoptera), bleached by exposing thin bands of the natural yellow wax for several weeks to the action of air and sunlight, besides being watered from time to time and re-melted, if necessary, so as to expose fresh surfaces. Bleaching may also be effected by the aid of chemicals, such as chromic or nitric acid, but white wax so prepared is excluded by the official description. White beeswax has emollient properties, and is used in the preparation of Pilula Phosphori, Suppositoria Acidi Carbolici, Unguentum Aquæ Rosæ, and Unguentum Cetacei.

CHARACTERS AND TESTS.—White beeswax occurs in hard, nearly white, translucent masses, and should respond to the same tests as yellow beeswax. It is entirely soluble in oil of turpentine, insoluble in cold 90 per cent. alcohol, but soluble in about 100 parts of boiling alcohol; it is also soluble to a slight but variable extent in cold ether and in 10 parts of boiling ether.

NOTES.—The distinctive characters of white beeswax are its hardness, yellowish-white colour, and translucency. It may be adulterated with lard, tallow, paraffin, starch, or mineral substances, such as kaolin. Lard or tallow renders the wax soft and lessens its specific gravity; paraffin is not affected by sulphuric acid; starch and inorganic impurities are insoluble in oil of turpentine; moreover, starch gives a characteristic blue coloration when the wax containing it is boiled with water, and solution of iodine added to the cooled liquid.

Cera Flava.

YELLOW BEESWAX is a secretion formed by the hive bee, *Apis mellifica* (Order Hymenoptera), and used by that insect to make the walls of the cells of which the honeycomb consists. After the honey has been separated, the wax is melted with water, separated, and strained. It possesses emollient properties, and is chiefly used in medicine as an ingredient of plasters and ointments, preparations made with it keeping a long time without becoming rancid. When bleached by exposure to moisture, air, and light, it constitutes the official Cera Alba; it is also used in the preparation of Emplastrum Calefaciens, Emplastrum Cantharidis, Emplastrum Menthol, Emplastrum Picis, Unguentum Hydrargyri Compositum, Unguentum Picis Liquidæ, Unguentum Resinæ, and Unguentum Staphisagriæ.

CHARACTERS.—Yellow beeswax, when pure, is firm, breaking with a granular fracture; it is yellowish in colour, possesses an agreeable honey-like odour, and is not unctuous to the touch. It should dissolve readily and entirely in hot oil of turpentine, but should not yield more than 50 per cent. to cold ether, nor more than 3 per cent. to cold 90 per cent. alcohol. It is quite insoluble in water or boiling sodium hydroxide solution. The specific gravity of beeswax varies from 0.960 to 0.970, and its melting point from 62.5 to 64° C., the solidifying point being two or three degrees lower.

TESTS.—If beeswax contain fatty acids, resin, or Japan wax, those impurities may be detected by their solubility in boiling sodium hydroxide solution, the filtered liquids becoming turbid by the separation of free fatty acids, or even yielding a precipitate thereof, on adding hydrochloric acid. On melting 5 Gm. of beeswax in boiling 90 per cent. alcohol and mixing it therewith, not less than 1.6 C.c. of normal alcoholic volumetric solution of potassium hydroxide will be required to effect neutralisation, whilst upon adding 20 C.c. more of the volumetric solution and well boiling for one hour under a reflux condenser, from 6.2 to 6.8 C.c. should combine with the beeswax. This saponification test shows

the freedom or otherwise from paraffin, fats, etc. (see *P. J.* [4], 5, 286). Paraffin separates unaltered when 5 Gm. of beeswax containing it is heated for fifteen minutes to 160° C. with 25 Gm. of sulphuric acid, though the beeswax is completely charred by the acid. The absence of starch is indicated by the iodine test.

NOTES.—The distinctive characters of yellow beeswax are its consistence, colour, odour, solubility, specific gravity, and melting point. It consists of about 15 per cent. of cerotic acid, $C_{26}H_{53}COOH$, a homologue of acetic acid, and more than 80 per cent. of myricin or myricyl palmitate, $C_{15}H_{31}COOC_{30}H_{61}$, the palmitic ester of myricyl alcohol, $C_{30}H_{61}OH$, a homologue of ethyl alcohol. An aromatic body, cerolein, is also found in beeswax. Most substances used to adulterate beeswax affect its specific gravity and melting point. The adulterants usually met with include barium sulphate, kaolin, ochre, or other mineral substances, all of which are insoluble in hot oil of turpentine, as are also starch, flour, etc. Resin and stearic acid are soluble in 90 per cent. alcohol; soap dissolves in hot water, and the solution becomes cloudy on adding hydrochloric acid, owing to the separation of fatty acids; paraffin reduces the density of the wax and the amount of potassium hydroxide required for complete saponification, whereas lard, tallow, and other fats require more alkali to effect complete saponification than is needed in the case of beeswax. Aqueous solution of sodium hydroxide saponifies tallow, suet, Japan wax, fats, etc., but an alcoholic solution is required to saponify beeswax.

Cetaceum.

SPERMACETI is a concrete, fatty substance, which crystallises from the oil obtained from the sperm whale, *Physeter macrocephalus*, Linn. (Order Cetacea). The oil is contained chiefly in a huge cavity in the head of the whale, but also occurs in smaller cavities in the body of the animal. The crystalline matter deposited from the oil on keeping is separated by filtration, pressed, melted, and purified from the last traces of oil by washing with dilute sodium hydroxide solution, being subsequently separated from the soap produced and freed from excess of alkali. It possesses emollient properties, and is used in the preparation of Unguentum Aquæ Rosæ, Unguentum Capsici, and Unguentum Cetacei.

CHARACTERS AND TESTS.—Spermaceti occurs in crystalline, pearly-white, glistening masses, which are translucent, slightly unctuous to the touch, and have but little taste or odour. It can be reduced to powder by the aid of a little 90 per cent. alcohol. It is insoluble in water, nearly insoluble in cold 90 per cent. alcohol, but soluble in ether, chloroform, boiling alcohol, and in fixed or volatile oils. It should melt at 46° to 50° C., and not more than one drop of volumetric solution of sodium hydroxide should be required to neutralise 0.2 Gm. when dissolved in 20 C.c. of 90 per cent. alcohol. The latter test indicates the absence of stearic or other fatty acid. Stearic acid, if present, is also precipitated on boiling spermaceti with 90 per cent. alcohol, cooling the mixture, filtering to remove the separated spermaceti, and adding water to the filtrate.

NOTES.—The distinctive characters of spermaceti are its pearly, crystalline appearance, the minute quantity of fatty acid it contains, and the fact that 1 Gm. requires between 125 and 135 Mgm. of potassium hydroxide to effect complete saponification. It consists almost entirely of cetyl palmitate, $C_{15}H_{31}COOC_{16}H_{33}$, the palmitic ester of cetyl alcohol, $C_{16}H_{33}OH$, together with small quantities of closely allied homologous esters.

Chirata.

CHIRETTA or CHIRAYTA, is the dried plant, *Swertia chirata*, Ham. (N.O. Gentianeæ), an erect herb, indigenous to the mountainous districts of Northern India. The entire plant is collected when flowering is well advanced and many fruits are formed, dried, and made into bundles about a metre in length, and weighing from

700 to 900 grammes each. The drug possesses bitter tonic and stomachic properties, without astringency; it is used in the preparation of Infusum Chiratae, Liquor Chiratae Concentratus, and Tinctura Chiratae.

CHIRETTA.—A, inflorescence of *Swertia chirata*; B, longitudinal section of stem; C, detached flower, showing calyx; D, corolla laid open, showing nectariferous glands; E, ovary; F, transverse section of ovary. A and B, natural size; C, D, E, and F, enlarged.

CHARACTERS.—Chiretta has a smooth yellowish-brown or purplish-brown stem, about a metre in length, slightly winged and much branched above, and rounded below. It contains a large, continuous, easily separable pith, enclosed by a narrow ring of wood and a very thin bark. The slender, elongated branches are arranged in a decussate manner, *i.e.*, successive opposite pairs are at right angles to each other; the branches in turn ramify further and bear numerous flowers and fruits. The few leaves usually found in the drug are opposite and without stalks, ovate to lanceolate in shape, and taper-pointed. The surface of the leaf is smooth, the margin entire, and there are usually three to seven lateral veins. The flowers are officially described as numerous, though not many are present in the drug; they are small, with yellow rotate corolla, and paniced, the inflorescence being a paniced cyme. The superior unilocular or one-celled fruits are formed from two carpels, and contain numerous minute reticulated seeds. The drug has no marked odour, but an extremely bitter taste.

NOTES.—The distinctive characters of chiretta are the brown colour of the stem, large continuous pith, intensely bitter taste, opposite leaves, and bicarpellary, unilocular fruits. Other species of *Swertia*, which are sometimes found mixed with chiretta, can be distinguished from it by the first three characters; the other two serve to distinguish chiretta from plants belonging to other natural orders, such as *Andrographis paniculata*, Nees (N.O. Acanthaceae). The root of *Rubia cordifolia*, Linn. (N.O. Rubiaceae) has also been found enclosed in bundles of chiretta. The tapering root of chiretta attains a length of about 10 Cm., and may measure about 12 Mm. in thickness at the crown. It is less frequently branched than the stem, but always bears some rootlets. In stronger specimens the root is somewhat oblique, the stem in such cases being probably the product of a second year's growth.

Chrysarobinum.

CHRYSAROBIN is a substance obtained from Araroba or Goa powder (see *ante*, p. 141) by extracting the crude drug with chloroform, evaporating the solution to dryness, and powdering the residue. It consists chiefly of chrysarobin, $C_{30}H_{26}O_7$, associated with a varying quantity of chrysophanic acid, $C_{14}H_5(CH_3)(OH)_2O_2$. The drug possesses parasiticide properties and is used in the preparation of Unguentum Chrysarobini.

CHARACTERS AND TESTS.—Chrysarobin is a crystalline yellow, tasteless, inodorous powder. It is entirely soluble in hot chloroform and almost so in hot 90 per cent. alcohol, partially soluble in petroleum spirit, but only slightly soluble in water. The drug dissolves partially in potassium hydroxide solution, and assumes a deep brownish-red colour. It melts when heated with free access of air, giving off yellow fumes, and leaves not more than 1 per cent. of ash on incineration.

NOTES.—The distinctive characters of official chrysarobin or purified Goa powder are its appearance, solubility, and small percentage of ash. The chrysophanic acid it contains dissolves readily in dilute caustic alkalis, yielding deep-red solutions; chrysarobin, properly so-called, is less easily soluble, and is rapidly oxidised to chrysophanic acid when dissolved by a strong alkali, the solution turning from yellowish-brown to deep red, a change which may be hastened by passing a current of air through the solution.

Obituary.

BROWN.—On March 21, at Sutton Without, Thomas Brown, Chemist and Druggist. Aged 43.

FERRIDAY.—On March 21, Edwin Joseph Pitchford Ferriday, Chemist and Druggist, Birmingham. Aged 46. Mr. Ferriday was a life member of the Pharmaceutical Society.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

COMPOUNDS OF THE EMETIC SERIES.

Commenting on the results of the researches of Baudran and others, on tartar emetic and analogous compounds, L. Prunier points out that considerable light has been thrown upon these derivatives of tartaric acid, which present so many distinctive characters that he suggests the generic name of "emetics" for these bodies. When recently precipitated antimonious oxide is dissolved in the cold in tartaric acid, two acids, either mono-antimonio-tartaric acid, $\text{COOH}-\text{CHOH}-\text{CHOSbO}-\text{COOH}$, or diantimonio-tartaric acid, $\text{COOH}-\text{CHOSbO}-\text{CHOSbO}-\text{COOH}$, may be obtained, according as one or two molecules of antimonious oxide are present. In both these only the two alcohol groups enter into the reaction, both the acid groups remain free. On saturating one of the acid groups of mono-antimonious acid with potassium hydrate a typical "emetic" is obtained. In a similar manner diantimonio-tartaric acid gives an analogous body on mixing, in solution, one molecule with a molecule of neutral potassium tartrate, thus, $\text{COOH}-\text{CHOSbO}-\text{CHOSbO}-\text{COOH} + \text{COOK}-\text{CHOH}-\text{CHOH}-\text{COOK} = 2(\text{COOH}-\text{CHOSbO}-\text{CHOH}-\text{COOK})$. Similarly constituted "emetics" may be obtained by substituting arsenic or bismuth for antimony. Not only so, but other metallic oxides and hydrated sesquioxides, such as those of iron and alumina, and also boric acid, combine in a similar manner.—*Bull. Soc. Chim.* [3], **23**, 101.

NEW STAINS FOR GONOCOCCUS.

Pick's stain for gonococcus consists of Ziehl's carbol-fuchsin, 15 drops; concentrated alcoholic solution of methyl blue, 8 drops; distilled water, 20 C.c. Stain cold for ten seconds, wash, dry, and mount. The gonococcus is stained deep blue, other bacteria light blue, cell nuclei lighter blue, protoplasm pink. Lanz's stain consists of saturated solution of fuchsin in 2 per cent. aqueous phenol, 10 C.c.; saturated solution of thionin in 2 per cent. aqueous phenol, 30 C.c. Mix, stain for fifteen to thirty seconds, and wash with water. Gonococci are stained by thionin, and nuclei take both colours. Both solutions should be freshly prepared.—*Inter. Med. Mag.*, **9**, 53.

CARBOHYDRATES OF LUCERNE AND FENUGREEK SEEDS.

The so-called galactine which Muentz isolated from the seeds of lucerne is, according to Bourquelot and H. Hérissey, really a mannogalactane, yielding on hydrolysis practically equal quantities of mannose and galactose. Fenugreek seeds yield an analogous substance, which, however, is less soluble in water and yields relatively more mannose and less galactose than the product from lucerne seeds. Both these carbohydrates are hydrolysed by semiase. They are extracted by macerating the ground seeds with excess of solution of lead acetate, removing the excess of lead with oxalic acid, and precipitating the carbohydrate from the aqueous filtrate by the addition of alcohol.—*Comptes. rend.*, **130**, 731.

CRYSTALLINE BISMUTH OXYALS.

By heating the amorphous precipitates of the oxychloride and oxybromide of bismuth with a large volume of water in the presence of excess of hydrochloric or hydrobromic acid, so as to dissolve the precipitate, and then allowing the solution to cool, A. de Schulten obtains the respective oxyalts in a definite crystalline form. BiOCl and BiOBr thus obtained, occur in clear, colourless, quadratic crystals. The oxyiodide, BiOI , on the contrary, crystallises as the temperature rises, in the form of clear copper-coloured crystals, when a solution

of bismuth oxide is dissolved in excess of hydriodic acid, then diluted with a large volume of water and warmed on the water bath. If a considerable excess of acid be not present, black crystals of bismuthous iodide will be formed.—*Bull. Soc. chim.*, **23**, 156.

ANIMAL FERMENTS.

Further experiments with the ferments of horse kidney have shown E. Abelous and E. Gérard that not only does that organ contain an oxydase and a reducing diastase (*P.J.* [4], **10**, 41), but that the latter also has, in an atmosphere of hydrogen, the power of converting nitrobenzol into phenylamine. That action explains the formation of bases in the organs of animals, and confirms the opinion of A. Gautier that they are formed in the tissues, particularly in the anaerobic cells, apart from any action of putrefactive germs. The fact of the co-existence of the oxidising and reducing ferments, and the predominance of the latter in the absence of oxygen, explains the increased formation of organic bases, when the energy of the reactions brought about by oxidation is diminished, as is found to be the case in certain diseases.—*Comp. rend.*, **130**, 420.

CELLULOSE TETRACETATE.

This ester is prepared by heating a mixture of molecular proportions of cellulose with magnesium or zinc acetate and 2 molecular weights of acetyl chloride, and eventually with acetic anhydride. Nitrobenzol (as a solvent) is gradually added to the acetylising mixture, the greater part being added at the last, when the temperature is highest. The reaction is represented by the following equation:—

$$\text{C}_6\text{H}_{10}\text{O}_5 + \text{Mg}(\text{C}_2\text{H}_3\text{O}_2)_2 + 2\text{CH}_3\text{COCl} = \text{C}_6\text{H}_8\text{O}_5(\text{C}_2\text{H}_3\text{O}_2)_4 + \text{MgCl}_2 + 2\text{H}_2\text{O}$$

Cellulose tetracetate is insoluble in alcohol, ether, and acetone, but soluble in chloroform, in glacial acetic acid, and in nitrobenzol. It separates from the latter as a transparent jelly; it is not acted on by alkalis nor by strong acids. It differs from nitrocellulose in not being explosive, and may be used as an insulator for electrical purposes.—*Pharm. Centralh.*, **41**, 68.

CONSTITUENTS OF EAST INDIAN SANTAL OIL.

M. Guerbet has isolated the following constituents from East Indian santal oil. Two sesquiterpenes α - and β -santalene, $\text{C}_{15}\text{H}_{24}$; two corresponding sesquiterpene alcohols α - and β -santalol $\text{C}_{15}\text{H}_{26}\text{O}$; an aldehyde, *santalal* $\text{C}_{15}\text{H}_{24}\text{O}$; *santalie acid*, $\text{C}_{15}\text{H}_{24}\text{O}_2$; *teresantalie acid*, $\text{C}_{10}\text{H}_{14}\text{O}_2$; also small quantities of more volatile bodies of powerful odour, present to the extent of only 0.2 to 0.3 per cent. of the oil, but to which the greater part of the aroma is due, since the other constituents, except santalal, are almost odourless. α -Santalene has the following characters:—Boiling point, $252^\circ-252^\circ.5\text{C}$.; sp. g. 0.9134 at 0°C . rotation $-13^\circ 98'$; β -santalene boils at $261^\circ-262^\circ\text{C}$., has a rotation of $-28^\circ 55'$ and sp. g. of 0.9139 at 0°C . The mixture of the two alcohols, α and β -santalol, which have not yet been separated, varies in rotation from $-9^\circ 4'$ to $-25^\circ 3'$. *Santalal* boils at 180°C . under 40 Mm. pressure; it is a colourless oily liquid with a powerful pungent odour. It gives a crystalline semicarbazone melting at 212°C . *Santalie acid* boils between $210^\circ-212^\circ\text{C}$. under 20 Mm. pressure. It is a weak acid resembling campholic acid in its characters and affords crystalline salts. It may also be obtained by the oxidation of *santalal*. *Teresantalie acid* is a solid body which crystallises from alcohol in large colourless prisms, melting at 157°C . It boils at 183°C . under 28 Mm. pressure. It is liberated from the alkaline salts, after the saponification of the esters, by treatment with sulphuric acid, when *teresantalie* and *santalie* acids separate as an insoluble layer, while acetic acid and a trace of formic acid are found dissolved in the aqueous layer. *Teresantalie acid* is volatilised by steam distillation whereas *santalie acid* remains behind. The oil of santal employed for the research had the sp. g. 0.9674 at 0°C . and its optical rotation was $-21^\circ 1'$.—*Comp. rend.*, **130**, 417.

NOTES ON THE B.P. STANDARDISATIONS.*

BY JOHN A. DEWHIRST, PH.C., F.C.S.

When one turns to the chemical and pharmaceutical literature concerning the determination of alkaloids in plants and their preparations, one is struck by the great amount of work that has been done on the subject, by the great similarity of the numberless processes suggested, and again by the conflicting accounts of the efficacy or otherwise of the latter. The differing constituents of a particular species of plant, according to the nature of its surroundings during growth, the time of collection, the strength of alcohol used in making the extract or tincture, and the varying methods as to heat, etc., employed by manufacturers, account for this discrepancy to a large extent. The "personal equation" of the analyst has a good deal to do with it. Details of manipulation employed by one, but considered too unimportant for publication, make his process quite unworkable by another, and hence arise the multitude of processes. After all, we are dealing with only one class of chemical substance, and consequently one process only might be expected to suffice for all cases. Speaking broadly, it does. Chloroform is undoubtedly the best all-round solvent of alkaloids, and when a liquid preparation containing one or more of them is made alkaline and shaken with it in two or three quantities, the alkaloids are extracted. Subsequent treatment of this chloroform solution with acidulated water extracts them again, and leaves colouring matters and other substances in the chloroform, whilst the alkaloids are now in a fairly pure condition in the aqueous solution, and can be dealt with according to the particular preference of the analyst. They can be precipitated by various reagents, such as tannic acid, picric acid, iodine, mercuric or bismuth iodides, in presence of potassium iodide, phosphomolybdates, or sulphovanadates, filtered off and weighed, or the precipitate decomposed and the alkaloid extracted in a pure condition. Or they may be titrated with standard solutions of the above. The results, however, are not reliable in most cases, and in the others there seems no advantage over the simpler method of titrating the alkaloid residue with standard acid. Prescott has devised some rather elaborate methods of determination by precipitation with standard iodine, filtering off an aliquot part, and titrating the excess of iodine with thiosulphate. The somewhat uncertain composition of the iodine compound, and in cases the extreme dilution of the alkaloidal solution, probably introduce more error than in the above simpler method.

A recent suggestion for the easy titration of coloured alkaloid residues consists in the use of an ammoniacal solution of copper oxide. Dissolve 10 Gm. of copper sulphate in 500 C.c. of water, add ammonia till the precipitate first formed is nearly dissolved, filter and dilute to a litre. Titrate a portion of this with standard acid to the formation of a persistent turbidity, and note quantity used. For a determination 0.1 Gm. of alkaloid is dissolved in 20 C.c. dilute H_2SO_4 , the flask placed on a black surface, and the ammoniacal copper solution added to persistent turbidity. This shows the amount of acid left uncombined with the alkaloid.

Unfortunately, when the preparation to be standardised is shaken with chloroform and ammonia, troublesome emulsions are usually formed which make the process either impracticable or a matter of days. This difficulty is largely overcome by a preliminary treatment with acid and chloroform which removes some objectionable emulsifying matter. Indeed, the principle of shaking with ammonia or other alkali and the solvent in the first place may be considered as superseded by the acid method. Other solvents, such as ether, benzene, petroleum ether, and amyl alcohol, separate from alkaline solutions better than chloroform, and they may be employed with the acid method, but as final extractors of alkaloid from alkaline solutions they are, with the exception of amyl alcohol, unsatisfactory. Amyl alcohol has the disadvantage of a high boiling point, and it requires heat and a reduced pressure or

strong current of air to evaporate in a reasonable time and leave the alkaloidal residue in a condition suitable for weighing or titration. It is a recognised custom now to use only small quantities of the galenic for standardisation, and the resulting small quantity of alkaloid cannot be satisfactorily weighed in a comparatively large dish, which is condensing moisture from the air and getting heavier every moment. Moreover, time is taken up in drying the alkaloid perfectly, and in some cases one must be careful not to allow the temperature of the oven to rise above a certain point. All this is tedious and unnecessary. A fair idea of the alkaloidal yield is usually possessed by the operator, and a better check is obtained by a parallel determination.

BELLADONNA.

Taking the Pharmacopœia standardisations in alphabetical order, we come to Belladonna first. The B.P. method—shaking the liquid extract with chloroform and ammonia—produces intractable emulsions. To avoid them Alcock has proposed a method which is a great improvement. He first shakes out with acid and ether, and then with a mixture of ether and chloroform in the proportion of one to two or more, with the addition of ammonia. The separations occur fairly readily, but, in my experience, ether or any mixture of it with chloroform is an incomplete solvent of alkaloid in this case and others. A subsequent shaking with chloroform alone will always extract a further small quantity. Bird's preliminary shaking with chloroform and acid is excellent, and on treating with ammonia and chloroform the separation takes place even better than in Alcock's process. Bird recommends that the full B.P. process be then gone through, but this is not necessary. If the final chloroform is washed with a little water, the residue of alkaloid obtained on spontaneous evaporation is as crystalline and colourless as when the full B.P. method is followed. It is necessary to wash the first acid chloroform with a little water and add it to the bulk of the aqueous liquid, and then the alcohol of the preparation need not be removed as Wilson requires.

Dowzard has suggested a process involving the use of sand, percolation and the taking of an aliquot part of the solvent. The extraction by percolation through sand is not easy, using a reasonably small quantity of solvent, and the taking of an aliquot part is always an uncertain method.

CINCHONA.

Taking now the cinchona determinations. With respect to the tincture and liquid extract, we have the treatment with potash and benzolated amyl alcohol. This, again, produces an emulsion. A more satisfactory method is the preliminary with acid and ether, subsequently with ammonia and ether-chloroform (1:2) twice, and finally with chloroform alone. The minimum of emulsion occurs, and the alkaloid is completely extracted. Stenhouse's method of extraction with mixture of ether and chloroform in proportion of 9 to 1 gives a low result.

I think the process for determining the alkaloids in the bark needs revising. It is easy to get 500 C.c. of amyl alcohol by digestion and percolation, and then this quantity is directed to be extracted with 14 C.c. of acid water until all alkaloid is removed. This is not readily done. A considerable quantity of acid is used. This has to be neutralised with ammonia, and the liquid concentrated to 16 C.c. Now, at this degree of concentration there is a good proportion of ammonium chloride present, and a sticky brownish deposit forms, containing much alkaloid. The crystals of the tartrates mix with it, and cannot be got out of the vessel on to a filter paper. A volume of 24 C.c. appears to be low enough. A rough experiment with known weights of the alkaloids gave a sufficient weight of precipitate, and at this volume the brown deposit does not form.

At best, however, the process is a large undertaking, and one dealing with smaller quantities would be a great improvement.

EXTRACTUM IPECACUANHÆ LIQUIDUM.

The B.P. determination of this is a more vexed question than any other. There have been many suggested modifications. First we

* Read at a meeting of the Chemists Assistants' Association, March 29, 1900.

have Wilson's, which relies on ether-chloroform—equal parts—to extract all the alkaloid. Moreover, he ignores the alkaloid in his acid chloroform. Then we have Farr and Wright's, which produces bad emulsions. They have a quick method of extracting direct with chloroform and ammonia, and titrating the residue. Again, bad emulsions are formed, the residue is needlessly impure, and how they get a lower titration value by a simpler process I don't understand. The inference is that by going through two more operations more alkaloid is picked up from somewhere. Their purification by means of iodine gives an alkaloid by no means free from colour. This, and the fact that no solvent removing the whole of the alkaloid does so without taking up colour, and that the titration value does not come up to the weight, seems to point to the presence of coloured alkaloid—like that in cinchona—with a high molecular weight.

Naylor and Bryant's No. 4 process is an advance, but they do not direct the washing of the acid chloroform, and emulsion also occurs. Alcock's appears the quickest and best, yielding the highest result.

Farr and Wright's statement that in titrating the residue the end point is sharp and precise, is not confirmed by Henderson, Bird, or general experience; but I cannot agree with Henderson that weighing is superior to titration, whether the alkaloids are in unchanging proportion or not.

Bird stoutly upholds the B.P. process with the modification of heating the lead precipitate to cause aggregation and facilitate washing, but I fear the process will not be generally used, official though it is. The question arises whether the use of another process is allowable, but the B.P. states that the extract must contain 2 to 2½ grains of the alkaloids in 110 minims, and then directs the use of a process which might result in the production of an extract containing more than 2½ grains.

NUX VOMICA.

I have never had any particular difficulty with the B.P. process for the extraction of the alkaloids from Ext. Nucis Vom. Liq., but Alcock proposes his ether method here also, and I have no doubt it works quickly. I would suggest, however, that he washes his ether solutions.

The ferrocyanide process for the separation of strychnine and brucine is unsatisfactory. It has been pointed out that the concentration of the alkaloid solution is greater than that employed by Dunstan and Short, but even when this is remedied the fact remains that both alkaloids are precipitated, and that no amount of washing will separate them. If washing be continued till bitterness ceases no alkaloid is left, and if it be stopped at any point the resulting alkaloid is found to contain brucine in an uncertain quantity. It is very unsatisfactory to weigh as strychnine what you afterwards prove to contain brucine. The nitric acid process is the most accurate. Use the B.P. process as far as the extraction with 30 C.c. of acid water. Concentrate this to one half; add 1 C.c. of nitric acid (1.42). In an hour make alkaline with ammonia, and extract with chloroform. Test experiments made with known quantities of strychnine and brucine yielded 100 per cent. of strychnine when carefully done. A source of loss exists in the violent decrepitation of the strychnine on crystallising if due precautions are not taken. The brucine used in these experiments proved to contain the merest trace of strychnine.

Another process is recommended, using KMnO_4 as the oxidising agent in place of nitric acid; but an acid solution of strychnine decolorises the permanganate to some extent, and therefore loss appears inevitable.

OPIMUM.

In the case of opium no less a quantity than 14 Gm. is directed to be used in standardisation. This is an absurdly large quantity, and in the case of the tincture one-seventh of the volume made is so employed. This must be a ruinous quantity for a retail man, and the B.P. is carefully compiled in these matters from the retail man's

point of view. The filtering off of an aliquot part of the aqueous solution has undoubtedly been proved erroneous, and the allowance of a certain fixed amount of alkaloid for waste is an admission of error. The fact is, that the quantity of morphine left in solution varies. I have found in it more than twice the amount allowed.

It appears to me that a process on the following lines would be an improvement. Take 10 C.c. of the tincture, add 0.5 Gm. of lime. Warm to cause aggregation. Filter and wash. The morphine is quickly all washed through. Shake the liquid twice with benzene, washing the latter with a few C.c. of water. This benzene on evaporation gives a considerable residue of alkaloid, from which lime-water extracts the merest trace of morphine. Then add ammonium chloride and a little ammonia to the aqueous solution, and shake out with hot amyl alcohol. If this is not done quickly the morphine crystallises out and is soluble with great difficulty in the amyl alcohol. The latter is easily evaporated with gentle heat and a stream of air through the containing flask. The residue is rather dark-coloured, but it can be titrated with ease in the B.P. manner, using litmus paper.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Society's Library and Museum.

The question of opening the Society's London Library in the evening appears to be becoming somewhat acute, judging from the number of protests that have been entered against the rule at present prevailing, and the matter is one of sufficient gravity to merit serious consideration. As the Editor has pointed out, it was for a time customary to keep open the Society's premises at Bloomsbury Square until 10 p.m. every day except Saturday, but the time of closing has gradually crept back, until the Library and Museum are virtually not open in the evening at all. I refer here to the Museum because we must not lose sight of the fact that the Museum is affected by the recent decision of the Committee, as well as the Library, so that it is now impossible for any London assistant or apprentice to refer to materia medica specimens or books after 6 p.m., which in most cases means not at all, as comparatively few can get away from business for a sufficient length of time during the day. The seriousness of the position is obvious, and it would be interesting to know whether the Library and Museum Committee had any evidence to justify its action in the matter, except the usual attendance statistics. I say advisedly "except" statistics, for I know well how easy it is to prove almost anything by means of figures. But no member of the Society who ever has occasion to use the Library or Museum seriously, and finds himself permanently excluded because he cannot attend before 6 p.m., is likely to be conciliated by the production of figures proving that he and other members have not maintained the average nightly attendance above a certain point.

The Necessities of the Case.

The truth is that members and students who only have their evenings free have a much greater claim to consideration than appears to have been recognised. An individual who is so limited as regards time, and entitled to make use of the Society's Library or Museum, may not have occasion to attend more than once or twice a year, but it may be a matter of the highest importance that he should be able to gain admittance on those occasions, and, to me, it appears hardly reasonable that he should be prevented by the existence of a somewhat arbitrary rule. If all libraries and museums were permanently closed during certain hours because of the small attendance during those hours, there would never be any occasion for some of them to be open at all. I am disposed to think that if the members had been asked to state their views on this subject, when the Society's premises were kept open till 9 p.m., a very different arrangement

from the actual one would prevail at the present time. Any question about unduly prolonging the hours during which the Librarian and Curator are in attendance need not arise. Indeed, it is well known that it has not been customary for the Curator to be in attendance after 6 p.m., though much useful work has been done in the Museum after that hour. With a satisfactory reference catalogue, such as does not now exist, there would be almost as little reason for detaining the Librarian until a late hour. But the main point appears to be that attention should be paid, in the first place, to the necessities of members and students of the Society. And that can hardly be said to be the case at present, having regard to the fact that so many are absolutely precluded from taking advantage of the facilities offered.

The Case of Carbolic Acid.

The figures quoted in last week's *P. J.* from the Registrar-General's latest report are decidedly satisfactory, as showing how comparatively few accidental deaths and suicides are caused by poisons over the distribution of which pharmacists are enabled to exercise some measure of control. Unfortunately, the same cannot be said of the position in respect of other poisons, and more particularly of carbolic acid. It is not many years since fatalities due to the misuse of that poison were as uncommon as those caused by other unscheduled substances, but the possibilities offered by carbolic acid have been so well advertised by the lay Press that it has become one of the most fashionable means of terminating existence, whilst its vastly increased use for so-called disinfecting purposes has helped to swell the total of accidental poisoning cases to an enormous extent. If carbolic acid were included in the list of scheduled poisons, the position in both respects would be very different, but vested interests have so far thwarted all efforts to protect the public efficiently against its misuse. The Council of the Pharmaceutical Society has repeatedly taken action in the matter, but the Privy Council has declined to follow suit and, as a result, carbolic acid maintains its high record as a destroyer of human life. To show to what an extent that is the case, I propose to quote statistics, in spite of what I have already written concerning the sometimes unsatisfactory nature of such evidence. In the present instance, however, no other evidence is available.

A Comparison of Figures.

I have therefore, taken the trouble to pick out from the Registrar-General's dry-as-dust reports for the five years 1894 to 1898 inclusive, figures showing the total number of deaths by poisoning in England and Wales. The result appears in the following table:—

Year.	Accidents.	Suicides.	Murders.	Man-slaughters.	Total.
1894.....	588	501	2	0	1091
1895.....	598	580	6	0	1184
1896.....	619	472	2	0	1093
1897.....	691	504	3	1	1199
1898.....	620	494	2	1	1117
1894-98	3116	2551	15	2	5684

We see that the total number of deaths caused by poison during the five years was 5684, of which 3116 were the result of accident; 2551 cases of suicide, and 17 of homicide. Comparing those figures with what are recorded in respect of carbolic acid, we get the startling result that between one-sixth and one-fifth of the deaths caused by poison were officially attributed to that one article. The figures for carbolic acid are given in the second table.

Year.	Accidents.	Suicides.	Murders.	Man-slaughters.	Total.
1894.....	34	167	1	0	202
1895.....	34	224	3	0	261
1896.....	34	163	0	0	197
1897.....	43	176	0	0	219
1898.....	37	169	0	0	206
1894-8	182	899	4	0	1085

Carbolic acid, that is to say, caused 1,085 deaths during the five years, including 182 accidental cases, 899 suicides, and 4 murders. The suicidal cases preponderate largely, it will be observed, and it seems impossible to resist the impression that, if carbolic acid were not so easily obtainable, the number of such cases must be largely diminished. It may be urged that if carbolic acid had not been available, those 899 unfortunates would have adopted other means of shuffling off the mortal coil, but that assertion is of doubtful value and incapable of proof. In any case, it would be merciful to close such an unpleasant avenue of escape from mundane troubles; death need not be preceded by intolerable torture.

The Photographic Business.

I understand that this week's issue of the *P. J.* will contain the usual annual Photographic Supplement, the object of which is to convey practical up-to-date information in photographic matters to pharmacists who eke out their modest income from the practice of pure pharmacy by the sale of cameras, lenses, and appliances and materials used in connection therewith. The amateur photographer is the individual usually catered for, but some business may occasionally be done with local professionals. In that connection, let me warn my fellow craftsmen to beware of giving too long credit. As regards prices, most professionals expect a little discount, and some are not above saying that they get a much bigger discount from one's business opponents. But, as a rule, it is wise to pay no attention to such remarks. In this connection, it may be stated that the Photographic Plate and Paper Makers' Association, which includes almost every leading firm, has laid down certain fixed rules, which, if they are broken by anyone and the fact be brought to notice, leads to the somewhat summary and unpleasant penalty of a stoppage of supplies. The rules relating to the sales of plates, papers, and films in the United Kingdom are that those articles shall only be sold (1) in original unopened packages; (2) retail, not under manufacturers' published list prices; (3) to professional photographers, with not more than the following discounts:—PLATES AND FILMS (rollable films excepted)—£2 per month, 5 per cent.; £5 per month, 7½ per cent.; £10 per month, 10 per cent., with 5 per cent. extra if the account be paid on or before the last day of the following month. The discount allowed on the quire of printing-out paper (or its equivalent in cut sheets or bromide paper) and upwards is not more than 10 per cent. When sales of less than £2 worth of plates or 1 quire of paper are made for cash to a professional, no discount may be allowed; but, when such a customer's total cash purchases during the month are £2 or over, he may be credited with the discounts as per scale on production of his invoices at the end of the month.

The Association Worthy of Support.

Some may grumble and say they don't see why they should not sell how they like, but I can say from experience that the Association has done an enormous amount of good by stopping the cutting of retail prices, and by the wholesale trade giving retailers a living profit where, in many cases, they formerly got none. It is true that, in some few cases, the rulings of the Association are hard,

but was there ever a set of rules that did not press hardly here and there on someone or other. All communications about the Association should be made to the "Secretary," Photographic Manufacturers' Association, London Chamber of Commerce, Eastcheap, London, E.C. I may state briefly what the other rules of the Association are. Carriage will be paid by the manufacturers on £5 (net) worth of plates and papers, or on £4 (net) worth of paper only, to dealers direct, or to professionals on dealers' orders; but not to dealers on dealers' orders, and on all amounts within Carter, Paterson, and Co.'s district. Dealers are not permitted to allow more than the manufacturers' trade discount, *i.e.*, no cash or counting house discount is to be allowed by one dealer to another dealer or shipper. Dealers' terms may be allowed to chemists and other traders, after careful inquiries, but no manufacturer or dealer may allow more than the foregoing terms to any photographer (whether he is also a dealer or not) without the consent of the manufacturers signing the agreement. Finally, photographic plates, papers and films must not be sold off at clearance sales at reduced prices, except with the consent of the Association, and under certain conditions, which may be ascertained from the Secretary.

The President and the Companies Bill.

It appears to me that, in his Liverpool speech (see *ante*, p. 351), the President of the Pharmaceutical Society has at last freely and fully explained the pharmaceutical position as it presents itself to him. Can that be because Mr. Martindale does not anticipate occupying the chair a second year, and he has, therefore, taken the opportunity afforded by the Liverpool meeting to sing his presidential swan song. Be that as it may, there is now no uncertainty about the position he takes up, and he is apparently as hopeless of solving the company pharmacy problem as the most enthusiastic promoter of companies of unqualified persons could desire. In effect, he tells us that it is impossible to stop company trading in drugs, or to restrict the business to duly qualified individuals, and that it may even be difficult to prevent companies using our statutory titles. Mr. Ritchie, as representing the Government, was asked to restore the position of chemists to what it was understood to be before the Selborne judgment, and to treat pharmacy in the same manner as the professions included in Clause 3 of the Companies Bill. But that, according to Mr. Ritchie, is impossible, and he also proved "obdurate" when he was pressed to regard the titles as sacred. Finally, he professed his inability to alter Clause 2 in any way, because it is the Lord Chancellor's clause. In the circumstances, therefore, there is nothing for it but out and out opposition to the Clause if it is brought up for discussion in the House of Commons, and the Council could not reasonably have decided upon any other course. I note, also, that Mr. Martindale appears sceptical about the possibility of amending the Pharmacy Acts in the desired direction; in fact, the best he could say upon that point consisted of quotations from speeches by Mr. Carteighe, in which we were virtually told that nothing could be done. Such may or may not be the case, but I would again urge that something ought to be attempted. If we make an honest attempt to remedy matters and fail, we shall then definitely know the worst. As things are, we remain in a state of cruel uncertainty, and the sooner that is past the better for all concerned. The experience of the promoters of the Midwives Bill should go far to prove that the House of Commons is not so strongly opposed to the protection of professional qualifications and titles as is generally supposed. Our chief difficulty, however, appears to consist in persuading the Government and legislators generally that we are entitled to claim recognition as members of a professional body, and it may possibly be the work of many years to establish our position as such.

POLITICAL GOSSIP.

AS A MODEL of what a regulating Bill should be, the Midwives Bill, now rapidly progressing through the House of Commons, presents points for the consideration of those who contemplate the preparation of a new Pharmacy Acts Amendment Bill. In the first place the clause protecting the title of midwife is much more thorough than the corresponding clause in the Pharmacy Act. From and after January 1, 1903, it is prescribed that no woman (the male practitioner is left to the care of the Medical and Apothecaries Acts) who is uncertified under the proposed provisions shall "take or use the name or title of midwife (either alone or in combination with any other word or words), or any name, title, addition, or description implying that she is certified under this Act, or is qualified to act as a midwife." No loophole there for the "cash midwife" or the other species of adjectival evaders familiar to the administrators of the Pharmacy Acts. But that is not all, practice is protected, though not so rigorously, and a very useful tag is added to the penal clause in the shape of a prohibition against the employment of unqualified assistants. No woman qualified to practise is to be permitted to "employ as her substitute or assistant an uncertified person"; that is an exceptionally effective conservation of public interests, which might advantageously be applied to the practice of pharmacy.

STRANGE TO STATE, the argument "what are the aspirants for qualification to do?" has not, as yet, been urged against the above cited clause. Further good points about the Bill are the provisions for annual registration, and for the exercise of disciplinary control over certified practitioners. A woman may pass the prescribed examinations and receive her certificate of competency, but unless she is licensed by the proper local authority (which formality will cost her one shilling a year) she may not practise. A £2 penalty emphasises this point. Then, as to disciplinary powers, the licence may be revoked by the supervising authority if the holder infringes any of the very elaborate set of regulations which the Bill empowers the Central Board to frame. A final admirable characteristic of the measure is that it proposes to make the public pay for its own protection, *i.e.*, the cost of administration is to come partly from Imperial and partly from local sources. Naturally there are weak spots in the Bill, but the drafters of a new Pharmacy Bill do not need reference to bad models. The further consideration of the Bill will probably not be taken until after Easter.

PATRIOTIC PICRIC, it is gratifying to know, is being used for the manufacture of high explosives destined for the destruction of the Queen's enemies. Replying to Sir Charles Dilke on Tuesday, Mr. Powell Williams stated that with the exception of a small quantity recently ordered to meet present urgent demands, all the supplies of picric acid obtained for both land and sea service have been manufactured in various parts of this country.

THE COPYRIGHT BILLS (H. L.), which differ very slightly from those before Parliament last Session, have gone—like their predecessors—to a Select Committee, and that body has just decided to take its evidence and print, but not publish, it. It has been ordered that no copies of the evidence are to be delivered except to members of the Committee. Those are the Lord Chancellor, Lords Selborne, Knutsford, Monkswell, Farrer, Davey, Balfour, Hatherton, Thring, Welby, and Avebury—a very powerful combination of legal, artistic, literary, and scientific wisdom, strengthened with a backing of sound common-sense. It was understood that Mr. Samuel Clemens—more widely known as Mark Twain—had evidence to give to the Committee, and perhaps that may account for the restriction in the circulation of the Proceedings. The noble investigators probably

desired to keep to themselves the good things "The Innocent" might deliver in speaking his piece! But, if so, the attempt has proved a failure, since a report of his evidence has appeared in the daily papers.

THE EASTER RECESS is expected to commence on Tuesday next and terminate on the 26th inst., on which day the House will resume business. Our expectations, therefore, that the Companies Bill would not be taken before the recess appear likely to be realised. Mr. Ritchie is not being permitted to forget that Clause 2 is distasteful to at least fifteen thousand persons in Great Britain, and he is represented to have manifested a perfectly natural disinclination to make a move with the Bill until necessity compels. It is down for Thursday, 5th inst., but its inclusion in the long list of orders of the day is a purely formal proceeding, since Thursday is set aside for the Railways (Prevention of Accidents) Bill, as well as for the completion of the debate on the Municipal Trading Committee.

THE BOILERS' COMMITTEE was set up on Monday, and comprises the following members:—Sir W. Arrol (S. Ayrshire), Mr. Crombie (Kincardine), Mr. Emmott (Oldham), Mr. Fenwick (Wansbeck), Sir J. Fortescue-Flannery (Shipley), Mr. Galloway (S.W. Manchester), Sir E. Gourley (Sunderland), Mr. Hazell (Leicester), Mr. Heath (N.W. Staffs), Sir A. Hickman (Wolverhampton, W.), Sir W. Houldsworth (N.W. Manchester), Mr. M'Ghee (Leuth, S.), Mr. Penn (Lewisham), Col. Pilkington (Newton, Lancs.), and Mr. Renshaw (Renfrew, W.).

ANOTHER SHOPS BILL is announced. This time it is from Mr. Steadman (Stepney), who on Friday, March 30, introduced a Bill to amend the Shop Hours Act, 1892. With reference to the other measures on the same subject, Mr. Kimber has joined the list of objectors to Sir C. Dilke's Shops Bill, and has added a fourth "block" to the notice paper, whilst Sir S. Montague has told the Whitechapel District Board of Works that he will also oppose the further passage of the Bill. Mr. Provand's Shop Hours Bill has also received obstructive notice, Mr. McLaren (Bosworth) having expressed his sentiments on the matter by placing against it the usual motion for a six months' adjournment.

THE ASSAY OF OFFICIAL ANTIMONY COMPOUNDS.

BY F. H. ALCOCK.

Reference has on more than one occasion been made in the journals to the difficulty experienced by operators when ascertaining the purity of the above by the official volumetric method by reason of the precipitation of the antimony in the form of $Sb(OH)_3$, unless the operation be conducted rapidly. Mr. J. R. Allen, representing the student, has communicated to his fellow students through the *P. J.* (see September 2, 1899, page 233) some remarks showing how the difficulty may be lessened.

Squire's 'Companion' calls attention to the same in the following words:—"The alkali must be added not long before the titration, or the antimony will be precipitated." Professor Attfield's 'Manual' gives the same warning: "The whole operation should be conducted quickly, or a precipitate of antimonious hydroxide will be formed, and it is only when in solution that the antimony is properly attacked."

In view of this real difficulty some experiments have been made in the endeavour to find some plan which will make the process more suitable, especially for the busy pharmacist and student. After many trials, which need not be mentioned here, it was found that the following process can be confidently recommended for trial:—

Antimonium Tartaratum.—Weigh one gramme, add 50 cubic centimetres of water and 10 grammes of Rochelle salt, and finally add, after solution, two, three, or more grammes of the sodium bicarbonate and make up to a suitable volume—say 100 cubic centi-

metres—and operate upon an aliquot part, 20 cubic centimetres being quite enough.

In order to ascertain how long this solution may be kept without precipitation of the antimony or anything else if the salt is pure, a solution was made as above, but the dilution was made to 250 cubic centimetres and the salt weighed 0.9 gramme. For 25 cubic centimetres, on January 25, 1900, there was required 5.4 cubic centimetres of a solution of iodine; and on February 19, 1900, the same result was again obtained and no precipitation had occurred; again on February 27 and March 19 and the original figure was the same; on the last date confirmation was obtained by several workers independently. It should be stated that the liquid was kept in a stoppered bottle lying on its side, and the same solution of iodine—which had been carefully preserved—was used for each experiment.

Antimonii Chloridi Liquor.—5 cubic centimetres were put into a quarter-litre stoppered flask, and to it were added some water and 10 grammes of Rochelle salt and vigorously agitated until the solution became clear, further diluted, and then excess of sodium bicarbonate added *gradually* (owing to the intense acidity of this liquid as ordinarily sold), and finally made up to the mark. A large excess of sodium bicarbonate does not appear to affect the result. On February 19, 1900, 5 C.c. of this solution required 1.7 C.c. of a solution of iodine; February 27, 25 C.c. required 8.5 C.c.; March 19, this occasion gave same result. It was observed that a few brown flocculi appeared on the last-named day which was shown to be ferric hydrate.

To the operator not familiar with this reaction it will be necessary to say that as the iodine solution gets towards the end of the process it acts less energetically than at the beginning, and it is best to stir well and wait half a minute or so, to ensure that the blue colour of the iodine-starch is permanent. After a time he will find by the use of open dishes that mucilage of starch may be discarded and reliance placed upon the yellow tint of the surplus iodine used, for which he can deduct an equivalent from his reading. It is found that this tinctorial power of iodine solution (B.P.) is very great—0.2 C.c.—imparting a distinct yellow colour to one litre of pure distilled water. In reading the burette when it contains such dark liquids as iodine, the student will find that the top line is the best to read from unless the instrument is between his eye and a good light, when the lowest line is the best.

Antimonii Oxidum.—In one experiment 1 Gm. of this was made into tartar emetic by warming with 2 Gms. cream of tartar and water added, then 10 Gms. Rochelle salt, excess of sodium bicarbonate, and solution made up to 200 C.c. Of this, 20 C.c. required 13.5 C.c. B.P. volumetric iodine solution, representing 96.6 per cent. of oxide (nearly). This solution was not clear; the turbidity, however, was found to be due to the calcium tartrate in the cream of tartar, which only contained 92.3 per cent. real potassium hydrogen tartrate.

In a second experiment the gramme of oxide was converted into chloride by the action of diluted hydrochloric acid, then to the clear liquid were added 10 Gms. Rochelle salts, excess of sodium bicarbonate, and diluted with water to measure as before 200 C.c.; of this 20 C.c. required 13.50 C.c. of the iodine solution also. This plan appears to be better than the official one, because the solution is easily made without the use of heat, and it is almost immediate, and the resulting solution is of course free from turbidity, there being no calcium tartrate present. These two solutions were exposed to the free action of air for twenty-four hours, and there was in the one only the calcium tartrate precipitate, and in the other (the chloride solution) the faintest turbidity derived from the sodium bicarbonate. The antimonium tartaratum solution first referred to was also filtered from the trace of iron precipitate, and the clear solution freely exposed to the air for forty-eight hours, when not the slightest turbidity made its appearance. The plan suggested may be, therefore, recommended.

INCOMPATIBILITY AND SOME OF ITS LESSONS.*

BY WALTER G. SMITH, M.D.

Ex-President Royal College of Physicians, Ireland; Physician to his Excellency the Lord Lieutenant; King's Professor of Materia Medica and Pharmacy, School of Physic, T.C.D.

PART II.—SPECIAL. (Concluded.)

EXPLOSIVE AND INFLAMMABLE COMPOUNDS.

Many dangerous and some fatal accidents have happened through carelessness or ignorance of first principles, and I propose now to adduce the more important examples which have occurred in practice.

An explosion may be defined as a sudden and stormy decomposition, attended with noise, and frequently with flame.† It is evidently a non-reversible action.

Danger may arise from dealing with either—

(a) Unstable single molecules.

(b) Processes of rapid and violent chemical reaction between two or more substances.

I. UNSTABLE MOLECULE, *i.e.*, one containing a store of energy in a condition of stress. This energy is liable to be suddenly liberated, with evolution of much heat:

(i.) Hypophosphites of calcium and sodium:—

These salts are likely to explode when simply heated or triturated. A druggist who was engaged in drying some calcium hypophosphite over a sand-bath was killed by the explosion.

Calcis hypophosph.....	ʒss.	M. Ft. pulv. vi.	One 3 times a
Potass-chlorat.....	ʒss.		

When separately powdered and carefully mixed, they were being removed from a glass mortar by a metal spatula, when they suddenly exploded and half stunned the dispenser, blowing off some of his eyebrows and eyelashes (*Ph. Journ.*, 3rd Ser., xi. 506).

(ii.) Picric acid and picrates. *Lyddite* is a mixture of picric acid and gun-cotton.

(iii.) Nitro-glycerin (trinitrine).

May explode when shaken or agitated. The *Liq. trinitrini B.P.*, when diluted with water, and let stand, deposits a liquid of oily consistence, one drop of which, absorbed by paper and struck with a hammer on a hard surface, explodes.

(iv.) Erythrol tetranitrate.

An accident by which a chemist lost his life happened at a tabloid factory in Deptford in 1897. He was engaged mixing tetranitrate of erythrol with finely powdered lactose in a mortar, when an explosion occurred.

A medical man was sent a sample specimen of the same drug. He carelessly threw the bottle containing it into the waste-paper basket. Next morning the basket was emptied into a dust-pan containing hot ashes. An explosion ensued; the cook was partially stunned, and received about two dozen small wounds on the hands, arms, and face.

Mannitol hexanitrate explodes violently on being struck with a hammer, or when suddenly heated.

(v.) Iodide of nitrogen.

The chemical nature of this compound has been already explained.

It is extraordinary that combinations of *Liq. ammoniæ* and *Tinct. iodi*, or *Liq. ammoniæ* with *Tinct. iodi* and collodion, have been recommended as safe for external use, for serious accidents have occurred (Kobert).

* Reprinted, by permission, from the *Practitioner*. Concluded from page 337.

† It has been shown in the General Part that Berthelot's law of maximum work has limitations. Thus:—

II. RAPID CHEMICAL ACTION, *i.e.*, oxidation or reduction.

This mode of action is naturally observed, chiefly in connection with compounds rich in disposable oxygen; *e.g.*, chlorates, iodates, nitrates, chromates, permanganates, and peroxides.*

(a) *In the dry state*—

It is dangerous to triturate potassium chlorate or nitrate with—

(a) Free sulphur, or Pulv. glycyrrh. co. (contains 1 in 12 of sulphur);

(b) Antimonious sulphide; †

(c) Finely divided carbon, *e.g.*, in dentifrices.

(d) Tannin, *e.g.*, catechu.

A mixture of Pot. chlorate, ʒiss., with ʒiiss. of tannic acid, was rubbed in a new Wedgwood mortar with a rough surface. A violent explosion occurred.

(e) Sugar: Saccharin.

(f) Hypophosphites. This is very dangerous.

A young pupil rubbed up a mixture of 2¼ parts of hypophosphite of calcium, 3¾ parts of potassium chlorate, and ¼ part of lactate of iron. Suddenly the whole mixture took fire, and there was a violent detonation. The young man received such severe burns that his life was endangered.

(g) Mercuric oxide detonates if rubbed with iodol.

(b) *In the liquid or moist condition.*

(i.) Nitric acid acts violently upon phenol, creosote, and on some volatile oils, *e.g.*, *Oleum terebinthinæ*.

Sawdust has been set on fire by spilling strong nitric acid upon it.

A mixture of nitric acid, hydrochloric acid, and *Tinct. nucis vom.* exploded after some hours (Kobert).

(ii.) Chromic acid, CrO_3 , if concentrated, will set fire to glycerin or alcohol.

Such a prescription as this should not be dispensed:—

Ac. chromici	ʒss.	For external use. †
Glycerin	ʒiv.	

or Ac. chromic., glycerin. alcohol, equal parts.

(iii.) Potassium permanganate can likewise ignite glycerin or alcohol, and detonates when rubbed up with *Confect. rosæ*.

Ext. nuc. vom.	gr. ½	The pill mass, when triturated in a	
Ext. aloes aq.	gr. 1		mortar, exploded.
Pot. permangan.	gr. 1		

An unlucky apothecary attempted to dispense the following formula:—

Pot. permangan. }	10 parts	Scarcely had the bottle been corked	
Alcohol }	15 "		when an explosion took place, and the
Distilled water.....	15 "		
		the surprised pharmacist. He nearly	
			lost the sight of one eye, and was dis-
		month.	

(iv.) Iodine reacts violently upon, and may inflame, some volatile oils, *e.g.*, *Ol. terebinth.* and *Ol. limonis*.

A medical man set about manufacturing terebene by acting upon oil of turpentine with pure sulphuric acid. An explosion followed and burnt his clothes. Worse would have happened but that he had taken care to envelop the bottle in a towel.

(v.) Oxide of silver, freshly precipitated, develops much heat when rubbed up with creosote, confection of roses, or extract of gentian. Occasionally pills containing the oxide have exploded

* True peroxides develop peroxide of hydrogen (H_2O_2) with acids, and should be distinguished from dioxides (*e.g.*, MnO_2) which form salts with acids.

† The following prescription was presented at a pharmacy in New York:—

Lactis sulphuris.....	gr. iij.
Antimon. sulph. aurant.....	gr. iii.
Zinci valerian.....	gr. i.
Potassæ chlor.....	gr. ij. Ft. pulvis.

This cannot be dispensed without an explosion.

‡ A dispenser dissolved the chromic acid in a little water, added the glycerin, and shook up the mixture. Explosion ensued and scattered the contents of the flask.

several hours after dispensing. Silver oxide also forms a very explosive compound with Liq. ammonia.

(vi.) Potassium chlorate + tinct. ferri perchlor. + glycerin, when warm is liable to explode.

This event happened in the pocket of a patient who carried a bottle containing this mixture.

Another time a similar mixture exploded under the influence of the solar rays and set fire to the house.

A curious accident happened in London. A man who was packing capsules of amyl nitrite broke some of them by chance, and the wrapping wool, soaked with the liquid, was thrown out of the window. It happened to fall through a grating beneath which was an open barrel containing chlorate of potassium, which, on contact with the amyl nitrite, blazed up, and nearly set fire to the building.

(vii.) Peroxide of sodium (Na_2O_2).

This substance, a light yellow powder, is now an article of commerce, and is prepared on the large scale by the action of air upon metallic sodium at 300° . It is used for bleaching.

When added to water it develops much heat and liberates oxygen:—

This reaction has been utilised in the study of the respiratory function in animals in a confined space. The products, viz., oxygen and caustic soda, are precisely those necessary to absorb CO_2 , and replace it by oxygen. Calcium peroxide (CaO_2) has been suggested by Nencki and Zalesky as an intestinal antiseptic.

If some of the peroxide be wrapped in muslin, or in cotton wool, and water be dropped upon it, the whole bursts into flame.

The peroxide at once sets glycerin on fire, and if added to commercial formalin a very violent explosion occurs.

This latter experiment should be performed only with small quantities.

A bandage which had been soaked in solution of peroxide of hydrogen ignited when dry.

NEW REMEDIES.

COPPER OINTMENTS FOR GLANDULAR ENLARGEMENTS.—Hoppe some time ago recommended the application of cupric oxide ointment for enlarged glands of the neck. The ointment was composed of copper black oxide, 1; lard, 8. Mosler employs the following:—Cupric oxide, 2; vaseline, 14. This is applied with friction until it causes papular eruption, which, if caution be not used, may go on to actual ulceration of the skin. Luton has used the following application for scrofulous glands. Neutral cupric acetate, 15 grains; vaseline, 1 to 3 ozs.—*Therap. Gaz.* [3], 16, 31.

IODOL-PERU BALSAM OINTMENT.—This ointment having the following composition, iodol, 1; Peru balsam, 1; vaseline, 10; is unsatisfactory on account of a black colour developing due to the combination of a trace of free iodine with the Peru balsam. This may be obviated by the addition of sodium thiosulphate, 0.1, dissolved in a few drops of water.—*Osterr. Zeits. für Pharm.*, 14, 2.

ARGONIN, AIROL AND PROTARGOL SOLUTIONS.—On account of the difficulty of dissolving argonin in cold water, and since, if heat be applied, the substance is liable to decomposition, it is proposed first to mix the argonin with an equal weight of glycerin, and to dissolve the thin paste thus obtained in hot water; this prevents decomposition. Solutions of aïrol and protargol may be prepared in the cold by mixing the drug 5, with glycerin 35, and water 10.—*Pharm. Post*, 33, 33.

PRACTICAL NOTES AND FORMULÆ.

Cooling Ointments.

In the *Monats. für prakt. Derm.* Unna gives formulæ for various ointments. *Zinc sulphur-kieselguhr paste*: Zinc oxide, 3; sulphur, 3; siliceous earth, 2; lanoline, 4; rape oil, 2; distilled water, 6. *Cooling ointments* may be prepared as follows, with a cold cream basis:—(1) Cold cream, 4; magnesia carbonate, 1; or (2) cold cream, 2; starch, 1. (3) Vaseline may be employed for the same purpose. Magnesium carbonate, 1; distilled water, 2; mix and incorporate vaseline, 2. The carbonate is first rubbed down with the vaseline, and the water afterwards added. Dilute solution of lead acetate or lime water may be substituted for the water, and a glycerin fat for the vaseline. The following formulæ for *soft zinc pastes* are also given:—

	(1)	(2)	(3)
Linseed oil.....	1	2.5	2
Lime water	2	2.5	2
Zinc oxide	3	2.5	4
Prepared chalk	3	2.5	2

A much employed ointment consists of a mixture of equal parts of the soft zinc ointment and sulphur zinc ointment, composed of zinc oxide, 3; precipitated sulphur, 2; siliceous earth, 1; benzoated lard, 14. Ichthyol preparations, not miscible with the soft zinc ointment, are perfectly miscible in this mixture.—*Pharm. Centralh.*, 41, 66.

Superfatted Cod Liver Oil Soap.

Dr. Rohden recommends this soap for external application in tuberculosis. It is prepared by mixing an odourless soft soap with 20 to 40 per cent. of cod liver oil, and if desired with 10 to 20 per cent. lanolin glycerin.—*Pharm. Centralh.*, 40, 707, after *Therap. Monatsh.*

Banana Juice as Ink.

This juice is recommended as a sympathetic ink. When used for writing on paper it is as invisible as water, but develops when heated. It may also be used for marking linen. The linen is marked first with legible ink and then traced with the juice; the former washes out while the latter develops. It may also be used for horticultural zinc labels. It seems strange that this property has not been noticed previously, as bananas are so much used.—*Pharm. Cent.*, 40, 416.

Spray for American Blight on Apple Trees.

Where a tree is so large that it cannot be freed from American blight by scrubbing with paraffin emulsion, the following alkaline spray applied by means of a knapsack spraying machine, before the buds begin to show signs of bursting, will remove the blight. Dissolve caustic soda, 1 lb., and pearlash, 12 oz., in about 1 gallon of water, pour it into 10 gallons of water, and add soft soap, 10 oz., previously dissolved in hot water.—*Garden*, 57, 18.

Honey Cream.

Spermaceti, 60 Gms.; almond or nut oil, 480 Gms.; are digested with gamboge, 3.75 Gms., for twenty minutes. Verbena oil, 10 drops; cassia oil, 20 drops; bergamot oil, 3 drops; rose oil, 3 drops are added, and the mixture thoroughly rubbed together.—*Pharm. Post*, 32, 721.

Gripping Lubricant for Driving Belts.

One part of caoutchouc minutely divided is heated to 60°C ., with 1 part of rectified turpentine oil; when dissolved, 1 part of ceresin is added and also melted. In another vessel 2 parts tallow and 5 parts train oil are melted together, and both portions are mixed together.—*Pharm. Central.*, 40, 449, after *Neueste Erfind und Erfahr.*

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, APRIL 4, 1900.

Present:—

MR. WM. MARTINDALE, President.

MR. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Bateson, Carteighe, Corder, Cross, Glyn-Jones, Grose, Harrington, Harrison, Hills, Savory, Southall, Symes, Warren, and Young.

The minutes of the last meeting were read and confirmed.

The Waterall Legacy.

Mr. ATKINS said, arising out of the minutes, he had to announce that he had complied with the instructions of the Council with regard to the Waterall Legacy, and had purchased £1,000 of Consols. He would remind the Council that the particulars of the scheme would be found in the transactions of the last Council Meeting, at p. 258 of the Journal.

The late Mr. James Watt.

The PRESIDENT said he had to report the death since the last meeting, of Mr. Jas. Watt, pharmaceutical chemist, at Haddington. In 1853 he became a member of the Society, and acted as local Secretary from 1870 down to the present time. For six years he was a member of the North British Executive, and for four years was a member of the Council, from both of which offices he retired in 1889, owing to age and infirmity. On the death of his younger son, who conducted his business some two years ago, he took as partner a former apprentice, Mr. W. P. Wilson, who now became sole proprietor. They would all remember Mr. Watt's genial face, the wise and sage advice which he always gave, and the lively interest he took in all that pertained to the business of the Council. He had been married about fifty-one years, and he and Mrs. Watt, who survived him, celebrated their golden wedding about eight months ago. He had nine children, including two sons, the elder of whom, Mr. Frank Watt, was a barrister, practising in London, who had made a name in literature, amongst his books being a 'Life of John Bright' and 'Picturesque Scotland.' Mr. Watt was greatly respected by all who knew him, as a man of high principle. A few weeks ago he appeared to be in better health than he had been for many years, but he was suddenly struck down by a paralytic stroke about a fortnight ago, and passed peacefully away on Sunday, March 11, at the ripe age of 78. He would move—"That this Council records its appreciation of the services rendered to the Society and to pharmacy by the late Mr. James Watt, of Haddington, a member of the Society for nearly fifty years, and local secretary for thirty years, who served for six years on the Executive of the North British Branch, and for four years on the Council of the Society. The Council, comprising many of his former colleagues, desires to tender its expression of regret and sympathy to his family."

The VICE-PRESIDENT briefly seconded the resolution. He said the late Mr. Watt's colleagues on the Council would remember him as a very thoughtful and careful man.

Mr. ATKINS wished to express his very great respect for the deceased gentleman, having known him for many years.

The late Mr. William Burley.

The PRESIDENT said information had been received of the death of Mr. William Burley, of Edinburgh, a member of the Executive of the North British Branch. The deceased gentleman was a comparatively young man, from whom good work in the future might reasonably have been expected.

Election of Members.

The following persons having tendered their subscriptions for the current year, were elected "Members" of the Society:—

Bennett, Frederick, W. M.; Arbroath	Holroyd, Asa; Wibsey
Bickford, Harding; Kennington	Innes, William Rome; Port Gordon
Bolus, George; Spittal	Jesson, Albert Robert; Birmingham
Broad, Henry Reynolds; Gloucester	Leggott, Harry; Hull
Carnegie, James; Swindon	McGhie, John Knowles; London
Carr, Hugh Livingstone; Wrexham	Mackie, George; Edinburgh
Chambers, John; Cheltenham	Marshall, Robert; Tayport
Charnley, Arthur Walker; Blackburn	Milne, Alexander; Maud
Cochrane, Alexander; Grangemouth	Mitchell, Thomas Robert; Colombo
Collins, Alfred; Llandudno	Oliver, John; Southsea
Crook, Thomas; Blackburn	Pae, Archibald Thos.; Stenhousemuir
Dallow, Charles Ernest; Birmingham	Pickup, Ralph; Blackburn
Earl, Frederick Greenwood; Pendleton	Priestley, Dawson Smith; Bradford
Eaton, Tom Wilcox; Reading	Rhodes, Joseph; Mirfield
Edwards, Henry Charles; Hastings	Robinson, John George; London
Ewell, Ernest William; Dover	Robinson, Percy; Norwich
Fletcher, Richard Bewley; Eastbourne	Simpson, Bertram; Sheffield
Fowles, Frederick William; Brighton	Smith, Walter Woodhouse; Doncaster
Francis, John; Wood Green	Stead, Thomas; Bradford
Gair, Duncan; Cononbridge	Sturdy, Thos. Tyerman; Sheffield
Gibbs, Harold Rodier; Southsea	Vaughan, Edward Edwards; Rhyl
Girdler, Arthur Thomas; London	Vint, Thos. Dickinson; Hastings
Greaves, William Thos.; Nottingham	Wallis, Sydney Wilson; Brixton
Greenhalgh, Edmund P.; Bolton	Webb, George; Hitchin
Hemming, Francis Harry; Beeston	Wilford, John Henry; Nottingham
Hesketh, Thomas Arthur; Croydon	Wright, George; Chesterfield

Election of Student-Associates.

The following persons having passed the First examination, and tendered their subscriptions for the current year, were elected "Student-Associates" of the Society:—

Buckner, Harry; Whitstable	Illsley, Thos. Henry; Barnard Castle
Chambers, Maxse W.; New Watnall	Irvin, John Wallis; Hartlepool
Christopher, John Martin; Stamford	Paton, Andrew Hunter; Ayr
Christopher, Richard T.; Sleaford	Peake, Walter Henry; Twickenham
Donaldson, George; Cullen	Robertson, Donald Wm.; Pickering
Eason, Samuel Bainbridge; Liverpool	Taylor, Arthur Camden; London
Glaholm, William; Jarrow	Wade, Alfred; Leeds
Hudson, Chas. F.; Ash next-Sandwich	White, Thos. Redford; Long Eaton
Hutchens, Hugh Pashley; Holt	Wigginton, Harold A.; Warrington

Restorations.

The names of the following persons, who have severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists:—

Joe Seels Boulton, 275, Liscoard Road, Liscoard.
John Francis, 15, Crescent Road, Alexandra Park, Wood Green, N.
Francis Rice Jennings, 24, Broadway, Maidstone.
William Alfred Townsend, York House, Salisbury Road, Chatham.

Several persons were restored to membership upon payment of the current year's subscription.

Nominations for Council.

The SECRETARY reported that he had received *twenty-six* nominations in respect of the seven vacant seats on the Council, and that the following *seventeen* nominees had expressed their readiness to accept office if elected:—

Bateson, Thomas; Kendal	Grose, Nicholas, M.; Swansea
Campkin, Algernon S.; Cambridge	Hills, Walter; London
Cooper, Albert; London	Morrison, John W. T.; Tring
Cross, William Gowen; Shrewsbury	Pickering, Charles E.; London
Currie, William Little; Glasgow	Storror, David; Kirkealdy
Gibbons, Walter; Manchester	Symes, Charles; Liverpool
Gifford, Richard L.; Blackburn	Taylor, John; Bolton
Gostling, George Jas.; Stowmarket	Warren, William; London
	Wootton, Alfred C.; London

The following *nine* nominees had not expressed their readiness to accept office:—

Bowen, John William; London	MacKenzie, James; Edinburgh
Howie, W. Lamond; London	Reid, James; Dumfries
Ince, Joseph; London	Taylor, George S.; London
Kerr, Charles; Dundee	Umney, Charles; London
	Wright, Robert E.; London

Nominations for Auditors.

The following nominations had been received for Auditors:—

Butt, Edward Northway; London	Stacey, Samuel Lloyd; London
Lescher, Frank Harwood; London	Umney, Charles; London
	Yates, Francis; London

The following *four* nominees had expressed their readiness to accept office:—

Butt, Edward Northway; London	Umney, Charles; London
Lescher, Frank Harwood; London	Yates, Francis; London

Mr. S. L. Stacey had not expressed his readiness to accept office. The Council, pursuant to the provisions of Bye-law 4 of Section V., nominated for election as an Auditor in May next,

Hodgkinson, Charles; London,

he being eligible for election, and having expressed his willingness to accept office.

Mr. CARTEIGHE approved the nomination of Mr. Hodgkinson, who, he said, had been associated with the Society for many years. Those who knew Mr. Hodgkinson knew he was a man of common sense and tact.

The proposition was carried.

Dr. Stevenson's Report on the Examinations.

The SECRETARY read the following report from Dr. Stevenson:—

Report on the Examinations held by the London Board of Examiners of the Pharmaceutical Society of Great Britain during the year ending March 31, 1900.

To the Lords of the Council,

My Lords,—I have the honour to report for your information that during the year ending March 31, 1900, I attended twelve examinations of the London Board of Examiners of the Pharmaceutical Society of Great Britain, held during the months of April, July, October, and January.

FIRST OR PRELIMINARY EXAMINATION.

	Number.	Percentages.
Candidates examined	1589	—
„ who passed	746	47.0
„ „ failed	843	53.0
Failed in Latin	593	37.3
„ English	483	30.4
„ Arithmetic	739	46.5
„ all subjects	325	20.5

These figures reveal the striking fact that about seven out of eight candidates who failed were rejected in arithmetic, a subject of supreme importance to the chemist and druggist. The examination is by no means a severe one. It will be superseded in the ensuing year by a higher examination, the effect of which will doubtless be to reduce the number of candidates who will be able to present themselves for the qualifying (Minor) examination. This alteration is, in my opinion, a highly commendable one.

MINOR OR QUALIFYING EXAMINATION.

	Number.	Percentages.
Candidates examined	1371	—
„ who passed	378	27.6
„ „ failed	993	72.4
Failed in Chemistry	599	43.7
„ „ Materia Medica	24	1.8
„ „ Botany	31	2.3
„ „ Prescriptions	44	3.2
„ „ Pharmacy and Dispensing	299	21.8
„ „ obtaining aggregate number of marks for a pass	129	9.4

The number of candidates was quite exceptionally large, and the proportion of rejections more than the average.

It will be seen what a very large percentage of the candidates failed in the two most essential and practical subjects of Chemistry, and Pharmacy and Dispensing. Indeed, a large number of candidates, having hopelessly failed in one or both of these practical subjects, were rejected without having been examined in other branches. Practical Chemistry, and Pharmacy and Dispensing are subjects not lending themselves to cram, and the need of laboratory training is painfully revealed by the results of the examinations. Having paid close attention to these I cannot say that the Examiners have been unduly severe, having regard to the paramount interests of the public. It is not too much to ask that the chemist and druggist should be not only able to dispense accurately, but also to be able to test the ordinary chemical substances he uses in his business; and these attainments are rigorously demanded of the candidates. The improvement in the quality of the candidates noted in my report last year has not been altogether maintained.

MAJOR EXAMINATION.

	Number.	Percentages.
Candidates examined	103	—
„ who passed	50	48.5
„ „ failed	53	51.5
Failed in Chemistry	29	28.2
„ Physics	18	17.5
„ Materia Medica	8	7.8
„ Botany	13	12.6
„ obtaining the aggregate number of marks for a pass	13	12.6

The number of candidates who presented themselves was below the average of the last few years, whilst the percentage of passes was about the same. There were, however, more failures in specific subjects and fewer failures in aggregate marks.

The standard of the examinations was fully maintained, and the conduct of the examinations met with my entire approval.

(Signed) THOS. STEVENSON.

March 31, 1900.

Finance Committee.

The report of this Committee was read by the SECRETARY. It

recommended the payment of sundry accounts, and the purchase of certain freehold property.

The PRESIDENT, in moving the adoption of the report and recommendations, said, considerable sums had come in during the month from subscriptions and examination fees, so that the income had been rather above the average, while the payments were about as usual. There was nothing requiring special comment.

The resolution was at once agreed to.

Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £83 in the following cases:—

The widow (49) of a registered chemist and druggist, who died in February last. (Walthamstow.)

A registered chemist and druggist (75), who has had two previous grants; has only partial employment. (Surbiton.)

The widow (49) of a registered chemist and druggist who is blind and paralytic. (London.)

The widow (65) of registered chemist and druggist who has had several previous grants. (Birmingham.)

A member (80) from 1855-98 and subscriber to the Fund for over twenty years. He has had two previous grants. (London.)

The widow (50) of a former associate who has received previous assistance (Wrexham.)

The VICE-PRESIDENT moved the adoption of the report and recommendations, which was at once agreed to, Dr. SYMES remarking that only one of the six applicants on this occasion appeared to have subscribed to the Fund.

The PRESIDENT said he had omitted to mention that a donation of 25s. had been received from the Liverpool Pharmaceutical Students' Society, collected at a smoking concert.

Library, Museum, School and House Committee.

The report of this Committee was read. It appeared that, besides the ordinary routine work, the Committee had sat as a Research Committee and received reports from Professors Collie and Greenish respecting the progress of certain pharmaceutical work, which, at the request of the General Medical Council, had been undertaken in the Society's laboratories.

The PRESIDENT moved the adoption of the report of the Committee, which was unanimously agreed to.

Appointment of Local Secretaries.

The SECRETARY announced that a letter had been received from Mr. Thompson, local secretary for Birmingham, who had written saying that the number of members in Birmingham had increased so greatly that it was advisable to have an assistant local secretary for the western division of that city, and nominating Mr. Geo. E. Perry.

The PRESIDENT moved that Mr. Geo. E. Perry be appointed assistant local secretary for the western division of Birmingham.

The resolution passed unanimously.

The PRESIDENT then moved that Mr. W. T. Wilson, of 36, High Street, Haddington, be appointed local secretary for the Haddington division, in the place of the late Mr. James Watt.

Appointment of an Assistant to the Board of Examiners.

The PRESIDENT said the examination which was being held at the present time was rather a heavy one, and unfortunately one of the Examiners had broken down in health, it was therefore necessary, in order to get through the work in reasonable time, to appoint an Assistant to the Board. Mr. Edmund White, a former Examiner, had expressed his willingness to undertake the duty, and he would therefore move:—That Mr. Edmund White be appointed to assist the Board of Examiners for England and Wales in accordance with the provisions of Bye-law 7, Section 10, and that the nature, extent and duration of such assistance be determined by the Chairman of the Board.

The motion was unanimously adopted.

Correspondence.

The SECRETARY reported that the following communications had been received from:—

1. The Manchester Pharmaceutical Association, conveying two resolutions passed at a meeting held on March 14—(a) Approving the action of the Council in regard to Clause 2 of the Companies Bill and promising support; (b) suggesting the propriety of agitating for the inclusion of pharmaceutical chemists and chemists and druggists in Clause 3 of the Bill.

2. Sheffield Pharmaceutical and Chemical Society, conveying a resolution passed at a general meeting of the Society on March 14, expressing the opinion that the conclusion of the Council in reference to Clause 2 of the Companies Bill should have the universal support of the chemists of Great Britain.

3. Oxford and District Chemists' Association, conveying a resolution passed at the annual meeting on March 14. The resolution urges the amendment of Clause 2 of the Bill as follows:—"No company of unqualified persons may use the description of a pharmaceutical chemist, or chemist and druggist, or any other title implying registration under the Pharmacy Act, 1868."

4. Lancaster and Morecambe Chemists' Association, conveying a resolution passed on March 15, supporting Clause 2 A in the Federation programme (*P. J.*, p. 237).

5. Bolton Pharmaceutical Association, conveying resolutions passed at a meeting held on March 19. The resolutions were—(a) In support of the Council's opposition to Clause 2, and (b) in support of the candidature of two nominees for election on the Council in May.

6. Mr. Birkbeck, local secretary for Lincoln, conveying decision of the chemists of the district to support the Council in its opposition to Clause 2.

7. Leicester Chemists' Social Union, conveying a resolution passed on March 22 in support of the Council's action in regard to Clause 2, and also suggesting that the Council should, at an early date, proceed to the framing of a new Pharmacy Bill to deal with the whole question of companies.

8. Forfarshire and District Chemists' Association, conveying resolutions passed on March 29, approving decision of Council in regard to Clause 2, and urging preparation of a new Pharmacy Bill.

9. Midland Pharmaceutical Association, conveying resolution passed on March 15, supporting the policy of the Council in reference to Clause 2 of the Companies Bill, and suggesting the issue of a circular for signature by all the chemists in Great Britain.

10. Glasgow and West of Scotland Pharmaceutical Association, conveying resolutions passed on March 22—(a) Resolving to oppose Clause 2; (b) urging promotion by the Council of a new Bill to amend the Pharmacy Acts.

Mr. HILLS said these letters were very interesting, but he hoped that at some of the meetings throughout the country their friends would not only advise the Council to take steps to frame a new Pharmacy Bill, but also say what their views were with reference to the company question, and on what lines legislation was desirable and practicable.

The PRESIDENT suggested that they wanted not only destructive but constructive criticism.

Mr. CARTEIGHE moved that all these communications be referred to the Law and Parliamentary Committee, which was at once agreed to.

Dr. SYMES said it was very satisfactory to note that all the letters supported the Council in its decision.

Mr. GLYN-JONES said most of them also expressed a wish that the Council should do something in the way of promoting a Bill!

The Auditors' Report.

The report of the Auditors was laid upon the table.

Freehold Investments.

The PRESIDENT proposed that the corporate seal of the Society be affixed to the transfer deeds relating to the Strawberry Hill property purchased by the Society.

Mr. CARTEIGHE, in seconding the proposition, said the house that was being purchased stood upon the Society's own ground. The ground surrounding was very extensive, and was in such a position that it would be more or less damaged if buildings were erected in the immediate neighbourhood. A question had arisen with regard to their ancient lights, and instead of wasting time and money in going to law, they had thought it better to buy the house, as they were entitled to under the bye-laws. It would be a satisfaction to know that the purchase for the purpose of letting would yield 6 to 6½ per cent.

The resolution was carried.

General Purposes Committee.

A portion of this report was read, including the reports of the Professors on the School Prizes Competitions, in accordance with which the Committee made the following awards:—

Botany.

Silver Medal	E. W. Pollard.
Certificates of Honour	{ H. Finnemore. J. F. Young.

Chemistry.

Silver Medal	J. F. Young.
Certificates of Honour	{ E. Nash. H. Finnemore.

Practical Chemistry.

Silver Medal	H. Finnemore.
Certificates of Honour	{ J. F. Young. E. Nash.

Materia Medica.

Silver Medal	H. Finnemore.
Certificates of Honour	{ E. W. Pollard. P. B. Gray.

The Council then went into committee to consider the legal portion of the report, and on resuming, the report and recommendations were adopted, and special resolutions passed, authorising the Registrar to take proceedings.

MAJOR EXAMINATION QUESTIONS (EDINBURGH).**BOTANY.**

March 29, 1900, from 10 a.m. to 12 noon.

1. By what characters are Xerophytes and Hydrophytes distinguished? Give an example of each, and show how the organs in the plants you mention are adapted to their environment.
2. Give an account of the structure of any seed, and describe the successive stages of its germination up to the period when the embryo-plant is established in the soil.
3. Describe the methods of sexual reproduction observed in the Algae.

MATERIA MEDICA.

March 29, 1900, from 12 noon to 1 p.m.

1. What are the Botanical and Geographical Sources of Myrrh? What proportions of Volatile Oil, Resin, and Ash would you take to be characteristic of a good specimen?
2. Describe the chief diagnostic features of the official Buchu leaves, and indicate the principal points of difference between them and other species of *Barosma* as regards (1) physical characters and (2) active constituents. How would you form an opinion as to the quality of a sample of the official leaves?

PRACTICAL MATERIA MEDICA.

March 29, 1900, from 2 p.m. to 3.30 p.m.

1. Prepare sections of the root supplied to indicate its characteristics. Draw and describe your sections.
2. Report on the sample of powdered gentian root as to whether it is genuine or adulterated. Give your reasons for your opinion.

PRACTICAL BOTANY.

March 29, 1900, from 3.30 to 5 p.m.

1. Describe the external morphological characters of the specimens A and B, the plants C and D to their natural orders, giving reasons for your es.

3. Make one transverse section of E. From what group of plants and from what part of the plant is it derived? Sketch your preparation, and give explanatory references to your drawing.

CHEMISTRY.

March 30, 1900, from 10 a.m. to 1 p.m.

[Six questions only are to be attempted, and at least two must be taken from Part II.]

PART I.

1. Assuming that free oxygen is correctly represented by the formula O_2 , what evidence is there that the formula of ozone is O_3 ?

2. Mention the chief impurities commonly met with in commercial potassium hydroxide, and state how you would recognise each when present in a sample.

3. Mention all the substances formed when each of the following compounds is decomposed by heating:—(a) Ammonium magnesium phosphate; (b) Calcium oxalate; (c) Lead nitrate; (d) Potassium bichromate; (e) Potassium chloroplatinate; (f) Silver cyanide.

4. You are supplied with magnesium sulphate. Describe fully the steps you would take in order to obtain the following substances from it, without employing any other compound containing either magnesium or sulphur:—(a) Magnesium; (b) Magnesium oxide; (c) Sulphuric acid.

5. Twenty cubic centimetres of dilute sulphuric acid, when mixed with a solution of barium chloride in slight excess, yield 0.4626 gram of barium sulphate. How many grams of sulphuric acid are contained in one litre of the solution?

(H = 1; O = 15.88; S = 31.82; Ba = 136.4.)

PART II.

6. How many isomeric hydrocarbons possessing the formula C_4H_8 are known? Give the name and the constitutional formula of each.

7. How is acetic acid obtained from the products of the distillation of wood? Starting from acetic acid, how would you obtain: (a) Lead acetate; (b) Basic lead acetate; (c) Ethyl acetate; (d) Acetone?

8. Specimens of propyl and isopropyl alcohol are given you. Describe fully the chemical tests you would apply in order to ascertain which is the former and which the latter.

9. Describe fully how you would proceed in order to prepare a specimen of benzene synthetically, starting from the elements.

PHYSICS.

March 30, 1900, from 2 p.m. to 5 p.m.

[Six questions only are to be attempted.]

1. Describe the method devised by Dumas for determining vapour densities at high temperatures; and explain the bearing which his determinations of the vapour densities of mercury, sulphur, and phosphorus had upon his views concerning the atomic theory.

2. What do you understand by latent heat? Describe an experiment arranged to measure the latent heat of steam.

3. Explain the principle which is adopted in the modern machines employed for the liquefaction of air in quantity.

4. What do you understand by the terms continuous spectrum, line spectrum, and absorption spectrum? How can each be obtained, and what explanation can be given of the differences observed in spectra of each kind.

5. Describe the construction, and explain the action, of the Wimshurst electrical machine.

6. After a shower, the water upon a wet pavement sometimes dries up rapidly and sometimes very slowly. Mention all the causes you know which tend to produce variation in this respect, and give such explanations as you can.

7. Explain the principle of fractional distillation, and clearly state the conditions under which this process may be applied so as to effect the separation of mixed liquids.

8. What are specific volumes, and how are they determined? Mention any theoretical conclusions that have been arrived at from a study of the results of specific volume determinations.

9. Describe the construction of a Nicol's prism, and state any purposes for which Nicol's prisms are employed.

PHOTOGRAPHIC NOTES—SCIENTIFIC AND PRACTICAL.

One of the most interesting applications of photography of recent date is the production of water marks on papers. A matrix is made by exposing a sheet of gelatin sensitised with a bichromate salt to the action of light under a negative, so that the gelatin is rendered insoluble where the light acts. When all the soluble gelatin is washed away an extremely delicate skin of gelatin is left, and this is so hard that it may be forced by hydraulic pressure into a plate of type metal without suffering any harm. In water-marking paper, however, several of these matrices are formed and forced into the sheets of paper whilst they are still damp, with the result that a permanent water mark is caused which nothing will eradicate. W. B. Woodbury, in 1860, suggested a similar process, and many specimens of such pictures, which he called "Photofiligrain," are still in existence.

No doubt many of our readers have wondered how it is possible to sell reprints of such works as the 'Encyclopedia Britannica' at such low cost. By the aid of photography it is possible to reproduce the whole of any work, no matter what its size, at one-third of the cost of type. And there is this further advantage, that these plates may be reproduced at any time at very little outlay. In connection with this subject, a recent use of photography in America which is extremely useful was the copying, in miniature form, of the whole of the MSS. of the 'Century Dictionary,' which was so extremely valuable that no fire insurance office would accept the risk. There are numerous books in the Library of the Pharmaceutical Society at 17, Bloomsbury Square, which are seldom, if ever, read; they occupy considerable space, and are still valuable. Why should not minute photographic copies of them be kept, and thus give greater space for those that are useful?

The subject of colour photography is one which always has a great attraction for photographers as well as the outsider, and the latest method suggested by Professor R. W. Wood, of Wisconsin, U.S.A., is extremely ingenious and one of the most striking that has yet been brought forward. He uses as a fundamental basis the theory of the primary colour sensation curves of Clerk Maxwell, and, therefore, three negatives taken through green, orange, and violet screens. He then sensitises a sheet of thin glass with bichromated gelatin, allows it to dry, and it is next exposed under diffraction gratings having 2,000, 2,400, and 2,750 lines to the inch. A positive representing the red sensation is placed behind the 2,000-line grating, and the exposure made, then the sensitive plate is shifted till it comes in contact with the 2,400-line grating, behind which is the green sensation positive, then exposed, and again shifted to the third grating, behind which is the violet sensation positive. On washing the plate and allowing it to dry we have an image formed of varying distances of impressed lines, which give us all the colours exactly as a diffraction grating does.

All that is now required is merely to mount the gelatin positive on a stand and view the image of it formed by a convex lens, through a minute hole. Unfortunately, the process is by no means perfect, but some of the results shown have been wonderful, and there is the great advantage in this process that, having once obtained a diffraction picture, it is possible to duplicate it by mere contact printing in sunlight on bichromated gelatin.

It has long been one of the aims of those workers who adhere to gelatino-chloride of the P.O.P. to obtain black tones similar to those given by the true platinotype paper, and whilst it seems somewhat a roundabout way to obtain these when we have such excellent papers as the platino-bromide and Velox, there is not the slightest doubt that the reason why such tones are desired on P.O.P. is that one can actually see the image during the whole of the operations, and therefore have it more under control. The best method up till quite recently has been Valenta's method of toning first with a gold and borax bath, and then with the normal phosphoric acid and chloroplatinite of potassium. His last recommendation, however, is quite satisfactory—namely, the use of *m*-phenylenediamine.

The bath will not keep long, and it is therefore advisable to make up stock solutions, one of chloroplatinite and another of *m*-phenylenediamine, both 1 per cent., and when required for use take ten parts of each to 100 parts of water, washing the prints first in soft water. The tones obtained are excellent, and may be varied at will from brownish black to pure black.

CHEMICAL SOCIETY.

Bunsen Memorial Lecture.

The high esteem in which Bunsen is universally held was demonstrated on Thursday, March 29, when the Chemical Society met to hear a memorial lecture on the great chemist, delivered by Sir HENRY ROSCOE. In the crowded lecture hall were recognised many Fellows of the Society, who, living in distant parts of the country, are rarely seen at ordinary meetings.

The PRESIDENT (Dr. T. E. Thorpe, F.R.S.) occupied the chair.

Sir HENRY ROSCOE stated that he had enjoyed the friendship of Robert Bunsen for nearly half a century, and he had to speak of him not only as one of the greatest chemists but also as one of the truest and noblest of men. He first briefly outlined the career of Bunsen up to his death, which took place at Heidelberg on August 16, 1899, at the ripe age of eighty-eight years; and then proceeded to enumerate his more important researches. The discovery of the cacodyl compounds and their investigation, although his only research in organic chemistry, was of such a classical nature as to place him in the rank of pioneers in this branch. Berzelius, who was unsparing in his criticisms of work that was untrustworthy, as well as Adolf Baeyer, spoke in high praise of this work. His work on the gases of the blast furnace was of singular importance. Having set on foot the work of improvement in the economy of the fuel of blast furnaces in Germany he came to England at the instigation of his friend, Sir Lyon Playfair, and found that here even greater waste was allowed to take place than in his own country. His only book, a book dealing with the collection, preservation, and measurement of gases, is a model of accurate work.

The discovery of the Bunsen battery marked an era in the economic production of electricity, and after he had discovered how to get rid of the disintegrating effect of nitric acid on the carbon by igniting, he was able to describe the first step towards lighting by the electric arc.

In 1852, while at Breslau, he turned his attention to the electrolytic production of metals that had hitherto only been obtained either impure or in a powdery condition. By the ingenious device of making inverted pockets in the carbon, into which the metal could be collected without oxidation, he succeeded in obtaining magnesium. He also brought to a successful issue the investigation of the conditions most favourable to the production of the alkali metals. Mention was made also of the grease-spot photometer and the ice calorimeter, elaborated for the purpose of determining the specific heats of cerium, lanthanum, didymium, and germanium. His vapour calorimeter, which was devised when he was 76 years of age, was a masterpiece in originality, and was considered a wonderful achievement for a man of his years.

He was quick to recognise the ability of Kirchhoff, and was influential in bringing him to the chair of physics at Heidelberg, where they laboured together in their famous photochemical researches. In a letter written to the lecturer at this period, he stated that he was now engaged with Kirchhoff in a research that gave him sleepless nights; the nature of the Franhofer lines had been discovered and their production artificially imitated, and thus the way was pointed out of discovering the things contained in the sun with the same certainty that they were identified on the earth, as well as of examining terrestrial substances with the same exactitude as the solar ones. This discovery led to that of the rare alkali metals, caesium, rubidium, and others. An accident, singularly like the historical one of Sir Isaac Newton's burnt manuscripts, happened to Bunsen. On returning to his study one day he found the whole of his writings and maps on the spark spectra of metals, a completed work, reduced to ashes, having been set on fire by the sun's rays falling on them through a spherical water bottle. So undaunted, however, were his energy and

zeal that he patiently retraversed the whole of the work, never relaxing until all was replaced. Of the Bunsen burner, the lecturer said it was unnecessary to speak. It had carried his name everywhere, and was known by thousands, who knew little or nothing of the inventor. His studies of the great geyser of Iceland were also described, as well as his work upon the platinum group of metals and mineral water analyses. The lecturer then went on to speak of personal reminiscences of Bunsen. He was impressed at his first meeting with him. Standing fully six feet high, his figure was well knit and powerful, his manner of suave dignity, and his expression of great kindness and rare intelligence. Modest and retiring, he was with difficulty persuaded ever to give public utterance of either a scientific or social character. Having an affectionate nature, he must have felt keenly in his declining years the lack of those on whom to bestow his affection. He often said he had never had time to think of getting married.

A well-known trait of his character was his keen sense of humour, but of all the witty sayings that passed from mouth to mouth as "Bunsen's last," none were ever tinged with ill nature, for that was foreign to his being.

His manipulative ability was remarkable, and his hands, though large and powerful, were supple and dexterous. He was amusingly proud of having a large thumb, with which he was able to close the end of a long eudiometer tube filled with mercury, and immerse it in the bath without admitting the least bubble of air—a feat those endowed with smaller digits were unable to accomplish. He was a skilful glass-blower, while he had a salamander-like power of handling hot glass tubes, and, said the lecturer, "many a time at the blow-pipe I have smelt burnt Bunsen and seen his fingers smoke."

Accuracy of work was the first essential with him—most of his pupils learnt from him for the first time what that meant. Not that he was averse to quick work, for he advocated many methods of shortening chemical processes, but never at the expense of accuracy. Being entirely without monetary ambition himself, he particularly disliked anything savouring of money-making out of pure science. The zinc carbon battery alone might have brought him a large fortune had he sought to turn it to such account. The great variety of subjects studied at one time indicated only a tithe of his energy. It was to be wondered how he found time to accomplish all his work, for he never had an assistant in his own researches, only occasionally giving in his memoirs the analyses of students he could trust. The lecturer recalled a stay with Bunsen upon a certain occasion, when he said that, although he himself rose very early, he always found him already at work. He lectured on general chemistry every morning in the week, from 8 to 9 in summer, and from 9 to 10 in winter. His exposition was clear and his delivery easy. He was accustomed to spend from a half to one hour before each lecture rehearsing the experiments of the lecture, which were always to the point, being never of the firework kind. He did not enlarge on theoretical questions, indeed to discuss points of theory was not to his liking, and although he did much to establish the evidence on which modern theories are based, he used to say that one chemical fact properly proved was worth all the theories one could invent. In his habits Bunsen was frugal, his only extravagance being cigars, of which he usually had one, but as it was allowed to go out several times in the course of his work the number he consumed was less than it appeared to be. Although he took but little active interest in politics, he was a staunch Liberal, and when invited to the Chair of Chemistry in Berlin in succession to Mitscherlich he refused the offer, since, as he explained to his friends, he did not want to have anything to do with Bismarck.

At the close of the lecture Dr. THORPE added a few of his own reminiscences. A vote of thanks was ably proposed by Professor ODLING, and seconded by Dr. ATKINSON.

LETTERS TO THE EDITOR.

Thoughts Suggested by Clause 2 of the Companies Bill.

Is the position of company chemists, as regards the use of titles and the dispensing and sale of poisons, a legal one at the present moment?

If the answer be "Yes," we are led to ask, "Why, then, should the Lord Chancellor burden his Bill by a useless clause?" If the position of the companies be a legal one already, surely they need no further legislation to protect them from any assault of the Pharmaceutical Society or its members. If, on the other hand, the present status of company chemists be illegal, how is it that such an eminent lawyer as the Lord Chancellor should show such anxiety to put them on a legal footing?

Note the *permissive* wording of Clause 2 in regard to company *pharmacy*, as opposed to the *prohibitive* wording of Clause 3, when dealing with company medicine, surgery, dentistry, and *midwifery*. The midwives, by the way, are not yet a registered body, while we pharmacists have for years been compelled to register before we could use the title of chemist, etc., or legally sell a poison.

The *amended* Clause 2, containing the provision as to the posting of the name of the manager, is evidently intended as a sop to registered chemists, for it has not met with the approval of the companies, as evidenced by their circular to members of Parliament. If I held the view that the company chemists' present position were a legal one, I should not think it worth while to discuss Clause 2. It would be a mere waste of time on our part, as this clause would then make the position of the registered chemist neither worse nor better than it is at present. Even if the proviso as to the name of the manager appearing, annoyed the companies, it would be of no practical value to the registered chemists and druggists. But holding firmly the contention that the company chemists are carrying on their businesses in direct contravention of the Pharmacy Act, 1868, I will proceed to notice a few points which seem to me to be of the utmost importance at the present juncture, and require the *careful* study of the *full* text of the Pharmacy Act.

(1) A great point has been made by some of the use of the singular "person" in Section 15 of the Act. If the preamble to the Act be read carefully, I think it will be seen that that argument is neutralised by the use of the plural "persons," the phrase "*all persons*" occurring once in the preamble.

(2) *Registration*.—Sections 12 and 13 should be consulted on this point. The plural "persons" again appears, and the *absence* of name from the Register is evidence of *non-registration* under the Pharmacy Act. If the singular "person" were *always* used, there might be *some* ground for the argument that the term did not apply to a company; but when in several places the plural "persons" is used, it surely cannot be maintained that companies as well as individuals are not included in the operations of the Act. The phrase "*all persons*" in the preamble is very comprehensive. The absence, then, of *registration under the Pharmacy Act* is, I maintain, a strong point against the companies, for *registration* is essential in order to legally keep open shop for the retailing, dispensing, or compounding of poisons, and for the use of titles.

(3) *The Seller of Poisons*.—Section 17 should be carefully read, as it does not seem to be universally understood. It will be seen that the seller is the *person on whose behalf* any sale is made by an apprentice or servant; that is to say, the assistant, or manager, or apprentice who hands the poison to the customer is not the *seller* in the eye of the law. Therefore, how can the sale of poison by any registered *assistant or manager* in the employ of a company legalise that sale, seeing that the *servants* are not recognised as the sellers. No herbalist or unqualified chemist, however intimate he may be with drugs and poisons by long training and

practical experience, may legally keep open shop for the retailing of poisons, even though he employ a *registered* assistant or manager to conduct the sale, for he (the unqualified proprietor) remains the *seller*, and as such his name and address must appear on all the labels. Is it not, then (to say the least), quite as illegal for a company of unqualified persons to sell poisons through the agency of a registered chemist (who is only their *servant*) as for one of that company individually to do so?

To briefly summarise my arguments to show that chemist companies are at present illegal:—

(1) The use of the word "*person*" in Section 15 of the Pharmacy Act must be taken in conjunction with the use of the plural in the preamble and other sections of the Pharmacy Act.

(2) The absence of *registration* under the Pharmacy Act prohibits the keeping of open shop for the sale of poisons, and also prohibits the use of titles.

(3) Chemist companies of unqualified individuals are not legally covered by qualified *servants*.

I think it is to be regretted that the Council of the Pharmaceutical Society should have decided to oppose Clause 2 without making a further attempt to amend it, as proposed by Mr. Walter Hills. I cannot see why Mr. Ritchie's reply should cause such discouragement. One hardly expects a member of the Government to welcome a proposal to amend a Bill of which he has charge, and which he is naturally anxious to get through with as little opposition as possible. We have nothing to lose by a vigorous policy, but much to gain.

March 30, 1900.

ALPHA (26/8).

The Society's Library.

Being placed at "scratch," so to speak, in the above matter, I wish to make a few further remarks, although I had hoped that the question would be raised long ago by some well-known pharmaceutical "researcher." I think everyone will agree that the keeping open of the Library every night for an average attendance of one or two is nearly as absurd as closing it absolutely to all members engaged in daily work. Those members who do not want the Library are out of the running altogether.

The advancement of pharmacy, which, according to the Charter, was the prime object of the Society, is not the invention of new names, terminating in "ule" or "oid," for slightly dissimilar forms of compact medicines more or less easily swallowed—by the medical profession. Nor can it be much furthered by the student whose interests appear to predominate at No. 17. Pharmacy has been, and is being, advanced by the work of a comparatively few practical, experienced men, who are engaged in business, often in the employment of others, and whose leisure is generally very small indeed.

I admit they are few. The Council of the Society, when arranging evening meetings, finds that they are few. The Conference secretaries, with their much vaster field of influence, find how few they are. The secretaries of the C.A.A. and such bodies turn grey and prematurely aged in their search after men willing to attempt a little original work. Such work, however little, usually requires access to current scientific literature, and any of the few will tell you that, although he visits the Library only five or six times a year, he stays each time perhaps two hours, and consults many works of reference.

I am assured that the members of the Committee only took their closure step—a step, by the way, a trifle too long—after much consideration. I can imagine that they were in possession of, and duly assimilated, a few of those statistics so necessary in proving a fact, or its antithesis, but I do not suppose that it occurred to any of them that they were seriously interfering with the work of a few men whose work is already classic, and positively discouraging a possibly good deal larger number from entering upon any research work at all. Even the students appear to be dissatisfied, according to Mr. Jewson.

In all probability, one evening per week, till 10 p.m., as Mr. Gamble suggests, will meet the necessity. Members must make it convenient to come on whatever night should be appointed, and to meet the Committee in that way. I would remind Mr. Miller that discussion in a library should not be allowed, but there seems no reason why the room adjoining should not be opened for that purpose on the same evening.

London, N.W., April 2, 1900.

T. MORLEY TAYLOR.

It may not have been the original intention that the Library should be used as a reading (studying) room by students, but that it has been so for many years nobody would deny; and to close it in the evening would, I doubt not, be a great hardship to many who, in their student days, have, like myself, to accommodate attendance at lecture and laboratory to a limited purse. That some relief should be found for Mr. Knapman, the most courteous and omniscient of librarians, whose hours are much too long, without curtailing the hours during which the Library is open, ought not to be beyond the ability of such a Council as we possess.

London, April 2, 1900.

C. A. PARKINSON.

The Society's Library is practically useless for town visitors unless it at least is kept open as late as some of the town shops and public libraries. I think it is now high time that something was done for the benefit of Junior Pharmacists as an incentive to encourage them, the same as is done at Brighton, where I belonged; and what can be done at nights in a country town so easily on a small scale I fail to see why it cannot be done on a much larger scale in a magnificent city like London. The Junior Pharmacy Association at Brighton not only met for self-improvement on certain evenings in the week by holding concerts, reading essays, and collecting some substantial sums of money towards the Benevolent Fund at the end of each meeting, when the box was handed around, but was patronised by several members of the Senior Pharmacy Association, who offered prizes for the best essays and papers written at set times there.

Apart from the prevalent idea of some energetic minds that the only resource left open to the bewildered student is the tap-room and the bar of a public-house, after having travelled mayhap some miles to make a cross reference, is, indeed, a very sad one. Why not keep open the temperance bar, and, in case of any overcrowding, have the Library accommodation enlarged? All the additional expense required for such a praiseworthy undertaking would be met by the resident attendant in taking the names and addresses of visitors on entering, seeing to the books, and regulating the supply of light, which, on these dark nights, is so much needed.

Hampstead, April 3, 1900.

A. SMITH.

The letters which appeared in the *Pharmaceutical Journal* last week will, I trust, have the effect of drawing attention to the inconvenience experienced by many residents in London on account of the closing of the Society's Library in the evening. It is true that books can be obtained from the Library by sending for them, or through the post, but when reference has to be made to a special subject one often requires to consult perhaps twenty volumes before lighting on the information sought. There are few who can spare the necessary time for prolonged reference during the day, and, in my own case, when I have wished to make use of the Library for this purpose, the evening has been my only opportunity. I would be the last to wish to add anything to the duties of the Library staff, whose courteous chief, Mr. Knapman, is always so willing to assist inquirers, but I think the difficulty could easily be met by making the daily time of opening the Library an hour later and keeping it open on one evening in each week until ten p.m.

London, April 2, 1900.

F. C. J. BIRD.

Glaucium Luteum.

I was interested in seeing Mr. Ashton's letter *re* the above in this week's *Journal* (see p. 344), as I had already contemplated writing, drawing attention that this plant could be found on the Sussex littoral. I can now, however, corroborate his statement, as I found it growing last summer along the coast at Elmer, half-way between Littlehampton and Bognor, and also in abundance to the west of the latter place, at Selsey Bill.

In John's 'Flowers of the Field' it is mentioned as being "conspicuous on the sandy seashore," from which one would infer that it is not uncommon, or that it is not sufficiently localised to mention where it may be found. I think if botanists would give their experience when points arise like these, we should know more correctly the habitats of some of our more interesting flowers.

Bognor, March 31, 1900.

C. T. JOHNSON.

The Preliminary Examination.

Having passed only the "Modified" Examination myself, to which I was entitled, as an assistant of three years' standing, when the Act passed, I think there is good reason to deal leniently also with the present apprentices, who may present themselves at the April and July Preliminary Examinations—the last to be held. If the comparison has not been raised, it is, in my opinion, a fair one, and worth acting on. I admit having a friendly interest in the matter as a reason for writing on it. Regarding the future, unless School Boards can turn out the necessary certificates, I expect we shall have to train message-boys—if we can get them—or otherwise leave our apprentices in the lurch, to swell the ranks of the great unqualified. Taking diminished trade and diminished profits into account, this, it seems to me, will be the net result of the Society's efforts up to date.

Edinburgh, April 2, 1900.

S. WALKER.

The Blackburn Committee Meeting.

The criticisms on the committee meeting of the North-East Lancashire Chemists' Association held on Tuesday, March 27, certainly call for some reply. At the outset let me disclaim any intention of submitting that our Association and its committee are above criticism, for that is not the case. Any just criticism founded on facts we gladly welcome.

As to the remarks in the first Annotation in regard to committee meetings being private, our meeting was certainly private, but as Mr. Gifford had attended the Liverpool dinner in his capacity as Secretary of the N.E.L.C.A. and representative of the Association, he at this meeting reported his visit and gave a short *résumé* of the proceedings at the dinner. He also had occasion to mention some of the statements of the President of the Pharmaceutical Society, and took the opportunity of refuting some of them. Many of the members present spoke on the subject, but as they were in accord with Mr. Gifford's views, it was not thought necessary to take note of their remarks. The committee, thinking Mr. Gifford's remarks sufficiently important to justify publication, ordered their issue to the Press, and the notes were given to the local reporter in due course. I am not aware that there is anything irregular in this. As to Mr. Gifford's intentions when he wrote his report for presentation to the committee, of course I cannot speak; but one thing is certain, that the meeting was not called for the special purpose of hearing Mr. Gifford and putting his views before the "world of pharmacy at large."

There is no need to "draw the bow at a venture," for I suppose the reporter supplied you with the same report as the other papers, and in that it was distinctly stated that it was an *Election* Committee meeting, and generally committees meet for the transaction of the business which they were formed to transact. You have in your report of the meeting and Annotations altogether omitted to insert *Election* Committee. Had Mr. Gifford or the committee wished the matter to be reported, we could easily have called a general

meeting to meet after the committee meeting and asked reporters to be present. Of course, as a committee we are open to instruction in the methods of procedure and the correct way of conducting our meetings, if your "Annotator" will give us what he considers the orthodox manner of so doing. As to your statements "that there was a chairman and apparently the meeting was properly constituted," I suppose you intend "the world of pharmacy" to understand that sometimes we *do manage without* a chairman, and that our meetings are sometimes *not* properly constituted. Such a supposition is very wide of the truth, however. My purpose in writing is not to defend Mr. Gifford's views or to attack those of the President, for they are both able to do that for themselves. I must, however, protest against criticisms which are not founded on facts. It certainly seems that no good thing can come out of North-East Lancashire. Will you kindly give this disclaimer of mine equal prominence with the Annotation which has caused me to make it?

Blackburn, April 2, 1900.

JOS. HINDLE,
Chairman of the Meeting.

The Business of a Chemist and Druggist.

The leading article in this day's *Pharmaceutical Journal* is well worth reading, and worthy of the thoughtful consideration of all engaged in our calling. The case, so far as my memory serves me, has never been so concisely or so plainly stated; there is an impression abroad, not only amongst the public, but even amongst some of our own people, that our object in opposing company trading is to put a stop entirely to the sale of all drugs and chemicals by others than chemists and druggists; but there is really no such wish, I am sure, in the minds of those who object to companies carrying on the business of chemists and druggists. My object now in calling attention to the matter is to ask our friends, when talking to the public or to their members of Parliament, to make it quite clear, as you have done, that the real objection to company trading is not that we pharmacists wish to have a monopoly of the sale of drugs and chemicals, but only to carry on business on the lines that were laid down by the Pharmacy Act of 1868; if that is done, I feel sure there will be little or no difficulty in attaining the object we have in view at present—namely, the defeat of Clause 2 in the Companies Bill. But are we to rest there? Do we wish to preserve the *status quo* only? Is not our wish to have the *status quo ante* company trading? If that be so, it behoves the Council to face boldly the question of the use of titles by companies which are in no sense qualified under the Pharmacy Act. I am of opinion the Council is bound to succeed. If it should not in the first instance, the matter should be taken to the highest court. If then the Act is found to be so utterly faulty that such misuse of titles cannot be prevented, it will be necessary to go for an amended Act. I cannot think that Parliament would allow the use of titles by others than those who have earned them by legitimate means.

March 31, 1900.

M.P.S. (26/36).

The following statement I quote from the *P. J.* editorial of to-day:—"The question to be considered—whether companies should be prevented from carrying on that very small part of a chemist and druggist's business for which an individual qualification is required by the Pharmacy Act, 1868—is therefore a very narrow one, and it is really a question affecting the public interest more than the interests of chemists and druggists." Speaking by the strict letter of the law, the statement may be absolutely accurate; taking a view as it affects the daily business of an ordinary retail chemist, it is sheer nonsense. If companies, stores, etc., were only allowed to trade outside the limits of the Pharmacy Act, would not the discerning public rapidly discover that there was a screw loose

somewhere, and while ready enough to patronise them for Beecham's at 10½d., etc. (which the chemist would never regret), would purchase their drugs, etc., from the responsible retailer.

March 31, 1900.

C. P. (26/30).

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

LONDON MATRICULATION (E. A. T.—40/26).—All the information you ask for was given in the Students' number of the *P. J.*, published September 9, 1899.

CHEMISTRY OF THE B.P. (S. A. J.—40/27).—There is nothing of the kind in existence except the notes in The Students' Columns of the *P. J.*, published during the last three years.

LAVENDER OIL (D. S.—10/31).—The price varies from 2s. 6d. to 50s. per pound, according to quality. You might offer the oil to a firm of wholesale druggists and the blooms to a florist.

PRELIMINARY EXAMINATION (A. B. G.—40/29).—Having already passed one preliminary examination and been registered as a "Student," there is no occasion for you to pass any other.

STILL (D. S.—40/31).—Any dealer in chemical apparatus, such as J. J. Griffin and Sons, Limited, 20, Sardinia Street, Lincoln's Inn Fields, London, W.C., will quote a price and supply you with the information you require.

MEDICAL DIPLOMA (H. D.—40/30).—Passing the Minor Examination will not save you anything in connection with the medical curriculum. Refer to the last Students' Number of the *P. J.*, published September 9 last, for the other information required.

PRESERVING THE COLOUR OF FLOWERS (H. C. T. G.—40/25).—Various processes have been recommended for the purpose and two are given here:—(1) Immerse in aqueous solution of sulphurous acid before drying; (2) plunge for an instant in a boiling alcoholic solution (1 in 600) of salicylic acid and dry.

REGISTRATION OF WORD (F. W. J.—40/28).—You must pay five shillings for a form of application, obtainable at any money order office, and, having filled it in, send it to the Comptroller, Patent Office, Trade Marks Branch, 25, Southampton Buildings, Chancery Lane, London, E.C. If the word be accepted for registration you must then pay twenty shillings for the registration form.

LIQUOR AMMON. ACET. CONC. (M. S.—40/19).—Take 64 fluid ounces of glacial acetic acid, add to it 30 ounces of water, then gradually add freshly powdered or crushed ammonium carbonate, 64 ounces: stir occasionally until all the salt has dissolved, then nearly neutralise by the addition of a little more acid. It is not easy to determine the exact neutral point of this liquid. It may be made just faintly acid after dilution 1:7 then as the taste is, less nauseous. Finally, adjust the volume to one gallon with distilled water. Instead of glacial acid the equivalent quantity commercial 80 per cent. acetic acid may be used. That materially lessens the cost.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, APRIL 7, 1900.

THE COUNCIL MEETING.

AFTER confirmation of the minutes of the previous meeting, the PRESIDENT drew attention to the death of Mr. JAMES WATT—a former member of the Council and of the Executive of the North British Branch of the Society, as well as local secretary for Haddington for many years, and a resolution was passed expressing regret and sympathy with his family.

Mention was also made of the death of Mr. WILLIAM BURLEY, of Edinburgh, a member of the Executive of the North British Branch.

The TREASURER announced that, in compliance with the instructions of the Council in reference to the Waterall legacy, particulars of which are recorded at page 258 of the Journal, he had purchased one thousand pounds of Consols.

The additions to the Society comprised, 52 members, 18 student-associates, several restorations to membership, and 4 persons were restored to the Register of Chemists and Druggists.

The SECRETARY read the report of Dr. STEVENSON to the Privy Council on the examinations conducted by the Pharmaceutical Society during the year ending in March last, stating that the improvement in the quality of the candidates mentioned in last year's report has not been altogether maintained, and showing that the number of candidates for the qualifying examination was exceptionally large, and that the proportion of failures was above the previous average, a very large percentage of them being due to deficiency in regard to the most essential and practical subjects of chemistry, pharmacy, and dispensing (see page 366).

The SECRETARY read a list of nominations for the Council election, and the names of those who had signified their willingness to take office if elected (see page 365).

Pursuant to the Bye-law 4, Section 5, Mr. CHARLES HODGKINSON was nominated to fill the vacancy arising from the retirement of Mr. STACEY from the office of Auditor. Mr. CARTEIGHE supported the nomination, and it was agreed to.

The report and recommendations of the Finance Committee were adopted without comment.

On the recommendation of the Benevolent Fund Committee, six grants, amounting in all to eighty-three

pounds, were ordered to be paid, and Dr. SYMES mentioned that on this occasion only one of the recipients had been a subscriber to the Fund. Another donation has been received this year from the Liverpool Students' Association of a sum collected at a smoking concert.

The report of the Library, etc., Committee stated that in addition to carrying out ordinary work, the Committee has sat as a Research Committee, and received reports from the Professors as to the progress of work undertaken at the request of the General Medical Council.

The SECRETARY stated that Mr. THOMPSON has represented that in Birmingham the increase in the number of members of the Society rendered necessary the appointment of an assistant local secretary for the western division of that city, and on the motion of the PRESIDENT, Mr. GEORGE E. PERRY was appointed to that office: Mr. W. T. WILSON was also appointed local secretary for the Haddington division, in the place of the late JAMES WATT.

In consequence of the ill-health of one of the Examiners a necessity has arisen to obtain assistance in the heavy examinations now in progress, and on the motion of the PRESIDENT, Mr. EDMUND WHITE was appointed to assist the examiners.

The SECRETARY reported that letters had been received;—

1. From the Manchester Pharmaceutical Association with a resolution passed at a meeting on the 14th March, approving of the action of the Council in regard to Clause 2 of the Companies Bill, and suggesting the propriety of including pharmaceutical chemists in Clause 3 of the Bill.

2. From the Sheffield Pharmaceutical and Chemical Society with a resolution passed at a general meeting on the 14th March, expressing the opinion that the action of the Council in reference to Clause 2 of the Companies Bill should have universal support from the chemists of Great Britain.

