HarvestTemplates, your best frenemy
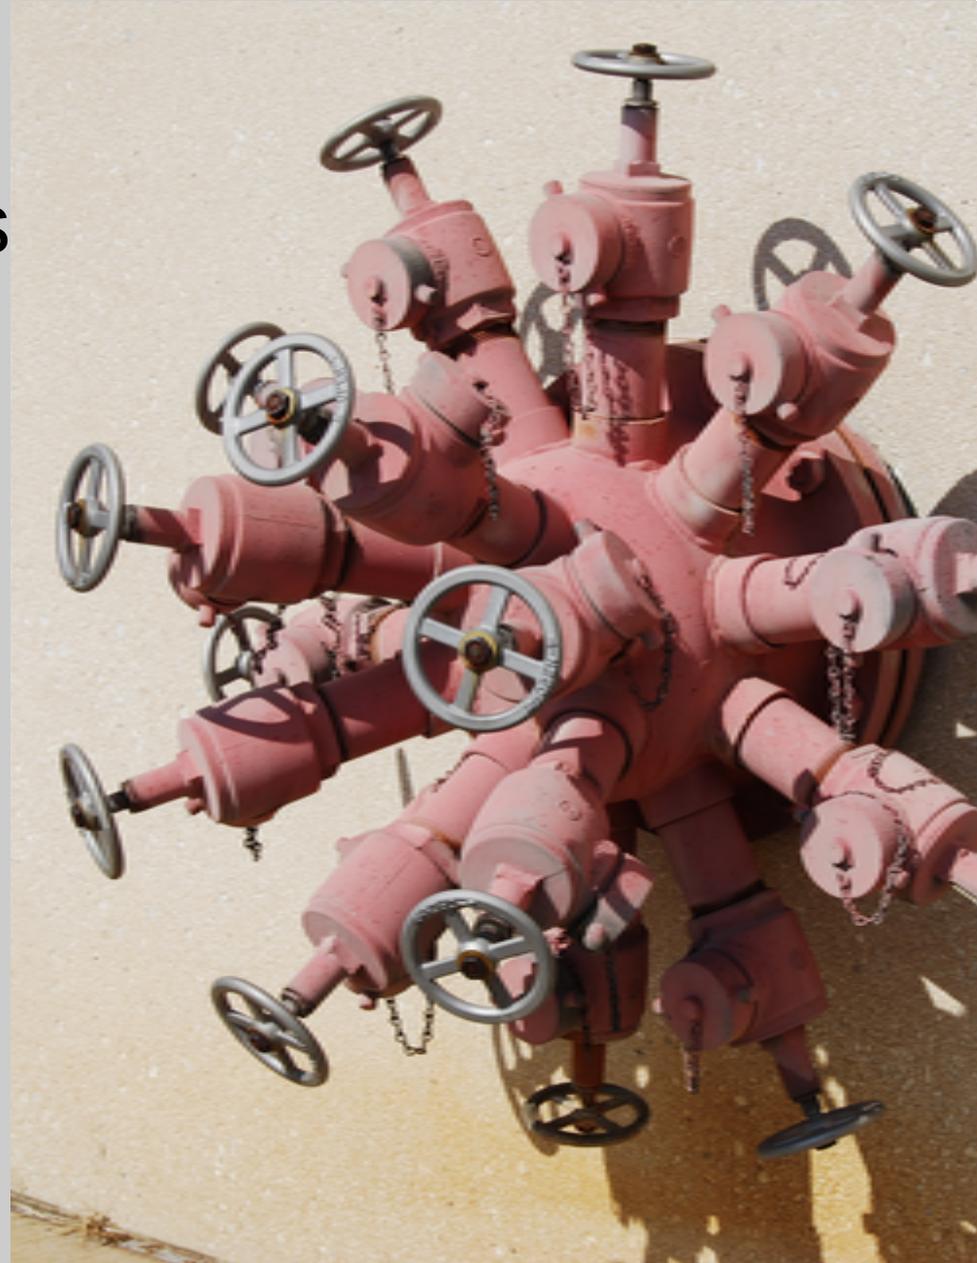

What

- Online tool
- from Wikipedia templates to Wikidata

- Some failsafe but…

Warning

- Double checks

- Don't bite more than you can chew

How it works

https://tools.wmflabs. org/pltools/harvesttem plates/

Load pages from

Wiki   en . wikipedia .org

Namespace   0

Import data

Property   P   1

Template

Parameter

+ add alias

Filter

Category

Depth   0

Manual list

Already set   ☑ don't load items with the property set

Offset   0

Limit   10000

get pages

Copy data from a Wikimedia template to Wikidata.
The tool parses templates and adds the found values to the item of the page the template is located in.

- *Wiki:* language and project name of the wiki you're working on
- *Namespace:* default value 0 corresponds to the article namespace in Wikipedia
- *Property:* destination property in Wikidata
- *Template:* source template
- *Parameter:* parameter name in the template. Use numbers for nameless parameters
- *Category:* non-mandatory option to filter pages on wiki by category
- *Manual list:* non-mandatory option to filter pages on wiki by page name or item id
- *Already set:* deactivate this option if you encounter performance issues
- *Offset:* skip a specific number of results. A negative number will start that far from the end
- *Limit:* limit the number of pages getting loaded

By clicking *get pages* a list with articles gets created. After it, when clicking *add values* the articles get parsed and claims get added to Wikidata. Alternatively, with *demo* only parsing is done without any edit action.
