Business Manager.

EASTERN OFFICE, 100 WILLIAM STREET, NEW YORK.
C. B. FAIRCHILD, EASTERN REPRESENTATIVE.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X. JANUARY 15, 1900. NO. 1

The usual winter troubles seem this season to be found in extremes. In such portions of the country as have had snow they have had it in abundance, even to the extent of three feet on the level; while in other sections the plows have not yet left the barns. In the central western states the winter thus far has been a phenomenal one for mild and clear weather.

The Railroad Commissioners of Connecticut have issued instructions to the effect that the street railways of that state shall after June 30, 1900, keep their accounts according to the "Standard System" developed by the Street Railway Accountants' Association of America and approved by the Convention of Railroad Commissioners. The intention of the Connecticut commissioners to issue such instructions was announced at the Chicago convention of the Accountants' Association, but their formal action may be taken as the real beginning of that long desired era when the reports shall be uniform.

Mention was made in our editorial columns last month of the position taken by an appellate division of the New York supreme court on the question of a street railway operating special cars for the transportation of freight only, and those interested in this subject will find an abstract of the decision in the legal department of this issue. This ruling to the effect that cars for freight only are permissible on street railways so long as they do not increase the burden of use of the street is a decided gain for such roads as have broad franchises and desire to engage in the express business.

Two other cases on this subject were decided in favor of the railway companies by lower courts last month, one in Connecticut and one in Ohio. In the former case the city of Hartford sought to enjoin the Hartford Street Ry. from the transportation of freight, but the court held that cities had no power to regulate the property

to be carried on street railways. The laws of Connecticut provide that street railways may carry bundles and small parcels belonging to passengers, but in the transportation of any other merchandise they shall be subject at all times to the regulations prescribed by the superior court or by a judge thereof. The same applies to "all steam and horse railroads or those run by other motive powers." The clear inference would seem to be that the Legislature intended that the street railways should be permitted to engage in freight traffic under proper regulations, and that this should not be dependent upon the city.

In the Ohio case the court held a provision in the franchise that freight should not be carried was void, because repugnant to the principal thing granted, that is, the right to use the streets. This ruling will be very important, if sustained by the higher courts.

Another indication that the freight business of electric roads is daily becoming of more importance is the fact that there is now pending in the Detroit common council a general suburban freight ordinance.

We have always believed that this part of the street railway field would well repay cultivation, and are gratified to note the increasing number of roads engaged in handling freight.

At the Boston convention of the American Street Railway Association in 1898, a report on carrying United States mail on street railways was presented; both the report and discussion brought out the facts the compensation offered by the government for this service was in nearly every case grossly inadequate. Elsewhere we give a statement showing that in Syracuse, N. Y., the postoffice paid 28 cents per mile to a wagon mail route contractor in the city and 3.1 cents per mile to the street railway company for interurban mail service.

It is possibly true that the postoffice department would not be justified in giving the same service to the suburban towns were it obliged to pay at the same rate per mile as for the wagon route to the city depots. The latter is a necessity and must be had at any cost. Nevertheless it is scarcely fair to pay the electric railway only one-ninth as much as the contractor.

In his presidential address before the Institution of Electrical Engineers (England), Professor Silvanus P. Thompson gave an interesting account of the present status of electric traction in Europe. He believes that the world must now look to Switzerland for guidance in the equipment of heavy (steam) railroads for electric working, the inauguration in July last of the three-phase system on the Burgdorf-Thun railway displacing America as leader in this branch of the traction field. He regards the question of whether, where there is a long distance to transmit current, a simple three-phase system throughout is, or is not, more economical than direct current or a mixed system with three-phase transmission and rotary converters, as the only important question in electric railway work that is not yet settled. Professor Thompson is a warm advocate of surface contact systems for urban roads and has great hopes of the lines now being tried in Paris.

Employes' clubs, such as that at Denver, which is described on another page, are becoming more numerous and we believe that all street railway companies should encourage their formation. The first step in the case of all such organizations that have come to our notice is for the company to provide at its operating barn or station suitable rooms, and light, heat and janitor service are also furnished free of charge, so that the cost of maintenance to the men is reduced to a minimum. This is as it should be, since while the club is for the men it is also solely for employes of the company, and on leaving the service a man loses his membership in the club, and under these circumstances the men could not be expected to bear the heavier dues that would be reasonable were membership independent of occupation.

The cost to the company in providing the quarters is insignificant, as it would in any case be necessary to have waiting rooms for the extras and other men awaiting their turns to go on duty. In the case of the Denver club the company met the men half way in contributing funds to furnish the club rooms, and the result was something more elaborate than is ordinarily found. But the furnishings need not be costly, and with the rooms provided there is no danger but that the club will make them attractive.

The advantages to the service resulting from the club are that the men spend their leisure hours in the rooms when off duty and

can always be found when needed for an emergency, they are not tempted to spend their time at the "workingmen's resorts" usually found in the neighborhood of a car barn or large shop, and above all their general condition, mental and physical, is improved by means of the healthful recreation found at the club. The men also find in the club far more pleasant surroundings than in the regulation waiting room.

Governor Pingree and his large following who favor the municipal ownership and operation of the so-called public utilities are making strong efforts to have an amendment to the state constitution adopted, which will permit the cities so desiring to embark in these enterprises. The League of Michigan Municipalities, which met in Grand Rapids in September last, strongly endorsed the plan, and an active campaign is in progress. The lower house of the Legislature, however, recently tabled a resolution asking the governor to submit a special message on the subject, and the conservative element may prevail and the municipalities of Michigan be spared the bitter experience similar to that the state had in its building and operating of railroads and canals.

The experience of the state of Michigan as a railroad owner between 1835 and 1850 was epitomized in the opinion of the Supreme Court of Michigan in the case against the Detroit Railway Commissioners. The state enterprises for internal improvements which had been specially commended in the constitution of 1835 were expressly prohibited in that of 1850, but now the cycle is complete and in 1900 it is proposed to give public ownership of improvements another trial. This time, however, it is not the Legislature which is to be given power to bond and tax, but those notoriously incompetent administrators—the municipalities the most glaringly faulty of our political institutions.

One element that is very active in promoting the cause of municipal ownership of electrical enterprise comprises certain promoters and bond brokers, who will agree to build a plant with almost any desired guaranty as to cost and performance, and take their pay in bonds. By the time that plant needs repairs or rebuilding, and the absence of a sinking fund confronts the city as a really serious condition, the bonds have all been disposed of. The city has nothing to do but pay interest and mayhap issue some more bonds to rebuild.

In Ohio there is a most startling plan to be placed before the Legislature for approval, whereby municipalities are to be authorized to issue bonds without limit for the purpose of buying street railway, electric lighting, gas and water properties, and, further, given the power to levy taxes to pay any deficits that may occur under municipal management. On another page there is a discussion of this subject by Mr. A. R. Foote, who points out the dangers in thus encouraging the wild speculation which all experience shows would surely follow.

The most serious difficulty in the way of making such schemes financially successful is, that with universal suffrage the majority of the voters are not tax-payers, and hence are very liberal when it is a question of spending other peoples' money.

During the last sixty days a portion of the employes of the street railway at Springfield, Ill., have been upon a strike, and as in nearly all of these unfortunate controversies, of which there were so many during 1899, between managers and employes the issue was the formal recognition of the employes' union. There was no grievance on the part of the men save that they were not permitted to pass upon the sufficiency of the company's reasons for discharging of some of their number.

The strike was begun November 10th and after a settlement had been agreed upon December 20th was at once renewed for insufficient and trivial reasons. As at Cleveland, London and elsewhere attempts were made to intimidate employes and patrons and on four occasions explosives were placed on the tracks.

The situation in Milwaukee at the present time is peculiar, in that the officials in charge of the city government are the allies, and not the opponents, of the street railway company, and both are defending suits in equity brought by two citizens who do not approve of the new ordinance passed on January 2d. The essential features of this compromise, which was accepted by the company as better than a continuation of the controversy so long pending, are: Special tickets, 6 for 25 cents and 25 for \$1, good for two hours in the mornings and evenings until 1905, and good at all hours of the day after that date; a ten-year extension of certain

franchises, with the proviso that all franchises shall expire in 1934; a provision for sale to the city in 1934, if it shall so elect; an agreement on the part of the company to extend its main lines to the city limits as the latter shall be from time to time established.

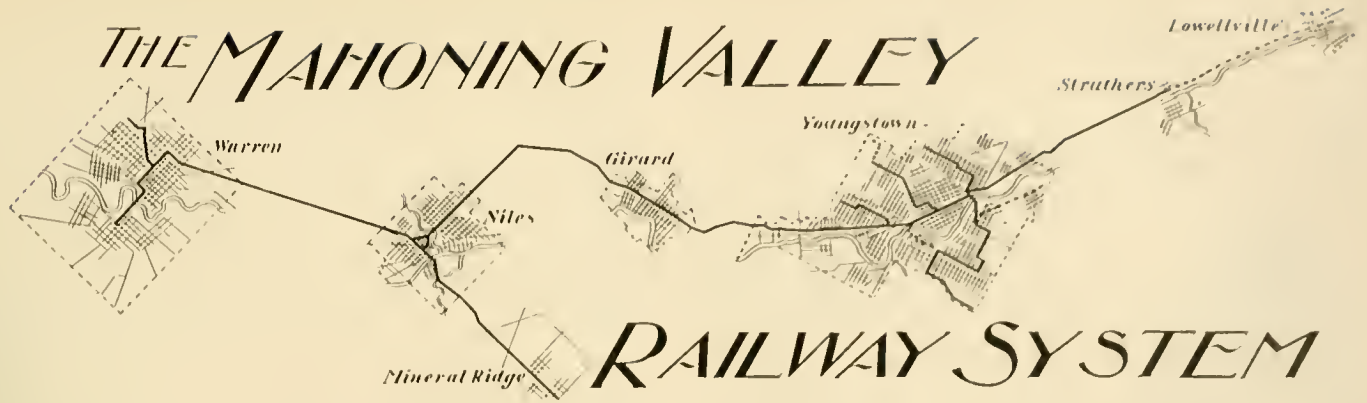

The mayor and council were twice enjoined, but the dilatory tactics of the complainants convinced them that the suits were not begun in good faith, but with the object of delaying action on the street railway question till after the next city election. Accordingly the orders of court were ignored and the ordinance passed. If the council is correct in its contention that being a legislative body the courts have no jurisdiction to enjoin it, the long-standing dispute may be considered as settled for 35 years to come, a result on which all parties are to be congratulated.

The report of the New York Railroad Commissioners for the year ending June 30, 1899, has just been issued, and elsewhere in this issue will be found extracts from those portions dealing with the elevated roads in Greater New York and the street surface railways throughout the state. The number of passengers carried on the elevated roads of Brooklyn is given as nearly 7 per cent less than for the preceding year, but this decrease in traffic is explained in large part by the fact that the returns of the Brooklyn Elevated Railroad are given for only nine months of the year, the returns of this company for the other three months being included in those of the Brooklyn Heights Rapid Transit Co. In the case of the Manhattan Elevated there is a decrease of over 5 per cent in the number of passengers carried. The street surface roads, on the other hand, show gains in traffic; the total for the entire state is nearly 7.7 per cent in excess of the preceding year, and of this over five-sevenths was on the lines in the boroughs of Manhattan and Bronx, New York City. The lines in these boroughs carried 55 per cent of the total of passengers in the state, and showed an increase amounting to nearly 74 per cent of the total increase of the state. In this connection it must be noted that the number of passengers as reported includes "transfers." The table of gross receipts and total expenses per passenger and per car-mile will be found very instructive.

The board dwells at length on the accidents, such as were formerly regarded as incidents alone of steam railroading, that have occurred on street railways. This class of accidents includes head-on and rear-end collisions, derailments and crossing accidents. In conclusion the Board restates its recommendations, made in previous reports, for the precautions which it is believed will prevent accidents of this nature.

The probable amount of new construction work to be done the coming season is very uncertain. Last year contract letting was left until late in many instances, and then it was found impossible to secure delivery at any but remote dates. This difficulty in securing material resulted in a very considerable amount of proposed work going over to this season. In the meantime the demands upon our manufacturers, many of whom have other interests to supply and which have been and are also very active, have steadily increased until prices have been advanced from 25 to 100 per cent and in some exceptional cases even more. The advance has been especially strong in those construction items which are always the heavy accounts. Rails, cars, engines and boilers, and all copper manufactures are now so high and the time of delivery on new contracts so uncertain for some of them, that much contemplated work will be forced over for another year. There will be a very respectable amount of work in the aggregate, but it will be confined to such lines as come within the limits of being a positive necessity. Scarcely a manager who is going to build a few miles but would have constructed twice as much could he have done so at last year's prices. The result is not, however, without its wholesome features. It is well to curb the ambitions of some promoters who think that once a line is built the balance sheet is bound to take care of itself. We want no repetition of the wild cat roads which came into existence by the score 10 years ago. Some of these are just now beginning to get upon a good paying basis. There are legitimate enterprises in abundance, and such are having a very fair degree of success in disposing of their securities, and at good prices, hence it is no great cause of regret that much other legitimate work is to be carried over another 12 months.

New city work is largely that of rebuilding worn out tracks, constructing extensions to care for the spread of population, and increasing the capacity of stations. The year will be an extremely busy one for contractors and manufacturers.

This system embraces 44 miles of track and connects Youngstown with a number of neighboring villages, as shown by the accompanying diagram. To the northwest of Youngstown the places, in order, include Girard, Niles, Warren and as an adjunct of Niles, Mineral Ridge. To the southeast are Struthers and Lowellville. The line connecting the two last named villages is to be built in the early spring and will be about four miles in length. Other extensions in Youngstown will also be built early in 1900, and part of the material is already on hand and the work of grading begun.

The service is both passenger and freight and is well patronized in both departments. A fast passenger service is maintained between Youngstown and Warren, which passes through the intervening villages, two large cars being used. These cars leave the respective cities every hour and make stops only at certain designated points; the trip each way is made in about 57 minutes, the distance being 16 miles.

The package and freight cars make two round trips each day between Warren and Struthers, and the indications from the growth of the patronage are that an additional car will soon be required. In the Youngstown division, which includes Struthers on the east

This is designed to be equal in strength to the work usually employed on steam roads. Heavy oak timbers compose the bent, and the structure is thoroughly braced to avoid any surging movement due to the starting and stopping of cars. Heavy guard beams are provided as shown, and the trolley wire is supported by span wires attached to arches composed of 3-in. iron pipe and thoroughly braced by wire guys having turnbuckles for adjustment. Other sections of trestle work and of the steel bridge are shown in the illustrations.

In the suburban track construction a 70-lb. T-rail of the American Society of Civil Engineers section, rolled by the Pennsylvania Steel Co., is used. The roadbed consists of a foundation of 6 in. of furnace slag, which is procured from the neighboring furnaces; on this the ties are placed 2 ft. c. to c. The space between the ties is then filled and tamped with gravel, but left to slant each way from the center for drainage. The rail joints are made with 6-hole splice bars and bonded with "Crown Fig. 8" bonds made by the American Steel & Wire Co. On a part of the old construction near Youngstown cast-welded joints are employed.

On the rear platform of some of the large cars is placed a guard rail composed of 1-in iron pipe, which is attached just to one side of

TRESTLES AND BRIDGES ON MAHONING VALLEY LINE.

and Niles on the west, 10 cars are operated, and on the Trumbull division, which includes Warren and Niles, 4 cars are required, and between Niles and Mineral Ridge 2 cars, making 27 cars in all. Twelve of these are long cars, with double trucks, and on some of these air brakes are about to be installed. It is the intention of the company to add eight more long cars to the equipment in the near future. These will be of the same length (36 ft.) as the present cars.

Considerable new track has been laid during the past season, and on some portions of the line trestle construction has been required.

the inside door post about 3 ft. above the platform. The door (accelerator type) is hung to one side of the end and the guard rails curve out toward the steps and are supported by an end post opposite the middle of the step. This serves to keep the passengers from obstructing the doorway when the platform is crowded, but gives room for the conductor to stand between the door and the rail without interfering with the entrance or exit of passengers.

The company is planning to erect a large power station during the coming season, from which the entire system will be operated:

it is probable that a high tension alternating current will be generated, which will be conducted to transformer stations located at different points of the system.

This is one of the most promising interurban street railway systems in the country, for the reason that this section of the Mahoning Valley is rapidly being filled up with manufacturing establishments, consisting mostly of blast furnaces and steel and iron mills for rolling structural shapes. Doubtless at no distant day the system will be one of the links in the chain of electrical railways that is already projected to unite some of the larger Ohio cities with cities in Pennsylvania and possibly some in New York.

The affairs of the company are in charge of M. A. Verner, of Pittsburg, president, and A. A. Anderson, general manager and treasurer. Mr. Anderson has now been connected with the system about six years, and it is largely due to his foresight and executive ability that the various systems above described have been brought under a single management and the intercommunicating system established.

A. A. ANDERSON.

ALONG THE MAHONING VALLEY LINE.

A VISIONARY SCHEME.

How will the man who wishes to improve present conditions can sometimes be shown by the following extract from a letter to the Chicago Post:

"I would have the city government select a route ten miles long, beginning at the business center, or as near it as practicable, and running in a nearly straight line either west or south, take the whole of this street and construct in it four tramways; make the rails grooved at street crossings, 60 ft. in length, electrically welded, 90 lb. to the yard, with steam pipes laid in the outside neck. These pipes would keep the rails dry at all times and in winter free from snow and ice.

"The cars should be built with wheels at the ends; double floors with steam pipes between and a steam heater at one end. The under side of floors need not be more than 6 in. above the rails. All three tracks at the right should be used in one direction during rush hours, and the cars on the two inside tracks should stop only once in four blocks, and not at all for the mile and one-half just outside of the business district. At certain hours the two inside tracks could be used for freight, to be delivered anywhere on the line of the road. Traffic teaming should not be allowed, but the line could accommodate residents with their supplies, and the sidewalk could be used for delivery purposes for less than one block. Children should be prohibited from making this street a playground, but if they did, the fenders are expected to pick them up."

NEW ROADS IN CRIPPLE CREEK DISTRICT.

In our issue of October, 1898, page 707, we published a description of the Cripple Creek District Railway, which at that time comprised 61.4 miles of track between Cripple Creek and Victor, opened for traffic Jan. 2, 1898. The company was then making surveys for a line 26 miles long to connect the Cripple Creek district with Colorado Springs. Now the early completion of one road to connect these points is regarded as a certainty and a competing line is also proposed.

The Colorado Springs & Cripple Creek District Railroad Co. is closely allied to the Cripple Creek District Railway Co. and will build a road from Colorado Springs to Cameron, formerly called Grassy. This road will be operated by steam at first but the branches and spurs will be equipped electrically. At Cameron connection will be made with the Cripple Creek District Ry., its lines having been extended to that point. The operation of the main line by steam is to be temporary only, electricity being the power ultimately contemplated.

Another company, the Colorado Springs, Cripple Creek & Southern, proposes to apply for franchises for an electric line between the two towns, to carry passengers, freight, mail and express.

On December 19th the last rail of the Canon City & Cripple Creek Ry. (a steam line) was laid and several other steam roads are projected in the district to serve the new mines which are being opened.

STEEP GRADES IN FRANCE.

An electric railway recently opened at Laon, France, is remarkable for its steep gradients. The line is 1,479 m. long and one portion has a rise of 81 mm. to the m. Another section, about 860 m. long, has a grade of 10 per cent, and in a short run of 202 m. the rise is 130 mm. to the m. A rack and gear combination is provided as a safety measure to prevent cars from slipping, but it is stated this is seldom used as sufficient traction is secured between the rails and wheels under ordinary conditions. Combination baggage and passenger cars with capacity for 26 persons are in operation, each car having two G. E. 53 motors. Current at 120 volts is supplied from a generator of 1,200 amperes capacity.

CONNECTICUT ASSOCIATION.

At a meeting of the Connecticut State Street Railway Association, held at New Haven December 6th, the following officers were elected: President, H. S. Parmelee, New Haven; vice-president, A. M. Young, Waterbury; secretary, B. W. Porter, Derby; treasurer, E. S. Goodrich, Hartford.

The Detroit, Ypsilanti & Ann Arbor Electric Railway.

An excellent example of modern practice in the equipment of an interurban traction system is furnished by the Detroit, Ypsilanti & Ann Arbor Electric Ry. When the company was organized in 1897 the promoters determined to introduce the very highest types of machinery and equipment, to complete every detail in the most reliable manner, and to exercise a liberal policy toward the public. The result of the first year's operation shows the wisdom of this broad-minded policy, as a valuable freight and passenger traffic has been developed, and the property is already earning dividends for its stockholders.

MAP OF DETROIT ANN ARBOR LINE.

The length of the track is 50 miles. The main line from Detroit, passing through Wayne and Ypsilanti to Ann Arbor, is 40 miles, and a branch from Ypsilanti to Saline is 10 miles in length. From the City Hall, in the center of Detroit, cars pass down Michigan Ave. for six miles, using the tracks of the Citizens' Street Railway Co. From the city limits a new track was laid through Dearborn and Wayne to Ypsilanti, and thence to Ann Arbor. The franchises of the former railway from Ypsilanti to Ann Arbor, and of five miles of track in Ann Arbor City, were acquired by purchase, and the lines entirely rebuilt and re-equipped. The Saline division is a new construction.

The route passes through a rich agricultural country and through several thriving towns and cities, from which local and through traffic is drawn. Dearborn, 10 miles from Detroit, has about one thousand inhabitants. Inkster and Eloise are smaller places. Wayne, 20 miles from Detroit, is the junction of the Plymouth & Northfield Electric Ry. Canton and Denton are passed before reaching Ypsilanti, a manufacturing town of 4,000 inhabitants. In addition to the ordinary population of Ypsilanti the State Normal School has from two to three thousand students. Ann Arbor, the terminus of the line, has a regular population of 15,000 and is the seat of the University of Michigan.

The plans for the complete engineering equipment of this railway

FIG. 1.—POWER HOUSE AND CAR BARN, YPSILANTI.

were prepared by Westinghouse, Church, Kerr & Co., New York, and to the Detroit office of the same company was awarded the contract for furnishing the steam and electrical machinery for the two power houses and the motors and air brakes for the cars. The promoters of the railway stipulated for the most advanced type of

machinery and the introduction of the latest mechanical devices for securing economy in operation. It is no secret that the engineers were given a free hand, and the contract was in the nature of a confidential one. This latitude has been justified, for the installation is a model in all respects, embodying great simplicity yet completeness of design, and is an excellent illustration of economical practice where direct current electricity only is used for operating a railroad of considerable length. These desirable results are mainly to be attributed to concentrating the various branches of construction in the hands of capable engineers.

Two power houses have been built, 19 miles apart, one at Ypsilanti, 10 miles from the Ann Arbor terminus, and the other at Dearborn, 5 miles from the Detroit city limits. The equipment

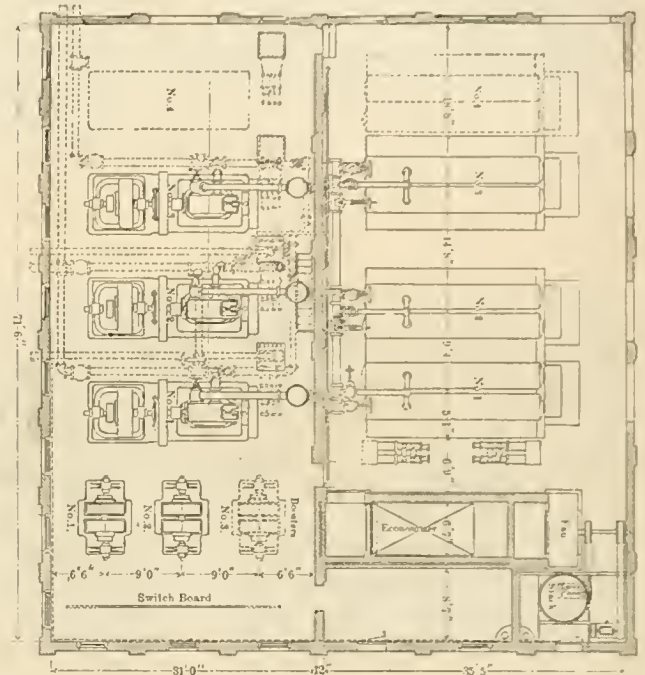

FIG. 2.—POWER HOUSE.

of both power houses is very similar, differing only in the feeders and in boiler feeding apparatus. A description of the Ypsilanti plant will therefore suffice for both.

The power house and car barns are attractive buildings and present a pleasing appearance upon the main road entering Ypsilanti from the east. They adjoin the Huron River, which affords an abundant supply of water for boilers and condensers at all seasons of the year. Facing the high road are the extensive car barns and repair shops, with the company's offices in front, a view of which is seen in Fig. 1. At the back stands the power house, a substantial fire-proof building, constructed of brick, measuring 67 ft. by 72 ft. A heavy brick wall divides the spaces about equally between

the boiler and generating rooms. The appearance of the interior of the generating room is very attractive, it being lofty, well lighted and ventilated. A few palms add greatly to the cheerfulness, and emphasize the neatness of the surroundings. The foundations are of concrete, the floors being cemented throughout.

The equipment of the steam plant shown in Fig. 4 includes the latest improvements and secures the utmost economy in operation. Three Babcock & Wilcox water-tube boilers, rated at 225 h. p. each, carry a steam pressure of 150 lb., are equipped with Roney mechanical stokers, which afford complete combustion of the fuel and enable the cheapest grades of coal to be burned with minimum labor in firing. Ohio slack coal, costing \$1.45 a ton delivered at the railway, is used. Reference to Fig. 1 shows the stack, which extends only a few feet above the roof of the building. The ground plan and a section of the power house are shown in Fig. 2.

The Westinghouse system of economizer mechanical draft has been introduced, with two vertical fans driven by an 8-h. p. Westinghouse steam engine. The blowers were furnished by the Fuller Co., of Detroit. The speed of the engine and therefore that of the fans is controlled by quick-acting regulators, so that as the steam pressure begins to rise upon the boilers a valve reduces the supply of steam. By this automatic arrangement the mechanical draft is regulated by the pressure in the boilers, as an increase of boiler pressure slows down the engine driving the fans. By combining fuel economizers with the mechanical draft, low temperature of the waste gases are secured and the heat is returned to the feed water.

The water for feeding the boilers and for the condensers is obtained from the Huron River alongside the power house, as shown in

Fig. 6. A crib has been carried into the river into which the water passes and then flows by an 18-in. pipe to a well 14 ft. deep. Feed water for the boilers is pumped from the well through a 4-in. pipe by two Worthington outside-packed pumps, each sufficient to care for the whole plant. The feed water passes through a Baragwanath exhaust heater, utilizing the heat of the exhaust steam from pumps, condensers and blower engine, and thence passes through a fuel economizer, where it takes up the heat of the waste gases from the boilers; the feed water is heated to 275° F. before it enters the boilers. Any or all of this apparatus between the feed pumps and the boilers may be by-passed at will. The steam passes through large separators before going to the engines, and the water of condensation is returned to the boilers by a system of Westinghouse steam loops.

The steam piping throughout the plant is very heavily constructed to carry a working pressure of 175 lb. The arrangement is very carefully designed to secure the greatest freedom from internal strains due to expansion or contraction. It may be noted from the diagrams of the power house that the steam pipes from the boilers to engines are curved, avoiding elbows, and there are no pockets except those purposely provided for handling entrained water. The valves and piping were furnished by Roe, Stephens & Co., Detroit.

Three Worthington compound condensers 6 and 9 x 12 x 10 are installed in the basement of the power house under the engine room. The independent condensers are so connected that the engines can be used either condensing or non-condensing. A 10-in. intake pipe from the well by the river supplies water for the condensers, which is returned direct to the river. The condensers and

engines are cross-connected, so that in the event of one being disabled the other can be used to furnish a vacuum.

The engine room shown in Fig. 3 contains three 450-h. p. Westinghouse condensing compound engines running at 250 r. p. m. direct coupled to the generators. These engines are of the constant terminal compound type specially designed for the widely fluctuating loads incidental to railroad work. They were built by the Westinghouse Machine Co., East Pittsburg, Pa.

The usual load upon the engines is from 650 h. p. to 680 h. p., but it is very fluctuating in character, as the 9 to 12 cars operated upon the tracks meet at certain times in the turnouts, which causes the load as registered by the ammeter to vary from 100 amperes to 1,300 amperes, equivalent to a variation of from 70 h. p. to 900 h. p. Two of the engines carry the usual load, the third being held as a reserve, two boilers only are habitually under steam.

The electrical equipment comprises three 225-k.w. Westinghouse direct current generators, 575 volts, connected to the engines by flexible couplings. They are of the standard Westinghouse type, as shown in Fig. 3. There have also been installed in the power house two Westinghouse motor-driven boosters, one 135-k.w. and one 125-k.w. The motor and booster armatures are mounted upon the same shaft. The fields of both machines are supported upon the same bedplate and are split in a vertical plane to permit the removal of either half horizontally from its armature. The motor receives power directly from the station bus bars and the booster is operated in series with the feeders. The full load voltage of the boosters is 325, making the voltage on the booster feeders at the station 900 volts. A view of one of the two boosters in the Ypsilanti station is

FIG. 3.—GENERATORS.

FIG. 4.—BOILER ROOM.

FIG. 5.—BOOSTERS.

shown in Fig. 5. One of the boosters supplies the line running westward to Ann Arbor, the feeder being tapped in at the Ann Arbor city limits, about 7½ miles from the power house. The feeder from the other booster going east taps in at Sheldon Corners, an equal distance from the station. The three feeder wires running east and west from the Ypsilanti power house and the one running west from the Dearborn power house each consists of 39,600 ft. of copper wire. The Ann Arbor line has a section of 550,000 cm., and the other two wires 400,000 cm.

The switchboard consists of 11 heavy marble panels mounted upon an iron frame work of very neat design, occupying one end of the generating room. The feed wires are carried from the bus bars through the side wall to brackets on the outside and thence to the overhead construction upon the tracks. There are three generator panels, following the standard Westinghouse practice. Upon the fourth panel is a voltmeter and wattmeter. Then follow the east and west feeder panels and four panels for the motors and motor-driven boosters. The eleventh panel controls the south feeder for the Saline division. Voltmeters upon swinging brackets at either end of the switchboard show the voltage upon the line. The panels are supplied with the usual meters, circuit breakers, switches and other apparatus for the complete control of the current under all conditions.

The stations at Ypsilanti and Dearborn are arranged to work in parallel, helping each other out in case of a very heavy load upon either station, but they can be separated in case of need. Either booster may be operated in series with either booster feeder. The switches are so arranged that the booster feeders may be used for

supplementing the direct fed feeders should it be desirable to shut down the boosters.

The power house is equipped with an overhead $7\frac{1}{2}$ -ton traveling crane for moving any part of the machinery.

From the city limits of Detroit to Ann Arbor a single track has been laid by the side of the high road of standard gage, with frequent turnouts; the contractors are J. Griffin & Co., Detroit. Profiles of the country show a mainly level surface, with a few grades up to $7\frac{1}{2}$ per cent in approaching bridges and where sudden dips occur. The track has been laid in the most substantial manner, with cedar ties upon a gravel bed, according to the best steam railroad practice. The Cleveland Frog & Crossing Co. furnished the special work. Upon the curves, which are few, the outer rail is elevated and the strong, substantial roadbed enables a speed of 45 miles an hour to be readily maintained by the cars. The standard rail is a T section weighing 77 lb., but parts of the track are laid with 70-lb. and 75-lb. rails. The rails are bonded with No. 0000 cross bonds every 500 ft., with joint bonds of No. 0000 wire. The Atkinson bonds are used.

The overhead construction was made by the Ohio Brass Co. and consists of two No. 000 figure 8 trolley wires, the two wires being used to avoid switches at the turnouts. The east bound cars run on one trolley wire and the west bound cars on the other. The two wires are in parallel, being tied together every 500 ft. Upon the Saline division a No. 000 figure 8 trolley wire is used, with a No. 0000 feeder wire in parallel. There are 25 miles of span construction work, the trolleys being suspended from the poles on either side, and about 18 miles of bracket construction.

The standard car used by the Detroit, Ypsilanti & Ann Arbor Railway Co., shown in Fig. 7, is 50 ft. in length, with motorman's cab at one end, the cars having a seating capacity for 56 passengers. The present equipment consists of 20 cars, built by the Barney & Smith Car Co., of Dayton, O. They are of extra width, the interior being handsomely finished and the cross seats upholstered with plush. Each car is warmed by Baker hot water heaters in the winter, and an ample supply of electric lights is provided. The cars are equipped with Westinghouse quick acting air brakes of special design. An air compressor driven by a direct connected motor is mounted in the cab of each car. The motor is automatically controlled by a pneumatic switch, so that it starts as soon as the air pressure in the reservoir falls below 70 lb. and stops when the pressure is raised to 100 lb. This automatic system of air brake apparatus is highly efficient and reliable in operation, working comparatively noiselessly, being devoid of the usual hum of high speed gearing and the knocking of reciprocative parts.

Each car is equipped with double trucks, upon which are mounted four 50-h. p. Westinghouse railway motors of the well known multipolar type, with iron clad armature. Each car is also provided with a series of multiple controllers for operating the motors in combination of pairs in series multiple and all motors in multiple; the canopy switch is in the form of an automatic circuit breaker, thus enhancing the ease of operation when using the heavy currents required. The cars also carry hand brakes. The cars weigh 26 tons each when loaded. The Wilson trolley pole catchers are used and give satisfaction.

A well equipped repair shop is in operation at the car barns at Ypsilanti, furnished with the necessary machinery for repairing breakdowns of the cars, for rewinding armatures, machinery car wheels and axles, and for general repairs of electrical machinery. Power is furnished for the repair shop by a 10-h. p. Westinghouse multipolar direct current motor. A regular half hour service is provided between Detroit and Ann Arbor, special cars for excursion parties being dispatched between the times of regular service. Occasionally the traffic necessitates 15-minute service. An operator at the Ypsilanti office dispatches all cars by telephone, the conductors reporting their arrival and departure from each point; a complete control is thus maintained. A single car provides for the service upon the Saline division.

The cash fare from Detroit to Ann Arbor, a distance of 40 miles, is 60 cents if paid upon the car, or 50 cents if a ticket is bought at the office before starting. Mileage books are sold for 1,000 miles at the rate of one cent a mile. The schedule time for the journey of 40 miles is $2\frac{1}{4}$ hours. The ordinary train on the steam railroad occupies 1 h. 43 min. between Detroit and Ann Arbor, the fare being \$1.12.

A very interesting calculation was made regarding the amount of local traffic upon the railroad between Ann Arbor and Detroit,

which is paralleled by the electric traction lines, it being found that immediately prior to the opening of the electric railway the local traffic averaged 200 passengers a day. The figures of the Detroit, Ypsilanti & Ann Arbor Railway Co. show that during the past year they have averaged 4,000 passengers a day and during the month of September the average fare per passenger was 15 9 10 cents. It is thus clearly shown that when the public is given facilities for travel at an economical rate a valuable traffic can be developed. It

FIG. 6.—YPSILANTI POWER HOUSE ON HURON RIVER.

must be borne in mind that the railway system under review has but just completed its first financial year. These excellent returns have enabled the company to earn a substantial dividend for the stockholders.

Fourteen cars have run 120,000 miles during one month. For such a service only the best materials, the strongest cars, the latest mechanical and electrical machinery and apparatus could make such continual strain possible.

The advent of the electric road has been of untold value to the country through which it passes. Building operations have had a marked stimulus along the route. In Wayne, hitherto a small village, 50 houses have sprung up, and a similar impetus has been given to other places. A considerable tract of land is now devoted to market gardening, since the way is opened for a frequent and rapid delivery of fresh fruits and vegetables to Detroit and to other markets. Various industries have been initiated, and a new life poured into the veins of the inhabitants, stimulating a healthy activity on all sides.

The railroad passes through a richly productive country, partly agricultural and partly horticultural, which yields a large freight traffic. At present only one freight car makes two round trips a day from Detroit to Ann Arbor, but so great is the demand for increasing this freight service that the company is making arrange-

FIG. 7. STANDARD CAR.

ments for a central clearing house in Detroit, where an exchange can be made with all the interurban lines running into the city. It is proposed to secure a separate building, in connection with which there will be a regular service of wagons for collection and delivery. At present the company is in the anomalous position of curbing the development of this branch of its business by charging very high rates on account of the poor facilities it has for receiving and distributing in Detroit. In spite of charging two-thirds more than the steam railway company, it receives far more freight than the car can take care of. Two rates of charge are in vogue, for freight and express matter. Express packages are carried in the baggage

department of the passenger cars. The rapid and prompt delivery of packages by electric cars is in itself sufficient to attract a large business. As soon as arrangements are completed at the Detroit end the company fully anticipates earning from \$3,000 to \$5,000 a month in place of the \$1,000 a month now received for freight. The country served by the railway produces a large quantity of raspberries, strawberries and other fresh fruits, as well as garden and dairy produce. Packages of merchandise can be picked up by the freight cars at all points along the line, and goods can be similarly delivered, affording the greatest facilities to shippers and receivers.

The great success attendant upon the operation of this electric railroad has led to the commencement of several projects of a similar nature.

The officers of the Detroit, Ypsilanti & Ann Arbor are: President, J. D. Hawks; vice-president, M. J. Griffin; treasurer, S. F. Angus; secretary, F. A. Hinchman; manager, F. E. Merrill.

NORTHWESTERN ELEVATED OPEN.

Shortly after 2 p. m. on Dec. 30, 1899, the first train on the Northwestern Elevated R. R., of Chicago, comprising motor car No. 1 and two trailers, all three cars gayly decorated with flags and bunting, left the Lincoln Ave. station of the road for a trip over the line. The party on board consisted of D. H. Louderback, president; Howard Abel, secretary and treasurer; George F. Jewett, auditor; Clarence A. Knight, general counsel; C. V. Weston, chief engineer; Frank Hedley, general superintendent of both the Lake Street Elevated and Northwestern Elevated; J. H. L. Waddell, consulting engineer; R. B. Stearns, assistant engineer; O. E. Morgensen, assistant engineer in charge of the design; and W. W. Miller of New York, counsel for Blair & Co.; John B. Dennis of Blair & Co., Caleb H. Marshall, ex-Mayor Washburne, T. G. Milstead of New York, Ben Marshall, Clarence Buckingham, F. C. Wheeler of London, W. A. Patterson, J. L. Cochran, A. P. Richardson, Mr. Angus of the Angus & Gindele Co., and a few other guests, among whom was a representative of the "Review."

When the train reached the bridge over the Chicago River it was welcomed by blasts from the whistles of tugboats and by cheers from the workmen along the line. On the trip around the loop President Louderback and Chief Engineer Weston occupied the front platform. The train completed the circuit of the loop at a few minutes before 3 o'clock and then ran to the northern end of the structure and back to Lincoln Ave. again.

Twenty-seven fares were collected on this trip. Chief Engineer Weston paid the first nickel to Superintendent Hedley, who acted as conductor till this formality was over.

It had not been the intention of the company to begin the operation of the road until March next, but when in December it became evident that the city council would not consent to a further extension of time and would seek to have the company's \$100,000 bond forfeited were the road not in operation before the close of the year, the company decided to have trains running before the time limit expired. At that time there was practically nothing done between Chicago Ave. and Lake St., a distance of 4,100 ft., except the foundations; by far the greater portion of the metal work of the structure had not reached Chicago, and over half of it had to be shipped from the mills by special trains. Forces of from 400 to 700 men were put on and the work pushed day and night; the company's men erected the metal work and the North American Railway Construction Co. laid the track, the track layers being followed close by the electrical force under the direction of J. R. Chapman, electrical engineer for the road. Power was taken from the stations of the Union and Consolidated Traction companies.

By noon of December 30th a single track to the loop was ready for trains and before midnight a run was made to Wilson Ave., the northern terminus; the structure at present stops 2,000 ft. south of that point and the incline to the surface was not completed till late that night. An enormous amount of work was done in two weeks and the men responsible for it received hearty congratulations when the task was accomplished.

Trains were run on the 31st, and on New Year's day over 500 fares were collected. The second track will be completed with all the expedition possible.

January 1st the commissioner of public works directed that work be stopped on the Northwestern Elevated, as he claimed the road had not been completed as required by the ordinance.

The daily trip on January 2d was the source of some entertainment to some 25 passengers and numerous spectators. The train started from the northern terminus and at Lincoln Ave. was met by four policemen who acted under orders from the city and arrested the train crew, taking the men to the police station, firm in the belief that the train would not pull out without motorman or conductor. There chanced to be a man on board who had both the necessary knowledge and authority and he promptly took the motorman's cab and started for the loop.

When Lake St. was reached the structure was found crowded with 50 or 60 policemen who had orders to stop the train. The acting motorman smiled and increased the speed, whereupon the patrolmen scrambled out of the way and watched the train enter the loop. Having been foiled in the attempt to hold up the train on the down trip the representatives of the city proceeded to block the track by piling timbers and ties across it so that the train would have to stop on the return trip.

Being advised as to what was happening, the Northwestern officials got the right of way over the Lake Street road and instead of stopping at the obstructions the Northwestern train proceeded out Lake St. to a nearby siding. Here it was finally overhauled by the police force and a detail spent the night in a cold car to be sure that it did not get away.

When the cases against the trainmen, against whom charges of criminal carelessness had been made, came before the court it was decided that the police had exceeded their authority in making the arrests. Following this the city officials agreed not to further molest the company in running its trains.

A new ordinance which the company and the city officials agreed upon is now under consideration.

SHELTON ACCIDENT CLAIMS SETTLED.

It has been announced that the Shelton Street Railway Co. last month settled the last of the claims for damages arising out of the accident near Bridgeport (Conn.), Aug. 6, 1899, when 29 persons were killed and 12 seriously injured. The terms of the settlements have not been made public, and the money cost to the company cannot, therefore, be stated; it is reported, however, that the amounts paid have been greatly underestimated by the general public.

EXTENSIONS AT SHEBOYGAN, WIS.

The Sheboygan (Wis.) Light, Power & Railway Co. has recently completed a six-mile line from Sheboygan to Sheboygan Falls over a toll road, over which long double truck cars will be operated giving a 30-minute service. The line was opened November 30th, and last month was operated with the single truck cars used on the urban lines. The business has been very good from the start and will increase in the future. Sheboygan Falls is a manufacturing town of some 1,500 people, and a large bath tub factory has been located on the line, which gives employment to several hundred men. In addition to passenger traffic, the inter-urban road will carry mail, express, milk and light freight.

The line was built under the personal supervision of Mr. John M. Saemann, vice-president and manager of the company.

UNIVERSAL TRANSFERS AT MEMPHIS.

In 1895 the city council of Memphis, Tenn., passed an ordinance under which franchise rights were granted to a street railway company to be formed by the consolidation of the four companies then operating in the city and suburbs. All of these four were controlled by A. M. Billings, of Chicago, and his associates, and they were promptly consolidated as the Memphis Street Railway Co.; the consolidation had only been prevented by the terms of the franchises to the several companies.

Under the ordinance which was agreed upon between Mr. Billings and the council a limited transfer system was to go into effect on Jan. 1, 1896, and a continuous ride between any two points in the city was to be given for 5 cents after Jan. 1, 1900, at all hours of the day.

In accordance with this agreement the universal transfer system was put in effect Dec. 25, 1899.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

DROUGHTS CAUSE BOILER SCALE.

The Hartford Steam Boiler Inspection & Insurance Co. is authority for the statement that there is a direct relation between the amount of rainfall in any locality and the formation of scale in boilers depending for their feed water upon rivers, ponds or wells affected by the rainfall. The example is cited that the unusual lack of rain during the past season in many sections of the country is a matter of note, and the reports turned in by boiler inspectors in regions so affected show that more than the usual amount of scale has been found.

The explanation is advanced that the larger deposits of scale are due to the increased hardness of the water after a long dry spell. In times of drought the water is drawn necessarily from the lower levels, in reaching which it has become impregnated with lime, magnesia and other soluble substances contained in the overlying strata. Periods of dry weather, therefore, call for more frequent examination and cleaning of boilers than is necessary at other times.

IMPROVED EXPANSION JOINT.

The expansion joint for steam pipes, shown in the accompanying illustrations, designed to admit of all-round play as well as of a sliding movement was recently described by Engineering of Lon-

don. The assembled joint is shown in section in Fig. 1, from which it will be noted that the packing consists of a single ring of metal covered with asbestos; this is arranged in a conical box so that the steam itself does the setting up. Of course more than one packing

ring may be used if necessary. Fig. 2 shows the joint dismantled for repacking. This type of joint is reported as being in successful use on ships where boiler pressures up to 220 lb. are carried with only one packing ring.

EFFICIENCY TEST OF 125-H. P. GAS ENGINE.

At the recent meeting of the American Society of Mechanical Engineers, Mr. C. H. Robertson, of Purdue University, presented a paper giving the results of a test made upon a 125-h. p. Westinghouse gas engine in the plant of the Merchants' Electric Lighting Co., LaFayette, Ind. The engine tested is of the 3-cylinder Westinghouse type, using natural gas as fuel, running at about 270 r. p. m. and belted to a 60-kw. two-phase alternator of 2,000 volts with 60 cycles; the engine is one of the first lot of five of this type turned out for commercial service by the makers. The test was from 7:05 p. m., March 22d to 12:05 a. m., March 23d, one engine carrying the entire load of the station.

We reproduce herewith the graphical log of the test, together with other diagrams and portions of the paper explaining them. The heating value of 1 cu. ft. of "standard" natural gas is taken as 1,000 B. t. u. By "standard" is meant at a temperature of 62° F. and atmospheric pressure.

The distribution of the heat during each hour of the test was as follows:

Hour.	Heat Supplied, B. t. u.	Converted into work indicated, per cent.	Absorbed by jacket, per cent.	In exhaust, per cent.	Heat per i. h. p. per minute, B. t. u.
1 st	1,574,200	17.9	25.2	56.9	237.5
2 d	1,674,880	16.3	21.1	62.8	244.7
3 d	1,169,000	20.7	30.2	48.9	244.2
4 th	1,096,600	20.2	36.9	42.7	211.1
5 th	828,000	16.0	30.4	43.9	259.3

The author states that the whole sequence of events, from the gas meter to the engine and generator in a plant like this, follow each other so rapidly that it is entirely possible to run a satisfactory and reliable test of but a few minutes' duration. With this point in

FIG. 1.

FIG. 2.

mind, the whole collection of data (consisting of five hours of five-minute observations) was divided up into a series of tests of ten minutes' duration, in each of which an observation was had at the

beginning, in the middle, and at the end of the ten-minute period under consideration.

The best performance, in cubic feet of standard gas, occurs at 10:00, and is per indicated horse-power-hour, 11.87; per brake horse-power-hour, 14.71; per electrical horse-power-hour, 16.52. The highest consumption (under a mixture of 1:12) comes at 11:50, and is per indicated horse-power-hour, 18.42; per brake horse-power-hour, 29.65; per electrical horse-power-hour, 40.59. By plotting the total gas per hour against the different horse-powers (Fig. 1), a very interesting law seems apparent. It is nothing more nor less than the parallel of the well-known Willans law for steam engines, namely, that the total steam per hour plotted against the indicated horse-power is a straight line. This has been stated to be true for at least one type of the steam turbine as well. (Trans. A. S. M. E., vol. xvii, "Tests of a 10-h. p. Steam Turbine.")

Referring to Fig. 1, the solid circles show the relation between total gas per hour and the indicated horse-power. The points up to 100 horse-power fall within a reasonable distance of the straight line drawn to represent their average. There are, beside these, two points near the top of the sheet, which should not be considered in drawing the line, because they came from that part of the

figure show gas consumption per brake horse-power-hour and per electrical horse-power-hour.

In conclusion, the author gives the following miscellaneous notes:

It should be borne in mind in considering the data here presented that engine No. 1 was the first of this make and size installed for commercial service in this country, and that engine No. 2 (the one tested) was of the same lot of five engines, and was put in a short time after No. 1. Since they were installed, gas enginery has made a considerable advance, and the performance of this machine is probably not as good as an up-to-date engine would give. It is expected that the engine will be thoroughly overhauled and brought up to date during the coming winter. In case this is done, another test will be run in the spring, whence will be possible some interesting comparisons.

Chief among the changes expected to give greater economy will be the substitution of solid oil in the crank case instead of oil and water, as at present. It is stated on good authority that the presence of water in the oil when exposed to the conditions met with in the cylinder, very much injures its lubricating effect, whence comes rapid wear of cylinders and bearings and, consequently, low mechanical efficiency. Care must be exercised in the amount of oil

GRAPHICAL LOG OF TESTS OF 125-H. P. GAS ENGINE.

test (between 8:30 and 9:10) when the mixing valve was accidentally changed. Between these two points and the upper end of the straight line is another group, made up of a considerable number of points, which, without exception, are from the observation taken before 9:15, when the ratio of mixture was 1:11, which, consequently, are not comparable with those points where the mixture was 1:12. The crosses represent the same relation for the brake horse-power, while the hollow circles are the points for the gas per hour against electrical horse-power; and the same general observation may be made for these as for the indicated horse-power line. Three quite important conclusions seem to be warranted by this comparison:

1. That the proportion of gas to air is a very important factor in fuel economy.
2. That one test at a light and one test at a heavy load would serve to locate the line, from which a quite approximate prediction could be made of the gas consumption under intermediate loads.
3. That these considerations hold for the fuel consumption per brake horse-power-hour and per electrical horse-power-hour.

By Fig. 2 is shown the relation between standard gas per indicated horse-power-hour and the indicated horse-power based upon observations when the mixture was 1:12. The other curves on this

permitted in the crank case, lest so much reach the cylinders as to carry flame over an exhaust stroke and ignite the next succeeding charge and with it the mixture in the distribution pipe. Any considerable amount of this "back firing" has a very detrimental effect on the engine in general, and seriously interferes with good governing. Back firing may also be caused by a leaky admission valve or a leak in the caging on which the admission valve is seated.

Cases have been reported where engines are running on gasoline in which a coating of burnt oil has collected on the end of the piston. This, it is thought, may come to high enough a temperature to ignite the incoming charge. At any rate, the "back firing" ceased with its removal.

The red glow of the exhaust pipe at night, or the red-hot condition of the copper ball used in determining the exhaust temperature, bore convincing evidence of the high temperature within the cylinder. This high temperature gives some trouble with the exhaust valves, making it necessary to watch them quite closely lest a little leak soon burns out into a hole of considerable dimension. This intense heat sometimes has caused the breaking off of the exhaust-valve stem. The use of more metal in the valves has practically ended these troubles.

In a gas-engine plant the certainty of action depends upon a

**Cost of Oil per Barrel.

number of details such as quality and time of ignition, proper compression, right proportion of gas to air, control of cylinder temperatures, etc. Any one of these defective to any considerable degree is quite sure to stop or prevent the starting of the engine. In one of the preliminary tests on this engine an observer accidentally struck one of the incandescence lamps in the igniting circuit. The lamp was apparently uninjured, but the engine at once slowed down. An examination of the lamp showed that just the tip end of the bulb had been broken off, thus destroying the vacuum within and, consequently, the igniting circuit.

On another occasion sand was deposited in the jacket from the cooling water, making it impossible to cool the cylinder properly. The result was that the heat of compression furnished a high enough temperature to ignite the charge, and the engine was run for some time without the igniters in operation.

At various times the gas supply for the city has been shut off. Under such circumstances the engine (acting as a pump) has continued to draw gas from the mains, and to run through such shut-offs of thirty minutes' duration.

Soon after the gasoline vapor generator was installed, artificial gas was piped to the plant, and proved so much more convenient for emergency runs that the vapor generator was not used, and at the present writing has been removed.

In the warm months of summer some trouble has been experienced in cooling the jacket water in the cooling tower. As a result, a motor and pump was installed at the river bank some distance away, and the jacket water secured from that source. As soon as the warm months are over the cooling tower is used again. When the engine was first installed, cast steel gears were used which, on giving trouble, were replaced by steel cut gears. This change has ended the trouble from that source.

Natural gas is sold to the company by meter at the rate of \$.07 per 1,000 cu. ft.

GOOD ADVICE.

Before a recent meeting of the Ohio Electric Light Association of Cleveland, Mr. Geo. Hayler, jr., read a paper on "Some Suggestions to the Managers of Small Electric Light Central Stations," in the course of which occurred the following paragraph which is equally applicable to small street railway plants.

"It is a mistake to suppose that anyone who is familiar with steam machinery will be the man to operate an electric plant. It is hard to teach an old dog new tricks, and it will probably cost you more to teach an erstwhile engineer of a threshing machine or a sawmill how not to do things, than it would be to take a green man and teach him how things ought to be done. Don't make the mistake of employing one of those men who know it all and who has had his pockets full of credentials from plants where he has been employed. A letter of recommendation is often a mighty cheap price to pay for the privilege of dispensing with a man's services. Shun, also, as you would the Old Nick himself, the man who is continually and eternally skipping around with a monkey wrench in one hand and an oil can in the other, adjusting everything in sight. He will make you nervous, and eventually cause

you more trouble and expense than a man who sits down and deliberately neglects things until they will run no longer. Get good, sober, cool, reliable men, and then keep them; and if you can't find the men you want, get some good, young raw material and make them. It will take time and patience, and you will get your hands dirty, but in the end you will have men whose reliability, carefulness and loyalty will pay you a thousand times over for the time and patience spent in developing them."

TEST OF THE CAPITAL TRACTION POWER HOUSE, WASHINGTON.

The power plant of the Capital Traction Co., of Washington, D. C., which was built to replace that destroyed by fire in September, 1897, was recently tested by Messrs. William R. Miller, Nelson E. Otterson, Frank H. Eastman and H. Worthington Talbot and the results presented in their graduation theses at Cornell University.

The main equipment of this station comprises eight 350-h. p. Babcock & Wilcox boilers arranged in batteries of two, and fitted with Roney stokers, and five units in the engine room, each consisting of an 800-h. p. Reynolds-Corliss tandem compound engine, with cylinders 20 and 40 by 48 in. direct connected to a General Electric generator. Hartwell horizontal, exhaust feed heaters and Dean jet condensers are used.

The test was to find the efficiency of the main plant under ordinary working conditions during the whole 24 hours. The first of the main units is started at 5 a. m. and the last one shut down at 1:30 a. m.; the variation is of course great between these hours, the maximum loads occurring between 8 and 9:30 a. m. and 4:30 and 6 p. m.

The coal used during the test contained 2.16 per cent moisture, 16.85 per cent volatile matter, 72.23 per cent fixed carbon and 8.76 per cent ash; the heating value per pound was 14,708 B. t. u. and per pound of combustible 16,511 B. t. u.

Data from the test are as follows:

Dry coal per sq. ft. of grate per hour.....	11.4 lb.
Actual evaporation per lb. coal.....	10.44 lb.
Equivalent evaporation per lb. coal.....	12.37 lb.
Average horse power per boiler.....	218.8
Water per i. h. p. per hour.....	22.78 lb.
Coal per i. h. p. per hour.....	2.18 lb.
Coal per e. h. p. per hour.....	2.21 lb.
Cost of coal per i. h. p. hour.....	.204 cent.
Cost of coal per e. h. p. hour.....	.207 cent.

The Toledo Traction Co. has closed a contract with the E. P. Allis Co. for a 2,800-h. p. engine and with the General Electric Co. for a generator of the same capacity. These machines will be delivered next winter by which time the Traction company will have further increased the capacity of its power house by extending the addition built last year.

The Sioux City (Ia.) Traction Co. is installing a 600-h. p. engine and generator unit in its power house.

Power Plant Piping and Accessories.

BY WILLIAM D. ENNIS, M. E.

PART I.

The cost of the piping in a power plant is apt to be underestimated by a prospective investor. The piping contract is often as large an item as the boilers, and in some cases is greater than the amount paid for the engines to which it is auxiliary. Proper design and construction in this direction are, therefore, entitled to consideration, and from an engineering standpoint, as well as from that view which is purely commercial, there is no part of a plant of greater interest than that of steam and water connections and auxiliaries.

In five electric or power plants recently installed the relative costs of the three items mentioned were as follows:

Reference No.	Character of Plant.	Boilers.	Engines.	Generators	Piping.
A	Simple Condensing.	\$2,650	\$4,360	\$8,230	\$3,235
B	Comp. "	2,897	6,150	7,585	3,987
C	" "	2,200	5,300	7,010	4,140
D	" "	2,140	3,860	...	2,575
E	" "	3,397	4,268	5,135†	3,239

*Trans. A. S. M. E., decci.

†Switchboard included.

*Not the entire cost, as some of the exhaust connections were included in another contract.

It is difficult to base reliable comparisons on such data as these, for the reason that the "piping contract" does not in every case embody the same portions of a plant. In A, for instance, feed pumps, but not condensers, were included; in C both pumps and condensers were covered in the contract price; in D neither are included. Separators and heaters are included in each of the five cases, and in B, C, D and E, covering the pipes with heat insulating material as well. It should be noted that the "cost" of the piping includes erection, while the other apparatus is usually purchased f. o. b., excepting that expert superintendence is furnished.

Two general tendencies prevail at the present time among engineers, in drawing up specifications for pipe work. One is to leave as little as possible of the auxiliary apparatus in the hands of the steam fitter, excepting that he may be called upon to set it on its foundations. The other practice is radically different. The piping contractor is required to furnish practically all of the steam plant, engines and boilers excepted; and instances are known in which not only the piping and condensing apparatus, but also the stack, flue, blower, blower engine and the completion of a build-

items in the construction of a plant, it is natural that they, as well as their clients and those engineers whose work lies in this direction, should appreciate the importance of a thorough understanding of the details of design and erection in their work.

Piping is expensive, and from all points of view the first essential in any system of piping is careful and intelligent design. There is no more delicate and difficult problem to solve in the entire planning of a power station, than the arrangement of pipe, with the separators, condensers and heating apparatus to secure economy, flexibility, durability and convenience. No part of a plant can give more trouble than badly planned piping. Engines may be in duplicate, boilers are seldom worked to their full capacity, and when trouble comes there is a reserve to fall back upon; but, in this country at least, where duplicate-piped plants are rare, a single break or failure in the steam main or connections may close an entire mill for days. Mr. Bryan errs, if at all, on the side of moderation, when he says (Trans. A. S. M. E., decci), "The general arrangement of this work (piping) and the selection of proper apparatus, demand the most careful study."

The substance of the above is well stated by Mr. E. A. Darling in his paper in the power plant of Columbia University. (Trans. A. S. M. E., deccxxii):

"Simplicity, brevity and elasticity are of the very essence of good practice in this line, and we believe that these ends should be sought before all others in laying down a plant. It is better to make the engines and boilers fit the piping than to go the other way about it. An unnecessary turn or length of pipe occasions a never-ceasing waste from friction and radiation."

Mr. Darling goes on to enunciate the following maxims in piping design, considering a pipe system as "just so much machinery":

"Put it up so that it may adjust itself freely under the strains imposed by expansion and contraction.

"Consider the human element involved in its operation, by setting all valves where they can be easily and quickly handled without making undue calls on the heroism of the engine-room force in case of an emergency.

"Put the piping together in the way you would any other machinery, with bolted joints that can be easily made and unmade without destroying or damaging either pipe or fittings.

"Provide especially for free straight passages with exhaust steam and water pipes, on account of the less energy which they possess to overcome obstacles, as compared with live steam."

FIG. 6.—HEADER DESIGNED FOR A STREET RAILWAY

ing that had been partially erected by day work in charge of the owner, were merged into one contract with a firm of steam fitters.

Such work demands more engineering ability than the old time steam heating contractors manifested, and as more responsibility has been involved in pipe work, firms of general steam contractors have come into existence. With full charge of one of the largest

To these rules additional maxims might be laid down, such as the following:

a. Provide intelligently for the disposition of condensation, relying as little as possible on special devices, which in the case of live steam, should be used rather as safety apparatus than as ordinary necessities.

b. Make the losses due to condensation and friction as small as possible by computing from both standpoints the advantageous sizes of pipes to use.

c. Construct the system so as to be self-resisting and self-adjusting against vibratory strains due to the motion of steam and machinery, depending on hangers, brackets and supports only where their purpose cannot be fulfilled by the elements of the system themselves.

d. Obey everywhere the inviolable law of expansion. As an engineer remarked, the two leading characteristics of pipe are its expensiveness and its expansiveness.

which the main steam pipe may run. Horizontal water tube boilers have one or two nozzles. A common method of connecting the latter type of steam generator to the main pipe is that shown in Fig. 1, in which the boiler has two longitudinal drums with a nozzle in each. Two-nozzle fire tube boilers furnishing steam to the main at either end have the safety valve attached to the free nozzle. It is customary to extend a pipe the size of the nozzle upward some six feet from the (pop) valve outlet, and to drip the exhaust head thus formed. Boilers are occasionally built with four nozzles; two for steam connections and two for pop and lever safety valves.

The choice as to which nozzle shall be used for the main steam

Many other more or less familiar precepts might be enjoined at this point in connection with the engineering features of an efficient pipe system. It will be of greater value, however, to consider first the elements which enter into such a system, treating in this connection the principles which may be induced as applicable to an entire plant, made up of combinations of those elements.

THE PIPING SYSTEM CONSIDERED IN ITS PARTS.

Adopting the foregoing characterization of a piping system as "so much machinery," there are certain principles governing its design and construction and, so to speak, its operation, apart from the properties and qualities of the elements of which it is composed. Some of these principles have been briefly mentioned, and we have now to consider the theories involved and their practical consequences.

In a steam plant, there are several distinct piping systems serving particular purposes and co-ordinating toward a definite object

connection is usually made with regard to the position of the engines. It is best, of course, to have all steam lines as short as possible, to avoid radiation and condensation. Sometimes the main steam is taken from one nozzle and the auxiliaries from the other. A plant where this system was adapted is shown in Fig. 2.

Starting from the main steam nozzle, the most important line of pipe in the plant runs in as direct a manner as possible to the engine. But in the case of steam, at least, it fails to be true that a straight line is the shortest distance between two points. The pipe should at first be run upward, making the header just below the highest point the steam reaches in its entire course. This run may be a piece of straight pipe terminating in an elbow, which in turn leads horizontally to the header (Fig. 3), from which steam is led to the engines, or it may be a bend like those shown in Fig. 2, which combine in one piece the two lengths of pipe and the elbow, avoid-

PLANT-CAST OF GUN IRON IN TWO PIECES.

—the economical transmission of the fluids used to and from their respective points of operation.

HIGH PRESSURE STEAM PIPES.

First is the main steam line and branches, carrying steam from the boilers to the engines, pumps, condensers, etc. Ordinary fire tube boilers are made with two nozzles, from either or both of

ing in this case two joints and consequent increased risk of leakage. The bend has other advantages. In Fig. 3, supposing the points C and A to be fixed, the four joints shown are subjected to a strain which forms one of the most important factors in all piping design. When high pressure steam is turned into these pipes an irresistible expansion takes place in both lengths, the amount of

expansion depending upon the pressure (and temperature) of the steam. If the horizontal pipe is 6 ft. long, and the temperature at which the joints were made tight is 70° F., the increase in length at a pressure of 150 lb. is over $\frac{1}{8}$ in. This increase tends to throw back the elbow and the upper end of the vertical pipe, as shown in Fig. 4, and if the flange, A, remains rigid one of the joints, a or d, is sure to be impaired.

This effect is counteracted to some extent, though not perfectly, by the elasticity of the vertical pipe, which may take the shape shown in Fig. 4B. There is, even in this case, however, a destructive strain on the two joints. A bend, such as is shown in Fig. 2, simply a piece of ordinary pipe formed on rolls to the required radius, possesses a shape better adapted to withstand expansive and distortive strains, and is almost universally used for high pressure piping of large size in this part of the plant.

the latter be used the thickness should be liberal, and all corners should have large fillets, not less than 2 in. radius.

A cast-metal header of this kind is shown in Fig. 7. This was made up with the thickness $\frac{3}{4}$ in. for the section, 7 in. inside diameter; $\frac{7}{8}$ in. for the 8 in.; $\frac{7}{8}$ in. for the 9 in., and 1 in. for the 10 in. sections.

It was designed for a working pressure of 160 lb. The construction is open to criticism, because of the absence of any main valve in the header, but as steam for the engines was taken from the end of the run instead of midway along the boiler line, this objection is of less force than it otherwise would be. The complete set of castings cost \$275. Their equivalent in standard wrought pipe and heavy cast iron fittings would have cost \$185. The expense of making up and erecting the wrought iron header would have been somewhat greater than that of the cast iron.

Bends are sometimes made of copper, in rare instances of brass, but this latter practice is not to be recommended in any case. Copper bends should be made with brass or copper flanges and the ends of the pipe should be brazed into the flange, then peened over and faced. Even with this form of construction, there are several objections to the use of copper bends. They are expensive, as compared with iron. It is impossible to judge on inspection, whether the brazed joint has been properly made or not. A method of connecting mains to a header, which in the writer's opinion, is the best practiced, is shown in Fig. 5. With a system of this kind, a steam separator becomes almost superfluous. It requires considerable head room, however, and for pressures above 135 lb. the large number of joints necessary forms a drawback.

The main steam header, into which the boiler mains run and from which the supply is furnished to the engines, is made usually of wrought iron pipe or of a good quality of gray iron casting. If

Another form of cast iron metal header is shown in Fig. 6. This was cast of gun iron, in two pieces, the shell being 1 in. thick, and cost \$75. The working pressure was 140 lb.

The material and dimensions of the header being fixed, the next question is that of support. Where there is a trussed roof overhead, the common method is to hang the pipe from the trusses in some such manner as is shown in Fig. 8.

If the header is close to a stout wall, it may rest on brackets, one form of which is shown in Fig. 9. These should be made adjustable in every direction, and should be bolted clear through the wall, the bolt heads or nuts resting on plates or very large washers. A third method of supporting a header is shown in Fig. 10.

When the boiler plant consists of a large number of units, and the header is of any considerable length, it should be anchored at some point, to divide the expansion. This may be done by fixing strong clamps upon the pipe and guying them to the roof trusses

or walls. The best form of anchor is one bolted direct to the wall or floor, such as that shown in Fig 11.

The main supply from the header to the engines should be taken from the side, end, or (preferably) from the top of the header, and should be made up of pipe bends in preference to straight pipe and cast fittings. It is usually necessary to support this line of pipe from above, and provision should be made for tightening the hangers.

The pipe used for high pressure steam (100 lb. and above) should be of full standard weight, and the fittings should be of the "extra heavy" pattern. Valves should also be "extra heavy." These three grades of material are suitable for any pressure up to 140 lb., excepting in cases where the vibration is excessive. "Extra heavy" stock is built for a working pressure up to 200 lb. The standard weight pipes should never be used for pressures above 150 lb. per sq. in. Pipes larger than 3 in. are usually put together with flanges and flange fittings, those smaller than that size with unions or union flanges and screwed fittings. Valves for high pressure pipes, especially the larger sizes, should be of the "outside screw" type, which can be repacked under pressure. (Fig. 12) Valves larger than 7 in. should have a bypass in order to admit of a gradually opening passage for the steam. It is customary when valves are some distance above the floor, to set them with their spindles horizontal, and to provide a sprocket wheel and chain so that they can be operated from the floor.

Flanged joints on high pressure steam pipes should be made with corrugated copper gaskets, and the flanges should be screwed to bottom on the pipe thread, then faced off square with the axis of the pipe. The bolt holes on flanges are drilled 1-16 in. larger than the diameter of the bolts, and the gaskets should be cut so as to bear from the inside of the pipe to the inside of the bolt holes. The best form of flange for this purpose is shown in Fig. 13, a projecting ring of sufficient area being left on the inside of the bolt circle of the flange. This, when faced with the pipe on centers, forms the bearing surface for the gasket.

All high pressure pipe and fittings should be covered with a good non-conductor, and where the best economy is desired, valves and pipe flanges should also be covered. It is sometimes claimed that flanges should be left exposed in order that ready access may be had in case of leakage, but the sectional coverings now in use are readily removed, and the sharp corners of flanges present an outlet for thermal units that ought not to be neglected.

In determining the sizes of steam pipes it is customary to allow a velocity for live steam of 6,000 ft. per minute. Having determined the steam pressure and the number of pounds of steam required to flow through given pipes in that time, the volume of steam corresponding to the required weight can be found from the steam table, and this divided by the permissible velocity gives the area of the pipe required. The nearest commercial size of pipe to this should be chosen. A smaller size throttles the steam and diminishes the pressure at the outlet, and a larger size results in increased radiation and loss.

CARRIED A BAG OF DYNAMITE.

An Italian employed to do blasting, boarded a trolley car of the Union Railway Co., of New York City, recently, bound for Mount Vernon. He had a large feed bag, which he held in his lap until he reached Mount Vernon, where he went into the crowded waiting-room and dropped it carelessly on the floor.

A patrolman seeing the Italian get off the car and thinking that he might be one of the lead pipe thieves who have been at work in Westchester County, tapped the bag to see what it contained. There was a suspicious rattle and as the man appeared to be badly frightened the officer arrested him and took him to the police station, where it was found the bag held nearly 75 lb. of dynamite with caps and other explosives. The Italian was fined \$100 or 100 days in jail for carrying dangerous chemicals in the public streets.

Boston has again taken the lead in religious affairs. Two motor-men in the employ of the Boston Elevated R. R. have been suspended from the congregation of the Broadway Tabernacle church of that city for running their cars on Sunday. When the young men got their jobs they were warned by the pastor not to work on Sunday.

UNITED KINGDOM ELECTRIC TRAMWAY STATISTICS.

From the list of "Electric Tramways and Railways in the United Kingdom," now in operation, under construction, or for which the contracts are let, published by the Electrical Review, London, under date of Dec. 1, 1899, the following data are taken:

The overhead trolley lines owned by municipal corporations are located as follows: Aberdeen, 2 $\frac{1}{4}$ miles double, $\frac{1}{4}$ mile single; Blackburn, 4 miles; Blackpool, 11 $\frac{1}{2}$ miles single track running and arranged for; Bolton, 31 miles single; Bradford, 5 miles; Darwen, 2.84 miles double; Dover, 3 miles single, 1 $\frac{1}{2}$ miles double; Dundee, 3 $\frac{1}{2}$ miles double; East Ham, 1 $\frac{1}{2}$ miles double, 2 $\frac{1}{4}$ miles single; Glasgow, 3 $\frac{1}{4}$ miles double running, 1 $\frac{3}{4}$ miles double ready, 35 miles double under construction, 19 miles double to be constructed; Halifax, 11 $\frac{1}{4}$ miles, 24 miles under construction; Hull, 9 miles double, 1 mile single; Leeds, 7 miles double running, 22 miles under construction, 36 miles projected; Liverpool, 20.6 miles; Manchester; Nottingham, 14 $\frac{1}{4}$ miles double, 4 miles single; Oldham, 25 miles; Plymouth, 3.1 miles single working, 2.7 miles to be equipped; St. Helen (Lancashire), 6 miles running, 13 miles building; Salford, 40 miles single; Sheffield, 2 miles single, 9 miles double; Southampton, 7 miles single; Southport, 3 2-3 miles single, 1 mile double; Sunderland, 13 $\frac{1}{2}$ miles single.

The overhead trolley lines owned by companies or individuals are located as follows: Blackpool and Fleetwood, 6 $\frac{1}{2}$ miles enclosed road, 2 miles tramway; Brighton and Rottingdean, 3 miles; Bristol, 8 $\frac{1}{2}$ miles; Carlisle, 7 $\frac{1}{4}$ miles; Cork, 5 miles double, 2 miles single; Coventry, 5 $\frac{1}{2}$ miles double, 5 miles single; Devonport, 4 $\frac{1}{2}$ miles double, $\frac{1}{8}$ mile single; Dublin and District, 39 miles, mostly double; Dublin and Lucan, 6 $\frac{1}{4}$ miles single, $\frac{1}{2}$ mile double; Dudley, 5 $\frac{1}{2}$ miles; Giant's Causeway, Port Rush & Bush Valley, 8 $\frac{1}{2}$ miles single; Hartlepool, 4 $\frac{1}{2}$ miles single; Isle of Man (three lines each with one accumulator sub-station), 46 miles single; Kidderminster & Stourport, 4 $\frac{1}{2}$ miles; London, 20 miles; Middlesbrough, Stockton and Thornaby, 15 miles; Norwich, 13 miles single, 3 miles double; Oldham, Ashton and Hyde, 8 miles; Potteries (North Staffordshire), 33 miles; South Staffordshire, 8 miles; Swansea, 3 miles single, 2 $\frac{1}{2}$ miles double.

The only accumulator line is owned by the City of Birmingham Tramways Co., and comprises 3 miles of double track.

The "electric railways" in the United Kingdom comprise: Bessbrook & Newry Tramway, 3 miles double track, third rail system; Brighton, 1 mile single track owned by Magnus Volk, third rail; Herne Bay Pier Electric Ry., $\frac{3}{4}$ miles; Liverpool Overhead Electric Ry., 6 $\frac{1}{2}$ miles double track; Ryde Pier Electric Ry., $\frac{1}{2}$ mile, third rail; Southend-on-Sea Pier Electric Ry., 1 $\frac{1}{4}$ miles, third rail, owned by town council; Walton-on-the-Naze Pier Electric Ry., $\frac{1}{2}$ mile; and the following underground roads in London:

Baker Street & Waterloo Electric Ry., 3 $\frac{2}{3}$ miles, to be completed in about three years.

Central London Ry., 13 miles, nearing completion.

City & South London Electric Ry., twin tunnels, 3 $\frac{1}{2}$ miles.

Great Northern & City Electric Ry., to be completed June, 1902.

Metropolitan Underground Ry., experimental section equipped for electricity by the Metropolitan and the Metropolitan District Railway companies.

Waterloo & City Electric Ry., line opened August, 1868.

CONTRACTS LET AT BAY CITY.

Mr. E. S. Dimmock, general manager of the Bay Cities Consolidated Railway Co., of Bay City, Mich., writes us that his company has given out contracts for the construction of a new power house that it is believed will be one of the most attractive and economical stations in that part of the country. Arbuckle Ryan Co. will have general charge of construction work, and J. J. Thorne, of Bay City, will supply the switchboard; the Stirling Co., of Chicago, the boilers; Russell & Co., of Massillon, O., the engines, and the Westinghouse Co. the dynamos, which will be of 550 kw. capacity.

The power station will be 115 x 75 ft., built of pressed brick and finished on the inside in cream enamel brick. Mechanical draft, with blower attachment, will be employed, doing away with the necessity of erecting a stack. The plant is to be in operation by May 15 or June 1, 1900.

BUCKLAND PAVING BLOCK.

In our issue of October, 1899, page 725, we illustrated the Buckland paving block, which is the invention of S. J. Buckland, of Springfield, Mass., and was laid as an experiment on about 2,000 ft. of double track of the Springfield Street Ry. in the late fall of 1898. The block is of cast iron, 12 in. long, with a V-shaped slot in one edge, and when slipped over the inner flange of a tram head transforms it so far as the exposed surface is concerned into a full groove rail.

The result of this experiment is referred to in the report of the city engineer, Charles M. Slocum, for 1899, from which we take the following extracts:

"The use of the tram head girder rail on Dwight and lower Main Sts. as laid in 1866 and the roadway paved with vitrified brick has been a source of much dissatisfaction; complaints have been

LAYING BUCKLAND PAVING BLOCKS.

constant as to the discomfort and danger attending the use of these streets, owing to the form of rail head and the manner of paving between rails of each track, the paving inside of each track being an inch or more lower than outside.

"The Buckland device (designed to remedy this objection) has now withstood the action of the traffic for more than a year and shows no defect whatever and is evidently in every way a most satisfactory device, affording the public all the advantages of a street having a full grooved rail. It can be used at a great money saving over and above what would be required to take up the pavement and substitute a new full grooved rail."

A contract has lately been made for the relaying of the pavements between car tracks in the same manner on Main St., between William and Marble Sts., as soon as settled weather in the spring time will permit.

NEW INTERURBAN AT DENVER, COL.

The Denver, Boulder & Northern Railway Co. has not as yet made formal application for a franchise from the city of Denver, but will undoubtedly do so within a short time. A party is now in the field, and an office force at work preparing plans and specifications. T. J. Milner, formerly chief engineer of the Denver Board of Public Works, is chief engineer for the road.

The plan is to connect Denver with the northern Colorado coal fields, which are distant about 15 miles from this city. The present railroad transportation charges are 80 cents per short ton, which, for a down-hill pull, is very profitable. There is also considerable traffic, passenger and otherwise, between Denver and Lafayette, Louisville, Boulder, Longmont and Fort Collins, which it is proposed to compete for. The main business, however, is expected to

come from the transportation of coal. The present retail price of coal in Denver of \$4.00 per ton, will undoubtedly be lowered to \$3.00.

The line is not intended in any way to compete with the system of the Denver City Tramway Co. and traffic arrangements may be made with that company to enter the city over its tracks by laying a third rail, the gage of the City Tramway tracks being 3 ft. 6 in., while the gage of the new road will be 4 ft. 8½ in. The rail will be the 75-lb. A. S. C. E. standard, and will be rolled by the Colorado Fuel & Iron Co. at Bessemer, Col.

In connection with the railway a large electric power plant will be erected at Lafayette or Louisville, in the center of the lignite coal district, 16 miles northwest of Denver. Current will be transmitted to Denver by means of the three phase system and supplied for lighting and power purposes.

The general manager of the road is E. L. Bevington.

REMOVING SNOW IN MONTREAL.

The question of removing snow is now under discussion at Montreal. Under its franchises the Montreal Street Railway Co. is required to keep its tracks free from ice and snow and the city may at its option remove all or a part of the snow and ice in the street from curb to curb and recover one-half of the cost from the company. In 1894 the company agreed to pay \$1,650 per mile of street per annum for five years in lieu of its half of the cost for removing snow. During the next five years this sum proved to be 58 per cent, 61 per cent, 72 per cent, 94 per cent and 50 per cent, respectively, of the total cost. In the five years the company paid over \$255,000 for this service, the amount being nearly \$59,000 more than one-half the total cost.

The five-year agreement having now expired, the Montreal Street Ry. makes the following proposition:

"First, to pay the city monthly one-half of the cost of removing snow from the streets from curb to curb, without prejudice to the city's rights to recover any greater sum in the courts, if it can establish its rights thereto; secondly, or the company is prepared to submit article 16 of the contract to the courts, as a special case for immediate decision, and to facilitate the immediate decision of the case in every way; thirdly, or the company is prepared to enter into a contract that the city shall do the removing of the snow, for a period of five years, and shall receive \$1,125 per mile of street per annum as the company's contribution, that being estimated as one-half of the cost, based upon the experience of the last five years, with a proviso that a special case may be submitted if the city so desire, or the city may take such legal proceedings as it likes to get an interpretation of the contract, and if the courts interpret the contract as compelling the company not only to clear the snow from its tracks, but also to remove itself the snow so cleared, the company will pay an additional sum so as to bring this contribution up to \$1,650 per mile."

This will serve to explain a resolution of the road committee of the city approving of a notarial protest being served on the company to prevent it using snow sweepers on its tracks.

TRAMWAY IN SIAM.

Mr. Hamilton King, U. S. consul-general at Bangkok, Siam, writes the State Department as follows concerning the Bangkok Tramway Co., of which W. F. Jacobson is manager:

"A private syndicate in 1887 obtained a concession for street railway lines in Bangkok. These were built for horse cars in 1889 and changed to an electric trolley system in 1892. This line is crowded with passengers all day long and pays 12 per cent on the investment. The rolling stock, machinery and wire for this road have all been bought in America; the rails in Europe.

"It is probable that this line will be extended in the near future, and that another similar system will be built."

ELECTRIC FREIGHT LINE AT TORONTO.

The question of whether street railways shall be permitted to carry freight is a live one in Canada, the attorney general having asked for an injunction to restrain the Metropolitan Railway Co., Toronto, Ont., from making connection with the Canadian Pacific R. R., and from carrying freight into the city.

TRAMWAY SYSTEM OF SHEFFIELD, ENG.

(From Our Own Correspondent.)

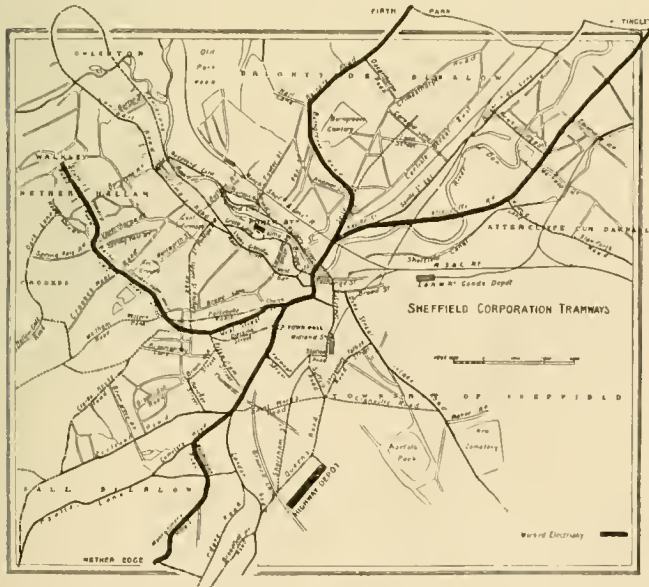

The world-famous cutlery producing city of Sheffield is now actively engaged in extending its tramway system and in adopting electrical power for traction. The lines were originally constructed by the municipality and leased to a company. The term expired in 1866, and the Town Council then began to operate the system. There were nine miles of double track worked by horses, and the corporation soon saw that in such an important town the system was capable of much development. The result of a delegation sent to inspect tramways in different parts of the country was a report strongly in favor of the overhead trolley system. Powers were obtained from Parliament to extend tramways to 36 miles—about three-fourths of which is to be double track—at an estimated cost of £600,000. When these extensions have been completed there will be about one mile of tramway to every ten miles of street in the city, and to every 10,000 of the population. The accompanying map shows the system clearly, but powers are now being sought for further extensions.

Some of the routes, especially those known as the Walkley, are very hilly, presenting gradients as steep as one in ten. A section is here given of the Walkley route, as it is believed to be one of the most severe not worked by cable traction in the United Kingdom.

Reconstruction was started in January last year on the Nether-edge & Tinsley route. Steel girder rails weighing 108 lb. per yd. supplied by the Barrow Hematite Steel Co. were laid, and the joints were made with fish-plates 3 ft. long and weighing 80 lb. per pair. The rails were laid direct on a concrete foundation after the usual British practice. The accompanying drawings show the very strong track construction which has been carried out. The paving for the most part is granite sets, and the laying of the permanent way was done by the corporations own workmen.

The first contract for the boilers, engines, dynamos, poles, cars, and electric cables was let to the British Thomson-Houston Co., the specifications and designs having been supplied by Mr. C. F. Wike, M. I. C. E., who also directed the permanent way construction. Both side and center poles are employed, and a good idea of the general appearance of the street design may be obtained from the photographic views here reproduced.

Other lines are now in hand, and the total length of the extensions so far constructed is equal to 24 miles of single track.

MAP OF THE SYSTEM.

The power station is situated on Kelham Island, and a continuous supply of condensing water is at hand. The contract for the building was let to Eshelby & Son, Sheffield, for £7,900. The building including boiler house, engine room and coal bunkers, is 183 ft. long by 109 ft. wide, and the general disposition of the machinery may be gathered from the plan and elevation here shown. The British Thomson-Houston Co. secured the first machinery con-

tract, including three boilers, engines and dynamos, pumps, condensers, switchboard, overhead crane, etc. The boilers are of marine type, 10 ft. x 10 ft., and the working steam pressure is 160 lb. The engines are tandem compound condensing corliss, made by the E. P. Allis Co., of Milwaukee. The cylinders are 12 in. and 22 in.

SHOWING OVERHEAD CONSTRUCTION.

diameter with a 30-in. stroke. The variation in speed allowed is 2 per cent. The flywheels are 12 ft. in diameter and weigh 15,000 lb. The generators are of the six-pole type of British Thomson-Houston Co., 225 kw. each.

Each car is provided with two G. E. 52 motors, wound for 500 volts, and the controllers are of the Thomson-Houston B. 13 type. The gear is so proportioned that with a 30-in. wheel each motor will

TYPE OF CAR.

develop a horizontal effort of 1,000 lb. at 8.4 miles per hour. The trolley arms and heads are of the swivelling type, so as to obviate the necessity of keeping the trolley wire over the center of the track. In many cases it is several feet away from the center.

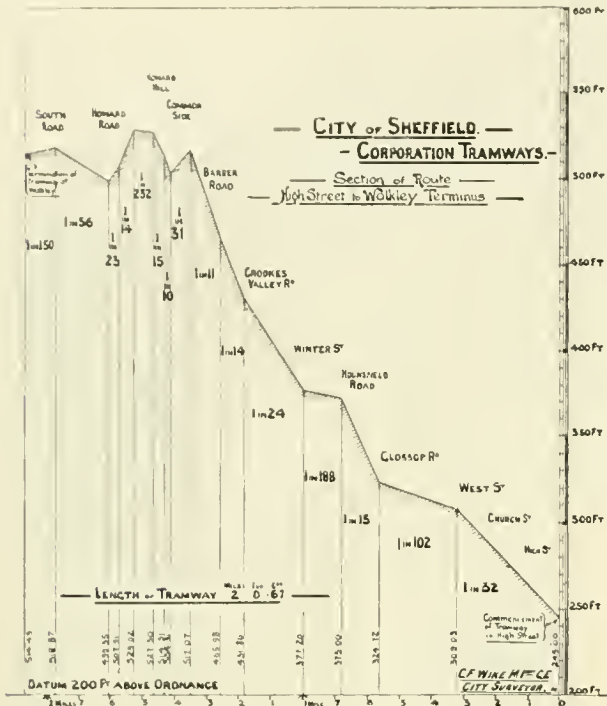

On account of the gradients the brake arrangements are of an unusually thorough nature. Beside the usual hand brake there is a trailing slipper brake, by means of which the weight of the car is

taken almost entirely off the wheels and transferred to the wooden brake blocks which slide along the rails. This brake is operated by turning a wheel immediately under the handle for the hand brake. There is also an electric brake operated by the same handle that starts and controls the motors. Trailing wedge blocks are a further provision. In addition to the above the driver can, in a case of great emergency, reverse his motors.

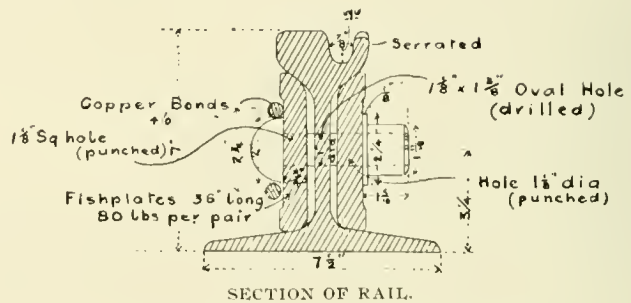

The cars already in use number 39, 25 being double-decked and 14 single decked. The total number of cars ordered up to the pres-

MAIL SERVICE IN SYRACUSE, N. Y.

The Syracuse (N. Y.) Rapid Transit Railway Co. last year made 7,907.48 miles in carrying United States mail between Syracuse, East Onondaga, Onondaga Valley and Elmwood Park, receiving therefor \$250. A wagon route in Syracuse 1.27 miles long made 6,423.04 miles during the same period and for this service the contractor received \$1,795.

PROFILE OF WALKLEY ROUTE.

SECTION OF RAIL.

SECTION OF ROADBED.

ent is about 100, and if the traffic continues to increase at the present rate, there is no doubt the first estimate of the number of cars required, viz., 150, will be greatly exceeded.

The engines at present installed are barely sufficient to work the present number of cars, and in a few weeks new boilers, engine, and dynamo will be at work. Another unit is on order, and will be fixed as soon as the extension of the power station will permit.

Although the trolley has only been at work since the middle of September, the receipts have already shown an increase of about 80 per cent over the corresponding period of last year.

Feed trolley wires interfered with traffic on the Louisville (Ky.) road on December 14th.

ABUSE OF TRANSFER PRIVILEGES.

The United Railways & Electric Co., of Baltimore, is endeavoring to restrict the issue of transfers to those cases where it is necessary for a passenger to make use of two lines to reach his destination, and as an experiment has begun on one line by refusing to issue the transfers except when the passenger's fare is received and refusing to issue transfers on transfers. The company has assented to the proposed legislation removing the privilege of charging for transfers and is willing to encourage their legitimate use, but protests against abuse of them.

General Manager House estimates the loss of one fare for each half trip to amount to \$307,476 per year.

A POSSIBLE EXPERIMENT IN MUNICIPAL OWNERSHIP IN OHIO.

Extract from a lecture on "Economic Aspects of Municipal Franchises" by Allen Ripley Foote, delivered at the Ohio State University, Columbus, Dec. 19, 1899.

The Ohio Municipal Code Commission (a commission appointed by the governor to prepare a "Revised Municipal Code of Ohio") proposes to give municipalities power to own and operate the following public service industries: In Sec. 2073 a municipal garbage plant. In Sec. 2137 municipal gasworks, waterworks and lighting works. In Sec. 2165 to "levy and assess, upon the general tax list, an assessment on all taxable real and personal property in the corporation, for the payment of cost and repairs of the following improvements, including the cost of the necessary real estate therefor, waterworks, gasworks, and public lighting works." In Secs. 2277, 2278, 2279 and 2280, to buy waterworks by an issue of bonds at rate of interest not to exceed 6 per cent per annum and to run not more than 20 years, and to "levy a tax of sufficient amount to pay the interest of such bonds, and to provide for the redemption of the same." In Secs. 2383, 2384, 2385, 2386, to cities of 50,000 inhabitants and over to buy existing street railways, to issue 6 per cent, 20-year bonds therefor, and to "levy a tax of sufficient amount to pay the interest on such bonds, and to provide for the redemption of the same." In Secs. 2388, 2389, 2399, 2391, 2392, 2393, 2394, 2395, 2396, 2397, to cities of 50,000 inhabitants and over to construct and operate street railways, issue 6 per cent, 20-year bonds therefor, "and the council shall annually, after such street railway shall have been put into operation, if necessary, levy and assess such a tax, as, TOGETHER WITH THE RECEIPTS from the street railway and other moneys applicable to the purpose, shall be sufficient to provide for said interest and sinking fund, the same to be assessed and levied upon the entire taxable property of the corporation." In Secs. 2401, 2402, 2403, 2404, 2406, 2407, 2408, 2409, 2410, 2411, 2412, 2413, 2414, to buy or construct a telephone system, to issue 6 per cent, 20-year bonds therefor, and, "if necessary levy and assess such a tax, as, together with the receipts from the telephone service and other moneys applicable to the purpose, shall be sufficient to provide for said interest and a sinking fund, the same to be assessed and levied upon the entire taxable property of the corporation." In Sec. 2652, in addition to taxes specified in Sec. 2651, by sub-Sec. 26, "the council in each city and village may levy taxes, annually, for waterworks, gas plants, electric lighting plants, telephone plants, street railways or any of them, owned, operated and controlled by any municipal corporation, when the proceeds derived from the operation of such works, plant or plants or such street railway are found to be insufficient to pay the expenses of operating and conducting the same, respectively, and the council of such municipal corporation may levy the taxes on each dollar valuation of all the taxable property listed for taxation in the corporation, both real and personal, to pay the amount found to be due on the operating expenses thereof after applying them to the proceeds of such works or plant or plants and street railways." In Sec. 2683, "in determining the city's power to incur indebtedness there shall not be included the following classes of indebtedness: Bonds issued for the purpose of erecting or purchasing waterworks and supplying water to any city and the inhabitants thereof, for the purpose of erecting or purchasing gasworks, or electric light works, for supplying light to the city and its inhabitants, or for the purpose of constructing, erecting or providing any public service which shall permanently produce a revenue to the city, owned and operated by the city."

Here is a complete destruction of every barrier in existing law, placed there as the result of a bitter experience for the protection of property owners from the evils of excessive municipal indebtedness and taxation.

The theory upon which the Code Commission bases its proposed grant of powers is that public service industries are producers of revenue and therefore will provide for themselves. Would it not be wise in putting this theory into practice to provide that they shall do so, instead of destroying all inducement to hold them to a correct test by providing that taxpayers shall make good all failures to pay operating expenses, interest on bonds and provision for sinking fund? With a constituency taught to expect great reductions in prices for services as a result of municipal ownership

and operation, in which there is from ten to fifty voters who think they pay no taxes for every one who knows he does, how long will a city council be able to protect taxpayers by holding prices sufficiently high to pay all costs of ownership and operation and capital charges? Add to the deficit producing power of selling these services at less than cost, inefficient management by a committee of the council and the prospect for the taxpayers is truly appalling.

When a city has issued its bonds for the purpose of a garbage plant, waterworks, gasworks, electric lighting works, street car and telephone systems, and is operating all of these industries with no check on the prices it shall charge for the services rendered, but with special power to levy taxes to make good all deficiencies to cover cost of operation, interest and sinking fund provisions, can anyone tell what property in that city will be worth? Clear-headed business men can regard with complacency the proposals on this subject contained in the reports of the National Municipal League and the Ohio Municipal Code Commission only because they do not understand them.

A danger that cannot well be overestimated is found in the growing discontent with existing conditions. A mistake made now by adopting the proposals under consideration will do the municipalities of this country an injury from which they cannot recover in a generation. We have heard much about the crime of voting away the rights of unborn generations through granting long term franchises to corporations. What about the crime of placing a mortgage on unborn generations to satisfy a theoretical demand for the municipal ownership and operation of all public service industries? The vitality of the crime, in either case, is in the fact that such procedure is absolutely unnecessary to the attainment of the desired result, which is the best service at the lowest practicable price.

The lowest practicable price under municipal ownership and operation is one that will provide for all costs of ownership and operation and for a sinking fund to redeem the bonds issued on account of the industry. If a municipality having an absolute and perpetual monopoly, and the power to fix prices for the services it may render at any rate it pleases, cannot secure a sufficient revenue from the industry fully to pay all cost of ownership and operation and to provide for the redemption of the bonds issued for the purchase or construction of the works, it has no business to be in the business.

Municipalities should be prohibited from placing a mortgage upon taxpayers' property, and from raising any money whatever by taxation for the purchase or construction and operation of any public service industry. They should be authorized to secure funds for such industries only by mortgaging the property and franchise, and a pledge of revenue sufficient fully to pay all costs of ownership and operation and to provide for the redemption of the bonds issued in behalf of the industry.

With no possibility of competition, and absolute power to so fix prices that they will produce the revenue required, there is no necessary reason why any municipality cannot secure all the funds it may require for public service purposes on these conditions, and protect the property from foreclosure. If it cannot do this, that fact, or the fear of it, is sufficient reason why a municipality should not be given power to involve taxpayers in an inevitable disaster by mortgaging their property for such a purpose.

CARBONDALE BURGLARS CONVICTED.

In our issue of Apr. 15, 1899, was published an account of a daring burglary at Carbondale, Pa., six men entering the power house of the Carbondale Traction Co. early on the morning of March 27th and securing \$75. The six men were pursued, one killed and four of the other five captured; \$60 of the money was recovered.

Indictments were returned against the prisoners, and they were put on trial in December and all were convicted. December 9th they were each sentenced to 3 years and 10 months in the penitentiary and fined \$500, which is the maximum penalty for burglary where the house entered is not a dwelling house.

Mr. C. E. Flynn, superintendent of the Carbondale Traction Co., has as a souvenir the revolver carried by one of the men.

Mr. P. A. B. Widener has given \$2,000,000 for a Home for Crippled Children in Philadelphia.

ELECTRIC TRACTION.

Extract from the presidential address of Prof. Sylvanus P. Thompson, before the Institution of Electrical Engineers (Great Britain).

Passing from the generation of current to its utilization for electric traction, the most notable evolution now in progress is that of the application of electric power to heavy railways. The application to street railroads—in other words, to mere tramways—has been an accomplished fact for 10 years on the other side of the Atlantic, where there are now thousands of miles of electric tramways, mostly operated from overhead lines from which the current is taken by a contact trolley wheel. If in this country the development of electric tramways has been slower, we have at least the advantage that our cities are not disfigured by networks of overhead trolley lines. No such objections hold good for rural districts, and slowly but surely both the industrial and agricultural districts of England are being furnished with electric intercommunication with its many attendant advantages. It may come as a surprise to many who think England behindhand in this respect, when they learn that while the total subscribed capital invested in this country in 1899 for public electric supply is about £17,800,000, no less than £20,800,000 is already invested in electric traction. Of the effect of the introduction of electric traction as a social and economic factor I have spoken elsewhere. There can be no question of the immense social benefit, particularly to the artisan population, afforded by this means. But the electrical engineer is now engaged on the still greater problem of operating heavy railways, and the development in this branch is being watched with keen interest. The two deep level railways in London, the City & South London Ry. and the Waterloo & City Ry., both of which have amply justified their promoters, are shortly to be supplemented by the Central London Electric Ry., an undertaking of much greater magnitude, while several other similar schemes are either under construction or authorized. In the City & South London Ry., the rolling stock is designed for separate electric locomotives, each drawing three passenger cars. The gage is 4 ft. 8½ in. On the Waterloo & City line the trains consist each of four cars, of which the two end ones are fitted with motors, four motors on each terminal car, so that the train can be driven by either set of four motors. Each train can carry 204 passengers. The gage is 4 ft. 8½ in., but owing to the size of the tunnel, ordinary railway rolling stock could not be used. In the Central London line the gage is also 4 ft. 8½ in. The locomotives, each with four gearless motors, weigh 35 tons each. Each will draw a train of seven cars, with a seating capacity of 336 persons per train. The total length, including sidings and cross-over lines, exceeds eight miles of double track.

In all three of these railways the current is taken from a third rail on the surface, and the return current is through the ordinary rails, which, for this purpose, are bonded with copper bonds. All these lines are operated by continuous currents at 400 to 500 volts. In the case of the Central London line, part of the feeding is effected through rotary converters which receive three-phase currents from step-down transformers.

In sharp contrast to these three London undertakings is the Burgdorf-Thun railway in Switzerland, which was opened in July last. It is in every sense of the word a full-gage railway. Not only is its rolling stock full gage (the full gage of Switzerland is 4 ft. 8½ in.), but the railway admits of use by ordinary steam locomotives, drawing ordinary trains. The electric rolling stock is of two kinds—automobile cars carrying 66 passengers each, for use singly or in pairs, and locomotives of 300 h. p. each, for drawing trains of ordinary carriages or goods wagons. This railway is worked by alternating currents supplied in three phases, at 750 volts, the feeding being effected through stationary transformers at 16,000 volts. The currents are taken from two overhead conducting wires, the rails serving as the third conductor. The length of line thus electrically equipped is 40 kilometers, or 26 miles. The arrangements were designed, and the electrical equipment constructed, by Messrs. Brown, Boyer & Co., of Baden, who were the first to apply three-phase currents to traction. In the Lugano tramways as a commencement, then in the steep mountain light railways of Engelberg, of the Gornergrat, and lastly of the Jungfrau, they gained experience in this method, which now stands triumphantly demonstrated in its adaptability to the service of

heavy lines. In the United States heavy railways have been, to a very limited extent, operated by electric locomotives. Some built for the Baltimore & Ohio R. R., weighing about 90 tons, are employed to draw ordinary trains over a short line around part of the city of Baltimore. They work with continuous currents from overhead trolley lines.

There can be little doubt, however, that to Switzerland rather than to America we must look when desiring guidance as to the future development of this problem. All necessary data now exist for the exact working out of the necessary equipment of any given line, actual or projected. No experiments are needed to enable the constructor to proceed, so soon as it shall have been determined which kind of current is to be used. Already it has been found in the designing of the Central London line that continuous current methods, however suitable for light and short railways, and for tramways where frequent stoppages occur, fail when the current has to be supplied from a distance of several miles, alternating currents being brought in because of their greater economy in transmission. The extraordinary thing is, that this having been so far grasped, the whole of the rest of the equipment was not designed to match with three-phase motors, instead of introducing the complication of rotary converters to work continuous current motors. Time alone can show how the mixed system adopted will work in practice. To me the choice of the mixed system appears of doubtful wisdom. Perhaps the distinguished engineers who are understood to be spending £30,000 on experiments for the Metropolitan Ry. to enable them to recommend the best system for our inner circle underground line will shortly be able to report whether a simple three-phase system throughout is, or is not, more economical than either a continuous current system throughout or than a mixed system with converters. If they do not settle this question, which is today the one important question in electric railway work not yet settled, we must regard the expenditure as pure waste.

Returning to the question of electric tramways, the problem of the hour is the equipment of busy city thoroughfares, where, for obvious reasons, overhead wires are inadmissible. To all the three possible methods that dispense with overhead construction, viz., by accumulators carried on the car, by use of slot conduits in the road, and by use of surface contacts, objections are not wanting. Accumulators are found too heavy and too short-lived to be satisfactory. Conduit constructions are objected to as too costly, and as interfering too much with the roadway, while to surface contacts there is brought the terrible indictment—worse than any against the conduit—that nobody has had experience of them. You are aware that in this question of surface contact systems of tramways I am an interested party, and cannot be expected, even in a presidential address, to speak dispassionately. Yet you have never expected your president to banish from his inaugural address the topics to which he has devoted his thoughts, his energies, his time, or his resources. And with the examples before me of other presidents who have spoken of their own work, I take the liberty of speaking of mine. A paper dealing with some aspects of surface contact working was read by me at the Bristol meeting of the British Association, and in January last you listened here to a paper on some other points by Mr. Miles Walker, my former assistant, and partner in this matter. We have, indeed, worked out several different systems, of which the earlier only have yet been publicly described. We are at work on modified plans, the result of our experience gained on our short experimental line at Willesden; and before long we expect to demonstrate the advances we have in hand. Meantime we are not alone in the field. Since the time when the late Dr. Hopkinson proposed his original plan, many others, including Mr. Wynne, Mr. Holroyd Smith, Mr. Esmond, and Messrs. Johnson and Lundell, have suggested various new methods. Three years ago Dr. Hopkinson wrote of one of these methods that he "would not hesitate to approve its adoption in any town in which overhead conductors were inadmissible"; adding that he had "not the least doubt that it would work thoroughly, effectively, and safely." A good deal has happened since then, and much experience has been gained. But there remains not only in London, but in many provincial cities, crowded thoroughfares where overhead construction is absolutely out of the question, and where a slot-conduit would be almost equally objectionable. It is some years since Mr. J. Love equipped slot-conduit lines in Washington and Chicago. It is now most significant that in three great capitals—New York, Berlin, and Paris—the electric

tramways are being largely extended without overhead wires. New York and Berlin are putting down slot conduits; New York, most expensively, as if the object were to put as much cast iron as possible into the roads; and the conduit at every 15 ft. is furnished with pairs of hand holes, the covers of which interfere with the surface quite as much as any surface contact system, to say nothing of the interference of the central slot or of trouble about drainage. In Paris, on the other hand, where a tentative surface contact system has for about a couple of years been tried with moderate success, no fewer than 63 kilometers—about 48 miles—are now being equipped by Mr. Diatto on his surface contact plan which has been in successful operation on a small scale at Tours. Surely, then, if a method of surface contact can be shown which is at once simple, safe, and not too expensive, there is every reason to urge its adoption on engineers and municipal authorities. Thanks to the criticisms—some of them passed in this place—with respect to possible difficulties likely to arise from the use of underground coils, from mercury switches, and from surface leakage around the contact studs, improvements have been worked out which largely, if not wholly, remove the fears that have been expressed on these grounds. As contrasted with the conduit, a surface contact system has the advantages of much lower prime cost, of less interference with the roadway, and of not requiring any drainage arrangements. On long lines that run out into the country it can be operated with the same cars that carry trolley poles for use in the suburban part of the track. Those cities and towns which, like London, Birmingham, and Cambridge, have waited before erecting overhead lines, will have justified their waiting attitude when they can point to examples of the successful surface contact roads at Monaco, at Tours, and, lastly, at Paris.

DETROIT ARBITRATION CASES.

The Detroit Citizens' Street Railway Co. has recently found it necessary to discharge a number of its conductors for carelessness in handling fares. Such cases are tried before a board of arbitrators. December 18th the cases of 13 conductors were investigated by the board and the findings were all against the men.

Mr. Dohany, representing the union on the board, said concerning the verdict:

"This result must teach the public one lesson at least, and that is when they escape from paying their fares they are not only beating a 'corporation' but they are robbing innocent conductors of the opportunity of earning for themselves and families a livelihood. Let those passengers feel that they are largely the ones who have brought this pitiable condition upon these unfortunate men tonight."

HAULING STONE ON THE CLEVELAND & CHAGRIN FALLS.

As noted in the "Review" for December 15th, page 825, the Cleveland & Chagrin Falls Electric R. R., has succeeded in proving in court its full right to carry heavy freight. We are in receipt of a letter from Mr. R. L. Palmer, general manager of the road, stating that his company is now hauling stone regularly from quarries about eight miles from the city, using for this service special 10-ton flat cars, 16 ft. in length and having about one-half the capacity of an ordinary steam freight car. This freight service is carried on at night between the closing of the passenger traffic and the starting up of the same in the morning, although it is believed it could be sandwiched in between the regular cars if necessary. The company has been getting \$5 per car for hauling stone.

\$25,000 REWARD.

Under date of Dec. 22, 1899, the Brooklyn Rapid Transit Co. published an advertisement offering \$25,000 reward for information furnished to the company's counsel, Sheehan & Collin, 32 Nassau St., New York, which will lead to the discovery and conviction of any of the persons who have circulated false statements or rumors concerning the company, with intent to affect the stock market.

The Brooklyn Rapid Transit stock suffered severely in the slump of last month, and the company's officers believe it was largely due to libelous statements and rumors.

BUILDING THE NIAGARA GORGE ROAD.

In June last Mr. George A. Ricker, chief engineer of the Niagara Gorge Railroad Co. (formerly the Niagara Falls & Lewiston Railroad Co.) read a paper before the Engineers Club, of Philadelphia, on the building of this road, in which are presented interesting facts connected with the enterprise not heretofore generally known.

Benjamin Fenton and Ensign Bennett first proposed to build a steam railroad, with a gage of 39 in., from Prospect Park to the Whirlpool, and the Niagara Falls & Whirlpool Co. was organized. The company failed in its efforts to purchase a right of way and on instituting condemnation proceedings the courts held that it did not meet the requirements of the railroad law so as to entitle it to exercise the right of eminent domain.

In 1880, Capt. J. M. Brinker, of Buffalo, organized the Niagara Falls & Lewiston Railroad Co., which purchased the stock of the old company. It decided to build a double track standard gage road to connect with the electric and steam railroads entering Niagara Falls and with the ferry at Lewiston. A survey was completed in September, 1890, and the right of way bought, the company securing the fee of the land.

Mr. Schoellkopf, of the Niagara Falls Hydraulic Power & Manufacturing Co., opposed the plan to carry the road along the bank in front of his mills, but was defeated in the courts. He then suggested carrying the line up the high bank into the town, which plan was adopted and the location in front of the mills abandoned.

The right of way was very expensive; the total cost is not given, but \$110,000 was paid for Buttery Elevator and \$60,000 for the Van Horn and Grand View Elevators.

Mr. Ricker describes the construction of the road as follows:

"In order that we may better understand the actual operation of building, I will refer briefly to the geology of the Gorge. For our purpose the Gorge may be best considered as made up of three distinct sections; the upper or newly made channel excavated by the constantly receding falls; the middle or original channel, which is of preglacial origin, and the lower or postglacial channel. The characteristics of the typical cross sections of these three channels are widely different. The preglacial section is of least width, and has nearly vertical walls extending almost to the water on the American side. The postglacial section is wider and has vertical walls to about one-third the depth of the Gorge, and steps down to the water which are covered with debris that has accumulated by regular contribution from the exposed walls above. The new system, which extends southerly from the railroad bridges, is much wider than the preglacial channel and has slopes or talis reaching nearly to the tops of the cliffs. This debris is much deeper than that resting on the steps of the lower channel, and no excavation has as yet been made of sufficient depth to disclose the steps.

"The river is now flowing through the Medina sandstone, which underlies all western New York. The railroad at frequent intervals passes through sections of sandstone, and practically all the rock excavation was made in the quartzose belt of this stratum. Above the sandstone lies the Clinton limestone, over the Niagara shale, and at the top of the cliff, the Niagara limestone. While the railroad follows the irregular line of the foot of the talus from the whirlpool to Lewiston, the directions of the entire channel form, roughly speaking, four tangents. The new channel is about two miles long and extends, approximately, northeasterly from the present fall to the railroad bridges. The preglacial channel is about one mile in length from the bridges northwesterly to the Whirlpool. The waters leave the Whirlpool in a direction nearly at right angles to that at which they enter, and continue northeasterly to the Devil's Hole, a distance of about two miles, and from Devil's Hole to Lewiston, about two miles more, running almost due north. The continuation of the preglacial channel, known as St. David's, lies directly to the northward in the extension of the line of the Whirlpool Rapids, and is plainly marked, but is nearly filled with glacial drift.

"About the 1st of April, 1895, an agreement was entered into with Messrs. Cragg & Tench, contractors of Buffalo, to build the Gorge railroad, in which the contractors were to secure the men, furnish all necessary tools, and their services for 10 per cent of the force account. After five tedious years of waiting the company suddenly decided to proceed with construction, and I received a

telephone message from President Brinker to the effect that "the graders would be at Lewiston to start work tomorrow morning," and asking me to be on hand to give necessary directions. Construction was begun at Lewiston on April 11th, and a few weeks later at several points along the line between Lewiston and the Buttery Elevator. Beyond a profile, which it was afterward found impracticable to follow, no plans were made as the result of the original survey.

"I am now confronted with a task more difficult than that of building the railroad—how to tell you in engineering terms of the construction of this road that was built in a most unscientific manner. My orders were to put a railroad in this unpromising place, and I proceeded forthwith to obey. Before stakes were set a path was graded, following, as nearly as possible, a few feet above the proposed grade-line, and gangs of laborers were placed at frequent intervals. No reliance could be put upon any slope made outside of the natural slope. Had classification been attempted, but two kinds of material would have been named: loose and solid rock, as the talus is made up of large and small stones with not sufficient earth to fill the interstices, and with no cementing material, although the roots of dense vegetation tend to hold it in place and maintain a much stronger slope than would otherwise be possible. The deep channel of the river afforded the very best place for wasting the material excavated and work proceeded rapidly. From 600 to 1,000 men were employed, and the first five miles to Buttery Elevator roughly completed, and one track laid, and the first train entered this temporary southern terminus August 25th. On the inner side of the road-bed such a slope was formed as would stand for the time being, which, of course, meant that the heavy rains and the frost in the coming spring would bring down large quantities of material left on the steps above. Cross-overs were placed at such points as seemed to threaten most, and from time to time, as slide occurred, the road was operated with single track in that section, and large numbers of men quickly removed the encroaching talus. Several slides took place in the early spring of 1896 and again in the spring of 1897. The quantities decreased each year. A view of the slide of this spring, at the same point where occurred the greatest encroachment in '96 and '97, shows how surely the slopes are being reduced to an angle of repose and are taking on the appearance of stability. New vegetation adds greatly to their permanence and more agreeable appearance.

"Coming out of Lewiston at the south line of the village is a timber trestle 104 ft. in length and 42 ft. high, crossing a small stream flowing into the river from the foot of the Lewiston escarpment. A little further up the line is a timber trestle carrying the tracks over a deep gully formed by another lateral stream, into which for many years the New York Central R. R. has wasted its surplus earth and rock. It was my intention to use 80-ft. girders at this point, but owing to the crowded condition of the bridge shops, delivery could not be secured in several months, and as the company was extremely anxious to open the road to catch the summer traffic, installation of the permanent structure was deferred. In the expectation that a large amount of water would filter through the talus, a great many open culverts were put in, but four years' experience has proved that the danger from this cause was overestimated. These culverts, to be effective, should be movable, as a boulder or other obstacle falling in the path of a stream high up on the talus will often divert the stream many feet from its former bed, and leave the culvert high and dry. The track is ballasted with rock borrowed from the talus over most of the line. The ties are of cedar, except on steep grades, where oak was used, and the rails, rolled by the Carnegie Steel Co., weigh 60 lb. to the yard. No attempt was made at mathematical alinement, as the roadbed followed the irregular outline of the natural slope.

"Construction from the Buttery Elevator to the city of Niagara Falls was much more difficult than upon the lower five miles of the road. South of the elevator began almost vertical cliffs, extending from the top of the escarpment to the rapids below and continuing for a distance of about one-half of a mile to the Railroad Suspension Bridge. Drills and men were lowered over the cliff to the first ledge, about 100 feet above the grade line, and blasting operations carried on mostly by hand, as it was difficult to get steam drills into position. The blasts were fired usually at noon, and huge quantities of rock were thrown into the river, disappearing beneath the tumbling waters of the rapids below, without appearing in any way to obstruct the stream or to change in the

slightest degree the form of the waves. The vertical cuttings averaged nearly 100 ft., and, estimated roughly, fully 100,000 cu. yd. of rock were thrown into the river from this section.

"At the site of the Van Horn Elevator a deep recess in the cliff formed a bay across which an attempt was made to construct a roadbed in the swift current of the rapids. This experiment I believed would be futile, as a powerful stream of water was constantly discharged upon the embankment, diverted from the main current by a high boulder of Niagara limestone resting in the channel about 50 ft. from the cliff. It was evident that this bay had been excavated by the same powerful hydraulic agency, and it was useless to attempt to place in its way any structure less substantial than the cliff which it had cut out. During a period of extreme high water in the spring of 1897, when the river rose 19 ft. above its ordinary level, most of this embankment was

SECTIONS OF THE NIAGARA GORGE.

washed away. In its place rough, but heavy, longitudinal walls were built to resist the encroachment of the current; spaces between the walls were refilled with stone and a stout timber trestle built to carry the tracks. In the spring of 1898 this structure was swept away, after which the company determined to do what it might have profitably done at first, and the old elevator-shaft was removed, the cliff blasted away, and a shelf made of sufficient width for a single track. Three timber cribs, each about 60 ft. in length, protect the roadbed at critical points above this bay.

"Beneath the railroad bridges a combination of difficulties was met. A small water-wheel under the Suspension Bridge, which furnished power for a flour-mill at the top of the bank, was rearranged to permit building the roadbed, the transmitting cable raised, and a portion of the tailrace changed and a retaining wall built to hold the embankment. Near this point is an inclined railway, the floor of which, resting directly over the center line, was raised vertically about 15 ft. Between the incline and the cantilever bridge heavy walls were put in to hold back the loose rock on the inner side of the track, and retaining walls built on the outer side to prevent encroachment upon the head race.

"Permission was obtained from the Michigan Central Railroad to build abutments on both sides of the cantilever bridge piers and a central pier in front of and between their piers. The underlying material at this point is composed of very large boulders, upon which rest the foundations of the cantilever bridge, between which and the deep waters of the river there were but 13 ft. in which to pass. To prevent possible danger to the bridge foundations, blasting was prohibited within 100 ft. on the south side and 50 ft. on the north. No soundings could be obtained on account of the swiftness and great depth of the current. Within this limited area, hedged about by restrictions, construction was made doubly inconvenient.

"From the bridges to the top of the high cliff, a distance of nearly a mile, the tracks are laid on a slowly ascending grade up the talus for about 3,500 ft.; thence entering the cliff and passing through a thorough cut 60 ft. deep at the lower section, rising continually until the top of the bank is reached. The average gradient is 4.7, the maximum 6.4 per cent, and the total elevation overcome, from the bridges to the top, is just 200 ft. Passing beneath the New York Central tracks, the line swings sharply to the right and, paralleling the Central for a few hundred feet, reaches Second St. in Niagara Falls. At the southern end of Second St. connection is made with the Niagara Falls Street Ry. and thence over the tracks of the latter company to Prospect Park. The under-crossing of the Central is made at an angle of 55°; the bridge is of trough-girder type and carries at present five tracks.

"I think you will grant that it was not practicable to make detailed plans for construction of this peculiar road. It was not possible to determine, with even approximate accuracy, how the unseen conditions might alter proposed methods. I cannot say that any very serious engineering difficulties were met with, and I think there are no problems to be solved that will not be successfully met. The same vigor and energy which characterized the attack upon the ground were exhibited later in the effort to put the road in operation, and as gangs of men and construction tools would have been unsightly, work was suspended as suddenly as it was begun. You will recall the fact that wooden trestles and bridges had been put in place because the company was not willing to wait for permanent structures. The work was, therefore, left unfinished, but I was sustained by the vain hope that in the coming spring I should be permitted to scale down the slopes and replace the temporary structures.

"When 1896 arrived all our efforts were concentrated upon construction above the Buttery Elevator, and this section, too, when nearly completed, was given over to operation in much the same incomplete form as was the lower. It was expected that immediate earnings would be so great that a goodly portion of them could be applied to completion of the work, but receipts proved disappointing, and all further work was suspended, excepting such as was necessary to clear the track of slides and to provide for maintenance. As the outcome of business complications the owners of the road were obliged to relinquish it a few months ago, and it passed into the hands of a receiver. Reorganization of the company is now being undertaken, and I am engaged in making the necessary repairs, which amount to a reconstruction of the road, as considerable damage had been sustained by the track from slides and by the roadbed from the action of the river.

"A fall of rock that occurred some weeks ago (March)—accounts of which have appeared in the technical journals and in the daily papers, and called an avalanche—was greatly exaggerated. Before the road passed into the hands of the receiver I had recommended that some of the overhanging Niagara limestone just above the Buttery Elevator be removed by blasting, as it seemed to be insecure. The railroad was shut down; all people were warned not to walk upon the tracks, as it was intended before beginning operations to remove all overhanging rock which appeared to be dangerous. By reason of some blasting that was going on near by, within 100 ft. of the point in question, where the city was excavating for a sewer, two large pieces of limestone were dislodged, falling between the tracks and the cliff without doing damage. A few days later our superintendent blasted and threw off into the river the large boulders, which now rest in the margin of the rapids just outside of the tracks. A considerable amount of loose material, of course, fell with the boulders and covered the road for a distance of about two hundred feet, a depth of from three to five feet. This was easily removed, and when taken away it was found that the rails were cut in several places, but that no great damage had

been done, except to the lower portion of the shaft of the elevator, the casting of which had been carried away. Where these large rocks now stand in the river some difficulty had previously been found in maintaining the embankment, owing to the heavy current thrown against it, and a retaining wall about 400 ft. long had been resorted to for protection. With great good fortune these large rocks now stand directly in the way of the heaviest attack of this current, and the retaining wall is no longer necessary. In general it may be said in regard to falling rock that it comes down only in the early spring months, when, under the new management, it is not intended to operate the railroad.

"Since the opening of the road in 1895 to the present time no passenger or employee has ever received injury from falling rock. I was daily over the road during the construction, and have since been frequently from the Falls to Lewiston and return, both on cars and on foot, and have never seen a rock fall. It is my opinion that, with due care, the maintenance of this railroad need not be excessively expensive, and that the same safety of operation can be obtained as is secured on any mountain road."

The "Review" has at different times published illustrations showing scenes of this road and particular reference may be made to the issues of August, 1896, page 478, and October, 1897, page 651.

ELECTRIC CARS FOR CUBA.

The first electric railway in Cuba is now building from Regla, on the bay opposite Havana, to Guanabacoa, a distance of five miles, and the first shipment of cars for it was made a few weeks ago by the J. G. Brill Co. The cars are of the type shown in the illustration. The body is a slight modification of one of the standard American types that has been successfully used between Buffalo and Niagara Falls. The body is 28 ft. long with two 4-ft. platforms, making the length over the vestibules 36 ft.; the width at the sills is 7 ft. 5 in., and at the belt rails 8 ft. The inside finish is ash and cherry with three-ply brick veneer ceiling. The seating capacity is 40, 20 double cane seats being placed on either side of a center aisle.

BRILL CAR FOR CUBA.

The car is mounted on "Eureka" maximum traction trucks, with 33-in wheels; the wheels have 2 1/4 in. treads and 7 3/8-in. flanges. The gage is 4 ft. 8 1/2 in. Among the details may be noted Brill folding gates, Brill patent angle iron bumpers, Hovey-Brill radial draw bars, a pair of Brill sand boxes, two Dedenda gongs, one on each platform, and inside each car at diagonally opposite corners, under the corner seats, are good sized tool boxes. These cars are built complete as shown in the engraving, and then knocked down so as to pack in the smallest possible space. The motors for these cars are two Westinghouse No. 38 B. This equipment, mounted upon the maximum-traction trucks, will enable the cars to be run at a very high rate of speed with safety. At the same time the platforms are carried so low as to make access to them quite easy.

The suit of the Birmingham Traction Co., of Pittsburg, against H. Sellers McKee and others, for an accounting, which came to trial last month, was discontinued. No details of the compromise are made public.

The Woman's Club, of Chicago, recommended that persons using the street cars on December 23d remember the season and give the conductor 6 cents instead of the regular fare, but this plan for Christmas gifts was not a success.

SAVING AT THE CONTROLLER.

BY J. R. CRAVATH.

In view of all that has been written in the past few years about the saving possible by proper handling of the controller and the way for motormen to operate cars with the maximum economy, this article may seem out of place. It is nevertheless true that many of the articles written have not come under the notice of practical railway operators, while some were too technical in their nature to be in most helpful form for the busy street railway man. It has come to my notice that many popular misconceptions exist as to how current is usually wasted in operating cars and it is the purpose of this article to correct some of these if possible, and also to make some practical suggestions as to the instructions that should be given motormen where the management of a road has a desire to effect a "saving at the controller."

Saving at the controller, to accomplish any extensive result, involves a saving by the majority of motormen on the road. For this reason many managers have been inclined to make all their attempts at economy in other directions, and let the motormen go on operating cars in the old way, rather than try to effect any economy by a reform in method of handling cars, because the latter attempt involves the reforming of a number of men, and hence involves questions of discipline and management of men. Many superintendents are loath to undertake this, even with the demonstrated fact before them that 20 to 40 per cent saving in power may result from properly directed efforts to make men save power at the front platform. When more economical power house machinery is put in or money is invested in copper to reduce line losses the management feels that it has a "lead pipe cinch" on the saving that results, while if the saving depends on a lot of motormen the management naturally has a feeling that its executive labor will be somewhat increased by the constant watchfulness necessary to produce economies where the results are dependent on the actions of so many men. The writer has always felt that questions of this kind, like most others around a street railway system, should be looked at purely from a dollars and cents point of view. The clerk hire necessary with any system of motormen's records so far put in operation effecting a saving of power by motormen is so very small that it is hardly to be considered at the side of the saving made. The main question, then, remaining is as to whether the time of the manager or of some competent member of his staff is so immensely valuable as to make the few minutes spent daily on this matter more than offset a saving of 20 to 40 per cent in power. However, a discussion of whether it is advisable or feasible to try to make motormen economize in power is somewhat aside from the main purpose of this article. The main questions to be taken up are the technical ones as to how power can be saved or wasted at the controller. The business question as to whether attempts to save power in this way pay (provided such attempts are properly directed) has been already settled by practical demonstrations, which amount to more than anyone's theory to the contrary.

In the first place it must be kept closely in mind that any real saving in power by proper controller handling must be made without interfering with the schedule. The faster the schedule the more power required to maintain it per car-

mile. It is not, therefore, fair to consider the question of controller economy, except with the assumption that the schedule is the same "before and after taking." In city street railway practice the greater part of the energy required by a car is used in getting the car up to speed or accelerating after each stop. At least 75 per cent of the energy used per car-mile is so consumed, the remainder being used to keep the car in motion after it has been brought up to speed. The greater part of the energy is, therefore, stored up in the car, getting it up to speed. Part of this energy must be destroyed or wasted by the brakes as soon as the car has to slow down. Part of it may be utilized to propel the car by motormen by drifting with the current off. The proportion that is used or wasted rests with the motorman. The economy with which a man handles a car depends mainly on two things, namely, on the way he gets his car up to speed and on the way he utilizes the momentum of the car to propel it after it is up to speed. In order to make this plain in a practical way, suppose we take an imaginary trip over the road with two motormen, one of whom is making an effort to operate his car as economically as possible as regards power and repairs consistently with maintaining schedule time, and the other of whom, being an average man, aims simply to get over the road on time, without regard to power or repairs. The difference between these men in the way they handle their cars is so marked to an experienced man that there is no wonder to him that there is a difference of 20 to 40 per cent between them in power used, to say nothing of repairs. The difference begins to show itself even before they are fairly away from the barn. The uneconomical man (we will call him A for convenience) after leaving the barn has a switch a few feet ahead before running onto the main line. Although he has such a short distance to run and is not behind or greatly pressed for time he throws the controller around to the top notch and almost before he has time to get it there has to jam the brakes on hard, to avoid taking the switch too fast. The economical man (we will call him B) would have not run his car up to more than quarter the speed that A did, and would have been therefore able to drift easily over the switch without using the brakes at all, so saving all the energy that A had to waste at the brake shoes. When A reaches the switch the probability is that he has applied the brakes so hard and carelessly that he has to use current again to get over the switch instead of drifting over as B would, so some more wasted energy is to be charged up against A. Once out on the street and under full speed A sees a team ahead on the track, which he knows very well he will overtake before it gets off the track. Nevertheless he keeps current full on until the last minute, and then turns off power and jams on brakes as hard as he can. Now this may furnish some excitement and amusement for the motorman and those on the front platform, but it increases the liability to accident and wastes a lot of energy which our friend B would have saved by shutting off the current some distance back from the wagon and letting the momentum carry him along until the wagon is reached. By that time perhaps the wagon will have had time to clear the track and in any case B has made as good time as A, and has not wasted nearly as much of his own or the company's energy in the brakes. Then, too, it may often happen that by giving the team a little more time it will get out of the way before the car reaches it, so that instead of having to start the car up from almost a standstill, as A does, B only has to reduce his

speed to five or six miles an hour, so that B gains both in power and in time in getting the car under way after passing the wagon.

Going on a little farther A begins to pick up passengers. He invariably keeps the power on until the last minute before applying the brakes, and then applies them hard, but usually makes up for the small time he gains in this way by making a long drawn out stop after he has first checked the speed of the car. B, on the other hand, hardly ever keeps the current on after the car is brought up to speed, but unless there is a considerable distance to be run without a stop, shuts off power and drifts with current off. He has cultivated good judgment of stopping distances and makes "prompt" stops. That is he lets the car drift until a comparatively short distance from a stopping place, and then applies the brakes moderately hard. He does not apply them very hard and then be obliged to release and drift along at slow speed for a considerable distance before making the final stop, as A would do. B realizes that the less he has to use the brakes the easier time he will have physically, and the easier he will be on the company's coal pile, while A gives it no thought.

And now a few notes as to the way these two men start their cars; a subject upon which there is perhaps more misunderstanding than any other connected with electric car operation. A good many who read this article may think that B, being an economical man, starts his car with a slow "tar in January" advancement of the controller handle from point to point, waiting several seconds on each notch. Such is far from the case. Such a method is wasteful in time, for obvious reasons, and wasteful in current because with such slow starts drifting can not be practiced and maintain schedule time, and higher momentum speeds are necessary to maintain the schedule. The start should be a "prompt" one, that no time may be wasted, just as the stop should be prompt for the same reason. With prompt stops and starts more drifting with current off after speed is attained can be indulged in and moreover the motors are worked by this method for short periods at heavy load and consequently high efficiency, instead of being worked a greater percentage of the time at lighter loads and a poorer efficiency, as is the case when the starts are slow and the current has to be kept on much of the time after maximum speed is attained, at which time they work very inefficiently, as they are working on the very light load of overcoming car friction only. However, when we look at A when he starts his car we find that the word "prompt" is entirely too slow to define the way he moves his controller handle ahead. He is around to the top notch in an incredibly short space of time. The wheels slip and power which should go into acceleration heats the car wheels instead. The economy of series-parallel control becomes a myth, because he does not stop long enough on the series points to get any benefit from them. The field shunts are cut in so soon that the motors have to do much of their acceleration on a weak, inefficient field, and the motors are unduly heated and strained. Prompt acceleration is a good thing, but when it is run into the ground, as it commonly is on large city systems, it is quite another matter. It would be a good thing if the rate of acceleration could be regulated automatically and taken out of the motorman's hands entirely, for there is a happy medium which is neither too fast nor too slow, which might better be left to an automatic device than to the caprice of a motorman, no matter how conscientious that motorman may be.

To sum up the economical motorman differs from the wasteful one in the following respects:

He utilizes the momentum of his car to get him over the road as far as practicable by drifting with current off.

He never wastes energy by running his car up to a high speed when a slower one would do just as well.

He uses the brakes as little as possible, but when he does use them he does not do it in a dilatory way or make long drawn out, time consuming stops (I do not refer to the time the car is at a standstill), but brings the car speed down promptly.

He is neither dilatory or too rapid in advancing the controller, but turns from notch to notch promptly, which in the case of most light cars in crowded city service means about one second to each notch.

He always remembers that having once made a proper start the greater per cent of the time he can keep current out of the motors and still maintain schedule time the better.

FOUND FOR THE COMPANY.

By the courtesy of Mr. C. L. Harry, general manager of the Kokomo (Ind.) Railway & Light Co., we have been advised of the result of a suit for damages recently decided in favor of the company. The facts are as follows:

Mrs. Jessie K. Jackson, of Kokomo, claimed to have been injured Mar. 29, 1898, and sued for \$10,000 damages. She alleged that because of the shock received when the front wheels left the track she was permanently injured internally so that a delicate surgical operation was necessary. The case was hotly contested and the verdict was for the defendant company, which established at the trial that the plaintiff had prior to the injury suffered from the same disease, which was claimed was produced by the injury, and also that while the track of the railway company was in bad condition at certain other points, and certain cars not in first class order, that the track at the point of the accident was in good condition, and that the injury was not caused by reason of the bad condition of the track or the car; and further, that the company had exercised the highest degree of practical care in maintaining and operating its railway system. The case was one of great importance, as the husband of the plaintiff also had a \$5,000 suit pending against the company for medical services and the loss of service of his wife. The verdict is one of great value to the company, as it tends to discourage litigation against the company on account of alleged personal injuries.

PITTSBURG EMPLOYES' ASSOCIATION.

At the annual meeting, held in December, of the Consolidated Traction Relief Association, the employees' association of the Consolidated Traction Co., of Pittsburg, the treasurer's report showed the following details:

Balance in bank, Dec. 14, 1898, \$1,438.84; receipts from all sources for year ending Dec. 12, 1899, \$10,083.31; total funds, \$11,523.15; paid out in death benefits, \$1,200; on sick benefits, \$7,404; other expenses, \$471.30; balance in bank Dec. 12, 1899, \$2,447.85. Secretary William G. Gish reported 122 members admitted during the year; total, 635. Four members died; 120 resigned after leaving the service of the company. The present membership is 511. Forty-one applicants were rejected.

C. L. Magee was elected president.

The Columbus (O.) Street Railway Co., in accordance with its custom, last month issued new uniforms to 63 employes who have been in the service more than five years. All the men received Christmas turkeys with the compliments of the company.

A temporary injunction has been issued to restrain the United Railways & Electric Co., of Baltimore, from discontinuing an old line between Mt. Washington and Pikesville. The suit was brought by an owner of abutting property.

BENEFITS OF WIDENED STREET.

An interesting legal point is involved in a suit now pending between the city of Hartford, Conn., and the Hartford Street Railway Co. One of the streets occupied by the company's tracks was widened and the company was assessed for benefits to the amount of \$3,100. The assessment was based on the alleged fact that the ties and rails of the company would be much benefited by such action. Also that the liability for accident would be much decreased; that if the railroad should put in double tracks, as it would be then able to, it would be a great convenience; it would be able to carry more passengers and its tracks would be much less liable to obstruction than formerly.

An appeal was taken and the matter was left to a committee consisting of Judge Loomis, of Hartford. After a hearing the assess-

TRACK CONSTRUCTION IN BUFFALO.

The International Traction Co., of Buffalo, has adopted as its standards for track construction with 9-in. rails the two types shown in the accompanying illustrations. That shown in Figs. 1 and 2 is called the "trench" construction, and is used in all streets having common stone paving between the tracks, and either asphalt or common stone on the sides. The second type, Figs. 3 and 4, is called the smooth excavation construction, and is used where first-class block paving is between the rails and in the devil strip. The rails are 94-lb. 9-in. semi-grooved girders.

TRENCH CONSTRUCTION.

For this type two longitudinal trenches 17 in. deep and the width of a shovel at the bottom were dug out at a distance of 4 ft.

FIG. 1. CROSS SECTION OF 9-IN. TRACK BEAM CONSTRUCTION—COMMON STONE PAVING.

ment was cut to \$1,550 on the physical property of the company in the street, and a pecuniary benefit was found, but the question of whether the latter is a special benefit on which the company can be assessed, was reserved.

This decision of Judge Loomis, acting as a committee, was reversed by Judge Case, in the Court of Common Pleas, the court holding that the benefit because the widened street would lessen the company's liabilities to accident is purely speculative and its cash value cannot be assessed. Without considering the other elements of benefit the assessment was set aside and judgment for the company to recover its costs was entered.

The company would willingly pay the assessment as a donation, but objects to making a precedent.

9 in. between centers. Afterwards, cross trenches 5 ft. c. to c. were cut out; half of these were 20 in. deep below grade, and the alternate ones 17 in. below grade. The ties, of hard oak 5 x 7 in. x 7 ft., were then put in the cross trenches and the rails laid upon them, spiked and gaged, and held together by the regular 9-in. plates secured by only two bolts. The track was then surfaced, and the ties in the shallow cross trenches tamped up with dry stone, each joint tie being blocked up; after this the track was alined.

The concrete gang, comprising 25 men to a board, then filled in the trenches under the rail and ties as shown in Figs. 1 and 2, and the concrete was allowed to set for 72 hours, after which the plates were taken off and the joints welded. The old sand between the ties which had been disturbed in ripping up the old track was

FIG. 2.—LONGITUDINAL SECTION AB (FIG. 1).

LONGITUDINAL SECTION CD (FIG. 1).

WAR ON OHIO INTERURBANS.

A number of suits have recently been instituted by the attorney general of Ohio against interurban electric lines in that state. The attorney general brings the suits because the state is nominally the plaintiff, but the parties really interested are the steam railroads.

December 12th, the first of these suits was decided in favor of the electric interurban; it was sought to enjoin the commissioners of Sandusky County from giving the Toledo, Fremont & Norwalk Electric Ry. a right of way over one of the state roads, but the supreme court dismissed the petition.

On the same day a suit was begun against the Dayton & Xenia Traction Co., alleging that the company has no charter rights to carry freight and baggage through city streets.

Other cases pending are against the Dayton Traction Co. and the Cincinnati & Miami Valley Traction Co.

The extensions to the Escanaba (Mich.) Electric Street Ry. were completed in December, and a four-train service to the "Soo" put on.

next dug out and pounded with heavy sand pounders, as a paving base for the common stone.

If the paving on the outside of the track was asphalt, tootinging stones were set next the rails, long and short stones being placed alternately, in a gravel mortar, which was made of one part common cement and two parts gravel. The space between the tootinging and the old concrete was then filled in with concrete for paving base and then sheeted.

SMOOTH EXCAVATION CONSTRUCTION.

In first-class block construction, a trench was dug 7 ft. 8 in. wide and 15 in. deep, then cross trenches spaced at 10 ft. c. to c. were dug 5 in. deeper for the concreted ties, and the rails were spiked, gaged, surfaced and alined as before. The trench was then filled in solid with concrete, not only affording support to the track, but acting as a paving base. A cushion of about four inches of gravel was then laid on a concrete base, and a first-class paving was laid. This was grouted with a mixture of one part Lehigh cement and two parts sand. A special device was designed for handling this part of the work in the shape of a small grouting box on wheels,

and it was found that it decreased the cost of grouting at least one-half. This is shown in Figs. 3 and 4.

ORGANIZATION.

The organization of the construction force was as follows: There were five distinct departments or divisions, namely, track gang, concrete gang, paving gang, welding gang, cleaning up gang, each of them under the direct charge of a boss foreman who reported directly to the engineer in charge.

The boss trackman had charge of tearing up the old track and paving, excavating, laying the ties and rails, spiking, gaging, bolting, surfacing, alining and cleaning out the trenches for the concrete gang. He had under his charge about 50 men and about 10 foremen.

The concrete gang consisted of six boards, and was under the charge of a boss concrete foreman and six sub-foremen. It was found that a great saving in mixing the concrete was accomplished by using hoes only and no shovels, the concrete being turned three

FIG. 3.—CROSS SECTION OF 9-IN. TRACK IN ASPHALT STREET—FIRST-CLASS BLOCK PAVING BETWEEN RAILS.

times, and then into the trenches by these hoes. The boss concrete man had under his charge about 150 men.

The concrete gang was followed by the paving gang, a boss paver with 6 foremen under him, 60 pavers and about 150 laborers.

The welding was under the direct supervision of a welder foreman, who took off the joint plates and excavated around the joints to a space of 40 in. square. The latter part of the season, two welders were employed.

Finally, the cleaning up division followed the welders under the charge of a boss cleaner, who had two large motor flat cars and six trail dump cars under his control. Cleaning up was carried on night and day, entirely by cars.

The company has various other types of track construction which were put in by the old companies before the consolidation, but those illustrated here are much preferred for the advantage of quick construction.

The largest number of feet of track laid by this department, through the summer just passed, was 2,760 ft. in a day of 10 hours, except in Utica St. This record was made on North Main St., an asphalt street. During the entire season, the rate of track laying

FIG. 4.—LONGITUDINAL SECTION OF FIG. 3, BEFORE PAVING.

per day averaged 1,100 ft., without taking out Sundays and rainy days. In the Utica St. job mentioned above 7,000 ft. were laid in 10 hours.

In our article on the International Traction Co. in the "Review" for December last the names of two of the officers were inadvertently omitted. The complete list of the managing officers of the allied companies controlled by the International Traction Co. are: President, W. Caryl Ely; vice-president, Daniel S. Lamont; chairman executive committee, Charles H. Coster; treasurer, R. F. Rankine; general manager, Burt Van Horn; superintendent Buffalo Ry., R. E. Danforth; passenger agent, J. E. Stephenson; electrical engineer, C. K. Marshall; engineer of way, C. C. Lewis; master mechanic, Robert Dunning.

The main office of the company is 178 Main St., Buffalo.

On page 819 of the December issue, the maximum pressure used in electrical welding is given as 35 tons; this should read 35,000 lb.

LAKE MANAWA & MANHATTAN BEACH R. R.

The Lake Manawa & Manhattan Beach Railway Co. is a new corporation which is to be operated in connection with the Omaha & Council Bluffs Railway & Bridge Co., between Omaha and Lake Manawa, Iowa. The directors are N. W. Wells, J. J. Brown, J. H. Millard and Guy C. Barton, of Omaha, and C. T. Stewart, Geo. F. Wright and W. S. Dimmock, of Council Bluffs. The officers are: N. W. Wells, president; J. J. Brown, vice-president; Charles T. Stewart, secretary; J. H. Millard, treasurer, and W. S. Dimmock, general manager. These gentlemen are connected with the Omaha & Council Bluffs Railway & Bridge Co. in similar capacities.

This new road will start from the foot of Main St. in Council Bluffs, which is the terminus of the present Pearl and Main Sts. line, of the Omaha & Council Bluffs Co., and run south to Lake Manawa, a distance of some four miles. It will then run around the lake to Manhattan Beach, another mile, making the line about five miles long.

The company expects to spend \$200,000 on this line and lake improvements. The company controls the entire south shore of the lake and 400 acres of land, which will be put in the best shape possible to attract the public as an amusement resort. A line of small steamers will be placed on the lake as well as electric launches and numerous row boats. The lake will be dredged and a summer theater will be erected. A beautiful club house will be set out in the lake, having dancing floors and the finest of restaurants. New bath houses will be built, and in fact everything done that pertains to a first-class summer resort. It will be similar in scope to Sans Souci Park, of Chicago, though the main attraction will be the bathing facilities, and the company controls the only real bathing beach upon the shores of the lake.

Some 15 new car bodies, 50 ft. long, with double trucks and high

speed motors will be purchased to operate the road and a new 800-kw. direct connected generator as well as additional boilers will be placed in the power house of the Omaha & Council Bluffs Railway & Bridge Co. to furnish power. The tracks will be laid with 65-lb. steel rails, 60 ft. long and will be well ballasted. The company owns its private right of way from Council Bluffs to Manhattan Beach, on the south shore of the lake, and is not compelled to ask for anything in the way of franchises, except permission from the city council to cross some six or seven avenues in the lower part of the city of Council Bluffs, which will undoubtedly be granted by the time it is ready to lay the steel at this point, as the public is very much in favor of the road being extended to the lake.

With Omaha, South Omaha and Council Bluffs, and the sur-

rounding suburban towns, the enterprise will have 200,000 or more people to support it; and, as it is the only lake of any prominence within 200 miles, and there are no other resorts in the cities mentioned, the road will undoubtedly be a success as well as the concessions that will be granted at the lake. The finest music available will be engaged for the grounds, and everything possible will be done to make the resort worthy of public patronage.

CORRESPONDENCE.

Editor "Review": We have noted in your issue of December 15th last, page 848, the valuable comment on training for the electrical engineering profession as embodying a number of suggestions that the foundation should be thoroughly laid in mechanical engineering. Permit us to bring to your attention the course in electrical engineering which we have recently organized here and which has been in operation since the opening of this college year.

The distinctive feature of this course is the recognition of the growing specialization in electrical engineering as in other branches of work; and the University of Illinois therefore offers three groups of elective studies, after the satisfactory completion of the first two and one-half years of work, in electrical engineering courses. These groups of electives are: 1. Regular electrical course; 2. Electro-physical course; 3. Electro-chemical course; and comprise the remaining one and one-half years of work of the four years' undergraduate course leading to the degree of B. S. in electrical engineering.

For the full professional degree of E. E., a further year of advanced graduate study and work is required, with still further provision for specialization, according to the direction of the student's activities and work in his undergraduate course.

The University of Illinois is, in its Group 1, the regular electrical engineering course, offering a very large amount of mechanical engineering that, of course, is not taken in the other two groups to such an extent. We might add that all of the courses in electrical and mechanical engineering have the same schedule of studies and work for the first two years of the four years' undergraduate course, so that the prospective mechanical and electrical engineering students all work together in all branches during their early formative period. Very truly yours,

WM. I. ALDRICH,
Professor of Electrical Engineering.

Urbana, Dec. 19, 1899.

PAYING CROSSING PATROLMEN.

The ordinance of the Consolidated Street Railway Co., of Grand Rapids, Mich., provides that the company shall pay the cost of maintaining patrolmen at such crossings as the common council shall designate, and of late the council seems disposed to designate too many crossings. The company claims that the clause is intended merely to indemnify the city against the cost of maintaining those patrolmen who are rendered necessary by reason of the street railway company being in the streets, and that in nearly all cases the patrolmen would be needed just as much if there were no street cars. As a compromise the company proposes to pay a portion, not exceeding one-fourth, of the cost of patrolling four street crossings.

TROLLEY FUNERALS IN MILWAUKEE.

The experiment of trolley funeral trains is reported to be contemplated by the Milwaukee Electric Railway & Light Co. Perhaps it is scarcely proper to say experiment in referring to such a service, but as conditions vary so much in different cities, each road must make the trial for itself.

As our readers know, the funeral service provided on the street railways in San Francisco, Denver, Chicago and elsewhere is greatly appreciated.

The Benton Power & Traction Co., of St. Cloud, Minn., was unable to complete its power plant by December 15th as planned and was obliged to shut down its street railway service because the company from which it had formerly rented power could no longer supply current.

ONE WAY OF DOING IT.

The street railway company which is seeking to build through the town of Lemont, Ill., desired a right of way over a street which had two names; it had more frontage consents than were necessary on one end, and the combined totals exceeded the majority, but by reason of the two names could not get the right of way on one end of the street. The difficulty was surmounted by securing an ordinance giving the street the same name throughout its entire length.

INSULATORS FOR ORDINARY AND HIGH TENSION CURRENTS.

The group of porcelain and glass insulators shown in the accompanying illustration exhibits a few of the most important types of these goods as made at the establishment of Fred. M. Locke, at Victor, N. Y. The capacity for resisting high pressures is stated in connection with the different types. This petticoat type of insulator was designed and patented by Mr. Locke, and is in use on many high tension lines in this country, including the 11,000-volt transmission line between Niagara Falls and Buffalo.

Mr. Locke claims to produce only high class goods, and from observations made on several different occasions, it would seem difficult to suggest any additional precautions, facilities or methods

LOCKE INSULATORS.

1. For 25,000 Volts.
2. Transposition.
3. For 25,000 Volts.
4. For 40,000 Volts.
5. Glass, for 50,000 Volts.
6. Street Railway Cable.

that would be necessary to sustain this claim. Mr. Locke being an expert chemist, makes a chemical test of every batch of clay bought, so that he is sure of his mixtures, and sure that the goods when they leave the kiln are of a uniform and safe grade. For the purpose of making these tests he has fitted up a large room in his dwelling house with an elaborate chemical outfit, and here samples of all clays and kaolins required, both native and foreign, are brought, so that no clay dealer is able to palm off upon this establishment an inferior material. Mr. Locke's new catalog, No. 4, describes in detail his high insulation line material.

TICKETS INSTEAD OF ANNUALS.

The Metropolitan Street Railway Co., of Kansas City, Mo., has decided to abolish annual passes and issue instead books of coupons. There are two reasons for the change, to prevent people who have no passes from getting on the cars and calling some number to the conductor with the expectation that he will not ask to see the pass, and also to protect the conductors, who have the habit of merely nodding to passengers who they know have annuals, from being reported for missing fares.

December 15th, a trolley car in Cincinnati was struck by a Pennsylvania train; the car was demolished and a number of passengers stunned, though none was seriously injured.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO

AFFIRMS SUPERIOR RIGHT BETWEEN CROSSINGS AND EXCLUDES MOTORMAN'S NARRATIVE.

Citizens' Street Railroad Co. v. Howard (Tenn.), 52 S. W. Rep. 864. May 18, 1899.

With reference to the preferential right which a street railway company has between crossings, the supreme court of Tennessee says that the rule is well established that street railways have the superior, though not the exclusive, right of way between street crossings.

The court further holds that it was error to admit statements of the motorman made to a witness after probably fifteen minutes had been consumed in extricating a man from under the car, etc., as that "he saw plaintiff, but thought he would get off the track," this being deemed merely a narrative of a past occurrence.

NO PUBLIC POLICY AGAINST EXTENSION OF TER- MINI.

State v. Lindell Railway Co. (Mo.), 52 S. W. Rep. 248. June 30, 1899.

There is, and can be, the supreme court of Missouri holds, no public policy which would prohibit a street railway from extending its termini, and thereby carrying the public a greater distance for the same price it was formerly authorized to charge for carrying them a shorter distance. Neither does public policy prohibit one street railway from acquiring another street railway, and making the two one continuous route, and charging the traveler one fare, where he had formerly been obliged to pay two fares to travel the same distance.

Moreover, the court declares that it can see no reason for making "fish of one and flesh of the other," where a street railway company has been granted the right by the city to make various extensions, which it has accepted and acted upon, and the attorney general challenges, and intends to challenge only, a part of them, whereas, if his contentions are correct, the company had no more right to accept any of the other of the grants than it had to accept those challenged.

THINKS ELECTRICITY COULD NOT ENTER CAR FROM BROKEN GUY WIRE.

Huck v. Rochester Railway Co. (N. Y.), 59 N. Y. Supp. 1107. July 18, 1899.

The plaintiff alleged in her complaint that by reason of the negligence of the defendant, while the plaintiff was riding in one of its cars, the car suddenly stopped, and the wires conducting the electricity used for the propulsion of the car, and the guy wires used to keep the trolley wire in proper position, were so disturbed and broken that the plaintiff received a severe electrical shock, and her legs, feet, and back were burned, and the plaintiff was otherwise severely injured. It seems that she was at the time the only passenger, and was sitting down, nearly in the middle of the car, but nearest the conductor's door, on the side nearest the roadway, and facing the sidewalk. The car was going fast, and did not slow up as it approached a sharp curve. As it passed the curve there came a crash, the car stopped right there, and the lights went out. In other words, the car jumped off at the curve, and broke the first guy wire, carrying along with it 30 or 50 feet of the broken guy wire, 20 feet from the first. The plaintiff testified that she received the injuries alleged to have been sustained while seated, and by being thrown from side to side of the car—caused, as it seemed to her, by the electric disturbances. The only effect of the breaking of the guy wire was to cause the end of the broken wire to hang over the doorway of the car; the end hanging down part way or touching the ground. The trolley wire did not touch the car, or fall. The car, constructed in the ordinary manner of electric cars used on the street railways, was in perfect condition and order, and uninjured. No proof was offered by the plaintiff as to the way, or in what manner, an electrical current could, under such conditions,

have entered the car from the guy or trolley wire. The evidence of electrical experts called by the defendant fully explained the impossibility of such an occurrence from such a cause. Under these circumstances, the fourth appellate division of the supreme court of New York denies the plaintiff's motion for a new trial after a direction of a verdict in favor of the defendant. In doing so, it declares that the testimony of these experts just mentioned is in accordance with common experience that it is perfectly safe to ride in electric cars on the streets of our cities and towns, and that the electricity for their propulsion cannot enter into the car, to the injury of the passenger, either from the operation of the trolley or from a broken guy wire hanging over outside the end of a car.

WHEN ALIGHTING AFTER CAR HAS STARTED IS ON PASSENGER'S SOLE RESPONSIBILITY

Douyette v. Nashua Street Railway (N. H.), 44 Atl. Rep. 104. July 28, 1899.

The plaintiff was a passenger upon one of the defendant's cars, and in attempting to alight after the car had started was caught by the coat, and dragged some distance. There was evidence tending to show that his coat was caught beneath the outside door of the vestibule. There was no evidence that the car was defective. The jury was instructed that, "if he (the plaintiff) got off of a moving car, knowing or having reason to know that it was in motion, he took the chance of any injury that might result from such action, and cannot recover therefor." A verdict was returned for the defendant. In overruling the exceptions thereto, the supreme court of New Hampshire says that it only appeared that the plaintiff was injured in attempting to alight after the car had started. It might be that the evidence showed that he had arrived at the age of discretion, was of ordinary intelligence, and was not under the influence of intoxication or other infirmity, and that he voluntarily, without any request by the defendant, or special occasion for so doing, attempted to alight from the car while it was in motion. If such was the evidence, it holds, he certainly would have no reason to complain of the instruction given. The act would be wholly his, and he alone would be responsible for its consequences.

LIABILITY FOR LEAVING SNOW REMOVED FROM TRACKS IN BANKS ON THE SIDES.

Smith v. Nashua Street Railway (N. H.), 44 Atl. Rep. 133. Mar. 17, 1899.

Aside from the common law liability of any person who places an obstruction in the highway, or causes any defect in it, in consequence of which another suffers a special damage, the supreme court of New Hampshire calls attention to the fact that section 1 of chapter 59 of the laws of that state of 1893 provides that "any person or corporation except municipal corporations through whose negligence or carelessness any obstruction, defect, insufficiency, or want of repair in a highway is caused, shall be liable to any person injured by reason thereof." An "obstruction, defect, insufficiency, or want of repair," when used in this connection, it holds, is such as renders a highway unsuitable for the public travel thereon.

Although the defendant's charter does not expressly authorize it to remove the snow from its tracks, the court further holds, it has the right, by implication, to do so sufficiently to operate its road for the accommodation of the public. But, in the exercise of this right, it is bound to consider the rights of the public generally to the use of the streets, including those portions occupied by the defendants' tracks.

Travelers while driving from one side of the street to the other, the court goes on to say, are entitled to find the passage reasonably safe. If, after storms, the tracks are cleared, so that steep banks of snow are left on either side, the use of a portion of the street may be attended with great danger. Should the character of the banks be such as to make the street unsuitable for public travel, the banks would be obstructions, and the street would be defective and insufficient.

In the removal of snow, the court declares, ordinary care must be used to avoid so changing the general surface of the street as to render it unsuitable for the public to travel thereon.

This was an action brought to recover damages for injuries to the plaintiff's intestate, who, while attempting to cross the defendants' track was thrown from his sleigh and injured. The evidence tended to prove that the cause of the accident was the existence of a hard, steep bank of snow and ice in the street, on the side of the street railway track, running from the rail to the height of from 10 to 20 inches, made by the defendants in plowing out their tracks. The court holds that there was evidence proper for the jury to consider upon the question of the defendants' negligence. It says that it tended to prove that in plowing out the tracks, some 10 days before the intestate received his injuries, the company made a dangerous bank of snow and ice where the accident occurred, and that, even if this unsafe condition of the street was unavoidable when the track was cleared, a reasonable length of time had elapsed before the accident in question occurred in which its dangerous character might have been removed.

There was a verdict for the plaintiff, and the supreme court overrules the defendants' exceptions.

ACTS ON DIVIDED REPORT ABOUT USING ROADWAYS IMPROVED AT PRIVATE EXPENSE.

In re Port Chester Street Railway Co. (N. Y.), 60 N. Y. Supp. 160. Oct. 3, 1899.

The second appellate division of the supreme court of New York is of the opinion that the state constitution contemplates that the determination to be reached is that of the court as well as that of the commissioners, where the court is authorized to appoint commissioners to determine whether a street railroad ought to be constructed when the consent of the abutting owners cannot be obtained therefor. All of the purposes of the commission, it says, have been fulfilled when the commissioners, after notice to all parties, have heard the evidence and have made their report to the court, whether that report shall be unanimous, or by a majority of such commissioners. The determination of the commissioners is without force or effect until it has received the sanction of the court, and the fact that it is necessary for the court to confirm the report devolves upon it the duty of determining for itself whether the facts disclosed to the commissioners are sufficient to justify the granting of the petition. And so the court holds that it is authorized to act on a report of a majority of the commission. This report here was in favor of the construction of the proposed road. But the court, having considered the evidence before the commissioners and reached the conclusion that no considerations of a public nature demanded the construction of the road over the particular route selected by the projectors of the enterprise, it holds that the report ought therefor not to be confirmed, and denies the motion to confirm it.

The roadways over which the proposed street railroad was to pass, it says, had been improved at private expense; large sums of money had been expended by individuals to make a high-grade driveway leading out to the summer homes of a large number of people, who had made investments and fitted up handsome residences, greatly to the advantage of that particular section. And while the highways are the common property of the people, and considerations of a private nature must yield to public necessity or convenience, the court declares that there was no good reason why these particular roadways, improved at private expense, should be appropriated by a corporation, when there were other ways which would answer equally as well every purpose of a public nature.

Moreover, while the only question before the commissioners was whether the street railroad should be constructed over the particular route selected by the company, it was proper, in determining this question, the court holds, to consider whether there were other routes equally available, and which were calculated to accommodate the public in an equal degree, if there was a necessity for the construction of the street railroad at all.

Considerations of public policy, in view of the generally poor highways in rural districts, the court goes on to say, forbid that it should permit the work of individuals in improving driveways to be appropriated by corporations, when no public necessity calls for such a sacrifice of quasi private rights.

CONSIDERATION OF NAME OF EMPLOYEE, NOT HAVING CONDUCTORS, PRESENCE OF CORD AND BELL, NONOBSERVANCE OF RULE, GETTING UPON RUNNING BOARD, AND DEATH FROM BLOOD POISONING.

Armstrong v. Montgomery Street Railway Co. (Ala.) 26 So. Rep. 349. June 30, 1899.

A passenger, from his casual and temporary relations to the carrier's employes, the supreme court of Alabama says, is not in a position to be better informed than the employer as to the name of an alleged negligent employe, so that it has never been held or supposed, and is not the law, that when he is injured through the negligence of an employe, and sues to recover damages therefor, he should, under the employers' liability act, aver the name of the employe, or his ignorance of it.

The operation of the defendant's street cars without conductors, the court holds, cannot be said, as matter of law, to be negligence. Consequently, it having been averred that the failure to have a conductor on a certain car was negligence, the court holds that the averment should have been allowed to stand, so that evidence might be adduced upon it for the jury's consideration in determining—first, whether such failure was negligence; and, second, if it was, whether the negligence combined with the other alleged acts and omissions to produce the passenger's death, the plaintiff having undertaken to show that the passenger's injury resulted not from one or more of the negligent acts and omissions alleged, but from all of them operating together to the disaster complained of.

Surely, the court further holds, the passenger could not be held to have been guilty of contributory negligence upon the mere fact of the presence of a cord and bell, and that, of course, if he was not negligent in respect of these appliances, the fact that the car was equipped with them was of no pertinency in the case.

A rule of a street railway company that passengers must not leave its cars while they are in motion, the court holds, is a reasonable rule; but, it also insists, a passenger cannot be charged with negligence for its nonobservance unless he knew of it, though conduct in violation of the rule might be negligent without reference to it.

And the court holds that whether the passenger was guilty of negligence in getting upon the running board, preparatory to alighting, while the car was in motion, was a question for the jury.

Last of all, the court holds that one guilty of negligence should be held responsible for all the consequences which a prudent and experienced man, fully acquainted with all the circumstances which in fact existed, whether they could have been ascertained by reasonable diligence or not, would, at the time of the negligent act, have thought reasonably possible to follow, if they had occurred to his mind. Applying that rule to this case, the court holds that, there being a reasonable possibility of blood poisoning being developed or produced by the wounds to the fingers which the passenger received, and blood poisoning having resulted from the wounds and produced death, death was therefore within the range of responsibility for the negligent act which inflicted the wounds.

DUTY AS TO FILING MAP AND CONSENT OF LOCAL AUTHORITIES BEFORE BUILDING EXTENSION ACROSS STEAM RAILROAD IN NEW YORK.

Delaware, Lackawanna & Western Railroad Co. v. Syracuse, Lakeside & Baldwinsville Railroad Co. (N. Y.), 59 N. Y. Supp. 1035. July, 1899.

The provision of section 90 of the railroad law, as amended by laws of 1895, which says that every street surface railroad corporation before constructing any part of its road upon or through any private property described in its statement, and before instituting any proceedings for the condemnation of any real property, shall make a map and profile of the route adopted by it upon or through any private property, etc., a special term of the supreme court of New York, Onondaga County, says, was doubtless mainly intended to apply to cases in which resort might be had to condemnation proceedings to acquire right of way over ordinary private lands. But notwithstanding this, and that in some respects its requirements are not especially appropriate to a case of building an extension of a street surface railroad across a steam railroad, the court holds

that, as the statute, independent of condemnation proceedings, calls for the filing of a map, etc., before entering upon private property, the steam railroad property to be so crossed is within the meaning of this provision. The court is of the opinion, however, that the benefits of this provision are to be invoked by each owner as to his own property, and that he cannot complain because a map has not been filed of the proposed route through the lands of some other person. And certainly, it says, one property owner cannot enjoin the construction of a road because the builder thereof has not filed a map of its proposed course through private lands where a right of way has been amicably secured. Again, it says that it is to be observed that this provision does not require a map and profile of the entire route which might be of general use to all property owners, but only of the route through private property, which, naturally, will be a matter of interest in each case to the individual owner.

The court further holds that, before crossing the steam railroad, the consent of the local authorities must not only be obtained, but filed in the office of the county clerk, as required by sections 91 and 92 of the railroad law.

The contingency of the street surface railroad company being compelled by a final decision to make "compensation," the court holds, can be safely provided for by the giving of a sufficient undertaking.

Finally, the papers in the case before the court failing to establish that the company was attempting in bad faith to evade the provisions of the statute by constructing a street surface railroad under the guise of a branch or extension, the court says that it sees no adequate reason for treating the construction as other than an "extension," exempted from the requirements of a certificate of public necessity.

CAN OPERATE CARS INTENDED EXCLUSIVELY FOR CARRYING FREIGHT AND EXPRESS MATTER.

Degrauw v. Long Island Electric Railway Co. (N. Y.), 60 N. Y. Supp. 163. Oct. 3, 1899.

Street surface railway companies, authorized by the general railroad law of New York, the second appellate division of the supreme court of that state holds, can operate cars designed and intended exclusively for carrying express matter, freight, or property, and used exclusively for such purpose.

It is not doubted, says the court, but that the legislature has authority to charter a street surface railroad company, and grant the power to carry freight exclusively or passengers exclusively, or unite the authority to carry both. But the company that assumes to exercise the power in question, it also maintains, must justify the right to do so by the terms of some grant of power as broad as the acts themselves.

The statutory grant of authority in question being to convey "persons and property in cars for compensation," the court does not think it reasonably conceivable that the legislature intended that it should be cut down as though it said "passengers with property." In the ordinary carriage of passengers upon street railroads, the court goes on to say, it has never been thought that passengers carrying small articles, or such baggage as may be carried by hand, was the occasion for the use of the word "property" as used in the statute. The regulation for the carriage of such property, that which accompanies the passenger, even upon commercial roads, is usually by rule of the company, and not by statutes. It stands upon a different footing from the carriage of other property, and by common acceptance is usually denominated "baggage," or, to adopt the English expression, "luggage," meaning, in popular phrase, that which is carried by the person. No such limited meaning is to be ascribed to language deliberately used in a statute, where the interpretation placed upon it is as discriminating freight, quite independent of passage by its owner. Again, in the use of the word "compensation," the court sees an indication of an intent upon the part of the legislature to embrace the subject of the transportation of passengers and of property.

Nor is the court at all sure that the transportation in single cars of such property as must be transported throughout the city in cars or upon wagons will increase the burden of use of the street. Time, it says, will demonstrate whether the use of cars is more burdensome than that of wagons.

And the court does not apprehend that its present construction of the statute will entail all of the evils which it was argued must follow in the train thereof. While, in the struggle which is going on for the transportation of persons and property, it must be confessed that street surface railroads are not backward in the assertion of all the rights which the grant of power confers, and admitting that, in whatever right they have acquired to transport passengers or freight or property, they have a vested right, which may not be defeated or impaired by legislation, still, the court declares, the law is—and the courts may be relied upon to enforce the law—that the right of the street by the public is first and primary; and when the right of the public or an individual member of it requires the use of the street for a proper purpose, the rights of the railroad company must yield thereto, even though the effect be, for the time, to stop the operation of its cars thereon.

ASSUMPTION OF RISK IN USING VISE AND WORKING ON INSIDE OF A CURVE.

Shadford v. Ann Arbor Street Railway Co. (Mich.), 80 N. W. Rep. 30. Sept. 19, 1899.

A vise of which complaint was here made, the street railway company contended was in general use by railway companies in the same or similar lines of work, and that the proof offered by it established this contention. Now, if this contention was uncontroverted, the supreme court of Michigan says, that would be a complete defense, to this action for personal injuries. But the contention was controverted.

The plaintiff insisted that the tool was not a reasonably safe one for the kind of work in question; that, while it was in general use by electric railways, telephone and telegraph companies for many purposes which did not subject it to much strain, it was not in general use for drawing up trolley wires upon a curve, under the conditions which obtained when the accident in question happened. And there being many witnesses produced to show the truth of this contention, and the testimony for and against it being very contradictory, the supreme court holds that the question of whether the instrument was in common use in the same or similar lines of work became a controverted fact—a question not competent for the court to decide as a matter of law, but a question of fact very proper to be left to a jury under proper instructions.

The court goes on to state that the rule is too well settled to be longer open to discussion that when a servant enters upon employment which is, from its nature, dangerous, he assumes the usual risks and perils of the service, and this is equally so as to those risks which require only the exercise of ordinary observation to make them apparent. But here, again, the plaintiff maintaining that he was not acquainted with the dangers of the employment, and was not familiar with the tools used in the work of this character; that he was told that the vise was a suitable tool for this work, and that it would hold anything; that he relied upon this statement; and that the danger attending the use of this vise consisted of its treacherous nature, of which there was nothing in its construction to give indication, the court holds that, if such were the facts, the doctrine of assumption of risks did not apply, and the question of fact was a proper one for the jury.

Then, the company insisted that, as a matter of law, the plaintiff was guilty of contributory negligence when he undertook to do this work from the inside of a curve. It argued that he was bound to know the workings of natural laws, and that any person of ordinary intelligence would know there was danger in being on the wrong side of a trolley wire stretched upon a curve and held in place by the grip of an instrument; and that the trial judge should have directed a verdict upon the ground of contributory negligence. But the plaintiff replied that he was not familiar with the fact that to work on the inside of the curve was more dangerous than to work on the outside; that, if the vise held fast to the guy wire, as he was told by the foreman it would do, which statement he believed to be true, it would not be more dangerous to work on the inside of the curve than on the outside, while the necessities of the business frequently made it necessary for the men to work on the inside of the curve, etc. In this situation, the court thinks that it was proper to allow the jury to say whether the plaintiff was guilty of contributory negligence.

Judgment for the plaintiff affirmed.

LEGAL PROOF NECESSARY TO GIVE JURISDICTION TO REGULATE CROSSING OF STEAM RAILROAD.

In re Trenton Street Railway Co. (N. J.), 44 Atl. Rep. 177. Oct. 9, 1899.

In an application, under the New Jersey act of Mar. 22, 1895, to regulate the mode of crossing a steam railroad by a street railway, authority being given to the chancellor, under specified conditions, to direct the mode of crossing, the court of errors and appeals of New Jersey holds that the petitioner must show, by due proof, that his application is within the terms of the statute. More expressly does the court hold that the petition, verified by affidavit and served is not sufficient proof to establish jurisdictional facts as to which the oath of the affiant is not competent evidence, although it may be a rule of the court of chancery that "affidavits and petitions duly sworn to, on which orders to show cause may be granted, if served as affidavits, may be used on the hearing of the order to show cause." In other words, the court declares that legal proof cannot be dispensed with, under this statute, by the rule of court. Such affidavits as those mentioned cannot be accepted as competent proof of the corporate existence of the street railway, or of a grant by a turnpike company to the street railway. Those are basic facts, and until they are made to appear by legal proof the chancellor is without authority to act.

RIGHT OF THROUGH PASSENGER TO RIDE AT LOCAL RATES.

Kissane v. Detroit, Ypsilanti & Ann Arbor Railway (Mich.), 79 N. W. Rep. 1104. Sept. 12, 1899.

On Apr. 10, 1899, the plaintiff boarded one of the defendant's cars at a point in the township of Canton, with the intention of going through to Detroit. He did not communicate this intention to the conductor. The through fare was 35 cents. He offered the conductor 10 cents, as a fare to Inkster. The conductor demanded 15 cents, and the 5 cents was paid under protest. On arriving at Inkster, the plaintiff tendered the conductor a ticket, costing 13 cents, when bought in a strip of five tickets, which ticket the conductor refused, demanding a cash fare of 20 cents, which the plaintiff paid to prevent being put off the car. This suit was then brought to recover the 5 cents which the plaintiff claimed was an overcharge for his fare to Inkster, and 7 cents, the excess of his cash fare over the ticket from Inkster to Detroit.

The case was tried before the court without a jury. The court found (1) that the plaintiff was entitled to ride from the point where he boarded said car in the township of Canton to the village of Inkster for the sum of 10 cents, and that the additional sum of 5 cents was wrongfully exacted, and for which he was entitled to recover; (2) that the ticket tendered at Inkster entitled the plaintiff to ride from Inkster to the city hall in Detroit, and that, therefore, the 20 cents demanded and paid was illegally and wrongfully exacted, and the plaintiff was entitled to recover the difference between 13 cents, which he had paid for his ticket, and the 20 cents exacted, or 7 cents for that part of the route, making 12 cents in all, with his costs of suit, not exceeding \$25.

The supreme court of Michigan holds that the judgment of the circuit court must be affirmed. It holds that the Canton township franchise, which fixed the maximum fare at 5 cents, entitled the plaintiff to the right to be carried through that township for 5 cents, though he may have intended at the time of taking passage to go beyond the limits of the township, and that this limit of fare in the franchise could not be held to apply to local passengers alone, but must apply to all who desired passage, even if going beyond the limits of the township. The company had no right to make such a discrimination. So, when the other township which he must go through to reach Inkster limited the maximum fare therein to 5 cents, that made the maximum fare through the two to Inkster 10 cents. Another franchise not only limited the fare from Inkster, but the court says that the ticket produced was itself a contract binding upon the company to accept it for one fare from Inkster, as it was unrestricted and unlimited.

The statute under which the defendant company was organized provides that "any company organized under the provisions of this act may construct, use, maintain and own a street railway for the transportation of passengers in and along the streets and highways

of any township, upon such terms and conditions as may be agreed upon by the company and the township board of the township, which agreement and acceptance by the company of the terms thereof shall be recorded by the township clerk in the records of the township."

Street railways, the supreme court declares, are bound by such agreements, and the defendant could not release itself from the obligation to comply with these agreements in the townships through which it passed because the passenger intended to take passage to some other place.

Nor does the court consider that an extra 5 cents could be charged, besides what a township franchise authorized, for fare through a village, so long as the latter was wholly within the township, although a franchise obtained from the village provided that no passenger should be carried for a less fare than 5 cents for any distance. This the court construes as authorizing merely a charge of 5 cents for any short trip which would otherwise, on a prescribed mileage basis, amount to less than that sum, and not as authorizing a charge of 5 cents extra for riding through the village.

LIABILITY FOR INJURY OF NEW PASSENGER ON RUNNING BOARD OF GRIP CAR.

Bertram v. People's Railway Co. (Mo.), 52 S. W. Rep. 1119. "Memorandum decision." April Term, 1899.

The plaintiff obtained a judgment for \$3,500, upon a petition bottomed upon an averment that the train was slowed up, coming nearly to a stop, when, upon the invitation of the defendant's agents and servants in charge of said train, he stepped upon the running board of the grip car, and before he had time to take a seat the car was started with a violent lurch, so that it threw his body outward, and brought it into contact with a wagon standing near the track, and which the defendant's agents saw, or could have seen by the exercise of reasonable care, but which the plaintiff did not see because his back was turned towards it, whereby he was injured. Admitting that, measured by rules which he deduces from the adjudicated cases, the petition stated a good cause of action, nevertheless, of law and fact set forth at some length, including a belief that the evidence did not tend to support the petition in some vital points, Mr. Justice Marshall says that he thinks the judgment of the circuit court ought to be reversed; but, the court (division No. 1 of the supreme court of Missouri) not concurring, the case was transferred to the court in banc.

MUST SHOW FACTS FROM WHICH EXERCISE OF PROPER CARE MAY BE INFERRED.

Lorickio v. Brooklyn Heights Railroad Co. (N. Y.), 60 N. Y. Supp. 247. Oct. 10, 1899.

While it is not necessary to produce direct evidence of lack of contributory negligence in every instance, the second appellate division of the supreme court of New York holds, it is necessary to show facts and circumstances from which the jury might reasonably infer that the deceased was exercising proper care. There are no presumptions in favor of the plaintiff. The burden of proving the case is upon the one who seeks to recover.

Here was an action brought by the plaintiff, as administratrix, to recover damages sustained by the death of her son, due to an accident on a line of street railway, at a street crossing, where he had been seen just before the accident—according to one witness—leaving the curb not more than 20 feet in front of the car. The entire evidence in support of the plaintiff's case established no more than that her son, a bright boy, in good health, who discharged his duties as barber well, was run over and killed at the intersection of two streets, by a car which was being operated at a rate of speed which one witness testified was too high to permit him to get off, and which was sufficient to carry the car 75 feet after striking the boy before it came to a standstill. The court remarks that, so far as shown, the speed might have been two miles an hour or ten, and that there was no evidence as to the grade at the point of collision, nor as to the distance within which the car might have been stopped under the circumstances, nor of the conduct of the motorman.

Under these circumstances, it insists that no end of justice could have been promoted by submitting the case to the jury, and affirms a judgment against the plaintiff, for costs, with costs.

IS ADVERTISING AS PROFITABLE TO STREET RAILWAYS AS TO STEAM RAILROADS?

Abstract of an address before the Massachusetts Street Railway Association by Robert H. Derrah, Dec. 13, 1899.

Every president, manager, and even the employe is, or should be interested in the matter of increasing the revenue of his road, and the general talk which I shall make, may give you some suggestions as to how this may be done through the means of publicity.

Ten years ago, here in eastern Massachusetts, there were 28 street railways, operating 600 miles of tracks, in 48 cities and towns. All the roads, with the exception of the West End (now the Boston Elevated), the Lynn & Boston and the North Woburn street railways, were isolated. Ten years ago the street railways were built for the business man who wished to go to or from his work, or the woman who wished to go down town to do her shopping and return on the cars afterwards; it was purely a business man's institution. The roads were built in the thickly populated sections of the different cities and towns because there was a revenue to be derived from the traffic to be picked up along the line. There were no opportunities afforded the people who wished to take a ride in the country for an afternoon's outing. The street railways did not consider it advantageous to extend their lines into the suburbs unless there were a suburban population to be brought into town or the connecting of large centers such as Boston, Lynn and Salem.

Since that time, however, these cities and towns have been connected by electric lines, running in most cases, over the old country turnpikes, until today we have some 75 street railways in eastern, central and southern Massachusetts, directly connected with Boston, operating some 1,400 miles of tracks in 130 odd cities and towns, and forming a great network between the centers of population. There are figures to show that within 50 miles of the Boston City Hall there are 2,392,394 people, while within the same distance from Philadelphia there are 2,361,041 and within 50 miles of the Chicago City Hall 1,915,716. It is a fact that only a small proportion of these 2,300,000 people around Boston understand that there are so many places directly connected with Boston by the trolley cars, and it may be news to some of you to know that there is not a town in this state with a population of more than 3,000 that has not a street railway in operation or under construction.

Now a great many of these railroads run through country districts where there is very little traffic to be picked up on the line, and some of them connect places where there is not sufficient travel between their termini to pay operating expenses. Why have they been built? Look over the figures for their year's business and you will see that in the summer months they carry a very large volume of traffic which is able to make up any losses which they may sustain in the winter. The truth is that the extension of the street railways of eastern Massachusetts has led to the growth of a new kind of business—the pleasure travel. A business man will take a car to go to or from his work. The man who has no occasion to use the car for business will take the trolley car that passes his door for it affords him an afternoon's outing in the country at a small expense and places within easy reach hundreds of places which he has intended to visit, but which have heretofore been difficult of access.

Looking back to the time when the street railways were all located in the cities and were disconnected, you will find that the population then served was less than 1,170,000. Taking the population and the number of passengers carried, you will find that each person rode on an average of 123 times within the year. Since then, although the mileage of the electric lines has increased something like 125 per cent, and the population served has increased 50 per cent, the individual riding has more than kept pace with the growth of facilities and the advance in population, so that each person now rides on an average of 160 times within the year. Now we all know that this increase of mileage, as I have said, has largely been through the country districts, where there was not the additional population to be picked up, and all this goes to show that the increase in travel is very largely pleasure travel.

About 15 years ago the steam railroads of the country found that there were these two classes of travel to be catered to, one the regulars, and the others what they called the "floaters." The

regulars were interested in the railroad only so far as changes in the rates of fare, running time and schedule were concerned. The floaters were that class of people who had no regular route to follow, but were looking for information as to where they might spend a holiday or a vacation, the places of interest on the different steam railroad lines, the possible points they were able to reach, the cost of getting there, etc. The railroads found that a man in Colorado might wish to spend his vacation in Boston and a man in Boston might wish to go to Colorado. The receipt from this class of travel began to be such that the different lines all began to make an effort to secure it, and the man in Boston who did not know where he would go was invited by one company to go to Yellowstone Park, by another to visit California, by another to go to the White Mountains, and so on. To reach the regular patrons of the railroads a notice posted up in the stations was sufficient. To reach the floaters, it was found necessary to appeal to them in a variety of ways. The railroads advertised their varying attractions in the newspapers and the magazines, sent out letters and circulars, and within the last 10 years have generally issued booklets which they have distributed free all over the country. Some of the railroads not only distributed these booklets, but they sent out competent lecturers to different sections of the country from which they thought they might draw travel, giving illustrated lectures upon the points of interest reached by their system. The Santa Fe company issues a handsome book of 125 pages, finely illustrated, describing the scenery to California and back. Nothing in the nature of a railroad advertisement is inserted in the book, but there is a slip enclosed giving the location of the Santa Fe offices in different parts of the country. Does this pay? The answer is that the road has just issued the 124th thousand of these books, which are given away. People see the book, become interested in the reading matter and pictures, keep it because it is handsomely gotten up and is in no sense a cheap thing, and after they get interested in the West, write to the ticket agents for further information. The Boston & Maine R. R. issues many handsome books, and every year in greater quantities. They help a man in planning his vacation, and get him interested in that line, and there is no question that they pay, or the railroad company would soon stop issuing them.

To get up such booklets successfully, one must be familiar with the country through which the lines pass, the location of historic places, the picturesque scenery, and this must be put up in an attractive form, so that people will not throw the book aside as a cheap thing unworthy of their attention. The succeeding issues from year to year must have new matter and new pictures, and come to the readers as new attractions for their attention. One might think that ten years of persistent advertising of the attractions along the Boston & Maine, for instance, would have familiarized almost everybody who travels, with the places along that line, but the fact is that the amount of pleasure travel is constantly increasing and that people who have taken a single trip one year take two trips the next year. The different lines have their own individual features and advantages to offer the public and these illustrated booklets can be made so interesting and so artistic that they are not only worth reading, but worth preserving. On account of the different features and advantages of different lines, no set rules or forms can be followed, which adds to their attractiveness. Not every man will accept the first invitation to travel which comes to him in these publications, but if you keep putting the subject into his mind, he will come to travel sooner or later. It is this persistent advertising of the steam railroads which takes so many travelers in summer to all parts of the country.

I think I have said enough to show you that the steam railroad managers, who are generally pretty wide-awake business men, consider this advertising for pleasure travel as one of the best means of earning revenue for their roads. Now, I would like to ask you what the street railways of central, eastern and southern Massachusetts are doing in the way of impressing upon the minds of not only the two or three millions of people reached by their lines, but the million of people who visit these cities and towns annually, that their lines afford the best and cheapest means of visiting points of interest, seashore resorts, historic places, etc., from the city of Boston. Travelers who have come home from long journeys on the steam roads are well informed about these distant places, but there are many of them who know nothing of the historic and interesting places which may be reached by trolley from their own doors. I

think you will all agree with me when I say that there is no part of the United States richer in diversity of scenery, in historic associations and points of varied interest than this very section of eastern Massachusetts which is so well covered by electric lines. What the steam railroads of this country have done in securing additional revenue through people making long pleasure trips may be done by the street railways among the people who would take the shorter and cheaper trips which are within the reach of everybody, and many of whom cannot afford the time or money for long trips. The street railways of this section, represented in this Association have not only the material to describe and illustrate in order to attract travel, but they have the people who are ready and willing to take advantage of the opportunity if it is brought before them in the right way.

Now it seems to me that it is time for the electric railways of Massachusetts to take a leaf from the book of the steam railway passenger agents. It is more perplexing, today, to find out how to reach various points within a few miles of Boston by the electric cars than it is to find out how to go to points in any section of the country traversed by the steam railroads. If a traveler to a distant section of the country wants information about some point he goes to the agent of the local line, and not only finds out about that line, but all its connections, and often has a choice of routes on connecting lines in getting to his destination. The man who wishes to take his family for a couple of days' riding on the trolley cars must have some special means of getting information, or he is obliged to communicate with the various companies over whose lines he will pass in order to find out about running time, rates of fare and connections. A great many people, knowing of the work which the steam roads have done in issuing illustrated booklets, for free distribution, naturally imagine that the trolley lines have done something in the same direction, and I may say that you gentlemen are not in a position to know how great is the demand for such publications. The street railways in this section of the country do not advertise in the newspapers, magazines or illustrated booklets except in a limited way. One might say that they have done practically nothing in the way of building up pleasure travel. It seems to me that you should see that the present is a most opportune time to take advantage of your opportunities, and educate the people to taking these pleasure trips by trolley. It is not a matter of spending a few dollars to help somebody to get up an advertising circular which will be looked through for information and thrown away when the traveler finds that it contains plenty of advertising, but little of the information wanted. It is the time to set forth the advantages, points of interest, routes, rates of fare, parks and attractions of the street railways of eastern Massachusetts in attractive booklets which will give people a desire to travel on these street railways. Such publications would not only be in great demand by the traveling public, but I think you would soon find that they resulted in an increase of travel in pleasant weather which might be directly attributed to their influence, and which the trolley lines would not get otherwise.

About four years ago it occurred to me that the public had no idea of the magnitude of the street railway system of eastern Massachusetts, nor of the places that could be visited by trolley at a small expense. I believed that there would be a great deal more of pleasure riding on the street cars if the public knew where to go, what to see, how to get there, and what it would cost. I published a book for two years giving general information, with a map of the street railways of eastern Massachusetts. The third year I was convinced, by many requests I had received, that a great many of the people who used my book wanted more information as to the points of interest, and I added a large amount of descriptive matter, together with some half-tone illustrations, making an attractive publication which would make a favorable impression upon the constantly growing number of pleasure excursionists. This was not a book to be given away. Every purchaser—and there were no unsold copies left over from year to year—felt that he was getting something of value.

There is no street railway man in Massachusetts qualified to give the public the information they desire in reference to the network of electric lines, and it therefore seems to me that one of the best paying investments for the street railways is to have them all combine and pay their proportionate share towards maintaining an office in Boston for giving the public this information. I am sure that if a sufficient amount of money were appropriated to publish in the different papers the fact that an office of this kind has been estab-

lished for the benefit of the general public, it would be a very popular office and a great benefit to the mass of people asking for such information.

Should we go into any steam railroad office, we would find elaborate pictures illustrating some beautiful scenery through which the lines pass in the south, or west, or wherever it may be. If an office for the street railways were opened in Boston with photographs of historical places, seashore resorts, inland scenery, etc. it would be most interesting.

HIGH TENSION SWITCH.

The Power Development Co., of Bakersfield, Cal., employs an ingenious combination fuse and switch on its high voltage transmission line for cutting out sub-stations for purposes of inspection or cleaning. As will be seen from the illustration, the device consists of a frame, supporting on insulators the terminals of the line wires and the wires leading to the sub-station. Within the frame is pinioned a 4 x 4 in. timber carrying arms provided at their ends with switch clips, designed to engage the wire terminals when the switch is closed and complete the connection. On turning the

DETAILS OF WHORFF HIGH TENSION SWITCH.

central timber, which is done by means of cords attached to one arm and leading to the ground, the station is entirely isolated from the line. The switch clips form the terminals of a copper wire fuse 28 in. in length.

The switch is supported on two poles just outside the station and has handled successfully for some time a current of between 10,000 and 11,000 volts. It is the invention of Frank T. Whorff, superintendent of the Power Development Co.

TRANSFERS IN CHICAGO.

One of the discouraging things met by street railway managers who would fain have a good opinion of patrons of their roads is the dishonesty in the use of free transfers. There is a general feeling that to outwit a corporation is a praiseworthy action, and men who would scorn to steal a nickel from the company's till were they to visit the treasurer's office have no scruples in buying a transfer from a newsboy for 3 cents and by riding on it beating the railway out of a fare.

The Chicago City Ry. has for a long time suffered from the newsboy-passenger combination, its very liberal transfer system making it particularly vulnerable. The company's policy heretofore has been to issue transfers at the time the fare is paid, the ticket being good on all intersecting lines, but quite recently it was decided to issue the transfers at the transfer point, making them good at that point and for 15 minutes only.

By a vote of 51,855 to 25,331 the question of replacing the street railway tracks on Tremont and Boylston Sts. in Boston, which were removed when the subway was completed, was decided in the negative, it having been submitted to a popular vote at the last election.

KANSAS CITY-LEAVENWORTH ELECTRIC RAILWAY.

One of the latest interurban roads to go into operation is the 24-mile line from Kansas City to Leavenworth, Kan., known as the Kansas City-Leavenworth Electric Ry. The line runs parallel to the Kansas City & Northwestern R. R. from Kansas City, Kan., to Vance, a distance of eight miles. It then crosses that line and strikes across the country to a point just south of the village of Conner, whose name has been changed to Wolcott, in honor of Herbert W. Wolcott, secretary and general manager of the company, who was largely instrumental in bringing about the successful completion of the road. From Wolcott the route runs parallel to the main line of the Missouri Pacific R. R. almost to Leavenworth Junction; it then passes westward to Lansing and through that city to the Soldiers' Home, Leavenworth and Fort Leavenworth. The new line therefore comes into direct competition with two steam roads.

Kansas City has a population of 250,000 and its position as a railroad center for receiving and shipping freight will be of great value to the new company, as it is the intention to carry freight between Kansas City and Leavenworth at night, providing an outlet cheaper than over the steam lines for the Leavenworth factories, of which there are several, notably the Great Western Stove Works, the Great Western Milling Machinery Works, three large furniture factories, a shoe factory, mattress factory, etc. Beside these and some jobbing houses there are three coal mines in operation, with a prospect for a fourth, and when the freight rate is cheapened much of the coal traffic is expected. As a rich farming and fruit growing country is traversed, it is believed much patronage will come from the farmers.

Leavenworth is a growing and prosperous city of about 25,000 people, with a large military post at the north and a Soldiers' Home at the south, both beautiful suburban excursion points, made more interesting because of the fact that the federal prison containing nearly 1,000 military and other prisoners is located at the military post, and the Kansas state prison, with 900 convicts, is situated 1½ miles from the Soldiers' Home and within 100 ft. of the track of the new line. It is believed by the proper use of advertising these will attract profitable passenger traffic from among people arriving at Kansas City with a few days to spare for sightseeing.

of the trolley board 12 ft. 4½ in. The weight of the car complete is about 42,000 lb.

The inside is furnished in plain cherry rubbed to a high polish; the ceiling is of birch veneer. There are twin doors at the ends and between the two compartments; the vestibules are semicircular in form and have drop sash and folding doors. Plate glass is used throughout the car.

Electric heaters made by the Consolidated Car Heating Co. are in all compartments and in the motorman's cab. The seats are rat-

H. W. WOLCOTT.

M. C. CANFIELD.

tan covered, with corner grab handles; five reversible and two stationary seats are placed in the large compartment and two reversible and two stationary seats in the smoker; folding seats for smokers are in the baggage compartments of cars of that type.

The cars are mounted on Peckham No. 14 A double trucks and equipped with four 50-h. p. motors made by the Lorain Steel Co.

The company's principal buildings are located at Wolcott, which is 13 miles from Leavenworth, and comprise the power house and car barn, which are completed, and repair shops that are as yet unfinished. All of the structures are of brick on stone foundations. The smoke stack, which is also of brick, is 14.5 ft. high.

STANDARD CAR, KANSAS CITY LEAVENWORTH ELECTRIC RAILWAY—AMERICAN CAR CO.

The line consists of a single track, with 62-lb. steel T-rails, with rock ballast for the roadbed. The majority of the grades are less than 3 per cent, with two short stretches, one of 4 per cent and the other 5 per cent. There are two curves of 18°; all other curves are 12° or less. The track joints were made by the American Rail Joint Co. The company owns six combination coaches, with smoking compartments; 4 combination express and passenger coaches; 15 freight cars and one 35-ton locomotive. The cars were built by the American Car Co., of St. Louis, and the company will soon put on 20 more cars of the same type. The bodies are 31 ft. 8 in. long over the corner posts, the cars being 41 ft. over the bumpers. The width over the sill plates is 8 ft. 5 in., and the height to the top

In the power station is a 32 x 56 in. Hamilton-Corliss engine, belted to two 300-kw. General Electric generators. The switch-board is also of the General Electric make.

The boiler room contains two batteries of two 400-h. p. Stirling water tube boilers each.

The car barn is complete in each detail. It has a capacity of 12 coaches and has an excellent system of pits.

The overhead line is single pole and bracket construction, cedar poles 35 ft. long being used, together with the Ohio Brass Co's. line material and figure 8 trolley wire. As the double trolley system is used, no overhead switches are required. The feeders are aluminum cables of 350,000 cm. section.

The plant line and track were built by the Cleveland Construction Co. and were turned over to the Kansas City-Leavenworth Electric Railway Co. this month. The latter corporation has an authorized capital of \$1,000,000.