3. From the Oxford and District Chemists' Association with a resolution passed at the annual meeting on the 14th March, urging as an amendment of Clause 2 of the Companies Bill, that "no company of unqualified persons may use the description of pharmaceutical chemist or chemist and druggist, or any other title implying registration under the Pharmacy Act, 1868."

4. From the Lancaster and Morecambe Chemists' Association with a resolution passed on the 15th March, supporting the amended Clause 2 (A) in the Federation programme (see *ante*, page 237).

5. From the Bolton Pharmaceutical Association with resolutions passed on the 19th March, supporting the Council's opposition to Clause 2 of the Companies Bill, and the candidature of two nominees for election on the Council.

6. From Mr. BIRKBECK, local secretary for Lincoln, communicating the decision of the chemists of that district to support the Council in opposition to Clause 2 of the Companies Bill.

7. From the Leicester Chemists' Social Union, with a resolution passed on 22nd March, supporting the action of the Council in regard to Clause 2 of the Companies Bill, and suggesting that the Council should at an early date proceed to framing a Pharmacy Bill.

8. From the Forfarshire and District Chemists' Association with resolutions passed on 29th March approving decision of Council in regard to Clause 2 of the Companies Bill, and urging the preparation of a Bill to amend the Pharmacy Act.

9. From the Midland Pharmaceutical Association, with a resolution passed 15th March, supporting the action of the Council in regard to Clause 2 of the Companies Bill, and suggesting the issue of a circular for signature by all registered chemists in Great Britain.

10. From the Glasgow and West of Scotland Pharmaceutical Association, with resolutions passed on the 22nd March, to oppose Clause 2 of the Companies Bill and urging the promotion by the Council of a Bill to amend the Pharmacy Acts.

Mr. HILLS referred to these communications as being very interesting, and expressed a hope that at some of the meetings taking place throughout the country, the friends of the Council would not only advise that steps should be taken to frame a Pharmacy Act Amendment Bill, but also say on what lines they consider legislation to be desirable and practicable. The PRESIDENT also remarked that there is need, not only of destructive criticism, but also of something constructive. On the motion of Mr. CARTEIGHE the communications were referred to the Law and Parliamentary Committee.

On the proposition of the PRESIDENT, that the seal of the Society should be affixed to transfer deeds relating to the Society's Strawberry Hill property, Mr. CARTEIGHE explained the circumstances of the case (see page 367), and the proposition was agreed to.

After consideration of the legal part of the report a resolution was passed adopting the recommendations as to proceedings to be taken by the Registrar.

THE COUNCIL ELECTION.

THE candidates for the Council are seventeen in number, and as there will be only seven vacancies to fill, ten of the nominees must of necessity be rejected. The retiring members, all of whom are offering themselves for re-election, are Messrs. Bateson (Kendal), Cross (Shrewsbury), Grose (Swansea), Hills (London), Storrar (Kirkcaldy), Symes (Liverpool), and Warren (London). The ten who are prepared to replace them are Messrs. Campkin (Cambridge), Cooper (London), Currie (Glasgow), Gibbons (Manchester), Gifford (Blackburn), Gostling (Stowmarket), Morrison (Tring), Pickering (London), Taylor (Bolton), and Wootton (London). Three of those—Messrs. Campkin, Gibbons, and Morrison—have previously offered themselves for election, and been rejected. Mr. Cooper is a director of the Chemists' Defence Association, Mr. Currie is a former Vice-Chairman of the North British Branch Executive, Mr. Gifford has made himself prominent as a strong supporter of the no-surrender policy, Mr. Gostling is a relative of a former esteemed member of Council, Mr. Pickering was formerly Hon. Secretary of the Chemists' Assistants' Union, Mr. Taylor is the author of the paper recently published (see *ante*, p. 148) on "The Outlook in Pharmacy," Mr. Wootton has only recently retired from the editorial chair of a trade paper, the prosperity of which has been based upon constant endeavours to oppose the best interests of the Pharmaceutical Society and, consequently, of pharmacy in general.

ANNOTATIONS.

THE LETTER which appears in this week's Journal under the heading "Thoughts Suggested by Clause 2 of the Companies Bill," is published chiefly because the questions it raises illustrate some misconceptions still prevalent as to the relative positions of persons legally qualified under the Pharmacy Act, 1868, and the companies formed by unqualified persons for carrying on the business of a chemist and druggist, which thus set at defiance the object and provisions of the Statute. Those misconceptions often divert attention from the real points of interest, besides being otherwise a source of mischievous antagonism among registered chemists, and though they have been frequently dealt with on previous occasions, they may now be usefully referred to again in reply to the above-mentioned letter.

THE FIRST QUESTION raised as to whether the position of a company carrying on the business of a chemist and druggist is a legal one is, at the present moment, a quite superfluous question; one that really cannot be discussed: that was the main question when the case of the London and Provincial Supply Association was under consideration by the Courts; but it was not then decided, and, according to the admission of most of the judges, it could not be decided for various reasons. If the question had then been decided, there would not, of course, have been any occasion for Clause 2 of the Companies Bill. Unfortunately, the final judgment of the House of Lords, instead of deciding whether such companies were legal or illegal, only decided that, in the Pharmacy Act, the term "person" should not be held to include a company or a corporate body. That decision—which may be regarded as practically an evasion of the real question at issue—was essentially a declaration that the Pharmacy Act was so defective as to be unequal to securing even the specific object for which the Act was passed—viz., that certain poisons should be supplied, either by sale or as medicine, only by persons whose knowledge of their business had been tested by examination and officially certified. That position was reached twenty years ago; it demonstrated the imperfection of the "patchwork" Act which had been forced upon chemists under the influence of "clashing interests." Consequently the action then taken for the purpose of obtaining obviously necessary amendment should have been supported by all persons registered under the Act. Instead of that, the attempt then made by the Council of the Pharmaceutical Society, and numerous subsequent attempts in the same direction, were opposed and defeated. As a consequence of the influence of conflicting views and tendencies, nothing has been done either to stop the mischief most complained of by persons registered under the Act or to effect various other necessary amendments of the law relating to the practice of pharmacy and to the business of a chemist and druggist.

IN ADDITION to the fact that the question as to the legality of chemist companies still remains undecided, there is a far more important point in the judgment of the House of Lords—viz., the decision that a company, as a "person" in the eye of the law, is not such a person as the Pharmacy Act relates to; consequently, that companies, being altogether outside the scope of the Act, might freely do anything that individual persons are prohibited, by the Act, from doing, except under prescribed conditions. That decision has been considered by many to be absurd because it affords opportunity for unqualified persons—as a company—to violate the purpose of the Act. From a one-sided point of view, there is some reason for that opinion which is, moreover, in accord with the view that was taken of the matter by Lord Chief Justice Cockburn and by his colleague, Mr. Justice Mellor. But careful perusal of the judgments delivered by Lords Selborne, Blackburn, and Watson should suffice to convince an unprejudiced person that the very provisions of the Act furnish some more or less positive foundation for the conclusion they arrived at. In the first place, the Act of 1868—incorrectly called a Pharmacy Act—does not

relate to pharmacy: it does not deal with the practice of pharmacy; but only with the business of a chemist and druggist, and chiefly from a trade point of view. Then the omission of any direct reference to companies, though they were in existence when the Act was passed, appeared to give plausible support to the view that companies were not intended to be brought within the purview of the Act. Further, the evidently personal nature of the chemist's qualification, as well as the opinion that any individual acting contrary to the provisions of the Act—whether as master or as servant—would be liable to its penalties, operated as additional inducements to conclude that the object and purposes of the Act did not necessarily require the proprietor of a business to be personally qualified. Lastly, there was the fatal influence of the "Widows' Clause" to support that view. Still, with all allowance for these circumstances, as accounting for the opinion that the Pharmacy Act is itself defective, the result that has been brought about by the House of Lords' decision is obviously and undeniably a monstrous absurdity, since its effect is to negative the very provisions by which the specific public object of the Act was to be secured. The result of that decision is also unjust to persons registered under the Act; hence it is strange that, for the most part, their attitude should have been confined to mere complaint and lamentation, so long, that the practices of unqualified persons, directly in opposition to the object of the Pharmacy Act, are now made use of to support the argument claiming vested interest in the continuance of those practices.

THE REPRESENTATIONS made to the Government on this subject by the Councils of the Pharmaceutical Societies, have at length been productive of something more than mere expressions of sympathy. The Lord Chancellor has recognised the absurdity of the existing position, as well as the necessity for amendment of the law. He has also given evidence of his conviction "that a company ought not to be permitted to do what a private person is prohibited from doing." But the legislative amendment he has proposed regards the business of a chemist and druggist altogether as a trade instead of an occupation requiring, in so far as its exercise is subject to the law, a qualification that is as much professional as that of the medical practitioner. That he should regard the matter as one primarily affecting the public interest is not remarkable, nor is it surprising that, in proposing a remedy for the legal anomaly that "a company can do the very thing which an individual is not permitted to do without examination as to qualification," he should be guided by, and support, the view of the law Lords as to construction of the Pharmacy Act. From that point of view the Lord Chancellor appears to have come to the conclusion that a provision compelling companies to employ qualified persons to conduct the business to which the Pharmacy Act relates would not only bring companies within the scope of that Act, but would also satisfy all other requirements. He even proposes that a company of unqualified persons may use the titles indicating qualification which a company cannot in any case acquire. That view of the matter is one-sided and erroneous: it leaves out of consideration the vested interest and the just claims of persons registered under the Pharmacy Act; such amendment of the law cannot, therefore, be accepted by them—to any extent—without undue sacrifice of their position and of the only legal privilege attaching to their qualification—viz., the right to use the title of chemist and druggist in connection with their business.

THE EFFECT OF QUALIFICATION under the Act of 1868 is to give the qualified person a right to use the title of chemist and druggist in connection with his business. The whole value of that title—to the public or to the user of it—consists in its being a credential that the person using the title is certified by the State to be competent to discharge certain duties connected with the sale or dispensing of about one-tenth part of the articles constituting the pharmaceutical stock-in-trade of an ordinary chemist's shop. The fact that the other nine-tenths can be dealt

in, either by companies or by individuals without qualification, as freely as ordinary groceries, drysalteries, or the other miscellaneous articles sometimes dealt in by chemists and druggists, altogether disposes of the specious but wholly false pretence often put forward that the Pharmacy Act creates a monopoly of trade; that fact also proves that the intention of the Act was only to restrict trade in certain dangerous articles, because such restriction was deemed expedient in the interest of the public. Therefore, whenever Clause 2 of the Companies Bill comes before Parliament the real question to be considered will involve the alternative whether the salutary provisions of the Pharmacy Act—meagre as they are in regard to the practice of pharmacy—shall be maintained, in the public interest, or repealed in the interest of companies which violate the spirit of the Act. In regard to that question persons registered under the Act can take only one position. No compromise is possible: no admissible amendment of Clause 2 of the Companies Bill would suffice to remedy the alleged defect of the Pharmacy Act, either from their point of view or in the public interest; therefore, as the Council of the Society has decided, nothing should be done by legally qualified persons but oppose the Clause altogether. If any considerable number supported the proposals of Clause 2 while another section remained apathetic or undecided and only a minority adopted the decision of the Council, the result might be doubtful; but, with a properly united effort, the case is so reasonable that success might be confidently anticipated. The further question of adequate amendment of the Pharmacy Acts, in regard to the practice of pharmacy, is for the future: that task must not be attempted with the object of restricting trade; but from the point of view that the business of a chemist and druggist is, to some extent, of a professional character. In that sense the essential point to be secured is limitation of the use of any title indicating legal qualification in connection with the exercise of that business.

MR. JESSE BOOT—with his usual ingenuity as an advertiser—seeks to take an unfair advantage of the remarks made at the dinner of the Liverpool Chemists' Association, in reference to the position of legally registered chemists and that of limited liability companies carrying on the business of a chemist and druggist. In a letter to the *Liverpool Courier* he mentions several instances in which that business is carried on by limited liability companies, viz., Symes and Co., Allen and Hanbury, Southall Brothers and Barclay, and Woolley's, for the purpose, as he says, of showing "that company pharmacy is by no means subversive of the best traditions of the trade." He further asks "why then should the Liverpool Chemists' Association seek to deny the title of chemists and druggists to limited companies?" and he mentions Boot's Cash Chemists as being a case of company trading analogous to that of the firms above mentioned. That comparison may appear plausible to the uninformed and, though Mr. Jesse Boot is not among that number, the question he asks may be replied to for general information by stating the circumstance which he is careful to leave unnoticed, viz., that while the firms he mentions are owned by and conducted by persons legally qualified under the Pharmacy Act to carry on the business and to use the title of chemist and druggist in connection with that business, Mr. Jesse Boot is not so qualified. His position, and that of the company to which he belongs, is therefore a direct violation of the Pharmacy Act, in so far as the company carries on any part of the business which the Pharmacy Act—passed solely in the public interest—was intended to prevent any persons from carrying on but those legally qualified, viz., the sale and dispensing of scheduled poisons. The limitation of that part of a chemist and druggists business to persons legally qualified under the Act was established by the Legislature to secure public safety on the principle always advocated by the Pharmaceutical Society that the only safeguard to be relied upon in dealing in poisons or medicines and dangerous articles of that nature, is the competent knowledge and trained skill of the persons supplying them.

THE RIGHT TO USE THE TITLE of chemist and druggist in connection with that business was conferred by the Act upon qualified persons, and it is the only indication by which the public can distinguish such persons from impostors or pretenders. It is therefore a provision to secure public safety and the use of the title by a company—which in the nature of things cannot be qualified—is as the Lord Chancellor has pointed out essentially absurd, though there is no reason why persons duly qualified under the Pharmacy Act should not form themselves into limited companies such as those mentioned by Mr. Jesse Boot as some of the finest in the kingdom, with the obvious but fallacious desire of bringing his own company under the ægis of their well-deserved credit. The passage from a letter of Mr. Barnard Proctor in the *Pharmaceutical Journal*, which Mr. Boot quotes, apparently for the purpose of discrediting the notions of chemists, does not in its isolated form fully or fairly represent the argument intended by the writer of the letter. In face of the excessive competition now carried on between chemists the attempt made by Mr. Boot to justify the action of violators of the law by the suggestion that the real point at issue between chemists and the companies which usurp their position is whether chemists shall be allowed to charge "exorbitant prices" is too ridiculous to need further comment. The real facts of the case are that the general stores, run by companies of unqualified persons, do carry on greater part of the business of a chemist and druggist; there is nothing to prevent them, nor is there any desire to do so; but in so far as such companies sell or dispense scheduled poisons they act in contravention of the Pharmacy Act and defeat its object, while, in assuming the title of chemist and druggist, or any title conveying the impression that they are acting in conformity with the law, they deceive the public and appropriate what they have no right to. The comparison Mr. Boot seeks to make between such companies and others referred to in his letter has no real foundation, because these latter are not in the ordinary sense joint-stock companies, but merely applications of the principle of limited liability for private purposes which are not, in themselves, illegal and do not in any way violate the law.

MR. HINDLE'S REMARKS in reference to the comments in last week's Journal on the meeting held at Blackburn (see page 371) confirm the suspicion, then expressed, that the meeting was not regularly reported. As to the various potentialities and supposititious matters which Mr. Hindle discusses, the published report of the meeting and his own letter will enable anyone who thinks the matter worth notice to ascertain the facts of the case and to form their own opinion whether Mr. Gifford's *résumé* of what took place at the Liverpool dinner was correct, and also to judge what foundation there is either for Mr. Hindle's innuendo that the plain statement of facts then made by the President of the Pharmaceutical Society was an exposition of his "views" on the subject of Clause 2 of the Companies Bill, or for the equally unfounded suggestion that those facts are capable of refutation by Mr. Gifford.

THE COUNCIL ELECTION WILL TAKE PLACE at the annual meeting on Wednesday, May 16 next, and the Secretary must send voting papers to all members of the Society qualified to vote, not less than ten days prior to that meeting, the names and addresses of the members willing to serve on the Council, if elected, appearing in such voting papers. Being qualified to vote implies the payment of the current year's subscription as a member of the Society on or before Monday, April 30. The voting papers having been received, every person voting must erase the names of all the members for whom he does not intend to vote—leaving not more than seven names, otherwise the voting paper will be void—and transmit his voting paper, under cover, to the Secretary, so as to arrive not later than twelve o'clock noon on May 16, or, if he prefers to do so, he may deliver the voting paper personally at the

time of election. The method of procedure is extremely simple, but many voting papers are spoiled every year owing to the instructions not being strictly followed. Too few names are erased, or the voter marks the names of those he desires to support with a cross, or he neglects to write his name and address on the outside of the cover, or there is some delay in delivering the voting paper to the Secretary. Such errors should be carefully avoided if it is wished to make the votes effective, the more especially as it is very desirable that the result of the election should thoroughly represent the feelings of the members of the Society.

DR. STEVENSON'S REPORT (see p. 366), as Government Visitor, on the examinations held by the London Board of Examiners of the Pharmaceutical Society during the year ending March 31 last, is as full of interest as usual. It will be noted that he expresses gratification at the approaching abolition of the Society's First Examination, and anticipates that the number of candidates who will in future be able to present themselves for the qualifying examination will be reduced as a consequence of superseding that examination by one of higher standard. Referring to the qualifying examination, Dr. Stevenson notes a falling off in the improvement which he observed last year in the quality of candidates. At the same time he is satisfied that the examiners have not been unduly severe, "having regard to the paramount interests of the public." The words quoted are worthy of especial attention at the present moment, in view of the persistent efforts that are being made by chemists who take their opinions from trade journals to bring about a reduction in the standard of examination. Such efforts are, of course, bound to fail, but Dr. Stevenson's timely statement may go far to minimise their apparent importance. The Major examination is dealt with very briefly in the report, the chief points in regard to it being the smaller number of candidates who presented themselves, an increase of failures in specific subjects, and a decrease in the number of failures in aggregate marks.

THE FIRST EXAMINATION, on the approaching supersession of which Dr. Stevenson congratulates the Society, is being abolished, as the more or less direct outcome of a resolution passed some time ago at a representative meeting of Scottish pharmacists. But for their insistence, the examination might have been allowed to continue to exist for many years to come. It is curious, therefore, to find a contrary tendency now being manifested in Scotland, where several chemists seem anxious to put back the hands of the clock in an altogether too pronounced retrogressive manner. Evidence of that tendency is afforded by a report (see p. 386) of a meeting of the Forfarshire Chemists' Association, at which a resolution was adopted, requesting the Council of the Pharmaceutical Society to consider the propriety of preventing the new preliminary examination regulations coming in force for five years. The only reason for this curious suggestion is that a difficulty is anticipated in getting apprentices if the standard of education is raised. But the chief point in favour of the new regulations is that they may be expected to exclude insufficiently-educated youths. Registered chemists have no moral right to take intellectually unfit individuals as apprentices, and the authorities are not likely to pander to any desire to secure cheap labour, and so damage the general interests of pharmacists and the public.

MR. J. F. TOCHER writes to complain that the inaccuracies in his paper, referred to by him last week (see p. 344), should have been allowed to pass uncorrected by the Editor, but he betrays a want of acquaintance with the duties of an author—the due fulfilment of which would justify the expectation that his contributions will be properly reproduced—which no amount of argumentation on his part can conceal or compensate for.

ENGLISH NEWS.

BRITISH PHARMACEUTICAL CONFERENCE (LONDON MEETING).—The following are the names of the gentlemen forming the Local General Committee, as at present constituted:—Allen, C. B.; Allen, E. R.; Andrews, E. A.; Andrews, F.; Arkinstall, W.; Atkinson, Leo; Attfield, Dr. J.; Baker, Parson C.; Barnett, J. A.; Bascombe, F.; Bate, H.; Bourdas, I.; Bowen, J. W.; Bremridge, Elias; Bremridge, Richard; Butler, H. J.; Butt, E. N.; Carteighe, M.; Collier, H.; Cooper, A.; Cooper, A. J. B.; Cracknell, H.; Dyson, W. B.; Ekins, A. E.; Fisk, F. M.; Fletcher, F. W.; Gerrard, A. W.; Glyn-Jones, W. S.; Goldby, F.; Goldfinch, G.; Greenish, Professor; Gulliver, W.; Hanbury, C.; Hanson, A. W.; Harrington, J. F.; Hill, E. W.; Hills, Walter; Holding, J.; Holmes, E. M.; Howard, D. Lloyd; Howell, M.; Humphrey, John; Hyslop, J. C.; Idris, T. H. W.; Jacks, D. R.; Knight, G. J.; Lescher, F. H.; MacEwan, P.; Marsh, E. N.; Martindale, W.; Mathews, J. H.; Miles, C.; Moore, J. E. Langford; Moss, Harold; Moss, John; Naylor, W. A. H.; Nickolls, Theo.; Parker, R. H.; Phillips, A. J.; Philp, W. J. I.; Preston, J. Claxson; Probyn, Lieut.-Col. Clifford; Ransom, F.; Robbins, John; Robinson, R. A.; Robinson, W. P.; Savory, A. L.; Shacklock, J. H.; Smith, F. A. Upsher; Taplin, J. W.; Taylor, G. S.; Turner, J. Scriven; Tyrer, Thomas; Umney, C.; Umney, J. C.; Ward, J. S.; Warren, W.; White, E.; Wiggins, H.; Wiggington, A.; Worsley, A. G. Any gentlemen who would like to have their names added to the list are requested to communicate with the Hon. Local Secretary, Mr. W. Warren, 24, Russell Street, Covent Garden, W.C.

ROYAL INSTITUTION.—A general monthly meeting of the members of the Royal Institution was held on April 2, Sir J. Crichton-Browne in the chair. The following were elected members:—Mr. R. T. Glazebrook, Mr. E. J. Humphrey, Mr. H. S. Maxim, Mr. S. W. A. Noble, Mr. W. F. Snell, W. J. Tennant. The special thanks of the members were returned to Mrs. West and Mrs. F. Colenso for their present of a portrait of their father, the late Sir Edward Frankland, K.C.B., D.C.L., F.R.S., Professor of Chemistry at the Royal Institution from 1863 to 1868.

HALIFAX AND DISTRICT CHEMISTS' ASSOCIATION.—At a meeting of this Association on March 21, before a good muster of members, Mr. Clement Fielding read a paper upon "Pharmaceutical Malthusianism." He first explained the application of Malthusianism to pharmacy. He would limit the supply by curriculum and examinations, weeding out the unfit. He also advocated taking only the better educated youths as apprentices. Specialisation was Mr. Fielding's remedy for the growing evils threatening the profession.—Messrs. H. C. Brierley, Gibson, Dixon, W. C. Hebden, and Tiffany joined in the discussion which followed.—A hearty vote of thanks was accorded Mr. Fielding.

CHEMICAL SOCIETY.—On Thursday afternoon, March 29, the President, Dr. T. E. Thorpe, took the chair at the annual meeting of members, which was held at Burlington House, Piccadilly, W. There was a small attendance. The President, in the course of an address, stated that the strength of the Society at the present time is 2,288; twenty-five Fellows had died during the year, nineteen had withdrawn, and one hundred and eighteen had been elected. He referred briefly to the losses sustained by the Society in the deaths of such men as Frankland, Bunsen, Friedel, Nilson, Rammelsberg, and Waage. With regard to the work of the Society, the President mentioned that during the past year one hundred and seventy-five communications had been made; he also referred to the contents of the Society's Journal and the general index.—In the absence of Professor W. H. Perkin, jun., the Long-

staff Medal was then handed to his father, Dr. W. H. Perkin.—Dr. Tilden, Treasurer, in his report, stated that the Society's income during the year had been, from admission fees and subscriptions, £4,088; Journal, £781 15s. 6d.; interest, £444 13s. 7d. The total expenditure had been £4,993 13s. 1d., including payments on account of the Journal, £3,388 12s. 11d.; proceedings, £171 14s. 7d.; library and catalogue, £322 6s. 5d.; house expenses, £543 5s. 11d. Research grants amounting to £192 had been made.—The election of officers and Council then followed, Professor Divers and Dr. Thomas Stevenson being elected Vice-Presidents in place of Professors Ramsay and Emerson Reynolds (retired); and Professor J. N. Collie, Dr. Chattaway, Mr. A. Dixon, and Mr. W. J. Pope were elected to the Council in place of Messrs. Bevan, Moody, Morley, and Smithells (retired). All other officers, including the President, Dr. Thorpe, continue in office for another year.

PROCEEDINGS UNDER THE PHARMACY ACT.—On Thursday, April 5, a summons taken out by the Pharmaceutical Society against Mr. Gaskell, carrying on business as Gaskell's Drug Stores, at 161, Goldhawk Road, Shepherd's Bush, for two penalties of £5 each, for the illegal sale of a preparation of opium (laudanum), the defendant not being duly qualified within the meaning of the Pharmacy Act, came before the Deputy Judge at the Brompton County Court. Prior to the hearing the defendant had paid the penalties, and did not appear on the summons.—Mr. Vaughan Williams (instructed by Messrs. Flux, Son, and Thompson) appeared as Counsel for the Society, and applied under Section 13 of the Act of 1852 for full costs, including the costs of five witnesses, and a certificate for the attendance of Counsel.—His Honour made the order as asked, payment to be made within fourteen days.

SALE OF SEIDLITZ POWDERS.—At the recent Seaham Harbour Petty Sessions, George H. Brown, wholesale grocer, of Newcastle-upon-Tyne, was summoned by Inspector Scott-Elder, acting on behalf of the Durham County Council, for selling to William Davison, retail grocer, of East Murton, goods bearing false descriptive labels.—The Inspector stated that his object in bringing the case before the Bench was to endeavour to fix the responsibility for adulterated articles, not upon the retail trader, who was innocent in the matter, but upon the wholesale firm which supplied him. In the present case he had charged defendant with selling Seidlitz powders not only seriously deficient in strength, but which bore labels falsely describing the compound thus:—"Effervescent saline powders, formerly called seidlitz powders—not in accordance with the British Pharmacopœia." He pointed out that the words "Seidlitz Powders" were in big letters, whilst the remainder of the writing was so small as not to be readable at a casual glance. The intention was clearly to deceive the purchasers into the belief that they were buying seidlitz powders, whereas, according to the county analyst's certificate, the powders were deficient in the proper ingredients to the following extent:—Sodium potassium, 33 per cent.; sodium bicarbonate, 35 per cent.; tartaric acid, 26 per cent.—Evidence having been given that the invoice issued by defendant for the goods read, "Three dozen seidlitz powders, 2s.," Mr. Hewetson, for the defence, contended that the wording on the label was a true description of the contents of the packet.—The Bench considered the charge proved and fined defendant £5 and costs.—A charge against Mr. Davison for selling the powders was withdrawn, and his costs remitted.

SCOTTISH NEWS.

GLASGOW INTERNATIONAL EXHIBITION, 1901.—It is officially notified that all applications for space at the Glasgow International Exhibition, which is to be opened in May, 1901, must be lodged, not later than June 1, with the general manager, Mr. H. A. Hedley. There are in all eight classes, embracing agriculture, mining, indus-

trial design and manufactures, machinery and labour-saving appliances in motion, locomotion and transport, marine engineering and shipbuilding, lighting and heating, science, education, music, sports and sporting appliances. Separate sections will be devoted to women's exhibits, archæology and fine art.

GLASGOW SCHOOL OF PHARMACY.—On Saturday, March 31, the students, accompanied by the principal and demonstrators, visited the works of Messrs. Harkness, Beaumont, and Co., manufacturing chemists, Junction Bridge, Edinburgh. The preparation of malt extract was explained by Mr. McDiarmid, chemist to the firm. The malt is crushed, infused, and the wort evaporated in vacuum pans. The liquid extracts are also evaporated *in vacuo*, by which a finer flavoured product is obtained than by evaporation in open steam pans. The preparation of spt. ether. nit. in earthenware stills was next witnessed, and also the stills for the recovery of alcohol from tincture marcs. The disintegrators were seen in operation, and a visit was then paid to the calcium bisulphite works. Sulphur dioxide is generated by the action of charcoal on vitriol and passed into slaked lime. The visit was terminated by an inspection of the malt vinegar plant. The wort is rapidly cooled by means of refrigerators, fermented by means of yeast, and acetified by being sparged over birch shavings (containing the *Mycoderma aceti*), while kept at a temperature of about 90° F. The product contains from 10 to 12 per cent. of acetic acid, and on keeping the flavour is developed by the action of the acetic acid on the unoxidised alcohol, ethyl acetate being formed.

POISONING CASES.

POISONING BY HYDROCYANIC ACID.—The Manchester City Coroner held an inquest on Friday, March 30, concerning the death of Thomas Hart (58), pharmaceutical chemist, 56, Ducie Street, Greenheys, Manchester. Evidence was given to the effect that deceased had lately been depressed because his business was not prospering, and that he had also had some trouble with his youngest son. Early on Thursday morning, March 29, Mrs. Hart awoke and found that her husband had already risen; she sent her daughter to look for him, and he was found lying on the bathroom floor. It was subsequently discovered that he had taken a quantity of hydrocyanic acid. A verdict of suicide whilst insane was returned.

OVERDOSE OF OPIUM.—At an inquest, held on Thursday, March 29, evidence was given to the effect that James Joseph Lovibond (33), pharmaceutical chemist, lately residing at 56, Galatley Road, Nunhead, was, on the previous Friday, found unconscious on a seat on the Thames Embankment, and that before he could be removed to King's College Hospital he died. It appeared that deceased had suffered from bronchitis, and on the day of his death had been told by the manager of a wholesale firm of chemists in Whitecross Street, where he was employed, to go home, as he was too unwell for business.—The medical evidence showed that a quantity of opium had been swallowed.—The jury was of opinion that there was no evidence to show that the drug had been taken with any improper motive.

POISONING BY CARBOLIC ACID.—Michael O'Neil (38), a fireman on board the s.s. "Holgate," while the vessel was lying at Tyne Dock South Shields, on March 19, found a bottle containing liquid in his bunk, and, mistaking it for spirits, drank some of the contents, which proved to be carbolic acid. At a subsequent inquest a verdict of "Death from misadventure" was returned.

POISONING BY CARBOLIC ACID.—On Thursday evening, March 29, a young woman, about twenty years of age, was found lying unconscious in Firs Lane, Winchmore Hill, suffering from poison-

ing. A doctor was called, but he was unable to prevent death from claiming another victim to carbolic acid, which had evidently been contained in a pint bottle labelled "Champion's Vinegar."

POISONING BY AMMONIA.—On Sunday, March 25, Frederick Joseph Elliot, butcher, 76, High Street East, Sunderland, after partaking of dinner, complained of being unwell; went to a cupboard to get some whisky, accidentally picked up a bottle which contained ammonia, and drank the contents. Medical aid was requisitioned, without avail, death occurring shortly afterwards.

OVERDOSE OF LAUDANUM.—At Kidderminster, on the evening of March 26, John Wright, veterinary surgeon, of that town, died from the effects of an overdose of laudanum. An inquest was held on March 27, and a verdict of "Death from Misadventure" was returned.

AN OVERDOSE OF COUGH MIXTURE.—An inquest was held at Belfast on the 30th ult. touching the death of an engineer named Robert Brown, of Wellington Park, Belfast, who, it appeared had been suffering from a cold, and had taken an overdose of cough mixture on the 27th ult., from the effects of which he died on the following day in the Royal Hospital, Belfast. Medical evidence having been heard, the jury returned a verdict that death was due to morphia poison taken by misadventure.

Obituary.

FREW.—On March 29, James McDonald Frew, Chemist and Druggist, Dingwall, N.B. Aged 33.

HART.—On March 22, Thomas Hart, Pharmaceutical Chemist, Greenheys, Manchester. Aged 58.

HENDRY.—Last week, Alex. John G. Hendry, Pharmaceutical Chemist, late of Edinburgh. Mr. Hendry served his apprenticeship with a chemist in Turriff, and afterwards studied in Edinburgh, gaining practical experience in the laboratories of one of the wholesale houses there. Latterly he has acted as chemist in the laboratory of Messrs. Lorimer and Co., Limited, London, which position he held for several years, winning the entire confidence of his principals.

JONES.—On March 31, Hugh Jones, Student-Associate of the Pharmaceutical Society, Llanfairfechan. Aged 21.

KENNERLEY.—On March 31, William Kennerley, Chemist and Druggist, Liscard. Aged 51.

LOVIBOND.—On March 23, James Joseph Lovibond, Pharmaceutical Chemist, late of Nunhead. Aged 33. Mr. Lovibond was a life member of the Pharmaceutical Society.

NORFOLK.—On March 27, Henry Norfolk, Chemist and Druggist, Darlington. Aged 42.

SUTHERLAND.—On March 30, John Sutherland, Chemist and Druggist, Portsoy (Banff). Aged 52. Mr. Sutherland was a native of Portsoy, and was apprenticed to Mr. Findlay, druggist, of that place, afterwards serving as an assistant at Greenock. A little over thirty years ago he returned to Portsoy, commenced in business on his own account, and succeeded in establishing a good connection in the district. He took an active interest in local affairs, although he never allowed himself to be connected with any public bodies, except as one of the burial-ground trustees, the extension and beautifying of the burial-ground being largely due to his exertions. Death occurred suddenly. He was apparently in the enjoyment of his usual health, and was attending to the duties of the shop, when, without warning, he fell to the floor and was picked up unconscious. Medical aid was quickly summoned, but life was found to be extinct.

MIDLAND PHARMACEUTICAL ASSOCIATION.

A well-attended meeting of this Association was held at Mason College, Birmingham, on the 29th ult., at which a highly-interesting paper on

Pharmacy and Medicine.

was read by Mr. ALFRED H. CARTER, M.D., F.R.C.P., senior physician to the Queen's Hospital and Professor of Medicine at Mason University College. At the outset Dr. Carter said the two professions of pharmacy and medicine were bound together by ties of many kinds, but all arose from their common interest in drugs as used for the treatment of disease. Doctors used the drugs which the pharmacists prepared. This had ever been the fundamental and essential nature of the relation between the two professions, but increasing knowledge on both sides had placed them on very different platforms from those occupied less than a century ago. The doctrines and methods of the medical men had undergone complete revolution, and so had those of the pharmacist. It had occurred to him that out of these changed relations he might find a few topics for discussion, and so he passed on to describe what he conceived to be the place of drugs in the treatment of disease as doctors understood it to-day. There was, he said, no part of the doctor's art with regard to which there was more popular misconception, and for this the non-medical public were not entirely to be blamed. The erroneous views which prevailed were due in some considerable measure to irrational expectations from the employment of medicines, encouraged too often by those who ought to know better. The first thought occurring to the great majority when overtaken by illness was what medicine should be taken. Medicine of some kind was forthwith prescribed and swallowed. If recovery followed, all the credit was given to the drug, which quite possibly had had little or nothing to do with the result. Unfortunately, this attitude rested upon such deep-rooted convictions that the best of medical men were compelled largely to conform to it, and thus it came about that a prescription still continued to form at least a part of nearly every medical consultation. At any rate, the letter of the prejudice was observed, though the spirit of it, he was glad to know, was very often evaded. He admitted the doctors had the remedy in their own hands, but it was one that must be employed with much tact and discretion, or the patient would promptly transfer his favours to quarters in which his prejudices received greater consideration. Little could be done until public opinion became educated to more intelligent and reasonable views on the subject. Such education was undoubtedly in progress. Sounder views of the nature and causes of disease were spreading; the scope and limitations of the art of healing were coming to be better understood, and there was a growing trustfulness in the knowledge and good judgment of medical practitioners which year by year made it easier to take an independent line in the regulation of such treatment as was thought to be desirable.

WHAT THE PHARMACIST CAN DO.

Next to medical practitioners themselves, there was no class of the community which, if well-informed, could do more to bring about a sounder state of things than pharmaceutical chemists. They were expected by the public to be, and had a right to be, better acquainted with the inner methods of working adopted by the medical profession than any other body of men outside its ranks, and the interests of the two professions were so closely allied that, in the long run, whatever was good and right for the one was equally so for the other. It might, therefore, be worth the while of the pharmacist to look somewhat closely into the question as to what sphere of action might reasonably and legitimately extend to drugs as a means of treating disease. Although it was true that drugs still held an important place among the means at disposal for the treatment of disease, it was equally certain

that in the course of the last half-century the attitude of the medical profession, as he had already pointed out, had been radically altered. The change was primarily and mainly due to truer conceptions of the nature of disease in general, to a far more exact knowledge of the causes of diseases and the mode in which they operated, and to an extraordinary advance in the art of diagnosis. Scarcely second in importance to the influence of these facts was that which had arisen from more exact knowledge of the means at the doctor's disposal for the purposes of treatment. This not only held good with regard to the actions of drugs—pharmacology pure and simple—but to the whole range of measures which were available for modifying bodily action. The three master questions which the modern practitioner put to himself were: (1) What is the nature of the disease or disturbance which has been set up; (2) where is it located; (3) what are its probable causes. From the answers he got to these questions the medical man proceeded to construct a picture in his mind of the natural history of the morbid disturbance, and then turned his attention to the means at his disposal for treatment.

THE PLACE OF DRUGS.

In the light of modern knowledge and experience, he soon grasped the fact that among the means capable of accomplishing these ends drugs had to take a very different rank from that which had hitherto been accorded to them. With the exception of a few diseases dependent upon some simple specific cause such as an animal or vegetable organism or poison which is capable of being directly removed or neutralised by drugs, the latter were incapable of dealing directly with the large majority of ailments which depended upon faults of environment. At any rate, they could do little or nothing by way of cure; and whatever advantage they were capable of conferring must be of an entirely subordinate nature. Again, it was only reasonable to assume that in all bodily disturbance, under whatever circumstances it was brought about, the system would be more naturally influenced for good and more readily turned in the direction of recovery by those agents to which it was accustomed to respond by nature, such as climate, nourishment, fresh air, light, heat, cold, rest, exercise, and the like, rather than by the introduction of agents which were naturally foreign to the body, such as drugs. Whilst admitting, therefore, that there was a legitimate sphere for the beneficial employment of medicinal remedies, it must be understood that as a class they occupied for the most part a position of secondary and subordinate importance as compared with the value of what were known as general remedies. No treatment could supersede or replace, when lost, the natural powers of recovery which the human body possessed. Treatment helped the body which could help itself, but for the body which was no longer able to help itself it could do practically nothing. It was no derogation of their art thus to wait upon nature. On the contrary, it made a far greater demand upon the knowledge, patience, courage, and good judgment of a practitioner to interpret the inarticulate appeals of nature for help, and to minister to her needs, than to treat a disease by a formula, pharmaceutical or otherwise, however cunningly devised or however plausible the doctrine on which it rested. The only drugs, then, that could be said in any sense to cure disease were just those few which struck at prime causes. They might almost be numbered on the fingers of one hand—namely, quinine in malarial fever, mercury and iodide of potassium in certain forms of syphilis, sulphur in scabies, certain parasiticide drugs in skin diseases, permanganate of potash in early stages of opium-poisoning by the mouth, and chlorate of potash in certain forms of stomatitis. Salicylate of soda only just fell short of being a specific for uncomplicated acute rheumatism. It checked the development of the disease close to its source so long as the patient was under its influence, and if this was maintained until the morbid condition—which was a temporary one—passed off, the disease for the time being was cured. Again, digitalis in certain types of heart disease helped the organ so directly to contend successfully with its difficulties

that in such cases it almost deserved to rank as a curative drug. Antiseptic drugs for the purpose of diminishing or actually preventing purely local effects of bacterial activity in accessible parts like open wounds, the throat, and the like, deserved to be included in the same category. In all other cases drugs could only minister indirectly to recovery, with greater or less effect, in one of the following ways: (1) By relieving symptoms especially by the relief of pain and sleeplessness; (2) by supplying something of which the body is in need, such as lime, iron, or fat in the form of cod liver oil; (3) by promoting natural process of elimination by skin, bowels, or kidneys; (4) by assisting the processes of nutrition; (5) by helping to obviate the tendency to death.

FEATURES OF PRESENT-DAY PHARMACY

Turning to topics of a more strictly pharmaceutical order, Dr. Carter said that in the course of the century which was just now expiring there had been vast changes in the application of pharmacy for medical purposes. What an enormous change from the first Pharmacopœia of 1618, with its 1,254 drugs and preparations, to that recently issued! Yet even this change, vast as it was, did not cover the whole ground, because there has always been a large amount of unofficial medication carried on with drugs that had never found a home in official formularies, and this had never been more truly the case than at the present day. The leading features of present-day pharmacy naturally followed from the considerations referred to in the earlier part of the paper. First and foremost a much smaller number of drugs was employed than ever before, especially if they considered the practice of any individual prescriber. So closely was this progressive elimination related to the progress of medical knowledge that it was possible to measure with considerable accuracy the state of knowledge in respect of any disease by the number of the different remedies recommended or employed for it. Whenever a great variety of medicinal remedies was recommended for any complaint, they might be quite sure either that very little was known about it or that very little could be done for it. A second feature of modern pharmacy was increased simplicity in the construction of prescriptions, which often consisted nowadays of only one active ingredient, and the total amount of medicine prescribed was also much smaller. This arose from a better appreciation of what was expected from medicinal treatment, and a truer estimate of the chances of the drug accomplishing the purpose for which it was selected. It was obvious that from this point of view the combination of drugs, except in a very limited and simple way, must obscure and confuse the mind in judging the results of medication, and thus place the practitioner at a disadvantage. A third feature closely allied to and growing out of the first-mentioned was an increasing preference for active principles in the place of crude drugs. By this means they were enabled to bring medication to a focus, as it were. A fourth feature was the great increase in the relative prominence of chemical as compared with galenic preparations. Unfortunately, the chemical structure of a large number of these substances was exceedingly complex, and in the absence of that chemical knowledge which was essential for their intelligent use, the rank and file of practitioners were compelled more or less exclusively to rely on the statements contained in the literature with which the introduction of these drugs was boomed—a literature which endeavoured to compensate for its lack of authority by dogmatic statements inspired rather by the instincts of commercial enterprise than by any desire to extend knowledge for its own sake. A fifth and last characteristic of modern pharmacy was the extraordinary progress that had been made in the form in which remedies were prepared and presented for use. Perles, granules, sugar-coated tabloids, capsules, and cachets had not only given to nauseous drugs the attractiveness of bon-bons, but had greatly ministered to the convenience of both practitioner and patient. He feared, however, that the new régime imposed a good deal of extra trouble upon the pharmaceutical chemist for which he got no adequate remuneration. These elegant and con-

venient modes of preparation had not yet found a place in the Pharmacopœia, but their existence had been recognised to some extent by the requirement that their ingredients should conform to the official tests of purity.

TO PREVENT SELF-MEDICATION.

It would be very desirable if some plan could be devised which would meet the objectionable and rapidly-growing habit of self-medication with active and powerful drugs on the part of the public, which was due to the facility with which bottles of medicinal tabloids, labelled with full therapeutic directions, could be obtained. If any member of the Association could suggest any remedy (even though it were partial in its effect), he should be glad to take such steps as were possible with a view of securing the co-operation of members of the medical profession. He thought something might be done if the leading dispensing chemists of the city were to draw up a list of such preparations as they were prepared to stock without reference to any particular maker, so that doctors could prescribe them in the ordinary course like any other preparation. But whether this would be practicable or not, the question was an important one and deserving of attention.

IMPROVEMENTS IN THE PHARMACOPŒIA.

With regard to the last Pharmacopœia, there could be no doubt that from the point of view of students and practitioners it represented a considerable advance on any of its predecessors. He was not qualified to speak of its more strictly pharmaceutical aspects, but, seeing that the Pharmaceutical Society took such an important part in its compilation, there was every reason both to hope and believe that from this point of view also it represented an advance. From the varied interests which such a work had to meet it was, of course, impossible that it should please everybody; but for his own part, the more familiar he became with it, and the more he was able to understand the conditions of its construction, the higher was the opinion which he was inclined to form of it. One was glad to see the omission of no fewer than 188 items which found a place in the previous issue, and it might have been better, perhaps, if the advice of the Pharmaceutical Society as to the omission of eighty-two additional items had been followed. But apart from the riddance of rubbish, it was a most conspicuous merit of the present edition that it tended to a greater simplification of dosage standardisation and methods of preparation. A greater uniformity of dosage as regarded analogous preparations—such as the tinctures, for instance—was a great boon, both to the student and the practitioner. When once a practitioner came to believe and to know that all he could reasonably require for the medicinal treatment of disease might be found within the four corners of the Pharmacopœia, when once he could rely upon a fair standardisation of the preparations it contained, when once he found it easy to grasp their dosage, he would at the same time come to see that the more strictly and exclusively he confined himself to such official resources, the better for himself, for his patients, and for the dispensing chemist. The deficiency of such attractions, which had been only too apparent in previous editions, had much to answer for in the relatively small use that had hitherto been made of it. Of course, there always was, and ought to be, room for the introduction of new drugs and methods of preparation which deserved attention from those who had the opportunity and personal qualifications for giving them fair investigation and full trial. But the wholesale fashion in which chemical compounds issued from German laboratories, and the multiplicity of vegetable extracts which we owed to the ruthless enterprise of American drug firms, nine out of ten of which were simply a delusion and a snare, was an evil of colossal magnitude. It was for the most part a monstrous system of quackery, which demoralised the whole art of medicinal therapeutics, struck at the very root of reasonable and intelligent practice, and sacrificed the best interests of a noble profession to the rapacity of a hungry commercialism which cared for nothing but the filling of its own pockets. It was easier to state the evil than to provide a remedy. Something might be done by giving greater prominence in the medical schools to

the methods of medicinal treatment, and by attaching greater importance to the selection of appropriate medicines and the art of prescribing. The crowded condition of the medical curriculum, the pressure arising from the number of patients to be seen and dealt with, and the promiscuous employment of a cut-and-dried hospital formulary, were not favourable to the cultivation of the arts and methods of modernised pharmacy, as applied to the treatment of disease. He liked also to think that it was something more than a vain Utopian dream to look forward to the organisation, at some not very distant day, of a society for the systematic therapeutical and pharmacological investigation of current new remedies, with access to laboratories and hospitals for the purpose, and affiliated with independent workers all over the country, whose special business it would be to sift the wheat from the chaff and publish their reports at periodic intervals, or to draw up from time to time something in the nature of an authorised extra Pharmacopœia, accessible to medical and pharmaceutical practitioners alike. Such an organisation might also deal with chemical analysis in relation to the composition of advertised foods, malt extracts, and quack medicines, for the benefit of medical practitioners. It was obvious this knowledge was essential for the rational practice of the art of medicine, and so long as practitioners were continually using vaunted remedies and preparations of which they knew little or nothing, the whole practice was degraded and debased. On the other hand, every fresh light on the nature of their work and on their means of fulfilling it, led to a greater intellectual interest in the performance of their duties, a greater efficiency in their results, and the general elevation of professional life and work.

PROGRESS OF PHARMACY.

This thought brought to mind the splendid progress made by the profession of pharmacy during the last fifty years. It would ever redound to the credit and sagacity of the Pharmaceutical Society that, in spite of the prejudice, ignorance, and indifference with which they had had to contend, they had kept steadily before them the ideal of progress through knowledge, and fought their way step by step, with magnificent perseverance, until they attained the important and influential position they now occupied. Looking back upon these struggles, it was difficult to understand the opposition that was encountered, and it was a matter for unfeigned regret that no small portion of it came, directly or indirectly, from the ranks of the medical profession—from a fear that higher education would convert chemists and druggists into medical practitioners, and thus bring the two professions into conflict. We heard a good deal still of so-called "prescribing chemists," and it no doubt happened that some of these carried their practice to an illegitimate point, to the detriment of their craft and at considerable risk to themselves and still greater risk to their customers; but he would fain believe that such practice was repudiated and condemned by all pharmacists of position and repute. It was necessary to bear in mind that the factor of public requirements should not be altogether ignored. It was impossible to forbid a person applying at a pharmacy and obtaining a simple remedy for a passing toothache, a muscular pain, or a trifling dyspeptic ailment, and to insist upon a man having a formal interview with his medical adviser under the penalty of going without what he wanted. The line which separated legitimate from illegitimate prescribing on the part of chemists was an arbitrary one, and to some extent a variable one according to circumstances. The drawing of the line must be left to the guidance of common-sense, ordinary fair dealing, and the influence of honourable tradition.

AN OBJECTIONABLE PUBLICATION.

There one would be content to leave the matter but for occasional unpleasant reminders that in some quarters considerations of this kind carried but little weight. For instance, his attention was called in May of last year to a book entitled 'Diseases and their Remedies,' published from the offices of the *Chemist and Druggist*. A prefatory editorial note to the publication said it was offered to

chemists and druggists under the conviction that it was of the utmost importance that they should be well acquainted with diseases as well as with remedies, and that they failed to occupy the position they were often called upon to hold in their relation to the public, and as an intermediary between them and the medical man, unless they had an intelligent acquaintance not only with the medicine, but also with the cases in which it was used. Now, all this was mere balderdash, and the information which followed with regard to the diseases referred to was quite in keeping with such nonsense. The book could only be described as a counter-prescribing manual of the worst possible type. Serious diseases, such as no honourable chemist would take the responsibility of dealing with, were in many cases recommended to be treated with powerful and dangerous drugs without a single hint as to the necessity of caution or discrimination in their use. A book of the kind, from such a source, did incalculable harm to the honour of the pharmacist's profession, and should be emphatically repudiated by the Society as a highly objectionable publication.

COMPANY TRADING.

In conclusion, Dr. Carter referred to the recent proposed legislation on medical and pharmaceutical practice by companies. In the circumstances, he said, the professional pharmacists deserved all the sympathy and support which the medical profession could give them. In the first place, it was obviously unfair and inexpedient that responsible professional positions should be held by unqualified persons under the "cover" of a single qualified person, such as the clause in the latest Bill provided for. Secondly, it was monstrously unjust and inadvisable that professional men should be placed under the control of, and be exploited for profit by, a body of unqualified persons. For the medical profession the former had already been made illegal, and they hoped to be speedily relieved by legislation from the latter. He earnestly hoped that Clause 2 in the Bill (applying to pharmacy companies) would not be carried, but replaced by a clause, practically on all fours with Clause 3, which applied to medical practice. Any such proposal would, of course, be hotly contested in the interests of drug companies and their shareholders. In this event it was not improbable that the pharmacy clause might be dropped in Committee, and that the medical clause would then share the same fate. Such a result would be deplorable in the last degree, and indefinitely postpone a much-needed reform. Although it seemed desirable that the clauses applying to each profession should be kept separate, it was much to be desired that influential representatives of each should combine to approach Mr. Ritchie in defence of important professional principles common to both.

DISCUSSION.

Dr. KAUFFMAN pointed out that in dealing with specifics Dr. Carter had made no reference to the anti-toxins, which were pre-eminently specifics, and reached the cause of the disease, in many cases alleviating it, and in some cases stopping it entirely. He felt, with regard to the companies question, that legislation was imperative, and it behoved the Pharmaceutical Society to take the matter in hand.

Mr. A. SOUTHALL, in moving a vote of thanks to Dr. Carter, expressed himself as disappointed at finding that the lecturer did not attach that importance to drugs which he himself, as a pharmacist, attached to them. Nevertheless, there was great truth in the statement that environment, particularly climate and diet, had an effect upon illness which could not be produced by drugs. The dispensing of tabloids and the like was particularly objectionable because when a person got his prescription he forthwith began to medicate himself for every ailment by the medicants thus prescribed.

Mr. GERRARD, in seconding the vote, thought the principal cause of self-medication was the publicity given to it by the Press. The periodical Press were the greatest sinners in this respect, and seemed to be sustained in a great measure by such advertisements as were disastrous alike to the medical profession, the pharmacist, and the public.

Mr. C. THOMPSON, as the local Secretary of the Pharmaceutical Society, said there were few unqualified chemists employed in Birmingham. There were, however, a number of shops in the city made to look like chemists' shops, and no doubt the public were misled by the similarity. In these places unqualified men were no doubt employed, but seldom, if ever, were the scheduled poisons sold by retail.

The vote was heartily accorded, and Dr. CARTER briefly replied.

GLASGOW CHEMISTS' AND DRUGGISTS' ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The weekly meeting of this Association was held in the Masonic Chambers, W. Regent Street, on the 23rd ult. Mr. J. P. GILMOUR, President, occupied the chair, and in introducing Dr. COULL, who lectured on the

STEREO-CHEMISTRY OF CARBON,

expressed warmly, on behalf of the members, their lively sense of gratification at Dr. Coull's visit and contribution to the session's work. Dr. COULL, having acknowledged what he called the Chairman's too hospitable references, proceeded with his lecture, in the course of which he first showed the necessity for a new theory, owing to the insufficiency of the existing theories to explain the occurrence of only one di-substituted methane, when ordinary structural formulæ indicated the existence of two isomers, and, among other cases of isomerism, to explain the existence of ordinary fermentation, lactic acid, and paralactic acid, and of the four tartaric acids. A short historical sketch was then given of the history of the theory since its enunciation by Van't Hoff and Le Bel, the aid the latter received from the work of Pasteur and the former from Wislicenus being mentioned. Indeed, it was the words of Wislicenus, in his classic paper on "Lactic Acid"—"The facts compel us to explain the difference between isomeric molecules having the same structural formulæ by the different arrangement of their atoms in space"—that set Van't Hoff thinking. Van't Hoff's fundamental conception is that the valencies of the carbon atom are situated at the apices of the solid angles of a regular tetrahedron, of which the carbon atom occupies the centre. When a carbon atom is united to four different elements or groups there is a manifest want of symmetry, and the atom thus combined is called an asymmetric carbon atom, written thus: *c*. In this case we can predict the possibility of two different relative positions of the groups. This is shown in the *d*- and *l*-lactic acids, which have the same chemical properties, their only difference being in their optical activity and in the solubility of their salts. Their solid formulæ, illustrated by these models, are the mirror images of each other. For experimental proof of the truth of his fundamental conception, and that the peculiar isomerism demanded by his three-dimensional formulæ really existed, Van't Hoff pointed to the right and left-handed modifications of substances that rotate the plane of polarised light, to the fact that the property of rotation in the case of solutions is peculiar to substances which contain an asymmetric carbon atom, and to the fact that the relation between his formulæ for the two modifications—the object and image relation—is identical with the relation between the crystal forms of the two modifications. The latter relationship—enantiomorphism—is very clearly seen in the right and left-handed ammonium bimalate and right and left-handed sodium ammonium tartrate. Accordingly, then, every compound containing *c* ought to exist in two modifications which possess equal and opposite activity. This relation was first discovered by Pasteur, in 1848, with the tartaric acids, and was afterwards observed in the case of malic and mandelic acids, and many other substances. But many substances which possess an asymmetric carbon atom do not rotate the plane of polarised light, the explanation of which is that when a substance is prepared in the laboratory an equal number of right and left-handed molecules are formed which neutralise each other, and an inactive mixture results. Before discussing the methods of dividing the

inactive mixture, it was pointed out that when a derivative is formed from an active compound, the activity remains with the asymmetric carbon atom and vanishes when the resulting compound does not contain *c*. Active amyl alcohol by oxidation gives valeric acid, which contains an asymmetric carbon atom and is optically active, and, by reduction, dimethyl-ethyl-methane, which contains two methyl groups attached to the carbon atom; the latter is, therefore, no longer asymmetric, and the compound is inactive. Similarly, with tartaric and malic acids, the rotating power is preserved in their salts, esters, etc., but disappears, for example, in succinic acid, which does not contain an asymmetric carbon atom. It must be added, as a final restriction regarding the activity of molecules containing *c*, that no compound has yet been discovered containing less than two carbon atoms, united with the asymmetric atom, the group *c. c. c.* being evidently essential to the possession of optical activity by the molecule. The separation of the inactive mixture resulting from equal numbers of molecules of equal and opposite activity was then discussed. The various methods of division were described, and their value indicated, for different purposes, (1) by the addition of an active substance such as cinchonine to racemic acid, restricted to acids and bases, but useful for preparing a large quantity of pure substance; (2) by the use of organisms—*penicillium*, for instance, when added to racemic acid, feeds upon the right-handed modification of tartaric acid and leaves the left-handed, and in the case of amyl alcohol it feeds upon the left-handed variety and leaves the right. This method is mainly used qualitatively to ascertain whether a compound is divisible or no, and was applied by Le Bel in all his investigations. (3) Spontaneously, by the temperature at which crystallisation takes place; not much used, but interesting historically. Tartaric acid was taken as a type of a substance containing two asymmetric carbon atoms in a symmetric formula, and the long unexplained isomerism of the tartaric acids clearly shown by the aid of the models; the spatial relationships of the active acids—*dextro* and *laevo*—and the inactive acids—racemic acid, a mixture of the two active acids, and merotartaric acid, an example of the inactive, indivisible type, being described.

The case of unsaturated carbon compounds was next considered, double-linking being shown by placing the edges of two tetrahedra in contact, and triple by placing two surfaces together. As examples of previously unexplained isomerism in doubly linked (ethylene) derivatives, fumaric and maleic acids were specially referred to. It was shown by means of the models how the occurrence of two such bodies was possible, the greater stability of fumaric acid, and the ability of maleic acid to form an anhydride being mentioned as differences in properties, due to their three-dimensional formulæ.

In conclusion, Dr. Coull expressed his thanks to Dr. Dobbin, of Edinburgh University, for the loan of the models and crystals used to illustrate the lecture.

After some remarks by the CHAIRMAN on the fascinating nature of the subject and the extraordinary recent progress of molecular physics and their application to chemical problems, Mr. J. LOTHIAN moved a vote of thanks to Dr. Coull, complimenting him highly on the lucid way in which he had expounded an essentially technical subject. Mr. Lothian contrasted the state of knowledge on the subject in his student days and now. He had recently been reading a remarkable pamphlet by a German chemist who had worked out the stereo-chemistry of nitrogen, etc. The whole subject seemed to be on the eve of great developments. Dr. COULL then replied briefly, and the meeting separated.

ANNUAL DANCE.

The first annual dance of the Association was held in the Rosemount Academy, Renfrew Street, on Wednesday evening, 28th ult., and was attended by a large and brilliant gathering of honorary members, members, and their friends. The invited guests who were present included Messrs. J. L. Hatrick (W. and R. Hatrick and Co.), Dykes (Lorimer and Moyes), J. Gray (Gray and Co.), Thom-

son (J. Taylor), ——— (C. T. Cockburn, Limited), W. L. Currie (President, Glasgow and West of Scotland Pharmaceutical Association), J. Lothian, and Dr. J. Forrester; and apologies for absence were received from Dr. G. Coull, and Messrs. J. R. Hill and F. McDiarmid (President, Edinburgh Chemists', Assistants', Etc., Association, Edinburgh), Dr. Grant Andrew (Victoria Infirmary), and Messrs. R. McAdam (Hon. President of the Association), W. Greig, T. Maben, T. S. Barrie, T. Macfie Smith, W. Bowie, and Coun. Wm. Martin (Glasgow). Mr. J. T. Lynn made a model M.C., and a formidable programme of well-arranged dances was fulfilled without hitch or hurry to well-selected and skilfully-executed dance music. The only song of the evening was given by Mr. W. L. Currie, whose rendering of "The Soldiers of the Queen" made a great hit. The running buffet, which was in charge of Mr. McKinstry, maintained a liberal supply and ready service of solid and liquid refreshment. On its social side the dance was in every respect quite a triumph.

The closing meeting of the session was held on the 30th ult., when Mr. J. P. GILMOUR, President, occupied the chair, and Mr. J. THOMSON read a paper, postponed from the 9th, on

The Decline of Pharmacy,

in which he contended that, owing to the extending use of proprietaries by medical men, the multiplication of widely-advertised factory-made specialties, and the pharmacopoeial enforcement of standardised drugs and galenicals, the pharmacist's occupation *quâ* pharmacist would soon be gone, and he would sink into the commercial rôle of a mere distributor of commodities. In the discussion that followed, the PRESIDENT and Mr. J. P. TAYLOR both deprecated the pessimism of Mr. Thomson's outlook, and suggested that he came nearest the truth when he surmised that we are in a transition state. The CHAIRMAN also attributed the weakness of medical men for compressed drugs, etc., largely to their deficient training in materia medica and pharmacy, a subject which was relatively more neglected in the modern than in the old curriculum. Mr. Thomson was warmly thanked for his paper. The

First Annual Business Meeting

was then constituted, Mr. J. P. GILMOUR being in the chair. The SECRETARY, Mr. M. Meldrum, read his report, which related the circumstances under which the Association was formed, and gave a brief account of the state of its membership and the session's work, describing the one as encouraging and the other as satisfactory. From the statement of the TREASURER (Mr. J. Sturgeon) it appeared that after all claims were met there would be a small surplus. After some motions of amendment to the constitution had been discussed and adopted, the following office-bearers were elected for the ensuing year:—Hon. President, R. McAdam; President, J. P. Gilmour; Vice-President, J. Dickie; Secretary, M. Meldrum; Assistant Secretary, J. T. Lynn; Treasurer, J. Sturgeon; Members of Committee, Messrs. Taylor, Williams, Rowan, Radwell, Adams, Thomson, Wright, Walls, Davie, Grierson, Mackay, and Hannah.

TUNBRIDGE WELLS AND DISTRICT CHEMISTS' ASSOCIATION.

The annual general meeting of this Association was held at the Castle Hotel on Thursday, March 8. Mr. E. DUNKLEY was in the chair, and the members present were:—Messrs. Booth, Chatterton, Gower, Green, A. E. Hobbs, Johns, McRae, G. Nicholson, Ogle, Rogers, and Wardley. The Companies Bill was again discussed, and suggestions from the Federation of the Local Pharmaceutical Associations were dealt with. It was decided to forward to the local M.P.'s the circular letter sent by the Federation, together with the Clause "B," this seeming the better course. It was also decided that the letters should bear the signatures of all those chemists who would endorse them. The following officers were elected: President, Mr. Gower; Vice-President, Mr. O. Rogers; Treasurer, Mr. Ogle; Secretary, Mr. S. V. Booth; Com-

mittee, Messrs. Hobbs, Pearmund, and Wardley. A vote of thanks was accorded to Mr. E. Dunkley for his services as President.—Mr. A. E. HOBBS, as local secretary of the Pharmaceutical Society, suggested that a donation should be given to the Benevolent Fund, and on the proposition made by Mr. E. DUNKLEY, the meeting voted £1 1s. for that purpose.

The annual dinner of the Association was held at the Castle Hotel on Wednesday, March 28. An excellent musical programme was arranged between the several toasts, which were ably proposed and responded to by the following members: Messrs. Gower, Dunkley, Robinson, Blair, Harris, Sells, Hobbs, Rogers. Songs and instrumental music were given by Messrs. A. E. Hobbs, Warwick, Oliver, F. Hobbs, Burgess, and Booth.

CHEMISTS' ASSISTANTS' ASSOCIATION.

A meeting of this Association was held on Thursday, March 29, at 73, Newman Street, London, W., the PRESIDENT, Mr. F. W. Gamble, in the chair. There was a fair attendance. After the usual light refreshments and the reading of the minutes, Mr. J. A. DEWHIRST communicated some notes on

B.P. Standardisations.

the substance of which is printed at page 358.

The PRESIDENT said that the Association appreciated nothing so much as theory applied to practice, but, unfortunately, the members saw little enough of it at the meetings. On that occasion, however, they might not only congratulate Mr. Dewhirst, but also themselves on having listened to so eminently practical a paper. The members of the Association were pharmacists, not scientific chemists, but, as he noticed several chemists present, he hoped they would have something to say on the subject. In speaking of ipecacuanha, he had expected Mr. Dewhirst to refer to the deterioration of some kinds of ipecacuanha preparations. Pharmacists were familiar with the copious deposit which appears at the bottom of the bottles, and it was usual to pour it away, but, according to one worker, that was all wrong. In listening to the paper, they gathered that some of the B.P. processes are bad. "How is it," he asked, "seeing that there are so many pharmacists on the B.P. Committee, that these processes are bad?" It would, he thought, appear that it is necessary that there should be more chemists than doctors working on the B.P. assay processes. If the addition of some manufacturing and scientific chemists to the B.P. Committee would be of advantage, he thought it should certainly be done. He thanked Mr. Dewhirst most heartily for his paper.

Mr. H. HYMANS echoed the President's remarks concerning the practical nature of Mr. Dewhirst's paper. With regard to the official process for opium, he did not think it was necessary to take the full quantity. If one worked carefully, half the quantity could be taken. Of course, they were expected to stick to the B.P., but it would be rather rough on the retail pharmacist in some cases.

Mr. F. C. J. BIRD said that he had listened with pleasure to an admirable paper on a subject which was of great importance to all engaged in the analytical examination of pharmaceutical preparations. He would only allude to a few of the principal points which had been raised. With reference to chloroform, he quite agreed with Mr. Dewhirst that it was the best general solvent for alkaloids. But he thought the author had misunderstood the purport of some recently published notes on the extraction of the alkaloids of ipecacuanha. His object was to show that the alkaloidal residue obtained in the assay of liquid extract of ipecacuanha consisted of two substances—alkaloid and a deep brown substance of unknown composition, sometimes forming as much as 30 per cent. of the weight of the residue. Ether or ether benzene dissolved out nearly all the titratable alkaloid, leaving the brown substance, whilst chloroform extracted both. Whether the brown substance should be included in the residue or not was a question for the future; if

not, clearly chloroform was not the best solvent in that particular instance. Emulsification, which appeared to be the bane of most of the assay processes mentioned, could be generally got over in a very simple manner. Liquids containing either easily saponifiable or suspended matter, especially when made alkaline, were very prone to emulsify chloroform; but the same liquids, when fairly acid, as a rule separated quite readily. He therefore, whenever possible, acidified the diluted liquid extract, and washed out with chloroform, which removed fatty and resinous bodies, the chloroform being afterwards washed with a little water. He quite agreed with Mr. Dewhirst as to the unreliability of "aliquot part" processes for absolutely accurate figures. A little consideration would show that several factors combined to influence the result, but when a rough comparison only had to be made between several samples of crude drug, such results were near enough for the purpose, and (excepting that for opium) the processes themselves were comparatively rapid. He could not share the author's opinion that titration of a chloroformic solution of the alkaloid might be usefully substituted for a gravimetric determination. It appeared to him that the most rational plan was to weigh the alkaloid and check its purity by titration. He was very much interested in the author's suggested alternative processes for nux vomica and opium. They promised well, and he should take an early opportunity of trying them. With reference to the broad subject of Mr. Dewhirst's paper, he considered that standardisation as applied to pharmaceutical preparations was an ideal principle. But there were many practical difficulties in the way of its more general application. Nux vomica was a case in point; in that case standardisation was not so easily applied. The present official method for nux vomica was not quite satisfactory, for, as Mr. Dewhirst had mentioned, the wash-water removed strychnine ferrocyanide as well as brucine. There was also the difficulty that the alkaloid, finally weighed, always contained an unknown proportion of brucine, nor was it certain that the B.P. process gave comparable results when dealing with different samples of unstandardised liquid extract, which probably varied in strength as much as the seeds from which they were made. The clearing up of such points was an urgent necessity, and this opened up a vast field of really useful work for an institution he had in mind at the moment—viz., the Research Laboratory of the Pharmaceutical Society. The energies of that institution had in the past been turned rather in the direction of pure chemistry, and he thought now the time had arrived when pharmaceutical research might be allowed to come to the front. There was another branch of standardisation to which he might be permitted to allude. Some years ago he had suggested the inclusion in the B.P. of such physical details relating to galenical preparations as specific gravity, extractive, colour, etc., but whilst admitting that that might be going a little too far, such information was exceedingly useful to every pharmacist. There was so much work, however, involved, that private individuals could hardly be expected to undertake it. Here, again, was unquestionably a very useful, if humble, field for the work of the Research Laboratory, and he most earnestly appealed to them, as members of an influential Association, to use their best endeavours to induce the powers that controlled the Research Laboratory to take this view of the question and turn the Laboratory to account for the purpose of pharmaceutical research. He trusted they would make it their duty to do what they could to bring about this desirable result. With so many problems awaiting solution, it seemed a great pity that such an ideal means of accomplishing useful pharmaceutical work should be allowed to lie neglected. He congratulated Mr. Dewhirst on the able manner in which he had treated a very interesting subject.

Mr. T. MORLEY TAYLOR having referred to the subject matter of the paper, and, humorously, to Mr. Hyman's remark about taking half quantity in the official processes,

Mr. BREWIS said he had experienced nearly all the difficulties referred to by Mr. Dewhirst. He then drew attention to some of

the "tips" which had been suggested from time to time for either avoiding or getting rid of the troublesome emulsions sometimes met with in the determinations of alkaloids by the use of immiscible solvents. Many infallible remedies had been put forward, but he had noticed with regret that their efficacy seemed to be sadly wanting when tried upon the emulsions to be found in laboratories other than those from whence these certain cures emanated. In this work the problem of "How to make an emulsion?" presented far less difficulty than "How not to make an emulsion?" or "What to do with an emulsion when you had made one?" Samples of drugs and preparations which came in for alkaloidal assay, of course, varied very much in their composition; sometimes the extractive and gummy bodies, and at others resins and fatty matters, were the causes of the emulsion trouble. In the former case precipitation of the offending bodies by alcohol, and in the latter their removal by chloroform or other suitable solvent; preliminary to proceeding with the extraction process, seem to be the best general methods. In the nux vomica assay he found that a mixture of 2 vols. chloroform and 1 vol. ether worked somewhat better than chloroform alone. As to the strychnine-brucine separation, he could only confirm what other speakers had said. He had found that when washing the strychnine ferrocyanide 50 C.c. of acid water, if applied in small successive portions (say, 5 C.c. each) was generally sufficient to render the last portion of the filtrate, if not quite free from bitterness, at any rate sufficiently so for all practical purposes. He would certainly try Mr. Dewhirst's nitric acid process, as it seemed most promising, and would probably not only save time, but also afford more accurate results. In the belladonna assay Bird's preliminary treatment of the diluted, acidulated solution, and the final titration under the conditions recommended by him left nothing to be desired. He thought Mr. Dewhirst's difficulty as to the evaporation of the amylic alcohol could be overcome by conducting the operation in a flask and under reduced pressure. In this connection he might mention that he was having a flask of a new pattern made, with a very wide and flat bottom, which he thought would prove specially serviceable for the evaporation and subsequent treatment of the alkaloidal residues.

Mr. DEWHIRST having replied, the meeting adjourned.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting, held on Monday, April 2, Mr. W. STEAD in the chair, there was a large attendance, including Mr. R. L. Gifford (Blackburn), Mr. S. N. Pickard (Bradford), and Mr. H. Sykes (Huddersfield).

The CHAIRMAN, having thanked the members of the Association for electing him as President,

Mr. J. WALKER (Cleckheaton) reported that a deputation had waited upon Mr. T. P. Whittaker, M.P. for the Spen Valley Division, with regard to

THE COMPANIES BILL.

They explained that they regarded it as a great injustice that a man who qualified for a chemist and druggist, at great expense, should have to compete with companies, but Mr. Whittaker replied that so long as companies put in qualified men to manage their shops the public were protected. That was all that concerned the House of Commons. He (Mr. Walker) contended that the public were not protected. Ultimately Mr. Whittaker promised to make further inquiries, and it was understood that he would be communicated with when the Bill came on.

Mr. R. GLEDHILL (Dewsbury) explained that a memorial, signed by all the chemists in the Parliamentary borough of Dewsbury, had been forwarded to Mr. Mark Oldroyd, the borough member, who was asked if he would receive a deputation. Mr. Oldroyd had replied, thanking them for the letter, and stating that he would give the matter his most careful consideration. The suggested

clause (Clause B, proposed by the Federation) seemed clearly explanatory of their requirements, and that being so, there was hardly any need for an interview.

Mr. GIFFORD being called upon to speak, said that for all practical purposes the Pharmacy Act of 1868 had become a grotesque travesty of what the Legislature intended it to be. But if registered chemists could be got to join the Pharmaceutical Society and intelligently watch and govern it, the present state of affairs would be altered as by a magician's wand. The profession of pharmacy should be placed in such a position that it might be possible for natural evolutionary forces to work. The proposal to permit companies to carry on the business of a chemist and druggist if they had qualified managers possessed one merit; it threw into relief the point at issue, which was the personality of the qualification. On the question of a qualified directorate, if they in Dewsbury believed it to be a sound remedy, it was their duty to give that belief logical justification. If the proposers of qualified directorate could have their way, they would bring about the state of things he desired to see established. The fault of this proposal was that it started by giving personal qualification and responsibility. If they allowed that corporations could exercise their rightful prerogative, then the Legislature would assuredly see that no conditions were imposed which would tend to make that exercise impossible (*sic*). He thought it was Mephistopheles who originated the idea of a qualified directorate. The policy he favoured would rigidly restrict unqualified persons from any interest in the qualifications and privileges earned by personal endeavour and personal sacrifice. The esteemed President of the Pharmaceutical Society made at Liverpool the most humiliating statement it was possible for a twenty years' member of the Council to make. He started off with the dogmatic statement that justice was impossible in this country [Reference to page 351 will show that no such statement was made, or could be inferred from the President's remarks.—Editor *P.J.*], but he (Mr. Gifford) believed that they needed to ask nothing but the merest elementary justice; he also thought if the Council would use the resources of the Society quickly, intelligently, and determinedly, they could speedily bring about a reformation. When matters were explained to members of Parliament, or the general public, they were simply amazed that chemists needed to ask for what they wanted. The policy he advocated was to claim all the rights intended to be granted in 1868, on the ground that it was merely justice; that what was admittedly a compromise then, could not be too much now, seeing that the present body was an examined one, which was not the case then. He would take up this policy on the Companies Bill, because it focussed the issue—objection to Clause 2 and the necessary corollary, inclusion in Clause 3, which would make effective the Pharmacy Acts. If these clauses were dropped, he would have a short amending Pharmacy Bill ready, and in that he would ask nothing but that the intention of the Act of 1868 should be made effective. So far as the Companies Bill affects chemists and druggists, it is not a trade question. If it is right for a limited company to practise the profession of chemist vicariously, it is equally right for individuals (unlimited) to do the same; yet such a proposition is absurd in regard to any professional qualification. There can be no objection to companies dealing in drugs, or doing anything that is lawful; but there is a strong and grave objection to companies acquiring qualifications specifically intended for examined and duly qualified persons.

Mr. ROBERT GLEDHILL, in proposing that Mr. Gifford be heartily thanked for his remarks, recommended all the members of the Association to support him by their votes in his candidature for a seat on the Council of the Pharmaceutical Society. The Dewsbury chemists adopted Clause B, sent out by the Federation, as the lesser of two evils. If they could not get the title protected, then by all means get an amendment, whereby all directors would have to qualify.

Mr. R. BROADHEAD, in seconding the proposition, said Mr. Gifford seemed to think the Council was very much to blame, but it was in a most difficult position. The members of the Council were elected by members of the Society, and they had to be guided by the views of those members. It was an anomalous thing that, although chemists had a representative Society and Journal, many of them took their views, political ideas, and their cue in everything from an opposition trade journal. That was an anomaly which led to division, and he did not suppose the trade journal referred to cared a jot for his views so long as he paid his subscription. The duty of all qualified men was to join the Society and exercise the franchise, instead of grumbling and complaining, and taking their views from any trade journal.

Mr. PICKARD also said he did not think the Council of the Pharmaceutical Society was altogether to blame for the present position of affairs. He believed it had tried to do its level best. It was because of the apathy of chemists that the present state of affairs existed. It was necessary that they should be thoroughly organised. He thought, with Mr. Newsholme, that they ought to have a local secretary in every Parliamentary division in the country. By that means almost every chemist in the country could be brought into line.

After further conversation the vote of thanks was accorded unanimously.

FORFARSHIRE AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting held in Mather's Hotel, Dundee, on March 28, Mr. CHARLES KERR presided, and there were present Mr. Storrar (Kirkcaldy), Mr. Currie (Glasgow), John Anderson, Booth, Cummings, W. Doig, J. Doig, Ferrier, J. Russell, Milne and Taylor (Dundee), Bennett, Buchan, Naysmith and White (Arbroath), Fleming and Park (Broughty ferry), Walker (Downfield), Macfarlane (Forfar), Ford (Kirriemuir), Pecbles and Thomson (Lochee), Harley (Perth), Kermath (St. Andrews), and Marshall (Tayport).

Mr. KERR said he had first to thank Mr. Seabury, of New York, on behalf of the Association, for sending to each of their members a copy of his book, "Should Pharmacists Become Tradesmen?" The next thing to mention was the steps which had been taken on their behalf to oppose Clause 2 of

THE COMPANIES BILL.

Shortly after their meeting in November an opportunity occurred to send a protest to Mr. C. T. Ritchie, President of the Board of Trade, who introduced the Bill to the House of Commons, and whose connection with the district they considered entitled them to do so. Then he (Mr. Kerr) and their Secretary had an interview with Sir John Leng, M.P., previous to his resuming Parliamentary duties. Further, letters had been sent to Mr. Edmund Robertson, Mr. John Morley, and Capt. Sinclair at the House of Commons, inviting their attention to the matter. Mr. Kerr proceeded to say that the Pharmaceutical Council having now come to a decision to oppose Clause 2, he thought it was their duty to support that decision. But he hoped the Council would not stop there. They had been looking to the Council for years to get the Pharmacy Act amended, and a serious attempt ought to be made in that direction without any more delay.

Mr. KERMATH proposed that the meeting should approve of the steps taken by the Chairman and Secretary in the matter. He said it was a case for prompt action, and it was necessary that they should move on their own account. He would insist upon that, though it did not seem to please some members of the Council. But let the Council show a little more backbone, and take members a little more into its confidence if it had anything to confide. There was too much waiting to see what would turn up. Hesitation and procrastination had had a long innings, and as a result, chemists had lost positions they should have held. He wished to take that opportunity of refuting the statement attributed to Mr. Ritchie—that chemists were running

branches with unqualified managers. In the district of Fifeshire, of which he was local secretary, there was no example of that. He thought it was a strange argument for Mr. Ritchie to use, even if there were any truth in it.

Bailie DOIG seconded. He said they were quite within their rights in addressing their grievances to the highest authorities at any time, and their thanks were due to the Chairman and Secretary for their action.

Bailie DOIG moved "That this meeting approves of the decision of the Pharmaceutical Council to oppose Clause 2, at the same time urging the Council to take immediate steps to obtain an amendment of the Pharmacy Act." He considered there was very little likelihood of the Companies Bill passing this Session or next, but they must do what they could to defeat it.

Mr. NAYSMITH seconded, with much pleasure.

Mr. STORRAR, in supporting the resolution, proceeded to give a summary of the reasons which led to the recent decision at the meeting of Council. He said he had been again nominated for the Council. He had served for ten years, and thought he should now retire to allow some others to share the work of the Council. He had not yet accepted nomination, but if he thought anyone was coming forward to challenge his actions he was prepared to accept the challenge.

Mr. CURRIE said he could endorse a very great deal of what Mr. Storrar had said. He wished to assure Mr. Storrar that when he accepted nomination he was sure that no support would be given him at the expense of Mr. Storrar. Mr. Currie proceeded to say he thought they in Scotland took a broader view of the Companies question than their English friends—that the Council was lax in giving no lead. What was the Council there for? It had lost many opportunities. He would have the Council go strongly for restriction of titles and effective control of companies.

Mr. WALKER wished to move an amendment, as he did not approve of the recent decision of the Council, but, as he failed to find a seconder, the resolution was put to the meeting and carried.

THE NEW PRELIMINARY EXAMINATION.

Bailie DOIG wished to know if it would be possible to suspend the coming into operation of the new Preliminary Examination arrangements. He said they were going to be face to face with a serious difficulty in getting apprentices. The present race was quite unable to meet the new conditions which seem, for the time being, unnecessarily high, and this would be so until the secondary education of the country, which is only now developing, begins to tell upon youths.

Mr. STORRAR did not know if it would be possible to do as proposed, but he had great sympathy with it, and thought a representation should be sent to the Council. He had been making inquiries of the Rector of the High School, Kirkcaldy, and was able to confirm what Bailie Doig had said. Any lad would be unable to face the examination until after two years' further study.

Mr. KERR said he could endorse those remarks.

Bailie DOIG moved:—"That this meeting would respectfully memorialise the Pharmaceutical Council to consider the propriety of suspending the operations of the new regulations for the Preliminary Examination for a period, say, of five years, until the standard of secondary education has so advanced that youths may be more able to pass the higher examinations now proposed. Otherwise, chemists, in country districts especially, will have great difficulty in obtaining apprentices."

This was agreed to.

Mr. KERMATH gave notice of the following motion for next meeting:—"That the time has now arrived when the method of conducting the Minor Examination should be altered, and that the same rules should apply as obtain in medicine and law—namely, that candidates be credited with the subject or subjects on which they obtain pass marks."

PRESTON CHEMISTS' ASSOCIATION.

At a well-attended meeting held at the Bull Hotel, Preston, on Thursday, March 29, Mr. W. STEWART in the chair, it was announced that the Borough Members had been communicated with regarding

CLAUSE 2 OF THE COMPANIES BILL,

and that replies had been received from the Right Hon. R. W. Hanbury, M.P., Financial Secretary to the Treasury, and Mr. W. E. M. Tomlinson, M.P. Mr. Hanbury wrote: "I am much obliged by the letter you have sent to me on the subject of Clause 2 of the Companies Bill, and I will gladly bring the points you raise before the Minister who is responsible for the Bill in question. Mr. TOMLINSON replied: "I have received your letter with reference to this Bill, together with a statement signed by a considerable number of chemists and druggists in Preston, and beg to say that the subject shall have my earnest consideration, my present feeling being that the clause in question ought not to pass in its present form."

Mr. ARKLE then said that meeting had been called to pass a resolution, which would be forwarded to the members of Parliament in the district, with a view to securing

THE DISMISSAL OF CLAUSE 2

from the Companies Bill. As chemists they felt that the clause as it stood was absolutely at variance with all that was fair and just. Clause 2 of the Bill proposed to allow the qualification and title of the individual chemist to be usurped and practised by a conglomeration of nonentities under the Companies Act. There could be no doubt in the mind of any reasonable being that to attempt to take away the individuality of the title and the personality of the qualification was a most unfair and illegal proceeding. As chemists they did not want a monopoly, but they wanted everyone who claimed to be a chemist to enter the ranks by the front door. If Mr. Ritchie would not see any wrong in the conduct of the business by companies, then the profession must close its ranks, cease internal strife, put all personal grievances in the background, and go solid for the total rejection of Clause 2. He begged to move:—

That this meeting is of opinion that Clause 2 of the Companies Bill, now before Parliament, should be opposed with a view to its entire elimination from the Bill, and that the local, borough, and county members of Parliament be communicated with, urging them to do their utmost to prevent its passing.

Mr. WILLIAMSON seconded the resolution, and said he felt that no candidate for the Council of the Pharmaceutical Society ought to receive the support of pharmacists who were not prepared to favour a campaign calculated to relieve the profession of some of its burdens. Capable men were needed at headquarters, men who had dared to speak, and having given utterance to their opinions, to act—men who would work for the interest of the honourable calling they represented, and who could bring to bear upon the affairs of a corporate body the same business capacity introduced in their own private transactions. Those in the past who had failed to do what they required must be replaced, and then they would perhaps be able to claim that the Pharmaceutical Council rejected the opinion of chemists at large. Let chemists record their votes in this spirit, and their reward would be the dawn of a brighter day.

Mr. FISHER accorded the resolution his very hearty support, and expressed the fervent hope that they might secure the reforms so urgently needed.

The CHAIRMAN, in submitting the resolution, which was unanimously agreed to, also addressed himself to the proposition, and expressed the hope that Clause 2 would be deleted.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cimicifugæ Rhizoma.

CIMICIFUGA, or *Actææ Racemosæ Radix*, consists of the dried rhizome and roots of *Cimicifuga racemosa*, Ell. (N.O. Ranunculacæ) a tall, herbaceous plant, which grows freely in shady woods in

CIMICIFUGA.—Rhizome and roots of *Cimicifuga racemosa*.

Canada and the United States. The plant produces a stout perennial rhizome, which is collected in the autumn—after the fruit has formed and the leaves have died down—cut into pieces, and dried. The drug possesses bitter stomachic, analgesic, and expectorant properties; it is used in the preparation of *Extractum Cimicifugæ Liquidum* and *Tinctura Cimicifugæ*.

CHARACTERS AND TEST.—*Cimicifuga* is a thick, hard, and knotty horizontal rhizome, from 5 to 15 Cm. long, and from 12 to 25 Mm. in diameter. It is nearly cylindrical in shape, and bears the remains of numerous stout ascending branches, which are about 25 Mm. or more in length, about 9. Mm. in thickness, and so close together as almost to conceal the rhizome. The branches curve upwards and terminate in the remains of a bud, or in a circular cup-shaped scar which exhibits a distinctly radiate structure. Encircling scars of cataphyllary leaves mark the rhizome and its branches, being more conspicuous

CIMICIFUGA.—A, Transverse section of rhizome; B, Transverse section of root. Both slightly enlarged.

on the latter. The straight, stout, dark-brown roots, which are given off from the under surface of the rhizome, are obscurely quadrangular or longitudinally furrowed; they are brittle, usually broken off quite close to the rhizome, and exhibit in transverse section from three to five, or even six—but usually three or four—wedge-shaped bundles of porous whitish wood, separated by broad and dark medullary rays. A similar section of the rhizome or one of its branches exhibits a large dark-coloured horny pith, surrounded by a ring of numerous pale wedges of wood, alternating with wide dark medullary rays outside which is a thin dark horny bark or cortex. *Cimicifuga* is blackened when test solution of ferric chloride is applied to the

rhizome or roots. This reaction distinguishes the drug from black hellebore, and it is stated to be due to the presence of tannic acid, but it has also been attributed to a body allied to the glucoside quercitrin, which gives a dark green colour with ferric salts. The odour of *cimicifuga* is faint and not characteristic; its bitter acrid taste is said to be due to the presence of a crystalline body, *racemosin*.

NOTES.—The distinctive characters of *cimicifuga* are the numerous stout branches curving upwards, and the appearance of transverse sections of the rhizome and roots. Black hellebore rhizome, which has been confused with it, is tortuous, and its irregular branches are not prominently curved upwards; sections of the rhizome show a thicker bark and fewer wood bundles than *cimicifuga*, and in sections of the roots the wood is much less distinctly cruciate.

Cinchonæ Rubræ Cortex.

RED CINCHONA BARK is obtained from the stem and branches of cultivated plants of *Cinchona succirubra*, Pavon (N.O. Rubiaceæ), and imported chiefly from India, though bark corresponding to the official description and test is occasionally received from Jamaica, Ceylon, and elsewhere. The drug possesses tonic, bitter stomachic,

RED CINCHONA BARK.—Stem bark of East Indian *Cinchona succirubra*.

and astringent properties; it is used in the preparation of *Extractum Cinchonæ Liquidum*, *Infusum Cinchonæ Acidum*, *Tinctura Cinchonæ*, *Tinctura Cinchonæ Composita*, and is a source of the official salts of Quinine.

CHARACTERS AND TESTS.—Red Cinchona Bark occurs in quilled or more or less incurved pieces, coated with the periderm, and varying in length from 5 to 30 Cm. or more. The bark is usually from 2.5 to 6 Mm. thick, and the quills vary in size, but are often about 35 Mm. in diameter. The outer surface of the bark is brownish or reddish-brown, and often bears greyish lichens; it is also more or less rough from longitudinal ridges and numerous reddish warts or enlarged lenticels which often run into lines in the larger pieces of bark. The ridges are most apparent in the bark obtained from the branches; in some varieties (e.g., Jamaica bark, from *C. succirubra*, var. *subpubescens*) there are numerous transverse cracks, the edges of which are not thickened or raised. The inner surface of the bark is brick-red or deep reddish-brown, but when the exposed portion is cut away the surface appears of a yellowish-brown colour, which

RED CINCHONA BARK.—Branch bark of East Indian *Cinchona succirubra*.

darkens on exposure owing to a change in the tannin of the bark, by which a reddish phlobaphene is produced. Other features of the bark are the irregularly and coarsely striated appearance of its inner surface, the fibrous fracture—short in smaller and fine in larger pieces, the brownish or reddish-brown colour of the powder, the bitter and astringent taste, and the absence of any marked

odour. When used for making galenical preparations, it should yield from 5 to 6 per cent. of total alkaloid, of which not less than half should consist of quinine and cinchonidine.

RED CINCHONA BARK.—Stem bark of Jamaica *Cinchona succirubra*.

NOTES.—The distinctive characters of red cinchona bark are its quilled or incurved appearance, more or less spongy nature, longitudinal wrinkles, and reddish warts. There are several other quilled

used in the preparation of *Aqua Cinnamomi*, *Decoctum Hæmatoxyli*, *Oleum Cinnamomi*, *Pulvis Catechu Compositus*, *Pulvis Cinnamomi Compositus*, *Pulvis Cretæ Aromaticus*, *Pulvis Kino Compositus*, *Tinctura Cardamomi Composita*, *Tinctura Catechu*, *Tinctura Cinnamomi*, *Tinctura Lavandulæ Composita*, and, indirectly, of *Acidum Sulphuricum Aromaticum*, *Mistura Cretæ*, *Mistura Guaiaci*, *Mistura Olei Ricini*, *Mistura Spiritus Vini Gallici*, *Pilula Aloes et Ferri*, *Pilula Cambogiæ Composita*, *Spiritus Cinnamomi*, *Syrupus Aromaticus*, and *Syrupus Cascaræ Aromaticus*.

CHARACTERS.—Cinnamon bark occurs in closely rolled quills, each about a metre or more long, from 6 to 9 Mm. in diameter, and containing numerous and very short quills or channelled pieces. The quills are dull pale yellowish-brown externally, and somewhat darker on the inner surface. They are extremely thin, brittle, splintery, and marked by small scars or holes (indicating the insertion of leaves or lateral shoots), and faint shining wavy lines, formed by bundles of bast fibres. A transverse section of the

CINNAMON BARK.—From *Cinnamomum zeylanicum*.

CASSIA BARK.—From *Cinnamomum cassia*.

cinchona barks, none of which meet the official requirements. That from *C. calisaya* occurs in firm and hard quills, with longitudinal furrows, transverse cracks, and an outer corky layer which shows a tendency to exfoliate in flakes. The bark of *C. officinalis* is also firm, but has numerous small transverse and longitudinal cracks, and the quills are usually small and rough, with thickened edges. That of *C. lancifolia* has a more or less uniformly smooth surface, with patches of silvery-grey cork and a very fibrous fracture. The chief constituents of cinchona barks are the alkaloids quinine, cinchonidine, cinchonine, and quinidine; other constituents are hydroquinine, hydrocinchonidine, quinamine, homo cinchonidine, quinovin—a bitter amorphous glucoside, quinic or kinic acid, cinchotannic acid (the peculiar tannin which yields on oxidation the reddish phlobaphene—cinchona red), starch, calcium oxalate, etc. Red cinchona bark of average quality contains about 1.5 per cent. of quinine, 2.5 per cent. of cinchonidine, 1.0 per cent. of cinchonine, and 0.8 per cent. of amorphous alkaloids. For an explanation of the official assay process, see *P.J.*, April 17, 1897, page 337. For a detailed account of the macroscopic and microscopic characters of the drug, see *P.J.*, September 24, 1898, page 350.

Cinnamomi Cortex.

CINNAMON BARK is the dried inner bark of shoots from the truncated stocks of *Cinnamomum zeylanicum*, Breyn. (N.O. Lauraceæ), a small evergreen tree, indigenous to Ceylon, and cultivated in that island. Ceylon cinnamon from cultivated trees is alone official. The shoots are cut down when nearly two years old and from 1 to 2 metres long; the bark is then removed in strips, which are exposed in heaps for about twenty-four hours, and afterwards freed from epidermis and cortex by scraping. The strips are next packed inside one another, rolled into sticks and dried. The drug possesses carminative, astringent and aromatic properties; it is

bark shows an outer pale layer of sclerenchymatous cells and an inner dark layer of bast. The fragrant odour and warm, sweet, aromatic taste are due to the presence of volatile oil.

NOTES.—The distinctive characters of cinnamon bark are the compound quills, uniform colour, absence of cork, narrow wavy longitudinal lines, odour, and taste. The commercial varieties differ in the thinness and smoothness of the quills, which also vary considerably in size. For a detailed macroscopic and microscopic description, see *P.J.*, December 3, 1898, page 584. Cinnamon of good quality comes from Southern India, and inferior varieties from Brazil, the West Indies, and Java. The chief constituent of the bark is the volatile oil, of which it yields 0.5 to 1.0 per cent.; other constituents are tannin and mucilage. Cassia bark, from *Cinnamomum cassia*, Blume (N.O. Lauraceæ), resembles cinnamon in odour and taste, but is less delicate in aroma and more mucilaginous and astringent. It occurs in thicker, usually single, quills, which are darker in colour than cinnamon and bear patches of cork.

CINNAMON BARK.—A, Transverse section of a roll of cinnamon quills; B, Transverse section of bark, enlarged; r, Medullary rays; q, Phloem masses; s, Sclerenchyma ring. $\times 65$. (After Berg.)

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

PARASITES OF WHEAT

M. L. Malgin has studied the disease of wheat known as "piétin." It chiefly attacks the haulms, and is caused by *Leptosphaeria herpotrichoides*, often accompanied by *Ophiobolus graminis*, *Pyrenophora trichostoma*, and the conidial forms of *Dictyosporium opacum* (?), *Coniosporium rhizophyllum* (?), and *Aspergillus circinatus*, sp. n. Cultural experiments showed that *Dictyosporium opacum* (?) is the conidial form of *Leptosphaeria herpotrichoides*, and *Coniosporium rhizophyllum* (?) the conidial form of *Ophiobolus graminis*. *Septoria graminis* is also very destructive, putting out germinating filaments which do not enter through the stomates; their action is purely chemical.—*Overs. k. Dansk. Vidensk.*, 1899, 213.

PIGMENTS OF AMANITA MUSCARIA.

Dr. A. B. Griffiths gives the formula for the green pigment of the poisonous "fly amanita" as $C_{20}H_{20}O_{10}$, and for the red pigment he proposes the formula $C_{19}H_{18}O_6$.—*Comptes rendus*, 130, 42.

MOULD-FUNGI AND ARSENICAL WALL-PAPERS.

Herr H. A. Schmidt has confirmed by experiment the current opinion that the effect of moulds on hangings or papers coloured by an arsenical pigment is to reduce the arsenic-compound and to set free arseniuretted hydrogen. This reducing power is especially strong in four of the commonest mould-fungi, viz., *Penicillium glaucum*, *Aspergillus flavus*, *Mucor mucedo*, and *Dematium pullulans*, but is possessed also to a lesser degree by nearly everyone of twenty-four species examined.—*Zeitschr. für angewandte Mikroskopie*, 1899, 176.

IS PLEUROTUS OLEARIUS A POISON P

According to Professor G. Arcangeli, this alleged poisonous fungus is greedily eaten by the larvæ of some insects, and by snails, without appearing to do them any harm. Although rabbits in the wild state refuse it, it does not appear to have any specially injurious effect on them in small quantities. On dogs it acts as an emetic, as it does with man.—*Atti Soc. Toscana Sci. Nat.*, 1900, 22.

MANNITE IN THE TUBERACEÆ.

Professor O. Mattirolo has extracted from a number of different species of Tuberaceæ—*Tuber excavatum*, *Elaphomyces variegatus*, etc.—a substance identical in chemical composition and in properties with the mannite of the mountain-ash, $C_6H_{14}O_6$. It can be crystallised out from an aqueous solution in the form of small white shining needle-like crystals.—*Malpighia*, 1899, 154.

MYRME- COPHILOUS TREES AND SHRUBS.

Observations made during a stay in South America have led Dr. L. Buscalioni and Herr J. Huber to doubt the correctness of the current theory of myrmecophilous trees and shrubs, that the ants protect the plants against the attacks of other injurious insects, especially leaf-cutting ants. They find myrmecophilous species to abound chiefly in localities which are frequently submerged by floods, where leaf-cutting ants do not exist. This is especially the case with species of *Cecropia*. The authors advance the theory that the habit is simply one for the advantage of the inhabiting ants themselves, and that the myrmecophilous habit is confined to species which inhabit localities liable to be flooded, or which have been at some previous period liable to be flooded, or to species descended from those which inhabited such localities.—*Beih. z. Bot. Centralblatt*, 1900, 85.

LUTEOL, A NEW INDICATOR.

Another addition has recently been made to the many indicators for use in alkalimetry. This is luteol, a derivative of phenacetine, chloroxydiphenyl-quinoline. It crystallises from alcohol in fine, slightly yellow needles, melting at 246° C. The indicator is prepared by dissolving 1 Gm. of luteol in 500 C.c. of alcohol. It is extremely sensitive towards alkalies, giving, in their presence, an intense yellow colour, which disappears in the presence of free acid, by which it is at the same time precipitated.—*Nouv. rem.*, 16, 25.

FUNCTION OF HYDROCYANIC ACID IN PLANTS.

Plants containing hydrocyanic acid—the bitter almond and *Pangium edule*—have been investigated by Dr. M. Soave, with the view of determining the part played by this substance in the vital economy of the plant. He concludes that cyanogen compounds are transitional substances from which plants obtain their nitrogenous food materials. At the time when the seeds begin to swell, as long as the embryo is dormant, the bitter almond contains no trace of hydrocyanic acid; it makes its appearance only in the stem, not in the root nor in the cotyledons. The sweet almond contains no trace of amygdalin.—*Nuov. Giorn. Bot. Ital.*, 1899, 219.

INFLUENCE OF CARBON DIOXIDE ON PLANT GROWTH.

M. E. C. Téodoresco has carried on a series of experiments on a number of flowering plants and on some Hepaticæ (*Marc'antia polymorpha* and *Lunularia vulgaris*) with the view of determining the effect on their form and structure of growth in an atmosphere containing more than the normal amount of carbon dioxide (2 p.c.), and growth in an atmosphere deprived as completely as possible of that gas. With the Hepaticæ growth is much more luxuriant when the atmosphere contains an excess of CO_2 , and the gemmæ are formed only in the presence of this gas. With flowering plants, CO_2 appears to retard growth so long as the plant is consuming the food-materials of the seed; but after that period an increase in the proportion of CO_2 causes the leaves to become thicker, the palisade-tissue better developed, and the aciferous chambers larger.—*Bonnier's Rev. Gén. de Bot.*, 1899, 429.

ANATOMY AND MORPHOLOGY OF RHUS VERNICIFERA.

An exhaustive account of the anatomy and morphology of the Japanese lacquer tree is published by Professor M. Mœbius. The species is strictly dioecious, no intermingling of male and female flowers having been observed. The wax exuded from the mesocarp forms a thick incrustation on the inner side of the cell-walls. Its purpose appears to be the attraction of birds, especially pigeons, to assist in the dissemination of the seeds, which pass through their bodies without digestion, when they feed on the fleshy mesocarp. The seeds contain a thin layer of endosperm within the thin testa.—*Abhandl. Senck. Naturf. Gesellsch.*, 1899, 201.

ASSIMILATION OF ATMOSPHERIC NITROGEN.

D. L. Hiltner brings forward evidence to show that the power of assimilating the free nitrogen of the atmosphere is not confined to the bacteroids which inhabit the root-tubercles of the Leguminosæ and some other plants, but is possessed also by endotrophic mycorrhiza in the underground or aerial organs of other plants. He especially mentions in this respect the mycorrhiza of *Podocarpus*, and he believes this to be the case also with the mycorrhiza of other Coniferæ, as also of the Ericaceæ and Orchideæ. He gives also experimental reasons for the belief that the fungus found by Nestler and others in the ovary of *Lolium temulentum* has also the property of increasing, by absorption directly from the atmosphere, the small amount of nitrogen contained in the seed.—*Centralbl. f. Bakteriol. u. Parasitenk.*, 2te Abt., 1899, 191.

THE DRUGGIST AS A CIVIL SERVANT.*

BY J. P. TAYLOR.

In conversation with a medical man some time ago, he gave it as his opinion that instead of the continual struggle and worry which many doctors have to face in their efforts to build up a practice—instead of some men having too many patients and some too few—if Government would only make the practice of medicine a civil service, then those misfortunes would be obliterated, and both doctor and patient benefit—the doctor in having a free mind and more leisure to perfect himself in his profession and assimilate the teachings of experience; the patient in having a medical man who would devote more time to his case, and who would have, presumably, more skill in the treatment of disease. Well, it occurred to me that if such a course would be for the benefit of the medical profession, it would probably be equally for the benefit of drug trade, and so I determined to discuss this matter with you.

Let us consider now what such a change as this would involve. It is a common saying that opposition is the life of trade, but like all proverbs this one is only partly true. It is said that opposition and competition in business are the means of bringing out the best that is in a man; that they bring the best men to the front, and put the laggard out of the running. In other words, this is simply the doctrine of the weakest going to the wall—a doctrine which, to say the least of it, is lacking in common humanity. There are many advantages in opposition so long as that opposition is legitimate and honest. But when it comes to the system which is in vogue to-day of each man trying to cut his neighbour's throat—when opposition means that we are all playing a game, and very much in earnest, of beggar my neighbour—then opposition becomes contemptible and despicable. It is contended that opposition makes tradesmen sell the best article at the lowest price in order to hold his own with his opponents. Well, I am willing to admit that it lowers the prices, but I am certain that it does not improve the quality of the goods sold. On the other hand, I do hold that opposition such as we have to-day is the cause of the inferior quality of goods which are put on the market now, and is responsible for the amount of adulteration which prevails at the present time. In an article in the *Pharmaceutical Journal* of May 20, 1899, on "Pharmacy in Germany," the writer says: "Too much competition is not elevating in its tendencies." And I think that applies very particularly to pharmacy. I have two reasons for thinking so. The first is, that purity of drugs being essential for the proper practice of pharmacy, it is unwise to bring in the element of competition, which, as I have pointed out above, is likely to throw inferior articles on the market. The second is, that the worries of business competition prevent the pharmacist having the leisure to become as perfect in the higher branches of his work as he otherwise might be.

My first reason seems to me to be a very important one, and I think no one can deny that it is correct. Where one man is being hard pushed by an opponent close by there is a great temptation for him, in the hope of nullifying the efforts of his neighbour, to cut prices as keenly as he can. He may commence with the honest intention of doing so only so far as is consistent with supplying the finest quality of drugs. But as he goes on cutting so does his opponent, the prices become lower and lower, and in order to have any profit at all various dodges are resorted to in order to place inferior drugs on the market. Then the food and drug inspector steps in, and we hear of prosecutions for various offences, such as camphorated oil, deficient in strength or made with sesame oil; zinc ointment prepared with lard instead of benzoated lard; and numerous other paltry and contemptible artifices, all the outcome of this degrading competition and of the craving for cheapness, which it begets in the public. Then there are other devices which, while

outside the reach of the law, are still very questionable, such as the habitual stocking of second and third-rate drugs by men who advertise to a too-confiding public as using only the best quality they can obtain. Well, all this is far from creditable to us who are fond of posing as something superior to the ordinary grocer or draper; and it has a more serious side than this, in so far as the use of inferior drugs in dispensing is apt to diminish the action which the prescriber is entitled to expect, if indeed it does not disappoint him altogether.

My second reason for thinking that competition is especially hurtful to pharmacy is because the worries of business caused by undue opposition prevent the pharmacist having the leisure to become as perfect in the higher branches of his work as he otherwise might be. My first reason applied purely to our business side; this one refers to what there is of the professional. The strain of long hours, business anxiety, and the hundred and one little annoyances incidental to shop work nowadays, especially in our cities, is not conducive to a frame of mind which would make study a pleasure instead of a toil after a man has had a twelve-hours' day behind a counter in the vain effort to please all his customers. It is a difficult matter to settle down to a study of the many new drugs which are continually appearing, or to refresh the memory by a run over some such interesting work as the "B.P." The result is that most chemists finish their education with the Minor examination. If we can learn enough to qualify that is sufficient for most of us. The conditions of life which we have to face after qualification do not encourage us to make our trade or profession a real study—a book which we must learn thoroughly in the school of experience. It is a pity that all this should be so. It is a pity that so many of us should be content with merely qualifying for registration, but as things are I do not think we need feel surprised. So long as this blameworthy competition forces upon us all, masters and assistants alike, long hours, poor remuneration, and excessive worry, so long will such a state of things endure.

Having thus briefly touched on the disadvantages of opposition, the question arises, What remedy can we suggest? To my mind there is only one way of removing those evils—that is, by removing the cause—excessive competition. Take away from men the necessity for all this petty lying and cheating. Give them the prospect of a remuneration sufficient to keep them in comfort, give them leisure for study and self-improvement, and then I have sufficient faith in human nature to believe that men will show themselves worthy of their new circumstances. I believe then that the public would benefit by the change, that they would have pure drugs, and men to compound them who would be skilful and apt in doing so, men who would be, in short, experts in their business instead of a sort of mongrel mixture of business and professional men who know sufficient to carry on their businesses, but who are not in any real sense experts. I do not mean to say that the stopping of competition would in itself work such changes, but I think that the improved conditions under which we would then work would be sufficient to spur men on, and would be an inducement for us to strive after a higher level of attainment. We hear much about the necessity for raising the standard of the *personnel* of the drug trade. I do not see the necessity for that. I think that as we are at present we have nothing to complain of in the general standard of those in the trade. What we want to do is to give them a position which will enable them to take a deeper interest in the professional part of the trade by giving them time and inducements to do so.

I have already said that the way to do so is to remove the destructive opposition which now prevails. How, then, can we do so? By placing the trade under Government control—in other words, by making the trade a civil service and druggists civil servants. As to the methods by which this is to be done, I think we may safely leave these to be discussed when there is some near prospect of such a change taking place. Let us suppose that all

* Read before the Glasgow Chemists' and Druggists' Assistants' Association.

the preliminary difficulties have been overcome, and that the Government has acquired all the drug businesses in the country, and let us try to picture the conditions under which we would then work. In the first place, instead of half-a-dozen shops within a radius of two or three hundred yards, each working for its own interest and in antagonism to the others, we would have the number of shops regulated to suit the requirements of the population. This is the case in Germany at the present time. In that country a chemist is not at liberty to start business for himself when he qualifies. He must have permission to do so from the Government, which is granted only when his opening is not in opposition to the rule laid down that the number of shops in a district will be in proportion to the population. This arrangement seems to work satisfactorily enough in Germany, and there is no reason to suppose that it would be otherwise here. Certainly it would be to the advantage of those who received the appointment: while as for the others well, they would have to grin and bear their disappointment. The position would be somewhat like that which the Post Office is in. There can only be comparatively few postmasters and a large number of assistants, so there would be few dispensing masters and many assistants. To get over this seeming injustice, it seems to me that it would require to have examinations for qualifying assistants, and higher and stricter requirements for those who wished to have charge of a shop. We must bear in mind, however, that assistants under Government would probably be better paid than they are just now, and the higher grades of assistants would in all likelihood receive as much as many master chemists at present.

We would have then to hand over the whole management of the examinations to Government, and they would become special civil service examinations. This is a point which I think should be considered, even in the existing circumstances. If the Legislature demands certain qualifications from chemists, and appoints that these qualifications shall be determined by examination, and if all this is, as we are assured, in the interests of the public, then I hold that the representatives of the public—the Government—should control the examinations, and should bear the expense of conducting them. Were the trade to become a civil service this would become a necessity, and our examinations would be conducted as the present civil service examinations are.

Well, then, supposing that all preliminaries were settled, let me sketch the conditions which would prevail. The youth who aspired to the honour of serving his country as a dispensing chemist would require, as now, to satisfy duly appointed examiners of his possession of a sufficiency of general knowledge to give a reasonable prospect of success in his after studies. The examination would probably be conducted exactly as it is at present, the only change being that the civil authorities would be the responsible party instead of a semi-private body such as the existing society. Having gained the required number of marks for appointment, he would be passed into Government dispensaries, to be trained in the practical work of his profession. Our aspiring youth, being instilled into the mysteries of pill and powder making, would then be handed over to the tender mercies of a Government School of Pharmacy. He would take the necessary curriculum, and would then be at liberty to offer himself for examination as a candidate for an assistantship. Being again successful, he would receive the first vacant appointment, and would content himself as an assistant for the remainder of his life, or prepare himself for a higher position, such as manager or master. There could, of course, only be a limited number of such appointments, so the exam. would require to be a searching one, and the percentage of marks would be high. This would stimulate to higher exertion those possessed of the ambition and ability to better their positions, and they would have what few of us have—a certainty of a secure position. Such in outline is the drug trade as a civil service.

Is such a plan feasible? I think it is, and especially if all the dispensing were done by Civil Service chemists—let the Government reserve to him the entire right of dispensing prescriptions. The time may not yet be ripe, but I believe that it will come. Co-operation is the same principle, except that instead of public control they have private committees; and I would rather be under the control of a public body. Then, again, I shall be told that such a scheme would kill all enterprise. I cannot think so. Were such a system as I have sketched to become an accomplished fact, there would still be scope for the man of push. At present the man of capital is the man who has the best chance of success. Then, capital would be at a discount, and the man with perseverance and ability would be the successful man.

Such then is the scheme which I have to lay before you. I do not suppose that it will be accomplished in our time. I believe that in time individualism must give place to communism. The municipalities are quickly developing in this direction, as we, in Glasgow, must see. The movement is bound to spread and involve all enterprises, and I hold that it will lead to the greater prosperity of the chemist and druggist.

In conclusion, I should like to refer to a point I have already touched upon, that of handing over the management of the examinations to Government.

The object of making us face the ordeal of examination is to assure the public that only competent men handle poisonous drugs, and that the safety of consumers of medicines is guaranteed. If this is the real object of examinations, should not the Government take the trouble of conducting these examinations? Why should any private society have the trouble of doing so?

If the examinations were held for the purpose of keeping down the number of those entering the trade, were they merely a means of preserving a monopoly, then it would be quite fair. But since they are for the public interest, let the people pay for them.

I do not suggest that there should be no entrance fee. By all means have a sufficient fee to ensure that those going up for examination shall be *bonâ fide* candidates, but do not require us to pay such a sum as would pay the expenses of several examinations. If the public desire skilled labour, let them pay for it. This question is worthy of consideration, and I hope the after discussion will elicit some views upon it. It is in this way that we may hope to achieve something which will give tangible results and further the interests of the drug trade—whose interests are ours, and the success of which is our success.

THE CLINICAL SIGNIFICANCE OF URIC ACID.

In a paper, entitled "Facts and Fallacies in Ureanalysis," in the *Medical Record*, Schaefer discusses, among other topics, the clinical significance of uric acid, a subject on which much new light has been thrown within recent years by the labours of Horbaczewski, Kossel, Von Noorden, and other physiological chemists and clinicians.

The uric-acid theory (says Schaefer) is now the great pathological fetis of the medical profession. It is contended by many writers, foremost among whom is Haig, the great apostle of the uric acid theory, that uric acid is the responsible factor of the *fons et origo mali*, of a large number of ills and aches. This is a great question, and it is the firm conviction of the writer that the day is not far distant when we shall be obliged to give up the uric acid hypothesis altogether and be compelled to look for causes elsewhere. The amount of uric acid excreted in twenty-four hours ranges from 0.4 to 1 Gm. (gr. vi. to xv.). The quantity of uric acid in the urine should never be presumed to be excessive from the mere fact of deposit of uric acid crystals in the urine upon cooling, as in fact such may, and very often does, occur when the uric acid is both relatively and absolutely deficient. The conditions of the urine which tend to precipitation of uric acid are as follows:—
(1) High grade of acidity of the urine; (2) poverty in mineral salts;

(3) low percentage of pigmentation; (4) long standing. Any urine upon standing will deposit uric acid crystals in consequence of the changes culminating in ammoniacal decomposition.

Now a word or more in regard to the so-called brick-dust sediment of the urine. I will say that it is usually not of much diagnostic value, although physicians frequently attach great importance to it. A uric acid sediment is observed in cases in which an increased excretion of uric acid occurs, but it should be remembered that, as a rule, it is not permissible to infer an increased production or elimination from the presence of an abundant deposit of urates alone. Brick-dust sediments are frequently observed in the urine during winter months; but nothing would be more erroneous than to infer an increased elimination from such an observation, as the phenomenon in nine out of ten cases is explained by the fact that uric acid is far less soluble in cold than in warm water. According to Bunge, it takes about fourteen litres of water at the ordinary temperature of the room to dissolve 1 Gm. of uric acid, at the boiling temperature it required two litres, and at the temperature of the body seven to eight litres. The acid urate of sodium dissolves in eleven hundred parts of cold and one hundred and twenty-four parts of boiling water. Much more difficultly soluble are the urates of ammonium and those of the alkaline earths. During summer months a deposit of urates is less frequently observed, although an increased amount may nevertheless be present, being held in solution owing to a higher temperature. The more concentrated the urine and the more uric acid it actually contains, the more readily will a deposit of the kind occur. Uric acid sediments are most often encountered in very acid urines (Purdy). Horbaczewski and others have shown in recent years that enormous amounts of uric acid are excreted under a diet rich in nucleins, thymus having been employed in the cases observed.

Now permit me to express a few words in regard to the so-called uric acid diathesis, particularly gout, and its relationship to uric acid. It has long been a matter of doubt in my mind as to whether uric acid has actually any casual connection with the varied manifestations pictured under the name of uric acid diathesis. Recent investigations seem to show in a very conclusive manner, notwithstanding numerous statements to the contrary, that the excretion of uric acid in gouty patients moves in the same wide limits as in the healthy. In this disease the urates are neither increased nor diminished in any stage. An increase of uric acid in the blood of gouty patients has not been established with any great degree of certainty. Von Noorden has arrived at the conclusion that the gouty condition is independent of the presence of uric acid in the blood. This experimenter holds the opinion that the gouty process can be traced back to a specific local inflammation of the respective tissues. Changes occur which show partly the character of an inflammation, partly that of a necrosis. The acuteness of the process and other conditions may produce a slight or an abundant deposit, or even a deposit entirely free from uric acid. The uric acid which is once formed remains *in loco* at the necrotic areas, because it is insoluble in the fluids, notwithstanding their alkaline character. In leukemia the presence of uric acid is greatly increased in the blood and in the tissues, and yet no gouty deposits nor symptoms characteristic of gout occur. This late view of the nature of gout seriously questions the rationale of the treatment at present advocated against the malady in question. Besides, clinical experience teaches clearly enough the absolute immunity of gouty nodules against alkaline medication.—*Food and Sanitation.*

COSMETIC ALMOND MEAL—Sweet almond, peach kernel, or white poppy oil, 60 Gms., is rubbed up with sodium carbonate, 120 Gms., and then with wheat or barley meal, 2,000 Gms.; then put through a fine sieve, and perfume with 60 drops of a mixture of equal parts of oils of bergamot, bitter almonds, sandal, and ylang-ylang.—*Pharm. Post*, 32, 721, after *Sudd. Ap. Ztg.*

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

Problems to be Solved.