The officers of the company are as follows: President, David H. Kimberly; vice-president, H. C. Ellson; treasurer, Charles O.

INTERIOR OF CAR.

Evarts; secretary and general manager, Herbert W. Wolcott; superintendent and electrician, M. C. Canfield; civil engineer, Z. P. Herndon.

TILE WATER TANK.

The accompanying illustrations show a water tank lately completed by the H. B. Camp Co. for the Pittsburg & Western Railway Co., at Hazelton, O., which is quite interesting, being built of tile. The tank has not yet been tested, and will probably not be in regular service for a month or two.

FIG. 1.

The ground being soft the foundation was made of a heavy bed of concrete laid on top of piling. On this concrete bed the square portion of the structure (see Fig. 1) was built of what are known among building block makers as "corner brick," 8 x 8 x 16 in., 1/2 in. shell, placed end to end with the hollows vertical. A sample of these bricks (see Fig. 2) was tested at the Watertown Arsenal and showed an ultimate strength in compression of 241,000 lb., which was equivalent to 1,775 lb. per sq. in. of gross area, or 4,465 lb. per sq. in. of net bearing area.

The lower portion of the tank structure is 25 ft. square and 20 ft. high. It is divided into three sections by walls; the outer sections are again subdivided by cross walls, and the middle section by two

cross walls, thus providing supports for the floor of the tank proper. The compartments thus formed are utilized for various purposes, one for the pumps, one for the boiler, one for tools, one for a hand car house, and one for a telegraph operator's office (yard business).

The tank proper is 23 ft. 6 in. internal diameter, and 16 ft. deep; the vertical wall is constructed of tiles 6 x 6 x 12 in., 1/2 in. web, curved to the proper radius, assembled after a method patented by Mr. H. B. Camp, of the H. B. Camp Co., Akron, O. A section of the wall is shown in Fig. 3 from which the construction is readily

FIG. 2.

apparent. The tile has grooves on two opposite edges, the object of which is to form circumferential cavities in which bands or hoops of steel or iron are placed. All the joints are laid in cement. The hoop in this tank is 1/2 x 3 in. for the bottom course, the section being reduced for the upper courses where the bursting stress is less.

Not less interesting than the vertical wall is the bottom of the tank, which serves also as the roof for the first story, and is made

FIG. 3.

of hollow tiles 12 in. deep, 10 in. wide and 24 in. long, with two longitudinal webs; all the walls and webs are 5/8 in. thick. The construction is known as the Johnson patent floor, tile and steel fabric, the latter forming the tension member of the beam. We shall give a more complete description of this floor in another connection.

The weight to be sustained by the floor is 1,200 lb. per sq. ft. when the tank is full.

FIG. 4.

A section of this type of floor 20 ft. 4 in. between supports was recently tested (see Fig. 4) by subjecting it to the equivalent of a uniformly distributed load of 500 lb. per sq. ft. The deflection at the center was 9-16 in. and the permanent set 3-16 in.

The Lynn & Boston road has opened a new line into Boston to accommodate what is known as the County Park district of Chelsea.

A petition has been filed asking the Massachusetts Legislature to authorize the carriage of freight by street railways.

WILD ANIMALS FOR EXHIBITION PURPOSES.

A correspondent in the Scientific American gives a number of facts that will be of interest to street railway managers owning or contemplating a collection of animals for street railway parks. The writer states that the demand for wild animals for small parks in summer is rapidly increasing and owners of and dealers in wild creatures make quite a fair profit in renting them out during the warm weather. As winter approaches most of the animals are returned to the city for exhibition in their regular quarters, where the public is always willing to pay a small fee to gaze at them.

In spite of the brisk demand, however, prices instead of advancing for most of the animals have fallen; the reason for this is attributed to the fact that expeditions for capturing wild beasts in their natural homes are more numerous and are better equipped than ever before, and also that breeding in captivity is now possible with nearly all of the birds and animals.

This success of breeding in captivity is noticeable among lions in particular, and from present indications there is little danger of these felines becoming extinct. Formerly an importer of fine lions could calculate upon getting \$5,000 for a good specimen, but today young lions bred in captivity are almost a drug in the market. Tigers do not take as kindly to cage life as the lions, and they do not breed so satisfactorily in captivity, and considerable numbers are imported every year. Elephants do not breed well in captivity, not more than two or three ever having been born in this country, but the importations of these animals is so large that the prices obtained for them have dropped from \$10,000 to \$1,500 to \$2,500 each.

Monkeys do not breed well in cages. They are so easily obtained in the country south of us, however, that prices are merely nominal, and there is little danger of their immediate extinction. Among the highest priced animals of today are the rhinoceros and hippopotamus, specimens of the former, of which there is only about a half dozen in the country, having sold for \$7,000 and \$7,250.

Snakes and birds form a large part of the animal importer's business. These creatures come in great numbers from India, Africa and South America. The public is peculiarly fascinated by snakes, and they are among the most popular creatures exhibited. The best specimens of reptiles come from India, and a snake 20 ft. or more in length is worth considerable money. In a cage it is the size of the snake more than its venomous qualities that attract, and a large boa constrictor or python is worth more than a more deadly reptile of smaller size.

REDUCED FARES AT TERRE HAUTE.

The Terre Haute (Ind.) Electric Co. on December 15th commenced the sale of 25 tickets for \$1.00. These reduced rate tickets are bound in small books 2¼ x 1½ in., 24 in a book, and the cover is good for the last ride. Tickets must be detached in the presence of the conductor to be valid.

Mr. C. B. Kidder, manager of the company, writes us these books have been well received by the public and promise to become very popular.

TROLLEY MAIL COLLECTION AT HARTFORD.

The postoffice at Hartford, Conn., where the street cars were recently provided with mail boxes, finds that while this service is very popular, it does not have the effect that was predicted for it. One of the strong arguments urged in favor of the trolley car mail boxes was that they would relieve the mail carriers from collecting a large portion of the mail and enable the trips to street boxes to be made in shorter time. At the present time, however, the carriers are collecting just as much mail from street boxes, although the cars carry thousands and thousands of letters per month. The only explanation offered is that the people are writing more letters than formerly.

An electric car at Piqua, O., was struck by a westbound passenger train on the Panhandle R. R. on December 24th and entirely demolished. The car became stalled at the crossing and all the passengers had time to jump before the collision. No one was injured.

EMPLOYES' CLUB AT DENVER.

The employes of the Denver City Tramway Co. not long since organized the Tramway Athletic and Literary Club, and on December 27th the club rooms in the Tramway Building at the North Denver loop were christened. The rooms were crowded and a good vaudeville entertainment presented; the performers were for the most members of the club or their immediate relatives.

The suite occupied by the club consists of three rooms not including the smaller dressing room auxiliary to the stage. The

EAST END OF MAIN ROOM.

main room is 40 ft. long, 22 ft. wide and 14 ft. high and has been furnished so that men with the most widely differing tastes can all find something to interest them. One of the accompanying illustrations is from a photograph taken the morning after a club smoker; it shows the west end of the room which is fitted up as a gymnasium, horizontal ladder, parallel bars, trapeze, vaulting horse, punching bag, indian clubs, wrestling mat, etc., all being in evidence.

On the north side of this room is the stage which is shown in another view; it is 16 ft. wide, 12 ft. deep and 22 ft. high, the floor

THE MUSIC CORNER.

being 2½ ft. above that of the main room. The stage is up to date in all its appointments, and is supplied with both gas and electric lights which are all manipulated from the wings.

The third view of this room is taken looking east. On this wall is a life sized portrait of Mr. C. K. Durbin, general superintendent

of the Denver City Tramway Co., to whose hearty co-operation the success of the club is very largely due. East of this room is the reading room in which is already the nucleus of a library of standard works; for those who care for cards, draughts or chess, tables are provided.

WEST END OF MAIN ROOM.

West of the main room is a bath room, 12 x 12 ft. The music corner is shown in another view.

The association, which has a membership of nearly 100, takes great pride in its handsome quarters, and the indications are all for a most successful club. Outsiders also have shown interest in the association, merchants of the city having made donations of books and chairs. But the warmest friend of the association is the Denver City Tramway Co. which provides the rooms and heat, light and janitor service free of charge and also subscribed a sum equal to that raised by the members toward furnishing the club. Nearly \$1,300 has been spent in fitting up the rooms.

C. K. DURBIN.

C. M. SEARLES.

The Tramway baseball team is auxiliary to the association. Members with special talents have formed a string band of six pieces and there is also a male quartette.

The officers of the association are: C. M. Searles, president; Eli Adams, vice-president; H. M. Dikeman, secretary, and E. D. Bonham, treasurer. It costs an employe of the company 50 cents to secure a membership and the monthly charge for dues is 25 cents. Mr. Searles, who was largely instrumental in organizing the club was formerly connected with one of the Chicago roads and had experience in similar work in that city.

At the suggestion of Senator Hanna, president of the Cleveland City Railway Co., and its heaviest stockholder, the directors set apart \$5,000 to be distributed among the employes as a Christmas gift. It was given to show the company's "appreciation of the manly course taken by its employes during the late strike," on the Cleveland Electric, when the Cleveland City men refused to go out on a sympathetic strike.

FROM THE DAILY PRESS.

"This present distress" falls on small and great alike. Galesburg likewise has its street railway question. The old company is seeking an extension of its franchise from eleven to twenty years, to-

STAGE.

gether with certain new lines, and a new company is also in the field asking for a system of streets. Street railway experience in the larger towns thus far has developed two or three conclusions which ought to be of service by way of counsel to Galesburg. The first is that security through competing companies is pretty sure to prove an illusive dream, since it is bound to give place to consolidation in one form or another. The second is that a town, if it retains proper control over the business, is better off with all lines owned by one company, so that the best paying lines may help out those which pay less, and so that there may be universal transfers. The third is that it is not prudent or necessary to fix fares beyond revision for long periods in advance. And the fourth is that all blackmailing schemes against existing companies and all grants made to "unknown" parties, and merely intended for sale, are as inimical to the public interests as they are to the immediate corporations against which they are practiced. These four conclusions are not longer open to debate.—Chicago Tribune Editorial.

The use of electric traction promises to become the most important economic development of the immediate future. It is destined to effect a complete revolution in the methods of travel and freight carriage between the cities and country districts. Internal trade is generally more important though less discussed than commerce with foreign nations, and any change materially affecting local traffic must have far-reaching consequences. It would be most unfortunate if a few legislative errors should deprive this generation of the chief benefits to be derived from the coming change. It is well that the Provincial Ministry have acted promptly, and we trust they may be successful in framing legislation that will adequately protect the public interest.—Toronto Globe.

TOLEDO TRACTION BAND ENTERTAINS.

On the 21st of December the Toledo Traction Centennial Band entertained its friends. The band concert was the principal feature of the evening, but in addition there were a number of vocal and instrumental solos and recitations. The entertainment was followed by a banquet, and when the regular toast list was finished a number of short speeches were made; among those who spoke were President Lang and General Manager McLean of the Toledo Traction Co.

An English contemporary last month announced that a "wind-up order" had been made against the British Gas Traction Co., Ltd., and this fact may be taken as an indication that the gas motor at present is not a success for the purposes of street traction.

MECHANICAL DEPARTMENT

MACHINE FOR BREAKING UP TRACKS.

The accompanying illustrations show a very novel and successful machine designed for breaking up street railway tracks, which has been patented by Geo. W. Baumhoff, superintendent of the Lindell Division of the United Railways Co., of St. Louis, and Otto Schmid, of the same road. The two half-ton reproductions from photographs show the machine in operation and a view of the street after the car has passed through it on a working trip, while the line drawings will make clear the construction.

The machine, as shown in side elevation in Fig. 1, consists of a car mounted on an ordinary truck. The side sills are made up of two steel channels enclosing wooden filling pieces, and at the front end are bent down towards the track; from the toe of the

RAIL BREAKING MACHINE.

projecting sill a horizontal piece, b, is carried back towards the car. The object of the piece will be explained later. Chains running over suitable pulleys and pulled by a winding drum driven by an electric motor have tongs at the ends which grip the rails. When power is applied the rails and ties are lifted, the rail being

FIG. 1.

bent over the fulcrum a. As the rails are lifted the ties come, one by one, in contact with the horizontal piece b, and are forced free from the rails. The fulcrum a is a pointed block which when the machine is not in use is swung upward on a hinge at the front side and thus held out of contact with the track. When in opera-

tion of lifting the car is prevented from tilting forward, by clamps c hooked under the rails and over the side sills as shown in Fig. 1.

In some instances the rail is not broken when bent up the first

VIEW OF PIECE OF WRECKED TRACK.

time and in this case a wire cable is attached to the chain, carried around a pulley at the nose of the side sill and the rail bent down as shown in Fig. 2. When bending rails down the clamps c are placed at the fulcrum as in Fig. 2. Bending the rails is continued till they are broken.

When it is desirable to nick the rails this is done by striking with sledges on two cold chisels d d, mounted on the fulcrum blocks.

This machine is especially designed to tear up track having welded joints and for this purpose has proved to be a great labor saving device. Mr. Baumhoff reports that this machine with a crew of three men will tear up nearly two miles of track in a day, break-

FIG. 2.

FIG. 3.

ing the rails into short lengths as desired, usually 4 or 8 ft. Old rails when so broken command about \$1 per ton more as scrap, and are cheaper to load and haul.

The United Railways Co., of St. Louis, has been using the machine in breaking up its old track preparatory to rebuilding.

The rails shown in illustration are 6-in. grooved girders weighing 78 lb.; 7-in. rails have been broken and the machine is heavy enough to break 9-in. or even larger sections.

COLORS OF HEATED STEEL CORRESPONDING TO DIFFERENT DEGREES OF TEMPERATURE.

A paper before the American Society of Mechanical Engineers by Maunsel White and F. W. Taylor, Bethlehem, Pa.

There is, perhaps, nothing more indefinite in the industrial treatment of steel, than the so-called color temperatures, and as they are daily used by thousands of steel workers, it would seem that a few notes on the subject would prove of general interest.

The temperatures corresponding to the colors commonly used to express different heats, as published in various text books, hand books, etc., are so widely different as given by different authorities, it is impossible to draw any definite or reliable conclusion. The main trouble seems to have been in the defective apparatus used for determining the higher temperatures. The introduction of the Le Chatelier pyrometer within the last few years, has placed in the hands of the scientific investigator, an instrument of extreme delicacy and accuracy, which has enabled him to determine the temperatures through the whole practical range of influence, and led to the establishment of new melting and freezing points of various metals and salts, which are now accepted as the standard in all scientific investigation. There has not, however, been published any results with the Le Chatelier pyrometer seeking to establish a correspondence of temperatures with color heats.

The first work done in this line, of which we are aware, is that of Dr. H. M. Howe, some eight or nine years ago. His results, however, have not been published, and with his kind permission we are enabled to give them here:

Dull red	625 to 550 C.	1,022 to 1,157 F.
Full cherry	700	1,292
Light red	850	1,562
Full yellow	950 to 1,000	1,742 to 1,832
Light yellow	1,050	1,922
Very light yellow	1,100	2,012
White	1,150	2,102

The nomenclature used for color heats differs with different operators, but in our investigation we have adopted that which seems more nearly to represent the actual color corresponding to the heat sought to be represented. We have found that different observers have quite a different eye for color, which leads to quite a range of temperatures covering the same color. Further, we have found that the quality or intensity of light in which color heats are observed—that is, a bright sunny day, or cloudy day, or the time of day, such as morning, afternoon, or evening, with their varying light—influence to a greater or less degree the determination of temperatures by eye.

After many tests with the Le Chatelier pyrometer, and different skilled observers working in all kinds of intensity of light, we have adopted the following nomenclature of color scale with the corresponding determined values in degrees Fahr. as best suited to the ordinary conditions met with in the majority of smith shops:

Dark blood red, black red	990
Dark red, blood red, low red	1,050
Dark cherry red	1,175
Medium cherry red	1,250
Cherry, full red	1,375
Light cherry, bright cherry, scaling heat, light red ..	1,550
Salmon, orange, free scaling heat	1,650
Light salmon, light orange	1,725
Yellow	1,825
Light yellow	1,975
White	2,200

With the advancing knowledge of, and interest in, the heat treatment of steel, the foregoing notes, it is hoped, may prove of some value to those engaged in the handling of steel at various temperatures, and lead to further and wider discussion of the subject, with a view to the better understanding and more accurate knowledge of the correct temperatures. The importance of knowing with

close approximation the temperatures used in the treatment of steel, cannot be over-estimated, as it holds out the surest promise of success in obtaining desired results.

This demand for more accurate temperatures must eventually lead to the use of accurate pyrometric instruments; but at present the only available instruments do not lend themselves readily to ordinary uses, and the eye of the operator must be largely depended upon; therefore, the training of the eye, by observing accurately determined temperatures, will prove of much material assistance in the regulation of temperatures which cannot be otherwise controlled.

THE BLOWER SYSTEM FOR HEATING AND VENTILATION.

The fan system of heating and ventilation has grown rapidly into favor in the last few years. As is generally known, the apparatus used in connection with this system consists of a fan which draws or forces air over a bank of steam coils, the air then being blown through conduits to the various apartments. To none of the many and varied classes of buildings to which it is applied is it better adapted than to the shops and car houses connected with street railway systems.

AMERICAN BLOWERS.

One of the features which makes the system valuable for such application is the possibility of forcing a current of heated air into the car pits, rendering it easy to thaw out cars that are frozen up, and to dry out "grounded" cars in wet weather. While furnishing a uniform degree of heat, the system also provides perfect ventilation. This is an important feature in shops where a large number of men are employed, as comfortable surroundings and pure air are conducive to the best work.

The American Blower Co., of Detroit, Mich., with offices in New York and Chicago and London, England, makes a complete line of apparatus for use in connection with heating and ventilating plants, and has had large experience in designing the system for use in street railway plants.

What is recommended as a very convenient method for testing whether an armature is in balance and correcting defects is as follows: Mount the armature in bearings which are free to move horizontally and then, as the armature will tend to rotate on its center of gravity, if the center of gravity does not lie in the axis of the shaft, the lateral motion of the bearings will indicate the fact. The heavy side can be marked on the shaft with a piece of chalk and counterweights added until the balance is perfect, as shown by the end bearings not moving.

ELECTRICAL MACHINERY IN SWEDEN.

Robert S. S. Bergh, U. S. consul at Gothenburg, Sweden, writes the State Department as follows:

"Another thing of importance in this country is electrical machinery in general, which will be in great demand as soon as the people have fully learned the value of their numerous waterfalls. A large electric power plant will soon be built at Trollhattan; electric railways and tramways are being planned for Gothenburg, Lund Bjerrod and Jonkoping. In this line, as in everything else, the Germans are always watchful; they pay close attention to details, and if necessary send experts here to study plans, etc., whereby they greatly increase their chances to introduce machinery. If it is not practical for Americans to do likewise they could possibly employ active agents to represent them here."

W. F. FURBECK & CO.

A new banking and brokerage house was formed under this name on Nov. 1, 1899, and has opened extensive offices at Nos. 149 to 153 Washington St., Chicago, for the purpose of carrying on a general business of this kind. The senior partner of the firm is Mr. W. F. Furbeck who was formerly connected with the north and west sides street railway systems of Chicago.

Mr. Furbeck was born in 1848 in Schenectady County, N. Y. He came to Chicago in 1861 and entered the employ of the First National Bank of Chicago, in 1863, at the age of 15 years. He remained in this bank for 19 years and in 1882 accepted the position of cashier in the brokerage firm of Chas. T. Yerkes, jr. & Co. In 1887 he became private secretary to Mr. Yerkes who was then president of the street railway lines. In 1892 Mr. Furbeck was elected vice-president of the North Chicago Street Railroad Co., and continued in this office until the sale of that road to the Chicago Union Traction Co.

W. F. FURBECK.

J. CHARLES MOORE.

The stock department of W. F. Furbeck & Co., is under the management of Mr. J. Charles Moore who has also been identified with the work of Mr. Yerkes for 21 years, first in the banking and brokerage business for eight years and later with the Yerkes' street railway lines of Chicago for 13 years. Mr. Moore's last position was that of secretary of the Chicago Union Traction Co. The extensive experience of both Mr. Furbeck and Mr. Moore and their wide acquaintance insures a large and select clientele for the new concern.

The junior member of the firm, Mr. R. J. Furbeck, represents the house in New York and is a member of the New York stock exchange. He was formerly associated with the brokerage firm of A. L. Dewar & Co.

DEATH OF S. DANA GREENE.

Lieutenant S. Dana Greene, general sales manager of the General Electric Co., and his wife were drowned on January 8th while skating on the Mowhawk River at Schenectady, N. Y. About 5:45 p. m. men working at an ice house some distance below the town heard screams proceeding from a point where a cut in the ice some 300 ft. wide had been made clear across the river; putting off in a small boat they picked up Mrs. Greene, who was in an unconscious condition and died shortly after. Not until some time later was it learned that Mr. Greene had been with his wife; then a search was made and after several hours his body was also recovered.

S. Dana Greene was 35 years old, and was a son of Samuel Dana Greene, who was first lieutenant and executive officer of the Monitor in the fight with the Merrimac, and a grandson of General George S. Greene, who died about a year ago at an advanced age. He was a graduate of the naval academy at Annapolis and stood at the head of his class. About eight years ago he resigned from the navy to go into the electrical business, and was one of the managers of the General Electric Co. at Schenectady.

Four years ago he married Miss Cornelia Chandler, daughter of Admiral Chandler of the navy. Mr. Greene was a member of the Century and University clubs, was in the naval reserve and was naval aid on Governor Roosevelt's staff.

REPORT OF THE NEW YORK RAILROAD COMMISSIONERS.

The Board of Railroad Commissioners of the State of New York, consisting of Ashley W. Cole, Frank M. Baker and George W. Dunn, under date of Jan. 8, 1900, presented its 17th annual report to the Legislature. From this report we extract the following:

ELEVATED RAILROADS.

The most notable circumstance, from the point of view of the public, during the past year, in connection with elevated railroads of the state (which are all in New York City), is that to a considerable extent the motive power of those in the borough of Brooklyn has been changed from steam to the third rail system. The work of equipping the remainder of the lines in Brooklyn is progressing, and it is expected that in the coming summer all of the elevated lines there will be operated by electricity.

Several of the railroads in Brooklyn which in past years have been operated by steam have been converted to the overhead electrical trolley system, and three of them have been operated in connection with the elevated railroads through the construction of inclined planes at the points of junction. The result has been that a passenger could enter an elevated railroad car at the entrance to the Brooklyn bridge, at New York City, and ride to Coney Island, without change of cars, for a single fare of 5 cents.

The Manhattan Ry. in New York, is preparing to change its motive power from steam to electricity, third rail system.

It is likely that operation by electricity will benefit the companies through economies which such operation will render possible; people living along the routes of these railroads will be benefited by the removal of the annoyances caused by the operation of locomotive steam engines; and it is probable that the traveling public will be better satisfied with the accommodations enabled to be offered through such operation.

Several accidents, causing a stoppage of cars on that part of the Brooklyn system operated by electricity, have occurred. In one case on the Brooklyn Union Co's. line, passengers started to walk from the cars to a station, along a foot path which was not protected by a handrail. The cars started in the meantime, and a person who had tried to board the last car and was clinging to the gate, brushed against several of those on the footway, hurling them to the street, resulting in the death of two and the injury of several others. As the result of an investigation of this occurrence by its electrical expert, the Board recommended that the entire line of the Brooklyn Union Elevated R. R. be equipped with handrails on the sides of the structure. The company notified the Board that it would comply with this recommendation.

At the time of writing this report, the matter of the complaint of residents of the borough of the Bronx, New York City, against the Manhattan Railway Co., as to its failure to construct its railroad from the present terminus at 177th St. and Tremont Ave. northward to Bedford Park and vicinity, is pending before the Board.

The total number of passengers carried by the elevated railroads during the year ending June 30, 1899, was 213,248,419, a decrease of 14,528,133, as compared with 1898. This decrease is in large part accounted for by the fact that the returns of the Brooklyn Elevated Railroad Co. and its successor the Brooklyn Union Elevated Railroad Co. cover a period of but nine months, the other three months' statistics being included in the report of the Brooklyn Heights Surface R. R. The number carried by the Manhattan Ry. was 174,324,575, a decrease of 9,036,271, as compared with 1898.

The following accidents occurred on elevated railroads during the year ending June 30, 1899; Total killed, 19, of whom 5 were passengers and 8 were employes; total injured, 20, of whom 8 were passengers and 12 were employes.

STREET SURFACE RAILROADS.

The percentage of dividends to capital stock of street surface-railroad companies for the year ending June 30, 1899, was 4.67. The number of passengers carried on all the street surface railroads of the state, including the few remaining horse railroads, during the year ending June 30, 1899, including "transfers," was 920,365,560, an increase over 1898 of 71,054,890. The number carried in the boroughs of the Bronx and Manhattan, New York City, including "transfers," was 509,314,816, an increase over 1898 of 52,351,063. The number carried in the borough of Brooklyn (including some carried in the borough of Queens) including

"transfers," and including those carried during the last three months of the year by the Brooklyn Union Elevated R. R., was 238,721,051. The table gives statistics relative to the operation of some of the more important street surface railroads during the year ending June 30, 1899.

The following is a comparative statement of totals compiled from the reports of the street surface railroads for the years ending June 30, 1898, and June 30, 1899:

	For year ending June 30, 1898.	For year ending June 30, 1899.
Capital stock.....	\$132,844,303 33	\$151,427,128 33
Funded debt.....	130,179,166 90	129,524,373 63
Unfunded debt.....	31,806,542 42	87,089,302 02
Cost of road and equipment.....	233,635,396 51	267,388,036 95
Gross earnings from operation.....	31,884,384 20	35,460,822 71
Operating expenses.....	19,153,716 55	21,142,563 63
Net earnings from operation.....	12,730,667 65	14,318,259 08
Income from other sources.....	1,451,501 55	1,636,006 43
Gross income from all sources.....	14,182,169 20	15,954,265 51
Taxes and miscellaneous.....	1,459,498 56	1,779,127 78
* Interest paid and accrued.....	6,924,276 79	6,711,108 76
* Dividends.....	5,799,359 32	7,070,219 50
Surplus or deficit for the year.....	a 631,007 34	a 14,083 30

* Includes respectively interest and dividends paid by lessors from rentals received from lessees as follows.

	1898	1899
Interest.....	\$1,666,068 34	\$2,375,500 45
Dividends.....	2,720,894 32	2,828,892 50

a. Surplus d. Deficit

The total number of passengers killed during the year ending June 30, 1899, on the street railways using other than animal tractive power was 23, not including the 15 persons killed in the grade crossing accident at Troy; employes, 12; other persons, 88; total, 123. The injured were: Passengers, 287 (not including 17 at Troy); employes, 62; other persons, 215; total, 564. On the animal power roads 14 passengers were injured, 3 other persons killed and 11 injured.

During the past year, in other states as well as in this state, many kinds of accidents which have until lately been considered incidents alone of the operation of steam railroads, have occurred on street railroads. Head-on collisions of motor cars have not been infrequent. Cars have left track. Rear-end collisions have occurred. Motor cars have struck wagons as well as other motor cars at crossings. Cars have been struck at crossings of steam railroads. Nearly all of these accidents have resulted in loss of life or injury. Many of them in this state, would have been avoided, if the companies had complied with the recommendations of this Board, repeatedly made, which are again repeated here at the end of this title. The Board has endeavored to see that its recom-

mendations are compiled with, but co-operation of managers is necessary. That some managers are not awakened to the dangers incident to the operation by the new systems of power, seems to the Board to be proved by the accidents which have occurred.

The electrical expert of the Board has made inspections of many crossings of electrical and steam railroads. His recommendations as to switch and signal devices to be installed at these crossings have been made the requirements of this Board, under section 36 of the Railroad Law. The inspection of these crossings is proceeding, and it is the intention of the Board that each such crossing in the state shall have been inspected and recommendations in regard thereto, where necessary, made before its next annual report.

In several instances in Brooklyn during the past year electric cars have been operated on the tracks of steam railroads. This method of operation has been investigated by the Board, and a report by the electrical expert on the subject will be found in the report. It is the intention in these instances that, ultimately, the railroads involved will be entirely operated by electricity.

During the year the Board conducted a test of improved brakes for street surface cars. These tests covered a considerable period of time. At the time of writing this report the necessary compilations have not been made and the report as to the result is not completed.

Inspections and reports are constantly made by the electrical expert and members of the Board as to the accommodations, in general, furnished the public by street surface railroad companies.

The Appellate Division of the Supreme Court, Second Department, has decided that freight may be carried on street surface railroads. This is being done in several instances in the state at present, especially express business, the number of tons of freight carried during the year being 129,040.

The average number of persons, including officials, employed during the year ending June 30, 1899, on all the street surface railroads of the state was 25,729. The aggregate amount of salaries and wages paid them was \$14,447,573.82. The companies owned or operated on June 30, 1899, 4,743 electric and cable box cars, 3,681 electric and cable open cars, 139 electric mail cars, 631 electric and cable freight, express and service cars. Of these 8,302 were reported as equipped with fenders. There were 1,406 horse cars in operation.

The Board renews its former recommendations as to the operation of street surface railroads, especially in the following particulars:

First.—Every street car which crosses a steam railroad at grade

Street Surface Railway (Principal Companies) Receipts and Expenditures per Passenger and Cost of Operation per Car Mile for Year Ending June 30, 1899.

(a) Includes all lines controlled by Brooklyn Heights not making separate reports. (b) Includes all lines controlled by Metropolitan not making separate reports. (c) For nine months only.

shall be equipped with a red flag for use during the day and a red lantern for use at night. When approaching such crossings the car shall come to a full stop at least 30 ft. from crossing, and shall not proceed until the conductor has gone upon the steam railroad, carrying the flag or lantern, and after ascertaining that the way is clear, given the proper signal for the car to proceed. At crossings protected by a system of derailing switches interlocked with signals on the steam railroad, and operated by a man stationed at the crossing, this recommendation does not apply. The Board also recommends that at all grade crossings, on overhead trolley railroads, a V-shaped trough (preferably of metal) be constructed over the trolley wire or wires to insure the motor retaining the current, while the crossing is being made.

Second.—That where two or more street car lines cross, or where they merge, an agreement shall be made as to which line shall have the right of way. The car that has not the right of way shall come to a full stop before crossing over the tracks of the other line, or entering on the joint track.

Third.—That cars passing in opposite directions shall not meet on street crossings.

Fourth.—That the speed of the cars be reduced to a minimum on all curves where the view is obstructed.

Fifth.—That passengers be prohibited from riding on the running boards or side steps of open cars.

Sixth.—That the passengers be not permitted to stand on the front platforms of open cars, and that only as many passengers be permitted on such platforms as can be conveniently seated. In the case of open cars that have no seats on the front platform, passengers shall not be permitted to ride on the platform, and the side gates shall at all times be kept closed. Under no circumstances should passengers be permitted to ride on the front platforms of closed cars.

CONCLUSION.

The period covered by this report has been an exceedingly busy and prosperous one for the railroads of the state, and it may reasonably be expected that such conditions will continue to exist for some time to come. Experience teaches, however, that times of depression occur. Prudence requires that the directors and managers of railroad companies shall, during the prosperous period, endeavor to place the properties in their charge in such physical condition that they may, on the score of safety and convenience of the public, view with little alarm, if not with equanimity, the approach of less prosperous times.

The Legislature at its last session passed the bill recommended by the Board providing that mortgages made by the railroad companies must be approved by this Board before issue, and bills amending the Grade Crossing Law in certain particulars.

LARGE CARS FOR THIRD AVENUE RAILROAD.

The new electric cars adopted as standard by the Third Avenue Railroad Co., of New York, are among the longest in use on any street railway in the United States. They were built after designs by John H. Robertson, superintendent of the company, are 41 ft. long over all and the bodies are 32 ft. in length. The platforms are large and with the extra wide doors make ingress and egress unusually easy, even when the car is crowded to its full capacity. There are 12 cross seats on each side, giving a seating capacity of 48 passengers. The seats are provided with grab handles at the corners nearest the aisle for the convenience of passengers forced to stand.

The car can be converted into practically an open car by dropping the windows into the sides.

Each car is fitted with Standard air brakes. Four sets of cylinders and brake mechanism, one for each pair of wheels, are furnished, so that the breaking down of one would not impair the efficiency of the system. The cars weigh 40,000 lb., are mounted on Peckham trucks and are driven by four 30-h. p. motors.

James McGrath, a juror in a personal injury case against the Chicago City Ry., who was accused of soliciting a bribe from the company, was fined \$50 for contempt of court.

There is now pending in the Detroit Common Council a general ordinance providing for the carrying of freight by the suburban and interurban electric lines entering that city.

THE MILWAUKEE SITUATION.

The controversy over street railway franchises in Milwaukee still goes merrily on, though now the company and the council are in accord.

While the ordinance was before the council both parties were active in debating the question. On December 18th the council, by a vote of 25 to 17, ordered the ordinance to a third reading, after amending it so as to provide for tickets at the rate of 6 for 25 cents, 25 for \$1, good between 5:30 and 8 a. m. and 5 and 7 p. m., and for carrying firemen in uniform free. Otherwise the provisions were as given on page 866 of the "Review" for December last. The low-fare hours as amended are 30 minutes longer than in the original draft, which also provided for the free transportation of policemen and detectives only.

On December 21st an injunction was issued on the petition of Mr. H. A. Schwartzburg, restraining the mayor, the 25 aldermen, the city clerk, the street railway company, and others from taking any further steps looking to the passage, publication or acceptance of the ordinance; in this petition conspiracy was alleged.

The answers denied any conspiracy and alleged that a legislative body cannot be enjoined, whereupon the petitioner was directed to show cause why the injunction should not be dissolved. The case was continued until January 2d.

December 30th a second injunction was secured by Cassius M. Paine on behalf of the state, the allegation of the petition being that the council had no power to grant franchises to a company organized to carry freight, mail and express.

January 2d, the mayor and council decided to ignore the injunctions, and the ordinance was passed by a vote of 23 to 1 and signed by the mayor. Mayor Rose, in answer to an inquiry, made the following statement:

"We became satisfied that the opponents of the ordinance intended to resort to every expedient to prevent the passage of the ordinance. The opposition from the beginning was unfair, and even dishonest. There seemed to be a deliberate attempt to mislead the people and to misrepresent the ordinance.

"If the second injunction had not been served, the council would have waited for the decision upon the first injunction, but when the second was served and we received information that applications for more were in process of preparation, we knew that it would avail nothing to wait for a final determination in the courts.

"We were firmly convinced that the opposition was not prosecuted in good faith, but solely for the purpose of delaying action upon the ordinance with the hope of defeating its passage by postponing action upon it until after the next election. Its opponents calculated, beyond question, that if they could go to the people before they became familiar with the provisions of the ordinance by a practical demonstration that it would be defeated.

"I am perfectly confident that the injunctions served are void: that they were secured merely for the purpose of delay and were not expected to be ultimately upheld by the courts, and when we became convinced of these facts and became satisfied that new injunctions would be secured as fast as others were dissolved, we determined to exercise the power that is vested in legislative bodies and their executive under the organic law and constitution of the state and insist upon our right to proceed in the execution of powers which we claim the courts have no right to interfere with.

"The ordinance is now in force and our people will speedily become familiar with the benefits it secures to them."

January 3d the company began the sale of tickets according to the terms of the new franchise, and it is stated nearly every passenger bought tickets, so that the conductors' supplies were quickly exhausted. The company has not yet filed its acceptance of the ordinance and so is not in contempt.

The court whose orders were ignored by the council has not yet taken action to punish the council for contempt, the hearing of the case on its merits not having been concluded.

The Tiffin, Fostoria & Eastern Electric Ry. has a boycott on its hands because fares were increased 50 per cent.

The employes of the Springfield (Mass.) Street Ry. are devoted to the game of whist and at stated intervals tournaments are held at the club rooms in the car barns, the conductors being pitted against the motormen.

FOREIGN FACTS.

The Leeds (Eng.) Tramways are being extended.

The Idawara (Japan) Tramway Co. began running electric cars last November.

It is stated Serpollet steam motors may be introduced on tramways at Tokyo, Japan.

The City of Birmingham (Eng.) Tramways Co. has reduced fares on its cable lines from 3d. to 1d.

The street railway at Morelia, Mexico, is being extended two miles to the penitentiary at San Pedro.

As soon as Government permission is given an electric line will be built between Yumoto and Kojiri, Japan.

It has been decided by the city council of Worcester, Eng., to lease the municipal tramways to a private company.

It is proposed to build an electric tramway from Dundee to Carnoustie. Mr. Hopkins is electrical engineer for the former town.

Dresden, Germany is to have a new electric line, which will be built by the A. G. Elektrizitätswerke, formerly O. L. Kummer & Co.

The United Kingdom has exported coal during the past year at the rate of 1,000,000 tons per week according to a late compilation.

The British Government is purchasing hundreds of horses from various tramway companies for use in the Transvaal during the war.

Mr. Alfred Dickinson of Birmingham, Eng., is said to have been granted important tramway concessions in Cape Town, South Africa.

A Paris company is arranging to construct an electric road at Calais, France. United States Consul Milner, of Calais, can give further information.

An electric railway will be built between Shiogama and Sendai, Japan, by the Rikuu Electric Railway Co. Eizo Konishi of Sendai, Japan, is said to be interested.

The sanitary committee of the Thornaby (Eng.) Town Council has served notice on the tramway company that it must abate the nuisance caused by watering its lines.

It is stated the St. Etienne (France) R. R. will be equipped electrically by the Societe Hydro-Electrique Roussillonnaise, 7 Rue Lafayette, Paris, which was recently formed for the purpose.

In Dublin (Ireland) the Palmerston Park tramways are now running by electricity. The Dublin Tramway Co. has secured permission to build a number of new electric lines in Cork County.

A company has been formed at Paris, known as La Compagnie des Tramways Electriques de Vanves a Paris et Extensions to construct and operate an electric tramway from Paris to Vanves on the Diatto system.

In response to petitions from the workmen of the city, the Dover (Eng.) Tramways Co. will run special cars at certain hours for working people at a fare of 1/2d. for the distance of three miles, instead of 1d.—the regular rate.

The City & South London Ry., one of the underground roads of London, has escaped paying city taxes this year by reason of a decision to the effect that as the line does not pass under any site previously occupied by a building, no assessment can be made.

The parliamentary committee of the Hull (Eng.) Town Council has decided to recommend the council to apply for a provisional order to construct a double line of tramways in Great Union St. and on the Hedon Road, and to extend a number of existing tramway lines.

A bureau of information has been established by the Italian government at Rome for the use of importers and exporters. All questions dealing with trade with Italy will be answered. Address "Ufficio d' Informazioni Commerciali, Ministero di Agricoltura, Industria e Commercio, Rome, Italia."

The Huddersfield Corporation Tramways Co. reports total traffic receipts for last year of £32,372, an increase of £1,775 over the previous year; number of passengers carried 5,077,936, equal to the entire population of the city carried 50 times. Number of letters posted in the tramcar letter boxes 456,002.

There is so great a scarcity of tramway cars in Great Britain that a number of town corporations are seriously considering the advisability of erecting car building plants of their own. All of the regular car building works have orders enough on hand to keep them busy for from one to two years to come.

One little incident of the present war in South Africa is reflected in the following cablegram from the Johannesburg City & Suburban Tramway Co. to the London office of the company. It reads: "All horses commandeered; hold Government receipts. Works entirely suspended; depot occupied as police barracks."

Serious mob demonstrations occurred at Limerick, Ireland, recently in connection with the granting of a tramway franchise for the town. The citizens opposed the scheme and went to the council hall in a body hooting and jeering and threatening the members of the council with personal injury. Policemen succeeded in dispersing the crowd.

A disputed halfpenny has cost the South London Tramways' Co. £150 in damages. A lady traveled on one of the company's trains from Chelsea Bridge to Clapham Junction and refused to pay more than 1/2d., the authorized fare for the journey, although the conductor demanded 2d. The court has granted the lady £150 damages for her injured feelings.

A large portion of the tramway lines in Liverpool has been equipped with the overhead electric system, but about 40 miles of track are still worked by horse haulage. A bill has been introduced in the city council providing for the reconstruction of all of these lines for electric traction, as well as for the construction of a number of new lines at a cost of over £270,000.

Electric tramways are made responsible for a curious phenomenon at Brussels, states a contemporary. It has been noticed that since the running of electric cars in that city the trees along the route begin to turn brown and drop their leaves early in August and bud and even blossom again in October, while trees in other parts of the city retain their regular custom of dropping their foliage late in the fall and do not put forth fresh blossoms until spring. It is believed the extraordinary state of affairs is due to the effects of leakage currents acting on the roots of the trees. Next!

All the street railway interests in the city of Havana have been consolidated. These include the franchises owned by the Harvey syndicate, comprising the International Bank of Paris, Hanson Brothers of Montreal, G. B. M. Harvey, F. S. Pearson and others of New York City, and the concession known as the Torre Pla concession, covering 12 miles of streets and owned by the American Indies Co., composed of Thomas F. Ryan, P. A. B. Widener, R. A. C. Smith, Sir William C. Van Horne, William McKenzie and others. Construction work has been commenced, and it is expected a complete system of electric traction will be in operation by June 1st.

PAN-AMERICAN EXPOSITION BUILDINGS.

Very satisfactory progress has been made in preparing for the Pan-American Exposition to be held in Buffalo during the summer months of 1901 and the plans for the buildings are practically completed. The accompanying illustration shows the Machinery and Transportation Building, in which our readers will be most interested, which is 500 x 350 ft. It is designed in a type of Spanish Renaissance, the best examples of which on this continent are found in the old mission buildings in California and Mexico. The Machinery and Transportation building forms a hollow square

COPYRIGHT, 1899, BY PAN-AMERICAN EXPOSITION CO.
MACHINERY AND TRANSPORTATION BUILDING.

with arcades on all sides, the interior court being 100 x 200 ft. The court is adorned with a fountain surrounded by flowers and shrubs. The facades present an arcaded effect corresponding in appearance to mission cloisters; the eaves with great overhangs add to the picturesque. Each facade is broken by an important architectural feature, and each corner flanked with low pavilions, the design giving large plain surfaces for color, while the eaves give deep shadows. The color scheme is made up in reds and yellows, light in tint.

MORE THEFTS OF WIRE.

The night of December 23d over 2,000 lb. of trolley wire was taken from the lines of the Chicago Union Traction Co. in Ridgeland Ave., south of 22d St.

The night of December 10th, 1,300 ft. of trolley wire was taken from the lines of the Detroit & Northwestern road near Farmington, Mich.

On December 14th two attempts were made to wreck a car on Hackensack and Ft. Lee line of the Bergen County (N. J.) Traction Co.; it is believed that the motive was revenge for the arrest of a trolley wire thief some weeks since.

On December 20th, 2,100 ft. of bond wire was taken from the tracks of the electric line between Burlington and Mt. Holly, N. J.

On December 13th, the Delaware & Atlantic Telephone Co. suffered the loss of eight copper wires from its lines in Delaware County, Pa. The wires were cut down for a distance of two miles. This is the fifth theft of wire in this county within three months.

RE-SALE OF GALVESTON ROAD.

The property of the Galveston (Tex.) City Railway Co. will again be sold on February 6th, the terms of the sale made last September not having been complied with. The road was first placed in the hands of a receiver on Oct. 13, 1897, when R. B. Baer was appointed receiver by the federal court. On Sept. 5th, 1899, the property was sold to Julius Runge for \$905,000, who was formerly president of the company. On November 10th the sale was confirmed and the purchaser was given until December 20th to pay the balance of the purchase price. As this requirement has not been fulfilled the sale is declared void and a new one ordered.

A peculiar accident occurred on one of the cable lines of the Chicago Union Traction Co. on December 20th, a grip car being pulled in two; no one was injured.

STREET RAILWAY MAIL BOXES IN GRAND RAPIDS.

Last month the Consolidated Street Railway Co., of Grand Rapids, Mich., through the effort of G. S. Johnson, president and general manager, inaugurated a mail collecting system that will nearly double the efficiency of the postal department in the city and suburbs. Two mail boxes of medium size and of the standard type such as are now used on street corners, are placed on each car, one at each end. The box is placed inside the vestibule by the controller stand; an opening is made in the front of the car large enough to slip letters through. The side of the box from which the carriers remove mail is next the vestibule door, enabling collections to be made without entering the car.

The instructions issued by the company to its employes for the care of the mail, explains fully the details of the system. These instructions, for a copy of which we are indebted to Mr. Johnson, are as follows:

"You are expected to exercise proper care and diligence regarding the mail boxes, giving them as much attention as you would any other attachment to the cars, and at all times being careful to prevent breakages of the boxes.

"Conductors will please see that all boxes are open for the reception of mail matter when they take their cars out in the morning. At night, the boxes will be closed by an employe of the postal department, and the employes of this company will be careful to see that they are kept closed until the cars are again ready for use.

"There is likely to be confusion and misunderstanding for some time regarding the boxes. For that reason, I ask you to be especially careful in your replies to questions regarding the mail service, being at all times courteous and gentlemanly, giving as much information as possible.

"You are not required to stop at a crossing or anywhere else for the purpose of allowing mail to be deposited only, except for mail carriers. It is expected that people who wish to deposit mail will be at the proper street crossings, and will take their chances as to whether or not cars will stop. If you have no passengers to get off and there are no persons to get on the car at any landing, you are not obliged to stop for mail matter. At the same time, you are expected to exercise judgment regarding it. If you find you have time to stop for the purpose of picking up mail, you must do

MAIL BOXES ON GRAND RAPIDS CARS.

so, but your first duty and obligation is to keep on your schedule time and to carry out the instructions and desire of the company. It will be agreeable to the company to extend to the public every courtesy possible which will not impair the regular service, and it is expected by a combination of judgment and a desire to accommodate that the public can be very thoroughly served in the matter of these mail boxes.

"You will stop at any regular stopping place, at any time, when signaled by a mail carrier, and give him ample opportunity to deposit what mail he desires.

"Employes of the postoffice will be stationed in or about Campau Place and on Lyon St., opposite the postoffice, and possibly at other locations, for the collecting of mail from the boxes. You will please give them time and opportunity to do this, assisting them if need be, so as to save as much time as possible.

"If any trouble arises of any kind or character, regarding this service, if any breakages occur, or if anything happens out of the ordinary, you will please report them immediately by telephone or messenger to the superintendent.

"If a car is disabled, its number, the point where it is, and the place (shop or car house) to which it is being taken, must be immediately reported to the superintendent. This is of the utmost importance, because there may be mail in the boxes which must be taken out by the postal authorities, and not permitted to remain in the boxes while the car is in a car house or shop."

President Johnson, writing on December 22d, says: "The system has been in operation since December 18th, and it is wonderful to see what use has already been made of the boxes. The number of letters coming in in this way is very large, and is constantly growing, and the public seems to appreciate the convenience greatly. Mail formerly deposited in street boxes at the outskirts of the city and which had to await the rounds of the carriers to be brought down to the main post office, now gets to the office from two to five hours sooner than before the new plan was adopted. So far, we have not experienced any inconvenience to speak of in stopping for mail or for the collectors."

CAR LIGHTING.

The accompanying illustration shows a scene with which most travelers are familiar for much to the general public's delight, the Pintsch gas lamps can now be seen on almost every railroad car in the country, and also on the majority of the cable surface roads of the various American cities, and on some electrically propelled cars also.

The rapid progress of this car-lighting system tells better than anything else could of the merits which the Pintsch light possesses. There are now in this country nearly 14,000 cars equipped with this system of illumination, which means a total of 70,000 Pintsch gas lamps in service. These 14,000 cars that are distributed over 115 railroads that have adopted this as the standard method of car lighting; the gas is made at 50 Pintsch gas works, located at various cities throughout this country. Pintsch supply stations are now established at necessary points all the way from Portland, Ore., and Montreal, Can., in the north, to Jacksonville, Fla., and Houston, Tex., in the south, and there is now no trip in which a passenger car might be employed, where Pintsch gas cannot be supplied.

The Safety Car Heating & Lighting Co. that controls the Pintsch patents in the United States, is also the owner of patents covering six standard heating systems that are employed by most of the principal railroads of this country. Some of these systems simply employ straight steam taken directly from the locomotive; others are hot water circulating systems, operated either by steam from the locomotive or in conjunction with the Baker heater. The latter system is the standard that has been adopted by the Pullman and Wagner Palace Car companies. There are about 80 railroads that are now using the steam system of the Safety Car Heating & Lighting Co. This company also controls a hot water circulating system for street railways, as well as electric heaters for surface cars.

The general offices of the company are at 160 Broadway, New York, with a branch office in the Monadnock building, Chicago, and another in the Union Trust building, St. Louis.

The Homer, Mich., street railway was opened January 1st.

"NOARK" FUSES.

A fuse that will not arc or flash under any circumstances is sold by the Manville Covering Co., western representative for the H. W. Johns Manufacturing Co. The device consists of a fusible conductor enclosed in a tube with a peculiarly arranged filling entirely surrounding the conductor. The blowing of the "Noark" fuse under overload is a definite action occurring in a certain time interval for each definite increment of excess current, as determined by the character of the service for which it is intended. Owing to the arrangement of the surrounding material, the blowing time interval at any period during the life of the fuse remains practically constant, and simply varies in an inverse ratio to the amount of excess current above its rated capacity.

The condition of the fuse is shown at all times by means of a fine wire extending along the outside of the case, and which breaks the instant the fuse blows.

ART CALENDAR.

One of the handsomest calendars that has appeared for the new year represents children playing on the broad beach of one of our Atlantic coast resorts. The youngest, a little tot, is defying the approaching tide of the ocean, and in a spirit of bravado calls out to his companions who are eagerly watching him. "Who's Afraid?"

Copy of this calendar carefully mailed in strawboard to protect in transmitting, will be mailed on receipt of 10 cents in postage stamps by W. B. Kniskern, G. P. & T. A., Chicago & North-Western Ry., Chicago, Ill.

Early application should be made as the edition is limited.

NIAGARA, ST. CATHERINES & TORONTO.

The Niagara, St. Catharines & Toronto Railway Co., of St. Catharines, Ont., is rebuilding its steam road and equipping it with electricity. This company is a reorganization of the St. Catharines & Niagara Central Railway Co. The officers are: President, J. A. Powers; secretary and treasurer, A. B. Colvin; general manager, F. A. Cheney.

STEEL TRACK FOR COMMON ROADWAY.

Mr. Horace L. Washington, U. S. consul at Valencia, Spain, in a recent report described a steel track laid for a distance of two miles on the road between Valencia and Groo and which has been in use for seven years. The road is nearly 40 ft. wide, with double tracks

SECTION OF ROADWAY.

26.76 ft., center to center. The tracks are a trifle over 4 ft. gage. The rails consist of two flaring channels fastened together by bolts spaced 4 in. apart. The rails are held to gage by flat tie bars 9-16 x 5 in x 5 1/2 ft., with slots cut into the upper edge, into which the flanges of rails fit, and the outer ones held by keys.

ELECTRIC TRACTION ON THE NEW YORK, NEW HAVEN & HARTFORD.

There are six of the branch lines of the New York, New Haven & Hartford R. R. which are now operated by electric power. These are the Nantasket Beach branch, 8 miles in length and which is operated by the third rail system; the Nantasket Junction to Pemberton branch, 7 miles, which is operated by the overhead trolley; the Nantasket to Cohasset, 3 1/2 miles, operated by the third rail system; Berlin to New Britain, 3 miles, by third rail; Hartford to Bristol, 9 miles, third rail; New Britain to Bristol, 9 miles, third rail; Stamford to New Canaan, 8 miles, by the overhead trolley.

AT THE M'GUIRE WORKS.

The McGuire Manufacturing company reports the year 1899 as one of the best it has ever had, and notwithstanding the enormous rise in the cost of material the year has been a very profitable one. Two orders of the same amounts, placed just one year apart, explains the advance in iron clearly. In December, 1898, the company bought 1,000 tons of bar iron at \$20 per ton. Exactly the same date in 1899 the company ordered 1,000 tons of bar iron at \$48 per ton. It is therefore enabled to make a good showing for 1899 because of purchases made in 1898 and early in 1899, that participated in the advance in the first half of the year 1899, and, while the business of the last half of the year was very much in excess of the first half, the prices of material had advanced so that everything equalized. The firm was therefore entirely satisfied with the year's business and anticipates for 1900 one of the best years it has ever known.

While this company has always been busy in the truck department for the home market, during the year 1899 it sent its product to foreign markets which nearly encircle the globe. It has just completed a large order for San Francisco, and other large orders for Havana, Cuba, Brooklyn Elevated, New South Wales, Australia, and has shipped to Germany, England and France during the year.

The new truck which has been placed on the greatest number of lines is the No. 39. The general result of the use of this truck is best explained by one of the users. Mr. Cummings, of the Indiana Railway Co., South Bend, Ind., which is using these trucks on large interurban cars and where the schedule time is 40 miles an hour, writes as follows: "These trucks for our high speed inter-urban service are highly satisfactory. They ride like a sleeping car. It is the simplest in its construction, and we do not hesitate to say that it is the best truck we ever saw. It has so many good points that it must be seen and used to be appreciated. Come down and see us and bring your friends and we will show you the very best equipped high speed service in the country."

McGUIRE HANGER.

After the closest competition of all the truck makers of the country, this truck has been accepted by the Brooklyn Elevated R. R. Certainly a simpler construction can hardly be imagined. It is not of more than ordinary weight, but the distribution of metal is such that it has been demonstrated to have the maximum of strength and durability, while its riding qualities are all Mr. Cummings says.

A very important feature of the McGuire company's business has developed strongly within the last year; that is, the elastic brake hanger. It has been behind in filling these orders, a whole year, and it has been discovered that the different railway lines are putting them on all makes of trucks as well as those made by the McGuire company. The accompanying cut shows the elastic hanger as used. A feature that recommends this hanger is the fact that it automatically takes up its own wear and absolutely prevents kicking, and contains its own release spring.

In the year 1899 the company did the heaviest snow sweeper business in all its history, bringing the total number of these machines in use throughout the country to about 500. The stove business has also been quite large and the company is so satisfied with the year's work in the stove line that it is preparing for an immense business in 1900. It claims that the public preference for cars heated by stoves is being felt; that the electric heaters arranged as they have been—concentrating the heat at six different points under the seats—are very offensive to passengers as well as being decidedly dangerous to the health of passengers who use the seats over these heaters. In cold weather there is call for such a strong heat at these points that the persons sitting over them are overheated, and then leaving the car when it is possibly below zero, endanger health and life. The company calls attention to the common scene of passengers looking under the seat to locate the heater so as to avoid the heat, while in the car heated by a stove, with the glowing coals seen through the isinglass, the passenger is comfortable and satisfied, and runs no risk of catching cold therefrom. Besides this feature, the company claims that it is very much

cheaper for railway companies to heat their cars by coal stoves than by current. For this reason it will not be caught another year as it was this—unable to supply the demand.

AIR CARS IN NEW YORK.

Mr. Joseph Hoadley, of the American Air Power Co., advises us that the statement printed in the December "Review" that the compressed air cars had been withdrawn from the 28th and 29th St. crosstown lines of the Metropolitan Street Ry. in New York is in error. It appears that these cars have not been withdrawn yet.

NOTES FROM INDIA.

Kashmir, a state of India, is to have an electric railway 180 miles long, so it is said. The line will connect Tumu and Srinagar, and will be operated by water power obtained from the Chenab River.

The Bombay Tramway Co. is urging as one reason why it should be given permission to equip its road for electric traction, the fact that it is constantly having its horses drop dead in the street from heat.

Mr. F. J. E. Spring, consulting engineer to the Government of India, for railways, has prepared a note on the subject of tramways in the province of Assam, India, in which he points out the necessity for such lines.

Madras is said to be the only city in India having electric tramways. The lines in this city are owned by the New Madras Electric Tramways Co., which is a reorganization of the Madras Electric Tramways Co., whose property was foreclosed by the bondholders. It is stated a proposition has been made to the Madras municipality to operate the road as a municipal concern.

The annual report of the Calcutta Tramway Co. for 1899 states that negotiations for the introduction of electric traction on its lines have been satisfactorily settled. The principal condition of the new agreement is, the company shall remain in possession of the lines for 30 years from Jan. 1, 1901, in consideration of its converting the system from horse to electric traction within three years. Preliminary surveys are in progress and within a short time the directors will be in a position to let contracts for the construction of the power station, etc.

TESTS ON CEMENT.

In a paper on "Cement" read before the Franklin Institute by A. S. Cooper, the author gave the results of various tests on portland cement mortar to determine the effect of time on that material. It is the opinion of many engineers that a portland cement mortar which has stood an hour or two has lost some of its strength, but this was proved to be erroneous.

Four large batches of mortar were mixed and briquettes were made by hand from each pile at intervals ranging up to eight and one-half hours after mixing. These were all carefully marked, stored away, and broken after one year. The results showed that the loss of strength after the eight and one-half hours' standing is practically nothing. In practical working with most portland cement, if it becomes necessary for the mortar to stand for half a day even, no injury will result, according to Mr. Cooper, provided the precaution is taken to keep the mortar wet.

In a recent decision Judge John Goodland, of Appleton, Wis., holds that a street railway company or any company that has a franchise for the erection of poles on the highway, is not responsible for accidents occurring in consequence of the poles being in the streets. He decides the city granting the franchise for the placing of the poles is the responsible party in all accidents arising therefrom.

The borough of West Pittston, Pa., has imposed license fees of \$15 per car on the Wilkes-Barre & Wyoming Valley Traction Co.

SNOW FENCES ON ELECTRIC RAILWAYS.

In the "Review" for December last, page 821, was illustrated a type of temporary snow fence of which the International Traction Co., of Buffalo, has some 16 miles in use. This fence is made up in 16-ft. panels 5½ to 8 ft. high, and is set as shown in the engraving which we reproduce here. The fence is put out in the fall and removed in the spring.

In order to get the experience of other roads with snow fences a number of letters of inquiry were addressed to interurban companies, but by far the greater number of answers stated that such fences were not used.

Last winter the Boston Elevated Railway Co. for the first time in its history made use of snow fences, placing them on private lands adjoining the highway at exposed points. The results were

BUFFALO SNOW FENCES.

fairly satisfactory but the mistake had been made of setting the snow fences too near the tracks. This winter the company placed out considerably more snow fence than last year and set it about 100 ft. from the tracks. The fence is portable and abutting owners give their consent to its use for a small or nominal consideration; it is indeed a benefit to the property owner as it assists in keeping drifts from the sidewalks.

The details of construction of the Boston Elevated's snow fence and the manner of assembling the panels are shown in the accompanying illustration, Fig. 1. The sections are 16 ft. long, each made of three 1 x 6-in. boards nailed to 4 x 4-in. pieces at the ends and stiffened at the center by a 1 x 6-in. piece. The bottom board is placed 6 in. from the ground.

The Lynn & Boston R. R. has less than 1-3 mile of snow fence on its system. Mr. E. C. Foster, general manager of the company, states that the fence has thus far proved of but little advantage, though the benefits of such a device where the surroundings favor the formation of drifts is recognized.

The Dunkirk & Fredonia (N. Y.) R. R., the electric line connecting these towns, has ½ mile of snow fence protecting a stretch of the interurban track. This fence is made by nailing three 1 x 6-in. hemlock planks, 16 ft. long to V-shaped supports made of pieces

FIG. 1.—FENCE USED BY BOSTON ELEVATED.

2 x 4 in. and 6 ft. long and spaced 8 ft. apart. When in place the legs of the V are nailed to stakes 2 ft. long driven in the ground. In placing this fence the company's practice differs from that of the Buffalo and Boston roads in that the longitudinal planks are all on the leeward side of the fence instead of the sections alternating as shown in the illustrations. The inclination is such that the top of the fence is from 4 to 4½ ft. high. It is placed 110 ft. from the track.

Concerning the benefits of this fence Mr. M. M. Fenner, manager of the Dunkirk & Fredonia, writes as follows:

"We have had the worst snows this year that we ever knew, and have opened our road with the least trouble, on account of having extended the snow fences. Where we had heretofore been compelled to keep 100 men shoveling for a week, we can now open the road with half the number of men in a day, which feat we accomplished January 3d. and have done the same thing twice before during the present season. This season has been a record breaker in this particular locality along the lake shore in the state of New York, taking in Dunkirk and Fredonia as a center, the snow being about 3 ft. deep on the level. It has been so cold the snow has been very light and it has also been windy so that the drifts have been immense.

"We still need about a quarter of mile of fence, having about ½ mile at this time, and will be able to get most of it as residents, as a general thing, do not refuse permission to have the fence put up late in the season and removed in March, after the period of heavy snows. We have used the fences about five years and at an early period had much trouble in getting a fence that would do the work, but after much experience in the use of it we have now what we think gives the best possible results."

The Duluth (Minn.) Street Railway Co. has 1¼ miles of the portable snow fence shown in Fig. 2, which, during the winter months, is placed from 60 to 80 ft. from the exposed tracks, depending on the location. The company finds little difficulty in securing permission from abutting owners to erect the fence on their land. The fence is made up in 12-ft. panels, with the supporting legs and braces designed to be folded up for handling; it will be noted that the longitudinal planks on this fence are more numerous and spaced closer than in the fences previously mentioned. When built in 1894 the following was the itemized cost per mile:

51,000 ft. lumber @ \$7.50 per M.....	\$382.50
2,640 machine bolts, ½-in., @ 85 cents per 100.....	22.44
70 lb. ½-in. cut washers @ 3 cents.....	2.10
300 lb. wire nails @ 1½ cents.....	4.50
51 days labor @ \$2.00.....	102.00

Total\$513.54

Mr. Herbert Warren, general manager of the company, in sending us the figures adds that at the present time the same quality of lumber would cost \$13 per M and labor would cost \$2.25 per day.

FIG. 2.—FENCE USED BY DULUTH STREET RAILWAY.

The company also has about ¾ mile of fence of a similar pattern, but not so high, and some brush fence upon the lines of the Lake-side Ry., which it operates.

The Eastern Maintenance of Way Association at its meeting in September last received a report on the subject of wire and snow fences and for the latter it was recommended that when the right of way is sufficiently wide to permit, close board fences of sufficient height should be built. Where such is not practicable portable fences in 12-ft. lengths to be fastened together with bolts were recommended. When permission can be secured from abutting property owners, these fences should be placed parallel to and about 100 ft. from the track.

If the prevailing winds are approximately parallel to the track it is seldom that cuts will be filled with drifts. In some instances, however, it is well to build so-called wing fences; these are placed along the sides of the cuts, at about right angles with the track and at such distances apart as experience shows to be necessary.

FUNERAL CARS FOR ST. LOUIS.

It is announced that contracts have been made between the St. Louis Funeral Car Association and the St. Louis Transit Co. and United Railways Co. for the operation of funeral cars over the street railway lines of the city. The tracks at present pass within a block of nearly all the churches and hospitals in St. Louis and temporary switches are to be provided for the cars so that regular traffic will not be delayed by reason of the funeral service.

Switches are to be laid into all the cemeteries and chapels for use in inclement weather built. A novel feature contemplated is the building of four chapels in different parts of the city at which the funeral services can be held instead of at the late residence of the deceased, as is customary.

REPORTS OF CHICAGO ELEVATED ROADS.

The traffic report of the South Side Elevated shows a daily average of 61,994 passengers in 1899 as against 51,777 in 1898, an increase of 19.7 per cent. The average daily traffic by months is as follows:

	1899.	1898.	Inc.
January	58,762	52,117	6,615
February	60,292	52,682	7,610
March	63,909	54,827	9,082
April	63,878	54,148	9,730
May	59,588	49,459	10,128
June	56,117	45,427	10,690
July	52,644	44,148	8,496
August	52,599	41,770	10,829
September	52,599	41,770	10,829
October	73,793	58,198	15,595
November	69,972	59,257	10,715
December	72,683	62,735	9,948

The report presented at the annual meeting of the Metropolitan Elevated, January 4th, covered the period from July 1st to December 30th. The traffic shows an increase of 22.37 per cent in the daily average as compared with the returns for 1898. The daily averages by months are:

	1899.	1898.	Inc.
July	67,498	53,878	13,620
August	68,070	55,925	12,145
September	76,184	60,702	15,482
October	94,430	74,490	19,940
November	88,820	74,745	14,075
December	90,682	77,168	13,514
Average six months	80,930	66,134	14,796

The figures on operation from July 1st to November 30th are: Gross earnings, \$624,158.10; gross operating expenses, \$270,717.64; surplus applicable to stock, \$99,078.33.

This company has 13.11 miles of double track, 1.67 miles of four track road and leases 4.38 miles of track from the Union Consolidated and loop companies.

The Lake Street Elevated had a daily passenger average of 37,266 in 1899 as against 33,948 for 1898. The gross earnings were \$697,513.27; operating expenses, \$331,552.87; interest, taxes and rentals of surface lines and loop, \$372,318.82; surplus for the year, \$3,639.58. It was announced that the company would complete two miles of three-track line this year, from 52d Ave. to Rockwell St., whereby express service would be provided for the western traffic of the road. This, with the natural expansion of business from the Oak Park extension, would greatly increase the income of the road. From the three-track system the company expects an increase of about 5,000 passengers a day.

PRIZES FOR EMPLOYEES.

The annual distribution of cash prizes to motormen and conductors was made by the Cincinnati, Newport & Covington Street Railway Co. early in January. The awards are made for clean cars, freedom from accident and attention to duty. Seventeen motormen received \$25 each, one motorman received \$10, one conductor received \$25, five conductors received \$10 each and 11 conductors received \$5 each.

ANNUAL REPORT OF BOSTON ELEVATED.

The second annual report of the Boston Elevated Railway Co., for an advance copy of which we are indebted to Mr. H. L. Wilson, auditor, gives the following summary of the company's business for the year ending Sept. 30, 1899:

Gross earnings from operation	\$9,671,441
Operating expenses	6,827,150
Earnings from operation	\$2,844,291
Payments under lease of West End St. Ry.	2,357,968
	\$ 486,323
Add interest on special deposits	84,696
	\$ 571,019
Taxes, Boston Elevated	257,420

Balance	\$ 313,599
Interest paid to holders of B. E. receipts	262,500
Surplus for the year	\$ 51,099
Operating Expenses	
General expenses	\$ 835,000
Maintenance of roadway and buildings	1,309,198
Maintenance of equipment	602,521
Transportation expenses	4,080,431
Total	\$6,827,150

Revenue Miles.	
Run by electric passenger cars	34,542,520
Run by horse passenger cars	51,704
Run by electric U. S. mail cars	174,294
Total	34,768,518
Passengers Carried.	
Revenue passengers on electric cars	199,898,995
Revenue passengers on horse cars	124,229

Total revenue passengers	191,023,224
Free transfer passengers on electric cars	42,113,715

Total passengers carried	233,136,939
Plant and Equipment.	

Miles of track completely equipped with electric overhead system, 327; partially equipped, 3.9; miles of overhead electric feeder lines, 468. Number of horse cars, 248; of electric cars, 2,710; of mail cars, 11; of snow plows, 244; of snow sleds, 391; of miscellaneous vehicles, 515.

COLLECTION OF RAIL SECTIONS.

The catalog of the Chisholm & Moore Manufacturing Co. for 1900 contains a collection of drawings to scale, showing every section of rail rolled by the six leading rolling mills in this country, with the American standard rail joint as applied to each pattern. It will be remembered this company published a similar collection of drawings last year and these have been in such demand that it was decided to republish them this year with numerous additions. Copies of the catalog may be had on application to Chisholm & Moore Manufacturing Co., Cleveland, O., and no railway official's reference library will be complete without one.

FREIGHT SERVICE FOR BROOKLYN.

It is understood that the National Express Co. is interested in a plan to operate a night freight and express service on the lines of the Brooklyn Rapid Transit Co. A year ago a similar scheme was discussed, but nothing came of it. The present plan is for a regular freight service to and from all parts of the city, with large receiving and distributing depots. A ferry service connecting with Manhattan and Jersey City railroad stations is included in the scheme.

The Toledo Traction Co. has made a donation of \$250 to the Toledo Public Library.

CAPITAL TRACTION ANNUAL MEETING.

On January 10th the annual meeting of the stockholders of the Capital Traction Co., of Washington, D. C., was held at the offices of the company, 91,705 shares being represented out of the total of 120,000.

The following were unanimously chosen directors: George T. Dunlop, Charles C. Glover, Henry Hurt, John G. Parke, Edward J. Stellwagen, Wm. Manice, Maurice J. Adler.

It was voted to authorize \$1,500,000 of bonds dated Apr. 2, 1900, payable in 20 years and bearing interest at the rate of 4 per cent, payable semi-annually; the company retains the option to redeem the whole or a part after three years at 5 per cent premium. Of the total, \$1,080,000 will be offered to stockholders at par and \$420,000 held in the treasury.

The proceeds will be used to retire an issue of 5 per cent bonds authorized Jan. 12, 1898, amounting to \$1,000,000; to funding the present floating indebtedness of about \$80,000, and to providing a fund from which there can be restored to the earnings account the sum of \$150,670 used for improvements, and further sums used for extensions and additions to the equipment. The cost of installing the underground system was in excess of \$1,500,000.

The directors met on the same day, January 10th, and re-elected the officers, who are as follows:

Geo. T. Dunlop, president; C. C. Glover, vice-president; C. M. Koones, secretary and treasurer; David S. Carll, chief engineer and superintendent.

CONSOLIDATION OF UNION AND CONSOLIDATED, CHICAGO.

On December 21st Secretary Marlowe sent the following circular to stockholders of the Chicago Consolidated Traction Co. explaining the plan for amalgamating that company with the Chicago Union Traction Co.: "Arrangements have been made so that the holders of the stock of the Chicago Consolidated Traction Co. will receive for each share of stock the sum of \$45, payable in 4½ per cent 40-year gold bonds of a kind to be decided by the counsel for the company, and which bonds are to be guaranteed, principal and interest, by the Chicago Union Traction Co. The stock shall be held in such manner as to be additional security. The bonds will be of the denomination of \$1,000. Any of the holders of the stock of the Chicago Consolidated Traction Co. who may desire to accept this offer will please notify me on or before Dec. 31, 1899, and deposit their stock with the undersigned."

CAR BARNs BURNED.

The barns of the South Chicago City Ry. at Hammond, Ind., were destroyed by fire early on the morning of January 9th. The barn was a brick building 72 x 225 ft.; the rolling stock destroyed included 32 cars, sweepers and sprinklers. No serious delay in traffic was occasioned as by the time cars were scheduled to leave temporary repairs had been made of the line connections destroyed.

WHAT SANTA CLAUS BROUGHT.

The Cleveland City Railway Co. distributed \$5,000 to its employes on Christmas.

The London (Ont.) Street Ry. distributed \$500 among its employes on Christmas.

The Consolidated Street Ry., of Seattle, Wash., announced a 10 per cent advance in wages on Christmas.

The Savannah (Ga.) Thunderbolt & Isle of Hope Ry. presented each of its employes with a turkey or its cash equivalent.

Each employe of the Union Elevated Railroad Co., of Chicago, received a gift of \$10 on reporting for duty Christmas day.

The Galveston (Tex.) City Railroad Co., by its receiver, Major Baer, made all of its employes the present of an extra day's pay.

The Columbus (O.) Street Ry. presented 400 turkeys to the married men and 97 silver dollars to the single men in its employ on Christmas.

The Nashville (Tenn.) Street Ry. served coffee and hot rolls at the transfer stations from 5 to 8 a. m. and a Christmas dinner was provided at restaurants for all employes.

The Chicago Consolidated Traction Co. served Christmas dinners from 10 a. m. to midnight at its car barns and all the employes who had to work that day had from one to three meals as the company's guests.

For some time past the Cincinnati Street Ry. has been fitting up a portion of its old cable power station for the use of its employes as club rooms, and they were opened to the men on Christmas day. President Kilgour and other officials of the company were present at the opening. Rooms are to be fitted up at the other power houses and stations.

In some cities Santa Claus by reason of press of other business was unable to get around until a week later.

The Topeka (Kan.) Ry. increased wages 20 per cent dating from January 1st.

The Lexington (Ky.) Street Ry. announced on New Years that wages would be increased 25 per cent.

The Franklin (Pa.) Electric Street Ry. suspended traffic from 12 to 1:30 on New Years day and entertained its employes at dinner.

The Zanesville (O.) Electric Ry. announced that beginning January 1st wages would be increased 10 per cent. The company also offers premiums of \$10 to the motormen and \$5 to the conductors operating cars for six months without accident.

The Cleveland Electric Ry. gave a dinner to its employes and their wives on the night of January 1st; the dinner was served in the club rooms at one of the barns. President Everett and Superintendent Douglass were present and made short speeches.

The New Orleans & Carrollton Railroad Co. added extra time to the pay roll of its men as follows: Those continuously in the service of the company from Jan. 1, 1899, to Dec. 20, 1899, three days' extra pay; from July 1, 1899, to Dec. 20, 1899, two days' extra pay; all other employes, one day's extra pay. President Newman in announcing the order added: "The efficient and satisfactory services rendered and the marked interest displayed at all times by its employes is a guarantee of its success, and its success is that of those employed by the company."

TOLEDO OUT OF THE GAS BUSINESS.

The city of Toledo, O., has sold its gas plant to private parties for \$228,000. This is the plant which cost the city \$1,500,000 (paid by a bond issue) and from which it has received a gross total revenue of \$100,000. Those interested in further details should refer to our issue of December last, page 845.

A MODEL ACCIDENT REPORT.

One of our readers sends in the following, a copy of a report turned in recently by one of his men. For brevity it rivals Dewey.

"Car going south at Third St., bicycle coming north, boy kicking at dog. When most to car turned in front car. Boy not hurt, bicycle damaged."

GRADE CROSSING ACCIDENTS.

December 30th a Panhandle train struck a Chicago City Ry. car, injuring three persons.

On December 23d a St. Louis trolley car was struck by a freight train, the motorman being killed and three of the six passengers injured.

December 20th an Illinois Central engine moving at slow speed struck a car of the Urbana & Champaign Railway, Gas & Electric Co. at a grade crossing and seven persons on board the trolley car were slightly injured.

An express train on the Pennsylvania R. R. ran into an electric car at Delta Ave., Cincinnati, on December 15th, demolishing the car and damaging the locomotive. The car was filled with passengers, but none were badly hurt.

December 28th a car on the Cleveland (O.) Electric Ry. ran into a freight train at a grade crossing; there were 15 passengers on board, but only two or three were injured slightly. The collision was due to the rails being wet and it is alleged a defective brake on the trolley car.

HALF FARES.

The Dayton & Xenia Electric Ry. is in operation.

The Peoria & Pekin Terminal Co., of Peoria, Ill., has been formally opened.

The government pays 12 cents a mile for all mails carried by the Brooklyn Rapid Transit Co.

The Greenwood Electric Ry., connecting Greenwood and Indianapolis, Ind., is open for traffic.

The Reading (Pa.) Traction Co. declared a dividend of 50 cents per share payable January 1st.

A mail service has been established between Goshen and Elkhart, Ind., over the Indiana Electric Ry.

The Metropolitan Street Ry., of New York, has declared its regular quarterly dividend of $1\frac{3}{4}$ per cent.

All the conductors and motormen of the Toledo Traction Co. will hereafter wear a regulation uniform.

The Metropolitan Street Railway Co., of Kansas City, Mo., spent nearly \$2,000,000 in improvements last year.

The Chattanooga Rapid Transit Co. has completed a 9-mile extension from Chattanooga to Chickamauga Park.

The recently completed Carnegie (Pa.) Heidelberg & Bridgeville Electric Ry. was placed in operation January 6th.

The College Hills & Park Line Ry., of Sherman, Tex., was sold last month to satisfy a deed of trust, to J. P. Harrison.

The city of Chicago has sued the Union Loop Co., alleging that the latter sweeps dirt from the structure into the streets.

Ray C. Logan, who is held responsible for several hold-ups on street cars in Chicago, has been sentenced to the penitentiary.

An injunction restraining the city of Dallas from selling the property of the Dallas Consolidated Electric Street Ry. has been secured.

Power from the Mechanicville (N. Y.) water power plant is used on the Albany and Troy branches of the United Traction Co., of Albany.

The North Milwaukee line of the Milwaukee Electric Railway & Light Co. was formally opened on the evening of Saturday, December 16th.

A steam heating system for supplying heat to the residences and business houses in the city is contemplated by the Findlay (O.) Street Ry.

A new company will be formed to operate the new Paltz (N. Y.) & Walkill Valley Electric R. R., which has been sold at receiver's sale.

Over 1,600,000 passengers were carried last year by the Leavenworth (Kan.) Electric Ry., an increase of 550,000 as compared with the previous year.

A car on the Detroit (Mich.) Rapid Ry. was derailed on January 7th by a misplaced switch, evidently the work of some one with malicious intent.

Combination opened and closed cars will be operated all winter by the Metropolitan Street Railway Co. of New York City, no matter how cold the weather. It is stated smokers demand the open cars.

The Haverford St. repair shop of the Union Traction Co. of Philadelphia, were partially destroyed by fire on January 2d. The loss is placed at \$15,000.

Four non-union men accused of taking part in a riot the outgrowth of the recent street railway strike at Buffalo, N. Y., were fined from \$25 to \$50 each.

A quarterly dividend of 60 cents per share on its capital stock was declared by the Market Street Railway Co. of San Francisco, payable after January 16th.

The British Institute of Electrical Engineers and the American Institute of Electrical Engineers will probably hold a joint meeting during the Paris Exposition.

The Evansville (Ind.) Street Railroad Co. has paid into the city treasury the sum of \$2,040, representing 2 per cent of the road's earnings for the past year.

The Delaware, Lackawanna & Western R. R. has decided to reduce passenger rates between Syracuse and Baldwinville, N. Y., to compete with the electric line.

The offices of the New York & Queens County Electric Railroad Co. have been moved into a new building at Nos. 5 and 7 Borden Ave., Long Island City.

A breakdown in the power house of the Santa Barbara (Cal.) Consolidated Electric Co. recently necessitated the running of an old mule car on State St. for several days.

The Circuit Court of Cook County has ruled that the repeal of the Allen law at the last session of the Illinois Legislature did not abolish the necessity for frontage consents.

It has been decided to consolidate the Gardner (Mass.) Street Railway Co. and the Gardner, Westminster & Fitchburg Street Railway Co., under the name of the latter.

The Muskegon (Mich.) Street Railway Co. has placed on sale working people's tickets at the rate of six for a quarter. The tickets are good until 8 a. m., and from 5 to 7 p. m.

The council of Kirkwood, a suburb of St. Louis, has passed an ordinance prohibiting any street railways operating within its limits from carrying any mail, baggage or express matter.

The residents of South Omaha, Neb., have petitioned the mayor and city council of Omaha to ask the Omaha Street Railway Co. to extend its lines and improve its service to that suburb.

The Haverhill (Mass.) Georgetown & Danvers Street Railway reports gross earnings for the year ending Sept. 30, 1899, of \$23,209. Under the excise tax law the company pays the city \$66.30.

The Denver City Tramway Co. is to be prosecuted for not complying with the car heating ordinance. It is believed that the company has not been given a reasonable time in which to comply.

Boston experienced the first heavy snow storm of the season on January 1st, and all of the snow fighting facilities of the Boston Elevated R. R. had to be called into use to keep the cars moving.

The Dotz Third-Rail Electrical Co. was incorporated in Delaware last month, with an authorized capital of \$2,500,000. W. W. Dotz and William Reinhart, of New York, are among the incorporators.

A consolidation of the Virginia Electric Co., Norfolk Street Ry. and the Norfolk & Ocean View Railway Co., of Norfolk, Va., has been completed, under the name of the Norfolk Railway & Light Co.

The property of the Phoenix City (Arizona) Railway Co. was sold on December 28th by the receiver for \$33,342. The purchaser is the Phoenix Railway Co., a California corporation, and it is believed that Gen. M. H. Sherman who was at the head of the old

company is interested in the new one. The sale was ordered on account of a judgment for \$354,000 secured by the Valley Bank of Phoenix as trustee for the bondholders.

An application of the Atlanta (Ga.) Railway & Power Co. for the privilege of laying underground pipes for the purpose of supplying steam heat to the public has been held up by the Board of Aldermen.

By the deposit on December 27th of \$4,500,000 with the Continental National Bank, of St. Louis, the final step in the transfer of all the consolidating lines in St. Louis to the United Railways Co. is completed.

A gang of pickpockets is successfully working the street cars in Baltimore, as shown by the large number of losses reported by passengers. The holiday season, with its crowded cars, offered great opportunities.

The Chicago City Council has passed an ordinance requiring all street railway companies in the city to replace all flanged rails with grooved rails within five years. From this time on new track must be laid with grooved rails.

Among recent petitions to the Massachusetts Legislature was one from the Boston & Suburban Express Co. for authority to permit street railway companies to furnish it facilities for transporting mails, parcels and express matter.

The Newark (N. J.) Tax Board has announced that it intends to tax as real estate, the franchises of street railway, electric light and other companies enjoying public grants of this nature. The matter will be taken into the courts.

The Union Traction Co., of Anderson, Ind., will probably make arrangements for entering Indianapolis over the tracks of the Indianapolis Street Railway Co. It is stated very friendly relations exist between the two corporations.

Owl cars on the Broadway cable road in St. Louis are now operated by electricity instead of mules as heretofore. It is announced within a few months the Broadway line will have been entirely converted to electric traction.

The Berlin power station that supplies current for the third rail section of the New York, New Haven & Hartford R. R. was forced to shut down recently for several hours owing to the failure of the water supply due to the severe drought.

It is stated in Spokane (Wash.) papers that President Hill, of the Great Northern R. R., ex-Senator Warner Miller, of New York, and others are to build an electric road to connect the Republic mining camp with the Spokane & Northern road.

The statement is made that the company owning the union loop in Chicago is about to make application for permission to build elevated railways in Adams and Monroe Sts., from Fifth Ave. to Wahash Ave., thus changing the present loop into two smaller ones.

The Monongahela Traction Co., of Pittsburg, is about to lay out a new ball park at Kennywood. The athletic grounds will be a level field 450 ft. long and 350 ft. wide, with a grand stand having a capacity of 2,200, and two extensive bleachers at the side of the infield.

The litigation in the supreme court over the consolidation of the Cincinnati & Hamilton Electric Street Ry. and the Cincinnati & Miami Valley Traction lines into a through line from Cincinnati to Dayton has been compromised and through cars will soon be in operation.

The Bay Cities Consolidated Ry. has effected a settlement with the bridge commissioners of Bay County which puts an end to a controversy which has been pending for some time, and gives it the right to use the bridge and approaches on the payment of \$500 per annum.

The Brooklyn Rapid Transit Co. on January 1st made a 5 per cent advance in the wages of employes who had been continuously in the service for two years, 10 per cent for those in the service for three years, and 15 per cent for those who have been with the company five years or longer.

Abutting property owners have brought a number of suits against the Union Elevated R. R., Chicago, alleging damages by reason of the shutting out of light and by the vibrations. Similar suits filed some time ago have been decided in favor of the company and are now pending in the upper courts.

The gross receipts of the Milwaukee Electric Railway & Light Co., for the year ending Dec. 31, 1899, were \$1,977,193, on which the company will pay taxes of \$79,088 to the city. The gross earnings of the Milwaukee Light, Heat & Traction Co., were \$232,500 on which city taxes of \$4,650 will be paid.

The attorneys of the city of Columbus, O., have advised the council that the resolutions passed recently declaring sundry street railway franchises forfeited and directing the clerk to advertise them for sale, are void, as the council had no authority to take such action; it must originate with the board of public works.

As the result of the Brooklyn Rapid Transit Co.'s new transfer system whereby all the through travel from the suburbs is carried on the elevated roads, the traffic over the Bridge has increased to 190,000 passengers a day. The greatest number of passengers carried when this railroad was controlled by the municipality was from 145,000 to 150,000 a day.

The Tri-City Railway Co., of Davenport, Ia., has opened its new line to the Arsenal at Rock Island for the accommodation of the Government employes at that place. Special Arsenal cars will be run for this purpose morning and evening, and special employes' tickets entitling the holder to one round trip ride each working day in the month will be sold at \$2 per month.

An attempt to hold up a street car in Seattle, Wash., on December 28th, resulted in the death of one of the would-be robbers and the wounding of several of the passengers. Two masked men entered the car, which carried eight people, at 11 o'clock p. m., and ordered the occupants to throw up their hands. Instead of doing so several of the passengers opened fire on the highwaymen with the above results.

A deliberate attempt to wreck an electric car belonging to the United Railways & Electric Co., of Baltimore, was made last month on the elevated trestle over North St. An unknown person placed a large paving stone on the track between the rail and the wooden guard, but fortunately the first car that struck the stone was moving slowly and no damage aside from derailing the car was done.

Acting on the report of the fire chief of New York City that an unusual number of collisions between cars and fire apparatus had occurred recently, both the Metropolitan Street Railway Co. and the Third Avenue Railroad Co. have issued instruction to all the motormen and gripmen to stop their cars before crossing streets in which fire companies are stationed, to see if a fire engine or truck is approaching.

An authority states that the first-class passenger fares on the steam roads of the United States last year averaged 2.14 cents per mile. In England the first-class fare is 4 cents per mile; the third-class fare is 2 cents per mile; in Prussia the fare is 2.99 cents per mile; in Austria 3.05 cents per mile, and in France 3.36 cents per mile. These figures were compiled by George H. Daniels, of the New York Central R. R.

A new price list of leather belting has been adopted by the Leather Belting Manufacturers' Association. The following prices from this list will give an idea of the revised schedule: Single belting, 1/2 in. wide, 8 cents a ft.; 1 in. wide, 14 cents a ft.; 2 in., 34 cents; 4 in., 72 cents; 6 in., \$1.11; 8 in., \$1.48; 1 ft. wide, \$2.22; 2 ft., \$4.44; 3 ft., \$6.66; 4 ft., \$8.88; 5 ft., \$11.10; 6 ft., \$13.32. Double belting is twice the price of single belts.

A suit for foreclosure of mortgage has been filed against the Astoria (Ore.) Street Railway Co., and Judge McBride has been appointed receiver of the property. The mortgage is a first lien and there is now due the principal of \$25,000 and \$4,500 accrued interest. The company owns three miles of electric road, five motor cars and two trail cars, and one 80-kw. generator, one 125-h. p. engine and one 200-h. p. boiler.

The Keokuk & Hamilton Water Power Co. has been incorporated in Iowa by capitalists of Keokuk, Ia., and Hamilton, Ill., to develop the water power of the Des Moines rapids of the Mississippi River, and transmit it electrically to various cities and towns of the two states. The officers of the company are: Charles P. Birge, Keokuk, president; R. R. Wallace, Hamilton, vice-president; Edward Jarger, Keokuk, secretary and treasurer.

President W. Caryl Ely of the International Traction Co., of Buffalo, in a recent interview regarding the street railway transportation facilities at the coming Pan-American Exposition said in part: "We will have five lines of street cars running to and from the exposition grounds and will be in a position to care for from 75,000 to 100,000 persons an hour. North of the grounds we will have terminal tracks with room for between 400 and 500 cars."

The city council of Buffalo, N. Y., has passed a resolution requiring the Buffalo Traction Co. to begin the building of a few new lines next spring, allowing an extension of time on several other lines, releasing the company from its obligation to build a number of lines that were originally intended to parallel the routes of the Buffalo Railway Co., and removing the legal obstacles in the way of an actual consolidation of the Buffalo Traction Co. and the Buffalo Railway Co.

At the recent meeting of the Fairmount Park Transportation Co., of Philadelphia, the president stated that Woodside Park, in which the company had invested \$300,000, was in fine condition. The Transportation Co., during the year ending October 1st last, advanced the Woodside Park Co. \$45,000, and in addition expended \$20,000 in improvements. The number of passengers carried for the year was 2,552,562, an increase of 309,408 over the previous year. Net receipts were \$70,952.

The bitter feeling in consequence of the recent strike in Cleveland has not entirely disappeared, as is evidenced by the number of arrests that have been made of persons willfully annoying the new conductors and injuring the company's property. The chief amusement of the rowdies who caused the trouble was the ringing up of fares, for which the conductors would have to account. Another pastime was the cutting of the trolley rope and annoying peaceably disposed passengers.

The report of the Board of Railroad Commissioners of Maine for the year ending June 30, 1899, states there are 240 miles of street railways in the state, three of which are horse and the rest electric. The total gross earnings for all the roads is given at \$1,090,418; operating expenses, \$686,420; net earnings, \$403,998. There were two passengers killed and seven injured. Total number of passengers carried was 18,496,374. Motormen and conductors on street railways of Maine are paid from \$1.43 to \$1.60 per day.

The State Board of Equalization of Connecticut has completed the work of auditing the returns of the steam and street railway companies of the state for calculating the taxes. The largest amount of tax paid by any electric road is by the Fair Haven & Westville Ry., which pays \$36,728.73, the stock being valued by the board of equalization at \$25 per share. The next highest trolley taxpayer is the Hartford Street Railway Co., \$30,296.47, the stock being valued at \$125 per share. The smallest amount of tax is paid by the Newington Tramway Co., which has an existence practically in name only. The amount is 8 cents.

The superior court at New Haven, Conn., has awarded judgment for \$3,000 damages to the parents of a child killed by a car of the Derby (Conn.) Street Ry. The defendant at the trial made the fol-

lowing argument, that "as the statute authorizes the Railroad Commissioners to require street railways to place fenders on their cars whenever public safety requires it, this authority invested in the commissioners is exclusive and deprives the court of the power to find negligence from their absence in cases where the commissioners have failed to order their use." It is held, however, by the Hartford court that this is not good law.

ADDIS' SINGLE RAIL TRAMWAY.

The accompanying illustration is from Indian Engineering, in a recent issue of which is reprinted a letter, dated Nov. 2, 1891, from the inventor, W. J. Addis. The tramway consists of a single rail; the vehicles are any of those in ordinary use with the addition of

SINGLE RAIL TRAMWAY.

one or more centrally located wheels to bear on the rail. Mr. Addis states that the road has been worked in Europe, India and Burma, and recommends it for feeder lines and famine roads.

A CASE OF WORM EATEN PILES.

Mr. Onward Bates, engineer and superintendent of bridges and buildings of the Chicago, Milwaukee & St. Paul, recently presented before the Western Society of Engineers, of which he is president, an account of the experience of his road with worm eaten piles. The company uses Wisconsin oak for piling when this timber can be secured, but on one occasion was obliged to get a lot of Arkansas oak piles. These were driven in various bridges on the company's lines; two years later it was discovered that worms were eating the Arkansas piles in one of the bridges and 60 of them had to be replaced. Within four years after being driven all of this lot of piles were found alive with worms. The worms attacked the pile near the surface of the ground and worked downward, being most destructive in sandy soils and during dry seasons; they confined themselves to the Arkansas timber and did not molest northern oak piles driven in the same bent.

In answer to an inquiry, the Forestry Division of the Department of Agriculture gave the following information concerning these piles:

"If an oak is felled in Arkansas in May and left only a week on the ground and unbarked, the boring insects, like green flies on a dead animal, will have deposited their eggs by the thousands. Even if peeled and taken away, young larvae will continue their mischief. If the bark is pushed off, the logs at first do not show any conspicuous signs of the presence of these borers and thus may easily pass muster. From the fact that the piles decayed so readily it seems plausible that:

- "1. They were left in the bark for some time before peeling.
- "2. That they became infested by fungi (causing decay) as well as the borers.
- "3. That they remained in the wood for sometime and thus facilitated the progress of both.

"Any after-treatment except impregnation or subjection to dry kiln seasoning could not benefit these timbers.

"Had they been cut in winter (any time after September 15th), peeled and at once taken out of the woods to some dry yarding ground, they would have lasted as well as Wisconsin oak. Oak sapwood is generally not durable and it might be well to cut it away whenever the exposure requires great durability."

Mr. Bates stated the life of Wisconsin oak piles was from 12 to 18 years.

PATROLMEN AND FIREMEN USUALLY RIDE FREE.

There is one valuable service rendered by street railway companies to the municipalities in which they are located that is seldom taken into consideration when the questions of remuneration for franchisees, rates of fares, etc., are up for discussion. This is the carrying of city employes, as policemen and firemen, without charge, and in a number of cities this free transportation, if paid for at regular cash fare rates would amount in the aggregate to several thousand dollars per year. The greater portion of this sum is virtually a gift to the community, as it costs the company as much to carry a policeman or fireman as any other passenger. Most of the roads have of their own accord offered free transportation to these public servants although they were under no more obligation to do so than they were to carry without charge, doctors, school teachers or in fact any other class of citizens.

To ascertain what the custom is in this regard and to determine something of the cash value of this free riding the "Review" recently sent out a list of questions to a few prominent roads picked at random from different sections of the country. Of the 29 companies addressed only 2 do not carry either policemen or firemen without charge; 6 carry policemen but not firemen; and 21 carry both policemen and firemen. In nearly all cases the stipulation is made that these officers must be in uniform or a fare will be collected.

Twenty of the companies reporting do not keep records of free riders and 9 do.

The Albany Ry., and the Milwaukee Electric Ry. & Light Co. carry neither policemen nor firemen free.

The following companies carry policemen only and not firemen: Portland (Me.) R. R., Cleveland Electric Ry., Cincinnati Street Ry., Binghamton R. R., Ithaca (N. Y.) Street Ry., and Duluth (Minn.) Street Ry.

The following companies carry both policemen and firemen but are not able to estimate the total number that ride per annum: St. Louis & Suburban Ry.; Twin City Rapid Transit Co., of Minneapolis, Minn.; Omaha Street Ry.; Metropolitan Street Ry., of New York City; Union Traction Co., of Philadelphia; Wilmington (Del.) City Ry.; United Railways & Electric Co., of Baltimore, Washington (D. C.) Traction & Electric Co., and Louisville (Ky.) Ry.

T. M. Jenkins, general manager of the St. Louis & Suburban Ry., writes as follows: "We carry both policemen and firemen free of charge—that is the policemen when they may desire to ride, and firemen going to or coming from their meals. (Of course this clause is merely one of form, as we have no means of telling when any particular firemen is going to or coming from his meals.) Both policemen and firemen are required to be in uniform to entitle them to free transportation."

The Cincinnati Street Ry. has a rule that not more than two officers are to ride on a car at any one time.

Willard J. Hield, general manager of the Twin City Rapid Transit Co., of Minneapolis, writes: "We permit police and firemen when in full uniform, to ride free on all our cars. We receive compensation from the government for the transportation of mail carriers and postoffice special delivery boys, but this is paid in a lump sum, and they are allowed to ride on their uniforms and are consequently regarded by the conductor as free riders. The conductors report all free riders, but do not separate the different classes."

The following companies report the estimated number of police and firemen carried free each year and the value of this service if it were paid for at regular cash fare rates as follows:

Boston Elevated Ry., number carried, 3,285,000; value, \$164,250.

Denver (Col.) City Tramway Co., number carried, 81,000; value, \$4,050.

Columbus (O.) Ry., number carried, 264,000; value, \$13,200.

Buffalo Ry., number carried, 1,280,936; value, \$64,046.

Chicago Union Traction Co. number carried, 1,600,000; value, \$80,000.

Birmingham (Ala.) Ry. & Electric Co., number carried, 50,000; value, \$2,500.

Detroit Citizens' Street Ry., number carried, 800,000; value, \$40,000.

New Orleans City R. R., number carried, 530,000; value \$26,500.

Market Street Ry., of San Francisco, number carried, 360,000; value, \$18,000.

Consolidated Traction Co., of Pittsburg, number carried, 365,000; value, \$18,250.

Indianapolis Street Ry., number carried, 521,950; value, \$26,097.50.

Rochester Ry., number carried, 150,000; value \$7,500.

The Ithaca Street Ry. does not carry firemen free but estimates the number of police at from 5,000 to 6,000 per year, and the value of the service at \$250 to \$300.

The Duluth Street Ry. carries 73,000 policemen per annum; value of service, \$3,650.

MERRY-GO ROUNDS OR CAROUSELS; HOW THEY ARE MADE.

One of the most interesting manufacturing establishments that one can visit is found at 3635 Germantown Ave., Philadelphia, where the proprietor, Mr. G. E. Dantzel will explain to the visitor the method of constructing the mechanical details of one of these child fascinating amusement appliances, and what is still more interesting will describe the method of constructing the various wooden animals, and chariots on which the children are mounted for a ride. The animals provided with the carousels, which are turned out from this establishment are not mere graven images, stiff and ugly, but animals designed true to life, and graceful in form and poise, and in fact highly artistic as to form and coloring. In the process of manufacture, seasoned planks 3 in. thick, of poplar or other white woods are cut into peculiar shapes by a band saw, and then glued firmly together making a hollow box with various irregular attachments. These then go to the carving room and are carved by hand by skilled artists into the desired forms. The horses have glass eyes, genuine horse tails, and the saddles and saddle-cloths are carved in the wood. For models the designers go to the illustrated animal books or zoological gardens where they study animal life and draw and design in the most natural manner possible. If it be a horse that is being constructed, the head and mane are carefully formed and carved as if for a bronze statue, and the pose of the limbs and that of the whole body is oftentimes that of an animal running or galloping, and the detail designs are so accurate that even the shoes on the feet are carved and colored so as to imitate a real iron shoe. The favorite animals imitated include horses, donkeys, camels, oxens, deers, giraffes, buffaloes, ostriches, lions, dogs and almost all the animals familiar to child life, both domestic and wild. Not only is the carving carefully and artistically done, but the painting and decorating is in pleasing and durable colors. Two or four rows of animals are usually mounted on the large machines, and in some cases, the individual animals of the inside rows are mounted on ingeniously arranged movable pedestals which give to the animals an automatic rocking or galloping motion independent of the whirling motion of the entire device. Outfits are sold complete including motors or two-cylinder vertical or horizontal engines for operating the carousel, and also imported organ orchestrions, concertinos and trumpetinos for furnishing the music that is usually provided with these machines. The organ cylinders are made in the works and are so designed that they are interchangeable, so that a change can be made every year in the tunes played. The carousels are made in eight sizes and range from 36 ft. in diameter to 48 ft. and one size is a double deck machine 44 ft. in diameter. The different machines carry from 24 to 60 animals and from 2 to 6 double seated chariots which are also carved and beautifully upholstered and frescoed. The double deck machines carry 68 animals and 6 double seated chariots.

The carousels are sold at prices ranging from \$3,000 to \$7,000, depending upon size and finish. In one case an outfit was sold and put up with a tent at the Pittsburg Exposition for \$14,000 which paid for itself the first year.

Mr. Dantzel has been engaged in the manufacture of carousels, swings and other amusement appliances in this country since 1867. His father before him was engaged in constructing similar appliances for amusement more than 70 years ago in Germany. Mr. Dantzel claims that his products are the finest in the world, a result of long experience in this line of work, and from the fact that only the best and most skillful artists and carvers are employed for designing and shaping the animals, while the mechanical appliances are up-to-date in every particular. It is claimed that demand for amusement appliances of this character is increasing from year to

year, but the orders that come to this establishment are not confined to this country merely, but shipments are made to South America and other foreign countries.

A NEW SURFACE CONTACT SYSTEM.

The following description of a new surface contact system was recently given by Mr. W. H. Merriman, in the London Electrical Engineer.

Fig. 1 shows details of the cross section of this system. As a car travels along the road the flanges of the wheels press the treadle A, and with it the short plunger, B, thereby depressing the shorter arm of the lever. The treadle, A, may be either a rigid bar of a length equal to the wheel base of the car, or, preferably, a continuous flexible strip of steel as shown in Fig. 2. It is held in its

FIG. 1.

normal position by the studs, B, which are placed along the groove of the rails at intervals equal to the wheel-base of the car. When the short arm of the lever is depressed the long arm rises, carrying with it by means of the flexible coupling, f, the contact stud, C, C., which when raised makes electrical contact between D and E, the latter being in direct connection through a fuse with the main feeder. The contact stud when raised presses against the collecting bar fixed on the bottom of the car, a firm contact being secured by the spiral spring, S. At the end of the long lever a weight is fixed which is sufficiently heavy to prevent anything less than the weight of the car from depressing the treadles and raising the contact stud. This weight also insures the contact stud falling back promptly into its normal position. As soon as the car wheels leave the treadle the weight falls, and it will be seen from this arrangement that the stud is raised only when the car is directly over it and only is "alive" at such times as it is raised. Fig. 2

FIG. 2.

shows a diagram of the electrical connections with the alternative systems of rigid and flexible treadles, two of the plungers, B, being shown depressed as the car wheels pass over them, the contact studs consequently being raised.

The system appears to be extremely complicated on account of the number of moving parts and the ease with which dirt, stones, etc., would be able to work into the treadle and eventually prevent its being depressed. While the general idea of contact rising from the road, making connections with the collector and falling back "dead" again after the car passes, has long been an attractive

problem to inventors, the advisability of such a system is doubtful, and experience has proved that it is almost impossible to obtain a smooth working device which contains any great number of moving parts.

STREET CARS IN MANILA.

A private in Co. C, Thirteenth United States Infantry, stationed in the Philippines, writes as follows concerning the transportation facilities in Manila:

"The street cars in Manila are fearfully and wonderfully made, but not more so than some of the other conveniences for hire in the streets. You hear nothing but the whistle of the driver of the approaching street car, who uses an old trumpet with a squeaky and ear-splitting note, playing a weird tune for the purpose of clearing the tracks, which, however, never seem to want clearing."

MUNICIPAL OWNERSHIP WANTED AT SEATTLE.

There is in Seattle, Wash., a considerable party which strongly favors the municipal ownership of street railways and is conducting its campaign through a committee of 100. The committee has applied for a writ of mandamus to compel the city council to submit to popular vote at the election in March next a proposed amendment to the city charter. It is claimed that the council has disregarded a petition praying that such an amendment be submitted.

HIGH GRADE ELECTRICAL INSTRUMENTS.

The complete line of portable and switchboard ammeters, milliammeters and volt meters, made by the Jewell Electrical Instrument Co., of Chicago, has been on the market for two years and is giving perfect satisfaction, as is proved by the fact that the business of the company has so increased within the past six months that it has been necessary to secure larger factory floor space. This has been obtained at the corner of Randolph and Canal Sts., Chicago, and the works will be moved from the present location on February 1st, thus starting out the new year with a quadrupled factory capacity to meet the requirements of the rapidly growing patronage.

In the company's 1900 price list just received special attention is drawn to the following strong features of these instruments; rigidity of construction, especially noticeable in the movements; "deadbeat" qualities; constant temperature co-efficient; hand drawn scales, so that readings are as correct as the human eye can read; scale divisions are uniformly spaced; scale readings all begin at zero and the scale is adjustable; no magnetic lag, as the instruments have no iron in the moving parts; the device for eliminating effects due to static electricity.

A THREE-CENT FARE ROAD.

In order to get a connecting link for its line from Braddock, Homestead and other towns east of Pittsburg to the city, the Monongahela Street Railway Co. was obliged to accept a franchise from the town of Wilkinsburg which provided for 3-cent fares.

The 3-cent fare will be strictly confined to the limits of Wilkinsburg, so that town will now have the distinction of being the only one in America where the street railway rates are so low.

Several officials of the Allentown & Kutztown Traction Co., of Allentown, Pa., were severely injured recently while testing a new gasoline engine for driving street cars. The tank containing the gasoline was carried beneath the forward part of the car and by proper mechanism when the motorman turned a crank the vapor would ignite and the car start. On the first trial when the lever was turned a terrific explosion occurred and the occupants of the car, consisting of officers of the company, were thrown in all directions. It is announced that all experiments with gasoline as a motive power will be abandoned on this road.

The Birmingham (Ala.) Railway & Electric Co. has ordered 30 new summer cars.

PERSONAL.

MR. J. F. TAYLOR has accepted the position of general manager of the Madras Tramways.

MR. THOMAS LEES has been appointed superintendent of the Nashua (N. H.) Street Ry.

MR. HORACE E. ANDREWS has succeeded Mr. S. T. Everett as director of the Little Consolidated, of Cleveland.

MR. ALBERT S. RICHEY has assumed the duties of electrical engineer for the Union Traction Co., of Anderson, Ind.

MR. W. B. LONGYEAR succeeds Mr. W. F. Ham as auditor of the Brook'yn Rapid Transit Co., with all its allied properties.

MR. C. H. WILMERDING, of Chicago, has been appointed superintendent of stations for the Third Avenue R. R., of New York.

MR. R. B. DAVIS has resigned his position as superintendent of track department of the Syracuse (N. Y.) Rapid Transit Co.

MR. H. M. LYNN, of Milwaukee, is in charge of the extensions the Fond du Lac (Wis.) Street Railway & Light Co. is now building.

MR. JAMES R. CARRIER, superintendent of transportation of the Syracuse (N. Y.) Rapid Transit Co., has been succeeded by Mr. Harry J. Clark.

MR. MORRIS M. NASH will take the office of superintendent of the Lowell (Mass.) & Suburban Street Ry., made vacant by the death of Mr. Philip T. Begley.

MR. L. A. SCOVIL, superintendent of the Quincy (Ill.) Horse Railway & Carrying Co., has resigned to take a position with the street railway lines at Kansas City, Mo.

MR. EDGAR F. FASSETT will be superintendent of the new United Traction Co., of Albany, N. Y. Mr. Fassett was formerly assistant superintendent of the Albany Ry.

MR. ALFRED GIBBINGS, until recently engineer to the Bradford (Eng.) Corporation, has been made consulting engineer to the borough, and a new engineer will be appointed.

MR. WILLARD R. KIMBALL, a director and large stockholder in the Syracuse (N. Y.) Rapid Transit Ry., has sold all his holdings in that company and resigned from the directorate.

MR. JAMES WALLACE, formerly road-master of the Toronto (Ont.) Ry., has taken a responsible position in connection with the management of the Winnipeg (Manitoba) Street Ry.

MR. CHARLES E. FLYNN, superintendent of the Carbondale (Pa.) Traction Co., on Christmas eve received a midnight call from his employes and was presented with a handsome opal ring.

MR. ROBERT F. CARR, vice president and general manager of the Dearborn Drug & Chemical Works, of Chicago, is making a two months' business trip to the Pacific Coast and is now at Los Angeles.

MR. H. B. WESTCOTT, general manager of the Cortland & Homer Traction Co., of Cortland, N. Y., has accepted the position of general manager of the Sidney & Louisburg R. R., a steam line in Nova Scotia.

MR. W. G. MELOON, formerly superintendent of the Portsmouth, Kittery & York Street Railway Co., of Portsmouth, Me., has been made general manager of the road, succeeding Mr. A. F. Gerald, resigned.

MR. W. T. GOUNDIE, who has been for many years general manager of the Kings County Elevated R. R. of Brooklyn, has been made general superintendent of all the elevated lines of the Brooklyn Rapid Transit Co.

MR. E. H. MATHIER, assistant general manager of the street railway systems owned by the Connecticut Lighting & Power Co., has resigned to accept the position of treasurer of the Portland (Me.) Electric Light Co.

MR. BROWN CALDWELL, recently secretary of the Peerless Rubber Co., has assumed the position of general eastern representative of the Sargent Co., of Chicago, and will have offices in Pittsburg and New York City.

MR. W. G. WAGENIALLS, formerly superintendent of the Miami Valley Traction Co., now manager of the Millcreek Electric Street Ry., of Cincinnati, received a Christmas present from the employes of his road in the shape of an elegant leather upholstered chair.

GEN. MGR. E. C. HATHAWAY and Supt. R. T. Gunn, of the Lexington (Ky.) Railway Co., received handsome Christmas remembrances from the employes of the road on Christmas morning. Mr. Hathaway was presented with a leather upholstered chair and Mr. Gunn with a gold watch.

MR. W. S. DIMMOCK was last month appointed general manager of the Omaha & Council Bluffs Railway & Bridge Co., of Council Bluffs, Ia., a newly created office. Mr. Dimmock for the last six years has had the virtual position and authority of general manager under the title of general superintendent; the latter office will remain vacant.

MR. GRANVILLE C. CUNNINGHAM, who is known in street railway circles in this country through his connection with the electric railway interests of Toronto and Montreal, has resigned his position as managing director of the City of Birmingham Tramways Co., Ltd., of Birmingham, Eng., to accept the post of general manager of the Central London Ry.

MR. C. LOOMIS ALLEN, who succeeded Mr. John H. Moffitt as general manager of the Syracuse (N. Y.) Rapid Transit Co., has left Syracuse to take up the duties of general manager of the street railway system at Lorain, O. Mr. Allen was presented with a handsome gold watch by the employes of the Rapid Transit Co. the day he left for his new work.

MR. S. L. NELSON resigned as general manager of the Springfield (O.) Railway Co. on December 31st, and it is stated will take a similar position with the Wichita properties recently purchased by Mr. W. B. McKinley, of Joliet and Champaign, Ill. Mr. Nelson left Springfield with the best wishes of every man connected with the railway, and of his many friends among the citizens of Springfield.

MR. WILLIAM F. HAM auditor of the Brooklyn Rapid Transit Co., has severed his connection with that system to accept the office of comptroller of the Washington (D. C.) Traction & Electric Co. Mr. Ham's work in connection with the Accountants' Association has made him one of the best-known street railway men in this country and he will take with him into his new labors the best wishes of his host of friends.

MR. W. B. BROCKWAY, secretary of the Toledo, Bowling Green & Fremont Ry., and secretary of the Street Railway Accountants' Association of America, has resigned his position with the Toledo road to accept a flattering offer from the New Orleans & Carrollton R. R. He will enter on his new duties in New Orleans this month, and carry with him to his new work the best wishes of a large circle of friends.

MR. WALTER H. WILSON, who lately resigned as first vice-president of the Chicago Union Traction Co. and was succeeded by Mr. John M. Roach, was last month chosen third vice-president of the company, a newly created office. At the same meeting four directors were added to the board, Messrs. William Dickenson and John V. Clarke, of Chicago, and Walter S. Johnson and Henry B. Hollins, of New York.

MAJ. E. C. LEWIS on December 14th resigned as vice-president and director of the Nashville Street Railway Co. and the three subsidiary companies, the Nashville & Suburban Street Railway Co., the Citizens' Rapid Transit Co. and the Cumberland Electric Light & Power Co., with which he has been connected. Mr. T. J. Felder succeeds him as vice-president of the latter companies and Mr. S. M. Murphy as vice-president of the Nashville Street Ry.

MR. EDWARD P. BURCH, electrical engineer for the Twin City Rapid Transit Co., has resigned his position with that company to become a consulting engineer. Mr. Burch has been the company's chief electrician for nearly eight years. Among more recent work, he has installed and has supervised the operation of the electrical apparatus at the new 10,000 h. p. water power plant of the Pillsbury-Washburn Co., in Minneapolis, and has had entire charge of the Twin City Rapid Transit sub-stations in Minneapolis and St. Paul. The power plant has ten 1,000-h. p. direct connected units. Power is transmitted from 3 to 10 miles through paper insulated underground cables by three phase alternating currents at 3,500 and 12,000 volts and is transformed and converted at sub-stations into direct current at 600 volts for the entire railway system of Minneapolis and St. Paul. This was the first large installation of the kind. The system has been in operation over two years.

ELECTIONS.

THE QUAKERTOWN (PA.) TRACTION CO. has passed into the control of C. Taylor Leland. The new directors are S. R. Kramer, Perkasio, Pa.; W. H. Davis, Quakertown, Pa.; C. Taylor Leland, Quakertown, Pa.

THE CLARKSBURG (W. VA.) STREET RAILWAY CO., at a recent meeting, elected the following officers? President, S. C. Dunham; vice-president, Leonard Peck; secretary, V. L. Highland; treasurer, F. B. Haymaker.

THE STATEN ISLAND (N. Y.) ELECTRIC RAILROAD CO. has elected the following board of directors: Gen. Samuel Thomas, W. G. Oakman, W. E. Findley, H. W. Poor, J. H. Swinarton, T. F. Ryan, Charles R. Flint, H. H. Rogers and Col. G. B. M. Harvey.

THE HAVANA (CUBA) ELECTRIC RAILWAY CO., which has acquired all the street railway franchises and concessions in Havana, has elected new officers as follows: President, Edwin Hanson; vice-presidents, William L. Bull and R. A. C. Smith; secretary and treasurer, Arnold Marcus. Directors in addition to those above named are P. A. B. Widener, T. F. Ryan, Sir William C. Van Horne, William McKenzie, Frederic Nichols, II. M. Perkins, Thomas P. Fowler, E. H. Androni, William M. Doull, N. Gelats and G. B. M. Harvey.

The Michigan Traction Co., of Kalamazoo, Mich., is now controlled and operated by the Railways Co., General, whose offices are in the Harrison Building, Philadelphia.

CHARLES J. MAYER. A. H. ENGLUND.

MAYER & ENGLUND,

10 SOUTH TENTH STREET,

PHILADELPHIA, PA. NEW YORK OFFICE:
85 LIBERTY STREET.

CABLE ADDRESS:
"MAYLUND" Philadelphia.
A. B. C. Code, 4th Ed.

Electric Railway Material and Supplies of Every Description.

We are exclusive Territorial Representatives of the following leading Manufacturers of Railway Materials:

<p>R. D. Nuttall Co., Allegheny, Pa. Gears, Pinions, Bearings, Trolleys, Etc.</p> <p>Van Wagner & Williams Hardware Co., Cleveland, O. Drop Forged Copper Commutator Segments.</p> <p>The Protected Rail Bond Co., Philadelphia. "Protected" Flexible Rail Bonds.</p> <p>American Electric Heating Corporation, Boston, Mass. Electric Car Heaters of Every Design.</p> <p>Chisholm & Moore Manfg. Co., Cleveland, O. Moore's Chain Bolts.</p> <p>New York & Ohio Co., Warren, O. "Packard" Incandescent Lamps.</p>	<p>The International Register Co., Chicago, Ill. Single and Double Fare Registers.</p> <p>W. T. C. Macallen Co., Boston, Mass. Standard Overhead Insulating Material.</p> <p>Bradford Belting Co., Cincinnati, O. "Monarch" Insulating Paint.</p> <p>Sterling Varnish Co., Pittsburgh, Pa. Sterling New Process Insulating Varnish.</p> <p>Garton-Daniels Electric Co., Keokuk, Ia. Garton Lightning Arresters.</p> <p>D. & W. Fuse Co., Providence, R. I. Enclosed Non-Arcing Fuses.</p>
---	---

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

We carry the largest stock in this country of Strictly Electric Railway Material.

We are now occupying our entire building, five floors and basement.

Special Attention given to Export Business.

Send for Catalogues.

OBITUARY.

MR. PHILIP T. BEGLEY, superintendent of the Lowell (Mass.) & Suburban Street Ry., died recently.

DR. E. J. FINNEY, the well-known inventor of numerous electrical devices, died at his home in Fox Lake, Wis., December 19th.

MR. JOHN D. OXNER, who was for many years connected with the street railways of New York City, died at his home in Rome, N. Y., on December 21st.

MR. PAUL BEDFORD ELWELL, electrical engineer for the Government Railways in New South Wales, died at Double Bay, N. S. W. on September 10th.

CAPT. THOMAS H. BROWNE died last month of yellow fever. Capt Browne at his death was secretary and treasurer of the Havana Street Railway Co., and has been connected with the street railway system at Boston and with the Metropolitan Street Railway Co., of New York, leaving the latter position to go to Havana in September last.

NEW PUBLICATIONS.

A SECOND EDITION of the lecture by Walter B. Snow on "The Influence of Mechanical Draft Upon the Ultimate Efficiency of Steam Boilers" has just been issued by the B. F. Sturtevant Co., of Boston, Mass., by whom copies will be sent upon application.

"DIRECT CURRENT LABORATORY WORK IN AN ELECTRICAL ENGINEERING COURSE," read before the last meeting of the Society for the Promotion of Engineering Education by Frank W. Springer, instructor in electrical engineering, University of Minnesota, has been reprinted in pamphlet form and copies may be obtained by those interested on application to the author.

"WIRE ROPE" is the title of an 80-page pamphlet just issued by the Hazard Manufacturing Co., which describes the steel, iron and galvanized wire ropes made by this company and, more particularly, illustrates some of the many uses to which these materials are put. For the latter purpose there are handsome half-tone engravings of mining, railroad and manufacturing plants, inclined railways, bridges, yachts, ships, etc. This company's works were established in 1848, and it has recently extended the plant and engaged in making insulated electric wires and cables.

THE EMPIRE OF THE SOUTH is the royal title of 200 pages just published by the general passenger department of the Southern Railway Company, of Washington, D. C. It is certainly one of the largest, as well as one of the most handsome railroad publications we have ever seen. Each of the Southern states is taken in turn, and the hundreds of beautiful half-tone illustrations are accompanied by a description as interesting as a novel. No one who has ever traveled the South but will find the utmost pleasure in making the trip again as he peruses this book. Those who have never visited the southland cannot scan its pages without a strong resolution to see the cotton fields and mossy live oaks for himself, while to the young man starting out in life the "go west" may well be paraphrased to "go south and grow up with the country." Copies of the book may be had by sending the amount of the postage, 15 cents, to W. A. Smith, general passenger agent, Washington, D. C., or J. C. Beam, Jr., 80 Adams St., Chicago.

LES MOTEURS A EXPLOSION, by George Moreau, just published by Charles Beranger, of Paris, successor to Baudry et Cie., is a treatise on explosive engines prepared with particular reference to the application to automobiles, and comprises a full exposition of the principles underlying the design, construction and operation of motors for vehicles of this type. The development of the practicable automobile has been entirely in recent years, making this work very timely in its appearance. The plan followed by the author was to begin with the elements of the subject and give a complete analysis, the reader who has some knowledge of mathematics as applied in mechanics and physics will easily follow him.

The introductory chapters deal with general considerations and fundamental principles of thermodynamics and the theory of explosive motors. Following the ideal cycle is a discussion of the imperfections of the actual cycle and the causes of them; this chapter is admirable in its completeness. The problems in design resulting from the conditions imposed by the automobile are next fully treated and there is a chapter on the resistance of materials with formulas for the design of different parts of the apparatus. The calculations of capacity are based upon a consideration of what the author terms passive resistances, under which are friction, air resistance, the effect of the inertia of the moving parts of the mechanism. Chapters on the properties of different combustibles suitable for this type of motors and on the proper method of conducting comparative tests of automobiles conclude the subject. "Les Moteurs a Explosion" comprises 435 octavo pages; the typographical work is excellent.

The motorman of a car belonging to the Bridgeton & Millville Traction Co., while making his last run for the night recently discovered a farm house in an unrequented locality near Bridgeton, N. J., to be on fire, and with the aid of the conductor succeeded in rescuing the three inmates, who had been overcome with smoke.

ECHOES FROM THE TRADE

THE GRIFFIN WHEEL CO.'S products are popular. The Chicago works are turning out 1,500 car wheels a day.

THE GENERAL ELECTRIC CO. has declared its regular quarterly dividend of 1¼ per cent on common stock.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. declared a quarterly dividend of 1¼ per cent payable January 2.

THE ELECTRICAL INSTALLATION CO., of Chicago, is finishing up the work of what has been the busiest year in its history.

THE STERLING VARNISH CO. announces its removal from 324 Water St., Pittsburg, Pa., to the Times Building, 4th Ave., Pittsburg.

EXPORT BUSINESS is worth having—the "Review" advertisers are getting it because our foreign issue reaches every buyer each month.

THE VAN DORN & DUTTON CO., general machinery and engineering, of Cleveland, O., was early in the mails with a handsome wall calendar for 1900.

THE WESTERN ELECTRIC CO.'S. calendar for 1900 bears a fine half-tone engraving of the company's New York factory looking from the Hudson River.

THE CRANE CO., of Chicago, is furnishing all the steam piping, valves and accessories for two tramways at London, England, and one at Bristol, England.

EUGENE MUNSELL & CO., of New York and Chicago, report a larger business during the past few months than ever before in the history of the company.

THE OKONITE CO., of New York, is presenting its friends with an artistic calendar, on which are engraved views of Westminster Abbey and Windsor Castle.

THE W. T. VAN DORN CO., of Chicago, sold twice as many couplers during 1899 as have been sold in any one year since these have been placed on the market.

THE DEARBORN DRUG & CHEMICAL WORKS, of Chicago, is doing an extensive business in the West, and has offices at Los Angeles and San Francisco.

THE RAIL BONDS made by the American Steel & Wire Co., of Chicago, are in greater demand than ever before, necessitating the factory working night and day to keep up with orders.

ALFRED F. MOORE, 200-218 N. Third St., Philadelphia, maker of insulated electric wire, is distributing a large wall calendar, 22 x 14 in., bearing several early colonial views of historical interest.

THE SWARTS METAL REFINING CO., of Chicago, is preparing for an unusually large trade in castings during 1900. The demand has nearly doubled during the past year and prices are high.

THE MORRIS ELECTRIC CO. is the agent for Eastern states of the Spiral Journal Bearing Co., of St. Louis. This company's bearings are in use on a number of St. Louis roads and are highly recommended by them.

THE TWENTY-FIRST ANNUAL NUMBER OF THE TRADESMAN contains practical and valuable articles on the growth and development of various trades in the South, written by experts in the lines treated.

E. G. JOHNSON & CO., 1135 Broadway, New York City, state they are prepared to furnish at short notice experienced street railway superintendents, general managers, engineers, etc., to railway companies having vacancies.

THE TESLA ELECTRIC CO. on Dec. 9, 1899, secured a permanent injunction against the Scott & Janney Electric & Manufacturing Co., to prevent infringement of the Tesla patents Nos. 519015 and 555190 on polyphase motors.

RAILS AND ROLLING STOCK for the San Paulo (Brazil) Electric Light & Power Co. were shipped from Philadelphia on December 14th. The J. G. Brill Co. sent 13 cars and trucks and the Pennsylvania Steel Co. 7259 steel rails.

THE CONSOLIDATED CAR FENDER CO., of Providence, R. I., sent to its many friends at Christmas a small card bearing a "slight token" of its remembrance and best wishes. The token consisted of a bright new penny of the coinage of 1899.

THE GENERAL ELECTRIC CO. on Christmas sent to each of its railway friends a handsome souvenir of the Chicago Convention in the shape of a miniature car controller which on investigation proves to be a combined cigar cutter and match safe.

EXPORT BUSINESS is worth having—the "Review" advertisers are getting it because our foreign issue reaches every buyer each month.

THE WARREN ELECTRIC MANUFACTURING CO., of Sandusky, O., was "at home" to visitors on December 15th, from 2 to 5 p. m., the occasion being the test of three alternating generators the company had just completed for the lighting plant of Armour & Co., at the Chicago Stock Yards.

THE Q & C CO.'S. Stanwood step is being shipped to every part of the civilized world where street railways have been built. Managers that are particular about the details of their rolling stock equipment and desire to have their cars strictly modern and up-to-date should specify the Stanwood step.

MAYER & ENGLUND, of Philadelphia and New York City, are sending out one of the finest desk calendars of the season. Supported on a red background is a medallion portrait of a young woman finished in colors and enclosed in a gilt frame. The date pad is fastened in the lower right hand corner.

THE BABCOCK & WILCOX CO.'S. business for 1899 was nearly double that of the previous year. New works are being erected at Bayonne, N. J., having a greater capacity than the company's present factory at Elizabethport, N. J. The Chicago office is at 1215 Marquette Building, and is in charge of S. P. Wells, jr., manager.

THE MURPHY SAFETY THIRD RAIL ELECTRIC CO. has been incorporated in New Jersey by Matthias Plum, Alexander Beach and William M. Keepers of Newark, Charles T. Hayman of Cincinnati, and George H. Carey, John B. Renwick and Lauron Ingles of New York. The capital stock is \$2,500,000.

THE GARL ELECTRIC CO., of Akron, O., has sold its portable telephone and other electrical supply business to the Standard Silver Plating Co., of Akron, but these specialties will be handled under the name of the Garl Electric Co., as formerly. Mr. Garl will still have the management of the works. The president of the company is Hugo Schumacher.

THE WESTERN ELECTRIC SUPPLY CO., of St. Louis, sent to the trade as Christmas remembrances aluminum pocket cigar cases filled with cigars, which made a welcome and useful present. This company has built up an enormous business in electrical supplies and its success is largely due to the policy of giving all orders the promptest attention possible.

THE BETHLEHEM STEEL CO., of South Bethlehem, Pa., made its friends a New Year's gift of a handsome wall calendar consisting of a heavy cardboard back on which are mounted twelve leaflets, one for each month of the year. Printed on the card-board sheet is the company's valuable reference table of weights and on each leaflet is shown a typical Bethlehem steel forging.

THE EDWARD P. ALLIS CO., of Milwaukee, has enjoyed during the past year the largest trade it has ever had before in any one year, and to aid in meeting the demand for its engines has found it necessary to build a new shop 60 x 250 ft., and has also acquired the works of the Lake Erie Engineering Co., at Buffalo. A large extension to its Milwaukee plant will be built in the spring.

THE CONSOLIDATED CAR HEATING CO., of Albany, N. Y., has just finished delivering electric heaters for 147 cars for the new Northwestern Elevated of Chicago. These heaters are of a special type and 18 will be placed in each car, making 2,646 on the entire order. Richmond P. Scales is general agent for the Consolidated heaters, with offices in the Western Union Building, Chicago.

EXPORT BUSINESS is worth having—the "Review" advertisers are getting it because our foreign issue reaches every buyer each month.

THE CHRISTENSEN ENGINEERING CO., of Milwaukee, Wis., is out with a new catalog for 1900, entitled illustrated catalog A. It describes the Christensen system of air brakes with axle driven compressor, and also contains direction for equipment and instruction for motormen and care takers. A valuable feature is a four-page inset diagram complete, of a quick acting automatic air brake equipment.

THE WESTERN ELECTRIC CO., of Chicago, has recently issued bulletin No. 3003, descriptive of power and lighting machines. It contains illustrations of the different types of belt connected generators, and gives a full description of the general details and construction of the machines, a complete list of slow speed multipolar motors from 3 up to 300 h. p., for 110, 220 and 500 volts, and a list of slow speed belt driven multipolar dynamos from 3 to 250 kw.

THE DE WITT SAND BOX CO. is a new company organized in New York by E. F. De Witt, for the purpose of making the De Witt common-sense sand box. The new company will assume the business of the E. F. De Witt Co., of Lansingburg, N. Y., and has offices at 36 Wall St. The officers of the company are: President, G. S. Lewis; vice-president, E. F. De Witt; secretary and treasurer, Daniel E. Wing.

THE SIEMENS & HALSKE ELECTRIC CO. OF AMERICA, with head quarters at Chicago, has elected the following directors: Samuel Insull, M. J. Budlong, O. S. Lyford, jr., C. B. Rockhill, Levy Mayer, T. A. Moran, jr., Martin Moloney, Isaac L. Rice and R. McA. Lloyd. The officers of the company are: President, R. McA. Lloyd; vice-president, O. S. Lyford, jr.; secretary, Willard T. Block; treasurer, F. Vieweg; assistant secretary and treasurer, M. J. Budlong.

EXPORT BUSINESS is worth having—the "Review" advertisers are getting it because our foreign issue reaches every buyer each month.

PERCE & RICHARDSON, electrical and mechanical engineers, of Manhattan Building, Chicago, during the year just closed have completed power stations for Adams & Westlake, Armour & Co., Kansas City Electric Light Co. and Kansas City Edison Co., for the Chicago City Railway Co., and many others. The work for the Chicago City Ry. included the remodeling of the 21st St. station and changing it from a cable to an electric plant. They are now at work on a number of important installations.

THE JAPAN-AMERICAN ASSOCIATION, of Tokyo, Japan, announces that it has established American offices in the Singer Building, New York City, for the purpose of furnishing practical assistance to manufacturers, shippers and others of the United States desiring to make reliable business connections for the sale of their products in Japan, China, Korea, Straits Settlements, Philippine Islands and Hawaii. The association does not buy or sell, nor does it accept commissions. An annual registration fee of \$25 is charged.

THE ELECTRIC STORAGE BATTERY CO., of Philadelphia, Pa., during the year just passed has closed many important contracts. Among the largest in the West may be mentioned a 2,300-ampere-hour battery for the Chicago Edison Co., this being a duplicate of one installed for this company some time ago; also a smaller battery for the Chicago Edison Co., at its 27th St. sub-station. The company has also furnished a 4,000-ampere-hour battery for the Columbia Edison Co., Columbus, O., one of 8,000-ampere-hour capacity for a station at Minneapolis, and batteries for Waterloo, Ia., and Rockford, Ind. The works at Philadelphia are now turning out the batteries for the nine sub-stations of the Union Traction Co. at Anderson, Ind.

J. J. RYAN & CO., brass founders and machinists, Chicago, report that the sales in brass, bronze and aluminum castings during the past year has been something more than 300 per cent greater than that of any year since 1893, and the company has had to increase its foundry facilities three times during the year in order to keep up with orders. Its trade in babbitt metals has increased in the same ratio as castings. In the machine shop every tool has been in use for the first time since 1893. The equipment in this department has been increased by the addition of milling machines and a number of other tools. The polishing, electro-plating and metal pattern departments have been running up to full capacity. The company is looking for a continuation of these conditions for 1900.

THE B. F. STURTEVANT CO., of Boston, Mass., reports an increase of nearly 40 per cent in the volume of its business for 1899 over that of the previous year. The shipments, both foreign and domestic, included fan blowers for all purposes, heating, ventilating, drying and mechanical draft apparatus, engines, electrical apparatus, etc. During the past year an addition covering 20,000 sq. ft. has been made for the use of the electrical department, which has shown the most rapid growth, the output having more than doubled during the year, and covering principally electric fans and special generating sets. The sale of mechanical draft apparatus has been practically quadrupled, while the output of engines has increased one-third over that of the preceding year, and has included many special designs.

THE STAR BRASS WORKS, of Kalamazoo, Mich., has recently made a change in the management and some of the stock has changed hands. The officers now are: Horace B. Peck, president; H. P. Schutt, vice-president; O. P. Johnson, secretary; A. B. Connable, treasurer; Fred P. Crockett, general manager. The officers and Wm. S. Dewing and Charles A. Peck constitute the directors. The company was incorporated in 1898 and engaged in the manufacture of brass and aluminum and similar castings and hardware specialties. On the trolley wheel and harp of its make the works has gained a deservedly high name throughout the country. The harps and wheel are reported to be in use on almost all the principal trolley lines of the country. The works has heavy orders booked and the trade is growing rapidly.

EXPORT BUSINESS is worth having—the "Review" advertisers are getting it because our foreign issue reaches every buyer each month.

THE VAN WAGONER & WILLIAMS HARDWARE CO., Cleveland, announce the termination in their favor of the suit against the Billings & Spencer Co., which is more fully explained in the following extract from the opinion rendered by Judge Taft, in the United States circuit court for the northern district of Ohio, eastern division:

"The parallelism of the fiber with the longitudinal axes of the arms is something which has been dwelt upon at great length in the expert evidence for the complainant, but the result of the experiments of the expert, when subjected to cross-examination, shows that the increase in conductivity of the commutator,

AN AMERICAN PRODUCT PURE AND SIMPLE

THE Q & C- STANWOOD IS A STRICTLY HIGH-GRADE STEP

CHICAGO

NEW YORK
LIBERTY & CHURCH STS.

SEND FOR CATALOGUE.

due to this parallelism, is practically unworthy of note. * * * After reading the voluminous record carefully, I am clearly of opinion that the use of the drop-forging for the commutator bars does not produce an article which, in view of the prior art, entitles its first discoverer and user to a patent and monopoly."

THE SARGENT CO., of Chicago, manufacturer of iron and steel castings, has increased its facilities and has placed an order with the Western Electric Co. for one 150-kw. 125 volt belted generator.

ARTHUR W. FIELD, of Boston, agent for street railway specialties, is presenting to his many friends in the trade a small calendar, the upper half of which bears a reproduction of a photograph showing Echo Bridge, at Newton, Mass.

THE W. R. GARTON CO., of Chicago, is prepared to supply very nearly everything in the way of street railway material for which a manager may have a call. Its long list of A-No. 1 agencies enables it to ship at short notice rail bonds, commutator bars, circuit breakers, reflectors, trolley wheels, tape, wire, incandescent lamps, insulating compounds, mica, street car gongs, motor supply and repair parts, gears, pinions, bearings, trolley poles, carbon brushes, etc. The company's motto is "Honorable dealings in business."

NEWS NOTES.

ALLENTOWN, PA.—The Lehigh Valley Traction Co. is preparing for the construction of a nine-mile line from Catasauqua, via Nazareth, to Baty Rights of way through Bath have been applied for. A. F. Walter, secretary Allentown & Lehigh Valley Traction Co.

ALLIANCE, O.—The Alliance, Sebring & Salem Electric Railway has been granted an increase of capital stock from \$100,000 to \$300,000.

ATLANTA, GA.—The Atlanta & Western Railway & Power Co. will procure a franchise for the construction of an electric railway between Atlanta, Austell and Marietta. Petitioners for the franchise are M. B. Earnhardt, Eli West, L. C. Lull, A. E. Childs, W. S. Hays, S. A. Collins, J. S. Schman, W. J. Northen, T. B. Neal, E. P. Black and A. H. Cox. The application is filed by Abbott, Cox & Abbott, attorneys.

ANACONDA, MONT.—The Electric Light & Railway Co. is preparing to build a new power house. The best equipment procurable will be purchased. J. A. Dunlap, purchasing agent.

ASHVILLE, N. C.—It is reported that I. B. Wilford, of Bowling Green, Ky., will build an electric line from Ashville to Weaverville, eight miles distant. A charter has been applied for.

ATTLEBORO, MASS.—A franchise has been granted to the Bristol County Electric Railway Co. for a line that will be constructed in the early spring. H. E. Swazey and D. A. Brooks, Attleboro.

BALTIMORE, MD.—The Patapsco Park Electric Railway Co. is authorized to extend its line from the city to Patapsco park. John Grason, attorney for the company, Baltimore. Surveys have been made for a railway to connect with the United Railways & Electric Co.'s system from a point near the Patapsco river. E. A. Howell, Chester, Pa., chief engineer.

BANGOR, ME.—The Penobscot Central R. R., 26 miles in length, connecting Bangor and Charlestown, may be purchased by Philadelphia and Boston capitalists and extended to Corinth. Inspections of the road with a view to determining the cost of extension are being made by G. D. Howell, Philadelphia, and L. Tillinghast, Boston.

BRATTLEBORO, VT.—B. J. Weeks, of Quincy, Mass., and others, propose an electric line to connect Brattleboro and Keene, N. H.

BROCKTON, MASS.—The Boston, Milton & Brockton Street Railway Co. has petitioned the General Court for authority to construct an electric line over the Blue Hills Parkway. B. Hamilton, secretary.

BUTTE, MONT.—The Butte Electric Railway Co., with a capital stock of \$100,000, has been incorporated to build and operate an electric line in Butte. Incorporators: W. A. Clark, Butte; J. A. McDonald, New York; and H. Gattwater, East Orange, N. J.

COLUMBUS, O.—The Worthington, Clintonville & Columbus Street Railway Co. has applied for a franchise for the extension of its line. T. A. Simons, manager.

CHILICOTHE, O.—The Chillicothe, Clarksburg & Columbus Electric Railway Co. is making surveys of its proposed line, 52 miles in length. Isaac S. Cook, president, writes the "Review" that estimates are being made, and the work of construction will continue through the winter.

COLUMBIA, TENN.—D. F. Carpenter, of Cleveland, O., has a proposition before the Chamber of Commerce of Columbia for the construction of an electric railway between Columbia and Mount Pleasant.

CORSICANA, TEX.—S. W. Bogy, of this place, desires propositions for the construction of a street railway from any persons who may be interested in the project. Mr. Bogy reports Corsicana as a most promising field for such an enterprise.

COLORADO SPRINGS, COL.—The contract for grading the first 23 miles of the projected Colorado Springs & Cripple Creek District R. R. has been awarded to Orman, Crook & Co., Pueblo. Bids for grading the remaining distance will be received and contracts awarded later. The line will be 38 miles in length, connecting with the Cripple Creek Electric line at Cameron.

COFFEYVILLE, KAN.—C. L. Long, of Coffeyville, represents an eastern company in application for a franchise to build a street railway in this city. The city is disposed to grant the franchise, in which case it is promised that the road will be at once constructed.

COLORADO SPRINGS, COL.—C. M. Coleman has applied for a franchise for an electric street railway to be built in this city and suburbs.

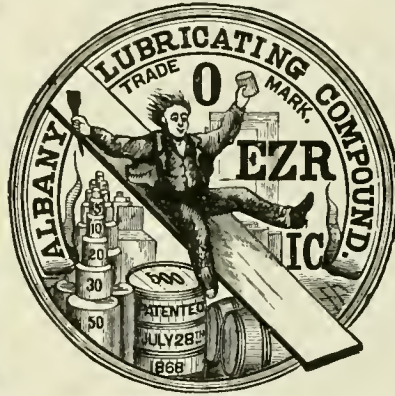

CANTON, O.—Fire in the barns of the Canton-Massillon Electric Railway Co., December 24th, damaged the barn and cars to the extent of \$15,000. The loss is covered by insurance. H. C. Fogle, manager.

The Canton-Massillon Electric Railway Co. has announced its purpose of reconstructing all its lines in the spring, and changing to standard gage. The Massillon branch will be extended to Navarre, five miles distant. H. C. Fogle, manager.

CAMBRIDGE, O.—The Cambridge & Byersville Electric Railway Co. has obtained a franchise through Cambridge for the projected eight mile line from Cambridge to Byersville, via Nocolson. Franchises in Byersville have been applied for. Address A. E. Townsend, Doylestown, O.

CLEVELAND, O.—A Canton syndicate is promoting an electric railway to be built from Canton to Akron, connecting with the Akron, Bedford & Cleveland line and thus affording a direct route to Cleveland. Henry Everett and others who control the A. B. & C. line are believed to support the project. The United States Construction Co. has been awarded the contract for the construction of the Massillon, Akron & Cleveland Ry. The contract calls for 60 miles of road, to be completed within a year. The estimated cost is \$1,000,000. A power house will be built between Akron and Massillon.

THE LIFE OF A MOTOR **ALBANY GREASE**
Is Prolonged by Using

Has never failed to reduce a hot journal where used. Cost of expense using oils. **Cost of expense using Albany Grease.**

Every Engineer and Machinist ought to send for a free catalogue and sample, as the use of Albany Grease saves oil, time and trouble.

ONLY MADE BY
ADAM COOK'S SONS,
313 WEST ST.,
N. Y. CITY, U. S. A.

Remember—A sample can of Grease with an Albany Grease Cup, free of charge or expense for testing.

Branch, 55 S. Canal St.,
Chicago.

THIS TRADE MARK ON EVERY PACKAGE.

THE GRAF AUTOMATIC, LIFE-SAVING FENDER.

For Electric, Cable, and Other Motor Cars.

ALSO FOR AUTOMOBILES, AUTOTRUCKS, AND ALL OTHER MOTOR VEHICLES.

Patented in United States, Great Britain, Canada, Germany, France Hungary, Austria and Belgium.

Fender Received Highest Award, over all other Fenders, at American Institute Exposition, Madison Square Garden, New York, and stands Highly Recommended by THE PRESS.

Fender is operated by the Motorman, or by the Person being rescued, at the same time; doing away with the old excuse, "I did not see Person," or "could not stop in time," or "Person came from behind a Car, or Vehicle."

Fender is Reliable, Durable, and Ornamental, and cannot be damaged through Collisions, or unnecessarily Weather-beaten, thereby saving quite an item of expense, a valuable advantage over Fenders, which are attached outside on front of Cars, or Motor Vehicles.

Working Model of Fender, is open for Inspection.

Fenders, Manufacturing Rights, or Patents For Sale.

For full particulars address,

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

FEBRUARY 15, 1900.

NO. 2

At the convention of the League of American Municipalities, which warmly advocates the municipal operation of public utilities, a proposition was made in behalf of the Northwestern Electrical Association and the National Electric Light Association to bear one-half of the expense of an investigation of 20 municipal electric plants, to be selected by the president of the League, in order to determine the true cost of service for comparison with the rates charged by private companies. President Doherty of the Northwestern Electrical Association stated in his annual address that the League would only accept this offer upon the condition of being able to raise the necessary funds, and that so far as he could learn no efforts to raise money for the purpose had been made.

If those active in the councils of the League of American Municipalities are favoring the principles they advocate from purely selfish motives it is not surprising that they should look coldly upon this offer to get at the facts, though the action should place them in a bad light with the public. No unprejudiced persons ever attempted to investigate the cost of an undertaking of this nature as operated by an American city who did not put on record a protest against the methods of municipal bookkeeping.

In December, 1897, page 831, we published data taken from the annual message of the mayor of Chicago, which showed that in 1896 the cost of operating the city lighting plant was \$96.40 per year for each street lamp. Interest at 5 per cent and depreciation at 10 per cent for machinery and 5 per cent for poles, cables and conduits, brought this figure to \$172 per lamp. During 1896 private companies furnished the 517 street lamps by contract at a cost of \$110.24 per lamp; the contract lamps were required to burn the same number of hours per year as the city lamps. We repeat these figures because the subsequent annual reports do not contain data on the cost of investment from which fixed charges can be estimated. The report for 1898 says that the cost of the city lamps was

\$68.52 per year and it is naively added "Formerly the city paid \$137.50 for rented lamps." It is not apparent why comparison should be made with that "former" period rather than with 1896, when the cost of rented lamps was only \$110. The annual message for 1898 does not give the cost of rented lamps per lamp nor the number of such lamps; only the gross rental is shown.

A number of interesting questions are briefly discussed in the introduction to the annual report of Maj. I. B. Brown, superintendent of the Bureau of Railroads of the Commonwealth of Pennsylvania, for the year ending June 30, 1899, an abstract of which will be found on another page. It appears the street railways of the state are in a fairly prosperous condition, the receipts from passengers showing an increase of about \$1,900,000 over the previous year. The 161 operating and subsidiary companies paid in dividends \$9,133,647 and the 90 operating companies have a surplus of \$789,593 from the year's operations. The report calls attention to the wonderful advances made in the last 10 years with reference to the convenience, the speed and the comfort in the local transportation of passengers on street railways and notes the entire disappearance of every vestige of the old horse railways. Mention is also made of the many consolidations and merging of interests that have taken place, the roads in Pennsylvania having been particularly active in this respect.

The report urges legislation for abolishing grade crossings at the points of intersection of steam and street railways, the statement being made that probably one-half of the accidents that occur in the operation of street railways in Pennsylvania are due to crossings at grade.

What seems to be almost an anomaly is presented by the statistics referring to employes. Although the mileage and number of cars have considerably increased, the total number of street railway employes on all lines has decreased from 12,680 on June 30, 1898, to 12,506 at the same time in 1899, the decrease undoubtedly being due in large part to consolidations. But the total wages paid to employes has increased from \$6,542,840 in 1898 to \$6,569,041 in 1899, so that it would appear that while consolidations enable fewer men to care for and operate a greater number of cars and miles of track, it is necessary to increase the actual total compensation to employes.

Another very interesting feature of the report is the observations made on the percentage of pedestrians and bicycle riders to the number of passengers on the cars, which will be found in the resume of the report printed on another page. Of 10,791 persons passing a given point during a given period in the city of Harrisburg, 66.02 per cent were pedestrians, 19.12 per cent were on wheels and 14.86 per cent were in cars. The percentage of wheel riders is considerably lower than for the two previous years, and the figures would seem to indicate that the number of wheels in use had dropped to a nearly permanent level, so that, as is pointed out, the problem now before the manager is not so much how to overcome the competition of the bicycle as it is to make it advantageous for a large portion of the 66 per cent of pedestrians to patronize the cars.

Some of the publications devoted to the growing interests of the horseless carriage are using considerable space in exploiting the possibilities of their various vehicles as active competitors of street railways in the transportation of passengers in cities, and passengers and express in country districts.

The street railway interest has nothing to fear, in our judgment, from competition of the horseless carriage. At the present time its use is more of a pastime for a few wealthy persons who are forming automobile clubs, and for transient service in two or three large cities, than any well organized system of passenger transportation. By this we do not mean to be understood as in any way underestimating the desirability of supplanting the horse for city work in carriage and cab service. But there is a long way, and it is full of obstacles, between this transient service and the transportation of any considerable number of people at fixed hours, and under all conditions of weather, such as enter into the street car problem. The various vapor motors have not yet been brought to any such degree of perfection as to warrant the establishment of large numbers of these vehicles on certain routes with specified schedules. The electrical storage battery carriages and delivery wagons operate quite satisfactorily, but the character of their work thus far has been of such a nature that no particular harm results

when they run out of current or fail to work, as they sometimes do.

To transport any considerable number of people the carriage must be of large size, and with the necessary battery storage, of considerable weight. The heavier this becomes the greater the disparity between the auto with its wheels resting on pavement and the street car which runs upon rails. The auto, possibly, can make even better time in cities than the car, when built to carry say two to four people; but such a service cannot be rendered for less than five to ten times the usual street car fare. To carry at five cents per passenger there must be large carrying capacity to reduce the cost per passenger, of the crew in charge.

The auto would have some advantage over the car in that it has no expensive tracks and paving to maintain, and can run on boulevards and such residence streets as have no car tracks, or where it is impossible to get rights to lay tracks. This would land passengers residing on such streets practically at their own doors; on the other hand, when the auto gets down into the business district it is doubtful if it could make as good time threading its way among other vehicles as the car which has a definite right of way, from which it can not turn out, thus forcing other vehicles to turn out for it.

The cities where omnibus lines and cabs are in service are found to show that the business carried by them is no considerable factor in competition with surface car lines.

In country districts the auto comes under the head of fair weather carriers. They might do good service during certain seasons of the year, and in such districts as have good hard gravel roads could make pretty fair time; but their operation even then must be in the nature of furnishing a service where the traffic would not warrant an electric line. The interurban would easily average from two to four times the speed of the auto.

It would seem then that the auto service cannot expect to compete with the street car, either in time or carrying rates. It should, however, find a field of usefulness in supplying outlying districts which have not yet grown up to the ability to support a street car line, and where some kind of feeder service is desired. For this the auto is adaptable, as the number can be increased morning and night without much trouble, and the day service cut down with a minimum of investment lying idle. It may be that street railways will come to use them in this way, as the batteries could be charged at comparatively slight expense during the late and early hours when the station load is light.

The question of abolishing grade crossing of railroads and highways is one that is attracting more interest and discussion each year, and one of the reasons for this is the increase in the number of highways occupied by interurban electric lines; in cities the grade crossing problem increases in importance as traffic grows in volume, but here, also, the most dangerous crossings are in the streets occupied by street railways. In a series of articles published in the "Review" in October and December, 1897, and February, 1898, an attempt was made to summarize the laws governing crossings of steam and electric roads and the general policy of the states and railroad commissioners concerning crossings. The tendency generally manifested by state legislatures is to prevent so far as possible any new crossings of railroads being made at grade unless interlocking or other safety devices are provided, leaving to the future plans for removing grade crossings now in existence. In New York, Pennsylvania, Massachusetts and some of the smaller of the Eastern states, the work of abolishing the existing crossings has been undertaken with considerable success.

The report of the Massachusetts Railroad Commissioners for 1899 showed the total expenditures of the state, under a general law passed in 1890 and other special laws applying to Boston, for abolishing grade crossings up to Jan. 1, 1899, to be over \$3,370,000. Under the general law mentioned the state bears 25 per cent, the city or town 10 per cent and the railroad 65 per cent of the cost; under the special laws mentioned the share of the state was 31.5 per cent and of the company 55 per cent. The total cost of the work in the eight years was over \$12,415,500. Some idea of the progress made is had from the statement that there were 2,070 grade crossings in the state; 27 had been abolished during the year, 14 were in process of abolition and petitions concerning 155 more were pending.

In New York a law was passed in 1897 providing for the abolition of grade crossings on the motion of the city, the railroad or the

commissioners, the cost being assessed between the state, the city and the railroads concerned in the proportion of 1, 1 and 2. The commissioners in their annual report for the year 1899 gave the number of crossings actually abolished under this act as 19; work is in progress on 25 others, determinations have been made in 13 cases and 44 petitions are now pending.

In Ohio when a city and a railroad company agree upon the elimination of a grade crossing the railroad company is required to pay not less than 65 per cent of the cost and the city not more than 35 per cent. The city of Cleveland has recently taken up this question and is now discussing the abolition of grade crossings of electric and steam tracks within the city limits. The city's portion of the cost of making the changes is estimated at \$400,000, and it asks that this expense be borne by the street railways which use the crossings in question. The steam railroads either own their rights of way in fee or have a perpetual easement; on the other hand the street railways in Ohio are limited to short terms of years in their occupancy of the streets, and this difference in charter or franchise rights does not admit of the same reasoning being applied when discussing what is an equitable division of cost. This was clearly recognized by the city of Cleveland when it asked the street railways to pay its share, as the proposition included an agreement to reimburse the companies in case they do not succeed in securing renewals of their franchises.

As pointed out in a paper on grade crossings elsewhere in this issue, the advantages to the street railway of abolishing a grade crossing are a slight saving in time and in the decreased liability to accidents. The first is not important and the second is problematical in amount and is a benefit which cannot be assigned a money value and which is shared by every other user of the street.

In discussing the problem it is only fair to consider that the steam railroad is the source from which the danger emanates. An electric car might, it is true, run into a steam car standing on the crossing, but it would be with a minimum of damage to the steam car and a maximum danger to itself. A steam train or car, on the other hand, could not fail to injure the street car or occupants when in collision. We fail to recall a single instance where the steam train has been derailed when in collision at any of the recorded grade crossing accidents. This being the case, it would seem to us that the percentage of cost of abolishing grade crossings, which the city of Cleveland wishes allotted to the street railways as their share, is somewhat larger than the conditions warrant, even after admitting certain advantages of time and safety which the street railway gains by the change.

Owing to the extraordinary rapidity with which street railways have been built and developed and the fact that the constructing engineers in many cases had no long term of experience such as prevails in steam road construction, a condition has been created involving a great lack of uniformity. This is not so much a matter of surprise although none the less unfortunate, and is discerned as never before now consolidations are being made.

The electric railway developing with such tremendous energy, and being itself a new engineering problem, there arose the necessity not only of calling in engineers who had never built such roads before, but even using those who had never constructed any street railway whatever. Many of these men were bright, resourceful, energetic fellows, fresh from the engineering schools, but without any previous practical experience. Others had been in the employ of horse roads, and commanding the confidence of the directors were retained to plan and execute the transformation to electric power. That so large a number succeeded as well as they did, and with no greater losses in experimental work is indeed the wonder, rather than that mistakes were frequently made.

The companies manufacturing electric apparatus and machinery were freely drawn on for information as to engineering rules regarding which in the first few years they knew almost as little as those they counseled. Thus the blind tried to lead the blind, and as we look back it seems little short of a miracle that both did not perish in the ditch together.

At the end of 10 years a fairly established practice was reached as to many features; that is, a generally accepted theory was adopted as to certain things which were not to be. But all this time the growing and expansion and extension policy was at work in all our cities. Instead of inspecting carefully a series of roads in as many cities and carefully discarding the weak features and copying the

strong ones, the engineer seemed possessed of an irresistible desire to stamp his own individuality upon his road, and to do this he devised new ways and means. The same experience marked the installation of cable roads, no two of which were exactly alike, and most of the later built were by no means an improvement on the earlier types.

Not only was this great dissimilarity between roads in cities east and cities west; but of two, three or five roads in the same city, no two were alike to any considerable extent. Perhaps each had a different rail section; a different system of feeder wires was usual; as to the power house equipment, one road had high speed belt connected engines; another had simple engines, and a third was running condensing. And when it came to rolling stock! Not only would each company in the same city build a different type of car from that in use on the other roads there, but in many instances there would be such a variety of trucks, motors, and cars on a single road, as would make it a working exposition of electric railway apparatus. We call to mind a road which once ordered one car from each of all the various car builders, and placed under this Babel of car bodies a polyglot of trucks. The idea was to have a personal demonstration of the good or bad qualities of each, letting the fittest survive. These equipments have not yet worn out, and already fully one-third of the building concerns have either gone out of business entirely, or abandoned street railway work.

We should not, however, wholly condemn the engineer, contractor, or manager who has several mitigating circumstances to plead. There was the evolution of the art, and his desire, and frequently the necessity in many directions, to advance with the times and in buying for additions and extensions to purchase the improvements which came with such bewildering rapidity. Some of these new departures proved to be improvements and some proved otherwise. If the engineer guessed right, he took due credit to himself for his perspicuity; if it turned out a disappointment he laid the failure on the builder and comforted himself—and so far as possible his directors—by pointing out others whose condition was such as to be really deplorable.

Nor was the energetic manufacturer, builder and sales agent altogether an unknown quantity in producing this growing chaos of property. The sellers called to their aid scores of bright young men against whose persuasive arguments the bewildered manager was no match. This season one company secured the order for new cars; the next another carried off the prize. And the steady depression in business for five years greatly accentuated this distribution of orders, for the manager felt a strong obligation to purchase from low bidders even if the plans and specifications were by no means similar to those of the previous year. Stockholders and directors also did their full share by putting pressure on the manager to buy cheap even against his better judgment and earnest protest.

And thus has come about, by what may fairly be termed natural conditions, this lack of uniformity which, as intimated in the outset, is now brought forcibly to view since consolidations of several lines in the same city are being consummated every month. The corporation taking over the properties finds itself in possession of a little of everything in the way of track, overhead equipment, power plants and rolling stock. Motors of all types and sizes, trucks and car bodies of varying lengths; wheels of assorted sizes, weights, treads and flanges; axles long, short, small and large diameters. The gates of the Avenue A line will not interchange with a single car on any of the other avenues all the way down to Z; brasses and journal trimmings in variety to keep a small foundry working overtime; curtains on the open cars are found to possess a remarkable individuality; in fact the combined properties bring together a cosmopolitan collection which enables the company's store keeper to fill three stories with thousand of dollars worth of "parts" and keep busy a force of clerks sufficient to conduct a small wholesale establishment.

The picture is anything but an exaggerated one; we only wish it were, for we have visited not a few of these museums of supplies, and many of our readers will not have to go off their own premises to find a well developed example. The drain from this source is often enormous. There must necessarily be always with electric traction a long list of repair parts and supplies greatly in excess of what was necessary under cable operation, which in turn multiplied the wants which were unknown when the motive power was exclusively animal; but the increase has been beyond the fondest dream of any company's store keeper 10 years ago.

We are now beginning to enter the reconstruction period. Already we have scrapped millions of dollars worth of machinery and apparatus displaced by improved design which offered such economy of operation that the change was taken bodily out of the realm of the debatable. In this motors, generators and engine figure most prominently, although each carried with it quite a train of attendants in foundations, belts, gear, etc. The power house problem has been fairly well settled and unless some radically new force, such as liquid air would be, comes in to revolutionize the plant, we may reasonably expect to wear out the machinery now going into our new stations. Experience also has demonstrated what are the economical units, although improved transmission will continue to shut down branch stations and open large central plants in many cities. We have now secured data which could only come from experience and are better qualified to anticipate the future than was possible a decade ago.

Track construction also has settled down to a firmer basis, and there will be more wearing out of rails, and less relaying of the light weights to be taken up and practically thrown away as has been the case thus far.

But the rolling stock is something to vigorously tackle next. Public demand and utility of service are bringing greater stress to bear each year, and this department of operation will have to be taken up and brought to the same degree of exactness which has been attained at the power station. Larger and better cars are becoming a necessity. In our opinion here is now the weak point in our operations. It has been impossible to reach it earlier but the evils hidden in that large item "repairs cars" demand just as critical study and reform on the majority of roads as the power house ever did.

How to get at this and what remedy to apply will furnish a subject for next month.

OHIO INTERURBAN ASSOCIATION.

On January 16th a meeting was held at Columbus, and the Ohio Interurban Street Railway Association organized. The objects are "for mutual co-operation in everything tending to the welfare of interurban street railroads in the state of Ohio, and to fully present and keep before the people of the state the advantages of such companies as common carriers of passengers, express matter, United States mails and light freight."

It is understood that this association will take no part in the negotiations now pending with the Columbus Street Ry.

The officers of the association are: President, O. W. Aldrich, Columbus; first vice-president, J. S. Harshman, Springfield; second vice-president, V. Winters, Dayton; secretary, L. P. Stephens, Columbus; treasurer, I. N. Cook, Chillicothe; executive committee, D. J. Ryan and A. G. Grant, of Columbus; O. B. Brown, of Dayton, and Eugene Rawdon, of Windsor.

FRANCHISE AT GUTHRIE, O. T.

The common council of Guthrie has recently passed a street railway ordinance which shows the attitude in Oklahoma Territory toward such undertakings. The grant is to Mrs. A. C. Beckwith, of San Francisco, Cal., and others, but the road is to be known as the Guthrie Electric Street Ry. The principal provisions of the ordinance, which became a law without the mayor's approval, are as follows:

The franchise grant is for 40 years; overhead trolley system, with iron poles, is contemplated, but any practicable system of traction may be used; company to pave tracks between rails and 2 ft. on each side; maximum fare, 5 cents; fine provided for obstructing tracks by driving teams thereon after a warning from motorman by ringing bell; limits of speed fixed at from 5 to 8 miles per hour in business districts, and from 8 to 12 miles per hour in residence districts; distance of 300 ft. required between cars running in same direction; conductors to announce names of streets and use "proper diligence to prevent women and children from leaving the cars while in motion"; cars not to remain standing at stations for more than 10 minutes; headway to be 10 minutes or less on all principal lines between 6 a. m. and 11 p. m.; right to adopt reasonable regulations reserved by council.

System of the Saratoga Traction Co.

The Saratoga Traction Co., of Saratoga, N. Y., which has for several years operated an electric railway between Saratoga Springs and Saratoga Lake, has recently completed a line to Ballston Spa, aggregating with its race track line already built, 14 miles of single track. All of this, with the exception of about two miles within the city limits, is on private right of way and is fenced.

Ballston Spa, the county seat of Saratoga County, has a population of about 4,500, and is quite a manufacturing center, a paper mill, one of the largest tanneries in the world, a wrapper and other factories being situated here. The summer population, owing to

TYPES OF CARS USED.

several fine mineral springs, is quite large and the people as a rule are a class to patronize street railways.

Saratoga Springs, in which is located the main offices of the company, has a winter population of 10,000. In the summer this is increased to about 35,000, for two months and a half, owing to the racing at the Saratoga Racing Association's Park, situated just out of the town, and also to the numerous mineral springs and beautiful drives. Through the opposition of the Hackmen's Associations, the company has found it impossible to obtain a very suitable entrance into Saratoga, and it has been permitted only on the back streets in the poorest locality and then only for short distances. Despite these hard conditions, the road is gaining ground with the public, and will eventually have a better entrance.

At the close of each season Saratoga has a Flora Fete, which is being arranged on a larger scale each year. This season it lasted three days and in the grand parade of the last day there were over 100 floats, which were fitted up at an expense of more than \$15,000. This feature is very popular with the summer visitors, and during the three days it was estimated there were 60,000 tourists in the town.

The line to Ballston Spa runs through the Geysers, where are located several carbonic acid gas wells from which thousands of cylinders are charged each year and shipped to all parts of the country. There are also five mineral springs.

The road runs through a farming country from the wells to Ballston, and is some distance from the highway. The grading has been done in a very thorough manner and arranged on a 2 per cent grade basis, although the land is quite rolling. The roadbed is 14 ft. wide, all fills are sloped $1\frac{1}{2}$ to 1, cuts are 16 ft. at the base and regular steam road construction practice has been followed. There are two bridges on the Ballston line, one 384 ft. long rests on piling, and the other, made of steel, is 240 ft. long, and was erected by the Berlin Iron Bridge Co. The steel bridge has piers 52 ft. high, resting on concrete and crushed stone mixed in the proportion of 1 of cement, 3 of sand and 6 of crushed rock. The best of portland cement was used. A plank form was made and the cement and rocks poured in, in layers, and then tamped. There are 16 of these piers from 12 to 6 ft. deep, resting on the solid

rock, which was blasted out to make even foundation. On both of these bridges the ties are 6 x 8 in., every fourth tie being 18 ft. long and the others 10 ft. Along the ends of these are laid side guards, 8 x 8 in., placed lengthwise two on each side, 3 ft. apart and supporting a plank sidewalk. This with a 5 ft. railing prevents passengers or cars from being thrown from the bridge. This construction makes the bridges as safe as any point on the line.

The road is laid with Wharton 56-lb. T-rails, 60 ft. in length, on ties 6 x 7 in. x 7 ft., placed 2 ft. c. to c. The joints are bonded with figure 8 flexible bonds of No. 0000 wire. The foundation for the roadbed is gravel and sand. In the city the company is compelled to put in crushed rock in the center and for 2 ft. each side of the track.

The overhead construction is supported upon chestnut poles, 35 ft. long, 6 ft. in the ground and set with 10 in. rake on bracket construction and 18 in. rake on cross suspension. These poles are 100 ft. apart, and have tin tops. In the city cross suspension is used and on all curves of the cross country work. The remainder is bracket construction, Creaghead Engineering Co.'s standard flexible brackets being used. All poles are painted with two coats in two colors, the upper portion of colonial yellow and the bottom golden ocher to match the cars. The trolley wire is No. 00 B. & S. gage. The trolley hangers and insulators were made by the Ohio Brass Co.

The company owns 24 cars, of which four are short trailers, eight are 14-bench open Pullman cars, three are side door double deck Pullman cars, having capacity for 120 passengers, three are closed Laconia cars, one of which is used for baggage and one is a small closed car. All of these closed equipments have vestibules and are heated with H. W. John's electric heaters. One construction car, a Taunton snow plow and two flat cars complete the rolling stock. Brill, Bemis, Taylor and Pullman trucks are used with $3\frac{3}{4}$ -in. and 4-in. axles; the wheels are 33-in. with $2\frac{1}{2}$ -in. thread and $\frac{7}{8}$ -in. flange. For the closed cars "Walkover" seats are provided, finished with plush, and each car is fitted with Van Dorn track scrapers. The company has adopted the G. E. 1,000 motor and K 10 controller as standard, although a few W. P. 50 motors are used.

There are two wooden car barns situated at Saratoga, but these will be replaced soon by larger and better ones. The power station is located at the Geysers near a small pond, suitable for condensing water, and is a 50 x 100-ft. building with a brick stack 90

SCENES ON THE LINE OF THE SARATOGA TRACTION CO.

ft. high with 5 ft. flue. The station contains two 125-h. p. Westinghouse and one 250-h. p. Ball & Wood engine, with M. P. 90 and M. P. 300 generators. The wiring is all done in a substantial manner; the instruments are mounted on a skeleton switchboard made of quartered oak, finished in the natural wood, and resting on a foundation entirely separate from the building. It is so arranged as to be accessible at all points without danger.

In the boiler room there are two horizontal tubular boilers 125 h. p. each, and one 250-h. p. Stirling water tube boiler. The boil-

ers are fed through a Cochran heater which raises the temperature to 210°.

The seven miles of new work between Ballston and Saratoga was finished and in operation in six weeks from the time it was commenced. This line will be extended to Mechanicsville in the spring of 1900. At present the company is building a two mile extension to the Saratoga Lake line in the same general manner and creating a fine park in which will be a rustic theater, casino building, pleasure boats, band stands and everything necessary to a first-class railway park. There are in this park 120 acres, all of which will be laid out, under the supervision of E. A. Blaisdell, of Brunswick, Me., an expert park designer, in walks and flower beds, with rustic summer houses. The grounds are located on the shores of Saratoga Lake and command one of the finest views in

VIEW ALONG THE LAKE LINE.

the vicinity. The population at this point is entirely of a summer nature, and no attempt will be made to operate this branch in the winter.

On the main system, during the summer, cars run on a 30 minute schedule from 6 a. m. to 12:30 p. m., and in special cases each car draws from two to four trailers. In the winter the cars run on a 40 minute headway, the motors on the closed cars being geared so as to run the seven miles from Ballston to Saratoga in 20 minutes. On some portions of the line a speed of 50 miles an hour is made.

The Saratoga Traction Co. was organized and the lake and race track lines built in 1890. The capital stock of the company is \$500,000. The officers are: President, E. A. Noyes; secretary, F. H. Lang; general manager, Geo. E. Macomber; superintendent, F. B. Lee. The construction work was all done by Geo. E. Macomber, of Augusta, Me., under the supervision of Superintendent Lee.

REWARDS FOR EMPLOYEES AT BIRMINGHAM.

Mr. J. B. McClary, general manager of the Birmingham (Ala.) Railway & Electric Co., advises us that the plan instituted some time ago in Birmingham of giving rewards to employes for clean cars and freedom from accidents has been a great success, the increased cleanliness of the cars and the reduction in the number of accidents more than balancing the cost of maintaining the prize system. The plan finally adopted and the one found to give the best results is as follows:

On the cars operated without conductors the motormen are given a reward of \$1.00 2-3 per month for clean cars, and if they have had no accidents during the month for which the company has had to pay out money they receive an additional reward of \$3.33 1-3, making a possible total of \$5.00 a month or \$60.00 a year over their regular wages. On cars having both motormen and conductors the motormen participate in the no accident reward and the conductors in the clean car reward. Inspectors examine the cars every day, and if a man has as many as three reports for dirty cars in any one month he fails to receive a reward for that month. A man who has cost the company any amount, no matter how small, for accidents, also fails of a prize. The company keeps a book properly indexed, and every morning the reports of the inspectors are gone over and all charges entered against the man responsi-

ble. All names against which there is nothing entered at the end of the month are credited with the extra reward on the pay roll. About 90 per cent of the men secured prizes last month.

The company pays its motormen 13 cents an hour the first year and 14 cents thereafter.

Sample pages of the record book have been sent us by Mr. McClary. They read as follows:

JOHN DOE, MOTORMAN.

Sept.	\$3.33
Oct. Killed cow at Red Bank.....	0.00
Nov. Pulled down wire at Big Cut.....	0.00
Hit Jones' dray at 5th Ave.....	0.00
Dec.	3.33

RICHARD ROE, CONDUCTOR.

Sept.	\$1.00
Oct. 7 D. C. (Dirty car).....	0.00
11 D. C.....	0.00
17 D. C.....	0.00
Nov. 12 D. C.....	1.00
Dec.	1.00

LONDON (ONT.) RIOTORS PUNISHED.

We fear that our people have much to learn from the other "branches of the English speaking race" when it comes to enforcing the laws, and particularly in punishing mob violence attendant upon strikes. In our issue of August last we gave a brief account of the riot in London, Ont., July 8, 1899, when a mob attacked the cars of the London Street Railway Co., damaging 10 of them and injuring a number of the non-union employes of the company. Martial law was declared and order restored by troops.

Some 20 indictments were returned against persons participating in the riot and these cases reached trial late in January. At the first day's session of the court four of the men pleaded guilty to rioting or stone throwing and were sentenced to pay fines of \$25 to \$50 or as an alternative undergo imprisonment in jail for from 30 to 60 days. Three others were temporarily granted bail and are to receive sentence later. One of the defendants pleaded not guilty and was acquitted.

January 31st, three others pleaded guilty to stone throwing, and were fined \$25 with option of serving jail sentences of two months. A fourth man who preferred a jury trial was convicted, and was sentenced to imprisonment for nine months. The heaviest sentence imposed was two years' imprisonment in the Central prison at Toronto, which was for assisting in the destruction of a car.

SOUTHERN OHIO TRACTION CO.

January 22d the directors of the Cincinnati & Hamilton Electric Street Railway Co., the Cincinnati & Miami Valley Traction Co. and the Dayton Traction Co. (whose property is leased to the Cincinnati & Miami Valley) met at Cleveland and completed the formal consolidation of those companies.

The consolidated company is to be known as the Southern Ohio Traction Co. and have a capital stock of \$2,000,000, with an authorized bond issue of \$2,000,000. Temporary officers were chosen as follows: President, Will Christy, Akron; vice-president, H. C. Ford, Cleveland; secretary and treasurer, F. T. Pomeroy, Cleveland. The directors are: James Christy, Jr., and Will Christy, of Akron; Peter Schwab, of Hamilton, and H. Clark Ford, M. J. Mandelbaum, H. R. Newcomb, D. H. Kimberley, Amos B. McNairy, A. E. Akins, H. A. Sherwin, R. A. Harman and R. M. Parmely, of Cleveland.

The Cincinnati & Hamilton line is 15 miles long, the Cincinnati & Miami Valley 26 miles, and the Dayton Traction 15 miles long. This gives a 56-mile road connecting Dayton with the urban system of Cincinnati.

Superintendent H. A. Nicholl, of the Rochester (N. Y.) Railway Co., and the Rochester & Sodus Bay Electric Ry., has moved his office from the office building of the Rochester Ry., on State St., to the station on Main St., East, formerly used by the Glen Haven road.

THE UNION TRACTION CO. OF INDIANA.

The forerunner of the extensive electric railway system centering at Anderson, Ind., was a one-mile mule line built in Anderson in September, 1888, the charter for which was granted to Seldon R. Williams and D. C. Williams, of Lebanon, Tenn., on Aug. 19, 1887, for 12 years. Branches were subsequently constructed from this line and in 1892 the Anderson Electric Street Railway Co. was organized by Chas. L. Henry, of Anderson, and Philip Matter, of Marion, for the purpose of purchasing the stock of the old street railway company and reconstructing the system for electric traction. This was done, heavier rails were laid, the old lines were extended and the best electrical equipment known at the time was

this branch is in operation the Union Traction Co. will serve a population of nearly 200,000 people.

The completed system will comprise 165 miles of track, and there is now in process of erection at Anderson, a central station from which power will be furnished on the three-phase distributing system to all lines owned by the company. This station will be 164 ft. 3 in. long x 116 ft. 3 in. wide, and 59 ft. high, front elevation. The structure will be fireproof, with brick walls and steel trusses supporting the roof. In the engine room, which will be 160 ft. 9 in. long x 70 ft. wide x 30 ft. high, will be erected three 1,500-h. p. horizontal cross-compound Rice & Sargent engines, built by the Providence Engineering Works, direct connected to three 1,000-kw. Westinghouse generators built to carry 50 per cent overload.

Babcock & Wilcox boilers of 400 h. p. each will be placed in the boiler room, which will be 160 ft. 9 in. long x 42 ft. wide x 60 ft. high. Stillwell-Bierce & Smith Vaile feed-water heaters and Blake-Knowles condensers have been contracted for.

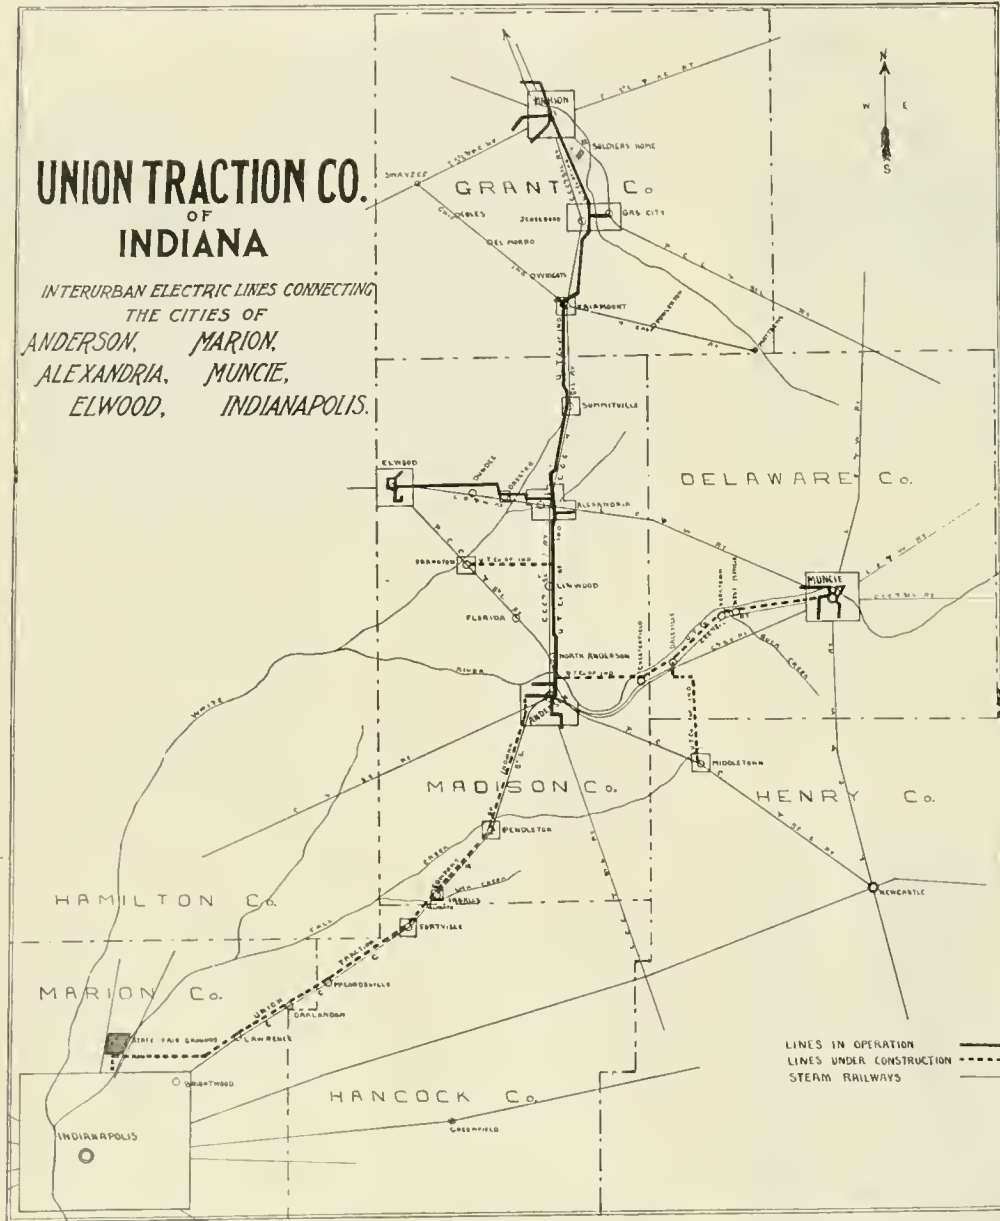

The furnaces will be arranged for natural gas fuel, but to meet the contingency of a shortage in the gas supply, coal bins, with John A. Mead coal conveyers and stokers will be provided. The smokestack will stand a few feet from the boiler room to the south of the main building. It will have a diameter of 19½ ft. at the base and will be 180 ft. high.

Current will be generated at 370 volts, alternating, and by means of 15 Westinghouse static transformers of 250-kw. each, will be raised to 15,000 volts for transmission. At sub-stations, of which there will be eight, located at suitable places along the line, current will be stepped down to 370 volts and changed to 550-volt direct current through rotary converters. For this work twelve 175-kw. and twenty 87.5 static transformers and twelve 250-kw. converters will be installed. Nine storage batteries, supplied by the Electric Storage Battery Co., aggregating 1,100 kw. h. capacity, will regulate the voltage, one battery being placed at each sub-station and one at the central station.

The main switchboard will consist of three generator panels, one storage battery, three alternating current synchronous converter, three direct current converter, and five direct current feeder panels.

A switch will be laid from the P., C. C. & St. L. R. R. direct to the power house, to be used for hauling coal, building supplies and heavy machinery, for which service an electric locomotive will probably be used.

Work on the new road from Muncie to Indianapolis is being pushed with vigor. The abutments and piers are nearly completed for four bridges, one across White River at Anderson, one across the same river at Chesterfield, near the famous Indiana mounds, one across Fall Creek at Pendleton, and one across Lick Creek at Ingalls. All culverts, piers and abutments of these bridges are being constructed of heavy stone masonry laid in hydraulic cement.

purchased. On Sept. 3, 1897, the property and franchises were acquired by the Union Traction Co., of Anderson, which in turn, on June 28, 1899, was consolidated with the Muncie, Anderson & Indianapolis Street Railway Co., of Muncie, under the name of the Union Traction Co., of Indiana, which now owns and operates the city lines of Anderson, Alexandria and Marion, the interurban roads connecting Anderson with Marion and Elwood, and the new line under construction from Muncie via Anderson to Indianapolis, with branches to Middletown and Frankton. The latter branch will connect with the Indianapolis Street Ry. lines at the State Fair Grounds, north of Indianapolis, and cars will run into the city over the lines of that company. It is estimated when

The roadbed construction on this branch will follow steam road practice, the tracks being 70 lb. steel rails, in 60 ft. lengths, laid on 6 in. x 8 in. x 8 ft. ties. Rails are being rolled by the Cambria Iron Co., of Johnstown, Pa. A maximum speed of 42 miles per hour will be reached in the run to Indianapolis.

C. L. HENRY.

The Union Traction Co. carries on an extensive express business. Two express cars are at present employed, one making three trips per day from Anderson to Alexandria, thence two trips to Summitville and one trip to Orestes. The express cars have regular time schedules for collecting merchandise from the local merchants, commission houses and wholesale houses and carrying to destination. All of the passengers coaches have baggage compartments and take trunks, bicycles, parcels, etc., at the same rate as the

special express cars.

The officers of the company are: President, Philip Matter; first vice-president, Jas. A. Van Osdal; second vice-president, Frank M. Riter; secretary and general manager, Chas. L. Henry; treasurer, Geo. F. McCullough; superintendent, Chas. Berry. The general offices are in the Masonic Temple, Anderson.

MILWAUKEE STREET RAILWAY REPORTS.

The reports of the Milwaukee street railway companies exhibit the business of the year 1899, and extracts show the following:

The Milwaukee Electric Railway & Light Co. operates 140.29 miles of track (63.45 double and 13.39 single) in the city, and gives this data.

Amount of preferred stock.....	\$3,500,000.00
Amount of common stock.....	3,500,000.00
Bonded indebtedness.....	8,000,000.00
Indebtedness of the company.....	932,074.07
Receipts from railway business.....	1,668,962.87
Disbursements.....	1,095,445.63
Construction.....	701,981.17
General expense operating railway system.....	75,378.62
Legal expense operating railway system.....	25,034.38
Injury claims and damages.....	50,068.88
Rentals.....	2,462.42
Conducting transportation.....	527,174.47
Maintenance of ways and structure.....	92,300.48
Maintenance of rolling stock.....	73,943.05
For producing power.....	324,000.00

The Milwaukee Light, Heat & Traction Co., which is controlled by the Milwaukee Electric Railway & Light Co., and has the same officers, controls the companies owning the interurban lines to Waukesha, North Milwaukee, Wauwatosa, Racine and Kenosha, and the Belle City road in Racine. It operates 73.18 miles of track, and makes the following statement:

Common stock.....	\$ 500,000.00
Bonded indebtedness.....	1,500,000.00
Other indebtedness.....	244,084.30
Total receipts.....	170,545.03
Total disbursements, exclusive of interest.....	124,274.65
Charged to construction.....	1,028,084.00
Charged to operating expenses.....	120,261.13

FREIGHT SERVICE ON INDIANAPOLIS INTER-URBANS.

The three interurban electric roads reaching Indianapolis are now negotiating with the authorities of that city for franchises allowing a freight and express traffic. Arrangements will be made with the Indianapolis Street Ry. to use its lines within the city. The three roads are the Union Traction Co., with headquarters at Anderson, the Indianapolis, Greenwood & Franklin, and the Indianapolis & Greenfield.

STREET RAILWAY BENEFIT ASSOCIATIONS.

An inquiry recently received from the manager of a street railway who wished to organize a mutual benefit association among the employes of his company, led us to send letter to the benefit associations of which we have any record in our files, asking for the latest data concerning them. The replies so far received are given herewith and will be found of interest by all those interested in such organizations.

It is our wish to secure similar information concerning all such associations among street railway men, and it is earnestly requested that the secretaries or other officers will send us data for their respective associations covering the following points: Name of association. Date of organization. Number of members when organized. How the management is chosen. Initiation fees and dues. Sick benefits allowed. Death benefits. Total sick benefits paid since organization. Total death benefits paid since organization. Sick benefits paid in 1899. Death benefit paid in 1899. Number of members at the present time. Officers. Interesting facts as to the growth of the association.

The employes of the Cincinnati Street Railway Co. organized the Street Railway Employes' Mutual Protective Association, Nov. 14, 1887, having at that time 57 members. Any employe of the company between the ages of 21 and 45 is eligible for membership, after being in the company's service for three months. The initiation fee is \$1. Formerly dues of 25 cents per week were paid, but on Sept. 5, 1899, the Cincinnati Street Ry. appropriated \$5,000 for the Protective Association, so that the monthly dues might be remitted; it is expected that a similar appropriation will be made each year. On the death of a member there is an assessment of \$1 per capita. The sick benefit is \$7.50 per week. Since the organization the association has paid \$6,572.87 in sick benefits and \$6,081 in death benefits. In 1899 the totals were \$2,622.87 for sick and \$781 for death benefits.

The present membership is 762. Officers are chosen by ballot of the membership, and are: President, two vice-presidents, treasurer, financial secretary and corresponding secretary. George Attig is president, and C. C. King, corresponding secretary.

The Columbus (O.) Street Railway Employes' Beneficial Association was organized in October, 1893, with about 200 members, and now has 325 members. The management is chosen by a vote of the membership; besides the president, vice-president and secretary and treasurer, there is a trustee for each division of the road and shops. The dues are \$2 initiation, 50 cents per month and \$1 death assessment. The sick benefits allowed are \$3 for the first week and \$5 thereafter; the death benefit is the result of an assessment of \$1 on each member. Since the organization, the total death benefits paid have amounted to \$2,652, while the sick benefits paid aggregated \$9,017. For 1899 the sick benefits paid were \$1,458, and the death benefits \$303.

The following statement is sent us by Mr. H. R. Beeson, secretary of the association: "The association has been helped financially by the Columbus Street Railway Co., by donations, and today we have a cash balance of \$1,200. The men are all greatly interested in it and the membership continues to grow. One of the best features is the payment of \$50 immediately upon the death of a member, this amount to be deducted from a later settlement with the beneficiary, thus affording relief when it is most needed. The cash collections are made through the division foreman, and turned over to the secretary and treasurer. Sick benefits are paid upon a certificate of the attending physician and trustee of the division to which the member may belong. There is no doubt it has benefited both employer and employe by bringing them closer together in a friendly manner."

The employes of the Chicago City Railway Co. organized the Chicago City Railway Employes' Mutual Aid Association, Sept. 26, 1894, with a membership of about 1,000. Sept. 20, 1898, the association was reorganized and incorporated under the laws of Illinois. The objects of the association is "to establish and maintain a benefit fund out of which shall be paid on the death of a member in good standing a sum not exceeding \$500," to the persons designated by the deceased. It pays no sick benefits.

All employes of the Chicago City Ry. of good moral character, not over 50 years of age, are eligible for membership upon passing the requisite medical examination.

The initiation fee is \$1, the annual dues 50 cents, and the assessments 50 cents per capita, levied as often as may be necessary to pay death claims. Membership in the association is not forfeited upon leaving the employ of the company unless one engage in the manufacture or sale of intoxicating liquors; non-employes who are suspended for non-payment of dues are not eligible to reinstatement, however.

The death benefit is the amount produced by a 50-cent assessment providing it shall not exceed \$500. Since organization the association has paid \$33,000 in death claims, and during the year ending Oct. 1, 1899, paid \$8,500. The present membership is 2,600.

The nine directors, the secretary and the treasurer are chosen by the members, and the president and vice-president by the directors. The present officers are: President, A. Christ, jr.; vice-president, M. P. McDonald; treasurer, T. C. Penington; secretary, C. R. Penington.

The Metropolitan Street Railway Association (New York) was organized among the employes of that company, Feb. 1, 1897, with 100 members. Dues were \$1 initiation and 50 cents per month, and the benefits \$1 per day in sickness (limited to 90 days in any one year) and \$150 on death. Membership is voluntary, all male employes of the company being eligible. Since its organization the association has paid \$21,791 in sick benefits and \$7,650 on account of deaths. In 1899 the sick benefits paid were \$10,870 and the death benefits, \$3,600. The association now has a membership of 3,014. H. H. Vreeland, general manager of the Metropolitan Street Ry., is ex-officio president of the association; H. S. Beattie, treasurer of the company, is ex-officio treasurer; the other officers are chosen by ballot, E. J. O'Connell being vice-president, and D. J. Purfield, secretary.

Feb. 18, 1897, the Middletown (Conn.) Street Railway Co. arranged for a benefit association among its employes, membership being compulsory. The dues were 25 cents per week, and the sick benefit 50 cents per day for employes who had been in the service three months. The superintendent of the street railway is ex-officio president of the relief association, and the clerk to the superintendent is ex-officio secretary and treasurer of the association. Three members are chosen by ballot, and with the officers constitute the executive committee.

The organization is known as the Street Railway Employees' Benefit Association, and had originally 21 members. Since its organization it has paid out \$381.50 in sick benefits (it has no death benefits); last year the sick benefits were \$195.50. The present membership is 24.

The secretary, Mr. C. H. Chapman, has sent us a copy of the by-laws, from which we learn that the weekly dues are 15 cents and the sick benefit \$1 per day (limited to 5 weeks in every 12 consecutive months) the dues having been reduced from 25 cents and the benefit increased from 50 cents. As a safeguard against temporary insolvency, the by-laws provide for an assessment of 25 cents per member in event of sickness at a time when there is no money in the treasury.

The history of this association, which is now three years old, shows that it is not necessary that the company be a large one in order to make an employes' mutual benefit association a success, and for this reason the Middletown association is of particular interest to small roads. The superintendent of the company and ex-officio president of the association, is E. W. Goss, who effected the original organization in 1897.

The Third Avenue Railroad Employes' Relief Association, New York, was organized Mar. 1, 1890, with a membership of 650. All employes of the Third Avenue R. R., in good health, are eligible to membership. The dues are \$1 initiation, 50 cents per month, and a special assessment of 25 cents for the death fund levied on new members when joining the association. The sick benefit allowed is \$1 per day beginning on the eighth day, and the total for one year is limited to \$84. The death benefit is \$150.

Since the organization the total sum paid out for sick benefits is \$32,593, and for death benefits, \$18,670. In 1899, the sick bene-

fits amounted to \$3,407, and the death benefits to \$2,150. The membership at present is 1,000.

The officers of the association are a president, a vice-president, a secretary, a treasurer, a sergeant-at-arms and a physician. The president is the superintendent of the company, and the treasurer, the treasurer of the company; other officers are chosen by ballot.

Mr. C. C. Swertfager, secretary, writes us as follows: "Our association was started by Pres. Louis Lyons, of the Third Avenue R. R., who is now deceased. He presented the men with \$100, which, together with \$200 more realized from a "chowder party," given by the employes on Oct. 9, 1889, formed the financial nucleus of the organization. The good done in the last 10 years can best be judged by the total of benefits paid. At this time we have \$9,000 in the treasury.

"During the first two years we had an assessment of 25 cents upon the death of a member, but for the last eight years there has been no assessment. We give an entertainment sometime during the winter, and a picnic in the summer, and all sums realized from this source, over expenses, are placed in the Death Fund, also all assessments from new members, who pay 25 cents assessment when they become members. Our dues are 50 cents per month; this sum pays sick benefits and other expenses.

"All of the officers of the road are members of the association, from Pres. A. J. Elias down. Supt. J. H. Robertson is the president. Mr. John Beaver, treasurer of the road, is our treasurer.

"A strict account of all money received and disbursed is rendered at every monthly meeting. There are eleven trustees and an advisory board (consisting of the president, vice-president and treasurer), to whom are referred all bills, and no money can be paid out without their orders, except sick benefits, which are paid on the order of the association physician.

"The secretary devotes his whole time to the association, and is paid a salary. Among his duties is that of visiting the sick at least twice a week."

Mr. A. A. Anderson, general manager of the Mahoning Valley Railway Co., of Youngstown, O., in answer to our inquiry, says: "Our employes have no organization or association. I believe a mutual benefit association of street railway employes is a good feature, and we have discussed the matter a number of times. At one time the employes among themselves attempted to perfect such an organization, but for some reason they failed to carry out their plans. I have delayed giving the matter my personal attention for the reason that in starting it off I desired to furnish them with good quarters for their meetings, entertainment during hours when off duty, etc., provision for which I expect to make in the near future."