I note with mingled feelings of pleasure and apprehension the very general expression of a desire for amendment of the Pharmacy Acts by a Bill to be promoted by the Council of the Pharmaceutical Society. That amendment of the law affecting the practice of pharmacy and the business of a chemist and druggist is urgently needed has long been apparent, and the general recognition of that fact affords satisfaction. But the question which raises doubt in my mind has reference to the lines on which amendment of the law is to be attempted. As the Editor has recently pointed out, there has not been any qualification for the practice of pharmacy in this country since the qualification of the Society of Apothecaries became obsolete in that respect. Qualification under the Act of 1858 only does duty as an inadequate substitute, while qualification as a pharmaceutical chemist is merely voluntary. Assuming that opposition to Clause 2 of the Companies Bill proves successful and that the clause is withdrawn, there will then be the diversity of opinion and practice prevailing among legally qualified chemists to be dealt with. How great that is may be seen by comparing Mr. John Taylor's definition of pharmacy (see *ante*, p. 148), with the opinion that the dispensing of medicine is the proper business of the pharmaceutical chemist and should be confined to those holding that qualification, or the opinion that the proprietor of a business is the person who requires to be qualified, with the probably more popular one that the person actually conducting business in a chemist's shop is the only person who need be qualified. Then there is the practice of many legally qualified persons, who hire themselves to unqualified persons and thus enable companies to carry on the business, for some part of which legal qualification of individuals is necessary. How all these different views and tendencies of interest are to be harmonised and amalgamated is truly a very difficult problem.

Two Qualifications Needed.

If it were possible to make a separation of the dispensing of medicine from the sale of poisons the basis of an arrangement by which the professional practice of pharmacy could be connected with the title of pharmaceutical chemist, as a qualification of the proprietor of a business, while the title of chemist and druggist was made a personal qualification for the sale of scheduled poisons in connection with the ordinary trading operations now carried on under that title—as well as a qualification to be publicly used for the information and guidance of the public, either by the proprietor of a business, or by a person in his employ—such an arrangement might be a convenient means of solving the problem. It would probably require considerable concessions on all sides; but it appears to offer some prospect of possible adjustment so as to meet all existing requirements. Such a compromise would have the great advantage of opening a way to the establishment of a purely professional qualification for the practice of pharmacy, realisation of which can scarcely be expected otherwise. A professional qualification of that kind could not be adapted to the entire rank and file of registered chemists and druggists and to the very varied conditions under which their business is carried on in many instances in different localities. Those who have cognisance of these circumstances, who also take an intelligent interest in the future of British pharmacy and of the drug trade in this country, might render good service to their calling and to their colleagues by thinking over this fancy and discussing the difficulties that will naturally suggest themselves to practical men looking at it from various points of view, as well as the means by which they might be overcome with advantage to all concerned.

The Council Election, 1900.

Mr. Glyn-Jones, who was formerly credited, as I stated three weeks ago, with the intention of doing all in his power this year to secure the rejection of seven of his colleagues on the Council of the Pharmaceutical Society, limited himself in his recent letter to a proposal that at least three or four new members should be returned at the approaching election. More recently, in a type-written letter sent to a limited and very select circle, he has stated that he has received about a hundred and thirty communications from members of the Society, including a number of local secretaries throughout the country, who desire to see at least four new candidates returned. Emboldened apparently by the support of those one hundred and thirty persons, he invited the whole of them to a private meeting at the Holborn Viaduct Hotel, London, on Monday last, to discuss the election and make a selection from the list of new candidates, "in order that a combined effort may be made to secure their return." Members who received Mr. Glyn-Jones' letter, and found it inconvenient to attend the meeting, were requested to send him, "for the guidance of the meeting," a selection in writing of four or five candidates out of the ten at present standing for election. A type-written slip, enclosed with the letter, gave the names of the ten new candidates, with all too brief particulars about them. Thus:—

A. S. Campkin, Cambridge.

Albert Cooper, Gloucester Road, London. (Chairman of the Chemists' Defence Association, and of the Retail Section of the P.A.T.A.)

J. Currie, Glasgow. (Supported by Glasgow Association.)

Walter Gibbons, P.A.T.A. Local Secretary, Manchester.

R. Lord Gifford, Blackburn. (Secretary of the Blackburn Association.)

G. J. Gostling, Stowmarket.

J. W. T. Morrison, Tring.

C. E. Pickering, Chemists' Assistant, London. (Supported by Chemists' Assistants' Union.)

John Taylor, Bolton. (Supported by Bolton Chemists' Association, of which he was formerly Convener.)

A. C. Wootton, London. (Formerly Editor of the *Chemist and Druggist*.)

Mr. Currie's name, I may say, was given incorrectly in the type-written slip, as in the foregoing list. It should be W. L. Currie.

A Pharmaceutical Caucus.

The information regarding the candidates seems to me decidedly meagre and quite unworthy of Mr. Glyn-Jones, who is nothing if limited in his statements. But that doubtless counted for little with the fraction of his one hundred and thirty supporters who attended the meeting arranged by him, with the object of forming a caucus to influence the approaching election. For the action taken by Mr. Glyn-Jones amounts to nothing less than a deliberate attempt to run a caucus, which may be expected to receive the support of self-proclaimed disinterested trade journals, with such assistance as the well-arranged machinery of the P. A. T. A. may be capable of affording. Mr. Albert Cooper, the Chairman of the retail section of that organisation, is one of the candidates included in Mr. Glyn-Jones' select list, along with Mr. A. C. Wootton, the former conductor of the one trade journal which is capable of serious mischief. Mr. John Taylor, of Bolton, is the third selected candidate, and Mr. Walter Gibbons, of Manchester, the fourth. I have nothing to say with regard to the merits or demerits of the respective individuals, but I imagine that it may not prove an un-mixed advantage to be mentioned in the list issued by the caucus. Readers of the Journal will not remain long in suspense as to what is likely to be done in the attempt to influence the result, as only a month remains before the day of election and anything serious in the nature of canvassing must be done within the next three weeks. Meanwhile, I may be permitted to point out that—with regard to the four new candidates recommended by the Glyn-Jones caucus for election—voters would do well to ask why they should act on that recommendation and in what respect the new men are better than those they may reasonably expect to displace.

The Support Required by Candidates.

I find there appears to be some misconception as to the amount of support a candidate must receive to insure his return. Judging from the experience of last year, not less than eighteen hundred votes will suffice to return a candidate, and if the usually apathetic ones should record their votes to any great extent, some hundreds must probably be added to that number. The one hundred and thirty votes which may be supposed to be at the command of the caucus will, therefore, not go far in themselves, even if the voters plump for the same candidates. Of even less avail will one vote prove, though Mr. James Reid appears to think that it would have given him a good position at the poll. In a letter buried, so far as the members of the Pharmaceutical Society are concerned, in the pages of a trade journal, he has thanked those who nominated him, and states that he has every reason to believe that their support would have given him "a good position at the poll." In view, however, of the fact that probably only one person nominated him, it is difficult to see how that good position could have been attained by the means referred to, and Mr. Reid may therefore have exercised a very wise discretion in deciding not to stand for election "just now." It is interesting, by the way, to learn that he does not think anything can be done within the Council towards the redemption of pharmacy—whatever that may mean—for a considerable time to come. It would, therefore, be little short of an absurdity for him to waste his talents at present by boating the air; in the dim and distant future, however, he may sacrifice himself in the interests of pharmacy, and attempt to secure a seat upon the Council. That, at least, is something for us to be thankful for.

POLITICAL GOSSIP.

PARLIAMENT stands adjourned until Thursday, April 26, for the Commons, and until Monday, 30, for the Peers. On resuming, the House of Commons will have a very full menu on which to exercise its renewed appetite for work, for there are no less than twenty-nine items on the Order Book for the first day. Thirteen of these are Government-measures of first-class controversial power, such as the Companies Bill, Factories and Workshops Bill, and so forth, whilst the other sixteen are ordinary Bills, six of which are blocked and the majority of the remainder objected to by individual members who find the public device of a "block" inexpedient. The first business on Thursday will probably be the Civil Service Estimates, which may occupy a considerable time, as there are on the paper seven motions for the reduction of various items in the Vote. The Companies Bill, being number six on the official list, is manifestly not intended for active service on that night.

MR. FAITHFULL BEGG, the London stockbroker who represents the St. Rollox Division of Glasgow, is apparently convinced that the way to undying fame does not lie through the thorny paths of Companies Acts amendment. He has not abandoned his measure on the subject, but it has dropped out of the list of immediate possibilities, being twenty-four down the list for Wednesday, May 2. This has given the hon. member some leisure, which he has devoted to the task of drafting a new Bank Holiday Bill. This attempt to out-Lubbock Lord Avebury was well received by the House on the 6th instant, and has been relegated to May 23 for further consideration. The proposal contained in the Bill is to amend the Bank Holiday Acts of 1871 and 1874 by providing for an additional public holiday to be called Empire Day. May 23 being the eve of the Queen's birthday, seems a highly fortunate date for the second reading, and Mr. Begg is to be congratulated on having taken the tide of loyalty and patriotism at its flood.

MORE REGISTRATION AND REGULATION.—After the midwives, the plumbers. Mr. Lees Knowles (Salford West), who formerly assisted

Mr. Ritchie as an unpaid private secretary at the Local Government Board and at the Board of Trade, has notified that on May 15 he will call attention to the national registration of plumbers, and will move a resolution thereon. Mr. Knowles has been much interested for a long time past in the question of protecting the public from incompetent workmen, and has introduced on more than one occasion a Plumbers' Registration Bill. This year he is confining himself to a tentative motion, with a view to ascertaining the temper of the House in regard to the question. As chemists know, to their cost, Parliament does not view the registration remedy with a too favourable eye.

THE REGISTRATION OF FIRMS is a much more important matter to the general public than the desire of Mr. Knowles to evolve a certificated and registered worker in lead-piping. As has been many times maintained in these columns (and we are glad to notice the support of Mr. C. Symes), the Registration of Firms Bill now before Parliament is almost as important in regard to the efficient administration of the Pharmacy Acts, as an amendment of the Companies Acts. For the first time for many years there appears to be a chance of progress with the Bill, which is now in the charge of Mr. Emmott (Oldham). It is first order of the day for Wednesday, May 2, and if any pharmacists possess opportunities for influencing members of the House, they are hereby urged to put in a good word for the modest measure of reform above stated. All who are interested in knowing with whom they are dealing and desire to avoid being victimised by the thousand and one anonymous transformations of unprincipled adventurers, should heartily support the Bill.

THE PRESENT POSITION of the Bills possessing interest for pharmacists is indicated below:—

Midwives: Consideration of the amendments of Grand Committee.....	Wed., June 27
Petroleum: Second Reading	April 26
Shop Hours: (Steadman) Second Reading.....	May 2
Shop Hours: (Provan) Second Reading	April 27
Shops: (Dilke) Second Reading.....	May 1
Veterinary Surgeons: Second Reading	April 30
Accountants (Professional): Second Reading....	May 2

USERS OF STEAM POWER who wish to be heard before the Select Committee on the Registration and Inspection of Boilers now sitting should communicate with the Chairman, Mr. J. Penn (Lewisham). The committee will have its first business meeting on Friday, May 4.

ROYAL INSTITUTION.

A lecture of remarkable and historical interest was given on Friday, April 6, by Professor DEWAR, F.R.S., on

Solid Hydrogen.

He observed that since the dawn of chemistry conjecture had been rife as to the properties of hydrogen in the liquid and in the solid condition. Black, a loyal disciple of Newton, said that what the nature of solid hydrogen was no man could foretell. Lavoisier promulgated the metallic theory when he suggested that the atmosphere might contain certain substances possessing a metallic character. Davy said of nitrogen and hydrogen that their elastic state was no proof that they were non-metallic. Faraday and Daniel supported this view, so did Dumas, and, generally speaking, chemists have thought hydrogen to be metallic in character. The two theories as to the constitution of salts have given support to this view—viz., the old idea that salts were composed of two oxides, one basic, the other acidic; and the more modern view, that salts are produced by the replacement of the hydrogen of an acid by a metal.

To Professor Odling, of Oxford, belongs the credit of having first suggested the contrary. He said some years ago that he did

not expect liquid hydrogen would have the properties of a metal because, among other things, it had a chlorous as well as a basyous half. In this he hit upon the true physical characters of liquid hydrogen.

Professor Dewar went on to show a long series of brilliant experiments, showing that unless reasonable quantities of liquid hydrogen were available it was not possible to do much with it, in consequence of its physical characters. When liquid air is poured into a cup a heavy vapour of air falls over the side. When liquid hydrogen is similarly treated the superincumbent atmosphere falls down bodily as a solid, the vapour of hydrogen rising in the air. During the condensation of the air so much heat is given out that the liquid hydrogen soon evaporates.

By means of two thermo-junctions it was shown that the temperature of liquid hydrogen is 70° below that of liquid air, the former being from —250 to —252° C., the latter —180° C. As a consequence, to reach a still lower temperature the difficulties are greater, it being well known the lower the starting point on the scale the greater the difficulties to be encountered. The difference in the behaviour of liquid nitrogen and liquid air when made to boil under diminished pressure was next illustrated. The temperature of both was reduced, but, while the nitrogen became viscid and ultimately solid, the oxygen absolutely refused to solidify. In fact, it is quite impossible to get solid oxygen in this way by evaporation, the reason being that at the lowest temperatures it has an inappreciable pressure of vapour, whereas that of nitrogen is considerable, being about 45 millimetres. That of oxygen, like mercury vapour, at normal temperature amounts only to about a millionth part of an atmosphere.

To give an idea of the power of liquid hydrogen as a cooling agent, he performed an experiment depending on the same principle as a Wollaston's cryophorus, with the difference that the fluid to be solidified was not water, but liquid air containing a large proportion of nitrogen, the material used to effect condensation being liquid hydrogen. He next showed how hydrogen could be liquefied in a closed tube, explaining the importance of this fact in determining its density and other constants, and then proceeded to exhibit the gas in the solid form.

This experiment was the *pièce de résistance*, and was carried through successfully. This result was effected by putting a portion of the liquid into a vacuum vessel isolated from heat as perfectly as possible. When the pressure on the liquid in the vessel was slowly reduced, the hydrogen was suddenly seen to appear like a white mass of solidified foam, possessing the lowest steady temperature it is possible to reach at present—viz., 258° below zero Centigrade, or 15° on the absolute scale.

Professor Dewar remarked that the solidification of hydrogen at this point was in a sense a disappointment to those who had hoped to reach by means of liquid hydrogen a point nearer the absolute zero than 15°, inasmuch as a solid is a bad conductor for cooling purposes. Coming to

THE USES OF LIQUID HYDROGEN

for scientific research, the lecturer showed how it afforded the only means of obtaining solid oxygen. Another important application is in the separation of the more volatile gases of a mixture. By way of illustration coal gas was passed through liquid air, liquid oxygen, and liquid hydrogen. On emerging from the last it was found to be non-luminous, and in each case it was found to be different in composition, showing that each liquid removed certain gases by condensation. In this way it is possible to get pure nitrogen, preferably by condensing Bath gas, which contains no oxygen. The behaviour of metals with regard to electrical conductivity at very low temperatures is an interesting question. From experiments with liquid air it was expected that at the zero of absolute temperature pure metals would have no electrical resistance at all. But although the resistance curves appeared to be going straight to zero at the temperature of liquid air, he found that lower down

below the temperature of solid air they bent sharply round, so that a finite resistance was expected. Samples of pure metals were obtained for the experiments, iron from Mr. Swan, and gold from Professor Roberts-Austen.

In conclusion, Professor Dewar acknowledged the generosity of those who had contributed to the cost of the investigations, notably the Goldsmiths' Company. He paid a glowing tribute to the skill, fidelity, and perseverance of his assistants, who had given ungrudgingly of their leisure to achieve success. In this connection special reference was made to Mr. Lennox and Mr. Heath. It had been suggested, said the lecturer, that the costliness of the investigation had not been justified by the results, but he was unable to share this view.

PHARMACEUTICAL SOCIETY.

Library, Museum, School and House Committee.

At the ordinary monthly meeting of this Committee, held on Wednesday, April 11, the following particulars respecting the Society's Libraries and Museums were presented:—

ATTENDANCES.

	Total.	Highest.	Lowest.	Average.
Museum (March)	611	50	3	23
Library (March).....	511	38	4	19

CIRCULATION OF BOOKS.

	Total.	Town.	Country.	Carriage Paid.
London (March)	179	110	69	17s. 8½d.
Edinburgh (March) ..	168	115	53	4s. 10d.

DONATIONS TO THE LIBRARY (LONDON).

Mr. F. Manson Bailey, F.L.S., Colonial Botanist, Queensland:—Queensland Flora, part 1; Contributions to the Flora of Queensland, 1900.

College of Preceptors, London:—Calendar, 1900.

Prof. Dr. G. Lagerheim, Stockholm:—7 pamphlets.

DONATIONS TO THE MUSEUM (LONDON).

Mr. A. Peake, Earlstown:—Five specimens of native remedies from British Honduras.

Mr. Th. Wardleworth, F.L.S., Liverpool.—Large specimen of the fruit of *Theobroma cacao*; fruits of *Mucuna pruriens*.

TO THE HERBARIUM (LONDON).

Mr. C. P. Andrews, St. John's College, Battersea:—Specimen of *Phalaris minor*.

Mr. E. W. Hunnybun, Godmanchester:—Specimens of *Mibora verna*.

PURCHASE OF BOOKS.

The Committee authorised the purchase of the undermentioned work:—

For the Library (London), The Times Atlas, latest edition.

EXAMINATIONS IN EDINBURGH.

April, 1900.

MAJOR EXAMINATION.

One candidate was examined, and failed.

MINOR EXAMINATION.

Candidates examined.....	117
„ failed	84
„ passed	33

Andrews, Martha
 Arnott, David
 Birnie, James Murison
 Dawson, Frederic William
 Dowell, James
 Drummond, Wallace Blair
 Duncan, Howat
 Fairbairn, Alexander
 Ferrier, John Greig
 Hedger, Harry Ormsby
 Hume, Robert Marshall
 Johnston, Robert Adamson
 McEwan, Arthur
 McMillan, Allan
 Melrose, Francis
 Middleton, Edward Loggie
 Milne, William Farquhar

Nicoll, Thomas
 Owens, Thomas Owen
 Patten, Mary
 Petrie, David Laurance
 Ross, Albert
 Russell, William
 Shadforth, William
 Smith, Charles Monie
 Strachan, Robert Guild
 Thomson, George
 Traill, Alexander Melville
 Walker, James
 Wallace, Robert
 Waters, Robert Sandison
 Weir, John
 Wilson, Robert Mackie

MAJOR EXAMINATION QUESTIONS (LONDON).

CHEMISTRY.

April 10, 1900, from 10 a.m. to 1 p.m.

[Six questions only are to be attempted, and, of these, at least two must be taken from Part II.]

PART I.

- 0.5 gramme of an element gives 0.6355 gramme of oxide. The vapour density of a chloride of the element is 130. Show how these data can be used in deducing the probable atomic weight of the element.
- Compare and contrast the properties of phosphoric and arsenic acids.
- Write an account of the common chlorides which contain three atoms of chlorine to one of the element.
- Hydrogen sulphide is passed at ordinary temperatures into the following: (a) nitric acid; (b) sulphuric acid; (c) solution of ammonia; (d) solution of potassium permanganate made alkaline with potassium hydrate. Describe the changes which occur in each case, and give equations where possible.
- Describe three experiments illustrating the reducing action of magnesium, and give equations representing the changes which take place.
- Give detailed instructions for the preparation of crystals of chrome (potash) alum from potassium dichromate and of a solution of subacetate of lead from lead nitrate.

PART II.

- Starting from acetic acid, how could you obtain (a) carbonic acid, (b) glycollic acid, (c) oxalic acid, (d) malonic acid?
- If you were given an organic compound and were told that it was an amine, amide, or an ammonium salt, what tests would you apply in order to ascertain to which of these groups the substance belonged?
- Commercial (synthetical) benzoic acid frequently contains chlorine compounds. Indicate the origin of this chlorine, and describe one method by which you could estimate the quantity in a given sample of the acid.
- Write a short account of any three derivatives of naphthalene, and give the constitutional formulæ of the compounds chosen.

PHYSICS.

April 10, 1900, from 2 p.m. to 5 p.m.

[Only six questions to be attempted.]

- A mass of iron of 750 grammes at a temperature of 400° C. is introduced into an ice calorimeter when 420 grammes of water are produced; what is the specific heat of iron?
- An object is held in front of a convex mirror at a distance equal to its focal length; what is the size of the image?
- Describe the construction of an induction coil and explain its action.
- Describe the method for determining the velocity of light by a revolving mirror.
- What do you understand by the expression "the diffusion of gases"? Describe a case in which the determination of the rate of diffusion has substantiated the molecular weight of a gas.
- What is meant by the co-efficient of absolute expansion of a liquid? How can it be experimentally measured?
- Describe some method of measuring the angle of a prism and the refractive index of the material of which it is composed.

MATERIA MEDICA (A Paper).

April 11, 1900, from 10 a.m. to 11 a.m.

- What are the chief commercial varieties of Aconite root? How would you distinguish each one severally from the others?
- What are the chief chemical properties of Quinine and Cocaine?

PRACTICAL MATERIA MEDICA (B Paper).

April 11, 1900, from 10 a.m. to 11.30 a.m.

- Prepare transverse and epidermal sections of the leaf provided. Draw and describe your sections, pointing out anything characteristic observed.
- Is the sample of powdered Coea leaf genuine or not? State your reasons for the opinion expressed.

BOTANY (A Paper).

April 11, 1900, from 11 a.m. to 1 p.m.

- Describe the structural modifications seen in plants which inhabit a dry climate (Xerophytes).
- Describe the chief forms of fruit met with in Cruciferae.
- What is a Ferment? Write an account of the mode of action of any vegetable ferment other than Diastase.

PRACTICAL BOTANY (B Paper).

April 11, 1900, from 11.30 a.m. to 1 p.m.

- Prepare a transverse section of A. Draw your preparation, identify it, and indicate any features that suggest to you the environment in which it lives.
- Dissect the specimen B. Accompany your preparation with explanatory sketches.
- Determine the natural order of specimen C, giving your reasons.

PRACTICAL MATERIA MEDICA (A Paper).

April 11, 1900, from 2 p.m. to 3.30 p.m.

1. Prepare transverse and epidermal sections of the leaf provided. Draw and describe your preparations, pointing out anything characteristic observed.
2. Is the sample of powdered Senna leaf genuine or not? State your reasons for the opinion expressed.

MATERIA MEDICA (B Paper).

April 11, 1900, from 2 p.m. to 3 p.m.

1. What are the chief commercial varieties of Ginger? How may the non-official ones be distinguished from the official?
2. What are the chief chemical properties of Morphine and Salicin?

PRACTICAL BOTANY (A Paper).

April 11, 1900, from 3.30 p.m. to 5 p.m.

1. Prepare a transverse section of A. Draw your preparation, identify it, and indicate any features that suggest to you the environment in which it lives.
2. Dissect the specimen B. Accompany your preparation with explanatory sketches.
3. Determine the natural order of specimen C, giving your reasons.

BOTANY (B Paper).

April 11, 1900, from 3 p.m. to 5 p.m.

1. What are the essential differences between Gymnosperms and Angiosperms? Enumerate the Gymnosperms native to the British Isles.
2. What is meant by Irritability? Illustrate your answer by reference to a special case.
3. Give a short account of the minute structure of a foliage leaf, and point out the uses of the various parts.

FIRST EXAMINATION QUESTIONS.

LATIN.

April 10, from 11 a.m. to 12.30 p.m.

I. For all Candidates. Translate into Latin;—

1. The soldier's daughters are very unhappy.
2. This servant will be praised by the father of Crassus.
3. The fourth legion has been sent to the assistance of the Gauls.
4. The book which we were reading has been lost.
5. This thing being done, she wished to return.

II. Translate into English either A (Caesar) or B (Virgil).

[Candidates must not attempt both authors.]

A.—CAESAR.

1. Pro multitudine autem hominum, et pro gloria belli atque fortitudinis, angustos se fines habere arbitrabantur, qui in longitudinem millia passuum ducenta et quadraginta, in latitudinem centum et octoginta patebant. His rebus adducti, et auctoritate Orgetorigis permoti, constituerunt, ea, quae ad proficiscendum pertinent, comparare; jumentorum et carrorum quam maximum numerum coemere; sementes quam maximas facere, ut in itinere copia frumenti suppeteret; eum proximis civitatibus pacem et amicitiam confirmare.

2. Cognito Caesaris adventu, Ariovistus legatos ad eum mittit: Quod antea de colloquio postulasset, id per se fieri licere, quoniam propius accessisset; seque id sine periculo facere posse existimare. Non respuit conditionem Caesar, jamque eum ad sanitatem reverti arbitrabatur, quum id, quod antea petenti denegasset, ultro polliceretur; magnamque in spem veniebat, pro suis tantis populique Romani in eum beneficiis, cognitis suis postulatis, fore uti pertinacia desisteret. Dies colloquio dictus est, ex eo die quintus.

Grammatical Questions.

[For those only who take Caesar.]

1. Decline, in full, in the singular *magnam spem*, and in the plural *eo die*. (Passage 2.)
2. Give the principal parts of all the verbs in Passage 1. Parse fully—"Cognito Caesaris adventu, Ariovistus legatos ad eum mittit." (Passage 2.)
4. What cases are used in Latin to express (a) motion to a place, (b) measure of space? Give sentences in illustration.

B.—VIRGIL.

1. O Dea! si prima repetens ab origine pergam,
Et vacet annales nostrorum audire laborum;
Ante diem clauso componet Vesper Olympo.
Nos, Troja, antiqua (si vestras forte per aures
Trojae nomen iit) diversa per aequora vectos,
Forte sua Libycis tempestas appulit oris.
2. Dixit, et in mensam laticum libavit honorem,
Primaque, libato, summo tenus attigit ore:
Tum Bitiae dedit increpitans. Ille impiger hausit
Spumantem pateram, et pleno se proluit auro.
Post alii proceres. Cithara crinitus Iopas
Personat aurata, docuit quem maximus Atlas.
Hic canit errantem lunam solisque labores;
Unde hominum genus et pecudes; unde imber et ignes
Arcturum pluviasque Hyadas geminosque Triones;
Quid tantum Oceano properent se tingere soles
Hiberni, vel quae tardis mora noctibus obstet.

Grammatical Questions.

[For those only who take Virgil.]

1. Decline, in full, in the singular *errantem lunam*, and in the plural *tardis noctibus*. (Passage 2.)
2. Give the principal parts of all the verbs in Passage 1.
3. Parse fully—"Cithara crinitus Iopas personat aurata, docuit quem maximus Atlas." (Passage 2.)
4. What cases are used in Latin to express (a) motion to a place, (b) measure of space? Give sentences in illustration.

ARITHMETIC.

April 10, 1900, from 12.30 p.m. to 2 p.m.

[The working of these questions, as well as the answers, must be written out in full.]

1. A dishonest inn-keeper buys 12 pipes of wine, and mixes $1\frac{1}{2}$ quarts of water with every 3 gallons of wine. How many pints will he have to sell? (Answer in words.)
2. If $\frac{1}{10}$ of 1 cwt. cost £7 3s., what will $\frac{6}{11}$ of 1 ton cost?
3. If 25 men can perform a piece of work in 16 days, working 12 hours a day, in what time will 20 men perform a similar piece of work 6 times as large, when they work only 8 hours a day?
4. Simplify $\left(\frac{3\frac{1}{2}}{7} + \frac{2}{10\frac{1}{2}} - \frac{5}{6} \times \frac{4}{21}\right) \times 1\frac{3}{4}$.
5. Add 0.40972 of 3s. to 0.27 of 8s., and express the result as the decimal of £1.
6. The difference between the incomes derived from investing a certain sum in 6 per cent. stock at 126 and a similar sum in $4\frac{1}{2}$ per cent. stock at 105 is £22.10s. What is the amount invested in each?

The following question must be attempted by every candidate:—

7. A journey of 725 kilometres can be performed by railway in 18 hours. Find, approximately, the average number of miles per hour at which the train goes.

ENGLISH.

April 10, 1900, from 3 p.m. to 4.30 p.m.

1. Analyse:—

"Like a knell of death and judgment
Rung from heaven by angel hand,
Fell the words of desolation
On the elders of the land."

2. Give the force of the suffixes in the following words:—*yeomanry, lancet, womanish, freedom, gosling, youngster*.
3. Correct the following sentences, giving your reasons:—
(a) He neither knows Latin or French.
(b) He did not get so many rewards as me.
(c) She had fair hair, which was quite different to her sisters.

4. In the following passage, supply the necessary capital letters, and put in the stops and the inverted commas where necessary:—quite so said the editor and it is just that reputation for accuracy that I want to gain for the daily bugle dont you think the truth of it is that the man wants more money who hazel oh no I am sure the money does not come into the matter at all replied hardwick.

[The following question must be attempted by every candidate]:—

5. Write a short Composition on *one* of the following subjects:—
(i.) Wireless Telegraphy.
(ii.) Conscription.
(iii.) Changes in the Social Condition of the People of this Country during the Nineteenth Century.
(iv.) Coal.

A NEW TREATMENT FOR PULMONARY CONSUMPTION.—Mendel has instituted a new kind of treatment for consumption, which has given him considerable satisfaction. By means of a long curved syringe of the capacity of a drachm, he injects through the mouth into the trachea about 3 drachms of the following solution:—Oil of eucalyptus, oil of thyme, oil of cinnamon, of each 1 drachm; iodoform, 20 grains; bromoform, 10 drops; sterilised olive oil, $3\frac{1}{2}$ fluid ounces. The tracheal injection is practised daily. The patient, who feels the solution trickling into his lungs, experiences an agreeable sensation of warmth, and does not cough. In his early experiments Dr. Mendel operated with a mirror, but now he is able to dispense with that aid. The patient holds his tongue himself outside his mouth between thumb and finger by means of a napkin. The treatment is simple and inoffensive, and the effects vary with the stage of the disease. In patients in the first stage, he has succeeded after two or three weeks' treatment in relieving the cough and expectoration, and even stopping them altogether; strength, sleep, and appetite also return. In the two remaining stages of the malady, the results are not so satisfactory, but still considerable benefit is obtained, expectoration being easier and less abundant, while strength and appetite improve.—*Med. Press*, 69, 87.

LETTERS TO THE EDITOR.

The Council Election, 1900.

As a candidate for election on the Council, I have been asked in several quarters to make some statement of my views—I do not know that I can add very much to what I have recently said in the paper and letter published in the *P. J.* for February 17 and 24 last. When asked to stand for the Council my first thought was that I could do as much or more for the trade in a position of "greater freedom and less responsibility" than a councillorship permits. But there is a consideration that weighed heavily with me—viz., that without a seat on the Council one cannot get that first-hand acquaintance with the ways of Bloomsbury Square which I think is desirable for those who seek to shape in any way the policy and future of our trade. Until a man has experienced the responsibilities and opportunities of office he cannot gauge what is and what is not possible to effective administration and policy. To gain that acquaintance, and in the hope that I might be of service to my fellow-craftsmen I resolved to stand. That point being settled, other and personal considerations which would have led me to decline were put aside.

I have not seen any cause to change my mind on the wisdom of opposing Clause 2. I think there is little chance to amend it satisfactorily. It may be true that if this opportunity of amendment be let slip we may, for a long time, lose the chance of legislating on the question. I think such a lapse of time would not be entirely wasted. The Society and Council have, for a long time, been out of touch with provincial pharmacists. They have not made the most and best use of the Pharmacy Act—at least, not always. The commercial side of pharmacy has been entirely ignored. To bring the Society into touch with the full ranks of pharmacy, to utilise the Pharmacy Act as well for the trade as in the interests of the public, and to throw all the weight of an organised trade into the scale when commercial interests are in question, is, in my opinion, the duty of the Council at all times. In working for such ends there is no need to neglect the education of pharmacists or to lower the standard of examinations. I would guard very jealously the traditions and practice of the Society in that respect. It is possible that even a fairly strong infusion of new blood will be unable to effect an immediate change in the policy of the Council. But if I am elected it will always be my aim to make its action subserve the interests of the whole trade.

Bolton, April 7, 1900.

JOHN TAYLOR.

I desire to have in the election now pending what in my experience I find most difficult to get—viz., a straight issue. Perhaps, therefore, it is desirable for me to give my idea of what the issue is. It is this: The making operative of the Pharmacy Act of 1868. I am striving to get a declaration from the electorate that this ought to be the policy of the Council. This demand is so moderate, so reasonable, so much in the interest of the public, as well as really less than justice to registered chemists, that if we force the claim by every means—and we have powerful means—at our command we are likely to be successful, because by this means we place the community, *i.e.*, the Government, into the position of either enforcing most apparent right, justice, and expediency, or the actual deliberate committing of flagrant injustice and confiscation. It is said that we must knuckle under, because, forsooth, we are but 15,000 in some 40,000,000. That statement I will not have at any price; it insults me as an Englishman; it insults Great Britain! The straight issue I mean is that the examinations so ably conducted by the Pharmaceutical Council shall have the corollary which alone can justify them. At present these examinations have not their necessary consequence, because they do not give exclusive right to the title and the exclusive responsibility of distributing scheduled poisons.

I have an abiding faith in pharmacy, because there is such scope, in my opinion, for natural development in a pharmacy resting on the foundation set in 1868. Common sense says it intended and should insist that the qualified person shall be distinguished, that he shall be associated with the handling of scheduled poisons, and that handling is more than the mechanical operation. In my view "pharmacy" is the drug trade not as it is, but as we all know it should be—the dispensing of medicine and the distribution of medicinal substances. Dispensing is by no means the principal factor in a rational pharmacy. Thousands of chemists understand me when I say that often more judgment, more trained intelligence, more power for good or ill can be brought into play by a three-penny sale than could be displayed in a good deal of dispensing. Let not this be taken to mean that I dream of confining the distribution of drugs, etc., to qualified people. I do nothing of the sort, first, because it is not desirable, and, second, because of its being contrary to English tradition; but what would be the effect of a proper footing? What would have been the effect of holding tight the principles of the 1868 Act, so that the legitimate person could be (1) distinguished and (2) associated with qualification and responsibility? The effect without doubt, in the light of all experience, would be that the practice of pharmacy would crystallise round the qualified chemist. My trade interests are my own affair and do not concern the members of the Pharmaceutical Society. If the Pharmaceutical Council became to any extent a trade union, the propriety of its administering the Pharmacy Acts would rightly be called in question. Here, then, we have a simple issue, and if any member of the Society sees difficulties which he cannot overcome, I shall be ready to address myself to them.

Blackburn, April 8, 1900.

R. LORD GIFFORD.

As one of the candidates for the approaching Council Election, perhaps it may not be out of place to ask your insertion of this communication, as showing my views—shortly, but I hope clearly—on current pharmaceutical topics. That which bulks most largely before pharmacists at the present time is Clause 2 of the Companies Bill, now before the House of Commons. I may say straight away, that I oppose that Clause as it stands for two reasons—1st. It proposes to do away with rights and privileges conferred by the 1868 Pharmacy Act—this being a distinct breach of faith which even the Legislature must not be allowed to perpetrate. 2nd. The Companies Bill is not the place to insert a clause bearing on pharmaceutical legislation. We want legislation badly enough, but we want something that will go a long way further than such a clause can give. We require an amended Pharmacy Act, what we should have had twenty years ago.

There is much in the present state of affairs which calls for improvement. I have long been of opinion that the Society, through its Council, has been too limited in its endeavours to cement the rank and file in one common bond. There has been a great want of unity among its members. The Society should be more than merely an examining and administrative body. It should look after those who pass its examinations representing and conserving trade interests, which it at present ignores. I am quite in favour of some suitable division of the qualifying examination. I am of opinion that chemists should be exempt from jury service, as the safety of the public can only be assured by the constant attendance of qualified men at their places of business. I think the financial affairs of the Society require careful looking into. In conclusion, I would just say that I do not put myself forward as a Scotch pharmacist, but as representing British pharmacists, and can lay claim to having a fairly wide knowledge of pharmaceutical affairs.

Glasgow, April 9, 1900.

WILLIAM L. CURRIE.

The issue of the coming election for the seven vacant seats in the Council is of such great importance to the whole body of chemists that it is to be hoped each member will weigh carefully the evidence

and decide whether he should vote for or against a change in the present Council. According to this week's Journal, ten new candidates offer themselves for the seven seats, and I think there should be no difficulty in making a judicious selection of at least four or five new members, who will be able to throw in their lot with the few progressive men we have at present on that body, and thereby bring about a welcome change in its administration and régime. It is not necessary to make a more than casual study of past work done by the Council to see that it would be decidedly beneficial for future legislation to all concerned if the present majority could in future act as a progressive minority. I hope that some concerted action will be taken to bring this about, as proposed in my letter of March 24, so that success may attend the efforts of those who, like myself, are impressed with its absolute necessity.

I used the words "apathy of the Council" in my last letter, which innocent remark brought down upon me an attack of a purely personal nature from a writer in the *Pharmaceutical Journal* who styles himself "An Ordinary Pharmacist," and although that attack is really unworthy of notice, I will for his edification presume to justify that remark by giving one instance. Twelve months ago a prominent member of the Council, speaking at our annual dinner at Burnley, said that the scheduling of carbolic acid was practically an accomplished fact, but to-day we know that it is as far off as ever. If the Council has wished to bring about this desirable end, its duty was to elicit the support and sympathy of the coroners and the medical profession. Its duty also was to agitate members of Parliament to persistently raise the question in the House and post such members on all cases of poisoning by carbolic acid, and especially where the sale was made by grocers and unqualified men. Had this course been adopted, I have no hesitation whatever in saying that carbolic acid would have been on the schedule years ago and scores of valuable lives would have been saved. But this progressive body contents itself with the manly effort of formally bringing the matter under the notice of the authorities every four or five years. This is one of the many sins of omission that are rousing members of the Society to action, and it is very evident, from the number of nominations this week and the numerous outspoken letters that appear regularly in the journals week after week, that this state of things, which has passively existed for the last twenty years, ought to be ended once and for all.

Burnley, April 9, 1900.

J. A. HEATON.

The Council and the Companies Bill.

Mr. Heaton's charge against the Council of "apathy, indifference and, perhaps, incapacity," has been well earned by the Council, and if there was no foundation for such a remark it is quite evident there would have been no occasion to refute it. One of the objects for which the Society was founded was to safeguard the interests of the trade. Had that been done in the manner it should have been done, unqualified company pharmacy would never have been allowed to exist. It is all very well for the Council to say that because it is not supported so well as it should be by the trade it cannot develop a better policy and stop the scandalous condition that competition in "pharmacy" has come to. It has been the Society's duty for the last twenty years or more to remedy the flaw in the Act that is powerless in this matter at present, and it is the duty that has been, invariably, year after year, put off for "want of support." It is absurd to suppose for a moment that the Government—which has imposed a standard of qualification, by dint of hard mental effort in securing the necessary diploma before a man can style himself a pharmacist or chemist and druggist, or practise as such—would not, if approached in the proper manner, defend such position, originated for the protection of the public. As worked at present, the Act is inoperative, as it allows a company of persons to sell and conduct the sale of medicines and poisons, whilst each separate member of such company under the same Act is debarred from so doing.

Where is the safety of the public safeguarded under such ridiculous conditions as this? As soon as this anomaly was found to exist, it

was, and still is, the paramount duty of the Society entrusted with the carrying out of the provisions of such Act to take the most energetic, persistent steps to remedy the matter. Yet it has been allowed to exist for so many years that the very persons who have filched the privileges of others now actually have the audacity to talk about their vested interests in the business. Can anything be conceived more barefaced in pharmacy than such effrontery as this? Why, the burglar who has had possession of stolen property for twenty years might as soon be expected to claim his vested interests. The sooner the Society wipes this slur off the annals of pharmacy the sooner will it have a claim to be supported as it should be by the whole trade. Until then, how can it expect the guineas and support from those who see their trade going to company pharmacy, and their interests not only not protected as they should be, but the pirates of pharmacy allowed to go on, year in and year out, defrauding them of their just rights? If the Council has not been apathetic and indifferent in this very definite issue, it has at all events shown itself completely incapable—else this grievance would never have been permitted to last as long as it has. The time, however, is coming when the anomaly must end. If members will only vote at each election for those candidates who will pledge themselves to do their utmost to make it illegal for persons to do what it is illegal for one to do, then, and not until then, will the public be protected properly and the proper status of the pharmacist be assured.

London, April 3, 1900.

C. E. PICKERING.

The Society's Library.

Would it not simplify the late hour Library question if masters would set their assistants free for an hour or so as occasion might require when literary work is in hand involving research? I am certain they would do this gladly. Masters themselves are in a position to consult their own convenience. Writers in general, including those whose studies lie in the direction of pharmacy, learn the management of time and accommodate themselves to circumstances. All arrangements are inconvenient to some. But surely it would be hard to condemn our small staff to prolonged and almost useless attendance in order to meet exceptional cases, or for the sake of the supposed visitor from the country who may be expected once or twice a year to consult the Library at the Square. Were I to narrate my own "after six" Library experience, the recital would verge upon the comic. I have constantly enjoyed the sole companionship of our admirable Librarian, whose patient courtesy is equal to his literary knowledge. To be correct, once or twice the porter made a third in the select circle when he brought up a fresh supply of coals. I was then lecturing to a night class at a college in Queen's Square. I venture to express the hope that the new Council will not allow the Library to drift once more into long hours and needless expenditure in the matter of gas and firing.

Acton, W., April 9, 1900.

JOSEPH INCE.

The Society and the Trade.

It has struck me as being rather singular that the Pharmaceutical Society has never issued a voting paper to all chemists on the Register, with the different suggestions that have been put forward in regard to limited companies. By so doing they would, I think, get to know the feelings of the trade in general. The list of members, unfortunately, is too small, and even if they all went for one thing, anyone could say that they did not represent the feelings of the trade in general, as out of over 15,000 registered men there are only between 5,000 and 6,000 members.

Rochdale, April 7, 1900.

H. WOODWARD.

Reflections and Questions.

Some time ago the formation of a Chemists' Club was suggested in your columns. The idea was certainly an excellent one, but, like many other schemes calculated to bring members of our profession into closer touch and to facilitate the opportunities of discussing

the many grievances of which we may justly complain, it seems to have died from the usual disease—apathy. When chemists will realise the necessity of asserting their rights and professional privileges by supporting the Society to a man, heaven only knows! It is a melancholy fact that less than fifty per cent. of qualified chemists and druggists associate themselves with the Pharmaceutical Society, and so long as these men are so dead to their sense of duty and so blind to the dignity of their responsible profession, so long shall interested persons be able to resist reforms by insidiously throwing dust into the eyes of the public, and so preventing them seeing the nature of that philanthropy that pays by selling "patent and proprietary articles" at cost price! This in some cases can be done after the interesting fact has been extensively advertised!

I have often heard the questions asked, "What becomes of all the drugs of lower grade sold by our brokers?" What proportion of sales is up to the B. P. standard? Can any one of your readers acquainted with the wholesale trade enlighten us? Another question I should like to ask is, "Do wholesale houses (or does any wholesale house, soliciting the patronage of chemists) prepare concentrated mixtures and supply dispensing doctors with the same?" I hope it is not possible that such a practice exists, but I would consider it a great obligation as a chemist in business, on behalf of all retail chemists, if the wholesale houses would answer this question in the columns of the *Pharmaceutical Journal*.

April 9, 1900.

M. P. S. (27/30).

Glaucium Luteum.

With regard to the letters by Messrs. Ashton and Johnson concerning the occurrence of *Glaucium luteum* in the south-east of England, I have found it in abundance between Dover and Folkestone, and also, but less frequently, at St. Margaret's Bay, about five miles to the eastward of Dover. It may be of interest to note that in neither of these situations is the soil in the least sandy, being in the first blue gault, a clay belonging to the lower division of the upper cretaceous rocks, and in the second chalk. It would therefore seem that Bentham and Hooker and John are somewhat misleading when they give sandy seashores as the habitat of the plant. On the other hand, I am bound to admit that the fugacious beauty under discussion finds herself more at home on the sandy erosions from the lower limestones than on the cold and clayey gault; but even this she prefers to the austere and meagre diet provided by the chalk.

Bridgnorth, April 7, 1900.

W. J. BROWN.

The Assay of Official Antimony Compounds.

My own experience confirms that of Mr. Allen with regard to the determination of the official antimonious compounds, and it has been my practice for some time to emphasise to my students the importance of having the solution cold before adding the sodium bicarbonate. Mr. Alcock's suggestion to use Rochelle salt is a distinct advance upon the present method in the case of the oxide, and it is to be hoped that the Editor of the B.P. will incorporate both improvements into the next edition.

Newcastle-on-Tyne, April 7, 1900.

FRANK R. DUDDERIDGE.

Gelatinisation of Tincture of Kino.

In the Research List of the British Pharmaceutical Conference (*Pharm. Journ.*, December 30, 1899, p. 628), kino is one of the subjects recommended for investigation. I am anxious to obtain some specimens of gelatinised tincture of kino, in order to hand them for examination to the gentleman who has consented to take up this subject. Will you kindly make known, through the medium of your valuable Journal, that any specimens forwarded to me will be gratefully accepted for this purpose.

17, Bloomsbury Square, W.C., April 6, 1900. E. M. HOLMES.

The Sale of Photographic Chemicals.

I was recently induced to take up photography as a profitable side-line. If it is to be one, I sincerely hope that the retail prices

for chemicals used by photographers quoted in last week's Photographic Supplement of the Journal are not universal. In going through the list I find that no less than fourteen are below London wholesale list prices, while nine are the same, and some others leave only a bare margin. I should like to learn, through the Journal, what are the usual charges made for chemicals used by amateur photographers.

April 9, 1900.

PHOTOGRAPHIC CHEMIST (27/29).

Kachin Developer.

We note in your last issue (Photographic Supplement, page 5) that you publish our formula for kachin developer, and in connection therewith state that this is nothing more or less than pyrocatechin. We must tell you that this is absolutely untrue, and likely to cause serious disturbance in our business. Will you be good enough, therefore, to withdraw this statement in your next issue? It is possible that you have made this mistake on account of the fact that we are the sole agents for Messrs. Ellon's developers, and sell pyrocatechin as well as kachin. The latter, however, is a distinct patent developer, and is not sold under any other name or by any other house. We would also state that kachin possesses all the good characteristics of pyrocatechin without its drawbacks.

London, April 9, 1900. JOHN J. GRIFFIN AND SONS, LIMITED.

* * * The statement in the Photographic Supplement was that pyrocatechin has lately been introduced on the market as "Kachin." According to Messrs. Griffin and Sons, however, that is incorrect, and we regret that the error should have appeared in the *Journal*.—[Ed., P.J.]

The Preliminary Examination.

I notice in last week's *Journal* that a resolution has been passed by the Forfarshire and District Chemists' Association "To memorialise the Pharmaceutical Council to consider the propriety of suspending the operations of the new regulations for the preliminary examination for a period, say, of five years, until the standard of secondary education has so advanced that youths may be more able to pass the higher examinations now proposed. Otherwise, chemists in country districts especially will have great difficulty in getting apprentices." I am quite prepared to admit there is at present a difficulty in obtaining apprentices, but I should like to ask our Forfarshire friends if they are quite sure—supposing the new regulations for the preliminary examination were suspended—the difficulty would be overcome? I think not. The average youth at fifteen years of age ought, with any middle-class education, to be quite able to pass such examinations as "Second College of Preceptors" or "Cambridge Junior" without very much exertion; and those who cannot, it is much better for them, and for the whole pharmaceutical fraternity, not to attempt to take up pharmacy at all. I quite believe it is such fellows as these—and these are the only ones that the new regulations will affect, who get through the whole or greater part of their apprenticeship before passing their "Preliminary," instead of getting thoroughly initiated with the "Minor" work—that cause our percentage in the "Minor" to be so low.

Leeds, April 9, 1900.

BEN. M. PRESTON.

EPICARIN.—This is a condensation product of creosotic acid and β -naphthol, claimed to possess all the medicinal value of β -naphthol, with the advantage of being easily soluble and relatively non-poisonous. It is an acid, and forms neutral soluble salts, whereas β -naphthol only forms alkaline salts. Epicarin occurs as reddish yellow powder, which dissolves easily in alcohol, in ether, and vaseline, and has a slight odour of acetic acid. In place of the free acid, the easily soluble sodium salt may be used. For treatment of scabies, prurigo, acute and chronic, eczema, Kaposi recommends a 10 to 20 per cent. ointment, or a 10 to 15 per cent. solution of epicarin. —*Oesterr. Zeits. für Pharm.*, 44, 125.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

PHARMACIST (S. H.—41/1).—The use of the title "pharmacist" is legally restricted to registered pharmaceutical chemists.

PRELIMINARY EXAMINATION (S. H. P.—41/7).—The certificate will not be accepted after August unless it covers the extra subjects. Why not register at once, and be done with it?

ARTICLES ON INCOMPATIBILITY (E. H. J.—41/5).—They have been reprinted by the author (see *ante*, p. 348), but we do not know whether copies of the pamphlet can be purchased. Apply to Dr. Walter Smith, 25, Merrion Square, Dublin.

SELF-GLAZING STARCH (G. and K.—40/24).—It is probably a mixture of borax and starch, say 1 part to 7, but you can easily determine that by analysis. An American formula for a similar preparation is: Stearic acid, 5; absolute alcohol, 5; wheat starch, 95. Melt the acid, add the alcohol, and triturate the mixture with the starch.

PHOTOGRAPHIC (J. S. W.—41/2).—We cannot afford space to describe the processes you mention. You can easily look the subjects up in an encyclopædia or other standard work of reference. The *Photographic Dealer* is published at 15, Harp Alley, London, E.C., monthly, price 2s. 6d.

FOREIGN PRESCRIPTION (W. E.—40/32).—The first ingredient in the prescription is "Saturatio Citrat. e Citro uno, 180.0," which, being put into English, means "The juice of one lemon neutralised (with sodium bicarbonate), and made up (with distilled water) to 180 grammes." A reference to Braithwaite's 'Pharmaceutical Formulary' would have given you the clue, a formula for a similar preparation—made with citric acid—appearing in that book.

PRINTERS' ROLLERS (F. J.—41/3).—Best glue, 11 lbs.; glucose syrup, 2½ gallons; glycerin, 12 fl. oz.; Venice turpentine, 2 oz.; water, *q.s.* Let the glue swell, with just sufficient water to cover it; melt with a gentle heat, add the glucose with constant stirring, then the glycerin and the Venice turpentine; evaporate with constant stirring until a little, when cold, sets to a firm, pliable, non-sticky mass.

MARKING INK (A. M. W.—40/33).—Silver nitrate, 1 ounce, sodium carbonate, 1½ ounce; dissolve separately in sufficient water, mix and collect the precipitate, wash it free from nitrate and rub while still moist with powdered tartaric acid, 90 grains. When effervescence ceases, rub the pasty mass with solution of ammonia, 6 fluid ounces; then add mucilage of acacia, 2½ ounces, simple syrup, 1½ ounce, liquid archil, ½ ounce. Mix thoroughly, and keep in well closed bottles, free from exposure to light. Of course, the writing with this ink requires to be developed by heating after the characters have been traced.

LIQUID CEMENT FOR CHINA (A.W.—40/34).—The ingredients you name would no doubt make a very indifferent cement, but it would not last. The "violet powder" is only used for the starch it contains, and is certainly not an ingredient in any of the pro-

prietary cements put up for sale. A better article is made by dissolving sheet gelatin or glue in strong (80 per cent.) acetic acid. Break up the gelatin into small pieces and cover it with the acid in a wide mouth stone jar; stand the jar in warm water and stir occasionally; when the gelatin has all dissolved, add just sufficient extra acid to give a thick pourable liquid while warm.

Information Wanted.

**The Editor will be obliged to any readers who can supply the information asked for by correspondents.

ACME BRAND CAMPHOR OIL.—Address of proprietors required?—(A. B.—41/6.)

PINOLENE.—Address of makers?—(R. D.—40/16.)

SULPHOCALCINE.—Particulars regarding liquid, supposed to be used as a vaginal injection?—(F. W. H.—40/8.)

EXTRACTS FROM CONSULAR REPORTS.

THE PRACTICE OF PHOTOGRAPHY is reported to be making headway among amateurs in the Bilbao district of Spain. Photographic goods were at first supplied by French houses, who were subsequently largely supplanted by the exertions of German agents who offered cheaper articles. British houses are stated to confine themselves to sending catalogues of their goods; there also appears to be an impression abroad that British photographic materials would be more expensive than German, and that cameras and plates would be made to measures different from those in current use.

FOREIGN OPIUM is rapidly ceasing to hold the important place which it formerly occupied among the imports of China. That fact is clearly shown by the appended comparative table of foreign opium imports at Wuhu during the years 1885-1898 which has been compiled by Consul Clennell. What is true of Wuhu is also the case in other parts of China, the present importation being, both in bulk and value, only about one-third of the usual average of not many years ago.

Year.	Quantity.	Value.
	Lbs.	£
1885	649,906	484,475
1886	779,728	652,223
1887	592,990	485,594
1888	464,668	388,836
1889	333,066	314,481
1890	342,279	279,869
1891	347,764	299,235
1892	349,395	274,944
1893	339,120	243,187
1894	385,746	225,617
1895	336,533	240,030
1896	280,733	221,575
1897	207,627	152,978
1898	226,747	162,289

Consul Clennell remarks that it would appear from the tabulated returns that the small increase in the import of the foreign drug in 1898 was more than covered twice over by a diminution of the import of native opium to about one-half of the figures for 1897, *i.e.*, to 50,301 lbs., valued at £18,448, instead of 104,548 lbs., valued at £37,847. But if the increase in foreign opium is no index of a real revival of that trade, neither is the diminished import of the native drug a sure indication of a lessening in the prevalence of the opium habit in the district. He regards it rather as a sign that opium grown locally, and consequently not passed through the Customs, is supplanting that brought from other and distant provinces, such as Szechuen.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, APRIL 14, 1900.

"LYING INNUENDO."

LANGUAGE less pungent than that used by Mr. R. LORD GIFFORD would be inadequate to characterise the tissue of unfounded insinuations against the Council of the Pharmaceutical Society, by which a trade journal seeks to foster various mischievous untruths, some relics of which may still float in the minds, or the vacua, of the uninformed and the misinformed. Such venomous explosions have become so habitual that reformation is probably as hopeless in that quarter as it is there thought to be necessary for the Council. But without attempting the superfluous task of defending the Council or any of its members, against either direct charges or veiled suggestions of neglect of duty, it will not be out of place to call attention to two facts which do not appear to have received consideration by those who are prominent in unmeaning denunciations which have not even the merit of being reasonably critical.

In regard to the attempted revival of the ancient fiction as to incompatibility of town and country chemists, the fact that thirteen members of the Council are engaged in business in various parts of the country should be a sufficient guarantee of proper consideration for the needs of the provinces. If that is not the case, and if, as is suggested, those country members have failed to carry out the original determination to serve the trade, which they are credited with, then the electors—whose anticipations are assumed to have been disappointed, owing to an alleged malignant influence of "Bloomsbury tradition"—are to blame that they have not availed themselves of constitutional means, at their disposal, to express their dissatisfaction and give effect to their desires.

The disingenuous complaint that the Council has not led in regard to the Companies Bill unfairly conceals the fact that the directly opposite views held by members of the Council have represented equal disagreement throughout the country. That circumstance has prevented any other representative action by the Council than the decision to oppose Clause 2, which has now been agreed upon, though it will most probably be

supported by some, for reasons that are different from, and to a great extent antagonistic to, the reasons actuating other opponents of the Clause. What possibility is there under such conditions for the Council, in its representative capacity, to take the lead or to indicate in detail a line of action? Is there any more probability that in regard to a Pharmacy Bill there would be greater agreement? Have not the "suggestions" been scouted by many chemists as well as by Mr. Boot, as representative of companies?

RICHARD REYNOLDS.

ON Thursday evening last week the close of an active and beneficent life, which had reached the normal limit, took place somewhat unexpectedly. Though such occurrences seldom cause disturbance of the general course of events, as is sometimes imagined must be a necessary consequence of the decease of anyone holding a prominent position, or who has been an influential actor in any phase of the great drama of life, those who have already become acquainted with the fact that RICHARD REYNOLDS is dead, as well as those who will first hear of it from this notice, will at least recognise, with profound regret, that a factor which has been potent, for the past fifty years, in the world of pharmacy has passed out of existence.

The first notification that Mr. REYNOLDS was suffering rather acutely from his old bronchial trouble reached the Journal office by post on Friday morning, about the time last week's issue was in course of delivery. It reported that at 5 p.m. on Thursday evening he was just a trifle better than he had been in the morning. But the delivery of that letter had been preceded by a telegram dispatched from Leeds at 8.24 p.m., by Mr. FRED REYNOLDS, stating that "My father passed away to-day."

It is proper in this place to speak of RICHARD REYNOLDS chiefly in connection with pharmacy. In that relation the important and useful influence he has exercised should be sufficiently within the knowledge of all members of the Pharmaceutical Society, if not of all persons engaged in business as chemists and druggists; not to require elaborate description on the present occasion. As a student in the Society's School he was distinguished in 1851 by outstripping his contemporaries and taking the first prizes in chemistry, pharmacy, materia medica, and botany. Entering business soon after as assistant to THOMAS HARVEY, of Leeds, the successor of WILLIAM WEST, F.R.S., he afterwards became a partner in the business, carried on under the style of HARVEY and REYNOLDS, until after the death of Mr. HARVEY, and when Mr. F. W. BRANSON became a partner; the firm known as REYNOLDS AND BRANSON has since been converted into a limited liability company within the last few years. At an early period Mr. REYNOLDS began to take an active part in pharmaceutical affairs; in 1863 he was elected a member of the Council of the Pharmaceutical Society, and continued to serve in that office until 1872. About the same period, in conjunction with BRADY, SCHACHT, and others, some of whom are still living, he directed attention to the necessity for systematic scientific enquiry in connection with the occupation of

pharmacy, by publishing in the *Pharmaceutical Journal* [2], iv., 504, a letter which led a few months later to the formation of the British Pharmaceutical Conference, of which REYNOLDS was for some years one of the Honorary Secretaries and, in 1881, President at the meeting in York. Another sphere of action connected with the business of chemists and druggists, in which Mr. REYNOLDS was a prominent participator, was the formation of the Chemists and Druggists' Trade Association at a trade conference held in Birmingham in 1876.

But important and influential as the work of RICHARD REYNOLDS has been in connection with the occupation in which he was chiefly engaged, there are various other relations in which he has been an active worker. He was an active participator in the promotion of scientific progress in Leeds, officiating as co-lecturer on chemistry with Mr. SCATTERGOOD at the Medical School, from 1861 to 1865. He also took part in the work which led to the foundation of the Yorkshire College at Leeds. In the early days he acted as honorary secretary of that institution; later he was a life governor, and for several years he had a seat on its Council. He was also for some time honorary secretary of the Leeds Philosophical and Literary Society, and, afterwards, one of its most prominent officers.

The funeral, which took place last Monday afternoon at the Friends' Burial Ground, Adel, was very numerously attended by representatives of many public bodies with which the deceased had been associated, and by many public men, as well as by the members of the family, and by about sixty employees of the firm. The coffin bore the simple inscription—RICHARD REYNOLDS, died 5th of 4th month, 1900. Aged 76.

THAT BLESSED WORD "UNANIMITY."

It has for years been a standing grievance with certain opponents of the Pharmaceutical Society and irresponsible critics of its Council that the executive body has been unanimous on so many subjects, and particularly in most matters of any serious importance. To-day, however, the cry of the same critics is different and, unanimity being non-existent on the most important subject that has presented itself for consideration during the past twenty years, the electors are being urged to thrust from the Council men who have served them well for many years, and to replace them with believers in the efficacy of a "wonderful panacea."

That is to say, because certain members of the Council are not disposed to trust in the efficacy of the qualified directorship proposal as a remedy for all the ills that pharmacy is heir to, they are to be compelled to make way for individuals possessing greater faith in the virtues of the supposed panacea. The members of the Society may or may not see matters in the same light as the supporters of the qualified directorship proposal. It may not be unprofitable, however, to direct their attention to the fact that, in certain quarters, what was regarded as a vice a few short months ago is now considered a virtue, the unanimity which was formerly so strongly denounced being now in extremely great demand in the same quarters; so much so, in fact, that it is to be secured by force if necessary—and if feasible.

ANNOTATIONS.

EVENING MEETING IN EDINBURGH.—A meeting of the Society will be held at 36, York Place, Edinburgh, on Wednesday next, April 18, at 8.30 p.m., when Mr. Archibald Currie will contribute some dispensing notes on (a) Solution of Arsenic and Iron Wine, and (b) Glycerin of Codeine. The Assistant Secretary will deal with a dispensing query relative to copper in a mixture. Mr. Peter Boa will take the chair punctually at the hour named.

SUPPLEMENTING A FURTHER COMMUNICATION on the "feeler" for opinion that necessity exists for "securing the return of at least three or four new members to the Council," Mr. Heaton laments as "very unfortunate that letters of this kind should be held up in pious horror by the *Pharmaceutical Journal*, and he complains "that members who are endeavouring to assist useful work by honest criticism should be subjected to virulent attacks of a purely personal nature." Perhaps Mr. Heaton must be understood to consider the project referred to in his first letter as "useful work," and his remarks at page 317, the "honest criticism" suitable to assist such work; but he appears to have overlooked the possibility that both may be regarded in a very different light by others who have, at least, as much right to express their views and to exercise criticism. When, therefore, he finds himself almost driven, as he puts it, on serious reflection to ask the question, Does the *Pharmaceutical Journal* exist for the Society or is the Society run in the interests of the Journal? some consolation still remains in the probability that there may be opinions different from those of Mr. Heaton, although he volunteers his own assurance that "our boasted *Pharmaceutical Journal*" as a "result of a too zealous attachment to outworn and discredited creeds," has "fallen from its former high estate," both "as a medium for useful work and benefit to the members of the Society, and as a representative journal."

THE CONFERENCE ARRANGEMENTS for the 1900 meeting have now assumed definite shape, a report presented by the Executive Committee at a meeting held on Tuesday last (see p. 404) supplying sufficient details to enable readers to form a fairly clear idea of the programme for the last week in July. One of the most satisfactory points in the report is the announcement that the Whitehall Rooms, Hôtel Métropole, London, have been secured for the presidential reception, and for the concert and dance which it is proposed to hold at the close of the sessions of Conference. There is also to be an afternoon reception at the Botanic Gardens, Regent's Park, and the whole-day excursion will take the form of a river trip from Henley to Maidenhead. The business meetings will be held in the Pharmaceutical Society's House, 17, Bloomsbury Square, luncheon being served each day at the Holborn Restaurant, and Mr. Richard Bremridge has kindly offered to place his residence in Great Russell Street at the service of ladies attending the meetings. The Entertainment Fund at present amounts to nearly three hundred and fifty pounds, but the Hon. Secretary intimates that more will be required. Chemists in the London District who have not yet sent in their names as subscribers are, therefore, requested to do so. No individual may contribute more than two guineas to the Fund, and firms are limited to a maximum of five guineas. All communications should be addressed to Mr. William Warren, 24, Russell Street, Covent Garden, W.C.

THE BRISTOL PHARMACEUTICAL ASSOCIATION is issuing a circular to the registered chemists of neighbouring towns, directing attention to the urgent need that exists for all retail chemists to become associated with some local organisation. It is pointed out that, as individuals, chemists can do less in their own defence than as members of an organised body, especially in the direction of

influencing members of Parliament. It is suggested, therefore, that the chemists residing in Bath, Clevedon, and Weston-super-Mare should join the Bristol Association, and that the name of the united body should be changed so as to include the whole district. Further, it is proposed that the newly-constituted association should be somewhat peripatetic in character, meetings of all members being held in each town represented not less than once a year. At Bristol, as elsewhere, it has been found highly advantageous to have occasional social and business meetings, and it is thought that still greater benefit might accrue if other chemists in the wider district referred to could sometimes meet each other and their Bristol friends to discuss matters of general interest. The subject will probably be considered at the annual dinner of the Bristol Pharmaceutical Association, which is to be held on Wednesday, April 25.

SIR ANDREW DOUGLAS MACLAGAN, whose death occurred on Thursday, April 5, at Edinburgh, was the senior Honorary Member of the Pharmaceutical Society, having been elected as far back as 1852. He was born at Ayr in 1812, his father being Dr. David MacLagan, who had served with distinction in the Peninsula War under Wellington, and was subsequently Physician to the Forces and Surgeon-in-Ordinary to the Queen. Young MacLagan was educated at the Royal High School, Edinburgh, and at the University of that City, taking his diploma as a licentiate of the Royal College of Surgeons, Edinburgh, at the early age of nineteen years, whilst a year later he became a Fellow of the College and took his M.D. degree. Subsequently, he studied medicine in Berlin, London, and Paris, devoting special attention, such as is now rare amongst medical men, to the subject of *materia medica*. He was appointed lecturer on that subject to the Royal College of Surgeons, a position which he occupied for fourteen years. He was also a Fellow of the Royal College of Physicians, Edinburgh, and at one time President of that body, as well as of the Royal College of Surgeons.

A FINE SERIES OF SPECIMENS of *materia medica*, collected by Sir Douglas MacLagan, is now in the Pharmaceutical Society's Museum at Edinburgh, having been purchased from the widow of one of his successors in the post of lecturer on that subject. Many other specimens, presented to the Museum by Sir Douglas, serve to show the great interest he took in the Pharmaceutical Society. He read papers at its Evening Meetings, was nominated by the Executive of the North British Branch as a member of the Edinburgh Committee for preparing the first British Pharmacopœia, and acted as Government Visitor to the Society's Examinations in Edinburgh for a number of years, retiring in 1897. He was an ardent advocate of a compulsory curriculum for pharmaceutical students, and of the use of the microscope in the practical part of the Minor and Major examinations. He was an accomplished botanist, for many years held the office of Hon. Secretary to the Botanical Society of Edinburgh, was an Hon. Member of the Royal Medical Society, Edinburgh, and Emeritus Professor of Medical Jurisprudence and Public Health in the University. He held the honorary degree of LL.D. of both the Universities of Glasgow and Edinburgh, and received the honour of knighthood in 1886. At the funeral, on Monday last, the Pharmaceutical Society was represented by Mr. Peter Boa, Chairman of the Executive of the North British Branch.

THE COUNCIL ELECTION this year appears likely to be memorable because of an attempt to bring trade influences to bear in the contest, upon somewhat novel and yet very old lines. Such, at least, is what may be gathered from the facts supplied by "An Ordinary Pharmacist" in this week's issue. The information he

gives, which seems to be well authenticated, is to the effect that a private meeting has been convened by Mr. Glyn-Jones with the express object of selecting candidates to replace certain of his colleagues on the Council of the Pharmaceutical Society. Apparently the meeting has been held, but particulars of what took place there, beyond the fact that four candidates were selected, had not been received at the time of going to press—earlier than usual, as it happens, this week. Neither was any confirmation forthcoming of the suggestion that trade journals and a purely trade organisation might be expected to take a more or less active part in the coming struggle. If such should prove to be the case, it may be taken for granted that the action will be strongly resented by a considerable section of the Pharmaceutical Society, as was the interference of the Anti-Vivisection Society, and of the Chemists and Druggists' Trade Association many years ago. In connection with the last-named organisation it is interesting to refer to the vigorously worded letter in which the late Richard Reynolds responded to a summons to a meeting of a sub-committee "appointed to consider the advisability of the Association taking official action in the next election of the Pharmaceutical Council." Not only did he decline to act on the sub-committee, but he pointed out so clearly what mischief might result from the interference of another association in the Council elections of the Pharmaceutical Society, that the idea was promptly dropped, and the suggestion never renewed.

DISPENSERS IN NAVAL HOSPITALS are affected by a recent Treasury letter which provides that the age of dispensers on entry shall not be less than twenty-one or more than twenty-eight years. Candidates must hold the Major or Minor qualification of the Pharmaceutical Society of Great Britain or the licence of the Pharmaceutical Society of Ireland. Entry into the service will be by limited competition, conducted by the Civil Service Commissioners, but all applications should be addressed to the Director-General of the Medical Department of the Navy, Northumberland Avenue, W.C., who will select the candidates for examination. Dispensers will be required to serve in any naval hospital to which they may be appointed, either at home or abroad. The pay is £110 per annum on entry, rising by £5 biennially to £130, and thence by £10 biennially to £230. Free quarters will also be provided, and dispensers will be entitled to pensions. If in charge of stores, they will be granted additional allowances of £20 to £40 per annum, and if serving abroad, further allowances will be made to meet the increased cost of living. Dispensers are granted twenty-eight days' annual leave, exclusive of Sundays, those serving abroad being allowed to reserve it from year to year, so as to obtain a lengthened period of absence, but the reserved leave shall not in any case exceed six calendar months. Sick leave may be granted for six months on full pay, but subsequently half-pay only will be allowed. Three months' notice must be given if a dispenser desires to resign his appointment. The establishment at home and abroad includes sixteen dispensers, including one each at Haulbowline, Chatham, Cape of Good Hope, Jamaica, Bermuda, and Hong Kong, two at Malta, three at Plymouth, four and a supernumerary at Haslar. The conditions of service are considerably improved under the new arrangements, as will be seen by comparing the foregoing particulars with those given in the Calendar of the Pharmaceutical Society for the present year, and credit for that improvement is due to Mr. Walter Hills for the action taken by him during his term of office as President of the Society.

AN INTERESTING CASE has been before the Courts, in which Messrs. Boots, the self-styled "cash chemists," Lancashire, Limited, proceeded against Messrs. Grundy and others, the point raised being whether the plaintiffs' statement of claim, in which they asked for an injunction restraining the defendants from en-

deavouring to induce others to boycott them, disclosed any ground of action. It was alleged that a circular had been sent out by the defendants, addressed to print-sellers throughout the country, directing attention to the fact that Messrs. Boots, as well as stores, drapers, and others, were being supplied with prints at half price. That was considered to be unfair to the print-selling trade, in view of the fact that those buyers sold the prints to the public at twenty-five per cent. off the published prices, and advertised that fact. The alleged circular suggested that print-sellers should abstain from doing business with publishers who sold their prints to the persons referred to, so that by their combined action underselling might be mitigated, if not entirely prevented. Judgment was reserved, and will be looked forward to with interest by chemists as well as other traders.

THREE CANDIDATES FOR THE COUNCIL have sent what are virtually election addresses for publication in this week's Journal—Messrs. Taylor, Gifford, and Currie. Mr. Taylor approves of out-and-out opposition to Clause 2 of the Companies Bill, since he thinks there is little chance to amend it satisfactorily. And though he recognises that it may be long before there is another opportunity of legislating on the subject, he thinks that the possible interval need not necessarily be wasted. He is naturally of opinion that he has something better to offer than those candidates who are standing for re-election. To quote his own words, his policy is "to bring the Society into touch with the full ranks of pharmacy, to utilise the Pharmacy Act as well for the trade as in the interests of the public, and to throw all the weight of an organised trade into the scale when commercial interests are in question." Mr. Gifford very sensibly asserts that his trade interests are his own affair, and do not concern the members of the Pharmaceutical Society. His policy is "the making operative of the Pharmacy Act of 1868," a thing which many pharmacists had innocently, but perhaps mistakenly, assumed to be already done. Mr. Currie would also oppose Clause 2 of the Companies Bill as it stands, and his policy is to attempt to secure "an amended Pharmacy Act" which should, in his opinion, go a long way further than any clause in a Companies Bill.

ANOTHER CANDIDATE has communicated a letter which serves as a good example of the necessity that may exist for gaining sound information on a subject concerning which one proposes to write. Mr. Pickering is unfortunate in his advocacy of Mr. Heaton and hardly justified in assuming that "if members will only vote at each election for those candidates who will pledge themselves to do their utmost to make it illegal for persons to do what it is illegal for one to do, then, and not until then, will the public be protected properly and the proper status of the pharmacist be assured." How the election of only such candidates as will give that pledge could produce so great an effect is not explained, though the explanation is sadly needed. Possibly, however, that may be forthcoming when Mr. Pickering issues his election address, which, he intimates, is now in course of preparation. It would be interesting also if he would explain in what respect the Pharmaceutical Society has failed to safeguard the interests of the trade, how such failure has enabled company pharmacy to exist, and in what manner he would propose to deal with the Government if it declined to defend the position he refers to.

WE REGRET that an article on "Student Life in the Latin Quarter," which appeared in the *Pharmaceutical Journal*, of February 24 last, should not have been duly acknowledged as copied from the *English and American Gazette*, in which paper it was published originally. The article was sent in as an original communication, by a regular contributor in whom the Editor had been accustomed to repose full confidence. Unfortunately, that confidence has been abused and an apology is hereby tendered to the editor of the *English and American Gazette* for the apparent discourtesy.

ENGLISH NEWS.

BRITISH PHARMACEUTICAL CONFERENCE (EXECUTIVE COMMITTEE)—A meeting was held at 16, Bloomsbury Square, on Wednesday, April 4. Present:—Mr. E. M. Holmes (President) in the chair; Professor Atfield, Messrs. Atkins, Symes, Hills, and Harrington (Vice-President), Professor Greenish, Messrs. Bird, White, Atkinson; Messrs. Warren and Cracknell (Hon. Local Secretaries), Mr. J. C. Umney (Treasurer), Messrs. Naylor and Ransom (Hon. General Secretaries), and Mr. Nightingale (Assistant Secretary). Letters expressing regret at their inability to be present were read from Messrs. Moss, Bowen, and Collier. The minutes of the previous meeting were read and confirmed. The President introduced the question of a proposed Conference Scholarship for the promotion of pharmaceutical research. After considerable discussion it was decided to postpone the consideration of the subject until the next meeting of the Executive. The President also announced that he had, on behalf of the Committee, caused to be sent to all members of the Society of Public Analysts, a circular note inviting them to join the Conference. On the recommendation of the Local Committee, the date of the commencement of the London meeting of the Conference was definitely fixed for Monday, July 23. The following thirty-nine gentlemen, having been duly nominated, were elected to membership:—

Bell, Peter, Newcastle-on-Tyne;	Peters, G. H., London;
Bevan, E. J., London;	Phillips, J., Ashton-under-Lyne;
Birkbeck, J. T., Lincoln;	Pollard, H. H., Ryde;
Boardman, F. J., Leigh (Lancs);	Power, Dr. F. B., London;
Candy, Hugh, London;	Priest, Martin, London;
Chambers, J. W. P., West Bridgford;	Riddell, J. H., Glasgow;
Collen, W. C., London;	Rogers, F. A., London;
Cresswell, F., London;	Sargeant, F. Pilkington, Leeds;
Dampney, R. S., London;	Sargent, G. A., London;
Edmunds, J. M. D.	Selley, J., London;
Gilmour, J. P., Glasgow;	Smith, J. H., London;
Hartridge, J. Hills, Hendon;	Stamp, F. A., London;
Hodgkinson, G. A., London;	Storey, E. H., London;
Jeans, A., Manchester;	Turner, J. W. J., Sheffield;
Knott, P., Bolton;	Walmsley, G., Kingston;
Muter, A. H. M., London;	Wigginton, A., London;
Muter, Dr. John, London;	Williamson, F. A., Preston;
Naysmith, A., Arbroath;	Woodward, H., Mellor, Reigate;
Oxen, D. H., Newcastle (Staffs);	Wootton, H., London.
Parsons, W., Blackheath;	

BRITISH PHARMACEUTICAL CONFERENCE (LONDON COMMITTEE).—The General Committee appointed to make arrangements for the London meeting of the British Pharmaceutical Conference, to be held in July next, met at 16, Bloomsbury Square, W.C., on Tuesday, April 10, to receive the report of the Local Executive Committee. Mr. Michael Carteighe, Chairman of the Committee, presided, and there was a representative attendance. The Hon. Secretary, Mr. Wm. Warren, having read the minutes of the previous meeting, which were confirmed, communicated the Executive's report, which was to the effect that having failed to come to a satisfactory arrangement with the proprietors of the Hotel Russell, in regard to accommodation for the headquarters of the Conference, the Secretary, accompanied by Mr. R. Bremridge, had interviewed the managers of the Hôtel Métropole, and, subject to the approval of the Committee, had secured the Whitehall suite of rooms there. The proposed programme was as follows:—Monday evening, July 23, a reception in the Hôtel Métropole; Tuesday, July 24, President's address and the usual business, followed in the afternoon by a reception in the Botanic Gardens, Regent's Park; the evening to be devoted to private hospitality and in visiting various places of amusement; Wednesday, July 25, Reading of Papers, and in the evening a high-class concert at the Hôtel Métropole, followed by a "smoker" and dance; Thursday, July 26, Party to assemble at Paddington, whence by special train to Henley for a day on the river—Henley to Maidenhead—a light lunch to be provided en route, and an evening meal at "Skindles," Maidenhead Bridge, party returning to Paddington by special train from Taplow.

It was also mentioned that arrangements had been made for luncheon on Tuesday and Wednesday in the King's Hall, Holborn Restaurant. With regard to a Ladies' Committee, it was proposed to leave that to be appointed later, in the meantime it might be mentioned that Mr. Bremridge had kindly placed his house at the service of lady visitors to the Sessions of Conference, and his daughters would be prepared to receive them.—Mr. W. A. H. Naylor said he was particularly pleased with one part of the report. That was the proposed concert on the Wednesday evening. He had long felt that the smoking concerts usually held had not been of the dignified character that members of the Conference could have desired, hence he was extremely glad that the Local Committee had seen its way to that departure, which he believed would be a great success. He had pleasure in proposing the adoption of the report.—Mr. Peter MacEwan, in seconding the motion, asked what time was to be allowed for luncheon? He thought the time usually allowed was rather too short.—Mr. Carteighe: About an hour.—Mr. MacEwan then suggested that tea should be provided for the ladies on the Wednesday afternoon at the Society's House.—This was approved, and the report and recommendations were then unanimously adopted.—In reply to a question with regard to the river excursion, Mr. Carteighe said it was not proposed to engage steam launches, as it was thought to be much more enjoyable to drift quietly down that most beautiful part of the river in large well-fitted barges—such as were used by the Oxford Universities—without the noise, bustle, and smoke of the steam launch. He also stated that arrangements would be made to have conveyances for the ladies from the train to the river and *vice versa*.—The Secretary mentioned that they had now £330 towards expenses generally; while the Committee was not pressing urgently for funds, more would be needed, and they would be very glad to receive further subscriptions.—The meeting then adjourned.

CHEMISTS' ASSISTANTS' ASSOCIATION.—The last meeting before the Easter vacation was of a musical and social character, held at 73, Newman Street, on Thursday, April 5. There was a fair gathering of members, but not nearly so large as had been expected by the committee, who provided a programme of unusual excellence. The chair was taken by Mr. William Warren, member of the Council of the Pharmaceutical Society, and a very hearty vote of thanks was conveyed to him on the motion of the President. Mr. Warren, in replying, touched on the existing difficulties in the political situation and expressed his great pleasure at being present. The following gentlemen took part in the programme: Songs by Messrs. C. J. Strother, C. Morley, Marcus, Victor Blin, J. S. Barker, H. A. Martin, and A. Latreille; violin solos by Mr. H. Hymans; pianoforte selections by Mr. W. Neale Ellis; recitations by Mr. T. Morley Taylor. The duties of accompanist were efficiently performed by Mr. Ellis.

ROYAL INSTITUTION.—The following are the lecture arrangements at the Royal Institution, after Easter:—Dr. Hugh Robert Mill, three lectures on Studies in British Geography; Dr. Alexander Hill, two lectures on "Brain Tissue considered as the Apparatus of Thought"; Mr. R. Warwick Bond, two lectures on (1) "Ruskin, Man and Prophet," (2) "Ruskin, the Servant of Art"; Professor Dewar, four lectures on "A Century of Chemistry in the Royal Institution"; The Rev. Canon Ainger, three lectures on "Chaucer"; Professor Stanley Lane-Poole, two lectures on "Egypt in the Middle Ages"; Dr. Alfred Hillier, two lectures on "South Africa, Past and Future"; Sir Frederick Bridge, three lectures on "The Growth of Chamber Music from Allegri's Symphonia (1580-1652) to Haydn's First Quartet" (with musical illustrations). The Friday evening meetings will be resumed on April 27, when a discourse will be given by the Right Hon. Lord Kelvin on "Nineteenth Century Clouds over the Dynamical Theory of Heat and Light."

THE SACCHARIN PATENTS.—On March 27 the case of the Saccharin Corporation, Limited, *v.* The Anglo-Continental Chemical Works, Limited, and Robert Reitmeyer, was commenced before Mr. Justice Buckley in the Chancery Division of the High Court. This was an action for an injunction to restrain alleged infringement of Monet's patent for the manufacture of saccharin, which was owned by the plaintiff company. The defendants denied infringement, and alleged the patent was invalid by reason of anticipation. Mr. Fletcher Moulton, Q.C., M.P., Mr. Cripps, Q.C., M.P., and Mr. Graham and Mr. Colefax appeared for the plaintiffs; Mr. R. Neville, Q.C., Mr. Roger Wallace, Q.C., Lord Robert Cecil, Q.C., Mr. A. J. Walter and Mr. Bucknill for the defendants.—Mr. Moulton explained that the Saccharin Corporation possessed substantially the whole of the letters patent by which saccharin was manufactured, but by arrangement this case proceeded only on Monet's patent. That patent had already been under judicial decision before Mr. Justice North in an action by the Saccharin Corporation against the Chemical and Drugs Company. Infringers of these patents had found it wiser to create bogus companies for that purpose than to take individual responsibility. The Chemical and Drugs Company which fought a spirited action in a spirited manner had, he believed, only a paid-up capital of seven shares of £10 each. The person who was the active agent there was Mr. Robert Reitmeyer, who was managing director of the defendants, and was also a defendant in the action. After the former action had gone a certain distance against the Chemical and Drugs Company that company liquidated, and sold all its business to the Anglo-Continental Chemical Works, Limited, the present defendants. It was not denied that there had been infringement, but the validity of plaintiffs' patent was contested. The action resulted in establishing validity, and no funds being available to pay plaintiffs' damages, Mr. Reitmeyer went on as usual; this time under the name of the Anglo-Continental Chemical Works, Limited, which had, he believed, a nominal capital of about £4,000. As the defendants had been importing saccharin without any indication or mark as to its source of origin, the onus was on plaintiffs to prove that its manufacture was an infringement of plaintiffs' patent, and he would call evidence to that effect.—Next day a number of professional witnesses were called to prove plaintiffs' case. For the defence it was admitted the saccharin imported by defendants was manufactured at the Basle Chemical Works, but they said there was no infringement of Monet's patent; the process was different.—Mr. Mark Romer, for the defendant, Robert Reitmeyer, submitted his client could not be held personally liable for the alleged infringement, because he only acted as manager. There was not a word of truth in the suggestions made by Mr. Moulton that his client was the active agent in the Chemical and Drugs Company action. He had no connection or interest in that matter, as the company was merely one of his customers, and he took no part in the litigation.—The hearing of the evidence and arguments was concluded on Friday, March 30, and his lordship reserved judgment.—On April 6 Mr. Justice Buckley gave judgment. He said when the question of the validity of Monet's patent was before Mr. Justice North in December last, it was decided that the process described in that patent was sufficient subject matter for a patent, and Mr. Justice North granted an injunction to restrain infringement, and certified the validity of the patent. He had simply to follow up Justice North's decision in that respect. It remained for him to determine novelty, as far as it was open, after Justice North's decision and anticipation. As to the question of novelty and anticipation he held that the defendants had not made out their case. With reference to infringement it appeared to him both the company and Mr. Reitmeyer were responsible for that, and that the saccharin manufactured by the Continental Company were infringements of Monet's patent. Therefore, plaintiffs were entitled to an injunction against defendants, and an inquiry as to damages, with costs.—Execution stayed, pending an appeal.

IRISH NEWS.

DEATH OF MR. R. J. DOWNES.—At a meeting of the Council of the Pharmaceutical Society of Ireland, held on Wednesday, April 4 (reported in this week's issue), a letter was received from Mr. R. J. Downes, ex-President of the Society, resigning, on account of ill-health, one of the positions held by him as a member of the Council. Since then Mr. Downes has died, and on Monday last, April 9, his remains were laid to rest at Mount Jerome. The large and representative *cortège* testified to the great respect entertained for the deceased. Amongst those present were Rev. R. W. Landey, Rev. T. P. Landey, brothers-in-law; T. Bible, Esq., J.P., Cork; Rev. J. Stuart Long, Rev. C. B. Dowse, A.M., Rev. H. E. Patton, A.M., Alderman Ireland, J.P.; Wm. Spence, C.E., Goods Superintendent, G.S. and W.R.; Messrs. C. Ashenurst, L. Murphy, W. arey, R. S. Webster, D. P. Curtis, C. B. Carey, H. Bowden, John Gardiner, J. H. Bowden, H. J. Owgan, J. Hall, J. R. Middleton, W. Dawson, and G. Collins (of Messrs. Casey and Clay). The following represented the Pharmaceutical Society:—Messrs. G. D. Beggs, P.P.S.I.; J. I. Bernard, V.P.P.S.I.; Chas. Evans, Dr. Tichborne, and W. F. Wells, Ex-Presidents; W. D. Porter, P. Kelly, R. Simpson, and James Michie, members of the Council; Messrs. Henry O'Connor, W. V. Johnston, J. S. Ashe, J. Smith, H. Conyngham, H. S. Misstear, members of the Society; Mr. A. T. Ferrall, Registrar. The following represented Royal Arch Chapter, 245:—Messrs. R. Marchbanks, K.; Justin McCarthy, P.K., Registrar; J. Gibson, P.K., Treasurer; J. Gardiner, P.K.; Alderman Ireland, J.P., D. P. Curtis, W. Spence, P.K., C.E. The Revs. C. B. Dowse and H. E. Patton officiated. Messrs. Gerty and Rorke had charge of the funeral arrangements.

PHARMACEUTICAL SOCIETY OF IRELAND.—The monthly meeting of the Council was held on Wednesday, April 4, at the Society's House, 67, Lower Mount Street, Dublin, the President, Mr. George D. Beggs, in the Chair.—A draft address to the Queen on the occasion of Her Majesty's visit to Dublin was approved. A letter was then read from the Under Secretary, Dublin Castle, stating that the Lord Lieutenant having considered the memorial of James White, of Castleblancy, for the remission of a penalty of £5, which had been imposed on him for an illegal sale of a poison, and also the observations from the Council thereon, had decided that the law should take its course. A letter has also been received from Mr. R. J. Downes, ex-President, stating that he felt obliged, on account of his health, to relinquish his position as representative of the Council at the Conference of the British Pharmacopœia Committee of the General Medical Council.—Mr. Tate moved that Mr. Downes be requested to reconsider his decision.—Mr. Kelly seconded the motion, which passed unanimously.—A letter from the Lancaster and Morecambe Chemists' Association relating to the Companies Bill at present before Parliament was referred to the Law Committee.—Dr. Ninian Falkiner sent a letter resigning his position as Lecturer for the Society in Materia Medica and Botany. He mentioned that he had been appointed Medical Superintendent in the office of the Registrar-General, and expressed his thanks to the Council for the courtesy and support they had extended to him in connection with the discharge of his duties.—The resignation was received with regret, and it was agreed that Mr. Henry O'Connor be continued as Lecturer in Materia Medica and Botany until the end of the current session, and that advertisements be published for a successor to Dr. Falkiner.—The resignation of Dr. M. A. Whitla as Examiner in Pharmacy was also accepted, and it was ordered that advertisements be inserted for a successor to him. A donation had been received from the Pharmacy Board of Victoria of a copy of their Register for 1899, and on the motion of Mr. Jameson thanks were voted to the donors.—Other business having been disposed of the Council adjourned.

BRADFORD CHEMISTS' ASSOCIATION.

The annual dinner of this Association was held at the County Restaurant, Bradford, on Tuesday, April 9, Mr. R. W. SILSON in the chair. There was a good attendance of members and friends. After dinner, the toast of

THE PHARMACEUTICAL SOCIETY

was proposed by Mr. WORFOLK, who said he had been told that the less a man knew about the subject the better he was equipped to propose the toast. If that were so, he was hardly the man for the purpose, because he had taken a great interest in the Society, and had followed its proceedings carefully. When they were disposed to criticise the Society, they should remember that the Council was elected by them, and that it was their duty to send men who would represent their views. Although the Society might not have done all that they could have wished, that might to some extent be their own fault. He was glad to see that Clause 2 of the Companies Bill would be dropped, and hoped that the Society would push on with a new Pharmacy Bill for the protection of the interests of chemists and for guaranteeing the safety of the public.

Mr. PICKARD responded. He said the Society might have shortcomings, but it had acted according to the intentions with which it had been formed. People who knew the history of the Society could only say that it had done a great deal of useful work. It had been greatly abused in the past, but he hoped that they had reached a new era in respect of that matter, and that most chemists now recognised that the more they knew about the Society the better. Its policy with regard to examinations he thought was decidedly designed to do good to the chemists. At the time when the Bradford Association was formed little was known of the Pharmaceutical Society, but since then they had received great assistance in the putting down of a great deal of illegal trading, and now they knew a great deal more about it and had a good deal more appreciation of it. He thought that the action of the Society had taught the Lord Chancellor a considerable lesson in regard to the Companies Bill. He wished that more members of the Society would put their shoulders to the wheel and help to make the Society stronger instead of doing nothing but grumbling. Clause 2 of the Companies Bill was an iniquitous clause which would never have been put into the Bill if chemists had been stronger and more combined years ago. The sole cause of all the controversy which was now taking place with regard to the Pharmaceutical Society was the indifference of members. In a good many instances those who criticised the Society most would be found to be those who were least qualified to criticise because of their own ignorance of pharmacy. Out of 15,000 chemists registered at the present time there were only about 6,000 who supported the Society, despite the great efforts which it was continually making on behalf of the trade. If chemists would only be united, they could not only get their rights under the 1868 Act, but could go a step further and demand a new Pharmacy Acts Amendment Act.

Mr. EDWARD EVANS, jun., proposed

THE BRADFORD AND DISTRICT CHEMISTS' ASSOCIATION.

Speaking as the son of one who was one of the founders of the Pharmaceutical Society, and was to-day the senior member of that body, he quite agreed with the views expressed by Mr. Pickard. They were all the better in many ways for association, and he felt that, as a certain amount of qualification was demanded from them, they were entitled to such protection as the Pharmaceutical Society suggested. At the same time they should be careful to ask for legislation from the point of view of its need in the interests of the public rather than from the trade point of view. They would be aware that in certain directions great advantage was being taken at the present moment of the observations which fell from speakers at such trade gatherings as that, and those were being used to the disadvantage not only of the qualified chemist, but also of the

public. He was of the opinion that every trade in every city or town ought to have such an association as that of which those before him were members, if only for the sake of the development of that feeling of brotherhood which did so much to diminish the friction which might otherwise exist. He believed that, in spite of all that was said about the irregular competition of the time, there would always be in the case of a competent chemist an individuality which would be considered by the public and would enable him to earn a very respectable living. He heartily wished success to the Association and to chemists throughout the country, if only because it was by them that he lived and moved and had his being.

The CHAIRMAN having responded to the toast, and other toasts having been honoured, the speech-making ended. The speeches were interspersed with songs rendered by members.

BURNLEY AND DISTRICT CHEMISTS' ASSOCIATION.

On Tuesday, April 10, the annual meeting of this Association was held at the Bull Hotel, Burnley, Mr. J. A. HEATON, President, in the chair.

Mr. BROWN submitted his report as Secretary. This was
THE FIRST ANNUAL REPORT,

the Society only being one year old. He remarked that the meetings, except the general meetings, had been fairly well attended. The work they had taken in hand had been well carried through. Their first work was the opposition to the Companies Bill of last session. Then there had been meetings in Liverpool and Blackburn, from which reports had been given. Unfortunately, as he had said, the general meetings had not been largely attended. He was sorry to see that there was this indifference, which he hoped would be overcome in the future. The numerical strength of the Society was twenty-nine.

Mr. U. A. COATES moved thanks to the Secretary for his arduous labours on behalf of the Association, and that was carried.

Mr. BROWN said he appreciated the resolution of confidence. The greatest reward would be a stronger Association, and no one would be prouder to see it a success.

Mr. Dodsley's report as Treasurer showed that the balance in hand was £2 4s. 9d., the President waiving his expenses in regard to his visit to Plymouth.—For this he was heartily thanked.

Mr. Dodsley was thanked for his services.

The PRESIDENT remarked that the Association had got through a good amount of work. He passed a high compliment on the Committee, who had been very earnest in all matters.—Mr. Heaton was thanked for his services as President, on the proposition of Mr. BROWN, who eulogised Mr. Heaton's business-like conduct and urbanity of manner.

Mr. COATES, in seconding, urged the necessity of keeping united. During next year there would be one of the most exhilarating times in the interests of pharmacy. What they needed to do was to stir up interest, and there was nothing like activity to ensure success.

Mr. Heaton was re-elected President, and Mr. Hitchin was appointed the Vice-president. The Secretary (Mr. Brown) was re-chosen amidst applause, and Mr. Dodsley was also appointed Treasurer. A committee was also chosen.

The CHAIRMAN said that in regard to the Pharmaceutical Council it was felt that there ought to be some change. They ought to endeavour to get four new members in order to support the progressive members, and so endeavour to bring about more active legislation.—The matter was left over, the meeting agreeing with the Chairman's suggestion.

In regard to the Companies Bill, the SECRETARY read several items of correspondence, remarking that the M.P. for Burnley (Hon. P. Stanhope) had promised to use his influence against the objectionable clauses.—It was decided to have a meeting in the future to decide the action of the Association.

GRIMSBY AND DISTRICT CHEMISTS' ASSOCIATION.

The sixth annual dinner of this Association was held at the Oberon Hotel on Thursday, April 5, Mr. ROBERT COOK, J.P. (President) in the chair, supported by Mr. Cor. Willson in the vice-chair, Mr. T. D. Sneath (Secretary), Mr. C. Dewing (Assistant Secretary), Messrs. H. W. Colley, T. J. North, H. Colley, T. C. Palmer, J.P., J. Wharton, Geo. R. Cook, R. H. Hearne, A. H. Swift, and others. —After an excellent dinner, and the usual loyal toasts, Mr. COR WILLSON proposed the toast of the

GRIMSBY AND DISTRICT CHEMISTS' ASSOCIATION.

He referred to the death of the late President of the Association, Mr. Alderman Palmer, expressing the regret of the members, and extending their sympathy to his family. He then went on to speak of the importance of the Association both to chemists and the public. In regard to company pharmacy, he pointed out the injustice to chemists and danger to the public in allowing an unqualified person to carry on the business of a chemist and druggist simply by forming a limited liability company. The importance of local Associations lay in the fact that they gave chemists an opportunity of meeting together to discuss various matters affecting their interests. In this connection he mentioned the "cruel law" which extracted a quarter-of-a-million sterling per annum from the sick poor in the form of revenue by means of the stamp duty on medicines. He thought it would be wise if the Chancellor of the Exchequer would accept a hint from the Grimsby Chemists' Association and alter that form of taxation. He coupled with the toast the names of the Secretaries.

Mr. SNEATH, in replying, referred to the work of the Association and its relations with the Federation of Local Pharmaceutical Associations, giving a brief summary of the subjects which had been brought under notice and discussed. With respect to the Storage of Poisons Regulations adopted by the Pharmaceutical Society last year, he was pleased to know that the measures recommended had already been adopted by the chemists of Grimsby.

Mr. DEWING also responded. He regretted that all the chemists of the district did not belong to the Association. If it did nothing else but promote sociability it was worthy of support, and he cordially invited all who were not members to join the Association. Speaking in reference to the Pharmaceutical Society, he urged that, instead of making complaints, chemists should unite and send men to the Council who would represent their views. He thanked the company for the cordial way in which the toast had been received.

Mr. WHARTON then gave the toast of the "Officers of the Association."

The PRESIDENT, in responding, said he felt proud that he had been selected to preside over the affairs of the Association, and to know that in that capacity he had the goodwill of the whole of the pharmacutists in Grimsby. It was, however, also with regret that he occupied the chair that evening, because he felt sincerely the loss of the late President, Alderman Palmer. But, whatever he could do to help forward pharmacy in Grimsby he would do to the utmost of his ability.

Mr. WILLSON and Mr. COLLEY also responded.

Other toasts were "The Town and Trade of Grimsby," proposed by Mr. HAWDON, and responded to by Mr. T. PALMER; "The Pharmaceutical Society," proposed by Councillor WHITE, and responded to by the PRESIDENT; and "The Ladies."

During the evening Mr. Cook recited "The Absent-minded Beggar," a collection being made on behalf of the Widows' and Orphans' Fund.

NORTH STAFFORDSHIRE CHEMISTS AND DRUGGISTS' ASSOCIATION.

The annual meeting of this Association was held at the Grand Hotel, Hanley, on Thursday, April 5, Mr. T. C. CORNWELL in the chair.

Mr. EDMUND JONES, the Hon. Secretary, read a letter from the President, Mr. Averill, who was unable to attend through illness, and he then gave a *résumé* of the work done by the Association during the past session. The average attendance during the year had been about thirteen—a decided falling-off when compared with the attendance during previous sessions. He thought an association of forty odd members should have a better average attendance. He would be glad if the members would take a more active interest in the affairs of the Association and pharmaceutical politics generally.

Mr. WESTON POOLE, Treasurer, next read the annual balance-sheet, which showed an increased and satisfactory balance in hand, after which the report and balance-sheet were adopted, and a vote of thanks passed to the officers for their services, on the motion of Mr. OLDHAM.

The election of officers was then proceeded with, and Mr. J. Averill was unanimously re-elected President. Mr. Cornwell and Mr. Oldham were elected Vice-Presidents. Mr. Weston Poole was re-elected Treasurer and Mr. Edmund Jones Secretary.

THE COMPANIES BILL.

Mr. W. GOWEN CROSS, of Shrewsbury, at the invitation of the Chairman, afterwards made a few remarks for the private information of the members with respect to the attitude of the Pharmaceutical Council towards the Companies Bill at present before Parliament; at the conclusion,

Mr. CORNWELL said he was quite of the opinion that they ought to support the Society. It was very gratifying to find that the Pharmaceutical Council had arrived at a unanimous decision as to a course of action. He proposed the following resolution:—

That this meeting, having heard Mr. Cross's exposition of the position, is gratified to find that the Pharmaceutical Council has arrived at a unanimous decision to oppose Clauses 2 and 3 of the Bill, and we beg to support the present attitude of the Society towards the Bill now before Parliament.

Mr. E. JONES, seconding the resolution, which was carried with acclamation, said he was glad that the Council had at last decided to do something in regard to Clauses 2 and 3 in the Companies Bill. He was of the opinion, together with Mr. Averill, that the attitude of the Council of late was most unsatisfactory and very disheartening and discouraging. The passive and apparently inactive policy of the Council was becoming intolerable, and unless the Council roused themselves, he feared the Society would be somewhat weakened and seriously damaged in the esteem and consideration of its most heretofore loyal supporters. He sincerely hoped that before long the Council would mobilise its forces for an active campaign in the interests of its members and the craft generally.

Mr. POOLE said that what Mr. Cross had told them had put fresh ideas into their heads. It was all very well for them, with their limited knowledge, to say certain things, but when they were told things from behind the scenes their opinions were very much altered. Personally, he (Mr. Poole) had always been of the opinion that it would be a very bad thing indeed to attempt to regulate companies in the way that had been suggested. He did not think they had anything to do with that. What they had got to do was to carry out the Pharmacy Act, and to base all their efforts upon that. It seemed to him that it was contrary to British justice that any man, or any set of men, should be allowed to take the privileges attaching to individual qualification, and he did not think it was at all fair that a professional qualification should be exploited by capitalists. Here it was said years ago that if they did certain things they should have certain privileges, and now, forsooth, because it had been laid down by one of the lower Lords that a company, being not an individual, could not be qualified, therefore a company did not come within the Pharmacy law. He did not see

the logic of that at all. Proceeding, Mr. Poole said he thought they ought to bear in mind also that if they once climbed down from their position, and said they would regulate companies to this extent, that if they have a qualified man actually on the premises to conduct the business, then we will allow them to practise as chemists, he did not see where they were going to stop, because there might be any number of capitalists who would say, "Well, I have plenty of money; why should not I start a chemist's business, and get a qualified man to look after it?" If the British public did not think it necessary that the man who sold them poisons should be qualified, let them have free trade by all means. In conclusion, he hoped all the local associations throughout the country would pass resolutions similar to the one they had passed that afternoon, supporting the Pharmaceutical Society in its opposition to Clauses 2 and 3.

The Annual Dinner.

Subsequently, the annual dinner of the Association was held, some twenty-five persons being present, and at the conclusion Mr. WESTON POOLE gave the toast of

THE PHARMACEUTICAL SOCIETY.

Mr. W. G. CROSS, who responded, said he could assure Mr. Poole that not only in that room, but throughout the length and breadth of the country, the Pharmaceutical Society was looked upon as one of the grandest institutions in the land. For the chemists of this country it had done more than anyone could possibly point out. It had raised a mere heterogeneous occupation into a high professional calling, and whatever standing the chemists and druggists to-day had, was due to the work of the Pharmaceutical Society. The Society had a working income of £20,000, a sum which meant no small item in the financial affairs of this country. The Benevolent Fund, he was pleased to see by the balance-sheet, had distributed over £2,000 to those who had fallen by the way, and over £700 had been paid during last year in casual grants to pick up those who had been temporarily distressed. It was a grand institution, of which they might all be proud. But, though they might be very proud of their Society, their unanimity might come to a sudden stop when they thought about those who administered their affairs, but he was glad to say that there was not much to find fault with the *personnel* of the Pharmaceutical Council. There were one or two misapprehensions as to the scope of the functions of the Pharmaceutical Society, which obtained about the country, one of which was that the Pharmaceutical Council was above all law and order, and could direct the doings of pharmacy in this country just as it pleased. He was afraid they were gradually coming to that belief all over the country, and it was well they should grasp the fact at once that the Pharmaceutical Society was not the dictator of the law. It could not put down what they called illegal practices to anything like the extent that some members believed it could, or ought to do; and then, again, there was an idea, likewise a fallacy, that the members of the Pharmaceutical Council did nothing whatever, but were simply ornamental heads of the Society, who sat in their armchairs, and knew nothing about the business of the country. He had had the pleasure of belonging to the Council for fifteen years, and during the whole of that time there was not a pharmaceutical interest but what had received most earnest and careful attention at the hands of the Pharmaceutical Council. Illegal trading, as they knew, had been put a stop to to a very large extent, and though they could not stop some very notorious sinners, they did all that was possible. With regard to the state of trade throughout the country, the Pharmaceutical Society was very fortunate in having amongst its members representatives of the trade from all parts of the country, and if members of the Pharmaceutical Council were not made aware of the grievances that existed in the various localities, it was not the fault of the Pharmaceutical Council. The Pharmaceutical Society was a most democratic institution. The members elected their own officers, and if they did not like them they could very easily discharge them. He felt sure that the whole of

the gentlemen present would agree with him when he said that the present Council of the Pharmaceutical Society was as anxious to-day as it ever had been to promote the welfare of pharmacy throughout the country. The methods of the Society may not have been right. Some said the members of the Council were all of one mind, and that when once a man got to 17, Bloomsbury Square, he had no opinions of his own. He had heard from the North Staffordshire Association an actual complaint that the Pharmaceutical Council was not unanimous enough. The members of the Council were sometimes very hard to one who wanted to play a little off his own bat, but that was natural enough. He thought that during the fifteen years he had been a member of the Council he had learnt a little wisdom. Proceeding, Mr. Cross said that looking into the future, they had a chance of a very considerable sensation next May in the election of the Council. No less than twenty-six gentlemen had been nominated, the most healthy sign he had seen for a long time, and there were now seventeen candidates for seven seats. He was beginning to feel that having had a long innings on the Council, it was time for him to retire, and give place to a younger man, but he would say to that younger man that he would find there twenty other gentlemen besides himself who were quite ready and willing to receive him, and to hear what he had to say, to receive him as a brother, and if he could do any good for the pharmaceutical calling they would be very quick to recognise him. But if, on the other hand, he did not do more than air his own particular grievances, he would sink into that oblivion which, he was sure, they would all agree he would righteously deserve.

Mr. GLYN-JONES, who also responded, said he agreed very largely with what Mr. Cross had said as to the usefulness of the Pharmaceutical Society, and as to its democratic constitution; but he for one could not but feel sorry that there had not been more differences amongst the body which they called so democratic in constitution. He, personally, was sorry that the individual members of the Society had not taken that interest year by year that they should have done in the government of the Pharmaceutical Society, and that was not a matter of opinion, it was a matter of evidence. It was a sorry fact that in the election half the papers had year by year been returned. He thought that that showed a lack of healthy interest in the Society. There could be no two opinions amongst chemists with regard to the company trading question. He did not think they should waste time in discussing and trying to satisfy each other as to what they wanted and what were their just rights, he thought they should rather consider what had they the best possible chance of getting. He really thought that they had in the near future a chance of getting their titles. He did not for a moment think there was any chance of the Government doing anything with companies, with the exception of regulating them. He was convinced of this, that they had got in the Pharmacy Act as it at present stands all the protection they wanted. They had in their Pharmacy Act powers which, if enforced, would soon work out their salvation. Referring again to the Pharmaceutical Council, he said he thought there was something wrong in a body which was always unanimous, and personally he thought the more healthy expression of opinion they got the better, provided that the gentlemen in the minority would ultimately give in to the majority. Speaking of the coming election, Mr. Glyn-Jones said he did personally think that, much as the Council had done for them, it would have done more if they had always had seventeen candidates for seven places. It stood to reason that if they had the same governing body year after year they were liable to get into one road of reasoning always, and never progress.

Mr. E. JONES having proposed the toast of "The Visitors,"

Mr. GIFFORD (Blackburn) responded. He said he must protest against the idea which seemed to permeate a great many pharmaceutical minds, that it was a disgraceful thing for chemists to expect to have any rights whatever. The chemist had been so used to going to the wall that he would apologise for looking

after himself. His strong opinion at the present time was that they wanted, and it was time they had, a clean issue in the Pharmaceutical Council election that was coming on. They wished the electors of the Pharmaceutical Society to take the responsibility of voting deliberately and making themselves acquainted with the reasons why they were voting. The issue they thought amounted to this:—Chemists thought they earned something in the examination room, and they not only earned something, but ought to have it. That was their sheet anchor, which they must stick to, and if it was worked for all it could be worked, chemists believed that it could be made effective. The qualification at the present time was reduced to an absurdity, so much so that the Lord Chancellor had stepped in and said: "You must alter the absurdity; if not, I shall do it for you."

Mr. W. G. CROSS proposed the toast of the North Staffordshire Association. He said he looked upon the Association as an ideal one. It had not a very large membership, it was true, but its members were of a most genuine character. He hoped the Association would continue on the lines it had so successfully pursued in the past, and continue to prosper and flourish.

Mr. CORNWELL and Mr. OXEN suitably responded, and spoke of the great help the Association had been to them and to the district in every way.

The remaining toasts were "The President" and "The Chairman." During the evening songs, etc., were given by members of the company, and the singing of "Auld Lang Syne" concluded a most enjoyable evening.

Obituary.

ALLEN.—On April 6, Augustine Allen, Chemist and Druggist, Wombwell. Aged 81.

BAXTER.—On April 8, at Mason Hill, Bromley, Kent, William Walmisley Baxter, Pharmaceutical Chemist. Aged 70. Mr. Baxter had been a member of the Pharmaceutical Society since 1855, and was one of the oldest tradesmen in Bromley. The business was established by his father in 1818, and, after the latter's death, was carried on by him until, owing to impaired health, he relinquished the business in September, 1897, in favour of his son, Mr. William Baxter, Ph.C. It is interesting to note that the founder of the business was for many years assistant to the celebrated Dr. Scott, of Bromley, and that the late Mr. Frederick Barron (Barron, Squire, and Co.) was apprenticed to him. The deceased gentleman was a Freemason, being a founder of the Crystal Palace and Hervey Lodge; he was also a constant subscriber to the Pharmaceutical Society's Benevolent Fund.

BURFORD.—On April 2, George Burford, Chemist and Druggist, Leicester. Aged 80.

FOSTER.—On March 21, at St. Mary's Pharmacy, Carlisle, Sarah Jane, wife of James Foster, Chemist and Druggist, who has been a member of the Pharmaceutical Society since 1875.

HURST.—On April 4, John Hurst, Pharmaceutical Chemist, Louth. Aged 84. Mr. Hurst, who had been a member of the Pharmaceutical Society since 1842, was one of the oldest tradesmen in the town, having succeeded his brother, Mr. Thomas Hurst, in business about the time he joined the Society. He took an active part in local affairs, being elected to the Louth Town Council over half-a-century ago. In 1871 he was elected a member of the committee of management of the Louth Hospital and Dispensary, being the oldest person connected with the institution. He was also the oldest trustee of the Fotherby Almshouses. For many years he was a director of the Louth Gas Company, and a Commissioner of the Louth Navigation, and for upwards of twenty years was on the Commission of the Peace for the Borough. He was greatly interested in education, being the Honorary Treasurer of the Louth National Schools. Nearly fifty years ago he was appointed auditor to the Louth Savings Bank, and on tendering his resignation in December, 1898, the trustees and managers, in order to show their appreciation of his services, elected him a Vice-President of the

Bank, and placed on record a resolution expressing regret at having to accept his resignation, at the same time recording their appreciation of the fidelity and efficiency with which he had discharged his duties during the period of forty-nine years.

LESLIE.—On April 8, Joseph Leslie, Chemist and Druggist, late of Carlisle. Aged 79.

MACLAGAN.—On April 5, at Edinburgh, Sir Andrew Douglas MacLagan, M.D., LL.D. Aged 88. Sir A. D. MacLagan was an honorary member of the Pharmaceutical Society, and formerly acted as Government Visitor to the Society's examinations in Edinburgh.

REYNOLDS.—On April 5, Richard Reynolds, Pharmaceutical Chemist, Leeds. Aged 76. Mr. Reynolds had been a member of the Pharmaceutical Society since 1854.

ROWNTREE.—On April 6, Thomas Rowntree, Pharmaceutical Chemist, Barnsbury, London, N. Mr. Rowntree had been a member of the Pharmaceutical Society since 1857.

TILSON.—On March 6, James Tilson, Chemist and Druggist, Long Sutton. Aged 75. Mr. Tilson had been connected with the Pharmaceutical Society for many years, as an Associate, and latterly as a Member. He was the father of Miss Annie E. Tilson, who was a "Square" student, and gained the Society's silver medal in 1893.

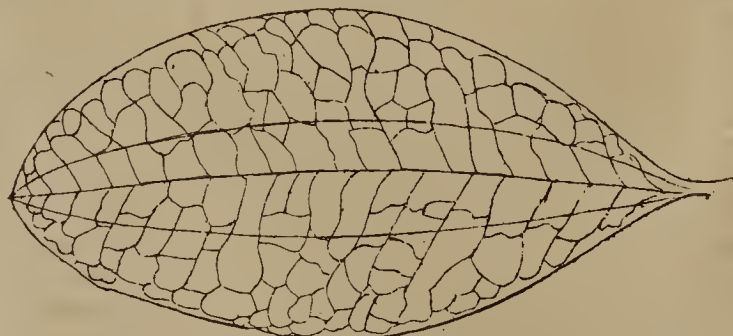

WARDE.—On March 29, Richard Smith Warde, Chemist and Druggist, East Retford. Aged 63. Mr. Warde was a member of the Pharmaceutical Society.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Cocæ Folia.

COCA LEAVES are obtained from *Erythroxylum coca*, Lam. (N.O. Linacæ), and varieties of that species. The leaves are picked twice a year, or oftener, and dried. The plants are cultivated in Bolivia and Peru, the dried leaves imported from those two countries constituting well-marked varieties and being known commercially as Huanuco (Bolivian) and Truxillo (Peruvian) coca leaves. Those two varieties are alone official, other kinds—such as Java and Ceylon coca—being less constant in the quantity of cocaine present, and apt to contain other alkaloids of a toxic nature. The drug is a nervine and muscular tonic, possessing stimulant and restorative properties; it is used in the preparation of Cocaine, Cocaine Hydrochloride, and Extractum Cocæ Liquidum.

COCA.—Leaf of *Erythroxylum coca*, Lam., var. *bolivianum*, Burck.

CHARACTERS.—Coca leaves from *E. coca*, Lam., are not obtainable in commerce. Bolivian (Huanuco) coca leaves, from *E. coca*, var. *bolivianum*, Burck, vary usually from 3.5 to 7 Cm. in length, and from 25 to 35 Mm. in breadth, but much smaller leaves may be found. They have a characteristic brownish-green colour, oval outline, and entire margin; both surfaces are glabrous, the upper surface bearing a distinct ridge above the midrib, and the under surface showing two curved lines near the midrib, running from the base to the acute apex of the leaf. The blade tapers in both directions, the midrib projecting at the apex in the form of a minute

horny apiculus or point, which, however, is frequently broken off. In a transverse section of the leaf, examined under the microscope, most of the epidermal cells of the under surface are seen to project in the form of small papillæ. The odour of the drug is faint but characteristic, and its slightly bitter taste is succeeded

COCA.—Large leaf of *Erythroxylum coca*, var. *novo-granatense*, Morris.

by a sensation of numbness in the mouth, owing to the local anæsthetic action of the cocaine present. The leaves should be free from mildew, because their alkaloidal content diminishes rapidly when they are not carefully preserved. Peruvian (Truxillo) coca consists of leaves from *E. coca*, var. *novo-granatense*, Morris; they are somewhat smaller, narrower, and more fragile than those imported from Bolivia, pale green in colour, without the prominent ridge above the midrib on the upper surface, and with less distinct curved lines near the midrib on the under surface.

NOTES.—The distinctive characters of coca leaves are the curved lines on the under surface, the minute horny apiculus, and the characteristic odour and taste. The midrib in Huanuco coca lies in a slight depression, as is usually apparent when the upper surface of a leaf is examined with a lens. The two curved lines are much less distinct on the under surface of Truxillo coca, there is no ridge above the midrib on the upper surface, and the network of small veins is less close and less prominent. The flowers of a species of *Inga* are frequently found in Truxillo coca, being apparently

COCA.—Leaf of *Erythroxylum coca*, var. *spruceanum*, Burck, natural size.

added with the view of improving the drug; they are about an inch long, with a yellowish-brown, tubular, hairy calyx and numerous deep red filaments forming a plume. The most important constituent of coca leaves is cocaine, or methyl-benzoyl-ecgonine, of which the quantity is usually less than 1 per cent., Bolivian coca containing more than Peruvian. The total alkaloids present, of which about two-thirds may be cocaine, do not usually exceed 1.5 per cent., and the average amount is 0.5 per cent. Other alkaloids found, in addition to cocaine, are cinnamyl-cocaine and isatropyl-cocaine (truxilline or cocamine), which are frequently present in Truxillo coca in larger quantity than cocaine. Benzoyl-ecgonine

COCÆ FOLIA.—*Erythroxylum coca*. Under epidermis in transverse section, enlarged, showing papillæ. (After Moeller.)

and hygrine (?) are also found, as well as cocatannic acid, methyl salicylate, and wax. When hydrolysed by heating to 100° C. with hydrochloric acid, cocaine yields methyl alcohol, benzoic acid, and a crystalline alkaloid—ecgonine, which is very closely allied to tropine. See *P.J.*, November 5, 1898, p. 492. In the case of cinnamyl-cocaine

the result is similar, except that cinnamic acid is formed in place of benzoic acid. Isatropyl-cocaine, in like manner, yields isotropic (truxillie or cocaic) acid. Benzoyl-ecgonine is an intermediate product of the complete hydrolysis of cocaine. It can be split into benzoic acid and ecgonine; by methylation it can be converted into cocaine. Java coca, from *E. coca*, var. *spruceanum*, Burck, contains cocamine and benzoyl pseudo-tropeine which, when hydrolysed, yields benzoic acid and pseudo-tropine—an isomer of tropine. Ceylon coca leaves correspond in physical characters to the Huanuco variety. Like the Java leaves, they are not so rich in cocaine as Bolivian and Peruvian coca, although sometimes richer in total alkaloid. For the microscopic characters of coca leaves, see *P. J.*, May 27, 1899, pp. 484-5.

Coccus.

COCHINEAL is the dried fecundated female insect, *Coccus cacti*, Linn. (order Hemiptera), a native of Central America and Mexico, but also bred in the Canary Islands. The insects are reared upon the fleshy branches of *Nopalea coccinellifera*, Salm-Dyck (N. O. Cactaceæ), and are normally of a bluish-red colour, and about 1.25 Mm. in length, the males alone being provided with wings. After fecundation the females increase in size rapidly, and develop an abundance of red colouring matter, though a waxy secretion with which their bodies are covered gives them a whitish appearance. At this stage they are brushed off the plants, killed, and dried, being thereby reduced to one-third their original size or less. If the insects are killed by the fumes of burning sulphur or charcoal and dried in the sun, the waxy secretion remains unaffected, and "silver-grain" cochineal is the result; but if killed by hot water or in an oven and dried by artificial heat "black-grain" cochineal is obtained, the waxy secretion being removed and the colour of the insects changing to a reddish or purplish black. Cochineal is of value as a colouring agent only; it is used in the preparation of *Tinctura Cardamomi Composita*, *Tinctura Cocci*, and *Tinctura Cinchonæ Composita*.

COCHINEAL.—A, Adult female, nat. size; B, ditto, magnified; C, Impregnated female, nat. size; D, Male, larval form; E, ditto, winged form.

CHARACTERS.—Cochineal insects, when dried, are about 5 Mm. long, oval in outline, flattish or slightly concave on one side, convex or arched on the other. In colour they are purplish-grey or purplish-black and, if properly dried, they can easily be reduced to a puce-coloured or dark-red powder. The dried insects are transversely wrinkled and swell considerably when macerated in water, three pairs of legs being then rendered visible in each case.

TESTS.—Cochineal may be faced, in the case of the "silver-grain" variety, with barium or lead carbonate or sulphate; "black-grain" cochineal may be faced with black lead, ivory black, or manganese dioxide. All such additions can be detected by macerating the cochineal in water, as the insoluble powders then separate. Inorganic impurities also increase the amount of ash—not exceeding 6 per cent.—which should be left on incineration with free access of air.

NOTES.—The chief characteristics of cochineal are the shape and general appearance of the dried insects. They contain about 10 per cent. of a red colouring matter—carminic acid—which is obtainable in small red prismatic crystals, and is soluble in water, alcohol, and alkaline solutions. Other constituents of cochineal are about 10 per cent. of fat (myristin, etc.) and 2 per cent. of wax (coccerin), together with albuminoids, inorganic matter, etc. Carmine is obtained by precipitating a decoction of cochineal with alum, potassium bitartrate, etc., and contains about 50 per cent. of carminic acid.

Colchici Cormus.

COLCHICUM CORM is the short, fleshy, bulb-shaped, underground stem of *Colchicum autumnale*, Linn. (N. O. Liliaceæ), the meadow saffron, a plant which is widely distributed over Central and Southern Europe, and abundant in moist meadows and pastures in many parts of England and Ireland. To insure the drug being in the best condition, it is directed that the corms should be collected in early summer. They are then filled with the reserve material stored up in them by the aid of the leaves, which is gradually used up as the flowers develop, the corms shrivelling, and ultimately decaying until the only trace of the existence of the original corm is a rounded cicatrix upon the new corm, marking the point of attachment to its predecessor. The corms are, therefore, dug up between the decay of the foliage and the appearance of the flower, or, as the plant is then less difficult to find, soon after the flower has appeared. The fresh corms are stripped of their membranous coats and cut into transverse slices; these are dried at a temperature not exceeding 65°-5 C., to avoid causing gelatinisation of the starch present, and then constitute the drug as usually seen in commerce. *Colchicum* relieves the pain and inflammation of gout and kindred affections; the fresh corms are used in the preparation of *Extractum Colchici* and the dried slices in preparing *Vinum Colchici*. The dose of the dried corm is 2 to 5 grains.

CHARACTERS.—*Colchicum* corm, when fresh, is about 35 Mm. long and 25 Mm. broad, bluntly conical in shape, rounded on one side and flattened or hollowed on the other, where a new corm is in process of development. The outer thin brown membranous coat and inner reddish-yellow one are derived from the leaves of the plant, which have decayed prior to the collection of the corm. Internally the corm is firm, white, and solid. The juice which exudes when it is cut has a bitter taste due to the poisonous alkaloid colchicine, and is milky owing to the presence of numerous starch grains. The disagreeable odour of the juice is apparently due to a volatile body which disappears from the corm on drying. The dried slices, which are cut while

COLCHICUM CORM.
Natural size.

the corms are fresh and freed from the remains of the membranous coats by winnowing, are reniform or kidney-shaped in outline, from 2 to 3 Mm. thick, and their shortest diameter is from 1 to 2 Cm.; they break readily with a short fracture. When the surface is smoothed numerous fibro-vascular bundles reveal themselves as scattered darker points. The margin of each slice is slightly raised—owing to the greater shrinkage of the firm, whitish, starchy, central portion in drying—and presents on its outer surface a yellowish or dull pale brown epidermis. The slices have the same bitter taste as the fresh corm or juice, but they are free from the disagreeable odour.

COLCHICUM CORM.—Transverse slices, natural size.

NOTES.—The distinctive characters of fresh colchicum corm are its peculiar shape, bitter taste, disagreeable odour, and milky juice. When sliced and dried it loses the volatile body to which the odour appears to be due, and about 70 per cent. of water; the dried slices are characterised by their kidney-shaped outline, short starchy fracture, and bitter taste. The active principle of the drug is the poisonous alkaloid colchicine, of which it contains 0.5 to 0.6 per cent. when dried. It has been isolated as a pale yellow amorphous substance, possessing weak basic properties. Other constituents are starch, gum, sugar, resin, tannin, and fat. The corm is considered to be most active about July, but it is questionable whether the alkaloidal content varies to any appreciable extent with the time of collection; it is said to decrease, however, if the drug is kept for a long time before use.

Colchici Semina.

COLCHICUM SEEDS are the product of *Colchicum autumnale*, Linn. (N. O. Liliaceæ), collected in the autumn and dried. The reddish-purple flower which springs from the side of the corm has superior ovary, and that is raised to the surface of the ground as

COLCHICUM SEEDS.—A, Seed, enlarged; B, ditto, section, showing embryo.

development of the flower proceeds, by elongation of the peduncle. After fertilisation the fruit forms as a three-celled capsule, which ripens during the summer, dehisces septicidally, and discloses numerous pale seeds which darken as they dry. The medicinal

properties of the seeds are similar to those of the corm, but they have been considered to be more certain in effect and milder in operation; they are used in the preparation of *Tinctura Colchici Seminum*.

CHARACTERS.—Colchicum seeds are about 2.5 Mm. in diameter, nearly spherical in shape, but slightly pointed at the hilum, where occur the remains of a thick funiculus or stalk with which the seed has been attached to the placenta, in the fruit. The presence of minute pits on the surface makes the dull reddish-brown seeds rough. They are also very hard and tough, and must be soaked in water to enable them to be cut easily. A transverse section shows a yellowish oily endosperm, consisting of cells with thickened walls and large pits, the minute embryo being situated near the margin opposite the hilum. The seeds have no odour, but a bitter acrid taste.

COLCHICUM SEED.—Section, greatly enlarged. A, Embryo; B, Funiculus. (After Berg.)

NOTES.—The distinctive characters of colchicum seeds are the rough surface, hard horny endosperm, and the remains of the thick funiculus. Black mustard seeds are much smaller and softer; henbane seeds are kidney-shaped; grains of paradise are larger and paler, with a soft white endosperm and pungent taste. The chief constituent of colchicum seeds is the poisonous alkaloid colchicine, of which they contain from 0.6 to 1 per cent.; other substances present are colchicein, a white crystalline body—trimethyl-acetyl-colchicine acid—of which colchicine is stated to be the methyl ether, colchicoresin, β -colchicoresin, 6 to 8 per cent. of fixed oil, gum, starch, sugar, etc.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

ARROW POISONS.

According to Schellman the arrow poison of the Wagogo is derived from the juice of the bark of two Euphorbiaceous trees by continued boiling. Brieger has isolated therefrom a crystalline body which corresponds chemically and physiologically with the Wakamba arrow poison. This body has the same action as the amorphous ouabain, and similar to the amorphous strophanthin, obtained from *Strophanthus hispidus*, by Thoms, but does not give a glucosidal reaction. The Euphorbia juice appears to act as progressive poison.—*Chem. Zeit. Repert.*, **24**, 41.

LARGIN IN OPHTHALMIC CASES.

As a substitute for silver nitrate, Sidney Stevenson finds that largin is very efficient in most superficial diseases of the eye in any of the conjunctival inflammations associated with the Koch-Weeks' bacillus, such as acute infectious ophthalmia, and acute, or sub-acute trachoma. It is, however, distinctly inferior to the nitrate and to protargol in gonorrhœal ophthalmia, and in diplo-bacillary conjunctivitis it does not always succeed as well as zinc sulphate. It has the advantage that the application of even strong solutions is almost painless, and it is of great service as an antiseptic after trachoma operations.—*Brit. Med. Journ.*, 2046, 622.

PRESERVING URINARY SEDIMENTS.

The following process is due to Martin Cohn. The sediment is drawn off with a pipette and dried on a microscopic cover-glass by exposure to the air, fixed by immersion for ten minutes in 10 per cent. formalin solution, washed with water for a short time and stained by immersion in concentrated solution of Soudan dye in alcohol (70 per cent.), and after washing with alcohol (70 per cent.) again stained with hæmatoxylin or alum cochineal, and finally, after treatment with water, mounted in glycerin.—*Chem. Zeit. Repert.*, **24**, 335, after *Zeits. Klin. Med.*

SOME EXTINCT VASCULAR CRYPTOGAMS.

Dr. D. H. Scott has read a paper "On *Sphenophyllum* and its Allies, an Extinct Division of the Vascular Cryptogams," before the Linnean Society. He pointed out that the study of the Palæozoic Flora not only greatly widens our conception of the three existing classes of Pteridophyta, but adds a fourth—that of the Sphenophyllales—to their number. In describing the external characters of certain species of *Sphenophyllum* and *Trizygia*, he directed attention to the slender ribbed and jointed stems, the whorled and superposed leaves, and the great variation in the form of the leaf. The common hypothesis, based on the dimorphism of the leaf, that *Sphenophyllum* is an aquatic genus, was said to be inconsistent with other facts, Mr. Seward's suggestion of a climbing habit appearing preferable. In external morphology the resemblance is closest with the Equisetales. The chief points noted in connection with the anatomy of *Sphenophyllum* were the centripetal, triarch or hexarch primary wood, and the successive addition of secondary tissues by means of a normal cambium, the formation of a regular scale-bark being another remarkable feature. The cones of *Sphenophyllum dawsoni* were explained in detail. The presence of pedicellate sporangia, of peculiar structure, appear to be general in the genus, and there are reasons for regarding the pedicel as comparable to a ventral lobe of the subtending bract. *Bowmanites roemeri* and *Sphenophyllum majus* were cited as examples of somewhat more complex examples of Sphenophyllaceous fructification.

The latter was compared with the fructification of *Tmesipteris*, and the points of agreement between Psilotæ and Sphenophyllales indicated. In *Cheirostrobos peltzemensis*, a cone discovered some years ago in the Lower Carboniferous strata of Burntisland, the agreement anatomically with the Lycopods and morphologically with the Equisetales was found to be even more striking than in the Sphenophyllales proper, and Dr. Scott has been led to place the genus in the class Sphenophyllales. The supposed relation of the Sphenophyllales to Hydropteridæ he rejects as baseless, and as inconsistent with the manifest Filicinean affinities of that family. He has come to the conclusion that the Sphenophyllales are most naturally regarded as the derivatives of a synthetic group, combining the characters of Lycopods and Equisetales, and indicating the common origin of those two classes.

FRUIT OF SAMBUCUS EBULUS.

Dr. P. Radulescu has investigated the nature of the colouring matter of the berries of the danewort, largely used for colouring red wines in Roumania. Its chemical and spectroscopic properties are given in detail. It possesses no injurious properties.—*Bull. Soc. Sci. Bucharest*, 1899, 636.

STAINING WITH SAFRANIN.

Ssobolew recommends first immersing sections for two to five minutes in diluted Fleming's solution (10 to 15 drops to water 5 C.c.), washing with water, and then staining in a saturated aqueous solution of safranin, finally mounting in the usual manner. The colour is extremely distinct. Treatment of the sections with dilute osmic acid solution gives poor results and a colour of a violet tint.—*Chem. Zeit. Repert.*, **24**, 335, after *Wratseh*.

BELLADONNA POISONING.

A case is recorded by G. Scott in which six stable lads, employed in a racing stable near Twyford, were recently poisoned by taking horse medicine, an electuary, consisting of belladonna and liquorice. When medical aid arrived, two of them were wildly delirious, another, who had fortunately vomited after taking a considerable quantity of the poison, was comatose; the other three were less severely affected, and were able to swallow an emetic; the three first, however, had to have emetics forcibly administered. All subsequently recovered under treatment with emetics and purgatives, with a stimulant mixture to the comatose patient. The electuary contained fifteen grains of extract of belladonna in each drachm, and was taken by the boys on account of its sweet taste; two admitting taking half a teaspoonful and one as much as a teaspoonful.—*Brit. Med. Journ.*, 2046, 633.

PLUMIERIDE.

The bitter principle of *Plumiera lancifolia* has been investigated by Franchimont, who states that the substances derived from that source by Boorsma and E. Merck are identical, the difference in their melting points—that obtained by Merck melting at 158° C., while that by Boorsma does not melt at all—being due to their differing in water of crystallisation. Plumieride crystallises well, is optically active $[\alpha]_D = -106.4$, the melting point after crystallisation from water is 153° C. It is obtained completely anhydrous by treatment with acetic ether free from water. By heating with five per cent. hydrochloric acid an amorphous brown mass separates, and the solution contains dextrose which can be identified by means of its osazone. By continued treatment with ten per cent. caustic soda solution there separates, after acidifying, a crystalline acid, which is quite insoluble in hot water and in methylic alcohol. This acid deviates polarised light more powerfully than plumieride, has no bitter taste, and yet must be a glucoside, as the aqueous solution heated with diluted hydrochloric acid sets free dextrose. This body closely resembles agoniadin, but its precise nature has not yet been established.—*Chem. Z. it. Repert.*, **23**, 334.

THE OFFICIAL PROCESSES FOR THE ASSAY OF IPECACUANHA, BELLADONNA, AND NUX YOMICA.*

BY F. C. J. BIRD.

I.—Ipecacuanha (Concluded).

Ipecacuanha Wine.—Farr and Wright (*P.J.* [4], 9, 85) state that in the application of their process to the assay of this preparation the alkaloids are yielded in an almost perfectly pure condition, attributable to the fact that the impurity present in the crude alkaloids from the liquid extract is filtered out in the process of conversion into wine. If this is true of all samples, then wine made from extracts of B.P. strength, in which the proportion of titratable alkaloid is low, might be expected to exhibit an apparent deficiency of alkaloid which would unjustly condemn them as being below the official standard. The following results, however, show that the B.P. analytical method (see below) applied to ipecacuanha wine gives figures in fair correspondence with those yielded by the liquid extract from which the wine has been prepared:—

	Taken for Assay.	Percentage of Alkaloid.	
		Weight.	Titration.
Liquid extract (pale residue), modified B.P. process	10 C.c.	1.95	1.79
Calculated for wine	—	0.097	0.089
Found by modified B.P. method	100 C.c.	0.101	0.089
Found by Farr and Wright's process † ..	50 C.c.	0.10	0.089
Liquid extract (intense orange-brown residue), modified B.P. process	C.c.	1.96	1.50
Calculated for wine	—	0.098	0.075
Found by modified B.P. process	100 C.c.	0.100	0.073
Found by Farr and Wright's process † ..	50 C.c.	0.102	0.074

Both samples were prepared with detannated sherry. The results of the analyses come out slightly above the gravimetric figures calculated from the respective liquid extracts, but below the figures from the same extracts assayed by Alcock's process.

Process.—Wine, 100 C.c.; add solution of subacetate of lead, 2.5 C.c., and a few grains of washed asbestos powder. Heat for a minute or two on the water bath until a distinct separation of the precipitate is observed, then transfer to a Buchner's filter and continue the process as on page 176, using one-fourth the quantities there given. The weight of the residue in grammes is the percentage of alkaloid in the wine.

Loss of Alkaloid on keeping Liquid Preparations of Ipecacuanha.—A sample of wine and a sample of liquid extract, both filtered bright, were tested by the B.P. process on January 3, 1900, and set aside until March 30. When examined on the latter date the wine was found to be bright, with an almost imperceptible sediment and acid reaction, whilst the liquid extract had deposited a very thin brown film on the sides of the bottle, and was neutral or faintly acid to test paper. Evidently no change of any importance had taken place, for the alkaloidal value of both preparations, when assayed by the same process, was practically unaltered, thus proving that some samples of these galenicals can be kept for at least three months without deterioration. The pronounced reduction in strength pointed out by Guyer (*P.J.* [4], 9, 622) still awaits explanation, but it will probably be found to depend on the presence of much free alkaloid in alkaline or insufficiently acid solution.

ASSAY OF IPECACUANHA PREPARATIONS.—SUMMARY.

(1) The B.P. analytical method for ipecacuanha preparations is both easy and expeditious when carried out in the manner described on page 176. The advantages of the process are that the actual analytical operations can be performed in about an hour; there is no emulsification, and being official, its general employment should ensure uniformity of results. Its one disadvantage is the loss of alkaloid, which, however, only averages 0.05 per cent. by titration.

(2) Prolonged washing of the precipitate may be avoided by preliminary acidification of the liquid extract. The results are practically identical.

(3) The presence of alcohol in a sufficiently diluted condition does not diminish the yield of alkaloids; on the contrary it appears to facilitate extraction.

(4) The average loss of alkaloidal residue in the lead precipitate when the foregoing process is employed averages about 0.08 per cent. by weight. A small quantity of alkaloid also remains in the mother liquor after extraction with chloroform and a small part of the deficiency by titration may be set down to decomposition of the alkaloid during evaporation and drying at 80° C.

(5) A possible explanation of the great difference between the results obtained by titration and by weight with dark coloured residues may be found in the probable presence in such residues of alkaloid which has undergone some decomposition or molecular change under the influences of the heat and alkali employed in the preparation of the extract.

(6) The alkaloidal value of highly coloured residues which are incapable of accurate titration with cochineal in the usual way can be determined with great exactitude by the use of ether amyl alcohol, brine and methyl orange (or other indicator).

THE ASSAY OF IPECACUANHA ROOT.

Although no definite percentage of alkaloid is required by the British Pharmacopœia to be present in the crude powdered drug, such information is nevertheless often of considerable importance, both from a commercial point of view and as a guarantee of the good quality of the article. The absence of an official method of assay is also unfortunate on account of the very varying results obtained with different processes, even when worked by the same operator, and this fact lends force to the argument that an official analytical process, even if a little faulty, is distinctly advantageous in tending to secure uniformity in certain drugs and pharmaceutical preparations.

Rapidity in working and accuracy of result have hitherto been two seemingly incompatible conditions, for those processes which were quickly carried out have left much to be desired in point of accuracy, and those which gave figures nearer the truth required much more time for their performance than the busy pharmacist could conveniently devote to them. At one time continuous hot extraction of the powdered drug was considered a good method, but it is now generally agreed that the application of heat to the free alkaloid during the analysis should be avoided. Rejecting therefore those processes dependent on hot extraction the others resolve themselves into two classes, the one in which the drug is agitated and macerated with the solvent, an aliquot being taken for the assay, and the other in which the powder is exhausted by percolation with the solvent. The first of these has the advantage in point

of speed, but is liable to error in several directions, such as the possible want in uniformity of the liquid poured off with that absorbed by the drug, the increase in volume of the solvent by substances dissolved, the alteration in volume by water added to cause aggregation of the powder and the loss of volatile solvent during transference of the "aliquot part" taken. The latter source of error would mean concentration of the alkaloidal solution and higher results, and when the whole operation has been performed on a balanced scale-pan the loss of ether (which in warm weather would probably be still greater) has in Keller's and Lyon's processes amounted to from 1.7 to 4.0 Gm. during the transference of 100 C.c. of liquid.

The points aimed at in the following process for the determination of total alkaloid in the root have been (1) rapidity, and (2) the isolation of the alkaloids in such a pure condition that the gravimetric and volumetric results should be almost identical. Its chief features are extraction in the cold by an application of the well-known maceration-pressure process so successfully employed in the exhaustion of drugs on the large scale, the use of a special solvent for the alkaloids, the avoidance of contact of the liberated alkaloid with caustic alkali and the purification of the final alkaloidal solution in chloroform by means of brine.

The drug should be in very fine powder, preferably No. 100. If a sample of the root itself is under assay it is sufficient to pass the cortical portion through a No. 100 sieve, the remaining woody part being mixed in as a coarse powder. Extraction can be accomplished in about four hours if necessary, but it is advisable to start an analysis overnight whenever possible. The alkaloids of ipecacuanha are very easily removed by a small volume of dilute acid from a large volume of immiscible solvent; it is much more difficult to wash them out with chloroform from an alkaline aqueous solution, concentration should therefore be effected during the acid extraction, so that in the final extraction the volume of the immiscible solvent may be large relative to that of the aqueous liquid.

Both Keller's and Lyon's processes give results which are too high. This, neglecting minor sources of error, appears to be due both to loss of solvent during transference of the "aliquot part" and to impurities in the alkaloidal residue. The alkaloidal residues from Keller's process contain from 6.7 to 11 per cent. impurity, and from Lyon's ammoniated ether method from 5 to 7.5 per cent. Cripp's figures (*P.J.* [4], 1, 161) show with Lyon's process (calculated to the equivalent 0.0244) 3.5 and 7 per cent., and with Keller's from 15 to 17 per cent. impurity in the alkaloidal residue. Keller's own figures (*Y.B.*, 1894, 127) are much nearer, but they are calculated on an equivalent of 0.0254, now known to be too high, and when reduced to a 0.0244 equivalent they exhibit discrepancies up to 8 per cent. Paul and Cownley* have shown the total alkaloid in Rio ipecacuanha to consist of about three parts of emetine with one of cephaeline, which, neglecting the third alkaloid, fixes the equivalent for this variety of the root at 0.0244. In the attempt to purify the alkaloids by eliminating the foreign substances which the figures quoted above prove to be present, it was found that immiscible solvents removed practically nothing from the acid aqueous solution. From the chloroformic solution water extracted alkaloid as well as non-alkaloidal bodies, but brine proved quite effective in removing impurities without dissolving alkaloid. Details will be found in the notes accompanying the process given on this page.

Throughout the process the predominant colour of the solutions is a pale greenish yellow, in marked contrast to the deep brownish yellow noticeable when caustic ammonia is employed.

The addition of a little ether is advantageous in causing the chloroform to separate in a clear condition. It is unnecessary if a little longer time for the separation be allowed.

PROCESS No. 1.

Rio ipecacuanha in fine powder 10 Gm.
Sodium bicarbonate..... 2 Gm.
Water 5 C.c.

Mix about half the soda with the powdered ipecacuanha, shake the remainder with the water and rub the whole in a small mortar to a uniform moist granular powder.

Amyl alcohol 1 volume }
Chloroform 1 volume } *g.s.*
Ether..... 3 volumes }

Add the moistened powder to 20 C.c. of the above solvent, previously placed in D (plugged with cotton wool, as shown at page 176), and macerate for half-an-hour, with occasional shaking. Force out the liquid by compressing H, and cover the powder with 10 C.c. more menstruum. Agitate vigorously, let stand fifteen minutes and again force out the liquid. Repeat this at intervals of a quarter of an hour until ten or twelve quantities of menstruum have been used or the powder is exhausted.

(If time is of no importance, percolation in the ordinary way may be substituted for the above procedure.)

Agitate the mixed ethereal extracts successively with.....

Normal sulphuric acid 4 C.c. }
Water..... 6 C.c. }

Water..... 5 C.c. (2)
Water..... 5 C.c. (3)
Water..... 5 C.c. (4)

To the mixed acid solutions add carefully ammonium bicarbonate..... 0.5 Gm.

Shake out the alkaloid with chloroform containing about one-sixth its volume of ether.

Chloroform 20 C.c. (1)
Chloroform 10 C.c. (2)
Chloroform 10 C.c. (3)

Chloroform 10 C.c. }
Strong solution of ammonia .. 1 drop. }
Agitate the mixed chloroforms with—

Saturated solution of sodium chloride..... 30 C.c. }
Strong solution of ammonia.... 1 drop. }

Run off the perfectly clear chloroform by forcing it with air pressure (see page 176) through a very small plug of cotton wool previously saturated with chloroform and placed in the neck of the separator; rotate the brine with a few C.c.'s more chloroform; mix with the first portion and either (1) evaporate, dry below 80° C. and weigh, or (2) dilute with chloroform to 100 C.c. and divide into two equal volumes. Evaporate, dry, and weigh the one as usual, but remove the chloroform from the other by a current of air and titrate the residue, using the equivalent 0.0244. The titration figure should come within 2 or 3 per cent. of the weight.

PROCESS No. 2.

The "aliquot part" principle can be usefully applied in the assay of ipecacuanha root whenever approximate or comparative results only are required. By attention to the following details of manipulation, etc., the errors usually accompanying this method may be so minimised that they become almost a negligible quantity, and in working the process there is a considerable saving of time and trouble.

Ipecacuanha root in fine powder, 12 Gm.; sodium bicarbonate, 2.4 Gm.; water, 6 C.c.; solvent (as above), 120 C.c. Introduce the solvent by means of a pipette into the stoppered separator D (page 176), the neck of which has been previously plugged with cotton wool; add the powder moistened uniformly with the bicarbonate and water, as in process No. 1, and shake occasionally during two or three hours; then add brine, 5 C.c.; agitate, and when aggregation of the powder has taken place force out 100 C.c. of the clear liquid into a graduated 100 C.c. flask by air pressure applied through H. If the stem of the separator passes well down into the

Ether extracts .. 0.005 p.c. none.

Chloroform ,, 0.030 p.c. none.

(1) (2) (3) Mother liquor still contains very heavy traces of alkaloid.

(4) Alkaloid completely removed.

This treatment removes a yellow substance which dissolves in acids to a yellow solution, but gives no precipitate with alkaloidal reagents. By comparison between two assays, in one of which the washing with brine was omitted, the amount of non-alkaloidal substance removed was found to be 0.15 per cent.

Water also purifies the final chloroformic solution, but it removes a notable quantity of alkaloid as well, so that its use for the purpose is inadmissible. In a duplicate assay treatment with small quantities of water extracted—

AN EXPERIMENTAL APPARATUS FOR MAKING POTASSIUM BICARBONATE.

BY F. H. ALCOCK.

The following represents a method and apparatus for making potassium bicarbonate, in place of the plan recommended by Professor Atfield in his 'Manual of Chemistry.' The one there suggested takes a very long time to get a crop of crystals from such quantities as half a fluid ounce or so of saturated aqueous solution of potassium carbonate. The proposed plan takes a very short time; in fact, the crystals can be seen forming, or, rather, falling as they form, at A in a few minutes after the operation has started. The globe H is an old bichromate battery glass, now used as an aspirator vessel, but the left-hand elbow tube could be replaced by a

thistle funnel, or, better, by a tube bent slightly, as shown in figure, under which a bottle F could be placed to catch the liquid which would be expelled from the generator H if by accident a stoppage by crystals occurred in A. The stoppers are of india-rubber; the thistle funnel to the right is only used as a safeguard against projection of fluid from A if attention is not paid to the details. The U tube is useful, for, from time to time, the progress of the chemical change can be tested by removal of a few drops of the liquid, by a tube, to a watch-glass containing a little mercuric chloride solution or other suitable test reagent. With the apparatus, as shown, two ounces of marble (four pieces) placed in the generator with fifteen ounces of water and one fluid ounce of B.P. hydrochloric acid, gave bubbles of gas at the rate of five per minute, and yielded in a few hours, from a solution of 100 grains of potassium car-

bonate and two fluid drachms of water, a mass of good-sized crystals, weighing, after well draining and drying, fifty grains. Evolution of gas practically ceased after six hours, and a quarter of an ounce of marble had been consumed.

NOTE ON QUININE ACETATE.*

BY J. RUTHERFORD HILL.

In connection with a recent paper on quinine solutions and ammonium acetate, by Mr. D. B. Kidd (*P.J.* [4] 10, 94), some discussion took place as to the solubility of acetate of quinine. On this point the 'Art of Dispensing' says: "The greater number of difficulties with quinine mixtures are caused by the formation of less soluble salts, owing to double decomposition—for example, in the case of Mindererus spirit and sulphate of quinine. It so happens that acetate of quinine is one of its least soluble salts, although it dissolves readily on heating, and in certain proportions it is possible to get a mixture of an alkaline acetate and quinine sulphate perfectly solid owing to the formation of quinine acetate."

Mr. Kidd suggested, and apparently correctly, that the above-mentioned precipitate is not acetate but hydrate of quinine, which separates, owing to dilution of the acetic acid ions by the alkaline acetate solution.

That any alkaloidal acetate should be exceptionally insoluble was considered improbable, and it seemed desirable that acetate of quinine should be further examined. Mr. Kidd obtained a sample from Howards, which he kindly handed to me. Howards say they have not much information about the salt, which is very little used and not quoted commercially. Its solubility in cold water is said to be slight, and in hot water it is said to be fairly freely soluble. I have been unable to find any published reference to the salt, and Howards can give none.

It is in light filiform silky white crystals, rather smaller and duller in appearance than those of quinine sulphate. The crystals are permanent in air at the ordinary temperature. The aqueous solution is almost neutral, or very faintly alkaline, and, like the sulphate, has a bluish fluorescence which is greatly intensified on adding excess of acetic acid, and is still very evident when the solution is largely diluted.

0.52 Gm. of the salt was dissolved in water, excess of ammonia added, and the alkaloid washed out with chloroform. 0.52 Gm. gave 0.389 Gm. of quinine = 74.8 per cent.

0.222 Gm. of the salt was dissolved in water and titrated with N/10 sodium hydroxide solution and phenolphthalein. 0.222 Gm. required 7.3 C.c. of the N/10 solution = 0.0435 Gm. acetic acid, or 19.6 per cent. The salt contained a slight trace of sulphate, and hence the foregoing result is lower than it would otherwise have been.

An attempt to determine water of crystallisation by drying at 100° C. failed, because at that temperature the whole of the acetic acid, as well as the water, is driven off. This is confirmed by Howards. The presence of water of crystallisation is easily proved by heating a little of the salt in a dry test tube, and the amount, indirectly determined by difference, is 5.6 per cent.

A salt having the formula—

requires—

	Calculated.	Found.
Quinine	74.37	74.8
Acetic acid	19.97	19.6
Water	5.66	5.6

The foregoing therefore represents the correct formula.

Excess of the salt was shaken up with water, allowed to stand for 24 hours, with frequent agitation, at 15° C., and filtered. It was found that 20.8 Gm. of water dissolved 0.4 Gm. of quinine acetate.

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh. April 18, 1900 (see page 430).

The solubility in cold water is therefore 1 in 52. It was freely soluble in hot water.

Excess of the salt was similarly shaken up with alcohol (90 per cent.), and it was found that 8.87 Gm. had dissolved 1.25 Gm. The solubility in alcohol (90 per cent.) is therefore nearly 1 in 7 (1 in 8.5 by vol.).

The salt dissolves in chloroform about 1 in 12 (1 in 8 by vol.), less readily in ordinary ether, about 1 in 130 (1 in 172 by vol.), and in absolute ether about 1 in 390 (1 in 542 by vol.). Howards say: "We are not aware of any salt of quinine which is soluble to any extent in ether." Quinine acetate seems to be an instance.

When excess of ammonium acetate solution is added to a saturated aqueous solution of quinine acetate, the liquid in a short time becomes solid, owing to formation of the bulky quinine hydrate. The same result happens even when considerable excess of acetic acid is present. This tends to substantiate the accuracy of Mr. Kidd's suggestion as to the cause of precipitation in such mixtures as Mindererus spirit and sulphate of quinine. There are many other dispensing occurrences in the elucidation of which a knowledge of the new dualism in chemistry would doubtless be useful.

I have to thank the Messrs. Howards for their prompt and courteous reply to my inquiry.

NOTE ON GELATINISED TINCTURE OF KINO.*

BY J. RUTHERFORD HILL.

Much has been written on the subject of the gelatinising of this tincture, but my experience is that many pharmacists have never seen a sample, and I thought members might be interested to see this one, which occurred under my own observation. In 1885 glycerin was introduced into the formula as a means of preventing gelatinisation. In 1886 Mr. Duncan and I did some work on the subject, which proved that glycerin did not prevent gelatinisation. This sample was made by the 1885 formula, and its present condition corroborates our work, because, as you see, it is completely gelatinised. It has been standing in this glass-stoppered bottle in an ordinary laboratory for more than three years, and though periodically handled during that time, it was only recently observed to have become solid. The curious thing is, that a sample of the same make, kept for the same period in a similar bottle in the same place, remained liquid, and with no sign of gelatinisation. It has been said that some samples of kino yield tinctures which gelatinise, and others do not, and inquiry has been directed to the discovery of some difference in the kinos used. This sample rather suggests that the cause of gelatinisation does not lie in any difference in the kino. On the same shelf with the tincture of kino bottles is a similar bottle containing collodion, which also, you will see, has become quite solid. It has, in fact, gelatinised. In this case there is not the slightest doubt that the collodion has become solid owing to slow evaporation of the ether and alcohol escaping between the glass stopper and the neck of the bottle.

May not a similar loss of menstruum account for the gelatinisation of the tincture of kino? An examination of the bottle will show that the stopper is not quite tight owing to a slight caking of the kino inside the neck. In the other bottle in which the tincture remained liquid, the stopper was tight.

May not the efficacy of glycerin as a preventive of gelatinisation be due to the fact that it lubricates the stopper and prevents evaporation, as it does, for instance, when added as a preservative to spiritus ætheris nitrosi?

A bottle of similar make containing flexible collodion stood beside the collodion, and it remains unchanged, because the castor oil lubricates the stopper and makes it tight.

If there is any foundation for my surmise, the true remedy for gelatinisation would be a slight reduction in the strength of the

tincture, say, $1\frac{1}{2}$ ounces, instead of 2 ounces, in each pint. Keeping in carefully-stoppered bottles would also be desirable. Since the foregoing was written I observe that Mr. E. M. Holmes asks for any samples of gelatinised tincture to be sent to him for investigation, and I shall have pleasure in forwarding this one. What I have said is merely a suggestion which may be worthy of further investigation.

COPPER IN NUX VOMICA.*

BY J. RUTHERFORD HILL.

Recently one of our members consulted me as to the following mixture:—

R	Tinct. Nucis Vom.	ʒii.
	Sp. Ammon. Aromat.....	ʒiv.
	Sp. Chloroformi	ʒii.
	Aq. Ment. Pip.	ad ʒvi.

This, by the way, is an incompatible mixture similar to that dealt with by me at a former meeting (*P. J.* [3], 23, 799), but that was not the question raised. When dispensed, the mixture has a slightly yellowish white milky appearance, which, on standing, slowly changes to a greenish blue colour, somewhat resembling commercial ferrous phosphate in tint. This change of colour in the hands of the patient raised suspicion, amounting to a complaint that the medicine was wrong, and although dispensed again with a similar result, the patient refused to be satisfied, and demanded the return of her money. The question was why did the mixture change colour?

A few experiments showed that the change of colour was due to a reaction between the tincture of nux vomica and the aromatic spirit of ammonia. The mixture was dispensed with eight samples of tincture of nux vomica from different makers, and in every instance the same change of colour took place, though in varying degree. Some of the tincture was evaporated to dryness and ignited and the residue tested for copper, of which a minute, almost doubtful trace was found to be present. One fluid ounce of liquid extract of nux vomica was evaporated to dryness, ignited, and tested for copper, which was easily proved to be present, and obtained on a polished steel wire in the metallic state. It was quite evident, therefore, that this copper in the nux vomica was the cause of the colour.

In a paper read at the Brighton meeting of the British Pharmaceutical Conference ('Year-Book,' 1884, p. 586), I drew attention to the presence of copper in several extracts, infusions, and decoctions, and its presence was attributed to the use of copper evaporating pans.

I obtained a sample of fluid extract, guaranteed never to have been in contact with copper during the process of manufacture. On dispensing the mixture with a tincture made from this, I found evidence of copper even more than in some of the other tinctures. I prepared myself some tincture direct from the powdered seeds, entirely in glass vessels, and this also gave the same evidence of copper when used to dispense the mixture. I was kindly supplied by the maker with some of the same ground seeds as those from which the guaranteed fluid extract had been made. 19.16 grammes of these powdered nux vomica seeds were incinerated, and yielded 0.613 gramme of ash, equal to 3.2 per cent. The ash was treated with hot sulphuric acid, water added, filtered into a Nessler tube, excess of ammonia added, and water up to 200 C.c. By comparison with a standard solution of ammonio-sulphate of copper the blue tint indicated that the 0.613 gramme of ash contained 0.045 gramme of copper, which is equal to 7.34 per cent. in the ash, or 0.24 per cent. in the powdered seeds. The ash also contained iron and manganese. Unfortunately I could obtain none of the whole seeds from which the ground sample was made, and the question as to whether the

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh, April 18, 1900. (See page 430.)

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh, April 18, 1900. (See page 430.)

copper arose partly from contamination in the process of grinding could not be absolutely settled. I examined several commercial samples of powdered nux vomica and in every instance found copper present, though in less amount than in the sample above referred to. I also examined two commercial specimens of the whole seeds, one grey coloured and the other greenish, and in both instances found distinct evidence of copper, though in less amount than in the first sample. I fancied the amount was slightly greater in the green than the grey, but this is not definitely ascertained.

It was evident, therefore, that the copper in the fluid extract was not necessarily due either to the grinding or manufacturing process, though some might come from the latter source, as I found in several instances that copper pans were used. But the copper was evidently present in the seeds themselves. Whether this is what is known as "normal copper," naturally present in the seeds, could only be determined by a further research. 35.28 grammes of the guaranteed fluid extract were evaporated to dryness, and incinerated, yielding 0.054 gramme of ash, equal to 0.16 per cent. The ash was dissolved in hot sulphuric acid, water added, filtered into a Nessler tube, excess of ammonia added, and water up to 50 C.c. Compared with standard solution of ammonio-sulphate of copper the ash contained 0.002 gramme of copper, which is equal to 3.76 per cent. in the ash, or 0.006 per cent. in the fluid extract, or 0.001 per cent. in the tincture made from the fluid extract. The 6 oz. mixture would, therefore, contain rather less than one-thousandth part of a grain of copper. Many of the tinctures with even less than this gave distinct evidence of its presence. The quantity is so small as to be entirely harmless. Lehman ('Year-Book,' 1897, page 204) says the ordinary daily diet of an adult contains about 0.002 gramme of copper, and that only when the daily amount reaches 0.012 gramme is it harmful.

The presence of copper in plants is well-known. Bloxam says, "copper is not at all frequently found in animals or vegetables." This is not correct; Walchuer says it is as widely distributed in nature as iron, and occurs in all soils and ferruginous natural waters and ores. It occurs in seaweed, straw, hay, eggs, cheese, meat, and other food-stuffs, and in human blood. Gmelin says it occurs in many moulds, and in plants growing therein. Dieufalait says it occurs in all plants growing on primary rocks, or on soil derived from these rocks. More to the point is the statement of Pereira (Materia Medica, page 867), "Copper has been discovered in the ashes of most plants, as of stavesacre, rhatany, flax, nux vomica, and hemlock." Later on, however (page 1,483), he says, "Meissner detected copper in the ashes of nux vomica; but I have several times repeated his experiment without recognising this metal." Meissner, nevertheless, seems to have been correct.

The curious thing is that it should not apparently before now have revealed itself in an unexpected way at the dispensing counter. One is almost inclined to think the quantity present in this case is so distinct as to be more than the mere trace I had always considered to be the limit of normal copper in any plant. It could hardly have escaped so careful an observer as Pereira. So far as I know, the only descriptions of the collecting of the seeds are those given by Watt ('Dictionary of Economic Products of India,' vol. vi., part 3, p. 380): "The seeds are collected either together with the fruit, or from the ground, where they have been thrown by birds while eating the pulp. They are then washed to free them from fragments of pulp, dried, and exported to Europe"; and by Dymock ('Pharmacographia Indica,' vol. ii., p. 501): "The best seed is obtained by collecting the fruits, washing out the seeds and drying in the sun." Whether the seeds are ever treated with a salt of copper in preparing them for the market is a point I would like to know about, but it must remain for enquiry. This must be settled before it can be absolutely stated that the copper which gave rise to this enquiry is to be regarded as normal copper.

Incidentally it may be mentioned that no two of the eight samples of tincture of nux vomica are alike in colour. They range from a light brownish-green to a deep dark brown. One of the samples is distinctly darker in colour than the guaranteed fluid extract before referred to. The reason why the blue copper tint only slowly develops in the mixture is possibly the fact that the metal does not occur as an ordinary copper salt, but as a complex organic compound, probably of an albuminoid nature.

SOLUTION OF ARSENIC AND IRON WINE.*

BY ARCHIBALD CURRIE.

My attention was directed to the following prescription by dispensing it on two occasions with different results:—

R Liq. Arsenicalis	ʒii.
Syr. Simplicis	ʒii.
Vin. Ferri	ʒi.

On the first occasion the mixture was clear, while on the second occasion a green turbidity was observed, which settled out as a green precipitate. They were dispensed with two different wines. Fortunately I had some of the first wine left. The first I call No. 1, and the second No. 2. On testing No. 1 wine for iron I found merely a trace in the ferric condition. No. 2 contained 0.47 per cent. in the ferrous state, with a trace of ferric. No. 1 was faintly acid and No. 2 was neutral. No. 1 was a rich, full-bodied, rather sweet sherry. No. 2 was dry and faintly acidulous. Both wines conformed to the official B.P. tests.

My experiments entirely bear out the general opinion that the proportion of iron dissolved depends on the acidity of the wine. The state of the iron and acidity of No. 1 were, doubtless, due to age, it having been in stock over a year, whereas No. 2 was freshly prepared.

On examining the mixture made with No. 2, I found that practically all the arsenic had been precipitated as ferrous arsenite, the precipitate consisting of a mixture of this and ferrous hydrate. Whatever value ferrous arsenite may have as a therapeutic agent, the form it takes in No. 2 is certainly both inelegant and dangerous; and in No. 1 the prescriber might as well order arsenic and sherry wine.

If No. 2 is dispensed with the hydrochloric solution of arsenic the mixture remains clear, the ferrous arsenite being held in solution by the hydrochloric acid.

The inference is that the proportion of iron in iron wine is very indefinite, and if prescribed with arsenic the hydrochloric solution of the latter should always be ordered.

A much better preparation, and one which may be prescribed with either of the arsenic solutions, is the vinum ferri citratis.

GLYCERIN OF CODEINE.*

BY ARCHIBALD CURRIE.

I had occasion some time ago to make a glycerin of codeine containing 2 grains in each ounce. At first the codeine was dissolved in alcohol, but it was found that unless an excessive amount (ʒii.) was used, the codeine crystallised out on being added to the glycerin. Codeine combining readily to form soluble salts with most acids, the solution was made as follows, using heat to hasten solution:—

R Codeine	gr.ii.
Acid. hydrochlor. dil.	ʒii.
Aquæ	ʒxxx.
Glycerin	ad ʒi.

I was surprised to find that this solution developed a yellowish tinge and a most disgusting odour. The same result happened, only more slowly, when the glycerin was added cold. Dilute sulphuric and phosphoric acids gave a solution which kept clear and

* Read at an Evening Meeting of the Pharmaceutical Society in Edinburgh April 18, 1900. (See page 430.)

odourless. Codcine alone heated with water and hydrochloric acid gave no odour. Glycerin and hydrochloric acid developed the same disgusting odour and yellow tinge. Price's glycerin gave the same reaction in a less degree. Both glycerins conformed to the official B.P. tests.

COMMERCIAL GLYCEROPHOSPHATES.*

BY J. H. HOSEASON.

The examination of a number of samples of glycerophosphates collected during the past few years yielded the following results:—

No.	Salt Examined.	Percentage of Pure Salt.†	Remarks.
	p. c.		
1	Sodium glycerophos. 75 paste	74.8	Colour, pale straw
2	Do. do. 75 liquid.....	72.2	Do. dark brown
3	Do. do. 75 paste.....	75.5	Do. do.
4	Do. do. 50 liquid.....	48.9	Do. do.
5	Potassium do. 75 thick liquid..	74.9	Do. pale straw
6	Do. do. 50 liquid.....	52.3	Do. dark, contains 4 per cent. K ₂ HPO ₄
7	Calcium do. white powder ..	99.2	H ₂ O 8.2 per cent.
8	Do. do. do.	98.1	H ₂ O 9.34 per cent.
9	Do. do. yellowish powder	97.8	H ₂ O 9.72 per cent.
10	Iron do. scales	92.6	79.8 Fe (ous)
11	Do. do. yellow powder..	91.4	50.2 Fe (ous)
12	Quinine do. grey crys.mas ..	93.3	Excessive moisture
13	Do. do. do.	92.6	Do. do.

† Calculated from H₃PO₄ content, excepting 12 and 13, from alkaloid.

Samples of the potassium and sodium salts by different makers had varying physical characters, some being in the form of a thick syrup, others existing as a stiff paste, manufacturers evidently working to a percentage of phosphoric acid. A possible explanation of this is the fact that glycerin and phosphoric acid may combine in various ratios giving rise to different glycerophosphoric acids. A great improvement has been effected recently in the manufacture of these salts, the charring usually occurring during the combination of glycerin and phosphoric acid being avoided to a great extent, so that the salts are less highly charged with colouring matter than formerly.

EXTRACTS FROM CONSULAR REPORTS.

BRITISH SOAP MANUFACTURERS formerly supplied Java with the cheaper qualities of soap on a large scale, but the trade is now said to have been almost entirely supplanted by the product of local industry, which turns out an article suitable to the native requirements at a figure considerably below that required by British manufacturers.

THE TOTAL EXPORTS OF CINCHONA BARK from Java during the years 1893-1898 amounted to 54,827,400 Amsterdam lbs., the yearly exports being as follows:—

Year.	Quantity.	Average Price per Unit.
	Amsterdam Lbs.	Cents.
1893	7,342,000	4.28
1894	8,917,700	3.95
1895	8,827,700	2.79
1896	10,079,000	2.67
1897	8,511,000	4.70
1898	11,150,000	4.78

The large quantity exported in 1898 was attributed to a number of the cinchona estates having taken advantage of the rise in home prices to harvest their bark on an unprecedentedly large scale; it should also be remembered that 500,000 ounces of quinine sulphate, manufactured in Java in 1898, represented in bark nearly another 350,000 Amst. lbs. According to Acting-Consul A. F. McLachlan, such large exports of bark are not likely to prove permanent.

*Abstract of a paper read before the Manchester Pharmaceutical Association March 14, 1900.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

The Sale of Photographic Chemicals.

I note that a correspondent of the *P.J.* takes exception, in last week's issue, to the retail prices quoted for chemicals used by photographers, since he finds that a number of them are below London wholesale list prices. That is not at all surprising, as London wholesale list prices are usually arranged with a view to a discount of five per cent. or more being allowed to the retailer, and carriage being paid on all orders above a certain value. If "Photographic Chemist" wishes to do a trade in photographic chemicals, on the best possible lines, he should write to such a firm as Messrs. Harrington Brothers for their wholesale price list of chemicals for photography and he will probably find, on referring to it, that the prices he alludes to in his letter are not so extravagantly low as he seems to imagine. It is necessary to recognise that photographers, as a class—both amateurs and professionals—are accustomed to purchase the chemicals they require on the best terms available, and that, if one desires to secure a share of the photographic business, it must be by selling goods at prices which may sometimes appear of a cut-rate character, though they leave a fair margin of profit if sufficient business be done, and if the photographic "side-line" be developed on proper lines, so that the retailer does not depend upon the sale of chemicals alone.

Of Matters Microscopical.

There is never any end to improvements in microscopes and accessories, but it may be doubted whether any time has been so prolific as the present with regard to the introduction of new instruments for use in the examination of the infinitely little. I was particularly struck with that fact on looking through the 'Illustrated Annual of Microscopy' for the current year—a volume which is full of useful information on the subject of which it treats. In the section devoted to new instruments and apparatus are particulars of some of the most practical microscopes that have yet been produced—microscopes, that is to say, which combine the chief advantages of the large and most expensive instruments with the undoubted convenience of the smaller students' stands. Watson and Sons' new "Royal" microscope is an excellent type of that class of instrument. It takes eye-pieces of the English size, has a fine adjustment to the sub-stage as well as to the body, a rackwork draw-tube which permits of the use of objectives adjusted for various tube-lengths, and a capital mechanical stage with stationary milled heads, rotating top plate, etc. Other instruments on similar lines are Baker's "D P H" microscope, No. 1, and Swift's "New" microscope, which are equally suitable for good, all-round work, and fit for use in the most delicate investigations. Then, a new series of instruments is about to be introduced by Messrs. Ross, Limited. Messrs. Watson and Sons, I notice, have formed a circulating series of microscopical slides, two hundred and forty slides being sent on loan for an annual subscription of one guinea. The details differ somewhat from those of Baker's scheme, but an excellent guinea's worth is offered in either case. Space will not permit me to deal at length with other novelties that have struck me, but I must just direct attention to Watson's new "Holoscopic" eye-pieces and objectives, and to their oil immersion and dry condensers of high aperture. All those novelties are offered at prices which are almost fabulously low, compared with what microscopists have been accustomed to pay for many years past, and the only trouble is to decide which among so many admirable accessories will best serve one's purpose.

New R.M.S. Universal Sizes.

The incalculable benefit that has resulted from the general adoption of the Royal Microscopical Society's standard screw for objectives has, at last, encouraged the Council of that body to go

beyond what was done in 1882 in the matter of recommending standard sizes for the diameters of eye-pieces. It has now been decided that the following four sizes should be adopted as standards:—

R.M.S.	No. 1	0.9173 inch =	23.300 Mm.
„	No. 2	1.04 „ =	26.416 „
„	No. 3	1.27 „ =	32.258 „
„	No. 4	1.41 „ =	35.814 „

No. 1 is the Continental gauge, No. 2 is the mean of the sizes used by English makers of students' microscopes, No. 3 is the mean of the sizes used for medium-sized instruments, and No. 4 is the maximum size for long-tube microscopes. I should advise pharmacists to specify No. 2 or No. 3 size when ordering new microscopes, and to decline to purchase any instrument with a draw-tube of lesser or intermediate diameter. The present senseless variation in sizes is frequently the cause of much annoyance and needless expense, and I hope there will be such unanimity amongst users of the microscope as will compel manufacturers to co-operate with the Council of the Royal Microscopical Society in this matter. A standard size—1.527 inch = 38.786 Mm.—has also been adopted for the inside diameter of the substage fitting, and in that respect, as well as with regard to standard sizes for objectives and eye-pieces, it should not be long before there is general agreement—in England, on the Continent, and in America.

The Council Election, 1900.

My information about the Glyn-Jones caucus meeting has been fully confirmed, but, thus far, not supplemented by anything which has appeared on the subject in the trade journals. One point upon which it would be interesting to have further information is whether the four selected candidates approve of the manner in which their claims are to be brought before the electors. In particular, I, in common with many other pharmacists, would like to know what is the relation of Messrs. Gibbons and Taylor to the caucus; it may almost be taken for granted that Messrs. Cooper and Wootton have acquiesced in what is being done on their behalf. Again, are the voters to be asked to plump for the curiously assorted four, or are three of the old members of Council to be added to the selected list, and, if so, which three? Messrs. Hills, Storrar, and Symes, are, in my opinion, more likely to commend themselves to the caucus than Messrs. Bateson, Cross, Grose, or Warren. I find, however, that there is a strong determination on the part of the seven old members to stick together and share the responsibility of whatever portion of the Council's proceedings may not be approved by any section of the electors. In those circumstances, therefore, it will probably be in vain that Mr. Glyn-Jones and his associates may endeavour to sow dissension amongst the supporters of the policy of the Council as at present constituted.

Unsatisfactory Compressed Tablets.

No better example is afforded of the tendency to work an idea to death than in the case of compressed tablets—a form of presenting medicaments, etc., which is nowadays resorted to indiscriminately and without sufficient regard to its fitness. One could almost imagine that manufacturers of tablets would have the world believe that there is a special virtue in the form in which they prepare drugs and chemicals, over and above that of the substances compressed, but though that may occasionally be true, it is more frequently the reverse of fact. I have been particularly struck with the unsatisfactory nature of different makes of so-called effervescent tablets which have passed through my hands of late. Almost without exception, they are utterly useless for the preparation of effervescent draughts, as disintegration proceeds so slowly that nearly all the gas has been dissipated before solution is complete. On dropping the tablets into water, effervescence proceeds very slowly from the surface only, and at any given stage in the process of disintegration the solution is flat and insipid. The only thing to be done is to crush the tablets before adding them to the water, and they are so unnecessarily hard that it requires considerable force to reduce

them even to coarse powder. I am afraid the manufacturers think too much of producing well-finished tablets and too little about making them good. There may, possibly, be some properly made effervescent compressed tablets on the market, but so far I have not handled them, and I am rather inclined to doubt the existence of such articles.

The Conference Programme.

There is, it seems to me, one great fault in the proposed arrangements for the Conference week in July next, inasmuch as they have not been arranged with a view to showing what London is capable of. The reception on Monday night, concert on Wednesday night, and river excursion on Thursday, are items which might have occurred to anyone, even if called upon to make the arrangements at a week's notice, but no genius has been displayed in suggesting such an ordinary, matter-of-fact programme for a meeting in the greatest city of the world, during the closing year of a most famous century. We ought to have had something quite out of the ordinary this year, beginning with a reception at the Mansion House by the Lord Mayor of London. The garden party at the Botanic Gardens on the Tuesday afternoon is well enough in its way, if the Executive Committee proposes to engage the Gardens for the purpose, but I sincerely hope it is not again intended to allow any individual to entertain the members of the B.P.C. on that occasion. For the following day the stereotyped concert might well have been dispensed with for once; a dinner at the Hôtel Métropole, followed by a general move to some theatre previously engaged, would have been much more to the point. Leading actors, literary men, scientists, etc., might have been invited to the dinner and pharmacy permitted for once to feel itself the power in the world it really is. But no, we must adhere to precedent and save the wear and tear of brain tissue on the part of those responsible for making the arrangements, by agreeing to the usual tea-and-muffin sort of programme, on a somewhat more elaborate scale than usual, five hundred pounds being spent by the local committee instead of the modest fifty expended in smaller places. It is pitiable to reflect, however, what a golden opportunity is being missed by those whose united efforts do not enable them to rise above the idea of spending the whole day of a large company assembled in London in going out of town by an excursion train, then drifting down the river in barges, and finally returning again to the world's centre by rail. The whole affair is ridiculous in the extreme, and more likely to make angels laugh than weep, though the latter ought to be the correct thing to do.

Closing Time at No. 17.

The brisk correspondence on the subject of the time at which the Pharmaceutical Society's Library and Museum close has drawn a veteran into the field in defence of the existing position, but I fail to see that Mr. Ince has proved his case. He knows well enough that masters will not set their assistants free as suggested, and he ought also to know that freedom from duty for "an hour or so" will not suffice in cases where serious literary research is involved. Several hours' quiet and continuous work are not uncommonly needed for the purpose, and it is hardly fair to expect masters to spare their assistants for so long a time during the day. Is it quite fair, too, for one who has enjoyed the advantage of late hours in the Library, as Mr. Ince has done, to deny a similar privilege to others, now that he is resting in his well-earned retirement? The expenditure on illuminating and heating arrangements is altogether too trivial a matter for consideration, and I trust that will not be permitted to affect the matter. It is a serious question for students, young and old, that admission to the Library and Museum should be inconveniently restricted, and not one to be answered in an off-hand manner. As regards the attendance of the Librarian and Curator, Mr. Ince will probably find both absent from their posts during the whole of the present week and on many other occasions, yet the Library and Museum are open and can be used for reference purposes.

LETTERS TO THE EDITOR.

A Pharmaceutical Caucus.

In the comments made by "An Ordinary Pharmacist," which appear in your issue of April 14, upon the formation of a pharmaceutical caucus, there is abundant matter for the serious consideration of every member of the Pharmaceutical Society. If future elections are to be preceded by meetings of the extraordinary character reported, I have no hesitation in saying that such action would rapidly result in the destruction of independence. Future candidates would be at the mercy of a self-constituted secret committee of selection: they would, in all likelihood, be expected to represent its policy, and in the majority of cases become delegates rather than independent Councillors.

The candidature of a much larger number of gentlemen than is usually the case should be regarded as extremely satisfactory evidence of greater interest in the work of the Society's Council: for whether it amounts to an appreciation or a condemnation of its policy, the net result must be in the direction of renewed vigour. The fighting instinct is strong in the breast of every British subject—in this case even the pharmaceutical Councillor affords no exception to the general rule—but no candidate can be proud of an election, which, from the first, appears to be an almost foregone conclusion. Another instinct, equally British, is for a fair field and no favour; but in the circumstances which surround the creation of this new caucus, I consider that all candidates, except the four who have accepted its patronage, have cause for complaint, and more particularly my seven colleagues who are retiring from the Council and—submitting themselves for re-election—are denied the fair field. They may not thank me for endeavouring to champion their cause, for every one of them is well able to take care of himself; but I am compelled, through the force of my conviction, to protest with all my strength against the elements of disintegration which would surely follow upon the undercurrent of this latest pharmaceutical caucus if such proceedings should become a precedent for future interference.

I admit that it is both right and judicious for members of our Society, whether as associations, or in meetings convened for the purpose, to gather together and discuss the claims of rival candidates;—whether singly or in group—and to recommend them to their brother electors as desirable representatives, pushing the candidature by every influence they can bring to bear. That has been done before, on many occasions, and probably will be again. In concerted action of this kind, however, it should be borne in mind that no individual can dissociate himself from the office he holds. Indeed, his position amongst his fellow members marks the sphere of his influence and, from my point of view, it is a deplorable fact that a member of Council, whose own seat therein is not imperilled for two years, has expressed his desire to oust at least four of his colleagues from their position and has initiated a movement with the express object of so doing. It is for the members of the Society at large to determine whether the action taken by Mr. Glyn-Jones is conducive to the interests of the Pharmaceutical Society, and to assess the importance of its example in the constitution of future councils; for in my opinion such a procedure is likely to render the honourable position of Councillor intolerable, and to deter many otherwise suitable candidates from accepting nomination. I write in no unfriendly feeling towards my colleague Mr. Glyn-Jones, but since he has boldly declared himself on one side, I am no longer inclined to keep silence on the other. In the interest of all the gentlemen whose candidature is subjected to an attack of a nature altogether unprecedented, I venture to reiterate the supplication of "An Ordinary Pharmacist," viz.:—That voters "would do well to ask why they should act on the recommendation of the Glyn-Jones caucus?" and that they should consider

"in what respect the new men are better than those they may reasonably expect to displace?"

Kilburn, N.W., April 16, 1900.

CHARLES B. ALLEN.

Candidates for the Council.

It would appear from the unusual number of candidates for the Council this year that considerably more interest is taken in the event than on other occasions. While looking over the respective views and claims of the candidates one cannot but reflect upon surrounding circumstances and observe the very unsatisfactory muddle consequent upon the various irreconcilable opinions so tenaciously held. There is one extreme section that will listen to no proposal which will not give us the Pharmacy Act of 1868—as interpreted by the adherents of that section—and appear to ignore the House of Lord's interpretation. Then there are the supporters of another extreme section, the pessimistic party, who, broadly speaking, would accept the Lord Chancellor's solution, excepting so far as the use of chemists' titles is concerned.

I take the liberty of reminding the former section that during the last twenty years pharmacy companies have not been breaking the law, and that fact is a serious obstacle to the accomplishment of our wishes. I do not say that length of tenure is an argument for continuing that which is contrary to public policy; but I do say that some consideration will have to be shown because of it. To the latter section I venture to offer my opinion that, irrespective of any merit their scheme may have, it cannot be carried to our satisfaction, because it has practically no supporters, except in Scotland and London. In any case, we can get that result by simply doing nothing, or by maintaining present disunity. There is also a third party who think a solution is to be found in making a qualified directorate compulsory. I have much sympathy with that section, because they see that while the demands of the uncompromising party are unattainable, the qualified manager supporters concede too much, and they have endeavoured to find a middle course which would be acceptable.

There is reason for disquietude in the fact that prominent men who advocate one view or another, will do their level best to bring the Council to adopt the scheme which is the particular pet of the individual. There is strong indication of this being the case in some instances. If all approach the subject in this frame of mind we must be content to remain helpless and incapable. It is nothing to us that some men should be able to say in the future, "I told you so; I was the true prophet." What we want is that men of ability and knowledge should be sent to the Council, who would contribute intelligent assistance in the effort to solve a problem and be broad-minded enough to appreciate the value of contra-arguments. It has been correctly stated that the diverse opinions in the Council reflect the opinions of the constituents; but I have good reason for the belief that if the Council would adopt a definite policy, not unreasonable on the one hand, nor too submissive on the other, the support of practically the whole of the pharmaceutical community would be forthcoming.

It must be admitted that neither of the three proposals before us meets the case, for the following reasons:—

(1) The objects of the no-compromise section are now unattainable, however greatly to be desired.

(2) The qualified manager scheme concedes far too much and secures too little in return.

(3) The qualified director plan would be prohibitive if practicable, otherwise it would be useless; therefore must go with (1). Further, in the event of failure, with this policy we should have made admissions on points of principle which would be used against us.

With the rejection of these suggested policies, are our resources exhausted? I think not. The Council has decided upon the only course open in the circumstances, that is, to oppose Clause 2, but let the opposition be successful so far, the first step only will have

been gained, the problem will still remain for solution. I would welcome the return of men to the Council who would enter upon the consideration of the subject with open minds, realising their responsibility, men who would feel that the solution of a riddle must be found, and that they have got to find it. Circumstances change, and opinions must change or be modified accordingly. Success, or anything near it, will never be reached if the administration of the affairs of the Society is in the hands of men who are unable to divest themselves of bias or prejudice and will have nothing more nor less than the adoption of the one particular scheme they favour.

I am not impressed with the selection of Mr. Glyn-Jones's meeting; the information we have upon which that selection has been made scarcely justifies it; probably the recommended candidates will further enlighten us as to their views.

Liverpool, April 16, 1900.

JOHN SMITH.

"Constructive Criticism."

May I ask your Annotator to introduce me to some pharmacist who assumes either "mistakenly" or "innocently that the Pharmacy Act of 1868 is operative"? I submit that a statement such as the one on page 404, second paragraph, is calculated to confuse the electorate; I am further justified in thinking it of first importance that a clear issue ought to be placed before the members of the Society, in order that all doubt as to their opinions may be avoided. I would point out also, that it is repeatedly asserted that the division of opinion amongst members of the Council merely reflects the views of the electorate. This I have persistently denied, and claimed that practical unanimity existed, that the apparent disunity is not real, and is caused by the simple problem being confused. In support of this you say, *e.g.*, in an editorial, page 611, December 23, 1899, "The opinions of the registered chemists of Great Britain, as voiced by their representative organisations, are—generally speaking—that none but individuals registered under the Pharmacy Acts should be permitted to assume or use the titles protected by those Acts, or to retail, dispense, or compound poisons." You continue: "The vast majority of registered chemists are in favour of an attempt being made to enforce those views by legislative action." This is admittedly a fair deduction from the evidence obtained by the Federation as to the state of public opinion existing; for what did they find? The "vicarious" qualification, *i.e.*, the qualified managership proposition, utterly discredited, and ought never again to have been heard of. Next, the character and amount of support which the "qualified directorate" solution received only gave evidence that some confusion existed in chemists' minds which, if dispelled, would leave a practically unanimous opinion in favour of "No compromise." On these grounds, I am justified in saying that due importance has not been attached to the policy of active aggressiveness to "make operative" the Pharmacy Act of 1868—the policy supported by a large majority of opinion. Members of the Council ought not to be degraded to the position of delegates; but due regard has not, in my opinion, been attached to such an important expression of opinion.

Objection to the statements made in open Council that only "destructive criticism" is offered of the action or inaction of the Council. It has often also been stated and inferred in the pages of the official Journal that critics were presumably incapable of "constructive criticism." I think such statements are a little less than just! Personally, I have said "that the only practical policy was one that would rigidly restrict unqualified persons from any interest in the qualifications and privileges earned by personal endeavour and sacrifice." I have advocated "claiming all the rights intended to be granted in 1868," on the ground that it was merely justice, that what was the minimum then cannot be too much after thirty-two years' compulsory examination. I have said

repeatedly that the action of the Lord Chancellor gave us a straight fight, and made the issue definite. I have advocated objection to Clause 2 and claiming inclusion—at the same time—in Clause 3. I have insisted that this issue should be forced, that the unanimous support of the medical and legal professions can (it has been demonstrated) be obtained. I have said, and it is proved, that the favourable consideration of members of Parliament and the public can be obtained for this policy. I have gone further, I have said if this policy merely made the Government drop the two clauses (which I refuse to take for granted), the ground will have been prepared for an agitation in favour of a short Amending Act, in which I would ask nothing but what would make the Act of 1868 real, and carry out the evident intention of the Legislature. The Council would confine itself to this because there can be no argument as to the justice of the claim, but especially because a principle is involved, which, if established, will put pharmacy on a footing from which progression and elevation are inevitable. In short, I stand or fall on the question of personal qualification and responsibility—which is the issue. In view of the statements in open Council and repeated suggestions elsewhere to the same effect, I am entitled to show that "constructive criticism" has been offered.

Blackburn, April 16, 1900.

R. LORD GIFFORD.

A Candidate's Views.

Being a candidate for the forthcoming Council Election, I should esteem it a favour to be allowed to express my views in the Journal. Briefly stated, they are as follow:—I consider that this is an opportune moment for securing legislation relating to company pharmacy. Something more should be done than merely to oppose Clause 2 of the Companies Bill, for if it is deleted our position remains unaltered. Now that the question is before Parliament, we should strain every nerve to secure titles for the qualified individual. I am in favour of the division of the Minor Examination, provided no qualification is given until the whole of the examination is passed. I am strongly of opinion that the Research Laboratory has not been used to the best advantage, and I should earnestly support any endeavour to secure that the investigations carried out there may be of more distinct pharmaceutical interest than has formerly been the case.

The question of reciprocity with the colonies in relation to the qualifying examinations has recently received prominence; whilst aware of the difficulties in enforcing a definite standard for all parts of the Empire, I am convinced our own qualified men would benefit from reciprocity. I should therefore be prepared to seize this, the most favourable of opportunities, when the mother country and her colonies are so closely drawn together, to obtain powers to reciprocate in any or all cases where it may ultimately be found desirable. Whilst anxious to secure fresh legislation, I believe much can still be done by more thoroughly enforcing all the provisions of the present Pharmacy Act—a faulty system of registration makes the Act, in many cases, a dead letter—and I therefore urge the immediate consideration of this registration question.

That I am specially in sympathy with attempts to improve our position as traders is, I hope, shown by the part it has been my privilege to take in connection with the P.A.T.A. (which is now in its fifth year). I have been a member of that Committee since its inception, and have the honour to be the first Chairman of the "Chemists' Defence Association." From my connection with these organisations I have learnt much as to the particular needs and difficulties of chemists in businesses of the various kinds met with throughout the United Kingdom, and I hope that the experience I have so gained will, if I am elected, prove useful to me as a member of the Pharmaceutical Council. As a London candidate, I should be readily available for any Committee work.

South Kensington, S.W., April 18, 1900. ALBERT COOPER.

The Council Election.

Many expressions of opinion have appeared in the *P.J.* as to whether it would be advisable to elect some new members to the Council or be content with the old ones. In my humble opinion, as a small retail chemist, some change is absolutely necessary. We are told by Mr. Cross in last week's Journal that the Society has done an immense amount of good for chemists. That statement, if it refers to years ago may be correct, but during the last ten years unqualified companies have been launching out in all directions, and the Society has quietly looked on without trying to make a really stern effort to stop them. That the majority of chemists would not join the Society has been a standing complaint of late. How can it be expected that a man in a small way of business can keep on paying his guinea and see large unqualified companies opening next door, without any attempt being made to stop them. Competition we must expect, but let that be confined to those legally allowed to compete. The very first item of the Council's work should be to ask Parliament to stop unqualified companies dispensing and selling poisons, and considering the number of members of Parliament who agree we have a great grievance, there should be a reasonable chance of getting what we want. The majority of the present Council have had ample chances of dealing with the company question and have not been particularly successful, so why should not others have a try?

April 16, 1900.

WANDSWORTH (28/15).

Some Suggested Reforms.

To a great extent the public estimate a man or a body of men at their own valuation. This largely explains why one man should receive better remuneration than another—the man who is content to occupy the back street position, receives back street position—and pay. We hear a great deal about the "status" of the pharmacist, and some of our members affect contempt for rank or position—they say "we don't want status, we want better pay," altogether forgetting that the better pay always follows better status. Mercenary considerations ought not, of course, to be the sole object in carrying on a business or profession, but it should nevertheless be taken for granted that the man who does his business well and thoroughly should as a matter of course receive a proper decent stipend—and as a rule does. Granted all this, how to do it? Suggestions without end have been made, many of them very good, some adopted, and some to be adopted. There are, however, one or two little things that might be done without any difficulty, which, I think, would add immediately and immensely to the dignity of our craft, and that is the adoption of a badge, in the shape of cap and gown, distinctive of pharmacists. It has been pointed out over and over again that the pharmaceutical diploma is on the same lines as the medical. In my opinion, it should be equal in dignity—some of the most eminent scientific men of this century in Europe have belonged to our craft—and yet in public ceremonial while an M.D. wears his hood, or even the licentiate of any of the various schools of music, or such Universities as Durham, has his gown and mortar board, the pharmacist, whose examination, has entailed a much greater acquisition of scientific knowledge, must perforce be content with the hideous silk hat and frock coat of civilised society. Why, even our Aldermen wear gowns—very ugly ones, too, as a rule. Another thing needing reform is the certificate of membership; this is ugly, inartistic, and bald to the last degree. If our Society cannot afford to go to Walter Crane or some specialist to get a decent design, I feel sure if a subscription list was opened pharmacists would quickly subscribe sufficient to pay the bill. I would give my guinea with pleasure. Out of a few school and other certificates I have, it is a fact that the Pharmaceutical Society's is the ugliest. It is a relic of early Victorian pseudo-art, when no designer aspired to anything better than ornamental pen-and-ink flourishes, or orna-

ment of the cast-iron fender variety. Then too, members of the Pharmaceutical Society ought to be able to call themselves pharmacists as well as "chemists and druggists." The word chemist is misused—we are chemists certainly in virtue of our scientific training, but we are also in addition pharmacists, *i.e.*, vendors of drugs? Of course, the title Ph.C.—the best and most dignified we have, by-the-bye—should be reserved for Major men.

Blackpool, April 16, 1900.

CHAS. H. TURVER.

The Practice of Pharmacy.

The following words occur in the preface to Bell and Redwood's 'Historical Sketch of the Progress of Pharmacy in Great Britain, 1880':—"An account of the early but unsuccessful attempts made to separate pharmacy from the practice of medicine in this country, and of the efforts which at a later period were successfully made to found an institution with the object of raising up a race of qualified men devoted to the practice of pharmacy as a distinct occupation." Thinking of the ceaseless chatter going on relating to what is called pharmaceutical politics, one is tempted to ask where is this race of men devoted to pharmacy as a distinct occupation? If such can scarcely be found, no wonder that many a one is soon shaken in his allegiance by the blatant talker who, being himself a lineal descendant of the enemy, makes it his business to persuade others that it is all a hoax, and that we have to begin afresh. The talkers about pharmacy are everywhere; but where are the workers? The workers who, after a very few years of service, come to realise what an inestimable treasure personal reputation is, and who go to work with greater energy than ever, with "the paramount interests of the public" in view as their chief concern?

I am writing as a "chemist and druggist," and let me say I have never felt any occasion of being ashamed of that good old John Bull title. It often, however, has occurred to me somewhat of a puzzle that the very Act of 1868 which gave that title its first legislative recognition seems to have ushered in its final doom. The very men who were the first to be enfranchised by the adoption of the term as a qualifying title were the first to discard it, and, for the purposes of business, call themselves simply "chemists," or "dispensing," or "consulting," or "store," or "cash" chemists—anything except the designation that they had themselves fought against and spoilt the Pharmacy Act for the purpose of gaining. And yet another puzzle; that men, with anything like an upper storey to their intellect, should, having fought for and gained a position of advantage fortified by Act of Parliament, and guarded for them by a quasi-government department of pharmacy, should break through the fence for the sake of meddling in everybody else's business, and let in the enemy to steal away their own fatness through the breaches they themselves had made. And still the most wonderful marvel of all is, that with the C. and D. outsider, and with those more active insiders who pretend to so keenly sympathise with him, the order of nature seems reversed, and it all presents a case of *Experientia non docet*.

We once had a United Society of Chemists and Druggists to contend with; that was an open enemy, and had it not been for very weak-kneed elements on the Council at that time, that led to a sort of peace-at-any-price policy, it would not have wrought the mischief that it did. Since then boredom has divided itself to worry us in detail as much as possible, and combine on critical occasions to gain a stronger foothold. We have in reality an organisation to bind on to the pharmacist still tighter the manacles of quackery and so prevent the consummation so earnestly wished and worked for so long—the proper co-relation of medicine and pharmacy as sister pursuits—styling itself the P.A.T.A. We have again what has called itself the Federation of Local Pharmaceutical Associations, a big bauble that arrogates to itself an influence to which it has no just or moral claim whatever, and we have, thirdly, what is called a Chemists' Defence Scheme, well calculated to catch

the silly fish who know that, being astray from their proper preserve, and wishful to stray further, are ready to venture their last mite, it may be, on the hope of being helped out by the lawyers in case of a capture.

These three nasty groups, set agoing by busybodies in other men's matters, are now combined to revolutionise the Council itself, a threat that has more than once been indulged in, but which seemed too monstrous to be seriously entertained. Surely the situation has become critical enough at last to call forth from their retirement the more quiet workers of the members of the Society who send, with gladness, their guinea a year, with what they can well afford in addition to the B.F., but who hitherto have refrained from helping on the work of the Society by further public effort, and who seem so satisfied with the conduct of affairs, and have such confidence in the stability of our cause as to forget or neglect to record their vote. Do let me remind such that this last assistance may become worth more than any number of guineas to the actual progress of pharmacy, for the question to be decided at this next Council Election is of no mean order; it is simply whether pharmacy proper is to be still nurtured and protected as the essential business of the chemist and druggist, or whether it is to become stifled and crippled in its natural development still more by the agglomeration of the meanest and basest kinds of promiscuous trade. Whether the chemist and druggist is to follow self-appointed leaders because of the din and the mimicry so much in fashion, or whether the good work of the Society is to be consolidated and extended on the lines that have already secured for it a place and a power in the Legislature.

April 10, 1900.

SKYLIGHT (27/47).

Glaucium Luteum.

As several correspondents have contributed their experience of this beautiful and interesting plant, and there still remains something to be said on the subject, perhaps another witness may be allowed to give evidence. Your correspondent, Mr. W. J. Brown, takes exception to the authorities, "Bentham, Hooker, and Johns as somewhat misleading," as they all state that the habitat is a "sandy seashore," and although he admits that it prefers the "sandy erosions (?) from the lower limestone," yet says that "the soil is not in the least sandy at Dover, Folkestone, or St. Margaret's Bay." Now, as a native of Dover, who, from the age of five years, has been familiar with the plant, I must beg to differ from Mr. Brown, who has himself been probably "misled."

I state as a fact that the horned poppy grows in sand, and that although a shallow stratum of shingle overlies it, *the root is in sand*. Withering, in 1818, records yellow-horned poppy, sea celandine, *Glaucium luteum* (Gærtner), *Chelidonium luteum* (With.), sandy seashores: Norfolk and Suffolk coast, Dunwich and Cartmel sands, and Roosebeck, Lancashire (Mr. Woodward), Northshore, Liverpool, Isle of Wight, Walney Isle, Teignmouth, Queen's Ferry, near Edinburgh, on the ballast hills of Tyne and Wear. Babington agrees with every other authority regarding habitat. Very abundant on the Kentish shores, particularly about Dover, etc.

I found it growing very freely at Portland, and all along the sandy reach towards Rodwell. Withering records that "although a high wind does not affect the petals, yet it is difficult to pluck the flowers without some of them falling off; perhaps this fact may be ascribed to a rapid loss of vitality in consequence of the copious exudation of milky juice.

Withering mentions two other species of *Glaucium*—*G. phœnicium* and *G. viola'ceum*, having opal petals veined with an elliptical purplish spot at the base of each.

Yet another species is recorded, both by Withering and Babington, *G. phœnicium*, by the former author—the latter styles it *G. phœnic'ceum*, red-horned poppy—pet. scarlet, with a black spot at the base; said to have been found in Norfolk. Withering states it was discovered by Mr. Stillingfleet in Norfolk, but Dr. Smith observes, "it has never been found by any person since." It seems

remarkable that so able a botanist as Babington should consider the plant entitled to a place in "British Botany" on so slender a credit. Nevertheless, a legend survives that such a plant does exist, and that it is to be found at Portland. I have paid three visits to that remarkable little peninsula, made diligent search and inquiry for the mysterious beauty, but without success. Possibly, if not probably, some of our enthusiastic young botanists may yet be successful.

Kew, April 16, 1900.

R. GOODWIN MUMBRAY.

A Botanical Freak.

The following particulars of an abnormal development in the inflorescence of *Primula vulgaris* may not be without interest to some readers of the Journal. The calyx was eight-toothed, and contained two distinct corollas, one considerably smaller than the other and of an infundibuliform shape without stamens, and attached to the side of the calyx. The other corolla was of the usual hypocrateriform shape, on which were inserted seven perfect stamens, two of these being united by their anthers; also, in addition to these, one stamen in a very rudimentary condition, and one filament without the anther lobes. Two pistils of bad formation were found, and the structure of the ovary was very irregular, but ovules were present. Since writing the above, I have also found a flower with the corolla four-cleft, the other petal having been transformed into a structure resembling a stamen and pistil combined, and arising from the ovary.

Bognor, April 16, 1900.

C. T. J. (28/1).

Mr. Boot Explains.

As you have introduced my name into a leaderette which appears on page 375 of your issue of April 7, I think you ought to allow me the privilege of commenting upon the statements therein made.

Your Journal states that the firms he (Mr. Boot) mentions—viz., Symes and Co., Allen and Hanburys, Southall Bros., and Barclay, etc.—are owned by and conducted by persons legally qualified under the Pharmacy Act to carry on the business, and to use the title of chemist and druggist in connection with that business.

On turning to your issue of July 25, 1898, page 604e, a notice of the formation of Messrs. Southall Bros. and Barclay, Limited, appears. It details an offer to the public of some 45,000 preference shares. These shares are daily quoted by Birmingham stockbrokers, and may be bought by even the much-despised dock labourer and drapers' assistant alluded to by a pharmacist in the Liverpool newspapers.

Moreover, the very first subscribers to that company included the names of ladies as proprietors, who, although legally qualified to become the partners (for life) of qualified chemists, are not yet themselves qualified under the Pharmacy Acts to carry on the business and use the title. With respect to persons legally qualified conducting the business, two of the first directors, namely, Messrs. Gilbert Southall and Thomas Barclay, jun., do not appear on the Register of Chemists and Druggists for the year in which they were appointed directors.

April 10, 1900.

JESSE BOOT.

The Sale of Photographic Chemicals.

With reference to the letter on the above subject in last week's *P.J.*, I have compared the prices given in the list of the 7th inst. with those of four of the largest retail dealers in London, and find they are practically correct, all coinciding except in a few cases, where there is a penny or two difference in the prices per pound one way or the other. If your correspondent will obtain the price lists of such houses as Fallowfield, Houghton and Sons, etc., he will find that no mistake was made by

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, APRIL 21, 1900.

PROFESSED EXPONENTS OF OPINION.

THE views expressed, respectively by Mr. R. LORD GIFFORD and by Mr. GLYN-JONES, in regard to the subject which is now exciting so much interest among chemists and druggists, represent the very extreme poles of opinion on that subject. The "straight issue" Mr. GIFFORD insists upon is that the provisions of the Pharmacy Act, 1868, shall have the effect he considers they were originally intended to have—while Mr. GLYN-JONES maintains that "regulation of company pharmacy" is now the only possible alternative registered chemists can hope for, together with "some chance of getting their titles." Both speak with very great confidence of the support which they believe is given to those views by chemists throughout the country and, though their several statements to that effect are by no means confirmed by the reports of proceedings at provincial meetings, they may be taken to indicate the existence of considerable division in the pharmaceutical house.

From a sentimental point of view there is much reason for sympathy with Mr. GIFFORD's idea that the intention of the Pharmacy Act should be realised. Such a result would at least be in accord with the Bloomsbury tradition which some presume to despise. But Mr. GIFFORD appears to overlook the fact that the course of events has had a contrary tendency; that judicial interpretation of the Act has decided the qualification it requires to be a purely personal one; that in popular opinion a qualified employee is thought to satisfy the object of the Act; that the practice of qualified persons has given support to that view, and that the Government as well as the highest legal authorities are disposed to give further effect to it. How those influences are to be counteracted, and the unrecognised intention of the Act effectively established Mr. GIFFORD has not yet shown, nor has he yet shown that any considerable number of registered chemists are ready to support the attempt to arrive at such a result. The full effect of the Pharmacy Act at the present moment is that a person who sells scheduled poisons must be

qualified under the Act, or liable to its penalty. Such a person may also use the title of chemist and druggist, but while that is the extent of the privilege the Act confers in regard to the practice of pharmacy, a company of unqualified persons, being held outside of the Act, can carry on the business of a chemist and druggist with impunity. It is now proposed to authorise such a company to use the title as well. That effect is certainly far short of Mr. GIFFORD's idea as to what the Act intended; but there is nothing tangible to show how he considers a better effect is to be brought about, beyond the utterance of futile demands.

The opposite opinion held by Mr. GLYN-JONES, viz., that all chance of realising the effect of the Pharmacy Act has been irretrievably lost, favours compromise involving entire sacrifice of principle: though it has been quite recently declared by him to be so general that "there could be no two opinions amongst chemists with regard to the company trading question," that statement may nevertheless be called in question. It is an opinion contrary to the spirit of the Act in every sense, though it has some practical support, of a kind. His chief assumption that consistency with the views and principles of the Pharmaceutical Society would exclude every kind of company from carrying on the business of a chemist and druggist is obviously fallacious, while the conclusion that "regulation of company pharmacy is inevitable" is in direct opposition to the intense feeling described by Mr. JOHN SMITH as pervading the ranks of chemists and druggists on that subject. The letter published by him last October (*P.J.* [4], 9, 413) gave a far sounder exposition of the state of opinion and the line of action to be taken by chemists, than either of the views above mentioned. The only apparent element of uncertainty on the point arises from the language used in expressing the desire that companies should be placed "on the same footing as individuals" in regard to liability for infringement of the Pharmacy Acts, the meaning being—not that of the LORD CHANCELLOR—but, on the contrary, that companies, as unqualified persons, should be held liable, or in other words prohibited from selling or dispensing scheduled poisons.

In connection with this view of the matter, Mr. SMITH's further letter, in this week's Journal, p. 421, is worthy of most careful consideration as showing that the regulation of company trading is a matter with which chemists should have nothing to do; but that Clause 2 is to be opposed, as Mr. JOHN TAYLOR has argued, simply because it involves violation of the principle of qualification. In regard to the use of titles there is, however, no kind of difference and, while their restriction to registered persons is held to be indispensable, chemists have accepted the statement, repeatedly made at the Council meetings, that there is absolute unanimity of its members on that point. But if Parliament should authorise companies of unqualified persons to carry on the business of a chemist and druggist, to a further extent than they are lawfully entitled to do at present, it would still be as unbecoming for the Pharmaceutical Society to take any part in the regulation of such company trading as it would be for the Collège of Physicians to regulate the practice of quack doctors.

ANNOTATIONS.

MR. BOOT THINKS A REPLY IS REQUIRED to the remarks which appeared at page 375, and, for his satisfaction, that reply will be found at page 424, though it does not, in the least degree, affect the main point of the remarks as to the fallacy of comparisons between Mr. Boot and persons—qualified under the Pharmacy Act—who legally carry on their business as a limited liability company. Nor does Mr. Boot require to be reminded that the business of any limited liability company is necessarily conducted on company lines, though that may be requisite to prevent others from being misled. The "preference shareholders" he speaks of are (as he is no doubt aware) practically mortgagees of the property, standing in the same relation to the firm he names as the landlord of a retail chemist, and having no more share in the control or management of its business. Then, in regard to the two directors mentioned as "conducting the business," though not qualified chemists, Mr. Boot must understand that in large druggists' sundries, scientific apparatus, table water, and other departments, there is occupation for directors who need not be registered chemists, though the drug portions of the business are under the control of five pharmaceutical chemists, who are directors and not merely managers. Those circumstances constitute the essential difference between such companies and those like Mr. Boot's; to point out that difference was the object of the remarks which appeared in this Journal on the 7th inst. Mr. Boot's letter shows nothing to the contrary. From a pharmaceutical point of view therefore, appreciation of Mr. Boot and his company must continue to be limited, as suggested in the first instance, to admiration of his capacity for securing a business advertisement—not always too fairly.

THE INTENTION OF THE PHARMACY ACT, 1868—viz., to establish a qualification for persons engaged in business on their own account as chemists and druggists, may be inferred from the definition in Section 3, and from the language of the certificates in schedules C. and D. In that respect, the Act followed the precedent of the Society's Charter, and of the Act of 1852; but its intention was obscured by the provision that the examination to be passed, for the purpose of qualification, should be that provided under the Pharmacy Act, 1852, "for the purposes of a qualification to be registered as an assistant under that Act." Consequent to that circumstance and to the provision that the business of a deceased chemist and druggist might be continued and conducted by such a qualified assistant, it was not thought by the House of Lords necessarily inconsistent with the object and policy of the Act that the principals—the proprietors of a business—should be unqualified, provided there was in the business a duly qualified assistant.

BY THAT CONCLUSION the legal position of the chemist and druggist was materially damaged, as regards the right to keep open shop, and qualification under the Act was made more analogous to the qualification of a ship's captain than the apparent intention of the Act indicates. Then a company, being a person outside the scope of the Act, was not held by the law Lords to be incapable of performing the functions to which the Act relates, but, on the contrary, capable of carrying on the business of a chemist and druggist. So the qualification was reduced to giving its possessor a right to use the title of chemist and druggist in connection with the exercise of his business. The resulting legal anomaly that a company, as a person, necessarily unqualified under the Act, can carry on the business of a chemist and druggist, is the point to which the Lord Chancellor's Clause 2 of the Companies Bill is directed; the intention of it is to remedy the existing anomaly by the provision that a company, carrying on the business of a chemist and druggist, shall employ an assistant legally qualified under the Pharmacy Act to conduct that business.

FROM THE POINT OF VIEW OF PUBLIC INTEREST, that provision would secure the object of the Pharmacy Act—viz., that none but qualified persons should perform the functions to which the Act relates; so far, it would respect the personal qualification. The Government and the Lord Chancellor consider that to be sufficient, and the difficulty in which registered chemists are placed in regard to Clause 2 of the Companies Bill arises from the fact that many of the body are inclined to accede to that part of the proposed settlement of the matter, provided the exclusive use of their title is reserved to them. On this latter point, however, it may be assumed that all registered chemists are agreed and absolutely unanimous in their determination to oppose the provisions of Clause 2, and that is the line of action which the Council of the Society has decided to take in regard to the Companies Bill when it comes on for second reading.

THE DEATH OF PROFESSOR GUSTAVE PLANCHON is a great loss to pharmacy in France, and causes another gap in the roll of the Pharmaceutical Society's honorary members. He was elected to that position in 1876, and in 1889 he was awarded the fifth Hanbury Medal, attending in person to receive it at the inaugural meeting of the Society in October of that year. He was born at Ganges, near Montpellier, and was only sixty-six years old when he died. He graduated as doctor of medicine at Montpellier before taking his diploma as pharmacist, and subsequently took the degree of doctor of science. He was appointed professor of materia medica at the Paris School of Pharmacy in 1866 and, in 1885, he became director of that institution. Finally, he was a member of the Academy of Medicine, an officer of the Legion of Honour, and president-elect of the forthcoming international pharmaceutical congress at Paris. Probably his most important work is the admirable 'Traité pratique de la détermination des drogues simples d'origine végétale,' but he also published classic memoirs on the cinchonas, and on the Montpellier Flora, a new edition of Guibourt's 'Histoire naturelle des drogues simples,' and numerous smaller works.

NO FURTHER INFORMATION is as yet forthcoming respecting the meeting referred to by "An Ordinary Pharmacist" in last week's issue, but neither have any of his statements been denied by the promoter of the meeting or his friends. It may be taken for granted, therefore, that the facts are as stated last week, Messrs. Cooper, Gibbons, Taylor, and Wootton having been selected at a private meeting, convened by Mr. Glyn-Jones, to replace present members of the Council. Why those four persons, and why not more than four, remains a mystery for the present; nor is it known whether the persons selected have assented to the inclusion of their names in the selected list. Apart from those points, however, curiosity attaches chiefly to the attitude taken up by a member of Council, who has deliberately gone out of his way to initiate a movement to replace four of those who have been his colleagues during the past twelve months or more. The opinion of another member of Council on the subject is expressed by himself in a letter which appears at page 421; what the opinions of the members of the Society may be will doubtless be ascertained on the day of election. It would be a pity, however, if the advocacy—in a somewhat unprecedented manner—of the claims of any candidate, against his own will, should be found to have acted prejudicially in his case.

THE PHARMACY ACT OF 1868 has been made operative, though, perhaps, not in exactly the way that registered chemists would prefer, by the judgments of the High Courts which have been called upon, from time to time, to interpret its provisions. But what Mr. Gifford means by making the Act operative is, presumably, to make it illegal for any but duly registered persons to assume or use chemists' titles, or to compound, dispense, or retail poisons. The pity of it is, however, that he will not state clearly and in few words what he does mean; but that he will persist in talking

and writing in vague general terms, instead of explaining what is his "straight issue." To say he stands or falls "on the question of personal qualification and responsibility" conveys no definite idea; the same statement might well be made by Mr. Jesse Boot, or any other advocate of the claims of limited companies carrying on the business of a chemist and druggist. Whilst, therefore, it is undoubtedly of the first importance that a clear issue should be placed before the members of the Society, that has not yet been done by Mr. Gifford, even when he advocated opposition to Clause 2 of the Companies Bill and that chemists should claim to be included in Clause 3 of that measure. Moreover, he has not yet offered anything that could, by any possible distortion of the meaning of words, be described as "constructive criticism."

THE STAMP DUTY ON MEDICINES was attacked by Mr. Cornelius Willson at the annual dinner of the Grimsby and District Chemists' Association, reported last week (see *ante*, page 407), but he was evidently imbued with the fallacious notion that abolition of that duty would be to the advantage of chemists and druggists. It is certain, however, that the reverse would be the case, and that chemists would have as much cause to regret such abolition as they had years ago to regret the lowering of the cost of licences to retail stamped medicines. In any case, it is absurd to talk about the "cruel law" which extracts a quarter of a million sterling from "the sick poor," for, as Mr. Willson ought to know, that is not the class which contributes much to the revenue in the form of stamp duty on medicines. So far as the interests of chemists and druggists are concerned, it would be a distinct advantage if the stamp duty on proprietary medicines were increased, and if also the exemption from duty of medicinal drugs vended entire were limited, as specified in 52 Geo. III. c. 150, to cases where such drugs are sold by a chemist, or a person holding a stamped medicine licence. For it is beyond question that simple drugs cannot be sold unstamped by other persons without committing an offence against the Stamp Acts.

SARTORIAL REFORMS SUGGESTED by Mr. Turver (see p. 423) savour too much of frivolity to commend themselves generally to sober chemists, and it is to be feared that the love of finery will be found less potent generally than the desire to appear in public without a label. Would Mr. Turver wear his cap and gown behind the counter, or—like grammar-school boys—when he goes to church, or would he reserve them for appearances on the platform at public meetings, at funerals, or at public celebrations of various kinds, such as the inauguration of a new village pump, a Royal visit, Maypole dances, Guy Fawkes day rejoicings, etc., etc.? Seriously, the thing is impossible in this prosaic age, though there is nothing to prevent any registered chemist purchasing and wearing a cap and gown, if he fancies doing so. With regard to the Society's diploma of membership, there is, of course, no particular reason why it should be less artistic than any other. Such as it is, however, it has served its purpose well and, in any case, if a prettier or more gorgeous one were to replace it, that would have to be reserved for new members, and not distributed broadcast among the older ones. As to the title "pharmacist," that certainly ought to be legally applicable to everyone who is truly a pharmacist, but an Act of Parliament will be needed to legalise its wider application, and such an Act cannot be got by simply asking for it.

ANOTHER CANDIDATE FOR THE COUNCIL has sent a statement of his views for publication in the Journal. Mr. Cooper—who is perhaps best known as Chairman of the Retail Section of the P.A.T.A., and of the Chemists' Defence Association—would not, as the Council has decided, merely oppose Clause 2 of the Companies Bill, but would seek to amend it, so as to restrict the use of chemists' titles to duly registered individuals. Apparently, he has no hope of being able to do more than that. He is also in favour of division of the Minor Examination, of some change in the

Research Laboratory arrangements, of reciprocity with the Colonies, so far as the interchange of certificates is concerned, and of enforcing the Pharmacy Act more vigorously.

AMONGST THE MANY LETTERS which the journalists' usually dull Eastertide has brought forth, that of Mr. John Smith will attract and merit especial attention by reason of its clearness and the logical nature of the writer's arguments. He points out that if the candidates who may be elected upon the Council are committed in advance to positions from which they are determined not to move, the lack of unanimity will be as marked in the immediate future as at present, and chemists "must be content to remain helpless and incapable." As Mr. Smith wisely remarks, what is wanted is that men of ability and knowledge should be sent to the Council, who can help intelligently in the effort to solve a problem, and remain broad-minded enough to appreciate the value of arguments against their own particular views. He would welcome the election of men who would enter upon the consideration of the company trading difficulty with open minds, realising their responsibility and convinced that a solution of the problem must be found. Men imbued with bias or prejudice, who will agree to nothing but the adoption of the particular scheme they favour, do not commend themselves to Mr. Smith, since he holds—reasonably enough—that as circumstances change, opinions must be modified accordingly.

THE 'PROCEEDINGS OF THE CHEMISTS' ASSISTANTS' ASSOCIATION,' containing papers and discussions and full particulars of the meetings held during the Session 1898—1899, occupy nearly seventy pages, and the editors—Messrs. H. Hymans and T. Morley Taylor—are to be congratulated on the completion of the fifteenth annual record of the useful work done by and in connection with the Association. The balance-sheet of that body for the year shows that such a record can be produced at a low cost and distributed to the members gratis without causing any strain upon the funds; there is no reason, therefore, why the enjoyment of so slight a luxury should not be continued, whilst there is every reason for endeavouring to maintain the interest of new and old members in the Association by the aid of such a useful and interesting reminder of each session's work.

THE ANNUAL DINNER ARRANGEMENTS are progressing, and the Secretary will be glad to receive applications for tickets, which are now ready. The first list of Stewards will be found in another place in this week's Journal, and those who may be desirous of having their names added to that list should promptly communicate with Mr. Richard Bremridge, 17, Bloomsbury Square, London, W.C. The liability of each Steward is but a few shillings—being a share of the incidental expenses incurred for music, printing, etc.—and is less in proportion to the number of Stewards. The price of the dinner tickets is one guinea each, inclusive.

THE SOCIETY OF CHEMICAL INDUSTRY is holding its annual general meeting in London this year, during the week preceding the British Pharmaceutical Conference meeting. The President, Professor C. F. Chandler, and with him a considerable number of the members of the New York section of the Society, will attend, and it is hoped that the London section will exhibit its appreciation of the hospitality extended in 1895-96 to the then president and the hon. foreign secretary of the Society when visiting the United States. An appeal is being made to the London members for contributions towards an expenses guarantee fund. A trip to Paris is being arranged by a party of the Society's members, and that will, unfortunately, take place during the Conference week.

THE LATE RICHARD REYNOLDS was inadvertently stated, in the obituary notice published last week, to be seventy-six years old when he died, instead of seventy, as originally written.

ENGLISH NEWS.

THE COMPANIES BILL.—On Tuesday evening, the 10th inst., Messrs. Geo. S. Woolley and Harry Kemp, President and Senior Vice-President of the Manchester Pharmaceutical Association, attended, by invitation, a meeting of the Manchester Medico-Ethical Society to take part in a discussion on the Companies Bill. The dental profession was also represented by the Presidents and Secretaries of the Manchester Odontological Society, and the local branch of the British Dental Association. Mr. Walter Whitehead, F.R.C.S., F.R.S.E., the President, occupied the chair, and first called upon Mr. F. H. Westmacott, F.R.C.S. After this gentleman had spoken at some length upon the anomalous position of the medical and dental professions, and quoted numerous instances to show the absence of any protection against charlatanism, so far as the public was concerned, or any to the *bonâ-fide* practitioner, excepting so far as titles were concerned, he gave it as his opinion that every effort should be made to get Clause 3 in the proposed measure passed. He further referred to Clause 2, affecting chemists, and expressed a wish to hear what the representatives of that body had to say in regard to it. Messrs. Campion, Whittaker, and Headridge then spoke of the situation from the dentists' position, after which the Chairman requested Mr. Woolley to explain the position of pharmacists and their views on the Bill. Giving details of what had been done by the Manchester chemists in respect to both clauses, Mr. Woolley said it was sought to wipe out all that had been done by the great body of chemists since 1842, to put a number of unqualified individuals on a level with the man who had attained a title after the expenditure of much time and money. Mr. Kemp, following, pointed out that it was to the interests of all branches of the healing art to stand together, that there should be no acquiescence in an attempt to deprive pharmacists of their legitimate titles, and that it was distinctly for the public good that the practice of pharmacy by companies should be declared illegal. He further argued that if it were once conceded that a qualified person could cover any number of unqualified ones in the calling of pharmacy, it would require a lot of argument to show that it was illogical for the same principle to apply to medicine and surgery. Dr. A. Wähltuch afterwards moved—"That it is desirable that Clause 2 be expunged from the Bill, and that Clause 3 be supported, after it has been amended so as to include chemists and druggists." This was carried unanimously, as well as a resolution instructing a committee to take all necessary steps to give it effect. Messrs. Woolley and Kemp were thanked for attending, and for the very lucid way in which the pharmacists' position in the Bill had been placed before the meeting.

LEEDS COLLEGE OF PHARMACY.—On Saturday, April 7, the Principal, Mr. F. Pilkington Sargeant, delivered a lecture to the students on "Bacteriology." The lecture, which was illustrated by over one hundred slides, dealt with the analysis of yeasts and the identification of micro-organisms by means of tube, plate, and hanging drop cultures. The methods of obtaining antitoxins, etc., were also explained, and the theories of the causes of disease formulated since the time of Kircher discussed. In the afternoon a botanical excursion was arranged to Bardsey, when amongst other plants *Fragaria fragariastrum*, *Stellaria media*, *Viola canina*, and *Ranunculus ficaria* were found in flower. Altogether the day was highly instructive and enjoyable to the participants.

ROYAL INSTITUTION.—On Tuesday next, April 24, Dr. H. R. Mill will deliver the first of a course of three lectures at the Royal Institution on "Studies in British Geography." On Thursday, April 26, Professor Dewar will commence a course of four lectures on a "Century of Chemistry in the Royal Institution." On Saturday, April 28, Professor Stanley Lane-Poole will deliver the first of two lectures on "Egypt in the Middle Ages." The

Friday evening discourse on April 27 will be delivered by Lord Kelvin; the subject is the "Nineteenth-Century Cloud over the Dynamical Theory of Heat and Light." The discourse on May 4 is on "Pottery and Plumbism," and the lecturer will be Professor T. E. Thorpe.

OVERDOSE OF LAUDANUM.—The Liverpool City Coroner held an inquest, on Friday, April 6, with respect to the death of Flora Ann Moore (70), a widow, of Greyrock Street.—The evidence showed deceased had suffered from sleepiness for some twenty years past, and had been in the habit of taking laudanum to produce sleep. On the previous Tuesday evening she took half a teaspoonful in water, and next morning was found dead in bed, death, according to medical evidence, being due to failure of the heart's action, accelerated by an overdose of laudanum.—The jury returned a verdict of death from misadventure.

A CORONER ON THE SALE OF CARBOLIC ACID.—At an inquest, held on Wednesday, April 11, at Monkwearmouth, in respect to the death of Thomas Maskell (41), miner, through drinking carbolic acid in mistake for stout, Coroner Graham strongly commented on the present state of the law with regard to the sale of carbolic acid. Replying to a juror who expressed the opinion that carbolic acid should not be sold in such bottles as the one in the case before the jury, the coroner said that unfortunately there was no law against it, though coroners had occasion again and again to deplore that certain poisons could be sold without labels. In the present case carbolic acid had been put into a bottle bearing the impress of a brewery company, and what could be more natural than for a thirsty man who thought he had discovered a prize to drink it off. Recommendations had from time to time been sent to the proper authorities, suggesting improvements in the law as to the sale of poisons such as carbolic acid, but it was time and labour utterly thrown away, and he was sick and tired of sending such recommendations; he could get no assistance whatever. He supposed nothing would be done in the matter until some prominent member of Parliament met his death in the same way as the deceased man. Coroners were perfectly helpless, they could only grumble and complain; as for getting any reform, it appeared to be utterly out of the question. The Act relating to the sale of poisons was not worth the paper it was printed on, because, while it closed the door against certain poisons, it left the door open to others equally deadly. He was inclined towards the opinion of Mr. Bumble in Dickens that "the law is a hass."

FOOD AND DRUGS ACT PROSECUTIONS.

CAMPHORATED OIL.—At Lambeth Police Court on Thursday, April 5, William B. Greig, trading as Greig and Co., chemists and druggists, Old Kent Road, S.E., was summoned by the Camberwell Vestry for selling camphorated oil which was certified by the public analyst to be deficient in camphor to the extent of 43 per cent.—Defendant, who repudiated any idea of fraud or intent to injure the purchaser, stated that the deficiency was due to an oversight on the part of the assistant when making the article.—Fined £5, and 17s. 6d. costs.—At Lambeth Police-court on Thursday, April 12, Albert Matten, trading as and for Elizabeth Williams, of Nunhead Green, was fined 20s. and costs for selling as camphorated oil a substance which was certified by the public analyst to contain 93.6 per cent. of oil other than olive oil, and to be deficient in camphor to the extent of 75 per cent.—Sarah Jane Hunter, Gordon Road, Peckham, was fined 40s. and costs for a similar offence, the oil being deficient to the extent of 82 per cent. of camphor, and contained 96.3 per cent. of mineral oil.—Both defendants pleaded that they sold the oil as received from the wholesale dealers.

QUININE WINE.—John E. Pedwell, grocer, High Street, Calne (Wilts), was summoned at Calne Police Court for selling as quinine wine, orange wine containing not more than 10 grains of quinine hydrochloride per pint, instead of 20 grains as ordered by the 'British Pharmacopœia.'—The analysis was not disputed, but it was contended for the defence that the case was covered by Sub-section 1 of Section 6 of the Sale of Food and Drugs Act.—Defendant pleaded that there were two qualities of quinine wine; one supplied by chemists as a medicine and the other supplied as a beverage, and drunk as such. If quinine wine B.P. was required, the purchaser would go to a chemist; but if he wanted a beverage, he would go to a grocer. The wine in question was sold and labelled thus—

"HOME'S QUININE WINE."—A pure and perfectly fermented aromatic bitter orange wine, free from acidity or any objectionable sweetness, and containing a st machic dose of pure sulphate of quinine to the glass. Of this invaluable medicine, sulphate of quinine, the dose is from half a grain to one grain as a stomachic, and from one to three grains as a tonic. For these purposes the present is by far the most agreeable form for its exhibition, and, as such, is universally recommended by the faculty. Manufactured by G. Y. Home and Co., wine makers and importers, Redcross Street, Bristol, and sold by all chemists, grocers, confectioners, and oilmen. Proprietors of Stiven's original green ginger wine.

The Chairman, having pointed out that the label did not state that the wine was prepared in accordance with the B.P. and did not state the number of grains of quinine in the bottle, Section 8 was quoted for the defence, and it was contended that the inspector did not ask for quinine wine, B.P., but asked for the quinine wine sold as a beverage.—The Bench decided that there must be a conviction, for if a person went to either a grocer or a chemist he expected to get the article asked for. The wine in question did not contain the amount of quinine it should; moreover, the magistrates were of opinion that the label should have shown the amount of quinine contained in the wine, and hoped that in future chemists and grocers selling quinine wine would affix such labels. Defendant would be fined 8s., including costs.

MAGNESIA.—George Smith, grocer, Wood Street, Calne, was summoned before the local magistrates for selling magnesia which was not of the nature, substance, and quality demanded by the purchaser, being composed of magnesium carbonate instead of magnesium oxide.—Defendant, who pleaded that he sold the magnesia as he bought it, was ordered to pay the costs, 7s.

ALUM IN BAKING POWDER.—Arthur W. Buckeridge, grocer, High Street, Calne, was fined 1s. and 7s. costs, for selling, on February 16, four packets of baking powder which contained 38 parts per cent. of alum, an ingredient injurious to health.—The defendant, who pleaded guilty, said he bought the article in question as "Nation's American baking and egg powder," labelled "Always genuine. See analytical report." He further stated that he sold many articles which might be adulterated for all he knew.—The Chairman said it was for him to ascertain whether the articles he sold were injurious or not, and not for the Bench to tell him. They hoped for the future he would insist upon having a warranty with goods.

SPIRIT OF NITRE.—John Teebay, chemist and druggist, Chorley Old Road, Bolton, was charged at Bolton Police Court on Monday, April 2, with selling sweet spirit of nitre not of the nature, substance, and quality demanded; it being deficient to a considerable extent in ethyl nitrite, the analyst's certificate stating that it contained only 62.8 per cent. of the minimum amount allowed by the B.P.—For the defence it was stated that defendant's assistant did not understand the Inspector to ask for the B.P. article.—As the prosecution did not press for a heavy penalty, the magistrates only ordered defendant to pay the costs.

IRISH NEWS.

PHARMACEUTICAL SOCIETY OF IRELAND.—The following have passed the Preliminary Examination: R. B. Lemon, T. Dunning, W. McCaw, W. J. McKane, L. J. Wilkins, H. E. Grimshaw, W. Crymble, R. Dillon (P. J. Cleary, M. McCabe, and J. J. O'Brien—equal), J. J. Fitzgibbon (T. Horan and G. H. Wilson—equal). Twelve candidates were rejected. James Dale passed as a pharmaceutical assistant. At the Registered Druggists' Examination at Belfast, S. Carson, J. Dunlop, Sara D. Gilmer, J. Moffett, and H. Todd passed; two candidates were rejected. At the Registered Druggists' Examination at Dublin, H. Harwood, J. Hood, and M. S. Keane—passed; two candidates were rejected. At the Pharmaceutical License Examination, C. McCann, Christina M. Jessop, D. F. Hegarty, A. Mawhinney, G. Wilson, W. A. Jones, and R. G. Greer passed; eight candidates were rejected.

COLONIAL NEWS.

AUSTRALASIAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.—The eighth session of this Association, which opened at Melbourne on January 9, and was continued until the 15th, was a very successful gathering, more than one hundred and fifty papers having been read in the various sections, while the average daily attendance was estimated at no less than 350. Papers of immediate pharmaceutical interest there were practically none, but no little stir has been created in the colony by the results given by Mr. W. Percy Wilkinson of a chemical examination of the local wines retailed in Victoria, showing that out of 166 samples submitted to analysis 67 were found to contain salicylic acid, in amounts varying from 1 to 8 grains per reputed quart bottle. Mr. Wilkinson showed that for this condition of things the climate of Victoria furnished no excuse, as the wine maker can, if he takes the trouble, control the temperature of fermentation and the proportion of acidity in the must, just as effectually in Victoria as is done in the hot climates of the South of France, Algiers, and California. The author drew attention to the strict laws against adulteration which are enforced in Continental wine-growing countries, and it is understood that practical attention is now being given to the subject by the Victorian Government. Among other papers of interest might be mentioned specially one by Mr. G. Harker, B.Sc., giving the results of an investigation undertaken at the suggestion of Professor Liversidge, of Sydney, the object being to search for alkaloids among the indigenous Australian plants belonging to the drug-producing class. A report of this, as well as another paper by the same author, "On the Estimation of Nicotine in Tobacco," is given in the January number of the *Australasian Journal of Pharmacy*.

PHARMACY BOARD OF VICTORIA.—At the January meeting of this Board a vote of thanks was passed, and ordered to be recorded in the minutes, to Mr. Henry Francis, for the valued honorary services he has rendered as a member during the past fourteen years. Mr. Francis explained that he had decided to retire from the Board in consequence of the work in connection with the examinations having become of too fatiguing and arduous a nature, but he would continue to feel deep interest in the proceedings and progress of the important work which the Board was performing in the educational interests of the colony. The report of the Board for 1899 shows that the work referred to by Mr. Francis has of late years been steadily increasing in volume, the increase in 1899 being something phenomenal. The examinations for the Final, it may be here explained, are conducted by the members of the Board, sitting in sections, and acting in an honorary capacity. In the year 1897 the candidates entering for this examination numbered only 30; in 1898 this was increased to 56 and last year to no less than 88. When, apart from this strictly

personal work, it is remembered that the Board are practically responsible for the preliminary and College of Pharmacy Examinations conducted by examiners appointed by the Board, the onerous nature of their educational labours will be apparent. During the past year the candidates for the Preliminary increased to 182, as against 87 in 1897, while for the College of Pharmacy Certificate Examination 72 entered in Chemistry and Practical Chemistry, and 71 in Materia Medica and Botany.

DURING THE YEAR 1899, 37 pharmaceutical chemists and 43 apprentices were registered in Victoria, showing in each case an increase over recent years. On December 31, 1899, the Pharmaceutical Register of Victoria contained the names of 815 pharmaceutical chemists. In 1879 the total number registered under the Pharmacy Act, 1876, was 631; since then, of 630 registered, 293 passed the Final, and 67 the Modified Examination of Victoria; 142 were registered under certificates from the Pharmaceutical Society of Great Britain, and 16 under the certificate of the Pharmaceutical Society of Ireland; 14 qualified by foreign diplomas, and 121 were registered by virtue of having been in business at or before the passing of the Pharmacy Act, 1876. Mr. R. P. Francis has been elected to fill the vacancy on the Board left by the retirement of Mr. Henry Francis, and Mr. H. A. Woolnough, the other retiring member for the year, has been re-elected. The President, Mr. C. R. Blackett, and Treasurer, Mr. H. T. Tompsitt, have also been re-appointed to their respective offices for another twelve months.

AT A MEETING OF DENTISTS held at the Australian College of Dentistry, Melbourne, on February 8, it was decided to form a Dental Defence Association, with the object of protecting dentists who were reputably practising throughout the colony, as well as the public, against the inroads of charlatans who were running all over the country. Dr. A. P. Merrill, D.D.S., who presided, asserted that thousands of good teeth were being extracted by such men, merely to replace them with artificial teeth of inferior quality. He stated further that it was the intention of the Association to expose the bogus diplomas which had been purchased from bogus dental colleges in the United States, and, if possible, to prosecute those who had, merely by a money payment without undergoing any examination, obtained and were utilising such sham diplomas.

THE PHARMACY BOARD OF NEW SOUTH WALES had under discussion at their February meeting the following remarkable communication from the Government:—"With reference to the prosecutions instituted against J. C. Radford and E. Leafe, in February last, for breaches of the Sale and Use of Poisons Act, I have the honour, by direction of the Hon. Premier and Colonial Treasurer, to inform you that His Excellency the Governor, upon the recommendation of the Hon. the Minister for Justice, has been pleased to approve of the fines being reduced from £10 to £2 in each case. As half of both fines was paid over to the informer, Mr. Angus McLeod, Inspector of the Pharmacy Board, I have to request that that gentleman may be instructed to repay £4 on account of each case, or £8 in all, in order that refunds may be made to Messrs. Radford and Leafe,—(Signed) F. KIRKPATRICK, Under-Secretary for Finance and Trade. January 25, 1900." Considering that a year had elapsed since the prosecution, and that, so far as the Board was concerned, no appeal had been lodged nor anything done in the matter, this generous remission of fines at their expense, and without their having been consulted, did not commend itself to their approval, and it was decided to have legal opinion on the matter before coming to a definite decision.

THE REPORT OF THE PHARMACEUTICAL SOCIETY OF WESTERN AUSTRALIA for 1899 affords evidence of steady progress. During

the year four candidates presented themselves for the Preliminary, all of whom were successful, and ten for the Qualifying Examination, of whom seven were successful. The passing of the amended Pharmacy Act, which, it is hoped, will greatly conduce to the more effectual carrying out of the original Act, was an important part of the year's work. The balance-sheet shows a credit balance of £487 4s. 11d., a result obtained by the amount of honorary work done by the secretary and examiners, and the gratuitous services of the members of the Council. The register now contains the names of one hundred and thirteen chemists, being an increase of fifteen during the year.

PHARMACEUTICAL SOCIETY.

Evening Meeting in Edinburgh.

The sixth evening meeting of the session was held in the Society's House, 36, York Place, Edinburgh, on Wednesday, April 18, Mr. PETER BOA, Chairman of the Executive, in the chair. The minutes of last meeting were read and approved, and apologies were intimated from Dr. Coull, Messrs. Davidson, Forret, Fraser, and Guyer. The Chairman referred to the loss sustained by the Society in the death of Sir Douglas MacLagan, and the meeting agreed to send a letter of sympathy to the family. The first two papers were on

"SOLUTION OF ARSENIC AND IRON WINE" AND "GLYCERIN OF CODEINE,"

by Mr. Archibald Currie, and are printed at page 418. In the discussion which followed,

Mr. LEMON said but for some sentimental regard for iron wine on the part of the Medical Council, it might well have been omitted from the Pharmacopœia. Wines varied much in acidity. He had examined a sample which required fifteen grains of sodium carbonate to neutralise one ounce; Squire said the wine never contained more than $\frac{1}{4}$ per cent. of iron. The hydrochloric solution of arsenic should be used, and could be flavoured with compound tincture of lavender.