The Montreal Street Railway Co., Montreal, Can., has no benefit association among its employes, but all permanent employes are insured under contract with the Ocean Accident & Guarantee Corporation. In answering our inquiry, Mr. F. L. Wanklyn, the general manager of the company, did not enter into the details of this arrangement, but we quote the following from a general order of the management, announcing an increase in wages, issued in June last and published in the "Review" for July, 1899, page 475: "On and after July 16th, all permanent employes in the operating department and workshops will be insured in an accident insurance company of good standing, and the premium will be paid by the Montreal Street Railway Co. The insurance will amount to \$1,000 in event of death from accident either on or off duty, one-half of this amount for total disablement, and \$5 per week indemnity for loss of time through injuries or diseases specified in the policy."

According to press reports, flat cars running over the tracks of the Brooklyn Rapid Transit Co. are to be used for removing all the snow from streets in the down-town districts. These cars will be run in the night only, when they will not interfere with the regular service. Wagons will collect the snow in the side streets during the day and will deposit it at convenient dumps along the line, from which it will be removed at night by the flat cars drawn by motor cars. The city contractor receives 21½ cents per cu. yd. for removing snow.

PLANS MADE FOR NEXT CONVENTION.

The executive committee of the American Street Railway Association met in Kansas City on February 5th and 6th, accepted the buildings offered for exhibits and set the date for the next convention, which will be held on October 16th, 17th, 18th and 19th of this year. Members present included President John M. Roach; Chicago; Secretary T. C. Pennington, Chicago; Frank G. Jones, Memphis; Nicholas S. Hill, Charleston; Chas. W. Wason, Cleveland; and John R. Graham, Quincy, Mass. Mrs. Jones and Mrs. Hill accompanied their husbands.

The business transacted included the report of the secretary and treasurer, which showed financial conditions to be better than at any time since organization; the selection of subjects and the appointment of committees to prepare the papers; confirming the selection of Kansas City as the meeting place; and fixing the dates for the convention.

The building to accommodate the sessions and exhibits is always a point of vital importance, and the committee were delighted with what they found. The convention hall is a new and mammoth structure erected by the public spirited citizens of Kansas City more for the credit of the city than with a special view to being a money making institution. It has, however, proved to be both. The building is conveniently situated relative to the leading hotels, and seats 25,000 people. Our illustrations of exterior and interior will convey a very intelligent idea of the structure, which is roomy and attractive and equipped with every modern convenience required in such a place. The lighting and heating arrangements are perfect.

The building is 314 ft. long by 198 ft. wide. In addition to the main floor, there is a row of small stalls extending from entrance to the stage, on the main floor, which will make ideal space for the smaller exhibitors who will have no carpenter work to do. The land and the building cost \$225,000, two years ago. It is altogether the best suited to the requirements of the association of any ever occupied for convention purposes. Tiers of galleries rise one above another until the roof garden is reached by gentle inclines with-

Gore, of Boston, and H. H. Windsor of the "Street Railway Review." On Tuesday afternoon the party made a trip over some of the city lines and visited the new power house, which is being largely increased in capacity with very large units, and which presents one of the best examples of the modern station to be found in this country. Fire Chief White also entertained the party at his headquarters with fire drill and a demonstration of his recent invention by which the phonograph is utilized to instantly an-

EXTERIOR OF CONVENTION HALL.

nounce to telephone exchanges the breaking out of a fire in any room of buildings containing a city telephone. This invention, by the way, has just been sold for \$50,000, and is destined to revolutionize the present system of private watchmen.

The selection of the headquarters hotel will be announced later. In the question of hotels, the committee were very agreeably surprised at the number and quality of good hotels, all convenient to the Convention Hall, and if the entertainment tendered the visiting party is any indication of what is in store next October,—and President Holmes says it was only the index to the book—the Asso-

THE CONVENTION HALL IN KANSAS CITY.

out a single stair. The acoustic properties are remarkable. For the sessions there are abundant meeting rooms, well lighted and ventilated.

On Monday evening, President Holmes, of the Metropolitan Street Railway, gave a theater party to the visiting guests, followed by a banquet at the Midland Hotel. In addition to the members of the committee named above, there were present Gen. Mgr. C. F. Holmes, Secretary Kirkpatrick, Superintendent Satterly, and Purchasing Agent H. C. Schwitzgebel, all of the Metropolitan; F. J. Taggart and John Brown, of Kansas City; Latham Karnes, of the legal department of the Metropolitan Street Railway Co.; Mr.

ciation will not only have a highly delightful and instructive time, but an occasion in no degree less memorable than any conventions which have preceded the one for 1900.

A check for \$69,150 has been sent to the comptroller of Baltimore by the United Railways & Electric Co., in payment of the park tax for the quarter ending Dec. 31, 1899. This is 9 per cent of the gross earnings of the system within the city limits. The amount for the same period of the previous year, which was before the consolidation, was \$68,265.

TOLEDO TRACTION CENTENNIAL BAND.

In the "Review" for February, 1899, was published an announcement of the formation of the Traction Company Centennial Band among the employes of the Toledo Traction Co., and a half-tone engraving of the members. Through the courtesy of Mr. Thomas H. McLean, general manager of the company, we have received a copy of the constitution of the band association, which is reproduced below for the information of managers who may wish to encourage the formation of similar organizations among the employes of their roads.

Eighteen months ago Mr. McLean learned that a number of the Traction company's men had at various times been members of band organizations, and with his customary energy soon had the Toledo Traction band an accomplished fact.

From the very first the idea was enthusiastically received by its members, by the other employes of the Traction company, who regard it with growing pride, by the officers and shareholders of the company, and by the citizens of the city, and today it is the most popular musical organization in Toledo. Under its constitution, the band can accept no paid commissions; it receives no outside compensation for its services, playing only for philanthropic movements, municipal affairs, social mass meetings, and entertainment functions of employes, and company matters.

as shall be hereinafter stipulated; and all members of the band either individually or collectively agree not to play for any entertainment, function, parade or gathering of any kind whatsoever, without first obtaining the permission and approval of the secretary and manager.

III. The officers of this society or band shall be a president, a vice-president, a secretary and manager, a treasurer, a librarian, and an executive committee of three, of which the president shall be a member ex-officio.

IV. The president, vice-president, secretary and manager and treasurer shall be elected annually by ballot and shall hold their respective offices until successors are elected and installed.

The librarian shall be appointed by the manager, and shall serve for such a period as he shall elect.

The executive committee (of which the president shall be chairman ex-officio) shall be appointed by the president and shall serve at his discretion.

V. It shall be the duty of the president or vice-president to preside at all meetings.

The treasurer shall take charge of all funds of the band and shall render an accounting of same to the executive committee whenever required so to do.

The secretary, who shall also be the manager, shall take the minutes of each meeting, spreading same upon a minute book pro-

TOLEDO TRACTION CENTENNIAL BAND.

At this writing the band numbers 36 members. Twelve months ago the Traction company presented them with full uniforms of the Gilmore pattern, and equipped them with a complete set of the C. G. Conn & Besson silver instruments. Two rehearsals are held each week in comfortable club rooms, also furnished by the company.

The officers are: President, J. F. Collins, superintendent of the Traction company; vice-president, F. D. Brooks; treasurer, C. L. Wight, auditor of the company; secretary and manager, A. A. Atkinson, contracting agent of the lighting department of the company.

The accompanying illustration shows the band in its new uniforms. The face of Mr. McLean, who forms the center of the group, is well known to most of our readers; seated at his right is President Collins, of the band, and standing immediately behind them is Manager Atkinson.

CONSTITUTION.

I. The title and name of this organization or body shall be "The Traction Company Centennial Band."

II. The object of this organization shall be the formation of a selected number into an association for the purpose of study and practice in the use of brass band instruments for the purpose of furnishing music for such occasions and under such arrangements

provided for such purpose; shall collect all accounts, including money due for professional services rendered, membership fees, dues, fines, assessments and all other accounts receivable, and shall turn the same over to the treasurer, taking his receipt therefor upon blanks provided, and shall give attention to all correspondence and other duties pertaining to his office. He shall also be the manager of the band, and all matters of business, of finances, and the making of all contracts shall be attended to by him.

BY-LAWS.

The regular meetings of the band shall be held at 7:30 o'clock each Thursday evening. The business meeting to precede the practice or rehearsal.

The director or teacher shall be hired by the secretary, after first being voted upon by the band in business meeting, and shall be hired for no specified time, and can be retired at any time by a vote of the band.

An admission fee of one dollar shall be assessed each member at the time he is enrolled.

Monthly dues of 50 cents per capita shall be assessed each month, payable the first of each month, in advance.

A fine of 25 cents shall be charged for tardiness or absence of a member at rehearsals.

Each member shall be held responsible for uniforms, instru-

ments or music belonging to the organization, and shall take proper care of the same.

The regular order of business of each meeting shall be as follows: Call to order; roll call; reading of minutes; report of committee; new business; good of the order; adjournment; rehearsal.

This constitution and by-laws may be amended or changed by a two-thirds vote of the band in business session.

IN THE OHIO LEGISLATURE.

The question of urban track rights for interurban lines is one that promises to be quite important in Ohio. A bill has been introduced in the Legislature which provides that interurban roads shall have power to condemn rights of way over urban lines, which is as follows:

Section 1. Any railway company incorporated and organized under the laws of this state for the purpose of building, acquiring, owning, leasing, operating and maintaining a railroad or railroads, to be operated by electricity or other motive power, other than steam, from one municipal corporation or point in this state to any other municipal corporation, municipal corporations, point or points, may appropriate, by proceedings in the probate court of the proper county, which shall be governed by the provisions of chapter eight of part third, title two, of the Revised Statutes, for its joint and equal use and occupancy with any existing street railway, the tracks and property of such existing street railway in any such municipal corporation or corporations, and the right of way of any such existing street railway upon streets upon which its tracks have not been laid and its road constructed, for not more than the entire distance between the termini of the route as actually constructed, operated and run over of the appropriating company at the time appropriation proceedings are commenced, not to exceed five miles, whether such termini be wholly without or partly within and partly without such municipal corporation or corporations; but no such right to use and occupy such tracks or property shall be exercised until the owner thereof shall have been first compensated therefor in money. Such appropriation proceedings and payments shall vest in such appropriating company all the rights and privileges, subject to the same regulations, as to those streets jointly occupied, for the unexpired term of the franchise that may have been granted to the company whose tracks and property or right of way have been so appropriated, and for the term of any renewals or extensions of such franchise, without the previous consent of any of the owners of property abutting upon such streets, and without the right to use the same having been granted to such appropriating company by council or other municipal authority; provided, that when there is a difference in the gage in the tracks of the existing company and the appropriating company, the latter may also appropriate the right to lay and construct along the line so appropriated an additional rail to conform to its gage.

Sec. 2. That in ascertaining the measure of compensation to be paid in a proceeding under this act, there shall be taken into consideration the value of so much of the railway structure and materials in place as is sought to be appropriated, including the cost of any paving constructed in conformity with city ordinance; also the damages which such structure will sustain in adapting it to the uses of the appropriating company, and the reasonable cost of keeping the structure in repair; but the amount of compensation to be awarded for such use shall be limited to the value of such use during the unexpired term of the franchise of the company whose tracks are sought to be appropriated, and no compensation shall be allowed for any depreciation in the value of any franchise, nor for any loss of fares, nor for any inconvenience or interruption to business, nor for any consequential diminution in the value of other portions of the line forming part of such street railway system, caused by the joint use and occupancy of its tracks and property or right of way.

To enact this bill would be to innovate a policy almost certain to work grave injustice to the city roads. The matter can much better be left to various companies concerned to be arranged by contract, as has been done in various cities.

Other bills now pending in the Ohio Legislature are on the following subjects:

Requiring conductors on all cars in Dayton.

Requiring all grants, renewal and extension in municipalities to be approved by vote of people before becoming operative, and preventing renewals more than eighteen months prior to expiration.

Requiring all interurban railways securing right of way over highways to pay one fourth cost of macadam road, pike, etc., in cash, before construction, and to keep in repair twenty inches on outside of rail.

Permitting trustees of state institution to grant consent for franchise.

Granting use of berme bank Ohio Canal, Newark to Buckeye Lake, to C. B. L. & N. Traction Co.

Providing that electric railways shall not charge a passenger rate exceeding 2 cents per mile, single fares 5 cents.

Bills being prepared for introduction prohibit county commissioners from granting franchise on the public highways; to establish a standard gage, and to require electric roads to report to state department and pay per cent to maintenance of commissioner of railroads.

THE COPPER KING.

By the courtesy of Mr. John N. Akarman, superintendent of the Worcester (Mass.) Consolidated Street Railway Co., we have received a photograph of William Londrigan, whom the police have named the Copper King. He was caught in the act of stealing bonds from the track of the Worcester Consolidated, and has been bound over to the grand jury. Londrigan had been operating

WM. LONDRIGAN, THE COPPER KING.

for some time, stealing from 25 to 100 lb. of bonds each night. He used an axe for removing the bonds and when detected turned his weapon on the police.

The man's description is as follows: Age, 39 years; shoemaker; married; stout build; 6 ft. tall; weight, 190 lb.; brown hair; hazel eyes; dark complexion; can read and write.

HE EXPERIMENTED AT THE COST OF THE COMPANY.

The Chicago Consolidated Traction Co. for several days last month unwittingly supplied an ambitious inventor with power free of cost for carrying on his experiments with a new electric system. The would-be revolutionist of existing methods selected an infrequently used section of track in a secluded suburb, and after familiarizing himself with the running schedule, took possession of the tracks for the purpose of trying a small motor car, running on the rails and taking current from the line. When one of the company's cars hove in sight he would remove his vehicle and wait until the car had passed, when he would resume his trips. A motorman running off of schedule discovered the inventor and his machine.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

ARNOLD MAGNETIC CLUTCH.

In connection with the "Arnold system" of power station construction, its inventor, Mr. Bion J. Arnold, developed magnet clutches designed to meet the requirement for a ready means of connecting or disconnecting the electrical generating units with their prime movers. While the clutches are friction clutches, the friction between the contact surfaces is due to magnetic attraction.

The energizing circuit is controlled by means of a switch placed at a convenient point, which is quite a decided advantage over the ordinary friction clutch. It is thus possible in throwing a generator in or out of service to control it entirely from the switch-board, where all the regulating devices and measuring instruments are within the reach of one attendant. These magnetic clutches are neat in appearance and compact in design. Even in the larger sizes the amount of space occupied upon the shaft is not much more than twice the diameter of the shaft, and by using a flange forged solid on the end of the shaft, they can be made to occupy even less space when used as cut-off couplings. Having no projecting surface or parts to catch the air when in operation, the windage resistance is negligible. The greatest advantage claimed of this form of clutch over others is that it is self contained—the "action and reaction" being within the clutch itself, and consequently there is no resulting end thrust upon the shaft bearings and no additional friction load due to the operation of the clutch.

It has been suggested that in many instances a clutch of this design could be substituted for the fly-wheel; thus permitting the use of magnetic clutches without great increase in the cost or weight of the engine units.

Fig. 1 shows what is believed to be the largest magnetic clutch ever built. It is 100 in. in diameter, and is designed to transmit

FIG. 1—100-IN. MAGNETIC CLUTCH.

3,000 h. p. at 150 r. p. m. This is one of three clutches now in use connecting the engines and generators in the central station of the Imperial Electric Light, Heat & Power Co., at St. Louis, a view of the equipment of which is shown in Fig. 2. The experience with this plant demonstrates that this form of clutch is applicable to the large size units now being installed for power station purposes, whereas the ordinary friction clutch becomes unwieldy and unsightly after passing the 500-h. p. size.

The current is carried to the clutch coils through contact rings upon the side of the clutch, and carbon brushes held by insulated brush holders, the electrical connections being simple and easily

FIG. 2 PLANT OF IMPERIAL ELECTRIC LIGHT HEAT & POWER CO., ST. LOUIS.

accessible for inspection. The loss in the clutch, due to the continuous use of current while the clutch is in operation, is given as one-tenth thousandth of its power transmitting capacity.

CONTINUOUS MEAN PRESSURE INDICATOR FOR STEAM ENGINES.

A paper on this subject was presented before the Institute of Mechanical Engineers (England) by Prof. William Ripper, in which the author described the construction and operation of instruments by which the mean pressures in an engine cylinder can be read directly from steam gages.

Originally the mean pressure gage was designed for engines of high rotative speeds, but it was found possible to use it for engines running at any speed. The apparatus consists of a valve chest with a valve of the four-way-cock type driven from the moving parts of the engine so that steam from the driving or working end of the cylinder is directed to one steam gage and steam from the exhaust or back pressure end of the cylinder is carried to another steam gage. The valves are of various designs; on long stroke engines there are two valves, one close to each end of the cylinder to avoid long connecting pipes; for very high rotative speeds a rotary valve is used.

The effect of the arrangement is that a series of impulses is directed to each of the two steam gages employed, and by throttling the flow the vibrations of the gage pointers are reduced to any desired reasonable range without, it is stated, affecting the accuracy of the indications; the difference between the readings of the two gages is the difference between the mean forward pressure and the mean back pressure measured on a time basis.

The ordinary indicator diagram is measured on a distance basis, so that its area is proportional to the work done in the cylinder. By reason of the reciprocating motion of the piston and the uni-

form speed of rotation of the engine the piston does not have a uniform speed, and therefore the mean time pressure will in general be different from the mean-distance pressure as measured from an indicator diagram.

The difference between the mean time gage reading and the mean pressure from an indicator diagram will vary with each change in the cut-off, but Professor Ripper states that it is quite

SECTIONS OF FOUR WAY VALVE.

practicable to use an average correction factor, and gives the difference between the two methods in per cent of the mean absolute forward pressure as follows:

Cut-off,	Difference, per cent.
.2	+2.9
.3	-1.4
.4	-3.5
.5	-3.9
.6	-3.4
.7	-2.6
.8	-2.1
.9	-1.1

Below .1 cut-off the difference is much greater, but so early a cut-off being quite rare this does not matter.

In using the mean-pressure indicator it is recommended that comparisons be made between it and indicator diagrams, and so determine the proper correction ratio for the given engine or type of engine.

The concluding sections of Professor Ripper's paper are given below:

READING BY PRESSURE GAGES.

In order to obtain a reading of the mean pressure acting upon the gage, the writer employs two throttling cocks, one close to the instrument and one more or less close to gage. By the use of these regulating cocks the oscillations of the finger of the gage may be reduced to any desired degree of steadiness without inter-

FIG. 3 ARRANGEMENT OF GAGES.

fering with the accuracy of the reading of the mean pressure.

It is not unlikely that some engineers will object ab initio to the arrangement described in this paper, seeing that it is proposed to obtain such an important value as the mean effective pressure in an engine cylinder by means of an appliance so unreliable as the pressure gage is said to be, by some authorities, and still more so when it is proposed to throttle the steam supply to the gage, as has just been described.

But in answer to these objections, the writer desires to give the results of his own experience, as having himself been in doubt as to the accuracy of gages and the effect of throttling, he has made

many hundreds of experiments in order to test the extent of the error to be expected and he has come to the conclusion that readings by a pressure gage may be obtained which are as accurate as consistent and as reliable as by any known instrument for the measurement of pressure, not excepting the best of indicators; also that the throttling, when properly applied, does not endanger the accuracy of the reading, but, on the contrary, gives the true mean effect of the regular successions of momentary variations of pressures acting on the gage.

In order to obtain accurate readings by means of a pressure gage, such gage must (1) be properly constructed; (2) be properly used. That a large number of the pressure gages in ordinary use in practice are more or less unreliable is well known, but it will be admitted that such gages, of the unreliable class, have not been constructed for the purpose of extremely accurate measurements, and have not received that care in the process of manufacture which is necessary to enable them to be classed as "instruments of precision." Their deficiencies are usually not due to defect in the principle upon which they are constructed, but are rather a question of quality of manufacture. But however perfectly constructed a gage may be, it is of course necessary that it should be carefully used, if it is expected to give uniformly accurate readings. Probably no instrument used by engineers receives such scant attention as the pressure gage; and while some of our measuring instruments must be carefully cleaned, oiled and set, before we may have a single measurement, the pressure gage may be dirty or rusty, or hot or cold, or its syphon may be empty or full, but under all these conditions it is expected to be equally accurate.

PRESSURE GAGE SYPHONS.

The importance is admitted of maintaining a column of water in the syphon of the pressure gage to keep the gage cool, so that its readings may be consistent, and so as not to subject the gage to high or variable temperatures. It is generally supposed that if the gage has a syphon there is always water in it, and that when the syphon is once full of water, the water is easily retained therein, but these assumptions are not warranted by the facts of the case. The water will disappear from the syphon from various causes: (1) If there is the smallest leak in the gage end of the syphon, then the water is all gone in a minute or two by being blown out by the steam, though the leak may be almost imperceptible. (2) If the pressure to which the gage is subjected is a variable one, as is the case when the gage is attached by its syphon to the valve chest of an engine regulated by a throttling governor, then the water will disappear from the syphon as usually constructed in a few minutes, especially on a sudden reduction of load and consequent fall of pressure, in the same way that water in the engine cylinder disappears during expansion and exhaust. (3) When the gage is liable to be subjected to a vacuum, as is the case when it is attached anywhere on the engine side of the throttle valve, then if the throttle valve is closed by the governor, or by hand, while the engine continues running, especially if it is a condensing engine, the engine becomes an air pump and the water in the syphon is displaced by the expanding air initially contained in the spring tube of the gage and its connections. Thus if the pressure in the engine falls to 3 lb. absolute, the volume of water displaced in the syphon equals 15 ÷ 3 = 5 times the volume of air in the gage. If now the steam is again suddenly turned on the engine, it is certain that the gage readings will be different from what they were when the syphons were full of water. When there is water in the syphon, the syphon pipe is practically cold with a steady pressure. When the pipe is very hot, the water has probably gone from the syphon, unless it happens that the pipe is in contact with some hot metal. (4) If the gage is subjected to a vacuum, and there is the smallest leak in the fitting at the gage end of the syphon, then the water in the syphon is displaced by the air which enters the syphon through the leak.

When the cause is due to the variable nature of the pressure acting on the gage, the water may be retained in the syphon by the method of double throttling already mentioned. When the mean-pressure instrument was first constructed, only a single cock was fitted to the syphon of each pressure gage, and great difficulty was found to keep the water in the syphon. Many devices were tried to overcome this difficulty, but without avail. A second cock would have been fitted at an early period of the experiments, at the end of the syphon farthest from the gage—which, when throttled, would instantly have stopped the trouble—but for the fact that

the writer set out with the notion that if the throttling of the syphon cock was a throttling of water the pressure would be transmitted to the gage undiminished, but that if the throttling took place in the steam a loss of pressure would follow, and the reading of the gage would be low. This erroneous notion cost about twelve months' experimenting to try to discover how to do without the use of water in a syphon.

Fig. 4 shows the arrangement employed for experimenting on the effect of double throttling. A short water gage glass A is secured between two plates B and C held together by bolts. The glass is connected at the top with the engine cylinder D by the pipe as shown, and at the bottom of the glass the gage pipe is attached. There are regulating cocks at E and F. When the cock E is opened wide and the engine is running, the change or pressure in the cylinder between the driving and the exhaust stroke caused a more or less violent agitation of the water in A, being the more violent as the range of pressure was greater. When the range of pressure was not more than about 10 lb., the water in the glass was quiet; but when the range of pressure exceeded this (by increasing the load on the engine) agitation again began. The action appeared to be due first to the heating of the water in the tube by the rush of steam, mixed with globules of hot water, into the tube; and secondly, to the re-evaporation of the heated water when the pressure fell during expansion and exhaust in the cylinder. It is not possible to give numerical data as to the effect of different ranges of pressure, because the behavior of the water was most

FIG. 4.

erratic. Sometimes, with a given range of pressure in the engine, the water was violently agitated and would disappear from the glass in a few minutes; in other cases it would remain quiescent in the glass for hours, though the conditions appear to be unchanged. Then it would suddenly commence to boil and to disappear without any apparent cause. But in all cases of agitation of the water in the tube A, when the cock E was throttled down the agitation immediately ceased.

The amount of throttling of the cock E which was necessary to stop the agitation still left a fairly large movement of the gage finger across the scale, and the final adjustment for steadying the figure to the smallest possible movement was obtained by throttling the cock F. Throttling the cock E had no effect on the pressure reading by the gage unless the throttling was carried too far. It was not necessary in order to stop the ebullition to throttle the cock E so far as to reduce the pressure. If any doubt remained as to whether the cock E was throttled too much, a little more opening of E would show at once whether such was the case. But it is only necessary to move E sufficiently to stop the ebullition and consequent disappearance of the water, and this leaves a good margin before the throttling of E is excessive.

With such an arrangement the effect of suitably throttling the cock E is to automatically fill up the syphon, if partly empty from any cause, and the water in the syphon will thus reach as far as the cock E when the apparatus has been at work a short time. In this way the problem of keeping the water in the syphon continuously and free from agitation was solved, and there is now practically no difficulty in obtaining a constant and accurate reading of the mean pressure by gages subjected to variable pressures.

When the cause of loss of water in the syphon is due to the gage being subjected to a vacuum, a type of gage is preferable from which the air in the Bourdon tube has been excluded, and the tube filled with liquid to its extremity; there is then no air to expand in the tube to expel the water from the syphon.

To sum up: (1) The instrument here described gives a correct record of the mean-time pressure. (2) The mean-time pressure bears a definite ratio to the mean pressure as given by an ordinary indicator. (3) The correction may be made by the use of a factor, or by a corrected scale on the gage dial. (4) Pressure gages when properly made and properly used may be relied upon to give accurate readings.

ROCKFORD RAILWAY, LIGHT & POWER CO.

Mr. T. M. Ellis, general manager of the Rockford (Ill.) Railway, Light & Power Co., has sent us a copy of the report of the operation of the company's electric railway for the months of December, 1899. The company operates 22 miles of track.

In connection with the data for December, we reprint the corresponding figures for July, 1899.

BALANCE SHEET.

	July.	Dec.
Cash from passengers.....	\$6,346.40	\$5,226.07
Ticket sales.....	1,055.00	1,695.00
Received from carrying mail.....		50.00
	\$7,401.40	\$6,971.07
Operating expenses.....	3,715.03	3,578.30
Net earnings.....	\$3,686.37	\$3,392.77

SUMMARY.

Passengers carried.....	163,222	148,225
Average earnings per day.....	\$238.75	\$224.87
Average cars operated per day....	11.34	10 2-3
Earnings per car per day.....	\$20.32	\$21.07
Operating expenses per day.....	\$119.84	\$115.42
Operating expenses per car per day	\$10.20	\$10.82
Total motor car-mileage.....	54,457.5	48,832.6
Mileage per day.....	1,756.7	1,575.2
Mileage per car per day.....	149.5	147.7
Earnings per car-mile.....	13.59 cents	14.28 cents
Operating expense per car-mile...	6.82 cents	7.33 cents
Net earnings per car-mile.....	6.77 cents	6.95 cents

This is a particularly good showing, as, notwithstanding the decrease in the number of passengers, due to the season, of 9.2 per cent, the decrease in net earnings was only 8 per cent and the net earnings per car-mile show a gain. The operating expenses, 7.33 cents per car-mile, is a particularly good showing.

The total energy for the month, including that required for motors in the repair shops and lights in the car house, was 55,110 kw. h., or 1.13 kw. h. per car-mile.

For the whole year the gross earnings were \$71,096; the operating expenses, \$43,921; bond interest and other charges, \$17,446; surplus \$9,729. The number of passengers carried was 1,554,058, an increase of about one-third over the preceding year. The business for January, 1900, shows an increase of 20 per cent over January, 1899.

The Rockford Railway, Light & Power Co. now has all of the street railway lines in Rockford and is making numerous improvements. Loops are being put in at all the terminals where practicable and in the business district a loop two blocks each way is to be provided, which will greatly facilitate the handling of cars and improve the service. A new waiting room for passengers has been arranged at the company's offices and also a club room for employees.

This company has a beautiful park about three miles from the city, at which is a summer theater having a seating capacity for 2,000 persons; there are also other amusement features, such as bowling alleys, dancing pavilions, merry-go-rounds, etc.

One interesting feature of the road is that while it owns a power plant, it has been found cheaper to keep that plant closed and buy power, which it gets at the rate of 1.5 cents per kw. h.

MECHANICAL DEPARTMENT

A FOUR-MOTOR SNOW PLOW.

BY JOSEPH H. SMITH.

A well-known railway electrician once made the statement that if he could put a nose on the front of one of his four-motor cars, he could push all the snow that would come in front of him, and it was mainly because of this suggestion that the Interstate Consolidated Street Railway Co., of North Attleborough, Mass., determined to have a four-motor snow plow.

During the severe winter of 1898-99, when so many railway companies met such hard storms as to completely tie up their systems, on two different occasions the value of a first-class plow, something better than had been put out as yet, was easily seen. Though the Interstate Consolidated had its cars in operation several hours before any other road in the state, still the management, with customary enterprise, was not satisfied to have its lines tied up at all. So it was decided to spare no time or expense to place the road in such a condition as to be equal to any emergency.

The value of a snow plow lies in the weight available for adhesion and in its power; these two factors have been carefully observed in the construction of this plow. The total weight of this plow is 20 tons, distributed as follows: the body, 4 tons; noses, 2 tons; trucks and motors, 14 tons. Adding to this 10 barrels of salt and sand that will be carried, 3 tons more, gives a total weight of 23 tons on the wheels. There being eight driving wheels, the weight on each wheel will be 5,750 lb. The equipment consists of four G. E. 1,000 motors with 4-turn armatures; the shaft of each armature carries a 22-tooth pinion which meshes into a 62-tooth gear, giving a speed reduction of 2.81.

The plow, including the trucks, was built by Polard & Grothe, of Woburn, Mass., who are to be congratulated upon the thoroughness of their work. The trucks were designed especially

to envelop the motor wheels and brake rigging, thus preventing any snow from falling back in between the wheels. The trucks have Bemis wheels on a 3 3/4 in. axle, key seated for G. E. 1,000 or W. P. 50 motors.

Ice cutters or diggers are fastened directly to the truck, ensuring a good ground contact at all times, and also allowing them

4-MOTOR SNOW PLOW.

to be on the rail when going around a curve, which would not be the case if they were suspended from the body.

The digger post is of steel 3 1/2 in. square, with a changeable cast shoe. A sleeve about 8 in. long keeps it in position, and a helical spring acts upon the sleeve and returns it to its normal position should it strike a high joint or any other obstruction. This prevents it from getting bent or knocked out of shape in any manner.

It was a matter of great difficulty to arrange the diggers so that they could be fastened to the truck and controlled inside the body and still not interfere with the truck swinging. A clasp with a projecting stud is fastened to the upper end of the digger-post; this stud engages with a lever, the other end of which is moved by a rod running horizontally to the other post; another rod is fastened perpendicularly to this one and projects about 4 in. above the top of the truck. The lever inside presses down a plate upon

INTERIOR OF CAB.

for this work and combine strength and durability with the minimum number of parts. The body rests upon a stationary bolster with the usual circle and recess at the center, chafing plates at the ends of the bolster and at the corners of the trucks. There are no springs used except those on top of the journal boxes and in the suspension. The truck is enclosed by a steel frame which completely

FIG. 1.

the end of this rod and raises the posts and they come down by their own weight when the lever is released. In swinging around a curve the perpendicular rod slides on the face of the plate which moves with the body.

Fig. 1 shows the arrangement of the trucks and noses. A cast iron roller 5 in. in diameter and 18 in. long is set at each end of each truck and opposite to these are concave plates on which the rollers bear. At the ends these bearing plates are on the nose, while in center they are on a centerboard which is fastened to the body. This brings the force of both trucks directly on the forward nose, so there is no stress on the body.

The nose is made of 1 1/4-in. steel and is of the moldboard type, with a heavy cast-iron point. From this point to the end, along the side, the nose is 10 ft. long, and 4 1/2 ft. high. It is raised by

a wheel which turns a worm and gear. A wing 4½ ft. long is set at each corner. With these set down, the plow will cut a path 13 ft 8 in. wide through the snow.

From point to point the length is 39 ft. 8 in. The body inside is 27 ft. 8 in. long and 7 ft. wide. Windows at each end give all the light necessary by day, and six lamps arranged around the walls serve at night. Each headlight contains three 16-c. p. lamps and a red light burns in the rear as a danger signal.

The controller is set at the extreme end directly under one of the windows. A little back and to the left is the brake wheel and on the right is the wheel for raising the nose and the digger lever. All the wiring is exposed, being merely cleated to the ribs on the ceiling. This prevents any water from resting around it, and

one of the features for the coming season. Arrangements have been made with a theatrical agency for a first-class light opera troupe of 35 members to play from May 15th until July 1st, and longer, if the patronage warrants it. No pains or expense will be spared to make this a first-class up-to-date place of amusement.

PRIZES FOR TRANSFER STATION DESIGNS.

The New York Municipal Art Society has offered prizes of \$300, \$200 and \$100 for the best three designs for a public transfer station for street railway passengers at Seventh Ave. and 59th St., New York. The society does not promise that the building will be

FIG. 2 DIAGRAM OF WIRING.

makes it easy to locate the cause of trouble, should any occur. Fig. 2 shows the wiring in detail; the center wires are No. 2 B. & S., while the others are No. 6.

A 2-in. steel pipe set flush with the floor on each side opposite the door allows enough sand and salt to strike the rail to keep it in good condition.

On account of the length of the body, it was necessary to put on two trolley poles. This arrangement has the advantage of having a spare pole to fall back on in an emergency, and if there is ice on the wire they can be run in tandem, the first one to clear the way for the second.

Though at the present writing the opportunity has not yet arrived to test this land-battleship, yet every confidence is placed in her to perform her duty to the best satisfaction.

PARK IMPROVEMENTS AT NASHVILLE.

The officials of the Nashville (Tenn.) & Suburban Railway Co. have definitely decided upon the character of improvements to be made at the resort known as Glendale Park, and in the line running thereto. This branch is single track, but 3½ miles of additional track will be built from the park back to the city by another route, forming a loop and making it possible to go out to the grounds one way and return another, giving pleasure passengers the advantages of varying scenery and a longer ride in the country.

At the park a large force of men is at work improving and beautifying the grounds in a number of ways. Wires have been run from the power house for the purpose of illuminating the place at night and a number of arc lamps have been placed at frequent intervals throughout the grounds. Florists have been engaged, and at least two acres of land will be laid out in large flower beds. The casino will be enlarged and repaired and an excellent restaurant made

erected, but agrees to submit the successful plans to the city and to the Metropolitan Street Ry., and to use its influence to have the best design accepted. The proposed structure is not to cost over \$5,000. The competition was to have closed February 15th.

FURNACE FOR DRYING SAND.

We are indebted to F. L. Wanklyn, manager of the Montreal Street Railway Co., for the particulars of a sand drying oven that has been erected by his company and which appears to answer admirably the purpose for which it was constructed. It consists of a rectangular brick chamber, about 5 x 10 ft. inside, with a "V" shaped boiler plate bottom, which is placed immediately over the fire-grate. To prevent undue warping and buckling of this plate, it is stiffened with T irons and protected inside by a firebrick arch, in which there are openings at intervals to permit the heated gases to reach the plate. The sand as it dries falls by gravity through openings in the outside of the brick wall into screens, on which it is sifted and prepared for use. The furnace is large enough to permit old waste wood to be used as fuel.

FIRE AT FREDONIA, N. Y.

A serious fire at Fredonia, N. Y., on the morning of January 25th, destroyed, among other property, the electric power house of the Dunkirk & Fredonia Railroad Co., compelling a suspension of the traffic between those points. The loss to the railroad company is estimated at \$60,000; the total loss was reported at \$200,000.

A dividend of 1½ per cent has been declared upon the common stock of the Twin City Rapid Transit Co., of Minneapolis, payable February 15th.

NORTHWESTERN ELECTRICAL ASSOCIATION.

The eighth annual meeting of the Northwestern Electrical Association was held at Milwaukee on January 17th and 18th. The papers presented in addition to the president's address were as follows:

"Modern Development in Alternating-current Series Arc Lamps," by R. Fleming, General Electric Co., Lynn, Mass.

"Fundamental Ideas of Alternating Currents," by Professor Dugald C. Jackson, University of Wisconsin, Madison, Wis.

"Central-station Heating in Connection with Electric-lighting Plants," by W. H. Schott, Chicago.

"Central-station Economics," by H. W. Frund, Vincennes Electric Light and Power Co., Vincennes, Ind.

"The Polyphase Induction Motor," by Ralph D. Mershon, Westinghouse Electric and Manufacturing Co., New York.

"Relative Efficiency and Desirability of Various Types of Engines in Central-station Loads," by Prof. A. W. Richter, University of Wisconsin, Madison.

"A Life Test of Incandescent Lamps," by Prof. George D. Shephardson, University of Minnesota.

"A Canadian Plant," by L. G. Van Ness, Quebec.

Officers were chosen as follows: President, Pliny Norcross, Janesville, Wis.; vice-presidents, H. W. Frund, Vincennes, Ind., and H. J. Gille, St. Paul, Minn.; secretary and treasurer, Thomas R. Mercin, Milwaukee; directors, W. H. Schott, Chicago; G. D. Westover, Cadillac, Mich.; Mr. Innes, Eagle Grove, Ia.

It was decided to hold the summer meeting of the association at Waupaca, Wis., which lovely spot one of its friends described as "the center of the world, bounded on the east by the rising sun, on the west by eternity, and on the north and south by woods."

NEW JERSEY GRADE CROSSING DECISION.

In New Jersey the conditions under which a new railroad, electric or steam, may cross the track of an older road are very largely in the discretion of the chancellor of the state, who is charged with the duty of protecting the public and equitably apportioning costs between the two companies. Last month the vice-chancellor rendered a decision which will require the West Jersey Traction Co. (which is controlled by the Camden & Suburban Ry.) to tunnel under the tracks of the Pennsylvania R. R. at Haddonfield, the estimated cost of the crossing being nearly \$13,000. The traffic of the steam road over this crossing is 72 regular and often as many as 30 special trains daily in the summer season. In his opinion the vice-chancellor said concerning grade crossings in general:

"It cannot be denied that there is an element of danger in every grade crossing of a steam railroad. If all persons were constantly vigilant danger would disappear or be reduced to an infinitesimal proportion. So long, however, as men are careless, as they always will be, the instances of collision on grade crossings will engage the attention of courts and create the wish that grade crossings may be abolished."

A NEW PROPOSITION.

We have had tunnel roads operating entirely underground, conduit systems and surface contact systems, but here is a new one. Andrew McGill, of Dunedin, New Zealand, has invented a system in which half of the car is underground and half above. It is proposed to construct a conduit of sufficient capacity to receive the truck and running-gear of an electric or cable car. Attached to the truck and passing up through the slot, are thin wide bars, of sufficient cross section, to support the body of the car. Special provision is made to facilitate passage around curves.

A committee appointed by the Franklin Institute to investigate the invention reports that in its opinion, "the disadvantages of inaccessibility to the truck mechanism, especially in the case of electric railways where prompt access to the motors and their connections is of the highest importance, would more than offset the advantages claimed for the system." We think they would.

The Chicago & Northwestern Ry. has reduced the fare from Milwaukee to Waukesha to 60 cents in order to meet the competition of the electric railway running to that town.

HANDLING FREIGHT ON THE ISLE OF MAN TRAMWAYS.

The Isle of Man Tramways Co., in addition to its regular passenger traffic, has developed an extensive freight and heavy goods haulage business, the receipts from which form a considerable part of the road's net income. To handle this traffic with the least expense and with the smallest possible interruption to the ordinary service, three Bonner rail wagons, made by the Bonner Rail Wagon

TRAIN OF BONNER RAIL WAGONS.

Co., of Toledo, O., have been acquired and are in daily operation with very satisfactory results. The Isle of Man Tramway is about 25 miles long, with a number of severe grades, some as steep as 1 in 58, and numerous sharp curves, the conditions under which the wagons are used being unusually hard in this respect.

The Bonner rail wagon is more or less familiar in the United States. It is in successful operation at Toledo, O., at Detroit, Mich., and at other points and has satisfactorily demonstrated its usefulness in the hauling of heavy goods, as stone and ores, farm products and general merchandise. As the adaptability of the electric railway to the carrying of this class of freight becomes more widely

VIEW AT DHOON GLENS STATION.

recognized, these wagons will undoubtedly come into more general use.

In the Isle of Man, a large part of the freight business consists of hauling granite from quarries owned by the tramway company

to the shipping dock. This was formerly carried on by one-horse, two-wheeled carts of 1,700 lb. capacity, which hauled the stone a long distance to the railway, when it was unloaded from the carts, and loaded into the cars. On reaching the coast it had to again be loaded into carts and taken to the docks. With the present system the stone is loaded into Bonner wagons at the quarries, drawn by a two-horse team to the street railway tracks, and without unloading, the wagons are attached to a motor car in trains, of two or three and taken directly to the nearest point to the docks, where horses are again hitched on, and the wagons driven to the side of the ships. The saving in time, convenience and expense over the old way is evident.

The wagons are very strongly built and otherwise but little different from the ordinary road vehicles. The bodies are 13 ft. long, 6 ft. wide and 2 ft. 6 in. deep, and are capable of carrying from 4 to 6 tons. The four sides are hinged, and can be lowered, so that they can be loaded with facility. The bodies are mounted on four strong, wide-tired wheels. When it is desired to go by rail the wagon is drawn by horses on to four specially constructed, inclined planes, which are placed two on each side of the rails, and which raise the wagon to the required height. These planes are

UNLOADING TRAIN AT RAMSEY STATION, ISLE OF MAN.

shown in one of the accompanying illustrations. A low bogie truck of the same gage as the tracks and consisting of a stout and well braced frame carried upon two axles is run under the wagon, and fastened thereto by means of cast iron stops, which are raised to receive the axles of the wagon, by small hand levers. The bogie truck is then coupled to the motor car and taken to any desired point on the line. In removing the wagon from the truck, the former operation is, of course, simply reversed. The bogie is stopped over the inclined planes, the engaging stops lowered, and the wagon drawn off by horses.

ACCIDENT AT UTICA, N. Y.

At 10 p. m. on January 19th there was a head-on collision between a work car and a regular car of the Belt Line Street Railroad Co., Utica, N. Y., which resulted in the death of one person and slight injuries to seven others. The work car was returning from Oriskany, where it had been summoned to extricate a horse from a bridge, and a dense fog prevented the lights of the regular car being seen in time to avoid the collision.

The platform of the work car being some inches higher than that of the other and strongly built, it cut through the vestibule of the passenger car and into the body. The motorman of the passenger car had both legs cut off and died from the injuries received.

A general order issued by Superintendent W. P. Read, of the Salt Lake City (Utah) R. R., requests all the employes of the system to undergo vaccination.

NO STRIKE AT LOUISVILLE.

The employes of the Louisville Railway Co. began the new year with threats of a strike unless certain demands should be granted. These demands were recognition of the union, an increase in wages from 16½ to 20 cents per hour, the right to arbitrate cases of the removal of employes for various offenses, and the right to buy uniforms in the open market.

January 17th the company made its answer, which was a refusal to recognize the union or make any agreement as to arbitration. Concerning uniforms, it was pointed out that the demand was misleading, as all the company requires is that all the men shall get uniforms from the same firm, which is chosen at suitable intervals by a committee of the employes. The prices now paid are \$12.35 for winter and \$9.50 for summer uniforms.

As to wages, the company announced it could not pay the 20 cents asked, but that it would on February 1st put the following schedule in effect, having decided upon the increase before the demands were made by the men: For motormen, 16 cents per hour for the first 100 days, 17 cents per hour for the next 265 days, 17½ cents after the first year's service. For conductors, 17 cents per hour

for the first year, 17½ cents per hour thereafter. Other employes, an increase of 5 per cent.

This was considered satisfactory, and on January 24th the men decided not to strike.

DANGER IN POLITENESS.

A returned traveler has given the public a rather amusing account of how his ideas of courtesy towards women passengers and the rules of the street railway company failed to mix satisfactorily in Hamburg. The European street car is full when a given number of passengers are on board and the law strictly forbids the conductor from making room "for one more," as is the accepted rule in this country.

Sometimes, while the conductor is in front collecting fares, a lady will step on the car, which is already "occupied." As there is no conductor on hand to prevent her, the lady steps inside, and the gentleman who may offer her a seat comes out and takes his stand on the platform. When the conductor, after going his rounds, returns to his post, he promptly requests the gentleman to step off the car, as he has forfeited his seat, and the car is fully "occupied." Should he refuse to leave the car he is put off. The policemen on the streets are instructed to watch the cars sharply, and if they find a car carries even one more passenger than its proper complement the conductor is fined 72 cents.

The extension of the Fond du Lac (Wis.) Street Ry. to North Fond du Lac was formally opened January 20th.

THE STREET RAILWAYS OF PENNSYLVANIA.

That section of the annual report of the Secretary of Internal Affairs of the Commonwealth of Pennsylvania for the year ending June 30, 1899, which contains the report of Maj. I. B. Brown, superintendent of the Bureau of Railroads, gives an interesting resume of the street railway situation in that state, from which we take the following extracts:

The street railways of Pennsylvania have been in a process of financial change to a greater degree than perhaps any other class of corporations that have existed under the laws of the commonwealth. The number of charters taken out, especially since the introduction of electricity as a motive power, has been remarkably large, and yet there are comparatively few lines being operated under these chartered rights. In many cases the charters have died through non-usage, or the powers and rights conferred by the granting of such charters have been merged into other similar corporations.

So far as the public is concerned in the growth of street railway interests in the state, there can be but one opinion expressed, and that is that the means of local transportation have been greatly improved and the cost to the passenger has been greatly reduced on account of the centralization of managements in the development of these interests.

From the returns received it appears that of the 324 street railway corporations making reports, 90 are operating companies, 71 are subsidiary companies and 163 are corporations whose lines were not so far constructed as to be in whole or in part in operation at the close of the fiscal year, to wit, June 30th. In addition to these, there are 56 street railway corporations, whose capital stock, rights and franchises have been acquired by operating companies, and whose reports are included in the statements made by such operating companies.

The total capital stock outstanding of operating companies is \$103,122,319; funded debt outstanding, \$31,309,425; total current liabilities, \$13,139,149; total capitalization and liabilities, \$147,570,893. Compared with the year ending June 30, 1898, the capital stock for 1899 shows an increase of \$2,212,984; the funded debt a decrease of \$1,131,425.

Of the \$103,122,319 capital stock outstanding, six companies, i. e., the Consolidated, of Pittsburg, the Pennsylvania Traction, the Union Traction, of Philadelphia, the United Traction, of Pittsburg, the West End Traction, of Pittsburg, and the Wilkes-Barre & Wyoming Valley Traction, together have \$73,909,380, or 71 per cent of the total.

In addition to the capitalization reported by operating companies, there is reported by subsidiary or lesser companies capital stock outstanding of \$53,407,639; funded and unfunded indebtedness of \$41,649,487; which, added to the total capitalization of operating companies, \$147,570,893, makes a total capitalization of operating and subsidiary companies of \$242,628,019. In considering this total, however, it must be taken into account that there is some duplication, as many of the corporations have purchased the stock of subsidiary companies out of the capital which has been secured by the disposal of their own stocks.

The total cost of road and equipment as reported by all companies is \$197,161,214.

The operating companies report as receipts from operation, \$21,046,808; from other sources, \$922,448; total receipts, \$22,569,256. The total receipts from operating companies for the previous year was \$19,745,706. The volume of business done by street railways in the state has, therefore, greatly increased, but not in proportion to the increase of business in other enterprises, as, for instance, the business done by steel and iron companies.

From the total receipts from operations, \$10,519,810 was paid in operating expenses, or substantially 46 per cent. The amount of taxes paid was \$1,314,470; interest on funded debt, \$2,257,765; rentals, \$6,237,691; other expenses, \$279,453; dividends paid, \$1,179,474; total, including dividends, \$21,788,663. The surplus for the year is therefore \$780,593. In addition to the dividends paid by the operating companies, there has been paid as dividends by the subsidiary companies the amount of \$7,954,173, or a total, with the dividends paid by the operating companies, of \$9,133,647. This, however, if considered as a disbursement, produces a duplication, as the amount of dividends paid by subsidiary companies is largely

derived from the \$6,237,691 received by subsidiary companies in the way of rentals from operating companies.

The total mileage of street railways operated in the state given at 1,812.94; in 1898 it was 1,708.32. The total number of cars owned is 5,804; in 1898 the number was 5,616. The total number of employes for 1899 was 12,506; the previous year the number was 12,680. The total compensation of employes in 1899 was \$6,569,004; in 1898 it was \$6,542,840. The number of passengers carried in 1899 was 473,313,258; in 1898 the number was 432,770,314, an increase of 49,533,944.

The total number of passengers killed during the year was 17; injured, 484; the total number of employes killed was 3; injured, 139; the total number of other persons than passengers and employes killed was 77; injured, 504; or a total of fatal casualties of 97, and of non fatal, 1,127. For the previous year the number of passengers killed was 15, injured 506; employes killed, 11; injured, 86; other persons killed, 89; injured, 409; total killed, 106; injured, 1,001.

In the report for the year ending June 30, 1898, as well as that for the year ending June 30, 1897, an account was given of observations made on the use of bicycles, or, more particularly, of the number of persons who passed a given point on Third St., in the city of Harrisburg, on wheels and of those who patronized the cars of the Harrisburg Traction Co. In the investigation for the year 1897 it was found that the number of persons passing the given point during the given twenty-four hours, both on wheels and in cars, was 6,078. Of this number, 1,962 were on the cars and 4,116 were on wheels. That is, 67.7 per cent were on bicycles and 32.3 per cent on the cars. In the report for 1898 the number of persons passing the same point on a certain day was given as 5,819. Of this number, 3,449 were on wheels and 2,370 in cars, or a percentage of 59.3 on wheels and 40.7 on the cars. In the investigation made for the 1899 report, during the same length of time and on a day when the conditions for traveling were substantially the same as on the days selected for the observations of the two previous years, the total number of persons passing on wheels was 3,784, in cars, 2,941, or a total of 6,725, the percentage on wheels being 56.27, and on cars, 43.73.

There is evidence in these figures to indicate that while the wheel is still in constant use by a large number of people, yet the percentage of those who ride on wheels as compared with those who ride in cars has considerably decreased during the period covered by these observations. A feature of the observations made for the 1899 report is the counting of the number of pedestrians who passed a given point during the same hours that the observations were made of those riding on cars or on wheels. The total number of such pedestrians was found to be 13,066, or 6,341 more than the combined number on wheels and in cars. From the above figures it will be seen that the total number of pedestrians, bicyclists and passengers on cars is 19,791, of which 66.02 per cent were pedestrians, 19.12 per cent on wheels and 14.86 per cent in cars.

The report adds: "These observations probably are not of much weight, and yet they present a problem for all street railway companies to solve, and that is to make it advantageous for this large number of pedestrians to ride in the cars, rather than walk."

NO PAYMENTS BY UNION LOOP, CHICAGO.

When the Chicago Union Elevated Railroad Co. was granted a franchise to build the Union Loop, the mayor would not sign the ordinance until the company agreed to pay the city a portion of its gross receipts in excess of \$2,500,000, increasing from 5 per cent for the first five years to 25 per cent for the last 15 years. One of the provisions of the original ordinance was that private passages might be built from buildings to the loop, but after a few such passages had been erected the city refused to permit any new ones. On this ground the company considered itself released from the contract, and the present city administration has decided to make no attempt to compel the payments by the company.

The Toledo (O.) Traction Co.'s employes' band has tendered its services to the Playground Association, a charitable institution of the city. The band recently gave the sixth of a series of concerts that have been very much appreciated by the people of Toledo.

GRADE CROSSINGS.

Read before the Engineers' Club of Cleveland by Augustus Mordecai, and published in the "Journal of the Association of Engineering Societies."

In the discussion of the question of eliminating grade crossings of highways with railroads we must be careful to avoid prejudice. It is hard to overcome the natural impulse to make the corporation bear as much of the burden as possible, whether it is right or wrong to do so. "The corporation can afford it," we say. It is hard even for an employe to divest himself of this feeling, and still more so for one not so employed. Often we notice an employe throwing away as worthless a bolt, for example, that has lost a nut; but if the bolt belongs to his bicycle, how carefully he preserves it for future use.

Even to the most wealthy, the expenditure of millions of dollars must be a matter of careful and judicious thought, not lightly to be entered into.

Let us see what are the rights of the parties, the public and the railroads, in the highway. They are equal as far as occupancy is concerned, and both can go their ways, provided that in so doing neither interferences unreasonably with the other. All are obliged to use caution in the use of the common highway. The individual must be careful he does not take any unnecessary chances in crossing the tracks of the railroad. The electric company, if there is one, must see that its conductor knows that the way is clear before he allows its car to cross; and the railroad company must, by watchmen and gates, or by bell and whistle, warn the public, and use every precaution to have the way clear before its train crosses the highway. Neither of the parties must obstruct the crossing for an unreasonable length of time, consequently all would be benefited equally by the elimination of the grade crossing if it were not for certain conditions not common to both. By the abolition of the grade crossing the public saves time, annoyance due to delays or to precautions necessary for the prevention of accident, and damage caused by the accident itself. A very large proportion of accidents (judging from the records of the Erie R. R., as high as 60 per cent) is due to the contributory negligence of the individual. The street car company saves time—not a large item, as the men are paid by the trip—and the liability of accident, which is a much more important consideration with them than with the steam railroad, as its car is weaker and the passenger much more liable to injury. The steam railroad saves the expense incident to watching the crossing, an expense which legally, but perhaps not justly, it is forced exclusively to bear; the time which would be lost in taking precaution against accident (a larger item than in the case of an electric railroad, as the steam road generally has many highways to cross) and the liability of injury in case of accident, which, as shown, is lower in the case of the steam railroad than with the electric road or with the public. The laws of New York make it obligatory on the part of the parties interested to abolish the crossing if the Board of Railroad Commissioners says it should be abolished; the railroad company paying one-half, the city or village one quarter and the state one-quarter of the cost. In Ohio, if the railroad company and the municipal authorities agree that the crossing may be abolished, not more than 35 per cent of the cost is paid by the municipality, and not less than 65 per cent by the railroad company. This is certainly not burdensome on the municipality, especially when we remember that the railroad company, being a large taxpayer, eventually pays no mean proportion of the 35 per cent charged to the municipality.

In the design for the work, if the railroad is put under the highway, there should be not less than 18 ft. headroom and 2 ft. for floor of bridge. In Ohio there is a statute obliging an obstruction over a railroad track to be at least 21 ft. above the top of rail, but I think this should be amended so as to give the Railroad Commissioner some discretion in the matter. Out on the open road, where trains run fast, and in the days before the nearly universal use of air brakes had greatly diminished the brakeman's duties in running from one car to another to set the brake, it might have been proper to require such headroom; but in these days and in cities, where there is slow movement and where the locomotives and cars are equipped with air brakes, it does not seem necessary in all cases; and in fact other cities are adopting less headroom, and the Erie R. R. has been running for years in this city under

bridges of very much less headroom, properly protected, without accident. I think the headroom should not be less than 18 ft., however; first to allow for the future probable increase in height of locomotives and cars which are constantly growing higher and higher, and also to allow a brakeman if he is on top of a car, to sit down without being struck. If it were impressed on him that he could not stand, but might sit down, on going through a city, the liability to accident would be much reduced.

If the highway is put under the railroad there should be at least 13 ft. headroom allowed, with 2 ft. for floor of bridge at highways where there is or may be an electric railroad, and 12 ft., with 2 ft. for floor of bridge, at highways where no electric railway is likely to be built. This will not allow the use of a double-decked electric car, but I think it is not unreasonable to make this restriction. In fact, it must be remembered that the placing of the highway under the railroad immediately restricts materially the height of the vehicle and its load that can pass under the bridge, a restriction that, except for the trolley wires, which I hope are but temporary, is not encountered in any other part of the highway. The gorgeous band-wagon of the circus, for instance, or the floats of an industrial parade will have to take another route, whereas the railroad equipment is restricted just as much by other things, such as the heights of the top bracing on bridges or the cross-section of the tunnels, etc. This is one of the strong arguments in favor of placing the highways above the railroad.

The width of the highway should not be restricted unless under exceptional circumstances. It is true that London bridge, with its enormous traffic, is but 56 ft. wide, and that Chestnut St. bridge, in Philadelphia, is but 40 ft. wide; yet room seems to be necessary in this bustling life of ours, and the people are entitled to it. The grades on the highway approaches should be not more than 5 per cent. This is the grade used in Chicago, and many cities have steeper natural ones; certainly Cleveland has. I mention Chestnut St. bridge because it is on one of the main thoroughfares between populations nearly twice as large as in Cleveland, and carries two street railroad tracks.

Nor should the width of the railroad be curtailed. It is hard to foresee what conditions may arise, and allowance must be made for future growth. If a highway becomes congested there are other highways, but to obtain other railroad tracks is another matter; always expensive, often impossible. The grades on the railroad should not be changed to make them a burden at the time or in the event of any possible future improvement to the railroad property, and for this reason great care must be taken in raising the elevation of the railroad tracks or in increasing their grade, as such change might involve a very serious burden on the property. There may be very little, if any, reserve power in a locomotive. It is usually loaded to its capacity; whereas, in the individual and electric car, within certain limits, there is ample reserve power, and the same is true of most horses. The railroad is an essential and admirable instrument in the growth and development of a city. It is a tool not to be abused and knocked about, but, like all other good tools, to be handled somewhat affectionately; to be kept always neat and clean and in through working order.

Other things being equal, it is certainly lighter, pleasanter, in every way better, to raise the highway. This may or may not involve the depression of the railroad tracks. If the tracks can remain as they are, well and good. In that case we have only to see that the structure and its supports are so constructed that they shall not interfere with the railroad and its operation; and, although the railroad authorities are seemingly actuated by selfish motives, it is pretty safe to conclude that they are fairly good guides to follow in these and in similar cases. If the tracks must be raised or lowered in order to avoid steep approaches or excessive property damage, it may be wise to lower them, the depth depending on circumstances. Through the residence district of a great city it may be well to lower the tracks the full distance required. An elevated track is an eyesore, noisy, extremely ugly and altogether horrid. Through the manufacturing districts of the same city it is better to elevate them, other things being equal; or, at most, to depress them but a few feet, so that existing manufactories can meet the changed conditions without excessive expenditure, and that adjoining unimproved property owners may not be deprived of the use of their property for the best purpose to which it can be put, as might be the case if the railroad tracks were depressed

the full distance required. It is also true that, especially with railroad tracks, it is much easier and cheaper to raise them than to depress them.

The difficulties incident to the location of sewers, water mains, etc., in the depression of the tracks have no terrors for the engineer who is familiar with the work done by the cable car company in New York City, or with that proposed to be done by the Rapid Transit Co.

The question of damage to abutting property on the highway is always comparatively an important one where conditions are changed ever so slightly, and is always very thoroughly considered in cases of this kind; but it should not be given undue importance. Granted an equitable division, the cost is a secondary consideration, as the work is for all time and should be done in the best manner. Then again, the damage is only the cost of changing the buildings and other improvements to meet the changed conditions. The value of the land itself is rarely changed, for that depends upon the ease of access to and from a more or less crowded thoroughfare. For instance, the most valuable land in the world is at the intersection of Fleet St. and the Strand in London, because of the crowds passing it. The corner of Broad and Wall St., in New York, is possibly equally valuable, and especially in a raised highway this condition is not changed. What, then, is the damage to the improvements? If, for instance, all the buildings at the corner of Euclid and Willson Aves. and 200 ft. each side were wiped out by fire in a night, the most sensational report would not put the loss on the buildings alone at any enormous figure. The insurance companies would certainly pay much less, and I do not doubt that the owners' sworn estimates of their value made to the tax assessor would show a very much further reduction from the amount the insurance companies would be called upon to pay; and again, the buildings in the aggregate would be damaged much less than half their value. Looked at in this way, the damage is reduced to a less formidable proposition. The trouble consists in arousing the antagonism of the owners themselves, who generally, and by the very nature of things, are men of influence and standing, and of much more power in the community than is the intangible stockholder of the railroad company, for instance; so that it is easy for them to obtain excessive judgments, especially when municipalities and corporations are to pay them. The process of awarding damages is human, therefore fallible. It might be better to appoint one or a few good men as commissioners to award them in place of the ordinary jury, as has been done in New York; but this may seem arbitrary to many accustomed to the old way.

In the actual performance of the work, that party who is in position to do any part of it best and most cheaply should do it. The municipality should settle the damages with abutting owners; and, as it can borrow money more cheaply than can the railroad companies, it might, if desired, lend its credit to the latter under well-considered conditions. The railroad companies might build part or the whole of the structure. The general principles being agreed upon, the details can easily be arranged.

As far as the maintenance is concerned, each party should maintain that part worn or used by it exclusively, and those parts where failure would render it liable in damages to others; where several parties use the same part, or where several would be liable, the expense should be divided proportionately.

This paper is of interest at this time by reason of the fact that the city of Cleveland is desirous of abolishing railroad grade crossings over the streets used by street railways, but seeks to have the street railways bear the city's share of the cost, 35 per cent.

Storage battery automobile busses may make regular trips in Denver, Col., in competition with the street railway lines, as it is announced that a company is soon to be incorporated for that purpose.

It is said the first Bessemer rails ever made were rolled in 1856, and analysis shows they contained the following: Carbon, 0.08 per cent; silicon, traces; sulphur, 0.162 per cent; phosphorus, 0.428 per cent; arsenic, traces; manganese, traces; iron, 99.33 per cent. Owing to the effects of the sulphur and phosphorus, the rails were not satisfactory and their manufacture was abandoned and not resumed till 1864.

EWING SINGLE-RAIL TRAMWAY.

The accompanying illustrations are reproduced from an article in the Electrical Review, of London, descriptive of a single-rail tramway invented by Charles Ewing, C. E., of Adyar, Madras. This system was the subject of a paper before the United Service Institution of India by Lt. Col. F. F. R. Burgess, who said in part:

"On a level road one pair of bullocks can, on a single line, draw a train of trucks, carrying a net load of from six to seven tons, a distance of 15 miles in a day with ease; it requires from 16 to 18

TRUCKS TO CARRY 3½ TONS EACH.

pairs of bullocks to draw this load in ordinary carts carrying the military regulation 800 lb. load.

"The trucks run on a single line of rail laid on the ground or roadway and are mounted on two or three double-flanged wheels placed under their center. These wheels are of small diameter, varying from 15 to 30 in., according to the size and weight of the trucks and rails, the flanges being twice as far apart as the width of the rail on which the wheels run.

"The whole weight of the truck is thus borne on two or three double flanged wheels which run on the single rail, so that, unless it were supported in some way, it must fall over. The necessary support is afforded by a lightly constructed iron 'balance' wheel of comparatively large diameter, from 4 to 5 ft., with a 4-in. wide tire, placed at the side of the truck.

"This balance wheel runs on the surface of the ground or roadway about 4½ or 5 ft. away from the rail. It runs on an axle

TRAIN LOADED.

which is pivoted at right angles to the center of the truck and is kept in position by a horn plate fixed to the frame of the truck. The axle is also furnished with a double helical spring which eases the jolting of the balance wheel when going over any inequalities. The platform of the truck, which carries the load, extends to an equal distance on each side of the central line of the truck over the rail and flanged wheels, and the load would usually be evenly distributed on it, but should it not be so, there would be no risk of the

truck upsetting, as the balance wheel provides for an excess of several hundredweight."

The rails used vary with the loads it is desired to haul. Colonel Burgess mentions one with 22 miles of track which has rails weighing 14 lb. per yd., it being designed for loads of three-quarter ton per wheel. The rails may be laid along the edge of the roadway except at bridges, where they would have to be carried out far enough to permit the carts to clear the sides.

Our contemporary suggests that electricity could readily be adapted as the motive power for such a system, and furnish a cheap equipment for light work.

In a letter to the Electrical Review the inventor states that patents were secured on the system in many countries in 1895. He also states that as early as 1881 he exhibited a single-rail tramway worked on the same principle as that of the system patented by M. Cailletet (see St. Ry. Rev., Mar. 1897, p. 169). In this system the draft animal was harnessed at the side of the car and it was abandoned by Mr. Ewing because of the width of road occupied, the fact that the animal was necessary to balance the car, and that one team could not draw a train of cars. The cheapest motive power suggested by Mr. Ewing is that of a traction engine running on the roadway and drawing a train of these cars.

REPORT OF CHICAGO CITY RY.

The annual meeting of the Chicago City Railway Co. was held on January 15th, when the following directors were elected: S. W. Allerton, D. G. Hamilton, Joseph Leiter, Arthur Orr, G. T. Smith, W. B. Walker, Otto Young.

The president's report showed the passenger receipts for the year to be \$5,162,665, an increase of \$363,059.27; receipts from other sources were \$31,774.40, making the total \$5,194,439.40 an increase of \$361,633.59.

Operating expenses were \$3,325,677.27, an increase of \$399,186.90. The operating expenses were 64.42 per cent of the passenger receipts and 64.02 per cent of the gross earnings; for 1898 the corresponding figures were 60.97 and 60.55 per cent.

Interest on bonds was \$207,877.50, leaving the net income \$1,660,884.63, which was 13.287 per cent on the capital. Dividends of 12 per cent were declared, leaving a surplus of \$160,887.63.

The car-miles during the year were: Electric (55.1 per cent of the total), 14,517,690, an increase of 1,954,310. Cable (44.5 per cent of the total), 11,741,840, an increase of 63,820. Horse (0.4 per cent of the total), 11,470, a decrease of 32,430. Total, 26,371,000, an increase of 1,985,700, or 8.1 per cent more than last year.

The company now has 160,005 miles of electric track, 34.75 miles of cable and 1,731 miles of horse track. During the year 9,635 miles of new track were built and 21,158 miles rebuilt. It has 195 horses and 1,946 passenger cars.

During the year paving was done as follows:

	Sq. Yd.
Granite	58,671
Cedar blocks	38,573
Brick and asphalt.....	1,113
Granite and asphalt.....	496
Brick	3,192
Total	102,045

The officers elected by the board were: President D. G. Hamilton; vice-presidents, Joseph Leiter and W. B. Walker; secretary, Frank R. Greene; treasurer, T. C. Penington; auditor, C. N. Duffy; general manager, Robert McCulloch.

At the annual meeting the following resigned from the operating staff: George O. Nagle, assistant general manager and superintendent; A. C. Heidelberg, assistant superintendent; C. E. Moore, master mechanic; Frederick Stevens, track master; J. J. O'Keefe, chief supervisor.

Michael O'Brien was appointed master mechanic and H. B. Fleming, track master. Both of these gentlemen were formerly with the National lines of St. Louis.

The city fathers of Kansas City, Mo., are said to be much dissatisfied with the action of the Metropolitan Street Railway Co. in withdrawing annual passes and issuing books of tickets, as announced in our last issue.

ON MUNICIPAL OWNERSHIP.

From the address of President Doherty before the Northwestern Electrical Association.

The agitation about "municipal ownership" seems to be as active as ever; and, to be frank, I think it is increasing rather than diminishing. Without commenting on the motives of many of the leaders, it must be admitted that others of them are sincere and honest in their advocacy of this cause. If this craze is allowed to run its course, popular opinion will, in time, desert it; but, in the meantime, many of our properties will be injured, and the cities adopting it will reap a harvest of disappointment for their failure to give the matter proper consideration.

One of my political friends once wrote me as follows: "They (the people) want it, and I am on record as favoring it. I am no longer so sure I am right, but there are other reforms that I know I am right about. Were I to experience a change of heart on this question, it would remove all chances for my election and would elect my opponent, who knows less about this subject than I, and who has but this one plan in mind. Even should our electrical venture not prove thoroughly successful, I can manipulate other reforms that will more than compensate for this. No matter what my personal views may be, my election will make me their servant, and I can but do as 90 per cent of the people want me to do. Even if I admit that most municipal electrical plants have been failures, it does not follow that ours will also be a failure. I think you will grant that it will be honestly run during my administration." There is a lesson for all of us in this letter. Here is a man that, to my personal knowledge, is as honest as the average man; in fact, even more so. To his mind 90 per cent of the people want a municipal plant; and no sane man would express opposite views to 90 per cent of the people and expect to receive an election at their hands. I fear we are wasting our breath in trying to educate the municipal officers. A majority of them already know that municipal ownership is a rank fallacy, but they are too wise to express views contrary to the people they must look to for re-election. By championing the views of the people—even though they know them to be wrong—offers an easy road to office. We must educate the people.

"You can't fool all the people all the time," and more than one community has awakened to the fact that municipal ownership did not yield what was promised. I challenge any one to cite a single instance where a municipal plant cost no more than was anticipated and yielded all that was promised.

I attended the convention of the League of American Municipalities by invitation from them, as the representative of the Northwestern Electrical Association and the National Electric Light Association. Other representatives and myself contended that municipal ownership had not been a success in the past, and we could not see how they could expect to make it a success in the future. We offered, on behalf of the National Electric Light Association, to bear half the cost of an investigation of 20 municipal electric plants, selected by the president of the league, to determine the true cost of service, for comparison with the rates charged by private plants.

We made this offer in good faith, believing that an investigation would vindicate our position. I regret to state that the league failed to accept our proposition in a manner insuring its execution. Their acceptance on any terms was only secured by a great effort, and their final acceptance was promised conditional upon their ability to provide funds, and, as far as I know, they are making no effort to raise them. I would recommend, if they cannot otherwise be induced to make this effort, that our association solicit subscriptions and notify them that if they will make an earnest effort to solicit funds among the advocates of municipal ownership, we will guarantee them enough more to make the necessary amount of \$2,500. I promise \$100 toward this subscription, and recommend that this matter be placed in the hands of a suitable committee.

Governmental and municipal ownership, if carried to their reasonable ultimatum, would include every form of industry, and the undesirable result of this is too apparent to call for comment. Unconsciously, or otherwise, the advocates of municipal ownership seek to thrust upon us a bad foreign policy, and the best examples they can cite are among those nations that are "traveling toward the night." We have enough municipally operated plants in this

country from which to seek our examples; but these examples fail to strengthen the theory of these people, and they, therefore, seek examples in countries where workmen are practically serfs and their rate of pay is such as to maintain them in an ignorant and dependent state.

America's greatness is not due to imitation or adaptations of foreign policies. Let us think and act for ourselves. Individualism has made us a great and prosperous nation; and even if individualism is open to criticism, let us be sure that paternalism is better before it is adopted, even in the slightest degree.

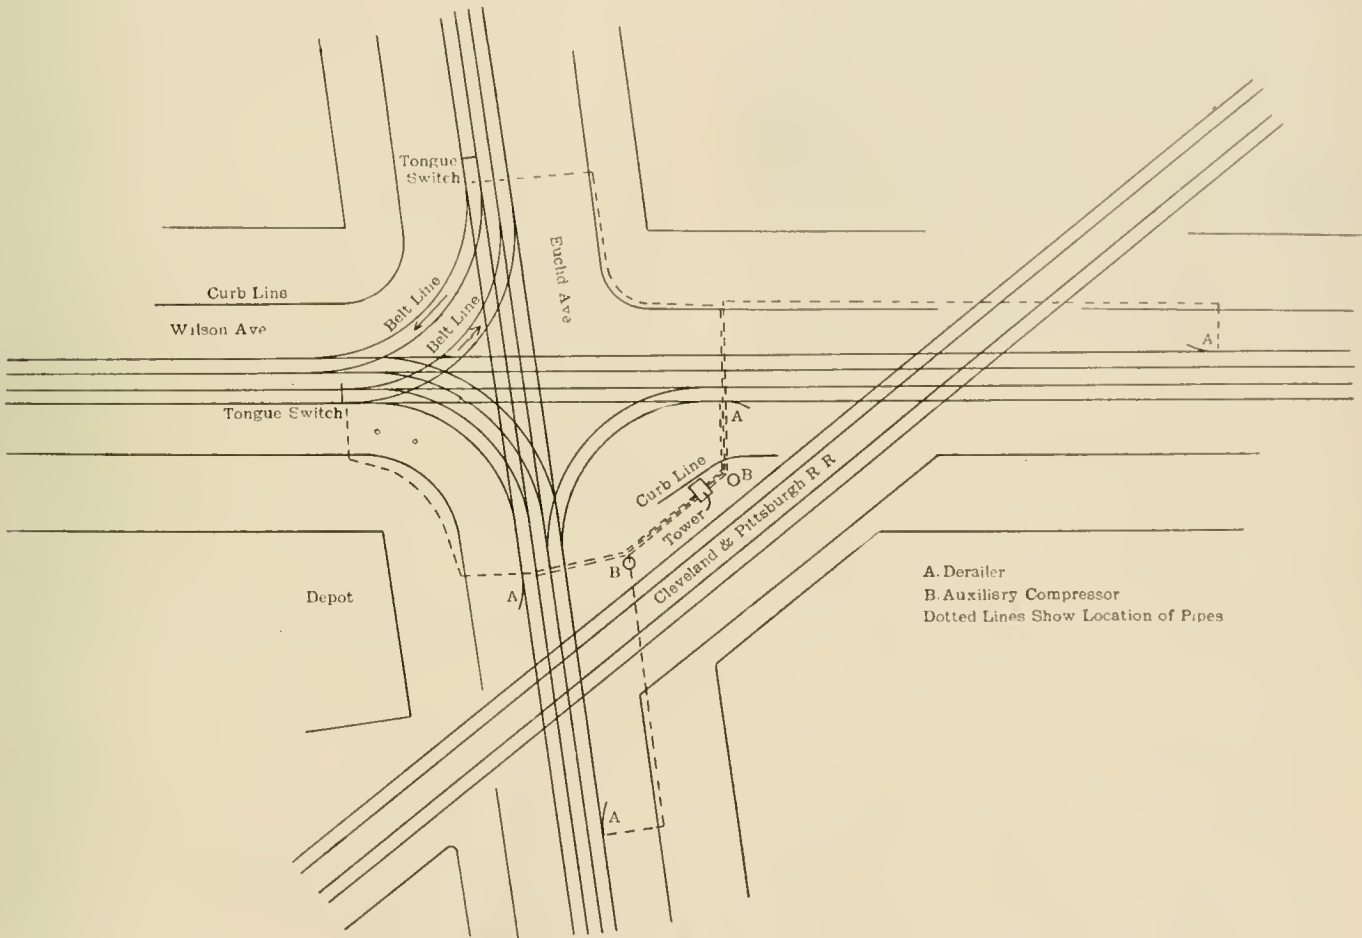

REMOVING SNOW IN WORCESTER, MASS.

A new agreement has been made between the Worcester (Mass.) Consolidated Street Railway Co. and the Worcester city officials as to the portion of the cost of removing snow each party should pay. For the purpose of having a definite basis upon which to

SWITCH TOWER IN CLEVELAND.

The Cleveland Electric Railway Co. has a very complicated crossing at Euclid and Willson Aves., the nature of which is shown in the accompanying diagram. At this point the Euclid and Willson Ave. lines intersect and three different sets of crossovers are laid connecting the Euclid line with the Willson line. In addition the Cleveland & Pittsburgh R. R., which is a part of the Pennsylvania system, diagonally intersects both of these lines a few feet away from the crossing of the two avenues. To more fully protect this point there has recently been erected at the spot marked "tower" in the diagram a three-story switching tower which is shown in the accompanying half tone illustration.

Up to the middle of last summer the safety devices at this place consisted of the regulation gates operated by a gateman in a small tower near the site of the new one. From this were operated the gates on Euclid Ave. alone and another tower and gateman operated the gates on Willson Ave. In addition there was a flagman

MAP OF CROSSING AT WILLSON AND EUCLID AVES., CLEVELAND.

work, the city engineer had prepared a table containing the area of every street in which a street railway track is laid, and also the areas included between the tracks in those streets. From this it was found the area covered by the tracks was about 40 per cent of the total, and an agreement was immediately signed by which the company is to pay 40 per cent and the city the remainder of the cost of removing snow from all streets occupied by rails. In making up the table the width of the adjoining sidewalks was also included as well as the space between curbs, as snow that falls on sidewalks is thrown into the streets and enters largely into the question of snow removal. This method of settling this vexatious question seems entirely fair to both sides.

Orders have been issued by the Board of Railroad Commissioners to the Manhattan Elevated Ry., of New York, directing the latter to extend its structure from 177th St. and Third Ave. to Bedford Park, and from 145th St. to West Farms, a distance of 4½ miles, or forfeit franchises granted for these extensions several years ago.

on the ground to look out for the safety of teams and pedestrians on Euclid Ave. These men were in the employ of the Pennsylvania R. R., and the same policy will be continued, the top story of the tower being for the Pennsylvania's gateman and the lower one for its flagman.

The Cleveland Electric Railway Co. formerly had derails on each side of the track on both streets operated by a lever on a pole set in a position to control a view of the steam railroad in both directions. The street cars were obliged to come to a full stop at the derailing switch and stand while the conductor ran ahead to the pole and set the switch in position by pulling the lever. This not only took valuable time, but it was noticed the people took advantage of the conductor's absence from the car and would get on and crowd in among the other passengers, where it would be next to impossible to find them and get their fare, even if they were observed getting on.

To overcome these difficulties a change was made in the operating device on Euclid Ave. and both levers were put on one pole and a man stationed there to operate them, thus allowing the

conductor to remain on his car. This plan worked so well that it was decided to adopt it permanently and also connect up the derails on Willson Ave. and let one man look after both crossings.

To protect him from rain and cold some kind of a shelter was needed, and an arrangement was entered into with the Pennsylvania company for the present tower. After some investigation it was found that the pneumatic derailing switches could be put in cheaper than the change could be made on the old ones, and, as they were considered better, were adopted. These switches are to be operated from a compressor located in the second story of the tower, except from 11 p. m. to 5 a. m., while the night cars are running, at which time the derail will be thrown by the conductor,

SWITCH TOWER AT WILLSON AND EUCLID AVES., CLEVELAND.

by means of an auxiliary compressor located on the ground on each street.

It will be noticed that the route of the Belt line cars takes them around the southwest corner of Euclid and Willson Aves., the right hand Belt switching off Euclid and the left hand off Willson. Should it be found that one man can manage it, these switches will also be attached to the main compressor and operated from the tower. These various derails operate for 1,340 cars each day.

It will be seen that this improvement saves both time and revenue and also insures greater safety. The arrangement was conceived and put into effect by Mr. R. M. Douglass, the general superintendent of the Cleveland Electric Ry.

DOUBLE SIGNAL GONG FOR CARS.

There is a certain class of accidents whose frequency could undoubtedly be greatly reduced if the conductor had some simple yet positive way of signaling the motorman to stop instantly, and it is a little surprising that some device for this purpose has not been forthcoming before this. As it now is the best way for giving the motorman an emergency signal is by means of three taps of the bell, this method being recommended in the report made in October, 1898, by the Committee on Standard Rules and Regulations for the Guidance and Government of Employes appointed by the American Street Railway Association. In this report under rules for bell signals from conductor to motorman, Rule 4 reads, "Three quick taps of the bell, when car is running, is the signal to stop immediately. This signal should be used to prevent accidents or when trolley is off the wire." But this rule is not entirely satisfactory. It is too complicated for an emergency signal and takes too long to give, especially as the conductor is apt to be laboring under excitement at the moment the signal is most required. Furthermore the code is not usually known to the passengers who may be aware of the impending accident before the conductor, and had they some means of communication at once with the motorman the mishap in a number of cases could be avoided.

The double action signal gong shown herewith is designed to provide a simple and unmistakable signal for an immediate stop

and one that can be operated by the same cord or strap used for the ordinary starting and stopping signal. Fig. 1 is a side view of a gong fitted with the improvement and Fig. 2 is an elevation of the same with the cap of the bell removed. The bell cord is bifurcated at its one end, one of the branches connecting with the regular bell-clapper for producing the usual starting and stopping signal, and the other, which does not come into action until a

FIG. 1.

FIG. 2.

greatly increased tension is put on the cord, controlling the emergency signal, which in the case shown in Fig. 2 is the well-known ratchet-lever mechanism with meshes and small revolving knockers, that fly out against the bell by centrifugal force and produce a continuous ring. Almost any form of bell-ringing mechanism may be utilized, but the gong should be in two sections, the regularly used clapper acting on the cap and the emergency knocker on the base section.

It will be seen that an ordinary pull on the cord will operate the usual signal only, while an extra hard pull will cause both mechanisms to come into action, giving a combination signal that cannot possibly be misunderstood by the man at the controller. As shown in Fig. 1 a small spiral spring is interposed in the cord to the ordinarily used knocker, necessitating an abnormal pull before the other cord will become taut enough to actuate the ratchet signal. The device is the invention of H. S. Rodgers of 190 E. Second St., Covington, Ky.

SOUTH SIDE ELEVATED, CHICAGO.

In our issue for January, page 49, we gave the average daily traffic by months of the South Side Elevated Ry. for the year 1899. The president's annual report was presented to the stockholders on January 25th and from it we take the following additional data:

EARNINGS.

Passenger	\$1,131,403.70
Other earnings	34,985.42
Miscellaneous	3,991.56
	<hr/>
	\$1,170,380.68

EXPENSES.

Maintenance of way and structure.....	\$ 50,754.53
Maintenance of equipment.....	79,489.50
Conducting transportation.....	297,489.93
General expenses.....	88,471.29
Loop rental and expenses.....	153,727.12
	<hr/>
	\$669,932.37

Net earnings	\$500,448.31
Deduct interest on bonds.....	\$33,750.00
Deduct dividends on capital stock..	306,672.00
	<hr/>
	340,422.00

Surplus for year 1899..... 160,026.31

The ratio of operating expenses to gross earnings by months varied from .499 in October to .599 in June, the average of the figures for the 12 months being .572.

The board of directors was unchanged.

Steam was admitted for the first time to the engines in the power station of the Dayton (O.), Springfield & Urbana Ry. on January 14th, with appropriate ceremonies. Mrs. J. S. Harshman, wife of the president of the company, opened the throttle valve.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

PROTECTION OWED PERSONS LEARNING TO RIDE BICYCLES ON STREETS.

Louisville Railway Co. v. Blaydes (Ky.), 52 S. W. Rep. 960. Oct. 7, 1899.

The evidence showed that the plaintiff in the court below was on a street, trying to ride a wheel, and being unaccustomed to riding, and by reason of a grade in the street, she lost control of the wheel, and ran into another street, and, in trying to turn, the wheels of her vehicle were caught in a street railway track, between the rails and rocks. While in this condition, and without warning of any kind, a car ran over, and seriously injured, her. She sued the street railway company, and obtained a judgment for \$2,500. The company appealed, seeking to obtain a reversal on the ground that it was error to refuse a peremptory instruction to find for it, and that the verdict was flagrantly against the evidence. But the court of appeals of Kentucky affirms the judgment of the lower court.

The street railway company insisted that the plaintiff in the court below was shown, by her own testimony, to have been guilty of such contributory negligence as precluded a recovery of damages. It cannot, however, be held, as a matter of law, the court of appeals maintains, that she was so guilty in being on the streets of the city trying to ride a wheel. But, if it might be said that she was guilty of negligence on this occasion, the court holds, it was the duty of the company to keep a lookout for persons on the track, and to avoid injury to them.

The proof, the court goes on to state, conducted to show that the motorman could have seen this plaintiff in ample time, after she was caught on the track, to have avoided the injury. At least, there was sufficient proof to that effect to go to the jury. The place of injury was a public street. It was the duty of the operator to use the highest degree of care in avoiding injury, after discovering the perilous position of the plaintiff. So the court holds that, if her testimony as to how the accident occurred was true, the company was liable.

CONSTRUCTION OF LIMITATION OF USE OF LAND AND STIPULATION FOR DAMAGES.

Atlanta Consolidated Street Railway Co. v. Jackson (Ga.), 34 S. E. Rep. 184. Aug. 2, 1899.

A deed conveying to a street railroad company the title to the right of way over the land of the grantor contained a recital that the grantee was to run its cars over the right of way a specified number of times during the day, perpetually, and the habendum clause, as it is called, was as follows: "To hold and to have so long as the party of the second part * * * uses the said right of way * * * for all legitimate railroad purposes as herein set forth, and no other." The successor to this company abandoned the right of way, and an action was brought against it for breach of the alleged covenant. Taken to the supreme court of Georgia, the latter, however, holds that the above does not constitute a covenant, but is a conditional limitation, and that the land reverted to the grantor at the same instant when the company abandoned the right of way.

To constitute a covenant running with the land, the supreme court goes on to say, the covenant must have relation to the interest or estate granted, and the act to be done must concern the interest or estate created or conveyed." Hence, when such an habendum clause further provides, as it did in this instance, that "in case the party of the second part or their assigns default in complying with the covenants herein set forth, in whole or in part, all the rights and perquisites thereof shall revert to the party of the first part and his assigns, together with lawful damages as shall be awarded by due process or otherwise," the court holds that the stipulation for damages is not such a covenant running with the land, under the above definition, as would render the successor to the grantee, who purchased at judicial sale, liable for a breach of covenant, although it abandoned the land after its purchase.

WAITING ROOM OBSTRUCTING VIEW NOT A NUISANCE.

Cummins v. Summuduwoot Lodge (Kan.), 58 Pac. Rep. 486. Oct. 6, 1899.

Where a waiting room is erected in the streets of a city by the authority of the council thereof, the court of appeal of Kansas holds, it cannot be abated as a nuisance, on the complaint of an abutting lot owner, for the reason that said building partially obstructs the view of his business house by persons passing over a particular portion of the street.

The plaintiff in the court below was the lodge. The defendant was a party who had entered into an arrangement with a street railway company for the erection of the building complained of, whereby he was to erect said building and maintain a portion thereof as a waiting room for passengers on said railway; said defendant in consideration of the erection and maintenance of said building to also use and occupy the same for the sale of cigars, fruit, newspapers, periodicals, and other similar articles.

In consideration of this case, the court of appeals ignores the fact that a part of the uses for which the building in controversy was erected was of a private nature, and considers it from the standpoint of a waiting room alone. It does this, it says, for the reason that, if the defendant had a right to erect and maintain the building as a waiting room, its erection could not be enjoined, or its removal as a nuisance ordered, although a portion of it was used for other purposes.

That a waiting room at or near the point where this building was located was a public convenience was apparent, and the court of appeals quotes the supreme court of the state as holding that "the city corporation may make every use of a street which reasonably conduces to the public convenience and enjoyment." So the court of appeals thinks that the city had the right to authorize the erection of the building, and did so authorize it by the franchise ordinance providing that "said grantees may construct and maintain at such points along the line of said railway such depots and waiting rooms, with stairways leading thereto, as may be necessary and requisite for the accommodation of the public."

Then, on the nuisance question, it holds as first stated, reversing the judgment of the district court.

NO RIGHT TO RELY UPON PEOPLE GETTING OUT OF WAY AT CROSSINGS.

Towner v. Brooklyn Heights Railroad Co. (N. Y.), 60 N. Y. Supp. 289. Oct. 17, 1899.

The second appellate division of the supreme court of New York declares here that the Hickman case, reported on page 467 of the "Street Railway Review" for July, 1899, 56 N. Y. Supp. 751, was not intended to lay down any new rule of law in negligence cases, and that that decision is not to be extended to cases in which the same circumstances are not present.

This case was similar to that one only in that the plaintiff in this case testified that he looked in both directions before leaving the curb, and that he saw no car or other vehicle approaching, and that he then stepped down, and started across the street, and that he was just leaving the track when he heard the gong of an approaching car, and simultaneously he was struck and thrown a distance of 20 feet, the car running 50 to 75 feet before it was stopped. Then, the court goes on to point out that in the Hickman case the streets did not cross the avenue on which the cars ran, and that the cars had the paramount right to the use of the tracks, while in this case the accident occurred at a street crossing, where the rights of the parties were equal, and where the defendant owed the plaintiff the duty of having its car in control, or at least of giving warning of its approach.

The defendant, in this case, the court goes on to say, had no right to rely upon people getting out of the way of its cars at crossings. It was charged with the duty of operating them with reasonable care, and the plaintiff had a right to rely, in some degree, upon the

discharge of this duty on the part of the defendant. The plaintiff, having looked in both directions before starting to cross, and seeing no car, the court here holds, was justified in walking across the street at a point where the rights of both parties were equal, and in assuming that a car running at a rate of speed calculated to make the crossing dangerous would give some notice of its approach, or that it would be in the control of the motorman sufficiently to prevent his being run down.

And, declaring that there was certainly nothing in the Hickman case which justified the conclusion that the plaintiff in this case was guilty of contributory negligence as a matter of law, the court holds that it was error to dismiss the complaint, and grants a new trial, after also stating that there was evidence in the case from which the jury might reach the conclusion that the defendant was guilty of negligence, and that the plaintiff was free from negligence contributing to the accident.

CASE OF CAR STARTING AND COLLIDING WITH TRAIN REVERSED FOR INADEQUATE CHARGE AS TO DAMAGES OF PERSON INJURED.

Todd v. Second Avenue Traction Co. (Pa.), 44 Atl. Rep. 337. Oct. 6, 1899.

The plaintiff alleged that while standing in the rear car of a railroad train he was injured by being thrown against the radiator or stove through a street car which had been standing about 20 feet from the railroad crossing starting suddenly forward, breaking through the safety gate, and colliding with said rear car.

Of course, says the supreme court of Pennsylvania, it devolved on the plaintiff to establish by competent evidence the negligence he imputed to the street railway company, and, failing in this, he could not maintain an action against it for damages. He obtained a judgment in the court of common pleas. But it was difficult to determine from the evidence whether the starting of the car was caused by improper management of the company's employes in charge of it, or by defects in the machinery discoverable by them, or, if discoverable, not within their power to remedy or control. However, it was too clear for argument that the employes charged with the operation of the car did not intend to start it while the safety gates were down and a train was on the crossing, and that they exercised their best skill and judgment in the discharge of their duty as they understood it.

Under these circumstances, the supreme court discovers no substantial ground for complaint or criticism in a charge to the jury that it was the duty of the street railway company "to furnish reasonably skilled and competent men to operate the cars and the machinery and appliances," and in the judge saying, in immediate connection therewith, "That is just where the plaintiff claims the defendant failed in its duty." And it holds that certainly the instruction that it was for the jury to determine whether the defendant exercised proper care under the circumstances was unobjectionable.

But the court reverses the judgment rendered in the plaintiff's favor, because, in view of the evidence, and the circumstances surrounding it, it considers inadequate, and especially so in that part of it relating to the plaintiff's loss of earning power, a charge relating to the measure of damages which was exceedingly brief and nothing more than a perfunctory specification of the items constituting the damage claimed as the result of the negligence attributed to the defendant. These items consisted of expenses incurred as a consequence of the injury received, the inconvenience and suffering naturally resulting from it, and the abridgement or loss of earning power, whether temporary or permanent, consequent upon the character of the injury. No reference to or explanation of the evidence or law applicable to either item was made. Thus, the jury was left without such aid or guidance to a conclusion, the supreme court thinks, as it was fairly entitled to.

LEASING OF ROADS TO MOTOR POWER COMPANIES.

Pinkerton v. Pennsylvania Traction Co. (Pa.), 44 Atl. Rep. 284. Oct. 6, 1899.

By a clause in the Pennsylvania act of March 22, 1887, motor power companies are authorized "to lease the property and franchises of passenger railway companies which they may desire to operate, and to operate such railways." The title of the act is "An

act to provide for the incorporation and regulation of motor power companies for operating passenger railways by cables, electrical or other means." It was argued that the clause mentioned was unconstitutional, because it contained a subject not indicated in the title, to wit, the lease of their roads by passenger railway companies. But this objection to the constitutionality of the clause in question the supreme court of Pennsylvania pronounces wholly untenable.

The supreme court says that as the very object of the incorporation of the motor power companies indicated by this title was to operate passenger railways, they must have some means of obtaining such railways to operate. It was clearly not intended that they should build, nor necessarily to buy, for in either case they would become not merely operators, but passenger railway companies themselves. The most obvious, if not the only other, way in which they could operate roads was to lease them. The title of the act gave notice that they were incorporated with power to operate passenger railways, and an obvious way to do so was by lease of already existing roads.

Nor does the court consider that there was any weight in the objection that the passenger railways had no power to lease their roads. The power to take leases is expressly given to the motor companies, and the corresponding power in the passenger railway companies, as owners, to give leases, is necessarily implied. Without it the grant in the act would be nugatory.

The objection that the powers of passenger railways cannot be indirectly enlarged, the court holds, is answered by the established principle that the constitutional mandate as to revival, amendment, extension, etc., of acts by re-enactment at length applies only to express amendments, etc., and does not affect those which are merely incidental to the passage of other acts, complete and valid in themselves.

The Pennsylvania act of May 14, 1889, contains no express prohibition of the power to lease, and as such power was already granted by necessary implication, so far as concerns motor power companies as lessees, under the act of 1887, the court holds that the later act cannot be construed as an implied repeal of a power already existing, and not necessarily inconsistent with the act's own purpose.

Last of all, the court declares itself of the opinion that the settled principles of law and the decided weight of authority are in favor of the rule that, where a lease is duly authorized by law, as under the act of 1887, there is no further liability of the lessor for negligence of the lessee in the operation of the road.

WHEN MANDAMUS CANNOT BE USED TO GET CROSSING BEFORE APPEAL IS HEARD IN CONDEMNATION CASE.

State ex rel. Oshkosh, Algoma & Black Wolf Railroad Co. v. Burrell, circuit judge (Wis.), 80 N. W. Rep. 460. Oct. 20, 1899.

This was a mandamus action brought in the supreme court of Wisconsin to compel a judge of the circuit court to enter an order directing a writ of assistance to be issued to put the relator, a railway company incorporated for the purpose of carrying persons only, and endeavoring to condemn a right of way for a trolley electric line across the right of way of the Chicago & Northwestern Railway Company, in possession of a crossing 16 feet wide across said latter company's right of way. The condemnation proceedings had been carried successfully through the circuit court, the amount awarded by the commissioners had been deposited in court, and judgment entered dismissing the appeal of the Chicago & Northwestern Railway Company from the award, to the circuit court. From this judgment an appeal had been taken to the supreme court. And thereupon the street railway company instituted this action, contending that it had then an absolute right to a writ of assistance, under the Wisconsin statute.

The Chicago & Northwestern Railway Company opposed these mandamus proceedings on the ground that if they were of any validity at all, they were proceedings by one railway company to condemn lands of another, and that, under section 1854 of the Revised Statutes, in such cases the question of the necessity of taking the land is open for retrial in the circuit court, and no crossing should be forced, by means of which a street railway will cross a steam railway on grade, until the question of the right to cross it is finally settled. In this view, the supreme court seems to concur.

In order to justify mandamus in such a case as this, the court says that it must appear that the duty of the court below was plain, the refusal to perform such duty clear, the result of the refusal prejudicial, and the remedy by writ of error or appeal utterly inadequate. The Chicago & Northwestern Railway Company having given a sufficient undertaking to protect the street railway company from loss in case it should be finally determined that it was entitled to a crossing, it not appearing plain that it was the duty of the court to award a writ of assistance, nor that there was any emergency calling for immediate action, nor that the remedy by appeal or writ of error was not entirely sufficient, and the questions involved being deemed very important and deserving of that careful consideration which they are promised to receive upon the hearing of the appeal upon the merits, the supreme court denies the peremptory writ sought, adding that, if it were to take up the questions and decide them in this action, it would be causing the writ of mandamus to serve the purpose of a writ of error or appeal.

RIGHTS UNDER WRONGLY PUNCHED TRANSFER TICKETS.

O'Rourke v. Citizens' Street Railway Co. (Tenn.), 52 S. W. Rep. 872. Sept. 6, 1899.

As to the conclusiveness of the face of a ticket, the authorities are in irreconcilable conflict. Many of them treat the face of the ticket as the sole criterion of the holder's right of passage, justify his ejection in case of defective ticket and refusal to pay fare, and allow him, as his only remedy therefor, an action of damages for the negligent mistake of the agent, or for breach of contract, and not for expulsion. Others, on the contrary, deny the ticket such conclusive force and dignity, and rule that the passenger has the right to rely upon the acts and statements of the ticket agent or conductor, and that, if he be expelled on account of a defective ticket when he has acted in good faith and is without fault, the carrier is liable in damages for such expulsion.

The supreme court of Tennessee takes the latter view, and holds here, where a conductor, through mistake, punched a transfer ticket to indicate its issuance at 1:40 p. m., when, as a matter of fact, it was issued nearly an hour later, that a person who makes a valid contract is entitled to passage according to its terms, though the face of the ticket furnished him may not in any true sense express the contract. It is the contract, it says, and not the ticket, that gives the right to transportation. The ticket is but an evidence of the contract, made out and furnished by the carrier; and, if it fail to disclose the true contract, the fault is with the carrier, and it is responsible for the natural consequences of the variance.

The passenger, the court goes on to say, is not required in law, nor allowed in fact, to print or write or stamp the ticket. The carrier alone has that right, and the passenger is authorized to believe and presume that it will be properly exercised, and that the ticket, when delivered, is a faithful expression of the contract as made. The ticket, whether for transfer, as in the present case, or for original passage, may well be called the carrier's written direction by one agent to another concerning the particular transportation in hand; and if the direction be contrary to the contract, and expulsion follow as a consequence, the carrier must be answerable for all proximate damages ensuing therefrom, just as any principal is liable for the injurious result of misdirection to his agent. The legal result, in such a case, cannot be influenced by the fact that the carrier has conducted the transaction through two agents instead of one; for the combined acts of the two agents constitute but one continuous act of the carrier. Each agent is the alter ego (another self) of the carrier. The issuance of the void ticket is the fault of the first agent, the expulsion is the fault of the second agent, and both faults are those of the principal, which stands before the court as if it had made the contract, issued the ticket, and expelled the passenger through one and the same agent.

Beyond question, continues the court, carriers have the legal right to require passengers to procure and present tickets; but that does not imply that passengers who have done their part in the matter may be rightfully expelled from the car because the tickets they offer chance to be defective or void. Before the rule of expulsion for want of proper tickets can be made absolute and universal in its application, the carriers must discharge the reciprocal duty of absolute and universal accuracy in the issuance of

the tickets. The latter would be impossible, the former harsh and unreasonable. To require a passenger who has made a valid contract for transportation and paid the requisite fare, as did the plaintiff, to retire from the car, and suspend his journey, because of an original defect in the ticket furnished him by the company's agent, is to visit the wrong of the offender upon the offended. It is to make the rightful passenger suffer for the fault of the carrier, and that, too, in the latter's interest. The court will not yield its assent to a result so unjust and oppressive.

The plaintiff, the court holds, had a right to believe the transfer ticket all that it should be. With it he diligently sought and promptly entered the first transfer car, and, upon being challenged by the conductor of that car as too late to use the ticket, he made a fair and reasonable statement, showing that he had just left the first car, and that the first conductor must have wrongfully indicated the hour of issuance on the face of the ticket. On that statement, the court maintains, the plaintiff should have been allowed to pursue his own journey to its end. He, the court adds, owed the company no other duty, and his expulsion, under such circumstances, was a tortious breach of the contract, for which he became entitled to recover all proximately resulting damages, including those for humiliation and mortification, if they were in fact sustained.

Nor does the court consider it an answer to the legal right of the bona fide passenger to say that the carrier's general interest is better subserved by his expulsion than by his carriage; by the violation of his contract than by its observance. His right is not to be affected by the mistakes of ticket agents, or the attempted frauds of impostors. These are to be met, if met at all, otherwise than through a rule that excludes innocent as well as fraudulent passengers. It is not allowable to punish the innocent with the guilty, to prevent the escape of the guilty.

Every expulsion of a rightful passenger is wrongful.

Over against the testimony of the conductor that he was respectful, and used no more force than was necessary, the court holds that testimony of the plaintiff, who was accompanied by his little boy and little girl, that both cried and he thought that the little girl would go into spasms, was admissible, as possibly shedding some light on the real demeanor of the conductor.

Again, the court says that no explanation the conductor might make could affect the plaintiff's legal right as a passenger. That right depended upon the contract, and not upon the face of the ticket; and it was incumbent on the conductor to heed the plaintiff's explanation, and observe the contract, rather than upon the plaintiff to accept the conductor's explanation as final, and abandon his contract. The disclosure of the fault of one agent by another agent could not absolve their principal from the obligation of the contract, and render the plaintiff a trespasser. Such a result cannot be justified in law, whatever the rule of the company may be.

On the face of the transfer check were printed the following words: "Transfer. Passenger, in accepting this transfer, agrees to read and be governed by the conditions on the back hereof, subject to the rules of the company—F. G. Jones, V. P. & G. M." Among the conditions printed on the back of the transfer check was one in this language: "Part of the conditions upon which this transfer is given and accepted are that the passenger examine date, time, and direction, and sees that the same are correct, and complies with all its conditions." This condition, the supreme court holds, is unreasonable, because no passenger can be bound to verify the act of the conductor in issuing a transfer check; and also because no inexperienced passenger, however intelligent, could, in the time at his command on so brief a trip, "examine date, time, and direction" indicated by the punch marks, and, without an explanation, see "that the same are correct."

Another condition on the back of the check was expressed thus: "In accepting this transfer, passenger agrees that in case of controversy with conductor about this ticket, and its refusal, to pay regular fare charged, and apply at the office of the company for refund of same within three days." This condition, the court holds, is unreasonable, in that it makes the conductor, for the time, the sole judge of the sufficiency of the ticket, and requires the passenger to pay additional fare, though his ticket may be refused without sufficient cause; and, further, in that it requires the wronged passenger, who so pays, to apply for refund at the office of the company, which must be remote from the houses and business places of most passengers, and then limits the amount to be received by such

person to that wrongfully exacted. It puts, declares the court, all of the burden of the "controversy" upon the wronged passenger, and none upon the wrongdoing company, and thereby makes the just suffer for the unjust.

—————

FAILURE OF DRIVER TO SEE CAR PREVENTS INFERENCE THAT HIS WAGON WAS SEEN.

McFarland v. Third Avenue Railroad Co. (N. Y.), 60 N. Y. Supp. 273. Oct. 4, 1899.

In reversing a judgment for damages to a wagon from a collision at about 11:30 p. m., the appellate term of the supreme court of New York holds that, if the plaintiff, who was driving, looked and did not observe the approach of the car, no inference could be drawn that the servants of the defendant in charge of the car observed the plaintiff in time, and neglected to stop the car before it struck the wagon. No greater duty in that respect, the court insists, was imposed upon the defendant than was required of the plaintiff, especially in view of the fact that the collision occurred at a point where the defendant had a paramount right to the use of that portion of the roadway upon which its tracks were located.

—————

STREET RAILWAY COMPANY IS BOTH A "RAILROAD" AND A "TRANSPORTATION" COMPANY.

Old Colony Trust Co. v. Allentown & Bethlehem Rapid Transit Co. (Pa.), 44 Atl. Rep. 319. Oct. 6, 1899.

Under statutes respectively conferring upon courts of common pleas general power to entertain bills for the foreclosure of mortgages given by railroad companies and in cases of mortgages of the property and franchises of transportation companies, the supreme court of Pennsylvania declares itself very clearly of the opinion that jurisdiction can be maintained under both acts to foreclose a mortgage given by a street railway company, for the plain reason that the mortgagor company is both a railroad and a transportation company, within the plain meaning of both acts. The attempted distinction between "railroad" and "railway" companies, the court insists, has long since been exploded, and, indeed, it adds, never received its sanction in this class of cases.

—————

NOTICE FROM AUTHORITIES NOT NEEDED TO IMPOSE DUTY TO REPAIR STREET.

Simon v. Metropolitan Street Railway Co. (N. Y.), 60 N. Y. Supp. 251. Oct. 4, 1899.

This action was brought to recover damages for an injury to a horse that stepped into a hole contiguous to one of the rails of a street railway track. The defendant contended that it was not liable because section 98 of the New York railroad law only makes it the duty of a street surface railroad company to keep in permanent repair the street between and two feet in width outside of its tracks "under the supervision of the proper local authorities and whenever required by them to do," whereas there was no evidence in this case that any local authority had given the company notice of the condition of the pavement. But the appellate term of the supreme court of New York holds that such notice is not a condition precedent to the performance by the company of the duty assumed by it of keeping the public thoroughfare in repair, neglect of which renders it liable in a civil action to any one of the public sustaining special damage from such neglect. And it calls attention to the fact that the defendant was aware anyhow, through its officers, of the bad condition of the street, as further settling the question of the necessity of notice.

—————

GROSS CARELESSNESS TO LEAVE MILK WAGON STANDING ON TRACK.

New York Condensed Milk Co. v. Nassau Electric Railroad Co. (N. Y.), 60 N. Y. Supp. 234. Oct. 4, 1899.

A milk wagon was left standing upon a street railway track a little before sunrise, while the driver went down a side street to deliver milk to three customers, halfway down the block. As stated by the driver, the wagon was painted white, and without lights. The snow was piled up on either side of the railway track, and there had been a fall of snow during the preceding night, so that the side street

was covered to the depth of 12 or 14 inches—so deep that he thought he could not drive through it. The superintendent of the company admitted that, though difficult, it was possible to drive through the snow upon the side street, and a truckman, called as a witness by the plaintiff, testified that he had driven just before the accident through the next side street, which was in the same condition as the one upon which the customers lived. As the driver knew, cars were constantly passing and to be expected, yet he left his wagon upon the track, where it was not likely to be seen; for, although there may have been bright moonlight that morning, the place of the collision was dark, because it was covered over by the structure of an elevated railway. This, the appellate term of the supreme court of New York holds, was gross carelessness, contributing to the accident, and, therefore, a judgment for damages for the injury done by an electric car to the wagon and its contents should be reversed.

—————

CONSENT OF CITY MADE SUFFICIENT BY COMPANY'S CHARTER AND COUNTY CONSENT NOT NEEDED.

Almand v. Atlanta Consolidated Street Railway Co. (Ga.), 34 S. E. Rep. 6. July 25, 1899.

The authorities, the supreme court of Georgia says, are conflicting as to whether the powers over streets usually granted to municipal corporations are sufficient to authorize them to permit street railways to use the streets longitudinally, but, without deeming it necessary in this case for it definitely to decide whether or not such powers are sufficient, the court states that the weight of authority seems to be that they are not.

However, when a street railway company has power, under its charter, to lay its track along the streets of a city, the court holds that the city authorities may consent to such use of its streets by the street railway company, although there may be no express power in the charter of the city authorizing it to grant such a privilege. It says that if the street railway company had no charter authority to use the streets of the town, consent by the authorities of the town would be ineffectual to confer such power; but the railway company having such charter power, and the constitution impliedly recognizing that any city may consent to such use of its streets, it has the power to do so. The authority to construct a railway along a street may therefore, it declares, be derived either from the charter of the city or from the charter of the railway company that is applying for the use of the city's streets.

Moreover, the court holds that the general rule is that, when a municipal corporation is created, it becomes vested with jurisdiction over the territory embraced within its corporate limits, and the mere fact that there has been a valuable improvement made by the county authorities on one of the streets of an incorporated city does not oust the municipality of its jurisdiction over such street. And the above, it holds, is true, notwithstanding the street improved was before the incorporation of the city a part of an established public road of the county.

The court says that if the authorities of a municipal corporation see fit to permit individuals, private corporations, or even the authorities of the county in which such municipality is located, to expend money in improving one of the streets of the municipality, this will not have the effect of relinquishing control over such street, and placing the same under the jurisdiction of those who have made the improvements upon it. When the improvement is completed, although the street may be radically changed, it is still a street of the city, and under its control. It goes almost without saying, adds the court, that any municipality would grant permission to any person or corporation so disposed to voluntarily and gratuitously pave and improve one of the streets of the municipality; and the mere fact that the authorities take advantage of an offer of this character, and allow the improvement to be made, would not amount to a relinquishment of control over the street thus improved.

Then, it was contended, in this case, that an injunction should have been granted because it did not appear that the county authorities had given their consent for the railway company to appropriate that part of the public road of the county between the city in question and a certain other city, and that therefore it would be impossible for the railway company to construct and operate a continuous line as contemplated, and the city street ought not to be disturbed

when it could never be used for the purpose for which it was intended by the company. But this contention, the court holds, was disposed of by evidence, properly admitted, to the effect that, if there should be any difficulty in obtaining the consent of the county authorities to use that part of the road necessary to make the line continuous, the railway company could and would acquire the necessary property contiguous to the road in question.

EXPOSURE OF PASSENGERS TO DANGER FROM OVERCROWDING CARS IS NEGLIGENCE.

Reem v. St. Paul City Railway Co. (Minn.), 80 N. W. Rep. 638. Oct. 26, 1899.

The exposure of a passenger to danger which the exercise of reasonable foresight would have anticipated, and due care have avoided, the supreme court of Minnesota holds, is negligence on the part of the carrier. And more particularly does it insist here that, when a street railway company undertakes to carry large numbers of people, vastly in excess of the seating and standing capacity of its cars, and permits passengers to ride on the platforms, stops its cars when in such crowded condition that other persons may get upon them, and, because of the crowd, a passenger who has boarded a car before it was crowded is pushed off a platform and injured, the company is guilty of negligence.

ASSUMPTION BY NEW COMPANIES OF AGREEMENTS FOR PASSES.

Wallace v. Ann Arbor & Ypsilanti Electric Railway Co. (Mich.), 80 N. W. Rep. 572. Oct. 24, 1899.

It is undoubtedly the rule, says the supreme court of Michigan, that such an agreement as one to give a land owner and members of his family passes until the premises are transferred in consideration of an encroachment thereon does not run with the land, and is not binding upon the purchaser of the rights, franchises, etc., of the old company, in the absence of a statute or contract making such purchaser liable. But where the bill of sale contained nothing inconsistent with the assumption by the new company of contracts for the right of way, and the vice-president of the old company testified that the purchase was subject to all the conditions attached to the old company as well as told the landowner that the transaction was nothing more than a consolidation of the old and new companies, the supreme court thinks that this made out a prima facie case of consolidation, under which the consolidated company succeeded to all the rights and obligations of the old company. Yet the fact that a connecting line had also for several years honored the old company's pass would not bind the new company to furnish transportation beyond its line extending only to city limits.

LIABILITY FOR INJURY DONE BY MOTORMAN THROWING STONE TO FRIGHTEN BOYS AWAY.

Dolan v. Hubinger and others (Ia.), 80 N. W. Rep. 514. Oct. 19, 1899.

The petition in this case contained allegations that a certain motorman on being employed had been instructed to use special diligence to prevent the further mischief of boys who had for a long time been placing obstructions on the tracks at a point where there was a steep grade; that, one day, observing some boys running away from the track and finding at the place obstructions left there by them, he stopped his car, got off to remove the obstructions, discovered the boys hiding about fifteen feet away, and, believing them to be in waiting to do more mischief, sought to frighten and drive them away as he believed it to be his duty to his employer to do; that, to do this, he picked up a small stone, and threw it violently at the walk, near the boys, but not intending to hit them; that the stone struck the plaintiff in and over his right eye, severely injuring him, etc.

The question was raised by demurrer whether this petition stated a cause of action. The lower court sustained the demurrer. But its judgment is reversed by the supreme court of Iowa.

First, however, the supreme court says that the facts stated did not show that the motorman had authority to bind the street railway company by the act of which complaint was made; that is, it did not appear that in throwing the stone he was acting within the scope of his employment. Nor was it shown that the motor-

man was authorized to repel trespassers. What was affirmatively charged in the petition was that a trespass had been committed, and those engaged in it had retreated, when the stone was thrown that caused the injury to the plaintiff. In such an event, declares the court, it cannot be said that the act done was within the scope of the servant's employment.

The reversal is explained to be because of the error of the trial court in sustaining the demurrer when the latter nevertheless stated it to thereby hold that the act, as done, constituted a crime, and therefore could not be ratified. The supreme court says that it will be noticed that the petition affirmatively alleged that the motorman, when he threw the stone, had no intention of hitting either of the boys. As charged, the act was a tort, but not a crime. Any act of the motorman which might have been previously authorized by the company could be ratified by it so far as to incur civil liability therefor. Surely, adds the supreme court, the corporation might have made itself responsible in this case by authorizing the motorman to use force against trespassers.

The test applied in order to determine whether the master is liable is not the character of the servant's act, but whether it was done within the scope of his duty. When it is said that the master is not responsible for the willful wrong of the servant, the statement must be understood as referring to an act done outside the line of employment. The general rule is that, if the act done is in the execution of the authority given by the master, the master will be liable, whether the wrong be occasioned by negligence or by a wanton, reckless purpose to accomplish the master's business in an unlawful manner.

NO INJUNCTION AGAINST ERECTION OF SUBWAY PREVENTING USE OF PORTION OF EQUIPMENT.

Chicago General Railway Co. v. Chicago, Burlington & Quincy Railroad Co. (Ill.), 54 N. E. Rep. 1026. Oct. 19, 1899.

Neither a city alone, nor a city in conjunction with a railroad company, has a right, the supreme court of Illinois holds, to build or erect over a public highway any permanent obstruction which will interfere with the passage of such persons and vehicles, including street cars, as have the right to use such highway. But, the court goes on to say, when the tracks of a steam railroad company are raised, the city is not obliged to make the subway there under high enough for the passage of vehicles of an extraordinary and unnecessarily great height. It is only obliged to make such a subway as will permit the passage of such cars, or cars of such height, as are customarily run upon street railway tracks. And an injunction, it holds, will not be granted at the instance of a street railway company, to prevent the construction of a subway of say less than 16 feet headroom where the allegations of the injury it will suffer if the subway is built as proposed are indefinite and do not show that such injury will be irreparable, as that it will thereby be prevented from using "a portion of its equipment," damages for which there is nothing to indicate could not be recovered in an action at law.

RIGHT OF CAR FIRST HAVING MADE REQUIRED STOP AT CROSSING TO PROCEED.

Becker v. Detroit Citizens' Street Railway Co. (Mich.), 80 N. W. Rep. 581. Oct. 24, 1899.

The supreme court of Michigan states that it does not think that it can be said, as a matter of law, that a motorman, who has already made the stop required at a crossing of street railways by a city ordinance, is guilty of contributory negligence in attempting to cross with his car when the approaching car on the other railway is 150 or 200 feet away, and is also yet required, by the ordinance, to stop before reaching the crossing. The reason given is that if he must wait before he goes forward until he knows that the approaching car will stop, he will fail to meet the demands of modern street railway traffic. Nor does the court consider that this ruling is changed by a state statute which provides that, at all crossings of the tracks of two street railways, when a car on each road approaches such crossing at substantially the same time, the car on the track first laid shall have precedence and be entitled to the right of way, even if this would under other circumstances give the approaching car the right of way. The statute, the court holds, does not authorize a street railway company in a city to

ignore the provisions of an ordinance requiring a car to come to a full stop before making a street railway crossing, and so it maintains that the second car here referred to did not have the right of way until it made the stop.

ILLEGAL EVASION OF PAYMENT OF FARE IN TRYING TO FORCE TRANSFER AGAINST A REASONABLE REGULATION.

Commonwealth v. Jones (Mass.), 54 N. E. Rep. 860. Oct. 19, 1899.

A street railway company owning electric railway lines over different streets and required by law to give transfers from one line to another in such a way as to make the rate of fare not more than five cents for a continuous ride over one or more of its lines made a rule than transfers would be given from a certain one of its lines to another which ran parallel with it for a short distance in the heart of the city only at the point where they diverged. The defendant took a car on the first mentioned line and on tendering his fare demanded a transfer right away, his purpose apparently being to thereby be able to take a car on the other line sooner than he otherwise could. The conductor refused to give the transfer then, and the man refused to pay his fare without he got it. At the earliest possible transfer point he got out, took the other car, and paid the usual fare of five cents for riding on that. Subsequently he was prosecuted for, and convicted of, evading payment of fare on a street railway, in which the supreme judicial court of Massachusetts finds no error.

The court says that there was nothing to show that the rule of the corporation was not a reasonable one, and holds that the defendant was bound by it. He argued that the statute did not contemplate a conviction unless there was moral turpitude in the evasion or attempt to evade. The court thinks that it goes further, specifying acts, the commission of either of which shall constitute an offense, and that one is guilty who evades or attempts to evade "either by giving a false answer to the collector of the toll or fares, or by traveling beyond the point to which he has paid the same, or by leaving the train or car without having paid the toll or fare established for the distance traveled or otherwise." One who willfully or intentionally does either of these things, it maintains, is within the meaning as well as the language of the statute. That the defendant, after he left the car, entered another car, and paid the fare prescribed for his ride upon that, and that if he had conformed to the rules of the corporation he could have obtained a continuous ride over the route covered by both cars on payment of a single fare, the court pronounces facts which were immaterial.

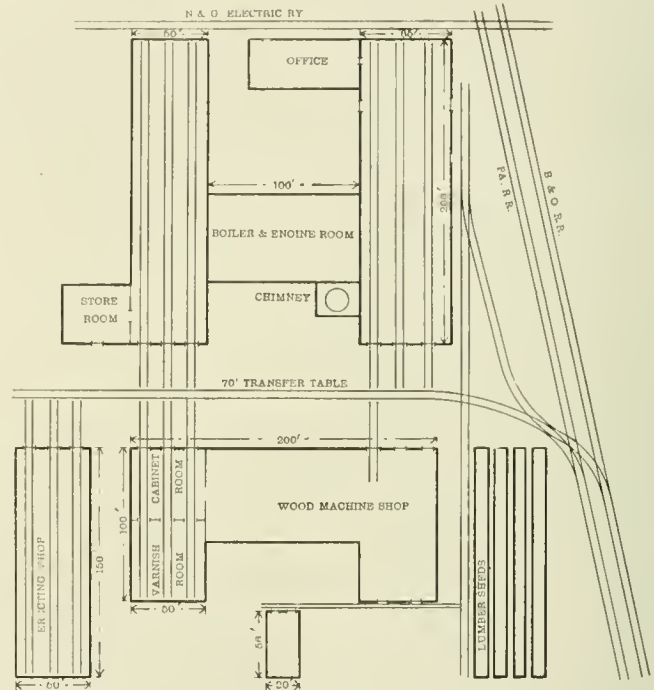

EXTENSION OF JEWETT CO. PLANT.

We take pleasure in showing herewith the ground plan of the new shops of the Jewett Car Co., at Newark, O. This company was formerly located at Jewett, O., and under the old management met with very little success. The company was reorganized in 1864, and then went into a receiver's hands, the shop being closed, but in the fall of 1895 it was opened and business was conducted by the receiver. In 1897 it was sold by the receiver to Howard Hazzlett, of Wheeling, W. Va., and immediately purchased by Sisson & Krebs, general contractors and builders, of Wheeling. The factory then was opened and business was solicited under the name of the Jewett Car & Planing Mill Co., with the following acting officers. A. H. Sisson, manager; C. E. Krebs, secretary and treasurer, and N. Paulson, superintendent. Under this management business rapidly increased and it was only a short time before it was found that the company was handicapped on account of location and poor shipping facilities, and would be obliged to either build a larger shop at Jewett or seek new quarters.

In December, 1899, the company was incorporated under the old name of the Jewett Car Co., and located at Newark, O., in the new shops. Part of the plant was built and at the time of the removal in December, 1899, it was thought that more shop room would not be needed, but during the month of January the company received a great many orders and found it would be obliged to build large additions. It now has one of the most complete shops in the country, and has taken orders from some of the largest roads. It makes a specialty of interurban cars, and now in this particular

line is filling a great many orders. The shops and lumber sheds cover about five acres.

The shops are adjacent to the tracks of the Baltimore & Ohio and the Pennsylvania railroads, with switches to all the buildings. The main erecting shops, three in number, are of pressed brick with slate roof. Two of them are 50 x 200 ft. and the other 50 x 150 ft. The wood working shop and the paint shop is 200 x 100 ft., and is separated from the erecting shop by a 70-ft. yard, in which there is a transfer table for handling the cars in moving them from one shop to another. Back of the wood working shop is a dry kiln with a capacity of 50,000 ft. The company have built several lumber sheds so that all of its lumber will be kept under cover.

PLAN OF JEWETT CAR CO'S. NEW PLANT.

The present officers are: W. S. Wright, Wheeling, W. Va., president; H. S. Hands, Wheeling, W. Va., vice-president; A. H. Sisson, Newark, O., general manager and treasurer; N. Paulson, general superintendent. Mr. Sisson will also act as general sales agent. Mr. Paulson was for many years connected with the sleeping car department of the Pullman company, and is thoroughly acquainted with car construction, and is giving special attention to the construction of heavy cars.

ORLEANS TERMINAL, PARIS.

In the "Review" for June, 1898, we gave the preliminary plans of the Orleans Railroad of France for building an underground extension of 2½ miles in order to secure a more central terminus in Paris, and in February, 1899, announced that a three-phase transmission line with transformer substations would be used.

Considerable progress has been made in the construction of this line which follows the River Siene, partly in tunnels proper and partly as a covered subway with arched openings in the wall towards the river. The new station on the Quai d'Orsay is to be a large building with 15 tracks, all of which connect with the double track underground road. Electric locomotives similar to those of the Hoboken Shore road will be used for handling the trains between the old and the new terminals. These locomotives will have four axles to each motor driven. Current will be taken from a third rail laid on the same ties as the track rail; the plans contemplate placing the third rail in different positions relative to the track rails and therefore the locomotives will have three contact shoes at each end. The locomotives are to have two controllers and will not be turned at the termini.

ELECTRIC TRAMWAY AT BATAVIA, JAVA.

One of the first electric railways to be built in the East Indies is now nearing completion at Batavia, a city of about 100,000 inhabitants, situated on the north coast of the island of Java. This system may properly be called a suburban road, as it is constructed for a considerable distance through open stretches of country and for a portion of the route on private right of way. The construction work would do credit to an American town and the service is excellent, a five minute schedule being observed on market days

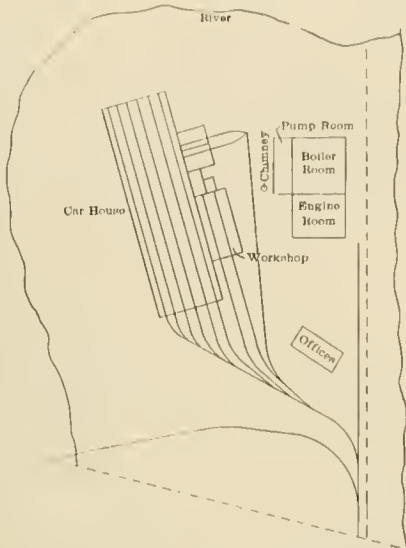

FIG. 1—ARRANGEMENT OF BUILDINGS.

and a ten-minute headway on other days. The cars often reach a speed of 15½ miles an hour and average from 7 to 10 miles.

Owing to the climatic and social conditions the work of installing the system was necessarily slow and attended with exceptional difficulties. Native Malay labor was relied upon almost exclusively and most of the foremen were educated natives. The transportation of heavy boiler and engine sections was particularly difficult and at times even dangerous. As an example of the peculiarities of the help employed it is stated that before each trolley

FIG. 2—BOILERS IN COURSE OF ERECTION.

pole was placed in position it was necessary to offer up a prayer for the safety of the erection gang.

At present three lines are in operation, aggregating 8.6 miles of track. The gage is 3 ft. 11 in., and grooved rails laid on wooden ties are employed. The ties are cut from the Djatti tree or Indian oak, as it has been found this material successfully resists the climatic conditions and the attacks of tropical boring insects. The

lines at present are single track with turn outs, but it is expected that eventually double tracks will be built throughout, and this fact has been kept in mind while completing the road. The trolley poles were designed to facilitate double tracking when this should become necessary, and a double trolley wire has been erected the entire distance, this latter feature making unnecessary the use of overhead crossovers and also effecting a saving in feeder cables. Hard drawn copper wire of .682 sq. in. sectional area was adopted for the trolley wire. The overhead construction is divided into sections, 550 yd. long, in order to localize disturbances of the system, each switch serving as a feeding point, and each section being protected by a lightning arrester. The rails are bonded with copper bonds of .166 sq. in. sectional area and in addition are connected every 55 yards with wire of the same capacity.

The arrangement of the various buildings belonging to the company is shown in Fig. 1. In the engine room are three generating units, each consisting of an horizontal tandem compound engine rated at 150 h. p. at 235 r. p. m., belted to a six pole continuous current 500 volt generator. The generators were supplied by the Union Elektricitäts-Gesellschaft, of Berlin. Each engine has two fly-wheels, one carrying the generator belt, and the other the governor belt, and the machines are arranged to run condensing or non-condensing as desired. A surface condenser of the Worthington type has been installed. The pumping system is in a separate room adjoining the boiler room as shown in Fig. 1. There are two Worthington feed pumps each having a capacity of 2,500 gallons per hour, two injectors having a capacity of 800

FIG. 3—TRACK SHOWING LINE CONSTRUCTION.

gallons per hour, with a lift of 20 ft., and a storage tank, into which condenser pumps discharge fresh condensing water in addition to the water returned by the surface condenser. The boiler feed pumps draw directly from this tank, forcing the water through a Green economizer before it reaches the boilers.

In the boiler room are three boilers as shown in Fig. 2. These are of the double drum type, and have a heating surface of 1,030 sq. ft., and a normal evaporating capacity of 3,300 lb. per hour. The drums are 6 ft. 11 in. in diameter, the upper drum being 20 ft. long and the lower one 23 ft. long. The two water and steam spaces are directly connected by enclosed tubes. Both drums may be separately fed, and any section of the feed pipes between the boilers and pumps may be cut off. The fuel employed is Australian coal, although it is proposed to utilize petroleum waste for this purpose at an early date, as this material can be secured on the grounds at low cost.

The furnaces are so arranged as to enable the hot waste gases to be passed either through the economizer or through an unobstructed flue direct to the chimney, which is 150 ft. high and built of iron plates riveted together. The chimney stands isolated from the power house building, the flue connections being underground.

The Colorado Springs (Colo.) City Council has passed an ordinance requiring all cars in the city to be vestibuled during the winter months.

CREOSOTED WOOD BLOCK PAVEMENTS IN INDIANAPOLIS.

Read before the American Society for Municipal Improvements by M. A. Downing, President Board of Public Works, of Indianapolis, Ind.

Before, and when, I became a member of the Board of Public works a number of years ago we often had property owners say, "Why can't we have such wood pavements as we see in Paris, London and other European cities? They seem to be so much cleaner and quieter than asphalt or stone." They insisted that there was a fine dust, a glare, a noise and heat that were positive discomforts, which they could escape to a great extent if they could have a wood pavement, and if we could give them a durable wood pavement they wanted it, and many wanted the wood without conditions, and many petitions for it were presented.

A careful study of wood pavements in this country and Europe followed. There can be no doubt that the consensus of opinion in this country is that the wood block pavement as commonly known has not been a success. It seems strange that the glaring defects—one might almost say the kindergarten defects—of those pavements had not been noted and eliminated, but they were not, and millions of square yards of wooden block pavement have been laid and are yet being laid, the only foundation for which is plank laid on sand. The blocks were cut from round, green cedar posts, with the sapwood left on, and in some instances the bark. These blocks, without further preparation, were laid on boards, some gravel tamped into the joints and covered with coal tar. It would seem almost absurd to call such a structure a pavement. In saying this, I am not forgetting the Nicholson pavement, the principal defect of which was the lack of suitable wood. It seems to me that all the ingenuity and inventive genius of that time was exercised along the line of discovering some odd or novel way to cut and lay the blocks, or to bind and lock them together. As far as I have been able to discover, these things were of little avail. The cardinal defects were:

First. Failure to select wood with sufficient strength and toughness to withstand the loads and abrasion, and

Second. The total absence of any attempt to create conditions to prevent the rotting of the blocks.

Just why it was considered necessary to select white pine and cedar when the country abounded in the harder and stronger woods it would be difficult to conjecture, but the fact remains.

And why no adequate effort was made to properly season and treat the wood I leave to engineers to answer. It may have been because it was a new field and explorers are scarce. Certain it is that if any architect had attempted to build a house of such material treated in the same way he would have been severely criticized by his professional brethren, to say the least.

As a result of our studies of wood pavements, we decided to require the concrete foundation in every instance. We first laid Washington red cedar, rectangular blocks without treatment of any kind. This wood was very soft and porous. It was practically the Nicholson pavement. The blocks were laid close together on a 1-in. cushion of sand over the concrete. Two heavy traffic resident streets were laid in this way and they are now in their fifth year; both are considerably worn on account of the softness of the blocks, while here and there rotted blocks are visible. Washington red cedar was still in the specifications when I became a member of the Board of Public Works. A provision was inserted providing for creosoting, but the specifications were indefinite. The following spring and summer, 1896, four streets were paved with creosoted (about three pounds of oil to the cubic foot of wood) Washington red cedar. These blocks were 4 in. wide and 5 in. with the grain of the wood. The blocks were laid in rows at an angle of 45° with the curb. All of these pavements are in excellent condition at this time, and on parts of them the traffic is heavy. No provision was made for expansion, the blocks were driven as close together as could be with a sledge and the joints filled as far as could be with paving pitch. We have had some trouble caused by the blocks bulging. Most of this was where the blocks were not creosoted; in a few cases blocks bulged on other streets, but nothing serious. The specifications were then changed providing for the heartwood of the long leaf southern yellow pine, with the blocks 4 in. wide, 4 in. deep with the grain of the wood, and impregnated with ten pounds of the best quality of creosote oil. These blocks were laid in the manner above de-

scribed, except that a space of from 1 to 2 in. (according to the width of the streets) was left between the curb and the blocks for expansion. This space was filled with dry sand and covered over with heated paving pitch. The interstices were partly filled with fine, dry sand and the street surface rolled to a smooth surface before covering with heated paving pitch and top dressing with fine gravel or screenings. In no instance have we had any trouble on any of these streets from the blocks bulging. The surface of these streets is as smooth as a floor, and has a soft brown color that is restful to the eye. Under the heaviest traffic no wear is as yet noticeable and the streets are in perfect condition. The oldest is about three years old. It appears that the dirt on these pavements does not grind into such fine dust as it does on the asphalt and consequently is not as unsanitary nor annoying. The cost of cleaning is less than brick or asphalt, for the reason that we do not have to clean as often. We often hear complaints of the heat that comes from the asphalt on hot days. This does not seem to be common to the wood, but the one quality that seems to be pre-eminent is noiselessness. I think that people pay more attention to this quality, of late years, than they used to; in fact, they now often demand it, whereas, when I was a younger man, people would speak of it as desirable, but were not willing to be assessed anything extra on that account. We feel that the creosoted wood block pavement is a success from every point of view. We believe that, constructed of the material we are using (or other strong woods, like beech, tamarack, red or yellow fir), properly creosoted, using first-class quality of creosote without adulteration, that the pavement is more durable than asphalt and brick and nearly as durable as granite. It certainly has met with an enthusiastic reception in this city, as is testified to by the great demand for it. We have contracted for about three times as much of it this year as we have for asphalt. There is practically no demand for stone or brick in this city except for alleys.

We have not adopted the European method of spacing the blocks from a quarter to a half inch apart and filling them with portland cement grout, but I am not sure that their practice is not preferable. We have found up to this time that our present practice is good, and our engineer hesitates to depart from it, although I must say that when the blocks are driven so close together it is next to impossible to get any filled in the joints. This may cause swelling later, although I hardly think so.

We have thus far not followed the common European practice of making the surface of the concrete perfectly smooth and laying the blocks directly thereon, but have introduced the 1-in. cushion of sand. But if we are called upon to pave heavy traffic streets we will probably do so, as experience in both London and Paris has shown that the practice has been successful, as the Rue de Rivoli, over which passes 42,000 vehicles per day and King William St., the heaviest in London, are both paved with wood in that way. Few people understand the efficacy of creosoting; why the wood seems harder, tougher and more durable. It is simple. Wood dried to 10 per cent moisture has about double the power to resist crushing and abrasion that it has if very wet. In creosoting, the sap and moisture are removed and the heavy oil (creosote) which repels moisture becomes encysted in the fiber of the wood. When snow and rain lie on the pavement, they may get to some extent into the cells, but not to any great extent into the fiber, because they cannot displace the oil; hence the fiber remains dry, and, of course, retains its strength. The uncreosoted wood pavements wear doubly as much in wet weather as they do in dry weather. This is not true of the creosoted wood pavements for the reasons above given.

I might say a word in regard to cost. This would probably vary according to the distance the blocks would have to be freighted. The pavement laid with long leaf yellow pine blocks, 4 in. deep, treated with 10 lb. of the best quality of creosote oil per cubic foot of wood, laid on a concrete foundation complete, and guaranteed for from five to nine years, has cost us from \$2.10 to \$2.50 per square yard.

The Greenwich & Schuylerville (N. Y.) Electric R. R. is open for traffic. The company is having several electric locomotives built for hauling freight cars.

A system of electric haulage for canals, employing two overhead wires, will be tested on the canal at Tonowanda, N. Y. Philip Perew, of North Tonowanda, is the inventor of the system.

Power Plant Piping and Accessories.

BY WILLIAM D. ENNIS, M. E.

PART II.

EXHAUST PIPES.

Another system of piping with which the steam engineer is concerned is that comprising the exhaust mains and branches running from the exhaust outlets of engines, condensers and pumps to the heaters and condensers and by-passing the latter through a relief valve to the atmosphere. This system is of equal importance with that first considered; it is often fully as prolific of trouble and offers even greater facilities for economizing steam production through intelligent arrangement.

It is beyond the province of this paper to discuss the theories and efficiencies of condensing and heating apparatus; but, whatever system or systems may be selected, there is always opportunity for

FIG. 14.

combining it and the piping so as to increase the productiveness, so to speak, of that part of the plant.

With a non-condensing engine, heating the feed water from its own exhaust, the combination is simple, a tubular or open heater being placed in the horizontal or vertical portions of the exhaust pipe. It is best that this should be by-passed, as shown in Fig. 14.

When two or more such engines are used the exhaust from one is

FIG. 15.

usually sufficient to heat all the feed water the boiler requires to or near the boiling point. If the boilers require more than this amount of feed, all the engines may supply exhaust steam for heating it, either separately or in a single heater. One way of arranging the latter is shown in Fig. 15.

With this construction, one or both of the exhaust can by pass the heater, and in case it becomes necessary to remove it, this can be quickly done by taking apart the flanges at A and B after which the engines can go on running.

With condensing engines, the exhaust pipe system increases in interest. Again the engine exhausts may pass through a feed water heater before complete condensation, or the exhausts from pumps and condenser alone may be sufficient for heating purpose. The latter is seldom the case. If the engine exhausts are used for heating a building it is advisable to place an oil separator between the engines and the heating pipes. Usually separate heaters are provided for main and auxiliary exhausts, and the latter are carried to the main free exhaust after passing through the heater. All valves on exhaust systems should be placed so as to be operated from the engine room floor. This necessitates their being set with vertical spindles, when the bodies are below the floor line. A cast iron stand

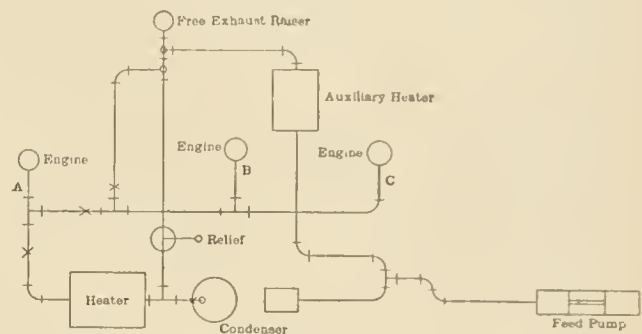

FIG. 16.

is bolted to the floor, and the valve spindle extended through it is operated from the top. It is best to use stands of the indicator pattern, in which a marker rises and falls along a scale fastened to the side of the stand, showing at all times the position of the gate.

It is absolutely necessary to have a free passage for the exhaust, independent of the condenser, and for this purpose an automatic relief valve should be placed on a by-pass around the condenser. This valve consists essentially of a disk bearing on a flat surface, the latter having in it an opening the size of the exhaust pipe. When the condenser is in operation, the vacuum under the disk holds it down, and the exhaust steam is condensed continuously. If for any reason, as a failure of water supply in the condenser, the pressure on the exhaust pipe increases, the relief valve opens, and the engine runs non-condensing. Upon starting condensation again, the disk falls and holds the vacuum. As pumps and condensers are not ordinarily planned to operate as condensing engines, their exhausts should be piped into the main exhaust, if at all, on the free side of the relief valve. Condenser pumps are sometimes connected with their own condensing chambers.

Fig. 16 shows diagrammatically an arrangement of exhaust connections in accordance with the foregoing principles.

The exhaust pipe A is from a 350-h. p. compound condensing engine. B and C connect to engines, which are planned to run either condensing or non-condensing. In laying out this plant, the data given were, first, the size and location of the three engines, with the diameters of their steam and exhaust pipes. The crowded condition of the basement made the arrangement of heater and condenser shown imperative. The main exhaust valves of the three engines are above the floor line. A 5-in. pipe runs downward from the low pressure cylinder of the right hand engine, turning at right angles to rest upon the floor level. This terminates in a 5 x 7 x 5-in. tee to which the exhaust from the middle engine is brought. From the 7-in. exhaust line thus created, connections are made with both the exhaust from the large engine and with the outboard free line. Both of these connections have valves, but as these valves will be only occasionally used, they are not arranged to be operated from above.

The 10-in. exhaust from the main engine, into which the smaller exhausts are carried, runs to the 10 x 12 x 7-in. tee to the heater, thence 12 in. to the condenser, with a side outlet through a relief valve to the atmosphere. The spindle on the exhaust inlet valve to the condenser extends through the floor. The injection and discharge pipes to and from the condenser both have valves, and the valve on the former is also operated from the floor above.

When a condenser of the injector type is used, it is placed vertically near the wall of the engine or pump room, and guyed to the walls or roof. The exhaust pipe from the engine runs upward to the condenser inlet, which is usually at the top, and the relief valve opens from the upper flange of the condenser. The injection pipe from the pump also enters near the top of the condenser, and the discharge pipe is led from the hot well at the foot.

Wrought iron pipe used for exhaust or low pressure steam may be made with either flanged or screwed joints, composition gaskets being used in the former case. Cast iron pipe for this purpose should be flanged.

Fig. 17 shows the arrangement of injector condensers for the electric power plant of the Boston Navy Yard.

The sizes of exhaust pipes are determined in the same way as explained for steam pipes, the permissible velocity being assumed at 4,000 ft. per minute instead of 6,000.

From a standpoint of economy, the only covering necessary on exhaust piping is from the engines and auxiliary apparatus to the heaters. Heaters also should be covered and all exhaust covering should be of good quality, put on by experienced mechanics. The entire exhaust system is frequently covered, to add to the workmanlike appearance of the plant.

The noise of an escaping exhaust, at least in cities, is a decided nuisance, and to obviate this and also to prevent the deposit of condensed steam on roofs and neighboring buildings, an exhaust head is usually placed on top of the vertical free exhaust. This muffles and partially condenses the escaping steam.

WATER PIPING.

The water piping in a power plant consists of injection and discharge connections for the condenser, pump suction, hot and cold feed water lines, individual boiler feed pipes, cold and hot water fire and washing service, etc.

Water piping for the condenser is of cast iron. The injection pipe is usually flanged, the joints being made with some form of rubber or composition gasket. As this line of pipe must hold a vacuum, it should be carefully made tight and tested at a hydrostatic pressure of not less than 30 lb. The injection inlet to the condenser should always have a valve, and it is preferable to have this valve arranged so that it can be operated from the engine room floor. It is well, also, to put a check valve on the discharge pipe. To protect the condenser from debris, floating billets, etc., which may be contained in the condensing water, a strainer should be placed on the injection pipe at its inlet, and it is preferable also to use a foot valve at this point. These are made in various forms, plain disk, multiple, shaft, and spring. Whatever form is used, the bearing parts should be of brass.

Should the condenser be stopped suddenly, it often happens that the foot valve closes, holding a column of water above it, and in case of a prolonged shut down, the pressure of this water is objectionable. A simple method of providing for its removal is to tap the injection pipe just above the foot valve and to run a small pipe from the opening thus made. The overflow valve on this pipe should have a long stem so as to be readily operated from the ground. If the suction well is very deep this long stem can be braced at the top of the uptake by iron straps bolted to the main pipe.

Injection pipes should have a vertical length for their inlets, and the foot valve should be placed within a foot or two of the bottom of the well.

Condenser discharge lines, which are subject to no pressure, are made up of bell and spigot pipe, caulked with hemp and lead. This construction admits of a slight variation in direction, and is therefore convenient where the pipe is placed underground. If the discharge is carried into a running stream, the outlet may be a horizontal pipe; but if into a well, the outlet should be vertical.

A hot well is sometimes placed in the discharge, so that hot feed water may be taken independently from this source before passing

to the heaters. A simple way of arranging this is shown in Fig. 18.

Either cold or hot water may be taken, respectively, from the hot well or main suction, by the pump or injector. The heater can be by-passed if desired. Where there is danger from high water, a check valve should be placed on the discharge pipe of the condenser.

The suction lines to the feed pumps and injectors are usually of galvanized iron, sometimes of cast iron. In the former case, they are put together with ordinary screwed joints, galvanized fittings also being used. They should run underground, outside the building, and they, as should all water and drip pipes, are preferably run in a trench inside the building. Trenches for pipe are built with 8-in. brick walls, and are covered with cast iron plates, properly drilled to allow connections to be made. The inside of

FIG. 17.

the trench should be smeared with portland cement on the sides and bottom. Avoid placing valves in trenches.

From the feed pump, wrought iron pipe carries the feed water to the heater—or, if cold water is used, direct to the boiler. It is customary in large plants to use both systems, so that the heater can be cut out of service, if necessary. Feed pipes for hot water should always be of brass, with brass valves and fittings. Very long runs are sometimes made of cast iron, as far as the economizers,

FIG. 18.

but this is only commendable in extreme cases. Brass pipe should be made up with screwed joints for all ordinary sizes; if larger than 4 in. in size, however, special brass flanges and brass flanged fittings should be used. A relief valve should be placed on the main feed line to guard against excessive pressure. It is of importance to make the feed system as direct and simple as possible, avoiding sharp bends, and in fact all bends that can be avoided, as every one adds to the work of the pump and increases

the amount of steam required by it. It is always bad practice to have brass and iron in contact with each other when connections may require breaking.

The main feed lines, running across the boiler fronts, branch out into the individual feed pipes. If an injector is used as an auxiliary to the pumps, it may be connected to the feed either on the main line or at each boiler feed. The cold water feed line, if any, can be connected in the latter way, or can branch off into individual cold feed pipes, entering the boiler independently. This practice seems to be an unjustifiable expense.

Individual branches to the boilers should be each provided with a check valve and stop valve, the latter arranged so as to operate from the boiler room floor.

In certain localities kerosene is used as a solvent in boilers, and where this is the case, the boiler lubricators should be attached to the individual feed pipes. Internal feed pipes, when used, are always furnished by the boiler maker.

Other water piping about the power plant consists of connections to faucets and fire hose. Hose should be mounted on racks, out of harm's way, and should be provided with quick opening valves.

Rules for determining the sizes of water pipes are plentiful, and recourse should be had to some good handbook in planning such parts of a plant. The injection and discharge inlets on the condenser will usually be found right for its rated capacity, but the length of pipe, number of bends, etc., should always be given careful consideration.

(To be continued.)

BRITISH METHODS OF TRAMWAY PROMOTION.

(From Our London Correspondent.)

It is quite probable that American street railway men have often difficulty in grasping the meaning of news items concerning the promotion of tramways in Great Britain because the procedure to secure charters and franchises is so different in the two countries.

In England and Scotland the main statute on the subject is the Tramways Act of 1870, which contained a clause empowering the municipality or other local authority to purchase the road after 21 years at a price to be found by deducting from the original cost an allowance for depreciation. This is the so-called "old iron" purchase clause, and its application practically paralyzed tramway building for years after this meaning of the act had been decided upon by the courts. Ireland has its own Tramway Act, with a less stringent purchase clause.

The second important statute is the Light Railways Act of 1896, which originally contemplated the building of light railways in agricultural and fishing districts where the traffic would not be sufficient to render a steam railway profitable. This act has been taken advantage of for the building of tramways in streets and roads.

It will be well to premise the description of the methods of promotion by a few words concerning the Board of Trade. The British Board of Trade is a permanent department of the government, entrusted with the powers to regulate shipping, railroads, tramways, electric lighting, etc., and has an army of officials. Its statutory powers are practically absolute, though if its acts are attacked the president of the Board, who is always a member of Parliament, and one of the Government of the day, must defend its action in Parliament.

When a company or a municipality wishes to build a tramway three methods are open:

1. It may promote a private bill in Parliament. Under the parliamentary standing orders this involves much work and expense. Elaborate plans and books of reference must be prepared long before the session of Parliament begins; notices must be served on all parties interested, including land owners whose property may be desired; long detailed notices must be advertised in the official gazettes and in local newspapers; the bill must be prepared and lodged in the private bill offices of both houses of Parliament; estimates of cost and copies of the documents must be filed with the Board of Trade and other departments concerned.

Next follows a preliminary inquiry to determine whether all

the parliamentary standing orders have been complied with, and a bill may be thrown out at this stage before receiving any consideration on its merits.

Passing this inquiry safely the bill is introduced in one house and read a first time; a few days later it is read a second time; occasionally there is opposition at the second reading and bill are sometimes, though rarely, thrown out at this stage. On second reading the bill is referred to a select committee of four or five members, which hears all evidence for and against the bill; promoters and objectors are represented by counsel and the fight may last for weeks. If the committee rejects the bill it is practically a final decision, as the house will not readily overturn a committee's findings. If the committee's report is favorable the bill is read a third time and sent to the other house, where it must run the same gauntlet. Bills sometimes fail of passage in the second house. After passing both houses the assent of the crown makes the bill an act.

All this, it can be readily seen, involves great expense, as the parliamentary fees are heavy, besides the engineering and legal expense incurred.

2. It may proceed by provisional order, a cheaper method, but seldom resorted to for large schemes. In this case the promoters apply to the Board of Trade for an order to construct the line. The Board holds an inquiry, hears all parties, and if it thinks proper grants an order, which is provisional until confirmed by Parliament. This order is similar in form to a private bill. The Board groups a number of these orders and then introduces a bill to confirm them.

3. It may apply for a Light Railway order. The Light Railways Act provides for three commissioners to whom application must be made for the construction of proposed light railways. The proposal is accompanied with plans and estimates and after notices are given to the parties affected the commissioners hold an inquiry and if, after hearing the evidence, they approve of the scheme, an order is issued and sent to the Board of Trade for confirmation. Objectors may be again heard before the Board, which either confirms or rejects the order. When confirmed by the Board the order has the effect of an act of Parliament.

One main ground of rejection is that the proposed line will compete with an existing steam railway. It is especially provided in the Light Railways Act that if a proposed light railway will materially affect an existing railroad the Board shall not confirm the order, but refer the promoters to Parliament. Such a case is hard upon the promoters, as they must then incur all the expense of promoting a private bill.

It is now clearly determined that when proposed tramway lines lie in the jurisdiction of more than one local authority they may be sanctioned as light railways, but if all in one jurisdiction the promoters must proceed by private bill.

A number of light railways are now under construction under orders which provide for longer tenures than would be the case under the Tramways Act and with a provision that if the local authorities buy the lines, the price shall not be the "old iron" value, but the value as a going concern.

In any case a company can scarcely hope to get a bill or order which is strongly opposed by the local authorities.

PULLMAN CO. WITHDRAWS FROM STREET RAILWAY FIELD.

It was last month announced that Pullman's Palace Car Co. had decided to abandon its street car shops. It is understood that this department has not been profitable during the last five years, and the company considered that the space and equipment could be used to best advantage by increasing the capacity of the other departments, which are now overtaxed. A new building, 140 x 192 ft., is in course of erection, and it, with the old street car shops, will be used exclusively for the repair of railroad coaches.

The Report of the Board of Directors of the American Society of Civil Engineers for the year 1899 shows a substantial growth in the society's membership, and a very satisfactory condition in its financial affairs. The net increase in membership during the year was 103. The total number of applications received was 259.

BOSTON TRANSIT COMMISSION.

The Boston Transit Commission on January 25th made its fifth annual report, covering the year ending Aug. 15, 1899, and from it we take some interesting data. Up to that date the net cost of the subway was \$4,141,900, and the total cost was estimated at not to exceed \$4,200,000. The net cost has since been reduced \$616,000 by a credit given by the city for certain property taken by the Commission and released to the city, it not having been needed in the construction of the subway.

In 1897 the utmost limit of capacity of the Tremont St. surface tracks was 200 cars each way per hour, and the rate of progress was often not more than two miles per hour. In October, 1898, the number of cars passing in the subway at the hours of greatest traffic was 282 per hour, the speed, including stops, being from seven to eight miles per hour.

At the date of this report the subway as a whole has been in use a little over 11 months. Statistics for the full year cannot, therefore, be given. It is, however, believed to be a safe estimate that the use of the subway for the first 11 months has been at the rate of at least 50,000,000 passengers per year. The Boston Elevated and the Lynn & Boston together operate in Boston and vicinity over 400 miles of track, reckoned as single track, and in the year 1897 to 1898 carried in round numbers 200,000,000 passengers. The trackage in the subway is one-eighth of this total trackage (5 miles out of 400), and yet it appears as above that of the total number of passengers carried on all the 400 miles of track of these two great roads, about one out of four passes through some portion of the subway.

The traffic at the Park St. Station was expected to be, and is, greater than that at any other station within the subway. The number of people who pass up and down the stairways to this station is about twice as great as that using the Scollay Sq. Station, which is the next largest in point of traffic. The Park St. Station, moreover, is used as the general transfer station for the subway. This transfer traffic does not use the stairways, but it increases the use of the platforms by about 42 per cent. From statistics furnished by the elevated railway company, it appears that during the first 11 months of the operation of the subway as a whole the passenger traffic on the two island platforms at this station, which platforms have together an area of 15,197 sq. ft., a little over one-third of an acre, has been at the rate of 27,400,000 per year. In amount of passenger traffic the Park St. Station ranks among the largest in the world.

St. Louis Union Station.....	8,000,000
Grand Central Station, New York.....	14,000,000
South Union Station, Boston.....	21,000,000
North Union Station, Boston.....	23,108,384
Broad St. Station, North London R. R.....	27,000,000
Park St. Station, Boston Subway.....	27,400,000
Waterloo Station, London.....	28,659,118
St. Lazare Station, Western Ry., Paris.....	43,062,688
Liverpool St. Station, Great Eastern R. R., London	44,377,000

At first there was well-grounded complaint as to crowding, hustling and confusion on the easterly side of the westerly platform between 4:30 and 6 p. m. This side of the platform at the

CAR INDICATOR AT PARK ST. STATION.

time of maximum traffic was served by about 108 cars per hour. They ran on more than 20 different routes, and came to the station platform without fixed order. The passengers did not know what cars were coming nor where they were to stop. They crowded to the edge of the platform in order to get the first view of the incoming car, and those whose car had not arrived blocked the way of those attempting to get on board. The conclusion was reached that the only satisfactory remedy lay in the use of indicators showing before the arrival of each car to what line it belonged, and the point in the platform opposite to which it would stop. Electrically

ELEVATED STRUCTURE ON CHARLESTOWN BRIDGE.

Had it been permissible to lay out the station without limitations as to its size and shape, it could have been so planned as to accommodate the traffic more conveniently; but in spite of the enormous amount of traffic and the limited space available for handling it, the business is now being conducted without serious crowding or discomfort. The limit of capacity has not been reached. There has never been any complaint of crowding on the easterly platform, nor on the westerly side of the westerly platform.

Other great stations with the total number of passengers per annum are:

TURNTABLE OF DRAW SPAN.

illuminated indicators were, at the request of the commission, installed by the Elevated Railway Co., and have been operated during the hours of largest outgoing traffic, namely, from 3 to 6 o'clock in the afternoon.

When they are in operation, a passenger can wait in the central part of the platform till his car is announced, and he then has half a minute to walk to the berth. As shown in the illustration, the indicators have the names of the routes on which the cars run arranged in parallel columns. At one side of the name of each route is a set of five pigeon holes, each with an incandescent lamp, which,

when lighted, displays a figure from 1 to 5, indicating the berth at which the car will arrive.

Counts of traffic taken in Tremont St. in December, 1894, and in December, 1898, the latter date being three months after the surface tracks had been removed showed that the vehicle traffic, exclusive of cars, had increased 29.4 per cent, the number of persons in vehicles, exclusive of cars, had increased 36.2 per cent, the number of pedestrians had increased 10.6 per cent, and the total of persons in vehicles and on foot had increased 12.2 per cent.

Analyses of the air in various parts of the subway show from 7.8 to 9.5 parts of carbonic acid gas in 10,000 volumes. On the

DRAWSPAN OF CHARLESTOWN BRIDGE.

street in the central part of the city at about the same time of the year the proportion of carbon dioxide was from 4.5 to 5.9 parts in 10,000; while in various public halls and theaters it was found to be from 10 to 49 parts in 10,000.

During the year the engineering department has been engaged in making borings and preparing plans and drawings for the tunnel under Boston Harbor, which is to connect East Boston and the subway.

The act providing for the Boston Subway required the Transit Commission to build a new bridge over the Charles River and in 1897 the Boston Elevated Ry. was authorized to construct its tracks over this bridge. The permit from the secretary of war authorizing the new bridge required the removal of the old Charles River bridge, which work has been contracted for.

Work on the Charlestown bridge was begun in August, 1896, and was under way for a little more than three years. The drawspan was first moved by hand July 6, 1899; on Aug. 8, 1899, it was operated by electric motors.

The bridge with its approaches has a total length of 1,920 ft., 1,000 ft. being over water. It is of steel on stone piers. The width is

100 ft., which is divided into two footways 10 ft. wide, two roadways 29 ft. wide, and a central space for street car tracks 22 ft. wide. The central space may be used by teams except so far as the posts of the elevated railway structure act as a barrier. The fixed spans are 85 ft. each, and the draw span 240 ft. The draw has a clear height of 23 ft. above mean high water; it rests on a central pier. The circular track on which the span turns is 54 ft. in diameter. The weight of the draw span is 1,200 tons. The A. & P. Roberts Co. furnish the steel for eight of the fixed spans, and the Pennsylvania Steel Co. that for the other two fixed spans and for the draw.

The grades for the approaches of this bridge do not exceed 3 per cent.

The Boston Transit Commission consists of George G. Crocker, chairman; Charles S. Dalton, Thomas J. Gargan, George F. Swan, Horace G. Allen, B. Leighton Bell is secretary, and Howard A. Carson, chief engineer. William Jackson is chief engineer for the Charlestown Bridge.

ECONOMIC RAILWAYS FOR COUNTRY DISTRICTS.

From a paper by E. E. Russell Treatman, associate editor of Engineering News, read before the Illinois Society of Engineers and Surveyors.

Where cheap railways for light traffic are to be built, and especially when they are to be operated as independent enterprises, it is important that good engineering skill, good business judgment and good executive ability should be combined in their promotion. Great pains must be taken to adopt the most advantageous location for securing traffic and for operation, while in construction the lowest possible cost must be aimed at. Care must be exercised, however, that the construction is not of such a cheap and flimsy character as to impair the operating capacity of the road at moderate speeds (with due regard to the expected train loads), or to impose heavy maintenance expenses.

About ten years ago, an interesting paper on "The Cheapest Railway in the World" was presented to the American Society of Civil Engineers, by Mr. Arthur Pew. The conditions were to build the very cheapest road that could be built, very little money being available. The line was Dublin to Wrightsville, Ga., 19 miles, passing through moderately rough country and crossing two rivers and several smaller streams. Convict labor was employed, clearing the forest for a width sufficient for the roadbed, then doing the grading, and then clearing the right of way and making ties from the trees. The contract price for this labor was \$1 per day per man. The grading was light, averaging about 4,000 cu. yd. per mile, and cost about 9 cents per cu. yd. The ties cost about 10 cents each. The cost for the first 11 1/2 miles, all ready for the rails, was \$1,005 per mile for clearing, grubbing, grading, ditching, ties and trestles. Adding the expenses for right of way and for engineering, the average cost was \$1,164 per mile. With the 19 miles all built and ready for traffic, with track, stations, water tanks, etc., the cost was \$3,441 per mile. It is to be noted that the company did not make the mistake of trying to economize in the engineering, and Mr. Pew stated it was generally considered that the care with which the location was made was an important element in assuring the construction of the road. Another reason for the low cost was that there were no middlemen to divide the profit. The management did not pride themselves so much on building a cheap road as on doing so much good work at such small expense.

Mr. Pew informs me that he has since built other roads even more cheaply, owing to the following conditions: (1) A smoother country; (2) the lower price of rails; and (3) the use of lighter rails. The

very cheapest road that has come under his observation (and which was built under his supervision), cost about \$2,300 per mile, all ready for the rolling stock.

Railways of this character have been built in the South Atlantic states, in broken and undulating country, at a cost of \$2,500 to \$3,000 per mile, the cheaper ones being mainly for hauling lumber. The maximum grades are from 2 to 2.6 per cent in the direction of the heaviest traffic, and 2.75 to 3.25 per cent in the opposite direction, while the curves are from 6 to 10 degrees. Earthwork is kept as light as possible, and rock cuts are avoided when practicable by

shifting the location. The width at sub-grade is usually 12 ft. in cuts and 10 ft. on banks. The grading is done by small local contractors or by men employed by the railway company and directed by a good foreman. State convicts are also employed. The contractors usually bid on the work at about 6 to 9 cents per cu. yd. for aggregate excavation and filling, without taking haul, waste or borrow into account. The grading on the lighter lines costs about \$100 to \$200. On a heavier line, with elevations of 200 ft. in 1 3/4 miles, and 300 ft. in 3 miles, with some extensive cuts and fills, and some rock work, the cost was \$650 per mile for grading, with a total of \$900 per mile for grading, pipe drainage, trestles, etc. Wooden box culverts are used in light fills, and pipe culverts in larger fills, while for creeks and small streams the grade is kept as low as possible and low trestles are put in. For spans of 30 to 45 ft., the abutments consist of double trestle bents on cribs, these cribs having sheet piling inside and outside.

The engineers for such railways are usually employed by the week or month to locate the line, establish grades, furnish plans for trestles, etc. They sometimes set the center stakes only, but on heavy work or on work done by contract they usually stake out the work in the ordinary way.

For lines of this character the ordinary standard gage should be adopted, although there are some cases where narrow-gage lines have been used with fair success, though they involve break of bulk for all freight. As a rule, little is to be gained by the adoption of a narrow gage, but if it is adopted, then the gage should be really narrow, say 24 in., and in no case exceeding 36 in. In Maine there are seven lines of 24-in. gage, aggregating 150 miles in length, the longest being 44 miles and the shortest 4 miles in length.

This paper would not be complete without some reference to the electric railways for country districts, although these are built mainly for passenger traffic, and accommodate freight traffic as a side issue. The Philadelphia & Westchester Electric Ry. is 20 miles long, and passes from the city's suburbs through a rich farming country. The grades are 4 to 6 per cent, some of them 3,500 ft. long. The track consists of 58-lb. T-rails on ties 7 ft. long, 5 x 7 in., spaced 2 ft. c. to c. For carrying milk and farm produce, there are double-truck cars 36 ft. long in the body and 46 ft. over the vestibuled platforms. This road cost about \$23,000 per mile, exclusive of buildings and power plant.

The Dayton & Western Traction Co., extending 25 miles from Dayton, O., to Eaton, passes through a number of small villages and towns in a farming district, in which carriages and wagons were the only means of transportation until this line was built. The track is laid at the side of the National Turnpike Road, and in 22 miles there is but one curve. The maximum grade is 4 per cent, and there are also grades of 3.85 per cent for 2,600 ft., and 3.5 per cent for 1,700 ft. on a long grade six miles in length. There are 19 steel bridges of 10 to 154 ft. span; all built alongside the county highway bridges on independent abutments. One is a through truss bridge, all the others are deck plate girder bridges. The track is laid with 70-lb. T-rails, with girder rails in the streets of Dayton and Eaton, all rails being 60 ft. long. The ties are 7 ft. 6 in. long, 5 x 7 in. section, about 80 per cent being white oak and 20 per cent chestnut. The gravel ballast is 6 in. deep under the ties. The passing sidings are 200 ft. long, and there are two railway grade crossings, both fitted with derailing devices. The power plant comprises two Buckeye tandem compound engines of 250 h. p. each coupled directly to a Siemens & Halske dynamo of 250 kw. There are also two Babcock & Wilcox water tube boilers of 250 h. p. Double truck cars are used, and the traffic includes passengers, packages, light freight and general freight.

These electric railways are usually built wholly or mainly along existing roads, and the earthworks are therefore very light. Wooden trestles, occasional steel or stone bridges (when highway bridges are of insufficient strength), subways under steam railways, and the necessary power houses, are the principal structures. These electric railways, however, represent a considerably higher cost than the cheap style of railways above noted, for while they have usually but little earthwork, yet the poles and wires represent a considerable expense, and a power plant is a necessity and its first cost is large. Such a plant, too, is often worked uneconomically under the conditions of service, although the economy may be greater in cases where the plant can be utilized for lighting and for general power purposes, as well as for railway service. A low estimate for a line of this character is \$12,000 per mile. The cost of the Dayton &

Western Electric Ry., already mentioned, was about \$16,000 per mile, all complete. This includes the grading, track, overhead work, power plant, buildings, etc., in fact for the road complete and ready for traffic, but exclusive of rolling stock.

For purposes of comparison, it may be noted that a double track electric line substantially built for fast traffic and having its own right of way, masonry culverts, and a third of a mile of trestle, cost about \$31,500 per mile.

Where conditions are such that it is essential to reach the very lowest point of first cost, the steam railway has a more favorable showing, and this is especially the case where the line is built across country. There is, however, a third and intermediate character of railway that may be adopted to advantage where the existing highway affords an easy route with a small amount of grading, bridging and trestling. In this case the line could be built practically the same as the light electric railways, but without poles, wires, or power plant. The power would be furnished by gasoline, oil or other engines, with suitable gearing and connections, mounted in a car and driving one of the trucks or axles. In such a line, probably the very lowest figure for construction could be reached, while the cost of rolling stock and its operation would be materially less than for ordinary steam locomotives and cars.

Appended to this paper is a general estimate of cost per mile for a light country electric railway five miles in length, with a limited amount of traffic:

80 tons of 50-lb. rails, at \$35.....	\$2,800
360 angle bar joints, at 85 cents	306
2,640 ties, at 35 cents.....	924
30 kegs of spikes, at \$5.10.....	153
360 rail joint bonds	144
Miscellaneous material	150
Grading	300
Tracklaying, surfacing and bonding	1,320
Teaming and incidental expenses and labor.....	300
45 cedar poles, at \$2.40.....	108
45 pole arms, at \$2.00	90
Overhead wire and material	445
Labor	200
Special work	300

Total cost of construction per mile.....	\$7,540
Power plant, at \$10,000.....	2,000
Power station and car house, at \$5,000.....	1,000
Total cost per mile	\$10,540

AUTOMOBILES VS. STREET RAILWAYS.

In a paper on the advantages of automobiles, read before the English Automobile Club, Mr. R. E. Crompton, a prominent electrical engineer of unquestionable standing in the profession, makes the startling statement "that a line of motor omnibuses running at an average rate of 10 miles an hour, following each other in the same direction at intervals of 100 ft., would be able to transport past a given point no less than 14,080 passengers per hour, whereas the maximum capacity of an electric tramway is stated by experienced tramway managers not to exceed 3,000 passengers per hour; and the Metropolitan Ry. of London, worked to its maximum capacity, cannot carry more than 10,000 passengers per hour in one direction."

We cannot tell where the gentleman obtained his figures, but can see no very good reason—and the paper does not enlighten us upon the subject—why street cars of the same carrying capacity as the above mentioned motor omnibuses could not be run at an average speed of 10 miles an hour and 100 ft. apart, if the possible traffic in any particular locality would warrant such a service, and if in addition, as is pointed out in another column of this issue, the tram cars could be operated much more cheaply, we cannot conceive just where the advantage of the automobile 'busses comes in.

A conductor on the Toronto (Ont.) Ry. has been granted \$1,200 damages in a suit against the company for injuries received by being struck by a wagon as he was standing on the running board of an open car while in the discharge of his duties.

CALIFORNIA TYPE CARS.

The accompanying illustration shows one of a lot of cars built by the J. G. Brill Co. for shipment to Geneva, Switzerland; it is quite similar to a number built at the same time for the Redlands Electric Light & Power Co., Redlands, Cal. The Geneva car is a modification of the California type; among the changes may be noted the single reversible seat on each platform and the omission of the bulkhead. The car is 15 ft. 5½ in. long in the body, 35 ft. 7½ in. long over the dashes, a trifle over 5 ft. wide at the sills. The truck is the Brill No. 21 B, with a wheel base of 6 ft., and 30 in. wheels; the gage is 1 m. (39.37 in.). There are two motors, and the weight complete is 8,450 lb.

The seats inside are longitudinal, of spring cane, and the platform seats cherry and maple slats. The inside finish is of white ash with birch veneer headlinings; the blinds are cherry and maple slats. The platforms of these cars are protected at the sides by curtains in the usual way. In front of the seat, however, a curtain of the old fashioned type not mounted on a roller is fitted to come

CALIFORNIA TYPE CAR FOR SWITZERLAND.

down to the dasher. This leaves the whole front of the car open so that in bad weather the forward seat will be practically unused. These changes seem to be ill-advised.

The Redlands car is 13 ft. 6 in. long in the body and 28 ft. 7 in. over the dashers. Though considerably shorter than the Geneva cars, this car having bulkheads and two seats on each platform accommodates 10 more persons on the platform seats, while the interior seating capacity is only two less. The wheel base of this car is 7 ft. 6 in. The introduction of the bulkhead with sash dropping between the backs of the platform seats enables one seat on each platform to be completely enclosed in case of stormy weather, and from an American standpoint, therefore, this car is much better suited for an all round winter and summer service than the other.

There is little reason to doubt that when the California type once gains a foothold in Europe it will become quite as popular there as it has on the Pacific Coast in the United States. The monetary advantages of having all the passengers on the lower deck will no doubt influence the railway companies more strongly than the prejudices of the people. That they must have open cars on the other side is a well recognized fact, and to dispose of the open seats on the top of the car is too costly a proceeding for the tramway companies to tolerate.

ANNUAL REPORT OF OTTAWA ELECTRIC RY.

At the last annual meeting of the shareholders of the Ottawa (Ont.) Electric Railway Co., Pres. T. Ahearn submitted the annual report of the company for the year ending Dec. 31, 1899. In transmitting his statement, he called attention to the good state of repair in which everything connected with the system has been kept, and also made the following statement: "In order to provide against the disablement which an accident to the power house would probably cause, a duplicate power plant, consisting of a set of horizontal water wheels of 1,800 h. p. capacity, directly connected to a generator of a similar capacity, is now being installed and will be ready for operation within a few weeks. The new plant will be housed in fire-proof buildings.

"In September last a contract was made for the building of a 4½-mile extension to the company's lines from Holland Ave.,

in Hintonburgh, to Britannia on the Bay, the only safe beach for bathing in the neighborhood of Ottawa. The line is double tracked, with 72 lb. rail. A Sunday car service was inaugurated on the entire system on July 23d last."

The financial report for the year is as follows:

	13 Mon	13 Mon	13 Mon	13 Mon	13 Mon	13 Mon	13 Mon	13 Mon	13 Mon

FLEXIBLE POLE BRACKETS.

A demand has long been felt for a suitable pole bracket combining strength and perfect flexibility, as the old type of a rigid pole bracket has in many cases proved unsuitable on account of the constant pounding effect of the trolley wheel in passing under the hanger. To meet this demand for a flexible support for the trolley wire the Richmond flexible pole brackets have been placed on the market by the Ohio Brass Co., of Mansfield, O.

These brackets are furnished in styles designated respectively as "A" and "B"; style A is supported from beneath with a brace arm (see Fig. 1), while style "B" is suspended from above by means of an iron rod support (see Fig. 2). Both styles are furnished for use

RICHMOND FLEXIBLE BRACKETS.

with iron and wood poles and also arranged for single and double suspension. These brackets are made exclusively of malleable iron castings of the best quality and either standard weight of wrought iron, gas and water pipe or, in some cases, of structural steel tubing. The design is such as to secure the utmost strength in all parts, at the same time preserving a symmetrical form, so that when the brackets are set up they present a very neat appearance.

These brackets are proving popular, and are now in use on many of the most important systems throughout the country; among these may be mentioned the Michigan Traction Co., Kalamazoo, Mich.; the Chicago, Harvard & Geneva Lake Ry., Chicago, Ill.; the Saratoga Traction Co., Saratoga Springs, N. Y.; the Syracuse (N. Y.), Lakeside & Baldwinsville Railway Co.; the Compania de Ferrocarriles del Distrito Federal de Mexico, City of Mexico.

The Oakland (Cal.) Transit Co. has been petitioned by its employes to raise wages from 20 cents to 21 cents an hour.

CORRESPONDENCE

A Plea for Equity.

Editor "Review": The following was suggested by reading in the "Street Railway Review" the remarks of Mr. G. T. Rogers, at the late convention held in Ithica, N. Y. He referred to the treatment and success of employes. His words are well worthy of being repeated, but it would be superfluous, as expressions so clean and talented as those were, must have made an impression on those who read or were fortunate enough to have heard them, which was so deep, that to refer to them is to call them back. Since reading the able address referred to, the writer (a working man) has been thinking of men and their relative positions, and in this light sends these lines, hoping that a closer and more perfect knowledge may be had between the men who give the orders and those who execute them, and that this may help to open the way for a still greater success. Let me say that in this instance the term manhood does not imply either blue overalls or a high collar, nor, in fact, any particular uniform, but the term will be used simply in its best and highest sense, regardless of position or apparel. As men, we are not all good, nor all bad, but are so placed in this world that we form a certain average. It is concerning this average I would write.

There are characteristics in each individual which neither education, financial standing, or position change, and a trouble seems to be that one person is not willing to accept from others what he practices himself. To illustrate: Does it not seem strange that the more greed a man has in his nature the less he wants to see it in those around him? If he should occupy a position of authority his greed is only measured by his zeal in striving to make those under him particularly generous in his service, even to the extent of forgetting that his motives are seen about as plainly as his face. "Like begets like." The manager or superintendent whose character is selfish, with very few exceptions will have careless, lazy men to work under him. If there is not a spirit of justice on the one side it will not be shown on the other. To expect any other result is folly. It is a case of cause and effect, and is as legitimate as one link following another in a chain. On the other hand, what is more justly provoking or disgusting than to see a man who has received all that could be done for him by an employer, remain unfaithful and lazy, even to the extent of thinking that because he may have been favored he has an assumed right to imagine that he is indispensable and makes his kind treatment a license to trample on forbearance. In either condition this spirit is liable to pass the limit and so recoil upon itself. Should we not try to learn the lesson that "whatsoever a man soweth that shall he also reap."

It is to be regretted that the sentiment of distrust has taken possession of mankind and made every man suspicious of his fellow. This tendency is degrading. There is probably nothing so productive of crime and dishonor as to place a man in a position where he is continually compelled to realize that he is looked upon as dishonest. Should this occur in such a relation as employer and employe on a street railway system it makes a gap which nothing on earth can bridge.

Employes may receive many tokens of kindness or respect as a body or singly, but there remains a condition of feeling that is not spoken and could not be expressed in language. It must not be mentioned, particularly by the workman, as he learns in a sense to feel dependent on his employer to feed the little ones at home. So he retires within himself and becomes a sort of man-machine. It is impossible to conceive how there can be any feeling of interest in favor of the person or company from whom he draws a salary. The service becomes a compulsion and a study how the least can be done to hold a position and draw the pay. There is also a dangerous sentiment which is falsely called socialism; on the contrary it is anarchism and is productive of very much harm, not only to workmen themselves, but to the community where they live. One particular tendency of this sentiment is to assume that all accumulated wealth is a robbery of workmen and a crime; this is wrong. And a spirit of hate and envy is also engendered by this false theory.

We will admit that there are crimes committed in the name

of business at which a highway man might blush with shame. But to indiscriminately charge that all success in business is robbery is as lamentable as it is false. It is a fact not to be questioned that many of the wealthy men are among the best in the Union. An exhibition of ability and ambition is not measured simply by ability to make money. On the contrary, where the mental caliber is large and natural impulses are high, success will surely crown the effort. There is a vast difference between simply scheming to get money, and being filled with a noble impulse to be, and make the world, better. Less capable men do themselves a great injustice by attempting to lower the standard of the best. The watchword of every American should be "Upward," not "Downward."

We cannot afford to retrograde in any degree from our high position among the nations. Fellow workmen, let us be true, rather than allow jealousy to control our thoughts. It is quite natural that persons holding inferior places should to some extent look to superiors for a pattern. Custom has made it almost a law and officials should not so far forget themselves in pushing affairs entrusted to them that equity is in any case forgotten or placed on file. But, remember they are dealing with men exactly like themselves, who, although they may not remind them, are taking note and are very quick to read between lines and see the motives that govern all notices which may be posted. And where injustice is intended, a reward will surely be meted out in some way. It is quite possible that a president or general manager may issue an order in the best of faith that all under him shall have good wages and just treatment, and yet have his orders basely misrepresented by some person in office under him who is incompetent and who seeks to shield himself by treachery and unjust actions, thereby defeating plans and bringing discord where peace and full success would have reigned.

"Then let us pray that come it may,

As come is will for a' that.

That sense and worth o'er all the earth,

May bear the gree and a' that

For a' that and a' that,

It's coming yet for a' that

That man to man the world o'er

Shall brothers be for a' that."

ONE OF THE MEN.

TWO OPINIONS ON ICE SKATING FACILITIES.

Concerning the advisability of furnishing places along street railway lines where ice skating can be enjoyed during suitable weather, and the increased traffic that comes from the skaters, J. P. E. Clark, general manager of the Binghamton (N. Y.) Railroad Co., writes as follows:

"We have had no experience in maintaining an ice skating rink and have never considered the question seriously for the reason that we have two rivers that intersect our city, besides numerous small ponds and lakes in close proximity to the town, affording unlimited resources to those desiring to indulge in the winter pastime. However, we carry a great many passengers to and from the various bodies of water where the sport is indulged in, as is evinced by the large number of people who carry skates while riding upon our cars. I will state unreservedly that if the natural facilities for skating were not so numerous in this vicinity we should provide skating facilities, as I am positive it would prove an excellent stimulant for street railway traffic."

A company in New England serving a large lake at the end of one of its branches writes, under date of January 23d:

"Our first skating was on December 30th, and since that date we have had skating on 17 days, and the receipts have been much greater than the expenditures. We have to pay the ice company \$75 for the season for the privilege of using the ice for skating. We maintain some arc lights on the lake, and our other expenses are for clearing the lake of snow, which this season has been very small, owing to our not having over 2 in. during the winter. If we have much snow the expense of removing it from the lake would very rapidly decrease the profits. We make no charge for entrance on the ice."

The Duluth (Minn.) Street Railway Co. has for several seasons rented an abandoned car house to outside parties, who utilize it as a public ice rink. The company carries banners advertising the place, free of cost, on its cars.

OPERATING COMPANIES IN ST. LOUIS.

From time to time during the last year we have published notes concerning the consolidation of the street railways of St. Louis, the final result of which was to reduce the number of operating companies to three, or, more properly, two, as the Fourth Street & Arsenal R. R. is not now operating.

The most extensive of these is the St. Louis Transit Co., which began operating the properties of the United Railways Co., under a lease, on September 1st last; this company operates all the street railroads in the city of St. Louis, with the exception of the St. Louis & Suburban Ry. and the Fourth Street & Arsenal R. R. (not in operation).

When the St. Louis Transit Co. took charge of these properties the mileage was as follows:

	Electric.	Cable.	Total.
Union Depot	75.87		75.87
Lindell	75.11		75.11
Missouri R. R.....	16.61	9.60	26.21
People's Ry		9.50	9.50
National Ry.....	62.97	14.62	77.59
Southern Electric Ry.....	22.50		22.50
Jefferson Avenue Ry.....	6.70		6.70
Total	250.76	33.72	293.48

The Lindell had also built 12.1 miles and the National 2 miles not yet in operation, and if to this is added the track now under construction by the St. Louis Transit Co., 22 miles, the total trackage of the company is 329.58 miles. During the coming season the cable roads are to be changed for overhead electric operation, and within the next two years the company expects to increase its mileage.

The officers and operating staff of the St. Louis Transit Co. are: President, Edwards Whitaker; vice-president, Murray Carleton; general manager, Jilson J. Coleman; superintendents, G. W. Baumhoff, G. W. Hunter, Joe S. Minary, Jas. F. Davidson, John Mahoney; secretary and treasurer, James Adkins; auditor, Frank R. Henry; purchasing agent, J. Boyle Price; chief engineer, W. Jens; master mechanic, F. S. Drake; superintendent of overhead lines, John J. Lichter; engineer of power stations, S. G. Hill.

The lines are divided into five divisions, each under a superintendent. The divisions are: Lindell, including the lines formerly operated by that company; G. W. Baumhoff, superintendent. Southern, including the Southern Electric and the southern lines of the Union Depot; G. W. Hunter, superintendent. Northern, including the northern lines of the Union Depot, the Cass Avenue, the Northern Central, the Citizens and the Union; Joe S. Minary, superintendent. Central, including the Missouri and the Jefferson Avenue; Jas. F. Davidson, superintendent. Eastern, including the St. Louis Traction Co., the St. Louis R. R., the Baden & St. Louis and the Southwestern; John Mahoney, superintendent.

"The Suburban" operates the St. Louis & Suburban Electric Ry., the St. Louis & Meramec River R. R., and the St. Louis & Kirkwood R. R., and is closely allied to, and will operate, when completed, the Brentwood, Clayton & St. Louis R. R., which is to build this year.

The officers and staff of the St. Louis & Suburban are: President, Chas. H. Turner; vice-president, Samuel M. Kennard; general manager, Thomas M. Jenkins; secretary and treasurer, Thomas C. Kimber; chief of departments, W. C. Jenkins; auditor, L. C. Shipherd; division superintendents, Jas. A. McCabe, D. R. Redden, and Chas. J. Crane; master mechanic, G. J. Smith; engineer of maintenance of way, Chas. S. Butts; superintendent of lines, Nathan Smith; superintendent of power stations, H. W. Tingley.

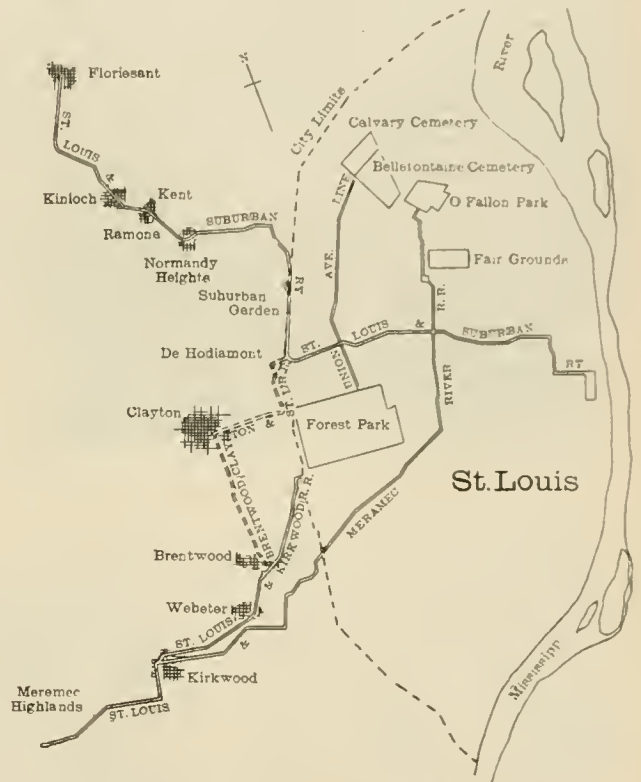

The officers of the St. Louis & Meramec are the same, with the exception of the vice-president, J. B. Chase. The St. Louis & Kirkwood has the same officers, excepting the president, James P. Dawson. Hunt Turner is president of the Brentwood, Clayton & St. Louis R. R., otherwise the officers are the same.

The Suburban system comprises a total of 91.68 miles (measured as single track), and the territory covered is shown in the accompanying map. The St. Louis & Suburban proper has a loop for a down-town terminus and extends beyond the city limits to the towns Normandy Heights, Ramona, Carsonville, Kinloch and Florissant. The St. Louis & Meramec road connects Meramec

Highlands and Kirkwood, and from Kirkwood extends to and through the city, passing the Fair Grounds (St. Louis race course) and terminating at O'Fallon Park. The St. Louis & Kirkwood extends from Kirkwood to the city limits of St. Louis. The northern portion of the St. Louis & Meramec River road was built in 1899. An addition to the St. Louis & Suburban road (the Union Ave line), extending from the Forest Park to two large cemeteries in the northern part of the city is almost completed, the greater portion of the work having been done last year. The Brentwood, Clayton & St. Louis road (13 miles) is to be built during the coming year, and, as will be seen from the map, will make a valuable addition to the property.

The management is now extending every effort to improve the physical condition of the road and its equipment and increase the economy of operation. We understand that the cost of operating for 1899 was about 25 per cent less than for the preceding year, and further reductions are expected.

The track is laid with Cambria and Johnson rails, weighing from 40 to 60 lb. per yd., laid on 6 x 8-in. oak ties, spaced 2 ft. c

MAP OF ST. LOUIS & SUBURBAN SYSTEM.

to c. The trolley wires are No. 0 and No. 00, and over a considerable portion of the route are carried on iron poles.

The rolling stock comprises 24 convertible and 130 closed cars, which were made by the St. Louis Car Co.; they are all mounted on maximum traction trucks and equipped with G. E. 1200, G. E. 57, and Westinghouse No. 38 motors. Electric heaters made by the Consolidated Car Heating Co. are used. The company operates two power stations. One is at DeHodiamont Station, and is a brick building 232 x 129 ft.; its equipment comprises five Hamilton-Corliss (Hooven, Owens & Rentschler Co.) engines aggregating 6,000 h. p., belt connected to 14, and direct connected to G. E. generators, having a total rated capacity of 2,950 kw., and 18 boilers of 250 h. p. each. The second station is at Brentwood: it is 72 x 60 ft. equipped with three engines (Porter-Allen and St. Louis Corliss), aggregating 1,500 h. p., three Westinghouse generators of a total capacity of 725 kw. and eight 200-h. p. boilers. Current is generated at from 565 to 575 volts.

Car houses are located at DeHodiamont, Benton, and Brentwood, having capacities of 85, 85 and 15 cars, respectively; all are brick buildings. The shops are at DeHodiamont.

READERS who note errors in our "Directory of Street Railways" will confer a favor by sending us corrections.

LONDON (ONT.) STREET RAILWAY REVERSES.

As a result of the recent strike, the report of the London (Ont.) Street Railway Co. for the past year, shows, as compared with the year previous, a decrease in gross revenues amounting to \$53,864.19. All shareholders were present at the 25th annual meeting of the company, held in London, January 24th, on which occasion the following report was rendered by Pres. H. A. Everett:

IN A MICA VEIN.

"Your directors beg to submit statement of the past year's business, showing gross revenue of \$59,947.58, as against \$113,811.75 for the previous year. Operating expenses were \$66,872.10, as against \$65,665.23, an increase of 1.8 per cent. It is notable that the revenue increased during the first quarter of the year (when no strike was on) 10.2 per cent."

In previous issues of the "Review" we have given accounts of the strike which began May 22d, and culminated in a serious riot on July 8, 1890. The earnings of the company have long since returned to a normal figure, and show satisfactory increases over the

TRAIN LOAD OF MICA.

earnings of a year ago. The line is now operated with favorable prospects, and it has been decided to double track a portion of the system. At the meeting in London, January 24th, the old board of directors was re-elected. The board chose officers as follows: H. A. Everett, president; Mr. Smallman, vice president; Mr. Carr, general manager and secretary-treasurer, and Messrs. Moore, Wasson, Spencer and Broderick, directors.

PREPARING MICA FOR COMMERCE.

Mica, popularly called isinglass, is the name given to a group of minerals characterized by highly perfect cleavage, so that they readily separate into very thin leaves, more or less elastic. The different grades vary widely in composition and range in color from pale brown or yellow to green or black. This material is found in various parts of the world, but is mined in largest quantities in India, although good deposits are found in the United States

MOUTH OF ST. ANTHONY MINE.

and in Canada. The mineral is usually discovered in veins commencing at the surface of the earth and running down diagonally between lime rock walls, the vein occasionally spreading out into pockets. The mining operations are simple, although the mines are often found in remote and mountainous regions, necessitating long hauls in wagons. A vein is worked by drilling holes with steam drills and blasting away sections at a time, the chunks of mica being raised to the surface by derricks and packed in jute bags for shipment. North Carolina furnishes a goodly quantity of this material, it being one of the occupations of the mountain farmers of that state to "go prospecting" between crops. In fact, in some sections of the state mica forms the principal circulating medium between the farmers and the storekeepers. When the former require supplies they pay for them in mica, which is found in small quantities on the hill-side farms, and dry groceries, meat and clothing are quoted at so many pounds of mica.

SAMPLES OF CANADIAN MICA.
For British Section, Paris Exposition.

One of the largest dealers in this material in the world is the W. H. Sills Mica Co., and all the various processes of cutting, trimming and molding mica for its many commercial uses, are carried out at this establishment, located at 64 Michigan Ave., Chicago. This business was founded in 1885 by W. H. Sills, who is still at the head of the concern, so that he has been furnishing

mica to the trade for 15 years. In 1897, Clarence B. Wisner became interested in the company as its secretary and treasurer, having in charge the financial management of the concern. The company has a factory at Ottawa, Can., and owns a rich mica mine at Gracefield, Que., views of which are shown herewith. In addition to the supply received from its own deposits, it has agencies in several parts of the world, through which large quantities of the foreign product are purchased.

The first step in preparing the material to fill the requirements of the electrical industries is the splitting of the clunks into the thinnest sections possible. When the last sub-division is made, the pieces are little thicker than tissue paper. These are spread over a specially treated cloth to a depth of perhaps an eighth of an inch and are glued to the cloth and to each other by a composition paste. This makes a flexible sheet of insulating material, and in this form, with the addition of a layer of paper, it is used in the winding of armatures, etc. In making commutator segments and rings, alternating layers of mica and cloth are placed in a powerful hydraulic press, from which they come in the form of compact but pliable sheets, capable of being cut and molded into the various shapes employed in the construction of electrical machinery. The products of the W. H. Sills Mica Co. are sold under the trade name of "Micabeston."

In one of the accompanying views is shown a shipment of mica of which the company is justly proud, as it is probably the largest single shipment of this material ever made. The total weight of this consignment was 400,000 lb., requiring nine freight cars, running as a special train to carry it from the company's St. Anthony mine, at Gracefield, to Ottawa.

Two of the illustrations herewith show samples of mica prepared for exhibit at the Paris Exposition.

LOW FARE BILL FOR WASHINGTON, D. C.

A bill regulating the operating conditions of street railways in the District of Columbia was introduced last month in the House of Representatives, and will shortly be brought up for action.

The bill provides that the rate of fare for a single ride for a

LARGE ORDER OF MICA RINGS FOR UNION TRACTION CO. PHILADELPHIA.

continuous trip any distance in one direction over any of the street railway routes in the city of Washington, shall be five cents, and the passenger shall also be entitled to a transfer ticket, good for a ride over any other line or route operated or controlled by the same company, provided that such transfer is presented on the next regular car of such other route within 15 minutes after the passenger has left the first car. It is also provided that there shall be kept on sale on all street cars in service, between the hours of 5:45 a. m. and 8 p. m. of each day, tickets to be sold in strips or packages of eight tickets for 25 cents, each of which tickets shall be accepted the same as a 5-cent cash fare, between the hours named, and such ticket shall carry the same transfer privileges as a cash fare. In addition, the street railway companies must keep on sale on their cars in service between the hours of 8 p. m. and 5:45 a. m., tickets to be sold in strips or packages of six tickets for 25 cents, such tickets to be good only during the hours last named and to entitle the passenger to a transfer as in the other cases.

The bill orders that all street cars owned and operated in the city of Washington shall be properly vestibuled to protect the motorman from unreasonable exposure to the weather, and a failure on the part of any company to so protect the motorman shall be punished by a fine of \$50 per day for each car unfitted with vestibules. All lines in the city must run cars in both directions after midnight at intervals of 15 minutes until 5:45 a. m.

The act is to take effect Mar. 1, 1900, and the failure of any company to comply with the provisions as to rates of fare, will cause a forfeiture of its charter and franchises.

SAMPLES OF UNITED STATES MICA.
For Mines and Mining Section, Paris Exposition.

The Supreme Court of New York has decided that the New York, Westchester & Connecticut Traction Co., has no rights in East Chester and Bronxville, and can, therefore, not prevent the Union Railway Co. from completing its road from Mount Vernon to White Plains.

NEW TRANSFERS FOR CHICAGO UNION TRACTION CO.

On February 1st the Chicago Union Traction Co. commenced using a new transfer ticket that is something of a departure in its line. Prior to the consolidation of the North and West Chicago companies each of these systems had been employing a number of different forms of transfer tickets and after the merger no change was made in this respect. The complicated arrangement of the lines and the number of interesting routes, required the giving of from 200,000 to 250,000 transfers a day, or about 50 per cent of all the passengers using the cars of the Union Traction Co. The system in force necessitated the keeping of 10 or 12 separate plates and required the attention of a large force of clerks to oversee the printing, and distribution of each kind to the proper line. The checking up after the tickets had been turned in to the receiver was also an enormous task, as in each bunch returned by each conductor would be several of the different forms, requiring a great deal of work to sort and trace each form back to the issuing conductor.

The new tickets, one of which is shown herewith reduced in size, are 5 x 1 1/4 in., and will greatly simplify the labor of the transfer department, as well as reducing the work of the conductor. But two plates will be needed for the entire system owned by the

TRANSFER FOR WEST SIDE LINES.

Chicago Union Traction Co., one for all the West Side lines and one for the North Side lines. The ticket shown is the form for the West Side. The North Side ticket is the same in principle, but has a different set of transfer points. On each ticket is printed the names of all the routes, although transfers are not given from each route to all the others. In each car is posted a notice setting forth the lines to which transfers will be given from that car, and from what routes they will be accepted, and on the ticket itself is printed a notice calling the attention of the passenger to these regulations; this does away with the necessity of printing a long list of the possible transfer points on each ticket. The conductor giving the transfer stamps his badge number in the blank space in the lower right hand corner next to the date, and designates the line on which he is running by a double punch at the proper name, and the line to which the passenger wishes to transfer by a single punch mark. The stamping and double punching can be done at the barn before he takes his car out. Each conductor is provided with a self-inking rubber stamp on the end of his lead pencil for stamping his badge number.

The time of day is designated in the usual manner by punching shaded figures at the left for p. m. time and the light column at right for a. m. The day of the month is printed when the original impression is made. Tickets must be used on the first connecting car, but are good for an hour after time punched. Transfers are not given on transfers except at two or three specially designated points.

When the ticket is intended to be good in either direction on the intersecting line, no direction is indicated, but when it is to be used in one direction only, the conductor punches out one of the words, North, South, East or West, as the case requires.

In one of the columns of names will be noticed the words, "On Account Delay," "Car to Car," and "To Extension." These are punched with a single punch mark in addition to the other punches in special cases only. For instance, if a line is blocked and it is desired to transfer passengers to a nearby parallel line, the words "On Account Delay" are punched out. If a car cannot finish a trip and passengers are to be changed to a following car, a mark at "Car to Car" is made. "To Extension" is used when it is neces-

sary for passengers to walk around some obstruction on the track or break in the overhead work.

Before turning the transfers collected for the day into the office, the conductor stamps on the back of each his badge number and places a rubber band around the bundle. The number turned in must agree with the number entered on his trip sheets.

From this explanation, it will be seen what a saving in the work of printing and checking has been effected, as there are but two forms, and each ticket bears its own complete record of line from which and to which it is given, badge number of issuing and receiving conductor, and whether or not it has been issued for some special cause. It is thought, also, that the posting of the possible transfer points in each car will be a convenience to the public, as it will enable a passenger to decide the best way to reach his destination for a single fare.

ANOTHER 100 MILE LINE.

The latest "gigantic electric line," as it is termed by the daily press, to make its appearance, runs—on paper—from Tiffin, O., to Sandusky, O., and will be over 100 miles in length. After leaving Tiffin the road will pass through Old Fort, Fremont, Port Clinton and Toledo, thence along the shore of Lake Erie to Sandusky, by way of Lakeside and Marblehead. The Tiffin, Toledo & Sandusky Electric Railway Co. has been organized with a capital stock of \$3,000,000, to build the road, and the capitalists interested are said to include S. B. Hege, of the Baltimore & Ohio R. R., Washington, D. C.; R. W. Brown and Richard Young, of Washington, D. C.; S. B. Calef, of Middletown, Conn.; H. S. Frye, of Windsor, Conn., and F. A. Anderson, of Alexandria, Va.

RULES FOR CONDUCTORS.

The following rules for the guidance of conductors were issued last month by Supt. John N. Akarman, of the Worcester (Mass.) Consolidated Street Railway Co.:

"On and after this date conductors will be required to strictly observe the following rules: Remain on the rear platform when not collecting fares. Keep the car doors shut. Do not turn the signs until the car reaches the end of the route. Do not push in the front fender or pull out the rear fender until the car reaches the end of the route. See that every passenger gets a seat whenever there is any vacant space by asking those seated to make room. Do not talk to passengers, except to answer questions, then be polite, and make no unnecessary conversation. Keep a sharp lookout for passengers; see everybody who may wish to ride. Do not start your car from the inside; step to the platform, so you can see that everything is safe, before you give the bell to start. Collect your fare as soon as the passenger has had time to enter the car and take a seat. Ring up each fare separately, as collecting fares from several passengers and then ringing them all in at once is not allowed. Be on the rear platform when leaving the ends of the route, so you can see anyone who may wish to ride.

"Any conductor reported for failure to comply with the above will be suspended for two days for the first offense and discharged for continued neglect of duty."

REYNOLDSVILLE TRACTION CO.

E. A. Ferrin, president of the Reynoldsville (Pa.) Traction Co., writes us that surveys for the line have been completed and maps, profiles, plans and specifications are being prepared by F. H. Loomis, of Brooklyn, N. Y., for Vandegrift & Co., of Philadelphia. The company will be ready to receive bids for material at an early date.

AN EXTRA MAN DURING RUSH HOURS.

A bill has been introduced in the New York Legislature requiring street railway companies operating in New York City to employ three persons, a gripman, or motorman, a fare collector and a conductor, on all cars exceeding 30 ft. in length, during rush hours. The duty of the conductor is to stay on the rear platform to stop and start the car, and he is prohibited from collecting fares or going inside the car.

PLANT FOR MAKING TERRA COTTA CONDUITS.

The first plant in this country to make conduits for electric wires from terra cotta, or baked clay, was the establishment owned by the Potomac Terra Cotta Co., and located at Terra Cotta, a station on the Baltimore & Ohio R. R., about four miles from Washington, D. C. The company was organized about 25 years ago, and for a long time was engaged exclusively in the making of sewer pipe, of which it was and still is one of the largest producers. About 12 years ago the company turned its attention to developing earthen or clay electric conductor conduits, and finding the deposits of clay upon which its plant was built was adapted to this

PLANT OF POTOMAC TERRA COTTA CO.

class of work, it commenced at once to turn out terra cotta ducts in large quantities. Its products are called the "Mason," after Mr. George Mason, the general manager, and differ materially from other conduits both in the nature of clay from which they are made and in their shape. The principal feature, and one on which letters patent were obtained, is the arrangement of small openings and iron dowels fitting into them, securing perfect registration and alignment of the ducts in the process of laying, and preventing joints from becoming displaced by ramming concrete or in other ways. The dowel pins are about 1/2 in. in diameter, and are made with a barb on one side, which prevents them from settling too far into the openings. When the conduits come from the kiln they are glazed inside as well as out, and offer little resistance to the wires when the latter are drawn into place, and hence there is no danger of damaging the cable sheath.

One claim of superiority is that of absolute vitrification, due to the use of a clay that vitrifies at a high temperature, rendering it

2-DUCT AND 4-DUCT CONDUITS.

non-absorbent, while it is practically indestructible by the elements when properly baked. The ducts are made in standard lengths of 30 in., which size has been found the most suitable to insure perfect vitrification and glazing, is most easily handled, least liable to breakage in handling, and consequently the most economical. One, two and four-duct sections are the usual patterns made.

The processes of mining and preparing the material from which these products are formed, are interesting, and while not com-

plicated, require great care and skill at every stage to obtain satisfactory results.

The clay deposits, the supply at the disposal of the company being seemingly inexhaustible, are found in irregular veins, located from a few to several feet below the surface, and usually in a hard and dry condition. The earth is broken from the face of the vein with picks and wedges and shoveled into carts which take it to a hopper at the side of the main building and dump it directly into the first grinding mill. In their passage through this, the lumps of clay are reduced in size and are then taken by a belt conveyor to a second mill and through crushing rolls, from which the material comes as a fine powder. This is carried, again by a belt conveyor, to the basement, where it is thoroughly soaked and allowed to "temper" for from five to seven days. After this period the clay is again passed through a grinding mill, when it is ready to be molded into the various shapes, in a vertical steam press, which forces the material into suitable dies. When the molds have dried sufficiently in a drying room heated by steam, the sections are ready to be burned or baked in kilns, which are circular in shape and from 22 ft. to 30 ft. in diameter. The fire is started gradually and increased until the contents of the kiln are brought to a white heat, and is kept at this point from five to seven days, when the fire is removed, the kiln sealed up and the contents allowed to cool, which process takes several days. Just before the firing about a wheelbarrow load of salt is thrown into each kiln, and the fumes from this, uniting with the heated clay, causes the glazed surface which is characteristic of these conduits.

ENTRY OF INTERURBAN LINES INTO COLUMBUS, O.

There are a number of interurban electric lines whose promoters wish to secure an entry into the city of Columbus, O., with termini in the central part of the city where the streets are already occupied by the tracks of the Columbus Street Railway Co. Robert E. Sheldon, president of the Columbus Street Ry., recently took advantage of a mass meeting of citizens to make an address outlining the policy of his company. He stated that his company would enter into agreements with interurban roads for handling their cars upon terms mutually satisfactory.

In Dayton the City Ry. has made contracts with three interurban lines for track rights; the compensation paid the City Ry. is 3 cents for each passenger carried over its lines by the interurban. As yet the Dayton & Western Traction Co. is the only one actually operating under such an agreement; it runs over two miles of the urban company's tracks. Concerning this, D. B. Corwin, president of the City Ry., says:

"We have found the arrangement entirely satisfactory to the city company, as we receive from six to seven hundred dollars per month from the D. & W. Traction Co. for the use of our tracks and power, and this is almost all new business, as we find that very few, if any, local passengers use the interurban company's cars. The Traction company has placed in its cars registers on which are registered all passengers carried over any part of our lines and this register is solely used for registering passengers carried on our lines, and is open to the inspection of our employes at all times, and the plan has proved entirely satisfactory. We furnish simply power and tracks. The employes operating the cars are the employes of the D. & W. Traction Co."

FIRE AT MUNCIE, IND.

On January 22d, the power house, shops, barns and offices of the Union Traction Co., at Muncie, Ind., were totally destroyed by fire, with their contents, including engines, dynamos and boilers and 16 cars. The loss is partially covered by insurance. The service was temporarily resumed with horse cars until other arrangements can be made. It is charged that the fire was of incendiary origin and this view is rendered more probable by reason of the discovery that brick dust had been placed in the bearings of a new generator temporarily installed by the street railway company in a local power plant.

A movement is on foot looking to a consolidation of the three street railway companies centering at Kutztown, Pa.

TRAMWAY CONGRESS AT PARIS.

We have just received from Mr. F. Nonnenberg, secretary of the Union Internationale Permanente de Tramways, the announcements relative to the International Tramway Congress, which is to be held at Paris, Sept. 10-13, 1900. The Minister of Commerce, Industry, Posts and Telegraphs has placed the organization of the congress, under the auspices of the Union Internationale Permanente de Tramways, in the hands of a commission of 17 members under the presidency of Mr. Leon Janssen, of Brussels; Mr. J. M. Roach, president of the American Street Railway Association, is a member of this commission. Mr. Nonnenberg is secretary general of the commission and Mr. Albert Janssen is secretary.

The members of the congress will be:

1. The members of the Union Internationale Permanente de Tramways.

2. Companies and individuals who apply for admission and are accepted by the bureau of the commission.

Companies who wish to be represented abroad should apply to Mr. F. Nonnenberg, 85 Rue Potagere, Brussels, giving name of company, name of delegate, title or profession of delegate and the complete postoffice address. Individuals making application should give name, title or position, and address. A fee of 20 fr. (\$4) is required.

This will be the 11th meeting of the International Tramway Union, the last one having been held at Geneva in 1898.

The following reports will be presented:

"Tariffs of Urban Tramways," by Mr. Gerbn, of Cologne.

"Results of the Adoption of Electric Traction," by Mr. Pirch, of Barmen-Elberfeld Tramway.

"Relative Advantages of Narrow and of Standard Gages for Electric Railways," by Mr. Gunderloch, of Elberfeld.

"Design of Central Stations," by Mr. d'Hoop, of Brussels.

"Systems of Distributing Current," by Mr. Van Vloten, of Brussels.

"The Falk Cast-Welded Joint," by Mr. Fischer-Dick, of Berlin.

"Storage Batteries," by Messrs. Broca and Johannet, of Paris.

"Heating Cars," by Mr. C. de Burlet, of Brussels.

"Exploitation of Branch and Feeder Lines," by Mr. Ziffer, of Vienna.

"Adoption of Standard Ratings for Electric Motors and Generators," by Mr. Macloskie, of Tours.

"Brakes for Tramways Using Mechanical Traction," by Mr. Monmerque, of Paris.

American street railway men who contemplate attending the Exposition would do well to time their visits so as to be present during this congress, as we believe that they would receive a warm welcome from their European brethren.

NEW STREET RAILWAY SWITCH.

William E. Sleight, of Lansing, Mich., has invented a switch apparatus for use on street railways which is designed for setting switches without stopping the cars. The device is reported to have been in use, experimentally, on the Lansing Street Ry., and to have given satisfaction.

The method of operation will be readily understood from the accompanying sketch. A rocker bar is mounted on suitable bearings at a point about 40 ft. from the switch, and so arranged that one end will be depressed when it is struck by a movable foot lever on the car and actuated by the motorman. An arrangement of bell cranks and levers connects the rocker bar with the switch point.

NEW PLANER AND MATCHER.

The accompanying illustration shows one of the latest designs in woodworking machinery which has been developed by the Egan Co., of 322 to 342 West Front St., Cincinnati. This company makes everything in the machinery line that is used in the manufacture of wood, and exerts every effort to keep fully abreast of the natural evolution that goes on steadily in the mechanical world. The Government requested the Egan Co. to exhibit at the Paris Exposition, and the company is going to make a display that will uphold the prestige of America for high-grade machinery.

No. 8 EGAN PLANER AND MATCHER.

The No. 8 planer and matcher shown herewith is designed for small mills, and is capable of doing both light and heavy work. It planes one side up to 2 1/4 in. wide and up to 6 in. thick, and matches up to 12 in. wide; being fitted with adjustable pressure bars and slotted cylinders, it is particularly adapted for molding, casing, base boards, etc. The details have all been worked out to insure durability and convenience in operation.

TORONTO (ONT.) RAILWAY CO.

The eighth annual report of Pres. Wm. Mackenzie, of the Toronto (Ont.) Railway Co., for the year ending Dec. 31, 1899, was submitted to the stockholders on January 17th. The results of

COMPARATIVE STATEMENT	1890	1898	1897	1896	1895	1894	1893	1892
GROSS EARNINGS	\$1,335,542.44	\$1,210,618.24	\$1,077,612.53	\$907,173.20	\$993,800.88	\$956,770.24	\$900,232.59	\$830,008.49
OPERATING EXPENSES	650,374.55	578,857.26	525,801.25	507,700.31	489,914.76	517,797.53	537,597.15	590,333.26
NET EARNINGS	685,167.89	631,760.98	551,811.28	489,472.89	503,886.04	440,603.21	362,635.44	239,675.23
PASSENGERS CARRIED	31,826,040	28,770,388	25,921,314	23,537,011	23,353,222	22,004,338	21,215,010	19,122,022
TRANSFERS	10,538,220	9,287,230	4,169,000	2,354,883	2,257,572	2,453,422	1,477,147	5,592,208
PERCENTAGE OF OPERATING EXPENSES TO EARNINGS	48.8	47.4	48.8	50.9	49.3	54.0	59.97	71.9

the operation of the road for the last eight years are shown in the accompanying table.

During the year the rolling stock was increased by 80 cars and 2 electric sweepers built in the company's shops; 20 open cars are now building. Two new car sheds each with capacity for 100 cars have been built, and a brass foundry erected and equipped.

During the year the company paid taxes as follows: Percentage on earnings to city, \$111,426; pavement charges, \$64,000; city taxes on poles, rails and wires, \$2,641; taxes on real estate, \$9,366; provincial taxes, \$4,748; total, \$192,181. This is over 14.4 per cent of the gross earnings and over 28.1 per cent of the net earnings. Dividends of 4 per cent were paid on the capital stock of \$6,000,000.

One of the strong arguments in favor of another bridge over the East River between New York and Brooklyn, is the fact that on foggy mornings, when the ferries are always delayed, the usual ferry passengers all rush for the cars on the bridge, sometimes in this way demoralizing the service on that structure as well.

NEW YORK RAPID TRANSIT ROAD.

Nov. 14, 1899, the Rapid Transit Commissioners of New York City advertised for bids on the construction, equipment and operation for a term of 50 years (with right to a lease for a further term of 25 years) of an underground rapid transit road in New York City over the following route:

Section I.—From the City Hall through Center St., Elm St., LaFayette Place, Fourth Ave. to the Grand Central Station, west in 42d St. to Broadway and thence to 59th St.

Section II.—North through Broadway Boulevard to 103d St., where the route divides, extending on the west side in Broadway Boulevard to 137th St., and on the east side from the 103d St. junction to Central Park, under the corner of the park to Lenox Ave. and out Lenox Ave. to 135th St.

Section III.—On the west side from 137th St. along 11th Ave. to Ft. George; and on the east side from 135th St. east under the Harlem River to Melrose Ave.

Section IV.—On the west side from Ft. George along the Harlem River to Kingsbridge; and on the east side, out Westchester Ave. and Boston Road to Bronx Park.

January 15th the bids were opened and it was found there were only two bidders, Andrew Onderdonk, whose bid for the whole was \$30,300,000, and John B. McDonald. Mr. McDonald's bid was as follows:

Section I.	\$15,000,000
Sections I and II.	26,000,000
Sections I, II and III.	32,000,000
Sections I, II, III and IV.	35,000,000

On January 16th the board awarded Mr. McDonald the contract subject to his complying with the terms of the contract and depositing \$1,000,000 in approved securities, and giving bonds for \$1,000,000 to secure the construction, operation and payment of rentals, and for \$5,000,000 to secure the construction and equipment.

The following are interesting statistics concerning the enterprise: Length in all sections of the tunnel, as surveyed, 109,570 ft., nearly 21 miles; total excavation of earth, 1,700,228 cu. yd.; earth to be filled back, 773,093 cu. yd.; rock excavated, 921,128 cu. yd.; rock

THE BURNHAM TRACK DRILL.

tunneled, 368,606 cu. yd.; steel used in structures, 65,044 net tons; cast iron used, 7,901 net tons; concrete, 489,122 cu. yd.; brick, 18,519 cu. yd.; waterproofing, 775,795 yd.; vault lights, 6,640 sq. yd.; local stations, 43; express stations, 5; station elevators, 10; lineal feet of track, 305,380; lineal feet of track underground, 245,514; lineal feet of track elevated, 59,766.

John B. McDonald was born in Cork, Ireland, in 1846, coming to this country when 15 years old. He is widely known as a contractor, having done work for the New Jersey Central, the Canadian Pacific, the Boston & Hoosic Tunnel, the Delaware, Lackawanna & Western, the West Shore and the Baltimore & Ohio railroads. For the last named road he built the Belt Line Tunnel.

The last trip of the steam dummy formerly used on the Lakeview line of the Birmingham (Ala.) Railway & Electric Co., was made on February 1st. The first trolley car on this line was run the same day.

THE MILWAUKEE SITUATION.

When we went to press last month the city council of Milwaukee had passed the street railway ordinance and while a formal acceptance had not been filed, the company was acting under it; the court had under advisement the question of punishing for contempt the city officials who had ignored its orders.

January 17th, Judge Ludwig held that Mayor Rose, the city clerk and the 24 aldermen who voted for the franchise were in contempt, but suspended further proceedings on this question till after the motion to dissolve the injunctions had been decided.

The following day the Supreme Court issued an alternative writ of prohibition, citing Judge Ludwig to show cause why he should go further in the contempt proceedings.

January 19th, the trial of the injunction cases on their merits was begun, and on January 29th Judge Ludwig dissolved both the Schwartzburg and the Paine injunctions. On the same day the Milwaukee Electric Railway & Light Co. filed its acceptance of the ordinance.

A third injunction to prevent the acceptance of the ordinance, secured by J. G. Trentlage in behalf of himself and other abutting owners, was still in force, however. The plaintiff wished to dismiss this suit but the court would not hear him for that purpose, and another abutting owner, the Linden Land Co., was substituted as plaintiff. February 2d, the Supreme Court ordered Judge Ludwig to show cause why he should not be restrained from proceeding with the Trentlage case.

Pending the decision of the Supreme Court, the new ordinance is now in effect.

The street railway company was convinced that the opponents of the ordinance intended to keep a few injunction suits always pending, and to secure a short respite on January 26th got an injunction restraining all citizens, property owners, etc., from suing the company.

BURNHAM TRACK DRILL.

The accompanying illustration shows a machine for drilling rails which has some improvements over the ordinary drills used for this purpose. The frame consists of a bar or piece of pipe having at one end a Y-shaped casting with two depending lugs, and at the other a casting with a single lug; both of these pieces are readily adjustable for different gages. The drill has two extension cranks, enabling the leverage to be adjusted to the work. The two cranks are used for heavy work, the gearing being arranged as shown in the illustration, and giving the ratio of 1 to 1 between the crank and the drill. For light work the top yoke is removed and one of the cranks placed on the vertical shaft; this change makes the gear ratio 2 to 1, and enables such work as drilling holes for bond wires on electric roads to be done with convenience and dispatch.

The machine weighs 85 lb. and is designed to be amply strong in all parts. It is made by the George Burnham Co., of 21 Herman St., Worcester, Mass.

NEW ORLEANS GRAPHIC DIRECTORY.

We have received from the New Orleans & Carrollton Railroad Co. a copy of an advertising folder which is one of the best we have seen. The sheet is about 15 in. square; on one side are the schedules on which cars are run on all the lines operated by the company, and on the other side is the graphical directory. This is a map of the city showing the company's lines and the location of public buildings and principal points of interest, with an index. The sheet folds to 2 1/2 x 5 in., vest-pocket size.

Suit has been commenced to wind up the affairs of the Chesterfield Transit Co. This was not a railway, as might be supposed from the name, but a scheme for transporting ground coal from Virginian fields to the seaboard by means of a pipe line.

CEMENT CONDUIT DUCTS.

The National Telephone Co., of London, Eng., in all its underground work is now using ducts made of cement, experiments in Sweden having shown them to be perfectly satisfactory. The company has itself engaged in the manufacture of the ducts; it has used blocks with as few as 3 and as many as 30 ducts. The sections are in general of the type shown in the illustration, which is taken from the Electrician. In the trench the sections of conduit are placed with the ends resting on bearers which serve to bring them to the proper level for the joints. The alinement is kept true

NINE-WAY CONDUIT.

by means of iron bars 1 in. square laid in the three grooves, the bars being of such length that only one joint comes on any one section. The joint is wrapped with a strip of canvas steeped in boiling pitch and applied while hot; there are two layers of the sacking on the top of the joint. The circumferential groove made by the junction of the recessed ends is then filled flush with neat cement after cement grout has been run in between the bearer and the packing along the lower side of the joint. The longitudinal grooves are also filled with neat cement.

Sections with only three ducts have spigot and socket ends and no canvas binding at the joints; iron bars for alinement, but no bearing blocks are used.

FIRE PROOF PAINT.

The Frank S. De Ronde Co., of 54 John St., New York City, is making a specialty of its "Lythite" cold water paints for the use of street railway companies, which are well adapted for coating walls of car barns, repair shops, power houses, etc. These coatings are strictly fireproof, come in powder form and simply require mixing with water, when they are ready for use. They come in white and colors. The white gives a very brilliant surface and the "pole green," for trolley poles, gives a fine, glossy, durable finish that retains its color under all climatic conditions and changes in temperature.

This company has a branch store and warehouse at 48 N. Fourth St., Philadelphia, where it handles all its own lines, which include "Lythite," waterproof lining paper, roofing, varnishes, pipe covering, deadening felt, insulating papers, preservative paint, waterproof flooring, etc., and also all the products made by the Standard Paint Co., its Philadelphia branch acting as general distributing agent for P. & B. compounds, armature varnish, tape, rubberoid motor cloth, etc., in Pennsylvania, southern New Jersey and Delaware.

SPRINGFIELD STRIKE CONTINUES.

The strike of the street railway employes at Springfield, Ill., which was begun Nov. 10, 1899, continues. January 19th for the fifth time explosives were placed on the tracks and a car damaged. This last explosion occurred on one of the main streets of the city within one square of the police station.

President Jarvis offered to put the strikers back at work, but they hold out for a recognition of the union, which the company refuses to grant.

CINCINNATI, NEWPORT & COVINGTON.

Mr. James C. Ernst, president of the Cincinnati, Newport & Covington Railway Co., sends us the following condensed statement of the company for December, 1899, and the year 1899. The ratio of expenses to earnings for the year was 52.3 per cent, while the same ratio for the first six months of 1899, as published in our issue of August last, p. 566, was 56.7 per cent.

	DECEMBER.		FOR THE YEAR.	
	1899	1898	1899	1898
Gross receipts	\$61,021.15	\$54,144.34	\$713,385.55	\$681,672.27
Operating expenses	23,816.92	24,511.30	286,233.98	342,119.36
Net earnings	37,204.23	29,633.04	427,151.57	339,552.91
Tolls, taxes, damages, etc.	12,139.68	21,395.67	147,362.64	136,116.30
Net profit	25,064.55	8,237.37	279,788.93	203,436.61
Ratio of expenses to earnings:				
With tolls	.5119	.5852	.5232	.6126
Without tolls	.3902	.4527	.4012	.5018

ELECTRICAL DEPARTMENT OF STURTEVANT CO.

The B. F. Sturtevant Co. has made a large addition to its works to better accommodate the electrical department of the business, which has developed with the use of electricity for driving auxiliary apparatus. Just as in the 70's the demand for its blowers to be engine driven led the company to take up the design and manufacture of special engines for direct attachment to the blowers, the use of motors in place of the engines led to the development of the electrical department which now covers over 20,000 sq. ft. of the shops. Prominent among the company's late products is an elec-

ERECTING FLOOR, WORKS OF B. F. STURTEVANT CO.

tric fan of the propeller type having the motor entirely enclosed.

The accompanying illustration is from a view of one corner of the erecting floor at the Sturtevant works and shows a variety of motor driven fans. The product of the company includes fans up to 15 ft. in diameter, a line of electric motors and generators ranging in size from 1-6 h. p. to 125 h. p., and a line of engines covering the same range of capacity.

March 1st, the Collins Park & Belt line, Atlanta, Ga., will inaugurate a 15-minute service on its river line, putting on 10 new cars.

There has been considerable complaint in Minneapolis and St. Paul in regard to high steps with which the street cars are equipped, the distance from the ground to the first step being 19 inches. A change is to be made by the company by lowering the car bodies and adding another step to the car.

HANDLING LONG RAILS.

Mr. S. P. Baird, Asso. Mem. Am. Soc. C. E., has kindly sent us the photographs from which the accompanying engravings were made and a description of the method of handling long rails which was employed by the Portsmouth (O.) Street Railroad & Light Co., of which he is superintendent.

The rails are 7-in., 70-lb., T-section in 60-ft. lengths and six men unloaded 80 of them in a day besides putting up and taking down

UNLOADING LONG RAILS.

the gin poles, and also loading the rails on wagons. The rails were hauled by ordinary short coupled, two horse, lumber wagons, the rail being first laid on its side, then raised up at one end by the six men and the wagon backed under until it supported from 1-3 to 2-5 of the weight of the rail; the chain was then passed several times around the rail and the rear axle, the team hauling about half the rail on the wagon and dragging the remainder. Of the total of over 500 handled in this manner there was not a rail injured. In unloading from the wagons the driver merely unhooked his chain from around the rail and drove the wagon out from under the rail, thus requiring no help in unloading.

UNLOADING LONG RAILS.

The apparatus required comprised two pair of tongs, similar to ice hooks, two poles 6 in. square by 12 ft. long, two pair of double blocks large enough to carry 7/8-in. rope, and five guy lines as shown in the illustration.

Another point in connection with this method of handling long rails, which is worth considering is the reduced liability of injuring any of the workmen. In the entire season's work at Portsmouth there was not a man injured by this system.

READERS who note errors in our "Directory of Street Railways" will confer a favor by sending us corrections.

ORDER CONCERNING TRANSFERS.

The Chicago City Railway Co., in order to put a stop to the abuse of transfers on its lines, has issued the following:

SPECIAL NOTICE TO TRAINMEN
CONCERNING TRANSFERS.

When a passenger to whom a transfer has been issued, disposes of that transfer and remains on the car, the conductor will deny him the right of further transportation, unless he pays another cash fare, and will STOP his car and eject him from it.

When newsboys board the cars and sell papers to persons who have not yet paid their fare, and with the paper give a transfer, or sell or give a transfer without the paper, the conductor shall decline to accept such transfer in payment of fare.

Do not allow newsboys on your cars when it is possible to keep them off without using violence.

When it becomes necessary to eject a person from a car, STOP THE CAR TO A STANDSTILL, do not put any one off a moving car, call the motorman or gripman to your assistance and get the offender off without injuring or tearing of clothing.

The ejection of a person from a car is a serious matter UNLESS WE ARE RIGHT, consequently the conductor must know from his own observation that the person tendering transfer is not entitled to passage therefor before he takes action, and when possible procure names and addresses of passengers as witnesses. If the conductor is in doubt as to the absolute certainty of the attempted fraud, allow it to pass and neither say nor do anything concerning it.

Conductors taking any action whatever under these instructions will make immediate and full report of it.

ROBT. McCULLOCH,

General Manager.

Feb. 5, 1900.

HEATING BY EXHAUST STEAM.

The American District Steam Co. of Lockport, N. Y., undertakes by contract and guarantees to place in successful operation in connection with a central power station, a plant for supplying neighboring stores, offices, residences, churches, theaters and public buildings with heat, utilizing exhaust steam by means of an underground system of mains. In comparing its exhaust steam method with hot water circulating systems, the company makes the following statement:

"Several attempts have been made during the past 10 or 12 years to install successful heat distributing plants, using hot water, the most notable of which was that of the Boston (Mass.) Heating Co., which, about the year 1887, put down pipes to convey hot water for heating over quite a large district in the heart of the city of Boston. More than half a million dollars was expended in this venture. Its customers were satisfied with the heat, but the expense of the service precluded all possibility of profit. Another serious and unlooked for difficulty was developed as the experiment proceeded. At the end of a year and a half or less it was found that the return pipes were in a precarious condition, and leaks developed all along the line, and an examination showed that these lines were beyond repair, and as a consequence, at the end of two years, the company had to abandon its plant.

"We are not prepared to explain fully this destruction of pipes used to return the water to the station, but certain it is that between the distilled water and the iron pipes a chemical action takes place that is destructive to the metal."

MORE WIRE THIEVES.

A particularly bold theft of trolley wire was made one night recently at Darby, Pa., from the Philadelphia, Morton & Swarthmore Street Ry., a new road not yet in operation. About 2,500 ft. of the wire was cut down, and to prevent themselves from being seen while at work, the thieves broke all the incandescent light globes for some distance along the road.

Three boys were caught last month by the Cincinnati & Miami Valley Traction Co. officials, and convicted for stealing copper bonds. The boys when captured had \$200 worth of bonds in a bag.

James Price, colored, was arraigned in the police court at Atlantic City, N. J., on February 2d, charged with stealing \$100 worth of copper wire from one of the trolley lines.

PERSONAL.

MR. EUGENE CHAMBERLAIN has been made superintendent of equipment of the Brooklyn Rapid Transit Co.

MR. C. D. SHEPARD, on February 15th, resigned as superintendent of the Palmer (Mass.) & Monson Electric Ry.

MR. JAMES ATKINSON and his wife have just returned from a trip through Cuba, where they had a very pleasant time.

MR. S. T. NORVEL, president and general manager of the Superior Rapid Transit Railway Co., of West Superior, Wis., was a "Review" caller last month.

MR. A. E. LANG, president of the Toledo Traction Co., has been very successful in securing subscriptions to the Toledo Centennial fund.

MR. L. D. ROSS has returned from his trip abroad and may be addressed the next few weeks, care the Elpaso Club, Colorado Springs, Col.

MR. F. N. MANN, JR., was last month elected vice-president of the United Traction Co., of Albany, N. Y., in place of Mr. Charles Clemmshaw, resigned.

MR. FREDERICK H. TIDMAN, receiver for the Oswego (N. Y.) Traction Co., has transferred the property to the company by direction of the courts.

MR. CHARLES ALDINGTON, a representative of the London Central Ry., one of the underground lines, has been in Chicago making a study of the transportation systems.

MR. JAMES W. BROWN has been appointed manager of the Rome (N. Y.) City Electric Ry. He has had charge of the reconstruction of the line during the past summer.

MR. ROBERT BLACK, for many years roadmaster of the Manhattan Elevated, of New York, has resigned to become general superintendent of the Dressel Railway Lamp Works.

MR. CHARLES H. SMITH, general superintendent of the Lebanon (Pa.) Valley Street Ry., has been appointed to a responsible position with the Edison Illuminating Co., of that city.

MR. GEO. M. KUEMMERLEIN, superintendent of transportation of the Milwaukee Electric Railway & Light Co., has assumed in addition, the duties of superintendent of the Racine division.

MR. CHARLES BLIZARD, formerly manager of the New York office of the Electric Storage Battery Co., is now manager of the sales department of that company, with office at Philadelphia.

PRES. JOHN B. PARSONS, of the Union Traction Co., Philadelphia, has received a handsomely engrossed resolution from the men expressing their appreciation of his action in increasing wages.

MR. E. W. GOSS, of Middletown, Conn., will hereafter manage both the Middletown Street Ry. and the Milford (Mass.), Holliston & Framingham Street R. R., spending part of his time in each city.

MR. CHARLES H. CHAPMAN, on February 1st, assumed the duties of assistant superintendent of the Middletown (Conn.) Street Railway Co., and will have full charge of the road in the absence of Mr. E. W. Goss.

MR. WILLIAM ELMER, JR., of the Pennsylvania R. R., with headquarters at Altoona, Pa., has been appointed superintendent of the Atlantic City (N. J.) Street Ry., which is owned by the Pennsylvania Railroad Co.

MR. C. E. FLYNN, who has for three years been general manager of the Carbondale (Pa.) Traction Co., resigned on February

1st to become general manager of the Easton Consolidated Electric Co., at Easton, Pa. His work at Carbondale has been attended with great success and won deserved praise from both the company and its patrons. Easton offers a larger field to Mr. Flynn, which he enters with the best wishes of his former associates.

MR. T. K. GLENN, formerly secretary and assistant treasurer of the Atlanta (Ga.) Railway & Power Co., has been elected first vice-president of the company. Mr. A. J. Chapman, former auditor, has been made secretary and assistant treasurer.

MR. JOHN Q. BROWN, at one time assistant engineer of the Columbus (O.) Street Ry., and more recently acting manager of the Columbus Electric Co., has accepted a position with the San Antonio (Tex.) Street Railway Co.

MESSRS. LAWTON C. BONNEY AND CHARLES L. BONNEY, treasurer and vice-president, respectively, of the Chicago General Ry., have resigned those offices; both remain on the board of directors, and Mr. C. L. Bonney will continue as general counsel for the company.

MR. R. A. HARMAN, succeeds Mr. Charles L. Pack as vice-president of the Cleveland Electric Railway Co., and the office of secretary which he has formerly held, will be filled by Fred S. Borton, until now assistant secretary.

MR. JOHN T. WHEELER, formerly in the purchasing department of the Grand Rapids & Indiana Railway Co., at Grand Rapids, Mich., has been appointed purchasing agent of the Sargent Co., of Chicago, with office at 675 Old Colony Building.

MR. IRA A. McCORMACK has tendered his resignation as vice-president and managing director of the Syracuse (N. Y.) Rapid Transit Co., to take effect April 1st, and will then assume the duties of general superintendent of the Cleveland (O.) Electric Railway Co.

HON. MARTIN A. KNAPP, chairman of the Interstate Commerce Commission, Washington, on January 30th addressed the faculty and students of Purdue University, LaFayette, Ind., on the subject, "The Interstate Commerce Laws and Their Relation to the Public."

MR. C. E. HOOVEN, secretary of the Cincinnati & Hamilton Electric Street Railway Co. since its organization, last month presented his resignation in order to accept the office of treasurer and general manager of the Cincinnati, Lawrenceburg & Aurora R. R., a new line in course of construction.

MR. H. J. SOMERSET, superintendent of the Winnipeg (Manitoba) Street Railway Co., resigned that position on February 1st, and has left for Perth, West Australia, where he will manage the new electric railway system. Mr. Somerset was presented with an address and a handsome watch charm by the employees.

MR. IRVING P. LORD, president and counsel of the Waupaca Electric Light & Railway Co., of Waupaca, Wis., is largely responsible for having his city selected for the place to hold the next convention of the Northwestern Electrical Association. A report of the recent meeting of this society will be found elsewhere in this issue.

MR. H. J. CLARK, as announced last month, has been appointed chief engineer and superintendent of the Syracuse (N. Y.) Rapid Transit Co., and in addition will take charge of the transportation department. Mr. M. J. French, jr., has been made engineer of maintenance of way of the system, and T. C. Cherry has been appointed track superintendent.

GEN. WILLIAM A. BANCROFT, president of the Boston Elevated Ry., on January 26th delivered a lecture on the "Boston Elevated Railway," before the Men's League of the Second Congregational Church, at North Chelmsford. The amount paid to the public by this company, in taxes and other contributions, amounts to about 12 per cent of the gross receipts.

MR. G. T. ROGERS, who is well known to the street railway men of the country as president of the Binghamton (N. Y.) Railroad Co., and president of the New York State Street Railway Association, has become interested in the firm of Ellingwood & Cunningham, bankers and brokers, 41 and 43 Wall St., New York. Mr. Rogers will be a special partner only, and will remain at the head of the Binghamton Railroad Co., which he is conducting with such marked success.

MR. CHARLES H. SMITH, the retiring superintendent of the Troy (N. Y.) City Ry., now consolidated with the United Traction Co., of Albany, was given a testimonial banquet and reception on the evening of January 16th, by his former employes. Mr. Chas. Clemmshaw, formerly president, and Mr. Joseph J. Hagen, secretary and treasurer, also shared the honors of the occasion. Mr. Smith was presented with a gold watch, and Mr. Clemmshaw and Mr. Hagen with gold-headed umbrellas.

ELECTIONS.

THE DAYTON (O.), SPRINGFIELD & URBAN ELECTRIC RAILWAY CO. has elected the following officers: President, John H. Harshman; vice-president, Frederick Colburn; secretary, John G. Webb. Mr. Colburn, the retiring president, refused re-election.

THE COLUMBUS (O.) RAILWAY CO., at a recent meeting elected the following board of directors: Robert E. Sheldon, E. K. Stewart, Clarence M. Clark, George W. Sinks and Theodore Rhoads. The executive committee consists of Robert E. Sheldon, E. K. Stewart and G. W. Sinks. The officers remain the same.

THE NEW ORLEANS CITY R. R. re-elected the old board of directors on February 5th, and on the same day the following officers were re-elected by the board: President, R. M. Walmsley; vice-president, Albert Baldwin; secretary and treasurer, A. H. Ford; general manager, C. D. Wyman; surgeon, Dr. R. W. Walmsley; attorneys, Dengree, Blair & Dengree, and Lawrence O'Donnell.

THE WEST CHESTER (PA.) STREET RAILWAY CO., at its annual meeting, made one or two changes in its list of officers and directors: The officials as elected are: President, Joseph S. Harris; board of directors, R. T. Cornwell, A. G. McCausland, M. H. Matlack, J. Carroll Hayes. Mr. William M. Hayes retires from the presidential chair, which he has occupied for several years. He was not a candidate for re-election.

THE WASHINGTON (D. C.) TRACTION & ELECTRIC CO., last month voted to increase the number of directors from 10 to 20 members. The new directors are: John Joy Edson, S. W. Woodward, Albert A. Wilson, George H. Harris, and E. Southard Parker, all of Washington; G. B. N. Harvey, of New York, editor of the North American Review; Luther Kountze, of the New York banking firm of that name; John N. Dennis, New York, and Charles D. Dickey, of the banking firm of Brown Bros., Baltimore.

THE BROOKLYN RAPID TRANSIT CO. made a number of changes in its directorate at its annual meeting last month. The following directors were elected: Clinton L. Rossiter, Timothy S. Williams, Henry Seibert, John G. Jenkins, Horace C. Du Val, David H. Valentine, Anthony N. Brady, August Belmont, H. H. Porter, E. H. Herriman, Walter G. Oakman, Anson R. Flower, Frederic P. Olcott. The last six are new men, and they succeeded John M. Keiley, Seth L. Keeney, William C. Bryant, John Englis, Charles D. Meneely and Theodore F. Jackson. All of the directors retired were Brooklyn men.

READERS who note errors in our "Directory of Street Railways" will confer a favor by sending us corrections.

The Oakland (Cal.), San Leandro & Hayward Electric Railway Co. pays its conductors and motormen, 19 cents for the first year, 20 cents for the second, 21 cents for the third year, and 22 cents thereafter.

OBITUARY.

MR. JOHN McLEOD, receiver of the New Albany (Ind.) Street Ry., died January 22d, at Louisville, Ky.

MR. FRANK TRYON, JR., superintendent of the Huntington (N. Y.) Street R. R., died last month, at the age of 20 years.

MR. W. K. McALLISTER, formerly of Camden, N. J., superintendent of the Atlantic City (N. J.) Ry., died suddenly last month.

MR. EDWARD A. DURBIN, brother of Mr. C. K. Durbin, superintendent of the Denver (Col.) City Tramway, died January 22d. He was president and secretary of the E. A. Durbin Surgical & Dental Supply Co.

MR. JOHN QUINCY ADAMS HOYT, who was one of the promoters of the elevated railway system of New York, and prominent in business in Chicago and New York, died in the latter city, January 12th, aged 73 years.

MR. GEORGE C. HERSCHELL, treasurer of the Armitage-Herschell Co., North Tonawanda, N. Y., died on January 11th after an illness of four days. He was taken ill with a severe cold, which was followed by complications, causing his death.

Mr. HERBERT A. REEVES, of the Manville Covering Co., of Chicago, died last month, in California, after a short illness. Mr. Reeves formerly had charge of the western branch of the H. W. Johns Co. for over eight years, and when the Manville Covering Co. became the Western representative of that concern in April last, he was continued as manager of the business.

NEW PUBLICATIONS.

"UNIVERSITY OF TENNESSEE RECORD" for 1899 contains a number of valuable papers on technical subjects written by professors and graduates of the University of Tennessee, at Knoxville. The leading article is a description of the application of electric power in the shops of the university.

"THE COLLEGE QUARTERLY" is a new publication issued every three months by the students of the Working Men's College, at Melbourne, Australia. It is intended to be the official organ of this school, and contains articles on the value of a technical education, announcements and general college news. All the typesetting, press work, etc., is done by the students.

THE MULHALL-HARPER COMPARATIVE STATISTICAL TABLES AND CHARTS OF THE COMMERCE OF THE WORLD have been compiled by William Harper, chief of the Bureau of Information of the Philadelphia Commercial Museum, and published by the museum in a 6 x 9 in. pamphlet of about 50 pages. The charts are printed in colors, and give the comparisons sought in a very vivid manner.

THE CORNICE WORK MANUAL is an exposition of cornice work in all its branches, compiled from the files of the American Artisan, by Sidney P. Johnson, and published by the American Artisan Press, Chicago. This work has been issued in book form to meet a wide demand for a practical treatise on the working of sheet metal for architectural purposes; it is the first book on the subject published in 20 years and cannot fail of a hearty reception by the trade.

"CONDENSERS," by F. R. Low, has recently been issued by the Power Publishing Co., of New York. It is a reprint of a series of lectures and articles upon this subject which have appeared in the columns of Power, and comprises 80 pages. After a general discussion of the principles underlying all condensing apparatus, the author takes up the various types of jet condensers, surface condensers, injector or siphon condensers, and exhaust steam induction condensers, and concludes with a chapter on condenser capacities which comprises various rules and data for designing such apparatus. Tables of data concerning the principal makes of condensers increase the value of the work, which well deserves a

place in the library of every engineer. The book is bound in paper; price, 50 cents.

"PICTORIAL HISTORY OF THE LOCOMOTIVE" is the title of a collection of line drawings showing the evolution of the modern steam locomotive, commencing with the earliest model of Cugnot, of France, built in 1771, and illustrating the developments made by Watt, Murdock, Wm. Symington, Oliver Evans, Trevethick, Murray, Hedley, Stephenson and Hackworth, and the leading types built by more recent designers, including M. W. Baldwin, of Philadelphia; Rogers, Ketchum & Grosvenor, of Patterson, N. J.; William Norris and Garrett & Eastwick, of Philadelphia, and others. The collection was made by William Wright, and is now published in book form, with valuable data, by the Chicago Pneumatic Tool Co., Monadnock Block, Chicago.

LOW FARES IN SAN FRANCISCO.

On December 11th, last, two orders were introduced in the Board of Supervisors of San Francisco, in reference to street railway fares, one calling for the sale of 8 tickets for 25 cents for the use of school children between the ages of 5 and 17 years, when going to or returning from school and available between the hours of 8 a. m. and 5 p. m., but not on Saturdays, Sundays and legal holidays, and the second order providing for the sale of tickets at the rate of 7 tickets for 25 cents, available between 6 and 8 a. m. and 5 and 7 p. m. on each and every day except Sundays. Any person, company or corporation operating street car lines in San Francisco and neglecting or refusing to comply with either of the orders to be deemed guilty of a misdemeanor, and on conviction to be punished by a fine of not less than \$100 and not more than \$500, or imprisonment in the county jail for not more than six months, or by both such fine and imprisonment.

The orders were passed to print and referred to the judiciary committee. Several meetings of the judiciary committee were held. The only railway companies to make an appearance were the San Francisco & San Mateo Electric Ry., represented by Mr. W. Clayton, its secretary, the Presidio & Ferries Ry., represented by Mr. Geo. A. Newhall, its president, and the Sutter Street Ry., represented by its secretary, Mr. A. K. Stevens. All but the first meeting of this committee was attended by a large number of conductors and motormen from all the roads in the city. The men made their own fight, realizing that reduced fares would inevitably result in lower wages. They introduced a petition containing 4,000 signatures of street car employes, protesting against the reduction, and this probably had more weight with the judiciary committee than any argument advanced by the railway companies themselves.

Finally, the passage of the orders was indefinitely postponed in committee by two votes to one, mainly on the grounds that the reduction would probably lead to a lower scale of wages for street car employes.

On January 8th the new charter took effect, and the mayor, in his address, suggested that the new board take the question up again, and it is probable the controversy will be renewed.

REPORT OF MAINE RAILROAD COMMISSIONERS.

The 41st annual report of the Railroad Commissioners of the State of Maine, just issued, contains a financial report from each street and steam railroad in the state for the year ending June 30, 1899. There are 20 street railway companies doing business in Maine, and these operate 240 miles of track. The total receipts for all roads for the year named were \$1,090,418; operating expenses, \$686,420; net earnings, \$403,998; passengers carried, 18,496,374.

A scheme for the consolidation of the Monongahela (Pa.) Street Railway Co., the Wilkesburg & East Pittsburg Railway Co., and the Wilmerding & East Pittsburg Railway Co., is under way.

A car belonging to the Peoples Electric Street Railway Co., of Rochester, Pa., on January 25th ran away down a steep grade, left the tracks at the foot and crashed into the front of a barber shop, killing a boy who was playing in front of the building.

CHICAGO UNION TRACTION CO.

The Chicago Union Traction Co. will publish no complete report until the end of its fiscal year, June 30th. The gross earnings for the seven months this company has controlled the property and for the corresponding months of the previous year are:

	1899-1900.	1898-9.	Increase.
July	\$653,811.60	\$612,392.19	\$41,483.41
August	672,049.55	612,764.02	59,285.53
September	633,253.80	605,900.28	27,353.52
October	679,039.80	623,194.15	55,845.65
November	608,836.45	563,710.43	45,126.02
December	621,614.90	587,979.11	33,635.79
January	587,020.70	531,657.71	55,362.90

Seven months ..\$4,455,626.80 \$4,137,534.89 \$318,091.91
 Percentage increase seven months..... 7.68

CLEVELAND CITY RY. ASKS EXTENSIONS.

The Cleveland City Ry., generally known in Cleveland as the Little Consolidated, on January 22d made a proposition to the city which has only recently been given to the public. The principal points are: The company asks that its franchises be extended so that they will all expire in 1925, instead of at various dates between 1908 and 1918; it will assume the duty of paving 16 ft. of the streets where it has double tracks; it will pay 17½ per cent (one-half the city's share) of the cost of abolishing certain grade crossings, and contribute in cash a sum sufficient to make its total cash payments \$200,000; beginning with 1908 the company will pay the city 2 per cent of its gross receipts for the first five years, 3 per cent for the second five years, 4 per cent for the third five years and 5 per cent for the remainder of the term; the fare to be 5 cents cash or 6 tickets for 25 cents.

ICE-CUTTING TROLLEY WHEEL.

A device for removing ice and sleet from the trolley wire is shown herewith. The essential features are a ribbed skeleton wheel of ordinary size carried on a short arm, which is so mounted on the main trolley pole as to cause this sleet cutting skeleton wheel to travel a little in advance of the regular trolley wheel, thus securing good electrical contact for the latter. A two-part clamp is permanently attached to the trolley pole, and is provided with a swiveled socket and lug, so that the short arm with its wheel can be readily adjusted in case of a storm; it is carried when not in

use under the car seat. A spiral spring serves to hold the cutting wheel firmly against the wire, as shown in the engraving.

The wheel is cast in two parts, with staggered ribs on the inner surfaces, and is provided with openings to allow the ice to escape. This wheel is attached to a harp in the ordinary manner, which in turn is securely fastened to the short arm, which may be of wood or metal, and does not add materially to the weight of the pole. The device is the invention of P. H. Gilbert, Scranton, Pa.

IMPORTANT TAX DECISION.

The Court of Appeals of Ontario has rendered an important decision in which it is held that the roadbed of a street railway is not for the exclusive use of the railway and is therefore not assessable for taxation.

The Boston Elevated Ry. has secured locations in Brookline for four new lines which will enable it to take passengers from the Newton line and carry them to practically any part of the metropolitan district for 5 cents. The Boston & Worcester road was a rival applicant for locations in Brookline.

ECHOES FROM THE TRADE

READERS who note errors in our "Directory of Street Railways" will confer a favor by sending us corrections.

THE BARNEY & SMITH CAR CO. has recently completed its cars for the Dayton, Springfield & Urbana (O.) interurban line.

SARGENT & LUNDY, Monadnock Block, Chicago, are mechanical and electrical engineers for the Union Traction Co. of Indiana, whose system is described on page 66 of this issue.

THE CO-PARTNERSHIP of Gates & Randolph, of Chicago, was dissolved on January 23d, and W. E. Mack has been appointed to close up the business and will pay all bills and receive all money due the firm.

THE NATIONAL CARBON CO., of Cleveland, O., is out with a wall calendar bearing a view of the company's works, and calling attention to its various products. A lighting schedule appears on the sheet for each month.

ANOTHER SHIPMENT of supplies for the Sao Paulo (Brazil) Tramway, Light & Power Co. was made on January 19th. The Lorain Steel Co. had sent a lot of special work and the Walworth Manufacturing Co., pipe and bracket fittings.

THE PARTRIDGE CARBON WORKS, of Sandusky, O., emphasizes the fact that Partridge carbons are "always on top" with a calendar for 1900, on which is a large view of Niagara Falls, with Partridge motor brushes floating on the water.

THE LEADING ARTICLE in Graphite for January is on the protection of galvanized ironwork and the relative value for this purpose of Dixon's silica-graphite paint and red lead. Some strong testimonials from users of paints for exposed iron work are given.

THE DUFF MANUFACTURING CO., of Allegheny, Pa., has been successful in suits brought against a number of jack makers, for infringement of patents, and now owns well sustained ground patents for jacks of all styles made on the general principle embodied.

THE CLING-SURFACE MANUFACTURING CO. has recently issued an interesting folder showing nine half-tone illustrations of power plants where this popular compound is in use, each view is accompanied by a strong letter of recommendation from the engineer in charge.

THE CHICAGO PNEUMATIC TOOL CO., Monadnock Block, Chicago, has published a second edition of its catalog No. 6, containing reproductions from photographs showing its various pneumatic riveters, hammers and drills each doing the work for which it was designed.

THE CENTRAL ELECTRIC CO. reports an increased trade in all lines of electrical goods. Two classes of articles for which the demand has been particularly strong are circular looms and electro carbons, and the company has laid in large supplies of both lines and is prepared to fill all orders promptly.

M'KEE, FULLER & CO., of Catasauqua, Pa., owners of the Lehigh Car, Wheel & Axle Works, report an increasing demand for their products, which include car wheels, both steel tired and cast iron with chilled tread, for all kinds of railway service, axles, hammered or rolled, of both iron and steel, also all kinds of cars for freight or mining purposes.

THE ARMITAGE-HERSCHELL CO., of North Tonawanda, N. Y., is fully prepared to meet the early spring demand for its park attractions, consisting of riding galleries, mountain valley rail-

ways and other amusement novelties. The same policy will be pursued by this company as in the past, of furnishing goods that are thoroughly first class, both as to material and workmanship.

THE FIRM OF Littlefield & Meyersburg, of Chicago, has been dissolved. Mr. Andrew S. Littlefield has been appointed Western selling agent of the Lorain Steel Co., of Lorain, O., and Johnstown, Pa., and will be pleased to receive inquiries and orders for girder and high T-rails, track special work, du Pont truck and electric motors. He will have offices in the Monadnock Block, Chicago.

THE STANLEY ELECTRIC MANUFACTURING CO. has been organized to take over the property at Pittsfield, Mass., of a company with the same name. The Stanley plant, which was recently purchased by the John A. Roebling's Sons Co. will be greatly extended, and the business carried on, on a much larger scale than formerly. The new company is composed of officials of the Roebling company.

THE AMERICAN STEEL & WIRE CO. has published a balance sheet showing profits for the year 1899 to be \$13,362,529. Of this \$1,000,000 has been written off for depreciation, and deducting 7 per cent on the \$40,000,000 of preferred stock leaves \$9,362,529, which is 18.7 per cent on the common stock. A dividend of 7 per cent on the common stock was declared on January 29th, payable in quarterly installments.

THE SIEGRIST LUBRICATOR CO., of St. Louis, advises us that the McCormick Harvesting Machine Co., of Chicago, Ill., after a personal inspection of the Siegrist automatic oiling system at the power house of the Metropolitan West Side Elevated Railway Co., of Chicago, and a thorough investigation of all other oiling devices has awarded the Siegrist Lubricator Co. the contract to equip its two new power houses with the latter's automatic oiling system.

THE BURT MANUFACTURING CO., of Akron, O. has recently received an order for four 90-gallon Cross oil filters from the Metropolitan Electric Supply Co., of London, England, one of the largest electrical concerns in the British Empire. The British Government has also been a large buyer of these goods during the past year. Among home orders received by the Burt company recently is a large duplicate order for filters from Thos. A. Edison.

THE GATES & MACK CO. has opened an automobile emporium at 394 and 396 Wabash Ave., Chicago, where a number of Waverly electric carriages, steam locomotives, Haynes-Apperson automobiles, gasoline and other styles of motor vehicles are on exhibition. Visitors will be made cordially welcome. J. Holt Gates & Co., at 15 Monadnock Block, are carrying on the railway generator business of the Triumph Electric Co., of Cincinnati, O., and the alternating current business of the Warren Electric Co., of Sandusky, O.

E. W. SELKIRK, 849 North Kedzie Ave., Chicago, is serving many street railways in a very important matter, which has troubled the smaller roads a great deal. He is an experienced car painter, and has a trained force of assistants. Such medium sized roads as cannot afford to operate a paint shop of their own the year round, are obliged to call in local painters once or twice a year, and while such may be first class in painting houses and buildings, every railway man knows what an entirely different proposition car painting is. It is not so much in the first appearance when the work is finished that local painters fail, as in the knowledge of what to use and how to apply it for the severe service on cars. Mr. Selkirk already serves a fine line of roads around Chicago, whose cars he keeps protected and presentable. Managers can secure this work

by the day, or by contract by the year; also furnishing their own material if so desired.

ARRANGEMENTS FOR THE CONSOLIDATION of the following electric car lighting and equipment companies were made on January 25th: Electric Axle Light & Power Co., Columbian Electric Car Lighting & Brake Co., American Railway Electric Co., United Electric Co., Lindstrom Brake Co., and Railway Triplex Ticket Co. The new company is incorporated under the law of New Jersey, with a capital stock of \$16,000,000, and will be known as the Consolidated Railway, Electric Lighting & Equipment Co. Isaac L. Rice is president.

ADAM COOK'S SONS, of New York, have received the following letter from Chas. E. Waddell, superintendent of the street railway lines at Asheville, N. C., which speaks for itself: "In reply to your inquiry about the result of the Albany grease, will repeat that I told you I was no stranger to Albany grease and liked it very much; the grease was put in one of the motors on its arrival and the boxes have only required replenishing about every 15 days, and I find that it effects a great saving in lubricants, at the same time giving satisfaction."

THE CLING SURFACE MANUFACTURING CO., of Buffalo, N. Y., has just been incorporated under the laws of the state of New York, retaining the same name as heretofore, with Albert B. Young as president and general manager and Wm. D. Young, vice-president and secretary. The past year has been the most prosperous in the history of the company and the demand for "Cling-Surface" is reported to be increasing steadily. The company has now three branches, one each in Boston, New York and Chicago, with others just opening in St. Louis and New Orleans, while the well-known importing house of W. J. Moxham & Co., of Sidney, Australia, has ordered a large shipment of "Cling-Surface" with the exclusive right to handle it in Australia.

THE SCARRITT FURNITURE CO., of St. Louis, is now filling an order for 2,800 Scarritt reversible-back rattan covered double seats to be placed in 140 cars built for the St. Louis Transit Co. by the St. Louis and the Laclede car companies. Within the past few months the Scarritt company has received a great many smaller orders for both steam and street railways. There are two features of the Scarritt seat which particularly commend it to passengers, the resilient cushions and the three-ply veneer covering rear of the seat back and effectually preventing the person occupying the seat from being discommoded by the knees of the person in the seat behind. This discomfort is one that is too often met with in cars not equipped with this company's seats.

THE B. F. STURTEVANT CO., of Boston, is receiving daily testimonial letters from its customers expressing satisfaction with the apparatus which it has supplied. One from the Frost & Wood Co., of Smith's Falls, Ont., in reference to a Sturtevant exhaust head reads: "Allow us to add that we have never paid with greater satisfaction an account for an article of this description, than we paid for your steam exhaust head. It has given us great satisfaction, and we would not be without it for several times what it cost. It should prove invaluable to steam users in a cold climate. Previous to using this we were greatly bothered with an accumulation of ice from the exhaust spray. This has now been entirely overcome."

STRIKE AT TROY, N. Y.

On January 21st about 250 men employed on the Troy division of the United Traction Co., operating the street railways in Albany and Troy, went out on a strike, causing a total suspension of traffic on the Troy lines.

A settlement was effected January 29th on the following basis: Committees of employes always to be heard touching any grievance. Employes of the Troy division to be allowed to ride free on showing their badges. Wages to be 20 cents an hour for regular car crews and 18½ cents for other trainmen. In cases of suspension, an appeal is to lie to the executive committee of the company. The wage scale is a compromise.

FOREIGN FACTS.

The Light Railways Act of 1896 will expire in 1901.

A system of electric trams may be built at Karachi, India.

The Madras (India) Electric Tramways will probably be purchased by the city corporation.

The new electric tramway system on the Woodside route at Aberdeen was opened recently.

Speed indicators are to be placed on the cars of the Dublin (Ireland) United Tramways.

The Rockdale (Eng.) Corporation has asked Parliament for permission to build 18 miles of new electric lines.

Tramways for Warrington, England, have been proposed and the Town Council is applying for powers.

The Yarmouth (Eng.) Town Council wishes to purchase 800 tons of steel rails and other tramway supplies.

The St. Helens Tramways, of St. Helens, Lancashire, England, will borrow £45,000 to spend in tramway extensions.

The Garston (Eng.) & District Tramways Co. has been formed to build an electric tramway in the village of Garston and vicinity.

Automobile buses have made their appearance in London. They run from Kennington to Victoria, and carry 12 passengers inside and 14 outside.

Experiments are being carried on at Antwerp, Belgium, to determine the economy of equipping railroad lines centering in that city with electricity.

Tramways at Berlin report having considerable trouble with snow and ice last month, and had to employ 1,000 extra men to get the lines into running order.

The Acton (Eng.) City Council objects to the plans of the London United Tramways Co. for tramway extensions in the district, on the ground that the streets are too narrow.

The Manchester (Eng.) & Liverpool Electric Express Ry. has been organized to build electric tramways 34 miles in length between the two cities named in title.

There has been a hitch in the negotiations for an electric railway to run from Manchester (Eng.) to Liverpool, owing to the attitude of the Irlam District Council.

A concession has been asked for by La Societa delle Tramvie Ferrovie Elettriche de Roma, of Rome, Italy, for an electric railway to run between Taranto, Manduria and Lecce, Italy.

District Councils of Guisely, Horsforth, Rawdon and Yeadon, England, have opened negotiations with the Leeds Corporation looking to the extensions of the electric tramways in those districts.

Press dispatches from Berlin announce that the Berlin Elevated Railroad Co. intends to provide Berlin with an electric elevated railway similar to that in operation in Chicago. The cost will be 43,000,000 marks.

It is proposed to build a continuous line of electric railways to connect the states of Tabasco, Yucatan, Chiapas and Campeche, in Mexico, with the railroad system of Central Mexico. The states through which the line will run, will be asked to give subsidies, in addition to the \$6,000,000 said to have been promised by the federal government, to defray the cost, which is estimated will be about \$14,000,000. The road will be known as the Southern National & International, and, if built, will be about 400 miles long.

HALF FARES.

Ice on the trolley wire badly crippled the service of the Rochester (N. Y.) Railway Co. for a day last month.

The snow and sleet storm on February 3d compelled the Lake Street Elevated, Chicago, to suspend traffic at 11 p. m.

The Rome (N. Y.) City Electric Ry. last year operated at a gross loss of \$5.48; fixed charges increased this amount, making the net loss, \$614.

Three motormen on the Cleveland Electric Ry. were arrested last month for violating the speed ordinance, and were fined \$5 each and costs.

The Negaumee (Mich.) & Ishpeming Street Railway & Electric Lighting Co. has declared its first dividend; it is at the rate of 4 per cent per annum.

Owing to the smallpox scare in Missouri, the electric cars running from Independence to Kansas City, and the cars in Kansas City are being thoroughly fumigated.

On January 30th, a runaway car on the Dayton (O.) & Xenia Traction Co. jumped the track and was hurled several feet. Two passengers were killed and four injured.

The Union Traction Co., of Philadelphia, voluntarily increased the pay of motormen and conductors from 16 2-3 cents per hour to 18 cents per hour, to take effect February 1st.

Mayor Hayes, of Baltimore, has drafted a bill for the Legislature providing for the appointment of a franchise commission, which is to keep the state advised as to the rights of corporate bodies, especially street railway companies, and is to have super-

vision of the rates of fare charged by street railways. The mayor has stated he will favor a bill providing for six tickets for a quarter.

Through errors of clerks in the tax office, the street railway companies of Chicago were assessed for 1900, several hundred thousand dollars more than they should have been.

Sam Jones, the evangelist, has been invited to speak at a park owned by the street railway company at Columbus, O. Other noted revivalists will hold services at the park from time to time.

The Birmingham (Ala.) Railway & Electric Co. will at once rebuild its car shops and barn recently destroyed by fire. J. M. Morgan & Co., local contractors, will construct the new buildings.

All the trainmen on the Cedar Falls division of the Waterloo (Ia.) & Cedar Falls Rapid Transit Co. went on strike last month, when the company appointed a new superintendent for the division.

A contract for the erection of new car barns and repair shops at Bowling Green, O., has been given to James Turnbull, of Toledo, by the Toledo, Fremont & Bowling Green Electric Ry. This will cost about \$5,500.

During the intensely cold weather at the beginning of this month the Toledo (O.) Traction Co., at its own expense, established stations along its lines where its employes could stop and obtain hot coffee and sandwiches.

The receiver of the Duluth (Minn.) Street Railway Co. has filed his statement concerning the company for the quarter ending Dec. 31, 1899. It shows receipts from all sources of \$73,376.38, and total disbursements, including fixed charges, of \$95,016.76, which, with the surplus of \$31,612.59 carried forward from the previous quarter, leaves a surplus of \$9,072.21. Among the disbursements are no-

ticed the following items: Strike, \$330.90; bridge tolls, \$2,712.22; accidents, \$1,122.18; fuel, \$6,433.59; legal, \$165; detective service, \$887.92.

In response to a petition from its employes, the Elgin (Ill.), Carpentersville & Aurora Railway Co. has increased wages of regular motormen to \$1.75 per day, regular conductors to \$1.05 per day, and extras to \$1.55 per day.

The Ft. Wayne (Ind.) Traction Co. has issued laboring men's ticket books of 100 rides for \$3.50, good between the hours of 6 and 7 a. m. and 5:30 and 6:30 p. m., and citizens' ticket books of 100 rides for \$4., good at all hours.

The Central Labor Union, of Louisville, Ky., has undertaken to strengthen the position of the street railway employes' union, by resolving that no member of any labor organization should ride on a street car not manned by a union crew.

A company has been formed to generate electricity at the falls of the River Cellina and River Piave, Italy, and transmit the same to Venice. The prime movers in the enterprise are Counts N. and A. Papadopoli, of Venice, and Commendatore Giuseppe Da Zara, of Padua.

The mail cars which have heretofore run on the North Side cable lines of Chicago are to be replaced in the near future by handsome cars on the electric lines which it is expected will make a great improvement in the local mail transportation between the post office and the sub-stations.

The Union Traction Co., of Philadelphia, pays a car tax of \$50 for each car it owns, and in addition \$50 for each car that crosses city bridges over the Schuylkill River. The company, January 27th, sent a check for \$82,500 to the collector of taxes, covering the licenses on 1,500 regular cars and 155 bridge cars for 1900.

Mrs. Mary T. Leiter has filed a petition for an accounting by the Metropolitan Street Railway Co., of Washington, in which she is a stockholder. The control of the Metropolitan was acquired by the Washington Traction & Electric Co. last year, and the petitioner asks that the relations between the two companies be made public.

The United Traction Co., of Albany, N. Y., has taken up all passes on the lines formerly owned by the Troy City Ry., and not even policemen will be allowed to ride free. The Albany Ry. never issued passes. A new rule has also gone into effect on the entire system prohibiting passengers from riding on the front platforms of closed cars.

The Union Traction Co., of Anderson, Ind., has purchased 160 acres of ground near Fortville and will probably lay out a pleasure park. The property is said to contain large deposits of good gravel. It is also stated the company is negotiating for the purchase of a prominent corner lot in the city and will erect a building for depot and other purposes.

Ninety-four employes of the Worcester (Mass.) Consolidated Street Railway Co., that have served the company for five years or more, received an increase of 10 per cent in their wages commencing January 17th. The increase is from 20 cents to 22 cents per hour. The car crews work from nine hours to nine hours and twenty minutes a day.

Complaints have been made against the Metropolitan and Third Avenue roads and the Manhattan Elevated, of New York City, for violation of the ordinance requiring all cars to be heated when the temperature is below 40° F. Inspectors of the Board of Health found an occasional car on each of the systems that was not heated according to requirements.

A head-end collision occurred on January 19th between two cars on the Lockport division of the International Traction Co., of Buffalo, N. Y.; the time was 10:30 a. m., the cars being invisible because of a dense fog. All four of the men constituting the crews

were injured, one of the motormen perhaps fatally; in addition to these, a passenger was slightly injured.

The conductor on a car belonging to the Second Avenue Traction Co., of Pittsburg, was held up at the point of a revolver on the night of January 25th. He had gone ahead of the car to inspect a steam road crossing, as required by the rules of the company, when a burly negro stepped from the shadow and demanded money. The conductor called for help and succeeded in frightening the highwayman away.

The McKeesport (Pa.) City Council has been asked for a certain right of way by the McKeesport, Duquesne & Wilmerding Street Ry. The Council will pass the ordinance providing the company will give 33 tickets for a dollar, a tax of \$25 a year per car for the first five years, and \$50 a year thereafter, a bonus of \$5,000, and will promise to clean and repair the streets through which its tracks run.

Mayor Hayes, of Baltimore, has written the United Railways & Electric Co., stating that the treasury officials are greatly annoyed by the constantly recurring bills for car fare charged against the city by its employes who use the street cars in riding to and from work at distant points. He suggests that the company honor tickets prepared and issued by the city, and which could be paid for by the city at the end of every quarter, or at any time agreed upon.

An ordinance has been introduced in the city council at Louisville, Ky., making it unlawful to employ any motorman who has not had three weeks' training on cars in the city. For employing one not trained, the employer is subject to a fine of \$10 to \$20 for each offense, and the employed motorman is to be fined from \$5 to \$10. The avowed object of the framer of the bill is to prevent the importation of green men should there be a strike on the local lines.

Under a contract made last month between the Metropolitan Street Ry., of Kansas City, Mo., and the Kansas City & Leavenworth Electric Ry., passengers will be transferred from the cars of either road, to the cars of the other without extra expense, and the two companies will build a joint depot in Kansas City, Kan. As transfer arrangements have been made with the local system in Leavenworth, it is possible to ride from any point in Leavenworth to any point in Kansas City for one fare—but this is not a 5-cent fare.

Slippery rails were given as the cause of a slight accident, January 20th, on the Druid Hill Ave. line of the United Railways & Electric Co., Baltimore. A north bound car and a west bound car had stopped at the near crossing of two intersecting streets to discharge passengers, and both started forward at the same moment, the condition of the rails preventing either motorman from stopping after he had seen the other's action. The north bound car was struck in the center and thrown over on its side. No one was seriously injured.

It is believed that miscreants deliberately threw open a switch on the Detroit Rapid Ry. last month, with the intention of causing a wreck. A car running from Detroit to Mt. Clemens at high speed struck the switch and was hurled against a tree at the side of the track, injuring several passengers, but killing no one. Some time ago, near this same point, it was discovered that someone had thrown a heavy wire over the trolley wire, and attached the other end to a trolley pole, grounding the line in such a way as to make it very difficult to discover the trouble.

The Metropolitan Street Railway Co., of Kansas City, has been carrying letter carriers on its cars for six months without receiving compensation for the service owing to the delay on the part of the postal authorities in signing a contract. In former years the United States Government has paid the company \$3,000 a year for transportation for the carriers, but the system having been greatly extended and the number of carriers increased, at the expiration of the contract last year the company asked \$4,000 for the service. No contract was concluded, however, and carriers have been riding free ever since, through the courtesy of the company.

NEWS NOTES.

ALBANY, N. Y.—It is reported that the United Traction Co. will purchase 25 new open cars and 35 box cars. Improvements of the Troy car house and power house and the tracks of the Troy division will be effected. R. C. Truyn, Albany, president.

ALLENTOWN, PA.—The Lehigh Valley Traction Co. (A. F. Walter, secretary,) has purchased the Bethlehem & Nazareth Passenger Ry. (10 miles long) and the Bethlehem electric light plant.

AMSTERDAM, N. Y. Preliminary surveys are being made for the proposed line to connect Amsterdam with Saratoga and Ballston. A. B. Paine, of New York, is at the head of the engineering corps.

ASTABULA, O.—The Fairport & Youngstown Railway Co., of Astabula, has been incorporated with a capital stock of \$30,000 to build an interurban road. J. McCrea, R. F. Smith and C. T. Brookes are among the promoters.

ATLANTA, GA.—The Collins Park & Belt Railroad Co. has purchased land on which a new car house will be erected. The car house will accommodate 25 cars, and a portion of the building will be reserved for repair shops. Address A. M. Atkinson.

BEAVER FALLS, PA.—Harry W. Reeves, of Beaver Falls, H. C. Eagle, Henry Fitzpatrick and Charles H. A. Deems are promoting a line to be constructed between Vanport, Pa., and East Liverpool, O. Charters have been applied for in both states, and when grants shall have been secured construction will begin without delay.

BELVIDERE, ILL.—It is reported that the Belvidere electric plant has been purchased by Edwin Magill of the Sycamore & DeKalb Street Railway Co. (De Kalb) and two others. Improvements will be made in the plant and a railway perhaps extended from De Kalb to Belvidere.

BLOOMINGTON, IND.—Contracts will be awarded in the early summer for the construction of the Columbus, Bloomington & Terre Haute Ry. Surveys for the line, which will be 91 miles long, have been completed, and competitive bids will soon be in order. Edwin S. Brodix, Bloomington, president.

CATONSVILLE, MD.—The Baltimore, Halethorpe & St. Denis Railway Co. has secured a franchise to build a railway from Catonsville to a point near St. Denis. A bond of \$10,000 has been filed with the county commissioners as an earnest that the construction of the line will be commenced in one year and completed in two years. Oregon R. Benson, Catonsville, president.

CHARLOTTE, MICH.—W. P. Engel, for the past five years in control of the Charlotte Electric Railway Co., has sold the line to Hugh A. Holmes, of Detroit, and John C. Farrer, of Brighton, for \$40,000. The new owners have filed articles of incorporation, and will be known as the Charlotte General Electric Co., with a capital of \$50,000.

CHICAGO, ILL.—The South Side Elevated R. R. will within six weeks order 30 new passenger coaches or make arrangements for building them itself.

CLEVELAND, O.—An extension of the Cleveland, Berea, Elyria & Oberlin Railway Co.'s line will be constructed from Elyria to Amherst, and later to Wellington. When the extensions shall be built the railway will aggregate 65 miles. It is also reported that a new power house will be built at Elyria. F. T. Pomeroy, manager. Office, Cleveland.

CLINTON, MASS.—The Railroad Commissioners have approved of an increase of \$100,000 in the capital stock of the Clinton & Hudson Street Railway Co. for the purpose of building and equipping the proposed railway. Alexander S. Paton, of Leominster, W. R. Dame, of Clinton, and William H. Tybee, Worcester, directors.

COLUMBUS, O.—The Lancaster & Newark Traction Co., of Columbus, has been incorporated by E. Rowles, F. S. Monnette, E. Kibler, W. D. Guilbert and S. B. Campbell.

DANIELSON, CONN.—The Providence & Danielson Railway Co., with a capital stock of \$300,000, has been incorporated to build an electric line between the cities named in its title. F. P. Owen, Geo. W. Prentice and Joel Hay are promoters of the enterprise.

DAYTON, O.—The Dayton & Xenia Traction Co. will issue 1,000 bonds of \$300 each. The proceeds will be used for the purchase of new equipment. C. J. Ferneding, president.

DAYTON, O.—The Dayton & Troy Street Railway Co. has been incorporated with a capital stock of \$30,000 by J. M. Wilson, W. L. Caten, R. L. Worrell, L. G. Reynolds and Thomas B. Herrman, and will build a line between Dayton and Troy.

DAYTON, O.—It is reported that the Dayton & Western Traction Co. is considering the improvement of its rolling stock. Cars equipped with four 35-h. p. motors and automatic air brakes are wanted. Purchases to amount to \$12,000 will be made. Y. Winters, president.

DE KALB, ILL.—The Sycamore & De Kalb Electric Railway Co. has obtained a franchise and will construct an interurban line within two years. Address Edwin Magill, De Kalb.

DETROIT, MICH.—The Rochester & St. Clair Railway Co. has been incorporated with a capital of \$150,000, by F. C. Andrews and E. H. Parker, of Detroit, and J. R. Whiting, of St. Clair.

DETROIT, MICH.—A third rail interurban line from Detroit to Ann Arbor via Belleville and Ypsilanti is projected. Rights of way between Detroit and Belleville have been obtained, and the projectors have applied for further grants. Address Milton Carmichael, Detroit.

TERRE HAUTE, IND.—The sale of the Brazil (Ind.) Rapid Transit Ry. to the Terre Haute Street Railway Co. is reported. It is said that the purchase price was \$50,000, and that the line will be improved and new equipment purchased. Supt. C. B. Kidder, of the Terre Haute company, may be addressed.

DOVER, DEL.—The Delaware Electric Railway Co. has been granted permission to construct a line from Dover to Woodland Beach. Address John D. Hawkins. It is also stated that the council has accepted the \$10,000 bond of the Delaware General Electric Railway Co. to begin the construction of the projected line through Dover within nine months.

DOYLESTOWN, PA.—Judge Yerkes has issued a decree for the sale of the Bucks County Ry., operating between Doylestown and Willow Grove. The Doylestown Trust Co. has been acting as receiver for the railway company. The sale will take place at the Philadelphia Bourse March 14th, and the property, including rolling stock, machinery, etc., will be sold to the highest bidder.

EAGLE PASS, TEX.—A company has been organized and stock subscribed by capitalists of Eagle Pass for the construction of a 15-mile tramway from Nava to Zaragoza, Coahuila, Mexico.

ELKTON, MD.—It is stated that Senator Crothers will introduce a bill in the Senate to have the \$58,000 standing to the credit of Cecil County transferred to the Elkton & Chesapeake City Electric Railway Co. A line to connect Elkton and Chesapeake City will be constructed if the transfer be effected.

FALL RIVER, MASS.—The Fall River, Myricks & Middleboro Air Line Street Railway Co. has been organized with a capital stock of \$50,000 to build an interurban line in southern Massachusetts. The directors are Byron B. Grinnell, Frank A. Rouse and Albert M. Field, of Taunton, Mass., and Silas P. Richmond, N. W. Davis, G. M. Nichols and Charles A. Briggs, of Freetown.

FINDLAY, O.—The Findlay Street Railway Co. is considering the question of installing a heating system to enable it to sell steam heat to offices and residences near the power station. Chas. Smith, superintendent, will be glad to receive information as to the cost of building and operating such a plant.

FOND DU LAC, WIS.—W. E. Cole, secretary of the Fond du Lac Street Railway & Light Co., has purchased suburban property which will be improved for a park. The railway will be extended to connect with the park.

FORT WORTH, TEX.—Col. J. T. Voss, president of the Glenwood & Polytechnic College Street Railway Co. and Pres. G. Van Ginkel, of the Dallas Consolidated Street Railway, project an electric line to be built between Dallas and Fort Worth, 30 miles distant. Construction will soon begin. Some of the equipment is already ordered.

FRANKLIN, PA.—Hon. W. H. Forbes is reported to have consummated the long pending sale of the Franklin electric railway to the Citizens' Traction Co., Oil City. The line will be extended to Oil City and Rocky Grove, in the spring.

GALESBURG, ILL.—The franchise contest in Galesburg is ended, the Galesburg & Monmouth Rapid Transit Co. accepting the franchise ordinance as finally passed by the council. A bond of \$10,000 will be filed by the company to assure the construction of the line during the present year. Fred Seacord, president.

GLOUCESTER, MASS.—The Gloucester Street Railway, the Gloucester, Essex & Beverly, the Rockport Street Ry. and the Gloucester & Rockport Street Rys. have been merged into one corporation known as the Gloucester Street Railway Co. Address W. A. Larrabee, Essex.

GRAND RAPIDS, MICH.—Ben S. Hanchette, of the Grand Rapids Consolidated Street Railway Co., is said to be associated with Messrs. Strong, Campbell, Law and Barrett, of Detroit, in promoting the line that will be constructed between Grand Rapids and Holland, in the spring. The Grand Rapids, Holland & Lake Michigan Rapid Railway Co. has been formed with a capital of \$500,000. Mr. Hanchette is en route for Detroit to confer with the other promoters concerning the purchase of material.

GREENVILLE, S. C.—The Greenville Traction Co. is considering the building of a new car house. J. H. Dawes, manager.

HAMILTON, ONT.—The Hamilton Radial electric railway will be extended to Oakville. This line is operated by the Cataract Power Co. Address John Patterson, Hamilton.

HEMPSTEAD, N. Y.—The New York & Nassau County Railway Co., capitalized at \$500,000, has been incorporated at Albany, and will build a seven-mile electric line from Hempstead to the village of Queens. It is understood that the company is backed by New York & Queens County R. R., the New York & North Shore R. R. companies and the Whitney-Elkins-Widener syndicate.

HOLLAND, MICH.—A recent fire destroyed the entire rolling stock, comprising 11 cars and a freight motor and the car barn of the Holland & Lake Michigan Electric Railway Co. The loss is estimated to approximate \$40,000. M. J. Kinch, superintendent.

HOOSICK FALLS, N. Y.—The Bennington & Hoosick Valley Electric Railway Co. will erect a new power house. G. E. Green, president.

HUNTINGTON, IND.—An electric line to be built between Huntington and Portland is being promoted by Mayor Z. T. Dungan, City Attorney J. Fred France, Isaac F. Beard of Huntington, and others. Bonds for \$500,000 will be issued to provide for construction and equipment.

ITHACA, N. Y.—The Ithaca Street Railway Co. is in the market for a good sized merry-go-round, either new or second hand, with a good organ. This company would also like to correspond with the manufacturers and agents of penny and nickel-in-the-slot machines, and vending machines, with a view to purchasing. J. A. Mortimer, secretary.

JEFFERSONVILLE, IND.—The Jeffersonville City & Suburban Railway Co. has been incorporated with a capital stock of \$25,000. The directors are Thos. W. Scott, Charles W. McGuire, Oscar C. Barth, Robert W. Morris, Henry F. Elosse, Earl S. Gwin and Harry W. Heath.

KANSAS CITY, MO.—The East Side Electric Railway Co. is the market for to new or second hand open summer cars. The cars should be in serviceable condition, have single trucks and be equipped with two motors or should have trucks on which could be mounted two motors. The company desires to know the price f. o. b. point of shipment. Terms will be cash. Address W. O. Hands, manager.

JACKSONVILLE, FLA.—The Jacksonville Street Railway Co. and a new company of which Walter C. Nelson and George W. Riggs, of Chicago, are the principal stockholders, are competing before the council for the street railway rights in Jacksonville. It is said that the council will probably favor the Jacksonville Street Railway Co. D. F. Jack, Savannah, Ga., president.

JOPLIN, MO.—F. W. Brees, of Macon, Mo., is promoting a line in Joplin, which he may later extend to Galena, Baxter and neighboring towns. J. F. Schaber represents Mr. Brees. A franchise will be applied for.

KNOXVILLE, PA.—A charter has been issued to the Summit Street Railway Co. to build a line in Knoxville. William Grimm, R. R. Grimes and C. D. Lockwood, directors.

LA CROSSE, WIS.—The La Crosse Street Railway Co. is considering the extension of its system within the city. Peter Valier, manager.

LANCASTER, PA.—The Lancaster, Mechanicsburg & New Holland Electric Railway Co. has been granted a charter and will proceed to construct a 14-mile line. The company has a capital stock of \$150,000. William B. Given, Columbia, president.

LENOX, MASS.—It is understood that an electric third rail extension will be made by the New York, New Haven & Hartford R. R. from Pittsfield through Lenox, Lee and Stockbridge to Great Barrington. The project is in opposition to that of the Pittsfield Electric Street Railway Co. to extend its lines to Lenox. N. H. Heft, electrical engineer of the N. Y., N. H. & H. may be addressed at Hartford.

LEWISBURG, PA.—J. W. Zellers, of Lewisburg, is reported to be seeking a franchise for an electric line to be built through Hughesville, Picture Rocks and other towns to Eaglesmere and ultimately to Wilkesbarre.

LIMA, N. Y.—The property of the Lima & Honeoye Falls Electric Light & Railroad Co. was recently sold at receiver's sale, bid in for \$35,000 by Frank Williams of Buffalo, representing capitalists of that city. C. T. Whiting will remain as superintendent.

MARQUETTE, MICH.—The papers announce that the Marquette City & Presque Isle Railway Co. will float bonds for \$70,000, half of which sum, it is said, will be used for the construction of new lines. F. O. Clark, president.

MECHANICSVILLE, MD.—The Washington, Mechanicsville, Leonardtown & Point Lookout Electric Railway Co. has been incorporated by Messrs. Comly R. Jones and Frank R. Tenney, of Philadelphia, and John T. Ballenger, Giles F. Dyer, B. Harris Camalier and Jos. F. Morgan of Maryland. The capital stock is \$1,000,000. A line will be built from Washington to Point Lookout via Mechanicsville and Leonardtown.

MESSENA, N. Y.—It is reported that the Massena Electric Street Railway Co. will increase its capital stock from \$100,000 to \$125,000, and that the line will be built without further delay.

MILAN, MICH.—Albert A. Graves, of Ypsilanti, is a new contestant in the field for a franchise to build a line from Ypsilanti to Milan and Dundee.

MILLVILLE, N. J.—It is reported that the Millville Traction Co. has applied for permission to extend its line to Vineland. G. B. Langley, president.

MOBILE, ALA.—A franchise for a belt line railway around the city of Mobile has been applied for. Messrs. D. R. Burgess, J. C. Rich or George Ober may be addressed.

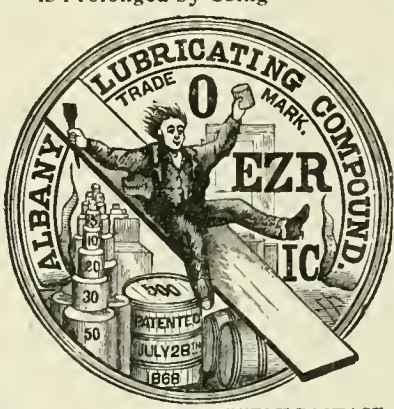

NEWARK, N. J.—Col. E. L. Price, of Newark, is preparing a bill to be introduced in the Legislature, authorizing the construction of an elevated railway from Jersey City to Newark and adjacent towns.

NEW ALBANY, IND.—Louis Hartman, of New Albany, has been appointed receiver of the New Albany Railway Co. He succeeds John McLeod who died January 24th.

NEW PLATZ, N. Y.—The New Platz & Poughkeepsie Traction Co., capitalized at \$100,000, has been incorporated to operate a nine-mile railway in Ulster county. The directors include William L. Suplee and Harry J. Verner, Philadelphia, and Charles W. Dayton and Oliver S. Carter, New York.

NEW BRUNSWICK, N. J.—A meeting to consider the consolidation of the Brunswick Traction Co., of New Brunswick, the New York & Philadelphia Traction Co. and the New Brunswick City Railway Co. to complete a trolley system from Jersey City to Philadelphia will be held in New Brunswick February 10th. G. Krueger is president of the Brunswick Traction Co.

C. B. FAIRCHILD, EASTERN REPRESENTATIVE.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X. MARCH 15, 1900. NO. 3

The announcement by the management of the Chattanooga Rapid Transit Co. that it will build a line up Lookout Mountain and institute a carriage service through Chickamauga Park is one that should be welcomed by all tourists who intend making a visit to Chattanooga, and the example of this company will doubtless be followed by others where the surroundings are such as to render such a policy practicable.

It is gratifying to note that managers are at last exerting themselves to follow up copper bond thieves and push the case against them to conviction and punishment. In doing this we believe they have not fully realized, nor brought to the attention of the court, the consequential damages which result from these depredations. It by no means covers the whole loss when the engineer has testified to what an equal number of new bonds can be purchased for and installed. There is the very serious loss of power and the incidental annoyance to passengers who may also suffer pecuniary loss through inability to operate the car on time or even at all.

Every manager who suffers from stolen bonds owes it to himself and the fraternity to relentlessly follow up and secure the conviction of the bond thief.

The transportation of freight on street railway lines is now attracting attention in Massachusetts, particularly between Brockton and Boston, application having been made for the incorporation of a company for hauling freight which shall have power to use the tracks of the street railway companies. It is not believed that the Legislature will authorize such a condemnation of the property of existing companies and the solution adopted will probably be the passage of an act permitting the street railways to carry freight where the service is demanded by the public. The street railways

would gladly accept such powers, though the passenger traffic has been so satisfactory that they have not cared to take the initiative.

Legislators both city and state are constantly misled into undoubtedly an honest though none the less mistaken belief as to the results to be obtained from a compulsorily lowered rate of fare. They assume that a reduction of one or two cents per fare cannot fail to procure more net revenue to a company. Even where they make comparisons they do not do it logically and ignore the local conditions which are alike in scarcely any two cities. Without reflection one would think that what is done in Washington certainly could be duplicated in Baltimore, on account of the close proximity of the two cities.

On another page we quote from the address of General Manager House, of the United Railway & Electric Co., of Baltimore, before the legislative committee. It is a remarkably concise and convincing proof, in which figures tell the story, of why Baltimore is not Washington.

The work of the United States Patent Office is greatly hampered by reason of the inadequate space assigned to it, and the condition of affairs is steadily becoming worse as the business of the office increases, and more storage room must be found for documents and records by encroaching on the working space. Already in some departments the weight of papers has become such that further storage on the floors is forbidden by the building inspectors, and the records which constitute the title to valuable manufacturing properties are stacked in halls and passageways, where they are exposed and sure to be destroyed in case of accidental fire.

Up to Jan. 1, 1899, the number of patents granted was 693,979 and the number of trade marks, labels, etc., registered 41,422. Last year 25,527 patents were granted and 2,260 trade marks registered. This accumulation has resulted in crowding the halls originally intended for models with record matter, rendering exhibitions of the models practically impossible and has forced different departments of the office to be separated and located on different floors with great increase in the labor of routine business.

In no respect is the Patent Office more cramped than for money and space for its Scientific and Law Libraries. Less than \$1,500 was this year available for the Scientific Library and nothing whatever for the Law Library. To permit these departments to grow as they should competent judges say that at least \$6,000 per annum should be made available for the purchase of books.

The American Society of Mechanical Engineers at its Washington meeting in May last resolved to urge upon Congress the necessity for action which will provide safe storage for valuable records, make a suitable provision for the library upon which the efficiency and accuracy of all the bureau's work is dependent, and secure adequate office room for the force. Every one who is interested in this reform, and none can be more so than the electrical manufacturers, should do his share in bringing the matter before Congress by personal letters to the member from his district and the senators from his state.

There can be no greater folly than to expect public benefits to flow from the "competition" of transportation and other public service companies. If the enterprises are in fact competing ones the result must be either consolidation or the driving of one of the competitors into insolvency; the latter contingency means ruin for the solvent company and in the end, consolidation.

Gen. John McNulta, who won an enviable reputation as a financier and administrator of large properties, said the basic doctrine of all receiverships is that "a solvent corporation cannot successfully compete with an insolvent corporation in the hands of a solvent receivership." When asked how he could afford to make the rate of 2½ cents from 63d St. to South Chicago over the Calumet road, of which he was receiver, he said:

"It is as plain as day. See here. This reduction affects only one-tenth of our traffic. It affects nine-tenths of the traffic of our competitor. He is a solvent corporation and must pay fixed charges. We are an insolvent corporation in the hands of a solvent receivership. We have no fixed charges to worry us. We can afford to suffer a small loss on 10 per cent of our total traffic. Our competitor cannot. He cannot afford to come to our 2½-cent fare because it would reduce 90 per cent of his income just one-half. If he does not come to our fare he will lose his traffic and we will

gain it. In the end he will be willing to consider a fair offer for his property. That will mean a consolidation of all the now competing lines south of 63d St."

That the work of the American Street Railway Association is appreciated by the street railway men of this country is shown by the large number who make it a point to attend the annual conventions, though identified with non-member companies. As the membership is vested in companies, not individuals, the expense to any one road is small, as it may send as many representatives as it desires. That the Association has proved itself of great value to the street railway interests of the country is without question. That at no time since its organization has there existed a greater need for its work is equally true. It deserves and should receive the moral and financial support of every street railway in this country. The strength and influence of association work are measured largely by numbers. In these days the large bodies and undertakings are the influential ones.

The management of the association has decided to lend a helping hand to membership to the several hundred smaller roads to some of whom the first year's payment of dues and initiation might seem burdensome. The secretary announces the decision to waive the initiation fee of \$25 for the next few months making the entire cost for new members only the regular \$25 yearly dues.

It is greatly to be hoped a large number will take advantage of this opportunity and send in their applications promptly. "Now is the time to subscribe."

Last month we took a hasty glance at conditions prevailing to a greater or less extent on every road in the country; some were found to be greatly handicapped by a diversity of rolling stock and allied appliances. In no respect, however, did there appear to be a greater lack of uniformity than in the cars, and the question forces itself upon every thinking manager as to how much longer this thing will continue and what is going to be the practical remedy.

Men who are capable of developing such magnificent properties and operating them successfully certainly will find a way to eradicate the existing evils which confront us. Some have already started in to standardize their rolling stock, and where a few years ago it was deemed essential to letter each car permanently with its street or avenue or route, making it impractical for use on other lines of the same company, now the only prominent lettering is the name of the company, and revolving or movable signs are placed to indicate the route. This has naturally led to a greater uniformity of color in the car painting and the passenger no longer watches for a red or blue car, but for the sign board which indicates its destination. The advantage of this is apparent in the greater number of available cars for service at all times. It is precisely this same theory which has not been carried out in car building. The improvements recommended by the car builders, however, are by no means responsible for the great variety of rolling stock, which variety as we mentioned last month is not confined to different cities only, but is to be found among the several companies in the same city.

Managers have been largely to blame for this. They have insisted on making their own specifications, even where the one doing so had had no special experience or qualifications for so important a decision. Some men, moreover, seem determined to stamp their own individuality on everything they can, and with some of these individuality proved nothing more nor less than being different from other people. A car which has no greater excuse for its unusual dimensions and construction than that it is different from others, has a very doubtful claim to improvement, and yet hundreds of cars have been built along precisely just such lines with the inevitable result that the time came when somebody devoutly wished that he or somebody else had done differently.

The following has often been the case: The car builder who is called in to bid on an order is confronted first of all with a set of plans and specifications which represent the ideas of the manager. As like as not the former is not asked if he approves of the plans, or could suggest any changes, for to do so would be to admit they were not perfect (which of course they are!); and besides might give the car builder a chance to work in some scheme to his own advantage. The builder quickly sizes up the situation and reasons that while these cars are not what they might be, or even ought to be, that the buyers know what they want, are determined to

have it so, and have the money to pay for what they want, hence why should he jeopardize his chances of securing the order by volunteering a lot of advice which however sound and good is almost sure to be unwelcome and rejected?

We do not mean to be understood as saying that all managers, or even the majority, buy cars in the manner described; at the same time scores of them have done so, and we can point to the cars in evidence thereof.

Is there any good reason why the car builders and managers cannot get together and agree upon a certain standardization in car construction and dimensions? This does not necessarily mean that we should all agree to say a 24 ft. car for city use, for in many places the 30 ft. and more, are deemed best suited to the work. But is there any good, sensible reason why the general work on a 30-ft. car should not be equally applicable to the car intended for Cleveland as the one for Chicago or Omaha?

Steam roads have already found a standardization for all kinds of rolling stock from four-wheel cabooses to longest sleepers, and have effected a saving of thousands of dollars. There are many old style cars still in use, but as fast as they are rebuilt they are brought into line as far as possible. With the street railway the problem is vastly more simple and can be put into operation with comparatively little trouble. It is not contemplated in this suggestion, that all the cars in the country should hereafter be cast in the same mold like so many bullets, but that the American Street Railway Association ought to take up vigorously the question of standardizing rolling stock. This would still leave to each buyer the opportunity to carry out his own artistic ideas of exterior color and interior finish; the desired symmetrical curvature of grab handles or the texture of window curtains. But is there any reason to prevent the standardization of what are really the vital parts of the car; and when this has been agreed upon why go on experimenting? Or, if experiments are still desirable and necessary, let some one experiment for the benefit of the association, at the association's expense, and not have a harvest of failures where a smaller example would amply suffice. For example, if a car builder had a generally accepted standard of car decks to go by, he could buy material and make up parts, or if he had a little spare time—which none of them have just now—he could as safely go ahead and stock up on 24-ft. and 30-ft. decks, as he can now lay in nails and screws and floor lumber.

Under such conditions the car builders could do a great deal of their work to much better advantage, and even if buyers did not noticeably benefit in the way of direct saving in price, they certainly would gain something in time of delivery under ordinary conditions.

Three years ago managers smiled when one suggested a standard system of accounts, while admitting its great desirability. The energy and promptness with which the young men of the Accountants' Association grappled with the problem and worked it out, is something of which we are all proud. Not only do we know they have succeeded, but the voluntary commendation of state railroad commissioners places their stamp of approval on the work.

What has been done in the accounting department can be done in the shop. Whether the manager is best qualified to decide on car standards; or whether he should allow his master mechanic in conference with other master mechanics to do this; or whether the managers and the master mechanics and the car builders all together, is something to think about. It would seem that the car builders and the street railway master mechanics could very profitably confer and submit a report to the managerial association for its adoption.

There is probably such a thing as overdoing the association-convention business, but as long as we have so much to learn in the shop department it cannot be an unprofitable thing for the manager to bring his shop superintendent or master mechanic, or whatever his title, with him to the annual convention. If these men after an exchange of methods and experiences cannot bring home with them ideas worth to their company many times the expense of sending them to such a meeting, it must be because they are not the right men for the place.

The shop department is bound to receive more careful attention and greater recognition from this time on, than it has been awarded in the past. The American Association has already recognized this fact to the extent of deciding on a report at the next meeting on the supply department, and if the subject receives the careful study and fearless treatment it deserves we predict the paper will be one of the most valuable and suggestive on the program.

The System of the Boston Elevated Railway Co.

The New Elevated Line—The Subway—The Organization—The Mechanical and Electrical Features and Methods in Vogue in the Different Departments.

BY C. B. FAIRCHILD.

PART I.

The name of the West End Street Railway Co., of Boston, is more familiar to the readers of street railway literature than that of the Boston Elevated Railway Co., but the latter company having leased all the lines and property of the first-named company, now controls all the street railway lines in Boston except those of the Lynn & Boston Railroad Co. This company, however, has a traffic arrangement with the Boston Elevated and enters Boston over its tracks.

It is proper to note in the introduction of this article that the credit for having made electricity available as a motive power, on a commercial scale, is largely due to the West End company because of its early adoption of this power and the liberal manner in which the company set about experimenting, and its financial ability to meet the great experimental outlays that have marked the introduction of electricity as a motive power for street railways. Probably, if names are to be mentioned in connection with the adoption of electric power for traction purposes, no one deserves more credit for foresight, faith and courage in the future of this subtle power than Mr. Henry M. Whitney, former president of the West End company. Whatever may be said, however, in the way of credit about the pioneer work that was done on these lines, no less is due to the principal officers now responsible for the operation of this extensive system and the admirable manner in which the operating forces have been organized and the methods of control that are now in vogue. These names include those of William A. Bancroft, who was made president of the company in October last, and Charles S. Sergeant, vice-president. Other names will appear in order in connection with the description of the different departments, nearly all of which will have attention in this article.

THE ELEVATED STRUCTURE.

The erection of the elevated structure which has given its name to the entire system, is now well under way, and it is expected that the elevated lines will be in full operation, by electric power, in about a year. The accompanying diagram, Fig. 1, shows the loca-

also the traffic to and from the South Union Station, locally known as the Terminal Station and which is said to be the largest steam railway station in the world. The main line of the structure in

tion and direction of the elevated structure. It will be noted that the main line from each end terminates at the portals of the subway which is a prominent feature in connection with the Boston system of street railways. A loop passing around the subway connects the inner terminals and provides for the patrons on Atlantic Ave. and

Boston is located on Washington St. and in Charlestown, on Main St., and crosses the Charles River on the upper deck of a large draw bridge which with the approaches constitutes an interesting

feature of the system. The cars are to enter the subway by means of inclines and the bore of the subway is being enlarged where necessary to provide for the passage of the elevated trains. All through traffic in the subway is to be by elevated train only, while certain of the surface cars will enter the subway and loop

at a station, as is now done by some of the lines, in a manner to be described later on. The main line of the elevated structure terminates in a loop at each end and in connection with this inclines are provided for bringing the cars of certain of the surface lines to the

gusset plates, cutting away unnecessary material from the central portions.

Fig. 11 is a plan and elevation of the longitudinal trusses for spans from 29 to 37 ft. On the Charlestown Bridge, plate construc-

FIG. 7—STRUCTURE AS ERECTED IN WIDE STREETS.

same level as the elevated cars, to and from which, free transfers are to be given.

The total length of the elevated structure is 6 miles, the main line including the subway, is 5.1 miles; the Atlantic Ave. loop is 2.3 and the subway 1.2 miles.

The character of this structure which provides for a double track line throughout the entire length is shown in the accompanying diagrams and half-tone illustrations.

Fig. 2 shows a typical concrete foundation for the columns where the soil was found to be sufficiently firm to sustain the load without piling.

The foundations are of portland cement concrete mixed in proportions of 1, 2½ and 5 for the first five courses and of 1, 2 and 4 for the top course. Fig. 3 illustrates a foundation where piling was required to support the concrete, as was the case on nearly all of the Atlantic Ave. loop. The pile foundations are supported on 22 piles and are in four courses of portland cement concrete, the top course being 1, 2 and 4 and the others 1, 2½ and 5. The bottom of the first course is placed below ground water level.

Fig. 4 shows a base with anchor bolts and Fig. 5 the base of a column and fenders.

The columns and cross trusses are shown in Figs. 6 and 7. This form of construction is used only where the streets are wide and where the tracks are located above the column. Should it be found necessary in the future to provide for a third track these cross trusses will be replaced with plate or lattice girders. The clear headway under the girders on the main line is 14 ft., while on Atlantic Ave, where steam freight cars also operate, the height is 15 ft. 5 in. Typical cross girders are shown in Figs. 8 and 9. The former is of the lattice type and is employed where the shadows of the plate girders would be objectionable. The latter type, however, is generally used at the south end of the line on Washington St., Fig. 10, and on the Charlestown Bridge. Where plate girders are used on the main structure, a group of round 3-in. holes are provided in some of the plates to provide for locating the feeder cables. The lengths and other dimensions of the cross girders are shown on the diagram. Fig. 9 also shows the design of the expansion pockets which are placed at least every 200 ft.

It will be noted on inspecting the drawings of these trusses that contrary to the usual practice an effort has been made to improve the appearance of the structure by giving curved outlines to the

tion is also used for the longitudinal spans. The same diagram shows the sway frames that are placed at suitable intervals. Figs. 12 and 13 illustrate the hoists employed for erecting purposes.

THE CHARLESTOWN BRIDGE.

Fig. 14 illustrates the draw span of the Charlestown Bridge, one of the most interesting structures of its class in the world. The bridge proper was finished last year and was built by the city, but the elevated structure was built by the railway company.

The draw span is 240 ft. long, resting on a center pier,

FIG. 10—PLATE CROSS GIRDER CONSTRUCTION.

with a passage for vessels on each side 50 ft. wide. The draw is 100 ft. wide and 23 ft. above mean high water. The individual trusses, of which there are four, are 24 ft. deep at the end and 45 ft. at the highest point of the center. The bridge provides

for a double line of surface car tracks, two roadways 20 ft. wide for vehicle traffic and two side paths 10 ft. wide for pedestrians. The revolving mechanism is contained in the circular base which is 54 ft. in diameter and the load is supported on solid steel wheels which are placed very close together. Two electric motors, mounted on

manner as that described for the Charlestown Station. Fig. 17 is a cross section of the elevated station on Atlantic Ave. at the South Union or Terminal Depot, showing the approaches; it is noted that on one side a bridge leads from the elevated station through the side wall of the passenger station.

FIG. 12-ERECTING COLUMNS.

FIG. 13-ERECTING STRUCTURE.

brackets, on either side of the base, provide the power for operating the draw and are connected by suitable shafts and reducing gear to a spur wheel which meshes into a gear extending entirely around the base. Suitable hydraulic lifts at the ends of the structure serve to lock and help support the ends of the draw when closed.

The surface construction of the elevated structure is illustrated in Fig. 15 and shows the location of the track and conductor rails. The conductor rail is partially housed and guarded by means of two plank stringers which are supported by iron brackets spiked to the cross ties. The conductor rail will probably be mounted on insulating blocks. All of the rails, including the conductor rails, are to be of the A. S. C. E. standard section weighing 85 lb. per yd., and the track rails are connected by "Continuous joints." The rails are laid on tie plates. All timber work shown in the illustration is of long leaf southern pine. A tubular guard rail or fence is provided for the protection of the employes while on the structure and this is shown in the same illustration.

The different levels are indicated by the elevation above datum, and are required to meet the peculiar conditions in the station. The stairs leading to the elevated structure from the street are also shown in the same connection.

Fig. 18 shows the arrangement of the ticket offices, waiting rooms, and platforms, and is a typical layout for all the stations on the line. The others, however, are designed to suit the local condition. The exterior walls and roof of this station are of copper, painted, while the inside is finished in oak panelling, hard pine flooring, both for the station rooms and platform, and in the toilet rooms open plumbing is employed. The whole station is made as light and airy as possible.

Fig. 20 shows the general layout of the elevated and surface tracks at the Sullivan Square Station at the Charlestown Terminal. Here is also located the repair shop for the elevated system and the tracks leading off to the right enter the repair shop. As noted above the elevated tracks make a loop and the surface cars come up to a level with the structure over inclines which have a grade of about 5 per cent. Some of these inclines lead to the inside of the loop, others outside, and passengers are delivered and re-

FIG. 14-DRAW-SPAN, CHARLESTOWN BRIDGE.

Fig. 16 is a layout of the south terminal loop on Dudley St. known as the Roxbury Station. Here it will be noted that two lines of surface cars come up to the elevated level and loop on each side of the elevated track, but at different levels. The platform of the surface cars is 13 in. above the rail, while that of the elevated cars is 4 ft. above the rail. The dotted lines shows the surface tracks that pass beneath the structure. The structure is roofed in the same

FIG. 15-SECTION OF TRACK.

ceived from the elevated platform. A double elevated track is shown around part of the loop and on one side. This is designed for storing trains after they are made up and waiting for their schedule time.

Fig. 19 shows the ground plan of the station, the ticket offices and waiting room, and also the tracks of the surface line which loop here and pass the station on the ground level. The main floor is

FIG. 19—GROUND PLAN OF SULLIVAN SQ. STATION.

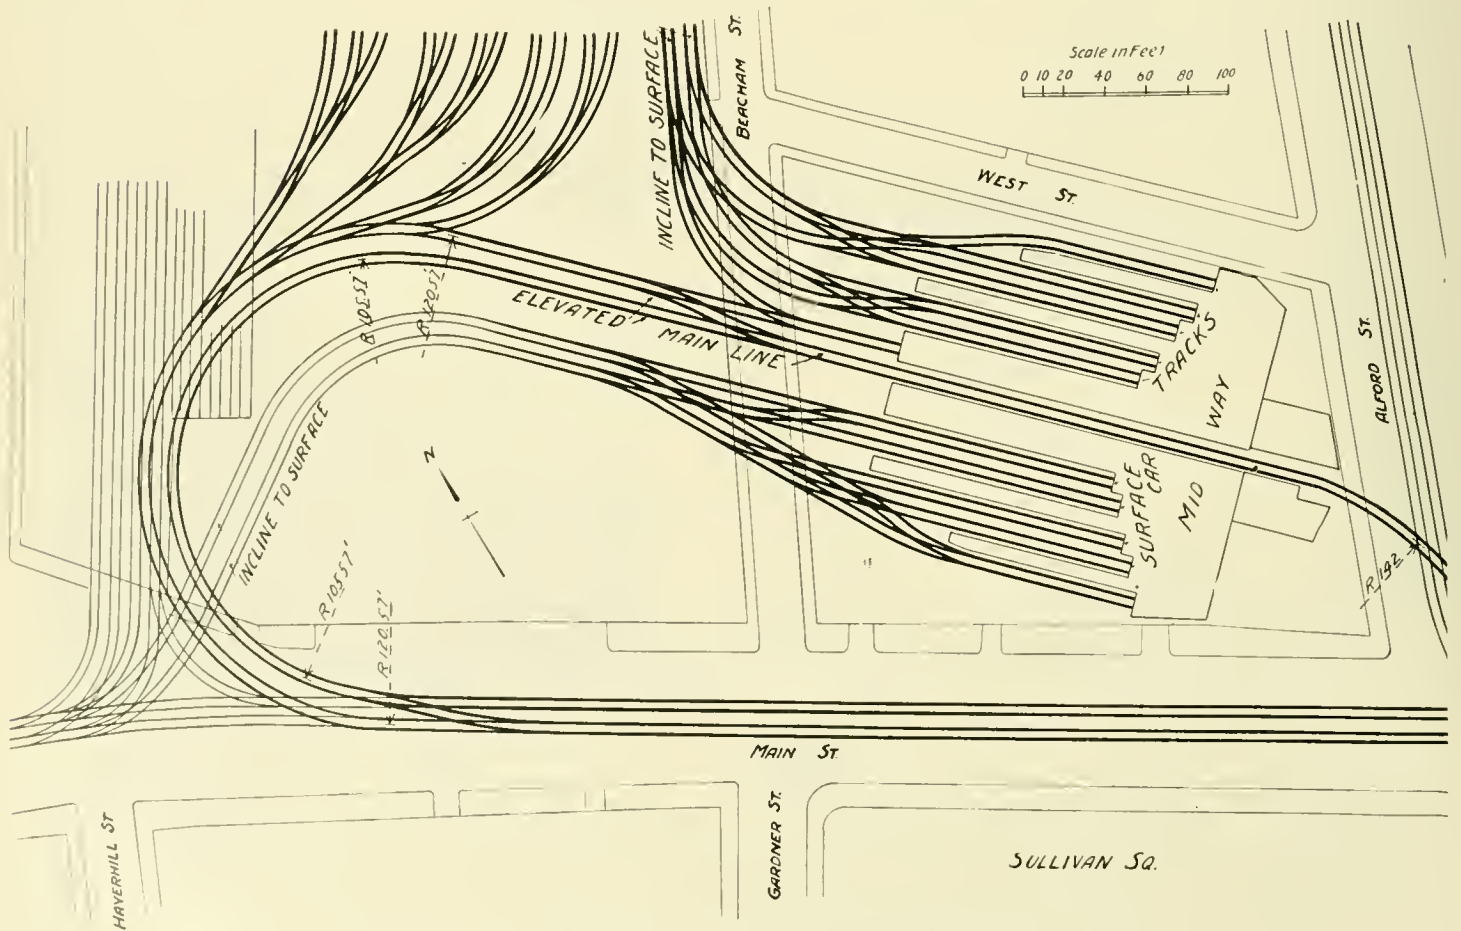

FIG. 20—LAYOUT OF ELEVATED AND SURFACE TRACKS AT SULLIVAN SQ. STATION.

FIG. 23- SULLIVAN SQ. STATION.

FIG. 21- THIRD FLOOR OF STATION BUILDING.

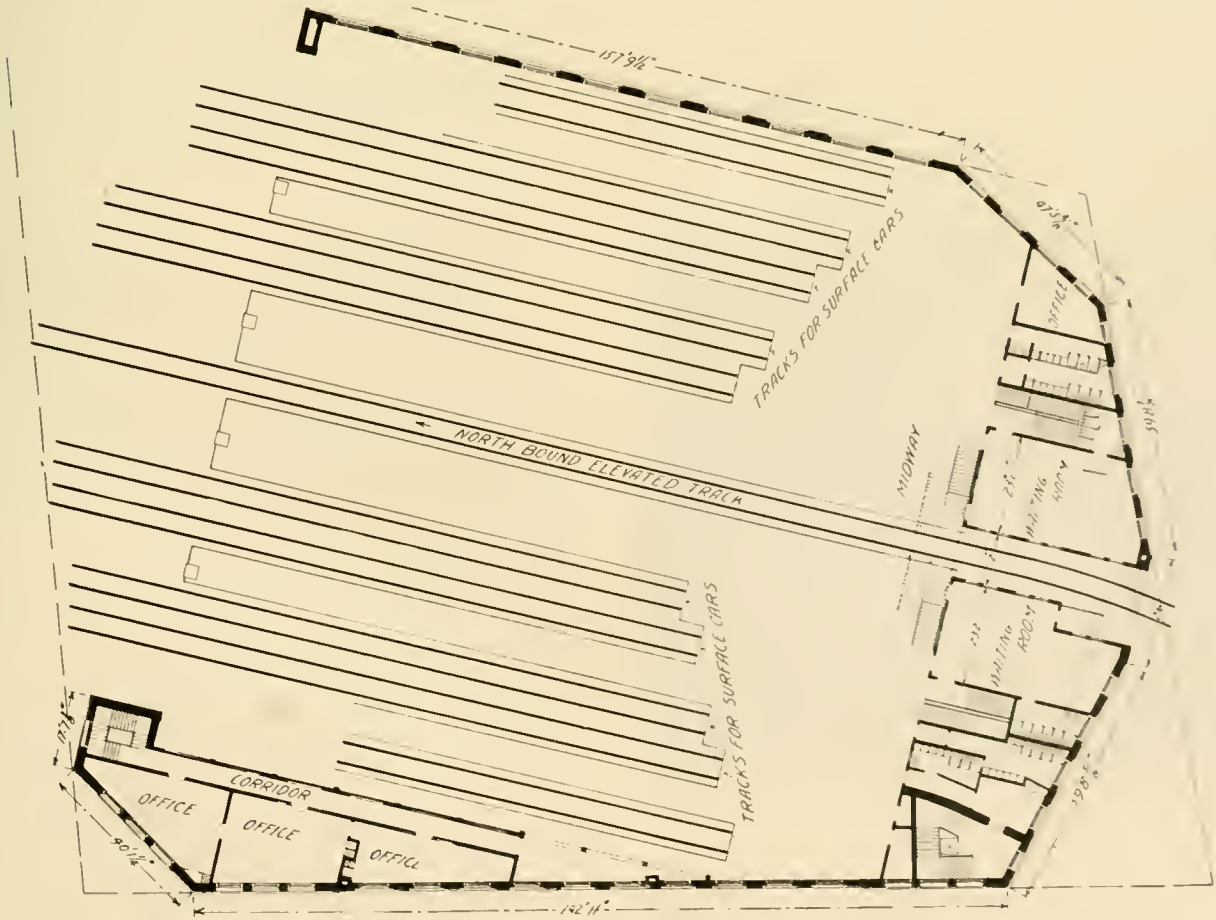

FIG. 22- LAYOUT OF SECOND FLOOR.

railed off, so that access can be had to the inner waiting room only by the passengers that come in on the surface cars. Stairs from this waiting room and also from the main ticket office lead up to the elevated platform. On the inside of the building, concessions are sold or rented for refreshment room, billiard parlors, and stores on a portion of the ground floor. The third floor layout is shown in Fig. 21 and here are the executive offices of the Elevated company. Fig. 22 is another layout of the second floor, showing waiting room with porters' closets and toilet rooms and also shows the terminal

FIG. 24.

track of the surface lines on the elevated platform. The platform and part of the loop are roofed in and the roof is supported on steel arches that span the entire space of 175 ft. The return and storage tracks of the Elevated are outside the structure. Fig. 23 is an exterior view of this station. The walls are of brick and the interior finish of waiting rooms and station is of enamel brick of various shades. The station is light and airy and contains all the conveniences that can be suggested for the accommodation of the patrons and employes.

ROLLING STOCK.

The cars to be operated on the elevated structure are of about the same general pattern as those employed on the Manhattan Elevated Ry., of New York. The bodies are 46 ft. 2 in. over all, and 8 ft. 6 in. wide, and have side as well as end doors.

FIG. 26.

Side seats only are provided. The trains are to be run with from two to five cars and are to be controlled by a "multiple unit system" so that the motors can be operated from each platform. Before de-

termining on the make of the electrical equipment three trains of four cars each will be equipped with three different electric systems. Three cars of the type described have been built for the company by the Wasson Car Co., of Springfield, Mass., and each of these will be equipped as a motor and will each haul a train of loaded flat cars equipped with suitable controlling mechanism.

With these, experimental trips in the subway, at night, will soon be begun after the surface car traffic is withdrawn. The three experimental motor cars are mounted on trucks of the engine, swing

FIG. 25.

bolster type, which were made by the Baldwin Locomotive Works, of Philadelphia.

Each car will be equipped with two 150-h. p. motors both mounted on one truck. One of the cars will be equipped with the General Electric motors and the G. E. system of multiple control. A second will be equipped with Westinghouse motors and method of control and the third will be fitted on the Sprague system.

Automatic air brakes are to be used and one train will have the Westinghouse system, another the New York Air Brake system and the third the Christensen system. The experimental trains will be equipped with different types of electrical car heaters including the Gold system, the American Heating Corporation system, the Consolidated and a new system making use of a blower designed by Boston parties. The cars will be coupled by means of the Van Dorn draw bar and couplers and are provided with platform gates which will be fitted with the Gold locking and operating device the same as is universally employed on elevated and suburban trains.

POWER STATION.

A new plant from which the elevated line will be operated is being erected on Lincoln Wharf to which coal can be delivered direct from barges without having to pass any draw bridges. The preliminary power equipment of the station will consist of two vertical cross compound condensing engines with cylinders 44 and 88 x 60 in. and rated at 4,000 h. p. each; they will have a maximum of about 7,000 h. p. each. These machines are each direct coupled to a 500-volt direct current generator of 2,700 kw. capacity. The generators have been ordered, one from the General Electric Co., and one from the Westinghouse Electric & Manufacturing Co.

The first equipment of boilers consist of four batteries of Babcock & Wilcox boilers, each rated at 3,800 h. p. Included in the auxiliary equipment is a Green economizer with 1,152 tubes. The condensers are of the Blake type with vertical twin pumps.

The stack is of brick and is 260 ft. in height with a 13 ft. flue. Foundation and room are provided for a second stack of the same dimension. An elaborate coal storage and coal handling system will be established consisting of cars and conveyors both for handling coal and ashes. Roney stokers will be used.

The steel for the elevated structure was bought for the most part from the Pencoyd Steel Co., although considerable was furnished by the Carnegie Steel Co. and the Pennsylvania Steel Co. The design and erection of the elevated structure and equipment have been under the direction of Mr. Geo. A. Kimball, chief engineer of the elevated lines.

THE BOSTON SUBWAY.

This is a prominent and interesting feature of the Boston Elevated system. The subway was built by the city and was designed to relieve the congested condition of Tremont and Washington Sts. near the center of the city where the surface traffic had become too great for the narrow streets. The work of construction was begun in March, 1895, and was finished in 20 months. The tunnel proper is 9,498 ft. long and runs under the public gardens and under several of the principal streets. On being finished it was leased by the street railway company for a period of 20 years, and the electrical equipment, tracks, etc., installed by the company. The subway is not a low-level tunnel but is built as near the surface as possible. One section is designed for a four-track railway and here it is 48 ft. across with roof supported in the middle by a row of steel columns. The two track section is 24 ft. wide and has a flat roof which is supported by brick arches turned between I-beams with diagonal stringers connecting the vertical and horizontal beam across the corners. One section is divided into two separate single track subways, which afterwards converge into a double barrel subway. Leading to the portals, are open inclines, protected by retaining walls on concrete foundation. The grades range from 5 to 8 per cent.

Sections of the subway and one of the approaches are shown in Figs. 24, 25 and 26.

The layout of the tracks at the five principal stations in the subway and the passenger platforms are shown in Fig. 27. It will be noted that some of the tracks loop at three of the stations while the other continues through and provides for a continuous trip to and from any part of the city. Entrance to the platforms is had through stations which are built of granite with flights of steps leading to the ticket offices and platforms. The roofs of these stations are principally of glass and the stations were made as complete as the conditions would allow. The platforms are of artificial stone with suitable guard rails and wire fences for the protection and guidance of the passengers. Ticket offices are provided at each station and all subway passengers entering by the station are required to purchase tickets which the conductors collect before the cars emerge from the subway. At the stations the lining of the tube is of white enameled brick, and the stations are brilliantly lighted by arc and incandescent lamps.

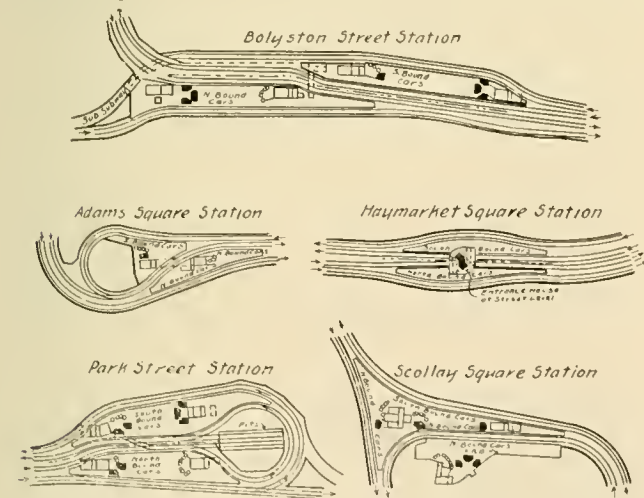

FIG. 27 - LAYOUTS AT SUBWAY STATIONS.

At the Boylston St. Station is a cross sub-subway, so that the southbound passengers after purchasing their tickets can pass under the tracks to the platform of the southbound cars. Uniformed attendants are stationed at the platforms to direct and care for passengers. The subway is lighted throughout by electric lamps and electric heaters are provided for warming the ticket offices. There is also an elaborate lock signal system. Perfect ventilation is secured by means of fans driven by electric motors with flues leading to ventilating chambers that communicate with the external air.

The Park St. Station of the subway is said to rank third among the busy railway stations of the world, although one of the smallest in platform capacity, having only 15,197 sq. ft. of available surface. This station is used as the general transfer point of the subway and it is estimated that in busy hours 2,500 people transfer at this point

while the number of tickets sold between the hour of 5 and 6 at night has been as high as 8,631, and the maximum number of cars passing in one hour is 204 including those that pass on the inside loop, and 124 in each direction on the through tracks.

The number of tickets sold daily at this station is about 25,000 and the maximum for any one day was 40,000. It is estimated

W. A. BANCROFT.

C. S. SERGEANT.

that as many people leave the station during the day of 18 hours as enter it, so that it is safe to say that as many as 100,000 people are daily accommodated at this station. Electrically operated indicators are in use during the hours of largest out-going traffic. These indicators have the names of the routes arranged in parallel columns and between these are illuminated numbers to indicate the berth at which the car will stop. This prevents the passengers from crowding to the edge of the platform to watch for their car. The subway fully meets the requirements for which it was designed and is a pronounced success both in construction and operation. About the only objection that can be named from the standpoint of the passenger is the excessive noise due to the echo from the walls and is caused chiefly, one would think, from the action of the trolley wheels on the wire.

HEADQUARTERS.

The executive offices of the company and of most of the departments occupy eight floors of a large building at 101 Milk St. The space includes the drafting room for both the elevated lines and for the civil engineer's department of the surface line. Each floor is cut up into offices suitable to the requirements of the different departments and all are supplied with the latest designs of office furniture, and are as completely organized as the latest office practice can suggest. Three of the departments have headquarters in other buildings. On the roof of this building, two blue print rooms have been constructed of sheet metal, one for the engineering department of the elevated lines and the other for the civil engineer's department of surface lines.

The equipment of these rooms is very complete and the glass with its frame and table is mounted on a truck by means of which it is run out or in over a suitable track. The layout of rooms also includes a small tool room, a track museum for samples of rail and track equipment and a store room for telephone supplies and tools.

A private telephone exchange is maintained in the building which connects all the offices, not only those in the building, but the car houses and car stations of the whole system.

ORGANIZATION AND REGULATION OF DEPARTMENTS FOR SURFACE LINES.

With one exception the system of the Boston Elevated Railway Co. is the largest under one management in the country. The length of the surface lines aggregate 338 miles, nearly all of which is operated by electric power, and for generating the current, seven power houses have been erected with a total capacity of 26,144 kw.

The number of uniformed employes ordinarily on the pay rolls is 4,421. The number of closed cars is 1,381, and of open cars, 1,392. The number of passengers including free transfers as reported for the last fiscal year was 233,136,939, of which 191,023,224 were revenue

passengers. The earnings were \$9,671,441, and the operating expenses were \$6,827,150.

In order to operate a property of such vast magnitude economically and satisfactorily, to both the patrons and the investors, it is evident that a complete organization of the forces and a wise system of discipline must be primary requirements and that each must be done to a scientific nicety. That the responsible parties have mastered the situation admirably so as to meet the many difficult problems, due both to the geographical situation and public demands is evident to one who will inform himself and compare the work with that which prevails in other cities. If there is one thing more than another to be quoted in evidence of the wisdom of the plans followed it is that of the universal harmony and good-will that is apparent among the heads of the different departments in their relations to each other.

The bureau of surface lines was established by the directors, and placed in charge of the vice-president, Mr. Charles S. Sergeant and by him organized into 10 departments with a head for each department who is responsible directly to him. The departments having been organized, a pamphlet was issued and supplied to the head of each department naming the department and briefly outlining the duties of each head and defining his relations to each of the other departments. In this pamphlet the names of the different departments appear as follows:

That of Transportation; of Motive Power and Machinery; of Wires and Conduits; of Maintenance of Way; of Civil Engineering; of Electrical Engineering; of Buildings; of Employment; of Inspection; of Stores.

The head of the auditing department is responsible directly to the president and board of directors.

(To be continued.)

TRAMWAY FOR SARAN DISTRICT, INDIA.

Some time in 1898 the District Board of Saran, India, reached the conclusion that a tramway or light railway should be built to carry the very heavy traffic over the Chapra-Satter-Ghat Road, one of the principal roads of the district. In pursuance of this decision an advertisement was published, and several replies were received; but since then little or nothing has been done in the matter, except that the board decided, at one of its recent meetings, to offer to any firm or company willing to undertake the scheme, a subsidy of 8,000 rupees per year for eight years. The engineering difficulties connected with the building of the tramway would be small.

According to Indian Engineering the native merchants of Chapra are very enthusiastic over the tramway scheme, and would afford considerable support, as, by its existence, the existing high charges for cartage would be vastly decreased, and where now it takes them two to three days to obtain their goods from the northern ghat, the "tram" would deliver them in 12 hours or less.

It is a scheme well worthy of the notice of capitalists, more especially as it will be the pioneer tramway of northern Behar, and the company taking it in hand will naturally reap all the advantages obtainable by the opening up of a hitherto untouched country, and one where, owing to population, the traffic is constant and heavy.

NEW LINES FOR KANSAS CITY.

The Metropolitan Street Railway Co., of Kansas City, Mo., and its allied companies, the Central Electric Co. and the Home Electric Co., have asked the city council for street railway franchises on 11 additional streets. The proposed franchise ordinance provides that the construction of the new lines must begin within six months after the acceptance of the franchise, and must be finished within 18 months thereafter; for the payment to the city of 2 per cent per annum of the entire gross earnings of these lines; the average rate of speed of cars to be 12 miles an hour and the fare to be 5 cents.

It is the intention of the company to make Main St., Walnut St. and Grand Ave. the three trunk lines of the city's entire car system, and every car will have one of these three streets on its route. Pres. W. H. Holmes is quoted as saying that the contemplated improvements will cost nearly \$2,000,000.

TRAMWAYS IN GREAT BRITAIN.

The report of the Board of Trade to the House of Commons, on the street and road tramways of the United Kingdom for the year ending June 30, 1899, shows that on that date there were 1,122 miles of line open for traffic, of which 881 miles were in England and Wales, 106 miles in Scotland and 135 miles in Ireland. The total paid-up capital represented by these lines was £18,052,773, of which about £8,500,000 was share capital. Out of the 169 undertakings, 61 are owned by local authorities.

The number of passengers carried on all lines for the year was 924,820,247, as against 146,001,223 for 1878, and 858,485,542 for 1898. Gross receipts for the year were £4,879,602, working expenses £3,675,559, net receipts £1,204,043, equivalent to about 6½ per cent on the total capital.

ELECTRIC RAILWAY MAGNETIC DISTURBANCE.

The question of the magnetic disturbances caused by electric street railways was discussed recently in a paper by Mr. Mariani before the Institute of the University of Rome, Italy. The author reaches the conclusion that the magnetic materials on a street railway directly affect the compass up to a distance of 150 yd. from the line, and the further disturbances such as are felt by magnetic observatories are due to the leakage currents from the earth return, the range over which these are felt being about 2,000 yd.

PULL ON TROLLEY WIRES DUE TO VARYING TEMPERATURE.

A formula for computing the stresses in trolley wires caused by variations in temperature has been worked out by Mr. M. Essig and published in the *Electrotechnischer Zeitung*. Assuming a span of 40 meters (131¼ ft.), a wire of 50 sq. mm. area (equal to .316 in. in diameter), and a working tension of 400 kg. (880 lb.), the additional pull per degree Fahrenheit is as follows:

Temperature, degrees F.	Extra pull, lb.
From 86 to 79.....	3.7
" 79 to 68.....	4.9
" 68 to 54.....	6.1
" 54 to 46.....	7.3
" 46 to 32.....	8.6
" 32 to 14.....	9.8
" 14 to 4.....	11.0

PRECAUTIONS AGAINST ELECTROLYSIS.

Mr. Edward B. Ellicott, city electrician of Chicago, states that after a careful study of the conditions for over two years and making tests which extended throughout the city, he recommends to the council that in electric railway ordinances the company be required to provide and maintain a return circuit of such conductivity that the maximum potential difference between the rails and water pipes in the street shall not exceed 1 volt, and such that the maximum difference in potential between points on the rails 300 ft. apart shall not exceed ½ volt. This will not prevent flow of current to and from water pipes, but it is claimed will reduce the liability of serious damage to a minimum.

EARNINGS OF CLEVELAND INTERURBANS.

The earnings of the Cleveland interurban electric railways for the year 1899 show substantial increases over those of the preceding year. They are: Cleveland, Berea, Elyria & Oberlin, \$67,377; Lorain & Cleveland, \$53,305; Northern Ohio Traction (A. B. & C.), \$124,300; Cleveland & Chagrin Falls, \$15,355; Cleveland, Painesville & Eastern, \$55,441.

Three-Phase Installation of the Newtown (Pa.) Electric Street Railway.

In the closing years of the seventeenth century the illustrious William Penn, founder of the present city of Philadelphia, drew up his famous contract with the Lenni Lenape tribe of Indians, who, by its wording, were to release to William Penn and his successors as much land lying between the Delaware and Susquehanna Rivers, as could be stepped off in 24 hours, commencing at a point indicated by a rough stone monument, a view of which is shown

FIG. 1—MONUMENT NEAR NEWTOWN.

in Fig. 1. From that time the people of Bucks County have had no better methods than were then in use, for traveling across from different towns to the county seat, until the construction of the present lines of the Newtown Electric Street Railway Co. This company absorbed the Bristol & Langhorne Railway Co., and by the construction of an extension of 14 miles from Newtown to Doylestown, completed one of the longest continuous suburban trolley lines at present operating. Starting at Bristol, Pa., on the New York Division of the Pennsylvania R. R., the road runs continuously on its own private right-of-way parallel to and adjacent to the turnpike, through the village of Hulmeville to Langhorne, crossing the New York Division of the Philadelphia & Reading R. R. on an overhead bridge at the above-named station, and continuing thence through Langhorne Manor, crossing under the Trenton cut-off branch of the Pennsylvania R. R. This crossing was accomplished after several years of legal battle, waged by the electric company against its steam road antagonist. The line con-

FIG. 3—BRIDGE AND TRESTLE AT WYCOMBE.

tinues to Newtown, crosses at grade the Newtown branch of the Philadelphia & Reading R. R., and thence through Main St. of Newtown, to and through the village of Wrightstown, crossing over the New Hope branch of the Philadelphia & Reading R. R. at Wycombe, Pa., on a trestle and iron bridge, shown in Fig. 3.

From this place it passes through Forrest Grove and Bushington to Doylestown, the county seat, making a total distance of 28 miles.

The rail in the boroughs is 7 in. girder and on the other portions of the road 60-lb. T rail has been used, laid on ties 6 in. x 8 in. x 8 ft., spaced 2,112 ties to the mile, laid with suspended joints, the rails being bonded together with No. 0000 copper bond, placed un-

FIG. 2—EXTERIOR OF POWER HOUSE.

der the plates. The rail and special work was furnished by William Wharton, jr., & Co., of Philadelphia; the ties by Kirby & Hawkins, of Philadelphia.

When the extension of the line from Newtown to Doylestown was first considered, the principal question that arose was the one of supplying power to the continuous line from Bristol to Doyles-

FIG. 4—CLOSED CAR.

town. It was finally concluded to install a power plant at Newtown, which is the center of the line, putting two transforming sub-stations, one seven miles to the south of power plant and one 11 miles to the north. The contract for construction was awarded to the American Engineering Co., of Philadelphia, and was by it carried

FIG. 5—ROTARY TRANSFORMERS.

FIG. 8—ENGINES.

to successful completion, its able and efficient corps of engineers having entire charge of the work.

The power house, the exterior of which is shown in Fig. 2, is situated at Newtown, on the Philadelphia & Newtown R. R., with coal siding connecting therewith. Its equipment consists of two Ridgeway simple engines of 300 and 400 h. p. each, belt connected to one 225-kw. direct current generator and one alternating current generator. The switchboard consists of one direct current feeder panel, three alternating current feeder panels and one ex-

rotary transformers, and three stationary transformers. The alternating current enters the transformers at 6,000 volts, and is fed to the line at 550 volts, direct current. The transformer stations are also equipped with marble switchboard, consisting of alternating current and direct current panels, with necessary fixtures, the electrical equipment being furnished throughout by the General Electric Co.

FIG. 6—EXTERIOR OF SUB-STATION.

FIG. 9—MAIN POWER STATION.

terior panel mounted on Tennessee and black marble, the alternating current panels being of the light marble, and the direct current of the black. Interior views of the power station are given in Figs. 8 and 9.

The overhead material consists of No. 00 trolley wire, suspended from brackets supported by wooden poles with cross arm attached, upon which is strung the feeder wire, consisting of three No. 6 wires, hung on triple petticoated porcelain insulators, the direct

FIG. 7 FEEDER SYSTEM.

There are two sub-stations, one located at Hulmeville, 7½ miles from the power house, and the other at Bushington, 11 miles from the power house. The exterior of the sub-stations is shown in Fig. 6, the interior in Fig. 5. The sub-stations are equipped with

current feeder being hung on glass insulators. The feeder system is shown in Fig. 7.

The car barn is of wood, on stone foundation, with two tracks of sufficient capacity to hold 10 cars, which are of the type illus-

trated in Fig. 4. The closed cars were furnished by the St. Louis Car Co., and are equipped with two G. E. 1,000 motors, K-2 controllers, Syracuse changeable headlights and New Haven illuminated face registers, and rattan walkover seats. They are mounted on St. Louis No. 13 double trucks. That the road has filled a long felt want is attested by the travel since its opening.

The officers of the company are: President, Thos. P. Chambers; vice-president, G. C. Worstall; secretary, A. Chambers; treasurer, general manager and purchasing agent, W. J. Keener; superintendent, B. F. Knabb.

We were supplied with the above information and the accompanying illustrations through the courtesy of D. A. Hegarty, general superintendent of the Railways Company General, of Philadelphia.

NEW YORK RAPID TRANSIT.

The Rapid Transit Subway Construction Co., of New York, was incorporated on February 19th with a capital stock of \$6,000,000. The object is "to construct or aid in constructing and equipment of rapid transit railroad in New York City authorized by Chapter 4, Laws of 1891, and its amendments, the putting of same in operation and use, maintenance and operation thereof, also to manufacture, purchase, sell and deal in all supplies, etc., useful in connection therewith; also to deal in stock and bonds of any other corporations organized to construct or operate said railroad."

The directors of the company are: August Belmont; James Jourdan, president of the Brooklyn Union Gas Co. and the Amsterdam Gas Co.; W. H. Baldwin, jr., president of the Long Island Railroad Co.; Walter G. Oakman, director of the Long Island and Brooklyn Rapid Transit companies; Charles T. Barney, president of the Knickerbocker Trust Co.; George Coppell, president of the Wisconsin Central R. R.; Andrew Freedman, vice-president of the United States Fidelity & Guaranty Co.; John Pierce, contractor for the new Hall of Records; William A. Read, of Vermilye & Co.; George W. Young, president of the United States Mortgage & Trust Co.; Cornelius Vanderbilt; John B. McDonald; Gardiner M. Lane, formerly of Lee, Higginson & Co., Boston, and E. Mora Davison, of August Belmont & Co.

The officers are: President, August Belmont; vice-president, Walter G. Oakman; secretary, Frederick Evans; treasurer, W. C. Emmet. The offices will be in the Park Row Building.

February 24th the contract for building and operating the road was signed at the office of the New York Board of Rapid Transit Commissioners.

THE MILWAUKEE SITUATION.

The Supreme Court of Wisconsin, on February 27th, issued a peremptory writ of prohibition restraining further proceedings against Mayor Rose, of Milwaukee, the city clerk, and the 23 aldermen whom Judge Ludwig had held to be in contempt of court for disregarding the injunction against passing the street railway ordinances.

While this decision is in the Schwartzburg case only, the attorneys for the street railway believe that the other injunction cases have now no standing.

The court, which was unanimous, said in part:

"The theory of Schwartzburg's complaint is that the corporate rights and franchises in question were owned by the city and were held in trust for its citizens and taxpayers and the public, and that the same were the subject of barter and sale to the highest bidder. Such corporate rights and franchises in this country are special privileges conferred by the sovereign power of the state or nation, and do not belong to the citizens of the state or county by common right. This brings us to the question whether the common council has the power to pass the ordinance. No one doubts the power of the Legislature to create cities and give them the general powers possessed by municipal corporations at common law, and in addition thereto such powers pertaining to municipalities as may be specifically granted, as in the case of the city of Milwaukee.

"The statute expressly authorizes the formation of 'corporations for constructing, maintaining and operating street railways,' under chapter 86, R. S., and provides that they 'shall have powers and

be governed accordingly.' That section also expressly provides that 'any municipal corporation or county may grant to any such corporation the use, upon such terms as the proper authority shall determine, of any streets or bridges within its limits, for the purpose of laying single or double tracks and running cars thereon

"The authority of the Legislature to delegate to municipal corporations the power to so grant such corporate rights and franchises cannot be seriously doubted. In fact, this court, construing that section, has expressly held that a municipal ordinance granting such corporate rights and franchises 'has the force and effect of a statute of the state.'"

GENERAL ELECTRIC ROAD WINS.

In our issue for November, 1898, page 847, we described the attempts made by the General Electric Railway Co., of Chicago, to build its line in Dearborn St. and cross the tracks of the Chicago & Western Indiana R. R. at 15th St. Work was stopped, an injunction being secured by the steam road.

On February 19th, the Illinois Supreme Court dissolved the injunction and a large force of men was put at work to build the coveted crossing. The Chicago & Western Indiana men wrecked a number of cars on the crossing, seriously injuring two men who could not get out of the way in time. After a brisk fight between the opposing forces had been stopped by the police, the wreck was cleared and the street railway completed from 14th St. to 17th St., where tracks had been laid when the injunction was secured in 1898.

It is understood that work will proceed and the road be built in Custom House and Plymouth Places as soon as possible. The men controlling this company are friendly to the Chicago City Ry., and it is thought that eventually the latter will absorb it and thus secure another electric line which will relieve the Clark St. tracks.

A WATER FAMINE AVERTED.

Early in January, the engine which drives the water works pump from which the city of Hartford, Conn., receives its water supply, broke down. The engine being of an ancient type, it was found that it would require from four to six weeks to have it repaired, so that a water famine seemed imminent. In their extremity, the members of the water works board appealed to the directors of the Hartford Street Railway Co. for advice and help in the matter. The directors referred the matter to their general manager, Mr. Norman McD. Crawford. Mr. Crawford informed them that he could take one of the generators from the company's power station, install it as a motor in the water works station and have the pumps running in 24 hours, provided a suitable countershaft and pulleys could be secured. The water board accepted the proposition of the street railway company to provide motor and current up to 400 h. p. The necessary shafting was promptly ordered from New York, and in a few days the pump was running with better satisfaction to the water works engineer than the engine had given. The generator was a G. E. M. P. machine 4-200-425. As the speed of the pump could not exceed 12 r. p. m., it was necessary to reduce the generator (motor) speed 425 through a countershaft. This was successfully accomplished, and the machine ran perfectly, without sparking and at constant speed, and up to February 8th had run continuously and pumped over 68,000,000 gallons. It speaks well for the street railway company that it had machinery and power to spare in such abundance in mid-winter, that it could take the city on its shoulders and lift it out of its plight in so creditable a fashion.

EXTENSION TO RAPID RY. OPENED.

February 26th the Rapid Railway Co., of Detroit, ran its first car from Mt. Clemens to Marine City, operating its new three-phase power house at New Baltimore. Regular service will be started about April 1st and the extension from Marine City to Port Huron will be completed and ready to operate before June 1st. The new power house equipment, which was constructed by Westinghouse, Church, Kerr & Co., operated to perfection.

NEW ORLEANS CARNIVAL BY TROLLEY.

On the occasion of the opening parade of the New Orleans Carnival, on February 21st, the floats were all mounted on electric trucks and were driven by the overhead trolley system. While the feasibility of thus employing electricity for light and motive power in the Carnival parades has often been discussed, it has never before been attempted.

The pioneer was Prince Nereus, and he and his Krewe scored a great success. The pageant was run on the street car tracks, and the motive power and light derived from the trolley wires overhead. But to the spectator the tableaux moved along without any apparent motive force. The tableaux, several of which are shown in our engraving, were built upon specially constructed platforms, placed upon McGuire car trucks. The controller and brake were in the forward part, and the trolley post and pole towards the rear. Each car was equipped with a switch to control the lights and the current for the motive power. It tested the ingenuity of the designer to devise a plan to completely conceal both the motorman and trolleyman, and to so disguise the trolley pole that it would not be recognized. It was a difficult piece of work, especially on account of the radical difference of all the tableaux, but it was accomplished admirably. Due regard had to be exercised as well to give both men ample room to work in, and to see ahead. Though each tableau had a cave in front, and a larger one to the rear, the design comprehended this so cleverly that its purpose was alto-

The New Orleans City Railroad Co. donated to the Nereus organization the use of two car barns to build and store the parade, the use of 20 trucks complete with motors, controllers, trolleys, etc., and in addition furnished the skilled labor to operate them in the parade. Over 4,000 incandescent lamps were employed in the decorations. The movement of the parade was in charge of Mr. H. J. Dressel, superintendent of the company.

The use of the car tracks and power for the purpose was largely due to the recommendation of General Manager Wyman, whose predictions for a grand success were more than realized.

The company also handled an enormous traffic without accident.

ANOTHER ROAD AT ZANESVILLE, O.

The Zanesville, Adamsville & Coshocton Electric Railway Co. has been organized to connect a number of Ohio towns by an electric line. We are in receipt of the following letter from Mr. H. E. Buker, secretary of the company, concerning the project:

"Our proposed electric railway will be about 40 miles in length, and will traverse a section of country that has absolutely no outlet, except the common country roads, and being well acquainted with these roads, I am forced to say that they are very common indeed. In fact, for about five months in the year, people living along the proposed route of our road, are mud bound. We will pass through a country rich in agriculture, and a country that is also supplied with rich mineral fields. We have already been assured that we will

FLOATS IN THE NEREUS PARADE, NEW ORLEANS.

gether lost in the general effect. Take, for instance, the first car, Nereus. The motorman was concealed in the head of the fish, and a small, inconspicuous aperture gave him full opportunity to see ahead. The trolleyman was concealed in the tail of the fish, while the trolley pole was hidden by several seagulls in flight. In the car showing the burning of the Templars, the motorman and trolleyman were concealed in the flames, while the trolley pole was a huge tongue of flame which swayed to and fro with the vacillation of the wire.

be granted a free right of way, and we have already been offered a considerable sum of money by way of a cash bonus, conditioned upon the construction of this road. All this has been offered without any solicitation on our part. Our road will not be difficult to construct, as we will encounter but few hills of any consequence."

The officers of the new company are: President, J. B. Wilson; vice-president, E. G. Abbott; secretary, H. E. Buker; treasurer, W. O. Littick. The general offices are at 47 North 4th St., Zanesville, O.

Power Plant Piping and Accessories.

BY WILLIAM D. ENNIS, M. E.

PART III.

DRIP PIPES.

The drip piping and accessories form of themselves a system. Outlets for water of condensation must be provided at the header, and in long lines of pipe, at several points. Engine cylinders must be dripped, as must also vertical exhaust pipes, separators, exhaust heads, heaters, receivers, and the like. The invariable rules applicable to every drip connection are two: first, tap into the lowest part or pocket of the section of pipe to be drained; second, tap in such a position that the current of steam as it flows from boiler to engine will carry the condensation to the drip opening. To illustrate, suppose, in Fig. 19, that a single header delivers at opposite ends the steam for two engines. The boiler mains are carried into the sides of the header. The drip connections for the section of piping represented, in accordance with the first rule, are tapped in the bottom of the header. To properly observe the second rule, it is necessary that the header should be tapped in

FIG. 19.

two places as shown. If either engine be stopped, the current of steam will be entirely toward the other engine. In case the left hand boiler and the left hand engine should be shut down, the current would carry the condensation away from the main body of the header and the left hand drip opening. Perfect security can only be obtained by dripping as shown. Connections are made to both boilers, so that in case one of them is not operating, all the hot water can be returned to the other boiler, where only it can be of use. Each connection to the boilers must be provided with a check valve and stop valve.

This is the method of dripping ordinarily used for elevated headers. It is of course applicable only where the lowest part of the header is above the water line in the boilers. Separators, if sufficiently high, can be dripped in the same manner.

High pressure drips can also be disposed of by using a gravity return system or return steam traps. Most of these are patented

when taken from the outboard side of the relief or back pressure valve, as from an exhaust head. Engine drips are often disposed of in the same way, but it is most economical to free the water from animal and vegetable oil and return it to the boiler. High pressure drips not returned to the boilers are taken care of by traps. The most essential quality of a steam trap is its durability. It must be depended on to keep working steadily under all conditions. For intermittent service, the writer prefers a gravity or float trap of the simplest possible construction; for constant, high pressure work, expansion traps have given good results.

The disastrous phenomenon known as a "water hammer" is caused by accumulated condensation hurling itself with immense momentum under the action of live steam. For instance, if at the foot of a vertical pipe, the direction of supply being downward, a valve is placed, and no drip connection made, a gradual accumulation of water may take place in the pipe above the valve. Let this go on for some time, and then let the valve be opened. The live steam behind the water column will force it along the pipe with increasing momentum, until it reaches a sharp turn, when something is sure to break.

There is no definite rule for determining the sizes of drip pipes. A bare steam pipe will condense from 3 lb. of steam at 125 lb. pressure per sq. ft. per hour. The efficiency of the covering, dimensions of the section of pipe it is proposed to drain, and steam pressure, being known, it is easy to calculate the amount of condensation and the size of drip pipe for that amount. This however would give sizes very much below those adopted in practice, for the reason that such a formula takes no account of the possibility of a sudden accumulation of condensation. The size must be selected with due reference to the location of the drip. Separator drips are usually fixed with reference to the size of the drip outlet on the separator. Engine drips are planned in the same way. For high pressure steam headers the formula $D^2L \div 200 = d$ may be found of use, in which D equals diameter of the header in inches, L equals length in feet, and d equals drip area required, in square inches. In every case, it is best to err on the side of liberality, and above all, to make the trap, basin, or whatever device is used to dispose of the drips, of a capacity fully equal to any work that may reasonably be given it to take care of. This rule sounds almost like a truism, but in every part of steam pipe design it must be kept constantly in mind.

PLANNING A PIPE SYSTEM.

The scientific side of pipe design is largely comprised in attention to three points; expansion, vibration, and drainage. Let these be provided for, and the rest is merely a question of sizes and standards.

In laying out a piping plant for the estimates of prospective builders, the engines and boilers must usually be taken for granted, and

FIG. 20—CONVENTIONAL METHODS OF DRAWING PIPING.

devices, dependent for their action on the vacuum formed in closed chambers by condensing steam. The piping in connection with the special apparatus is usually very simple, consisting of a main drip line to the point where the apparatus is located, and a return line to the boilers. This return line is preferably of brass.

Low pressure drips can be carried into the blow-off tank or sewer,

the piping made to fit them. The first step is to determine the sizes of condensers, feed pumps, heaters, separators, and pipes necessary. This done, the entire system should be drawn to scale—quarter-inch to the foot being customary, and the piping arranged, not only with a view to the three factors mentioned above, but also with due regard to compactness, elasticity and convenience. The

finished plans, however, should be less crowded than this sketch must of necessity be. For plants of any size a general plan of the building and machinery should first be made. To this should be appended separate plans for the live steam, exhaust, and water piping, unless these systems can be combined without impairing the clearness and simplicity of the diagram. Various methods of representing the pipes and fittings are in use, but for plants of any importance the following conventionalisms are convenient.

Represent flanged pipe, fittings and valves with their flanges, as in A. Screwed fittings may be shown with beaded edges, B, thus being readily distinguished from flanges. All pipes 4 in. in size and above, are represented with two lines, C. Pipes below this size are shown with a single heavy line, fittings with heavy lines and beads, as in D. Spiral riveted pipe should be shown as in E. Bell and spigot, as in F; cast iron flanged, as in G. Large valves should be drawn in detail as in H. Small valves, on double lined pipe, as in I. Still smaller sizes of valves as in J. Hangers should be omitted, they being best shown by details and mention in the specifications.

Specifications for piping vary in intelligence, force, and rigor, to an almost infinite degree. Each consulting engineer has his own preferred form, but for the outside engineer who casually finds himself called upon to draw up a set of specifications for competitive bids for piping a plant, a few suggestions may be of value. The arrangement of items should be somewhat as follows:

- (1. Advertisement and invitation to bidders.)
2. General scope of the work.
3. Description of the boilers, engines, and apparatus to be piped.
- (4. Auxiliaries to be furnished by the contractor.)
- (5. Auxiliaries to be furnished by the owner.)
6. Pipe—grades of each size for various purposes.
7. Fittings—weights, qualities, standards.
8. Valves—kinds, maker, special details.
9. Joints—flanged or screwed, for various sizes of steam and exhaust pipes.
- (10. Pipe covering.)
- (11. Hangers and supports.)
12. Bolts, nuts and gaskets.
- (13. Time of completion.)
- (14. Miscellaneous.)
- (15. Tests.)
- (16. Guarantee.)
- (17. Payments.)
- (18. Extras and deductions.)

The items enclosed in parenthesis in certain cases would be unnecessary. Under 2 should be stated the size and location of the plant, the facilities for teaming, freightage, etc., and the different systems of piping to be furnished. Under 3 the size and types of boilers, engines, condensers, pumps, heaters, separators, etc., should be stated, and where apparatus furnished by the owner is to connect with that furnished by the contractor, the standard of drilling necessary should be described, in order that the latter party may not be delayed in getting out his stock. This paragraph should also describe in a general way the plan of the piping, mentioning all the special apparatus, stating clearly the exhaust arrangement, whether simple-condensing, compound-condensing, or non-condensing, and describing the headers, bypasses, etc., required.

Paragraphs 4 and 5 should settle whether such work as excavation, foundations, cutting of walls, floors, and the like, is to be done by the owner or by the contractor.

Paragraph 10 should specify the makes and grades of pipe covering that will be accepted if this work is to be included in the piping contract. As nearly all steam fitters sub-let the pipe covering, and as it is a distinct and separate kind of work, it is not to be recommended that it be combined with the piping contract.

Paragraph 11 should describe the location, spacing, and character of the various pipe hangers, brackets, and other supports, referring to the plans for details. Under 12 the bolts, nuts and gaskets should be specified, the amount of machining necessary on the two former—whether the heads and nuts are hexagonal or square—and the kind, diameter, and thickness of gasket for various sizes and grades of pipe.

Under 13 should be stated the forfeiture for non-completion of the work in the specified time, if any is required.

Under 14 may be specified such small piping and accessories as cannot be conveniently shown on the plan.

Paragraph 15 should state at whose expense the tests are to be made, what they are to consist of, when they are to be made, what

requirements are to be fulfilled, and what penalties are to be enforced if the requirements are not met.

Paragraph 18 should arrange for the amicable adjustment of questions as to extra work and deductions from the work in the contract; stating whether the decision of the engineer is to be final, or whether an appeal to a mixed board of arbitration may be made. If the latter, the composition of such board should be specified.

A methodical arrangement of procedure is vastly preferable to the haphazard way in which some managers who possess the requisite knowledge and skill for planning their own pipe systems often express their wishes on paper. Such a method the writer has endeavored to set forth. Even for a small addition to an existing plant, it pays to draw up a regular specification, and the time spent in doing so will never be wasted.

"ANNOYANCES."

BY G. J. A. P.

The lot of a superintendent of a road, where he must be a "little of everything" is not a very happy one and this is particularly true when his equipment is insufficient and he is obliged to hustle through repair works when a car is disabled, in order to get it out and keep up the service. Many of his experiences are exasperating yet the mishaps have their amusing sides.

An annoying occurrence came up some time since, in which an F. 30 armature newly rewound at the factory was the cause of the writer's righteous anger. The motorman—a careful one—reported that the commutator would "flash fire" all the time while coming towards the house. Careful examination showed the brushes, yoke and commutator to be in perfect order and tight. No signs of sparking were noticeable until a curve was reached, when the flash was very pronounced. On reversing the motor and going back over the line there was no sign of sparking. A chalk mark was made on the armature hood and down over the shaft, and the run back continued; when the first curve was reached, a "squeak" came from the armature and the flash was there. The reader can imagine my sentiments when on inspecting the chalk marks it was discovered that the wire had turned one-third way round on the core!

An occurrence, as interesting as it is rare, took place in the power house during a day of heavy travel. The pull became so hard toward evening that the voltage died down to where the lights represented mere "red strings in bottles." The night man stated that the needle in the ammeter went clear out of sight. The car, supposed to be the offender, was brought in and thoroughly examined, but found in fine shape and returned to the line. Another car was brought in, and it was then noticed that bringing in any one car overcame the trouble to some extent. Changing engines and generators showed the load was only normal for the number of cars running. Examination of the first generator failed to disclose any trouble. Starting up again, the voltage built up as usual, but, as soon as the load was thrown on the same trouble appeared. Placing a speed indicator on the engine showed that it was running at the regulation speed, but placing it on the generator it was found that as soon as the load exceeded 100 amperes the armature slowed down to half speed. The trouble was only a new belt slipping so nicely and quietly that the most sensitive ear could not hear it.

One rainy, cold afternoon, when all hands (that meant two) were taking life easy, the following telephone message came from a motorman: "The commutator on car 13 exploded, and is scattered all over the street." The car was brought in and another armature substituted, first examining the commutator very closely and finding it to be sound. The motorman had gone only a half mile when he sent in the same message as before concerning the same car! Still another commutator was put on that night by a faithful young man who volunteered to "sit up and repair the leads of the corpse." The car went out the next morning and is still in service.

Perhaps some of your readers have experienced the delightful sensation of being on a car when a motor broke from the nose beam, bringing the car to a stand still, quicker than if it had been "plugged." The motorman made a quick "ground"—over the dasher—and the only passenger, a young lady, was uninjured but she did not like the way the car stopped. To quote the motorman: "She just roasted me good and plenty, for stopping so quick. I tried to explain what had happened, but no use; she would have it, that I had no business to stop so quick as that."

Electric Tramways of Coventry, England.

The Coventry Electric Tramway Co. has been operating some seven miles of road, including turn-outs, for about three years and has recently completed extensions which make its total trackage $12\frac{1}{2}$ miles, of which $8\frac{1}{2}$ is single track. There was at first some prejudice against the electric cars, and especially to the overhead trolley system, but the steam tram had become quite unbearable, so the people finally became venturesome enough to permit the electric tram on one of the streets. When once the electric tram had been thoroughly tried, the fair minded citizen said, "I scarcely see how we ever got on without them." So when application was made for an extension of the system, the officials were encouraged and received the support of those who had to travel on the line.

The new extension necessitated a change in the location of the power house which was too far from the center of the system, and not near any good water supply. The new power plant is situated on the bank of the canal, from which water is secured and by which coal can be placed at the very door of the coal shed. It is also much nearer the center of the system than the old one.

The general arrangement of the power plant, shops, and yards is apparent from an inspection of Fig. 1. The boiler room is 40×60 ft.

sure cylinders 13×13 in. added when the present station was built. These two engines are belt connected while the other two are direct connected to their generators. All four generators are of the Westinghouse make, of 100 kw. capacity and give 500 volts at no load and 550 volts at full load. The two generators that were in the old station have four poles and run at 650 r. p. m.; the two new ones have six poles and run at 250 r. p. m.

In addition to this main equipment, there is a small lighting unit consisting of a Westinghouse single acting engine and generator. This generator is of 17 kw. capacity and furnishes current at 500 volts, so that it can be used to drive the shop motors in case night work is necessary.

The condensing plant is located in a pit in the engine room floor and comprises two surface condensers with 450 sq. ft. of surface each, two vertical air pumps $12\frac{1}{4} \times 8$ in., making 100 double strokes per minute when the driving engine runs at 300 r. p. m., and a centrifugal circulating pump belted to the engine.

The switchboard was also furnished by the Westinghouse company. It is of marble and consists of eight panels, four for the generators, two for feeders, one for Board of Trade instruments

COVENTRY ELECTRIC TRAMWAYS.

and is equipped with four Babcock & Wilcox boilers, two rated at 172 h. p. and two rated at 106 h. p., all of which are fitted with patent mechanical stokers and grates and endless chain conveyors made by Bennis & Co., of Bolton. The grates have open ash-pits and steam-jet fire bars. In one of our illustrations there are shown three views of the conveyor and stokers; the conveyor takes coal from the store house, which has a capacity for 500 tons, and delivers it to the stokers. In this connection it should be stated that the company has a market for its ashes which not only cost nothing for removal but are paid for.

There are three Worthington feed pumps with 3-in. plungers. Adjoining the boiler room is a Green economizer of 240 tubes; the scrapers for this are driven from a small steam engine used in the old plant.

The engine room adjoins the boiler room, being separated by a brick wall. It is 25×80 ft. and covered with slate. The slates are nailed to three inches of coke breeze laid on sheet iron, supported by steel framework. The floor is asphalt on concrete. The foundations for the engines and generators are constructed of 2 ft. of concrete and 4 ft. of brick laid in concrete.

There are four tandem compound condensing engines each rated at 150 h. p. Two of these were originally installed as simple non-condensing engines with cylinders 13×19 in., and had high pres-

and one for the lighting circuits of station. There are two Weston voltmeters, seven Westinghouse ammeters and four Thompson wattmeters.

The station, car shed, shops and office may be lighted by the small lighting unit mentioned, which is run only after the rest of the plant is shut down, generally from about 1 o'clock until daylight.

The engine room is furnished with a 5-ton crane. It is worked by hand power and is heavy enough to handle any piece of machinery in the room.

The stack is of brick, circular above the base, and lined with fire brick to a point 6 ft. above where the flue enters. The base is of concrete, 22 ft. square and extends down 12 ft. to solid rock. The stack is 100 ft. high and 6 ft. 4 in. in diameter at the top.

The building for the car shed and shops is 60 ft. wide, and 93 ft. long; 58 ft. of it is used for the car shed, and 35 ft. for the shops. There are six tracks, three of which have pits and run the whole length of the building, while the other three run the length of the car shed only, and have no pits.

The shops are divided into three parts, known as the paint shop, carpenter shop and general repair shop. They are equipped with modern conveniences and the necessary machines. In the carpenter shop is a band saw, a universal planer and circular saw.

and a wheel grinder, all of which are driven by a 10-h. p. Westinghouse motor. In the machine shop are several lathes, a wheel-press, power hack-saw, two drilling machines, and a tool grinder, all driven by a 5-h. p. Westinghouse motor, which also drives the blower for the smithy just outside the shop.

The offices are located just in front of the car shed. All these

brackets being designed by Mr. I. E. Winslow, chief engineer. Fig. 5 shows the details of these bracket arms. No. 1 is the arm used for double tracks, while Nos. 2 and 3 are the arms used for single track; it will be noted that they are designed for the use of double trolley wires. As will be seen the suspension wire is run between the prongs of the bracket which are sufficiently wide apart

FIG. 1 PLAN OF POWER PLANT, SHOPS AND YARDS.

buildings are of brick. They are substantial in appearance; the architecture is pleasing, and the plan is excellent.

The track, 3 ft. 6 1/8 in. gage, is laid with grooved rails weighing 65 1/2 lb. per yd. The groove is 1 1/4 in. deep and the tread is 1/8 in. higher than the lip of the groove; the tread projects above the pavement and allows considerable wear before it gets below the street level. The rails are clamped to steel cross-ties spaced 10 ft. c. to c. The ties are 5 ft. long, and like an inverted trough in section; width of the tie at the top is 3 in. and at the bottom, measured over the flanges, 6 in.; the depth is 2 1/4 in. and the thickness of the metal 3/4 in. Half way between the ties are iron tie-rods 1 1/2 x 3/4 in. in section. The foundation for the roadbed is a layer of concrete 6 in. deep, in which the ties are imbedded so as to have the tops flush and thus let the rails bear on the concrete throughout their entire length. The rails are 6 in. high and the paving

to allow the trolley car to rise between them. In case of a loose suspension, to prevent the trolley wire from coming in contact with the bracket and being short-circuited, a guard is placed above each suspension. Guard wires are placed above the line where there are telephone or telegraph wires crossing it.

FIG. 3—FALK JOINTS AND MOLDS.

stones used 5 in. deep, thus giving space for a bedding of concrete 1 in. thick. Concrete is placed between the paving and the rail webs, as appears from Fig. 2.

The joints are all cast-welded by the Falk process. The dimensions of the joint and molds are given in Fig. 3. The special work is of 85-lb. rails, all welded; at the switches all portions below the tongue are welded together.

Fig. 4 shows the long arm trolley pole used; the poles are of steel in three sections and are 30 ft. long. The bracket arm is unusually long from an American point of view, the center of the trolley line being 12 ft. from the pole. This distance, of course, varies with the width of the street. The bracket is affixed to the pole at a point 2 ft. from the top and the pole is set 6 ft. in the ground, which brings the wires 22 ft. above grade. The feeders are laid underground in the city and where connection is made with the trolley wires they are carried up the interior of the poles; the detail drawings in Fig. 4 show the construction where the feeders enter and leave the poles.

The insulators are supported by two wires fixed in harps, the

FIG. 4—POLE AND FEEDER DETAILS.

The trolley lines are divided into half-mile sections, which is required by the Board of Trade regulations. A switch is placed on the pole at each of these section insulators which is normally closed and carries the current around the insulator to the next section.

There are four distributing boxes placed at important feeding points along the line, each being supplied by one of the four feeders; three of the feeders are of .24 sq. in. cross section and 900 ft., 3,900 ft. and 5,700 ft. long respectively; the fourth one is of .5 sq. in. section and 3,600 ft. long. In the distributing boxes there are

fective radius at each point bears a constant ratio to the sine of the angle the trolley arm makes with the axis of the standard. The tension of the springs, being transmitted to the trolley arm by a wire cable which runs over the cam, it is evident that the upward thrust at the trolley wheel is always the same. The sec-

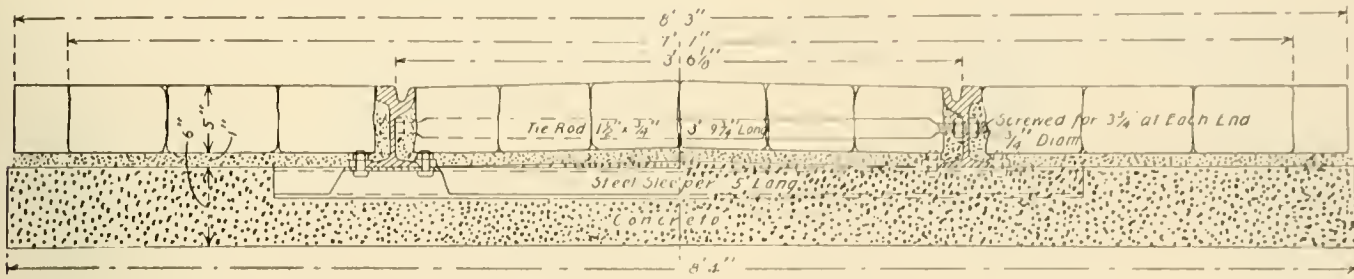

FIG. 2—SECTION OF TRACK CONSTRUCTION.

switches for controlling the feed to the line. Running parallel to the whole track are test wire which connect the station directly with any point on the line where testing may be desirable.

There are no insulated return feeders, but the rail return from the old line, five miles long, is supplemented by old rails laid four in parallel with plastic bonds at the joints.

While, as stated before, the trolley poles are designed to carry the wires 22 ft. above the street, there are a number of points on the line where by reason of bridges the clearance had to be reduced to 16 ft. To meet this variation and yet maintain a uniform pressure

tional view of the standard shows the hood which prevents water from entering the interior.

The company has 10 old motor cars, 10 new motor cars and 5 trailers; all the motor cars are equipped with two 20 h. p. Westinghouse motors, and the series-parallel controllers. They are all double decked and mounted on Peckham single trucks. The capacity of the new motor cars is 26 persons inside and 26 outside. The trailers carry 20 outside and 20 inside. The old cars are very narrow, being only 6 ft. over all. The new ones are 6 ft. 6 in. The extra 6 in. adds a great deal to the convenience of the cars.

FIG. 5—DETAILS OF BRACKET ARMS AND HANGERS.

of the trolley wheel on the wire, Mr. Winslow designed a special standard which is shown in Fig. 6. The springs are placed vertically within the standard; the swivel head of the standard and the pivot of the trolley arm are both provided with ball bearings. The trolley arm on the short end has a cam so designed that the ef-

The car bodies were all furnished by the Brush Electric Co. The cars having reversible back seats are much more popular than those which have one long double seat running the whole length of the top of the car. The passengers much prefer facing the direction the car is moving.

Fig. 7 is a section of the wheels used, and shows the shallow flanges used.

Coventry has been fortunate in having its tramway lines placed in such good hands as the New General Traction Co., Ltd., and

FIG. 6—TROLLEY STANDARD.

Mr. I. E. Winslow deserves much credit for the pioneer work he has done in constructing this road. He is one of the engineers in England who does not befriend side trolley wire and the swivel

FIG. 7—SECTION OF CAR WHEEL.

trolley wheel and stand, and if the reports that come from some roads using the swivel trolley and side wire system are true, he certainly has good grounds for the position he takes. Mr. R. T. Whitehead is resident engineer and manager of the system.

The Cleveland Electric Ry. has let the contract for an addition to its Cedar Ave. power house and will install a 1,600-kw. unit.

The Consolidated Street Railway Co., of Worcester, Mass., takes an active interest in the welfare of its men and has arranged a number of pleasant concerts and entertainments for their benefit. It also permits sacred services to be held Sunday mornings, at the car barn, and which are conducted by pastors from the different churches in the city.

PREPARING FOR A CONVENTION.

Mr. W. H. Holmes, president of the Metropolitan Street Railway Co., of Kansas City, is making preparations for handling the crowds which will be at the city during the Democratic convention in July next. The company has had much experience with crowds during the carnival weeks and Mr. Holmes expects that with the sundry improvements, which will be completed before July, he can show visitors a model transportation system.

MAINE COMMISSIONERS MAKE DECISION.

At a recent hearing the Railroad Commissioners of Maine refused to approve the application of the Biddeford, Kennebunk & Wells Electric Railroad Co., of which the promoters are William A. Roberts, Edgar A. Hubbard, Ex-Mayor Chas. S. Hamilton, Ex-Mayor Jas. O. Bradbury of Saco, Me., and others, for power to build an electric railway from Biddeford to Wells, through the towns of Kennebunk and Kennebunkport, on the ground that the route of the proposed road was in part over Main St. in Kennebunk, where the tracks of another company are already laid. An appeal will probably be made to the courts from this ruling.

Referring to the "good faith" required by the statutes of promoters applying for permission to construct, maintain and operate an electric railway the Commissioners said: "Of course the high standard of faith, which is defined as 'the substance of things hoped for, and the evidence of things not seen,' cannot be expected in street railway affidavits, yet those who make them should not be wholly satisfied with mere form, when the substance may be entirely lacking."

The Board also makes the ruling that under the public laws of the state the charter of any electric railroad company becomes null and void if the road is not built within two years. According to this, it is stated the charter of the Saco River Electric Railway Co., whose road is not completed, expired last July.

The present commissioners since they have been in office have approved the articles of association of 10 electric railway companies.

OPERATING CONDITIONS IN TOKYO.

From the Japan-American Commercial Journal, published at Tokyo, Japan, we take the following information concerning the conditions under which the Council of Aldermen in that city has granted franchises to a new tramway company.

The total length of the routes shall be 200 miles. When the city deems it necessary, for the purpose of improving, relaying or reconstructing roads, sewers or water pipes, it may remove the street railway tracks without paying compensation. The motive power is to be compressed air, storage batteries or the single or double overhead trolley system. In case the single overhead system is used, the concession shall be granted only when all possible precautions have been provided to prevent leakage currents from the return circuit.

After paying a dividend of 7 per cent in any one year, and the necessary charges to sinking fund, the company shall pay to the city one-third of the remaining surplus.

Other conditions are: Where streets are not wide enough to permit tracks to be laid the company shall widen such streets at its own expense; the company shall keep in good repair a strip of the street 18 in. wide on both sides of its tracks; it must sprinkle the streets in summer and remove snow in winter; it shall bear a share of the expense incidental to the repairing, widening or building of bridges and drains on its route; when altering or fixing the rates of fares the company shall first secure the consent of the city; on the expiration of the term of charter the city may buy up the whole concern at current valuation; the city reserves the privilege of appointing an official supervisor for the company when it deems such a step necessary, and also of examining its books at any time.

The Grand Rapids (Mich.), Holland & Lake Michigan Rapid Ry. hopes to have its cars running by May.

The services of a wife are valued at \$12 a week according to a suit brought against the Harrisburg (Pa.) Traction Co., by the husband of a woman injured by one of defendant's cars.

Street Railway Mutual Benefit Associations.

The United Traction Relief Association, of Allegheny City, Pa., then known as the Pleasant Valley Beneficial Society, of Allegheny, Pa., and composed of employes and ex-employes of the Federal Street & Pleasant Valley Passenger Railway Co., was organized in May, 1893, with 50 members. The name was changed in June, 1897, because of changes in the street railway company. Up to Dec. 31, 1895, the total receipts of the association were \$3,904, and \$2,376 had been paid for sick benefits and \$600 for death benefits.

Later financial figures are not at hand except for the year 1899, when the death claims amounted to \$600 and the sick benefits to \$1,860. The present membership is 310.

From a copy of the constitution and by-laws for which we are indebted to the secretary, Mr. S. S. Perrine, the following data are taken: Any person in the employ of the United Traction Co. who is in good health is eligible to membership, and shall retain his membership upon leaving the company's service so long as he shall be in good standing with the association; but having left the company's service and also withdrawing from the association, he cannot again become a member unless he shall first be employed by the company.

The admission fee is \$1.00, and the dues 10 cents per week, which amounts the member authorizes the paymaster of the United Traction Co. to withhold from wages due. In event these dues will not pay the benefits provided an assessment to pay death benefits will be made. When in arrears for 13 weeks a member is suspended, and if his dues remain unpaid after 24 weeks his name is dropped from the rolls. Men may be reinstated by a majority vote, but cannot participate in benefits till four weeks after all dues have been paid up.

When a member shall be reported sick, and the illness is not the result of intemperance or vicious habits, he shall be entitled to \$5.00 per week beginning after the third day's illness, unless the disability is the result of accident in which case the benefits begin with the first day. Benefits will not be allowed to continue for more than 12 successive weeks, in which case 12 weeks more must elapse when benefits may be paid for another 12 weeks if necessary; after paying benefits for 24 weeks, further claims for that particular illness will not be recognized.

On the death of a member \$100 will be paid to his beneficiaries.

The elective officers are a president, a vice-president, and a secretary and treasurer. The relief committee consists of five members appointed by the president and serve without pay for terms not longer than three months. The secretary and treasurer is paid a salary of \$100 per annum. The company's paymaster merely deducts the dues from the men's wages and his responsibility ceases when the money so collected is turned over to the association's treasurer.

The Employes Mutual Benefit Association of the Syracuse (N. Y.) Rapid Transit Co. was organized Jan. 1, 1899, largely through the efforts of Mr. C. Loomis Allen, then general manager of the company, and now has a membership of 148. Mr. Theodore Morrison, secretary of the association, has sent us a membership book which contains the constitution and by-laws and a certificate of membership which is signed by the secretary and issued to the new member.

Membership is limited to employes of the company and terminates on leaving its service. All persons who had been in the employ of the company for three months on Dec. 1, 1899, and those entering the service later who are between the ages of 21 and 45 years are eligible to membership on passing the medical examination.

The dues are \$1.00 initiation, 50 cents per month, and such assessments (not exceeding 50 cents in any one month nor \$3.00 in any one year) as may be necessary to pay the benefits allowed. Dues are not payable while a member is sick or disabled.

The sick benefit is \$1 per day after the first seven days and no member shall draw more than \$90 sick benefits in any one year. In case of death the beneficiaries of the deceased receive \$150, but out of this sum the association in its discretion may expend not exceeding \$60 for funeral expenses and \$30 for other urgent expenses incidental to the death of a member.

The officers are a president, a vice-president, a secretary and a treasurer chosen by the association by ballot. There are also eight trustees who with the president of the association constitute the executive board; the trustees are apportioned among the different departments of the service and each is chosen by the members in the

department he represents. Vouchers and warrants on the treasurer are countersigned by the general manager of the company.

The association has paid \$1,953 in sick benefits and \$300 in death benefits since its organization. At the time of organization the Syracuse Rapid Transit Railway Co. made a donation of \$500 to the association and provided meeting rooms; in these rooms are two pool tables and a library.

The New Orleans Traction Co. Employes Aid Association was organized Mar. 25, 1896, with about 650 members. The management is by a board consisting of the president of the New Orleans City Railroad Co., three other active members whom he may appoint and seven members, one elected from each of the seven branches, making a governing board of 11 members.

Any employe in good physical health and of Caucasian birth is eligible for membership, and all applicants must submit to medical examination. The regular dues are initiation \$1.00, and 50 cents per month; an assessment of 50 cents is levied upon the death of a member and 25 cents upon the death of a wife of a member or the mother of an unmarried member dependent upon him for support. Benefits are also paid on the death of children under 14 years of age.

Sick benefits of \$3.00 a week are allowed for six consecutive months, after which benefits cease. A death benefit is an amount equal to 50 cents a member at the time of the death. Besides these benefits, the association provides a physician for the member and his family, for medical and minor surgical attendance, and also provides free medicines for the members and their families.

Since its organization the association has paid 16 death benefits for members.

The present officers of the association are: President, W. G. Lusk, painter in the shops; vice-president, H. J. Dole, pitman; secretary, Ed. Holt, conductor; treasurer, A. H. Ford, secretary and treasurer of the New Orleans City R. R. The following data are from the treasurer's annual statement for the year ending Jan. 9, 1900, sent us by Mr. Ford:

RECEIPTS.	
Cash balance on hand Feb. 16, 1899	\$ 785.79
From dues and assessments of members	4,610.35
From New Orleans City R. R.—subscription	1,000.00
Total	\$6,396.14
DISBURSEMENTS.	
5 Member Death payments	\$1,072.00
8 Wife and Mother Death payments	400.00
13 Child Death payments	195.00

Annunciation	117	51
Total	839	426

In touch with the Magazine Station are the shop and power house employes, 65 in each. Possibly but a small number of these employes are not eligible to membership in the association, but many belong to other associations. In addition to these employes, there are 188 men on the overhead and track forces. A few of the latter are members of the Aid Association, but this is a changing force, which condition keeps many of them out of the association. The membership of the association at present is principally and almost entirely among the station and car employes.

Mr. Ford's report concludes: "Since organization, not quite four years, the receipts from members have been \$16,712.77 and subscriptions from the company \$3,500, a total of \$20,212.77, nearly all of which large amount has been paid out on hundreds of claims for sickness and death, going directly into the families of our members and in many cases relieving them of absolute want or helping them over a hard place while the family support was disabled. Your treasurer has seen much of these sufferings and can testify to the

great good our association is doing. Our affairs are in a prosperous condition and I can see no reason why every fellow-employee should not be with us and sharing the benefits.

"We have passed through the experimental stage, have kept every promise and paid every obligation, and our association is now upon a solid foundation and working upon a broad and safe plan. We should not fail to hold in grateful remembrance the substantial help our employers are giving us, for to this help is due in great measure our success."

The Street Car Mutual Benefit Association is the organization formed among the employes of the Union Railroad Co., of Providence, R. I., and the following concerning the association is extracted from an "official souvenir" recently issued by it, and of which we have received a copy from the secretary and treasurer, Mr. D. S. B. Allardice.

"The association was formed in 1894 by a few conductors and motormen, who believed in insurance, and especially in that form that affords assistance to the living in times of sickness and distress. They reasoned that if it was wise for wealthy men and for men receiving large incomes or salaries to provide for their families by insuring their lives for large sums running up into the thousands, it was more than wise for the working man, whose daily earnings support himself and his family, to lay aside a few dollars from time to time, while enjoying good health, and thus to provide for a future possible need, rather than to depend upon cold charity when sickness cuts off the weekly earnings, and when the expenses for medicine, nurses, doctors, food and other supplies are greatly increased—coming to the member of the association as a right and not as a charity and when it is most needed, supplying little comforts and accompanied by cheering words to the sick one, it brings a gleam of sunshine and hope into his home and assists his recovery.

"Does a man love his wife, children or parents dependent upon him for support? Can he be so selfish as to decline to lay aside a small part of his earnings for their benefit or perhaps for his own relief when he becomes helpless? Will he permit a fellow employe to suffer for the want of necessary food and medicine, when that person would hasten to his assistance under like conditions?

"The wisdom as well as the peculiar advantage of this fraternal assistance has already been well demonstrated in other organizations of this nature. It is therefore no experiment.

"All intelligent and true men recognize the blessings bestowed by life insurance. In these insurance companies are found men noted as governors, statesmen, bankers, manufacturers and otherwise prominent and whose great wealth would seemingly place them or their families beyond all possible need of assistance, and yet they recognize the uncertainty of wealth and provide for future emergencies. Far more does the wage-earner need assistance today or tomorrow when accidents or sickness overtakes him with no accumulated wealth to draw from.

"This relief association was organized Nov. 5, 1894, with no funds in its treasury. It has paid from its receipts to sick members over \$400; and to the widow of the only member dying in that time, \$100, and there still remains on deposit in bank, over \$600 for future needs.

"The only assistance received by the association from the public was derived from a concert and ball given in Infantry Hall a few years ago. While this organization has been dispensing its assistance many of the employes not members of the association have fallen by the wayside, leaving their families, in many instances, in destitute circumstances and the objects of pity and charity, when if they had been members they would have been promptly and kindly relieved.

The business affairs of the association are managed carefully and economically; none of its officers are paid for their services. A board of directors, chosen annually, one from each station, elect from their own number a president and a vice-president, and from the association a secretary and treasurer. All employes of the Union Railroad Co., having been in its employ for six months, between the ages of 21 and 50, having a good moral character and capable of passing a physician's examination, may become members of this association.

The cost of membership is as follows: Admission fee \$5, yearly dues \$8, payable quarterly in advance; assessments, \$2 on the death of each member. The benefits allowed a member are, \$5 a week for 13 weeks, after the first week's sickness, and should the sickness

continues they may be continued by a vote of the directors. Upon the receipt of proof of the death of a member his wife or children are paid \$100, and this sum is to be made larger when the membership has increased sufficiently to warrant doing so.

"It can thus be clearly seen by this brief sketch of the methods of affording relief and transacting its business that this association is not a money-making enterprise, dependent upon trade conditions, nor a labor union for adjusting troubles between the employer and employed."

The "souvenir" from which the foregoing history of the association is taken is a pamphlet of 68 pages; it includes a copy of the constitution and by-laws, the portraits of officers of the association, officers of the Union Railroad Co., the Governor of Rhode Island and other prominent persons, and some 42 pages of advertisements.

The Capital Traction Employes' Relief Association is the present name of an association organized among the employes of the Washington & Georgetown R. R., of Washington, D. C. The change in name was a consequence of the absorption of the Washington & Georgetown road by the Capital Traction. The relief association was organized Aug. 2, 1886, with a membership of 236, which increased to 257 in 1889 and to 457 in 1897; the present membership is 403.

Any employe of the company between the ages of 21 and 50 is eligible for membership. The management is chosen by ballot on the first Wednesday in January of each year. There is no initiation fee and the dues are \$1 a month with an assessment of 50 cents in case of the death of a member and 25 cents in case of the death of the wife of a member. The sick benefit is \$1 for each day (except Sunday) so lost, but if a disability shall continue for more than six months the benefit is reduced to 50 cents per day and ceases after one year. No sick payments are made in cases of disability of less than six working days. The death benefit is \$100 on the death of a member and \$50 on the death of a member's wife. Members withdrawing from the service of the company shall withdraw from the association and are entitled to receive the full amount of contributions paid by them less their pro rata share of disbursements made during the time they were members.

Moneys and securities belonging to the association are entrusted to the custody of the treasurer of the company, subject to the order of the management. The association now has a surplus of \$5,539.46, of which amount \$5,000 was donated by the company.

In addition to the relief features the association receives savings accounts, on which it pays interest at the rate of 5 per cent per annum. The amount on deposit January 1st was \$67,231.87.

The secretary of the association, Mr. H. D. Crampton, advises us that by reason of the destruction of the records by fire some time since, he cannot state the total of death and sick benefits paid. In a statement concerning this association published in the "Review" for February, 1897, the total of sick benefits paid up to Jan. 1, 1897, was given as \$18,030 and the total of death benefits as \$4,000. In 1899 the amounts were \$3,000 for sick and \$200 for death benefits.

 FORM 3.

CAPITAL TRACTION EMPLOYEES' RELIEF ASSOCIATION.

No. ... WASHINGTON, D. C., 18

THIS CERTIFIES that

employed as a ... by the Capital Traction Company, is a member of this Association, and is entitled to all the benefits enjoyed by contributors to its Relief Fund, as herein set forth.

President.
Secretary.

Constitution and By-Laws subscribed to by me, this day of 18

WITNESS:

[SEAL.]

FORM 1.

CAPITAL TRACTION EMPLOYEES' RELIEF ASSOCIATION.

APPLICATION FOR MEMBERSHIP.

To the Secretary of the Capital Traction Employees' Relief Association:

I, ... of ... in the service of the Capital Traction Company, apply to be admitted a member of the CAPITAL TRACTION EMPLOYEES' RELIEF ASSOCIATION, hereby consenting to be bound by the rules of the Association as set forth in the Constitution and By-Laws, which I have read (or have heard read to me), and also to conform to, and be bound by, such additional by-laws, rules, and regulations as have been, or may hereafter be, adopted by its Committee of Management, in accordance with the provisions of its Constitution.

I also agree that \$1.00, in addition to the death assessments, shall be deducted monthly, in advance, from the wages that are now, or may hereafter become, due me, in order to secure to myself, or in case of my death, to ...

or if there shall then be no such person, to my legal representatives, the benefits and return of contribution secured by said rules, by-laws, and regulations to contributors to its relief fund.

I certify that I am correct and temperate in my habits; that I am now in good health; that I have no injury or disease which will tend to shorten my life, and that I am ... years of age.

I do hereby acknowledge, consent, and agree that my suspension or discharge from, or voluntary severance of my connection with, the Capital Traction Company shall forfeit my rights of membership in the above-named Association, and all benefits arising therefrom, except the return of contributions as provided for in its Constitution and By-Laws.

In witness hereof, I have signed these presents this ... day of ... 18 ... [SEAL.]

WITNESS:

FORM 2.

RECEIPT FOR SICK ALLOWANCE.

Received this day from the CAPITAL TRACTION EMPLOYEES' RELIEF ASSOCIATION, by the hands of the Treasurer, the sum of ... Dollars (\$...), the same being full allowance, which, as a member of said Association, I am entitled to receive from its funds for the period commencing ... and ending ... 18 by reason of sickness incurred in the service of the Capital Traction Company.

I declare, on honor, that during the period above stated I have not been able, by reason of said sickness, to perform my accustomed labor, and have not done work of any kind for pay

(Sign)

Member of Association.

FORM 4.

This association was organized through the efforts of Mr. Henry Hurt, who was then president of the Washington & Georgetown company.

The constitution and by laws of the association are printed on the first pages of the individual pass books, one of which is issued to each member and in which his account with the association is kept. These books are about 4 x 6 in. and contain 34 blank pages ruled for the account. Following the constitution and by laws is a certificate of membership shown in Form 1.

The application form is printed on a sheet 8 x 10 in. and is shown reduced in Form 2. The physician's certificate of disability and the receipt for benefit received are on opposite sides of a sheet 7 x 8 in., and are shown reduced in Forms 3 and 4.

INSTRUCTION BY CORRESPONDENCE.

During the last 10 years an entirely novel method of education has been developed in this country and has proved to be extremely popular because the instruction, being carried on by correspondence, was available to a very large number who had neither time nor money for a regular course in the engineering schools.

The growth of the International Correspondence Schools of Scranton, Pa., which are typical of this method of education, has been so rapid as to be phenomenal. They developed originally from a demand made by the miners of Pennsylvania for education to help them pass the mine law examinations. Mr. T. J. Foster, manager of "The Colliery Engineer and Metal Miner," Scranton, prepared, in 1891, a course of study in mining to meet this demand, and from this small beginning the schools have grown until now there are some 70 separate courses with 150,000 students enrolled.

The system of instruction is based fundamentally on "instruction papers," which are pamphlets of from 30 to 150 pages, convenient for the pocket and hence for study at any available time. These papers are frequently revised to make them clearer on points which correspondence with students shows are most difficult, are made as simple in style as the subject will permit and are freely illustrated. Each course is made up of from 1 to 60 instruction papers and accompanying "question papers" containing test questions. These papers become the property of the student, who, however, agrees to reserve them solely for his own use.

The instruction of a student is carried on as follows: When he enrolls he is sent the first two instruction papers with their question papers. After thoroughly studying the first instruction paper he writes his answers to the test questions and sends his work to the Schools for examination and correction, and continues with the second paper. All corrections are noted in red ink upon the student's work, which is then returned to him with suggestions for improvement, and so on until the course is finished. The student is obliged to pass a final examination in all the subjects before a diploma is issued to him.