Mr. HENRY said they would expect liquor arsenicalis to be incompatible with iron wine, and he would also have expected it to be incompatible with citrate of iron wine.

Mr. J. RUTHERFORD HILL said he could confirm the statement that glycerin became coloured and acquired an unpleasant odour, suggestive of some butyric compound, when heated with even a trace of hydrochloric acid; skatol, or methylindol, was formed when aniline zinc chloride was heated with glycerin. Possibly the disgusting odour might be due to some indol compound.

Mr. BOA said the colour and odour might be due to some minute trace of a fatty acid. He had frequently detected on the palate a taste of fried fat in samples of glycerin, and that was a ready means of judging. The precipitate in Mr. Currie's No. 2 mixture looked suspiciously bulky, as if it had been fortified with iron.

Mr. CURRIE, in reply, said when the glycerin was heated pretty hot with sulphuric acid and alcohol, he detected a fruity odour suggesting butyric acid. He had prepared the wines himself, and they were genuine. He had found nearly $\frac{1}{2}$ per cent. of iron in wine No. 2.

The next papers read were on

"QUININE ACETATE," "COPPER IN NUX VOMICA," AND "GELATINISATION OF TINCTURE OF KINO,"

by Mr. J. Rutherford Hill, which are printed at pages 416 and 417. In the discussion which followed,

Mr. CURRIE said he had a similar experience with a nux vomica mixture, but the patient did not complain.

Mr. MACPHERSON said it would be necessary to determine whether copper had been used in preparing the nux vomica seeds for the market. He exhibited a sample of gelatinised tincture of kino made by the 1867 formula; it was the remains of a quantity kept in a shop round; the last portion had been poured into a half-ounce

corked phial, and after standing it became solid. The shop round had a very tight stopper, and he thought Mr. Hill's theory as to loss of menstruum was correct.

Mr. HENRY said he had tried adding water to a gelatinised tincture of kino, and it slowly dissolved. He doubted the evaporation theory, because he evaporated some tincture to a low bulk, and it did not gelatinise. It would be interesting to know if the mill had been used to grind copper sulphate before the nux vomica containing so high a percentage of copper.

Mr. LUNAN asked if all the tinctures shown had been made from fluid extract. Some were as light as the old 1867 tincture.

Mr. KIDD asked if 1885 tincture had been tried. He had roughly determined the solubility of quinine acetate, and found it 1 in 84 of water. He asked if there was no dissociation when the acetate was dissolved in chloroform.

Mr. GLASS said if the copper was present in the metallic state in the ash it would be visible by using a powerful lens. It would be interesting to find out if the menstruum removed all the copper from the seeds.

Mr. DUNCAN said he thought the quantity of copper was accidental. The plant would absorb the metal from the soil if it were present. He had a case where several sheep had been poisoned. On examination, a deposit of copper was found on the teeth. They had eaten grass growing on soil that had been dosed with copper sulphate, used for steeping wheat. He had prepared a quantity of tincture of kino by the 1885 formula, and placed one half in one bottle and the rest in another; one was placed in the cellar and the other in the shop. The specimen in the cellar became solid, while the shop sample remained liquid. On repeating the experiment, the exact opposite happened. He had never seen trouble with the tincture till the glycerin was added.

Mr. McEWAN asked if Mr. Hill had tested whether the copper was combined with sulphuric acid. He had examined some seeds, but found no copper.

Mr. BOWMAN said he prepared a quantity of tincture of kino; one half was put into the ordinary stoppered shop round, the other half was placed in a 10-oz. bottle on the same shelf. The tincture in the shop round soon began to get thick and gelatinous, whereas that in the corked bottle remained liquid. He had no trouble when the tincture was kept in a well-corked bottle.

The CHAIRMAN said the note on copper in nux vomica might turn out to be of some importance. The reason why it had not previously been noticed was due to the mixture being an unusual combination, most prescribers being aware that sal volatile and nux vomica are incompatible. As to the tincture of kino, he was inclined to think evaporation of the menstruum had something to do with gelatinisation. He could quite confirm Mr. Bowman's opinion as to the superiority of cork to glass stoppers, in the case of such liquids as ether, for instance.

Mr. HILL, in replying, said he had tried the 1885 tincture, and it gave indications of copper. When quinine acetate was dissolved in chloroform the water of crystallisation seems to separate in little globules, but he did not find any evidence of dissociation. He found copper in some of the Museum specimens of nux vomica. He did not look for sulphuric acid.

CONCLUDING BUSINESS.

The ASSISTANT SECRETARY said, through the kindness of Mr. Henry, he was enabled to exhibit a bandolier, a leather legging, a Boer Psalm hymn-book, catechism, and prayer-book, and letters in Boer Dutch, one being pierced by a bullet, which had been taken from Cronje's laager at Paardeberg and sent home by an Army dispenser who used to be a regular attender at their evening meetings.

On the motion of the CHAIRMAN, votes of thanks were awarded to the authors of papers. He also expressed his indebtedness to all who had assisted in carrying on the meetings. The meeting closed with a cordial vote of thanks to the Chairman for the way he had presided during the session, on the motion of Mr. LUNAN.

CHEMICAL SOCIETY.

A meeting was held on Thursday, April 5, Professor J. M. THOMSON, F.R.S., in the chair. The first communication was given by Mr. NEWTH, who demonstrated a

METHOD OF LIQUEFYING A GAS

suitable for lecture purposes. Since the apparatus used by Professor Dewar and others for producing liquid air is very costly, it was desirable to have at hand a method illustrating the principle involved, that could be carried out in any lecture-room at a small cost. This can be done by taking a bottle of nitrous oxide, such as is sold for surgical purposes, and allowing the gas to stream from it down through a vertically fixed spiral of copper tubing. The liquid nitrous oxide drips from the tube, and in a few minutes several cubic centimetres of the liquid are produced. By collecting the liquid in the ordinary vacuum-jacketed glass vessels it can be preserved for a considerable length of time. Moreover, it is only necessary to blow air into the vessel for a few seconds in order to produce a crystalline crust of solid nitrous oxide over the liquid, which remains permanent for a quarter of an hour or more. This was performed by Mr. Newth, and the solid handed round for inspection. Criticisms on the paper were made by Dr. TRAVERS and by Dr. SCOTT, who said that there was nothing new in the principle adopted.

Mr. NEWTH also read a note on partially miscible inorganic solutions. Although many cases exist among organic compounds of the behaviour of water and ether when shaken up, the author said he had been unable to find any record of such behaviour in inorganic solutions. He showed that by skaking up a saturated solution of potassium carbonate with ordinary strong ammonia solution, the two liquids quickly separate, the heavier potassium carbonate solution, dissolving the ammonia solution to the extent of about 37 per cent., while the latter dissolves about 6 per cent. of the potassium carbonate solution. He has investigated the amounts of solution dissolved by each other at different temperatures, and has found that the solubilities increase with increasing temperature, becoming miscible in all proportions above 43°. If the quantity of water present be diminished, as when ordinary 0.880 ammonia is shaken up with solid potassium carbonate, the liquids are only miscible in all proportions at temperatures above 60°. The temperatures at which the different solutions become miscible in all proportions are sharply defined. The cloudy liquid obtained by shaking up the mixture becomes clear quite sharply at its critical temperature. If a solution of copper sulphate be treated with excess of a saturated solution of potassium carbonate so that the copper precipitate is redissolved, and strong ammonia be shaken up with this liquid, the layer containing the potassium carbonate retains almost all the copper, the ammonia layer possessing only a faint blue tint. Ferric chloride dissolved in excess of potassium carbonate and treated with ammonia behaves in the same way, the iron remaining dissolved in the potassium carbonate.

Dr. DIVERS enquired whether the author had tried the experiment of dissolving potassium carbonate in 0.880 ammonia in a closed vessel. He believed that liquid NH₃ might be produced as a layer floating on the potassium carbonate solution.

In reply, Mr. NEWTH stated that when this was done the potassium carbonate ceased to dissolve, but a useful method of obtaining dry NH₃ consisted in allowing 0.880 ammonia to drop slowly on potassium carbonate.

A paper was read by Mr. SODEAU on

THE NATURE OF THE DECOMPOSITION OF LEAD CHLORATE BY HEAT,

this being a continuation of his work on the heating of chlorates generally. No perchlorate is produced, his observations leading

him to the conclusion that the reaction taking place is of two kinds only, namely:—

and

His own criticisms on the deductions made by Spring and Prost are, therefore, confirmed.

A paper was then read by Dr. HEWITT, dealing with

THE CONSTITUTION OF OXYAZO COMPOUNDS.

A great deal of work has been done to determine whether benzene azophenol existed as hydroxyazo benzene, or whether it took the configuration of quinone hydrozone. From the nitration of the compound he had come to the conclusion that it was the hydroxy compound, while Dr. Armstrong through brominating had come to the opposite conclusion. But he was able to show that a fault existed in Dr. Armstrong's deduction, since when the compound is brominated in the presence of sodium acetate, so that no free hydrobromic acid acts upon it, different results are obtained. The substance must therefore be regarded as the hydroxy derivative of azobenzene.

Mr. DUNSTAN congratulated the author, remarking that the work was one of the highest importance.

Dr. H. A. D. JOWETT read a paper on

A NEW GLUCOSIDE FROM WILLOW BARK,

to which he gives the name of Salinigrin. It is obtained from a new bark lately introduced into commerce, but the species of willow from which it is derived is not known with exactitude. He finds salinigrin to be the glucoside of meta-hydroxy-benzaldehyde.

A paper was next read by Dr. LANDER on

METHODS OF ALKYLATING BY MEANS OF ALKYL IODIDES AND DRY SILVER OXIDE.

The author has produced a great number of alkyl derivatives by this method, the most important of which were briefly described.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.

The annual meeting was held in the Pharmaceutical Society's House, 36, York Place, Edinburgh, on Wednesday, April 11, Mr. FRASER MCDIARMID, President, in the chair.

ANNUAL REPORT.

Mr. J. G. SCLATER, Hon. Treasurer, read the financial statement, indicating a satisfactory balance in hand of £8 6s. 6d. On the motion of Mr. PLENDERLEITH, seconded by Mr. KIDD, the statement was approved.

Mr. JAMES LENNOX, Hon. Secretary, read the annual report. In membership and finance the Association continued to prosper, but the attendance at meetings during the session had not been so good as in previous years. Regret was also expressed at the want of appreciation of the prizes offered in connection with the Association, as indicated by the small number of competitors. On the motion of Mr. GORRIE, seconded by Mr. ROWLAND, the report was approved.

On the motion of the PRESIDENT, seconded by the VICE-PRESIDENT, it was unanimously agreed to give a donation of £1 1s. to the Benevolent Fund of the Pharmaceutical Society.

ELECTION OF OFFICERS.

The following were elected office bearers for the next session:—President, David Harley; Vice-President, James Lennox; Secretary, J. G. Sclater, 6, St. Andrew Square; Assistant Secretary, Peter Gorrie; Treasurer, J. W. Plenderleith; members of Committee, P. Brown, W. F. Buist, A. Currie, G. P. Grainger, J. McBain, F. McDiarmid, G. H. C. Rowland, and J. Wright; Prize Committee, the President, Vice-President, and Secretary, and Messrs. McBain, McDiarmid, and Rowland.

A discussion then took place on the question,

SHOULD THE MINOR EXAMINATION BE DIVIDED?

Mr. LENNOX, in moving "That the Minor Examination be divided," grouped his reasons for doing so under the following nine heads:—

(1) The standard has been raised very appreciably in recent years.
(2) All six subjects have to be passed at one and the same time, a demand not made upon candidates in any similar examination in the kingdom.

(3) The present low percentage of passes shows the difficulty experienced in preparing for six subjects at once.

(4) The examination is capable, naturally, of being divided into two parts—viz., (1) scientific, and (2) technical.

(5) Chemists' assistants are not endowed with superhuman memories.

(6) We are only once more taking up the position which it was attempted to take up in the 1884 Pharmacy Bill, which, however, then, as now, was unfortunately loaded with suggestions for coincidentally enforcing a curriculum.

(7) By spreading the period of preparation over a longer period it would undoubtedly raise the educational standard of candidates, would approximate the standard of the candidates' knowledge to something nearer the standard demanded by examiners, and would also tend to do away with "cram."

(8) The aim of this, as of all examinations, is to test the state of education reached by the candidate.

This can be done as readily by having the examination in two portions, with a suitable interval, as at present, with only a week's interval.

(9) And probably at the present time most important. The new Preliminary Examination introduces a new set of circumstances. The apprentice now commences his life work with the necessary certificates, which will stand for the Preliminary Examination, obtained whilst yet at school. This causes, as was lately pointed out by Dr. Symes, a dangerous time of inaction between, say, the ages of sixteen and nineteen (when the serious studies for the Minor Examination may be said to commence), which would be obviated were part of the examination permitted to be entered for before that *sine qua non*, the age of twenty-one years, was reached.

From all the foregoing points of view the division of the Minor Examination is urgent and immediate, apart from all consideration of a curriculum.

Mr. PLENDERLEITH having seconded the motion,

Mr. W. B. COWIE moved a direct negative, and argued for retaining the examination as at present. To divide the examination would involve a curriculum of twelve months, instead of six months, as at present. It would also mean raising the standard. It was generally considered that the educational standard of the examination was quite high enough at present. The outlook in the drug trade did not warrant any such change. The subjects of the examination were so closely related that they did not involve a great tax on the memory. To take the scientific and technical subjects separate would be a mistake, because candidates in the technical subjects might fail, owing to having forgotten their chemistry or botany. The high percentage of failures was caused by students badly trained during apprenticeship, who failed again and again, and thus swelled the numbers. Division of the Minor would mean the expenditure of more time and money by the students. At present the Boards only examined on one session's work, just as was done in the medical examinations. They ought to think well before committing themselves to such a proposal.

The subsequent speaking was all on the affirmative side. On a vote being taken the affirmative was declared carried by a majority of two to one. Several members had left before the vote was taken. All the speakers favoured a compulsory curriculum, but regarded it as a question distinct from the division of the examination. One member stated that the former practice of the

Boards in the Minor Examination was to allow men to come up again for those subjects only in which they had previously failed.

The meeting closed with a cordial vote of thanks to the retiring office-bearers, and especially the President, for their services during the session, proposed by Mr. J. D. SINCLAIR, and passed with acclamation.

CHEMISTS' DEFENCE ASSOCIATION.

A representative meeting of North London chemists was held on the 11th inst. at The Old Cock Tavern, Highbury, to discuss the subject of chemists' defence.

The CHAIRMAN, Mr. Albert Cooper, Kensington, Chairman of the C.D.A. Directors, after a few commendatory remarks, called on

Mr. GLYN-JONES, who fully explained the objects and capabilities of the Association, as exemplified by some of its recent actions on behalf of its members. He said a member had recently been persuaded into ordering a considerable quantity of medicated wine, on the traveller's assurance that no licence was needed. Subsequently he discovered that the wine was excisable, and returned it to the makers, who, however, declined to receive it from the railway company. After some correspondence a lawyer's letter was sent to the chemist requesting payment, and threatening legal proceedings in default. The matter was referred to the Defence Association, and ultimately, as a result of courteous representations made by the Association, the manufacturers consented to take back the goods. That was only one instance, among many, of the advantage of having a strong trade protection society behind one. He (Mr. Glyn-Jones), in criticising the excise laws, said it was a fact, strange but true, that many chemists stamped proprietary articles which did not really require stamps. Speaking of various Acts, he pointed out how easy it was to break them unwittingly. A candid critic of the C.D.A. objected to the Shop Hours Act being included in the Official List. "Surely," said this gentleman, "no chemist ever breaks that!" He (Mr. Glyn-Jones) asked him if he had a copy of the Act exhibited in his shop. He admitted that he had not, and that he was unaware he was liable to a fine for the omission.

Mr. MCGEORGE wished to know if the Association was a limited liability one, and was informed it was.

Mr. MCKNIGHT expressed his intention to push the C.D.A. amongst his friends in the trade. He objected to the iniquitous methods practised by Somerset House informants, who often tried to trap chemists into breaking the Excise Acts. A letter had come to him some time ago purporting to be from the Rev. Somebody at an address named. It requested him (Mr. McKnight) to supply a number of samples of a proprietary ointment, which the "reverend" gentleman said he had found most efficacious. He would pay for them. Before supplying, he (Mr. McKnight) called at the address given, and asked if the Rev. So-and-So lived there. He was told no one of that name was known there, but that it was the residence of two gentlemen from the Strand. He was hopeful that the Defence Association would help to checkmate such tricks. He thought Somerset House should not prosecute or demand fines until they had first tried the effect of a caution. If that failed he would let them fine as heavily as they liked. He thought the knowledge that a chemist had an association at his back would have a good effect in warding off blackmail frauds. For instance, his assistant sold a little hartshorn and oil to a customer, who afterwards demanded compensation for injury, which he alleged had been caused to his skin by the medicament. The fellow was told that the hartshorn and oil was all right, that the fault lay in the application, and that no compensation would be paid. He was told, moreover, if he tried to recover damages in the law courts he would have an association to fight. After that the claim was dropped.

Mr. GAUBERT, Wembley, asked for an opinion as to the legality of selling bitter apple. He generally refused to sell it. He would also like to have a definition of a "noxious drug" in that sense.

Mr. GLYN-JONES said that the sale of noxious drugs, or any other substance with intent to procure abortion, was forbidden by the Offences to the Persons Act. According to a recent judgment it was more the intention with which a drug was sold or administered than the nature of it that rendered it a "noxious drug" within the meaning of the Act. Even a harmless drug had been decided to be noxious if sold with an illegal intention.

Mr. ANDREWS, Leinster Terrace, said he sold a good deal of bitter apple for the prevention of moths in fur.

Mr. MCKNIGHT said he did the same. He always used his discretion in each particular case.

Mr. CHIPP, Hackney, wished to know how far the Association would go in defending a case of, say, defective sweet nitre.

Mr. GLYN-JONES replied that members were entitled to defence before the magistrates up to £10; and if the Directors thought it would be in the interests of the members at large they would take suitable cases before the Appeal Courts, without restriction as to amount.

Mr. HOLDING, Barnsbury, commenting on prosecutions for defective sweet nitre, remarked that it was frequently the seller's own fault. The shop-bottle was too often allowed to run nearly empty before refilling. When that was done the last few ounces in the bottle could not fail to be much below the proper strength.

The CHAIRMAN intimated that the Directors had made arrangements so that members could have any article they were in doubt about analysed at a nominal fee by the Association's analyst. The analyst would simply report on the article as to whether it would or would not pass the Food and Drugs Acts.

The following resolution, moved by Mr. CHIPP, seconded by Mr. HOLDING, was passed unanimously:—

"That this meeting of north and north-west London chemists approves of the Defence Association recently formed, and wishes it complete success."

NEWCASTLE-ON-TYNE AND DISTRICT CHEMISTS' ASSOCIATION.

At a meeting of this Association, held on Wednesday, April 11, the PRESIDENT, Mr. Charles Ridley, read a paper on

THE BOTANY AND MATERIA MEDICA OF THE BIBLE,

which will be printed in the Journal later. He exhibited specimens of all the articles named in the paper, as well as many excellent photographs, also a collection of dried plants which had been gathered in the Holy Land. Those were of a very high order, and much admired on account of the flowers having retained their natural colours, as well as the superb manner in which they had been mounted. Considerable interest was taken in an experiment with the dried fruit of the "Rose of Jericho," which when damped with water expanded, thus exposing the seeds, a characteristic which ensured fertilisation.

The paper was listened to with much interest, a hearty vote of thanks being accorded to Mr. Ridley for his contribution, which was stated to have been one of the most interesting ever read before the Association.

MANCHESTER PHARMACEUTICAL ASSOCIATION.

The annual meeting was held at the Victoria Hotel on April 11, Mr. G. S. WOOLLEY in the chair.

The SECRETARY read the report for the past session, and the TREASURER presented the accounts showing a balance in hand of about £19.

The PRESIDENT, in proposing the adoption of the report and balance-sheet, said that the Council of the Association was issuing to all the local members of Parliament a letter setting forth its views upon

THE COMPANIES BILL

now before Parliament. He also stated that he and Mr. Kemp had attended, by invitation, on the previous evening a meeting of the Manchester Medico-Ethical Society (see p. 428), to which were also invited representatives of the two Manchester Dental Associations. The pharmaceutical representatives succeeded in considerably modifying the opinions of some of the medical men present, with the ultimate result that this conference of medical men, dentists, and pharmacists unanimously decided to oppose Clause 2, and proposed the amendment of Clause 3 by the inclusion of pharmacists.

The officers elected for the ensuing session are as follows:—President, G. S. Woolley; Vice-Presidents, H. Kemp and W. Kirkby; Treasurer, A. J. Pidd; Secretary, W. Walton.

Obituary.

BIRD.—On April 13, Augustus Bird, Pharmaceutical Chemist, Shepherd's Bush, W. Aged 73. Mr. Bird had been a member of the Pharmaceutical Society since 1850; prior to that he was for some time a student in the School of Pharmacy, and in 1849 gained the second prize for Chemistry and Pharmacy. In 1853 he was appointed an Examiner to the Society, which position he held until 1872, when Mr. Wm. Martindale was appointed in his place. He was a constant supporter of the Benevolent Fund, contributing something like 120 guineas in donations.

COOPER.—On April 15, Frederick Richard Cooper, Chemist and Druggist, late of Manchester. Aged 48. Mr. Cooper had been connected with the Pharmaceutical Society for many years as an Associate, and latterly as a Member.

EVANS.—On April 12, Richard Evans, Chemist and Druggist, West Bromwich. Aged 69.

HUGILL.—On April 10, at Rosedale, Chislehurst, John Hugill, Pharmaceutical Chemist. Aged 87. Mr. Hugill was the son of John Hugill, an auctioneer and estate agent, Whitby, an influential townsman of local celebrity, who was associated with George Stephenson, the celebrated engineer, in acquiring land for and constructing one of the first railway lines in the kingdom. He was born at Whitby on May 29, 1812, and having served a six years' apprenticeship with Mr. Proctor, of Scarborough, was brought to London by the said George Stephenson, at the age of twenty, who was coming to London to give evidence before a Committee of the House of Lords. These were the times when barrels of oil for street lighting purposes were supplied by chemists, when paints were ground, and grey powder was mixed by hand by the apprentices. He first applied to Messrs. Bell, of Oxford Street, for a situation; being unsuccessful, he approached Messrs. Hearon, Squire's, and through their recommendation, accepted an engagement with Mr. Spite, chemist, Newington Butts (opposite the Debtors' Prison), where he remained for six months. From there he engaged with Mr. Wilmot, chemist, High Street, Borough. At that time the Borough was a fashionable residential quarter, many bankers and leading citizens residing in that district, and many of the customers at that time still wore knee-breeches and silk stockings. He had been in this situation three years when Mr. Wilmot died, and, in accordance with a promise given in his lifetime, Mr. Hugill arranged to carry on the business for the widow until the education of the sons was completed. That occupied a further period of twelve years. In 1848 he entered into partnership with Mr. George Meggeson, of Cannon Street, in conjunction with Mr. Alfred Attwood (both since deceased). At that period there was no railway station, and Cannon Street had not been widened, it being so narrow that one could almost shake hands across the street. When he first joined the firm of Meggeson and Co. the business was a retail one, and the two Misses Meggeson assisted their father in making the goods and in the general

conduct of the business, the family residing over the shop. It was then that Mr. Hugill's business ability, organising powers, and personal application found scope, enabling him to lay the foundation of, and eventually develop, the business which has become an historical name in the trade. The existence at that period of the heavy duties on sugar (the market value of which was £80 per ton) was a temptation to confectioners to adulterate. Mr. Hugill set his face against this from the first, and by raising the standard of the goods manufactured (in which his experience as a druggist stood him in good stead), secured to the firm an additional branch to their business. In the early days of the partnership no clerk was employed, and Mr. Hugill was accustomed to cross London Bridge from his lodgings in the Borough at 5 a.m., to make out the invoices of the previous day's work. George Newton, the first clerk he engaged, is still actively employed in the firm (after more than fifty years' service) as head ledger clerk. In 1876, on the expiration of the lease, the business was transferred to the present premises at Miles Lane. Mr. Hugill was present at the first meeting presided over by "Jacob Bell," to consider the advantage of establishing a corporate body for promoting the welfare of the trade and the advancement of pharmacy, which eventually resulted in the formation of the Pharmaceutical Society. Although taking a lively interest in all pharmaceutical matters, he took no active part, owing to his sensitive nature and peculiarly retiring disposition. No doubt the difficulties he had to surmount in coming friendless to London caused him to be ready at all times to interest himself in young men seeking situations—it was a source of pleasure to him to do so—and we feel sure there are many successful chemists to-day who can trace their success to his kindly advice and assistance. Mr. Hugill was actively engaged in business until his 81st year, when the shock caused by the sudden death of a younger son in India decided him to retire; but he was spared for some seven years to enjoy the quiet and rest he had so well deserved. He was a man of great ability and judgment, as well as of marked kindness of heart, of whom it may truly be said that he died as full of honour as of years, respected and loved by all who knew him.

PLANCHON.—On April 13, at Montpellier, Gustave Planchon, Director of the Ecole Supérieure de Pharmacie de Paris. Aged 66. Monsieur Planchon, who was a honorary member of the Pharmaceutical Society and a Hanbury medallist, was a member of the Académie de Médecine and an officer of the Legion d'Honneur, and was the President of the forthcoming International Pharmaceutical Congress.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Colocynthis Pulpa.

COLCYNTH PULP or bitter apple is the fruit freed from its rind and seeds, of *Citrullus colocynthis*, Schrad. (N. O. Cucurbitaceæ), a slender scabrous plant with a perennial root, which is widely distributed throughout Northern Africa, Syria, North-Western India, Persia, etc., and cultivated to a certain extent in Spain and Cyprus. The fruit is a gourd of the size and shape of an orange, having a smooth marbled-green surface which changes to yellow as ripening proceeds. It is three-celled when young and bears numerous seeds attached to axile placentas, which extend from the centre of the fruit nearly to the circumference. Near the pericarp the placentas divides in two, each half curving inwards and bearing seeds on the inside of the curve. As the fruit develops the carpellary walls disappear, and it becomes spuriously one-celled. The fleshy placentas of which the pulp chiefly consists are not juicy in the fresh state; they usually split in a radial direction throughout the greater part of their length, and appear deeply fissured in the dried

fruit. The fruit is collected when ripe, freed from the thin rind by peeling with a sharp knife, and dried. Unpeeled colocynth is occasionally imported from Mogadore; the peeled fruit is imported chiefly from Smyrna, Trieste, France, Spain and, less frequently, from Persia. It is freed from seeds after arriving in this country. The drug is a powerful hydragogue cathartic and dangerous in large doses; it is used in the preparation of *Extractum Colocynthis Compositum*, *Pilula Colocynthis Composita*, and *Pilula Colocynthis et Hyoseyami*.

COLOCYNTH FRUIT.—The peeled fruit of Turkey Colocynth, as imported.

CHARACTERS.—Colocynth fruit is usually imported peeled, occurring in more or less broken balls—about 5 Cm. or less in diameter, and very light in weight—the outer surface of which is formed by part of the thin whitish mesocarp, the seeds and fleshy placentas being visible at points where the mesocarp has been removed. On cutting a fruit transversely the placentas are generally exhibited as radiating fissures dividing the fruit into three parts. In each part, near the periphery, half of each placenta curves inwards and bears on its inner margin several vertical rows of seeds. The flattened ovoid seeds, which number from two to three hundred in each fruit, are yellowish-white to dark-brown in colour, according to the degree of ripeness. The pulp, which alone should be used for medicinal purposes, constitutes about one-fourth the weight of the peeled fruit, and consists chiefly of the placentas; it is very light, spongy, whitish, and pith-like, with a very slight odour but an intensely bitter taste.

COLOCYNTH FRUIT.—Transverse section of Turkey Colocynth, showing radiating fissures and seeds.

TESTS.—Colocynth pulp contains no starch, and when powdered should, therefore, not respond to the tests for that substance (see under "*Amylum*," *ante*, p. 113). Neither should the powder

yield more than traces of fixed oil to ether, thus showing that the seeds have been entirely removed. The seeds contain 15 to 17 per cent. of fixed oil, whereas the pulp alone does not yield to ether more than 3 to 5 per cent. of extractive of an oily nature. When dried at 100° C. and incinerated the pulp yields not less than 9 per cent. of ash, but the seeds yield only about 2.5 to 3 per cent., whilst the pulp and seeds together yield from 4.5 to 5 per cent. of ash.

NOTES.—The distinctive characters of colocynth pulp are its light weight, general appearance, and intensely bitter taste. Turkey colocynth, imported from the Levant, is the finest, and Spanish comes next in value; the poorest is Persian, which is only occasionally seen on the market. The bitter principle of colocynth is an amorphous yellow glucoside, colocynthin, which is found in the pulp to the extent of about 0.6 per cent., but not in the seeds; it has not been fully investigated, but appears to be easily hydrolysed by dilute acids or alkalis, yielding resinous colocynthein and sugar. The name "colocynthin" has been applied to a tasteless crystalline resin found in colocynth, which also contains fixed oil, pectin, gum, albuminoids, etc.

Conii Folia.

CONIUM LEAVES, or Hemlock Herb, consists of the fresh leaves and young branches of *Conium maculatum*, Linn. (N.O. Umbelliferae), the spotted hemlock, collected when the fruit begins to form. The plant is cultivated for medicinal purposes, but wild specimens are also collected and used. The drug possesses sedative and antispasmodic properties; it is used in the preparation of *Succus Conii* and that, in turn, enters into the composition of *Unguentum Conii*.

CONIUM LEAF.—Upper leaf of *Conium maculatum*, and clasping petiole.

CHARACTERS AND TEST.—Conium leaves are more or less divided in a pinnate manner, dark green on the upper surface, paler on the under surface, quite glabrous, and attached to the stem by amplexicaul or clasping petioles of varying length, those of the

lower leaves being hollow. The lower leaves are decomposed, and sometimes nearly 70 Cm. in length, but the upper ones are less divided, and smaller; the ultimate ovate or lanceolate segments or divisions of all the leaves terminate in smooth, colourless, horny points. The stem is smooth, hollow, and marked on its lower part with dark purple spots which tend to disappear on drying. The inflorescence of hemlock is an umbel, with about twelve rays and both general and partial involucre, the latter consisting of three short lanceolate bracts directed outwards. The broadly ovoid fruits have irregular crenate ridges and a grooved endosperm. The plant has a bitter taste and a strong disagreeable odour, which is more pronounced—recalling that of mice—when the plant is crushed and rubbed with solution of potassium hydroxide.

CONIUM LEAF.—Tip of ultimate segment of leaf of *Conium maculatum*, magnified.

NOTES.—The distinctive characters of hemlock are the smooth spotted hollow stem, the much divided glabrous leaves with their ultimate divisions terminating in smooth colourless points, the presence of both general and partial involucre, the crenate ridges and grooved endosperm of the fruit. In Fool's Parsley, *Aethusa cynapium*, Linn., the ultimate divisions of the leaves terminate in short brownish points, the umbel has no general involucre, and the bracts of the partial involucre are long and narrow; in Wild Chervil, *Anthriscus sylvestris*, Hoffm. the leaves are hairy, the partial involucre is not directed outwards, and the fruit is elongated. The chief constituents of hemlock are the alkaloids coniine and conhydrine, which are present in largest proportion when the plant is in full bloom, the stem then containing about 0.064 per cent. of alkaloid, the leaves 0.187 per cent., and the flowers and flower stalks 0.236 per cent. Other substances found in the plant are a volatile oil, albumin, mucilage, etc. Coniine is a colourless, oily, volatile liquid, of disagreeable mouse-like odour, acrid taste, and possessing poisonous properties. Conhydrine or oxy-coniine, which is less poisonous, occurs in glittering plates or scales, and yields coniceine on heating with phosphoric anhydride.

Conii Fructus.

CONIUM FRUIT is collected from *Conium maculatum*, Linn. (N.O. Umbelliferae), when full-grown but whilst yet unripe, *i.e.*, before the colour has changed from green to yellow. It is then dried and carefully preserved. The medicinal properties of the fruit are the same as those of the leaves, but the fruit is stronger; it is used in the preparation of Tinctura Conii.

CHARACTERS AND TEST.—Conium fruit is broadly ovoid in shape, greenish grey in colour, about 3 Mm. in length and breadth, slightly compressed laterally, and crowned by the small depressed stylopod bearing the remains of the stigmas. The two glabrous mericarps of which the fruit consists are usually separated in the drug as met with in commerce; each one possesses five irregular, more or less crenate or wavy primary ridges, which are paler than the rest of the mericarp and sharply prominent. When a mericarp is cut transversely and examined with a lens, the endosperm is seen to be deeply grooved on the commissural surface, and no vittae are visible. The fruit has no marked taste or odour, but a strong disagreeable odour, recalling that of mice, is produced on rubbing it with potassium hydroxide solution.

NOTES.—The distinctive characters of conium fruit are the glabrous surface, irregular crenate ridges, grooved endosperm, absence of vittae, and the mouse-like odour given off on rubbing with potassium hydroxide solution. Anise fruit bear short bristly hairs, have

CONIUM AND FOOL'S PARSLEY FRUIT.—A. Fruit of *Conium maculatum*, *in situ* with enlarged representations of an entire cremocarp, of back and front of a mericarp, and transverse section of latter. B. Fruit of *Aethusa cynapium*, *in situ*, with enlarged representations of front and back of mericarp, and transverse section of latter.

numerous vittae, and an ungrooved endosperm, which is nearly flat on the commissural surface; the fruit of Fool's Parsley also has vittae, besides differing considerably in shape (see illustration) from conium. The chief constituent of conium fruit is the poisonous, volatile liquid alkaloid coniine, of which they may contain as much as 3.36 per cent.; as the fruit ripens the proportion of coniine diminishes rapidly. The production of the mouse-like odour on rubbing the fruit with potassium hydroxide solution is due to the liberation of coniine from its natural combinations with vegetable acids. Other constituents of the seeds are methylconiine—an oily liquid resembling coniine, conhydrine, volatile and fixed oils, etc.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

ENERGY OF BECQUEREL RAYS.

In a further note on the question as to the origin of the energy possessed by the Becquerel rays (see *ante*, p. 333), it is pointed out that the existence of substances capable of emitting radiations possessing energy, without any appreciable loss of weight or introduction of work from external sources, would appear to be impossible from the view of conservation of energy. The measurements of M. Henri Becquerel upon the deviation of the radium rays in an electric field, taken in conjunction with those of M. and Mme. Curie of the charges carried by those rays, lead to results which show a way out of this difficulty, on account of the extreme minuteness of the quantities of energy in question. The calculations of M. Becquerel show that the energy radiated per square centimetre is of the order of one ten-millionth of a watt per second. Hence a loss of weight of about a milligramme in a thousand million years would suffice to account for the observed effects, assuming the energy of the radium to be derived from an actual loss of material.—*Nature*, **61**, 547.

CONSTITUTION OF SULPHITES.

It is now very generally agreed that the true constitution of the sulphites is represented by the unsymmetrical formula $R.SO_2.OR$, as opposed to the symmetrical $SO.(OR)_2$. One interesting outcome of the former view is that there should be isomeric double sulphites, the one $R.SO_2.OR'$, and the other $R'.SO_2.OR$, and Schwicker and Barth have indicated the existence of such isomers in the case of sodium potassium sulphite. Dr. Fraps, however, after carefully repeating those experiments, has been driven to the conclusion that no such isomerism exists in this case. That coincides with the views of Hantzsch, who holds that structural isomerism is unknown in inorganic bodies.—*Am. Chem. Journ.*, through *Nature*, **61**, 547.

MEDICATED WATERS.

A. G. Criddle and W. O. Richtmann compare the results of preparing medicated waters by various methods, and state that all the evidence is in favour of the method depending upon impregnation of and filtration through cotton. The waters are easier and more readily prepared, retain their strength and quality of odour longer, do not become turbid, remain free from fungus growths, contain practically no foreign matter, and are not incompatible with the substances with which they are most frequently combined. Waters prepared by the aid of cotton gave no reaction with silver nitrate, ferrous sulphate, copper sulphate, or zinc sulphate. The same result was noted in the case of medicated waters prepared by agitation with cold water, or by distillation of water vapour through cotton impregnated with volatile oil. When kieselguhr or talc was used as a filtering agent the resulting waters gave no precipitate, but those prepared by filtration through calcium phosphate or magnesium carbonate gave precipitates with several of the reagents. Cocaine hydrochloride, atropine sulphate and boric acid were not affected by medicated waters prepared by any of the methods tested.—*Pharm. Archives*, **3**, 22.

A NEW THERMOMETER SCALE.

A. Betts has devised a milligrade thermometer in which mercury freezes at zero and boils at 1,000 degrees, the scale being to Fahrenheit as 10 to 7, and minus degrees abolished for all ordinary purposes. On the proposed scale water boils at 360 degrees—the number of degrees in a circle, the point of aqueous congelation is just above 100 degrees, and 200 degrees milligrade equals 100 degrees Fahrenheit.—*Scient. Amer.*, **82**, 170.

VOL. 64. FOURTH SERIES, VOL. 10.). No. 1557.

F. P. Venable discusses the nature of the **COLOUR CHANGE OF CHROMIUM SALTS** change from violet to green in solutions of chromium salts and adheres to the opinion, formerly expressed by himself and Miller, that the colour of the green solutions is due to the formation of green and uncrystallisable basic salts of chromium, as first suggested by Berzelius. It is now stated, in addition, that the formation of those salts is accompanied by the liberation of a portion of the combined acid, corresponding to one-half of the total in the case of alum.—*Journ. Am. Chem. Soc.*, **22**, 111.

OIL OF CHRYSANTHEMUM.

The green leaves of *Chrysanthemum japonicum* yield on distillation, according to G. Perrier, about 0.16 per cent. of a greenish volatile oil, which is most abundant at the commencement of flowering. It is a somewhat oily liquid with a peculiar odour, resembling that of mint and of chamomile. It begins to boil at 160° C. Its sp. g. is 0.932 at 15° C., and its refraction index 1.4931 at 18° C. It is soluble in 10 parts of alcohol (70 per cent.). When cooled to -15° C. it deposits a small amount of a solid amorphous body, probably a paraffin; at -24 C. it becomes very thick, and is completely solidified on immersion in a mixture of ether and solid carbonic anhydride. It is acid to litmus, combines partially with bisulphite, and has a saponification index of 8.61. When the alkaline salt resulting from this saponification is decomposed with hydrochloric acid, there is formed a solid acid resembling angelic acid in odour.—*Bull. Soc. Chim.*, **23**, 216.

COMPARISON OF TESTS FOR FORMALDEHYDE.

B. M. Pilhashy finds that in some instances the delicacy of tests for formaldehyde is not as claimed, and in others the reaction supposed to be peculiar to formaldehyde is obtained with other aldehydes, and even with distilled water. Thus Schiff's reagent (fuchsine decolorised by sulphurous acid) is affected by most aldehydes in dilute solution, but a similar result can also be obtained by merely exposing the reagent to air, or warming the suspected liquid with it in the absence of an aldehyde. Phenol with sulphuric acid gives a reaction with most aldehydes, as also does diazobenzenesulphonic acid. Nessler's solution reacts with acetaldehyde as well as formaldehyde. Trillat's reagent (dimethylaniline and sulphuric acid) does not show the presence of formaldehyde, but of dimethylaniline or its salts when not completely volatilised. Lebbin's reagent (resorcinol with sodium hydroxide) will only detect 1 part of formaldehyde in 200,000, and not 1 in 10,000,000 as claimed. Morphine hydrochloride with sulphuric acid is not sensitive enough to detect formaldehyde in a solution containing less than 1 part in 1,000. Phenylhydrazine hydrochloride seems to be the best reagent for formaldehyde and, when used in conjunction with sodium nitroprusside and concentrated sodium hydroxide, is capable of indicating the presence of 1 part in 1,000,000.—*Journ. Am. Chem. Soc.*, **22**, 132.

ARTIFICIAL COLOURS IN MILK.

A. E. Leach presents a scheme for the detection of foreign colouring matter in milk, more especially annatto, caramel, or aniline orange. About 150 C.c. of the milk is curdled by the aid of heat and acetic acid, the curd macerated with ether, and the ethereal extract separated. The ether is then removed by evaporation, the residue made alkaline with sodium hydroxide and poured on a wetted filter which will be coloured orange if annatto be present. If the extracted curd be orange or brownish in colour, it is shaken up with concentrated hydrochloric acid; the solution immediately becomes pink if aniline orange be present, or gradually turns blue if caramel has been used as a colouring agent.—*Journ. Am. Chem. Soc.*, **22**, 207.

QUININE HYDROCHLORIDE AND CAFFEINE.

BY DR. B. H. PAUL AND A. J. COWNLEY.

The tendency of alkaloids to form compounds with each other when present in various solvents, and to simulate a distinct alkaloid having characters different from each of the component parts, is well known. Quinine and cinchonidine, for example, will crystallise together from a solvent such as ether, in which quinine by itself is most freely soluble, in a crystalline form quite distinct from crystals of cinchonidine. The sulphates of these alkaloids will also form double sulphates crystallising from water of varying composition according to the proportion of each present. Cupreine and quinine will produce a similar combination, which was at first regarded as a distinct alkaloid. In these instances, however, the solubility of the compound is to a great extent dependent on the proportion of the more insoluble alkaloid or its salt forming the combination. "A chemical union of quinine and caffeine" is claimed by Dr. Kreidmann for a preparation termed basicine. This compound, however, is more freely soluble in water than either of its constituents. It is said to be produced by melting two parts by weight of quinine hydrochloride—hydrobromide or hydriodide—with about one part of caffeine. The "liquefaction" is stated to take place without addition of a solvent, but neutral solvents such as water, alcohol, or chloroform may be added. The quinine hydrochloride and caffeine are claimed in this manner to have "entered into a combination which has essentially other physical properties than its constituents," the chief of which is that one part will dissolve in its own weight of cold water, while quinine hydrochloride requires about 35 parts, and caffeine about 70 parts of cold water respectively. It is also described as melting at "+125° C.," quinine hydrochloride at 193° C., and caffeine at 225° C.

Basicine dissolves, as stated, very readily in its own weight of cold water, with a faintly alkaline reaction. From its aqueous solution quinine can be precipitated by ammonia and separated by ether, leaving the caffeine in the aqueous liquid. It was found to melt at 174° C., whilst quinine hydrochloride and caffeine, both dried at 100° C., melted at 153° C. and 228° C. respectively. An admixture of two parts of quinine hydrochloride and one part of caffeine, both in the dried condition, should melt at 175°·5 C. The melting point of basicine, therefore, would seem to indicate a mechanical mixture rather than a chemical combination. In fact it is quite unnecessary that quinine hydrochloride and caffeine should be melted together to make the soluble compound, as the mere admixture of the two in the proportion of 2 : 1 will dissolve in its own weight of water on slightly warming the solution, and remain dissolved on cooling. Analysis of basicine gave the following result:—

	Per cent.
Quinine hydrochloride	62·6
Caffeine	33·0
Water at 100° C.	4·4
	100·0

When expressed on the dry substance the results are as follow:—

	Per cent.
Quinine hydrochloride	65·5
Caffeine	34·5
	100·0

In aqueous solution it would fairly well agree with the formula $(C_{20}H_{24}N_2O_2, C_8H_{10}N_4O_2)HCl$, as shown by the following analysis.

	Theory.	Found.
$(C_{20}H_{24}N_2O_2, C_8H_{10}N_4O_2)HCl$.		
	Per cent.	Per cent.
Quinic	58·6	58·9
Caffeine	34·9	34·5
HCl	6·5	6·6
	100·0	100·0

The formation, in the manner above described, of this very soluble preparation of quinine hydrochloride and caffeine is of chemical interest, apart from any medicinal value that may be assigned to it.

BACTERIOLOGY FOR PHARMACISTS.—II.

BY C. EDWARD SAGE.

METHODS OF STERILISING AND WORKING.

Before we can proceed with the cultivation of micro-organisms, we must be able to start with apparatus absolutely free from living specimens, and the process of getting rid of or killing them is called sterilisation.

Apparatus must not be only outwardly and visibly clean, it must be absolutely clean, and when we consider that London tap-water contains somewhere between 30,000 and 100,000 organisms per litre, it will be evident that something more than washing will be needed.

The principal means of sterilisation are heat and germicidal agents, but for most practical purposes the student will find that heat in some form or other is necessary. The processes of sterilisation do not make very interesting reading, but unless they are carefully studied and scrupulously carried out no work worthy the name can be done.

To begin with the apparatus. Test-tubes, flasks, Petri dishes, pipettes, measures or bottles will be the chief things used by the student, and their sterilisation is best carried out as follows:—Make a solution of soft soap, 8 oz.; washing soda, 2 oz.; water, 4 pints, and keep some always ready. When operations are commenced, take a large enamel ware bowl and half fill it with boiling

HOT AIR STERILISER.

water, add a few ounces of the above soap solution, and place a bottle-brush or nail-brush in the hot water, then put in the test-tubes or other things, and as soon as the water has cooled to a temperature at which it can be borne by the hands, commence to brush all the things well with the soapy water; this removes all the dirt and grease. Next rinse well in tap-water and allow them to drain, then wash out with dilute hydrochloric acid (about 1 in 10), this removes mineral matter and other impurity, then rinse well with tap-water and finally with distilled water. If the distilled water is not used a film of lime salts will remain on the tubes and flasks when they are dried. When all the things have drained well place them on a tray, and put them into the hot air steriliser when

it is cold and gradually raise the temperature to about 150° C. The water is gradually expelled, and at the temperature named all organisms are killed and the utensils rendered sterile in about fifteen minutes after the maximum heat has been maintained. Thick glass vessels are very liable to crack when treated in this way, and it will be better to dry them more gradually in a warm oven and then to hold them in a jet of steam for a few moments, and afterwards to place them in a large sterile vessel to protect them from the air.

A hot air steriliser may be easily improvised if needed, but when the kitchen oven can be made use of, it saves a lot of gas.

To sterilise tubes, flasks, or dishes in an ordinary oven they should be placed on a dish and put in the oven when it is cool, and left there until it has been hot for an hour or more.

A very useful hot air steriliser may be made from a biscuit or quinine tin by boring a number of small holes in the sides about two inches from the bottom and threading iron wire through the tin, so as to form a network inside the tin. A hole must be cut in the lid for the thermometer, and when the damp apparatus is first placed in it the lid should be tilted to allow the steam to escape.

Flasks may be readily and conveniently sterilised by boiling a few ounces of water in each for five minutes, pouring out the water, and plugging with cotton wool previously sterilised.

STEAM JET STERILISER.—A Section of cork showing numbered holes.

For sterilising pipettes, bottles, or measures a jet of low pressure steam is invaluable, and may be easily obtained by boiling water in a half-gallon tin can fitted as follows:—Take a can with a wide neck and fit it with a good cork, bore six holes in the cork, as in the diagram. Through hole No. 1 fit a piece of $\frac{1}{4}$ -inch glass tubing long enough to go nearly to the bottom of the can and also to allow six inches above the cork. Through each of the holes 2, 3 and 4 fit pieces of $\frac{3}{4}$ -inch glass tubing about two inches long, and through holes 5 and 6 two pieces of $\frac{1}{4}$ -inch tubing about six inches long and bent at an angle of about 40° two inches from one end. The can is about half filled with water and boiled for a few minutes, then when steam is issuing freely pipettes may be slipped through the tubes in 2, 3 and 4, mouth downwards; on the tubes 5 and 6, test-tubes or small bottles may be placed, five minutes' steaming will effectually sterilise them and they can be plugged with sterile wool

and kept until wanted. Tube No. 1 acts as a safeguard, for if it is pushed through the cork until it is within half an inch of the bottom of the tin, as soon as the water gets below that level steam begins to issue from it.

Large bottles may be sterilised by washing them well with Liq. Hydrarg. Perchlor., then with distilled water, and holding them over the steam jet until the steam ceases to be condensed in the bottle. They must be plugged with wool until needed, and even if they are stoppered bottles wool is the best thing to put into the neck until they are cool.

Pharmacists would find this process of steaming out bottles of great utility if they wish to avoid the decomposition of hypodermic injections or eyedrops.

Cotton wool is continually needed with which to plug the necks of tubes or flasks, and it must be carefully sterilised before it is used. It will be found most convenient to use absorbent wool of fairly good quality, and to pull it into small pieces before sterilising, then it need not be handled until it is used. Having pulled some wool into convenient-sized pieces, place the whole loosely in a tin or old covered pot and place this in the hot air steriliser. It must be heated to 130° C. for about fifteen minutes, and no longer. Above this temperature the wool becomes brown and brittle, and falls to dust when handled. When it is required to plug a sterile flask all that is necessary is to take a piece of the sterile wool in a pair of forceps, previously sterilised by passing them through a bunsen flame, push the wool into the neck of the flask in a compact mass and singe it in the flame.

Flasks so plugged will remain sterile, and several should be done at a time; in fact, the washing and sterilising of apparatus should never be done piecemeal.

Alembroth wool, coloured blue, and Lister double-cyanide wool, coloured pink, are useful additions, and the coloured plugs are sometimes a means for distinction of different sets of experiments.

All vessels in which culture media or solutions are to be placed must be sterilised in one of these ways, but bell-glass covers and large dishes, in which the tubes and flasks are to be placed, can be sufficiently sterilised by washing with soapy water, rinsing well with water first and afterwards with 1 in 1,000 solution of mercuric chloride.

To keep apparatus out of the dust it is very convenient to have several bell jars and a cupboard with glazed doors and some shelves. All these should be carefully washed with soapy water and dilute mercuric chloride solution. Forceps and any metal instruments can be safely and effectively sterilised by heating them in the hot air steriliser in the tin in which they are kept when not in use, or platinum needles, scalpels, or scissors may be passed through a bunsen flame two or three times.

The room in which the student works should be as free from dust as possible, and a damp cloth should be used for dusting.

Before commencing and after finishing work the hands should be well washed, using some of the soap solution and, after rinsing a little, 1 in 1,000 perchloride solution.

Methods of sterilising liquids will be considered under the preparation of the different culture media.

With the exception of a few small things, all the apparatus required has now been enumerated, and although some of the things recommended have been improvised inexpensively yet it will be found that workmanship is of much more importance than costly apparatus.

The few remaining things needed by the beginner are:—

Glass plates for cultures, old photographic negatives are as convenient as anything, and the student may suit himself as to size according to the size of the bell jar he provides himself with. The corners of the plates should be cut off and the edges filed down a little.

A glass dish, about 10 or 12 inches in diameter, with another dish or a bell jar fitting inside it.

Glass shelves. These can be made by cutting up "half-plate" negative glasses and fixing a narrow strip of $\frac{1}{4}$ -inch plate-glass on each end. They are intended for placing one on each other, to form a tier of shelves for glass plates.

PETRI DISHES.

Petri dishes are shallow, flat-bottomed glass dishes about four inches in diameter and $\frac{1}{2}$ -inch deep, one fitting inside the other. They are by far the most convenient form for plate cultures, and every beginner should have some. Some form of levelling apparatus is necessary, and a wooden triangle with levelling screws is what is generally employed; this carries a large dish of cold water on which is placed a larger glass plate, and this will serve for a cold bed on which to set gelatin cultures to cool.

It is probable, however, that the student will not need this very frequently at first, and as mercury is always to be found in every pharmacy it may be utilised by pouring it into a developing dish, and then a glass plate floated on its surface makes a perfect level.

Petri dishes, if not very thick, will float on water, and if the water is cold the lower dish containing melted gelatin medium may be cooled on the level surface by floating it with care.

For the present no more apparatus, except flasks, test-tubes, and items to be found in every pharmacy, will be needed, but a small supply of agar-agar and white gelatin should be procured for making some of the culture media.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

A Sensible Appeal to Voters.

Of all the letters that have as yet appeared in connection with the approaching Council election, that of Mr. John Smith is far and away in advance of the rest. It is not couched in unintelligible language, it contains no absurd arguments or misstatements of fact, and its writer—unlike some others whom it would be invidious to mention—does not assume that his readers are so lacking in intelligence as to be able to see straight issues where there are none but very crooked ones. Nevertheless, he does put one straight issue before the electorate, when he urges the desirability of electing good all-round men on the Council, rather than mere partisans. The man of one idea may be an able exponent of the particular line of policy he advocates; but I think he is to be distrusted if he makes up his mind in advance not to diverge from that line, whatever may be the force of arguments advanced in favour of divergence. The members of the Pharmaceutical Society, if they are wise, will elect broad-minded representatives on the Council, and not mere delegates whose situation when attempting to deal with other subjects than those concerning which they have received instructions will be as that of ships without rudders—drifting aimlessly here and there, as the prevailing current may direct.

The Need of Sweet Reasonableness.

I note that even Mr. Glyn-Jones does not approve of returning men pledged to follow a particular course with regard to a single subject only. True, in his open letter issued with the *Anti-Cutting Record* a few days ago, he refers to the company trading difficulty as the matter requiring most pressing attention; but he appeals that new men may be elected on the Council, on the broader ground that he thinks great improvement is possible in the administration of the Society's affairs, and that only by reconstituting the executive body can such improvement as is needed be properly effected. That may or may not be so; I merely refer to his opinion on the

subject as an instance of the sweet reasonableness which is not necessarily absent from the minds of the most radical reformers. Mr. Glyn-Jones is a man of the world, possessing more than an average acquaintance with the difficulties that beset pharmacists, and he is at least entitled to such credit as may be earned by—though not always awarded to—anyone who devotes himself disinterestedly to the improvement of the position of his fellow-craftsmen. Such a man I firmly believe Mr. Glyn-Jones to be and, though I am not at all times able to see eye to eye with him, I trust that as full consideration will always be given to his arguments as to those advanced by individuals of a less impulsive temperament.

An Offence Against Tradition.

The only serious objection that has been and, in my opinion, can be raised in connection with the adoption of a caucus policy at the secret meeting previously referred to, is that matters have been put in train by a member of Council who is not himself standing for re-election on the present occasion. That circumstance alone is unusual and, perhaps, repetition or imitation of Mr. Glyn-Jones's action may render us so familiar with such procedure as to enable us to regard it with sufficient imperturbability in the days to come. Just at first, however, the novelty of the thing has caused something like a shock; it may be that recovery from that will not be complete until after the sixteenth day of May next ensuing. If such should prove to be the case, I anticipate the re-election of the seven retiring members of Council; at the same time, I must warn those who are not anxious for any change in their representation that they cannot afford to remain inactive in the coming struggle, as at least two thousand votes—and possibly many more—may be required to secure a seat. Mr. Glyn-Jones—as representing the views of some seventy writers of letters—has urged the members of the Society to vote solidly for the four new candidates selected after considering those letters. Doubtless we shall yet be similarly urged to vote for the seven old representatives and possibly for other combinations. In any case I would strongly urge every voter to exercise his full voting power. Seven members of Council must be elected and for every vote a member of the Society fails to record he sacrifices one-seventh part of his power to influence the course of events.

How Mischief is Done.

It may seem brave to be careless of consequences; but it is not always discreet to throw stones at one's own glass house and I utterly fail to appreciate the frame of mind which leads some pharmacists to send to trade journals letters in which they confess the imaginary sins of others. One of the latest shining examples of that bad habit is a pharmaceutical oracle, hailing from Dumfries, who is not attempting to secure election on the Council of the Pharmaceutical Society this year, though a time may come, etc. But, though not of the Council, he has chosen to identify himself with that body by writing about the prosecutions (under the Pharmacy Act) "we" undertake and, with sublime impertinence, asserting that they are not according to sound judgment. Continuing, he gives expression to rank nonsense in the statement that "*we* drag up some poor grocer for selling a quack medicine which is too valueless to injure anybody and which (*sic*) brings no profit to *us*, whilst *we* let the unqualified man who conducts branch shops, either for limited companies or private persons, alone." Then, apparently quite convinced of the truthfulness of the foregoing statement, he raves about the supposed facts leading people to accuse "us" of being a close corporation seeking after a monopoly, and about an imaginary charge by the President of the Board of Trade that "we" do not look after the public interest, in addition to much more rubbish of a similar kind. So long as they were carefully buried in the columns of a trade journal those reckless exaggerations and misstatements counted for nothing, but they have been

taken seriously by the *Grocer* and quoted by the editor of that sedate journal, who has been so far imposed upon in the matter that he refers to the self-constituted and mistaken apologist for the Pharmaceutical Society and its Council as appearing to be "a person of sound common-sense." The thing would be laughable if it were not so serious; but perhaps, after all, even the commendation of the credulous editor of the *Grocer* may not suffice to give weight to the nonsensical scribblings I have referred to.

An Ex-Editor's Views.

The gist of the vicarious confession partially quoted in the preceding paragraph is, it will be noted, that the Council of the Pharmaceutical Society has not, in the opinion of its Dumfries critic, acted as it ought to have done in the matter of administering the Pharmacy Act of 1868. But, in the election address just issued by the recently retired editor of the trade journal in which the "confession" appeared, I find a passage which cuts the ground from under the feet of the Dumfries critic. Thus, Mr. Wootton says: "I do not complain in the least of the legal administration of the Act. As far as an outsider can judge, the Council of the Pharmaceutical Society have (*sic*) exercised their powers in this direction with such vigour, tempered with discretion, as to make the statute respected without risking the alienation of judicial sympathy." So much for Dumfries criticism and grocers' approval thereof. With regard to the rest of Mr. Wootton's address, I find in it but small trace of the policy he sets himself to define. The guiding principle of his policy is to be "the maintenance in its integrity of the Pharmacy Act of 1868." But that is what Mr. Gifford says and he means something quite different from what Mr. Wootton means. Apart from that, however, Mr. Wootton's policy would apparently be limited to attempting to come to an agreement with the Lord Chancellor on the subject of company trading in pharmacy and the starting of a "crusade"—a Red Cross one, presumably—to secure the scheduling of carbolic acid as a poison. The policy is neither a rash nor a striking one; in fact, its chief feature appears, to me, to be its close resemblance to that of the Council as at present constituted. Nor can much more be said of Mr. Cooper's statement of his views, which appeared in last week's *P. J.* I therefore feel impelled to ask, once more, in what respect are the new men better than those they propose to replace? Newness may be a sufficient recommendation to some voters; but ability to do what is required strikes me as being a quality of a more practical character.

Un-Natural Selection.

It would seem, however, that Mr. Glyn-Jones and his friends are prepared to stake everything, at this election, on the fact that the candidates supported by them have never served on the Council before. The same qualification is possessed by six other candidates, but they, apparently, are lacking in some other saving grace. Such, at least, I infer from their non-selection by those who attended the caucus meeting and had those seventy letters before them. Doubtless, the favoured four are good men of business; but are the remaining six otherwise? Something in the nature of a reason for making a selection is to be found in Mr. Glyn-Jones' words: "There are ten new candidates and if your votes are distributed amongst them, none of them will be successful. If, therefore, you want 'fresh blood' on the Council, I respectfully urge you to vote solidly for the above four." But though the reason given for making a selection is intelligible enough, I am still unable to comprehend why only four of the new candidates should be thus favoured, especially in view of the fact that none of the old candidates are recommended for re-election. Time, however, solves most problems and we may expect to have Mr. Glyn-Jones' explanation of his little mystery before many days are past. The voting papers will have been issued by the time the next issue of the *P. J.* is published and I shall be surprised if we do not receive further advice, how to vote, about a week or so hence.

A NEW PHARMACOGRAPHIC ATLAS.

ATLAS DE PHOTOMICROGRAPHIE DES PLANTES MEDICINALES. Par Dr. L. BRAEMAR and Dr. A. SUIS. Pp. 76 (Illustrated). Price 15 fr. Paris: Vigot Frères, 23, Place de l'Ecole-de-Médecine, 1899.

The publication of an Atlas of Photomicrography of Medicinal Plants is the more cordially to be welcomed, as unusual energy has been devoted during the last few years to the study of the anatomy of drugs, and several valuable works have in consequence made their appearance.

The object that Messrs. Braemar and Suis have had in view has been the collection of a series of illustrations that shall faithfully represent microscopical preparations as they appear to the observer. They state in the preface that they have found their students experience considerable difficulty in identifying the illustrations in the current text-books when compared with the corresponding objects examined under the microscope. Attributing this to the inaccuracies inherent in every illustration produced by sketching, which can necessarily be but an approximation to the truth, they have endeavoured to obtain by photography an exact representation of the object, and by means of the usual mechanical methods of reproduction, to furnish illustrations more faithfully accurate than the best of sketches.

The vast advance that has been made during the last few years in the mechanical reproduction of photographs has created a revolution in the methods of illustrating works of the most varied nature. The half-tone, collotype, and other processes have rendered the production possible of faithful, elegant, and inexpensive illustrations, and the attempt has not been wanting to apply these processes in conjunction with photography to the reproduction of objects viewed under the microscope. Such attempts have, however, met with only a modicum of success, and the leading pharmacognosists and anatomical botanists have continued to draw the object by hand and reproduce their sketches by wood-cuts or lithography, or one of the mechanical processes referred to.

The subject is one of great interest and high importance, and merits, therefore, the most careful consideration. If it is possible by means of simple mechanical processes not only to avoid the tedious sketching by hand, but at the same time to produce a more accurate illustration, an enormous saving of time and labour can be effected.

The work that Messrs. Braemar and Suis are offering to the scientific world consists of 76 plates, embracing 159 illustrations and accompanied by 70 pages of descriptive text. A few of the illustrations are photographs of the drugs themselves, but the majority of them are reproductions of microscopical preparations such as sections of barks and leaves, surface views of the epidermis of leaves, etc. These illustrations, which form the *raison d'être* of the work, have been printed from blocks made by the half-tone process from photographs of the objects themselves.

Of the photographs of the drugs some are remarkably good, as, for instance, those of couch grass rhizome (Fig. 7), cassia bark (Fig. 35), boldo leaf (Fig. 64), and cherry laurel leaf (Fig. 90), but others such as senna leaf (Fig. 92), foxglove leaf (Fig. 121), and star anise fruits (Fig. 148) are only moderately successful.

Turning to the photomicrographs, it is truly unfortunate that the first plate, illustrating wheat, sago, and potato starch, should fail to afford support to the process adopted. The starch grains appear uniformly black, the outline being shown, but all detail such as the hilum, striae, etc., being completely lost. The difficulty of obtaining good photographs of starch grains is, however, well known, and this plate may therefore for the present be passed over.

Fig. 8 on Plate 3 illustrates the transverse section of the rhizome of *Agropyron repens*, P.B., and Fig. 9 that of *Cynodon dactylon*, Pers. In these sections strongly lignified, thick-walled

cells and fibres are sharply contrasted with parenchymatous tissue, the distribution of the bundles and their general structure being well shown. The same may be said of the section of Honduras sarsaparilla (Fig. 13). The illustrations of the sections of aconite root (Fig. 14), of rhatany root (Fig. 22), of cinnamon bark (Fig. 34), and cusparia bark (Fig. 38) are also good. In the illustrations of Jamaica and Surinam quassia the distribution of the vessels is well shown, but that of the wood parenchyma is less easily perceptible, as the difference between this and the wood fibres is not very well marked. All of them are, however, characterised by a truly remarkable veracity, and one could readily imagine oneself to be looking through the microscope at the section itself.

But it is amongst the leaves that the best illustrations of all are to be found. Here the epidermis can usually be separated, and often lends itself well to reproduction by photography, whilst the transverse section of the midrib exhibits a bold contrast between strongly lignified wood tissue and non-lignified parenchyma. Particular allusion might be made to the sections of the orange leaf (Fig. 75), periwinkle (Fig. 114), and foxglove (Fig. 122), as well as to the surface views of the lily of the valley (Fig. 55), periwinkle (Fig. 115), and buckbean (Fig. 119). These are all beautiful examples, for the production of which exquisite sections, as well as great experience and skill, must have been necessary.

An inspection of these illustrations will show that the process is well adapted for exhibiting the general distribution of tissues in sections of large size under low powers, and Messrs. Braemar and Suis may be congratulated on producing a series of plates that certainly surpass in excellence any similar ones that have hitherto been published. Such illustrations as these have, moreover, a unique value in their unimpeachable veracity. At the same time, in this, as in all cases, there is a reverse to the medal, and it is only right to inquire into and point out the shortcomings of the process. Let it, however, be understood that the remarks that follow apply to all mechanical processes of reproduction, and not to Messrs. Braemar and Suis's plates alone.

The illustrations of the anatomy of a drug should show, first, the distribution of the various cells and tissues, and, second, the details in the structure, etc., of those cells and tissues.

The distribution is usually sketched under a low power, and must include a considerable area; although the insertion of details is not necessary, yet a higher power must often be requisitioned to clear up the nature of doubtful parts that are generally to be found even in sections of more than average quality.

The details of the tissues are sketched under a higher power, and the attempt should be made to reproduce them accurately in all their minute details. Now, only that part of the section can be seen distinctly that is exactly, or very nearly exactly, in focus at the moment of observation; this permissible variation from the exact focus has been estimated to be about one ten-thousandth of an inch in either direction—that is, either above or below the accurate focus. In other words, all those parts of the section that for any reason such as the unavoidable thickness of the section, inequalities in the mounting, etc., are more than one ten-thousandth of an inch above or below the exact focus will not be distinctly seen without special adjustment of the focus. Hence, while a section is being examined under a high power, a continual changing of the focus is necessary, and as a matter of fact the finger of the expert microscopist seldom leaves the fine adjustment. The observer must mentally combine the several views of the object under examination at different foci, so as to obtain a complete conception of it; he has then to depict upon one plane points that exist in different planes, as proved by the necessary change of focus. The production of a sketch is therefore a matter for the brain as well as for the eye and the hand.

Moreover, portions of the section lying above or below the part focussed interfere with a distinct vision of that part; in that case

the worker has it in his power to make his sketch more distinct by omitting them, and this is invariably done.

Now, let the reader interested in the subject examine Messrs. Braemar and Suis's photomicrographs, bearing in mind always that the following remarks apply to all mechanical reproductions of microscopic objects, and not to these illustrations alone. He will observe that although, as already pointed out, the general distribution of the tissues is well shown, the details are so indistinct that these tissues can only be identified with difficulty, if indeed at all. Thus in the leaf sections the bast and the pericyclic fibres can be identified by their position only; in the surface preparations the stomata, which are often elevated above or depressed below the level of the epidermal cells, are usually indistinct, and sometimes quite unrecognisable. Take, for instance, the upper and lower epidermis of the orange leaf (Figs. 77 and 78); in the former the calcium oxalate crystals that lie just below the surface would infallibly be mistaken for stomata were not their nature indicated; whilst in the latter even an experienced eye can detect them only with difficulty. These details would have at once become apparent by a slight alteration of the focus, and in a sketch would be clearly delineated.

But, it may be urged, details, as already observed, are not necessary in somewhat extensive views under a low power. That is true, and it will be desirable to ascertain to what extent smaller portions under higher powers exhibit the particulars required. Take, for example, the illustration of cassia bark (Fig. 36); here the shape of the cork cells, sclerenchymatous cells, and bast fibres are quite indistinguishable, whilst the starch grains and calcium oxalate crystals are not depicted at all, yet these constitute important points of the section. Hairs, as is well known, are amongst the most important features; but there is scarcely an instance in which they are satisfactorily shown. Compare in this respect the illustrations of the senna leaf, witch-hazel leaf, foxglove, henbane, etc.

It may be said that these details are better exhibited on slides made and photographed for that purpose. But this necessitates the production of a large number of such, and even then there is no guarantee that they would be more successful, at least if one is to judge by the plates of starch grains shown in the atlas. Moreover, it must also be remembered that the screen necessary for the production of blocks by the half-tone process (the one selected for the atlas) is very liable to obliterate fine lines, which might therefore be visible in a photograph, but lost during the process of reproduction. In the production of illustrations of powdered drugs the disadvantages of photography would be still more conspicuous, for how many different preparations must be examined to produce one sketch that shall include all the important cells, cell contents, etc., shown with the necessary clearness?

But even if photomicrography should eventually become capable of producing illustrations equal to sketches, there is one very cogent reason why it should be employed with caution—viz., the educational value that the latter possesses. The close and critical attention that both student and expert must give to any object examined under the microscope before a sketch can be produced is in itself, as every teacher knows, an education of incalculable value. Such sketches prepared by students serve as an excellent index of his comprehension of the subject. Hence there are good grounds for recommending illustrations produced by sketching for comparison, an opinion which is contrary to that expressed by the authors in their preface.

The plates in Messrs. Braemar and Suis's atlas are beautiful specimens of what photomicrography as applied to the anatomy of drugs is capable of effecting. It is a convenient method for exhibiting the distribution of tissues, as shown by large sections under low powers; but it is not, even in the high state of efficiency to which the authors have brought it, well adapted for delineating delicate details, and it is devoid of the educational value possessed

by the drawing of sketches. These opinions coincide with those recently published by Lenz, in the *Berichte d. deutschen pharm. Gesellschaft*, after devoting considerable attention to the subject.

For the expert pharmacognosist the atlas possesses a great and permanent value. It provides indisputably authentic records with the utmost detail that the process allows, and will therefore take a high place as a standard work of reference. It is to be hoped that the authors will publish an account of the method by which their results have been attained, and thus, by saving the time, lengthen the lives of their fellow-workers.

PHARMACEUTICAL SOCIETY. COUNCIL PRIZES EXAMINATION.

BOTANY.

Saturday, April 21, 1900, from 10 a.m. to 11.30 a.m.

1. State what you know of the different methods in which Flowering Plants perennate. Give an example of each method you describe, and point out its ecological significance.

2. Write an account of the life-history of any Saccharomycete, and point out the effect of its life upon the medium in which it lives.

3. Arrange in a convenient classification the methods of pollination observed in Flowering Plants. Describe the process of fertilisation in Flowering Plants, comparing particularly the features of it in Gymnosperms and Angiosperms.

4. What are the characters to which you would ascribe importance in determining the position of a Natural Order as low down or high up in the group of Dicotyledones? Give illustrative examples.

MATERIA MEDICA.

Time: 11.30 a.m. to 1 p.m.

1. Describe the two chief active principles of Broom, outline a method by which they can be obtained, and state to what extent they are represented in the official preparations of the drug.

2. Name the principal fatty acids in Cod-liver Oil, and state approximately their proportions and the state of combination in which they chiefly exist. Give, if you can, a process by which the admixture of other fish-liver oils may be determined. To what is the "rancidity" of Cod-liver Oil due?

3. Give the botanic source of the commercial varieties of Liquorice Root; indicate their respective characteristics; describe the best method of obtaining and retaining their sweet content; and say which you think the most generally useful for pharmaceutical purposes.

4. How would you identify a sample of Powdered Ginger and determine its value, and freedom from sophistication?

CHEMISTRY.

Time: 2 p.m. to 5 p.m.

1. Describe and explain the phenomena that would be observed on treating a quantity of mercury with excess of nitric acid in an open dish, and afterwards evaporating the resulting solution to dryness and applying heat to the residue until no further change took place.

2. What changes, if any, take place when the following salts are exposed to the action of heat:—Zinc sulphate; potassium sulphate; ferric sulphate; ammonium sulphate; potassium chlorate; potassium chloride; ammonium chloride; ammonium nitrate?

3. Starting from ethane, describe the steps you would take in preparing from it (a) Ethyl alcohol; (b) acetone; (c) oxalic acid.

4. How is acetanilide prepared? Mention the chief properties of acetanilide, and give its constitutional formula.

5. Write out in concise form an account of the process, as you would actually use it in the laboratory, for the gravimetric determination of magnesium in a sample of magnesium sulphate, and emphasise any precautions necessary to secure a high degree of accuracy.

6. 0.5013 Gm. of a mixture of sodium and potassium sulphates, when mixed with a solution of barium chloride in slight excess, yielded 0.7634 Gm. of barium sulphate. Find the quantity of each sulphate in 100 Gm. of the mixture.

EXAMINATIONS IN LONDON.

April, 1900.

MAJOR EXAMINATION.

Candidates examined	36
„ failed	17
„ passed	19

Barnes, George Harry	Heaton, Wallace Evans
Chatburn, Edwin Jordan	Hobbs, Henry Allmond
Collin, John Francis	Lenton, Walter Henry

PRACTICAL NOTES AND FORMULÆ.

Liquid Cement.

Gelatin, 10 Gm.; water, 15 Gm.; sodium salicylate, 1 Gm.; clove oil, 9 drops.—*Oesterr. Zeits. für Pharm.* 54, 101.

Cough Mixture for Consumptives.

Bromoform, 30 drops; alcohol (90 per cent.), 10 Gm.; ipecacuanha syrup, 30 Gm.; cherry-laurel water, 20 Gm.; syrup of opium, 150 Gm. Three or four tablespoonfuls to be taken daily.—*Oesterr. Zeits. für Pharm.*, 54, 100.

LETTERS TO THE EDITOR.

The Council Election, 1900.

In connection with my candidature for re-election to the Council, I am rather averse to do anything in the way of issuing an address. To do so is quite right and proper on the part of new candidates; but in the case of one who, like myself, has been a Councillor for ten years, it appears to be quite unnecessary. My opinions upon current pharmaceutical questions are well known, and if my services have been satisfactory to the electors I shall no doubt continue to receive their support, and if unsatisfactory no promises which I can make now could or should induce them to return me again. Some of my friends, however, appear to misunderstand the position I have taken up in regard to the Companies Bill, and have expressed a wish that I should restate my case. This I shall do as briefly as possible.

Whatever our opinions may be as to the original intention of the Pharmacy Act of 1868, there can be no doubt as to the interpretation put upon the Act by the Law Courts and the Legislature. They say, in effect, that the sole motive of the Act is to secure the safety of the public, and that any protection which it gives to pharmacists is purely incidental. It is this opinion which has inspired Clause 2 of the Companies Bill. Companies, its framers say, have been declared to be outside the Act, and it is expedient for the safety of the public that they should be brought inside, and, *from the point of view of its authors*, the proposed clause does this most effectively, although from our point of view, as pharmacists, it does so most unfairly to us, more especially by giving away our clear right to exclusive use of the titles. I feel as strongly as ever I did that we should fight to the last in defence of our titles. These can only be earned by personal effort, and their use should therefore be confined to the persons earning them; but I have come round to the conviction that it is useless trying to put a stop to company trading altogether. Our aim should rather be to ensure that such trading is carried out under thoroughly efficient and qualified control.

In the present state of opinion upon company trading, both in and out of Parliament, it appears hopeless to try to secure anything savouring of protection, so long as it can be argued, with some measure of truth, that the safety of the public may be as efficiently secured in company as in private trading. But while my opinion, as an individual, is in favour of treating with the enemy, I could not, and cannot yet, see my way to do so as a member of Council. To begin with, I think that any amendment of the Pharmacy Acts should be done *directly* by an Amending Pharmacy Bill, instead of *indirectly* in an Amending Companies Bill. And, again, for the Council to propose any amendment upon Clause 2 would commit, not only itself, but the Society to its principle. Is the majority of the Society prepared for this? I think not. It is rapidly nearing the point, but has not quite reached it.

The present Council was elected to carry out the traditional policy of the Society, and cannot constitutionally change that policy without an "appeal to the country." Besides, it cannot be denied that, as yet, the prevailing *expressed* opinion of the members is in favour of prohibition, not control; so long as that is the case it appears to me incumbent upon the Council not to give the Society away. The result of this election will to a certain extent clear the situation and, should I be re-elected, I shall after this declaration, consider myself free to support the policy of control if I see fit to do so. If, holding these opinions, the electors should return me to office, I shall, as hitherto, do what little I can, as a country member of the Society, to look after their interests.

Kirkcaldy, April 20, 1900.

DAVID STORRAR.

Mr. Glyn-Jones and the Council Election.

I have received, in common with many other chemists, the April number of the *Anti-Cutting Record* and find therein (see enclosure) "An Open Letter to the Members of the Pharmaceutical Society," signed by Mr. W. S. Glyn-Jones, in which he seeks to influence voters on the forthcoming Council election to return Messrs. Cooper, Gibbons, Taylor and Wootton in place of four of the present members who offer themselves for re-election. Mr. Glyn-Jones states that he feels extreme urgency for doing so; but I wish to point out that the matters to which he refers are capable of being represented in a light quite different to the one in which he is desirous to exhibit them and that the interest of the Society lies in the direction exactly opposite to that which he is taking.

Mr. Glyn-Jones complains broadly of the inactivity of the Council; that he—presumably the only active member of it—is "hopelessly outvoted." He gives in detail examples of the inaction of which he is the opponent. The first of these is the question of unqualified dispensers in doctors' surgeries, about which so much was said at last year's annual meeting. It will be remembered that when that discussion took place the subject had been referred to the General Medical Council by the Privy Council; that fact was stated at the annual meeting before it was asked to leave the further consideration of the matter in the hands of the incoming Council.

Mr. Glyn-Jones is, however, incorrect in stating that the Council has "done absolutely nothing since," for at the very first meeting of the General Purposes Committee, at which Mr. Glyn-Jones was present, the matter was carefully considered and a conclusion unanimously arrived at, that while the General Medical Council had the matter under consideration, it was not the province of the Pharmaceutical Council to interfere. When the General Medical Council did report upon the matter—although disappointment was undoubtedly universally felt at the conclusion arrived at by that body—no one, not even Mr. Glyn-Jones, proposed to come into conflict with a duly accredited department and surely no member of the Pharmaceutical Society would desire the Council to take a course that would certainly expose it to rebuff for interfering with a matter wholly outside its own province. Surely the most superficial reflection should convince us that while we have our own affairs to regulate, those of the medical profession must be left to its own rulers.

Mr. Glyn-Jones goes on to say that "companies are still using our titles and keeping open shop for the sale of poisons," but the inference that he, and he only, of the members of the Pharmaceutical Council, has made any move to alter and amend this state of things is not justified by facts. I can testify that each and every one of his colleagues was, and is still, quite as anxious as himself to amend the law and no one knows better than himself that it is because the Government is determined not to accept any amendment of the clause, that a practically unanimous decision has been arrived at to oppose the clause altogether. On other matters Mr. Glyn-Jones complains that his views are in a hopeless minority and therefore, strongly believing in himself, he demands "a change in the personnel of the Council."

With regard to the selected list, I presume that he has carefully consulted, and come to an arrangement with, the four gentlemen he recommends; for it would be a dire disappointment to find, after all, that some, if not all, of them held different views to himself and, having seen some of the opinions formerly expressed by one of them, I should not personally be surprised at such a result. After all, Mr. Glyn-Jones, although a shrewd, capable man, is only a one-year-old Councillor; his energy is manifest and his courage is dauntless; but, after all, it is a large order to give him the controlling power of the Society all at once.

Shrewsbury, April 24, 1900.

W. GOWEN CROSS.

[ENCLOSURE.]

AN OPEN LETTER
TO THE

MEMBERS OF THE PHARMACEUTICAL SOCIETY.

Last year I solicited your support for my candidature for a seat on the Pharmaceutical Council—you were good enough to elect me, and I have now had almost twelve months' experience as a member of that Council. I asked for your support last year because I was, above all things, anxious that dispensing by unqualified persons in doctors' surgeries and elsewhere should be dealt with. In spite of the evident feeling on that subject, expressed at last year's annual meeting, nothing has been done. The Council at that meeting asked you to leave the matter in their hands. They have done absolutely nothing since. Until there is a change in the personnel of the Council I am convinced I should be wasting time in again raising the question.

Companies are still using our titles and keeping open shop for the sale of poisons. The Council for years have been appealing to the Government to deal in a Companies Bill with the anomaly. The Government have at last inserted a clause dealing with it in the present Companies Bill. That clause has been receiving the attention of our Council's Committee, and that Committee has been allowed by the Council to dally with the question for months at a time. Now the Council proposes to make no attempt to get a suitable clause in the Companies Bill, but simply to secure the deletion of the present objectionable clause, and as a result let things go unaltered. If the deadlock is to be ended new men must be sent to the Council.

On other matters those of you who have followed the reports of the Council meetings will have noted that I am hopelessly outvoted. I believe that a great improvement is possible in the administration of the Society's affairs. Money can be saved and utilised for fostering healthy local organisations. The majority of the outgoing members are, judging from their votes in the Council and its Committees, satisfied with the present state of things. If you think no improvement is possible you will doubtless vote for retiring members. If, however, you are not satisfied that the most is being made of the Council's opportunity to improve your position as registered chemists, return new men to the Council. Over 130 chemists from all parts of the country, including a number of local secretaries, have written me that they want to see new men returned. I invited them to a meeting, and if they could not come, I asked them to select four they favoured out of the new candidates. The meeting was held, and had before it over seventy letters containing such selections, and in view of these letters decided that the following were the most likely of the new candidates to secure election:—

Mr. ALBERT COOPER, F.C.S., 80, Gloucester Road, London.

Mr. WALTER GIBBONS, 21, Market Street, Manchester.

Mr. JOHN TAYLOR, 210, St. George's Road, Bolton.

Mr. A. C. WOOTTON, Barrymore, East Finchley, London.

There are ten new candidates, and if your votes are distributed amongst them none of them will be successful. If, therefore, you want "fresh blood" on the Council, I respectfully urge you to vote solidly for the above four.

I would esteem it a favour if any of you who will assist in securing the return of these candidates would send me a post-card to that effect—if you have not already done so. That this is all very unusual on the part of a member of the Council, I am well aware, but I feel the urgency of such a step, and I therefore make no apology for taking it.—Yours obediently,

159, East India Road, London, E.

W. S. GLYN-JONES.

Mr. Glyn-Jones' Open Letter.

A few days ago I received a circular or open letter, *re* the pharmaceutical election, signed by Mr. Glyn-Jones. As this was enclosed

with the *Anti-Cutting Record*, the official organ of the P.A.T.A., I, as a member of that Association, wish to raise my protest against its Secretary being allowed to use the Association on behalf of any set of candidates. The four candidates recommended by Mr. Glyn-Jones are no doubt very estimable gentlemen and may be the nominees of Mr. Glyn-Jones, but they are not the nominees of the P.A.T.A.

I, myself, voted for Mr. Glyn-Jones at the last election on account of his labours for the P.A.T.A., but I could not vote for him again, as I cannot understand his position on the companies' question. I feel sure that he only represents a very very small minority of the P.A.T.A. in this matter. I consider that the right stand for the Council to take is to demand what was intended by the Pharmacy Act of 1868, viz., that the title of chemist and druggist, or pharmaceutical chemist, should only be used by those who have earned it by qualifying for the same in the examination room; also, that the retailing and dispensing of poisons should only be done by those who have qualified. I argue that if a company cannot pass an examination, therefore it cannot claim either one or the other of the above privileges.

April 23, 1900.

"P.A.T.A. MEMBER" (29/26).

A Pharmaceutical Caucus.

Mr. C. B. Allen's severe criticism of my action in respect to this election merits a reply. We are agreed there is nothing wrong in taking concerted action to secure the return of certain candidates; indeed, I should like to quote Mr. Allen's letter on this point:—

"I admit that it is both right and judicious for members of our Society, whether as associations or in meetings convened for the purpose, to gather together and discuss the claims of rival candidates—whether singly or in group—and to recommend them to their brother electors as desirable representatives, pushing the candidature by every influence they can bring to bear. That has been done before, on many occasions, and probably will be again."

It is therefore not a caucus, as such, that Mr. Allen attacks; but this particular movement, which he describes as "the Glyn-Jones caucus." And why? Because it is initiated by a member of the Council, who seeks "to oust at least four of his colleagues." Last year a "caucus" ran four of the retiring candidates, and succeeded in placing them almost at the head of the poll, but we had no protest from Mr. Allen as to there being any iniquity in that, nor did he suggest that its example, if followed, would be "likely to render the honourable position of Councillors intolerable." It would almost appear as if, in Mr. Allen's opinion, such action is wicked only when the operator happens not to be of *his* way of thinking. Does not Mr. Allen's letter afford strong evidence that new men are wanted on the Council? However strong the convictions of Councillors, and however hopeless they may be about carrying their reforms because of the constitution of the Council, it appears, from Mr. Allen's argument, that such Councillors, owing to a strained conception of loyalty to their colleagues, must put respect for the retiring members before duty to their constituents; in other words, put loyalty to colleagues before loyalty to convictions. The fact that a member of Council dares to welcome to the Council strangers, who share his convictions, to take the place of friends who oppose what he believes to be reforms, shocks Mr. Allen. Need I argue further in support of change?

As a member of the Council I have learnt a little about the Society's internal administration, and new members will find that under existing conditions it is not easy to learn rapidly in that direction. What I have learnt places me, other things being equal, in a better position to judge of the need of a change or otherwise than one who has no "inside" information. I now *know* that improvement in the administration is urgently needed. I have learnt that in past years money has been needlessly lost on the Journal. I believe

figures will show that, last year, an amount equal to the subscriptions of nearly a thousand members has been saved. That saving was effected before I became a member. I believe we might save further hundreds of pounds a year in that direction. I know we are spending hundreds a year too much for our legal work, and I know these things as a member of Council. Does Mr. Allen suggest that, if I believe "new blood" will effect reform, I am not to speak out and ask the members of the Society to send men to the Square who will be likely to remedy these things?

I asked to be sent to the Council because I wanted unqualified dispensing tackled. The votes of my present colleagues at the annual meeting carried an amendment leaving the question to them. I raised the question from my place at the Council, a member was good enough to second my motion, though he found it necessary to parenthetically remark that he did so in order that the subject might be discussed. I wanted immediate action taken, but, with the exception of the seconder, the rest of the Council voted against me. They shelved the question until the General Medical Council Committee had reported. That Committee reported last November—nothing has yet been done. Does Mr. Allen expect me to abandon my convictions on this subject, or to keep on moving resolutions in reference to it, without finding a seconder, especially when I was backed by a general meeting of members of the Society? Surely these members thought I was in earnest about the matter, and they expect me to take every legitimate means for securing support for them? My reply to Mr. Allen is that, even should it prove intolerable to present members of the Council, it will be well for the trade when men sit at that table with convictions sufficiently strong to compel them, when they think the question of sufficient importance, to help to oust those of their colleagues who block the way. I quite accept Mr. Allen's statement that he has criticised my action in no unfriendly spirit, and I hope that he, and those of my colleagues who agree with him, will believe my defence has been made in the same spirit: that my action in asking 130 members of the Society to act as a committee for securing the return of Messrs. Cooper, Gibbons, Taylor, and Wootton (whom they, not I, have selected) has not been actuated by the slightest personal feeling against my colleagues.

London, April 23, 1900.

W. S. GLYN-JONES.

Mr. Wootton's Views.

"An Ordinary Pharmacist" professes to be to some extent curious as to whether I, with others, have consented to be recommended by Mr. Glyn-Jones and his friends as a candidate for the Council. The question seems a superfluous one. Of course I assent with gratitude to the recommendation with which any member of the Society may honour me. Why should I object? I shall be even more grateful to all those members who may be good enough to vote for me. I do not understand that this recommendation on the part of Mr. Glyn-Jones and those associated with him commits the persons selected to any particular line of action. Nothing of the kind has been suggested to me. I have my own ideas of the policy which it would be wise for the Council to pursue at this time, and these are embodied in my address, copy of which I enclose. If any share my views they need not wait for my assent before recommending me.

North Finchley, April 23, 1900.

A. C. WOOTTON.

[ENCLOSURE.]

TO THE MEMBERS OF THE PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

Ladies and Gentlemen,—In asking for the favour of your support at the forthcoming election for the Council of the Pharmaceutical Society, it becomes my duty to indicate concisely my qualifications for the honour I seek at your hands and the policy I should advocate if my candidature should be successful.

I have been a member of the Society since the year 1865, and from 1869 to 1899 I was editor of the *Chemist and Druggist*. This occupation involved, or I might say compelled, the acquirement of an intimate familiarity with the general conditions of pharmacy throughout the Empire, with the difficulties, the needs, the aims, and the aspirations of British pharmacists, and, of course, incidentally, with the history and proceedings of the Pharmaceutical Society. I think, therefore, I may fairly lay claim to the possession of the equipment of knowledge essential to a member of the Council.

The guiding principle of the policy which, according to my judgment, should be pursued by the Council of the Pharmaceutical Society may be succinctly described as the maintenance in its integrity of the Pharmacy Act of 1868. That Act may not have been a perfect statute, but the chemists and druggists of the present generation perhaps hardly realise how much they owe to it. It set them apart from other traders, made their title a property, raised them in the estimation of the public, and gave them the nucleus of a monopoly. If the official guardians of the Act had regarded it with more cordiality, our position at this time would have been much better than it now is. I do not complain in the least of the legal administration of the Act. As far as an outsider can judge, the Council of the Pharmaceutical Society have exercised their powers in this direction with such vigour tempered with discretion as to make the statute respected without risking the alienation of judicial sympathy. But they have not, I submit with all due deference, shown the zeal which might have been fairly expected from them in fulfilling the duties which the Act cast upon them or in defending the rights which it bestowed upon chemists and druggists. The statute had been in operation more than twenty-five years before it was realised that it restricted the right to sell poisons to qualified persons, and that only such persons could keep open shop for the sale of so-called patent medicines containing poisons, and the High Court decisions which established these views, and which almost doubled the value of the qualification, were obtained rather by the aid of outside pressure than by willing action on the part of the Council. The adoption of regulations for the storage and sale of poisons, though obviously contemplated by those who framed the measure, was delayed for thirty years, and at the present time the substance which holds the highest position in the Registrar-General's list of poisons is not named on the schedule of the British Act.

I only refer to past history because I regret to believe that the indifference, if not the hostility, to the provisions of the Pharmacy Act, which was the cause of the neglect alluded to, prevails still. During the past two years opportunities have presented themselves in Parliament, such as could hardly have been hoped for, to remedy the most serious defect in the Act. It is not possible to say what might not have been accomplished by a Council thoroughly in earnest, and with the trade at their back. So far, however, to the keen disappointment of many who have the advancement of pharmaceutical interests at heart, not only has nothing been done, but practically nothing has been attempted. The inaction of the Council in this matter of the professional clauses of the Companies Bill is a serious calamity to pharmacists. So long as the Council of the Pharmaceutical Society are looked upon as officially voicing the opinion of the trade, and members of Parliament naturally so regard them, their apathy must neutralise all other efforts. If they could have done no more, the Council could certainly have secured the defeat of the monstrous proposal to appropriate for the benefit of unqualified companies the authority to use titles which the Pharmacy Act expressly reserved to those who could acquire them after examination.

It may not be too late for the new Council to take effective action in the House of Lords. The Lord Chancellor, who is the real author of the clause affecting pharmacists, would surely discuss it

with a deputation able to speak to him with representative authority, and it is not necessary to assume that he would be impervious to reasonable arguments. Since he drafted the clause he has not even been approached by the Council.

If elected, and if there should still be time, I should do what one member could to press the policy suggested in regard to the Companies Bill, and I should support the present minority in the Council in their attempt to take advantage of the opportunity which that Bill offers to secure justice for qualified chemists. At an early date I would also seek to induce the Council to enter upon a resolute crusade to extend the present schedule of the Act so as to include in it at least the arch-poison of the day, carbolic acid. Most influential support to such action could readily be obtained, and I conceive the enterprise to be one which the Pharmaceutical Society owes to the community.

It is not practicable for me to comment on the many topics of pharmaceutical concern which must come before the Council within the limits of an address. I will, however, with pleasure reply to any questions which may be addressed to me.

I may add, in conclusion, that in seeking election to the Council I have no private interest to serve; I have the necessary leisure to properly fulfil the duties incumbent upon a member of Council; and, if honoured by the confidence of the pharmaceutical constituency, I should spare no pains to serve to the best of my ability the trade (and thereby the Pharmaceutical Society) to which I am myself deeply indebted.—I am, Ladies and Gentlemen, yours faithfully and respectfully,

Barrymore, North Finchley, London, N. A. C. WOOTTON.

Separable Solutions.

Referring to the report of the Chemical Society's meeting in the last issue of the Journal, if Mr. Newth, or any other reader of the *Pharmaceutical Journal*, desires to find record of such experiments as Mr. Newth describes, he may find in the *Chemical News* of January, 1864, a record of observations which I made about that time of a character much the same as those now described by Mr. Newth, and each edition of Proctor's 'Pharmacy' has given similar notes in the Lectures on Solution. The separability of ethereal solutions of tannin is a phenomenon which may be advantageously studied in connection with this matter. It forms the subject of a paper which I contributed to the Newcastle meeting of the British Pharmaceutical Conference, 1889, and will be found in the pharmaceutical periodicals of that date.

Bradford-on-Avon, April 23, 1900. BARNARD S. PROCTOR.

Glaucium luteum.

With reference to the comments appearing in the Journal about this plant, I would like to add that it may be found in great profusion on the higher beach between Rye and Winchelsea, and right on to Cliff End. In the middle of October last I was in this locality, and found the plant still freshly blooming, many of the fruits being at that time more than twelve inches in length. I still have a number of the fruits in my possession, and if any of your student readers would like one I shall be happy to distribute what I have to those who first apply.

Dore, near Sheffield, April 21, 1900. JOHN AUSTEN.

I regret for Mr. Mumbray's sake that my note on *Glaucium luteum* was not so clear as it might have been, and also that he does not take the trouble to quote me correctly. My words were, "I have found it (*i.e.*, *Glaucium luteum*) in abundance between Dover and Folkestone, and also, but less frequently, at St. Margaret's Bay. . . . It may be of interest to note that in neither of these situations (meaning the spot where I actually found the plant growing) is the soil in the least sandy," not that "the soil

is not in the least sandy at Dover, Folkestone, or St. Margaret's Bay."

I am positive of the fact that at the Warren, between Dover and Folkestone, on July 1, 1891, there was a strong colony of *Glaucium* growing on the outcrop of a stratum of gault at least twenty feet thick and at least a hundred yards from any sand, and I have specimens of those self-same plants now in my herbarium. Anyone familiar with the blue gault knows that in a moist condition it more resembles Ung. Hydrargyri than sand or anything else, hence my remark that I considered Bentham and Hooker's and John's restriction of the habitat to sandy seashores somewhat misleading. I had in my mind the relation of botany to geology, and intended to draw attention to the fact that as one travelled from Brighton to Dover—*i.e.*, from the lower limestones to the upper cretaceous rocks—so *Glaucium luteum* became less frequent.

There is only one other misunderstanding I should like to explain, and that is the one indicated by the query mark placed by Mr. Mumbray after the words "sandy erosions," but as he takes no further notice of the phrase I fail, at present, to understand the difficulty.

Bridgnorth, April 22, 1900.

W. J. BROWN.

There is a minute typographical error in my letter published last week—thus, at line 30 for "opal" read "oval," the correct wording of the quotation. It is pleasing to remark that some of your readers manifest satisfaction in the study of natural objects amidst the troubles of business and domestic politics.

Kew, April 23, 1900.

R. G. MUMBRAY.

Gelatinised Tincture of Kino.

I beg to express my thanks to the following gentlemen who have kindly forwarded specimens of gelatinised tincture of kino, in response to my request for specimens, published in the Journal for April 14 last, p. 399:—Mons. F. Delchevalerie, Brussels; Mr. F. Dudderidge, Newcastle; Mr. C. A. Macpherson, Edinburgh; Mr. J. J. Makin, Dorking; Mr. C. Innes Russell, Newcastle; Mr. N. G. Beck, Burgess Hill; Messrs. Davidson and Kay, Aberdeen; Mr. W. J. Tiltman, London. I shall be much obliged if any further specimens included some of the liquid from which the kino has separated, as that may contain some clue to the change. Two of the specimens received consisted of the kino alone, without the spirituous liquid.

17, Bloomsbury Square, W.C.,
April 21, 1900.

E. M. HOLMES.

The Kinninmont Prize Competition.

I shall be greatly obliged by being permitted to mention in the Journal that April 30 is the last day for receiving names for the Kinninmont Prize Competition. Names to be sent to me.

WILLIAM L. CURRIE.

223, Byres Road, Dowanhill, Glasgow, April 21, 1900.

The Society's Library.

In view of the extreme importance of the matter, I wish, through the medium of the Journal, to invite all members and students who desire occasionally to use the Library in the evening to communicate with me as early as possible. In the opinion of many it is unnecessary to open the Library before 10 a.m. any day, but it is distinctly necessary that it should remain open until 10 p.m. one evening per week for the convenience of those engaged during the day.

13, Queen's Terrace, St. John's Wood,
N.W., April 25, 1900.

T. MORLEY TAYLOR.

Copper in Nux Vomica.

I was rather astonished to see Mr. Hill's figures with regard to the presence of copper in nux vomica seeds, viz., 0.24 per cent. Nux vomica seeds are generally powdered by machinery, and in considerable quantities at a time, say, for instance, 10 cwt. lots. Now

such a batch of powdered seeds would contain 2.68 lbs. of copper. Grinding machines are not made of copper, or of copper alloys such as gun metal or brass, but only certain small parts, such as the bearings, are made of those metals. The wear and tear indicated by Mr. Hill's figures are out of all proportions to common sense; no machine would work under such conditions, for if the copper represented by those figures is calculated into gun metal or brass, the amount comes to over 3 lbs. of the alloy.

I can scarcely credit that any grinder would allow his machines to suffer such a terrific wear and tear as this, since it involves an enormous expense each time for the renewal of the bearings. It is hardly possible, on the other hand, that Nature has turned these seeds into a veritable copper mine. I think Mr. Hill should revise his work, and study his results from a practical standpoint, and then there would be no need for a grinder to grin.

April 25, 1900.

"GRINDER" (29/37).

Solution of Arsenic and Iron Wine.

Referring to Mr. Archibald Currie's interesting paper upon "Solution of Arsenic and Iron Wine," may I venture to suggest an explanation of the "green precipitate" noticed? As liquor arsenicalis contains potassium carbonate, the following reaction would probably take place:—

$$3K_2CO_3 + Fe_26C_2H_3O_2 + 3H_2O = Fe_6(OH) + 6KC_2H_3O_2 + 3CO_2$$

This freshly precipitated ferric hydroxide would then interact with the arsenious oxide as follows:—

giving a precipitate of ferrous *arsenate*, quickly becoming oxidised to ferric *arsenate* or ferroso-ferric *arsenate* (Wittstein), and ferrous hydroxide.

I am not quite clear from the *Pharmaceutical Journal* report whether No. 2 sample of iron wine was "neutral" or "faintly acidulous," as it is described as being both—if the latter, the amount of K_2CO_3 was sufficient to more than neutralise this acidity and to form the ferric hydroxide required to react with the arsenious oxide, while in the No. 1 sample the amount of acid present was probably greater than that required to neutralise the K_2CO_3 and so prevent the formation of ferric hydroxide and, further, "the green precipitate." The fact that the greater portion of the iron in No. 2 existed in the *ferrous* condition need not interfere with the above explanation, as the ferrous hydroxide formed in that case would be quickly oxidised to the ferric condition.

Cambridge, April 25, 1900.

E. SAVILLE PECK.

The P.A.T.A. and the Council Election.

Being a subscriber to the P.A.T.A. (on the principle that if it is any benefit to the trade I am willing to support it) and receiving the *Anti-Cutting Record* regularly, I was surprised on opening the current issue to find enclosed a circular letter from Mr. Glyn-Jones, advocating the return of certain gentlemen to the Pharmaceutical Council. Now, whatever the merits of those gentlemen, I feel very strongly that Mr. Glyn-Jones is using the *Anti-Cutting Record* for a purpose for which it was never intended, and, as a member of the P.A.T.A., I certainly think it is against the interests of the Association. The question naturally arises, "To whom does the *Anti-Cutting Record* belong and who pays the postage?" If the members of the Association, ought the paper to be issued without their consent in the interests of a few individuals?

Sheffield, April 25, 1900.

J. F. EARDLEY.

ANSWERS TO QUERIES.

APOTHEKER VEREIN (A. B.—41/17).—The address is Berlin C. 22, Spandauerbrücke 14.

PHOTOGRAPHIC SUPPLEMENT (F. S. H.—28/23).—No, only once a year, at the beginning of the season.

DEFINITION (J. L.—41/18).—The views you express are reasonable and are not being lost sight of.

APOTHECARIES' HALL EXAMINATIONS (B. L.—41/16).—Apply to the Secretary, Apothecaries' Hall, Blackfriars, London, E.C.

POWDER (A. A. M.—41/19).—It is apparently the powder of a starchy root like calumba, but it is probably not an official drug.

BACTERIOLOGY (F. R. D.—41/10).—Hewlett's 'Manual of Bacteriology' (Churchill, 10s. 6d.) is about the best work of its kind.

PRELIMINARY EXAMINATION (R. R.—41/13).—The examination will not be held after July. See the *Pharmaceutical Journal* for February 24 last, page 189.

TONING AND FIXING BATH (H. L. S.—41/14).—If the lead is not used the alum decomposes the hyposulphite, setting free sulphurous acid, etc., which act on the silver image and cause yellowness.

CONSULTANT CHEMIST (S. R.—41/15).—Possibly Dr. Samuel Rideal, D.Sc., F.I.C., 28, Victoria Mansions, S.W., would undertake the work you require. He is a specialist on the lines you speak of.

GREASY BOTTLES (W. J. D.—41/12).—Leave them for some time in a tub containing strong soda or potash lye, or, if a more speedy result be desired, boil them in a copper with a similar liquid.

BOTANICAL (A. H.—41/9).—Hooker's 'Students' Flora of the British Islands' (Macmillan, 10s. 6d.) provides the information you require. A more convenient book for field use is Hayward's 'Botanists' Pocket Book' (Bell, 4s. 6d.).

PRELIMINARY EXAMINATION (F. W.—29/28).—The matter is now settled, and it is impossible to act upon your suggestion. Moreover, the reason advanced by you appears insufficient to justify any further delay in the matter.

SILVER MIRRORS (L. E.—41/8).—We have no information on the subject beyond that given in the article referred to. It may be that you have got wrong through ignorance of the fact that the United States fluid measures are not the same as the British. Thus, whereas the British fluid ounce is equivalent to 28.412 millilitres, the American is equivalent to 29.574 millilitres. Possibly, a knowledge of that fact may help you to get the solutions right.

COATED PILLS (D. L.—29/14).—It certainly ought not to be necessary to coat 4-grain pills so thickly as to increase their weight to $6\frac{1}{2}$ grains, but that is a point to be taken into consideration when comparing prices. A quoted price may seem low, so far as the composition, etc., of the pills is concerned, but if you buy by weight and less than two-thirds of each pill consists of the mass you think you are obtaining cheaply, you may simply be paying an unreasonably high price for French chalk. At the same time, you should not call it "cheating," the proper term is "commercial enterprise."

POLARIMETER FOR SUGARS AND ESSENTIAL OILS (F. R. D.—41/10).—Probably Zeiss's Saccharimeter will answer your purpose. You should order a 100 Mm. tube for essential oils, in addition to the 200 Mm. tube used for saccharimetry. The shorter tube is now universally employed for oils, as it requires much less to fill it. If you want a more delicate instrument, you cannot do better than get Messrs. Watson and Co., 313, High Holborn, to make you one of their "half shade" instruments of the Laurent type.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, APRIL 28, 1900.

ELECTION ADDRESSES.

THE unprecedented occurrence that has taken place in connection with the approaching election of seven members of the Society's Council, is a phenomenon deserving of some notice, both on account of its novelty and because of the interest attaching to the question whether it should be compared to a fierce outburst of suppressed volcanic force, to the equally irresistible avalanche of crumbling *débris* from which support has been suddenly removed, or whether, in reality, there is any sufficient reason for departure from the practice which has hitherto been generally regarded as consistent with the position of a candidate offering himself for election to the Council. Members of the Council of the Pharmaceutical Society occupy a position which is honourable chiefly in being honorary; a position of trust and public responsibility, involving much laborious, tiresome, and onerous work, for the performance of which holders of the office are entitled to nothing less than the gratitude and respect of the electors and of the entire trade. Unless—in accordance with the ethics of Burnley—that view of the matter is to be regarded as “old, antiquated, worm-eaten,” any idea of a “contest,” in the ordinary electioneering sense, between members of the Society who are willing to undertake a share in the official administration of affairs, would be utterly out of place—merely an effluvium of the parasitic press that aims at directing the affairs of the Society and would rejoice to see the Society's election a faction fight and its Council chamber a bear garden. To that source of inspiration alone can be attributed the assumption that the present Council would be “improved” if some of its members were replaced “by new and inexperienced men.” To the same misleading influence may be attributed, in some instances, the acceptance of nomination on the present occasion; for though increased willingness to undertake administrative duties may be a sign of “healthy interest in the Society,” it would probably be far more correct to say that there is at present no greater desire, on the part of the members, to

effect some change in the constitution of the Council than there was last year, or has been during the past twenty years; notwithstanding the platitudes that have been uttered about “new blood.” Moreover, on looking back to the records of that period for information, the question may well be asked what particular mark has been left upon pharmaceutical affairs by some half-dozen members of the Council who held office, for a time, during the alleged “reactionary” period?

A NEW EVANGEL.

Regarded from the point of view above described, the election addresses that have been issued by new candidates, do not generally commend themselves to favourable consideration. Some of them betray direct hostility to the action of the Council, in regard to the matter now prominently under notice, others a want of acquaintance with historical facts and prevailing conditions which are of prime importance in reference to that matter, while others again deliberately misrepresent those facts and conditions. Only one of them is at all in accord with the policy which the Council, in its representative capacity, has by a large majority decided to adopt, as the only one possible for the Society, in regard to company trading. But the most remarkable circumstance is that some of the present members of Council, who offer themselves for re-election, have responded to invitations which, in their position, might be considered to convey the impertinent assumption that they have not afforded members of the Society opportunity of judging how they have discharged their representative duties, but require to furnish assurances on that point. Still more strange is it that they should have been induced to make trade journals the medium for addressing their constituents; that they should, apparently, have forgotten they have, in common with their fellow-members, an official journal of their own, which is the proper medium for such communications as may be necessary or desirable and of which they are, officially, joint custodians. That advantage should be taken by the promoters of “change in the Council” to treat the views expressed with compassionate ridicule and to point out the sign to be taken by electors “as an indication of whom not to vote for” cannot be matter for surprise. But such procedure tends to degrade the function of electing representatives “to direct and manage the affairs” of the Pharmaceutical Society and the members of that body, who have any regard for the maintenance of its credit, will do well to beware lest they fall a prey to the insidious wiles of self-constituted and irresponsible instigators of mischief.

A REVIVAL.

One of the addresses “to the members of the Pharmaceutical Society of Great Britain” is especially deserving of notice, inasmuch as it breathes a latent spirit of hostility to the Society, which is in fact merely a recrudescence of that once animating the defunct “United Society of Chemists and Druggists,” an organisation created by the glorified trade circular now known as the *Chemist and Druggist*, to represent a “trading community,” to oppose the Pharmaceutical Society and largely instrumental in curtailing the pharmaceutical provisions of the 1868 Act. The late editor of that

journal now solicits the favour of support by pharmacists, recommending himself for the position of member of Council, as possessing intimate familiarity with imperial pharmacy and with the "aspirations of British pharmacists." That is an equipment the dimensions of which appear too fine at one end and too large at the other, to fit the comparatively modest aperture to be filled by a member of the Council, especially since acquaintance with "the history and proceedings of the Pharmaceutical Society" is claimed only as an "incidental" accomplishment, as though those details were matters of mere "Bloomsbury tradition," lying quite outside the range of practical consideration. Proceeding with his recommendations, the candidate deftly suggests that his line of action would be guided by a policy different to that of the Council; but of a better sort, ensuring more due fulfilment of the duties cast upon the Council by the Pharmacy Act and greater defence of "the rights which it bestowed upon chemists and druggists." As if in support of those suggestions, the statement is made that twenty-five years elapsed before establishing that the right to sell poisons was restricted to qualified persons. That statement is made with the evident intention of casting blame on the Council, in face of the fact that while many chemists and druggists strenuously objected to conform to the Act by labelling their cough linctus, etc., poison, they complained sorely when that necessity was enforced upon them, as well as upon the vendors of secret remedies containing poison. As further support of the suggestion that the Council has neglected its administrative duty, reference is made to the postponement for thirty years of poison regulations; as though it were not due to the opposition—so unwisely made by chemists to the fulfilment of that obligation—of which the *Chemist and Druggist* was a prime instigator. Obviously this candidate, having with success promoted hostility to the provisions of the Pharmacy Act, cannot now do otherwise than believe in its existence; but the pretence of regret that there should be such hostility, and at the indifference it has produced, should be too transparent to deceive any but ignorant or willing dupes. To contend that blame for that result attaches to the Council and not chiefly to the entire body of individuals who are all equally guardians of the Act, is distinctly false and disingenuous. But that is the line of inflated pretence that has always been followed by the *Chemist and Druggist*. Of course it is not possible to say what might not have been accomplished in the interest of chemists, by a Council with the trade at its back, had the trade not been misled, by the destructive delusions of the *Chemist and Druggist*, into a bottomless pit of disappointment and company-trading competition, where even the titles representing qualification and the privileges attached to it, are now as much in jeopardy as the exercise of that part of the chemists' business for which legal qualification is required by the Act—not in the chemists' interest, but in the public interest.

ORACULAR.

Another candidate for a seat on the Council—in preference to a present member—comes forward as the apostle of "demands" and a policy of "active aggressiveness," no knuckling under, etc. His communica-

tions and utterances display a spirit of unrest which persistently refuses to be comforted and, probably, his letter at page 422 must be understood as complaining of the comment, at page 404, upon his election address. So far as that letter can be fathomed, it appears to deny the existence of any real division of opinion on the subject of company pharmacy and to attribute "apparent disunity" to confusion of a simple problem. This candidate is in the habit of confining his argument to statements that he is "justified in thinking" or that he is "entitled to say," either this, that, or the other, of which he feels satisfied, and there leaving the matter; there is consequently much difficulty in getting to close quarters with him. But assuming "the simple problem" to be that of making the Pharmacy Act operative, the question may be asked—Did not the House of Lords' decision take the bottom out of nearly all the Act intended? and at the present moment—Does not the Lord Chancellor's Clause 2 propose to cast to the winds any remaining relics of what was intended by the Act? The issue is not whether that should be so; but how that is to be counteracted. Notwithstanding the miserable shred that the intention of the 1868 Act amounted to, careful observance of its requirements, together with "an abiding faith in pharmacy," might, in the past, have served as a nucleus round which the practice of pharmacy could have crystallised and built up for itself, from within, a fence which intruders would not have broken through, as they have done through the breaches made in the provisions of the Act by chemists' own disregard of it. At present, however, the intended effect of the Act as to the proprietor of a chemist and druggist's business is, as Mr. GLYN-JONES holds, irretrievably lost—nothing remains of it but the necessity of legal qualification being personal, the use of which individuals may, and do, hire out, as a chattel, to enable companies of unqualified persons to keep open shop in opposition to the intention of the Pharmacy Act. That is the aspect of affairs to which "constructive" action and constructive criticism must be directed.

FRIENDS IN COUNCIL AND OUTSIDE.

THOUGH disputation *de gustibus* is seldom a profitable exercise, all the available materials for consideration connected with the ethical question that has been raised are printed in this week's Journal at page 444 *et seq.* for the convenience of those who may desire to form their own opinion on the matter. Much other matter on the same and similar questions has been sent for publication in the Journal but, a selection being necessary on account of the limitations of space, preference has been given to communications by those who have not previously had an opportunity of stating their views, or who have something fresh to say. Mr. GIFFORD sends eight quarto pages of manuscript in which he criticises and argues about many things; repeating much that has been said, at various times, in this Journal about the action that chemists and druggists should have taken, years ago, in regard to company trading that interferes with the provisions of the Pharmacy Act. Such criticism might flow on for ever without much benefit, but it does not appear sufficiently "constructive" to merit occupation of the space it would require.

ANNOTATIONS.

ALL SUBSCRIPTIONS TO THE PHARMACEUTICAL SOCIETY for the current year must be received by the Secretary—Mr. Richard Bremridge, 17, Bloomsbury Square, London, W.C.—on or before Monday next, April 30, and the names of persons who have not paid their annual subscription before Tuesday, May 1, will be omitted from the Register of Members or of Student-Associates. One effect of that, so far as defaulting members are concerned, will be the loss of their qualification to vote at the approaching election of members of the Council and auditors. The annual subscriptions were due on January 1 last, and subscribers who did not, prior to that date, give notice of their intention to withdraw from the Society are, therefore, liable to be called upon to pay the subscription for the current year, whether or not they now intend to withdraw. Nevertheless, unless they have discharged their liability to the Society by May 1 they will cease to receive the usual weekly copy of the Journal, and they will not be entitled to attend the Annual Meeting or to vote at the forthcoming election.

THE ANNUAL GENERAL MEETING of the Pharmaceutical Society, as officially notified in another part of this week's Journal, will take place at 17, Bloomsbury Square, London, on Wednesday, May 16, at noon precisely. In the absence of the President—Mr. William Martindale—who is visiting South Africa for the good of his health, the chair will be taken by the Vice-President—Mr. G. T. W. Newsholme. The annual report will first be presented and, presumably, discussed before adoption. Any notices of motion will then be dealt with, after which scrutineers will be appointed to ascertain the number of votes given for each member nominated for election, and auditors will also be appointed for the year. Subsequently, the meeting will be adjourned until the following day, to receive the report of the scrutineers.

THE ANNUAL DINNER of the members of the Society and their friends will be held at the Hôtel Métropole, on the evening preceding the Annual Meeting. In addition to the list of Stewards published in last week's Journal, the following gentlemen have intimated their readiness to become Stewards in connection with the Annual Dinner:—T. P. Blunt, Shrewsbury; A. S. Campkin, Cambridge; W. P. Robinson, Clapham; P. H. Marsden, University College, Liverpool, and J. A. Wink, Devonshire Square, E.C. Other pharmacists who desire to contribute to the success of the chief social function of the year directly associated with official pharmacy, are invited to send their names to the Honorary Secretary to the Dinner Committee, Mr. R. Bremridge, 17, Bloomsbury Square, W.C.

THERE IS GOOD REASON for stating that Mr. Taylor, who, as a candidate for election as a member of Council, has been placed in a somewhat perilous position by being recommended to the electors by the Glyn-Jones caucus, is in no way pledged to support a line of action in regard to regulation of companies inconsistent with the view put forward in his paper (see *ante*, page 148).

MR. PICKERING writes to say he infers, from the Annotation at page 404, that he "was not sufficiently explicit" in his letter; but, though no deficiency was felt in that direction, it must be admitted that the long explanation he now proceeds to enter into—as to the purport of the Royal Charter of Incorporation granted to the Pharmaceutical Society in 1843, and as to what he considers should consequently have been done by an apparently imaginary entity, which he speaks of as "the Society"—betrays such evident want of acquaintance with the subject he writes upon as to make his long letter unfit for publication.

"ALPHA" writes again to say he cannot grant that the question of the legality of company chemists is a quite superfluous question at the present moment; on the contrary he thinks that question is the crux of the whole matter. That being the case, it can only be inferred that "Alpha" has not fully considered the statement (*ante*, page 374) of the conditions under which the present legal interpretation of the Pharmacy Act has taken shape and left companies outside the operation of the Act. Chemists have certainly contributed largely to that result themselves; but, late as it is, they have much to gain and nothing to lose by opposing the encroachments of companies. Such opposition requires something more *ad rem* than amendment of Clause 2 of the Companies Bill, in fact, a thorough Pharmacy Acts Amendment Bill could alone deal with the matter. Meanwhile the only course to be taken in regard to Clause 2, which tinkers with the matter, is to oppose that Clause as the Council has decided.