When a student desires assistance from his instructors he uses an "information blank" provided for the purpose, and the information is promptly given him in personal letters. If he fails to send in work within a reasonable time it is presumed that he is not progressing and he is urged to resume. A special instructor is provided for him if he so desires; thus many backward students are enabled to finish their courses. Each student is provided with a complete set of instruction papers in the form of bound volumes.

The subjects taught by mail include all branches of mechanical, electrical, steam and civil engineering, mining, architecture, plumbing, chemistry, bookkeeping, stenography, lettering and English branches.

That new lines often create their own traffic is well shown in the case of the extension of the Helena Power & Light Co., of Helena, Mont., to East Helena. The new branch runs through a thinly populated country to the little smelting town, but the travel has already reached large proportions and is increasing.

The Toledo (O.) Traction Co., in anticipation of next summer's demands, has ordered 13 new 38-ft motor cars, having a seating capacity of 65 passengers each.

Operating Expenses of Connecticut Roads in 1899.

In accordance with our custom, we give below extracts from the report of the Railroad Commissioners of Connecticut and itemized statements of operating expenses on a car-mile basis. The report covers the year ending June 30, 1899.

Since the 1898 report, the Waterbury Traction Co., the Central Railway & Electric Co. (New Britain), and the Norwalk Street Railway Co. have passed under the control of the Connecticut Lighting & Power Co. The Fair Haven & Westville road has acquired the New Haven Street Ry. The Hartford & West Hartford Horse Ry. has been placed in receiver's hands. The Milford Street Railway Co. and the Meriden, Southington & Compounce Traction Co. present their first reports this year.

The street railways of the state carried 59,084,702 passengers during the year, as against 50,269,468 passengers carried by the steam roads of the state which have more than seven times the mileage.

The total length of street railways in operation June 30, 1899, was 416.233 miles, exclusive of 26.351 miles of siding; the increase during the year was 29.222 miles of main track and 1.956 miles of siding. The roads having the greatest mileage are the Hartford Street Ry., 65.9 miles; Fair Haven & Westville R. R., 60.9 miles; Bridgeport Traction Co., 53.6 miles; Connecticut Light & Power Co., 25.6 miles.

The total capital stock authorized is \$23,328,000, of which \$12,715,948 is issued; the increase during the year was \$2,264,908. Per mile of road the capitalization is \$30,550.07, not including sidings, and \$28,731.15 including sidings.

The total amount of bond issued is \$10,608,800, an increase of \$580,000 during the year. Per mile of road the bonded debt is \$25,487.65, not including sidings, or \$23,970.14, sidings included.

The floating indebtedness is \$1,341,314.31, an increase of \$582,486.27 over the previous year. The total of stock, bonds and floating debt is \$59,260.23 per mile of track not including sidings, or \$55,731.94 per mile including sidings.

The cost of construction is placed at \$50,452.17 per mile not including sidings and \$47,418.30 per mile including sidings. The corresponding figures for cost of equipment are \$6,162.34 and \$5,795.43. The totals are \$56,614.50 and \$53,243.71. The figures include the cost of lighting plants in some instances.

The gross earnings were \$3,040,886.83, which is \$7,305.73 per mile of track operated, \$0.2082 per car-mile and \$0.05147 per passenger.

Operating expenses were \$1,919,378.24, being 63 per cent of the gross earnings. The operating expenses were \$4,611.31 per mile of track, \$0.1314 per car-mile and \$0.03248 per passenger.

Dividends were paid by 15 out of 31 companies reporting, the amount being \$343,000 on \$9,940,000 of capital. No dividends were paid on \$2,775,948 of capital stock.

Interest charges were \$468,848.26, including all of the bonded debts save that of the Hartford & West Hartford Horse R. R.

The taxes paid aggregate \$150,276.61, which is .7 per cent on the cost of construction, 4.9 per cent of the gross earnings and 13 per cent of the net earnings.

Pages 55 to 123 of the report are devoted to a reprint of the "Standard System" of street railway accounting, which has been made compulsory for the street railways of Connecticut.

In the following statements, the trackage is measured as single track exclusive of switches and sidings, and the costs are in cents per car-mile:

BRIDGEPORT TRACTION CO.

Track operated, 53.60 miles; closed cars, 53; open cars, 35; equipped with motors, 71; snow plows, 7; car-miles run, 1,911,373; passengers carried, 6,943,559; passengers per car-mile, 3.633; round trips run, 329,465; employes, 200; fare, 5, 10 and 15 cents; operating expenses, 53.7 per cent of earnings.

A GALLERY STREET CAR.

Letters patent have been granted to Fred Steffens and Otto F. Koss of St. Joseph, Mo., for a new design of street car which is shown in the accompanying illustration. The objects of the improvements are to provide a car having greater seating capacity than any single compartment car now in use, one that will be better ventilated and cooler in summer and warmer in winter, that will be more accessible to the conductor than a double-deck car, and that will economize in height over the usual double-deck car.

STEFFENS AND KOSS CAR.

As will be seen, the lower portion is constructed substantially as an ordinary motor car, except that in each of the four corners there is a stairway connecting with the gallery floor above. The gallery flooring is supported by T iron bars, which at one end are rigidly fastened to the side posts of the lower section, and at the center are arched, to enable passengers in the lower compartment to stand upright in the aisle, the floor itself not being of

sufficient height above the main floor to permit this. The seats in the gallery compartment are arranged along this arch, back to back, as shown.

We publish a description of this car because of its novelty and not with the idea that the construction will commend itself to American street railway managers.

WEIGHT OF STORAGE BATTERIES FOR VEHICLES.

Mr. J. Rosset, discussing the "Weight of Accumulators for Electric Vehicles" in *L'Industrie Electrique*, gives the equation $y = Pl \div (250 - l)$; where y is the weight in kilograms of the accumulators, P the weight in kilograms of the vehicle including passengers, and l the distance run in kilometers.

Reduced to English units this formula becomes: $w = Wl \div (150 - w)$; where W is the weight of the vehicle and load in pounds, w the weight of the accumulators in pounds, and l the distance run in miles.

A LONG VIADUCT.

The Wilkesbarre (Pa.) & Wyoming Valley Traction Company last year completed a viaduct in Wilkesbarre which is over 1,000 ft. long and crosses 19 steam railroad tracks. The viaduct was designed by Thomas Wright, chief engineer of the Traction Company; the material was furnished by the Pennsylvania Steel Company.

The street railway track is in Welles street which is parallel to the tracks of the Delaware & Hudson Canal Company and the Lehigh Valley Railroad. The Delaware & Hudson Canal tracks are about 35 ft. below, and the Lehigh Valley about 30 ft. below the grade of Welles street. The viaduct begins at a point 220 ft. from the line of Welles street, the approach to it being an earth fill on a down grade of about 3 per cent, and continues in a line at right angles to that of Welles street for a distance of 560 ft. On the approach is located a turn-out there being but a single track laid on the viaduct.

The first four spans of the viaduct are 40 ft. each in length and cover the sharp slope from the higher level down to the Delaware & Hudson Canal tracks; these spans are of 48-in. plate girders. The six succeeding spans are from 45 ft. to 76 ft. in length, and are of 72-in. plate girders. In crossing the Lehigh Valley tracks the viaduct is on a skew, the railway track being curved to a radius of 80 ft. and thence proceeding at right angles to the former direction; over these tracks the floor of the viaduct is carried on the lower instead of the upper flanges of the girders, this arrangement giving the same clearance, 21 ft., above these tracks as above the others.

Up to this point the length is, measuring the periphery of the curve, 689 ft. and is level; from here on the structure is 331 ft. long on a down grade of about 5.5 per cent. From the end of the structure to Market street is an earth embankment 135 ft. long on the same grade. Under the descending portion of the viaduct is a switch of the Lehigh Valley Company which had to be covered to avoid interference.

The viaduct is 12 ft. wide in clear with hand rails of gas pipe and fittings. The ties are of 8-in. x 8-in. yellow pine. The trolley poles are of steel mounted on the side of the bent and braced by 1/2-in. x 6-in. plates bolted to the cross ties.

The foundation piers for the structure are of concrete and at some points are over 20 ft. deep by reason of being located over the bed of the old canal. The piers are with stones 30 in. square and 24 in. thick. Resting on the piers are steel columns to support the viaduct, and these are fastened to 1 1/4-in. rods 5 ft. long, built into the piers.

INSURING A TRAMWAY BILL.

Street railway presidents and general managers who have spent time and labor in getting a franchise through a contrarily-minded city council will be interested to know that in England it is possible to insure oneself against the risk involved in undertaking such a task. The following is taken from the *Light Railway and Tramway Journal*, of London.

"It is pretty generally known that the underwriters who compose the institution of world-wide reputation called Lloyds, will insure almost anything, from the risk of twins up to the largest battleship, but we fancy that a good many of our readers were not aware that they can insure a bill in Parliament. That such is the case, however, is proven by recent happenings in connection with the Coatbridge & Airdrie Tramways. The Town Council of Coatbridge had carefully debated the best plan to adopt in order to carry out the tramway scheme, and had decided to apply for a board of trade order, when at the last moment the dean of Guild (also convenor of the tramways committee) received a telegram from Mr. Kennedy, the Parliamentary agent in London of the burgh, announcing that the expense of a bill could be insured with Lloyds for a premium of 10 per cent." In view of the fact that a bill from Parliament gives greater privileges, it was decided to apply to that body, and take out insurance against possible defeat.

Arrangements may soon be made by the Chicago & Milwaukee Electric Railway Co. for furnishing electric lights to all the towns along the north shore from Waukegan to Evanston.

A DIFFERENTIAL METHOD OF TESTING RAIL BONDING AND RETURN CIRCUITS FOR ELECTRIC RAILWAYS.

BY LINCOLN NISSLEY, E. E., M. E.

For the past eight or nine years there have appeared at various irregular intervals in the columns of the technical press, descriptive articles relative to rail bonding, return circuits and electrolysis of electric railways.

The instruments and methods employed in making tests, the style of bonding and the results obtained by the various electric railway companies who have made investigations in this very important subject and whose claims from time to time have been advanced by conceded authorities, differ widely, and hence are very confusing to those who happen to notice the disparity.

In the absence of definite information as to how results have been obtained in any particular case, and the various different opinions held by those directing electric railway properties, the electrical engineer who happens to be making investigations in this field, is liable to have his report of results obtained classified at once among those mysterious variables that affect the economies of operation of nearly every electric railway in the country—and have his investigation placed in that category, of being capable only of approximative predictions.

The writer believes that the attention of investors in electric railway properties has never been sufficiently called to this matter, and that in a great many cases they have suffered from this lack of attention to the question; but the past year has witnessed the amalgamation of many of the smaller and competing roads into larger systems. The manifest advantages of such consolidation will be the placing of such properties in the hands of men who from their special training and wider experience will organize and operate them with due regard to technical and financial economies.

This article is, therefore, an attempt to describe a method of testing return circuits of electric railways, a method successfully employed by the writer in a recent test made on one of the largest consolidated roads in the country.

For making this test an old 18-ft. car with single motor equipment was fitted up, the necessary instruments and contact arrangements for making observation were devised and installed at very slight expense, the method of wiring and connecting differentially

FIG. 1.

FIG. 2.

the instruments, rheostats, switches, etc., in testing car, is shown in wiring diagrams Figs. 1 and 2, and is sufficiently clear to need no further description.

The time of making observations and measurements was at night, this plan being adopted for the purpose of getting uniform conditions throughout the operations, and to avoid, as far as possible, interference with regular car schedules. Fortunately during the time of taking the observations the condition of track was the same, there being a dry rail.

The method of taking the readings was as follows: The car was stopped opposite, or at the place where the observations were to be taken, if at a fire hydrant, the smaller cable (not shown on Fig. 1) was taken by an assistant and contact made on the composition valve of the hydrant. Now, if the Weston ammeter indicated that current was passing, the differential ammeter was switched into circuit and the current increased by the rheostats to 20 amperes, which was decided upon by former adjustment of the instrument to be about the best range of its graduation, and within the safe

limits of its winding. With 20 amperes of current flowing (as indicated by the Weston ammeter) from the trolley to the rail and fire hydrant, the voltage was taken, simultaneously the reading of the differential ammeter was also taken and the readings noted, and the difference or proportionate amount of current passing into rail and hydrant according to the law of divided circuits placed in the proper column of the record.

In testing bridges, viaduct and other conductors along the lines, the exploring cable was run out and attached, the differential ammeter cut out and the current increased to 500 and 600 amperes and the drop measured. A water rheostat was used in connection with taking these readings, so as to better guard against the accidental burning out of the instruments and the possible overloading of the independent generator used in the car.

After the entire system of trackage was covered by the testing car operations, and the electrical survey finished, all the notes and data sheets were calculated and properly reduced to graphic form.

Fig. 3 shows a cross-section sheet with plotted curve derived from the deductions of the notes and covering one of the shorter

FIG. 3.

divisions of the road. All of the divisions were similarly treated, and from the curve sheets a map was constructed where-on electric contour lines were drawn, condensing, to a handy and workable form all the electrical track conditions as they existed at the time of making the survey. The curve readily shows where the greatest leakage is taking place between the rails and the water mains. On this division the two points of the curve show that the pipes in this part of the system are not within the danger zone as the current is leaking from the rails to the pipes, but after uncovering the rails at the two points indicated by the curve it was found that the base of the rail was nearly eaten away by corrosion. To illustrate further, it was easy to determine in running the testing car over the various divisions the portions of track that were in poor shape electrically. Whenever a portion of the track was reached that was not well bonded the instruments would show it instantly. Readings in this test would invariably show an increase of current on the water main side of the differential instrument, indicating of course that the water main and the intervening soil combined offered the path of least resistance from the testing car to the station. Within the danger zones of the metallic conductors underground, the reverse would be shown, or in other words the instruments would indicate the underground structures to be positive to the rails, and the amount of current passing, and the difference of potential could be determined, in the same way as before. On the better bonded tracks the current would proportion itself between the rails and the pipes and in many instances would gradually come back to the rails and abandon the pipes and vice versa.

At all points where instruments indicated that all the current that was flowing was returning to the generator by the pipe routes, the resistance at that point was measured, and also the resistance by way of the rail route was calculated from the same point of observation. Taking the cross-section of the rails and assuming them to be electrically continuous from the car to the generator, anyone would naturally suppose that the current from the car passing to the generator would take this route, but in the majority of cases that have come under the observation of the writer the pipe route is the path of least resistance back to the station, whether it be one, two or six miles, and if the cross section of the rails be small, but bonded to their carrying capacity part of the current will still return to the station by way of the pipe and earth route. The kil-

watt curves show this to advantage, and this fact points to the necessity in the case in hand of connecting the pipes to the rails at the points of the curve on the water main side of the diagram, or by connecting the rails at these points to a pre-determined size of return feeder of such low resistance compared with the earth as to completely lead away from these two points of positive to earth all the current that would otherwise escape into the pipe.

Only a slight study of the curve in Fig. 3 is needed to discover the value of the differential method of testing, which the writer has so far described. If it is desirable to devise a protective system for all metallic conductors buried underground, the danger zones can be easily traced out on the electric contour map and their location relative to the power stations at once determined. The primary cause of all the trouble is, of course, poor bonding.

The contour map will show at a glance where this prevails and the remedy can then be applied at these points. If the underground metallic conductor to be protected should be the lead sheathing of the electric railway's own feeders, then a ready means is at hand for knowing the destructive currents most active. It is certain that these lead covered cables will be the first to suffer.

If it is advisable to connect the system of trackage to the water companies' underground piping, then it is only necessary to find on the plotted curves of each division of the road the lowest points of the curve and note their location and make the connection at these points. After one or more of these things have been carried out, another survey of the lines should be made with the testing car, the data thus gathered to be again reduced to graphic form and the electric contour drawn on the original map, using ink of a different color.

A comparative study can now be made of the two surveys and if we desire to go further into the study of the condition, calculating from the mean areas of the contours will give the approximate return reduced to dollars, on the money invested for bonding after the first survey was made. It will now also be found that the areas of the danger zones have been reduced very much in size and have shifted into new locations and are now confined to small areas in close proximity to the power station or stations, where they belong and can be further treated in these newer locations much more economically and with greater certainty.

It will readily be seen from the above that in a further study of the contour map, other information can be gathered affecting the economy of other departments of electric railway construction and operation. In fact there is hardly any limit to the uses of a testing car, where these comparative tests may not be employed to advantage. The use of plotted data in graphic form can continually be enlarged and extended to cover almost every department of electric railway work.

Every electric railway company should make careful observations and measurements at the power stations for the determination of the existing conditions of the ground return in these stations. One particular case the writer has recently had to deal with, will suffice as an illustration of how this important detail is neglected, by some electric railway companies at least. The location of the station was about 1,000 ft. from the nearest line of rails. There was found to be over 4,000,000 c. m. of copper in the feeder leaving the station switchboard and ramifying to all parts of the system, and supplying the positive side of the line which was the trolley. As a return for the negative or rail side of the system was found one 500,000 c. m. cable fastened with a clampband to the deep well pump and leading from there to the negative bus bar. This feeder was supplemented by one of equal cross section leading from the switchboard, over a pole line to the nearest point of the rails and there tapped in making a total of 1,000,000 c. m. for a return of a station in which the maximum amount of current to be delivered to the line daily amounted to about 2,100 amperes. There was also found a potential difference of many volts between the pipes in the station and the negative bus bar. The investor in electric railway properties has no protection, no hope for dividends where such an unbalanced, ohmic condition exists. It has been said that the business of electric railways is a business of detail; it is hoped by the writer that investors at least will find it to be true, that it is becoming to be, in a large measure, an engineering detail. In no other enterprise is a smattering of knowledge so dangerous as in the direction of electric railways. We do not insist that in this particular instance the profound mathematics of a Clerk Maxwell need be applied to obtain results, but rather an abundance of common sense of the broad

gage type. Conditions will, of course, vary in every instance. No two systems being exactly alike, individual study must be made of every detail to reach results of best economy. In this instance of neglected return circuit the only way to realize an ohmic balance in the distributing system would be to reduce to a minimum the potential difference between the piping in the station and the negative bus bar, thus relieving the pipes from further damage. The most economical way in the end would be to reduce the potential difference between all the pipes, and all the parts of the track system to and below a safe limit by tapping the rails at pre-determined points with insulated return feeders so calculated as to size that the proportionate drop in all of them will be the same. This would necessitate an outlay for additional copper, which would mean an increase of fixed charges; but the resultant increase of economy of operation, the saving of fuel, better lighted cars, reduction of repairs to motors, increased speed, and the reduced liability for electrolytic losses would in the opinion of the writer fully warrant a considerable increase in the fixed charges.

That too large an investment could be made for additional copper is granted, as well as that there may be too little copper, but there is a happy medium between the two, in which it is nearly always possible to confine the case.

It is in place to add here, however, that the return feeders should not be determined in the perfunctory way that such feeders are generally put up, but the entire system should be completely worked out on the electric contour map, and be made exactly analogous to the trolley and over-head feeder system.

The investigations of the system, at present in vogue, of utilizing the metal of the rails for taking current back to the station, from the more distant portion of the line, show that the cross-section of the rails is sometimes insufficient to bring the current in without excessive drop. Assume two power stations of a consolidated line supplying a net work of trackage, and say that for present conditions a drop of 50 volts between the distant ends and the sections adjacent to station A and station B as a fair basis. It has been found in the writer's experience of testing such lines, that the drop is considerably more than this; the great deterioration of bonds, or no bonds, and the growth of traffic beyond that anticipated when the lines were built, have more than doubled this drop so that there is now a potential difference of 100 and even 200 volts between the grounded return systems in sections between station A and station B. This potential difference is enough to force the great current flowing through a wide sweep of area about the system of trackage and eat whatever metal it can find buried in the ground. Better bonds, heavier and longer rails, and more return copper can be added, but so long as the rails only are used as a return the reduction of the drop between 10 or 15 volts would, under the conditions assumed, require an excessive coat of the conducting system.

WHY DON'T THEY GET ON?

The bureau-of-information-man in blank depot of blank road—one of the great roads—yawned and said: "No show for an ambitious man in this position; no chance to advance." I asked him for information as to how to buy my ticket for Crystal, Fla. He didn't know, and, getting out the Plant System book, he couldn't find out.

First, it was December 30th, and he passed out a November book; all out of tune, as a December book was out changing many time tables.

Next, he was dumb about sleeper accommodations.

Finally, he wound up by saying: "I guess you know more about this than I do."

This was the man who yawned and said: "No show in my position for an ambitious man."

He cursed his "luck," cursed Carnegie, and Rockefeller for having "money to burn." "Them fellers," he said, "had a show," and more to same intent. He is a twentieth century illustration of the New Testament, first century parable of the talents: "I know thee, Lord, that thou wert a hard master, austere. Take your old talent,—a little bureau of information job is no place in which to get recognition." Then the Lord took it, and possibly will give it to Carnegie or Rockefeller, saying: "He will improve it; for to him that hath shall be given, and to him that hath not, shall be taken away, even that which he hath."—Graphite.

MECHANICAL DEPARTMENT

ELECTRIC PILE DRIVER.

By courtesy of Mr. A. L. Kempster, secretary of the Seattle (Wash.) Traction Co., we have received a photograph and description of an electric pile driver built in the company's shops after designs of Supt. N. Lawson. The company has about two miles of trestle work along the east shore of Lake Union, and when it became necessary to replace this piling last spring the car shown in the accompanying illustration was built for the work.

The machine is mounted on a 30-ft. double truck flat car. The gins are 35 ft. in height and in order to permit the car to pass under the span wires, the gins are swung from channel

ELECTRIC PILE DRIVER, SEATTLE.

pins 8 ft. above the deck of the car. The hammer is of the ordinary design weighing 2,400 lb. The motive power is one 15-h. p. F-30 railway motor.

With this pile driver as many as 72 piles were driven in one day, the average number being 50.

SOME ESTIMATES ON COSTS.

The following table is extracted from an article entitled "The Commercial Engineer" by Mr. C. W. Bennett, B. M. E., published in the Wisconsin Engineer. Mr. Bennett is connected with the Elwood, Ind., plant of the American Tin Plate Co., and the data were prepared with special reference to rolling mill construction. However, they should be of value for other shop and manufacturing buildings.

"The following table of costs has been found very useful and fairly accurate for estimate work, the various items having been checked over a number of years' observations and under varying conditions

of locality and state of market. The present unstable high prices quoted on steel products prevent close figures on these lines and necessitate in the case of steel buildings or machinery the addition of a percentage to the average cost, which percentage at present is about one hundred. Where a ranging price on material or labor is given the one best suited to the particular locality is of course to be selected."

TABLE OF COSTS USED IN ESTIMATES.

Excavation—earth or clay.....		\$0.40 per yd.	
Excavation—rock cutting.....		1.70 per yd.	
Brick work in foundations and walls—			
Common red brick—8½ x 4 x 2½—20½ to the cu. ft.			
Cost per 1000.....	Laid in cement. \$4.50 to \$5.50	Lime mortar. \$4.50 to \$5.50	
Labor laying.....	2.00 to 6.00	2.00 to 6.00	
Sand—¾ yd.....	45 to 70	45 to 70	
Cement—Portland—6 sacks of 87 lbs.....	78 to 4.50	30 to 45	
Lime—3 bu.....			
Total cost per 1,000.....	\$7.73 to \$13.70	\$7.31 to \$12.68	
First quality fire brick—9 x 4½ x 2½—17 to cu. ft.			
Cost per 1000.....		\$22.00	
Labor laying.....		4.50	
Fire-clay—½ ton.....		1.00	
Total.....		\$27.50	
Masonry Rubble—16½ cu. ft. equal 1 perch.			
Cost per perch.....	Laid in Cement. \$0.60 to \$1.35	Lime Mortar. \$0.60 to \$1.35	
Labor laying.....	.80 to 2.00	.80 to 2.00	
Sand—½ yd.....	.30 to .45	.30 to .45	
Cement—5 sacks of 87 lb.....	.65 to 1.30	2 bu. 24 to 32	
Total.....	\$2.35 to \$5.10	\$1.94 to \$4.12	
Concreting for foundations—			
Crushed stone—1 yd.....		\$1.75	
Labor.....		.80	
Sand—1 yd.....		.90	
Cement—6 sacks of 87 lb.....		.78	
Total.....		\$4.23	
Mill Buildings. Safe load on roof 40 lb. per square ft. ground area. Horizontal wind pressure 30 lb. per sq. ft. Foundations and floors not included.			
Iron or steel throughout, 50 ft. span, 18 ft. columns.....		\$0.40 sq. ft.	
Iron or steel throughout, 65 ft. span, 25 ft. columns, crane runway.....		.50 sq. ft.	
Iron or steel throughout, 60 ft. span, 30 ft. columns, crane runway, brick curtains, asbestos roof.....		.70 sq. ft.	
Iron or steel throughout, 50 ft. span, 30 ft. columns, slate roof.....		.50 sq. ft.	
Brick—50 ft. span, 18 ft. height, walls 18 ft. high, wood trusses, iron roof.....		.50 sq. ft.	
Frame, for shop and factory purposes.....		.40 to .60 sq. ft.	
Foundation walls for brick building.....	.10 to .15 sq. ft. bld. area		
Piers for iron building.....		.02 sq. ft.	
Flooring—2 in. oak plank, 600 lbs. per sq. ft. net load.....		.14 sq. ft.	
Hard burned paving brick.....		.09 sq. ft.	
Cast iron plates—¾ in. thick.....		.35 sq. ft.	
Boilers	Actual floor space occupied per h. p.	Cost per h. p. set up complete.	
Return tubular.....	\$0.85 to \$1.25 sq. ft.	\$ 9.00 to \$11.00	
Water tube.....	.66 to .85 sq. ft.	11.00 to 14.00	
Piping and Boiler Connections.			
Steam header and boiler pipes.....		\$0.80 per h. p.	
Feed pumps.....		.40 per h. p.	
Steam line to engines, 10 in. erected.....		3.25 per ft.	
Cast iron water line 12 in.....		2.45 per ft.	
Engines F. O. B. plant, per h. p.	Simple. \$7 to \$9	Cross Compound. \$15 to \$15	Tandem Compound. \$9 to \$14

"The preceding table does not pretend to be strictly accurate in the matter of costs, but serves as a good guide in the making up of preliminary estimates. As showing the difficulty of establishing a fixed line of prices, the particular item of steel buildings may be noted: the prices given in the table are the average that have prevailed for the past few years. A building that per the table would cost 40 cents a square foot, at the present writing would be quoted at 80 cents a square foot, or an advance of 100 per cent, as before remarked. This is due to extraordinary conditions in the steel trade, but it may confidently be expected that the immense producing capacity of the country, which is being rapidly increased by the construction of numerous large steel plants, will shortly have the effect of bringing the price of steel down to the average of the past seven

years. It was thought best to give average prices in the table and then make due allowance for a phenomenal condition. A few further remarks as to the conditions governing some of the other items herewith attach.

"Excavation for the ordinary mill foundation is usually performed by hand labor with wheel barrows. If the dirt is wheeled over 100 ft. the cost may reach 50 cents or more per yard; on the other hand if shoveling directly into cars is possible, or if wheel scrapers are used to good advantage, the cost may be as low as 20 cents.

"Foundation structure is governed largely by local conditions. It is assumed that hard-pan, stiff clay, or other bed can be uncovered within a few feet of the surface. Soft, marshy, or quicksand formations requiring the use of piling, need special treatment in every particular case. Of the materials ordinarily used, brick and limestone, either makes an excellent foundation when properly put in. The expression 'foundations are often too light but never too heavy' deserves a wide and emphatic publication. Poorly constructed masonry, or insufficient depth of same, are exceedingly difficult things to rectify after a foundation is once in place. Good cement mortar should always be used below the flooring level and the top courses laid with portland to give greater cohesion and solidity. Financial considerations will advise the use of limestone, where same can be delivered for 50 cents a perch or thereabouts. In central Indiana, where the cost reaches \$1.35 or more with good brick at \$4.50 or \$5.00, the use of the latter material will dominate. The class of work determines the cost of laying in either case. In rough foundations the mason will lay as high as 4,000 brick or 10 perch of stone per day, but in faced walls of less than 18 in. thickness the average will be 1,200 brick or 4 perch of stone.

"Mill building specifications often provide for loads of one ton or more to be suspended from any point of a roof truss, in which case allowance should be made for the increased weight of material required. The strain sheet for trusses is usually based on 1,200 lb. tension, 10,000 lb. compression, 9,000 lb. shear per sq. in. of net section of member. Crane runways, say for 10-ton cranes, cost approximately \$6.00 per running foot, when put in independent of building. The commonly specified iron or steel roofing consists of No. 20 corrugated sheets, 2½-in. corrugations; for sides of building No. 22 gage is used."

NEW CARS FOR THE CHICAGO UNION TRACTION CO.

The Chicago Union Traction Co. is building at its Madison and West 40th St. shops, which were described on page 661 of the "Review" for Oct. 15, 1899, 70 single truck cars 31 ft. long, and 10 double truck cars, 40 ft. long. These cars, which are all of the open type, are being erected after plans drawn by Mr. F. T. C. Brydges, superintendent of shops, and the aim is to turn out solid, substantial rolling stock without "frills" or unnecessary decorative features, and built to fill the traffic conditions encountered on the North and West Side lines. The single truck car-bodies have reversible seats, ceilings finished in quartered oak, and will be mounted on Brill E 21 trucks with G. E. No. 52 motors. Curtains will be supplied by the Curtain Supply Co., of Chicago.

In addition to the construction of these new cars, most of the regular repair work for all the West Side lines of the Union Traction Co. and also some for the Chicago Consolidated Traction Co., which has no repair shops of its own, is being carried out at this plant. Since our description in the "Review" a number of new wood and iron working tools have been placed in position to enable certain classes of repairs to be made with greater dispatch and economy.

To keep track of the quantity of small tools, as drill points, punches, wrenches, etc., constantly in use in a large machine shop such as this, the company employs the numbered check system. Each man in the shop has a number and is allotted six brass checks upon which his number is stamped. When he requires some tool not included in the regular kit that goes with his machine, he applies to the store keeper and obtains it, and the keeper hangs upon a small hook in front of the pigeon hole from which the tool was taken, a check bearing the man's number. In this way the employe in charge of the store room can quickly tell where every small tool in the shop is, and it is his duty to see that tools are returned within a reasonable time, particularly when it is a special

pattern, of which there is a limited number. When the man returns the borrowed tool the check is taken from the hook and placed on a board near the store keeper's desk. The checks are not given to the men personally. The store keeper is a mechanic and busies himself making light electrical repairs and doing odd jobs of punching and drilling when his services are not otherwise required.

UNION TRACK JACK.

The accompanying illustrations show the "Union" track jack which has been perfected by the Morden Frog & Crossing Works, of South Chicago, Ill., for railway track work.

Experience for several years on both steam and electric roads has demonstrated that it is admirably designed for the service required. The movement is simple, the number of parts small, the frame open so that dirt does not collect inside and clog the movements and all the working parts are easy of access. A cap or lug is placed over the fulcrum pin obviating the use of bushings and providing double wearing surfaces. The teeth on the lifting bar are ½ in. apart and the full movement of the lever reaches three teeth; by taking stroke of one tooth only with the lever well down, a very powerful leverage is secured, the arrangement of bearing pins giving a toggle joint. The movable fulcrum permits the pin carrying the lifting pawl to move in a straight line, and permits a

lifting pawl that is practically a clutch to be used; there is no rocking motion of the pawl relative to the rack, as occurs where the pawl pin moves in an arc.

The method of tripping the jack is readily seen by reference to the three line drawings. No. 1 shows the position of the pawls when the bar has been raised to the full extent of a single stroke of the lever, and is at a point where both pawls are in engagement with the teeth of the bar. To set the pawls to trip remove the wooden handle, depress the lower pawl by raising the iron lever socket, until it is low enough to allow A to pass B without touching. Hold the lever with one hand and lift the front of the lower pawl, revolving it on the pin, until it comes in contact with the face of the bar and A has passed by B. Then raise the pawl, by depressing the lever socket, until A has passed up back of B, as shown in No. 2. In this position the lower pawl is securely held out of engagement with the rack by the upper pawl, which is still sustaining the load, and the jack is ready to be tripped. Press down on the lever socket with the hand or foot and the lower pawl will move upward, throwing the holding pawl out of engagement and releasing the load.

The pawls will then, as is shown in No. 3, each be securely held away from the teeth while the bar descends. The first upward stroke of the lever releases the pawls and they engage the bar without further attention. With a weight of 150 to 200 lb. on the lifting bar there is sufficient friction on the upper pawl to hold it in place against the weight of the lever socket when set to trip. This makes it possible to remove the

wooden handle and set the pawls to trip when the track has been raised to the proper height, before doing any tamping; and the jack can be tripped instantly and removed in case of emergency,

without the necessity of stopping to adjust a key and lower the load, as with many other jacks.

The number of the jack corresponds to the distance in inches through which it lifts its load. The capacity from No. 14 to No. 18, inclusive, is 12 tons, and they are exactly alike save in height. All parts are malleable iron, except the bar and pawl teeth, which are of steel.

the under side of the roof, thus keeping them out of the way of snow water.

The body is a car formerly used as an express car. The weight complete, when the car is loaded with sand to increase the traction, is from 9 to 10 tons.

Mr. Rice advises us that this plow has been needed several times this winter and has done its work in a satisfactory manner. Only two men are required.

TOLEDO-MONROE ELECTRIC RAILWAY.

The Toledo Monroe Electric Railway Co. was recently formed by some of Detroit's wealthiest business men, and will build from Toledo to Monroe, and from Monroe to Monroe Beach (a distance of about 22 miles), an electric road of the very best character.

It has placed the building and equipping of the road in the hands of J. G. White & Co. (well-known contractors and engineers, of 29 Broadway, New York), who will survey the route, plan the special structures, power house, cars, etc., and supervise the installation of the entire outfit, turning over the road in complete working order. The specifications for apparatus are complete and cover the very latest and best types.

The power house will be equipped with an alternating current plant, and current will be distributed to sub-stations at a potential of 15,000 volts and there converted to direct current at 600 volts. The cars will be quite similar to those used on the Niagara Falls & Buffalo road (which was built and equipped by J. G. White & Co.), and will be equipped with sufficient motor capacity

SNOW PLOWS BANGOR, ORONO & OLD TOWN RY.

A MAINE SNOW PLOW.

We are indebted to Mr. W. G. Rice, superintendent of the Bangor, Orono & Old Town Railway Co., of Bangor, Me., for the accompanying illustration and description of a snow plow built in the shops of that company. The company formerly had two snow plows like that shown at the right in the engraving, and the truck from one of these was lengthened for the new plow and the noses fastened at the ends. The noses are about 8 ft. 8 in. wide at the base and are built of white oak covered with 1/4-in. iron plates. When the wings at the rear of the nose are extended the snow is cleared for a distance of 6 ft. on either side of the track.

In front of the wheels are the ordinary diggers to clear the rail for the wheel flanges. The noses have a vertical movement of about 12 in. and the position is readily controlled by means of hoisting apparatus, which is easily operated by one man. The details of this were worked out by the company's foreman, Mr. A. E. Reynolds.

The motor equipment consists of two 30-h. p. Westinghouse motors, but the wires are carried directly through the floor and along

for making a maximum speed of between 50 and 60 miles an hour. T-rails of 70-lb. section will be used and the road will be of the very best possible character; rock ballast is to be used throughout the entire length of the line. With the exception of terminal connections, this road will be built on private right-of-way, and in every respect will be laid out on the lines of a high-grade steam railroad.

This work was secured for J. G. White & Co. by its agent, the Michigan Electric Co., of Detroit.

A new 24 and 52 by 48-in. compound Green-Wheelock engine direct connected to a General Electric generator has been put in operation at the power house of the Columbus (O.) Street Ry.

The Duluth (Minn.) Street Railway Co. is making preparation for improving its service to Park Point, a popular camping ground and beach. New cars have been ordered and additional switches will be laid down. A large hotel and pavilion will also be erected at the Point by the company.

LOSSES DUE TO REMOVAL OF BONDS.

Last month the manager of an interurban electric railway which has suffered the loss of its bonds and direct return wires at the hands of copper thieves, wrote us requesting information concerning the losses involved, aside from the mere cost of the copper. This company has secured the conviction of six copper thieves, the sentences being 18 months in each case, and it is believed that if the judge understood the full money loss the company suffers by reason of the impairment of its return lines, heavier sentences would be imposed.

The road in question operates from 1 to 14 miles from the power house.

Following are the replies of several electrical engineers of street railways to whom the hypothetical question was submitted:

"I cannot answer off hand. In fact, it would be impossible to give any kind of an idea without actually making tests. The resistance of the return, under the conditions mentioned, would very likely be extremely high, probably so high that on a road 1 to 14 miles long it would hardly be possible to move a car at the far end of the line. And again, the small amount of current that they would be able to have flow would necessarily have to return by way of the earth, water pipes or other than through the rails."

"A."

"It is a very difficult matter to arrive definitely at an answer to the question, but I would say that, under ordinary conditions, on a line having three or four hundred bonds removed, unless of extra heavy rails with well tightened fish plates, the cars would be practically at a standstill. On a stretch of road recently acquired where both bonds and fish plates were very much out of repair, the drop on the line was enormous. The maximum voltage obtained from the car while going up a slight grade was about 300 volts, while the station voltage was 550. After bonding the rail, this drop was reduced so that, under similar conditions, 500 volts was obtained. I should say the only definite way to arrive at the exact loss due to bonds being removed would be to measure the drop on the joint when properly bonded, then remove the bond and measure the drop with other conditions the same. The difference between the drop in these two cases multiplied by the current flowing will give the loss in watts at that joint, multiplying this by the length of time that the bond is removed will give the watt-hours of current lost. This multiplied by the cost of power per watt-hour will give the loss in dollars and cents due to the bond being removed.

"This on a recent test showed as follows: Current flowing, 99 amperes; drop on joint without bond, .5 volts; drop when bonded, .001 volt; equaling a loss of 49.41 watts per hour. At the rate of 5 cents per kw. h. (average rate charged for electric power) this is a cost of 2.47 cents per joint per hour. As this is only a test on an individual joint, the actual conditions on the road referred to may be better or worse according to the condition of the fish plate, as I have seen the drop across a fish plate without bonds as high as 5 volts."

"B."

"From actual experience with the rail bond question, I have found that the loss of the copper used for these bonds is a mere trifle of the actual loss caused by their removal from the rails. Testing a stretch of track (from which the bonds were stolen for about 200 yd.) by putting an ammeter in circuit with the car motors, I found that the increase in amperes was from 20 to 25 per cent; and this was not confined to that particular place alone, but for all the track beyond this place and away from the power plant. In this case there were 5½ miles of track beyond the point where the bonds had been removed and the schedule called for three cars on this portion, each one of which required 20 to 25 per cent more current to operate it. When new bonds were put in, a test showed a corresponding reduction in current consumption.

"My experience with another road resulted in practically the same figures. The fish plates will carry the current so long as the rail and plates are bright and perfectly tight, but after only one or two rains rust appears between the plates and rail, and if the bonds are removed, there is to a certain extent a 'dead section.' All the tests I have made showed a loss of 20 to 25 per cent, and in one instance 52 per cent—consequently requiring so much additional

power, to say nothing of the heating of motors caused by the imperfect circuits."

"C."

Where the line from which the bonds are removed is part of an extensive system the loss may not be readily discovered, as is shown by the following from the engineer of a large road:

"The loss of more or less bonds on a line extending from 1 to 14 miles from the power house, in my opinion, will depend entirely upon the condition of the fish plates. We have had a similar experience on a road three miles long where practically four-fifths of the bonds were stolen and the operating department were not aware of the loss for some weeks afterwards. The rail was 70-lb. and the fish plates were generally tight."

"D."

"We have no data at hand which would show us the loss due to absence of rail bonds. We do know, however, that if bonds are removed the rails themselves would deteriorate very rapidly where heavy currents are used."

"E."

CUTTER FOR ICE ON TROLLEY WIRE.

The Chicago, Harvard & Geneva Lake Ry. has during this winter made use of a device for cutting sleet from the trolley wire which will be readily understood from an inspection of the accompanying drawing. It is simply a bar of iron ½ x 1½ in. and about 10 in. long, bent slightly in the middle and with a V-shaped notch cut in one end. It is clamped to the pole in contact with the harp

CUTTER FOR ICE ON TROLLEY WIRE.

and replaces the trolley wheel so far as making contact is concerned; when not in use it is clamped to the under side of the pole.

Usually when the wires are so coated with ice as to require the use of this fork there is a man stationed on top of the car to manipulate the trolley pole.

The experience of this company was that the sleet on its overhead wires is very hard and forms with extraordinary rapidity, due to the peculiar atmospheric conditions.

REDUCED FARES AT FORT WAYNE.

As announced in the last issue of the "Review," the Fort Wayne (Ind.) Traction Co. has placed on sale books of tickets for working people at the rate of 3½ cents per ticket. In a recent interview, A. L. Scott, manager of the road, stated that these reduced rates were for working people only, the term including any person engaged at a regular occupation and drawing a weekly or monthly salary, as clerks, mechanics, solicitors, bookkeepers, etc. The person must be working for an employer, whose name must be written on the book. The books will be sold to men only at 100 tickets for \$3.50, but girls or women can purchase 50 tickets at a time at \$1.75. A number of large firms in the city have bought quantities of the books for the benefit of their employees, allowing the latter to pay for the tickets in small installments. The books are good only during the hours of 6 to 7 a. m. and from 5:30 to 7:30 p. m.

The Fort Wayne Traction Co. also sells what it calls a citizens' 4-cent ticket, good at all hours. These are issued in books of 25 and 100, and the person buying one must give his full name and this is written on the book. If he wants his family to use the tickets he must state that fact and the words "and family" will be added.

SINGLE RAIL SUSPENSION RAILWAY.

There is now nearing completion in Germany what may safely said to be the most novel electric railway that ever progressed beyond the paper stage. This line extends from the Rittershausen railroad station in Bremen, through Elberfeld to the railroad station in Vohwinkle, having a length of 8 1/3 miles, all double track, and the accompanying illustrations, which are reproduced from our German contemporary, the Zeitschrift fuer Kleinbahnen, will be of interest. The structure for a portion of the line is built over the

FIG. 1—SECTIONS.

River Wupper; the general arrangement is shown in Figs. 1 and 2. The cars, seating 50 or 60 passengers, are suspended from above and run on small double flanged wheels bearing on a single rail. The arrangement of the truck and the method of preventing derailment are very well seen from Figs. 3 and 4, in which c is the electrical conductor, g the trolley, and s the running rail. The speed to be attained is 25 to 30 miles per hour.

FIG. 3.

FIG. 4.

The curves are made of 300 ft. radius where possible, though near the Vohwinkle terminus are some of 100 ft.; in the car shed and station, shown in plan in Fig. 5, some of the curves have radii as short as 8 and 9 m. (26.6 ft. and 30 ft.).

The longitudinal portion of the structure is in section like an I with the lower bar extended, and is built of rolled shapes. The relative position of the running rails on straight track, on curves, and at island stations is shown in Figs. 6, 7 and 8. In Figs. 6 and 7

FIG. 6.

FIG. 7.

FIG. 8.

the two rails are 157 1/2 in. c. to c. and at the stations 275 3/8 in. c. to c. The height is such as to bring the cars 16 ft. above the bridges over the river.

The system is the invention of Mr. Eugene Langen, of Cologne, and the road is being built by a Nuremburg company.

The postmaster of Chicago contemplates establishing three new electric railway postoffices, the cars to run over the Clark St. and Wentworth Ave. lines of the Chicago City Ry., connecting the Armour, Brighton Park, Stockyards and Englewood postal stations with the main office. This extension has long been considered a desirable one, but was impracticable until after the grade crossings at Clark and 16th Sts. were abolished.

MARYLAND 4-CENT FARE BILL.

There was last month pending in the Maryland Legislature a bill providing for lower street car fares in Baltimore. The Senate gave the opponents of the measure a hearing, and as a result the bill failed to pass. At this hearing Gen. Mgr W. A. House, of the United Railways & Electric Co., said:

"Basing our calculations on the passenger earnings for 1899, which were \$4,127,209.77, and upon the theory that all of the revenue passengers carried would avail themselves of the privilege of six tickets for a quarter, our passenger earnings would be \$3,439,341.50,

FIG. 2 ELEVATION.

showing the enormous decrease of \$687,868.29, and to make up this loss we would have to carry 16,508,839 additional revenue passengers for the year or 45,230 passengers per diem. This statement, however, that all riders will avail themselves of the privilege of buying tickets has been questioned, and we are informed that where six tickets for a quarter are sold 80 per cent of the company's revenue is in tickets, and upon this basis we will submit the loss that will be sustained by the company. Taking the passenger earnings for 1899 as a basis, our earnings would then be \$3,576,915.12, \$2,751,473 from sale of tickets and \$825,442 cash, thus showing a loss to the company of \$550,294.65, requiring us to carry 13,207,072 additional revenue passengers for the year or 36,184 per diem.

"It has been said that a large number of people now walk because they will not pay 5 cents, but would ride if six tickets for a quarter were sold. Is it reasonable to suppose that a man who is

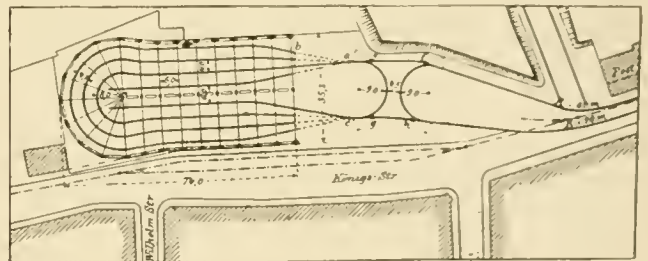

FIG. 5—TERMINAL STATION.

now walking to save 60 cents per week will spend 50 cents to secure two free rides? Certainly there is but one answer to this question—he'll not do it, and we cannot look for this increase in passengers from those who do not now ride at all, and surely we have not the floating population, and must depend entirely upon the more frequent riding of our old patrons. For the sake of argument, and admitting that this reduction in fare would become popular, increasing the riding thereby to the extent that is necessary to realize the same revenue, how is it to be taken care of? Our present equipment, taxed to its full capacity, is carrying 235,268 revenue passengers per diem, and should we secure the increased riding on the 80 per cent basis, or 36,184 additional passengers, we would be compelled to increase our rolling stock 15 per cent, our working force in the transportation department, the mechanical department, our power house capacity, and even the clerical force, and the fact should not be lost sight of that in handling this greater number of passengers the liability of accident is proportionately increased, all without any increase whatever in revenue.

"The company's claim is that it will be injured for the reason that it must do 20 per cent more business to take in the same amount of cash, and in doing this increased business it will materially increase its operating expenses; but, assuming that the revenue of the company will not only equal its present revenue, but will be increased, granting the argument that has been made, that the public

will ride more and that those who do not now ride will then ride, wherein lies the benefit to the public, when the aggregate amount of car fare spent by the public must necessarily be greater than that now spent, if the argument made by the friends of the bill holds good."

Mr. Robert Crain, counsel for the company, said in part: "An argument that I understand has weight with you is the fact that six tickets for a quarter works well in Washington. It is the one city in the country where it does work well, and the reasons are obvious. Washington is no criterion for Baltimore. In the first place, Washington has a large transient population and we have none. Two things result from this: Many strangers never use tickets at all and many who do buy them never use them; less than 40 per cent of the Washington traffic is on tickets and unredeemed tickets amount to as much as \$200,000 a year. But the great reason why six tickets for a quarter is a success in Washington and would ruin us is this: Our roads in 1897 carried less than 165,000 per mile; the Metropolitan, of Washington, in that year carried 766,414 passengers per mile—nearly five times as many. Washington streets have no hills, no curves, no narrow crowded thoroughfares. There is less danger of accident, the service can be operated more economically and there are no burdensome franchise taxes."

REPORT OF LOUISVILLE RY.

The annual meeting of the Louisville (Ky.) Railway Co. was held February 21st. The report of Pres. T. J. Minary gave the following summary of the business for 1899:

Gross receipts	\$1,436,828.30
Operating expenses, including taxes, interest and dividend on preferred stock.....	1,399,749.06
Net earnings	\$ 37,088.24
Dividend of 1 per cent on common stock.....	35,000.00
Net balance	\$ 2,088.24

During the year the claim of the city of Louisville for back taxes has been compromised by the payment of \$182,948.71, the same being 70 per cent of the amount claimed. The power house was improved at an expense of about \$40,000, extensions made to the lines and some additional rolling stock bought.

The earnings of the company in excess of what was necessary to meet fixed charges have for some time past been used for improvements, but as this plan did not altogether meet with the approval of the stockholders, it was at this meeting decided to issue second mortgage 4½ per cent bonds to the amount of \$2,000,000 upon the property, to be sold at the rate of not exceeding \$200,000 per annum, the proceeds to be expended for extensions and betterments. The first issue will be as of March 1st, and a 3½-mile extension will be built this spring.

SPRINGFIELD TROUBLES OVER.

The boycott against the Springfield (Ill.) Street Railway Co. was declared off on February 20th. The strike began on October 19th, the grievance being that the company would not recognize the union. No cars were run for two days, but the tie-up was of short duration, as the company found little trouble in securing men to take charge of the cars in place of the union men who had quit work. The Federation of Labor in a short time decided to put a 'bus line into operation, which for a time was liberally patronized by a number of union men and sympathizers. After a time the 'bus line did not pay expenses and the union men who were making weekly payments for the strike fund became dissatisfied and as a result objected to making them. The matter was discussed in a number of unions, which resulted in the Federation declaring the boycott off. It is understood that the Federation has contracted debts to the amount of several hundred dollars.

A company, in which Dr. J. E. Lowes is interested, has been organized to build a 36 mile interurban electric line from Dayton, O., to Greenville, and has secured franchises. Twelve towns are on the line. Dr. Lowes advises us that work will be commenced about April first.

FARES AT BUTTE, MONT.

The Butte Consolidated Railway Co. in accordance with its promise made several months ago to the people of Butte has from time to time reduced the fare from 10 cents to 5 cents on its different lines until there are but two branches remaining upon which 10 cents is charged, the Meaderville and Boulevard line and the branch to the Columbia Gardens; in pursuance of this policy the announcement was made last month that when tickets were purchased in quantities the fare on the Meaderville and Boulevard line would be 5 cents, although the regular cash fare would remain at 10 cents for the present.

The company has recently issued a little handbook containing the following information regarding rates:

Twenty 10-cent tickets will be sold for.....	\$1.50
Twenty 5-cent tickets for.....	1.00
Fifty 5-cent tickets for.....	2.50
Twenty students' tickets for.....	.50

Ten-cent tickets are good for one fare to Columbia Gardens. Five-cent tickets are good for one fare to cemeteries, Williamsburg and Meaderville.

Students' tickets good for one fare on all lines at all times during school days only, for students over 10 years of age, and good at all times for children under 10 years old.

During workmen's hours, from 6 to 8 o'clock a. m., fare on all 10-cent lines is 5 cents.

Funeral cars from all points on the lines to and from cemetery for \$10, including motor car, seating 40 passengers.

Special cars to and from cemetery from all points in Butte for \$5, from Centerville \$7.50, from Meaderville \$7.50.

NORTH METROPOLITAN, LONDON.

We are indebted to Mr. R. L. Adamson, a director of the North Metropolitan Tramways Co., of London, for a copy of the directors' report for the half-year ending Dec. 31, 1899, from which we take the following data:

The company owns 62¼ miles of tramways (nearly all double lines) and at the close of the half-year owned the following working stock: 681 street cars seating from 38 to 52 persons each; 21 omnibuses seating 26 persons each; 6,928 horses; 117 carts, traps, vans and trolleys; 37 water vans; 19 forage vans; 3 breaks, 3 horse conveyances.

The following is a comparison between the second half-year of 1899 with that of 1898:

	1898.	1899.
Average number of cars run.....	562.27	566.35
Car-miles run	7,611,207	7,808,075
Passengers carried.....	80,782,426	81,787,750
Average receipts per passenger...	2.24 cents	2.26 cents
Average receipts per car-mile....	23.90 cents	23.66 cents
Percentage of total working and general expenses to total receipts.	91.63	92.26
Traffic receipts	£ 375,796	£ 384,832

A table in the report gives the total traffic receipts for the year 1899 at £749,153. In 1898 they were £471,649.

An interesting item in the horse account is this: "522 horses sold to War Office."

The company has an outstanding share capital of £1,109,211 and bonds to the amount of £157,700. The dividend declared was 2½ per cent on the stock.

CARD PARTY ON INTERURBAN CAR.

Mrs. E. E. Downs, wife of the general manager of the Citizens Traction Co., of Oshkosh, Wis., on February 20th entertained a whist club of which she is a member on board the interurban car "Winnebago." Tables were set in the smoking compartment for refreshments, while in the larger apartment lap-boards were provided so that the guests might play cards en route. The car left the Athearn hotel in Oshkosh at 2 p. m. and two hours were consumed in making the run to Neenah, where the afternoon was spent at cards and refreshments served. The return trip was made early in the evening.

CONSOLIDATION IN MASSACHUSETTS.

The manager of the Massachusetts Electric Cos., Mr. P. F. Sullivan, advises us that 13 of the street railway companies which passed under its control in June of last year have ceased to exist. They are the following:

Norfolk Suburban Street Railway Co., Norfolk Central Street Railway Co. and Needham & Boston Street Railway Co., which have been absorbed by and consolidated with the West Roxbury & Roslindale Street Railway Co.

Gloucester, Essex & Beverly Street Railway Co. and Rockport Street Railway Co., which have been absorbed by and consolidated with the Gloucester Street Railway Co.

Mystic Valley Street Railway Co., Reading & Lowell Street Railway Co., Salem & Wakefield Street Railway Co. and Woburn & Reading Street Railway Co., which have been absorbed by and consolidated with the Wakefield & Stoneham Street Railway Co.

Brockton, Bridgewater & Taunton Street Railway Co., Brockton & East Bridgewater Street Railway Co., Boston, Milton & Brockton Street Railway Co. and Taunton & Brockton Street Railway Co., which have been absorbed by and consolidated with the Brockton Street Railway Co.

EXCURSION ON THE DAYTON & WESTERN.

One of the accompanying engravings was made from a photograph taken in August, 1899, and shows the cars provided to transport an excursion party delivered to the Dayton & Western Traction Co. at West Alexandria, O., by the Cincinnati Northern R. R.

One thousand persons were in the cars shown in the picture and were bound for the Soldiers' Home at Dayton.

This company believes in advertising for excursion business and

our second illustration is reproduced from a poster recently put out by it. The original measures 18 x 32 in. and is printed in red, blue, yellow and black. The Dayton & Western road extends 25 miles west from Dayton and through a territory where it does not have to compete with team railroads. Since the property was described

A DAYTON EXCURSION PARTY.

in our issue of March, 1899, page 170, Mr. Valentine Winters has been chosen president and he now holds that office in addition to the general managership to which he was chosen a year ago.

This company is now equipping all its cars with four G. E. 57 motors instead of two of that size; it has abandoned electric brakes and adopted the system of the Standard Air Brake Co., using motor-driven compressors.

TUNNELS AND FRANCHISES IN CHICAGO.

All of our readers remember the bitter campaign waged between the street railways of Chicago and the city council over the granting of 50-year extensions of franchises under the Allen law passed in 1897; the agitation of the subject resulted in a failure of the extension ordinance to pass and later in the repeal of the Allen law by the Legislature.

At the present time the opening of the Drainage Canal and the desire of deepening the Chicago River to meet the requirements of the deep-draft vessels of the lakes will probably bring the question up again with prospects of an amicable settlement. The Chicago Union Traction Co. has three tunnels under the Chicago River which the city wishes to have lowered several feet; the company wishes to secure extensions to its franchise and permission to substitute the overhead trolley on its cable lines. It is quite certain that the street railway cannot afford to incur the expense of lowering the tunnels with only a few years of operating ahead of it. The city cannot afford to undertake the work itself and the Federal Government refuses to do anything towards improving the river until the tunnels are lowered.

We believe the general public would be highly pleased at the substitution of electricity for the cable and that outside of the City Hall there is practically no objection to the overhead trolley in the few down town blocks necessary for loops. The trolley has given no trouble on any of the present lines and there is no good reason why the entire system should not be made uniform. It would greatly facilitate the breaking of blockades and relieve the few present trunk lines, as electric cars could find exit from the congested district over several additional routes.

ACCIDENTS IN CLEVELAND.

During the year 1899, 115 damage suits for personal injuries were brought against the Cleveland Electric Ry., 50 against the Cleveland City Ry. and 30 against the various interurban roads. The amounts claimed ranged from \$100 to \$25,000, the aggregate being nearly \$2,500,000. Few of these went to trial, however, and the court dockets show that suits for amounts ranging from \$5,000 to \$25,000 were usually compromised for about \$150.

TRAMWAY SITUATION IN BOMBAY.

The municipal corporation of Bombay, India, is now considering the action which it shall take in the tramway question. The Bombay Tramway Co., which is operating its lines by animal traction, has made application to the city for permission to adopt electricity. According to the Tramway Act the municipality was given the right to purchase the company's property at the end of each seven years. The first opportunity was offered in 1894, and the city declined to purchase, being frightened at the value of plant and good will, which was then estimated at 7,750,000 rupees (at the present value of silver this is about \$2,000,000), and in doubt as to its ability to profitably operate the lines. The company, in view of the heavy expenditures it would be called upon to make in equipping its lines electrically, wishes the city to agree to forego its right to purchase till 1915.

At present the city has borrowed some 47,500,000 rupees, the debt limit being 54,000,000 rupees, and it would appear that there are very serious financial difficulties in the way of a purchase in 1901. On the other hand, it is contended that if the city waits till 1915 it will have a much greater sum to pay by reason of the extensions to the tramway system which will inevitably follow the adoption of electricity as a motive power.

CHICAGO LAND DAMAGE CLAIMS.

In the "Review" for June, 1899, page 376, was noted the decision of the Circuit Court in a suit for land damage brought against the Lake Street Elevated R. R., Chicago, by the Chicago Office Building Co., owning a building abutting on one of the streets occupied by the elevated road. The Circuit Court held that as the fee of the streets is in the city, and the city gave the railroad company permission to build its road, property owners sustaining damage had no right of action against the railroad.

This ruling was reversed by the Appellate Court on February 26th. The court said in part:

"While we are of the opinion that the construction and operation of an elevated railway in a street, for the convenience of the public and the transportation of persons from place to place in the city, is not an additional servitude imposed on the street, we cannot concede that the owner of property abutting on the street, who suffers special damage by reason of the construction and operation of the railway, cannot recover. Counsel assumes, erroneously, as we think, that if there is no additional servitude there can be no recovery. This doubtless was the rule prior to the adoption of the present constitution in cases where there was no direct injury to the corpus of the property. But such has not been the rule since the adoption of the present constitution, which provides that private property shall not be taken or damaged for public use without just compensation."

The case will be carried to the Supreme Court.

FREIGHT QUESTION IN MASSACHUSETTS.

James Means and others who had petitioned the Massachusetts Legislature for incorporation as the Boston & Brockton Freight Co., with powers to haul freight over the lines of the Boston Elevated Ry., the Quincy & Boston Street Ry. and the Brockton Street Ry., were last month given a hearing by the committee on street railways at which the street railways concerned presented their protests. The people of Brockton wish to secure lower freight rates to Boston than the steam roads will grant and seek to secure them by means of a street railway freight service.

In opposing the petition and bill it was argued that if a freight business was to be done it should be done by the street railways themselves under a general law, and not by special grant to one company. As to the proposed company, there certainly would not be room for freight and passenger service over the routes asked for. The bill was also faulty in many respects, particularly in taking control of the operation of cars from the street railways themselves.

Pres. John R. Graham, of the Quincy & Boston road, said that it would be impossible to operate his road, some of which was single tracked, safely and expeditiously, if the freight cars of another corporation were allowed to run over its rails.

Besides, it was absolutely necessary that his road have complete

control of its electrical power at all times. His road was ready to carry freight, and believed it could do it at certain times of the day without interfering with its passenger business, but he did not believe that the time had yet come when the people were ready for freight transportation over the streets.

He would cheerfully take the right to carry freight if the Legislature would give it to him, but the road had not asked for it because it was not believed that the right could be secured.

CINCINNATI, NEWPORT & COVINGTON.

The following is the statement of earnings and expenses of the Cincinnati, Newport & Covington Railway Co. for January, 1900, compared with January, 1899, furnished us by Mr. J. C. Ernst, president of the company:

	JANUARY.	
	1900	1899
Gross receipts	\$57,196.16	\$49,871.86
Operating expenses	23,136.59	23,392.47
Net earnings	34,059.57	26,479.39
Tolls, taxes, damages, etc.	12,479.00	14,176.23
Net profit	\$21,580.57	\$12,303.16
Ratio of expense to earnings:		
With tolls402	.6130
Without tolls4045	.4690

CONSOLIDATION IN NASHVILLE.

On January 21st the street railways of Nashville, Tenn., comprising the Nashville Street Ry., the Citizens Rapid Transit Co. and the Nashville & Suburban Railway Co., were all consolidated under the name of the Nashville Ry. The Cumberland Electric Light & Power Co. is also owned and controlled by the stockholders of the Nashville Ry. Under the laws of Tennessee street railways and electric light companies cannot consolidate, therefore the two companies are operated separately.

The officers of the two companies are as follows: T. Edward Hambleton, Baltimore, president; Thos. J. Felder, vice-president; E. G. Connette, general manager; N. P. Yeatman, secretary and treasurer.

General Manager Connette advises us that the street railway is now building 3½ miles of new track completing a double track line to Glendale Park, and has contracted for a number of new trucks and motors. A considerable sum will be expended in other improvements during the coming summer; Glendale Park will be beautified and the Casino remodeled so as to provide for a country club in the second story. The lighting company has contracted for another engine and additional boilers and alternating current generators.

ATTEMPTED HOLD-UP IN NEW JERSEY.

A conductor and motorman, employes of the Bergen County Traction Co., of Fort Lee, N. J., had an exciting experience one morning last month with two negro desperadoes, who attempted to rob the conductor. The negroes boarded the car at the Bogota terminus, and when approaching a long stretch of lonely road, one of them with a revolver started for the conductor, while the other armed with a heavy walking stick made for the motorman, who was running the car at moderate speed. The conductor saw the movements and instantly gave the emergency signal "full speed ahead," at the same time preparing to grapple with the man with the revolver. The negroes were not expecting the sudden jerk and were almost thrown to the floor, giving the conductor an opportunity to seize and disarm one of them and attracting the attention of the motorman, who turned and overpowered the second. There were no passengers on the car.

Mr. W. F. Sadler, Jr., secretary and treasurer of the Trenton (N. J.), Lawrenceville & Princeton Railroad Co., writes us that his company expects to be running in the spring. Several condemnation proceedings have delayed construction work longer than was anticipated.

FOREIGN FACTS.

Extensions to the Hull (Eng.) Tramways are projected.

The London United Tramways Co. will build extensions.

Additional lines are to be built by the Ipswich (Eng.) Corporation Tramways Co.

A bill has been introduced in the Prussian Diet for the construction of light railways in Prussia.

The Cape Town (S. A.) Electric Tramways Co., Ltd., has declared an interim dividend of 4 per cent.

Power to build 17 miles of electric tramways has been asked of Parliament by the Hastings (Eng.) Tramways.

The Han-Shin (Osaka-Kobe, Japan) Tramway Co. will increase its capital stock from 1,500,000 yen to 3,000,000 yen.

The Blackpool (Eng.), St. Anne's & Lytham Tramways Co. has a bill in Parliament providing for the double tracking of its line.

The Musselburgh (Scotland) Town Council has granted a franchise for an electric tramway between Musselburgh and Portobello.

The Wellingborough (Eng.) & District Tramroads Co. is promoting a tramway bill in Parliament. The route to be covered is 20 miles long.

The Anglo-Argentino Tramway Co., with offices at Calle Rivadavia 3583, Buenos Ayres, Argentine, will equip its system with electricity.

The Madras (India) Government is opposed to the Madras Municipality issuing bonds for the purpose of purchasing the Madras Electric Tramways.

Whitehaven, Eng., and the adjacent district is to have electric trams. Franchises have been granted to the British Industrials Co., Market St., Manchester, Eng.

A bill is being promoted in Parliament by the Great Grimsby (Eng.) Street Tramways Co. for permission to introduce electric traction and make extensions.

Electric traction is being rapidly extended to almost all the principal winter resorts of the Riviera, France. The tramways at Cannes, France, have been completed.

Concessions for electric railways from Samaden to Campoclogno, Switzerland, with branches, have been granted to Frote & Westermann, of Vogelsangstrasse, 50-4, Zurich, Switzerland.

The Sheffield (Eng.) Tramway Co. proposes to divide its car into two compartments by putting a sliding door across the interior, forming accommodations for first and second class passengers.

The gross receipts of the Patna (India) City Tramway for the year 1899 were 31,839 rupees, as against 31,346 rupees for the previous year. The expenses amounted to 27,242 rupees, leaving a profit of 4,597 rupees.

The new tramways committee of the Newcastle (Eng.) City Council has decided on the plans for the power station and equipment of electric tramways. Contracts have not been let. Mr. Hopkinson is electrical engineer.

It has been decided by the Middlesex (Eng.) County Council, of which R. M. Littler is chairman, to construct a system of light railways in the county, which, it is expected, will ultimately involve the expenditure of £3,000,000.

The cost of converting, for electric traction, the existing horse tramways owned by the Salford (Eng.) Corporation, is estimated at £1,940 per mile of track, and the total cost is placed at £414,753. Contracts have been let for the work.

Applications for laying an electric railway between Kanagawa and Kawasaki, Japan, has been presented to the Kanagawa Prefectural authorities for sanction, by Zensuke Tanaka and several other promoters of Yokohama, Japan.

The promoters of the recently organized Puerto Principe (Cuba) Tramway Co. are I. A. Kelsey, the prominent street railway capitalist of New Haven, Conn., and R. A. Bentancourt, W. G. Bushnell and S. C. Moorehouse, also of New Haven.

The authorities at Moscow, Russia, have decided to permit American manufacturers, who desire to bid for the construction of electric tramways in Moscow, to examine all the details of plans, specifications, conditions and terms. M. Teploff, Russian, consul-general at New York, can give further particulars.

From Calcutta, India, comes the statement that the negotiations between the Calcutta Tramways Co. (Ltd.) and the Town Corporation regarding the proposed agreement for electric traction have been brought to a successful conclusion. The company will issue £350,000 of 4½ per cent first debenture bonds to defray the cost of making the change.

The Durban (Natal, S. A.) Corporation is inviting tenders for the supply of material for 14.36 miles of electric railways and bonding 2.96 miles of existing track. Specifications may be secured from the London agents, Webster, Steel & Co., 5 East India Ave., London, E. C., by depositing £10 ros., which will be returned later. Bids must be in by April.

Consul General Richard Guenther, of Frankfurt on the Main, advises the State Department that the old horse car system in that city is being converted for electric traction. One line connecting the suburb of Sachsenhausen has been in operation by electricity for several months and work is in progress on the others. The overhead system with iron side poles is being used.

The first Chinese electric railway has been opened. It is four miles long, connecting the Pekin railway station at Machiapu and the South Gate of the capital. Its installation is interesting, as showing the disappearance of that official superstition that placed the steam railroad station for Pekin four miles outside the walls so as not to offend the Feng-shin, which is one of the gods or goddesses, we don't know which, that patronize the capital city.

A novel double-deck motor car has been purchased by the Dublin United Tramways Co. It is vestibuled at either end, and the staircases to the roof are enclosed within the vestibules, making it impossible for passengers to fall off. Access to the upper deck is through a hatchway above the vestibules. Around the edge of the roof is a strong railing, and the seats on top are provided with a cover. Complete protection is afforded to both motorman and conductor from bad weather, and the platform area is increased so as to accommodate parcels, etc. The seating capacity is 25 inside and 37 on top.

Berlin is the center at present of a number of electric transportation experiments. On the tramways between Berlin and the adjoining district of Charlottenburg, new storage battery cars are being tried, and the mayor and traffic committee have also approved a scheme for the construction of a system of underground electric railways similar to that in operation at Buda-Pesth. In addition to these, it has been suggested that by the substitution of electric for steam traction on the Berlin Metropolitan and Berlin Circle railways, the carrying capacity would be increased 260 per cent. and steps have been taken to bring this about.

CORRESPONDENCE

Spliced Cars.

Editor "Review": In view of the increasing popularity of long cars for city and of the fact that most roads now have an equipment of short cars your readers may be interested in a short description of the method of splicing small car bodies which was employed by the Omaha & Council Bluffs Railway & Bridge Co.

We took two 16-ft. bodies and removed the ends of each car with the exception of the end floor sills. The cars were exactly alike and all moldings, panels, etc., matched so that it was only necessary to draw the two parts together and fasten them with steel angles and straps. Steel angles 4 x 6 in. by 3/2 ft. long were then placed under the side sills; similar angles placed across the ends of the spliced car and securely bolted to the old sills. At the center of each of the old bodies, the distance between the two being about one-third the total length of the spliced car, oak cross sills 4 x 6 in. were put under the floor and mortised into the other floor sills. From these cross sills iron struts were extended, and two 1 1/2-in. iron truss rods carried from the steel angles at the ends over the struts on the cross sills. New platforms were placed on each end of the car, vestibuled, and so arranged that whenever the ends would drop down and get out of line, the ends of the bolsters carrying the platforms, which extended back to the truck beams, could be wedged at the outer end of the platform and the car thrown back into line.

On the first car so spliced it was found that the only weak point in the construction was at the junction of the vestibule and the car body, the platform sagging and pulling the joints apart over the end door of the car. This car did not have the steel under frame extended around the ends. The steel end sill remedied this difficulty and after five years' service the spliced cars are in as good condition as when they came from the shop.

It is my belief that if we were to ask a car builder to make a 45-ft. car for us today the whole construction would be probably one-third heavier than in our spliced cars, the present tendency being to increase the weight and strength of all parts. While I approve of this heavier construction as a general proposition, I find that our spliced cars, with a well-constructed floor and the other parts light, have a considerable advantage over more modern construction because of the less power required for propulsion. This is shown by the fact that our 45-ft. open cars seating 75 and often carrying 150 people with the steps loaded, do not take any more power than one of our closed cars, because of the latter being heavier in the trucks and body.

W. S. DIMMOCK,
General Manager.

Council Bluffs, Feb. 24, 1900.

Benefit Associations.

Editor "Review": I was quite interested in the data concerning mutual benefit associations organized among the employes of street railway companies. While associations of this sort have their drawbacks, still when wisely managed and controlled by the persons in charge of the company they are, in my opinion, beneficial. Of course there are always in the service some employes who will not join, but this very fact works for good, as it creates somewhat of rivalry and urges activity and enthusiasm in behalf of the association on the part of those who are members, in the face of adverse criticism. I do not believe that there should be any compulsion exerted either actually or morally on the part of a road's management to force employes to join such an association.

It is some times the practice of railroad companies to give to their employes at Christmas time, presents of various kinds. Such sporadic generosity often fails to accomplish the object desired, but a regular system of contributing to the welfare of a company's employes, such as is afforded by the giving to a mutual benefit association, largely under the control of the men, of a regular fixed amount, directs the money and benefits so contributed into channels of usefulness and help, and makes certain that those in actual need are made the beneficiaries. One association I have in mind is not only assisted by the company's regular contribution and the

dues of the members, but once or twice a year when some specific object, either social, educational or charitable is to be compassed, it gives a benefit entertainment under the control and management of the employes themselves, with a two-fold result of increasing the amount in its treasury and at the same time giving to the members, relaxation, and a closer social relationship.

The work connected with such an association does not fall heavily upon anyone, and is far less troublesome than perhaps some street railroad managers may imagine, for once instituted upon right lines, its conduct is easy. As a manager I am heartily in favor of mutual benefit associations both on theoretical grounds and as the result of my experience with them. Yours truly,

GENERAL MANAGER.

Sleet Wheels.

Editor "Review": For the benefit of those who may be looking for a first class sleet wheel, I would suggest that after all others have failed, just pull the wheel out of the harp and slide along without the wheel until the ice has been removed from the wire. The harp makes a good scraper and does no injury to wire or hangers, if the wheel is replaced as soon as the ice is removed. Thus you have a sleet cutter that you can bring into use on short notice, which is usually all the notice we get at such times. During the last sleet storm we had here I ran our 16-mile interurban line on schedule time, 40 miles per hour, and the ice was frozen on the wire; so it was impossible to get contact through any kind of a wheel. Yours truly,

E. E. DOWNS,

Vice-Pres. and Gen. Mgr. Citizens' Traction Co.
Oshkosh, Wis., Feb. 18, 1900.

WATCH FOR PICKPOCKET GAME.

Two pickpockets, well known to the police of Detroit, Mich., were arrested in that city a short time ago while trying to ply their trade in a crowded car, after a rather novel fashion. The two men boarded the car, and soon became engaged in a dispute that grew into a hand-to-hand fight. Several passengers interfered and after separating the two combatants, instead of permitting the men to leave the car, as they evidently wished to do, held them until they could be turned over to the police. In court several detectives recognized the prisoners and made the statement that the pair have been working their game for sometime, by starting a row in a crowded car and trusting to the resulting uproar and confusion to enable them or their accomplices to busy themselves with the pocketbooks and jewelry of the passengers. The men were fined \$5 and costs, with the alternative of six months in the house of correction.

HALIFAX TRAMWAY REPORT.

The report of the Halifax (N. S.) Electric Tramway Co., Ltd., for the year ending Dec. 31, 1899, shows a net profit of \$61,799, as against \$54,749 for the previous year. The gross receipts were \$203,936, of which \$120,697 were from the railway and the remainder from the lighting and power business. Operating expenses were \$112,137, being 55 per cent of the receipts. The number of passengers carried was 2,616,231, and the car-miles run, 613,942. The receipts per passenger were 4.59 cents. During the year the boiler house and coal sheds were enlarged and a new 250-h. p. boiler and some lighting generators installed.

The officers are: David MacKeen, president; John Y. Payzant and W. B. Ross, vice-presidents; B. F. Pearson, secretary.

ICE-SKATING RINK NOT A SUCCESS.

Mr. H. C. Higgins, president and manager of the Marinette (Wis.) Gas, Electric Light & Street Railway Co., in reply to an inquiry, writes as follows:

"We have no skating rink on our lines this winter. We did run a rink for two years some years ago, but as it was a losing investment (as the brass band adjunct took all our profits), we abandoned it. We could not seem to get a crowd without a band and as the band cost us \$20 a night we could not make both ends meet."

A. S. R. A. ANNOUNCEMENTS.

The 19th annual meeting of the American Street Railway Association will be held at Convention Hall, Kansas City, Mo., Oct. 16, 17, 18 and 19, 1900.

Papers will be read on the following subjects

"Double Truck Cars; How to Equip Them to Obtain Maximum Efficiency Under Varying Conditions."

"Construction, Operation and Maintenance of Roads that Operate 20 Cars or Less."

"Comparisons of the Various Systems of Electrical Distribution for Street Railways."

"Consolidation of Street Railways and Its Effect Upon the Public."

"The Store Room and Store Room Accounting."

"Painting, Repainting and Maintenance of Car Bodies."

The building contains 50,000 sq. ft. of floor space, without a post or obstruction of any kind.

Friday, October 19th, has been set apart as a day for the examination of the exhibits; no session of the association will be held, so that all may have plenty of time to view the exhibits. It is earnestly requested that managers have their heads of departments present on that day.

The annual banquet will be held Friday evening, when the officers-elect will be installed.

The headquarters of the association will be at the Midland Hotel.

Rates per day at the hotels will be as follows:

	American.	European.
Midland	\$3.00 to \$6.00	\$1.00 to \$5.00
New Coates	3.00 and upwards	1.00 and upwards
Savoy	2.50 to 6.00	1.50 to 3.50
Baltimore	3.00 to 5.00	1.50 to 3.00

All of these are in close proximity to the hall.

The income from the sale of space will go to the American Street Railway Association. The executive committee of the Association has fixed the price at 10 cents per sq. ft., and ruled that no space of less than 100 sq. ft. will be assigned, but applicants may have as many multiples of this quantity as they wish, all in one body. Payment for space should be made to T. C. Penington, secretary and treasurer of the American Street Railway Association, No. 2020 State St., Chicago. Application for space should be made to W. A. Satterlee, 15th and Grand Ave., Kansas City, chairman committee on exhibits. It should be stated in the application for space, the shape desired, number of feet wide and long, and the committee on exhibits will comply with the request, if possible. Cars, sweepers, and plows will be placed outside of the building under a porch which can be closed in with canvas.

It is earnestly requested that all exhibits shall be in place and all work finished by Monday evening, October 15th, which is the evening prior to the opening of the convention. Watchmen will be in charge of the building, so that the exhibits will be safe.

All articles intended for the exhibition shall be delivered at the building by the agent or owner, and at his expense, but the local committee has made arrangements with the Kansas City Transfer Co. to haul and deliver all shipments to and from the building at low rates, if directed in its care.

All goods should be marked to yourselves. Convention Hall, Kansas City, Mo., in care of Kansas City Transfer Co., sending it the bill of lading or advice that you have shipped goods in its care, giving particulars in regard to shipment, and they will be delivered on your space in the Exhibition Hall. Ship all goods early to insure delivery in time and prepay charges.

Articles will be placed on the proper space in the hall if marked with the number of space on the boxes. The numbers of the spaces will be mailed to exhibitors in ample time for shipment.

All electrical connections for power and extra light must be made at the expense of the exhibitor. Perhaps it would be well for the exhibitors to make arrangements to have the building open in the evening, as it is well lighted, and the electrical companies expect to make a large display.

Space should be applied for by September 1st. Assignments will be made as promptly as possible and exhibitors notified of their location. Exhibits of like character will be grouped together, and space will be assigned in the order of application.

The committee on exhibits will make contracts with carpenters,

electrical workers and laborers, at regular prices, so the exhibitor will not be overcharged for lumber, labor, etc.

Railroad rates will be the same as at former conventions, one and one-third fares for the round trip.

In order to increase the membership of the Association, and make 1900 the banner year, the executive committee, at a meeting held Feb. 5, 1900, passed the following:

"Resolved, That the payment of the membership fee of \$25 be waived to any company becoming a member of the Association prior to Oct. 1, 1900, provided the annual due of \$25 to October, 1900, be paid at the time application for membership is made."

CHANGES TO BE MADE AT CHATTANOOGA.

The officials of the Chattanooga (Tenn.) Rapid Transit Co. have decided to extend the service to the top of Lookout Mountain and will build three miles of new track to connect with the incline roads now running to the summit. The company expects to arrange for a carriage service at Chickamauga Park under its own supervision, and arrangements have been made with the Southeastern Passenger Association so that tourists will be permitted to stop over at Chattanooga for one day. According to these plans, it will be possible to go to the park, drive over it for half the day, return and go up on the mountain for the remainder of the day, visiting all the places of interest and return to the city on the Rapid Transit company's line. The price of this trip will not exceed \$1.

With the completion of the three-mile line mentioned, the Chattanooga Rapid Transit Co. will own 21 miles of track. At its power station there are installed one direct connected Hamilton-Corliss engine and a 550-volt Siemens & Halske generator, and two belted generators of 215 watts capacity.

ATLANTA CONSOLIDATION.

An injunction to prevent the Trust Company of Georgia, which controls the securities of the Atlanta Railway Co. and the Atlanta Consolidated Railway Co., from consolidating the two properties was granted in November last. The petition was filed in the name of the state by a property owner who claimed he would be injured by the consolidation.

February 27th the Supreme Court of Georgia reversed the judgment, and the consolidation may now be carried out.

The court, all concurring, held:

That portion of the constitution which denies to the general assembly "power to authorize any corporation to buy shares or stock in any other corporation" is not absolute in its terms; but it was designed only to prevent the General Assembly from authorizing one corporation to purchase shares or stock in another when doing so "may have the effect, or be intended to have the effect, to defeat or lessen competition in their respective business, or to encourage monopoly."

The Trust Company of Georgia is authorized by its charter to buy stock in other corporations.

The proposed control of the two railways by the Trust company is not a lessening of competition.

After the decision became public, Mr. Woodruff, president of the Atlanta Railway & Power Co., said:

"There are about 26 miles of the Atlanta Ry. practically isolated from the Atlanta Railway & Power Co. This means two fares when passengers go from one of these lines to the other. It is a fact that 25 per cent of the passengers on the Atlanta Consolidated ask for transfers to the Atlanta Railway Co., which, of course, cannot be furnished.

"It can be seen at a glance then how the public convenience and the public purse would be subserved by proper and needed physical connections which this decision would seem to give the power of making."

The Camden (N. J.) & Suburban Railway Co. presented to the city of Camden a bill for \$3.91 for damages to one of its cars which was struck by a fire truck. The common council instructed the clerk to inform the company that the city would stand half of the expense.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

NEW STATION AT BAY CITY.

By the courtesy of Mr. E. S. Dimmock, general manager of the Bay Cities Consolidated Railway Co., of Bay City, Mich., we have received drawings showing the front elevation and the ground plan of the new power house which that company is now building, the contracts having been placed in December last. In exterior appearance and in general arrangement this station is similar to that of the Omaha & Council Bluffs Railway & Bridge Co. described in

NEW POWER STATION AT BAY CITY.

our May, 1899, issue, page 296; one marked difference, however, is that in the Bay City station mechanical draft will be used.

The plan shows the arrangement of the building, which is one story in height. The main portion is 65 ft. 7 in. wide and 96 ft. 8 in. long, these measurements being from outside to outside of pilasters. Adjoining the boiler room is a low roofed addition for coal which measures 15 ft. 4 in. by 55 ft. 5 in. outside and 13 ft. 7 in. by 52 ft. 11 in. inside. The exterior walls of the main building are 21 in. thick, with pilasters 12½ x 25 in. spaced about 12 ft. 4 in. c. to c. The exterior is to be of No. 1 hydraulic pressed brick. The interior

PLAN OF STATION.

finish in both engine and boiler rooms will be cream enamel brick.

The engine room measures 48 x 60 ft. inside and will be equipped with two tandem-compound condensing engines built by the Russell Manufacturing Co., which will be direct connected each to a Siemens & Halske generator of 550 kw. capacity. The Siegrist system of lubrication will be used. Other minor equipment includes Cochran separators, heaters and purifiers, Kelly & Jones valves and Laidlaw, Dunn & Gordon jet condensers and pumps. The Arluckle-Ryan Co., of Toledo, O., general contractor, was awarded the contract for the complete installation.

The boiler room is separated from the engine room by a 17-in. wall, and measures 41 ft. 4 in. by 60 ft. inside. The contract for boilers has been let to the Stirling Co.

The cost of the building and its equipment is estimated at \$84,000.

RELATIVE EFFICIENCY AND DESIRABILITY OF VARIOUS TYPES OF ENGINES ON CENTRAL STATION LOADS.

Abstract of a paper read before the Northwestern Electrical Association, by Prof. A. W. Richter, of the University of Wisconsin.

From the time of Savery and Newcomen, the steam engine, with a duty of but a few million foot pounds per hundred pounds of coal, has gradually advanced, until we have attained the high efficiencies of the present day. The very highest efficiencies reported are those of the Nordberg pumping engines at Wildwood, Pa., showing the remarkable duty of about 163,000,000 ft.-lb. per 1,000,000 B. t. u., and the performance of the Sibley College quadruple expansion engine with a reported consumption of less than 10 lb. of steam per i. h. p. per hour.

Such high economies have not been reached in power and lighting station engines and probably never can be, but there is no reason why, with modern appliances and with the gradual improvement in the efficiency of such appliances, results more nearly approaching these, should not be attained in station engines.

Considering the efficiencies quoted as standard, we must look upon the station engine as a very uneconomical machine; this is especially true of the street railway engines. The deficiency is due principally to the great fluctuation in load, added to the fact that the engines are usually underloaded, in order to enable them to carry the "peak" of the load.

The general improvement called for in station engines, as indeed in all other engines, is the reduction of

First: Cylinder wastes effected by

(a) The kind, size and style of engine and

(b) The introduction of the storage battery and other equalizing devices.

Second: Transmission losses from cylinder to dynamo.

Third: Losses and wastes in auxiliaries, piping, etc.

In discussing the style of engine for power and lighting purposes, time will not permit a discussion of all the details, but it is hoped that some of the principal points may be made clear. In order to meet the demands of the varying load on the engine, the work done in the engine cylinder must be varied, the changes being in all cases automatic. This is accomplished by throttling, as in the throttling engine, or by varying the range of cut-off, as in the automatic cut-off. The only advantage of the common throttling or slide valve engine is its cheapness. The workmanship is usually very poor, causing leaks and increased friction. This engine uses more steam for a given power than any other engine on the market, its consumption being about 60 lb. of steam per i. h. p. per hour; in some cases it even exceeds that amount.

The only circumstances that would make the use of this engine excusable, though probably not advisable, would be if all the exhaust steam were used for heating purposes. The great difficulty, however, is that seldom, if ever, can all the exhaust steam be utilized. Having then practically discarded the common throttling engine, we will consider for a moment the automatic cut-off, classified as to valve gear, we have the drop cut-off engines and those engines which have a positive valve gear. Considering speed as a basis, we have the high and low speed engines. We have also the condensing or non-condensing engines; the simple, compound, triple expansion engines, etc.

The principal types of the drop cut-off engines are the Corliss and some poppet valve engines. The advantages of these engines lie in the facts that the steam is admitted at a pressure almost equal to the boiler pressure. A more perfect steam distribution can be maintained for the different points of cut-off. The rapid motion of the valve at cut-off and admission causes less wire drawing at these points. All of these points result in an increased efficiency. The first cost of these engines is, however, considerable, as the valve gear is usually quite complicated. The action of the Corliss and other detachable valve gear engines limits their speed to that of slow and medium speed engines.

Passing on to the consideration of the high and slow speed engines, we find that all engines may be run direct connected. The high rotative speed permits the direct connection of engine and dynamo at less cost than the slow speed, as the reduction in speed necessitates an increase in the size of the dynamo and engine and in the amount of material used in their construction.

Increasing the speed of an engine reduces the time allowed for initial condensation, and, therefore, other things being equal, reduces the amount of steam condensed in the cylinder. On the other hand, high speed engines are usually constructed with a proportionately shorter stroke than are engines of less speed and with greater clearance and port areas, thus presenting more condensing surface to the inflowing steam. They are, consequently, more subject to internal wastes by cylinder condensation. High speed engines are more easily regulated and operate with less friction; they are, however, more subject to wear and to accidents. Accidents occurring with high speed engines are usually much more serious in results than with engines running at lower speeds. The slow speed engines are generally more economical in steam consumption, though some of the high speed engines, as the "Willans," show a remarkably good efficiency.

If it is desired to obtain the very highest engine efficiency, slow or medium speed engines should be used, while if the first cost is of prime importance, it might be advisable to use engines of high speed; but it should be remembered at all times that the cheaper engine usually increases the cost of boilers and auxiliaries. There is no reason, however, why the high speed engine should not be used for the necessary duplicates.

Condensing engines are more economical than non-condensing, because the temperature of the exhaust steam is less. As the effective steam pressure is greater for the same cut-off a smaller cylinder is required for the same power. With engines of equal power and cylinders of the same size, the steam can be cut off earlier in the cylinder of the condensing engine, consequently less steam is used per stroke, and, therefore, per horse power. The cylinder condensation and subsequent re-evaporation depends in part upon the range of temperature in the cylinder through which the steam acts. The compound engine has an advantage over the simple engine in that this range of temperature is reduced, the volume of each of its cylinders is less and the steam re-evaporated during expansion and exhaust in the first cylinder is again available for work in the next succeeding cylinder.

Compound engines are more generally used than triple expansion engines, not alone on account of first cost, but also because of the variable load; triple engines cannot attain a sufficiently greater economy to warrant their use in many cases. Of the compound engines, the tandem has an advantage in first cost, compactness and small friction. The cross compound has lighter stresses in its running parts, and has no dead center when the cranks are set at an angle of 90° .

Engines of the vertical type require less floor space and have less friction as compared to those of the horizontal type.

On several occasions the following question has been put to me by members of the electrical fraternity: "Is it advisable to place a heater in the exhaust of a condensing engine?" It seems that claims are occasionally made by unscrupulous agents that the feed water temperature can be raised to, say, 180° or 200° F. Suppose we have a pressure of 2 lb. absolute in our exhaust pipe, corresponding to a temperature of 126° F. It stands to reason that if a heater be introduced without changing the conditions, the temperature of the feed water leaving this heater must be considerably below 126° . Should the temperature of the feed water be higher, it would simply show that with the introduction of the heater sufficient resistance has been introduced to raise the temperature and pressure of the exhaust steam and consequently the back pressure on the engine. The loss occasioned by the rise in the back pressure

will, of course, be greater than the gain occasioned by the rise in the temperature of the feed water. This would be true even though the vacuum gage, which is usually connected directly to the condenser, may show no apparent change of vacuum.

With the possible exception of the rolling mill, the variation in load upon an engine is probably nowhere as great as in the electric station. This is especially true of the street railway engine, in which we have sudden changes of from a few amperes to the maximum output of the station. The lighting load offers no such great sudden changes, although here, also, the load varies considerably with different hours of the day.

Unless other means are provided, the engine must immediately respond to these variations of load; the engine must then be of a size to enable it to carry the heavy maximum load. It will at once be seen that for a greater portion of the time the station engine is an underloaded machine. This evil has been greatly mitigated by the introduction of the storage battery. In taking up the rapid fluctuations, the battery relieves the engine of this duty and makes the engine load more constant. We are told of tests in which the fluctuation of the engine load has been decreased to a remarkable degree.

In an article on "Electric Tramways with Stationary Accumulators," by Ludwig Schroder, we find that in speaking of the Remscheid Electric Tramway, he says: "The battery consists of 250 cells, having a capacity of 648 ampere-hours at a discharge rate of 216 amperes, though a current up to 420 amperes may be taken from them. Eight cars seat 16 passengers each, and there is standing room for 12 more. The current delivered to the line for factory motors and the tramway varies from 100 to 460 amperes on week days, the mean being 232 amperes; the current from the machine varies from 210 to 255 amperes. Without the factory load the current supplied to the lines varies from 0 to 375 amperes, its mean value being 135 amperes; the current from the machine varies from 115 to 150 amperes. The pressure varies from 495 to 510 volts. It has been calculated that at this station over 11 tons of coal are saved per week since the traction system was altered, but it is not only the coal consumption that must be considered. Two hundred horse power of dynamo output has been saved, and the battery that effected this saving only cost one-half as much as the machines which have been set at liberty and are now available for any further increase in the load."

In reports of the Chicago Edison Station, it appears that about 25 per cent of the peak of the load is carried by the batteries.

Many similar cases could be cited, but those given will be sufficient to illustrate the effect of the storage battery when introduced as a part of the station equipment.

The extreme fluctuations and the peak of the load being carried by the storage battery, the size of the engine can be reduced. The engine can be of a size nearly equal to the average load of the station. Its cylinder condensation could thus be reduced. As the fluctuation decreases, the triple expansion will show a greater commercial gain over the compound and simple engines. It will be possible to introduce larger units with an increased economy.

There is now and always has been a tendency toward the introduction of higher steam pressures. The time is probably not far distant when steam pressure of four or five hundred pounds will be used with a corresponding increase in the number of cylinders. All of these conditions will tend to increase the efficiency of the station, the greater the improvements, the more nearly will the efficiencies approach those of engines having perfectly constant loads, as our modern pumping engines.

With reference to friction losses it is evident that the direct connected system offers the highest efficiency. Efficiencies of 82 per cent between indicated horse power and electrical output are guaranteed and we also have reported efficiencies as high as from 84 to 85 per cent. The belting of dynamo direct to engine at times offers some advantages as it may provide better facilities for dividing the machinery into the most economical units, while the losses introduced by the belt are not very great. As the belt is flexible it responds somewhat to the sudden changes of the load, thus relieving the engine of sudden shocks. This of course is an advantage.

By placing the dynamos at different distances from the engine, several machines may be belted to the same engine pulley. The introduction of a jack or counter shaft, as was common practice in some of our older stations, causes additional and unnecessary losses. At the present time counter shafts are seldom employed. In many stations a change to a more direct method of transmitting

the work of the engine to the dynamo would show a decided financial gain even though it might be necessary to discard some of the machines in order to make such a change. With efficiencies ranging from 60 to 70 per cent as are occasionally reported, it is evident that a saving of from 15 to 20 per cent can be effected. Whether it is advisable to make changes and especially to what extent such changes should be made is a question which must be specially considered for each case.

(As an instance of what a small change may do, data of tests of a combined railway and lighting plant taken under different conditions were presented and it was shown that moving a small alternating machine formerly driven from the jack shaft to a position where it was connected to the engine pulley by a short belt reduced the commercial efficiency of the station from 3 to 5 per cent. The principal reason for this loss was that the short belt slipped at heavy loads and the generator could not carry the night load alone as it had formerly done.)

Since the efficiency of a station engine is so intimately connected with the efficiency of its auxiliaries, a few words in this connection will probably not be found out of place. It is a noted fact that auxiliaries are as a rule very wasteful in the use of steam; a steam consumption as high as several hundred pounds per h. p. hour having been observed. They are, of course, usually operated with a very much smaller steam consumption. It can be shown, however, that an electrically driven pump will, in a great many if not in all cases, show a very great improvement in efficiency. Suppose, for example, that we require 20 lb. of steam per engine i. h. p. per hour; if engine, dynamo, and motor each have an efficiency of 90 per cent we have an efficiency from engine cylinder to motor output of about 73 per cent corresponding to a steam consumption of 27.4 lb. per e. h. p. h. delivered by the motor. With a total efficiency of 60 per cent as compared to the mechanical efficiency of the ordinary steam pump, the steam consumption will be but 33 1-3 pounds per h. p. h. With an engine using 25 lb. of steam per i. h. p. per hour this amount will be increased to 41 lb., a steam consumption considerably below that of the ordinary feed pump. On the other hand the introduction of the motor will increase the first cost. Other things being equal, the more inefficient the main engine, dynamo, motor and transmitting device from motor to pump, and the greater the cost of motor as compared to the steam pump the less will be the gain occasioned by the introduction of the motor. When the exhaust from the steam pump is utilized the electrically driven pump has not so great an advantage. On the whole it would seem, however, that in many stations the electrically driven pump will show the greater commercial efficiency.

In choosing the most economical outfit for a station local conditions must largely govern, but the tendency should be in the following directions:

First: The introduction of the largest possible units in order to make the cylinder condensation, first cost per horse power, attendance, etc., a minimum.

Second: The choice of a style of engine giving as great a thermodynamic efficiency as local conditions will admit, it being borne in mind that, with the ordinary conditions, the compound condensing engine gives the greater commercial efficiency. For small units and for duplicates the vertical compound, condensing, direct connected high speed engines give excellent results. With several engines on the same circuit it would be advantageous to have all engines but one continually operated at rated capacity.

Third: The introduction of storage batteries, thus equalizing the load upon the engine. The size of the engine can be chosen more nearly equal to the average load, decreasing cylinder and other wastes. This with the introduction of higher steam pressures will make it profitable to introduce triple and quadruple expansion engines for the larger powers.

Fourth: The introduction of the direct connected system, thus reducing the transmission losses to a minimum.

Fifth: Great care should be exercised in the choice of auxiliaries since an uneconomical system of auxiliaries will often greatly reduce the efficiency of an otherwise economical plant.

The Brooklyn Rapid Transit Co., as announced in the "Review" last month, has made arrangements with the street cleaning department of Brooklyn for clearing snow from the streets, and will employ in addition to carts and trucks 50 flat trail cars, each holding 18 cu. yd. of snow.

IDE ENGINES FOR RAILWAY SERVICE.

A. L. Ide & Sons, of Springfield, Ill., are paying special attention to their 500-h. p. direct coupled four-ported compound engines, which are built after designs, drawn with the view of securing the greatest possible strength, economy and efficiency, under the heavy fluctuating loads found in street railway service. This concern is better prepared than ever before to fill contracts quickly and well, having recently made large extensions to its factory, placed electric cranes in the foundry and machine shop, built additional switches into the works, and installed a new three-wire system for lighting and independent motor work.

ELECTRICAL LABORATORIES OF THE UNIVERSITY OF ILLINOIS.

The electrical engineering laboratory of the University of Illinois is well equipped with alternating and direct current apparatus of various types and sizes, and has a large collection of the best measuring instruments.

A standardizing laboratory is equipped for accurately measuring current and electro-motive force, thus admitting at all times of ready calibration of the instruments used in the laboratory. An experimental telephone and signaling line has been erected, and several sets of receivers and transmitters have been provided for testing purposes. A high potential testing transformer, with a specially designed electrically heated oven, and other accessory apparatus, facilitate disruptive tests on insulators and insulating materials.

ENTRY OF INTERURBANS AT COLUMBUS, O.

The various interurban electric roads seeking an entry into Columbus, O., have decided to make no further attempt to come to an agreement with the Columbus Street Ry. for the use of the latter's track, but will endeavor to get an independent entrance. The interurban companies concerned are the following: Columbus, London & Springfield Ry.; the Columbus & Lancaster Traction; the Grove City & Green Lawn Street Ry.; the Columbus, New Albany & Johnstown Traction; the Columbus, Buckeye Lake & Newark Traction; the Chillicothe, Clarksburg & Columbus Ry.

The proposition from the Columbus Street Ry. asked the interurban roads to pay it 75 per cent of the receipts from local passengers and 10 per cent per annum on the cost of laying the third rail necessary to make a standard gage track.

FRANKLIN (PA.) ROAD SOLD.

The property of the Franklin Electric Street Railway Co., of Franklin, Pa., has been purchased by the Citizens' Traction Co., of Oil City, Pa., and the following officers elected: President, Daniel J. Geary; vice-president, William Hasson; secretary, F. W. Bowen; treasurer, James Hasson.

The Citizens' Traction Co. is a new corporation organized to build lines in competition with the Oil City Street Railway Co. and in addition to franchises in Oil City, has secured rights of way in Ronseville, Cornplanter Township, Siverly, Reno and other localities. Mr. John Fobes has been appointed general manager, with offices in the Blizzard Block, Oil City, and construction work will be started at once.

FROM SOUTH AFRICA.

A correspondent in Harper's Weekly writes as follows: "There is a car line propelled by sleepy mules, running from Kimberley along Dutoitspan Road to Dutoitspan, a suburb. The day I arrived in Kimberley I beheld the apparition, and stood mute. Tears—patriotic tears—gathered in my eyes; for, lo and behold! on the side of the car stood forth, in bold American letters, 'Battery to Central Park.' It was an old New York Broadway car, redolent with the perfume of Jake Sharpe—misunderstood man—and his aldermen. The world is small indeed, my masters!"

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO

NOT LIABLE FOR DRAGGING WOMAN BY SKIRT AFTER ALIGHTING.

Doyle v. Metropolitan Street Railway Co. (N. Y.), 60 N. Y. Supp., 475. Oct. 25, 1899.

According to the testimony of the plaintiff, she was a passenger on one of the cars of the defendant company, and, desiring to alight at a certain street corner, so signaled, and the car stopped. She alighted, and, after both feet were on the pavement, the car started, and dragged her along for about the width of two houses. She testified that her skirt was caught by some part of the car, how or in what manner did not appear. There was no evidence of any defect in the car. On the contrary, it appeared that the car was built in June, 1898, of the most approved form and pattern. Under these circumstances, the appellate term of the supreme court of New York holds that the judgment of the trial justice in favor of the defendant, on the ground that the plaintiff had failed to establish her case, was right, and should be affirmed, with costs.

NOT LIABLE FOR COLLISION WHERE DRIVER TRIES TO CROSS TRACKS AFTER WAITING FOR ONE CAR WITHOUT LOOKING FOR ANOTHER.

Devine v. Metropolitan Street Railway Co. (N. Y.), 60 N. Y. Supp., 520. Oct. 25, 1899.

While driving a horse and cart, the latter loaded with dirt, the plaintiff, seeing a south-bound car approaching, when he reached a double-track street railway, stopped and waited until that car had passed. Then he started on, and, too late to avoid a collision, discovered a north-bound car close at hand. The gripman on the latter car saw him stop, and continued on with his car, not seeing that he started on again until he emerged from behind the south-bound car not more than 10 or 12 feet away. Under the circumstances, says the appellate term of the supreme court of New York, in reversing a judgment which the plaintiff obtained and the general term of the city court of New York affirmed, no greater duty was imposed upon the defendant than was required of the plaintiff, and, it holds, the necessary inference was that the plaintiff failed to acquit himself of contributory fault, so that it was error to deny a dismissal of the complaint.

CHANGE OF PLANS DOES NOT RELEASE GUARANTYING COMPANY FROM LIABILITY.

Mathesius v. Brooklyn Heights Railroad Co. (U. S. C. C.), 96 Fed. Rep. 792. Oct. 4, 1899.

It is within the exercise of its legitimate powers, the United States circuit court, Eastern District of New York, holds, for a company which has employed a construction company to build a road for it to guaranty the payment of the price agreed to be paid by the construction company for appropriate plans it bought and labor necessary to make such plans effective. And while the court admits that the railway company may be at liberty to change its plan, it denies that it can do so at the expense of third persons, of whom it has engaged labor and material. So it holds that if the construction company engaged an engineer whose skill related to a system of construction adapted for the use of compressed air, the guarantying railway company would not be excused from paying for such engaged services upon the plea that it had concluded to employ an electrical plant, in the construction of which such engineer's ability would not be serviceable.

INSTRUCTIONS PERTINENT TO CASE WHERE ATTEMPT WAS MADE TO CROSS IN FRONT OF CAR.

Williamson v. Metropolitan Street Railway Co. (N. Y.), 60 N. Y. Supp., 477. Oct. 25, 1899.

Counsel for the defendant company asked the court to charge "that, if the jury find that both the plaintiff and the defendant were negligent, their verdict must be for the defendant." The court

said: "That is for the jury to decide." Again, counsel asked the court to charge "that if the jury believe that, at the time when the plaintiff started to cross in front of the defendant's car, it was evident to him that he could not pass in safety unless the motorman stopped or slackened the speed of the car, he is guilty of contributory negligence, and their verdict must be for the defendant." The court answered: "The jury has been charged as to negligence as to that point, and as to the power to stop the car." Lastly, counsel asked the court to charge "that, if the plaintiff saw the car, the negligence of the defendant cannot be predicated on an alleged failure to ring the gong." And to this the court replied: "That is for the jury to decide." The plaintiff got judgment. But that is reversed by the appellate term of the supreme court of New York. The legal propositions contained in the foregoing requests being applicable to the facts and circumstances disclosed by the testimony, and not being covered by the charge as given, the higher court holds that the defendant had a right to have them laid before the jury. As the testimony was undisputed that the plaintiff's driver saw the approach of the car, actionable negligence, the court particularly says, could not be established by proof of the fact that the motorman did not ring the gong.

COURTS CANNOT INQUIRE INTO MOTIVE OF LEGISLATIVE AND LOCAL ACTION ON FRANCHISES AND THE LEGISLATURE CAN CURE DEFECTS.

Kittinger v. Buffalo Traction Co. (N. Y.), 54 N. E. Rep. 1681. Oct. 10, 1899.

Mr. Chief Justice Parker, speaking for the court of appeals of New York, here states that, after considerable investigation of the subject, he feels warranted in saying that there is no case in any court of last resort in this country holding that the motive of legislation may be inquired into by the courts, and the legislation set aside, if, in the judgment of the court, it was induced by dishonest and corrupt motives.

The local municipal authorities, under the constitution, as supplemented by the provisions of the railroad law, it is recounted, have the power to determine upon what streets, if any, there shall be constructed a surface railroad; to which of two or more corporations, if so many applicants there be, it shall be given; the amount of the bond that may be required for the purpose of protecting the municipality against injury to the streets by their tearing up; and the many other conditions that experience has taught municipal authorities it is wise to impose in order to fully protect the public interests. In the exercise of this power the local municipal authorities are, by the constitution and the statute, clothed with sovereignty, and are, therefore, it is held, beyond the direction and control of the courts.

There is, it is further declared, no constitutional restriction upon the power of the legislature to validate and confirm consents to the construction and operation of street railroads, notwithstanding the failure to obtain the certificate required by section 59 of the railroad law. More specifically, the court holds that the legislature had the power, in the first instance, to have authorized the granting of franchises without the consent of the railroad commissioners; and that it also possessed the power by retrospective act to cure any irregularity which existed by reason of the refusal of the railroad commissioners to grant certificates.

Three members of the court dissent, maintaining that where a municipal body is charged with fraudulent use of power and collusion, and a consequent waste of municipal property, a case is presented for judicial inquiry.

NOT LIABLE TO SCHOOL BOY INJURED PLAYING WITH TRAILERS LEFT AT END OF LINE.

George v. Los Angeles Railway Co. (Cal.), 58 Pac. Rep. 819. Oct. 20, 1899.

This was an action brought to recover damages for personal injuries sustained by a boy of the age of 9 years and 6 months. The evidence disclosed that for two days preceding the accident the

company had left seven or eight small cars, commonly known as "trailers," at the end of the line on a certain street. It was the custom of the company to use the cars during the hours of time when there was the heaviest travel, and during the interval they were left at the point stated, for convenience. One of the public schools of the city was within one block of this point, and another within three blocks, and fully one-half of the pupils at these schools passed this place in going to and from these schools. On the day of the injury, a number of boys, including this one, left one of the schools at a little after three o'clock in the afternoon, and, on arriving at the cars, began to play with them by pushing them a short distance up the track, starting them down the grade, and jumping on and riding back. The only means which had been taken to hold the cars in place was to properly set the brakes on them. The employes engaged in operating the regular cars came to this point about every 15 minutes during the day. And that afternoon, a little before the accident occurred, the employe of the company in charge of the trailer cars was at the place, and made the boys leave the cars. He also set the one loose brake that he found. This boy had not been on the cars before. He was injured by being run over by the forward of two cars started down the grade, after he had jumped from the car step and tried to cross 10 or 20 feet in front of it and had his foot caught by a splinter of wood projecting from one of the cross-ties. Under these circumstances, the jury found a general verdict for the defendant, and the supreme court of California affirms an order denying the plaintiff's motion for a new trial. In passing, the court acknowledges it to be true that the right to so use the street must come from the city, and holds that the force of other instructions as to the care the company should exercise in so occupying the street was not weakened by an instruction that whether the defendant's trailer cars should have been permitted to stand on the track in the street during the hours of the day when they were not needed for carrying passengers was a question to be determined by the city authorities, and was a wholly irrelevant and immaterial question in this case.

DOES NOT THINK HOUSE INJURED BY CARS PASSING OVER SWITCH.

Starr v. North Side Traction Co. (Pa.), 44 Atl. Rep. 556. Nov. 6, 1899.

The mere appearance of some small cracks on the inside and outside of a house built with 13-inch brick walls which are not otherwise injured in any way, the supreme court of Pennsylvania does not consider would warrant taking off a compulsory nonsuit in an action brought to recover damages from a street railway company on the ground that the house was thus injured by the bumping of the cars over a switch 80 feet away.

NOT DEFENSES TO ACTION FOR INJURIES SUSTAINED BY INFIRM PASSENGER BOARDING CAR.

Post v. Hartford Street Railway Co. (Conn.), 44 Atl. Rep. 547. Nov. 7, 1899.

The plaintiff signaled a car to stop. It was night. The conductor did not see her nor her signal, but the motorman did, and stopped the car. The conductor was at the time engaged in the front part of the car. After the car had stopped a sufficient time for passengers to enter, the conductor gave the signal to start, and the car was immediately started. Up to this time the conductor, who had not left the front part of the car, had not seen the plaintiff, nor the woman who accompanied her. As a result of the start, the plaintiff was thrown to one side against the rear railing, and partly down upon the steps or platform. Immediately thereafter the conductor's attention was called to the situation. The car was at once stopped, and the ladies were assisted by him into the car. The plaintiff was at the time suffering from a spinal injury, caused by a fall upon the sidewalk nearly two years previously, and in consequence was unable to board a car without considerable difficulty and some assistance. But of this neither the motorman nor the conductor had any knowledge. The fall in attempting to board the car was one which would have meant little to a person in ordinary physical condition, but happening to the plaintiff in her then enfeebled state, it was the exciting cause for the aggravation of her spinal and nervous troubles, and resulted in an increase of pain, suffering, and disability for some considerable time.

Upon these facts, the trial court found that the defendant was guilty of negligence in starting the car in the manner above stated, that this negligence was the cause of the injury to the plaintiff for which a recovery was had in this case, and that the plaintiff was not guilty of contributory negligence. The supreme court of errors of Connecticut affirms the judgment for the plaintiff. It holds that under the circumstances it was the duty of the conductor to know, before giving the signal to start, that the plaintiff was either safely on board of the car, or so far free from the car that she could not be injured physically by putting the car in motion. He knew that the car had stopped to receive a passenger. Before he gave the signal to start, he knew the passenger had not boarded the car, and he did not know, and made no reasonable attempt to know, whether she was or was not in the act of getting on board. He thus failed, the court says, to perform a plain duty devolving upon him, and such a failure, under the circumstances disclosed, warranted a holding that the accident to the plaintiff was due to the defendant's negligence. And, in this view of the case, it holds that the fact that those in charge of the car had no notice of the plaintiff's infirmities was of no consequence. It also holds that it was no defense to her right of action against the company, if, after the accident and before trial, she obtained damages from the city for the sidewalk injury without disclosing that it had been aggravated by another injury and thereby practically recovered damages from the city for both injuries.

TO PROVE OWNERSHIP OF CAR.

Karrigan v. Ninth Avenue Railroad Co. (N. Y.), 60 N. Y. Supp. 682. Nov. 10, 1899.

One of the issues in a personal injury case being whether a certain car was owned and operated by the defendant, or the latter was legally responsible for such operation, the appellate division, first department, supreme court of New York, holds that a witness might be asked if he knew of his own knowledge that it was the car of the defendant, and that if the witness testified without having knowledge of the facts it was for this weakness to be shown upon cross-examination.

WAITING FOR TEAM TO PASS BEFORE ALIGHTING.

Hutchins v. Macomber (N. H.), 44 Atl. Rep. 602.

From the facts disclosed it appeared that the plaintiff, as she was about alighting from the rear platform of a street car, requested the conductor to wait a moment for a team to pass, which was approaching at a high rate of speed on the side of the car on which she was; and that, after it had passed, as she was putting one foot from the lower step to the ground, she was injured by the sudden starting of the car. Here, the supreme court of New Hampshire holds, was evidence from which the jury was warranted in finding that the plaintiff acted properly in waiting for the rapidly approaching team to pass, and in not exposing herself to injury by stepping in front of it; that, having requested the conductor to wait a moment for it to pass, and there being no objection on his part, she had a right to expect that he would wait a reasonable time for her to alight; and that she was in the exercise of due care in respect to the occurrence from which the injury arose. Wherefore, it maintains, a motion for a nonsuit was properly denied.

FAILURE TO RING GONG WHEN BOY STOPPED TO PICK UP PENNY DROPPED ON TRACK.

Frank v. Metropolitan Street Railway Co. (N. Y.), 60 N. Y. Supp. 616. Nov. 10, 1899.

In reversing the judgment which the plaintiff obtained in this case, the appellate division, first department, supreme court of New York, holds that if the boy, after starting to run across the track, stopped to pick up the penny which he had dropped, and as a result was injured, then no recovery could be had. Nor does it consider that it could be inferred that the gripman was negligent because he devoted his energies to the brake, and failed to ring the gong, assuming that the boy could have crossed safely but for his stopping to pick up the penny. With the boy suddenly stooping in front of the car, he could not be saved by ringing the gong, and the duty of the gripman was to give all his attention to stopping the car.

MAY MAKE CONDITIONS FOR GRANTING CONSENT.

Gaedeke v. Staten Midland Railroad Co. (N. Y.), 60 N. Y. Supp. 598. Oct. 3, 1899.

Where the power to give consent to the laying of the tracks of a street railroad in the highway is by law deposited with the highway commissioners, the appellate division, second department, of the supreme court of New York, holds that, while they may not make any unreasonable requirement a condition of granting such consent, and probably may not add other conditions where the statutes provide the conditions upon which the consent shall be granted, yet conditions which are for the benefit of the public, which are proper in character, and are not prohibited, either actually or explicitly, are properly exacted, and that in such a case it is proper to condition the giving of the consent upon an agreement of the company to issue transfers to its connecting lines.

DRIVER OF DRAG RESPONSIBLE FOR COLLISION.

Schlitz v. Nassau Electric Railroad Co. (N. Y.), 60 N. Y. Supp. 822. Nov. 21, 1899.

Where a driver of a "drag" or vehicle having seven cross seats, which was drawn by six horses, hitched in spans, knowing that cars were running upon each track at intervals of about a minute, and could have turned to the right, though his progress might thereby have been impeded, when a car came up behind and rang its bell for the vehicle to remove from the track, he was properly chargeable with negligence, the appellate division, second department, supreme court of New York, holds, in turning to the left, whether he saw a car approaching on the left track or not. It holds the driver chargeable with the knowledge that the transference of his horses and drag from one side of the street to the other would almost certainly bring him into contact with an approaching car, and, if a collision did not occur, the progress of the car would be impeded, and he would in any event infringe upon the paramount right of way which the moving car possessed.

NOT LIABLE WHERE LITTLE BOY RUNS ACROSS STREET TOO CLOSE CAR.

Hunter v. Consolidated Traction Co. (Pa.), 44 Atl. Rep. 578. Nov. 6, 1899.

The supreme court of Pennsylvania here affirms a judgment rendered for the defendant on a charge that the latter would not be liable for an injury to a little boy, who could not himself be charged with contributory negligence on account of his not being more than perhaps 6 or 7 years of age, if the jury found from the evidence that the company had not been guilty of any negligence, the boy being so close to the car when he ran across the street from the curb that it was not practicable for the motorman to stop the car in time to avoid the accident, in other words, if the jury found that the accident was unavoidable, and that the motorman did, under the circumstances, his whole duty; that immediately upon discovering the boy he did all that he reasonably could to stop the car and prevent the accident.

CARE MUST BE TAKEN TO STOP CARS AT SAFE PLACES.

Stewart v. St. Paul City Railway Co. (Minn.), 80 N. W. Rep. 854. Nov. 17, 1899.

The supreme court of Minnesota says that a street railway company is not responsible for the condition of the streets on which it operates its cars, but it is bound to exercise proper care to stop its cars for the discharge of passengers at a safe and suitable place for that purpose. Or, as the court expresses it in slightly different language in the syllabus prepared by it, while a street car company is not responsible for the condition of the streets on which it operates its cars, yet it is bound to exercise reasonable care to stop its cars for the discharge of passengers at a safe and proper place for that purpose. And, without stating just what the evidence in this case was, it holds it sufficient to justify the jury in finding that the defendant was chargeable with notice of a certain hole in the street, and was negligent in stopping its car in such close proximity to it that a passenger, in alighting in the dark, was liable to step into it.

NOT REQUIRED TO PAY FOR DEPRECIATION AND BUT REASONABLE INTEREST

Lakeside Railway Co. v. Duluth Street Railway Co. (Minn.), 80 N. W. Rep. 831. Nov. 22, 1899.

The supreme court of Minnesota says that the plaintiff built an extension to the defendant's street car line, and furnished cars for the same; and the defendant, by means of its own power house and power plant, operates such extension in connection with its own line. By the terms of the contract therefor, the plaintiff agreed to pay the actual cost of operating such extension, and of maintaining the same and keeping it in repair. Construing the contract the court holds that the plaintiff is not required to remunerate the defendant for any part of its loss caused by the depreciation of its power house, power plant, or car houses.

Taking up the further provision of the contract requiring the plaintiff to pay to the defendant "a fair proportion of the interest of the investment" of the defendant "in its power house and its equipment, and in car houses and equipment," the court holds that the plaintiff should pay a reasonable interest or income on the investment, and not the legal rate of 7 per cent per annum on the indebtedness of the defendant incurred in constructing such property, nor the rate of interest which the defendant then paid or is now paying on any such indebtedness.

METHOD OF STARTING CARS.

Dickert v. Salt Lake City Railroad Co. (Utah), 59 Pac. Rep. 95. Nov. 4, 1899.

However usual the method of a common carrier, such as a street railway company, in starting its cars, if that method is dangerous, and its use violative of the high degree of care which the carrier is required to observe regarding its passengers, and in the use of that method a passenger is injured, the carrier, the supreme court of Utah holds, is liable.

In an action for damages for personal injuries alleged to have been caused by the defendant starting one of its cars, on which the person injured was a passenger, in a reckless, careless, and negligent manner, the question for the jury, the court goes on to say, is whether or not in this particular instance the car was started in a negligent, dangerous, or improper manner; and it holds that an instruction which, in effect, charges the jury that, if the officers of the defendant, by experience, were satisfied in their own minds that the method used in starting the car was reasonably safe, the defendant would not be liable, is erroneous.

MERE RAPID APPROACH OF CARS DOES NOT CREATE LIABILITY FOR FRIGHTENING HORSE.

Marion City Railway Co. v. Buboise (Ind.), 55 N. E. Rep. 266. Nov. 23, 1899.

In a case where it thinks that it would seem almost a declaration against the right of the public to be transported by means of electric railways to hold the railway company responsible for an unfortunate accident arising from the frightening of a horse, the appellate court of Indiana holds that a street railway company cannot be held responsible for injury caused by a mere taking fright of horses at the appearance of a car approaching on the same street, and being operated in the ordinary manner, though it be approaching rapidly, where there is no reckless or wanton conduct indicating disregard of the safety of those so using the street for passage, or malicious purpose to injure them. No rights, it says, should be held to belong to such a company in this respect, except such as legitimately belong to the full enjoyment of the franchise; but the rights of others in the use of the highway must be enjoyed with such regard for the right to the concurrent use by the railway company as will not practically and unreasonably interfere with the rapid transit for which electric railways are intended and adapted. A rule prescribing the care which a street railway company should exercise for the safety of travelers in vehicles must be reasonable and practicable, having in view the purpose to be subserved and the means of accomplishing it.

STREET CARS NOT EMBRACED IN ORDINANCE RE-
QUIRING PERSONS RIDING OR DRIVING TO
CHECK UP AT CROSSINGS.

Citizens' Railway Co. v. Ford (Tex.), 53 S. W. Rep. 575. Nov. 14, 1899.

A city ordinance of Waco, entitled "Streets, Alleys and Sidewalks," provided that "on all crossings over the streets and alleys of this city from one pavement or sidewalk to another, preference shall be given to pedestrians, and it shall be the duty of any person riding or driving on any of said streets or alleys to check up or even halt, if necessary, when they approach such crossing, if persons on foot be passing thereon, so as not to obstruct, hinder or endanger such foot passengers or pedestrians on any such crossing."

In a personal injury case the question was raised, which the court of civil appeals certified to the supreme court of Texas for an answer, whether such ordinance applied to street cars operated by electricity, and required them to check up or halt, if necessary, when they approached such crossings, if persons on foot were passing, etc. The supreme court for its answer holds that street cars are not embraced in the terms of the ordinance.

After discussing at some length the ordinary signification of the words "riding" and "driving," and the effect of using them in the disjunctive form, etc., the supreme court says that the rule of construction is to ascertain the intent of the lawmaker, and, applying this rule to the language used, it thinks the motorman of a street car was not intended to be included in the phrase "any person driving." To justify the application of the ordinance to street cars, it goes on to state, it is not sufficient that the words might be construed so as to embrace motormen on street cars, but the language, as ordinarily used, must point them out as persons to be affected, with such certainty that, upon reading it, they would understand obedience to its mandates to be required of them.

ON COLLISION WITH FURNITURE WAGON AND DUTY
TO KEEP DOWN DAMAGES.

Blate v. Third Avenue Railroad Co. (N. Y.), 60 N. Y. Supp. 732. Nov. 10, 1899.

With a horse and a furniture wagon that was about 25 feet long, the plaintiff attempted to cross the street, in front of an approaching cable car, under circumstances warranting a jury finding that when he started he had reason to believe that he would be able to cross without a collision, and that, upon seeing the car, he increased his speed considerably, but that the car was not stopped, nor its speed slackened, although he was in plain sight, and that if the speed of the car had been slackened he would have succeeded in crossing without a collision, as he was able to get so nearly across that the car struck only the tailboard of his wagon. Such being the case, and in view of what it says is now established to be the reciprocal duty of a driver of a car towards one attempting to cross a street, the appellate division, first department, supreme court of New York, holds that the plaintiff was not guilty of contributory negligence as a matter of law, and that the jury was justified in concluding as a fact, not only that the plaintiff was not guilty of contributory negligence, but that the defendant failed in its duty towards him, and was guilty of negligence.

Furthermore, in affirming a judgment for the plaintiff, the court holds that while the rule is not doubtful that the party who claims to have suffered damage by the wrongful act of another is bound to use reasonable and proper efforts to make the damage as small as practicable, and is not entitled to recover for any damage which, by the use of such efforts, might have been avoided, yet a jury cannot say that he should or should not have taken the advice of any particular physician, nor that he should have obtained any particular kind of treatment. As to that he must himself be the judge. The jury is concerned simply with the affairs presented to it at the trial, and whether the damages then appearing to exist are the natural and probable results of the injuries, diminished by the efforts for a cure which a reasonably prudent man would have made. If the damages have not been kept down by means that a reasonably prudent man would have used, the jury must take that into account in reaching its verdict.

TROLLEY OFF AND ANOTHER CAR FOLLOWING.

Blanchette v. Holyoke Street Railway Co. (Mass.), 55 N. E. Rep. 481. Dec. 16, 1899.

The evidence in this case was such as to warrant a finding that the plaintiff, while a passenger on an open electric car of the defendant company, was thrown from the car by reason of its coming into collision with the rear end of another car of the company's. Damages were assessed in the sum of \$5,000.

On the trial the following instruction was asked: "The proximate cause of the collision or contact of the two cars was the throwing off by a passenger of the trolley of the first car, and the plaintiff cannot recover because of any injury to her as the result of the collision." This, the supreme judicial court of Massachusetts holds, was rightly refused, because the plaintiff's case rested entirely upon evidence of negligence on the part of the conductor after the trolley came off, and this negligence was nearer to the accident in point of time, and more closely connected with it as a cause, than the throwing off of the trolley, however or by whatever person it was thrown off.

The tracks of the railway ran through woods, on a down grade, with frequent curves. The curve just before the place of the accident was of such a kind that the motorman of the second car could see only about 150 feet ahead. A light rain had fallen, and the tracks were slippery, so that the brakes would not hold well. The second car left two minutes after the first. All this was known to the conductor of the first car, and yet, when the trolley came off, instead of letting his car go by its own momentum down the grade, he signaled to stop it, and when it stopped after going some distance, instead of giving warning to the other car which was approaching from behind, he proceeded to get on the top of the car to adjust the trolley; and the collision occurred. Evidence to this effect, the court holds, would warrant a finding of negligence on the part of the conductor.

Then, the defendant offered to show that it was not customary for the motorman to leave his post at the front of the car, and go back to give warning to any approaching car of the position of the car which is ahead, or for the conductor to give him any such directions. The evidence, the court holds, was rigidly excluded. It says that if the offer was to show the defendant's own custom in answer to a charge of negligence, the evidence was plainly incompetent. If it was to show a general custom on electric railways, the offer was to prove a negative, and it related to other railways as they were constructed, while it did not appear that there was any other electric railway situated as this one was, or that a trolley car came off on another railway in such a place. The situation was so unlike that of electric railways generally, that the absence of a custom on such railways to do that which ought to have been done at the place and under the circumstances of this accident was of no significance.

STATES CASE FOR PASSENGER ON FOOTBOARD IN-
JURED BY FIXED STRUCTURE.

West Chicago Street Railway Co. v. Marks (Ill.), 55 N. E. Rep. 67. Oct. 25, 1899.

A cause of action, the supreme court of Illinois holds, is stated by a declaration alleging that the plaintiff became a passenger on the defendant's cars, and the latter did not use proper care to see that the former should be carried safely; that it negligently ran its cars so near to a fixed structure that there was not room enough, unless standing very close to the car, when riding on the footboard, to be carried in safety; and that the plaintiff did not know of the fixed structure, and was not warned of it by the defendant, and, while using due care and caution for his own safety, was unavoidably struck and injured.

The Great Falls (Mont.) Street Railway Co. has refused to accept a franchise for an extension to its line, for the reason that the ordinance contains a clause making the franchise non-transferable.

A resolution has been introduced in the city council of St. Louis providing for a maximum fare of 3 cents to be collected from every passenger over 12 years old, and of 1 cent for every passenger under 12 years of age, who enters a car after every seat is occupied.

A TALE OF WOE.

One of the hardest rain storms experienced in the East in years swept across Massachusetts last month causing streams to overflow their banks, washing away dams and doing great damage to land and buildings. Reports from several street railway companies state that they suffered considerable destruction of property and in a number of places traffic had to be entirely abandoned for several hours.

At noon on February 13th cars on the Northampton Street Ry. were stalled by water flooding the tracks near the Williston Mills and at 1 o'clock the Northampton & Amherst Street Railway Co. had to abandon cars between Hadley and Amherst, as the rails were several inches under water. At Woodlawn a dam gave way, washing out a section of the line of the Holyoke Street Railway Co. In a short time afterward, however, the company had cars running in both directions from this point and passengers were transferred around the break. The dam which gave way was formed chiefly by an embankment about 15 ft. in height and 25 ft. or 30 ft. wide, on the top of which were the roadway and the street railway tracks. The cut was deep, and it took several days to replace the roadbed in its former condition.

The cars entering Orange, Franklin County, could not get into the square at the center of the town owing to the high water, and people living at the east end of the village had to walk around the outskirts to arrive at their homes.

The storm was particularly disastrous to the Greenfield & Turner's Falls Street Railway Co., and for a time its power station at Miller's Falls was threatened with destruction. As it was, cakes of ice carried away the wooden gate house and clogged the water wheels, causing a damage of about \$400. The company fortunately has a reserve steam plant, which enabled it to keep cars running through the storm. The Palmer & Monson Street Ry., the lines in the vicinity of Springfield, and all the roads along the valley of the Connecticut River, report washouts and damages to property amounting to several thousands of dollars.

From other sections of the country also come tales of disasters due to rains and snow. At Allegheny, Pa., one day last month, 20 passengers on a car of the Troy Hill line of the United Traction Co., of Pittsburg, had a narrow escape from being buried under a landslide caused by excessive moisture. The Troy Hill road is cut out of a hillside for a distance of about a mile. Part of this cut is held in place by retaining walls, some of them nearly 25 ft. high, but at other places there is no wall, and it was at one of the latter, near Prospect St., that the landslide occurred. The motorman of a car, while approaching the point, noticed that the recent rains and thaw had loosened the earth all along the hillside, but paid no special heed until he saw a great mass of earth suddenly break loose and start down the hill a few feet ahead of his car. Knowing he could not stop in time to escape being struck, he turned the current on full and succeeded in running from under the greater part of the stone and dirt. One edge of the slide struck the rear platform, but did no serious injury. The pile of earth completely covered the tracks and stopped all travel for some time.

Freshets near the headwaters of the Mohawk and Hudson Rivers caused those streams to rise and overflow their banks in several places. All the streets near the river at Albany were flooded and the United Traction Co. was compelled to resort to horses to keep cars moving on some of its lines.

The Stillwater branch, operated by the Twin City Rapid Transit Co., of Minneapolis, Minn., was tied up for a day by a recent snow fall. One of the heavy plows from the St. Paul-Minneapolis interurban line had to be sent over the branch to clear the tracks so that traffic could be resumed.

At Kansas City, Mo., the Metropolitan Street Railway Co. had a hard fight with snow and sleet early in February. It took five loads of salt, 70 wagon-loads of sand, a number of sleet cutting trolley wheels, all the snow sweepers on the system, and a large force of extra men to keep the road open.

A snow storm on February 22d compelled the street railway at Lacomia, N. H., to suspend operations for the day.

On the morning of February 26th there were serious blockades on nearly all of the Cleveland lines, but the lines were cleared before noon. The trouble was due to ice which in some places formed to a depth of several inches over stretches of track from 50 to 200 ft. long.

The storm of February 27th was very severe at St. Louis. Mr. W. C. Jenkins, of the St. Louis & Suburban Ry., writes us that the tracks of that system were covered with two inches of solid ice (not snow) and that there was an inch of ice on the trolley wires. The storm, with its after effect, meant 60 hours' continuous work, with but little sleep, for the men. The following comment from one of the St. Louis papers shows how well the work was done: "The Suburban Street Railway Co. is entitled to credit for the manner in which it did not let the blizzard shut it up. Any line can run in fine weather, but it takes forethought and management to face emergencies like the present." In appreciation of the manner in which the men fought the storm, Gen. Mgr. T. M. Jenkins issued the following bulletin: "For your faithful, manly and persistent work during the recent storm, which not only kept our lines from closing, but enabled us to operate cars of the Suburban lines proper, on almost perfect schedule time, a 10 per cent increase in the pay roll for the last half of February will be given you." This applied to all in the company's service, and included the men in shops, power houses, car houses, and on the cars.

The St. Louis Transit Co. fared even worse than the Suburban company, and was forced to entirely abandon one or two of its divisions for several hours. The chief source of trouble was the sleet and ice on the trolley wire, this being heavy enough in one or two instances to tear down the overhead work. The only way some of the lines were kept open was by placing a man on the top of each car to break the ice on the wires as they went along. Considerable delay was also caused by broken limbs of trees falling upon the track.

At East St. Louis, Ill., the East St. Louis Electric Ry. was greatly hampered by ice on the rails and during the night the wires on the Denverside division gave way under the weight of sleet, and cars were unable to operate until nearly noon the next day.

The fall of snow at Chicago during the storm of February 27th was the heaviest that has occurred since the Weather Bureau has kept records; it amounted to 11.4 in., the heaviest snow previously recorded being 11.2 in. The street railways by hard work succeeded in keeping all of the main lines open and traffic was delayed less than on some of the steam suburban roads where delays of from one to two hours were the rule on the morning of the 28th. This storm proved the Waterloo of many of the automobiles.

March 5th the street railway traffic in Milwaukee was badly demoralized by a blizzard. A car on the Milwaukee-Racine line was snowbound all day, and the 11 passengers on board had nothing to eat except the lunches of the train crew, which the latter divided with them.

This same storm reached Chicago later in the day; snow and sleet fell in the afternoon and evening, changing to rain at midnight. By the next morning the temperature had again fallen and another storm was predicted. On the evening of the 5th all the transportation lines in Chicago suffered.

At 8:15 p. m. the South Side Elevated was blocked by slippery rails at the incline at 16th St. and traffic interrupted for over three hours. About the same time the trains of the Lake Street Elevated struck ice on the Wabash Ave. side of the Union Loop, and they were not able to move until after 10 o'clock. The Metropolitan Elevated lines were stopped near Canal St., by the sleet on the rails, at 8:25 p. m., and were unable to move a train across the river for several hours.

The electric surface lines were able to give only a very irregular service, the trouble being ice on the wires and rails.

CHARGED WITH DEPRECIATING STOCK.

The special grand jury that has been investigating the circulation of false rumors resulting in the recent serious depreciation of Brooklyn Rapid Transit stock, has placed six men under indictment, and five of them have been arrested. The men taken into custody are Alfred R. Goslin, president of the Security Investment Co., 29 Broadway; H. J. Alexander, advertising agent, 11 Broadway; Eugene L. Packer, broker, 29 Broadway; Chas. Thomas Davis, editor of the Wall Street Review; and W. T. Allen, all of New York City.

THE THIRD AVENUE RAILROAD IN THE HANDS OF A RECEIVER.

The public press in all parts of the country has of late been teeming with statements regarding the financial condition of the Third Avenue Railroad Co. as though it were a matter of national interest as indeed it is a matter of universal commercial interest. The reports regarding the condition of the company include rumors of mismanagement and in some cases charges of fraud against the managing officials. The cause of the trouble, however, seems to be rather a mistake in judgment on the part of some of the largest stockholders, who were also the highest officials, they being unwilling to have the extra \$40,000,000 stock issued, that was authorized in July last and designed to pay for the extensive improvements that have been going on for a year or more. This unwillingness arose doubtless from a desire to retain a controlling position in the affairs of the company. The Third Avenue system of street railways includes the old Third Avenue lines proper, the main trunk line of which is on Third Ave. with the 125th St. cross town line and the 10th Ave. line, all of which was formerly operated by cable. The system also includes the Forty-second Street, Manhattanville & St. Nicholas Avenue Ry. Co., Dry Dock, East Broadway & Battery Railroad Co. and the Union Railway Co., the latter lines of which operate north of the Harlem River and include the street railway system of Yonkers. The improvements mentioned above include the change of the Third Avenue system proper from cable to underground electric traction, and the changing of the Forty-second Street system from horse to the underground electric system.

The work on the cable line was nearly completed, there being only about one mile at the upper end of Tenth Ave. that was about half finished, and the remaining work on the Forty-second Street system could have been finished in about three months. The cars on the Third Avenue lines proper and some of the cars on the Forty-second Street line have been operated by electric power for sometime, although there has been great delay in getting the cars and equipment, so that the returns from operation are just beginning to pick up and show such a gratifying increase in traffic as to justify the decision of the company in making the change from cable to electricity. Power for operating cars is derived from temporary stations that have been installed in or near the three cable power houses, but the main power house which is located near Kingsbridge and from which the entire system is to be operated is not yet completed, the foundations only being in. The cost of reconstruction has doubtless been excessively high as charged, but the conditions have been correspondingly severe. It was necessary to keep the lines running during the construction period and this required the installation of temporary tracks over the whole reconstructed portion. This with the higher price of material has helped to load the road with a debt out of proportion to the present earning power of the system. It is still a good property, however, the new construction being as good as the state of the art could provide, and the company will doubtless soon recover under the receiver's management.

The flurry in the price of securities began in December and the stock declined till it reached the selling price of $45\frac{1}{4}$, having fallen in one year from 230.

On February 28th, Judge Lacombe in the United States Circuit Court appointed ex-Mayor Hugh J. Grant as temporary receiver, the application being made by representatives of the Old Colony Trust Co. of Boston. The time of temporary receivership was made for two weeks and will terminate on the 14th of March, when Mr. Grant will doubtless be made permanent receiver. For some weeks before the receiver was appointed, efforts were made to reorganize the property. A banker's syndicate was proposed and also a stockholder's company that should lease the property, but the necessary sum for completing either of these arrangements, \$8,000,000 in cash, was not forthcoming. Soon after the appointment of the receiver, the principal officers resigned from the Third Avenue company and from the allied roads, Mr. A. J. Elias, president, and Mr. Henry Hart, vice-president, leaving their positions. Mr. J. Beaver was retained as treasurer of the Third Avenue system by the receiver and Mr. J. H. Robertson was continued as superintendent. Mr. Beaver was also made president of the Forty-second Street system and Mr. J. W. Lynch, former superintendent, president of the Dry Dock & East Broadway.

The receiver will doubtless issue receiver's certificates to pay off

the mechanic's liens that have been recently entered against the property and which will be a prior lien to the \$5,000,000 first mortgage bonds of the company, which have also fallen from 125 to 117.

Among the names of firms familiar in the street railway field that have filed mechanic's liens against the Third Avenue and also some of the controlled lines are: Noughton & Co., railway contractors, for machinery and services, the two liens amounting to \$2,879,691; the John A. Roebling's Sons Co., \$291,178 for materials; the Westinghouse Electric & Manufacturing Co., \$507,861 for electrical appliances and machinery; Westinghouse, Church, Kerr & Co., of New York, \$622,416 for engines, electrical appliances, etc.; Isaac A. Hopper, \$1,332,809 material and labor; John P. Kane Co., \$109,242 for cement, brick, and broken stone; the Lorain Steel Co., Loraine, O., \$548,205 for girder rails; Haskins & Coffin, \$2,800 for coal conveying machinery; the National Conduit & Cable Co., two liens, one of \$144,389 and the other \$83,234; the Pennsylvania Iron Works Co., \$48,732; the St. Louis Car Co., \$114,048 balance due for cars and trucks furnished; James Curren Manufacturing Co., \$9,581; the New Haven Car Register Co., \$6,048; the United Building & Machinery Co., \$65,813. It is said that some of these liens are duplicated, that is, that some of the larger companies have filed liens to include their obligations to some of the smaller ones, while the smaller ones have not neglected their interest but have filed their independent claims. The first lien was that of the National Conduit & Cable Co., filed February 23d.

Whatever may be said in regard to the financial affairs of the road, no word of complaint has been heard against the operating department, and the work of Superintendent Robertson in keeping the cars running during the period of reconstruction and the general supervision that he has been required to have over the new designs and plans challenge the admiration of all who understand street railway management. In company with the consulting engineer, Dr. Louis Dumeau, he has designed the cars and the mechanical features of the street construction. As an evidence of the economical management of the operating affairs, one has but to refer to the last annual report of the Railroad Commissioners of the State of New York and compare the published results with that of some of the neighboring systems. The Brooklyn Heights system reports the cost of operation at 12.94 cents per car-mile, and the total expenses per car-mile, including fixed charges are 20.40 cents. The Metropolitan Street Railway Co. reports cost of operation 15.09 cents per car-mile and total expenses including fixed charges 25.86 cents, while the report of the Third Avenue system shows 10.74 cents for operating and 13.88 cents total.

The last annual report of the company, up to Sept. 30, 1899, shows the securities and indebtedness of the company as follows: Capital stock, \$12,000,000; funded debt, \$5,000,000; net floating debt, \$12,866,215.

Construction work on the Phoenixville (Pa.) & Bridgeport Electric Ry. will be commenced at once. This will make a complete electric line from Philadelphia to Spring City.

It is reported that on a number of interurban electric lines in Connecticut, including the third-rail section of the New York, New Haven & Hartford R. R., a sweeping reduction in fares will be made in the early summer.

For the six months ending Dec. 31, 1899, the Union Traction Co., of Anderson, Ind., reports gross earnings of \$222,895; operating expenses, including taxes, \$112,640; net earnings, \$110,255; other income, \$20,439; total, \$130,694; interest on bonds, \$109,820; surplus, \$20,874.

Suit has been brought against the Toledo (O.) Traction Co. by the city of Toledo, to recover 1 per cent of the gross receipts of the road since March, 1889. In that month a franchise was granted that has since been acquired by the Toledo Traction Co. and it is on a clause of this franchise that the suit is based.

H. D. Laughlin has bought the patents on the Moore street railway truck from C. E. Moore and W. H. Carter and will organize a company to make these trucks, using the plant of the American Brake Beam Co. It is rumored that Mr. Carter will be connected with the new company. These trucks, several hundred of which are used on the Chicago City Ry., were described in our issue of March, 1899, page 178.

INSULATING FORMS FOR THIRD RAIL INSULATORS, RHEOSTAT BLOCKS, ETC.

The illustrations herewith show forms of insulators for various special purposes which are made of reconstructed granite, a material that is a good insulator and is strong both in tension and compression. This material is a high grade of Maine granite, which in the process of manufacture, is pulverized, mixed with a binding clay, molded into the desired form and vitrified in kilns at a high temperature. The material undergoes important chemical changes, so that the product when put upon the market has such insulating qualities that the designs for third rail work have stood up under test made at Niagara Falls to a voltage of 56,000 even after being soaked in water. The product is not only fireproof, but is not injured or affected by heating to a high temperature and then suddenly cooling. Neither is it affected by the lowest temperature that can be produced by liquid air. It resists acids and alkalis, does not contain or absorb moisture, and has a crushing strength of

FIG. 1.

FIG. 2.

14,565 lb. and a tensile strength of from 680 to 700 lb. per sq. in. The material is not only adopted for third-rail insulation, but is now being employed for a general line of insulators for electric railway purposes.

Fig. 2 illustrates a three-channel rheostat block. These are made in three or six channel sizes or in any desired size. The material is specially valuable for rheostat and controller blocks, as it will not receive or hold an electrolytic deposit of copper upon its surface, a feature that causes short circuits with some other materials. It is also a good arc blow-out, and is designed as an arc arrester for street car controllers. Reconstructed granite can be as readily molded into switch bases, lamp sockets or other form of insulating blocks as well as porcelain material. These blocks have been employed on a number of elevated railways for insulating the third rails, and have sustained all the claims made for them. For this use the style shown in Fig. 1 is mounted on a wooden block and attached by means of strips of metal or fibre, as in the illustration; each wooden block is provided with a lag screw by means of which the device is firmly attached to the end of the tie.

The works of the Reconstructed Granite Co. are located at Norristown, Pa., where they occupy large buildings with an area of seven acres of ground. The New York office is at 17 Dey St., and is under the management of Mr. W. Courtenay, president of the company, who will gladly furnish information desired.

TRANSFER SUIT AT DETROIT.

Detroit has another street railway suit in the Federal courts. In January the city council passed an ordinance to compel the Detroit Electric Railway Co. (the 3-cent line) to issue transfers on transfers, the old ordinance of the company only calling for transfers on tickets. The company claimed that this was a reduction in the rates of fare and on March 1st secured an injunction from Judge Swan, of the United States District Court, restraining the city from enforcing the ordinance. The court announced that it would hear arguments on the permanency of the injunction March 14th.

The city council instructed Corporation Counsel Flowers to appear for the city and defend its interests, but that official politely stated that the city had no legal right to reduce the rates of fare and that he did not care to father a losing case. The council will, therefore, have to employ outside counsel.

NEW CARS FOR SOUTH SIDE ELEVATED.

The South Side Elevated Railway Co., of Chicago, has let contracts for the construction of 50 new elevated railway cars, which, when finished, will represent the highest development of the car builder's art.

The order for the coaches was secured by the Jewett Car Co., of Newark, O., through its Chicago representatives, Hanna & Gray, Marquette Building, Chicago. The general dimensions will be: Length over platforms, 46 ft. 5¾ in.; length over sills, 39 ft. 4 in.; height of platform above rail, 3 ft. 6 in.; weight complete without motors, but including trucks, 50,000 lb.

The car bodies are to be finished throughout in mahogany with plate glass windows, Pantasote curtains on fixtures furnished by the Curtain Supply Co. They will have spring seats and backs, covered with rattan. They will be mounted on Peckham "L" special trucks, fitted with Christensen air brakes and Van Dorn couplers. A separate cab is to be provided for the motormen, as on the cars now running over the road.

The platform gates will be different from those now in use. They will be worked by means of a lever as at present, but will extend from the platform floor clear to the hood of the car, making, when closed, practically a vestibuled train. This departure was made primarily to prevent passengers from catching on to the gates after the train has started.

EXPERT INVESTIGATION AT CLEVELAND.

Both the Cleveland Electric Railway Co. and the Cleveland City Railway Co. have applied for extensions to their present franchises which expire within the next four or eight years, the exact date being in dispute. The city appointed a franchise commission to handle the question of compensation, fares, etc., and after holding several sessions, this commission decided to make a thorough investigation of the books of the Cleveland City Railway Co. for the purpose of determining six points regarding the company's affairs, i. e., the amount of capital stock, the total investment, the gross receipts, the cost of carrying passengers and the probable increase of business in the next 25 years. The officers of the City railway promptly notified the commission that any responsible experts who should be appointed would have free access to the company's books, and they would be aided in every way to arrive at the true state of affairs. In accordance with this, the city council, on February 26th, passed a resolution appropriating \$2,000 to defray the expense of employing experts to make the examination, and the commission has appointed to do the work John W. Langley, of Case School of Applied Science, of Cleveland, and Richard Tregaskis, a prominent street railway accounting authority of Detroit. It is expected the report of the experts will be ready in about a month.

SIGNAL LAW PROPOSED IN OHIO.

In addition to the bills pending in the Ohio Legislature that were mentioned last month, page 71, there is one amending the existing law relating to the authority of county and city officials to compel electric and steam railroads to place danger signals at crossings. The bill defines what shall constitute a dangerous crossing, and provides that all such shall be so regarded where the road is on a level with the railroad crossing it. The measure attaches a very heavy penalty for the failure of the railroad company to comply with the order to erect some modern danger signal or provide gates, within the time prescribed by city councils or boards of county commissioners, after proper notification of the action of the authorities shall have been given requiring them to do so. For failure to comply with the law in this respect the company subjects itself to a penalty of \$500, with an additional \$10 for each day thereafter while the neglect continues.

Mail cars will be put on the Exeter (N. H.), Hampton & Amesbury Street Ry. between Exeter and Amesbury, Mass.

The Worcester (Mass.) & Marlboro Street Railway Co. has been granted the right to carry baggage on its regular cars to and from Worcester.

HALF FARES.

Denver, Col., is to have a street railway mail collecting and distributing system.

Telephones will be placed in all the elevated stations of the Brooklyn Rapid Transit Co.

The Louisville (Ky.) Railway Co. paid its taxes for 1900 with a check for \$70,125.22.

A new electric railway between Elyria and North Amherst, O., has been opened to traffic.

Press reports state that the women of Ortonville, Mich., have raised \$600 for a new electric road.

Construction work is about completed on the Caseyville, Collinsville & East St. Louis (Ill.) Electric Ry.

Over 150 new open summer cars are being built by the Union Traction Co., of Philadelphia, at its own shops.

A second unsuccessful attempt to wreck a car at Columbus, O., by placing a large stone on the track was made recently.

The Metropolitan Elevated Railroad Co., of Chicago, has declared a dividend of 2½ per cent on the preferred stock.

The Tri-City Railway Co., of Davenport, Ia., has voluntarily increased wages of motormen and conductors, 10 per cent.

The Montreal (Can.) Street Railway Co. has asked the city council for permission to place all of its feed wires under ground.

Twenty carloads of structural iron for the northern terminus of the Northwestern Elevated of Chicago have arrived from the mills.

The Echo Mountain House, at the head of the long inclines of the Mount Lowe Ry., up Mount Lowe, Cal., was destroyed by fire last month.

The City & Suburban Railway Co., of Portland, Ore., is installing a new 400-h. p. corliss engine, which will enable it to increase its service one-third.

The strike of members of the Building Trades' Union in Chicago has resulted in a number of fights in street cars between non-union men and union pickets.

The Lakeside Street Ry., until recently operated by the Duluth (Minn.) Street Railway Co., has been purchased by Thomas Lowry, of Minneapolis.

The Wilmington (Del.) & Chester Traction Co. has decided to adopt a 12-hour swing system, with wages at \$1.90 for the 12 hours, an increase of 6 per cent.

A half-hourly all-night service has been instituted by the Capital Traction Co., of Washington, D. C. This is the first time the capital city has had owl cars.

The Metropolitan Street Railway Co., of New York, reports for the last quarter of 1899 \$3,565,682 gross; increase, \$472,926, and \$1,807,661 net; increase, \$182,485.

The Board of Railroad Commissioners of New York has given the United Traction Co., of Albany, authority to increase its capital stock from \$4,000,000 to \$5,000,000.

In the counties of Queens and Nassau, New York, street railways may not be built in macadamized public highways without a majority vote of the town electors, and a bill has been recently introduced

in the Legislature to except incorporated villages in Nassau County from this act.

The Union Traction Co., of Philadelphia, has let the contract for the building of a new car barn at West Philadelphia, to F. T. Maguire, of that city. The contract price is \$20,000.

The summer pavilion at Wenona Beach, owned by the Saginaw (Mich.) Consolidated Street Railway Co., was totally destroyed by fire recently, causing a loss of \$16,000.

The colored people of Savannah, Ga., have petitioned the Savannah, Thunderbolt & Isle of Hope Street Railway Co. to provide a pleasure park, exclusively for their race.

The Syracuse (N. Y.) Rapid Transit Co. is having considerable trouble with counterfeit silver pieces which are being passed on the conductors in unusually large quantities.

The Washington (D. C.) Traction & Electric Co. has removed its offices from the old location at East Capitol and 15th Sts. to the Loan & Trust Building, at 9th and F Sts. N. E.

The Union Traction Co., of Philadelphia, contributed \$2,500 to the Republican National Convention fund for defraying the expenses of the convention to be held in that city.

A serious personal conflict recently arose between a Milwaukee street railway conductor and a passenger over the time of day, the question having reference to the validity of a 4-cent ticket.

The Cleveland, Painesville & Eastern Electric Railroad Co. does not permit its motormen to make use of the electric brakes on its cars within the city limits, except in cases of emergency.

The common council of Montreal has passed a resolution compelling the Montreal Street Railway Co. to operate cars on a two-minute instead of a five-minute headway during business hours.

It is announced that the Seattle (Wash.) Electric Co., owning four out of the six street railway systems in the city, will spend \$2,000,000 in improvements and extensions during the next two years.

An attraction at Idora Park, Youngstown, O., next summer, will be an aerial railway from which are suspended small carriages controlled and propelled by one person, after the fashion of a bicycle.

We are indebted to Mr. T. J. Nicholl, general manager of the Rochester (N. Y.) & Sodus Bay R. R., for a number of fine half-tone engravings from photographs of places of interest along the route.

Several suits, growing out of the combination of the street railway properties forming the Cleveland City Ry., are being tried. The disagreement arises over the transference of various blocks of the stock.

The Chicago City Railway Co., on a number of its line, is putting an extra man on each car during rush hours, whose only duty is to prevent boys from jumping on to the platforms and buying and selling transfers.

An electric railway from Rochester, N. Y., to Canandaigua, with a branch from Pittsford to Fairport, is said to be a probability of the not distant future. John Winter and A. L. Parker, of Detroit, are known to be interested.

Early in the spring the Chattanooga (Tenn.) Rapid Transit Co. will commence putting the park at McFarland Lake in shape. The lake, it is understood, will be enlarged, and swings, pavilions, etc., will be placed on the grounds.

An increase of 5 per cent in wages of motormen and conductors went into effect March 1st on the lines of the Wilmington (Del.) &

Chester Traction Co. This will make a difference of 10 cents a day on a 12-hour run, bringing the wages of the men from \$12.60 to \$13.30 for seven days' work.

Water power controlled by the city of Marquette, Mich., will probably be rented for operating in future the cars of the Marquette City & Presque Isle Railway Co. This company will retain its present steam plant for use in case of emergency.

The Columbus (O.) Street Railway Co. has asked for a 25-year extension of one of its important franchises which expires this year, and also for permission to connect its old lines with the newly acquired lines of the Columbus Central Railway Co.

The Worcester (Mass.) & Suburban Street Railroad Co. will sell all its old summer cars, and has ordered 24 new ones. These will be of the combination open and closed California type, with all the latest appliances for the safety and comfort of passengers.

The Omaha (Neb.), Council Bluffs & Suburban Railway Co. has arranged for a bond issue of \$600,000; dated Jan. 1, 1900, due in 20 years, but redeemable Jan. 1, 1906; interest, 5 per cent per annum; trustee of mortgage, Royal Trust Co., of Chicago.

Atlanta, Ga., is to be one terminal of a new 45-mile interurban road. The line will run to Douglasville, Ga., traversing a portion of the country made famous by Sherman's march to the sea. At Austell, Ga., a park of several hundred acres will be developed.

To protect the smaller animals and birds in the Cincinnati Zoo from rats and cats, two moderately heavy copper wires are stretched around the cages and at night current from the electric light wires is turned on. Hardly a night passes that a rat is not killed in this way.

The Twin City Rapid Transit Co. is engaged in repairing 30 of its old cars that have been out of use for some years and in completing 20 double truck cars that were commenced last summer and on which work was suspended because of the difficulty in securing steel.

The mayor of Little Rock, Ark., has officially notified the officers of the Little Rock Traction & Electric Co. that unless immediate steps are taken to improve and repair the plant, rolling stock and track, he will proceed at once to have its charter revoked and declared void.

The final arguments in the suit brought by the Peoria (Ill.) Water Co. against the street railway companies of Peoria, for damages to water mains by electrolysis, have been submitted before Frank L. Wean, special master in chancery. A report is expected at an early date.

A total of 1,961,400 passengers were carried by the South Side Elevated R. R., of Chicago, for the month of February, last, or an average of 70,050 a day. This is a gain of 16 per cent over the corresponding month of 1899, which was itself a gain of 14½ per cent over February, 1898.

The contract for a power house at Elsmere, Del., has been let by the Wilmington (Del.) & Brandywine Springs Railway Co. to William H. Greenwalt & Son, of Wilmington, who are to erect the building for \$5,000. Three boilers, three engines and three generators, for which contracts have been signed, will be installed.

Owing to the urgent demand made by the local liquor dealers of Adrian, Mich., for a rigid observance of the Sunday laws, the street railway company and all the hack lines in the city suspended operation on Sunday, February 18th. It is believed the liquor men are trying to get square for recent interference in their business.

The presidents of the New Orleans & Carrollton Railway Co. and the New Orleans Traction Co. have each been fined \$10 for violation of a city ordinance, requiring street railway companies to

put their feed wires underground. In each case an appeal bond was taken and the validity of the law will be fought in the higher courts.

The Brooklyn Rapid Transit Co. in accordance with a recent decision of the courts has put into effect an optional transfer arrangement between the surface lines and the elevated roads, instead of the system requiring passengers on the outlying branches to change to the elevated line in order to reach the heart of the city.

President Lowry, of the Twin City Rapid Transit Co., of Minneapolis, in his annual report for the year ending Dec. 31, 1899, states: "The surplus earnings for the year were \$737,578, an increase of 49 per cent, after paying quarterly regular dividends on preferred stock. The surplus for common stock was \$550,025 on August 15th.

The South Bend (Ind.) Power Co. has been incorporated to build a dam across the St. Joseph River at Bertrand, four miles north of Niles, Mich. Power will be generated at this point for operating an electric railway to be built from South Bend to LaPorte and Michigan City, in Indiana, and from South Bend to Niles and Benton Harbor.

All the property and franchises of the Nassau Electric Railroad Co., of Brooklyn, have been leased to the Brooklyn Heights Railroad Co. for 999 years, upon the same terms, it is understood, as expressed in the one year lease under which the former road has been operated since Apr. 1, 1899. This lease provided for an annual rental of \$150,000 and payment of all fixed charges and taxes.

Residents of Jefferson Park, Avondale and Mayfair, northern suburbs of Chicago, have petitioned the city council to secure for them a 5-cent fare to the business district, via the lines of the Consolidated Traction Co. and the Union Traction Co. The council is considering an ordinance remitting all compensation requirements on certain lines on condition that the companies will reduce the fare.

Preliminary conferences looking to a consolidation of the New Brunswick City Railway Co., the Brunswick Traction Co. and the New York & Philadelphia Traction Co. under the name of the latter have been held. This would give the consolidated company a line as far as Irvington, a suburb of Newark, N. J., and be a great step in the completion of a New York-Philadelphia electric line.

It is proposed to repeal the New York law forbidding the building of railroads on the Albany and New York post road, and it is stated a syndicate in which John D. Rockefeller, Levi P. Morton and J. Pierpont Morgan are reported to be interested, will build electric lines, connecting the prosperous towns along the Hudson, and forming a continuous electric railway from New York to Albany.

The Appellate Division of the Supreme Court, Borough of Manhattan, on February 23d, rendered a decision vacating the reassessment of the capital stock and surplus of the Manhattan Elevated Railroad Co., of New York, for 1894, and the assessment is ordered stricken from the roll. The decision absolves the company from paying such taxes for not only 1894, but for all the years from then up to and including 1898.

The Ashland & Catlettsburg Street Railway Co. is extending its line from Catlettsburg, Ky., to Huntington, W. Va. When this branch is completed, the system will comprise 20 miles of track. The company has also just let the contract for the construction of a new opera house at Clyffeside Park, which will seat 2,000 people and will be one of the best equipped, up-to-date opera houses in northeastern Kentucky.

A consolidation of the Bergen County Traction Co., of Fort Lee, N. J., and the Ridgefield & Teanock Railway Co., has been perfected, and a new company formed to be called the New Jersey & Hudson River Railway & Ferry Co. The plans include the building of extensions, establishment of a pleasure park at Edgewater-on-the-Hudson, improvement in the ferry service, etc. Frank R. Ford is general manager of the system.

AN INTERESTING STREET CAR.

The accompanying illustration shows an interesting novelty, being a combined passenger and freight car and an electric locomotive as well. The car body is 29 ft. long by 8 ft. wide and is carried on a No. 21-E, Brill truck of 7 ft. 6 in. wheel base. The front end is vestibuled with a door at the left side which forms the main entrance to the passenger compartment; this compartment is 11 ft. 6½ in. long with six reversible back seats spaced 2 ft. 5 in. between centers. The only passengers which it is intended to carry are workmen to and from their labor and the single entrance and stirrup step are sufficient.

COMBINATION CAR AND LOCOMOTIVE.

The freight compartment is 17 ft. 5½ in. long with side doors in the center of the car, 3 ft. 6 in. wide. This compartment is also reached by a door from the passenger compartment and is provided with folding seats along the sides and bulkhead. With its two motors the weight of the car is 19,850 lb. This car, which was built by the J. G. Brill Co., is a very pretty illustration of the flexibility and adaptability of the electric locomotive; it is equipped with an M. C. B. coupler for handling standard steam cars and also has a radial draw bar for street cars.

GOLD CAR HEATERS AND PLATFORM GATES.

The illustrations herewith show the Gold platform gate which has been applied to the entire equipment of passenger cars on all elevated railways, as well as to many surface lines. Gates are a necessity on elevated cars, and the desirable features are simplicity and ease of operation, and a lock such that when the gate is shut it cannot be opened by pressure either from the outside or inside.

The various parts in the engraving are indicated as follows: B,

GOLD PLATFORM GATE.

platform; D, link to door; E, slide; F, link; H, handle. The left hand view shows the gate, closed, in elevation and the dotted lines indicate the position of the levers when open. On the right hand is a plan of a platform showing one gate open and one closed. When the gate is closed the hand lever is past the dead center and effectually locks it in position.

Since the first gate lock was produced no change whatever has been made in the construction, and it is operated satisfactorily on the elevated roads in New York, Chicago, Brooklyn and the London Underground, where it has never been the cause of an accident of any kind. These gates are now made and sold by Edward E. Gold, president of the Gold Car Heating Co., Frankfort and Cliff Sts., New York.

During the past year the Gold Car Heating Co. has made a number of improvements in its electric heaters and has perfected a system for elevated railways which will commend itself for simplicity and efficiency. The illustration shows one end of an elevated car equipped with 18 Gold standard heaters in the body of the car and 2 "Improved" panel heaters, in the motorman's compartments, 1 at each end. With this improved system three intensities of heat are provided, the regulation being by means of the 3-point switch A. When the switch is turned to point 1, current is passed through one-third of each heater in the car; point 2 puts two-thirds in circuit, etc. The heater B in the motorman's compartment is connected to the general system wiring, so that it is

IMPROVED GOLD CAR HEATING SYSTEM.

controlled by the shunt switch "E," and may be twisted off or on at will. When in circuit current passes through one-third, two-thirds, or the whole of B, according as the regulator A may be set. The heaters in the body of the car are suspended underneath the seats about half way between the floor and seat.

The illustration shows the arrangement as adopted for the Brooklyn Elevated cars; the Gold standard heaters are used by the South Side Elevated, Chicago.

IMPROVEMENTS AT WICHITA, KAN.

We are in receipt of a letter from Mr. S. L. Nelson, the newly appointed manager of the Wichita Railroad & Light Co., giving some of the details of the work planned at that city. The company will rebuild 4½ miles of track with 7-in. 60 and 70-lb. T-rail, and about five miles with re-rolled 50-lb. T-rail; it will also rebuild the remaining 8 or 10 miles of track with the present 35-lb. T-rail, using new ties. Atlas rail joints for both the new and old rails have been purchased and the first shipments arrived March 5th. The company has ordered 12 new closed car bodies, 10 of which will be 16 ft. long and two 18 ft. 6 in. long; also 10 seven-bench center-aisle open cars. These will all be of the latest pattern, and are under construction at the works of the Jewett Car Co., of Newark, O. They will be mounted on Peckham 7-B trucks, equipped with G. E. 800 motors.

For street railway purposes, the company is installing three Stirling boilers, aggregating 800 h. p., one Westinghouse 250-kw. direct connected generator and one 360-h. p. tandem compound condensing Russell engine. For the street lighting plant, there are being placed in position, temporarily, two A. S. 8-120-900-2,300 volt, 60 cycle single phase generators, to operate 185 enclosed type series arc lamps, but this installation will later be changed for a 300-kw., 150 r. p. m. mono-cyclic generator.

Mr. L. O. Williams, late superintendent of the Springfield (O.) R. R., is now in charge of the installation of the steam and electric plant, and Mr. W. R. Morrison, formerly assistant manager of the Bay Cities (Mich.) Consolidated Railway Co., will be in active charge of the track work.

CHANGES IN WELL-KNOWN SUPPLY

McGill, Porter & Berg, successors to McGill, Pomeroy & Co., have moved into their new office and store room at 309 Dearborn St., Chicago, where they will make a specialty of electric street railway and electric manufacturers' supplies, representing the following manufacturers as territorial agents: Ohio Brass Co., Cutter Electric & Manufacturing Co., Speer Carbon Co., Horsburgh & Scott, Chicago Mica Co., Frank Ridlon Co., and Ham Sand Box Co.

Mr. J. H. McGill has been actively engaged in the electric supply business since 1890, when he was employed as stock man by the Electric Supply Co., afterwards the Ansonia Electric Co. At the time of that company's failure in 1893 he held the position of traveling salesman. After the dissolving of the Ansonia Electric Co. he secured a position as salesman with the Peru Electrical & Manufacturing Co., but resigned this to take a like position with the Sunbeam Lamp Co. When the latter company was obliged to discontinue temporarily, pending patent litigation, he opened an office in Room 1533 Monadnock Building, as Western sales agent for the Peru Electrical & Manufacturing Co. To this agency was soon added that of the Ohio Brass Co. In March, 1897, his business

J. H. MCGILL.

J. W. PORTER.

was consolidated with that of J. G. Pomeroy, agent for the Adams Bagnall Electric Co., under the firm name of McGill & Pomeroy. The business increasing, they moved to 317 Dearborn St., and to their business as manufacturers' agents added that of dealers in street railway supplies.

Mr. J. W. Porter came into the firm, May 1, 1899, having purchased Mr. Pomeroy's interest. Mr. Porter has been in the electrical business since 1891. He was with the Edison General Electric Co., in the engineering department, erecting street railways before the formation of the General Electric Co. At this time he went with the Electric Supply Co., Chicago, and remained until the affairs of this concern were wound up in 1893, since when he has been in the electric lighting field as the manager of a central station in Chicago.

MAX A. BERG.

Mr. Max A. Berg, recently assistant secretary in the railway department of the Ohio Brass Co., Mansfield, O., returns to Chicago, his native city, to become the third member of the new firm. He began his career in the electrical business in 1889 with the Electrical Supply Co., and in 1893 when the Supply company went out of business he held the position of manager of the railway department, and assistant to the manager of the company. During the past four years Mr. Berg has held a very responsible position with the Ohio Brass Co. and is thoroughly familiar with the details of the street railway supply business in its various branches. He is very well and favorably known, and has a wide acquaintance among street railway men and the supply trade.

The new firm makes a strong combination of enterprising and popular young men, all of whom have a large acquaintance with both street railway men and their wants. They are determined to please their customers in every possible way, and have every reason to largely increase a business already prosperous and growing rapidly.

MACHINE FOR CLEANING AND RE-INSULATING WIRE.

We are indebted to Mr. F. W. Henninger, of the Detroit Citizens' Street Railway Co., for the following description of a very ingenious machine invented by him. The device takes wire the insulation of which has been injured, strips it and re-insulates it ready to be again used. While it was designed for use in rewinding the fields of railway motors, its application is not limited to this purpose. Mr. A. B. du Pont, general manager of the Citizens' road, advises us that this machine has greatly reduced the cost of motor repairs on his road.

The description and method of operating are as follows: The reel of wire or "field" is placed at the right near A; the wire passes through a hole in the end of the frame C, under the guide wheel D, over the end of the cleaner E, and under F, over the guide wheel H, and under the tension wheel M, over the driver N, and through the arbor S, and thence on to the new field to be wound. The wheel D is fastened on to the frame by means of a stud and is stationary. The cleaner EF is held in place by the hand wheel G, and is so arranged that it can be turned at any angle desired producing any desired pressure upon the wire. To the same stud upon which the guide wheel H is fastened, the arm J swings as a hinge, and the other end slides in the slot L and is held in place by the hand wheel K, adjustable so that any desired pressure can be produced on the driver N. The friction bevel wheel T is on the same shaft as N, and engages the bevel wheel U to which a U-shaped frame V carrying the tape W is fastened. As the wire passes over N motion is imparted to T, which wraps the tape around the wire as it passes through the arbor S and on to a new field. The frame is fastened to the stand by means of a trunion, so as to adjust itself to any irregularities in the wire. The cleaner is made of tempered steel, and the end E cleans the under part of the wire and the end F the upper part. In the latest design the driver N is made

RE-INSULATING MACHINE.

up of a double pulley, one being a little larger than the other and movable on the shaft O, so that two different speeds can be given winding mechanism.

Mr. Henninger states that the company uses a special tape made exclusively for this purpose, and believes it is a better insulation and lasts longer than ordinary cotton fiber, and it is not so easily displaced, and being interwoven, is more rigid and durable. The time required to wind a field with this device is no greater than one wound with ordinary insulated wire except the few moments that are required to replace the tape.

HIGH PRICES BLOCK NEW ROADS.

We are in receipt of a letter from Mr. John Patterson, secretary of the Hamilton Electric Light & Cataract Power Co., of Hamilton, Ont., stating that owing to the prevailing high prices of rails, wire and supplies, construction work has not been started on the two roads to be built by his company, plans for which were given on page 868 of the "Review" for Dec. 15, 1899. The company may possibly do some grading this spring, but it is expected the price of rails and other material will come down very considerably before long, and then work will be commenced in earnest.

PERSONAL.

MR. WILLIAM GARRETT, of Cleveland, will become consulting engineer for the Bethlehem Steel Co., of South Bethlehem, Pa.

MR. LOUIS HARTMAN has been appointed receiver of the New Albany (Ind.) Ry., succeeding Mr. John McLeod, recently deceased.

MR. ELMER P. MORRIS, of New York City, is in Cuba on business connected with his recent large shipment of tramway material to Havana.

MR. JOHN I. BEGGS has been chosen a director of the Milwaukee Electric Railway & Light Co., succeeding Mr. A. Marcus, of New York.

MR. MARK B. THOMAS, formerly manager of the Hamilton (Ont.) & Dundas Ry., has been appointed to a responsible position with the Cataract Power Co.

MR. C. G. WINGATE is superintending the construction of the Branford (Conn.) Electric Ry. He was formerly superintendent of the Huntington (N. Y.) Street R. R.

MR. JAS. LAPPIN has left the position of electrician for the Metropolitan Railway Co., of Toronto, Ont., to take a place with the Canadian General Electric Co., of Toronto.

MR. J. J. O'KEEFE, formerly chief supervisor for the Chicago City Ry., was, on February 1st, appointed to a similar position with the Metropolitan Street Railway Co., of Kansas City, Mo.

MR. A. E. BLANCK has returned to his home in Battle Creek, Mich., from Galesburg, Mich., where he has been building the new power station for the Michigan Traction Co., of Kalamazoo.

MR. FRANK ARNOLD, of Watertown, N. Y., formerly engaged on the R. W. & O. division of the New York Central R. R., has been appointed manager of the Oswego (N. Y.) Traction Co.

MR. C. E. MOORE, formerly master mechanic of the Chicago City Ry., has been appointed superintendent of the Simplex Railway Equipment Co., of Chicago, entering on his duties March 1st.

MR. E. EUGENE HAWKINS, JR., assumed the duties of general superintendent of the New Platz (N. Y.) & Poughkeepsie Traction Co., on Feb. 15, 1900, succeeding Mr. C. C. Southard, resigned.

MR. H. E. BRADFORD, formerly superintendent of the Marlborough (Mass.) Street Ry., has succeeded Mr. E. P. Shaw, jr., as secretary and treasurer of the Worcester (Mass.) & Northboro Street Railway Co.

MR. W. W. GURLEY, a well known lawyer of Chicago, was last month made general counsel of the Chicago Union Traction Co., succeeding to the title as well as the position formerly held by Mr. Henry Crawford.

MR. JOHN H. FOWLER, who has been connected for some years with Naugle, Holcombe & Co., of Chicago, has opened an office in the Fisher Building, Chicago, and will make a specialty of telephone and telegraph poles.

PROF. REGINALD A. FESSENDEN has resigned his chair in the electrical engineering department of the Western University of Pennsylvania, at Allegheny, Pa., to accept a position in the Weather Bureau, at Washington.

MR. WILLIAM B. GIVEN, last month tendered a dinner to all the gentlemen that were associated with him in the organization of the Conestoga Traction Co., which controls all the street railway lines in Lancaster, Pa., and vicinity.

MR. DAVID A. JENKINS, car inspector of the Springfield (O.) Street Railway Co., has been appointed superintendent of the road in place of Mr. L. O. Williams, who has accepted a position with the street railway company at Wichita, Kan.

MR. THOMAS RODD, consulting engineer of the Westinghouse interests and chief engineer of the Pennsylvania Steel Co., sailed for Europe last month, taking with him the plans for the new plant of the British Westinghouse Co., at Manchester, Eng.

MR. J. M. HOLLISTER, president of the Chicago Electrical Association, left for Paris on March 14th. Mr. Hollister will be the engineer in charge of the preparations for the exhibit of the Western Electric Co., at the Paris Exposition, and will remain there during the Exposition.

PROF. D. F. A. C. PERRINE will be connected with the new Stanley Electric Manufacturing Co., of Pittsfield, Mass., in an important position. Professor Perrine has been for some time at the head of the electrical engineering department of the Leland Stanford Junior University.

MR. GILES S. ALLISON, whose name is familiar in street railway supply circles, has associated himself with Valentine & Co., of New York City, the well known makers of first-class varnishes. Mr. Allison was formerly with the Hildreth Varnish Co.

MR. PAUL D. CABLE, formerly with the Commercial Electrical Co., of St. Louis, has taken the management of the electrical department of the Rumsey V. Sikemeier Co., of St. Louis. Mr. Cable takes with him to his new position many years' experience in the same line and a thorough knowledge of the electrical field.

MR. A. E. LE ROSSIGNOL, of Newcastle-on-Tyne, Eng., who has been in this country for several weeks investigating American electric transportation practice, has returned to England. The Corporation Tramways of Newcastle-on-Tyne, of which Mr. Rossignol is engineer, are about to be converted to electric traction.

MR. CLINTON L. ROSSITER, of Brooklyn, was a recent visitor to Chicago, for the purpose of studying certain methods employed by the Chicago elevated roads. Electricity on the Brooklyn elevated lines has not proven entirely satisfactory, and Mr. Rossiter expected to obtain several suggestions as to ways of remedying the defects.

MR. H. H. VREELAND, president and general manager of the Metropolitan Street Railway Co., of New York City, was the recipient on St. Valentine's Day of a check for \$100,000. The check was the gift of individual members of the Whitney syndicate, that practically owns the Metropolitan road, and was bestowed as a token of their appreciation of the work accomplished by Mr. Vreeland, in bringing the property to its present high state of development.

MR. C. S. DRUMMOND, of the board of directors of the British Electric Traction Co., of London, was a "Review" caller recently. He has been in Chicago, investigating local electric transportation systems and purchasing equipment for the 51 roads his company operates, having just returned from a visit to Nelson, British Columbia, where a 13-mile electric line is in process of construction, being the first of a series of projected trolley roads the English corporation will establish in the queen's domain on this continent. Speaking of British traction affairs, Mr. Drummond said: "We have, of course, not reached the stage of progress and development attained in America, but the surest evidence of our intention to do so is the fact that we are importing the great bulk of our equipment from the United States."

MR. H. MILTON KENNEDY, who was probably the first man in this country to hold the position of general passenger agent on a street railway system, has severed his connection with the Brooklyn Rapid Transit Co., to enter a wider field of work. Mr. Kennedy held the office of general passenger agent for the Brooklyn Heights Railroad Co. for some time, and when the consolidation was made,

he was continued in the same position with the Rapid Transit Co. In this capacity he had entire charge of all the advertising of the pleasure resorts to which the company's lines ran, and he was constantly devising ways for encouraging and developing what is known as the strictly pleasure traffic of the system. In this work he was peculiarly successful.

MR. G. P. FRANCIS has accepted a position as chief engineer of the suburban lines of the Union Railroad Co., of Providence, R. I. Mr. Francis was the architect who designed and superintended the construction of the magnificent new railway station in Boston, known as the South Terminal Station. He was in charge of the work from the first survey to the completion of the structure, a period of three years.

OBITUARY.

MR. EDWIN N. LEWIS, whose name is widely known in railroad circles, died in Chicago February 16th. He was manager of the Railway Master Mechanic and the Official Railway List.

GEN. JOHN McNULTA, receiver of the Calumet Electric Street Railway Co., of Chicago, died suddenly at Washington, D. C., February 22d, from an attack of angina pectoris. General McNulta was born in New York City in 1837 and moved to Bloomington, Ill., in 1857. He served during the Rebellion in the First Illinois cavalry, rising from the ranks to colonel and brevet brigadier-general; at the close of the war he resumed his legal studies and since then has engaged in the practice of law. He served four years in the Illinois Senate and one term in Congress. General McNulta's greatest claim to fame is his record as a financier and manager of large properties, having been receiver of the Toledo, St. Louis & Kansas City R. R., of the Wabash R. R., of the whisky trust, and of the National Bank of Illinois, the principal asset of which was the Calumet Electric Street Ry. Since 1895 he resided in Chicago, being a law partner of John D. Hood. He was president of the Naval Reserve Association, the Loyal Legion, and the Society of the Army of the Tennessee, and a member of most of the prominent clubs in Chicago. He leaves a widow and four children.

NEW PUBLICATIONS.

THE UNIVERSITY OF ILLINOIS, at Champaign, Ill., has published a handsome souvenir of the college in the shape of a pamphlet containing half-tone cuts of the grounds and exterior and interior views of the buildings.

"THE EMPIRE OF THE SOUTH," published by the Southern Railway Co., is a book of nearly 200 pages, printed on heavy coated paper and profusely illustrated with fine engravings, describing the resources and developments of the South.

"SCIENCE ABSTRACTS" has completed its second year, and we note from Vol. III, Part 1, which has just been received, that new sections dealing with "Steam Plant, Gas and Oil Engines" and with "Motor Cars," have been added. This extension of the field covered will greatly add to the value of the publication. The index to Vol. II is a pamphlet of nearly 100 pages. "Science Abstracts" has heretofore covered only the field of physics and electrical engineering, being issued monthly under the direction of the Institution of Electrical Engineers and the Physical Society of London. Publishers, E. & F. N. Spon, Ltd., 125 Strand, W. C., London; Spon & Chamberlain, 12 Cortlandt St., New York. Price, 18. per number.

"GENTSCHE'S ELECTRIC RAILWAY GUIDE," Vol. I, No. 1, of which was issued last month, is a monthly publication, containing time tables, rates of fare and information regarding the express and freight carrying facilities of suburban and interurban electric lines in Ohio and Michigan. According to the announcement made in the first number, the scope of the guide is to be increased so as to include interurban roads in Indiana and also Illinois. The aim is to make the guide of general benefit to the public, especially to commercial travelers. It is published by the Gentsch Publishing Co., 29 Monroe Ave., Detroit, Mich.

NEW RECEIVER FOR THE CALUMET.

Mr. Edwin A. Potter, president of the American Trust & Savings Bank, of Chicago, has been appointed receiver of the National Bank of Illinois and the Calumet Electric Street Railway Co., succeeding the late Gen. John McNulta. The selection was made as the result of a conference between Charles H. Dawes, comptroller of the currency, Judge Grosscup, and the parties most deeply interested, and is entirely satisfactory to all concerned in the receivership. Mr. Potter will take charge of both the bank and the street railway company, as the chief remaining assets of the bank are the securities of the Calumet Electric Street Railway Co., in which it has over \$3,500,000 invested.

E. A. POTTER.

Mr. Potter was born in Bath, Me., Sept. 18, 1845. His grandfather and father were both natives of the same state. His father was in the lumber and ship building business, when, in 1872, Abram French & Co., of Boston, opened a branch house in Chicago, they placed Mr. Potter in charge. Mr. Potter continued in this business until 1879, when the firm of French, Potter & Wilson, dealers in glassware, was formed. This firm dissolved in 1889, and he immediately formed the partnership of Lyon & Potter, dealers in pianos. In 1897 this partnership was also dissolved, and in January, 1898, Mr. Potter was elected president of the American Trust & Savings Bank, which position he now holds. Under his direction the bank has grown with a rapidity remarkable even in Chicago, and is known as one of the most substantial in this city. It is trustee for a large number of corporations, including many street railways. Its newly occupied banking quarters, La Salle and Monroe, are among the finest in the city.

BONUS FOR LONG SERVICE.

Under date of Feb. 27, 1900, Gen. Mgr. E. P. Vining, of the Market Street Railway Co., San Francisco, published the following order:

Notice is hereby given that the board of directors of this company has today adopted the following resolution:

"In recognition of and as a special reward for faithful service the board of directors of the Market Street Railway Co. does hereby authorize the general manager to pay a bonus at the end of each month to conductors, motormen, and gripmen, beginning with the month of March next, in accordance with the following scale:

"To all such employes who on Jan. 1, 1900, had been in the employ of this company, including its constituent companies, for 5 years, 1 cent per hour; for 10 years, 2 cents per hour; for 15 years, 3 cents per hour; for 20 years, 4 cents per hour. The above regardless of whether said length of service was continuous or not.

"The list of such employes will be revised on the first day of January of each year, so as to add thereto the names of men who at that time shall have completed terms of continuous service as above stated, attention being called to the fact, that hereafter no new names will be added except for continuous service.

"The board reserves the right to annul, rescind or amend this resolution at its pleasure."

On and after Mar. 1, 1900, no new service stripes will be authorized except in conformity with the terms above stated, that is to say, on January 1st of each year, conductors, motormen and gripmen who have then completed the above-mentioned terms of continuous service will be authorized to wear service stripes accordingly.

A dispute has arisen between the Washington (D. C.), Alexandria & Mt. Vernon Railroad Co. and the Anacostia & Potomac River Railroad Co. over the joint use of the conduits and tracks on 14th St. between E and B Sts.

OPENING OF MEXICO CITY'S ELECTRIC LINE.

We are indebted to Modern Mexico for the following description of the opening of the new electric system of Mexico City and the accompanying view of the first car operated:

"Mexico City's first electric street cars have been running since January 31st, and the novelty is wearing off. For a week after they were started, however, they were the object of greatest wonder and amusement to the lower classes. People not only stopped to watch them go by, but crowds of small boys and Indians followed them at full speed until their breath gave out. Then their places were taken by others, and the cars went through town for a few days with a motley escort following each one. The formal opening of the line was conducted with due ceremony. Minister Mariscal, the Mexican secretary of foreign relations, turned on the current. Our illustration presents a clear idea of the inaugural train. On the platform of the first car Secretary Mariscal is to be seen starting the car. At his right is the Russian minister, and behind him the

FIRST ELECTRIC CARS IN MEXICO CITY.

Japanese minister. Behind the secretary is Captain Porfirio Diaz, son of the president. At his left is Captain Pablo Esandon. The gentleman next is Sr. J. D. Casanus, of the board of directors of the district railways, and behind him is Mr. A. E. Worswick, resident engineer of the company, who has had charge of the construction for the new electric traction. On the ground, with one hand on the car, is Hon. Chandos Stanhope, who has recently arrived from England to take charge of the company's business here as managing director. Beside him is Sr. Thomas Moran, secretary of the Mexican board of directors. Just behind these two gentlemen is to be seen Gen. Mariano Ruiz. Many prominent people occupied the cars.

"Two important lines are now being operated entirely with the electric service, and the new system gives the best of satisfaction. The cars are comfortable and make excellent time. The company is equipping other lines as fast as possible. A number of double-deck cars will shortly be added to the city service."

WISCONSIN VALLEY ADVANCEMENT ASSOCIATION.

We are in receipt of a letter from Mr. Lester A. Rose, of Wausau, Wis., giving considerable information regarding the plans of the Wisconsin Valley Advancement Association, which was organized three months ago to exploit the advantages, and promote the development of the Wisconsin River Valley, from Eagle River to Grand Rapids and Centralia. This section of territory is attracting the attention of capitalists to a rapidly increasing extent and is enjoying an era of progress that is best characterized as a "boom." It has a population in six counties of more than 140,000 people, of which 50,000 live in cities.

Perhaps the greatest resources of the Wisconsin Valley are in the forests of hard and pulp woods, recent investigation revealing the fact that there are from 12,000,000,000 to 14,000,000,000 feet of hemlock and other paper pulp woods, easy of access to abundant water power, and in addition there are billions of feet of hard woods, as curly birch, bird's eye maple, red oak, ash and butternut.

The Advancement Association intends to establish logging camps, develop electricity from the 100,000 h. p. of water power it is estimated are available from the various waterways, build mills and factories, open up granite quarries, etc. One of its most extensive plans, however, is the building of an electric railway from Eagle River to Nakoosa, a distance of 140 miles, and passing through the cities and towns of Rhineland, Tomahawk, Merrill, Wausau, Mosinee, Stevens Point, Centralia and Grand Rapids.

The gentlemen interested in this enterprise include some of the leading business men of the West, whose names are a guarantee that any work undertaken by the association will be pushed through to successful completion. W. H. Bradley, the president of the organization, is the founder of the town of Tomahawk, Wis., a prosperous place of 4,000 inhabitants, the center for four railroads, and possessing water works, electric light plant, gas works, paper mills and one of the largest lumber concerns in Northern Wisconsin. In laying the foundation for this city, Mr. Bradley, 12 years ago, went back into the pine forest, built a \$50,000 hotel, and with this as a nucleus, commenced erecting buildings and opening up the surrounding country by building railroads in different directions. The growth and development of the place have been phenomenal.

The other officers are: Vice-President, W. E. Brown, of Rhineland, Wis.; secretary, Lester A. Rose, of Wausau, Wis.; treasurer, Ernest Oberbeck, Centralia, Wis. The board of directors includes D. E. Riordan and N. A. Coleman, of Eagle River; C. C. Yawkey and A. O. Jenne, of Hazelhurst; R. C. Thielman, of Tomahawk; D. L. Plumer and A. L. Kreutzer, of Wausau; H. M. Thompson and Chas. Gardner, of Mosinee, and many others.

CHICAGO CONSOLIDATED.

The offer made to the holders of the stock of the Chicago Consolidated Traction Co. by the Chicago Union Traction Co., which was published in our issue of January last, page 50, has been accepted by the owners of \$13,000,000 of the \$15,000,000 of Consolidated stock. The arrangements for the sale were perfected on February 24th. The holders of Consolidated stock who consented to sell will receive one-half of its face value in 4½ per cent bonds of the Union Traction company.

Mr. Yerkes thus retires from active interest in the Chicago surface lines.

This sale gives the Union Traction control of all the surface lines on the North and West Sides, except the Suburban R. R., and brings the total mileage of the system up to 507.7 miles. It is understood that the Suburban (56 miles) will be acquired later. There are also unconfirmed rumors that the Union Traction is seeking to obtain control of the Chicago General Ry.

LONG INTERURBAN IN OHIO.

The Columbus, London & Springfield Railway Co. has been incorporated with a capital stock of \$1,000,000, to build an electric line connecting Columbus and Springfield, O. In its application to the council of Columbus for a franchise within the limits of that city, the company offers to give 3-cent fares night and morning for the benefit of working people, and interchangeable transfers to all connecting lines. It also proposes to pay the city from 2 to 5 per cent of the gross receipts per annum.

Mr. H. A. Fisher, general manager of the company, writes us as follows:

"The route between termini has not been definitely located, but will probably touch London. It will be 60 or 90 days before we will be ready to let contracts. The railway will be 45 miles long, and the roadbed will be constructed in a most substantial manner, with a view of making fast time, the limited trains covering the distance in 1 h. and 30 min. We will carry mail, express and all kinds of freight. Our terminus in Columbus is in the shape of a loop around Capitol Square, and in Springfield we will have a loop

CHAS. J. MAYER,
President.

A. H. ENGLUND,
Sec'y & Treas.

Electric Railway Material and Supplies of Every Description.

We are exclusive Territorial Representatives of the following leading Manufacturers of Railway Materials:

R. D. Nuttall Co., Gears, Pinions, Bearings, Trolleys, Etc.	Allegheny, Pa.	The International Register Co., Single and Double Fare Registers.	Chicago, Ill.
Van Wagoner & Williams Hardware Co., Dropped Forged Copper Commutator Segments.	Cleveland, O.	W. T. C. Macallen Co., Standard Overhead Insulating Material.	Boston, Mass.
The Protected Rail Bond Co., "Protected" Flexible Rail Bonds.	Philadelphia.	Bradford Belling Co., "Monarch" Insulating Paint.	Cincinnati, O.
American Electric Heating Corporation, Electric Car Heaters of Every Design.	Boston, Mass.	Sterling Varnish Co., Sterling New Process Insulating Varnish.	Pittsburg, Pa.
Chisholm & Moore Manfg. Co., Moore's Chain Hoists.	Cleveland, O.	Garton Daniels Electric Co., Garton Lightning Arresters.	Keokuk, Ia.
New York & Ohio Co., "Packard" Incandescent Lamps.	Warren, O.	D. & W. Fuse Co., Enclosed Non-Arching Fuses.	Providence, R. I.

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

We carry the largest stock in this country of Strictly Electric Railway Material.

We are now occupying our entire building, five floors and basement.

Special Attention Given to Export Business.

Send for Catalogues.

around Fountain Square. The cars will be 45 ft. long, with smoking compartment, toilet room, state room, buffet, air brakes, Baker heaters, and other modern appliances."

The officers are: President, Charles E. Wentworth; first vice-president and treasurer, J. G. Webb; secretary, Emmett Tompkins; general manager, H. A. Fisher; general counsel, Merrick & Tompkins. The general manager's office is at Columbus, O.

RUMORED CONSOLIDATION AT PITTSBURG.

Application has been made for a charter by a new company, to be called the Union Traction Co., of Pittsburg, and which it is understood is to be formed for the purpose of consolidating all the street railway properties in and around Pittsburg. It is announced the president of the consolidation will be Senator C. L. Magee.

It is further stated that the Castle Shannon R. R., an eight-mile, narrow-gage coal and passenger road, operated by steam, and also 500 acres of fine coal land have been purchased by parties interested in the deal. This will give the consolidated system an abundant supply of good cheap fuel entirely under its own control.

NEW ROAD IN DELAWARE.

On February 22d, actual construction work was commenced on the Delaware General Electric Ry. by the driving of a silver spike at Dover, Del. The incident was made the occasion for interesting ceremonies, which were witnessed by about 1,500 persons. Several addresses were made and an elaborate dinner was served at a leading hotel.

The road, which will have both a freight and a passenger service, will be about 45 miles long, passing through a number of Delaware towns, and reaching an estimated population of 35,000 to 40,000 people. It will open up land for grain and fruit that has not hitherto been under cultivation, because of lack of facilities for quickly handling the product.

AN ECHO FROM THE CLEVELAND STRIKE.

Members of the Cleveland fire department have petitioned the Cleveland Electric Railway Co. to repeal the order issued soon after the strike was declared last summer denying the right of firemen in uniform to ride on its cars free. Up to that time employes of the fire department had been granted the courtesy of riding gratis when in uniform, but at the time of the strike, the firemen took an active part in the boycott and refused to ride on the cars at all. The company now takes the position that if the men were not willing to ride when there was trouble on the lines, they should not ask for favors after the trouble is settled.

SOUVENIR MEMORANDUM BOOK.

The Star Lubricating Oil Co., of Cleveland, O., has been sending out as a souvenir, a useful pocket memorandum book, containing space for notes for every day in the year, and in addition a quantity of valuable general information as rates of postage, U. S. Weather Bureau signals, interest tables, coins, weights and measures, etc. A chronology of the Spanish war is also included. The company will be pleased to send a copy of the book on application.