THE CRITICISM OF THE B.P.C. PROVISIONAL PROGRAMME, which appeared in the notes by "An Ordinary Pharmacist," published last week, appears to have commended itself to a number of readers who seem to be quite as dissatisfied with the proposed arrangements as our contributor has expressed himself. It may be suggested that the proper place to express disapproval was at the meeting of the General Committee, held on April 10 last, but everyone who has attended such meetings knows well how difficult it is to form a clear idea of proposals when presented for the first time, and how difficult it is to criticise them off-hand without incurring the risk of appearing unmindful of the feelings and labours of those who have been responsible for drafting the proposals. In the present instance the responsible persons were the members of the Local Executive Committee—Messrs. R. Bremridge, M. Carteighe, H. Cracknell, J. F. Harrington, W. Martindale, J. H. Mathews, J. C. Umney, and Warren. The responsibility for the programme as it now stands, however, must be shared by every member of the General Committee, inasmuch as the report and recommendations of the smaller committee were unanimously adopted at the meeting held a fortnight ago. For the rest, if any strong desire exists for modification of the draft programme, there is ample time to effect any reasonable alteration if attention be properly directed to the matter, and pressure brought to bear upon those responsible for carrying out the arrangements.

WISHING PROPHETS vaguely predicted or suggested last year that the alleged existence of a profound feeling of disapproval of the action of the Council would properly be manifested by the rejection of all the members who offered themselves for re-election. The true quality of those prophets was demonstrated by the result of the election. Either they did not know the state of opinion or they spoke falsely and tried to mislead. But their desire for the introduction of discordant elements was frustrated. The object of their chief aversion was returned at the head of the poll and only one of the new candidates for office was elected. This year a still more insolent attempt is made, through the medium of an isolated member of the Council, to indicate to the members of the Society whom they should vote for and it is being made on the basis of statements that are utterly destitute of foundation.

THE STATEMENT that the maintenance of the integrity of the Pharmacy Act has been neglected and that the Council has not done its duty in that respect is not unfrequently referable to want of knowledge; but no such excuse can be made in the case of those who, knowing better, persistently propagate that false representation and strive to conceal the fact that, by allowing apprentices and unqualified assistants to sell poisons and by keeping branch shops in the charge of unqualified persons, the rank and file of chemists and druggists have neutralised the intention of the Pharmacy Act, even as a "wretched poisons Act." Such practical neglect

of the Act, arising from indifference or hostility to its provisions, has unduly developed the opportunity, afforded by the "Widows' Clause," for the conclusion arrived at by the law Lords—viz., that legal qualification of the proprietor of a chemist and druggist's business is not required for the public purposes of the Act and, thus, apparent foundation has been provided for the spread of company trading contrary to the spirit of the Act.

THE FURTHER STATEMENT that no attempt has been made by the Council to effect amendment of the law can only be attributed to ignorance or to deliberate misrepresentation. From the time of the House of Lords decision, Bills have been repeatedly prepared for the purpose of providing a remedy for the state of things then established. Those Bills have met with more or less strenuous opposition from the rank and file of chemists and druggists. It is as a consequence of that opposition, of the disinclination to acquiesce in reasonable modification of the "Widows' Clause" or to throw the entire influence of the body into support of proposed action, and generally, in other respects, to be led by the Council, that nothing has been done for the advancement of pharmaceutical interests or for the protection of those carrying on the business of chemists and druggists.

ON VARIOUS OCCASIONS, observes the *Physician and Surgeon*, pharmacists have sighed for the protection that medicalmen enjoy, and at one annual meeting of the Pharmaceutical Society a member stoutly maintained against all explanations by the President (at that time Mr. Carteighe) that no one dared entrench on medical practice who was not a registered medical man. The mistakes on this point are said to arise probably from the fact that chemists and druggists are practically the only persons who have been made sensible of the provision of the Apothecaries Act, which is the only Statute that checks the unqualified practice of physic when it is not accompanied by illegal assumption of title. "The Apothecaries' Society seems to have gone on the principle that a man could not be said to practise as an apothecary unless he prescribed from behind a counter, and hence it is that chemists who ventured to attempt the treatment of disease by any pretence of diagnosis rendered themselves peculiarly liable to the Apothecaries Act. Even the pharmacist, however, has to admit that this Act has been administered with great moderation. It is a pity it cannot be applied to those most arrant quacks who tour the country posing as professors of some department (or more usually the whole field) of medicine, or to those makers of remedies which are guaranteed to cure all diseases under the sun."

THE NEW BIRMINGHAM UNIVERSITY is the subject of a recent report by the Advisory Committee appointed to inquire into the best manner of providing for scientific and commercial training respectively, in connection with the new University of Birmingham. The report is summarised in the *Times*, which points out that Mr. Andrew Carnegie and an anonymous donor have each promised a gift of fifty thousand pounds towards the establishment of those two departments. The question has been exhaustively considered in all its aspects, one feature of the investigation being a visit of inspection to colleges and universities in the United States and Canada by Mr. George Kenrick and Professors Poynting and Burstall. The members of the committee have also made themselves acquainted with the facilities existing in various colleges and universities of England for the teaching of science in its application to industries. In their opinion no such teaching, complete as they contemplate it and as it must be if it is to be successful, exists in any college in Great Britain. They are encouraged therefore to believe that a really complete technical college would not only be of use to the industries of the district, but would attract a number

of students from a much larger area. The first object in view has been the teaching of science in its application to industry, coupled with such technical instruction in handicrafts as will enable the students to complete their course in the University itself. The committee recommends that the facilities already provided in Mason University College should be supplemented by chairs of mining, metallurgy, engineering, and applied chemistry.

THE SCHEME SUBMITTED contemplates the introduction of a complete equipment for the treatment of metals by heat and a small plant for treatment by electricity, as well as the necessary outfit for testing metals. Shops would be provided for manual training, and it is recommended that the machines used should be of the best and most modern type of English, American, and foreign manufacture. The committee further recommends the acquisition of twenty-five acres of land in the outskirts of Birmingham on which to build the University, the estimate of the total cost being £155,000. The cost of maintenance, including staff, is put at £10,450 per annum. On an estimate of two hundred day students at £55 a year each there would be a surplus of £550. The cost of education given in the existing institution would, however, remain to be provided. The Advisory Committee submits an elaborate scheme of commercial education, the adoption of which would entail an outlay of £6,000 for building and equipment, and £2,200 per annum for staff. The deputation to the United States and Canada reports that in America subdivision of subjects and specialisation in teaching is carried much further than in this country. Admiration is expressed alike for the high ideal of scientific education, which is the aim in American universities, and for the enthusiasm in all classes which renders it possible to approach so near that ideal. Everywhere evidence was found that the wealthier citizens realise the importance of university education, and encourage the universities by generous gifts, and everywhere, both by teachers and by students, those gifts are being used for higher learning and research.

"A LADY WHO WALKED WITH WORDSWORTH" was Mrs. Richard Reynolds, of Cliff Lodge, Leeds, the wife of that distinguished member of the Pharmaceutical Society whose death was recorded only a fortnight ago. We now have to record the lamentable fact that Mrs. Reynolds, who never got over the shock of her husband's sudden death, is also dead. According to the *Yorkshire Post*, she was born at Kendal, in 1829, and was the youngest daughter of Mr. Samuel Marshall, who kept the Friends' School in the county town of Westmorland. Mr. Marshall's great interest in religion, literature, and science led to many valued friendships, and his youngest daughter was privileged both in her Westmorland home and in later years to make the acquaintance of some of the great men of the present century. She knew Wordsworth, and used often to walk with him in the garden attached to his Lakeland home. She was also acquainted with Coleridge, Livingstone, John Bright, and other men of eminence. Her knowledge of old Quaker families was very extensive, and only within the past month she was asked to write an account of the Friends in Westmorland. Mrs. Reynolds was always clever with her pen and pencil, and as a young girl found pleasure in the study of several branches of science. Her fondness for collecting specimens was encouraged by the curator of the York Museum, whom she met when a pupil at the Friends' School in that city. Some of those collections are still to be seen with beautifully-printed labels, done by her own hand. Her father kept records of the rainfall, wind, and temperature in the Lake District for half a century, and it was this, no doubt, which influenced the late Mr. Richard Reynolds to take similar meteorological readings in Leeds. Mrs. Reynolds' father used to regularly correspond on scientific matters with the late Duke of Devonshire whose letters are still preserved.

ENGLISH NEWS.

WESTERN CHEMISTS' ASSOCIATION (OF LONDON).—On Wednesday, April 25, a very enjoyable social and musical evening was held at the Westbourne Restaurant, 1, Craven Road, W., the President, Mr. J. F. Harrington, in the chair. A programme of unusual excellence had been provided, and was successfully carried through under the able direction of Mr. T. Lawler, the accompanist being Miss Blanche Walker.

INLAND REVENUE PROSECUTION.—At Bow Street Police Court on Thursday, April 19, George Squire Boutall, chemist and druggist, was summoned by the Inland Revenue authorities for selling at his branch shop in the Strand a bottle of chargeable cough medicine, to which no duty stamp was affixed.—Mr. Albert Osborn, who defended, said the offence was admitted, although the defendant was not personally to blame. The defendant had several shops in London, and he always instructed his assistants not to sell "patent" medicines without an Inland Revenue stamp affixed to each bottle. In this instance, an unstamped bottle was sold—owing to the carelessness of an assistant, who had since been discharged—although there were stamped bottles in the shop, and about £5 worth of stamps on the premises.—Sir F. Lushington (Magistrate) imposed the reduced penalty of £4 and 2s. costs.

POISONING BY POTASSIUM CYANIDE.—On Friday, April 20, the Brighton Borough Coroner resumed an inquest, which had been adjourned from April 7, on the body of Obadiah Streeter, an elderly man, who had been found dead in his bedroom.—Evidence was given to the effect that deceased was in the habit of doctoring himself, and that he had complained very much about his heart. An analysis of the contents of the stomach and also of a medical measure-glass found near deceased had been made, potassium cyanide being detected in both. Death was attributed to poisoning, together with the shocking condition of the heart.—A verdict of "Death from misadventure" was returned.

FOOD AND DRUGS ACT PROSECUTIONS.

CAMPHORATED OIL.—At Lambeth Police-court on Thursday, April 19, Edgar F. Munday, chemist and druggist, Camberwell Green, was summoned by the Camberwell Vestry for selling camphorated oil which was found upon analysis to be deficient in camphor to the extent of 57 per cent.—Mr. Marsden, solicitor for the prosecution, having pointed out that in this case there was no complaint against the quality of the article beyond the fact that there was a deficiency in the amount of camphor, the defendant explained that at the time the article was made the whole of the camphor necessary was put in, but, owing to the very cold weather, the camphor had not dissolved.—Mr. Francis (Magistrate) said this was not one of those bad cases in which some foreign ingredient had been introduced; the defendant would, however, have to pay a penalty of 40s. and costs.—George Pardoe, Lower Park Road, Peckham, was also summoned by the Vestry for selling camphorated oil, which was found upon analysis to be deficient in camphor to the extent of 95 per cent., and which had, apparently, been made with mineral, instead of olive, oil.—Mr. Marsden said that the defendant kept a general shop. The Vestry had done its best to get hold of the wholesale man who supplied the defendant, but had been unsuccessful. If a fine was inflicted upon the defendant, he would have his remedy against the wholesale dealer.—The defendant who agreed that the Inspector had taken a great deal of trouble to bring the right man to justice, was ordered to pay the full penalty of £20 and costs.—Three other cases were adjourned in order that the Vestry might proceed against the wholesale dealer.—Llewellyn Davies, chemist and druggist,

3, Bridge Terrace, Enfield Wash, was summoned at the Enfield Petty Sessions on April 2 for selling camphorated oil deficient in camphor to the extent of 21 per cent.—For the defence it was stated that the sample left with defendant had been analysed by Mr. F. Davis, who certified that it contained 18.5 per cent. of camphor, and was therefore not deficient to the extent mentioned by the public analyst. A technical objection was also raised on the ground that when the summons was served a copy of the analyst's certificate was not served with it, as required by the new Act.—The magistrates dismissed the case, but refused to grant costs to defendant.

SEIDLITZ POWDERS.—George Stevens, grocer, Headington, was summoned at Bullingdon Petty Sessions, Oxford, on April 7, for selling seidlitz powders not of the substance and quality demanded.—Defendant, who pleaded that he sold them as genuine quite innocently, was fined £1 18s. 6d., including costs.—Evan E. Newell, grocer, Iffley Road, Oxford, was summoned for a like offence at his branch shop at Littlemore.—For the defence, it was stated that the powders were sold as "Aperient Powders," not as seidlitz powders.—Fined £5 and costs.

OLIVE OIL.—William Florence, Station Road, Rickmansworth, was summoned at Watford Police Court, on Tuesday, April 3, for selling cottonseed oil for olive oil.—Defendant stated that it was a mistake, made by his wife in his absence, and that it would not have occurred if he had been present.—The Bench considered that there was no intention to defraud; it would be sufficient, therefore, if defendant paid the costs; £1 2s. 6d.

MILK OF SULPHUR.—William Holmes, shopkeeper, Glascote, was summoned at Tamworth Petty Sessions, on March 27, for selling milk of sulphur, alleged to be adulterated with 49 per cent. of sulphate of lime.—Defendant pleaded that he sold the article in the same condition as he received it from Messrs. R. Judd and Co., Birmingham. On the suggestion of the Chairman the case was adjourned in order that Messrs. Judd and Co. might also be prosecuted.

LINSEED OIL.—Frederick Laurens, pharmaceutical chemist Great Missenden (Bucks), was summoned at the Aylesbury Petty Sessions on March 31 for selling linseed oil adulterated with 40 per cent. of rosin oil.—Evidence having been given to show that linseed oil came within the definition of drugs in the Foods and Drugs Act, defendant admitted selling the oil, but stated that he sold it in the same condition as received from Messrs. S. Bowley and Sons, of Battersea, who had since expressed their regret that a mistake had been made, and had offered to bear all the expenses that he was put to in connection with the case.—In reply to the Chairman one of the witnesses for the prosecution said that linseed oil was used for other purposes besides that of a drug; it was pointed out, however, that there was nothing to show that defendant sold the oil in any other capacity but that of a pharmaceutical chemist.—The Chairman said the Bench were of opinion that it was their duty to convict. Hence a fine of £2 including costs must be imposed.

SPIRIT OF NITRE.—On Saturday, April 14, Mallinson Helliwell, grocer, Sowerby Bridge, was summoned at Halifax West Riding Police Court for selling sweet spirit of nitre not of the nature, substance, and quality demanded.—Defendant produced a guarantee from the wholesale house stating that the article was genuine, but as he had failed to give seven days' notice to the prosecution that he had such a guarantee, the Magistrates decided, that while they were wishful to give defendant the benefit of the guarantee, they could not do so.—A penalty of £1 was imposed.

SCOTTISH NEWS.

GLASGOW AND WEST OF SCOTLAND SCHOOL OF PHARMACY.—On Saturday, April 21, the students of this College went botanising, with Mr. T. S. Barrie, co-Principal, in Orbiston Glen, famous for its beauty and its ideal communal settlement of sixty years ago. A large number of specimens were collected and examined by the students. The following plants were found in flower:—*Pellia epiphylla* (in fruit), *Agrapis nutans*, *Galanthus nivalis*, *Mercurialis perennis*, *Ulmus montana*, *Corylus avellana*, *Salix caprea*, *Anemone nemorosa*, *Ranunculus ficaria*, *Chrysosplenium alternifolium*, *C. oppositifolium*, *Ribes rubra*, *Primula vulgaris*, *Tussilago farfara*.

EDINBURGH CHEMISTS', ASSISTANTS', AND APPRENTICES' ASSOCIATION.—In connection with the report of the meeting published last week the reporter writes to say that he made a slip in saying that the vote was two to one in favour of dividing the Minor examination. It should have been three to one.

FATAL EXPLOSION OF A CHEMICAL DRUM.—On Wednesday, April 18, while a chemical drum belonging to Sir Charles Tennant and Company, Glasgow and Manchester, was being repaired at a Manchester tinplate works, the drum exploded, and a man named Thornton was killed. The inquiry was opened by the Manchester Coroner on April 20. The report of an analytical chemist showed that the explosion was due to the action of sulphuric acid on the steel or iron of the drum, generating hydrogen which had mixed with the air. Tennant and Company were legally represented. The Coroner pointed out that there was a suggestion of negligence on the part of Tennant's firm in sending a drum like that to be repaired, and suggested to the firm's representative that his clients should investigate the matter. The jury might take the same view as to negligence, and that was all the more reason why the affair should be thoroughly sifted. If it was known that the drum contained an explosive, and it was sent in that condition to be repaired, the jury would have to say what degree of negligence there had been. Formal evidence of identification was taken, and the inquiry adjourned until May 2.

IRISH NEWS.

PHARMACEUTICAL SOCIETY OF IRELAND.—The following is the text of the address presented to the Queen:—"May it please your Majesty: We, the President and Council of the Pharmaceutical Society of Ireland, respectfully approach your Majesty on behalf of ourselves, the members of our Society, and the associate druggists, to offer to your Majesty a most sincere and hearty welcome on this the occasion of your visit to Ireland. In tendering this welcome to your Majesty, we, in common with all your loyal Irish subjects, most gratefully recognise your Majesty's devotion to the interests of your subjects and the kindly and self-forgetful thought which prompted you to undertake such a journey to give pleasure to your Irish subjects, and we trust that this visit may prove of great benefit and pleasure to your Majesty. We would express our loyalty to your throne and person, and earnestly pray your Majesty's reign may still be continued, and that your remaining days may be days of health, happiness, and honour."

COLONIAL NEWS.

THE PHARMACEUTICAL SOCIETY OF TASMANIA reports a satisfactory condition of affairs generally, the past year being represented as the most successful in its history, fourteen members having been added to the roll. At a recent meeting the following officers were re-elected for 1900:—President, Mr. H. T. Gould

J.P.; Vice-President, Mr. Carl Eberhard; Hon. Treasurer, Mr. Percy Ash; Secretary and Registrar, Mr. J. B. Hickson; Hon. Auditor, Mr. M. Mason. The Council now consists of: The President Vice-President, Hon. Treasurer, and Messrs. T. Holmes, F. K. Fairthorne, A. P. Miller, J. T. Weaver, F. Styant Browne, and W. J. Clewer. On the evening of the annual meeting a banquet was given by the President at the Metropolitan, Hobart, the guests numbering about thirty, including Dr. Bright (President of the Court of Medical Examiners), the Hon. G. H. Butler, M.L.C., Dr. E. L. Crowther, M.H.A., Dr. E. J. Crouch (Hon. Secretary to the Court of the Medical Examiners), Dr. Barnard, and Mr. Leonard Rodway, L.D.S., R.C.S., Eng.

THE INTER-COLONIAL RECIPROCITY MOVEMENT.—The effort recently made to resuscitate this movement having dismally failed, it may be interesting to note what the various Colonies, or, at least, those of them who have recently spoken, have to say on the subject. The Western Australian report refers to the question as having, until that colony took it up, been at a standstill "owing to the Victorian Board's unwillingness to come to an understanding with New South Wales," and hopes that "when Victoria gets out of its masterly inactive mood, some progress will be made, and that the movement will be eventually successful." The Victorian Pharmacy Board, while describing the effort as a commendable one, and many of the Western Australian suggestions as admirable ones which had already been urged without success by themselves, lays the blame on New South Wales, which had again raised the old points in dispute, and wanted to arrive at an understanding in reference to the recognition of the various present registers before agreeing to a conference. Most outspoken of all, however, was the President of the Tasmanian Society, who, in his annual address, said:—"A move has been made towards a reciprocity of certificates throughout the colonies, and whilst I should welcome a reciprocity on the basis of recognised examination by the various Boards, I am not prepared to admit men who have passed nothing at all of an equal status with our young men who have passed the examinations required by our regulations. We have very few men in Tasmania who have got on our Register without passing an examination. Up to within three or four years ago we did admit some Victorian and New Zealand men who had certificates of having passed their examinations in those colonies, but at present the British is the only certificate we recognise. If some arrangement can be entered into by which all certificates of passing the Final Examination of a Colony will be recognised I shall be very glad to move in the matter; but whilst New South Wales admits lads of three months' standing and yet shuts out British majors and minors, I see no prospect of such a movement succeeding." It now remains to be seen what New South Wales has to say in reply to this straight-out criticism.

FOREIGN NEWS.

THE RESTRICTIONS OF THE SALE OF MEDICINES IN GERMANY.—The exercise of medical practice is free throughout the German Empire, and it is only forbidden to use the title of "Arzt"—i.e., physician—or any similar denomination without having duly passed the medical examinations. The pharmacist is specially prohibited from medical practice by the trade-law, except in cases of necessity; for example, in cases of severe injury or poisoning. On the other hand, medical men are not allowed to dispense medicines for their patients, unless danger be imminent. But in places where a pharmacist's shop does not exist or is not found in the neighbourhood, doctors may be permitted by the competent authority to have a house dispensary. Homeopathic practitioners who are qualified physicians and have passed a special examination in pharmacology and pharmaceutical technics, are authorised to keep a private

homœopathic dispensary everywhere. Also veterinary surgeons are entitled to dispense their medicines themselves. Apart from these exceptions conceded to medical men, the sale of drugs is regulated for the whole of the Empire by Imperial ordinances based upon a special paragraph of the German trade-law. The issue of an amended ordinance is expected within the next month.

THE EXISTING REGULATION is based on two principles: (1) The sale or offering for sale of certain forms of preparations, particularised in a special schedule A, is reserved to pharmacists, if the preparation is destined for a medical purpose (as a remedy for human or animal diseases), no matter whether it contains substances possessing really sanative powers or not.

THE SALE OF DRESSINGS AND BANDAGES is excepted from those restrictions, as well as the sale of preparations destined for the bath, and of soaps for external use. Disinfectants are open to free trade if they do not contain potent remedies, the dispensing of which is prohibited without a doctor's prescription. Corn-rings, corn-plasters, and cosmetics are also free, unless they contain substances included in Schedule B. Artificial mineral waters are free if their composition does not correspond to natural waters and contain no antimony, arsenic, barium, chrome, copper, free nitric acid, free muriatic acid, nor free sulphuric acid. (2) Pharmacists only are allowed to sell or to offer for sale certain drugs and chemical preparations enumerated in the Schedule B. The Schedule A runs thus: (1) Decoctions and infusions, (2) caustic styles, (3) extracts and tinctures, except certain household medicines of common use, like tincture of arnica, tincture of valerian, tincture of benzoin, liquorice, malt extract, etc.; (4) powders, mixed salts, and teas, triturations (except effervescent powder), smelling salts, salts made from natural mineral waters or imitations of such salts, etc.; (5) mixtures and solutions, enclosed mixed balsams, honey preparations and syrups, except certain household medicines like alcoholised hydratic-ether, formic spirit, aromatic vinegar, Goulard water, lime-water, etc.; (6) filled capsules of gelatin or amyllum, except capsules filled with balsam of copaiva, cod-liver oil, bicarbonate of soda, castor oil, or tartaric acid; (7) electuaries; (8) liniments; (9) pastilles, lozenges, tablets, pills and granules, except mineral water tablets, peppermint lozenges, and similar preparations; (10) plasters and ointments, except cold cream, court-plaster, adhesive plaster, mustard leaf, etc.; (11) Suppositories and cereoli. The Schedule B, which resembles the British poison schedule, comprises about 250 drugs and chemical preparations (with their salts, etc.) of a poisonous or somewhat potent character, the sale of which is reserved to the pharmacist. The sale of substances enumerated in Schedule B by wholesale to pharmacists and public institutions (for research and teaching purposes) is free. The sale of poisons for technical purposes is also restricted. Except in the case of pharmacists who are allowed to sell poisons for all purposes under certain conditions, and the local head of the police is authorised to give special licences for the sale of certain poisons for technical purposes to other trustworthy dealers. On the basis of the limitation of the ancient apothecaries' privileges has arisen the class of druggists (*Drogisten*) who, by taking advantage of the concessions to free trade, have had a large development, and are now continually asking for extension of free trade by making the most of public prejudices, of the antagonism of the medical body, and the self-interests of the sick funds, so that the pharmacists are always in a state of defence.

THE "APOTHEKER-ZEITUNG" publishes a description and illustrations of the newly-built "Polnische Apotheke" at Berlin, the property of the well-known member of the Council of the German Apotheker-Verein, Dr. Karl Schacht. The building is a handsome edifice, and the store, laboratory, etc., are of modern style—a model of the German "Apotheke" of to-day.

RAID ON A PARIS OPIUM DEN.—The Paris police recently made an unexpected raid on an opium den kept by Madame Veuve Assim at 6, Rue de l'Etoile, and, after badly frightening the smokers, habitués of the place, seized all the paraphernalia and arrested the proprietress. Until quite recently opium smoking was not included among the side attractions offered the visitor to Paris. Madame Assim is a Frenchwoman, and the widow of a Chinaman, named Seing Leing, who died in 1898. When she first met him he was engaged with a dealer in Chinese wares in the Avenue de Choisy. Since her marriage, however, and although she is but thirty years old, her personal appearance has undergone a complete change. She was once very pretty, but her features now bear a remarkable resemblance to the Chinese type. This, it is claimed, is owing to her association with her husband, whose habits she quickly adopted, and who initiated her into the joys of opium smoking directly they were married. On her husband's death, Madame Assim opened her opium den in the Rue de l'Etoile. She furnished a large room on the ground floor with all kinds of Chinese bric-à-brac—pottery, grinning masks, and silk hangings, porcelain vases, parasols, fans, etc.—and amidst these exotic surroundings her customers indulged in their day dreams. To this den repaired clandestinely, not Chinamen and Colonials, accustomed to smoke opium, but Parisians belonging to the wealthy bourgeois class. The price of each séance was left to the generosity of the smokers, who usually paid liberally for their celestial joys. For some time complaints regarding the place had reached the police, and on Saturday Monsieur Cochefort, with a force of detectives, went to the Rue de l'Etoile to raid Madame Assim's paradise. When the police forced their way in, six persons—two women and four men—were lying stretched out side by side on an enormous bed. Each was fully dressed, and had within reach the pipe and chafing dish. As the police entered the smokers rose in panic and tried to escape, but all the exits had been closed, and each had to give a name and address before being allowed to depart. The police cannot proceed against the smokers, for there is no law against indulging the habit in France. Monsieur Cochefort, however, informed Madame Assim, who had been looking on in a state of considerable perturbation, that she would be proceeded against for selling poisonous substances in contravention of the Pharmacy Acts, such being punishable by a law of July, 1845, and a decree of 1850. Madame Assim's case will come on shortly in the Police Correctionnelle.

ANOTHER USE FOR NESTLE'S FOOD TINS.—A bomb, with the fuse lighted, has been found by a policeman on the exterior window-ledge of the ground floor of 132, Boulevard Malesherbes, Paris, a flat occupied by Monsieur Paul de Cassagnac. It appears that the policeman, whose name is Nodin, could not reach the bomb as he stood, but by pulling himself up by the ironwork of the window he succeeded in knocking the bomb down on to the pavement. With commendable pluck he extinguished the fuse, burning his hands rather severely in doing so. The bomb had been placed on the exterior window-ledge, inside the ironwork, after which the fuse had been lighted. When examined later on at the Municipal Laboratory, it was found that the bomb was a dangerous one. It would not have done great damage to the building in exploding, but might have seriously injured or even killed any persons who might have been passing at the time. The bomb was made of a "Nestlé Food" tin, wound round with electric wire, and covered with white cotton and gutta percha. The fuse passed through a hole in the lid. The explosives used were black powder and pyroxile powder, while rough bits of iron and lead, revolver and rifle bullets, were put in as projectiles. The police maintain secrecy regarding the bomb, but do not consider it as an act of anarchist propaganda. Monsieur de Cassagnac said he supposed his being a property owner had been the motive of the extraordinary incident, but he could throw no light on the affair. A portion of an address label remaining on the tin is scarcely expected to furnish much information in the way of a clue.

BRISTOL PHARMACEUTICAL ASSOCIATION.

The annual dinner of this Association took place at the Royal Hotel, Bristol, on Wednesday, April 25, Mr. G. T. TURNER, President, in the chair, supported by a large company, including Mr. Michael Carteighe, past-President of the Pharmaceutical Society; Professor Lloyd Morgan, Principal of University College, Bristol; Professor Wertheimer, Principal of Merchant Venturers' Technical College; Captain Rintoul, Mr. F. Richardson Cross, Dr. Watson Williams, Mr. S. R. Atkins, Treasurer of the Pharmaceutical Society; Alderman Gadd, of Exeter; Mr. N. M. Grose, member of the Pharmaceutical Council; Mr. B. Keen, Hon. Secretary of the Bristol Association, and others.

The CHAIRMAN, in giving the usual loyal toast, referred to the Queen's visit to Bristol last November, and said her goodness, purity of life, and beauty of character had done more than anything else to make England what it is. He next proposed the "Navy, Army, and Auxiliary Forces," Captain RINTOUL, Bristol Engineer Volunteers, responding.

Professor LLOYD MORGAN gave the toast of the

PHARMACEUTICAL SOCIETY OF GREAT BRITAIN.

He said that, in looking at the constitution of the Pharmaceutical Society, he was struck with the breadth and the wisdom of its basis; it was constituted to elevate the calling by furnishing proper means of education, and thus to benefit the public, while at the same time, individually and collectively, members were protected from hostile attack. No doubt it was most valuable that there should be mutual protection of common interests; but the broader and richer and fuller basis was that which was placed first—the founding of the great conception of the Society upon education. The Society was a pioneer in technical education, about which we heard so much now. He used to think that the College of Chemistry in London, where he spent a good deal of time, was the first college in which practical chemistry was taught in London. But he found that the Laboratory of the Pharmaceutical Society was a year or two older. He was glad to think that Professor Norman Collie won the Chemical Scholarship at University College, Bristol, and he was proud to have known the late Mr. Schacht. He coupled with the toast the name of Mr. Carteighe, who had had the unique honour of being President of the Pharmaceutical Society for fourteen years.

Mr. M. CARTEIGHE, who was received with applause, observed that he was pressed into the service of the Pharmaceutical Society at a very early age. He belonged to that period which dated from about the death of Jacob Bell to the passing of the Pharmacy Act, 1868. Bell went into Parliament and got a Pharmacy Act of a voluntary character, which tended materially to advance the respect in which the Society was held educationally. But he did not obtain from Parliament recognition of the principle that the practice of pharmacy should be limited to persons who had had certain training and had passed certain examinations. The principal actor in the work after the death of Jacob Bell was George Webb Sandford, who possessed no scientific training whatever; but he had a very clear notion of the value of training. In 1867 the Society's Bill was opposed by a Poisons Bill, promoted by the United Society of Chemists and Druggists; the result was a joint Poisons Bill next session. But the Society always insisted upon education and the effect of the work had been to advance enormously the rank and file of pharmacy from the bottom upwards. He did not find that the middle or the higher pharmacy had advanced much; but the Society was exercising its powers in regard to examinations in a way which some might think a little onerous. To them he would say that the difficulty of examinations was entirely due to the fact that the candidates were not taken through a definite course, but were crammed just before the examination. Referring to the question of company pharmacy, he said that the Pharmaceutical Society was

doing its best to defeat the clause which would allow seven persons to be a pharmacy company if they had a qualified assistant. The application of the company principle might be made to destroy all education, for instance, and everything else. He was of opinion that the opposition of the Society would be successful and he would rather wait ten years than accept any compromise. He did not see how the objectionable clause in the present Bill could be modified satisfactorily. They could not at one and the same time get rid of the principle of the Pharmacy Act and yet retain it.

Mr. B. KEEN proposed the toast of

THE MEDICAL PROFESSION,

and observed that no body of men knew better than chemists what the work of medical men was like. Hard work and hard reading were their lot and he hoped to see some provincial medical baronets in Bristol. He believed that pharmacists had the confidence of the medical profession. Both had common enemies—the flagrant advertiser and the despot capital.

Mr. F. RICHARDSON CROSS, who was the first to reply, said it was obvious that the two professions were closely allied. Sixty or seventy years ago the pharmacists of England determined to make themselves fully qualified men. The Government then encouraged them; but now the Government appeared to be threatening them with company law. Medicine and pharmacy largely overlapped. Let them take care that they did not interfere with each other. Do not let it be said that pharmacists, who objected to interference, were interfering with the work of medical men. His own relations with the pharmacists of Bristol had been excellent and he believed that the two professions work very pleasantly together.

Dr. WATSON WILLIAMS also replied, saying that often enough he was indebted to the care and patience of the pharmacist. Medical men depended more and more upon educated pharmacists, as separate branches of medicine and surgery increasingly occupied their attention.

OTHER TOASTS.

Mr. S. R. ATKINS proposed the "Bristol and other Pharmaceutical Local Associations," to which Mr. KEEN replied.

Mr. H. E. MATTHEWS proposed "Our Visitors," to which Mr. GROSE responded.

A capital selection of vocal music was given during the evening.

EXTRACTS FROM CONSULAR REPORTS.

INDIARUBBER IS THE CHIEF SOURCE OF REVENUE of the State of Pará and district, Brazil. That it is enormously taxed is shown by the fact that out of a total income of £476,000 derived from the taxation of exports in 1897-98, the sum of £437,000 was collected on indiarubber alone. The total quantity of rubber exported in that year was 22,218 tons, of which 10,796 tons were shipped to Europe, and 11,422 to the United States. In the year 1898-99 the total quantity exported was 25,246 tons, the year's crop amounting to 25,374 tons, of which 9,839 tons were produced by the State of Pará, the previous year's crop being 8,919 tons. The total shipments of Amazonian rubber during the year 1899 amounted to 25,401 tons, of which 8,954 tons came to the United Kingdom.

THE CACAO PLANT, according to a recent report, is not cultivated in the States of Pará and Amazonas, but grows wild and in great profusion. When the fruit is mature it is picked and the seeds are sun dried and sold to exporters. That is practically the only time when the plant receives attention. The Pará quality is said to be one of the best in the world, in that it readily assimilates the delicate perfumes given to it in the manufacture of chocolate. In 1899 the exports from the two States amounted to 5,653 tons, of which 5,239 tons were sent to France, the average price being 6·27d. per lb.

MEETING OF BRADFORD CHEMISTS.

On Tuesday, April 24, a meeting of the members of the Pharmaceutical Society in the Bradford district was held at the County Restaurant, Bradford, Mr. H. G. ROGERSON, presiding, to consider the candidatures for

SEATS ON THE PHARMACEUTICAL COUNCIL.

Mr. WADDINGTON introduced the subject. He said that, in view of the increased interest in the election the three local secretaries had met to go through the list of candidates, with a view to the selection of seven names which they would recommend for the support of the Bradford members. They did not want the members to think that they desired to dictate in any way, but had thought it might be useful to the members if they made detailed comparison of the candidates, and then offered suggestions with a view to securing common action among them. He believed that by its recent extension of the franchise the Society had done a great deal to increase interest in its work, and he would remind members that although they might not think that the Society was immaculate, or had done all that was possible, they should remember that at no previous time in its history had it had such a considerable following as it had to-day. The great thing that they had to bear in mind in making their selection was that they should get seven candidates who would be prepared to act together on something like common lines, and whose ideas were as nearly as possible identical, and who were prepared to forward the policy of the majority of the Council, to oppose Clause 2 of the Companies Bill. Until they were agreed that the first thing that they had to do was to look after their titles and leave the matter of the actual management of their pharmacy for the moment they would not be able to go forward with any real strength. After they had got the members of the trade thoroughly united upon one point, they would be able to go on to others, and so to do something in respect of the purely trading aspect of their businesses. One of the greatest difficulties which the Council had had to deal with had been the fractious opposition of one of the trade journals, and he could scarcely believe that a man who had been the editor of the *Chemist and Druggist* could have issued such an election address as he and others had received a few days ago. They could not fail to be struck by the extraordinary difference between the views expressed by past editorials in the journal in question and those of the election address. One of the greatest objections to the present Council had been that it was not so constituted as to represent properly the views of provincial chemists. He did not think he need greatly press the point that the past editor of the journal in question could scarcely be considered able to represent the views of these provincial chemists. They had considered first of all the names of the seven retiring candidates, and had carefully searched the pages of the trade journals, so that they might become acquainted with the views of those gentlemen. Eventually they decided to recommend the adoption of Messrs. Hills, Storrar, Warren and Symes for re-election. Mr. Hills they felt they could not afford to lose, because of his long and energetic services for eighteen or nineteen years past. Mr. Storrar they regarded as representing the Scotch chemists and they gave him the preference over Mr. Currie, because, the views of the two candidates were very similar, and they preferred the one with experience. Mr. Warren had been selected for similar reasons in preference to a new candidate from London. Upon consideration of the question of the proportion in which London should be represented they formed the conclusion that eight was not really more than a proper share for London. After selecting those four retiring members, they went carefully through the new candidates with reference to the three vacancies still to be filled. The two men who they felt were most likely to do good at the moment were Mr. Taylor, of Bolton, and Mr. Gifford, of Blackburn, both being absolutely decided that the first thing that chemists should do was to protect their titles, whilst they were at one with the

majority of the present Council in that they would oppose Clause 2 *in toto*. Mr. Taylor made use of the very effective argument that the time spent before the introduction of the Pharmacy Acts Amendment Bill would not be at all wasted if they as chemists only put their shoulders to the wheel, and really did their best to cement the trade into a harmonious whole. Mr. Gifford was very much of the same opinion, and went in strongly for the protection of the professional side of their calling. That gentleman said that if the Pharmaceutical Society would do its duty in protecting his title and professional standing, he would look after his trade interests himself. There was another point, that if the Society was to retain its peculiar administrative functions they could not make it too much of a trade union. After very careful consideration they decided that the seventh to be recommended should be Mr. Cross, of Shrewsbury. He felt it was only right that he should say a little about the action of Mr. Glyn-Jones. He did not think that the action of that gentleman in addressing the members of the P.A.T.A. through their journal in regard to the election of members of the Pharmaceutical Council could be justified in any way, and he wished to offer his protest against such action. Mr. Glyn-Jones also raised the question of dispensing in doctors' surgeries. That was a great mistake. The less they heard about doctors' surgeries the better it would be at the present time. They wanted to concentrate their attention for the moment entirely upon the Companies Bill and the protection of their titles, and the introduction of such side issues was merely drawing a red herring across the track, and endeavouring to sow dissension among the members of the Society. So far as the *Chemist and Druggist* was concerned there was not a shadow of a doubt that it was a good trade paper, but they could not afford to have two leaders. They were members of the Pharmaceutical Society, and the *Pharmaceutical Journal* was the Journal of that Society. The *Chemist and Druggist* prided itself upon being the official journal of sixteen Pharmaceutical Societies in the British Empire, and he thought that, in all conscience, it ought to be satisfied and let the Pharmaceutical Society of Great Britain alone, and let it have its own Journal without attempting to lead that Society.

The CHAIRMAN said he was prepared to say "ditto" to almost all that Mr. Waddington had said, except that he thought Mr. Glyn-Jones had been somewhat hardly dealt with. Mr. Glyn-Jones was, of course, not infallible. With regard to the question of medical dispensing that gentleman was decidedly out of order in introducing it. If they were to succeed they would undoubtedly have to look for the co-operation of the medical societies. If they indulged in pin-pricks at the medical profession because of their employment of unqualified dispensers they could not do any good by it now.

Alderman DUNN expressed doubt as to the wisdom of the local secretaries in taking up this task of recommendation, and thought that Mr. Glyn-Jones had as much right to take the action which he had taken as those local secretaries had to do what they had done. He rather disagreed with Mr. Waddington's statement that experience was the most desirable thing at the present election. He thought that policy was of more importance. What they needed was not men but measures, and they should support men who would support the policy which they needed. He quite agreed that the question of medical dispensing was a side issue. The thing which concerned them in the first instance was company pharmacy. He felt, however, that they had not had full reasons given why some of the old members should be included, and others should be omitted.

Mr. WADDINGTON: These others publish no addresses, and refuse to make any appeal to the electorate. We have no means of getting to know what their opinions are.

Mr. MACKAY said it would be an advantage if the local secretaries would communicate with some other centres so that there might be effective co-operation on seven names to be jointly recommended.

Alderman DUNN also thought that unless there was concerted action with other districts, it was useless for them to attempt to accomplish anything.

The CHAIRMAN said the election would take place so soon that there was no time for such action.

Mr. WATSON said he felt some doubt whether the recommendation introduced enough of the new element, but on the whole he thought it would be well to support the names mentioned.

Mr. PICKARD said that if the meeting desired to substitute another new candidate for one of the retiring members, he could conscientiously recommend Mr. Cooper; but the local secretaries, of whom he was one, had gone into the whole matter very carefully.

Mr. MITCHELL said that among the factors which had helped them very considerably were the addresses of the various candidates.

Mr. WADDINGTON said, in answer to Mr. Marshall, that all the gentlemen who were recommended were entirely in the retail trade.

Mr. BLACK spoke strongly in recommendation of the inclusion of Mr. Gibbons' name in the list. He added that his feelings in regard to the old Council were mostly feelings of disgust, and he thought his views were shared by many thousands of others.

Mr. PARKER expressed the opinion that greater emphasis ought to be put upon the trade aspects of the chemist's business for ninety-nine out of a hundred of them had to consider those more than the professional aspect.

Mr. WADDINGTON briefly replied to the various arguments, and a show of hands was taken, with the result that it was decided to support Messrs. Gibbons, Gifford, Hills, Taylor, Symes, Storrar, and Warren.

EXETER ASSOCIATION OF CHEMISTS AND DRUGGISTS.

A meeting of the Exeter Association of Chemists and Druggists was held at the Albert Memorial Museum on Tuesday, April 24, the chair being occupied by the PRESIDENT (Mr. T. C. Milton). Apologies were received from several members, regretting their inability to be present. A discussion arose on a letter from the Federation of Local Pharmaceutical Associations in regard to

THE COMPANIES QUESTION.

The PRESIDENT expressed the opinion that the matter should be left in the hands of the Pharmaceutical Society.

Mr. J. HINTON LAKE said that, acting on the advice given by one of the journals, he wired to the member of Parliament for the city (Sir Edgar Vincent, K.C.M.G.), asking him, if the Bill came on for consideration, to vote against Clause 2, after he had given the matter his attention. The hon. member acknowledged the receipt of the telegram, and said he would give the matter his very serious consideration.

The PRESIDENT said that the hon. member would be visiting the city shortly, and the question was whether it was worth their while to obtain an interview with him and bring the subject before him.

Mr. LAKE said the question was whether it was considered advisable to oppose Clause 2 or not. It was a question of allowing companies to assume titles which should only be borne by qualified men.

Mr. E. LEMMON: But they do it at the present time.

Mr. LAKE said it was a case of making legal what was now done without the sanction of the Legislature. He, however, did not feel strongly about the matter.

The PRESIDENT agreed. He had not much interest in the subject.

Mr. D. REID thought that they ought to make the strongest effort possible to prevent new interests of the same kind being created in future. It should be illegal for those companies to use the title of chemist and druggist or pharmaceutical chemist.

Mr. LAKE suggested that they would have to sacrifice the "Widows' Clause."

Mr. D. REID: I don't think that would be very much hardship.

Mr. LAKE observed that if it was considered illegal for a company to carry on business by employing a qualified man, the Government would consider it illegal for a widow to carry on a business.

The PRESIDENT: That is a common-sense view, certainly.

Mr. LEMMON pointed out that this was not exactly the question before them. The question was whether those companies which were not qualified could call themselves by the titles of qualified men. He did not think the Pharmaceutical Society had ever fought the question. It was admitted that it must be a limited company.

The PRESIDENT said the Lord Chancellor would probably say that they themselves were not acting in a proper spirit by carrying out the "Widows' Clause"; but they should reply: "If you think it wrong, do away with it." He, however, did not think that their adopting errors should encourage them to make greater hardships.

Mr. REID remarked that if there was anything to be got by fighting Clause 2 they ought to try and get it.

The PRESIDENT: I feel very indifferent about it myself.

Alderman GADD, J.P., pointed out that the "Widows' Clause" was specially provided for by Act of Parliament. He also mentioned the case of a principal having half-a-dozen shops, and Mr. LAKE remarked that the principal saw that there was a qualified man in charge in each case.

The PRESIDENT agreed that the actual manager's or dispenser's name should appear, but he thought that it was a waste of time discussing the matter; for instance, they would not be able to prevent co-operative stores discussing the matter. They were too strong. If only they could now undo the work of the last twenty years they might be able to take action which would be for their benefit.

In the course of further discussion it was suggested that the subject should be considered at a special meeting. One member observed that he did not think the Bill would come before the present Parliament.

Mr. REID said they would find a tremendous amount of opposition throughout the country. They ought to make a stand and improve matters in the future. If they were not going to get some advantage by being qualified men, it would be better to be without the Pharmacy Act altogether.

Eventually the PRESIDENT said he would take care that the subject was placed on the agenda at the next meeting.

SUMMER OUTING.

In regard to the proposal of the Association to join the Plymouth Association in an outing during the ensuing summer, the PRESIDENT said he had placed himself in communication with Mr. Cocks, the Secretary of the Federation, and Mr. G. Breeze, the Secretary of the Plymouth Association. The members of the latter body fell in with the suggestion with very great pleasure. They suggested that the outing should take place on the Thursday in the last week of June, and that Totnes should be the meeting-place for a drive, returning for high tea. It was also suggested that members should bring their friends.

After a discussion, during which several suggestions connected with the proposed outing were made, it was decided to reply accepting Plymouth's invitation, but proposing that the outing should take place on the second or third Thursday in June, the meeting place to be arranged by the President and Secretary with the Plymouth Association.

THE B. P. CONFERENCE.

A letter was read from Mr. E. M. Holmes, enclosing particulars about the advantages of the British Pharmaceutical Conference, and asking those who were not members to join. He hoped to see in the future the 'Year-Book' made increasingly useful as a desk companion for the pharmacist; prizes offered for the best papers; and meetings of the various bodies—commercial, political, and scientific—connected with pharmacy, at the same time of the year as the Conference, so that a good and powerful organisation might be formed for protecting the interests of the profession.

ROYAL INSTITUTI N.

The Friday evening discourse on March 30 was delivered by Professor J. ARTHUR THOMSON, M.A., on

Facts of Inheritance.

The lecturer prefaced his remarks by pointing out that one of the main features in recent scientific progress has been the development of greater precision in scientific nomenclature. For example, the term specific vital force is now disowned, and force itself is described as the measure of motion. Heredity is another term which has lost its former importance. Heredity is neither a power, a principle, nor a force, but a convenient term for expressing the relation of organic or genetic continuity which binds together grandsire, sire, and son. It is well that terms such as this are now being valued at their true worth, so that the enquirer may beware of these dust particles of intellectual fog.

The facts of inheritance have recently received considerable attention at the hands of Francis Dalton and Karl Pearson from a mathematical and a statistical point of view.

The fundamental facts rest on certain physical bases. Of these the lecturer chose a few to explain some of the leading principles. Each living thing, whether plant or animal, has the elements of its life in the egg cell and the spermatozoid. In biology there is no difference, as a rule, as there is in human affairs, between an inheritance and the inheritor. The egg cell may be looked upon as representing both. The question is frequently asked "can there be room in these cells for the complexity of organisation supposed to be requisite?" Darwin considered the microscopic brain of the ant to be the most marvellous sample of the handiwork of nature. But if there are degrees in the marvellous, surely the unit that produced the ant is still more wonderful! It has been stated that the "Great Eastern" filled with a mechanism as delicate as that of the smallest watch would not be so complex in structure as a single minute spermatozoid. An ovum is a small body, but a spermatozoid averages one-hundred-thousandth of the size of an ovum. The finding of a complete answer to this question rests more with the student of physiology and embryology.

Another question that lies within the province of the student of inheritance relates to the

UNIQUE CHARACTER OF THE GERM CELLS.

"How do they develop into an organism?"

In answer various theories have been advanced. Democritus, Paracelsus, and some more modern thinkers have held that the various cells of the body give off "gemmules" which by fusion give a germ cell that is a representative sample of the organism. The latter theory of germinal continuity has, however, superseded the gemmule theory. By this theory, due to Dalton, it is held that germinal material is set apart in the parent to form the germinal reproductive cells, any one of which may become the starting point of a child.

In the process of division of the nucleus the centrosome, which is derived from the paternal side, organises the machinery of division. As far back as 1878 Huxley prophesied that every part of an organism contains elements derived from both the paternal and maternal side, just as a web is composed of warp and weft. The inheritance is therefore dual. There are known to everybody degrees of hereditary resemblance, as when a child is more like one parent than the other. Certain tendencies may be transmitted more than others, *e.g.*, certain diseases, and some subtle qualities as longevity and fecundity. The old phrase "like begets like" would better be paraphrased into

"LIKE TENDS TO BEGET LIKE."

It is probable that where a child appears to resemble one parent more than the other we fail to detect the idiosyncrasies that are present.

There are three familiar kinds of inheritance:—(i.) blended, (ii.) exclusive, and (iii.) particulate inheritance. The first is well seen in the colour of the hair, especially in hybrids; in (ii.) the paternal or maternal characters are suppressed, *e.g.*, the colour of the eyes. This is called a unilateral resemblance, as when a child resembles one parent more than the other; the third type is well seen in the colour of the hair, which resembles that of the two parents in different patches. The foal of a dark horse and a light mare would show blended inheritance if light brown, exclusive inheritance if very light or very dark, and particulate inheritance if piebald.

THE QUALITY OF PREPOTENCY

next received attention. By this is meant the quality by virtue of which the male or female contribution predominates. Thus a man generally resembles his father in stature, and the colour of a mare is prepotent over that of its sire. Prepotency is developed by the process of inbreeding. Any carefully inbred race tends to become prepotent and transmit its qualities. Thus inbreeding tends to fix characteristics in a race, as is well seen in the Jews. The people of the United States serve as an example of the opposite of inbreeding, *viz.*, cross-breeding. They thus avoid the degeneracy that follows from inbreeding, and constant variations are provoked which form the raw material of progress. An ideal race should follow generations of inbreeding with generations of cross-breeding.

Another point of interest is the remarkable stability of type from generation to generation. The proportion, *e.g.*, between the large and small men in any particular family varies so little. Children tend to differ less from mediocrity than their parents. To this tendency the name

FILIAL REGRESSION.

has been given. The theory of germinal continuity helps us to appreciate the fact that a man is not merely the product of his parents, but of all his ancestors. Calculation will show that allowing three generations per century, there have been twenty-five generations since the Norman Conquest. Working on this basis, it may be calculated that the average man now living has had 1,024 ancestors going back 10 generations, 16 millions since the Norman Conquest, and 70,000 millions of millions since the year A.D. 1. Owing to intermarriage the number is in all cases capable of great reduction. Thus, the present Emperor of Germany can name only 206 ancestors out of a theoretical 1,024. Even allowing a margin for some who may have been forgotten the number does not exceed 256. Each parent contributes one-fourth to the germ cell that will develop into the child, each grand-parent one-sixteenth, each great-grand-parent one sixty-fourth, and so on. It is fortunate for the individual that there is this tendency towards mediocrity in the inheritance, otherwise the son of a degenerate father would bear the whole weight of his parent's ill-doing. This principle of filial regression is seen in the animal world in the mule, the product of a male ass and a female horse, as well as in the vegetable world. Thus the product of two species of willow gave leaves which were a mean of the originals in size; two species of water avens produced a variety whose fruit was midway between them in size, hairiness, and other characters.

It has been shown by statistics that certain qualities are transmitted along one line more than along the other. In a family, the descendants of a colour-blind father and normal-sighted mother show even to the third generation colour-blindness in the males and normal sight in the females. The same is seen in the case of deaf mutes, and certain diseases. Dalton has done much to clear up this difficult subject in his studies of the human faculties. He has shown conclusively that inheritance is dual in respect of the father and mother, but multiple in a deeper sense.

In conclusion, the lecturer said it was necessary to warn his audience against the common fallacy that there was a fatalism connected with a man's inheritance. Though each individual has

a given inheritance, yet it is capable of modification by culture. The realms of literature, science, and art furnish means of culture which place man in a more favourable position to combat an unfortunate inheritance than is the case with the beasts that perish.

The fourth lecture of the series was given by the Right Hon. Lord RAYLEIGH, F.R.S., on Saturday, March 31, on

Polarised Light.

The lecturer showed that it is not only bodies that are subjected to mechanical stress that may acquire doubly refracting properties, but that an electrical stress may bring about the same result. The stress acts in the direction in which the electrical change of potential is fastest. An experiment was performed to illustrate this point, carbon disulphide being the substance acted upon, and a Wimshurst machine the source of the electricity. On passing a beam of light through the liquid and two Nicol's prisms reversed, so as to gain the position of maximum darkness, no light passed through; but on starting the Wimshurst machine the obscured light was seen to be renewed, owing to the carbon disulphide becoming capable of doubly refracting light on being electrically charged. It is necessary that the carbon disulphide should be dry and free from shreds, which if present would tend to aggregate between the two charged balls.

The reflection of light from a surface of glass or water was next considered, and Fresnel's formula was given for determining the amount of light reflected from the surface of a given medium. The symbol μ representing the index of refraction of the medium, the amplitude of the reflection is found from the formula—

$$\frac{\mu - 1}{\mu + 1}$$

Thus if $\mu = \frac{3}{2}$, the amount of light reflected will be $\frac{1}{5}$ of the incident light. The intensity will be the square of the amount, in this case $\frac{1}{25}$. Young devised a similar formula, and on arranging experiments so that the light falls vertically on the reflecting surface, the formula is found to be almost correct. When light does not fall vertically on the reflecting surfaces, other factors have to be reckoned with, *e.g.*, traces may remain of the material with which the glass was polished.

The reflection of light in cases when the second medium is metallic was next considered. The reflection is different at a silver surface from what it is at a surface of gold. Opacity is what causes a copious reflection of light.

Some salts show peculiarities in the way in which they reflect light. Thus, potassium permanganate has an intense absorbing power of the green rays of the spectrum. The spectrum of crystalline potassium permanganate is different from that of a solution of the salt; the dark band in the absorption spectrum corresponds with the bright band in the reflected light. Certain crystals, notably certain potassium chlorate crystals, exhibit a brilliantly coloured reflection from a thin layer in the crystals. This was observed by Sir George Stokes, who ascertained that the layer causing the coloured reflection was very thin, being only about a thousandth part of an inch in thickness. The quality of the light reflected varies with the angle of incidence; as the angle increases the amount of reflected light increases, and the colour changes from red to yellow, then to green; or from green to blue. The coloration is not seen from all positions; from two positions at right angles to each other the effect is best seen; midway between these two points it is not seen at all. Stokes thought such crystals contained a single plane, but the lecturer considered that a twin plane was present. A piece of Iceland spar often contains twin planes. If a small batch of potassium chlorate crystals be made, some of them will be found to possess this remarkable property of reflecting light of various colours.

On Saturday, April 7, Lord RAYLEIGH gave the fifth lecture of his course on

Polarised Light.

In plane polarisation the vibrations are in one plane, but there are, strictly speaking, two other kinds—*viz.*, elliptical and circular polarisation. This is best understood by regarding the elliptical polarisation as the mean. In the one extreme—*i.e.*, plane polarisation—the ellipse has been reduced to its major axis only, whereas, in circular polarisation, the other extreme, the major and minor axes are equal in length. Elliptical polarisation of light is looked upon as the general case, comprising the two extremes. It is the most homogeneous kind of light. Circular polarisation can be produced by interposing in the polarised beam a mica plate known as a quarter-wave plate, of such thickness that one ray gains exactly a quarter undulation on the other. It is interesting to note that the interposition of two quarter-wave plates instead of one produces plane polarisation.

The nature of ordinary light itself is more difficult to understand than polarisation. It may be regarded as light of which the plane of polarisation was continually shifting—in other words, as elliptically polarised light, with the direction of the major axis constantly changing. This point is not brought out in text-books.

Homogeneity in light is only found when there is an infinite succession of rays of the same wave-length, intensity, amplitude of vibration, and when there is no change of phase.

It is possible to obtain circular polarisation by means of Fresnel's rhombs. This the lecturer did, and showed Savart's bands, which afford a convenient means of detecting whether a particular sample of light is polarised or not, say in the case of light from the sky.

When a thin slice of quartz—a uniaxial crystal—is interposed between two Nicol prisms in the crossed position, a revival of light is seen. The action of quartz differs from that of other uniaxial crystals in certain respects. There are two optical varieties of quartz—one rotating the plane of polarisation to the right, the other to the left, and in nature specimens are found in which the two varieties are conjoined.

Some fluids possess a similar power of rotation—*e.g.*, oil of turpentine and sugar solutions, and while in a crystalline solid this effect may be attributed to some special character of the structure, in fluids it is only possible to suppose that the molecules themselves have something of that character. It is found that the rotation of the ray depends on the length of the column of liquid and the strength of the liquid. Poynting has devised an excellent method of polarimetry, whereby the light is transmitted through a cell so constructed that one-half of the light passes through glass, the other through strong syrup. This apparatus is known as the half-shade polarimeter.

Polarimetric determinations are, as is well known, of great importance in chemistry. This new field was opened up by Pasteur in his researches on the rotatory powers of tartaric acid. He noticed that tartaric acid was dextro-rotatory, and that racemic acid, though possessing the same chemical properties as tartaric acid, was inactive—*i.e.*, did not produce rotation. He prepared the ammonium-sodium salt of racemic acid, and on sorting out the two kinds of crystals which he observed and dissolving each kind separately, one solution produced right-handed, the other left-handed rotation. Pasteur was thus able to discover a new substance by this method. He then found that certain bacteria have the power of decomposing tartaric acid, using up one variety and leaving the other intact.

A discussion has been held as to whether the property of rotating the plane of a ray of polarised light is ever found without the intervention of life. This subject has been fully dealt with by Professor Jupp in an address before the British Association in 1898.

An interesting experiment of Faraday's devising consists in inducing in carbon bisulphide—an inactive body—this rotatory power by the agency of magnetic force.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Copaiba.

COPAIBA or COPAIVA is an oleo-resin obtained from the trunk of *Copaifera lansdorffii*, Desf. (N.O. Leguminosæ), and other species of *Copaifera*, Linn. The trees yielding it are indigenous to Brazil, Venezuela, New Granada, and other parts of Central and South America. The anastomosing, schizogenous secretion ducts containing the oleo-resin form an extensive network in each zone of the secondary wood of both stem and root, resembling in arrangement the laticiferous tissue of the dandelion. Lysigenous cavities are also found; they appear to be formed by the breaking down of cell walls, which are probably transformed into resinous or oleo-resinous substances. The oleo-resin is collected in cavities cut in the trunk of the tree near the base, and as much as 48 litres is stated to have been obtained from a single tree. The commercial varieties of the drug are named after the ports—Maracaibo, Para, Maranhã, Savanilla, Angostura, etc.—whence they are shipped. Maracaibo copaiba is most efficacious. The oleo-resin, which possesses stimulant, antiseptic, and diuretic properties, yields Oleum Copaibæ by distillation. The dose of copaiba is 0.5 to 1 fluid drachm.

CHARACTERS.—Copaiba is a more or less viscid liquid, generally transparent, but sometimes opalescent and occasionally slightly fluorescent. It has a characteristic aromatic odour, a persistent acrid somewhat bitter taste, and a colour varying from light yellow to pale golden brown. Para copaiba is a thin yellowish liquid; the Maracaibo variety is viscid as treacle and brownish-yellow in colour. The specific gravity of the oleo-resin varies from 0.916 to 0.993, according to the proportion of volatile oil it contains; when kept it becomes thicker by resinification of the volatile oil and the specific gravity increases. Volatile oil and resin are the chief constituents of the drug, the proportion of the former varying from 20 to 80 per cent., though it is usually between 40 and 60 per cent., and should not be less than 40 per cent. for medicinal purposes. The oil should rotate the plane of a ray of polarised light from 28° to 34° to the left; it should not boil under 250° C., and its specific gravity should be from 0.900 to 0.910. Pure copaiba is entirely soluble in absolute alcohol, ether, benzene, carbon bisulphide, fixed and volatile oils; also in two parts of glacial acetic acid, and four of petroleum spirit, only a filmy deposit being yielded by the latter solution on standing.

TESTS.—Copaiba, when heated until all volatile oil is removed and then cooled, yields a hard residue which is easily reduced to powder, thus indicating absence of castor oil and other fixed oils. No odour of turpentine should be given off by the oil volatilised during the operation. The presence of turpentine (b. p. about 160° C.) also lowers the boiling point of the oil. The absence of African copaiba is indicated by the oil rotating a ray of polarised light to the left; the oil from African copaiba causes the ray to deviate to the right. If gurjun oil or "balsam" be present, a transient violet colour will be produced on dissolving two drops of the impure copaiba in 20 parts of carbon bisulphide, and adding 1 drop of a cooled mixture of equal parts of nitric and sulphuric acids, but a similar coloration is stated to have occasionally been yielded by genuine copaiba. Another test for the presence of gurjun oil is the reddish or purple colour produced on carefully adding 4 drops of the impure copaiba to a mixture of 0.5 oz. of glacial acetic acid and 4 drops of nitric acid. If a hydrocarbon oil be present as an adulterant, it will form a separate layer at the bottom of a test tube on warming therein 1 C.c. of copaiba with 4 C.c. of 95 per cent. alcohol.

NOTES.—The distinctive characters of copaiba are its odour, unpleasant taste, and its solubility in absolute alcohol and in petroleum spirit. Genuine copaiba is extremely rare. The hard, brittle, amorphous mass left after removal of the volatile oil is a mixture of acid resins—copaivic, oxycopaivic, and metacopaivic acids. A bitter principle also present in small quantity in the oleo-resin can be removed by boiling the drug with water. Though frequently termed a "balsam," copaiba cannot properly be so regarded, inasmuch as it contains neither cinnamic nor benzoic acid. Neither does gurjun "balsam," or wood oil—an oleo-resin obtained from *Dipterocarpus turbinatus*, Gaertner (N.O. Dipterocarpaceæ), which has been used to adulterate copaiba. It somewhat resembles copaiba in odour and taste, but is usually of a dark-red colour and fluorescent.

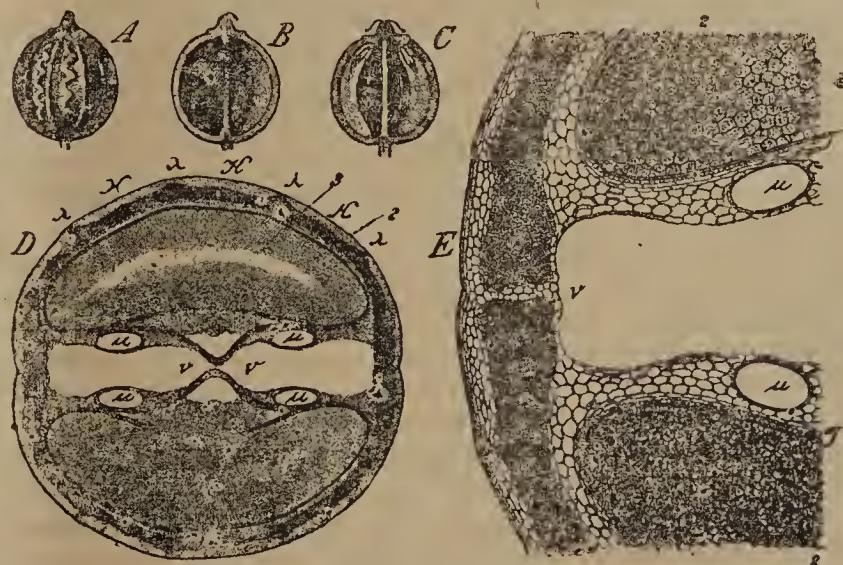

Coriandri Fructus.

CORIANDER FRUIT is the product of *Coriandrum sativum*, Linn. (N.O. Umbelliferae), an erect herbaceous annual which has been naturalised throughout temperate Europe and is cultivated in Russia, Thuringia, Northern Africa, Malta, and India. The fruit, which is collected when ripe and dried, possesses stimulant, aromatic, and carminative properties; it is used in the preparation of Confectio Sennæ, Oleum Coriandri, Syrupus Rhei, Tinctura Rhei Composita, and Tinctura Sennæ Composita; also, indirectly, of Syrupus Sennæ.

CORIANDER FRUIT.—A, English; B, Indian, both natural size; C, English fruit (cremocarp), slightly magnified; D, ditto, commissural surface of mericarp.

CHARACTERS.—Coriander Fruit is a cremocarp which is nearly globular in shape, the two mericarps of which it consists being firmly united by their margins and enclosing between them a small cavity. The fruit is about 5 Mm. in diameter, brownish-yellow in

CORIANDER FRUIT.—A, Whole fruit (cremocarp); B, commissural surface of a mericarp, showing the vittæ as dark lines; C, Longitudinal section through cremocarp, showing the endosperm and embryo; D, Transverse section, and E, part of ditto, showing vittæ u. A, B, and C magnified 3 diameters; D, magnified 14 diameters; E, much enlarged. (After Berg.)

colour, and quite glabrous. The two mericarps—each of which bears five inconspicuous wavy primary ridges, containing fibro-vascular bundles and alternating with four more prominent straight second-

dary ridges—are crowned by the remains of the calyx teeth and styles. A transverse section exhibits two vittæ on the commissural or inner surface of each mericarp, and both transverse and radial sections show a curved endosperm. The agreeable taste and the aromatic odour, which is more marked when the fruit is bruised, are due to the volatile oil present.

NOTES.—The distinctive characters of coriander fruit are the nearly globular shape, firmly united mericarps, wavy primary and straight secondary ridges, and two vittæ on each commissural surface. Indian coriander fruit is ovoid instead of globular in shape. Unripe coriander fruit and oil distilled therefrom have a disagreeable fetid odour; that disappears from the fruit as it ripens, and from the oil on keeping. The ripe fruit yields about 1 per cent. of volatile oil, which contains about 90 per cent. of coriandrol.

Creosotum.

CREOSOTE is a mixture of guaiacol, creosol, and other phenols, obtained during the distillation of wood tar. Guaiacol predominates in some specimens and creosol in others, beechwood creosote containing most guaiacol. Rhenish beech tar creosote is stated to contain guaiacol, creosol, phlorol, phenol and cresols. The drug possesses disinfectant and antiseptic properties; it is used in the preparation of *Mistura Creosoti* and *Unguentum Creosoti*. The dose of creosote is 1 to 5 minims.

CHARACTERS.—Creosote is a colourless or yellowish liquid which is highly refractive, has a strong empyreumatic odour and acrid taste, and is neutral or only faintly acid to litmus. It dissolves in about 150 parts of water at ordinary temperatures, but is more soluble in hot water, and freely soluble in 90 per cent. alcohol, ether, chloroform, glycerin, or glacial acetic acid. It rotates the plane of a ray of polarised light to the left, its specific gravity should not be below 1.079, and it distils between 200° and 220° C. Compare these characters with those of *Acidum Carbolicum*.

TESTS.—Creosote yields a green coloration, rapidly changing to reddish-brown, when a drop of test-solution of ferric chloride is added to a 1 per cent. solution in 90 per cent. alcohol, or a 0.5 per cent. solution in water. Phenol gives a deep purple colour with ferric chloride, and does not affect a ray of polarised light. Other distinctions from phenol are that creosote is practically insoluble in solution of ammonia or in diluted glycerin (3 volumes to 1 of water), and can be mixed with an equal bulk of collodion without causing it to gelatinise. Less volatile liquids than creosote leave a translucent stain when the liquid is dropped on white filter paper and exposed to a temperature of 100° C.

NOTES.—The distinctive characters of creosote are its odour, solubility, reaction with ferric chloride, and action on polarised light. Beechwood creosote dissolves in about 110 parts of water, and mixes in all proportions with absolute alcohol, 90 per cent. alcohol, ether, glacial acetic acid, chloroform, benzene, or petroleum spirit; it also mixes freely with glycerin up to 3 parts of the latter, but a further addition of glycerin renders the mixture turbid. Guaiacol is soluble in 80 parts of water, and mixes with glycerin in all proportions; creosol is soluble in 150 parts of water, but will not form a clear mixture with glycerin in any proportion. Neither pure guaiacol nor creosol has any measureable effect upon polarised light, nor have most commercial samples of genuine wood tar creosote.

Obituary.

HIRST.—On April 19, Jacob Hirst, Chemist and Druggist, Bradford. Aged 69.

HYNE.—On April 6, at 175, West End Lane, West Hampstead, Emma Rebecca, the beloved wife of Harry Hyne, Pharmaceutical Chemist, and member of the Pharmaceutical Society since 1873. Aged 45.

JAMESON.—On April 22, at Baker Street, London, W., Sophia Jameson, the dearly beloved wife of Walter Carpenter Jameson, Pharmaceutical Chemist and member of the Pharmaceutical Society since 1853. Aged 77.

JONES.—On April 10, William Henry Jones, Chemist and Druggist, Caledonian Road, London, N. Aged 50.

REYNOLDS.—On April 21, at Cliff Lodge, Leeds, Frances, widow of Richard Reynolds, the distinguished pharmacist whose decease was announced only a fortnight ago. Mrs. Reynolds was the daughter of Mr. Samuel Marshall, one of the best-known Quakers in Westmorland. She never recovered from the shock of her husband's death. The funeral took place at the Friends' Burial Ground, Adel, on Tuesday, April 24. Aged 70.

SOUTHALL.—On April 17, Horace Southall, Pharmaceutical Chemist, Walthamstow. Aged 28. Mr. Southall has been a member of the Pharmaceutical Society since 1894.

THOMPSON.—On April 18, John Thompson, Pharmaceutical Chemist, Liverpool. Aged 79. Mr. Thompson, who was the oldest chemist in business in Liverpool, was a native of Sheffield, and originally intended to enter the medical profession, to which he served five years' apprenticeship with a well-known firm of physicians and surgeons in Sedgley. In 1840, however, owing to family reasons, he went to Liverpool, and in 1843 commenced business as a chemist at 54, Stanhope Street, where he soon established a large connection, which was afterwards extended to Lodge Lane and Mossley Hill. He became a member of the Pharmaceutical Society in 1845, during the presidency of the late Peter Squire. For some time he took an active interest in local politics, and for ten years was elected a member of the Toxteth Board of Guardians, to which body he also filled the office of vice-chairman. Latterly, he gave his leisure time to local archæological research, and was an active member of the "Historic Society of Lancashire and Cheshire." He was the author of several works, including 'Liverpool in the Olden Time' and 'Paris During the Commune.'

WILKINSON.—On April 19, at Solway Mount, Colne, Lancs., Anne Elizabeth Wilkinson, *née* Horsley, the loving and devoted, wife of Wm. Wilkinson, M.P.S. Interred in the Colne cemetery, April 23. Aged 62.

LETTERS, NEWSPAPERS, QUERIES, and OTHER COMMUNICATIONS have been received from Messrs. Bower, Brunt, Butler, Collins, Dallow, Eberlin, Ferrall, Gifford, Gilderdale, Goldsmith, Griffin, Hill, Lancaster, Lawson, Lewis, Ling, Lucas, Marshall, Mereer, Munoukurn, Philp, Price, Reynolds, Robinson, Runciman, mith, Thompson, Wardleworth, Warneford, Whineray, Zossenheim.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

FORMATION OF VANILLIN.

Behrens has already pointed out that vanillin is developed in the leaves of the vanilla plant by a ferment or by mineral acids, showing that it exists in combination with a glucosidal body. Busse has now proved that a similar combination exists in the fruit. He obtained from the Botanical Gardens at Berlin an unripe vanilla pod weighing 28 Gm. This, when comminuted, gave a faint vegetable odour, but no odour of vanillin. It was extracted with alcohol, 80 per cent., at normal temperature. The extract was treated with lead acetate, and excess of lead removed by H_2S , and the alcohol removed from the filtrate by heat at $60^\circ C$. A portion of this aqueous fluid was gently heated with 2.5 per cent. sulphuric acid, another equal portion with hydrochloric acid, and a third portion a few grains of emulsin and warmed to $37^\circ C$.; in all three cases the odour of vanillin was very strong, but accompanied by a mercaptan-like odour from the treatment with sulphuretted hydrogen. The product was purified by dissolving in ether, and washing the solution with water; on evaporation of the ether a pure vanilla odour was obtained. The melting point of the vanillin was not determined.—*Schweiz. Woch.*, **38**, 105.

ABSORPTION OF IODIDES BY THE SKIN.

An interesting series of experiments, conducted on his own person by F. Gallard, shows that the human epidermis is permeated by sodium iodide, only slightly at first, but increasing progressively until a notable quantity is absorbed, as shown by the amount of iodine eliminated by the kidneys; further, that this elimination does not take place rapidly, so that, by this means, a cumulative dose of iodine may be absorbed. The experiments were conducted by daily immersing the arms and forearms for thirty minutes in a bath containing a 5 per cent. solution of sodium iodide at $36^\circ C$. This was repeated daily for twenty days, the amount of iodine eliminated in the urine being daily determined. After the first, second, and third immersion the output of iodine amounted to 0.066 Mgm., after the fifth to 0.167 Mgm., after the ninth to 1.900 Mgm., and after the last, to no less than 3.863 Mgm. As showing the slowness with which the iodine is excreted, 1.98 Mgm. was eliminated between the thirty-sixth and forty-seventh hour after the last immersion, and 0.333 Mgm. from that time up to the seventy-second hour. A control experiment to demonstrate the amount of iodine which might be attributed to inhalation through the respiratory organs was then conducted. The experimenter inhaled the air, breathing naturally, over the same bath, but without immersing the arms. Although a faint trace of iodine was thus found to be absorbed it was very minute, the amount excreted not exceeding 0.166 Mgm. after the twentieth day. These results have considerable therapeutical significance.—*Compt. rend.*, **130**, 858.

ANIODOL.

Under this name a solution of formolic and allylic derivatives has been introduced, which is stated to be a powerful bactericide. Its germicidal power is said to be between 1:4000 and 1:5000, and, for some bacteria, as little as 1:6000 is fatal. For sterilising instruments a 1:2000 solution is recommended, in which strength aniodol is stated to be without action on the hands of the operator. For injections and dressings a 1:5000 solution is sufficient; a more, concentrated form should not be used, since, in larger doses, it has a tendency to destroy the repairing elements of wounds and thus hinder healing.—*Bull. Com.*, **28**, 132.

VOL. 64. FOURTH SERIES, VOL. 10.). No. 1558.

QUARTZ THERMOMETERS.

Taking advantage of the fusibility of quartz, that substance having been shown by Boys to assume a plastic state in the flame of the oxyhydrogen blow-pipe before melting, A. Dufour has constructed a thermometer for high temperatures which has a quartz bulb and stem. Tin is used for the liquid, since it is readily obtained in a pure condition, has a relatively low melting-point, and is not appreciably volatile below a red heat. The thermometer is filled with molten tin by aspiration. After obtaining as perfect a vacuum as possible in the stem, it is sealed in the oxyhydrogen blow-pipe. The last few bubbles of air are got rid of by melting the tin and giving the thermometer repeated shocks. If the tin forms a trace of oxide this collects in the bulb and remains there. The meniscus in the stem is always very bright, resembling that of a mercury thermometer. The bulb must be thick, otherwise the tin, in contracting, will fracture it. The author suggests that tubes of quartz are likely to prove valuable for spectroscopic work, obviating the difficulty of obtaining a pure spectrum, which is not possible under certain conditions, when glass tubes are employed. Commenting on this note, Armand Gautier states that in 1869 he succeeded in making small tubes of quartz, employed as air thermometers, and as coils for causing gaseous mixtures to circulate in unalterable capillary tubes, in the course of his researches on the influence of temperature on the combination of gases. The apparatus constructed thus of quartz was shown by him at the Universal Exhibition of 1878.—*Comp. rend.*, **130**, 775 and 816.

ACETYLENE TETRABROMIDE.

This colourless fluid, $C_2H_2Br_4$, does not crystallise on cooling to $-20^\circ C$., and boils at $137^\circ C$. The sp.g. is 3.0011; it is insoluble in water, but soluble in ether in all proportions. In consequence of its high gravity this body is a very useful separating liquid for mineral mixtures. Dissolved in ether it is employed to separate the woody parts and starch granules of plants, and possesses the advantage that it does not cause the parts to swell.—*Merck's Report*, 1900, 16.

CASSARIPE.

This name is applied to the inspissated juice of the root of *Manihot utilissima*, the bitter cassava. This root yields in the fresh condition, besides arrowroot and tapioca sago, a poisonous juice, the toxicity of which is due to the active principle, manihotoxin which, according to Peckoldt, is destroyed on heating or by fermentation. Cassaripe is non-toxic, but is an antiseptic, and is largely employed by the Brazilians as a meat preservative. According to Risley, cassaripe is useful in the treatment of diseases of the eye. A ten per cent. ointment quickly curing ophthalmia, corneal ulcers, and other similar affections. The ointment should be applied two or three times daily. Its application gives rise to no irritation.—*Merck's Report*, 1900, 47.

KOSAM SEEDS.

Heckel and Schlagdenhauffen describe the seeds of *Brucea sumatrana*, a Simaroubaceous plant, indigenous in the hot regions of China, and in India, as being contained in a greyish egg-shaped drupe. Recently Physalis and Bertrand have isolated a glucoside, kosamin, the first-named authors having previously recorded the presence of fixed oil, gum, quassin, saponin, and sugar in the fruits. Moungal has given the seeds with success in cases of metrorrhagia, dysentery, and intractable diarrhoea. The decorticated crushed seed is employed, the paste obtained being made into pills. Five seeds are given to children for the first day, six seeds for the three succeeding days. For adults the dose is ten seeds for the initial day, and twelve for succeeding days. From their marked hæmostatic properties, it is possible that these seeds may prove useful in the treatment of catamenial disorders.—*Bull. Com.*, **28**, 131.

POTASSIUM FERRATE.

BY F. H. ALCOCK.

Text-books available do not give much useful information concerning the above substance. They state that the valency of iron is variable, with which most students are familiar, but when it comes to the statement that the iron atom also exerts sexivalent activity, its proof is considered demonstrated by a reference to the ferrates. Some authorities go a step further, and something like this appears: "*It is said* that this substance may be made by," or, again, "This substance *may* be produced," and one wonders whether it really has been produced by the plan suggested. Dr. Attfield recommends a different process. Thus, he says: "Obtained on warming in a test-tube a mixture of a few fragments of solid potassium hydroxide and ferric chloride with a few drops of bromine." All this is not enough for the student, for he has a curious and variable idea of the word "fragment," and asks if the ferric chloride required is the solid or liquid (ordinary laboratory test solution), and the "few drops" is another stumbling block; so, too, the "warming." Indeed, the demonstrator himself often fails in successfully accomplishing the reaction from the instruction to the satisfaction of the student. He will try—on the assumption that a big quantity is likely to make the effect more marked and successful—melting a piece of the hydroxide about an inch long in a test-tube, which he has not been careful to dry, or, if quite dry, then in this form the moisture which it held mechanically is given off and fractures tubes without number, and eventually he tries a porcelain crucible, then platinum, then silver, gold, and, finally, wrought iron, and in each case a non-successful result is obtained.

Now all this trouble could be obviated if the books would supply students with more manipulative pabulum, and this is now supplied. Thus, weigh 5 Gm. of potassium hydroxide, powder it, and add thereto 0.10 Gm. solid ferric chloride (made by evaporation of about 1 cubic centimetre of liquor ferri perchloridi fortior, which will supply sufficient for many trials), mix well in the wedgwood mortar, when a peculiar salmon pink colour appears (quite different to the ferric oxide tint). As trituration proceeds, the mass absorbs water from the air and becomes damp. Now add, from a burette charged with bromine and contained in a fume chamber or in a good draught, a sufficient quantity (slowly, because of the great heat which is generated and evolved with a hissing sound) of this element to form a creamy consistence (2 to 3 cubic centimetres); then continue the mixing until all the surplus bromine has volatilised. Then dissolve the peculiarly tinted mass (not unlike amorphous phosphorus) in cold distilled water, when the beautifully coloured solution makes its appearance, and may be clarified by filtration through Swedish filter paper and its tinctorial power tested by allowing the liquid to drop into pure distilled water. If care be taken vortex rings form, which, as they fall, expand and finally break up with a revolving motion.

IBIT is the name given to a combination of iodine, bismuth, and tannin (bismuth oxyiodotannate), which closely resembles airol. C. Brunner and C. Meyer describe it as a greenish-grey, tasteless, odourless, and very light powder, which may be easily applied by means of a powder bellows. The colour is not affected by light, except that direct sunlight develops a brownish tint. Ibit is gradually decomposed by contact with water, moist air, or animal matter, forming a faint iodine-brown coloured body. It is insoluble in the usual solvents, forms a stable ointment with fats or vaseline, and a good emulsion with glycerin and water. Iodine is liberated on oxidation as well as by the action of concentrated acids. Ibit has a faint acid reaction and dissolves in diluted acid or caustic soda solution.—*Pharm. Centralh.*, 41, 66, after *Pharm. Post.*

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

Incoherence Run Riot.

During the many years I have been engaged in the practice of pharmacy, I have read nothing which inspired me with a more profound sense of pity than an editorial attempt in a trade journal, last week, to supply an omission, that omission being the selection of three of the old candidates for seats on the Pharmaceutical Council to add to the Glyn-Jones quartette and so complete the tale of those to be supported by the caucus. But the incoherence permeating the article in question is almost on a par with that which has characterised so many of Mr. Gifford's utterances, though Blackburn incoherence is almost necessarily a thing apart. Beginning with the statement that there is no precedent for such behaviour as that of Mr. Glyn-Jones, the writer of the article next twits that gentleman with his lack of any but provincial authority when he speaks. The authority he possesses, we are told, is derived from "frequent visits to and personal association with the people in the provinces who have opinions, and those people are not, it is easy to understand, in direct touch or even in correspondence with the central authority." The meaning of the words quoted is far from clear, but they appear to imply that Mr. Glyn-Jones is authorised by people in the provinces "who have opinions" to adopt a certain line in dealing with the affairs of a Society of which those people are not members. Policy formulated in that way is undoubtedly inimical to unanimity, and advocacy of such a policy must necessarily be fatal even to Mr. Glyn-Jones' influence on the Council. I doubt, however, whether Mr. Glyn-Jones is quite so foolish a person as the incoherent statement published by the editor of the journal in question would make it appear.

Change for the Sake of Change.

Though it is not clear to me whether the writer of the article quoted approves or disapproves of what it assumes Mr. Glyn-Jones' attitude to be, he is certainly blamed in that incoherent production for contenting himself with the recommendation of four candidates only, though the caucus nominees are spoken of as "a good quartette" with only one "weak-kneed" member. To supply the omission already referred to, what are described as "records" of retiring councillors have been compiled and, as I suggested would be the case (see *ante*, p. 420), Messrs. Hills, Storrar, and Symes are selected to convert the quartette into a septette. The so-called records make those four gentlemen appear models of what councillors should be, whilst Messrs. Bateson, Cross, Grose, and Warren are journalistically damned. Accordingly we are faced with the fact that the caucus organ recommends the members of the Pharmaceutical Society to vote for Messrs. Cooper, Gibbons, Hills, Storrar, Symes, Taylor, and Wootton, at the election for which voting papers are now being issued. The only reason urged for supporting the Glyn-Jones quartette is that the four have never been on the Council before, but that reason is not to be allowed to operate against the three stalwarts who are assumed by the caucus organ to have done most talking during their term of office. For whilst it is admitted to be sad that activity should be reckoned by speeches, experience is held to show that men who are silent when affairs are going through a crisis ought to be replaced by talkers. I fail to see the force of that argument and would suggest that the "experience" referred to cannot be worth much when it leads a writer to urge that men who possess a record for much talking should be appointed to do the serious work of the Pharmaceutical Society, in preference to others whose speech-making propensity is less pronounced. The views of candidates with regard to Clause 2 of the Companies Bill are, apparently, not taken into consideration, for the four new members whose candidature is to be supported are as

equally divided on the subject as are the four old ones who are to be opposed by the trade journal-cum-Glyn-Jones caucus. In fact, so far as I can see, we are asked to approve of unjustifiable interference in the conduct of our affairs with no other object than that of effecting change for the sake of change. But we have to reckon with the fact that the remarkable, and probably assumed, incoherence of the writer of the article I have commented upon may persuade a few voters who have no opinions that support of such change is both politic and statesmanlike.

Botany or Word-Puzzles?

The Council Prizes Examination is generally understood to be much more advanced in scope than the Major examination, but the first question in the botany paper published in last week's *P. J.*, appears to have called for the possession of linguistic knowledge which it is scarcely reasonable to expect candidates to possess. Thus the word "ecological" is not given in Murray's 'New English Dictionary,' but I find it appears in 'Webster's International Dictionary' and in the 'Century Dictionary,' in the form "œcological," i.e., "of or pertaining to œcology." The definition of "œcology" given by Webster is: "The various relations of animals and plants to one another and to the outer world." The 'Century' gives the following definition:—"œcology (Gr. οἶκος, a house, family, and -λογία). In *biol.*, the science of animal and vegetable economy; the study of the phenomena of the life-history of organisms, in their individual and reciprocal relations; the doctrine of the laws of animal and vegetable activities, as manifested in their modes of life. Thus, parasitism, socialism, and nest-building are prominent in the scope of œcology." Further, it may be noted that, in reviewing a recent American work on botany in *Nature*, Professor J. B. Farmer referred to "ecology, as it is now the fashion to designate what used to be called natural history." In that sense the word is in frequent use by American writers on botanical subjects, but as yet it is quite unfamiliar in its Americanised form in this country. No reasonable objection can be taken to the change in the initial vowel, which is convenient and simply accords with what has taken place in the case of the word "economy," but I hold that the introduction of newly coined or practically unknown words into science examination papers is distinctly unfair. A second strange word which appears in the same question in the botany paper is "perennate" which obviously means "to live perennially," though the term is very uncommon. In certain "Suggestions for those studying the life-histories of British Flowering Plants," by Professor Bayley Balfour, published in *Nature* twelve years ago, reference was made to the "perennating" parts of plants, and the term "perennation" was also used, as implying the perennial continuance of life. So far as I have been able to ascertain, however, no one but Professor Balfour has ever used the term "perennate" or any of its derivatives. It would be interesting to know whether any candidate who sat for the Council Prizes Examination made an attempt to answer the question in which the term appears.

The Milligrade Thermometer Scale.

The individual who was stated in last week's *P. J.* to have devised a thermometer in which mercury freezes at zero and boils at one thousand degrees, was anticipated by an English pharmacist exactly twenty-five years ago, the late John Williams, who was then the Pharmaceutical Society's Treasurer, having brought up the self-same idea at a meeting of the Chemical Society on May 6, 1875. In his paper he pointed out the several defects of the thermometer scales in common use, and described a scale based upon the physical characters of mercury, with one thousand degrees between the solidifying and boiling points of that metal. The melting point of ice on the Williams' milligrade scale was 100° and the boiling point of water 350°; fractions of degrees were avoided, since the degrees were so much smaller than usual;

minus degrees were abolished, while the indication of temperatures below the freezing point of water was sufficiently distinct, all numbers below 100° M. being between 0° and -40° C. It will be seen, therefore, that the whole ground of Mr. Betts' communication to the *Scientific American* was covered by Mr. Williams, and the supposed novelty is a quarter of a century old. Apparently, however, the advantages claimed for the milligrade scale were insufficient to secure its substitution for those in common use. But that is not surprising when we consider that the Fahrenheit scale still maintains its position, as against the much more rationally conceived scale of Celsius.

In Darkest Exeter.

I suppose Mr. Gifford will think that the members of the Exeter Association of Chemists and Druggists did not realise the importance of the issue raised by the question which they were called upon to consider last week. It is curious to reflect, however, that a subject which has been troubling the minds of pharmacists throughout the rest of Great Britain for many months past should affect the men of Exeter so slightly. The subject was introduced at the meeting by the somewhat belated consideration of a letter received from the Federation of Local Pharmaceutical Associations, and the chairman opened the ball by suggesting that the matter should be left in the hands of the Pharmaceutical Society—a suggestion which would have been more practical had he proposed that the action already decided upon by the Council of the Society should be approved. But, so far as those present at the Exeter meeting appeared to be aware, the Council might have done nothing whatever in the matter. Still I marvel most at the unanimity with which the leading pharmacists of Exeter seem to think that the company pharmacy problem is of but little, if any, concern to them. One "did not feel strongly about the matter," another "had not much interest in the subject," and the only explanation of such a curiously apathetic state of affairs is, apparently, the existence in Exeter of a strong disinclination to have the so-called "Widow's Clause" interfered with. Fortunately, one member of the Association was equal to the occasion, and I am glad to find that his persistence induced the Chairman to consent to put the subject down for discussion at a later date. Let us hope that, by the time the next meeting is held, the pharmacists of Exeter may have realised that the company pharmacy problem really requires solution, and that it is not too much to expect them to take their fair share in the labour of solving it.

Bradford's Choice.

I do not suppose the energetic Local Secretary for Bradford cares much for my approval, but I cannot refrain from giving expression to a lively sense of satisfaction that all our provincial talent is not restricted to Lancashire. Mr. Waddington's statement was clear, intelligible, and distinguished by loyalty to the Society of which he is far from being the least important member. I grant that it revealed strong prejudice, but, inasmuch as that is directed against outside interference in the Pharmaceutical Society's affairs, the failing is one to be encouraged. The "extraordinary difference" between the views expressed in past editorials of the trade journal referred to, and those embodied in the election address issued by the former editor of that journal—the only candidate who has called forth expression of uncompromising disapproval—could not fail to excite the interest of so keen an observer as Mr. Waddington, and it does not surprise me that the candidate in question has failed to satisfy the pharmacists of Bradford and district that he is able to represent their views. The seven candidates selected by those present at the Bradford meeting may not commend themselves as a whole to other districts, but it cannot be denied that the choice was made as the result of very careful consideration and that satisfactory reasons were advanced by Mr. Waddington for including each name in his list. It will be noted that Bradford accepts the whole of the four Lancashire

candidates and is not afraid to be represented by eight London men. If the Bradford seven should be elected, London and Lancashire will share between them thirteen out of the twenty-one seats, a fact which will not fit in with any scheme of territorial representation. But that is a matter of no consequence whatever so long as men of the right type are elected.

What Can Be Done.

I have been asked by Mr. Gifford's election committee to vote for him at the forthcoming Council election, a copy of an address signed by him being enclosed as evidence of the soundness of his views on the question of "company pharmacy." The address, unfortunately, is difficult to follow, such vague and unskillfully-selected language being employed; but Mr. Gifford appears to demand "a straight issue" which shall embody the doctrine of "no compromise." I wish he had explained how the Pharmacy Act of 1868 instituted a profession "on a sound footing" and why, that being the case, the Act is "quite inadequate in the privileges it gave to a profession of pharmacy." The second statement, taken by itself, is undoubtedly correct, but the first is not consistent with it and, in my opinion, is incorrect. I agree with Mr. Gifford that we should refuse our consent to any attempt at compromise, if our professional position is likely thereby to be imperilled and injured for all time, but I am unable to assent to his proposition that the Council of the Pharmaceutical Society can assure the future of pharmacy by bringing "strong influence" to bear upon the Lord Chancellor. No influence that the Council can exert is likely to enable the Lord Chancellor "to make effective his repeated assertion 'that company practice and personal qualification do not cohere,'" for his Lordship has long since realised the hopeless nature of the task he set himself at the bidding of Irish pharmacists and has dropped the subject. Whilst, therefore, I agree with Mr. Gifford respecting the desirability of having clear issues and practical unanimity, and of recognising that the company pharmacy problem is not a trade question, I am convinced that he is utterly mistaken in his assumption that anything the Council can do will secure what he wants. Nevertheless, let us by all means agree to pursue an active aggressive policy and educate members of Parliament and others, as Mr. Gifford suggests. It is beyond question that we have not yet exhausted the possibilities of the situation—in fact, we have scarcely sampled them—and if Mr. Gifford should be so fortunate as to secure a seat upon the Council I hope he will do all he can to secure the systematic education of pharmacists, legislators and the general public, with regard to the all-important question of the professional nature of the practice of pharmacy.

Why Not Wait and Work?

What our former perennial president said at Bristol was not new, but it was very much to the point and especially interesting as a concise exposition of his views on the company trading question. Mr. Carteighe trusts to time to remedy what legislation appears unable to touch, and I am inclined to think with him that ten years hence we may find things considerably changed for the better. The only alternative to out-and-out opposition to Clause 2 of the Companies Bill appears to be compromise of some kind, but if we can only get the use of our titles restricted to duly qualified individuals, it seems the wiser course on the whole to decline to accept any compromise. The thing to aim at is the development of the professional idea in pharmacy, so that in days to come no pharmacist will stoop to hire himself out as the servant of unqualified persons. The abolition of the inadequate preliminary examination, the changes in the qualifying examination, and the increasing necessity of a definite course of technical training and study, will all tend to make registered men hesitate before lending their qualification to those whose only object is to evade the operation of the Pharmacy Acts and make money by so doing. Ten years hence, I venture to say, such a

tendency will be very marked; it should then cost so much to tempt a pharmacist to betray his profession that but few associations of unqualified persons ought to be in a position to afford the luxury of carrying on the business of a chemist and druggist. It is only by the aid of the most varied side-lines that such companies running drug stores can make ends meet and earn profits to-day; ten years hence that difficulty will, almost certainly, be much greater. If, therefore, we cannot get what we want at present, let us, at least, refuse to entertain the notion of compromise, and wait for time's revenge, working steadily meanwhile in the direction of improving our professional position.

PHARMACEUTICAL SOCIETY.

MEETING OF THE COUNCIL.

WEDNESDAY, MAY 2, 1900.

Present:—

Mr. G. T. W. NEWSHOLME, Vice-President.

Messrs. Allen, Atkins, Bateson, Carteighe, Corder, Cross, Glyn-Jones, Grose, Harrington, Harrison, Hills, Johnson, Park, Savory, Southall, Storrar, Warren, and Young.

The minutes of the last meeting were read and confirmed.

Deaths of Honorary Members.

The VICE-PRESIDENT, who occupied the chair, said this was the first time during his three years' term of office that he had been called upon to take that position, and he regretted it all the more because of the reason, which was, as they knew, that the President had not been in very good health during the past few months. Under the orders of his physician, Mr. Martindale had been ordered to take a long voyage, and would probably be away for about a couple of months. He was quite sure that he was only expressing the opinion of everyone in saying that he hoped soon to see him back again thoroughly restored to health. Since the Council last met, the Society had suffered many losses by death, and he must first ask the Council to authorise him to write a letter of condolence to the family of the late Sir Douglas Maclagan, who was for many years the visitor appointed by the Privy Council to attend the examinations conducted in Edinburgh under the Pharmacy Act. He resigned the position in 1897 owing to failing health. Sir Douglas was the *doyen* of the Society's honorary members, having been elected as far back as 1852, and he had always exhibited a keen interest in the scientific and educational work of the Society. In the early days he not only read papers at the evening meetings, but frequently placed at the disposal of the *Pharmaceutical Journal* the results of his chemical and pharmacological investigations. He died on April 5, aged eighty-seven. Intimation had also been received of the death of Dr. Gustave Planchon, Director of the High School of Pharmacy of Paris, another honorary member whose loss they deplored. He died on Good Friday, aged sixty-six. The work of Dr. Planchon in materia medica and in the natural history of drugs was too well known to require recapitulation, and the fact of the Hanbury Gold Medal having been adjudicated to him in 1889 was in itself an indication of the estimation in which his classic contributions to pharmacognosy were held in this country. Some members of Council would remember the doctor coming to receive the Hanbury Medal, and would recall the charm and grace with which he acknowledged the honour paid him. As one of the delegates of the Society to the forthcoming International Congress of Pharmacy, of which Congress Dr. Planchon had been elected President, it was particularly fitting that he (the Vice-President) should be the medium for the conveyance of an expression of sympathy to the family of the deceased.

The propositions were unanimously agreed to.

The late Richard Reynolds.

The VICE-PRESIDENT next referred to the death of the late Richard Reynolds, who in his time played many parts on the pharmaceutical stage, always to noble purpose, and for the advancement of praiseworthy projects. He died on April 5, aged seventy, and those who were his personal friends, as well as those who knew him only by reputation, would equally regret the removal by death of so zealous and high-minded a worker. Probably, said Mr. Newsholme, the essential points of his career had already been made known to the Council through the medium of the pharmaceutical Press, and he need only recall him as a former member of the Council for ten years, a member of the Board of Examiners in the pre-Pharmacy Act days, and a local Secretary of the Society for very many years. He would just add that if anyone desired to obtain an idea of the versatility and zeal of Richard Reynolds they could not do better than consult the indexes to the *Pharmaceutical Journal*. He might add that, as a Yorkshireman and a neighbour of Mr. Reynolds, he knew something of the work that he had done in Leeds. As most of the members knew, Mr. Reynolds was one of the leading men of Leeds, and he did great work in connection with the Yorkshire College. He did an immense work in the foundation of that College, which must not only be of lasting benefit to Leeds, but to the country at large, because it was by the establishment of such Colleges that the country would progress. He (the Vice-President) had frequently consulted Mr. Reynolds when first he came on the Council, and had always found him exceedingly kind. Mr. Reynolds used to say that his day had gone by, and that the younger generation knew best; but the Council would all know how to estimate the value of the services which Mr. Reynolds had rendered to pharmacy. He wished also to refer to the sad fact that Mrs. Reynolds only survived her husband a few days. He begged to move the following resolution:—

“That this Council desires to record its high appreciation of the character and services of the late Mr. Richard Reynolds, of Leeds, who, as an examiner, as a member of the Council, and as a local secretary, did much good work for pharmacy and for the Pharmaceutical Society during a distinguished pharmaceutical career of nearly fifty years. The Council deeply regrets his death and tenders its sincere sympathy with his family.”

Mr. CARTEIGHE, in seconding the resolution, said he had had the privilege of the friendship of Mr. Reynolds for about forty years. Mr. Reynolds was one of a band of three who were nick-named “R. R.,” “H. B. B.,” and “M. C.” He (Mr. Carteighe) knew Mr. Reynolds in every phase of his domestic life, and as a fighter in pharmaceutical life. The attractive feature of Mr. Reynolds’ career was his zeal for education, not only in connection with pharmacy, but generally. By his life he showed how respected a pharmacist could become in a place like Leeds if he showed that he was something more than a shopkeeper, and had broad views and was high minded. He was not in strong health, and, like many other men in that condition, he liked to be in the company of those who had exuberant spirits. In addition to his purely pharmaceutical career one ought to remember, as had been mentioned by the Vice-President, that he was one of the chief founders of the Yorkshire College, that previous to the foundation of that college he was the principal lecturer on chemistry in Leeds, where there was then a school of medicine, and that throughout his life he took a keen interest in everything that was scientific. He abhorred the notion that there was any bit of science that was pharmaceutical which was not only general. He was also a distinguished member of the Society of Friends. The relationship between Mr. Reynolds and his former partner, Mr. Harvey, were probably not known to the present generation; therefore, he would refer to the fact that Mr. Harvey having inherited a small fortune, Mr. Reynolds in due course became the proprietor of the business. Mr. Brady, also a Quaker, who afterwards

became a distinguished Fellow of the Royal Society, was an apprentice to Harvey and Reynolds. Lastly, they had another generation in which they had the firm of Reynolds and Branson, of which Mr. Reynolds’ son was the managing director conjointly with Mr. Branson, whose career, as they knew, had been a highly distinguished one, and whose knowledge and power would be felt in Leeds. It was a matter of personal regret to him (Mr. Carteighe) that owing to the suddenness of Mr. Reynolds’ death he had not received information of it in time to pay his respects to the family.

Mr. ATKINS said he had known Mr. Reynolds many years, and had been much struck by his many-sidedness. He was a generous philanthropist, a thoroughly kind-hearted man, a good pharmacist, and was deeply interested in all scientific work. Some time ago he had a very pleasant testimony to his generosity which he should like to mention. A gentleman whose name was well known to many present told him that he owed everything practically in life to Richard Reynolds. He said his environment in early life was unpromising, and his apprenticeship not a very brilliant success; the first word of encouragement he had as a lad, the offer of apparatus and books, and a small sum of money, came from Richard Reynolds, and he felt that he had been his greatest benefactor in life. Last week he had a letter from an intimate friend of Mr. Reynolds, from which he would quote one sentence, “Men knew they could trust him, and they did.” The Vice-President had referred to the death of Mrs. Reynolds, and many would remember the kind and generous hospitality shown them when the Conference met in Leeds, and on other occasions he had seen the beauty of their home life. Mr. Reynolds was happy in having a wife who took a deep interest in all his best work, and one felt that as in their lives they were united, so in their deaths they were not long divided.

Mr. CORDER said other gentlemen had spoken of Mr. Reynolds as a man, but he could speak of him as a boy. In the early forties they shared the same desk in a school at Colchester, and did their Latin and sums together. After fifty years’ friendship he could say that Reynolds was as a man what he was as a boy—honest, straightforward, and true.

Mr. BATESON said he should like to bear his meed of respect and esteem for the memory of Mr. Reynolds. It was entirely owing to Mr. Reynolds that he obtained a seat on the Council. He had known him all through his public life, in connection with the Yorkshire College, and so on; and also Mrs. Reynolds, who came from his own county, and whom he knew before she was married. It might well be said that Mr. and Mrs. Reynolds were “lovely and pleasant in their lives, and in their deaths they were not divided.”

The resolution was then put and carried unanimously.

The late Augustus Bird.

The VICE-PRESIDENT then referred to the death of the late Augustus Bird, of Shepherd’s Bush, who died on April 13, aged seventy-three. He was an old student of the Society’s School and a prizeman in chemistry and pharmacy. He was for twenty years a member of the Board of Examiners for England and Wales, and though for at least thirty-five years before his death he had practically retired from pharmacy, he maintained to the last the liveliest interest in and the profoundest loyalty for the Society. For many years he had been a liberal supporter to the Benevolent Fund. Mr. Newsholme added that he heard on good authority that, though Mr. Bird was well-known for his liberality, that liberality was also shown in many ways which were not generally known. He would move:—

“That the respectful sympathy of the Council be tendered to the family of the late Mr. Augustus Bird, a former member of the Board of Examiners for twenty years, and a loyal supporter of the Society and of the Benevolent Fund.”

Mr. ATKINS having seconded the motion,

Mr. HARRINGTON said he had had the privilege of knowing Mr. Bird for some years, and now conducted the business which Mr. Bird established in 1853. He left the business some twenty years

ago or more and devoted his attention with great success to the manufacture of bricks, but he always kept a warm place in his heart for anything connected with pharmacy. About eight or nine years ago he came to see him with Mrs. Bird, and after going over the premises said the happiest years of his life were spent there, where he brought up his family. He remembered also on many occasions his saying that he had been to Bloomsbury Square, and what a pleasure it was to look in there and see his old friends, Mr. Car-teighe and others.

Mr. CARTEIGHE said he lived in the same neighbourhood as Mr. Bird, and, especially during his term of office as President, it afforded him the greatest pleasure in keeping in touch with him. Mr. Bird succeeded to a competence on the death of his father, and also to certain businesses, which were carried on on a more gigantic scale than that of an ordinary chemist and druggist. He could quite believe, as had been said, that the happiest time of Mr. Bird's life was in his early days, because he had a good business, took a deep interest in pharmacy, and, having none of the worries which some had, was able to carry it on in a satisfactory manner. The interest in Mr. Bird centred very largely in his association with the late Mr. Cracknell, whose pupil he was. Mr. Cracknell, after being at Squire's, went to Mr. Watts' in the Edgware Road, ultimately married his daughter, and became a partner in the business. His eldest son was a distinguished officer of the Western Chemists' Association, and was associated on the Committee of the forthcoming London Conference with Mr. Warren. In early days, when the Society could not afford to pay fees to its examiners, Mr. Bird, Mr. Cracknell, and some others, including himself, discharged the duties gratuitously. Mr. Bird examined in pharmacy for many years, and must have come in contact with an enormous number of candidates. He was an exceedingly conscientious man, but, like his friend Mr. Cracknell, was slightly timid of speech, and candidates often thought he was not quite as nice as he might have been; but, as he had sometimes said before, it was quite possible for examiners to be as nervous as candidates, and he was not always sure, in the case of Mr. Bird and Mr. Cracknell, whether the examiner or the candidate were the more nervous. When Mr. Bird succeeded to a large income he still retained an interest in the Society, and assisted it by liberal donations, especially the Benevolent Fund, and in a quiet, unostentatious way did much good amongst pharmacists. When he left the Board of Examiners he told him (Mr. Car-teighe) to apply to him whenever he wanted help for any case of distress. He also knew Mrs. Bird, who was a charming woman, who thoroughly delighted in her children. She predeceased her husband, much to his distress. As many knew, Mr. Bird suffered from a painful affection of the tongue, which involved the removal of about half of it some years ago, and made his speech rather peculiar; that led him to avoid general intercourse with his friends, and he saw few but his own family, who he was sure would receive this resolution with great satisfaction.

The resolution was carried unanimously.

The late John Hugill.

The VICE-PRESIDENT then said that by the death of the late Mr. John Hugill, on April 10, aged eighty-seven, the Society had lost a widely-known and respected supporter for nearly fifty years past, and one whose loss would be especially keenly felt by the many who had been assisted by his generosity and consoled by his sympathy. His appreciation of the work of the Benevolent Fund—to which he contributed both in his private capacity and as Meggeson and Co.—was manifested by a bequest of one hundred guineas to the Fund.

It was agreed to send an official letter of sympathy to the family.

The late R. J. Downes.

The VICE-PRESIDENT also referred to the death of Mr. R. J. Downes, the immediate past-President of the Pharmaceutical Society of Ireland, whose zealous services on behalf of pharmacy on the other side of St. George's Channel they all recognised and appreciated. He was sure it would be their wish that a message of

sympathy be sent to the Pharmaceutical Society of Ireland, and he therefore submitted the following motion:—

“That this Council learns with sincere regret the death of Mr. R. J. Downes, the late President of the Pharmaceutical Society of Ireland, and desires to express its deep sympathy with the Pharmaceutical Society of Ireland in the loss of so able, earnest, and zealous a leader.”

Mr. HILLS seconded the resolution. He could not claim any special or intimate acquaintance with Mr. Downes, but during the time he was President Mr. Downes favoured them with his company at one of the annual dinners, and on that occasion he had the opportunity of meeting him, and he had also had some correspondence with him. He regarded Mr. Downes as a conscientious pharmacist of a kindly nature, but could not help seeing that he did not enjoy very strong health. They regretted his somewhat early death, and their sympathy must go out to the sister Society in the loss it had sustained.

Mr. ATKINS, in supporting the motion, said few round that table knew Mr. Downes at all intimately; but in August, 1898, when spending some days in Dublin, he was taken by Mr. Wells to see Mr. Downes. The impression produced on his mind was, first, the extremely fragile state of his health; but though physically feeble, he was immensely strong mentally. Two things impressed him very strongly—his intimate acquaintance with the political side of pharmacy; there was not a clause in the Charter or the Acts of Parliament which Mr. Downes had not carefully noted and studied—in fact, he had made the study of pharmacy on its legal and political side a perfect passion. The next thing that impressed him, after an interview of three hours, was that he was an intensely good man—a true, transparent, and conscientious man.

The resolution was carried unanimously.

Diplomas.

The undermentioned, being duly registered as Pharmaceutical Chemists, were granted diplomas, stamped with the seal of the Society:—

Barnes, George Henry
Chatburn, Edwin Jordan
Collin, John Francis
Dawson, Robert Hilliard
Derbyshire, Chas. Henry
Dunford, Walter Henry
Finnemore, Horace
Griffiths, Edwin
Hardcastle, Edward
Heaton, Wallace E.

Hobbs, Hy. Allmond
Lenton, Walter Hy.
Nash, Ernest
Newton, Alfred
Pollard, Evelyn Wm.
Roy, Louis Leslie
Thwaites, Geo. Rose
Wilson, Thos. Elick
Young, Fras. Joseph

Election of Members.

The following persons having tendered their subscriptions for the current year, were elected “Members” of the Society:—

Appleyard, Charles Percival; Bow
Arnold, William Robert B.; London
Ashford, Frederick Chas.; Northampton
Ashton, Charles Henry; St. Helens
Bayley, Leonard; Lydd
Birkett, George Noel M.; Kendal
Black, John; Aberdeen.
Blyth, Wm. John B.; Ryton-on-Tyne
Broad, Herbert Charles; Reading
Bruce, Alexander Leslie; Aberdeen
Bustard, Francis Edwin; London
Cartwright, Alfred Harry; Silverdale

Election of Student-Associates.

The following persons having passed the First examination, and tendered their subscriptions for the current year, were elected "Student-Associates" of the Society:—

Allen, William Herbert; Kilburn
 Bartlett, Henry Walsh; Brackley
 Bateley, Spencer Robert; Gorseston
 Eadie, Walter; Doncaster
 Grainger, G. W. H. P.; Edinburgh
 Hooper, Elsie Seville; Clapton

Meek, Herbert Owen; Liverpool
 Mitchell, Godfrey T.; Accrington
 Rickard, Albert Henry; Rugby
 Verdier, Louis; London
 Welton, Charles Henry; Coventry
 Windle, Josiah Weston; Wolsingham

Restorations to the Register.

The names of the following persons, who had severally made the required declarations and paid a fine of one guinea, were restored to the Register of Chemists and Druggists:—

John Dixon Cutforth, 161, Middlegate Street, Great Yarmouth.
 Thomas Nicholson Harrison, 35a, Sparkenhoe Street, Leicester.

Library, Museum, School, and House Committee.

The report of this Committee included the usual monthly statements respecting the Society's Libraries and Museums in London and in Edinburgh, particulars of which were published in the *Pharmaceutical Journal* for April 14, 1900, page 395. Reports had also been received from the staff of the Society's School of Pharmacy, and from the Editor of the Society's Journal. Messrs. Parkinson and Sons' account for £210 3s. 3d. has been submitted, passed, and transferred to the Finance Committee. The Committee had considered a proposal by a firm of publishers to undertake the conduct of the advertisement pages of the Journal. The Editor was asked to give the proposal his consideration, and to report to the Committee thereon. The Editor reported at the adjourned meeting, and the Committee recommended that the proposal be not entertained. The Committee had received and considered tenders for the supply of paper for the Journal for the ensuing year, and decided to place the order in the hands of the present contractors. The Vice-President had submitted a draft annual report, which was considered, amended, and finally adopted for presentation to the Council. A copy of the approved draft had been forwarded to each member of the Council. The Committee had dealt with various administrative matters relating to the superintendence of the Society's School and House, and the proper and efficient conduct of the other departments of the Society placed under the charge of the Committee. The Committee had also sat as a Research Committee, and received reports from Professor Collie and Professor Greenish respecting the work in connection with Pharmacopœia standards now in progress in the Society's Laboratories. The Professors were authorised to procure certain apparatus found to be requisite for the prosecution of the investigations undertaken.

North British Branch Report.

The annual report to the Council from the Executive of the North British Branch of the Society was received. The report stated that the expenditure for 1899 was £1,366 12s. 6d., including £802 4s. 8d. in respect of the examinations, and that the slight increase was accounted for by certain refitting work that had been necessary. The library and museum had been much more utilised by members and student-associates of the Society than in previous years, and had largely served as a place of meeting for pharmacists generally. The Evening Meetings had been successful, though the attendance had not been entirely satisfactory, and the proceedings are said to have elicited evidences of appreciation from members of the Society

and others at home and abroad. The report mentions numerous routine items which have already been published by the Council from time to time, it also states that the Society's House in Edinburgh is in thorough order and repair and that the internal arrangements are satisfactory.

Mr. CARTEIGHE moved that the report be received and entered on the minutes. It was not necessary to refer to it in detail, as the work done was reported from time to time. He was glad to find that the recent alterations had made the process of carrying on the examination in Edinburgh as nearly perfect as possible. The premises had certain advantages, partly because they were specially constructed for the purpose, and partly because the number of candidates there was not so great as in England. As he was, so to speak, the godfather of 36, York Place, having persuaded the Council to purchase it, it was a great satisfaction to him to find that everything in Scotland seemed now to be going on satisfactorily, and that there was such a strong feeling of responsibility and loyalty to the Council as a whole. In times gone by the Council had been liberal to their friends in the North. It never raised the question of how many subscribers there were, but always considered that the central institution round which pharmacy circulated in Scotland should be a credit to the Society as a whole; and he believed that the respect in which pharmacy was held by the medical profession and men of science in Edinburgh was partly due to the fact that they saw that the Society was in earnest in all that it undertook.

Mr. HILLS seconded the motion with great pleasure. It was not necessary to say much, after what Mr. Carteighe had said, but having had somewhat intimate relations with the Executive in Scotland, it was only fitting that he should second the resolution. He had been sometimes a little jealous when in Edinburgh to see the completeness of the fittings and the way in which the premises had been adapted to the uses for which they were intended. A great deal of credit was due to Mr. Carteighe and to the various members of the Executive for the way in which they had altered the premises from time to time to meet the increasing needs of the Society, and their thanks were due to the members of the Executive for the intense interest they took in the work, and the way in which they looked after the interests of the Society.

Mr. STORRAR, as an old member of the Executive, thanked the Council for the appreciation it had shown of the work done. The Council had treated the North British Branch remarkably well, especially in the matter of house accommodation. Owing in great measure to this, pharmacy had taken a position in Edinburgh which it never held before, and he hoped the result would be an increased interest on the part of members of the Society in Scotland. At the same time, he did not like to see the premises in Edinburgh looked upon as a purely Scottish branch. It was the North British Branch of the Pharmaceutical Society, and embraced a much larger area than Scotland. Candidates were examined there from both sides of the Tweed, and the sooner they forgot there were two nationalities in connection with the Pharmaceutical Society the better.

Mr. JOHNSTON, as another member of the Executive in Scotland, said he agreed with what Mr. Storrar had said. The rooms in Edinburgh were second to none in the kingdom for completeness, and the candidates had every opportunity of getting through their examination if they were able to do so. The premises were much more convenient than those in London, and he thought it would be a good thing if more candidates went down there to be examined.

The VICE-PRESIDENT having expressed his satisfaction at what Mr. Storrar had said, put the resolution, which was carried unanimously.

Finance Committee.

Mr. HILLS, as Chairman of the Committee, moved the adoption of its report. He said there was nothing requiring special mention; the receipts and payments were both rather large at this time of the year. With reference to the Benevolent Fund, a sum of £32 10s. was required to purchase the fixtures at The Elms,

Strawberry Hill, which now belonged to the Benevolent Fund. The Council would recollect that a certain sum of money was voted for the purchase of this property; in order to put the house in such a condition that it could be let, it was necessary to buy the fixtures at a valuation.

Mr. HARRINGTON, in seconding the proposition, congratulated the Benevolent Fund on having obtained the property at Strawberry Hill, which he thought would increase in value, and thus greatly benefit the Fund.

The resolution was carried.

Benevolent Fund Committee.

The report of this Committee included a recommendation of grants to the amount of £33 in the following cases:—

A registered C. and D. (75). Has had a previous grant. (Caistor.)

A former Associate (81). Has had nine previous grants. (Croydon.)

Widow of a registered C. and D. who had grants previous to his death in 1892. Has herself had two previous grants. (Gravesend.)

The VICE-PRESIDENT moved the adoption of the report, which passed unanimously.

Carbolic Acid.

The VICE-PRESIDENT called attention to the following question, which had been put in the House of Commons with reference to scheduling carbolic acid:—

“To ask the Secretary of State for the Home Department if he has observed that the reports of the Registrar-General show that the scheduling of poisons has greatly diminished the number of fatalities from their accidental or suicidal use, and has not interfered with the use of potent poisons, such as arsenic and potassium cyanide, for industrial purposes, while from the Report for 1898, recently issued, it appears that the fatalities from carbolic acid alone number 206, being nearly as many as for the whole of the scheduled poisons. Whether he is aware that since he stated last session that the Privy Council are prepared to consider whether carbolic acid can be advantageously dealt with in some way, but cannot take any step except on the resolution of the Pharmaceutical Society, the Council of that Society has passed a resolution declaring that carbolic acid in crystal, commercial carbolic acid, and liquids containing more than 3 per cent. of phenol are to be deemed poisons, and added to the second part of Schedule A of the Pharmacy Act. Whether, although that resolution was communicated to the Privy Council in July last, it has not yet sanctioned the resolution. And, whether he will represent to the Privy Council the expediency of at once giving effect to it, with the view of preventing many cases of suffering and death.”

The answer was given by the Home Secretary as follows:—

“I think that there is no doubt that the number of deaths caused by carbolic acid is deplorably great, and shows that some remedy is desirable. I am informed that the Pharmaceutical Society have passed a resolution on the subject, but I must explain that the matter is by no means a simple one. It is, however, now under the active consideration of the Departments concerned, in consultation with the Society, with good prospects, I hope, of steps being taken in the direction desired.”

He thought it well to call attention to the matter, because statements were constantly being made to the effect that nothing was being done by the Council, though it had done all it could.

Mr. GLYN-JONES said that the Home Secretary had stated more than he knew as a member of the Council, viz., that a responsible Department of the Government was in consultation with the Society on this question. It would be helpful if they had some explanation of that statement, because it was difficult to imagine what negotiations could possibly pass between the Society and the Government other than the resolution which had been passed. As he understood it, the Council was not to blame for any delay that there had been in the matter.

Mr. BATESON was also disposed to think that the Council was not to blame in the matter, and thought that they might congratu-

late each other that the matter of scheduling carbolic acid had advanced so far.

Mr. GLYN-JONES said he should like to put it as a definite question whether any communication had come from the Government other than what the Council already knew, as might be gathered from the report of the Home Secretary's answer.

Mr. CARTEIGHE said the reported statement was incorrect to that extent, but probably it was not correctly reported. The matter was not in the Home Secretary's Department. It was a fact that the Government had acknowledged receipt of a communication from the Society. The spirit in which the Home Secretary appeared to speak was very satisfactory as far as the report went.

Mr. HILLS said it was well to remember, in the absence of the President, that it was quite possible that there had been communications not altogether official, by means of the President.

Naval Dispensers.

Mr. HILLS read a letter which he had received from the Admiralty since the last meeting of the Council, forwarding him a copy of the new regulations for dispensers in Naval hospitals, and thanking him for his attendance at the committee which sat to consider the matter. He had done what he did as the mouthpiece of the Council, which in its turn was the mouthpiece of the Society, and it would have been equally well done by any President for the time being. Attention had already been called to the new regulations in the Journal. It was obvious that certain advantages were offered to Naval dispensers, especially with reference to remuneration, and there were also other advantages or improvements which were not so obvious, and improvements which he ventured to hope the representations that he had made to the committee might help to bring about. The more their representatives, whether it were the President or any individual member of Council, were brought into direct and intimate communication with official representatives of public Departments the better it would be for the individual dispensers in every Department, and the better would be the position which their members would hold in the future. Public opinion moved slowly, and although it was easy to talk to men of enlightenment and public knowledge, it was not always so easy to get public bodies which were not so highly educated to see the advantage of having a high qualification and to give proper remuneration and position to those who held appointments as dispensers in public Departments of the State. The more opportunities they took as representatives of that Society of meeting the heads of Departments the better it would be for the members of their calling, and he was sure the Council of the Pharmaceutical Society was in a position, through its officers, to do a great deal of good for its members, and he did not hesitate to say that its President would always be glad to undertake any such duty.

The VICE-PRESIDENT said that thanks were due to Mr. Hills for the trouble he had taken in the matter. They were sometimes told that the Council did not do much for the craft, but he thought this was an instance to the contrary.

Mr. PARK said that, having come in contact with many Naval dispensers, he was sure he would only be giving expression to their feelings if he tendered their thanks to Mr. Hills for the trouble he had taken on their behalf. The dispensers in the Navy were only a small body and could only approach headquarters through their superior officers, who probably had not much sympathy with them. They felt that they were greatly indebted to the Council for the action that had been taken by their past-President in this matter, and they would recognise that it was only a step to benefit them more in the future. He was sure the Council would do all it could to back up any just demand that they might make.

Reciprocity with the Colonies.

The VICE-PRESIDENT announced that a letter had been received from Mr. Arthur B. Chater, thanking the Council for the kind con-

sideration of the proposal which he had put before them for the acceptance by the Society of the diplomas granted in the Australian Colonies, and asking that a resolution might be passed confirming the desirability of that. Mr. Chater had had an informal meeting with the Council on this subject. He should like to point out to Mr. Chater that there existed at present no reciprocity between the different provinces of Australia. It was impossible to compare examinations so far apart as those of Great Britain and Australia; therefore, without some evidence of a curriculum, it would not be easy to do what Mr. Chater desired. He would move the following resolution:—

“That this Council sympathises with the desire for reciprocity between Great Britain and her Colonies in regard to qualifying pharmaceutical certificates, but is of opinion that this can only be accomplished on the basis that a qualification for registration in this country must rest on satisfactory evidence of technical training, and be associated with a definite curriculum in a public University or kindred institution, in addition to any statutory qualifying examination.”

Mr. HILLS said he had taken a great interest in this subject. Mr. Chater represented the Queensland Board of Pharmacy, and was in a position, more or less officially, to speak for other bodies in Australia. He met the Council a month ago, when the matter was talked over. This was a specially good time for Mr. Chater to press this matter, as they were all imbued with an Imperial spirit. In various ways their great Empire was being drawn together, especially at this particular time, when their soldiers were fighting side by side with the Colonists. There were great difficulties in the way of what was suggested by Mr. Chater; even between their own examinations, conducted in Edinburgh and London, comparisons were sometimes drawn, to the effect that one was easier or more difficult than the other; but when they came to examinations conducted some 10,000 miles away, then it would be very difficult, even on the same schedule, to determine that the results of the examinations should be the same both here and in Australia. He thought that by the resolution which was proposed the Council had come to a very wise decision, because he thought to arrive at a practical solution of the question they should have a compulsory curriculum, which would be an evidence of technical training for their own men. That would not only be an advantage from their own point of view, but it would also enable the chemists in the Colonies to have a standard which they should try and attain. Mr. Chater's reply to the observation of there being no reciprocity between the different provinces of Australia was that they were rather looking to the Mother Country to set before them a standard to which they should attain. As being profoundly interested in education, he hoped every opportunity would be taken of pressing upon the powers that be the great necessity there was that their men should be obliged to go through a certain amount of training in some university or public institution. He hoped the letter that the Council was going to send would help to advance their own educational condition, and at the same time to show their sympathy with their colonial brethren, and in that way help to bind the Empire together even more closely.

Pharmacy in New Zealand.

The SECRETARY read a communication which had been received from the Colonial Office, enclosing a copy of an Act of the Legislature of New Zealand, duly sanctioned, amending the Pharmacy Act of 1898. The Bill contained only one clause, and had the effect of restricting the registration of persons under the Act without passing an examination to those who had previously been in business, as principals or managers, in New Zealand, instead of in the Australian colonies generally, as before.

Doncaster Chemists' Society.

The SECRETARY read a letter from the Secretary of the Doncaster Chemists' Society, enclosing a resolution to the following effect:— “That this meeting is of opinion that Clause 2 of the Companies Bill, being a departure from the principle of the Pharmacy Act of

1868, passed in the interest of public safety, should be strenuously opposed, and this meeting furthermore pledges itself to co-operate with the Council of the Pharmaceutical Society in preventing this clause becoming law.”

It was resolved that this communication be referred to the Law and Parliamentary Committee.

The Research Laboratory.

The VICE-PRESIDENT said he had received a letter from Mr. Butt, enclosing a requisition, duly signed, for a special general meeting of the Society. He would therefore move that a special general meeting of the Society be held on May 16, at the conclusion of the annual meeting, to take into consideration the future working of the Research Laboratory of the Pharmaceutical Society.

Mr. CARTEIGHE seconded the resolution, which was agreed to.

General Purposes Committee.

The report of this Committee included the results of the competition for the

PEREIRA AND COUNCIL PRIZES.

Professor J. Bayley Balfour, Dr. L. Dobbin, and Mr. Peter Boa, who had been appointed to conduct this examination, had reported that eleven candidates had entered for the competition, and that two had obtained the requisite standard of efficiency for the awards. The envelopes bearing the mottoes of the successful candidates having been opened were found to contain the names of—

FRANCIS JOSEPH YOUNG

and

EDWIN GRIFFITHS.

None of the other candidates reached the required standard.

The following are the mottoes of the remaining competitors who completed their papers. The mottoes are arranged in order of merit:—

3. Imperial.
4. Sapientia industriam coronat.
5. Per aspera ad astra.
6. Student.
7. Praemia virtutis honores.
8. Disce ant discede.

The following awards were therefore made in accordance with the report of the Examiners:—

- 1st.—Pereira Medal (Silver) and books, value £5, presented by the late Thomas Hyde Hills.
- 2nd.—Pharmaceutical Society's Medal (Silver).

The VICE-PRESIDENT moved a vote of thanks to Professor Balfour, Dr. L. Dobbin, and Mr. Peter Boa for conducting the examination, which was carried unanimously.

The Council then went into committee to consider the legal portion of the report of the Committee. On resuming, the report and recommendations were unanimously adopted, and a special resolution was passed authorising the Registrar to take proceedings against the persons named therein.

The Jacob Bell and Manchester Scholarships.

Mr. Peck and Mr. Pinches were appointed to conduct the examination for the Jacob Bell and Manchester Scholarships in July next.

The Annual Report.

The Council went into committee to consider the draft annual report. A few verbal alterations having been made, the Report was adopted, and is printed at page 472.

Report on the Examinations.

The following report on the examinations was presented:—
April, 1900.

England and Wales:—

	Candidates.	Passed.	Failed.
Major	36	19	17
Minor	363	100	263
	<hr/> 399	<hr/> 119	<hr/> 280

Scotland:—

Major	1	—	1
Minor	117	33	84
	<hr/> 517	<hr/> 152	<hr/> 365

FIRST EXAMINATION.

Forty-five certificates of approved examining bodies were accepted in lieu of the First Examination.

First Examination.	Candidates.	Passed.	Failed.
April, 1900	705	334	371

The Board of Examiners, having carefully considered the application of the Welsh Central Board and the report of the College of Preceptors thereon, recommended the Council to add to the list of Certificates of approved examining bodies contemplated by Bye-Law 11, of Section X., the Junior, Senior, and Honours Certificates of the Central Welsh Board. The Board of Examiners had also considered an application remitted to it by the Council for the acceptance of certain Leaving Certificates of the Scotch Education Department. The Board decided that the certificates could not be accepted in lieu of the First Examination as they had not been obtained at "one annual examination."

The VICE-PRESIDENT moved that on the recommendation of the Board of Examiners, the Junior, Senior, and Honours Certificate of the Central Welsh Board be added to the list of certificates to be recognised after August, 1900, in lieu of the "First" Examination.

ANNUAL REPORT OF THE COUNCIL.

The candidates for the "First" examination during the year numbered 1,530, of whom 723, or 47.26 per cent., were successful, and 807, or 52.74 per cent., were rejected. These figures show an increase over the year 1898 of 181 in the number of candidates, but the percentage of rejections has remained practically stationary. The large increase in the entries for this examination is probably due to the fact that after August next a more stringent test of preliminary training will be required of persons desirous of qualifying as chemists and druggists. For the Minor examination 1,816 candidates presented themselves—an increase of 137—and 552, or 30.39 per cent., passed. The pass percentage for the previous year was 31.89. For the Major examination there were 103 candidates, of whom 50, or 48.54 per cent., satisfied the examiners.

These departments have been steadily developed during the year, and their usefulness has been increased by many important additions. Donations of books and specimens have well supplemented the purchases authorised by the Library Committee. The additions to the Libraries and Museums are published month by month in the *Pharmaceutical Journal*, and the donors receive the official thanks of the Council at the time of publication. In consequence of the Library and Museum in London not having been used in the evening by the Members and Student-Associates of the Society, for whose exclusive advantage these departments are maintained, the Council has deemed it inexpedient to keep the premises open after 6 o'clock p.m.

The fifty-eighth session of the School of Pharmacy was inaugurated in October, when a very interesting and instructive address to the students was delivered by Dr. D. J. Leech, Professor of Materia Medica and Therapeutics at Owens College, Manchester, and Chairman of the Pharmacopœia Committee of the General Medical Council. On the same occasion the Hanbury Gold Medal, which had earlier in the year been awarded to Professor Albert Ladenburg, of Breslau, was presented, Baron von Mirbach, of the German Embassy, attending as the official representative of the absent medallist. The Council has the gratification to report that the School is now part of the London Teaching University, its Professorial Staff having been recognised by the London University Commission as teachers of the University.

Reference was made in the last Annual Report to the appointment, on the invitation of the General Medical Council, of two pharmacists to represent the Society at the meetings of a Conference convened for the purpose of discussing matters in regard to Pharmacopœia standards and processes. It has now to be reported that the General Medical Council has asked the further co-operation of the Society in determining certain chemical and pharmaceutical problems requiring elucidation. The Council of the Society readily agreed to afford the assistance desired, and the necessary work is now in progress in the laboratories of the Society, under the direction of the Professor of Chemistry and the Professor of Pharmaceutics, who report from time to time to the Research Committee.

The following lectures have been given and papers read at the Evening Meetings in London:—"The Biology of Yeast," by Professor J. Reynolds Green; "Some Relations of Water to other Substances," by Professor J. Millar Thomson; "Aromatic Spirit of Ammonia," by Mr. Edmund White; and "The Commerce of Drugs," by Mr. E. M. Holmes. Mr. J. S. Ward and Mr. J. C. Stead also contributed interesting notes. In Edinburgh the Session was opened by an interesting address by Mr. P. Boa, and subsequent papers were contributed by Dr. Dobbin, Messrs. T. Dunlop, G. E. Merson, J. Lothian, J. Tocher, A. Currie, and J. R. Hill.

In view of the statement made in the House of Commons by the Home Secretary that the Government would be prepared to consider any resolution passed in accordance with Section 2 of the Pharmacy Act, 1868, in regard to the scheduling of carbolic acid as a poison, the Council, at its June meeting, again formally resolved that carbolic acid ought to be deemed a poison. The resolution was duly forwarded to the Privy Council, which Department is now in consultation with the Board of Agriculture on the subject.

The income from subscriptions during the past year shows a slight diminution, whilst the expenditure for grants and annuities continues to increase. From the details given in the Balance Sheet it will be noted that the Council is practically spending each year, in the relief of necessitous chemists and druggists or their widows, the whole of its income. Four additional annuitants were elected on the Fund in December last, and there are now forty-four persons receiving annuities from the Fund.

At the April meeting of the Council, Edwin Bennett, the orphan child of a member of the Society and subscriber to the Benevolent Fund, was selected for admission to the London Orphan Asylum.

One thousand pounds having been left to the Society by the late Mr. E. Waterall, of Nottingham, subject to certain conditions securing priority of claim for necessitous chemists resident in that city, the Council has created a new Fund, to be called the "Waterall Legacy Fund," and has adopted a scheme for the administration of the Fund in pursuance of the wishes of the testator. The scheme was published in full in the *Pharmaceutical Journal* for March 10, 1900.

The Lord Chancellor's Pharmacy Bill and Companies (Medical Profession) Bill, to which allusion was made last year, were not proceeded with; but before the end of the session they became incorporated, with a slightly altered form of wording in the case of the Pharmacy Bill, in the Board of Trade Companies Bill, which had long been under the consideration of a Select Committee of the House of Lords. This Bill, as amended by the Committee, passed

GENERAL FUND.

AUDITORS' REPORT.

We, the undersigned Auditors, have examined the foregoing accounts of the Pharmaceutical Society of Great Britain, and find them correct. We have inspected the Deeds relating to the House Property and Ground Rents, and also find that there were standing to the account of the Society at the Bank of England, and in the hands of the Society's Bankers, on December 31, 1899, the several securities named in the Balance Sheet of the respective accounts.

In addition to the above, the following Securities were standing to the credit of the Society on December 31, 1899:—

Pereira Memorial Fund.....	} Two and three-quarters per cent. Consols	£	100 0 0
Bell Memorial Fund			2050 0 0

Auditors.

the House of Lords, but the lateness of the session, coupled with the probability of strenuous opposition, rendered its introduction into the House of Commons inexpedient, and the Bill lapsed. The Council, conceiving its duty to lie in resisting all attempts to remedy company law anomalies by sacrificing the essential principle of the Pharmacy Act, had already made arrangements to oppose the pharmaceutical clause of the Bill. During the long recess efforts were made to impress upon the Government—and more especially the President of the Board of Trade, who was expected to take charge of any Companies Bill introduced into the House of Commons—the objections which chemists and druggists throughout Great Britain entertained to the proposal contained in the Lord Chancellor's clause. These efforts, however, met with scant success, for the Bill that passed the House of Lords last session was introduced into the House of Commons at the beginning of the session, and no evidence was forthcoming that the representations made to Mr. Ritchie had been considered. The Council subsequently ascertained that the view of the Minister in charge of the measure was that the clause to which objection is taken is an insertion by the Lord Chancellor, and that the Government could accept no amendment thereto. In view of this declaration on the part of the Minister in charge of the Bill, the Council deemed it wisest to oppose Clause 2 of the Companies Bill. The Bill has not yet reached its second reading; when this stage is reached the Local and Divisional Secretaries and the members generally will receive due notice.

LEGAL.

The number of alleged infringement cases reported to the Registrar and investigated during the year was 276, which is a considerable decrease on those reported in recent years. A very large proportion of the offenders did not attempt to contest their liability, but paid the penalties claimed without going into Court. A report has appeared in the *Pharmaceutical Journal* of each contested case, and the only one to which attention need be directed is that of a seedsman at Worcester, who was sued for a penalty under Section 15 of the Pharmacy Act, 1868, for selling weed-killer containing arsenic. At the hearing of the case it appeared that defendant did not stock the weed-killer, but took orders for it, which orders he transmitted for execution to a limited company at Liverpool. It was admitted that he gave a receipt for the purchase money on a bill-head bearing the name of the limited company, and that he received 25 per cent. commission on each order. He also had in his shop price-lists of the weed-killer bearing his name and address as agent. The County Court judge came to the conclusion that this did not constitute a sale by the defendant within the meaning of the Pharmacy Act, 1868, but leave to appeal was given. This appeal was heard before Justices Grantham and Channell, and resulted in the appeal being dismissed, but with liberty to go to the Appeal Court. Having regard to the grave issues involved in the case, and acting on the advice of counsel, an appeal has been entered accordingly, but it is not expected that the case will be reached until after the Long Vacation.

LOCAL ORGANISATION.

During the year the Council has again had its attention directed to the need for improving the local organisation of the Society. Without in any way minimising the value of the excellent services rendered by a number of the Local Secretaries throughout the country, it has been suggested that it might be possible to exert a much more potent political influence, both in the promotion of desirable legislation and opposition to objectionable measures, if the Society possessed a competent representative in every Parliamentary division in Great Britain. The subject was discussed at the October Council, and the proposal of Mr. Cross, that a meeting of local officers should be convened during the meeting of the British Pharmaceutical Conference in London this year, was adopted. This meeting will take place on Friday, July 27, and it is hoped that beneficial results may ensue from the associa-

tion, in the Society's House, of local officers with the executive body which appointed them. The Council at its April meeting appointed a small Committee to investigate and to report on the desirability of re-arranging upon a Parliamentary basis the districts for which local secretaries are at present appointed. The Committee will also consider, in connection with any possible re-arrangement, the expediency of making a change in the duties of local representatives.

NAVAL DISPENSERS.

The Council is glad to be able to record that its efforts for some years past to improve the status of dispensers in Naval Hospitals have borne some fruit, many of the suggestions submitted by the President of the Society in 1898 to the Admiralty authorities having been recently adopted. The new regulations were published in the *Journal* for April 14, 1900.

NORTH BRITISH BRANCH.

The Report of the Executive of the North British Branch was presented to the Council at its May meeting. The work of the Society in Scotland is efficiently conducted.

OBITUARY.

The following deaths have to be recorded:—Sir Edward Frankland, Dr. von Waldheim, Dr. K. L. Dey, Sir Douglas MacLagan, and Professor Gustave Planchon—Honorary Members; Dr. Adolphus Ernst and Dr. Yatabe—Corresponding Members; T. Greenish—a former President of the Society; J. G. F. Richardson, J. Watt, R. Reynolds, and Daniel Frazer—former members of the Council; Augustus Bird—formerly a member of the Board of Examiners for England and Wales; Wm. Burley—a member of the Executive of the Society's North British Branch; E. C. Cortis Stanford, formerly Demonstrator in the Society's Laboratory, and a well-known manufacturing chemist; and the following local officers:—R. U. Clark (Jarrow), C. F. Bevan (Harwich), T. W. H. Hodson (Hoxton), G. Lines (Hertford)—a founder of the Society.

LETTERS TO THE EDITOR.**The Council Election, 1900.**

As a member of Council who is seeking re-election, it is but right that I should thank the members of the Society who have voted for me on former occasions, and in seeking the votes of the members, I would state that the policy I should advocate would be to protect our titles in the fullest manner possible. I hold that our titles are personal, therefore should not be assumed by unqualified capitalists. I do not think the Council can expect to restrict the freedom of trade in drugs which are outside the poison schedules. I do not think the Council should in any way attempt the suicidal policy of regulating limited companies; if the Legislature undertakes that task, chemists must do their best to defend their lawfully acquired privileges from being interfered with. I would also hail with pleasure a project to divide the Minor Examination, with adequate precautions. I am also of opinion that the time has come when all who pass the qualifying examination should have the title of pharmaceutical chemist. I see that one of the trade papers says I have occupied a seat on the Council of the Pharmaceutical Society four years, and that I have not spoken once. I am not an orator, and when my views have been ably expressed by more than one member, I do not see the use of occupying the time of twenty other gentlemen to hear the same thing over again. I do not think that I have missed any meetings of the Council except through sickness in my family, and I have always attended the Committee meetings on the day before the Council meeting.

Swansea, May 1, 1900.

N. M. GROSE.

As a country chemist with an ordinary intelligence I would respectfully urge my brother pharmacists that they be not misled by the electioneering addresses of various new aspirants for

Council honours. We are threatened with two dangers. First, Mr. Wootton—in the guise of an astute sophist—has, whilst editor of the *Chemist and Druggist*, consistently opposed every measure that had for its object the raising of the status and the welfare of chemists. It will be remembered that he made a great cry of “guineas” when the Society was last amending its bye-laws. In the Society’s efforts to render more efficient the coming pharmacist, he only detected a sinister desire on the Council’s part to feather its own nest, etc., *ad nauseam*. The other danger we are confronted with is the candidature of a gentleman from Lancashire, with a high-sounding name, whose chief qualification can best be described in the somewhat inelegant term—windbag. I have carefully read the deliverances of both gentlemen for the last year or two and I hope I shall find some support when I say that the Council can very well be spared the services of these candidates. It is in the highest degree important that in the present crisis we should have level-headed and well-balanced men whose loyalty to the craft is above suspicion and whose influence and experience of affairs pharmaceutical must conduce to the success of the struggle with the enemy.

Cockermouth, April 27, 1900.

W. S. SCOTT.

It is too often assumed that the amount of interest aroused by a given Council election may be gauged by the number of candidates newly put forward for the contest. A moment’s reflection is enough to show that this criterion would of itself prove oftentimes quite fallacious—that it is only when the election is over, when we know the proportion of those that have actually voted to the whole number of the electorate, that a due estimate on this point can be formed. Last year’s contest is a case in point. It was taken for granted, at the outset, that an unusual amount of interest would be excited, because, forsooth, six outside candidates were standing, in addition to the seven retiring members of Council, to fill the seven vacant seats. The result, however, showed a lamentable lack of concern amongst the members generally and a result that was most unsatisfactory, 5,468 voting papers being issued and 3,733 only being returned.

What can be the cause and what the remedy, for such a lamentable waste of power as we have seen hitherto? I think procrastination is the thief that steals away our best force on these occasions. Why not ask members to return the voting papers, properly and leisurely dealt with, as soon as possible after receiving them?—to do this in advance, whether it be a man’s intention to be present at the annual meeting or not. The “new blood” proposed to be pumped into the Council this time beats all record as to its heterogeneous character. There is too much of “Shake the mixture”—too much agitation required to keep up the semblance of a presentable article; in fine, it is not pharmaceutical enough to get through even the Glyn-Jones’ new patent transfusion apparatus at all kindly.

Mr. Wootton seems to have degenerated somewhat from what he was as editor of the *Chemist and Druggist*. Some little while ago, before relinquishing that post, he spoke out in plain English that his periodical had for years done what it could to get as much as possible “out of” the vast wealth and resources of the Society for the benefit of the trade—*i.e.*, for the benefit, I presume, of the two-thirds who refuse to join its membership. Had he much succeeded the Council would certainly have wanted “new blood” by this time; but he did not succeed to any appreciable extent, in spite of a deal of real talent wasted which might have been employed to nobler uses. From Mr. Wootton’s address, now before me, he seems to be relinquishing the manly style of the old *C. and D.* whilst he was its editor, and descends to a rather Pecksniffian level. “I regret,” says he, “to believe”—*régret* to believe! why believe it, then? Would I regret any one of my beliefs? Oh! throw away such vain regret, and beliefs, too. But does he regret to believe? Was it not originally meat and drink, and wine that made the heart glad,

to force into the minds of men certain dogmas connected with the assumed shortcomings of the Council and the Society? And now, as a candidate for the suffrages of the members of the same Society that he spent thirty years in slandering, on bended knee he craves admission and regrets to believe that things are so bad as to warrant the election of himself and colleagues for setting straight such a lot of crookedness!

Mr. Taylor wants to get on the Council to gain experience—cart before the horse. Another, Mr. Currie, protests that the Society ought to look better after those who pass its examinations. Is it not the end of education to fit a man to take care of himself? And are not the statutory examinations to serve as a criterion who is or is not thus capable to conduct what he himself has chosen as the business of his life? Another says that “the commercial side of pharmacy has been entirely ignored.” One would think the commercial side of our calling differs so much with each individual that it is much better left to oneself, that each one may cut out his own garment according to the amount of stuff at his disposal, and see that he does not in any matter “over-reach the constable” or make his horns too ramifying for going in and out with comfort. Mr. Gifford says, sensibly enough, that his trade interests are his own affair, and that “if the Pharmaceutical Society becomes to any extent a trade union (forgetting that to some extent it is such already) the propriety of its administering the Pharmacy Acts would rightly be called in question.” What say the other new-blood men to this? “Yet,” says he, “we ought to combine with all the weight of an organised trade,” whilst we are but about 15,000 at the most, all told.

Viewing the whole question comprehensively, we must come to the conclusion that the one principle of union amongst these people is hatred of the Pharmaceutical Society as to its highest and best endeavours. It would seem as if concession has been carried much too far already. The fact that the benefits of the Benevolent Fund have been generously extended to friends and foes alike—that special openings have been made at times in the inclosure for the admission of any, however sulky or faint-hearted they may have been—any who could produce the shred of a claim for consideration—all has been interpreted as merely an indication of weakness instead of sturdy benevolence. The result has been to further demoralise the chronic outsiders, who seem to think that this state of things will go on for ever and that new blood is going to lead to a general trade victory over the ruins of a Pharmaceutical Society. Let them be awakened from their wild dreamings by members all rising to the urgency of the present moment and showing, by their universal interest in this election, that the time is over for making bargains with imbecility and crippledom, either on the score of assumed right or of policy. It is now more than ever urgent for members to save their own by coming forward in full strength with a candid enforcement of the lesson of consolidation, that the 5,000 or so who have seen the wisdom of union, on educational principles, refuse to be the tools of those who would perpetuate the indefinite attenuation of the Society’s best energies.

London, April 30, 1900.

J. C. HYSLOP.

I hereby beg to convey my thanks to the candidates for their prompt and courteous replies to queries sent.

St. Andrews, Fife, May 1, 1900.

W. R. KERMATH.

The P.A.T.A. and the Council Election.

In last week’s issue Mr. J. F. Eardley, after mildly rebuking me for enclosing my circular letter to the members of the Pharmaceutical Society in the *Anti-Cutting Record*, asks, “To whom does the *Anti-Cutting Record* belong, and who pays the postage?” To both enquiries the answer is—

London, May 1, 1900.

W. S. GLYN-JONES.

Mr. Cross and the Council Election.

I am obliged to Mr. Cross for kindly drawing the attention of your readers to the letter in which I ask them to vote for Messrs. Cooper, Gibbons, Taylor, and Wootton. He states that the matters therein dealt with are capable of being represented in quite a different light. First, Mr. Cross points out that I was incorrect in stating, in reference to the question of dispensing in doctors' surgeries, that the Council had done absolutely nothing. He says that the matter was carefully considered, and that a conclusion was unanimously arrived at that it was not the province of the Council to interfere. (Mr. Cross is so used to thinking of unanimity in connection with the Council's decisions that his slip in using it in this connection is excusable.) It therefore appears that I ought not to have said that the Council had done nothing, but that it considered and came to a conclusion not to do anything, and had carefully adhered to its decision. I am afraid the correction will not console those of our members who want to see our qualification recognised as that of a pharmacist—a dispenser of medicines—not merely that of a vendor of poisons. On the company question Mr. Cross says that I know it is "because the Government is determined not to accept any amendment of the clause that a practically unanimous decision has been arrived at to oppose the Clause altogether." I know that Mr. Ritchie, who is not the author of the clause, and who personally does not like its being in the Bill, declined to amend it at the first time of asking by the President and Mr. Carteghe. But I did not expect Mr. Ritchie would have said: "Certainly, gentlemen, how would you like it amended?" The Government does not usually capitulate at the first sign of opposition from interested quarters, but it often does give way to pressure brought to bear upon it in Parliament. Mr. Ritchie's answer amounted to a refusal to voluntarily amend the clause. But it is Parliament and not Mr. Ritchie that will ultimately decide what clause, if any, shall become law. And it is because the Council has shirked placing the issue before Parliament that I complain. I would not be justified in using your space to reply to Mr. Cross's pleasant little sarcasms at my expense, except to say that when he suggests it is a large order to give me the controlling power of the Society all at once, I believe the four new candidates we are recommending will agree with him and that, if elected, they will do what they can to make impossible in the future what it is alleged has existed in times past—viz., one man rule at "the Square." This I suggest as another reason why your readers should vote for them.

London, May 1, 1900.

W. S. GLYN-JONES.

A Pharmaceutical Caucus.

As I did not vote for Mr. Glyn-Jones at the last Council Election, and as I do not agree with his agitation against medical dispensers, but fully agree with the views of Mr. H. G. Rogerson (see *ante*, p. 457), I nevertheless give a few reasons why I intend to "plump" for the caucus candidates. (1) While (as Mr. Glyn-Jones pointed out some time ago) men who are members of limited companies have seats on the Council, no hope of doing anything in the company question can be expected. (2) In my humble opinion, the "swell" chemists, not being in touch or understanding the position and the struggle which their poorer brethren have to keep their heads above water (and who undoubtedly are greatly in the majority), are not the ones to assist the poor ones in their daily struggle for a bare existence; therefore, more men like Mr. Glyn-Jones (who understand and sympathise with the position of the poorer members of the craft) should be installed in their places.

Liverpool, April 30, 1900.

A POOR CHEMIST (30/7).

The quotation from my letter published on April 21, upon which Mr. Glyn-Jones bases his reply, is of itself almost sufficient to disprove the argument he has deduced from it. At the risk of reiteration, however, and because I wish to make my protest perfectly understood, it appears necessary to repeat that I

have no objection to a "caucus" when it is composed of members of the Society outside the Council. My sole reason for protesting against the movement which Mr. Glyn-Jones has initiated lies in the fact that he is a member of Council. I should be sorry indeed if I felt that any difference of opinion upon questions which present themselves for debate could influence my conduct so as to provoke me to obvious insincerity. If it be true that my former letter affords "strong evidence that new men are wanted on the Council," it is fortunate that the members of the Society will be able to exercise a clear discrimination.

I hold that loyalty to conviction, duty to constituents, or loyalty to colleagues ought on no account to imperil the dignity of the Society itself, and that it would be absolutely impossible for its Council to command the respect of the members of the Society—to say nothing of departments and institutions in close association with its work—if in a few years the twenty-one representatives who compose it became separated into sections, easily identified by the efforts which their stronger colleagues had made to secure them. Surely it is not too much to say that, in such a case as the present, the honourable position of a Councillor would become an intolerable one. The general arguments advanced by Mr. Glyn-Jones lead away from the principle which forms the real issue, and I am quite content to allow my fellow-members to determine whether they wish to create a precedent by justifying the action which Mr. Glyn-Jones has taken.

Kilburn, N.W., May 1, 1900.

CHARLES B. ALLEN.

The Companies Bill.

There seems to be some doubt as to whether or not I have changed my views with regard to company pharmacy, as expressed in my paper "The Outlook in Pharmacy" (see p. 148 *ante*), and the letters I have since written in connection with the Companies Bill and my candidature. I have not changed my views. With regard to my being on the ticket of the so-called "caucus," let me say I have given no pledges as to the Bill or company pharmacy to the gentlemen who have initiated that movement. Nor have they attempted to interfere with my freedom of judgment or action. Consequently, if I am elected to the Council, I can enter on its duties free to act as my convictions dictate.

Bolton, May 1, 1900.

JOHN TAYLOR.

Gelatinised Tincture of Kino.

I desire to tender grateful thanks to the following gentlemen, who have forwarded specimens of gelatinised tincture of kino in response to my request:—Mr. J. Balcomb, Cheltenham; Mr. H. Barton, St. Ives (Hunts); Mr. A. W. Hudson, Cranbrook; Mr. F. J. Muskett, Rochester; Mr. Jas. Robb (Messrs. Frazer and Green), Glasgow; Mr. J. Wild, Manchester; Mr. W. Wilkinson, Manchester; Mr. J. Williams, Notting Hill. The specimens already received will probably be sufficient for the purposes, but any information concerning them will be of interest (in those cases in which none has been sent), in respect of exposure to light, time that elapsed before gelatinisation took place, possibility of evaporation of spirit, and date of preparation.

E. M. HOLMES.

17, Bloomsbury Square, W.C., April 21, 1900.

What is Ecology?

I notice in the questions set for the Council Prizes Examination (see *ante*, p. 443), a reference to the "ecological significance" of the "perennation" (if I may venture to coin a word) of flowering plants. If you or any of your readers can refer me to any text-book or dictionary in which "ecology" is discussed or defined I shall feel greatly obliged.

April 30, 1900.

Kpovos (29/49).

** The word "œcology" will be found defined in standard dictionaries of recent date, such as the "Century"; also "perennation," which appears to have been coined by Professor Bayley Balfour, about twelve years ago. See the remarks of "An Ordinary Pharmacist" on this subject, at page 465. [Ed. P.J.]

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.

Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MAY 5, 1900.

THE COUNCIL MEETING.

IN the absence of the PRESIDENT, who has, in compliance with medical advice, gone on a voyage for the benefit of his health, the chair was occupied last Wednesday by the VICE-PRESIDENT, who explained the reason for occupying that position and expressed a hope that Mr. MARTINDALE would soon return thoroughly restored. That wish met with a hearty response from the members of Council and, after the minutes of the previous meeting had been confirmed, the VICE-PRESIDENT proceeded to speak of several distinguished members of the Society who have died since the last meeting, viz., Sir DOUGLAS MACLAGAN, Dr. GUSTAVE PLANCHON, RICHARD REYNOLDS, AUGUSTUS BIRD, and JOHN HUGILL, resolutions being passed authorising official letters of sympathy and condolence to be sent to their respective families on behalf of the Council (see page 466). Reference was also made to the death of Mr. R. J. DOWNES, the late President of the Pharmaceutical Society of Ireland, and a resolution was passed to be sent to the Council of the Irish Society.

The additions to the Society comprised 95 members, 12 student-associates, and several restorations. See page 468.

A summary of the annual report of the North British Branch of the Society was read by the SECRETARY and, before the report was ordered to be inserted in the minutes of the Council proceedings, it gave rise to an interesting discussion. Mr. CARTEIGHE, in moving the adoption of the report, expressed satisfaction at hearing that the establishment at 36, York Place was so useful and so much appreciated, because he had been, in a way, its godfather and had endeavoured to give practical effect to the idea that the establishment in Scotland should be a credit to the Society, enabling it to command the respect of the medical profession and of scientific men in the metropolis of the North and to be regarded generally as the official representative of British pharmacy. Mr. HILLS, in seconding the motion, also expressed satisfaction at finding that the provision made for the local requirements of the Society in Scotland were so zealously

utilised and supported by the members of the North British Executive, and Mr. STORRAR, referring to the assistance that had been given as having been in great measure the means by which pharmacy has taken its present position in Edinburgh, remarked that the North British Branch should not be looked upon as purely Scottish; but as representing a much wider area than Scotland and as being, in the spirit of the late JOHN MACKAY, "part and parcel" of the Society, so that the sooner they forgot there were two nationalities the better. Mr. JOHNSTON supported these remarks.

The report of the Finance Committee was adopted and gave rise to no comment, the only point to which special attention was directed by Mr. HILLS, in moving its adoption, being an unusual item charged against the Benevolent Fund Account for the repairs of the recently acquired property at Strawberry Hill, an acquisition on which Mr. HARRINGTON said the Society might be congratulated.

On the recommendation of the Benevolent Fund Committee three grants, amounting to thirty-three pounds, were ordered to be paid.

The report of the House Committee was also adopted without comment.

Attention was directed to the question asked by Sir JOHN LENG in the House of Commons, on Monday, in reference to carbolic acid, and to the answer given by the HOME SECRETARY on that occasion. See page 469.

Mr. GLYN-JONES remarked that he had learnt more from the HOME SECRETARY than he knew as a member of the Council and he thought some explanation of that, apparently unintelligible position, was needed. Mr. BATESON held that the Council is in no way to blame for the delay in placing carbolic acid on the Schedule, but it might be congratulated that the matter has now been advanced somewhat. Mr. GLYN-JONES then put the definite question whether any communication had come from the Government other than that the Council has already been made aware of? Mr. CARTEIGHE said that as the matter is not in the HOME SECRETARY'S department, the published report was probably incorrect and that it should not be taken too literally, but the spirit of the reply appeared very satisfactory. Mr. HILLS added that, in the absence of the PRESIDENT, the Council might not be fully informed of what has taken place, not altogether officially, but by personal communication.

In reference to a letter from the Admiralty on the new regulations for naval dispensers, Mr. HILLS said he had received it since the last Council Meeting and proceeded to explain what has been done in consequence of his representations in that connection. That, he said, might well have been done by anyone else representing the Society, in the position of PRESIDENT, and he thought the more the officials of the Society were brought into communication with official representatives of public departments, the more they would be able to be of benefit to those they represented. The VICE-PRESIDENT said that thanks were due to Mr. HILLS for the trouble he has taken in the matter of Naval dispensers and the same feeling was expressed by Mr. PARK on behalf of the naval dispensers with whom he is in the habit of coming in contact. See page 470.

In mentioning a letter received from Mr. CHATER, of New Zealand, on the subject of reciprocity of pharma-

ceutical qualification, the difficulties surrounding it were pointed out by the VICE-PRESIDENT and, on his motion, it was resolved that the Council should express its sympathy with the desire for reciprocity, provided it could be effected on the basis of systematic education, in a public university or other satisfactory public institution, as well as a statutory qualifying examination.

Mr. HILLS said he thought that the present time was favourable for pressing this matter forward, but it was surrounded with difficulty, for even in connection with the Society's present examinations comparisons are sometimes made with the view of showing the existence of inequality between them.

On the recommendation of the Board of Examiners, the Council resolved to add the junior, senior, and honours certificates of the Central Welsh Board, to the list of certificates to be recognised in lieu of the first examination.

A letter from the Colonial Office, relating to an amendment of the Pharmacy Act, 1898, was read. See page 471.

Another letter was from the Secretary of the Doncaster Chemists' Society, forwarding a resolution that Clause 2 of the Companies Bill should be opposed and pledging the Society to support the Council in any action taken with that object: it was referred to the Law and Parliamentary Committee.

A duly-signed requisition for the holding of a special general meeting in reference to the Research Laboratory having been submitted by Mr. BUTT, the VICE-PRESIDENT moved that the meeting be called; Mr. CARTEIGHE seconded the motion, and it was carried.

In that part of the report of the General Purposes Committee relating to the award of the Pereira Medal and Council prizes and, on recommendation of the examiners, FRANCIS JOSEPH YOUNG and EDWIN GRIFFITHS were declared to be the only successful candidates. A vote of thanks was passed to the examiners. See page 471.

After consideration of the legal part of the report resolutions were passed authorising the Registrar to take proceedings in various cases.

The Council then considered in committee the draft of the annual report, and after making some verbal alterations, it was adopted and ordered to be printed. See page 472.

THE ALLEGED CHEMISTS' MONOPOLY OF THE SALE OF DRUGS.

THE plea put forward by Mr. JESSE BOOT and other unqualified persons—connected with companies keeping open shop for the sale of poisons and using the title of chemist and druggist or pharmaceutical chemist, regardless of the provisions of the Pharmacy Act—is entirely without foundation. They allege, in attempted justification of their procedure, that the effect of the Act is to create a monopoly of the sale of drugs and medicines, operating to the advantage of a special class and interfering with freedom of trade prejudicially to the general interests of the community. That specious plea has met with some acceptance in influential quarters. In order, therefore, to show how little ground there is for it, a list of the drugs and medicinal preparations

—chemical and pharmaceutical—of the British Pharmacopœia, that are poisons within the meaning of the Act, has been drawn up and will be found at page 478. Those articles are 120 in number, while the total number of articles included in the Pharmacopœia is 817, so that the sale of only about one-seventh, or less than 15 per cent. of the whole number, is subject to the provisions of the Act. That in itself should be sufficient to show that the alleged chemists' monopoly is imaginary.

But in addition to the evidence thus furnished, consideration of the nature of the articles which are included in Schedule A of the Act, shows still more convincingly that the restriction of their sale to properly qualified persons is not of the nature of monopoly. Only ten drugs are in the schedule, seven of them official, three non-official, and reference to the list at page 478 should convince any sensible person that none of those drugs are of a nature to be indiscriminately saleable in a fancy bazaar, the shop of a grocer, or together with the quack medicines and packed goods which are lawfully the stock-in-trade of a company's drug store.

The thirty official and three non-official chemical preparations, the sale of which is subject to the provisions of the Pharmacy Act, are of a still more deadly and dangerous nature than the scheduled drugs already mentioned. So far, therefore, from the restriction of their sale, to persons properly qualified to deal with them, being a provision entailing privation upon any members of the community—whether poor or rich—it will more probably appear, to sensible persons, that the statutory restriction is to be regarded as a wise and salutary safeguard that should be maintained.

Of the eighty-three pharmaceutical preparations named in the last section of the list there are not more than two or three which are articles in ordinary demand and are used—often very unwisely—as domestic remedies. Very largely on account of such misuse, of those very articles, and from consideration of the fatal consequences that sometimes resulted from their improper use, the Pharmacy Act was passed, to impose restrictions on the sale of those and similar articles, as some means of affording protection to the public against itself. The remaining articles in the list are all of a poisonous and in some instances very deadly nature; they belong especially to the province of the pharmacist; as medicinal preparations they are for the most part fit only to be supplied under directions of a regular medical practitioner in cases for which they are applicable. Certainly not any of them are proper articles of ordinary trade, to be sold in shops or stores where food materials, household commodities, confectionery, etc., are sold.

The sale of the remaining 697 official drugs and medicinal preparations is absolutely free from restriction, though many of those articles are of a very poisonous nature, and the use of them as medicine is often attended with danger. As an instance, carbolic acid may be cited, which has for years past been the cause of more deaths than any other article included in the Poison Schedule. These are facts which prove that the alleged chemists' monopoly of the trade in drugs and medicines is non-existent. They also demonstrate that the Act of 1868 is not in any sense an Act to protect chemists or the practice of Pharmacy; but that it is one entirely for public protection.

ANNOTATIONS.

PUTTING COMPANIES IN THE SAME POSITION—under the Pharmacy Acts—as individuals, is the point on which there is such a wide difference of opinion among chemists and druggists. Some consider—like Mr. Gifford—that a company, being necessarily an unqualified person, should be subject to all the provisions of the Act; while others take the view that companies which have kept open shop for the sale of poisons, etc., in opposition to the manifest intention of the Act, have thereby acquired a vested interest, and must be allowed to continue the practice, under such restrictions as the Lord Chancellor has proposed, viz., employment of qualified persons to conduct their business and the exhibition of those persons' names, as the managers.

MR. GIFFORD'S LOGIC is indisputable—and he is so entirely possessed by the conclusions he has arrived at that he evidently thinks every other body—who is sane or rational—must necessarily agree with him. Those who have come to that state of mind are apt to believe they have attained to perfect infallibility. Such belief begets bigotry and a condition like that of the two knights in the fable, who each saw only one side of the shield over which they disputed. In like manner Mr. Gifford overlooks the very important consideration that for a sound logical conclusion to be accepted, the premisses from which it is deduced must be thoroughly understood and fully appreciated: that they must also be free from improper association of unconnected ideas. That a qualification implies corresponding privilege and that maintenance of the value of qualification, either to its possessor, or for those it is intended to benefit, involves exclusive exercise, by qualified persons, of such privilege as it confers, are propositions which in themselves could scarcely fail to command general acquiescence.

IN THE APPLICATION OF THOSE ALMOST SELF-EVIDENT PROPOSITIONS to the business of a chemist and druggist, as regulated by the Pharmacy Act, persons imperfectly acquainted with the circumstances of the case are, however, apt to be influenced by a discordant idea introduced by the assumption that the privileges—conferred by qualification under the Act—of selling poison or keeping open shop for its sale, partake of the nature of trade monopoly. Then since all trade monopoly is held to be bad and since companies have been held, by the House of Lords' decision, to be outside the operation of the Pharmacy Act, the fallacious conclusion has been arrived at that there is no inherent impropriety in a company doing what no member of it could lawfully do as an individual. That position has some superficial plausibility; but it rests upon the false premiss that qualification under the Act gives a trade monopoly. Even Mr. Jesse Boot and the other promoters of companies, acting in opposition to the intention of the Pharmacy Act, have come to perceive that it is politic to cover their legal nakedness by employing legally qualified persons to conduct the business of selling poisons, though, according to the House of Lords' view that companies are outside the Act, companies are under no obligation to do that.

THE LORD CHANCELLOR—worried by Irish chemists—has gone further than that, and, as a lawyer—perceiving the legal anomaly, "contrary to common sense," of seven unqualified persons being able to do with impunity what no one of them can lawfully do—has proposed to bring companies within the operation of the Act, by subjecting their carrying on the business of chemists and druggists to restrictions, viz., necessity of employing legally qualified persons to conduct the business, conspicuous exhibition of those persons' names and making companies liable to penalties for offences under the Act in the same manner as individuals. That proposition, considered together with the accompanying provision

—that it shall be unlawful for a company to carry on the profession or business of a physician, surgeon, dentist, or midwife—points to the assumption of essential difference between the qualifications for those occupations and the qualification for carrying on the business of a chemist and druggist. Here again comes in the influence of the incoherent idea that the privileges of selling poison and keeping open shop for that purpose, conferred by qualification under the Pharmacy Act, amount to the grant of trade monopoly. Under the misleading influence of that idea the fallacious conclusion is arrived at that legislative regulation of the business of a chemist and druggist is to be carried out on a different line to that appropriate in the case of the other occupations. Here is a striking instance of that "wrong and unnatural" association of "incoherent ideas" which, according to a great thinker, is the source and foundation of the greatest errors in the world, since it "hinders men from seeing and examining" while it "fills their heads with false views and their reasonings with false conclusions."

THE ASSUMED DIFFERENCE of qualification under the Pharmacy Act from the other qualifications is however non-existent. They are all equally qualifications indicating scientific knowledge and technical skill, as well as certifying the possession of those requirements for the performance of certain duties. The common object of all of them is protection of the public interest. Consequently, exclusive exercise by qualified persons of the privileges conferred by any one of those qualifications is essentially necessary for the maintenance of their value in connection with the object for which they are required. The right to use statutory titles denoting the respective qualifications is one of those privileges; but in the case of chemists and druggists no greater reason can be urged for the exclusive exercise of that privilege than for exclusive use of any of the other privileges conferred by qualification. The Lord Chancellor's proposal to authorise a company—which cannot possibly be qualified—to use the titles reserved by the Pharmacy Acts to legally qualified individuals is therefore in itself a most cogent demonstration that his proposed plan of bringing companies within the operation of the Pharmacy Act is a mistaken one. The simple fact to be considered in that respect is that companies of unqualified persons—selling poisons or keeping open shop for that purpose and using titles denoting statutory qualification—are acting in direct opposition to the intention of the Pharmacy Acts, defeating their public object and improperly interfering with the privileges of legally qualified persons. The equally simple remedy would be to make companies liable under the Act, as individuals are, and nothing short of such a legislative provision can satisfy the requirements of the case.

SUCH AN ENACTMENT need not interfere with legally qualified persons, or prevent them from availing themselves of the advantages offered by the law of limited liability. Seven registered chemists and druggists might form a company, if that were desirable, to carry on business, say, as the Birmingham Drug Company of Registered Chemists and Druggists, Limited. Such a company—by reason of the qualification of its shareholders—would not be inconsistent with the object of the Act, would not violate its provisions, or be contrary to its intention, though it could not, as a person, call itself a chemist and druggist. The real and only objection to companies carrying on the business is when that is done by unqualified persons through misapplication of the Companies Acts. Even pharmaceutical chemists might carry on business as a company in the same manner and it is difficult to perceive why seven legally qualified medical practitioners might not carry on their practice, in the same way, as a Medical Aid Company, Limited.

ONE EFFECT OF CLAUSE 2 of the Companies Bill, if it were passed, would be to alter the significance of "keeping open shop" for the sale, etc., of scheduled poisons. Instead of the meaning—un-

doubtedly intended—that the person required to be qualified should be the proprietor of a business; that he should be responsible for the conduct of his business and for the actions of his assistants—whether qualified or not—greater significance would be given to the interpretation of the Pharmacy Act by the House of Lords; the legally-qualified person actually conducting the sale or dispensing of poisons—whether master or servant—would be regarded to a much greater extent as the keeper of a shop for all the purposes of the Act. In the eye of the law the proprietor of a business would be, to a great extent, a person of comparatively little importance so far as the public were concerned. Should that ever come to be the case there would be need for additional means of ensuring due regard for the requirements of public safety that would be specially adapted to such conditions and much more effectual than any now existing. At present it is almost impossible to ascertain whether the requirements of the Act are complied with in shops carried on by companies, or whether the dispensers or sellers of scheduled poisons, in such shops, are qualified.

THAT IDEA OF PLACING COMPANIES under the same legal conditions as individuals is the most mischievous delusion of all. Though some excuse may be made for such a notion being entertained by the Lord Chancellor, its adoption by chemists and druggists is quite inconceivable unless indeed they are hopelessly infatuated by the "Widow's Clause." If, for the sake of obtaining full advantage of that clause, unqualifiable persons, *i.e.*, companies, were placed in the same position as qualified persons, on condition of their employing qualified assistants or managers to conduct their business, necessary qualification of the proprietor of a business—the principle of the Pharmacy Act—would be sacrificed. There would then be no maintainable reason for objecting to any unqualified person carrying on the business of a chemist and druggist on the same condition.

EDUCATION OF THE PUBLIC in regard to all the points above mentioned is urgently needed in order to correct and remove erroneous impressions. Members of Parliament, Government officials, magistrates, medical men and a great majority of the public require to be instructed as to the intention, object and operation of the Pharmacy Act, as a measure having only the object of providing for public safety. As pointed out last October in an article defining "the task to be accomplished" every person registered under the Act, who is represented by a member of Parliament, should exercise his influence in that direction, either individually or in concert with others. Even among his own local colleagues ample opportunity might often be found for awakening in them more reasonable appreciation of the true meaning and intention of the Pharmacy Acts.

THE CARBOLIC ACID QUESTION has again come up for consideration in the House of Commons, Sir John Leng having asked the Secretary of State for the Home Department if he has observed that the Reports of the Registrar-General show that the scheduling of poisons has greatly diminished the number of fatalities from their accidental or suicidal use, but has not interfered with the use of potent poisons, such as arsenic and potassium cyanide, for industrial purposes, while from the Report for 1898, recently issued, it appears that the fatalities from carbolic acid alone number 206, being nearly as many as for the whole of the scheduled poisons. Sir John also asked whether the Council of the Pharmaceutical Society had passed a resolution declaring that carbolic acid in crystals, commercial carbolic acid, and liquids containing more than three per cent. of phenol should be deemed poisons and added to the second part of Schedule A of the Pharmacy Act, and whether, although that resolution was communicated to the Privy Council in July last, it had not yet received

the sanction of that body. In reply, Sir Matthew Ridley said he thought there could be no doubt that the number of deaths caused by carbolic acid is deplorably great, and shows that some remedy is desirable. He was informed that the Pharmaceutical Society had passed a resolution on the subject, but he must explain that the matter was by means a simple one. It is, however, he asserted, now under the active consideration of the departments concerned, in consultation with the Pharmaceutical Society, with good prospects, he hoped, of steps being taken in the direction desired.

AT THE ANNUAL MEETING on May 16, Mr. F. T. P. Wells intends to propose the omission from the pages of the *Pharmaceutical Journal* of everything that a large proportion of our readers consider to be most interesting. The terms of the notice he has sent in will be found in the advertisement columns of the Journal this week, and members of the Society may be able to judge from that what kind of periodical Mr. Wells would like the official organ to be. It is difficult to conceive, however, why he should wish to go back ten years to initiate the change he proposes, nor is it easy to imagine why he should have thought it necessary to emphasise his objection to reports of the Chemists' Defence Association by referring to that body twice in the notice. But, taking the notice as it stands, Mr. Wells apparently desires to destroy the value of the Journal as a means of conveying news and useful information of various kinds to his fellow-members, since he proposes that all such matter should be omitted from our pages and printed in a non-existent supplement. Possibly the whole thing is meant as a joke, though Mr. Wells is not usually regarded as other than a very austere-minded person.

A SPECIAL GENERAL MEETING is to be held at the conclusion of the business of the annual meeting, for the purpose of considering the manner in which the Society's Research Laboratory is conducted, a requisition to that effect, signed by members of the Society, having been received by the Council. The matter to be discussed will be introduced by Mr. E. N. Butt, who has given notice of his intention to propose: (a) That the Research Laboratory of the Pharmaceutical Society of Great Britain be reconstituted and placed under the control of a Special Committee, consisting of the President, the Vice-President (*ex-officio*), and two members of the Council, four Pharmaceutical Chemists not being members of the Council, and the Professors of Chemistry, Botany, and Pharmacy in the School of the Society; (b) That the Research Laboratory be used for the purpose of pharmaceutical investigations and research only, and be placed under the direction of the Professors of Chemistry and of Pharmacy; and (c) That the Special Committee shall have absolute power in selecting the Research workers, the subjects for investigation, and control the publication of the results of their investigations. All such workers should preferably be pharmacists and if necessary may be subsidised.

THE METRIC SYSTEM AND ITS COST is the subject of a recent article quoted by the *British Journal of Photography* from an American magazine, in which it is pointed out that more than twenty years ago it was reported to the Franklin Institute that, according to calculation, in a well-regulated machine-shop, thoroughly prepared for doing miscellaneous work and employing 250 workmen, the cost of a new outfit, adapted to new measures, would not be less than £30,000, or £120 per man. If new weights and measures were to be adopted all the scale beams in the country would have to be regraduated and readjusted, the thousands of tons of brass weights, the myriads of gallon, quart, and pint measures, and every measuring rule and rod of every description throughout the land would have to be thrown aside, and others, which the common mind cannot estimate, substituted. The great mass of English technical literature would become almost useless, and would have to be translated, so far as

weights and measures were concerned, into a new tongue which is strange to most English-speaking people. "To the teacher, to the closet scholar, to the professional man, to those who never handled a rule or a measure, but use weights and measures only in calculation, it may seem merely a matter of legal enactment; but to the worker, the dealers in the market-places, to those who produce the wealth and prosperity of the land, the question is a most serious one. Altogether, the ultimate benefits of the change proposed would be of less value than the damages during the transition. Those who choose to do so can use the metric system, and no one can object to it; but for the Government to require its people to use that, and no other, would be an arbitrary measure, which they would be neither willing nor able to bear."

A GUIDE TO THE DRUG TRADE, supposed to be contributed by a chemist, appears in the supplement to the *Grocer* for April 28. The writer suggests that, "within certain limits," a tradesman should allow his customers to decide what class of articles he shall sell them, but he advises the grocer to leave the drug business alone where possible. Continuing, he says: "If he touches it at all there are two ways of taking it up. He may take out a patent medicine licence and sell proprietary medicines and a few packed drugs, or he may go the whole hog—in other words, open up a drug department." The village grocer who has no chemist neighbour is told that he may be consulting his own interests and meeting a public want in adopting the first-mentioned course, and, as he is not likely to have to meet keen competition, he is promised an all-round profit of 20 per cent. on the medicinal articles he sells. But he is warned of possible troubles which may arise if the Pharmacy Act be infringed, and that his difficulties under the Sale of Food and Drugs Acts, Merchandise Marks Acts, and Excise laws will increase tenfold. The "cutting" of prices is not recommended, as it no longer "draws." Moreover, "If the grocer happens to be in a district where there is no cutting, and starts it, he will find that he will be immediately followed by some one or more of his neighbouring chemists, and, beyond being a game two can play at, the grocer will find that it is a game the other fellow has much better facilities for playing than he has."

A PROPERLY EQUIPPED DRUG DEPARTMENT, the grocer is informed by the candid chemist, is a very different thing to run, particularly if poisons are to be dispensed and sold. "In order to evade the law it is necessary for the grocer to become 'a limited company,' and, whether or not he is ethically justified in seeking to evade the law, he must consider beforehand whether or not it is worth his while to convert himself into such a company. "Taking it for granted that he has decided to do so, the company will find it necessary to employ a qualified chemist as salesman—not necessarily manager—for its drug department. The 'company' is under no legal obligation to do this, as companies are outside the Pharmacy Act, but any of its unqualified assistants who sell poisons may be prosecuted for the recovery of penalties at the rate of £5 a time." The strange anomaly is commented on, that an errand-boy may, without breaking the law, dispense a bottle of medicine containing strychnine or any other virulent poison, but the man who hands the medicine over the counter and takes the cash for it—that is, sells it—must be a qualified chemist. The fact is insisted upon, however, that it is selling, not dispensing, which constitutes the offence. In order that the law should be properly fulfilled it is recommended by this candid chemist that more than one qualified assistant should be employed, as one man cannot be in attendance at all times. "Of course, where only one qualified man is engaged poisons can be refused in his absence—an alternative which is anything but satisfactory." At the same time, it is remarked, since a qualified chemist can command a salary of £150 per annum outdoors, and his market value is increasing yearly, the drug department will be an expensive one to run. "It will be a department where more risks will

be run of breaking the excise, adulteration, and other laws than any other. The provisions for labelling and registering the sales of certain poisons will have to be carefully carried out, and within the last year or two stringent regulations for the storing and selling of poisons have come into force." In more ways than one, therefore, it is thought that the drug department is likely to prove to the grocer more a source of worry than of profit.

THE IDEA OF AN INTERNATIONAL PHARMACOPŒIA is not likely to be realised for some time to come, but the useful suggestion comes from Canada that some arrangement might be made to secure agreement between the standards of the British and United States Pharmacopœias. As the *Canadian Pharmaceutical Journal* points out, many similar preparations official in the two Pharmacopœias differ considerably, and an element of danger is thus introduced when persons travelling from Canada to the United States, or *vice-versâ*, carry with them prescriptions which they may require to have dispensed. "Accustomed in one country to have preparations of a certain strength, they find in the other that they are either very much stronger or weaker than those which they are accustomed to use at home." Thus, the strength of tincture of aconite, B.P., is 1 in 20, whilst that of the U.S.P. preparation is 1 in 2.75, and in the case of other potent preparations there are differences almost as great. Thus, considerable variation exists in the respective tinctures of belladonna, cannabis indica, cantharides, cimicifuga, colchicum, digitalis, gelsemium, hydrastis, hyoscyamus, opium and strophanthus, as well as in the case of certain potent extracts. The difficulty does not appeal to British pharmacists so forcibly as to their Canadian cousins, but it does not appear unreasonable to ask that, so far as regards the strength of potent drugs and preparations at least, the pharmacopœias of the English-speaking peoples should fall into line.

ELECTRIC LIGHT WIRES, according to Mr. A. A. C. Swinton, who writes to *Nature* on the subject, collect much more dust when the switch is in the negative conductor than when it is in the positive one. He therefore attributes the collection of dust upon electric light wires and fittings to electrostatic attraction rather than to air currents due to thermal causes, as in the case of hot water pipes. The negative conductor of a street supply tends always to earth itself, whereas the positive may be nearly 200 volts above the potential of the earth. When the switches are on all the wires are under similar conditions, but when they are off the conditions differ greatly, wires which have the switch in the negative being nearly at 200 volts potential above the earth, and it is then that the accumulation of dust appears to take place. In the case of electric light cords under the same conditions, except that some had the switch in the negative and the rest in the positive conductor, the latter remained practically clean after a few months' use, whilst the others gathered dust to an extraordinary degree.

THE JOURNAL ACCOUNT for the past year compares very favourably with that for the previous twelve months, the net cost to the members of their official organ for 1899 being £1,675 19s. 7d., as against £2,252 3s. 10d. for 1898, *i.e.*, a saving of £576 4s. 3d. on the year's working, or, including the postage, of £499 12s. 10d. That result is the more satisfactory because the number of subscribers to the Society, to all of whom the Journal is sent week by week, was 6,410 last year, as against 5,402 the year before. A large number of copies are also sent every week to honorary and corresponding members, learned societies, etc., but the net cost of the Journal for the past year to each subscriber to the Society was less than eight shillings, including postage. For the year 1898 the net cost per head was eleven shillings and fourpence, or nearly forty-two per cent. more than last year. It is not always advisable to prophesy, but it is safe to say that the financial position for the current year will be quite as good as last year's, and the probability is that it will be much better.

POLITICAL GOSSIP.

SIR JOHN LENG, as befits a man of enterprise, does not readily acquiesce in the cult of *festina lente*, as practised in Departments of the State. Hence his interrogation of the Home Secretary on Monday concerning the delay in scheduling carbolic acid as a poison. The reply is printed at page 470 of the present issue, and is of a satisfactory nature, since it indicates a desire on the part of the Government to deal with the indiscriminate distribution of this dangerous substance by making use of the restrictive machinery provided by the Pharmacy Act, 1868. Sir John has obviously been inspired by a registered person who imagined the Pharmaceutical Council had gone to sleep on the question, and Sir Matthew Ridley's answer is very valuable in revealing the fact that the Council is quietly doing its duty, and is quite in touch with the Privy Council and the Board of Agriculture. So far one may thank Sir John Leng, and entertain a feeling of modified gratitude for his pharmaceutical prompter, but there is a depressing aftermath of reflection that the affairs of pharmacy cannot be in a way to flourish to any appreciable extent whilst evidences of a lack of confidence in the Council crop up from time to time. In Parliamentary matters, at any rate, chemists have everything to lose and nothing to gain by dissociating themselves from their executive body. As the Home Secretary said, the task of settling the carbolic acid question is by no means simple, and the majority of registered persons do not realise, and cannot be expected to realise, the difficulties which those at the head of affairs are called upon to surmount.

THE REGISTRATION OF FIRMS BILL, after many vicissitudes, secured a second reading on Wednesday afternoon. To briefly recapitulate, the objects of the measure are to secure the systematic registration of the names and addresses of persons in business who do not trade under their own names, and also to provide for a cheap and ready means of inspecting the Register so formed. As a means of promoting commercial honesty and of discouraging the Fregoli-like permutations of shadowy adventurers, there is nothing like a judicious application of publicity, and that is just what Mr. Emmott's Bill provides. It might almost be called a measure for enabling traders to give credit safely. There appeared to be no opposition to the Bill, and it received even the blessing of the President of the Board of Trade, but that Minister impressed upon the House the necessity for examining closely the possible effects of the proposed registration, and talked so effectively about temporary ventures, the law of partnership, goodwill, and the cost of working the Register, that the Bill was eventually referred to a Select Committee instead of going to Grand Committee in the ordinary way. The member in charge of the Bill (Mr. Emmott) agreed—he could hardly do otherwise—but he expressed the hope that the proceedings of the Committee might be expedited so that a reasonable chance of passing the Bill this Session could be afforded. We share that hope, but, knowing the ways of Select Committees, are not sanguine.

IN CONNECTION with this Bill, it is interesting to note that the Vice-President wired to Mr. Emmott on Wednesday, to the effect that the Pharmaceutical Society, which was charged with statutory duties in the interests of public safety, desired to express the opinion that, apart from its commercial value, the Registration Bill would facilitate the administration of the Pharmacy Act and similar salutary statutes. That action will no doubt commend itself to a good many pharmacists throughout Great Britain.

THE COMPANIES BILL is not yet in sight of its second reading. Last Thursday week it was on the paper for the consideration of the re-assembled House, and was put down again on the following Monday, only to be postponed till May 7. Mr. Swift MacNeill evidently means to take a prominent part in the debate when it arrives, and meantime he is preparing himself for action by inter-

rogating Mr. Balfour on the subject of company directors who are also members of the Cabinet. As we go to press the ubiquitous member for South Donegal is due to point out that eleven members of the present Cabinet hold seventeen directorships, and that fifteen other Ministers hold twenty-five directorships among them. He will ask whether this is quite the proper thing, seeing that some of the companies thus represented are or might be carrying out Government contracts. Other signs of activity have been afforded by Mr. Kimber, who has tabled a notice opposing Clause 27 of the Companies Bill and has held an influential meeting in the House to further his views, and also by a petition from Birmingham for alteration of some of the clauses. Mr. Faithfull Begg's Companies Acts Amendment Bill is still opposed, and though it stood for hearing on Wednesday, it could not be taken.

PHARMACEUTICAL SOCIETY.

"FIRST" EXAMINATION RESULTS.

A meeting of the Board of Examiners for England and Wales was held on Tuesday, May 1.

The report of the College of Preceptors on the examination held on April 10, was received. 705 candidates had presented themselves for examination, of whom 371 had failed.

The following 334 passed, and the Registrar was authorised to place their names upon the Register of Apprentices or Students:—

Aitken, Arthur Campbell; Edinburgh	Cope, Arthur Geo.; Congleton
Amundsen, John I.; Sunderland	Coulthard, George; Dumfries
Andrews, Arthur; Billingham	Couper, John McD.; Edinburgh
Ashforth, Frank P.; Whitley Bay	Couper, Robt. Jno. A.; Glasgow
Ashworth, Wilfred; Blackpool	Cowie, Alexander; Buckie
Atkinson, Wm. A.; Grimsby	Cresswell, Hy. Edwin; London
Badgett, Thomas John; London	Crisp, Edward; Cambridge
Bagshaw, Harold; Oldham	Crompton, Alexr.; Ashton-under-Lyne
Baker, E. H. T.; Newcastle-on-Tyne	Daniel, Edwd. Walter; Swindon
Baker, Henry; Didsbury	Davies, Francis W.; Carmarthen
Balch, Stanley S.; Chippenham	Davies, Wm. J.; Ton Pentre
Barnaby, Charles Hy.; Nottingham	Davison, Wm. Edwd.; Morpeth
Barr, Geo. Hamilton; Greenock	Dean, Arthur A.; Warwick
Barrett, William; Torquay	Deeth, George; Kirkcaldy
Bedell, Margaret I.; Sandgate	de Faye, Geo. K.; Jersey
Beilby, Cyril; Nottingham	Dewhurst, Joseph; Preston
Bell, Matthew Wm.; Stockton-on-Tees	Dickinson, David T.; Chester
Bell, Sydney; Brigg	Dickson, Robert; Glasgow
Betts, Frank E. J.; Herne Bay	Doel, Geo. Tilling; High Wycombe
Beveridge, Alexr.; Kinross	Dwyer, Ernest; York
Binnall, Alfred A. B.; Tunstall	Dyson, Joseph; Ashton-under-Lyne
Blair, John; Millom	Edgar, Duncan, J.; Lenzie
Blenkinship, Francis T.; Appleby	Edis, Sarah W.; Liverpool
Blunt, Thomas Saml.; Coventry	Elson, Thos. Geo.; Tiverton
Bodley, Wm. Geo. Price; Simpson	English, Geo.; Huddersfield
Bolus, Gerald; Derby	Entwisle, Herbert A.; Wakefield
Boon, Francis Wm.; Fenny Stratford	Ethierington, Leonard; Royton
Brander, Bruce M.; Banff	Evans, Arthur; Wrexham
Brennan, Dorothea W.; Derby	Evans, Percy; Carnarvon
Brooks, Frank; Salisbury	Evans, Robt. A.; Denbigh
Brooks, Thomas; Sheffield	Evetts, Ellen E.; Birmingham
Brown, Richd. R.; Padiham	Ferguson, Peter B.; Port Bannatyre
Brown, Thos. McM.; Dumfries	Field, Ernest H.; Cambridge
Brown, Wm. Wilson; Buckpool	Finlayson, James; Alness
Brown, Winifred M.; Langley	Fordyce; Effie Ker; Edinburgh
Browning, A. W. B.; New Brompton	Fox, Chas. Wm. N.; Woodford Green
Bull, Edwd. Regd.; Newport Pagnell	Francis, Wm. D. C.; Llanelli
Burt, May; Croydon	Froggatt, Ernest S.; Buxton
Byers, Robert; Felling-on-Tyne	Fyfe, Hugh McG. F.; Glasgow
Byth, John; Aberdeen	Fyfe, Peter G.; Aberdeen
Callen, John; Partick	Gadsby, James; Nottingham
Campbell, Flora; Birmingham	Galbraith, Thos. H.; Glasgow
Camplin, Harold R.; Southampton	Gardner, Albert E.; Lancaster
Cartledge, Percy C.; Newark-on-Trent	Garner, John W.; Horncastle
Cashmore, Frank Guy; Warwick	Gelling, Edwd. C.; Douglas, I.M.
Caulton, John S.; Marehay	Gibbons, Charles; Liscard
Chandler, Francis Le C.; Pendleton	Gilliatt, Alice; Boston
Chapman, Charles N.; Grimsby	Glass, Henry D.; Edinburgh
Chapman, James E.; Brumby	Glenny, Sophia G.; London
Chase, Annie Selina; Birmingham	Gordon, Wm. A.; Aberdeen
Cheesman, Clifford G.; Bridlington	Gower, John; Burry Port
Cheshire, John; Grantham	Grange, Hy.; Northwood
Chipp, James; London	Grant, Alfred E.; Frome
Clark, Alexander; Fraserburgh	Gray, James O. W.; Strichen
Clark, Daniel; Glasgow	Gregg, Wm. Hy.; Barnoldswick
Clark, Wm. Davie; Portsoy	Gregory, Brooke Wm.; Kings Lynn
Clarke, Frank E. S.; Windsor	Gunn, John; Duns
Clarkson, Ellen Lucy; Putney	Hague, Harry P.; Birmingham
Cochrane, James A.; Leith	Hall, Thos. Hy.; Bath
Cockeram, Arthur H.; West Malvern	Halley, James; Kirkcaldy
Cockroft, Mildred C.; Manchester	Hamblin, Walter J.; Trowbridge
Coe, Percival H.; Buxton	Hambling, Annie B.; Eltham
Cooper, Sydney H.; Birmingham	Hamer, Thomas; Heywood

Harden, Ernest C.; Newton Abbot
 Hardingham, Arthur F.; London
 Hardwicke, Eva E.; Bury St. Edmunds
 Hartley, Tom H.; Burnley
 Haughton, Cyril F.; Blackburn
 Haworth, Dionysius; Burnley
 Hay, James Jno. G.; Lerwick
 Hayes, Percy W.; Preston
 Henderson, Christina McL.; Montrose
 Henshaw, John L.; Alsager
 Herville, Douglas; Parkstone
 Hill, Albert F.; London
 Hobson, Joseph J.; Blackburn
 Hedkinson, R. G.; Newton-le-Willows
 Holmes, Ernest S.; Hull

Certificates by approved examining bodies were received from the undermentioned in lieu of the Society's Examination:—

Dixon, Charles Herbert; London
 Gardner, William Temple; Bournemouth
 Hooper, Elsie Seville; London
 Weston, William K. S.; Exmouth

The questions set at the First Examination were published in the *Pharmaceutical Journal* for April 14, p. 396.

The following is a list of the centres at which the examination was held, showing the number of candidates at each centre, and the result:—

	Candidates.				Candidates.		
	Examined.	Passed.	Failed.		Examined.	Passed.	Failed.
Aberdeen.....	36	20	16	Lancaster	9	4	5
Birmingham	30	15	15	Leeds	27	10	17
Brighton	12	6	6	Lincoln.....	14	4	10

NORTH BRITISH BRANCH.

A meeting of the Executive of the North British Branch of the Pharmaceutical Society of Great Britain was held in the Society's House, 36, York Place, Edinburgh, on Friday, the 27th inst., at 11.30 a.m., Mr. PETER BOA in the chair.

Present: Messrs. Ayre, Boa, Bowman, Cowie, Currie, Fisher, Gilmour, Henry Johnston, Kerr, McLaren, Mitchell, Russell, Storrar, Strachan, and Tocher.

The CHAIRMAN referred to the loss sustained by the Executive in the death of one of their number, Mr. Burley, in March. It being so near the end of the Executive's year of office, no steps had been taken to fill the vacancy. He also referred to the deaths of Sir Douglas McLagan, Mr. Daniel Frazer, and Mr. James Watt. He proposed that they record an expression of regret in their minutes. This was seconded by Mr. JOHNSTON and unanimously agreed to; as was also a proposal that an excerpt be sent to Mrs. Burley.

The report of the General Purposes Committee dealing with some repairs and payment of accounts was read and adopted.

The Executive then went into committee to consider the Annual Report to the Council, which was adopted and ordered to be forwarded to the Council, on the motion of Mr. KERR, seconded by Mr. RUSSELL. It was also resolved to reserve for consideration a suggestion by Mr. Gilmour that one of the sessional scientific meetings might be held in the forenoon, when country members could attend.

It was moved by Mr. BOWMAN, and seconded by Mr. McLAREN:—

That the next election of Executive take place on Friday, June 22, 1900, and that the Chairman and Vice-Chairman act as Scrutineers of the voting papers, with power to add to their number.

Mr. CURRIE moved that the election take place on June 15, 1900. This was not seconded, and the first motion was agreed to.

Mr. COWIE moved:—

That a second teaching examiner in chemistry should be elected on the Board of Examiners for Scotland.

He made this motion on principle and without any reference to individuals. Teaching examiners being always engaged in the

special work of the examination were in a much better position to do the work than any person engaged daily in another occupation. He had been told that day that teaching examiners would examine candidates in glass-blowing, but they need have no fear that they would be competent to examine according to the syllabus. No matter how great the ability of an ordinary pharmacist might be they were at a great disadvantage, for it could not be expected that they would keep themselves abreast of all the advances in chemical science. All admitted that the appointment of teaching examiners had been a great advantage. But having a teaching examiner and a pharmacist both examining in chemistry made the position such that candidates were apt to be examined in two different ways. Candidates declared that this was so, and that they much preferred to be examined by a teaching examiner even though they failed. Mr. Carteighe had recently said, it was alleged, that teaching examiners were harder on students; but that was the very opposite of the fact. He agreed with that, and thought teaching examiners were easier with candidates. They had two teaching examiners in London, and he thought they ought to have the same in Edinburgh. He only wanted this to hold in regard to chemistry. In the case of materia medica and pharmacy they could only have ordinary pharmacists. In botany the examination was carried through satisfactorily by one teaching examiner. He emphasised the point that there were two teaching examiners in chemistry in London and only one in Edinburgh, and hence there must be a difference in the examination in Scotland. If this proposal were carried out it would be of benefit to the Society as well as to the candidates.

Mr. RUSSELL in seconding the motion, said he did so on principle with a view to securing uniformity in examination. Chemistry and botany being scientific subjects, a teacher was a better examiner than a chemist engaged in business. He made no reflection on any pharmaceutical examiner, but rather the contrary. It was highly creditable to any ordinary pharmacist if he could come anything near the standard of a teaching examiner. As to the teaching examiner being harder than the pharmaceutical examiner opinion was quite the other way. Students preferred a teaching examiner and complained especially of the examination in organic chemistry. He desired to see uniformity in the examination, and he thought they were called upon to give heed to the feeling among students that there is a difference in the examination as it is at present conducted.

Mr. FISHER moved :—

That the existing arrangement for appointment of examiners in chemistry be retained.

He did not think any adequate reason had been given for the proposed change. They should not extend the plan of teaching examiners, else they would remove the inducement which prompted men to take the higher pharmaceutical qualification in anticipation of filling the office of an examiner some day. He did not think teaching examiners were easier, and the examinations were being made so stiff that it was almost impossible to get apprentices. If they went in the direction of the motion they would not get young men to enter the profession at all.

Mr. KERR seconded the amendment, and said he agreed with what Mr. Fisher said.

Mr. CURRIE said this was a matter of great importance, and he favoured the motion of Mr. Cowie. In doing so, he made no reflection on any examiner. There was no fear of taking away the inducements mentioned by Mr. Fisher for passing the Major. He would not say a teaching examiner was easier, but he had a broader grasp of the subject, and could thus better test a student's knowledge. He hardly thought it possible for a pharmacist engaged in business to keep ahead of chemical knowledge. They heard on every occasion that students complained of a difference in the two examinations. Of course, it did not do to attach too much

importance to what candidates said. He thought it would improve matters if two teaching examiners were appointed.

Mr. GILMOUR said he would have liked to support Mr. Cowie but he thought they could not do much in that direction till they had a compulsory curriculum. Mr. Cowie rather gave away his case by saying he was content with non-teaching examiners in other departments. A pharmaceutical chemist ought to be competent to examine in chemistry. It was all very well to have the University side of chemistry in the examination, but they were training men to dispense, and must not miss altogether the pharmaceutical side. The teaching examiner alongside of a pharmaceutical examiner, was, he thought, the proper plan in the present position of matters. It was better and safer to have both sides. They in the country had experiences of incompatible prescriptions written by graduates who had only got the scientific side. He supported the amendment.

Mr. BOWMAN said he could have supported Mr. Cowie if he had said "scientific" instead of "teaching" examiner, but he could not support the motion as it stood because it excluded pharmaceutical chemists.

Mr. HENRY said he could not support Mr. Cowie's motion. The subject should be looked at in a wider light. He had every sympathy with students. On this question, however, their opinions should not affect the decision. Students had likes and dislikes, and a "cranky" teaching examiner might be appointed, and at once there would be a demand for a pharmaceutical examiner. He was glad to hear the present teaching examiners were appreciated by the students. He was averse to the control of the examinations passing out of the hands of the Society, and this policy might have that result, as it might be said a certificate from these examiners would be enough. Too much of the teaching element might make the questions more scientific and technical than was required. The examination was intended to test a man's capacity to conduct the business of a chemist and druggist. They were not training iron smelters, gas engineers, or glass manufacturers. He thought pharmaceutical chemistry should not be lost sight of, and therefore he thought a pharmaceutical examiner in chemistry was necessary.

Mr. MITCHELL said he thought they could easily get pharmacists in England who could examine in chemistry, and some Scotch pharmacists should also be elected on the London Board. The present unsatisfactory state of things were due to mushroom schools where no chemistry is really taught. Any pharmacist who had had a proper training and a regular course of chemistry, such as a Bell or Manchester scholar, would make an efficient examiner in chemistry.

Mr. TOCHER said, until the institution of a compulsory curriculum they must stick to the present plan.

The CHAIRMAN said he might be allowed to say that to hand over chemistry entirely to outside examiners would remove that pharmaceutical element which maintained a certain amount of sympathy, and that was undesirable. It prevented the examination getting into a rut to have a teacher and an ordinary pharmacist associated in the chemical work of the examination. The obvious reply to the reference to there being two teaching chemistry examiners in London was that the board there was twice the size of the Scotch board. Candidates' preferences had to be regarded with a certain amount of caution. Both teaching and pharmaceutical examiners kept strictly by the syllabus. Several pharmacists were engaged in teaching candidates for examination, and he thought a pharmacist was as competent to examine in as he was to teach chemistry.

Mr. COWIE having replied, a vote was taken, when twelve voted for the amendment, and three for the motion.

The amendment was therefore declared carried.

CHEMISTS' ASSISTANTS' ASSOCIATION.

On Thursday, April 26, a meeting of this Association was held at 73, Newman Street, London, W., the PRESIDENT, Mr. F. W. Gamble, in the chair. There was a larger attendance than usual, the attraction being a paper by Professor H. G. GREENISH, F.I.C., F.L.S., Professor of Materia Medica and Pharmacy to the Pharmaceutical Society of Great Britain, which will be published in full in an early issue of the Journal. The subject was—

PHARMACOGNOSY—SCIENTIFIC AND APPLIED.

In introducing the subject, Professor GREENISH stated that a short time ago a well-known lecturer on pharmacology, finding it necessary to distinguish between pharmacology and pharmacognosy, defined the latter thus:—

By pharmacognosy we mean the recognition of drugs by their physical and chemical characters with the detection of adulteration. It means practically the same thing as "spotting specimens," an expression in common use among students.

That definition exhibited such an ignorance of what pharmacognosy really is, that, believing a similar impression of the nature of pharmacognosy to be by no means unusual, he sketched an outline of a paper on the subject which, unfortunately, had to be set aside to make room for other more pressing duties. About the same time, and a little later, several addresses and papers bearing on the subject were published, mostly in German works and journals. The present occasion having afforded him an opportunity of taking up his deferred sketch, he had incorporated some of the observations of other writers and now offered it as an expression of his views on the subject. He then quoted Professor Flückiger's definition of pharmacognosy as:—

The simultaneous application of various scientific disciplines with the object of acquiring a knowledge of drugs from every point of view.

He thought that definition might be accepted as correct and proceeded to deal with the scientific disciplines necessary to aid the pharmacognosist in acquiring a complete knowledge of drugs, arranging the requisite steps in the order of their importance, and considering each step from a scientific as well as from a practical point of view, in order to make clear what knowledge it is desirable to acquire and how that knowledge can be made useful in the daily life of the pharmacist or druggist. He dealt first with the examination of drugs, as being of primary importance, because without careful examination it is impossible to become familiar with a drug so as to describe it properly and thus render the labour of the pharmacognosist useful to others. Not only must the macroscopical characters of the drug be carefully ascertained, but the minute structure must also be investigated by means of the microscope, the classical researches of Schleiden, Berg, Vogl, Tschirch, and others being mentioned, as showing how much is to be learnt in that way. After dealing with the scientific investigation of the drug, Professor Greenish went on to show that a knowledge of the anatomy of drugs is necessary from a practical as well as from a scientific point of view, as being the only definite means of identifying powdered drugs and foodstuffs and of ascertaining their purity. He then referred to the method of description so that a worker's results may be available to others, and went on to discuss the investigation of drugs with a view of isolating their chemical constituents. The botanical source of drugs was next considered as contributing to a complete knowledge of a drug and also as affording an indestructible criterion to which reference can always be made when the question of identity is raised. The geographical source was also considered, the difficulties of ascertaining the true geographical source being pointed out. The production and preparation of drugs and the many commercial varieties and methods of cultivation then came under consideration; also the history of drugs. In concluding his paper, Professor Greenish said it was the duty of the pharmacist to remember that of all persons he alone is qualified from the outset to deal with the problems of scientific and applied pharmacognosy.

His scientific training in chemistry, botany, and pharmacognosy, and the technical training that is coupled with the daily handling of drugs, fits him as no other is fitted to undertake such work. Neither the chemist nor the botanist is a competent expert in pharmacognosy. The field is the pharmacist's; chemistry, botany, geography, and all the sciences and disciplines serving as means to enable him to cultivate it. He found himself in complete sympathy with Professor Tschirch and other Continental authorities in advocating that pharmacognosy should occupy a much more important position in the education of the pharmacist than is at present the case.

The PRESIDENT, commenting on the paper, said that what they had heard that night emphasised the regret some of those present felt that the course of lectures on pharmacognosy, which was at one time proposed, had to be abandoned. He thought at the time the proposal was made that it was an admirable move on the part of the authorities; he was sure all present would regret that the lecture they had listened to was not to be followed by others. Speaking of the literature of pharmacognosy, the President said it was curious that so little has been done by English workers; so far as he knew, Professor Greenish was the only Englishman who has taken up the subject thoroughly in recent years. He certainly thought it should be taken up more by English pharmacists. Professor Greenish had referred to the study of commercial varieties of drugs; he (the speaker) had seen the papers set for the Pereira Medal examination, and he was surprised to see that one of the questions dealt with the different varieties of liquorice root. The President went on to speak as to the terms used in botany, and entered a mild protest against the introduction of so many different and, to his mind, needless terms. He thought it would be a slighter tax upon the memories of all students of botany if such terms, for instance, as "ecological significance"—a term used in one of the Council prizes examination papers—were deleted from the botanist's vocabulary. He then referred to the controversy respecting the active principles of such substances as digitalin and digitoxin, scopolamine and hyoscyne; he thought that perhaps such difficulties would have been avoided if the study of pharmacognosy had received more careful attention. He felt that he was expressing the feeling of the meeting in saying that all present were much obliged to Professor Greenish for his valuable and extremely interesting paper.

Mr. J. A. DEWHIRST said that the paper raised many interesting points; one was in regard to the functions of alkaloids in plants and the opinion of some botanists that they are simply the excreta of the plant for which it has no further use. He was inclined to think that plants are not in the habit of making things they have done with into complicated molecules, as is the case in cinchona bark. He thought that the alkaloids are of great use to the plant. He then instanced a case which had occurred with himself during the week showing the necessity for careful observation. He had under examination a piece of horseradish root with young leaves very finely divided; at first, he thought he had discovered a new alkaloid, but on closer examination he came to the conclusion that it was probably choline—a basic substance that occurs in a few plants but lacks some of the characters of an alkaloid.

Mr. T. MORLEY TAYLOR echoed the President's regret that the proposed post-graduate course of lectures on pharmacognosy had fallen through for want of support by the authorities. It seemed to him that Professor Greenish's subject was a very suitable one for a post-graduate course.

Professor GREENISH, in replying to the President's remarks, agreed that there is no necessity for many of the terms employed in botany and pharmacognosy. In regard to the post-graduate course of lectures, the matter had been discussed by the staff at the "Square," and it was decided that for the present it was not advisable to establish them. As to there being so few English contributors to the literature on pharmacognosy in recent years, he attributed the cause to the fact that in England the microscopic work has not been taken up by investigators; it is only within

the last few years that English botanists had devoted their attention to botanical anatomy. He believed it would be taken up more in the future. As a matter of fact, he understood that the forthcoming German Pharmacopœia proposes to give more details to the structure of drugs, so that the pharmacist who buys powdered drugs may be able to recognise them. With regard to digitalin and digitoxin, hyosine and scopolamine, he did not know what to say. They could only watch the controversy and be of the opinion of the last speaker. In accepting the statements of the different workers, they did not know whether they might not be controverted. As to the alkaloids in cinchona bark, he thought an interesting point for investigation would be to ascertain the amount of alkaloids in the dead portions of bark and leaves. Mr. Dewhurst's remarks about horseradish emphasised the necessity for careful systematic examination and the necessity for making a drawing of sections; it also showed the value of making good use of one's eyes and systematising the isolated observations.

Mr. C. MORLEY, in proposing a hearty vote of thanks to Professor Greenish, strongly objected to the definition of pharmacognosy as "spotting specimens."

Mr. H. HYMANS seconded the motion, and added his protest to the use of long and antiquated words.

The vote of thanks was accorded by acclamation, and Professor GREENISH having replied, the meeting adjourned.

ROYAL INSTITUTION.

A discourse was given on Friday evening, April 27, by the Right Hon. Lord KELVIN, whose subject was:—

NINETEENTH-CENTURY CLOUDS OVER THE DYNAMICAL THEORY OF HEAT AND LIGHT.

The following are brief notes of the discourse. There are only two clouds which obscure the beauty and clearness of the dynamical theory of heat and light. This dynamical theory holds that heat and light are modes of motion and are subject to the laws of force and matter in virtue of matter being set in motion by force.

The first cloud came into existence with the undulatory theory of light, and received the support of Fresnel and Thomas Young. It involved the problem—How could the earth move through an elastic solid, such as the luminiferous ether was supposed to be, far more easily and freely than the wind through a grove of trees?

This cloud hung heavy and undispersed, largely through the work of Michelson and Morley, co-workers with Lord Kelvin in this field of research. Michelson made a beautiful experiment to find whether the ether passed through the earth and whether the earth passed freely through the ether. The results of the experiments, contrary to what Lord Kelvin had hoped, showed clearly that the one does not pass freely through the other. There seems, therefore, no way of escape from this cloud.

The second cloud over the dynamical theory was the Maxwell-Boltzmann doctrine of the partition of energy. In this case the outlook is less sombre, since the fact that the doctrine does not derive support from mathematics proves it to be untrue. Lord Kelvin did not know of anyone besides himself who had attacked it; on the other hand, his own views had been attacked by Poincaré, Lord Rayleigh, and other distinguished mathematicians, though none of his assailants had proved the proposition.

Lord Kelvin proceeded to give some illustrations of the doctrine by means of balls connected by elastic and suspended in the air. He emphasised the labour and difficulty of putting the doctrine to experimental tests. Its mathematical consequences, indeed, sometimes appeared to be contrary to common sense, but that was not conclusive, for, said the lecturer, "mathematics must never be judged by common sense; the imagination is no guide."

Paley, in his evidences, remarks that in mathematics if a simple case be taken to prove a theory and it be found to hold good that

does not prove the theory, whereas if a simple case does not hold good it at once disproves the theory.

In spite of the difficulty of the subject Lord Kelvin has recently, with the aid of one of his secretaries, worked out a large number of cases, indeed, many hundreds, and has obtained results that do not agree with the Maxwell-Boltzmann doctrine. The simple way, therefore, to destroy this second cloud over the dynamical theory is to drop the destructive general conclusion of the Maxwell-Boltzmann distribution.

Lord Kelvin brought forward some speculations as to the structure of atoms, upsetting the notion that an atom is indivisible by supposing that atoms belied their name by being composed possibly of thousands of minute particles.

In conclusion the probable nature of the ether received attention; it is regarded as a true imponderable outside the law of universal gravitation. It may have mutual gravitation between its parts, and is considered to be perfectly homogeneous.

LIVERPOOL CHEMISTS' ASSOCIATION.

A good attendance honoured the last meeting of the winter session of this Association, held at the Royal Institution on Thursday, April 26. The chair was taken by the PRESIDENT, Mr. A. S. Buck, and four new members were elected—viz., Messrs. C. A. Maries, J. A. Thomas, W. H. Clubb, and J. T. Birchall.

The frequent acidity of samples of crystallised ammonium benzoate was alluded to by Mr. R. C. COWLEY, who accounted for it by the well-known fact that solutions of ammonium salts, particularly those of organic acids, were apt to become decomposed, or, rather, dissociated, even when every care was taken in their crystallisation and concentration. Some remarks were offered by Mr. A. C. ABRAHAM in confirmation of this, and Mr. H. WYATT, jun., said that the colour of a sample of ammonium benzoate was an indication as to the acidity and insolubility to be expected—the darker the colour the more insoluble the salt.

The PRESIDENT then called upon Dr. Symes to open a discussion on

COMPANIES AND PHARMACY.

Dr. SYMES said that the subject on which he had been asked to open a discussion had received considerable attention of late, and so much had been said and had been written on it in the journals devoted to pharmacy that scarcely anything new could be added. He felt, however, that it was quite right that an important body like the Chemists' Association of Liverpool should hold a meeting for the purpose of enabling its members to record their views on this vexed question. He took considerable interest in the Pharmacy Act, 1868, at the time of its passing, and he could assert, without fear of contradiction, that its original intention was to provide for the personal qualification of everyone who should carry on the business of pharmacy on his own account. The object of the Government was to restrict the sale of poisons, and that of pharmacists to advance pharmaceutical knowledge, both with the object of protecting and benefiting the public by means of qualification of those who should enter into the calling and conduct or control the sale of these dangerous substances scheduled as poisons. As is well known, companies were never contemplated or thought of in drafting the Bill which subsequently became the Pharmacy Act. He then went on to point out that the Act had been considerably modified by certain legal decisions—notably, that in which the Pharmaceutical Society instituted proceedings against the London and Provincial Supply Association, in which the decision in the House of Lords held companies to be outside the Act and unaffected by it except Section 17. The Wheeldon case, in which it was decided that except in Section 17 the seller was the person who handed over the poison to the customer. This was a decision in favour of the Pharmaceutical Society, who prosecuted, and many similar cases have been successfully prosecuted. But this difficulty

had always presented itself to his mind. If a qualified assistant was the responsible person in every particular except the name of the label, where did the personal qualification of the responsible proprietor, which was the undoubted intention of the Pharmacy Act, come in? The Piper case was also an important one, but the two decisions previously mentioned sapped the very foundation of the Pharmacy Act and re-established to a great extent "free trade in poisons." By the original omission and then subsequent decisions, companies of unqualified persons had assumed and maintained a right for many years to carry on the business, and the vested interest had become so great there seemed no hope of being able to re-establish the original intention of the Act. He thought possibly a case would lie against an unqualified individual who, converting himself into a company, used as a director his name in conjunction with the title which could only be acquired by examination. But in the case of a company which had a registered chemist as part of its name this would probably fail. He looked on Clause 2 of the Companies Bill as one which must be thoroughly opposed, as it was unjust to pharmacy and dangerous to the public weal. He said some eighteen months ago that the Council of the Pharmaceutical Society drafted suggestions for an amended Pharmacy Bill, and sent it to the Lord Chancellor in the hope that he would see his way to adopt it, or some modification of it, as the basis of a Bill to be introduced by the Government. If this Bill had been accepted and had become law, it would have placed pharmacy on a sound basis, and would have given it a position equal to that held in any Continental country. Those suggestions for a Bill had been published, and yet it had been said that the Council had done nothing at this critical period for the interests of pharmacy. No reply whatever had been received, but instead of the "bread" which had been asked for a "stone" had been offered, and that "stone" had been refused. He did not think that any satisfactory modification of Clause 2 could be obtained, and he felt it would be better to get it deleted and go in, at an early date, for an amended Pharmacy Act. The essential thing was, Mr. A. C. ABRAHAM opined, to get to know what the Pharmaceutical Council intended to do, and until this was definitely known it was of little use to pass any resolutions of confidence, or the reverse, at similar meetings to the present one. Many of the members of the Council seemed to want the moon, and were not, apparently, prepared to take anything less, and, moreover, a certain section had frittered away to no purpose a considerable amount of the Council's valuable time. What was wanted was a strong Council with a firm belief in and a clear understanding as to what it wants, and one which will not ask things of an impossible or Utopian nature, but will show an absolutely united front and be determined to work hard to attain its carefully considered ends. He sincerely hoped the election which would soon take place would provide them with such a Council. The opinions he held regarding the subject of discussion were definite, and he was prepared to state them, but not at the present juncture.

Mr. JOHN SMITH then rose and said that, in his opinion, they had first to support the Council in its opposition to Clause 2 of the Companies Bill, and to do what they could to assist the Council in making its opposition effective. There were, however, several points which it would be well to bear in mind when considering the matter. The Act of 1868 was really a Poisons Act, and it must be the aim of the chemist to get a true Pharmacy Act through Parliament. Since for years companies of unregistered persons had been selling poisons in the shape of compounds of a so-called patented nature, or other packed goods, it would be useless at the present time to contend that the safety of the public requires that such undoubted malpractice should be stopped, and therefore the purely professional operations would gain by separating from them those of an entirely trade nature—the sale of the aforesaid packed goods, for instance. The dispensing and correct compounding of poisons as ingredients in medical prescriptions are operations of a purely professional character, and as such should only be per-

mitted to persons who are competent to perform such special work, and it should be rendered illegal for such operations to be carried on except under the supervision of owners who have themselves had the training demanded and who are acquainted with the properties of the drugs handled and competent to estimate their value. This latter is a point of importance when the ineffective working of the Sale of Food and Drugs Act as regards pharmaceutical preparations is taken into account.

Mr. T. F. ABRAHAM was strongly of the opinion that the safety of the public demanded that any individual should be able at a glance to determine whether a man keeping what was ostensibly a chemist's shop was a qualified man or not. We should be able, and we have a right, to prevent persons using a title to which we alone have the right by virtue of training and examination. The men on the Register who had never passed an examination, but were there purely by inscription, were fast disappearing, and examined men were consequently becoming more valuable. When in course of time our body shall consist of examined men alone, it would be an unheard-of thing to lessen the stringency of the personal qualification now demanded, so that Clause 2 of the Bill should be unhesitatingly rejected.

Mr. PROSPER H. MARSDEN quite thought that in reference to this Companies Bill the Pharmaceutical Council had made a great mistake in not trying to persuade the Medical Council to throw in its lot with the Pharmaceutical Society in opposing Clause 2. Such a combination would have been a very powerful weapon, and would have been advantageous to all parties concerned.

The illegalities complained of had been allowed to exist and to be committed for such a length of time without let or hindrance that Mr. H. WYATT, jun., thought there would be a considerable amount of trouble in persuading Parliament that the present system was not conducive to the safety of the public. So long as each branch shop kept open by a limited company was in charge of a duly qualified manager, and in addition these managers were under the direct control of a qualified general manager or director, the public would take a great deal of convincing before they arrived at the conclusion that proper care was not being paid to their safety. As a pharmacist he was not sanguine that the trade in drugs or even poisons could be kept entirely to qualified men, but as regards dispensing of medical prescriptions and such operations as demanded that skill which a pharmacist alone possessed, he hoped a strong stand would be made and no concessions allowed.

In this he was supported by Mr. HORNBLLOWER, who considered the Food and Drugs Act guaranteed to a large extent the purity of drugs, no matter by whom they were sold.

The PRESIDENT gave instances showing that the present Pharmacy Act was not sufficient protection to the public.

It was then proposed by Mr. T. F. ABRAHAM "that this meeting of the Liverpool Chemists' Association desires to uphold the action of the Pharmaceutical Council in their rejection of Clause 2 of the Companies Bill."

This was seconded by Mr. J. SMITH, and passed unanimously, and the Secretary was desired to write to the Pharmaceutical Council bringing the resolution to their notice.

Mr. PROSPER H. MARSDEN then proceeded to give a paper on

THE APPLICATION OF THE ROENTGEN RAYS IN DENTISTRY, which will appear in the Journal later.

A vote of thanks to the lecturer was proposed by Mr. T. F. ABRAHAM, seconded by Mr. H. WYATT, jun.

A visitor, Mr. JONES, a dental surgeon, referred to the assistance the Roentgen rays would undoubtedly be in many cases to dentists if their application was at all simple. There were many instances where a large amount of pain might be spared patients if a skiagraph of the mouth were made before operation.

The vote having been passed, the proceedings closed after a few remarks by Mr. MARSDEN.

LANCASTER CHEMISTS' ASSOCIATION.

A special meeting was held at the King's Arms Hotel, Lancaster, on Thursday, April 19, Mr. W. ARKLE presiding. There were present Mr. Tibbits (Secretary), Mr. Vince, Mr. Barker, Mr. Troughton, Mr. Simpson, Lancaster; Mr. Birkett, Morecambe; Mr. Shattock, Lancaster; Mr. Bateson, Kendal, and Mr. Gifford, Blackburn.

The CHAIRMAN made a few remarks as to the object of the meeting, and said the greatest good would come from it if they, as members of an important trade, were more united. Unity was strength, and if the 15,000 members of the trade acted in unity, whatever reasonable thing they were anxious for they would be able to acquire.

Mr. BATESON, member of Council of the Pharmaceutical Society, who had been invited to address the Association on

LIMITED COMPANIES,

dealt with his subject at considerable length. He said it was evident the limited companies which they saw around them had come to stay. These were in almost every town and had an enormous amount of capital behind them, even the Lord Chancellor and, he dared say, a great number of members of Parliament being shareholders. The preservation of title was as dear to him as to Mr. Gifford; the protection of it constituted the main work of the Pharmaceutical Council. Prosecutions were constantly taking place all over the country, and in nearly all cases they were successful and penalties obtained. That which had cost them so much would be lost in a great measure if companies were to be allowed to use the title. They must be brought into a line with all of us, and possess the same qualification that we have. He hoped ere this that carbolic acid would have been added to the Poison Schedule, and now there seemed to be a near prospect of it. The question of jury service was also an important matter, and he saw no reason why the pharmaceutical chemist should have exemption and the qualified chemist and druggist should not, as their services were alike important in business, so far as the safety of the public was concerned. He thought that London should be more fully represented on the Council, because he believed such an arrangement would be for the benefit of the trade as a whole. What they wanted was a good working Council in touch with the trade throughout the country.

Mr. GIFFORD, in a comprehensive address, pointed out that the result of the pending

COUNCIL ELECTION

meant infinitely more than the mere return, as members of the Council, of seven gentlemen who would help to manage the affairs of the Society for the next three years. Were the members of the Pharmaceutical Society satisfied that the Pharmacy Acts should continue to be trampled under foot? Were they satisfied to acquiesce in the cruel mockery brought about by the decision of the House of Lords twenty years ago? That decision had now brought the law to such a state of absurdity that the Lord Chancellor had said it must be amended. They as chemists had protested, and the Council had protested, against the injustice and incongruity of the interpretation of the law, yet chemists had on their side kept to the spirit of the Pharmacy Act. The standard of qualification had been raised and when the application of the law was concluded to be improper they were entitled to say that unqualified persons should be outside the Act, and that there should be no means for them to get in. Repeal the Act if they liked, rob them of their legally-earned privileges, confiscate their rights, do anything; but do not degrade their qualification. That, he submitted, was the question to be faced. Waiting and patience spelt acquiescence and that was fatal. The Council had repeatedly tried to alter the interpretation of the law, and therefore had never acquiesced, but the Lord Chancellor had altered the situation entirely and given them no option but to fight. Mr. Gifford, turning to his candidature, said he had always fought for the old position, against giving away any privi-

lege, and that policy was the only practicable one. Qualified chemists were united for insistence upon having their rights, and the Council was at one with them.

Mr. SHATTOCK and Mr. VINCE asked several questions and a discussion followed, the meeting terminating with an expression of thanks to Mr. Bateson and Mr. Gifford for their addresses.

DEWSBURY AND DISTRICT CHEMISTS' ASSOCIATION

At a meeting of this Association held on Monday, April 30, Mr. W. STEAD presided, and stated that he had been instructed by Miss Foster and Mrs. Blackburn to convey to the Association their thanks for the vote of condolence passed with them on the death of Mr. A. Foster, late President of the Association.

Reference was next made by the PRESIDENT to the election of members of the Council of the Pharmaceutical Society. He was not going to exercise any undue pressure upon the members of the Association as to whom they should support, but he wanted them to have an unbiassed discussion of the merits and demerits of the candidates. Seeing there were so many candidates, they would have to be careful how they voted. There had been a great deal said *re* the introduction of new blood into the Council. He thought they would be wise in confining their votes to three or four men.

Mr. J. DAY (Savile Town) moved that five candidates be supported, and that those be the men brought out by the P.A.T.A. They ought to have an entire change in the constitution of the Council.

Mr. J. RHODES (Mirfield) seconded the motion; but Mr. G. N. GUTTERIDGE (Dewsbury) moved that four candidates be voted for, the amendment being seconded by Mr. A. B. BARKER (Heckmondwike). The latter remarked that their influence would not be felt unless they went for a small number of candidates.—The amendment was carried.

Mr. R. BROADHEAD (Batley) remarked that they had committed themselves to support Mr. Gifford in his efforts to make the Pharmacy Act operative. That, he thought, was a forlorn hope. Still, they would obtain the views of other candidates regarding the old Pharmacy Act, which had been described as a miserable Poisons Bill, or, as Shakespeare would say, "a damnable iteration of exemptions." As to the candidates suggested by Mr. Glyn-Jones, he only objected to Mr. Wootton. Many persons had been influenced by Mr. Wootton, and they held aloof from the Society. Those who did not follow his advice, but became members of the Society, were now asked to vote for him. He (Mr. Broadhead) had been connected with the Society twenty years, and he felt more misgiving about this election than any other. He had always looked upon the Council as being composed of the best men connected with pharmacy. The *Pharmaceutical Journal* had suggested that the idea seemed to be to revolutionise affairs and turn the Council Chamber into a bear garden. He did not believe such a thing would occur. They would be sorry to see the Council sink to the level of the House of Commons.

After further discussion it was decided to vote for the following candidates:—Messrs. R. L. Gifford, Blackburn; W. Gibbons, Manchester; W. Hills, London; and J. Taylor, Bolton.

PUBLIC AND POOR-LAW DISPENSERS' ASSOCIATION.

A meeting was held on Wednesday, April 24, Mr. HEWITT in the chair. The usual preliminary business having been despatched,

Mr. FORSTER, Secretary, informed the meeting that Mr. J. Langford Moore had been appointed senior dispenser to St. Bartholomew's Hospital, which was received with acclamation.

It was proposed and carried unanimously that Mr. Moore should have a letter of congratulation from the Association.

An animated discussion was raised by Mr. CLARK, who read a paragraph from the *Daily Telegraph* stating that a lady who had been appointed a dispenser in a Poor-law institution had informed the Guardians that it had only taken her nine months to qualify for the post. At the close of the discussion,

Mr. W. DUFF, Banstead, gave notice that he would bring the subject before the next meeting, with a view of preventing inexperienced persons from holding such responsible positions.

A lecture was then delivered by Mr. J. NOAD CLARK, President of the Association, on

PRACTICAL PHOTOGRAPHY,

illustrated with specimens of his work, together with examples of faulty negatives, brought in order to demonstrate the difficulties which the beginner usually experiences.

Commencing with the collodion process, the lecturer explained in a practical manner every stage to the production of a finished photograph, including the action of light on the sensitive plates, the construction of the camera, the use of the lens, tips in development, and subsequent process referring to the bromide and platinotype process, and the production of lantern slides.

Mr. Clark is a very old amateur photographer, having commenced work in the wet collodion days, but more recently has taken up photo-micrography as a special study in connection with entomology. He pointed out the advantages of photography to pharmacists, who, he considered, ought to excel by reason of their scientific training. He said photography had been rightly termed the handmaid of science, and there was scarcely any branch where its use was not of great assistance, particularly so in botany, histology, and pathology. At the conclusion, Mr. Clark promised to give a lecture on photo-micrography at a future date which would be illustrated with a lantern.

In the discussion which followed, it was stated that some public dispensers have photography included amongst their duties.

After some interesting remarks from Mr. Welford, Colney Hatch; Mr. Lindsey, Camberwell; Mr. Hewitt, Holborn; Mr. Turner, St. Pancras, and others, a hearty vote of thanks to Mr. Clark for the trouble and pains he had taken, and the interesting manner in which he had handled the subject before them, brought a very profitably-spent evening to a close.

NOTTINGHAM AND NOTTS. CHEMISTS' ASSOCIATION.

A meeting of this Association was held on May 2 at the Albert Hotel, Derby Road, for the purpose of considering Clause 2 of the Companies Bill, and to hear an address from Mr. GLYN-JONES (a member of the Council of the Pharmaceutical Society) on the scheme of the Chemists' Defence Association, Mr. C. A. BOLTON presiding.

THE COMPANIES BILL.

Mr. EBERLIN, having explained the effect of Clause 2 of the Bill, said whatever they might think about the case of selling poisons—that was to say, whether an unqualified company shall have the right to deal with poisons—at any rate, he thought there was no division of opinion on this, that a company of unqualified persons should not have the right to rob chemists of their titles. They knew the Pharmaceutical Council, after considerable hesitation, debate, and procrastination, had at last come to a decision that it would oppose Clause 2 with all its power, but they did not propose any amendment. That was the point which, at any rate, concerned them most that night—as to whether the Pharmaceutical Council ought not to have drafted an amendment and tried to get it inserted in the Bill. Of course, there were differences of opinion as to how the thing could best be accomplished—whether it would

not be best to have a new Pharmacy Act. One had to bear in mind that a new Pharmacy Act had been required since 1868 and, for this reason, he might not be supported by a single member present; but his private opinion was that the former Act was never drafted with any sincere intention to confine the sale of poisons to qualified persons. The Bill was drafted by people whose portraits hung in prominent places, whose names were household words, and who were as insincere as could possibly be. He was speaking of an actual fact. A gentleman who sat upon the Pharmaceutical Council for many years, and was upon it now, had a branch shop, which was his main business, and for years he never had a qualified assistant at all. Yet they were told that this was the crux of the whole matter—that a branch shop must be under a qualified assistant. It certainly looked as if the Pharmaceutical Council—or, at any rate, some members of it—were suffering from senile degeneracy. They were degenerating, at any rate, and they did not seem able to touch these questions with anything like vigour. The question was one of supreme importance—whether they ought to allow this opportunity to slip by and do nothing, or whether they ought to try to get some amended clause inserted in the Bill. For his part, he thought that a new Pharmacy Act would not come for many years; possibly many of those present would not then be interested in it and therefore he would prefer that some effort should be made to safeguard their titles. This was an opportunity of a lifetime. He therefore begged to propose—

That this meeting of the Nottingham and Notts. Chemists' Association, while giving its support to the Pharmaceutical Council in opposing Clause 2 of the Companies Bill, regrets that the Council has not seen its way to endeavour to obtain some amendment inserted in the Bill safeguarding the rights and titles of chemists.

Mr. GASCOYNE seconded. He said it was one of the most hopeful signs that he had seen for many years that some of the staunchest supporters of the Pharmaceutical Council were becoming alive to the fact that it was not doing its duty. He must confess, however, that the position in which the Council was placed was somewhat difficult. There had been opinions expressed from all parts of the country which were as wide asunder as the poles, and it was not easy to reconcile them. Men who had studied pharmaceutical politics had come to the conclusion that company pharmacy had come to stay and that no Bill that would seriously affect the conduct of company pharmacy would get a single supporter in the House of Lords. The scheme which seemed to have taken the fancy of most members throughout the country was that of a qualified directorship. He was sure they could get that and the demand was consistent as well as logical. He believed every member of Parliament would be bound by common justice to agree with chemists that their titles should not be borne by men who had not gained them in a personal sense—who had simply bought them by employing qualified men. Although the Bill was introduced by a responsible Minister of the Crown, it was not a party question and pressure, he thought, could be brought to bear inside the House of Commons, upon the President of the Board of Trade, to amend the Bill in such a way that if it did nothing else it would preserve to chemists their titles which had been won by examination, and not give them away wholesale.

Mr. MIDDLETON, who thoroughly supported the proposition, asked if the deletion of the clause would not secure the very thing they wanted?

Mr. GLYN-JONES said Mr. Ritchie had said that he would not accept an amendment. The mere deletion of the clause would leave them in their present position, which was not satisfactory.

Mr. SARGEANT said he wished the Association would give its entire support to the Pharmaceutical Council without expressing regret, for the sufficient reason that Mr. Ritchie had said definitely that it was either Clause 2 or nothing. When they got down to that, he did not think they could go much farther. He thought the President and Mr. Carteighe had done their part. They had paid more than one visit to the House of Commons and threshed the matter out with people there. He gave his support to the deletion

of Clause 2. He thought they should be in a much worse position if the clause was passed. Therefore, he would move, as an amendment, to strike out of the resolution the words expressing regret, etc. If Mr. Gascoyne and his friends would put their shoulders to the wheel and give their guineas and support to the Council, it would probably be able to do very much more for them.

Mr. GLYN-JONES again briefly spoke, remarking that he hoped it was not too late even now for the Council to make an attempt to obtain an amendment of the Bill.

Mr. BEILBY thought it would be a bad policy to leave the expression of regret out of the resolution. The position taken up by the Pharmaceutical Council, of mere opposition to the clause, was not likely to be successful.

As no one seconded Mr. Sargeant's amendment, it fell through, and the resolution was carried, the CHAIRMAN, in putting it, remarking that things were looking brighter for chemists in connection with the forthcoming election.

Subsequently Mr. GLYN-JONES delivered an address on the "Chemists' Defence Association," and a discussion followed.

ENGLISH NEWS.

ABSENCE OF AN ASSISTANT WITHOUT LEAVE.—At Marylebone County Court, on May 1, before Judge Stonor, William Henry Hern sought to recover £3 from Mr. Edward Taylor, pharmaceutical chemist, 12, Richmond Road, Bayswater, W., the claim being for two guineas as a week's salary in lieu of notice and 18s. for a week's board and lodging.—The Plaintiff stated that he had been engaged by the defendant, who came to him one Saturday morning, and without any proper cause informed him that his services would no longer be required. He (plaintiff) accordingly paid himself up to that day and left, and now sued for a week's remuneration in lieu of proper notice. He was the only qualified chemist left in the shop, and it was true that he had absented himself from business without his master's permission, but he did so for the purpose of attending his medical adviser. There had been a previous complaint about his leaving the shop without permission on a bank holiday. On the occasion that he left the shop to visit his medical man he said nothing to anyone, but just went, and he afterwards wrote offering to resign his position if necessary. Evidence having been given to show that the resignation was accepted, the Judge said that was quite sufficient. The assistant said that he would be pleased to resign, and the master accepted the resignation. The defendant was evidently quite justified in acting as he did, particularly as the assistant left the shop without permission. For any assistant to do such a thing would be very wrong, but for a chemist's assistant to do so, leaving no qualified chemist upon the premises, was most irregular. He, therefore, found for the defendant.

SULPHURIC ACID IN VINEGAR.—At Marlborough Street Police Court on Thursday, April 26, Messrs. Robert and Norbury Pott, vinegar brewers, Sumner Street, Southwark, were charged, on an adjourned summons, with selling vinegar with a false warranty.—The evidence showed that the public analyst to the St. James's Vestry certified that a sample of the vinegar contained a certain proportion of sulphuric acid. The defendants absolutely denied that sulphuric acid had been added to the vinegar, stating that the only substance added was calcium sulphate or gypsum, a neutral substance used to bring the water to a standard of hardness more suitable than ordinary drinking water for the brewing of vinegar, and that the vinegar was pure and properly warranted pure and free from added acid.—The case was originally adjourned for a sample to be sent to Somerset House, whence a certificate was now produced stating that the vinegar contained 0.133 per cent. of "chemically combined sulphuric acid."—Mr. Fenwick (magistrate), in deciding the case, took the view that sulphuric acid was formed in the vinegar by the addition of calcium sulphate, but the prosecu-

tion had failed to prove that the defendants had been guilty of a breach of their warranty. The summons would therefore be dismissed, and the prosecution would have to pay a guinea, the fee due to the authorities at Somerset House.