This little souvenir calls attention to the fact that "Excelsior" boiler compound, made by the Star Lubricating Oil Co., contains no oil or acid and destroys oil and grease in boilers.

E. B. Hutchinson, the expert accountant, Detroit, Mich., is making a specialty of reports on street railway properties. It was he who made the report to the Detroit Street Railway Commission recently, and on which their report was based. The commissioners spoke very highly of Mr. Hutchinson's work and complimented it in their published report.

Frank Morrell, one of the well known sales agents in street railway supplies, has taken the eastern agency for the McGuire company, with headquarters at No. 15 Cortlandt St., New York City, where he will be glad to see all his old friends.

ECHOES FROM THE TRADE

THE J. A. FAY & EGAN CO., of Cincinnati, O., has declared the regular quarterly dividend of 13 $\frac{1}{4}$ per cent on the preferred stock and also a 13 $\frac{1}{4}$ per cent back dividend. Both were payable February 20th.

CONSUL-GENERAL J. G. STOWE, Cape Town, South Africa, advises the State Department that many tenders for bridge work, electrical and railway material, and machinery are open for bids.

THE KUELL AIR BRAKE CO., of Battle Creek, Mich., has been incorporated to manufacture air brakes for street cars. The incorporators are W. F. Kuell, J. E. Linihan, R. F. Hoffmaster, W. H. Hoffmaster, H. F. Beckman.

THE BERLIN IRON BRIDGE CO., of East Berlin, Conn., has increased its capital stock to \$750,000. The following board of directors has been elected: Chas. M. Jarvis, Frank L. Wilcox, S. H. Wilcox, H. H. Peck, Geo. H. Sage, D. E. Bradley, and S. N. Robinson.

THE AMERICAN ELECTRICAL WORKS, of Providence, R. I., sent to the trade on Washington's Birthday another one of their series of holiday remembrances. It consisted of a steel plate portrait of Martha Washington and a sketch of the principal incidents of her life.

THE JEFFREY MANUFACTURING CO., of Columbus, O., makes coal washing machinery, retarding conveyors, steam coal tipples, elevating-conveying machinery and coal mining machinery. It calls attention to its products in a newly issued catalog, which will be sent on application.

THE NEW YORK AIR COMPRESSOR CO., 120 Liberty St., New York, has issued a handsomely illustrated catalog descriptive of steam-driven and belt-driven compressors. This company states that its machines are the only ones on the market which were designed expressly for the higher pressure now in vogue.

THE CROSS OIL FILTER, made by the Burt Manufacturing Co., Akron, O., has been selected for use in the power house of the U. S. Machinery Exhibit at the Paris Exposition. The Burt Co. will also make an independent exhibit of its filters at the Exposition, and has just made a superbly finished shipment for that purpose.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO. is building extensions to its Pittsburg plant that, when finished, will give it one of the largest factories in the world, one room of which will be 1,206 ft. long x 370 ft. wide. The company declared a quarterly dividend of 1 $\frac{1}{4}$ per cent on its common stock, payable February 20th.

THE CONSOLIDATED CAR FENDER CO., of Providence, for its "little reminders" this month sends out a neat folder bearing a clipping from the New York Sun of Dec. 7, 1890, giving an account of how a woman was picked up uninjured, by a Providence fender, attached to a car of the Metropolitan Street Railway Co., while the car was running at high speed.

THE SPEER CARBON CO., of Saint Marys, Pa., is making a carbon that, judging from the repeat orders that are coming in from all sides, must be nearly perfect. The company's abundance of capital, thoroughly equipped factory, and natural-gas heated ovens, together with the experience of its general manager, J. S. Speer, place it in a position to supply the best products at lowest prices, consistent therewith.

THE RITER-CONLEY MANUFACTURING CO., of Pittsburg, Pa., has been awarded a contract for 1,300 tons of structural steel and plate work for the Glasgow Tramways. It is for the complete equipment of the power plant, and includes the erection of power house, smoke stack, coal and ash, tanks, boilers, etc. This company has done similar work for Dublin and Bristol tramways, and maintains an erecting force abroad.

THE COMPRESSED AIR MOTOR CO., Monadnock Block, Chicago, has issued a handsome illustrated catalog descriptive of motors made by it, and giving details concerning the operation of air driven street cars in various cities, particularly those in Chicago and New York. During the blizzard of February 3d and 4th, this year, the air cars on the Chicago Union Traction lines ran satisfactorily under most disadvantageous conditions.

THE GOHEEN MANUFACTURING CO., of Canton, O., maker of carbonizing coating for the protection of iron and steel construction work, and also dealer in technical paints for all purposes, including red lead, white lead, carbon, asphaltic, iron oxide, magnetic galvanum, etc., has issued a pamphlet on the preservation of wood, steel and galvanized surfaces, taking up the subject from a scientific standpoint and giving the effects of various substances on those materials.

THE CROUSE-HINDS ELECTRIC CO., of Syracuse, N. Y., will doubtless have many weddings on its hand during the coming year, as invitations have been sent to interested parties asking each and every one to be the bridegroom at the marriage of the "Syracuse Changeable" electric headlight to an up-to-date railway manager, which is scheduled to occur on some bright morning during the year. One advantage of the proposition is that the bride will be sent on 30 days' trial.

THE STANDARD UNDERGROUND CABLE CO., of Pittsburg, through its representative, J. W. Marsh, has sent a letter to the Senate Committee on the Pacific cable, ridiculing the statement that there is no firm in America capable of taking the contract for making and laying this cable. Mr. Marsh asserts there are at least two companies with ample resources for doing the work, and that his company stands ready to assume the entire contract, including the purchasing of ships to stretch the wire across the Pacific.

THE WESTERN ELECTRICAL SUPPLY CO., of St. Louis, reports that the demand for its "Monarch" incandescent lamps for use on street railway circuits has been almost more than it could handle. The company claims that the "Monarch" is the best incandescent lamp that a combination of up-to-date machinery and mechanical skill can produce, and states that it has placed them on all kinds of circuits and under the most trying conditions, and has yet to find where they have not come up to the guarantee in every way and given the most complete satisfaction.

THE SHELBY STEEL TUBE CO., of Cleveland, O., has acquired all the assets, including patents, of 14 prominent tube manufacturing plants, among which are the Newcastle Tube Co., Tubing Department of the United States Projectile Co., Tubing Department of the Mansfield Machine Works, the United States Standard Drawn Steel Co., and the Shelby Tube Co., of Ohio. The reorganized company has an authorized capital stock of \$15,000,000. The officers are: President, W. E. Miller; treasurer, W. S. Miller; secretary, H. H. Cockley; general counsel, N. A. Gilbert.

THE MAYER & ENGLUND CO., Philadelphia, has been organized as a Pennsylvania corporation to acquire the business, contracts, good will, etc., of the well known firm of Mayer & Englund,

of Philadelphia. The officers of the new company are Charles J. Mayer, president, and A. H. England, secretary and treasurer. The business heretofore carried on by Mayer & England as a firm will be largely increased by the corporation. An extensive complete catalog, illustrating the full line of railway material handled, will shortly be published, and will be mailed to any railway manager upon request.

THE WESTERN ELECTRIC CO., of Chicago, has furnished the Metropolitan Street Railway Co., of New York City, a 300 kw., 2,500-ampere booster, said to be the largest of its kind ever built. This machine is driven by a 550-volt direct connected motor, the current passing through the series windings. The Western Electric Co. has also received a flattering order from abroad, as the United States Commissioners of the Paris Exposition have chosen Western enclosed arc lamps for lighting the entire American section of the Exposition. These lamps will be placed two in series on 220-volt circuits.

ADAM COOK'S SONS, of New York City, have received the following letter from Wendell Kirth, of Gordon, Neb.: "I wish to report unqualified success with the sample box of Albany compound on our crank pin here. We have been running with it every day since; at first it heated up as it usually has done for the past five or six years, owing to box being badly scored, but now it is running cool every day and we have had no trouble at all with it. There has been more oil used every day in quantity, than would be used with the grease in 80 days' continuous run. We will send to your Chicago people for more."

THE STANDARD PAINT CO., of New York, which makes all of the P. & B. products, is supplying the European market from its factory at Hamburg, and P. & B. goods have taken high rank with electric railway companies abroad. This company makes a lining for battery boxes that has withstood the severest tests. During a heavy snow storm in Berlin recently, the accumulator cars having P. & B. lining in the storage battery boxes were able to run with but little trouble from linings being eaten by acid or the excessive heat, with the result that this material is to be placed on many of the Berlin lines, including the Grosse Berliner Strassenbahn Gesellschaft. The P. & B. lining consists of an application of P. & B. paint, P. & B. "Ruberine," P. & B. junction box compound and P. & B. "Ruberoid."

THE DETROIT STEEL & SPRING CO., advises us that the fire of February 25th was much less disastrous than reported in the papers and was confined to one department—the rolling mill. The spring shops, crucible furnaces and steel castings foundries were unharmed. The American Car & Foundry Co., of Detroit, promptly placed at the disposal of the Spring company its rolling department, which will enable it to promptly fill all orders. Before the fire was extinguished the Spring company had ordered a new steel building 180 x 300 ft. which will be erected immediately. Fortunately the extensive machine shops were not injured which will permit the company to repair and put in order at its own works the rolling machinery. One thousand men are employed by the Detroit Steel & Spring Co., which is running night and day, and prepared to take the same prompt care of customers as heretofore.

THE WALWORTH MANUFACTURING CO., now located at 128-136 Federal St., Boston, where it occupies the entire building, five stories and basement, is one of the old establishments, having been founded in 1842. The company is engaged in the manufacture of steam heating apparatus and supplies of all kinds, and is one of the best known houses in that branch of business in New England. In addition to being steam contractor on a large scale, it makes and deals in heating and ventilating apparatus, automatic sprinkling apparatus, boilers and engines, and makes a long list of specialties, which include a full line of gas and steam fitters' tools, and these special tools are shipped to every part of the known globe. The export trade of this company is very large, and its special valves and fittings are used in large quantities in England, on the continent of Europe, in the East Indies, South Africa, South America and Australia, and its trade in these localities is constantly growing.

NEWS NOTES.

ADRIAN, MICH.—Surveys for the route of the Toledo & Western Co. have been completed between Toledo and Adrian. It is further projected to build a branch line between Toledo and Lyons, O. Seagraves Bros. are promoting the line.

ALBANY, N. Y.—The Senate railroads committee has favorably reported a bill authorizing the United Traction Co. to construct a bridge across the Hudson at Troy.

ATLANTA, GA.—The Atlanta & Western Railway & Power Co. has secured rights of way from Atlanta to the Chattahoochee river, and the project of building a line to connect Atlanta, Douglasville and Marietta, as announced in the "Street Railway Review" bulletin December 22d, will be pushed to completion. The capital stock of \$200,000 has been entirely subscribed. Frank S. Monnett and Judge Earnhart, of Columbus, O., are the principal promoters.

ATLANTIC CITY, N. J.—A new electric line to cost \$400,000 will be built in and about Atlantic City, including Somers Point, Pleasantville and Absecon on its route. J. Howard Gendell may be addressed.

AUGUSTA, ME.—The Railroad Commissioners have rendered a favorable decision on the petition of the Atlantic Shore Line Co. which is projected to run between Biddeford and York via Wells and Kennebunkport. H. M. Heath, Augusta, and Fred J. Allen, Sanford, are promoters.

BALTIMORE, MD.—I. L. Straus and Arthur P. Gorman, jr., are counsel for the Maryland Electric Railway Co. A franchise is asked for a line in Baltimore and suburbs.

BROCKTON, MASS.—Authority for the consolidation of the Brockton, Bridgewater & Taunton, the Taunton & Brockton, the Boston, Milton & Brockton, and the Brockton & East Bridgewater street railway companies with the Brockton Street Railway Co. has been granted by the Railroad Commissioners. The five lines will be operated under the title of the Brockton Street Railway Co. A. A. Glasier, president.

BUENOS AYRES, A. R.—F. C. Marty of Buenos Ayres is investigating American street railway systems with a view to installing electric railways in Buenos Ayres and other South American cities. While in the United States Mr. Marty is the guest of H. S. Judson, Minneapolis.

CHATTANOOGA, TENN.—Bids will be received by the Chattanooga Rapid Transit Co. for the construction of its five-mile suburban line to St. Elmo. S. W. Divine, president.

CHICAGO, ILL.—The Metropolitan West Side Elevated R. R. Co. will purchase 56 new passenger coaches at once. D. MacAllister, president.

COLUMBUS, O.—The Columbus Freight & Traction Co. has been incorporated by W. D. Brickell, W. D. Park, W. D. Hamilton, Charles E. Morris and John W. Mooney. The line is intended to afford the new wholesale district of Columbus prompt and adequate facilities for the receipt and shipment of freight. Any power other than that of steam may be employed. Should electric traction be elected the underground system would be installed.

COVINGTON, KY.—It is reported that the South Covington & Cincinnati Street Railway Co. will build a line to Erlanger. J. C. Ernst, president Cincinnati, Newport & Covington Railway Co., Covington.

DETROIT, MICH.—C. H. White & Co., New York bankers, have purchased the entire \$1,250,000 bond issue of the Detroit, Rochester, Romeo & Lake Orion electric line, taking at once the bonds now issued and owned by John Winter, F. C. Andrews and Oliver H. Lau. The purchase will include the bonds to be issued for the construction of the system from Oxford to Flint. The American Trust & Savings bank of Chicago will act as trustee of the bonds in connection with the Guarantee Trust Co. of New York.

EASTON, PA.—The Easton Consolidated Electric Co. is in the market for three or four 8 or 9-bench open motor cars equipped with Brill 21 trucks and Westinghouse No. 3 motors suitable for 5 ft. 2½ in. gage. Would also like prices on double truck open cars with 12 or 14 benches suitable for standard gage, 4 ft. 8½ in. Address C. E. Flynn, general manager.

EL PASO, TEX.—The Santa Fe street railway of El Paso, a mule car line, has been sold to John T. Terry, of New York, for \$30,000. The new owner will equip the line with electricity.

FAYETTEVILLE, N. C.—Dr. J. W. McNeill has secured a franchise for a street railway in this city, and construction will begin within a year. The line may be extended to Hope Mills, seven miles distant.

FORT WAYNE, IND.—P. A. Randall of Fort Wayne, V. R. Brown of Columbia City, and Oscar Gandy of Churubusco are promoting an electric line from Fort Wayne to Ligonier, to connect by branch lines with Mishawaka, Goshen, South Bend and Elkhart.

It is reported that the Fort Wayne Traction Co. will erect a new car house. A. L. Scott, manager.

GALVESTON, TEX.—The Galveston City R. R. has been sold under order of the United States Circuit Court, it is reported, to Charles E. Hotchkiss, New York, who represents the Guaranty Trust Co. of that city, trustee of the mortgage bondholders, plaintiff in the foreclosure proceedings in which the order of sale was made. Mr. Hotchkiss also represents the reorganization committee of bondholders. The line aggregates 41 miles. The purchase price was \$905,000.

GEORGETOWN, MASS.—The car house and seven cars of the Haverhill, Georgetown & Danvers Street Railway Co. were destroyed by a recent fire, entailing a loss of \$25,000, covered by insurance. C. E. Barnes, president.

HAMILTON, O.—The Hamilton & Lindenwald Electric Transit Co. has been reorganized with Christian Benninghofen, president; J. J. McMaken, vice-president; Peter Benninghofen, secretary and treasurer, and C. E. Warwick, assistant secretary. Under the new regime Ira S. Milliken retires as secretary and manager. Extensive improvements of the line are under consideration.

HARPERS FERRY, W. VA.—Paul Evans, of Philadelphia, formerly owner of the Hagerstown electric light plant, is reported to be promoting an interurban line in West Virginia. A site for a terminal has been purchased at Harpers Ferry. Power will be secured from Weverton.

HASTINGS, MICH.—A company of Detroit and Ann Arbor capitalists has been organized to build an electric line between Hastings and Battle Creek. Franchises have been applied for, and the proposition is favorably considered by both cities. The company is represented by George W. Bullis, of Ann Arbor.

HONOLULU, H. I.—L. P. Matthews, Cleveland, O., represents an American syndicate in promoting an electric railway system in Honolulu. It is reported that \$5,000,000 may be expended in building the proposed lines.

JOLIET, ILL.—The Joliet Street Railway Co. has received and accepted franchises for the proposed extensions to Plainfield and Manhattan. The construction of a down town loop in Joliet is also considered by the company. F. E. Fisher, superintendent.

KALAMAZOO, MICH.—The Michigan Traction Co. will issue \$600,000 bonds, assuming an obligation to the American Trust Co. of Philadelphia. The Michigan company controls the street railways in Kalamazoo and Battle Creek and will extend the system to connect these cities. An extension to Jackson is also projected. Major L. N. Downs, Kalamazoo, president.

KANSAS CITY, MO.—A recent fire in Kansas City destroyed 13 passenger cars, two construction cars and three sweepers of the Metropolitan Street Railway Co. The loss is estimated at \$27,000. W. H. Holmes, president.

LOVELAND, COLO.—The citizens of Loveland in a mass meeting recently appointed Attorneys E. S. Allen and Lyman Porter to arrange with contractors for an electric lighting and trolley system for their city. It is believed that inducements may be offered the Denver, Boulder & Northern to extend its electric line to Loveland.

MEROM, IND.—F. S. Aldrich, president of Union Christian College, Merom, J. W. Beauchamp and J. V. Barbre are promoting a line to be built by popular subscription from Merom to Terre Haute. The line is estimated to cost \$300,000. At meetings in Middletown, Merom and Prairie Creek a large majority voted in favor of the enterprise.

MILBRIDGE, ME.—W. A. Roberts and E. A. Hubbard of Biddeford, Me., are promoting an interurban electric line, to include four towns on its route. The citizens of Milbridge and Cherryfield favor the enterprise. The road may be capitalized by subscription and bonds will be issued for \$120,000.

MOLINE, ILL.—The petition of the Tri-City Railway Co. for a franchise to build an electric line in Moline is favorably received by the council and equipment will be purchased at once. James F. Lardner, manager and secretary.

MORRIS, ILL.—Application has been made for the incorporation of the Geneva Lake, Sycamore & Morris Electric R. R. A line from Morris to Geneva Lake, Wis., with branches to DeKalb and Helvidere is projected. This is practically a revival of the old Geneva Lake, Sycamore & Southern R. R. project. It is said that a new company has been organized with a capital stock of \$150,000.

NEW YORK, N. Y.—The car house and 43 cars of the Sixth Ave. branch of the Metropolitan Street Railway were damaged by fire February 19th. The loss is estimated at \$75,000, covered by insurance. H. H. Vreeland, president.

OSHKOSH, WIS.—Late reports announce the sale of the properties of the Oshkosh Traction Co. to McMillan, Emerson & Co., of New York. The Oshkosh company is capitalized at \$500,000. The terms of the sale have not been given for publication. G. J. Kobusch, president, Oshkosh.

PETERSBURG, VA.—It is reported that the Southside Railway & Development Co. will build nine miles of extensions in Petersburg, and that a theatre will be erected at the terminus of one of the lines for summer entertainments.

PHILADELPHIA, PA.—Reports have been received that the Railways Company General will build an electric line from Philadelphia to New York and that a capital of \$10,000,000 will be required for the purpose. Stock to the value of \$1,500,000 will at once be issued. The directors of project are George J. Kobusch, W. W. Gibbs, Dr. J. H. W. Chestnut, Edwin S. Cramp, J. B. MacAfee and L. N. Downs. The promoters have acquired control of the Philadelphia & Bristol Railway Co. and hold an option on the New Hope bridge, the only available bridge across the Delaware. When the line shall be completed passengers will be carried from Philadelphia to New York for \$1.00.

PHOENIXVILLE, PA.—The Phoenixville & Bridgeport Electric Railway Co. has been incorporated with a capital of \$100,000 by H. H. Gilkyson and H. S. Williams, Phoenixville, J. MacCarroll, J. W. Perry and L. P. Bane, Philadelphia, and G. F. P. Wagner, Pottstown.

PORTSMOUTH, N. H.—The capital stock of the Portsmouth, Kittery & York Street Railway will be increased by \$30,000. Extensions of the system will be made, a storage battery installed, and a ferry boat to run between Portsmouth and Badger's Island will be purchased. A. F. Gerald, president.

REYNOLDSVILLE, PA.—The Reynoldsville Traction Co. has changed its name and is now known as the Northern Pennsylvania Traction Co. A line will be built to Rathmel, Sykesville, Clarion and Oil City. Offices will be taken by the president of the company, in the Drexel Building, Philadelphia.

RICHMOND, IND.—Further franchises have been obtained by the Eaton & Richmond R. R. Co. and the construction of the proposed electric line between Eaton and Richmond will be commenced in the summer. Henry B. Pruden, of Dayton, O., is the principal promoter.

ROCHESTER, N. Y.—The Rochester & Suburban Railway Co., a reorganization of the Rochester & Irondequoit R. R. Co., has been incorporated with a capital stock of \$420,000, of which \$350,000 is preferred stock. Frederick Cook, George W. Archer, William C. Barry, John N. Beckley, Jacob Gerling, Bernard Dunn, Joseph C. Tone, Albrecht Vogt, William Purcell, W. D. Ellwanger, F. S. Upton, Max Brickner and Louis Griesheimer, all of Rochester, are directors.

ROCKVILLE CENTER, N. Y.—The Nassau Belt Line Traction Co. which was organized March 17th, 1899, has completed its organization, obtained its consent from the Railroad Commissioners, has all its local consents from abutting property owners required by statute and has secured the franchises from all the villages through which it passes, including Rockville Centre and Freeport, and from the Town Boardway Commissioners except in the village of Hempstead a distance of two miles, thus completing 28 of its 30 miles of desired franchises. Paul K. Ames, Rockville Centre, president.

C. B. FAIRCHILD, EASTERN REPRESENTATIVE.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

APRIL 15, 1900.

NO. 4

One of the strongest arguments against the municipal ownership or operation of business enterprises is that political consideration instead of efficiency will be the standard for measuring the value of employes. A very good illustration of how this works in practice is shown in the report of the chief of the wiring department of the electrical construction division of public buildings, Boston. Men obtain appointments at the instance of political bosses who see to it that they are not discharged when work becomes scarce. The work done by the wiring department has cost the city of Boston about 60 per cent more than the bids made by reliable companies.

The management of the Hamilton & Lindenwald Electric Transit Co., of Hamilton, O., has announced a radical, and many of our readers will doubtless think, ill-advised reduction in the rates of fare. The tickets are all limited as to the time within which they must be used and consist of three classes. First, books of tickets that are good only during certain hours at the rate of 3½ cents per ticket for 12-ride weekly books and a trifle under 3 cents per ticket for 104-ride monthly books. Second, commutation family books at the rate 3.7 cents per ticket in books of 50, good for 30 days, and 3.5 cents per ticket in books of 100 good for 60 days. Third, individual tickets good for any number of rides in 3 months for \$10.

This company operates 9 miles of track and serves a comparatively small population, say 30,000 people. (The census of 1890 gave Hamilton less than 18,000.) The hauls are short and we venture the guess that the average cost to the passenger even at the 3 cent rate will be in excess of 1 cent per mile. Under these conditions the company may find that traffic will be increased so that cars now carrying but few passengers will be filled, thus producing a revenue with but slightly increased cost of operation.

We sincerely hope that the company may find the reduction of fares a financial gain, but wish to point out that success in this case

would be no indication that the same methods would produce similar results in a city where the hauls are long and the problem is not to fill empty cars, and with the wages and other operating expenses higher than is usual in the country.

For several years there has been a growing tendency on the part of municipalities to try and force a reduction in the fares to be charged by street railway companies, by an ordinance purporting to be based on a clause in the franchise reserving to the city the "power to regulate the operation, etc.," or else defended as a proper exercise of the "police power." It is unfortunately true that no matter how ill-founded may be such pretensions as to the power of the city to confiscate street railway property under the guise of "regulation," there is always danger of the state courts sustaining the validity of the ordinances in question. The company, however, can usually raise a "federal question" and even after the case has been passed on by the state courts, have it reviewed by the federal courts. In view of the frequency of such litigation, those intrusted with the management of large street railway properties, either incorporate in a foreign state or choose non-residents for the trustees of their mortgages, so that the case can be fought in the federal courts from the first.

The three most bitter controversies over a reduction of rates of fare are those in Indianapolis, in Milwaukee and in Detroit. In the Indianapolis 3-cent fare case the Indiana courts held the law to be proper exercise of the "police power" while the federal circuit court decided it was a violation of the contract rights secured to the railway company by its charter; the point was also made that even were it merely a police law, the question of whether the prescribed rate were reasonable would remain to be determined.

The Milwaukee 4-cent fare case decided in the United States Circuit Court, May 31, 1898, was contested on the ground that the prescribed rate was unreasonable and a "taking of private property without due process of law" and also that the company by its franchises had the right to charge a 5-cent fare which right the city could not impair. The case was decided on the first ground only.

Last month the Detroit 3-cent fare ordinance passed in August last was held invalid. The decision of Judge Swan of the United States Circuit Court is given at length elsewhere in this issue. The court held that the power reserved to the city "to make such further rules, orders or regulations * * * deemed necessary to protect the interests, welfare or accommodation of the public * * *," could not be construed to give the right to reduce the fare to 3 cents. Said the court: "If the city may sequester two-fifths of the grantee's earnings, why may it not take all?" It was further held that by prescribing a maximum fare of 5 cents the city was debarred from attempting to regulate this point. This is independent of whether the reduction was reasonable or unreasonable.

There is now pending at Detroit another suit to prevent the enforcement of an ordinance, which provides that transfers should be issued on transfers. The corporation counsel is reported to have refused to appear for the city on the ground that the ordinance is invalid. This is an indication that the ordinance was not passed with any idea of being able to enforce it, but as a play to the galleries and to keep the controversy going.

The necessity of guarding against stray currents from street railway circuits by providing better track returns is again brought to the front in a paper read before the Institution of Engineers and Shipbuilders of Scotland, by Prof. Andrew Jamieson. Although we have always maintained that the danger from such leakage currents has been grossly exaggerated by the daily press and by misguided alarmists, we believe the best way to silence the carping of these critics, and remove any possible ground they may have to stand on, is to provide the best possible return circuit that the latest developments of the science can suggest, even though this is done at an increase in cost of installation. The increased efficiency of the system, the decreased risk of interruption to the service, and in addition the lessening of the chances of having to defend suits for alleged damages by electrolysis will more than counterbalance the extra expenditure. The mere fact that a company can give evidence of having done everything reasonable in its power to prevent electrolysis, will bear considerable weight with an impartial jury, should a suit be brought for alleged destruction of pipes.

But according to Professor Jamieson, it appears that damage to water and sewer pipes and interference with telephone exchanges, are not the only charges to be brought against wandering currents

from tramway circuits. In his communication to the Scottish Institution mentioned above, he draws attention to the action of electric tramway currents on submarine telegraph cables and other electric circuits. In concluding his article he proposes a remedy for perfecting the track return, and thus preventing injury to neighboring pipes, or interference with near-by submarine telegraph lines.

The paper deals particularly with the trouble experienced by the Eastern Telegraph Co. at Cape Town, South Africa, from induced or secondary currents in its telegraph cables, where they approach the shore, along which are laid the tracks of the Cape Town Electric Tramway Co. It is said that this disturbance was one of the many causes of delay in the transmission of cablegrams during the early part of the British-Boer war, and the author states that the same trouble has been experienced to a less degree at Madras, India, and at Coney Island, New York. There is a chance of its occurring wherever submarine cables approach, or run parallel a short distance from electric railway lines, unless proper precautions are taken.

Professor Jamieson was requested last July to proceed to Cape Town for the purpose of acting as one of the advisors to the Cape Town Electric Tramway Co. in an action brought against it by the Eastern Telegraph Co. for this interruption to its business. There was no allegation made that the cables had been injured by electrolytic action, but simply that false, inductive impulses were generated in them by return stray currents from the tramway, these of course rendering regular messages very difficult or impossible to decipher. After a thorough investigation, Professor Jamieson advised a specially prepared cable with twin twisted core with double armoring, for the shore ends of the telegraph lines, and recommended the tramway company to obtain and place in circuit, with separate return feeders from different points along the rails, a sufficient number of negative boosters (or sucking dynamos as he calls them), in order to reduce the return currents in the rails at these points to zero potential; and thus prevent the fall of pressure along any portion thereof ever exceeding the limits of the Board of Trade rules, i. e., not over 7 volts. He says: "This would naturally stop electrolytic action on neighboring pipes, and greatly reduce the potential, the strength and the range of stray currents, and hence the chance of their reaching the sheathing of the submarine cable and of acting inductively upon its conductor. Finally, I believe that land telegraph, telephone, and other electric circuits can be protected from all interfering influences of electric tramways by employing twisted outgoing and return insulated conductors, and that electrolysis may be prevented by using heavy well-bonded rails with return feeders and sucking dynamos whenever the fall of pressure along any section tends to exceed five volts."

As a rule the street railway companies subscribe to the technical journals devoted to the industry, for the general officers, and many of them go farther and take from five to one hundred copies per month, according to the size of the road, for the purpose of supplying its minor officials and employes with this instructive literature. That the best managed and largest roads in the country pursue this policy to the largest extent is evidence that they consider it a desirable and profitable investment. They certainly are not actuated so to do from motives of charity.

Recently, however, the executive committee of a well-known road reached the conclusion that "its heads of departments should have ambition enough to secure for themselves such matter as will qualify them for their several positions." The committee could not see why the company should furnish its president, secretary, superintendent or any other officer with reading matter of any kind. It maintained that these offices are filled by men who have received a liberal education and who are paid all they are worth. If they feel the need of information and experience other than that now possessed, or to be obtained within the limits of their own daily routine work, let them individually bear the expense. The inference plainly is that the committee has done its work of selecting officers so well that those officers have or should have,—if the committee has made no mistake,—a fund of knowledge and experience which needs no addition from outside sources.

We freely subscribe to the claim that the road in question is well conducted, and its officers rank well in the official fraternity, but the impression conveyed in the ruling of the committee, while highly complimentary to the ability of its officers today, carries no urgent expectation of a greatly higher standard. None of us but should feel, however well performed an accomplishment of today,

we ought to do a little better next time. In these days the man who hesitates—hesitates to crowd his efforts constantly to the utmost—will soon fall behind in the race. There is a meritorious pride in a thing well done, but it could and should be better done another time. We believe in frankly commending the deserving, faithful worker, from the president down to the employe filling the most humble position; but we also believe in holding before him in the right spirit the policy of always striving after still better results.

The secret of success of many managers who most satisfactorily handle large bodies of employes is found in an intelligent exercise of this means of encouragement and improvement. Apparently the executive committee in question does not take this into consideration. It is not the little matter of the few dollars involved in the half dozen or so subscriptions, for the total amount is too small to spend any time in discussion; it is the principle involved. It is seldom the large things but rather the small ones which show the direction of the wind.

Is there any reason why a company should furnish its operating heads with literature? Is a technical journal, or is it not, one of the necessary tools with which a man should be provided? Does the paper represent merely the individual ideas of its editor or does it collect and present the experiences and opinions of the best workers in its field, every where? Would the up-to-date manager of ten years ago be considered up-to-date today had he remained at home all through these years of evolution and read nothing of what other men were doing? The ideas and methods contained in a single issue of any first-class technical journal would cost the individual reader weeks of travel and study to obtain. No man in these days can hope to do the best work of which he is capable unless he regularly studies the current literature of his business, calling or profession. When very sick do you seek out the doctor who was good a few years ago but has read nothing of medical discoveries, appliances and methods for five years past? Street railway properties are subject to constant and acute attacks of socialistic germs and other vicious microbes, and the manager who is to keep his corporate patient well and strong and in the fullest possession of its faculties cannot be too well fortified against the day of need. It is no time to read up on bone setting when an arm is fractured.

It is also true that the officer reads his street railway paper because he is a street railway man. When for any reason he goes out of the work to engage in some other, he no longer has the time, necessity or inclination to continue studying street railway problems but takes up another publication devoted to the industry or profession to which he has gone. The journals for which he has paid several dollars per year are worthless to him for reference in his new occupation; they are, however, extremely valuable to his successor. They should therefore be paid for by the company and after reading become the property of the office, to be handed down to the new incumbent together with the desk and other office equipment. That these monthly records of events are valuable is evidenced in the fact that scarcely a day passes but we are called on to furnish one or more back numbers. Frequently these requests come by telegraph, showing the emergency of the need.

When the American Street Railway Association was organized and for several years, very many of the men who attended these meetings did so at their own personal expense.

The directors with a great show of liberality allowed the manager a week's vacation (!) in order to attend the annual convention. Happily this has changed; boards have realized how important it is to have its operating heads attend these meetings and where a few years ago one representative came, the same official is now accompanied not only by other officers, but the electrician and trackmaster and master mechanic also are with him.

We have not wandered from our subject. The latter instance simply illustrates the original proposition, which is, all the experience is not bound up in boards of directors and executive committees, and it is poor economy to withhold from your workers, official, or in the ranks, anything within reason which will strengthen their position. The daily press of the country are not fighting the battles of the street railway to any noticeable extent. It is left almost wholly to the street railway press to secure, collate and present in usable form, such data and ideas as help to fortify the street railway official in his tireless efforts to protect street railway interests.

The System of the Boston Elevated Railway Co.

Department of Motive Power and Machinery—Rolling Stock and Repairs—Shop Methods—Department of Electrical Engineering—Department of Stores.

BY C. B. FAIRCHILD.

PART II.

DEPARTMENT OF MOTIVE POWER AND MACHINERY.

The regulations state that the superintendent of this department (Mr. Charles F. Baker) shall have charge for surface lines of all power stations, repair shops, machinery, mechanical motive power, car, motor and truck repairs, and is to be assisted by the following officers: Superintendent of Power Distribution, Superintendent of Machine Shops, Superintendent of Car Equipment Shops, Superintendent of Car Shops, Chief Mechanical Draftsman, Inspector of Motor Car Repair.

All appointments to positions of importance in these departments have to be submitted to the vice-president for his approval before taking effect, as also the discharges of these officials, and the wages and salaries paid with any change in same are also to be submitted to the same officer for approval before becoming effective.

POWER STATIONS.

As stated, the electric current for the entire system is supplied from seven stations, and these are named from the location. The accompanying table shows the name and electrical capacity of each of the stations. From this, it will be noted the nominal capacity is 26,144 kw. and 47,533 amperes, but the equipment is safe for an over load of 25 per cent, which means 32,680 kw. or 59,417 amperes.

STATION CAPACITIES.

STATION.	Number of Machines.	Size.	Nominal Capacity.	
			Kw.	Amperes
Central Power Station	1	2,700	2,700	4,909
" " "	2	1,500	3,000	5,454
" " "	6	1,200	7,200	13,091
Total	9		12,900	23,454
Auxiliary Station	38	50	1,900	3,455
Total Main Station	47		14,800	26,909
Harvard	3	1,200	3,600	6,545
East Cambridge	7	400	2,800	5,090
Dorchester	2	1,000	2,000	3,636
Charlestown	2	800	1,600	2,909
Allston	12	62	744	1,353
Total Main System	73		25,544	46,412
East Boston	3	200	600	1,091
Grand Total	76		26,144	47,533

Space will not permit of an elaborate description of the steam and electrical equipment of the various stations, but the reader is referred to the Boston Convention number of the "Street Railway Review," August, 1898, for the description of the seven stations then in existence. The central power station, however, which is located on Albany St. and near the center of power distribution is of interest in this connection from the fact that the station and equipment have been remodeled since the plant was first established and because the equipment has recently been increased by the addition of a new unit larger, and of a different type, from those in any of the other stations and raising the capacity of the station to 18,000 h. p. This unit consists of a vertical cross-compound condensing engine of 4,000 nominal h. p. but capable of working up to 7,000 h. p. The cylinders are 42 and 90 x 60 in. and it is designed to run at 75 revolutions. The fly-wheel is 28 ft. in diameter and of the spoke type. The top of the frame stands about 34 ft. above the floor. In workmanship and design this machine sustains the reputation of both the old and new companies. The engine is direct coupled to a 2,700-kw. generator. This generator was contracted for and partly built by the Walker Co., of Cleveland, but was finished by the Westinghouse company after the latter came into possession of the plant of the Walker Co., and at that time it was the largest machine that had been designed. The total weight of the generator is about 300,000 lb., and the armature, which is 16 ft. 6 in. in diameter, weighs 115,000 lb., and is mounted on a 37-in. hollow-forged nickel steel shaft made by the Bethlehem Steel Co. The outside diameter of the commutator is 8 ft. 9 in. The field magnet frame is of cast steel and provided with hand holes. The poles are of laminated wrought iron and bolted into the frame, the handholes giving easy access to the bolts which hold

the poles in place. At a normal load this generator is designed to give an output of 4,500 amperes at 600 volts, or sufficient to operate 300 loaded street cars.

The condensing "plant" of this engine is of special interest, as it dispenses with the usual air pump required with condensing engines, and forms and maintains its vacuum entirely by the use of the exhaust steam and the condensing water. The apparatus consists of two of the well-known "Bulkley" injector-condensers, attached by angle elbows to the main exhaust pipe, each condenser being 24 in. in its exhaust opening. The exhaust steam enters a hollow cone of moving water, at the upper part of the condenser, and in condensing imparts to it a velocity that it enables it to carry

FIG. 28 BULKLEY CONDENSER.

out the air and vapor into the enlarged portion of the condenser below. The condensers are each connected with the hot-well below by air-tight water discharge pipes, of sufficient length to allow the water to be delivered by gravity against the pressure of the atmosphere. They are both supplied with water by a centrifugal pump operated by an electric motor, which takes its supply of salt water from the Bay, and after the vacuum is formed the water is elevated about 25 ft. by atmospheric pressure, thus giving the pump very little work to do. Either or both condensers may be used, according to the load on the engine and temperature of the water, and a very high vacuum is thus maintained as long as the water supply is kept up. The automatic relief valves at the top, will allow the engine to work non-condensing the instant the vacuum is lost from

any cause. In many instances a natural head of water of 10 ft. or more can be obtained, in which case no pump is required, the condenser syphoning the water, after starting, and operating until the water is shut off. The safety, simplicity, and economy of this device will commend themselves to any one using a steam engine, where condensing water can be obtained. Several independent condensers may be supplied by a single pump, which may be a steam driven, a centrifugal, a rotary or other power pump.

The central power station has a very interesting history. It was designed and built in 1889-91 under the direction of Mr. F. S. Pearson, then chief engineer of the West End Co. As originally designed the equipment consisted of six triple-expansion engines belted through countershafting to multipolar 500 kw. generators. In 1896, however, under the direction of the present superintendent of power stations, the six triple-expansion engines were enlarged to 1,600 h. p. and direct coupled to G. E. generators. Two of these are of 1,350 kw. capacity and four of 1,200 kw. There are also two 2,000-h. p. engines direct coupled to generators of 1,500 kw. capacity. The fly-wheels of all the engines are of the solid plate type. This type of wheel, however, is not in favor with the engineer of the

are tandem-compound of 200 h. p. each and are run at 210 revolutions and are each belted to four G. E. generators of the D. 62 type. It is interesting to note in this connection that no deterioration of efficiency is observed in the engines or generators notwithstanding their long service. It is not claimed, however, that the arrangement is as economical as that obtained by more modern methods.

Among the station practices, it is worthy of remark that it is the custom of the engineer to have the different machines started up and run for an hour before the load is thrown on, thus giving the cylinders and ports a chance to warm up and prevent the danger of condensation in the cylinders, resulting in breakdowns which were so common in the early history of this equipment. In the engineer's room is found a testing equipment by which the steam and vacuum gages can be tested, the same apparatus answering for both types of gages, by the proper adjustment of the pump connections. It is the practice of the engineer to test all the gages of each machine once every month and also to indicate each engine monthly. When the station was changed, as stated above, the piping system of the whole station was also reorganized and sim-

FIG. 29—GENERAL VIEW OF CENTRAL POWER STATION, BOSTON.

station for the reason that the attendants cannot see through so as to know the condition of the machinery on the opposite side, and they do not provide as good ventilation for the generators as spoke wheels, for the spokes set up a circulation of air that helps to cool the generators. The engines are of the Reynolds-Corliss type and were made by the E. P. Allis Co., of Milwaukee. Included in the auxiliary equipment are Stratton separators built by the Goubert Manufacturing Co., of New York, and Green economizers. The feed water is handled by a series of gang pumps of the four-plunger pattern, piped to heaters, economizers and boilers. These pumps are driven by means of a shaft actuated by a D-62 type of generator run as a motor. Fig. 29 is a general view of this station showing engines Nos. 1, 2 and 3.

In connection with the central power station should be noted the original power equipment located in neighboring building which was a part of the old Hinkley locomotive works that formerly occupied this property. This station was one of the first installed by the railway company for electrical purposes and was built in 1889, but is still running, and is used to help out the load during the heavy morning and evening traffic and in stormy weather. This station has a total capacity of 10 engines and 40 generators. The engines

plified. The duplicate system of pipes was removed and by a method of coupling the same results were secured with much less complication and all this overhauling was done without interfering with the operation of the station.

The boiler equipment of the central station includes 32 boilers, all of the Babcock & Wilcox type; eight of these are double-deck batteries and 24 in single decks; two extra boilers were recently installed to provide steam for the new vertical engine. Thus far mechanical stokers have not been employed in this boiler plant.

COAL HANDLING.

Coal for the central station is landed from barges and schooners upon a wharf just across the street from the station. Here is also landed the coal for such of the stations as are not located on the rivers or water front. An elaborate coal-handling equipment is provided. This consists of a bridge crane which transports all the coal between the vessel and cars; this span is shown in Fig. 30. At the water end is a cab with an 80-h. p. motor for operating the ropes controlling the shovel which is of the clam-shell type, so that the coal is elevated and run out over the storage area and dumped where necessary. The storage platform is provided with two tun-

nels, one larger than the other, constructed as shown in Fig. 30. These are of wood and are of sufficient height to allow the coal cars and mining trains to back in and out. The coal is piled in heaps above these tunnels and at suitable intervals chutes and gates through the roof are provided, by the opening of which the coal falls directly into the cars.

For delivering coal to the boiler house of the central station from the dump, a distance of about 950 ft., a mining train is employed, consisting of a narrow-gage electric locomotive and two Hunt automatic side-dumping cars. The train being backed into one of the tunnels is loaded as above described and after crossing the street is run onto scales, as shown in Fig. 31, where each car is weighed,

HARVARD POWER STATION.

This being the last new station erected, having been completed in 1898, the nature of the power equipment is of interest. This consists of six 500 h. p. Babcock & Wilcox boilers with economizers and smokestack for twice this number. At this station the boilers are fitted with "Acme" stokers, these being the only mechanical stokers used by the Boston Elevated. The main engine equipment comprises three compound corliss engines, 28 and 56 by 60 in., made by the Allis company, direct connected to 1,200-kw. General Electric generators. An extended description of this plant and the results of a 45-hour test of the station were published in the "Review" for December, 1898, page 875, et seq.

FIG. 30—COAL WHARF.
FIG. 32—ALLSTON COAL CAR.

FIG. 31—SCALES.
FIG. 33—HARVARD COAL CAR.

when the train proceeds to the boiler room over a slightly elevated track where the cars are unloaded in front of the boiler, the cars being so constructed that they dump without shoveling.

For transporting the coal to some of the stations and car houses two types of coal cars are employed, both of which are loaded in the tunnels as already described. A car that delivers coal to the Allston power station and car houses is shown in Fig. 32. It carries a number of steel buckets, provided with heavy cross arms or bails, which are so designed that they can be unloaded by hoists, and being lifted are run by overhead trolleys and dumped at any desired location, and the bucket returned to the car. Fig. 33 is an electric coal car with a capacity of 30,000 lb. serving the Harvard station. This consists of a single bin into which the coal is loaded in the tunnels and which is provided with side-dumping mechanism.

ROLLING STOCK AND REPAIR SHOPS.

The number of closed passenger cars employed by the company is 1,381 and of open cars 1,392. Of the former 18 are 16-ft. cars, 330 are 20-ft. cars with single trucks (including parlor cars) and 1,033 are 25-ft. cars, double trucks. The open passenger cars include 88 seven-bench single truck cars, 480 eight-bench single truck, and 747 nine-bench single truck, 46 ten-bench and 31 twelve-bench double truck cars. There are also eleven 16-ft. mail cars, two electric locomotives, four 16-ft. service cars and one 16-ft. directors' car. There are now under contract, for delivery the coming summer, 150 standard 25-ft. closed passenger cars, and the company is building in its shops at Bartlett St. 50 standard 12-bench double truck passenger cars to be ready for use in June next.

Fig. 34 illustrates the standard closed car. The standard length

for closed cars is 25 feet. These are provided with side seats upholstered with plush and plush backs. All the closed cars have Woods safety gates, made by the R. Bliss Manufacturing Co., of Pawtucket, R. I.; this gate is the type as used by the Brooklyn Heights R. R. The car shown in Fig. 34 is equipped with the illuminated sign shown in Fig. 40 and also has the Wilson trolley pole catcher, which was furnished by the Frank Ridlon Co.

The standard open car is illustrated in Fig. 35. Trucks are provided for both closed and open cars, but the motor equipment for

FIG. 34—STANDARD CLOSED CAR.

the open cars is taken in part from the trucks of the closed cars. The single truck open cars are usually equipped with only one motor and on these the current is controlled by means of rheostats of the half circle type and operated with lever and chain.

nearly all mounted on single trucks; out of the total number 1,315 are single. The motor equipment consists of 1,620 of the W. P. type, 550 G. E. 58, 519 G. E. 800, 773 No. 12 A Westinghouse, 396 No. 12 Westinghouse, 30 Westinghouse 68, and four of the Walker type, making a total of 3,808. The latest additions are the large size

FIG. 35—STANDARD 12-BENCH OPEN CAR.

motors. The miscellaneous equipment includes 188 snow plows of which 43 are of the Taunton type. The others were made by the company. Fig. 36 shows the Taunton 1800-1900 model and Fig. 37 the Taunton plow with the Boston Elevated Railway Co's improvements; these are standard on the Boston Elevated. Fig. 38 is from a view of a plow with the fluke raised. The lever attachment was devised to relieve the men of the work of holding down the fluke, which was usually done by riding on the wing. This lever is like a wagon tongue and is pivoted to the top of the wing with the upper end passing through a ring attached to the edge of the roof. From the upper end a chain descends to a foot lever, which may be operated from the rear platform or from within the cab, by means of which the wing may be held down with pressure sufficient to hold

FIG. 37—TAUNTON PLOW WITH IMPROVEMENTS.

Various types of trucks are employed. These consist of 1,715 four-wheel trucks, 22 Robinson radial, 678 West End swivel, 292 Bemis, 131 maximum traction, including those of the Brill and Peckham make, and 7 miscellaneous trucks. The open cars are

it to its work without exposing the men. A helical spring inserted in the chain near the top provides an elastic motion for the wing.

The latest addition to the snow plow equipment is what is termed by the company a parlor snow plow; this was built in the com-

pany's shop after a design suggested by the president, and is fitted up for the accommodation of the president and his friends whenever he shall choose to get a practical demonstration of the best methods of fighting snow. The cab is finished with interior apartments with cushion seats and observation rooms and provision is made for keeping it warm and comfortable. This machine is illustrated in Fig. 30. The methods of handling the snow problem will be described later in connection with the transportation department. Besides the coal cars already illustrated there are four miscellaneous cars for handling freight and distributing supplies.

An interesting feature of the 50 open cars the company is building in its own shops is the steel plate which reinforces the car sills. This plate is $\frac{3}{4}$ in. thick, 10 in. wide and 30 ft. in length, with square and round holes for the bolts, the holes being punched in the repair shop.

Notwithstanding the different makes of trucks employed, the company specifies the type of brake mechanism, the journal boxes and the method of motor suspension. These are standards with the company. Included in the latest snow plow equipments are several sets of wheels having serrated flanges furnished by the Burnham & Duggan Railway Appliance Co., of 60 State St., Boston. The serrations are on the outside of the flange and are designed to dig the snow and ice out of the groove of the rail to insure good traction and electrical contact; it is stated that these wheels work in a very satisfactory manner.

An interesting point of the car equipment is an illuminated sign, shown in Fig. 40, which is located under the hood of the car. The illumination is secured by means of a long semi-circular metal reflector attached under the edge of the hood and open on the under side, with an 8 c. p. incandescent lamp in a horizontal position near each end. The sign is slid into a holder consisting of a metal plate with double flanges which provides for carrying two signs. The letters of the sign are large and of a bluish white dead color. Each plate has lettering on each side, so that four changes may be made. The success of the sign is due to absence of reflecting surfaces in the letter or sign.

The reflector and sign were devised at the suggestion of Mr. Sergeant, and were made in the company's shops. The ordinary tin shop tools were used, with the addition of a hydraulic press, so that the plates are trimmed and stamped out in a very economical manner.

on Bartlett St., near Washington, and several miles from the former. The Albany St. buildings also provide for the storing of supplies. A new shop is contemplated by the management, so that all the repairing can be done under one roof. The first floor of the Albany St. shop is known as the car equipment shop, where motors are mounted, trucks repaired and car bodies adjusted to the truck. On this floor are a number of heavy iron working machines together with the wheel borers and the wheel presses. The tools are operated by a stationary motor, and special motors are provided for some of the larger tools. This shop is provided with pits, also with trucks and hand hoists and pneumatic hoists for the handling of heavy parts. One section of the blacksmith's shop also occupies this floor. The different floors of the

FIG. 30. STANDARD TAUNTON SNOW PLOW.

building are served by an elevator, and material is hited to the different floors on small trucks, which run on tracks through the different departments. The first floor also contains the motor testing department, which will have attention later on.

The machine shop proper, which is under the supervision of Mr. John L. Mitchell, occupies the third floor and the equipment of tools is very complete. The company has discontinued the manufacture of gears and pinions, finding it better to purchase these from the makers of this class of supplies. For this reason it has several gear cutters for sale, which are first-class machines. Trolley wheels, car trimmings and brass fittings of every description are made in the shops, a brass foundry being provided for the

FIG. 38—PLOW WITH FLUKE RAISED.

FIG. 39—OBSERVATION SNOW PLOW.

The wheels are chiefly of the Griffin make. These are turned bored and mounted in the company's repair shop two 30-in., 100-ton wheel presses made by the J. T. Schaffer Manufacturing Co., of Rochester, N. Y., being employed. The axles are of cold rolled steel and are turned and fitted in the shop.

The repair shops of the entire system occupy two sets of buildings, one on Albany St., near the central power station, which was formerly occupied by the Hinkley Locomotive Works, the other

castings. Among the special methods and practices of the shop may be noted a device for turning trolley wheels. This is so designed that the wheel is mounted on a mandrel and a cutting tool of the desired shape for the groove is brought into action and turns each wheel to an exact pattern at one operation. The cutting tool is made of steel like a small sheave, but with a segment cut out making the cross section of the rim of the desired form of the groove. To sharpen this tool one side of the segment is

ground flat, a very simple operation, and each grinding leaves the cutting edges of the same shape. A single cutter of this design is said to last for the turning of as many as 50,000 wheels. In fact, it is almost indestructible. The work of turning the wheels can be done by a boy, as very little skill is required, and one is able to turn up as many as 300 wheels a day. For forming the outside edges of the flange of the wheel a cutting tool is mounted on the same head, and is brought into action as required.

Among other interesting machines are two Hartness flat turret lathes made by the Jones & Lamson Machine Co., Springfield, Vt., which are used for making the steel bond thimbles, by means of which the rail bonds used on this system are attached to the rail. The largest of these are taper plugs about 2 in. long, bored out to receive the bond wire; these being swedged to the bond and driven into the rail holes, make good electrical contact. This

FIG. 40—SIGN.

machine receives a steel rod of proper size and turns out complete thimbles.

In one section is a machine for testing the ability of trolley wire to stand the bending strains. A section of trolley wire about a foot long is fastened to an ear or clamp in the ordinary manner, and this is held stationary, while a rod attached to the crank of a wheel is fastened to the other end, so that the wire is bent up and down through about the range that is found in actual service. This machine has a register which counts the number of times the wire is bent, and the machine is run at about 60 revolutions per minute. A record is made of how many bends the wires of different sizes will stand before breaking.

The tool room is fenced off in one section of the floor in which tools are kept and repaired and dealt out to the workmen.

The superintendent of the machine shop keeps a pattern book, in which he makes a sketch (see Fig. 41) of every pattern that is made for parts of either iron or brass. These sketches are numbered, and though not drawn to scale have the dimensions and weights noted. Those for iron parts are made in black ink, and those for brass in red. This serves as a handy reference, and when a part is wanted the foreman has but to turn to the record, when the pattern can be located by its number and the weight and character of the material to be ordered is readily ascertained.

Several of the best machinists are assigned to night work in the shop. These are always on duty at night, so that they may be on hand for any special repairs that may be required. A list of 15 or 20 of the regular machinists is also kept, with their house address and nearest telephone station, so that in case of breakdowns, or when their services are required at night, the master mechanic can call on one or all of them and order them out for any special work.

The armature repair department occupies a floor of this same building, and here all repairs to armatures, commutators, rheostats and controllers are made. Commutators are made in the shop from drop forged bars, which are purchased from the dealers. Female help is employed in the coil winding and taping department. For taping the coils, stands are provided with a swinging button, so that the coil is held firmly in position to facilitate the winding. The tape is wound on circular bobbins having a tension apparatus, so that the roll is passed readily through the coil, and the winding quickly effected. Only plain tape is employed for winding the coils, but after winding the coils are dipped in an insulating compound known as "Armalac." In the opinion of the shop superintendent, this method is superior to that formerly employed, as it gives the best insulating quality, remains flexible, and is cheaper than paper or rubber insulation.

The brass foundry occupies a portion of the ground floor and

here seven molders are usually employed, for, as noted above, all the trimmings, as well as trolley wheels and other brass supplies, are cast in this department. Scrap copper is used, while the tin and spelter are purchased in the pig. The equipment of this foundry includes six brass furnaces, with all the auxiliary equipment usually found in foundries of this character. Car trimmings for repairs are not only made, but all the trimmings for the 50 new open cars that are being built are here cast and finished up in the machine shops. The car trimmings include the out rigged double handles, which are illustrated as mounted on the posts in Fig. 35.

A written order, with number, is given by the superintendent for every item of repair that is done in the shops, and the time and character of the work is reported by the machinist, so that a careful record is kept of all work done.

A full description of the car repair shop will not be attempted, as the general details are much the same as prevail in the shops of other large systems, and only a few tools and methods will be mentioned. The machine tool equipment for the wood shop is very complete, and among the recent additions is a surface sanding machine that is considered by the shop superintendent as a very valuable tool.

It is the practice of the company to make the cushions and backs for upholstering the car seats, the seats being all of the longitud-

FIG. 41—PAGE FROM RECORD BOOK.

inal type. This department is partitioned off from the main shop, and is equipped with sewing machines and other appliances for cutting and uniting the materials and also for preparing the curled hair. All the car seats are upholstered in plush, and for this purpose the material, in a combination of red and black colors, is bought in quantities, and this, as well as the curled hair, is of the best quality.

Among the labor saving devices, found in an adjoining department, is an arrangement for cutting glass, on which the faces for the stationary headlights are cut out in circular form. The headlight disks are about 9 in. in diameter, and are cut out from square panes of glass at the rate of three a minute. This is accomplished by placing from 25 to 30 plates of glass in a pile on a pivoted table, so that the pile can be readily turned by a handle attached to the table. Above this is a vertical rod having on its lower end a wooden disk of the diameter to which the glass is to be cut. The rod, by means of a short lever and rope, is made to bring the disk down upon the top layer of glass with sufficient pressure to keep

the pile in position. A diamond glass cutter is then placed against one side of the disk, and the table being revolved a circular cut is made in the upper layer of glass. The disk is then lifted, the top glass taken out, placed to one side, and the process is repeated till each layer of glass has been cut. After this the different panes of glass are gently tapped against a plug located over a hole in the table, and the outside rim breaks away in pieces, the pieces falling into a barrel placed underneath the table, and the completed disks, all of the same diameter, are ready for the lamps.

The saving of scrap paint is quite a feature in these shops. The inner surfaces of barrels, kegs and cans, in which paint is received, are carefully scraped after being emptied. These paint skins, together with the paint soaked out of the brushes, are cooked in a jacketed steam boiler; then all the paint and oil is skimmed off and this material is then properly mixed and used for painting tracks and floors of buildings.

One of the types of car motors used has to be housed in with wood or canvas to protect it from dirt and moisture, and another labor-saving device is noted in the means used for painting the strips of canvas from which these motor screens or coverings are cut. The water proof paint for this purpose, on being mixed, is put into a wooden box with slanting sides, and to one side is fastened a set of large tinner's rolls, borrowed from the tin shop, and used as is a clothes wringer. The rolls of canvas, which are purchased in 100 yd. lengths and 28 in. wide, are mounted to one side of this box when the end is dipped into the paint and led out through the rolls. An attendant then takes hold of the end of the strip and pulls it through the rolls as fast as he can walk. After all is run through, it is left lying on the shop floor till the paint is partially dry, when it is hung in a suitable place for further drying.

Open cars are run through the shops for cleaning and painting in the winter season at the rate of about 60 a week. The old paint and varnish is burnt off; this process is considered by the shop superintendent better than the use of any of the liquid compounds which are recommended for removing paint, for the reason that by the burning process, no acid is left to affect the wood. The open cars are numbered on the bumpers.

A room with fire-proof walls is set apart for the storing of paint, oil and varnish, and this is provided with steam pipes and boilers and other accessories usually found in a paint department of this character. Paints are dealt out only on orders from the foremen of the different departments.

The buffing department is run in connection with the shop for the purpose of finishing and cleaning the brass car trimmings, all of which are cast in the company's foundry as before mentioned.

The shop stock room adjoins the superintendent's office, and occupies a part of two floors. All supplies are issued to the men on an order from the shop foreman, and are charged to the particular car or job. The shops employ ordinarily in winter 225 hands, but more in summer. Each man is provided with a daily time slip, which he fills out in his own handwriting, giving his name, residence and the department in which he works. He records the time he spends on any job, and the men are checked in and out of the shop both morning and afternoon. The time slips are copied in the office and are kept on record. In conducting the office work a library card system is provided, both for the records of the men and for each car or job. Suitable cabinets are provided for the cards, and the work is so systematized that with comparatively little labor the cost of all work is accurately recorded. All the work at the Bartlett St. works is done under the direction of Mr. Henry L. Libby, who has the title of Superintendent of Car Shops.

DEPARTMENT OF STORES.

The second floor, 125 x 60 ft., of the Albany St. building, known as the car equipment shop, is devoted to the storing of supplies for the entire system. This department is fitted with suitable bins, shelving, racks, etc., for holding the goods, and on the floor is a system of narrow gage tracks on which low trucks are run for shifting material. All of the stores are classified, and each item has a number and the different bins and racks are numbered to correspond. Besides in case of small pieces, samples of each are fastened to the bin front in full view of the keepers. All orders are filled by numbers, and requisitions are received from the superintendents of the different car houses only on certain days. This is to avoid confusion, as there are 30 car houses, 7 power houses and 3 shops which draw their supplies from the department

of stores. During the last year, ending September 30th, the orders filled embraced over 82,000 items. All supplies are received and shipped through one door on the first floor of the building, and are transported to the different buildings by special motor freight cars, of which there are four employed. For unloading goods from cars or wagon, hydraulic lift are provided, by means of which heavy boxes or supplies are placed upon the small trucks before noted, which run on narrow gage tracks to the elevator, and when lifted are run off onto the track, which run through all the aisles and cross galleries of the stock room. These tracks have turn tables at all the inter sections, thus providing for the shifting of cars to any part of the room for delivering or receiving loads for distribution. The floor between the rails is planked flush with the top of the rail, so that hand truck and cart employed can be readily run across the tracks or through any aisle. All goods that are received or shipped are checked up or weighed and inspected by a keeper having an office located near the main door. Among the things of interest in a locked fire proof department in the same room, was noted a large quantity of subway tickets. These tickets are received in rolls about 12 in. in diameter, and each roll contains about 5,000 tickets, all printed and suitably numbered, the numbers being made to correspond with the subway station at which the tickets are to be sold. The depot of stores is conducted under the management of Mr. Frank T. Lewis, with the title of General Store Keeper, and he has under him 18 men for conducting the work of the department. His duties, as prescribed in the printed regulations, to which reference has already been made, state that he "shall, under the vice-president, have charge of the receipt, issue and distribution of the general stores of material and supplies, shall make requisition for replenishment of stock and for such material and supplies as are not in stock, for which requisition is made upon him by the several departments, shall specify upon requisitions the purposes for which the articles are required, shall certify all bills for goods received by him as to their quality and quantity, and shall be responsible for the custody and accounting for all material in his charge. He shall keep such accounts and make such reports to the auditor and vice-president as may be required."

DEPARTMENT OF ELECTRICAL ENGINEERING.

The duties of the head of this department, now presided over by Mr. Roger W. Conant, with the title of Electrical Engineer, are prescribed as follows:

"He shall have charge of all electrical engineering for surface lines, shall prepare plans for the distribution of feeders and returns, shall investigate all special troubles with electric wires or genera-

FIG. 42—MOTOR TESTING ROOM.

tors and report thereon; shall consult and advise with the superintendent of motive power and the superintendent of wires upon electrical matters, and shall perform such other duties and make such report as may be required."

The office of the electrical engineer is also in the Albany St. building, and in one portion of the equipment shop are the motor testing stands, shown in Fig. 42. All motor testing is done in a very thorough manner. The method used is to couple two motors in the manner shown, and one is run as a generator. The two motors are placed in line, and to the ends of their respective shafts

disks are attached to which round, wooden or rubber blocks are bolted. The disks are brought close enough together for these blocks to overlap each other, so that power is transmitted from one shaft to the other without any time being lost in getting a perfect alignment of the shafts, as the couplings work even if the shafts are slightly out of line. The testing is made to determine temperature and efficiency. In the test six different instruments are used, and for the resistance test a storage battery current is employed. The instruments are located on the table as shown; the water rheostats are placed just outside the door, and consist of large barrels, some of which are on an insulated foundation, and in which is a solution of salsoda. The resistance plates are suspended in a group by means of a rope and pulley, the different plates being about 1 in. apart. These plates are raised out of or lowered into the water by means of the rope attachment connecting with the windlass mounted on a frame near the operator. The temperature is electrically determined by the rise in the resistance, no thermometer being employed. The rise in temperature is reckoned as 2.5° C to each one per cent increase in resistance. The commutator tests are made after the motors are mounted on the car, and for this the truck is chained to the rail, and the line current is turned into the motors without any resistance, the wheels being made to slip upon the rails.

In order to accurately test the consumption of power, while the car is in active service, 60 cars have been equipped with wattmeters; 30 of these are open cars and 30 closed. The cost of equipping these cars with these instruments is said to be about \$25 each. Careful records are kept, and the weekly reports are used to check the different motormen in the use of the current, as the results on the different cars can be compared and a proper average made.

METER INSPECTION CHECK.

Herewith is shown the form of ticket used by the conductor of these specially equipped cars in recording the wattmeter readings. The numbers are punched out to read from left to right. The accompanying table shows the amount of power consumed on one division for one week, and from it interesting comparisons can be worked out.

STATEMENT OF ELECTRICAL POWER CONSUMED IN DIVISION 4 CAR SERVICE. FOR WEEK ENDING JAN. 28, 1900.

Besides testing motors and other appliances, the electrical engineer has recently made an elaborate test of the incandescent lamps in use on the entire system. Lamps from 13 different makers were subject to the test, the object being to ascertain the efficiency, resistance and life. The lamps were all of 16 candle power of 4 watt capacity. The tests show a wide range in the value of the lamps from the different makers. Three types of electric heaters are used on the cars of the surface lines; these include those made by the Simplex Electric Co., the Consolidated Car Heating Co. and the Gold Street Car Heating Co. Tests show that there is not a very wide difference in the consumption of current by the different heaters. In extreme cold weather it requires about 10.5 amperes to properly warm a 25-ft. car. The range is from 3.5 to 10.5 amperes, the average being about 7.5 amperes. It is the practice of the company to make thorough tests of all new electric equipments, and when any electric appliances are ordered the electrical engineer makes the specification to embody the best and highest efficiency that his tests indicate it is possible to attain.

the joint. It will be remarked that of the 54 joints indicated, resistance of 3 ft. of rail, including the joint, was in 37 cases equal to the resistance of an equal length of rail; in 5 cases was less; in 7 cases was one-sixth more, and in 5 cases was more than one-sixth more than an equal length of rail.

The standard bond for fish plate construction consists of a No. 0000 flexible wire, tinned at the ends and sweated into a tapering steel sleeve or thimble. The hole in the rail being reamed to fit, the steel plug or thimble is driven in tightly by means of a half round tool which embraces the wire, so that a blow from a hammer drives it home to a close fit.

The standard size for the trolley wire is a No. 0; in the subway the trolley wire is of the figure 8 section. Beneath the elevated structure the trolley wire is supported from braided span wires, which extend across beneath the arch of the cross girders, being clamped to the flanges of the girder or to the tops of the supporting columns.

The system of current distribution employed by the electrical engineer is one of the most interesting features of the Boston

FIG. 44.

Elevated system. Early in the history of electrical railway development in Boston, it was decided, owing to the physical condition that prevailed in and about the city, that a direct current system with a number of power houses, properly distributed, was preferable in this case to a high pressure system with a single power house and transformer stations, especially as it was found possible with one exception to locate the various power stations on tide water. In order to solve the feeder problem, however, the engineer did not follow the ordinary methods of copper distribution by taking the average current consumption per car, and assuming a certain fixed drop per mile, but planned to provide for the varying loads. The load is affected by the speed of cars in congested localities when the cars are off schedule time, and varies

FIG. 46.

greatly because of the snow plow operation in winter; the maximum demand during the summer months had also to be considered. The average consumption of power was found by dividing the total output of the stations by the number of cars on the line at any one time. The result, however, was modified in many cases

by the actual feeder readings which were taken on days of excessive load at all the power stations between 4 and 6 o'clock p. m., the hours of maximum travel, from which the capacity load of each section was obtained. As a basis for the work, a map is prepared each year, showing all the lines operated, together with the loca-

FIG. 45—LINE ON COMMONWEALTH AVE.

tion of each power station, car house, and the boundaries of the various sections into which the territory is divided. The position of every car at the time of maximum load is based on the regular time table schedule. The cars are indicated by cross lines, each cross line representing two cars. One of the maps is shown in the accompanying diagram, Fig. 43. The territory is divided into 56 sections, shown by dotted lines. These sections are so coupled that any one can be cut off in case of trouble and sections can be coupled together to help out during hours of heavy traffic. In arranging the size of the section, care was exercised to make them small enough to be safe and large enough for economical operation, so each was made to meet the local condition. In computing the copper required to give the most economical results, the engineer followed a method devised by himself, and which was published in the "Review" for July, 1897.

In the central power station the feeder panels and tables are grouped at one end of the switchboard gallery and the ground feeders are connected in on the opposite side of the same bus bars as the negative leads from the generator, an arrangement which saves copper. The feeders lead beneath the floor of the gallery and into the basement, where they separate into four divisions or groups. Group 1, going west, consists of 20 overhead feeders; group 2, of

FIG. 47.

20 underground cables and 90 buried ground or return wires; group 3, going east, 15 overhead feeders and 4 overhead returns, and group 4 of 25 underground cables and 8 buried grounds. Fig. 44 shows one of the towers carrying overhead feeders, which stands near the central power station.

The lines are all operated by the overhead system, except on the elevated structure. The feeders in the business district are carried underground, as also a few in the outlying district. In other cases they are carried overhead, as shown in Fig. 45, which illustrates the method of supporting the feeder and trolley wires on a section where the tracks are located on a reservation, as is the case on some of the finest avenues.

The overhead feeders consist principally of 500,000 c. m. cables; some, however, are 300,000-c. m. and a few 1,000,000 c. m. For the small feeders No. 0000 and No. 0 wire are used. The insulation

FIG. 48.

of the overhead feeders is of tarred jute principally, and they are supported on glass insulators of the petticoat pattern. The underground feeders are insulated with paper or rubber, according to the conditions likely to be encountered in the soil. The resistance of the insulation on the underground cables ranges from 200 to 1,500 megohms per mile. It is the practice to test the different cables at the station every two or three days, in order to detect incipient defects, so that they may be remedied before developing into serious trouble. The drop in potential varies on the lines from 10 to 15 per cent, except on one or two of the longer lines, where the drop reaches 20 per cent. In ordering cables or wires the specifications as to purity are that the resistance shall not exceed .1157 ohms per mile of 500,000-c. m. section.

The total length of the overhead feeders is 456.5 miles, of which 13 miles are returns. The aggregate of the underground feeders is 63 miles, and of the returns 68 miles. There are also nearly 3 miles of armored submarine cables for use under the draw or swingbridges, of which there are 25 on the system.

The underground conduits have been constructed both of terra cotta ducts laid in cement and of cement lined iron tubes. The manholes are from 50 to 400 ft. apart, and are in general located at street corners. In moist ground the manholes are built with double

FIG. 49—TRUCK USED IN REMOVING WAGONS.

walls with water proof paper between. About 11 miles of underground conduits have been constructed, containing 133 miles of individual ducts. In some cases the return consists of scrap cable, from which the covering has been removed, the bare wires being drawn into the duct. In some cases as many as five wires have been placed in a single duct. Scrap trolley and feed wire is also used for bridging around special work; also for laying across bridges where flat rails are used, and also for cross connections from track to track.

Figs. 46, 47 and 48 show three different methods used at draw-bridges for supporting the overhead trolley wires so as to provide for automatic contact when the bridges are closed and to support the terminals.

Besides the general map showing the entire feeder system, as illustrated in Fig. 43, the electrical engineer prepares, from time to time, blue prints of the individual sections showing the location of all the feeders, overhead, underground or submarine, also the location of switch boxes and cutouts, with the sizes and numbers. These diagrams are supplied as changes occur, to the crews of each of the eight emergency stations, and also to each division superintendent and to each of the general officers. These are designed to assist the crews of the emergency stations in making repairs to overhead lines and feeders and to enable them to make temporary changes in the feeder switches, as may be directed by the operating department.

The emergency stations are all equipped with all the usual appliances, including tower wagon, tools and teams, and the crews are on duty at all hours. Among the appliances not usually used with wagons of this nature was noted a low two wheeled truck or dinky, Fig. 49, which is carried on some of the emergency wagons, and is designed for removing from the tracks heavy trucks or wagons that may become disabled by the breaking of a wheel or axle. The tower wagons are mostly of the Trenton type. The stations are all connected with the public telephone service, and also by private telephone line and exchanges, to all the power stations, car houses, and with the offices of the company. The crews respond to all fire alarms in their respective districts, and when necessary remove overhead wires and feeders and afterward restore them to their proper positions.

To be continued.

VAN DORN COUPLERS FOR BOSTON.

The accompanying engraving shows the No. 8 Van Dorn draw bar which was specially designed for the Boston Elevated Ry. As mentioned in "Review" for March, page 128, the three experimental trains now in operation were fitted with these couplers and all of the elevated rolling stock is to be similarly equipped. The W. T.

NO. 8 VAN DORN DRAW BAR.

Van Dorn Co. has also received orders from the Brooklyn Heights R. R. for 250 sets of No. 3 trail draw bars, and from the Metropolitan Elevated, of Chicago, for 50 sets for new cars. The Brooklyn order will make six car loads. Among recent foreign shipments is one of 20 sets for Japan.

SERRATED WHEELS.

In the article on the Boston Elevated Ry., page 189, reference is made to the serrated wheels with which a number of the company's snow plows, including the observation snow plow, are equipped. These wheels derive their name from the serrations in the flanges and are designed for use with either cars or snow plows operating over tracks obstructed by dirt, ice or snow. The advantages arising from the increased traction secured are longer life for wheels and motors, and a saving of time and power; it is also claimed that there is less wear on the track.

"Serrated" wheels are made for the Burnham & Duggan Railway Appliance Co., of 60 State St., Boston, by the New York Car Wheel Works, the Boston Car Wheel Co., and the Rochester Car Wheel Works. The Burnham & Duggan company, in addition to those in use on the Boston Elevated, has supplied serrated wheels for cars of the Quincy & Boston, the Massachusetts Electric Cos., the Portland Railway Co., the Metropolitan Street Ry., of New York, and others. Snow plows and sweepers recently built by the Taunton, Peckham, Wesson and Woburn companies have been equipped with these wheels.

A verdict for the defendant has been returned in a suit against the Chicago City Railway Co. for alleged damage, caused by vibration, to property adjacent to the power house at 52d St. and Wabash Ave.

MORE TROUBLE FROM SNOW AND RAIN.

The accompanying reproductions from photographs are good proof that the general manager's couch is not always the softest one in the world; he occasionally has to lay down the coupon cutter and get out and hustle to keep cars moving.

The view at Springfield, Vt., was taken during the high water of February last. The line of the highway along which are laid the tracks of the Springfield Electric Ry. can be traced between the two rows of poles, the trolley poles on the left and telephone and

FLOODED TRACKS AT SPRINGFIELD, VT.

telegraph poles on the right. Mr. M. A. Coolidge, of Northampton, Mass., who sent us the photograph, writes that at the point on the street railway tracks, where stands the freight car, which is on a turn-out, there is a standard railroad flat car entirely covered by water. The rails at this place are about 18 in. above the level of the highway. The flood was occasioned by the great amount of water coming down the Black River, and was also increased by the ice jam in the Connecticut River. The water was about 15 ft. above normal height.

For the view on the Palmer & Monson Street Ry. we are indebted to Gen. Mgr. D. F. Burrill. The amount of water can be judged by the fact that the fence at the left is nearly covered.

The Toledo (O.) Traction Co. last month had the hardest fight with snow that it has had in six years, but through the excellent management of Gen. Mgr. Thomas H. McLean and Superintendent Collins, cars were kept running in comparatively regular order on the principal lines. Over 200 extra men and a score of teams, in

ON THE PALMER & MONSON LINE.

addition to the snow plows and the company's regular force, were at work for nearly 24 hours at a stretch before the battle was won.

A number of interesting statistics are at hand from Montreal, Can., relative to the heavy snow of February 28th and March 1st and 2d, and the cost of removing it from the tracks of the Montreal Street Railway Co. The official records give the snow fall

on February 28th as 1.3 in.; on March 1st, 18.2 in.; on March 2d, 3.6, making a total of 23.1 in. To keep the tracks open during these three days the street railway company employed 2,100 men and boys at an expense of about \$5,300 per day. Its loss in traffic was about 85 per cent, as will be seen from the statement that on Mar. 1, 1899, the total receipts were \$4,249.39, while on the corresponding date in 1900 they were but \$1,410.15. On Mar. 2, 1900, they were \$1,211.00. It is estimated the rolling stock was damaged as a direct result of the snow to the amount of about \$1,700. As a single example of the obstacles encountered it is stated that a natural drift over 15 ft. high and containing 1,900 cu. yd. of snow completely filled one broad thoroughfare. Sleighs passed through this by means of a tunnelled passage.

The Rochester (N. Y.) Railway Co., on March 1st was forced to call its cars into the barn for part of the day, owing to one of the heaviest falls of snow that western New York has known for years. The eleven plows and three sweepers belonging to the company were kept constantly at work and cars were in operation at the first sign of abatement in the storm. The plows in some cases were pushed by two and three motor cars.

The same storm visited Buffalo and it took every facility for fighting snow that the company could command to restore regular schedules.

Peoria, Ill., was the center of a hard snow storm on the last day of February, but in spite of this, cars were operated on nearly

SCENE AT TOLEDO, O.

all the lines. A local paper, in speaking of the good work accomplished by the company in keeping its lines open, said:

"It is the fashion to berate the street car company. Perhaps no other company in the city has met with more abuse than this same corporation. The company expects this. It would perhaps be lonesome if it did not get it. But there comes a time now and then when the company does get a little credit—deserved credit—and one of these occasions was furnished by the great snow storm of this week. Honor to whom honor is due."

A sleet storm in Cleveland, O., on March 8th, caused immense damage to overhead wires. All of the street railways in the city, both cable and electric, were obliged to suspend service, some of the lines not getting into operation for two days after the storm.

ANOTHER INTERURBAN FOR INDIANA.

We are in receipt of a letter from Stillwell & Browne, Lovett Block, Anderson, Ind., stating that a company has been organized for the purpose of constructing an interurban electric railway from Indianapolis to Kokomo, Ind., passing through Noblesville, Cicero, Arcadia, Atlanta and Tipton, with a branch line from Tipton to Elwood. The total length of the road will be 65 miles. The officers are: President, William L. Kann, of Pittsburg; vice-president, Charles A. Ford, of Kokomo, Ind.; secretary, George Lilly, of Anderson, Ind.; treasurer, Horace C. Stillwell, of Anderson, Ind.

CORRESPONDENCE

Electricity vs. Steam in Connecticut.

Editor "Review": Lately there appeared in the railroad news column of the New York Evening Post a special dispatch reporting another purchase by the New York, New Haven and Hartford R. R. of a link in one of the many trolley parallels to this system in the state of Connecticut. In the dispatch appears the following:

"By the purchase the New Haven company breaks the threatened parallel. * * * It is also significant as showing that the New Haven is not relying altogether on the third rail to meet trolley competition—(passengers! and freight?)."

The following may be of interest to those who are in hearty sympathy with the development of our trolley systems; affording, as they do, facilities and conveniences which have never heretofore existed between and in communities; but who are also desirous of furthering electrical development on our steam railroad systems along those lines which will bring success to both. I quote from a paper before the American Society of Civil Engineers ("Proceedings," November, 1899).

(1) Steam railroads will, in the near future, handle their suburban and short-distance interurban passenger traffic and mail, express, baggage and light local freight carried in said suburban and interurban passenger trains, by electric motive power; and this, irrespective of whether operating expenses are affected favorably or unfavorably. * * * *

In the future development of steam railroad systems they will eventually be operated jointly with surface electric railways, either through actual mutual ownership, or by traffic contracts, leases, etc.

The above conclusions are obviously dependent upon what Mr. Prout properly defines as "traffic conditions," and not primarily engineering details or operating expenses. * * * *

Effect of Competition.—One often hears of the competition which electric parallels have brought to our steam-railroad systems. This has been exaggerated greatly, for most of the traffic of electric railways did not exist until created by low "total cost" and frequent and quick service, although, in certain isolated cases, the building of electric parallels has temporarily drawn away traffic from steam railroads, only to be recovered as the total volume naturally increased. * * * *

nected by a steam railroad. More unwise legislation against a natural progress, which would also benefit those whose influence created it, can scarcely be imagined. It is fair to assume that in this controversy—for the street railways naturally opposed such legislation—both sides produced the strongest arguments in support of their respective contentions; the Consolidated presenting losses of traffic, while the street railways insisted that their passenger travel was mostly an induced one, which did not and could not exist under steam-railroad conditions and operative methods.

An examination of Table No. 30 shows conclusively how the steam railroads convicted themselves. The Consolidated System only claimed a total loss of \$4,000 per month, or \$48,000 per annum on the entire system, being about one-third of one per cent of their gross passenger revenue. If the average fare were 10 cents, this would mean a total loss of 480,000 passengers per annum out of a total of 44,448,324, or 1.1 per cent; but 1894 was the year of financial depression, when the steam railroads of Massachusetts lost 8.3 per cent of their former passenger traffic, so that only part of this loss on the Consolidated was due to trolley parallels. While the total loss to the Consolidated was given by its officers, all the towns between which it occurred were not stated, so that in Table No. 30 the 12,365,571 passenger trips, between and in a few of these towns, is only part of the total passenger traffic of the street railways serving all localities where such loss took place. Whether this figure should be increased by 50 to 100 per cent, or more, we cannot say, but, in any case, the data are sufficient to show the large induced traffic of street railways; or, in other words, systems which give low fares, frequent service, short total time consumed in round trip and a "leave-at-your-door" service.

As an example of interurban traffic, we can take Ansonia and New Haven, Conn. When the steam railroad owns the systems of street railways in both towns, their cars will pick up passengers at either center, will pass onto the present steam tracks on the right-of-way of the New Haven and Derby Railroad (New York, New Haven and Hartford Railroad Co.), run at high speed without stops to the other center, pass onto the local street railway tracks there and distribute its passengers where they desire, all for one fare. Such a system operated by electric motors would be a financial success, where a line like the third-rail between Hartford and New Britain is a failure in the true sense. Many other similar examples might be given, but this indicates the future of our steam railroads.

Yours truly,

99 Cedar St., New York. CHARLES H. DAVIS.

TABLE No. 30.—EFFECT OF COMPETING ELECTRIC INTERURBAN PARALLELS TO STEAM RAILROADS.

Localities Connected.	Loss due to trolley parallels, as claimed by V. F. Hall of N. Y., N. H. & H. R. R. Committee, Railroad State Legislature of Connecticut (a).	Approximate distance between R. R. Road Committee Map.	Trips per day as given by time table of N. Y., N. H. & H. R. R.	Trips per day of trolley roads.	Number of passengers carried by Electric Railway System in and between these towns, part of which them, 1894.
Norwalk—Rowayton	50%	4.75	57	84	956 241
Bridgeport—Stratford	\$35 per day.	3.00	36	84	4 659 822 (Est.)
Bridgeport—Southport	80%	5.50	33	69	2 024 421
Waterbury—Naugatuck	90%	6.00	13	30	2 001 347
Wallingford—Meriden	90%	5.50	17	112	1 083 977
Birmingham—Ansonia	90%	3.00	16	1 090 263
Winoepauk—S. Norwalk	(b) 50%	3.00
					12 865 571

(a) Total loss to N. Y., N. H. & H. R. R. from all parallel trolley roads in the State of Connecticut = \$1,000 per month = \$38,000 per annum, or 1/17 loss on total passenger income of \$12,971,000 in 1894, as shown by Railroad Committee Reports.

(b) 64 passengers were carried on N. Y., N. H. & H. R. R. in the month of December, 1898, and 9 in the same month of 1894, or a total loss of 780 passengers per annum, at a possible maximum of 15 cents = \$117.

Table No. 30 has been prepared from a speech by Mr. Edwin B. Gager before the railroad committee of the State Legislature at Hartford, Conn., March 22, 1895. (Those who are interested can obtain a reprint of Mr. Gager's speech by addressing him at Derby, Conn.) For many years bitter warfare has been waged against interurban electric railways by the Consolidated System (New York, New Haven and Hartford Railway Co.) resulting in the electric parallel law, where "public convenience and necessity" must be demonstrated to the satisfaction of the Superior Court before an electric railway can be built between two points already con-

Electrolysis and the Testing of Rail Bonds.

Editor "Review": I have read with interest Mr. Lincoln Nissley's article regarding electrolysis published in the "Review" for March, page 149, but must take issue with him on several points.

First, that his test involves placing artificial conditions on the system under test which do not exist in practice.

Secondly, that his method of remedying the troubles makes the railroad company legally liable for damages from electrolysis by making the connections proposed which would convert the water pipe system into an auxiliary ground return system.

Taking up the testing methods employed it will be noticed from the connections in Fig. 1 that they introduce into the water pipe system current directly; and also that the other leg of the differential ammeter passes current to the rails. This will give him the ratio of resistance of the rail return and pipe return circuit, but there is neglected in this test the important determination of the resistance between the rails and the water pipe, which is included in the circuit when any car passes that point; and the current that actually traverses the water pipe system in the practical operation of the road will only give the results from which information for determining the proper remedies for electrolytic damages to the water pipe by those currents can be determined. The character of the soil and pavement adjacent to and underlying the rails greatly affects this leakage from the rail to the water pipe. For instance, rails laid on a 10 in. cement bed with sand 4 in. and a brick pavement will measure as high as forty ohms per mile single track with 90-lb. 7-in. girder rail. In one test the track was parallel to a 24-in. main; the leakage of current to the main was .02 of an ampere per mile; from a resistance measurement the pipe line showed lower resistance to station than rail, yet the current it actu-

ally carried was 1-40 of one per cent. of the current flow in the rails. Again referring to Fig. 1, with the switches closed on this differential ammeter, he reads the drop on the ammeter and switches with the current flowing; a reading of volts with the switches open gives the difference of potential between the rail and pipe system which is using the pipe as a pressure wire for the average ground resistance and rail drop. The higher the electrical resistance of the rail environment, the nearer this voltage will be to the true rail drop back to the station if the pipes are connected to ground bus at station. If the test car is placed on the track at any point and a current delivered to the rails, and an ammeter inserted in the pipe returns and also in the ground returns at the station, the ratio of these two ammeter readings will be as the conductivity of these two returns as exists in the operation of the road. This

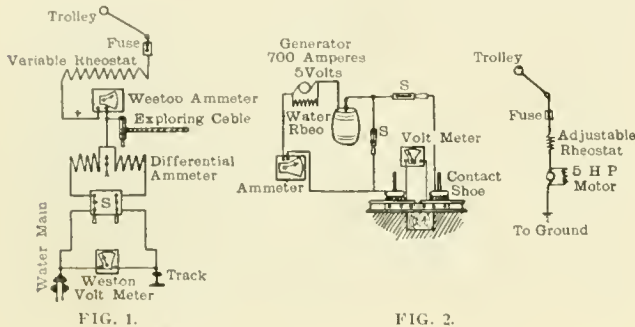

FIG. 1.
From the "Review" for March, 1900.

also gives a means of discovering any metallic connections which the water company may have established by locating gate boxes against the rails, and in this way introducing current into their system.

The flow of current in the water pipe system can be readily determined by the shunting method between hydrants.

Regarding so-called danger zones determined by the voltmeter method the difference of potential observed is that due to the fall of potential along the track circuit and the resistance between the rails and the pipe system. This voltage is at a maximum when the rails are insulated, with the water pipe connected to the ground bus of the system but with no current flow in the pipe system. Yet the flow of current in actual conditions in a water pipe is greatest where the difference of potential between the track and pipe is the least; that is, where the pipe is passing through the so-called neutral potential area located between the positive and negative potential areas. With lead service pipes passing under the tracks the negative potential of the pipe system with regard to the rails is sometimes least where the passage of current and corrosion is the greatest. I know that, in the past, potential areas have been plotted in order to indicate electrolytic troubles, but I can find no tangible relation between potential areas in street railway practice, using the earth as a ground return, and locations of electrolytic action on water pipes.

In regard to the second suggestion, to connect the rails to the water pipe at any points where current would flow from the rails to the water pipe, it would place the railway company so doing in a dangerous legal position in respect to the water company, for the reason that it would establish clearly the use of the water pipes for assisting the rail return back to the station; and any electrolytic damages resulting from the use of this water pipe system for a purpose distinctly to the advantage of the railway company would be a burden that would have to be borne by the railway company.

The excessive flow of current caused by such connections will at least damage the lead service pipes and pipe joints in the water pipe system which increases with the resistance with the flow of current through them; this is one of the reasons why the natural currents through water pipes gradually fall off from year to year. By making connections to introduce current into the water pipe system he is at variance with the accepted practice to reduce this current to the lowest possible amount by harmlessly conducting away through metallic conductors only such current which will seep into the water pipe system, and those currents which enter it due to the paralleling of two conductor systems, and in this way remedying electrolytic troubles. Yours truly,

ALBERT B. HERRICK.

New York, Apr. 2, 1900.

THIRD-RAIL ROAD AT ALBANY, N. Y.

Newspaper dispatches state that contracts for the building of a 35-mile railway from Hudson to Albany, N. Y., have been let to C. W. Blakeslee & Sons, contractors, of New Haven, Conn. A company of which A. M. Young, of Waterbury, Conn., is president, has been organized with a capital of \$2,000,000 to construct and equip the road, which will be built upon the third-rail system, using a T-rail located about 30 in. outside of the tracks. Contact will be by a sliding shoe similar to that employed on the New York, New Haven & Hartford branch between Hartford and Bristol. Electricity will be generated from water power at Stuyvesant Falls, N. Y.

The road will run via Niversville, N. Y., where it will intersect the Boston & Albany R. R., and will be a strong competitor for the passenger and freight traffic between Hudson and Albany, now carried exclusively by the New York Central. Private rights-of-way will be purchased for the entire distance, permitting high speeds and frequent service. It is estimated the district immediately tributary to the line has a population of about 200,000 people.

THE PITTSBURG CONSOLIDATION.

The stockholders of the Consolidated Traction Co., of Pittsburg, on March 31st voted to lease the property for 900 years to the Union Traction Co., which was recently organized to effect a consolidation of the principal systems of Pittsburg. The action was not unanimous, the small stockholders, led by the firm of Whitney & Stephenson, strongly opposing the combining of interests. It is probable litigation will be instituted at once to have the consolidation set aside, and the merger will not take place until this litigation has been decided.

The lease as it now stands provides for the payment of 6 per cent per annum on the preferred stock of the Consolidated Traction Co. from April 1, 1900, to April 1, 1906, at which time the rate will be increased to 7 per cent per annum, and that rate maintained during the life of the lease. Upon the common stock, 2 per cent per annum will be paid for two years; 3 per cent for the following three years; 3½ per cent for the next two years, and 4 per cent thereafter. The lessee will also pay in May, 1900, certain accumulated dividends amounting to about 6 per cent.

It is the intention to include in the consolidation the Consolidated Traction Co., the United Traction Co., and the Monongahela Street Railway Co.

CHANGES IN BROOKLYN RAPID TRANSIT.

Last month a number of changes in the form of management were made by the Brooklyn Rapid Transit Co. Mr. J. C. Brackenridge, who has been chief engineer of the company, is now acting general manager, that office having been created to relieve President Rossiter of much of the detail work that has hitherto fallen upon him. Mr. Brackenridge will perform in part the duties formerly discharged by Mr. Ira A. McCormack.

In addition to the position of acting general manager the offices of second and third vice-president were made to still further relieve the president. Mr. T. S. Williams, secretary and treasurer for the company, will assume the duties of second vice-president. The other position has not yet been filled. Mr. C. D. Meneely, who has been assistant secretary and treasurer, has been elected secretary and treasurer to succeed Mr. Williams.

ANOTHER MASSACHUSETTS CONSOLIDATION

New York and Philadelphia capitalists represented by Clark Bros., bankers, of Philadelphia, have arranged for a consolidation of the following roads in and near Worcester, Mass.: Worcester Consolidated; Worcester & Suburban; Worcester & Marlboro; Worcester & Clinton; Warren, Brookfield & Spencer; Clinton & Hudson; Leominster & Clinton; Worcester & Blackstone Valley.

These roads aggregate 157 miles of track and for the last fiscal year earned \$902,906.

It is intended to incorporate these properties as the Massachusetts Electrical Co.

Hauling Freight and Express Matter on Electric Railways.

Some Theory and Practice.

Starting with the point that the fundamental and essential duty of a street railway is to furnish better transportation facilities to a considerable majority of the community tributary to the road, and that franchises are granted, or at least should be granted, only after it has been proven that the best good of the community requires the extra means of travel that the new road is going to provide, it has been argued in times past, and the statement is still occasionally heard, that electric railway companies operating on rights of way through the public streets or highways, should confine themselves strictly to the transportation of passengers, and should not

erally supposed. The carrying of goods is in fact a natural development of passenger transportation. In the early days of electric railroading passengers were permitted to take into the car only such bundles, satchels or packages as could be held in the lap or placed under the seat without causing inconvenience to fellow passengers. It was not long before this accommodation was extended to carrying larger bundles which were deposited on the front platform. In this case the owner of the bundle was usually requested to pay an extra fare. There certainly could be no objection to this arrangement, and there should be none when a special compartment in the car is provided for the better accommodation of such bundles or packages; nor should the fact that the owner does not accompany the package alter the principle. From the special compartment to the special car is but a step.

If it is an advantage to the public to have the roads carry packages and bundles, it is not difficult to prove the benefits of a general freight service. It will be admitted that freight must be transported in some way, and how better can this be done, than in special cars, operated so as to cause no delay to the passenger traffic, running on rails where the tractive force per ton is only one-half to one-fiftieth what it is on a street or road, saving the wear and tear on the highways caused by the wheels of heavy trucks, and traveling at a speed from three to ten times faster than horses could draw the same goods. Taking into consideration these advantages with others of increased facilities, saving in time and reduction in cost of haulage, it is hard to explain why the question of transporting goods on electric railways was not brought forward sooner than it has been, and why the practice is not now more nearly universal. One cause for the delay, and perhaps this is the chief cause, is found in the opposition of the steam railroads wherever the subject was suggested. But the opposition encountered is gradually being overcome, and the question is one of the live ones of the day. In the language of Judge Marean of the Supreme Court of New York, "The public having discovered that the transportation of freight can be made more economically on electric railways than by former methods, there is no meritorious reason

FIG. 1.—STANDARD EXPRESS CAR, CLEVELAND.

be permitted to use their tracks for the carrying of baggage, freight or express packages.

This premise may or may not be true, but admitting for the moment that it is, the conclusion should by no means be accepted as necessarily following, for it can easily be demonstrated that the best interests of the public will as surely be furthered by a combination passenger and goods service, as by a passenger service exclusively. It will of course be granted that the freight or express traffic must be kept under proper restrictions, and must never be

FIG. 2.—AT HEADQUARTERS OF ELECTRIC PACKAGE CO., CLEVELAND.

permitted to interfere with the passenger accommodations which should receive paramount consideration in every case.

Contrary to the first impression one might have on thinking of this question, the transition from a traffic exclusively passenger, to one including express and freight is not so abrupt as is gen-

erally supposed. The public is demanding a goods carrying service and the public usually gets what it wants sooner or later. As examples of this demand, and these are but two of many, various attempts have been made to interfere by injunction with the package and freight business carried on by the

will enable a package delivery service to be instituted on almost any road, to the convenience of the public and the material increase of the company's receipts.

The question of handling farm products and heavy goods also presents to the manager opportunities for thinking out ways of taking advantage of conditions as they exist in his community. No single item illustrates better the possibilities in this direction than

In exactly the same way other products of the farm can be gathered and distributed.

There is one more point that is not always considered when this goods service is under discussion. The cry of the day is down with expenses and to this end every by-product of the power house is carefully scrutinized to see if it can be utilized in some way. Freight and express cars can be run whenever passenger traffic is light, and

FIG. 6.—RECEIPT.

the carrying of milk. Under the usual arrangement the farmers awake in the wee small hours, do their milking, load their cans into wagons and start on a long, often times four or five mile drive to the railroad station. This must be done no matter what the condition of roads or weather. The milk train then takes up the cans and delivers them at some central distributing depot in the city, where they are again loaded into wagons for delivery to the small milk merchants through the town. This is a tedious, expensive and unsatisfactory routine. With the interurban roads doing the work, the farmers carry their cans out to the tracks at their front doors, or perhaps wheel them in small hand carts, for a short distance to reach the line. Here they are left on a rude platform erected for the purpose. The milk car comes along, gathers up the cans along the way, and without another handling sets them down at the milk dealers' door. The saving can be counted in hours and in dollars.

FIG. 8.—FREIGHT AT NEWBURGH, N. Y.

why then does this not present to the manager a method of using the surplus power of his station, which in a certain sense then becomes a by-product, for the running of goods cars, and in this manner bringing up the drops in his load curves to the more nearly straight line of maximum efficiency. There are many railway plants where an engine and generator have to be kept in operation all night to run a few owl cars, in which cases the ideal conditions are found for introducing an "economy" by means of the class of service under discussion.

It is not the province of this article to give advice. The managers and superintendents of this country are in a position to work out their own problems better than any one else, and they are fully capable of doing so. It is the intention to give here suggestions only and for the purpose of presenting the latest and best practice in this new field of usefulness now rapidly opening up, the "Review" has obtained from a number of leading roads a description

of their methods. Several of the printed forms used and photographs of cars are reproduced for the convenience of companies about to start an express or freight traffic.

Cleveland, O., is the center of what is probably the most extensive parcel and light freight service in the United States, its location and the network of interurban roads entering the city, furnishing the very best conditions for the development of traffic of this nature. The business has grown to such an extent that the prominent electric lines centering there do not attempt to take care of the express matter themselves, but have placed the traffic in the hands of a separate company known as the Electric Package Co. and doing business on exactly the same methods as the older ex-

press companies operate on steam roads. The Electric Package Co. controls the carriage of baggage and parcels on the Lorain & Cleveland Ry., the Cleveland, Berea, Elyria & Oberlin Ry., the Northern Ohio Traction Co., and the Cleveland, Painesville & Eastern R. R., reaching Cleveland, Akron, Painesville, Oberlin, Elyria, Lorain and other points.

Mr. W. H. Kenworthy, superintendent of the package company sends us the following account of the work it is doing:

FIG. 10 BAGGAGE CARRIER, WATERLOO, IA.

"The keen competition of electric street railways in the line of all business covered by steam roads has led the large trunk roads in different sections of the country to take advantage of all means to affect this class of competition. About a year ago a number of the trunk lines compelled the express companies operating over their systems to vacate electric railways that in any way competed with or paralleled their roads. This, as a matter of course, compelled the old line express companies to vacate all suburban electric lines centering in Cleveland, and this led to the development of our express service for light freight.

"The Electric Package Co., which is a direct representative of the suburban electric lines centering in Cleveland and which cover a radius of 50 or 60 miles from Cleveland, has inaugurated a system of baggage and express service which is equal to that on any steam line in the country.

"First, take into consideration the handling of milk. We are at present handling altogether on our five lines, from 800 to 1,000 ten-gallon cans per day. This, you will note, was formerly carried by the baggage department of the railroads, and from it they derived considerable revenue. We obtain this business through the advantages offered by electric suburban lines, which traverse the country highways and make each farm house or road crossing a loading station at which cars can stop and load; and this stopping and starting can be accomplished with little or no expense or inconvenience in comparison with the steam lines. Again, the cars traverse the city streets, and we find that cans can be delivered to milk-men along streets, causing no more delay to cars than to pick up and discharge passengers. We also get a large quantity of mill feed to handle for the dairy farms, which furnishes us with a profitable revenue.

"Our system offers to the traveling public the proper care and security for the handling of baggage in transit, and places our lines on the same basis as the steam roads. This, together with the fact that we can carry passengers at a rate lower than steam lines, and give them good speed service, naturally forces business our way.

"Our system of express freight is handled just as by the old line companies, and at rates equivalent to those charged by them; we maintain city terminal delivery and collection service, and as we are in position to forward and receive matter in transit on cars on the hour schedule, these advantages are readily seized by our city dealers and the suburban merchants, as they can order goods and have the satisfaction of knowing about when to expect them.

"As we speed along by the farm, the farmer realizes the advantages of our lines, and instead of loading his produce on his wagon and teaming it to the city markets, he uses our cars, and in a short space of time he is bartering his produce on the market and

is enabled to return home without the aid of a slow team; and while en route, can with amazement figure the advantages of the electric age.

"Having demonstrated that there is no end to the advantages in handling freight on electric lines, after securing proper legislation which will give us the privileges of handling our cars on the city lines during the night, we will be able to handle freight in car-load lots at rates lower or equivalent to those offered by steam lines, and as time is a great advantage, will in time, control the suburban freight short haul traffic.

"We have not confined our service to lines directly under our control, but accept freight destined to lake ports, which we transfer to the fast passenger boats when lake navigation is in operation. We could handle rail freight connection, but are handicapped by the steam roads refusing to have business intercourse with the electric lines.

"The Electric Package Co. is under the management of B. Mahler, manager, and W. H. Kenworthy, superintendent, who has had over 20 years experience in all branches of the express service with the old line companies."

Fig. 1 is a view of one of the standard express cars at Cleveland, Fig. 2 shows two of the cars in front of the office of the Electric Package Co., just as they came in to be loaded and unloaded, and Fig. 3 shows the receipt blank used. This in its original size is 5½ x 8½ in.

The Mahoning Valley Railway Co., of Youngstown, O., operates a package and freight car between Struthers, Youngstown, Girard, Niles, Warren and Mineral Ridge. Two trips a day are made to each point except Mineral Ridge, which has but one trip a day. A map of this company's system was published on page 3 of the "Review" for January, 1900.

The freight car is 32 ft. in length with two sliding doors on each side. The interior is one large compartment extending from vestibule to vestibule with only a small partition at the motorman's end, about 3 ft. high to prevent packages and freight matter from interfering with the controller or brake. The company also has a short, single truck box car about 14 ft. in length, which is used as a trailer when occasion requires.

Through the courtesy of Mr. A. A. Anderson, general manager and treasurer of the Mahoning Valley Railway Co., we are able to reproduce herewith, Figs. 4 to 7 inclusive, several printed forms used in connection with the operation of its freight department, including bill of lading, card for showing distribution of amounts collected over the various divisions, receipt given for goods, and an advertising poster, which announces schedules, shipping instructions, etc.

FIG. 12—DAYTON & WESTERN BAGGAGE CAR.

The bill of lading is shown reduced in Fig. 4. This form is on a sheet 45½ x 7½ in.; it is coated on the back with a special duplicating substance and is printed on the same sheet as the receipt to be signed by the consignee, and folds over it, being detached when filled out, the two forming one leaf in a book. Thus when the conductor receives a package and fills out the bill of lading he at the same time secures a duplicate of the entry on the page of his receipt book. The amount paid by the consignor is indicated by punch marks in the margin. This scheme of coating the back of the bill of lading obviates the necessity of using loose sheets of carbon paper.

The receipt remaining in the conductor's book serves as a duplicate of the bill of lading and is signed by the consignee when the goods are delivered.

The distribution card is shown in Fig. 5. The lower half is a duplication of the upper half, with the exception that the letters at the top of the columns are reversed. These letters stand for the names of the towns on the route, Y for Youngstown, G for Girard, N for Niles, W for Warren, etc. The card is 6 3/4 x 9 1/8 in. The receipt used at depots, Fig. 6, is 8 x 5 3/8 in. and the poster notice, Fig. 7, is 9 x 11 1/8 in.

Waterloo and Cedar Falls Rapid Transit Railway Co.
FREIGHT WAY BILL. NO 9585

Table with columns: NO, DESCRIPTION, WEIGHT, CONSIGNEE, RATE, TOTAL, etc. Includes a section for 'WRITE NAME OF MONTH' and '189'.

FIG. 11—FREIGHT WAY BILL, WATERLOO & CEDAR FALLS.

Figs. 8 and 9 show two of the freight cars on the Newburgh (N. Y.) Electric Ry. The company has four of these flat trail cars, each capable of carrying from 8 to 9 tons. The box cars are so arranged that snow plows can be attached to them, and the tracks outside of the city are cleaned of snow in this way.

One of the best schemes that has come to our attention, for carrying merchandise, baggage, etc., where this class of traffic has not developed to proportions sufficiently large to justify the running of special cars, has been worked out by Mr. L. S. Cass, president and general manager of the Waterloo (Ia.) & Cedar Falls Rapid Transit Co. On this line between Waterloo and Cedar Falls, this company operates long, double truck, vestibuled "interurban" cars, a type now well developed in this country. Attached to the rear end of each car is a removable shelf or carrier, a good idea of which can be obtained from Fig. 10. This is supported at one edge by pockets under the car on the sills, and is strengthened at the other by two stay chains as shown. The carrier can be quickly removed if necessary although this should be seldom required. If it is desired to run a trailer with a motor car equipped with the device, an extension coupling can be easily utilized.

On the Waterloo and Cedar Falls line a canvas cover is carried with each car at all times for the purpose of covering any articles that may be on the suspended platform, in case of storm. The weight to be placed on each carrier is limited to 4,000 lb. Mr. Cass states he first got the idea of these extension shelves for baggage, etc. from seeing a similar device on the old stage coach in Buffalo Bill's Wild West Show. He courteously offers to furnish further details to any manager who desires to adopt the arrangement.

The freight way bill in use on this road with conductor's stub attached is reproduced in Fig. 11. Its original size is 4 1/4 x 14 3/4 in.

From a small folder issued by the Waterloo & Cedar Falls Rapid Transit Co. to its conductors, we reprint the following rates and rules governing the handling of packages, etc. on both its interurban and city cars.

- All packages of merchandise up to 100 lb., inclusive, from Waterloo or Cedar Falls to Cedar River Park, San Souci, Fossilman, Cass Junction, Cedar Falls, Waterloo, and intermediate points... 20 cents
- Packages carried to and from points within the city limits of Waterloo up to 100 lb., inclusive... 10 cents
- Over 100 lb. 6 cents per 100 lb. or fraction thereof. (Example: a package weighing 110 lb., 26 cents or 16 cents, according to destination).

Bicycles and baby cabs will be carried at the same rate as 100 lb. of merchandise, except when accompanied by their owner, in which case the same rate will be collected for the bicycle or baby cab as is collected for the passenger.

(Example: a 5 cent fare is collected for the passenger, collect 5 cents for the bicycle or baby cab.)

Hand baggage that does not occupy the space of a passenger will be carried free. All other baggage will be charged for at 20 cents per piece, regardless of weight or destination.

Dogs will not be allowed in any car, but will be carried on platform and a

charge of 25 cents shall be made for every dog on any car between all points on this line.

When goods are shipped C. O. D., you will make a charge of 25 cents for collecting the money and returning it to the consignee.

All empty cases, crates, kegs, etc., when being returned to original consignee for re-filling, will be carried at 5 cents each, regardless of weight, and at owner's risk.

No goods must be accepted that are perishable, after 5 p. m. of any day, unless the conductor knows personally that delivery can be made promptly upon arrival at destination.

All articles will be accepted for transportation, either prepaid or collect. When collect, the conductor or agent will mark the word "collect" in pencil on wrapper or tag, and in figures mark the amount to be collected.

Packages that are marked collect will not be delivered to consignee until charges have been paid. In case charges are not paid you will retain package in your possession and notify the general office.

All packages of merchandise, bicycles, baby cabs, dogs, etc., except baggage and empty crates, kegs, etc., will be called for and delivered within the city limits of Waterloo and Cedar Falls at the rates above named.

Baggage will not be called for or delivered, but will be transported from any given point on the line to any destination on the line at rates named above.

Empty crates, kegs, cases, etc., will be delivered free of charge within the

Form titled 'COPY Received from By the DAYTON & WESTERN TRACTION CO.' with fields for 'Consignee', 'Destination', 'MARKS', 'ARTICLES', 'WEIGHT Subject to Correction', and 'Received the above described property in good condition, except as noted.' Includes a table for freight rates.

FIG. 13—COPY OF BILL OF LADING.

cities of Waterloo or Cedar Falls, but must be delivered to car by consignor at point of shipment.

Bicycles and baby cabs, when accompanied by owner, must be delivered to car by consignor, and taken from car and receipted for by parties accompanying it.

All shipments, when consigned to any point on our line outside of the city limits of Waterloo or Cedar Falls, must be received at owner's risk and will only be delivered by parties calling at car and receipting for same.

Receipts for articles delivered must be taken on way bills by interurban conductors and on reports furnished for that purpose by local conductors.

Charges collected by local conductors will be shown on report furnished them for that purpose, deposited with passenger collections and rung up on register.

Interurban conductors will way bill all articles carried by them; will deposit all collections with passenger earnings but not ring collections for packages on their register.

No agent or conductor has the authority to vary from these rules without written authority from an officer of this company.

Fig. 12 is a view of the type of freight and baggage car, adopted by the Dayton (O.) & Western Traction Co., which has a well organized freight department. We are indebted to Mr. Valentine Winters, president, for the photograph from which this was taken, and also for several samples of printed matter used in connection with the handling of freight. The form reproduced in Fig. 13 is the duplicate bill of lading, retained by the company. The original which is given to the consignor is substantially the same, except that it bears the word "Original" in place of the word "Copy," the word "Agent" instead of "Consignee," and it does not contain the last line referring to the condition of the property. A shipping order, also of about the same form is provided, in which the shipper declares the contents of his consignment.

All of these blanks are 5 x 9 in. and on the backs, the following conditions are printed in small type:

CONDITIONS.

1. No carrier or party in possession of all or any of the property herein described, shall be liable for any loss thereof or damage thereto; by causes beyond its control or by floods or by fire from any cause or wheresoever occurring; or by riots, strikes or stoppage of labor; or by leakage, breakage, chafing, loss in weight, changes in weather, heat, frost, wet or decay; or from any cause if it be necessary or is usual to carry such property upon open cars.

2. No carrier is bound to carry said property by any particular train or vessel, or in time for any particular market, or otherwise than with as reasonable dispatch as its general business will permit. Every carrier shall have the right, in case of necessity, to forward said property by any railroad or route between the point of shipment and the point to which the rate is given.

3. No carrier shall be liable for loss or damage not occurring on its own road or its portion of the through route, nor after said property is ready for delivery to the next carrier or to consignee. The amount of any loss or damage for which any carrier becomes liable shall be computed at the value of the property at the place and time of shipment under this bill of lading, unless a lower value has been agreed upon or is determined by the classification upon which the rate is based, in either of which events such lower value shall be maximum price to govern such computation. Claims for loss or damage must be made in writing to the agent at point of delivery after arrival of the property, and if delayed for more than 30 days after delivery of the property or after due time for the delivery thereof, no carrier hereunder shall be liable in any event.

4. All property shall be subject to necessary cooperage and baling at owners cost. Each carrier over whose route cotton is to be carried hereunder shall have the privilege at its own cost, of compressing the same for greater convenience in handling and forwarding, and shall not be held responsible for unavoidable delays in procuring such compression. Grain in bulk consigned to a point where there is an elevator may (unless otherwise expressly noted herein, and then if it is not promptly unloaded) be there delivered and placed with other grain of same kind, without respect to ownership, and if so delivered shall be subject to a lien for elevator charges in addition to all other charges hereunder. No carrier shall be liable for difference in weights or for shrinkage of any grain or seed carried in bulk.

5. Property not removed by the person or party entitled to receive it, within 24 hours after its arrival at destination, may be kept in the car, depot or place of delivery of the carrier, at the sole risk of the owner of said property, or may be, at the option of the carrier, removed and otherwise stored at the owner's risk and cost and there held subject to lien for all freight and other charges. The delivering carrier may make a reasonable charge per day for the detention of any car and for use of track after the car has been held 48 hours for unloading, and may add such charge to all other charges hereunder, and hold said property subject to a lien therefor. Property destined to or from a station at which there is no regularly appointed agent, shall be entirely at risk of owner when unloaded from cars, or until loaded into cars and when received from or delivered on private or other sidings, shall be at owner's risk until the cars are attached to and after they are detached from trains.

6. No carrier hereunder will carry, or be liable in any way for any documents, specie or for any article of extraordinary value not specifically rated in the published classifications unless a special agreement to do so and a stipulated value of the articles are endorsed hereon.

7. Every party, whether principal or agent, shipping inflammable, explosive or dangerous goods without previous full written disclosure to the carrier of their nature shall be liable for all loss or damage caused thereby, and such goods may be warehoused at owner's risk and expense or destroyed without compensation.

8. Any alteration, addition, or erasure in this bill of lading which shall be made without special notation hereon of the agent of the carrier issuing this bill of lading shall be void.

9. If the word "order" is written hereon immediately before or after the name of the party to whose order the property is consigned without any condition or limitation other than the name of a party to be notified of the arrival of the property, the surrender of this bill of lading properly endorsed shall be required before the delivery of property at destination. If any other than the aforesaid form of consignment is used herein the said property may, at the option of the carrier, be delivered without requiring the production or surrender of this bill of lading.

10. Owner or consignee shall pay freight at the rate below stated, and all

other charges occurring on said property, before delivery, and according to weights ascertained by any carrier hereunder; and if upon inspection it is ascertained that the articles shipped are not those described in this bill of lading, the freight charges must be paid upon the articles actually shipped, and at the rates and under the rules provided for by published classification.

11. If all or any part of said property is carried by water over any part of said route, such water carriage shall be performed subject to the condition whether written or printed contained in this bill of lading, including the condition that no carrier or party shall be liable for any loss or damage resulting from the perils of the lakes, seas, or other waters; or from exposure, bursting

FIG. 14—MAIL CAR, BROOKLYN.

of boilers, breaking of shafts, or any latent defect in hull, machinery or appurtenances; or from collision, stranding, or other accidents of navigation or prolongation of the voyage. And any vessel carrying any or all of the property herein described shall have liberty to call at intermediate ports; to tow and be towed and to assist vessels in distress, and to deviate for the purpose of saving life or property. And any carrier by water liable on account of loss or damage to any of said property shall have the full benefit of any insurance that may have been effected upon or on account of said property.

We are enabled to show herewith, Figs. 14 to 19 inclusive, through the courtesy of Mr. C. L. Rossiter, president of the Brooklyn Rapid Transit Co., six of the special cars operating on that system, including two flat cars used by the company for handling rails, motors, heavy tools, etc. for its own purpose. The Brooklyn Rapid Transit Co. does not do a public freight and express business itself, but furnishes cars and power to run them, to the National

FIG. 15—INTERIOR OF MAIL CAR.

Express Co., which operates over the line in about the same way as over steam railroads.

The following letter has been received from Mr. R. E. Danforth, superintendent of the International Traction Co., of Buffalo, on the subject of freight:

"We have two electric locomotives on the Buffalo & Lockport division in constant use. We haul no freight at present on any of the other lines. For a number of years freight cars were hauled by a small motor car weighing 6 tons and equipped with two W. P. 50

FIG. 16—SPECIAL CAR WITH CRANE.

FIG. 17 SPECIAL CAR FOR RAILS.

motors, on the Buffalo, Bellevue & Lancaster line. The work was done very satisfactorily and to the profit of the company. The shutting down of the stone quarry put an end to the freight business on that line, as the freight consisted entirely of building and crushed stone.

"The Buffalo & Niagara Falls Electric Ry. and Buffalo & Lockport Ry. run on regular schedule, combination passenger and baggage cars, handling the personal baggage of passengers between Buffalo and Niagara Falls and Lockport.

"A single truck baggage car is used on the Niagara Falls Park & River Ry. during summer months. This car is the usual closed box pattern with large side doors and small end platforms."

The Chicago, Harvard & Geneva Lake Ry., which has been in operation now eight months, finds its freight income steadily increasing and the company has been obliged to purchase a second

On cross examination, however, the information was elicited that the three witnesses had prior to the trial, received from Irwin, a carefully prepared typewritten statement "to look over and refresh their recollection so that they would know what to say on the trial of the action." This statement was wholly false and untrue.

In Chicago last month the city attorneys discovered an organized bureau which advertised for all kinds of personal injury cases, undertaking to make the evidence fit the complaint. The promoter and nearly all of his clients are Poles or Bohemians and they operate against all corporations, but make a specialty of defective sidewalk cases against the city.

FIG. 18—EXPRESS CAR.

FIG. 19—FREIGHT CAR.

freight locomotive. In addition to piece freight and express the car-load business is good. On March 12th to the 15th inclusive—four days—30 full car loads were hauled, including coal, lumber, brick and live stock. This all went in and out of a farm district where the largest village is less than 500 population.

AN EXPERT "ACCIDENT ADJUSTER."

Counsel for the Metropolitan Street Railway Co., of New York, has been successful in bringing to trial for subornation of perjury, a man named Robert J. Irwin, who is described as an "accident adjuster", with offices at 7 Beekman St., New York. The particular offense on which the charge is made was discovered on February 8th last, at the trial of an action to recover \$25,000 damages from the Metropolitan Street Railway Co. for a woman's death, said to have been caused by injuries received while alighting from a car. At the hearing three witnesses testified that the conductor was clearly at fault, having given the signal to go ahead before the woman had stepped to the ground.

NEW FRANCHISE AT DENVER.

On March 20th the Denver board of aldermen passed an ordinance giving the Denver City Tramway Co. a 20 year franchise on all the streets now occupied by cable lines, with permission to change the motive power; the mayor gave his approval the following day. As soon as Mr. C. K. Durbin, general superintendent of the company was advised of the mayor's action a force of 200 men was put at work setting poles, and it was promised that within two weeks cables would be a thing of the past in Denver. The company expects to spend \$1,000,000 on improvements which will include a new power house.

It is stated that suit has been filed by stockholders of the Dayton (O.) Traction Co., to set aside the consolidation of the Dayton Traction Co., the Cincinnati & Miami Valley Traction Co., the Cincinnati & Hamilton Electric Street Railway Co. as the Southern Ohio Traction Co., and praying for a receiver for the Dayton Traction Co.

TRAMWAY LETTER BOXES AT HUDDERSFIELD, ENG.

Through the courtesy of Mr. J. Pogson, general manager of the Huddersfield (Eng.) Corporation Tramways, we are enabled to give an account of the letter-box collecting system which has been in use on the tramway cars at Huddersfield for seven years with results equally satisfactory to the postal authorities, the tramway company and the public. The method is totally different from the street railway postal service common in this country in that in place of letter boxes rigidly fastened to the cars, a detachable box is employed, and mail collections are made by collecting the boxes themselves.

One of the receptacles is shown herewith. These are furnished by the Town Corporation, but are fitted with locks provided by the postal authorities and keys to which are carried only by special postmen. Two boxes, each numbered alike, are provided for each car, although but one is carried at a time.

At the end of every trip or about every hour, the conductor removes the filled box from his car and deposits it at the general office of the tramway company, in a small room specially fitted up for the purpose. Here are two rows of shelves divided into pigeon holes, each large enough to receive one of the boxes, and numbered to correspond with the box numbers. The conductor places the full box on the top shelf in the proper space and takes an empty one, bearing the same number, from immediately under it on the bottom shelf. A postman at frequent intervals visits the office, opens the boxes and collects the mail, placing the empty ones on the bottom shelf under their respective numbers and ready for the next clearance.

The boxes are attached to the cars by means of a sliding bracket somewhat similar to the usual device for attaching a lamp to the front fork of a bicycle. The movement of placing the box on the

LETTER BOX.

HUDDERSFIELD TRAM CAR.

bracket automatically locks it in position and operates a shutter which opens the aperture for receiving letters. It is necessary to use the conductor's carriage key for disengaging the box, and the act of disengaging, operates the shutter again and closes the aperture for letters and it remains closed and cannot be opened until the letter box is opened by the postman, when the shutter is released automatically and put into position for receiving mail.

The number of letters posted annually in the boxes attached to the 20 street cars in operation is about 500,000. An arrangement is made with the postal authorities for the postal and telegraph staff to have the use of the cars when on duty; the amount of the contract, inclusive of the letter boxes, is £300 per annum.

The instructions, a copy of which is reproduced herewith, allow for letters to be posted at the various termini, rd. stages and authorized stopping places free, but rd. is charged for a stoppage for the sole purpose of posting a letter. This rule was considered necessary to prevent abuse, but no difficulty has been experienced, the public appearing very willing to walk to a stopping place.

Huddersfield  Corporation
TRAMWAYS.

POSTAL LETTER BOX
ON THE TRAM CARS.

For the convenience of the Outer Districts, arrangements have been made with the Postal Authorities to have a Letter Box attached to each Tram Car.

The Boxes will be cleared by the Postal Staff, at the times stated on the tablet attached to the Box.

Letters Posted in these Boxes are subject to the usual Postal Rules and Regulations.

INSTRUCTIONS.

Letters may be Posted at the various Termini, rd. Stages, and the authorised stopping places, Free

The Tram may be stopped at any other point for the purpose of Posting Letters, on payment of rd., which must be put into the Conductor's Fare Box.

BY ORDER

J. POGSON,

MANAGER.

*Tramways Department,
March 20th, 1893.*

The tramway arrangements of the town are very favorable for a satisfactory letter box system, all the cars converging on one center (St. George's Square), immediately in front of the railway station. The tramway offices and postoffice practically adjoin each other in the square.

TICKET BOOKS AT HAMILTON, O.

The Hamilton (O.) & Lindenwald Electric Transit Co. has decided to issue books of tickets at reduced rates and from the announcement published by the company we take the following:

Twelve tickets book, good for eight days (Sunday to Sunday inclusive), 40c each.

Fifty-two tickets book, good for one calendar month, \$1.65 each.

One hundred and four tickets book, good for one calendar month, \$3 each.

These tickets are to be detached by the conductor when used, and when presented by the person named on the cover, and are good only between the following hours: 5:30 a. m. to 7 a. m.; 12 m. to 1 p. m.; 5 p. m. to 7 p. m. (Saturdays 4 p. m. to 6 p. m.).

A liberal construction will be given to the above condition by conductors, who will be instructed to allow 20 minutes' latitude on same. Upon request a change in the conditions will be made so that holders of books, who are employed until say 9 p. m. can use the tickets when returning from work at night. In case purchaser is prevented through sickness, or other good cause, from using all of his tickets within the time specified, his unused tickets will be accepted at full price charged, in part payment on a new coupon book.

Fifty tickets book, good for 30 days from date of sale, \$1.85 each.

One hundred tickets book, good for 60 days from date of sale, \$3.50 each.

These tickets are good for all hours of the day, to be used by the person whose name is mentioned on the cover, or by any member of his family. The holder of this kind of coupon book may leave it at his home and detach tickets from it as needed.

One ticket, good for three months from date of sale, permitting person whose name is mentioned to ride as often as desired, \$10.

All of the special rate coupon books are for sale at the office of the H. & L. Electric Transit Co. An authorized agent in each shop will take orders for and deliver coupon books.

The announcement is signed by C. Benninghofen, president; J. J. McMaken, vice-president; P. Benninghofen, secretary and treasurer; C. E. Warwick, assistant secretary.

In answer to an inquiry as to the reasons which prompted these reductions President Benninghofen writes us: "We made the reductions because we wish to encourage street car riding. We undertook the active management of this road only quite recently and found it was necessary to adopt means whereby traffic would be increased. The change in rates is of such recent date that we cannot at present state how well the plan will work. However, we can say this much, that we are meeting with encouragement, and believe that ultimately the plan will prove successful."

◆◆◆

ANNUAL REPORT TWIN CITY RAPID TRANSIT CO.

Pres. Thomas Lowry, in transmitting the annual report for last year of the Twin City Rapid Transit Co., of Minneapolis, said:

"The gross earnings of the company for the fiscal year ending Dec. 31, 1899, have been \$2,522,793.85, as against \$2,170,716.01 for the year 1898. The cost of operation including taxes, has been 48.71 per cent. For the year 1898 this cost was 49.92 per cent, and for the year 1897, 53.18 per cent. The efficiency of the property in every respect has not only been maintained but increased. The surplus earnings for the year were \$737,578.60, which was an increase over the previous year of 49 per cent. After paying the regular quarterly dividends on the preferred stock, the surplus for the common stock was \$550,025.26. On August 15th the first dividend of one per cent, or \$150,100, was paid on the common stock, and on February 15th of this year a second dividend of 1½ per cent, or \$225,150, was paid. This left a balance in the surplus account of 1899 of \$174,775.26, carried to surplus account.

"During the year the company has cancelled \$20,000 of the remaining \$310,000 Minneapolis Street Railway Co.'s first mortgage 7 per cent bonds by the issue of \$20,000 consolidated mortgage 5 per cent bonds of the same company. By the sale of \$237,800 of the preferred stock of the company it has purchased \$291,000 St. Paul City Railway Co.'s 6 per cent debenture bonds.

"The company has likewise acquired further amounts of stock of the Minneapolis & St. Paul Suburban Railway Co. The St. Paul City Railway Co. has guaranteed for the latter company the principal and interest of \$450,000 25-year 5 per cent gold bonds, thus enabling the company to sell the bonds and make an important addition to its line which now joins with the lines of the St. Paul City Railway Co. and runs through the villages of North St. Paul, White Bear and Mahtomedi to the city of Stillwater, where it occupies the main street in that city.

"The whole line is operated by electric power from stations located in St. Paul, White Bear and the city of Stillwater. The road has been thoroughly equipped with large standard cars of the most improved type. It was opened for traffic July 1, 1899, and the earnings have proved satisfactory."

The operating expenses for the year are given as follows:

Maintenance of way and structures.....	\$ 33,820.00
Maintenance of equipment.....	165,364.44
Operation of power plant.....	147,467.12
Car services.....	602,601.79
General expenses.....	105,855.79
Legal expenses.....	21,099.92
Injuries and damages.....	72,910.64
Insurance.....	6,862.67

Total operating expenses.....\$1,156,972.37
 The number of car-miles run during the year was 13,211,865.

SLID-FLAT WHEELS.

At the January meeting of the Northwest Railway Club the subject of "Slid Flat Car Wheels" was discussed by Mr. F. B. Farmer, of the Westinghouse Air Brake Co. The author said that the general experience appeared to be that more wheels are skidded in winter when there is no snow, dust and frost being a combination most conducive to skidding. Proceeding to the other causes, he said in part:

Some time ago, while investigating the question of slid wheels, my attention was called to a machine that was being used at that time in the Soo shops. They grind cast wheels and mate and remount them. Noticing that a pair of wheels in the grinder had flat spots, and that the wheels were out of true, I asked the man to see if other cases were similar to this, showing that the large part of the wheel was just passing under the brake shoe, when the part having the flat spot would have been in contact with the rail. He followed it up for some time, and found that this is almost invariably true. On a road that had considerable trouble from cast wheels flattening, the matter was given some attention, and a device was got up for quickly testing this feature. They found a few cases where the wheels were bored out of center, traced them, and found a boring mill responsible for the poor condition; so that I think the two instances cited are sample illustrations of causes of wheels sliding.

It has been frequently remarked that when a wheel or a pair of wheels flattens, the next time they catch it will be in the same spot. I think this is more often due to such a cause as just mentioned rather than to the flat spot made in the first instance.

It may be of interest to hear of a test that was made on a western road some three years ago. Owing to the large number of flat wheels in a train of loaded cars, a test was made to determine about what pressure was necessary to slide wheels, and the distance necessary to produce a given length of flat spot. A loaded box car weighing 69,000 lb. at the rails, was charged to 100 lb. pressure, the brake was applied with full force standing, and the car was pulled for one-half mile. One pair of wheels turned almost the whole distance, two pairs slid intermittently, causing what is termed a "chain" flat, a succession of small flat spots, not serious enough to justify removal. One pair slid the entire distance, and had a 2¼-in. flat spot. Another test was made by applying the brake heavily, and pulling the car 100 ft. on what might be termed an ordinary rail, without sand. Then they examined the spot in contact with the rail and found scarcely any abrasion. The test was repeated on an undamaged spot, using sand the whole distance, and they found, upon examination, a 1-in. flat spot. So this shows how seriously sand may effect the flattening, and it indicates as well the small probability of wheels starting to revolve when sand is used after once locking. Of course, the great weight on the rail, with the car loaded, aided materially in causing this long flat spot, resulting from 100 ft. of sliding.

On the ore-carrying roads much trouble has been experienced from wheels sliding, due to several causes, the most important being that the empties are hauled one way, and the direction is generally an ascending grade. The grade and the empty cars enable the stop to be made with a very light application of the brake. In order to insure a release of applied brakes, the train-pipe pressure throughout the whole length of the train should be raised quickly and considerably. Where the reduction is small, the difference between the main reservoir pressure and the train line at the time of the release is correspondingly less than where the application is heavier. For that reason, holding the brake valve in the full-release position for a short length of time would give a sluggish flow toward the rear end and a lesser raise in pressure. If, to correct that, as far as possible, the brake valve is left in full release for a longer period, the brakes up at the head end are liable to be overcharged, and later on, through the temporary absence of any supply, the brakes may stick.

To overcome this the men have been instructed to insure, before attempting to release, a reduction of at least 10 to 15 lb. On one road they even went so far as to say that before attempting to release, a full service application of 20 lb. reduction should be made, and at the end of the season, whether from that or more attention being paid to other details, they had a better showing on the flat wheel question than previously. That same difficulty of

brakes sticking from a light application has been met with often on passenger trains, particularly when the engineman has applied the brake a little to steady the train around curves. It does not mean that the application made for the purpose of stopping the train at a given point must be any different than otherwise, but before the release is attempted enough should be added to that to insure the desired result.

NEW HAMPSHIRE ELECTRIC RAILWAYS.

The following is extracted from the "New Hampshire Railroad Commissioners' Report" for the year 1899 and gives that portion dealing with the electric railways in the state:

The Legislature of 1899 granted special charters for eight electric street roads: The Alton & Gilmanton, from Alton Bay to any point in the town of Gilmanton; the Claremont, between any points in the town of Claremont; the Derry & Pelham, from Derry Depot through the towns of Derry, Londonderry, Windham, and Pelham to the Massachusetts line; the Gilmanton & Barnstead, from any point in Gilmanton to any point in Barnstead; the Hudson, Pelham & Salem, from the Merrimack river in Hudson through the towns of Hudson, Pelham, Windham, and Salem to the Massachusetts line; the Meredith & Ossipee, from the steam railroad station in Meredith through the towns of Meredith, Center Harbor, Moultonborough, Sandwich, Tamworth, and Ossipee to the Boston & Maine Railroad in Ossipee; the Mont Vernon & Milford, from Milford village to any point in Mont Vernon, and the Troy, from the Fitchburg Railroad to the quarries of the Granite Co. It also authorized the Manchester Street Railway Co. to extend its road to Goffstown, extended the charters of the Keene road, and granted a charter to the Exeter, Hampton & Amesbury, with authority to consolidate in this corporation the Exeter & Hampton Street Ry., the Hampton & Amesbury Ry. and the Rockingham Electric companies.

All these street railway companies were authorized to occupy the highways, to issue stock and bonds, to construct and maintain dams and power-houses, and given all the rights, privileges and immunities that were asked for, but neither has built a rod of road or, so far as we are informed, taken any steps towards the use of its charter, for the reason that the grantees have not been able to convince capitalists that the enterprises could be made to pay.

The only new electric road construction of the year has been an extension of the Laconia road from Lakeport to the Weirs, another along Hampton Beach by the Exeter, Hampton & Amesbury Corporation, a short one in Manchester, and the production of a road from Portsmouth to Rye Center by the Boston & Maine. A petition for the approval of the issue of stock and bonds necessary to the construction of a road from Berlin to a point in Gorham, under a charter granted by the court upon the finding of the commission that the public good required it, is now pending before the board.

The Laconia road was extended from Lakeport to the Weirs to accommodate summer travel, and during the tourist season the extension had a paying patronage, but with the close of that season its business entirely disappeared, and the board, upon petition, authorized the managers to discontinue its operation until May 1, 1900.

The Legislature of 1899 passed an act imposing upon this board the duty of determining to what extent cars used upon electric roads in this state should be provided with vestibules and what the character of the vestibules should be.

After several public hearings and much investigation, it was ordered that all cars making regular round trips of more than fifteen minutes during the months of December, January, February and March should be vestibuled. This order was promptly complied with by the managers of the roads and the improvement is now in general use in this state. Experience thus far has abundantly justified the change.

The appearance of the cars is much better, the passengers are much more comfortable, and conductors and motormen are shielded from the winter weather which, when they worked upon open platforms, severely tested their powers of endurance, made them the objects of the pity of the public, and subjected their employers to bitter criticism.

None of the objections urged have been found to be important.

No accidents have resulted from the use of vestibules. No serious inconvenience has attended ingress or egress through them, and the testimony of motormen is that even in a storm when the windows are partially covered with snow or rain they can see as well and handle themselves better than they could when exposed as they were formerly.

The gross receipts and net earnings of all our completed street roads were larger in 1899 than in any previous year. Omitting the Laconia, which was being converted into an electric and extended, and the Exeter, Hampton & Amesbury and the Portsmouth, which were in process of construction, the footings for the year, as shown by the corporation returns, are as follows:

	Capital Stock.	Bonded Debt.	Floating Debt.	Earnings.	All Expenses.
Concord.....	\$100,000	\$118,500	\$12,325.00	\$67,364.02	\$56,230.37
Chester & Derry.....	50,000	50,000	7,301.46	10,340.23	10,314.63
Nashua.....	250,000	150,000	57,136.75	62,384.34	54,383.52
Manchester.....	170,000	250,000	36,559.95	162,074.43	162,455.77
Union.....	100,000	100,000	6,077.65	36,492.78	29,876.70
Totals.....	\$670,000	\$668,500	\$119,400.81	\$328,565.80	\$313,230.99

The expense account of the Manchester includes \$20,437.18 for the old accident claims. Making due allowance for this, the total payments of the five completed roads, including operating expenses, taxes, interest and incidentals, were \$292,793.81, and the receipts were \$328,565.80, a net income of \$35,771.99, or about 5 1-3 per cent on the capital stock, which is \$670,000. No dividends were paid, the divisible income being applied to floating indebtedness.

STORAGE BATTERY DECISION.

The United States Circuit Court of Appeals for the First Circuit (Judges Putnam, Aldrich and Brown) recently rendered a decision in the case of the Electric Storage Battery Co. against the Hatch Storage Battery Co., affirming the decision of the Circuit Court (Judge Colt) wherein the Hatch battery was held to be an infringement of the Brush patent, owned by the Electric Storage Battery Co., and an injunction granted against the further manufacture and sale of the Hatch battery. The opinion says that the Hatch battery "is clearly an infringement" and "it also seems clear to us that the respondent has taken the complainant's device," the court therefore affirmed the decretal order appealed from, with special reference to the first claim of the Brush patent, which is the basic claim.

This is the broadest legal victory yet won by the Electric Storage Battery Co. and secures to it a continuation of its monopoly during the life of the patent, on batteries composed of "a plate or suitable support primarily coated or combined with a chemically applied oxide or lead or equivalent lead compound" without which a commercial storage battery is impossible. This litigation has been pending for the past three years and has been most vigorously contested throughout, the Electric Storage Battery Co. being represented by John R. Bennett of New York and the Hatch company by Causten Brown and Alexander P. Brown, of Boston.

MANUFACTURERS' EXHIBIT AT NEW YORK.

The International Land & Exhibition Co. has been incorporated with a capital stock of \$500,000 for the purpose of extending to inland manufacturing concerns the privileges of an office in New York City. It has secured a space of 10,000 sq. ft. occupying the northwesterly quarter of the ground floor of the Bowling Green Building, and this will be devoted to exhibits of machinery, samples, etc., for clients. In connection with the showroom the company will have an export department, with branches in Europe, Mexico, Central and South America, Asia, Africa and Australia, a patent department and a land department. The charge for exhibition space is \$6 per sq. ft. per year. Mr. Albert Krimmert, Bowling Green Building, New York, is president of the company.

FIXED STOPPING POINTS FOR CARS.

The street railways at Worcester, Mass., and Hartford, Conn., are endeavoring to reduce the number of necessary stops made by their cars in service by stopping only at fixed points indicated by suitable signs. In discussing the change the Hartford Courant says that it is "informed that one motorman on the Asylum Ave. line whose running time is 10 hours a day, recently made a count and found that he stopped 550 times in the 600 minutes. It needs only to give (and accept) the figures to see how the business of running the car must have been interrupted. Of course, cars must stop. If they did not, they would be of no use. But stopping every minute all day long suggests that people stand in a long row and wait to be picked up. This is an apparent convenience to them, but, when you study it and note that whoever takes the car is stopped for but once and then has to be delayed by all the stops for others, the question opens whether the frequency of stops helps anybody as much as it hampers."

Some doubt is expressed as to the accuracy of the count but after a liberal allowance for excess of zeal it is evident that there is room for a marked reduction in the number of stops with corresponding increase in the convenience of the service.

STATISTICS FROM LIVERPOOL.

By the end of 1898 the city of Liverpool had $6\frac{1}{4}$ miles of electric road which had been built as an experiment. During 1899 over 30 miles were reconstructed for electric traction. In 1898 the traffic receipts were £311,610; passengers carried, 41,772,034; car-miles run, 4,789,300. In 1899 the receipts were £356,265; passengers carried, 63,771,450; car-miles run, 7,600,545. Of these passengers the electric cars carried 15,853,160; horse cars, 39,321,946; omnibuses, 8,596,344. In 1898 the rolling stock actually in service comprised 12 electric cars, 187 horse cars, 80 omnibuses; in 1899 there were 70 electric cars, 180 horse cars and 40 omnibuses in use, showing that the electric traffic was new business or obtained at the expense of the omnibus traffic.

Up to the first of the year the total expenditures on the tramway account aggregated £260,000, but the proposed expenditure for this year is over £600,000, of which £140,000 is for cars.

COLUMBUS (O.) CONTROVERSY.

The press dispatches from Columbus, O., of late have been full of accounts of the controversy pending between the Columbus Railway Co. and the city council over the renewal of franchises. In a letter to the mayor, Mr. E. K. Stewart, vice-president of the company, sets forth that the present dispute is not of the company's making and explains why a franchise ordinance was proposed. Last fall the Columbus Ry. acquired the property of the Columbus Central Ry. and in accordance with the general desire of the public wished to secure connections between these lines and its old High St. line. In anticipation of being able to get the necessary grants surveys were made and the special work bought at a cost of over \$25,000. On making application to the council, however, an outcry was raised that the street railway company was trying to get new franchises. The company was not seeking renewals, as the present grants do not expire for from 11 to 17 years, but at the request of the board of trade it prepared an ordinance for a 25-year extension of its High St. franchise and offered to pay the city \$50,000. This offer was rejected by the board of public works.

1,000 MILES BY TROLLEY.

Mrs. Jane Lindsey, in the New York World, describes the details of a trip of 1,008 miles by trolley which was as nearly continuous as schedules would permit; the time spent on the cars was 112 hours, 25 minutes, and the money spent in fares over the electric lines was \$12.05. During the trip which occupied just one week it was necessary to ride 54 miles in conveyances other than electric cars to cover breaks.

The start was made from Paterson, N. J., Friday, Feb. 9, 1900, at 9 p. m. The route was from Paterson to New York, via Passaic, Rutherford and Hoboken; thence to Coney Island and return; thence to Boston, via Mt. Vernon, New Rochelle, Bridgeport, New Haven, Hartford, Worcester, South Framingham, Niantic and New-

ton; thence to Nashua, N. H., via Lowell, and return; from Boston to Rockport, via Stoneham, Wakefield and Gloucester, and return, via Beverly; from Boston to Providence, R. I.; thence to Taunton; thence to Boston via Fall River, New Bedford and Brockton; from Boston to Worcester, via Needham; thence to New York over the same route as from New York to Worcester.

NO STRIKE AT ST. LOUIS.

As we went to press last month there was a strike threatened by the employes of the St. Louis Transit Co., the men asking for recognition of their union, a 10-hour day and uniform rate of wages. On March 11th the company and a committee of the men reached an agreement embodied in the following language:

"We will fairly inquire into every case, and any man discharged solely on the ground that he belonged to the union will be re-employed.

"Ten-hour work day, completed within 12 consecutive hours when possible, and a uniform rate of 20 cents an hour. Uniform rate may be established at once if the men wish.

"Men ordered to report for duty at a specified hour shall be paid from that hour until relieved. If not put on duty to receive half pay until relieved.

"Firemen, greasers, motor inspectors, car-washers and shedmen to be paid for overtime. We will meet any individual employe or any committee of employes in relation to any grievance."

Professional agitators worked up the strike situation, but the prompt, determined and eminently fair proposition laid down by General Manager Coleman left nothing to strike for.

REPORT OF THE CHARLESTON COMPANY.

The Charleston (S. C.) Consolidation Railway, Gas & Electric Co. was organized Feb. 21, 1899 (St. Ry. Rev., Apr., 1899, p. 268) under a special act of the Legislature granting a perpetual charter and gas and electric light powers, and controls the whole transportation and lighting field of Charleston. The only securities of the company are the following: Stock, \$1,500,000. Charleston City Ry., first mortgage 5 per cent gold bonds, \$816,000. Consolidated mortgage 5 per cent gold bonds, \$1,664,000. The authorized issue of the Consolidated bonds is \$2,500,000, of which \$850,000 is held in the treasury to retire the Charleston City bonds when due in 1923.

President Carey advises us that the earnings for the year ending Mar. 28, 1900, were \$439,920.85, and the operating expenses \$280,742.76, leaving \$159,178.09 net earnings.

The company owns 40 miles of electric road, of which 30 miles are in Charleston and 10 miles from Mount Pleasant (connecting by ferry with Charleston) to Sullivan's Island and Isle of Palms, a pleasure resort on the Atlantic coast, including land at Isle of Palms, ferry, etc. The company is consolidating all of its three power stations in one and in March, 1900, its addition to its City Ry. power station for that purpose was rapidly approaching completion. On completion both railway systems and light and power division will be operated from same station; the Seashore division having been connected by submarine cable.

The officers are: President, Francis K. Carey; vice-president, Philip H. Gadsden; general manager, Nicholas S. Hill, jr.; auditor, P. J. Balaguer; cashier, Montague Trieste. The directors are: Francis K. Carey, Robert C. Davidson, J. Bannister Hall, of Baltimore, and Philip H. Gadsden, Samuel H. Wilson, J. S. Buist, George B. Edwards, George W. Williams, jr., George A. Wagener and William M. Bird, of Charleston. Offices, No. 141 Meeting St., Charleston.

LONG ELECTRIC LINE IN AUSTRIA.

Mr. Josef Mechtl-Steinmanger in a recent article in the *Electrotechnischer Anzeiger* describes the electrical equipment of a proposed double-track tramway between Vienna and Pressburg, Austria. A stretch of 55 miles is to be worked from one power station; the whole system comprises over 60 miles. The power station will be at Hainburg on the Danube, where a fall of 19 ft. will be utilized. The generators of 250 kw. each will furnish alternating and continuous currents simultaneously from one winding.

G. W. KNOX.

Mr. George W. Knox, who recently resigned his position as electrical engineer of the Chicago City Railway Co., has associated himself with the firm of Kohler Brothers, engineers and contractors, as engineer and manager of the railway department. This

G. W. KNOX.

firm is prepared to engage in general railway engineering and construction work, commencing with the bare ground, building the road, equipping it completely and turning it over ready for operation. Mr. Knox is particularly well fitted for undertaking the direction of this department, having been engaged in similar work for the past 15 years. In 1885 he was employed in the mechanical department of the Chicago, Burlington & Northern; two years later he went with the Pullman company, being in the street car department of the works; the following year he was

with the Thomson-Houston company and in 1886 entered the service of the Sprague Electric Railway & Motor Co., with headquarters in Chicago, having charge of the electrical equipment of cars built at the Pullman shops.

In 1890 Mr. Knox was in charge of work for the Sprague company in equipping the West Side or Becker line in Milwaukee; the next year the company sent him to Minneapolis and St. Paul where he was assistant to the chief engineer in charge of the car and station equipment for over 200 miles of road. When this installation was completed Mr. Knox continued with the Edison General Electric Co., successor to the Sprague company, and was engaged at Milwaukee, Cincinnati, Columbus, Newark and elsewhere. In 1892 he went to Kansas City to superintend the conversion of the elevated road for electric traction and while there was offered a position with the Chicago City Ry.

Mr. Knox remained with the Chicago City Ry. for 7½ years, and three years ago was placed in charge of the track construction and general construction work of the entire system, with the title of engineer of construction, by the late Mr. M. K. Bowen, who was then general manager of the company. This long experience makes Mr. Knox well qualified for the work he has undertaken and we predict his success.

MUNICIPAL WIRING IN BOSTON.

The advocates of municipal ownership will find little comfort in the report of Mr. William Brophy, chief electrician of the Boston wire department, recently made to the mayor. This department was inaugurated several years ago by Mayor Quincy, together with other city undertakings with the avowed object of protecting the municipal treasury from the raids of private contractors. Details of the cost of work done by the wiring department of the electrical-construction division of public buildings show that the work as a rule cost about 2½ times the estimated cost, and on a number of instances where bids from private contractors had been rejected, the cost of the work to the city was about 60 per cent more than the amount of the rejected bids.

This difference is largely due to the class of labor. Mr. Brophy says: "A glance at the pay-rolls shows that nearly 60 per cent of the men whose names they contain were appointed at the request of certain prominent gentlemen, who, to say the least, are not the best judges of the necessary qualifications of the employes of this department. Electrical contractors employ only a sufficient number of men to meet the requirements of their business. Not so with the head of this department, for when, in his judgment, the force should be reduced, owing to lack of business, he meets with a most decided opposition from the friends of the men whose services sound business principles prompt him to dispense with. In nine cases out of ten the men selected for dismissal, because their services are not required, owe their appointment to some active politician, high in the councils of his party, who sees to it that his friends are

reinstated, regardless of the city's interest or the condition of its treasury. As a result of this unwarrantable interference men are kept on the pay-roll whose services are not needed, and others who never should have been employed. Discipline, which is so necessary for the success of any establishment, cannot be maintained in this department so long as a large percentage of its employes can retain their position, not through any effort of their own, but owing to party exigencies."

He recommends that the electrical construction division be discontinued.

A NEW STYLE OF ELECTRICALLY-DRIVEN VENTILATING WHEEL.

In the accompanying illustration is shown a form of ventilating wheel with special eight-pole attached motor, recently designed and constructed by the B. F. Sturtevant Co., of Boston, Mass. The fan is arranged with a large inlet for admission of air through one side only, has curved blades, and a conoidal plate concentric with the inlet, which serves to gradually deflect the air from an axial to a radial movement. In the inlet is placed a continuous-oiling journal box, which supports the fan shaft upon that side. Immediately outside and at the back of the wheel is a flanged coupling which joins the fan shaft to the motor shaft.

The motor is built within a wrought iron field ring. Attached to each side of the ring are tripod supports which carry the ring oiler bearings and absolutely center the armature within the field. The field cores are of wrought iron, with a special type of cast iron pole shoe, the peculiar size and shape of which makes possible extreme variation in load without sparking or adjustment of the brushes.

STURTEVANT VENTILATING WHEEL.

The armature coils are built up of laminated slotted discs which are solidly clamped between brass rings, having teeth to correspond with the core teeth which support both edges of the core. The commutator is built up of pure drop-forged copper segments and is of large diameter. Self-adjusting and self-feeding brush holders with carbon brushes are used.

This type of electric fan is employed without a casing, and usually arranged to draw the air through an opening in a wall and discharge it at a comparatively low velocity into the space within which is located the fan and the motor.

By the blowing of a fuse a conductor on the Metropolitan Street Ry., of New York, had the sight of both eyes destroyed. One fuse had blown out and the man was under the car making repairs when the second fuse flashed in his face.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

PHOTOGRAPHS AS EVIDENCE.

Stewart v. St. Paul City Railway Co. (Minn.), 80 N. W. Rep. 855. Nov. 17, 1899.

Photographs are frequently admitted in evidence as either secondary or demonstrative evidence, according to the method of their use. As demonstrative evidence they are competent whenever it is important that the locus in quo or place in which interest centers, or any object, person, or thing, be described to the jury. In such cases they serve to illustrate and apply the testimony, and are aids to the court or jury in comprehending the questions in dispute, as affected by the evidence. But their value depends upon their accuracy. They must be shown by extrinsic evidence to be faithful representations of the place or subject as it existed at the time involved in the controversy.

Here was an action for personal injuries caused by the alleged negligence of the defendant in stopping its car for a passenger to alight at an unsafe place. The principal issue being the distance from the car steps to a hole in the street, the defendant, after the hole had been filled, and about eight months after the accident occurred, placed the car where it claimed it stood at the time of the accident, and placed a crowbar in a vertical position where it claimed the hole had been, and then caused a photograph of the surroundings to be taken. Upon the trial the defendant offered the photograph in evidence, accompanied by an offer to prove that the car stood about where it stood when the accident occurred, and that the crowbar correctly indicated the location of the hole.

In this case, the photograph was evidently offered as demonstrative evidence. The mere fact that the hole had been filled up would not of itself, the supreme court of Minnesota holds, be sufficient ground for excluding the photograph, if otherwise competent. But it points out that not only had the hole been filled up, but the car had been removed, and the defendant attempted to reproduce the former condition of things, while the value, if any, of the photograph depended upon the fact that the condition existing when it was taken was an exactly accurate reproduction of the condition existing when the accident occurred, and an error of a single foot in the location of the car or of the hole might render the photograph very misleading to the jury. Moreover, it says that in this case a photograph would have had no real value as demonstrative evidence. Given the exact location of the hole and of the car at the time of the accident, the distance and direction of the one from the other was a mere mathematical problem, to be solved by a measurement on the face of the earth. The photograph could in no way aid in this matter. Its only effect would be to possibly mislead the jury, and give them an erroneous impression of distance, resulting either from the manner in which it was taken, or from error in the evidence tending to show that the car and the crowbar constituted an exact reproduction of the condition existing at the time of the accident—prone, as juries would naturally be, to accept any photograph as absolutely correct, not only as to the physical objects which it represents, but also as to the impressions which it conveys as to size and distance.

Under such circumstances, the supreme court does not consider that there was any error in refusing to admit the photograph in evidence.

LIABILITY FOR INSULTING AND INDECENT LANGUAGE OF EMPLOYEE.

Knoxville Traction Co. v. Lane (Tenn.), 53 S. W. Rep. 557. Oct. 28, 1899.

When Mrs. Lane entered the car of the company here sued, and paid her fare, there was an implied contract on the part of the company, the supreme court of Tennessee holds, that she should receive proper, polite, and courteous treatment from its employes, and that she should be protected against hearing obscenity, witnessing immodest conduct, or submitting to wanton approach; and a violation of this contract on the part of the company was actionable, and entitled her to some damages. The contract to carry passengers is not one of mere toleration and duty to transport the

passenger on its cars, but it also includes the obligation on the part of the carrier to guaranty to its passengers respectful and courteous treatment, and to protect them, not only from violence and insults from strangers, but also against violence and insult from the carrier's own servants.

It is well-settled law, the court goes on to say, that, in all cases where the master owes a contractual duty to third persons or to the public, he cannot shirk or evade it by committing its performance to another, but is bound absolutely to perform the duty, and is liable for a failure to do so in any respect whereby injury results to others, whether such failure results from negligence, or from the willful, wanton, or criminal conduct of the agent to whom the duty is committed. Being bound to do the act or perform the duty, if he does it by another the master is treated as having done it himself; and the fact that his servant or agent acted contrary to his instructions, without his consent, or even fraudulently, will not excuse him.

Either the company or the passenger must take the risk of infirmities of temper, maliciousness, and misconduct of the employes whom the company has placed upon its cars, and to whom it has committed the discharge of its duty to protect and look after the safety of its passengers. A passenger has no control over them, and the company alone has the power to select and remove them. It is therefore but just to make the company, rather than the passengers, take the risk, and to hold it responsible.

This leads the court to the conclusion that the defendant company was liable for an injury and insult willfully inflicted upon Mrs. Lane by its employe (a motorman) while engaged in performing the duty which the company owed to her, although the company was guilty of no negligence in selecting its employes, and did not authorize or ratify the servant's wrongful act. Any other rule, it adds, might place the traveling public at the mercy of a reckless and vicious employe.

The gravamen of the action being for the defendant's breach of its contract of carriage, which included, as above stated, the duty to protect the passenger from insult or injury either by its employes or third persons, and this contract on the part of the defendant having been directly violated by the inexcusable conduct of its servants, the court holds that not only did the contract give her a clear right of action and entitle her to recover some damages, but that she might maintain her action to recover all the damages she might show herself to have sustained by reason of the wrongful act of the defendant's agent, including injuries to her feelings and sensibilities. Nor does it consider \$500 an excessive award in this case.

Moreover, inasmuch as the act of the servant in this case was the act of the master, and was oppressive and insulting in the highest degree, showing an utter disregard of the rights of the passenger under its protection, the court holds that the trial judge very properly charged the jury that, in its discretion, it might find vindictive or punitive damages against the defendant. Exemplary damages, it says, are allowed when a wrongful act is done with a bad motive and in disregard of social obligations, or where there is negligence so gross as to amount to positive misconduct.

TEST OF NEGLIGENCE IN NOT HAVING SECOND MAN ON CAR.

Palmer v. Winona Railway & Light Co. (Minn.), 80 N. W. Rep. 869. Nov. 22, 1899.

A passenger was injured in getting off a street car on which one man performed the services of both motorman and conductor. He put the blame on the motorman suddenly starting the car while he stood upon the step and was about to step off. The motorman testified that, although he told him to wait until he stopped the car, the passenger stepped off before the car stopped, while he turned to set the brake.

The court charged the jury as follows: "I charge you that the evidence in this case is not sufficient to warrant you in finding that the want of a conductor was the proximate cause of the injury to the plaintiff; and you are therefore instructed to leave that alleged fact entirely out of consideration, except so far, if at all, as

you may think the want of a conductor increased the degree of care and watchfulness required from the motorman, and, of course, from the company, through the motorman." The company requested the court to charge as follows, and the court gave the request, with the modification inclosed in brackets, following the same: "The fact that defendant company was operating its cars without a conductor on the occasion in question is in itself no evidence of negligence. It had a right to so operate its cars. And you will therefore disregard that fact in your deliberation (except so far, if at all, as the absence of the conductor rendered necessary an increase of care and attention on the part of the motorman)." Now, the supreme court of Minnesota holds that the defendant was entitled to have the request given without the modification, and that the part of the charge included in the modification was erroneous, as was also the corresponding part of the charge first quoted; and for this error it has granted a new trial.

The supreme court says that even if it were conceded that, had there been a conductor on the car, he could, and, in the exercise of due care in the performance of his duty, should, have intervened between the motorman and the plaintiff, and prevented this accident, still there was no evidence in the case which warranted the jury in finding that the defendant was negligent in failing to have a conductor on the car. In the absence of any valid law or ordinance regulating the matter, the mere fact that in a particular instance an injury might have been averted if the street railway company had employed two men to operate and manage its car, instead of one, is not the test whether or not the company is negligent in failing to employ the second man. A number of other circumstances must be taken into consideration. Taking into consideration the expense of employing the second man on the car, are the amount of traffic on the streets, the amount of traffic on the cars, and the danger to be encountered in operating the cars over the particular route, so great that the company is negligent in failing to employ the second man? A street railway company may be guilty of negligence in failing to employ the second man in a large city, where the streets are crowded with pedestrians and vehicles, or the cars are crowded with passengers, or both, while it would not be guilty of negligence in failing to employ the second man in a small city, where there is less travel on the streets or in the cars, or both. Again, the rate of speed at which the street cars run, the absence or presence of grade railroad crossings which are dangerous, and other circumstances, should often be considered. Of course, the negligence of the company in failing to employ the second man must also be the proximate cause of the injury.

The burden, the court holds, was on the plaintiff to show that the defendant was negligent in failing to employ a conductor or second man on its cars, or on this particular car. There was, as stated, no evidence showing such negligence in this case, and the court holds that if the company was not negligent in failing to employ a conductor, it was not liable at all, if the motorman used proper care. True, proper care is care commensurate with the occasion, but, the court holds, the test is not the amount of watchfulness and care which two men might in this particular instance have used, when it was not the duty of the company to employ two men. The parts of the charges condemned were misleading in that they left the jury to infer that it was the duty of the one man to exercise as much watchfulness and care as the two would, under the circumstances, have exercised.

CARE REQUIRED IN OPERATING CAR DRAWN BY MULES.

Brown v. Louisville Railway Co. (Ky.), 53 S. W. Rep. 1041. Nov. 23, 1899.

Where a street car is drawn by mules, the court of appeals of Kentucky applies the same rule which it long ago laid down in the case of a street car propelled by horse power, namely, that the carrier of passengers for hire operating it must use the utmost care and skill which prudent men are accustomed to use under like circumstances.

USUAL NOISE OF POWER PLANTS NOT ACTIONABLE.

Hughes v. General Electric Light & Power Co. (Ky.), 54 S. W. Rep. 723. Jan. 6, 1900.

Where a noise produced in the operation of an electric plant used

to furnish power for a street railway and electric lighting is only the usual and ordinary sound incident to a careful operation of such plants, the court of appeals of Kentucky holds that no action for damages can be maintained therefor by an adjacent landowner.

SOME THINGS REQUIRED OF PERSONS DRIVING ACROSS TRACKS.

Ponsano v. St. Charles Street Railroad Co. (La.), 26 So. Rep. 820. Dec. 4, 1899.

The supreme court of Louisiana says in this case, wherein it affirms a judgment for the defendant company, that those who drive across railroad tracks, unlike those who, as passengers, submit themselves to the control of the carrier, and who are not called upon to do more than remain strictly in their places, must exercise some vigilance, and they must not assume unnecessary danger. They must guard against the danger of thoughtlessness and pre-occupation, and avoid reckless driving to cross in advance of a coming car.

CARE REQUIRED IN GOING TO MEET ANOTHER CAR.

Hudson v. People's Street Railway Co. (Mass.), 55 N. E. Rep. 464. Dec. 6, 1899.

When going to meet another car beyond the regular place of meeting, even under orders, when he has every reason to believe that such meeting will not be expected by the conductor or motorman on the other car, the supreme judicial court of Massachusetts holds that it is a motorman's duty, after passing the regular turnout, to run his car very carefully, and, except in places where the road is visible for a long distance before, very slowly, using special care if going down hill on slippery rails.

EJECTED TOO SOON BY SECOND CONDUCTOR.

Vining v. Detroit, Ypsilanti & Ann Arbor Railway (Mich.), 80 N. W. Rep. 1080. Dec. 12, 1899.

Two street railway companies, one operating what might be termed a rural and the other a city road, having an arrangement whereby the former used the tracks of the latter, coupon tickets being employed, and each company having its own conductor on its own portion of the line, the supreme court of Michigan holds that, where the city conductor took the wrong coupon, and the rural conductor got on the car and demanded that coupon before the car reached the point to which the city coupon entitled the passenger to ride, the rural road company was liable to him in damages for an ejection before the limit of his right to ride had expired, he having in his possession the city coupon and delivered it to the rural conductor, although, presumably, for the rural ride, which he was refused on it.

CAN BE PROHIBITED BY LAW FROM BURNING SOFT COAL AT POWER HOUSE.

City of Brooklyn v. Nassau Electric Railroad Co. (N. Y.), 61 N. Y. Supp. 33. Nov. 21, 1899.

Chapter 322, Laws of New York of 1895, entitled "An act to prevent the burning of soft coal in factories in the city of Brooklyn," which provides under penalty of a fine for a violation thereof, that "no factory, engine-room or electrical station shall use what is known as soft coal for fuel in the furnaces of such factories, engine-room or electrical stations within a radius of four miles of the city hall in the city of Brooklyn, except for the purpose of heating or welding iron or steel," the appellate division, second department, supreme court of New York holds within the police power of the legislature to enact and therefore constitutional.

OPERATION OF ROAD ACCEPTANCE OF SPEED LIMIT IN FRANCHISE ORDINANCE.

Chouquette v. Southern Electric Railroad Co. (Mo.), 53 S. W. Rep. 897. Nov. 14, 1899.

It would be illogical, the supreme court of Missouri, division No. 1, thinks, to hold that a street railway company which had obtained its franchise and right to use the streets of a city under an ordinance limiting the speed of its cars should require any further

assent thereto than is implied and shown by the operation of its road upon the streets of the city in pursuance of the ordinance granting the franchise. Indeed, it expressly holds that, where, by the provisions of an ordinance under which a company acquired its franchise, its cars could be run only at a prescribed rate of speed, the operation of the road under such ordinance was a sufficient acceptance thereof, and bound the company to an observance of its provisions with respect to the rate of speed.

SUDDEN STOPPING OF SLOWLY MOVING CAR NOT GROUND OF LIABILITY.

Hoffman v. Third Avenue Railroad Co. (N. Y.), 61 N. Y. Supp. 590. Dec. 15, 1899.

The rule applied to steam railroads, that where trains running at a great rate of speed leave the track, and passengers are injured, presents a question which calls for an explanation from the company, the appellate division, first department, supreme court of New York declares, has never been applied to street cars in a city, proceeding at a slow pace. More particularly, does it hold entirely different from the cases in which the nature of the accident is of itself evidence of negligence the case presented where a car, going at a rate that a man can walk, suddenly comes to a stop upon a crowded street, when it affirmatively appears that the gripman who controlled the car had nothing to do with stopping it. And, not being prepared to say that in every case where a passenger in a street railway car, without apparent cause, is injured, there is a presumption of negligence, it holds it improper to submit to a jury a case such as that just mentioned.

WAY ATTORNEY'S LIEN AFFECTS SETTLEMENT.

Schriever v. Brooklyn Heights Railroad Co. (N. Y.), 61 N. Y. Supp. 644 Dec., 1899.

Section 66 of the New York Code of Civil Procedure gives the plaintiff's attorney a lien on the cause of action for his compensation, and says that "lien cannot be affected by any settlement between the parties before or after judgment." Nor, it is settled, need any formal notice of such lien be given to the opposite party, the statute itself being notice. However, an attorney's lien, Mr. Justice Gaynor holds, at a special term of the supreme court, King's county, is subject to the right of the parties to settle the action. The policy of the law that litigation have an end, he thinks, would seem to forbid a contrary suggestion. But, he holds, if the money be paid over to the client, without the consent of his attorney, and such client is irresponsible, and does not pay the attorney, and the money cannot be reached by the court, the party paying it does not escape the attorney's lien. He must nevertheless pay the attorney the amount of his lien. The sum paid in settlement serves as a basis for fixing the amount of his lien, the same as a judgment would.

COLLISION WITH AMBULANCE.

Buys v. Third Avenue Railroad Co. (N. Y.), 61 N. Y. Supp. 113. Nov. 28, 1899.

A judgment in favor of a hospital surgeon for damages for personal injuries which he sustained in a collision wherein one of the rear wheels of an ambulance going to answer a call was struck by a cable car is here affirmed by the appellate division, second department, supreme court of New York. It says that it has been held that a violation of a municipal ordinance is some evidence of negligence, and holds that it was proper on this trial to place before the jury the ordinance of the city of New York giving to ambulances the right of way, as that was one of the restrictions under which the defendant company operated its cars. At street intersections the rights of all vehicles, in the absence of municipal or statutory regulations, it states, are equal, but considerations of humanity step in, and determine that ambulances shall have the right of way, and the defendant owed the duty to the public of operating its cars with reference to that ordinance. The duty to give the right of way is not absolute; it must "yield the right of way where possible," continues the court, apparently quoting from the ordinance referred to; and, it holds, it was proper that the jury should have this ordinance in view when determining the question of the defendant's negligence.

DELAY OF 10 YEARS TO BUILD ROAD ACCOUNTED GROSS LACHES.

East St. Louis Connecting Railway Co. v. City of East St. Louis (Ill.), 55 N. E. Rep. 533. Oct. 16, 1899. Rehearing denied Dec. 13, 1899.

In this case the supreme court of Illinois adopts the opinion of the appellate court, holding, in effect, that, notwithstanding that there may have been in an ordinance granting a right of way no limit of time in which the road must be constructed, and notwithstanding that a repealing ordinance passed a few days after the granting ordinance may have been ineffective on account of a prior formal acceptance of the latter by the payment of the small consideration charged therefor, nevertheless, a delay of more than ten years to build the road was such gross laches, when the conditions of the city had greatly changed in the meantime, it having doubled its population and built a \$50,000 school house on one of the streets, that a court of equity would not decree a specific performance of the contract, or, in other words, would not restrain the city from preventing the construction of the road.

GIVING UP SEAT TO WOMAN AND RIDING ON RUNNING BOARD.

Brainard v. Nassau Electric Railroad Co. (N. Y.), 61 N. Y. Supp. 74. Nov. 28, 1899.

Custom, even at Coney Island, the appellate division, second department, supreme court of New York insists, has not deadened all sense of courtesy; and, if it had, it goes on to say, it should continue to think that the law of negligence has still a sufficient respect for the amenities of life as not per se to charge as negligence the surrender of a seat by a man to woman. So it holds here that the fact that a man had an opportunity to occupy a seat he had by his wife, and voluntarily surrendered such right to another passenger, did not charge him with contributory negligence, as matter of law. Such question, it explains, is usually one of fact, and is dependent upon the circumstances. In this case the surrender, it says, was made to a woman, who may be presumed to have been weaker than the man who gave up his seat. The car being crowded with passengers, the court holds that riding upon the running board was not in itself or per se negligence. On the other hand, it holds that the evidence being such as to warrant the conclusion that the man was thrown from the car by reason of a sudden violent jerk inconsistent with its prudent and careful management, this condition was sufficient to warrant a finding of negligence in the operation of the car. It moreover holds it fair to assume that the man, as he stood upon the running board of the car, was using such means as were furnished for security to a person standing thereon.

ATTEMPTING TO RESCUE CHILD FROM IN FRONT OF CAR NOT CONTRIBUTORY NEGLIGENCE.

Hirschman v. Dry Dock, East Broadway & Battery Railroad Co. (N. Y.), 61 N. Y. Supp. 304. Dec. 8, 1899.

As a mother and her little child, between 2 and 3 years of age, were sitting on a stoop in front of the house one afternoon, a horse car approached at a rapid rate, and the child ran away from its mother, and upon the track in front of the car. The mother ran after it, and, apparently being unable to reach the child, seized the horses by their heads and attempted to stop them. In this attempt she was unsuccessful, was thrown down, and was seriously hurt. For the personal injuries which she thus sustained she brought this action to recover damages. In disposing of the case, the appellate division, first department, supreme court of New York says that it is but fair to state that, from the testimony, the child was in imminent danger of death when the mother went to its rescue. It also declares that the rule is well established in that state that it is not contributory negligence for a person to put himself in a place of peril for the purpose of rescuing another who is in serious danger of injury because of the negligence of the defendant. And it holds that, so far as the question of contributory negligence was concerned, the plaintiff, brought herself within the foregoing rule. But failing to find any evidence that the plaintiff was guilty of negligence by reason of which the child was in peril, the only inference to be drawn from the evidence being that it ran upon the track so unexpectedly, and so close to the rapidly approaching car that the driver had no opportunity to take any steps to stop the car or to

save the little one from injury, it holds that it was proper to dismiss the complaint.

INFERENCES AS TO ACCEPTANCES OF ORDINANCES FROM GIVING OF BONDS.

Murphy v. Lindell Railway Co. (Mo.), 54 S. W. Rep. 442. Nov. 14, 1899.

That an agreement to observe a city ordinance may be inferred from a covenant in a bond to indemnify the city against any damages that may occur to the city by reason of the failure of the obligor to comply with the terms and conditions of the ordinance is, the supreme court of Missouri, division No. 1, thinks, quite reasonable. But acceptance of an ordinance providing that the motorman, conductor or other person in charge of a car shall keep a vigilant watch for all vehicles and persons in front, either on the track or moving towards it, and on the first appearance of danger to stop the car in the shortest time and space possible, the court holds, is not to be inferred from the giving of such a bond, because the city could not be held in damages for any failure of the company giving the bond or any one else to obey the provisions of such an ordinance. At the same time, the court says that the admission of a company that it was operating a street railway under a lease from another company would put it in the shoes of such other company, and it would be bound by the agreement of the latter to observe the provisions of the ordinance, if proven.

ARREST AND DECLARATION OF DRIVER ON RETURN TRIP NOT EVIDENCE AGAINST COMPANY.

Seipp v. Dry Dock, East Broadway & Battery Railroad Co. (N. Y.), 61 N. Y. Supp. 409. Dec. 8, 1899.

In an action brought to recover damages for the death of a person alleged to have been caused by injuries received in a collision between a street car and an ice wagon, the appellate division, first department, supreme court of New York holds that it was clearly error to permit the plaintiff to prove, under the defendant's objection and exception, that, on his next return trip after the accident, the driver of the car was arrested by a police officer, and that, upon the arrest, he told this police officer that he was the man he wanted. The fact of the arrest, the court holds, was irrelevant and its admission, it says, was likely to influence the jury adversely to the company's contention that the car never struck the wagon, but that the accident was caused by the latter's jolting against another company's tracks at a crossing, and it deems it especially likely to influence the jury adversely with regard to the driver's credibility, whose testimony on the trial supported the company's contention. Then, the declaration of the driver, made on a subsequent trip,—a declaration from which the jury might fairly have inferred that he deemed himself at fault, and was looking for the policeman to make a voluntary surrender,—it holds was equally inadmissible, the authorities being all one way on this point.

FAVORS MAKING TIME CONDITION SHORTER THAN STATUTORY LIMIT AND REQUIRES PROOF OF CONSENTS.

Dusenberry v. New York, Westchester & Connecticut Traction Co. (N. Y.), 61 N. Y. Supp. 420. Dec. 5, 1899.

The appellate division, second department, supreme court of New York does not consider that by sections 93 and 99 of the railroad law the legislature of that state has imposed an absolute rule of limitation as to the time within which a street railroad shall be constructed after it has obtained the consent of the proper authorities, but holds that the persons or body authorized to give the consent may impose a condition that it shall be constructed within a shorter time. In other words, as it views the statute, and the purpose which it sought to accomplish in imposing a three years' limit, it thinks that its proper construction is to confer upon the persons or body authorized to give the consent the authority to impose a condition requiring it to construct its railroad within a less period than the limit prescribed by the statute; and as the railroad is in no sense misled, and is the moving power in securing the consent, it holds that it does not lie in its mouth to say that the condition which it voluntarily assumed is void and unenforceable. To claim that such a condition is against the interest of the com-

munity, and therefore void, as against public policy, the court declares, is to ignore the facts, and vest in the railroad company power to defeat the very object which the interest of the community requires for its good. Wherefore it holds the imposition of such a condition clearly upheld by public policy. At the same time, it holds that a forfeiture for failure to comply with such a condition should be declared through legal proceedings, although the language in the consent might be broad enough to work a forfeiture without any legal proceeding, as it might very well be that conditions had existed which furnished a legal excuse for noncompliance. For example, it says that it was competent for the commissioner giving the consent to waive exact compliance with its terms. But no excuse being shown by the papers in opposition to a motion therefore, the court holds that a temporary injunction should be continued pending the action to have a forfeiture declared. It also holds that the defendant, having no right to construct the road until it obtained the requisite consents of owners, when challenged as to its right in this respect, it imposes no harsh rule to compel it to produce and clearly establish such authority.

RIGHT OF PASSENGERS ALIGHTING IN SUBURBS AND AT NIGHT TO PROTECTION FROM OTHER CARS.

Wise v. Brooklyn Heights Railroad Co. (N. Y.), 61 N. Y. Supp. 530. Dec. 12, 1899.

This was an action brought to recover for personal injuries sustained by a passenger who alighted from a very slowly moving car, at about 10 o'clock at night, at a trolley station in a long block, in a thinly populated suburban section of the city, and was struck by the fender of a car running at a high rate of speed on the adjoining track, and which car was distant, according to the testimony of the motorman on his car, from eight to twelve hundred feet when he alighted. At the close of the plaintiff's evidence his complaint was dismissed on the ground that he had been guilty of contributory negligence in failing to observe the approach of the car. But the appellate division, second department, supreme court of New York reverses that judgment.

The court thinks it easy of deduction that a person, in the light of day, with nothing to obstruct his vision, ought to discover the approach of a car, if he used his eyesight; and yet, at the same place, by reason of darkness and the existing obscurities, he might not, in the exercise of prudence, determine that the car was too close to be dangerous to attempt the crossing of the track. Under these latter circumstances, it holds, the question of contributory negligence is for the jury, and not to be determined by the court.

Even more certain is the court that while it is true that in the thickly settled parts of a city the practical operation of cars does not admit of the actual stoppage of an approaching car at a street crossing where a car running in the opposite direction is at a standstill for the purpose of permitting passengers to alight, as such stoppage might continually embarrass the traffic of the street, yet such rule does not apply to suburban localities, where the burden of use of the street is practically limited to the passage of cars thereon, and few vehicles. Under such conditions, it thinks it does not establish any harsh rule, or mitigate in any sense the doctrine of ordinary care, for the passenger to assume that, during the time necessary for him to alight and reach a place of safety upon either side of the street, the company will not make the surrounding conditions dangerous to him. There is scarcely justification under such circumstances, the court holds, for the company to run its cars at a high rate of speed past the standing car, which it knows is in that position for the purpose of permitting passengers to alight; and, as the whole situation is the creation of the company, it holds it ought not to be excused for inflicting injury upon a passenger whom it has carried to that point, unless such passenger be the willful or heedless instrument of his own injury.

When a car has come to a standstill, or is moving so slowly as to permit persons to alight, and passengers do alight at such place, the company, the court insists, is chargeable with notice that the passenger thus alighting is as likely to pass to one side of the street as to the other; and under such circumstances the company ought to be, and is justly, held to a rigid degree of care in making the place safe for the passenger to reach either side of the street.

Hence, it holds that this case was one to be submitted to the scrutiny of the jury. One justice concurs in the opinion. Two concur in result. One dissents.

THEFTS OF WIRE.

Numerous thefts of trolley and feed wire were committed last month. The International Traction Co., of Buffalo, secured the conviction of two men who took 875 lb. of wire from the Buffalo & Niagara Falls line. In Chicago the Union Traction company had 500 ft. of trolley wire cut down from the Ogden Ave line, and the police captured a horse and wagon containing over a ton of feeder wire taken from the South Chicago City road. The Chestnut Hill line at Norristown, Pa., for the third time within six months had feeders and bonds stolen.

March 23d over 500 ft. of trolley wire was taken from the lines of the Wilmington & Chester (Pa.) company.

March 21st the Cleveland & Chagrin Falls Electric Ry. had 1,500 ft. of bond wire stolen from the tracks in Orange township.

BILLS FOR BUFFALO.

Two bills have been introduced in the New York Legislature which it is said will particularly affect the street railway companies operating in Buffalo and vicinity. One of these has passed the Senate and provides that the corporate existence of street railway and certain other companies, the stocks of which are owned by other stock corporations, may be extended at any time to coincide with the term of the corporate existence of the possessor corporation, by filing in the office or offices in which the original certificates of incorporation of the subsidiary companies were filed, a certificate of such extension properly executed.

The second bill is an amendment to the general railroad law and provides that: "Any street surface railroad corporation, whose route as stated in its certificate of incorporation or in any proposed extension or branch thereof is wholly within towns, villages or cities of less than 50,000 inhabitants, may abandon any portion of its route not built upon and which it may deem unnecessary for the successful operation of its road and the convenience of the public by filing a declaration of such abandonment, approved by the Board of Railroad Commissioners in the office of the Secretary of State."

SOME SPECIAL OPERATING PROBLEMS IN BROOKLYN.

Mr. R. L. Russell, assistant engineer of the Brooklyn Heights, in a paper read before the New York Railroad Club in February last gave some interesting data concerning the power station equipment of the Brooklyn Heights road and the methods adopted to keep up the voltage on the excursion lines running down to the beach resorts.

The first permanent power station of the company is located at 52d St. on the river front four miles from the city hall, and has 16 Babcock & Wilcox boilers, 250 h. p. each; 12 G. E. 500-kw. generators belted in pairs to Allis horizontal compound engines, and two 350-kw. G. E. boosters, one direct connected and one belt connected to a Westinghouse vertical compound engine. When put in operation, Jan. 14, 1893, this was considered a model station.

The second large station was completed Dec. 2, 1893, and is on the river front at Division Ave., and is known as the Eastern Power station. Its equipment comprises 34 Babcock & Wilcox boilers, four 1,500-kw. G. E. generators and two 1,600-kw. Walker generators each direct connected to a Reynolds-Corliss cross-compound condensing engine. The Walker machines were installed in 1896.

In July, 1893, a station at Wyckoff Ave. and Madison St. was opened. This station now has four 250-h. p. Babcock & Wilcox boilers and six 300-kw. G. E. generators belted to three McIntosh & Seymour tandem compound high speed engines.

On acquiring control of the Nassau road two more stations were added to the system. The first of these is at Third Ave. and First St., built by the Atlantic Avenue R. R. in 1892; the engine room was enlarged in 1898 and it has now seven 500-kw. generators belted to C. & G. Cooper tandem compound engines, two direct connected 800-kw. generators, and two boosters; one of these is a belted Westinghouse machine, 200 volts and 1,150 amperes, and the other a belted G. E. multipolar, 165 volts and 1,212 amperes.

The second Nassau station, built in 1895, is at 39th St. and has 10 B & W boilers of 250 h. p. each, Westinghouse generators, 2 of 1,120 kw. and 2 of 660 kw., direct-connected to Cooper engines, and

one direct-connected Westinghouse booster, 200 volt and 2,800 amperes.

The average current output of the power stations of the Brooklyn Heights system has risen from less than 200 amperes in January, 1892, to 8,000 amperes in January, 1895, to 15,000 in 1898 and the first week in January of this year was 27,000. The maximum output early in January, 1900, was nearly 50,000 amperes. Roughly speaking, diagrams giving the current output of the stations, show the average to be about one half the maximum; the winter loads, both the average and the maximum, are heavier than the summer loads, by about 25 per cent.

The development of excursion lines to the beach resorts introduced some interesting problems in current distribution. On the Bergen Beach line, built in 1895, the extreme ends of the feeders are 8.8 miles from the nearest power station. Only sufficient copper was put up to provide for a service, 30 cars requiring not more than 600 amperes, a pressure on the line as low as 400 volts being considered permissible.

This line was opened on Decoration Day, 1896, and the facilities provided could not even begin to meet the heavy traffic. To provide for the extra load the following arrangement was made: One of the generators in the 52d St. station was provided with sufficient resistances in the shunt field to bring the voltage down to 125 volts, and it could be raised, if desired, to 600 volts. When the load increased beyond the 600 amperes (or 400 h. p.), for which the line was designed, this generator was connected in series with the feeders and the station bus, thus raising the electrical pressure at the station to a sufficient amount to take up the increased line loss. There were three wires on the line; two were fed through the temporary booster, while the third remained connected with the main station feeder bus. This was so that the reading on its ammeter would show whether the pressure on the line exceeded that at the power house, and therefore determine if the line pressure was dangerous to motors and lamp circuits. After a little experimenting, it was found that this rough method gave very satisfactory results and it was possible to keep the electrical pressure at any desired amount, regardless of the number of cars running on the line; in fact, a large number of cars was a safeguard against getting the voltage too high. The points to be emphasized are these: The wires were made to carry three times the designed amount of electrical current by taking up the losses, thereby increasing the pressure, and this rise in pressure was obtained without special machinery, and carried much higher than ever before attempted in electrical railroad practice.

When the Sea Beach R. R., a double track line 6.13 miles long to Coney Island, was acquired by the Brooklyn Heights it was at once connected with electric system giving a through service by trolley cars from New York to Coney Island. This road has always been a popular line for excursionists but the traffic has increased since the electrical equipment has been put on; with steam the maximum daily traffic was 55,000 passengers, last summer it rose as high as 105,000 per day.

In distributing the load on this line a radical departure was made from established methods of figuring the necessary copper for feeders. The carrying capacity was the only thing considered in the arrangement. It was estimated that 1,900 amperes (or 1,275 h. p.) would be very near the average maximum on the line, and, as a matter of fact, readings showed that on the day of heaviest travel the greatest load during the maximum hour was 2,060 amperes or 1,380 h. p., about 8 per cent increase over the original estimate. The feeder problem was the first to be met and solved. To keep the uniform voltage, so that a high speed schedule could be maintained, two boosters designed especially for the work were direct connected to comparatively inexpensive engines. These boosters were so designed that any desired increase of pressure from 25 to 400 volts above that of the power station could be secured. They were so wound that they would be in a measure self-regulating, but contained also shunt field coils, which could be easily adjusted to take up the fixed current of the system, and divide proportionately the load between the two machines and the feeders, which were direct-connected on the station bus. The beginning of the line was a little over three-quarters of a mile from the station, and so a certain portion of the road could be easily operated without raising the voltage. Each of the two boosters were "cut in" at two points and these four wires and the direct-feed wire were connected by an equalizing wire. That is, the feed for this section of 12 miles of trolley

ley wire was supplied from the station bus at 575 volts, and from two independent boosters of different voltage. This line, running in multiple, operates with entire satisfaction, the average voltage of the line during its heaviest hours running from 486 to 510 volts.

More recently another difficult problem has arisen in connection with the running of the heavy electric elevated trains over former steam roads, such as on the Brighton Beach line. These trains will take from 700 to 800 amperes when starting and an average load of 400 amperes for four-car trains, when making an average schedule of 28 miles an hour. This low schedule speed is accounted for by

SINGLE RAIL SUSPENSION RAILWAY AT BARMEN.

In our issue of last month, page 155, we gave some notes on the novel single rail suspension railway now building to connect Barmen, Germany, with Elberfeld and Vohwinkel, and showed line drawings giving an idea of the construction. Mr. Charles Bouchsein, United States consul at Barmen, in answer to our request recently made a report to the State Department giving additional data concerning this undertaking and by courtesy of Mr. Scanlon,

FIG. 1—VIEW OF THE STRUCTURE OVER THE RIVER, FROM BENEATH.

the fact that connections to the steam road make it possible to run surface cars over a part of the line. It will thus be seen that the stoppage for any reason of one elevated train makes a considerable difference in the load carried on one section and consequently greatly affects the local voltage. Specially designed boosters could, however, keep these fluctuations well under control, providing wires were carried to enough points on the line, so that a change of load would not greatly affect the pressure over any considerable portion of the line; but if one of the trains stopped and then immediately started again, the current used would run up to 800 amperes and drop immediately to zero. If there were no trolley cars interspersed between the elevated trains and the current for lighting the cars of the elevated road were supplied from some source other than that used for the trolley cars, a sudden rise in voltage would do no harm whatever, for the motors would be taking current until the controller was thrown off, and so the voltage would not rise abruptly until the current circuit was opened; consequently, no damage could be done. Under existing conditions, however, these varying loads cannot be handled without expensive machinery and the erection of a larger amount of copper than would pay for excursion lines.

One end of this line connects with the elevated railroad at a point where it is advantageous to put in a storage battery to take up the fluctuations on the road during the winter months. At a point about 6,000 ft. from the Brighton beach terminal are some disused car sheds and it is proposed to mount a second battery on old freight cars and then transport the whole battery to the yards of the elevated road for use during the winter.

The Lewiston (Pa.) & Reedsville Electric Ry. between Lewiston and Burnham was opened March 14th.

acting chief of the bureau of foreign commerce, we are permitted to publish this matter simultaneously with its appearance in the Consular Reports.

The total length of the road is 8.3 miles, and from the terminus at Barmen through Elberfeld to Sonnborn, a distance of 6.9 miles, it follows the course of the River Wupper. After leaving Sonnborn

attention to operate trains of two cars, though the station platforms are long enough for four-car trains. The headway is to be 3 minutes.

An automatic block signal system is installed and special precautions for braking have been taken. There are: 1. Westinghouse air

construction is between \$200,000 and \$225,000 per mile including the foundations and stations. Figs. 5 and 6 show exterior and interior views of one of the proposed stations.

The road is now over half completed and it is expected that cars will be in operation early in 1901.

Detroit 3-Cent Ordinance Held Invalid.

Last year when the municipal ownership fight was pending at Detroit, Mayor Maybury, who was opposed to Governor Pingree's plans, embodied his own ideas of the proper solution of the street railway question in ordinances which were passed by the council and approved in August last.

The Detroit Citizens' Street Railway Co. at once secured a temporary injunction against the enforcement of the ordinance, filing a bill in the United States Circuit Court (Judge Henry H. Swan). Arguments were heard last fall and the court took the matter under advisement; March 19th Judge Swan rendered his decision, which was in favor of the company's contentions, and made the injunction permanent.

The opinion quotes sections of acts of the Legislature of 1855 and 1867, and from the company's bill of complaint which alleges violation of its rights under these acts. From the history of the street railways of Detroit from the original contract with Eben N. Wilcox, Nov. 24, 1862, it appears that a rate of fare not exceeding 5 cents could be charged. By ordinance of Jan. 3, 1889, additional lines were provided for and the fare was to be 5 cents. Other lines have been acquired and are operated by the complaining company.

The ordinances which authorized the several lines have been amended by the joint action and consent of the common council and the railway companies, apparently in consideration of mutual concessions and undertakings of the contracting parties. The principal changes effected by these amendments were the privileges of transfer over various lines to a passenger paying a single fare of 5 cents, and the company's consent to sell eight workingmen's tickets, so-called, good during specified hours, for 25 cents.

Aside from these modifications, which were prices paid by the railway companies for the extensions and changes in their lines, and extensions of the term of their easements in the streets of the city, and other rights and privileges, the rate of fare established by the agreement of the city and the companies was, and has been from the first, uniformly 5 cents, which was prescribed by the ordinances, and accepted by the grantees, as appears in the municipal legislatures declaring the terms and conditions on which the city's consent to the use of its streets was granted, and accepted by the grantees. These several ordinances contain differences of expression, but none of substance or meaning.

Each permits the company to charge a 5 cent fare, except an eight-for-a-quarter for workingmen during certain designated hours.

After quoting the section relative to the fare of 5 cents that is authorized in the franchise for each and every line, the opinion proceeds as follows:

All these ordinances were accepted in writing by the respective grantees. Other ordinances affecting the street railways were passed by the council between the time of the grants conferred by the city in 1862 and 1865, and the passage of the ordinances of Aug. 17, 1899, but they contain nothing germane to the question involved in this suit, with three exceptions. On the 14th of November, 1879, the common council passed an ordinance making certain requirements from the Detroit City Railway Co., which had become the owner of all the street railways then in operation excepting the Fort Wayne & Elmwood Railway Co. and its extensions, and the Grand River Railway Co. and its lines.

This ordinance was the culmination of many differences which had arisen between the city and the Detroit City Railway Co., notably controversies concerning the taxes payable by the railway companies to the city, and was an adjustment of the relations of the city and the company as to the controverted matters. It exacted of the company the extension of certain of its lines, and that its cars on all lines should be operated as the public convenience might require and the common council order.

In consideration of the acceptance of this ordinance by the Detroit City Railway Co. as a compromise of the differences existing between it and the city, and in view of the expenditure required of the grantee to comply with the demands of the city council, by section 5 of the ordinance it was enacted:

"The powers and privileges conferred and obligations imposed on the Detroit City Railway Co. by the ordinance passed Nov. 24, 1862, and the amendments thereto, are hereby extended and limited to 30 years from this date."

By section 6 the ordinance was made to take immediate effect when written acceptance of the terms thereof were filed in the office of the city clerk of Detroit by the Detroit City Railway Co., the Detroit & Grand Trunk Junction Street Railway Co., and the Central Market, Cass Avenue and Third Street Railway Co., or their successors, which two latter corporations had assigned their rights and property to the Detroit City Railway, and:

"From that date, all ordinances or parts of ordinances in conflict with the provisions hereof, shall stand repealed, and all ordinances and parts of ordinances not in any conflict herewith shall be affirmed and continued in force."

By section 7, the "right to amend or repeal this ordinance in case of its vio-

lation by said company or companies," is expressly reserved. A like ordinance was passed June 30, 1880, giving to the Fort Wayne & Elmwood Street Railway Co. an extension of the powers and privileges conferred upon it under its original corporate name by the ordinance of Jan. 31, 1865, and the amendments thereof, for 30 years. This ordinance is apparently identical, mutatis mutandis, with that applicable to the Detroit City Ry. above quoted. These ordinances were accepted in writing by the grantees. Both the city and the railway companies assumed that the easement or franchise in the streets by the ordinances of 1862 and 1865 were limited to 30 years. By a similar ordinance, approved Dec. 3, 1885:

"The powers and privileges conferred and obligations imposed on the Grand River Street Railway Co. by the ordinance passed May 31, 1868, and the amendments thereto, are hereby extended and limited to 30 years from and after the first day of January, A. D. 1886."

All of the railways named in the bill, except the Grand River Ry. and the Fort Wayne & Belle Isle company, were acquired by the Detroit City Railway Co., which in September, 1891, sold and conveyed the same, with the rights, easements or franchises belonging thereto, to complainant, which also acquired, Oct. 1, 1891, all of the rights and property of the Grand River Railway Co., and subsequently became the lessee of the rights, privileges and property of the Fort Wayne & Belle Isle Railway Co. Since its acquisition of said several lines, complainant has lawfully operated, and still is so operating the same.

Section 14 of the act of 1867 provides that "after any city, village, or township shall have consented, as in this act provided, to the construction and maintenance of any street railways therein, or granted any rights and privileges to any such company, and such consent and grant have been accepted by the company, such township, city or village shall not revoke such consent, nor deprive the company of the rights and privileges so conferred."

When the original grant to the Detroit City Railway was re-enacted and extended, Nov. 14, 1879, and that to the Fort Wayne & Elmwood Railway Co. was re-enacted and extended in 1880, and the original grant to the Grand River Street Railway Co. was re-enacted and extended in 1885, the provisions of this street railway act were in force, and by the express terms thereof the grantees, although incorporated under the train railway act, became entitled to the benefit and protection of all provisions of the street railway act. This is true also to the subsequent grants made by the city to the various street railway companies, which are the constituents of complainant's system, including also the Fort Wayne & Belle Isle Railway Co., which it holds by lease.

The charter of the city of Detroit, approved June 7, 1883, sections 121 and 122, clothed the common council with power over the streets, highways and alleys, to establish, open, widen, extend, straighten, alter, vacate, etc., and generally to "control, prescribe and regulate the manner in which the highways, streets, avenues, lanes, alleys, public grounds and spaces within said city, shall be used and enjoyed."

Section 19 of the ordinance of Nov. 24, 1862, provides:

"It is hereby reserved to the common council of the city of Detroit, the right to make such further rules, orders or regulations as may from time to time be deemed necessary to protect the interests, safety, welfare or accommodation of the public in relation to said railways."

The later ordinance, granting consent to railways for the occupancy of the street and extensions of easements previously granted, contained similar provisions.

Aug. 16, 1899, the common council of Detroit passed five ordinances, which the mayor approved, requiring complainant, its successors and assigns, and the railway companies named in said ordinances:

"To keep on sale on its cars in service at all times, tickets to be sold in strips or packages of eight tickets for twenty-five cents, each of which tickets shall be accepted by such railway company, its successors or assigns, for a single ride for any distance in either direction over all lines or routes operated by said railway company, its successors and assigns, on a car on which it is presented, and a passenger presenting such ticket, or on the payment of one single fare charged by said company, shall be entitled to a transfer ticket good for a continuous ride over any other line or route of said company, provided such transfer ticket is presented on the next regular car of such other route, or within 15 minutes after such passenger leaves the car on which he received said transfer ticket."

It will be seen that these ordinances not only reduced the rate of fare fixed by the original consent ordinance of 1862, and ratified in that of Nov. 14, 1879, and the other ordinances above recited, and which had been recognized as a lawful rate over each separate route or line ever since the street railway service was introduced, but also required complainant to transfer a passenger free of charge over any other of complainant's lines or routes to which he might request a transfer ticket.

It is the claim of complainant that these ordinances violate its agreements with the city, evidenced by the ordinances granting the consent of the city to the use of the streets by complainant, its grantors and predecessors, and accepted by the latter as the terms and conditions of the easement granted, and impaired the obligation of its contracts with complainant, its grantors and predecessors, and is null and void.

A restraining order was issued, staying the enforcement of the ordinances of August 16th, pending the hearing of a motion for a perpetual injunction. No answer to the bill has been made, but defendant has filed certified copies of the various consent ordinances and the amendments thereto, and these copies have been submitted in connection with the charter of the city, and the acts of 1855 and 1867, and the amendments thereto, as the city's answer to the motion for injunction. Both parties concede the jurisdiction of the court.

The controlling question in this case is the effect of the ordinances of consent, and their acceptance by the railway companies. These ordinances were enacted under express legislative authority conferred on the city authorities to prescribe the terms and conditions an easement in the streets should be granted to street railway companies. The constitution of Michigan, section 38 of article 4, provides:

"The legislature may confer upon organized townships, incorporated cities and villages, and upon the board of supervisors of the several counties, such powers of a local legislative and administrative character as they may deem proper."

With the two limitations of this broad power, this case has no concern. "Municipal corporations derive their sole source of power from legislative enactments." "The power of a municipality to grant an easement in a street to a street railway is not inherent, but is derived from the legislature." (*Street Railway Co. v. City of Detroit*, 110 Mich. 390; *Detroit Citizens' Street Railway Co. v. Detroit Railway*, 171 U. S. 48.)

In the exercise of this constitutional power, the legislature gave to the city, by the acts of 1855 and of 1867, authority to grant or deny to a railway company, the use of its streets for the construction and operation of its railway. The franchise of corporate capacity had been acquired by the railway companies under the laws of the state, and this was all that the legislature had to bestow. It left the acquisition of the easement in the streets to the action of each municipality from which it was sought, and by making it the subject-matter of agreement between the city and the railway company, vested the city with the power to prescribe, and the grantee to accept or reject, the terms and conditions of consent offered. Both parties had capacity to enter into the contract.

The only limitation upon the exercise of that power, was that the state requires that the city's consent should be evidenced by ordinance, and that acceptance of the railway company, should be in writing. The fact that the early ordinances gave an exclusive right to the grantee has lost significance by the decisions in: *Street Railway Co. v. Detroit*, 110 Mich. 384, and *Detroit Citizens' Street Railway Co. v. Detroit Railway*, 171 U. S. 46.

The acceptance of the terms and conditions of the city's consent, and of the obligations imposed upon, and the reciprocal undertakings given by the railroad company to the city, constitute a sufficient consideration, and supply all the essentials of a contract. It "constitutes a contractual ordinance conferring an easement which is irrevocable"—*Mayor of Knoxville v. Africa C. C. A.* 77 F. R. 508; *Township of Hamtramck v. Rapid Railway*, 6 *Detroit Legal News*, 821; *Iron Mountain R. Co. v. Memphis*, 96 F. R. 128; *Louisville Trust Co. v. Cincinnati*, 76 F. R. 209 (C. C. A.); *Electric Railway Co. v. Grand Rapids*, 84 Mich. 257; *Union St. R. Co. v. Circuit Judge*, 113 Mich. 645-6; *City Railway Co. v. Citizens' Co.* 166 U. S. 567.

The rule which requires a strict construction of the powers of municipal corporations, and the equally familiar principle that all public grants must be strictly construed, leaving nothing to inference, find no room for application in this case, for the grant of authority is explicit and unqualified. The legislature expressly reserved to itself, in the acts of 1855 and 1867, what the constitution gave it, independent of such reservation—the right to alter, amend or repeal those acts at any time. In the train railway act, the affirmation of this power in section 31 was thus qualified:

"But such alteration, amendment or repeal shall not operate as an alteration or amendment of the corporate rights of the companies formed under it, unless specially named in the act so altering or amending this act. * * *"

The legislature has not exercised its constitutional or reserved power in any particular affecting this case, except in the enactment of the second proviso to section 34 of the act of 1855; nor has it delegated, even if it could, the power to the city to modify its consent. On the contrary, by the second proviso of section 34 of the act of 1855, quoted above, and section 14 of the act of 1867, providing that after the consent of a municipality to the use of its streets by a street railway company has been accepted by the latter, "such townships, city or village shall not revoke such consent, nor deprive the company of the rights and privileges so conferred," it has expressly forbidden any impairment of the grant.

The force of this prohibition is supplemented by section 29 of the same act, giving to street railway companies organized under prior legislation "the same powers, rights, protection and privileges," and subjecting them "to all the liabilities as are hereby provided for companies and corporations organized under the provisions of this act."

It is plain, therefore, that whatever construction might have been given to section 34 of the act of 1855 prior to the enactment, March 27, 1867, of the second proviso thereto, the inviolability of its consent declared by section 14 of the act of 1867, was a right and protection acquired under section 29 which could not be nullified by a city ordinance.

In *Detroit City Railway v. Guthart*, 51 Mich. 183, construing section 31 of the train railway act referred to supra, Justice Cooley said:

"The rights intended by that section are the essential and important rights of corporations formed for the particular purposes which the act had in view, as distinguished from the privileges and immunities which are not so fundamental, but which may nevertheless have value. An attempt to enumerate the rights here would be presumptuous and without value, but in general terms it may be said that the franchise to construct and operate a road, and to levy and collect remunerative tolls or charges, would be corporate rights."

The acts of 1855 and 1867 being in pari materia, no reason is perceived why this definition of the word "rights" should not be applied to the same word in sections 34 of the act of 1855, and 14 of the act of 1867. (*Reiche v. Smythe*, 13 Wall, 162.)

By section 20 of the act of 1867 the rate of fare was made matter of agreement between "such company and the corporate authorities of the city or village where the road is located," and therefore, "when established by agreement," a right vested in the railway company which is protected by section 20 of the act of 1867, as well as by the federal constitution.

It is replied to this that section 34 of the act of 1855 was added to that act twenty-two days after the act of 1867 was approved, and must therefore be regarded as the latest expression of the legislative will upon this subject; that under the first proviso to that section, prohibiting a railway company from constructing its road in "the streets of any town or city without the consent of the municipal authorities of such town or city, and under such regulations and terms and conditions as said authorities may "from time to time prescribe," the city was empowered to change the rate of fare.

This is not an exact statement of the amendments to section 34. All that part

of the section preceding its second proviso was added April 13, 1861. The second proviso says:

"After said consent shall have been given and accepted by the company or corporation to which the same is granted, such authority shall make no regulation or condition whereby the rights or franchises so granted shall be destroyed or unreasonably impaired, or such corporation be deprived of the right of constructing, maintaining and operating such railway in the streets in such consent or grant named, pursuant to the terms thereof."

This was approved Mar. 27, 1867. Its clear intent, purpose and effect was to bring the act of 1855 into harmony with that of 1867, but primarily and beyond question, to take from the city the authority, if any it had, to prescribe further regulations and conditions "from time to time" impairing the consent thus granted, and its enjoyment "pursuant to the terms thereof." This is evidenced also by section 36 of the same act, also added Mar. 27, 1867, by which it is provided that:

"It shall be a sufficient description of the route or routes thereof to declare that said railway is to be constructed and maintained in such streets or public ways of the particular city as has been or shall hereafter from time to time be granted to said company for that purpose by the proper municipal authorities of such city; and it shall be lawful to build, maintain or extend the railway of such company according to the terms and conditions of such grant or grants."

The street railway act of 1867, entitled: "An act to provide for the organization of street railway companies," was approved Mar. 5, 1867. While it does not repeal the act of 1855, but is in pari materia, yet by its thirtieth section, quoted supra, it so far displaced it as to require that all street railway companies thereafter formed, should be organized under its provisions.

This act is complete in itself, and in marked contrast with the heterogeneous provisions of the act of 1855, which, for want of a more suitable statute, was amended to adapt it to objects not within its original scope and purpose. The later act was the product of a more enlightened conception of the character and necessity of the new system of urban passenger transportation, and obviously recognized the impolicy and injustice of subjecting the large investments of capital needed for such enterprises to the caprice of fluctuating municipal bodies.

By leaving to the city or village authorities the right to give or withhold consent to the use of its streets by such railways "under such rules, regulations and conditions as the local authorities might impose," it enabled municipalities to protect themselves by the ordinance of consent, and, by section 14, secured the protection of the grantee of the servitude by the acceptance of that ordinance as the irrevocable contract of the parties.

The justice and necessity of this provision was approved by the same legislature 22 days thereafter, by adding the second proviso to section 34 of the act of 1855, which, differing in phraseology, is identical in purpose and effect with section 14 of the later act, and was doubtless enacted to harmonize the two acts, the latter of which was made the only basis for the organization of street railway companies thereafter.

The city and the railway companies have, ever since the original ordinances, practically and uniformly construed the consents as controlling their mutual rights and obligations, except in those particulars in which they have been changed with the consent of both parties. What the railway companies have consent to do by such modifications as have been made furnishes no measure of its rights under the consents, or sanctions their impairment. (*Lake Shore Ry. Co. v. Smith*, 173 U. S. 64, 697; *Highland Park v. Plank Road Co.*, 95 Mich. 480, 491.)

With full knowledge of their provisions, 12 years after the enactment of the second proviso and the act of 1867, the city authorities also expressly renewed and ratified these ordinances and their acceptance as the lawful agreement of the city and companies. The rights of the parties must be measured by the law as it now stands, and by their agreements thereunder.

By the ordinance of Nov. 14, 1879, section 5, "the powers and privileges conferred, or obligations imposed, on the Detroit City Ry. by the ordinance of November 24th and the amendments thereto, are hereby extended and limited to 30 years from this date."

By the ordinance of June 30, 1880, a like proviso was made relative to the Fort Wayne & Elmwood Street Railway Co. confirming and extending for 30 years its grant under the ordinance of Jan. 31, 1865. Like ordinances were passed in favor of other lines.

The practical construction given by the parties to their agreement prior to Nov. 14, 1879, ever since the enactment of the second proviso of section 34 of the act of 1855 and the act of 1867, a period of 37 years, is a fair standard in itself of their rights thereunder (*Chicago v. Sheldon*, 9 Wall, 50-54), and when supplemented and adopted by these confirmatory ordinances, which the statute authorized, the fact that the original ordinances antedated the second proviso of section 34, is a matter of no moment.

The second proviso of section 34 is therefore clearly in confirmation and adoption of the spirit and purpose of sections 14 and 29 of the act of 1867, not in the least degree detracting from the absolute interdict of section 14 against the revocation of the consent granted. It does not profess to amend or repeal any part of the act of 1867, or to qualify the rights it granted or the liabilities it imposed.

This conclusion is confirmed by the fact that the amendment of 1867 to section 34 of the act of 1855, was made by proviso, "the general purpose of which is to except the clause covered by it from the general provisions of a statute of some provisions of it, or to qualify the operation of the statute in some particular."

George Banking Co. v. Smith, 128 U. S. 181; or, as said in *Wyman v. Southard*, 10 Wheat. 1, 30: "The proviso is generally intended to restrain the enacting clause, and to except something which would otherwise have been within it, or in some measure to modify the enacting clause."

Both provisos to section 34 were evidently made with this intent. The first modified the broad grant of authority to street railway companies to use and operate street railways by making the consent of the city or village under such regulations, terms and conditions as its authorities might "from time to time prescribe," a condition precedent to the use and operation of such railways in the streets of a municipality.

The second proviso modified all that preceded it in the section by prohibit-

ing impairment of the rights and franchises named in the accepted grant, or deprivation of the right of constructing, maintaining and operating such railway in the streets in the consent named, "pursuant to the terms thereof" (of the consent.)

Prior to the enactment of the second proviso the city had never exercised or claimed the power to vary its consent in any degree or particular.

That it was competent for the legislature to withdraw from the city the apparent authority to prescribe further terms and conditions to its consent "from time to time," is unquestionable. (*Board of Park Com'rs v. Common Council*, 28 Mich. 230. *New Orleans v. N. O. Water Works Co.*, 142 U. S. 91.)

The act of 1867, and the second proviso of section 34 of the act of 1855, should be considered as a ratification of these ordinances. (*City Railway Co. v. Citizens' Railway Co.*, 166 U. S. 567, 590.)

The ordinances of 1879 and 1880, and their acceptance, had all the force and effect of a new consent, which was authorized by the legislature and protected both by section 34 of the train railway act, as it then stood, and by section 20 of the street railway act of 1867, against destruction or impairment by the municipal authorities, and are sustained by sufficient consideration. (*City Railway Co. v. Citizens' Railway Co.*, 166 U. S. 568.) The argument that it is not claimed in the bill that by a reduction of fare from 5 to 3 cents, the contract is "unreasonably impaired," and therefore is a "regulation" which the city authorities may lawfully make under section 34 of the act of 1855, and section 19 of the original consent ordinance, is untenable:

"An objection to a law on the ground of its impairing the obligation of a contract can never depend upon the extent of the change which the law effects in it. Any deviation from its terms by postponing or accelerating the period of performance which it prescribes, imposing conditions not expressed in the contract, or dispensing with the performance of those which are, however minute, or apparently immaterial in their effect upon the contract of the parties, impairs its obligations" (*Green v. Biddle*, 8 Wheaton, 184; *Walker v. Whitehead*, 16 Wall. 314.)

That the original and subsequent ordinances, accepted by the complainant and its assignors, established the right of the street railway companies to a 5-cent fare is as clear as that the attempted reduction of that fare by the enactment of the ordinances of Aug. 16, 1899, impaired the obligations of the contract of consent between the city and the companies.

It is as idle to claim that the change of rate did not "unreasonably" impair that consent as to deny that the proposed reduction of fares is not the deprivation of the railway company's "right of constructing, maintaining and operating such railway in the streets in such consent or grant named, pursuant to the terms thereof."

By any change of its terms, or any regulation diminishing its value or altering its conditions, to the prejudice of either party, a contract is "unreasonably" impaired. It is not the degree, but the fact of impairment, that determines the validity of legislation effecting it. In the case at bar, the "regulation" that the company shall sell eight tickets for 25 cents, each of which tickets shall be valid for the carriage of a passenger for whose transportation the company, under its agreement with the city, is authorized to collect 5 cents, is so clearly the deprivation of a right valuable to the company that the effect "goes without saying."

In *Detroit vs. Detroit & Howell Plank Road Co.*, 43, Mich., 140, 146, it was sought to compel the respondent company to remove 2½ miles of its road from within the city without compensation, and in violation of its chartered rights. The proceedings were taken under the act of the legislature forbidding the company to take tolls on paved roads within said limitations. Justice Campbell said:

"What the city claims a right to do, is to deprive the respondent of the privilege any longer to take tolls for the travel and traffic on two and one-half miles of its road. If it may do this in respect to one part of the road, it may in respect to any other part. If it may exclude the respondent from Detroit, it may from Howell also, or from any other township on the line, and a single section of the statute may annihilate the property of respondent altogether. A statute which could have this effect would not be a statute to amend franchises, but a statute to confiscate property; it would not be a statute of regulation, but of spoliation."

A fortiori, as the city derives all its powers from the legislature, which has prohibited its recession from its consent, the attempted abrogation of that contract, and the deprivation of the rights which it confers, is an indefensible usurpation.

The argument that the ordinances of Aug. 16, 1899, were passed in the exercise of the "police power" of the state by its agent, the city, affords no justification to the defendant. Without attempting to specify what is included in the elastic term "police power," the view taken of the contractual relations of complainant and the city negatives the defense asserted on that ground. In the language of Mr. Justice Peckham:

"This (the police power) must, however, be exercised in subordination to the provisions of the federal constitution. If, in the assumed exercise of its police power, the legislature of a state directly and plainly violates a provision of the constitution of the United States, such legislation would be void." (*Lake Shore Ry. Co. vs. Smith*, 173, U. S. 680, 690.)

These ordinances contravene the provisions of the federal constitution forbidding the impairment of contracts and the deprivation of property without due process of law, and equally the statutes of Michigan from which alone the city obtained the power to grant its consent unless that consent has reserved the power to modify its terms and conditions.

This result necessitates the proposition that the ordinances of Aug. 16, 1899, are a proper exercise of the powers reserved to the city by section 19 of the ordinances of consent of 1862 and 1865, and therefore do not impair the contract of the parties. This contention is without merit.

That section reserved the power to enact "such further rules, orders and regulations as may from time to time be deemed necessary to protect the interests, safety, welfare or accommodation of the public in relation to said railways."

Similar sections are contained in the later ordinances granting consent to the construction and operation of the new lines owned by complainant.

The terms, "further rules, orders and regulations," for the purposes specified, are inapt to express a purpose to vary the "consent, permission and authority" granted, but are a declaration of the right and purpose of the city authorities to "further" exercise the police power in regard to all matters incident to the construction and operation of the road; such as the location of the tracks in the streets, the placing of switches and turn-tables, the repair of the pavement between the tracks, the removal or limitation of the number of tracks, in the interest of public travel (*Grand Rapids Railways*, 43 Mich. 433; *Baltimore Trust Co.*, 166 U. S. 673), the frequency with which cars should be run for the public convenience, the stopping of cars at street crossings, the use of fenders, the rate of speed to be maintained, the sale of tickets (*City of Detroit vs. Railway Co.*, 95 Mich. 456), and, generally to details of the conduct and operation of the railway which experience might show to be necessary in addition to or in amendment of those specified in the consent, for the protection of life, the accommodation of the public and the avoidance of injury to private property. Such regulations are not invasions of the contract rights of the company, and are just and reasonable. (*Lake Shore & Mich. Southern Railway Co. vs. Ohio*, 173 U. S. 285, 305.)

But the right of the grantee to use its franchise in the city, and to take the stipulated fare for the carriage of passengers are vested rights of property under the consents, and clearly distinguishable from immunity from the duties and requirements necessitated by the new easement, and consistent with its full enjoyment, and from which even the legislature could not release the grantee.

The entire abolition of fares might, for a time, conduce, in a degree, to the material "interest" and "welfare" of the traveling public, and be a public "accommodation," but the rule, order or regulation which would require free transportation of the public would differ only in degree from the ordinances in question, which have no relation to the comfort, safety or welfare of society. (*Cooley's Cons. Lim.* p. 577; *People vs. Jackson Plank Road Co.* 9 Mich. 306.)

If the city may sequester two-fifths of the grantee's earnings, why may it not take all? Such a power is neither expressly given nor can it be implied. It is a confiscation.

Besides the considerations already stated, which conclusively repel this defense, may be added that the canons of statutory construction also exclude it. The rate of fare having been nominally fixed by one section of each of the many ordinances of consent, and by Section 20 of the act of 1867, are not within the general authority to make "rules, orders or regulations" committed to the discretion of the common council by section 19. The general words of that section must yield to the specific provision fixing the rate of fare. (*Hornor v. Collector*, 1 Wall. 486, 490; *Reiche v. Smythe*, 13 Wall. 162, 165.)

The same rule of interpretation must be applied to municipal ordinances as obtains in construing statutes. A thing which is given in particular shall not be taken away by general words. (*Churchill vs. Crease*, 5 Bing. 180.)

The fundamental principle of construction applicable both to legislative and municipal enactments, is that the intention of the legislature is to govern. (*Sedgwick on Stats. & Cons. Law*, p. 360; *Pease vs. Whitney*, 5 Mass., 380, 382.)

It has never been claimed for section 19, and the corresponding sections in all the numerous ordinances of consent passed by the common council, that they authorized any interference with the rates of fare prescribed by all the consent ordinances from 1862 to 1899 inclusive. This disclaimer for a period of 37 years also negatives the relation of that section to the subject of fares.

The objection to the validity of the consent ordinance that the common council was without power to grant an easement in its streets for 39 years, and therefore the rate of fare could not be fixed so as to be beyond the control of the city authorities for that period, has been determined adversely to the defendant in *Detroit Citizens' Street Railway Company vs. City of Detroit*, 64 F. R., 628-646.

There is nothing in the charter of the city which sanctions the action of its common council.

The arguments have taken a wide range, and many questions have been presented relative to the power of the legislature to prescribe or change the rates of transportation of railway companies, and otherwise alter or amend the organic acts under which they were formed, but those questions are foreign to the issues here involved. While the authorities cited have been carefully examined, nothing has been found which controls the determination of this case.

It follows from what has been said that the motion to vacate the restraining order must be denied, and that the complainant is entitled to an injunction against the enforcement of the ordinances of Aug. 16, 1899, and such injunction will issue accordingly.

THE CENTER-BEARING LORD BALTIMORE MAXIMUM TRACTION TRUCK.

The Baltimore Car Wheel Co., Baltimore, Md., has recently sent to managers very handsomely mounted photographs showing the center-bearing "Lord Baltimore" maximum traction truck. In this truck, which was illustrated in our Daily Edition, October, 1899, one-third of the weight is carried on the bolster which is placed midway between the wheels, the other two-thirds of the weight being carried on roller side bearings. The frame supporting the rollers rests at one end on the bolster and at the other on a helical spring seated in a pocket on the truck frame near the driving axle. The distribution is such that the large wheels carry from 68 to 71 per cent of the total load.

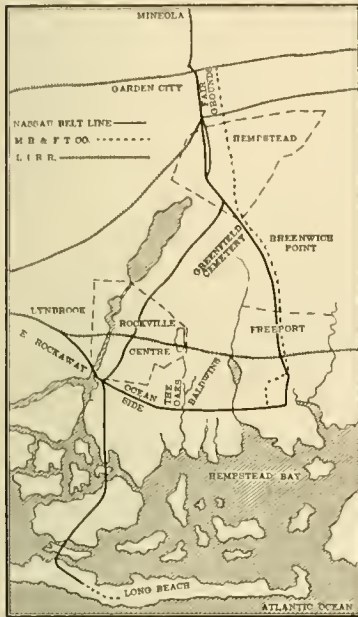

It is stated that freight will be carried on the Brooklyn elevated railroads. This service will be performed at night and will relieve the streets of a great deal of heavy trucking.

ELECTRIC LINES IN NASSAU COUNTY, N. Y.

There are two rival companies incorporated to build electric railways from Mineola, the county seat of Nassau County (erected in 1808 out of a part of Queens County), south to Long Island Sound. This territory is traversed from east to west by three branches of the Long Island R. R., but there is great need of north and south lines such as it is proposed to build. An electric line would prove a valuable feeder to the Long Island R. R. and the latter has thrown no obstacle in the way of promoting the former.

The most extensive of the proposed lines is that of the Nassau Belt Line Traction Co., which plans to operate 30 miles of road. This company was organized Mar. 17, 1899, and has obtained its consent from the Railroad Commissioners and all the consents of abutting property owners that are required by statute; it also has franchises from all the villages through which it passes except that for Hempstead—two miles—thus having franchises for 28 out of the 30 miles desired.

President Ames was recently quoted in an interview as follows: "We have only 18 miles to build in order to secure our 30 miles

of road. We are to run over the already completed lines of the Long Island R. R. from Mineola to Hempstead, a distance of 2½ miles and over the line of the same road from Lynbrook to Long Beach, 7 miles, and over one or two other short sections. We will have to build 9 miles from Hempstead to Mineola; 6 miles from Freeport by way of Woodcleft Inn to East Rockaway and a portion of the 5½ miles between East Rockaway and Hempstead."

The rival company is the Mineola, Hempstead & Freeport Traction Co. It seeks to build a line that would parallel the eastern branch of the Nassau Belt and the Mineola extension, but as yet

has only secured a franchise for 2½ miles and the promise of a franchise through the village of Hempstead. A number of the gentlemen interested in this company are representatives of electric supply houses.

A third company which by reason of similarity of name is sometimes confused with the Nassau Belt Line, is the New York & Nassau County Railway Co. The promoters of this line, who are connected with Tammany Hall, purpose to parallel the Long Island R. R., but as yet no applications have been made for local consents or to the Railroad Commissioners.

DRY SEAT AND FENDER PRIZES.

The promoters of the International Tramways and Light Railways Exhibition to be held in London June 2 to July 4, 1900, offers two prizes to exhibitors: 1. A prize of £25 (\$125) for the best invention for securing a dry seat on the tops of tram cars and omnibuses in all conditions of weather. 2. A prize of £25 for the most practical and efficient life saving guard or fender for tram cars.

Competitors must exhibit a full size and complete apparatus and pay a nominal admission fee of £1, which entitles them to space in the exhibit hall. Every intending competitor must send to the office of the Tramway and Railway World, Amberley House, Norfolk St., London, W. C., not later than June 1st, a statement of his intention to exhibit and a typewritten description on foolscap paper of his intention to exhibit.

The Southwest Missouri Electric Ry. last month received 13 cars of rail from the Pennsylvania Steel Co., which will permit the early completion of its extensions.

COMBINED ELECTRIC LOCOMOTIVE AND CRANE.

The accompanying illustration shows an interesting car built by the J. G. Brill Co., which is an electric locomotive and power crane combined. The combination is more effective than either machine would be singly and will prove peculiarly valuable where weights greater than can be lifted by one or two men are to be loaded and transported, as is the case in and about shops and in railway construction. It is stated that with a crew of three or four men this machine will easily do the work usually performed by a gang of 15 or 20 laborers. In the yard it serves the same purpose as hoists and overhead trolleys or traveling cranes in the shop.

The car illustrated is 12 ft. long with a wheel base of 5 ft. Where it is not necessary to carry loads on the deck of the machine ad-

COMBINED ELECTRIC LOCOMOTIVE AND CRANE.

hesion may be obtained by piling ballast in the form of castings or pig iron upon the platform; where so desired the machine has pockets between the sills which are filled with scrap iron. The crane is of the ordinary type, with the improvement of a hollow mast made of 4-in. wrought iron pipe, through which the rope descends to the winding drum beneath the deck. The jib is of iron and is supported by a rod and in the design shown swings through about half a circle. Where the load is to be lifted at right angles heavier ballasting and a stronger mast are necessary. In case of necessity the platform can be made longer so as to use it for carrying freight, and if still greater extension is needed double trucks may be employed. In the type illustrated, by increasing the amount of ballast and using large motors more than 200 h. p. can be readily made available. The builders have recently made one of these machines for their own use and it has already demonstrated its usefulness in and about the works.

TUNNEL ORDINANCE IN CHICAGO.

March 20th the Chicago city council passed an ordinance directing the Chicago Union Traction Co. to lower the three tunnels under the Chicago River, which are used by it, so that there shall be a depth of 23 ft. of water above them at all times. It is provided that work on the La Salle St. and Washington St. tunnels shall begin by June 28th and be completed in one year.

Litigation will undoubtedly follow, as the company cannot afford to undertake the work without some agreement as to franchise extensions.

TROLLEY PARADE AT KANSAS CITY.

The Priests of Pallas Association, of Kansas City, have enlisted the co-operation of Mr. W. H. Holmes, president of the Metropolitan Street Railway Co., and will plan to have a trolley parade, buying the necessary trucks. The advantages of using the car tracks are that the floats may be made heavier, and better illumination can be had.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

REMOVING DUST FROM BOILER ROOMS.

Mr. Albert A. Cary in a paper before the American Society of Heating and Ventilating Engineers describes the plan adopted by him for removing dust from the boiler room of a manufacturing plant engaged in making rubber covered insulated wire where dust in the work rooms would be a most serious matter.

The steam plant has its boiler room and engine room adjoining. The boiler room contains four horizontal tubular boilers, 6 in. in diameter, and 18 ft. long, with 80 3-in. tubes, having a nominal rating of 100 h. p. each. The smoke flues are connected to the rear of these boilers. I have provided a dust house next to the engine

suction pipe, as shown in Fig. 2, and the lower end of the duct is thereby raised out of the way.

After the dust enters the ducts it is discharged by the Sturtevant steel-plate exhauster (placed in the engine room) into a centrifugal dust collector placed in the dust house. The heavier particles are discharged through the bottom pipe of this collector, and, as a further precaution, to catch any light floating particles which may escape through the upper or air delivery end of the collector, a pipe is run from this top opening, and, bending downwards, terminates within 2 in. of the surface of water held in a tank placed below the level of the floor in the dust house. The bottom-discharge pipe from the dust collector also terminates similarly, and thus all the

FIG. 1.

FIG. 2.

room, but on the opposite side from the boiler room. This dust house is designed so as to receive another 100-h. p. boiler, which will doubtless be required as the demand for steam increases. Surrounding conditions made it impossible to erect this house at the opposite end of the boiler room, where it would otherwise have been placed.

Figs. 1 and 2 show the general arrangement of ducts, exhaust fan, etc. It will be seen that the four suction ends of the ducts terminate in comparatively narrow open mouths, extending almost across the entire width of the boiler front, and they are placed directly above the firing doors. All coal is brought into the boiler room on an industrial railway in Hunt's charging cars, made for this purpose,

each car carrying one ton. These cars are filled from a distant coal pocket, and are then pushed by one man in front of any boiler which may need coal. The side of the car is then dropped like a hinged shelf, and coal is shoveled direct from the car into the furnace. As the car is easily moved from one boiler to another, no loose coal is dumped on the boiler room floor.

FIG. 3.

It will now be seen that any dust rising from the shoveled coal will be drawn into the suction mouth of the exhaust dust, since the shoveling operations take place only in front of these mouths.

When the boiler furnace is being cleaned, any dust accompanying the ash and clinker, as they are pulled out of the firing door, is drawn directly into the suction mouths, and this is again the case when this refuse is shoveled from the floor into an empty charging car, to be taken out of the boiler room.

Before following this dust out of the boiler room I would call attention to the construction of the vertical suction pipes above the firing doors. These pipes, it will be seen, are directly in front of the upper cleaning doors of the boilers. In order to open these doors, when the tubes require cleaning, a hinged joint is provided in the

dust, etc., is projected upon the surface of the water, where, as it gradually becomes soaked, it sinks to the bottom of the tank, from which it can be either washed out with a hose and stream of water, or else be shoveled out as mud.

In order to catch any particles of dust which might otherwise escape, a 1-in. water pipe is bent to a circle and secured concentrically around the lower ends of each of these delivery pipes, as shown in Fig. 3. The lower sides of these pipe rings are perforated with 1/8-in. holes, so as to produce a constant shower of water around the outlets.

This arrangement leaves a free escape of air, essential for best results with the type of fan used. A sewer connection near the top of the tank keeps the water at a constant level, and the added water from the sprays thus has a tendency to float off a considerable amount of the lighter floating particles before they have time to sink.

MONUMENTAL CHIMNEYS AT PARIS.

The power plant at the Paris Exposition is divided into two sections, one for French, and one for foreign machinery. Each section is to have a monumental chimney of brick; the two are of the same general dimensions and cost approximately \$40,000 each. The total height of the masonry construction of the chimney for the foreign section is 88 m. (289 ft.) of which 8 m. (26 ft.) are below ground. The base for a distance of 13 m. (42.5 ft.) is ornamented and also the top portion; the intermediate section, 20 m. (65 ft.), is plain white brick. The foundation rests on 133 oak piles, about 12 in. in diameter and 23 ft. long, which were driven until they no longer moved under the hammer; they were then cut off and concrete cast about them. The block of concrete is 18 m. (59 ft.) in diameter and 1.5 m. (4.9 ft.) thick. On this is a hollow truncated cone of masonry, 5.65 m. (18.5 ft.) high, 16.5 m. (54 ft.) external and 4.36 m. (14 ft.) internal diameter at the bottom and 12.9 m. (42 ft.) external and 6.9 m. (22.5 ft.) internal diameter at the top. Into this hollow space two tunnels, 4.7 x 2.6 m. in section, conduct the gases.

*During the months of October, November and December the supply of condensing water, which is taken from the Chicago River through a tunnel, was cut off for a few days by reason of work on the Chicago Drainage Canal, and the station was in consequence run non-condensing at those times.

**Cost of Oil per Barrel.

Above the ground the chimney comprises a pedestal 16 m. (52.5 ft.) in height, a shaft of 54 m. (177 ft.) and a capital of 10 m. (33 ft.). There is no core and the internal diameter is 6.2 m. (20 ft.) at the base and 4.5 m. (15 ft.) at the top; the thickness of the wall varies from 2.9 m. (9.5 ft.) to 1.35 m. (4.4 ft.) for the pedestal, and from 3.5 m. (11.5 ft.) to 1.6 m. (5.2 ft.) for the shaft and crown.

BURT EXHAUST HEAD.

We illustrate herewith a sectional view of the Burt exhaust head made by the Burt Manufacturing Co., of Akron, O. The construction is readily apparent; the steam emerging from the exhaust pipe strikes the cone immediately above the inlet and is deflected, the greater volume rising to the small projection extending around the top of the head. A portion of the vapor is condensed by contact with the metal surfaces of the head and this together with the entrained oil and water flows down between the double walls to the drip below.

BURT EXHAUST HEAD.

The heads for pipes up to 6 in. in diameter have a threaded base to which the upper portion is riveted; for larger sizes the base is flanged. The head is of heavy plate, lapped, riveted and soldered, and is protected against corrosion by anti-rust paint.

The advantages claimed for the design are that the increased volume secured by making the sides cylindrical instead of conical reduces the back pressure, and by reducing

the velocity of flow gives a more complete separation of the entrained oil and moisture; that the greater area of wall surface gives more condensation, hence more water is returned to the boiler room; that the absence of baffle plates and tortuous passages for the steam gives a free passage for escape and renders the head noiseless.

WATER IN THE BOILER.

Mr. J. W. Williams, a practicing chemist of Hamilton, Ont., recently discussed the subject of "Boiler Feed Water" before a Canadian engineering society and gave the following explanation of why corrosive action takes place in boilers.

Water in its ordinary state has a temperature of about 40° to 50° F., and the solvent quantity differs according to temperature. In many instances water will dissolve more when hot than cold, but conversely the earthly salts usually formed in water supplies are precipitated mainly because these salts are held in solution by

carbonic acid gas, and this with other gases is much more soluble in cold water than warm, and is dissipated from hot water, with the result of the throwing out of solution of the earthly salt. This, together with the evaporation of water leaving the solids behind in making steam, is the cause of scale and boiler mud.

Not only is the mud left behind, but the elements which form the chlorides, sulphates, etc., remain also, and these, under the influence of the high temperature in the presence of moisture, decompose with the liberation of the radical or acid part of the substance, which is then free to act on the iron plates or tubes, which it does to the sorrow of many a boiler owner.

The combinations which previously existed will be broken up and other combinations will occur, and the metal of the boiler is called on to take its part in forming these combinations. A water containing chlorides is fed into a boiler and concentrated by the evaporation of the water. This concentration brings with it the breaking up of the chlorides. Carbonic acid gas being present, free and also combined, is liberated by the decomposing effect of high temperature as referred to already, and by that law which governs matter and which couples atoms, to themselves if nothing else is available, this carbonic acid gas displaces the chlorine combined as chlorides, and this in turn seeking to obey this law of combination, unites itself to its heat affinity, the iron of the boiler plate.

It will here be concluded that the chlorine having done its best or worst is out of the game, but no, chloride of iron is not more stable than chloride of calcium, magnesium, potassium, sodium or any chlorides which may pass into the boiler in the feed water. Chloride of iron will take up oxygen, which as atmospheric air is taken into the boiler, dissolved in the water, and if this were not there the water would be called on to furnish oxygen, and an oxy-chloride formed passing on with a further addition of oxygen, and the formation of an insoluble oxide of iron and the chlorine is again on its cruel mission after an atom of iron. As with the chlorine, so with the other salts; just the exact changes and processes it is not presumed to define, but the foregoing will throw light on the cause of the corrosion of boilers. Having surveyed to a limited extent the origin of scale and the cause of corrosion, we will consider the action of boiler purges. We have observed the liberation of corrosive acid elements, and to neutralize these most purges are alkalies, and remembering the decompositions just referred to, we can see that if these neutralized acids now in the form of salt, generally a soda, are allowed to remain in the boiler, we can expect to experience similar results again, calling apparently for more alkali, but the precautions which will best combat these dangers are emptying the boiler, washing out and filling with fresh water. This has its limit, however, and must of necessity be controlled by fuel, time and circumstances, but it can be seen how valuable is blowing off—which only deducts from the contents of corrosive matter in the ratio of what is blown off—and more especially cleaning out.

A remonstrance has been entered by the Union Traction Co., of Philadelphia, against the granting of licenses for saloons near its car barns.

CINCINNATI, NEWPORT & COVINGTON.

In our issue for February last, page 108, was a summary of the earnings of the Cincinnati, Newport & Covington Ry. for the year 1899, and we give herewith further data taken from the report of Pres. James C. Ernst, published under date of February 21st.

The gross receipts were \$713,385, an increase of \$31,713 over 1898; the net earnings were \$270,780, an increase of \$76,552; and the surplus after paying fixed charges amounted to \$94,208, about 3 per cent. on the capital stock. Table I shows interesting statistics.

Table III shows the itemized statement of power house expenses. Twelve "American" stokers were installed in March, 1899, and have proved their efficiency as smoke preventers and greatly reduced the cost of fuel and labor. The Newport power station of the company was abolished and the equipment of the Covington station increased by the addition of a 1,200-h. p. engine built by the C. & G. Cooper Co., of Mt. Vernon, O., and an 800-kw Westinghouse generator.

This plant now has a capacity of 4,250 amperes, the engines being rated at 4,000 h.p. and the boilers at 3,100 h. p.

NOTE.—The total cost includes repairs amounting to \$1,427.06

During the year 58,000 ft. of new trolley wire was put in place. October 1st a new car house was completed. This building is of brick and iron, with a frontage of 90 ft., and depth of 275 ft., with capacity for 100 cars; eight tracks run the entire length of the building, with pits 60 ft. long, between each track for overhauling of cars; each pit is supplied with steam pipes for the drying out of cars and equipment. On lower floor is the Division Master's office, a fire proof oil room, repair room and first-class lavatory for use of the men, which is supplied with porcelain bath tubs and latest sanitary plumbing. On the second floor is the reporting room for men where they make out their daily reports, and lockers are provided for each crew; here are also the office of Inspector in Chief and Superintendent of Line Department; reading room, where can be found magazines, papers, etc., which the men thoroughly appreciate and enjoy. This building was erected at a cost of \$23,909.

Upon the completion of the new car house, the Dayton, Newport and Main St. car houses were abandoned, and the system was reorganized, making two distinct divisions. All lines east of the Licking River belong to the Newport Division, and all lines west of the Licking River belong to the Covington Division. By this centralization of the work, the results have been not only satisfactory, but the work has been simplified in every respect.

New shops in close proximity to the car house and power house have been fitted up.

During the year considerable work has been done on the track and roadbed, and on the Ft. Thomas line a substantial trestle of over 100 ft. long was put in. The system now embraces 56.25 miles, 24.11 in Kenton County, 25.87 in Campbell County, 3.52 on the four bridges and 2.75 miles in Cincinnati.

Ten new convertible cars mounted on Peckham trucks were added at a cost of \$15,422, which included also the Westinghouse controllers.

In conclusion President Ernst said:

"The company is to be congratulated upon the very few accidents which have occurred during the year, and the damage to property was in every instance slight. The total amount paid out during the year for claims amounted to the insignificant sum of \$4,300, and to carry 14,574,260 passengers without the loss of a single life or even serious injury is a record of which the company may well feel proud.

"This record is in a measure due to our custom of giving prizes

to motormen having no accidents during the year, as it has a tendency to make them both cautious and careful in the handling of their car, and although accidents of every character are charged up against them 17, out of 125 motormen received the first prize of \$25, as they had no accident of any nature during the entire year. Prizes of same amount are awarded to conductors taking the best care of the car and for general deportment while on duty.

"Owing to the steady increase in travel, our car equipment will be increased by the purchase of ten or fifteen more cars of the latest design, and will be ready for use in time for the summer travel.

"The car house at State and Madison Sts. will soon be thoroughly overhauled and remodeled, and capacity for the storage of cars enlarged, as well as the fitting up of rooms for the convenience of the men similar to the car house in Newport."

The officers are: President, J. C. Ernst; vice-president, Julius Fleischman; secretary and treasurer, George M. Abbott. The operating company is the South Covington & Cincinnati Street Ry. with the same officers, save the vice-president, John A. Simpson.

NEW YORK RAPID TRANSIT BEGUN.

The work of excavating for the New York Rapid Transit tunnel was formally begun on the afternoon of March 24th, when the mayor of New York thrust a silver spade into the ground at a point near the city hall. The mayor was followed by Mr. McDonald, the contractor, and then by President Orr, of the Rapid Transit commission, Vice-President Starrin, Comptroller Coler, and others, each throwing up a spadeful of earth. It is said that 20,000 people witnessed the ceremony, which was made the occasion of appropriate addresses by the mayor, Mr. Coler, Mr. Orr and others.

When it is considered that the dirt thrown out by these distinguished persons had already been once removed by the workmen who took up the pavement over it, and then returned and left loose so that the silver spade would handle it easily, and that the hole will have no connection with the tunnel, its only function being to provide something for the bronze commemorative tablet to cover, this ceremony appears to be somewhat of a farce, and a poor way of spending \$5,000.

CHISHOLM & MOORE EXHIBIT.

The Chisholm & Moore Manufacturing Co., of Cleveland, was the only supply company which had an exhibit at the meeting of the American Railway Engineering and Maintenance of Way Association, held in Chicago March 14th to 16th, and was represented by Col. W. E. Ludlow, manager of the railway department. Col. Ludlow's exhibit, which was displayed in one of the parlors of the Victoria Hotel, the association headquarters, consisted of the well-known "American Standard" rail joints and special track and shop tools.

The joint exhibit comprised sample joints, as assembled with the rails, for 60, 70 and 80 lb. A. S. C. E. sections, and the handsomest joint model that was ever shown at a convention; this was a full size model, the rail of polished brass and the joint castings of aluminum, mounted on a plush covered brass table. This model was made by Col. Ludlow, himself, and he was well repaid for his trouble by the attention which the "16 to 1" model attracted.

The tool exhibit comprised: A regular No. 2 Chisholm & Moore air drill for iron, a No. 2 reversible air drill, a pneumatic chipper and calker, a boiler flue expander and a flue cutting-off tool. The air drills are made in five sizes Nos. 1 to 5, and are designed so as to be very light for the capacity, the casings being of aluminum. The drill for iron, which was mounted for drilling rails in place with an "old man" designed by Col. Ludlow, had recently been in a competition with other drills where it drilled a 1 1/4-in. hole through 2-in. steel in 2 1/2 minutes, the second best doing the same work once in 7 minutes and sticking at the second attempt; on lighter work, 1-in. holes through the web of a 70-lb. rail, the time ranged from 32 to 38 seconds. The reversible drill is an entirely new tool, the one exhibited being the first made by the company.

The boiler tube expander mentioned is adapted for hand working or may be used with a power drill; it is self-feeding, that is, it enters the tube by virtue of its rotary motion and needs no end pressure. The tool has ball bearings so that friction is reduced to a minimum.

Among the other new devices made by the company is a rectangular frame for supporting a rail drill; it is mounted on four wheels that roll on the rails so that it can be easily moved from point to point. The exhibit also included Avery cast iron tie plates.

THE UNION AT INDIANAPOLIS.

On March 22d a number of the employes of the Indianapolis Street Ry. held a meeting to perfect organization as a branch of the Amalgamated Association of Street Railway Employes. The company having in mind the experience of the old Citizens' company with the organization among its men, naturally did not regard the movement with approval, and on March 28th it was announced that the local union had been dissolved.

There has been no union among Indianapolis street railway men since 1894; the organization disbanding at that time participated in three strikes, two of which lasted weeks and tied up all the lines. In the first strike arbitration was reached, and a temporary conciliation effected, but soon after there was another source of friction, and another strike was begun. The third was in the fall of 1893, on the day Nancy Hanks was to trot against the world's record at a race meeting, the G. A. R. encampment being there at the same time, the lines were suddenly tied up by order of the executive board at noon, and remained dead until night.

EMPLOYES' BALL AT OAKLAND, CAL.

The Carmen's Social & Benevolent Society, composed of the street railway employes of Oakland, Cal., recently entertained its friends at its third annual dance given in one of the large halls of the city. From one of the souvenir programs of the affair sent us by the secretary, Mr. D. Hughes, we notice the names of a number of the waltzes and polkas were changed to suit the occasion. Among the dances were: Got a Flat Wheel, Fares Please, Walk Back a Block and Au Revoir—The Owl is Waiting. The social features of the society are in charge of a competent committee.

The tickets for the ball, as shown herewith, were designed in imitation of the transfer slips used on the lines of the Oakland Transit Co., properly punched as to date and time limit.

LAKE STREET ELEVATED LITIGATION.

In 1896 the Lake Street Elevated R. R., of Chicago, filed a bill in equity to remove the Farmers Loan & Trust Co., of New York, as co-trustee under its first mortgage, on the ground that it had not complied with the state statutes by depositing \$200,000 with the state treasurer. An injunction was also obtained preventing the Farmers Loan & Trust Co. and Wm. Ziegler, who owned \$600,000 of bonds, from foreclosing the mortgage.

The decisions in the state courts were in favor of the Lake Street company, but on March 26th the United States Supreme Court held that the cause should have been removed to the Federal courts, and it will now be retried in the United States Circuit Court.

The Newport News & Old Point Railway & Electric Co. will endeavor to prove in court that the license tax imposed by the city is illegal.

PERSONAL.

MR. H. B. VANDEGRIFF has resigned as superintendent of the Wilmington (Del.) City Ry.

MR. W. J. COLE resigned as cashier of the Fond du Lac Street Railway & Light Co. on March 15th.

MR. T. J. CARMACK has succeeded Mr. F. W. Sweet as manager of the Charleston (W. Va.) Traction Co.

MR. S. L. NELSON, the newly appointed manager of the lines at Wichita, Kan., was a "Review" caller last month.

MR. CHARLES A. ALLEN, author of the Illinois Allen law, is a candidate for speaker of the state house of representatives.

MR. CHARLES T. VERKES has been chosen chairman of the board of directors of the Northwestern Elevated R. R., Chicago.

MR. E. E. CLARK was appointed temporary receiver for the Benton Power & Traction Co., St. Cloud, Minn., on March 11th.

MR. JOHN P. MORSE, president of the Brockton (Mass.) & Plymouth Street Railway Co., last month resigned from that office.

MR. RICHARD R. QUAY, son of Senator M. S. Quay, of Pennsylvania, has been elected president of the New Castle (Pa.) Traction Co.

MR. T. P. POPE, formerly with the Edison Electric Co. at New Orleans, has been appointed superintendent of the Virginia Electric Railway & Development Co.

MR. JOHN DAY, as president of the St. Louis & Belleville Traction Co., recently subscribed \$5,000 to the fund for the St. Louis World's Fair, to be given in 1903.

MR. GEORGE O. NAGLE has accepted a position with the well-known engineers, Ford, Bacon & Davis, New York City, and has taken charge of an engineering department.

MR. HENRY D. COOKE, president of the Compressed Air Motor Co., of Chicago, will, it is understood, succeed Mr. H. H. Vreeland as president of the American Air Power Co.

MR. CHARLES F. WOODWARD has resigned as president of the Waterville (Me.) & Fairfield Electric Railway, Light & Power Co., and has been succeeded by Mr. George K. Boutelle.

MR. CHARLES L. HULL, formerly master mechanic of the Chicago General Railway Co., has been made general manager and purchasing agent of that company, with which he has been connected since 1890. He came from Washington, D. C., in that year and was appointed clerk in the office of the promoters of the General Railway, his name appearing as one of the incorporators of the original company. His ability to handle details and master the difficulties of the work made his advancement rapid and from city buyer in 1894 he has been promoted to the positions of general bookkeeper, store-keeper, cashier, purchasing agent, master mechanic, and now has been made manager of the entire system. Mr. Hull has a large circle of acquaintances, all of

C. L. HULL.

whom will wish him well in his new position. The Chicago General Railway Co. originally commenced business with five cars and 10 miles of road, operated by one 100-kw. generator. It now owns 26 cars and 29 miles of road.

MR. GEORGE W. BAUMHOFF, formerly general manager of the Lindell Railway Co., and since the consolidations superintendent of the Lindell division of the St. Louis Transit Co., was on

G. W. BAUMHOFF.

March 27th chosen general manager of the entire system, to succeed Mr. Jilson J. Coleman, who had tendered his resignation some ten days before. Mr. Baumhoff is a practical street railway man, having spent nearly all his life since boyhood with the Lindell company, where he became thoroughly familiar with all departments of the service. Beginning as the driver of a horse car he worked up through the various grades of barn service and entered the general offices as a bookkeeper; continued promotions brought him to the top of the ladder in the operating department, and the present appointment makes him manager of one of the large street railway systems of the country. Mr. Baumhoff has the best wishes of a host of friends who feel confident that he will earn new laurels in a wider field.

MR. C. D. SHEPARD, for two years the superintendent of the Palmer & Monson Street Ry., has resigned to become superintendent of construction for Fred T. Ley & Co., of Springfield.

MR. GEORGE L. WELLINGTON, president of the Cumberland (Md.) Electric Ry., has succeeded Mr. J. A. Milholland as president of the Edison Electric Illuminating Co., of Cumberland.

MR. ALEXANDER CHAMBERS, secretary of the Newtown (Pa.) Electric Ry., accompanied by his brother, is soon to return to Honduras, where they are interested in railways and copper mines.

MR. WILLIAM D. GRANT, the mayor of Willimantic, Conn., has been chosen to succeed Mr. John Pettis as president of the Willimantic Street Railway Co. The company has not yet commenced to build its line.

MR. EDWARD P. BURCH, of Minneapolis, Minn., on March 21st delivered a lecture before the upper classmen of the Nebraska University on "Heavy Street Railway Engineering" illustrated with 50 lantern slides.

MR. PARIS L. DAVIS has taken up his new duties as superintendent of the Marquette City (Mich.) & Presque Isle Street Ry. He was for a number of years connected with the railways at Benton Harbor and St. Joseph, Mich.

MR. F. J. STOUT, formerly superintendent of the Wheeling & Lake Erie R. R., with headquarters at Toledo, O., has just been appointed general manager of the Toledo, Fremont & Norwalk Electric Ry., a new line under construction.

MR. E. P. BRYAN vice-president and manager of the St. Louis Terminal Ry., will be general manager of the company now organizing to operate the Rapid Transit road in New York. During construction he will act in a consulting capacity.

MR. E. E. HIGGINS, editor of the Street Railway Journal, of New York City, is devoting considerable time to Success, a new periodical in which he has recently become interested. We wish him all that the name of the new paper implies.

MR. HARRY DE STEESE, formerly manager of the railway supply department of the Western Electric Co. in New York, was a "Review" caller recently. Mr. De Steese is now on his way to Europe, where he will represent the Sturtevant Engineering Co., of London.

MR. E. G. CONNETTE, general manager of the Nashville Ry., and the Cumberland Electric Light & Power Co., resigned to become general manager of the Syracuse (N. Y.) Rapid Transit Co.,

E. G. CONNETTE.

assuming his new duties April 1st. He was also chosen a director of the company. Mr. Connette was born in Indiana, and at an early age entered the railroad business in the service of the Cincinnati Short Line. He was with this company when the Louisville & Nashville purchased the road, and he continued his connection with the Louisville & Nashville until 1899, when he resigned to accept the position of superintendent of the United Electric Railway Co., a position he held for one year, and since then has been general manager, until last April, when the various properties were consolidated. Since the consolidation of the properties, Mr. Connette has been General Manager of the Nashville Railway and Cumberland Electric Light & Power Companies, a position he filled with entire satisfaction to the owners of the properties.

MR. O. F. GAITHER, of Chicago, having disposed of his holdings in the Consolidated Street Railway Co., of Grand Rapids, Mich., has resigned as secretary. The new stockholders on March 16th elected four new directors, George E. Hardy, George Hefferan, C. M. Clark, Anton G. Hodeppyl.

MR. CHARLES E. FLYNN, general manager of the Easton (Pa.) Transit Co., has the sincere sympathy of all his friends in the recent death of his wife. Although Mrs. Flynn had been an invalid for several years, her death was quite unexpected. The funeral was held at Winona, Minn., her former home.

MR. GEORGE S. WHIPP, formerly with the Standard Air Brake Co., will hereafter represent the railroad department of the Boston Woven Hose & Rubber Co., of Boston and New York. Mr. Whipp has been in the supply business for many years and his large circle of friends will wish him every success in his new venture.

MR. A. H. FORD, secretary and treasurer of the New Orleans (La.) City Railroad Co., on April 1st retired from that office to accept the position of general manager of the New Orleans & Carrollton R. R.

A. H. FORD.

Mr. Ford was born in New York City, July 28, 1859, and his early business life was spent in the employment of various steam railroad companies. At the age of 17 he held the office of clerk to the receiver and local ticket agent of the Lake Erie, Evansville & Southwestern R. R. From 1880 to 1884 he was secretary of the Evansville & Eastern R. R., assistant auditor of Evansville, Rockport & Eastern R. R. and when the two companies were consolidated he became traveling auditor. From 1886 to 1892 he was successively auditor of the Kentucky & Indiana Bridge Co., treasurer and auditor of the Louisville & Southern R. R. and secretary and treasurer of the Southern Contract Co. He left Louisville in 1893 and since that time has been associated with the New Orleans City Railroad system, enjoying the fullest confidence of its officers and stockholders. His resignation was accepted with much reluctance.

Asked in regard to the rumored consolidation of all the street railway companies in New Orleans, Mr. Ford said to a reporter: "I have always been a strong advocate of consolidation and I am

sure it will eventually be consummated." At present there are four distinct systems in the city.

MR. T. J. FELDER, vice president of the Nashville Ry., has assumed the executive duties of the office vacated by Mr. Connette. Mr. George Swint will be superintendent in charge of the operation of the railway, and Mr. J. M. S. Waring, electrical engineer, will be superintendent of the Cumberland Electric Light & Power Co.

MR. J. CLIFTON ROBINSON, superintendent of the London United Tramways, writes on "British Tramway Development" in the February issue of Cassier's Magazine. He makes the statement in his opening paragraph that the initial attempt to introduce tramways in Great Britain was made at Birkenhead in 1860 by George Francis Train.

MR. MORMORU JIO, electrical engineer for the Kansas City (Mo.) & Leavenworth Electric R. R., has been appointed superintendent of a proposed system of electric railways between cities in Japan. Mr. Jio comes from one of the best Japanese families and is spending several years in this country in order to become thoroughly informed regarding American street railway practice. He is a graduate of the department of electrical engineering at Kansas State University.

MR. JOHN H. ROBERTSON, superintendent of the Third Avenue R. R., of New York, on April 7th tendered his resignation, to take effect April 30th, which was accepted with regret by Receiver Grant. Mr. Robertson has been in the service of this company for 33 years, during 7 of which he was in entire charge of the shops and all other mechanical work, and 19 as superintendent. In this time the system of motive power has been twice changed, from horse to cable and from cable to underground electric, the work being under his personal supervision. Mr. Robertson is a native of Edinburgh, Scotland; he served in the 69th New York in the Rebellion, and in 1867 began work in the shops of the Third Avenue company.

MR. G. M. BRILL, who for the last three years has been assistant manager of the construction and mechanical departments for Swift & Co., has resigned that position and opened offices at 1143-4 Marquette Bldg., Chicago, to engage in practice as consulting mechanical and electrical engineer. Mr. Brill is well fitted for this work, having had nearly 10 years' experience in designing and building power houses, shops and refrigerating plants. After graduating at Cornell University in 1891, he went with the Salvay Process Co., of Syracuse, N. Y., as engineer of experiments and tests, and later was chief engineer in charge of construction when the company built its Detroit works. In 1897 Mr. Brill became general engineer for Swift & Co., and during the three years he was with them his work was largely in a consulting capacity.

OBITUARY.

MR. ALLEN FOLLICK, master mechanic of the Oakwood Street Railway Co., Dayton, O., died on March 14th.

MR. WILLIAM R. PRALL, paymaster of the Staten Island (N. Y.) Rapid Transit Co., died March 19th, after an operation for appendicitis.

MR. JOSEPH H. BROWN, formerly a director of the Lowell (Mass.), Lawrence & Haverhill Street Ry., died at his home in Lowell on March 26th, aged 81 years.

MR. N. H. BECKER, vice-president of the Geneva (N. Y.), Waterloo, Seneca Falls & Cayuga Lake Traction Co., died at Constantinople on February 1st, aged 60 years.

MR. CORNELIUS PIERPONT, of New Haven, Conn., who built some of the horse car lines now forming part of the Fairhaven & Westville system, died on March 20th, aged 70.

MR. ADDISON C. RAND, president of the Rand Drill Co., died suddenly at his home in New York on March 9th. Mr. Rand was

one of the pioneers in developing rock-drilling and air-compressing machinery and was identified with many mechanical and engineering associations.

MR. FRANK O. MASON, superintendent of the New Castle Traction Co. and the New Castle Electric Co., of New Castle, Pa., died on March 22d, of typhoid fever, after an illness of three weeks.

MR. BERNARD M. SHANLEY, president of the Consolidated Traction Co., of Jersey City, N. J., and largely interested in electric railway and lighting companies, died at his home in Newark on March 19th.

MR. JOHN R. BULLARD, of Boston, died at his home March 16th; he was interested in electric railways and was for years a director of the Norfolk Suburban, West Roxbury, Roslindale and Norfolk Central companies.

MR. GEORGE E. NEWLIN, formerly treasurer of the West Chicago Street Railway Co., and since the consolidation associated with the Chicago Union Traction Co., having charge of the rentals, died suddenly on April 2nd.

MR. JAMES H. FROTHINGHAM, for many years treasurer and later receiver of the Kings County Elevated Railway Co., of Brooklyn, died recently at the age of 67 years. He was one of the original promoters of this road and assisted in the recent reorganization of the company.

MR. CHARLES R. BROWN, manager of the railway department of the Michigan Malleable Iron Co., Detroit, died in that city on Sunday, March 11th. He was sick but three days, and his death occurred at a hospital shortly after an operation. While Mr. Brown was more widely known among steam railroad men, he enjoyed a large acquaintance in our own field. He was for several years in the sales department of the Illinois Steel Co., and looked after such rail orders as were intended for street railway use. Mr. Brown possessed an unusually genial temperament, and was one of those men whom to meet was to like, and to know was to love. He leaves a widow and three children.

ELECTIONS.

THE NEW JERSEY & HUDSON RIVER RAILWAY & FERRY CO., which is a consolidation of the Bergen County Traction Co., of Fort Lee, N. J., the Ridgefield & Teaneck Railway Co., and the Riverside & Fort Lee Ferry Co., has elected the following directors: S. Davis Page, A. Merritt Taylor, Joseph De F. Junkin, Charles T. Calloday and William P. Clark, of Philadelphia; George W. Bacon, Frank R. Ford, Archibald S. White and Charles A. Liebe, of New York; Charles N. Black, of Norristown, and James C. Young, of Jersey City. The officers are: President, A. Merritt Taylor; vice-president, W. H. Clark; secretary and treasurer, W. N. Burrows.

THE BIDDEFORD & SACO RAILROAD CO. last month chose new directors who elected Charles H. Prescott (formerly treasurer and general manager) president, and E. A. Newman general manager.

NEW PUBLICATIONS.

"LA PEQUENA INDUSTRIA" is a paper just started at Valencia, Spain, to deal in a popular way with electrical developments in that country.

THE MINNEAPOLIS TIMES, of Minneapolis, Minn., is taking advantage of bright business prospects to issue a special edition called the "Times Northwest-Orient Edition." This deals with the present financial, commercial and maritime conditions of the Northwestern territory.

"SCIENCE ABSTRACTS" is published monthly by E. & F. N. Spon, 125 Strand, W. C., London, for whom Spon & Chamberlain, 12 Cortland St., New York, are sole American agents. The price is 25 or 50 cents per number; per year with index, \$6.

THE TRANSACTIONS OF THE PACIFIC COAST ELECTRIC TRANSMISSION ASSOCIATION, giving the proceedings of the third annual convention held in June last, have been received. The contents comprise the following papers, with the discussion had on them: "Tests and Calculations for a 40-mile Aluminum Transmission Line," by F. A. C. Perrine; "Hints on Long-Distance Transmission," by R. W. Van Norden; "Electric Lighting v. Gas," by John Martin; "The Regulation of Alternating-Current Generators," by C. L. Cory; "Electrically-Driven Centrifugal Pumps," by Lewis A. Hicks; "On the Determination of a Fair Return for Current Supply," by C. W. Hutton.

"ELECTRIC WIRING," by Cecil P. Poole, is a recent publication by the Power Publishing Co., of New York. It is designed for practical wiremen called upon to lay out their own work, and as a reference book for engineers having to make calculations for transmission circuits. In the preface the author states that all the tables given have been computed from fundamental formulas and their accuracy carefully verified. Wiring tables for alternating current motors are included and also tables giving the corrected drop in inductive circuits. It is believed that these are the only tables of the kind in print, and they should prove convenient and valuable. The book comprises 100 pages, pocket size, and is bound in flexible covers; price, \$1.00.

"THE JOURNAL OF THE ASSOCIATION OF ENGINEERING SOCIETIES" for January contains a paper from the Cleveland Society upon dock equipment for the rapid handling of coal and ore on the great American lakes, one from the St. Paul Society describing the removal of portions of a bridge crossing the Mississippi at that place, one from the Louisiana Society upon the progress of drainage in New Orleans and one from the Detroit Society upon masonry construction, earth pressures, etc. The report of the secretary, which is given in this number, shows that the membership of the allied societies has reached a total of nearly 1,500. The net cost of the Journal to members has been reduced from \$3.66 in 1895 to \$1.00 in 1899.

STEPHENSON WORKS TO BE SOLD.

The last chapter in the affairs of the John Stephenson Co., Limited, of Bayway, near Elizabeth, N. J., will be concluded on Wednesday, April 25th, when the receiver, Albert A. Wilcox, will dispose of all the real and personal property at public sale, without reserve. The material, such as lumber, iron, malleable, cast and rough stock; tool steel, cast steel and the hundred and one kinds of necessary supplies for such establishments, will be sold in lots. There is a large stock of well-seasoned, high-grade lumber which it is worth while for car builders and cabinet woodworkers to make note of. The plant, consisting of all the real estate, buildings, machinery, fixtures, motors, patterns, etc., will be disposed of in one parcel. The area of the grounds is about 90 acres, well located. Permits to inspect the premises can be had from the receiver at Room 709, No. 95 Liberty St., New York.

BATES FANS.

In anticipation of the demand for electric fans which develops with the approach of summer, D. L. Bates & Co., of Dayton, O., have issued a new descriptive catalog of their well-known fans and fan motors. The principal types offered this season are four-blade ceiling fans for direct current at 110, 167, 220, 250 or 500 volts; two-blade ceiling fans, direct current at any of these five voltages; electrolier ceiling fans with detachable blades, direct current, five voltages; stationary electrolier four-blade fans, direct current, five voltages; column fans, with or without lights, 110, 220, or 250 volts; desk fans for three speeds, made for direct current at 110, 220, or 250 volts; bracket fans. This firm has a national reputation for the excellence of its fans of which thousands are in use.

Mr. George H. Harris, electrical engineer of the Birmingham (Ala.) Railway & Electric Co., writes us that the company has convicted no less than a dozen persons of stealing rail bonds, the sentences being in some instances for three years.

FOREIGN FACTS.

The Swansea (Wales) Corporation Tramways are to be extended.

Contracts for electric tramways have been let by Newcastle on Tyne, Eng.

The Wolverhampton (Eng.) Corporation will take over the tramways at a price of £22,500.

Work has been commenced on the new power station of the Huddersfield (Eng.) Tramways.

An interim dividend of 4 per cent has been declared by the Cape Electric Tramways, of Cape Town, South Africa.

Another electric line has been opened in Liverpool, running from Aintree, at the north end of the city, to Aigburth St.

Dispatches from South Africa state that the tram cars at Kimberley were kept running through the entire period of the siege.

The Middlesex (Eng.) County Council is applying to the Light Railway Commissioners for rights to construct electric railways.

A concession for an electric railway in the Caucasus, Russia, from Tiflis to Kachetien, has been granted to Prince Tochawtschawodre.

March 9th the first electric railway, comprising a few miles of what will ere long be a large system, was opened at Havana, Cuba.

The building of an electric road connecting Salonica, Turkey-in-Europe, and Langaza is under consideration by the Turkish Government.

A majority of the members of the Glasgow tramways committee are opposed to the carrying of advertisements, either on the inside or outside of cars in that city.

Manaos, Brazil, has an electric railway 15 miles long, with seven miles additional under construction. The concession is owned by Chas. R. Flint, of New York City.

It is expected an experimental train will be run over the Central London Ry. within a few weeks, and the road will probably be opened to traffic a few months later.

Owing to the condition of the metal and money markets the Great Yarmouth (Eng.) tramways committee has decided to defer for the present the work of laying the tram lines.

The policemen at Hamburg, Germany, are instructed to watch the cars closely and if they find a car with a single passenger more than the law allows the conductor is fined 72 cents.

The technical institutions in Berlin, Germany, have filed complaints before the Reichstag respecting the electric and magnetic disturbances to various instruments caused by trolley currents.

By the bill deposited by the London United Tramways Co. for the next session of Parliament, power is sought to extend the system by the construction of new lines nearly 21 miles in length.

There has been incorporated at Naples, Italy, the Societe Generale des Tramways et Chemins de Fer du Centre, with a capital of 1,250,000 lire to construct electric tramways in the vicinity of Naples.

A bill has been introduced in the House of Commons empowering the South-Eastern Metropolitan Tramways Co., of London, Eng., to equip its system for electric traction at an estimated cost of £158,029.

A company has been formed for the construction of an electric railway connecting Kogoori, a station on the Sanyo Ry., with Yamaguchi, Japan, a distance of about nine miles. Count Yamada is one of the incorporators.

The Tokyo Tram Co. of Tokyo, Japan, has declared a dividend of over 30 per cent on its business for last year. On Jan. 1, 1900, the company carried 108,000 passengers, as compared with 96,700 passengers on Jan. 1, 1899.

Two electric tramway companies have been incorporated to build lines near Rome, Italy. These are Societa per le Tramvie Elettriche di Terni, and Societa delle Tramvie e Ferrovie Elettriche. The president of the latter is Count Carlo Rasponi.

The plan submitted by the Burma Electric Work Syndicate, Ltd., for building an electric railway has been accepted by the Mandalay (India) municipal committee. The tramway is to be commenced within one year and completed two years thereafter.

According to a London newspaper, in the first year of the corporation management, the Glasgow Tramways carried 60,000,000 passengers. Last year they carried 119,000,000 passengers, equivalent to the entire population of Glasgow three times every week.

The advantages of electric traction over horse haulage have been particularly well shown at Bristol, Eng., and Dublin, Ireland. In both of these cities traffic receipts have increased and operating expenses have decreased sufficiently to warrant an extra dividend of 1 per cent.

The electrical extensions of the City & South London Ry. to Moorgate St. have been opened to the public, and the new power station at Stockwell is now operating the system. There has been put in force a new tariff of fares, regulated on a ticket system according to the distance traveled.

Robert S. S. Bergh, U. S. Consul to Sweden, writes from that country as follows: "Electric railways and tramways are being planned for Gothenburg, Lund, Bjerrrod and Jonkoping. In this line, as in everything else, the Germans are always watchful; if necessary they send experts here to study plans, etc. If it is not practical for Americans to do likewise, they could possibly employ active agents to represent them here."

ELECTRIC RAILWAY DEVELOPMENT IN RUSSIA.

Prepared by the Philadelphia Commercial Museum.

Until quite recently little or no progress was made in the construction of electric street railways in Russia, but at the present time the construction of new lines is going on in all parts of the empire, and concessions have been granted for many others, so that now may be said to be an opportune moment for American manufacturers of street railway materials, rolling stock, electrical machinery and equipment, etc., to make energetic attempts to secure a market for their products in that country.

A correspondent of the Philadelphia Commercial Museum writes that institution from Riga to the effect that the city of Riga is seriously considering the question of building a network of electric street railways. The city had already taken the matter in hand and the Ministry of the Interior had expressed its willingness to assist the corporation by granting it a loan for the purpose. The estimated cost of this project is \$800,000.

Electric street railways are now in course of construction at Lublin and from Pabianice, via Lodz to Zgierz. A line is also proposed to connect Dombrowa, Sosnowice and Beddzin, and it is believed that work on this will shortly be commenced. We gave some interesting data concerning the street railways of Warsaw and Witebsk in the "Review" for November, 1899, page 797.

German manufacturers have sample warehouses established in the largest towns of Russia, and if American manufacturers want to enter into competition, they will certainly have to do likewise. They also should be properly represented by active agents.

Catalogs should be printed in the Russian language, or in default of this, in German, as those in English are absolutely useless, and the money spent in forwarding them is only wasted.

From New York to Reval, the nearest port to St. Petersburg, the present freight rate is 22s. 6d. (\$5.47) and 5 per cent prime per

ton of 2,240 lbs. or 40 cubic feet., ship's option. Particulars, however, can be obtained from the New York agents of the various steamship lines, as follows:

Funch, Edge & Co., Produce Exchange Annex.
 Furness, Withy & Co., Ltd., Produce Exchange Annex.
 Hamburg American Line, 37 Broadway.
 Sanderson & Son, 20 Broadway.
 John W. W. MacDonald in Warsaw desires to represent American manufacturers of tramway materials, etc.

Correspondence should be opened with and illustrated catalogs and price lists sent to the following selected list of importers of electric street cars and electric railway materials in Russia:

Max Kubitzky, Rue Grande Loubianska, Moscow.
 Henry A. Lehrs, Myasnitzkaya, House Baskakin, Moscow.
 Phillip & Co., Nachfolger, (Aussem & Co.), Naroscika, Haus Leonov, Moscow.
 E. Tillman & Co., Moscow.
 E. Bastian & Co., Bolschaja Morskaja, 27, St. Petersburg.
 Societe Energie, Nadeschdumskaja, 34, St. Petersburg.
 O. Spennemann, Tschernyschew, 12, St. Petersburg.
 Wossidlo & Co., St. Petersburg.

METROPOLITAN BUYS THIRD AVENUE, NEW YORK.

March 14th Mr. Hugh J. Grant filed his report as temporary receiver of the Third Avenue road, which showed the liabilities of the company to be:

Funded debt with interest.....	\$5,039,583.33
Mortgages and real estate, with interest.....	92,435.68
Judgments, taxes and assessments, with interest....	297,469.61
Loans on collateral with interest.....	7,251,764.73
Claims represented by liens filed prior to receivership	2,333,442.33
Claims represented by liens filed subsequent to receivership	186,027.78
Loans and bills payable with accrued interest.....	8,923,963.71
Accounts payable	837,220.82
Total liabilities	\$24,871,917.99

In addition to this are contingent liabilities as follows:

Indorsements on Union Railway Co. notes, \$1,105,000; claims in personal injury actions, \$10,619,447.69; total, \$11,724,447.69.

The sum required to complete the necessary changes in motive power was estimated at \$10,935,657.53.

March 16th Mr. Grant was appointed permanent receiver.

On March 20th the principal stockholder of the Metropolitan Street Ry. secured a controlling interest in the stock of the Third Avenue, thus giving the Metropolitan control of all the surface lines in Manhattan.

This action was a radical change of policy since on February 24th our eastern contemporary quoted Mr. Vreeland in a positive denial that his company intended to purchase or in any way seek control of the Third Avenue property. The reason for standing aloof was that "a fully developed property that can not earn the interest on its debts" did not offer any attractions.

The Metropolitan company has decided to spend \$10,000,000 during the present year, in improving and extending its lines.

All of the old power stations, seven in number, will be abandoned by July or August next, and the entire system will be operated from the new plant at the East River and 96th St., which has a total capacity of 70,000 h. p. During the present month the work of changing the cable lines to the conduit electric system will be commenced on Broadway, Columbus Ave. and Lexington Ave. About three-quarters of the material needed for the change has been delivered, so that the present condition of the iron and steel market will not delay progress. As soon as the necessary legal steps have been completed the company intends to commence the construction of two entirely new lines, one in the Boulevard, between 130th St. and 175th St., and the other in 145th St., from the Boulevard to Lenox Ave. Charters for these have been obtained. The new lines mentioned with several minor extensions to existing crosstown lines will amount to about seven miles of track.

The Union Elevated Railroad Co., of Chicago, is being sued for \$400,000, for alleged damage to the Palmer House property.

STREET RAILWAY MUTUAL BENEFIT ASSOCIATIONS.

In our issues for February and March of this year, pages 67 and 141, we gave data concerning quite a number of mutual benefit associations which have been organized among the employes of street railway companies. The following are brief statements concerning other similar associations:

The Louisville Railway Relief Association, incorporated under the laws of Kentucky for 25 years, was organized Feb. 14, 1900, with a membership of 254, and within two weeks there were over 50 applications for membership pending.

All present employes of the Louisville (Ky.) Railway Co. earning \$1.50 or more per day, who are under the age of 60 years, and men between the ages of 16 and 45 who may enter the service in the future, are eligible to membership. Membership in the association ceases when a member leaves the service of the company.

The officers are a president, a vice-president, a recording secretary, a financial secretary, a treasurer, and a board of managers of 18 members in good standing. At the present time the president is J. T. Funk, superintendent of the company, and the financial secretary, J. W. Mitchell; the Louisville Trust Co. is the depository. The financial secretary and the treasurer are permanent officers removable only for cause.

The dues are placed at 50 cents per month, but when the funds on hand shall amount to \$3,000, the dues may be reduced in the discretion of the management. The Louisville Railway Co. gave the association \$1,000, and promises further assistance if necessary.

The sick benefits are 90 cents per day (after the first seven days), but after six months' disability this is reduced to 50 cents. If the disability is local and apparently permanent, but the general health of the member such that he can engage in other pursuits, no benefit is payable. The death benefits are \$150 on the death of a member, \$50 on the death of a member's wife, and \$25 on the death of a member's child under 14 years of age.

The Lowell, Lawrence & Haverhill Street Railway Employes' Mutual Relief Association was incorporated under the laws of Massachusetts, June 7, 1894, having 77 members at that time. The initiation fee is \$2, and the dues 50 cents per month. Sick benefits are \$3 for the first week and then \$7 per week for 15 weeks; death benefit, \$100. The death fund is kept up by assessments. The total sick benefits paid amount to \$5,733; total death benefits \$500. The sick benefits paid in 1899 were \$1,448; death benefits paid in 1899 \$100. The membership at the present time 180. The officers comprise a president, two vice-presidents, one from the Haverhill division and one from the Lawrence division; a treasurer, a secretary, and four trustees, two from each division. Any employe of the company is eligible for membership if approved by the trustees. The company contributes \$100 annually towards the sick benefit. The association now has in the treasury \$984.

For the foregoing facts we are indebted to the secretary of the association, Edw. M. Tracy.

RESTRICTING THE USE OF 4-CENT TICKETS.

The Milwaukee Electric Railway & Light Co. announces that the 4-cent commutation tickets which it issues will positively not be accepted in payment of fares at any other time of day than the stipulated hours during the morning and evening; also that these low rate tickets are not legal tender and the company will not accept a 4-cent ticket and an additional cent in place of a cash fare of 5 cents. It has been necessary to make this ruling owing to the impossibility of properly registering such combination fares on the car registers now in use, and also to avoid difficulties in bookkeeping. The commutation tickets are not accepted at any time outside of the city limits.

A new freight ordinance has been proposed for Detroit, Mich. This provides that the street railways of the city may carry packages, merchandise and other light freight, milk, farm produce and garden truck, between 8 a. m. and 8 p. m. The freight cars must transport material and supplies for the various city commissions, and the company must pay the city a certain sum for every car of freight hauled over the lines.

ACCOUNTANTS' ASSOCIATION.

President Duffy and Secretary Brockway of the Street Railway Accountants' Association of America have issued the following circular No. 13 under date of April 10th:

In presenting this preliminary announcement of the fourth annual convention of the Street Railway Accountants' Association of America, it is deemed proper to make mention in a brief way of its organization and objects, and what it has accomplished, as well as the present status of the association.

It was organized at Cleveland, O., Mar. 24, 1897, with a membership of 25 companies. The object of the association is set forth in the Constitution as follows: "The object of this association shall be to bring together those engaged in the accounting department of street railway companies, for an interchange of ideas, to promote the adoption of a uniform system of accounts, and to improve the work of the accounting department."

There has since then been formulated and adopted a Standard System of Street Railway Accounting, covering the Classification of Construction and Equipment Accounts, Classification of Operating Expense Accounts and forms of monthly and annual reports, which has been adopted by the street railways of the United States, Canada and Mexico, thereby securing a uniformity of methods, so desirable, but heretofore considered an impossibility.

The standard system was adopted by the eleventh annual Convention of Railroad Commissioners, held in Denver, Col., Aug. 10, 1899, so that in every state where the boards of railroad commissioners exercise supervision over the books and accounts of street railways, the standard system will be followed.

The association's Department of Blanks and Forms is an important and valuable feature. There is a collection of some 12,000 blanks, classified and mounted in a series of books, for exhibition at the annual conventions. This exhibition appeals at once to the practical men in all departments of street railway work. An examination of this collection is always helpful, no matter how small or how large the road. There is a duplicate set of this collection in the secretary's office, which is at the service of the members; selections are sent for examination and use at any time.

The membership has increased in two years from 25 companies represented at the organization meeting in 1897, to 100 companies at the convention in Chicago in 1899. And although since then some members have been lost through consolidations, it has gained some new ones, which is especially gratifying in view of the fact that the annual dues for 1900 were increased from \$10 to \$20. The income with the annual dues at \$10 was not sufficient to meet the actual expenses, notwithstanding the affairs of the association were conducted with the most careful economy. No one makes any money out of the association; even the amount voted to the secretary is too small to be considered a salary, but is to defray his expenses incurred in attending the conventions. The traveling and hotel expenses of the officers and members of committees in attending meetings have not been paid by the association. The work has been with all a labor of love.

The work of the association has only begun, but now that the Standard System of Accounting has been made the standard system for the street railways of the United States, its sphere of usefulness and the work it proposes to undertake and successfully carry out will be more far-reaching in its effects and of greater benefit to the street railway interests.

The papers, reports and proceedings of each convention have dealt with practical accounting questions and the program for the fourth annual convention, to be held in Kansas City, Oct. 16, 17, 18 and 19, 1900, is along the same lines. The papers selected are as follows:

- "Material and Supplies Accounts."
- "A System of Department Accounts."
- "What Does the General Manager Want to Know from the Accounting Department?" (By a prominent general manager.)
- "Office Practices." (Referring to Stock Certificates and Ledgers, Dividend Books, Bond and Coupon Books, Filing Valuable Papers, Labor Saving Devices, etc.)

Annual reports will be read from the committee on Standard System of Street Railway Accounting, and the committee on Standard Unit of Comparison.

Informal Discussion on Street Railway Accounting. There will be a special time set apart for discussing informally all subjects

relating to street railway accounting, and will be of especial interest and value.

This program is one of the most interesting ever presented by this association, and a large attendance is urged and expected. In addition, Kansas City's reputation for hospitality and entertainment will be well sustained, as the action at the destruction of the convention building will demonstrate. The hotels are first class and close to the convention hall. At either the Midland, the New Coates, the Savoy or the Baltimore accommodations may be secured on the American or European plan at customary rates. The headquarters of the association will be at the Midland Hotel. Railroad rates will be on the certificate plan at one and one third fare for the round trip.

Secure your rooms at once and make your arrangements now to attend.

NEW YORK FRANCHISE VALUATIONS.

Beginning on March 6th the State Tax Commissioners of New York gave a number of public hearings at which representatives of the corporations to be taxed presented their protests. On March 29th the Commissioners made public the valuations fixed upon. Heretofore the corporations in New York City were assessed locally at \$70,018,025; the Commissioners have increased this to \$189,654,981. The same ratio holds for the rest of the state. The tax rate in New York City last year was 2.48 per cent.

The last assessments and the present franchise valuations for some of the larger roads are as follows:

Corporation.	Last Assessment.	Franchise Valuation.
Brooklyn Heights System.....	\$7,660,000	\$30,760,770
Metropolitan System	5,030,000	62,068,030
Third Avenue System	2,174,750	19,728,100
Buffalo Ry.	710,540	2,631,804
Buffalo Traction Co.	162,180	554,580
Crosstown St. Ry., Buffalo.....	550,575	2,455,735
Rochester Ry.	394,175	2,057,000
Rochester & Lake Ontario Ry.....	17,000	25,000

These assessments are subject to review by the commission after the corporations have been heard, when the final valuations will be fixed. Then the courts may be called upon to intervene, whose decisions may also cause a reduction in valuations. That the courts will very greatly reduce these valuations can scarcely be doubted when the condition of the street railway properties is considered. In 1898 only 18 street railways out of 103 reporting to the Railroad Commissioners paid any dividends and of the total sum so distributed five-sixths was paid by five New York City roads.

STREET RAILWAY MAIL SERVICE AT OTTUMWA, IA.

On March 28th the Ottumwa (Ia.) Electric Railway Co. inaugurated a mail collection service by means of boxes on its cars, similar in many respects to the system in vogue in Grand Rapids, Mich., which was described in the "Review" for January, 1900, page 45. The service will be tried experimentally for six months and if satisfactory will be continued. Collections from the street car boxes will be made four times daily, saving in many cases a day in the delivery of outgoing mail by enabling it to be placed on earlier trains.

TROLLEY FOR CHICAGO ELECTRIC TRACTION CO.

Ever since its reorganization the Chicago Electric Traction Co. has pursued a policy of extension and has now under way still further additions to its mileage, which will make it to a greater extent than before an interurban line. In view of this it was decided to equip the system for overhead trolley working, as it has been found that to use storage battery cars on such long lines it is necessary to build sub-charging stations as was done last year at Harvey.

Work has been commenced on a new brick car house for the Lebanon (Pa.) Valley Street Railway Co.

LARGE SHAFT FOR GLASGOW, SCOTLAND.

We illustrate herewith one of two hollow steel engine shafts of similar dimensions, made by the Cleveland City Forge & Iron Co., of Cleveland, O., for the Glasgow Tramways. These forgings will be used with E. P. Allis engines and are among the largest ever

LARGE SHAFT FOR GLASGOW.

attempted in this country. They each weigh 66,105 lbs., are 24 ft. 1½ in. long over all and 36 in. through the greatest diameter. The bore is 8 in. and 10 in. in diameter. The shafts were formed from ingots each weighing over 50 tons.

BROWN BROS. LOSE ST. LOUIS OPTION.

It is announced that Brown Bros., of New York, who a year ago secured options on the securities of the street railways now operated by the St. Louis Transit Co., have been unable to get the assent of 80 per cent of the certificate holders for an extension of the option and they will therefore before April 20th distribute the unsold bonds and stocks to the holders of certificates of beneficial interest. The securities not sold by Brown Bros. comprise nearly 11,000,000 United Railways bonds, over \$9,000,000 United Railways preferred stock, and over \$14,000,000 St. Louis Transit common stock.

The withdrawal of Brown Bros. will not affect the consolidation.

GARTON TRAILER CONNECTOR.

The accompanying illustration shows the Garton trailer connection, which is being extensively used, and overcomes a number of objectionable features found in other devices. As will be seen from the sectional views, the metal parts of the connection are completely protected, thus preventing accidents to trainmen, and the short circuits caused by contact of exposed couplers with the metal parts of the car.

By properly using these connectors in sets all the cars are matched, and may be connected when desired. The connectors are furnished complete with wire when so ordered. They are

GARTON TRAILER CONNECTOR.

strong and durable in severe service, and have proved to be all that was expected.

These connectors are sold and carried in stock by the W. R. Garton Co.; the company is also prepared to furnish the regular plug and socket trailer connectors, as well as the Wood connector. This company carries a very complete stock of electric railway and lighting supplies, tape, etc., and the business has shown a wonderful growth from month to month. Some very nice contracts have recently been secured for Keystone instruments, General equipment circuit breakers and "Multiplex" reflectors and headlights, and large orders are constantly coming in for Garton lighting arresters, of which the company has a large and complete stock.

ELECTRIC RAILWAY IN GENEVA.

The Consular Reports for March 27th give the following information concerning the electric railway in Geneva, Switzerland, which it is stated will be in operation within six months.

About two and one-half years ago Mr. Henry E. Butters, of San Francisco, visited Geneva and interested local capitalists in the plan to provide the city with a modern street railway system. A controlling interest in the Narrow-Gage Street Railway Co., operating about 45 miles, and an option on the property and franchises of the General Swiss Tramway Co., operating 10½ miles, were secured. This option will probably be exercised, the price being \$1,254,000.

The promoters have organized the Campagnie Genevoise des Tramways Electriques under a federal charter, but no stock is yet issued. An office is maintained at No. 43 Threadneedle St., London.

The new company was organized with a capital of 5,000,000 francs (\$965,000). It is understood that the money for the construction is being furnished by the Paris Bank of South Africa. London capitalists are also interested in the venture, and it is likely that the new company in a short time will own and control all the street car lines in the city and canton of Geneva. To put existing options into effect, to construct and equip all these lines on the American plan, and to exploit the extra exclusive rights of the new company will entail a total expenditure of about 15,000,000 francs (\$2,895,000). The company would then have about 150 kilometers (95 miles) of road traversing the city in every direction and serving the entire canton. The total population amounts to about 119,000. The canton is next to the smallest of the Swiss Confederation and has only about 12 square miles of territory. The lines would also cross the frontier into France and would serve various small towns in the French departments of Haute Savoie and Ain.

The engineer under whose management and direction the new lines are being constructed is Mr. Stephen D. Field, of New York. The work is progressing, and 15 kilometers (9 miles) of track have already been laid. One, at least, of the new lines will be in operation by June 1st. The American overhead trolley system is being used, and the American system of conduits for underground cables, for the first time in Europe.

The charter of the new company requires that the materials used in construction be bought either from Swiss manufacturers or from Swiss houses representing foreign manufacturers. This for the moment virtually bars United States manufacturers, as no American concern has a Swiss agency. Up to this time, all rails have been bought in Germany, and all contracts for the construction of cars have been placed with Swiss agencies of German builders. The cars, however, are being built on the American plan and one car has, by special permission, been shipped here from the factory of the J. G. Brill Co. in Philadelphia. France is largely furnishing the wire. The only American material that has yet been used is the Brown-Edison plastic rail bond.

Although Geneva has a large water-power force for generating

electricity, it is not believed that this plant will be able to furnish sufficient electric power for the new street railway. Mr. Field also thinks that the price asked by the city—12½ centimes (2¾ cents) per kilowatt hour—is unreasonably high. Electricity can probably be produced by steam in Geneva for from 6 to 8 centimes (1.6 to 1.9 cents) per kilowatt hour, and Mr. Field is willing to pay 8 centimes. The question is yet to be adjusted.

The tariff for street railway transportation in Geneva is fixed at 10 centimes (2 cents) per passenger for the first kilometer (five-eighths of a mile) and 5 centimes (1 cent) for each succeeding kilometer. Experts who have studied the situation do not doubt the profitable result of the enterprise.

MECHANICAL DEPARTMENT

HOME-MADE CARS FOR THE UNION TRACTION CO.

In the last issue of the "Review" brief mention was made of 70 single truck open cars and 15 double truck open cars, which the Chicago Union Traction Co. is building at its Madison and West

plan of floor framing for the double truck cars, which measure 41 ft. over the bumpers, and 8 ft. 5 in. wide over the running board. In the floor framing the best selected yellow pine was used for the sills, with cross timbers of oak. All joints are mortise and tenon. On reference to the floor plan it will be seen that care has been taken to thoroughly brace all parts in the direction of greatest

FIG. 1—NEW CARS FOR CHICAGO UNION TRACTION CO.—FIG. 3.

40th St. shops. Through the courtesy of Mr. F. T. C. Brydges, superintendent of shops, who made all the designs for the new cars, we are enabled to reproduce herewith the plans from which they are being constructed.

Fig. 2 shows the side elevation, seating plan, cross section and

stress. The first, second and third cross beams each way from the center, are joined by 3 x 3 in. diagonal timbers and at the first and third cross pieces are 3/4-in. tie rods. To properly support the ends of the car two 2 3/4 x 6 3/4 in. pine timbers are bolted to the two inside longitudinal sills, and tie bars are inserted at

FIG. 2 40-FT. OPEN CAR FOR CHICAGO UNION TRACTION CO.

the end sills. The longitudinal truss rods are anchored to the side sills immediately over the truck centers. Sections AA and BB show the cross trusses and the body bolsters.

The wheel houses or covers, for the large wheels are under the platform seats, the tops of the covers being fitted with trap doors

rolling stock to meet the severe traffic conditions of Chicago's crowded streets. The principal dimensions are given on the drawings and a photograph of a finished car is reproduced in Fig. 3. The cars are mounted on Brill E 21 trucks with G. E. No. 52 motors. The seating capacity is for 50 passengers.

FIG. 4—31-FT. SINGLE TRUCK OPEN CAR.

for the purpose of giving access to the motor bearings and commutators.

Nine cross seats spaced 2 ft. 11 in. center to center with reversible backs, and two additional seats at each end placed back to back give a seating capacity for 65 passengers. At each side of the car are adjustable wooden bars to prevent egress and ingress from the wrong side. As it was found difficult to obtain material for these bars in sufficient length to form them in one piece, and also to secure greater convenience in lowering and raising, they are made in two sections joined by a hinge. When the bars are raised they are held in place by an ingenious automatic catch consisting of a metal acute-angle piece, loosely fastened at the lower end with the short side normally in a horizontal plane and having the long stem slightly curved. An extra amount of metal is cast into the curved side, causing the catch to drop back to its normal position after having been pushed in to permit the bar to pass.

Each end panel has three drop sashes fitted with plate glass lights. As two trolley poles are provided, one at each end, steel carlines, 1 3/8 x 7-16 in. were used to give the roof the necessary strength. The long car shown in Fig. 1 is mounted on McGuire maximum traction trucks and the remainder of the lot will be mounted on Peckham maximum traction 14 D-3 trucks. All the long cars will be fitted with Christensen air brakes, electric headlights placed on the hoods, G. E. 57 motors, and Duplex duck open car curtains with "Acme" fixtures, furnished by the Curtain Supply Co., of Chicago. The interior finish is in quartered oak supplied by Frost's Veneer Ceiling Co., of Sheboygan, Wis.

Fig. 4 shows the drawings for the single truck cars. These follow conventional lines, no attempt having been made to adopt radical features the one idea being to construct solid substantial

IMPROVED CAR BORER.

The machine shown herewith is the No. 2 three spindle vertical car boring machine just placed on the market by J. A. Fay & Co., 557 West Front St., Cincinnati, and embodies many new arrangements for rapid and accurate work. It is quite heavy and was especially designed for use in street railway car and repair shops. It is

arranged for three augers, the spindles being separately adjustable, either across the stick or vertically; the transverse adjustment is made by levers supplied with a friction lock and under instant control of the operator, and the vertical motion of the spindles is produced by the movement of a counter-balanced lever with a handle attached.

The augers will bore up to 14 in. of timber and are furnished with stop collars to gage the depth of bore; different sized pulleys vary their speed. Adjustable stops attached to either side of column prevent the material being lifted by the bits.

The table is fitted with a series of large rollers (the two outside ones being driven by chains and the internal rollers being connected and driven by gearing on the countershaft that operates in either direction, moving the timber by power to the right or left by the movement of a lever in front of the table and convenient to the operator. A hand-wheel is also

easily accessible to the operator for moving the timbers laterally, by hand.

FLUKES BORING BAR.

The accompanying illustration shows a special labor and stock saving tool which has been widely used in railroad shops. The ob-

ject is to maintain a standard size of wheel seat by boring the wheels to fit the axles, instead of turning the axles to fit the wheels. The tool is quickly adjusted for its work and the mill can be operated by a low-priced mechanic, with a substantial saving in the cost for labor. The construction is shown in the illustration; the two cutters are adjusted by a V-shaped spreader moved by a square threaded screw and locked by set screws. With one of these bars from 25 to 35 pairs of wheels can be bored in a day of 10 hours, and it is stated that as a single pair of cutters will bore about 4,000

wheels, the bar will soon pay for itself in saving of steel. This bar is known as Flukes patent expansion boring bar and is handled by Carse Brothers Co., 62 Wabash Ave., Chicago.

KINNEAR STEEL ROLLING DOORS.

The accompanying illustration shows the Kinnear steel rolling doors applied to a car barn. These doors have met with great favor generally and are filling a long felt want in this direction, embodying as they do the prime features of simplicity, durability, compactness, ease of operation and fireproof qualities. The makers have devised a very simple and complete arrangement, which provides for a trolley connection when the doors are open, giving an uninterrupted wire and current for the trolley wheel.

The doors are made of No. 18 to No. 26 U. S. standard gage steel and of either black or galvanized stock as may be desired. They

ROLLING DOOR FOR CAR-HOUSES.

are of approved construction with spring balance, so that the doors are always properly balanced, and in cases of extreme size are so geared that they operate with ease.

The Kinnear steel rolling doors, shutters or partitions are easily applied to either new or old buildings, the makers providing necessary arrangement or construction as conditions may require.

These doors are made by the well-known Kinnear Manufacturing Co., of Columbus, O., which will be pleased to send descriptive catalog upon request.

An ordinance has been passed by the Richmond (Va.) County Council requiring all street railway companies in the city to sprinkle the streets and alleys occupied by their tracks.

WHEEL PRESS FOR CAR SHOP.

To meet the requirements of street railway the J. T. Schaffer Manufacturing Co., of Rochester, N. Y., has designed for use with its hydraulic wheel presses a special gear and pinion attachment which enables the one press to answer all the various demands of street railway shops. The Schaffer company is the oldest maker of

SCHAFFER WHEEL PRESS.

hydraulic presses in this country and has in the course of its long experience perfected the designs of its product. A strong point is made of the superior construction of the presses, steel being used for the tension bars, crank shaft, yoke facings, etc., instead of cast iron as is the case with a number of other presses. The cylinders are absolutely water tight, and have steel linings which are cast in the cylinder instead of being pressed in. This company was the first to use the system of triple pumps and all its large presses are so fitted. By the use of the triple pump system the operator is enabled to handle at least 20 wheels more per day than he could with the single or double pump system. The ram movement is very smooth and positive and the entire working of the press greatly improved.

Since the company was reorganized a few months ago it has made rapid strides and there has been a remarkable increase in its business. The foreign trade is being developed and recent shipments of presses have been made to Belgium, Mexico and Japan. A general agency has been established in Japan for the sale of the company's product which includes all types of stationary and portable hydrostatic presses. The company does not claim that its presses are the cheapest but that they are the best.

The Buffalo, Rochester & Pittsburg Ry. has recently installed a 72-in. Schaffer press which the superintendent of motive power, Mr. Charles Turner, states has given perfect satisfaction.

The officers of the Schaffer company are: President, Charles J. Brown; vice-president, H. F. Atwood; business manager, Alvin H. Dewey; treasurer, A. M. McDonell.

IMPROVEMENTS AT AUGUSTA, GA.

Mr. Walter M. Jackson, general manager of the North Augusta Land Co., writes us that the street railway lines have recently been extended about a mile to reach the highest elevation on his company's property. This makes one of the finest rides to be had in the state, as on a clear day the entire country for 20 or 30 miles can be seen from the car windows. The North Augusta Land Co. has set aside about 12 or 15 acres on the top of the hill for hotel purposes, and it is expected a popular winter resort will soon be established at this place.

The Augusta Railway & Electric Co., of which Mr. D. B. Dyer is president, has completed a belt line connecting the Monticello line with the Summerville line, making another pleasant route on which considerable purely pleasure traffic will undoubtedly be developed in the summer. Views in the park served by this company were published in the "Review" for May 1899, page 329.

By the completion of a street railway bridge across the Youghiogheny River there will be formed a continuous electric line from Pittsburg to Buena Vista, Pa., a distance of 26 miles, with but one change of cars.

NEW MAIL CARS ON CHICAGO CITY.

For several years the Chicago Postoffice has desired to extend the street railway mail service to the electric lines of the Chicago City Ry., but it is only quite recently that arrangements for this have been concluded with the company. Four single truck cars with 20 ft. bodies and 30 ft. over all, have been rebuilt in the company's shops under the direction of the master mechanic, Mr.

ELECTRIC MAIL CAR, CHICAGO.

Michael O'Brien, and we show herewith exterior and interior views of one of them.

A side door has been cut in each side and it will be noted that the sill is not at the floor level of the car but higher, so that it is even with the bed of a standard mail wagon. The interior fittings comprise a sorting table, pigeon holes and a sack rack.

One of the novel features is the location of the electric headlight. The car having too low a hood to permit of the light being placed underneath without interfering with the motorman's view, the hood was cut out and a sheet metal arch set in, as appears in the ex-

INTERIOR CHICAGO CITY MAIL CAR.

terior view of the car. Placing the light in this position permits the men to have access to it from the platform, which is an important consideration.

One of the cars is to have lights with the "Multiplex" reflectors, for which the W. R. Garton Co. is agent.

The car shown is mounted on a McGuire truck equipped with two 12A Westinghouse motors. It has Price's brake and G. E. K2 controllers.

The employes of the Carbondale (Pa.) Traction Co. have been granted a 25 per cent increase in wages.

NEW WEST VIRGINIA COMPANY.

We are indebted to Mr. E. W. McCormick, manager of the Kanawha Traction & Electric Co., of Montgomery, W. Va., for the following information. The company was incorporated in West Virginia by Geo. W. Champ, M. J. Simms, B. H. Early, C. W. Dillan, and E. W. McCormick, and has secured a perpetual right of way from the county courts of Fayette and Kanawha Counties, over so much of the county road as may be necessary, and also such private right of way as may be needed for the construction of an electric trolley line, between Mt. Carbon and Handley, a distance of seven miles. This road runs through one of the most thickly settled coal fields in West Virginia, and there are situated directly on the line 11 coal mines, and adjacent to the line are 11 more; all are producing mines. It is almost one continuous town from end to end. The company expects to handle not only passengers, but freight and express, and has arranged for the opening of a park during the coming summer, with attractions of all kinds for the amusement of the public. The capital of the company is \$100,000, and it proposes to issue an equal amount of first mortgage 5 per cent bonds. Bids have been received for the construction of this road, and contracts will shortly be closed, some of the machinery and other supplies having already been purchased. The principal office of the company will be at Montgomery.

MILWAUKEE SITUATION.

The Supreme Court of Wisconsin has refused a writ of mandamus to compel the dismissal of what is known as the Trentlage injunction suit. This was brought by Mr. Trentlage, a property owner, to enjoin the acceptance of the 4-cent ordinance by the Milwaukee Electric Railway & Light Co.; afterwards he wished to dismiss the suit, but the court substituted another plaintiff and refused to dismiss the case. This leaves a temporary injunction in force and the case has yet to be heard on its merits.

AIR CARS IN WINTER.

From a statement prepared by Mr. Wm. E. Selleck, general manager of the Compressed Air Motor Co., we take the following facts concerning the operation of the air cars on the North Side lines of the Chicago Union Traction Co. during the severe winter weather of February and March.

On February 4th when there was a severe blizzard with snow and sleet the air cars made their regular trips on schedule time and were also used to help stalled snow plows and for switching purposes at the barns.

On February 27th was the heaviest snow fall in 10 years, but the air cars found no difficulty in operating because of the snow.

SHORT STRIKE ON THE CHICAGO CITY.

On the afternoon of Friday, April 6th, the power house employes of the Chicago City Ry. went out on a strike. The company had but a few hours' notice of the intention to strike, but the men's places were so quickly filled that the down-town cables were not stopped and but slight delays occurred on the other lines.

GENERAL ELECTRIC BUYS SIEMENS-HALSKE.

Early in April it was announced that the General Electric Co. had purchased a controlling interest in the Siemens-Halske Co. Details regarding the consolidation and the disposition to be made of the Chicago plant thus acquired have not been made public.

AN ADVERTISING POINTER.

The Northern Ohio Traction Co., of Akron, O., advertises its pleasure park on all its time tables as follows: "The Gorge affords photographers unusual opportunities for procuring good pictures, both in the winter and summer seasons. The scenery is wild and picturesque, combining fine tree, water and wood effects. You will be amply repaid by a visit to this spot if you make 'pictures'. Try it some day."

THE EDISON-JOHNSON TROLLEY HARP.

The device herewith illustrated is presented to the public as a design so combining the trolley wheel and harp that curves can be taken at almost any speed without danger of the wheel leaving the trolley wire and interfering with the span wires. The device consists of a harp with a sufficient spread to receive a 1/2 in. spindle, 12 in. in length on which is a 1x12-in. steel tube with ball bearings at each end between it and the spindle. The trolley wheel is mounted loosely, with graphite bushings, upon the tube and on each side of the wheel are spiral brass springs embracing the tube and tending to hold the wheel in a central position at about 4 1/2 in. from each side of the yoke or harp. On entering a curve, the spring gives way to the side pressure and the wheel slides in the direction of the pressure along the spindle, giving time for the trolley pole to turn upon its base and conform to the curve without forcing the wheel

THE "ANTI-OFF YOUR TROLLEY" HARP.

off the wire. This arrangement not only prevents the wheel from leaving the wire, but also relieves the side pressure on the wire and prevents side wear both to the wire and trolley wheel. On leaving the curve, the springs bring the wheel back to a central position. By the use of ball or roller bearings, the friction of the wheel is reduced to a minimum, in fact it is estimated that the friction is reduced to only one-fortieth. The graphite bearings of the wheel provide sufficient lubrication for the side motion of the wheel on the tube and the roller bearings avoid the necessity of much lubrication. Oil, however, can be used if desired by dropping a little upon the ends of the spindle, when it works its way into contact with the roller bearings. Copper washers at each end of the tube provide good electrical contact with the arms of the harp. The harp proper or yoke is made from a steel bar, 1/4x1 in. and the spindle is held

SECTION OF HARP.

in its position by means of cotter pins at each end, so that a worn wheel can be readily unshipped and a new one substituted. A thorough test has been given the device, and on a road where the trolley left the wire at least four or five times on a trip, the new wheel ran over 4,000 miles without once leaving the wire at curves. The device is made by the Edison-Johnson Electric Manufacturing Co., which was recently incorporated, with a capital stock of \$75,000.

The works are located at Cornwall on the Hudson where the company has recently erected a three-story machine shop having ground dimensions of 158.60 ft. and equipped with steam power and a generator for lighting purpose. The officers are: President, E. G. Johnson; vice president, Thomas V. Edison Jr.; treasurer, J. W. Mott; secretary, F. D. Palmer. The New York office is in the St. James Bldg., 1135 Broadway.

TROLLEY PARADE FOR DENVER AND WICHITA.

The 16 trolley floats forming the "Era of Electricity" parade at the New Orleans carnival, some of which were illustrated in the "Review" for last month, page 134, have been sold and will be used at Denver. After the Denver parade it is announced that they will form one of the attractions at a street fair to be held at Wichita, Kas., the first week in October. Arrangements have been made with Gen. Mgr. S. L. Nelson of the street railway company for the use of current.

CHICAGO GENERAL RY.

On January 29th last there was a reorganization of the Chicago General Railway Co., the immediate object in view being the sale of the property. The officers then chosen were: J. H. Witbeck, re-elected president and also made treasurer in place of Lawton C. Bonney; J. I. Jones, re-elected secretary; James P. Black, vice-president in place of Charles L. Bonney; Charles L. Bonney, general counsel.

Differences arose between Mr. Witbeck and the other directors and a few weeks ago he brought suit on a note for \$121,000, and also against L. C. and C. L. Bonney personally for \$45,000. April 6th other creditors of the company sued on past due notes aggregating \$229,000.

April 9th a special meeting of the directors was held at which the minutes of the meeting of January 29th were disapproved and ordered cancelled. Mr. Witbeck was ordered to return to the owners certain stock and bonds deposited with the treasurer pending negotiations for the sale of the property. April 11th the directors again met and Glenn E. Plumb was chosen president and general counsel and C. L. Hull, secretary and treasurer.

Three of the directors, James P. Black, Glenn E. Plumb and Lyman M. Paine, were appointed as a committee to act with the banks and arrange for a reorganization. None of the creditors except Mr. Witbeck are pressing their claims, the later suits having been commenced merely to place all of the creditors on the same footing; it is confidently expected that the affairs of the company will be amicably arranged. The directors, in addition to the three constituting the reorganization committee, are J. H. Witbeck, L. C. Bonney and C. L. Bonney, of Chicago, and N. D. Lawton, of New York. Mr. Jones recently removed from Chicago.

April 14th, Mr. Witbeck made application for the appointment of a receiver for the company.

CONSOLIDATION IN CHICAGO.

On April 14th the directors of the Chicago Union Traction and the Chicago Consolidated Traction companies completed the formalities for the consolidation of the two systems in accordance with the plan outlined in our January issue. The Union Traction acquires a large majority of the Consolidated Traction stock paying therefor with a bond issue, the purchased stock being held by a trustee as collateral security.

The employes of the Springfield (Mass.) Street Ry. are planning to enlarge the social features of their benefit associations.

Mr. G. L. Henderson, Cottage Hotel, Yellowstone Park, proposes a system of electric railways for reaching the many points of interest in the reservation with less discomfort and loss of time.

The National Power & Manufacturing Co. has been formed with a capital of \$2,000,000, to operate the various electric plants which now supply power to the North Hudson Street Railway Co., and the electric plants of Jersey City and Newark, N. J.

TRAMWAY EXHIBITION AT LONDON.

All arrangements for the Tramway and Light Railways Exhibition to be held at Agricultural Hall, London, from June 23d to July 4th next, have been perfected, and judging from the list of firms that have applied for space and the general interest manifested the complete success of the exhibition is assured. Mr. A. M. Willeox, editor of the *Tramway & Railway World*, who is directing the undertaking, writes us that almost all the available room on the ground floor of the hall has been engaged, a number of firms taking from 1,500 to 3,000 sq. ft. The largest American exhibit will be made by the J. G. Brill Co. of Philadelphia, which has reserved 1,000 sq. ft. Among the American devices entered in the fender competition to be held in connection with the exhibition, and mentioned elsewhere in this issue, is the Barrett-Hipwood fender for which R. W. Blackwell & Co. are selling agents. A diagram of Agricultural Hall was published in the "Review" *Convention Daily* for Oct. 20, 1899.

The London County Council is taking considerable interest in the enterprise, and it is probable that from the cars displayed it will select a type to be used on the electric tramways which it proposes to equip on the south side of the Thames. The Council has been authorized to spend £3,000,000 in the work of building these lines and 500 cars will be required.

The following is a list of companies that have been allotted space:

Askham Brothers & Wilson, Ltd., Sheffield.
 Abnion Clay Co., Ltd., London, E. C.
 Blackwell & Co., Ltd., R. W., London, S. W.
 British Westinghouse Electric & Manufacturing Co., Ltd., London, W. C.
 British Thomson-Houston Co., Ltd., London, E. C.
 British Insulated Wire Co., Ltd., Prescott.
 British Mannesmann Tube Co., Ltd., Landore, S. Wales.
 Brush Electrical Engineering Co., Ltd., London, E. C., and Loughboro.
 Bennis & Co., Ltd., London, E. W.
 Bergtheil & Young, London, E. C.
 Burton, Griffiths & Co., Ltd., London, E. C.
 Bilbie, Hobson & Co., London, E. C.
 Babcock & Wilcox, Ltd., London, E. C.
 Brown, Harold P., New York.
 Brill Co., The J. G., Philadelphia and London.
 Barnes Cylindorama Railway Co., Chicago.
 Crossley Brothers, Ltd., London and Manchester.
 Christensen Engineering Co., Milwaukee.
 Consolidated Car Heating Co., Albany, N. Y.
 Dick, Kerr & Co., Ltd., London, E. C., and Kilmarnock.
 Dennis & Co., W. F., London, E. C.
 Docker Brothers, London and Birmingham.
 Doulton & Co., Ltd., London, S. E.
 Demerbe & Co., Jemmappe, Belgium.
 Electric Tramway & Railway Carriage Works, Ltd., Preston.
 Electric Construction Co., Ltd., London, E. C., and Wolverhampton.
 Electrical Power Storage Co., Ltd., London, E. C.
 English Electrical Manufacturing Co., Ltd., Preston.
 Estler Brothers, London, E. C.
 Elliott Brothers, Lewisham.
 Electricite & Hydraulic Societe Anon., Charleroi, Belgium.
 Felten & Guillaume, Mulheim-on-Rhine.
 Glover & Co., London, S. W., and Manchester.
 Haacke & Co., London, N. E.
 Helios Actien Gesellschaft, Ehrenfeld-Cologne and Berlin.
 Lorain Steel Co., London, E. C., and Lorain, O.
 Le. Carbone, London, E. C.
 Miller & Co., Ltd., Edinburgh.
 Mossberg Roller Bearings, Ltd., London, S. W.
 Meldrum Brothers, Manchester.
 Manuelle, A. & F., London, E. C.
 Monorail Portable Railway Co., Ltd., London, E. C.
 Magann Air Brake Co., Detroit, Mich.
 Norris, Major S. L., York.
 Nell, Fred., London, E. C.
 Owen & Sons, Ltd., Liverpool.
 Omer Syndicate, Dayton, O.
 New York Car Wheel Works, London and New York.

Penn, H., Norwood.
 Perry, J. B., Toronto, Can.
 Parish's Patent Steam-Jacketed Cooker Co., Ltd., London, E. C.
 Roller Bearing Co., Ltd., London, S. W.
 Ohio Brass Co., Mansfield, O.
 Stone & Co., J. B., London, E. C.
 Suter & Co., Frank, London, W.
 Smith, C. G., New York and London, E. C.
 Turr's Acetylene Gas Syndicate, Ltd., London, E. C.
 Tangyes, Ltd., London and Birmingham.
 Witting Brothers, Ltd., London, E. C.
 Wilkins & Co., London, E.
 Wheeler Condenser & Engineering Co., London, E. C., and New York.

CONVENTION HALL, KANSAS CITY, BURNED.

The convention Hall at Kansas City, where the A. S. R. A. was to have had its meetings and exhibits in October next, was destroyed by fire on the afternoon of April 4th. The fire started over the furnace room of the building at 1:10 p. m., and burned very quickly. The fire spread and burned a church and a school building across the street and a block of residences in the rear of the hall, the total loss being estimated at \$340,000, of which \$225,000 is for Convention Hall.

The building was well insured and it is stated that it will be rebuilt on the old foundations and be ready for the Democratic National Convention which is to meet there July 4th.

AN INTERESTING LAW SUIT.

A special election was held at Ottumwa, Ia., to decide whether a tax should be levied for the benefit of the Ottumwa & Northern Ry. to assist in the construction of its line, and suit was brought against the city and the company to recover for the cost. This case was carried from the justice court to the district court and finally decided against the plaintiffs. They then brought another action against the county and succeeded in getting a judgment.

WHEN TO HEAT CARS.

Considerable trouble is often experienced, particularly at this season of the year, in securing a proper temperature in cars, owing to the different opinions of different conductors as to what constitutes cold weather. One conductor will consider the temperature in his car too high, and will turn off the heat, often forgetting that he has done so, with the result that the passengers are soon shivering; another conductor may keep his car uncomfortably warm. The Knoxville Traction Co. does not rely on the judgment of the individual conductors in this matter, but hangs in a conspicuous place in front of the general office, a red sign, with the inscription "Heat" when the temperature drops below a certain point. When the sign is not displayed the conductors turn off the heaters in their cars.

TROUBLE AT WICHITA, KAN.

The central labor union of Wichita, Kan., has ordered a boycott of the street railway which is now building some 15 miles of new track. The grievance is that men willing to work for \$1.25 per day have been imported to do the work; the local unions demand \$1.50.

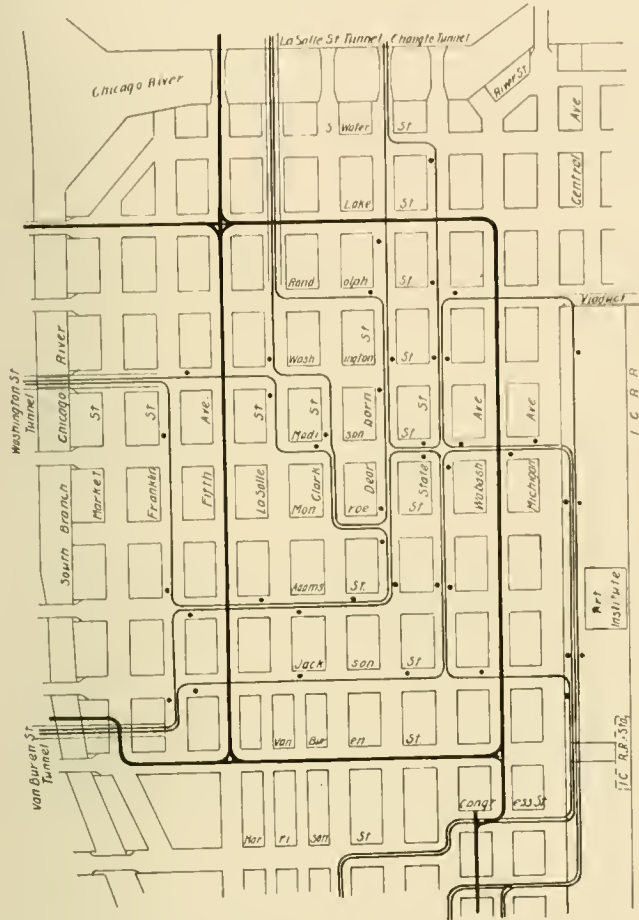

NEW AMUSEMENT RESORT.

The Cleveland, Berea, Elyria & Oberlin Ry. has purchased the Puritas Springs Park, near Linndale, about five miles from Cleveland, and will make it a summer resort during the coming season. The park includes about 26 acres.

President W. H. Holmes of the Metropolitan Street Railway Co., of Kansas City, Mo., has ordered a handsome special parlor car to be used for showing distinguished guests over the city. He expects to have it ready in time for the street railway convention in the fall.

PROPOSED SUBWAY SYSTEM FOR CHICAGO.

By direction of L. E. McGann, commissioner of public works of Chicago, R. W. Shuler, and W. S. MacHarg consulting engineer of the sewer bureau, have prepared plans for a system of subways in the down town district of the city which are shown in the accompanying illustrations. These plans provide for six underground

PROPOSED SUBWAY SYSTEM FOR CHICAGO.

loops for the different street car systems so arranged that there shall be no crossings, and for the reconstruction of the three tunnels under the river now used by the Chicago Union Traction Co. and the building of a fourth tunnel at Dearborn St.

For the North and West Side lines the subways connect with the down-town ends of the tunnels. For the Chicago City Ry. the subway commences in Michigan Ave. just south of Van Buren St.,

CROSS SECTION OF PROPOSED SUBWAY.

the electric lines now using Clark St. and also the two cable lines being brought east to Michigan Ave.

As shown in the sectional view the subways are 35 ft. wide and provide for the carrying of wires and pipes.

Mr. McGann is strongly in favor of having the street railways change their present tracks to a system of independent surface loops, even if the subway plans are not adopted at this time.

HALF FARES.

The Ft. Wayne (Ind.) Traction Co. is building a new car barn 150 x 60 ft

Vandals have been slashing the seat coverings on cars of Washington, D. C. roads.

The Peoria & Pekin Terminal Ry. ran its first electric car in Pekin, Ill., on April 4th

Postal cars are to be put in service on the lines of the Twin City Rapid Transit Co. in Minneapolis and St. Paul

Owl cars will be temporarily discontinued in Kansas City, Mo., to enable certain tracks to be repaired at night

The Northampton & Amherst Street Ry. has completed arrangements for a new bridge over the Connecticut River in Hadley

In March the South Side Elevated, Chicago, carried an average of 72,264 passengers per day, an increase of 8,355 over March, 1899.

The Toronto (Ont.) Railway Co. has been fined for not providing rear vestibules on its cars for the protection of conductors.

Slippery rails caused a rear-end collision between two cars at Newark, N. J., on March 10th, by which 10 persons were injured.

The Pottsville (Pa.) Union Traction Co. has voluntarily reduced the hours of the working shifts of its employes from 12 hours to 9 hours.

The first trolley car funeral ever attempted in St. Louis took place April 6th, without annoyance or inconvenience to any one concerned.

An ordinance fixing the maximum speed of street cars at 12 miles an hour and 6 miles on grades, has been passed by the Warren (O.) city council.

A reorganization of the Greensburg (Pa.) & Hempfield Street Railway Co. is now under way. Local capitalists will be interested in the new company.

The Hartford (Conn.) Street Ry. has given notice that it will call in and pay off its 5 per cent debentures; they are to be replaced by 4 per cent bonds.

The Pittsburg (Pa.) & Birmingham Traction Co. will replace the plush covered cushions in its cars by cane seats, sanitary reasons causing the change.

The first spike in the new electric railway between Greenfield, Ind., and Indianapolis was driven last month by F. G. Banker, the president of the company.

Work has been started on the Bedford Park extension of the Manhattan Elevated R. R. of New York. This involves 1 1/2 miles of structure and extensive yards.

Special smoking cars are to be added to the regular equipment of the Montreal (Can.) Street Railway Co. The company has recently fitted up club rooms for its employes.

The number of passengers carried daily on the Metropolitan Elevated of Chicago, for the month of February last, averaged 92,618, as compared with 75,344 for February, 1899.

The International Traction Co., of Buffalo, N. Y., and the allied companies have increased their subscriptions to the Pan-American Exposition, making the total \$100,000.

The Chattanooga (Tenn.) Electric Railway Co. recently engaged a vitoscope company to give free open air exhibitions of vitoscope pictures in one of the broad squares of the city.

A bill has been introduced in the New York Legislature providing that when cars are blocked for any reason, all fares must be returned to passengers or else tickets good for another ride be given.

To meet the competition of the electric lines the Flint & Pere Marquette R. R. has reduced the price of round trip tickets from Northville to Detroit and return to \$3.50 for bunches of 10.

Operation on the Greensburg (Pa.), Jeannette & Pittsburg Electric Ry. was resumed on March 31st, after an interruption of several months caused by the burning of the barns and rolling stock.

The Twin City Rapid Transit Co., of Minneapolis, has sold 3,000 shares of preferred stock from the treasury, and with the proceeds will retire the 6 per cent debenture bonds due May 1.

The falling of a heavy iron chute used for coaling engines just below Rector St. on the Ninth Ave. line of the Manhattan Elevated R. R., New York, recently wrecked a train and injured nine passengers.

Contracts have been let by the Delaware General Electric Co., of Dover, Del., for completing its electric line from Dover to Milford. The general contractors are McGlathery, Stone & Co., of Philadelphia.

An official of the Philadelphia & Reading Ry. is reported to have said that his company has under consideration the substitution of electricity for steam on that portion of the road between New York and Philadelphia.

A bill is under discussion in the Rhode Island Legislature providing that 10 hours, performed within 12 consecutive hours, shall constitute a day's work for all street railway motormen and conductors in the state.

On June 1, 1900, employes of the Findlay Street Railway Co. will receive an increase in wages of 20 per cent. Motormen and conductors will receive an advance of 25 cents per day and other employes \$5 per month.

The syndicate owning the Washington (D. C.) Traction & Electric Co., it is said, has offered \$100 per share for a controlling interest in the Capital Traction Co., the only road in Washington not included in the consolidation.

Press reports state that certain persons who do not wish their names known are to organize a street car transfer scalping bureau at Minneapolis and St. Paul to buy and sell unused transfer tickets of the Twin City Rapid Transit Co.

An ex-governor of Mississippi has entered suit against the Jackson (Miss.) Electric Railway, Light & Power Co. for \$2,000 damages because a motorman failed to stop for him when signaled to do so, thereby causing the plaintiff to lose a train.

The Butte (Mont.) Electric Co. has been incorporated as a reorganization of the Butte Consolidated Railway Co. and will take over all the property, franchises and privileges of the latter company. It is stated the same owners will continue in control.

For state and county purposes the street railway property of Detroit has been assessed at \$12,810,000, which is based on the selling price determined when negotiating with the Puigne commission; this assessment is an increase of about \$10,000,000.

Pres. Julius Runge, of the Galveston (Tex.) Street Ry., hopes to raise the necessary money, \$905,000, before July 1st and redeem the property which was sold February 5th to the Guarantee Trust Co., of New York, under a decree of the United States Circuit Court.

It is expected that the Kalamazoo-Battle Creek electric inter-urban line will be opened early in May, and branch to Gull Lake by June 1st. The Michigan Traction Co. which projected this road sold its interest to the Railway Companies General, of Philadelphia.

The six experts employed by the district attorney of New York City to go over the books of the Third Avenue Railroad Co. have reported that they could not find evidence of any misconduct in the management of the road, and the grand jury has dropped the case.

It is said the city council of Troy, O., has granted a franchise to the Dayton & Troy Electric Railway Co. with the stipulation that not to exceed one cent shall be charged for fare inside the city limits.

Seven cars which were being shipped by freight from St. Louis to the Black River Traction Co., of Watertown, N. Y., while in transit were stripped of all their brass work, including the railings, lamp chandeliers and the bells. It is believed this was the work of tramps.

A woman has been awarded a judgment for \$2,300 against the Nassau Electric Railroad Co. of Brooklyn, for injuries received by being sat upon by a "very fat man" while riding in a car. The man lost his balance as the result of a sudden application of the brakes.

The Saginaw (Mich.) Valley Traction Co. reports for the past year, gross receipts, \$133,380.78; operating expenses and interest on funded debt, \$138,427.51, leaving a net deficit of \$5,046.73. Nearly \$200,000 have been spent in improvements, paid for by bond issues.

An ordinance has been passed by the Detroit common council directing the committee on ordinances to meet and take under consideration the advisability of compelling all steam railroad trains to come to a full stop before reaching any street railway crossing at grade within the city limits.

Thirty open cars for the accommodation of smokers have been added to the equipment of the Broadway cable lines in New York, increasing the total number of cars regularly operated on those lines to about 320. Each of the special cars will bear a sign "Smoking Car" on the front dashboard.

The Consolidated Traction Co., of Pittsburg, has filed a protest against the proposition that the city should pay the cost of giving free Sunday band concerts at the public park. The company prefers to pay this cost itself so as to be in a position to select the class of music it thinks will draw the best.

A verdict of not guilty has been found by the jury that was trying a non-union conductor at Cleveland on a charge of murder in the second degree for fatally shooting a 19-year old boy during one of the street railway riots last summer. It was shown at the trial that the conductor acted in self-defense.

The township of Cicero, Cook County, Ill., has granted to the Aurora, Wheaton & Chicago Railway Co. a 50-year franchise, which provides for the sale of eight commutation tickets for 25 cents and reserves to the town the right to revise the fares after 20 years and again after 15 years if it desires to do so.

In order to reduce expenses the Brooklyn (N. Y.) Rapid Transit Co. is considering the advisability of closing the ticket offices in the elevated stations where the traffic is light and having the conductors collect fares on the trains, as is done on the elevated roads in Chicago. The men will be provided with portable registers.

An increase of \$50,000 per annum has been made in the pay roll of the Metropolitan Street Railway Co., of Kansas City, Mo. At the present time the wages of gripmen, motormen and conductors range from 15 to 18 cents an hour. By the new scale the men will begin at 15 cents and in the course of five years work up to 20 cents.

The new water power plant for furnishing power to the Ottawa (Ont.) Electric Ry. was placed in successful operation early in March. The station contains six water wheels, direct connected to a Westinghouse generator and was built and equipped under the supervision of W. H. Baldwin, hydraulic engineer to the company.

CHAS. J. MAYER,
President.

A. H. ENGLUND,
Sec'y & Treas.

THE MAYER & ENGLUND CO.

10 SOUTH TENTH STREET,

CABLE ADDRESS:

"MAYLUND" Philadelphia.
A. B. C. Code, 4th Ed.

PHILADELPHIA, PA.

NEW YORK OFFICE:
85 LIBERTY STREET.

Electric Railway Material and Supplies of Every Description.

We are exclusive Territorial Representatives of the following leading Manufacturers of Railway Materials:

R. D. Nuttall Co., Gears, Pinions, Bearings, Trolleys, Etc.	Allegheny, Pa.	The International Register Co., Single and Double Fare Registers.	Chicago, Ill.
Van Wagoner & Williams Hardware Co., Dropped Forged Copper Commutator Segments.	Cleveland, O.	W. T. C. Macallen Co., Standard Overhead Insulating Material.	Boston, Mass.
The Protected Rail Bond Co., "Protected" Flexible Rail Bonds.	Philadelphia.	Bradford Belting Co., "Monarch" Insulating Paint.	Cincinnati, O.
American Electric Heating Corporation, Electric Car Heaters of Every Design.	Boston, Mass.	Sterling Varnish Co., Sterling New Process Insulating Varnish.	Pittsburg, Pa.
Chisholm & Moore Manfg. Co., Moore's Chain Hoists.	Cleveland, O.	Garton Daniels Electric Co., Garton Lightning Arresters.	Keokuk, Ia.
New York & Ohio Co., "Packard" Incandescent Lamps.	Warren, O.	D. & W. Fuse Co., Enclosed Non-Arching Fuses.	Providence, R. I.

Special Agents: AMERICAN ELECTRICAL WORKS, Providence, R. I.

We carry the largest stock in this country of Strictly Electric Railway Material.

We are now occupying our entire building, five floors and basement.

Special Attention Given to Export Business.

Send for Catalogues.

Though over a hundred new cars were added to the rolling stock of the Montreal Street Ry. last year, the full staff at the company's shops is to be kept at work all winter and summer making new cars, and it is hoped that by the end of the year all of the old style cars will have been replaced.

The property of the Lock Haven (Pa.) Traction Co. has been sold by order of the court. It was purchased by W. B. Given, president of the Conestoga Traction Co., of Lancaster, Pa., for \$25,100. The company will be reorganized by local capitalists including beside Mr. Given, J. H. Fredericks, J. B. Furst and Wilson Kistler. New equipment will be bought and the road extended.

Last September a car belonging to the Camden (N. J.), Gloucester & Woodbury Railway Co. was struck by a train on the Philadelphia & Reading R. R. at a crossing in Gloucester, N. J., and one person was killed. The motorman and conductor of the car were last month acquitted of a charge of manslaughter by a jury in the Criminal Court of Camden and exonerated of all blame.

The Terre Haute (Ind.) Electric Co. is making extensive additions to its power station equipment. It is reported the company intends, upon the completion of the line between Brazil and Terre Haute, to buy its coal of the mines along its route and by hauling it in its own cars, materially reduce the cost of fuel. Three new Cahall boilers of 250 h. p. each have recently been installed at the power house.

The special committee mentioned on page 171 of the "Review" for last month, appointed to investigate the exact condition of the Cleveland City Ry. in order to reach a basis upon which new franchises are to be granted, has nearly finished its labors. Professor Langley, one of the experts, is quoted as saying: "The officials of the company have been extremely pleasant and accommodating to us in every way, and we have not met with any unusual obstacles in our work."

Drastic measures were taken by the Pennsylvania & Northwestern Railroad Co. last month to prevent the new electric road now

building from Punxsutawney, Pa., to Anita, from crossing its tracks at grade near Adrian Mines, Pa. Early one morning before daylight 50 employes of the steam railroad company went to the locality, overpowered the watchman of the street railway company's property and dragged his house away with a locomotive, after which they blew up the roadbed with dynamite.

The Union Traction Co., of Anderson, Ind., reports for the last six months of 1899 as follows: Gross earnings, \$222,895; operating expenses, including taxes, \$112,640; net earnings, \$110,254; other income, \$20,439; total income, \$130,693; interest on bonds, \$109,820; surplus, \$20,873. Of the \$5,000,000 new mortgage bonds recently issued, \$800,000 are reserved to retire underlying bonds; \$3,440,000 have been used to acquire properties and for improvements now under way; and \$760,000 are held for future needs.

MR. A. S. LITTLEFIELD, of Chicago, is now visiting in the East after several weeks in the South.

MR. W. C. RAY, of Louisville, has been appointed superintendent of the Henderson (Ky.) Street Railway Co.

MR. GEORGE M'KINLOCK, president of the Central Electric Co., of Chicago, has just returned from a two months' trip in California.

MR. S. B. M'LENEGAN, for two years past secretary of the Oakland, San Leandro & Haywards Electric Ry., has been chosen superintendent of the company.

MR. W. S. SMITH, superintendent of lighting for the Toledo Traction Co., has resigned to go into business for himself; he is temporarily succeeded by Mr. A. A. Atkinson.

MR. S. H. FINNEY has taken charge of the electrical department of the Manville Covering Co., 173 Randolph St., Chicago. Western representative of the H. W. Johns Manufacturing Co. Mr. Finney will fill the office left vacant by the death of Mr. Herbert A. Reeves.

 Receiver's Sale of Three-Quarters of a Million Dollars worth of Real and Personal Property of the John Stephenson Company (Limited), Bay Way, N. J., Wednesday, April 25th, 1900, 2 p. m. prompt,

BY AUCTION

TO THE HIGHEST BIDDER, WITHOUT RESERVE.

The undersigned, by virtue of an order of the Court of Chancery, of New Jersey, will sell on the above named date, in lots, positively without reserve, on terms to be made known at the sale, the following material: Lumber, Iron (rough stock), Cast Iron, Malleable Iron (parts worked up), Tool Steel, Cast Steel, Bolts and Nuts, Washers, Rivets, Screws, Nails and Brads, Tacks, Springs, Files, Sand Paper Rubber, Belting, Bronze and Brass Trimmings, Finished and Unfinished Electrical Materials, Glass, Paint Materials and Brushes, Miscellaneous Paint Utensils, Miscellaneous Merchandise, Office Furniture, Fixtures, Gold Leaf, Etc., Cars Manufactured and Under Construction.

AND IN ONE PARCEL

All the Real Estate, Buildings, Machinery, Fixtures, Motors, Patterns, Tools, and all personal property except the merchandise mentioned to be sold in lots as above.

The Plant covers an area of about 88 acres; the buildings (7) have floor space of 100,000 square feet. Railroad and tide-water facilities unexcelled; in fact, there is not another such advantageous location to be had in the Bay of New York. Wood-working machinery with individual electric motors, and tools of the latest type. Labor-saving devices are numerous. Sanitary requirements first-class. Artesian Wells, Electric Lighting, Etc., Etc. Everything in first-class working order, ready for the commencement of operations at once. Nothing has been left undone to make these works second to none in the car building business. Permits for the inspection of the works can be had from the Receiver, at Room 709, 95 Liberty Street, New York, where the Inventory of Personal Property, is on file, and may be inspected, and where also copies of the description of the Real Estate may be obtained.

ALBERT A. WILCOX, Receiver.

JOHN G. STEAD, Auctioneer, Romaine Building, Paterson, N. J.

ECHOES FROM THE TRADE

THE FALK CO. expects to begin work on the Third Street line of the Tri-City Ry., Davenport, Ia., about May 15th.

THE WESTERN ELECTRIC CO., of Chicago and New York, is out with a new 32-page catalog of general electrical supplies.

THE COMPRESSED AIR MOTOR CO., of Chicago, has increased its stock from \$1,250,000 to \$2,000,000 for the purpose of enlarging the business and buying certain foreign patents.

THE ELECTRIC LAUNCH CO. has removed its plant from Morris Heights, New York City, to Ave. A and North St. Bayonne City, N. J.

THE R. D. NUTTALL CO. is now located at Fayette St. and Garrison Ave., Pittsburg, Pa., where all communications should be addressed.

THE BERLIN IRON BRIDGE CO., of East Berlin, Conn., has opened an office in the Stephen Girard Bldg., Philadelphia. This new branch will be under the management of Mr. L. H. Brumbaugh.

THE WESTERN ELECTRIC SUPPLY CO., of St. Louis, has issued two new catalogs, one on direct current and the other on alternating current, fan motors and ceiling fans. As in times of peace it is well to prepare for war, so it is a good idea to buy electric fans before hot weather actually arrives. The catalogs will be mailed on application.

THE PECKHAM TRUCK CO., Havemeyer Building, New York, is sending to all its friends with its compliments a very acceptable glass paper weight.

MR. J. G. STOWE, U. S. Consul-General at Cape Town, writes the department that there will be a large field in South Africa for American machinery, especially electrical apparatus, as soon as the war is over.

THE WESTERN ELECTRIC CO., of Chicago, has recently installed for Carson, Pirie, Scott & Co., of that city, a 150-k. w. 125-volt generator. A generator of the same size was also installed for C. F. Gunther, of Chicago.

THE KISINGER-IRON CO., of Cincinnati, O., has on hand orders for about 1,200 tons of castings. This company has also received a contract from the United States Government for engines and dredging machinery to be used on the Ohio River.

THE B. F. STURTEVANT CO., of Boston, has sent us a supplement to its catalog No. 108, which was entitled "Who Uses Mechanical Draft?" The supplement contains the names of over 200 additional plants having Sturtevant apparatus.

MESSRS. THOMPSON, SON & CO., of 107 Liberty St., New York, have a number of inquiries for small steam dummy locomotives. These are used for driving snow plows and they can be quickly and cheaply equipped for this service. They are sold at from \$1,500 to \$2,000 each.

C. B. FAIRCHILD, EASTERN REPRESENTATIVE.

CORRESPONDENCE.

We cordially invite correspondence on all subjects of interest to those engaged in any branch of street railway work, and will gratefully appreciate any marked copies of papers or news items our street railway friends may send us, pertaining either to companies or officers.

DOES THE MANAGER WANT ANYTHING?

If you contemplate the purchase of any supplies or material, we can save you much time and trouble. Drop a line to THE REVIEW, stating what you are in the market for, and you will promptly receive bids and estimates from all the best dealers in that line. We make no charge for publishing such notices in our Bulletin of Advance News, which is sent to all manufacturers.

This paper is a member of the Chicago Trade Press Association.

Entered at the Post Office at Chicago as Second Class Matter.

VOL. X.

MAY 15, 1900.

NO. 5

The Iowa assessment board has decided that a steam railway grade on which the ties and rails have not yet been laid is a "railway" to a sufficient extent to be taxed as such. The position is about as consistent as it would be to tax a lot and foundations only, for the full amount of the 10-story building to be erected later.

Judging from the reports coming in from every hand an unusual overhauling is in progress for the summer season. Old rails are being replaced with new and heavier ones, long cars are taking the places of short ones, and everywhere preparations are being made for one of the best seasons in the history of electric traction. We thoroughly believe these expectations are to be realized, and predict that 1900, in spite of the slight setback that may come during the presidential campaign, will be the banner year of the decade.

On another page of this issue is an interesting account of the conversion to electricity of the cable lines of the Denver City Tramway Co., a change tending to emphasize the passing of the cable system of traction. In connection with a brief statement of the method of doing the work Mr. C. K. Durbin, the general superintendent of the company, to whom the present splendid condition of the property is largely due, has given the cost of setting poles and stringing wires, separated into its various items, which makes a valuable table for reference.

Probably every inventor is at times hard pressed for reasons to explain why his device is better than all others for accomplishing a given purpose, and why all the others must inevitably fail. The Brooklyn Eagle recently published an interview with M. Diatto, the distinguished French engineer, who designed the surface contact electric railway installed at Tours last year, in which M. Diatto

is quoted as saying that the conduit system "has never proved practicable, and its great expense and the unhealthy odors which emanate from the stagnant water which naturally collects in the slot, have precluded its general adoption."

One of the most interesting phases of the almost phenomenal increase of electric street railway mileage in this country, has been the corresponding increase in the amount of riding solely for pleasure, or as it might be called, the artificial traffic. Not over two or three years ago it was an open question whether street railway companies could profitably invest money in parks and amusement attractions, whereas today, there is hardly a road in the land that does not own, or at least is interested in a park resort of some kind. In a number of cities, as at Brooklyn, Cleveland, Toronto and others, this feature has developed to such proportions that it is found advantageous to appoint a separate official, known as the outing or excursion manager, to relieve the general manager of the details of caring for and encouraging pleasure riding. This is a point worthy of consideration. The right man giving his entire time to this one department should have no difficulty in increasing the receipts of the road by a sufficient amount to considerably more than pay the extra expenses, including his own salary.

We chronicle elsewhere this month the death of A. S. Hallide, inventor of the cable system. Thirty years ago the residents of San Francisco were forced to daily climb hills too steep for loaded wagons to ascend. Toiling slowly up to his home among the other "cliff dwellers" one hot day he resolved to solve the problem of a transportation system to which 25 per cent grades should be no hindrance. He did solve it, after many weeks of study, and the cable system was the answer. Without it San Francisco could never have been the city it is today, and although another and better method his entire time to this one department should have no difficulty his creation, the honor of a great invention will always attend his name.

He and his invention served well their day and generation, but who would be so venturesome as to assert that in another 30 years our present approved methods will not in turn have given place to something different; something perhaps as unthought of, as undiscovered as the trolley was when the first Clay St. car made its famous trip through Chinatown.

In his paper before the Texas Street Railway Association, Mr. MacGregor calls attention to the inclination of the officials of smaller cities to make comparisons with, and attempt to adjust local conditions to, the measure of large cities. With him we agree as to the unfairness of any such comparison. The large roads in the big cities do a wholesale business, where the small road has a retail trade with an occasional job lot in the shape of a Fourth of July or the County Fair. What may be only a heavy burden to the one is simply impossible to the other.

It seems to us much of this excessive burden of small city roads is due to the natural inclination to imitate, so common to humanity. The village trustee attempts to do as he sees the mayor of the recently incorporated city do; the little mayor apes the ruler of a big city, and the big city in turn follows after the ways of the few great cities. Hence it is, that when a city of say 25,000 to 50,000 undertakes to impose on its street railway the burdens which are borne by companies in the city of 500,000, we have presented simply the familiar example of the family with an income of \$1,200 per year, trying to keep up with the \$12,000 incomes. It simply cannot be done, and can only end in one result.

We believe that the city officials in these smaller places aim too high, for it is as easy to overshoot as to undershoot the mark. These officers make deductions from the big cities, and are ambitious to secure personal credit with their own constituents by applying the same processes at home. Of course the child cannot carry the load of the father, and if it is forced to do so, is either stunted in its growth or prematurely dies under the burden. This tendency to unfair conditions is also favored by the frequent change in office holders. About the time one has been in authority long enough to begin to realize the struggle the local company is making to build up the town, and because of that realization to entertain a fairer appreciation of its importance and needs, he is replaced by his successor. This successor not infrequently starts

right out to make for himself a record at the expense of the road, which, had he understood the facts as he will later, he would not have done.

It would seem then that much may be accomplished by managers in smaller cities by taking the city authorities and even the public into their confidence, to a greater extent than has generally been done, in the hope of appealing to that sense of fairness and justice of which by no means all office holders are devoid. In some cases we feel sure such a course intelligently and consistently followed would have resulted in much good. The street railway, of all home institutions, should deserve and receive the sympathy and good will of the people.

Last month we briefly mentioned in our news notes that an eastern syndicate was endeavoring to arrange for the building of lines to close the existing gaps in electric roads between Boston and New York, and this done would put on through sleeping and dining cars. Whether these plans are put in execution or not the suggestion is of interest, and the scheme will not be condemned as impossible or even as impracticable. Electric roads have been so developed and lent themselves so readily to various adaptations that the public now readily accepts as feasible plans that a few years ago would have been promptly rejected by our best managers.

A through sleeping car service between the points named involves no insuperable difficulties. The distance via the present electric lines, after filling the gaps, is about 260 miles, and while the electric cars by reason of passing through so many cities and towns where the speed must be reduced, cannot be expected to compete with the steam roads in point of time, the distance is not so great but that the trip can easily be made in one night. Leaving one terminal say at 9 p. m. and arriving at the destination at 9 a. m.,—which is as early as a business man cares to make business calls, we have 12 hours in which to make the run, or an average speed of less than 22 miles per hour. Between cities 35 miles an hour is a low estimate speed, and after midnight the car could make better time through cities than during the day. While the sleepers would not be as large or heavy as on steam roads they could be built with large single berths, upper and lower. There can be no question but that berths could be furnished at as low a price as is now charged on the regular sleepers, which is \$1.50. The railroad fare between Boston and New York at present is \$5.00, while on the electric lines, as shown by the trips between the two cities mentioned on another page, the fare is about 1-3 cents per mile, say \$3.50 for the entire distance. This may be taken as the minimum that can reasonably be expected since on the through trips the entire length of each of the several lines was in general traversed for the single fare.

Sleepers could run singly or in trains of two or more, thus adapting the service closely to the demand and reducing to a minimum the number of empty berths hauled. The small number of men required to run the car or train would also permit of departures at intervals of say 30 minutes between 9 p. m. and midnight. A passenger missing his train would not lose his trip.

Aside from difficulties that might possibly be experienced in arranging the schedules of the through cars so that they would not conflict with the regular service, the principal objection that may be urged to the scheme at the present time, is the fact that on most roads, particularly those in small towns, the power houses are not operated between midnight and 5 a. m. A small generating set in charge of one man who could do his own firing or a storage battery ordinarily used for regulating the day load on the generators, would solve this question.

During daylight hours a through parlor car service should prove very popular. Each year there are thousands of tourists traveling between New York and Boston to whom the extra time would make little difference; in most cases the fact that the journey lasted longer would be considered a positive advantage because of the attractive scenery. Because the electric lines run through highways and streets and cars stop whenever desired, every opportunity is afforded for passengers to stopover and visit points of historic interest. For touring parties not wishing to plan for more than a day in advance the electric cars have all the flexibility and convenience of bicycles, without the work.

Another company proposes to build "house cars" which will be chartered by parties desiring to have a few days' outing, in New

York or New England. Street railway literature is full of references to the electric car as the legitimate successor to the stage coach and though the suggestion that it be used for purely pleasure trips as well as for the business of transportation is a novelty, there are many possibilities which we may expect to see realized at an early day.

Whether taxes shall be included with operating expenses is a point on which there has been much discussion by railway accountants. When the committee of the Street Railway Accountants' Association prepared the first draft of its standard system of accounts in 1897, it recommended that taxes, "which might be termed an operating expense, or might not," be classed as a fixed charge, called a deduction from income. This subject had been discussed in the committee and in reaching the decision they did, the members were influenced by the fact that nearly all state boards of railroad commissioners require that taxes be so treated. In its second report submitted the following year, at Boston, the committee stated that its members were unanimously of the opinion that taxes, being incident to the ownership of property and the operation of the road, are an operating expense. This position was well sustained by arguments, and it was also stated that the general though not universal practice in street railway accounting was to charge taxes as an operating expense.

Last year when the Accountants' committee met with the committee of the Convention of Railroad Commissioners the disposition of taxes was one of the points taken up and in view of the classification of accounts prescribed by the Interstate Commerce Commission, the practice on steam roads, and the position taken by the railroad commissioners, the street railway men agreed to again class taxes as a fixed charge and this change was ratified at the Chicago convention of the Accountants' Association.

While, therefore, the recommended practice must be considered as fixed for the present the reasons which led the Accountants' committee to the unanimous conclusions that taxes should be classed as an operating expense still obtain, and are as potent as ever.

Mr. Stuyvesant Fish, president of the Illinois Central, in a letter recently published in one of the railroad papers after presenting the familiar arguments to demonstrate that taxes are an operating expense and should be so classed, points out the injustice done the railroads of the country by the classification of accounts at present used by the Interstate Commerce Commission. He says: "The Act to Regulate Commerce, by which the Interstate Commerce Commission was created, in terms applies to 'common carriers engaged in the transportation of passengers or property' by railway. The common law requires the charges of common carriers to be reasonable. Apart from the value of the service, the reasonableness of those charges can only be determined by deducting from them the cost of rendering the service. Taxes of necessity form part of that cost, and should, therefore, be included in all statements made by the railway companies to the Commission, or by it reported to Congress. This is made the more obvious by the further provision of the statute, which requires that the reports made by the Commission to Congress 'shall contain such information and data collected by the Commission as may be considered of value in the determination of questions connected with the regulation of commerce.'

"As those reports contain the only information which reaches Congress as to the cost, to the railways of the United States, of rendering service as common carriers, it is essential that they show it plainly and in full. The exclusion by the Commission of taxes from their statement of the expenses of operation of the railways of the United States, for the year 1898, resulted in those expenses being understated by \$43,828,224."

With the present outcry against corporations operating under public franchises what will more quickly increase the demand for the imposition of greater burdens, than to understate the cost of operation? In Connecticut the street railways in 1899 paid taxes amounting to 7 per cent of the investment, to 4.9 per cent of the gross earnings, or to 13 per cent of the net earnings—that is, the net earnings as given were in this case nearly 15 per cent greater than the true net earnings of the properties.

We were recently asked a question by a manager, and the longer we studied an answer the more difficult we found the task. As it is a subject well worth the thoughtful consideration of our readers the question is given here as it came to us.

The proposition comes from a manager who is conscientious and progressive and who honestly wants to do the very best by his men that existing conditions will permit. He has been put in charge of a consolidated property in a city where all but one of the several lines have either been in a receiver's hands or belonged there. The purchasers are cutting off unnecessary expense caused by duplication, and spending many thousands of dollars in bringing the rundown properties up to a first-class condition. When they have completed this work of improvement they must patiently wait for the revenue to grow up to a dividend paying point, for the city had been overbuilt by the several competing lines, and the usual result of needless parallels prevails.

With the property which came to this manager through consolidation were a number of men, two or three from each company, who were carried on the pay rolls out of sympathetic and sentimental reasons. So long as the separate roads each had a few the burden was less noticeable; now consolidation has brought them all, some 15 or 20 onto the same pay roll. This brings us back to the troublesome question, and we will do as the manager did, state one individual case, which is fairly illustrative of all the rest.

Smith is a man 48 years of age; he is perfectly honest, sober and industrious, but is physically incompetent for the duties of motor-man, which position he now holds. He started in to work for one of the merged companies the day the road was begun, and was retained out of the construction force and continued as driver of a horsecar. Year after year he faithfully performed his duties, and while his record shows an occasional mishap or shortcoming the total to date is what would be called a good and satisfactory record. Indeed, the fact that he continuously has worked for the same company for a period of 17 years under several managers, is in itself an indication that he was a good man. When horses gave way to motors he still remained and is today handling the controller.

But, as already stated he is no longer physically capable for, nor does the manager feel justified in longer retaining him in this position. The manager is responsible for the safety of the passengers carried in Smith's car and has no right to jeopardize human lives which some day may be sacrificed because the motor-man was not equal to an emergency. And the manager asks, "What shall I do?"

Some one suggests, "Can't he use him as a janitor at the office?" to which the reply is the manager cannot use 20 janitors, and moreover the present incumbent has filled the place satisfactorily for the past eight years and there would be no justice in discharging him simply to help some one else.

As the manager says, if his company was showing a surplus at the end of the year he would feel more inclined to strain a point and create some job even though it would virtually be a pension position, but in this case it is more than the road can do to declare a dividend now, to say nothing of surpluses and pensions.

And so we leave him with his troubles just where we started out.

INTERESTING CASE AT MONTREAL.

The Montreal Street Ry., which has an agreement with the city to pay the latter a percentage of the gross earnings, has, with the development of the system, built suburban lines. The company was sued by the city for its percentage of the gross receipts on the lines outside as well as inside the city, and the case was on April 20th decided in favor of the company.

The court held that while the contract required the company to pay the stipulated percentage upon "the total amount of its gross earnings arising from the whole operation of its 'said railway,'" the term "said railway" was exactly limited by another clause in the agreement which granted the right to operate an electric railway "in the city." Further, it was said that "the outside lines of the company are operated by virtue of franchises which the local municipalities have conceded and for which they exact consideration in one form or another. The city of Montreal can give no title in respect of them, and while no doubt, competent to exact a tribute on their earnings in payment of its own concessions would need to express that right in language of great certainty."

At the argument the court asked counsel what the company's obligations would be if it built a line to St. Johns or to Longueuil, or even to Quebec. The counsel for the city could not, in the interest of consistency, avoid the assertion that according to the true

intendment of the 36th article of the contract a percentage of the earnings of all these lines would be exactable. Marked difficulty was felt in maintaining a like position if a gap of a half mile, or a hundred feet, or even a single rail separated the systems within and without the city.

"These were features of the controversy," said the court, "which deserved serious consideration and required a practical solution. A passenger steps into a car in Montreal. His one fare carries him to any point either in the city or, if he wills, in any contiguous municipality to which the line extends. We may be certain that the extra distance is not traveled for nothing, but it is a plausible argument that this fare, certainly paid and apparently earned within the city limits, should be, to its full extent, subject to percentage. Take, however, the converse of this example. A passenger steps into a car in, say, Westmount, and in manner accustomed, forthwith pays his fare. He may not enter the city at all, or he may, if he chooses, travel over its lines without extra charge. Thus here is compensation of both traffic and argument. The loss to the city is nominal rather than real, for every mile of suburban roads indirectly adds to the revenue on which percentages are payable."

The exact amount to which the city was entitled was ascertained by an easy process of railway arithmetic certified as correct by a firm of accountants and the suit dismissed at the city's cost.

THE CONNECTICUT CONSOLIDATION.

Up to April 15th what is known as the Young syndicate, otherwise the Connecticut Lighting & Power Co., of New York, had secured control of the Bridgeport (Conn.) Traction Co., with 54.8 miles of track; the Central Lighting & Power Co., of New Britain, 18.6 miles of track; the Norwalk Street Railway Co., 7.5 miles; the Shelton Street Railway Co., 3 miles; the Waterbury Traction Co., 15.7 miles; Westport & Saugatuck Street Railway Co., 5.5 miles, and the Torrington & Winchester Street Railway Co., 13 miles. An option had also been taken on the stock of the Winchester Avenue Railroad Co., of New Haven, owned by the New England Street Railway Co., but on April 23d the stockholders refused to sell. Mr. I. A. Kelsey has filed a bill in equity claiming the Winchester Avenue stock, and the matter will have to await the termination of the litigation.

New officers were chosen for the Bridgeport Traction Co. as follows: President, A. M. Young, New York; vice-president and general manager, Randall Morgan, Philadelphia; secretary, H. G. Runkle, Plainfield, N. J.; treasurer, Lewis Lillie, Lillie Bay, Me. J. E. Sewell, superintendent of the Waterbury Traction Co., has been appointed superintendent of the Bridgeport, Shelton, Milford and Westport roads. E. L. Burnstett has been appointed auditor.

NO "JIM CROW" CARS IN NORFOLK.

Statements have appeared in the daily press to the effect that separate cars for negroes would be placed in operation by the Norfolk (Va.) Railway & Light Co. Upon inquiry, however, we find this report is misleading, as there is no intention of making a close class distinction in that city. Mr. H. C. Whitehead, secretary and assistant treasurer of the company, explains the situation as follows:

"On the Lambert's Point division of our line there is a fashionable country club, very generally frequented by the society people of the city. There is also the coaling station of the Norfolk & Terminal Ry. not very far from it, and on the same line. The presence of the workmen from this latter point, with their soiled clothing, in the cars occupied by the members of the club has been a source of much annoyance and inconvenience, and to obviate this we have put on trail cars on Saturday and Sunday afternoons only, in order that these two classes of passengers might naturally drift apart, and it has developed they do. While those trail cars, therefore, are intended primarily for the negro workmen, they are not put on for the purpose of excluding any class of passengers from any of the cars we are operating, and hence can hardly be classed as separate cars for negroes, since, as a matter of fact, in the city they are occupied by white persons as well."

The Canadian Electrical Association will hold its annual convention in Ottawa June 27th, 28th and 29th.

The System of the Boston Elevated Railway Co.

Department of Transportation—Snow Features—Moving of Buildings—Lost Articles—Departments of Civil Engineering and Maintenance of Way—Department of Employment—Bureau of Audit—Miscellaneous Departments.

BY C. B. FAIRCHILD.

PART III.

DEPARTMENT OF TRANSPORTATION.

The duties of the superintendent of this department, which is now in charge of Mr. J. E. Rugg, are outlined in the regulations as follows:

"The superintendent of transportation shall have general charge of the movement of surface cars, plowing and leveling of snow, and of all officials and employes engaged in car service, upon the street, and in the car houses and subway. He shall keep a vigilant outlook over the passenger traffic, shall arrange the time tables, investigate complaints, receive and care for lost articles, provide for chartered cars and cars for all special occasions, shall see that all accidents are investigated, and all discipline suitably administered. All appointments to positions above the rank of starter, inspector or foreman, and all discharges above the rank of switchman or car cleaner shall be submitted to the vice-president for approval before becoming effective; all changes in car routes, new routes, and important changes in time tables shall be submitted to the vice-president for approval before taking effect. Discipline of all car service, car house and street employes shall be administered through the several division superintendents. The superintendent of transportation shall hold a meeting of division superintendents for advice and consultation at least as often as once a fortnight. He shall arrange that his office shall be constantly open and attended, and shall keep such account, perform such other duties and make such reports as may from time to time be required."

The system of surface lines is divided into nine divisions, and each division is under the immediate supervision of a division superintendent, who is responsible "for the operation of cars, car houses, transfer stations, stables, etc., and the care and maintenance of poles and wires in prescribed districts, and for the care and maintenance of tracks in his territory. In case of the central division, however, the superintendent is relieved from the construction and repair of tracks." Each division superintendent is assisted by a chief inspector and by such other inspectors, starters, foremen and officials as may from time to time be authorized or required.

There is also a division track master in each operating division. Their duties will be outlined in a subsequent paragraph.

The regulations prescribe the limits of each division and give the name of the streets on which the tracks of every division are located.

It is the custom of the superintendent of this department to spend the morning hours till 11 o'clock in visiting and inspecting the different car houses or work in one or more of the divisions, and for this service he is provided with a horse and carriage, or rather a carriage and two horses, the horses being driven on alternate days. After 11 o'clock, for the rest of the day he is usually to be found in his office, where he inspects the daily reports of the different departments, attends to matters of discipline and studies the various reports to ascertain where improvements or a saving can be made. He has a corps of clerks to summarize and classify the different reports, and present the returns in a simple manner on suitable blanks. Once in two weeks, as the regulations require, he holds evening meetings with the division superintendents. At these meetings the division superintendents present reports, and sometimes prepare papers as requested on subjects of interest, and these are freely discussed, each one being expected to express his opinion on the propositions presented. At these meetings the superintendent of transportation takes the opportunity to instruct his assistants and explain the object and scope of particular orders and methods. By this practice of meeting with his assistants, he learns the mental characteristics of each one, and through them the attitude of the employes toward the company and towards their superior officers and associates. This feature of semi-monthly meetings is regarded by all concerned as a very important one, looking to the successful operation of the road. It seems to be the policy of the management, not merely to make the system as good

as others, but a great deal better, and to have every man imbued with the idea that all are aiming for the best.

In addition to the semi-monthly meetings, with the division superintendents, inspection tours are made at irregular intervals and without notice. The vice-president usually originates these trips, and when he is ready he orders, through the superintendent of transportation, a special car to be in waiting at a certain place and all the division superintendents are ordered on short notice to report at the same place at a certain hour. The party then boards the car in waiting and the vice-president indicates the destination. The trip is usually made to one or more of the car houses or power stations without notice to the foreman, and a thorough inspection is made, after which each division superintendent is expected to report at the next meeting any adverse criticism or commendation on the condition in which the building, rolling stock, tools and supplies is found. They are also to report on the condition of the special car in which the trip was made. By this means every division superintendent has an opportunity to see how each of the others conducts his department, and has an opportunity to learn what he can that will be of service in conducting his own department. These inspection tours have the tendency to spur the superintendent of each division to keep everything up to a high standard at all times, as he never knows when his turn to be inspected will come.

In addition to the meetings mentioned, each division superintendent is required to hold a meeting every two weeks with his inspectors, foremen and starters, which meetings are held on alternate weeks from those held by the superintendent of the department. At these meetings each division superintendent takes the opportunity to instruct his assistants and criticize their work, and advises with them, as does the superintendent of transportation with his assistants. The character of these instructions is indicated by the following report, which is copied from the minutes of the secretary of the meeting. These reports are made by the secretary and copies forwarded to the superintendents of the transportation department.

DIVISION FIVE.

Superintendent's Office.

South Boston, Mass., Jan. 29, 1900.

The eighth meeting of the superintendent, foremen, inspectors and starters was held this evening.

Meeting opened at 8 o'clock p. m. by the superintendent in the chair.

Minutes of last meeting were read by Inspector Damon.

Present—Supt. G. R. Tripp, Foremen Brewster, Clerk, O. M. Wells, Inspectors Dickey, Daman, Norton, Starters Clough, Hutchins and Donaldson.

The superintendent made the following remarks:

While in a great many things the matters that we shall talk about are perhaps but a repetition of what we have spoken about at previous meetings, still with few exceptions the conditions we are called upon to confront in the railroad business are practically the same. It is the same old story over again, but it is a story that we have got to have told us, and we in turn have to keep talking it to the men; and if this order of things was not carried out we should all get slack, therefore I say, for the good of the service, that it becomes necessary that we should all be critical, and keep talking up the rules of the road.

There are new men coming in all the time, and they must have the rules instilled into them, and the old men are apt to forget if you don't keep talking to them.

I am sorry to say that in the matter of collisions we have not much to our credit this month, and it certainly does look strange to the management, that we should have more than are being had anywhere else. It would seem as though from the action taken in these cases, that the men would be more careful, and try and

guard against them. I don't want you to relax your vigilance in this respect one mite, and if possible increase it.

If you see the motormen getting too close to the car ahead, jump on and tell them to keep back, and if it is not possible for you to get on at that time, by reason of its occurring between stops, to your being engaged in something else, why bear it in mind, and make it a point to see them later on, and caution them about it. That will let them know that you are watching them, and that you intend to see what is going on, and I think that this one thing alone, if rightly attended to, will go a long way toward stopping these collisions.

It would seem that when a collision has occurred, that the action taken in this office is all that could be expected. With very few exceptions the men have been discharged, and this should act as a preventive against collisions, but to my mind the stopping of collisions has in a great measure to be done on the streets, i. e. where the greater part of the work has got to be done, and it rests with you, street inspectors, whether the great number of car collisions which we are now having, are practically stopped or not.

Regarding the giving out of transfers at the corner of Broadway and Dorchester Ave. It seems to me that the starter should stand nearer the corner, so as to be able to notice passengers that get off the cars coming down Broadway. I am inclined to think that where you now stand it gives a great opportunity for people to get checks that are not entitled to them, and we don't want them to get in the way of beating checks, for if we do there will be no stopping them, and I would advise that you stand so as to have an eye on the cars that go down Broadway, and go via the South Station.

I notice that the cars are not getting the dusting out before starting on their inward trips that they should. While the conductors go over them after a fashion, they are not at all thorough. Their dusting strikes the middle of the sill, and they leave about three or four inches on each side that is not touched at all. See if there cannot be an improvement in this, and keep things up, so that we cannot be criticised as being slack.

I put out a notice last night, cautioning motormen in regard to running their cars at a slow rate of speed going down all grades, particular attention to be paid to Mt. Washington Hill.

I notice in a great many cases that motormen are taking the hill too fast, and there is liable to be a bad accident come out of it if it is not stopped. We cannot afford to take any chances with men running too fast down these grades, and I wish you would give the matter the closest attention.

While for the last few days the car house men have been very busy in beating the cushions, this has resulted in more or less neglect in keeping the rest of the car clean. Now that we are through with the cushions, we shall hope to see the cars cleaner. Too much attention cannot be paid to the keeping of cars clean, for they remain under the eyes of everybody, and there is a great deal of comment for, or against us, by the public at large, caused by the condition of our cars. Let us aim to have them in such shape that the criticism will be in our favor.

While we have had no snow as yet, still we are liable to get a large storm at any time. When we do get one I want you all to be on the alert, and if there don't seem to be plows enough out, or if the cars are being delayed on account of snow, get right to the telephone and let us know what the conditions are, and if more plows are needed don't hesitate to say so. This applies to the starters as well as the men on the street; let us all feel that in a snowstorm we all have got something at stake, and that is the keeping of the tracks clear of snow, so that we shall not be blocked up.

It don't make any difference what a man's position on the road is, or however humble it may be, if he has the welfare of the road at heart that man is going to succeed. What this road wants is loyal men, and a man that is not loyal to his superintendent and to the best interests of the road, cannot find fault if he don't have the confidence of the superintendent, and is not pushed ahead. If a man is loyal and does the business the best that he can and makes mistakes, the feeling of the management toward that man is more disposed to be liberal than with a man that you feel is working right against you.

I don't want you to understand by this that mistakes or blunders are to be encouraged or overlooked, and you want to do all you can to guard against them, because a mistake at some times is apt to cost this company a great deal of money. While it is best not to get so excited as to lose your head, still there are times when

you must think quickly, and be right, too, and I think it is a pretty good plan to suppose some cases that are liable to come up, think what it would be best to do if they should come up. If you do this and the trouble arises, you have made up your mind before hand what you should do, and can get right to work with a clear idea of what is required of you.

One more thing I want to call your attention to, and what has been spoken about at previous meetings, is the importance of having the conductors and motormen understand that they must keep the door closed.

I notice that the motorman sometimes will sit down inside and leave the door open, waiting for his time to be up to start. The heaters will be turned on, but when the car starts it is as cold as a barn, and would have to run half way to Boston before it would get warmed up. Now this is not right, and we don't want to do business that way.

Also the practice of conductors standing in the doors talking to the motorman going up P St. has a pretty strong tendency to cause a cold and uncomfortable car and also to cause the passengers to make remarks regarding the condition of the same. And so I might go on and enumerate all of these things that are coming up all the time. Matters that we can't be too careful about chasing the men upon.

We are having more or less trouble at the present time on account of conductors striking their bells too quick when passengers are getting on and off the car. There should be no excuse accepted for accidents of this kind. Conductors should not strike the bell until they know for sure that their passengers are safely on or off the car.

Even if a car does get back late, and it is due to the conductor being slow on the bell, such a conductor is far more valuable to this company than a conductor who to be thought a good fellow with his motorman, and quick on the bell, has struck the bell before some one of his passengers was safely on or off his car, and in consequence has a bad accident. This has cost the company a lot of money, and it wants the practice of giving the bell too quick discouraged. Keep at the conductors all the time, and try and get instilled into them that it is much better to prevent an accident, and save a great deal of money for this company, than it is to have an accident and then say that you are sorry. Sorrow is all right in its way, but it don't save money for the company. If you will just bear these suggestions in mind and act accordingly I think there will be good results from them.

Mr. Tripp then called for remarks on any of the subjects he had spoken of. He called upon Mr. Dickey for remarks. Mr. Dickey spoke of his endeavor to prevent car collisions by speaking to all motormen whom he had seen following the preceding car too closely, and he also spoke of the manner of their starting from the car house in a bunch.

Starter Clough, when asked about it, said there were times when several started at once, according to the tables, for instance at 6:30 a. m. there were four to go, and his habit had been to let the first one get up to Third St. before starting the next, and so on, to let each have a little headway, but he thought the most of the trouble was caused by some of the motormen using up two minutes to reach Fourth St. while others will run up there in less than a minute.

The amount of ashes at Dorchester St. Station was spoken of by Inspectors Norton and Dickey, and Mr. Tripp told Mr. Brewster to have the teamster to go there tomorrow and remove them. The subject of free transfers was spoken of and Mr. Donaldson, starter at Dorchester St. Station, said he thought the number given out there seemed to be on the increase at present; that about the only decrease was at morning or night; but through the middle of the day it was the same as before the change in the system at Dorchester Ave. was established.

The increase he referred to had been since the new system at Dorchester Ave. had been established, which at the first caused a great shrinkage in the number given out at Dorchester St. Station. Mr. Hutchins of the Dorchester Ave. Station, said the number given out there was constantly increasing.

Mr. Norton suggested that the sand man should carry in his wagon a set of jumping irons and a rope, so as to be able to help put a car on the track that he found off, and it would be a great saving of time over what it would if he had to drive to one of the stations to get them. It was thought to be a good idea, and Mr. Tripp instructed Mr. Brewster to make requisition for two sets of

sons are readily made, so that one foreman can be pitted against another, and as each one is furnished with a duplicate report, is able to compare his work with that of others.

In making the rounds of some of the car houses in company with the superintendent of transportation, it was noted that the offices of the division superintendent were provided with electric lamps and electric heaters and that the toilet rooms were furnished with first-class plumbing. Included in the office equipments are record boards for posting the names of conductors and motormen with their runs and also the names and time for the swing crews. In a blotter provided on a table conductors record their runs together with the number of passengers on both the out and in trips. A book of all published orders is provided, to which conductors and motormen have ready access. Each division superintendent is allowed a sufficient number of clerks for making up records and keeping the accounts of the employes. The conductors make their returns in canvas bags which they deposit in a hopper in the top of a safe at the receiver's office. When a bag is deposited, the receiver operates a trap which allows the bag to fall within the safe and the receiver makes a record of the number of the conductor making the deposit. Two money wagons are provided and the attendants, with these, strip the safe once a day when they drive to the central office and deliver the receipts to the treasurer. One station, however, sends its receipts in by messenger. For the division superintendent's office there is a messenger who is sent regularly to the general office for letters and orders. Lockers are provided in the rooms set apart for trainmen and these usually have ventilated doors or doors with wire screens to provide for ventilation. The

FIG. 51—TAUNTON TRANSFER TABLE.

practice of providing lockers for car employes is an old one, as the present department superintendent originated it on one of the Boston roads 24 years ago.

At the different starters' offices are tower clocks which are wound, regulated and kept in repair by an employe specially designated for the purpose. At all the car houses there are sand dryers. There are no sand boxes on the cars, but sand is carried in metal pails by each motorman and is kept on the platform, the sand being applied by means of a hand scoop as required. Each motorman is held responsible for the sand pail and takes it off at the end of his run with the rest of his kit of tools.

Most of the electric transfer tables at the different car houses are made by the Taunton Locomotive Manufacturing Co. The Boston Elevated formerly made its own transfer tables, but now buys them from the Taunton company. Fig. 51 shows one of the tables for double-truck cars; it is driven by an F-30 motor. At each end of the table there are wedge shape tracks, about 4 ft. long, which are held up from the rails by springs when the table is in motion, but when a car is run off or on, they are pushed down by the weight of the wheels to form a gentle incline for the wheels to pass from the floor level to the level of the transfer car. These tables have roller bearings for the journals and also track brakes. They carry a stand with a group of electric lamps.

Armatures that need repairs are packed in boxes having cross bars to hold them in position and in these they are shipped to and from the main repair shop. At each car house are extra armatures so that cars are not delayed while waiting for repairs. At each of the houses, the stock room is partitioned off for the storing of

supplies. The stock rooms have bins, cupboards and shelving for the proper sorting and storing of supplies. The supplies are received once a week on requisition, from the department of stores. Supplies are dealt out to the men in the houses on orders signed by the division superintendent; the foreman of each house is responsible for the stock and condition of the store room. Great care is taken to keep the stock rooms at all the houses neat and clean. The floors are oiled, and a strip of matting is usually spread all around the edge of the floor in front of the bins.

In the pit repair rooms are wheel dismantling devices; for operating these a section of the track is made removable, and the cradle consisting of heavy plank is operated by ropes or chains from overhead lifts. By this means the wheels and axles with the motors can be lowered to the bottom of the pit when the wheels are run out and new ones substituted.

There is a blacksmith shop with one forge for doing light work at each car house. In the repair department of each car house, it is the practice to cover the floors of the house and pits with a liberal sprinkling of sifted sand. This is designed to absorb the oil that may drip from motors and journals while the cars are over the pit, and prevent the men from tracking oil into the cars and about the building. The sweepings from cars while in the house are caught in baskets at the steps and not thrown out on the floor. The floors of the house and pit are swept only once a week, when a new lot of sand is sown over the floor by hand. Iron pans are provided in which the workmen can place their wrenches and tools to prevent them coming in contact with the sand on the floor. Extreme neatness is noted in every department about the car houses.

For motor connections on the motors of the W. P. type, cables with coverings of asbestos in place of soft rubber are used. By shifting the neutral point of the brushes on motors of the W. P. type about 3-10 in., sparking has been prevented and the life of the motor brushes which was formerly only about two days, has been lengthened to from 10 to 14 days, and the life of the commutators has also been prolonged.

SNOW FEATURES.

As the street railway company is required by city ordinance to remove or care for all the snow that is removed from those streets in the business district on which the cars run, the handling of snow becomes a very important factor with this system. The snow work is systematized and the particular duties of each division superintendent and those of his assistants are carefully outlined and printed in pamphlet form. The first two pages of the book on snow work contains general directions to the division superintendent. This is followed by an index giving the location of all the snow plows and this in turn by a snow plow route by divisions. The routes are all numbered and the names of the streets through which each machine is assigned to work is given, with the number of miles for a round trip.

The number of men required at each piece of special work is also given with the location of the work, also hill work when sanding is to be done, the number of men to sweep at certain points, and the location of teams that can be had for carting snow. The general directions are as follows:

"You are herewith supplied with a complete schedule of snow work for the coming winter, together with separate copies of work in the respective divisions, and you are expected to see to it that all employes connected with this work are provided with a copy each of division snow plow routes, so that they may be fully informed as to the work they have to do. A copy of routes for each division should also be posted in each lobby.

"All labor specially hired for any storm is to be paid as heretofore, on special snow pay rolls, at the close of each day by a special snow paymaster, to be designated by division superintendent, who will also see that he is provided with the necessary funds. The utmost care is necessary in the identification to the paymaster of all persons engaged in snow work, and whenever possible and consistent with the number of men to be paid, individual names should be made use of upon the pay roll.

"Full directions as to this and the issue of snow-teaming tickets, and accounting for hired teams, can be obtained from the auditor. The utmost vigilance will be exercised by superintendents to watch for snow storms and get their forces promptly at work at the earliest moment necessary.

"Arrangements must be made whereby, from all parts of the division, inspectors and other men on the street will communicate

with the superintendent's office by telephone or by messenger if wires fail, all important events during heavy storms, and the few days succeeding as often as once an hour. During the same period, this information must be telephoned to the office of the superintendent of transportation hourly. It is absolutely essential that the fullest information as to condition of snow, cars, and snow work on the divisions should be regularly and systematically communicated to the general office during snow storms and no excuse whatever will be accepted for failure to do this. All bills contracted for feeding men, hiring of horses and teams, etc., must be promptly procured and verified as correct by the superintendent and forwarded to the general office. Care should be taken in regard to all snow work to practice the utmost economy consistent with efficiency, and superintendents are especially notified that electric lines must be kept clean if they are to be kept running. In

FIG. 52—SNOW SLED.

heavy storms, the number of cars run must be reduced to provide for additional power required for both the cars and the electric plows. Prompt use of levelers following plowing will insure the greatest economy in teaming."

The company has snow carting sleds of its own make to the number of 500; one of these is illustrated in Fig. 52. Teams are engaged beforehand and contracts made so that in case of a snow storm the division superintendent knows on what parties to call for teams. A large list of men who will agree to respond to the company's call for snow work is also kept by the superintendents, and they also have an arrangement with the different charitable associations of the city to send all the men available. Through these associations, any number of men desired can usually be enlisted for fighting the snow, and when there is any shortage the company has only to send to the Italian quarter on the east side of the city to get all the men required. A list is also furnished giving the different gangs and the names of the foremen who are to supervise any special gang, and the number of men in each, also names of sub-foremen and the number of men each is expected to handle. The location of all places for dumping snow is also given, and this is usually one of the most annoying features of the work, as such places are scarce. The names of sub-foremen in charge of the

slight his duty. Two crews are assigned to each plow, and all are carefully instructed as to their duties.

A careful record of all snow work is kept, so that after each storm, the division superintendents report, on suitable blanks, the entire cost of storm. During one storm, that of Jan. 1, 1900, 485 extra teams were employed and 1,453 extra men, and the total cost of this storm was about \$16,000, and this for a fall of about 8 in. of snow. It costs the company from \$16,000 to \$20,000 to take care of from 8 to 10 in. of snow. When the weather is threatening, the snow crews and other extra men are required to remain at their respective stations all night to be ready in case of an emergency. These men are paid 30 cents an hour for their extra time, regardless of whether they are called out for work.

The layout for snow work as indicated above, is in keeping with the foresight manifest in the conduct of all of the departments. It is held that trouble is best prevented before it happens, for this reason great attention is paid to little things, for instance, conductors and inspectors are required to report when any car is off the track and condition of the track, and for this purpose blanks are provided, and the items on this blank on which information is required are as follows:

- Kind and number of cars,
- Kind and make of truck,
- Locality of derailment on straight track, curve, switch or frog.
- Kind of rail in track, Time of derailment, Lines delayed, Duration of delay, Conductor's number, Motorman's number, Cause of derailment.

The division superintendents report to headquarters on a similar blank.

If a fuse on a car blows, the officials want to know it, and the cause, and conductors are required to report it. The officials seek to know everything that happens or is likely to happen before the public knows of it, so that cars will not be put out to advertise the seeming inefficiency of the officials or the employees.

The system of discipline exercised over the employees, while it is strict, is not so rigid as to kill, but is flexible and uniform. The aim is to get good men and to keep them as long as possible in the employ of the company, the theory being that the longer a man serves the company, the more valuable he becomes.

MOVING OF BUILDINGS.

A city ordinance provides that the city authorities will not give permission to any person to move a building on the line of the street railway tracks without first getting the consent of the street

dumps and the number of men under each are also given. As before stated, the company operates 188 electric snow plows besides levelers. Tickets are given to the men on snow work and these are punched by the foreman of each gang twice in the forenoon and twice in the afternoon, so that no one has an opportunity to

railway company. When a building is to be moved, the owner or applicant first makes his request to the superintendent of transportation on a blank provided by the company, in which he states that he desires to move a building from a certain locality to another via certain streets. He gives the dimensions of the building and on the same blank agrees to the following conditions:

"In consideration of permission being granted me by your company, to cross its tracks with said building, via above named route, I hereby agree to move said building at such a time of day as may be agreed upon between Division Superintendent _____ and myself. I further agree in case of detention or interruption of any of the cars or lines of your company, to bear the full amount of expense incurred by your company caused by such detention or interruption, also to pay all expenses for labor and material in case it becomes necessary to cut or remove any of the wire, track, or other property belonging to your company, or used by it in the operation of its cars. And I also agree to use the utmost dispatch in removing said building from its position, whereby it in-

terferes with or interrupts in any way the cars or lines of your company."

Following this, the superintendent of transportation on a suitable blank refers the matter to the division superintendent interested with the facts in the case, and requests an investigation and an estimate of what it will cost the company. The questions are: With what lines will such moving interfere? To what approximate expense will the company be put if such permission is granted? Do you recommend that such permission be given, and if so, upon what day and at what hour of the day will it be the least inconvenience you to have such building moved?

FIG. 55.

The division superintendent having made his report, the superintendent of transportation decides whether the request shall be granted and if it is, the applicant is notified on a suitable blank and at the same time the superintendent of transportation, on a blank form, advises the auditor to that effect, and states the amount the applicant has deposited with the treasurer to cover the estimated cost to the company. After the building has been moved, and the wires restored, the auditor makes out a bill against the amount deposited, and when paid, if the cost is found to be less than the amount deposited, the balance is refunded to the applicant.

Some of the blanks used in the transportation department are shown herewith. Fig. 53 gives the headings of the division super-

intendent of time tables, whose duty it is to prepare, alter or revise the schedules for cars on each division. After being prepared, these schedules are submitted for approval to the superintendent of transportation and the vice-president, and when approved are issued on large sheets, being duplicated in sufficient numbers for posting in the lobbies of all the car houses. These reproductions are on plain paper, the sheets being usually 16 x 11 in. For the preparation of these sheets the matter is written by the typewriter on wax paper and from this duplicate copies are made on a rotary neostyle copy-press. A number of these duplicating machines or presses are used in some of the other departments as well.

FIG. 56—A FEW DIAGRAMS FROM THE RECORD BOOK.

intendent's report of accidents; the totals from the division reports are transferred to a smaller blank with similar headings, which gives the summary of accidents for the whole system.

Fig. 54 shows an application for leave of absence; the original measures 3 1/4 x 7 1/4 in.

Fig. 55 is the upper part of the form on which division superintendents report the service of trainmen.

Besides the blanks and reports that show the results in the different departments, the vice-president has charts plotted for his own inspection, which present graphically the records of the different departments. The book of cross section paper in which these charts are plotted has pages about 17 1/2 x 13 in. printed in green with 10 lines to the millimeter, every tenth line heavy.

LOST ARTICLES.

Conductors send postal cards to headquarters describing any article found, besides making a report on suitable blanks. The receivers send in daily lists of articles with description. There is very little of value turned in that is not called for. Umbrellas are the principal items turned in to the lost article department, but few of these are of value; if they are, they are usually called for.

The directors of the company take a special interest in the Metropolitan Mutual Aid Association, organized among the men, and authorize the payment of all the expenses incurred for the operation of the society, the amount for some years being as much as \$2,300. All the money contributed by the men goes to the benefit funds. The membership numbers about 1,700, and the benefits are \$1,000

at death and \$5 per week for a term not exceeding 13 weeks for such as are off duty from sickness. The members are also entitled to free medical advice and treatment. The company bears all the expense of a ball for the men in winter and in summer gives them all an excursion. There is great harmony between the directors and the members of the association.

In the summer of 1899 the Boston Elevated Mutual Aid Association was formed for the purpose of caring for those employes of the road who may be incapacitated for work on account of sickness. It pays no death benefit, but pays \$7 a week for 14 weeks in case of sickness. The president of the road is one of its officers, and its expenses are paid by the road. The men pay 10 cents a week and a board of trustees chosen directly from among them award the benefits and decide all disputed claims. This association also provides for immediate identification and care in case of injury. The membership has steadily increased from the beginning until now it numbers about 2,500.

Mr. J. E. Rugg, the superintendent of the transportation department, has been engaged in the street railway business for 37 years, having first served as a conductor in 1863 on the Chelsea & Boston road, now known as the Lynn & Boston.

DEPARTMENT OF CIVIL ENGINEERING AND OF MAINTENANCE OF WAY.

These departments are so closely allied in relation to the track work that they will be treated under one head. The first mentioned is under the direction of Mr. Arthur L. Plimpton, civil engineer, and the latter is in charge of Mr. Richard Hapgood, with the title of superintendent of tracks.

The duties of the civil engineer as outlined in the printed regulations are as follows: "He shall have charge of the engineering,

FIG. 57—SPECIAL WORK FOR DEWEY SQ.

plans and specifications for all matters connected with tracks of surface lines, shall prepare estimates, keep such records and make such reports as may from time to time be required. He shall also prepare such plans, specifications and estimates for buildings as may be required, and in general conduct all matters of civil engineering, connected with surface lines."

The duties of the superintendent of tracks are outlined as follows: "He shall have general charge of the repair, maintenance, inspection and construction of tracks and paving and the removal of snow from the streets. Division superintendents will be accountable to the vice-president, represented by the superintendent of tracks, for the inspection and care of tracks and paving in their several divisions, and will carry on such work and make such reports as he may direct or require. All appointments and discharges of division track masters and foremen in his department and all wages and salaries paid shall be submitted to the vice-president for approval before being effective. He shall perform only such work other than ordinary maintenance as may be authorized and shall keep such account and make such reports as may from time to time be required."

The department of civil engineering in the Boston Elevated System is of much greater importance and requires ability of a higher order in a city like Boston than any other city of its size in the country. This is because of the narrow and crooked streets and the necessity of designing special work to suit the very peculiar conditions that exist. The amount of work can be appreciated when it is stated that there are in the entire system over 600 pieces of special work.

The layout at Dewey Sq., opposite the new terminal station, is a particularly complicated one, including tracks running in all possible directions at a street corner and in addition a track of the Union Freight R. R., which crosses six of the street railway tracks. Fig. 57 is from a photograph of this crossing as assembled in the

FIG. 58—CROSSING WITH CAST STEEL RAILS.

yards of the makers, Wharton & Co., before shipment. The freight track appears at the left in the illustration; the treads of these rails are 5 in. wide and through the crossing are of a guard section having a groove 2 1/4 in. wide by 2 in. deep. The Boston Elevated rails have a groove 1 1/4 in. wide and outside arms fitted to admit of the use of the company's standard joint fastenings. All outside arms are at least 4 ft. long; the sharp angles in the frogs are fitted so as to give a length of 4 in. to pave against. All curves are joined with the tangents by transition curves. The rails are all 10 in. deep with Wharton manganese steel centers.

The Boston Elevated Ry. also has considerable special work built by the Lorain Steel Co.

Fig. 58 illustrates a crossing in which cast steel rails are used. The crossing frogs have manganese steel centers which are held in place by keys, as shown in the section on A-A, so that they can be replaced when necessary. This is at Causeway and Charlestown Sts. and the Bridge, and was built by Wm. Wharton, jr., & Co.

Fig. 59 is the standard switch tongue bolt. The bolt has a T-shaped head and after being inserted in the bed casting is turned through 90° in which position the long arms of T prevent the bolt lifting. The shank of the bolt is square and so locked by the switch tongue that it cannot be pulled from the bed. The bolt is tightened from above, the cap screwing down over it.

The standard surface roadbed is shown in section in Fig. 60.

Fig. 61 shows the Churchill rail joint which is extensively used on the system and is giving satisfaction. The joint illustrated is

FIG. 59—SWITCH TONGUE BOLT.

for a 9-in. girder rail; the two side plates and the bottom plate are shown reduced to a scale one-half that of the end elevation. These joints are made by the Diamond State Steel Co., of Wilmington, Del.

Fig. 62 shows the joint designed by the civil engineering depart-

ment. This differs from most fish plate construction in that the top flanges of the plates extend beyond the edge of the rail head. For the inside plate oval holes about 1 5/32 by 31/32 are punched so as to fit tightly the oval neck of a sample standard 7/8-in. mild steel bolt. Circular holes in the outside plate are drilled to 1 1/16 in. diameter, except the bond holes, which are oval as shown. The centers of all holes are to be located exactly as shown in the drawing and the edges left without burrs.

In connection with the fish plates, the company is using a cold rolled steel bolt, on which the threads have been rolled into shape instead of being cut in the ordinary manner. It is claimed that these bolts are much stronger than those made by the ordinary process, a 7/8-in. bolt being equal in strength to a 1-in. bolt of the old style, and that they can be turned up so tight that the

hold under all conditions, the former light rods having given out under the heavy teaming traffic.

About 35 miles of track of 65-lb rail section was electrically welded at the joints about five years ago. All of this track was removed last year and renewed with a heavier rail. About 8,000 cast welded joints were put in last season by the Falk process, the company having bought a cupola and accessories for making cast welded joints.

The officials are not as well satisfied with asphalt paving as with that of granite blocks. The standard block for granite paving is 12 x 8 x 4 in. No border along the rails is used with asphalt paving, although it is the opinion of the civil engineer that a toothing of granite blocks or brick would be preferable. About 1 1/2 miles of brick paving has been laid as an experiment, but has not yet

FIG. 60 STANDARD SURFACE ROADBED.

threads form a nut lock, so that they are not liable to work loose. The bolts are purchased from Sternbergh, of Reading, Pa.

The standard rail for the Boston Elevated Railway System is a 9-in. 95-lb. girder, rolled in 60-ft. lengths. On streets paved with asphalt a full grooved rail is used, and where the paving is of granite blocks and in other localities, a half groove section. A rail of harder material than formerly is now used, and the life of rails on Washington St., where the traffic is the heaviest, is about 6 years.

On some paved streets concrete is bedded between and over the ties and around the ends, and beneath the rail, thus thoroughly bonding the track to the street. Ties are placed 30 in. c. to c. On the reservations, where the soil and sod are above the ties, pine ties treated to a preparation of woodline, after the manner of the Pennsylvania R. R. practice, are used. In the subway, chestnut and hard pine ties are preferred. The dimensions of ties are usually 6 1/2 ft. long by 5 1/2 in. thick, with a 6-in. face. The ties generally last as long as the rail. The company is putting up an apparatus for treating ties with woodline.

A cast tie plate 1 in. thick is used, and is cast with three holes for the spikes; this thickness gives the requisite depth for the pav-

been down long enough to prove its advantage, as compared with granite. It is found that with the new rail construction the cost of maintaining tracks is not half as much as it was five years ago.

Hand drills are used for drilling the rails for bonding and among the other track tools are rail saws, made by the Q & C Co., of Chicago.

DEPARTMENT OF EMPLOYMENT.

The office of this department is located at 82 Water St., about two blocks from the company's general offices, and is in charge of Mr. A. W. Senter, superintendent, whose duties are thus outlined in the regulations: "He shall hire all employes for car service, shall instruct them, or cause them to be properly instructed in their duties and certify them when qualified to the several divisions. He shall carry on the work in his department in conformity to such regulations as may be established, and shall keep such record and make such reports as may be required."

The superintendent of this department and his clerks are required to give their entire time to hiring men and keeping their records and great pains is taken to secure only suitable men. The steps followed in the selection of men are about as follows:

The company has issued an open letter which outlines the requirements and duties of the employes and this being quite generally known, prevents undesirable men from making application. The requirements are that both conductors and motormen shall be not less than 21 nor more than 45 years of age. The eyesight and hearing must be perfect, and height not less than 5 ft. 4 in. for conductors and 5 ft. 6 in. for motormen. Applicants must be perfect as to their hands, not having lost any fingers or thumbs. In the case of conductors, it is required that they possess a common school educa-

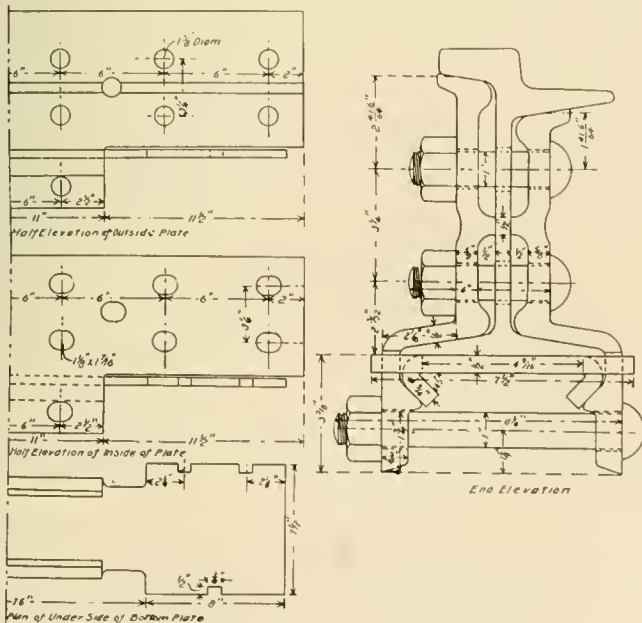

FIG. 61—CHURCHILL RAIL JOINT.