POISONING BY PRUSSIC ACID.—At Birmingham, on April 27, an inquest was held concerning the death of William Taylor (49), described as a medical dispenser. According to the evidence, deceased was found dead in bed at his lodgings in Aston Road on Thursday, April 26, and with him a bottle which had contained prussic acid. It was stated that he had been in ill-health for some time past, and was in the habit of taking prussic acid for his nerves.—A verdict of "Death by misadventure" was returned.

CAMWAL, LIMITED.—At a statutory meeting held in London on May 1, it was stated that the re-construction has gone through successfully, the shares having been more than subscribed for. The share certificates were very numerous, and would be got out as quickly as possible. The two branches, Manchester and Birmingham, were rapidly increasing their business on paying lines.

DEFECTIVE SPIRIT OF NITRE.—At Pontypridd Police-court on Wednesday, April 25, Jenkin W. Davies, chemist and druggist, Gilfachgoch, was charged with selling sweet spirit of nitre deficient in nitrous ether "to at least 10 per cent."—The defendant raised an objection to the analyst's certificate on the ground that the actual percentage was not stated.—The Bench upheld the objection and dismissed the case.

EXTRACTS FROM CONSULAR REPORTS.

THE UNITED KINGDOM IS NOT THE ONLY PLACE, apparently, where associations of persons can do what individuals are prohibited from doing. According to a recent report on the foreign trade of Japan, foreigners are debarred from the ownership of real estate in Japan. The Tokio Chamber of Commerce and other associations have expressed themselves in favour of the concession being made, but it is stated that there is hardly any prospect that the right of owning land will in the immediate future be granted to other than Japanese subjects. Aliens have consequently to be content with acquiring "rights of superficies" over land, which, for whatever period procurable, cannot be regarded as a satisfactory substitute for ownership. Yet it would appear that "juridical persons"—associations or partnerships composed of foreigners and constituted conformably to Japanese law—may acquire the right to own land.

FURTHER, NO FOREIGNER IS ALLOWED to engage in the mining industry, or to be the holder of shares in mining undertakings. It was hoped that an amendment of the Mining Law, which came before the Diet at a recent session, would remove this disability, but the amendment proved to be merely of a technical nature and to have no reference to foreigners at all. However, since then, the House of Representatives has adopted a representation in favour of granting to "juridical persons" of which foreigners may be members, the right to engage in mining enterprise in Japan, and this proposal was subsequently endorsed by the House of Peers.

AN UNPRECEDENTED ACCUMULATION OF ALCOHOL is reported to be now held in Japan, the bulk of it obtained from Germany. Most of the alcohol imported during 1899—valued at £210,405—passed into the country before August 15, when a high *ad valorem* duty of 250 per cent. came into force. The quantity imported during the whole year, however, did not equal that of the preceding year—value £275,623—when unusually large shipments of alcohol were imported in order to evade a duty of 0.036 yen per 1½ lbs.—2s. 0½d. = 1 yen—which came into force on January 1, 1899.

Obituary.

CONSTANCE.—On April 16, Edward Constance, Pharmaceutical Chemist, late of London. Aged 88. Mr. Constance had been a member of the Pharmaceutical Society since 1848.

MATHER.—On April 23, at Claremont Road, Birkdale, Southport, James Mather, Chemist and Druggist, late of Bolton. Aged 67. Mr. Mather formerly conducted a druggist's business in Kay Street, Bolton, and was well known in the town, though he never held any public office. He was a director of the Farnworth Spinning Company, and was looked upon as a shrewd man of business, being a considerable property owner in Bolton. He retired to Southport a few years ago on account of ill-health.

SMITH.—On April 22, George Smith, Pharmaceutical Chemist, East Dulwich. Aged 50.

TAYLOR.—On April 20, John Taylor, Chemist and Druggist, Baker Street, London, W. Aged 75. Mr. Taylor had been a member of the Pharmaceutical Society since 1880.

THE STUDENTS' COLUMNS.

THE MATERIA MEDICA OF THE PHARMACOPŒIA.

Crocus.

SAFFRON consists of the dried stigmas and tops of the styles of *Crocus sativus*, Linn. (N.O. Iridaceæ), which is cultivated in Spain, France, Austria, and Italy, and was formerly cultivated in England, near Saffron Walden. The flower produced by the plant in the autumn is of a pale purplish-violet colour, and has a long pale yellow style which terminates in three deep-red, elongated, protruding and pendulous stigmas. After the flowers have been collected the stigmas and upper part of the style are separated from each and dried, the resulting product being the hay saffron of commerce. The greater part of the drug is produced in Spain, being chiefly exported from Valencia and Alicante, whence the two most important commercial varieties take their names; the different qualities vary in the size of the stigmas, in relative freedom from useless parts of the flower such as the stamens, and from fraudulently added inorganic substances. Valencia saffron is much superior to the Alicante variety. The only use of saffron in medicine is to give colour and flavour to preparations, as in the case of Decoctum Aloes Compositum and Tinctura Cinchonæ Composita; it is also used in the preparation of Tinctura Croci.

CHARACTERS.—Saffron of good quality occurs in entire portions about 25 Mm. or more in length, consisting of single orange-red or reddish-brown stigmas, or three such attached to the top of a yellow style; they are thickened and tubular above, each having a slit on the inner side near the upper extremity and its mouth being jagged or irregularly notched. Unless quite dry, the loosely matted mass of stigmas is flexible and unctuous to the touch; it has a strong characteristic aromatic odour, due to the presence of volatile oil, and a somewhat bitter taste, which is attributable to a colourless bitter principle named picrocrocin. If thrown on the surface of water, the dry stigmas expand and their shape is clearly revealed; the liquid surrounding them assumes a deep yellow colour, owing to the extraction of the soluble colouring matter.

TESTS.—Saffron should impart an intense orange-yellow tint to a wet finger on which it is rubbed, thus showing that the colouring matter has not been extracted, and it should leave no oily stain when pressed between folds of white filter paper, thus proving freedom from added vegetable or mineral oil. Warm water in which saffron is soaked should be coloured orange-yellow, the saffron itself becoming paler and not depositing any white or coloured powder. If the water be coloured red or pink and the saffron yields colour freely

to ether or petroleum spirit, it has probably been exhausted and afterwards artificially coloured with aniline dyes, logwood, Brazil wood, or the yellow or orange salts of dinitrocresylic acid. Any white or coloured powder which may be deposited will probably consist of calcium carbonate, barium sulphate, bo'le, or other inorganic impurity with which the saffron has been dusted after being damped with glycerin, honey, or glucose and water. Absence of added water should be indicated by the saffron losing not more than 12.5 per cent. of moisture when dried at 100° C. The dried

SAFFRON.—A, *Crocus sativus*, showing protruding stigma, $\frac{1}{2}$ natural size; B, ditto, with perianth, leaves and scales removed, showing section through corm and ovary; C, Upper part of stigma, enlarged.

saffron should not deflagrate when incinerated with free access of air, nor should it yield more than about 7 per cent. of ash, the first test indicating absence of nitrates and the second of other fraudulently added inorganic matter. The presence of glycerin or other substances which are soluble in water and leave no ash when incinerated will be indicated by the proportion of water-soluble substances yielded by the saffron exceeding 15 per cent.

NOTES.—The distinctive characters of saffron are its shape, odour and colour. It contains about 1 per cent. of volatile oil, a colourless bitter principle (picrocrocin), and an amorphous red colouring matter (crocin). The last is a glucoside which, when hydrolysed with dilute mineral acids, yields crocetin and a sugar (crocose). The colour of crocin, or "polychroite" as it has been called, is changed by concentrated sulphuric acid to deep blue and by nitric acid to green. Saffron may be adulterated by the addition (1) of the stamens, or portions of the perianth of saffron or other flowers; (2) of safflower or calendula florets; or (3) of the slender stems and roots of monocotyledonous plants. All such adulterants may be detected by allowing the drug to expand in water and noting the shape of the pieces. Safflower and calendula florets are much shorter than the stigmas of saffron and differ considerably in shape.

Cubebæ Fructus.

CUBEBS, or "tailed pepper," consists of the dried unripe fruit of *Piper cubeba*, Linn. (N.O. Piperaceæ), a dioecious woody climber which is indigenous to, and probably cultivated in, Java, Sumatra and Borneo. The pistillate inflorescence of the plant is a spike of sessile flowers; as the young sessile fruits mature they become elevated on slender stalks produced by abnormal development of the pericarp at its base. When full-grown, but whilst still green and unripe, the fruit

small embryo embedded near the apex in a somewhat scanty endosperm surrounded by a copious perisperm. Frequently a fruit contains only the dark shrunken remains of a partially developed seed. The characteristic strong and aromatic odour of cubebs, due to the volatile oil present, is more marked when the fruit is crushed; the taste of the drug is also warm, aromatic and somewhat bitter, the bitterness being due to the cubebin present.

TESTS.—Cubebs have two layers of much thickened and lignified parenchymatous cells in the pericarp, as may be seen in a trans-

CUBEBS.—Fruit of *Piper cubeba* on rachis, with leaves.

is stripped from the rachis, dried in the sun, and exported from Batavia or Singapore to Amsterdam and London. The drug possesses aromatic, stimulant, antiseptic and diuretic properties; it is administered in doses of 30 to 60 grains, and is used in the preparation of *Oleum Cubebæ* and *Tinctura Cubebæ*.

verse section, one layer being near the epidermis, the other constituting the smooth, hard inner surface or endocarp and consisting of radially elongated cells. The presence of those two layers, which can only be detected under the microscope, helps to distinguish cubebs from fruits of similar appearance. The crushed fruit imparts a crimson colour to sulphuric acid; most of the substitutes for cubebs yield only a brownish-red colour under similar conditions.

CUBEBS.—A. Fruit of *Piper cubeba*, magnified; B. ditto, longitudinal section, showing embryo at apex of seed and stalk-like elongation of pericarp.

CHARACTERS.—Cubebs are nearly globular fruits, each containing a single seed attached by the base and bearing the minute remains of three or four stigmas at the apex; they are about 4 Mm. in diameter and greyish-brown or nearly black in colour. If depressed at the base the fruits are immature. Owing to shrinkage during the drying of the fruit, the thin, brittle pericarp is reticulately wrinkled. At the base the pericarp is abruptly prolonged into a slender, rounded or slightly flattened stalk about 6 Mm. in length. The fully developed seed is reddish-brown in colour, with a very

NOTES.—The distinctive characters of cubebs are the slender and not easily detachable stalk, the attachment of the seed to the pericarp by the base only, the characteristic odour and taste, the microscopical characters, and the reaction with sulphuric acid. The fruit contains a volatile oil, of which it yields about 14 per cent.; the oil occurs in cells in the pericarp and perisperm, and about 1·7 per cent. can also be obtained from the rachis, which contains similar oil cells, as well as the stem, leaves, etc. Other constituents of cubebs are cubebin—a bitter colourless crystalline substance which gives a cherry-red colour with sulphuric acid—and 3·5 to 4 per cent. of resin, 1 per cent. of which is an acid resin named cubebic acid. The last-named compound is white, amorphous, and gives a crimson colour with sulphuric acid. The resin as a whole produces purely diuretic effects and appears to constitute the active portion of the drug. Portions of the rachis on which the fruit is borne may be found mixed with cubebs, and many fruits of similar appearance have been used to adulterate the drug, but none possess the same microscopical characters, whilst also yielding the distinctive crimson colour with sulphuric acid.

Pharmacy and the Allied Sciences.

A REVIEW OF CURRENT WORK.

OIL OF CAMELLIA DRUPIFERA.

The oil extracted from the seeds of *Camellia drupifera*, known by the natives of Tonkin as Caydeau-So, is used by them as food, as well as for application to the hair and as an external remedial agent. The kernels of the seeds yield on expression 28 to 35 per cent. of a bland oil, which does not readily become rancid. Pottier has examined this oil, for which he gives the following figures:—Sp. g. at 15° C., 0.980; acidity in terms of oleic acid, 2.876 per 1,000; opt. rot. (200 Mm.) + 1.8; bromine absorption number (of fatty acids), 0.435; iodine absorption number (of fatty acids), 0.680. Twelve C.c. of the oil give a white permanent emulsion with 8 C.c. of lime water; with the same proportion of solution of ammonia separation takes place. Sulphuric acid gives a brown coloration with Heydenreich's test. It gives no reduction of silver with Becchi's test, nor does it afford any crystals of arachidate of potassium.—*Nouv. Rem.*, 16, 121.

ACTION OF HEAT ON PAPAIN.

V. Harley confirms the statement of Wuertz that, if papain be first thoroughly dried, its digestive power on fibrin is but little, if at all, influenced by prolonged exposure to a temperature of 100° C. It is, however, otherwise when the ferment is in solution. A series of digestions conducted at various temperatures, in which the amount of matter dissolved, the optical rotation of the resulting solutions, and the weight of the residual undigested fibrin were determined, show that the proteolytic action of papain in solution is destroyed at about 82° C. Fibrin was found to be quite unaltered when digested in a solution of papain which had been previously heated to 82.5° C. From the colour produced by tyrosinase on the products of digestion, it would appear that heat merely has the effect of lessening the digestive power of papain, but does not modify it in any other way. In all cases, even when the digestive action has been reduced to a minimum, in the solutions heated to the highest point, the typical colour-reaction at first red, then green, was obtained with tyrosinase, only differing in intensity from that produced by unheated papain digestion-products.—*Journ. de Pharm.* [6], 11, 269.

NOTES ON CHAULMOOGRA.

It appears that the seeds of chaulmoogra met with in commerce, and generally considered to be the product of *C. odorata*, differ materially from those of that species. D. Hanbury ('Science Papers,' 244) describes and figures Chinese chaulmoogra seeds, as imported from Siam into China, as having foliaceous, lanceolate cotyledons, which he recognises as not being identical with *Chaulmoogra odorata* of Roxburgh, that authority describing the cotyledons of *C. odorata* as being subreniform, with the radicle variable. Notwithstanding this, in works on materia medica and in museums, the Chaulmoogra seeds of Hanbury are attributed to *C. odorata*. G. Desprez has recently received from Calcutta specimens of both seeds. He describes the true *Chaulmoogra odorata* seeds as being larger, less uniformly grey, the testa being marked with dark patches. The integuments are not so brittle as in the ordinary kind, the kernel is reddish and marked with white. The cotyledons are thick, subreniform, the radicle placed at the side. These seeds contain a large amount of hydrocyanic acid. The seeds generally met with in commerce are uniformly grey in colour, the integuments are brittle, the kernel is dark in colour with a rough surface, the cotyledons are foliaceous-lanceolate, and the radicle direct, as described by Hanbury. These seeds contain no prussic acid.—*Journ. de Pharm.* [6], 11, 315.

VOL. 64. (FOURTH SERIES, VOL. 10.) No. 1559.

STRUCTURE OF LICHENS.

Professor G. J. Peirce contests the current view that the connection of the fungus (hyphal) and the algal (gonid) elements in lichens is one of commensalism. The hyphæ and the gonids are in the most intimate contact with one another; the hyphæ develop branches which may merely clasp the gonidial cells, or may penetrate them in the form of haustoria. This clasping or penetration stimulates the gonids to internal cell-divisions. The haustoria consume the protoplasmic contents of the gonidial cells which they have entered, leaving only the empty cell-walls. The fungus is fed by the alga, and there is no evidence that the gonids develop more luxuriantly in connection with the hyphæ than they would elsewhere.—*Proceedings California Acad. Sci.*, 1899.

FUNGI IN JUNIPER BERRIES.

Herr A. Nestler finds the mycele of a fungus almost universally present in the so-called "berries" of the juniper immediately before maturation. The change in colour from green to black or blue-black appears to be due to this fungus. It was not found in the fruit during the first year of its development.—*Ber. Deutsch. Bot.-Gesell.*, 17, 320.

RANCIDITY OF BUTTER.

According to Herr B. Reinmann there is not any relation between the rancid taste and odour of butter and the quantity of free acids found in it. The greater the amount of casein and of milk-sugar in butter the more quickly does it become rancid. Light and air do not appear to exert any direct influence on the process. Butter made from sterilised cream will rarely become rancid; but, if brought into contact with rancid butter, will turn in a few days.—*Centralblatt f. Bakt. u. Parasitenkunde*, 2te Abth., 1900.

EXTRA-NUPTIAL NECTARIES.

At the base and on the margin of the young leaves of *Ailanthus glandulosa* are two or more nectariferous glands which, according to Sig. L. Macchiati, constitute an extra-nuptial nectary, the species being myrmecophilous. The nectar of these glands is greedily devoured by ants, which stand as sentinels throughout the day at the base of the leaf-stalk, and ward off other insects, mites, and the larvæ of lepidoptera which would otherwise attack the young leaves. Another instance of an extra-nuptial nectary is furnished by the red or brown patches at the base of the young leaves of the cherry-laurel, *Prunus laurocerasus*. Herr Nestler regards it as incontrovertible that this bright colour attracts insects in the same way as the bright colour of the flowers.—*Bull. Soc. Bot. Italiana*, 1899.

PRODUCTION OF ALCOHOL BY PLANTS.

M. P. Mazé gives further evidence in favour of his previous observations on the production of alcohol by plants, especially in the germination of oily seeds. He concludes that these seeds are capable of transforming substances of the group CH_2 into substances of the group CHOH by the fixation of oxygen. The castor-oil plant exhibits this phenomenon to a remarkable degree.—*Comptes rendus*, 130, 424.

FORMATION OF PROTEIDS IN THE DARK.

According to Herr J. Goldberg, the processes which go on in the embryo and in the endosperm during the germination of wheat are of quite opposite characters. While the amount of proteids in the endosperm is continually decreasing, the amount in the embryo is, on the other hand, continually increasing. This can only be the result of a synthesis of proteids in the embryo at the expense of amides obtained from the endosperm.—*Beiheft z. Bot. Centralblatt*, 9, 130.

ON THE COMPOSITION OF EAST INDIAN SANDALWOOD OIL.*

BY M. M. GUERBET.

There have been various researches into the chemistry of sandalwood oil. According to Chapoteau it contains an alcohol $C_{15}H_{26}O$ called santalol, and also the corresponding aldehyde $C_{15}H_{24}O$, also identified by Chapman and Burgess.† The latter body gives by dehydration by phosphoric anhydride the hydrocarbon $C_{15}H_{22}$. The author's own work has been interrupted for a year, and his results partly forestalled by Soden and Müller.‡ These latter workers did not find an aldehyde, but isolated an alcohol, *santalol*, $C_{15}H_{26}O$, constituted of a mixture of isomeric and lævogyre alcohols of differing rotatory powers; these formed 90 per cent. of the oil; further, they isolated a sesquiterpene, *santalene*, $C_{15}H_{24}$, boiling at 261° - 262° ; and lastly declared the probable presence of other bodies not isolated. These results are confirmed by Messrs. Schimmel and Co., chemists.

The present author's researches§ confirm the complex nature of "santalol," and have also resulted in the isolation of the greater part of the hitherto undescribed bodies.

The oil examined was distilled from Bombay wood: it was a limpid, pale yellow oil, sp. gr. at 0° 9684, and rotation $[\alpha]_D = -21^{\circ} 16'$; it contained no bases, no free acid, and a minute amount of esters or alkali-absorbing bodies; the proportion of alcohols reckoned as santalol (by Parry's process||) was 90.1 per cent. In order to saponify the ethers, 5 kilos. of the oil were boiled with 200 Gm. KOH and 500 Gm. of 90 per cent. alcohol; the product diluted with water, the separated oil washed, and the alkaline liquor retained for identification of the organic acid. The oil, after washing and drying with anhydrous K_2CO_3 was distilled under reduced pressure and fractionated with a "Le Bel Heninger" apparatus. Two groups of fractions were thus obtained: (1) The hydrocarbons passing over at 110° - 180° at 38 Mm.; and (2) a group, principally alcohols, distilling at 180° - 200° . The residue left was resinous, yellow and honey-like.

The hydrocarbons were refractionated a great many times under reduced pressure, and finally under atmospheric pressure, lastly, the different fractions were rectified over sodium, thus isolating two principal fractions, viz., (1) Boiling 252° - 252° -5, and (2) Boiling 261° - 262° ; these were distinguished as *santalene* α , and *santalene* β . The fraction boiling below 252° appeared to contain a hydrocarbon boiling at 130° - 140° , and an oxygenated product boiling at 210° - 220° . These first fractions have a very powerful and agreeable odour, and to these above all is due the characteristic odour of sandalwood oil, but the percentage is so small (0.2 to 0.3 per cent.) that their exact nature could not be determined.

The fractions distilling at 180° - 200° (38 Mm.) contain alcohols (determined by Parry's method) to the extent of 97 per cent. of the product. In order to separate this mixture of alcohols, Haller's method was employed** for the extraction of terpene alcohols. The mixture was warmed at 120° for two hours with the calculated amount of phthalic anhydride, which converts the alcohols into their acid phthalic esters, the product was treated in the cold with carbonate of soda solution, in which it completely dissolved, leaving only a little unacted-on phthalic anhydride. This aqueous solution of the ethereal salts was freed from any non-alcoholic bodies by repeated extraction with ether; finally, the ethers were saponified by heating with soda under a reflux condenser, the liberated alcohols washed, dried with K_2CO_3 , and fractionated under reduced pressure. This yielded an oily colourless liquid distilling

at 183° - 197° (37 Mm.), which has not yet been separated into fractions having constant boiling points; the rotations of the fractions also differed, varying from $-9^{\circ} 4$ to $-25^{\circ} 3$. Therefore the alcohol known as santalol is probably a mixture of two alcohols of differing rotatory power, and corresponding to the *santalenes* α and β , whose rotatory powers are respectively $-13^{\circ} 98$ and $-28^{\circ} 55$.

Treatment of the Alkaline Liquor containing the Acids of Sandal Oil.—This was neutralised with H_2SO_4 , extracted with ether acidified with excess of H_2SO_4 , and the insoluble acids separating collected. To isolate the soluble acids the acid liquid was distilled; the distillate was found to contain solely acetic and formic acids, the latter in very small proportion; a titration experiment showed that the 5 kilos of oil yielded of these acids only 3.8 Gm. reckoned as acetic acid. The sticky precipitate of insoluble acids, washed with water and steam distilled, yielded a white crystalline solid, which was purified by crystallisation from alcohol (90 per cent.). It melted at 157° , and had the characters of a monobasic acid of the formula $C_{10}H_{14}O_2$; this acid was named *teresantalic acid*; the silver salt contains 39.3 per cent. silver ($C_{10}H_{13}AgO_2$ contains 39.56 per cent.). The residue from this steam distillation added to the mother liquors from the crystallisation yielded a monobasic acid of the formula $C_{15}H_{24}O_2$, which was named *santalalic acid*. It can be isolated by means of a solution of ammonium carbonate, in which it is insoluble, but which dissolves the *teresantalic acid*; it was purified by precipitating its alkaline solution by a prolonged current of CO_2 and distilling under reduced pressure; it boiled at 210° - 212° (20 Mm.). It is monobasic; its silver salt $C_{15}H_{23}AgO_2$ contains 30.2 per cent. Ag. (calculated 30.6).

In addition to the above compounds sandalwood oil contains an aldehyde, santalol, $C_{15}H_{24}O$, which was isolated by means of its carbazone by the process of Tiemann and Krüger*. Ten Gm. of powdered semi-carbazide hydrochloride were mixed with acetic acid and an equivalent of sodium acetate (about 12 Gm.); the mixture was allowed to stand twenty-four hours to complete transformation into semi-carbazide acetate, then 100 Gm. of sandalwood oil added and the mixture allowed to react in cold for three days; then 20 volumes of water added, the whole extracted with ether, the ethereal solution washed with water and weak sodium carbonate solution and evaporated. The semi-carbazone was deposited in small crystals, purified by dissolving in hot alcohol and recrystallising. The 100 Gm. of oil gave 3.5 of semi-carbazone, $C_{15}H_{24} = N-NH-CO-NH_2$. This compound, when decomposed by strong HCl at 50° , regenerated santalol $C_{15}H_{24}O$.

To summarise, the following definite compounds were isolated from sandalwood oil:—

(1) Two hydrocarbons—(sesquiterpenes) $C_{15}H_{24}$, *santalenes* α and β , oily colourless liquids, with feeble odour and a sweet burning taste. Their solution in chloroform shaken with sulphuric acid gives a currant-red after some minutes. *Santalene* α boils at 252° - 252° 5; $[\alpha]_D = -13.98^{\circ}$; sp. gr. at $0^{\circ} = 0.9134$. *Santalene* β boils at 261° - 262° ; $[\alpha]_D = -28.55^{\circ}$; sp. gr. at $0^{\circ} = 0.9139$.

(2) A mixture of sesquiterpene alcohols corresponding to the above hydrocarbons; these are the *santalols* α and β whose study is not yet complete.

(3) An aldehyde of the formula $C_{15}H_{24}O = \text{santalol}$, a colourless oil with a strong and peppery odour; boiling-point 180° (40 Mm.) its semi-carbazone exists in small needles melting at 212° , scarcely soluble in ether, petroleum ether, or cold alcohol; very soluble in boiling alcohol. Oxidised by chromic acid in acetic solution, it is partly transformed into a monobasic acid identical with santalalic acid $C_{15}H_{24}O_2$. Heated with P_2O_5 , it resinifies and does not yield a hydrocarbon. It is therefore a very different body from that of Chapoteau and Burgess ($C_{15}H_{24}O$); probably these workers had in their hands an alcohol and not an aldehyde.

|| *Pharm. Journ.*, [4], 5, 118.

** *Comptes rendus*, 108, 1308; and 122, 865.

(4) An acid $C_{15}H_{24}O_2$ —*santallic acid*, a viscous colourless liquid boiling at 210° – 212° (20 Mm.), insoluble in water and in strong ammonium carbonate solution, soluble in alcohol, ether, or chloroform; is a feeble acid with properties analogous to those of campholic acid*. The santalates of sodium and potassium occur in confused crystalline masses; the barium salt is slightly soluble in water, crystallising from alcohol in fine needles; the calcium salt is soluble in water and crystallises in crusts; the silver salt crystallises from alcohol in colourless lamellæ insoluble in water.

(5) An acid of the formula, $C_{10}H_{14}O_2$,—*teresantallic acid*, obtained by cooling its alcoholic solution in large prismatic needles, melting at 157° ; boils at 183° (28 Mm.) Its potassium salt occurs in pearly crystalline masses; its calcium salt is in small crystals of the formula $Ca(C_{10}H_{13}O_2)_2 + 2H_2O$.

(6) Lastly, the more volatile portions of sandalwood oil include every odorous compounds not yet isolated in a state of purity; whilst their amount is very small, it is above all to their presence that the oil owes its odour.

The following is the approximate composition of the oil according to these researches:—

Santalenes α and β	60
Santalols α and β	800
Santalal	30
Acids in the state of esters (formic, acetic, santallic, teresantallic) ..	30
Undetermined strongly odorous bodies boiling at 130° – 220°	3
Undetermined products boiling about 320° (hydrocarbons, alcohols, ethers, resinous products)	77
	1,000

The author is still engaged in the study of the santalenes and santalols.

MATERIA MEDICA FOR STUDENTS.

A TEXT-BOOK OF MATERIA MEDICA FOR PHARMACEUTICAL STUDENTS

By W. A. KNIGHT. Pp. 319. Price 9s. London: Clive and Co.

As the author states that this work has been written with a view to furnishing the student with "all that is required for the Minor and Major examinations in Materia Medica," it would not be reasonable for us to judge of it except according to that limitation. The restriction thus placed upon the work implies an urgent responsibility as to the thoroughness of the method and the accuracy of the information which it may set forth. The materials for a thoroughly reliable and comprehensive students' text-book of materia medica are ample; but they are scattered in so many departments of knowledge—botany, chemistry, physics, geography, zoology, microscopy, and commerce—that only after careful collection and a judicious selection can anyone hope to produce a work to command the reader's confidence. A perusal of the preface leads one to hope for a treatment of the subject somewhat in advance of that which it has received at the hands of others. The term *megascopic* is adopted in preference to *macroscopic*, which is certainly in pronunciation too much like *microscopic*, and the author has coined the word *mesoderma* to indicate the region of the cortical parenchyma. This verbal inventiveness indicates an alertness of mind which prognosticates novelty in the treatment of the matter proper of the book. The particular instances given, however, lead us to fear that caution may be lacking, because if the author had taken the trouble to look up a good dictionary he would have found that his two new words had previously been invented and used in a different connection. He speaks of his experience as a teacher, but surely a teacher's first duty is to make knowledge assimilable. The introduction of new terms, the manufacture of new definitions for old terms—such as pharmacography and pharmacognosy—and the displacement of terms by others which have ordinarily a different meaning—such as "cambiform tissue" for cambium is not only to create in the mind of the student mental nausea, but to make him an easy prey to the examiner.

* Guerbet, *Ann. de Chim. et de Phys.* [5], 14, 11 and 18.

The plan and detail of the book scarcely reveal the teacher, though for the most part the information which it contains is accurate. The drugs are treated of under three different heads: "(1) The specially diagnostic megascopic characters of the crude drugs. (2) The diagnostic microscopic characters of the powders; and (3) The pharmacography of the drugs." The latter is the epitome of the botanical and geographical sources, the chemistry and the adulteration of each drug. What advantage such an epitome can have when arranged in the same order as the monographs we cannot see; a very serious disadvantage may attend it, however, when, as in several instances in this book, the information given differs from that found in the monographs (catechu and catechu nigrum). When we say that the information is for the most part accurate, we feel that we have said the utmost that can be said that is favourable. The arrangement of even accurate statements is so bad as to produce in some cases a false impression—for instance, in one paragraph we are told that the second harvest of cochineal consists "of females exhausted by fecundation," and "constitutes the 'black' or 'dark grain' cochineal"; while in another paragraph it appears that "in the black grain," the insect having been killed by heat, this waxy [previously mentioned as 'cottony'] secretion has disappeared." Again, a most detailed description is given of the structure of senega root, but we should be much surprised if any student learned from it that the xylem column was generally fissured in an irregular manner below the crown of the root. On page 124 it is stated that a drug may be "partly identified" by certain characters. How anything can be "partly identified" is not explained.

The work should not be taken too seriously, perhaps, but the author has made us feel that he really has made a serious attempt to write a serviceable handbook. That he has not succeeded he will probably be quick to admit; and he will not realise his ambition in this direction until he shakes himself free from the bonds of other text-books, and braces himself to a first-hand knowledge of his subject. The drawings are not of uniform excellence, those which are drawn for the work leaving very much to be desired. Many errors, due to faulty revision, have been noted; it is to be hoped that the first edition has been small, so as to permit of a speedy revision. In order to justify this remark we may point out, first, that a micron is not equivalent to the micromillimetre; the former represents the thousandth part of a millimetre, and the latter the millionth part. Lycopodium contains more than 10 per cent. of fatty oil. On page 105 amyloextrin is spoken of as "proteid matter." Araroba is grouped with the resins. Facing page 51 is a drawing signed by the author, and, therefore, presumably original; but we feel sure that we have seen a similar drawing about ten years ago in a periodical. If this is a drawn copy, which, of course, it may not be, is it quite fair to reproduce it without any acknowledgment of source? West Indian sandal wood oil is not even mentioned, and the chemistry of the essential oil of sandal wood is quite ignored. But we must not multiply faults. Suffice it to say that the work represents an honest attempt to write a useful book; the attempt, however, has failed.

NEW REMEDIES.

AMMONIO-ARSENIO-CITRATE OF IRON.—This compound occurs in green scales which are very soluble in water; it contains 1.4 per cent. of arsenious acid, and 15 to 18 per cent. of metallic iron. Valvassori and Peroni find that it is a valuable antiperiodic, and that it may be administered subcutaneously to children.—*Merck's Report*, 1900, 74.

CUPRI-ASEPTOL.—This is a compound of copper with phenol-sulphonic acid and forms small deep bluish green opalescent crystals which dissolve easily in water. It is employed in veterinary practice as a hæmostatic.—*Merck's Report*, 1900, 53.

FACTS AND FANCIES.

BY AN ORDINARY PHARMACIST.

An Ending and a Beginning.

In a few days the pharmaceutical year will have closed and—with the annual dinner eaten, the annual meeting past, the vacancies in the Council filled—we shall all be waiting for the curtain to be raised once more and wondering in what respect the next twelve months will differ from the last, so far as matters pharmaceutical are concerned. Not that I, personally, expect to see any marked difference manifest itself immediately. As an old stager, I have learned that great and sudden changes in our social conditions are so rare and exceptional as to be practically non-existent. Even when a new Act of Parliament is passed, or new bye-laws are adopted, the effects are not immediately perceptible; the gradual manner in which effects manifest themselves is far remote from anything in the nature of cataclysmic change. In fact, taking one year with another, the variation in our environment appears so slight in an ordinary way that we are apt to jump to the erroneous conclusion that no progress has been made, when, in reality, the progress and improvement have been very considerable. Only by contrasting periods a few years apart are we able, as a rule, to form a just estimate of the march of events. This year, for example, we may expect to see more clearly than before how the change in the qualification for membership of the Pharmaceutical Society is likely to operate upon the traditional policy of the representative body; but next year will probably afford a still better opportunity of observing how the latest pharmaceutical application of the democratic principle works. Last year a big wave of enthusiasm brought in an unusually large number of new members; this year I expect to find that the pendulum has swung back some distance, and that the membership may show a slight decrease. But next year will supply the crucial test, and it is hard to say at present how the swing of the pendulum may be affected when the first flush of enthusiasm and the reaction naturally following that have alike ceased to be immediate factors in the situation.

The Year's Lesson.

Taking the annual report of the Council as a record of the pharmaceutical year, we find that whilst there has been no marvellous display of constructive ability, our position has been steadily maintained and strengthened. The Lord Chancellor's attack has not been entirely beaten off, but our defences are yet intact, and that delay in following up an attack, which is as good as a victory to the defenders, has enabled us to do much in the direction of educating outside opinion and furbishing up our somewhat rusted weapons for offensive action in the immediate future. Quite a short time ago the defects in the Pharmacy Act were known to very few persons outside our own ranks; to-day they supply food for reflection to a comparatively large number of prominent non-pharmacists, and that with but little effort on our part to direct public attention to the matter. What, then, may be the result of steady, persistent agitation, carried on by several thousand educated professional men, such as pharmacists are now entitled to be considered? It seems to me that there can only be one result—arrival at the conclusion that the existing state of things is illogical and altogether too absurd to be allowed to continue. And, though the manner in which reform is ultimately effected may conform more to prevailing notions of public policy than to the ideas of a few individuals in the ranks of pharmacy, I have but little doubt that we, as a class, will receive all the consideration to which we are entitled when the reform is brought about. How much or how little that consideration may be will depend upon our average for the time being. If the average be high the consideration will be marked, and it should be needless to suggest that it behoves us all to attempt to raise that average far above what it is at present if public consideration is to be as great as we should like. We must be prepared to recognise the necessity of a com-

pulsory curriculum, to let the "Widows' Clause" go by the board, to agree that no pharmacy shall ever have an unqualified person even in temporary charge, to act up to the spirit as well as the letter of the law, and—whatever personal inconvenience may be involved—to consider the public interest first and foremost, as the basis of any claim by pharmacists for special treatment.

The Official Journal as a Trade Paper.

I am glad to see that, according to the Society's revenue account for 1899, the official organ appears to have got well through the experimental stage into which it was thrust a few years ago. It is now received and read by more pharmacists than any other journal devoted to pharmaceutical topics in this country, and, I believe, has a weekly circulation in Great Britain not far short of that of all other similar papers put together. In that respect its position will doubtless improve steadily as time goes on, and as the paper is developed on such lines as will enable it to adapt itself to all the varying needs of British pharmacists. I am afraid Mr. Percy Wells cannot be regarded as a safe guide in that respect, though he appears to have got a faint glimmering of what is needed when he speaks of "the supplement." There is no regular supplement to the Journal at present, but it is a point worthy of consideration whether the existing inset pages might not, with advantage, be allowed to develop into a separately printed supplement, complete in itself and dealing exclusively with trade matters. Such a supplement might well have a circulation of its own, apart from its indissoluble connection with the Journal, though I would not for a moment suggest that the *P. J.* should attempt to rival one of its contemporaries, which contrives to mislead advertisers with regard to its circulation by occasionally issuing a few thousand extra gratuitous copies of a loose sheet. There is no occasion for the official journal to sin in that direction, for its regular weekly issue is so large that it is unnecessary to bolster up the figures representing a genuine circulation by any kind of semi-fiction. Nevertheless, I should be glad to see the multifarious nature of the ordinary pharmacist's occupation recognised even more fully than it has been by the Council, for that body, I presume, is directly responsible for such development as has taken place in the official organ of the Society during the past six years, and is alone competent to decide what further changes, if any, shall be effected in the future.

Turnover and Profits.

In addition to reading all the periodicals which cater especially for the needs of pharmacists, I like, at times, to dip into the pages of other trade papers, and, in glancing through the columns of a recent issue of the *Grocer*, I was pleased to find some useful tables on turnover and profits, in which the question of possible profit is placed upon a proper basis. Thus, to find the percentage of profit on cost, the rule is to multiply the profit by 100 and divide by the cost. Supposing, therefore, the cost is 8 and the profit 4, the percentage of profit on cost is 50, thus—

$$4 \times 100 = 400 \div 8 = 50 \text{ per cent.}$$

But, taking the same figures for cost and profit, the percentage of profit on sales is only 33, thus—

$$4 \times 100 = 400 \div 12 (4 + 8) = 33 \text{ per cent.}$$

To find what amount to add to cost to realise a certain rate per cent. upon the cost, we must multiply the cost by the rate required and divide by 100. Say the cost is 6 and the rate required 25 per cent., then—

$$6 \times 25 = 150 \div 100 = 1.5.$$

Finally, to find what amount to add to cost to produce a certain rate per cent. upon sales multiply the cost by the rate required and divide by 100 less that rate. Thus, if the cost be 6 and the rate required 25, then—

$$6 \times 25 = 150 \div (100 - 25) = 2.$$

A little time devoted to the study of the foregoing rules will be well spent by many pharmacists, and they may be glad to know that copies of the tables referred to can be obtained by sending an addressed envelope, with a halfpenny stamp affixed for postage, to Messrs. J. Bath and Co., 3, Crooked Lane, London, E.C.

ROYAL INSTITUTION.

On Friday, May 4, Dr. T. E. THORPE, of the Government Laboratory, Somerset House, delivered a lecture on

Pottery and Plumbism.

He showed the results of some recent chemical investigations which prove conclusively that lead poisoning among potters is a disease that can be stamped out. Lead is used by the potter for producing the well-known glaze on earthenware and china articles. Glazing is necessary to convert the porous, so-called "biscuit" ware, into an impervious material. It is obtained by using certain compounds of lead—*e.g.*, white and red lead, which are known as "raw lead," and lead silicate, formed by fusing litharge with flint. These lead compounds are mixed with silicates of aluminium and the alkaline earths to form a glazing solution. Lead poisoning is due to the solution of lead in the saliva and the gastric juice. The poison may enter the system in various ways; it may be inhaled as solid particles floating in the atmosphere, absorbed through the skin from the clothing, or introduced by eating with unwashed hands. Even the user of cheap earthenware articles is not exempt from liability to lead poisoning. A sample of mint sauce was found by the lecturer to be heavily contaminated with lead by standing for some few hours in an earthenware vessel. There are two ways of preventing this disease, both depending on a careful selection of the glazing materials. The first precaution is to select glazing materials free from "raw lead," and consisting of the silicate of lead mixed with other silicates. This compound is not so soluble as the "raw lead." In Germany it is illegal to sell any earthenware or china article which gives up lead when boiled for one hour in a 4 per cent. solution of acetic acid. A special commission was appointed in this country to find some means of combatting this disease and remove what constituted a grave scandal. As a result, the recommendation was made that manufacturers should substitute the silicate of lead for "raw lead," but unfortunately it was not enforced. It is noteworthy that a high percentage of lead in the mixture is quite compatible with a low solubility. While this precaution lessens the danger, lead poisoning can only be altogether avoided by abandoning the use of lead for glazing purposes. Leadless glazes are known to manufacturers of pottery, and answer the purpose as well. Many public bodies—*e.g.*, the Post Office—have notified manufacturers that all china and earthenware goods must in future be made for them by the leadless glaze process. In following this example the public may compel the manufacturers to take the only step that will effectually stamp out plumbism among potters.

On Thursday, April 26, Professor DEWAR delivered the first of a course of lectures on

A Century of Chemistry.

He pointed out that the scientific history of the Institution began with Sir Humphry Davy, and paid a high tribute to his singular boldness and originality in devising experiments, though he did not always show corresponding caution in drawing conclusions from them. Heat was at that time regarded as an entity which entered into combination with matter, and certain phenomena were explained as being due to the liberation of the specific heat of bodies. By grinding two pieces of ice together *in vacuo*, Davy showed that they melted, although the specific heat of the water produced was greater than that of the ice, thus establishing the truth of his view that heat was a mode of motion. He entered with great eagerness into the study of gases, to which the discoveries of Priestley and others had given prominence, and showed astonishing boldness in finding out their physiological action by experiments on his own person. Thus, having demonstrated the properties of nitrous oxide, now extensively used by dentists, he pushed his experiments with carbonic oxide so far as to put his life in imminent peril. That curiosity was the more remarkable

because he had left on record a very disparaging estimate of physiology, the ultimate object of which he declared must for ever remain unattainable. The same contempt for danger was shown in his experiments upon nitrogen chloride, which the loss of an eye and almost of his life did not deter him from resuming as soon as he could return to work. Davy's electrical work was next referred to, and some interesting pieces of his rudimentary apparatus were exhibited. He was able to detect exceedingly feeble currents by the aid of an instrument which the lecturer showed in operation, and with very simple appliances he attacked problems and arrived at conclusions which subsequent research had only confirmed and amplified.

On Thursday, May 3, Professor DEWAR delivered the second lecture of the series, in which he continued his examination of

The Work of Davy,

and showed the origin and development of the electro-chemical theory at the hands of that great investigator. By close reasoning from experiments, Davy arrived at the migration of atoms, or of ions, as the sufficient explanation of the phenomena of electro-chemical action. As freedom of movement among the atoms was a function of their temperature, it might be anticipated that at a sufficiently low temperature all voltaic piles would become inactive, and that was shown by Professor Dewar to be the case, by using temperatures far below those at Davy's command. An enormous stride was taken by Davy when he effected the separation of the alkali metals, and established the nature of chlorine. After proving the alkalies, which were then thought simple bodies, to be really compounds, he proved chlorine, then thought a compound, to be a simple body. To Davy was due the first clear and philosophic conception of an element as simply a body which cannot be decomposed by any methods at our command. However easy that conception might appear to-day, it met with much opposition even from some very distinguished chemists when Davy first put it forth. The invention of the safety-lamp gave Davy a place in popular estimation which his abstract researches would hardly have won for him. The safety-lamp remains to this day essentially what Davy made it, improved perhaps in workmanship and details but depending on the identical ideas Davy developed.

ROYAL SOCIETY.

The rooms occupied by the Royal Society at Burlington House, Piccadilly, W., were thronged on Wednesday evening, May 9, by a large assembly of Fellows and their friends, the occasion being the

Annual Conversazione,

presided over by the PRESIDENT, Lord Lister.

In addition to about thirty exhibits of scientific apparatus, etc., to which reference will be made, several

DEMONSTRATIONS

were given during the evening by means of an electric lantern. Sir Andrew Noble, K.C.B., F.R.S., led off with some illustrations of Modern Explosives and the results connected therewith. A considerable variety of explosives were shown, descriptions being given of the effect of some when exploded or detonated; a few experiments were made, and the results of others exhibited with lantern slides. The effect of erosion in guns was also shown, as well as the results of experiments made with the object of minimising erosion.

Dr. ARTHUR W. ROWE, F.G.S., followed with a series of splendid illustrations of the Photomicrography of Chalk Fossils, shown by reflected light. The photomicrographs exhibited the beautiful and delicate features of the fossils—consisting chiefly of sponges and bryozoa, developed from the matrix by means of a dental engine—in a most wonderful manner, every detail being shown distinctly. The forms of fossils exhibited have been not

a little neglected by geologists on account of the difficulty of extracting them from the matrix; but by means of the dental-engine every particle of chalk can now be removed, so that the fossil stands out clearly and may be examined and photographed from every side. Dr. Rowe also exhibited the series of *Micraster* used to illustrate his paper on "An Analysis of the genus *Micraster*," recently published in the 'Quarterly Journal of the Geological Society.'

Mr. F. ENOCK, F.L.S., gave a series of lantern illustrations of Photographs from Living Insects, showing the metamorphoses of one individual nymph of *Aeschna cyanea* from the moment of quitting the water to that of the perfect imago.

Mr. H. B. HARTLEY and Mr. H. L. BOWMAN, M.A., demonstrated the Properties of Crystals yielding Doubly-refracting Liquids on Fusion. Certain crystalline organic compounds—viz., *p*-azoxyanisole, *p*-azoxyphenetol, and cholesteryl benzoate, have been found by Professor Lehmann, of Carlsruhe, to give on melting (at temperatures of 116°, 134°, and 145° respectively) liquids possessing the properties of double-refraction and dichroism, even under conditions in which a state of strain is impossible. When these anisotropic liquids are further heated, they change at definite temperatures of transition (134°, 165°, and 178° respectively) into ordinary isotropic liquids. The intermediate bodies have been called "liquid crystals," for, although the evidence of their elasticity, viscosity, and dielectric capacity shows them to be undoubtedly liquids, yet nevertheless they possess, like crystals, both double-refraction and dichroism.

Mr. RICHARD KERR, F.G.S., exhibited a clock—the invention of Mr. Isaac H. Storey, of Lancaster—which is controlled at a distance by wireless telegraphy of the Hertzian wave system. A receiving instrument with a coherer was attached to the clock; a transmitting instrument in another part of the room gave rise to ethereal waves, which, acting upon the coherer, set the works of the clock in motion. Based upon this system, a method is being devised by which all the clocks in a city can be made synchronous, and can be driven without springs or pendulums other than the standard driving pendulum at headquarters, and also without the intervention of air-tubes or electrical wires or any device involving the erection of poles or the tearing-up of streets. Correct time, hitherto an unknown quantity in all the clocks of a city, will thus be available to everybody. Mr. Storey, it is understood, is at present completing plans whereby he will steer and direct a steam-launch at a distance of several miles from the operator, and entirely without the intervention of wires or any connection other than that of the Hertzian waves. This, it will be seen, opens up the great possibility of controlling and directing war vessels from any central station, such as a fort or an ironclad.

THE EXHIBITS

were of an extremely interesting character, not only from a scientific but also from a general point of view.

Sir H. HOWORTH showed a box, believed to be unique, painted by De Hooze Straten, representing the interior of a Dutch house. Its chief interest, apart from its character as a painting, is that it is an extraordinary *tour de force* in perspective—perhaps the most remarkable example of the application of the scientific principles of perspective extant.

Professor J. W. JUDD, C.B., F.R.S., on behalf of the Coral-Reef Committee of the Royal Society, exhibited specimens from the Reefs of Funafuti illustrating the rate of growth of corals and calcareous algæ; new and interesting forms of Foraminifera, which have been described by Mr. F. Chapman, including *Cycloclypens*, a genus previously regarded as being very rare, but now shown to exist abundantly at Funafuti; a curious form of *Polytrema*, which occurs encrusting various objects in alternate layers with the marine alga *Lithothamnion*, thus forming loose nodules; and the newly-described *Haddonina*, first obtained from Torres Straits.

Professor H. G. SEELEY, F.R.S., exhibited four natural-size

drawings illustrating Restorations of *Dimorphodon*. The drawings, based upon fossil remains from the Lias, in the British Museum, represent the skeleton as in the quadruped and biped positions, and show the contours of the body at rest, walking, and preparing for flight, to illustrate proportions of the skeleton. The drawings were made from working models with the wing membranes attached to the bones.

Prof. E. RAY LANKESTER, F.R.S., on behalf of the Archæological Survey of the Egypt Exploration Fund, showed a number of reproductions of Paintings and Sculptures in Tombs of Ancient Egypt, representing domestic and wild animals and birds. In spite of the artists' ignorance of perspective and occasional faulty colouring, the outlines were rendered with remarkable fidelity to nature, often enabling the species to be identified. Among domestic animals, the dogs were perhaps the most interesting, as showing that extreme development of various breeds had already taken place. The monuments from which the drawings exhibited were copied were of two periods:—(1) Tombs at Beni Hasan, of the XIIth Dynasty (*circa* 2000 B.C.); (2) the Tomb of Ptah-hetep at Saqqarah, of the Vth Dynasty (*circa* 3000-2500 B.C.).

Maps illustrating the Total Eclipse of the Sun of May 28, 1900, were exhibited by Dr. DOWNING, F.R.S. These included a general map of the eclipse, prepared by Señor Tarazona; the path of the moon's shadow across Mexico, and the path of the moon's shadow across the United States, prepared by Professors Todd and Brown; the path of the moon's shadow across Portugal, Spain, and Algiers, prepared by Señor Tarazona; and the stars and planets in the neighbourhood of the sun, prepared by Mr. A. C. Crommelin.

Mr. H. O. ARNOLD-FORSTER, M.P., had on view a specimen map from the London School Atlas—an atlas for Elementary Schools, to be published by the London School Atlas Company, Limited, which contains 48 pages of maps and 8 pages of text. He also exhibited the original drawings for plates appearing in the Atlas.

Mr. J. WIMSHURST, F.R.S., again gave practical demonstrations of the utility of his well-known Influence Machine—constructed with twelve plates of vulcanite—for either screen or photographic work in the hospital or on the battlefield.

An exhibit of especial interest to photographers was that of Mr. THOMAS THORP, showing Celloidin Grating Films and their application to Diffraction Colour Photography. Celloidin films of diffraction gratings, of about 14,500 lines to the inch, are impressed on chromated gelatin plates, the surface of which thus becomes grooved. Light falls on the gelatin surface through photographic transparency. The celloidin film is detached and the plate immersed in warm water, when an image appears in grooves more or less decided. The pictures are superposed and illuminated, and are then seen in their natural or other desired colours stereoscopically.

Prof. MINCHIN, F.R.S., gave practical demonstrations of flashes induced in a helium tube by Hertz waves, while Prof. SILVANUS P. THOMPSON, D.Sc., F.R.S., made several electromagnetic experiments, the converse of that made by De La Rive, using a floating magnet instead of a floating battery. He also demonstrated new varieties of the De La Rive experiment. Mr. A. P. TROTTER, M.Inst.Elect.Eng., had models illustrating leakage from electric tramways.

Messrs. W. A. SHENSTONE, F.R.S., and H. G. LACELL exhibited Apparatus constructed of Vitreous Silica. It comprised a long tube for use with a platinum thermometer, a mercury thermometer, bulbs and stems for thermometers, a Giessler tube, a small distilling tube, and rods and tubes of various sizes for various purposes. They also exhibited a quantity of non-splintering silica, suitable for use in the oxygen flame, and gave practical demonstrations of the method of converting this into tubes and other forms of apparatus, together with experiments to illustrate the

behaviour of vitreous silica under sudden and great changes of temperature.

Improved forms of Standard Resistance Coils were shown by the CAMBRIDGE SCIENTIFIC INSTRUMENT Co., Limited, Cambridge. The coils are of bare wire wound on mica frames, and are immersed in oil of high insulating properties, which can circulate freely in the vessel. The reading of a thermometer in the oil gives the temperature of the coil. One of the coils exhibited, by permission of the Board of Trade, was fitted with a platinum wire wound parallel to, and on the same frame, as the platinum-silver wire. These wires have very different temperature coefficients, and by measuring the resistances of both coils the temperature of the standard coil can be determined to a high degree of accuracy. The coils are annealed by heating them by a current when finished.

Mr. P. E. SHAW exhibited an Electric Micrometer, designed primarily to measure the small movements of a telephone diaphragm. A screw abuts on a system of three levers, set up on a strong wooden frame. By turning the screw the far end of the levers moves to and fro through distances which can be controlled and measured. This end of the levers carries a rod, and the diaphragm a small plate, both of iridio-platinum; if these two surfaces touch one another a flow of a small amount of electricity occurs, producing a sound in a telephone held by the observer; at the same time he reads by a telescope a graduated circular scale fixed on the screw. Since the screw and levers can be moved at will by the observer, he can, by this contact method, find the position of the diaphragm and follow its movements. Precautions against vibrations are taken by having india-rubber suspensions, and against temperature changes by covering the working parts with boxes wrapped in felt. Movements as small as 1/200th of a wave-length of sodium light have been measured by this apparatus.

Other exhibits included a set of Anthropometric Instruments, by Dr. J. G. GARSON, for the use of travellers desirous of making anthropometric observations on native races, or on the inhabitants of any special locality, whether at home or abroad; also instruments and apparatus used in England for making metric observations on prisoners in connection with the identification of criminals by means of that system; longitudinal sections of Filariated Mosquitoes (*Culex ciliaris*), showing that *Filaria nocturna*, like the malaria parasite, leaves its mosquito host *via* the proboscis, exhibited by Dr. MANSON; remains of extinct gigantic and lesser Lemurs from Madagascar, and living forms for comparison, shown by Dr. C. I. FORSYTH-MAJOR, F.Z.S.; a collection of living marine worms (Annelids) from the neighbourhood of Plymouth, designed to illustrate, as far as possible, the prominent features in the habits of life of the different types of this class of animals, and such modifications of form as are related thereto, exhibited by the MARINE BIOLOGICAL ASSOCIATION; examples of leadless glazed ware, shown by Dr. T. E. THORPE; specimens of the decorative art of the sea Dayaks of Sarawak, by Prof. A. C. HADDON, F.R.S.; jointing boxes and aigrettes, used in the re-arrangement of the Lightning Conductors of St. Paul's Cathedral, by Mr. KILLINGWORTH HEDGES, M.Inst.C.E.; a volume of photographs of Stars, Star-Clusters, and Nebulæ, by Dr. ISAAC ROBERTS, F.R.S.; ethnographical objects from Malay Peninsula (Malay and Sakai), including phonographic record of the songs of the Pangan tribe, a wild aboriginal tribe of Negrito stock, by Mr. W. W. SKEAT; section cut from the tree on Lake Bangweulu, Central Africa, under which Livingstone's heart was buried, and containing the inscription carved by his native followers, by the ROYAL GEOGRAPHICAL SOCIETY; and a photograph of the statue of the late Professor Huxley, Pres. R.S., now in the Natural History Museum, South Kensington, by Mr. H. R. HOLDER.

POLITICAL GOSSIP.

MR. BALFOUR'S PLEDGE to give several days' notice of the second reading stage of the Companies Bill was not, it appears, a permanent pledge, and was not intended to possess any of the dictionary attributes usually associated with the noun. The First Lord of the Treasury has, indeed, established the interesting fact that there are subtle distinctions and degrees in Parliamentary promises, and that the specimen he exhibited just before Easter (see *ante*, p. 282) had only a transitory *nuance* of sincerity. The situation is, therefore, that the second reading of the Companies Bill may come on suddenly, but not just yet. Mr. Balfour has definitely stated that he is not desirous of immediately taking measures of such importance as the Companies Bill, and the policy of the Cabinet right through the session has been to deal with the "small fry" of legislative proposals, rather than the more adult and vigorous items. It is a pretty open secret too in Parliamentary circles that the Bill will not be pushed on by the Government unless events in South Africa should render the prospect of an early dissolution hopeless. It will be just as well, however, for the Parliamentary Watch Committee of the Council not to be deluded into a sense of false security by the procrastinating tactics hitherto adopted by the Ministry, or by the rumoured intention of Mr. Ritchie to advise the omission of Clauses 2 and 3 of the Bill.

THE BIRMINGHAM CHAMBER OF COMMERCE having carefully considered the Companies Bill, expresses general satisfaction that the subject of company reform is occupying the attention of the Legislature, but it is not satisfied with some of the clauses of the Government Bill. A petition has therefore been presented to the House, on behalf of the Chamber by Mr. Jesse Collings, embodying a number of suggested amendments. Among the suggestions is one relating to Clause 3, and it reads thus:—"This clause should be limited by the exclusion of companies coming under Section 23 of the Companies Act of 1867." Presumably the Birmingham Chamber of Commerce regards Clause 2 as being perfect as it stands, for nothing is urged against it in the petition. This is all the more inexplicable when regard is had to the fact that the Secretary to the Chamber, and one of the signatories to the petition, is Mr. W. F. Haydon, who, if we are not mistaken, is a pharmaceutical chemist, and was at one time intimately connected with an association for protecting the trade interests of chemists and druggists.

PERSISTENCE is usually regarded as a virtue by those who possess the faculty, or who profit by its exploitation, but, like vaulting ambition, it sometimes overdoes the business. Mr. MacNeill, for instance, is a perfect genius of interrogation, and has never shown the faintest signs of weariness in plying ministers with queries about members of the Cabinet who are company directors; yet he does not advance matters much. Here is Mr. Balfour's answer to his onslaught on Thursday week. "I have answered questions on this subject twice in 1895, three times in 1898 and twice in 1899, and have also made long and elaborate speeches thereon. I really have nothing to add." Really this treating the virtue as a disease must be very galling to a persistent man with a mission. Undismayed and unabashed however, Mr. MacNeill revived the matter on Tuesday in the shape of a motion setting forth that the position of a company director was incompatible with the position of a Minister of the Crown; but the House again administered the snub direct by rejecting the motion—but by a majority of eleven votes only.

ANOTHER REFORMER.—Major Rasch—failed to carry his reform on Tuesday. He desired to pin the House to the rule that no speech (except by the big Treasury guns and movers of Bills or Resolutions) shall exceed twenty minutes. A majority of 46 in a House

of 230 members decided that no such restriction was desirable or necessary. The gallant member for S.E. Essex was consoled—or at any rate it was the only consolation offered—by the fact that a marked improvement had taken place in the House in the matter of speeches during the past few years, and that members generally were more business-like and less prolix.

THE SUCCESSOR to Sir William Priestly in the representation of Edinburgh and St. Andrews is not, after all, J. M. Barrie the "Little Minister," but Sir John Batty Tuke, M.D. The new member is a Fellow of the Royal College of Physicians in Edinburgh, and represents that body on the General Medical Council.

THE DEPARTMENTAL COMMITTEE of the Local Government Board, which was entrusted with the investigation of the question of the innocuousness or otherwise of food preservatives, is hearing evidence from medical experts under the presidency of Dr. T. E. Thorpe, F.R.S.—the Principal of the Government Laboratories. On Monday last four medical practitioners of standing gave testimony that may be summarised as being chiefly against the use of preservatives. Dr. R. Hutchison, however, considered that the use of boric acid and borax rather conduced to the health of the public, inasmuch as it tended to prevent the diseases produced by bad milk. Personal experiment had convinced him that the above-mentioned articles were perfectly harmless. On the other hand, Dr. E. H. Starling, on behalf of the Royal College of Surgeons, urged the prohibition of formalin, salicylic acid, boric acid, and borax. The other two witnesses held the view that preservatives in milk were unnecessary, but whereas one of the twain pinned his faith on sterilisation and cleanliness, the other was understood to entertain a very poor estimate of the value of the boiling or sterilising process. This brief note on the evidence given will be sufficient to convince the average man that the investigation in progress is no light task.

THE WEIGHTS AND MEASURES BILL which was brought in last Session by Mr. Bousfield (Hackney, N.), and was then commented upon in this column, was reintroduced on the 2nd instant, and is placed for second reading on the notice paper for Wednesday next. A large amount of extra work is proposed to be placed on the Board of Trade by the Bill, and the President of that Department may be excused if he is not quite prepared to endorse the views of the promoters of the measure. The abolition of cased weights is a feature in the Bill, and the provisions otherwise appear to be restricted to weights and measures used in trade.

EXTRACTS FROM CONSULAR REPORTS.

THE QUININE MANUFACTORY established in Java in 1897 is reported to have been well supported by most of the cinchona planters, who, during the first year, gave it a sufficient share of their bark for manipulation to enable it to work steadily throughout 1898, and to deliver about 500,000 ounces of quinine sulphate. Since then its capacity has been considerably enlarged, the bulk of the Bandong manufactory's product being shipped to London, whilst large shipments have also been made to New York and Amsterdam, and smaller consignments to Australia, China, Japan, and the Straits.

THE CINCHONA CULTIVATION COMPANY—"Pandan Aroem"—has erected a manufactory on its estate at Paroeng Koeda, in the Preanger Regencies, to convert its bark into quinine, but so far the greater part of the output is said to have been sold for local consumption, only small quantities being exported.

LETTERS TO THE EDITOR.

The Council Election, 1900.

As I have reason to believe that there may be a misunderstanding as to my position with reference to a circular recently issued by some of the friends and supporters of the retiring members of Council, I desire to state that whilst I am naturally gratified to have this evidence of confidence, the circular was drawn up without my knowledge or authority.

May 9, 1900.

WALTER HILLS.

We wish to emphasise and place on record the fact that it has been found necessary on behalf of five out of the seven retiring Councillors to repudiate their former action in Council, and to adopt the policy of the majority of the Law and Parliamentary Committee in order to have—as we must conclude—any chance of re-election. This recantation appears to us to savour of electioneering strategy, which is not always above suspicion. We regret that this action could not have been taken earlier; but, on the other hand, we are glad to have even at this late hour the position Mr. Gifford and our Association have consistently fought for so completely justified. In a circular issued on behalf of the seven retiring Councillors there appears the following sentence:—"There is also reason to believe that some of the proposed new members may be prevailed upon to favour a policy of allowing limited companies of unqualified men to legally dispense and deal in poisons provided some one or more of the directors are qualified. This would be a fatal mistake, and strike at the root of the principle of the Pharmacy Act, 1868." This declaration is emphatically one of "No compromise," and is contrary to the votes and expressed views of several of the retiring Councillors. It is to be hoped that the electorate will treasure up this precious document, and in the event of these gentlemen being elected will hold them strictly to the views expressed on their behalf.

Blackburn, May 7, 1900.

JOSEPH HINDLE,
WILLIAM HOLT,
PERCY BEAN.

** Whilst finding space for the foregoing letter from Mr. Gifford's Election Committee, we must point out that Mr. Percy Bean is not a member of the Pharmaceutical Society and is therefore not entitled to interfere in its affairs [Ed., P.J.]

We want new blood in the Council—men whose minds are made up on the all-important and pressing question of company pharmacy. Mr. Walter Hills must be re-elected, and Mr. Storrar, although not so full-blown as we should like, is a sound and safe Councillor. The four gentlemen recommended by Mr. Glyn-Jones's Committee are well-known men, whose presence in the Council should tend to stir the other members to vigorous action in the important work which lies before them. If we are to have some new Councillors united action is necessary. There are many good men seeking election, but we can't put them all in—hence selection is imperative if success in this direction is to be gained. It is desirable that Council honours should go round. Men elected and re-elected time and again often become stereotyped. This conservatism has of late become too pronounced. Ours is not a hereditary chamber, nor is the Council or elected *ad vitam aut culpam*. Since we have universal suffrage, why should our Council not be a thoroughly representative and democratic body? Why should I vote for Mr. Slowgoing or Mr. Waitawhile simply because they have been sitting for twenty or thirty years in the Council, when Mr. Goahead and Mr. Thoroughgoing are ready to advance the reforms demanded by registered chemists? What is most to be deprecated in the Council is the halting and uncertain policy pursued in regard to company pharmacy. It is known that many of the Councillors have given up hope of stopping company trading, yet very few are frank enough to publicly say so. This non-committing has the effect of catching blind votes. The Council members

thus re-elected assume that the go-as-you-please policy has been approved by the electorate, and the blundering continues.

Edinburgh, May 5, 1900.

W. S. GLASS.

Will those members who are determined that the Society shall adopt a more vigorous policy, instead of using their votes on behalf of those who are seeking re-election, and whose return is practically assured, divide their votes amongst seven of the new candidates who have pledged themselves to do all in their power to protect their trade interests?

London, May 8, 1900.

C. E. PICKERING.

The Poison Schedule.

The list of "drugs and preparations included in the schedule of poisons" published in this week's issue of the *Pharmaceutical Journal* contains certain items—and certain omissions, if a Hibernianism be permissible—the reason for which is not evident. I would therefore respectfully invite discussion upon these points, viz.:—Why are apomorphine hydrochloride, codeine and its phosphate, and the three official salts of morphine placed in part 2 and not in part 1 of the schedule? "Poisonous vegetable alkaloids and their salts" are distinctly mentioned in part 1, and such I contend these are, and not merely "preparations of morphine," which belong to part 2. Second: Why are liquid extracts of coca, ipecac., and jaborandi, green extract of hyoscyamus, extract of Calabar bean, vinegar and wine of ipecac. included in either part of the schedule? These I consider to be preparations of crude drugs which are not recognised as poisons by the Pharmacy Act, and of them only the preparations of ipecac. are standardised to contain a definite quantity of alkaloid. If these preparations are to be scheduled because they contain alkaloid, why should not the crude drugs be scheduled for the same reason? The schedule of the Act makes a distinction in certain cases—e.g., "belladonna and its preparations" are scheduled, but "chloroform" alone is scheduled, nothing being said about its preparations; yet we have legal decisions to the effect that he who sells a preparation of a poison sells the poison itself. If the articles I have mentioned have been included on the ground of their being preparations of alkaloids—which I am not prepared to admit them to be—I am at a loss to understand why preparations of other scheduled poisons—viz., liniment, spirit and water of chloroform, antimonial wine, red and white precipitate ointments—have been omitted. Third: Why are cantharides plaster and ointment and warming plaster placed in part 2? Cantharides is in part 1, its tincture and vesicating liquid preparations are in part 2. These are questions of more than mere academic interest to the trade as a whole, and I would be glad to know what views are taken of them by others, as they concern the student, the teacher, and the wholesale and retail pharmacist.

Newcastle-on-Tyne, May 5, 1900.

FRANK R. DUDDERIDGE.

A Protest from Dr. Symes.

I have received a gratuitous copy of a journal devoted to pharmacy, and, assuming there was some special object in sending it to me, I looked through its pages, and found that my name occurs a dozen or more times therein. The grievance is the subject of my remarks at the last meeting of the Liverpool Chemists' Association, where I had been asked to open a discussion on "Companies and Pharmacy." The report of my remarks is a condensed one, differing in some essential points from that in the *Pharmaceutical Journal*, and seems made rather to fit the criticism than the criticism to fit it. In the concluding lines, however, it is absolutely incorrect in saying, "In conclusion, he suggested passing a resolution supporting the Council of the Pharmaceutical Society in their opposition to the Bill." The statement is unfair alike to the members present, to myself, and to the Pharmaceutical Council. The resolution was moved by Mr. T. F. Abraham, and the action was entirely voluntary on his part, and the support given to the resolution was not at my suggestion in any way. Another journal reports my remarks and the proceedings very fairly, but the editor suggests

that I was providing "food for the enemy." I have always given that gentleman credit for considerable astuteness, and, if I am not mistaken in my assumption, he is fully aware that "the enemy" knows quite as much about the laws affecting pharmacy as we do, and requires no feeding on my part. If we are to do any good we must look the matter as it stands fairly in the face and deal with it according, rather than attempt to gain any advantage by trusting to the ignorance of those affected by it. The more absurd and anomalous our position can be shown to be under existing circumstances, the more reason have we to hope to obtain fresh legislation of a beneficial character.

Liverpool, May 7, 1900.

CHARLES SYMES.

The Journal and Its Needs.

Mr. Percy Wells' idea of a supplement to the Journal may look somewhat like a "joke," but it has often occurred to me that as a means of strengthening the Society a trade supplement would be a very good thing. There is much talk in these pre-election days of the difference in the points of view from which matters pharmaceutical are regarded between West-end London pharmacists and their provincial brethren. It may be—I hope it is—the fact that West-enders are to a man in the happy position of being able to subscribe to all the trade journals. I know, however, that we in the provinces are not all so pleasantly circumstanced, and when I read railings or bewailings editorial in your pages on the iniquity of registered men failing to see that it is their duty to join the Pharmaceutical Society, I sometimes wonder why it is not more clearly perceived that this reluctance may proceed from other causes than simple apathy.

The Journal, while not retrograding on its scientific side, has in recent years improved immensely as a trade paper. But, while this is so, there is no use blinking the fact that in this aspect it has to contend with strong opposition. This would be a matter for congratulation to the body generally were it not the case that, for the financial reasons suggested, success of the opposition journals tends inevitably to limiting the number of the Pharmaceutical Society's members. It may seem a large order to demand that you not only provide for us in the official organ the best scientific journal, but that in addition you give us in it the best trade journal. But that is the order. You have already gone a great way towards filling it, and if this "notion" of a trade supplement be properly handled it is possible that another long step in the right direction will have been taken.

My idea of what this proposed supplement should contain is not that of Mr. Wells' by any means. If we are not too proud to learn from our competitors, we know already, in the main, what a business supplement should look like. I feel sure that if the average man, who cannot afford to patronise all the journals, could be assured that the official organ—in its supplement or elsewhere—contained week by week the fullest collection of matter (and advertisements) interesting to him in his business, when he came to make the choice between joining the Society or contenting himself with the position only of subscriber to an unofficial journal, he would prefer to attach himself to the Society. I am aware that this is putting the matter on a not very exalted plane. We have sometimes, however, to look low for a thing which has been dropped, and in this case if we have not dropped we have certainly failed to pick up.

This letter is already too long; but I would like, before closing, to suggest—for others to think of—how comparatively small would be the expense of sending a supplement every week, free, to every chemist in business, and how great, in all probability, would be the effect in a few years on the membership of the Society.

Glasgow, May 5, 1900.

T. G. (31/8).

Of Things in General.

As a chemist of the second generation, with one of a third growing up, I have naturally taken a deep interest in all that concerns our business and profession. Having passed the qualifying examination early in 1873, I eagerly allied myself

with the Pharmaceutical Society, in the confident expectation that, while safeguarding the interests of the public, it would also see that those of its members would not be lost sight of, for, if the interests of the public were alone to be served, why should we alone have to bear the cost? That the interests of the members have not received that attention which many of us think we had a right to expect, is proved by the facts that we have had to organise subsidiary societies such as the P.A.T.A. and Chemists' Defence Association; that no amended Pharmacy Act has been urged upon the Government, after the Lords' decision had practically knocked the bottom out of that of 1868, and in various other ways which have been pointed out in recent correspondence and in speeches at meetings of chemists all over the country. Of recent pharmaceutical politics, which have been discussed *ad nauseam*, I will say nothing more than that I cannot understand there being more than one opinion upon the two questions of the sole right to the use of our titles and sole right to sell and dispense poisons. These are the irreducible minima, upon which there must be no compromise. Personally, I even go further than that. I think that as individual chemists, and as a Society, we have been much too modest in our claims, and the world and Parliament have been very apt to take us at our own valuation. If the two restrictions mentioned constitute the whole advantage we are to obtain, why go to the trouble and expense of passing examinations covering so much ground? Logically, we ought only in that case to be examined as to our knowledge of toxicology. Every chemist knows that there are a hundred and one drugs and chemicals in the Pharmacopœia not scheduled poisons which yet require care in handling and in their administration; many of these are used in domestic medicine, in arts and manufactures, and we are constantly called upon to answer questions as to their use and limitations, to give advice and cautions, and generally to protect the public from any possible ill-effects of their own want of knowledge. All such active substances should be procurable only from educated pharmacists, and should not be sold by grocers and hucksters, for when the blind lead the blind both are apt to fall into the ditch.

A restriction such as suggested would have the indubitable effect of improving our position, but it would also undoubtedly be very greatly to the advantage of the public. The sole right to our titles must, of course, remain, but the mere restriction of the sale of poisons to qualified chemists, even when companies are exempted, would be of precious little benefit to us, and not nearly enough for the public. I am fully aware that when any chemist ventures to make such claims he does so at his peril. He is howled down, strange to say, not by the public, but by his own Journal, by members of the Council, and by brother chemists not so unfavourably situated as himself. He is told that he is ignorant of pharmaceutical history, of the tendency of the times, the sacred name of free trade is trotted out to give him the *coup de grace*, and he is strongly recommended to retire to that obscurity from which he ought never to have emerged. Yet I know that similar opinions to these are held by large numbers of the rank and file in our craft. Unfortunately, many of these are inarticulate, because they have lost all hope of the assistance of their Council in the attainment of those objects which they believe to be theirs by right. It has been iterated and reiterated times without number that there is not the slightest hope of such Utopian ideas being accepted in Parliament, that it is a mere crying for the moon, and a waste of time and energy to bring them forward. Now, I do not for a moment believe that such is the case; whenever I have carefully and fairly explained the position to friends, they have invariably expressed surprise that any unqualified person or company should be allowed to sell physiologically active drugs or chemicals, whether actually poisons or not, and many of them were under the impression that the public had that amount of protection already. If the whole case were fairly stated, if we demanded what we have earned as a right, if it were shown that we had done our part by passing increasingly stringent examinations, and by so doing fitted ourselves for the

guardianship of the public interests, I am not yet convinced that even Parliament would not acknowledge the justice of our claims, and grant us a measure that would be at one and the same time a boon to us and an undoubted protection to the public. If, on the other hand, we approach Parliament "with bated breath and whispering humbleness," we need not be greatly surprised if we are, metaphorically speaking, kicked downstairs.

Even in the matter of jury service our Council dared not claim exemption for all on the Register, and we were told that such a claim would not be entertained for a moment, and yet, years afterwards, such a claim was made on behalf of our dental friends and accepted by Parliament, so far as I know, entirely without demur. I will venture to say that our right to exemption was much, very much, stronger than theirs, for Parliament had imposed upon us the duty of personal service to the public, a service which we were not allowed to delegate to our assistants. As an excuse for the inactivity of our Council, I have no doubt but that some kind apologist will triumphantly call my attention to the carbolic acid case as illustrating the difficulty of our position, and the all but impossibility of gaining even a proper protection to the public if that would involve some protection to us. Well, but even in that instance I do not for a moment admit that we have exhausted all the resources of civilisation. We could educate the public by occasional letters in our local papers, we could put up members to ask questions in Parliament, we could show how large a proportion of the deaths by poison were caused by carbolic acid, how often juries had strongly recommended it to be placed under proper restrictions, and how frequently coroners had publicly complained that no notice was taken of such recommendations. If the question was in these and other ways forced to the front, even such a tardigrade body as the Privy Council would be compelled to act in a matter which could so clearly be shown to be in the interests of the public; and I believe that similar measures would do much towards forcing through Parliament a Pharmacy Bill which would be a real boon to us, and not less really so to the public. Further than this, as it was a pharmacist in Parliament who first gained for us legal recognition, I would suggest that if all else fail, we should take steps to send other pharmacists there. In conclusion, I think that we have reasonable cause of complaint in the attitude our Journal assumes towards reforms, but more especially towards reformers. It is too much of a government organ for voicing the official mind and too intolerant of all but a colourless criticism of the Council. I have noted, with some indignation, a disposition to sneer at Lancastrian chemists, and several individuals whose only offence has been the advocacy of opinions differing from those held by the official pharmacists, have been most superciliously snubbed in one number and perhaps unmercifully castigated in the next. This ought not to be; the Journal is ours, and ought to exist only for our interests, and every member of the Society has an undoubted right to ventilate his opinions, provided always that he does so courteously, in temperate language, and with a due regard to the feelings of others. I trust that the awakened interest in the forthcoming election will result in a considerable infusion of new blood, so that the interests of the craft may be more vigorously prosecuted than has hitherto been the case.

A ROSSENDALE CHEMIST (31/9).

Rawtenstall, May 7, 1900.

Sorting the Sorters.

Though it may be too late for me to disinherit the chaos that prevails in and about this Council election, I have shaken off a legarthy regarding the trend of pharmaceutical affairs that has held me for a time. If, therefore, I may be allowed such space in the Journal as has been granted to others whose rapid outpourings have made confusion more confounded, we may bring order to the pharmaceutical barque and its undisciplined crew to our honour and glory for the common good. To make straight the path seems almost beyond the wit of man, as the amount of accumulated rubbish for which the Journal has of late been a

"free coup," or dumping ground, has first to be cleared away. I voted for Mr. Glyn-Jones at his former election and also gave him my moral support, for he is a strong man. He has, however, been beating the air, and at this time a period set apart with his four satellites for reflection will do him no harm and may prove advantageous. He reasons that limited companies, having stolen our donkey and utilised it so long as to acquire a vested interest in it, we cannot get it back; therefore, he would let them also have its harness and barrow. No, Mr. Glyn-Jones, we will not take for granted what has been too readily assumed without proof. There has been more than enough of sentimental twaddle about "the safety of the public" as the chief influence on Parliamentary legislation. The safety of the public is ensured as much as it can be by the requisites of pharmaceutical examination. Parliament did give, and purposed giving, a monopoly in passing the Poisons Acts and granting a charter to the Pharmaceutical Society. There is no logic, nor any sense, in the Courts' axiom that a corporate body cannot be qualified. The existence of the Pharmaceutical Society gives it the lie, because it is a corporate body, and had there been no qualification it would never have been incorporated. Neither would Parliament grant immunities to an irresponsible combination while it denies them to an individual singly.

Herein lies the straight issue our Mr. Lord Gifford has begun to clamour about. He, nevertheless, hugs the shadow of names and titles more than the substance of practical business; and when he so strongly asserts that his business interests are his own affair he demurs to anyone else taking an interest in them. Now, the whole pharmaceutical trouble springs from no merely sentimental ideals, but from the havoc done or threatened to business interests. The past history of Council procedure for twenty years shows grievous error in not rightly estimating this and acting on it. Mr. Lord Gifford, being so minded regarding his own business interests, does not take the right way to show fitness to look after the interests of pharmacists generally, and it would be a pity to take him away from his household gods. Peace be with him.

In conclusion, it is better to endure the ills we have than fly to others while our would-be councillors have hazy and immature notions of the duty lying before them. Mr. W. L. Currie, of Glasgow, seeks to represent the wider field of pharmacy at this time. He rightly thinks that we, as pharmacists, have no call to give form to a Limited Companies Bill; and though he does not trot a particular hobby-horse, his is the best kind of new blood to infuse into the London Council—strong, without being headstrong, and practical. Give the Council a little Currie and its quality will be greatly improved. Those who have not yet returned their voting papers will do well to return representatives pledged to oppose Clause 2 of the Companies Bill and force the new Council to take active measures. The wire entanglements and barbed fences we have made a terror to ourselves are of our own construction, and more imaginary than real as evidences of a strong position on the part of limited company pharmacy. Let us make a frontal attack and see. I have now put my hand to the helm of the drifting ship, and if there is any steam in its badly-corroded boilers I will make her bump.

Larbert, May 8, 1900.

ALEXANDER LAING.

The Title of The Qualifying Examination.

I notice that at a meeting of the Public and Poor-law Dispensers' Association, held on February 28, Mr. Frederick Davis suggested that the name of the qualifying examination should be changed. I consider this an excellent suggestion. There can be no doubt but that the term "Minor" is a very misleading one, and liable to give a totally inadequate idea of the scope and difficulty of the examination to anyone not conversant with the subject. "Qualifying Examination" would be a much better

title. I hope the Pharmaceutical Council will see its way to make the alteration.

Southport, May 8, 1900.

C. F. JESPER.

"The Outlook in Pharmacy."

I have received a number of applications for copies of my paper, "The Outlook in Pharmacy," from various parts of the country. May I have the use of the Journal columns to say that my supply of these is exhausted? The paper may be seen verbatim in the Journal of February 17 last.

Bolton, May 7, 1900.

JOHN TAYLOR.

The Literature of Pharmacognosy.

I note in the Journal of May 5 (p. 487), that Mr. F. W. Gamble is reported as saying at the meeting of the Chemists' Assistants' Association, that, "speaking of the literature of pharmacognosy, it was curious that so little has been done by English workers. So far as he knew, Professor Greenish was the only Englishman who has taken up the subject thoroughly in recent years." This seems to me a little unjust to previous English workers, who, not professionally, but in their spare hours after business, have devoted time to original work on this subject. Mr. H. Pocklington in the *Pharm. Journal* [3], 2, 3 and 4, gave a long series of articles on pharmacognosy, under the title of "The Microscope in Pharmacy," and although these were not illustrated by drawings, they were of considerable practical value as containing original observations on a large number of drugs. Mr. W. Kirkby, who was appointed lecturer on pharmacognosy in Owens College in 1891, has also done a considerable amount of original and very careful work in pharmacognosy, as the following papers testify:—"Kamala," *Pharm. Journal* [3], 14, 897; "False Cubebs," 15, 653; "Rio Ipecacuanha," 16, 126; "Sandal Wood," 16, 857, 1065; "W. African Pareira Brava," 17, 218; "Spurious Cubebs," 18, 269; "Insect Powder," 19, 239; "Adulterated Saffron," 21, 337. Excellent histological work on Pareira, has also been done by Mr. J. Moss and Mr. W. M. Holmes; on Hwang-peh bark and *Aconitum napellus* by Mr. P. W. Squire, and on *Daphnidium Cubeba* by Mr. Farr. These by no means exhaust the list of histological work in pharmacy done by Englishmen of recent years.

Sevenoaks, May 7, 1900.

E. M. HOLMES.

What is Pharmacognosy?

Every student of the theory of teaching is aware of the great danger of allowing students to give—parrot-like—text-book definitions, instead of using their own phraseology, lest the meaning of the phrase be imperfectly understood; and every teacher knows how difficult it is to eradicate this bad habit when once learnt. The danger of, and the great difficulty of the eradication of, this bad habit are well exemplified in the adoption by Professor Greenish, in his lecture before the Chemists' Assistants' Association of Flückiger's definition of pharmacognosy. This German authority defines pharmacognosy as "The simultaneous application of various scientific disciplines with the object of acquiring a knowledge of drugs from every point of view." This definition—if words have any meaning—certainly includes the study of drugs from the therapist's point of view (pharmacology), a branch of the study of drugs with which pharmacists have absolutely nothing to do; and yet at the conclusion of his paper Professor Greenish makes the statement that "the pharmacist alone is qualified from the outset to deal with the problems of scientific pharmacognosy." Prof. Greenish therefore either does not appreciate the full meaning of Flückiger's words or else he has no knowledge of the extent of modern pharmacological methods. Of the two explanations the former seems the more charitable and indicates the danger I have already pointed out, of adopting the definitions of others verbatim. But there seems no good reason for extending the meaning of the word pharmacognosy. It has been adopted in this country both by pharmaceutical teachers as well as by "well-known lec-

turers in pharmacology," to indicate the study of the "diagnostic characters of crude drugs," whilst the term "pharmacography" is used to describe the other information known about drugs, such as the history, preparation for the market, etc. Possibly the Professor adopts the German definition of pharmacognosy in the same highly intellectual manner that he adopts towards the controversy regarding "digitalin" and "digitoxin"—i.e., takes the "opinion of the last speaker," without reference to the arguments previously stated.

Clapham, May 14, 1900.

W. A. KNIGHT.

Œcology.

The earliest mention of the word "œcology" I have been able to find is in Professor Haeckel's 'The History of Creation,' the English edition of which was published in 1874. He includes it in the ten general laws of biology upon which the comprehensive law of development is firmly based. "Œcology of organisms," he says, is "the knowledge of the sum of the relations of organisms to the surrounding outer world, to organic and inorganic conditions of existence; the so-called 'economy of nature,' the correlations between all organisms living together in one and the same locality, their adaptation to their surroundings, their modification in the struggle for existence, especially the circumstances of parasitism, etc." It would indeed be extremely interesting to see the essays which the candidates in the Council Prizes Examination must have written in answering the first botanical question.

May 8, 1900.

Kpovos (31/23).

The Terms Ecological and Perennation.

I note the remarks by "An Ordinary Pharmacist" on the above terms, but I think Professor R. J. Harvey Gibson's definition of ecology to be far more expressive to the student's mind than those quoted:—"Ecology—the relation of plants to their environment." The word perennation explains itself by its obvious relation to the word perennial.

Stoke-on-Trent, May 4, 1900.

E. GRIFFITHS.

Urine Analysis.

Will some reader of the Journal kindly inform me what is the usual charge to medical men, and also to ordinary customers, for urine analysis?

May 2, 1900.

J. W. (41/31).

Copper in Nux Vomica.

In reply to the editorial footnote to my letter of last week, permit me to say the source of heat in incinerating the ground seeds was a brass Bunsen. I had my attention directed to this possible source of copper during incineration some years ago, but I have failed to discover the reference. I understood, however, that only a minute trace was likely to come from this source, and to avoid contamination as much as possible the incineration was conducted in a fairly large crucible, and the two Bunsens used were inclined at an angle of 45°, so that only the apex of the flame impinged on the bottom and sides without overlapping. In one case the incineration was allowed to continue for about twelve hours, while in another case it was completed in about one hour, and the amount of copper in both cases was practically the same. Nevertheless, some of the copper may have come from this source. In the case of the fluid extract an iron Bunsen was used for the incineration, so that this source of copper was eliminated. There are other proofs that the Bunsen is not the source of the copper, and as it has been shown by Vedrödi (*Pharm. Journ.* [4], 3, 177) that my process is attended by loss of copper, the possible Bunsen contamination may probably be disregarded. I send you a piece of polished iron wire which was immersed for half-an-hour in a dilute hydrochloric acid infusion of a few grains of the ground seeds, and you will note a very distinct coating of metallic copper. The tincture and fluid extract made from these ground seeds in vessels

free from copper give an exceptionally distinct greenish-blue colour when mixed with aromatic spirit of ammonia and water. I ought to say that the work was done merely to answer the query and with no thought of publication. It was only at the last moment that a quantitative estimation was thought of, and unfortunately the whole material was used up, and no more of the same can be procured. But there was abundant indisputable evidence that the sample contained much more copper than any of the others, which were merely qualitatively examined. I may add that I purpose continuing the inquiry, and would be glad of any information as to whether copper in any form is applied to the seed in commerce.

Edinburgh, May 8, 1900.

J. RUTHERFORD HILL.

Glaucium Luteum.

I have read with pleasure some letters about *Glaucium luteum*, which have appeared in the pages of this Journal, since they show that attention is being given, not only to plants themselves, but also to their surroundings. It is rather remarkable that in many of the ordinary floras and text-books the description of the localities in which plants grow, and the nature of the soil is even now very imperfectly given. I can quite support Mr. W. J. Brown's statement in this Journal, p. 447, about the above species being found on ground that is not sandy. Between Brighton and Dover—that is, near Excet Bridge—the yellow poppy grows abundantly on the cliff, where no sand is present, and which moreover differs essentially from the sand in that the soil there is not very porous. Dr. Arnold, in his 'Flora of Sussex,' gives as its place of growth in Sussex chalk cliffs and shingles, and the very first notice of it as a British plant is from Dover Cliffs, in Turner's Names of 1548. I may also add that it grows quite well in ordinary garden loam at Oxford, to which a small portion of salt is added, and that in the east of Europe or West of Asia it is also found at long distances from the sea, to the vicinity of which in Britain it is confined as a native plant.

May I say in allusion to the rather vexed word "ecology" that for the past year or two I have been engaged in collecting material for 'An Ecological Flora of the British Isles,' in which I hope will be shown more particulars as to the exact place of growth, altitude and distribution than is given in the usual text-books. May I also ask any reader of this Journal who has any information on the subject, or any notes on the relationship of plants and soil, or, in fact, any information bearing on this great subject, to kindly let me have the benefit of it, as such a work as the one I allude to can be only brought to an approximate completeness by the assistance of the many workers who are scattered through the British Isles. May I say that the correct name of the yellow-horned poppy is *Glaucium flavum* (Crantz), since the name given by Crantz in 'Stirp. Austr.' of 1763 takes precedence over that of *G. luteum*, used by Scopoli in the 'Flora Carniolica' of 1772.

Oxford, May 8, 1900.

G. CLARIDGE DRUCE.

At the risk of being considered either pertinacious or encroaching on your valuable space, I venture to return to the consideration of this "fugacious beauty." If I have misunderstood Mr. Brown's statement I hope he will not ascribe it to a captious motive, but rather to the obtusion incident to old age. It is not improbable that the plant may possess accommodating qualities common with several other maritime favourites; as sea-thrift, *Aroneria maritima*; sea lavender, *Statice spatulata*, *Asplenium maritimum*, *Tamarisk*, *Tamarix gal.*, etc., Asparagus, *A. off.*, found by the late Mr. Henry Deane in the Warren, Folkestone (where he also discovered *Hirudo off.*). It is pleasing to notice how cheerfully these wildings of nature accept exile from their native haunts and surroundings. I was not, however, successful in the culture of *G. luteum*, although planted in some of the sand in which it had grown—it seemed to be pining for the sea breezes, and gradually faded away. I must still

plead ignorance as to what is meant by "sandy erosions of limestone"—the term seems to imply disintegrated sandstone—which does not occur on the cretaceous system on the S. Kent coast. With the gault I am more familiar. My father informed me that about the year 1820 a subsidence of the chalk cliff occurred, occasioned by the undermining influence of subterranean springs; the pressure of the superincumbent mass upon a stratum of blue gault forced up an immense mound of it, seawards. This was gradually washed away by the tides; but I well remember the locality, called Copt Point, which as boys we often visited, excavating large stores of ammonites, belemnites, hamites, and corrugated bivalves, all small specimens, which on being washed and dried presented an iridescent appearance. Mr. Brown's comparison of blue gault with ung. hydrargyri is humorously correct—in one place it lies on the surface covered with long grass; the effect of rain had worn channels to the depth of four to five feet. In pursuit of a butterfly, I slipped into one of these crevasses, and lay there in a very ignominious position until hauled out. Remarking the tenacious quality of the clay upon my clothes, I suggested it might, if burned, make good cement. Some one appears to have taken the hint, for a year after extensive cement works were in full operation, under a lease granted by Earl Radnor to a private company. I hope the speculation has proved a success, it is full thirty years since I visited the spot.

Richmond, April 29, 1900.

R. GOODWIN MUMBAY.

The P.A.T.A. and the Council Election.

The letter from Mr. Glyn-Jones in last week's *Pharmaceutical Journal*, in reply to Mr. Eardley's two questions respecting the *Anti-Cutting Record*, will no doubt astonish many people who, like myself, were under the impression that the *Record* was the property of the P.A.T.A. and edited by Mr. Glyn-Jones as the paid Secretary of the Association, whereas it is evidently a private speculation of his own subsidised by the P.A.T.A.

Mr. Glyn-Jones's letter led me to make an examination of the accounts of the P.A.T.A., and I find there several items which I think deserve the very serious attention of members of that body as well as of members of the Pharmaceutical Society at the present juncture. In 1897-98 the total income of the P.A.T.A. was £1,468. The expenditure includes salaries, £653; travelling expenses, £114; subscriptions to the *Record*, £204; extra copies of the *Record* and advertising, £44; rent, £50. It is fair to presume that a considerable proportion of this item, £653 for salaries, goes to Mr. Glyn-Jones as Secretary, and seeing that the *Record* is his private property, the items of £204 and £44 are also paid to him.

The principal reasons which Mr. Glyn-Jones gave for his seeking a seat on the Council of the Pharmaceutical Society were:—

- (1) That it was dominated by one man.
- (2) That the 1868 Act should be more stringently carried out by the Council.
- (3) That great economy might be exercised in regard to the publishing of the *Pharmaceutical Journal*.

Now, sir, I think that anyone who has taken any interest in the P.A.T.A. will be compelled to admit that Mr. Glyn-Jones is practically the P.A.T.A., and that his influence predominates in its counsels. It will also be seen from the figures that I have quoted that a considerable part of its income finds its way into his possession. Of course, Mr. Glyn-Jones gives a great proportion of his time to this work, but so does the gentleman to whom Mr. Glyn-Jones objects so much on the Pharmaceutical Council, with this great difference, that he does it gratuitously, whereas Mr. Glyn-Jones is rapidly developing into a paid agitator, and what with the P.A.T.A., the Chemists' Defence Fund, and the Pharmaceutical Council, he will soon have no time left to attend to his business in the East-end.

Then with regard to the carrying out of the spirit of the 1868 Act. I should like to ask Mr. Glyn-Jones if it is a fact that he, as well as the gentleman to whom he objects on the Council, is carrying on business under an assumed name, and that his poison labels do not bear the name of the actual proprietor? Also, is it a fact that his business in his often prolonged absence is, or was, managed by a gentleman whose name does not appear on the Register of Chemists and Druggists, and that this gentleman has under him a qualified man as cover. If these things are so, I think it explains entirely Mr. Glyn-Jones's position with respect to company pharmacy, as he cannot be expected to go for legislation which is contrary to the spirit in which he is conducting his own business.

With regard to the third point, economy in conducting the *Pharmaceutical Journal*, I must say that I think the price the Council of the P.A.T.A. is paying for the *Record* is much greater, proportionately to its contents, than the cost of the *Pharmaceutical Journal* to the Society, though it does give us valuable literary and scientific knowledge that we look for in vain in the *Record*.

In conclusion, I would urge every member of the Pharmaceutical Society to weigh very carefully the arguments which are put forward in opposition to the present members of the Council, who have no interests of their own to serve, before allowing themselves to be led away by a gentleman who is, as I have shown—in another organisation, of which he is chief, and in his own business—doing exactly the things which he blames our present leaders for doing.

Bradford, May 9, 1900.

ALFRED H. WADDINGTON.

Dr. Symes and Company Pharmacy.

The present Council election is noteworthy for the number of caucuses set on foot. This may indicate a lively interest. I have received my voting paper, and by the same post I also received an appeal, signed by an influential number of chemists, to vote for the retiring members of the Council who are offering themselves for re-election. I understand we are absolutely determined to protect our title and will deal with nothing in the nature of concession whereby company pharmacy may be legalised. I will point out that the election of Dr. Symes to the Council, since he is associated with company pharmacy, would be calculated to stultify us in our efforts to deal with this question. I have a great appreciation for Dr. Symes individually, but emphatically declare his presence in Council to be a huge inconsistency.

London, May 9, 1900.

ROBERT EDWIN WRIGHT.

The New Caucus.

I would venture to add a word or two to my warning of last week against the new caucus candidates. I am agreeably surprised to find that my criticism of one of the candidates is endorsed by no less an authority than that monument of judgment and probity the *Chemist and Druggist*. There remains, however, the record of Mr. Walter Gibbons, of Manchester, to be dealt with. That gentleman is now making his second essay for Council honours. Early in 1898, when the Pharmacy Acts Amendment Bill was before Parliament and the pharmacists of the country, Mr. Gibbons obtained a certain amount of kudos from the amount of noisy alarm he sounded on the "confiscatory clauses of the Bill" and the injustice it betokened to "Major" men. A glance at the Register will show that Mr. Gifford and Mr. Gibbons both passed the Major Examination as far back as 1878. The comparative stringency of the Major Examination of that era and the present Minor will be duly appreciated by those of us who have more recently been privileged to become members of the Society—through no fault of, or assistance from, Mr. Gibbons.

Cockermouth, May 9, 1900.

W. S. SCOTT.

ANSWERS TO QUERIES.

Special Notice.—Scientific, technical, legal, and general information required by readers of the *Pharmaceutical Journal* will be furnished by the Editor as far as practicable and as early as possible, but he cannot undertake to reply by post, even though stamped envelopes accompany the queries. All communications must be addressed "Editor, 17, Bloomsbury Square, London, W.C.," and must also be authenticated by the names and addresses of the senders. Questions on different subjects should be written on different slips of paper, each of which must bear the sender's initials. Replies will, in all cases, be referred to such initials, and the registered number added in each instance should be quoted in any subsequent communication on the same subject. When formulæ are given without definite weights and measures, it should be understood that all solids are to be weighed and liquids measured. Not more than six plants should be sent for recognition at one time.

NAME OF PLANT (E. E. H.—41/33).—*Helleborus viride*.

ECOLOGICAL (H. M.—41/30).—A definition was given in last week's issue, at page 465.

LANTERN SLIDES (J. W.—41/28).—Have you tried George Houghton and Son, 88, High Holborn, W.C., or W. Watson and Sons, 313, High Holborn, W.C.?

SODIUM SULPHATE (R. E. W.—41/32).—The only article of the kind quoted by leading wholesale druggists is the powdered dried sulphate, and that, we imagine, is what you should expect to receive if you order the powdered salt.

ZEISS'S BUTYRO-REFRACTOMETER (A. W.—41/23).—You will find the information you require, with the requisite tables for calculating the results rapidly, in 'Oils, Fats, and Waxes,' by Benedikt and Lewkowitsch, pp. 507-509. The book is in the Society's Library.

WORK ON PHOTOGRAPHY (C. R. P.—41/34).—There is no one work that comprises all the subjects. You should get Abney's 'Instruction in Photography' (Sampson Low, 6s.), Hubert's 'Art of Retouching' (Hazell, Watson and Viney, 1s.), Townshend's 'Chemistry of Photography' (Dawbarn and Ward, 1s.).

F. C. S. (T. W.—41/29).—It is not a degree, and there is no examination, but a candidate is expected to submit evidence of chemical training, and must be recommended by five Fellows, three of whom must certify their personal knowledge of his qualifications. Write to the Secretary, Burlington House, London, W., for the form of application, and further particulars. If you wish to take a degree, why not work for the B.Sc.?

CEMENT FOR STOPPING TEETH (G. S.—41/26).—The term "crystal" is misapplied in this case, as there is no such thing as a crystal tooth-stopping. What you require is evidently the osteoplastic cement, prepared by pouring strong nitric acid on zinc oxide and stirring until the reaction is complete, then heating in a porcelain crucible until red vapours cease to be given off. Next raise the contents of the crucible to a white heat and allow to cool gradually, after which the mass should be very finely powdered and mixed with syrupy phosphoric acid for use.

PH.D. (H. L. H.—42/1).—The degree can be taken at many German, Austrian and Swiss Universities after two years' residence. A chemical student must furnish proof of satisfactory general education and devote at least a year to lectures and laboratory classes in chemistry, physics and allied sciences, after which he proceeds to investigate a suitable subject for the dissertation to be presented before he can take his degree. Examinations must also be passed in chemistry, physics and one other science, such as botany or geology. For further particulars write to one of the Universities, say, Berlin, Munich, Stuttgart, Würzburg, Marburg, Heidelberg, or Tübingen.

DETERMINATION OF TANNIN (E. F. M.—41/27).—The process of Simand and Weiss is simple and sufficiently accurate for most

purposes. Dissolve from 22 to 28 Gm. of the extract in distilled water, make up to 1 litre and filter. Determine the total amount of soluble matter by evaporating 100 C.c. of the filtrate to dryness and weighing. To extract all tanning material place 250 C.c. of the filtrate in a dry flask with 1 Gm. of hide powder, and shake for 2 hours; filter and repeat the treatment twice with 1 Gm. of hide powder each time; again filter and shake for 2 hours with 2 Gm. of hide powder. Finally, filter for the fourth time, and evaporate 100 C.c. of the filtrate to dryness. The difference between this weight and that obtained after the first evaporation indicates the amount of tannin. The hide powder can be obtained of dealers in chemicals for analytical purposes. You will find details of other processes in Trimble's work on 'The Tannins,' a copy of which is in the Society's Library.

PRACTICAL NOTES AND FORMULÆ.

Metol Developer.

Metol is dissolved in water, 1000; and then sodium sulphite, 150; potassium hydrate, 75; potassium bromide, 2, are dissolved in the solution. If negatives with little contrast are desired, less potash should be used, and little or no potassium bromide; if deep contrasts are aimed at, more of the bromide should be employed.—*Amat. Phot. g.* 14, 15.

Japan Varnish Recipes.

	(1)	(2)	(3)	(4)	(5)	(6)
Celluloid	2 ..	5 ..	10 ..	5 ..	5 ..	5
Amyl acetate	78 ..	16 ..	30 ..	— ..	50 ..	25
Acetone	20 ..	16 ..	30 ..	— ..	— ..	25
Camphor	— ..	— ..	4 ..	— ..	— ..	—
Methylated Spirit....	— ..	— ..	— ..	50 ..	— ..	—

All these preparations require months to settle, so that a centrifugal separator or filter press should be used.—*Pharm. Post*, 32, 721.

Inhalations for Coryza.

Menthol, 1; chloroform, 10; or menthol, 1, and chloroform and alcohol (90 per cent.), of each 5. Several drops of either mixture is rubbed on the hand, and the vapour inhaled.—*Pharm. Post* 32, 721.

Ointment for Acne Rosacea.

Precipitated sulphur, 3 to 15; salicylic acid, 0.5 to 1.5; sweet almond oil, 5; lanolin, 30.—*Deuts. Am. Apoth. Zeit.*, 20, 101, after *Monats. f. prakt. Dermatol.*

New Method of Copying.

The following process for obtaining copies of writing has been recently patented:—One side of a thin parchment paper is covered with tannin solution and thoroughly dried. The tannated side of the parchment is then laid on the manuscript to be copied and the other side of the parchment is damped. About fifty copies may be taken in this manner from one manuscript.—*Deuts. Am. Apoth. Zeit.*, 20, 131, after *Pharm. Post*.

Chilblain Remedies.

Thibridge recommends the following preparations:—(a) Zinc oxide, 150; carbolic acid, 8; vaseline, 225; lanoline, 230. (b) The same ingredients and proportions, except that the phenol is replaced by menthol, 4.5. For deeper inflammation the following is recommended:—(c) Lead subacetate, 30; carbolic acid, 7; zinc oxide, 225; vaseline, 225; lanoline, 225; or, (d) Lead subacetate, 3; bismuth subnitrate, 9; Rousseau's laudanum, 1.5; vaseline, lanoline, and lard, of each, 15.—*Pharm. Post*, 32, 721.

PHARMACEUTICAL JOURNAL.

A Weekly Record of Pharmacy and Allied Sciences.

ESTABLISHED 1841.

Circulating in the United Kingdom, France, Germany, Austria, Italy, Russia, Switzerland, Canada, the United States, South America, India, Australia, South Africa, etc.

Editorial Office: 17, BLOOMSBURY SQUARE, W.C.
Publishing and Advertising Office: 5, SERLE STREET, W.C.

Members of the Pharmaceutical Society must address all communications with reference to the transmission of the Journal, to the Secretary, 17, Bloomsbury Square, London, W.C.

LONDON: SATURDAY, MAY 12, 1900.

THE SOCIETY; ITS OBJECTS AND ITS UTILITY.

UTTERANCES relating to the Pharmaceutical Society are of a very varied nature, and frequently quite opposite, according to the source from which they proceed, or the audience to which they are addressed. Naturally, that is the case since the Society—though representing a legally recognised body—is only a comparatively small fraction of that body, and the majority have no direct connection with the Society. Those conditions have always prevailed, since the foundation of the Society. They existed as a matter of course, when its membership was a voluntary criterion of fitness; afterwards, also, when, with the same object, the title of pharmaceutical chemist received statutory recognition. Those conditions still continue to exist, even since the Society has been entrusted with wider administrative functions relating to qualification for—as well as to the exercise of—the business carried on by all the persons which the Society now represents, officially, the majority of whom, however, are not members of the Society. Though the sole object of the Society's administrative function is "safety of the public"—protection of those engaged in the business it relates to being only an incidental effect—various erroneous ideas have been formed respecting the exercise of that function in the grant of statutory qualification. On the one hand, that has been regarded as conferring a trade monopoly, though very little consideration should suffice to correct that notion. On the other hand, persons unable to satisfy the Society's examiners that they possess "competent practical knowledge" of the business they desire to carry on, regard the action of the Society as inflicting a hardship upon them, though the conduct of the examinations has throughout met with unqualified approval by the Government supervisors. To those two sources may be traced the whole of the hostility manifested in adverse criticism of the Society and of its proceedings. Nor is that hostility confined to persons outside the body that the Society officially represents, for unaccountable as it may seem, the same feeling prevails with many within the ranks of legally qualified persons.

Still more unaccountable is it to find within the ranks of the Society opinions expressed indicating that it is

looked upon as a centralised autocratic body, possessing independent ruling power, and not a democratic organisation, intended to give effect to objects that are, or should be, common to all persons on the Register of Chemists and Druggists. Practice of the art of pharmacy being more or less the occupation of all chemists and druggists, the advancement of that art should naturally be promoted by all of them, and the advancement of the science of chemistry with which their business is so closely connected should receive equal attention. For the furtherance of both those objects, and of the general interests of the whole body, the promotion of a uniform system of education, for the practice of the calling, should also be assisted by all registered persons as a primary condition of their welfare. The provision of a fund for relief of distressed chemists and druggists or their relatives is another object which might be expected to enlist the sympathy and co-operation of all engaged in the business. Then there is another object which is so immediately connected with the material welfare of persons who carry on the business of chemists and druggists, viz., the protection of those so engaged, that all persons on the Register might be expected to regard that object as requiring their zealous co-operation and support. Apart from public administrative functions, these are the objects of the Pharmaceutical Society. They are so natural and so important that their attainment, through mutual efforts of the persons interested, should appear indispensable; they should induce all registered chemists to join in the work and to regard membership of the Society as a duty and a primary desideratum. Considering the provision that has been made for such consolidated organisation and self-government, the fact that the Society still numbers only one-third of the entire body, is therefore matter for astonishment and regret. While that condition continues the complaints of chemists, as to the generally felt want of protection in the exercise of their business, are only evidence of their own neglect. In the case of those who are not members of the Society, they either amount to self-condemnation of their failure to incorporate themselves with their fellows and give support to such mutual co-operation as would render protection possible, or they point to the unreasonable assumption that protection of those who are not members of the Society is the particular business of the minority who do belong to it.

The lines on which protection of chemists' business interests is to be secured have always been plainly indicated since the foundation of the Society. The fundamental principle is education. That principle is the essence of the Society's charter, of the Pharmacy Act, and even of the Act of 1868; though the Society's original project was watered down to suit the desires of chemists and druggists as a "trading community," and as a mere "wretched Poisons Act" it is branded with the great seal of the "United Society." Still the possibility of protecting the interests of chemists and druggists, so far as that result is attainable under that Act, rests upon the distinction of chemists and druggists, as specially educated persons, from other traders. Only by cultivating the difference which justifies that distinction can chemists and druggists hope to provide, for themselves, the protection they desire and would then merit. But the great object, of establishing a

uniform system of education for that purpose is still unachieved. That has been persistently opposed for the last twenty or thirty years; the failure of all attempts made to obtain amendment of the Pharmacy Acts in the true interests of the pharmacist has been due to that opposition, with the result that the present difficulty of examinations arises entirely from the want of systematic education. Trade interests have always intervened, and, just in proportion to the descent from the educational standard to make trade interests prominent, so has the prospect of rational regulation of the practice of pharmacy become more and more remote. Meanwhile chemists and druggists have been shorn of the protection they should have furnished for themselves, and unqualified persons, trading as companies, have usurped the statutory privileges which chemists should have conserved more carefully. The position that has thus been reached ought to bring conviction as to the utility of the Pharmaceutical Society, greater respect for the sound principles on which it is founded, more general appreciation of the privilege of membership, and perception of the fact that the Society's protective action must necessarily depend upon the extent to which the entire body is identified with it. In fact, the history of the Pharmaceutical Society may be epitomised as the effort to establish qualification of the chemist and druggist. Qualification has two factors:—examination to protect the public; education to protect the chemist and druggist. Hence the utility of the Society.

QUESTIONS OF INTEREST.

“When will our British, and especially our English, pharmacists be able to concentrate their entire resources on the dispensing of physicians' prescriptions?”

“When will the Legislature give them the exclusive right?”

THESE questions have been suggested to a member of the Society by the fact that a friend, in a neighbouring country, is able to confine his business operations to the dispensing of medicines, finding therein sufficient and satisfactory occupation. His inquiry serves as a useful commentary on the foregoing article, and it gives opportunity for recalling the fact that the aim of the Pharmaceutical Society has always been to make the practice of pharmacy exclusively the business of the chemist and druggist, and to qualify the chemist and druggist for that work. That is shown by the original draft of the Society's Pharmacy Bill of 1864, which related to “compounding the prescriptions of duly qualified medical practitioners” (see *Ph. J.* [2], 5, 557). That aim was strenuously opposed by the rank and file of chemists and druggists, who then sought incorporation. Though the Society's principle of educational qualification was adopted in the Act of 1868, its application, generally, to the dispensing of medicine was stoutly resisted by the greater number of persons then entitled to call themselves chemists and druggists. A chief reason assigned for that opposition was the alleged desirability of “free trade in physic.” As a consequence the application of the principle, in the Act, was limited to the dealing in a few of the more dangerous drugs, etc., leaving by far the greater part of them, as well as the practice of pharmacy, open to the “free trade” which was then considered to be the *summum bonum*.

ANNOTATIONS.

THE STREAM OF CORRESPONDENCE continues at full flood, and views of all kinds—serious, amusing, accurate, and prejudiced—find space in our columns this week. One communication—which, by its inordinate length, might not unreasonably have been submitted to a cutting-down process—is published in full, as written, because of the special interest attaching to a letter written by an old subscriber to the Society, who has never troubled the Editor before and now asks for the most favoured treatment on the ground that, “in another place,” a new speaker is considered to have a special claim to be heard. But a new speaker in that other place does not wear a mask, as “A Rossendale Chemist” quite unnecessarily does, and though, in the present instance, our new correspondent's letter is printed without abridgment, it must not be assumed that a similar plea will produce a corresponding effect in the future. Space is always precious in the columns of the Journal, and though, other things being equal, preference is always given to correspondence—especially when contributed by members of the Society—over much other matter, writers of letters are expected to refrain from mere bald assertion, or vain repetition. Those who have something fresh to say and send properly authenticated communications, free from offensive personalities, can practically always depend upon securing publication in the Journal, but they must take full responsibility for what they write and be prepared for criticism. An impression seems to prevail in certain quarters that members of the Society ought to be able to use the pages of the Journal to criticise with impunity the Council, the Editor, and other contributors, but that impression really must be removed. The Journal undoubtedly exists for the members, but for the whole five thousand odd, and not for a few who happen to be a little more self-assertive than the rest.

“A ROSSENDALE CHEMIST” states an extreme case in fairly moderate language, but his censures upon the manner in which the Journal is conducted would have had more force if he had descended to particulars. He is quite wrong in asserting that the Journal is out of sympathy with chemists who ask that their titles should be protected and that registered persons alone should be allowed to dispense and sell scheduled poisons and other dangerous substances. In fact, that is the position which has consistently been defended in these pages. Notwithstanding pharmaceutical history, the tendency of the times, and the sacredness of “free trade,” the Journal has always contended that the educated pharmacist is unquestionably the only person who should be permitted to compound, dispense, or sell dangerous drugs and chemicals, whether scheduled poisons or not. So much for that point. Turning now to the supposed attitude of the Journal towards reforms and reformers, it is not too much to ask “A Rossendale Chemist” to explain more exactly what he means, and to adduce evidence in support of his case. It certainly should not be a cause for complaint by members of the Pharmaceutical Society that their official organ supports the executive body elected by them. Even when those who attack the Council are members of the Society, it must be remembered that they usually represent only a small section, and that the Journal, in meeting such attacks, is merely acting as the mouthpiece of the majority. Again, so far as Lancastrian chemists are concerned, it is incorrect to allege that they have been sneered at by the Journal; in no quarter is there higher appreciation of the energy, the enthusiasm, and the capacity for organisation displayed by Lancashire chemists. A few of them are, unfortunately, too susceptible to criticism of the mildest kind, but there is reason for believing they all mean well, and when it is generally recognised that Lancashire is not Great Britain, we may expect to see more of that due regard for the feelings of others, which has not always been manifested in the utterances of some Lancashire chemists.

THE ANNUAL DINNER OF THE PHARMACEUTICAL SOCIETY will be held on Tuesday, May 15, and members who wish to be present, but who have not yet obtained tickets for themselves and friends, must send in applications for tickets, accompanied by a remittance, immediately, so as to be in Mr. Bremridge's hands not later than Saturday of this week, in order to enable him to make the necessary detailed arrangements. The names of the gentlemen for whom tickets are intended should be notified to the Secretary; it will also assist the Committee, and ensure friends being seated together if the necessary information be sent with the applications for tickets.

THE SUGGESTION OF "XRAYSER" that by mistake as to the origin of the "United Society" an honourable distinction has been undeservedly thrust upon a contemporary is not supported by the quotation from the 'Progress of Pharmacy,' which was relied upon for the purpose. A more conclusive confirmation of the statement, made on page 449 of this Journal, will be found in the number of the trade circular there referred to, for February 15, 1861, where its next-door neighbour—the "United Society"—is spoken of in an editorial article as follows:—

"We originated the Society," etc.

In 1865 that family relationship had become disturbed; parent and child were then rending each other, and internal disintegration of the "United Society" had also commenced, so that, as the historian of that period, Dr. Redwood would naturally be chary of touching either of those parties.

THE 'MEDICAL REGISTER' for 1900 shows that the total number of persons whose names were registered on December 31 last as practitioners of medicine and surgery was 35,836, being an increase of nearly 800 on the number registered twelve months earlier, and more than 1,000 in excess of the average for the last five years. The numbers of persons whose names appear in the three local registers are: 20,627, or 57.56 per cent., for England; 10,230, or 28.54 per cent., for Scotland; and 4,979, or 13.90 per cent., for Ireland. During 1899 the number added by registration was 1,351—or 708 in England, 487 in Scotland, and 156 in Ireland; the restorations were 96 and the number removed was 668. From the beginning of registration in 1858 up to January 1, 1900, there have been 60,895 persons registered—37,887 in England, 13,668 in Scotland, and 9,320 in Ireland. But more than 25,000 have been removed by death, or have had their names erased for various reasons.

THE 'DENTISTS' REGISTER' for 1900 occupies only 235 pages, as against the 1,793 in the 'Medical Register.' It includes the names of 4,749 persons, of whom only 1,758, or 37.02 per cent., are licentiates in dental surgery of the four Colleges of Surgeons; 2,965, or 62.43 per cent., are persons who, on their own declaration, are in *bonâ fide* practice of dentistry; 6; or 0.55 per cent., are colonial, or foreign, dentists.

THE MINOR EXAMINATION has been the subject of two queries addressed by Mr. W. R. Kermath, of St. Andrews, to all the candidates at the forthcoming election of Council. He asked (1) whether the candidate was in favour of "an alteration in the method of conducting the examination?" and (2) whether, if returned to the Council, he would support a motion "to the effect that candidates for the Minor certificate get credit for any subject or subjects in which they may obtain pass marks?" The questions are so vague that the whole of the candidates might, with but little hesitation, have answered both in the affirmative. Apparently, however, the first was generally interpreted as referring to the proposed division of the Minor examination, and the second as inquiring whether a candidate who obtains pass marks in one or more subjects should be excused the examination in those sub-

jects when he presents himself again. Many of the replies were therefore more or less guarded, and the result of the inquisition has proved little beyond the fact that opinions may differ upon questions which are not properly stated. Why, in the circumstances, Mr. Kermath should have gone to the expense of printing all the replies it is not quite easy to conceive. They are certainly not worth printing in the Journal.