FIG. 62—STANDARD B. E. JOINT.

ing. Brace plates are used when necessary on special work and curves. Tie rods are spaced 5 ft. apart and are usually heavy, weighing 20 lb. each, the cross section being 2 1/2 x 2 1/2 in., and so upset at the ends as to give a full inch in diameter for the thread. The weight of tie rods has been gradually increased from 9 lb. in weight, used eight years ago, to the present size; they are now found to

tion, and they are required to furnish a bond with two real estate owners as sureties, each in the amount of \$300. Motormen must be able to read and write the English language, but no medical examination is required. Applicants appear in person and the superintendent of this department sizes them up as to general appearance, cleanliness and deportment. If they make a favorable impression in

manner and address and appear to have an honest purpose in applying for the position, they are allowed to register for further examination. The records show, however, that only about 13 per cent of the applicants receive appointment. On being tested for eyesight and hearing, and names of references taken, the applicant is given a blank which he is required to fill in, sign and swear to. This application, which is shown reduced in Fig. 63, contains the representations of the applicant as to various matters deemed pertinent by the superintendent. The references given in the application are then written to or visited and if satisfactory replies are received,

Next the pupil is put on the car and taken by the chief inspector to a side street, where he is put through a severe drill. He is tried on emergency signals, on reversing and backing cars and must demonstrate his ability to handle a car without abusing the apparatus and without an undue waste of power. This instruction is given no faster than the pupil is able to grasp it and care is exercised not to confuse him with a jumble of ideas. After being thus instructed in the division, he is sent back to the employment department office for examination upon the rules, on running and handling of cars, and the proper way to use the rheostat, controller and brake; he is also examined about how to cut out motors and how to make repairs. Then, upon a dummy car platform provided in the office, he is required to demonstrate the points upon which he is supposed to have been instructed. Some of the open cars are operated by the old half circle rheostat and handle. This explains why the men are instructed in handling this type of controller. Should the applicant be unable to pass this oral examination, he is sometimes given a second trial, but is rejected if he fails in this second trial. If, however, he passes a satisfactory examination, he is given employment on 60 days' probation and during that time he carries a letter of advice, shown reduced in Fig. 64, which gives his name, number, date of appointment, date of examination, and when his probation expires, and on this the instructors are required to note his conduct and their estimate of his ability to perform the duties required of him. At the end of 60 days if the reports are favorable, and the division superintendent considers him a suitable person to be employed, he forwards a recommendation for permanent appointment to the superintendent of transportation, who, if he approves the recommendation, forwards it to the department of employment, where it is filed with the man's examination papers. While on probation or on the extra list, they receive regular pay, but no pay while breaking in. While on probation, the applicant is required to wear a regulation cap and badge, but is not required to purchase a uniform till his time of probation has expired. The men are allowed to buy their uniforms where they like, provided that they conform to a certain style as given in the regulations for clothing and printed and illustrated in the book of rules.

Boston Elevated Railway Co.

APPLICATION FOR EMPLOYMENT.

BOSTON. 189

SUPERINTENDENT EMPLOYMENT DEPARTMENT

Dear Sir:— I hereby make application for a position as _____
in the service of the Company, with the full understanding that in the event of my securing employment I am to abide by such
rules and regulations governing its employees as the management may from time to time establish.

If employed I promise to loyally and faithfully serve the Company, and to do all in my power to further its interests
To conduct myself honestly, soberly, and with proper obedience and respect to its officials, and courtesy to passengers and the
public.

Age _____ Where born? _____
Married or single? _____ General condition of health _____

Employed the past five years as follows: _____ Reasons for leaving: _____

Previously employed by Railroad and Railway Companies as follows _____

Have you ever been convicted of a Misdemeanor or Felony? _____

Section of road preferred _____

Are you now using intoxicating liquors? _____

(Full name of applicant) _____
(Residence) _____
(P. O. Address) _____

COMMONWEALTH OF MASSACHUSETTS
COUNTY OF SUFFOLK.
Boston. 189

Then personally appeared the above named _____
and made oath that the foregoing is true to the best of his knowledge and belief.

Justice of the Peace.

FIG. 63.

he is accepted as an applicant and put on the waiting list. It will be noted that the applicant has to give a satisfactory account of his business life at least five years previous.

When a vacancy occurs a man on the waiting list is notified by mail when he can report for instruction and breaking in. On reporting, he is furnished with a badge and is assigned to a division for instruction; at the same time he is given a book of rules which he is expected to study carefully with a view of passing an examination on the subject. Conductors and motormen are provided with another book which gives the running time and the routes of each particular division. The routes are numbered and terminals named, and all the intermediate streets are given with the running time from start to finish and the running time between different points with the total minutes up to certain points, both for the in and out trips.

If the applicant is a candidate for the position of motorman, he is placed in the hands of a competent motorman in regular car service, and is allowed to ride around with him and observe how to handle the brake and controlling mechanism and to become familiar with the bell signals; he is then allowed, under the direction of his instructor, to handle the car himself. He remains with his instructor about nine days, and if he shows himself apt in handling the car, he runs a trip or two on each route in the division, and each man who has him in charge has to vouch for his efficiency. He is then taken by the chief inspector of the division to the "pit room" where he is shown under a car and the working of the brakes explained. Next he is instructed how to cut out motors, put in fuses and make such slight repairs as may be made on the street when there is no chance of delaying the traffic. Care is taken not to teach the motormen too much about repairs, as they are liable to block the street if they attempt it, the rule being that they should have the car pushed or towed home if it is disabled.

In the case of conductors, they are instructed in their duties about as follows: If the applicant is unfamiliar with the city, at least one day is given to teaching him how to give the signal bells, and he is not allowed to collect fare until he is thoroughly proficient in the use of signals. If he succeeds in bell ringing to the satisfaction of his instructor, he is allowed to collect fares on the second day. The method of doing his work is then explained to him and he is closely watched as to the manner in which he performs his duty. If he makes an error in registering, or in making change, selling tickets or in the receipt or issue of checks and transfers, he is corrected as to his failures. He is instructed to make his first collection as soon as possible after leaving the starting point and taught to be prompt in the collection of fares from passengers who board the cars at intermediate points. He is also instructed to call the destination of the car when necessary and the principal places along the

FIG. 64.

route and to announce the streets in a clear and distinct voice. At the close of the day he is instructed as to how to make his returns and to use a day card for each separate run with the cash and checks properly credited to the route upon which they were taken. He is then instructed as to how the deposit is returned in the safe and signs his deposit slip before leaving the station. As time goes on, he is instructed in time tables, and how to fill out accident reports and such other blanks as he may be required to carry, and is also instructed in regard to certain rules with which he must show himself familiar. In this way he gradually acquires a thorough knowledge of his duties.

Instructors are notified on suitable sheets that before they turn in a pupil they must be sure he understands the use of the daily lists, the time tables, and the principal duties on which they are to report are summarized as follows: Method of collecting fares, selling and receiving checks, announcing destination of car, calling streets, making up day cards, making up trip sheets, accident reports, rules and regulations, the use of the daily lists, and the use of time tables.

Instructors are cautioned not to turn in incompetent men as it reflects on their own ability. The period of instruction for conductors is about a week, when they are sent back to the employment department where they are required to pass a written examination upon the rules, and this is supplemented by oral questions, relating to the enforcement of rules and such other points as may occur to the superintendent of the department. If he passes a satisfactory examination, the applicant is appointed in the same manner as the motorman. This rigid system of selection results as a rule in securing competent, intelligent and urbane employes.

Not many applicants are found who have had experience on other roads. They are accepted, however, if they show a good record with the roads where previously employed. In conducting the affairs of the department of employment, the library card system is used, and the cards of men who have been discharged are all retained and kept on file for future reference. By this system of selecting and training employes no man can be put to work upon the request of the president, directors or any officers of the company, and only those who can comply with the requirements are selected.

By this system of selecting employes, the superintendents and other officers are relieved from all annoyances from would-be applicants and from the duty of examination and passing upon the qualification of the men.

The book of rules and regulations mentioned, which is supplied to conductors and motormen, has been very carefully prepared and is thoroughly indexed; no penalties are attached to particular offences. In the back of the book space is given to presenting such extracts from the Boston Police Manual as refer to the licensing and conduct of street railway employes. The book also contains the revised regulations of the Board of Aldermen, relating to street railways and also the public statutes of Massachusetts in regard to railway crossings, passing cars, the requirements of the Board of Railroad Commissioners, with penalties for infringement. There are also given the regulations of the Railroad Commissioners relating to the heating of street railway cars, and a general police order which reads as follows: "Complaints having been made of annoyances to passengers on street railway cars by intoxicated and disorderly persons, the police force is hereby instructed to respond to all calls for assistance from conductors and others in such cars to take such action in each case as in the judgment of the officer may be necessary for the safety and comfort of passengers."

The preface to the book of rules contains instructions and cautions as follows:

"For any violation of these rules, neglect of duty, or action adverse to the company's interest, an employe will, in the discretion of his superintendent, be suspended or discharged.

"Every employe whose duties are in any way prescribed in this book, is required to have a copy of it constantly in his possession when on duty and to make himself perfectly acquainted with the whole of it. Employes must strive carefully to perfect the discipline and increase the efficiency of the service. They must report any misconduct or negligence which may come to their knowledge, detrimental to the interests of the company.

"Employes must bear in mind that they are engaged in a public service, in which they are constantly called upon to exercise great patience, forbearance and self control. Politeness and courtesy continually practiced by employes will prevent controversy and complaint, and greatly benefit the service. In addition to these rules, general orders will be issued as occasion may require and posted in the station order book which all employes must examine each day. A general order, whether in conflict with these rules or not, which may from time to time be given by proper authority, will be fully observed so long as it may remain in force.

"If in doubt as to the meaning of any rule or order, application must be made at once to the proper authority for explanation. Ignorance will not be accepted as an excuse for neglect or omission of duty. In all matters, whether covered by these rules or not, em-

ployes are expected to use good judgment and discretion. In case of doubt, take the safe course.

"Every employe must promptly obey all instructions received from his superiors and is required to look after and be responsible for his own safety and to exercise the utmost caution to avoid injury to the public.

"Special attention of all employes is called to the provisions of the 'Public Statutes of Massachusetts,' the 'Regulations of the Board of Aldermen,' and the 'Rules of the Police Commissioners of the City of Boston,' which last are printed in full at the end of this book."

While penalties are not usually assigned to specific infringement of rules, it is the practice of the superintendent of transportation to discharge motormen whenever they are reported as having had a collision with another car the second time, no matter how slight the damage.

BUREAU OF AUDIT.

This department is not listed among the departments in charge of the vice-president as given elsewhere, but is conducted under the supervision of Mr. H. L. Wilson who is responsible directly to the president and board of directors. The offices of this department occupy the entire fourth floor of the department building and are elaborately furnished with all the necessary desks, cabinets, cases, and safes for the care and handling of the records. The clerical force consists of 34 clerks, all but three of whom are men. Three women stenographers and typewriters are employed. In the conduct of the business, the library card system prevails and so systematic is the organization that the work of the department is now conducted with only one additional clerk to the number formerly employed by the West End company before the lines were leased to the present company, although the business of the department has increased nearly 50 per cent. For readily shifting the heavy books, some of the shelves in the large safe are provided with iron rollers so that the books can be easily slid in or out of place. Some idea of the detail work which this department is required to handle can be formed when it is stated that last year the department paid 12,846 vouchers. The company furnishes blanks on which all bills are made, so that the vouchers are all uniform and can be filed in uniform packages. The pay rolls amount to from \$75,000 to \$110,000 per week. By a state law, the company is required to pay the employes weekly. Every man is required to sign his name on the pay rolls as a receipt for his money and these rolls are all bound and kept on file. The number of different report blanks which are prepared and furnished by this department and from which returns are tabulated is over 400. On an average, over 3,000 records relating to the operation of the lines are received at the auditor's department daily.

A very elaborate and complete method of accounting is required on the system of the Boston Elevated Railway Co., for the reason that all the property used in connection with the surface lines has been leased from the West End company. One feature of the records that is of special interest is the inventory record of real estate and all property that the West End company turned over to the Elevated company. These inventory ledgers comprise five large volumes and the method employed is unique and interesting. The first volume is that of the real estate and gives a record of all power houses, car houses, shops and tenement houses belonging to the company, and in connection with each item, there is first a written description on carefully prepared typewritten sheets, and the detail description includes each floor of the buildings. Next follows a ground plan in colors after the manner of keeping real estate records and shows the dimensions of the lots and the buildings and the plan of each floor. Next follows a photograph of the building.

Volume 2 is a record of the track construction, electric line equipment, power station equipment and subway equipment. This is carefully indexed and shows the kind of rail that is used on every street in each of the cities and towns through which the lines run, giving the length in feet, description, and the kind and condition of pavement; there is also a sectional drawing of every kind of rail on the road that existed when the company took possession of the lines. Following this is a description of the different types, and also each piece of special work with a drawing showing the general type of special work, and also the location of each piece, by whom made, when put in, type of rail and the number of feet. There are also separate illustrations, of all girder rail special work, all T-rail

special work, and all the special work of tram rail. The inventory of line equipment gives for every street on the system, the size and kind of trolley poles, these being alphabetically arranged by streets, cities and towns. There is also a sketch of the poles in which the dimensions and weight are given. The switch boxes, insulating material, a record of single and double trolley wire, single brackets, double brackets, and span wire, and all the different sizes of feed and return wires and type of wire are also given. A grand summary, showing everything in tabulated form by cities, and towns follows. There is also a statement of underground conduits and cables giving location, length of trench, length of conduit, average number of ducts, and number of feet of ducts, number of connections and manholes, also number of feet of each size of feeder cable and underground returns. This is followed by the submarine, bridge cables, together with the switches and the number of feet and size of wire on bridges. The same volume also contains a description and illustration of all the power station equipment.

Volume 3 contains an inventory of cars, motors, trucks, controllers, and car equipment and also the miscellaneous vehicles. The number of every car is given; when built, by whom, style of car, and a photograph of one of every lot of cars. Then follows a description and drawings of all the different types of trucks, also a description of all the motors, together with controllers, all spare parts, armature spools, etc. The vehicles of all kinds, including coal cars, sprinklers, sleighs, snow plows, etc., are described and illustrated.

Volume 4 is a record and description of the machinery and tools in all the manufacturing and repair departments, together with the furniture and fixtures of the buildings, also a record of horses and harnesses, and in connection with the horses, the register number and age as well as the description are given. The miscellaneous department includes all office furniture, and all tools and machinery of the entire system with location.

Volume 5 describes the material and supplies on hand.

A card is provided for every vehicle showing where it is to be found and all the information about it. The power station expenses are kept on cards, with a record of the coal and oil, there being a card for a record of 12 months, and the different years are so arranged that comparisons are readily made. The card record shows the power consumed for operating the car for lamps and for heaters. A card is provided for the transfer tables, one for the stationary motors and one for the armature record. This armature record shows when the armature was received with all repairs that have been made to it with their cost, number of the car on which it has been run, and cause of removal in each case. The motor records are also kept on cards, give the car number, the date put under the car, the date on which removed and cause of removal. By this record, the relative economy of the different type of motors is readily found. By the system of reports and accounting used, the auditing department is able to know the cost of any particular piece of work, and can tell the different repair departments what they can do under certain conditions. Twice a month, a report of the receipts per car-mile is made up.

In the auditing department is a ticket chopping machine driven by an electric motor, which is designed to cut up into fine pieces all checks and transfer tickets. This machine is provided with a hopper into which the tickets are thrown and the small pieces are delivered into a large willow basket, and then as scrap they are sold to paper dealers.

DEPARTMENT OF WIRES AND CONDUITS.

Mr. Charles H. Hile is the superintendent of this department and the regulations prescribe his duties as follows: "He shall have general charge of the inspection, care, maintenance and construction of all poles, trolley wires, feeder wires, conduits, cables and return wires (except track wiring) and of the testing of wires, cables, switch boxes, etc.

"Division superintendents will be accountable to the vice-president represented by the superintendent of wires, for the inspection and care of wires, performed by the emergency crews in their divisions and will carry on such work and make such report as he may direct or require. He shall perform only such work of new construction as may be authorized and shall keep such accounts and make such reports as may from time to time be required."

The office of the superintendent of this department is located in a large wooden building near the central power station and here is stored a large quantity of feed wires and other supplies for the con-

duct of the department. Wagons and drays are provided for the shifting and handling of the material and a suitable clerical force is provided for keeping the accounts. A very complete set of testing instruments is also provided and is part of the equipment of this department. The frequency and method of tests of feeders and electrical machinery have already been described.

DEPARTMENT OF INSPECTION.

The superintendent of this department is Mr. Clarence E. Learned. This department receives more attention than is usually given to work of this kind by street railway companies. The method of keeping the record of the men and the record of the open and secret inspection is kept by a code system which is very complete but which must be seen to be understood. The work of the department is considered highly essential and results in a high class service.

DEPARTMENT OF BUILDINGS.

The regulations prescribe that the superintendent of this department shall have charge of the inspection, repairs, maintenance and construction of buildings, and shall report hereon to the vice-president as may be required. The present incumbent is Mr. Marrett I. Paine with the title of superintendent of buildings.

PURCHASING AGENT.

All buying is done by the purchasing agent, Mr. Henry F. Woods, upon proper requisitions, duly approved. No official or employe of any department in the bureau of surface lines is authorized to make any purchase or to contract any debt or incur any obligation, other than for the employment of labor as may be authorized in the regular transactions of the business of the different departments, except when specially authorized by the vice-president or in case of emergency, as referred to in the case of snow work. All debts contracted in emergency are required to be promptly reported to the vice-president with the correct bill duly approved. All heads of departments are cautioned to exercise foresight in making requisitions for stores and materials so that ample time may be given for the consideration of the requisition and purchase of the material.

In connection with the department of motor power and machinery, should have been mentioned the drafting department, which is under the supervision of Mr. Howard P. Quick, with the title of chief mechanical draftsman. This department is located on the second floor of the machine shop building and is provided with all the appliances and furniture usually found in departments of this kind. Besides the draftsmen, an expert photographer is employed who makes photographs of all cars, machinery buildings, etc., that may be required. In this department originate all the designs for cars, trucks and special cars, as well as all the machinery for power station equipment. Formerly the department was responsible for the design of buildings, but this work has now been assigned to the civil engineering department.

There is also in this department, an inspector of motor car repairs, Mr. William S. Collins. The office of the inspector is in the repair shop, where he is to be found every morning until 9 o'clock, when he drives on his rounds to the different car houses, which are all visited once in 10 or 12 days. Besides the repairs to motors, the inspector of this department looks after the condition of the pit rooms, and is also responsible for the cleanliness of all the car houses and the method of storing and caring for the supplies that are delivered to the different car houses.

In closing this article on the Boston Elevated Ry., the writer wishes to express his appreciation for the favors and courtesies shown him by the officials, the superintendents and the foremen of the different departments.

EMPLOYEES' CLUB AT BIRMINGHAM, ALA.

The Electric Club, recently organized among the employes of the Birmingham (Ala.) Railway & Electric Co. for temporary campaign purposes, has decided to make the organization permanent and add social, literary and benefit features. The officers of the company have given the men their hearty support and it was determined that the president, general manager and treasurer of the company shall be ex-officio president, vice-president and treasurer, respectively, of the Electric Club. Under this plan the officers of the club are: President, A. M. Shook; vice-president, J. B. McClary; treasurer, Edward Warner.

THE ELECTRIC RAILWAY FROM PALERMO TO MONREALE.

The Continental Electric Co., of Nuremberg, Germany, has recently completed an electric railway between Palermo, the capital of Sicily, and Monreale, a town of 19,000 population, and on a portion of the line has installed a very interesting counterweight system. Formerly what we may call "rapid transit" between Palermo and Monreale ended at Rocca, a small suburb about three miles from Palermo, situated at the end of "the Chaussec" which runs in a straight line to the foot of the mountain on which Monreale lies. From Rocca the highway ascends a steep, winding grade. The highway was not available for the electric railway and a direct route was chosen which involved a rise of 433 ft. in 3,600 ft. Below this grade is one of 8 per cent for 3,600 ft., and at the upper end a grade of 6 per cent for 2,600 ft.,

Instead of using a rack rail for surmounting this grade, a counterbalanced cable system wherein electric motors on the car provide the traction power, was designed, which, we believe, is quite

FIG. 1—DIAGRAM OF OPERATION.

a novelty for electric roads in Europe, though in this country there are several examples of such installations, as for instance, the Bronsdon counter weight systems used in St. Paul and in Providence, and the Mt. Tom electric cable railway near Holyoke, Mass.

The passenger cars are of 1 meter (39.37 in.) gage and on the steep grade a double track with turnout is laid; these two tracks have one rail in common, making only three rails except at the turnout where the middle rail branches, as shown in the plan view, Fig. 1. The object of making a three-rail track instead of a two-rail was to avoid switches and simplify the arrangement of the cable. Between the rails of each of the two tracks is laid a track of 58 cm. (22.8 in.) gage, on which the counterbalance locomotives or "brake cars" run. The two brake cars, one on each narrow track, are connected by a wire cable which passes over a sheave at the upper end of the grade, and are thus balanced one against the other; they get the name "brake cars" from the fact that they are equipped with automatic tooth-brakes, as well as with electric motors.

The difficulty of constructing switches to permit the passenger cars to pass the brake cars at the foot of the grade, led to the introduction of a most unique feature, that of running the brake car into a pit and letting the passenger car pass over it. The operation will be understood from Fig. 1, which shows the cars in

seven position. In 1 the up-bound car has arrived at Rocca from Palermo and the down-bound car at Monreale is ready to descend; the lower brake car is in the pit. At 2 the up car has crossed the pit and stopped; the down car is coupled to its brake car and the trolley pole of the latter is adjusted. At 3 the down car has proceeded far enough to draw the other brake car from its pit when it is coupled to the up car. At 4 the two trams meet at the turnout. At 5 the cars are uncoupled from their respective

FIG. 2—PIT AT ROCCA.

brake cars. At 6 the lower brake car is entering its pit. At 7 the down car has crossed the pit on its way to Palermo.

It will be noted that by this ingenious arrangement the passenger cars are kept always on the upper side of the brake cars while on the grade and the danger from a failure of the coupling eliminated.

The weight of the passenger car is about 10 tons and that of the brake car 7½ tons.

Fig. 2 shows the car crossing the pit at Rocca, the lower end of the cable section. Fig. 3 is a view of the road crossing the valley.

FIG. 3 CROSSING THE VALLEY.

The advantages claimed for this system by the builder are: ability to ascend steep grades; minimum loss of time in connecting to cable; safety; simplicity of operation; narrow gage may be used; speed may be maintained on the grade; freight vans may be carried.

Just as a car on the Cincinnati, Newport & Covington road was crossing the line between Ohio and Kentucky, one day last month, two of the passengers—a young colored couple, were united in marriage by a colored preacher. Nobody knows in which state the ceremony was performed.

ENGINEERING IN CHINA.

An article that will not fail to be of interest to anyone who has ever considered China as a possible field for engineering labors, or for the introduction of American material, appears in the April issue of Cassier's Magazine. The author is Mr. G. James Morrison, who has been prominently engaged in railroad construction work in the Orient for a number of years, and is therefore qualified to speak with authority on the conditions under which engineering enterprises must be carried out among the Chinese,—a people, who while boasting of a civilization thousands of years old, honestly believe the common welfare of the nation demands that nothing be done to change the habits or customs of its citizens. Mr. Morrison first briefly reviews the often described mining, agriculture and commercial resources of this land, whose undeveloped riches are almost beyond conception, but then abruptly departs from the opinion usually maintained by writers on China, who hold that the best way to remedy the abuses and evil conditions they all recognize as existing is to approach the government itself, point out the abuses and suggest remedies. The author thinks that success in nullifying the evils that must be overcome before this vast territory can be opened to the improvements of modern civilization, particularly in the line of building railroads and tramways, is most likely to attend the efforts of those who are prepared to take China as it is, be thankful for the most meagre concessions at first, and gradually overcome the prejudices of the oriental mind without appearing to do so. It will be slow uphill work but Mr. Morrison believes the results will justify the labor.

In conclusion he says: "All who wish to succeed in China must be self-reliant,—they must trust as little as possible to government assistance, they must be prepared to accept the country as it is, and also its government, which, with all its defects, consists principally of men whose honest and patriotic belief is that European civilization is unsuitable to their empire; whose habits can be altered only by slow degrees; and whose modes of action result in what to European eyes is obstructiveness of the most determined type. While China will for years to come provide a field for engineers and engineering enterprise, it is neither going to be opened up nor broken up with the speed that many people seem to expect."

STREET RAILWAYS OF RHODE ISLAND.

The following data concerning the street railways of Rhode Island are taken from the annual report of the Railroad Commissioner, Mr. E. L. Freeman, which covers the year 1899. The reports submitted by the companies are for the year ending June 30, 1899.

There are 13 street railway companies organized in the state, one more than in the preceding year, of which 10 are in operation. These 10 have 183 miles of road in the state with 213 miles of (single) track, and own 580 motor and 152 other cars.

The capital stock aggregates \$10,982,000, an increase of \$70,000 over the preceding year. The funded debt is \$1,015,200, an increase of \$203,000; the floating indebtedness is \$718,335, an increase of \$218,315. The total of property and assets, as reported, is \$13,296,331, which is over \$580,000 in excess of capital stock and indebtedness.

During the year ending June 30, 1899, the total receipts were \$2,266,172, an increase of \$237,479 for the year; total expenditures, including interest and taxes, were \$1,428,888, an increase of \$211,502. The whole number of passengers carried was 44,603,401, an increase of 4,623,401 for the year. The number of employes is 1,320, which is 104 more than in 1898.

There were 49 accidents reported to the commissioner as occurring in connection with the street railways, in which 4 persons were killed and 84 more or less injured. Of those killed, 2 were crossing the tracks in front of cars; 1 was a woman lying beside the track; 1 was an employe, killed in collision of cars. Of the 84 injured, 42 were passengers; by collision of cars, 16; by cars jumping tracks, 10; by getting on or off cars, 11; knocked from running board by tree or car, 4; by breaking of car platform, 1. Of the other 42 injured, 20 were by collision of cars with teams; 12 were persons who were crossing tracks in front of cars; 3 by collision of cars and bicycles; 7 were employes, of whom 4 were injured by collision of cars, 2 by cars jumping tracks, 1 by falling from car.

Seven of the street railway corporations paid dividends as follows:

- Union Railroad Co., Providence, 8 per cent.
- Pawtucket Street Railway Co., 8 per cent.
- Newport Street Railway Co., 7 per cent on \$30,000 preferred.
- Providence Cable Tramway Co., 6 per cent.
- Interstate Consolidated Street Railway Co., 6 per cent.
- Pawcatuck Valley Street Railway Co., 2½ per cent.
- Newport & Fall River Street Railway Co., 3 per cent.

Tables 4 and 6 give data for the various railways of the state. It should be noted that the total expenses include taxes and interest.

TABLE NO. 4.—Showing Names of Corporations Capital Stock paid in, Funded Debt, Floating Debt, Total Indebtedness Total Receipts, Expenditures, and Net Earnings for the year ending June 30, 1899.

NAME OF CORPORATION	Capital Stock paid in	Funded Debt	Floating Debt	Total Indebtedness	Receipts	Expenses	Net Earnings
Union Railroad Co., Providence	\$8,200,000 00	\$25,000 00	\$189,651 75	\$214,651 75	\$1,712,818 87	\$2,78,975 48	\$78,848 99

* Operated by Union Railroad Co. † Part of road built, but not started till July 1, 1896. ‡ Road built, but not operated. § No return made.

Nearly all the street railways of the state have accepted the provisions of Chapter 580 of the Public Laws (St. Ry. Rev., Mar., 1899, p. 198) by which they pay an annual tax of 1 per cent of the gross earnings and an amount equal to all dividends in excess of 8 per cent, in lieu of all other state taxes. (By this act the burdens imposed on the roads by cities and towns may not be increased without the consent of both parties.)

The Union Railroad Co., of Providence, added 7.745 miles of track to its system, and enlarged its car house and power station capacity.

The Rhode Island Suburban Street Railway Co. was organized during the year and acquired by purchase the property of the Cumberland Street Railway Co., 7 miles; that of the Pawtucket Valley Electric Street Railway Co., 11 miles; the Oakland Beach branch of the New York, New Haven & Hartford, 10 miles, and the Barrington, Warren & Bristol road. This company has built a sub-station at Riverview and will take current from the Union Railroad Co., transmitting on by the three-phase system.

The total mileage of the Union Railroad Co., the Pawtucket Street Railway Co. and the Rhode Island Suburban Railway Co., all of which are controlled by the United Traction & Electric Co., is 173.12 miles.

The Holland & Lake Michigan Electric Railway Co. resumed operation over the Saugatuck branch on April 11th, the first time cars have been run since the destruction of all the company's rolling stock by fire on January 10th last.

New York twins born the day ground was broken for the rapid transit tunnel were named respectively William Rapid Transit and Robert Rapid Transit Behrend, after Mayor Robert A. Van Wyck and Chief Engineer William B. Parsons.

MEETING OF THE SOUTHWESTERN ASSOCIATION.

The second annual convention of the Southwestern Gas, Electric & Street Railway Association was held at Waco, Tex., on April 12th to 14th, the meetings being at the Business Men's Club. The first session was called to order by the president, Mr. T. D. Miller, of Dallas, at 10 a. m. Thursday April 12th. Capt. M. B. Davis was introduced and made an address of welcome; he was followed by the mayor, Mr. C. C. McCulloch, who greeted the association in behalf of the city. President Miller made a brief response and then, after the roll call and other routine business, made his annual address. He said in part:

"The past year has been noted for its great activity in industrial enterprises, with the natural rise in prices of supplies. Those who have lived up to the old precept, 'in time of peace prepare for war,' and taken advantage of the low prices to make extensions and improvements, find they are able to show a large profit on the investment in the amount saved in the expenditure over what the same would have cost had it been deferred a year or more. Competition has in numerous cases been tempered by consolidation or the courts. The anti-trust law has been declared constitutional, but no case has been reported where it has affected any of our industries, for the simple reason, that, forsooth, none of us are in a trust.

"A popular cry in municipal affairs today is municipal ownership of public or semi-public utilities, which include gas works, central-station electric plants and street railway lines. There has been considerable educational work done on this subject the past year, and it is to be hoped it will continue. An unfounded and erroneous idea is prevalent in the public mind as to the earnings of such institutions. There have been cases where city authorities have been unable to get the consent of the public for the purchase of such utilities, and still laboring under the delusion that the profits of the business were enormous. They have attempted to and have imposed heavy burdens in the shape of a privilege tax or income tax or bonus for the occupancy and use of the streets. The injustice of such course must be apparent to all, for such levy or impost must be paid by the patrons of the enterprise, which payment accrues to the benefit of all at the expense of a few. It is argued that our business is in its nature exclusive, and that it is impracticable to have competition in the sale of gas, electric lights and transportation of passengers. This statement is, in a measure, true, but the impracticability is not physical, but financial, as some of you here can testify from more or less lurid experience. If our profits are sufficient to enable us to give large bonuses to the government for a privilege to do business, would it not be more logical for us to give that amount to our customers in the shape of lower prices? An adjustment of this nature would, I believe, meet with approval from all interests involved, could the subject be treated in a perfectly impartial way.

"Everyone is inquiring for the cause of the failure of the Austin dam. Was it defective construction or faulty design, or error in judgment as to the sustaining power of natural material, or its ability to withstand the effects of the water under the new conditions? That there has been an error committed is beyond doubt, and it is to be hoped that a thorough and impartial investigation will develop the cause of the calamity and that the responsibility may be fixed where it belongs. This is due to the men who were in any way connected with the promotion, design, execution or management of this work. The failure of this dam is of interest to the engineer from a technical standpoint; to the gas man because it was in direct competition with a gas plant for light and power; to the electric light and street railway man because of the extremely low rate made in Austin by this plant for current for both light and power, for its moral effect reaches far beyond the confines of Travis County; to the political economist because it is a municipal enterprise, and perhaps of a magnitude far greater, for the size of the city, than has ever been attempted before in this country. The question has been asked, Has the plant paid? Has it earned sufficient revenue to warrant the million-and-a-half investment?

"Electrolysis or electro-chemical deterioration of underground metallic construction is a thing that gravely concerns the gas man and the street railway man. How to avoid damage to the mains from stray ground currents does engage the attention of the gas man, and how to avoid damages through the courts for damages accrued to gas, water and telephone mains should engage the attention of the electrician. The electrical associations have discussed this subject, the gas associations have done the same and the street rail-

way associations have given it consideration. It occurs to me that our association is in a particularly fortunate position to consider it.

"The relation of corporations to the public should engage our constant attention. It is a live subject, and one that has but recently been prominently brought before the public through attempted legislation of a special session of the state Legislature. In this connection let me call your attention to the fact that there is practically no criminal proceeding available for the protection of our business against the surreptitious user of gas or electric current. Under the criminal code the value of the thing stolen must be proven to obtain a conviction. The thief who steals gas or electric current does not use a meter and would hardly testify as a prosecuting witness and himself the defendant, so that it is impossible to convict for such theft, though the criminal be apprehended red-handed in the act. Of course, civil action can be resorted to, but such action against 'one who was slick enough to rob the gas or electric company' could hardly be expected to result in financial gain. I therefore recommend that a committee be appointed to prepare a bill covering this defect, which bill they will have introduced at the next session of the Legislature."

The papers presented included the following:

"Electrolysis," by E. H. Jenkins, San Antonio.

"Meters and Incandescent Lamps," by W. S. Rathell, Waco.

"Operation of Electric Lighting Plants from a Business Standpoint," by A. E. Judge, Tyler.

"Use and Care of Electric Meters," by E. D. Kelly, Waxahachie.

"Sale of Gas and Electricity for Light and Power," by J. R. Cullinane, Denison.

"The Cause and Remedy of Poor Incandescent Lighting," by H. L. Monroe, Dallas.

"The Attitude of Municipal Corporations to the Public," by John G. Boyd, Terrell.

"Operation and Maintenance of Street Railways," by H. F. MacGregor.

Abstracts of the papers of most interest to street railway men are given below:

Officers for the following year were chosen as follows: President, J. F. Strickland, Waxahachie; vice-president, C. F. Yeager, Laredo; E. H. Jenkins, San Antonio, and J. R. Cullinane, Denison. These gentlemen and H. F. MacGregor, T. D. Miller and W. S. Rathell were chosen directors. The next meeting will be at Houston.

OPERATION AND MAINTENANCE OF STREET RAILWAYS.

By H. F. MacGregor, Vice-President and General Manager of the Houston Electric Street Railway Co.

This subject affords scope enough to write a book, but consideration for my hearers and my own inclination will limit this paper to a few observations growing out of my experience which I feel may be useful to others, or that may invite discussion with some comments and criticisms on current conditions. Elaborate, technical or statistical information will be eliminated. This paper will be found dry enough without endeavoring to emphasize the condition.

Technical and statistical matter is available in better form than my knowledge or my records would furnish. Those who make such matters a special study furnish instructions and tables of value as a basis to work from. The usefulness of information of this character depends on the ability of a railway manager to correctly determine to what extent it applies to the conditions under which his lines are operated. My feeling is that these matters can be worked up by the technical papers from unquestioned authorities with greater benefit to the business, than they can be furnished by the average street railway man whose opportunities are limited; and that the sessions of the associations can be more profitably devoted to single topic papers, and discussions of them, experience meetings, and the question box, where the timid man gets in his work. It is this exchange of ideas from practical experience that makes the trips to the Southwestern and the American associations attractive to me, and beneficial to the interests I represent.

The last decade has witnessed revolution and annihilation; the night-mare of the succession being about the only reminder of the motive power of the past. Invention has crowded invention. The electrical apparatus of yesterday is a back number today. The standard of today, if we dare yet to talk of standards is likely to be obsolete tomorrow. The procession has moved rapidly, and but

few of us have had properties financially able to keep pace with it. Our experience like our machinery is obsolete; it was expensive but is perhaps worth all its cost and whether willing victims or forced, there was no choice; we could not stand still. Investors in street railways and other electrical plants have contributed large sums to the march of events, and those that come after us will consider it money well spent, and those that went through the transition find themselves cautious and self-reliant, two essentials today in the successful management of electrical properties. There was something to warm the cockles in the heart in the motive power of old, that is lacking in the modern method. Perhaps this is explained by the fact that "blood is thicker than water," for looking backward is there a street railway man who cannot picture that he was at one time or another a brother to the sire of the lamented but not forgotten mule that shared our burdens?

I should have profited by the knowledge of the habit of our neighbor across the border, and said in answer to the suggestion of your committee "Manana," for "tomorrow" I am hoping for several standards in the construction, operation and maintenance of street railways adapted to all classes and conditions. Systematic and thorough work in this direction is what I believe is needed most by railway interests, commencing with franchises, proper municipal demands, standards for material and equipment for cities of different classes. Everything now is based on what is accomplished in larger cities; municipal exactions are the same. The public mind is educated by object lessons from cities glutted with traffic where the problem is how to handle business and not how to create it; where the horn of plenty exists, and is not an iridescent dream.

At the meeting of the American Association I ventured to remark that the trend of the discussion was toward conditions existing in but few cities, and inapplicable to the wants of most of the members and suggested a division that would profit the smaller interests. I see from the published program that at the next convention, in Kansas City, we are to have a paper on construction, operation and maintenance of roads that operate 20 cars or less; this is a step in the right direction.

The improvements demanded by the public and the spoliation by the courts, municipalities and legislatures menace the very existence of street railways in cities under 50,000 inhabitants, or cripple them so they are unable to maintain the public service as they desire or should do. This should be remedied by the proper education of the public, and no one can better do this than the street railway people and allied interests working out with mathematical precision the results that can be obtained under given conditions. I believe we now have had sufficient experience to do this, and it is only a matter of compiling the facts and getting them properly before the people. The facts would be an aid to the successful development of improved city and suburban transportation facilities, and a convincing answer to the craze for municipal ownership and socialism.

In the operation of street railways I recommend the belt system as being more profitable, covering more territory for the same operating expense and affording greater protection against accidents over a double track system, and having fewer delays and annoyances over a switch system.

In cities of the class of Houston we average a car for about every 2,500 inhabitants. In smaller cities it would vary from this number to one for every 5,000 people. With us the travel amounts to one fare daily for less than 20 per cent of the population. The operation of these cars should have close attention and every possible effort should be made to encourage and increase travel. Attractions on lines operated on a business basis are desirable, but free shows are not beneficial; those of a class that should be encouraged cannot be afforded free on a 5-cent fare and it is preferable to give people full value for their money in attractions, concerts, etc., at popular prices, say 10 cents admission and 10 cents for reserved seats. Where the attraction is inexpensive in character the admission might include a coupon for refreshments at the privilege stands.

We operate our cars by the usual methods, and have no patent process better than others. Eternal vigilance is the price of success and if not success of the privilege of living.

Our headway varies from 5 to 30 minutes on different lines. On short lines it is desirable to have short headway. Formerly our outside limit was a 20 minute service, but we find half hour cars earn about the same money on light traffic lines; and that a 15-minute service increases the travel but slightly and only to a small percentage of the increased expense of another car. Patrons on long headway lines time themselves until it becomes a habit and the domestic

arrangements at home are systematized accordingly. Twenty dollars per day per car is required for the operation and maintenance of a proper standard of excellence and the profit must come from earnings above that.

For the economical maintenance of a line it should be constructed well in the beginning. The rail should be 60 lb. or heavier, the heavier the better; the base of the rail should be not less than 5 in. in width to prevent cutting into ties; the joints should be cast-welded. We have a cast-welding machine and it is undoubtedly the thing in paved streets as there is no weak point left in the track and no movement at the joints; bonds are unnecessary and by reason of the saving in the bonds the cost is approximately the same and the result is practically a perfect track. In unpaved streets we are cast-welding also and without trouble. Thus far the stretches have not exceeded a half mile. Until we have tried a long stretch of straight track I am not prepared to give my unqualified endorsement of cast-welding in unpaved streets in light soil. My impression is that expansion joints left at quarter mile intervals will prevent possible trouble.

We have generally used cypress ties; 12 years is about the limit of life, and under some circumstances not that long. We have recently used also creosoted pine ties, estimated to last 20 years. Tracks should be well ballasted, and carefully looked after. We use No. 0 trolley wire, and have red and white cedar poles and recently put up some creosoted pine poles; some of the white cedar poles erected 10 years ago have been replaced; the major portion are good for several years yet. The red cedar poles last longer, but are not as attractive in appearance, and the sap wood decays and makes the pole more difficult to climb.

The maintenance of the equipment and the station repairs constitute a heavy tax on the earnings. It is necessary to have quite an extensive repair plant and a very large sum of money can be thrown away or saved in the handling of these departments. The fuel question requires close attention and to know when one is getting the best results is difficult to determine.

The handling of claims and lawsuits requires rare judgment, a street railway man who handles small properties soon gets to be a jack of all trades; on larger systems special ability is found in separate departments. The greatest problem to be found in the operation and maintenance of street railways among the members of the Southwestern Association is how to make both ends meet. Everything is subordinated to this vital proposition. It dwarfs our recommendation, clips the wings of our ambition and destroys our reputations as managers. The inexorable conditions for which we are not responsible and that are beyond our control are ever present. We are, however, kept out of the clutches of the devil if there is anything in the saying that the devil finds something for idle hands to do. As the happy son of Erin, who was watchman for the Galveston Street R. R., remarked to a man who said he was looking for a steady job, "You have come to the right place; we work here nights, days and Sundays." Like the poor our troubles are always with us. These we get to endure as a matter of course, and keep cheerful looking at the bright side, for there are many pleasant features that compensate for the exactions in other directions.

ELECTROLYSIS.

By E. H. Jenkins, President San Antonio Gas & Electric Co. and San Antonio Traction Co.

There is now scarcely any doubt that electrolysis has existed in a mild form for several years before the introduction of trolley cars, as before that time the telephone and telegraph companies used the earth for the return circuit and the "vagrant" electricity from these systems used the water and gas pipes. That there was damage from this cause, fully accounts for the destruction of small service pipes in the past where the soil did not contain any substance, as far as could be ascertained, that would produce corrosion.

It is well established that only a small difference of potential, not exceeding one-hundredth of a volt, will under favorable conditions produce electrolytic action though it may take considerable time for the effect to become apparent.

The first electric railways undertook to return the current to the generators by the rails but made only poor attempts to electrically connect the rails at joints. Experience showed the bad effects of poor bonding and better provisions have been made for taking care of the return currents and the author believes that little or no dam-

age is possible from systems having rails of ample capacity properly bonded with copper bonds.

There is a difference of opinion among electrical engineers on this point. Mr. Hubert S. Wynkoop states that it is impossible, because of financial considerations, to provide a track return so satisfactory that considerable electricity will not seek a path through pipes, cable covers, etc., for to confine the current to the rails would require their resistance to be infinitely small compared to the earth; an improved track return is and must always be, a palliative and not a cure.

Mr. I. H. Farnham, of the New England Telephone Co., of Boston, was the first to investigate electrolysis and his experiments, conducted in 1893, led to the first attempt to improve conditions by reversing the polarity of the station dynamo and placing the positive pole to the trolley wire; this was succeeded by improved bonding.

In 1894 a committee of the Western Gas Association, through its chairman, Mr. George Treadway Thompson, made a report on electrolysis and considered various remedies suggested by gas and water companies. These included covering the gas and water pipes with non-conducting paints, or slipping drain pipes over the iron pipes, cementing them at the joints and ends. At Los Angeles some of the pipes were laid in conduits filled with sawdust; pitch kept in place by boxing of convenient form has also been tried. These methods of protecting the pipes are too expensive for general adoption and no partial installation would wholly cure the trouble. If the current enters the pipe and leaves it near the same point, a jacket of tiling or non-conducting paint would prove a true protection, but if the current enters the system at a remote point the local covering would merely force it to find a new outlet and transfer the difficulty to another point. At Cambridge, Mass., the practice of protecting pipes by attaching copper wires and plates to them was tried, and abandoned because of the rapid destruction of the copper plates.

Prof. Elihu Thompson has suggested the use of secondary generators, driven by the railway current, the current from which should be utilized to reduce the potential of the pipes and cables to that of the surrounding earth and rails.

The plan included means for making the operation of the secondary generators automatic, but it has never been put in operation.

The system adopted by large roads in Boston, Brooklyn, Cleveland and elsewhere is to provide insulated track feeders designed to carry the entire current and connected to the rails at intervals of 400 or 500 ft.; the rails carry the current only between feeder junctions.

The recommendations of Mr. T. J. McTighe are for heavy bonds so placed as to be protected against corrosion and convenient for inspection; the liberal use of heavy cross bonds, and the installation of an underground trunk return from power house to track and there connected to each rail.

Mr. A. A. Knudson, writing in the American Electrician for March states that he has found the resistance of the joints of water and gas pipes and Edison tubes increases with age because of the galvanic action between the pipes and the lead of the joints. The effect of this resistance is to cause electrical currents flowing in the pipes to leave the positive end of the pipe and flow to the next pipe through the surrounding soil or in case of water pipes through the contained water; this results in electrolytic pitting of the pipe or reduces it to graphite. For this reason any return which involves conducting railway current through pipes is not a cure of the trouble. As an absolute remedy the only thing in sight is the metallic circuit, the double overhead or underground wires.

In San Antonio the recently laid track has 74-lb., 60-ft. rails with Morris bonds under the fish plates and No. 0000 bonds around the plates. A return cable from the track to the power house is also provided and the gas pipes near the power station have been connected to the generator.

In conclusion Mr. Jenkins says: "I feel satisfied that in cities of say 100,000 inhabitants and less, if rails of the electric railway system are properly bonded, and the gas and water pipes have suitable return wire connections to the power house, there is little or no danger from electrolysis. In larger cities with more complicated systems of pipes electrical surveys should be made and when the facts are known suitable return conductors can be placed."

Wages on the Calumet Electric Ry. have been increased from 17½ cents to 20 cents per hour, taking effect May 1st.

SCHOOL FOR MOTORMEN AT BALTIMORE.

The United Railways & Electric Co., of Baltimore, Md., has established a training school for motormen where the new men are instructed and drilled in their duties before being "broken in" on the cars by old motormen. The illustration shows the interior of the school room; at the right and left will be noted the controller and brake equipments, which include all types in use on the system; at the front end is the instructor's desk and in the center of the room is a large table on which are always to be found the current street railway papers.

About 100 applications for employment as motormen are received each week. All applicants must present two letters of recommendation; one from their last employer, if any, and one from a well-known and reliable person who is willing to indorse them.

The applicant must weigh 160 lb. and must be at least 5 ft. 8 in. tall. He must not be under 25 years of age and not over 40 years. He must be sober and willing to perform his duties. He must furnish the company a bond of \$50.

All applications are made to the employment agency of the company, and after a number of suitable men have been selected, according to all requirements, the general manager, Mr. W. A. House, has the men come to his office where he explains in a general way the policy of the company towards its employees, and the motives

INTERIOR OF INSTRUCTION ROOM, BALTIMORE.

guiding it in selecting men. Good, trustworthy men who are seeking permanent and not temporary employment are wanted; such men are encouraged in their work and the company tries to keep them. Men over 25 years old are preferred because at that age most men have responsibilities to hold them to a fixed purpose and prevent them from shifting about. A man over 40 is harder to teach than when younger and Mr. House believes that he is often guided by a disposition similar to that preceding his 25th birthday.

The school is in charge of an instructor of motormen, Mr. J. K. Morgan, who is under the immediate supervision of Mr. S. W. Huff, master mechanic. Mr. Morgan gives the new men three days' drill in the manipulation of controllers and brakes, and instructs them as to the fuse boxes, switches, etc. The hours of instruction are 8 to 11:30 a. m. and 1 to 5:30 p. m.

The men are next put on cars with experienced and reliable motormen. Here they are under the eye of the inspector of motormen, Mr. E. N. Howell. At the end of seven days on the cars the inspector can usually tell whether the candidate will make a satisfactory motorman and passes on his case; in some instances more time is given.

This careful training makes accidents of infrequent occurrence. When accidents do happen, unless they are very serious, the men are not suspended at once but are given a hearing early the following morning so that if not at fault they can catch regular runs and lose no time. The investigating board consists of the general manager, the superintendent of transportation, the division superintendent, and the assistant claim agent.

500-VOLT CURRENT ALLEGED TO HAVE CAUSED DEATH.

About a year ago suit was commenced against the San Antonio (Tex.) Street Railway Co. because of the death of a man 60 years of age, who was standing on a pile of cinders which he had wetted down and was raking with an iron handled hoe. A trolley wire was suspended over the cinder pile and it was alleged that in raking the cinders the hoe handle came in contact with the wire, giving the deceased an electric shock which caused his death. This happened on a hot day in August, the thermometer being 95 degrees in the shade. The man fell and in a few moments expired; both hands clutched the handle of the hoe but there were no marks or burns on the hands or any other part of the body.

The witnesses for the plaintiff stated that they heard a sound as if the hoe came in contact with the trolley wire but did not see it touch the wire.

On the first trial the jury disagreed and on a second trial found for the defendant company. The plaintiffs carried the case to the court of Civil Appeals where it is now pending.

CLUB ROOMS AT CLEVELAND.

By the courtesy of Mr. R. M. Douglass we have been favored with copies of a number of photographs taken by the Cleveland Electric Railway Co. for exhibition at the Paris Exposition. The three engravings herewith are reproduced from interior views of the employes' club rooms as established at the various car houses. The company has had the matter of providing such rooms under consideration for a year, but it was only in December and January last that the plans were carried out.

Holmden Ave.

Miles Ave.

Lake Ave.

EMPLOYES' ROOMS AT THE CAR HOUSES OF THE CLEVELAND ELECTRIC RY.

As noted from the illustrations the games include bowling, pool, cards, chess and checkers. Punching bags and boxing gloves are also provided. In addition there is reading matter, and the city library has established a branch at each club room so that the men and their families can avail themselves of library privileges without inconvenience.

The company furnishes these amusements free to the employes and only asks the men to look after them, which is done by a committee of their number. A slight charge is made for games, a cent a cue for pool and a small charge for bowling; from this income they pay a man to look after the room, stand at the foot of the bowling alley, etc.; the income provides for this and leaves a surplus for the men, with which they can buy additional sources of amusements or create a fund for any purpose they may desire, possibly for a sick benefit.

Construction work has commenced on the extension to the Forest Park and Clayton branch of the St. Louis Transit Co.

The Birmingham (Ala.) Railway & Electric Co. will build a 100 x 140-ft. extension to its Highland Ave. car house, as its five barns now in use have become inadequate to accommodate all of its rolling stock. The new building will be of iron and will contain eight tracks.

SOME CONDITIONS AFFECTING THE MAINTENANCE OF CARS AND THEIR EQUIPMENTS.

(From the Electrical Review, London.)

If an English engineer were called to estimate the probable running costs of the various divisions of a potential electric traction scheme, he could, without much difficulty, and with good chances of accuracy, foretell the amount with which to debit the power station; for making allowances for the considerably increased load factor, the decreased charge for switchboard attendants, and a few other betterments, his experience in the lighting school will guide him in estimating the cost of power at the switchboard. He can, moreover, pick up nuggets of information on this point from the gold mine of American and Continental statistics.

For similar reasons he will not be far out in estimating the cost of maintenance, depreciation, and "inefficiency factor" of the electrical construction beyond the board, including feeders, with their boxes, switches, manholes, etc., poles, and overhead wires, electrical and supporting.

He may, by good fortune, attain a fair approximation when dealing with the track, with its special work, bonding, and diverse ballasting—macadam, setts, or wood—but when he comes to the running cost of cars, he is face to face with a fearsome octopus, whose tentacles are hidden, towards which he advances cheerfully, grasping a sword forged from the mean of countless statistics.

If the engineer was born under a particularly lucky star, he may have struck a line which, in this matter of cars, will verify his estimate. With this line we have nothing to do, the object of the article being to indicate, however vaguely, some of the difficulties with

which the question bristles, and which make the estimation so much a matter of chance.

The size of the outfit does not affect us particularly.

Expenses due to repairs and renewals should be merely nominal during the first six months. Everything is new, presumably in the pink of condition, and the contractors are, no doubt, hovering around, coaxing, and doctoring. It is after this critical period that the x's, the unknowns, the special characteristics of the men-in-charge of the line, of the cars and their equipments, begin to unfold themselves.

Let us attempt to marshal some of the unknowables:—First, and most thickly veiled, comes the personal factor. However lusty a babe is electric lighting, electric traction is certainly yet "in its infancy" in Great Britain, and large type would be needed to fill a sheet of scribbling paper with the names of those who know a tram-car from a traction engine—speaking more or less figuratively. It is necessary, therefore, to imagine the possibility of the resident engineer being a man sound in lighting, but with an elemental acquaintance with the vices and surprises of a traction job. He may have been on some line where the conditions were ideal—and monotonous (for who would give anything for that job where the engineer could talk about "the even tenor of his way?") The man most likely to succeed is he who has been in charge of a system where breakdowns of every possible description—not due neces-

sarily to bad management—come thick as leaves in—well, in autumn).

This man has an unlimited capacity for learning, but unfortunately for our estimator—a very small percentage of these surprises occur during the probation period of the undertaking, when the contractor's representative is at hand to advise; and so it happens, that instead of being able to strangle faults before birth they are allowed to develop fully, and only then is the preventive noted for use in future. In fact, the resident engineer has to learn by experience, which is likely to be a pretty penny out of the promoters' pockets.

Probably a more important place under the heading "Personal," should be assigned to the motorman—that most unspeakable product of devolution—for one must persist in counting him as belonging to a distinct genus, a race apart.

Who shall say beforehand what this uniformed wonder will do, or how he will do it; and who, when he considers what the motorman should know, would for a moment imagine that he could do it? In sooth, he should know all things, even as he knows the taste of beer. The contractors probably saw him through a period of skilled training; he is riddled with instructions as to what he should do under any circumstances; he has instruction books thrust upon him (sometimes with the adjuration that he read them as often as his Bible!); he has every chance to learn, and yet . . .

Is there a particularly bad point entering a loop, then shall your motorman go through on the last notch—poor wheels, poor car—what reeks he of broken flanges, of the terrible lurch on the lead, which twists the frame and strains horribly the car body; what cares he for the comfort of the passengers? All he cares about is to get a loop ahead of another of his kind. The damage to the car is not apparent at the time, so he will not suffer.

Is there a flooded place on the line? How fine to think that he can slosh through six inches of water, at the "making up" speed, without wetting his feet (oh! you wretched motors, arresters, and resistances). What a glorious device is the "emergency!" How it saves one's right arm to use that little handle to pull up for a passenger. If the passenger jumps on before the car has stopped, so much the better! Off goes the emergency, and nobody hears the ruinous arc inside. Look at the creature! He is climbing a hill when the current goes off—circuit-breaker out at the station. On goes the brake, and round goes the controller handle to the first notch, or maybe it remains where it was on the notch where the fields are shunted, the position which his "instructions" say "must on no account be used when climbing a grade;" then, when current again comes on, you see we start without loss of time, unless the station breaker opens at less than 200 amperes.

Look at him again. Something has caused his circuit-breaker to open time after time. What more natural than to hold the handle of that breaker until the depot is reached, or perchance till the main fuse blows, in which case he is hopelessly stranded, because he has quite forgotten what he should do under the circumstances.

(How I love to see him step off a car to find what ails it when the lights go out, and it happens to be "grounded.")

All these things do not lengthen the life of the motor equipments. The motorman can damage a car in so many ways, and he uses his power.

Let us get away from the personal factor with all speed. After the engineer has learned that a car will not run an infinite number of miles without being overhauled—knowledge sometimes obtained at considerable cost—he institutes a regular system by which every car is run into the repair shed, either after traveling a certain number of miles, or some fixed period of time. After a little while he finds to his disgust that his orderly system works out better on paper than in practice, for cars apparently are not keeping the rules at all, but are just dropping into the repair shed when they like, not when he wishes. Armatures or field coils failing, brush-holder yokes burning up, controllers niggling, arresters short-circuiting, trolley connections continually earthing to poles, (oh! those delightful double-deckers) poles doubling up, axles breaking, wheels cracking, and flanges chipping off, trucks sprung out of square, and, finally, cars being dragged in with platforms wrecked, dashes and vestibules unrecognizable, controllers in smithereens, and broken glass everywhere. Most of these things happen occasionally on lines working under the best conditions, but it is doubtful if any engineer, with foresight of the brick-wall order, would allow for every one of these calamities happening continually on any one line. Yet these exaggerated evils are found on some—probably a very few—lines.

To show how such a concourse of disasters could come about, it

will be well to indicate the possible condition existing in one line. On the opening day everything runs smoothly; all things appear in order and well done. The track runs through a mining and manufacturing district, serving a dense and dirty population. In a few months some portions of the road begin to sink, owing to disturbed workings caving in. It subsides most quickly under the track, and all heavy traffic prefers the middle of the soft track to the softer macadam road sides. Joints open and sink, the track gets out of gage, nasty kinks and curves are given to the rails. These things play havoc with wheels, axles, and springs. Setts rise and break low hung gear, such as life-guard and gear case.

The road is very hilly, and the grade severe. Often, under ordinary conditions, the motors are running overloaded for 15 minutes continuously, and when a motorman has adjusted the brakes so that they bind on the wheels, this overload is considerably increased. If the ninth notch (κ ; controllers are assumed) has not been removed it is probably used on this grade.

On a road which is hardly ever level, brakes may be on for half the round trip, which means that brake shoes require very frequent renewal, and much attention. On such a road 20 running cars will keep two men employed on little else than brakes. Moreover, on a greasy rail a bad driver will put a flat on a wheel in a remarkably short time, and being a bad driver, he will make it worse every time he slows up; consequently, the pair of wheels and their axle have to be taken out to allow the flats to be ground or turned out.

The locality is famous for its rain; all the low places on the track are flooded during wet weather, and much water finds its way into the motors. Certain types of arresters and resistances, unless well protected, are not at all fitted for a damp climate, and it is easy to surmise that the electrical equipment suffers much under the foregoing conditions. During the greater part of the winter dense white fogs prevail, and after most fogs, a car or two are found in the sheds, more or less damaged as the result of a collision, generally with heavy carts, the drivers of which are afflicted with incurable deafness; the heavier and slower the cart, the deafer is the driver.

In the summer the whole track is covered with a fine metallic dust, which finds its way into every part of the truck and car. Bearings run hot and melt out, thereby allowing the armatures to rub against pole faces. The life of every wearing part is lessened; and, until the bottoms of controllers are boxed in, the ravages of the dust increases the wages sheet considerably. Nor is it good for motors when the car runs over a rail insulated with dust every few yards with full current going on and off in jerks.

Snow is a "beautiful white devil" to the tramway man. In a manufacturing district its whiteness does not stay long, but it remains a devil throughout, and much salt mixed therewith is trying to things electrical.

Perhaps it is plain now to those who did not know before, that for some indefinite period after opening of a new system it is practically impossible to tell how much of the revenue is to be eaten up by "car equipments."

It is apparent that this article is a mere indication. Too little is seen in the technical papers of the experiences of traction men, and if this article should be the means of suggesting subjects on which others will expound, it will have served its purpose; and the writer may not have to subscribe so heavily to American traction organs.

REGULATING BATTERY OF THE PEEKSKILL (N. Y.) TRACTION CO.

The Peekskill (N. Y.) Traction Co. operates a 5 mile road and on one line is a continuous grade varying from 1 to 8 per cent. Only three or four cars are required to care for the traffic and the small number of cars and the steep grades make the current demand extremely variable. Power is furnished by the Peekskill Lighting Co. which installed a storage battery to regulate the load on the railway generators. This battery consists of 262 type F-9 cells of chloride accumulators made by the Electric Storage Battery Co., of Philadelphia; each cell has nine plates approximately 10½ in. square, with space in the jars for adding four other plates and thus increasing the capacity 50 per cent. On full charge this battery has a capacity of 40 amperes for 7 hours and can discharge at the rate of 160 amperes for short periods; for regulating it is often called on for momentary loads of 250 amperes.

The line load fluctuates from 15 to 250 amperes, which is taken by the battery, the generator load being nearly constant at from 75 to 85 amperes.

MECHANICAL DEPARTMENT

PNEUMATIC PRESS FOR ARMATURE COILS.

The saving of five hours' work is effected in putting armature coils in the core slots of an armature, and connecting up the leads, by the use of a press, illustrated herewith, which is employed in the armature repair department of the Chicago City Railway Co. The press was designed by Mr. C. E. Moore, formerly master mechanic of the road, and Mr. Bryant, then foreman of the department, and was made in the shops.

PRESS FOR ARMATURE COILS.

The device consists of a cast iron frame having a punch or follower which works up and down in guides, and is actuated by compressed air expanded in a vertical cylinder, placed on top of the frame, having a piston which is connected with the movable punchhead. The direction and force of the motion are controlled by a valve having a long handle placed in convenient reach of the operator.

The follower or head carries in its lower face a narrow removable plate, which is just the length of the slot, and of a width sufficient to just fill the slot. The armature is placed in the bearings provided for it as shown, the side openings being sufficiently wide to receive the shaft. When in place the armature can be easily revolved.

The coils which have been previously wound, taped and formed, are placed one at a time in position, one side just above the slot, when the air is admitted to the cylinder, and one side of the coil is pressed firmly, and without shock or jar into position.

As soon as the first half of each coil has been pressed into its slot, the armature is turned the other way, and the second half of each coil is in succession, pressed quickly into its place. The time required for putting all the coils into an armature of a No. 12 A Westinghouse motor, and connecting the leads, is only one and a half hours.

The controlling valve is so arranged that it gives a very delicate movement, when required, to the follower or punch. The blade of the punch is removable, and can be changed to correspond with the different length of armatures.

NEW CAR HOUSE OF CLEVELAND CITY RY.

The Cleveland City Ry. has recently completed a new car house at its Rocky River terminus, about 8½ miles from the public square in Cleveland; this point is the terminus of the tracks owned by the Lorain & Cleveland, its cars running into Cleveland over the city tracks. The car house is of brick and steel construction, 108 x 340 ft., and is divided into three sections by fire walls. The roofs are carried on steel trusses. Each section has a skylight, made of metal bars and wire glass, which extends the entire length of the building, and in addition the exterior walls have windows.

The repair shop and waiting room occupy a building which is parallel with the car house, but far enough away to permit of a track to run between. This building is of similar construction, and is 37 x 197 ft.

The general arrangement of buildings and tracks is apparent from Fig. 1. Fig. 2 shows sections and an elevation of the car house, and Fig. 3 a cross-section of the shop.

The entrance doors to the car house are a combination of sliding and folding doors, so that when opened they leave the entire width of the building clear, a space of about 34 ft., thus doing away with

EXTERIOR OF CAR HOUSE AND SHOP.

door posts between the tracks. The trolley wires are placed in notches cut in a plank across the doorway, as may be seen from the half-tone engraving, so that they do not interfere with opening and closing the doors.

In the pit construction in both the car house and machine shop the tracks are supported on steel posts, giving lightness and free-

FIG. 1.

dom of action in the underneath work. Heavy beam rails are used so that the posts are 15 ft. apart in the machine shop and 7 ft. 6 in. apart in the car house.

At the front end of the shop building is a commodious waiting

room for passengers with accompanying toilet rooms, also general offices, employes' rooms, including billiard room and reading room for the employes, these latter being located over the waiting room and offices, thus utilizing the upper or attic portion of that part of the building.

The rear portion of this building contains the machine shop, boiler room, sand room, etc.

The offices, waiting rooms, etc., are done in Southern pine in

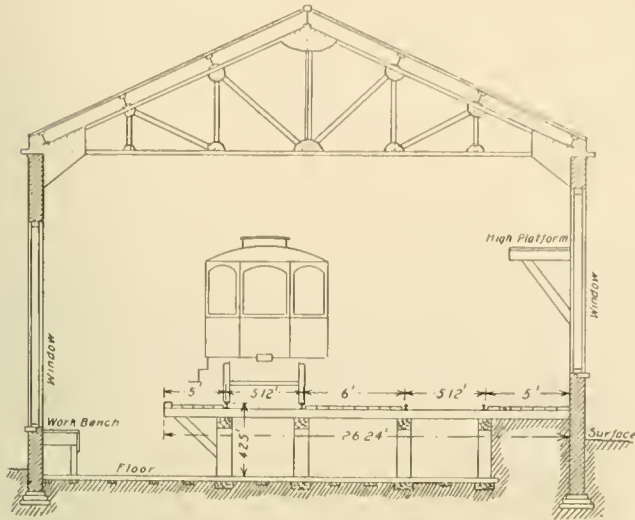

FIG. 3—CROSS SECTION OF SHOP.

natural finish, and the walls and ceiling tinted in colors. The roof boards of car house and machine shop are of narrow matched planks 3 in. thick, dressed on the under side and resting on the steel construction, the steel work and roof boarding being tinted in col-

FIG. 2.

ors. The walls are also to be tinted, giving the whole a pleasant and cheerful appearance.

As shown in Fig. 3 the floor of the machine shop is 4 ft. 3 in. below the track level. The pits are all provided with steam heating coils.

The architect of the buildings was J. N. Richardson; the brick construction was done by C. H. Fath & Son, the iron work by the

INTERIOR OF MACHINE SHOP.

National Iron & Wire Co., the roofing and carpenter work by W. S. Thompson, and the special track work, of which there was considerable, by the Cleveland Frog & Crossing Co.

We are indebted to Messrs. J. B. Hanna, secretary, and John Ehrhardt, assistant secretary, of the Cleveland City Ry. for the drawings and data.

SOME DETROIT IDEAS.

General Manager DuPont, of the Detroit Citizens company, has been studying the car heating question and arrived at the following conclusion. His theory is that with a stove heater in the center of the car two currents of air are set in motion, readily understood from the diagram. That circle next the rear door is frequently reinforced with fresh air from outside whenever the door is opened; but the circulation forward remains practically unchanged, and though moving, steadily becomes more and more impure. In this connection it should be remembered that these

FIG. 1.

cars all loop at terminals and the front door is not used by passengers.

To remedy this defect in ventilation, Mr. DuPont last winter put in service some 25 cars heated by a system of his own. The heater is placed on the front platform, where it not only serves

FIG. 2.

to keep the front vestibule comfortable for the motorman, but removes the coal and ash nuisance from the body of the car. The smoke pipe is carried straight up through the hood. Surrounding the heater is a sheet iron jacket opening into the car at the hood, and drawing its supply of air to be heated from pipes placed beneath and extending the entire length of the side seats. These

pipes are perforated to admit the air, and a sufficient amount of fresh air is secured through the holes in the pipes at the entrance end of the car, when the door opens. At the same time the circulation is rapidly kept up and the entire car heated in a uniform manner. The deck ventilators are seldom opened in cold weather. The second diagram shows the plan, and the movement of the air currents in the car, under this arrangement.

Twenty-five cars were built in the company's shops last summer for winter service, in which steel of No. 10 gage was used for the panels instead of wood. The idea was not only to secure a more durable panel with greater bracing strength to the car, but also immunity from the holes punched so easily through wood panels when buggy shafts and wagon poles collide with the car. It is found the iron panel, when struck by a wagon pole, suffers only a slight dent where the wood panel would have been punctured. As might be expected, there is more reverberation from the iron than the wood panel, but this has been corrected by the use of a deadener. The steel plates used for the side and vestibule panels are of various dimensions from 8 x 18 in. to 18 x 54 in.

Another new feature which was found on the Detroit cars last winter, and which has become extremely popular with both the public and conductors, is the pipe rail on the rear platform. The new winter cars which went into service last fall have vestibules at the front end and accelerator platforms on the rear, all cars turning on loop at terminals. As passengers are not allowed on the front platform, the smokers were driven to the rear, and with the usual outside riders used to crowd the platform until it was exceedingly difficult and often unpleasant for passengers to enter and leave the

FIG. 3.

car. To remedy this, Mr. DuPont devised a dividing rail, as shown in the sketch. It is made of 1½-in. gas pipe screwed to the platform floor with three legs. This leaves just room between the rail and the car body for a passenger to pass in or out. The conductor also makes his position between the rail and body of the car, but passengers are not allowed to remain there. This leaves ample standing space between the rail and dash for the smokers and standing passengers, who in turn are not subjected to being crowded by those getting on and off. The improvement is inexpensive, but effective.

A NEW BEARING METAL.

The bearings in most common use are compounds of copper, tin and lead in varying properties, there being in general, however, about 80 parts of copper and 10 each of tin and lead. From numerous tests of bearing metals, made principally by the Pennsylvania R. R., it was concluded that an increase in the proportion of lead used would result in decreased friction and wear; also metals having more than 15 per cent lead and less than 8 per cent tin were inferior because of segregation, but it was believed that a homogeneous metal having a larger proportion of lead would give better results.

The Ajax Metal Co. has recently developed a patented process for preventing segregation and making bearings with relatively large percentages of lead. The new metals have been given the

name of "Ajax Plastic Bronze" and tests in an Olsen friction machine show the following results:

	Friction, Lbs.	Wear, Grains in 1,000,000 rev.
Phosphor bronze	16.5	10.5
Ajax standard engine bearings.....	18.5	7.2
Ajax 31 per cent lead.....	18.0	6.7
Ajax 40 per cent lead.....	16.0	3.0
Ajax 47 per cent lead.....	13.5	1.65

CONVERTIBLE CARS.

By the courtesy of Mr. S. F. Hazelrigg, general manager of the Atlantic Coast Electric Ry., of Asbury Park, N. J., we are enabled to reproduce the accompanying illustrations showing one of the company's open cars as converted for winter service. The open

OPEN CAR FITTED FOR WINTER SERVICE.

car is enclosed by means of steel panels and sash with glass inserted in the curtain slots of the seat posts; longitudinal seats are placed inside. The vestibules are also part of the conversion.

The company has several of these converted cars, some of which have been in operation for two years. When changed from summer

INTERIOR OF CAR.

VESTIBULE.

to winter cars, or vice versa, no repainting is necessary; it takes two men about one day to make the conversion. For summer use the cross seats and running boards are replaced.

The Atlantic Coast Co. has a large surplus of open rolling stock and has found this an economical method of providing the closed cars needed for winter service; this scheme will doubtless appeal to other managers similarly situated.

The Butte (Mont.) Consolidated Railway Co. is building at Columbia Gardens four greenhouses, each 40 x 20 ft. for the care and propagation of its fine collection of plants, now numbering 8,000 specimens.

NEW CAR BARNS AT READING AND CHESTER, PA.

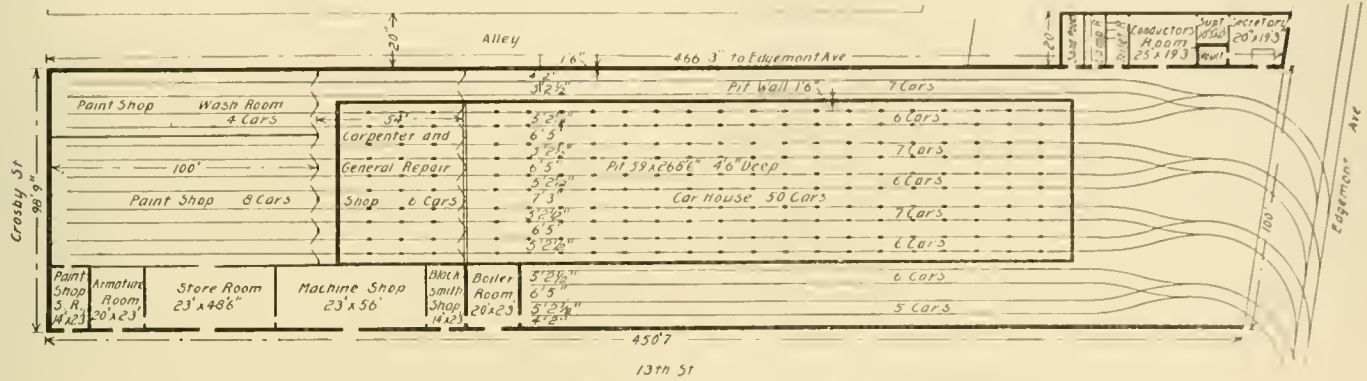

The United Power & Transportation Co., of Philadelphia, owning various electric lighting and street railway properties in Trenton, N. J., Wilmington, Del., and Eastern Pennsylvania, is building two new car barns, one at Chester, Pa., and one at Reading, Pa., to meet the increasing requirements of the important lines centering in those cities.

Through the kindness of Mr. E. L. Fuller, assistant to the president, we are permitted to reproduce herewith the plans for both of these buildings. Fig. 1 shows the barn at Chester, which is to be used as a combination paint and repair shop and storage house, and is designed for the operation and maintenance of 50 double truck cars, 42 ft. over all. The building which will be 100 x 450 ft. ap-

one utilized as a small paint shop and waste room having space for four cars, and the main paint shop with room for eight cars. Entrance from both of these to the repair shop is secured through swinging doors. The paint stock room, armature repairing room, store room, machine and blacksmith shop are conveniently located along the 13th St. side as shown. On a plot of ground adjoining the car barn property on Edgemont Ave., a building has been erected for office purposes, toilet room, etc.

The Reading barn is 105 ft. wide by 480 ft. deep with capacity for 84 double truck 42 ft. cars, and is to be used as an operating barn only, for making light repairs and for storing cars. Four of the tracks will be fitted for a distance of 343 ft. 6 in. in the same manner as in the Chester house.

In both of these car houses the entrance curves are of 35 ft. radius and where the entrance tracks fork the reverse curves are of 75 ft.

CAR HOUSE OF UNITED POWER & TRANSPORTATION CO., AT CHESTER, PA.

proximately, with walls 18 ft. high will be erected with one row of posts down the center supporting the roof and dividing the interior into two 50-ft. spans. Starting from a short distance from the special work at the front of the house and running back to a point near the center of the machine shop all the ground occupied by the second, third, fourth, fifth and sixth tracks counting from the 20-ft. alley indicated on the plan, will be excavated to a depth of 4 ft. 6 in. to provide for car pits and the floor and tracks will be supported on square iron posts, 170 in number, placed immediately under the track line. On top of the posts will be placed stringers and on these stringers the rails. By this construction the workmen can start from any point under the car house proper, the carpenter or general repair shop, and pass in any direction under all of the five tracks. The various jacks, hoists and tools may also be readily transferred

radius; the arcs from the tangent to the frog are 15' 43' in the Chester car house and 16' 20' in the other.

The United Power & Transportation Co. has recently purchased 40 new open cars with 15 benches to be mounted on Brill 27 G trucks, with Westinghouse No. 49 quadruple motor equipment. The general offices of the company are in the Bullitt Bldg., Philadelphia.

BEATING AN ANTI-TRUST LAW.

About April 1st of last year the capital stock of the San Antonio Gas Co., the Mutual Electric Light Co., the San Antonio Edison Co. and the San Antonio Street Railway Co. was all purchased by one syndicate and as two of these companies had formerly been

CAR HOUSE OF UNITED POWER & TRANSPORTATION CO., AT READING, PA.

from one track to another without carrying them to the surface. The pits are to be well lighted and the pit floors and side walls cemented.

Accommodations for 32 cars at one time will be secured in the main room of the building on the five pitted tracks with space for 18 additional cars on the three tracks at the side, which will be utilized for temporary storage purposes.

Immediately back of the main room and connected with it by swinging doors at each track is the carpenter and general repair shops, 54 ft. long with capacity for six cars. As before mentioned the pits under the tracks in this room open into the pits in the large room. At the rear of the building are two rooms each 100 ft. long,

competitors in the electric light and power business it was claimed that this sale created a consolidation of the several corporations in violation of the anti-trust statutes of Texas passed in 1880 and 1895.

The state by its attorney-general sued the several corporations, asking for their dissolution, the forfeiture of their charters and the appointment of receivers. The state won in the District Court and this decision was affirmed by the Court of Civil Appeal; where the defendants had carried it. The companies then applied to the Supreme Court for a writ of error which was refused. Thereupon all the corporations submitted to a similar decree in the trial court and on Mar. 5, 1900, receivers for their several estates were appointed. The stockholders petitioned that all the properties be at once sold

and there being no creditors to intervene the property of the four companies was on April 3d sold to W. F. Douthirt, trustee for the stockholders, and the sale confirmed by the court.

Two new companies were then organized, the San Antonio Gas & Electric Co. and the San Antonio Traction Co.; Mr. Douthirt assigned to the former all the property of the two lighting companies and to the latter the property of the two street railways. The new companies are now pursuing the even tenor of their respective ways at peace with the state.

The officers of the San Antonio Gas & Electric Co. are: President, E. H. Jenkins; vice-president, W. F. Douthirt; secretary and treasurer, V. N. Gurney. The officers of the San Antonio Traction Co. are: President, E. H. Jenkins; vice-president, W. F. Douthirt; secretary and treasurer, J. J. King.

BRILL TRUCK FOR THE PARIS EXPOSITION.

The truck shown in the accompanying engraving was built for the Orleans Railroad Co., of France, for use in its Paris terminal tunnel. It was built by the J. G. Brill Co. and will form a part of the Brill exhibit at the Paris Exposition. The frame is a solid forging but so nicely finished that it has the appearance of a smooth casting rather than a forging, the Brill shops being fitted up in a complete manner for such work. The general features of the truck are the same as those of the Brill No. 27. The spring links are carried over the wheel piece giving a long link and a particularly easy side motion. The wheels are 42 in. in diameter, cast centers and steel tires, and spaced 6 ft. 6 in. between centers.

BRILL TRUCK FOR PARIS.

The arrangement of the brakes will be seen from the illustration; the rods are all carried outside the wheels in order to leave more space for the motors. The gage is 4 ft. 8½ in. The journals are 4¼ in. in diameter, M. C. B. standard. Were it not that the car body which is mounted on a pair of these trucks is designed to carry 44 passengers, the trucks might be designated as electric locomotives as each is equipped with two 150-h. p. motors, giving 600 h. p. for the car. The weight of the truck alone is 11,880 lb.

The beam fastened to the journal boxes is for carrying the shoe for contact with the third rail.

ELEVATED RAILWAY FOR PARA, BRAZIL.

A recent consular report states that the city of Para, Brazil, is to have an elevated road. Dr. Francisco Bolonha, an enterprising Brazilian who visits the United States quite frequently, is working to obtain a franchise from the municipality, which, it is thought, will be granted. The road is very much needed, as the service given by the present horse-car line is very poor. Any company interested in this business could purchase the present franchise, and, with proper management, it would be profitable. It is understood that the present company would sell the railway and electric lighting plant for from 8,000,000 to 10,000,000 milries, Brazilian money (\$1,200,000 to \$1,500,000 gold). The concession is for a term of 50 years.

The North Jersey Street Railway Co. of Newark, N. J., carries about 980 policemen and 400 firemen free every day.

CINCINNATI, NEWPORT & COVINGTON.

A condensed statement of the operation of the Cincinnati, Newport & Covington Ry., Covington, Ky., for the first quarter of the current year, which we have received from Pres. J. C. Ernst, shows a remarkable increase in the net profits as compared with the corresponding period in 1899. For the first quarter of 1900 the gross receipts were \$168,983; operating expenses, \$66,625; tolls, taxes, damages, etc., \$36,944; net profits, \$65,414. For the first quarter of 1899, the gross receipts were \$147,935 and the net profits only \$36,323. Of this increase of \$29,091 in net profits, \$11,359 was in the month of March.

The ratio of expenses to earnings for the quarter was .5292, including tolls, and .3943 excluding tolls, as against .6083 and .4661 for the first quarter of 1899.

FREIGHT ON CITY STREETS.

Mr. Charles Truax, of Chicago, who was chairman of the Fall Festival committee last year, is a warm advocate of the handling of freight by electric street railways and says concerning it: "Any shipper can see the advantages of being able to load his goods on cars that are switched into his shipping room. He does not have to send a dray a mile or two with a few small packages. They are put on a car with freight from other houses and the company operating the lines will soon learn how to manage so that their cars are made up to save time in reaching the depots. In many places the alleys favor this system perfectly."

Mr. Truax, who is now in Europe, said before leaving that he intended to study the subject of urban freight transportation abroad and have a definite plan to submit on his return.

NOVEL ARRANGEMENT OF CURTAINS.

We reproduce an interior view of one of the Edinburgh cable cars as illustrated in our English contemporary, the Tramway and Railway World. Particular attention is directed to the curtains which slide longitudinally on rods. This arrangement is new to us, but we do not think that it has the same advantages as our system of ver-

INTERIOR OF EDINBURGH CAR.

tically moving curtains or shades. With the curtains shown one can not shut out the sun without also shutting out all view; in windy weather the curtains will be blown about, and we should think that they would gather dust and hold dust, unless given constant attention.

The Central Railway Co., of Peoria, Ill., recently equipped its cars with G. E. 52 motors and to avoid the expense of buying new controllers, those of the K2 type formerly used were rebuilt by the company's electrician, Mr. A. T. Leach. The change was made by putting in K10 cylinders and rewiring the controllers.

RECENT STREET RAILWAY DECISIONS.

EDITED BY J. L. ROSENBERGER, ATTORNEY AT LAW, CHICAGO.

ONCE STARTING CAR TOO QUICKLY DOES NOT SHOW UNFITNESS OF CONDUCTOR.

Gordon v. West End Street Railway Co. (Mass.), 55 N. E. Rep. 999. Jan. 5, 1900.

A single act of starting an electric car too quickly, without more, the supreme judicial court of Massachusetts holds, as a matter of common sense and on authority, will not warrant any general inference as to the competency of the conductor so as to support an action under a statute authorizing a recovery of damages for injuries sustained through the unfitness of an employee.

NO GREATER DEGREE OF CARE REQUIRED OF WOMAN THAN OF MAN.

Asbury v. Charlotte Electric Railway, Light & Power Co. (N. C.), 34 S. E. Rep. 654. Dec. 22, 1899.

There is no greater degree of care required to be exercised by a woman, as in alighting from a street car, the supreme court of North Carolina holds, than by a man, she being bound by the rule of "the prudent man," that is to say, bound to exercise ordinary care, or such care as an ordinarily prudent man, placed in like or similar circumstances, would exercise.

THE KIND OF POWER USED DOES NOT MAKE A STREET RAILWAY.

Hoboken Railroad, Warehouse & Steamship Connecting Co. v. State Board of Assessors (N. J.), 44 Atl. Rep. 960. Nov. 13, 1899.

The fact that the same power is used, and the same method of applying it is adopted, as prevails on the various street railway systems of the state, the supreme court of New Jersey holds, has no bearing on the question of the character of railroad property, or of the use to which it is put, even where part of the road is constructed through the streets of a city, particularly so when any railroad is authorized by statute to use any kind of motive power best adapted to its purpose.

NO DAMAGES FOR AUTHORIZED REMOVAL OF TRACK BY MUNICIPALITY.

Stewart v. Village of Ashtabula (U. S. C. C.), 98 Fed. Rep. 516. Dec. 23, 1899.

No damages can be recovered from a municipality for the removal from its streets of a street railway track, where it is done carefully, so as to damage the owner as little as possible. Judge Taft, of the United States circuit court, holds, when the ordinance under which the track was laid provided that the municipality might remove same if the council concluded that the conditions had not been complied with, and should any adjudication of forfeiture be necessary, which he does not pass upon, he holds that one after the removal would be sufficient.

NOT REGULAR DUTY OF CONDUCTOR TO ASSIST WOMEN AND CHILDREN TO ALIGHT.

Selby v. Detroit Railway (Mich.), 81 N. W. Rep. 106. Dec. 12, 1899.

The supreme court of Michigan here holds objectionable an instruction which may have been understood by the jury as meaning that the conductor on a street car was not only bound to give women and children an opportunity to alight with safety, but must assist them in so doing.

TAKING UP TRACKS NOT SUFFICIENT TO SHOW FORFEITURE OF FRANCHISE.

Sawyer v. City of Chicago (Ill.), 55 N. E. Rep. 645. Dec. 18, 1899.

A street railway company having constructed its tracks and operated cars thereon for several years under a city ordinance which it accepted that gave it a twenty years' franchise and imposed upon

it the duty to keep in good repair 16 feet in width of the street, the supreme court of Illinois holds that the fact that the tracks were taken up when a sewer was built, and had not been relaid, was not sufficient to show either a forfeiture of the franchise or a release from the obligation, and that the entire cost of grading and paving the street could not be assessed to the abutting owners.

PULLING DOWN POLE ON PEDESTRIAN.

Bamford v. Pittsburg & Birmingham Traction Co. (Pa.), 44 Atl. Rep. 1068. Dec. 30, 1899.

It is not enough, according to the supreme court of Pennsylvania, that a pedestrian shows that he was injured by the fall of a trolley pole. The burden is on him to prove negligence, or such a state of facts as fairly warrant an inference of negligence. But the last condition it holds was met by evidence tending to show that a loop of wire that had once been serviceable was permitted to hang down at such a point that when a trolley left the trolley wire near a span wire, the wheel caught in the loop, which held the wheel against the span wire, and thus pulled down a trolley pole upon a pedestrian.

NOT BOUND TO ANTICIPATE ATTEMPTS TO ALIGHT FROM MOVING CARS.

Stener v. Metropolitan Street Railway Co. (N. Y.), 61 N. Y. Supp. 1059. Jan. 5, 1900.

While conductors and drivers of street railway cars are bound to use diligence in looking after the safety of their passengers, the appellate division, first department, of the supreme court of New York holds that they have no reason to anticipate that passengers will attempt to alight from moving cars. Besides which, it further holds that if parties attempt to alight from a car, having given no information or indication to the persons in charge of their intention so to do, there is no negligence upon the part of the driver of the car in increasing its speed to the rate at which it can ordinarily proceed with safety.

INFERENCE THAT MAY BE DRAWN FROM COLLISION WITH REAR WHEEL OF TRUCK.

Meyer v. Brooklyn, Queens County & Suburban Railroad Co. (N. Y.), 62 N. Y. Supp. 33. Jan. 9, 1900.

From the fact that, though the plaintiff was driving at a slow walk, with a loaded vehicle,—a truck or business wagon loaded with woodenware,—the horse and the greater part of the vehicle had passed beyond the track at the time of the collision, the appellate division, second department, of the supreme court of New York holds that a jury might well find that when the head of the horse was either on the track, or so near it as to indicate the intention of the plaintiff to cross, the car must have been at such a distance away that, had it been properly managed, the collision would have been avoided.

NO WARNING REQUIRED FOR BOYS PLAYING ON SIDEWALK.

Graham v. Consolidated Traction Co. (N. J.), 44 Atl. Rep. 964. Nov. 13, 1899.

The supreme court of New Jersey says that there is no statutory duty imposed upon street railway companies in respect to giving audible signals of the approach of their cars, such as is imposed by law upon railroad companies. The duty of street railway companies in this regard arises out of their use of public highways in which the public have a right of passage. Since they are permitted to use cars running upon rails, from which they cannot deviate, and since this construction forbids their turning out to make way for the passage of other vehicles or passengers, a duty to give reasonable warning of the moving car may arise. Such a duty may reasonably require audible signals. But, the court holds, no signal nor warning is appropriate or required as to boys playing on the

sidewalk and giving no indication that they intend to cross the track. It is enough if the motorman makes every effort to arrest the motion of the car when they rush from the sidewalk and run directly in front of the car.

EVIDENCE OF SUBSEQUENT ARREST AND ACQUIT- TAL INADMISSIBLE IN ACTION FOR EJECTION.

Vadney v. Albany Railway (N. Y.), 62 N. Y. Supp. 140. Jan. 8, 1900.

In an action brought to recover damages for wrongful ejection from a street car by the conductor, where the defendant claimed that the plaintiff was guilty of such disorderly conduct as to justify the act of the conductor, and the plaintiff contended, on the other hand, that he was not guilty of disorderly conduct, but that the ejection was wrongful, the appellate division, third department, of the supreme court of New York holds that evidence that some days after the ejection the plaintiff had been arrested on complaint of the conductor, charged with disorderly conduct on the occasion under inquiry, and had been tried and acquitted, was immaterial and should have been excluded.

POLE OF DISABLED CAR THAT IS PUSHED SHOULD BE TIED DOWN.

Schenkel v. Pittsburg & Birmingham Traction Co. (Pa.), 44 Atl. Rep. 1072. Dec. 30, 1899.

A disabled trolley car was being pushed by another car behind it, and at a point where the street railway crossed another at right angles the trolley pole of the disabled car jumped its own wire, struck and broke the wire of the cross line, and thus caused the accident by which the plaintiff in this case was injured. There was also testimony that the proper course, under such circumstances, was to tie down the trolley pole of the disabled car, and that in this case the conductor was told by the conductor of the rear and operating car to do so, but he refused or neglected to tie it down. Such being the case, the supreme court of Pennsylvania holds that it was clearly one for the jury, and it affirms a judgment for damages against the company.

PERSON CARRIED BY DESTINATION AND BROUGHT BACK STILL A PASSENGER.

Rosenberg v. Third Avenue Railroad Co. (N. Y.), 61 N. Y. Supp. 1052. Jan. 9, 1900.

The appellate division, second department, of the supreme court of New York holds here that if the plaintiff was carried by his point of destination through the fault of the conductor, and he was thereafter permitted to remain upon the car on its return trip until he reached his point of destination, he must be regarded as occupying the relation of a passenger to the company, even though he paid but one fare. The company, when it received him as a passenger, it says, undertook to deliver him at his point of destination upon its line, so that, if he relied upon the conductor to inform him when such point was reached, and the conductor negligently omitted so to do, but carried him by, and thereafter he was permitted to remain upon the car until it again reached such point, the court does not think that it can be asserted that his relation as a passenger had changed.

MORTGAGEES' SECURITY SUBJECT TO OBLIGATION TO PAVE BETWEEN TRACKS.

Cambria Iron Co. v. Union Trust Co. (Ind.), 55 N. E. Rep. 745. Dec. 12, 1899.

The supreme court of Indiana says in this case, wherein was involved the construction of the franchise of a street railway company with reference to the latter's duty of paving between its tracks, that the following propositions of law have been by it declared settled in that state, viz.: (a) That a charter granted by a city and accepted by a railway company, constitutes a contract between the city and company; (b) that such a charter must be strictly construed against the company; (c) that such company has no doubtful rights under such charter; (d) that where there are doubts they must be construed against the grantee and in favor of the city.

In the light of these rules of construction, the court holds that the charter ordinance in question, which conferred the right to occupy the streets and manifested an intention to relieve the public so far as possible from any inconvenience in their use or increased burden in their repair and maintenance, in providing that the street should be paved between the rails made such paving by the company a condition to its enjoyment of the franchise.

Moreover, the court holds that the obligation to pave between its tracks when and as the street was improved being of the essence of the company's being, when mortgagees accepted their security they were bound to take the property as they found it, and bound to know that the rights they acquired in the property were subject to the burdens already imposed upon it.

FRANCHISE CONSTRUED AS TO GRADING REQUIRED.

People v. Detroit, Ypsilanti & Ann Arbor Railway Co. (Mich.), 81 N. W. Rep. 336. Dec. 21, 1899.

A street railway franchise provided that the track should be laid so as to obstruct as little as possible the free passage of vehicles along the highway; that so long as the highway should remain unpaved the tracks should be laid on the north side thereof; and that that portion of the road lying adjacent to the south rail of the track should be properly dressed to the track, so as to provide for the easy crossing of the same by vehicles. This was a country road, and the supreme court of Michigan holds that all that could be required was that where the railway was within the 16-foot driveway the company should continue the grading of the highway upon its track, but where it was wholly without such driveway it should continue to the south rail of the track.

LIABILITY TO PASSENGER INJURED IN COLLISION WITH FIRE DEPARTMENT WAGON.

Olsen v. Citizens' Railway Co. (Mo.), 54 S. W. Rep. 470. Nov. 28, 1899.

As a street car was proceeding on its way, an engine of the city fire department crossed the street at a crossing in front of it. The engine was followed by a hook and ladder wagon, which was being driven very rapidly, as is usual with such wagons going to a fire. The motorman did not stop the car, but when he saw the wagon approaching he undertook to avoid a collision by running his car at full speed across the intersection of the streets ahead of the wagon. A passenger on the car was injured by the resulting collision, and, in affirming a judgment in the passenger's favor, the supreme court of Missouri, division No. 2 holds that, under the facts developed on the trial, it was clearly a case for the jury to determine whether the motorman was negligent.

If the motorman heard the gong or the shouts of the people warning him of the approach of the fire department's wagon, the court goes on to say, the most ordinary care would have dictated to him to approach the crossing with his car well in hand. He must have known that it was the duty of the driver of the hook and ladder company to act with the utmost promptness, and regardless of a considerable degree of danger to himself, and that the hook and ladder wagon had the right of way. The custom of giving these fire engines and hook and ladder wagons the right of way grows out of necessity, in which all good citizens acquiesce.

The duty which the defendant street railway company owed to the plaintiff, who was its passenger, the court holds, was to use every effort that a very prudent person would have exercised under the circumstances to have averted injury from the plaintiff. This duty was not restricted solely to the motorman. It devolved upon the conductor, also. If the conductor heard, as the plaintiff heard, the fire gong and shouts, it was his duty to co-operate with the motorman in avoiding the collision.

Particularly does the court hold that there was nothing novel in, but the duty of the defendant and its servants and employes was correctly stated by an instruction given the jury that the defendant, by its servants in charge of its cars, in one of which the plaintiff was a passenger, was bound, in law, to exercise a high degree of care to watch and listen for any approaching vehicle at the street crossing, also, to use such care to avoid collision with any such vehicle, and, if the defendant's servants in charge of the said cars failed, even in a slight degree, to use such care, and thereby directly

contributed to cause the plaintiff's injury, then the defendant was liable, although the jury should find from the evidence that the employes of the city fire department also failed to exercise ordinary care, and thereby contributed to cause said collision.

The contention that the negligence of the defendant could only be predicated on the failure of the motorman to exercise the high degree of care, the court dismisses with the statement that such a rule would make a mere dummy of the conductor, and that it finds nothing in law or reason to exempt the defendant from responsibility for all its servants in charge of its cars. Likewise, in pronouncing without merit the objection that by the view taken in the trial court the defendant would be required to have skillful employes, it says that the law exacts that a company using appliances which will naturally prove very dangerous if not handled skillfully shall have competent servants in charge thereof.

Nor does the court consider that there was any error in permitting witnesses to state how far the gong on the wagon was heard, and could be heard, as in this way only could the plaintiff demonstrate to the jury that the motorman, by the exercise of ordinary care, could also have heard the gong.

The plaintiff being absolutely free from negligence, on her part, and the collision having occurred and injured her, the court holds that a prima facie case was made. The burden, it holds, was cast upon the defendant, after the proof of the collision, to show that it was the sole fault of the hook and ladder company. It was essential for it to show, not only that the driver of that wagon was negligent, but that its own negligence in no way contributed to the collision, it being for the latter only that the plaintiff here sought to hold it responsible.

SHOULD STOP CAR AND TAKE BOY INSIDE OR PUT HIM OFF.

Levin v. Second Avenue Traction Co. (Pa.), 45 Atl. Rep. 134. Dec. 30, 1899.

In this case, a child 5 years of age, got upon the step of the platform of a car, and while there, after the car had started, was seen by the motorman, who knocked on the window, and then kicked on the lower end of the closed side—the side next to the child—when the latter jumped off and fell. This was all that the motorman did. Nevertheless, the supreme court of Pennsylvania holds that the injury sustained resulted entirely from the negligence of the traction company, and that the case should not have been taken from the jury.

The court holds that when the motorman discovered the boy on the platform of the car, it was his duty to stop, and take him inside, or put him off. The moment the child was seen, the car should have been stopped, and failure to stop it instantly became negligence. Instead of stopping, and taking the boy inside, or putting him off, the motorman, as before stated, knocked on the window and kicked on the side, manifestly frightening the little fellow, and, the court goes on to say, the negligence became cruel; but before he knocked or kicked, having seen the boy, there was negligence in allowing him to remain on the platform of the moving car, and the knocking and kicking simply intensified it.

The youth of the boy, the court holds, exempted him from the charge of being a trespasser, in the legal signification of the word, and no negligence was imputable to him.

AS TO CONTRIBUTORY NEGLIGENCE OF BOY CROSSING IN FRONT OF MOVING CAR.

Costello v. Third Avenue Railroad Co. (N. Y.), 55 N. E. Rep. 897. Jan. 9, 1900.

The court of appeals of New York here reverses a judgment dismissing the complaint for what was held to be the contributory negligence of the plaintiff as a matter of law. He was 8 years old when, in attempting to cross the street diagonally in the middle of a block, he was run down and injured by a car, the motorman on which has just been engaged in an altercation with the driver of a wagon that had obstructed the progress of the car, and had but just left the track, the motorman turning on the electric current at the same time, and causing the car to shoot forward without his turning his face and surveying the track in front of him.

Under these peculiar circumstances, the court thinks that the question of the boy's contributory negligence should have been

submitted to the jury, the gross and well nigh criminal negligence of the motorman being undisputed, according to the record. The court says that in the city of New York, where the traffic is enormous upon its principal avenue, it is oftentimes necessary for the wayfarer to pass in front of moving cars, and it usually depends upon the surrounding circumstances of each case whether the particular act of crossing was negligent or not. If the pedestrian is obliged to cross the street a short distance in front of a car moving at a very moderate rate of speed, and with a vigilant motorman in charge, no danger need be apprehended; but if the latter may turn his back on the track before him, and send his car ahead with unexpected and dangerous velocity, the court holds that it is clearly a question for the jury whether the mature judgment of an adult might not fail to save him in such an emergency.

Moreover, even if contributory negligence were assumed, for argument's sake, the court says that the question remained whether the company might, by the exercise of reasonable care and prudence, have avoided the consequences of the injured party's negligence.

And, besides all this, the court holds that a boy 8 years old was not to be judged by the standard of intelligence and judgment applied to an adult in full possession of his faculties. It says that it has repeatedly held with reference to infants varying in age from 6 to 15 years that the law is not so unreasonable as to expect or require the same degree of care or circumspection in a child of tender years as in an adult.

DUTY OF COMPANY IN CHANGING STREET DRAINAGE.

Lion v. Baltimore City Passenger Railway Co. (Md.), 44 Atl. Rep. 1045. Dec. 6, 1899.

When a company, in constructing a cable system of street railway, undertook to change the accustomed flow of the surface water, and to concentrate it in underground drains and a vault at a point where but a part of it formerly had harmlessly flowed on the surface, the court of appeals of Maryland holds that it was bound, at its peril, to provide adequate means to discharge the water so gathered by it, and to discharge it in a way that would not be injurious to others. This, it says, was a perfectly plain duty that was incumbent upon it; and it was no answer to say that it relied on the judgment of competent engineers in the construction of its works, if in fact the works, as constructed, were inadequate to accomplish the purpose or were unskillfully built. The employment of a competent engineer to direct the work was not the fulfillment of a duty to avoid doing injury to another, when, notwithstanding the engineer's competency, the work, as constructed, did cause injury. The test of liability was not the fitness of the engineer, but the efficiency of the work. So the court holds that if the railway company elevated the bed of a certain avenue, and brought an increased volume of water to the corner of that avenue and a cross street, and then, by the negligent and unskillful construction of or attention to the sewers or drains and vault designed by it to carry off the water, failed to convey it away, whereby it overflowed the vault or receiver, and damaged the plaintiff's house, the company was liable.

MAY MAKE REASONABLE RULES AGAINST PASSENGERS CARRYING CERTAIN ARTICLES.

Dowd v. Albany Railway (N. Y.), 62 N. Y. Supp. 179. Jan. 8, 1900.

A man carrying two rifles, with bayonets attached, and a valise, boarded a street car. The conductor of the car informed him that he could not ride with those guns. Upon this request the man did not voluntarily act. Some minutes later the conductor again told him that he must get off the car, and thereupon forced him off, taking him by the collar of his coat, and pulling him. The man was not thrown down, and suffered no serious personal injury. He recovered a judgment for \$300 damages. In reviewing the case, the appellate division, third department, of the supreme court of New York says that it thinks that it would not be warranted in interfering with the verdict, except for the errors that were made in charging the jury.

There was offered in evidence, a rule of the company reading: "Passengers must not be permitted to take into the cars packages or goods that are cumbersome or dangerous, such as barrels,

boxes, trunks, gas pipe, and panes of glass." The court said to the jury that the company had a right to make reasonable rules, and that passengers must be governed by them, and then, in effect, left it to the jury to say whether this rule was reasonable. The appellate division thinks this was error, and holds that the court should have charged the jury, as a matter of law, that this was a reasonable rule.

Besides, the court further charged the jury, in effect, that they might find that the guns carried in the manner in which they were, were not dangerous, and the conductor was wrong in declaring them to be so. This, the appellate division holds, was also error. The man, incumbered with a valise, it says, carried these two rifles, with bayonets attached, in his hands, in a closed car in which there were a number of passengers, and passengers getting on and off at every crossing. The two guns, rigged and carried in that way by one man, with a valise also, it holds, were so obviously dangerous to others in the same car that it needed only the declaration of the conductor in charge to exclude the passenger proposing to ride so incumbered, and his declaration to that effect, it maintains, should have been conclusive, and the court should have instructed the jury that the only question for them to consider was whether unnecessary force was used in putting the man off the car, and if so, what was the damage suffered because of such unnecessary force.

For these reasons, the judgment was reversed, and a new trial granted.

DUTY WHERE NEW PASSENGER IS ON RUNNING BOARD WHEN PASSING FURNITURE VAN.

Henderson v. Nassau Electric Railroad Co. (N. Y.), 61 N. Y. Supp. 690. Dec. 19, 1899.

An open car, the seats of which were all occupied, and in which some persons were standing between the seats, was stopped to receive a passenger after the motorman had rung his bell to notify a furniture van proceeding in the car tracks ahead of the car to leave the tracks in order that the car might proceed. When the car then got to the van it had pulled to the side of the street and stopped so as to bring its rear end within about two feet of the track, and the passenger was injured by coming into contact with the van.

In affirming a judgment for damages in favor of the passenger, the appellate division, second department, of the supreme court of New York holds that the company was chargeable with notice that the car was crowded, and that this passenger and others stood upon the running board. The van was still in its front, and the motorman of the car, as he passed it, was chargeable with knowledge of the position the van occupied, and the small space that was left between it and the car. It was chargeable with notice that the distance was insufficient for persons standing upon the running board to escape contact with the van, unless, observing the same, they bent their bodies inward towards the car. Under such circumstances great care was imposed upon those charged with its operation to see that injury was not inflicted upon the passengers on the car. This duty was disregarded, and for such act the company was properly charged with negligence.

The passenger, the court holds, had the right to stand upon the running board, and to assume that the company would not so operate the car as to necessarily expose him to danger. It was his duty, if there was a seat within the car, to occupy it, rather than to stand in the dangerous position upon the running board. But it was evident that he was looking for a place within the car, as his duty required; and the company, having received him as a passenger, and then started the car before he had opportunity to see if there was a place which he might occupy within the body of it, must be held to have understood that he would make observation to find such place, and to know that his attention would be directed towards the inside of the car. It was as much his duty to seek a place within the body of the car as it was to observe existing conditions outside the car, and whether, when the car passed the van, reasonable care required that he should observe the side of the street, rather than to see if there was a vacant place within the car, presented a question for the jury. Nor was it conclusive evidence that he ought to have seen the van because one person upon the running board did observe it.

This case is distinguished from one where the car had passed

a truck before the passenger was received and it was held that he ought to have observed the existing conditions before he boarded the car, so as to have looked out for the truck coming up from behind.

TRANSFER POINTS AKIN TO STATIONS AND EACH PASSENGER NEED NOT SIGNAL TO STOP.

Schaefer v. Central Cross Town Railroad Co. (N. Y.), 61 N. Y. Supp. 806. Dec. 28, 1899.

The appellate term of the supreme court of New York holds that it cannot be said, as a matter of law, that each individual passenger must make a personal request of, or signal or communication of intention to, the conductor, that he or she desires to get off. Where a number of people arise simultaneously after one of them has signalled the conductor, it is his duty to give all of them equal opportunity to leave the car safely.

In this case, the car had stopped at a corner where it was usual for it to halt to permit transfer to connecting cars. The conductor had issued a transfer to the plaintiff for this crossing, and, the court holds, should be presumed to have known that she desired to alight at the place for which the transfer was given. It might also be said, the court continues, that points for which transfers have been issued bear some resemblance to regular stations of steam railroad companies, where it is incumbent on them to stop long enough to allow passengers a reasonable time to alight, whether or not the conductor knows of any passengers desiring to leave the car.

A conductor of a street railway car should give passengers a reasonable time to alight, and failure to do so is negligence. Whether the conductor did give the plaintiff a reasonable time to alight, the court holds, was, as also was the question whether he was advised of her intention to alight, a question of fact. Moreover, if the conductor was not on the rear platform, but somewhere towards the front of the car, it holds that it was equally his duty to ascertain whether the car could safely be started. It also holds that there was an invitation to alight contained in the conductor's announcement of "Broadway," when the car reached that thoroughfare.

Nor does the court consider that it is negligence in and of itself for a passenger to board or alight from a car without taking hold of the railings to guard against a sudden movement of the car.

PREREQUISITES TO COLLECTION OF FEES FOR RUNNING OF CARS.

City of Cape May v. Cape May Transportation Co. (N. J.), 44 Atl. Rep. 948. Nov. 13, 1899.

In an action brought by a city against a street railway company to recover an amount alleged to be due in accordance with an ordinance which provided that in consideration of the grant of authority to construct such railway, and to run cars thereon, a certain sum should be paid for "each passenger car," the supreme court of New Jersey holds that an averment of liability for "each" car run on said road is not sufficient.

It also holds that where the fees for the running of cars are by the city imposed by the ordinance only upon the railway company named in the ordinance, an action cannot be maintained by the city against the lessee of such railway for such fees, unless there be in the lease some agreement, condition, or covenant in reference to such ordinance made for the benefit of the city, and which inures to the benefit of the city, and then there must be an averment of such agreement, condition or covenant therein, as no privity of contract or obligation between the city and such lessee arises by the ordinance itself.

Moreover, a city, under the power merely "to regulate the streets thereof, and to prescribe the manner in which corporations shall exercise any privilege granted them in the use of any street," the court holds, cannot enact an ordinance imposing license fees for revenue upon a railway in the use of the streets. The power under such authority is one of police regulation, merely, and the fees imposed must be reasonable, in view of the accomplishment and fulfillment of such regulation. Under such a power the right of taxation for revenue is not conferred.

Lastly, under the act of 1885 (P. L. 1885, p. 317), which confers the power to license by ordinance the running of cars in the streets

of cities, and provides that the fees for such licenses may be imposed for revenue, the court holds that an ordinance enacted by virtue thereof must provide for such license in express terms, and indicate that the fees for such license are imposed for the purpose of revenue.

CONSTRUCTION OF FRANCHISE RESOLUTION RE-
QUIRING CONNECTION WITH ANOTHER ROAD
AFTER ITS COMPLETION.

Township of Hamtramck v. Rapid Railway Co. (Mich.), 81 N. W. Rep. 337. Dec. 21, 1899.

A township board adopted a resolution granting to a street railway company the right to construct a railway and maintain same during the corporate life of the company, upon certain conditions, one of which was that so much of the road as extended westerly of a certain point should be equipped and put in operation whenever convenient for the purpose of connecting with any street railway line built in the city, the connection to be made within two years after the completion of the railway in the city, on a certain avenue. The resolution also contained a provision that this franchise, and the permission hereby granted, should cease and be utterly void unless accepted in writing, by the railway company within ninety days.

Now this right conferred upon the railway company, taken in connection with the acceptance of the company, the supreme court of Michigan holds constituted what is known as a "franchise," and was not subject to revocation; and that the doctrine that forfeitures are not favored, and that equity will not decree a forfeiture except for substantial reasons, applied.

The term "completion," as used in the condition quoted, the court holds meant only such completion as would render the road built in the city suitable for the use contemplated by the parties in making the contract. In other words, it accepts the view that the two years would begin to run from the time when the road was substantially completed so as to answer the purpose of its construction, and was put in use as a public conveyance for passengers, although many more things might be required to complete the road in the technical sense of that term.

Again, it holds that the words "the connection to be made" meant the connection of the track of the railway to which this franchise was granted with the track of the railway built in the city for the purpose of allowing the cars of the former to pass over the track of the latter on the way to the central portion of the city. But the cars of the former were much heavier and much longer than the cars of the city line, and the evidence tended to show that for some time the track built in the city was not leveled up, nor ballasted, nor made safe for such larger cars. Wherefore, the court holds that the words "two years after the completion of the railway in the city" should be construed to mean two years after the completion of such railway to the extent that the cars of the company first mentioned might safely pass over its tracks.

RIGHTS OF REMONSTRATING OR INSULTING PASSENGERS.

Weber v. Brooklyn, Queens County & Suburban Railroad Co. (N. Y.), 62 N. Y. Supp. 1. Jan. 9, 1900.

The plaintiff, while a passenger on one of the defendant's cars, was forcibly ejected therefrom by the conductor. He had stepped to the rear platform, to remonstrate with the conductor for what the plaintiff conceived to be his abusive treatment of another passenger. An altercation ensued between the plaintiff and the conductor, which resulted in the removal of the plaintiff from the car. He brought an action for damages, and got judgment, which is here affirmed by the appellate division, second department, of the supreme court of New York. The controverted question was whether the assault involved in such removal was justifiable or not.

It was contended, on the one hand, that, inasmuch as the plaintiff voluntarily left his seat in the car, and interfered with the management of the car and its passengers, without cause, he waived his rights as a passenger, and the company was freed from liability for the result. But according to the plaintiff's narrative of the events which resulted in his ejection from the car, he did nothing

more than civilly to protest against what he considered the unkind treatment of an intoxicated passenger, whom the conductor had handled with unnecessary roughness before putting him off the car. Taking up the question at this point, the court says that it cannot be seriously supposed that a person, by such an act of remonstrance as this, forfeits his right to be protected from assaults by the servants of a common carrier in whose vehicle he is a passenger. As to whether the plaintiff had brought the assault upon himself the court holds was clearly a question of fact for the jury, to be determined from the circumstances preceding the assault and the circumstances of the assault itself.

Furthermore, the court holds that a conductor cannot rightfully assault a passenger merely because the passenger has insulted him, or otherwise provoked him, by mere words; and if he does assault the passenger by reason of such provocation only, unaccompanied by any threats or acts of personal violence, the railroad company will be liable for the consequences of the assault, under the well-established rule which protects passengers against the misconduct of a common carrier's servants. If a passenger in a railroad car is guilty of disorderly conduct, the conductor may lawfully require him to leave the car, and, in the event of his refusal to do so, may exercise such force as is necessary to eject him, but no more.

To avoid any possible misunderstanding, the court deems it well to add that, of course the passenger could not recover damages if he used the provoking language with the intent of bringing about the assault which followed.

POWER OF CITY TO ORDER LOCATION OF LOOP
CHANGED AND LINES EXTENDED.

State ex rel. City of St. Paul v. St. Paul City Railway Co. (Minn.), 81 N. W. Rep. 200. Dec. 15, 1899.

The supreme court of Minnesota holds that a municipality cannot abdicate or barter away, at least without express legislative authority, its governmental powers conferred upon it for public purposes. Hence any authority to use the streets granted to a street railway company must be construed as being subject to the general police power of the municipality over the public streets.

For example, if, by reason of increased traffic on the streets prescribed for the construction and operation of a "loop," or if for any other reason the use of those streets for that purpose became inconsistent with the convenient use of the streets by the public, or a menace to the safety of the public, it would, in the opinion of the court, be unquestionably within the police power of the city to enact an ordinance requiring the loop to be changed to some other reasonable location.

More particularly, however, is the court concerned in this case with the construction to be put upon section 18 of Ordinance 1227 of the city of St. Paul, commonly known as the "General Electric Ordinance." This section states that "the common council reserves and shall have the right, at any time, and from time to time, after January 1, 1892, to order the construction and completion, by said St. Paul City Railway Company, of any new lines of street railway or the extension of any present or future lines of railway upon any and all streets in the city of St. Paul upon which sewers shall have been constructed, and in operation within one year after such orders are made; provided, that when new lines or extensions are constructed all the provisions of the ordinance shall apply thereto."

The conclusion reached by the court is that the power thus reserved to the common council to order the St. Paul City Railway Company to extend any existing line or future lines of its railway is not limited to extension on streets or parts of streets not provided with any car service, but authorizes the extension of the car service of one line to or into the business or central part of the city, over streets or parts of streets upon which there is an existing track upon which the cars of another line are already operated.

But if it was attempted to require the extension of any line over a track on which another line was operated, entirely through the central portion of the city, out into a suburban district on the opposite side of the city, the court says that it apprehends that, unless there were some very exceptional circumstances creating a necessity for it, a court would very unhesitatingly hold that the common council had no authority, under either section 18 or the general police power, to require this to be done.

THE TRAMWAYS OF SUNDERLAND, ENGLAND.

Like most English towns the prosperous borough of Sunderland has in the past suffered from a lamentable deficiency of tramways. Having a population of about 150,000, situated at the mouth of the River Wear, in the county of Durham, a seaport, and a shipbuilding and engineering center, it has hitherto had only 10½ miles of tramway track, covering some six miles of streets, worked by horses. Doubtless here, as elsewhere, the purchase clause of the Tramways Act prevented the local company from making extensions.

The Sunderland Town Council has now made arrangements for taking over the lines, and at the last session of Parliament it obtained an act authorizing it to build extensions to a length of 23 miles of track. At present work has been commenced in equipping 13 miles of track for electricity, the contract having been let to Dick, Kerr & Co., London and Kilmarnock. The whole of the work is being carried out on specifications prepared by Mr. J. F. C. Snell, A. M. Inst. C. E., borough electrical and tramway engineer. In what follows it must be understood that the terms Town Council and Corporation are synonymous, as they are generally in Britain.

The municipality has adopted the course of giving contracts locally where no special advantage was apparent from going abroad, and at the same time not hesitating to obtain American apparatus when that seemed to be desirable.

Instead of building a separate power station the corporation is extending its electric lighting station by adding the units necessary for traction purposes. There will be five Galloway boilers, 28 ft. long by 8 ft. 6 in. diameter, working at 130 lb. steam pressure, with two Green's economizers each with 192 tubes. There is the usual by-pass flue to a new smoke stack 160 ft. high and 7 ft. in diameter at the top. The feed pumps, to be supplied by G. & J. Weir, Glasgow, will be each capable of pumping 4,000 gallons at a piston speed not exceeding 50 ft. per minute. Coal will be lifted to an overhead bunker, where it will be automatically weighed and distributed by conveyors into self-trimming bunkers, from which chutes will take it to Vicars mechanical stokers. There will be three three-crank engines of 420 i. h. p. each, direct-coupled to Pallion four-pole slot-wound dynamos, capable of an output of 750 kw. at 550 volts. This plant is made by the Sunderland Forge & Engineering Co. Surface condensers of the British Admiralty pattern, supplied by the Wheeler Condenser & Engineering Co., London, will be used. Each condenser will be able to deal with 16,000 lb. of steam, with a vacuum of not less than 25 inches. There are to be two Barnard cooling towers, provided with motor-driven 10-in. fans. The reservoir is of concrete, holding 16,000 gallons of water. The power required by the auxiliaries must not exceed 3½ per cent of the power of the main engines. A hot well with a coke breeze filter is to be provided, from which the feed pumps will draw and will deliver the water through pressure filters. The switchboard, the contract for which has not yet been let, will have the usual dynamo, feeder and Board of Trade panels.

There will be quite an elaborate system of feeders leading from the power house to the lines, as the trolley wires are to be divided into half-mile sections, each with its separate feeder. The feeder will, as usual, be placed underground in stone-ware ducts, and will feed into the trolley wires through section pillars erected along the side of the street with an equipment of switches, test terminals, telephone and lightning arrester. The specification calls for a distribution efficiency of 95 per cent for an evenly distributed load of 750 amperes.

The track will be of standard gage, and the rails will be 90-lb. 7-in. steel grooved girders in 40-ft. lengths, laid direct on a 6-in. bed of portland cement concrete. This is the usual modern British arrangement; cross timber ties or sleepers are scarcely known for street lines. The rails will be tied to gage every 8 ft. by steel tie-bars of 2 in. by ¾ in. The joints are to be secured by fish-plates weighing 60 lb. per pair and sole-plates 30 in. by 12 in. by ¾ in. securely bolted to the rails. The crossings will be braced by substantial sole-plates. The points are of the cast-steel type of Askham Brothers & Wilson, Sheffield. The joints will be bonded by No. 000 B. and S. Columbia bonds, and the cross-bonding opposite each pole is to consist of No. 00, B. and S. bonds. The paving between the rails and for 18 in. outside is partly of wood

blocks and partly of granite or whinstone setts, size 6 in. by 4 in., with pitch grating. The maximum gradient is 8 per cent, and the sharpest curve has a radius of 40 ft.

According to the character of the road along which the line passes, the style of the overhead equipment will vary; in some places the span wires will be attached to buildings, in others center poles with brackets will be employed. The desire is to make the overhead work as unobtrusive as possible, and ornamental poles will be employed. These will be in one piece, tapering from 7 in. to 5 in. The trolley wires, .325 of an inch in diameter, are to be of hand drawn copper. To assist in conforming to the Board of Trade regulations as to drop of potential in the rails (maximum allowed being 7 volts) return feeders will be joined to two minimum potential points in the rails and carried to negative boosters in the power station. This plan will doubtless be unnecessary at first, but further extensions are being kept in view.

The rolling stock will consist of 26 cars, all mounted on Brill trucks. This type of American truck seems to be a great favorite already in England; it is in use on some lines and has been ordered for many more. Six of the cars will have maximum traction trucks, each car having a seating capacity for 61 passengers. Twelve of the other cars will be able to carry 46 persons each. Both of these classes are double-deck cars, which are the favorite type in England. The remaining eight are single-deckers, and are only used because there is an overhead bridge on the route, with a clearance of only 13 ft. 6 in. Dick, Kerr & Co.'s standard motors will be used. It is probable that the lines will be started up electrically in July, 1900.

ANOTHER ELECTRICAL OMNIBUS.

In our issue for December, 1899, page 847, we published illustrations of two electrical omnibuses used in Berlin, and herewith present a view of another vehicle in the same city which, like one of those previously shown, utilizes the street railway current. This omnibus has places for 12 passengers inside and for 6 on the rear platform. There are two motors connected to the rear axle by

ELECTRIC OMNIBUS, BERLIN.

single reduction gearing. The storage battery consists of 44 elements of the Pollak type, which is said to be sufficient for a run of from 10 to 12 miles. Four collecting bows are provided on the roof so that at stations the battery may be recharged, taking current from the street railway overhead lines. This car complete weighs 7,700 lb., and loaded, about 10,000 lb.

The Twin City Rapid Transit Co., of Minneapolis, has placed in many of its cars, fire extinguishers to afford ample protection to passengers in the event of cars taking fire.

FAILURE OF THE AUSTIN DAM.

On April 7th the masonry dam across the Colorado River at Austin, Tex., failed under the stress of a great flood. On the preceding day and up to 4 a. m. on the 7th, five inches of rain fell along the Colorado River and by 11 a. m. the water was 11 ft. deep over the crest. At 11:15 the dam broke on a vertical line about 300 ft. from one end and two sections each 250 ft. long were swept down stream; a few minutes later one piece toppled over and disappeared and the other was partially broken up and washed away, leaving, however, a section of the dam over 40 ft. long standing upright some 30 ft. below the line of the dam. The break left 500 ft. of the dam standing at the west end and 83 ft. at the east end.

When the dam broke the escaping water was forced sidewise and at the east end struck the power house, crushing the west windows and flooding the pump rooms. Mr. Harry L. Monroe, state agent of the General Electric Co., was in the building with Mr. H. C. Patterson, superintendent of the plant, and they had only been out of the wheel pits for three minutes when the break came. Mr. Walter Johnson, chief engineer, was on his way back to the pit, and his two sons, small boys, who were helping at the pumps,

the same month. In the report of city officials of Austin for 1895 we find the cost of the installation given as \$1,391,129 64, of which \$611,313.39 was for the dam.

The dam was 1,143 ft. long, 60 ft. high above low water mark, 66 ft. thick at the bottom and 16 ft. thick at the top. The up stream face is vertical and the down-stream face curved of ogee form; the lower part of the down stream face is curved to a radius of 31 ft.; the central portion has a batter of 4 $\frac{1}{2}$ in. to the foot, and the upper portion has a radius of 20 ft. The two faces and top were built of red granite and the interior of hard limestone rubble laid in port-land cement.

The power house was built on the rock ledges just below the east end of the dam and was 198 x 54 ft.; on the river side the walls were 112 ft. high and on the land side 32 ft. The equipment comprised Victor wheels, made by the Stillwell Bierce & Smith Vaile Co., aggregating 2,400 h. p., pumps of 8,000,000 gallons capacity per 24 hours, and electric generators of 500 h. p. capacity.

The building of the dam by raising the water level 60 ft. formed a lake covering over 1,800 acres, and between 20 and 25 miles long, which was named Lake McDonald, after the mayor, Mr. John McDonald.

THE AUSTIN DAM AND VIEWS AFTER THE FAILURE.

lost their lives, with six others. About midnight of the same day two-thirds of the west wall of the power house fell, carrying with it the roof over the dynamo floor and wrecking the corresponding portion of the east wall.

We reproduce a number of photographs kindly sent us by Mr. Frank E. Scovill, superintendent of the Austin Rapid Transit Ry. No. 1 is a view of the dam taken from the east end, and No. 2 a view from the west end showing the power house; the steamer "Ben-Hur," which appears in this illustration, was stranded and broken in two, as seen in No. 4. No. 3 shows the power house on the morning of April 8th. Nos. 4 and 5 were taken after the break and show the section of the dam swept bodily down stream. No. 6 is a car of the Austin Rapid Transit Ry. standing near First St. bridge (about 4 miles from the dam), where it was when power was shut off.

Mr. Scovill states that it was expected that the city would have water by May 15th, but that light and power were in the more distant future. The Austin Rapid Transit Railway Co. will probably install a power plant of its own.

This dam has been of great interest both as an engineering structure and because its construction was a municipal undertaking. Work was begun on the masonry of the dam May 5, 1891, and the last stone was set May 2, 1893; water flowed over the crest during

The engineer who was first placed in charge of the construction of the dam was Mr. Jos. P. Frizell, who resigned in June, 1892, because of the interference to which he was subjected by Mr. McDonald; the letter of resignation stated that Mr. Frizell has offended Mr. McDonald by insisting that the latter's son, then employed on the work, should perform the duties for which he was paid.

July, 1893, Mr. E. W. Groves, who succeeded Mr. Frizell as engineer in charge, also resigned, giving as one reason the constant interference in the engineering work by Mr. McDonald. Mr. McDonald on his part claimed that Mr. Groves did not have the requisite skill or ability and would not be guided by advice or listen to reason. Mr. Groves was succeeded by Mr. Gorham P. Low, who continued in charge till his death six months later. He was succeeded by the former assistant-engineer, Mr. Joseph Kepferle, who died in December, 1894. He was succeeded by Mr. G. W. Sublette, of Minneapolis, who remained in charge until June, 1895, when the construction work was practically completed.

A few months before the dam failed the fact that the city of Austin had defaulted on the \$1,400,000 of bonds issued to pay for the dam and power house brought this municipal undertaking into prominence and the results of its operation have been urged as an argument against municipal ownership. About the same time

also, the partial filling of Lake McDonald with silt and leaks in the dam which developed last year were made the occasion of criticising the engineer, it being alleged that city ownership tends to a more careless system of engineering that would be permitted by a private company which depends for existence on receipts and economy.

We regard such implied criticisms on the engineers responsible for this work as unjust and think the important point is not that a private company would necessarily have better engineers, but that having engaged a competent engineer, private owners would not permit a layman to interfere with professional work.

The water and electric supply business of the city of Austin has been a financial failure, quite aside from engineering questions, and for this the municipal management is certainly responsible.

NEW SEATTLE-TACOMA ELECTRIC LINE.

Franchises for building an electric railway from Seattle to Tacoma, Wash., have been secured by Fred E. Sander & Co. and W. P. Trimble, of Seattle, Wash. Mr. Sander has made the following statement regarding the enterprise: "We have secured a right-of-way for a double-track standard gage road between Seattle and Tacoma, from the Pierce County line to the city limits of Seattle, with the exception of one stretch of a quarter of a mile. The right-of-way is 66 ft. wide, and passes through the richest part of the country. We shall touch at South Park, Orillia, O'Brien, Kent, Christopher and Auburn. From the latter place we skirt the bluff into Tacoma, passing through a rich and fertile district.

"We expect to lease the power necessary to run the road from the Snoqualmie Falls company, but, failing to make satisfactory arrangements, we have provided for the erection of a water power plant of our own.

"The road will have low grades and few of them. We shall be able to handle large passenger and freight business with rapidity and ease. The road will be supplied with the best of rolling stock and equipment."

STREET RAILWAYS TOO LARGE FOR CITIES TO CONTROL.

At the annual meeting of the Academy of Political and Social Science in Philadelphia, April 19th, Prof. L. S. Rowe, of the University of Pennsylvania, delivered an address on the "Possibilities and Humiliations of Municipal Control" in the course of which he said:

"During the last decade a number of influences have been at work, all of which have tended to place the municipality in a very different relation to the class of corporations under consideration from that which it has heretofore occupied. The first of these is the rapid growth of the suburban districts of our larger cities, offering profitable opportunities for the extension of the gas, water and street railway services beyond the limits of the city. With every such extension the economy of production and distribution has been increased and has finally led to the total disregard of municipal, county or township lines. As regards the water service this movement has been further strengthened by the necessity of seeking sources of supply at great distances from the distributing centers. The economy of supplying all the localities along the route dictates the inclusion of a considerable section of a state within the area of exploitation of a single company.

"Finally in the case of the street railways, the change in motor power from horse to electricity has completely revolutionized the service. In fact, it furnishes the most striking instance of the changed relation of the municipality to this class of industries. What was only a purely local means of transportation has already become interurban and soon bids fair to establish a network of communication throughout the various states. As a result of these changes two questions present themselves.

"First, can the municipality still be regarded as the effective unit of control over this class of corporations? and

"Secondly, can the state permit the municipality to fix the conditions under which these industries may be carried on?

"One of the first principles of governmental control over industry is that the unit of control must not be inferior to the unit of

exploitation, that is to say, the power of the public authority must, at least, be coterminous with the field of operation of the industry. This has ceased to be the case with the street railway companies, and, to a less degree, with the water and gas companies. Just as the difficulties of state control over corporations—particularly transportation companies—doing an interstate business forced us into national control, so the extension of the municipal public-service industries beyond the limits of municipal control will force the substitution of some larger administrative unit—possibly the state itself—as the controlling authority."

ADVERTISING A STREET RAILWAY PARK.

The strictly pleasure travel over the lines of the Cleveland, Berea, Elyria & Oberlin Ry., has increased to such an extent and the possibilities of development in this direction are so clearly manifest, that the company has established a separate "outing department," under the charge of Mr. J. W. Butler, with the title of excursion manager. The duties of this department, as its name indicates, is to devise ways and means for encouraging pleasure riding, and it also has charge of a new park recently purchased by the company, on the Berea and Linddale branch, about seven miles west of Cleveland. These beautiful grounds include 30 acres of forest shade, with numerous springs and flowing streams of pure mineral waters, romantic glens and dells, and to enhance the natural attractions, an elaborate pavilion and ball room have been erected, athletic and camping grounds have been established, swings and seats scattered through the grounds and other amusements provided. The resort is called Puritas Springs.

Mr. Butler informs us the main advertising will be accomplished through the general press, which he considers the best means of reaching the public. Supplementing this, descriptive circulars and special letters will be mailed at frequent intervals to superintendents of Sunday Schools, societies, and fraternities, calling attention to the advantages and attractions of the park at Puritas Springs for outings and excursions of all kinds, particularly for children and ladies. The excursion manager gives his personal attention to these parties and sees that everything possible is done for their enjoyment and convenience.

Another of this company's methods for gaining publicity is by the distribution on the cars, and broadcast through the city, of small cards $1\frac{1}{4} \times 2\frac{1}{4}$ in., printed on white paper, in green ink, with a $\frac{1}{2}$ -in. pink strip down the center, and describing the principal attractions at the resort.

BIRMINGHAM RAILWAY & ELECTRIC CO.

The city of Birmingham, Ala., has an extensive system of electric railways, all operated by one company, the Birmingham Railway & Electric Co. having last year secured control of the Birmingham Traction Co. During the last year the company acquired by purchase $22\frac{1}{2}$ miles of road and built $7\frac{1}{2}$ miles; it also equipped $7\frac{1}{2}$ miles of the purchased track for electrical operation, rebuilt a portion of the city lines, built a new car house, rebuilt one of the bridges used by its cars and spent over \$20,000 in new special work.

The system comprises over 100 miles of track, and extends to all the neighboring towns, including Pratt City, Ensley, Bessemer and Powderly. The East Lake resort of the company has been described in the "Review." The line to Bessemer and that from Powderly to Bessemer are operated by steam.

THAT CHICAGO-MILWAUKEE LINE AGAIN.

In a recent interview, Mr. John I. Beggs, general manager of the Milwaukee Electric Railway & Light Co., is quoted as saying: "Inside of five years I expect there will be a through electric car running from Chicago to Green Bay. There are a number of gaps which must be filled in, but in the time I have named I think that the right of way will have been acquired and the road constructed. If the plans of the electric railway managers and promoters in this section of the country carry, one of the largest systems in the country will be in operation by 1906."

GARTON LIGHTNING ARRESTERS.

The season of spring storms being at hand, the lightning arrester problem is again confronting street railway and central station managers, who will be interested in the new models of arresters just put on the market by the Garton Daniels Co., of Keokuk, Ia. Fig. 1 is a new direct current pole arrester for railway, light or power circuits of 750 volts or less. The base and spool are of porcelain

FIG. 1

FIG. 2.

and the makers feel confident that it will operate satisfactorily under all conditions. A novel feature of this arrester is the iron box which is so made that by loosening one screw the cover can be slipped off and swung to one side, making inspection easy. Fig. 2 shows the same arrester with wooden box. In all the new designs the principle of opening the circuit in two places after the charge has passed to earth is adhered to, thus allowing the use of

FIG. 3.

FIG. 4.

a much smaller air gap than would be practicable with a single opening in the circuit.

Fig. 3 is the new arrester used for protecting stationary motors of all sizes. With this arrester is used a new design of kicking coil known as the "type S"; this is a spiral of ribbon copper mounted on a dipped slate base.

Fig. 4 is one of a number of 1,200-ampere kicking coils furnished Siemens Bros. & Co., Ltd., of Woolwich and London.

The company has issued a 1900 edition of its catalogue on Garton arresters, which may be had on application at the home office.

NEW MASSACHUSETTS ROAD OPENED.

A new Massachusetts electric line, the Clinton & Hudson Electric Ry., was practically completed on April 18th. A car of the Worcester & Clinton Street Ry. in charge of Mr. John W. Ogden, who is superintendent of both the Worcester & Clinton and the Clinton & Hudson lines, with a party of officials and invited guests made the first trip.

Both of these lines have been acquired by the syndicate to be incorporated as the Massachusetts Electrical Co., and operate the electric railways in and about Worcester, as noted in our last issue, page 198.

The Worcester & Clinton road has an enviable record. It has never had an accident of any kind other than a derailment, and has never hurt a passenger or paid a cent in damage claims. The road was opened in December, 1898, and notwithstanding the operating expenses were 68 per cent of the gross receipt, it was able to pay a dividend on the first 10 months operation; since then operating expenses have been reduced and the receipts almost doubled.

N. Y., N. H. & H. SNOW PLOW.

By courtesy of Col. N. H. Heit, chief of the electrical department of the New York, New Haven & Hartford, we have received a photograph of the combination snow plow and sweeper used

SNOW PLOW ON THE THIRD-RAIL LINE.

on the motor cars of the electrically operated divisions. The plow is of the nose type secured to the truck by two curved arms. Along the lower edge of the plow is a heavy bristle brush which extends out so as to cover the third rail. This type of plow has been used for two years past and is found to be effective for heavy as well as light falls of snow.

KISINGER-ISON TROLLEY WIRE CONNECTOR.

When a tightly drawn trolley wire breaks, it is no easy task to join the severed ends, as the juncture must be made in spite of the absence of surplus wire or slack and when finished the joint must be smooth and symmetrical and present no obstruction to the passage of the trolley wheel. In addition the repair must usually be done quickly in order to delay traffic as little as possible.

The Kisinger-Ison Co., of Cincinnati, makes a connector for coupling the ends of broken wires that it is claimed will effect a saving in both time and money over the old method of soldering.

KISINGER-ISON TROLLEY WIRE CONNECTOR.

The device consists of a hollow sleeve with tapered ends and a central opening. The interior of the ends of the sleeve are tapered, the small ends of the taper being at the outward ends of the connector and large enough to admit the trolley wire. The severed ends of the wire are poked into the hole in the ends of the sleeve, and then locking devices in the form of toothed wedges, engage upon the side of the ends of the wire and against the tapering inner walls of the sleeve, the wire being thus pinched between one wall of the sleeve and the locking wedges. It follows therefore that the harder the pull the tighter the grip. One, two, or four wedges may be used in each end. With this coupling broken wires have been repaired by two men in three minutes.

IN THE POWER HOUSE

This department is devoted to the construction and operation of electric railway power houses. Correspondence from practical men is specially invited. Both the users and makers of power house appliances are expected to give their views and experiences on subjects within the range of the department.

ADDITIONAL UNIT FOR UNION RAILROAD OF PROVIDENCE.

The United Traction & Electric Co., of Providence, R. I., controls through the ownership of stock the following operating companies: Union Railroad Co., Providence Cable Tramway Co., property leased to Union R. R.; Pawtucket Street Railway Co.; Rhode Island Suburban Street Railway Co., which was organized last year and bought the property of the Cumberland Street Railway Co. and the Pawtucket Valley Electric Street Railway Co. (both of which were controlled by the United Traction & Electric Co.) and also bought the Oakland Beach branch of the New York, New Haven & Hartford R. R., and the Barrington, Warren & Bristol R. R. These last two were formerly operated by steam; the Oakland Beach branch, running down to Buttonwood on the west side of Providence Bay, 16 miles from the city, has been

being made in two pieces, divided to receive the packing ring; the junk ring in the low pressure piston is faced with hard babbitt metal almost the full width of the piston. The crank and cross heads are made of semi-steel; the cross heads are split and provided with large binder bolts to prevent the piston rods (which are screwed into the cross heads) from becoming loosened, should the lock nuts on the piston rods become slack. The cranks are of the disk pattern, heavily counterbalanced. The crank and cross head pins are of forged steel, the crank pins being forced into the cranks from the back side and provided with removable caps. The cross head pins are ground to a taper where they bear in the cross heads and are parallel for the rod brasses; they are held in place by four large screws on the outside faces of cross heads. Tripp's metallic packing is used on both piston rods and valve stems; corrugated copper gaskets are used on all joints in place of rubber. The crank pin brasses are of bronze, babbitted for their

1,600-H. P. FILER-STOWELL ENGINE, UNION R. R., PROVIDENCE.

equipped for electrical operation, and the company is also considering changing the motive power on the Barrington, Warren & Bristol R. R., which runs down the east side of the bay. The system of the Union, Pawtucket and Rhode Island Suburban companies comprises 173 miles of track.

The Oakland Beach road and some smaller extensions and the addition of some large and heavy cars to the suburban equipment of course brought an increased load on the power stations to meet which a new 1,600-h. p. unit has just been installed. This unit comprises a cross-compound condensing engine, built by the Filer & Stowell Co., of Milwaukee, Wis., direct connected to a 1,200-kw. General Electric generator. For the description of the engine and the accompanying illustrations we are indebted to Mr. M. H. Bronsdon, chief engineer of the Union Railroad Co.

The engine has cylinders 28 in. and 54 in. by 48 in. stroke, and is designed to run at 100 r. p. m. with 135 lb. of steam. The valve gear is designed to permit the governor to vary the point of cut-off from 0 to $\frac{3}{4}$ stroke in both the high and low pressure cylinders. Each piston is provided with but one packing ring, the junk ring

full width, and the cross head brasses of solid phosphor bronze. The connecting rods are of hammered iron, with straps, gibs and keys at the crank ends, and solid ends for the cross head brasses. The eccentric straps are babbitted for the full width.

The frames are the Filer & Stowell 1900 heavy duty tangye type with pillow blocks, frames and slides all cast in one piece, and are of massive construction. The slides are bored and the bed ends are made as large in diameter as possible, where they bolt up to cylinders. The frames bear full on the foundation from the pillow blocks to the ends of the slides, with the foundation bolts spread as much as possible. The shells of pillow blocks are made removable by raising the shaft 1-16 in. Heavy $\frac{3}{4}$ -in. pipe coils are cast in both bottom and side shells for water circulation. Wear is taken up by raising wedges moving vertically; the wedges bear full on the side shells and are provided with keyways and keys insuring their being raised alike on both ends. The main bearings are 22 x 42 in.; cross head shoes 18 x 31 in.; crank pins 10 x 10 in.; cross head pins 9 x 10 in. The shaft is of forged steel, 26 in. diameter in the armature and 22 in. diameter in the bearings.

One of the most interesting features of the engine is the fly-wheel, which is of novel construction. The wheel proper is cast

in two pieces, held at the rim joints by wrought iron links $3\frac{1}{2} \times 3\frac{1}{2}$ in. in section shrunk on; at the hub the two halves are bolted together. After the wheel had been turned smooth on the outer face it was re-enforced by a cast steel ring $7\frac{1}{2} \times 17$ in. in cross section

CLAMP HOLDING RING.

shrunk on. The ring was cast at Newark, N. J., and shipped by water to Providence, being delivered as it came from the mold. It was then fastened to the side of the fly-wheel, being held in

The straight way valves for this engine are all of the Chapman make. The throttle valve was made by the Crosby Steam Gage & Valve Co.; it is of the double ring seat type, so designed as to prevent leakage should any foreign substance become lodged in the passage.

CROSBY THROTTLE VALVE.

The installation of this unit brings the total capacity of the station up to 6,050 h. p. The new electrical equipment includes two rotary converters of 300 kw. capacity, which change the direct current to an alternating current at 460 volts, which is stepped up to 10,000 volts in static transformers for transmission to a sub-station at Riverview, 11 miles distant. The sub-station has static transformers and two rotary converters of 250 kw. capacity, which give direct current at 560 volts for the trolley line. A storage battery will be used at the sub-station.

Ten new cars have been purchased for the Oakland Beach line from the J. M. Jones Sons Co., of Troy, N. Y. These cars are 41 ft.

FLY-WHEEL AND RING, SHOWING ARRANGEMENT OF BURNER FOR HEATING THE RING.

place by clamps, as shown in one of the illustrations, and the interior surface turned. Four rings of 2-in. gas pipe, with 100 burners each were then put in position, as shown in the engraving and the ring heated until it was $\frac{3}{8}$ in. larger in diameter than the wheel, when it was slipped into place and allowed to cool. After cooling the sides and outer face of the ring were turned smooth. The exterior diameter of the completed wheel is 18 ft., and taking the elastic limit of the metal in the hub bolts and links as 25,000 lb. per sq. in. and of the steel ring as 30,000 lb. per sq. in., it is computed that the wheel may turn at 429 r. p. m. before the stresses exceed the elastic limits of the metals. The weight of the wheel complete is 102,000 lb.

DELIVERING THE RING.

The condenser is of the jet type made by Geo. F. Blake, and has simplex, vertical, twin-beam air pumps with steam cylinders 12 x 18 in. and air cylinders 30 x 18 in.; the air pump is of bronze throughout.

over all, and are equipped with four G. E. 57 motors and Christensen air brakes, and are mounted on Peckham trucks.

Among other improvements the Union Railroad Co. has during the past year erected a new car house between Providence and Pawtucket, which is 100 x 200 ft.

NEW BINARY-VAPOR ENGINE.

A recent report from Consul General Mason at Berlin describes in general terms the results of experiments made at the Royal Technical High School at Charlottenburg by Professor E. Josse with a binary-vapor engine. This machine consists of a cross compound steam engine with cylinders 340 and 530 by 500 mm. (13.39 and 20.87 by 19.69 in.) running at 41.5 r. p. m., and of an auxiliary sulphur dioxide engine with cylinder 200 x 500 mm. (7.87 x 19.69 in.) running at 77 r. p. m. The steam is worked in the compound engine in the usual manner and exhausted into a surface condenser, where the cooling fluid, instead of being water, is liquid sulphurous acid (H_2SO_3); the heat in the exhaust steam drives off sulphur dioxide gas from the acid, and this gas is worked in the cylinder of the auxiliary engine and discharged into a second surface condenser, where water is the cooling fluid. The sulphur dioxide is returned to the first condenser, which is also the boiler for the sulphurous acid, and is used over and over. The process was patented in 1889 by Mr. G. Behrend, of Hamburg, and Dr. Zimmermann, of Ludwigshafen.

As to results, the report states: "The steam engine is of the compound type, of good modern construction, and being given a steady load, developed 34 i. h. p., with a consumption of 8.6 kg. (18.96 lb.) of steam per i. h. p. hour. The auxiliary machine working with the sulphurous vapor indicated 19 h. p., that is, an increase of 56 per cent and yielding, instead of 1 h. p., 1.56 h. p. for the same

steam consumption, and reducing the steam consumption from 8.6 to 5.5 kg. (from 18.96 to 12.13 lb.) per i. h. p. hour.

"The experiments showed on the average that for every 15 kg. (33.169 lb.) of steam passing through the main engine, 1 h. p. could be gained in the auxiliary machine. Applied, therefore, to an ordinary single-cylinder steam engine, exhausting into the air at high temperature, the percentage of power saved by this new device would be very much higher than the economy reached in these experiments, which as has been shown, were made with a highly improved compound engine."

Dr. R. H. Thurston in discussing these results in the *Sibley Journal of Engineering* for April says that from the data at hand it is not apparent whether the economy reached is due to the excellence of the apparatus or the advantages of sulphur dioxide as the auxiliary fluid, and it is suggested that the result may to some extent be due to an improvement in thermal action and efficiency, coming of reduced wastes by heat exchanges between the working fluid and the metal of the cylinder walls. Dr. Thurston further states that the result of 12.13 lb. steam per horse power per hour is unexampled, being, when the low pressures are considered, practically all that could be expected of a quadruple expansion engine. The low speed and the small power of the engine, 53 h. p., make the results even more remarkable.

Some of our contemporaries in commenting on these tests make the point that if the steam engine were worked to as low a temperature as was the binary engine the theoretical efficiency would be the same. This is, of course, true, but it does not pay to reach the low limit in the steam engine because of the large cylinder volumes involved. Thus 1 lb. of steam at 70° F. has a volume of 334 cu. ft.; if the heat which this steam has when at 140° F. is used, as in the binary engine, it would evaporate about 6 lb. of the sulphur dioxide at 140° F., and this gas when expanded so that its temperature is 70° would have a volume of about 10 cu. ft. The higher pressures and smaller volumes of the sulphur dioxide give it advantages over steam for working between low temperature limits.

Laboratory experiments are quite different from commercial work, and it remains to be seen whether the steam-sulphur dioxide binary engine will prove practicable for general use or be classed with the many other improvements on the steam engine which have been relegated to the scrap heap.

NEW UNIT FOR TOLEDO TRACTION CO.

In our issue for September, 1899, page 593, we described the addition to the power house of the Toledo Traction Co., then building, and briefly mentioned the new unit which it was to accommodate. This unit consists of a vertical cross-compound Allis engine with cylinders 28 and 60 by 48 in. direct connected to a 1050-kw. Westinghouse generator, and since its installation in November last has carried nearly the whole of the railway load, which varies from 1,500 to 3,500 amperes, being supplemented when necessary by one or more 400-kw. generators with which it works in parallel.

The generator is "engine type," the armature and commutator being built together upon a ventilated cast iron sleeve, pressed upon the engine shaft. The field castings are divided in a vertical plane, accompanied with a cast iron sole plate. At the rated speed of 80 r. p. m., the machine gives 500 volts with no load, and over compounds to 575 volts with a load of 1,820 amperes. The last named load is carried continuously without undue rise of temperature, and various tests applied since the installation show that at 50 per cent overload the temperature is not materially increased. Tests have also shown that the guaranteed efficiencies of 91 per

cent at one-quarter load, 94 per cent at one-half load, and 94.5 per cent at three-quarters and full loads, have been more than attained in actual working. The position of the brushes need not be shifted if the load be increased from no-load to 50 per cent over-load. If the current in the shunt field be adjusted so that the

FIG. 1—1,050-KW. UNIT, TOLEDO.

voltage of the machine at no-load is 500, a load of 2,640 amperes at such increase of voltage as will be maintained by the combined shunt and series field current may be temporarily carried, and if, with the current in the main circuit, the circuit breaker be opened, there will be no bucking, serious sparking or other difficulty at the commutator.

The pole pieces are of laminated steel, and the field frame of cast iron. The windings are proportioned so as to reduce the distortion due to armature reaction to a minimum. The series coils are of copper bar formed into one layer; the shunt and series coils are separately insulated and so disposed as to admit of thorough ventilation. The insulation of the complete coils successfully withstood an alternating current of 3,500 volts.

The armature, Fig. 2, is of the slotted drum type, pressed upon the engine shaft, which is 24 in. in diameter. It has a multiple winding, so arranged that the circuits will not become unbalanced should the armature become displaced 1-16 in. from the geometric center of the fields, and when so displaced there will be no injurious sparking at the brushes, no vibration in the armature, and from each brush holder arm there will be drawn approximately its pro rata share of current. The core is built up of laminated steel sheet of the highest magnetic quality, built up on the cast iron spider; the sheets of steel are dovetailed accurately to the spider, the laminated core thus built up is held firmly between two end plates. The armature winding consists of flat copper bars, approximately rectangular in section, forged into shape without joints, and insulated before being placed in the slots. There are no bands, the coils being held in the slots by retaining wedges of hard fiber. The insulation of the armature conductors is of sheet material of high insulating quality applied in overlapping layers, held in place with taps, and the whole treated with a weather-proof and oil-proof compound.

The commutator, Fig. 3, is made up of bars of hard drawn copper, insulated from each other by mica. The number of bars is such that with an e. m. f. of 575 volts the average difference of potential between two bars does not exceed $8\frac{3}{4}$ volts. The bars are held in position at one end by a cast iron ring with a V section, the

ring being bolted securely to the armature spider. The opposite ends of the commutator bars are supported by segments of a similar section, firmly held in position by bolts and these segments are so arranged that one or more bars may be removed from the commutator without disconnecting other bars. The armature winding is thoroughly soldered to the necks of the commutator

FIG. 2—END VIEW OF ARMATURE.

bars; the necks are rigid, each of them being of hard rolled copper riveted and brazed to the commutator bar.

The arms carrying the brushes are strong and rigid, held at the end next the field casting. They are supported by a ring accurately fitted to the yoke, which may be shifted for adjusting the brushes by hand wheel and worm gear. This method of support leaves the commutator clear and comparatively free of obstructions and

FIG. 3—ARMATURE AND COMMUTATOR.

open for inspection. The brushes are of carbon. The brush holders are of the sliding shunt type; their size affords ample surface contact for the brushes in the boxes.

Throughout the armature, spider, core and windings, large and open ventilating ducts are provided, and the design of the spider is such as to set up a forced circulation of air through these ventilating spaces. Space is also left between the shunt and series coils and the pole pieces, and between the shunt and series coils themselves, for maintaining a free circulation of air while the machine is in operation.

ELECTRIC RAILWAY IN NOTTINGHAM.

Mr. S. C. McFarland, U. S. Consul at Nottingham, Eng., writes the State Department that following the lead of Liverpool, Sheffield, Bradford, Glasgow, Manchester, and other cities of Great Britain, it is promised that an electric street railway service will soon supersede the present horse tramways in Nottingham. The present system is probably as antiquated as any in England. There are, in fact, three main systems or lines, each extending from near the central portion of the business section to the railway depots or outskirts, the whole comprising only about 6 miles of track; but there is no central depot, the down-town termini being several blocks distant from each other. No transfers are given, each line being conducted independently. The fares vary in a peculiar manner. On one of the three lines, which is about 1 mile in length over level ground, the fare is 1d. (2 cents). The other two lines have each one steep and long hill on their routes. If you desire to travel the full length of one of these lines, 2d. (4 cents) will be charged. If you desire to ride only to the top of the hill, the same fare will be charged. If, however, you happen to be on the top of one of these hills and desire to ride down either way, the fare is only 1d. (2 cents). This variation of charge is made, as the authorities explain, because a third horse is necessary to pull the heavy trams, which are modeled after the London bus pattern, with seats on top, up the hills. This tram service is supplemented by a number of buses, which carry patrons not only along the regular routes, but to suburbs beyond the limits of the tram lines. Upon these, similar fares are charged. Double tracks for the trams exist only on portions of the routes, and trams run about every ten minutes. When once the seats are full, inside and out, not another passenger is admitted.

One result of the imperfect system has been the creation of a fine, comprehensive, and reasonable cab service. That an adequate modern electric system will find an abundant field here, and that it will revolutionize present conditions to a great extent, is apparent. Opportunity is also afforded for the introduction of devices found to be successful in the United States.

Originally, the tram system was introduced and owned by a private company. Its operation was supposed to be profitable, and after considerable local agitation the city bought the system in 1897 and assumed control in June, 1898, paying par value for the stock—approximately £80,000 (\$389,320). A large number of additional employes were put in service, new cars and horses added, and improvements made in time schedules; but it seems to be questionable whether these improvements have paid. At the time of purchase, the question of electricity was agitated and a grant for the purpose finally obtained from Parliament. Committees from the council were appointed to investigate electric service elsewhere, and last year the United States was visited for that purpose by local engineers. The overhead idea was finally adopted, and it is announced that by December 25th of this year, one branch of the proposed system will be in operation, the others to follow quickly. No statement is obtainable as to when the whole system will be complete. The city owns both extensive gas and electric-light works, and it is assured that no expense will eventually be spared in creating a modern street railway system, with a central depot and adequate suburban service.

Contracts for experimental motors have been placed in Sheffield. If not satisfactory upon trial, other offers will be considered. The bodies of the cars will be built in England, but a Philadelphia firm is under contract to make and deliver the wheels. The wire contracts are likely to go to New Jersey. American steel rails are also under consideration. American bids for miscellaneous material will receive attention, and inquiries should be addressed to Mr. Arthur Browne, city engineer.

AGAINST JOINT USE OF TRACKS IN BOSTON.

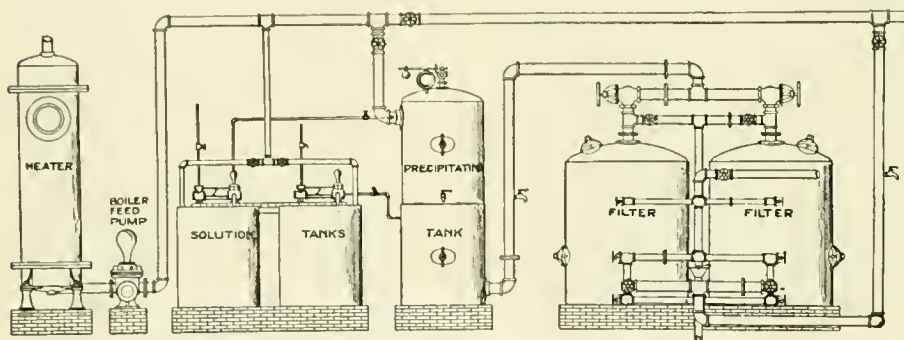

The Massachusetts legislative committee on street railways has unanimously voted against the petition to permit the Worcester & Boston road to run its cars over the Boston Elevated Ry. tracks in Brookline. The committee has decided to report a general bill for the joint use of tracks by street railways, but the Boston Elevated will be excepted from its operation.

The matter of putting vestibules on surface cars, the committee thinks, should be placed in charge of the railroad commissioners.

BACHMAN METHOD OF WATER PURIFICATION.

The evils resulting from bad boiler water are too well-known to need elaboration, and all owners of power plants are interested in the means for purifying water and preventing the formation of scale in their boilers with the attendant increase of fuel consumption and cost of cleaning. The Ideal Manufacturing Co., of Buffalo, N. Y., the maker of the apparatus used in what it terms "Bachman's Ideal System" of water purification, has achieved remarkably good results and claims for the system that it is the only one which will remove oil from water, which will remove carbonate of lime from hot water without hardening the filter bed, and which will automatically regulate itself to the changes in the amount of precipitating material required.

A general view of the apparatus is shown in the figure. An open heater is preferable as it precipitates a portion of the carbonate of lime and magnesia and saves the expense of precipitating these salts in the tanks. From the pump the water is taken to the upper portion of the precipitating tank which is in two sections; here there is introduced from one of the solution tanks the solution of reagents for precipitating the carbonate of lime and magnesia, iron, oil alumina and silica. The pump is so regulated as to furnish the proper amount of solution, this being determined by drawing a sam-

BACHMAN WATER PURIFYING PLANT IN ELEVATION.

ple of water from the lower part of the tank and testing it with a phenol solution.

When the first solution has been properly regulated the second pump is started and the second solution, for precipitating the sulphates of lime and magnesia as carbonates, and for so coating the precipitate as to prevent it solidifying in the filters, is introduced into the lower section of the precipitating tank. The amount of reagent supplied is regulated by testing samples of water.

From the precipitating tank the feed water is carried to the two filters, and thence to the boilers. The manner in which the system is working may be determined by testing a sample of the water after passing the filters.

The size of the precipitating tank will vary with the impurities in the water, the temperature, etc. The solution tanks are large enough to hold a supply for 8 to 12 hours. The filters need to be washed out at intervals of from three to six hours.

The street railways at Quincy, Ill., and Rochester, N. Y., employ this system of purification and have warmly recommended it.

NEW PLEASURE RESORT IN NEW JERSEY.

A group of prominent New York capitalists, including a number of Metropolitan and Third Avenue stockholders, have purchased a large plot of ground at Deal Beach, N. J., and will lay out an extensive park and summer resort covering some 585 acres to be known as Deal Park. Over \$1,500,000 have been put into the property and it is said at least \$1,000,000 additional will be used in improvements. Ground will be rented or leased to outsiders and many beautiful cottages will be erected at once.

Among the directors chosen to control the grounds are Daniel O'Day, (president); Thomas F. Ryan and Anthony N. Brady, of the Metropolitan Street Railway Co.; H. H. Rogers, of the Standard Oil Co.; Ex-Mayor Hugh J. Grant; Col. G. B. M. Harvey, head of the Harvey syndicate; and Geo. W. Young, president of the United States Mortgage & Trust Co.

ELECTRIC TRAMWAYS IN GERMANY.

Consul Hughes, of Coburg, on Mar. 7, 1900, quotes from a trade journal the statement that the length of electric lines in Germany shows an increase of 45 per cent over last year, the available power has gone up 57 per cent, and the growth of accumulator installations is represented by the figure of 164 per cent. The tramway accumulators now aggregate almost exactly a fourth of the dynamo power of the power stations; yet there are very few pure accumulator lines. Overhead conductors continue to predominate. Apart from the two pioneer lines of Siemens & Halske, at Berlin and Frankfort, of the years 1881 and 1884, all the electric roads have been built within the last nine years. The total length is 1,274 miles. Most lines have only a single track, which is made feasible by the almost universal practice of stopping at certain points only. The gas tram line at Dessau, which was considered so successful, will adopt electricity the coming summer.

CONSTRUCTION CONTRACTS SOON TO BE LET AT SYRACUSE, N. Y.

Mr. W. J. Hart, general manager of the Syracuse & Oneida Lake Electric Railway Co. writes us that his company has secured all necessary franchises from the cities, villages and towns through which the road is to run and will be ready shortly to let contracts for construction and equipment. The system will comprise 29 miles of track, one branch running from Syracuse to South Bay (Oneida Lake), 13 miles, and one from Syracuse to Phoenix, N. Y., 16 miles.

The officers of the company are: President, W. B. Kirk; vice-president, T. W. Meacham; secretary and treasurer, W. E. Wheaton; attorney, Louis L. Waters; general manager, W. J. Hart. Mr. Hart was at one time manager of the horse railway lines in Syracuse, was general manager of the Union Street Ry., of Saginaw, Mich., and constructed and operated the Interurban Ry. from Saginaw to Bay

City. He also constructed and operated the Detroit, Lake Shore & Mt. Clemens Ry., leaving the position of manager of that company last June to take up his present duties.

NO WONDER HE GOT A SEAT.

A young man got into a tram-car, and saw to his delight that the only vacant seat was by the side of a young lady acquaintance. He made for that seat with joyous strides, and her eyes answered his delighted looks. But just as he got there an elderly man on the same side moved up into the coveted place.

The young man approached more slowly, and accosted the young lady.

"How is your brother?" he asked; "is he able to get out?"

"Oh, yes," she answered.

"Will he be very badly marked, do you think?" he continued, and the old gentleman grew suddenly interested.

"Oh, no," said the fair deceiver; "with the exception of a few small marks in the middle of his forehead, you wouldn't know that he had ever had it."

"Were you not afraid of taking it?" the young man went on, while the old gentleman broke out in a cold perspiration.

"Not at all," she replied; "I have been vaccinated, you know."

The seat was vacated instantly, the two young hearts beat as half-a-dozen, and the prattle of "nice talk" strewed that part of the vehicle, while a gray-haired old man scowled upon them from the farther corner of the tram-car.—Tit Bits.

It is expected the new road from Rochester, N. Y., to Sodus Bay will be opened July 4th. The cars to be used on this line are double truck, with freight and passenger compartments. The outside finish is in royal blue with light trimmings; in silver lettering on the side panels appear the words, Rochester, Irondequoit Bay, Ridge Road, Sodus.

LAUGH WHILE THEY CAN.

The Railway Age, a leading exponent of the steam roads, indulges in an intoxication of mirth over the account by the newspaper reporter who recently made a trip from New York to Boston, using the trolley lines wherever possible. The affair strikes the Age as something exceedingly funny, but will hardly be so received by the thinking managers of steam roads anywhere, especially such roads as have already felt the competition of the few trolleys which have paralleled them and taken a large per cent of suburban travel. Our readers will recall the time when the trip from St. Paul to Portland, Ore., involved a steamboat transfer at the Missouri river and staging over the mountain gap three or four hundred miles. There was nothing very funny about that stage trip, but thousands of people traveled that way. It may lie within the possibilities of engineers and the future to some day fill the gaps of 58 miles now remaining and make a continuous trolley line between New York and Boston. The Age waxes vehement over the numerous collections of fare, which, however, aggregate about two-thirds of the steam rail rate, but fails to note that the passenger did not have to stand in line and show his ticket before he could get through a gate and again before allowed to enter his car. It is wise to make merry now while neither through track nor cars have been built, for within a very few years a large passenger business will be handled between the two eastern cities named, and it will go over the present trolley lines. It is also within the possibilities that through tickets and through cars may reduce the number of stops from "several hundred" to something like a few score. But read the story which our contemporary's young man lay awake nights to beat out:

AN ELECTRIC "PLEASURE EXERTION."

"Is the long-threatened substitution of electricity for steam in railway transportation about to take place? Is the frivolous trolley already replacing the ponderous locomotive, not merely for short suburban trips, but also for long-distance travel? Such a revolution has not yet become a matter of public knowledge, but the announcement that a journey between Boston and New York by trolley car is now possible seems to indicate that the prophets of 'electricity as the coming motive power' are about to see their predictions verified. The Boston Herald, a paper of good repute, has devoted over a page to an article descriptive of 'a trolley trip' between the cities named, with full details of route, stations, distances, time, rates of speed and fare; and the headlines ought to satisfy the incredulous that the thing can be done.

"The Herald undoubtedly sent two adventurous representatives from Boston to New York and they speak of their journey as a trolley ride; but examination of their itinerary does not suggest any fear that the through trains of the steam railways are likely to be discontinued at present. The reporters survived the journey and came back to write up what they call 'a pleasure trip,' the details of which will strike the reader as a very funny burlesque on that theme. Howell's 'pleasure exertion' mildly suggests the reality, as it would impress the bona fide traveler who might be tempted to try a similar journey between the two cities.

"In the first place, he would find that a 'trolley ride from Boston to New York' is at present impossible, because there are no trolley roads for a considerable part of the distance. Of the 262 miles between the two cities by the route indicated, it appears that only 204 miles were covered by electric roads, the remaining 58 miles being comfortably traversed over still surviving steam railways, not to mention a few gaps bridged by carriage or the good, old-fashioned 'Foot and Walker's line.'

"How many payments of fare does the reader suppose the traveler has to make on this so-called electric railway journey? Only 47! How many transfers from car to car—with several breaks of considerable length? Only about 30. How many stoppages for passengers, turn-outs, change of cars, change of road, etc.? Not stated, but undoubtedly several hundred. How many miles of standing up holding on to a strap, 'please move forward,' wedging upon a platform or waiting for the 'next car?' Unrecorded. How much dust and heat and cold and general discomfort, weariness and exasperation, especially when a steam train went flying by? Incalculable. How much time spent in the journey that is made by steam train in less than six hours? Nearly 55 hours. Cost of the 'electric pleasure trip' compared with railway fare? About double.

"It is often predicted that electric motors will far surpass the speed of steam locomotives. Let us time the runs on the Boston and New York electric railway route as at present operated. From various tables and statements in the Herald's elaborate article we construct the following complete schedule of hours of leaving and arriving, time of each run, terminal points and distances, for the 262 miles of the great composite journey:

SCHEDULE OF "TROLLEY CAR" JOURNEY FROM BOSTON TO NEW YORK.

*Steam railway †Elevated road.	
Summary	
Electric lines	204 miles
Steam lines	53 miles
Elevated road	5 miles
Total	262 miles
Actual running time	21.56 hours
Entire time on the road	25.66 hours
Time lost in making connections	5.21 hours
Time of entire journey	54.61 hours
Cost:	
42 trolley car payments	\$ 2.61
4 steam car payments	1.16
1 elevated railway fare	.05
1 bridge toll; foot	.03
Total transportation charges	\$ 3.87
Hotels and meals en route	7.75
Minimum cost of trip	\$11.62

"Many wonderful records of fast time are credited to steam railways, but this schedule of a run between Boston and New York the great combination electric, steam, horse and leg power route certainly defies comparison. It has never been approached since the good old stage coach times, when the traveler, after making his will and committing himself with much doubt to the care of Providence, bade adieu to Boston and eventually found himself in New York, in rather less time and considerably more comfort than the 'trolley ride' here recorded seems to promise."

The Age neglects, in its comparisons as to speed and time, to lay much stress on the running time over the steam roads bridging the gaps in trolley system. Between Spencer and West Warren by steam train required 80 minutes to make 13½ miles; the preceding stage by electric car took 68 minutes to make 12½ miles, and the succeeding stage 37 minutes for 18 miles. Between Warehouse Point and Hartford 6 miles was by steam and required 40 minutes; the 6 miles next preceding and also the 6 miles next following took electric cars but 34 minutes. That the steam roads could make better time than this is shown later in the table, the other two runs by steam being at the rate of 36 and 23.2 miles per hour.

As a man must eat and sleep whether he stays at home or travels, the comparisons of cost should be \$2.71 for 209 miles as against \$5.00 for the 262 miles which is the railroad fare between Boston and New York.

On April 21st a gaily decorated car made the first trip over the lines of the Inland Traction Co., from Lansdale, Pa., to Sellersville, Pa., a distance of 13 miles.

Changing the Denver Cable Lines for Electric Traction.

BY C. K. DURBIN, GENERAL SUPERINTENDENT OF THE DENVER CITY TRAMWAY CO.

After a struggle of 14 years' duration, the Denver City Cable Co. and the Denver Consolidated Tramway Co. were consolidated, Mar. 3, 1899, into the Denver City Tramway Co. Operation by cable having proved disastrous to the cable company, which had twice been in the hands of a receiver, it was determined by the new company to convert the cable lines into electric lines as soon as the necessary permission could be obtained from the city authorities. Being advised by its attorneys that it had the right under its existing franchise to operate the cable lines by electricity, the company made application to the Board of Public Works for a permit to proceed with the work. The permit being refused on the advice of the city attorney, the matter was taken into the United States court, where it now rests, to come up for hearing in the near future at St. Paul. The "blanket" franchises of the company were then attacked by the city, which sought to repeal them, but was restrained from so doing by Judge Moses Hallet of the United States District Court, sitting at Denver. Rather than delay until the matter could be determined by the courts, the company requested of the city council permission to string wires over the cable lines and to operate them electrically for a period of 20 years. Much agitation was carried on by certain designing politicians and newspapers in favor of requiring a percentage of gross receipts, in consideration of the granting of a new franchise, and the platform of the Democratic party at the last city election contained such a provision. In view of this, it was forcibly urged upon the officials by the parties referred to, that they could not consistently grant a franchise which did not require a percentage of gross receipts. The mayor and councilmen, however, took the stand that it was not a new franchise which the company desired, but simply permission to change from cable to electric power under the former franchise; and notwithstanding all opposition, the company having accepted the city's demands for certain concessions, the bill was finally passed, and was signed by the mayor on March 22d last. The concessions made by the company were: The payment of a disputed paying bill amounting with interest to \$30,000. The payment to

DERRICK WAGON FOR SETTING POLES.

the city within 12 months from the passage of the ordinance, \$72,000 cash, at the rate of \$6,000 per month. The granting of transfers to all lines intersecting with former cable lines. The carrying of bicycles, three to the car, on payment of a 5-cent fare

for each wheel. Half-fare tickets for children between the ages of 6 and 12 years.

As before stated, the period for which the permission is given is 20 years, and neither the company nor the city waive their respective rights in respect to the "blanket" franchise, which is now being tested in the United States court. The company, feeling

CONCRETE WAGON AND CREW.

that it was only a question of a short time until the necessary permission would be granted, went ahead and obtained the materials for electrifying the lines, so that when the ordinance was finally signed, everything was in complete readiness to proceed with the work in the shortest possible time. A plat of each line, giving the exact location of each pole, had been prepared by the engineers, under the energetic supervision of Mr. W. G. Matthews, superintendent of overhead construction. A great deal of time had been spent in preparation of the details. Materials were systematically arranged and prepared for rapid handling. A chart giving exact details was prepared for each foreman, so that when the word was given it was merely a matter of obtaining the necessary labor. Two gangs of men were organized, one for the wooden-pole district, the other for the iron pole district, and set to work simultaneously. Work on the West Curtis St. line was started Thursday afternoon, immediately after the bill was signed, and that line was ready to be operated the following Saturday evening, the time consumed being a little over two days. At the same time work was started at the foot of 17th St. in the iron pole district. The erection of iron poles was the most interesting part of the work. Some time previously the company had built by the Studebaker Wagon Co. a derrick wagon, as shown in one of the accompanying illustrations. Too much cannot be said in praise of the work done by this wagon. On the second day of operation 127 poles were erected in 11 hours, a good many obstacles being encountered. Those in charge of the work are confident that with a clear field 150 poles can easily be erected by the wagon in 10 hours.

The modus operandi for the erection of the iron poles was as follows: The flagstones, where possible, were raised by men with long steel bars; where not possible to turn the stones out, and where there were concrete sidewalks, stonecutters were set at work. Next followed the diggers; part of the time, in order to keep ahead of the raising crew, it was necessary to put two diggers at a hole, and in fact, so fast was the work crowded, that at one time there were over 100 diggers at work in different parts of the city. All the loading, hauling and unloading of both iron and wooden poles was done by separate crews specially detailed for the work. The pole having been dropped into place, it was lined up by means of a plumb bob, and was held in place by three men with pike-poles, as shown in the illustration. Next came the work

of concreting. Gravel had been distributed at each pole, and three sacks of cement left at the same place. A small squad of men went ahead and mixed the cement and gravel dry on the pavement; they were followed by two concrete wagons, one for each side of the street. One of the engravings shows one wagon with a small force of men, who are finishing up one of the poles opposite the Brown Palace Hotel. The men would throw the gravel and cement mixed into the tray of the wagon, wet the mass from the accompanying sprinkling cart, mix it thoroughly and shovel into the hole, where it was well tamped. As many as 25 men were used with each wagon, about half the number being allowed to rest while the others worked, so that no time was lost. It was indeed a very busy scene, and the people were delighted to see the poles going up so rapidly; often a pole would be erected and set completely in five minutes. Other wagons followed, cleaning up the surplus gravel, cement sacks, etc., and the stonecutters came after, fitting the stones back into place as quickly as it could be done.

The poles being in place, the next work was to put up the span-wires and to string the trolley wires. This was done by separate gangs under separate foremen, and by means of wagons, as shown in the illustrations. The towers, were built especially for the work, and when the word was given it was only necessary to set them on transfer wagons which had been hired. The concrete around the iron poles was allowed to set about three days before any wires were strung. So thoroughly was the work done, that in no case did a pole give way in the slightest degree. The two terminal poles at the foot of 17th St. in front of the Union Depot, were made of two cable slot-rails riveted together, and were imbedded in a specially rich concrete 8 ft. deep.

In all 26 miles of trolley-wire were strung and 1,228 poles erected, 279 of which were iron, and 949 wooden. The total cost of labor was \$5,672.12, the details of which are as follows:

CHARACTER OF WORK.	IRON.			WOOD.		
	No.	Cost per Pole.	Total.	No.	Cost per Pole.	Total.
Delivering poles	279	\$ 0.36	\$ 100.12	949	\$ 0.37	\$ 353.63
Digging post-holes	270	.86	236.38	949	.89	844.87
Raising poles	276	.21	58.75	949	.30	283.40
Hauling sand and blocks	279	.95	257.65	949	.05	49.00
Setting poles	278	2.00	555.70	949	.37	355.20
Stonecutters	276	.87	242.00
Cost of cement total per hole, 2.80 sacks; total used, 792 sacks	270	2.14	590.64
Total.....		\$ 7.39	\$2,041.24		\$ 1.98	\$1,886.10

Cost of three special iron poles in front of Equitable Building and Brown Palace Hotel, \$100.63.

Total for iron poles, \$2,141.87.

Total for wooden poles, \$1,886.10.

Total, \$4,027.97.

Cost of erecting wires, \$774.00.

Average cost of stringing trolley wire, per mile, \$6.97

Average cost of erecting curves, \$9.89.

Average cost of putting up span-wire, 53 cents.

Miscellaneous expenses, getting materials ready, hauling supplies, cleaning streets, time-keepers, watchmen, foremen, etc., \$870.15.

SUMMARY.

Total cost erection of poles, \$4,027.97.

Total cost erection of wires, \$774.00.

Total miscellaneous expense, \$870.15.

Total, \$5,672.12.

These figures are given not as a criterion of cheapness, although the work might have cost as much or more if it had been done within a longer period of time; but they are given because it is thought they may be of interest to some one who contemplates a similar "rush job." The work was simply "crowded," and no expense was spared. The lines were all completed and put in operation by March 31st. No work was done on Sunday, so that the entire work was done in about seven and one-half working days. The lines were not all put in operation simultaneously, but were started up on different days. The gripmen were "broken in" as motormen quite rapidly, each man being on with his instructor an average of four days. The men were allowed wages while they were breaking in, and the instructors were paid \$5 extra for each man broken in. The men were all subjected to a written exam-

ination, and were then set at work, starting up the lines which they had formerly run over with cable trains. All the lines started without a hitch, and without accidents. Almost the entire credit for the preparation of the details and the carrying out of the work

TOWER WAGONS AND CREWS.

is due to Mr. Matthews, who has "grown up" with the company, and who previously had no experience with similar undertakings.

Current was obtained from the feeder lines already up, the power-houses of the company having a sufficient surplus for the additional cars. Probably an entire new station of about 4,000 h. p. capacity will be erected as soon as the machinery can be obtained. When this is completed the present stations will be dismantled

C. K. DURBIN.

W. G. MATTHEWS.

and their contents sold. Much work remains to be done on the two viaducts, about 3,000 ft. each in length, to render them suitable for the heavier electric cars. Rails weighing 65 lb. per yard will be laid, and the stringers and other timbers are being changed where necessary. A number of track connections, Y's, etc., are being built at the company's shops, which are now worked to their full capacity, day and night. It is the intention of the management to put the entire property in first-class shape, as soon as the work can be done.

RIGHT OF COUNCIL TO REGULATE SCHEDULES NOT ADMITTED.

At a meeting last month the City Council of Montreal passed a resolution ordering the Montreal Street Railway Co. to change the running time on a number of its lines to give a more frequent service in certain parts of the city. After considering the resolution the directors of the company notified the council they could not concur in the assumption by the city that it had power to regulate schedules by simple resolution, and in order that the citizens who reside on the routes in question may not suffer a deprivation of their rights, the company offers to facilitate in any way in its power the obtaining of a judicial decision in the matter.

TESTS OF CONTROLLING SYSTEMS FOR THE BOSTON ELEVATED.

The illustration herewith is a view of one of the standard cars for use on the Boston elevated and also shows a dummy attached to the standard cars for making up the trains used in the competitive tests of controlling systems begun on April 3d. The standard cars are 46 ft. long with side doors and seat 48 persons; the net weight with equipment is about 27 tons.

There were three companies in the competition, the Sprague, the Westinghouse and the General Electric. The Sprague and the General Electric trains were each of four cars, one standard passenger car and three flat cars, all being loaded with pig lead or other ballast to give a total weight of 30 tons each. The Westinghouse train consisted of one flat car and three passenger cars from the experimental line between Wilmerding and East Pittsburg. All test cars had two motors, both being mounted on a Baldwin truck; on the Sprague and General Electric trains the motors were G. E. 55 built for the Northwestern Elevated of Chicago, while the Westinghouse train had Westinghouse 50 C motors.

The tests were made between the hours of 1 a. m. and 5 a. m. in the subway, two of the tracks having been provided with third rails; this addition is permanent and surface cars will be excluded from these tracks after the elevated section is in operation. The distance run by the test trains is 1.4 miles in the course of which is an 8 per cent grade with a 90-ft. radius reverse curve at the foot. Stops of

TWO CARS OF THE SPRAGUE EXPERIMENTAL TRAIN.

10 seconds were made at each of five stations, the total time being 6 minutes, which means an average speed of over 16 miles per hour excluding stops. Runs were made with one, two, three and four cars. All the instruments were in the passenger car. The various instruments were read at intervals of two seconds; the speeds were measured by noting the time of passing signal flags. The data are to be worked up by Mr. John Lundie, consulting engineer in the matter of equipment, using time as an abscissae and speed, distance, current, voltage, and grade as ordinates.

The Sprague system and the Westinghouse electric-pneumatic system of control have both been described in the "Review." In the General Electric multiple unit system the main controller, one under each car, consists of a series of solenoids each operating a contact; on each platform of each car is a master controller of the usual form, and the manipulation of any one of these controls the current in the solenoids of the main controllers causing them to act in unison. This system has no pilot motors or automatic throttling device.

Before regular operation of the elevated cars can be undertaken through the subway certain changes will be made in the special work to allow the use of deeper wheel flanges; the outer rails on curves will also be elevated where the dimensions of the tunnel permit of it.

The current consumption on the test trains was as high at times as 600 amperes per car, and to meet the fluctuations that are to be expected in regular service storage batteries will be installed in substations near the termini of the subway.

May 1st it was announced that the Sprague Electric Co. had been awarded the contract for controllers for 60 cars.

J. L. WILLCUTT'S LONG SERVICE IN SAN FRANCISCO.

At the annual meetings of the Market Street Railway Co. and the Geary Street, Park & Ocean Railroad Co., of San Francisco, Mr. J. L. Willcutt, secretary and controller of the first-named company, and secretary and general manager of the second, declined a re-election and was succeeded in these offices by his son, Mr. George B. Willcutt.

The pioneer street railway of San Francisco was the San Francisco Market Street Railroad, operated by steam, which was opened for traffic on July 4, 1860; two years later a branch line was built in Hayes St. As operated by steam, with a half-hour service, the road was a losing venture, and in 1866 was sold to the San Francisco & San Jose Railroad Co. (the first link of the present Southern Pacific system), of which Mr. J. L. Willcutt was secretary. A new company, the Market Street Railway Co., of San Francisco, was organized to operate the street railway, and Mr. Willcutt chosen secretary. About a year later six two-horse cars were substituted for the steam dummies. In 1879 the company decided to adopt cable traction, already in successful operation on other lines in the city, and greatly extend the system to meet the needs of the rapidly growing city; the new cable system was put in operation in 1883. In connection with these improvements the owners built the Park & Ocean R. R., a double track line 4 miles long, operated by steam dummies. Mr. Willcutt also served as general manager

until 1893, when the present Market Street Railway Co. was organized and a consolidation of twelve smaller corporations effected; after this he continued as secretary of the Market Street.

In 1887 the Southern Pacific capitalists bought a controlling interest in the Geary Street, Park & Ocean Railroad Co., and Mr. Willcutt was made secretary and general manager of that company, positions which he has held continuously till now.

During all this time Mr. Willcutt has also been secretary of the various steam road companies controlled by Southern Pacific interests, and being chosen to the same office in several other steam railroad corporations, at the recent annual meetings, the increased duties were such that he could no longer continue to act as an official of the street railways, though remaining as a director of the two companies. During his connection with the Market Street road the mileage has increased from 2½ to 185 miles, and the number of cars from 6 to 800.

Mr. George B. Willcutt, the newly chosen secretary and controller, is a young man of great promise, who has been connected with the Market Street company for a number of years, and thoroughly familiarized with all the details of his position. We wish for the son an equally long and successful career in the street railway field as that achieved by Mr. J. L. Willcutt.

The sinking of a steamer on the Atlantic last month caused the loss of a number of exhibits intended for Paris. Among these were a miniature of the Brooklyn Bridge, made by the Roebling Co., and orders have been given for its immediate reproduction. A complete electric railway system will be installed on the model.

INTERURBANS AT COLUMBUS, O.

We have made mention in recent issues of the efforts of various interurban electric roads to secure entry into the city of Columbus, O. April 21st it was announced that an agreement had been reached between the officials of the Columbus Railway Co. and the Worthington, Clintonville & Columbus Street Railway Co. whereby the latter company will operate its cars over the tracks of the former in the city. The compensation is to be on what is known as the "Dayton plan"; the Columbus Ry. will provide the tracks and power, and is to receive 3 cents for each passenger carried over the city lines in the interurban cars.

April 23d, the Columbus city council passed an ordinance giving the Columbus, London & Springfield Railway Co. a franchise on certain central streets. The vice-president of this company states that it is quite willing that the other interurbans shall make use of its tracks.

May 1st the Columbus, Buckeye Lake & Newark Traction Co. also secured the passage of an ordinance permitting it to enter the city. The company agrees to sell 7 tickets, good within the city limits, for 25 cents, and 28 for \$1.

May 3d the Columbus & Lancaster Traction Co. made an agreement with the Columbus Railway Co. to enter over the latter's tracks.

Other interurban companies seeking to enter the city are the Grove City & Green Lawn Street Railway Co., the Columbus, New Albany & Johnstown Traction Co. and the Chillicothe, Clarksburg & Columbus Railway Co.

WOODILINE FOR PRESERVING TIMBER.

Among all the processes for increasing the life of timber so placed as to be subject to rapid decay, that have been brought to public attention in recent years, none has proved to be more efficient and inexpensive than that of immersing the timber in a hot bath of liquid called "Woodiline." The composition of the liquid is not made public, but the American Wood Preserving Co., of Philadelphia, which developed this method of treatment, states that it is a mixture of certain powerful antiseptics with highly waterproof ingredients; the liquid is said to solidify and harden after entering the timber so that the timber is not only made materially tougher in its outer fibers, but the antiseptics are not liable to be washed out under the action of moisture, or to be evaporated.

The first important use of "Woodiline" in railway work was on the Amboy division of the Pennsylvania R. R., when some red and black oak ties treated by this process were laid in 1883; these proved to be sound after 16 years of service, though two and in some cases three sets of untreated white oak ties were in that time removed from positions immediately adjoining the treated ties. Since these tests the process has been extensively used by such railroads as the New York Central, the Chesapeake & Ohio, the Terminal Railroad Association of St. Louis, the Long Island, and on many smaller systems; it has also been used in Mexico, China and Brazil. Over three years ago the West End Street Railway Co., of Boston, placed an order with the makers for a large quantity of the preservative for treating the ties to be used in the subway. The experience of this road (now the Boston Elevated) has been very satisfactory; as is stated on page 253 of this issue, the ties treated with "Woodiline," even where covered with soil and sod, usually last as long as the rails.

For treating the ties by immersion they are placed in an open tank of the liquid, which is heated by steam pipes to 150° F. and allowed to remain for about 15 minutes, in which time a tie will absorb about half a gallon of the mixture. Only seasoned timber should be treated if the best results are to be expected; green or wet timber will not absorb the liquid.

Where the timber can not be immersed the liquid may be applied with a brush and good results obtained. For this method the preservative is heated in an iron pot to about 125° F. and the timber given three coats with a large brush; several hours should elapse between coats to give opportunity for drying.

The economy of this open-tank treatment by immersion simply, as compared with the more expensive methods of steaming the timber and forcing the preservative under pressure will readily be appreciated.

NEW ROAD IN THE OHIO VALLEY.

We are informed by Mr. H. S. Sands, purchasing agent for the Steubenville, Mingo & Ohio Valley Traction Co., that five miles of its proposed road are nearly completed. The present line extends from Steubenville, O., to Mingo Junction, O. At the power house are two Russell four-valve engines of 500 h. p. each, direct connected to Westinghouse generators and boilers of 800 h. p. capacity.

The general offices and a handsome car barn are located at Steubenville, where the company is also developing an extensive park, with casino, etc. Eight cars will be in operation by June 1st.

TRAFFIC IN ST. LOUIS.

The reports of the street railway companies of St. Louis for the quarter ending Mar. 31, 1900, show trips run and passengers carried as follows:

	Trips.	Passengers.
St. Louis & Suburban Ry.....	54,266	2,995,941
St. Louis Transit Co.....	1,267,775	27,038,585
Total	1,322,041	29,944,526

For the last quarter in 1899, the same companies reported trips run, 1,558,315; passengers carried 32,783,639.

NEW FAY SURFACING MACHINE.

The accompanying illustration shows an improved machine recently brought out by J. A. Fay & Co., of 557-577 W. Front St., Cincinnati, and known as their No. 2 "Centennial" surface planer.

This type of machine is made in sizes 16, 20 and 24 in. wide and is adapted for surfacing all kinds of hard or soft wood. The cylinder is of forged steel with lips; pressure bars are fitted on each side of the cylinder for planing thin or short material. The bed plate and under rollers raise and lower together to suit the

thickness of the material to be planed, which is shown by an index gage, and always maintain their relative position with respect to the cylinder, and upper feeding rolls.

FREIGHT ON MASSACHUSETTS ELECTRIC LINES.

The legislative committee on street railways of Massachusetts has decided to report a general bill authorizing electric and street railways to carry freight. The decision was not unanimous, and one member reserved the right to dissent, on the ground that some equivalent privilege should be required of the companies.

PICKPOCKETS ON ELECTRIC CARS.

The Chicago police have received a large number of complaints from persons whose purses and valuables have been stolen while riding on street cars. It is believed that the thefts are all the work of one gang which consists of four well-dressed men. The method is for one man to block the doorway and while the victim is explaining that he wishes to enter the car, the other men who are on the platform crowd against him and in the confusion secure their booty.

Corporation Counsel Whalen, of Greater New York, announces he is preparing to bring suits on behalf of the city to recover \$1,200,000, due from various street railway companies for car license fees, percentage of earnings and repaving the streets between the tracks.

FOREIGN FACTS.

The first electric line at Santiago, Chili, has been opened to the public.

Extensions will be built to the Bangkok (Siam) Electric Tramways. Mr. W. J. Jacobson is manager.

It has been decided to rebuild the Mersey (Eng.) & Wirral Ry., and equip it with a third-rail electric system.

Trolley wire thieves are giving the management of the new electric lines in Mexico City considerable trouble.

There are 54 tramway bills now before Parliament involving the possible construction of 504 miles of track, and an expenditure of £12,014,255.

Electricity will be applied to a section of the Societa delle Ferrovie Mediterranee line, a steam road running from Genoa to Turin, Italy.

The new tramway system in the city of Norwich, England, is nearing completion. The lines are owned by the Norwich Electric Tramways Co.

A scheme for a light electric railway of 110 miles from Lecce, Italy, to Taranto, has been presented to the Deputazione Provinciale of Lecce.

Extensions to Wrekenton and Dunston will be built by the Gateshead (Eng.) & District Tramways Co., of which Mr. Henry Foley is manager.

A Board of Trade order was last month issued to the Batley (Eng.) Corporation, giving permission to lay electric tramways through the borough.

An issue of 4½ per cent first debenture stock has been made by the Calcutta (India) Tramways Co. to provide funds for converting the lines to electric traction.

Government permission has been secured by the Societa delle Tramvie Ferronie Electriche of Rome, Italy, for building an extensive electric tramway system.

Formal sanction has been granted by the Local Government Board to the Ilford (Eng.) District Council to borrow £70,000 for electric lighting and electric tramways.

At Glasgow, a skeleton car is being used for the purpose of teaching the horse car men how to operate electric cars. It is devoid of furnishings, and the wiring is exposed.

The City of Birmingham (Eng.) Tramways Co. is making overtures to the city council to replace the electric accumulator cars on the Bristol Road with the overhead trolley system.

A bill has passed the House of Commons granting the Stockport (Eng.) Corporation powers to build electric tramways. Mr. Webb is mayor and chairman of the electricity committee.

Contracts for the construction of tramways in Vienna, Austria, have been awarded to Schuckert Co., of Nuremberg, Germany. The lines are controlled by the Vienna municipal authorities.

The Japan-American Commercial Journal states there are 19 power houses in Japan for supplying electric power to tramways. Of these 6 are operated by water-power and 13 by steam or other powers.

Application is before the authorities for leave to equip the Birmingham (Eng.) & Midland Tramways, now operated by steam motors, with the overhead electric system. The Birmingham Council has always opposed the trolley, but it is hoped permission will be granted in this case.

Over 8,300,000 passengers were carried last year on the Middlesborough (Eng.) Stockton & Thornaby interurban road. This system was described in the "Review" for October, 1898, page 711.

Hereafter all employes of the tramway lines owned by the London County Council will work only 60 hours a week. The reduction in hours represents an increase of \$50,000 per annum in operating expense.

The House of Commons has passed a bill authorizing the Reading (Eng.) Corporation to build new electric tramways and to reconstruct for electric traction the lines of the local tramway company.

Electricity is to be substituted for mule power on the tramways at Torreon, Mexico. Further information may be secured from Salvador Diaz Alvarado, manager of the Compania de Tramvias de Lerdo, Lerdo, Mexico.

A company recently formed at Brussels, Belgium, is planning to construct an electric railway between Brussels and Antwerp, a distance of 28 miles. The Allgemeine Electricitats-Gesellschaft of Berlin is said to be interested.

The horse tramways at Georgetown, British Guiana, have been purchased by the Demerara Electric Co., and will be equipped electrically. Among those interested are C. H. Cahna and B. F. Pearson, of Halifax, Nova Scotia.

At Frankfort-on-Main, Germany, a considerable reduction in the passenger rates on the city's electric railroad has been made. In future the rates will be 10 pfennigs (2½ cents) for 4 km. (2½ miles), and 15 pfennigs for greater distances.
